    - .2 Wind speed present value from building mounted weather station
    - .3 Rain status present value from building mounted weather station
    - .4 Zone perimeter thermostat temp present value, and ability to set minimum on LCD

- .5 Zone interior thermostat temp present value, and ability to adjust on LCD
- .6 Zone average temp present value (virtual point)
- .7 Window % open present value, and ability to manually override (conditional logic applies)
- .8 Clearly visible, plain English indication to the effect of "good time to have the windows open"
- .9 Clearly visible, plain English indication to the effect of "window manually overridden closed"
- .10 Window shade position % open present value.

## **2.17 RADIANT SLAB - CHW/HHW – Work in Progress**

### **2.17.1 General:**

- .1 CHW/HHW plant send the heating and cooling water, distributing it to radiant manifolds. (See appropriate sequence section for control of that equipment.)
- .2 Each radiant manifold zone shall have 1 slab temperature sensor, using very simple deadband control with two-position valves.
- .3 Radiant slabs are slow to respond, so a pre-determined setpoint will have to be determined long in advance of occupancy. A lookup table for each zone based on the appropriate weather will set the slab's target value.
- .4 Note: for some projects with ceiling fans, night flush, or 2 pipe CHW/HHW plants, additional sequence logic could be necessary for a complete zone logic set.

### **2.17.2 Scheduling:**

- .1 Radiant system shall be enabled based on user provided schedule.
- .2 Occupied: Monday through Friday 6:00 AM to 6:00 PM.
- .3 Unoccupied: For all other times, and holidays. Consult Owner for how they determined.

### **2.17.3 Variables Used:**

- .1 Forecast OSAT High: forecast for tomorrow's OSAT high where tomorrow is an occupied day.
- .2 Actual OSAT High: what the high for an occupied day actually was
- .3 Present OSAT: live value from the building weather station or AHU duct temp. This is a virtual point maintained at the front end for all building equipment to use.
- .4 Zone Temp: as measured by a zone thermostat
- .5 Slab Temp: present value of slab temp

- .6 Slab Temp Setpoint: the desired slab temp
- .7 Max Acceptable Zone Temp: the highest temp a room should ever get when initial slab temp was appropriate for that zone. Initially 78 deg F for all zones.
- .8 Min Acceptable Zone Temp: the lowest temp a room should ever get when initial slab temp was appropriate for that zone. Initially 68 deg F for all zones.
- .9 Forecast Error: difference between forecast high OSAT and actual OSAT high.

2.17.4 Control Valve for Radiant Zone:

- .1 The two position valves will use deadband control to supply slab with CHW/HHW to meet the desired slab temp. Use initial deadband range of +/- 1 deg (adj). When the slab temp is outside of range, binary control valves will remain open until setpoint is reached and then close.
- .2 PI loops work better with low thermal mass systems like air and water but tend to wind up or cause further delays when applied to concrete.
- .3 Provide full port ball valves rather than traditional control valves without characterizing discs for radiant manifold control. These will provide better response time for cooling or heating. Overshooting setpoint for radiant slabs is virtually never an issue.
- .4 Controls contractor to be mindful of not providing too wide of a deadband, or the system may not recover in a reasonable amount time.
- .5 Allow any user to raise or lower slab temp setpoint from the local zone thermostat +/- 1 deg (adj). Caution: non-admin users should not be allowed to change their slab temp more than a few degrees. This could lead to erroneous CHW/HHW plant requests or unrealistic expectations in response time.
- .6 Slab return water temp is a monitoring / troubleshooting point only.
- .7 Provide full port ball valves rather than traditional control valves with characterizing discs for radiant manifold control.
- .8 Allow users to slightly raise or lower slab temp setpoint from the local zone thermostat +/- 1 deg (adj).
- .9 If zone temp is above 78 deg F for more than 30 min (adj) AND the zone is in heating mode, close the valves and lock out heating sequence for 30 min. Resume heating if space temp is no longer above acceptable heating range at the end of lockout.
- .10 If zone temp is below 68 deg F for more than 30 min (adj) AND the zone is in cooling mode, close the valves and lock

out cooling sequence for 30 min. Resume cooling if space temp is no longer below acceptable cooling range at the end of lockout.

- .11 If the slab temp meets setpoint but falls out of deadband and cannot return for the remainder of occupancy, send alarm to the effect of "CHW/HHW pump flow may be inadequate."
- .12 If return water temp for a radiant slab is within 2 deg (adj) of plant supply water, send alarm to the effect of "excessive pump flow could be causing low delta T".
- .13 If the slab temp meets setpoint but falls out of deadband and cannot return for the remainder of occupancy, send alarm.
- .14 If the slab temp never achieves setpoint for a given day, send alarm to the effect of "adjust optimal start routine."
- .15 If a valve actuator feedback does not match the commanded position, send alarm.

#### 2.17.5 Pre-Heating & Pre-Cooling Plant Startup:

- .1 Being slow to react, an initial slab temp must be selected far in advance of any occupied state. Pre-heating or pre-cooling durations of 6-8 hours are common. For seasons with harsh temperatures it is common practice to continue heating/cooling to a lesser extent over weekends to prevent having too great of a temperature to overcome. This time to pre-cool/pre-heat can be calculated in the following ways:
- .2 Traditional optimal start where the BMS directly measures heating/cooling rate and uses this derivative to reverse calculate for time to heat/cool based on present slab temp vs desired slab temp.
- .3 Providing an unoccupied setback of slab setpoints to prevent too great of a differential between present value and setpoint. Use initial unoccupied lower threshold of 65 during heating months and upper threshold of 78 during cooling months.
- .4 For moderate climates with simple or limited zoning AND with owner's written permission, the DDC contractor may simply provide admin user an hour timer for pre-heating/pre-cooling.

#### 2.17.6 Initial Slab Temp Setpoint Determination:

- .1 Because the radiant slab takes time to respond, every zone will need to have an initial slab setpoint determined far in advance of the next occupied day as opposed to reacting to present temp values.
  - .1 Note: see Pre-Heating/Cooling section to determine how far in advance to start the plant.)

- .2 Note: this is not a single building-wide lookup table, these values will be re-written by the BMS. See corresponding section below.)

2.17.7 There are two methods of determining the initial slab setpoint: with and without a weather forecast.

- .1 When a BMS integration to NOAA weather data exists and is reasonably accurate, then use the table below based on the forecast OSAT high to choose initial slab temp setpoint. "Reasonably accurate" can be defined loosely here as a forecast that is often within 5 degrees of actual OSAT high because the table is arranged in 5-10 degree increments. This is also possible because these lookup tables are at the zone level and will be refined as the BMS detects need to rewrite these values. See corresponding section below.
- .2 Times arise where the NOAA airport weather data exists and is NOT a reasonably good indicator of the microclimate the building is in, but it can be used to determine if there is a general heating/cooling trend. Example: airport is by the coast and building is inland, temperatures between them could differ by 20 degrees, however one can still know if tomorrow likely to be the same, hotter or colder. For these instances, BMS to perform the following:
- .1 IF forecast value for tomorrow OSAT high is within +/- 5 deg (adj) of today's forecast OSAT high, use same initial slab setpoint value as today.
- .2 IF forecast value for tomorrow is 5 deg (adj) hotter/colder than today's forecast, then use a table lookup value corresponding to building OSAT +/- 5 deg (adj).
- .3 OSAT high lookup table to be used with BMS connection to NOAA weather forecast.

OSAT high for tomorrow	Slab Temp Setpoint
≤35°F	85°F
≤45°F	82°F
≤55°F	78°F
≤65°F	74°F
≤67°F	74°F
≤68°F	73°F
≤72°F	73°F

≤73°F	72°F
≤80°F	67°F
≤85°F	65°F
≥85°F	65°F

- .1 Note: the lookup table is not linear through the entire range. Moderate weather OSAT calls for about the same slab temp (72°F -74°F). As weather gets progressively harsh, then slab temps will need to provide greater amounts of cooling/heating.
- .4 When there is no BMS connection to forecast weather data, then an admin user will manually enter a simplified version of tomorrow's forecast: colder, neutral or warmer.
  - .1 If the admin user inputs neutral, use the same as initial slab temp setpoint as yesterday.
  - .2 If the admin user inputs colder or warmer, then use a table lookup value corresponding to building OSAT +/- 5 deg (adj).
- .5 Manual Override Option: At the front end allow an admin user to manually select an initial slab temp setpoint for the building or a zone. In this way outlier zones which do not have similar heating/cooling needs can still be addressed.
- .2 Slab Setpoint Table Modifications:
  - .1 The slab temp initial setpoint lookup table is to be programmed at the zone controller.
  - .2 The slab temp lookup table values provided here are just initial, educated guesses with estimated loads for occupancy. Some specific zones could require fine tuning with time and will be rewritten by the BMS to match the specific needs of the exposure and space requirements.
  - .3 A zone may need to re-write values in the slab temp column if the thermostat in the zone indicates excessive deviation. Correction to the table for a given zone should be applied as follows:
  - .4 IF BMS weather forecast connection exists:
    - .1 AND the zone temp high for a day exceeds an acceptable high limit of 78 deg F (adj) or low limit of 68 def F (adj) for more than 30 min (adj),

- 
- .2 AND the actual OSAT high for the day would have lead the BMS to choose that same initial slab temp as the forecast OSAT high,
  - .3 THEN, the prediction was good, but the slab temp was not well suited. Adjust that zone's initial slab temp setpoint by +/-1 deg F for heating/cooling respectively for the row corresponding to the OSAT high for the day.
  - .4 ELSE IF, make no table adjustment.
  - .5 IF no BMS weather forecast connection exists:
    - .1 AND the zone temp high for a day exceeds an acceptable high limit of 78 deg F (adj) or low limit of 68 deg F (adj) for more than 30 min (adj),
    - .2 THEN, adjust the zone's initial slab temp setpoint table value by +/- deg F for heating/cooling respectively for the row corresponding to the OSAT high for the day.
  - .6 Calculate the error between forecast and actual OSAT high. Display on front end. Trend these daily values for 90 days before auto-exporting.
  - .7 Send low level alarm if zone is outside of acceptable range 68 deg F to 78 deg F.
  - .3 Slab Temp Safety Lock Outs:
    - .1 If there is a condensate sensor at the radiant manifold, and it detects the presence of water, send low level alarm that moisture potential for the tempered water is present (as often there is not as there would be with 40 deg chilled water).
      - .1 Note: Humidity comes from many sources that are outside the control of the BSM (such as doors and windows). This is not to be confused with a condensate sensor on the floor or roof as one would have with a chilled beam. The slab temp has a sizeable difference in temp than the manifold water.
    - .2 If radiant slab return water temp is below 55 deg (adj) then shut control valve and lock out valve from opening for 30 min (adj, then resume cooling sequence.
    - .3 Anti-Freeze: if the OSAT is below 32 for more than 1 hour initialize heating systems and run to 60deg slab temp for 4 hours or until occupied.
  - .4 If change over valves are shown on the controls diagram, these must all be normally closed when the fans are off to prevent excessive bypass of the supply to the return.

3 . EXECUTION

3.1 Not Applicable

END OF SECTION

**ACCEPTABLE  
MANUFACTURERS LIST**

<b>ITEM</b>	<b>APPROVED MANUFACTURERS</b>
Access Doors	Can-Aqua, Mifab, Milcor, Maxam, Van-Met, Nystrom, Van-Met, Acudor, E.H. Price, Steel Brothers, Nailor, Zurn, Wade
Automatic Air Vent	Sarco, Armstrong, Dole, Maid-O-Mist, Taco, Watson McDaniel, Caleffi
Air Curtains	Berner, Schwank, Biddle
Air Separators	Armstrong, Spirotherm, Taco, Spirotech Caleffi, Wessels, B&G (Xylem)
Air Handling Units/Make-up Air/DOAS Units (Institutional)	AnnexAir, Engineered Air, Haakon, Ingenia, Ventrol, Govern-Air, Scott Springfield, Swegon, Tempeff, Scott Springfield, SystemAire
Balancing	Air Balance Group, Air Audit, Clark, Aerodynamics, Pro-Air, Dynamic Flow Balancing, Air Velocities Control, Flowset, Designtest and Balance, VPG, Vital Canada, Technical Air Balancing,
Backflow Protection	Watts, Febco, Clayton, Beeco, Wilkins
Buffer Tanks	AO Smith, Bell & Gossett (Xylem), Taco, Armstrong
Air Source Heat pump	Aermec, Climavenata, JCI, Water Furnace, Bluebox
Coils, Water	Aerofin, Trane, McQuay, Carrier, Engineered Air, Heatcraft, JCI/York, RAE. Macon
Boiler	Petterson Kelly, Lochinvar, Fulton, Acme Slim, Viessman
Controls	Alerton by Advanced Energy management LTd.
Couplings	Victaulic, Grinnell
Damper - Low Leakage	Tamco, Ruskin, Nailor, EH Price, Greenheck, Arrow United, NCA
Domestic Hot Water Heaters	AO Smith, Ruud, Rheem, State, PVI, GSW, John Wood, Bosch, Bradford White
Domestic Hot Water-Tankless	AO Smith, Bosch, Tagaki, Rinnai, Eemax, Navien, Stiebl

	Ebtron, NTI
Expansion Joints	Flexonics, Hyspan, Uniroyal, Keflex, Mason, Goodall, Yarway
Expansion Tanks	Amtro/Extrol, Therm-x-trol, State, Sparco, Expanflex, Armstrong, B & G (Xylem), Clemmer, Taco, Zilmet H & G, Watts, Flexcon
Fan Coil Units	Carrier, Trane, Daikin, Williams, MultiAquaEngineered Air, Airtherm, Climatec, Unilux, Price, International Environmental, first co, IEC
Fans - Cabinet, Roof and Propeller	Loren-Cook, Penn, Jenn-Air, Greenheck, Carnes, American Cool-Air, Broan, Delta Breez, Nutone, Reversomatic, Panasonic, Air King, Lexton
Fans - Centrifugal/Plenum	Buffalo, Northern, Pace, Chicago, Twin City fans, Barry Blower, Trane, Flakt-Woods, Penn, New York Blower, Greenheck, Loren-Cook ,
Fans - Inline	Loren-Cook, Penn, Jenn-Air, Greenheck, Carnes, S & P
Fans – Roof/Wall Exhaust	Acme, Penn, Greenheck, Loren-Cook,
Filters - Air	Camfil-Farr, Continental, Cambridge, AAF, EH Price, Dayco, Dafco
Fire Dampers	Canadian Advanced Air, Maxam, Ruskin, Controlled Air, Nailor-Hart , NCA
Fire Protection - Cabinets	Wilson & Cousins, National, Viking, NFE
Fire Protection - Extinguishers	Flagg, National, Kidde
Fire Protection - Sprinklers	Grinnell, Viking, Star, Astra, Vipond, Tyco, Reliable
Force Flow Units/Unit Heaters/Convectors (Hot Water)	Trane, Firstco, Modine, Rosemex, Daikin Dunham Bush, Engineered Air, Sterling, Sigma, Airtherm
Gas Detection Systems	Vulcain. QEL, Enmet, MSL, Armstrong, Honeywell
Grilles and Diffusers	Price, Nailor, Titus, Krueger, Lindab, Seiho, Tuttle & Bailey,

	Metalaire, NAD- Klima
Grilles and Diffusers-Self-Modulating	E H Price, Titus
Heat Exchangers	Armstrong, AIC, Alpha Laval, B & G (Xylem), GEA, Sondex
Humidifiers-Absorption Self-Contained Type	Steam-O-Vap, Carel, neptronic
Insulation	Fiberglas, Knauf, Johns-Manville, Atlas, PPG, Manson, Armstrong, Owens Corning, Certainteed, Roul, Thermafibre, Therma-Cel, Armacell, Aerocell, K-Flex, Flex USA, Kingspan
Jacketing Material	Childers, Fiberglas, Johns-Manville
Louvres	Ventex, Airolite, Ruskin, Greenheck
Motors, Electric – Premium Efficiency	Century Electric, Baldor, Toshiba, Teco
Pipe Fittings and Flanges	Crane, Grinnell, Jenkins, Victaulic
Pipe Supports and Hangers	Crane, Unistrut, Myatt, L.E. Taylor, Grinnell, Sarco
Plumbing Drainage Accessories	Roto-Tech-Smith, Enpoco, Ancon, J.R. Smith, Zurn, Mifab, Watts
Plumbing Fixtures and Trim	K.I.L., Fiat, Kohler, Eljer, American Standard, AMP, Moen-Commerical, Williams, AristaNewman, Haws, Elkay, Aquarius, Swan, Bradley, Cambridge, Speakman, Valley, Hytec, Watrous, Briggs, Symmons, Sloan, Nepitek, Crane, Toto, Mifab, Grohe, Guardian
Pressure Gauges	Marsh, Moeller, Weiss, Ametek, Trerice, Winters
Pumps-Domestic Booster	Armstrong, B&G, Wilo, Plad, Grundfos, Patterson (Gorman Rupp)
Pumps-Domestic Hot Water Recirculation	B&G, Armstrong, Taco, Grundfos, Wilo
Pumps – Vertical-In-Line, Circulators	Bell & Gossett, Armstrong, Grundfos, Wilo, Taco, Patterson (Gorman Rupp), Pentair

Pumps – Fire	Aurora, Xylem (B & G), Armstrong, Plad, Peerless, Patterson (Gorman Rupp)
Pumps- Submersible	Hydro-Matic, Leader, Flygt, Patterson (Gorman Rupp), Myers, Zoeller, Barnes, Plad
Radiant Ceiling Panels- Hot Water/Chilled water	Lindner, Aquatherm, Messana, Airtex (Eng Air), Giacomini, Barcol-Air, TWA-Frenger, Armstrong Ceilings, Zehnder, Climacustic, Eurotherm
Radiant Slab Heating and Cooling System	Uponor, Heat Link, Rehau (Klimatrol), Watts Radiant, Giacomini
Relief Valves	Crosby, Sarco, Watts
Reverse Osmosis Unit	Filterco, Barnstead, Nimbus, Culligan
Roof Drains	Zurn, Jay R Smith, Wade, Watts, Ancon
Sound Attenuation (Silencers)	I.A.C., Vibron, Vibro Acoustics, VAW Systems, Flanders-CSC Corp, Kinetics
Strainers	Red & White, Crane, Armstrong, Kitz, Mueller, Plenty, Colton, Metraflex, Muesco, Spirax/Sarco, Toyo, Victaulic
Thermometers	Marsh, Moeller, Terice, Weiss, Weksler, Winters
Toilet Seats	Beneke, Bemis, Olsonite, Moldex, Centoco
Trench Fan Coil Units	Jaga, Kampmann
Unit Heaters (Hot water)	Engineered Air, Trane, Sigma,
VAV Boxes	EH Price, Nailor, Titus, Krueger, Metalaire, Tuttle and Bailey
Valves - Ball	Red & White, Grinnell, Watts, Newman Hattersley, Crane, Victaulic, Nibo, Kitz, Toyo
Valves - Gate & Globe	Red & White, Crane, Jenkins, Grinnell, Kitz, Newman Hattersley, Dezurik, Nibco, Victaulic
Valves - Butterfly	Centerline, Keystone, Grinnell, Crane, Victaulic, Crane, MA Stewart, Nibco, Keystone, Toyo, Kurimoto, Kitz

---

Valves - Balancing	Armstrong, Tour and Anderson, Dezurik, Dahl, Toyo, Caleffi, Keystone, Ballcentric, Xylem, Victaulic, Wheatley, Overtrop, ESBE, Nexus
Valves - Check Spring Loaded	Mission, Moyes & Groves, Crane, Kitz, Newman Hattersley, Nibco, Toyo, Grinnell, Victaulic, Mueller, Conbraco, Durabla, Muessco, Centerline, Apco,
Valves- PICV	Belimo, Siemens
Valves – 6 way valves	Belimo, Siemens
Variable Speed Drives	ABB, AC Tech, Toshiba, Hitachi, Danfoss/Graham, Coyote, Armstrong, Reliance, Cerus (E.H. Price supplier).
Vibration Control Equipment	Vibro-Acoustics, Lo-Rez, Vibron, Korfund, Mason, Kinetics, EAR Grommets, American National Rubber, Unisource
Water Treatment & Pot Feeder	Suez (Campus Preferred)

**SPARE PARTS LIST**

<b>0</b>	<b>SPECIFICATION SECTION</b>	<b>WORK</b>	<b>DESCRIPTION FROM THE SPECS</b>
13	21 12 00	Fire-Suppression Standpipes & Fire Extinguishers	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide [two (2)] of hose nozzles and hoses.
14	21 13 00	Sprinklers	1.11.1 Extra Stock Materials: 1.11.1.1 Provide sprinkler cabinet with twelve (12) extra sprinkler heads. 1.11.1.2 Provide metal storage cabinet in Level 0 Mechanical Room. 1.11.2 Tools: Provide suitable wrenches for each sprinkler type.
15	21 30 00	Fire Pumps	1.10.1 Section 01 78 23: Maintenance and extra material requirements. 1.10.2 Extra Stock Materials: Provide one (1) set of gaskets/screens/seals for each pump type and model supplied.
16	22 42 01	Plumbing Specialties	1.7.1 Section 01 78 23: Maintenance and extra material requirements.
17	22 42 02	Plumbing Fixtures	1.7.1 Submit in accordance with Section 01 78 23 - Operation and Maintenance Manuals: Maintenance and extra material requirements. 1.7.2 Spare Parts: Supply two (2) sets of faucet washers flush valve service kits lavatory supply fittings shower heads toilet seats. 2 sets of washers 2 sets of flush 2 sets of service kits lavatory supply fittings 2 sets of shower heads 2 sets of toilet seats
18	22 47 00	Pumps	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide two (2) sets of pump seals for each pump. Provide two (2) sets of cartridges for each side-stream filter. 2 sets of pump seals

			2 sets of cartridges
19	23 05 16	Piping Expansion Compensation	1.6.1 Section 01 78 23: Maintenance and extra material requirements. 1.6.2 Extra Stock Materials: Provide two (2), 340 gm (12 oz.) containers of packing lubricant and cartridge style grease gun. Provide 2 - 340 gm (12oz) containers of packing lubricant. 2 Cartridge style grease gun.
20	23 05 19	Gauges & Meters	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: 1.7.2.1 Provide two (2) bottles of red gauge oil for static pressure gauges. 1.7.2.2 Provide two (2) each, dial thermometers, pressure gauges with pulsation damper. 2 bottles of red gauge oil 2 dial thermometers 2 pressure gauges
21	23 21 00	Hydronic Piping	1.8.1 Section 01 78 23: Maintenance and extra material requirements. 1.8.2 Extra Stock Materials: Provide two (2) repacking kits for each size and valve type. 2 repacking kits for size 2 replacing kits Valve type
22	23 21 16	Hydronic Specialties	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide one (1) extra [4 L (1 gal)] [40 L (10 gal)] [205 L (55 gal)] drum of [propylene] [ethylene] glycol. 1 extra [ 4 L (10 gal)] [ 205 L (55 gal) ] drum of [ propylene ] glycol.
23	23 25 00	Chemical Treatment For Piping	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide sufficient chemicals for treatment and testing during warranty period. Chemicals for treatment & Testing
24	23 33 00	Duct Work Accessories	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide two

			(2) of each size and type of fusible link. 2 size of fusible 2 type of fusible
25	23 34 16	Commercial Fans	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide two (2) sets of belts for each fan. 2 sets of belts for each fan
26	23 36 00	Air Terminal Units	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide two (2) additional electric motors of each size. 2 additional Electric Motors Of each Size
27	23 40 00	Air Cleaning Devices	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide one (1) set of disposable panel filters. 1 Set of Disposable panel filters
28	23 52 39	Boilers-Condensing	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Tools: Provide wire brush and [hinged] [one-piece] handle for tube cleaning. 1 Wire Brush Hinged one piecehandle for tube cleaning
29	23 57 00	Heat Exchangers	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: 1.7.2.1 Provide two (2) sets of replacement gaskets for each heat exchanger 1.7.2.2 Provide one (1) set of wrenches for disassembly of plate type heat exchangers. 2 sets of replacement gaskets 1 set of wrenches
30	23 73 23	Air Handling Units	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide one (1) set for each unit of fan belts and filters. 1 set for each unit of fan belts & filters
31	23 74 13	Conditioning Units - Packaged Roof Top	1.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide one (1) set of filters.

---

			1 set of filters.
32	23 82 00	Terminal Heat Transfer Units	.7.1 Section 01 78 23: Maintenance and extra material requirements. 1.7.2 Extra Stock Materials: Provide two (2) sets of filters. 1 set Of filters

## 1. **GENERAL**

### 1.1 **Related Sections**

- 1.1.1 The General Conditions, Supplements and Amendments shall govern this Section (read in conjunction with Instructions to Tenderers/Bidders). This section covers items common to all Electrical sections and is intended only to supplement the requirements of Division 1.
- 1.1.2 Reference to "Electrical Divisions" shall mean all sections of Divisions 26, 27, 28, 33, 34, and 48 in the Master Format of the Canadian Master Specifications and/or Division 16 and 17 in the standard format.
- 1.1.3 Provide materials, equipment and plant, or specified design, performance and quality, and current models with published certified ratings for which replacement parts are readily available. Provide project management and on-site supervision to undertake administration, meet schedules, ensure timely performance, ensure coordination, and establish orderly completion and the delivery of a fully commissioned installation.
- 1.1.4 The most stringent requirements of this and other electrical sections shall govern.
- 1.1.5 All work shall be in accordance with the Project Drawings and Specifications and their intent, complete with all necessary components, including those not normally shown or specified, but required for a complete installation.
- 1.1.6 Provide seismic restraints for all required equipment, piping and ductwork.
- 1.1.7 Connect to equipment specified in other Sections and to equipment supplied and installed by other Trade Contractors or by the Owner. Uncrate equipment, move in place and install complete; start up and test. Include all field assembly of loosely/separately packaged accessories.
- 1.1.8 Refer to Section 23 05 13 3.12: Mechanical and Electrical Coordination of Responsibilities

### 1.2 **References**

- 1.2.1 Canadian Standards Association (CSA International)
  - .1 CSA C22.1, Canadian Electrical Code, Part 1 (current edition), Safety Standard for Electrical Installations.
  - .2 Comply with all electrical CSA standards and electrical bulletins.
  - .3 CAN/CSA-C22.3 (current edition), Overhead Systems.

- .4 CAN3-C235 (current edition), Preferred Voltage Levels for AC Systems, 0 to 50,000 V.

### **1.3 Sustainable Requirements**

- 1.3.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.3.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.3.3 Waste Management and Disposal
  - .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.3.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
  - .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.
  - .6 VOC/Low-Emitting Materials Compliance.
- 1.3.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

---

**1.4 Design Requirements**

- 1.4.1 Operating voltages: to CAN3-C235 (current edition).
- 1.4.2 Motors, electric heating, control and distribution devices and equipment to operate satisfactorily at 60 Hz within normal operating limits established by above standard.
  - .1 Equipment to operate in extreme operating conditions established in above standard without damage to equipment.
- 1.4.3 Language operating requirements: provide identification nameplates and labels for control items in English.

**1.5 Definitions**

- 1.5.1 Electrical and electronic terms: unless otherwise specified or indicated, terms used in these specifications, and on drawings, are those defined by IEEE SP1122.
- 1.5.2 The “Engineer” is defined as Introba LLP.
- 1.5.3 The “Trade Contractor” is defined as the supplier of the Scope of Work as defined in the Electrical Specifications sections in Division 26 (Division 16).
- 1.5.4 “Provide” is defined as “supply, install, test and commission.”
- 1.5.5 “Install” is defined as all work and materials necessary to place the specified item into full operation, securely fastened, and to give a presentable finished appearance. “Install” also includes all necessary connections and conductors.
- 1.5.6 “Coordinate” is defined as: to make all arrangements directly with agencies and individuals, confirm schedules, be in attendance at the time work is being carried out, and take full responsibility for having the work carried out correctly and in a timely manner to meet the construction schedule.

**1.6 Submittals**

- 1.6.1 Submittals: in accordance with Section 01 33 00 – Submittal Procedures.
- 1.6.2 Product Data: submit WHMIS MSDS in accordance with Section 01 47 15 - Sustainable Requirements.
- 1.6.3 Submit for review single line electrical diagrams in glazed frames and locate in Electrical Room.
  - .1 Electrical distribution system in main electrical room.
  - .2 Electrical power generation and distribution systems in power plant rooms.
- 1.6.4 Submit for review fire alarm riser diagram, plan and zoning of building in glazed frames and locate at fire alarm control panel and annunciator.

---

1.6.5 Shop drawings:

- .1 Submit drawings stamped and signed by professional engineer registered or licensed in the Province of Ontario, Canada.
- .2 Submit wiring diagrams and installation details of equipment indicating proposed location, layout and arrangement, control panels, accessories, piping, ductwork, and other items that must be shown to ensure co-ordinated installation.
- .3 Identify on wiring diagrams circuit terminals and indicate internal wiring for each item of equipment and interconnection between each item of equipment.
- .4 Indicate of drawings clearances for operation, maintenance, and replacement of operating equipment devices.
- .5 Submit number of copies indicated in Submittals Section 01 33 00 of drawings and product data to the authority having jurisdiction.
- .6 If changes are required, notify Engineer of these changes before they are made.
- .7 Submit a detail schedule of all shop drawings prior to the first progress draw. Schedule shall include specification section, equipment name, manufacturer's name, distance from site to final manufacturing location, percent recycled content and delivery date.

1.6.6 Quality Control: in accordance with Section 01 45 00 - Quality Control.

- .1 Provide CSA certified equipment and material.
- .2 Where CSA certified equipment and materials are not available, submit such equipment and material to inspection authorities for special approval before delivery to site.
- .3 Submit test results of installed electrical systems and instrumentation.
- .4 Permits and fees: in accordance with General Conditions of contract.
- .5 Submit, upon completion of Work, load balance report as described in PART 3 - LOAD BALANCE.
- .6 Submit certificate of acceptance from authority having jurisdiction upon completion of Work to Engineer.

1.6.7 Manufacturer's Field Reports: submit to Engineer manufacturer's written report, within 3 days of review, verifying compliance of Work and electrical system and instrumentation testing, as described in PART 3 - FIELD QUALITY CONTROL.

1.6.8 Sustainable Requirements

- .1 All submittals shall include a completed copy of the DECLARE form. For the most recent version, refer to "Declare Product Declaration Form.docx" found at <http://www.declareproducts.com/for-manufacturers>.
- .2 All submittals shall include a completed copy of the JUST form. For the most recent version, refer to "Just Postcard" found at <http://living-future.org/node/764>.

## 1.7 **Quality Assurance**

- 1.7.1 Quality Assurance: in accordance with Section 01 45 00 - Quality Control.
- 1.7.2 Qualifications: electrical Work to be carried out by qualified, licensed electricians who hold valid Master Trade Contractor license in accordance with authorities having jurisdiction.
  - .1 Employees registered in provincial apprentices program: permitted, under direct supervision of qualified licensed electrician, to perform specific tasks.
  - .2 Permitted activities: determined based on training level attained and demonstration of ability to perform specific duties.
- 1.7.3 Site Meetings:
  - .1 In accordance with - Construction Schedule.
  - .2 Site Meetings: Schedule site visits, to review Work, at stages listed.
    - .1 After delivery and storage of products, and when preparatory Work is complete but before installation begins.
    - .2 A minimum of twice during progress of Work at 25% and 60% complete.
    - .3 Upon completion of Work, after cleaning is carried out.
- 1.7.4 Health and Safety Requirements: do construction occupational health and safety in accordance with Section 01 35 29 – Occupational Health and Safety.

## 1.8 **Delivery, Storage and Handling**

- 1.8.1 Material Delivery Schedule: provide Engineer with schedule of all materials within 2 weeks after award of Contract. Progress claims will not be reviewed until updated schedules are provided.
- 1.8.2 Construction/Demolition Waste Management and Disposal: separate waste materials for reuse and recycling in accordance with Section 01 74 00 – Cleaning and Waste Management.

---

**1.9 System Start-up**

- 1.9.1 Instruct Engineer and operating personnel in operation, care and maintenance of systems, system equipment and components.
- 1.9.2 Arrange and pay for services of manufacturer's factory service engineer to supervise start-up of installation, check, adjust, balance and calibrate components and instruct operating personnel.
- 1.9.3 Provide these services for such period, and for as many visits as necessary to put equipment in operation, and ensure that operating personnel are conversant with aspects of its care and operation.

**1.10 Operating Instructions**

- 1.10.1 Provide for each system and principal item of equipment as specified in technical sections for use by operation and maintenance personnel.
- 1.10.2 Operating instructions to include following:
  - .1 Wiring diagrams, control diagrams, and control sequence for each principal system and item of equipment.
  - .2 Start up, proper adjustment, operating, lubrication, and shutdown procedures.
  - .3 Safety precautions.
  - .4 Procedures to be followed in event of equipment failure.
  - .5 Other items of instruction as recommended by manufacturer of each system or item of equipment.
- 1.10.3 Print or engrave operating instructions and frame under glass or in approved laminated plastic.
- 1.10.4 Post instructions where directed.
- 1.10.5 For operating instructions exposed to weather, provide weather-resistant materials or weatherproof enclosures.
- 1.10.6 Ensure operating instructions will not fade when exposed to sunlight and are secured to prevent easy removal or peeling.

**1.11 Permits and Fees**

- 1.11.1 Submit to Electrical Review Department, Local Fire Authorities and Supply Authority the necessary number of drawings and specifications for examination and approval prior to commencement of work. Obtain all required permits and pay all fees.
- 1.11.2 Arrange for review of all Work by the authorities having jurisdiction. On completion of the Work, furnish final unconditional certificates of approval by the inspecting authorities.

**1.12 Equipment Restraint**

- 1.12.1 It is the entire responsibility of the equipment manufacturers to design their equipment so that the strength and anchorage of

internal components of the equipment exceeds the force level used to restrain and anchor the unit itself to the supporting structure.

### **1.13 Seismic Analysis and Provisions**

- 1.13.1 Install electrical systems with adequate structural support to withstand seismic forces in accordance with Section 4.1.8 of the National Building Code, and Province, Territory or Municipality of the project.
- 1.13.2 Retain a structural engineer licensed in the Province or Territory of the project to perform a review of the proposed electrical installation and prepare installation documents indicating all required seismic supports, bracings and fastenings. These documents shall be sealed and signed by the structural engineer and submitted as part of the shop drawing package prior to rough-in work commencing on site.
- 1.13.3 Equipment to be indicated in the structural design documents shall include but not be limited to: suspended transformers, bus ducts, cable trays, suspended conduit runs, free standing distribution equipment such as switchboards and motor control centres, and suspended lighting fixtures.
- 1.13.4 Verify the Facility is classified as "Normal" with an "Importance Factor of 1.0" as referenced in 4.1.8.5 (1) of the National Building Code and Province, Territory or Municipality of the project.
- 1.13.5 Refer to seismic risk reduction of operational and functional components (OFCs) of building S832-06 and meet all requirements.
- 1.13.6 Provide confirmation in writing, signed and sealed by the structural engineer, at completion of project that the electrical installation is in general compliance with the structural installation drawings submitted with the shop drawing package.
- 1.13.7 All light fixtures shall be provided with independent chain supports that are fastened to the structure of the Building.
- 1.13.8 The trade contractor shall be solely responsible for the full scope of this work. Include all costs of structural design, materials and site review in Bid Price.

### **1.14 Drawings and Measurements**

- 1.14.1 Drawings are generally diagrammatic and are intended to indicate the scope and general arrangement of work and are not detailed installation drawings. Do not scale the drawings. Obtain accurate dimensions from the Architectural and Structural drawings.
- 1.14.2 Consult the Architectural drawings and details for exact locations of fixtures and equipment. Obtain this information from the Engineer where definite locations are not indicated.

- 1.14.3 Take field measurements where equipment and material dimensions are dependent upon building dimensions.
- 1.14.4 Where imperial units have been indicated in brackets [ ] following the requirements in SI units, the conversion is approximate and provided for convenience. The SI units shall govern.

#### **1.15 Project Coordination**

- 1.15.1 Check drawings of all trades to verify space and headroom limitations for work to be installed. Coordinate work with all trades and make changes to facilitate a satisfactory installation. Make no deviations from the design intent involving extra cost to the Owner without the Engineer's written approval.
- 1.15.2 The drawings indicate the general location and route to be followed by the electrical services. Where details are not shown on the drawings or only shown diagrammatically, the services shall be installed in such a way as to conserve headroom and interfere as little as possible with the free use of space through which they pass. Service lines shall run parallel to building lines. All services in the ceiling shall be kept as tight as possible to beams or other limiting members at high level. All electrical services shall be coordinated in elevation to ensure that they are concealed in the ceiling or structural space provided unless detailed otherwise on drawings.
- 1.15.3 Work out jointly all interference problems on the site and coordinate all work before fabricating or installing any material or equipment. Where necessary, produce interference/coordination drawings showing exact locations of electrical systems or equipment within service areas, shafts and the ceiling space. Distribute copies of the final interference/coordination drawings to the Architect and Engineer and all affected parties.
- 1.15.4 Ensure that all materials and equipment fit into the allotted spaces and that all equipment can be properly serviced and replaced, if and when required. Advise the Engineer of space problems before installing any material or equipment. Demonstrate to the Engineer on completion of the work that all equipment installed can be properly, safely serviced and replaced, if and when required.

#### **1.16 Provision for Future Equipment and Construction**

- 1.16.1 Leave clear spaces designated for future equipment or building expansion where indicated. Plan for the installation under this contract and ensure clear, accessible, unhindered access to the space is allowed for.
- 1.16.2 Where contract documents do not clearly indicate the future expansion requirements but known services are required, provide written "request for information" to the Engineer before making assumptions as to intent.

---

**1.17 Sprinkler Proof Requirements**

- 1.17.1 All equipment and wiring systems shall be sprinkler proof standard where sprinkler fire protection systems are installed.
- 1.17.2 In rooms where electrical equipment is installed surface-mounted, electrical equipment contained in these rooms is to be protected by non-combustible drip hoods, shields and gasketed doors as applicable to inhibit water ingress into electrical equipment. Exposed conduits connected to equipment to utilize water-tight connectors. Top entry to be avoided where possible.
- 1.17.3 In particular, all unit substations, transformers, switchgear, motor control and panelboard shop drawings shall be certified "sprinkler proof" design.

**1.18 Phase Construction**

- 1.18.1 See Architectural specifications and drawings for construction phasing. Make all allowances to phase the work in accordance with the project phasing.
- 1.18.2 All existing services and the existing building(s) must be maintained in operation. Provide and install temporary services as required.
- 1.18.3 All trades in this Division shall make allowance for the implications of having to totally complete all work in the new addition before proceeding with work in the existing building.

**1.19 Sequence of Work**

- 1.19.1 Before interrupting major services, notify the Owner well in advance and arrange an acceptable schedule for the interruptions.
- 1.19.2 Before interrupting any services, complete all preparatory work as far as reasonably possible and have all necessary materials on site and pre-fabricated (where practical) and work continuously to keep the length of interruption to a minimum.
- 1.19.3 Include for the cost of all work that may be required out of regular hours to minimize the period of service interruption when modifying the existing systems.
- 1.19.4 All trades in this Division shall make allowance for the implications of having to totally complete all work in the new addition before proceeding with work in the existing building.

**1.20 Tender Inquiries**

- 1.20.1 All Trade Contractor queries during the tender period shall be made in writing to the Engineer. Trade Contractor queries will be collected and suitable addenda will be issued for clarification. No verbal information will be considered valid or issued by the Engineer's office during tender. All tender queries may be emailed, faxed,

---

mailed or couriered to the Engineer's office. No telephone queries will be answered.

**1.21 Examination**

- 1.21.1 Visit the site before preparing the tender and examine all existing conditions. No extra cost will be considered for any misunderstanding of the work to be done resulting from failure to visit the site.
- 1.21.2 Examine the documents for details of work included. Obtain a written clarification in the event of conflict within the specification, between the specification and the drawing, or in the drawing. Obtain written clarification from the Engineer if work affecting the installation is not clear. Where this is not done in advance, allow in the tender sum for providing the more costly alternative.

**1.22 Responsibilities**

- 1.22.1 Ensure that equipment does not transmit noise and/or vibration to other parts of the building, as a result of poor installation practices.
- 1.22.2 Where the Contract Documents do not contain sufficient information for the proper selection of equipment for bidding, notify the Engineer during the tendering period. If clarification is not obtainable, allow for the most expensive arrangement. Failure to do this shall not relieve the Trade Contractor of responsibility to provide the intended equipment.
- 1.22.3 Protect equipment and material from the weather, moisture, dust and physical damage.
- 1.22.4 Cover equipment openings and open ends of conduits, piping and pull boxes as work progresses. Failure to do so will result in the Trade being required to adequately clean or replace materials and equipment at no extra cost to the Owner.
- 1.22.5 Protect all existing services encountered. Obtain instructions from the Engineer when existing services require relocation or modification.
- 1.22.6 Refinish damaged or marred factory finish to factory finish.
- 1.22.7 The specifications and drawings form an integral part of the Contract Documents. Neither to drawings nor the specifications shall be used alone. Work omitted from the drawings but mentioned or reasonably implied in the specifications, and vice versa, shall be considered as properly and sufficiently specified and shall be provided. Misinterpretation of any requirement of either plans or specifications shall not relieve the Trade Contractor of the responsibility of properly completing his trade to the approval of the Engineer.

---

**1.23 Standard of Acceptance**

- 1.23.1 Standard of Acceptance means that the item named and specified by the manufacturer and/or catalogue number forms part of the specification and sets standard regarding performance, quality of material and workmanship and when used in conjunction with a reference standard, shall be deemed to supplement the standard.
- 1.23.2 Where two or more manufacturers are listed, the manufacturer's name shown first or underlined or shown with a model name and/or number was used in preparing the base design. Tenders may be based on any one of those named, provided that they meet every aspect of the base design and every aspect of the drawings and specifications.
- 1.23.3 Where other than the first named or the underlined manufacturer or scheduled/specified manufacturer is selected or approved, include for the cost of any resulting work (both under this Division and other Divisions) and any necessary redesign of installation or structure. Submit redesign drawings for review with Shop Drawings. Maintain installation, access and servicing clearances. Equipment/materials shall not exceed the available space limitations. Redesign drawings shall be to scale and of a standard equal to the Project Drawings.
- 1.23.4 A visible manufacturer's nameplate shall indicate manufacturer's name, model number, serial number, capacity data, electrical characteristics and approval stamps.

**1.24 Facility Commissioning**

- 1.24.1 The Trade Contractors are obliged to comply with the supporting commissioning documentation prepared by the BMS Contractor. The Trade Contractor is to provide all required manpower, testing, equipment, documentation and staff training in order to meet the Building Integration requirements.

**1.25 Progress Claim and Change Order Breakdowns**

- 1.25.1 Ten (10) days after the award of contract, submit price breakdowns.
- 1.25.2 In particular cases, more detail may be necessary to properly assess a change order or progress claims. This additional information could include all suppliers and all trade contractors when requested by the Engineer. Provide details for each section of the electrical work listed for each separate electrical change order.
- 1.25.3 Mark-up information is required for change orders but is optional on the original tender price.
- 1.25.4 Progress claims will not be certified nor payment made beyond 90% of the overall Electrical contract until commissioning and verification of the systems are complete. This procedure is to allow for any

---

necessary deficiency holdbacks on items which do not become apparent until the systems are commissioned.

**1.26 Warranty**

- 1.26.1 Use of installed equipment during construction shall not shorten or alter the warranty period, as specified in Division 1.
- 1.26.2 Take note of any extended warranties specified.
- 1.26.3 Furnish a written warranty stating that all work executed under this Division will be free from defects of material and workmanship for a period of one (1) year from the date of substantial performance.
- 1.26.4 Promptly investigate any electrical or control malfunction and repair or replace all such defective work and all other damages thereby which becomes defective during the time of the warranty.

**1.27 Substantial Performance Requirements**

- 1.27.1 Refer to each section in specifications for detailed requirements.
- 1.27.2 Before the Engineer is requested to make an review for substantial performance of the work:
  - .1 Commission all systems and prove out all components, interlocks and safety devices.
  - .2 Submit a letter certifying that all work is complete for the intended use, operational, clean and all required submissions have been completed.
  - .3 A complete list of incomplete or deficient items shall be provided. If, in the opinion of the Engineer, this list indicates the project is excessively incomplete, a substantial completion review will not be performed.
- 1.27.3 The work will not be considered to be ready for use or substantially complete until the following requirements have been met:
  - .1 All reported deficiencies have been corrected.
  - .2 Operating and Maintenance Manuals completed.
  - .3 "As Built" Record Drawing ready for review.
  - .4 Systems Commissioning has been completed and has been verified by the Engineer.
  - .5 All demonstrations to the Owner have been completed.
  - .6 All documentation required for LEED® certification has been submitted.
- 1.27.4 Engineer's Letters of Assurance will not be issued until the following requirements have been met:
  - .1 All items listed in .1 above have been completed or addressed.
  - .2 Certificate of Penetrations through Separations

- .3 Provincial or City Electrical Review – Certificate of Review.
- .4 Seismic Engineer's Letter of Assurance and Final Review Report.
- .5 Certificate of Substantial Performance.
- .6 Signed off copy of Engineer's Final Review Report.
- .7 Fire Alarm Verification.

**1.28 Deficiency Holdback and Deficiency Reviews**

- 1.28.1 Work under this Division which is still outstanding when substantial performance is certified will be considered deficient and a sum equal to at least twice the estimated cost of completing that work will be held back.
- 1.28.2 It is expected that outstanding work will be completed in an expeditious manner and the entire holdback sum will be retained until the requirements for Total Performance of work have been met and verified.

**2 . PRODUCTS**

**2.1 Sustainable Requirements**

- 2.1.1 Materials and products in accordance with Section 01 47 15 - Sustainable Requirements: Construction.
- 2.1.2 Do verification requirements in accordance with Section 01 47 17 - Sustainable Requirements: Trade Contractor's Verification.

**2.2 Materials and Equipment**

- 2.2.1 Provide material and equipment in accordance with Section 01 61 00 - Common Product Requirements.
- 2.2.2 Material and equipment to be CSA certified. Where CSA certified material and equipment are not available, obtain special approval from inspection authorities before delivery to site and submit such approval as described in PART 1 - SUBMITTALS.
- 2.2.3 Factory-assemble control panels and component assemblies.

**2.3 Warning Signs**

- 2.3.1 Warning Signs: in accordance with requirements of authority having jurisdiction.
- 2.3.2 Porcelain enamel signs, minimum size 175 x 250 mm.
- 2.3.3 For high voltage installations, provide permanent, legible warning notice carrying the wording: "DANGER – HIGH VOLTAGE" as required and indicated in Section 36 of CSA C22.1, CEC – Part 1.

---

## 2.4 Wiring Terminations

- 2.4.1 Ensure lugs, terminals, screws used for termination of wiring are suitable for either copper or aluminum conductors.

## 2.5 Equipment Identification

- 2.5.1 Identify electrical equipment with nameplates and labels as follows:

- .1 Nameplates:
  - .1 Supply and install white lamacoid nameplates with black lettering fastened with two (2) round head stainless steel screws on the following equipment and as noted on drawing.
  - .2 power and lighting panels lp-(panel number) 13mm (1/2") letters
  - .3 disconnect switch feed to (equipment name) 6mm (1/4") letters
  - .4 combination starters fan name and number 6mm (1/4") letters
  - .5 Starters and manual starters
- .2 lamicoid 3 mm thick plastic engraving sheet, matte white finish face, black core, lettering accurately aligned and engraved into core and mechanically attached with self tapping screws.

- 2.5.2 Labels: embossed plastic labels with 6 mm high letters unless specified otherwise.

- 2.5.3 Wording on nameplates and labels to be approved by Engineer prior to manufacture.

- 2.5.4 Allow for minimum of twenty-five (25) letters per nameplate and label.

- 2.5.5 Nameplates for terminal cabinets and junction boxes to indicate system and/or voltage characteristics.

- 2.5.6 Identify equipment with Size 3 labels engraved "ASSET INVENTORY NO. \_\_\_\_" as directed by Engineer.

- 2.5.7 Disconnects, starters and contactors: indicate equipment being controlled and voltage.

- 2.5.8 Terminal cabinets and pull boxes: indicate system and voltage.

- 2.5.9 Transformers: indicate capacity, primary and secondary voltages.

## 2.6 Wiring Identification

- 2.6.1 Identify wiring with permanent indelible identifying markings, numbered and coloured plastic tapes, on both ends of phase conductors of feeders and branch circuit wiring.

- 2.6.2 Maintain phase sequence and colour coding throughout.
- 2.6.3 Colour coding: to CSA C22.1 (current edition).
- 2.6.4 Use colour coded wires in communication cables, matched throughout system.

## **2.7 Conduit and Cable Identification**

- 2.7.1 Colour code conduits, boxes and metallic sheathed cables.
- 2.7.2 Code with plastic tape or paint at points where conduit or cable enters wall, ceiling, or floor, and at 15 m intervals.
- 2.7.3 Colours: 25 mm wide prime colour and 20 mm wide auxiliary colour.

	<b>Prime</b>	<b>Auxiliary</b>
120/208 V	Blue	
347/600 V	Orange	
Up to 25 kV	Yellow	
Emergency distribution	Red	Blue/Orange
Communication Systems	Green	
Fire Alarm	Red	
Emergency Voice	Red	Green
Security Systems	Red	Brown

## **2.8 Finishes**

- 2.8.1 Shop finish metal enclosure surfaces by application of rust resistant primer inside and outside, and at least two coats of finish enamel.
  - .1 Paint outdoor electrical equipment "equipment green" finish.
  - .2 Paint indoor switchgear and distribution enclosures as per the prime colours defined in Part 2.7, Conduit and Cable Identification

## **2.9 Fire-Stopping**

- 2.9.1 Include Labor, materials and equipment necessary to complete the installation required for Firestopping of Through Penetrations in Fire Rated Assemblies.
- 2.9.2 Related Sections
  - .1 Consult all other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete installation.
  - .2 This shall be considered as an augmentation to Section 07 84 10 Firestopping an smoke seals.
  - .3 This addresses those unique elements that affect the Firestopping of Information Technology cabling systems

which may not be addressed in 07 84 00 or any of its sub-sections.

#### 2.9.3 References

- .1 CAN4-S115-M, "Standard Method of Fire Tests of Firestop Systems".
- .2 CAN/ULC-S115, "Standard Method of Fire Tests of Firestop Systems".
- .3 Underwriters Laboratories Canada Inc. (ULC) – Fire Resistance Directory
- .4 Underwriters Laboratories, Inc. (cUL) – Fire Resistance Directory of Products Certified for use in Canada.

#### 2.9.4 Performance Requirements

- .1 Fire rated cable pathway devices shall be used for ALL low-voltage, video, data and voice cabling, optical fibre raceways and certain high-voltage cabling where frequent cable moves, adds and changes may occur. Pathways required for high voltage cabling will be detailed on the prints. Such devices shall:
  - .1 Meet the hourly fire-rating of fire rated wall and or floor penetrated.
  - .2 Be tested for the surrounding construction and cable types involved.
  - .3 Have ULC, cUL or cULus Systems permitting cable loads from; "Zero to 100% Visual Fill." This requirement eliminates need for fill-ratio calculations to be made by cable technicians to ensure cable load is within maximum allowed by ULC, cUL or cULus System.
  - .4 Not have a constrictive inner liner that constricts around or compresses cables tightly together encouraging potential alien cross-talk or network interference.
  - .5 Be "Zero-Maintenance", zero-maintenance is defined as; No action required by cabling technician to open and/or close pathway for cable moves, adds or changes, such as, but not limited to:
    - .1 Opening or closing of doors.
    - .2 Spinning rings to open or close fabric liner.
    - .3 Removal and or replacement of any material such as, but not limited to, firestop caulk, putty, pillows, bags, foam muffins, foam, foam plugs, foam blocks, or foam closures of any sort.
    - .4 Furnish letter from manufacturer certifying compliance with this definition of "Zero-Maintenance".

- 
- .6 Pathways shall be engineered such that two or more devices may be ganged together. When installed in gypsum wallboard walls, pathways shall be ganged and supported by a grid designed to transfer the weight load of the pathways to the studs by anchoring with fasteners. Unless tested otherwise by an accredited third-party test lab such as ULC, multiple pathways SHALL NOT be clustered unless separated by a minimum of 6" on all sides.
  - .7 Pathways shall be engineered to be re-enterable permitting retrofit and removal from around existing cables without cutting and re-splicing them.
  - .8 Cable Pathway Devices passing vertically through floors shall have equal FT Rating. (See cUL System # F-A-3037, Item #4 "EZ-PATH Grid T-Rating Kit" Part # TRK444)
  - .9 Affix adhesive wall label immediately adjacent to devices to communicate to future cable technicians, authorities having jurisdiction and others the manufacturer of the device and the corresponding cUL, ULC or cULus System number installed.
  - .2 As an alternate to using a fire-rated cable pathway device for single or a pair of low voltage cables (up to 0.53" / 14 mm) penetrating one or two-hour, gypsum board/stud wall assemblies, either as a through-penetration or as a membrane-penetration, a fire-rated cable grommet may be substituted. The firestop shall consist of a molded, two-piece, plenum-rated grommet having a foam fire and smoke sealing membrane that conforms to the outside diameter of the individual cable(s). The grommet product shall be capable of locking into place to secure the cable penetration within the wall assembly. The grommet shall be cUL, ULC or cULus Classified and tested to the requirements of CAN/ULC S115. Ready® Firestop Grommet RFG1 or RFG2.
  - .3 Where non-mechanical pathways cannot be utilized, such as sealing (caulking) around single or grouped conduits, provide products that upon curing do no re-emulsify, dissolve, leach, breakdown or otherwise deteriorate over time from exposure to atmospheric moisture, sweating pipes, ponding water or other forms of moisture characteristic during or after construction. Provide letter from manufacturer certifying compliance with this section.
  - .4 Cable pathway shall replace conduit sleeves in walls and floors, and;
    - .1 When installed individually in floors, devices shall pass through core-drilled opening utilizing tested floor plates.
-

- .2 When multiple units are ganged in floors, devices shall be anchored by means of a tested grid.
- .3 When installed individually in walls, devices shall pass through core drilled opening utilizing tested wall plates.
- .4 When multiple units are ganged in walls, devices shall be anchored by means of a tested grid.
- .5 Cable tray shall terminate at each fire barrier and resume on the other side such that cables pass independently through devices. Cable tray shall be properly supported on each side of fire barrier.

#### 2.9.5 Submittals

- .1 Submit under provisions of Section 01 33 00 Submittal procedures.
- .2 Product Data: Provide manufacturer's standard catalog data for specified products demonstrating compliance with referenced standards and listing numbers of systems in which each product is to be used.
- .3 Schedule of ULC, cUL or cULus System Drawings: Submit schedule of all expected opening locations and sizes, penetrating items, and required listed design numbers to seal openings to maintain fire resistance ratings. If engineering recommendations are necessary, list these in the schedule too.
- .4 ULC, cUL or cULus System Drawings: Furnish copies of all ULC, cUL or cULus Systems identified in schedule above. Include any engineering recommendations.
- .5 Certificates: Product Certificate of Compliance from the firestop system manufacturer certifying material compliance with applicable code and specified performance characteristics.
- .6 Installation Instructions: Submit manufacturer's printed installation instructions.

#### 2.9.6 Quality Assurance

- .1 Products/Systems: Provide firestopping systems that comply with the following requirements:
  - .1 Firestopping tests are performed by a qualified, testing and inspection agency. A qualified testing and inspection agency is ULC, cUL or cULus, or another agency performing testing and follow-up inspection services for firestop system acceptable to authorities having jurisdiction.
  - .2 Firestopping products bear the classification marking of qualified testing and inspection agency.

- 
- .2 Installer Qualifications: Experience in performing work of this section who is qualified by the firestopping manufacturer as having been provided the necessary training to install firestop products in accordance with specified requirements.
  - .3 Field Inspections: Inspection of completed work SHALL be performed by Engineer and authority having jurisdiction (AHJ), and/or the building underwriter's designee. If required by AHJ or underwriter, inspections may be performed by an independent, third-party construction inspection and testing service provided that:
    - .1 Inspections are performed to the requirements of the following standards, as applicable.
      - .1 Construction Joints: ASTM E2393 - 10a Standard Practice for On-Site Inspection of Installed Fire Resistive Joint Systems and Perimeter Fire Barriers
      - .2 Service Penetrations: ASTM E2174 - 10a Standard Practice for On-Site Inspection of Installed Fire Stops
    - .2 Individual(s) performing inspection SHALL provide evidence of valid Errors and Omissions insurance coverage for this service.
    - .3 Individual(s) performing inspection SHALL NOT have any financial connection to installer, especially including firestop manufacturer, distributor or supplier.
- 2.9.7 Project Conditions
- .1 Do not install firestopping products when ambient or substrate temperatures are outside limitations recommended by manufacturer.
  - .2 Do not install firestopping products when substrates are wet due to rain, frost, condensation, or other causes.
  - .3 Maintain minimum temperature before, during, and for a minimum 3 days after installation of materials.
  - .4 Do not use materials that contain flammable solvents.
  - .5 Coordinate construction of openings and penetrating items to ensure that through-penetration firestop systems are installed according to specified requirements.
  - .6 Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems.
  - .7 Schedule installation of firestopping after completion of penetrating item installation but prior to covering or concealing of openings
- 2.9.8 Acceptable Manufacturers

- .1 Single Source: Obtain firestop systems for each type of penetration and construction condition indicated only from a single manufacturer.
- .2 Acceptable Manufacturer: Refer to specification section 07 84 00 Firestopping and any or all sub sections of Section 07 84 00 and Architectural drawing A-661 for details.
- .3 There is no known equal. Submitter shall prove that proposed substitution complies with section 1.4 PERFORMANCE REQUIREMENTS and accept full liability for removal and replacement of specified product, if substituted product fails to meet or exceed specified performance requirements.
- .4

#### 2.9.9 Materials

- .1 General: Use only firestopping products that have been tested for specific fire resistance rated construction conditions conforming to construction assembly type, penetrating item type, annular space requirements, and fire rating involved for each separate instance.
- .2 Firestop Sealants: Single component latex formulations that upon cure do not re-emulsify during exposure to moisture.
- .3 Firestop Putty: Intumescent, non-hardening, water resistant putties containing no solvents, inorganic fibers or silicone compounds.
- .4 Firestop Pillows: Re-enterable, non-curing, mineral fiber core encapsulated on six sides with intumescent coating contained in a flame retardant poly bag.
- .5 Fire-Rated Cable Grommet: Firestop Grommet is a molded, two-piece grommet with an integral fire and smoke sealing foam membrane for sealing individual cables or pairs of cables penetrating through framed wall assemblies. Grommet snaps together around cable and locks tightly into the wall.
- .6 Fire Rated Cable Pathways: Device modules comprised of steel raceway with intumescent foam pads allowing 0 to 100 percent cable fill.

#### 2.9.10 Examination

- .1 Before beginning installation, verify that substrate conditions previously installed under other sections are acceptable for installation of firestopping in accordance with manufacturer's installation instructions and technical information.
- .2 Surfaces shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellants, and any other substances that may inhibit optimum adhesion.

- .3 Provide masking and temporary covering to protect adjacent surfaces.
- .4 Do not proceed until unsatisfactory conditions have been corrected.

#### 2.9.11 Installation

- .1 General: Install through-penetration firestop systems in accordance with Performance Criteria and in accordance with the conditions of testing and classification as specified in the published design.
- .2 Manufacturer's Instructions: Comply with manufacturer's instructions for installation of firestopping products.

#### 2.9.12 Field Quality Control

- .1 Inspections: Owner shall engage qualified independent inspection agency to inspect through-penetration firestop systems.
- .2 Keep areas of work accessible until inspection by authorities having jurisdiction.
- .3 Where deficiencies are found, repair firestopping products so they comply with requirements.

#### 2.9.13 Documentation

- .1 Place system label on each side of wall penetrations.
- .2 Place a reproduction (photo copy) of the UL System description in a document protector and mount to the wall next to the wall penetration
  - .1 Highlight the section of the system description that lists the allowed cable types.

### 2.10 **Bases Supports**

- 2.10.1 Where conduit and equipment is located on walls or slabs which will not permit the support of equipment, provide suitable supports to the building structure. Supports shall be constructed of steel members or of steel pipe and fittings designed to safely support the equipment.
- 2.10.2 All equipment bases shall be set on pads of kinetic pre-compressed fibreglass or vibration isolators sized to suit the equipment which they ought to support.

### 2.11 **Inserts, Sleeves and Curbs**

- 2.11.1 Provide all inserts, sleeves and curbs required for the work of this contract.
- 2.11.2 Use only factory-made threaded or toggle type inserts as required for support and anchors, properly sized for the load to be carried.

---

Place inserts only in portions of the main structure and not in any finishing material.

2.11.3 Use factory-made expansion shields where inserts cannot be placed, but only where approved by the Engineer and only for loads of 50 kg or less.

2.11.4 Do not use powder-activated tools unless with written permission of the Engineer.

2.11.5 Supply and locate all inserts, holes, anchor bolts and sleeves in time when walls, floors and roof are erected.

2.11.6 Size sleeves to provide 25 mm clearance all around.

2.11.7 Use the following sleeving materials:

- .1 Through all interior walls, use Schedule 40 steel pipes, machine cut, flush with finished structure. Check room finish schedules.
- .2 Through all exterior walls above grade, use Schedule 40 steel pipes, machine cut, flush with finished structure inside and to suite flashing on outside.
- .3 Through all exterior walls below grade and all other waterproof walls, use wrought iron pipes. Check flashing details for further information.
- .4 Through all waterproof floors, through washrooms, janitor's closets, boiler rooms, mechanical rooms, kitchen and through roofs, use wrought iron sleeves, machine cut. Extend sleeves 100 mm above finished floor upward and cut flush with underside of floor.
- .5 Approved type plastic sleeves, conduit sleeves or 18-gauge galvanized steel sleeves may be used as an alternative for Schedule 40 steel sleeves in interior areas.
- .6 Provide 100 mm high, 100 mm wide water-tight concrete curbs with 20 mm chamfered edges around all sleeves passing through waterproof floors except where furred in.
- .7 Sleeves are not required in walls and dry area floors where conduit is installed ahead of wall construction.
- .8 Pack all sleeves between the conduit or cable passing through the sleeve and the sleeve and all spare sleeves with loose fibreglass insulation. Seal the annular space on both sides as follows:
  - .1 For all horizontal sleeves in exposed areas, use a seal of equal or better fire rating than the wall to be sealed.
  - .2 For all horizontal concealed sleeves through firewalls and through walls separating areas of different air pressure, use a permanently resilient silicone base or equal sealing compound.

- .3 For all vertical sleeves through roofs, washrooms, janitor closets, equipment rooms, use permanently resilient silicone base or equal compound, non-flammable and waterproof. Ensure that the seal is compatible with floor and ceiling finishes. Check the room finishes schedules for further information.
- .4 The Trade Contractor to provide sleeving diagrams/drawings to the structural Engineer for review and approval prior to any work commencing.

## **2.12 Cutting and Patching**

- 2.12.1 The Trade Contractor shall employ the particular trades to do all required cutting and patching and the repairing of surfaces for his work.
- 2.12.2 Supporting members of any floor, wall or the building structure shall be cut only in such a location and manner as directed by the Engineer or the Structural Engineer.
- 2.12.3 Provide fire barriers around all components in holes which penetrate fire separations. The fire barrier medium provided shall make the fire separation equal to or better than the one which was cut away. All materials shall be CSA approved and UL listed.
- 2.12.4 All floor saw cutting and drilling required for electrical services is to be performed within hours approved by Owner. Prior written notice of 48 hours must be given to the Owner.

## **2.13 Access Panels and Doors**

- 2.13.1 Install concealed electrical equipment requiring adjustment or maintenance in locations easily accessible through access panels or doors. Install systems and components to result in a minimum number of access panels. Indicate access panels on "Record" drawings.
- 2.13.2 Provide other Trades with panels, doors or the frame therefore, complete with all pertinent information for installation. Supply to Trade in whose work they occur to install them. Ensure that access doors are installed in a manner to match the building material grids where applicable.
- 2.13.3 Prepare detail drawings showing location and type of access doors in coordination with other trades before proceeding with installation and hand these to the Engineer for review.
- 2.13.4 Size access doors to provide adequate access and commensurate with the type of structure and architectural finish. Should it be necessary for persons to enter, provide minimum 610 mm x 460 mm size doors.
- 2.13.5 Ensure proper fire rating of access doors in fire separations.

- 2.13.6 Access doors shall be Le Hage, SMS, Pedlar or Acudor with 14 US gauge steel door panel, rust-resistant concealed hinges and positive locking with self-opening screwdriver-operated lock. Frame shall be suitable for wall installation and shall have integral keys for plaster walls. Doors in tile wall shall be stainless steel and ceiling shall be suitable for plaster covering with only the frame joint showing. All other doors shall be prime painted steel. Minimum size of doors shall be 12" x 18" (300 mm x 450 mm). Wherever possible, 24" x 24" (600 mm x 600 mm) doors shall be used.
- 2.13.7 Lay-in type tiles, properly marked, may serve as access panels. Marking of ceiling tiles must be coordinated with Owner.
- 2.13.8 Panels in glazed tile walls shall be 12-gauge, 304 alloy stainless steel, No. 4 finish, with recessed frame secured with stainless steel counter-sunk flush head screws.
- 2.13.9 Panels in plaster surfaces shall have dish-shaped door and welded metal lath, ready to take plaster. Provide a plastic grommet for door key access.
- 2.13.10 Other access doors shall be welded 12-gauge steel, flush type with concealed hinges, lock and anchor straps, complete with factory prime coat. Obtain approval of non-standard door construction details.

## **2.14 Backboards**

- 2.14.1 Provide plywood backboard for all electrical rooms, communication rooms and security rooms as indicated. Where no size is indicated, provide a backboard a minimum of 100 mm wider and 100 mm higher than the equipment. Where more than one piece of equipment is installed on the backboard, construct the backboard of a size to suit the maximum vertical and horizontal dimensions of the equipment.
- 2.14.2 For communication and security rooms where not indicated, provide backboard for all surfaces in communication and security rooms. Backboard shall extend from finished floor to 8' AFF, continuously around the communication and security rooms, or as indicated.
- 2.14.3 Construct plywood backboards from 199 mm thick fir plywood (FSC to UF Free) good one side.
- 2.14.4 Use fire-retardant backboards, pressure impregnated with fire-retardant chemicals, and stamp. Conform to CSA 080.
- 2.14.5 Fastenings:
  - .1 Fasten each backboard to a wall or to a support structure using cadmium-plated hardware. Provide a flat washer under the head of each fastener. Recess the head of the mounting bolt where equipment, including future equipment, is to be installed.

- .2 Use expansion shields, toggle bolts or other types of wall fastenings to suit the wall type. Align the mounting bolts with the wall studs for stud type walls.
- .3 Install fastenings to a maximum 500 mm apart in both the vertical and horizontal directions.
- .4 When installing equipment heavier than 50 kg, fasten the equipment through the backboard directly to the wall or support structure.

### **2.15 Elevators, Lifts and Escalators**

- 2.15.1 A single fusible disconnect switch (or breaker) with means for locking it in the open position shall be provided for the following in each machine room or control room:
  - .1 At least one branch circuit for the car light.
  - .2 Branch circuit for the drive motor.
- 2.15.2 The disconnecting means shall be located where it is visible on entry to the machine room and readily accessibly to authorized persons.
- 2.15.3 Only conductors used in connection with operation of the elevator, lift or escalator shall be permitted to be installed in hoistways, machine room, etc.
- 2.15.4 Provide GFCI receptacle (CSA-5-20RA) in each machine room, hoistway and hoistway pit.
- 2.15.5 Provide Lighting and emergency lighting in each machine room, hoistway and hoistway pit.
- 2.15.6 Provide Fire Alarm smoke/heat detectors in each machine room, top of hoistway, elevator lobbies and fire alarm notification of alarms to each elevator from CACF.
- 2.15.7 Provide generator running notification to each elevator.
- 2.15.8 Provide 35 mm conduit 4 CAT6 UTP cables to each mechanic room for telephong, CATV, CCTV and access control from main command and or demarcation room.
- 2.15.9 Coordinate with elevator contractor for installation of all required sleeving between machine room and hoistway prior to rough-ins. Provide a minimum of 3 – 75 mm conduits.

## **3 . EXECUTION**

### **3.1 Installation**

- 3.1.1 Do complete installation in accordance with CSA C22.1 except where specified otherwise.
- 3.1.2 Do overhead and underground systems in accordance with CSA C22.3 No.1 except where specified otherwise.

---

**3.2 Nameplates and Labels**

- 3.2.1 Ensure manufacturer's nameplates, CSA labels and identification nameplates are visible and legible after equipment is installed.

**3.3 Location of Devices**

- 3.3.1 Locate outlets in accordance with Section 26 05 32 - Outlet Boxes, Conduit Boxes and Fittings.
- 3.3.2 Do not install outlets back-to-back in wall; allow minimum 150 mm horizontal clearance between boxes.
- 3.3.3 Change location of devices at no extra cost or credit, providing distance does not exceed 3000 mm, and information is given before installation.
- 3.3.4 Locate light switches on latch side of doors.
- 3.3.5 Locate disconnect devices in mechanical and elevator machine rooms on latch side of floor.

**3.4 Mounting Heights**

- 3.4.1 Mounting height of equipment is from finished floor to centreline of equipment unless specified or indicated otherwise.
- 3.4.2 If mounting height of equipment is not specified or indicated, verify before proceeding with installation.
- 3.4.3 Install electrical equipment at following heights unless indicated otherwise.
- .1 Local switches: 1070mm (42") above floor (on centre) or as noted on drawing.
  - .2 Wall outlets:
  - .3 General: 300mm (12") above floor (on centre) to match existing conditions or as noted on drawing.
  - .4 450mm (18") above floor (on centre) for new builds where there are no existing outlets in space or as noted on drawing.
  - .5 Above countertop: 150mm (6") above tabletop (on centre) or as noted on drawing Above top of continuous baseboard heater: 250 mm.
    - .1 Above top of counters or counter splash backs: 250 mm.
    - .2 In mechanical rooms: 1070mm (42") above floor (on centre).
  - .6 Panelboards: 1800 mm to top or as required by Code or as indicated.
  - .7 Communications outlets: 300 mm above floor (on centre) to match existing conditions or as noted on drawing

- .8 Communications outlets: 450 mm(18") above floor (on centre) for new builds where there are no existing outlets in space or as noted on drawing.
- .9 Wall mounted telephone and interphone outlets: 1070mm (42") above floor (on centre) or as noted on drawing.
- .10 Fire alarm manual stations: not less than 1200 mm to top of device.
- .11 Audible signal devices: not less than 2300mm and shall maintain 150mm clearance from the ceiling. Fire Visible Signal Device: not less than 2000mm (96") or 300mm (12") below finished ceiling or as noted. Whichever is lower..
- .12 Fire fighter handset: not less than 1350 mm and not more than 1500 mm to centre of device.
- .13 Fire alarm end of line resistors: less than 1800 mm to centre of device.
- .14 Annunciator: not more than 1800 mm to top of display.
- .15 Wall-mounted emergency lighting heads: 2.35 m.

### **3.5 Coordination of Protective Devices**

- 3.5.1 Ensure circuit protective devices such as overcurrent trips, relays and fuses are installed to required values and settings.

### **3.6 Field Quality Control**

#### **3.6.1 Load Balance:**

- .1 Measure phase current to panelboards with normal loads (lighting) operating at time of acceptance; adjust branch circuit connections as required to obtain best balance of current between phases and record changes.
- .2 Measure phase voltages at loads and adjust transformer taps to within 2% of rated voltage of equipment.
- .3 Provide upon completion of work, load balance report as directed in PART 1 - SUBMITTALS: phase and neutral currents on panelboards, dry-core transformers and motor control centres, operating under normal load, as well as hour and date on which each load was measured, and voltage at time of test.

#### **3.6.2 Conduct following tests:**

- .1 Power generation and distribution system including phasing, voltage, grounding and load balancing.
- .2 Circuits originating from branch distribution panels.
- .3 Lighting and its control.
- .4 Emergency lighting levels.

- 
- .5 Motors, heaters and associated control equipment including sequenced operation of systems where applicable.
  - .6 Systems: fire alarm system.
  - .7 Insulation resistance testing:
    - .1 Megger circuits, feeders and equipment up to 350 V with a 500 V instrument.
    - .2 Megger 350-600 V circuits, feeders and equipment with a 1000 V instrument.
    - .3 Check resistance to ground before energizing.
  - 3.6.3 Carry out tests in presence of Engineer.
  - 3.6.4 Provide instruments, meters, equipment and personnel required to conduct tests during and at conclusion of project.
  - 3.6.5 Manufacturer's Field Services:
    - .1 Obtain written report from manufacturer verifying compliance of Work, in handling, installing, applying, protecting and cleaning of product and submit Manufacturer's Field Reports as described in PART 1 - SUBMITTALS.
    - .2 Provide manufacturer's field services consisting of product use recommendations and periodic site visits for review of product installation in accordance with manufacturer's instructions.
    - .3 Schedule site visits, to review Work, as directed in PART 1 - QUALITY ASSURANCE.
  - 3.6.6 Reports:
    - .1 Provide written reports in a timely manner upon completion of testing and load balance. Indicate date and hour tested.
  - 3.7 Cleaning**
    - 3.7.1 Clean and touch up surfaces of shop-painted equipment scratched or marred during shipment or installation, to match original paint.
    - 3.7.2 Clean and prime exposed non-galvanized hangers, racks and fastenings to prevent rusting.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Section Includes**

1.1.1 Materials and installations for Commissioning.

1.2 **Related Sections**

1.2.1 This section of the specification forms part of the contract documents is to be read, interpreted and coordinated with all other parts.

1.3 **References**

1.3.1 Canadian Standards Association (CSA International)

- .1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1.
- .2 Guidelines for Commissioning Systems, ASHRAE (Current Edition).

1.4 **Sustainable Requirements**

1.4.1 Materials and products in accordance with - Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.

- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Operating and Maintenance Manuals**

- 1.5.1 Provide operating and maintenance manuals in accordance with the requirements of this section and Section 26 05 00 - Common Work Results - Electrical.
- 1.5.2 Submit the number of manuals as indicated.
- 1.5.3 Provide the services of electricians, manufacturer's representatives and technicians required to provide information which is necessary for the manuals. Note that a substantial completion certificate will not be issued until such a time as the manuals have been submitted in their final accepted form.
- 1.5.4 Operating and maintenance data shall be submitted to the Engineer for review. A list of comments will be generated and returned to the Trade Contractor as necessary. This process will continue until the manuals are acceptable to the Engineer.
- 1.5.5 The manuals shall be set up by the specification section. Provide all information appropriate for each section.
  - .1 Review Certificates.
  - .2 Letter of Guarantee.
  - .3 List of Suppliers and Contacts.
  - .4 Single Line Diagrams.
  - .5 Distribution Panels.
  - .6 Bus Duct.
  - .7 Lighting and Power Panels.
  - .8 System Coordination and Arc Flash.
  - .9 Lighting Systems including fixtures, ballasts, lamps.
  - .10 Switching and Dimming Systems.
  - .11 Wiring Devices.
  - .12 Fire Alarm Systems.
  - .13 Specialties.

## **1.6 Data for Operating and Maintenance Manuals**

- 1.6.1 Only data associated with actually installed systems should be included in Operating and Maintenance Manuals.
- 1.6.2 Include in operations and maintenance data:

- .1 Details of design elements, construction features, component function and maintenance requirements, to permit effective start up, operation, maintenance, repair, modification, extension and expansion of any portion or feature of installation.
- .2 Technical data, product data, supplemented by bulletins, component illustrations, exploded views, technical descriptions of items, and parts lists. Advertising or sales literature is not acceptable.
- .3 Wiring and schematic diagrams and performance curves.
- .4 Names and addresses of local suppliers for items included in maintenance manuals.
- .5 Copy of reviewed shop drawings.
- .6 Copies of all certificates including:
  - .1 Electrical Safety Authority (ESA) final certificate,
  - .2 Life safety systems verification certificate and test,
  - .3 Commissioning reports.

## **1.7      General Tests**

- 1.7.1 Conduct and pay for tests of the following systems:
  - .1 Power distribution systems.
  - .2 All circuits, including power, data, control and communications circuits.
  - .3 Lighting and associated controls.
  - .4 Provide two Infrared Thermo Scans of the entire new and existing normal and emergency power electrical distribution systems. The schedule for the first scan to be completed is at building turn over and the second scan shall be conduct at the ten month point. Submit three copies of test results.
  - .5 Motors, heaters and associated control equipment.
  - .6 All systems.
- 1.7.2 Give sufficient prior notice to the Engineer of the proposed time of the tests so that he can be represented at the tests if he so decides. Submit all test reports in triplicate to the Engineer for his review and records.
- 1.7.3 Submit test results with all operation and maintenance data.
- 1.7.4 Test all systems in accordance with details in appropriate sections.
- 1.7.5 Testing methods and test results shall be in accordance with CSA, the Electrical Code and regulations of the supply authority, other authorities having jurisdiction and in accordance with other sections of these Specifications.

- 
- 1.7.6 Remove and replace with new materials all conductors that are found to be shorted or grounded.
- 1.7.7 Do di-electric tests, hi pot tests in the factory and, insulation resistance tests and ground continuity tests as required by the nature of the various systems and equipment on site.
- 1.7.8 With the systems completely connected and lamped, the following tests shall be made:
- .1 Control and Switching: Test all circuits for the correct operation of devices, switches and controls.
  - .2 Polarity Tests: Test all circuits for the correct operation of devices, switches and controls.
  - .3 Voltage Tests: Make a voltage test at the last outlet of each circuit. The maximum drop in potential permitted will be 3% on 120 V, 208 V and 600 V branch circuits, 2% on 208 V and 600 V feeder circuits and 2% on feeder circuits serving Motor Control Centres. Correct any deficiency in this regard.
  - .4 Phase Balance: Measure the load on each phase at each switchboard, splitter, distribution panel, lighting panel and power panel and report the results in writing to the Engineer. Re arrange phase connections as necessary to balance the load on each phase as instructed by the Engineer, with the re arrangement being restricted to the exchanging of connections at the distribution points mentioned in this paragraph. After making any such changes, update the record drawings and as-built drawings to show the modified connections.
  - .5 Supply Voltage: Measure the line voltage of each phase at the load terminals of the main breakers and report the results in writing to the Engineer. This test shall be carried out with the majority of electrical equipment in use.
  - .6 Motor Loading: Measure the line current of each phase of each motor with the motor operating under load and report the results in writing to the Engineer. Upon indication of any imbalance or overload, thoroughly examine the electrical connections and rectify any defective parts or wiring. If electrical connections are correct, overloads due to defects in the driven machines shall be reported in writing to the Engineer.
  - .7 General Operations: Energize and put into operation each and every electrical circuit and item. Make repairs, alterations, replacements, tests and adjustments necessary for a complete and satisfactory operating electrical system.
- 1.7.9 Test all systems and obtain written confirmation from the manufacturer of each system that all components have been installed correctly and that the system is functioning properly.

---

Present separate certification for all systems: fire alarm, power distribution, IPC units, etc., to the Engineer.

1.7.10 Provide labour, instruments, apparatus and pay all expenses required for the tests. The Engineer reserves the right to demand proof of the accuracy of all instruments used.

1.7.11 When the tests are performed, the Engineer may require that equipment, outlets, devices, etc., be opened and/or removed from their housings and/or outlet boxes in order that the interior of the equipment and wiring terminations and connections may be examined. Provide all labour and tools for this purpose.

1.7.12 The testing of motors shall be coordinated with the trades providing the equipment driven by the motors so that they are carried out at the time the driven equipment is put on test. In addition to the tests called for in motor loading above, provide labour and instruments to take and record all motor load readings required to supplement the tests on the driven equipment through various load sequences, as required by the trades involved.

1.7.13 600 Volt Vacuum Circuit Breaker:

- .1 Conduct Visual and Mechanical Review:
  - .1 Inspect the frame, covers and conductors for proper mounting and alignment.
  - .2 Check cell fit and element alignment and proper operation of racking interlocks.
  - .3 Verify proper nameplate data to drawings and specifications.
  - .4 Inspect the insulating supports, bushings, operating links and barriers for potential shipping or installation damage.
  - .5 Check mechanical operation by manual closing and tripping. Verify proper latching and smooth operation.
  - .6 Breaker shall be closed and opened several times to assure free movement of all parts and correct mechanical sequence.
  - .7 Verify operation of cell interlocks, undervoltage trip (if exists), operations counter, the close-open indicator, anti-pumping relay and the spring charge indicator. Control wiring connections shall be checked.
  - .8 Primary disconnect fingers shall be inspected for proper alignment and lubricated with an oxidation inhibiting grease.
- .2 Complete the following Electrical Testing:

- .1 Measure contact resistance for each phase with a micro-ohmmeter and compare these values to adjacent poles and similar breakers.
- .2 Measure insulation resistance at the appropriate test value, each pole to ground, between phases and across open contacts of each phase with a DC test potential.
- .3 Verify proper operation including spring charge motor, closing operation, shunt trip and ground fault operation.
- .4 Verify operation by control switch and protective relays.
- .5 Test the trip unit by secondary current injection, if applicable.

1.7.14 HV (15,000 V) Primary Switchgear Assemblies:

- .1 Conduct Visual and Mechanical Review:
  - .1 Inspect the switch and enclosure for physical and mechanical condition.
  - .2 Inspect the switch, bus, and cable terminations for proper connections.
  - .3 Inspect the switch contacts. Check for smooth movement, proper alignment and flicker blade operation per manufacturer's procedures.
  - .4 Verify that any mechanical and key interlock schemes function as intended.
  - .5 Verify equipment ground connection.
  - .6 Compare equipment nameplate data with drawings and specifications.
  - .7 Verify proper phase barrier materials and installation.
  - .8 Inspect all indicating devices for proper operation.
  - .9 Clean and lubricate the operating mechanism and blade contact surfaces as required.
  - .10 Clean the switch, bus and support insulators by vacuuming and wiping. Some components may be cleaned with a manufacture approved electrical solvent.
- .2 Complete the following Electrical Testing:
  - .1 Measure contact resistance for each phase.
  - .2 Measure the fuse resistance.
  - .3 Measure insulation resistance at the appropriate test value, each pole to ground, between phases and across open contacts of each phase.
- .3 Complete the following Electrical Testing:

- .1 Measure insulation resistance at the appropriate test value.
- .2 Confirm starter operation On - Off - Hand.
- .3 Confirm current draw under normal operations condition.
- .4 Confirm current operation of all interlocks.

**1.7.15 600 Volt Switchgear and Switchboard Assemblies:**

- .1 Conduct Visual and Mechanical Review:
  - .1 Inspect panels, doors and latches for fit, dents, corrosion and missing hardware.
  - .2 Inspect insulators and barriers for contamination and broken parts.
  - .3 Check for proper operation of key interlock devices.
  - .4 Check breaker racking mechanisms, if applicable, for smooth movement, full travel and position indicator operation. Clean and lubricate per manufacturer=s guidelines.
  - .5 Check for proper shutter operation and position indicator operation.
  - .6 Inspect load cable termination for signs of overheating or deterioration.
  - .7 Inspect physical condition of PT's and CT's. Check for smooth draw-out movement and proper contact operation.
  - .8 Check that indicating lights are functional.
  - .9 Verify proper operation of digital metering systems.
  - .10 Clean cells, insulators and bus by vacuuming and wiping de-energized sections only.
  - .11 Check accessible bus connections with torque wrench or low-resistance ohmmeter.
- .2 Complete the following Electrical Testing:
  - .1 Test the bus insulation integrity by insulation resistance tests.
  - .2 Test for proper control power voltage.
  - .3 Test switchgear ground and bonding connections.
  - .4 Test protective relays.
  - .5 Verify proper tripping operation of breakers using protective devices.
  - .6 Test Ammeters and Voltmeters by applying appropriate signals.

- 
- .7 Check CT's and PT's for proper ratio.
- 1.7.16 HV – 600 V Volt Power Transformers:
- .1 Conduct Visual and Mechanical Review:
    - .1 With case covers removed, vacuum, cloth wipe and/or brush major insulating surfaces.
    - .2 Clean contacts and terminations by brushing, cloth wipe and applying electrical joint compound.
    - .3 Compare equipment nameplate data to drawings and specifications.
    - .4 Check primary, secondary and ground connections.
    - .5 Check tap connections and tap changer.
    - .6 Check tightness of all bolted connections.
    - .7 Verify that shipping brackets or fixtures have been removed or free.
    - .8 Check for loose iron and damaged coils.
    - .9 Inspect insulation.
    - .10 Inspect for loose mounting and support.
    - .11 Inspect for adequate electrical clearance.
    - .12 Inspect accessories when used.
    - .13 Verify proper core grounding.
    - .14 Verify proper equipment grounding.
    - .15 Verify that the tap changer is set at the specified ratio.
  - .2 Complete the following Electrical Testing:
    - .1 Perform an insulation resistance test using a megohmmeter at the appropriate test level on the transformer windings high to low and ground, low to high and ground, and high to low to ground.
    - .2 Perform a Turns Ratio Test on all three phases and at all tap settings.
    - .3 Check proper operation of fans and alarms.
    - .4 Perform an insulation resistance test on the core ground at the appropriate test level using a megohmmeter.
- 1.7.17 600 Volt Distribution Transformers:
- .1 Conduct Visual and Mechanical Review:
    - .1 With case covers removed, vacuum, cloth wipe and/or brush major insulating surfaces.
    - .2 Clean contacts and terminations by brushing, cloth wipe and applying electrical joint compound.

- 
- .3 Compare equipment nameplate data to drawings and specifications.
  - .4 Check primary, secondary and ground connections.
  - .5 Check tap connections and tap changer.
  - .6 Check tightness of all bolted connections.
  - .7 Verify that shipping brackets or fixtures have been removed or free.
  - .8 Check for loose iron and damaged coils.
  - .9 Inspect insulation.
  - .10 Inspect for loose mounting and support.
  - .11 Check for frame damage.
  - .12 Inspect for adequate electrical clearance.
  - .13 Inspect accessories when used.
  - .14 Verify proper core grounding.
  - .15 Verify proper equipment grounding.
  - .2 Complete the following Electrical Testing:
    - .1 Perform an insulation resistance test using a megohmmeter at the appropriate test level on the transformer windings high to low and ground, low to high and ground, and high to low to ground.
    - .2 Perform a Turns Ratio Test on all three phases and at all tap settings.
    - .3 Perform an insulation resistance test on the core ground at the appropriate test level using a megohmmeter.
- 1.7.18 Surge Protection Device (SPD)
- .1 Formally known as a Transient Voltage Surge Suppression (TVSS)
  - .2 Conduct Visual and Mechanical Review:
    - .1 As per Section.
  - .3 Complete the following Electrical Testing:
    - .1 As per Section.
- 1.7.19 Grounding Systems
- .1 Conduct Visual and Mechanical Review:
    - .1 As per Section.
  - .2 Complete the following Electrical Testing:
    - .1 As per Section.
- 1.7.20 Metering
- .1 Conduct Visual and Mechanical Review:
-

- 
- .1 As per Section.
    - .2 Complete the following Electrical Testing:
      - .1 As per Section.
  - 1.7.21 Generator
    - .1 Conduct Visual and Mechanical Review:
      - .1 As per Section.
    - .2 Complete the following Electrical Testing:
      - .1 As per Section.
  - 1.7.22 Static Uninterruptible Power Supply
    - .1 Conduct Visual and Mechanical Review:
      - .1 As per Section.
    - .2 Complete the following Electrical Testing:
      - .1 As per Section.
  - 1.7.23 Emergency Lighting
    - .1 Conduct Visual and Mechanical Review:
      - .1 As per Section
    - .2 Complete the following Electrical Testing:
      - .1 As per Section.
  - 1.7.24 Lighting Controls – Occupancy Based
    - .1 Conduct Visual and Mechanical Review:
      - .1 As per Section.
    - .2 Complete the following Electrical Testing:
      - .1 As per Section.
  - 1.7.25 Lighting Controls – Photoelectric Based
    - .1 Conduct Visual and Mechanical Review:
      - .1 As per Section.
    - .2 Complete the following Electrical Testing:
      - .1 As per Section.
  - 1.7.26 Lighting Controls – Centralized Systems
    - .1 Conduct Visual and Mechanical Review:
      - .1 As per Section.
    - .2 Complete the following Electrical Testing:
      - .1 As per Section.
  - 1.7.27 Fire Alarm Systems
    - .1 Conduct Visual and Mechanical Review:
      - .1 As per Section.
    - .2 Complete the following Electrical Testing:
-

.1 As per Section.

1.7.28 Communication Systems

.1 Conduct Visual and Mechanical Review:

.1 As per Section.

.2 Complete the following Electrical Testing:

.1 As per Section.

**1.8 Building Turn Over**

1.8.1 Provide labour, material, tools, etc., required to building turn over the electrical systems in the presence of the Engineer and the Owner.

1.8.2 Operate all systems and demonstrate how they conform with specifications. Under supervision, make adjustments and fine tune systems.

**1.9 Care, Operation, Start-Up and Training of Owner's Personnel**

1.9.1 Instruct operating personnel in operation, care and maintenance of equipment.

1.9.2 Arrange and pay for services of manufacturer's factory service representative to supervise start-up of installation, check, adjust, balance and calibrate components.

1.9.3 Provide these services for such period, and for as many visits as necessary to put equipment in operation, and ensure that operating personnel are conversant with aspects of its care and operation.

**1.10 Single Line Electrical Diagrams**

1.10.1 Provide single line diagrams in glazed frame of the Electrical distribution system. Locate in main Electrical Room and all other electrical rooms. The single line diagram shall be an up to date drawing of the new system distribution.

**1.11 Integration with BMS**

1.11.1 Supply and install BACnet IP certified interface.

1.11.2 Provide all wiring and devices required for the installation, programming, commissioning and documents of commissioning to prove correct circuitry and performance.

**1.12 Training of Owner Personnel**

1.12.1 General:

.1 Detailed information regarding contents, duration and instructors for any particular building system is included in Specification Section 01 91 00 – General Commissioning Requirements.

---

1.12.2 Trade Contractor:

- .1 The trade contractor shall have the following training responsibilities:
  - .1 Provide the **Engineer** with a training plan two weeks before the planned training according to the outline described in Section 01 91 0 – General Commissioning Requirements.
  - .2 Provide designated Owner Representative with comprehensive training in the understanding of the systems and the operation and maintenance of each major piece of commissioned electrical equipment or system.
  - .3 Training shall start with classroom sessions, if necessary, followed by hands-on training on each piece of equipment, which shall illustrate the various modes of operation, including start-up, shutdown, fire/smoke alarm, power failure, etc.
  - .4 During any demonstration, should the system fail to perform in accordance with the requirements of the O&M Manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
  - .5 The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing trade contractor or manufacturer's representative. Practical building operating expertise, as well as in-depth knowledge of all modes of operation of the specific piece of equipment, is required.
  - .6 The training sessions shall follow the outline in the Table of Contents of the O&M Manual and illustrate wherever possible the use of the O&M Manual for reference.
  - .7 Training shall include:
    - .1 Use the printed installation, operation and maintenance instruction material included in the O&M Manuals.
    - .2 Include a review of the written O&M manual instructions, emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shutdown,

- 
- seasonal changeover and any emergency procedures.
  - .3 Discuss relevant health and safety issues and concerns.
  - .4 Discuss warranties and guarantees.
  - .5 Cover common troubleshooting problems and solutions.
  - .6 Explain information included in the O&M manuals and the location of all plans and manuals in the facility.
  - .7 Discuss any peculiarities of equipment installation or operation.
  - .8 Classroom sessions shall include the use of overhead projections, slides, and video and audio taped materials as might be appropriate.
  - .8 Hands-on training shall include start-up; operation in all modes possible, including manual; shutdown; and any emergency procedures and maintenance of all pieces of equipment.
  - .9 The trade contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not controlled by the central control system.
  - .10 Training shall occur after functional testing is complete, unless approved otherwise by the Project Manager.
  - .2 Duration of Training:
    - .1 The trade contractor shall provide training on each piece of equipment.

**END OF SECTION**

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
- .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.
  - .6 VOC/Low-Emitting Materials Compliance.
- 1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

**1.5 Submittals**

- 1.5.1 The studies shall be submitted to the design engineer prior to receiving final approval of the distribution equipment shop drawings and/or prior to release of equipment drawings for manufacturing. If formal completion of the study may cause delays in equipment shipments, approval from the Engineer may be obtained for a preliminary submittal of data to ensure that the selection of device ratings and characteristics will be satisfactory to properly select the distribution equipment. The formal study will be provided to verify preliminary findings.

---

**1.6 Submittals for Construction**

1.6.1 The results of the short-circuit, protective device coordination and arc flash hazard analysis studies shall be summarized in a final report. A minimum of five (5) bound copies of the complete final report shall be submitted. For large system studies, submittals requiring more than five (5) copies of the report will be provided without the section containing the computer printout of the short-circuit input and output data. Electronic PDF copies of the report shall be provided upon request.

1.6.2 The report shall include the following sections:

- .1 Executive Summary including Introduction, Scope of Work and Results/Recommendations.
- .2 Short-Circuit Methodology Analysis Results and Recommendations
- .3 Short-Circuit Device Evaluation Table
- .4 Protective Device Coordination Methodology Analysis Results and recommendations
- .5 Protective Device Settings Table
- .6 Time-Current Coordination Graphs and Recommendations
- .7 Arc Flash Hazard Methodology Analysis Results and Recommendations including the details of the incident energy and flash protection boundary calculations, along with Arc Flash boundary distances, working distances, Incident Energy levels and Personal Protection Equipment levels.
- .8 Arc Flash Labeling section showing types of labels to be provided. Section will contain descriptive information as well as typical label images.
- .9 One-line system diagram that shall be computer generated and will clearly identify individual equipment buses, bus numbers used in the short-circuit analysis, cable and bus connections between the equipment, calculated maximum short-circuit current at each bus location, device numbers used in the time-current coordination analysis, and other information pertinent to the computer analysis.

**1.7 Qualifications**

1.7.1 The short-circuit, protective device coordination and arc flash hazard analysis studies shall be conducted under the responsible charge and approval of a Registered Professional Electrical Engineer skilled in performing and interpreting the power system studies.

- 1.7.2 The Registered Professional Electrical Engineer shall be an employee of the equipment manufacturer or an approved engineering firm.
- 1.7.3 The Registered Professional Electrical Engineer shall have a minimum of five (5) years of experience in performing power system studies.
- 1.7.4 The approved engineering firm shall demonstrate experience with Arc Flash Hazard Analysis by submitting names of at least ten actual arc flash hazard analyses it has performed in the past year.
- 1.7.5 The engineering firm shall have a minimum of twenty-five (25) years experience in performing power system studies.

**1.8 Description of System**

- 1.8.1 The trade contractor shall furnish short-circuit and protective device coordination studies.
- 1.8.2 The trade contractor shall furnish an Arc Flash Hazard Analysis Study per the requirements set forth in the current version of NFPA 70E -Standard for Electrical Safety in the Workplace. The arc flash hazard analysis shall be performed according to the IEEE Standard 1584 – 2002, the IEEE Guide for Performing Arc-Flash Calculations.
- 1.8.3 The scope of the studies shall include new distribution equipment supplied by trade contractor under this contract and engineering services by the Vendor.

**2 . PRODUCT**

**2.1 Studies**

- 2.1.1 The trade contractor shall furnish an Arc Flash Hazard Analysis Study per NFPA 70E -Standard for Electrical Safety in the Workplace, reference Article 130.3 and Annex D. This study shall also include short-circuit and protective device coordination studies. All studies to be prepared by approved vendor.

**2.2 Data**

- 2.2.1 Trade Contractor shall furnish all data as required for the power system studies. The Engineer performing the short-circuit, protective device coordination and arc flash hazard analysis studies shall furnish the Trade Contractor with a listing of required data immediately after award of the contract. The Trade Contractor shall expedite collection of the data to assure completion of the studies as required for final approval of the distribution equipment shop drawings and/or prior to the release of the equipment for manufacturing.

- 2.2.2 Source combination may include present and future motors and generators.
- 2.2.3 Load data utilized may include existing and proposed loads obtained from Contract Documents provided by Owner, or Trade Contractor.
- 2.2.4 If applicable, include fault contribution of existing motors in the study. The Trade Contractor shall obtain required existing equipment data, if necessary, to satisfy the study requirements.

## **2.3 Short Circuit Analysis**

- 2.3.1 Transformer design impedances shall be used when test impedances are not available.
- 2.3.2 Provide the following:
  - .1 Calculation methods and assumptions
  - .2 Selected base per unit quantities
  - .3 One-line diagram of the system being evaluated that clearly identifies individual equipment buses, bus numbers used in the short-circuit analysis, cable and bus connections between the equipment, calculated maximum short-circuit current at each bus location and other information pertinent to the computer analysis
  - .4 The study shall include input circuit data including electric utility system characteristics, source impedance data, conductor lengths, number of conductors per phase, conductor impedance values, insulation types, transformer impedances and X/R ratios, motor contributions, and other circuit information as related to the short-circuit calculations.
  - .5 Tabulations of calculated quantities including short-circuit currents, X/R ratios, equipment short-circuit interrupting or withstand current ratings and notes regarding adequacy or inadequacy of the equipment rating.
  - .6 Results, conclusions, and recommendations. A comprehensive discussion section evaluating the adequacy or inadequacy of the equipment must be provided and include recommendations as appropriate for improvements to the system.
- 2.3.3 For solidly-grounded systems, provide a bolted line-to-ground fault current study for applicable buses as determined by the engineer performing the study.

## **2.4 Protective Device Evaluation:**

- 2.4.1 Evaluate equipment and protective devices and compare to short circuit ratings

- 2.4.2 Adequacy of switchgear, motor control centers, and panelboard bus bars to withstand short-circuit stresses
- 2.4.3 Vendor shall notify Owner in writing, of any circuit protective devices improperly rated for the calculated available fault current.

**2.5 Protective Device Time Current Coordination Analysis**

- 2.5.1 Protective device coordination time-current curves (TCC) shall be displayed on log-log scale graphs.
- 2.5.2 Include on each TCC graph, a complete title with descriptive device names.
- 2.5.3 Terminate device characteristic curves at a point reflecting maximum symmetrical or asymmetrical fault current to which the device is exposed.
- 2.5.4 Identify the device associated with each curve by manufacturer type, function, and, if applicable, tap, time delay, and instantaneous settings recommended.
- 2.5.5 Plot the following characteristics on the TCC graphs, where applicable:
  - .1 Electric utility's overcurrent protective device
  - .2 Medium voltage equipment overcurrent relays
  - .3 Medium and low voltage fuses including manufacturer's minimum melt, total clearing, tolerance, and damage bands
  - .4 Low voltage equipment circuit breaker trip devices, including manufacturer's tolerance bands
  - .5 Transformer full-load current, magnetizing inrush current, and ANSI through-fault protection curves
  - .6 Medium voltage conductor damage curves
  - .7 Ground fault protective devices, as applicable
  - .8 Pertinent motor starting characteristics and motor damage points, where applicable
  - .9 Pertinent generator short-circuit decrement curve and generator damage point
  - .10 The largest feeder circuit breaker in each motor control center and applicable panelboard.
- 2.5.6 Provide adequate time margins between device characteristics such that selective operation is provided, while providing proper protection.
- 2.5.7 Provide the following:
  - .1 A One-line diagram shall be provided which clearly identifies individual equipment buses, bus numbers, device identification numbers and the maximum available short-circuit current at each bus when known.

- .2 A sufficient number of log-log plots shall be provided to indicate the degree of system protection and coordination by displaying the time-current characteristics of series connected overcurrent devices and other pertinent system parameters.
- .3 Computer printouts shall accompany the log-log plots and will contain descriptions for each of the devices shown, settings of the adjustable devices, and device identification numbers to aid in locating the devices on the log-log plots and the system one-line diagram.
- .4 The study shall include a separate, tabular printout containing the recommended settings of all adjustable overcurrent protective devices, the equipment designation where the device is located, and the device number corresponding to the device on the system one-line diagram
- .5 A discussion section which evaluates the degree of system protection and service continuity with overcurrent devices, along with recommendations as required for addressing system protection or device coordination deficiencies.
- .6 Square D shall notify Owner in writing of any significant deficiencies in protection and/or coordination. Provide recommendations for improvements.

## **2.6 Arc Flash Hazard Analysis**

- 2.6.1 The arc flash hazard analysis shall be performed according to the IEEE 1584 equations that are presented in NFPA70E-2004, Annex D. The arc flash hazard analysis shall be performed in conjunction with the short-circuit analysis (Section 2.03) and the protective device time-current coordination analysis (Section 2.04)
- 2.6.2 The flash protection boundary and the incident energy shall be calculated at significant locations in the electrical distribution system (switchboards, switchgear, motor-control centers, panelboards, busway and splitters) where work could be performed on energized parts.
- 2.6.3 Circuits 240V or less where available bolted short circuit current is less than 10 kA may be omitted from the computer model and will be assumed to have a hazard risk category 0 per NFPA 70E Table 130.7(C)(9)(a), including footnote 3.
- 2.6.4 Circuits 240V or less fed by transformers 112.5 kVA or less may be omitted from the computer model and will be assumed to have a hazard risk category 0 per IEEE 1584.
- 2.6.5 Working distances shall be based on IEEE 1584. The calculated arc flash protection boundary shall be determined using those working distances.

- 
- 2.6.6 When appropriate, the short circuit calculations and the clearing times of the phase overcurrent devices will be retrieved from the short-circuit and coordination study model. Ground overcurrent relays should not be taken into consideration when determining the clearing time when performing incident energy calculations
- 2.6.7 The short-circuit calculations and the corresponding incident energy calculations for multiple system scenarios must be compared and the greatest incident energy must be uniquely reported for each equipment location in a single table. Calculations must be performed to represent the maximum and minimum contributions of fault current magnitude for normal and emergency operating conditions. The minimum calculation will assume that the utility contribution is at a minimum. Conversely, the maximum calculation will assume a maximum contribution from the utility. Calculations shall take into consideration the parallel operation of synchronous generators with the electric utility, where applicable as well as any stand-by generator applications.
- 2.6.8 The Arc-Flash Hazard Analysis shall be performed utilizing mutually agreed upon facility operational conditions, and the final report shall describe, when applicable, how these conditions differ from worst-case bolted fault conditions.
- 2.6.9 The incident energy calculations must consider the accumulation of energy over time when performing arc flash calculations on buses with multiple sources. Iterative calculations must take into account the changing current contributions, as the sources are interrupted or decremented with time. Fault contribution from motors should be decremented as follows:
- .1 Fault contribution from induction motors should not be considered beyond 5 cycles.
- 2.6.10 For each piece of ANSI rated equipment with an enclosed main device, two calculations shall be made. A calculation shall be made for the main cubicle, sides, or rear; and shall be based on a device located upstream of the equipment to clear the arcing fault. A second calculation shall be made for the front cubicles and shall be based on the equipment's main device to clear the arcing fault. For all other non-ANSI rated equipment, only one calculation shall be required and it shall be based on a device located upstream of the equipment to clear the arcing fault.
- 2.6.11 When performing incident energy calculations on the line side of a main breaker (as required per above), the line side and load side contributions must be included in the fault calculation.
- 2.6.12 Mis-coordination should be checked amongst all devices within the branch containing the immediate protective device upstream of the calculation location and the calculation should utilize the fastest

device to compute the incident energy for the corresponding location.

2.6.13 Arc Flash calculations shall be based on actual overcurrent protective device clearing time. A maximum clearing time of 2 seconds will be used based on IEEE 1584-2002 section B.1.2. Where it is not physically possible to move outside of the flash protection boundary in less than 2 seconds during an arc flash event, a maximum clearing time based on the specific location shall be utilized.

2.6.14 Provide the following:

- .1 Results of the Arc-Flash Hazard Analysis shall be submitted in tabular form, and shall include device or bus name, bolted fault and arcing fault current levels, flash protection boundary distances, working distances, personal-protective equipment classes and AFIE (Arc Flash Incident Energy) levels.
- .2 The Arc-Flash Hazard Analysis shall report incident energy values based on recommended device settings for equipment within the scope of the study.
- .3 The Arc-Flash Hazard Analysis may include recommendations to reduce AFIE levels and enhance worker safety.
- .4 Provide a copy of the arc flash report to the owner.

### **3 . EXECUTION**

#### **3.1 Field Adjustment**

- 3.1.1 Trade Contractor shall adjust relay and protective device settings according to the recommended settings table provided by the coordination study.
- 3.1.2 Trade Contractor shall make minor modifications to equipment as required to accomplish conformance with short circuit and protective device coordination studies.
- 3.1.3 Vendor shall notify Owner in writing of any required major equipment modifications.

#### **3.2 Arc Flash Labels**

- 3.2.1 Trade Contractor shall provide a 4.0 in. x 4.0 in. Brady thermal transfer type label of high adhesion polyester for each work location analyzed.
- 3.2.2 The labels shall be designed according to the following standards:
  - .1 UL969 – Standard for Marking and Labeling Systems
  - .2 ANSI Z535.4 – Product Safety Signs and Labels

- .3 NFPA 70 (National Electric Code) – Article 110.16
- 3.2.3 The label shall include the following information:
  - .1 System Voltage
  - .2 Flash protection boundary
  - .3 Personal Protective Equipment category
  - .4 Arc Flash Incident energy value (cal/cm<sup>2</sup>)
  - .5 Limited, restricted, and prohibited Approach Boundaries
  - .6 Study report number and issue date
- 3.2.4 Labels shall be printed by a thermal transfer type printer, with no field markings.
- 3.2.5 Arc flash labels shall be provided for equipment as identified in the study and the respective equipment access areas per the following:
  - .1 Floor Standing Equipment - Labels shall be provided on the front of each individual section. Equipment requiring rear and/or side access shall have labels provided on each individual section access area. Equipment line-ups containing sections with multiple incident energy and flash protection boundaries shall be labeled as identified in the Arc Flash Analysis table.
  - .2 Wall Mounted Equipment – Labels shall be provided on the front cover or a nearby adjacent surface, depending upon equipment configuration.
  - .3 General Use Safety labels shall be installed on equipment in coordination with the Arc Flash labels. The General Use Safety labels shall warn of general electrical hazards associated with shock, arc flash, and explosions, and instruct workers to turn off power prior to work.
- 3.2.6 Labels shall be field installed by Trade Contractor. The technician providing the installation shall have completed an 8-Hour instructor led Electrical Safety Training Course with includes NFPA 70E material including the selection of personal protective equipment.

### **3.3 Arc Flash Training**

- 3.3.1 The vendor supplying the Arc Flash Hazard Analysis shall train the owner's qualified electrical personnel of the potential arc flash hazards associated with working on energized equipment (minimum of 4 hours). The training shall be certified for continuing education units (CEUs) by the International Association for Continuing Education Training (IACET) or equivalent. The trainer shall be an authorized OSHA Outreach instructor. The cost of training shall be included in electrical tender bid.
- 3.3.2 The vendor supplying the Arc Flash Hazard Analysis shall offer instructor led and online NFPA 70E training classes.

---

**END OF SECTION**

## **1. GENERAL**

### **1.1 Section Includes**

1.1.1 Materials and installation for wire and box connectors.

### **1.2 Related Sections**

1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

1.2.2 Section 01 74 00 – Cleaning and Waste Management.

### **1.3 References**

1.3.1 Canadian Standards Association (CSA International):

- .1 CAN/CSA-C22.1 (current edition), Canadian Electrical Code, Part 1.
- .2 CAN/CSA-C22.2No.18 (current edition), Outlet Boxes, Conduit Boxes, Fittings and Associated Hardware.
- .3 CSA C22.2No.65 (current edition), Wire Connectors.

1.3.2 Electrical and Electronic Manufacturers' Association of Canada (EEMAC):

- .1 EEMAC 1Y-2, 1961 Bushing Stud Connectors and Aluminum Adapters (1,200 Ampere Maximum Rating).

1.3.3 National Electrical Manufacturers Association (NEMA).

### **1.4 Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Section Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be

fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Section 01 47 15 - Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish

## **1.6 Delivery, Storage and Handling**

1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.

1.6.3 Handle materials with suitable lifting equipment.

1.6.4 Store materials in heated, dry, weather-protected enclosure

---

## 2 . **PRODUCTS**

### 2.1 **Material**

- 2.1.1 Pressure type wire connectors shall be in accordance with CSA C22.2 No.65, with current carrying parts of cooper sized to fit cooper conductors as required.
- 2.1.2 Fixture type splicing connectors to shall be in accordance with CSA C22.2 No.65, with current carrying parts of cooper sized to fit copper conductors 10 AWG or less.
- 2.1.3 Bushing stud connectors shall be EEMAC 1Y-2 to consist of:
  - .1 Connector body and stud clamp for stranded copper conductors.
  - .2 Clamp for stranded copper conductors to bar.
  - .3 Clamp for conductors
  - .4 Stud clamp bolts.
  - .5 Bolts for copper conductors
  - .6 Bolts for aluminum conductors
  - .7 Sized for conductors as indicated.
- 2.1.4 Clamps or connectors for aluminum sheathed cable mineral insulated cable flexible conduit, non-metallic sheathed cable as required shall be in accordance with CAN/CSA-C22.2 No.18.

## 3 . **EXECUTION**

### 3.1 **Installation**

- 3.1.1 Remove insulation carefully from ends of conductors and:
  - .1 Apply coat of zinc joint compound on aluminum conductors prior to installation of connectors.
  - .2 Install mechanical pressure type connectors and tighten screws with appropriate compression tool recommended by manufacturer. Installation shall meet secureness tests in accordance with CSA C22.2 No.65.
  - .3 Install fixture type connectors and tighten. Replace insulating cap.
  - .4 Install bushing stud connectors in accordance with EEMAC 1Y-2

### 3.2 **Maintenance – Clearances**

- 3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.3 Cleaning**

- 3.3.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.3.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for Wires and Cables (0 – 1,000 V)

**1.2 Related Sections**

- 1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted, and coordinated with all other parts.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International)  
.1 CSA C22.1 (current edition), Canadian Electric Code, Part 1.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.

.6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Section 01 47 15 - Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish
- .3 Provide product data in accordance with Section 01 33 00 - Submittal Procedures.

## **1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

## **1.7 Acceptable Manufactures**

- 1.7.1 Canda Wire
- 1.7.2 General Wire
- 1.7.3 Pirelli
- 1.7.4 United Wire and Cable
- 1.7.5 Or approved equal

## **2 . PRODUCTS**

### **2.1 Building Wires**

- 2.1.1 Conductors shall be stranded for 10 AWG and larger. Minimum size shall be 12 AWG.

- 2.1.2 All conductors shall be cooper unless otherwise indicated in contract documents.
- 2.1.3 Cooper and aluminum conductors shall be sized as indicated, with 1000 V insulation of cross-linked thermosetting polyethylene material rated 75 C.
- 2.1.4 Cooper and aluminum conductors shall be sized as indicated with thermoplastic insulation type TWH rated at 600 V.
- 2.1.5 Neutral supported cable shall be phase (as indicated) insulated conductors of cooper and one neutral conductor of cooper steel reinforced, size as indicated. Type shall be NS75

## **2.2 Teck 90 Cable**

- 2.2.1 Cable shall be in accordance with Section 26 05 00 - Common Work Results for Electrical.
- 2.2.2 Conductors:
  - .1 Grounding conductor shall be cooper as indicated.
  - .2 Circuit conductors shall be cooper as indicated; size as indicated.
- 2.2.3 Insulation:
  - .1 Ethylene propylene rubber EP.
  - .2 Cross-linked polyethylene XLPE.
  - .3 Rating shall be 1000V.
- 2.2.4 Inner jacket shall be polyvinyl chloride material.
- 2.2.5 Armour shall be interlocking.
- 2.2.6 Fastenings:
  - .1 One-hole steel to secure surface cables 50 mm and smaller. Two-hole steel straps for cables larger than 50 mm.
  - .2 Channel type supports for two or more cables at 50 mm centers.
  - .3 Threaded rods shall be 6 mm diameter to support suspended channels.
- 2.2.7 Connectors:
  - .1 Watertight approved for Teck cable.

## **2.3 Mineral-Insulated Cables**

- 2.3.1 Conductors shall be solid bare soft-annealed copper, size as indicated.
- 2.3.2 Insulation shall be compressed powdered magnesium oxide or silicon dioxide to form compact homogeneous mass throughout entire length of cable.

- 2.3.3 Outer covering shall be annealed seamless cooper sheath, Type M1 rated 600 V, 250°C.
- 2.3.4 Overall jacket shall be.
- 2.3.5 Two-hour fire rating.
- 2.3.6 Connectors shall be approved for MI cable.
- 2.3.7 Termination kits shall be field installed approved for MI cable

## **2.4 Armoured Cables**

- 2.4.1 Conductors shall be insulated, cooper, size as indicated.
- 2.4.2 Type shall be AC90.
- 2.4.3 Armour shall be interlocking type fabricated from aluminum strip.
- 2.4.4 Type shall ACWU90 jacket over thermoplastic armour and compliant to applicable Building Code classification for this project wet locations.
- 2.4.5 Connectors shall be anti-short connectors.

## **2.5 Aluminum Sheathed Cable**

- 2.5.1 Conductors shall be cooper size as indicated.
- 2.5.2 Insulation shall be cross linked polyethylene Type RA90 rated 1000V
- 2.5.3 Sheath shall be aluminum applied to form continuous seamless sheath.
- 2.5.4 Outer jacket shall be thermoplastic applied over sheath and to be compliant to applicable Building Code classification for this project.
- 2.5.5 Fastenings for aluminum sheathed cable:
  - .1 One-hole steel straps to secure surface cables 25 mm and smaller. Two-hole steel straps for cables larger than 25 mm. Use aluminum strap only with single conductor cable.
  - .2 Channel type supports for two or more cables at 50 mm centers.
  - .3 Threaded rods shall be 6 mm diameter to support suspended channels.

## **2.6 Control Cables**

- 2.6.1 Type shall be LVT with two soft annealed copper conductors, sized as indicated:
  - .1 Insulation shall be thermoplastic.
  - .2 Sheath shall be thermoplastic jacket.
- 2.6.2 Type shall be low energy 300 V control cable with stranded annealed copper conductors sized as indicated LVT with two soft annealed copper conductors, sized as indicated:

- .1 Insulation shall be TWH.
  - .2 Shielding shall be metallized tapes over each conductor.
  - .3 Overall covering shall be polyethylene jackets, copper strip.
- 2.6.3 Type shall be 600 V stranded annealed copper conductors, sizes as indicated:
- .1 Insulation shall be RW75, TWH, R90 cross-linked polyethylene type.
  - .2 Shielding shall be metalized tapes.
  - .3 Overall covering shall be thermoplastic jacket.

## **2.7 Non-Metallic Sheathed Cable**

- 2.7.1 Non-metallic sheathed cooper cable type shall be NMD90XLPE, size as indicated.

## **3 . EXECUTION**

### **3.1 General Cable Installation**

- 3.1.1 Install cable in trenches in accordance with Section 26 05 43.01 Installation of Cables in Trenches and ducts.
- 3.1.2 Lay cable in cable trays in accordance with Section 26 05 36 - Cable Trays for Electrical Systems.
- 3.1.3 Terminate cables in accordance with Section 26 05 20 - Wire and Box Connectors - (0 - 1,000 V).
- 3.1.4 Cable Colour Coding shall be in accordance with Section 26 05 00 Common Work Results for Electrical.
- 3.1.5 Conductor length for parallel feeders to be identical.
- 3.1.6 Lace or clip groups of feeder cables at distribution centres, pull boxes, and termination points.
- 3.1.7 Wiring in walls shall be typical drop or loop vertically from above to better facilitate future renovations. Generally wiring from below and horizontal wiring in walls to be avoided unless indicated.
- 3.1.8 Branch circuit wiring for surge suppression receptacles and permanently wired computer and electronic equipment to be two-wire circuits only, i.e. common neutrals not permitted.
- 3.1.9 Provide numbered wire collars for control wiring. Numbers to correspond to control shop drawing legend. Obtain wiring diagram for control wiring.

### **3.2 Installation of Building Wires**

- 3.2.1 Install wiring as follows:

- .1 In conduit systems in accordance with Section 26 05 34 - Conduits, Conduit Fastenings and Conduit Fittings.
- .2 In underground ducts in accordance with Section 33.
- .3 In underfloor distribution system in accordance with Section 21.
- .4 In cellular floor raceways in accordance with Section 21.
- .5 In surface and lighting fixture raceways in accordance with Section 26.
- .6 In wireways and auxiliary gutters in accordance with Section 21.
- .7 Overhead service conductors in accordance with Section 21.

**3.3 Installation of Teck 90 Cable (0 - 1,000 V)**

- 3.3.1 Group cables wherever possible on channels.
- 3.3.2 Install cable exposed, securely supported by straps or hangers.

**3.4 Installation of Mineral-Insulated Cables**

- 3.4.1 Install cable exposed, securely supported by straps or hangers.
- 3.4.2
- 3.4.3 Support two-hour fire rated cables at 1 m intervals.
- 3.4.4 Make cable terminations by using factory-made kits.
- 3.4.5 Cable terminations: use thermoplastic sleeving over bare conductors.
- 3.4.6 Where cables are buried in cast concrete or masonry, sleeve for entry of cables.
- 3.4.7 Do not splice cables unless indicated.

**3.5 Installation of Armoured Cables**

- 3.5.1 Group cables wherever possible on channels.

**3.6 Installation of Aluminum Sheathed Cable**

- 3.6.1 Group cables wherever possible on channels.

**3.7 Installation of Control Cables**

- 3.7.1 Install control In conduit.
- 3.7.2 Ground control cable shield.

**3.8 Installation of Non-Metallic Sheathed Cable**

- 3.8.1 Install cables.
- 3.8.2 Install straps and box connectors to cables as required.

**3.9 Cleaning**

- 3.9.1 Proceed in accordance with Section 01 74 00 – Cleaning and Waste Management.
- 3.9.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**3.10 Field Quality Control**

- 3.10.1 Perform tests in accordance with Section 26 05 00 - Common Work Results for Electrical.
- 3.10.2 Perform 5 tests using method appropriate to site conditions and to approval of Engineer and local authority having jurisdiction over installation.
- 3.10.3 Perform tests before energizing electrical system.

**END OF SECTION**

- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

## **1.7 Acceptable Manufacturers**

- 1.7.1 Canada Wire
- 1.7.2 General Wire
- 1.7.3 Pirelli
- 1.7.4 United Wire and Cable
- 1.7.5 Or approved equal.

---

## 2 . PRODUCTS

### 2.1 Building Wires

- 2.1.1 All conductors shall be copper unless requested in the contract documents. When indicated only larger than No. 2 AWG can be NUAL.
- 2.1.2 Conductors shall be stranded for 10 AWG and larger. Minimum size shall be 12 AWG.
- 2.1.3 Cooper and aluminum conductors shall be sized as indicated, with 1000 V insulation of cross-linked thermosetting polyethylene material rated 75 C.
- 2.1.4 Cooper and aluminum conductors shall be sized as indicated with thermoplastic insulation type TWH rated at 600 V.

### 2.2 Neutral supported cable shall be phase (as indicated) insulated conductors of cooper and one neutral conductor of cooper steel reinforced, size as indicated. Type shall be NS75 Teck 90 Cable

- 2.2.1 Conductors:
  - .1 Grounding conductor shall be cooper as indicated.
  - .2 Circuit conductors shall be cooper as indicated size as indicated.
- 2.2.2 Insulation:
  - .1 Ethylene propylene rubber EP.
  - .2 Cross-linked polyethylene XLPE.
  - .3 Rating shall be 600 V.
- 2.2.3 Inner jacket shall be polyvinyl chloride material.
- 2.2.4 Armour shall be interlocking.
- 2.2.5 Outer jacket: Sunlight Resistant AG14 Polyvinyl chloride jacket, - 40°C, FT-4 rated suitable for direct burial and suitable for Class 1, Zone 1 and 2, and classes 2, and 3, Division 1 and 2 hazardous locations.
- 2.2.6 Fastenings:
  - .1 One-hole steel to secure surface cables 50 mm and smaller. Two-hole steel straps for cables larger than 50 mm.
  - .2 Channel type supports for two or more cables at 50 mm centers.
  - .3 Threaded rods shall be 6 mm diameter to support suspended channels.
- 2.2.7 Connectors:
  - .1 Watertight approved for Teck cable.

---

**2.3 Mineral-Insulated Cables**

- 2.3.1 Conductors shall be solid bare soft-annealed copper, size as indicated.
- 2.3.2 Insulation shall be compressed powdered magnesium oxide or silicon dioxide to form compact homogeneous mass throughout entire length of cable.
- 2.3.3 Outer covering shall be annealed seamless copper sheath, Type M1 rated 600 V, 250°C.
- 2.3.4 Overall jacket shall be
- 2.3.5 Two-hour fire rating.
- 2.3.6 Connectors shall be approved for MI cable.
- 2.3.7 Termination kits shall be **field** installed approved for MI cable

**2.4 Armoured Cables**

- 2.4.1 Conductors shall be insulated, copper, size as indicated.
- 2.4.2 Type shall be AC90.
- 2.4.3 Armour shall be interlocking type fabricated from **aluminum** strip.
- 2.4.4 Type shall ACWU90 jacket over thermoplastic armour and compliant to applicable Building Code classification for this project wet locations.
- 2.4.5 Connectors shall be anti-short connectors.

**2.5 Aluminum Sheathed Cable**

- 2.5.1 Conductors shall be copper size as indicated.
- 2.5.2 Insulation shall be cross linked polyethylene Type RA90 rated 1000V
- 2.5.3 Sheath shall be aluminum applied to form continuous seamless sheath.
- 2.5.4 Outer jacket shall be thermoplastic applied over sheath and to be compliant to applicable Building Code classification for this project.
- 2.5.5 Fastenings for aluminum sheathed cable:
  - .1 One-hole steel straps to secure surface cables 25 mm and smaller. Two-hole steel straps for cables larger than 25 mm. Use aluminum strap only with single conductor cable.
  - .2 Channel type supports for two or more cables at 50 mm centers.
  - .3 Threaded rods shall be 6 mm diameter to support suspended channels.

## **2.6 Control Cables**

- 2.6.1 Type shall be LVT with two soft annealed copper conductors, sized as indicated:
- .1 Insulation shall be thermoplastic.
  - .2 Sheath shall be thermoplastic jacket.
- 2.6.2 Type shall be low energy 300 V control cable with stranded annealed copper conductors sized as indicated LVT with two soft annealed copper conductors, sized as indicated:
- .1 Insulation shall be TWH.
  - .2 Shielding shall be metallized tapes over each conductor.
  - .3 Overall covering shall be polyethylene jacket.
- 2.6.3 Type shall be 600 V stranded annealed copper conductors; sizes as indicated:
- .1 Insulation shall be RW75, TWH, R90 cross polyethene.
  - .2 Shielding shall be metalized tapes.
  - .3 Overall covering shall be thermoplastic jacket.

## **2.7 Non-Metallic Sheathed Cable**

- 2.7.1 Non-metallic sheathed cooper cable type shall be NMD90XLPE, size as indicated.

## **3 . EXECUTION**

### **3.1 General Cable Installation**

- 3.1.1 Install cable in trenches in accordance with Section 33 71 73.02 - Underground Electrical Service.
- 3.1.2 Lay cable in cable trays in accordance with Section 26 05 36 - Cable Trays for Electrical Systems.
- 3.1.3 Terminate cables in accordance with Section 26 05 20 - Wire and Box Connectors - (0 - 1,000 V).
- 3.1.4 Cable Colour Coding shall be in accordance with Section 26 05 00 Common Work Results for Electrical.
- 3.1.5 Conductor length for parallel feeders to be identical.
- 3.1.6 Lace or clip groups of feeder cables at distribution centres, pull boxes, and termination points.
- 3.1.7 Wiring in walls shall be typical drop or loop vertically from above to better facilitate future renovations. Generally wiring from below and horizontal wiring in walls to be avoided unless indicated.
- 3.1.8 Branch circuit wiring for surge suppression receptacles and permanently wired computer and electronic equipment to be two-wire circuits only, i.e. common neutrals not permitted.

- 3.1.9 Provide numbered wire collars for control wiring. Numbers to correspond to control shop drawing legend. Obtain wiring diagram for control wiring.

**3.2 Installation of Building Wires**

3.2.1 Install wiring as follows:

- .1 In conduit systems in accordance with Section 26 05 34 - Conduits, Conduit Fastenings and Conduit Fittings.
- .2 In underground ducts in accordance with Section 33.
- .3 In underfloor distribution system in accordance with Section 21.
- .4 In cellular floor raceways in accordance with Section 21.
- .5 In surface and lighting fixture raceways in accordance with Section 26.
- .6 In wireways and auxiliary gutters in accordance with Section 21.
- .7 Overhead service conductors in accordance with Section 21.

**3.3 Installation of Teck 90 Cable (0 - 600 V)**

- 3.3.1 Group cables wherever possible on channels.
- 3.3.2 Install cable exposed securely supported by straps or hangers.

**3.4 Installation of Mineral-Insulated Cables**

- 3.4.1 Install cable exposed, securely supported by straps or hangers.
- 3.4.2 Support two hour fire rated cables at 1 m intervals.
- 3.4.3 Make cable terminations by using factory-made kits.
- 3.4.4 Cable terminations: use thermoplastic sleeving over bare conductors.
- 3.4.5 Where cables are buried in cast concrete or masonry, sleeve for entry of cables.
- 3.4.6 Do not splice cables unless indicated.

**3.5 Installation of Armoured Cables**

- 3.5.1 Group cables wherever possible on channels.

**3.6 Installation of Aluminum Sheathed Cable**

- 3.6.1 Group cables wherever possible on channels.

**3.7 Installation of Control Cables**

- 3.7.1 Install control cables in conduit.
- 3.7.2 Ground control cable shield.

---

**3.8 Installation of Non-Metallic Sheathed Cable**

- 3.8.1 Install cables.
- 3.8.2 Install straps and box connectors to cables as required.

**3.9 Cleaning**

- 3.9.1 Proceed in accordance with 01 74 00 Cleaning and waste management.
- 3.9.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**3.10 Field Quality Control**

- 3.10.1 Perform tests in accordance with Section 26 05 00 - Common Work Results for Electrical.
- 3.10.2 Perform 5 tests using method appropriate to site conditions and to approval of Engineer and local authority having jurisdiction over installation.
- 3.10.3 Perform tests before energizing electrical system.

- .1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1.
- .2 CSA C22.2 No.41 (current edition), Grounding and Bonding Equipment.

1.4 **Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Section 01 47 15 - Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish
- .3 Submit product data in accordance with Section 01 33 00 - Submittal Procedures.

## **1.6 Delivery, Storage and Handling**

1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.

1.6.3 Handle materials with suitable lifting equipment.

1.6.4 Store materials in heated, dry, weather-protected enclosure

## **1.7 Acceptable Manufactures**

1.7.1 Hubbell,

1.7.2 Thomas and Betts

1.7.3 Or approved equal

---

**1.8 Certificates**

- 1.8.1 Obtain inspection certificate of compliance covering high voltage stress coning from inspection authority and include it with maintenance manuals.

**2 . PRODUCTS**

**2.1 Connectors and Terminations**

- 2.1.1 Cooper long barrel compression connectors to CSA C22.2No. 2 as required sized for conductors.
- 2.1.2 Contact aid for aluminum cables where applicable.
- 2.1.3 Two, three or four -way joint boxes dry location type in accordance with Section 26 05 33 - Raceway and Boxes for Electrical Systems.
- 2.1.4 Two, three or four-way junction boxes with respective pothead for Two, three or four -conductor cables for enclosing stress - cone within X-linked polyethylene cable with copper sheath, and overall jacket in accordance with Section 26 05 33 - Raceway and Boxes for Electrical Systems.

**3 . EXECUTION**

**3.1 Installation**

- 3.1.1 Install stress cones, terminations, and splices in accordance with manufacturer's instructions.
- 3.1.2 Bond and ground as required to CSA C22.2No.41.

**3.2 Maintenance – Clearances**

- 3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.3 Cleaning**

- 3.3.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.3.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

- .2 CSA C22.2 (current edition), Grounding and Bonding Equipment.

1.3.2 American National Standards Institute/Institute of Electrical and Electronics Engineers (ANSI/IEEE)

- .1 ANSI/IEEE 837 (current edition), Qualifying Permanent Connections Used in Substation Grounding.
- .2 Transformer grounding shall comply with CSA C22.2 No. 41 (current edition).

**1.4 Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve

sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.

1.5.3 Quality assurance submittals:

- .1 Manufacturer's Instructions: provide manufacturer's written installation instructions and special handling criteria, installation sequence, and cleaning procedures.

## **1.6 Delivery, Storage and Handling**

1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.

1.6.3 Handle materials with suitable lifting equipment.

1.6.4 Store materials in heated, dry, weather-protected enclosure

## **1.7 Testing Requirements**

1.7.1 Perform ground continuity and resistance test using method appropriate to site conditions. Measure ground grid resistance.

1.7.2 Any third party testing agency costs for the testing and reporting shall be included in the Electrical Division base tender and shall be carried out by a pre-approved testing agency.

---

## 2 . **PRODUCTS**

### 2.1 **Materials**

- 2.1.1 Rod electrodes: copper clad steel, 19 mm diameter by 3 m long.
- 2.1.2 Plate electrode: galvanized surface area and thickness as defined by the CSA C22.1-CEC Part 1.
- 2.1.3 Conductors: bare, stranded, soft annealed copper wire, size No. 4/0 AWG and 2/0 AWG for ground bus, electrode interconnections, metal structures, gradient control mats, transformers, switchgear, motors, ground connections.
- 2.1.4 Conductors: bare, stranded soft annealed copper wire, size No. 4 AWG for grounding cable sheaths, raceways, pipe work, screen guards, switchboards, potential transformers.
- 2.1.5 Conductors: pvc insulated coloured green, stranded soft annealed copper wire No. 10 AWG for grounding meter and relay cases.
- 2.1.6 Conductors: No. 4/0 AWG extra flexible copper conductor for connection of switch mechanism operating rod to gradient control mat, fence gates, vault doors.
- 2.1.7 Bolted removable test links.
- 2.1.8 Accessories: non-corroding, necessary for complete grounding system, type, size material as indicated, including:
  - .1 Grounding and bonding bushings.
  - .2 Protective type clamps.
  - .3 Bolted type conductor connectors.
  - .4 Thermit welded type conductor connectors.
  - .5 Bonding jumpers, straps.
  - .6 Pressure wire connectors.
- 2.1.9 Wire connectors and terminations: as indicated.
- 2.1.10 Grounding resistance bank: indoor, 3-phase, star-connected, 1 ohm, 25,000 A, 0.5 rating, 5,000 V, metallic type.
- 2.1.11 Cable sheath isolating sleeves.

## 3 . **EXECUTION**

### 3.1 **Installation**

- 3.1.1 Install continuous grounding system including, electrodes, conductors, connectors and accessories as indicated and to requirements of local authority having jurisdiction.
- 3.1.2 Ground fences to grounding system independent of station ground.
- 3.1.3 Install connectors and cadweld in accordance with manufacturer's instructions.

- 3.1.4 Protect exposed grounding conductors during and after construction.
- 3.1.5 Make buried connections, and connections to electrodes, structural steel work, using permanent mechanical connectors to ANSI/IEEE 837.
- 3.1.6 Use mechanical connectors for grounding connections to equipment provided with lugs.
- 3.1.7 Use No. 4/0 AWG bare copper cable for main ground bus of substation and No. 2/0 AWG mhd bare copper cable for taps on risers from main ground bus to equipment.
- 3.1.8 Use tinned copper conductors for aluminum structures.
- 3.1.9 Do not use bare copper conductors near un-jacketed lead sheath cables.
- 3.1.10 Install grounding resistor bank.
- 3.1.11 Install zig-zag grounding transformer.

### **3.2 Electrode Installation**

- 3.2.1 Provide and install an artificial ground consisting typically of four 3000mm x 20mm copper-weld ground rods, interconnected by bare-stranded copper #4/0 conductor and terminating to the Main Electrical Room ground bus. Conductors shall be cad-welded to the ground rods and shall be buried 600mm below grade. Check and measure the installation to ensure an adequate resistance to ground before floor slab cover is poured.
- 3.2.2 Provide additional grounding as necessary to meet the ground resistance specified.
- 3.2.3 In certain difficult circumstances, in-situ concrete-encased grounding conductors ("UFER") grounding may be used to enhance the grounding grid system.
- 3.2.4 Provide ground test well over one of the rods on the ground grid to allow access to the grid for testing.
- 3.2.5 Install gradient control mats. Connect mats to station ground electrode and switch mechanism operating rods.
- 3.2.6 Make special provision for installing electrodes that will give acceptable resistance to ground value, where rock or sand terrain prevails.

### **3.3 Building Service Grounding**

- 3.3.1 Water – From the main electrical room ground bus, connect 1#3/0 insulated ground conductor in 27mm conduit to water main with approved ground clamp ahead of water meter. Install 1#3/0 ground conductor jumper strapped around water meter and associated unions and valves to ground building side of water system.

- 3.3.2 Metallic Waste Water Piping – Each metallic waste water piping system to the building is to be grounded by bonding it to the interior metallic water supply system by copper bonding jumper of not less than No. 6 AWG as per the Canadian Electrical Code.
- 3.3.3 Gas Pip Grounding – All interior metal gas piping which may become energized is to be made electrically continuous and is to be bonded in accordance with the requirements of the Canadian Electrical Code.

### **3.4 Equipment Grounding**

- 3.4.1 Install grounding connections as indicated to typical station equipment including: metallic water main, line sky wire, neutral, gradient control mats. Non current carrying parts of: transformers, generators, motors, circuit breakers, reclosers, current transformers, frames of gang-operated switches and fuse cutout bases. Cable sheaths, raceways, pipe work, screen guards, switchboards, potential transformers. Meter and relay cases. Any exposed building metal, within or forming part of station enclosure. Sub-station fences, pothead bodies. Outdoor lighting.
- 3.4.2 Ground hinged doors to main frame of electrical equipment enclosure with flexible jumper.

### **3.5 Neutral Grounding**

- 3.5.1 Connect transformer neutral and distribution neutral together using 1000 V insulated conductor to one side of ground test link, the other side of the test link being connected directly to main station ground. Ensure distribution neutral and neutrals of potential transformers and service banks are bonded directly to transformer neutral and not to main station ground.
- 3.5.2 Interconnect electrodes and neutrals at each grounding installation.
- 3.5.3 Connect neutral of station service transformer to main neutral bus with tap of same size as secondary neutral.
- 3.5.4 Ground transformer tank with continuous conductor from tank ground lug through connector on ground bus to primary neutral. Connect neutral bushing at transformer to primary neutral in same manner.

### **3.6 Grounding in Manholes**

- 3.6.1 Install conveniently located grounding stud, electrode, size 3/0 stranded copper conductor in each manhole.
- 3.6.2 Install ground rod with lug for grounding connection in each manhole so that top projects through bottom of manhole.

---

**3.7 Field Quality Control**

- 3.7.1 Engage an independent testing agent to inspect grounding and perform ground resistance test before backfill.
- 3.7.2 Perform earth loop test and resistance tests using method appropriate to site conditions and to approval of Engineer and local authority having jurisdiction.
- 3.7.3 Perform test before energizing electrical system.
- 3.7.4 Provide step-and-touch potential calculations using measured station ground resistance measurements. Submit test result and review certificate before energizing electrical system.

**3.8 Maintenance – Clearances**

- 3.8.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.9 Cleaning**

- 3.9.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.9.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for secondary grounding.

**1.2 Related Sections**

- 1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

- 1.3.1 American National Standards Institute (ANSI)/Institute of Electrical and Electronics Engineers (IEEE).  
1.3.2 ANSI/IEEE 837 (current edition), Qualifying Permanent Connections Used in Substation Grounding.  
1.3.3 Canadian Standards Association, (CSA International).  
1.3.4 CAN/CSA Z32 (current edition), Electrical Safety and Essential Electrical Systems in Health Care Facilities.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.  
1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.  
1.4.3 Waste Management and Disposal  
.1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.  
.2 Avoid using landfill waste disposal procedures when recycling facilities are available.  
.3 Place materials defined as hazardous or toxic waste in designated containers.  
1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:  
.1 Construction Waste Management / Product Waste Recyclability.

- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Delivery, Storage and Handling**

- 1.5.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.5.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.5.3 Handle materials with suitable lifting equipment.
- 1.5.4 Store materials in heated, dry, weather-protected enclosure

## **1.6 Testing Requirements**

- 1.6.1 Perform ground continuity and resistance test using method appropriate to site conditions. Measure ground grid resistance.
- 1.6.2 Any third party testing agency costs for the testing and reporting shall be included in the Electrical Division base tender and shall be carried out by a pre-approved testing agency.

## **2. PRODUCTS**

### **2.1 Material**

- 2.1.1 Clamps for grounding of conductor: size as required to electrically conductive underground water pipe.
- 2.1.2 Copper conductor: minimum 6 m long for each concrete encased electrode, bare, stranded, soft annealed, size as indicated.
- 2.1.3 Rod electrodes: galvanized steel 19 mm diameter by 3 m long.
- 2.1.4 Plate electrodes: galvanized steel, surface area 0.2 m<sup>2</sup>, 1.6 mm thick.
- 2.1.5 Grounding conductors: bare stranded copper as indicated.
- 2.1.6 Insulated grounding conductors: green, type RWU90 XLPE.
- 2.1.7 Ground bus: copper, size as indicated, complete with insulated supports, fastenings, connectors.
- 2.1.8 Non-corroding accessories necessary for grounding system, type, size, material as indicated, including but not necessarily limited to:

- .1 Grounding and bonding bushings.
  - .2 Protective type clamps.
  - .3 Bolted type conductor connectors.
  - .4 Thermit welded type conductor connectors.
  - .5 Bonding jumpers, straps.
  - .6 Pressure wire connectors.
- 2.1.9 Grounding resistance bank: indoor, 3 phase, star connected, metallic type, system voltage as per drawings.

### 3 . **EXECUTION**

#### 3.1 **Installation – General**

- 3.1.1 Install complete permanent, continuous grounding system including, electrodes, conductors, connectors, accessories. Where EMT is used, run ground wire in conduit.
- 3.1.2 Install connectors in accordance with manufacturer's instructions.
- 3.1.3 Protect exposed grounding conductors from mechanical injury.
- 3.1.4 Make buried connections, and connections to conductive water main, electrodes, using permanent mechanical connectors or inspectable wrought copper compression connectors to ANSI/IEEE 837.
- 3.1.5 Use mechanical connectors for grounding connections to equipment provided with lugs.
- 3.1.6 Soldered joints not permitted.
- 3.1.7 Install bonding wire for flexible conduit, connected at both ends to grounding bushing, solderless lug, clamp or cup washer and screw. Neatly cleat bonding wire to exterior of flexible conduit.
- 3.1.8 Install flexible ground straps for bus duct enclosure joints, where such bonding is not inherently provided with equipment.
- 3.1.9 Install separate ground conductor to outdoor lighting standards.
- 3.1.10 Install grounding resistance bank.
- 3.1.11 Connect building structural steel and metal siding to ground by welding copper to steel.
- 3.1.12 Make grounding connections in radial configuration only, with connections terminating at single grounding point. Avoid loop connections.
- 3.1.13 Bond single conductor, metallic armoured cables to cabinet at supply end, and provide non-metallic entry plate at load end.
- 3.1.14 Ground secondary service pedestals.

---

**3.2 Manholes**

- 3.2.1 Install conveniently located grounding stud, electrode, size 3/0 stranded copper conductor in each manhole.
- 3.2.2 Install ground rod in each manhole so that top projects through bottom of manhole. Provide with lug to which grounding connection can be made.

**3.3 Electrodes**

- 3.3.1 Make ground connections to continuously conductive underground water pipe on street side of water meter.
- 3.3.2 Install water meter shunt.
- 3.3.3 Install concrete encased electrodes in building foundation footings, with terminal connected to grounding network.
- 3.3.4 Install rod electrodes and make grounding connections.
- 3.3.5 Bond separate, multiple electrodes together.
- 3.3.6 Use size 3/0 AWG copper conductors for connections to electrodes.
- 3.3.7 Make special provision for installing electrodes that will give acceptable resistance to ground value where rock or sand terrain prevails. Ground as indicated.

**3.4 System and Circuit Grounding**

- 3.4.1 Install system and circuit grounding connections to neutral of secondary 600 V system.
- 3.4.2 Install home run a #6 AWG insulated bonding conductor in conduit from the building main ground bus to the:
  - .1 Main Fire Alarm Panel
  - .2 Main Security Panel
  - .3 Sound and Communication Systems Head End
  - .4 RF Television System
  - .5 Uninterruptible Power Supply (UPS) System(s)

**3.5 Equipment Grounding**

- 3.5.1 Install grounding connections to typical equipment included in, but not necessarily limited to following list. Service equipment, transformers, switchgear, duct systems, frames of motors, motor control centres, starters, control panels, building steel work, generators, elevators and escalators, distribution panels, outdoor lighting.
- 3.5.2 Provide a grounding conductor from the secondary of every distribution transformer to the grounding system. Ground conductor to be sized and installed in accordance with the Canadian Electrical Code.

- 3.5.3 Provide grounding conductor(s) from all major switchgear to solidly ground the secondary system. This includes equipment located in the main electrical room as well as each sub-electrical room. Grounding conductors are to be sized to Canadian Electrical Code and switchgear manufacturer's requirements.

### **3.6 Grounding Bus**

- 3.6.1 Provide a ground bus in the main electrical room. The ground bus shall consist of a suitable length of 50mm x 6mm copper bus mounted on a 25mm insulating standoff. This bus shall be drilled and tapped to receive all the grounding conductors indicated and an engraved nameplate or tag shall be installed above or below individual conductors indicating their function.
- 3.6.2 Provide a similar ground bus in each sub-electrical room and major mechanical room. Interconnect to the main ground bus with a 3/0 AWG insulated copper grounding conductor that is typically installed with the power feeders.
- 3.6.3 Provide a similar ground bus in each data and voice equipment room and closet as indicated in "Data & Voice Grounding" clause.
- 3.6.4 Ground items of electrical equipment in the electrical room to the ground bus with individual bare stranded copper connections, size 3/0 AWG or as indicated.
- 3.6.5 Copper or bronze lugs are required for termination of all copper conductors at ground busses.

### **3.7 Communication Systems**

- 3.7.1 Install home run insulated ground conductor in conduit from the building main ground bus as follows:
- .1 #1/0 AWG to a ground bus in the main telecommunication equipment room.
  - .2 #2 AWG to a ground bus in the telecommunication equipment room.
  - .3 #2 AWG to a ground bus in the main telephone equipment room.
  - .4 #2 AWG to a ground bus in each telephone backboard in equipment rooms/closets.
- 3.7.2 Unless otherwise solidly bonded, bond all data and telephone incoming and outgoing steel conduits with insulated 1#12 AWG from the nearest "Communication" ground bus.

### **3.8 Permafrost**

- 3.8.1 Bond non-current carrying metal parts together with size AWG copper equipotential conductor. Run conductor from separate lug or

service neutral bar to, but not necessarily limited to, following indoor systems and equipment:

- .1 Hot water heating system.
  - .2 Main water pipe.
  - .3 Main building drain.
  - .4 Oil line.
  - .5 Telephone, radio/tv, emergency and fire alarm lead-in or service conduits, near panels.
  - .6 Make connections to pipes on building side of main valves and tanks. Connect jumpers across boilers to supply and return hot water heating pipes.
- 3.8.2 Drive three -19 mm diam x 3 m copper clad ground rods at least 1.8 m apart in original undisturbed ground. If rods will not penetrate permafrost, drive at angle not more than 60o from vertical, and in same direction. Rods must be driven, not trenched.
- 3.8.3 Install ground wire from service neutral bar to rods and where buried use bare copper not smaller than size 1AWG7- strand or size 4AWG solid, and at least 460 mm below ground. Bond ground conductor, or short tap from it, to outside metal sheathing of building close to power service conduit. Use lug or cast clamp, with bronze or plated bolt, nut and washers (not sheet metal screw or wood screw). Remove paint from sheathing for good contact. Conduit is required only on outside wall of building. Indoors, run bare and fasten as specified for equipotential bonding wire.
- 3.8.4 Install electrode interconnections where metal parts, circuits or grounding conductors and/or electrodes are in proximity to lightning rod conductors.

### **3.9 Mechanical Equipment Grounding**

- 3.9.1 Provide a #2 ground conductor from the mechanical room ground bus to each MCC.
- 3.9.2 Provide a #6 ground conductor from the mechanical room ground bus to each VFD.
- 3.9.3 Ground wires are to be installed in all conduits serving motor feeder circuits and are to extend to ground screws on junction and outlet boxes for bonding.

### **3.10 Emergency Generator Grounding**

- 3.10.1 Ground unit frame, control panel and switchgear in accordance with the Canadian Electrical Code (CEC).
- 3.10.2 Provide a grounding conductor in switchgear to solidly ground emergency system neutral. Grounding conductor to be sized to CEC and switchgear manufacturer's recommendations.

3.10.3 The generator neutral ground is to be connected at the generator input side of the generator breaker.

3.10.4 If a four-pole automatic transfer switch is utilized, provide a grounding conductor from the generator switchgear to solidly ground emergency system neutral. The grounding conductor is to be sized to Canadian Electrical Code and switchgear manufacturer's requirements.

**3.11 Cable Tray Grounding**

3.11.1 Install 1#2 to each cable tray from the nearest Telecom ground bus.

3.11.2 Install 1#2 bare copper ground, unless shown otherwise, for full length of tray bonded to tray at 15m intervals and to ground bus at each termination point as specified.

**3.12 Access Floor Grounding**

3.12.1 Install 1#4 ground connection to every fourth floor pedestal of the access flooring structural support system and make connection to a server room ground bus installed on the wall below the raised floor. From the ground bus, install one 3/0 ground to ground bus in the main electrical room.

**3.13 Post-Mounted Luminaire Grounding**

3.13.1 Provide #10 AWG bonding conductor with green RW90 X-link insulation to luminaire standards. Connect to luminaire corrosion-resistant ground stud or ground clamp.

**3.14 Field Quality Control**

3.14.1 Perform ground continuity and resistance tests using method appropriate to site conditions and to approval of Engineer and local authority having jurisdiction over installation.

3.14.2 Perform tests before energizing electrical system.

3.14.3 Disconnect ground fault indicator during tests.

**3.15 Maintenance – Clearances**

3.15.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.16 Cleaning**

3.16.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.

3.16.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Material and installation for hangers and supports.

**1.2 Related Sections**

- 1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International)  
1.3.2 CSA C22.1 (current edition), Canadian Electrical Code, Part 1.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
- .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.
  - .6 VOC/Low-Emitting Materials Compliance.

- 1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

**1.5 Submittals**

- 1.5.1 Submittals: in accordance with section 01 33 00 – Submittal Procedures.

- 1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

**2 . PRODUCTS**

**2.1 Support Channels**

- 2.1.1 U shape, size 41 x 41 mm, 2.5 mm thick, surface mounted, suspended or set in poured concrete walls and ceilings.

**3 . EXECUTION**

**3.1 Installation**

- 3.1.1 Secure equipment to masonry, tile and plaster surfaces with lead anchors.
- 3.1.2 Secure equipment to poured concrete with expandable inserts.
- 3.1.3 Secure equipment to hollow masonry walls or suspended ceilings with toggle bolts.
- 3.1.4 Secure surface mounted equipment with twist clip fasteners to inverted T bar ceilings. Ensure that T bars are adequately supported to carry weight of equipment specified before installation.
- 3.1.5 Support equipment, conduit or cables using clips, spring loaded bolts, cable clamps designed as accessories to basic channel members.

- 
- 3.1.6 Fasten exposed conduit or cables to building construction or support system using straps.
    - .1 One-hole steel straps to secure surface conduits and cables 50 mm and smaller.
    - .2 Two-hole steel straps for conduits and cables larger than 50 mm.
    - .3 Beam clamps to secure conduit to exposed steel work.
  - 3.1.7 Suspended support systems.
    - .1 Support individual cable or conduit runs with 6 mm diameter threaded rods and spring clips.
    - .2 Support 2 or more cables or conduits on channels supported by 6 mm diameter threaded rod hangers where direct fastening to building construction is impractical.
  - 3.1.8 For surface mounting of two or more conduits use channels at 1.5 m on centre spacing.
  - 3.1.9 Provide metal brackets, frames, hangers, clamps and related types of support structures where indicated or as required to support conduit and cable runs.
  - 3.1.10 Ensure adequate support for raceways and cables dropped vertically to equipment where there is no wall support.
  - 3.1.11 Do not use wire lashing or perforated strap to support or secure raceways or cables.
  - 3.1.12 Do not use supports or equipment installed for other trades for conduit or cable support except with permission of other trade and approval of Engineer.
  - 3.1.13 Install fastenings and supports as required for each type of equipment cables and conduits, and in accordance with manufacturer's installation recommendations.

### **3.2 Maintenance – Clearances**

- 3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

### **3.3 Cleaning**

- 3.3.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.3.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

## 1.5 **Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Section 01 47 15 - Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish

## 1.6 **Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

## 2. **PRODUCTS**

### 2.1 **Splitters**

- 2.1.1 Construction: sheet metal enclosure, welded corners and formed hinged cover suitable for locking in closed position.
- 2.1.2 Terminations: main and branch lugs to match required size and number of incoming and outgoing conductors as indicated.
- 2.1.3 Spare Terminals: minimum three spare terminals or lugs on each connection or lug block sized less than 400 A.

---

**2.2 Junction and Pull Boxes**

- 2.2.1 Construction-welded steel enclosure.
- 2.2.2 Covers Flush Mounted: 25 mm minimum extension all around.
- 2.2.3 Covers Surface Mounted: screw-on flat covers.

**2.3 Cabinets**

- 2.3.1 Construction: welded sheet steel hinged door, handle, latch and catch
- 2.3.2 Type E Empty: flush overlapping sides, mounting as indicated.
- 2.3.3 Type T Terminal: flush overlapping sides mounting as indicated containing 19 mm plywood backboard.

**3 . EXECUTION**

**3.1 Splitter Installation**

- 3.1.1 Mount plumb, true and square to building lines.
- 3.1.2 Extend splitters full length of equipment arrangement except where indicated otherwise.

**3.2 Junction, Pull Boxes and Cabinets Installation**

- 3.2.1 Install pull boxes in inconspicuous but accessible locations.
- 3.2.2 Mount cabinets with top not higher than 2 m above finished floor except where indicated otherwise.
- 3.2.3 Install terminal block as indicated in Type T cabinets.
- 3.2.4 Only main junction and pull boxes are indicated. Install additional pull boxes as required by CSA C22.1.

**3.3 Identification**

- 3.3.1 Identification Labels: size 2 indicating system name, voltage and phase, or as indicated.

**3.4 Maintenance – Clearances**

- 3.4.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.5 Cleaning**

- 3.5.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.5.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

END OF SECTION

---

**1.    GENERAL**

**1.1    Section Includes**

1.1.1    Materials and installation for outlet boxes, conduit boxes and fittings.

**1.2    Related Sections**

1.2.1    This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3    References**

1.3.1    Canadian Standards Association (CSA International)

- .1        CSA C22.1 (current edition), Canadian Electrical Code, Part 1, 20th Edition.
- .2        CSA C22.2 No. 18, Outlet boxes, conduit boxes and fittings.

**1.4    Sustainable Requirements**

1.4.1    Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2    Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3    Waste Management and Disposal

- .1        Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2        Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3        Place materials defined as hazardous or toxic waste in designated containers.

1.4.4    In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1        Construction Waste Management / Product Waste Recyclability.
- .2        Recycled Content.
- .3        Local and Regional Materials.
- .4        Certified Wood.

.5 Construction Indoor Air Quality (IAQ) management.

.6 VOC/Low-Emitting Materials Compliance.

1.4.5 **NOTE:** Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

.1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.

## **1.6 Delivery, Storage and Handling**

1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.

1.6.3 Handle materials with suitable lifting equipment.

1.6.4 Store materials in heated, dry, weather-protected enclosure

## **2. PRODUCTS**

### **2.1 Outlet and Conduit Boxes - General**

2.1.1 Size boxes in accordance with CSA C22.1.

2.1.2 102 mm square or larger outlet boxes as required.

2.1.3 Gang boxes where wiring devices are grouped.

2.1.4 Blank cover plates for boxes without wiring devices.

2.1.5 Combination boxes with barriers where outlets for more than one system are grouped.

### **2.2 Galvanized Steel Outlet Boxes**

2.2.1 One-piece electro-galvanized construction.

2.2.2 Single and multi gang flush device boxes for flush installation, minimum size 76 x 50 x 38 mm or as indicated. 102 mm square outlet boxes when more than one conduit enters one side with extension and plaster rings as required.

- 2.2.3 Utility boxes for outlets connected to surface-mounted EMT conduit, minimum size 102 x 54 x 48mm.
- 2.2.4 102 mm square or octagonal outlet boxes for lighting fixture outlets.
- 2.2.5 Extension and plaster rings for flush mounting devices in finished walls.

## **2.3 Masonry Boxes**

- 2.3.1 Electro-galvanized steel masonry single and multi gang boxes for devices flush mounted in exposed block walls.

## **2.4 Concrete Boxes**

- 2.4.1 Electro-galvanized sheet steel concrete type boxes for flush mount in concrete with matching extension and plaster rings as required.

## **2.5 Floor Boxes**

- 2.5.1 Concrete tight electro-galvanized sheet steel floor boxes with adjustable finishing rings to suit floor finish with brushed aluminum faceplate. Device mounting plate to accommodate short or long ear duplex receptacles. Minimum depth: 73 mm for receptacles and communication outlets. Adjustable, watertight, concrete tight, cast floor boxes with openings drilled and tapped for 16, 21, 27 and 35 mm conduit. Minimum size: 73 mm deep.
- 2.5.2 Raised Floor Type: Electro-galvanized sheet steel floor boxes with adjustable finishing rings to suit floor finish with brushed aluminum faceplate. 4 Gang with device mounting plate to accommodate short or long ear duplex receptacles. Minimum depth: 73 mm for receptacles and communication outlets. Adjustable, watertight floor boxes with openings drilled and tapped for 16, 21, 27 and 35 mm conduit. Minimum size: 73 mm deep.

## **2.6 Conduit Boxes**

- 2.6.1 Cast FS aluminum boxes with factory-threaded hubs and mounting feet for surface wiring of devices.

## **2.7 Outlet Boxes for Non-Metallic Sheathed Cable**

- 2.7.1 Electro-galvanized, sectional, screw ganging steel boxes, minimum size 76 x 50 x 63 mm with two double clamps to take non-metallic sheathed cables.

## **2.8 Fittings - General**

- 2.8.1 Bushing and connectors with nylon insulated throats.
- 2.8.2 Knock-out fillers to prevent entry of debris.
- 2.8.3 Conduit outlet bodies for conduit up to 35 mm and pull boxes for larger conduits.

2.8.4 Double locknuts and insulated bushings on sheet metal boxes.

**2.9 Service Fittings**

2.9.1 'High tension' receptacle fitting made of 2 piece die-cast aluminum with brushed aluminum housing finish for two duplex receptacles. Bottom plate with two knockouts for centered or offset installation. 12 x 102 mm extension piece as indicated.

2.9.2 Pedestal type 'low tension' fitting made of 2 piece die cast aluminum with brushed aluminum housing finish to accommodate two amphenol jack connectors.

**3 . EXECUTION**

**3.1 Installation**

3.1.1 Support boxes independently of connecting conduits.

3.1.2 Fill boxes with paper, sponges or foam or similar approved material to prevent entry of debris during construction. Remove upon completion of work.

3.1.3 For flush installations mount outlets flush with finished wall using plaster rings to permit wall finish to come within 6 mm of opening.

3.1.4 Provide correct size of openings in boxes for conduit, mineral insulated and armoured cable connections. Do not install reducing washers.

3.1.5 Vacuum clean interior of outlet boxes before installation of wiring devices.

3.1.6 Identify systems for outlet boxes as required.

**3.2 Maintenance – Clearances**

3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.3 Cleaning**

3.3.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.

3.3.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for cable splice and junction boxes.

**1.2 Related Sections**

- 1.2.1 Section 01 33 00 - Submittal Procedures.  
1.2.2 Section 01 74 21 - Construction/Demolition Waste Management and Disposal.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International):  
.1 CSA C22.2No.40-M1989(R1999), Cut-out, Junction and Pull Boxes.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.  
1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.  
1.4.3 Waste Management and Disposal  
.1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.  
.2 Avoid using landfill waste disposal procedures when recycling facilities are available.  
.3 Place materials defined as hazardous or toxic waste in designated containers.  
1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:  
.1 Construction Waste Management / Product Waste Recyclability.  
.2 Recycled Content.  
.3 Local and Regional Materials.  
.4 Certified Wood.  
.5 Construction Indoor Air Quality (IAQ) management.

.6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Section 01 47 15 - Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish

## **1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

## **2. PRODUCTS**

### **2.1 Junction Boxes Distribution Level**

2.1.1 Welded steel rectangular boxes 6 mm thick painted with chromate primer and gray enamel with removable plate on front side, designed for through run of main cable and porcelain enclosed disconnecting branches of three single conductor cables, using pothead plug and socket disconnectors enclosed in porcelain tubes and caps, standard designed for no voltage disconnecting, and for wall mounting in tunnels, branch cables rated 100 A, 5 kV, filled with medium hard asphalt base compound.

### **2.2 Junction Boxes Power Level**

2.2.1 Cast iron octagonal box painted with chromate primer and gray enamel with joints ground smooth and fitted with gasket, contacts

mounted on porcelain supports to which conductors are fastened by soldered-on lugs, medium hard asphalt compound filled, suitable for three-phase, 15 kV cable, 350 MCM maximum cable size, with wiping sleeve and stuffing box entrance.

- 2.2.2 Welded steel rectangular boxes, oil resistant gasketed steel plate lids fastened with silicon-bronze bolts, shot blasted and painted with chromate primer and gray enamel, cable-heads medium hard asphalt compound filled cap-nut sealed potheads with [stuffing box entrances, air filled, disconnecting links insulated switch stick operated at no voltage rated 500 A at 15,000 V, four-way for wall mounting in tunnels.

### 3 . **EXECUTION**

#### 3.1 **Installation**

- 3.1.1 Install splice boxes at cable joint, on floor of trench. Tighten armour clamps and fill with compound.
- 3.1.2 Install junctions boxes on trench floor around cable splice to CSA C22.2No.40. Connect cable terminals to box contacts. Fasten lid securely and check for air leaks before trench is backfilled.
- 3.1.3 Install subway level steel boxes on wall of tunnels. Connect cables to bus, install links, fasten lid and test for air leaks and fill with compound.
- 3.1.4 Install distribution level steel boxes on walls of tunnels. Splice main cable in box and connect branch feeder. Fasten cover and fill with compound.
- 3.1.5 Install power level boxes as follows:
- .1 Cast iron type shall be on trench floor, connect cable terminals to box contacts, fasten lid and fill with compound before trench is backfilled.
  - .2 Steel type shall be mount on wall of tunnel; connect cables to box terminals; install disconnect links, fasten lid securely fill with oil and check for air leaks.

#### 3.2 **Maintenance – Clearances**

- 3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

#### 3.3 **Cleaning**

- 3.3.1 Proceed in accordance with Section 01 74 00 Claening and waste management.

- 
- 3.3.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for Surface and Lighting Fixture Raceways.

**1.2 Related Sections**

- 1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International):

  - .2 CAN/CSA-C22.2 No. 62-93(R2003), Surface Raceway Systems.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
- .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.

- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

- 1.5.1 Provide submittals in accordance with Section 01 33 00 - Submittal Procedures.
- 1.5.2 Product Data:
  - .1 Provide manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.5.3 Quality assurance submittals shall be provided in accordance with Section 01 40 00 Quality requirement.
  - .1 Provide manufacturer's installation instructions and special handling criteria, installation sequence, and cleaning procedures.
- 1.5.4 Indicate types of raceways with terminology similar to that used in this Section.

## **2. PRODUCTS**

### **2.1 Surface Raceway System (Wiring Pulled In)**

- 2.1.1 One-piece steel, free of sharp edges to CAN/CSA-C22.2 No. 62.
- 2.1.2 Corners, pull boxes, elbows, tees, two piece assembly to facilitate site wiring.
- 2.1.3 Finish shall be White/ivory enamel.
- 2.1.4 Switch, receptacle, extension boxes, adapters and fittings required for complete installation.

### **2.2 Surface Raceway System (Wiring Laid In)**

- 2.2.1 Two-piece steel assembly CAN/CSA-C22.2 No. 62.
  - .1 Finish shall be White/ivory enamel.
- 2.2.2 Switch, receptacle, extension boxes, adapters and fittings required for complete installation.

- 
- 2.3 Surface Floor Raceway System**
- 2.3.1 Two-piece steel assembly manufactured for floor lay-in type raceway to CAN/CSA-C22.2 No. 62.
- 2.3.2 Finish shall be White/ivory enamel.
- 2.4 Channel Raceway**
- 2.4.1 Channel type raceway shall be in accordance with CAN/CSA-C22.2 No. 62, steel, solid.
- 2.5 Plastic Raceway**
- 2.5.1 Plastic raceway shall be in accordance with CAN/CSA-C22.2 No. 62, rigid extruded polyvinyl chloride with slots on either side of raceway for exit of wiring.
- 2.5.2 Channel shall be with solid snap-on cover throughout entire length.
- 2.6 Lighting Fixture Raceway**
- 2.6.1 Fluorescent fixture support system using channel type raceway with snap-on cover.
- 2.6.2 Channel shall be minimum 1.6 mm thick.
- 2.6.3 Clamp hangers with threaded rod, chain hangars.
- 2.7 Fittings**
- 2.7.1 Elbows, tees, supports, connectors couplings and fittings: to CAN/CSA-C22.2 No. 62.
- 3 . EXECUTION**
- 3.1 Installation**
- 3.1.1 Install raceway systems as indicated and in accordance with manufacturer's instructions.
- 3.1.2 Install supports, elbows, tees, connectors, fittings, bushings, adaptors as required.
- 3.1.3 Keep number of elbows, offsets and connections to minimum.
- 3.1.4 Use wiring with mechanical protection in channel raceways.
- 3.1.5 Install barriers in raceways for different services where required by code.
- 3.1.6 Install wiring after installation of raceway system is complete.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Section Includes**

- 1.1.1 Material and installation for conduits, conduit fastenings and conduit fittings.

### 1.2 **Related Sections**

- 1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

### 1.3 **References**

- 1.3.1 Canadian Standards Association (CSA International)
  - .1 CAN/CSA C22.2 No. 18 (current edition), Outlet Boxes, Conduit Boxes, Fittings and Associated Hardware, A National Standard of Canada.
  - .2 CSA C22.2 No. 45 (current edition), Rigid Metal Conduit.
  - .3 CSA C22.2 No. 56 (current edition), Flexible Metal Conduit and Liquid-Tight Flexible Metal Conduit.
  - .4 CSA C22.2 No. 83 (current edition), Electrical Metallic Tubing.
  - .5 CSA C22.2 No. 211.2 (current edition), Rigid PVC (Unplasticized) Conduit.
  - .6 CAN/CSA C22.2 No. 227.3 (current edition), Nonmetallic Mechanical Protection Tubing (NMPT), A National Standard of Canada (February 2006).

### 1.4 **Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
  - .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Section Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

## **1.6 Delivery, Storage and Handling**

1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.

1.6.3 Handle materials with suitable lifting equipment.

1.6.4 Store materials in heated, dry, weather-protected enclosure

---

## 2. PRODUCTS

### 2.1 Cables and Reels

- 2.1.1 Provide cables on reels or coils.
  - .1 Mark or tag each cable and outside of each reel or coil, to indicate cable length, voltage rating, conductor size, and manufacturer's lot number and reel number.
- 2.1.2 Each coil or reel of cable to contain only one continuous cable without splices.

### 2.2 Conduits

- 2.2.1 Rigid metal conduit: to CSA C22.2 No. 45, hot dipped galvanized steel threaded.
- 2.2.2 Epoxy coated conduit: to CSA C22.2 No. 45, with zinc coating and corrosion resistant epoxy finish inside and outside.
- 2.2.3 Electrical metallic tubing (EMT): to CSA C22.2 No. 83, with couplings.
- 2.2.4 Rigid PVC conduit: to CSA C22.2 No. 211.2.
- 2.2.5 Flexible metal conduit: to CSA C22.2 No. 56, liquid-tight flexible metal.

### 2.3 Conduit Fastenings

- 2.3.1 One-hole steel straps to secure surface conduits 50 mm and smaller.
  - .1 Two hole steel straps for conduits larger than 50 mm.
- 2.3.2 Beam clamps to secure conduits to exposed steel work.
- 2.3.3 Channel type supports for two or more conduits at 1.5 m on centre.
- 2.3.4 Threaded rods, 6 mm diameter, to support suspended channels.

### 2.4 Conduit Fittings

- 2.4.1 Fittings: to CAN/CSA C22.2 No. 18, manufactured for use with conduit specified. Coating: same as conduit.
- 2.4.2 Ensure factory "ells" where 90 degrees bends for 25 mm and larger conduits.
- 2.4.3 Watertight connectors and couplings for EMT.
  - .1 Set-screws are not acceptable.

### 2.5 Expansion Fittings for Rigid Conduit

- 2.5.1 Weatherproof expansion fittings with internal bonding assembly suitable for 100 mm linear expansion.

- 2.5.2 Watertight expansion fittings with integral bonding jumper suitable for linear expansion and 19 mm deflection.
- 2.5.3 Weatherproof expansion fittings for linear expansion at entry to panel.

## **2.6 Fish Cord**

- 2.6.1 Polypropylene.

## **3 . EXECUTION**

### **3.1 Installation**

- 3.1.1 Install conduits to conserve headroom in exposed locations and cause minimum interference in spaces through which they pass.
- 3.1.2 Conceal conduits except in mechanical and electrical service rooms.
- 3.1.3 Use rigid hot dipped galvanized steel threaded conduit except where specified otherwise.
- 3.1.4 Use epoxy coated conduit in corrosive areas.
- 3.1.5 Use electrical metallic tubing (EMT) except in cast concrete.
- 3.1.6 Use rigid PVC conduit underground.
- 3.1.7 Use liquid tight flexible metal conduit for connection to motors or vibrating equipment in damp, wet or corrosive locations.
- 3.1.8 Use explosion proof flexible connection for connection to explosion proof motors.
- 3.1.9 Install conduit sealing fittings in hazardous areas.
  - .1 Fill with compound.
- 3.1.10 Minimum conduit size for lighting and power circuits: 19 mm.
- 3.1.11 Install EMT conduit from branch circuit panel to outlet boxes located in sub floor.
- 3.1.12 Bend conduit cold:
  - .1 Replace conduit if kinked or flattened more than 1/10th of its original diameter.
- 3.1.13 Mechanically bend steel conduit over 19 mm diameter.
- 3.1.14 Field threads on rigid conduit must be of sufficient length to draw conduits up tight.
- 3.1.15 Install fish cord in empty conduits.
- 3.1.16 Run two 25 mm spare conduits up to ceiling space and two 25 mm spare conduits down to ceiling space from each flush panel.

- .1 Terminate these conduits in 152 x 152 x 102 mm junction boxes in ceiling space or in case of an exposed concrete slab, terminate each conduit in flush concrete type box.

3.1.17 Remove and replace blocked conduit sections.

- .1 Do not use liquids to clean out conduits.

3.1.18 Dry conduits out before installing wire.

### **3.2 Manufacturer's Instructions**

3.2.1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.

### **3.3 Surface Conduits**

3.3.1 Surface conduits shall only be installed in mechanical and electrical rooms.

3.3.2 Run parallel or perpendicular to building lines.

3.3.3 Locate conduits behind infrared or gas fired heaters with 1.5 m clearance.

3.3.4 Run conduits in flanged portion of structural steel.

3.3.5 Group conduits wherever possible on suspended channels.

3.3.6 Do not pass conduits through structural members except as indicated.

3.3.7 Do not locate conduits less than 75 mm parallel to steam or hot water lines with minimum of 25 mm at crossovers.

### **3.4 Concealed Conduits**

3.4.1 Run parallel or perpendicular to building lines.

3.4.2 Do not install horizontal runs in masonry walls.

3.4.3 Do not install conduits in terrazzo or concrete toppings.

### **3.5 Conduits in Cast-in-Place Concrete**

3.5.1 Locate to suit reinforcing steel.

- .1 Install in centre one third of slab.

3.5.2 Protect conduits from damage where they stub out of concrete.

3.5.3 Install sleeves where conduits pass through slab or wall.

3.5.4 Provide oversized sleeve for conduits passing through waterproof membrane, before membrane is installed.

- .1 Use cold mastic between sleeve and conduit.

3.5.5 Conduits in slabs: minimum slab thickness 4 times conduit diameter.

3.5.6 Encase conduits completely in concrete with minimum 25 mm concrete cover.

3.5.7 Organize conduits in slab to minimize cross-overs.

**3.6 Conduits in Cast-in-Place Slabs on Grade**

3.6.1 Run conduits 25 mm and larger below slab and encase in 75 mm concrete envelope.

.1 Provide 50 mm of sand over concrete envelope below floor slab.

**3.7 Conduits Underground**

3.7.1 Slope conduits to provide drainage.

3.7.2 Waterproof joints (pvc excepted) with heavy coat of bituminous paint.

**3.8 Maintenance – Clearances**

3.8.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.9 Cleaning**

3.9.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.

3.9.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

- .1 NEMA FG 1 (current edition), Fibreglass and Cable Tray Systems.
- .2 NEMA VE 1 (current edition), Metal Cable Tray Systems.
- .3 NEMA VE 2 (current edition), Cable Tray Installation Guidelines.

**1.4 Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve

sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## 1.5 **Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Submit manufacturer's product data sheets for cable tray indicating dimensions, materials, and finishes, including classifications and certifications.
- .2 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Shop Drawings:

- .1 Submit shop drawings showing materials, finish, dimensions, accessories, layout, and installation details.

1.5.4 Identify types of cabletroughs used.

1.5.5 Show actual cabletrough installation details and suspension system.

1.5.6 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.

---

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

**1.7 Acceptable Manufactures**

- 1.7.1 Lagrand
- 1.7.2 Graybar
- 1.7.3 Or approved equal.

**2. PRODUCTS**

**2.1 Cable Tray (Communication Room)**

- 2.1.1 A flex or basket type cable tray shall be provided around the perimeter of the room and shall be attached to the Communications cable tray infrastructure as per standard drawing ITSTD-05.
- 2.1.2 The tray shall be mounted at level indicated AFF.
- 2.1.3 When used, wall-mounted tray brackets shall be bolted through the plywood to the wall.
- 2.1.4 Concrete mounting will be as per standard drawing ITSTD-30.

**2.2 Cable Tray (Interior Pathways)**

- 2.2.1 All ventilated trays are to be steel or aluminum, complete with angles, offsets, corners, saddles, tees, etc., as indicated and required to suit the installation.
  - .1 Trays shall be as indicated mm wide with depth as indicated mm.
  - .2 Radii on fittings shall be according to cable tray size in mm minimum.
- 2.2.2 All steel non-painted trays shall be hot dip galvanized after fabrication to CSA G164-1965 ASTM designation A386.
- 2.2.3 All trays shall have 45° corners at all vertical and horizontal corners, tees and width change locations.
- 2.2.4 Cable trays are to have a minimum cable loading depth of 114mm. Cable tray width is to be a minimum of 305mm wide for communications, or as indicated on drawings.
- 2.2.5 Suspended tray supports are to be trapeze-style hangers of minimum 400mm square "Unistrut" supported from 9.5mm threaded

rod hangers from preset or afterset concrete inserts or direct steel support.

- 2.2.6 Barriers, where specified, are to be continuous metal dividers for the entire length of the tray.
- 2.2.7 Ventilated type shall be Class C1 to CSA C22.2 No. 126-M1980.
- 2.2.8 Fire Barrier Pillows are to be self-contained intumescent firestop product for use in through-penetration firestops. The product is to achieve up to three (3) hours fire rating in accordance with ASTM E 814 tests.

### **2.3 Supports**

- 2.3.1 Provide splices, supports for a continuously grounded system as required.

## **3 . EXECUTION**

### **3.1 Installation**

- 3.1.1 Provide cable tray in approximate location and general routing as shown on drawings.
- 3.1.2 Cable trays are usually installed in the false ceiling space of hallways and located to keep conduit lengths to a minimum.
- 3.1.3 Provide dropouts when cables exiting all horizontal cable trays.
- 3.1.4 Cable tray may require installation of risers, bend, etc. to adjust tray up or down as well as sideways for the tray routing to fit within limits of space available, and to clear other services, ducts, pipes etc. along the route. Routing maybe adjusted somewhat as necessary to enable installation of services under other trades. The above field adjustments are to be done at no extra cost to the Owner.
- 3.1.5 Where tray runs change elevation, trays shall overlay each other when manufactured waterfall assemblies can not be used. To prevent cables stress install drop-outs on the top tray when overlap method is to be used. Further, tray sections shall be coupled together to provide some rigidity. This coupling maybe made by using a short length of tray and adjustable elbows or may be coupled by means of common support rods at the tray overlap.
- 3.1.6 The Trade Contractor's price is to include an allowance for tray fittings required for change in elevation, direction, waterfall assemblies and cable drop out.
- 3.1.7 Trays shall be separated at a minimum 450mm from the adjacent wall unless otherwise instructed by the Information Technology Representative.
- 3.1.8 Install ventilated type tray in corridors and as vertical risers. Where cable trays pass through solid walls and floors, trays shall be solid

---

type with cover and shall extend a minimum of 450 mm on each side of the wall or floor.

- 3.1.9 Sharp metal edges in cable trays which could cut the cable shall be smoothed and the cable dressed away from these edges. Manufacturer surface imperfections shall be touched up with a cold galvanizing coating before installing cable.
- 3.1.10 Support suspended cable tray from trapeze style hangers with hangers spaced as recommended by the manufacturer based on a maximum load capacity for the tray. Support trays at all corners, offsets and tee fittings
- 3.1.11 Where shown and appropriate, support cable tray from wall using a cantilever support arrangement. Cable trays may be supported using wall mounted support on masonry walls or from the building steel only.
- 3.1.12 Cable tray location and mounting heights to be coordinated on site with other trades to provide minimum headroom and serviceability. Verify drawing details to allow for all services run in ceiling spaces. Provide vertical and horizontal offsets as required to suit job site conditions.
- 3.1.13 Cable tray sections shall be joined by approved connector plates and rust-resistant (plated) hardware. Torque all hardware as per manufacturer's recommendations.
- 3.1.14 Cables shall be secured in place in tray with tie wraps where in horizontal runs and with cable clamps in vertical runs. Low tension cabling shall be secured to tray by use of Velcro style straps. Support cables routed vertically through a service riser with a basket type wire grip equal to Hubbell Kellems grip for power cables and data cables including fiber optic cables.
- 3.1.15 Unless otherwise indicated, bond all cable tray with a minimum #2 AWG bare copper bonding conductor installed continuously within the full length of all cable trays. Securely connect the bond wire to the tray at each end and at a minimum of 15m intervals. Connect bonding conductor to the building ground system at one or both ends.
- 3.1.16 Provide pulleys and rollers to install cables.
- 3.1.17 Where cable tray passes through fire separations install fire stop material to maintain proper fire rating.
- 3.1.18 Power distribution conduits shall not be located within 200mm of the cable tray.
- 3.1.19 There shall be no joints or splices within the cable tray.
- 3.1.20 The cable tray system is for extra-low voltage cabling only. There shall be no cables within the tray that has a voltage exceeding 30V.

---

**3.2 Maintenance – Clearances**

3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.3 Cleaning**

3.3.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.

3.3.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for Installation of Cables in Trenches and Ducts.

**1.2 Related Sections**

- 1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.
- 1.2.2 Section 01 74 21 - Construction/Demolition Waste Management and Disposal.
- 1.2.3 Section 31 23 33.01 - Excavating, Trenching and Backfilling.
- 1.2.4 Section 26 05 00 - Common Work Results - Electrical.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
  - .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.
  - .6 VOC/Low-Emitting Materials Compliance.
- 1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

- 1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.
- 1.5.2 Product Data:
- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.
- 1.5.3 Sample:
- .1 Submit samples in accordance with Section 01 33 00 - Submittal.
- 1.5.4 Quality Assurance:
- .1 Engineer reserves the right to witness standard factory testing of the above.
  - .2 Submit site tests results of installed electrical systems and instrumentation
- 1.5.5 Closeout Submittals:
- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
  - .2 Data necessary for maintenance of materials.
  - .3 Manufacturers recommended list of spare parts.

---

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

**2 . PRODUCTS**

**2.1 Cable Protection**

- 2.1.1 38 mm x 140 mm planks pressure treated with clear, or copper naphthenate or 5% pentachlorophenol solution, water repellent preservative.

**2.2 Markers**

- 2.2.1 Concrete type cable markers shall be 600 mm x 600 mm x 100 mm with words, cable, joint or conduit impressed in top surface, with arrows to indicate change in direction of cable and duct runs.
- 2.2.2 Cedar post type markers shall be 89 mm x 89 mm, 1.5 m long, pressure treated with clear, or copper naphthenate or 5% pentachlorophenol solution, water repellent preservative, with nameplate fastened near post top, on side facing cable or conduit to indicate depth and direction of duct and cable runs.
  - .1 Nameplate: aluminum anodized 89 mm x 89 mm, 1.5 mm thick mounted on cedar post with Mylar label 0.125 mm thick with words cable, joint or conduit with arrows to indicate change in direction.

**3 . EXECUTION**

**3.1 Direct Burial of Cables**

- 3.1.1 After sand bed specified in Section 31 23 33.01 - Excavating, Trenching and Backfilling, is in place, lay cables maintaining 75 mm clearance from each side of trench to nearest cable. Do not pull cable into trench.
- 3.1.2 Provide offsets for thermal action and minor earth movements. Offset cables 150 mm for each 60 m run, maintaining minimum cable separation and bending radius requirements.
- 3.1.3 Make termination and splice only as indicated leaving 0.6 m of surplus cable in each direction.

- 
- .1 Make splices and terminations in accordance with manufacturer's instructions using approved splicing kits.
  - 3.1.4 Underground cable splices not acceptable.
  - 3.1.5 Minimum permitted radius at cable bends for rubber, plastic or lead covered cables, eight times diameter of cable; for metallic armoured cables, 12 times diameter of cables or in accordance with manufacturer's instructions.
  - 3.1.6 Cable separation:
    - .1 Maintain 75 mm minimum separation between cables of different circuits.
    - .2 Maintain 300 mm horizontal separation between low and high voltage cables.
    - .3 When low voltage cables cross high voltage cables maintain 300 mm vertical separation with low voltage cables in upper position.
    - .4 At crossover, maintain 75 mm minimum vertical separation between low voltage cables and 150 mm between high voltage cables.
    - .5 Maintain 300 mm minimum lateral and vertical separation for fire alarm and control cables when crossing other cables, with fire alarm and control cables in upper position.
    - .6 Install treated planks on lower cables 0.6 m in each direction at crossings.
  - 3.1.7 After sand protective cover specified in Section 31 23 33.01 - Excavating, Trenching and Backfilling, is in place, install continuous row of overlapping 38 x 140 mm interlocking cable blocks as indicated to cover length of run.

### **3.2 Cable Installation in Ducts**

- 3.2.1 Install cables as indicated in ducts.
  - .1 Do not pull spliced cables inside ducts.
- 3.2.2 Install multiple cables in duct simultaneously.
- 3.2.3 Use CSA approved lubricants of type compatible with cable jacket to reduce pulling tension.
- 3.2.4 To facilitate matching of colour coded multi-conductor control cables reel off in same direction during installation.
- 3.2.5 Before pulling cable into ducts and until cables are properly terminated, seal ends of lead covered cables with wiping solder; seal ends of non-leaded cables with moisture seal tape.
- 3.2.6 After installation of cables, seal duct ends with duct sealing compound.

---

**3.3 Markers**

- 3.3.1 Mark cable every 150 m along cable or duct runs and changes in direction.
- 3.3.2 Mark underground splices.
- 3.3.3 Where markers are removed to permit installation of additional cables, reinstall existing markers.
- 3.3.4 Install concrete cable markers within 180 m from each side of runway centreline; 45 m from each side of taxi way centreline; 50 m from edge of taxi ramps or aprons.
- 3.3.5 Install cedar post type markers.
- 3.3.6 Lay concrete markers flat and centred over cable with top flush with finish grade.

**3.4 Field Quality Control**

- 3.4.1 Perform tests in accordance with Section 26 05 00 - Common Work Results - Electrical.
- 3.4.2 Perform tests using qualified personnel. Provide necessary instruments and equipment.
- 3.4.3 Check phase rotation and identify each phase conductor of each feeder.
- 3.4.4 Check each feeder for continuity, short circuits and grounds. Ensure resistance to ground of circuits is not less than 50 megohms.
- 3.4.5 Pre-Acceptance Tests:
  - .1 After installing cable but before splicing and terminating, perform insulation resistance test with 1,000 V megger on each phase conductor.
  - .2 Check insulation resistance after each splice and/or termination to ensure that cable system is ready for acceptance testing.
- 3.4.6 Acceptance Tests
  - .1 Ensure that terminations and accessory equipment are disconnected.
  - .2 Ground shields, ground wires, metallic armour and conductors not under test.
  - .3 High Potential (Hipot) Testing.
    - .1 Conduct hipot testing in accordance with manufacturer's ICEA recommendations.
  - .4 Leakage Current Testing:

- 
- .1 Raise voltage in steps from zero to maximum values as specified by ICEA manufacturer for type of cable being tested.
  - .2 Hold maximum voltage for specified time period by ICEA manufacturer.
  - .3 Record leakage current at each step.
- 3.4.7 Provide Engineer with list of test results showing location at which each test was made, circuit tested and result of each test.
- 3.4.8 Remove and replace entire length of cable if cable fails to meet any of test criteria.

**3.5 Maintenance – Clearances**

- 3.5.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.6 Cleaning**

- 3.6.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.6.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for Pathways for Communications Systems.

**1.2 Related Sections**

- 1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 Sustainable Requirements**

- 1.3.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.3.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.3.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.3.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
- .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.
  - .6 VOC/Low-Emitting Materials Compliance.
- 1.3.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this

project. Any proposed alternative products must meet the Sustainable requirements of the project.Products

**1.4 Description of System**

1.4.1 Provide a complete system of conduits and boxes to suit wiring of the following systems:

- .1 Communication cabling
- .2 CATV
- .3 Security
- .4 Lighting control
- .5 Access control
- .6 CCTV
- .7 Metering
- .8 Wireless
- .9 DDC
- .10 BMS
- .11 Elevators
- .12 PV array

1.4.2 The conduit system is to be complete with all necessary fittings and components to facilitate the future system installation whether or not each and every item is necessarily mentioned.

1.4.3 The electrical division is to be responsible for supply and installation of all backboards, conduits, pullboxes, junction boxes, device boxes and terminal panels where required to provide a complete raceway system.

1.4.4 Install proprietary or specialists back boxes if provided by the systems installer.

1.4.5 Any indicated conduit and panel sizes are not to be reduced, or the layouts revised, without prior approval of the Engineer.

1.4.6 The design of the conduit system is based on a generic system layout wherever possible.

**2 . PRODUCTS**

**2.1 Material**

2.1.1 Conduits: 27mm EMT type, in accordance with Section 26 05 34 - Conduits, Conduit Fastenings and Conduit Fittings (16111).

2.1.2 Cabletroughs: in accordance with Section 26 05 36 - Cable Trays for Electrical Systems (16114).

- 2.1.3 Junction boxes, cabinets type E: in accordance with Section 26 05 31 - Splitters, Junction, Pull Boxes and Cabinets (16131).
- 2.1.4 Outlet boxes, conduit boxes and fittings: in accordance with Section 26 05 31 - Splitters, Junction, Pull Boxes and Cabinets (16131).
- 2.1.5 Fish wire: polypropylene type.

### **3 . EXECUTION**

#### **3.1 Installation**

- 3.1.1 Install empty raceway system, including under-floor distribution system, fish wire, terminal cabinets, outlet boxes, floor boxes, pull boxes, cover plates, conduit, sleeves and caps, cable troughs, service poles, miscellaneous and positioning material to constitute complete system.
- 3.1.2 Verify outlet height, layout and orientation in areas where equipment is to be positioned in millwork.
- 3.1.3 All outlet boxes are to be flush-mounted in all areas, excluding mechanical rooms, electrical rooms and above removable ceilings.
- 3.1.4 Adjust the position of outlets in finished masonry walls to suit masonry course lines. Coordinate cutting of masonry walls to achieve neat openings for all boxes. All cutting of masonry work for installation of electrical fittings is to be done using rotary cutting equipment.
- 3.1.5 No sectional or handy boxes are to be installed.
- 3.1.6 Provide vapour barrier wrap or boots behind outlets mounted in exterior walls. Maintain the integrity of the vapour barrier and insulation to prevent condensation through boxes.
- 3.1.7 Coordinate the location and mount heights of outlets above counters, benches, splash-backs, and with respect to heating units and plumbing fixtures. Coordinate with architectural details.
- 3.1.8 Separate outlets located immediately alongside one another are to be mounted at exactly the same height above the finished floor. Similarly, outlets mounted on a wall in the same general location at varying heights are to be on the same vertical centre-lines unless otherwise noted.
- 3.1.9 Where outlet boxes penetrate through a fire separation, ensure that the boxes are externally tightly fitted with an approved non-combustible material to prevent passage of smoke or flame in the event of a fire.

#### **3.2 Coordination**

- 3.2.1 Coordinate detail requirements where system and equipment suppliers are known.

- 3.2.2 Where available, refer to architectural layouts for mounting heights and positioning of outlet boxes.

**3.3 Maintenance – Clearances**

- 3.3.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.4 Cleaning**

- 3.4.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.4.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials, components, cabinets, instruments and installation for metering and switchboard Instruments.

**1.2 Related Sections**

- 1.2.1 Section 01 33 00 - Submittal Procedures.  
1.2.2 Section 01 74 21 - Construction/Demolition Waste Management and Disposal.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.  
1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.  
1.4.3 Waste Management and Disposal  
.1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.  
.2 Avoid using landfill waste disposal procedures when recycling facilities are available.  
.3 Place materials defined as hazardous or toxic waste in designated containers.  
1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:  
.1 Construction Waste Management / Product Waste Recyclability.

- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## 1.5 **Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.
- .3 Indicate meter outline dimensions, panel drilling dimensions and include cut-out template.

1.5.3 Sample:

- .1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.4 Quality Assurance:

- .1 Engineer reserves the right to witness standard factory testing of the above.
- .2 Submit site tests results of installed electrical systems and instrumentation

1.5.5 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.

## 1.6 **Delivery, Storage and Handling**

1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

## **1.7 Description of System**

- 1.7.1 Provide all material, equipment and services necessary for a complete and operational metering system.
- 1.7.2 Building Management System (BMS) Integration
  - .1 The system protocol shall be native BACnet/IP certified and fully compatible with the BMS. Gateways will not be accepted. The system software programmable controllers shall reside/communicate with the BACnet/IP on the management or automation level networks of the Building Management System.

## **2 . PRODUCTS**

### **2.1 Meter**

- 2.1.1 Polyphase, kilowatt-hour energy meter shall be in accordance with CAN3-C17.
- 2.1.2 Polyphase, kilowatt, kilovar, demand, thermally lagged, integrating, indicating, recording meter: to CAN3-C17.
- 2.1.3 Combination energy and demand meter shall be in accordance with CAN3-C17.
- 2.1.4 Ratings shall be as indicated.
- 2.1.5 Register shall be range, pulse contacts for transmitting signal.
- 2.1.6 Provision for remote sensing.

### **2.2 Meter Cabinet**

- 2.2.1 Sheet steel CSA enclosure with meter backplate, to accommodate meters, test terminal block and associated equipment, factory installed and wired.

### **2.3 Metering Instrument Transformer Cabinet**

- 2.3.1 Sheet steel CSA enclosure to accommodate potential and current transformers.

### **2.4 Test Terminal Blocks**

- 2.4.1 Test terminal blocks as required.

---

**2.5 Indicating Instruments**

2.5.1 Analogue indicating instruments shall be to ANSI C39.1, 1% accuracy, switchboard mounting, semi-flush, operated from shunt, current transformer.

- .1 Ammeter range shall be as indicated.
- .2 Voltmeter range shall be as indicated.
- .3 Wattmeter range shall be as indicated.
- .4 Varmeter range shall be as indicated.
- .5 Frequency meter range shall be as indicated.
- .6 Power factor meter range shall be as indicated.
- .7 Synchroscope range shall be as indicated.

**2.6 Instrument Selector Switches**

2.6.1 Voltmeter and ammeter selector switches: rotary, multi-position, maintained contacts, panel mounting, round notched handle, rated to suit instruments, nameplate marked as indicated to coincide with each rotary position. Ammeter selector switches designed to preclude opening of current circuits.

2.6.2 Four position ammeter selector switches identified "off-A-B-C".

2.6.3 Four position voltmeter selector switches identified "A-B, B-C, C-A, off".

2.6.4 Seven position voltmeter selector switches identified "A-B, B-C, C-A, off, A-N, B-N, C-N".

**2.7 Recording Instruments**

2.7.1 Recording instruments shall have 1% accuracy switchboard mounting, direct acting marking device, continuous marking, round strip chart size electric driver timing mechanism, chart speed in mm/h, scale calibrated

- .1 Ammeter range shall be as indicated.
- .2 Voltmeter range shall be as indicated.
- .3 Wattmeter: range shall be as indicated.
- .4 Varmeter range shall be as indicated.
- .5 Frequency mete: range shall be as indicated.
- .6 Power factor meter range shall be as indicated.

**2.8 Shop Installation**

2.8.1 Install meters and instrument transformers in separate compartment of switchboard.

2.8.2 Install instruments on switchboard

- 2.8.3 Ensure adequate spacing between current transformers installed on each phase.
- 2.8.4 Verify correctness of connections, polarities of meters, instruments, potential and current transformers, transducers, signal sources, electrical supplies.

### **3 . EXECUTION**

#### **3.1 Installation**

- 3.1.1 Install meters in location free from vibration and shock.
- 3.1.2 Make connections in accordance with diagrams.
- 3.1.3 If applicable, ensure power factor corrective equipment connected on load side of meter.
- 3.1.4 Connect meter and instrument transformer cabinets to ground.
- 3.1.5 Locate meters within 9 m of instrument transformers. Use 32 mm conduit for interconnections. Use separate conduit for each set of current transformer connections, exclusive for metering.

#### **3.2 Field Quality Control**

- 3.2.1 Conduct tests in accordance with Section 26 05 00 - Common Work Results - Electrical and in accordance with manufacturer's recommendations.
- 3.2.2 Perform simulated operation tests with metering, instruments disconnected from permanent signal and other electrical sources.
- 3.2.3 Verify correctness of connections, polarities of meters, instruments, potential and current transformers, transducers, signal sources and electrical supplies.
- 3.2.4 Perform tests to obtain correct calibration.
- 3.2.5 Do not dismantle meters and instruments.

#### **3.3 Maintenance – Clearances**

- 3.3.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

#### **3.4 Cleaning**

- 3.4.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.4.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

---

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Summary

- 1.1.1 Provide labor, material, equipment, related services, and supervision required, including, but not limited to, manufacturing, fabrication, erection, and installation for electrical power monitoring and control equipment as required for the complete performance of the work, and as shown on the project drawings and as herein specified.

### 1.2 Standards & References

- 1.2.1 American National Standards Institute (ANSI):
- .1 ANSI C12.20, "Electricity Meters - 0.2 and 0.5 Accuracy Classes – Part 5.5.4 Accuracy tests."
  - .2 ANSI / ISA – 61010-1, "Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use – Part 1: General Requirements."
  - .3 ANSI / ISA – 61010-2-030, "Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 2-030: Particular requirements for testing and measuring circuits."
- 1.2.2 Canadian Standards Association (CSA):
- .1 CAN/CSA C22.2 No. 61010-1, "Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 1: General Requirements."
  - .2 CAN/CSA C22.2 No. 61010-2-030, "Safety Requirements for Electrical Equipment for Electrical Equipment for Measurement, Control, and Laboratory Use - Part 2-030: Particular requirements for testing and measuring circuits."
  - .3 CSA Standard C17; Electricity Meters.
  - .4 CSA Standard C13; Instrument Transformers.
- 1.2.3 Measurement Canada
- .1 Measurement Canada LMB-EG-07 Specifications for Approval of Type of Electricity Meters, Instrument Transformers and Auxiliary Devices. Canadian Approval and Calibration Services Laboratory(ACSL).
- 1.2.4 ROP Mechanical Specifications
- .1 ROP Mechanical Specifications, Division 15 – Building Automation System (BAS) integration and metering.

---

**1.3 Submittals**

- 1.3.1 **Product Data:** Submit product data showing material proposed. Submit sufficient information to determine compliance with the Drawings and Specifications.
- 1.3.2 **Shop Drawings:** Submit shop drawings for each product and accessory required. Include information not fully detailed in manufacturer's standard product data.
- 1.3.3 **Wiring Diagrams:** Submit wiring diagrams detailing power, signal, and control systems, clearly differentiating between manufacturer-installed wiring and field-installed wiring, and between components provided by the manufacturer and those provided by others.
- 1.3.4 **Operation and Maintenance Data:** Submit operation and maintenance data for electrical power monitoring and control equipment to include in operation and maintenance manuals specified in **Division 01 - General Requirements**.

**1.4 Quality Assurance**

- 1.4.1 Manufacturer shall be a firm engaged in the manufacture of electrical power monitoring and control equipment of types and sizes required, and whose products have been in satisfactory use in similar service for a minimum of five years. The product test and calibration process shall be part of a quality program that is certified to ISO 9001.

**2 . ELECTRICAL METERING EQUIPMENT AND DEVICES:**

**2.1 Primary Service Entrance Energy Meter**

- 2.1.1 **Functionality:** Revenue metering and advanced power quality analysis.
- 2.1.2 **Applications:** includes but not limited to Tariff metering, distribution metering, demand side management, power quality analysis, Energy Pulsing and totalization, etc.
- 2.1.3 **Mounting:** The digital power meter instrument base unit must be flush mountable available as a combined front panel and base unit that can be mounted in switchgear cabinet doors.
- 2.1.4 **Basis of Design:** The revenue grade metering package designed in accordance with Ontario/ROP Specifications, tagged with region of Peel standard tags, Measurement Canada Revenue approved, sealed, identical to or exceed the functionality of Schneider Electric Power Logic design ION8650 / Model M8650A0C0H6E1A3A - AA403.
- 2.1.5 **Features:** The revenue grade metering device used to monitor incoming utility medium voltage mains for grid revenue, substation

---

automation, network management, energy cost allocation, power quality analysis, asset management, operational efficiency, and compliance reporting, shall have at minimum the following features:

- .1 Form factor—ANSI socket 9S, 29S, 35S and 36S; user-selectable 9S, 29S, and 36S. FT-21 switchboard/draw-out style as required.
- .2 Voltage and current inputs—3 phase inputs; Direct connect to circuits up to 600 VAC, eliminating the need for voltage (potential) transformers; 5 A nominal current inputs; equipped with two spring-loaded socket grounding tabs to ensure reliable electrical contact; mechanical bonding ground that may be optionally connected.
- .3 Supported measured and calculated metering parameters—four-quadrant metering, full range of three-phase voltage, current, power and energy measurements, percentage unbalance, power factor (true and displacement per phase and three-phase) demand (minimum/maximum, present demand interval, running average demand, and predicted demand), total harmonic distortion (THD), individual current, and voltage harmonics readings.
- .4 High accuracy standards—meet in a single device over the Class 2/10/20 current classes in a single device (over all environmental conditions and influence factors outlined in the standard and its referenced standards).
  - .1 Less than half the measurement error of ANSI C12.20 class 0.2 accuracy over the Class 2/10/20 current classes.
  - .2 Less than half the measurement error of IEC62053-22 class 0,2S accuracy from 0.010A- 20A in a single device.
  - .3 Less than 20 times the measurement error of IEC62053-23 class 2 accuracy from 0.010A-20A in a single device.
  - .4 Support up to 8 points of magnitude and phase correction for each voltage and current measurement input.
  - .5 Overvoltage/overcurrent protection—capable of meeting all accuracy specifications after withstanding 500A for 1 second or 2500 VAC RMS for 1 minute (with internal protection disabled).
- .5 High-visibility display with the following characteristics:
  - .1 User programmable to display up to 4 quantities per screen.

- 
- .2 Capable of displaying graphical metering data such as phasor diagrams, watt-hour disk simulator, spectral components etc.
  - .3 Capable of displaying harmonics content (THD, K-factor, crest-factor) in histogram format.
  - .6 Input/outputs—provide at least 4 digital inputs and 4 digital output for equipment status/position monitoring and equipment control or interfacing (e.g. Pulse output relay operation for kWh/kVARh total/imported/exported). Provide at least 4 analog 4-20 mA inputs.
  - .7 Communications Capability.
    - .1 Ethernet, RS485/232 serial, ANSI 12.18 compliant optical port.
    - .2 Protocol support: DNP3.0(Ethernet/serial); Modbus slave/mastering (Ethernet/serial); SMTP/SNTP(Ethernet); MV90(Ethernet/serial); XML(TCP); IEC61850(TCP).
    - .3 IRIG-B port to allow GPS time synchronization to +/- 1ms accuracy from GPS source.
    - .4 Automatically e-mail alarm notifications, scheduled system status updates and data logs on an event-driven or scheduled basis.
  - .8 On-board logging.
    - .1 Non-volatile time stamps with on-board logging of I/O conditions, minimum/maximum values, energy and demand, maintenance data, alarms, and any measured parameters; trending and short-term forecasting of energy and demand.
    - .2 Ability to record any parameter in the meter and trigger multiple such recordings in continuous succession (triggered manually or through internal event conditions, including periodic timers or set-point activity).
    - .3 Continuous recording of intervals from 100 years down to ½ cycle.
    - .4 Number of records (depth) and overflow conditions (stop-when-full or circular) shall be programmable.
  - .9 On-board web server that can be used for:
    - .1 Access to real-time values and basic power quality data through a web browser.
    - .2 Basic meter configuration.
  - .10 Alarming capabilities:
    - .1 Set-point driven alarming capability.

- 
- .2 Generate an email notification upon an alarm condition.
  - .3 Millisecond resolution timestamp on alarm entries
  - .4 Support consecutive high-speed alarm conditions for alarms and waveform recording, triggering on a cycle-by-cycle basis with no "dead" time between events (i.e., no need for a re-arming delay time between events).
  - .5 Operate relays or initiate data logging captures on alarm conditions.
  - .6 Control any number of digital output relays in an AND or an OR configuration using pulse mode or latch mode operation for control and alarm purposes.
  - .7 Combine any logical combination of any number of available set-point conditions to control an internal or external function or event.
  - .11 Time-stamped event log (1 ms resolution) with the following characteristics:
    - .1 Support at least 500 events, programmable up to a maximum of 20000 events.
    - .2 For each event, record date and time, cause and effect, and priority.
    - .3 Record all events relating to set-point activity, relay operation, and self-diagnostics.
    - .4 Capable of synchronizing time stamps between devices on the same serial communications network, to within 100 mss.
    - .5 Minimum event recording response time is  $\frac{1}{2}$  cycle (8.3ms 60Hz, 10ms 50Hz) for high- speed events and 1 second for other events.
    - .6 Programmable set-point events.
  - .12 Power quality analysis and compliance monitoring.
    - .1 Without separate software, shall have the following capabilities:
      - .1 Display statistical indicators of power quality on the front display.
      - .2 Compare power quality parameters (present, predicted, average, or calculated values) with an absolute or relative set point. When set-point is exceeded, alert via e-mail or pager, or enable control via a local interface to PQ mitigation equipment or control systems through relays and analog or digital outputs.
      - .3 Support EN50160 reporting for compliance monitoring.

- 
- .2 Third party Laboratory tested to the power quality standards IEC 61000-4-30 Class 'A' 2nd edition, IEC 61000-4-15, and Flicker.
    - .3 Low pass anti-aliasing signal filters to meet the requirements of IEC 61000-4-7:2002.
  - .13 Fault recording and waveform capture.
    - .1 Simultaneously capture voltage and current channels for sub-cycle disturbance, transients, as well as multi-cycle sags, swells and outages in quick succession, without dead time between recordings.
    - .2 1024 samples per cycle waveform recording, minimum 17/20  $\mu$ s transient capture (60/50 Hz).
    - .3 Configurable to provide COMTRADE waveforms for all captures.
  - .14 Disturbance detection.
    - .1 High-speed sag/swell detection of voltage disturbances on a cycle-by-cycle basis, providing duration of the disturbance, the minimum, maximum, and average value of the voltage for each phase during the disturbance.
    - .2 Detect disturbances less than one cycle in duration.
    - .3 Determine the location of a disturbance more quickly and accurately by determining the direction of the disturbance relative to the meter. Capture analysis results in the event log, along with a timestamp and confidence level indicating level of certainty.
  - .15 Programmability.
    - .1 Capable of deriving values for any combination of measured or calculated parameter using arithmetic, trigonometric, logic, thermocouple linearization, and temperature conversion functions,
    - .2 Capable (through a graphical flexible programming language) of creating programmable modules with metered and input data through arithmetic and logic operations (such as minimum, maximum, set point, digital input, digital output, etc.) that can be arbitrarily linked together to create application functionality.
    - .3 System Integration—capable of integrating with custom reporting, spreadsheet, database and other applications with XML compatible data.
  - .16 Field programmability: The power meter is field programmable as follows:
-

- 
- .1 Basic parameters: Voltage input scale, voltage mode (Wye, Delta, single phase), current input scale, auxiliary input and output scales, and communications setup parameters are programmable from the front panel.
  - .2 All basic parameters described above, plus additional setpoint/relay and data log setup parameters may be programmed via the communications port using a portable or remotely located computer terminal.
  - .3 Custom configuration of all operating parameters is possible through a graphical, flexible programming language.
  - .4 The configuration of the device will be done using programmable modules. The modules can be linked together in an arbitrary manner to create arbitrary functionality. Some example module types include min, max, setpoint, digital input, and digital output.
  - .5 Programming through a computer can be secured by user ID and password.
  - .6 Programming through the front panel is secured by password.
  - .7 Programmability shall be sectioned such that when the power meter is sealed it shall still be configurable to an extent that does not affect the accumulation of revenue metering- related data.
  - .17 Safety/grounding
    - .1 The power meter shall have two spring-loaded socket grounding tabs on the base to ensure a reliable electrical contact with the socket.
    - .2 The power meter shall have an optional mechanical bonding ground to allow for a permanent grounding method.

## **2.2 Advanced Energy And Power Quality Digital Meter**

2.2.1 **Functionality:** Advanced Energy and Power Quality Analysis.

2.2.2 **Applications:** Where Energy Demand and PQ Monitoring is required on the following Incomers/Feeders:

- .1 Main Incomer (s) breaker(s) on all switchgears and switchboards,
- .2 Main Sub-Station Transformers: on the secondary side of each substation transformer with primary of 44000 Volts, 27600 Volts, 13800 Volts or 4160 Volts and a secondary of 4160 Volts or 600Volts.

- 
- .3 Distribution Transformers: on the secondary side of each distribution transformer with a primary of 4160 Volts and a secondary of 600 Volts
- 2.2.3 **Mounting:** The digital energy and power quality meter instrument shall be designed for front-panel mounting supporting integrated or remote displays. The meter with integrated display option is designed to fit DIN standard 192 cutout (186 mm by 186 mm)
- 2.2.4 **Basis of Design:** The Energy and Power Quality metering package designed in accordance with Ontario/ROP Specifications, Measurement Canada approved, sealed, identical to or exceed the functionality of Schneider Electric Power Logic design **ION7650 / Model M7650A0C0B6F1N0E**
- 2.2.5 **Features:** The metering device used to monitor medium voltage mains for network management, energy cost allocation, power quality analysis, asset management, operational efficiency, and compliance reporting, shall have at minimum the following features:
- .1 Voltage and current inputs—3 phase inputs; direct connect to circuits up to 600 VAC, eliminating the need for voltage (potential) transformers; 5 A nominal current inputs.
  - .2 Supported measured and calculated metering parameters—four-quadrant metering, full range of 3 phase voltage, current, power and energy measurements, percentage unbalance, power factor (true and displacement per phase and 3 phase) demand (minimum/maximum, present demand interval, running average demand, and predicted demand), total harmonic distortion (THD), individual current and voltage harmonics readings.
  - .3 High accuracy standards—meets stringent IEC and ANSI measurement accuracy standards such as IEC 62053-22 Class 0.2S, ANSI C12.20 0.2 Class 10 and 20.
  - .4 High-visibility display with the following characteristics:
    - .1 User programmable to display up to 4 quantities per screen.
    - .2 Capable of displaying graphical metering data such as phasor diagrams, watt-hour disk simulator, spectral components etc.
    - .3 Capable of displaying harmonics content (THD, K-factor, crest-factor) in histogram format.
  - .5 Input/outputs—provide at least 4 digital inputs and 4 digital output for equipment status/position monitoring and equipment control or interfacing (e.g. Pulse output relay operation for kWh/kVARh total/imported/exported). Provide at least 4 analog 4-20 mA inputs.
-

- 
- .6 Communications Capability—multi-port serial and Ethernet communications with at least 2 Modbus serial ports and 1 Ethernet port offering e-mail on alarm, web server, and an Ethernet-to-serial RS-485 gateway able to serve as a Modbus Master in a communication network, either through reading and logging data from other Modbus devices, or serving as a Modbus serial to Ethernet gateway.
  - .7 On-board logging:
    - .1 Non-volatile time stamps with on-board logging of I/O conditions, minimum/maximum values, energy and demand, maintenance data, alarms, and all measured parameters; trending and short-term forecasting of energy and demand.
    - .2 Ability to record all parameters in the meter and trigger multiple such recordings in continuous succession (triggered manually or through internal event conditions, including periodic timers or set-point activity).
    - .3 Continuous recording of intervals from 100 years down to one-half ( $\frac{1}{2}$ ) cycle.
    - .4 Number of records (depth) and overflow conditions (stop-if-full or circular) shall be programmable
  - .8 On-board web server can be used for:
    - .1 Access to real-time values and basic power quality information using standard web browser.
    - .2 Basic meter configuration.
  - .9 Alarming capabilities:
    - .1 Set-point driven alarming capability in which the meter has the capability of learning set- point limits based on the system behavior.
    - .2 Generate an email notification upon an alarm condition.
    - .3 Millisecond resolution timestamp on alarm entries.
    - .4 Support consecutive high-speed triggers for alarms and waveform recording, triggering on a cycle-by-cycle basis with no “dead” time between events (i.e. no need for a re- arming delay time between events).
    - .5 Operate relays or initiate data logging captures on alarm conditions
    - .6 Control all digital output relays in an AND or an OR configuration, using pulse mode or latch mode operation, for control and alarm purposes.

- 
- .7 Combine all logical combinations of available set-point conditions to control an internal or external function/event.
  - .10 Time-stamped event log (1 ms resolution) with the following characteristics:
    - .1 Support at least 500 events, programmable up to a maximum of 20000 events.
    - .2 For each event, record date and time, cause and effect, and priority.
    - .3 Record all events relating to set-point activity, relay operation and self-diagnostics.
    - .4 Capable of synchronizing time stamps between devices on the same serial communications network to within 100 ms.
    - .5 Minimum event recording response time is one-half ( $\frac{1}{2}$ ) cycle (8.3ms 60Hz, 10ms 50Hz) for high-speed events and 1 second for other events.
    - .6 Programmable set-point events.
  - .11 Power quality analysis and compliance monitoring:
    - .1 Without separate software, have the following capabilities:
      - .1 Display statistical indicators of power quality on the front display.
      - .2 Compare power quality parameters (present, predicted, average, or calculated values) with an absolute or relative set point, and alert (via e-mail or pager), or enable control (via a local interface to power quality (PQ) mitigation equipment/control systems through relays and analog or digital outputs) if set-point is exceeded.
      - .3 Support EN50160 reporting for compliance monitoring.
    - .2 Third party laboratory tested to the power quality standards—IEC 61000-4-30 Class 'A' 2nd edition, IEC 61000-4-15 – Flicker.
    - .3 Low pass anti-aliasing signal filters to meet the requirements of IEC 61000-4-7:2002.
  - .12 Fault recording and waveform capture:
    - .1 Simultaneously capture voltage and current channels for sub-cycle disturbance, transients, as well as multi-cycle sags, swells and outages in quick succession, without dead time between recordings.

- 
- .2 1024 samples per cycle waveform recording, minimum 17/20  $\mu$ s transient capture (60/50 Hz).
  - .3 Configurable to provide COMTRADE waveforms for all captures.
  - .13 Disturbance detection:
    - .1 High-speed sag/swell detection of voltage disturbances on a cycle-by-cycle basis, providing duration of the disturbance, the minimum, maximum, and average value of the voltage for each phase during the disturbance.
    - .2 Detect disturbances less than one cycle in duration.
    - .3 Determine the location of a disturbance more quickly and accurately by determining the direction of the disturbance relative to the meter. Capture analysis results in the event log, along with a timestamp and confidence level indicating level of certainty.
    - .4 Programmability:
    - .5 Capable of deriving values for combinations of measured or calculated parameters, using arithmetic, trigonometric, logic, thermocouple linearization, and temperature conversion functions.
    - .6 Capable (through a graphical flexible programming language) of creating programmable modules with metered and input data, through arithmetic and logic operations (such as minimum, maximum, set point, digital input, digital output, etc.) that can be arbitrarily linked together to create application functionality.
  - .14 Field programmability
    - .1 The power monitoring instrument is field programmable as follows:
    - .2 Basic parameters: Voltage input scale, voltage mode (Wye, Delta, single phase), current input scale, auxiliary input and output scales, and communications set-up parameters are programmable from the front panel, without the need of external software.
    - .3 The power monitoring instrument firmware shall be field upgradeable.

## 2.3 **Sub-Metering For Energy And Electrical Monitoring**

2.3.1 **Functionality:** Energy Use and Electrical Monitoring

2.3.2 **Applications:** Where Energy Usage & Demand analysis, Sub-metering/billing, Electrical Monitoring, pinpointing energy savings,

optimizing equipment efficiency and utilization, and performing a basic assessment of the power quality of the electrical network.

2.3.3 **Mounting:** designed for front-panel mounting (Flush-mounted) supporting integrated or remote displays.

2.3.4 **Basis of Design:** The Energy and Electrical monitoring metering package designed in accordance with Ontario/ROP Specifications, Measurement Canada approved, identical to or exceed the functionality of Schneider Electric Power Logic design **PM5000 Series / Model METSEPM5560**

2.3.5 **Features:** The metering device used to provide the measurement capabilities needed to allocate energy usage, perform tenant metering and sub billing, pinpoint energy savings, optimize equipment efficiency and utilization, and perform a basic assessment of the power quality of the electrical network, shall have at minimum the following features:

- .1 Direct connect to circuits up to 600 VAC, eliminating the need for voltage (potential) transformers; Four metered 5 A nominal current inputs for 3 phase measurement plus neutral.
- .2 Hardware:
  - .1 A fourth current input for direct and accurate measurement of neutral current, to help avoid device overload and network outage.
  - .2 Two digital outputs for control and energy pulsing applications.
  - .3 Four digital inputs/two digital inputs with input metering support for WAGES monitoring applications.
  - .4 LED that can be used for energy pulsing applications when necessary.
  - .5 Two analog inputs to interpret an incoming analog current signal from transducers and provide the resulting scaled value such as gas metering pulses, etc.
- .3 Display and user interface
  - .1 Onboard webpages for displaying real-time, logged data and waveform capture information using a web browser.
  - .2 Multiple language support: The back-lit anti-glare display screen can be switched to display meter information in one of the supported languages (on models with a display screen).
  - .3 Graphical display of harmonics and phasor diagrams on models with an integrated or optional remote display.

- 
- .4 QR codes with embedded data for viewing meter information using Meter Insights.
  - .4 Alarming
    - .1 Extensive alarming options like unary, digital, standard, logic, custom, and disturbance alarms.
    - .2 The ability to send emails with alarm information.
  - .5 Communications
    - .1 Dual Ethernet switched ports allow fast Ethernet interconnection to other PM5500 / PM5600 / PM5700 meters using only one IP switch.
    - .2 Ethernet gateway functionality, allowing a Modbus master using Modbus TCP to communicate through the meter to downstream serial devices using Modbus RTU.
    - .3 Support for a variety of Ethernet protocols, such as Modbus TCP, BACnet/IP, EtherNet/IP and DNP3. All the Ethernet protocols can be used at the same time.
    - .4 Enhanced Modbus security using TCP/IP filtering to set the specific IP addresses that are permitted to access the meter.
  - .6 Measurements and logging
    - .1 4-quadrant, Class 0.2S accurate energy metering.
    - .2 Present, last, predicted and peak (maximum) demand using a selection of demand calculation methods.
    - .3 Highly accurate 1-second measurements.
    - .4 Onboard data logging support for up to 14 selectable parameters.
    - .5 Complete harmonic distortion metering, recording and Realtime reporting, up to the 63rd harmonic for all voltage and current inputs.
    - .6 Recording of each new minimum and new maximum value.
  - .7 Compliance to international standards
- 3 . **IEC 62053-22 CLASS 0.5S / CLASS 0.2S, ANSI C12.20 CLASS 0.2, IEC 61557-12 PMD/S/K70/0.2, IEC 62053-23, IEC 62052-11, IEC 62052-31, MID, EN50470-1/3 – ANNEX B AND ANNEX D, CE AS PER IEC 61010-1 ED.3,**

---

**CULUS AS PER UL 61010-1 ED.3, BACNET/IP - BTL LISTED (B-ASC),  
ETHERNET/IP - ODVA CERTIFIED**

**3.1 Instrument Transformers**

3.1.1 Current Transformers (CTs):

- .1 All Current Transformers shall be solid core CT (donut) or primary-wound with a 5A secondary unless noted otherwise.
- .2 CTs shall be Measurement Canada type approved or have a minimum accuracy of 0.3%.
- .3 All CT secondaries shall terminate in CT shorting blocks before being wired to the meter.
- .4 One CT is required for each phase being metered.

3.1.2 Potential Transformers (PTs).

- .1 PTs shall be supplied as required.
- .2 PTs shall be wired line-neutral for Wye systems and line-line for delta systems.
- .3 PTs shall be Measurement Canada type approved or have a minimum accuracy of 0.3%.
- .4 Meters shall not be powered from the PT secondaries.
- .5 Voltage inputs shall be fed from a dedicated 15A breaker in distribution panel where practical.
- .6 Supply and install appropriate 1A fuses.

**3.2 Meter Enclosures**

3.2.1 The PRIMARY SERVICE ENTRANCE ENERGY METER specified under 2.1 section shall be free issued to the Utility by the RoP and Installed by the Utility in their Energy Meter cabinet. Refer to sections for CEM Panels/ Enclosures.

3.2.2 The digital meters and sub-meters, specified in sections 2.2 & 2.3, shall be installed in new switchgear, panelboards, or switchboards.

3.2.3 For retrofit applications, or where meters are not installed in distribution equipment, the meters shall be installed in pre-wired, NEMA 12, CSA approved enclosures.

- .1 Multiple meters may be installed in the same enclosure.
- .2 Meters supplied from two different switchboards or different sources cannot be installed in the same enclosure.
- .3 Meters shall be wired according to manufacturer's recommended method.
- .4 Meter control power shall be from a separate source or control power transformer and not from the phase inputs to the meter.

3.2.4 General wiring guidelines:

- 
- .1 Control power and voltage sensing power separated for distribution to each meter from main set of incoming terminals.
  - .2 External control power transformers not required for any power systems up to, and including, 480 volts.
  - .3 Standard wiring harnesses for control power and voltage sensing to connect each meter internally. The harness may daisy chain the voltage connections from meter to meter on each row of meters. Finger safe terminals to terminate the meter end of the wiring harness.
  - .4 Common daisy chain wiring for communications wiring, with a single loop for all meters connected to the circuit and each end terminated in a common location. Communication wiring installed such that interference from the power wiring is minimized.
  - .5 Shorting terminal blocks for connecting the current transformer leads from the field to all ordered meters. Factory installed wiring harness shall be provided to connect the CT circuit from the shorting block to the meter. Shorting terminal blocks and wiring harness shall not be required for meters for meters compatible with low voltage current transducers.
  - .6 Capability to field-install meters without cutting or splicing the voltage or communication wiring harnesses to be provided.
  - .7 Terminal blocks for incoming and outgoing communications circuit connections.

**3.3 COROPRATE ENERGY METER CABINETS (To Support Primary Service Entrance Energy Meter Installation As Per RoP/Utility Requirement)**

**3.3.1 Indoor Panels (CEM) For Schneider Electric Meter ION 8650A/B/C:**

- .1 Supply and install a 30"x 30" x 12" NEMA 12 panel next to the main utility panel and install a conduit between the two panels with a maximum length of 5 feet using a minimum 2-inch inner diameter raceway. Tag the CEM panel with feeder information. This panel shall have the following specs:
  - .1 Fabricated in carbon steel construction finished with ANSI 61 gray polyester powder coating inside and out.
  - .2 Have a back plate for instrumentation mounting
  - .3 Have the door removed by pulling continuous hinge pin.
  - .4 Neoprene gasket attached to door with oil resistant seal.
  - .5 External welded-on mounting brackets for easy wall installation

- 
- .6 Panel shall have a backboard for mounting electrical devices
  - .7 Panel shall have one terminal strip mounted on the backboard of at least twelve positions.
  - .8 Panel shall have DIN rail of 10-inch length to fix components.
  - .9 Panel shall be grounded.
  - .10 Panel shall have Hasp and staple or similar provided for padlocking (minimum padlock size 1¼ inch)
  - .2 Supply and install a 120V (30 A) circuit from the existing back up generator / emergency supply (if on site) into the CEM panel and terminate inside the cabinet into a suitable disconnect switch, 30A, 120/240 VAC, DP general-duty safety switch for isolation in the CEM panel.
  - .3 Supply and connect three wire 120 VAC wirings from the disconnect switch to the duplex receptable in the 'CEM Panel'. A suitable beaker (15 A) shall be provided for protection.
  - .4 Supply and connect three wire 120 VAC wiring from the disconnect switch to the duplex receptable inside the 'Existing Utility Panel'. A suitable beaker (15 A) shall be provided for protection.
  - .5 Supply Cat 6 and/or fibre cable (minimum 6 strand multi mode 50/125) from the CEM panel to the Region of Peel Network switch for connection to the Region of Peel Corporate LAN or the SCADA ICP.
  - .6 Label all wirings, components, and circuits.
  - .7 Refer to below Conceptual Sketch (Power Cabling Only) of Electrical Installation Work Required.
  - .8 Note: If the existing switchgear is equipped with a dedicated disconnect switch, feeding the CEM panel, within the same room/space and clearly visible from the CEM panel, then the requirement for the disconnect switch is not necessary and the enclosure size can be reduced to 24"x24"x12"
- 3.3.2 Outdoor Panels (CEM) For Schneider Electric Meter ION 8650A/B/C:
- .1 Supply and install a 30" x 30" x 12" NEMA 4X panel next to or back-to-back with the existing main utility panel and install a conduit between the two panels with a maximum length of 5 feet using a minimum 2-inch inner diameter raceway. Tag the CEM panel with feeder information. This panel shall have the following specs:
    - .1 Fabricated in stainless steel construction.
-

- 
- .2 Have a back plate for instrumentation mounting
  - .3 Have the door removed by pulling stainless steel continuous hinge pin.
  - .4 Neoprene gasket attached to door with oil resistant adhesive.
  - .5 Clamps on three sides of door for watertight seal.
  - .6 Stainless steel external hardware
  - .7 Panel shall have a backboard for mounting electrical devices
  - .8 Panel shall have one terminal strip mounted on the backboard of at least twelve positions.
  - .9 Panel shall have DIN rail of 10-inch length to fix components.
  - .10 Panel shall be grounded.
  - .11 Panel shall have Hasp and staple or similar provided for padlocking (minimum padlock size 1¼ inch)
  - .2 Supply and install a 120V (30 A) circuit from the existing back up generator / emergency supply (if on site) into the CEM panel and terminate inside the cabinet into a suitable disconnect switch, 30A, 120/240 VAC, DP general-duty safety switch for isolation in the CEM panel.
  - .3 Supply and connect three wire 120 VAC wirings from the disconnect switch to the duplex receptable in the 'CEM Panel'. A suitable beaker (15 A) shall be provided for protection.
  - .4 Supply and connect three wire 120 VAC wiring from the disconnect switch to the duplex receptable inside the 'Existing Utility Panel'. A suitable beaker (15 A) shall be provided for protection.
  - .5 Supply Cat 6 and/or fibre cable (minimum 6 strand multi mode 50/125) from the CEM panel to the Region of Peel Network switch for connection to the Region of Peel Corporate LAN or the SCADA ICP.
  - .6 Label all wirings, components, and circuits.
  - .7 Refer to below Conceptual Sketch (Power Cabling Only) of Electrical Installation Work Required.
  - .8 Note: If the existing switchgear is equipped with a dedicated disconnect switch, feeding the CEM panel, within the same room/space and clearly visible from the CEM panel, then the requirement for the disconnect switch is not necessary and the enclosure size can be reduced to 24"x24"x12"

---

**3.4 Outdoor Natural Gas Metering Panel Specifications for Rotary Meters with Pulse Outputs:**

- 3.4.1 Supply a 6" x 6" x 4" NEMA 4X with screw on cover (PVC gas splice box) and mount this box within 3 feet of the gas meter.
- 3.4.2 Supply and install in conduit a quantity of 2 - 2 conductor FT6 shielded instrument cables – 18 gauge from the CEM panel to the gas splice box. Leave approximately 2 feet of cable in the gas splice box and 4 feet of cable in the CEM panel.

**3.5 Monitoring And Reporting Software**

- 3.5.1 The Region of Peel employs the Power Monitoring Expert (PME) real-time power and energy monitoring software by Schneider Electric.
  - .1 The contractor must ensure connectivity from the meters to the software through the Region of Peel network – Coordination with the Region of Peel is required.
  - .2 Include an appropriate number of additional device licenses for the PME software.
  - .3 Include three (3) days of on-site software configuration for a trained factory representative to complete the software and meter integration and configuration as necessary/if required by the RoP.
  - .4 The contractor shall ensure all new electrical meters are properly integrated to the ROP's existing Power Monitoring Expert software -Coordination with the RoP is required.

**3.6 Communications / Networking Components**

- 3.6.1 To enable the meters to communicate to the central monitoring software, CAT6 – 100BaseT Ethernet shall be run to each device.
- 3.6.2 Routers or other required networking components shall be provided according to Owner's standard.
- 3.6.3 The contractor shall coordinate with the Region of Peel Energy Specialist/IT department to assign appropriate IP addresses in each meter.
- 3.6.4 The contractor shall ensure network connectivity of all the new meters to the Corporate Energy LAN/ WAN.

**3.7 Warranty & Service**

- 3.7.1 The manufacturer warrants the products it supplies for a period of 18 Months from Commissioning date or 24 Months from Delivery date
- 3.7.2 Warranty Service may be performed by the manufacturer or authorized representative.

---

**3.8 New Meters Tagging:**

3.8.1 The newly supplier meters, basically the primary service entrance meters, shall be tagged with the region of Peel standard tag number that must appear on the faceplate of the meter in the following format. Actual tag numbers will be provided by the RoP at the time of order. as follows:

.1 Meter tag format: ROP-xxxxxx

**3.9 Loyalty Program Pricing:**

3.9.1 Vendor / Contractor shall consider customer loyalty special pricing program offered by the OEM, XX% discounts (usually 25% - to be confirmed by OEM during RFQ stage) to be applied to the product original pricing where applicable. The ROP will return old/defective meters to the manufacturer (Schneider Electric). Vendor shall arrange and provide the RMA (Return Material Authorization) and the ROP will provide necessary meters details upon issue of the Purchase order.

**4 . EXECUTION**

**4.1 Acceptable Contractor**

**4.2 All meters, components, wirings, and modifications (as necessary) to be installed by a qualified electrical contractor.**

**4.3 Installation requirements**

4.3.1 All power supply and communications wiring connections shall be performed in accordance with the guidelines set out in the product documentation.

4.3.2 All voltage sensing connections to instrumentation shall be made with 2A fuses.

4.3.3 Where practical, the meters voltage inputs shall be from a dedicated breaker.

4.3.4 Appropriately sized current transformers must be installed on each phase and must be installed with CT shorting blocks. All CTs with 5A secondary shall have CT shorting blocks.

4.3.5 Meters may be powered directly from an auxiliary supply, control power transformer, or the supply voltage. Meters cannot be powered from the measurement PTs.

4.3.6 For installations where the neutral is directly grounded at the transformer and no neutral is available, voltage measurements may be made line to ground.

- 
- 4.3.7 All wiring shall be done in accordance with Canadian National Electric Code standards and regulations, and in conjunction with the local Electrical Safety Association office.
  - 4.3.8 All communications networking including hubs, routers, etc. shall be provided by the contractor in accordance with the standards approved by the Owner.
  - 4.3.9 All meters, components, wirings, and enclosures to be labelled properly.

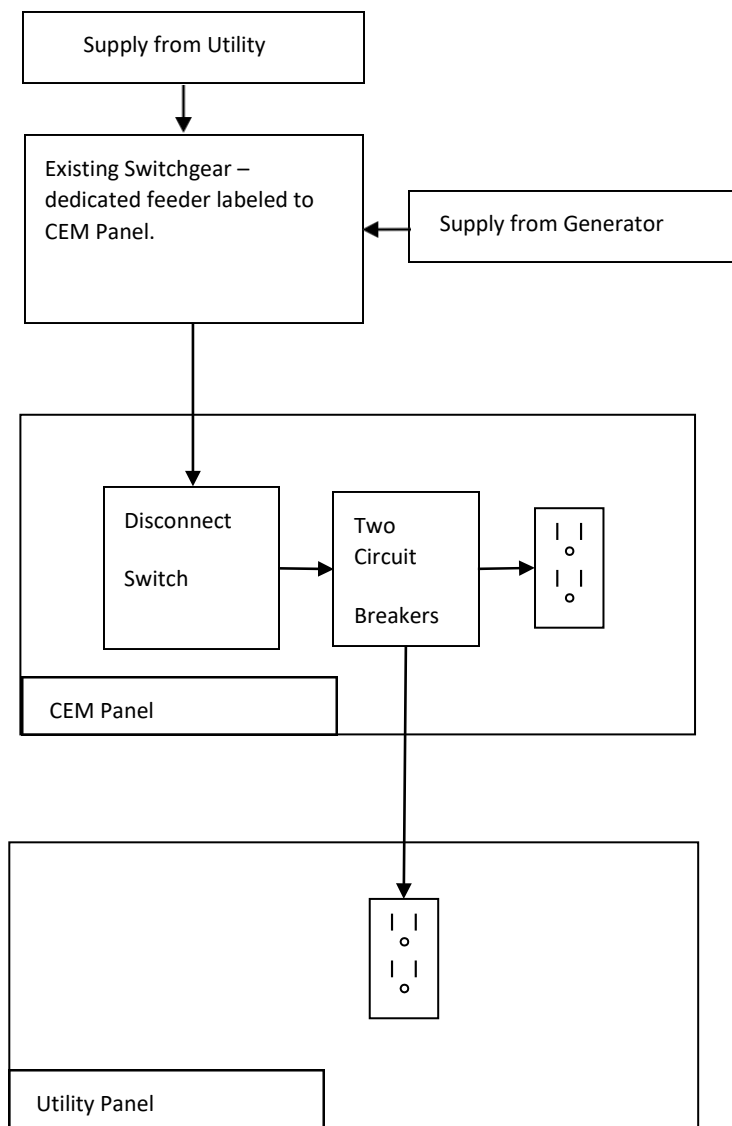

**4.4 On-site Configuration**

- 4.4.1 The meters shall be properly configured for the PME system
- 4.4.2 Any power quality settings on the meters shall be configured so the meter's disturbance capture and transient detection is enabled.
- 4.4.3 The contractor/vendor shall ensure all energy and min/max registers have been reset to zero.
- 4.4.4 Communications networking shall be tested and proved to be working before acceptance by the Owner.

**4.5 Locations**

- 4.5.1 The instrument shall be installed as specified on the drawings.

**4.6 Conceptual sketch (power cabling only) of Electrical Installations work:**

**END OF SECTION**

---

1. **GENERAL**

1.1 **Section Includes:**

1.1.1 Materials and installation for low voltage control system designed to provide remote switching of lighting loads by use of:

- .1 Low voltage momentary contact switches.
- .2 Manual Switch Control

1.2 **Related Sections:**

1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

1.3 **References**

1.3.1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1

1.3.2 Health Canada/Workplace Hazardous Materials Information System (WHMIS):

1.3.3 Material Safety Data Sheets (MSDS).

1.4 **Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements, and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.

- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Submit manufacturer's printed product literature, specifications and datasheet and Include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Sample:

- .1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.4 Quality Assurance:

- .1 Submit following in accordance with Section 01 33 00 - Submittal Procedures.
- .2 Submit site tests results of installed electrical systems and instrumentation
- .3 Test Reports:
  - .1 Submit certified test reports indicating compliance with specifications for specified performance characteristics and physical properties.
- .4 Certificates: Submit certificates signed by manufacturer certifying that materials comply with specified performance characteristics and physical properties.
- .5 Manufacturer's Instructions: Submit manufacturer's installation instructions.
- .6 Manufacturer's Field Reports: Manufacturer's field reports specified.

1.5.5 Closeout Submittals:

- .1 Submit maintenance data in accordance with Section 01 78 00 - Closeout Submittals.
- .2 Submit sequence of operation for the lighting control system.

1.5.6 Shop Drawings:

- .1 Submit shop drawings in accordance with Section 01 33 00 - Submittal Procedures.
- .2 Submit drawings stamped and signed by professional engineer registered or licensed in Province of Ontario , Canada.

**1.6 Extra Materials**

1.6.1 Provide maintenance materials and spare parts in accordance with Section 01 78 00 - Closeout Submittals.

1.6.2 Provide following spare Parts:

**1.7 Delivery, Storage and Handling**

1.7.1 Packing, shipping, handling and unloading:

- .1 Deliver, store and handle in accordance with Section 01 61 00 - Common Product Requirements.
- .2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- .3 Handle materials with suitable lifting equipment.
- .4 Store materials in heated, dry, weather-protected enclosure

**1.8 Description of System**

1.8.1 Integration with Building Management System (BMS)

- .1 Product protocol shall be native BACnet IP certified. No other protocols will be considered or accepted.
- .2 Provide all wiring and devices required for the installation, programming, commissioning and documents of commissioning to prove correct circuitry and performance.
- .3 BaCnet IP Network wiring specification is Cat 6 UTP – FT6 cable.

**1.9 Acceptable Manufactures**

1.9.1 Acuity Brands

- .1 Provide all material, equipment, and service necessary for a complete and operational Lighting Control System.
- .2 Provide individual low voltage lighting control for each luminaire type and circuit in each room and common area.

- .3 Building Management System (BMS) Integration
  - .1 The system protocol shall be native BACnet/IP certified and fully compatible with the BMS. Gateways will not be accepted. The system software programmable controllers shall reside/communicate with the BACnet/IP on the management or automation level networks of the Building Management System.

## 2. **PRODUCTS**

### 2.1 **Materials**

- 2.1.1 Control system by one manufacturer and assembled from compatible components.

### 2.2 **Remote Control Switches**

- 2.2.1 Single-pole, double throw, momentary contact, standard duty, rated 20 A, 25 V, pivot rocker action with pilot lights.

### 2.3 **Low Voltage Relays**

- 2.3.1 Electrically operated by momentary impulse, mechanically latched until activated.
- 2.3.2 Two coil solenoid type with one coil to close relay contacts and one coil to open relay contacts.
- 2.3.3 Operating voltage shall be 24 V, AC
- 2.3.4 Load contacts shall be 20 A, 120 V, AC.
- 2.3.5 Auxiliary contacts for pilot light.
- 2.3.6 Coloured pre-stripped leads.

### 2.4 **Control Transformer**

- 2.4.1 Low voltage power Class 2, input 120 V, AC, 60 Hz, output 20 VA at 24 V.

### 2.5 **Rectifier**

- 2.5.1 Selenium type shall be 24 V, AC, 60 Hz input, 0.36 A continuous duty output.
- 2.5.2 Silicon type shall be 24 V, AC, 60 Hz input, [7.5 A continuous duty or 20 A intermittent duty] output.

### 2.6 **Manual Control**

- 2.6.1 Individual remote control switches as indicated.
- 2.6.2 Eight circuit manual master selector switch mounted in 100 mm square box with:

- .1 Master lock-out switch.
- .2 Individual red jewelled pilot lights.
- 2.6.3 Nine circuit manual dial-type master selector.
- 2.6.4 Twelve circuit manual dial-type master selector.

**2.7 Motor Operated Master Control**

- 2.7.1 Motor-driven multiple contact momentary switching device.
- 2.7.2 Radial contact arm to rotate through one revolution in 17 seconds.
- 2.7.3 Contact made in succession between 25 points around circle.
- 2.7.4 One master required for "ON" operation and one for "OFF" operation.
- 2.7.5 Motor master units connected in cascade to control circuits.
- 2.7.6 Interface equipment as required to convert maintained contact signals to momentary contact control pulses.

**3 . EXECUTION**

**3.1 Installation**

- 3.1.1 Locate and install equipment in accordance with manufacturer's recommendations and as indicated.

**3.2 Manufacturer's Instructions**

- 3.2.1 Compliance: Comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheet.

**3.3 Field Quality Control**

- 3.3.1 Site Tests:
  - .1 Perform tests in accordance with Section 26 05 00 - Common Work Results - for Electrical.
- 3.3.2 Actuate control units in presence of consultant to demonstrate lighting circuits are controlled as designated.
- 3.3.3 Manufacturer's Field Services:
  - .1 Obtain written report from manufacturer verifying compliance of Work, in handling, installing, applying, protecting and cleaning of product and submit Manufacturer's Field Reports as described in Item 1 - Submittals.
  - .2 Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection

of product installation in accordance with manufacturer's instructions.

- .3 Schedule site visits, to review Work, as directed in Item 1 - Quality Assurance.

3.3.4 Verification requirements in accordance with Sustainable Requirements: Contractor's Verification, include:

- .1 Materials and resources.
- .2 Storage and collection of recyclables.
- .3 Construction waste management.
- .4 Resource reuse.
- .5 Recycled content.
- .6 Local/regional materials.
- .7 Low-emitting materials.

#### **3.4 Maintenance – Clearances**

- 3.4.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

#### **3.5 Cleaning**

- 3.5.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.5.2 Upon completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

1.1.1 Materials and installation of network lighting controls.

**1.2 Related Sections**

1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

1.3.1 Canadian Standards Association (CSA International)

- .1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1.

**1.4 Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.

- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 **NOTE:** Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submit shop drawings in accordance with Section 01 33 00 - Submittal.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Indicate:

- .1 Complete assembly.
- .2 Contact surfaces.
- .3 Construction features.
- .4 Wiring diagrams.
- .5 Catalogue information.

1.5.4 Sample:

- .1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.5 Quality Assurance:

- .1 Submit site tests results of installed electrical systems and instrumentation
- .2 Field Quality Control
  - .1 On completion of installation, manufacturer representative shall be notified to carry out site review and report any inconsistencies to the Engineer. Corrections are to be implemented to comply with manufacturer's report.

1.5.6 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.

- .3 Manufacturers recommended list of spare parts.

**1.6 Extra Materials**

- 1.6.1 Provide maintenance materials and spare parts in accordance with Section 01 78 00 - Closeout Submittals.
- 1.6.2 Provide following spare Parts:
  - .1

**1.7 Delivery, Storage and Handling**

- 1.7.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.7.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.7.3 Handle materials with suitable lifting equipment.
- 1.7.4 Store materials in heated, dry, weather-protected enclosure

**1.8 Description of System**

- 1.8.1 All materials, components, and services necessary to provide a complete working addressable lighting control system indicated in this section, as specified herein and shown on related drawings including, but not limited to:
  - .1 Dimensional drawings and schedules for specified equipment
  - .2 Shipment of equipment and supplies to job site
  - .3 Installation in accordance with these specifications, related drawings, the equipment manufacturers' recommendations, established trade criteria and all applicable code requirements.
- 1.8.2 Commissioning and demonstration of completed system.
- 1.8.3 Purpose
  - .1 The system shall be a standalone building-wide addressable networked lighting control system to perform scheduled and automatic lighting control events. The basis of system design shall utilize non-propriety industry standard DALI protocol for ballasts and/or 0-10V control of LED drivers, occupancy sensors, addressable daylight sensors, addressable switches, and DMX512 protocol interface for RGB colour changing fixtures.
  - .2 The lighting control "system" shall include a fully distributed WAN/LAN network of global controller/routers, individually addressable system field devices, sensors, switches, relays,

and other ancillary devices required for a complete and operable system.

- .3 The system design shall allow for use of non-propriety industry standard DALI protocol for ballasts and/or 0-10V control for ballasts or LED drivers, occupancy sensors, daylight sensors, and switches.

#### 1.8.4 BMS Integration

- .1 The system protocol shall be native BACnet/IP certified and fully compatible with the BMS. Gateways will not be accepted. The systems software programmable controllers shall reside/communicate with the BACnet/IP on the management or automation level networks of the Building Management System.

#### 1.8.5 Motorized Shades Integration

- .1 The system shall be fully capable to integrate with motorized shade system to allow sharing of daylight sensors, occupancy sensors and time schedules.

### 1.9 Acceptable Manufacturers

- 1.9.1 Encelium
- 1.9.2 N light
- 1.9.3 Or approved equal.

## 2. PRODUCTS

### 2.1 Components

- 2.1.1 The system Control Unit (CU) shall be rack or wall mounted lighting control device that collects, processes and distributes lighting control information to System Field Devices and lighting controllers over a Class 2 communication bus. Each CU shall have multiple Class 2 communication channels and can control a large quantity of nodes (sensors, lighting controllers, 0-10V Dimming, Fixed Output Ballasts, 0-10V LED Drivers, etc.) per channel, per the manufacturers recommended maximum. The CU is the central intelligence point for the area that it controls, collecting signal information from sensors, lighting controllers and personal control software and determining appropriate brightness levels or on/off status for each fixture or zone. Each CU shall have an Ethernet connection for communication with a facility's or tenant's Local Area Network (LAN) to enable desktop personal control.
- 2.1.2 Shall interconnect with other CUs and System Server using standard Ethernet connection that employs TCP/IP protocol.

- 
- 2.1.3 System Server shall host the lighting control system database for all the lighting control system field devices. Server shall have the ability to:
- .1 Remotely access a system in order to change system settings or configuration;
  - .2 Analyze system performance or energy data or generate system report;
  - .3 Record energy consumption with average sampling every 5 minutes for unlimited duration;
  - .4 Host the web interface required for the web enabled Personal Control Software or web based Central Control Software;
  - .5 Optionally can reside on a client server (virtual server) thus eliminating the need for dedicated physical hardware if desired;
- 2.1.4 Interconnect with CUs over standard Ethernet connection that employs TCP/IP protocol; 2.04 All operating parameters of the lighting control system shall be configured from central point of access through a secure internet connection or any internet enabled computer through a web browser. The system should be compatible with the current version standard browsers such as Internet Explorer, Chrome, Fire Fox and Safari. The system should be compatible with Microsoft Windows 7 and 8. The manufacturer should be able to provide update and patches for operating system upgrades and web browsers.
- 2.1.5 The lighting system shall resume operation after a power outage with no resetting or reprogramming requirement.
- 2.1.6 The lighting system shall adjust dimmable fluorescent ballast or dimmable LED driver levels in response to varying ambient light levels in order to maintain a constant, user -specified light level at locations indicated on the lighting plan drawings. Refer to drawings for location of the daylight sensors.
- 2.1.7 The operational status of all system hardware and software components shall be routinely checked. Faults with addressable components of the system shall be automatically detected and electronic notifications shall be distributed. These notifications clearly illustrate the location of the device on the floor plan and the time that the fault was detected on the Graphical interface. The system should be able to generate trouble/fault notification email to maintenance staff.
- 2.1.8 The energy consumption of the addressable luminaries shall be logged and recorded. Data shall be charted according to user-defined zones, which can be as small as an individual fixture or as large as a portfolio of buildings.

- 2.1.9 The system shall be capable of activating just the set of addressable luminaires required by an occupant to perform their work during the off-hour time period. The system shall avoid turning on an entire quadrant or floor when only an office, or meeting room, and associated hallways are required to remain on.
- 2.1.10 Luminaires within a lighting zone shall be activated in several ways including, a room switch, floor switch banks, occupancy sensors, time-clock, and/or web-based software interface screens. Cleaning staff are accommodated by a programmed turn-on and shut-down sequence initiated floor switch banks or schedule as per owner requirement. The sequence and override period shall be coordinated with the owner.
- 2.1.11 The system shall be capable of configuring zones via software and avert the need to re-wire certain power distribution circuitry and lighting equipment as tenancy patterns change.
- 2.1.12 The graphical interface of the software shall import the floor plan design file. All addressable luminaires and other addressable components of the lighting system contained in the floor plan design file shall be rendered into interactive objects on the graphical user interface. Include programming for base building and anchor tenant.

## **2.2 Wall Controllers (Switches)**

### **2.2.1 General:**

- .1 Addressing: all controllers shall be individually addressable via energy control software.
- .2 Electrical specifications
- .3 Ratings: shall be low voltage input.
- .4 Mechanical specifications

### **2.2.2 Operations:**

- .1 Localized on/off switching, dimming up/down, and programmable scene selection for dimming loads shall be provided, as required.
- .2 Led's: all controllers shall feature led's to indicate light on and light off status, as required.

### **2.2.3 Environmental specifications:**

- .1 Operating temperature range: 0°C to 55°C
- .2 Relative humidity: 20% to 90% non-condensing

### **2.2.4 Aesthetic requirements:**

- .1 Style: all controllers shall feature decorator styling.
- .2 Colour: all controllers shall be available in white, with an optional colour insert kit for changing colour without reinstalling switch.

- .3 Accessories: matching wallplate shall be available.

## **2.3 Photo Sensor**

### **2.3.1 General:**

- .1 A sensor that measures ambient light in a finite area shall be available.
- .2 Specifications: the sensor shall measure light from any source in the visible spectrum within at least a 60° cone. It shall measure light between 0 and minimum 75 foot-candles.

### **2.3.2 Electrical:**

- .1 Rating: maximum 10 vdc, 25 ma.

### **2.3.3 Mechanical:**

- .1 Mounting: the sensor shall be flush mounted on or recessed inside ceiling tile.

### **2.3.4 Environmental specifications**

- .1 Operating temperature range: 0°C to 55°C
- .2 Relative humidity: 20% to 90% non-condensing

## **2.4 Occupancy Sensors**

### **2.4.1 General:**

- .1 Sensors using passive infrared, ultrasonic, acoustic, and multi-technology adaptive technology shall be available.
- .2 Sensor timeouts shall be configurable by system software.

### **2.4.2 Electrical:**

- .1 Rating: maximum 24 vdc input voltage, 40 ma current draw.

### **2.4.3 Mechanical:**

- .1 Mounting: sensors for mounting on ceilings and walls, including corners, must be available.

### **2.4.4 Environmental:**

- .1 Operating temperature range: 0°C to 55°C.
- .2 Relative humidity: 20% to 90% non-condensing

## **2.5 BACnet IP Network**

### **2.5.1 BACnet IP Network wiring specification is Cat 6 – FT6 wire.**

### **2.5.2 Wiring for AI, AO, DO and DI points shall be 2c#awg ft6 600V twisted shielded pair, no longer than 70 meters. DO wiring shall be minimum AWG to suit voltage, current and electrical code. No splices are permitted in network wires. All wiring is to be run in electrical conduits where mechanical protection is required. In ceiling spaces such as removable tile return air plenum space,**

plenum-rated wiring is acceptable. All plenum wiring is to be run at right angles to building line and secured to avoid damage to wiring. Marr connectors are acceptable for terminations at field devices only. Terminal strips shall be used where connections are required at any junction box.

- 2.5.3 Als, DIs, AOs and Dos may be run in a common conduit if required. Line voltage will not be run with signal or network wiring.
- 2.5.4 If a shield is required on point wiring, the shield shall be grounded at the DDC panel and prevented from grounding at the terminal end.
- 2.5.5 Line voltage, 110 vac wiring will be separated from 24 vac, network and all DC wiring. Wiring methods are as Division 26 00 00 for 110 vac wiring.
- 2.5.6 Use 1 m of flexible, liquid-tight conduit and liquid-tight fittings for all connections to vibrating equipment.
- 2.5.7 BACnet IP communications network wiring shall be CAT5. Do not run BACnet UP networks in proximity to higher voltages than 24 vac.
- 2.5.8 ModBus RTU communications network wiring shall be 2c#18awg shielded ft6 600 V or shall match voltage requirements where higher voltages are present. Do not run ModBus RTU networks in proximity to higher voltages than 24 vac.

### 3 . **EXECUTION**

#### 3.1 **Installation**

- 3.1.1 Install system and components in accordance with manufacturer's instructions.
- 3.1.2 Install starter cables to circuit outlet boxes and connect to power circuit and energize.
- 3.1.3 Install Smart-Light enclosures as shown on drawings and connect starter cable to power-in plug.
- 3.1.4 Connect joiner cables to each of power-out receptacles to first luminaire of controlled circuit as shown.
- 3.1.5 Install joiner cables between interceptors in fixtures or equipment. Allow extra cable to facilitate removal and relocation of fixtures or equipment.
- 3.1.6 Integrally moulded thermoplastic components to match colour identification system (i.e. black for normal power, red for emergency power).
- 3.1.7 Install low voltage switch kits and low voltage cables as shown on drawings and connect to control ports of controlled circuits.

- 3.1.8 Install sensor kits and low voltage cables as shown on drawings and connect to control ports of controlled circuits.
- 3.1.9 Install central control kit from each or grouped Smart-Light enclosure to central control panel as shown on drawings.
  - .1 Connect to control port of Smart-Light as indicated.
  - .2 Connections within central control panel as instructed by control manufacturer.

**3.2 Field Quality Control**

- 3.2.1 On completion of installation, manufacturer representative shall be notified to carry out site review and report any inconsistencies to the Engineer. Corrections are to be implemented to comply with manufacturer's report.

**3.3 Maintenance – Clearances**

- 3.3.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.4 Cleaning**

- 3.4.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.4.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for Dry Type, Medium Voltage Transformers.
- 1.1.2 Dry type transformers with ratings up to 5000 kVA single phase and up to 7500 kVA three phase and voltage class up to 46 kV.
- 1.1.3 Text to complete Section 26 11 13.01 - Unit Substation to 15 kV.

**1.2 Related Sections**

- 1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.
- 1.2.2 Section 01 33 00 - Submittal Procedures.
- 1.2.3 Section 01 74 21 - Construction/Demolition Waste Management And Disposal.
- 1.2.4 Section 01 78 00 - Closeout Submittals.
- 1.2.5 Section 26 05 00 - Common Work Results - Electrical.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International)
  - .1 CSA C9-M1981(R2001), Dry-Type Transformers.
- 1.3.2 Electrical and Electronic Manufacturer's Association of Canada (EEMAC)
  - .1 EEMAC GL1-3-1988, Transformer and Reactor Bushings.
- 1.3.3 National Electrical Manufacturers Association (NEMA)

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
  - .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.

- .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
  - .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.
  - .6 VOC/Low-Emitting Materials Compliance.
- 1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

- 1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.
- 1.5.2 Product Data:
  - .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.
- 1.5.3 Include:
  - .1 Dimensioned drawing showing enclosure, mounting devices, terminals, taps, internal and external component layout.
  - .2 Technical data:
    - .1 kVA rating.
    - .2 Primary and secondary voltages.
    - .3 Frequency.
    - .4 Three Phase
    - .5 Polarity or angular displacement.

- .6 Full load efficiency.
- .7 Regulation at unity pf.
- .8 BIL.
- .9 Insulation type.
- .10 Sound rating.

1.5.4 Sample:

- .1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.5 Quality Assurance:

- .1 Engineer reserves the right to witness standard factory testing of the above.
- .2 Submit site tests results of installed electrical systems and instrumentation

1.5.6 Control Submittals

- .1 Submit to Engineer 6 copies of standard factory test certificates of each transformer and type test of each transformer in accordance with CSA C9.

1.5.7 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.
- .4 Operation and maintenance instructions to include:
  - .1 Tap changing.
  - .2 Recommended environmental conditions.
  - .3 Recommended periodic inspection and maintenance.
  - .4 Bushing replacement.

**1.6 Extra Materials**

- 1.6.1 Provide maintenance materials and spare parts in accordance with Section 01 78 00 - Closeout Submittals.

**1.7 Delivery, Storage and Handling**

- 1.7.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.7.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.7.3 Handle materials with suitable lifting equipment.
- 1.7.4 Store materials in heated, dry, weather-protected enclosure
- 1.7.5 Store transformers indoors in dry location.

---

**1.8 Acceptable Manufactures**

- 1.8.1 Eaton Cutler Hammond
- 1.8.2 Or approved equal.

**2 . PRODUCTS**

**2.1 Materials**

- 2.1.1 Dry-type transformers: to CSA C9.
- 2.1.2 Bushings: to EEMAC GL1-3.

**2.2 Transformer Characteristics**

- 2.2.1 Type: AFC
- 2.2.2 Rating: as per drawings and single line diagram
- 2.2.3 220 degrees insulation system class, 30 degrees C temperature rise.
- 2.2.4 Impedance: 7-12%, standard.
- 2.2.5 Primary winding: 13.8kV, BIL 75 kV.
- 2.2.6 Secondary winding: 600 V , three wire with neutral brought out and high resistance
- 2.2.7 No load losses not to exceed manufacturers recommendation as per KVA rating.
- 2.2.8 Full load losses not to exceed manufacturers recommendation as per KVA rating
- 2.2.9 Sound rating described as per NEMA TR1, IEE C57.12.90.

**2.3 Enclosure**

- 2.3.1 Fabricated from sheet steel.
- 2.3.2 Bolted removable panels for access to tap connections, enclosed terminals
- 2.3.3 Conductor entry:
  - .1 Knockouts.
  - .2 Potheads.
  - .3 Junction boxes.
  - .4 Bushings.
  - .5 Clamping rings.
  - .6 Entry for busbars
- 2.3.4 Designed for floor
- 2.3.5 Indoor, ventilated forced air cooled type. Temperature of exposed metal parts not to exceed 65 degrees C rise.

2.3.6 Shall contain all necessary components and wiring, including fans, for automatically increasing the kVA rating by 33%. The (FA) package shall include an electronic temperature monitor and fan control unit. The package shall include a TC-50 Transformer Temperature Controller that monitors up to three (3) ventilated Dry Type transformer windings and (1) ambient temperature. The controller's electronic components shall be conformally coated to prevent premature failure due to extreme environmental conditions. The controller shall operate relays by comparing the highest winding temperature to stored set point temperatures and display four (4) thermocouple inputs as well as the stored maximum temperature and its associated winding. The unit shall provide Fans, Alarm, and Trip output relays. Form C contacts shall be provided to trip the transformer off-line if any of the winding temperatures exceeds the trip setting. A test function shall be provided to test the digital display and all of the LEDs; simulate over-temperature conditions; and check the internal temperature of the monitor. A 4-20 mA analog signal shall be provided for remote indication or for use with SCADA systems. Control power shall be provided from a control power transformer in the secondary equipment.

2.3.7 Pad mounted type:

- .1 Conductor entry through bottom for underground distribution, with separate high and low voltage compartments divided by full length metal barrier.
- .2 Each compartment to have access door with concealed hinges.
- .3 Secondary door to have 3-point latch, external operating handle, provision for padlocking and arranged so that secondary door must be open before access gained to primary compartment.

2.3.8 Open type: no enclosure, for installation in switchgear enclosure.

## **2.4 Tap Changer**

2.4.1 Bolted-link type.

## **2.5 Windings**

2.5.1 Primary and secondary coils:

2.5.2 Copper

2.5.3 Coil and core assembly:

- .1 Taps located at front of coils for accessibility.

2.5.4 Sound level: not to exceed dB as described in IEEE C57.12.90.

## **2.6 Accessories**

2.6.1 Winding temperature detector relay and sensing elements

- 2.6.2 Wiring and terminal box for protective devices.
- 2.6.3 Digital type winding temperature indicator
- 2.6.4 Fans for forced air cooling,
- 2.6.5 Grounding terminal: inside enclosure.

**2.7 Equipment Identification**

- 2.7.1 Provide equipment identification in accordance with Section 26 05 00 - Common Work Results - Electrical.
- 2.7.2 Equipment labels: nameplate size 7 labelled as per drawings.

**3. EXECUTION**

**3.1 Installation**

- 3.1.1 Locate, install and ground transformers in accordance with manufacturer's instructions.
- 3.1.2 Set and secure transformers in place, rigid plumb and square.
- 3.1.3 Connect primary bushings/terminals to high voltage circuit.
- 3.1.4 Connect secondary bushings/terminals to secondary feeder.
- 3.1.5 Use flexible conduit to make connections to transformer.
- 3.1.6 Energize transformers and check secondary no-load voltage.
- 3.1.7 Adjust primary taps as necessary to produce rated secondary voltage at no-load.
- 3.1.8 Wire one set of contacts on winding temperature detector relay to sound alarm, wire second set of contacts to trip transformer circuit interrupter.
- 3.1.9 Wire alarm contacts on winding temperature indicator to sound alarm when excessive temperature reached.
- 3.1.10 Locate and install cooling fans.
  - .1 Connect thermostat control.
  - .2 Connect sequence contacts of temperature indicator:
    - .1 First contact closure: start fan.
    - .2 Second contact closure: sound alarm.
    - .3 Third contact closure: trip secondary breaker.
- 3.1.11 Use torque wrench to adjust internal connections in accordance with manufacturers' recommended values.
- 3.1.12 Check transformer for dryness before putting it into service and if it has not been energized for some considerable time.

---

**3.2 Field Quality Control**

- 3.2.1 Perform tests in accordance with Section 26 05 00 - Common Work Results – Electrical.
- 3.2.2 Energize transformers and apply incremental loads:
- .1 0% for 4 hours.
  - .2 10% for next 1 hour.
  - .3 25% for next 2 hours.
  - .4 50% for next 3 hours.
  - .5 Full load.
  - .6 At each load change, check temperatures ambient, enclosure, ventilating air and windings.
  - .7 Adjust cooling fan controls if required.

**3.3 Maintenance – Clearances**

- 3.3.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.4 Cleaning**

- 3.4.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.4.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1 . GENERAL**

**1.1 Section Includes**

- 1.1.1 Low voltage dry type transformers up to 600V primary.

**1.2 Related Sections**

- 1.2.1 This section of the Specification forms part of the contract documents and should be read, interpreted and coordinated with all other parts.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International)  
.1 CSA C9 (current edition), Dry-Type Transformers.

- 1.3.3 Bushings: to EEMAC GL1-3.
- 1.3.4 Electrical and Electronic Manufacturer's Association of Canada (EEMAC)  
.1 EEMAC GL1-3 (current edition), Transformer and Reactor Bushings.
- 1.3.5 National Electrical Manufacturers Association (NEMA)
- 1.3.6 DOE 2016 Energy efficient

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal  
.1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.  
.2 Avoid using landfill waste disposal procedures when recycling facilities are available.  
.3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements, and they shall be fully aware of all required laws and available strategies to achieve

sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

1.4.6

## 1.5 Submittals

1.5.1 Submit shop drawings in accordance with Section 01300 (01 33 00) - Submittal.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.

1.5.3 Include:

- .1 Dimensioned drawing showing enclosure, mounting devices, terminals, taps, internal and external component layout.
- .2 Technical data:
  - .1 kVA rating.
  - .2 Primary and secondary voltages.
  - .3 Frequency.
  - .4 Three phase.
  - .5 Polarity or angular displacement.
- .3 Full load efficiency.
  - .1 No load and full load losses per NEMA TP-1
  - .2 Linear load efficiency data @ 1/6, 1/4, 1/2, 3/4, 8 full load
  - .3 Linear load efficiency @ 35% loading tested per NEMA TP-2
  - .4 Efficiency under K7 load profile at 15%, 25%, 50%, 75%, 100% of name plate rating
- .4 Regulation at unity pf.

- .5 BIL.
- .6 Insulation type.
- .7 Sound rating.
- 1.5.4 Control Submittals
  - .1 Submit to Engineer 4 copies of standard factory test certificates of each transformer and type test of each transformer in accordance with CSA C9.
- 1.5.5 Operation and maintenance instructions to include:
  - .1 Tap changing.
  - .2 Recommended environmental conditions.
  - .3 Recommended periodic review and maintenance.
  - .4 Bushing replacement.
- 1.5.6 Quality Assurance:
  - .1 Submit site tests results of installed electrical systems and instrumentation
- 1.5.7 Closeout Submittals:
  - .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
  - .2 Data necessary for maintenance of materials.
  - .3 Manufacturers recommended list of spare parts.
- 1.6 **Extra Materials**
  - 1.6.1 Provide maintenance materials and spare parts in accordance with manufacturer's recommendations.
- 1.7 **Acceptable Manufactures**
  - 1.7.1 Eaton Electrical Inc: Cutler- Hammer Products
  - 1.7.2 Marcus
  - 1.7.3 Siemens Energy & Automotion Inc
  - 1.7.4 Schneider Electric; Square D
  - 1.7.5

## 2. **PRODUCTS**

### 2.1 **General Transformer Requirements**

- 2.1.1 Description: Factory – assembled and tested, air cooled units for 60Hz service
- 2.1.2 Core: Grain- orientated, non-aging silicon steel
- 2.1.3 Coils: Continuous windings without splices except for taps
  - .1 Internal Coil Connections: Brazed or pressure type

---

.2 Coil Material: Copper

**2.2 Materials**

2.2.1 Dry-type transformers: to CSA C9.

2.2.2 Bushings: to NEMA.

**2.3 Transformer Characteristics**

2.3.1 Comply with NEMA ST20, and list and label as complying with UL 1561.

2.3.2 Rating as shown in drawings.

2.3.3 220 insulation system class, 150 degrees C temperature rise.

2.3.4 Impedance: 5 % standard.

2.3.5 DOE 2016 Energy Efficient compliant

2.3.6 Low- Sound- Level Requirements: NEMA ST20 standard sound levels when factory tested according to IEEE C57.12.91.

**2.4 Enclosure**

2.4.1 Fabricated from sheet steel.

2.4.2 Bolted removable panels for access to tap connections, enclosed terminals.

2.4.3 Conductor entry:

.1 Knockouts.

.2 Potheads.

.3 Junction boxes.

.4 Bushings.

.5 Clamping rings.

.6 Entry for busbars.

2.4.4 Designed for floor or wall mounting.

2.4.5 Indoor, ventilated, self-cooled type. Temperature of exposed metal parts not to exceed 65 degrees C rise.

2.4.6 Outdoor, ventilated, self-cooled type, CSA 3 enclosure.

**2.5 Voltage Taps**

2.5.1 Standard.

**2.6 Tap Changer**

2.6.1 Bolted-link type.

**2.7 Windings**

2.7.1 Primary and secondary coils:

.1 Copper

.2 Open

2.7.2 Coil and core assembly:

.1 Taps located at front of coils for accessibility.

## **2.8 Accessories**

2.8.1 Winding temperature detector relay and sensing elements with sets of SPDT contacts.

2.8.2 Wiring and terminal box for protective devices.

2.8.3 Digital type winding temperature indicator with alarm contacts.

2.8.4 Fans for forced air cooling, 600 V, 3 phase, 60Hz, with thermostat control.

2.8.5 Grounding terminal: inside of enclosure.

## **2.9 Equipment Identification**

2.9.1 Provide equipment identification in accordance with Section 26 05 00 - Common Work Results (16010).

2.9.2 Equipment labels: nameplate size 7, labelled.

# **3 . EXECUTION**

## **3.1 Installation**

3.1.1 Locate, install and ground transformer in accordance with manufacturer's instructions.

3.1.2 Set and secure transformers in place, rigid plumb and square.

3.1.3 Connect primary terminals to high voltage circuit.

3.1.4 Connect secondary terminals to secondary feeder.

3.1.5 Use flexible conduit to make connections to transformer.

3.1.6 Energize transformers and check secondary no-load voltage.

3.1.7 Adjust primary taps as necessary to produce rated secondary voltage at no-load.

3.1.8 Wire one set of contacts on winding temperature detector relay to wire second set of contacts to.

3.1.9 Wire alarm contacts on winding temperature indicator to sound alarm when excessive temperature reached.

3.1.10 Locate and install cooling fans.

.1 Connect thermostat control.

.2 Connect sequence contacts of temperature indicator:

.1 First contact closure: start fan.

.2 Second contact closure: sound alarm.

---

.3 Third contact closure: trip secondary breaker.

3.1.11 Use torque wrench to adjust internal connections in accordance with manufacturers' recommended values.

3.1.12 Check transformer for dryness before putting it into service and if it has not been energized for some considerable time.

**3.2 Field Quality Control**

3.2.1 Energize transformers and apply incremental loads:

- .1 0% for 4 hours.
- .2 10% for next 1 hour.
- .3 25% for next 2 hours.
- .4 50% for next 3 hours.
- .5 Full load.
- .6 At each load change, check temperatures ambient.
- .7 Adjust cooling fan controls if required.

**3.3 Maintenance – Clearances**

3.3.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.4 Cleaning**

3.4.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.

3.4.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Section Includes**

1.1.1 Materials and installation for Switchboards.

1.2 **Related Sections**

1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

1.3 **References**

1.3.1 Canadian Standards Association (CSA International)

- .1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1.

1.4 **Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.

.6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Provide submittals in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.
- .3 Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, and limitations.

1.5.3 Quality Assurance:

- .1 Engineer reserves the right to witness standard factory testing of the above.
- .2 Submit site tests results of installed electrical systems and instrumentation
- .3 Submit following in accordance with Section 01 40 00 Quality requirement.
- .4 Instructions: Submit manufacturer's installation instructions.

1.5.4 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.

## **1.6 Extra Materials**

1.6.1 Provide maintenance materials and spare parts in accordance with Section 01 78 00 - Closeout Submittals.

## **1.7 Delivery, Storage and Handling**

1.7.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

- 1.7.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.7.3 Handle materials with suitable lifting equipment.
- 1.7.4 Store materials in heated, dry, weather-protected enclosure

**1.8 Acceptable Manufactures**

- 1.8.1 Eaton Cutler Hammond
- 1.8.2 Schneider
- 1.8.3 Siemens
- 1.8.4 Or approved equal.

**2 . PRODUCTS**

**2.1 Circuit Breakers**

- 2.1.1 Breaker type as per single line diagram.
- 2.1.2 Breaker interrupting capacity shall be as per short circuit study and manufactuters recommendations.
- 2.1.3 Breaker tripping devices, as indicated.
  - .1 Instantaneous overcurrent relays.
  - .2 Reverse power relay.
  - .3 Overvoltage relay.
  - .4 Undervoltage relay.
  - .5 Frequency relay.
  - .6 Time overcurrent relay.
  - .7 Locking-out relay.
  - .8 Time-delay relay.
  - .9 Ground fault relay.
  - .10 Negative sequence relay.
- 2.1.4 Trip setting devices shall be switches
- 2.1.5 Auxiliary contacts shall be - N.O., N.C.

**3 . EXECUTION**

**3.1 Manufacturer's Instructions**

- 3.1.1 Compliance: Comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.

---

**3.2 Installation**

3.2.1 As indicated.

**3.3 Maintenance – Clearances**

3.3.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.4 Cleaning**

3.4.1 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

### 1.4 **Submittals**

- 1.4.1 Submit shop DGIs in accordance with Section 26 05 00 (16010).
  - .1 DGIs are to include electrical detail of panel, branch breaker type, quantity, ampacity and enclosure dimension.
- 1.4.2 Product Data:
  - .1 Provide manufacturer's printed product literature, OMRs and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.4.3 Closeout Submittals:
  - .1 Data necessary for maintenance of materials.
  - .2 Manufacturers recommended list of spare parts.

### 1.5 **Acceptable Manufactures**

- 1.5.1 Eaton.
- 1.5.2 Schneider
- 1.5.3 Siemens
- 1.5.4 Or approved equal.

## 2. **PRODUCTS**

### 2.1 **Panelboards**

- 2.1.1 Panelboards to CSA C22.2 No. 22 and product of one manufacturer.
  - .1 Install circuit breakers in panelboards before shipment.

- 
- .2 In addition to CSA requirements, manufacturer's nameplate must show fault current that panel, including breakers, has been built to withstand.
- 2.1.2 250: bus and breakers rated for 10 kAIC (symmetrical) interrupting capacity as minimum. 600 V panelboards bus and breakers rated for 30 kAIC (symmetrical) interrupting capacity as minimum Final rating to be confirmed when coordination study is confirmed.
- 2.1.3 Sequence phase busing with odd-numbered breakers on left and even on right, with each breaker identified by permanent number identification as to circuit number and phase.
- 2.1.4 Panelboards: Mains, number of circuits, and number and size of branch circuit breakers as shown in documents.
- 2.1.5 Two keys for each panelboard and key panelboard alike.
- 2.1.6 Copper bus with neutral per code.
- 2.1.7 Mains: Suitable for bolt-on breakers.
- 2.1.8 Trim with concealed front bolts and hinges.
- 2.1.9 Trim and door finish: As per colour schedule.
- 2.2 Breakers**
- 2.2.1 Breakers with thermal and magnetic tripping in panelboards except as indicated otherwise.
- 2.2.2 Lock-on devices for fire alarm, emergency, door supervisory, stairway, exit and night light circuits.
- 2.3 Equipment Identification**
- 2.3.1 Complete circuit directory with typewritten legend showing location and load of each circuit.

### **3. EXECUTION**

#### **3.1 Installation**

- 3.1.1 Locate panelboards as indicated and mount securely, plumb, true and square, to adjoining surfaces.
- 3.1.2 Install surface-mounted panelboards on plywood backboards. Where practical, group panelboards on common backboard.
- 3.1.3 Connect loads to circuits.
- 3.1.4 Connect neutral conductors to common neutral bus with respective neutral identified.

---

**3.2 Maintenance – Clearances**

3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.3 Cleaning**

3.3.1 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1.    GENERAL**

**1.1    Section Includes**

1.1.1    Materials and installation for Multi-Outlet Assemblies.

**1.2    Related Sections**

1.2.1    This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3    References**

1.3.1    Canadian Standards Association (CSA International)

- .1        CSA C22.1 (current edition), Canadian Electrical Code, Part 1.

**1.4    Sustainable Requirements**

1.4.1    Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2    Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3    Waste Management and Disposal

- .1        Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2        Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3        Place materials defined as hazardous or toxic waste in designated containers.

1.4.4    In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1        Construction Waste Management / Product Waste Recyclability.
- .2        Recycled Content.
- .3        Local and Regional Materials.
- .4        Certified Wood.
- .5        Construction Indoor Air Quality (IAQ) management.

.6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Provide submittals in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

.1 Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.

1.5.3 Indicate type of multi-outlet assemblies with similar terminology to these documents.

## **1.6 Quality Assurance**

1.6.1 Quality assurance submittals: Submit following in accordance with Section 01 40 00 Quality requirement.

.1 Manufacturer's Instructions: Submit manufacturer's installation instructions and special handling criteria, installation sequence, cleaning procedures.

## **1.7 Delivery, Storage, and Handling**

1.7.1 Deliver, store and handle in accordance with Section 01 61 00 - Common Product Requirements.

1.7.2 Deliver materials to site in original factory packaging, labelled with manufacturer's name, address.

## **2. PRODUCTS**

### **2.1 Surface Raceway for Wiring Devices**

2.1.1 Two-piece assembly manufactured for mounting wiring devices and associated wiring.

2.1.2 Raceway with base channel and snap on cover plate. Cross-section dimensions as indicated.

2.1.3 Finish shall be white enamel, as indicated.

2.1.4 Internal barrier for raceway having power and communication.

### **2.2 Wiring Devices**

2.2.1 Wiring devices shall be as indicated.

- 2.2.2 Communication devices shall be as indicated.
- 2.2.3 Cover plate to match raceway manufacturer's standard snap-on cover.

**2.3 Prewired Receptacle Harness**

- 2.3.1 Receptacle harness factory assembled with single receptacles at 1,525 mm centres on one or two circuits.

**2.4 Vinyl Plastic Strip**

- 2.4.1 Extruded rigid vinyl plastic with two No. 12 AWG, 3 mm<sup>2</sup> copper wires and continuous ground strip.
- 2.4.2 Unfused "U" ground lock-in receptacle for each 1.5 m of strip as indicated.

**2.5 Fittings**

- 2.5.1 Elbows, tees, supports, connectors, couplings, and fittings to make a complete installation.

**3 . EXECUTION**

**3.1 Installation**

- 3.1.1 Install multi-outlet assemblies and raceway system in accordance with manufacturer's instructions.
- 3.1.2 Install supports, elbows, tees, connectors, fittings.
- 3.1.3 Keep number of elbows, offsets and connections to minimum.
- 3.1.4 Install barriers where required.
- 3.1.5 Install surface raceway continuous around corners. Provide corner and vertical sections as required.

**3.2 Wiring**

- 3.2.1 Install wiring after installation of raceway system is complete.
- 3.2.2 Install receptacle harness as indicated.
- 3.2.3 Fasten wiring with wire clips inside raceway.
- 3.2.4 Install ground wire as required.

**3.3 Wiring Devices**

- 3.3.1 Install wiring devices and cover plates as indicated
- 3.3.2 Install vinyl strip receptacles as indicated.
- 3.3.3 Install identification labels for all electrical outlets.

---

**3.4 Maintenance – Clearances**

3.4.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.5 Cleaning**

3.5.1 Clean in accordance with Section 01 74 00 Cleaning and waste management.

3.5.2 Clean installed products in accordance to manufacturer's recommendation.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

1.1.1 Materials and installation for Wiring Devices.

**1.2 Related Sections**

1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

1.3.1 Canadian Standards Association (CSA International)

- .3 CAN/CSA C22.2 No.42.1 (current edition), Cover Plates for Flush-Mounted Wiring Devices (Bi-national standard, with UL 514D).
- .4 CSA C22.2 No.55 (current edition), Special Use Switches.
- .5 CSA C22.2 No.111 (current edition), General-Use Snap Switches (Bi-national standard, with UL 20).

**1.4 Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve

sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## 1.5 **Submittals**

1.5.1 Submit in accordance with Section 01300 (01 33 00) - Submittal.

1.5.2 Product Data:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for wiring devices and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Sample:

- .1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.4 Quality Assurance:

- .1 Engineer reserves the right to witness standard factory testing of the and above.
- .2 Submit site tests results of installed electrical systems and instrumentation

1.5.5 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.

---

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

**2 . PRODUCTS**

**2.1 Switches**

- 2.1.1 [15] [20] A, [120 V] [single pole], [double pole], [three-way], [four-way] switches to: [CSA C22.2 No. 55] [and] [CSA C22.2 No. 111].
- 2.1.2 Manually-operated general purpose AC switches with following features:
  - .1 Terminal holes approved for No. 10 AWG wire.
  - .2 Silver alloy contacts.
  - .3 Urea or melamine moulding for parts subject to carbon tracking.
  - .4 Suitable for back and side wiring.
  - .5 White Decora.
- 2.1.3 [Toggle-operated] [locking], fully rated for tungsten filament and fluorescent lamps, and up to 80% of rated capacity of motor loads [and] [or] [Heating Loads].
- 2.1.4 Switches of one manufacturer throughout project.
- 2.1.5 Provide specification-grade switches.
- 2.1.6 Acceptable Manufactures
  - .1 Eaton Cutler Hammond
  - .2 Hubbell
  - .3 Schneider
  - .4 Or approved equal.

**2.2 Receptacles**

- 2.2.1 Duplex receptacles, CSA type 5-15 R, 125 V, 15 A, U ground, to: CSA C22.2 No.42 with following features:
  - .1 White urea moulded housing.
  - .2 Suitable for No. 10 AWG for back and side wiring.
  - .3 Break-off links for use as split receptacles.
  - .4 Eight back wired entrances, four side wiring screws.
  - .5 Triple wipe contacts and riveted grounding contacts.

- 2.2.2 Single receptacles CSA type 5-15 R, 125 V, 15 A, U ground with following features:
  - .1 White urea moulded housing.
  - .2 Suitable for No. 10 AWG for back and side wiring (Decora).
  - .3 Four back wired entrances, 2 side wiring screws.
- 2.2.3 Surge Protection Device (SPD) 15 A, 125 V duplex receptacles to be 2-pole, 3-wire specification grade, blue face, parallel blade, U ground, impact-resistant, nylon face, audible and LED alarm.
- 2.2.4 Isolated Ground type to be 15 A, 125 V duplex receptacles to be 2-pole, 3-wire specification grade, orange face, parallel blade, U ground, impact-resistant, nylon face.
- 2.2.5 Ground Fault Interrupter type to be 15 A, 125 V duplex receptacles to be 2-pole, 3-wire specification grade, white face, parallel blade, U ground, impact resistant, nylon face complete with breaker and reset button.
- 2.2.6 All other single outlet and special purpose receptacles are to be similar to the specification grade. Confirm ampacity, voltage and pin configuration prior to installation.
- 2.2.7 Receptacles of one manufacturer throughout project.
- 2.2.8 Acceptable Manufactures
  - .1 Eaton Cutler Hammond
  - .2 Hubbell
  - .3 Schneider
  - .4 Or approved equal.

## 2.3 **Special Wiring Devices**

- 2.3.1 Special wiring devices:
  - .1 Pilot lights as indicated, with neon type 0.04 W, 125 V lamp and red plastic lens flush type.
  - .2 Combination Occupancy Sensors Wall Switches (Line Voltage):
    - .1 Line voltage wall switch sensors shall be capable of detecting presence in the floor area to be controlled by detecting shifts in passive infrared and ultrasonic sensors.
    - .2 Provide a neutral wire at each switch position using dual technology.
    - .3 Sensors shall be complete with the following:
      - .1 Override push switch.
      - .2 LED detection status indicator.
      - .3 Low profile recessed design to suit "Decorator Plate".

- .4 Dual level lens to enhance detection at desktop level.
- .5 Ability to maintain luminaires in operation when occupancy is only one person sitting at a desk in accordance with NEMA WD7 guidelines.
- .6 Temperature and humidity resistance.
- .7 Time delay range from 30 seconds to 30 minutes.
- .8 Sensitivity adjustment from 20% to 100%.
- .9 Compatible with electronic ballasts and CF ballasts.
- .10 Immunity to FRI and EMI interference.
- .11 Integrated light level sensor option holds light off when the natural light is above the preset levels.
- .3 Acceptable Manufactures
- .4 Eaton Cutler Hammond
- .5 Hubbell
- .6 Schneider
- .1 Or approved equal.
- .7 Dimmers:
  - .1 Flush-mounted – specification grade.
  - .2 Incandescent application: 600 – 1500 watts based on connected load plus 25% spare.
  - .3 Electronic ballast application: compatible with ballasts specified.
  - .4 Radio interference suppression.
  - .5 Thin profile: slide to OFF feature.
  - .6 Finished in white or as indicated.
- .8 Interval Timers:
  - .1 Range: 0 – 30 minutes.
  - .2 Spring-wound or digital without hold feature.
  - .3 Single pole, 120 volt, 20 amp contacts to open at end of timing cycle.
  - .4 Flush-mounting.
  - .5 White finish.
  - .6 Acceptable Manufactures

## 2.4 **Cover Plates**

- 2.4.1 Cover plates for wiring devices to: CSA C22.2 No.42.1.
- 2.4.2 Sheet steel utility box cover for wiring devices installed in surface-mounted utility boxes.

- 2.4.3 Plastic white cover plates, thickness 2.5 mm for wiring devices mounted in flush-mounted outlet box.
- 2.4.4 Cast cover plates for wiring devices mounted in surface-mounted FS or FD type conduit boxes.
- 2.4.5 Weatherproof double lift spring-loaded cast aluminum cover plates, complete with gaskets for duplex receptacles as indicated.
- 2.4.6 Weatherproof spring-loaded cast aluminum cover plates complete with gaskets for single receptacles or switches.

## **2.5 Hand Dryer**

- 2.5.1 Sensor-activated high-speed concealed hand dryer. The following are the minimum requirements:
  - .1 120 V AC, 510 watt hardwire connection.
  - .2 360km/h air speed with a 62dB noise rating.
  - .3 Touch-free infrared sensors activation with power savings faction.
  - .4 Drip tray to prevent water from trickling to the floor.
  - .5 Mounts flush to the wall with stainless steel body.
  - .6 References:
    - .1 Meets or exceeds CSA C22.2 #113-14.
    - .2 ADA compliant.
- 2.5.2 Acceptable Manufactures:
  - .1 TOTO-HDR110#55

## **2.6 Electrical Heater**

- 2.6.1 Installation and material for Electrical Cabinet Heaters shall meet the following requirements:
  - .1 20 gauge steel cabinet.
  - .2 White poxy/polyester powder paint.
  - .3 208 V, 1 Phase with a watt density of 500 W/300 mm.
  - .4 Stainless steel tubular heating elements with aluminum fins.
  - .5 Built in tamper-proof thermostat.
  - .6 Programmable remote thermostate.
- 2.6.2 Acceptable Manufactures:
  - .1 Ouellef/OPA

## **3 . EXECUTION**

### **3.1 Installation**

- 3.1.1 Switches:

- .1 Install single throw switches with handle in "UP" position when switch closed.
- .2 Install switches in gang type outlet box when more than one switch is required in one location.
- .3 Mount toggle switches at height in accordance with Section 26 05 00 - Common Work Results.

3.1.2 Receptacles:

- .1 Install receptacles in gang type outlet box when more than one receptacle is required in one location.
- .2 Mount receptacles at height in accordance with Section 26 05 00 - Common Work Results.
- .3 Where split receptacle has one portion switched, mount vertically and switch upper portion.
- .4 Install GFI type receptacles as indicated.

3.1.3 Cover plates:

- .1 Install suitable common cover plates where wiring devices are grouped.
- .2 Do not use cover plates meant for flush outlet boxes on surface-mounted boxes.

**3.2 Examination**

3.2.1 Verification of Conditions: verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for wiring devices installation in accordance with manufacturer's written instructions.

- .1 Visually inspect substrate in presence of Engineer.
- .2 Inform Engineer of unacceptable conditions immediately upon discovery.
- .3 Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Engineer.

**3.3 Protection**

- 3.3.1 Protect installed products and components from damage during construction.
- 3.3.2 Protect stainless steel cover plate finish with paper or plastic film until painting and other work is finished.
- 3.3.3 Repair damage to adjacent materials caused by wiring device installation.

---

**3.4 Maintenance – Clearances**

- 3.4.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.5 Cleaning**

- 3.5.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.5.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

1.1.1 Materials and installation for Fuses – Low Voltage.

**1.2 Related Sections**

1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

1.3.1 Canadian Standards Association (CSA International)  
.1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
- .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.

.6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Provide submittals in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

.1 Provide fuse performance data characteristics for each fuse type and size above 60A. Performance data to include average melting time-current characteristics.

1.5.3 Shop Drawings:

.1 Provide shop drawings in accordance with Section 01 33 00 - Submittal Procedures.

.2 Submit drawings stamped and signed by professional engineer registered or licensed in Province of Ontario, Canada.

## **1.6 Delivery, Storage and Handling**

1.6.1 Ship fuses in original containers.

1.6.2 Do not ship fuses installed in switchboard.

1.6.3 Store fuses in original containers in storage cabinet.

## **1.7 Extra Materials**

1.7.1 Provide maintenance materials in accordance with Section 01 78 00 - Closeout Submittals.

1.7.2 Three spare fuses of each type and size installed above 600 A.

1.7.3 Six spare fuses of each type and size installed up to and including 600 A.

## **2. PRODUCTS**

### **2.1 Fuses - General**

2.1.1 Fuse type references L1, L2, J1, R1, etc. have been adopted for use in this specification.

2.1.2 Fuses shall be the product of one manufacturer.

### **2.2 Fuse Types**

2.2.1 Class L Fuses:

- .1 Type L1, time delay, capable of carrying 500% of its rated current for 10 seconds minimum.
- .2 Type L2, fast acting.
- 2.2.2 Class J Fuses:
  - .1 Type J1, time delay, capable of carrying 500% of its rated current for 10 seconds minimum.
  - .2 Type J2, fast acting.
- 2.2.3 Class R -R Fuses:
  - .1 Type R1, (UL Class RK1), time delay, capable of carrying 500% of its rated current for 10 seconds minimum, to meet UL Class RK1 maximum let-through limits.
  - .2 Type R2, time delay, capable of carrying 500% of its rated current for 10 seconds minimum.
  - .3 Type R3, (UL Class RK1), fast acting Class R, to meet UL Class RK1 maximum let-through limits

### **2.3 Spare parts**

- 2.3.1 Three spare fuses of each type and size installed above 600 A.
- 2.3.2 Six spare fuses of each type and size installed up to and including 600 A

## **3 . EXECUTION**

### **3.1 Installation**

- 3.1.1 Install fuses in mounting devices immediately before energizing circuit.
- 3.1.2 Ensure correct fuses fitted to physically matched mounting devices.
  - .1 Install rejection clips for Class R fuses.
- 3.1.3 Ensure correct fuses fitted to assigned electrical circuit.
- 3.1.4 Where UL Class RK1 fuses are specified, install warning label "Use only UL Class RK1 fuses for replacement" on equipment.
- 3.1.5 Install spare fuses in fuse storage cabinet.

### **3.2 Maintenance – Clearances**

- 3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

### **3.3 Cleaning**

- 3.3.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.

- 
- 3.3.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1.      GENERAL**

**1.1      Section Includes**

- 1.1.1 Materials for moulded-case circuit breakers, circuit breakers, and ground-fault circuit-interrupters.

**1.2      Related Sections**

- 1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.
- 1.2.2 Section 26 23 00 - Low Voltage Switchgear.
- 1.2.3 26 24 13 - Switchboards
- 1.2.4 Section 26 28 18 - Ground Fault Equipment Protection.

**1.3      References**

- 1.3.1 Canadian Standards Association (CSA International):
- .1 CSA-C22.2 No. 5-02, Moulded-Case Circuit Breakers, Moulded-Case Switches and Circuit-Breaker Enclosures (Tri-national standard with UL 489, tenth edition, and the second edition of NMX-J-266-ANCE).
  - .2 IEEE standard C37.13 – LVPCB Used in Enclosure
  - .3 UL 489 MCCB
  - .4 UL 489 Molded Case Switches

**1.4      Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be

fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## 1.5 Submittals

- 1.5.1 Submit product data in accordance with Section 01 33 00 - Submittal Procedures.
- 1.5.2 Include time-current characteristic curves for breakers with ampacity of 200 A and over or with interrupting capacity of 22,000 A symmetrical (RMS) and over at system voltage.

## 2. PRODUCTS

### 2.1 Breakers General

- 2.1.1 Moulded-case circuit breakers, Circuit breakers and Ground-fault circuit-interrupters, to CSA C22.2 No. 5
- 2.1.2 Bolt-on moulded case circuit breaker: quick-make, quick-break type, for manual and automatic operation with temperature compensation for 40°C ambient.
- 2.1.3 Plug-in moulded case circuit breakers: quick-make, quick-break type, for manual and automatic operation with temperature compensation for 40°C ambient.
- 2.1.4 Common-trip breakers with single handle for multi-pole applications.
- 2.1.5 Magnetic instantaneous trip elements in circuit breakers to operate only when value of current reaches setting.
  - .1 Trip settings on breakers with adjustable trips to range from three to eight times current rating.
- 2.1.6 Circuit breakers with interchangeable trips as indicated.
- 2.1.7 Circuit breakers to have minimum 20kA symmetrical RMS interrupting capacity rating.

---

**2.2 Thermal Magnetic Breakers Design A.**

2.2.1 Moulded case circuit breaker to operate automatically by means of thermal and magnetic tripping devices to provide inverse time current tripping and instantaneous tripping for short circuit protection.

**2.3 Magnetic Breakers Design B.**

2.3.1 Moulded case circuit breaker to operate automatically by means of magnetic tripping devices to provide instantaneous tripping for short circuit protection.

**2.4 Current Limiting and Series Rated Thermal Magnetic Breakers Design C.**

2.4.1 Thermal magnetic breakers with current limiters:

- .1 Time current limiting characteristics of fuses limiters coordinated with time current tripping characteristics of circuit breaker.
- .2 Coordination to result in interruption by breaker of fault-level currents up to interrupting capacity of breaker.

2.4.2 Series rated breakers to be manufacturer tested and listed. Breakers to be applied following manufacturer's guidelines and accepted best practice.

- .1 Breakers applied following manufacturer's guidelines and accepted best practice.

**2.5 Solid State Trip Breakers Design D.**

2.5.1 Moulded case circuit breaker to operate by means of solid-state trip unit with associated current monitors and self-powered shunt trip to provide inverse time current trip under overload condition, and [long time] [short time] [instantaneous] tripping for [phase] [ground] fault short circuit protection.

**2.6 Optional Features**

2.6.1 Include:

- .1 Shunt trip.
- .2 Auxiliary switch.
- .3 Motor-operated mechanism [complete with time delay unit].
- .4 Under-voltage release.
- .5 On-off locking device.
- .6 Handle mechanism.

---

**2.7    Enclosure**

**3 .    EXECUTION**

**3.1    Installation**

3.1.1 Install circuit breakers as per NEMA AB1 and/or NEMA AB3 or as indicated.

**3.2    Maintenance – Clearances**

3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.3    Cleaning**

3.3.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.

3.3.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

1.1.1 Materials and installation for Ground Fault Equipment Protection.

**1.2 Related Sections**

1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

1.3.1 CSA International:

- .1 CAN/CSA C22.2 No. 144-06(R2011), Ground Fault Circuit Interrupters.

1.3.2 National Electrical Manufacturers Association (NEMA):

- .1 NEMA PG 2.2-1999(R2009), Application Guide for Ground Fault Protection Devices for Equipment.

**1.4 Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.

- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 **NOTE:** Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submit in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for ground fault equipment protection and include product characteristics, performance criteria, physical size, finish and limitations.

1.5.3 Shop Drawings:

- .1 Submit drawings stamped and signed by professional engineer registered or licensed in Province of Ontario , Canada.
  - .1 Indicate on drawings:
    - .1 Amperage for each circuit intended to be protected

1.5.4 Test and Evaluation Reports: Submit test report for field testing of ground fault equipment to Engineer and certificate that system as installed meets criteria specified.

## **1.6 Closeout Submittals**

1.6.1 Submit in accordance with Section 01 78 00 - Closeout Submittals.

1.6.2 Operation and Maintenance Data: Submit operation and maintenance data for ground fault equipment protection for incorporation into manual.

## **1.7 Delivery, Storage and Handling**

1.7.1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements and with manufacturer's written instructions.

1.7.2 Delivery and Acceptance Requirements: Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

1.7.3 Storage and Handling Requirements:

- .1 Store materials indoors in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.

- .2 Store and protect ground fault equipment protection from nicks, scratches, and blemishes.
- .3 Replace defective or damaged materials with new.

## 1.8 **Payment**

- 1.8.1 Payment for field testing of ground fault equipment performed by Contractor in accordance with Section 01 29 83 - Payment Procedures: Testing Laboratory Services.

## 2. **PRODUCTS**

### 2.1 **Equipment**

- 2.1.1 Ground fault protective equipment: components of one manufacturer.
- 2.1.2 Provide ground fault protection on circuits provided to heating equipment, three-phase service to NEMA PG 2.2 and CAN/CSA C22.2 No. 144.
- 2.1.3 Ground fault unit to contain:
  - .1 Ground sensing relay suitable for operation at manufacturers recommendation Control voltage at 120/208/600 V.
  - .2 Ammeter with scale 0 to 1.0 A to indicate ground current value.
  - .3 Three position sensitivity control switch to select value of leakage current at which relay will operate.
  - .4 Indicating lamp illuminated when no ground fault exists, extinguished on ground fault or test.
  - .5 Switch:
    - .1 SPDT contacts for alarm and trip.
    - .2 Mechanical target indication.
    - .3 Manual reset.
  - .6 Reset button for contacts and target.
  - .7 Suitable for panel mounting.
- 2.1.4 Zero sequence transformer type with 300 - 3000 mA range.
- 2.1.5 Neutral:
- 2.1.6 System to operate instantaneously at ground current setting.

### 2.2 **Fabrication**

- 2.2.1 Install following components in equipment specified in other Sections and as indicated.
  - .1 Zero sequence transformer.

- .2 Ground fault relay.
- .3 Ground resistor unit.

### **2.3 Related Equipment**

#### **2.3.1 Shunt trip breakers**

## **3 . EXECUTION**

### **3.1 Examination**

3.1.1 Verification of Conditions: Verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for ground fault equipment installation in accordance with manufacturer's written instructions.

- .1 Visually inspect substrate in presence of Engineer.
- .2 Inform Engineer of unacceptable conditions immediately upon discovery.
- .3 Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Engineer.

### **3.2 Installation**

- 3.2.1 Do not ground neutral on load side of sensor.
- 3.2.2 Install phase conductors including neutral through zero sequence transformer.
- 3.2.3 Install ground fault protection system.
- 3.2.4 Make connections as indicated and in accordance with manufacturer's written recommendations.

### **3.3 Field Quality Control**

- 3.3.1 Perform tests in accordance with Section 26 05 00 - Common Work Results for Electrical and coordinate with Section 01 40 00 - Quality Requirements [if required].
- 3.3.2 Arrange for field testing of ground fault equipment by independent ground fault equipment manufacturer before commissioning service.
- 3.3.3 Demonstrate simulated ground fault tests.

### **3.4 Maintenance – Clearances**

- 3.4.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.5 Cleaning**

- 3.5.1 Progress Cleaning: Clean in accordance with Section 01 74 00  
Cleaning and waste management.  
.1 Leave Work area clean at end of each day.
- 3.5.2 Final Cleaning: Upon completion remove surplus materials, rubbish,  
tools and equipment in accordance with Section 01 74 00 Cleaning  
and waste management.

**END OF SECTION**

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for Ground Fault Circuit Interrupters – Class A.

**1.2 Related Sections**

- 1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted, and coordinated with all other parts.

**1.3 References**

- 1.3.1 CSA International  
.1 CAN/CSA C22.2 No.144-M91(R2006), Ground Fault Circuit Interrupters.
- 1.3.2 National Electrical Manufacturers Association (NEMA)  
.1 NEMA PG 2.2-1999(R2009), Application Guide for Ground Fault Protection Devices for Equipment.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal  
.1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.  
.2 Avoid using landfill waste disposal procedures when recycling facilities are available.  
.3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements, and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:  
.1 Construction Waste Management / Product Waste Recyclability.  
.2 Recycled Content.

- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 **NOTE:** Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submit in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for ground fault circuit interrupters and include product characteristics, performance criteria, physical size, finish and limitations.

1.5.3 Shop Drawings:

- .1 Submit drawings stamped and signed by professional engineer registered or licensed in Province of Ontario , Canada.

1.5.4 Test and Evaluation Reports: submit test report for field testing of ground fault equipment to Engineer and certificate that system as installed meets criteria specified.

## **1.6 Closeout Submittals**

1.6.1 Submit in accordance with Section 01 78 00 - Closeout Submittals.

1.6.2 Operation and Maintenance Data: submit operation and maintenance data for ground fault circuit interrupters for incorporation into manual.

## **1.7 Delivery, Storage and Handling**

1.7.1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements and with manufacturer's written instructions.

1.7.2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

1.7.3 Storage and Handling Requirements:

- .1 Store materials indoors and in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.
- .2 Store and protect ground fault circuit interrupters from nicks, scratches, and blemishes.

- .3 Replace defective or damaged materials with new.

**1.8 Payment**

- 1.8.1 Payment for field testing of ground fault equipment performed by contractor in accordance with Section 01 29 00 - Payment Procedures.

**2 . PRODUCTS**

**2.1 Materials**

- 2.1.1 Equipment and components for ground fault circuit interrupters (GFCI) to CAN/CSA C22.2 No.144
- 2.1.2 Components comprising ground fault protective system to be of same manufacturer.

**2.2 Breaker Type Ground Fault Interrupter**

- 2.2.1 Single pole ground fault circuit interrupter for 15 or 20 A (refer to panel schedules and drawings), 120 V, 1 phase circuit complete with test and reset facilities.

**2.3 Ground Fault Life Protector**

- 2.3.1 Two pole circuit breaker to supply power to panel and complete with:
- .1 Automatic shunt trip breaker.
  - .2 Zero sequence current sensor.
  - .3 Facilities for testing and reset.
  - .4 CSA Enclosure 3, surface mounted.
  - .5 Ground fault trip indicator light.

**2.4 Ground Fault Protector Unit**

- 2.4.1 Self-contained with 15 A, 120 V circuit interrupter and duplex or single receptacle complete with:
- .1 Solid state ground sensing device.
  - .2 Facility for testing and reset.
  - .3 CSA Enclosure 1 flush mounted with painted face plate.

**3 . EXECUTION**

**3.1 Examination**

- 3.1.1 Verification of Conditions: verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for ground fault circuit interrupters installation in accordance with manufacturer's written instructions.

- .1 Visually inspect substrate in presence of Engineer.
- .2 Inform Engineer of unacceptable conditions immediately upon discovery.
- .3 Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Department Representative.

**3.2 Installation**

- 3.2.1 Do not ground neutral on load side of ground fault relay. Pass phase conductors including neutral through zero sequence transformers.
- 3.2.2 Connect supply and load wiring to equipment in accordance with manufacturer's recommendations.

**3.3 Field Quality Control**

- 3.3.1 Perform tests in accordance with Section 26 05 00 - Common Work Results for Electrical and coordinate with Section 01 40 00 - Quality Requirements if required.
- 3.3.2 Arrange for field testing of ground fault equipment by [independent testing laboratory] [ground fault equipment manufacturer] [Contractor] before commissioning service.
- 3.3.3 Demonstrate simulated ground fault tests.

**3.4 Maintenance – Clearances**

- 3.4.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.5 Cleaning**

- 3.5.1 Progress Cleaning: Clean in accordance with Section 01 74 00 Cleaning and waste management.
  - .1 Leave Work area clean at end of each day.
- 3.5.2 Final Cleaning: Upon completion remove surplus materials, rubbish, tools and equipment in accordance with Section 01 74 00 Cleaning and waste management.

**END OF SECTION**

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for fused and non-fused disconnect switches.

**1.2 Related Sections**

- 1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International).  
.1 CAN/CSA C22.2 No.4 (current edition), Enclosed Switches.  
.2 CSA C22.2 No.39 (current edition), Fuseholder Assemblies.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.

.5 Construction Indoor Air Quality (IAQ) management.

.6 VOC/Low-Emitting Materials Compliance.

1.4.5 **NOTE:** Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submit product data in accordance with Section 01 33 00 - Submittal.

1.5.2 Product Data:

.1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.

.2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Sample:

.1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.4 Quality Assurance:

.1 Engineer reserves the right to witness standard factory testing of the and above.

.2 Submit site tests results of installed electrical systems and instrumentation

1.5.5 Closeout Submittals:

.1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.

.2 Data necessary for maintenance of materials.

.3 Manufacturers recommended list of spare parts.

## **1.6 Delivery, Storage and Handling**

1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.

1.6.3 Handle materials with suitable lifting equipment.

1.6.4 Store materials in heated, dry, weather-protected enclosure

---

**1.7 Acceptable Manufactures**

- 1.7.1 Eaton Cutler Hammond
- 1.7.2 Siemens
- 1.7.3 Square D
- 1.7.4 Or approved equal.

**2 . PRODUCTS**

**2.1 Disconnect Switches**

- 2.1.1 Fusible, non-fusible, horsepower rated disconnect switch in CSA Enclosure, to CAN/CSA C22.2 No.4 size as indicated.
- 2.1.2 Provision for padlocking in off switch position by locks.
- 2.1.3 Mechanically interlocked door to prevent opening when handle in ON position.
- 2.1.4 Fuseholders: to CSA C22.2 No.39 relocatable and suitable without adaptors, for type and size of fuse indicated.
- 2.1.5 Quick-make, quick-break action.
- 2.1.6 ON-OFF switch position indication on switch enclosure cover.

**3 . EXECUTION**

**3.1 Installation**

- 3.1.1 Install disconnect switches complete with fuses if applicable.

**3.2 Maintenance – Clearances**

- 3.2.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.3 Cleaning**

- 3.3.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.3.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

1.1.1 Materials and installation for Contractors.

**1.2 Related Sections**

1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

1.3.2 National Electrical Manufacturers Association (NEMA)

.1 NEMA ICS 2-2000 (R2005), Controllers, Contactors and Overload Relays Rated 600 V.

**1.4 Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

.1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.

.2 Avoid using landfill waste disposal procedures when recycling facilities are available.

.3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

.1 Construction Waste Management / Product Waste Recyclability.

- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## 1.5 Submittals

1.5.1 Submit in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for contactors and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Sample:

- .1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.4 Quality Assurance:

- .1 Engineer reserves the right to witness standard factory testing of the and above.
- .2 Submit site tests results of installed electrical systems and instrumentation

1.5.5 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.
- .4 Operation and Maintenance Data: Submit operation and maintenance data for contactors for incorporation into manual.

- .5 Include operating information required for start-up, synchronizing and shutdown of generating units.

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements and with manufacturer's written instructions.
- 1.6.2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.6.3 Storage and Handling Requirements:
  - .1 Store materials indoor and in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.
  - .2 Store and protect contactors from nicks, scratches, and blemishes.
  - .3 Replace defective or damaged materials with new.
- 1.6.4 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.5 Handle materials with suitable lifting equipment.
- 1.6.6 Store materials in heated, dry, weather-protected enclosure

**1.7 Acceptable Manufactures**

- 1.7.1 Cutler Hammond Eaton
- 1.7.2 Schneider
- 1.7.3 Or approved equal.

**2. PRODUCTS**

**2.1 Contactors**

- 2.1.1 Electrically held, Permanent magnet latch type, controlled by pilot devices as indicated and rated for type of load controlled. Half size contactors not accepted.
- 2.1.2 Breaker combination contactor as indicated.
- 2.1.3 Complete with two normally open and two normally closed auxiliary contacts unless indicated otherwise.
- 2.1.4 Mount in CSA enclosure unless otherwise indicated.
- 2.1.5 Include following options in cover:
  - .1 Green indicator
  - .2 Stop/Start pushbutton.
  - .3 Hand-Off/Auto selector switch.

.4 On/Off selector switch.

2.1.6 Control transformer: in accordance with Section 26 29 03 - Control Devices, factory wired and installed in contactor enclosure.

**2.2 Equipment Identification**

2.2.1 Identify equipment in accordance with Section 26 05 00 - Common Work Results for Electrical.

2.2.2 Size 4 nameplate indicating name of load controlled.

**3 . EXECUTION**

**3.1 Installation**

3.1.1 Install contactors and connect power wires and auxiliary control devices.

3.1.2 Identify contactors with nameplates or labels indicating panel and circuit number.

3.1.3 Test contactors in accordance with 26 05 00 - Common Work Results for Electrical.

**3.2 Protection**

3.2.1 Protect installed products and components from damage during construction.

3.2.2 Repair damage to adjacent materials caused by contactor installation.

**3.3 Maintenance – Clearances**

3.3.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.4 Cleaning**

3.4.1 Progress Cleaning: clean in accordance with Section 01 74 00 Cleaning and waste management.

.1 Leave Work area clean at end of each day.

3.4.2 Final Cleaning: upon completion remove surplus materials, rubbish, tools and equipment in accordance with Section 01 74 00 Cleaning and waste management.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for Motor Starters to 600 V.

**1.2 Related Sections**

- 1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International)
- .1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1.
- 1.3.2 International Electrotechnical Commission (IEC)
- .1 IEC 947-4-1-2002, Part 4: Electromechanical contactors and motor-starters.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.

- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## 1.5 Submittals

1.5.1 Provide submittals in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Provide manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Provide shop drawings for each type of starter to indicate:

- .1 Mounting method and dimensions.
- .2 Starter size and type.
- .3 Layout and components.
- .4 Enclosure types.
- .5 Wiring diagram.
- .6 Interconnection diagrams.

1.5.4 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.
- .4 Submit operation and maintenance data for each type and style of motor starter for incorporation into maintenance manual.
- .5 Extra Materials:
- .6 Provide listed spare parts for each different size and type of starter.

- 1. three contacts, stationary.
- 2. three contacts, movable.
- 3. one contacts, auxiliary.

4. one control transformer.
5. one operating coil.
6. two fuses.
7. 10% indicating lamp bulbs used.

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store and handle in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver materials to site in original factory packaging, labelled with manufacturer's name, address.
- 1.6.3 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.4 Handle materials with suitable lifting equipment.
- 1.6.5 Store materials in heated, dry, weather-protected enclosure

**1.7 Acceptable Manufacturers**

- 1.7.1 Eaton
- 1.7.2 Or approved equal.

**2. PRODUCTS**

**2.1 Materials**

- 2.1.1 Starters: to IEC 947-4 with AC4 utilization category.

**2.2 Manual Motor Starters**

- 2.2.1 Single or three phase manual motor starters of size, type, rating, and enclosure type as indicated, with components as follows:
  - .1 Switching mechanism, quick make and break.
  - .2 One or three overload heaters, manual reset, trip indicating handle.
- 2.2.2 Accessories:
  - .1 Toggle, Key, Switch, Pushbutton: standard labelled as indicated.
  - .2 Indicating Light: Standard type and colour as indicated.
  - .3 Locking tab to permit padlocking in "ON" or "OFF" position.

**2.3 Full Voltage Magnetic Starters**

- 2.3.1 Magnetic of size, type, rating and enclosure type as indicated with components as follows:
  - .1 Contactor solenoid operated, rapid action type.

- 
- .2 Motor overload protective device in each phase, manually reset from outside enclosure.
  - .3 Wiring and schematic diagram inside starter enclosure in visible location.
  - .4 Identify each wire and terminal for external connections, within starter, with permanent number marking identical to diagram.
- 2.3.2 Combination type starters to include fused disconnect switch with operating lever on outside of enclosure to control disconnect and provision for:
- .1 Locking in "OFF" position with up to three padlocks.
  - .2 Independent locking of enclosure door.
  - .3 Provision for preventing switching to "ON" position while enclosure door open.
- 2.4 Control Transformer**
- 2.4.1 Single phase, dry type, control transformer with primary voltage as indicated and 120 V secondary, complete with secondary fuse, installed in with starter as indicated.
- 2.4.2 Size control transformer for control circuit load plus 20% spare capacity.
- 2.5 Accessories**
- 2.5.1 Pushbutton: Heavy duty, oil tight as required.
- 2.5.2 Selector Switches: Heavy duty, oil tight as required.
- 2.5.3 Indicating Lights: Heavy duty, oil tight, type and colour as indicated.
- 2.6 Finishes**
- 2.6.1 Apply finishes to enclosure in accordance with Section 26 05 00 - Common Work Results for Electrical.
- 2.7 Equipment Identification**
- 2.7.1 Provide equipment identification in accordance with Section 26 05 00 - Common Work Results for Electrical.
- 2.7.2 Manual starter designation label, white plate, black letters, size 1, engraved as indicated.
- 2.7.3 Magnetic starter designation label, white plate, black letters, size 2 engraved as indicated.

---

**3 . EXECUTION**

**3.1 Installation**

- 3.1.1 Install starters and control devices in accordance with manufacturer's instructions.
- 3.1.2 Install and wire starters and controls as indicated.
- 3.1.3 Ensure correct fuses installed.
- 3.1.4 Confirm motor nameplate and adjust overload device to suit.

**3.2 Field Quality Control**

- 3.2.1 Perform tests in accordance with Section 26 05 00 - Common Work Results for Electrical and manufacturer's instructions.
- 3.2.2 Operate switches and contactors to verify correct functioning.
- 3.2.3 Perform starting and stopping sequences of contactors and relays.
- 3.2.4 Check that sequence controls, interlocking with other separate related starters, equipment, control devices, operate as indicated.

**3.3 Maintenance – Clearances**

- 3.3.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.4 Cleaning**

- 3.4.1 Clean in accordance with Section 01 74 00 Cleaning and waste management.
  - .1 Remove surplus materials, excess materials, rubbish, tools and equipment.
- 3.4.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Related Work**

- 1.1.1 Common Work Results – Electrical: Section 26 05 00.
- 1.1.2 Commissioning: Section 26 05 03.
- 1.1.3 Installation of Anchor Devices, Setting Templates: Architectural Section.
- 1.1.4 Concrete Pad: Architectural Section.
- 1.1.5 Automatic Transfer Switches: Section 26 36 23

1.2 **Description of System**

- 1.2.1 Generator set consists of:
  - .1 Diesel engine.
  - .2 Alternator.
  - .3 Generator control panel.
  - .4 Muffler and flexible connections.
  - .5 Cooling system.
  - .6 Sub-base fuel tank.
  - .7 Fuel pump.
  - .8 Battery charger and battery.
  - .9 Interconnecting wiring.
  - .10 Structural steel base.
  - .11 Remote annunciator
  - .12 Interconnections to BMS and fire alarm panel
  - .13 Metal enclosure
- 1.2.2 Set designed to operate as a prime type, emergency standby power source. Set shall be a packaged unit, complete and mounted on a skid.
- 1.2.3 Generator set and auxiliaries shall comply with CSA Standard C282 – 19 as well as the following specification. Where this specification calls for performance in excess of CSA Standard C282 – 19, this specification shall govern.
- 1.2.4 Control panel to:
  - .1 Monitor operation of generator.
  - .2 Annunciate trouble.
  - .3 Sound alarms.
- 1.2.5 Seismic Restraints suitable to BC Building Code Requirements

---

**1.3 Shop Drawings**

1.3.1 Submit shop drawings in accordance with Section 26 05 00.

**1.4 Preliminary Approval**

1.4.1 Prior to final purchase of diesel generator set, the following information contained in a binder, shall be submitted for approval:

- .1 Preliminary dimensioned outline of unit.
- .2 Confirmation of exhaust pipe diameter.
- .3 Brake horsepower versus rated speed curves.
- .4 Fuel consumption data.
- .5 Performance curves for local conditions and multipliers for ambient temperatures.
- .6 List of components.

**1.5 Operation and Maintenance Data**

1.5.1 Provide data for incorporation into Maintenance Manual. Provide four sets.

1.5.2 Operation and Maintenance Manual to include instructions for particular unit supplied and not general description of units manufactured by supplier and:

- .1 Operation and maintenance instructions for engine, alternator battery charger, battery, fuel system, engine room ventilation system, cooling system, exhaust system and accessories, to permit effective operation, maintenance, and repair.
- .2 Technical data:
  - .1 Illustrated parts list with parts catalogue number.
  - .2 Schematic diagram of electrical controls.
- .3 Flow diagrams for:
  - .1 Fuel system.
  - .2 Schematic diagram of electrical controls.
  - .3 Flow diagrams for:
    - .1 Fuel system.
    - .2 Lubricating oil.
  - .4 Certified copy of factory test results.

**1.6 Maintenance Materials**

1.6.1 Provide maintenance materials in accordance with Section 26 01 01

1.6.2 Include:

- .1 2 fuel filter replacement elements.
- .2 2 lube oil filter replacement elements.

- .3 2 air cleaner filter elements.
- .4 2 sets of fuses for control panel.
- .5 2 sets of approved headphone style ear protectors.

#### **1.7 Factory Test**

- 1.7.1 Supplier shall conduct performance and full load tests in his factory under supervision of the Consultant or his representative upon completion of assembly at factory and prior to shipping to prove that unit will start automatically pick up, load, and operate as required.
- 1.7.2 The test shall include:
  - .1 Demonstration of automatic start system.
  - .2 A one hour full load test, utilizing an adjustable load.
  - .3 Demonstration of safety features.
  - .4 During test, the following parameters shall be recorded at 30-minute intervals:
    - .1 Speed and frequency.
    - .2 Voltage and current per phase.
    - .3 Load.
    - .4 Coolant temperatures.
    - .5 Lubricating oil pressure.
    - .6 Fuel consumption for duration of test shall be noted.
- 1.7.3 Any undue overheating or failure of any component, caused by this overload, shall be considered a cause for rejection of plant design.
- 1.7.4 Electronic copies of certified test results shall be submitted upon completion of factory test procedure.

#### **1.8 Acceptance Test (Final On-Site Testing**

- 1.8.1 A satisfactory acceptance test shall be conducted after preliminary runs and tests have been made. This test shall be conducted on site after completion of installation. This acceptance test shall not be of less than four hours duration with full rated load on unit. Engine Manufacturer shall provide a 110% portable load bank of full rated load. After completion of above test, tests shall be performed to demonstrate overheat protection, low oil pressure protection and overspeed protection. Miscellaneous valves and piping required to demonstrate functioning of safety devices shall be provided.
- 1.8.2 The following data shall be taken at the test and at half hour intervals thereafter:
  - .1 Frequency.
  - .2 Voltage.
  - .3 Load (amperes).

- .4 Kilowatts.
- .5 Water temperatures (inlet and outlet).
- .6 Lubricating oil pressure.
- .7 Ambient temperature.
- 1.8.3 On completion of the site acceptance test, the supplier shall perform the following tests and demonstrate the satisfactory operation of the following control devices:
  - .1 High water temperature switch.
  - .2 Low oil pressure switch.
  - .3 Overcranking switch.
  - .4 Overspeed switch.
  - .5 Low water level.
  - .6 Low fuel supply level. (Sub base fuel tank).
  - .7 Low battery voltage level.
  - .8 Provide alignment of any flexible couplings.
- 1.8.4 Note: Before connection to building electrical system phase, rotation shall be checked for compatibility.
- 1.8.5 Fuel required for performing diesel generator acceptance test shall be provided by Division 26.
- 1.8.6 A competent diesel generator expert shall instruct the Owner's staff in maintenance and operation.

**1.9 Closeout**

- 1.9.1 Provide Seismic Letter of Assurance (S-B and S-C) from Structural P.Eng. registered in British Columbia for the seismic installation of the unit.

**1.10 Guarantee**

- 1.10.1 Provide a written guarantee, signed, and issued stating that the generating set is guaranteed against defects in material and workmanship for a period of one year, or 1500 operating hours, whichever occurs first, from the date of the Substantial Performance.

**2. PRODUCTS**

**2.1 Generator Set**

- 2.1.1 Provide a complete emergency diesel generator system including engine, alternator, starting battery, battery charger, start-up circuitry, control terminal cabinet, muffler, sub base tank, fuel pump, skin tight enclosure etc., as detailed and complete with all

interconnecting wiring, etc., required for this system to be fully operational.

- 2.1.2 The diesel generator shall be fully assembled with integral sub-base fuel tank. The unit shall be provided with all auxiliary systems connected and ready for operation. It shall only require setting and anchoring on its foundation at site and connection of electrical power and control wiring. Provide all necessary materials and labour at site to complete the assembly as may be necessary. The Installation Contractor shall offload the set at site, set and anchor it to its foundations and connect the external services to their connection points. Provide all other services and materials necessary to make the unit fully operational.
- 2.1.3 Sub base fuel tank to be sized for 24 hour back.
- 2.1.4 Comply with the following minimum performance standards for each individual generator set:
  - .1 Frequency:
    - .1  $\pm 1/4\%$  steady state stability at any load.
    - .2 Maximum  $1/2\%$  steady state regulation (droop) no load to full load.
    - .3 In accordance with CSA 282 requirements, maximum transient frequency dip shall not exceed 10% of rated frequency, with recovery to steady state within 3 seconds, for the maximum expected kW/kVA step load application. For these specifications, the step load application requirement for compliance with the 10%/3-second requirement is 70% rated at 0.8 pf. In addition, generator set shall be capable of application of step load of 100% rated kW at 0.8 PF, with frequency dip not to exceed 25% rated and recovery to rated conditions in 5 seconds.
  - .2 Voltage:
    - .1  $\pm 1\%$  steady state stability at any load.
    - .2 Maximum 1% steady state regulation no load to full load.
    - .3 Transient voltage maximum 25% of nominal with recovery to steady state within 5 seconds for the maximum expected kW/kVA load change.
- 2.1.5 Alternator shall be new and complete with necessary controls and accessories, to comprise a complete generating plant.
- 2.1.6 Generator shall operate a 60 Hz and shall be 600V three phase 4 wire drip-proof type with anti-friction bearings and shall have radio and TV interference suppression in accordance with applicable standards. 400kW.

- 2.1.7 The generator's neutral shall not be grounded inside the generator.
- 2.1.8 Generator shall be of rotating type with permanent magnetic generator (PMG).
- 2.1.9 Generator shall have Class H insulation and shall be rated for maximum 130°C temperature rise over an ambient of 40°C.
- 2.1.10 Generator shall be capable of providing sufficient short circuit current for duration necessary to trip generator main protective device without damaging the generator windings or insulation.
- 2.1.11 Generator shall be complete with automatic voltage regulator and exciter, acting on each phase and capable of controlling voltage +/- 2% of rated voltage, no load to full load, during steady state conditions.
- 2.1.12 Stable generator operating conditions shall be re-established within 3 seconds following any sudden change in load between no load and full load. The transient voltage surge shall not exceed 20% for the above load changes. The regulator shall have a rheostat capable of adjusting the generator terminal voltage +/- 5%. Largest motor to be connected on generator shall be 25HP.
- 2.1.13 The maximum allowable voltage dip during starting of any motor shall be 15%.
- 2.1.14 Decrement and generator damage curves shall be submitted to show fault current sustaining ability of generator.

## 2.2 Engine

- 2.2.1 Provide a diesel engine having a net continuous duty output standby power rating at least equal to the generator output plus excitation system requirements, direct coupled to the generator.
- 2.2.2 The speed of the generating set shall not exceed 1800 RPM and must be approved by the Engine Manufacturer for continuous operation. The Manufacturer shall certify that the proposed speed does not exceed 90% of the maximum engine speed approved by the Manufacturer for other applications.
- 2.2.3 The engine shall be water cooled, naturally aspirated or turbo-charged.
- 2.2.4 The engine, generator, radiator and fan shall mounted on a structural steel base. Base shall be of substantial mass and shall be torsionally rigid. Base shall be designed to permit ready removal of engine oil pan.
- 2.2.5 Vibration and Seismic Control as required by Seismic Engineer
- 2.2.6 Net brake horsepower, after allowance has been made for losses to engine driven accessories, shall be sufficient BHP to correspond to rated generator KW as determined by formula:
- 2.2.7  $BHP = \frac{KW}{\text{efficiency}}$

2.2.8 0746 x generator efficiency

2.2.9 BHP, plus allowance for engine driven accessories, shall not exceed 80% of maximum BHP of engine at generator RPM as substantiated by Engine Manufacturer's regularly published BHP curves. Engine rating conditions shall be 40 degrees C ambient. Engine Manufacturer shall either show horse-power curves at these conditions or at other conditions together with derating factors including data on losses to engine driven accessories.

2.2.10 Provide all necessary auxiliary equipment including:

- .1 Electrical governor with isochronous frequency regulation to maintain speed within  $\pm 10\%$ -25% steady state band.
- .2 Fuel injection system and fuel transfer pump.
- .3 Condensate trap complete with drain for crankcase breather.
- .4 Replaceable cartridge type lube oil filters. Filters shall have replaceable elements that can be easily removed without disturbing other parts of engine.
- .5 Combustion air cleaner. Air cleaner shall be of replaceable element type with an efficiency of at least 99.8%. Provide air filter service indicator.
- .6 Full pressure lubrication system with gear driven pump, pressure regulator, replaceable element filter with by-pass valve, supplying filtered lubricating oil under pressure to main bearings, crank pin bearings, piston pins, timing gears, camshaft bearings, valve rocker mechanism and governor. Readily accessible drain valves with suitable piping shall be provided for convenient draining of complete lubricating oil system. A water-cooled lubricating oil cooler shall be included. Provide lube oil pressure gauge.
- .7 Engine jacket, water cooling system complete with water pump, radiator and pusher fan. Radiator shall be flange type suitable for direct connections. Antifreeze to be provided for temperature to -20 degree C. Provide engine water coolant conditioner.
- .8 To ensure prompt starting, provide engine block heaters controlled by aquastat. Block heaters shall be of size as recommended by Manufacturer. Block heaters shall be located to heat water in block and not circulate it through radiator. Provide all circuits and fuses.
- .9 Electric starter suitable for 24 V.D.C.

## **2.3 Control Panel and Safety Devices**

2.3.1 Totally enclosed, engine mounted complete with vibration mount. Flexible conductors between door and fixed panel.

- 
- .1 The alternator instrument panel shall be wired, tested and shock mounted on the generator set by the manufacturer of the alternator. It shall provide the following controls and indicating lights on control panel.
- 2.3.2 Front panel face:
- .1 LCD display with at 16 character and 2 line complete with LED backlight
  - .2 Tactile-feel membrane switches for control and display navigation, generator operation and control set up.
  - .3 Switches are indicated by internationally accepted symbols
  - .4 Information display shall include:
    - .1 Data Logs
      - .1 Engine run time and controller on time
    - .2 Fault History
    - .3 Record of most recent fault conditions with control hours time stamp.
    - .4 Up to 5 events are stored in the control non-volatile memory
    - .5 Alternator Data
      - .1 Voltage
      - .2 single or three phase line to line and line to neutral
      - .3 Current
      - .4 single or three phase
      - .5 kVA
      - .6 three phase and total
      - .7 Frequency
    - .6 Engine Data
      - .1 Starting battery voltage
      - .2 Engine running hours
      - .3 Engine temperature
      - .4 Engine oil pressure
    - .7 Service/Control Adjustments
      - .1 Voltage selection
      - .2 Frequency selection
      - .3 Configurable input set up
      - .4 Configurable output set up
      - .5 Meter Calibration
      - .6 Units of measurement
  - .5 Emergency stop push button.
  - .6 The PLC shall control and monitor the ATS operation and the generator paralleling to the Utility. It shall provide alarm and status monitoring with indication.

- .7 Configure the PLC for TCP/IP and Modbus RS-485 communications and a separate RS-232 port for programming.
- .8 Generator Protection/Alarms with audible signal and silence push button for the following engine failures per CSA Standards.

Unsafe Operating Condition	Alarm	Engine Shutdown
Low Coolant temperature (i.e., unsuitable for a reliable start)	X	X
High Coolant temperature		X
Low Coolant Level	X	
Lubricating oil pressure below manufacturer's recommended safe operating range	X	
Lubricating oil pressure at shutdown condition	X	X
Fuel supply less than sufficient for 3 hours operation	X	
Fuel Leak/Critical Low Fuel		X
Engine temperature above safe operating range	X	
Engine temperature at shutdown condition	X	X
Engine has failed to start after programmed cranking period (not over 30s)	X	X
Engine speed exceeds limit recommended by manufacturer	X	X
Battery Charger Failure	X	

Note: All alarms shall be individually annunciated.

- .9 Fault reset.
- .10 Engine elapsed time meter.

#### 2.3.3 Interior

- .1 Molded case circuit breaker 3 phase, (Refer to drawing for rating). Supplier to ensure proper coordination with the generator at all levels of overcurrent.
- .2 Potential transformers.
- .3 Current transformers.
- .4 1 automatic voltage regulator complete with 3 phase sensing.
- .5 1 full capacity neutral bar.

- .6 1 engine alarm and control panel complete with lock-in alarm for the engine fault conditions as listed above.
- .7 3 cycle cranking.
- .8 1 pilot relay for remote indication of unit run.
- .9 1 cranking relay.
- .10 1 fault relay.
- .11 Reset of all faults by operating reset switch. System shall not cancel indication of fault until reset switch has been operated and fault cleared.
- .12 Electronic speed switch for crank disconnect and overspeed sensing.

## 2.4 **Starting System**

- 2.4.1 Provide 12 or 24 volt D.C. electric starting system for the diesel, including starting motor, regular and sealed lead calcium selenur selenium or lead antimony batteries, capable of providing three 30-seconds cranking cycles without recharging. A fully automatic battery charger with monitor circuit to prevent overcharging batteries shall be provided, complete with battery rack and cables.
- 2.4.2 Battery charger shall be 12 or 24 volt, 1.5/3 amp minimum, remote mounted. Cables with minimum of 5% voltage drop during cranking shall be provided from the battery to the engine in an enclosed conduit complete with bushed ends.

## 2.5 **Fuel System**

- 2.5.1 Provide a galvanized sheet metal oil drip pan under the engine.
- 2.5.2 Provide a sub-base fuel tank sized to accommodate a minimum of 72 hrs of fuel. Tank shall be Underwriters approved and labelled sub-base fuel tank with capacity as scheduled. The tank shall be constructed of steel ULC CAN4-S601 and/or CAN\$-S630, current edition, standards. The tank will require suction and return lines, fill and vent connections with the suction line terminating 100 mm above the bottom of the tank. Tank shall have a "CONTAINMENT TANK" or "DOUBLE WALLED TANK". Second containment to have 150% capacity.
  - .1 Tank Acceptance
  - .2 Before installing tank, inspect visually for and report any damage. Air test in accordance with governing Provincial legislation to a minimum of 34 kPa. In the absence of specific legislation air test at 34 kPa for two (2) hours.
  - .3 Accessories
    - .1 Provide, for each tank, a tank mounted fuel gauge to indicate the approximate level of contents a low level

float switch to indicate an external alarm when the level of fuel in the tank falls below 25% of capacity.

- .2 Filling of fuel will be provided by Division 26. The Contractor shall check the fuel system for leaks during and following first filling.
- .3 Install fuel tank in strict accordance with Manufacturer's instructions, National Fire Code and CSA-B139.M91 Codes. Bolt tank to foundations. Refer to Clause 2.6 Seismic Restraints.

2.5.3 This contractor is responsible for the Initial filling of fuel and the complete filling of fuel after all required tests are completed.

2.5.4 Monitoring of second containment tank

- .1 Fuel Leak - Alarm.
- .2 Overfill of tank – Alarm.

## **2.6 Safety Devices (Remote Annunciator)**

2.6.1 The engine shall be equipped with the following automatic safety devices, which will instantly shut down the engine and actuate visible lights and audible sonalert in the control panel. Provide additional contacts to enable shut down alarms to be signalled at a remote location.

2.6.2 Terminate wiring from all safety devices and controls to terminal blocks located in cabinet on the engine. Control wire shall have termination identification of each wire for ease of tracing.

2.6.3 Provide remote summary trouble buzzer, silence switch, reset button and shut down signal in a flush stainless-steel plate located where indicated on the Contract drawings. Operation of the silence button cancels the buzzer but maintain a monitory beep until problem is rectified. Remote annunciator shall include:

- .1 Unit ready LED.
- .2 Unit run LED.
- .3 Unit fail LED and alarm (audible).
- .4 Low battery flashing LED and alarm (audible).
- .5 Silence switch.
- .6 Test switch.

- .1 Note: Output signals shall be provided in the generator control panel to operate the remote annunciator.

2.6.4 Provide a single lockable, monitored breaker c/w local alarm to meet the intent of CSA 282 8.7.1. Send over and coordinate all required information for breaker coordination to comply with the intent of CSA 8.7.2.

---

**2.7 Exhaust System**

- 2.7.1 Include exhaust system complete with muffler and flexible connection.
- 2.7.2 The muffler shall be heavy duty, critical grade type. Submit attenuation characteristics of muffler to Engineer for review.
- 2.7.3 Muffler shall be complete with condensate drain and drain cock at outlet end of muffler.

**2.8 Enclosure**

- 2.8.1 Sound attenuated enclosure , skin tight, rated for 70dB @ 7 meters.

**2.9 Generator Set Accessories**

- 2.9.1 Block Heater: Provide 208 V AC, 1-phase coolant circulating pumps and heavy duty 208 V AC, 1-phase block heaters, thermostatically controlled, sized to maintain 40°C coolant temperature with ambient temperature of +10°C. Locate control thermostat to sense and maintain coolant temperature such that top of engine block is maintained at 40°C to 60°C. Provide separate oil pressure switch and controls to turn pump and heater power off when engine is running. Plumb heater for forced pump circulation. Coordinate block heater kW rating and circulation plumbing size/routing to avoid localized boiling of coolant in block heater. Oversize or poorly circulating block heaters will be cause for non-acceptance of equipment until rectified. Provide AC-powered block heater circulation pump with TEFC close-coupled motor and combination starter, all mounted and wired. Control pump to operate whenever block heater is on.
- 2.9.2 Cycle-Lubrication Pump: Provide unit-mounted, wired, and plumbed AC or DC-operated cycle-lubrication pump. Pump is to provide automatic engine lubrication for approximately one minute per 8 hours or per manufacturer's recommendations. Size pump and select controls to avoid over-lubrication. Lock out pump during engine operation. Provide check valves and isolation valves. Pump delivery is to enter engine before the oil filters so that only filtered oil is delivered. Configure pump suction and provide delivery valves to utilize circulation pump for removal of sump oil during oil changes. Provide manual pushbutton for local pump run. AC pump and controls are to be CSA-approved and installed in accordance with B.C. Electrical Code requirements.
- 2.9.3 Provide generator with an on engine fuel transfer pump with all piping and including vents.

---

**2.10 Generator Manufacturers**

- 2.10.1 Alternator and exciter shall be CSA approved and as manufactured by one of the following: Generac, Kato, Leroy Somer, Kohler, Onan, Stamford, Marathon or approved equal.
- 2.10.2 The diesel set shall be CSA approved and manufactured by one of the following: Detroit Diesel, Generac, Cummins Diesel, Caterpillar/CAT, Mitsubishi, Onan, Kohler or approved equal.
- 2.10.3 Instruments, meters and switches shall be CSA approved and as manufactured by one of the following: Schneider Electric Westinghouse Canada Ltd., Canadian General Electric Co. Ltd., Sangamo Co. Ltd., Generac, Compton Parkinson, Kohler, Enerlec, Onan.

**2.11 Electrical Generator System Remote Monitoring**

- 2.11.1 Provide interconnection with building fire alarm system to monitor the following:
  - .1 Generator running status
  - .2 Generator trouble
  - .3 Generator low fuel alarm
  - .4 CSA 282 8.7.2 breaker trouble
- 2.11.2 Provide all PT's and controllers required to achieve the remote monitoring noted

**3 . EXECUTION**

**3.1 Installation**

- 3.1.1 Coordinate with Installation Contractor for all final installation dimensions, locations, connections, and miscellaneous installation materials.
- 3.1.2 Obtain approval from Consultant for any significant changes in equipment location or connection.
- 3.1.3 Verify Installation Contractor's electrical connections to the generator set, switchgear and accessories as shown on Electrical Plans. Testing of power cables will be carried out by the Installation Contractor.
- 3.1.4 Set and test all protective devices.
- 3.1.5 Allow in the tender price for testing and commissioning work to be done during non-standard work hours. All testing shall comply with the CSA C282 requirements.
- 3.1.6 Locate generating unit and install in location as indicated.
- 3.1.7 Complete wiring and interconnections.

- 3.1.8 Start generating set and test to ensure correct performance of components with the help of the manufacturer.
- 3.1.9 All conduit or pipe connections to engine generator shall have flexible section to allow for vibration and noise transmission dampening.
- 3.1.10 Suitably protect all hot spots and moving parts to prevent accidental contact by personnel. Provide conspicuous sign, warning personnel that engine may start automatically at any time.
- 3.1.11 Connect all controls.

**3.2 Delivery, Storage and Handling**

- 3.2.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 3.2.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 3.2.3 Handle materials with suitable lifting equipment.
- 3.2.4 Store materials in heated, dry, weather-protected enclosure

**3.3 System Start-Up**

- 3.3.1 Preparation: before starting unit, carry out thorough mechanical and electrical inspection of equipment, and perform following checks and adjustments:
  - .1 Disconnect battery cables from batteries to prevent accidental starting.
  - .2 Turn engine several revolutions by means of hand-barring devices to ensure parts are free and there are no obstructions to its running.
  - .3 Check engine/generator alignment readings to ensure they match readings attained at time of manufacture.
  - .4 Check fluid levels and top up as necessary. Pre-lubricate engine and turbochargers as recommended by engine manufacturer. Install drip pan beneath engine.
  - .5 Ensure cooling system antifreeze is effective to at least - 40°C.
  - .6 Check belts for correct tension and adjust as necessary.
  - .7 Check and grease, grease points.
  - .8 Check and tighten properly nuts, bolts, etc.
  - .9 Ensure safety guards are in place and properly secured.
  - .10 Check linkages for damage and freedom of movement.
  - .11 Check fuel supply system for leakage.
  - .12 Ensure fuel supply and fuel injection systems are properly primed.

- 
- .13 Check and tighten properly electrical connections.
  - .14 Check starting battery electrolyte level specific gravity and for proper installation.
  - .15 Check battery charger for proper operation and adjust as necessary.
  - .16 Carry out generator winding insulation resistance test. If reading is unacceptable, carry out recognized drying procedure. Do not start unit until satisfactory reading has been achieved.
  - .17 Check jacket coolant heater for proper operation.
  - .18 Complete additional preparations deemed necessary.
- 3.3.2 Performance verification: on completion of start-up preparations, take following action:
- .1 Have at hand, during initial start-up, means for choking off air supply to engine air induction manifold in event of engine run away or other emergency.
  - .2 Reconnect starting battery cables to starting battery.
  - .3 Start unit and allow for warm up. Stop unit if abnormal conditions are encountered.
  - .4 Check for and correct leakage from exhaust system, fuel system, cooling system, and lubricating oil system.
  - .5 Adjust vibration isolators.
  - .6 Observe and ensure that lubricating oil pressure and coolant temperature are within limits and no harmful vibration or sounds are evident.
  - .7 Ensure voltage is within operating parameters and automatic voltage regulator is operating correctly.
  - .8 Ensure manual voltage control is operating correctly.
  - .9 Ensure frequency is within operating parameters and electronic governor is operating correctly.
  - .10 Check engine air ventilation system for proper operation.
  - .11 Check operation of engine-mounted protective sensing devices and adjust as necessary.
  - .12 Check phase sequence of normal power supply and ensure emergency power supply are in same sequence.
  - .13 Check operation of electronic controller protection, transfer, timing, metering, and annunciator functions and adjust as necessary.
  - .14 Check operation and calibration of analog metering and adjust as necessary.
  - .15 Apply electrical load, read the metres, and correlate these readings.
  - .16 Demonstrate:
-

- .17 Unit start, set up load for 25% of full load , transfer to load, increase the load by 25% increment till full load, retransfer to normal power, unit shutdown, on "automatic" control.
  - .1 Unit start, transfer to load (100% full load), decrease the load by 25% increment till No load, retransfer to normal power, unit shutdown, on "automatic" control. Unit start, transfer to load, retransfer to normal power, unit shutdown, on "automatic" control.
  - .2 Unit start, transfer to load, retransfer to normal power, unit shutdown, on "full load test" control. Unit start and shutdown, on "no load test" control.
  - .3 Unit cranking, start, and shutdown by means of engine-mounted key switch.
  - .4 Run unit on load for minimum period of eight hours to show load-carrying capability, stability of voltage and frequency, and satisfactory performance of engine ventilating system to provide adequate cooling.
  - .5 Every 1/2 hour carry out and record readings on Test Chart.
- .18 Perform additional tests as required by Engineer to ensure unit is operating satisfactorily.

### **3.4      Description of System Integration**

- 3.4.1 Provide all material, equipment and services necessary for a complete and operational generator.
- 3.4.2 Generator shall be prime type.
- 3.4.3 Building Management System (BMS) Integration
  - .1 The system protocol shall be native BACnet/IP certified and fully compatible with the BMS. Gateways will not be accepted. The system software programmable controllers shall reside/communicate with the BACnet/IP on the management or automation level networks of the Building Management System.
  - .2 Engineer to identify minimum requirements for the generator and list of points to be sent to the BAS controller (i.e. generator status, generator alarms, fuel level, etc.)

### **3.5      Owner's Instruction**

- 3.5.1 Provide instruction to site operation and maintenance staff for proper care, operation, and maintenance of equipment.

---

**3.6 Commissioning**

- 3.6.1 Do site commissioning of the gas electric generator unit by qualified gas electric technician in accordance with Section 01 91 00 - General Commissioning Requirements.
- 3.6.2 Provide commissioning report included time delay settings, operational set points and adjustment ranges.

**3.7 Qualifications**

- 3.7.1 Provide proof of Gas electric technician qualification to Engineer.

**3.8 Acceptable Manufactures**

- 3.8.1 Toromont
- 3.8.2 Or approved equal.

**3.9 Testing**

- 3.9.1 Perform tests in accordance with PART 1.
- 3.9.2 Notify Engineer 10 working days in advance of test date.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Section Includes**

- 1.1.1 Materials, components and installation for electric power generating equipment and system start-up.

### 1.2 **Related Sections**

- 1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.
- 1.2.2 Section 01 29 00 - Payment Procedures - Testing Laboratory Services.
- 1.2.3 Section 01 74 21 - Construction/Demolition Waste Management And Disposal.
- 1.2.4 Section 01 91 00 - General Commissioning Requirements.
- 1.2.5 Section 01 79 00 - Demonstration and Training.

### 1.3 **References**

- 1.3.1 Canadian Standards Association (CSA International)
  - .1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1
  - .2 CAN/CSA-B139-00(October 2001), Installation Code for Oil-Burning Equipment.
  - .3 CSA 282 - 19
- 1.3.2 Transport Canada - Marine Safety (TCMS)
  - .1 Approved Products Catalogue Index (APCI) - Structural Fire Prevention Item.
    - .1 Non-Combustible Material - Cloth and Paper.
- 1.3.3 Underwriters' Laboratories of Canada (ULC)

### 1.4 **Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
  - .1 Separate and recycle waste materials in accordance with Section 01 74 00 – Cleaning and Waste management.

- 
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
  - 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
    - .1 Construction Waste Management / Product Waste Recyclability.
    - .2 Recycled Content.
    - .3 Local and Regional Materials.
    - .4 Certified Wood.
    - .5 Construction Indoor Air Quality (IAQ) management.
    - .6 VOC/Low-Emitting Materials Compliance.
  - 1.4.5 **NOTE:** Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.
  - 1.5 **Submittals**
    - 1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.
    - 1.5.2 Product Data:
      - .1 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
      - .2 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.
    - 1.5.3 Sample:
      - .1 Submit samples in accordance with Section 01 33 00 - Submittal.
    - 1.5.4 Quality Assurance:
      - .1 Engineer reserves the right to witness standard factory testing of the above.
      - .2 Submit site tests results of installed electrical systems and instrumentation

1.5.5 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

**1.7 System Start-Up**

- 1.7.1 Preparation: before starting unit, carry out thorough mechanical and electrical inspection of equipment, and perform following checks and adjustments:
  - .1 Disconnect battery cables from batteries to prevent accidental starting.
  - .2 Turn engine several revolutions by means of hand-barring devices to ensure parts are free and there are no obstructions to its running.
  - .3 Check engine/generator alignment readings to ensure they match readings attained at time of manufacture.
  - .4 Check fluid levels and top up as necessary. Pre-lubricate engine and turbochargers as recommended by engine manufacturer. Install drip pan beneath engine.
  - .5 Ensure cooling system antifreeze is effective to at least -40°C.
  - .6 Check belts for correct tension and adjust as necessary.
  - .7 Check and grease, grease points.
  - .8 Check and tighten properly nuts, bolts, etc.
  - .9 Ensure safety guards are in place and properly secured.
  - .10 Check linkages for damage and freedom of movement.
  - .11 Check fuel supply system for leakage.
  - .12 Ensure fuel supply and fuel injection systems are properly primed.
  - .13 Check and tighten properly electrical connections.
  - .14 Check starting battery electrolyte level specific gravity and for proper installation.

- 
- .15 Check battery charger for proper operation and adjust as necessary.
  - .16 Carry out generator winding insulation resistance test. If reading is unacceptable, carry out recognized drying procedure. Do not start unit until satisfactory reading has been achieved.
  - .17 Check jacket coolant heater for proper operation.
  - .18 Complete additional preparations deemed necessary.
  - 1.7.2 Performance verification: on completion of start-up preparations, take following action:
    - .1 Have at hand, during initial start-up, means for choking off air supply to engine air induction manifold in event of engine run away or other emergency.
    - .2 Reconnect starting battery cables to starting battery.
    - .3 Start unit and allow for warm up. Stop unit if abnormal conditions are encountered.
    - .4 Check for and correct leakage from exhaust system, fuel system, cooling system, and lubricating oil system.
    - .5 Adjust vibration isolators.
    - .6 Observe and ensure that lubricating oil pressure and coolant temperature are within limits and no harmful vibration or sounds are evident.
    - .7 Ensure voltage is within operating parameters and automatic voltage regulator is operating correctly.
    - .8 Ensure manual voltage control is operating correctly.
    - .9 Ensure frequency is within operating parameters and electronic governor is operating correctly.
    - .10 Check engine air ventilation system for proper operation.
    - .11 Check operation of engine-mounted protective sensing devices and adjust as necessary.
    - .12 Check phase sequence of normal power supply and ensure emergency power supply are in same sequence.
    - .13 Check operation of electronic controller protection, transfer, timing, metering, and annunciator functions and adjust as necessary.
    - .14 Check operation and calibration of analog metering and adjust as necessary.
    - .15 Apply electrical load, read the metres, and correlate these readings.
    - .16 Demonstrate:

- .17 Unit start, set up load for 25% of full load , transfer to load, increase the load by 25% increment till full load, retransfer to normal power, unit shutdown, on "automatic" control.
  - .1 Unit start, transfer to load (100% full load), decrease the load by 25% increment till No load, retransfer to normal power, unit shutdown, on "automatic" control. Unit start, transfer to load, retransfer to normal power, unit shutdown, on "automatic" control.
  - .2 Unit start, transfer to load, retransfer to normal power, unit shutdown, on "full load test" control. Unit start and shutdown, on "no load test" control.
  - .3 Unit cranking, start, and shutdown by means of engine-mounted key switch.
  - .4 Run unit on load for minimum period of eight hours to show load-carrying capability, stability of voltage and frequency, and satisfactory performance of engine ventilating system to provide adequate cooling.
  - .5 Every 1/2 hour carry out and record readings on Test Chart.
- .18 Perform additional tests as required by Engineer to ensure unit is operating satisfactorily.

## **1.8 Description of System Integration**

- 1.8.1 Provide all material, equipment and services necessary for a complete and operational generator.
- 1.8.2 Generator shall be prime type.
- 1.8.3 Building Management System (BMS) Integration
  - .1 The system protocol shall be native BACnet/IP certified and fully compatible with the BMS. Gateways will not be accepted. The system software programmable controllers shall reside/communicate with the BACnet/IP on the management or automation level networks of the Building Management System.
  - .2 Engineer to identify minimum requirements for the generator and list of points to be sent to the BAS controller (i.e. generator status, generator alarms, fuel level, etc.)

## **1.9 Owner's Instruction**

- 1.9.1 Provide instruction to site operation and maintenance staff for proper care, operation, and maintenance of equipment.

---

**1.10 Commissioning**

- 1.10.1 Do site commissioning of the gas electric generator unit by qualified gas electric technician in accordance with Section 01 91 00 - General Commissioning Requirements.
- 1.10.2 Provide commissioning report included time delay settings, operational set points and adjustment ranges.

**1.11 Qualifications**

- 1.11.1 Provide proof of Gas electric technician qualification to Engineer.

**1.12 Acceptable Manufactures**

- 1.12.1 Toromont
- 1.12.2 Or approved equal.

**2 . PRODUCTS**

**2.1 Materials**

- 2.1.1 Provide following materials:
  - .1 Conduits and boxes as required.
  - .2 Copper fuel lines and fittings as required.
  - .3 ULC automatic fire shutoff valve.
  - .4 Primary fuel filter/water separator.
  - .5 Insulation for exhaust system.
  - .6 Electrical components as indicated.
  - .7 Wiring material.
  - .8 Antifreeze, ethylene glycol.
  - .9 Manual IPU bypass switch.
  - .10 All wiring and materials, including necessary [rigid] steel conduits and fittings for making connections.
  - .11 The power circuit cables will be as sized per single line diagram, RW90 (-40°C) cross link polyethylene, multiple conductors, shielded.
  - .12 The control circuit cables will not be less than No. 14, RW90, [single] [multiple] conductor[s], colour or number coded.
  - .13 Electronic governor control cable shall be minimum size No. [18] stranded copper conductor, shielded complete with drain wire and overall PVC jacket.
  - .14 Battery cable shall be welding cable type, extra flexible, rope stranded copper conductor with neoprene oil-resistant insulation, sized to limit voltage drop to 5% at time of peak load.

---

### 3 . **EXECUTION**

#### 3.1 **Locating and Mounting**

- 3.1.1 Locate unit as indicated.
- 3.1.2 Fit and adjust isolators in accordance with manufacturer's installation and adjustment instruction bulletin contained in unit manual.
- 3.1.3 Do not bolt housings to foundation if isolator housing feet are equipped with 6 mm rubber sound pads.

#### 3.2 **Alignment Check**

- 3.2.1 Since Engine-generator shaft alignment is adjusted at factory, check to ensure that no change has occurred due to shipment and handling.
- 3.2.2 Where engine and generator housings are close coupled and instruments at hand are not suitable for measuring alignment within confines of housings, just loosen engine and generator hold down bolts and ensure that each foot is carrying proportionate amount of weight and feet are level on base plate.

#### 3.3 **Gas Supply System**

- 3.3.1 Install Gas piping in accordance with CAN/CSA-282:19.
- 3.3.2 Inspect thoroughly fuel tank and lines to ensure they are clean and free of foreign material before connecting fuel system.
- 3.3.3 Install primary gas separator and servicing shutoff valves as indicated.
- 3.3.4 Install ULC automatic fire shutoff valve. Locate upstream of any combustible gas system component.
- 3.3.5 Install supply gas lines between engine and main gas lines. Install flexible sections between the engine, using materials supplied with unit.
- 3.3.6 Hard drawn copper pipe joints to be brazed or silver soldered.
- 3.3.7 Brazing or soldering alloys to have minimum melting point of 450°C.
- 3.3.8 Neatly install fuel lines parallel or perpendicular to building lines with no kinks or dents.
- 3.3.9 Install soft drawn copper fuel lines using brass 45 degrees flare and pipe fittings as required and bend with correct size lever type bending tool. Entirely replace leaking fuel lines.
- 3.3.10 Protect gas lines from mechanical damage.

---

**3.4 Batteries and Charger**

- 3.4.1 For dry charged batteries, activate in accordance with manufacturer's instructions in the unit manual prior to installation.
- 3.4.2 For wet batteries, inspect individually each battery cell and check electrolyte level. Check charge condition by measuring temperature and specific gravity of electrolyte. Consult manufacturer's instructions for recommended readings. If readings are lower, give batteries freshening charge until reading are reached.
- 3.4.3 Locate batteries as indicated and ensure that batteries are accessible for service. Run and protect cables to starting motor using cables supplied with unit.
- 3.4.4 Install battery charger on wall, adjacent to batteries and make connection to batteries.
- 3.4.5 Clean connections and tighten securely.
- 3.4.6 Install removable plexiglass cover on batteries.

**3.5 Exhaust System**

- 3.5.1 Install exhaust pipe and silencer using material supplied with unit.
- 3.5.2 Arrange silencer above and approximately in line with engine exhaust manifold with exhaust tail pipe protruding through thimble in wall.
- 3.5.3 Extend tail pipe not less than one metre beyond outside wall.
- 3.5.4 Support silencer with hangers so no weight or stress is applied to engine exhaust manifold or turbocharger.
- 3.5.5 Install flexible exhaust pipe between silencer and manifold.
- 3.5.6 Install exhaust system fireproof insulative material, after test run.
  - .1 Removable fibreglass jacket insulation rated for 650°C with stainless lacing hooks and wires.
    - .1 Jacket to be enclosed on inside by stainless steel mesh with outside cover silicone coated or aluminized fibreglass cloth: to USCG approved Non-Combustible Materials No. 164.009 and TCMS Non-Combustible Materials - Certificate No. F3-Series.
  - .2 Calcium Silicate removable insulation rated for 650°C with exterior stainless steel protective cover and fastenings.

**3.6 Cooling and Ventilation**

- 3.6.1 Install air outlet and inlet louvres and hoods in their respective openings.

- 3.6.2 Install louvre motors and linkages, adjust to ensure louvres are tight in closed position and give free damper movements from fully closed to fully open.
- 3.6.3 Where canvas boot is not provided, maintain 13 mm clearance between radiator and air outlet duct.
- 3.6.4 Mount thermostat in strategic position, away from inlet louvre as indicated.
- 3.6.5 Install conduits and junction boxes and make connections from louvre motors to thermostat and to 120/24 V AC transformer[in panel.
- 3.6.6 Fill engine radiator with water/ethylene glycol antifreeze mix good for -40°C.
- 3.6.7 Install remote radiator including piping, valves, fittings and pumps as indicated.

### **3.7 Control and Transfer Panel**

- 3.7.1 Locate panels as indicated.
- 3.7.2 Make control and power circuit connections as indicated.
- 3.7.3 Identify cables at both ends.
- 3.7.4 Tag with slip-on wire maker, each wire end with number corresponding to number in panel.
- 3.7.5 Make terminations with self-insulated terminals of flanged fork or ring type.

### **3.8 Additional Works**

- 3.8.1 Complete any additional work as instructed by Engineer to:
  - .1 Ensure equipment is safe to operate.
  - .2 Provide complete and operating system.

### **3.9 Field Quality Control**

- 3.9.1 Qualified gas electric technician to: inspect and verify that installation of interruptible power unit is acceptable and complete. Provide inspection report to the Engineer.

### **3.10 Demonstration and Training**

- 3.10.1 As directed by Engineer and in accordance with Section 01 79 00 - Demonstration and Training carry out demonstrations of complete interruptible power unit for Project Acceptance Board.
- 3.10.2 Provide familiarization training of operating and maintenance staff.

3.10.3 Provide these services for such period, and for as many visits as necessary to put equipment in operation, and ensure that operating personnel are conversant with aspects of its care and operation.

3.10.4 Provide fuel required for performing gas-generator site test and top-up after acceptance test completion.

**3.11 Maintenance – Clearances**

3.11.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.12 Cleaning**

3.12.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.

3.12.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

1.1.1 Materials and installation of Power Factor Correction Equipment.

**1.2 Related Sections**

1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

1.3.1 Canadian Standards Association (CSA International)

- .1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1
- .2 CSA C22.2 No.190 (current edition), Capacitors for Power Factor Correction.
- .3 IEEE-519-1992 or IEEE-519-2014 for the harmonic current limits.

**1.4 Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.

- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 **NOTE:** Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## 1.5 **Submittals**

1.5.1 Provide submittals in accordance with Section 01 33 00 - Submittal.

1.5.2 Product Data:

- .1 Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, and limitations.
- .2 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Sample:

- .1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.4 Quality Assurance:

- .1 Engineer reserves the right to witness standard factory testing of the above.
- .2 Submit site tests results of installed electrical systems and instrumentation

1.5.5 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.

1.5.6 Submit certified test results to Engineer.

1.5.7 Quality Assurance Submittals: submit following in accordance with Section 01 40 00 - Quality Requirements.

- .1 Instructions: submit manufacturer's installation instructions.
  - .1 Engineer will make available 4copies of systems supplier's installation instructions.

---

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

**1.7 Description of System**

- 1.7.1 Provide all material, equipment and services necessary for a complete and operational active harmonic filter equipment.
- 1.7.2 The active harmonic filter shall be provided by reputable supplier who can demonstrate adequate experience in the power quality and active harmonic filtering sector. The supplier's manufacturing process shall be audited in accordance with ISO 9001 quality standard. The supplier shall have their own R&D capabilities for the design, development and technical support of active harmonic filter hardware and control algorithms.
  - .1 The active harmonic filter shall be connected in parallel with the load to be compensated.

**1.8 Building Management System (BMS) Integration**

- 1.8.1 The system protocol shall be native BACnet/IP certified and fully compatible with the BMS. Gateways will not be accepted. The system software programmable controllers shall reside/communicate with the BACnet/IP on the management or automation level networks of the Building Management System.

**1.9 Acceptable Manufactures**

- 1.9.1 ABB
- 1.9.2 Allen-Bradley
- 1.9.3 Or approved equal.

**2 . PRODUCTS**

**2.1 Active harmonic filter characteristics**

- 2.1.1 The active harmonic filter unit shall be compatible with supply voltage from 600 V.
- 2.1.2 The active harmonic filter unit shall be compatible with both 50Hz and 60Hz networks.

- 
- 2.1.3 The nominal output current of the active harmonic filter modules shall be 50A, 100A, 150A and 200A. The total current capacity shall be any combination of these module currents.
  - 2.1.4 The configuration of the active harmonic filter shall be selectable to either 4-wire connection in order to filter harmonics from phase conductors and optionally the neutral conductor.
  - 2.1.5 The active harmonic filter shall not need any external power supplies or controller other than those built into the unit.
  - 2.1.6 The active harmonic filter shall measure all three phases of line current in real time and generate the measured harmonics currents in opposite phase by means of a Digital Signal Processor (DSP) based system.
  - 2.1.7 The active harmonic filter power inverter module shall be neutral point clamped 3-level topology based IGBT technology to provide good and accurate output current. The PWM modulation technology using fixed switching frequency shall be used. The switching frequency shall not be less than 20kHz to minimize audible noise.
  - 2.1.8 The active harmonic filter shall be capable of measuring the network currents from either the supply side or the load side allowing closed loop or open loop current control. The current signal provided by standard current transformers of Class 0.5 accuracy shall be sufficient for proper filter operation and performance.
  - 2.1.9 There shall be galvanic isolation between the current measuring transformer signals and active harmonic filter control electronics input.
  - 2.1.10 The active harmonic filter main circuit shall have galvanic isolation from the power network when active harmonic filter is switched off.
  - 2.1.11 The active harmonic filter shall be capable of filtering simultaneously from the 2nd to the 50th harmonic including even harmonics and interharmonics.
  - 2.1.12 The active harmonic filter shall have an operation mode enabling the user to set a target percentage of wanted mitigation of harmonic components from 2<sup>nd</sup> to the 25<sup>th</sup> harmonics
  - 2.1.13 The active harmonic filter shall be capable of providing fundamental frequency reactive power compensation up to full nominal output. This reactive power can be either capacitive or inductive.
  - 2.1.14 The active harmonic filter shall be capable of load balancing up to full nominal output current.
  - 2.1.15 The active harmonic filter shall have an automatic re-start feature enabling recovery of normal operation after a black out of the supply system or after being subjected to a non-severe condition.
  - 2.1.16 The active filter shall recognize the main voltage rotation and give indication if this is not correct.

- 2.1.17 The active filter shall have the capability to change CT-polarity from the user interface without changing the actual CT-wires.
- 2.1.18 The active harmonic filter shall have speed-controlled fans which are controlled via temperature in order to increase component lifetime and decrease heat losses.
- 2.1.19 The active filter shall be constructed in a way that component changes are possible for service activity.
- 2.1.20 The active filter shall operate correctly when operated at up to the full rated current without any trips in correct environment.
- 2.1.21 The active filter shall be constructed in a way that module protects itself from overheating by derating the output in case of high temperatures.

## **2.2 Output performance**

- 2.2.1 Filtering efficiency shall be not less than 95% provided that filter capacity is sufficient and load rate of the module is between 30 and 90%. The active harmonic filter shall not correct for utility supplied voltage distortion levels. Network nonlinear sources shall have >3% inductive impedance.
- 2.2.2 The active harmonic filter shall have heat losses less than 2.3% of nominal power.
- 2.2.3 The installation network shall not include capacitors without detuning reactors.
- 2.2.4 The active filter shall automatically sense the network angles and operate without any manual tuning parameters.
- 2.2.5 The parallel operation of multiple active harmonic filters shall be possible in both open-loop and closed-loop configuration. The possible amount of parallel connected active harmonic filters shall be more than 8 modules.
- 2.2.6 Each of the active harmonic filter modules shall have their own control system and the operation of the system shall continue if one of the parallel active harmonic filter modules is not operational.
- 2.2.7 Each of active harmonic filter modules shall have balanced outputs with respect to each other when operated in parallel active harmonic filter connections.
- 2.2.8 The active harmonic filter performance on reactive power mitigation shall increase the power factor to at least 0.99
- 2.2.9 The active filter shall provide up to the full nominal current at frequencies up to the 17th harmonic without derating.

## **2.3 Active harmonic filter operation modes**

- 2.3.1 The active harmonic filter shall have several operation modes allowing the user to program device to solve specific power quality

problems in the most economic manner. Every operation mode shall include possibility to set fundamental cycle load current balancing from 0 to 100%.

- 2.3.2 The active harmonic filter shall have 'all harmonics' operation mode. This operation mode shall offer real time compensation of all harmonics and fundamental reactive power. The response time of the active harmonic filter in this mode shall be less than 100µs.
- 2.3.3 The active harmonic filter shall have 'all harmonics but not fundamental frequency' operation mode. This operation mode shall offer real time compensation of all harmonics. Fundamental frequency reactive power compensation shall be excluded in this mode. The response time of Active harmonic filter in this mode shall be less than 100µs.
- 2.3.4 The active harmonic filter shall have 'selectable' operation mode. This operation mode shall offer the possibility to select which harmonic order is to be compensated. It shall be possible to set the percentage of compensation degree for harmonic orders 1 to 25. Odd and even harmonics shall be possible to select. The response time of the active harmonic filter in this mode shall be equal to fundamental frequency cycle time.
- 2.3.5 The active harmonic filter shall have an 'automatic standby' mode which is activated when the active harmonic filter output current falls below a predefined set point. The active harmonic filter shall automatically return to normal operation when the required output next exceeds the predefined set point. In the standby mode the power electronics controls and cooling fans shall be switched off to minimize energy consumption.

## **2.4 Human Machine Interface (HMI)**

- 2.4.1 The active harmonic filter shall be provided with a graphical Human Machine Interface (HMI) suitable for programming and monitoring the performance of the filter. A 7" touchscreen panel PC shall be used as the graphical HMI.
- 2.4.2 The user interface shall be of the touchscreen type and the user interface shall have color display with LED backlight with screensaver functionality
- 2.4.3 It shall be possible to connect up to seven active harmonic filters to one user interface.
- 2.4.4 The user interface shall have a lock-feature possibility in order to avoid parameter changes by unqualified persons.
- 2.4.5 The active harmonic filter user interface shall have a commissioning wizard to make the time required for commissioning as short as possible.

- 
- 2.4.6 The user interface shall allow the user to control the logical operations of Active harmonic filter, such as:
- .1 Program active harmonic filter parameters.
  - .2 Program system parameters.
  - .3 Select operation mode of the active harmonic filter.
  - .4 Initializing start or stop sequences.
  - .5 Update firmware's for the active harmonic filter and for the user interface.
  - .6 Download log, trend charts and fault signals to a USB-drive.
- 2.4.7 The graphical touchscreen user interface shall allow the user to monitor the operation status of the active harmonic filter. The monitored statuses of the active harmonic filter shall be as a minimum ready to run, pre-charging, running, alarm and trip. The status of the active harmonic filter shall be shown in color indications and written format.
- 2.4.8 The user main screen shall have visual indication of the active harmonic filter states, the load rate of the active harmonic filter units and network parameters such as powers and THDI, as a minimum.
- 2.4.9 An event log shall be provided for normal events, alarms and trips. The event list shall be recorded into internal flash memory and up to 5000 latest events shall be available for retrieval. Every event shall have clear written information about the events, and shall be divided into a minimum of five categories:
- .1 Normal events which give information when operations such as start and stop sequence have taken place.
  - .2 Informative alarms which give information when operations such as ac voltage high have been noticed but ac voltage has returned to normal operation level.
  - .3 Action alarms, such as IGBT temperature high, shall limit output current in order to get IGBT temperature back to normal operation range.
  - .4 Trips, such as IGBT temperature max, shall cause system trip. In this case the operator needs to clear out the reason for the trip and acknowledge error before re- starting.
  - .5 Parameter changes.
- 2.4.10 The active harmonic filter shall be capable of analyzing and calculating power quality parameters from the measured voltage and current signals. As a minimum, the following power quality parameters from both the load and the system feeder shall be monitored in graphical user interface.
- .1 Total harmonic current distortion thd(I) on each phase.
  - .2 Each individual harmonic current 1..25th on each phase.
  - .3 Total harmonic voltage distortion thd(U) on each phase.

- .4 Each individual harmonic voltage 1..25th on each phase.
- .5 Line to line ac voltages.
- .6 Line to neutral ac voltages.
- .7 Active power on each phase.
- .8 Reactive power on each phase.
- .9 Apparent power on each phase.
- .10 Power factor on each phase.
- .11 Load currents.
- .12 Active harmonic filter currents.
- .13 Network currents.

2.4.11 The harmonic currents and voltages shall be shown in graphical user interface as a bar-graph spectrum.

2.4.12 Three phase current and voltage waveforms shall be shown in graphical user interface.

2.4.13 At least five power quality parameters shall be possible to select for trend recoding purposes. The trend recordings shall be shown in the graphical user interface for one month cycling period. The measuring interwall shall be less or equal to one second.

## **2.5 Remote communications**

2.5.1 The active harmonic filter shall have the option to be connected to external devices via TCP/IP.

2.5.2 The active harmonic filter shall have the default communication method of modbus TCP/IP.

2.5.3 The active harmonic filter shall have as minimum 3 no. programmable hardwired inputs that can be minimum configured to start/stop and disable operation modes from the user interface. The input signal can be either AC- or DC voltage.

2.5.4 The active harmonic filter shall have a minimum of 4 programmable hardwired outputs that can be configured to running, trip and alarm options via the user interface. The outputs shall be potential free relays with the possibility to connect up to 208 VAC signals.

2.5.5 The basic states and power quality parameters shall be readable from a remote terminal unit using modbus TCP/IP protocol.

## **2.6 Protections**

2.6.1 The active harmonic filter shall have its own protection features which ensure safe and reliable operation in all abnormal system conditions. As a minimum, the following protection features shall be incorporate into Active harmonic filter:

- .1 Internal short circuit protection by fuses or circuit breaker.
- .2 RMS over current.

- .3 Peak value over current.
- .4 AC-system over- and undervoltage.
- .5 Ripple circuit overloading and ripple circuit failure.
- .6 IGBT over temperature.
- .7 Enclosure over temperature.
- .8 DC-capacitor over and under voltage.

## 2.7 **Applied standards and environment**

2.7.1 The active harmonic filter shall have following design standard and third-party approvals:

2.7.2 The active harmonic filter shall include third-party approval for by cULus: UI 508

2.7.3 The active filter shall comply with EMC standards IEC/EN 61000-6-2 and IEC/EN 61000-6-4.

2.7.4 The active filter shall comply with safety standard EN 50178.

2.7.5 The active harmonic filter shall follow the additional European Union directives:

- .1 Low Voltage Directive (LVD) 2014/35/EU
- .2 Electromagnetic Compatibility Directive (EMC) 2014/30/EU
- .3 Restriction of Hazardous Substances (ROHS 2) Directive 2011/65/EU
- .4 Ecodesign Directive 2009/125/EU
- .5 Waste Electrical and Electronics Equipment (WEEE) 2012/19/EU

2.7.6 The active harmonic filter shall be compatible with the following environmental conditions:

Climatic cond. (EN50178)	Ambient temperature	Relative humidity	Air pressure
Operation	5...40°C (Class 3K3)	5..85% (Class 3K3)	86..106kPa (Class 3K3)
Storage	-25...55°C (Class 1K4)	5..95% (Class 1K3)	86..106kPa (Class 1K4)
Transportation	-25...70°C (Class 2K3)	95% (Class 2K3)	70..106kPa (Class 2K3)
Pollution degree (EN 50178)	2		
Altitude	Up to 1000m		

---

**2.8 Testing**

2.8.1 The active harmonic filter shall be tested according to relevant part of IEC/EN50178. At least following test shall be done for each active harmonic filter unit:

- .1 Visual inspection, main circuit test
- .2 Insulation resistance test
- .3 Insulation voltage withstanding test
- .4 Functional test at nominal voltage and current
- .5 Temperature rise test
- .6 Step response test

**2.9 Enclosure and installation**

2.9.1 The active harmonic filter module enclosure shall be rated for NEMA1 which can be installed in the switchgear enclosed having protection index up to NEMA 4X.

2.9.2 The air ventilation of the switchgear shall be equipped with adequate air filtering system.

2.9.3 The active harmonic filter shall be meant for cubicle mounting by default. Floor or wall mounting shall be possible through optional accessories. The enclosure shall be designed so that installation to commercially available standard cubicles is possible with the standard mounting brackets available from the cubicle manufacturer. Mounting to other cubicle types shall be easy by simply designing a suitable mounting bracket.

2.9.4 The active harmonic filter shall have bottom cable entry, top cable entry shall be available as an option.

2.9.5 The physical dimensions shall enable the user to install up to two 200A devices into a standard cubicle.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

1.1.1 Materials and installation for Automatic Transfer Switches.

**1.2 Related Sections**

1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

1.2.2 Section 26 32 13 – Diesel Electric Generator – Liquid Cooled.

**1.3 References**

1.3.1 Canadian Standards Association (CSA International)

- .1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1
- .2 CSA C22.2 No.5-09, Moulded-Case Circuit Breakers, Moulded-Case Switches and Circuit-Breaker Enclosures (Tri-national standard with UL 489, NMX-J-266-ANCE-2010).
- .3 CSA C22.2 No.178.1-2007, Automatic Transfer Switches.
- .4 CAN/CSA C60044-1-07, Instrument Transformers.

1.3.2 National Electrical Manufacturers Association (NEMA)

- .1 NEMA ICS 2-1996(R2009), Controllers, Contactors, and Overload Relays, Rated Not More Than 2000 Volts AC or 750 Volts DC, part 8: Disconnect Devices for Use in Industrial Control Equipment.

**1.4 Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.

1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:

- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.
- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## 1.5 Submittals

1.5.1 Submit in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for transfer switches and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.
- .4 Shop Drawings:
  - .1 Submit drawings stamped and signed by professional engineer registered or licensed in the province of Ontario, Canada.
    - .1 Indicate on drawings:
      - .1 Make, model and type.
      - .2 Load classification:

- 
- .1 LED Load as per manufacturers recommendations
    - .2 Ballast Lamp Load as per manufacturers recommendations
    - .3 Motor Load as per manufacturers recommendations
    - .4 Restricted Use: resistance and general loads, 0.8 pf or higher
  - .3 Single line diagram showing controls and relays.
  - .4 Description of equipment operation including:
    - .1 Automatic starting and transfer to standby unit and back to normal power.
    - .2 Test control.
    - .3 Manual control.
    - .4 Automatic shutdown
- 1.5.3 Sample:
- .1 Submit samples in accordance with Section 01 33 00 - Submittal.
- 1.5.4 Quality Assurance:
- .1 Engineer reserves the right to witness standard factory testing of the above.
  - .2 Submit site tests results of installed electrical systems and instrumentation
- 1.5.5 Closeout Submittals:
- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
  - .2 Data necessary for maintenance of materials.
  - .3 Manufacturers recommended list of spare parts.
  - .4 Operation and Maintenance Data: submit operation and maintenance data for transfer switches for incorporation into manual.
  - .5 Detailed instructions to permit effective operation, maintenance and repair.
  - .6 Technical Data:
    - .1 Schematic diagram of components, controls and relays.
    - .2 Illustrated parts lists with parts catalogue numbers.
    - .3 Certified copy of factory test results.
-

---

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements and with manufacturer's written instructions.
- 1.6.2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.6.3 Storage and Handling Requirements:
  - .1 Store materials off ground, indoors, in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.
  - .2 Store and protect transfer switches from nicks, scratches, and blemishes.
  - .3 Replace defective or damaged materials with new.

**1.7 Description of System**

- 1.7.1 Provide all material, equipment and services necessary for a complete and operational automatic transfer switches.
- 1.7.2 Automatic load transfer equipment to to:
  - .1 Monitor voltage on phases of normal power supply.
  - .2 Initiate cranking of standby generator unit on normal power failure or abnormal voltage on any one phase below pre-set adjustable limits for adjustable period of time.
  - .3 Transfer load from normal supply to standby unit when standby unit reaches rated frequency and voltage pre-set adjustable limits.
  - .4 Transfer load from standby unit to normal power supply [when normal power restored, confirmed by sensing of voltage on phases above adjustable pre-set limit for adjustable time period.
  - .5 Shutdown standby unit after running unloaded to cool down using adjustable time delay relay.
- 1.7.3 Building Management System (BMS) Integration
  - .1 The system protocol shall be native BACnet/IP certified and fully compatible with the BMS. Gateways will not be accepted. The system software programmable controllers shall reside/communicate with the BACnet/IP on the management or automation level networks of the Building Management System.

---

## 2. PRODUCTS

### 2.1 Materials

- 2.1.1 Instrument transformers: to CAN/CSA C60044-1.
- 2.1.2 Contactors: to NEMA ICS2.

### 2.2 Contact Type Transfer Equipment

- 2.2.1 Contact Type Transfer Equipment: to CSA C22.2 No.178.1.
- 2.2.2 Two - three pole contactors mounted on common frame, in double throw arrangement, mechanically and electrically interlocked, motor operated, open type with CSA enclosure.
- 2.2.3 Rated: 600V, 6 0Hz0 amperage as per drawings, three wire, solid neutral.
- 2.2.4 Main Contacts: Silver surfaced, protected by arc disruption means.
- 2.2.5 Switch and relay contacts, coils, spring and control elements accessible for inspection and maintenance from front of panel without removal of switch panel or disconnection of drive linkages and power conductors.
- 2.2.6 Auxiliary Contact: Silver plated, to initiate emergency generator start-up on failure of normal power.
- 2.2.7 Fault withstand rating: kA symmetrical for three cycles with maximum peak value of specified kA.
- 2.2.8 Lever to operate switch manually when switch is isolated.
- 2.2.9 Neutral bar, solid, switch rated as per drawings.
- 2.2.10 Overlapping neutral contacts on contactor type transfer equipment.

### 2.3 Circuit Breaker Type Transfer Equipment

- 2.3.1 Circuit Breaker Type Transfer Equipment: To CSA C22.2 No.5.
- 2.3.2 Rated: 600 V, 60 Hz, amperage as per drawings, three wire, solid neutral.
- 2.3.3 Fault withstand rating: kA symmetrical for three cycles with maximum peak value of specified kA.
  - .1 One normal-three -pole moulded-case circuit breaker with thermal magnetic automatic trip, mounted on common base, designed for double throw action, motor operated, mechanically held and interlocked, wall or floor mounted with CSA enclosure.
  - .2 One emergency three pole moulded-case circuit breaker with thermal magnetic automatic trip, motor operated, and interlocked.
  - .3 Circuit breakers:
    - .1 Trip free in closed position.

- .2 Interrupting rating: symmetrical.
- .4 Dead front construction with access to relays and controls for inspection and maintenance, and manual operating lever for transfer switch.
- .5 Auxiliary contact: to initiate emergency generator start-up on failure of normal power.
- .6 Solid neutral bar
- .7 Overlapping switchable neutral pole on circuit breaker type equipment.

## 2.4 **Controls**

### 2.4.1 Selector switch – four position, "Test", "Auto", "Manual", "Engine start".

- .1 Test position - normal power failure simulated. Engine starts and transfer takes place. Return switch to "Auto" to stop engine.
- .2 Auto position - normal operation of transfer switch on failure of normal power; retransfers on return of normal voltage and shuts down engine.
- .3 Manual position - transfer switch may be operated by manual handle, but transfer switch will not operate automatically and engine will not start.
- .4 Engine start position - engine starts but unit will not transfer unless normal power supply fails. Switch must be returned to "Auto" to stop engine.

### 2.4.2 Control transformers: dry type with 120 V secondary to isolate control circuits from:

- .1 Normal power supply.
- .2 Emergency power supply.

### 2.4.3 Relays: continuous duty, industrial control type, with wiping action contacts rated 10 A minimum:

- .1 Voltage sensing: three-phase for normal power and on one phase only for emergency, solid state type, adjustable drop out and pick up, close differential, 2 V minimum under voltage and over voltage protection.
- .2 Time delay: normal power to standby, adjustable solid state, 0 to 60 seconds
- .3 Time delay on engine starting to override momentary power outages or dips, adjustable solid state, 0 to 60 seconds delay.
- .4 Time delay on retransfer from standby to normal power, adjustable 0 to 60.

- .5 Time delay for engine cool-off to permit standby set to run unloaded after retransfer to normal power, adjustable solid state, 0 to 60 seconds.
  - .6 Time delay during transfer to stop transfer action in neutral position to prevent fast transfer, adjustable, 5 second intervals to 180 seconds.
  - .7 Frequency sensing, to prevent transfer from normal power supply until frequency of standby unit reaches pre-set adjustable values.
  - .8 Neutral disconnected position delay: allow time for motors to delay between live sources, adjustable, 0 to 5 s.
- 2.4.4 Solid state electronic in-phase monitor.
- 2.4.5 Ensure pilot lights indicate power availability normal and standby, switch position, green for normal, red for standby, mounted in panel and remote.
- 2.4.6 Plant exerciser: 168 hours timer to start standby unit once each week for selected interval transfers load to emergency supply and retransfers to normal supply on standby unit shutdown. Timer adjustable 0-168 hours in 15 minute intervals.
- 2.4.7 Auxiliary relay to provide N.O. and N.C. contacts for remote alarms.
- 2.4.8 Manual bypass and isolator: to both supplies.

## **2.5 Equipment Identification**

- 2.5.1 Identify equipment in accordance with Section 26 05 00 - Common Work Results for Electrical.
- 2.5.2 Control panel:
- .1 For selector switch and manual switch: Size 4 nameplates.
  - .2 For meters, indicating lights, minor controls: use Size 2 nameplates.
  - .3 Nameplates to include voltage, amperage, poles, location, normal and emergency feeds.

## **2.6 Source Quality Control**

- 2.6.1 Complete equipment, including transfer mechanism, controls, relays and accessories factory assembled and tested
- 2.6.2 Notify Departmental Representative five days minimum in advance of date of factory test.
- 2.6.3 Tests:
- .1 Operate equipment both mechanically and electrically to ensure proper performance.
  - .2 Check selector switch, in modes of operation Test, Auto, Manual, Engine Start and record results.

- .3 Check voltage sensing and time delay relay settings.
- .4 Check:
  - .1 Automatic starting and transfer of load on failure of normal power.
  - .2 Retransfer of load when normal power supply resumed.
  - .3 Automatic shutdown.
  - .4 In-phase monitor operation.

### 3 . **EXECUTION**

#### 3.1 **Examination**

- 3.1.1 Verification of Conditions: verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for transfer switches installation in accordance with manufacturer's written instructions.
  - .1 Visually inspect substrate in presence of [Departmental Representative.
  - .2 Inform Departmental Representative of unacceptable conditions immediately upon discovery.
  - .3 Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Departmental Representative.

#### 3.2 **Installation**

- 3.2.1 Locate, install and connect transfer equipment as indicated.
- 3.2.2 Check relays and solid state monitors and adjust as required to ensure correct operation.
- 3.2.3 Install and connect battery and emote alarms.

#### 3.3 **Field Quality Control**

- 3.3.1 Perform tests in accordance with Section 26 05 00 - Common Work Results for Electrical.
- 3.3.2 Energize transfer equipment from normal power supply.
- 3.3.3 Set selector switch in "Test" position to ensure proper standby start, running, transfer, retransfer. Return selector switch to "Auto" position to ensure standby shuts down.
- 3.3.4 Set selector switch in "Manual" position and check to ensure proper performance.
- 3.3.5 Set selector switch in "Engine start" position and check to ensure proper performance. Return switch to "Auto" to stop engine.

- 3.3.6 Set selector switch in "Auto" position and open normal power supply disconnect. Standby should start, come up to rated voltage and frequency, and then load should transfer to standby. Allow to operate for 10 minutes, then close main power supply disconnect. Load should transfer back to normal power supply and standby should shutdown. Repeat, at 1 hour intervals, 6 times, complete test with selector switch in each position, for each test.

**3.4 Maintenance – Clearances**

- 3.4.1 Provide clearance around systems, equipment, and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.5 Cleaning**

- 3.5.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.5.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.
- 3.5.3 Progress Cleaning: clean in accordance with 01 74 00 Cleaning and waste management.
- .1 Leave Work area clean at end of each day.
- 3.5.4 Final Cleaning: upon completion remove surplus materials, rubbish, tools and equipment in accordance with 01 74 00 Cleaning and waste management.

**END OF SECTION**

## 1. **GENERAL**

### 1.1 **Section Includes**

- 1.1.1 Materials and installation of Electrical Vehicles charging stations and management system Equipment.
- 1.1.2 This section provides the technical specifications and requirements for electric vehicle charging station hardware installed across Regional properties. The Region of Peel requires EV Charging Stations can support operability with multiple Open Charge Point Protocol compliant Charging Station Management Systems / software platforms.

### 1.2 **Related Sections**

- 1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

### 1.3 **References**

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Section Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
  - .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
  - .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.
  - .6 VOC/Low-Emitting Materials Compliance.
- 1.4.5 **NOTE:** Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

---

**1.5 Submittals**

1.5.1 Provide submittals in accordance with Section 01 33 00 - Submittal.

1.5.2 Product Data:

- .1 Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, and limitations.
- .2 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Sample:

- .1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.4 Quality Assurance:

- .1 Engineer reserves the right to witness standard factory testing of the above.
- .2 Submit site tests results of installed electrical systems and instrumentation

1.5.5 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.

1.5.6 Submit certified test results to Engineer.

1.5.7 Quality Assurance Submittals: submit following in accordance with Section 01 40 00 - Quality Requirements.

- .1 Instructions: submit manufacturer's installation instructions.
  - .1 Engineer will make available 4copies of systems supplier's installation instructions.

**1.6 Delivery, Storage And Handling**

1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.

- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

**1.7 Description Of System**

- 1.7.1 Provide all material, equipment and services necessary for a complete and operational active harmonic filter equipment.
- 1.7.2 .

**1.8 Acceptable Manufactures**

- 1.8.1 ABB
- 1.8.2 Or approved equal.

**2 . PRODUCTS**

**2.1 Ac Charging Stations**

- 2.1.1 208-240 volt (V) alternating current (AC) with SAE J1772 or North American Charging Standard (NACS) charging connector
- 2.1.2 Commercial grade and certified for use in Canada nationally recognized certification agency Canadian Standards Association (CSA), Underwriters Laboratories of Canada (uLC) or other certification marks approved by the Technical Standards and Safety Authority (TSSA);
- 2.1.3 Enclosure must be rated for outdoor operation and achieve a minimum National Electrical Manufacturers Association (NEMA) 3R certification
- 2.1.4 Enable Open Charge Point Protocol (OCPP) 1.6J with an ability to upgrade to 2.0.1.
- 2.1.5 EV Chargers should support all OCPP 1.6J profiles including: Core, FirmwareManagement, LocalAuthListManagement, SmartCharging, RemoteTrigger. Reservation is preferred but not mandatory.
- 2.1.6 Have certified operating temperature range between minus 35 Degree Celsius (°C) and plus 50°C;
- 2.1.7 Surge protection of 6 kV @ 3,000A or higher
- 2.1.8 Cable length must be 5.49 meters (18 feet) or longer, and a cable management / retraction system must be an option and is preferred
- 2.1.9 Electricity metering accuracy of +/- 3%
- 2.1.10 Ability to remotely adjust and manage power supply (energy management and power sharing/limiting features (i.e. adjustable operating current (amperage))

- 2.1.11 Capable of simultaneously communicating via cellular (4G/LTE or better), WiFi and Ethernet
- 2.1.12 RFID access in accordance with ISO 14443 A/B, ISO 15693, NFC, NEMA interoperability protocol
- 2.1.13 ISO 15118 certified (Road Vehicles – Vehicle to grid communication interface)
- 2.1.14 Payment card industry (PCI) compliant card reader (*if applicable*)
- 2.1.15 Light Emitting Diode (LED) status indicator
  - .1 Display screen with the capability of conveying messages, user instructions, and/or pricing

## **2.2 Dc Charging Stations**

- 2.2.1 Direct current (DC) vehicle fast charger with SAE J 1772 Combined Charging System (CCS) Combo 1 and/or CHAdeMo and/or North American Charging Standard (NACS) charging connectors
- 2.2.2 Both power factor and efficiency greater than 93 per cent
- 2.2.3 Commercial grade and certified for use in Canada nationally recognized certification agency Canadian Standards Association (CSA), Underwriters Laboratories of Canada (uLC) or other certification marks approved by the Technical Standards and Safety Authority (TSSA);
- 2.2.4 Enclosure must be rated for outdoor operation and achieve a minimum National Electrical Manufacturers Association (NEMA) 3R certification
- 2.2.5 Enable Open Charge Point Protocol (OCPP) 1.6J with an ability to upgrade to 2.0.1.
  - .1 EV Chargers should support all OCPP 1.6J profiles including: Core, Firmware Management, Local Auth List Management, Smart Charging, Remote Trigger. Reservation is preferred but not mandatory.
- 2.2.6 Have certified operating temperature range between minus 30 Degree Celsius (<sup>0</sup>C) and plus 40<sup>0</sup>C;
- 2.2.7 Cable length must be 3.66 meters (12 feet) or longer and a cable management / retraction system is required
- 2.2.8 Electricity metering accuracy of +/- 3%
- 2.2.9 Ability to remotely adjust and manage power supply (energy management and power sharing/limiting features (i.e. adjustable operating current (amperage))
- 2.2.10 Capable of simultaneously communicating via cellular (4G/LTE or better), WiFi and Ethernet

- 2.2.11 RFID access in accordance with ISO 14443 A/B, ISO 15693, NFC, NEMA interoperability protocol
- 2.2.12 Payment card industry (PCI) compliant card reader *(if applicable)*
- 2.2.13 Light Emitting Diode (LED) status indicator
- 2.2.14 Push buttons for start, stop and emergency stop
- 2.2.15 Display screen with the capability of conveying messages, user instructions, and/or pricing

### 2.3 **Dcev Charging Station Management System**

- 2.3.1 The EV Charging Station Management System *(software)* must be ISO 15118 certified and Open Charge Point Protocol (OCPP) 2.0.1 compliant.
- 2.3.2 The EV Charging Station Management System must be proven through field testing, to work with OCPP certified EV charging station hardware from multiple manufacturers.
- 2.3.3 The EV Charging Station Management System must have demonstrated integrations with vehicle telematics providers and operations within a microgrid application *(potentially including back-up generators, battery energy storage systems, solar/wind on-site generation, and bidirectional chargers)*
- 2.3.4 The following data points are to be ongoingly tracked, stored, and remain accessible to the Region of Peel in .xls or .csv format in perpetuity by the EV Charging Station Management System.
  - .1 EV Charger Identification (ID)
  - .2 EV Charger location
  - .3 Unique customer identifier (a non-personal identifier (e.g. Network user ID))
  - .4 Charging session date
  - .5 Charging session start time
  - .6 Charging session end time
  - .7 Amount of power provided during charging session (kWh)
  - .8 Amount of revenue generated (CAD)
  - .9 Encountered malfunctions (including issue codes and descriptions, and duration of downtime)
- 2.3.5 The EV Charging Station Management System will include a dashboard that communicates and/or displays at a minimum:
  - .1 A map showing the number and location of EV charging stations
  - .2 Real-time EV Charger status (e.g. in-use, available, inoperable, charge per use or free type etc.)

- 
- .3 Cumulative electricity provided to vehicles, revenue generation, and GHG emissions avoidances are preferred
- 2.3.6 The EV Charging Station Management System and/or subsidiary reporting features must provide the following analytical functions at a minimum:
- .1 Isolate all data points by the entire EV charging station portfolio, specific site where chargers are installed, charger type (i.e. AC vs. DC), power output and individual charger.
  - .2 Determine the charging utilization ratio, between a specified calendar or time interval, across the EV Charger portfolio, a specific site, or individual EV Charger (*e.g. between 8:30am and 4:30pm at a specified office location, determine what percentage of time are chargers in use*)
  - .3 Determine the length of time EVs are plugged in but not actively charging across the EV Charger portfolio, a specific site, or individual EV Charger
  - .4 Report on revenue generation between a specified calendar or time interval
  - .5 Vehicle battery state of charge at the start and stop of a charging session (where available)
  - .6 The ability to report on greenhouse gas (GHG) emissions avoidances is preferred
- 2.3.7 The EV Charging Station Management System must provide the following management functions at a minimum:
- .1 Set tiered and flexible pricing models for use (e.g. applying a time-based or per kilowatt hour fee for vehicles which are actively charging AND a different rate for vehicles which remain plugged-in after charging has completed)
  - .2 Automatically program and manually adjust maximum power output and power-sharing modes in EV Charging Stations
  - .3 Enable or disable EV Charger operation
  - .4 Adjust messaging that appears on EV Charger displays
  - .5 Automatically notify operations personnel and EV Charger Service Provider of charger malfunctions and loss of functionality
  - .6 The ability to integrate EV Charger operation with electric utility demand response programs is preferred
  - .7 The ability to integrate with fleet fuel cards, telematics, and asset management systems
  - .8 The ability to integrate with on-site energy storage and generation systems
-

- .9 The ability to integrate with the Region's Enterprise Asset Management software

### 3. **EXEXECUTION**

#### 3.1 **General**

- 3.1.1 This section outlines installation requirements as they relate to electrical and civil works, and prescribes signage and parking space painting requirements to ensure EV Charging Station locations and terms of use are clearly communicated. All EV Charging Stations and associated equipment, infrastructure, and will be installed in accordance with the equipment manufacturer's installation requirements.

#### 3.2 **Electrical**

- 3.2.1 Where a site is undergoing its first installation of EV Charging Stations, the contractor shall lay parallel conduits that terminate into a buried handwell or weatherproof distribution panel to service a number of additional parking spaces in the future, as determined by the Region.
- .1 The number of spaces to 'future-proof' for EV Charging Station installations shall be at the discretion of the site's Property Manager, Operator and/or Program Owner, or Project Sponsor in the case of new construction, subject to existing parking and electrical capacity constraints. In the case where no provisions for future EV Chargers are desired, approvals must be obtained through the Standards and Guidelines (SAG) Committee.
- .2 Conduits must be sized to accommodate the desired number of EV Charging Stations to future-proof for, taking into account the run length, number and gauges of cables.
- 3.2.2 The contractor will provide all new circuit breakers from the same manufacturer installed on-site
- 3.2.3 The contractor will ensure sufficient space is available in electrical/utility room for charging station load management controllers / hardware for distributed energy resource integration.
- 3.2.4 The contractor is responsible for creating and submitting detailed system shop drawings and any accompanying documents to the Region of Peel, and other regulatory agencies as needed to obtain permits and approvals. These include, but are not limited to the Electrical Safety Authority, the Cities of Brampton and Mississauga, and the Town of Caledon.

---

**3.3 Civil**

- 3.3.1 The location of all utilities and underground services connections are to be performed by the contractor prior to the installation of EV Chargers
- 3.3.2 Parking stalls and aisles shall be designed in accordance with local municipal standards
- 3.3.3 All curbs, gutters, raised traffic inlands, walkways, piers, foundations, duct works etc. shall be designed and constructed in accordance with Ontario Provincial Standards
- 3.3.4 Positive surface drainage shall be ensured to avoid water ponding
- 3.3.5 Underground ducts for all power cables required to feed chargers, lights and ancillary equipment may be necessary
- 3.3.6 EV Charging Stations shall be mounted on a pedestal on a concrete pad and/or protected with bollards where required. Bolts and/or hardware used to secure bollards to concrete base should be rust resistant and proven track record of no rust after years of exposure to the elements.
- 3.3.7 All trees in the vicinity of parking should be retained and protected during construction

**3.4 Signage And Parking Space Painting**

- 3.4.1 The contractor shall print and install permanent signage in compliance with the specifications prescribed under O. Reg. 462/20 Section 27. 1(1) of Reg 615:  
<https://www.ontario.ca/laws/regulation/r20462> (see *signage example 1*) and signage to outline the site's terms of use (see *Signage Example 2*)
  - .1 The Region of Peel will provide the template design for terms of use signage
- 3.4.2 The contractor shall provide adequate way finding signage to direct EV drivers to the EV Charger site from the parking lot entrance and/or the nearest street, where deemed necessary by the Region
- 3.4.3 The contractor shall provide parking space pictogram and painting (see *parking space painting example*)

**END OF SECTION**

## 1. GENERAL

### 1.1 References

- 1.1.1 Comply with section 26 05 00, Electrical General Provisions, and all documents referred to therein.
- 1.1.2 All work shall be carried out in accordance with the latest CAN/CSA-B72-M87.

### 1.2 Work Included

- 1.2.1 Provide all components for a complete installation of a lightning protection system.

### 1.3 Submittals

- 1.3.1 Submit shop drawings for all components and equipment, complete with a roof plan and riser diagram.

### 1.4 Acceptable Manufacturers/Installers

- 1.4.1 Lighting Protection system shall be installed by a company licensed to carry out such installations.
- 1.4.2 Acceptable system installers are:
  - .1 Burchell lightning Protection

## 2. PRODUCTS

### 2.1 Materials

- 2.1.1 Materials shall be as described in Table 3.1 Class 1 and Class 2 installations - Minimum Material Requirements.
- 2.1.2 All connections between cable to ground rods, cable to cable, and cable to steel, shall be made using welded copper connections or approved mechanical connectors.
- 2.1.3 Roof cables shall form a closed loop around periphery of roof and run within 0.5m of edge and shall be fastened at 1.5m intervals using approved flat roof cable anchors. Provide interconnecting conductions connected at both ends as required ensuring that no point on the roof is more than 10m away from a conductor. Connect loop system to metal bodies of conductance every 30m or part thereof. Install all cables with sweep bends.
- 2.1.4 Provide aerial terminals at 8m centres mounted on roof bases and securely anchored to roof or parapet. Terminals shall project at least 50mm above highest point in their vicinity and shall be connected to perimeter loop system.

- 2.1.5 At down lead cable locations provide a suitable thru-roof connector with roof flashing plate. (Concealed System).
- 2.1.6 Provide a closed loop of grounding cable in excavated portion of proposed building prior to pouring of foundations or connect the downlead conductors to copperweld ground rods where good grounding soil is available.
- 2.1.7 Refer to detail drawings for additional information.

### 3 . **EXECUTION**

#### 3.1 **Installation**

- 3.1.1 Bond all metal projections through or masses of metal above the roof to the lightning protection system. Cover all high points of the roofs by air terminals in addition to standard required spacing.
- 3.1.2 Make connections between air terminals and cable, cable to cable, and cable to steel or other metals using welded copper connections 'Cadweld'.
- 3.1.3 The roof cables must form a closed loop as shown on the drawings, around the periphery of the roof run within 0.5m of the edge, and fastened at 1.5m centres, using manufactured flat roof cable anchors.

**1. GENERAL**

**1.1 Section Includes**

1.1.1 Materials and installation of Surge Protection Devices.

**1.2 Related Sections**

1.2.1 This section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

1.3.1 Canadian Standards Association (CSA International)

- .1 CSA C22.1 (current edition), Canadian Electrical Code, Part 1.
- .2 Canadian Standards Association (CSA) CSAC22.2-Latest Edition.

1.3.2 The specified unit shall be designed, manufactured, tested and installed in the following standards:

- .1 American National Standards Institute of Electrical and Electronic Engineer (ANSI/IEEE C62.41-latest and C62.45-latest)
- .2 Federal Information Processing Standards Publication 94 (FIPS PUB 94)
- .3 National Fire Protection Association (NFPA 75 and 78).
- .4 Underwriters Laboratories (ANSI/UL 1449-3<sup>rd</sup> Edition, UL 1283)

- .9 ANSI/IEEE C62.45 – IEEE Guide for Surge Testing on Equipment in Low Voltage AC Power Circuits.
- .10 FIPS Pub 94 (current edition) – USDC Guide for Installation Techniques on Electrical Power Environments.
- .11 NEMA LS-1 Guidebook for the Specification of Surge Protection Devices.

- .12 (RoHS) Restriction of Hazardous Substances Directive: All SPDs shall be compliant with the Restriction of Hazardous Substances Directive 2002/95/EC.4.

#### **1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
  - .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
  - .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
  - .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
  - .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.
  - .6 VOC/Low-Emitting Materials Compliance.
- 1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

#### **1.5 Submittals**

- 1.5.1 Submittals: in accordance with Section 01 33 00 - Submittal Procedures.
- 1.5.2 Product Data:
  - .1 Product data shall be submitted in accordance with Section 26 05 01 - Common Work Results. This shall include

- 
- schematic diagram and all options including indic and dry contacts.
- .2 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
  - .3 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.
- 1.5.3 Evidence of compliance to the certifications as per CSA and UL 1449 must be This will show actual test data as certified by UL and ANSI standard. Document to include copy of UL Listing Report. Manufacturer shall certify stating that test tests) and delivered product both had same suppliers for raw materials and same to manufacture.
- 1.5.4 The following information shall be made available to the Specifying Engineer:
- .1 Verification of the SPD Systems' compliance with the required ANSI/UL 1449, 3rd Edition Listing by Underwriters Laboratories (UL) or other valid, Nationally Recognized Testing Laboratory (NRTL) such as "c ETL us Listed", "c UL us Listed", "c CSA us Listed", "Intertek/ETL LISTED", for engineering review and approval.
  - .2 Manufacturer's electrical specifications and/or mechanical drawings indicating unit dimensions, weights, full installation instructions, and wiring configuration details.
  - .3 Compliance data, including Agency Listing or Agency Control Identification Number, Manufacturer's Model Numbers, SPD Type, System Voltage Type, Wiring Diagrams, Voltage Protection Ratings, applicable Technical Specification and/or Mechanical Drawings, and Installation Sheets.
- 1.5.5 Sample:
- .1 Submit samples in accordance with Section 01 33 00 - Submittal.
- 1.5.6 Quality Assurance:
- .1 Submit site tests results of installed electrical systems and instrumentation
- 1.5.7 Closeout Submittals:
- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
  - .2 Data necessary for maintenance of materials.
  - .3 Manufacturers recommended list of spare parts.

---

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

**1.7 Description of System**

- 1.7.1 Formally known as Transient Voltage Surge Suppression (TVSS) and now known as Surge Protect Device (SPD).
- 1.7.2 Provide all material, equipment and services necessary for a complete and operational surge protection devices.
- 1.7.3 Surge Suppression Device (SPD) shall consist of a high performance designed to provide surge protection and high-frequency electrical noise filtering.
- 1.7.4 The specified unit shall be compatible with non-linear loads and provide hi transient voltage suppression, surge current diversion and high-frequency electrical noise attenuation.
- 1.7.5 The unit shall be connected in parallel with the electrical distribution system.
- 1.7.6 The operation of the unit shall not be affected by or interact with any other reduction device installed on the electrical distribution system.
- 1.7.7 The SPD unit shall be connected to the equipment via a circuit breaker from within the equipment in or SPD unit can be serviced. The SPD shall be of modular design.
- 1.7.8 Building Management System (BMS) Integration
  - .1 The system protocol shall be native BACnet/IP certified and fully compatible with the BMS. Gateways will not be accepted. The system software programmable controllers shall reside/communicate with the BACnet/IP on the management or automation level networks of the Building Management System.

**1.8 Definitions**

- 1.8.1 Single Element: The safety-tested implementation of industrial-grade, "extra-large block" MOVs close-coupled/connected to each surge-path. This minimum 45KA-rated single element per surge path architecture maintains a virtually non-degrading technology for long-term SPD system integrity. Single element technology also provides single voltage and "response time" thresholds to virtually eliminate inherent and random SPD degradation found in

conventional designs. Typical SPD designs leave you guessing if they're still working after any known or unknown surge events.

- 1.8.2 Zoned and Cascading Protection/Isolation System: The safety-tested implementation of "Zoned" Primary and Secondary levels of industrial-grade, "extra-large block" MOVs close-coupled/connected to each surge-path. Through a facility, this maintains a virtual primary level "grid" of non-degrading SPD protection and isolation of all AC circuits and down-line equipment and components. This effectively separates and isolates the most sensitive in-house electronic circuitry from hazards caused by any nearby operating and switching motor loads, permitting even your most critical sensitive equipment to operate with spec-grade power integrity, thereby eliminating failures and costly downtime.
- 1.8.3 SCCR – Short Circuit Current Rating: The proven suitability of an SPD for use on an AC power circuit that is capable of safely delivering not more than a declared symmetrical or available current at a declared voltage during a "short circuit condition." The critical SCCR "high current" test is a rigid addition to the recently updated ANSI/UL Standard 1449, 3rd Edition, that includes user-friendly performance testing and product marking requirements. This indicates how safe the SPD is during and immediately after a catastrophic lightning, utility company or AC power event.

## 1.9 **Exclusions**

- 1.9.1 No user-accessible, integral or external disconnect switch intended for easy removal of the SPD from the power source is permitted, as it introduces a "weak link" into the intended "surge-path" and effectively defeats the intended purpose of the SPD.
- 1.9.2 SPD designs with "User Replaceable Surge Current Diversion Modules" or "plug-in" replaceable SPD modules shall not be permitted.
- 1.9.3 "Balanced Suppression Platform", conventional multi-element arrays, or "computer-matched MOV array" technology shall not be permitted as a substitute for safety-fused single-element technology.

## 1.10 **Qualified Manufacturers**

- 1.10.1 To establish definitive applicable options, performance and quality levels, the SurgePure SPD System, as branded and marketed by SurgePure Corporation, shall be used herein as the basis for product and system design.
- 1.10.2 All products and services submitted shall fully comply with the basic SPD design, performance characteristics and product applications as specified herein.

- 1.10.3 The registered service trademark shall be that of the actual provider. No secondary level branding shall be substituted or accepted.
- 1.10.4 The SPD manufacturer shall be exclusively and regularly engaged in the development and manufacture of power quality and surge protection products for a minimum of 15 years.
- 1.10.5 For reasons of SPD system design integration characteristics, cascading levels and voltage thresholds, no mixing of SPD brands will be permitted within the same facility.
- 1.10.6 All SPD providers' product data must be submitted and approved by the specifying engineer with 10 days prior to date of bidding, and shall meet and reasonably comply with specified ratings, features and functions as identified herein.

**1.11 Acceptable Manufacturers**

- 1.11.1 Eaton Cutler-Hammer.
- 1.11.2 Innosys
- 1.11.3 SurgePure
- 1.11.4 Or approved equal

**1.12 Warranty**

- 1.12.1 Equipment manufacturer shall warrant that all SPD products supplied are fully performance and safety tested and are free of operational and material defects in workmanship and performance for 10 years of the installation.

**2. PRODUCTS**

**2.1 General**

- 2.1.1 The SPD device shall be suited for operation in the following configuration 120/208VAC, 347/600V VAC, 3 pole, wye, 4 wire, electrical configuration. The operating environment classified by IEEE C62.41 as follows:
  - .1 Main Switchboard, MCC and distribution panels, 347/600V: Category C3.
  - .2 Panelboards, 120/208V: Category B.
- 2.1.2 Operating temperature range shall be -25to +55C.
- 2.1.3 Operation shall be reliable in an environment with 5% to 95% non-condensing humidity.
- 2.1.4 The unit shall not generate any audible noise during normal operation.

- 2.1.5 No appreciable magnetic fields shall be generated by the SPD. The unit shall be used directly in Computer Rooms and any location without danger to storage systems or devices.
- 2.1.6 Type 1 or 2: All SPDs shall be labeled as Type 1 or 2, intended for Load or Line side of over-current protection.
- 2.1.7 Non-Degrading, Single-Element Protection: All suppression components shall consist of a minimum of a single 45 kA rated MOV per mode of surge-path protection on the secondary level, and a minimum of a single 80 kA rated MOV per mode of surge-path protection on the primary level.
- 2.1.8 Two-Stage Surge-Path Protection: All primary level SPDs connected to switchgear applications rated over 500KW shall employ two composite stages of "dual-mode" surge-path protection rated at a minimum of 335kA per phase, All primary level SPDs connected to switchgear rated up to 2500KW shall employ two composite stages of "quad-mode" surge-path protection rated at a minimum of 665kA per phase.
- 2.1.9 Safe, Seven-Mode Surge-Path Protection: SPD technology shall employ full seven-mode protection paths to protect all L-L, L-N, L-G and N-G for wye systems; L-L and L-G in delta and impedance-grounded wye systems.
- 2.1.10 Dedicated Disconnect Breaker for Power Panel Installation: Where "most effective SPD performance" placement of SPD for "load-side" placement/connection is desired, the SPD shall be "close-coupled" to a dedicated circuit breaker or disconnect within the power panel or switchgear. However, if the SPD is located as a "Type 1, line-side SPD", no breaker or disconnect is required where the desired SPD or connection point is directly into the primary level Main Distribution Panel, Motor Control Centre or Main Switchgear.

## **2.2 Voltage Suppression – General**

### **2.2.1 Electrical Requirements**

- .1 Unit Operating Voltage – Refer to drawings for operating voltage and unit configuration.
- .2 Maximum Continuous Operating Voltage (MCOV) – The MCOV shall not be less than 125% of the nominal system operating voltage.
- .3 The suppression system shall incorporate individually thermal protected metal-oxide varistors (MOVs) as the core surge suppression component for the service entrance and all other distribution levels. The system shall not utilize silicon avalanche diodes, selenium cells, air gaps, or other components that may crowbar the system voltage leading to system upset or create any environmental hazards.

- .4 Protection Modes – The SPD must protect all modes of the electrical system being utilized. The required protection modes are indicated by bullets in the following table:

	PROTECTION MODES			
CONFIGURATION	L-N	L-G	L-L	N-G
Wye	•	•	•	•
Delta	N/A	•	•	N/A
Single Split Phase	•	•	•	•
High Leg Delta	•	•	•	•

- .5 Nominal Discharge Current ( $I_n$ ) – All SPDs applied to the distribution system shall have a UL tested and verified nominal discharge current rating of no less than 20,000A regardless of the SPD Type (includes Types 1 and 2) or operating voltage.
- .6 ANSI/UL 1449 3rd Edition Voltage Protection Rating (VPR) – The maximum ANSI/UL 1449 3rd Edition VPR for the device shall not exceed the following:

Modes	208Y/120	600Y/347
L-N; L-G; N-G	700	1500
L-L	1200	3000

#### 2.2.2 SPD Design

- .1 Maintenance Free Design – The SPD shall be maintenance free and shall not require any user intervention throughout its life. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted.
- .2 Balanced Suppression Platform – The surge current shall be equally distributed to all MOV components to ensure equal stressing and maximum performance. The surge suppression platform must provide equal impedance paths to each matched MOV.
- .3 Electrical Noise Filter – Each unit shall include a high-performance EMI/RFI noise rejection filter. Noise attenuation for electric line noise shall be up to 50 dB from 10 kHz to 100 MHz using the MIL-STD-220A insertion loss test method and

---

exhibit 50dB attenuation at a conducted frequency of 100 kHz.

- .4 Internal Connections – No plug-in component modules or printed circuit boards shall be used as surge current conductors. All internal components shall be soldered, hardwired with connections utilizing low impedance conductors.
- .5 Monitoring Diagnostics – Each SPD shall provide the following integral monitoring options:
  - .1 Protection Status Indicators - Each unit shall have a green / red solid-state indicator light that reports the status of the protection on each phase.
    - .1 For Wye configured units, the indicator lights must report the status of all protection elements and circuitry in the L-N and L-G modes. Wye configured units shall also contain an additional green/red solid-state indicator light that reports the status of the protection elements and circuitry in the N-G mode. SPDs that indicate only the status of the L-N and L-G modes shall not be accepted.
    - .2 For delta configured units, the indicator lights must report the status of all protection elements and circuitry in the L-G and L-L modes.
    - .3 The absence of a green light and the presence of a red light shall indicate that damage has occurred on the respective phase or mode. All protection status indicators must indicate the actual status of the protection on each phase or mode. If power is removed from any one phase, the indicator lights must continue to indicate the status of the protection on all other phases and protection modes. Diagnostics package that simply indicate whether power is present on a particular phase shall not be accepted.
  - .2 Remote Status Monitor – The SPD must include Form C dry contacts (one NO and one NC) for remote annunciation of its status. Both the NO and NC contacts shall change state under any fault condition.
  - .3 Audible Alarm and Silence Button – The SPD shall contain an audible alarm that will be activated under any fault condition. There shall be also be an audible alarm silence button used to silence the audible alarm after it has been activated.
  - .4 Surge Counter – The SPD shall be equipped with an LCD display that indicates to the user how many surges have occurred at the location. The surge

counter shall trigger each time a surge event with a peak current magnitude of a minimum  $50 \pm 20A$  occurs. A reset push button shall also be standard, allowing the surge counter to be zeroed. The reset button shall contain a mechanism to prevent accidental resetting of the counter via a single, short-duration button press. In order to prevent accidental resetting, the surge counter reset button shall be depressed for a minimum of 2 seconds in order to clear the surge count total.

- .1 The ongoing surge count shall be stored in non-volatile memory. If power to the SPD is completely interrupted, the ongoing count indicated on the surge counter's display prior to the interruption shall be stored in non-volatile memory and displayed after power is restored. The surge counter's memory shall not require backup battery in order to achieve this functionality.

.6 Overcurrent Protection

- .1 The unit shall contain thermally protected MOVs. These thermally protected MOVs shall have a thermal protection element packaged together with the MOV in order to achieve overcurrent protection of the MOV. The thermal protection element shall disconnect the MOV(s) from the system in a fail-safe manner should a condition occur that would cause them to enter a thermal runaway condition.

.7 Fully Integrated Component Design – All of the SPD's components and diagnostics shall be contained within one discrete assembly. SPDs or individual SPD modules that must be ganged together in order to achieve higher surge current ratings or other functionality shall not be accepted.

.8 Safety Requirements

- .1 The SPD shall minimize potential arc flash hazards by containing no user serviceable/replaceable parts and shall be maintenance free. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring any maintenance of any sort such as periodic tightening of connections shall not be accepted. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.
- .2 SPDs designed to interface with the electrical assembly via conductors shall require no user contact with the

inside of the unit. Such units shall have any required conductors be factory installed.

- .3 Sidemount SPDs shall be factory sealed in order to prevent access to the inside of the unit. Sidemount SPDs shall have factory installed phase, neutral, ground and remote status contact conductors factory installed and shall have a pigtail of conductors protruding outside of the enclosure for field installation.

## 2.3 System Application

2.3.1 The SPD applications covered under this section include distribution and branch panel locations, busway, motor control centers (MCC), switchgear, and switchboard assemblies. All SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C, B, and A environments.

2.3.2 Surge Current Capacity – The minimum surge current capacity the device is capable of withstanding shall be as shown in the following table (as per manufacturer's recommendation):

MINIMUM SURGE CURRENT CAPACITY BASED ON ANSI / IEEE C62.41 LOCATION CATEGORY			
CATEGORY	APPLICATION	PER PHASE	PER MODE
C	Service Entrance Locations (Switchboards, Switchgear, MCC, Main Entrance)	350 kA	
B	High Exposure, CDP or MCC locations	160 kA	
A	Branch Locations (Panelboards, MCCs, Busway)	120 kA	

2.3.3 SPD Type – all SPDs installed on the line side of the service entrance disconnect shall be Type 1 SPDs. All SPDs installed on the load side of the service entrance disconnect shall be Type 2 SPDs.

2.3.4 Sidemount Mounting Applications Installation (SPD mounted external to electrical assembly)

- .1 Applicable only when explicitly requested herein to mount SPD devices external to distribution points.
- .2 Lead length between the breaker and SPD shall be kept as short as possible to ensure optimum performance. Any excess conductor length shall be trimmed in order to minimize let-through voltage. The installer shall comply with the manufacturer's recommended installation and wiring practices.

2.3.5 Switchgear, Switchboard, and Busway Requirements

- .1 The SPD application covered under this section is for switchgear, switchboard, MCC, and busway locations. Service entrance located SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C Environments.
- .2 The SPD shall be of the same manufacturer as the switchgear, switchboard, MCC and busway.
- .3 The SPD shall be factory installed inside the switchgear, switchboard, MCC, and/or bus plug at the assembly point by the original equipment manufacturer
- .4 Locate the SPD on the load side of the main disconnect device, as close as possible to the phase conductors and the ground/neutral bar.
- .5 The SPD shall be connected through a disconnect (30A circuit breaker). The disconnect shall be located in immediate proximity to the SPD. Connection shall be made via bus, conductors, or other connections originating in the SPD and shall be kept as short as possible.
- .6 The SPD shall be integral to switchgear, switchboard, MCC, and/or bus plug as a factory standardized design.
- .7 All monitoring and diagnostic features shall be visible from the front of the equipment.

## **2.4 Enclosures**

- 2.4.1 All enclosed equipment shall have NEMA 1 general purpose enclosures, unless otherwise noted. Provide enclosures suitable for locations as indicated on the drawings and as described below:
- .1 NEMA 1 – Constructed of a polymer (units integrated within electrical assemblies) or steel (sidemount units only), intended for indoor use to provide a degree of protection to personal access to hazardous parts and provide a degree of protection against the ingress of solid foreign objects (falling dirt).
  - .2 NEMA 4 – Constructed of steel intended for either indoor or outdoor use to provide a degree of protection against access to hazardous parts; to provide a degree of protection of the equipment inside the enclosure against ingress of solid foreign objects (dirt and windblown dust); to provide a degree of protection with respect to the harmful effects on the equipment due to the ingress of water (rain, sleet, snow, splashing water, and hose directed water); and that will be undamaged by the external formation of ice on the enclosure. (sidemount units only).

- .3 NEMA 4X – Constructed of stainless steel providing the same level of protection as the NEMA 4 enclosure with the addition of corrosion protection. (sidemount units only).

### **3 . EXECUTION**

#### **3.1 Installation**

- 3.1.1 Integral SPD shall be installed by panel manufacturer/supplier in all equipment SPD units to circuit breaker within the equipment noted on drawings. Conductors as short and straight as possible as, no greater than 18" in length. Input conductor to SPD/filter shall be twisted to reduce impedance during high frequency filtering shall be minimum #6 AWG.
- 3.1.2 The SPD should be installed following the manufacturer's recommended practices and in compliance with all applicable codes.

#### **3.2 Equipment Identification**

- 3.2.1 Provide equipment identification nameplate.

#### **3.3 Field Testing**

- 3.3.1 Provide complete verification per manufacturer instruction including suggested values on bolted connections.
- 3.3.2 Ensure satisfactory performance to stated standards and if any module or un comply replace it completely.
- 3.3.3 Record insulation resistance from phase to ground according to manufacturer or industry standard. Provide formal records to Engineer for review.

#### **3.4 Maintenance – Clearances**

- 3.4.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

#### **3.5 Cleaning**

- 3.5.1 Proceed in accordance with Section 01 74 00 Claening and waste management.
- 3.5.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

1.4 **Sustainable Requirements**

1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.

1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.

1.4.3 Waste Management and Disposal

- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.

- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
  - .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.
  - .5 Construction Indoor Air Quality (IAQ) management.
  - .6 VOC/Low-Emitting Materials Compliance.
- 1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

- 1.5.1 Provide submittals in accordance with Section 01 33 00 - Submittal Procedures.
- 1.5.2 Product Data:
  - .1 Provide manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Provide complete photometric data prepared by independent testing laboratory for luminaires where specified, for review by Engineer.
  - .3 Photometric data to include: VCP Table where applicable, spacing criterion and luminaire coefficient of utilization.
- 1.5.3 Samples:
  - .1 Submit samples in accordance with Section 01 33 00 (01300) - Submittal.
- 1.5.4 Quality assurance submittals: provide following in accordance with Section 01 45 00 - Quality Control.
  - .1 Provide mock-ups in accordance with Section 01 40 00 - Quality Requirements.

- .2 Submit site tests results of installed electrical systems and instrumentation
  - .3 Manufacturer's instructions: provide manufacturer's written installation instructions and special handling criteria, installation sequence, and cleaning procedures.
- 1.5.5 Closeout Submittals:
- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
  - .2 Data necessary for maintenance of materials.
  - .3 Manufacturers recommended list of spare parts.

**1.6 Delivery, Storage and Handling**

- 1.6.1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements.
- 1.6.2 Deliver materials to site in original factory packaging, labelled with manufacturer's name, address.

**2 . PRODUCTS**

**2.1 LED**

- 2.1.1 All LEDs within luminaires of the same manufacturer shall have equal binning with similar lumen and colour output.

**2.2 Drivers**

- 2.2.1 All electronic driver that are listed as being compatible with the LED chip set used in the fixture.
- 2.2.2 Driver is to have a power factor than 0.9 with a Total Harmonic Distortion (THD) less than 20%.

**2.3 Finishes**

- 2.3.1 Light fixture finish and construction to meet ULC listings and CSA certifications related to intended installation.

**2.4 Optical Control Devices**

- 2.4.1 As indicated in luminaire schedule.

**2.5 Luminaires**

- 2.5.1 As indicated in luminaire schedule.

---

**2.6 Acceptable manufacturer as per Luminaires schedule.**

**3 . EXECUTION**

**3.1 Installation**

3.1.1 Locate and install luminaires as indicated.

**3.2 Wiring**

3.2.1 Connect luminaires to lighting circuits:

.1 Install flexible or rigid conduit for luminaires as indicated.

**3.3 Luminaire Supports**

3.3.1 For suspended ceiling installations support luminaires independently of ceiling.

**3.4 Luminaire Alignment**

3.4.1 Align luminaires mounted in continuous rows to form straight uninterrupted line.

3.4.2 Align luminaires mounted individually parallel or perpendicular to building grid lines.

**3.5 Maintenance – Clearances**

3.5.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.6 Cleaning**

3.6.1 Clean in accordance with Section 01 74 00 Cleaning and waste management.

.1 Remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation for Emergency Lighting.

**1.2 Related Sections**

- 1.2.1 This section of the specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International)

- .1 Construction Waste Management / Product Waste Recyclability.
  - .2 Recycled Content.
  - .3 Local and Regional Materials.
  - .4 Certified Wood.

.5 Construction Indoor Air Quality (IAQ) management.

.6 VOC/Low-Emitting Materials Compliance.

1.4.5 NOTE: Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Submit in accordance with Section 01 33 00 - Submittal Procedures.

1.5.2 Product Data:

.1 Submit manufacturer's instructions, printed product literature and data sheets for emergency lighting and include product characteristics, performance criteria, physical size, finish and limitations.

.2 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.

.3 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Sample:

.1 Submit samples in accordance with Section 01 33 00 (01300) - Submittal.

1.5.4 Quality Assurance:

.1 Submit site tests results of installed electrical systems and instrumentation

1.5.5 Closeout Submittals:

.1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.

.2 Data necessary for maintenance of materials.

.3 Manufacturers recommended list of spare parts.

.4 Submit in accordance with Section 01 78 00 - Closeout Submittals.

.5 Operation and Maintenance Data: submit operation and maintenance data for emergency lighting for incorporation into manual.

## **1.6 Delivery, Storage and Handling**

1.6.1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements and with manufacturer's written instructions.

- 1.6.2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

**1.7 Acceptable Manufactures**

- 1.7.1 As per Luminaire Schedule  
1.7.2 Or approved equal.

**1.8 Warranty**

- 1.8.1 For batteries in this Section 26 52 00 - Emergency Lighting, 12 months warranty period is extended to 120 months.

**2. PRODUCTS**

**2.1 Equipment**

- 2.1.1 Emergency lighting equipment: to CSA C22.2 No.141.  
2.1.2 Supply voltage: 120V AC  
2.1.3 Output voltage: 24 V DC  
2.1.4 Operating time: 120 minutes.  
2.1.5 Battery: sealed, maintenance free.  
2.1.6 Charger: solid state, multi-rate, voltage/current regulated, inverse temperature compensated, short circuit protected with regulated output of +/- 0.01 V for +/- 10% input variations.  
2.1.7 Solid state transfer circuit.  
2.1.8 Low voltage disconnect: solid state, modular, operates at 80% battery output voltage.  
2.1.9 Signal lights: solid state, for 'AC Power On and High Charge  
2.1.10 Lamp heads: Remote/Integral 345 degrees horizontal and 180 degrees vertical adjustment. Lamp type: LED 72 W, minimum lumen output to provide 10 lux average throughout space.  
2.1.11 Cabinet: suitable for direct or shelf mounting to wall and complete with knockouts for conduit. Removable or hinged front panel for easy access to batteries.  
2.1.12 Finish: White, Powder Coated.  
2.1.13 Auxiliary equipment:  
.1 Ammeter.  
.2 Voltmeter.  
.3 Test switch.  
.4 Time delay relay.  
.5 Battery disconnect device.

- .6 AC input and DC output terminal blocks inside cabinet.
- .7 Bracket
- .8 Cord and twist lock plug connection for AC.
- .9 RFI suppressors.

## **2.2 Wiring Of Remote Heads**

- 2.2.1 Conduit: type, in accordance with Section 26 05 34 - Conduits, Conduit Fastenings and Conduit Fittings.
- 2.2.2 Conductors: type in accordance with Section 26 05 21 - Wires and Cables (0-1000 V), sized as indicated in accordance with manufacturers recommendations.

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Verification of Conditions: verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for emergency lighting installation in accordance with manufacturer's written instructions.
  - .1 Visually inspect substrate in presence of Engineer
  - .2 Inform Engineer of unacceptable conditions immediately upon discovery.
  - .3 Proceed with installation only after unacceptable conditions have been remedied after receipt of written approval from Engineer.

### **3.2 Installation**

- 3.2.1 Install unit equipment and remote mounted fixtures.
- 3.2.2 Direct heads.
- 3.2.3 Connect exit lights to unit equipment.

### **3.3 Cleaning**

- 3.3.1 Progress Cleaning: clean in accordance with Section 01 74 00 Cleaning and waste management.
  - .1 Leave Work area clean at end of each day.
- 3.3.2 Final Cleaning: upon completion remove surplus materials, rubbish, tools and equipment in accordance with Section 01 74 00 Cleaning and waste management.

### **3.4 Protection**

- 3.4.1 Protect installed products and components from damage during construction.

- 
- 3.4.2 Repair damage to adjacent materials caused by emergency lighting installation.

**3.5 Maintenance – Clearances**

- 3.5.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Materials and installation of exit signs.

**1.2 Related Sections**

- 1.2.1 The section of the Specification forms part of the contract documents and is to be read, interpreted and coordinated with all other parts.

**1.3 References**

- 1.3.1 Canadian Standards Association (CSA International)  
.1 CSA C22.2 No.141 (current edition), Unit Equipment for Emergency Lighting.
- 1.3.2 National Fire Protection Association (NFPA)  
.1 NFPA 101 (current edition), Life Safety Code.

**1.4 Sustainable Requirements**

- 1.4.1 Materials and products in accordance with Sustainable Requirements: Construction.
- 1.4.2 Do verification requirements in accordance with Sustainable Requirements: Contractor's Verification.
- 1.4.3 Waste Management and Disposal
- .1 Separate and recycle waste materials in accordance with Section 01 61 00 - Construction/Demolition Waste Management and Disposal and with the Waste Reduction Work plan.
- .2 Avoid using landfill waste disposal procedures when recycling facilities are available.
- .3 Place materials defined as hazardous or toxic waste in designated containers.
- 1.4.4 In order to satisfy the Sustainable goals for the Project, the Construction Manager and all Trade Contractors, suppliers and manufacturers shall comply with all requirements and they shall be fully aware of all required laws and available strategies to achieve sustainable goals, including any applicable exemplary performance levels, for the following:
- .1 Construction Waste Management / Product Waste Recyclability.
- .2 Recycled Content.
- .3 Local and Regional Materials.

- .4 Certified Wood.
- .5 Construction Indoor Air Quality (IAQ) management.
- .6 VOC/Low-Emitting Materials Compliance.

1.4.5 **NOTE:** Any specific products listed herein are approved products, provided they meet with the Sustainable requirements for this project. Any proposed alternative products must meet the Sustainable requirements of the project.

## **1.5 Submittals**

1.5.1 Provide submittals in accordance with Section 01 33 00 - Submittal.

1.5.2 Product Data:

- .1 Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Provide manufacturer's printed product literature, specifications and data sheets, and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Submit WHMIS MSDS - Material Safety Data Sheets in accordance with Sustainable Requirements: Construction and include: product characteristics, performance criteria, physical size, horsepower, watt rating, limitations and finish.

1.5.3 Sample:

- .1 Submit samples in accordance with Section 01 33 00 - Submittal.

1.5.4 Quality Assurance:

- .1 Engineer reserves the right to witness standard factory testing of the above.
- .2 Submit site tests results of installed electrical systems and instrumentation

1.5.5 Closeout Submittals:

- .1 Provide maintenance data for materials for incorporation into manual specified in Section 01 78 00 - Closeout Submittals.
- .2 Data necessary for maintenance of materials.
- .3 Manufacturers recommended list of spare parts.

## **1.6 Delivery, Storage and Handling**

1.6.1 Deliver, store, handle and protect materials in accordance with Section 01 61 00 - Common Product Requirements.

- 1.6.2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- 1.6.3 Handle materials with suitable lifting equipment.
- 1.6.4 Store materials in heated, dry, weather-protected enclosure

**1.7 Description of System**

- 1.7.1 Exit signs shall be Running Man type. The light source shall be white LEDs and shall provide even illumination of the pictogram. The equipment shall operate with 120 V ac input with a total load less than 2.2 W. The pictogram has a green background with a white running man.

**1.8 Acceptable Manufacturers**

- 1.8.1 As per Luminaire Schedule
- 1.8.2 Or approved equal.

**2. PRODUCTS**

**2.1 Standard Units**

- 2.1.1 Exit lights: to CSA C22.2 No.141 Running Man Type.
- 2.1.2 Housing: cold rolled steel minimum 1.0mm thick, satin aluminum enamel finish extruded aluminum housing, brush aluminum finish.
- 2.1.3 Face and back plates: extruded aluminum.
- 2.1.4 Lamps: Multiple LED-12W, 120 V, over 500,000 hours.
- 2.1.5 Face plate to remain captive for relamping.

**2.2 Edge-Lit Unit**

- 2.2.1 Exit lights: to CSA C22.2 No.141 Running Man Type.
- 2.2.2 Extruded aluminium cylindrical housing and canopy.
- 2.2.3 High-clarity solid acrylic faceplate.
- 2.2.4 Lamps: Multiple LED-12W, 120 V, over 500,000 hours.
- 2.2.5 Field-removable directional chevron arrows.
- 2.2.6 Universal mounting (ceiling, wall, etc.)
- 2.2.7 Rounded corners.
- 2.2.8 Face plate to remain captive for relamping.

**2.3 Water-Tight Unit**

- 2.3.1 To CSA C22.2 No. 141 Running Man Type.
- 2.3.2 Housing: metal and plastic (NEMA 4X)
- 2.3.3 Lamps: Multiple LED-12W, 120 V, over 50,000 hours.

- 2.3.4 Field-removable directional chevron arrows.
- 2.3.5 Universal mounting (ceiling, wall, etc.)

### 3. **EXECUTION**

#### 3.1 **Manufacturer's Instructions**

- 3.1.1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.

#### 3.2 **Installation**

- 3.2.1 Install exit lights to manufacturer's recommendations, listing requirements, NFPA standard and local regulatory requirements.
- 3.2.2 Connect exit signs to dedicated circuits and breakers as required by the Canadian Electrical Code.
- 3.2.3 Provide circuit breaker locks for exit sign circuits.
- 3.2.4 Power to exist lights is to be sourced from emergency power where available.
- 3.2.5 Provide at least one exit sign circuit for each floor level except as noted.
- 3.2.6 All exit sign wiring is to be installed in a separate conduit and boxes.
- 3.2.7 All conductors are to be minimum #12 AWG with RW90 X-link insulation.
- 3.2.8 Support exit signs from ceiling tile in T-bar installation locations so as to provide a flush/neat installation and minimize tile lift.
- 3.2.9 Provide approved support hardware to the T-bar rail assembly to minimize tile stress and provide independent seismic cable(s) restraint from the building structure.
- 3.2.10 Wall-mounted exit lights are to be mounted 2900 mm to underside, or as detailed.
- 3.2.11 Ceiling-mounted exit lights in all service spaces are to be suspended to 2290mm to the underside.

#### 3.3 **Final Acceptance**

- 3.3.1 Position exit lights to optimize viewing angles and to avoid line-of-site obstructions.
- 3.3.2 Attend the building occupancy review with the authority having jurisdiction and adjust any locations as required.
- 3.3.3 Install any additional exit signs as requested in accordance with "Spare Exit Sign Material" clause noted above.

---

**3.4 Maintenance – Clearances**

- 3.4.1 Provide clearance around systems, equipment and components for observation of operation, review, servicing, maintenance and as recommended by manufacturer and CEC, Part 1.

**3.5 Cleaning**

- 3.5.1 Proceed in accordance with Section 01 74 00 Cleaning and waste management.
- 3.5.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Conform to the requirements of Divisions 0 and 1 and additional general information as prepared by the Architect or Prime Consultant, which apply to and form part of all sections of the work.
- 1.1.2. Read and comply with all sections of this document.
- 1.1.3. These instructions apply to and form part of all Communications Sections and drawing(s).
- 1.1.4. Refer to section 27 00 05 for definitions of names, titles, terms and abbreviations used in this document.
- 1.1.5. These specification documents have been prepared by Technology Systems Consultant specifically for use on this project and may not be reproduced in whole or in part without the express written consent of Technology Systems Consultant. These documents may not be used for any other purpose and/or for any other project and are considered confidential for the use of preparing a tender response.
- 1.1.6. This specification is divided into Sections which are not intended to identify contractual limits between Sub-Contractors nor between the Contractor and his Sub-Contractors. The requirements of any one Section apply to all Sections. Refer to other Divisions and Sections to ensure a complete and operational system.
- 1.1.7. These specification documents shall remain the property of the Technology Systems Consultant at all times.
- 1.1.8. All drawings and details have been prepared to illustrate the existing and new conditions of the project and shall be considered diagrammatic. The Communications Contractor shall ensure all components required to complete the fully operational system are installed with no additional cost to the Owner or the Technology Systems Consultant.
- 1.1.9. Provide all labour, materials, tools and equipment required for the complete installation of work called for in all Sections of the Contract Documents.
- 1.1.10. The Communications Contractor shall verify exact locations of all items shown and shall verify with the Technology Systems Consultant all new locations prior to installation. It shall be the responsibility of the Communications Contractor to provide the Technology Systems Consultant detailed layouts of all rooms and locations of installation prior to installation for approval. All costs, including other trades as applicable, associated with changes resulting from non-approved installation will be the responsibility of the Communications Contractor.
- 1.1.11. Minor changes in locations may be required by the Technology Systems Consultant in order to coordinate site conditions with other divisions and the Technology Systems Consultant reserves the right to make these changes with no additional cost to the Owner.

---

**1.2 Schedule**

- 1.2.1. The Communications Contractor shall be responsible to meet the project schedule as provided by the Project Manager and the Owner.
- 1.2.2. Work is generally to be performed during regular work hours unless noted otherwise in this document. The Communications Contractor shall include for all necessary overtime labour in order to complete the project. The Communications Contractor shall be responsible for providing labour in order to complete the work within the schedule with no additional cost to the Owner.
- 1.2.3. The Communications Contractor shall supply a written project plan detailing schedule of installation in coordination with the overall project schedule. Project plan shall be prepared in MS Project.
- 1.2.4. At and near the completion of the project the Communications Contractor will be responsible for providing project documentation for the Owner's further use. This will include:
  - .1 Temporary As-Builts
  - .2 Contact Info for Cutover Technician
  - .3 As Built Test Results
  - .4 As-Built Drawings
- 1.2.5. All documents and information shall be provided as further detailed in Section 27 00 11 and delivered to the Technology Systems Consultant.

**1.3 Labour**

- 1.3.1. The Communications Contractor shall provide only skilled, trained tradesmen experienced in the installation of a certified installation. Each installer shall be certified with the manufacturer providing the 2 year warranty for this project. All installers shall have successfully completed the approved manufacturer's installation training program. The Technology Systems Consultant reserves the right to receive written proof of such training at any time during the project. If such proof is not provided the Communications Contractor will remove the installer from the site immediately and replace the installer within 24 hours.
- 1.3.2. The Communications Contractor shall be responsible to provide Union or Non-union labour as required on the project site and meet all requirements without any delay or cost to the Owner, General Contractor or other trades.
- 1.3.3. Sub-Contractors shall not be allowed to perform all or any portion of the project unless approved in writing by the Technology Systems Consultant and the Owner. Subcontractors shall be identified at time of tender to be considered for approval.
- 1.3.4. The Communications Contractor shall be in compliance at all times with local, provincial and federal employee standards, safety acts, fire codes and other applicable legislations, codes and acts affecting the delivery of the project. The Communications Contractor is responsible for the training and notifying their employees of any details associated with all codes, standards, acts and legislation applicable to this project.

- 
- 1.3.5. WSIB (Workplace Safety Insurance Board) clearance certificate indicating a good standing shall be provided by the Communications Contractor prior to acceptance of any contract.
  - 1.3.6. Provide personal identification in a form acceptable to the Owner for all employees attending the site for this project when requested.

#### **1.4 Interpretation of Drawings and Specifications**

- 1.4.1. It is the responsibility of the Communications Contractor to read carefully these specifications and drawing(s) and report any discrepancies immediately to the Technology Systems Consultant.
- 1.4.2. At the time of tendering the Communications Contractor shall notify the Technology Systems Consultant in writing of any equipment, wiring feature, software or device necessary for full operation of any of the systems which is not included in the specification documents or drawings. Failure to supply notification shall not relieve the Communications Contractor of the responsibility for providing a fully functioning system at the bid price.
- 1.4.3. While every attempt has been made to ensure that all information (including specified products and part numbers) is correct, it is the responsibility of the Communications Contractor to verify availability of products and verify all part numbers.
- 1.4.4. Specifications and drawings are schematic and represent the intent of the project.
- 1.4.5. Dimensions and measurements shown in these documents shall be verified by the Communications Contractor on site prior to final installation.
- 1.4.6. Quantities and lengths identified are approximate and shall not be used to gage or limit work.
- 1.4.7. These Specifications are an integral part of the accompanying drawing(s). Any item or subject omitted from one or the other, but which is either mentioned or implied shall be considered as properly and sufficiently specified.
- 1.4.8. Certain details indicated on the drawings are general in nature and are not specifically identified for each and every occurrence of use; however, such details shall be applicable to every occurrence on the drawings.
- 1.4.9. The location and size of existing services and equipment shown on the drawings are based on the best available information. The Communications Contractor shall verify the exact location, type, size and any other pertinent information prior to commencing work.

#### **1.5 Installation**

- 1.5.1. Leave areas clear where space has been designated as reserved for future equipment and equipment for other trades.

- 
- 1.5.2. Adequate space and provisions shall be left for removal of components and servicing of equipment, with minimum inconvenience to the operation of systems.
  - 1.5.3. Where equipment is shown to be 'roughed in only' obtain information from the Technology Systems Consultant before proceeding with the work.

**1.6 Coordination**

- 1.6.1. The Communications Contractor shall provide an installation and make all changes associated with coordination with other trades and to accommodate unforeseen site conditions at no additional cost to the Owner.
- 1.6.2. Prepare interference drawings and sketches for presentation to the Technology Systems Consultant to review any anticipated conflicts with other trades.
- 1.6.3. Prepare detailed layouts of equipment rooms prior to installation for review by the Technology Systems Consultant. Layouts shall indicate other major pieces of equipment being supplied by other trades.
- 1.6.4. The Communications Contractor shall be responsible for attending coordination meetings as requested by the General Contractor or Project Manager for the coordination of locations and services. The project manager selected shall be assigned for the duration of the project and may only be changed with the written consent of the Technology Systems Consultant.
- 1.6.5. The Communications Contractor in addition to coordination meetings shall attend weekly site meetings and be prepared to provide current project progress status, anticipated completion of future tasks and information on outstanding delivery items.
- 1.6.6. Access to the site shall be in compliance to all rules, regulations, safety standards and security procedures established for the project or building. Fees for after-hours access shall be considered included in the tender amount. No additional cost shall be accepted by the Owner for these requirements.
- 1.6.7. Cutting and patching of all surfaces as applicable to the communications installation shall be the responsibility of and be performed by the Communications Contractor. All work shall be performed to the standards set by codes and standards, Building Management, General Contractor and the Owner.
- 1.6.8. Cutting and patching of all structural members shall be approved by the Structural Consultant prior to work starting.
- 1.6.9. Work causing noise, dust and/or odour shall be performed during evenings and/or weekends to prevent disturbance to the operation of the Owner's or surrounding businesses. Work shall be performed at agreed times and in coordination with each party. All damages caused for work performed not in compliance with this item shall be the responsibility of the Communications Contractor.

---

**1.7 Temporary Services**

- 1.7.1. The Communications Contractor shall provide all required materials, labour, tools and equipment to meet the temporary requirements of the project in coordination with other trades and the General Communications Contractor at no additional cost to the Owner.
- 1.7.2. All hoisting, mechanical lifts and special scaffolds shall be the responsibility of the Communications Contractor and at no additional cost to the Owner.
- 1.7.3. All power supplies, extension cords and equipment cords shall be the responsibility of the Communications Contractor and shall be installed in good working order and in accordance with all codes, standards and building regulations.

**1.8 Co-Operation With Other Divisions**

- 1.8.1. Communications Cabling shall not touch or be supported from piping, ductwork, conduits, ceiling supports or any other service / equipment. Communications Cabling shall be supported by approved j-hooks, cable slings, ladder / basket tray and/or conduit as outlined in this document.
- 1.8.2. Supply all items to be built in ample time for rapid progression of the work. Schedule and provide manpower and materials to proceed with work as required to satisfy the construction schedule.

**1.9 Existing Services and Equipment**

- 1.9.1. All changes and connections to existing services shall be made only in a manner and at a time approved by the Technology Systems Consultant and/or the Owner so as to avoid any interruption of such services during normal working hours. If necessary, changes and connections to existing services shall be made outside of normal business hours at no extra cost to the Owner.

**1.10 Metric Conversions**

- 1.10.1. Particular attention shall be paid with regard to Imperial versus S.I. Metric conversions. This applies to all services including, but not limited to, equipment, material and site services in both new and existing installations.
- 1.10.2. Conform to Canadian Metric Practice Guide CSA-CAN3-2234-1-89.

**1.11 Monthly Draws**

- 1.11.1. Monthly progress draws shall be submitted to the General Contractor for approval by the Technology Systems Consultant.

---

**1.12 Pricing of Changes**

- 1.12.1. Where a Contemplated Change Notice (CCN) has been issued and identifies potential changes to the scope of work and those changes have been price-identified in the Tender Form under the Alternate, Separate, Identified and/or Unit Pricing structure, the Communications Contractor shall price all changes in accordance with the pricing provided in the Tender Form at the time of tender. All prices shall be provided in a broken down format, identifying the pricing reference (i.e. The line item on the Tender Form).
- 1.12.2. Where a CCN has been issued and identifies potential changes to the scope of work and those changes have NOT been price-identified in the Tender Form under the Alternate, Separate, Identified and/or Unit Pricing structure, the Communications Contractor shall provide a complete breakdown of all material, equipment and labour cost associated with each submission in the following format.

All material used in the change(s) shall be identified by:

Quantity  
Price Per Unit  
Material Cost  
Hours per Unit  
Total Hours

Summary shall include:

Total Material Value  
HST  
Technician rate (as per Tender Form)  
Forman rate  
Overhead  
Markup (profit)

Contemplated Change Notices shall include at no extra cost:

Administration  
Record Drawings  
Clean up  
Co-ordination  
Engineering and Drafting  
Estimating  
Guarantee  
Hydro Inspection  
Material Delivery  
Material Expediting  
Mileage  
Parking  
Project Management  
Re-Assign Manpower

---

Safety  
Schedule Extension  
Supervision  
Tool Charges  
Wastage  
Warranty

Foreman Charges: Foreman Charges shall not exceed 10% of the labour component of the price.

Overhead and Profit: All overhead fees and profit shall be fixed at 5% and 10% unless agreed to by the owner / consultant prior to installation.

## **2 PRODUCT**

### **2.1 Substitutions**

- 2.1.1. Substitution of any product shall be prior approved in writing by only the Technology Systems Consultant.
- 2.1.2. The procedure for substitution approval will include the written submission by the Communications Contractor including the following:
  - .1 Original specified product
  - .2 Proposed product being substituted
  - .3 Reason for substitution
  - .4 Shop drawings indicating all technical specifications
  - .5 Financial advantage
  - .6 Schedule delivery date
  - .7 Written approval from certifying system manufacturer
- 2.1.3. Based on the review of the information requested above, the Owner and/or Technology Systems Consultant reserve the right to reject any proposed substitution without delay or cost to the project or the Owner.

### **2.2 Material Handling**

- 2.2.1. The Communications Contractor is responsible for the delivery of all materials to site and transportation to the work place in accordance with all safety regulations and procedures.
- 2.2.2. Make arrangements and schedule all hoisting with Building Management and the General Contractor.
- 2.2.3. Provide and be responsible for lockable storage for all tools and material required to complete the installation through the duration of the project. Once the project is complete remove all tools and excess materials within 2 business days.
- 2.2.4. The Owner and its representatives shall in no way be held liable for any missing material, equipment or tools required to complete the installation.

---

### **3 EXECUTION**

#### **3.1 General**

- 3.1.1. The Communications Contractor shall supply all materials, labour, tools and equipment to provide a complete warranted installation as outlined in the contract documents and suitable to the approval of the Owner, the Technology Systems Consultant and inspection bodies having jurisdiction.
- 3.1.2. Provide continuity of all existing services while completing the specified installation. Losses due to interruption of services will be the responsibility of the Communications Contractor.
- 3.1.3. Arrange for all shutdowns (1) week prior in writing with the Project Manager and those in control of services shall be disrupted. All overtime costs, fees, security and other requirements shall be the full responsibility of the Communications Contractor.
- 3.1.4. Should services be interrupted accidentally the Communications Contractor shall provide material and labour to re-establish services immediately and shall continue without stoppage until all services have been re-established. All material and labour costs including overtime shall be borne solely by the Communications Contractor. Any material and/or labour costs including overtime associated with other trades and/or the General Contractor to assist in any way the Communications Contractor in re-establishing services shall be borne solely by the Communications Contractor.

#### **3.2 Site Conditions**

- 3.2.1. The Communications Contractor is responsible for maintaining a clean work environment and is responsible for the removal of all debris on a daily basis. Debris and removed materials shall be disposed of in conformance with all local by laws and regulations. Failing to comply and after reasonable time and written notice the General Contractor reserves the right to hire cleaners to complete the cleaning and back charge the Communications Contractor.
- 3.2.2. The Communications Contractor shall be responsible for the removal and reinstallation of all floor or ceiling tiles, hatch ways or access panels. All items shall be removed and replaced on a daily basis and left in the original condition. Special caution shall be taken to not break, chip or discolour with dirt or finger prints any such items. The Communications Contractor will be fully responsible for repair or replacement of all damaged pieces at the discretion of the Project Manager or Owner.
- 3.2.3. The Communications Contractor is fully responsible for storage of all temporarily removed items for the project.
- 3.2.4. All materials and installation throughout the project will remain the responsibility of the Communications Contractor until final completion for the project is accepted by the Owner. Damages to any item installed shall be replaced or repaired by the Communications Contractor to provide a complete final installation at no additional cost to the Owner.

- 
- 3.2.5. At the completion of the project or as and when the Owner requires, restore the original condition of all materials, equipment and surfaces within the work area affected by this installation.
  - 3.2.6. All vehicular traffic entering the site shall be coordinated with the General Contractor and no parking or compensation for paid parking will be provided by the Owner.

**3.3 Cutting, Patching and Repairing**

- 3.3.1. It is the responsibility of the Communications Contractor to perform all cutting, patching and repair related to their work including any penetrations through walls or floors.

**3.4 Hoisting Facilities**

- 3.4.1. This Division shall provide its own hoisting facilities regardless of height required to perform work.
- 3.4.2. Hoisting facilities may be provided by the General Contractor, although the General Contractor may at its own discretion not allow the Communications Contractor to make use of such.

**3.5 Safety**

- 3.5.1. The Communications Contractor shall adhere to all safety laws, rules and regulations issued by the authorities having jurisdiction, General Contractor, Project Manager and the Owner.
- 3.5.2. The Communications Contractor shall attend all Safety Program meetings requested by the General Contractor.
- 3.5.3. Provide adequate protection in public and work areas to pedestrian and other trade traffic using approved safety barriers, caution tape and signage.
- 3.5.4. At all times maintain clear fire exits, emergency routes and access to emergency equipment including fire hose cabinets, fire extinguishers and stand pipe connections.
- 3.5.5. Smoking and combustion of any materials is strictly prohibited on all sites.
- 3.5.6. Provide information to all employees of emergency and fire safety plans for the work site and facility.
- 3.5.7. Provide protection as required by the authorities having jurisdiction to all employees for work performed in typically inaccessible or concealed spaces.
- 3.5.8. If an approved subcontractor is used provide information and ensure all safety specifications herein are met.

**3.6 Site Adjustments**

- 3.6.1. Locations of all equipment, outlets or devices prior to installation may be revised to within (3) meters without any additional cost or change request.

- 
- 3.6.2. Portions of the project may be at any time identified in writing to be "On Hold". Work in these areas shall not be started, continued or completed until further direction is received. No additional cost shall be accepted by the Owner for areas put on hold.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to the requirements of Divisions 0 and 1 and additional general information as prepared by the Architect or Prime Consultant, which apply to and form part of all sections of the work.
- 1.1.2 Read and comply with all sections of this document.
- 1.1.3 These instructions apply to and form part of all Audio-Visual Communications Sections and drawing(s).
- 1.1.4 Refer to section 27 00 05 for definitions of names, titles, terms, and abbreviations used in this document.
- 1.1.5 These specification documents have been prepared by the Technology Systems Consultant specifically for use on this project and may not be reproduced in whole or in part without the express written consent of the Technology Systems Consultant. These documents may not be used for any other purpose and/or for any other project and are considered confidential for the use of preparing a tender response.
- 1.1.6 This specification is divided into Sections which are not intended to identify contractual limits between Sub-Contractors nor between the Contractor and his Sub-Contractors. The requirements of any one Section apply to all Sections. Refer to other Divisions and Sections to ensure a complete and operational system.
- 1.1.7 These specification documents shall remain the property of the Technology Systems Consultant at all times.
- 1.1.8 The Audio-Visual Communications Contractor shall report any discrepancies between drawings and all applicable specifications to the Technology Systems Consultant immediately.
- 1.1.9 All drawings and details have been prepared to illustrate the existing and new conditions of the project and shall be considered diagrammatic. The Audio-Visual Communications Contractor shall ensure all components required to complete the fully operational system are installed with no additional cost to the Owner or the Technology Systems Consultant.
- 1.1.10 Provide all labour, materials, tools, and equipment required for the complete installation of work called for in all Sections of the Contract Documents.

- 1.1.11 The Audio-Visual Communications Contractor shall verify exact locations of all items shown and shall verify with the Technology Systems Consultant all new locations prior to installation. It shall be the responsibility of the Audio-Visual Communications Contractor to provide the Technology Systems Consultant detailed layouts of all rooms and locations of installation prior to installation for approval. All costs, including other trades as applicable, associated with changes resulting from non-approved installation will be the responsibility of the Audio-Visual Communications Contractor.
- 1.1.12 Minor changes in locations may be required by the Technology Systems Consultant in order to coordinate site conditions with other divisions and the Technology Systems Consultant reserves the right to make these changes with no additional cost to the Owner.

## **1.2 Schedule**

- 1.2.1 The Audio-Visual Communications Contractor shall be responsible to meet the project schedule as provided by the Project Manager and the Owner.
- 1.2.2 Work is generally to be performed during regular work hours unless noted otherwise in this document. The Audio-Visual Communications Contractor shall include for all necessary overtime labour in order to complete the project. The Audio-Visual Communications Contractor shall be responsible for providing labour in order to complete the work within the schedule with no additional cost to the Owner.
- 1.2.3 The Audio-Visual Communications Contractor shall supply a written project plan detailing schedule of installation in coordination with the overall project schedule. Project plan shall be prepared in MS Project.
- 1.2.4 At and near the completion of the project the Audio-Visual Communications Contractor will be responsible for providing project documentation for the Owner's further use.
- 1.2.5 All documents and information shall be provided as further detailed in Section 27 00 09 and delivered to the Technology Systems Consultant.

## **1.3 Labour**

- 1.3.1 The Audio-Visual Communications Contractor shall provide only skilled, trained tradesmen experienced in the installation of an Audio-Visual communications systems installation.
- 1.3.2 The Audio-Visual Communications Contractor shall provide at least one permanent technician with his CTS or CTS-T credentials for the duration of the project.
- 1.3.3 The Audio-Visual Communications Contractor shall be responsible to provide Union or Non-union labour as required on the project site and meet all requirements without any delay or cost to the Owner, General Contractor, or other trades.

- 1.3.4 Sub-Contractors shall not be allowed to perform all or any portion of the project unless identified in the tender submission, along with their respective qualifications and/or certifications.
- 1.3.5 The Audio-Visual Communications Contractor shall comply at all times with local, provincial and federal employee standards, safety acts, fire codes and other applicable legislations, codes and acts affecting the delivery of the project. The Audio-Visual Communications Contractor is responsible for the training and notifying their employees of any details associated with all codes, standards, acts and legislation applicable to this project.
- 1.3.6 WSIB (Workplace Safety Insurance Board) clearance certificate indicating a good standing shall be provided by the Audio-Visual Communications Contractor prior to acceptance of any contract.
- 1.3.7 Provide personal identification in a form acceptable to the Owner for all employees attending the site for this project when requested.

#### **1.4 Interpretation of Drawings and Specifications**

- 1.4.1 It is the responsibility of the Audio-Visual Communications Contractor to carefully read these specifications and drawing(s) and report any discrepancies immediately to the Technology Systems Consultant.
- 1.4.2 At the time of tendering the Audio-Visual Communications Contractor shall notify the Technology Systems Consultant in writing of any equipment, wiring feature, software, or device necessary for full operation of any of the systems which is not included in the specification documents or drawings. Failure to supply notification shall not relieve the Audio-Visual Communications Contractor of the responsibility for providing a fully functioning system at the bid price.
- 1.4.3 While every attempt has been made to ensure that all information (including specified products and part numbers) is correct, it is the responsibility of the Audio-Visual Communications Contractor to verify availability of products and verify all part numbers.
- 1.4.4 Specifications and drawings are schematic and represent the intent of the project.
- 1.4.5 Dimensions and measurements shown in these documents shall be verified by the Audio-Visual Communications Contractor on site prior to final installation.
- 1.4.6 Quantities and lengths identified are approximate and shall not be used to gage or limit work.
- 1.4.7 These Specifications are an integral part of the accompanying drawing(s). Any item or subject omitted from one or the other, but which is either mentioned or implied shall be considered as properly and sufficiently specified.
- 1.4.8 Certain details indicated on the drawings are general in nature and are not specifically identified for each and every occurrence of use, however, such details shall be applicable to every occurrence on the drawings.

- 1.4.9 The location and size of existing services and equipment shown on the drawings are based on the best available information. The Audio-Visual Communications Contractor shall verify the exact location, type, size, and any other pertinent information prior to commencing work.

## **1.5 Installation**

- 1.5.1 Leave areas clear where space has been designated as reserved for future equipment and equipment for other trades.
- 1.5.2 Adequate space and provisions shall be left for removal of components and servicing of equipment, with minimum inconvenience to the operation of systems.
- 1.5.3 Where equipment is shown to be 'roughed in only' obtain information from the Technology Systems Consultant before proceeding with the work.

## **1.6 Coordination**

- 1.6.1 The Audio-Visual Communications Contractor shall provide an installation and make all changes associated with coordination with other trades and to accommodate unforeseen site conditions at no additional cost to the Owner.
- 1.6.2 Prepare interference drawings and sketches for presentation to the Technology Systems Consultant to review any anticipated conflicts with other trades.
- 1.6.3 Prepare detailed layouts of equipment rooms prior to installation for review by the Technology Systems Consultant. Layouts shall indicate other major pieces of equipment being supplied by other trades.
- 1.6.4 The Audio-Visual Communications Contractor shall be responsible for attending coordination meetings as requested by the General Contractor or Project Manager or Technology Systems Consultant for the coordination of locations and services. The project manager selected shall be assigned for the duration of the project and may only be changed with the written consent of the Technology Systems Consultant.
- 1.6.5 The Audio-Visual Communications Contractor in addition to coordination meetings shall attend weekly site meetings and be prepared to provide current project progress status, anticipated completion of future tasks and information on outstanding delivery items.
- 1.6.6 Access to the site shall comply to all rules, regulations, safety standards and security procedures established for the project or building. Fees for after-hours access shall be considered included in the tender amount. No additional cost shall be accepted by the Owner for these requirements.
- 1.6.7 Cutting and patching of all surfaces as applicable to the Audio-Visual communications installation shall be the responsibility of and be performed by the Audio-Visual Communications Contractor. All work shall be performed to the standards set by codes and standards, Building Management, General Contractor, and the Owner.

- 1.6.8 Cutting and patching of all structural members shall be approved by the Structural Consultant prior to work starting.
- 1.6.9 Work causing noise, dust and/or odour shall be performed during evenings and/or weekends to prevent disturbance to the operation of the Owner's or surrounding businesses. Work shall be performed at agreed times and in coordination with each party. All damages caused for work performed not in compliance with this item shall be the responsibility of the Audio-Visual Communications Contractor.

### **1.7 Temporary Services**

- 1.7.1 The Audio-Visual Communications Contractor shall provide all required materials, labour, tools and equipment to meet the temporary requirements of the project in coordination with other trades and the General Audio-Visual Communications Contractor at no additional cost to the Owner.
- 1.7.2 All hoisting, mechanical lifts and special scaffolds shall be the responsibility of the Audio-Visual Communications Contractor and at no additional cost to the Owner.
- 1.7.3 All power supplies, extension cords and equipment cords shall be the responsibility of the Audio-Visual Communications Contractor and shall be installed in good working order and in accordance with all codes, standards and building regulations.

### **1.8 Co-Operation With Other Divisions**

- 1.8.1 Audio-Visual communications cabling shall not touch or be supported from piping, ductwork, conduits, ceiling supports or any other service / equipment. Audio-Visual communications cabling shall be supported by approved j-hooks, cable slings, ladder / basket tray and/or conduit as outlined in this document.
- 1.8.2 Supply all items to be built in ample time for rapid progression of the work. Schedule and provide manpower and materials to proceed with work as required to satisfy the construction schedule.

### **1.9 Existing Services and Equipment**

- 1.9.1 All changes and connections to existing services shall be made only in a manner and at a time approved by the Technology Systems Consultant and/or the Owner so as to avoid any interruption of such services during normal working hours. If necessary, changes and connections to existing services shall be made outside of normal business hours at no extra cost to the Owner.

### **1.10 Metric Conversions**

- 1.10.1 Particular attention shall be paid with regard to Imperial versus S.I. metric conversions. This applies to all services including, but not limited to, equipment, material, and site services in both new and existing installations.
- 1.10.2 Conform to Canadian Metric Practice Guide CSA-CAN3-2234-1-89.

---

**1.11 Monthly Draws**

1.11.1 Monthly progress draws shall be submitted to the General Contractor for approval by the Technology Systems Consultant.

**1.12 Pricing of Changes**

1.12.1 Where a Contemplated Change Notice (CCN) has been issued and identifies potential changes to the scope of work and those changes have been price-identified in the Tender Form under the Alternate, Separate, Identified and/or Unit Pricing structure, the Audio-Visual Communications Contractor shall price all changes in accordance with the pricing provided in the Tender Form at the time of tender. All prices shall be provided in a broken-down format, identifying the pricing reference (i.e. The line item on the Tender Form).

1.12.2 Where a CCN has been issued and identifies potential changes to the scope of work and those changes have NOT been price-identified in the Tender Form under the Alternate, Separate, Identified and/or Unit Pricing structure, the Audio-Visual Communications Contractor shall provide a complete breakdown of all material, equipment and labour cost associated with each submission in the following format.

All material used in the change(s) shall be identified by:

Quantity  
Price Per Unit  
Material Cost  
Hours per Unit  
Total Hours

Summary shall include:

Total Material Value  
HST  
Technician rate (as per Tender Form)  
Forman rate  
Overhead  
Markup (profit)

Contemplated Change Notices shall include at no extra cost:

Administration  
Record Drawings  
Clean up  
Co-ordination  
Engineering and Drafting  
Estimating  
Guarantee  
Hydro Inspection

Material Delivery  
Material Expediting  
Mileage  
Parking  
Project Management  
Re-Assign Manpower  
Safety  
Schedule Extension  
Supervision  
Tool Charges  
Wastage  
Warranty

Foreman Charges: Foreman Charges shall not exceed 10% of the labour component of the price.

Overhead and Profit: All overhead fees and profit shall be fixed at 5% and 10% unless agreed to by the owner / consultant prior to installation.

## **2 PRODUCT**

### **2.1 General**

- 2.1.1 All equipment and products supplied shall be new and free of all manufacturer defects and delivery or installation damage.
- 2.1.2 All equipment and products supplied shall meet all manufacturer listed characteristics as identified in the latest manufacturer catalogue.
- 2.1.3 All products shall meet all applicable codes and standards and bare the UL/ULC label, be CSA approved and meet FCC/CRTC Regulations.
- 2.1.4 All products shall be provided in accordance with local, provincial, and national fire ratings for the installation on this project.

### **2.2 Warranty**

- 2.2.1 Upon completion of the project the Audio-Visual Communications Contractor shall deliver to the Technology Systems Consultant for the Owner a copy of the manufacturer's warranty information or certificate. This information shall accompany the final documentation described further in these specifications.
- 2.2.2 Subcontractors shall not be acceptable to provide warranty unless pre-approved by the Technology Systems Consultant and the Owner at time of tender. Subcontractors shall not be approved after tender is awarded.
- 2.2.3 The Audio-Visual Communications Contractor shall provide a written 2-year warranty inclusive of all parts and labour. The Audio-Visual Communications Contractor shall also state and agree in writing to providing response for any warranty request within 24 hours during this warranty period.

---

### **2.3 Substitutions**

- 2.3.1 Substitution of any product shall be prior approved in writing by only the Technology Systems Consultant.
- 2.3.2 The procedure for substitution approval will include the written submission by the Audio-Visual Communications Contractor including the following:
  - .1 Original specified product
  - .2 Proposed product being substituted
  - .3 Reason for substitution
  - .4 Shop drawings indicating all technical specifications
  - .5 Financial advantage
  - .6 Schedule delivery date
  - .7 Written approval from certifying system manufacturer
- 2.3.3 Based on the review of the information requested above, the Owner and/or Technology Systems Consultant reserve the right to reject any proposed substitution without delay or cost to the project or the Owner.

### **2.4 Material Handling**

- 2.4.1 The Audio-Visual Communications Contractor is responsible for the following:
  - .1 Delivery of all materials to site and transportation to the workplace in accordance with all safety regulations and procedures.
  - .2 Coordinate and schedule all hoisting with Building Management and the General Contractor.
  - .3 Provide and be responsible for lockable storage for all tools and material required to complete the installation through the duration of the project.
  - .4 Remove all tools and excess materials within 2 business days once the project is complete.
- 2.4.2 The Owner and its representatives shall in no way be held liable for any missing material, equipment or tools required to complete the installation.

## **3 EXECUTION**

### **3.1 General**

- 3.1.1 The Audio-Visual Communications Contractor shall supply all materials, labour, tools, and equipment to provide a complete warranted installation as outlined in the contract documents and suitable to the approval of the Owner, Technology Systems Consultant and inspection bodies having jurisdiction.
- 3.1.2 The Audio-Visual Communications Contractor shall be responsible for installing and providing pulling strings, ropes, and fishing walls wherever conduit is not installed, or conduit is installed without these provisions.

- 3.1.3 Provide continuity of all existing services while completing the specified installation. Losses due to interruption of services will be the responsibility of the Audio-Visual Communications Contractor.
- 3.1.4 Arrange for all shutdowns (1) week prior in writing with the Project Manager and those in control of services shall be disrupted. All overtime costs, fees, security, and other requirements shall be the full responsibility of the Audio-Visual Communications Contractor.
- 3.1.5 Should services be interrupted accidentally the Audio-Visual Communications Contractor shall provide material and labour to re-establish services immediately and shall continue without stoppage until all services have been re-established. All material and labour costs including overtime shall be borne solely by the Audio-Visual Communications Contractor. Any material and/or labour costs including overtime associated with other trades and/or the General Contractor to assist in any way the Audio-Visual Communications Contractor in re-establishing services shall be borne solely by the Audio-Visual Communications Contractor.

## **3.2 Site Conditions**

- 3.2.1 The Audio-Visual Communications Contractor is responsible for maintaining a clean work environment and is responsible for the removal of all debris on a daily basis. Debris and removed materials shall be disposed of in conformance with all local by laws and regulations. Failing to comply and after reasonable time and written notice the General Contractor reserves the right to hire cleaners to complete the cleaning and back charge the Audio-Visual Communications Contractor.
- 3.2.2 The Audio-Visual Communications Contractor shall be responsible for the removal and reinstallation of all floor or ceiling tiles, hatch ways or access panels. All items shall be removed and replaced on a daily basis and left in the original condition. Special caution shall be taken to not break, chip or discolour with dirt or fingerprints any such items. The Audio-Visual Communications Contractor will be fully responsible for repair or replacement of all damaged pieces at the discretion of the Project Manager or Owner.
- 3.2.3 The Audio-Visual Communications Contractor is fully responsible for storage of all temporarily removed items for the project.
- 3.2.4 All materials and installation throughout the project will remain the responsibility of the Audio-Visual Communications Contractor until final completion for the project is accepted by the Owner. Damages to any item installed shall be replaced or repaired by the Audio-Visual Communications Contractor to provide a complete final installation at no additional cost to the Owner.
- 3.2.5 At the completion of the project or as and when the Owner requires, restore the original condition of all materials, equipment and surfaces within the work area affected by this installation.

- 3.2.6 All vehicular traffic entering the site shall be coordinated with the General Contractor and no parking or compensation for paid parking will be provided by the Owner.

### **3.3 Cutting, Patching and Repairing**

- 3.3.1 It is the responsibility of the Audio-Visual Communications Contractor to perform all cutting, patching and repair related to the Audio-Visual communications cabling work including any penetrations through walls or floors.

### **3.4 Hoisting Facilities**

- 3.4.1 This Division shall provide its own hoisting facilities regardless of height required to perform work.
- 3.4.2 Hoisting facilities may be provided by the General Contractor, although the General Contractor may at its own discretion not allow the Audio-Visual Communications Contractor to make use of such.

### **3.5 Safety**

- 3.5.1 The Audio-Visual Communications Contractor shall adhere to all safety laws, rules and regulations issued by the authorities having jurisdiction, General Contractor, Project Manager, and the Owner.
- 3.5.2 The Audio-Visual Communications Contractor shall attend all Safety Program meetings requested by the General Contractor.
- 3.5.3 Provide adequate protection in public and work areas to pedestrian and other trade traffic using approved safety barriers, caution tape and signage.
- 3.5.4 At all times maintain clear fire exits, emergency routes and access to emergency equipment including fire hose cabinets, fire extinguishers and standpipe connections.
- 3.5.5 Smoking and combustion of any materials is strictly prohibited on all sites.
- 3.5.6 Provide information to all employees of emergency and fire safety plans for the work site and facility.
- 3.5.7 Provide protection as required by the authorities having jurisdiction to all employees for work performed in typically inaccessible or concealed spaces.
- 3.5.8 If an approved subcontractor is used provide information and ensure all safety specifications herein are met.

### **3.6 Site Adjustments**

- 3.6.1 Locations of all equipment, outlets or devices prior to installation may be revised to within (3) meters without any additional cost or change request.

- 
- 3.6.2 Portions of the project may be at any time identified in writing to be "On Hold". Work in these areas shall not be started, continued, or completed until further direction is received. No additional cost shall be accepted by the Owner for areas put on hold.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 General**

1.1.1. The following definitions may be used in this document, as well as in any project documents such as but not limited to Addenda, Contemplated Change Notices, Change Orders, and Site Instructions:

Addendum	- Normative document used to provide additional requirements and recommendations to a published document (e.g., standards, contracts). When published, an addendum effectively becomes part of the document that it supports.
Bonding	- The permanent joining of metallic parts to form an electrically conductive path that will ensure electrical continuity and the capacity to conduct safely any current likely to be imposed.
Bonding Conductor (BC)	- A conductor used specifically for the purpose of bonding.
Building Entrance Facility	- The room or space inside a building where telecommunications cables enter and leave the building.
Communications Contractor	- The successful bidder(s) to this Specification responsible for the supply and installation.
Category	- A rating that defines the performance of cabling components and systems. Describes mechanical properties and transmission characteristics of balanced twisted-pair cabling and provides a numbered designation.
Change Notice	- Normative document approved to provide additional requirements and recommendations that describes and authorizes the implementation of an engineering change to the product and its approved configuration documentation.
Owner	- Region of Peel EMS
Technology Systems Consultant	- Ghazdanafar Rizvi SPECTECH

---

Contemplated Change Notice	- Normative document to provide additional requirements and recommendations that describes the implementation of an engineering change to the product and its approved configuration documentation for the purposes of pricing. This document does not authorize the implementation of a change to the product and its approved configuration documentation.
Cut Over	- The live date(s) when the Owner will occupy the space as indicated by date and/or phasing.
Grounded Conductor	- A system or circuit conductor that is intentionally grounded.
Grounding System	- A system of hardware and wiring that provides an electrical path from a specified location to an earth ground point.
Modular Copper Patch Panel	- A patch panel that allows each RJ-45 outlet (or port) to be removed individually.
Project	- Supply and installation of a complete Structured Cabling Solution to support Voice, Data and/or Video applications as described in this document.
Provide	- Supply and install.
Workstation	- Systems Furniture Workstation, Office, Meeting Room, Boardroom, Classroom, etc. Any Voice or Data cable originating in a Telecom, LAN, Computer Room or Consolidation Point that is not terminated on a patch panel / IDC Block at the other end.

1.1.2. The following abbreviations may be used in this document:

**1 GENERAL**

**1.1 General**

1.1.1 The following definitions may be used in this document, as well as in any project documents such as but not limited to Addenda, Contemplated Change Notices, Change Orders, and Site Instructions:

Addendum	- Normative document used to provide additional requirements and recommendations to a published document (e.g., standards, contracts). When published, an addendum effectively becomes part of the document that it supports.
Bonding	- The permanent joining of metallic parts to form an electrically conductive path that will ensure electrical continuity and the capacity to conduct safely any current likely to be imposed.
Bonding Conductor (BC)	- A conductor used specifically for the purpose of bonding.
Building Entrance Facility	- The room or space inside a building where telecommunications cables enter and leave the building.
Audio-Visual Communications Contractor	- The successful bidder(s) to this Specification responsible for the supply and installation.
Category	- A rating that defines the performance of cabling components and systems. Describes mechanical properties and transmission characteristics of balanced twisted-pair cabling and provides a numbered designation.
Change Notice	- Normative document approved to provide additional requirements and recommendations that describes and authorizes the implementation of an engineering change to the product and its approved configuration documentation.
Owner	- Region of Peel EMS
Technology Systems Consultant	- Ghazdanafar Rizvi SPECTECH

---

Contemplated Change Notice	- Normative document to provide additional requirements and recommendations that describes the implementation of an engineering change to the product and its approved configuration documentation for the purposes of pricing. This document does not authorize the implementation of a change to the product and its approved configuration documentation.
Cut Over	- The live date(s) when the Owner will occupy the space as indicated by date and/or phasing.
Grounded Conductor	- A system or circuit conductor that is intentionally grounded.
Grounding System	- A system of hardware and wiring that provides an electrical path from a specified location to an earth ground point.
Modular Copper Patch Panel	- A patch panel that allows each RJ-45 outlet (or port) to be removed individually.
Project	- Supply and installation of a complete Structured Cabling Solution to support Voice, Data and/or Video applications as described in this document.
Provide	- Supply and install.
Workstation	- Systems Furniture Workstation, Office, Meeting Room, Boardroom, Classroom, etc. Any Voice or Data cable originating in a Telecom, LAN, Computer Room or Consolidation Point that is not terminated on a patch panel / IDC Block at the other end.

2 **PRODUCT**

2.1 **Not applicable to this Section.**

3 **EXECUTION**

3.1 **Not applicable to this Section.**

END OF SECTION

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.2.1. The Communications Contractor shall adhere to all applicable codes, standards and regulations.
- 1.2.2. All equipment, products and installation methods shall adhere to all Codes and Standards having jurisdiction and as listed in this document.
- 1.2.3. The latest version, including technical bulletins and addenda will be applicable to all codes and standards.
- 1.2.4. If a conflict between codes and standards occur the most stringent code or standard will be applicable.
- 1.2.5. The following list highlights the typical applicable standards. All national and local codes and standards not listed for Products, Buildings, Fire, Health and Safety and Electrical will also apply.
- 1.2.6. All standards' addenda shall be included.
  - ANSI/TIA/EIA 568-B.1 - Commercial Building Telecommunications Cabling Standard: General Requirements
  - ANSI/TIA/EIA 568-B.2 - Commercial Building Telecommunications Cabling Standard: Balanced Twisted Pair Cabling
  - ANSI/TIA/EIA 568-B.3 - Commercial Building Telecommunications Cabling Standard: Optical Fibre Cabling Components Standard
  - ANSI/TIA/EIA 569-A - Commercial Building Standards for Telecommunications Pathways and Spaces. Including Addenda 1-6
  - ANSI/TIA/EIA 598-A - Optical Fibre Cable Color Coding
  - ANSI/TIA/EIA 570 - Residential and Light Commercial Telecommunications Wiring Standard
  - ANSI/TIA/EIA 604 - Fibre Optic Connector Intermateability Standard (Focis3)
  - ANSI/TIA/EIA 606 - Administration Standard for the Telecommunications Infrastructure of Commercial Buildings
  - ANSI/TIA/EIA 607 - Commercial Building Grounding and Bonding Requirements for Telecommunications
  - ANSI/TIA/EIA 758 - Customer Owned Outside Plant Telecommunications Cabling Standard
  - CSA C22.1-98:21 - Canadian Electric Code Part I: Safety Standards for Electrical Installations

## **2 PRODUCT**

### **2.1 Not applicable to this Section.**

## **3 EXECUTION**

### **3.1 Compliance to Codes and Standards**

- 3.1.1. The Communications Contractor shall install all equipment and material in accordance with the standards aforementioned in this section.
- 3.1.2. Quality and workmanship shall be at the highest of professional tradesman levels to be accepted for completion. The Technology Systems Consultant shall have the sole right to reject any work not in accordance with industry standards.
- 3.1.3. All work shall also be performed in accordance with the latest BICSI installation standards.
- 3.1.4. Communications Contractors shall provide installers trained in all applicable codes, standards, regulations, and installation standards.

**END OF SECTION**

---

**1 GENERAL**

**1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

**1.2 General**

- 1.2.1 The Audio-Visual Communications Contractor shall adhere to all applicable codes, standards, and regulations.
- 1.2.2 All equipment, products and installation methods shall adhere to all Codes and Standards having jurisdiction and as listed in this document.
- 1.2.3 The latest version, including technical bulletins and addenda will be applicable to all codes and standards.
- 1.2.4 If a conflict between codes and standards occur the most stringent code or standard will be applicable.
- 1.2.5 The following list highlights the typical applicable standards. All national and local codes and standards not listed for Products, Buildings, Fire, Health and Safety and Electrical will also apply.

ANSI/TIA/EIA 568-B.1	- Commercial Building Telecommunications Cabling Standard: General Requirements
ANSI/TIA/EIA 568-B.2	- Commercial Building Telecommunications Cabling Standard: Balanced Twisted Pair Cabling
ANSI/TIA/EIA 568-B.3	- Commercial Building Telecommunications Cabling Standard: Optical Fibre Cabling Components Standard
ANSI/TIA/EIA 569-A	- Commercial Building Standards for Telecommunications Pathways and Spaces. Including Addenda 1-6
ANSI/TIA/EIA 598-A	- Optical Fibre Cable Color Coding
ANSI/TIA/EIA 570	- Residential and Light Commercial Telecommunications Wiring Standard
ANSI/TIA/EIA 604	- Fibre Optic Connector Intermateability Standard (Focis3)
ANSI/TIA/EIA 606	- Administration Standard for the Telecommunications Infrastructure of Commercial Buildings
ANSI/TIA/EIA 607	- Commercial Building Grounding and Bonding Requirements for Telecommunications
ANSI/TIA/EIA 758	- Customer Owned Outside Plant Telecommunications Cabling Standard

## **2 PRODUCT**

### **2.1 Not applicable to this Section.**

## **3 EXECUTION**

### **3.1 Compliance to Codes and Standards**

- 3.1.1 The Audio-Visual Communications Contractor shall install all equipment and material in accordance with the standards aforementioned in this section.
- 3.1.2 Quality and workmanship shall be at the highest of professional tradesman levels to be accepted for completion. The Technology Systems Consultant shall have the sole right to reject any work not in accordance with industry standards.
- 3.1.3 All work shall also be performed in accordance with the latest InfoComm installation standards.
- 3.1.4 Audio-Visual Communications Contractors shall provide installers trained in all applicable codes, standards, regulations, and installation standards.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Includes**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 Acceptable Manufacturers – Copper Cabling**

- 1.2.1. All equipment and products supplied shall be new and free of all manufacturer defects and delivery or installation damage.
- 1.2.2. All equipment and products supplied shall meet all manufacturer listed characteristics as identified in the latest manufacturer catalogue.
- 1.2.3. All products shall meet all applicable codes and standards and bare the UL/ULC label, be CSA approved and meet FCC/CRTC Regulations.
- 1.2.4. All products shall be provided in accordance with local, provincial and national fire ratings for the installation on this project.
- 1.2.5. The only acceptable Manufacturers of an end-to-end solution for this project and as further specified in this document will be the following:

- .1 Belden
- .2 Hubbell
- .3 CommScope
- .4 Wirewerks

#### **1.2.6. Certification**

- .1 The Owner requires a complete “Permanent Link” tested and certified installation. Certification shall be provided by the specified and selected product manufacturer directly to the Owner for a period no less than 20 years.
- .2 The Communications Contractor is responsible for providing to the Technology Systems Consultant a copy of the application for certification with 5 days of project award.
- .3 Upon completion of the project the Communications Contractor shall deliver to the Technology Systems Consultant for the Owner a copy of the manufacturer’s warranty information, certificate and or plaque. This information shall accompany the final documentation described further in these specifications.
- .4 The Communications Contractor shall currently be an authorized installer of the manufacturer providing the warranty.

Belden	Certified Systems Vendor
Hubbell	Mission Critical Certified Contractor
CommScope	Certified Installer
Wirewerks	Certified System Vendor

- 1.2.7. Subcontractors shall not be acceptable to provide warranty unless pre-approved by the Technology Systems Consultant and the Owner at time of tender. Subcontractors will not be approved after tender is awarded.
- 1.2.8. The Communications Contractor shall provide a written 2 year warranty inclusive of all parts and labour for the end to end solution. The Communications Contractor shall also state and agree in writing to providing response for any warranty request within 24 hours during this warranty period.

### **1.3 Acceptable Manufacturers – Optical Fibre Cabling**

- 1.3.1. All equipment and products supplied shall be new and free of all manufacturer defects and delivery or installation damage.
- 1.3.2. All equipment and products supplied shall meet all manufacturer listed characteristics as identified in the latest manufacturer catalogue.
- 1.3.3. All products shall meet all applicable codes and standards and bare the UL/ULC label, be CSA approved and meet FCC/CRTC Regulations.
- 1.3.4. All products shall be provided in accordance with local, provincial and national fire ratings for the installation on this project.
- 1.3.5. The only acceptable Manufacturers of an end-to-end solution for this project and as further specified in this document will be the following:
  - .1 Corning
  - .2 Belden
  - .3 Hubbell
  - .4 CommScope
  - .5 Wirewerks
- 1.3.6. Certification
  - .1 The Owner requires a complete “Permanent Link” tested and certified installation. Certification shall be provided by the specified and selected product manufacturer directly to the Owner for a period no less than 20 years.
  - .2 The Communications Contractor is responsible for providing to the Technology Systems Consultant a copy of the application for certification with 5 days of project award.
  - .3 Upon completion of the project the Communications Contractor shall deliver to the Technology Systems Consultant for the Owner a copy of the manufacturer’s warranty information, certificate and or plaque. This information shall accompany the final documentation described further in these specifications.
  - .4 The Communications Contractor shall currently be an authorized installer of the manufacturer providing the warranty.

Corning  
Belden

Network of Preferred Installers (NPI)  
Certified Systems Vendor

---

Hubbell	Mission Critical Certified Contractor
CommScope	Certified Installer
Wirewerks	Certified System Vendor

- 1.3.7. Subcontractors shall not be acceptable to provide warranty unless pre-approved by the Technology Systems Consultant and the Owner at time of tender. Subcontractors will not be approved after tender is awarded.
- 1.3.8. The Communications Contractor shall provide a written 2-year warranty inclusive of all parts and labour for the end to end solution. The Communications Contractor shall also state and agree in writing to providing response for any warranty request within 24 hours during this warranty period.

## **2 PRODUCT**

### **2.1 Not applicable to this Section.**

## **3 EXECUTION**

### **3.1 Scope**

- 3.1.1. The project consists of the fit-out of the (3) floors, for Region of Peel EMS, located at 6 Docksteader Rd in the city of Brampton.
- 3.1.2. The specific structured cabling system scope of this project includes but is not limited to:
- .1 Supply of five bound copies of shop drawings for all products prior to placing material order to acquire written approval from the Technology Systems Consultant.
  - .2 Supply and installation of J-hook and cable sling pathways as indicated in this specification.
  - .3 Supply and installation of 4-pair UTP horizontal copper cabling and related accessories to support end-user data applications.
  - .4 Supply and installation of 4-pair UTP horizontal copper cabling and related accessories to support end-user voice applications.
  - .5 Supply and installation of multipair copper cabling and related accessories to support data and/or voice applications over backbone.
  - .6 Supply and installation of optical fibre cabling and related accessories to support data and/or voice applications over backbone.
  - .7 Supply and installation of innerduct for optical fibre cabling.
  - .8 Supply and installation of new open racks, equipment, and accessories.
  - .9 Supply and installation of new AV cabinets, equipment, and accessories.
  - .10 Supply and installation of backboards.
  - .11 Supply and installation of all fire stop materials and/or mechanisms for all penetrations used for communications cabling.

- .12 Complete testing of each cable in a timely fashion and in coordination with other trades and services to ensure a completely tested system prior to activation by the Owner.
- .13 Supply temporary and final record drawings as specified.
- .14 Complete all final documentation requirements including documentation and site reviews to provide manufacturer's certification as per Section 27 00 11.

### **3.2 Phasing**

- 3.2.1. This project shall be completed in (1) one phase. Co-ordination with the Owners staff (including but not limited to the IT staff) and other trades is imperative and shall form part of the scope of this project. This installation will not necessarily be completed over a continuous time period and may be completed over two or more time periods to allow for co-ordination with other groups / trades.

**END OF SECTION**

---

**1 GENERAL**

**1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

**1.2 Acceptable Manufacturers**

- 1.2.1 All equipment and products supplied shall be new and free of all manufacturer defects and delivery or installation damage.
- 1.2.2 All equipment and products supplied shall meet all manufacturer listed characteristics as identified in the latest manufacturer catalogue.
- 1.2.3 All products shall meet all applicable codes and standards and bear the UL/ULC label, be CSA approved and meet FCC/CRTC Regulations.
- 1.2.4 All products shall be provided in accordance with local, provincial, and national fire ratings for the installation on this project.

**1.3 Certification**

- 1.3.1 Upon completion of the project the Audio-Visual Communications Contractor shall deliver to the Technology Systems Consultant for the Owner a copy of the manufacturer's warranty information. This information shall accompany the final documentation described further in these specifications.
- 1.3.2 The Audio-Visual Communications Contractor shall currently be an authorized installer of the manufacturer providing the warranty.

**1.4 Warranty**

- 1.4.1 Subcontractors shall not be acceptable to provide warranty unless pre-approved by the Technology Systems Consultant and the Owner at time of tender. Subcontractors will not be approved after tender is awarded.
- 1.4.2 The Audio-Visual Communications Contractor shall provide a written 2-year warranty inclusive of all parts and labour for the end to end solution. The Audio-Visual Communications Contractor shall also state and agree in writing to providing response for any warranty request within 24 hours during this warranty period.

**2 PRODUCT**

- 2.1 **Not applicable to this Section.**

**3 EXECUTION**

**3.1 Scope**

- 3.1.1 The project consists of the fit-out of the two (3) floors for Region of Peel EMS Dockstader, located at 6 Dockstader Rd, Brampton.

- 
- 3.1.2 The Audio-Visual Communications Contractor(s) shall be responsible for the complete installation of the following system(s):
- .1 Audio system.
  - .2 Video system.
  - .3 Control Systems
- 3.1.3 The work in these subsystems shall include, supply and installation of cabling on Audio-Visual Communications Contractor installed J- hooks and pathways (some pathways may be shown to be installed by Division 26, refer to drawings and details), equipment racks and/or cabinets, controllers, amplifiers, projectors, screens, speakers, assistive listening devices, grounding and bonding, fire stopping and project documentation.
- 3.1.4 The specific Audio-Visual System scope of this project includes but is not limited to:
- .1 Supply of one (1) PDF format of shop drawings for all products prior to placing material order to acquire written approval from the Technology Systems Consultant.
  - .2 Preparation of connectivity diagrams.
  - .3 Supply and installation of Commercial displays and Interactive displays as specified.
  - .4 Supply and installation of display wall mounts and poles.
  - .5 Supply and installation of electronic control system.
  - .6 Supply and installation of wall and table top touch panels as specified.
  - .7 Supply and installation of digital signal processor.
  - .8 Supply and installation of Projector and projector screen.
  - .9 Supply and installation of AV rack.
  - .10 Supply and installation of wall input plates.
  - .11 Supply and installation of Video conferencing equipment
  - .12 Supply and installation of ceiling and goose neck microphones.
  - .13 Supply and installation of ceiling speakers.
  - .14 Supply and installation of PTZ cameras.
  - .15 Supply and installation of Airmedia.
  - .16 Installation of Owner supplied content player.
  - .17 Supply and installation of AV network.
  - .18 Supply and installation of Control Software on client PC's.
  - .19 Supply and installation of cabling, connectors, and accessories. All cabling, without exception, shall be Plenum (CMP/FT6) rated cabling. Assume all cabling in ceiling spaces require j-hooks.
-

- 
- .20 Supply and installation of all fire stop materials and/or mechanisms for all penetrations used for Audio-Visual cabling.
  - .21 Complete installation, testing, verification, and fine tuning of all video components to ensure acceptance by the owner.
  - .22 Complete programming of the Crestron control units and provide client training. Programming requirements shall include client interview(s) as required to determine client programming and functionality requirements. Assume all equipment capabilities are to be used and reflected in the programming for bidding purposes to capture all potential programming costs. No additional costs for programming shall be allowed. A copy of all programming (soft copy) shall be submitted to client for record and safe keeping as part of the record documentation.
  - .23 Complete testing of each piece of equipment and cable in a timely fashion and in coordination with other trades and services to ensure a completely tested system(s) prior to acceptance by the Owner.
  - .24 Supply final record drawings as specified.
  - .25 Complete all final documentation requirements including documentation and site reviews to provide manufacturer's warranty.

### 3.2 **Phasing**

- 3.2.1 This project shall be completed in (1) one phase. Co-ordination with the Owners staff (including but not limited to the IT staff) and other trades is imperative and shall form part of the scope of this project. This installation will not necessarily be completed over a continuous time period and may be completed over two or more time periods to allow for co-ordination with other groups / trades.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 Shop Drawings**

- 1.2.1. Provide 5 copies of manufacturer prepared shop drawings identifying complete technical specifications for each product being supplied as part of the end-to-end solution including fire stopping, pathways and other miscellaneous products.
- 1.2.2. Shop drawings shall be stamped and signed “For Review” complete with date submitted.
- 1.2.3. Manufacturers shop drawings showing various model or styles shall be labelled with identification arrows showing which items are being proposed. Arrows shall be reproducible through standard photocopying.
- 1.2.4. Shop drawings shall be approved by the Technology Systems Consultant prior to starting installation and the Communications Contractor will be responsible for the cost of replacing of all installed product not approved.
- 1.2.5. Approved shop drawings shall be included in the Project Manual for this project.

### **1.3 Project Documentation**

- 1.3.1. The Communications Contractor shall provide digitally marked record drawings showing all cable numbers on floor plans, rack elevations, backboard layouts and cable routing at the completion of the project. Drawings shall include all architectural and project changes. Provide within ten (10) days of completion of the project one (1) PDF copy for use by the Technology Systems Consultant.
- 1.3.2. The Communications Contractor shall prepare record drawing(s) using AutoCAD or better. The Communications Contractor shall issue one (1) AutoCAD copy and one (1) PDF copy of record drawings within ten (10) days of project completion. If the Communications Contractor cannot comply with this requirement, Spectech will update all hand drawn record drawings to AutoCAD. The cost for this service shall be based on per diem rates at the time of completion. The Communications Contractor shall be responsible for the costs associated with this work.
- 1.3.3. Prepare a complete test report for each cable identifying a successful test on each cable, complete with the technician’s signature and date. Test reports shall be full test reports in the testing software format and with one page per cable. Provide 1 soft copy on USB of test results with appropriate viewing software to the Technology Systems Consultant within ten (10) days of project completion for approval.

- 
- 1.3.4. At the completion of the project be prepared to submit 1 copy of a project manual in a digital PDF copy to the Technology Systems Consultants for review and approval. This project manual shall include:
- .1 Contractor's Name, contact information and lead installer/foreman's contact info
  - .2 Letter detailing, total cost of project (including changes), square footage, number of cable drops, project highlights, Architect/Interior Designer and Owner name and contact information.
  - .3 Final bill of materials
  - .4 Approved shop drawings
  - .5 WIMS data sheets on all applicable materials including fire stopping
  - .6 Maintenance and/or operation manuals for all equipment
  - .7 Connectivity database
  - .8 Test results
  - .9 Record drawings
  - .10 Letter of 2 year installation warranty
  - .11 Manufacturer's Certification and warranty documentation
- 1.3.5. Upon written approval from the Technology Systems Consultant prepare (3) additional project manuals for distribution to the Owner.
- 1.3.6. The Communications Contractor shall prepare a separate Data and Voice Connectivity Database in MS Excel spreadsheet format that includes but not limited to the following:
- .1 Data - Horizontal cable number, active equipment port, backbone cable/strand and Owner assigned designation.
  - .2 Voice - Horizontal cable number, backbone pair, Telephone Switch/Node (TN) and Owner assigned designation.
  - .3 Provide (1) soft copy for the Owners use prior to move in.
- 1.3.7. Final documentation not provided within 30 days of project completion and with reasonable notification may result in the commissioning of another agent to prepare such documents. Costs for this work will be deducted from all Holdback amounts available to the Communications Contractor.

#### **1.4 Site Documentation**

- 1.4.1. The Communications Contractor shall be responsible for maintaining a complete set of record marked up drawings on site for the Technology Systems Consultants review at all times. Drawings shall be up to date with all architectural and project changes.
- 1.4.2. Maintain a log of date, time, and reason for any delays in performing the installation. Details shall include names, conditions, and specific reason for delay.

## **2 PRODUCT**

### **2.1 Documentation Requirements**

2.1.1. The following items shall be delivered as scheduled after project award:

Delivery Item	Delivery Schedule	Presentation
Connectivity Diagrams (PDF)	10 days after project award	Email/Electronic PDF
Shop Drawings (PDF)	10 days after project award	Email/Electronic PDF
Monthly Draw Breakdown (PDF)	10 days after project award	Email/Electronic PDF

2.1.2. The following items shall be kept up to date during project construction.

Delivery Item	Delivery Schedule	Presentation
Continuously Updated Drawings	During construction on-site	Electronic PDF

2.1.3. The following items shall be delivered after project completion in a binder:

Delivery Item	Delivery Schedule	Presentation
Contractor's Information	10 Days after Cutover	Electronic PDF
Project Details	10 Days after Cutover	Electronic PDF
Final Bill of Materials	10 Days after Cutover	Electronic PDF
Approved Shop Drawings	10 Days after Cutover	Electronic PDF
WIMS Data Sheets	10 Days after Cutover	Electronic PDF
Maintenance / operation manuals	10 Days after Cutover	Electronic PDF
Record Test Results	10 Days after Cutover	Electronic PDF
Record Drawings (PDF)	10 Days after Cutover	Electronic PDF
Contractor's 2 Year Warranty	10 Days after Cutover	Electronic PDF
Manufacturer Warranty	10 Days after Cutover	Electronic PDF
Programming	10 Days after Cutover	Electronic PDF

- 2.1.4. Should the Owner or General Contractor require hardcopies of any documents listed here as to be provided in an electronic format, the Communications Contractor shall provide as requested at no additional cost.

### **3 EXECUTION**

**3.1 Not applicable to this Section.**

**END OF SECTION**

---

**1 GENERAL**

**1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

**1.2 Connectivity Diagram(s)**

- 1.2.1 Provide connectivity diagram(s), prepared by using AutoCAD, in PDF format prior to installation.

**1.3 Shop Drawings**

- 1.3.1 Provide 1 PDF format of manufacturer prepared shop drawings identifying complete technical specifications for each product being supplied as part of the solution including fire stopping, pathways and other miscellaneous products.
- 1.3.2 Shop drawings shall be stamped and signed “For Review” complete with date submitted.
- 1.3.3 Manufacturers shop drawings showing various model or styles shall be labelled with identification arrows showing which items are being proposed. Arrows shall be reproducible through standard photocopying.
- 1.3.4 Shop drawings shall be approved by the Technology Systems Consultant prior to starting installation and the Audio-Visual Communications Contractor will be responsible for the cost of replacing of all installed product not approved.
- 1.3.5 Approved shop drawings shall be included in the Project Manual for this project.

**1.4 Project Documentation**

- 1.4.1 The Audio-Visual Communications Contractor shall provide hand marked record drawings showing all cable numbers on floor plans, rack elevations, and cable routing at the completion of the project. Drawings shall include all architectural and project changes. Provide within ten (10) days of completion of the project two (2) hard copies for use by the Technology Systems Consultant.
- 1.4.2 At the completion of the project, be prepared to submit one (1) copy of a project manual on a DVD to the Technology Systems Consultants for review and approval. This project manual shall include:
- .1 Contractor’s Name, contact information and lead installer/foreman’s contact info
  - .2 Letter detailing, total cost of project (including changes), square footage, project highlights, Architect/Interior Designer and Owner name and contact information.
  - .3 Final bill of materials
  - .4 Approved shop drawings
  - .5 WIMS data sheets on all applicable materials including fire stopping

- .6 Maintenance and/or operation manuals for all equipment
- .7 Test results
- .8 Record drawings
- .9 Letter of 2 year installation warranty
- .10 Manufacturer's warranty documentation
- 1.4.3 Upon written approval from the Technology Systems Consultant prepare (2) additional project manuals for distribution to the Owner.
- 1.4.4 Final documentation not provided within 30 days of project completion and with reasonable notification may result in the commissioning of another agent to prepare such documents. Costs for this work will be deducted from all Holdback amounts available to the Audio-Visual Communications Contractor.

## 1.5 **Site Documentation**

- 1.5.1 The Audio-Visual Communications Contractor shall be responsible for maintaining a complete set of record marked up drawings on site for the Technology Systems Consultants review at all times. Drawings shall be up to date with all architectural and project changes.
- 1.5.2 Maintain a log of date, time, and reason for any delays in performing the installation. Details shall include names, conditions, and specific reason for delay.

## 2 **PRODUCT**

### 2.1 **Documentation Requirements**

- 2.1.1 The following items shall be delivered as scheduled after project award:

Delivery Item	Delivery Schedule	Presentation
Connectivity Diagrams (PDF)	10 days after project award	Email/ Electronic PDF
Shop Drawings (PDF)	10 days after project award	Email/ Electronic PDF
Monthly Draw Breakdown (PDF)	10 days after project award	Email/ Electronic PDF

- 2.1.2 The following items shall be kept up to date during project construction.

Delivery Item	Delivery Schedule	Presentation
Continuously Updated Drawings	During construction on-site	Electronic PDF

- 2.1.3 The following items shall be delivered after project completion in a binder:

Delivery Item	Delivery Schedule	Presentation
---------------	-------------------	--------------

---

Contractor's Information	10 Days after Cutover	Electronic PDF
Project Details	10 Days after Cutover	Electronic PDF
Final Bill of Materials	10 Days after Cutover	Electronic PDF
Approved Shop Drawings	10 Days after Cutover	Electronic PDF
WIMS Data Sheets	10 Days after Cutover	Electronic PDF
Maintenance / operation manuals	10 Days after Cutover	Electronic PDF
Record Test Results	10 Days after Cutover	Electronic PDF
Record Drawings	10 Days after Cutover	Electronic PDF
Record Drawings (PDF)	10 Days after Cutover	Electronic PDF
Contractor's 2 Year Warranty	10 Days after Cutover	Electronic PDF
Manufacturer Warranty	10 Days after Cutover	Electronic PDF
Programming	10 Days after Cutover	Electronic PDF

2.1.4 Should the Owner or General Contractor require hardcopies of any documents listed here as to be provided in an electronic format, the Audio-Visual Communications Contractor shall provide as requested at no additional cost.

### **3 EXECUTION**

#### **3.1 Not applicable to this Section.**

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.2.1. Use only fire stopping products that have been tested for specific fire resistance rated construction conditions conforming to construction assembly type, penetrating item type, annular space requirements, and fire rating involved for each separate instance.

### **1.3 Materials**

- 1.3.1. Products manufactured by Hilti, Specified Technologies Inc. (STI), or equivalent are acceptable.
- 1.3.2. Obtain fire stop systems for each type of penetration and construction condition indicated from a single manufacturer (i.e. Do not mix manufacturers for the same type of penetration).

### **1.4 Performance Requirements**

- 1.4.1. Fire Stop Systems shall conform to the fire (F), hose (H) and temperature (T) ratings of Codes and shall have a flame spread rating of 25 or less, National Fire Protection Association (NFPA Class "A").
- 1.4.2. Fire Stop Systems acceptable for this project are those that have been tested to the CAN/ULC S115 Standard.
- 1.4.3. Fire Stop Systems shall be CSA approved, non-permanent, dielectric, water resistant, non-hardening, permanently pliable/re-enterable putty along with the appropriate damming or backer materials.
- 1.4.4. Fire stopping shall maintain a minimum one-hour rating, meet applicable Federal, Provincial, Local building codes, and be tested by a SCC and accredited Third Party Testing Agency in accordance with the Standards.
- 1.4.5. In locations containing high moisture, fire stopping shall be compatible with Formalin.
- 1.4.6. Fire rated fittings allowing easy cable additions may be used. All non-permanent caulking or foams shall be replaced with the removal or addition of any cabling before final acceptance by the owner.
- 1.4.7. Fire rated pathway devices shall be the preferred product and shall be installed in all locations where frequent cable moves, add-ons and changes will occur.
- 1.4.8. Where non-mechanical products are utilized, provide products that upon curing do no re-emulsify, dissolve, leach, breakdown or otherwise deteriorate over time from exposure to atmospheric moisture, sweating pipes, ponding water, or other forms of moisture characteristic during or after construction.

- 1.4.9. Where it is not practical to use a mechanical device, openings within floors and walls designed to accommodate communications cabling shall be provided with re-enterable products that do not cure or dry.
- 1.4.10. Openings for cable trays shall be sealed using re-enterable fire stopping pillows.

## **1.5 Quality Assurance**

- 1.5.1. Products/Systems: Provide fire stopping systems that comply with the following requirements:
  - .1 Fire stopping tests are performed by a qualified, testing and inspection agency. A qualified testing and inspection agency is UL, or another agency performing testing and follow-up inspection services for fire stop system acceptable to authorities having jurisdiction.
  - .2 Fire stopping products bear the classification marking of qualified testing and inspection agency.
- 1.5.2. Installer Qualifications: Experience in performing work of this section who is qualified by the fire stopping manufacturer as having been provided the necessary training to install fire stop products in accordance with specified requirements.

## **1.6 Delivery, Storage and Handling**

- 1.6.1. Manufacturer's original, unopened, undamaged containers, identification labels intact identifying product and manufacturer, date of manufacture; lot number; shelf life, if applicable; qualified testing and inspection agency's classification marking; and mixing instruction for multicomponent products.
- 1.6.2. Handle and store products according to manufacturer's recommendations published in technical materials. Leave products wrapped or otherwise protected and under clean and dry storage conditions until required for installation.
- 1.6.3. Store materials protected from exposure to harmful weather conditions and at temperature and humidity conditions recommended by manufacturer.

## **1.7 Project Conditions**

- 1.7.1. Do not install fire stopping products when ambient or substrate temperatures are outside limitations recommended by manufacturer.
- 1.7.2. Do not install fire stopping products when substrates are wet due to rain, frost, condensation, or other causes.
- 1.7.3. Maintain minimum temperature before, during, and for a minimum 3 days after installation of materials.
- 1.7.4. Do not use materials that contain flammable solvents.
- 1.7.5. Coordinate construction of openings and penetrating items to ensure that through-penetration fire stop systems are installed according to specified requirements.

- 1.7.6. Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration fire stop systems.
- 1.7.7. Schedule installation of fire stopping after completion of penetrating item installation but prior to covering or concealing of openings.
- 1.7.8. Supply and install temporary fire stopping at the end of every work shift or when location of work is changing from one work area to another. This shall be done to maintain the penetration's fire rating in areas where no work is being done.

## **2 PRODUCT**

### **2.1 Fire Stop Grommets & Discs**

- 2.1.1. STI SpecSeal Brand molded two-piece grommet having a foam fire and smoke sealing membrane that conforms to the outside diameter of the individual cable.
- 2.1.2. Shall be used only for penetrations of only 1 (one) or 2 (two) individual 4-pair UTP or F/STP cables.

Specified Product:

	Part No.	# Of Cables	Hole Diameter
Hilti	CFS-D	1	1" (25mm)
Specified Technologies Inc. (STI)	RFG1	1	9/16" (14mm)
Specified Technologies Inc. (STI)	RFG2	2	1" (25mm)

### **2.2 Fire Stop Sealants**

- 2.2.1. STI SpecSeal® Brand single component latex formulations that upon cure do not re-emulsify during exposure to moisture.

Specified Product:

Hilti	CP 606 FS-ONE MAX Sealant
Specified Technologies Inc. (STI)	SpecSeal® Series SSS Sealant
Specified Technologies Inc. (STI)	SpecSeal® Series LCI Sealant

### **2.3 Fire Stop Putty**

- 2.3.1. STI SpecSeal® Brand intumescent, non-hardening, water resistant putties containing no solvents, inorganic fibres or silicone compounds.

Specified Product:

Hilti	CP 617 Firestop Putty Pads
Hilti	CP 618 Firestop Putty Stick
Specified Technologies Inc. (STI)	SpecSeal® Series SSP Putty

## **2.4 Fire Rated Cable Pathways**

- 2.4.1. STI EZ-PATH™ Brand device modules comprised of steel raceway with intumescent foam pads allowing 0 to 100 percent cable fill.

Specified STI Products:

EZ-Path Multi-Gang Wall Bracket	EZP544W
EZ-Path (No Options)	EZD44
Single EZ-Path Kit	EZDP44

Only where wall thickness exceeds 10" use the following.

(adjust quantity of EZ-Path units and accessories to suit cable quantity):

Single EZ-PATH Kit	EZDP33FWS
Two Gang EZ-PATH Kit	EZDP233GK
Three Gang EZ-PATH Kit	EZDP333GK
Four Gang EZ-PATH Kit	EZDP433GK
Radius Control Module	RCM33
Extension Module	EZD33E

Specified Hilti Products:

Firestop Gang Plate	CFS-SL GP
Single Speed Sleeve Kit	CFS-SL SK

Only where wall thickness exceeds 10" use the following

(adjust quantity of Sleeve units and accessories to suit cable quantity):

Single Speed Sleeve Kit	CP 653
Two Gang Speed Sleeve Kit	CFS-SL GP, CFS-SL GP CAP, and Speed Sleeves
Three Gang Speed Sleeve Kit	CFS-SL GP and Speed Sleeves
Four Gang Speed Sleeve Kit	CFS-SL GP and Speed Sleeves
Extended Speed Sleeve	CFS-SL GA L

## **3 EXECUTION**

### **3.1 Examination**

- 3.1.1. Before beginning installation, verify that substrate conditions previously installed under other sections are acceptable for installation of fire stopping in accordance with manufacturer's installation instructions and technical information.
- 3.1.2. Surfaces shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellents, and any other substances that may inhibit optimum adhesion.
- 3.1.3. Provide masking and temporary covering to protect adjacent surfaces.
- 3.1.4. Do not proceed until unsatisfactory conditions have been corrected.

**3.2     Installation**

- 3.2.1.     Install through-penetration fire stop systems in accordance with Performance Criteria and in accordance with the conditions of testing and classification as specified in the published design.
- 3.2.2.     Comply with manufacturer's instructions for installation of fire stopping products.

**3.3     Field Quality Control**

- 3.3.1.     Keep areas of work accessible until inspection by authorities having jurisdiction.
- 3.3.2.     Where deficiencies are found, repair fire stopping products so they comply with requirements.

**3.4     Non-Monitored Penetrations**

- 3.4.1.     Where fire watch is not in effect, or the Communications Contractor has not been able to confirm whether fire watch is in effect, all fire penetrations, whether all cables have been pulled or not, removed or not, shall be fire stopped at the end of every workday prior to the Communications Contractor leaving the site. At no time shall a penetration be un-attended or without fire stopping material in areas where work is not in progress.

**END OF SECTION**

---

**1 GENERAL**

**1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

**1.2 General**

- 1.2.1 Use only fire stopping products that have been tested for specific fire resistance rated construction conditions conforming to construction assembly type, penetrating item type, annular space requirements, and fire rating involved for each separate instance.

**1.3 Materials**

- 1.3.1 Products manufactured by Hilti, Specified Technologies Inc. (STI), or equivalent are acceptable.
- 1.3.2 Obtain fire stop systems for each type of penetration and construction condition indicated from a single manufacturer (i.e. Do not mix manufacturers for the same type of penetration).

**1.4 Definitions**

- 1.4.1 Fire stopping: Material or combination of materials used to retain integrity of fire-rated construction by maintaining an effective barrier against the spread of flame, smoke, and hot gases through penetrations in fire rated wall and floor assemblies.
- 1.4.2 Smoke and Acoustical Sealing: Material or combination of materials used to maintain an effective barrier against the spread of smoke and hot gases, and to restore the STC rating in through penetrations in non-fire rated wall and floor assemblies.

**1.5 Performance Requirements**

- 1.5.1 Fire Stop Systems shall conform to the fire (F), hose (H) and temperature (T) ratings of Codes and shall have a flame spread rating of 25 or less, National Fire Protection Association (NFPA Class "A").
- 1.5.2 Fire Stop Systems acceptable for this project are those that have been tested to the CAN/ULC S115 Standard.
- 1.5.3 Fire Stop Systems shall be CSA approved, non-permanent, dielectric, water resistant, non-hardening, permanently pliable/re-enterable putty along with the appropriate damming or backer materials.
- 1.5.4 Fire stopping shall maintain a minimum one-hour rating, meet applicable Federal, Provincial, Local building codes, and be tested by a SCC and accredited Third Party Testing Agency in accordance with the Standards.
- 1.5.5 In locations containing high moisture, fire stopping shall be compatible with Formalin.

- 1.5.6 Fire rated fittings allowing easy cable additions may be used. All non-permanent caulking or foams shall be replaced with the removal or addition of any cabling before final acceptance by the owner.
- 1.5.7 Fire rated pathway devices shall be the preferred product and shall be installed in all locations where frequent cable moves, add-ons and changes will occur.
- 1.5.8 Where non-mechanical products are utilized, provide products that upon curing do no re-emulsify, dissolve, leach, breakdown or otherwise deteriorate over time from exposure to atmospheric moisture, sweating pipes, ponding water or other forms of moisture characteristic during or after construction.
- 1.5.9 Where it is not practical to use a mechanical device, openings within floors and walls designed to accommodate communications cabling shall be provided with re-enterable products that do not cure or dry.
- 1.5.10 Openings for cable trays shall be sealed using re-enterable fire stopping pillows.

**1.6 Quality Assurance**

- 1.6.1 Products/Systems: Provide fire stopping systems that comply with the following requirements:
  - .1 Fire stopping tests are performed by a qualified, testing and inspection agency. A qualified testing and inspection agency is UL, or another agency performing testing and follow-up inspection services for fire stop system acceptable to authorities having jurisdiction.
  - .2 Fire stopping products bear the classification marking of qualified testing and inspection agency.
- 1.6.2 Installer Qualifications: Experience in performing work of this section who is qualified by the fire stopping manufacturer as having been provided the necessary training to install fire stop products in accordance with specified requirements.

**1.7 Delivery, Storage and Handling**

- 1.7.1 Manufacturer's original, unopened, undamaged containers, identification labels intact identifying product and manufacturer, date of manufacture; lot number; shelf life, if applicable; qualified testing and inspection agency's classification marking; and mixing instruction for multicomponent products.
- 1.7.2 Handle and store products according to manufacturer's recommendations published in technical materials. Leave products wrapped or otherwise protected and under clean and dry storage conditions until required for installation.
- 1.7.3 Store materials protected from exposure to harmful weather conditions and at temperature and humidity conditions recommended by manufacturer.

**1.8 Project Conditions**

- 1.8.1 Do not install fire stopping products when ambient or substrate temperatures are outside limitations recommended by manufacturer.

- 1.8.2 Do not install fire stopping products when substrates are wet due to rain, frost, condensation, or other causes.
- 1.8.3 Maintain minimum temperature before, during, and for a minimum 3 days after installation of materials.
- 1.8.4 Do not use materials that contain flammable solvents.
- 1.8.5 Coordinate construction of openings and penetrating items to ensure that through-penetration fire stop systems are installed according to specified requirements.
- 1.8.6 Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration fire stop systems.
- 1.8.7 Schedule installation of fire stopping after completion of penetrating item installation but prior to covering or concealing of openings.
- 1.8.8 Supply and install temporary fire stopping at the end of every work shift or when location of work is changing from one work area to another. This shall be done to maintain the penetration's fire rating in areas where no work is being done.

## **2 PRODUCT**

### **2.1 Fire Stop Grommets & Discs**

- 2.1.1 Shall be used only for penetrations of individual 4-pair UTP or F/STP cables.

Specified Product:

	Part No.	# Of Cables	Hole Diameter
Hilti	CFS-D	1	1" (25mm)
Specified Technologies Inc. (STI)	RFG1	1	9/16" (14mm)
Specified Technologies Inc. (STI)	RFG2	2	1" (25mm)

### **2.2 Fire Stop Sealants**

- 2.2.1 Single component latex formulations that upon cure do not re-emulsify during exposure to moisture.

Specified Product:

Hilti	CP 606 FS-ONE MAX Sealant
Specified Technologies Inc. (STI)	SpecSeal® Series SSS Sealant
Specified Technologies Inc. (STI)	SpecSeal® Series LCI Sealant

### **2.3 Fire Stop Putty**

- 2.3.1 Intumescent, non-hardening, water resistant putties containing no solvents, inorganic fibres or silicone compounds.

Specified Product:

Hilti	CP 617 Firestop Putty Pads
-------	----------------------------

Hilti	CP 618 Firestop Putty Stick
Specified Technologies Inc. (STI)	SpecSeal® Series SSP Putty

## 2.4 **Fire Rated Cable Pathways**

2.4.1 Device modules comprised of steel raceway with intumescent foam pads allowing 0 to 100 percent cable fill.

Specified STI Products:	
EZ-Path Multi-Gang Wall Bracket	EZP544W
EZ-Path (No Options)	EZD44
Single EZ-Path Kit	EZDP44

Only where wall thickness exceeds 10" use the following  
(Adjust quantity of EZ-Path units and accessories to suit cable quantity):

Single EZ-PATH Kit	EZDP33FWS
Two Gang EZ-PATH Kit	EZDP233GK
Three Gang EZ-PATH Kit	EZDP333GK
Four Gang EZ-PATH Kit	EZDP433GK
Radius Control Module	RCM33
Extension Module	EZD33E

Specified Hilti Products:	
Firestop Gang Plate	CFS-SL GP
Single Speed Sleeve Kit	CFS-SL SK

Only where wall thickness exceeds 10" use the following  
(Adjust quantity of Sleeve units and accessories to suit cable quantity):

Single Speed Sleeve Kit	CP 653
Two Gang Speed Sleeve Kit	CFS-SL GP, CFS-SL GP CAP, and Speed Sleeves
Three Gang Speed Sleeve Kit	CFS-SL GP and Speed Sleeves
Four Gang Speed Sleeve Kit	CFS-SL GP and Speed Sleeves
Extended Speed Sleeve	CFS-SL GA L

## 3 **EXECUTION**

### 3.1 **Examination**

3.1.1 Before beginning installation, verify that substrate conditions previously installed under other sections are acceptable for installation of fire stopping in accordance with manufacturer's installation instructions and technical information.

- 
- 3.1.2 Surfaces shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellents, and any other substances that may inhibit optimum adhesion.
  - 3.1.3 Provide masking and temporary covering to protect adjacent surfaces.
  - 3.1.4 Do not proceed until unsatisfactory conditions have been corrected.
  - 3.2 **Installation**
    - 3.2.1 Install through-penetration fire stop systems in accordance with Performance Criteria and in accordance with the conditions of testing and classification as specified in the published design.
    - 3.2.2 Comply with manufacturer's instructions for installation of fire stopping products.
  - 3.3 **Field Quality Control**
    - 3.3.1 Keep areas of work accessible until inspection by authorities having jurisdiction.
    - 3.3.2 Where deficiencies are found, repair fire stopping products, so they comply with requirements.
  - 3.4 **Non-Monitored Penetrations**
    - 3.4.1 Where fire watch is not in effect, or the Audio-Visual Communications Contractor has not been able to confirm whether fire watch is in effect, all fire penetrations, whether all cables have been pulled or not, removed or not, shall be fire stopped at the end of every workday prior to the Audio-Visual Communications Contractor leaving the site. At no time shall a penetration be un-attended or without fire stopping material in areas where work is not in progress.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.2.1 All cables and related terminations, support and grounding hardware shall be furnished, installed, wired, tested, labelled, and documented by the Communications Contractor as detailed in this section.
- 1.2.2 Product specifications, general design considerations and installation guidelines are provided in this section.
- 1.2.3 The Communications Contractor shall meet or exceed all requirements for the cable system described in this section.
- 1.2.4 Local electrical codes shall be adhered to.
- 1.2.5 Local building codes shall be adhered to.
- 1.2.6 All communications components including, entrance lugs, entrance terminal frames, racks, cabinets, cable tray, ladder racks, metallic pathways, enclosures, and other components noted on drawings shall be bonded to an independent grounding system and in accordance with local codes and standards, TIA/EIA J-STD-607-A, ANSI/TIA-942 and IEEE Std.1100 and these specifications.
- 1.2.7 Labelling shall conform to TIA/EIA-606.
- 1.2.8 Grounding system shall include a local copper Telecommunications Grounding Busbar (by Division 26) in each entrance facility and equipment room bonded to a Telecommunications Grounding Backbone (by Division 26).
- 1.2.9 The TBB shall be bonded directly to the Telecommunications Main Grounding Busbar (by Division 26). The TMGB shall be bonded directly to the building entrance grounding system and meet all local codes and standards as noted above.
- 1.2.10 The grounding system shall be visually verifiable and adequately sized to handle expected currents safely.
- 1.2.11 All grounding conductors and busbars shall be made of copper.
- 1.2.12 The grounding system shall be intentional, visually verifiable, adequately sized to handle expected currents safely, and direct these currents away from network equipment. As such, grounding shall be purposeful in its design and installation.
- 1.2.13 Lugs, HTAPs, grounding strips, and busbars shall be UL Listed, and CSA certified and made of premium quality tin-plated electrolytic copper that provides low electrical resistance while inhibiting corrosion. Antioxidant shall be used when making bonding connections in the field.

### **1.3 Lugs**

- 1.3.1 Wherever possible, two-hole lugs shall be used. All lugs shall be irreversible compression. Lugs with inspection windows shall be used in all non-corrosive environments so that connections may be inspected for full conductor insertion (battery rooms are an exception where windowless lugs may be used).
- 1.3.2 Die index numbers shall be embossed on all compression connections to allow crimp inspection.

### **1.4 Cable Assemblies**

- 1.4.1 Cable assemblies shall be UL Listed and CSA Certified. Cables shall be a distinctive green or green/yellow in color, and all jackets shall be UL, VW-1 flame rated.

### **1.5 Telecommunications Grounding Busbar**

- 1.5.1 The Telecommunications Grounding Busbar (TGB) shall be supplied and installed by Division 26.

### **1.6 Telecommunications Bonding Backbone Requirements**

- 1.6.1 The Telecommunications Grounding Busbar within each telecommunications space shall be bonded to the building ground riser with a Telecommunications Bonding Backbone. The TGB and the TBB shall be supplied and installed by Division 26.
- 1.6.2 The gauge of the TBB shall be determined based on TIA/EIA J-STD-607-A. The table below is shown for reference.

TBB Length in Linear meters (feet)	TBB Size (AWG)
Less than 4 (13)	6
4-6 (14-20)	4
6-8 (21-26)	3
8-10 (27-33)	2
10-13 (34-41)	1
13-16 (42-52)	1/0
16-20 (53-66)	2/0
Greater than 20 (66)	3/0

## **2 PRODUCT**

### **2.1 Common Bonding Network**

- 2.1.1 The Common Bonding Conductor within each Entrance Facility, Data Centre, Computer Room, Telecommunications Room, LAN Room, etc. shall be a green or green/yellow jacketed #2 copper conductor. The installation route shall be as shown on drawings.
- 2.1.2 The Common Bonding Conductor shall be routed in as straight a path as possible.

## **2.2 Grounding Clamps**

2.2.1 Where a grounding conductor is routed through a metal conduit, the Communications Contractor shall use a #6 AWG copper conductor with green or green/yellow jacket to bond the conduit to the grounding conductor routed through the metal conduit. Series GPL grounding clamps shall be used to bond to the conduit and series HTWC HTAP with clear cover shall be used to bond to the grounding conductor.

## **2.3 Communications Grounding and Bonding Conductor Label Kit**

2.3.1 Telecommunications Grounding and Bonding Conductor Label Kits shall be supplied and installed by the Communications Contractor at every rack and cabinet as well as one for every Telecommunications Grounding Busbar.

Specified Product:

Harger GRNTAG607PK10

Panduit LTYK

## **2.4 Code Conductor, Two-Hole, Long Barrel With Window Lug**

2.4.1 Where lugs are required for bonding, the Communications Contractor shall supply and install Code Conductor, Two-Hole, and Long Barrel with Window Lugs.

2.4.2 Code Conductor, Two-Hole, Long Barrel with Window Lugs shall be supplied and installed by the Communications Contractor as required.

2.4.3 Lugs shall be tin plated, irreversible compression, have NEMA hole sizes and spacing and shall meet NEBS Level 3.

## **2.5 Code/Flex Conductor HTAP**

2.5.1 Code/Flex Conductor HTAPs shall be supplied and installed by the Communications Contractor as required.

## **2.6 Clear Covers for HTCT HTAP**

2.6.1 Clear Covers for HTCT HTAPs shall be supplied and installed by the Communications Contractor (each HTAP requires one clear cover).

## **2.7 Grounding Clamp, U-Bolt, Bronze**

2.7.1 Each conduit entering/leaving a telecommunications space/room shall be bonded to the grounding system using a Series GPL Bronze U-Bolt Grounding Clamp.

## **2.8 Ladder Tray / Basket Tray Grounding**

2.8.1 Bonding network jumpers shall be supplied and installed by the Communications Contractor to bond the tray to the grounding system.

## **2.9 Antioxidant**

2.9.1 Antioxidant shall be used by the Communications Contractor when making bonding connections.

---

## **2.10 Bonding Screws**

- 2.10.1 Bonding screws shall have serrations on the bottom of screw to remove paint from patch panel to bond patch panel to rack or cabinet rails.
- 2.10.2 Bonding screws shall be thread-forming to remove paint from threaded rack or cabinet rail holes to bond patch panel to rack or cabinet rails.
- 2.10.3 The Communications Contractor shall supply and install four (4) screws for every patch panel (copper and optical fibre) as well as for every Owner supplied switch (assume 48 port switches).

Specified Product:

Panduit	RGTBSG-C	#12-24 screws
Panduit	RGTBS1032G-C	#10-32 screws
Panduit	RGTBSM6G-C	M6 screws
Panduit	RGTBSM5G-C	M5 screws

## **2.11 Bonding Cage Nut**

### **2.11.1**

Specified Product:

Panduit CNB4K

## **2.12 Bond Clamp**

Specified Product:

Belden	X9905753	For 0.75" or larger cables
Belden	X9905754	For 0.75" or smaller cables
Belden	AX100226	Six-Position Ground Bracket

## **2.13 Rack Grounding**

### **2.13.1 Paint Piercing Washers**

- 2.13.1.1.1.1 Series RGW paint piercing washers shall accommodate 3/8" stud size and shall have an outside diameter of 0.875".
- 2.13.1.1.1.1.2 Series RGW paint piercing washer kits shall come complete with 0.16 oz. (5cc) of antioxidant.
- 2.13.1.1.1.1.3 Series RGW paint piercing washers shall be supplied and installed by the Communications Contractor where rack elements bolt together.
- 2.13.1.1.1.1.4 Series RGW paint piercing washers shall be supplied and installed by the Communications Contractor where vertical cable managers are manufactured of metal.
- 2.13.1.1.1.1.5 Two paint piercing washers shall be supplied and installed by the Communications Contractor for every nut/bolt set.

Specified Product:

Panduit	RGW-24-1Y	Pack of 24
Panduit	RGW-100-1Y	Pack of 100

### **2.13.2 Rack Grounding Strip**

- .1 Series RGS grounding strip shall be 78.65" long, 0.67" wide, 0.05" thick, have EIA Universal mounting hole pattern and shall be made of high conductivity, low resistance wrought copper and tin plated.
- .2 Series RGS grounding strip kits shall come complete with 0.16 oz. (5cc) of antioxidant and thread-forming screws.
- .3 One series RGS rack grounding strip shall be supplied by the Communications Contractor for every two post rack. The rack grounding strip shall be mounted to the rear of the side rail of each rack.

Specified Product:

Harger RGBVKIT145872A

Panduit RGS134-1Y

2.13.3 Common Bonding Network Jumper

- .1 The Common Bonding Network Jumper shall be made of #6 AWG green or green/yellow jacketed copper conductor no less than 96" long with one end factory terminated to lug.
- .2 The Common Bonding Network Jumper kits shall come complete with 0.16 oz. (5cc) of antioxidant and thread-forming screws.
- .3 One Common Bonding Network Jumper shall be supplied and installed for every rack. Do not bond racks serially.

Specified Product:

Harger RGJ67G1082AKIT

Panduit RGREJ696Y

- .4 Where a Common Bonding Network has not been specified the Communications Contractor shall supply and install a Code Conductor Two Hole Long Barrel with Window Lug to bond the Common Bonding Network Jumper directly to the Telecommunications Grounding Busbar.

Specified Product:

Harger GECLB62A

Panduit LCC6-  
14JAW-L

- .5 Where a Common Bonding Network has been specified the Communications Contractor shall supply and install a Code/Flex Conductor HTAP or C-TAP Kit to bond the Common Bonding Network Jumper to the Common Bonding Network.

Specified Product:

Harger CT2248

Panduit HTWC250-2-  
1

2.13.4 Electrostatic Discharge Port

- .1 The Electrostatic Discharge Port shall accommodate a standard ESD wrist strap 4mm plug.

- .2 The Electrostatic Discharge Port kits shall come complete with an ESD protection sticker, 0.16 oz. (5cc) of antioxidant and thread-forming screws.
- .3 The Communications Contractor shall supply and install two Electrostatic Discharge Ports for every rack. One ESD port shall be mounted directly to the rack grounding strip on the back of the rack at approximately 48" AFF, and the other shall be mounted directly to the vertical mounting rail of the rack in the front at approximately 48" AFF.

Specified Product:

Panduit RGEDS2-1 Kit c/w #12-24 and M6 screws

Panduit RGEDS2A-1 Kit c/w #10-32 and M5 screws

## **2.14 Cabinet Grounding**

### **2.14.1 Cabinet Grounding Strip Kit**

- .1 Series RGS grounding strips shall have EIA Universal mounting hole pattern and shall be made of high conductivity, low resistance wrought copper and tin plated.
- .2 Series RGS grounding strip kits shall come complete with four (4) grounding strips, 0.16 oz. (5cc) of antioxidant and bonding studs.
- .3 One series RGS rack grounding strip kit with four (4) grounding strips shall be supplied by the Communications Contractor for every cabinet. Each grounding strip shall be mounted to each cabinet equipment rail.

Specified Product:

Panduit RGS134-1Y for #12-24, M6, #10-32 or M5 mounting hole rails

Panduit RGS134B-1 for cage-nut rails (pack of 1 strip)

Panduit RGS134B-10-1 For cage-nut rails (pack of 10 strips)

### **2.14.2 Grounding Busbar Kit**

- .1 The Grounding Busbar shall be made of high conductivity, low resistance wrought copper and tin plated.
- .2 One Cabinet Grounding Busbar kit shall be supplied and installed by the Communications Contractor for every cabinet.

Specified Product:

Panduit RGRB19U 20 holes

Panduit RGRB19Y 14 holes

Panduit RGRB19CN 20 holes for cage-nut

### **2.14.3 Front to Back Rail Jumper Kit**

- .1 The Front to Back Rail Jumper Kit shall be made of #6 AWG green or green/yellow jacketed copper conductors to bond the rear cabinet rails to the front cabinet rails.

.2 The Front to Back Rail Jumper Kit shall come complete with thread-forming screws or bonding studs.

.3 One Panduit series CGJ Front to Back Rail Jumper Kit shall be supplied and installed by the Communications Contractor for each cabinet.

Specified Product:

Panduit CGJ640U for #12-24 or M6 holes and a 42" deep cabinet

Panduit CGJ640UA for #10-32 or M5 holes and a 42" deep cabinet

Panduit CGJ640UB for cage-nut rails and a 42" deep cabinet

#### 2.14.4 Common Bonding Network Jumper

.1 The Common Bonding Network Jumper shall be made of #6 AWG green or green/yellow jacketed copper conductor 96" long with one end factory terminated to lug.

.2 The Common Bonding Network Jumper kits shall come complete with 0.16 oz. (5cc) of antioxidant and thread-forming screws.

.3 One Common Bonding Network Jumper shall be supplied and installed for every cabinet.

Specified Product:

Harger RGJ67G1082AKIT

Panduit RGREJ696Y

.4 Where a Common Bonding Network has not been specified the Communications Contractor shall supply and install a Code Conductor Two Hole Long Barrel with Window Lug to bond the Common Bonding Network Jumper directly to the Telecommunications Grounding Busbar.

Specified Product:

Harger GECLB62A

Panduit LCC6-  
14JAW-L

.5 Where a Common Bonding Network has been specified the Communications Contractor shall supply and install a Code/Flex Conductor HTAP Kit to bond the Common Bonding Network Jumper to the Common Bonding Network.

Specified Product:

Harger CT2248

Panduit HTWC250-2-  
1

#### 2.14.5 Electrostatic Discharge Port

.1 The Electrostatic Discharge Port shall accommodate a standard ESD wrist strap 4mm plug.

.2 The Electrostatic Discharge Port kits shall come complete with an ESD protection sticker, 0.16 oz. (5cc) of antioxidant and thread-forming screws or bonding studs.

- .3 The Communications Contractor shall supply and install two Electrostatic Discharge Ports for every cabinet. One ESD port shall be mounted directly to the cabinet grounding strip on the back of the cabinet at approximately 48" AFF, and the other shall be mounted directly to the cabinet grounding strip on the front of the cabinet at approximately 48" AFF. ESD ports may be mounted on top of patch panels or horizontal cable managers.

Specified Product:

Panduit	RGESD2-1	Kit c/w #12-24 and M6 screws
Panduit	RGESD2A-1	Kit c/w #10-32 and M5 screws
Panduit	RGESD2B-1	Kit c/w bonding studs

### **3 EXECUTION**

#### **3.1 General**

- 3.1.1 Structured grounding kits shall be TIA-942 compliant, listed for their purpose with a nationally recognized testing laboratory, and RoHS compliant.
- 3.1.2 Grounding strip shall comply with EIA universal mounting hole spacing and mount to standard 19-inch and 23-inch racks and cabinets.
- 3.1.3 All components shall be bonded to the rails with paint piercing hardware.
- 3.1.4 Electrostatic discharge (ESD) ports shall be mounted to the front and back of the rack(s) and/or cabinet(s).
- 3.1.5 Equipment shall be bonded to the grounding strip with a discrete jumper and two-hole long barrel compression lugs.
- 3.1.6 There shall be a #6 AWG copper code discrete jumper that terminates on the mesh common bonding network (MCBN) with a compression HTAP and attaches to the grounding strip using a two-hole, long barrel compression lug. The compression lugs shall meet NEBS Level 3 Criteria and have inspection windows.
- 3.1.7 All jumpers shall have green or green-and-yellow VW-1 rated insulation.
- 3.1.8 Where rack sections bolt together, paint piercing grounding washers shall be used on both sides, under the head of the bolt and between the nut and the rack.
- 3.1.9 The Communications Contractor shall ensure a complete grounding system is installed for the project. If any portion of the system to be installed by Division 26 is incomplete it shall be the responsibility of the Communications Contractor to advise the Technology Systems Consultant.

**END OF SECTION**

---

**1 GENERAL**

**1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

**1.2 General**

- 1.2.1 All cables and related terminations, support and grounding hardware shall be furnished, installed, wired, tested, labelled, and documented by the Audio-Visual Communications Contractor as detailed in this section.
- 1.2.2 Product specifications, general design considerations and installation guidelines are provided in this section.
- 1.2.3 The Audio-Visual Communications Contractor shall meet or exceed all requirements for the cable system described in this section.
- 1.2.4 Local electrical codes shall be adhered to.
- 1.2.5 Local building codes shall be adhered to.
- 1.2.6 All Audio-Visual Communications components including, entrance lugs, entrance terminal frames, racks, cabinets, cable tray, ladder racks, metallic pathways, enclosures, and other components noted on drawings shall be bonded to an independent grounding system and in accordance with local codes and standards, TIA/EIA J-STD-607-A, ANSI/TIA-942 and IEEE Std.1100 and these specifications.
- 1.2.7 Labelling shall conform to TIA/EIA-606.
- 1.2.8 Grounding system shall include a local copper Telecommunications Grounding Busbar (by Division 26) in each entrance facility and equipment room bonded to a Telecommunications Grounding Backbone (by Division 26).
- 1.2.9 The TBB shall be bonded directly to the Telecommunications Main Grounding Busbar (by Division 26). The TMGB shall be bonded directly to the building entrance grounding system and meet all local codes and standards as noted above.
- 1.2.10 The grounding system shall be visually verifiable and adequately sized to handle expected currents safely.
- 1.2.11 All grounding conductors and busbars shall be made of copper.
- 1.2.12 The grounding system shall be intentional, visually verifiable, adequately sized to handle expected currents safely, and direct these currents away from network equipment. As such, grounding shall be purposeful in its design and installation.
- 1.2.13 Lugs, HTAPs, grounding strips, and busbars shall be UL Listed, and CSA certified and made of premium quality tin-plated electrolytic copper that provides low electrical resistance while inhibiting corrosion. Antioxidant shall be used when making bonding connections in the field.

---

1.3 **Lugs**

- 1.3.1 Wherever possible, two-hole lugs shall be used. All lugs shall be irreversible compression. Lugs with inspection windows shall be used in all non-corrosive environments so that connections may be inspected for full conductor insertion (battery rooms are an exception where windowless lugs may be used).
- 1.3.2 Die index numbers shall be embossed on all compression connections to allow crimp inspection.

1.4 **Cable Assemblies**

- 1.4.1 Cable assemblies shall be UL Listed and CSA Certified. Cables shall be a distinctive green or green/yellow in color, and all jackets shall be UL, VW-1 flame rated.

2 **PRODUCT**

2.1 **Common Bonding Network**

- 2.1.1 The Common Bonding Conductor within each Entrance Facility, Data Centre, Computer Room, Telecommunications Room, LAN Room, etc. shall be a green or green/yellow jacketed #2 copper conductor. The installation route shall be as shown on drawings.

2.2 **Grounding Clamps**

- 2.2.1 Where a grounding conductor is routed through a metal conduit, the Audio-Visual Communications Contractor shall use a #6 AWG copper conductor with green or green/yellow jacket to bond the conduit to the grounding conductor routed through the metal conduit. Series GPL grounding clamps shall be used to bond to the conduit and series HTWC HTAP with clear cover shall be used to bond to the grounding conductor.

2.3 **Communications Grounding and Bonding Conductor Label Kit**

- 2.3.1 Telecommunications Grounding and Bonding Conductor Label Kits shall be supplied and installed by the Audio-Visual Communications Contractor at every rack and cabinet as well as one for every Telecommunications Grounding Busbar.

Specified Product:

Harger GRNTAG607PK10

Panduit LTYK

2.4 **Code Conductor, Two-Hole, Long Barrel with Window Lug**

- 2.4.1 Where lugs are required for bonding, the Audio-Visual Communications Contractor shall supply and install Code Conductor, Two-Hole, and Long Barrel with Window Lugs.
- 2.4.2 Code Conductor, Two-Hole, Long Barrel with Window Lugs shall be supplied and installed by the Audio-Visual Communications Contractor as required.

- 
- 2.4.3 Lugs shall be tin plated, irreversible compression, have NEMA hole sizes and spacing and shall meet NEBS Level 3.
- 2.5 **Grounding Clamp, U-Bolt, Bronze**
- 2.5.1 Each conduit entering/leaving a telecommunications space/room shall be bonded to the grounding system using a Series GPL Bronze U-Bolt Grounding Clamp.
- 2.6 **Antioxidant**
- 2.6.1 Antioxidant shall be used by the Audio-Visual Communications Contractor when making bonding connections.
- 2.7 **Bonding Screws**
- 2.7.1 Bonding screws shall have serrations on the bottom of screw to remove paint from patch panel to bond patch panel to rack or cabinet rails.
- 2.7.2 Bonding screws shall be thread-forming to remove paint from threaded rack or cabinet rail holes to bond patch panel to rack or cabinet rails.
- 2.7.3 The Audio-Visual Communications Contractor shall supply and install four (4) screws for every patch panel (copper and optical fibre) as well as for every Owner supplied switch (assume 48 port switches).
- Specified Product:
- |         |              |               |
|---------|--------------|---------------|
| Panduit | RGTBSG-C     | #12-24 screws |
| Panduit | RGTBS1032G-C | #10-32 screws |
| Panduit | RGTBSM6G-C   | M6 screws     |
| Panduit | RGTBSM5G-C   | M5 screws     |
- 2.8 **Bonding Cage Nut**
- 2.8.1
- Specified Product:
- Panduit CNB4K
- 2.8.2 Electrostatic Discharge Port
- .1 The Electrostatic Discharge Port shall accommodate a standard ESD wrist strap 4mm plug.
  - .2 The Electrostatic Discharge Port kits shall come complete with an ESD protection sticker, 0.16 oz. (5cc) of antioxidant and thread-forming screws.
  - .3 The Audio-Visual Communications Contractor shall supply and install two Electrostatic Discharge Ports for every rack. One ESD port shall be mounted directly to the rack grounding strip on the back of the rack at approximately 48" AFF, and the other shall be mounted directly to the vertical mounting rail of the rack in the front at approximately 48" AFF.
-

Specified Product:

Panduit RGEDS2-1 Kit c/w #12-24 and M6 screws

Panduit RGEDS2A-1 Kit c/w #10-32 and M5 screws

## 2.9 **Cabinet Grounding**

### 2.9.1 Cabinet Grounding Strip Kit

- .1 Series RGS grounding strips shall have EIA Universal mounting hole pattern and shall be made of high conductivity, low resistance wrought copper and tin plated.
- .2 Series RGS grounding strip kits shall come complete with four (4) grounding strips, 0.16 oz. (5cc) of antioxidant and bonding studs.
- .2 One series RGS rack grounding strip kit with four (4) grounding strips shall be supplied by the Audio-Visual Communications Contractor for every cabinet. Each grounding strip shall be mounted to each cabinet equipment rail.

Specified Product:

Panduit RGS134-1Y for #12-24, M6, #10-32 or M5 mounting hole rails

Panduit RGS134B-1 for cage-nut rails (pack of 1 strip)

Panduit RGS134B-10-1 For cage-nut rails (pack of 10 strips)

### 2.9.2 Grounding Busbar Kit

- .1 The Grounding Busbar shall be made of high conductivity, low resistance wrought copper and tin plated.
- .3 One Cabinet Grounding Busbar kit shall be supplied and installed by the Audio-Visual Communications Contractor for every cabinet.

Specified Product:

Panduit RGRB19U 20 holes

Panduit RGRB19Y 14 holes

Panduit RGRB19CN 20 holes for cage-nut

### 2.9.3 Front to Back Rail Jumper Kit

- .1 The Front to Back Rail Jumper Kit shall be made of #6 AWG green or green/yellow jacketed copper conductors to bond the rear cabinet rails to the front cabinet rails.
- .4 The Front to Back Rail Jumper Kit shall come complete with thread-forming screws or bonding studs.
- .5 One Panduit series CGJ Front to Back Rail Jumper Kit shall be supplied and installed by the Audio-Visual Communications Contractor for each cabinet.

Specified Product:

Panduit CGJ620U for #12-24 or M6 holes and a 24" deep cabinet

Panduit CGJ630U for #12-24 or M6 holes and a 36" deep cabinet

---

Panduit	CGJ640U	for #12-24 or M6 holes and a 42" deep cabinet
Panduit	CGJ620UA	for #10-32 or M5 holes and a 24" deep cabinet
Panduit	CGJ630UA	for #10-32 or M5 holes and a 36" deep cabinet
Panduit	CGJ640UA	for #10-32 or M5 holes and a 42" deep cabinet
Panduit	CGJ620UB	for cage-nut rails and a 24" deep cabinet
Panduit	CGJ630UB	for cage-nut rails and a 36" deep cabinet
Panduit	CGJ640UB	for cage-nut rails and a 42" deep cabinet

#### 2.9.4 Common Bonding Network Jumper

- .1 The Common Bonding Network Jumper shall be made of #6 AWG green or green/yellow jacketed copper conductor 96" long with one end factory terminated to lug.
- .6 The Common Bonding Network Jumper kits shall come complete with 0.16 oz. (5cc) of antioxidant and thread-forming screws.
- .7 One Common Bonding Network Jumper shall be supplied and installed for every cabinet.

##### Specified Product:

Harger RGJ67G1082AKIT

Panduit RGREJ696Y

- .8 Where a Common Bonding Network has not been specified the Audio-Visual Communications Contractor shall supply and install a Code Conductor Two Hole Long Barrel with Window Lug to bond the Common Bonding Network Jumper directly to the Telecommunications Grounding Busbar.

##### Specified Product:

Harger GECLB62A

Panduit LCC6-  
14JAW-L

- .9 Where a Common Bonding Network has been specified the Audio-Visual Communications Contractor shall supply and install a Code/Flex Conductor HTAP Kit to bond the Common Bonding Network Jumper to the Common Bonding Network.

##### Specified Product:

Harger CT2248

Panduit HTWC250-2-  
1

#### 2.9.5 Electrostatic Discharge Port

- .1 The Electrostatic Discharge Port shall accommodate a standard ESD wrist strap 4mm plug.
- .10 The Electrostatic Discharge Port kits shall come complete with an ESD protection sticker, 0.16 oz. (5cc) of antioxidant and thread-forming screws or bonding studs.
- .11 The Audio-Visual Communications Contractor shall supply and install two Electrostatic Discharge Ports for every cabinet. One ESD port shall be

mounted directly to the cabinet grounding strip on the back of the cabinet at approximately 48" AFF, and the other shall be mounted directly to the cabinet grounding strip on the front of the cabinet at approximately 48" AFF. ESD ports may be mounted on top of patch panels or horizontal cable managers.

Specified Product:

Panduit	RGESD2-1	Kit c/w #12-24 and M6 screws
Panduit	RGESD2A-1	Kit c/w #10-32 and M5 screws
Panduit	RGESD2B-1	Kit c/w bonding studs

### **3 EXECUTION**

#### **3.1 General**

- 3.1.1 Structured grounding kits shall be TIA-942 compliant, listed for their purpose with a nationally recognized testing laboratory, and RoHS compliant.
- 3.1.2 Grounding strip shall comply with EIA universal mounting hole spacing and mount to standard 19-inch and 23-inch racks and cabinets.
- 3.1.3 All components shall be bonded to the rails with paint piercing hardware.
- 3.1.4 Electrostatic discharge (ESD) ports shall be mounted to the front and back of the rack(s) and/or cabinet(s).
- 3.1.5 Equipment shall be bonded to the grounding strip with a discrete jumper and two-hole long barrel compression lugs.
- 3.1.6 All jumpers shall have green or green-and-yellow VW-1 rated insulation.
- 3.1.7 Where rack sections bolt together, paint piercing grounding washers shall be used on both sides, under the head of the bolt and between the nut and the rack.
- 3.1.8 The Audio-Visual Communications Contractor shall ensure a complete grounding system is installed for the project. If any portion of the system to be installed by Division 26 is incomplete it shall be the responsibility of the Audio-Visual Communications Contractor to advise the Technology Systems Consultant.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

### **1.2 General**

- 1.2.1 The Audio-Visual Communications Contractor shall be responsible for measuring and confirming cable pathways prior to installation of any cabling to ensure no cabling will exceed the specified distance limitations. Where the distance limitations are exceeded, the Audio-Visual Communications Contractor shall inform the Technology Systems Consultant prior to installation of cabling. No compensation for removal of cabling will be accepted if not adhered to.

### **1.3 Indoor Cable Distribution**

- 1.3.1 The Audio-Visual Communications Contractor shall install and distribute cabling using riser sleeves, conduit, communications cable tray, floor ducts systems and/or surface raceways as indicated on drawings and as supplied and installed by Division 26.
- 1.3.2 All cabling extending beyond conduit and /or cable tray pathways shall be supported using J-hooks and/or Cable Slings up to the point of termination complete with “Velcro” Ty-raps supplied and installed by the Audio-Visual Communications Contractor, in accordance with these specifications.
- 1.3.3 Innerduct shall be supplied and installed by the Audio-Visual Communications Contractor where required to protect Audio-Visual cabling. Innerduct shall be as further described in this specification.

## **2 PRODUCT**

### **2.1 J-Hooks**

- 2.1.1 J-hooks shall be made of metal and/or plastic and shall be Plenum rated.
- 2.1.2 J-hooks shall be supplied and installed with all necessary fastening suitable for the building structure being used to support the cabling and as per the manufacturer’s installation requirements or guidelines.
- 2.1.3 J-hooks shall be manufactured by Erico or Panduit and sized to suit.

#### **Specified Product:**

Erico	CAT12
Erico	CAT21
Erico	CAT32
Erico	CAT64
Panduit	JP75
Panduit	JP131
Panduit	JP2
Panduit	JP4

---

Notes: Product Codes shown above indicate only Series numbers and are not application specific.

## **2.2 Cable Slings**

- 2.2.1 Cable slings shall be supplied and installed as indicated on drawings and as required to support larger bundles of cabling.
- 2.2.2 Cable slings shall be supplied with all necessary fastening suitable for the building structure being used to support the cabling and as per the manufacturer's installation requirements or guidelines.
- 2.2.3 Cable slings shall be manufactured by Erico and sized to suit installation or as noted on drawings.

Specified Product:  
Erico CAT425

Notes: Product Code shown above indicates only Series number and is not application specific.

## **2.3 Velcro Wraps**

- 2.3.1 Velcro wraps shall be supplied and installed to support and neatly bundle all cabling.
- 2.3.2 No nylon or plastic Ty-wraps will be permitted on this project and will be removed and replaced at the expense of the Audio-Visual Communications Contractor.
- 2.3.3 Velcro wraps shall be black in colour.

Specified Product:  
Panduit HLS/HLM-15R0

# **3 EXECUTION**

## **3.1 General**

- 3.1.1 All pathways shall be installed to run parallel to building lines at all times.
- 3.1.2 Pathways shall be installed in coordination with other trades in order to minimize interferences and obstructions. The Audio-Visual Communications Contractor shall be responsible for relocating installed pathways at no cost to the Owner.
- 3.1.3 All cable supports shall be installed to the permanent structure of the building and be limited to areas that will not damage the structural stability such as tensioned beams and slabs. It is the responsibility of the Audio-Visual Communications Contractor to submit information to the structural engineer for review and approval prior to installation.
- 3.1.4 Anchors for J-hooks and/or Cable Slings shall not be drilled into post tensioned beams under any circumstances. All anchors shall be drilled into slab.
- 3.1.5 Pneumatic hammers shall not be used unless the Audio-Visual Communications Contractor has written authorization from the building owner/landlord.

- 3.1.6 The Audio-Visual Communications Contractor shall minimize the removal/disturbance of fire spray insulation while installing cable supports and/or accessories.

### 3.2 **Audio-Visual Indoor Cable Distribution**

- 3.2.1 The Audio-Visual Communications Contractor shall install cables in a manner that shall ensure that the Audio-Visual System(s) is free of noise (both video and audio).
- 3.2.2 The Audio-Visual Communications Contractor shall ensure that all proper installation practices are followed to prevent electromagnetic, electrostatic and radio frequency noise in the Audio-Visual System(s).
- 3.2.3 Separation of the audio system(s) and related cables from sources of noise shall be based on the following table of distances or manufacturer recommendations, whichever is more stringent.

	208V cct	Lighting cct	Heat Source	Plumbing
Intercom	30 cm	30 cm	30 cm	15 cm
Line	60 cm	60 cm	30 cm	15 cm
Loudspeaker	30 cm	30 cm	30 cm	15 cm
Microphone	60 cm	60 cm	30 cm	15 cm
Control Network				

- 3.2.4 Separation of the video system(s) and related cables from sources of noise shall be based on the following table of distances or manufacturer recommendations, whichever is more stringent.

	208V cct	Lighting cct	Heat Source	Plumbing
Component	15 cm	60 cm	30 cm	15 cm
Composite	15 cm	60 cm	30 cm	15 cm
RGB	15 cm	60 cm	30 cm	15 cm

### 3.3 **J-Hooks**

- 3.3.1 Suspended ceiling and T-Bar hangers shall not be acceptable in any situation.
- 3.3.2 J-Hooks shall be installed every 3' to 4' to support cabling (ensure that the distance between j-hooks is not consistent; do not place j-hooks exactly the same distance apart repeatedly).
- 3.3.3 All cabling shall be installed to have no more than 3" sag between J-hooks. All cabling shall be fastened using Velcro Wraps only. The Audio-Visual Communications Contractor will be responsible for all costs associated with removing other fasteners and install the specified product.
- 3.3.4 If the quantity of cables exceeds 80% of the manufacturer's capacity rating install the next larger size or substitute with cable slings at no additional cost to the Owner.

- 
- 3.3.5 J-hooks shall be installed in coordination with other building services and without interruption to the Owner or surrounding Owners within the building.
- 3.4 **Cable Slings**
- 3.4.1 Cable slings shall be installed as noted on drawings and when cabling exceeds the capacity of J-hooks.
- 3.4.2 Cable slings shall be installed every 3' to 4' to support cabling (ensure that the distance between cable slings is not consistent; do not place cable slings exactly the same distance apart repeatedly).
- 3.4.3 All cabling shall be installed to have no more than 3" sag between cable slings.
- 3.4.4 Cable slings shall be sized to not exceed 80% of the manufacturers published capacities.
- 3.5 **Velcro Wraps**
- 3.5.1 Velcro Wraps shall be installed at every J-hook, between every pair of J-hooks or within 2' of a J-hook to neatly bundle cabling.
- 3.5.2 Velcro Wraps shall be installed every 3' to neatly bundle cabling installed in cable tray.
- 3.5.3 Velcro Wraps shall be installed every 6" to neatly bundle cabling at all locations on racks, cabinets, patch panels and IDC mounts.
- 3.6 **Fire Stopping**
- 3.6.1 For all fire stopping requirements refer to Section 27 00 13 – Fire Stopping for Communications.
- 3.7 **Grounding**
- 3.7.1 For all grounding and bonding requirements refer to Section 27 05 26 – Grounding and Bonding for Communications Systems.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.2.1 The Communications Contractor shall be responsible for measuring and confirming cable pathways prior to installation of any cabling to ensure no cabling will exceed the specified distance limitations. Where the distance limitations are exceeded, the Communications Contractor shall inform the Technology Systems Consultant prior to installation of cabling. No compensation for removal of cabling will be accepted if not adhered to.
- 1.2.2 The Communications Contractor shall be responsible for installing and providing pulling strings, ropes and fishing walls wherever conduit is not installed or conduit is installed without these provisions.

### **1.3 Indoor Cable Distribution**

- 1.3.1 Ensure ANSI/EIA/TIA-568-B installation practices are followed for all indoor cable distribution.
- 1.3.2 The Communications Contractor shall install and distribute cabling using riser sleeves, conduit, communications cable tray, floor ducts systems and/or surface raceways as indicated on drawings and as supplied and installed by Division 26.
- 1.3.3 All cabling extending beyond conduit and /or cable tray pathways shall be supported using J-hooks and/or Cable Slings up to the point of termination complete with “Velcro” Ty-raps supplied and installed by the Communications Contractor, in accordance with these specifications.
- 1.3.4 Innerduct shall be supplied and installed by the Communications Contractor for all fibre optic cabling not indicated shall be installed in conduit and at locations fibre optic cabling leaves a conduit. Innerduct shall be as further described in this specification.

## **2 PRODUCT**

### **2.1 J-Hooks**

- 2.1.1 J-hooks shall be made of metal and/or plastic and shall be Plenum rated.
- 2.1.2 J-hooks shall be supplied and installed with all necessary fastening suitable for the building structure being used to support the cabling and as per the manufacturer’s installation requirements or guidelines.
- 2.1.3 J-hooks shall be manufactured by Erico or Panduit and sized to suit.

Specified Product:

Erico CAT12

Erico CAT21

Erico	CAT32
Erico	CAT64
Panduit	JP75
Panduit	JP131
Panduit	JP2
Panduit	JP4

Notes: Product Codes shown above indicate only Series numbers and are not application specific.

## **2.2 Cable Slings**

- 2.2.1 Cable slings shall be supplied and installed as indicated on drawings and as required to support larger bundles of cabling.
- 2.2.2 Cable slings shall be supplied with all necessary fastening suitable for the building structure being used to support the cabling and as per the manufacturer's installation requirements or guidelines.
- 2.2.3 Cable slings shall be manufactured by Erico and sized to suit installation or as noted on drawings.

Specified Product:  
Erico CAT425

Notes: Product Code shown above indicates only Series number and is not application specific.

## **2.3 Vertical Backbone Support**

- 2.3.1 Vertical backbone supports shall be supplied and installed as indicated on drawings and as required to support vertically installed backbone.
- 2.3.2 Vertical backbone supports shall be supplied with all necessary fastening suitable for the building structure being used to support the cabling and as per the manufacturer's installation requirements or guidelines.
- 2.3.3 Vertical backbone supports shall be manufactured by Erico and sized to suit installation or as noted on drawings.

Specified Product:  
Erico CAT600

Notes: Product Code shown above indicates only Series number and is not application specific.

## **2.4 Heavy Duty Split-Lace Kellum Grip With U Eye**

- 2.4.1 Split-lace cable grips with u eye shall be double weave with uniform gripping power and shall be CSA approved.
- 2.4.2 Tin-coated bronze split-lace cable grips shall be non-magnetic to minimize hysteresis and resultant heat build up.

Specified Product:

		Cable Dia. Range Inches (cm)	Approx. Breaking Strength Lbs (N)
Hubbell / Bryant	SHS075U	0.75-0.99 (1.90- 2.51)	2820 (12543)
Hubbell / Bryant	SHS100U	1.00-1.24 (2.54- 3.15)	4280 (19037)
Hubbell / Bryant	SHS125U	1.25-1.49 (3.17- 3.78)	4280 (19037)
Hubbell / Bryant	SHS150U	1.50-1.74 (3.81- 4.42)	4280 (19037)

- 2.4.3 Stainless steel grips shall be 302/304 and shall be designed for harsh environment where superior corrosion resistance and strength are required.

Specified Product:

		Cable Dia. Range Inches (cm)	Approx. Breaking Strength Lbs (N)
Hubbell / Bryant	SHS075US	0.75-0.99 (1.90- 2.51)	4250 (18904)
Hubbell / Bryant	SHS100US	1.00-1.24 (2.54- 3.15)	7300 (32470)
Hubbell / Bryant	SHS125US	1.25-1.49 (3.17- 3.78)	7300 (32470)
Hubbell / Bryant	SHS150US	1.50-1.74 (3.81- 4.42)	11150 (49595)

## 2.5 **Heavy Duty Split Lace Kellum Grip With Double U Eye**

- 2.5.1 Split-lace cable grips with double u eye shall be double weave with uniform gripping power and shall be CSA approved.
- 2.5.2 Tin-coated bronze split-lace cable grips shall be non-magnetic to minimize hysteresis and resultant heat build up.

Specified Product:

		Cable Dia. Range Inches (cm)	Approx. Breaking Strength Lbs (N)
Hubbell / Bryant	SHS075	0.75-0.99 (1.90-2.51)	2820 (12543)
Hubbell / Bryant	SHS100	1.00-1.24 (2.54-3.15)	4280 (19037)
Hubbell / Bryant	SHS125	1.25-1.49 (3.17-3.78)	4280 (19037)
Hubbell / Bryant	SHS150	1.50-1.99 (3.81-5.05)	4280 (19037)
Hubbell / Bryant	SHS200	2.00-2.49 (5.08-6.32)	8050 (35806)
Hubbell / Bryant	SHS250	2.50-2.99 (6.35-7.59)	8050 (35806)

Hubbell / Bryant	SHS300	3.00-3.49 (7.62-8.86)	10060 (44747)
Hubbell / Bryant	SHS350	3.50-3.99 (8.89-10.13)	12070 (53687)
Hubbell / Bryant	SHS400	4.00-4.49 (10.16- 11.40)	12070 (53687)
Hubbell / Bryant	SHS450	4.50-4.99 (11.43- 12.67)	12070 (53687)
Hubbell / Bryant	SHS500	5.00-5.99 (12.70- 15.21)	14080 (62628)

2.5.3 Stainless steel grips shall be 302/304 and shall be designed for harsh environment where superior corrosion resistance and strength are required.

Specified Product:

		Cable Dia. Range Inches (cm)	Approx. Breaking Strength Lbs (N)
Hubbell / Bryant	SHS200DES	2.00-2.49 (5.08-6.32)	20105 (89627)
Hubbell / Bryant	SHS250DES	2.50-2.99 (6.35-7.59)	20105 (89627)
Hubbell / Bryant	SHS300DES	3.00-3.49 (7.62-8.86)	25200 (112090)
Hubbell / Bryant	SHS350DES	3.50-3.99 (8.89-10.13)	30200 (134330)
Hubbell / Bryant	SHS400DES	4.00-4.49 (10.16- 11.40)	30200 (134330)

## 2.6 Velcro Wraps

2.6.1 Velcro wraps shall be supplied and installed to support and neatly bundle all cabling.

2.6.2 No nylon or plastic wraps will be permitted on this project and will be removed and replaced at the expense of the Communications Contractor.

2.6.3 Velcro Wraps shall be black in colour.

Specified Product:

		Width	Tensile Strength
Panduit	HLM-15R0	0.330"	18
Panduit	HLS-15R0	0.750"	50
Panduit	HLS-75R0	0.750"	50
Panduit	TTS-20R0	0.750"	40
Panduit	TTS-35R3-0	0.750"	40

## 2.7 Innerduct

2.7.1 Innerduct shall be supplied non-plenum (FT4) or plenum (FT6) rated to suit the installation.

2.7.2 All FT6 or CMP rated cabling shall be installed within equally rated innerduct.

- 2.7.3 All innerduct shall include pre-lubricated pull tape.
- 2.7.4 Optical fibre cabling may be installed without innerduct where either of the following is true:
- .1 The optical fibre cable is armoured.
  - .2 The conduit where the optical fibre cable(s) will be installed is equal to or less than 1.5" trade size and is dedicated to optical fibre cabling.
- 2.7.5 Innerduct shall be coloured for use with different cabling as follows:
- |                  |                |
|------------------|----------------|
| Multimode Fibre  | Orange         |
| Singlemode Fibre | Yellow         |
| Copper           | White or Clear |
- 2.7.6 Innerduct shall be sized to suit or as noted on drawings.
- Specified Product:
- |         |             |            |
|---------|-------------|------------|
| Carlton | CF4X1C-500  | for Plenum |
| Carlton | DF4X1C-500R | for Riser  |

## **2.8 Split Wrap**

- 2.8.1 Split wrap shall be supplied to dress cabling from wall feed to furniture feed locations.
- 2.8.2 Split wrap shall be sized to suit each location.
- 2.8.3 Split wrap shall be coloured to match the power whip supplied with the furniture.

Specified Product:

	Part Number	Tool Required
Panduit	PW50F-T20	PWT50
Panduit	PW75F-C20	PWT75
Panduit	PW100F-C20	PWT100
Panduit	PW150F-L20	PWT150

## **2.9 Overhead Wire Basket Tray**

- 2.9.1 Provide wire basket of types and sizes indicated with all required splicing and mounting hardware.
- 2.9.2 Wire basket crosswire to be constructed with shaped wire to provide flat surface for cable support, avoiding pressure points or cable strain. Round wire construction shall not be allowed.
- 2.9.3 Wire basket shall be made of high strength steel wires and formed into a standard 2 inch by 4 inch wire mesh pattern with intersecting wires welded together. All mesh sections must have at least one bottom longitudinal wire along entire length of straight section.

- 2.9.4 Wire diameter shall be 0.195" (5mm) minimum on all mesh sections up to 16 linear inches. Wire diameter linewire shall be 0.234" (6mm) minimum on all mesh sections in excess of 16 linear inches.
- 2.9.5 All straight section longitudinal wires shall be constructed with a continuous top wire safety edge. Safety edge must be the WBT "Canadian-Weld" on all tray sizes.
- 2.9.6 All fittings shall be field formed, from straight sections, in accordance with manufacturer's instructions.
- 2.9.7 All Tray sections and splicing assemblies shall be UL/C-UL Classified as an Equipment Ground Conductor (EGC).
- 2.9.8 The cable tray shall be installed complete with splice bars, "uni-strut" trapeze supports, threaded rod, ceiling anchors and all manufacturer recommended installation components following manufacturer's installation instructions and recommendations.
- 2.9.9 All cable counts shall be verified by Communications Contractor to size the cable tray appropriately for a maximum of 50% fill. The cable tray shall be increased in size if over 50% filled.

Specified Product:

Description	Part No.
WBT Tray	WBT(4") X (24") X (10') (Hot Dipped Galvanized
WBT Cable drop control ("waterfall")	VERTICAL DOWN
WBT Bend radius control corner	CABLE GUIDE
WBT Attachment to fill fitting gap	FITTING ATTACHMENT 2
WBT Attachment to fill fitting gap	FITTING ATTACHMENT 4/6
WBT Attaches tray directly to rack	RACK ATTACHMENT
WBT Used to splice tray sections	SPLICE KIT
WBT Used to splice tray sections	WASHER SUPPORT
WBT Used to splice tray sections	BAR SPLICE
WBT Used to splice fittings	CORNER SPLICE
WBT Ceiling support for 24" tray	CEILING SUPT 24

### **3 EXECUTION**

#### **3.1 General**

- 3.1.1 All pathways shall be installed to run parallel to building lines at all times.
- 3.1.2 Pathways shall be installed in coordination with other trades in order to minimize interferences and obstructions. The Communications Contractor shall be responsible for relocating installed pathways at no cost to the Owner.
- 3.1.3 All cable supports shall be installed to the permanent structure of the building and be limited to areas that will not damage the structural stability such as tensioned beams and slabs. It is the responsibility of the Communications Contractor to submit information to the structural engineer for review and approval prior to installation.

- 3.1.4 Anchors for J-hooks and/or Cable Slings shall not be drilled into post tensioned beams under any circumstances. All anchors shall be drilled into slab.
- 3.1.5 Pneumatic hammers shall not be used unless the Communications Contractor has written authorization from the building owner/landlord.
- 3.1.6 The Communications Contractor shall minimize the removal/disturbance of fire spray insulation while installing cable supports and/or accessories.

### **3.2 Data and / or Voice Indoor Cable Distribution**

- 3.2.1 All pathways and cabling installation shall maintain clearances from all electrical and heat sources as outlined below.

Fluorescent Fixtures	15 cm
Electrical distribution cabling and conduits less than 1KVA	1.0 m
Electrical distribution cabling and conduits greater than 1KVA	3.0 m
Transformers and Motors	1.2 m
HVAC system including ducts	30 cm
Mechanical piping	15 cm

- 3.2.2 Prepare all conduits and pathways prior to installation of cabling. This shall include bushing or reaming all conduit openings, pulling of wire brush and mandrel to clean out ducts and identifying any potential cause of damage to cabling during installation. Report all items to the Technology Systems Consultant immediately.
- 3.2.3 When installing cables in stacked duct banks install cabling in lower ducts leaving upper ducts for future installations.

### **3.3 J-Hooks**

- 3.3.1 Suspended ceiling and T-Bar hangers shall not be acceptable in any situation.
- 3.3.2 J-Hooks shall be installed every 3' to 4' to support cabling (ensure that the distance between j-hooks is not consistent; do not place j-hooks exactly the same distance apart repeatedly).
- 3.3.3 All cabling shall be installed to have no more than 3" sag between J-hooks. All cabling shall be fastened using Velcro Ty-Wraps only. The Communications Contractor will be responsible for all costs associated with removing other fasteners and install the specified product.
- 3.3.4 If the quantity of cables exceeds 80% of the manufacturer's capacity rating install the next larger size or substitute with cable slings at no additional cost to the Owner.
- 3.3.5 J-hooks shall be installed in coordination with other building services and without interruption to the Owner or surrounding Owners within the building.

### **3.4 Cable Slings**

- 3.4.1 Cable slings shall be installed as noted on drawings and when cabling exceeds the capacity of J-hooks.

- 3.4.2 Cable slings shall be installed every 3' to 4' to support cabling (ensure that the distance between cable slings is not consistent; do not place cable slings exactly the same distance apart repeatedly).
- 3.4.3 All cabling shall be installed to have no more than 3" sag between cable slings.
- 3.4.4 Cable slings shall be sized to not exceed 80% of the manufacturers published capacities.

### **3.5 Velcro Wraps**

- 3.5.1 Velcro Wraps shall be installed at every J-hook, between every pair of J-hooks or within 2' of a J-hook to neatly bundle cabling.
- 3.5.2 Velcro Wraps shall be installed every 3' to neatly bundle cabling installed in cable tray.
- 3.5.3 Velcro Wraps shall be installed every 6" to neatly bundle cabling at all locations on racks, cabinets, patch panels and IDC mounts.

### **3.6 Inner Duct**

- 3.6.1 Innerduct shall be installed and supported to meet all local codes and standards.
- 3.6.2 Innerduct shall be installed to meet the minimum bend radius for cable installation.

### **3.7 Split Wrap**

- 3.7.1 Split wrap shall be installed to neat bundle cabling from outlet location to system furniture connection point.
- 3.7.2 Split wrap installation should be in a manner to minimize the amount of exposed spiral wrap.
- 3.7.3 Secure split wrap neatly when applicable.

### **3.8 Fire Stopping**

- 3.8.1 For all fire stopping requirements refer to Section 27 00 13 – Fire Stopping for Communications.

### **3.9 Grounding**

- 3.9.1 For all grounding and bonding requirements refer to Section 27 05 26.10 – Grounding and Bonding for Communications.

**END OF SECTION**

XXX-YYY-SS-ZZ      where: XXX = Room (Origin)  
                              YYY = Room (Destination)  
                              SS = Number of Strands  
                              ZZ = Strand designation

Hubbell /	1.00-1.24 (2.54-	4280 (19037)
Bryant	3.15)	
Hubbell /	1.25-1.49 (3.17-	4280 (19037)
Bryant	3.78)	
Hubbell /	1.50-1.74 (3.81-	4280 (19037)
Bryant	4.42)	

## **2.2 IDC Mount Designation Strip Label**

2.2.1 IDC mounts shall be labelled using designation strips and labels specifically manufactured for the IDC mount being installed. Labels shall be colour coded as follows:

Orange	Incoming Circuits (Demarcation Point)
Green	Owner Connection to Incoming Circuits (Owner side of Demarcation Point)
White / Silver	Equipment Connections
Purple	First Level Backbone Cabling
Gray	Second Level Backbone Cabling
Blue	Horizontal Cabling
Brown	Interbuilding Backbone (Main XC to remote Intermediate XC)
Yellow	Auxiliary Circuits, Alarms, Maintenance, Security, and other Misc. Circuits
Red	Key Telephone Systems

## **2.3 Racks and Cabinets**

2.3.1 Racks and Cabinets shall be labelled using lamacoid plates.

2.3.2 Lamacoid plates shall be black background with white letters.

2.3.3 Lamacoid plate letters shall be 1" high.

2.3.4 Lamacoid plates shall be no more than 2" high.

2.3.5 Length of lamacoid plates shall be as required to accommodate number of characters.

# **3 EXECUTION**

## **3.1 General**

3.1.1 All labels shall be printed on a laser printer. No handwritten labels shall be accepted.

## **3.2 Cable Labels**

3.2.1 Cable labels shall be installed on clean and dry cable and mounted within 100mm or 4" of each end of each cable.

3.2.2 Labels on all faceplates, patch panels and IDC mounts shall be mounted on a clean dry surface and aligned accurately.

**3.3 Patch Cord Labels**

- 3.3.1 Patch cord labels shall be installed on clean and dry patch cords and mounted within 50mm or 2" of each end of each patch cord.

**3.4 Rack and Cabinet Labelling**

- 3.4.1 Rack and cabinet labelling shall be installed on clean and dry racks and cabinets and mounted on the top rail of each rack and each cabinet, at the front and at the rear.
- 3.4.2 Lamacoid plates shall be mounted to each rack and cabinet with screws. The Communications Contractor shall drill racks and cabinets prior to any cabling or equipment is mounted.
- 3.4.3 Adhesive shall not be accepted as a method of securing lamacoid plates to racks and cabinets.

**END OF SECTION**

**1 GENERAL**

**1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

**1.2 Cable Labelling**

- 1.2.1 All cabling runs shall be labelled in two (2) locations (at each end of the cable).
- 1.2.2 All cabling terminated in faceplate jacks or patch panels shall be labelled in four (4) locations (each end of cable and each faceplate/patch panel).

**2 PRODUCT**

**2.1 Cable Labelling**

- 2.1.1 All products shall meet UL 969 standards and be rated for indoor or outdoor use as applicable to the installation.
- 2.1.2 Cable labels shall be self laminating, vinyl with white printing area and sized to allow label to wrap around 2.5 times minimum. Labels also shall be sized to suit the labelling requirement maintaining a minimum 10pt. font size.

**3 EXECUTION**

**3.1 General**

- 3.1.1 All labels shall be laser printed. No handwritten labels shall be accepted.

**3.2 Cable Labels**

- 3.2.1 Cable labels shall be installed on clean and dry cable and mounted within 100mm or 4" of each end of each cable.
- 3.2.2 Labels on all faceplates, patch panels and IDC mounts shall be mounted on a clean dry surface and aligned accurately.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

### **1.2 General**

1.2.1 For General information refer to applicable sections in this document.

## **2 PRODUCT**

### **2.1 AV-401 and AV-402 – [Meeting Room 111 and 110]**

#### **2.1.1 Input**

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Huddly	L1	Conference Camera
1	Shure	MXA920	Ceiling Microphone

#### **2.1.2 Outputs**

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	NEC	M751	75" Commercial display
2	Shure	MXN5W-C	Ceiling mounted network loudspeaker

#### **2.1.3 Control**

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Crestron	UC-CX100-T-W	UC Engine Teams kit
1	Crestron	FT2-1200-PTL	Table Top
1	Crestron	FT2A-CBLR1T-HD	HDMI Cable retractor
1	Crestron	FT2A-PWR-US-2	AC Power Outlet Module
1	Crestron	FT2A-CBLR-1T-4K-USBC-HD	USB-C Cable retractor
1	Crestron	FT2A-CHGR-USBA/C	USB Type C & A Charging ports

#### **2.1.4 Hardware**

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Chief	AS3LDP7	Display Mount
1	Chief	AS3A102	UC Bracket Accessory

#### **2.1.5 Function**

Provide Video conference functionality through the Crestron teams kit.  
These functionalities include:

- .1 Room to be controlled by Crestron tabletop with custom programming.
- .2 Ability to connect BYOD device to display wirelessly and via cable cubby on the table.
- .3 Ability to have live video conference calling using UC assembly in conjunction with ceiling microphone and speakers with web-based conferencing platforms such as Teams, Zoom, etc.
- .4 Ability to share content on display wirelessly.
- .5 Ability to track speaker on the table using the conference camera.

## 2.2 **AV-403 – [ Workstations 112]**

### 2.2.1 Inputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
2	Generic		Region of Peel TV (By Owner)
1			TV Receiver (By Others)
3	Crestron	DM-TX-200-C-2G	Wall plate Input

### 2.2.2 Outputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
2	NEC	M551	55" Commercial Display
3	NEC	M751	75" Commercial Display
3	Crestron	SAROS SB-200-P-B	Sound Bar

### 2.2.3 Control

Specified Product.

Qty.	Manufacturer	Part No.	Description
3	Crestron	TSW-1070-W-S	10" Wall Mount touch screen
3	Crestron	DM-RMC-4KZ-100-C	DM Receiver
1	Crestron	DMF-CI-8	DM Card Chassis
6	Crestron	DM-NVX-351C	DM Encoder
3	Crestron	DM-NVX-350	Decoder
1	Crestron	HD-WP-4K-401-C	Video Processor
1	Crestron	CEN-SW-POE-16	16 Port POE Switch

### 2.2.4 Hardware

Specified Product.

Qty.	Manufacturer	Part No.	Description
------	--------------	----------	-------------

5	Chief	LSM1U	Display Mount
1	Middle Atlantic	MFR-1627GC	16RU Mobile Furniture rack
1	APC	AP9562	1U PDU

#### 2.2.5 Function

- .1 Ability to share content on the displays via TV Receiver, Region of Peel TV and HDMI wall input.
- .2 Ability to chose the video source of the content and destination display using Crestron wall mount touch panel.

### 2.3 **AV-404 – [Parade room 113]**

#### 2.3.1 Inputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Generic		TV Receiver
3	Brightsign		Digital Signage Player
1	Extron	WPB 109	Wall plate Input
1	Extron	WPD 100 AV	AV Wall plate input

#### 2.3.2 Outputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Surface	Surface Hub-85	85" Interactive Display c/w Cart
2	NEC	M551	55" Commercial Display

#### 2.3.3 Control

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Crestron	TSW-1070-W-S	10" Wall Mount touch screen
1	Crestron	HD-MD6X2-4K-E	HDMI Switcher

#### 2.3.4 Hardware

Specified Product.

Qty.	Manufacturer	Part No.	Description
2	Chief	LSM1U	Display Mount
2	Chief		Pole mount

#### 2.3.5 Function

- .1 Ability to present and collaborate using your own device's (BYOD). Connect BYOD to display using HDMI input.
- .2 Provide videowall information and control with access to programing content through any browser with appropriate credentials.

.3 Room to be controlled by Crestron wall mount touch panel.

#### 2.4 **AV-405 – [Cafeteria 114]**

##### 2.4.1 Inputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	BrightSign		Digital Signage Player
1	Extron	WPB 109	Wall plate Input
1	Extron	WPD 100 AV	AV Wall plate input
1			TV Receiver (By Others)

##### 2.4.2 Outputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
2	NEC	M651	65" Commercial Display
2	Crestron	SAROS SB-200-P-B	Sound Bar

##### 2.4.3 Control

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Crestron	TSW-1070-W-S	10" Wall Mount touch screen

##### 2.4.4 Hardware

Specified Product.

Qty.	Manufacturer	Part No.	Description
2	Chief	LSM1U	Display Mount

##### 2.4.5 Function

.1 Provide videowall information and control with access to programing content through any browser with appropriate credentials.

.4 Room to be controlled by Crestron wall mount touch panel.

#### 2.5 **AV-406 – [Expanded Training I 210]**

##### 2.5.1 Inputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Shure	MXA920	Ceiling Microphone
1	Crestron	IV-CAM-P20-B	PTZ Camera
1	Extron	WPB 109	Wall plate Input
1	Extron	WPD 100 AV	AV Wall plate input
1	Crestron	FT2-202-ELEC	Table Top

1 Crestron AM-3200 WF Airmedia

#### 2.5.2 Outputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Epson	Powerlite 810E	Ultra Shot Throw Projector
1	Da-Lite		120" Motorized Projector Screen
2	Shure	MXN5W-C	Ceiling mounted network loudspeaker

#### 2.5.3 Control

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Crestron	UC-CX-100-T	UC Engine Teams kit
1	Crestron	DMF-CI-8	DM Card Chasis
2	Crestron	DM-NVX-D30C	Decoder
1	Crestron	DM-NVX-360	Encoder
3	Crestron	DM-NVX-E30C	Encoder
2	Crestron	DM-NVX-360	Decoder
1	Crestron	C4PN	Control Processor
1	Crestron	GLS-PART-CN	Room Sensor
1	Crestron	IV-SAM-VXS-1B	Automate VX System
1	Inogeni		SDI to USB Converter

#### 2.5.4 Hardware

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Middle Atlantic	MFR-1627GC	16RU Mobile Furniture rack
1	APC	AP9562	1U PDU

#### 2.5.5 Function

- .1 Ability to present, call and collaborate using your own device's (BYOD). Connect BYOD to display wirelessly and input sound to the loudspeakers as required.
- .5 Provide video conference support to room through PTZ camera.
- .6 Ability to have audio input via ceiling microphones.
- .7 Room to be controlled by Crestron wall mount touch panel.

### 2.6 **AV-407 – [Expanded Training II 211]**

#### 2.6.1 Inputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Shure	MXA920	Ceiling Microphone

1	Crestron	IV-CAM-P20-B	PTZ Camera
1	Extron	WPB 109	Wall plate Input
1	Extron	WPD 100 AV	AV Wall plate input
1	Shure	MXA920	Ceiling Microphone

#### 2.6.2 Outputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	NEC	M981	98" Commercial Display
2	Shure	MXN5W-C	Ceiling mounted network loudspeaker

#### 2.6.3 Control

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Crestron	UC-CX-100-T	UC Engine Teams kit
1	Crestron	DMF-CI-8	DM Card Chasis
2	Crestron	DM-NVX-D30C	Decoder
1	Crestron	DM-NVX-360	Encoder
3	Crestron	DM-NVX-E30C	Encoder
2	Crestron	DM-NVX-360	Decoder
1	Crestron	C4PN	Control Processor
1	Crestron	GLS-PART-CN	Room Sensor
1	Crestron	IV-SAM-VXS-1B	Automate VX System
1	Inogeni		SDI to USB Converter

#### 2.6.4 Hardware

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Chief	XPA1UB	Mobile Display Cart

#### 2.6.5 Function

- .1 Ability to present, call and collaborate using your own device's (BYOD). Connect BYOD to display wirelessly and input sound to the loudspeakers as required.
- .8 Provide video conference support to room through PTZ camera.
- .9 Ability to have audio input via ceiling microphone.
- .10 Room to be controlled by Crestron wall mount touch panel.

### 2.7 **AV-408 – [Expanded Training III 212]**

#### 2.7.1 Inputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Shure	MXA920	Ceiling Microphone

1	Crestron	IV-CAM-P20-B	PTZ Camera
1	Extron	WPB 109	Wall plate Input
1	Extron	WPD 100 AV	AV Wall plate input
1	Shure	MXA920	Ceiling Microphone

#### 2.7.2 Outputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	NEC	M981	98" Commercial Display
2	Shure	MXN5W-C	Ceiling mounted network loudspeaker

#### 2.7.3 Control

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Crestron	UC-CX-100-T	UC Engine Teams kit
1	Crestron	DMF-CI-8	DM Card Chasis
1	Crestron	DM-NVX-360	Encoder
3	Crestron	DM-NVX-E30C	Encoder
2	Crestron	DM-NVX-360	Decoder
1	Crestron	C4PN	Control Processor
1	Crestron	GLS-PART-CN	Room Sensor
1	Crestron	IV-SAM-VXS-1B	Automate VX System
1	Inogeni		SDI to USB Converter

#### 2.7.4 Hardware

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Chief	XPA1UB	Mobile Display Cart

#### 2.7.5 Function

- .1 Ability to present, call and collaborate using your own device's (BYOD). Connect BYOD to display wirelessly and input sound to the loudspeakers as required.
- .11 Provide video conference support to room through PTZ camera.
- .12 Ability to have audio input via ceiling microphone.
- .13 Room to be controlled by Crestron wall mount touch panel.

### 2.8 **AV-409 – [Servery 213]**

#### 2.8.1 Inputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	BrightSign		Digital Signage Player
1	Extron	WPB 109	Wall plate Input

1	Extron	WPD 100 AV	AV Wall plate input
1			TV Receiver (By Others)

2.8.2 Outputs  
Specified Product.

Qty.	Manufacturer	Part No.	Description
2	NEC	M651	65" Commercial Display
2	Crestron	SAROS SB-200-P-B	Sound Bar

2.8.3 Control  
Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Crestron	TSW-1070-W-S	10" Wall Mount touch screen

2.8.4 Hardware  
Specified Product.

Qty.	Manufacturer	Part No.	Description
2	Chief	LSM1U	Display Mount

2.8.5 Function

- .1 Provide videowall information and control with access to programing content through any browser with appropriate credentials.
- .14 Room to be controlled by Crestron wall mount touch panel.

## 2.9 **AV-410 – [Fitness 693]**

2.9.1 Inputs  
Specified Product.

Qty.	Manufacturer	Part No.	Description
1			TV Receiver (By Others)

2.9.2 Outputs  
Specified Product.

Qty.	Manufacturer	Part No.	Description
1	NEC	M651	65" Commercial Display
2	TOA		Wall Speakers

2.9.3 Control  
Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Crestron	TSW-1070-W-S	10" Wall Mount touch screen

1 Crestron AMPX-300 Amplifier

2.9.4 Hardware

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Chief	LSM1U	Display Mount

2.9.5 Function

.1 Provide videowall information and control with access to programing content through any browser with appropriate credentials.

.15 Room to be controlled by Crestron wall mount touch panel.

**2.10 AV-411,414,416 and 417 – [Lobby 104, VEPA Room, Male and Female Locker]**

2.10.1 Inputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	BrightSign		Digital Signage Player

2.10.2 Outputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	NEC	M551	55" Commercial LED Display

2.10.3 Hardware

Specified Product.

Qty.	Manufacturer	Part No.	Description
1	Chief	LSM1U	Display Mount

2.10.4 Function

.1 Provide videowall information and control with access to programing content through any browser with appropriate credentials.

**2.11 AV-412 and AV-413 – [Corridor B 120]**

2.11.1 Inputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
3	BrightSign		Digital Signage Player

2.11.2 Outputs

Specified Product.

Qty.	Manufacturer	Part No.	Description
------	--------------	----------	-------------

---

3	NEC	M551	55" Commercial LED Display
---	-----	------	----------------------------

2.11.3 Hardware

Specified Product.

Qty.	Manufacturer	Part No.	Description
3	Chief	LSM1U	Display Mount

2.11.4 Function

- .1 Provide videowall information and control with access to programing content through any browser with appropriate credentials.

### 3 **EXECUTION**

- 3.1 **The Audio-Visual Communications Contractor shall refer to other sections of these specifications.**

END OF SECTION

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.2.1. The Communications Contractor shall commission the cabling infrastructure by completing detailed testing described further in this section and successfully completing requirements to ascertain a manufacturer's warranty of not less than 20 years for the complete copper and fibre solution.
- 1.2.2. The Communications Contractor shall be responsible for completing a "Permanent Link" test for 100% of all horizontal and backbone cabling installed for use as part of this project.
- 1.2.3. The Communications Contractor shall repair and/or replace all components at no additional cost to the Owner for all failed test results.
- 1.2.4. All copper test results will be based on the balanced twisted-pair test requirements as defined in:

ANSI/TIA/EIA-568-B.1  
ANSI/TIA/EIA-568-B.2

- 1.2.5. All fibre cabling testing will be based on the following testing standards:

ANSI/TIA/EIA-568-B.1  
ANSI/TIA/EIA-568-B.3  
TIA/EIA TSB-140  
ANSI/TIA/EIA-526-14-A OFSTP 14A—Optical Power Loss Measurements of  
Installer Multimode Fibre Cable Plant  
ANSI/TIA/EIA-526-7 OFSTP 7—Measurement of Optical Power Loss of  
Installed Single-Mode Fibre Cable Plant

### **1.3 Copper Test Parameters**

- 1.3.1. The following test parameters will be used and measured for all (4) pairs in every copper cable based on Category of cable:

Wire Map  
Length  
Insertion Loss  
Near End Cross Talk (NEXT)  
Power Sum Near End Cross Talk (PSNEXT)  
Equal Level Far End Cross Talk (ELFEXT)  
Power Sum Equal Level Far End Crosstalk (PSELFEXT)  
Return Loss  
Propagation Delay  
Delay Skew

1.3.2. Category 3 cabling only shall be tested for:

Wire map (continuity)  
Length  
Shorts  
Grounds

1.3.3. Test multi-pair cables in single, two or four pair configurations based on applicable use.

1.3.4. The nominal velocity propagation (NVP) shall be set for each specific manufacturer and cable specification.

1.3.5. The following test parameters will be used and measured for all Coaxial cabling:

DC loop resistance  
Impedance  
Length  
TDR  
Attenuation  
Noise

1.3.6. The tests shall be performed by comparing the measured value with the specified test limits based on the applicable category standards.

1.3.7. A Pass result shall only be accepted with a "Pass" result from an approved tester. "Pass\*" shall not be accepted and shall be deemed as a "Fail".

1.3.8. Test results from 1MHz through 100MHz or 250MHz as applicable shall all exceed the test limits in order for the cable to be considered to have passed.

#### **1.4 Optical Fibre Test Parameters**

1.4.1. Fibre test parameters shall meet ANSI/TIA/EIA Standard 568-B for field testing of fibre optic links. The link attenuation shall be calculated by the following formulas specified in ANSI/TIA/EIA 568-B:

Link Attenuation = Cable Attenuation + Connector Insertion Loss + Splice Insertion Loss

Cable Attenuation (dB) = Attenuation Coefficient (dB/km) x Length (km)

Connector Attenuation (dB) = Number of connector pairs x connector loss (dB)  
[Maximum allowable connector loss is 0.75 dB]

Splice Attenuation (dB) = Number of splices (S) x splice loss (dB)  
[Maximum allowable splice loss is 0.3 dB]

1.4.2. Acceptable Attenuation Coefficients are listed below:

Type	Wavelength (nm)	Coefficient (dB/km)
Multimode 62.5/125 µm	850	3.5
	1300	1.5

---

Multimode 50/125 µm	850	3.5
	1300	1.5
Singlemode (Inside Plant)	1310	1.0
	1550	1.0
Singlemode (Outside Plant)	1310	0.5
	1550	0.5

Notes: Active devices or passive devices other than cable, connectors, and splices are not included in Link Attenuation tests.

- 1.4.3. Link attenuation test limits are based on the use of the One Reference Jumper Method specified by ANSI/TIA/EIA-526-14A, Method B and ANSI/TIA/EIA- 526-7, Method A.1 and TSB 140.
- 1.4.4. The acceptable link attenuation for a multimode horizontal optical fibre cabling solution is based on the maximum 90 m (295ft) testing distance. The horizontal optical fibre cabling link segments need to be tested at only one (1) wavelength. The horizontal link should be tested at 850 nm or 1300 nm in one direction in accordance with ANSI/EIA/TIA-526-14A, Method B, and One Reference Jumper and TSB 140. The horizontal link may be tested using a fixed upper limit for attenuation of 2.0 dB. This value is based on the loss of two (2) connector pairs, one (1) pair at the telecommunications outlet/connector and one (1) pair at the horizontal cross-connect, plus 90 m (295 ft) of optical fibre cable.
- 1.4.5. Multimode Backbone Link shall be tested in both directions at both operating wavelengths. Tests shall be performed at 850 nm and 1300 nm in accordance with ANSI/EIA/TIA-526 14A and TSB 140. The link attenuation equation shall be used to determine limit acceptable values, because backbone length and the potential number of splices vary depending upon site conditions.
- 1.4.6. Singlemode Backbone Links shall be tested at 1310 nm and 1550 nm in accordance with ANSI/TIA/EIA-526-7, Method A.1, One Reference Jumper and TSB 140. All Singlemode links shall be certified with test tools using laser light sources at 1310 nm and 1550nm.
- 1.4.7. Complete a test each strand of fibre with an Optical Time Domain Reflectometer (OTDR) for length and attenuation. Performance test shall be below the total return loss budget for the cable connectors/balun. Provide comprehensive OTDR testing for all fibre runs. Include a hard copy chart recording with the test documentation.
- 1.4.8. Fibre Optic Cable test result data shall contain the following information in an electronic database for each strand tested:
  - .1 The identification of the link/fibre in accordance with the identification and labelling method specified for the project.

- .2 Insertion loss measured at each wavelength specified including the test limit calculated for the each wavelength and the margin.
- .3 Link length for each optical fibre based on the formulas in this document.

## **1.5 Test Documentation**

- 1.5.1. Test results shall be prepared in one page format and include:
  - .1 Cable Identity
  - .4 Date and Time of Test
  - .5 Technicians Signature
  - .6 Make and Model of Tester Hardware and Software Version
  - .7 Copy of Tester Calibration Certificate
- 1.5.2. Sample and layout of test results shall be approved by Technology Systems Consultant prior to final submission.
- 1.5.3. Test results shall be supplied in electronic format matching tester used to conduct testing. Files to be MS Windows based and inclusive of viewing software if required.

## **1.6 Warranty**

- 1.6.1. The Communications Contractor shall arrange for a not less than 20 year Manufacturer Warranty for a complete end to end solution for copper and fibre cabling.
- 1.6.2. In addition to the Manufactures Warranty the Communications Contractor shall provide a written unconditional parts and labour (1) warranty from the date of "Substantial Completion". On projects not requiring official filling of Substantial Completion the warranty start date will be based on written acceptance of the project by the Owner.
- 1.6.3. The Communications Contractor shall provide proof of application for the manufacturer's warranty within 5 days of project award.
- 1.6.4. The Communications Contractor shall provide a Plaque and/or framed Warranty Certificate issued directly from the Manufacturer at the completion of the project.

## **2 PRODUCT**

### **2.1 General**

- 2.1.1. Testing equipment shall provide testing based on the following standards:
  - .1 Level IIe field test instruments are required for measurements up to category 5e and Class D cabling.
  - .2 Level III field test instruments are required for measurements up to category 6 and Class E cabling.

- 2.1.2. Testers shall be calibrated prior to use on the project and proof of such calibration shall be available to the Technology Systems Consultant if requested.
- 2.1.3. Tester shall be equipped with manufacturer approved and provided test cords. Field assemblies for testing will not be acceptable.
- 2.1.4. The same tester type shall be used throughout the duration of the project.
- 2.1.5. Technicians shall be specifically trained and approved to use the tester used in this project. Proof of training may be requested.

## **2.2 Acceptable Field Testers**

### **2.2.1. Copper**

Fluke DSX Series

### **2.2.2. Optical Fibre**

- .1 For multimode fibre, field test equipment shall meet ANSI/TIA/EIA-525-14-A. Consult also ANSI/TIA/EIA-455-50B and ANSI/TIA/EIA-568-B.1, clause 11 for further clarification.
- .8 For singlemode fibre, field test equipment shall meet ANSI/TIA/EIA-526-7.

Fluke MultiFiber® series  
Fluke DSX Series  
OTDR

## **3 EXECUTION**

### **3.1 General**

- 3.1.1. The Technology Systems Consultant reserves the right to witness test any or all of the cabling as required. The Communications Contractor will provide (3) days notice prior to starting testing in any particular phase of the project.
- 3.1.2. The Technology Systems Consultant may request verification testing of up to 10% of the cabling installation. A fee of \$150 per cable will be back-charged to the Communications Contractor and deducted from the final payment for failed test results.
- 3.1.3. The Communications Contractor shall arrange and include all time required to tour site with manufacturer in order to warranty the cabling solution. This includes for additional visits if required.
- 3.1.4. The Communications Contractor shall provide (24) hour service for responding to warranty items. Initial response time to the Owner shall be no more than (1) hour. All repairs to shall be completed within (24) hours.

- 
- 3.1.5. The Communications Contractor shall provide (2) technicians for cut over support for each phase of the project as noted below. This work may be required after hours or on a weekend and shall be included in the tender amount.

Phase 1 (8) hours of regular time

- 3.1.6. During this time the Owner may request additional testing, moves, adds or changes to the installation.

**END OF SECTION**

---

**1 GENERAL**

**1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

**1.2 General**

- 1.2.1 The Audio-Visual Communications Contractor shall commission the Audio-Visual System(s) by completing detailed testing described further in this section, any testing required by the manufacturer(s) and successfully completing requirements to ascertain a manufacturer's warranty.
- 1.2.2 The Audio-Visual Communications Contractor shall repair and/or replace all components at no additional cost to the Owner for all failed tests.
- 1.2.3 The Audio-Visual Communications Contractor shall ensure that all equipment is bench tested prior to installation.
- 1.2.4 Upon completion of work as described in these specifications and drawings the Audio-Visual Communications Contractor shall submit a written requested to the Technology Systems Consultant for a site inspection. Should the Audio-Visual System(s) not be complete and ready for testing, the Audio-Visual Communications Contractor shall be required to pay for subsequent site inspection(s).
- 1.2.5 The Audio-Visual Communications Contractor shall provide all necessary personnel to operate and test the Audio-Visual System(s) and all shall be qualified to test and adjust all equipment.
- 1.2.6 The Audio-Visual Communications Contractor shall repair or replace any equipment that fails to operate or meet performance requirements.

**1.3 Warranty**

- 1.3.1 In addition to the Manufactures Warranty the Audio-Visual Communications Contractor shall provide a written unconditional parts and labour (1) warranty from the date of "Substantial Completion". On projects not requiring official filling of Substantial Completion the warranty start date shall be based on written acceptance of the Audio-Visual System(s) by the Owner.
- 1.3.2 The Audio-Visual Communications Contractor shall provide proof of application for the manufacturer's warranty within 5 days of project award, where such application is required.

**1.4 Service Contract**

- 1.4.1 The Audio-Visual Communications Contractor shall offer the Owner a service contract for a period of one, three and five years to start following expiration of warranty period.

---

**2    PRODUCT**

**2.1    Testers**

- 2.1.1 Provide any test equipment required to ensure that all tests provide confirmation of conformance to technical specifications.

**3    EXECUTION**

**3.1    General**

- 3.1.1 The Audio-Visual Communications Contractor shall provide (48) hour service for responding to warranty items. Initial response time to the Owner shall be no more than (1) hour. All repairs to shall be completed within (48) hours.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 Lightning and Surge Protection**

- 1.1.2. All Indoor/Outdoor copper or armoured cables shall be protected using Building Entrance Terminals.

## **2 PRODUCT**

### **2.1 Lightning and Surge Protectors**

- 1.1.3. Building Entrance Terminals shall use industry standard 5 pin protection modules.
- 1.1.4. Plastic components shall meet or exceed specifications set for in UL 497.
- 1.1.5. Surge protection modules shall be 5 pin, 3 element gas type protection modules. Over voltage on either side shall cause the entire tube to ionize to provide a simultaneous path to ground for both sides of the circuit.
- 1.1.6. Ground pin shall be tin. Tip and Ring pins shall be gold alloy.
- 1.1.7. The nominal DC breakdown shall be 300V @ 100V/μsec.
- 1.1.8. The minimum surge life shall be as follows:

Surge	Minimum Operations
10A, 10 x 1000 μsec	Unlimited
100A, 10 x 1000 μsec	> 300
1 Arms, 1 sec	> 60
10 Arms, 1 sec	> 20

- 1.1.9. The Capacitance shall be 1 Vrms@ 1 KHz, 50VDC < 100pf and the hold current shall be 200mA minimum.
- 1.1.10. Fail safe operation shall be:
- |         |          |
|---------|----------|
| Current | Time     |
| @ 1.0A  | < 50 sec |
| @ 5.0A  | < 15 sec |
| @ 20A   | < 10 sec |
| @ 60A   | < 3 sec  |
- 1.1.11. The Building Entrance Terminals shall include solid state surge protection modules.

Specified Product:		
Circa	2200B-100	Building Entrance Terminals
Circa	CT3B1S	Solid State Surge Protection Modules

---

Belden AX100826 Bix 4-pair  
Belden AX100827 110 4-pair

**2.2 Grounding Lug Kits**

1.1.12. Refer to Section 27 05 26 – Grounding and Bonding for Communications.

**3 EXECUTION**

**3.1 Lightening and Surge Protectors**

1.1.13. All pairs of the Indoor/Outdoor copper cable shall be installed with Building Entrance Terminals and surge protection modules at both ends. Building Entrance Terminals shall be installed within 50' of the copper cabling entering into a building.

**3.2 Lightening Protection Backboards**

1.1.14. Use backboard(s) for mounting of all cables that enter/exit the building as well as all building entrance terminals, lightening protection modules and all related equipment.

1.1.15. Refer to drawings for location of lightening protection backboard(s).

1.1.16. For backboard construction requirements refer to Section 27 11 16 – Communications Cabinets, Racks, Frames and Enclosures.

**3.3 Grounding and Bonding**

1.1.17. Bond building entrance terminals to Telecommunications Grounding Busbar (provided by Division 26).

1.1.18. For all grounding and bonding requirements refer to Section 27 05 26 – Grounding and Bonding for Communications.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.1.2. All Communications equipment rooms shall be kept clean and free of debris at all times including during construction.

### **1.3 Location of Equipment**

- 1.1.3. Cabinets, racks, brackets, backboards and devices may be relocated prior to installation from the location shown on contract documents a distance of up to 3.05 m (10'-0") without adjustment to the contract price.

### **1.4 Telecommunications Rooms (TR)**

- 1.1.4. Plywood backboards shall be provided as detailed on the drawings.
- 1.1.5. All racks, cabinets, and/or brackets shown on drawings shall be provided by the Communications Contractor unless otherwise noted.
- 1.1.6. Cable tray and pathways within the TR shall be provided by Division 26 unless otherwise noted.
- 1.1.7. The Communications Contractor shall supply and install cabling waterfalls for all locations cabling drops from the cable tray into racks, cabinets and backboards.

## **2 PRODUCT**

### **2.1 Telecommunications Racks**

- 1.1.8. Telecommunications racks supplied and installed for this project shall be floor mounted, free standing and black.
- 1.1.9. The racks shall provide 44U of rack mounting space and shall be double tapped (front and back of rail) with mounting holes as per EIA-310-C.
- 1.1.10. Refer to drawings for quantity of telecommunications racks. Provide additional mounting screws as required, to secure all patch panels, shelves and Owner equipment mounted on racks.

Specified Product:

	RU	Part Number	Type
Belden	45	XDR8419	2-Post Distribution Rack
Hammond	45	RB-2PA	2-Post Open Frame Rack
Panduit	45	R2P6S	2-Post Rack

---

## 2.2 **Telecommunications Rack Components**

### 1.1.11. Vertical Cable Managers

- .1 Vertical cable managers shall be installed to run the full height of the rack.
- .2 The vertical cable manager shall have hinged front doors and back and side knockouts or fingers for transition of patch cords. Knockouts and fingers shall be able to be removed without cutting and provide bend radius protection.
- .3 The manager shall include slack management spools that can be repositioned as required. Install the quantity of cable managers as shown on drawings.
- .4 Where racks are ganged, supply and install one 8" wide vertical cable manager at the end of each row, and supply and install one 12" wide vertical cable manager between racks.

#### Specified Product:

	Width	Part Number
Belden	8"	BHVVH008
Hammond	8"	FRCM44U812
Panduit	8"	PRVF8 c/w PRD8

### 1.1.12. Horizontal Cable Managers

- .1 Horizontal cable managers shall be compatible with standard 19" racks.
- .2 Each horizontal cable manager shall be located as shown on drawings.

#### Specified Product:

HCM 1	Systimax	HCM2U	Located as shown
	Ortronics	OR-MM6HMF2RU	Located as shown
	Panduit	NCMHAEF2	Located as shown
	Belden	BHH192U	Located as shown

## 2.3 **Audio-Visual Cabinets**

- 1.1.13. Cabinets shall be supplied and installed complete with all accessories to provide a complete cabinet as indicated below.
- 1.1.14. Cabinets shall be floor mounted, freestanding and have the ability to be ganged together.
- 1.1.15. Cabinets shall have a capacity of 44U, with mounting holes as per EIA-310-C.
- 1.1.16. Cabinets shall have (6) knockouts on top and be able to accept fans or chimney extensions.
- 1.1.17. Shelving shall be able to bear 200 lbs. in a retracted or extended position.
- 1.1.18. Each server cabinet shall be black, 30" x 42" and include the following components:

#### Specified Product:

Qt

---

Description	Middle Atlantic	y
30" x 42" Cabinet	BGR-4532-AV	1
Front – Mesh Door	-	1
Rear – Mesh Door	-	1
Solid Side Panels	-	2
Vertical Manager	-	2
19" Mounts with Cage Nuts	-	4
Keyboard	CTRS-R3-19-B	1
Roll-out Shelf (Heavy Duty)	SS-VTR-CVR5	2
Set of (2) Fixed and (2) Swivel	-	1
Castors		
10-32 Cage Nuts		50

## 2.4 **Plywood Backboards**

- 1.1.19. All backboards supplied and installed for this project shall be constructed of  $\frac{3}{4}$ " thick, fire rated, 4' wide x 8' high, one side good plywood as noted on drawings.
- 1.1.20. Unless otherwise noted, plywood sheets shall be placed vertically.
- 1.1.21. All backboards shall be painted with two (2) coats of fire retardant non-conductive white paint. "Fire Rating" stamp shall be left visible (unpainted) to allow for confirmation of rating.
- 1.1.22. Communications Contractor shall supply and install all backboards as noted on Communications Drawings including for use by others.
- 1.1.23. Offset backboards:
  - .1 Shall be mounted to 2"x6" studs.
  - .2 All cables shall be fed from behind the backboard unless otherwise noted.
  - .3 Install offset backboards where required as shown on drawings.
- 1.1.24. Surface mounted (flush) backboards:
  - .1 Shall be used for wall mount brackets, wall mount double swing-out cabinets, wall mount racks, telephone equipment, service provider equipment, lightening protection, horizontal cables, riser cables, IDC punch down blocks, CATV equipment, and/or any other use as identified in the scope of work for this project.
  - .2 Install surface mounted (flush) backboards where required as shown on drawings.

## 2.5 **Cable Drop Control ("waterfalls")**

- 1.1.25. Cable drop control fittings shall be manufactured by the cable tray manufacturer. For further information, refer to Section 27 05 28 – Pathways for Communications.

---

### **3 EXECUTION**

#### **3.1 General**

- 1.1.26. The Communications Contractor shall provide a complete installation and be responsible for coordination within all telecommunications rooms. Installations and locations of all equipment shall be as noted on drawings. The Communications Contractor shall confirm final layout before proceeding and be responsible to install equipment and fittings.
- 1.1.27. Any cutting or patching required for installation of any telecommunications component will be the responsibility of the Communications Contractor.

#### **3.2 Racks and Cabinets**

- 1.1.28. Install racks and cabinets in positions shown and gang as required with manufactured recommended products. All racks and cabinets shall be level and clean of all dust and debris.
- 1.1.29. The Communications Contractor shall anchor all racks to the floor, raised floor or wall in the location indicated.
- 1.1.30. All racks shall be installed without any applied or screened labelling containing any name or information other than the original manufacturer's identification.
- 1.1.31. Install all accessories with mechanical fasteners, including power bars permanently to racks to provide a complete solution.

#### **3.3 Grounding and Bonding**

- 1.1.32. For all grounding and bonding requirements refer to Section 27 05 26 – Grounding and Bonding for Communications.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 IDC Termination**

- 1.1.2. Insulation displacement connectors (IDC) shall have an insulation resistance of no less than 100 mega Ohms between clips.
- 1.1.3. Insulation displacement connectors (IDC) shall have a durability of no less than 200 insertions / withdrawals of any combination of wire gauge.
- 1.1.4. Insulation displacement connectors (IDC) shall be FCC Part 68, subpart F compliant.

## **2 PRODUCT**

### **2.1 IDC Termination Blocks**

- 1.1.5. All horizontal voice cables shall be terminated on the backboard (as shown on drawings) unless otherwise specified in this document.
- 1.1.6. All cables shall be terminated on IDC connectors complete with associated hardware such as mounts, cable/cross-connect wire managers, etc.
- 1.1.7. The IDC connectors shall accept 22 to 26 AWG solid copper conductors.
- 1.1.8. The IDC mounts shall accept cables from behind the connector.

Specified Product:

	Description	Part No.
Belden	BIX Mount (50 pair) - QMBIX10C	A0284798
Belden	BIX Distribution Connector (4 pair marking) - QCBIX1A4	A0393146
Belden	BIX Modular Jack Connector (6 port, PS5, T568A/B Coded)	AX100798
Belden	Distribution Ring	A0270168
Belden	Designation Strip (50/pack)	A0270169
Belden	19" Rack Bracket Kit	A0352331

- 1.1.9. Cable management in the form of distribution rings or approved similar shall be provided between columns and rows of IDC mounts to support cross connect management in a manner recommended by the manufacturer.

### **2.2 Modular Copper Patch Panels – 48 Port**

- 1.1.10. All horizontal UTP cabling shall be terminated on 2U, 48 port modular patch panels.

- 1.1.11. All copper patch panels shall be black.
- 1.1.12. All modular patch panels shall be populated with UTP modules as required. Module category and colour shall meet requirements set out in Section 27 15 43 - Communications Faceplates and Connectors.

Specified Product:		Comments:
Belden	AX103115	Keystone
Hubbell	HPJ48	Keystone
Commscope	CPP-UDDM-KJ-2U-48	Keystone
Wirewerks	WW-000041	Keystone

### 2.3 **Optical Fibre Patch Panels**

- 1.1.13. Fibre Optic cabling shall be terminated in patch panels.
- 1.1.14. Patch panels shall be black in colour and supplied as indicated on drawings.
- 1.1.15. Blank strips shall be provided for all unused openings.

Specified Product:		Comments:
Belden	AX105563	1U
Corning	PCH-01U	1U
Hubbell	FCR1U3SP	1U
Commscope	FL2-12RPNL-B	1U
e		
Wirewerks	PPW1U1	1U

## 3 **EXECUTION**

### 3.1 **Termination Requirements**

- 1.1.16. All cabling shall be terminated using EIA/TIA 568A configuration.

### 3.2 **Grounding and Bonding**

- 1.1.17. For all grounding and bonding requirements refer to Section 27 05 26 – Grounding and Bonding for Communications.

### 3.3 **Patch Panels**

- 1.1.18. Install patch panels on racks and cabinets with a minimum of four (4) bonding screws.
- 1.1.19. Provide a final installation that is clean of all fingerprints and dirt complete with identification labelling as per these specifications.

**END OF SECTION**

---

## 1 **GENERAL**

### 1.1 **Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### 1.2 **General**

- 1.1.2. The power cord must be a minimum 6 feet in length to reach up to the ladder tray or down to the floor where it will plug into a receptacle (supplied by Division 26).
- 1.1.3. The power bar(s) shall be UL/ULC listed and shall meet UL/ULC 1363 and 1449 requirements.

## 2 **PRODUCT**

### 2.1 **Vertical Power Bars**

- 1.1.4. Each active equipment rack shall come complete with two vertical power bars.
- 1.1.5. The power bar(s) shall be UL/ULC listed and shall meet UL/ULC 1363 and 1449 requirements.

Specified  
Product:

Comments:

APC AP8830 Metered Rack PDU w 24 NEMA 5-20R outlets.  
10-foot power cord w NEMA 5-20P connector.

APC AP8832 Metered Rack PDU w 24 NEMA 5-20R outlets.  
10-foot power cord w NEMA L5-30P connector.

### 2.2 **Uninterruptible Power Supplies**

- 1.1.6. The uninterruptible Power Supplies shall be CSA/UL/ULC listed.

Specified Product:

Comments:

APC SRT2200RMXLA-NC Rack mount, 2U, Network Card w Rail Kit.  
2200VA, 6 NEMA 5-20R, 1 NEMA L5-20R outlets.  
6-foot power cord w NEMA 5-20P connector.

---

APC	SRT3000RMXLA-NC	Rack mount, 2U, Network Card w Rail Kit. 3000VA, 8 NEMA 5-20R, 1 NEMA L5-30R outlets. 8-foot power cord w NEMA L5-30P connector.
-----	-----------------	--

### **3 EXECUTION**

#### **3.1 General**

1.1.7. Mount power bars to rear vertical cable managers of rack(s).

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.1.2. Backbone cabling shall be installed in pathways indicated on drawings and as per Section 27 05 28 of this specification.
- 1.1.3. All cables penetrating the exterior building enclosure shall conform to Section 01 83 16.
- 1.1.4. All cables shall be neatly bundled and installed as per the manufacturer's guidelines or the standards in these specifications; whichever is more stringent.
- 1.1.5. The Communications Contractor shall be responsible for a complete backbone cabling installation including but not limited to termination jacks, IDC mounts, cabling, Velcro wraps, patch panels and labelling.
- 1.1.6. Provide grounding and protection for all backbone cables as specified in section 27 05 26 of this specification.

## **2 PRODUCT**

### **2.1 Backbone 4 Pair UTP Cabling**

- 1.1.7. All backbone cabling shall be UTP, 4 pair, with solid copper conductors, compliant with EIA/TIA cable category as identified below.
- 1.1.8. The cable shall be CSA certified and stamped with CMP or CMR rating accordingly.
- 1.1.9. Cable shall have continuous sequential length markers clearly and permanently printed over the entire length of the cable.
- 1.1.10. All UTP cables shall meet requirements identified below.

Specified Product:

	Cat.	Rating	Colour	Series <sup>1</sup>	Termination
Belden	6A	CMP/FT6	White		Patch Panel
Hubbell	6A	CMP/FT6	White		Patch Panel
Commscope	6A	CMP/FT6	White		Patch Panel
Wirewerks	6A	CMP/FT6	White		Patch Panel

Notes: <sup>1</sup> Series or Product Codes shown are not colour specific.

## 2.2 **Multipair Backbone Cable**

- 1.1.11. All backbone cabling shall be UTP, with solid copper conductors, compliant with EIA/TIA cable category as identified below.
- 1.1.12. The cable shall be CSA certified and stamped with CMP or CMR rating accordingly.
- 1.1.13. Cable shall have continuous sequential length markers clearly and permanently printed over the entire length of the cable.
- 1.1.14. Cable shall be constructed with 25pr units complete with binding cords and overall jacket splitting cord.
- 1.1.15. All UTP cables shall meet requirements identified below.

Specified Product:

	Cat.	Rating	Pairs	Colour	Series <sup>1</sup>	Termination
Belden	5e	CMR/FT4	25	White		Patch Panel
Hubbell	5e	CMR/FT4	25	White		Patch Panel
Commscope	5e	CMR/FT4	25	White	PUR5525xx-UI	Patch Panel
Wirewerks	5e	CMR/FT4	25	White		Patch Panel

Notes: <sup>1</sup> Series or Product Codes shown are not colour specific.

## 3 **EXECUTION**

### 3.1 **General**

- 1.1.16. Comply with manufacturer's recommended bundling practices for installation. Ensure that excess pressure is not placed on the cable at any point that may result in the compression or deformation of the cable jacket and internal pair/conductor geometry.
- 1.1.17. Cables shall not be scrapped, dented or otherwise damaged before, during or after installation. All damaged cabling shall be replaced at no extra cost to the Owner.
- 1.1.18. Ensure that all cables are of sufficient length to allow for slack, vertical runs, wastage, connectorization and future moves.
- 1.1.19. All pairs of all copper cables shall be terminated.

### 3.2 **Multipair Copper Backbone Cable**

- 1.1.20. Multipair copper cabling shall be installed in a continuous run and no splices shall be permitted.
- 1.1.21. The Telecommunicates Contractor will be responsible to protect the cabling during installation and will be responsible for replacing the cable if found to have dents or scraps which may have an effect on the cable performance, reliability and life span.

- 1.1.22. Separate backbone cables in neatly combed bundles based on type service being provided for identification purposes. Secure all cables with Velcro wraps only.
- 1.1.23. When a potential for cable damage existing during installation provide a non-corrosive cable lubricant to allow ease of installation.
- 1.1.24. Armoured or metallic sheath cables shall be grounded with an approved bonding clamp to the local grounding busbar with a minimum #6 AWG green ground wire and installed as per section 27 05 26 of this specification.
- 1.1.25. Multipair cabling installed in common pathways with other types of cabling shall be bundled separately and installed in a manner not damage other cabling during installation or over the life of the installation.

**3.3 Cable Routing**

- 1.1.26. Make all necessary adjustments to cable route(s) / pathway(s) to accommodate architectural, structural, mechanical and/or electrical conditions.
- 1.1.27. All pathways shall be parallel to building lines. If it is necessary to route cables otherwise to accommodate cable length written permission shall be obtained from the Technology Systems Consultant prior to installation.
- 1.1.28. Any deviation from cable routing shown on drawings (where shown) shall be approved in writing by the Technology Systems Consultant prior to installation and shall be documented on record drawings.

**3.4 Bend Radius**

- 1.1.29. Do not kink or exceed the cable minimum bend radius for all cabling. For all copper cabling maintain a minimum of (4) times cable diameter as bend radii if the manufacturer specifies no bend radius.

**3.5 Cable Lubricant**

- 1.1.30. Where there is the potential for excess stress on a cable(s) when pulling through conduit systems, apply a non-corrosive quick drying lubricant to the cable to facilitate pulling.
- 1.1.31. Completely remove all cable lubricant from cable jacket as cable exits the conduit system prior to termination and labelling.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.1.2. Backbone cabling shall be installed in pathways indicated on drawings and as per Section 27 05 28 of this specification.
- 1.1.3. All cables penetrating the exterior building enclosure shall conform to Section 01 83 16.
- 1.1.4. All cables shall be neatly bundled and installed as per the manufacturer's guidelines or the standards in these specifications; whichever is more stringent.
- 1.1.5. The Communications Contractor shall be responsible for a complete backbone cabling installation including and not limited to, termination jacks, adaptor plates, cabling, velcro wraps, patch panels and labelling.
- 1.1.6. All Fibre Optic cabling shall be installed in dedicated conduit and/or innerduct.
- 1.1.7. Provide grounding and protection for all optical fibre armoured cables as specified in section 27 05 26 of this specification.

## **2 PRODUCT**

### **2.1 Multimode Distribution Series Optical Fibre Cable**

- 1.1.8. Optical fibre backbone cabling shall be distribution series indoor OFNP Plenum rated multimode optical fibre.
- 1.1.9. The cable(s) shall be CSA approved and stamped accordingly.
- 1.1.10. Distribution series optical fibre cabling shall have 900-micron tight buffered fibre individually placed in a 2mm coded sub-unit with aramid strength members.
- 1.1.11. Distribution series optical fibre cabling shall be fully dielectric with no metallic components in the cable.

Specified Product:

	Type	Rating	Strands	Colour	Series
Corning	OM3 50/125µm	OFNP	12	Aqua	
Belden	OM3 50/125µm	OFNP	12	Aqua	
Hubbell	OM3 50/125µm	OFNP	12	Aqua	
Commscope	OM3 50/125µm	OFNP	12	Aqua	
Wirewerks	OM3 50/125µm	OFNP	12	Aqua	

---

### **3 EXECUTION**

#### **3.1 Fibre Optic Backbone Cabling**

- 1.1.12. Fibre optic cabling shall be installed in conduit and/or innerduct and as per manufacturer's instructions.
- 1.1.13. Fibre optic cabling in racks and cabinets shall be neatly dressed using Velcro ty-wraps.
- 1.1.14. All cables shall be continuous with no splices other than those that may be identified on drawings.
- 1.1.15. Provide a minimum of 3.0 m (10'-0") of slack at the patch panel end of each fibre optic cable. Neatly coil slack in cabinet and fasten with Velcro wraps.
- 1.1.16. All strands of fibre optic cabling shall be terminated.
- 1.1.17. Clean all cabling of pulling lubricants prior to termination and labelling.
- 1.1.18. Carefully relocate existing fibre optic cabling into new racks without removing connectors. Provide complete testing of all existing fibre connections as per these specifications.

#### **3.2 Bend Radius**

- 1.1.19. Do not kink or exceed the cable minimum bend radius for all cabling. Maintain a minimum of ten (10) times the cable diameter or 30 mm (1.2") whichever is larger for a bend radius.

#### **3.3 Cable Lubricant**

- 1.1.20. Where there is the potential for excess stress on a cable(s) when pulling through conduit systems, apply a non-corrosive quick drying lubricant to the cable to facilitate pulling.
- 1.1.21. Completely remove all cable lubricant from cable jacket as cable exits the conduit system prior to termination and labelling.

**END OF SECTION**

---

## 1 **GENERAL**

### 1.1 **Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications.

### 1.2 **General**

- 1.2.1 Audio-Visual cabling shall be installed in pathways indicated on drawings (where indicated) and as per Section 27 05 28 of this specification.
- 1.2.2 All cables shall be neatly bundled and installed as per the manufacturer's guidelines or the standards in these specifications; whichever is more stringent.
- 1.2.3 Ensure that all cables are sufficiently long to allow for slack, vertical runs, wastage, connectorization and future moves.

## 2 **PRODUCT**

### 2.1 **Video Cable**

- 2.1.1 The cable shall be CSA certified and stamped with FT6 rating accordingly.
- 2.1.2 One (or more) of the following shall be used depending on signal carrying requirements. The Audio-Visual Communications Contractor shall determine based on equipment and connectors used.

Specified Product:

	Part No.	Rating	Cond.
Belden	1280P	FT6	6
Belden	1279P	FT6	5
Belden	1278P	FT6	4
Belden	1277P	FT6	3

### 2.2 **Microphone Cabling**

- 2.2.1 The cable shall be CSA certified and stamped with FT6 rating accordingly.

Specified Product:

	Part No.	Rating
Belden	TBD	FT6

### 2.3 **Computer Audio Cable**

- 2.3.1 The cable shall be CSA certified and stamped with FT6 rating accordingly.

Specified Product:

	Part No.	Rating	Cond.
Belden	83553	FT6	3

### 2.4 **Cresnet Control Cable**

- 2.4.1 The cable shall be CSA certified and stamped with FT6 rating accordingly.

---

Specified Product:

	Part No.	Rating	AWG	Pairs	Strands
Crestron	Cresnet-P	FT6	22, 18	2	7, 16
Belden	1502P	FT6	22, 18	2	7, 16

## 2.5 **Speaker Cable**

2.5.1 The cable shall be CSA certified and stamped with FT6 rating accordingly.

Specified Product:

	Part No.	Rating	AWG	Cond.	Strands
Belden	6300FC	FT6	18	2	7

## 2.6 **UTP Cable**

2.6.1 Refer to Section 27 15 13 (Communications Copper Horizontal Cabling) for details.

## 2.7 **HDMI Cable**

2.7.1 The cable shall be CSA certified and stamped with FT6 rating accordingly.

## 2.8 **Antennae Cable**

2.8.1 The cable shall be CSA certified and stamped with FT6 rating accordingly.

## 2.9 **Optical Fibre Cable**

2.9.1 The cable shall be CSA certified and stamped with FT6 rating accordingly.

# 3 **EXECUTION**

## 3.1 **General**

- 3.1.1 UTP cabling shall be terminated as per manufacturer's guidelines and remove only enough cable jacket to perform termination.
- 3.1.2 Comply with manufacturer's recommended bundling practices for installation. Ensure that excess pressure is not placed on the cable at any point that may result in the compression or deformation of the cable jacket and internal pair/conductor geometry.
- 3.1.3 Cables shall not be scrapped, dented or otherwise damaged before, during or after installation. All damaged cabling shall be replaced at no extra cost to the Owner.
- 3.1.4 Ensure that all cables are of sufficient length to allow for slack, vertical runs, wastage, connectorization and future moves.
- 3.1.5 All cables shall be continues between terminated ends. No splices or connections shall be permitted at any point between terminated ends.
- 3.1.6 The Audio-Visual Communications Contractor shall seal cable ends to prevent moisture from entering cable while being pulled through conduit. Assume moisture is present within all conduits.

---

**3.2 Cable Routing**

- 3.2.1 Make all necessary adjustments to cable route(s) / pathway(s) to accommodate architectural, structural, mechanical and/or electrical conditions.
- 3.2.2 All pathways shall be parallel to building lines. If it is necessary to route cables otherwise to accommodate cable length written permission shall be obtained from the Technology Consultant prior to installation.
- 3.2.3 Any deviation from cable routing shown on drawings (where shown) shall be approved in writing by the Technology Consultant prior to installation and shall be documented on record drawings.
- 3.2.4 Cables shall not be installed within non-metallic cable pathways such as PVC conduit.

**3.3 Bend Radius**

- 3.3.1 Do not kink or exceed the cable minimum bend radius for all cabling. For all copper cabling maintain a minimum of (4) times cable diameter as bend radii if the manufacturer specifies no bend radius.
- 3.3.2 Where there is the potential for excess stress on a cable(s) when pulling through conduit systems, apply a non-corrosive quick drying lubricant to the cable to facilitate pulling. Completely remove all cable lubricant from cable jacket as cable exits the conduit system prior to termination and labelling.

**3.4 Cable Distance Limitations**

- 3.4.1 The Audio-Visual Communications Contractor shall verify distance limitations of all cables and adjust AWG, cable type, and/or equipment to suite application.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.1.2. All cables penetrating the exterior building enclosure shall conform to Section 01 83 16.
- 1.1.3. Horizontal cabling shall be installed in pathways indicated on drawings and as per Section 27 05 28 of this specification.
- 1.1.4. All cables shall be neatly bundled and installed as per the manufacturer's guidelines or the standards in these specifications; whichever is more stringent.
- 1.1.5. Ensure that all cables are sufficiently long to allow for slack, vertical runs, wastage, connectorization and future moves.
- 1.1.6. The maximum horizontal run length shall not exceed 90-meters. If the 90 meter constraint cannot be met, the Communications Contractor shall notify the Technology Systems Consultant immediately (prior to installation).

## **2 PRODUCT**

### **2.1 Horizontal Unshielded Twisted Pair (UTP) Copper Cabling**

- 1.1.7. All horizontal cabling shall be UTP, 4 pair, minimum 22 AWG, solid copper conductor, compliant with EIA/TIA cable category as identified below.
- 1.1.8. The cable shall be CSA certified and stamped with CMP or CMR rating accordingly.
- 1.1.9. All UTP cables shall meet requirements identified below.

Specified Product:

	Cat.	Rating	Colour	Series <sup>1</sup>	System	Termination
Belden	6	CMR/FT4	Blue	2412	Data	Patch Panel
Hubbell	6	CMR/FT4	Blue	C6RRW	Data	Patch Panel
Commscope	6	CMR/FT4	Blue	CS34R WHT C6	Data	Patch Panel

Commscope	6	CMR/FT4	Red	CS34R WHT C6	Phones	Patch Panel
Wirewerks	6	CMR/FT4	Red	6040-2RWH- R305	Phones	Patch Panel

---

Notes: <sup>1</sup> Series or Product Codes shown are not colour specific.

### **3 EXECUTION**

#### **3.1 Horizontal UTP Cabling**

- 1.1.10. UTP cabling shall be terminated as per manufacturer's guidelines and remove only enough cable jacket to perform termination.
- 1.1.11. Untwist pairs a maximum of 13 mm (1/2") for all categories of cables.
- 1.1.12. Provide a minimum of 3.0 m (10'-0") of slack at both ends of each cable. Neatly coil slack and attach to ladder tray or provide independent support in ceiling. Slack for workstation outlets shall be located above outlet in ceiling space.
- 1.1.13. UTP cabling shall be neatly bundled using only Velcro wraps. Bundle cables separately for identification purposes when applicable.
- 1.1.14. Comply with manufacturer's recommended bundling practices for installation. Ensure that excess pressure is not placed on the cable at any point that may result in the compression or deformation of the cable jacket and internal pair/conductor geometry.
- 1.1.15. Cables shall not be scrapped, dented or otherwise damaged before, during or after installation. All damaged cabling shall be replaced at no extra cost to the Owner.
- 1.1.16. Ensure that all cables are of sufficient length to allow for slack, vertical runs, wastage, connectorization and future moves.

#### **3.2 Cable Routing**

- 1.1.17. Make all necessary adjustments to cable route(s) / pathway(s) to accommodate architectural, structural, mechanical and/or electrical conditions.
  - 1.1.18. All pathways shall be parallel to building lines. If it is necessary to route cables otherwise to accommodate cable length written permission shall be obtained from the Technology Systems Consultant prior to installation.
-

- 
- 1.1.19. Any deviation from cable routing shown on drawings (where shown) shall be approved in writing by the Technology Systems Consultant prior to installation and shall be documented on record drawings.

**3.3 Bend Radius**

- 1.1.20. Do not kink or exceed the cable minimum bend radius for all cabling. For all copper cabling maintain a minimum of (4) times cable diameter as bend radii if the manufacturer specifies no bend radius.
- 1.1.21. Where there is the potential for excess stress on a cable(s) when pulling through conduit systems, apply a non-corrosive quick drying lubricant to the cable to facilitate pulling.
- 1.1.22. Completely remove all cable lubricant from cable jacket as cable exits the conduit system prior to termination and labelling.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 Outlet Locations**

- 1.1.2. Horizontal cable outlets may be relocated prior to installation from the location shown on the drawings to a maximum distance of 3.05m (10'-0") without adjustment to the contract price.

## **2 PRODUCT**

### **2.1 Keystone Style UTP Termination Modules (Outlet)**

- 1.1.3. All keystone style UTP termination modules shall have the following minimum performance characteristics:

Modular jack current rating	1.5 Amperes maximum
Modular jack durability	1,000 mating cycles
Modular jack contact pressure	100 grams minimum per contact
Dielectric voltage strength	1,000 V RMS at 60Hz for 1 minute
Insulation resistance	200 MΩ minimum
Contact resistance	1 MΩ per contact
IDC termination connectors resistance	100 MΩ between clips

- 1.1.4. The contact material of the termination module shall be phosphor bronze with 50 micro-inches of gold over nickel.

- 1.1.5. Keystone style UTP termination modules shall be of the same category as the UTP cabling to ensure that manufacturer end to end warranties can be attained.

- 1.1.6. UTP cables shall be terminated with keystone style modules as listed below:

**Specified Product:**

	Cat.	Colour	Part No.	System
Belden	6	Blue	AX101326	Data/Voice
Hubbell	6	Blue	HXJ6B	Data/Voice
Commscope	6	Blue	NA	Data/Voice
Wirewerks	6	Blue	KW- CC645BBL	Data/Voice

---

2.2 **Optical Fibre Connectors**

- 1.1.7. Optical fibre terminations shall be made for field termination and shall be of the same manufacturer and style to suit the cabling installed.
- 1.1.8. Fibre terminations shall be made with a ceramic ferrule and cable boot.
- 1.1.9. Optical fibre cables shall be terminated with connectors as listed below:

Specified Product:

	Fibre	Type	Part No.
Corning	MM	LC	95-050-99-X
Belden	MM	LC	AX105202-S1
Hubbell	MM	LC	FCLCMM
Commscope	MM	LC	MFC-LCR
Wirewerks	MM	LC	FTALCMM

2.3 **Optical Fibre Adapter Strips**

- 1.1.10. Optical fibre adapter strips shall be of the same manufacturer and style to suit the cabling installed.
- 1.1.11. Optical fibre patch panels shall be installed complete with optical fibre adapter strips as listed below:

Specified Product:

	Fibre	Type	Part No.
Corning	MM	LC	CCH-CPXX-A8
Belden	MM	LC	
Hubbell	MM	LC	FSPLCDM3
Commscope	MM	LC	
Wirewerks	MM	LC	ASWL

2.4 **Workstation Faceplates and Adapters**

- 1.1.12. Workstation outlets shall be supplied and installed for all terminations at the workstation end and as further specified below to suit the application.
- 1.1.13. The Communications Contractor shall confirm colour of outlets prior to placing order.
- 1.1.14. Workstation outlets shall be manufactured by the end to end solution manufacturer when available.
- 1.1.15. Modular Furniture Faceplates
- .1 Modular furniture faceplates shall be installed in all furniture outlets that have a modular furniture knockout shall consist of a minimum of (3) ports.
- .2 Each outlet shall be installed with the specified termination modules or a blank insert. No openings shall remain exposed.
- .3 Communications Contractor shall verify furniture manufacturer and modular faceplate requirement prior to placing order

Specified Product:

---

	No. of Ports	Part No.	Style:
Corning	3-port		Keystone
Corning	4-port		Keystone
Belden	3-port		Keystone
Belden	4-port		Keystone
Hubbell	2-port	FP2BK	Keystone
Hubbell	4-port	FP4BK	Keystone
Commscope	3-port		Keystone
Commscope	4-port		Keystone
Wirewerks	3-port	WW000903BK	Keystone
Wirewerks	4-port	WW000904BK	Keystone

1.1.16. Wall Faceplates

- .1 Decora style adapters and faceplates shall be installed for all wall outlets, floor or raceway outlets and shall consist of a minimum of (2) ports.
- .1 Each outlet shall be installed with the specified termination modules or a blank insert. No openings shall remain exposed.

Specified Product:

	No. of Ports	Part No.	Style:
Corning	3-port		Keystone
Belden	3-port	AX102661	Keystone
Hubbell	3-port	IFP13W	Keystone
CommScope	3-port	M108FR3-262	Keystone
Wirewerks	3-port	WW-000056	Keystone

1.1.17. Surface Mount Boxes

- .1 Surface mount boxes shall be installed for all furniture outlets that do not have a modular furniture knockout, exposed ceiling outlets or any location not provided with an electrical backbox.
- .1 The surface mounted box shall consist of a minimum of (2) ports.
- .2 Each outlet shall be installed with the specified termination modules or a blank insert. No openings are to remain exposed.

Specified Product:

	No. of Ports	Part No.	Style:
Corning	2-port		Keystone
Belden	2-port	A0645273	Keystone
Hubbell	2-port	ISB2W	Keystone
Commscope	2-port		Keystone
Wirewerks	2-port	WW000071	Keystone

The Communications Contractor shall allow for the supply and installation of (10) blank plates and wall inserts to suit the application.

- 1.1.18. Blank inserts and faceplates shall be installed in all unused communication ports for workstation outlets. Blank insert plates shall be manufactured by the end to end solution manufacturer and be of the same colour as the workstation outlet.

### **3 EXECUTION**

#### **3.1 Termination Requirements**

- 1.1.19. All cabling shall be terminated using EIA/TIA 568A configuration.

#### **3.2 Workstation Outlets**

- 1.1.20. Install all workstation outlets level and flush to wall surface.
- 1.1.21. Provide a final installation that is clean of all fingerprints and dirt complete with identification labelling as per these specifications.

**END OF SECTION**

---

## 1 **GENERAL**

### 1.1 **Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### 1.2 **General**

- 1.1.2. All cables penetrating the exterior building enclosure shall conform to Section 01 83 16.
- 1.1.3. All products shall be supplied by the Communications contractor unless specified otherwise.
- 1.1.4. The Communications contractor shall verify the number of POE equipment as per the site drawings and with the Owner.
- 1.1.5. The Communications contractor shall keep allowance for modular expansion of 20% on day one (1) of a fully operational system.

## 2 **PRODUCT**

### 2.1 **Outdoor Remote Media converter.**

- 1.1.6. The Communications contractor shall specify and supply materials including the mounting hardware in accordance with the Manufacturer's installation guidelines.
- 1.1.7. The Communications contractor shall coordinate installation location on site with Owner.

#### Specified Product:

	Series	Comment
Fiber Connections	GR20YPBYE0B-001-SW	2-Port Media converter
Fiber Connections	Polycase ML-70F15	Enclosure for 2-Port media converter
Fiber Connections	GR10YPBYY0B-004-AEC	1-Port Media converter
Fiber Connections	PTK-18426	Enclosure for 1-Port media converter
Fiber Connections	PMH-2	Pole mount hardware

### 2.2 **Hybrid Cable**

- 1.1.8. The Communications contractor shall verify lengths for each data location on site with the Owner.

- 1.1.9. The Communications contractor shall coordinate with Div.26 (Electrical) and Owner for cable pathways.

Specified Product:  
Series

Fiber Connections	HQ022DENXL2FB001-XX	2 Fiber OS2+2x12 AWG IP1-LC to LC duplex + M8 armoured Hybrid assembly
-------------------	---------------------	---

- 1.1.10. XX denotes the length of the cable.

### 2.3 **Patch Panel with Power supply**

- 1.1.11. All hybrid cabling shall be terminated in powered patch panel as per the manufacturer's installations guidelines.

Specified Product:  
Series

Fiber Connections	PP2UT00-003 – 2U Power patch panel, 6slot, termination block, Class 2
Fiber Connections	PP4UT00-003 – 4U Power patch panel, 12 slot, termination block, Class 2
Fiber Connections	PS5600250AN-002 – Power Supply module
Fiber Connections	MM00-001 – Blank plate

### 2.4 **Media Module**

- 1.1.12. The Communications contractor shall specify and supply materials including the mounting hardware.

Specified Product:  
Series

Fiber Connections	MM60GPHSL0B-001
-------------------	-----------------

## 3 **EXECUTION**

### 3.1 **Grounding**

- 1.1.13. The Communications contractor shall follow the manufacturer's installation guidelines for all grounding requirements.

---

3.2 **Ethernet Cable**

- 1.1.14. The Communications contractor shall follow the manufacturer's installation guidelines for all cabling requirements .

3.3 **Hybrid Cabling**

- 1.1.15. Cabling shall be installed in conduits/pathways as per the manufacturer's instructions.
- 1.1.16. Cabling in racks and cabinets shall be neatly dressed using Velcro ty-wraps.
- 1.1.17. All cables shall be continuous with no splices other than those that may be identified on drawings.
- 1.1.18. Provide a minimum of 3.0 m (10'-0") of slack at the patch panel end of each cable. Neatly coil slack in cabinet and fasten with Velcro wraps.
- 1.1.19. All strands of cabling shall be terminated.
- 1.1.20. Clean all cabling of pulling lubricants prior to termination and labelling.

3.4 **Cable Routing**

- 1.1.21. Make all necessary adjustments to cable route(s) / pathway(s) to accommodate architectural, structural, mechanical and/or electrical conditions.
- 1.1.22. All pathways shall be parallel to building lines. If it is necessary to route cables otherwise to accommodate cable length written permission shall be obtained from the Technology Systems Consultant prior to installation.
- 1.1.23. Any deviation from cable routing shown on drawings (where shown) shall be approved in writing by the Technology Systems Consultant prior to installation and shall be documented on record drawings.

3.5 **Bend Radius**

- 1.1.24. Do not kink or exceed the cable minimum bend radius for all cabling. Maintain a minimum of ten (10) times the cable diameter or 30 mm (1.2") whichever is larger for a bend radius.

3.6 **Cable Lubricant**

- 1.1.25. Where there is the potential for excess stress on a cable(s) when pulling through conduit systems, apply a non-corrosive quick drying lubricant to the cable to facilitate pulling.
- 1.1.26. Completely remove all cable lubricant from cable jacket as cable exits the conduit system prior to termination and labelling.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1. Comply with Section 27 00 03 – General Specifications and Requirements for Communications.

### **1.2 General**

- 1.1.2. The Communications Contractor shall supply and install all cross-connects and patch cords at both ends unless otherwise noted.
- 1.1.3. Cross-connects and patch cords shall be of the same manufacturer, quality and category to provide a complete end to end solution which shall be warranted by the selected manufacturer.
- 1.1.4. Supply and install (2) patch cords for every horizontal cable installed. (Only (1) patch cord at patch panel end for voice cabling required).
- 1.1.5. Supply and install (2) duplex fibre optic patch cords for every two fibre optic strands installed.
- 1.1.6. Provide miscellaneous cross-connects to owner supplied circuits as required.

### **1.3 Patch Cords**

- 1.1.7. All patch cords used shall be 8 position 4 pair T568A/B: T568A/B patch cords unless otherwise noted.
- 1.1.8. All patch cords shall be CMR (FT4) rated and stamped accordingly and shall be consistent with the category and manufacturer of the UTP cabling system that shall be warranted as part of the end to end solution.

## **2 PRODUCT**

### **2.1 UTP Patch Cords**

- 1.1.9. All patch cords shall be CMR (FT4) rated and stamped accordingly.
- 1.1.10. Patch cords shall be manufactured of stranded conductor cable with (8) position (4) pair terminations at both ends.

Specified Product:

	Cat.	Rating	Colour	Length	System	Location
Belden	6	CMR/FT4	Blue	7'	Data	Telecom Room
Hubbell	6	CMR/FT4	Blue	7'	Data	Telecom Room

---

2.2 **Optical Fibre Patch Cords**

1.1.11. All patch cords shall be CMR (FT4) rated and stamped accordingly.

Specified Product:

	Cat.	Rating	Length	System	Location
Corning		CMR/FT4			
Belden		CMR/FT4			
Hubbell		CMR/FT4			
Commscope		CMR/FT4			
Wirewerks		CMR/FT4			

3 **EXECUTION**

3.1 **UTP Patch Cords**

1.1.12. Assume all ports shall be patched.

3.2 **Optical Fibre Patch Cords**

1.1.13. Assume all ports shall be patched.

3.3 **Cross-Connects**

1.1.14. Assume all pairs of all cables are cross-connected at both ends.

1.1.15. Install cross-connects and patch cords for each termination using cable management in a neat and workmanship fashion acceptable to the owner and the Technology Systems Consultant.

1.1.16. Provide cross-connects for all connections required by the Owner to complete the installation.

1.1.17. Use Velcro wraps to provide additional cable management as required.

1.1.18. Provide additional "D" rings and cable management for cross-connects as required.

**END OF SECTION**

**1 GENERAL**

**1.1 Work Included**

- 1.1.1 Comply with Section 27 00 03 – General Specifications and Requirements for Audio-Visual Communications Specifications and Scope.

**2 PRODUCT**

**2.1 Refer to Section 27 06 40 (Schedules for Audio-Visual Communications) for details.**

**2.2 Clock System**

- 2.2.1 Clock systems shall be powered with IP Ethernet/PoE technology.
- 2.2.2 Clock system software requirements shall be coordinated with Owner.
- 2.2.3 Acceptable manufacturers shall be Primex
- 2.2.4 Location and number of clocks shall be as per the drawings and shall be confirmed with Owner and Architect on site.

**3 EXECUTION**

**3.1 Coordination**

- 3.1.1 Audio-Visual Communications Contractor shall coordinate with Division 26 (Electrical Contractor) for the hard-wired electrical connection of any equipment requiring a hard wire connection.

**3.2 Installation**

- 3.2.1 Audio-Visual Communications Contractor shall install equipment using recommended manufacturer installation practices with approved support hardware appropriate for site conditions and installation type.

**3.3 Speakers**

- 3.3.1 Audio-Visual Communications Contractor shall be responsible for cutting ceiling tiles for the installation of speakers. Any damage to tiles shall remain the responsibility of the Audio-Visual Communications Contractor.

**3.4 Electronic Control**

- 3.4.1 Audio-Visual Communications Contractor shall create touch panel interface design as required and as noted in Part 1 of this Section.

**3.5 Touch Panel Interface Design**

- 3.5.1 The touch panel interface design layout shall be submitted for review by the Owner and the Technology Consultant prior to installation of hardware. Allow for initial interface design layout meeting with the Owner and the Technology Consultant and three additional design meetings for modifications.

- 3.5.2 The touch panel interface shall be designed with ease of use in mind.
  - 3.5.3 The Audio-Visual Communications Contractor shall document all programming for record.
  - 3.5.4 Audio-Visual Communications Contractor shall provide to the Owner un-compiled software for each program and touch panel interface design on CD for record and for future system modifications.
- 3.6 **Cables, Connectors, and Accessories**
- 3.6.1 Audio-Visual Communications Contractor shall supply and install all required cables, connectors, and accessories.
  - 3.6.2 Audio-Visual Communications Contractor shall use plenum rated cabling in all plenum ceiling spaces. Where it is unclear whether a specific space requires plenum rated cabling, the Audio-Visual Communications Contractor shall confirm with Technology Consultant prior to tender close. Use of non-plenum cabling in a plenum space installed within a plenum rated innerduct type of pathway shall not be allowed. Non-plenum cables installed in plenum spaces shall only be allowed if installed in fully enclosed metal pathways such as metal conduits (such as EMT) or fully enclosed metal tray.

**END OF SECTION**

**1 GENERAL**

**1.1 Work Included**

1.1.1 Comply with Section 27 00 03 – General Specifications and Scope.

**2 PRODUCT**

**2.1 Audio-Visual Cabinet**

2.1.1 Refer to Section 27 11 16 (Communications Cabinets, Racks, Frames and Enclosures) for details.

**3 EXECUTION**

**3.1 Coordination**

3.1.1 Audio-Visual Communications Contractor shall coordinate with Division 26 (Electrical Contractor) for the hard-wired electrical connection of any equipment requiring a hard wire connection.

**3.2 Cables, Connectors, and Accessories**

3.2.1 Audio-Visual Communications Contractor shall supply and install all required cables, connectors, and accessories.

3.2.2 Audio-Visual Communications Contractor shall use plenum rated cabling in all plenum ceiling spaces. Where it is unclear whether a specific space requires plenum rated cabling, the Audio-Visual Communications Contractor shall confirm with Technology Consultant prior to tender close. Use of non-plenum cabling in a plenum space installed within a plenum rated innerduct type of pathway shall not be allowed. Non-plenum cables installed in plenum spaces shall only be allowed if installed in fully enclosed metal pathways such as metal conduits (such as EMT) or fully enclosed metal tray.

**END OF SECTION**

**1 GENERAL**

**1.1 Work Included**

1.1.1 Comply with Section 27 00 03 – General Specifications and Scope.

**2 PRODUCT**

2.1 **Refer to Section 27 06 40 (Schedules for Audio-Visual Communications) for details.**

**3 EXECUTION**

**3.1 Coordination**

3.1.1 Audio-Visual Communications Contractor shall coordinate with Division 26 (Electrical Contractor) for the hard-wired electrical connection of any equipment requiring a hard wire connection.

**3.2 Cables, Connectors, and Accessories**

3.2.1 Audio-Visual Communications Contractor shall supply and install all required cables, connectors, and accessories.

3.2.2 Audio-Visual Communications Contractor shall use plenum rated cabling in all plenum ceiling spaces. Where it is unclear whether a specific space requires plenum rated cabling, the Audio-Visual Communications Contractor shall confirm with Technology Consultant prior to tender close. Use of non-plenum cabling in a plenum space installed within a plenum rated innerduct type of pathway shall not be allowed. Non-plenum cables installed in plenum spaces shall only be allowed if installed in fully enclosed metal pathways such as metal conduits (such as EMT) or fully enclosed metal tray.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to the requirements of Divisions 0 and 1 and additional general information as prepared by the Architect or Prime Consultant, which apply to and form part of all sections of the work.
- 1.1.2 Read and comply with all sections of this document.
- 1.1.3 These instructions apply to and form part of all Electronic Safety and Security Sections and drawing(s).
- 1.1.4 Refer to section 28 00 05 for definitions of names, titles, terms, and abbreviations used in this document.
- 1.1.5 These documents have been prepared by Spectech specifically for use on this project and may not be reproduced in whole or in part without the express written consent of Spectech. These documents may not be used for any other purpose and/or for any other project and are considered confidential for the use of preparing a tender response.
- 1.1.6 This specification is divided into Sections which are not intended to identify contractual limits between Sub-Contractors nor between the Contractor and his Sub-Contractors. The requirements of any one Section apply to all Sections. Refer to other Divisions and Sections to ensure a complete and operational system.
- 1.1.7 These tender documents shall remain the property of the Electronic Safety and Security Consultant at all times.
- 1.1.8 The Electronic Safety and Security Contractor shall report any discrepancies between drawings and all applicable specifications to the Electronic Safety and Security Consultant immediately.
- 1.1.9 All drawings and details have been prepared to illustrate the existing and new conditions of the project and shall be considered diagrammatic. The Electronic Safety and Security Contractor shall ensure all components required to complete the fully operational system are installed with no additional cost to the Owner or the Electronic Safety and Security Consultant.
- 1.1.10 Provide all labour, materials, tools, and equipment required for the complete installation of work called for in all Sections of the Contract Documents.
- 1.1.11 The Electronic Safety and Security Contractor shall verify exact locations of all items shown and shall verify with the Technology Systems Consultant all new locations prior to installation. It shall be the responsibility of the Electronic Safety and Security Contractor to provide the Electronic Safety and Security Consultant detailed layouts of all rooms and locations of installation prior to installation for approval. All costs, including other trades as applicable, associated with changes resulting from non-approved installation will be the responsibility of the Electronic Safety and Security Contractor.

- 1.1.12 Minor changes in locations may be required by the Electronic Safety and Security Consultant in order to coordinate site conditions with other divisions and the Electronic Safety and Security Consultant reserves the right to make these changes with no additional cost to the Owner.

## **1.2 Schedule**

- 1.2.1 The Electronic Safety and Security Contractor shall be responsible to meet the project schedule as provided by the Project Manager and the Owner.
- 1.2.2 Work is generally to be performed during regular work hours unless noted otherwise in this document. The Electronic Safety and Security Contractor shall include for all necessary overtime labour in order to complete the project. The Electronic Safety and Security Contractor shall be responsible for providing labour in order to complete the work within the schedule with no additional cost to the Owner.
- 1.2.3 The Electronic Safety and Security Contractor shall supply a written project plan detailing schedule of installation in coordination with the overall project schedule. Project plan shall be prepared in MS Project.
- 1.2.4 At and near the completion of the project the Electronic Safety and Security Contractor will be responsible for providing project documentation for the Owner's further use. This will include:
- Updated Excel Spreadsheet documenting the following:
  - .1 Camera or Security Node Number
  - .2 Cable ID
  - .3 Location or door number
  - .4 Temporary As-Builts
  - .5 Contact Info for Cutover Technician
  - .6 Verification Report
- 1.2.5 All documents and information shall be provided as further detailed in Section 28 00 09 and delivered to the Electronic Safety and Security Consultant.

## **1.3 Labour**

- 1.3.1 The Electronic Safety and Security Contractor shall provide only skilled, trained tradesmen experienced in the installation of a certified installation. Each installer shall be certified with the manufacturer providing the warranty for this project.
- 1.3.2 The Electronic Safety and Security Contractor shall be responsible to provide Union or Non-union labour as required on the project site and meet all requirements without any delay or cost to the Owner, General Contractor, or other trades.

- 1.3.3 Sub-Contractors shall not be allowed to perform all or any portion of the project unless approved in writing by the Electronic Safety and Security Consultant and the Owner. Subcontractors shall be identified at time of tender to be considered for approval.
- 1.3.4 The Electronic Safety and Security Contractor shall comply at all times with local, provincial, and federal employee standards, safety acts, fire codes and other applicable legislations, codes and acts affecting the delivery of the project. The Electronic Safety and Security Contractor is responsible for the training and notifying their employees of any details associated with all codes, standards, acts and legislation applicable to this project.
- 1.3.5 WSIB (Workplace Safety Insurance Board) clearance certificate indicating a good standing shall be provided by the Electronic Safety and Security Contractor prior to acceptance of any contract.
- 1.3.6 Provide personal identification in a form acceptable to the Owner for all employees attending the site for this project when requested.

#### **1.4 Interpretation of Drawings and Specifications**

- 1.4.1 It is the responsibility of the Electronic Safety and Security Contractor to carefully read these specifications and drawing(s) and report any discrepancies Electronic Safety and Security Contractor immediately to the Electronic Safety and Security Consultant.
- 1.4.2 At the time of tendering the Electronic Safety and Security Consultant shall notify the Electronic Safety and Security Consultant in writing of any equipment, wiring feature, software, or device necessary for full operation of any of the systems which is not included in the specification documents or drawings. Failure to supply notification shall not relieve the Electronic Safety and Security Consultant of the responsibility for providing a fully functioning system at the bid price.
- 1.4.3 While every attempt has been made to ensure that all information (including specified products and part numbers) is correct, it is the responsibility of the Electronic Safety and Security Contractor to verify availability of products and verify all part numbers.
- 1.4.4 Specifications and drawings are schematic and represent the intent of the project.
- 1.4.5 Dimensions and measurements shown in these documents shall be verified by the Electronic Safety and Security Contractor on site prior to final installation.
- 1.4.6 Quantities and lengths identified are approximate and shall not be used to gauge or limit work.
- 1.4.7 These Specifications are an integral part of the accompanying drawing(s). Any item or subject omitted from one or the other, but which is either mentioned or implied shall be considered as properly and sufficiently specified.

- 1.4.8 Certain details indicated on the drawings are general in nature and are not specifically identified for each and every occurrence of use, however, such details shall be applicable to every occurrence on the drawings.
- 1.4.9 The location and size of existing services and equipment shown on the drawings are based on the best available information. The Electronic Safety and Security Contractor shall verify the exact location, type, size, and any other pertinent information prior to commencing work.

## **1.5 Installation**

- 1.5.1 Leave areas clear where space has been designated as reserved for future equipment and equipment for other trades.
- 1.5.2 Adequate space and provisions shall be left for removal of components and servicing of equipment, with minimum inconvenience to the operation of systems.
- 1.5.3 Where equipment is shown to be 'roughed in only' obtain information from the Electronic Safety and Security Consultant before proceeding with the work.

## **1.6 Coordination**

- 1.6.1 The Electronic Safety and Security Contractor shall provide an installation and make all changes associated with coordination with other trades and to accommodate unforeseen site conditions at no additional cost to the Owner.
- 1.6.2 Prepare interference drawings and sketches for presentation to the Electronic Safety and Security Consultant to review any anticipated conflicts with other trades.
- 1.6.3 Prepare detailed layouts of equipment rooms prior to installation for review by the Electronic Safety and Security Consultant. Layouts shall indicate other major pieces of equipment being supplied by other trades.
- 1.6.4 The Electronic Safety and Security Contractor shall be responsible for attending coordination meetings as requested by the General Contractor or Project Manager for the coordination of locations and services. The Contractor's project co-ordinator selected shall be assigned for the duration of the project and may only be changed with the written consent of the Electronic Safety and Security Consultant.
- 1.6.5 The Electronic Safety and Security Contractor in addition to coordination meetings shall attend weekly site meetings and be prepared to provide current project progress status, anticipated completion of future tasks and information on outstanding delivery items.
- 1.6.6 Access to the site shall comply to all rules, regulations, safety standards and security procedures established for the project or building. Fees for after hours access shall be considered included in the tender amount. No additional cost shall be accepted by the Owner for these requirements.

- 1.6.7 Cutting and patching of all surfaces as applicable to the electronic safety and security installation shall be the responsibility of and be performed by the Electronic Safety and Security Contractor. All work shall be performed to the standards set by codes and standards, Building Management, General Contractor, and the Owner.
- 1.6.8 Cutting and patching of all structural members shall be approved by the Structural Consultant prior to work starting.
- 1.6.9 Work causing noise, dust and/or odour shall be performed during evenings and/or weekends to prevent disturbance to the operation of the Owner's or surrounding businesses. Work shall be performed at agreed times and in coordination with each party. All damages caused for work performed not in compliance with this item shall be the responsibility of the Electronic Safety and Security Contractor.

#### **1.7 Temporary Services**

- 1.7.1 The Electronic Safety and Security Contractor shall provide all required materials, labour, tools, and equipment to meet the temporary requirements of the project in coordination with other trades and the General Electronic Safety and Security Contractor at no additional cost to the Owner.
- 1.7.2 All hoisting, mechanical lifts and special scaffolds shall be the responsibility of the Electronic Safety and Security Contractor and at no additional cost to the Owner.
- 1.7.3 All power supplies, extension cords and equipment cords shall be the responsibility of the Electronic Safety and Security Contractor and shall be installed in good working order and in accordance with all codes, standards and building regulations.

#### **1.8 Co-Operation with Other Divisions**

- 1.8.1 Electronic Safety and Security Cabling shall not touch or be supported from piping, ductwork, conduits, ceiling supports or any other service / equipment. Electronic Safety and Security Cabling shall be supported by approved j-hooks, cable slings, ladder / basket tray and/or conduit as outlined in this document.
- 1.8.2 Supply all items to be built in ample time for rapid progression of the work. Schedule and provide manpower and materials to proceed with work as required to satisfy the construction schedule.

#### **1.9 Existing Services and Equipment**

- 1.9.1 All changes and connections to existing services shall be made only in a manner and at a time approved by the Electronic Safety and Security Consultant and/or the Owner so as to avoid any interruption of such services during normal working hours. If necessary, changes and connections to existing services shall be made outside of normal business hours at no extra cost to the Owner.

---

**1.10 Metric Conversions**

1.10.1 Particular attention shall be paid with regard to Imperial versus S.I. Metric conversions. This applies to all services including, but not limited to, equipment, material, and site services in both new and existing installations.

1.10.2 Conform to Canadian Metric Practice Guide CAN/CSA-Z234.1-89.

**1.11 Monthly Draws**

1.11.1 Monthly progress draws shall be submitted to the General Contractor for approval by the Electronic Safety and Security Consultant.

**1.12 Pricing of Changes**

1.12.1 Where a Contemplated Change Notice (CCN) has been issued and identifies potential changes to the scope of work and those changes have been price-identified in the Tender Form under the Alternate, Separate, Identified and/or Unit Pricing structure, the Electronic Safety and Security Contractor shall price all changes in accordance with the pricing provided in the Tender Form at the time of tender. All prices shall be provided in a broken-down format, identifying the pricing reference (i.e. The line item on the Tender Form).

1.12.2 Where a CCN has been issued and identifies potential changes to the scope of work and those changes have NOT been price-identified in the Tender Form under the Alternate, Separate, Identified and/or Unit Pricing structure, the Electronic Safety and Security Contractor shall provide a complete breakdown of all material, equipment and labour cost associated with each submission in the following format.

All material used in the change(s) shall be identified by:

Quantity  
Price Per Unit  
Material Cost  
Hours per Unit  
Total Hours

Summary shall include:

Total Material Value  
HST  
Technician rate (as per Tender Form)  
Forman rate  
Overhead  
Markup (profit)

Contemplated Change Notices shall include at no extra cost:

Administration

Record Drawings  
Clean up  
Co-ordination  
Engineering and Drafting  
Estimating  
Guarantee  
Hydro Inspection  
Material Delivery  
Material Expediting  
Mileage  
Parking  
Project Management  
Re-Assign Manpower  
Safety  
Schedule Extension  
Supervision  
Tool Charges  
Wastage  
Warranty

Foreman Charges: Foreman Charges shall not exceed 10% of the labour component of the price.

Overhead and Profit: All overhead fees and profit shall be fixed at 5% and 10% unless agreed to by the owner / consultant prior to installation.

## **2 PRODUCT**

### **2.1 General**

- 2.1.1 All equipment and products supplied shall be new and free of all manufacturer defects and delivery or installation damage.
- 2.1.2 All equipment and products supplied shall meet all manufacturer listed characteristics as identified in the latest manufacturer catalogue.
- 2.1.3 All products shall meet all applicable codes and standards and bare the UL/ULC label, be CSA approved and meet FCC/CRTC Regulations.
- 2.1.4 All products shall be provided in accordance with local, provincial, and national fire ratings for the installation on this project.
- 2.1.5 The only acceptable Manufacturers for this project and as further specified in this document will be the following:

HID	Access Control
Amag	Access Control
Bosch	Access Control
Assa Abloy	Access Control

Avigilon	Video Surveillance
Avigilon	Intercom System
Code Blue	EPP System
Bosch	EPP System

## **2.2 Substitutions**

- 2.2.1 Substitution of any product shall be prior approved in writing by only the Electronic Safety and Security Consultant.
- 2.2.2 The procedure for substitution approval will include the written submission by the Electronic Safety and Security Contractor including the following:
  - .1 Original specified product
  - .2 Proposed product being substituted
  - .3 Reason for substitution
  - .4 Shop drawings indicating all technical specifications
  - .5 Financial advantage
  - .6 Schedule delivery date
  - .7 Written approval from certifying system manufacturer
- 2.2.3 Based on the review of the information requested above, the Owner and/or Electronic Safety and Security Consultant reserve the right to reject any proposed substitution without delay or cost to the project or the Owner.

## **2.3 Material Handling**

- 2.3.1 The Electronic Safety and Security Contractor is responsible for the following:
  - .1 Delivery of all materials to site and transportation to the workplace in accordance with all safety regulations and procedures.
  - .2 Coordinate and schedule all hoisting with Building Management and the General Contractor.
  - .3 Provide and be responsible for lockable storage for all tools and material required to complete the installation through the duration of the project.
  - .4 Once the project is complete Remove all tools and excess materials within 2 business days once the project is complete.
- 2.3.2 The Owner and its representatives shall in no way be held liable for any missing material, equipment or tools required to complete the installation.

---

### **3 EXECUTION**

#### **3.1 General**

- 3.1.1 The Electronic Safety and Security Contractor shall supply all materials, labour, tools and equipment to provide a complete warranted installation as outlined in the contract documents and suitable to the approval of the Owner, Electronic Safety and Security Consultant and inspection bodies having jurisdiction.
- 3.1.2 The Electronic Safety and Security Contractor shall be responsible for installing and providing pulling strings, ropes and fishing walls wherever conduit is not installed, or conduit is installed without these provisions.
- 3.1.3 Provide continuity of all existing services while completing the specified installation. Losses due to interruption of services will be the responsibility of the Electronic Safety and Security Contractor.
- 3.1.4 Arrange for all shutdowns one (1) week prior in writing with the Project Manager and those in control of services shall be disrupted. All overtime costs, fees, security, and other requirements shall be the full responsibility of the Electronic Safety and Security Contractor.
- 3.1.5 Should services be interrupted accidentally the Electronic Safety and Security Contractor shall provide material and labour to re-establish services immediately and shall continue without stoppage until all services have been re-established. All material and labour costs including overtime shall be borne solely by the Electronic Safety and Security Contractor. Any material and/or labour costs including overtime associated with other trades and/or the General Contractor to assist in any way the Electronic Safety and Security Contractor in re-establishing services shall be borne solely by the Electronic Safety and Security Contractor.

#### **3.2 Site Conditions**

- 3.2.1 The Electronic Safety and Security Contractor is responsible for maintaining a clean work environment and is responsible for the removal of all debris on a daily basis. Debris and removed materials shall be disposed of in conformance with all local by laws and regulations. Failing to comply and after reasonable time and written notice the General Contractor reserves the right to hire cleaners to complete the cleaning and back charge the Electronic Safety and Security Contractor.
- 3.2.2 The Electronic Safety and Security Contractor shall be responsible for the removal and reinstallation of all floor or ceiling tiles, hatch ways or access panels. All items shall be removed and replaced on a daily basis and left in the original condition. Special caution shall be taken to not break, chip or discolour with dirt or fingerprints any such items. The Electronic Safety and Security Contractor will be fully responsible for repair or replacement of all damaged pieces at the discretion of the Project Manager or Owner.
- 3.2.3 The Electronic Safety and Security Contractor is fully responsible for storage of all temporarily removed items for the project.

- 3.2.4 All materials and installation throughout the project will remain the responsibility of the Electronic Safety and Security Contractor until final completion for the project is accepted by the Owner. Damages to any item installed shall be replaced or repaired by the Electronic Safety and Security Contractor to provide a complete final installation at no additional cost to the Owner.
- 3.2.5 At the completion of the project or when the Owner requires, restore the original condition of all materials, equipment and surfaces within the work area affected by this installation.
- 3.2.6 All vehicular traffic entering the site shall be coordinated with the General Contractor and no parking or compensation for paid parking will be provided by the Owner.

### **3.3 Cutting, Patching and Repairing**

- 3.3.1 It is the responsibility of the Electronic Safety and Security Contractor to perform all cutting, patching and repair related to the Electronic Safety and Security Cabling work including any penetrations through walls or floors.

### **3.4 Hoisting Facilities**

- 3.4.1 This Division shall provide its own hoisting facilities regardless of height required to perform work.
- 3.4.2 Hoisting facilities may be provided by the General Contractor, although the General Contractor may at its own discretion not allow the Electronic Safety and Security Contractor to make use of such.

### **3.5 Safety**

- 3.5.1 The Electronic Safety and Security Contractor shall adhere to all safety laws, rules and regulations issued by the authorities having jurisdiction, General Contractor, Project Manager and the Owner.
- 3.5.2 The Electronic Safety and Security Contractor shall attend all Safety Program meetings requested by the General Contractor.
- 3.5.3 Provide adequate protection in public and work areas to pedestrian and other trade traffic using approved safety barriers, caution tape and signage.
- 3.5.4 At all times maintain clear fire exits, emergency routes and access to emergency equipment including fire hose cabinets, fire extinguishers and standpipe connections.
- 3.5.5 Smoking and combustion of any materials is strictly prohibited on all sites.
- 3.5.6 Provide information to all employees of emergency and fire safety plans for the work site and facility.
- 3.5.7 Provide protection as required by the authorities having jurisdiction to all employees for work performed in typically inaccessible or concealed spaces.

- 
- 3.5.8 If an approved subcontractor is used provide information and ensure all safety specifications herein are met.

**3.6 Site Adjustments**

- 3.6.1 Locations of all equipment, outlets or devices prior to installation may be revised to within (3) meters without any additional cost or change request.
- 3.6.2 Portions of the project may be at any time identified in writing to be "On Hold". Work in these areas shall not be started, continued, or completed until further direction is received. No additional cost shall be accepted by the Owner for areas put on hold.

**END OF SECTION**

## **1 GENERAL**

### **1.1 General**

1.1.1 The following definitions may be used in this document, as well as in any project documents such as but not limited to Addenda, Contemplated Change Notices, Change Orders, and Site Instructions:

Addendum	- Normative document used to provide additional requirements and recommendations to a published document (e.g., standards, contracts). When published, an addendum effectively becomes part of the document that it supports.
Bonding	- The permanent joining of metallic parts to form an electrically conductive path that will ensure electrical continuity and the capacity to conduct safely any current likely to be imposed.
Bonding Conductor (BC)	- A conductor used specifically for the purpose of bonding.
Building Entrance Facility	- The room or space inside a building where telecommunications cables enter and leave the building.
Electronic Safety and Security Contractor	- The successful bidder(s) responsible for the supply and installation of the Electronic Safety and Security solution as described in this Specification.
Category	- A rating that defines the performance of cabling components and systems. Describes mechanical properties and transmission characteristics of balanced twisted-pair cabling and provides a numbered designation.
Change Notice	- Normative document approved to provide additional requirements and recommendations that describes and authorizes the implementation of an engineering change to the product and its approved configuration documentation.
Owner	- Region of Peel EMS
Electronic Safety and Security Consultant	- Ghazdanafar Rizvi SPECTECH

---

Contemplated Change Notice	- Normative document to provide additional requirements and recommendations that describes the implementation of an engineering change to the product and its approved configuration documentation for the purposes of pricing. This document does not authorize the implementation of a change to the product and its approved configuration documentation.
Cut Over	- The live date(s) is when the Owner will occupy the space as indicated by date and/or phasing.
Contract Drawings	All Electronic Safety and Security Systems / Security, Electrical, Architectural, Mechanical and Structural Drawings issued in relation to this project including any future changes and revision of said drawings
Contract Documents	All documents including Contract Drawings issued under this project
Grounded Conductor	- A system or circuit conductor that is intentionally grounded.
Grounding System	- A system of hardware and wiring that provides an electrical path from a specified location to an earth ground point.
Project	- Supply and installation of a complete Electronic Safety and Security solution to support Access Control, Intrusion Detection, Video Surveillance and Electronic Personal Protection system as described in this document.
Provide	- Supply and install.
Shop Drawing	- Drawings, diagrams, illustrations, schedules, performance charts, and other data prepared by the contractor which illustrate how specific portions of the work shall be installed. This includes but not limited to point-to-point high level integration diagram, riser diagram, termination diagram, panel layout, door types and product data sheet.

1.1.2 The following abbreviations may be used in this document:

---

A	- Ampere
A/E	- Architect or Engineer
ac	- Alternating current
AFF	- Above Finished Floor
AME	- Architectural, Mechanical, Electrical
AN	- Access Node
ANSI	- American National Standards Institute
AP	- Access Point

## **2 PRODUCT**

2.1 **Not applicable to this Section.**

## **3 EXECUTION**

3.1 **Not applicable to this Section.**

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 General**

- 1.2.1 The Electronic Safety and Security Contractor shall comply with the local Electrical Safety Cod, all Local, Provincial and Federal laws, where applicable and with requirements of the Canadian Standards Association (CSA) when mandatory. Make any changes or alteration required by the authorised inspector of the authority having jurisdiction, at no extra charge to the Client.
- 1.2.2 The latest version, including technical bulletins and addenda will be applicable to all codes and standards.
- 1.2.3 If a conflict between codes and standards occur the most stringent code or standard will be applicable.
- 1.2.4 Non-plenum (CMR) and plenum rated (CMP) cables shall be ULC (UL) Listed and/or SA Certified.
- 1.2.5 The following list highlights the typical applicable standards. All national and local codes and standards not listed for Products, Buildings, Fire, Health and Safety and Electrical will also apply.

ANSI INCITS 263	- Information Technology – Fibre Distributed Data Interface (FDDI) – Token Ring Twisted Pair Physical Layer Medium Dependent (TP-PMD)
ANSI/ASA S3.2-2009	- Method for Measuring the Intelligibility of Speech over Communication Systems
ANSI/ICEA S-80-576	- Standard for Category 1 & 2 Individually Unshielded Twisted Pair Indoor Cables (With or Without an Overall Shield) For Use in Communications Wiring Systems Technical Requirements
ANSI/ICEA S-83-596	- Indoor Optical Fibre Cable
ANSI/ICEA S-83-640	- Optical Fibre Outside Plant Communications Cable
ANSI/ICEA Z136.2	- American Standards for the Safe Use of Lasers in Manufacturing Environments
ANSI/TIA/EIA 455	- Fibre Optic Test Procedures
ANSI/TIA/EIA 472CAAA	- Detail Specification for All-Dielectric (Construction 1) Fibre Optic Communications Cable for Indoor Plenum Use, Containing Class Ia, 62.5 mm Core Diameter/125 Cladding Diameter Optical Fibre(s)
ANSI/TIA/EIA 472DAAA	- Detail Specification for All-Dielectric Fibre Optic Communications Cable for Outside Plant Use, Containing Class Ia, 62.5 mm Core Diameter/125 mm Cladding Diameter/250 mm Coating Diameter

---

ANSI/TIA/EIA 492AAAA	-	Optical Fibre(s) Detail Specification for 62.5-mm Core Diameter/125-mm Cladding Diameter Class Ia Multimode, Graded-Index Optical Waveguide Fibres
ANSI/TIA/EIA 492AAAB	-	Detail Specification for 50.0-mm Core Diameter/125-mm Cladding Diameter Class Ia Multimode, Graded-Index Optical Waveguide Fibres
ANSI/TIA/EIA 492BAAA	-	Detail Specification for Class IVa Dispersion- Unshifted Singlemode Optical Waveguide Fibres Used in Communications Systems
ANSI/TIA/EIA 568-C.1	-	Commercial Building Telecommunications Cabling Standard: General Requirements
ANSI/TIA/EIA 568-C.2	-	Commercial Building Telecommunications Cabling Standard: Balanced Twisted Pair Cabling
ANSI/TIA/EIA 568-C.3	-	Commercial Building Telecommunications Cabling Standard: Optical Fibre Cabling Components Standard
ANSI/TIA/EIA 569-C	-	Commercial Building Standards for Telecommunications Pathways and Spaces.
ANSI/TIA/EIA 570-B	-	Residential Telecommunications Infrastructure Standard
ANSI/TIA/EIA 598-C	-	Optical Fibre Cable Color Coding
ANSI/TIA/EIA 604	-	Fibre Optic Connector Intermateability Standard (Focis3)
ANSI/TIA/EIA 606-B	-	Administration Standard for the Telecommunications Infrastructure
ANSI/TIA/EIA 607-B	-	Commercial Building Grounding and Bonding (Earthing) for customer premises
ANSI/TIA/EIA 758-B	-	Residential Telecommunications Infrastructure Standard
BICSI ITSIM	-	Information Transport System Installation and Methods Manual
CAN/ULC S101	-	Standard Method of Fire Endurance Tests of Building Construction and Materials
CAN/ULC S102	-	Standard Method of Testing for Surface Burning Characteristics of Building Materials and Assemblies
CAN/ULC S115	-	Standard Method of Fire Tests of Fire stop Systems
CEC, Part 1	-	The Canadian Electrical Code, Part 1
CENELEC EN 50173	-	Performance Requirements for Generic Cabling Schemes
CSA C22.1-12	-	Canadian Electric Code Part I: Safety Standards for Electrical Installations
CSA C22.2 232 M1998	-	Canadian Electric Code Part II: Optical Fibre Cables

---

---

CSA C22.2 No. 0	- Canadian Electric Code Part II: General Requirements (Communications Cables)
CSA C22.2 No. 181.4	- Plugs, Receptacles, and Connectors for Communication Systems
CSA C22.2 No. 214	- Communications Cables
CSA T527	- Grounding and Bonding for Telecommunications in Commercial Buildings
CSA T528	- Design Guidelines for Administration of Telecommunications Infrastructure in Commercial Buildings
CSA T529	- Design Guidelines for Telecommunications Wiring Systems in Commercial Buildings
CSA T530	- Commercial Building Standard for Telecommunication's Pathways and Spaces

## **2 PRODUCT**

### **2.1 Not applicable to this Section.**

## **3 EXECUTION**

### **3.1 Compliance to Codes and Standards**

- 3.1.1 The Electronic Safety and Security Contractor shall install all equipment and material in accordance with the standards aforementioned in this section.
- 3.1.2 Quality and workmanship shall be at the highest of professional tradesman levels to be accepted for completion. The Electronic Safety and Security Consultant shall have the sole right to reject any work not in accordance with industry standards.
- 3.1.3 Electronic Safety and Security Contractors shall provide installers trained in all applicable codes, standards, regulations, and installation standards.
- 3.1.4 All installers shall have successfully completed the approved manufacturer's installation training program. The Electronic Safety and Security Consultant reserves the right to receive written proof of such training at any time during the project. If such proof is not provided the Electronic Safety and Security Contractor will remove the installer from the site immediately and replace the installer within 24 hours.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Comply with Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 Acceptable Manufacturers**

- 1.2.1 All equipment and products supplied shall be new and free of all manufacturer defects and delivery or installation damage.
- 1.2.2 All equipment and products supplied shall meet all manufacturer listed characteristics as identified in the latest manufacturer catalogue.
- 1.2.3 All products shall meet all applicable codes and standards and bare the UL/ULC label, be CSA approved and meet FCC/CRTC Regulations.
- 1.2.4 All products shall be provided in accordance with local, provincial, and national fire ratings for the installation on this project.

### **1.3 Certification**

- 1.3.1 Certification shall be provided by the specified and selected product manufacturer directly to the Electronic Safety and Security Consultant.
- 1.3.2 The Electronic Safety and Security Contractor is responsible for providing to the Electronic Safety and Security Consultant a copy of the application for certification with 5 in days of project award.
- 1.3.3 Upon completion of the project the Electronic Safety and Security Contractor shall deliver to the Electronic Safety and Security Consultant for the Owner a copy of the manufacturer's warranty information, certificate and or plaque. This information shall accompany the final documentation described further in these specifications.
- 1.3.4 The Electronic Safety and Security Contractor shall currently be an authorized installer of the manufacturer providing the warranty.
- 1.3.5 Subcontractors shall not be acceptable to provide warranty unless pre-approved by the Electronic Safety and Security Consultant and the Owner at time of tender. Subcontractors will not be approved after tender is awarded.
- 1.3.6 The Electronic Safety and Security Contractor shall provide a written 2-year warranty inclusive of all parts and labour for the end to end solution. The Electronic Safety and Security Contractor shall also state and agree in writing to providing response for any warranty request within 24 hours during this warranty period.

---

## **2 PRODUCT**

2.1 **Not applicable to this Section.**

## **3 EXECUTION**

### **3.1 Scope**

3.1.1 The specific Electronic Safety and Security scope of this project includes the complete supply, installation and commissioning of the following Electronic Safety and Security Systems.

- .1 Access Control
- .2 Video Surveillance/CCTV
- .3 Intercom System
- .4 Electronic Personal Protection system

3.1.2 The specific Electronic Safety and Security scope of this project includes but is not limited to:

- .1 Supply of one (1) electronic copy PDF format of shop drawings for all products prior to placing material order to acquire written approval from the Electronic Safety and Security Consultant.
- .2 Supply and installation of a complete access control system including cabling, accessories, and software.
- .3 Supply and installation of a complete video surveillance system including accessories and software.
- .4 Supply and installation of a complete intercom system including cabling and accessories.
- .5 Supply and installation of a complete electronic personal protection system including cabling and accessories.
- .6 Complete integration of the Access Control, Video Surveillance, Intercom and Electronic personal protection system.
- .7 Complete testing of each system in a timely fashion and in coordination with other trades and services to ensure completely tested systems prior to activation by the Owner.
- .8 Test Electronic Safety and Security Systems operations based on a point-by- point walkthrough review.
- .9 Perform end-user training.
- .10 Supply and installation of all active and passive hardware and cables as specified within this document to support the Electronic Safety and Security Systems.
- .11 Supply temporary and final record drawings as specified.

- .12 Complete all final documentation requirements including documentation and site reviews as per Section 28 00 09.

3.2 **Phasing**

- 3.2.1 This project shall be completed in (1) one phase. Co-ordination with the General Contractor and other trades is imperative and shall form part of the scope of this project. This installation will not necessarily be completed over a continuous time period and may be completed over two or more time periods to allow for co-ordination with other groups / trades.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 Shop Drawings**

- 1.2.1 Provide 1 PDF format of manufacturer prepared shop drawings identifying complete technical specifications for each product being supplied as part of the end-to-end solution including fire stopping, pathways and other miscellaneous products.
- 1.2.2 Shop drawings shall be stamped and signed “For Review” complete with date submitted.
- 1.2.3 Manufacturers shop drawings showing various model or styles shall be labelled with identification arrows and or highlights showing which items are being proposed. Arrows and or highlights shall be reproducible through standard photocopying.
- 1.2.4 Shop drawings shall be approved by the Electronic Safety and Security Consultant prior to starting installation and the Electronic Safety and Security Contractor will be responsible for the cost of replacing of all installed product not approved.
- 1.2.5 Approved shop drawings shall be included in the Project Manual for this project.

### **1.3 Project Documentation**

- 1.3.1 The Electronic Safety and Security Contractor shall provide hand marked record drawings showing all cable numbers on floor plans, rack elevations, backboard layouts and cable routing at the completion of the project. Drawings shall include all architectural and project changes. Provide within ten (10) days of substantial completion of the project two (2) hard copies for review and approval by the Electronic Safety and Security Consultant.
- 1.3.2 The Electronic Safety and Security Contractor shall prepare record drawing(s) using AutoCAD or better. The Electronic Safety and Security Contractor shall issue one (1) AutoCAD copy and one (1) PDF copy of record drawings within ten (10) days of project completion. If the Electronic Safety and Security Contractor cannot comply with this requirement, Spectech will update all hand drawn record drawings to AutoCAD. The cost for this service shall be based on per diem rates at the time of completion. The Electronic Safety and Security Contractor shall be responsible for the costs associated with this work.
- 1.3.3 Prepare a complete Verification report for each door or security device, complete with the technician’s signature and date

- 
- 1.3.4 At the completion of the project be prepared to submit 1 copy of a project manual in PDF format to the Electronic Safety and Security Consultants for review and approval. This project manual shall include:
- .1 Contractor's Name, contact information and lead installer/foreman's contact info
  - .2 Letter detailing, total cost of project (including changes), square footage, project highlights, Architect/Interior Designer and Owner name and contact information.
  - .3 Final bill of materials
  - .4 Approved shop drawings
  - .5 WHIMS data sheets on all applicable materials including fire stopping
  - .6 Maintenance and/or operation manuals for all equipment
  - .7 Connectivity database
  - .8 Test results
  - .9 Record drawings
  - .10 Letter of 2 year installation warranty
  - .11 Manufacturer's Certification and warranty documentation
- 1.3.5 Upon written approval from the Electronic Safety and Security Consultant prepare (3) additional project manuals for distribution to the Owner in PDF or hardcopy format as requested.
- 1.3.6 The Electronic Safety and Security Contractor shall prepare a separate Connectivity Database in Excel spreadsheet format.

#### **1.4 Site Documentation**

- 1.4.1 The Electronic Safety and Security Contractor shall be responsible for maintaining a complete set of record marked up drawings on site for the Electronic Safety and Security Consultants review at all times. Drawings shall be up to date with all architectural and project changes.
- 1.4.2 Maintain a log of date, time, and reason for any delays in performing the installation. Details shall include names, conditions, and specific reason for delay.
- 1.4.3 The Electronic Safety and Security Contractor shall prepare a separate Connectivity Database in Excel spreadsheet format.
- 1.4.4 Final documentation not provided within 30 days of project completion and with reasonable notification may result in the commissioning of another agent to prepare such documents. Costs for this work will be deducted from all Holdback amounts available to the Electronic Safety and Security Contractor.

## **2 PRODUCT**

### **2.1 Documentation Requirements**

2.1.1 The following items shall be delivered as scheduled after project award:

Delivery Item	Delivery Schedule	Presentation
Shop Drawings (PDF)	10 days after project award	Email/ Electronic PDF
Monthly Draw Breakdown (PDF)		

2.1.2 The following items shall be kept up to date during project construction.

Delivery Item	Delivery Schedule	Presentation
Continuously Updated Drawings	During construction on-site	Electronic PDF

2.1.3 The following items shall be delivered after project completion (in a single PDF):

Delivery Item	Delivery Schedule	Presentation
Contractor's Information	10 Days after Cutover	Electronic PDF
Project Details	10 Days after Cutover	Electronic PDF
Final Bill of Materials	10 Days after Cutover	Electronic PDF
Approved Shop Drawings	10 Days after Cutover	Electronic PDF
WHIMS Data Sheets	10 Days after Cutover	Electronic PDF
Maintenance / operation manuals	10 Days after Cutover	Electronic PDF
Verification Report	10 Days after Cutover	Electronic PDF
Record Drawings	10 Days after Cutover	Electronic PDF

2.1.4 Should the Owner or General Contractor require hardcopies of any documents listed here as to be provided in an electronic format, the Electronic Safety & Security Contractor shall provide as requested at no additional cost.

### **3 EXECUTION**

3.1 **Not applicable to this Section.**

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 General**

- 1.2.1 Use only fire stopping products that have been tested for specific fire resistance rated construction conditions conforming to construction assembly type, penetrating item type, annular space requirements, and fire rating involved for each separate instance.

### **1.3 Materials**

- 1.3.1 Products manufactured by Hilti, Specified Technologies Inc. (STI), or equivalent are acceptable.
- 1.3.2 Obtain fire stop systems for each type of penetration and construction condition indicated from a single manufacturer (i.e. Do not mix manufacturers for the same type of penetration).

### **1.4 Definitions**

- 1.4.1 Fire stopping: Material or combination of materials used to retain integrity of fire-rated construction by maintaining an effective barrier against the spread of flame, smoke, and hot gases through penetrations in fire rated wall and floor assemblies.
- 1.4.2 Smoke and Acoustical Sealing: Material or combination of materials used to maintain an effective barrier against the spread of smoke and hot gases, and to restore the STC rating in through penetrations in non-fire rated wall and floor assemblies.

### **1.5 Performance Requirements**

- 1.5.1 Fire Stop Systems shall conform to the fire (F), hose (H) and temperature (T) ratings of Codes and shall have a flame spread rating of 25 or less, National Fire Protection Association (NFPA Class "A").
- 1.5.2 Fire Stop Systems acceptable for this project are those that have been tested to the CAN/ULC S115 Standard.
- 1.5.3 Fire Stop Systems shall be CSA approved, non-permanent, dielectric, water resistant, non-hardening, permanently pliable/re-enterable putty along with the appropriate damming or backer materials.
- 1.5.4 Fire stopping shall maintain a minimum one-hour rating, meet applicable Federal, Provincial, Local building codes, and be tested by a SCC and accredited Third Party Testing Agency in accordance with the Standards.

- 1.5.5 In locations containing high moisture, fire stopping shall be compatible with Formalin.
- 1.5.6 Fire rated fittings allowing easy cable additions may be used. All non-permanent caulking or foams shall be replaced with the removal or addition of any cabling before final acceptance by the owner.
- 1.5.7 Fire rated pathway devices shall be the preferred product and shall be installed in all locations where frequent cable moves, add-ons and changes will occur.
- 1.5.8 Where non-mechanical products are utilized, provide products that upon curing do no re-emulsify, dissolve, leach, breakdown or otherwise deteriorate over time from exposure to atmospheric moisture, sweating pipes, ponding water, or other forms of moisture characteristic during or after construction.
- 1.5.9 Where it is not practical to use a mechanical device, openings within floors and walls designed to accommodate communications cabling shall be provided with re-enterable products that do not cure or dry.
- 1.5.10 Openings for cable trays shall be sealed using re-enterable fire stopping pillows.

#### **1.6 Quality Assurance**

- 1.6.1 Products/Systems: Provide fire stopping systems that comply with the following requirements:
  - .1 Fire stopping tests are performed by a qualified, testing and inspection agency. A qualified testing and inspection agency is UL, or another agency performing testing and follow-up inspection services for fire stop system acceptable to authorities having jurisdiction.
  - .2 Fire stopping products bear the classification marking of qualified testing and inspection agency.
- 1.6.2 Installer Qualifications: Experience in performing work of this section who is qualified by the fire stopping manufacturer as having been provided the necessary training to install fire stop products in accordance with specified requirements.

#### **1.7 Delivery, Storage and Handling**

- 1.7.1 Manufacturer's original, unopened, undamaged containers, identification labels intact identifying product and manufacturer, date of manufacture; lot number; shelf life, if applicable; qualified testing and inspection agency's classification marking; and mixing instruction for multicomponent products.
- 1.7.2 Handle and store products according to manufacturer's recommendations published in technical materials. Leave products wrapped or otherwise protected and under clean and dry storage conditions until required for installation.
- 1.7.3 Store materials protected from exposure to harmful weather conditions and at temperature and humidity conditions recommended by manufacturer.

---

1.8 **Project Conditions**

- 1.8.1 Do not install fire stopping products when ambient or substrate temperatures are outside limitations recommended by manufacturer.
- 1.8.2 Do not install fire stopping products when substrates are wet due to rain, frost, condensation, or other causes.
- 1.8.3 Maintain minimum temperature before, during, and for a minimum 3 days after installation of materials.
- 1.8.4 Do not use materials that contain flammable solvents.
- 1.8.5 Coordinate construction of openings and penetrating items to ensure that through-penetration fire stop systems are installed according to specified requirements.
- 1.8.6 Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration fire stop systems.
- 1.8.7 Schedule installation of fire stopping after completion of penetrating item installation but prior to covering or concealing of openings.
- 1.8.8 Supply and install temporary fire stopping at the end of every work shift or when location of work is changing from one work area to another. This shall be done to maintain the penetration's fire rating in areas where no work is being done.

**2 PRODUCT**

2.1 **Fire Stop Grommets & Discs**

- 2.1.1 Shall be used only for penetrations of individual 4-pair UTP or F/STP cables.

Specified Product:

	Part No.	# Of Cables	Hole Diameter
Hilti	CFS-D	1	1" (25mm)
Specified Technologies Inc. (STI)	RFG1	1	9/16" (14mm)
Specified Technologies Inc. (STI)	RFG2	2	1" (25mm)

2.2 **Fire Stop Sealants**

- 2.2.1 Single component latex formulations that upon cure do not re-emulsify during exposure to moisture.

Specified Product:

Hilti	CP 606 FS-ONE MAX Sealant
Specified Technologies Inc. (STI)	SpecSeal® Series SSS Sealant
Specified Technologies Inc. (STI)	SpecSeal® Series LCI Sealant

---

**2.3 Fire Stop Putty**

2.3.1 Intumescent, non-hardening, water resistant putties containing no solvents, inorganic fibres or silicone compounds.

Specified Product:

Hilti	CP 617 Firestop Putty Pads
Hilti	CP 618 Firestop Putty Stick
Specified Technologies Inc. (STI)	SpecSeal® Series SSP Putty

**2.4 Fire Rated Cable Pathways**

2.4.1 Device modules comprised of steel raceway with intumescent foam pads allowing 0 to 100 percent cable fill.

Specified STI Products:

EZ-Path Multi-Gang Wall Bracket	EZP544W
EZ-Path (No Options)	EZD44
Single EZ-Path Kit	EZDP44

Only where wall thickness exceeds 10" use the following  
(Adjust quantity of EZ-Path units and accessories to suit cable quantity):

Single EZ-PATH Kit	EZDP33FWS
Two Gang EZ-PATH Kit	EZDP233GK
Three Gang EZ-PATH Kit	EZDP333GK
Four Gang EZ-PATH Kit	EZDP433GK
Radius Control Module	RCM33
Extension Module	EZD33E

Specified Hilti Products:

Firestop Gang Plate	CFS-SL GP
Single Speed Sleeve Kit	CFS-SL SK

Only where wall thickness exceeds 10" use the following  
(Adjust quantity of Sleeve units and accessories to suit cable quantity):

Single Speed Sleeve Kit	CP 653
Two Gang Speed Sleeve Kit	CFS-SL GP, CFS-SL GP CAP, and Speed Sleeves
Three Gang Speed Sleeve Kit	CFS-SL GP and Speed Sleeves
Four Gang Speed Sleeve Kit	CFS-SL GP and Speed Sleeves
Extended Speed Sleeve	CFS-SL GA L

---

### **3 EXECUTION**

#### **3.1 Examination**

- 3.1.1 Before beginning installation, verify that substrate conditions previously installed under other sections are acceptable for installation of fire stopping in accordance with manufacturer's installation instructions and technical information.
- 3.1.2 Surfaces shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellents, and any other substances that may inhibit optimum adhesion.
- 3.1.3 Provide masking and temporary covering to protect adjacent surfaces.
- 3.1.4 Do not proceed until unsatisfactory conditions have been corrected.

#### **3.2 Installation**

- 3.2.1 Install through-penetration fire stop systems in accordance with Performance Criteria and in accordance with the conditions of testing and classification as specified in the published design.
- 3.2.2 Comply with manufacturer's instructions for installation of fire stopping products.

#### **3.3 Field Quality Control**

- 3.3.1 Keep areas of work accessible until inspection by authorities having jurisdiction.
- 3.3.2 Where deficiencies are found, repair fire stopping products, so they comply with requirements.

#### **3.4 Non-Monitored Penetrations**

- 3.4.1 Where fire watch is not in effect, or the Electronic Safety and Security Contractor has not been able to confirm whether fire watch is in effect, all fire penetrations, whether all cables have been pulled or not, removed or not, shall be fire stopped at the end of every workday prior to the Electronic Safety and Security Contractor leaving the site. At no time shall a penetration be un-attended or without fire stopping material in areas where work is not in progress.

**END OF SECTION**

**1 GENERAL**

**1.1 Work Included**

1.1.1 Conform to Section 27 00 00 – Communication Specifications.

**1.2 General**

1.2.1 All CCTV UTP cabling shall be installed by the Communications Contractor.

1.2.2 The Electronic Safety and Security Contractor shall coordinate with the Communications Contractor the final CCTV cabling locations and terminations.

1.2.3 CCTV UTP cabling shall be installed in conduit indicated on drawings and as per Section 28 05 28 of this specification.

**2 PRODUCT**

2.1 **Not Applicable to this Section**

**3 EXECUTION**

3.1 **Not applicable to this Section**

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 General**

- 1.2.1 Access control cabling shall be installed in conduit indicated on drawings and as per Section 28 05 28 of this specification.
- 1.2.2 Ensure that all cables are sufficiently long to allow for slack, vertical runs, wastage, connectorization and future moves.

## **2 PRODUCT**

### **2.1 UTP Cables**

- 2.1.1 Conform to Section 27 00 00 – Communication Specifications.

### **2.2 Multi-Conductor Copper Cabling**

- 2.2.1 All access control cabling shall be stranded, twisted, overall shield copper conductor, CSA certified and stamped with CMR/FT6 rating accordingly.
- 2.2.2 All multi-conductor copper cables shall meet the minimum requirements identified below.

Conductor	Rating	AWG	Device
6	CMR/FT6	22	Card Reader
		Shielded	
4	CMR/FT6	22	Door Contact
4	CMR/FT6	22	Request to Exit Sensor
2	CMR/FT6	22	Request to Exit Push Button
2	CMR/FT6	18	Electric Strike

## **3 EXECUTION**

### **3.1 Access Control Cabling**

- 3.1.1 Cabling shall be run in conduit and shall be concealed in finished areas.
- 3.1.2 Cabling shall be terminated as per manufacturer's guidelines and remove only enough cable jacket to perform termination.
- 3.1.3 Comply with manufacturer's recommended bundling practices for installation. Ensure that excess pressure is not placed on the cable at any point that may result in the compression or deformation of the cable jacket and internal pair/conductor geometry.

- 
- 3.1.4 Cables shall not be scrapped, dented, or otherwise damaged before, during or after installation. All damaged cabling shall be replaced at no extra cost to the Owner.
  - 3.1.5 The splicing of any access control cables is not permitted.
  - 3.1.6 After installation, and before termination, all wiring and cabling shall be checked and tested to insure there are no grounds, opens, or shorts on any conductors or shields. A V.O.M. shall be utilized to accomplish these tests and a reading of greater than 20 Megohms shall be required to successfully complete the test.
  - 3.1.7 Ensure that all cables are of sufficient length to allow for slack, vertical runs, wastage, and connectorization.

**END OF SECTION**

**1 GENERAL**

**1.1 Work Included**

1.1.1 Conform to Section 27 00 00 – Communication Specifications.

**1.2 General**

1.2.1 Follow manufacture specified guideline for grounding and bonding of all electronic safety and security devices and equipment.

**2 PRODUCT**

**2.1 Not applicable to this section**

**3 EXECUTION**

**3.1 General**

3.1.1 The Electronic Safety and Security Contractor shall ensure a complete grounding system is installed for the project. If any portion of the system to be installed by Division 26 is incomplete it shall be the responsibility of the Electronic Safety and Security Contractor to advise the Electronic Safety and Security Consultant.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security

### **1.2 General**

- 1.2.1 The Electronic Safety and Security Contractor shall be responsible for measuring and confirming cable pathways prior to installation of any cabling to ensure no cabling will exceed the specified distance limitations. Where the distance limitations are exceeded, the Electronic Safety and Security Contractor shall inform the Electronic Safety and Security Consultant prior to installation of cabling. No compensation for removal of cabling will be accepted if not adhered to.

### **1.3 Indoor Cable Distribution**

- 1.3.1 Ensure proper installation practices are followed for all indoor cable distribution.
- 1.3.2 The Electronic Safety and Security Contractor shall install and distribute cabling using conduit or cable tray as indicated on drawings. Where cables leave the indicated pathways, the Electronic Safety and Security Contractor shall supply and install additional pathways to support cabling up to point of termination.

## **2 PRODUCT**

### **2.1 J-Hooks**

- 2.1.1 J-hooks shall be made of metal and/or plastic and shall be Plenum rated.
- 2.1.2 J-hooks shall be supplied and installed with all necessary fastening suitable for the building structure being used to support the cabling and as per the manufacturer's installation requirements or guidelines.
- 2.1.3 J-hooks shall be manufactured by Erico or Panduit and sized to suit.

Specified Product:

Erico	CAT12
Erico	CAT21
Erico	CAT32
Erico	CAT64
Panduit	JP75
Panduit	JP131
Panduit	JP2
Panduit	JP4

Notes: Product Codes shown above indicate only Series numbers and are

---

not application specific.

## 2.2 **Velcro Wraps**

- 2.2.1 Velcro wraps shall be supplied and installed to support and neatly bundle all cabling.
- 2.2.2 No nylon or plastic wraps will be permitted on this project and will be removed and replaced at the expense of the Electronic Safety and Security Contractor.
- 2.2.3 Velcro Wraps shall be black in colour.

Specified Product:

		Width	Tensile Strength
Panduit	HLM-15R0	0.330"	18
Panduit	HLS-15R0	0.750"	50
Panduit	HLS-75R0	0.750"	50
Panduit	TTS-20R0	0.750"	40
Panduit	TTS-35R3-0	0.750"	40

## 3 **EXECUTION**

### 3.1 **Indoor Cable Distribution**

- 3.1.1 All pathways shall be installed to run parallel to building lines at all times.
- 3.1.2 Pathways shall be installed in coordination with other trades in order to minimize interferences and obstructions. The Electronic Safety and Security Contractor shall be responsible for relocating installed pathways at no cost to the Owner.
- 3.1.3 All cable supports shall be installed to the permanent structure of the building and be limited to areas that will not damage the structural stability such as tensioned beams and slabs. It is the responsibility of the Electronic Safety and Security Contractor to submit information to the structural engineer for review and approval prior to installation.
- 3.1.4 Anchors for J-hooks shall not be drilled into post tensioned beams under any circumstances. All anchors shall be drilled into slab.
- 3.1.5 Pneumatic hammers shall not be used unless the Electronic Safety and Security Contractor has written authorization from the building owner/landlord.
- 3.1.6 The Electronic Safety and Security Contractor shall minimize the removal/disturbance of fire spray insulation while installing cable supports and/or accessories.
- 3.1.7 All pathways and cabling installation shall maintain clearances from all electrical, communications, audio video and heat sources as outlined below.

---

Fluorescent Fixtures	15 cm
Electrical distribution cabling and conduits less than 1KVA	1.0 m
Electrical distribution cabling and conduits greater than 1KVA	3.0 m
Transformers and Motors	1.2 m
HVAC system including ducts	30 cm
Mechanical piping	15 cm

- 3.1.8 Prepare all conduits and pathways prior to installation of cabling. This shall include bushing or reaming all conduit openings, pulling of wire brush and mandrel to clean out ducts and identifying any potential issues that may cause damage to cables during installation. Report all items to the Electronic Safety and Security Consultant immediately.

### 3.2 **J-Hooks**

- 3.2.1 Suspended ceiling and T-Bar hangers shall not be acceptable in any situation.
- 3.2.2 J-Hooks shall be installed every 3' to 4' to support cabling (ensure that the distance between j-hooks is not consistent; do not place j-hooks exactly the same distance apart repeatedly).
- 3.2.3 All cabling shall be installed to have no more than 3" sag between J-hooks. All cabling shall be fastened using Velcro Ty-Wraps only. The Electronic Safety and Security Contractor will be responsible for all costs associated with removing other fasteners and install the specified product.
- 3.2.4 If the quantity of cables exceeds 80% of the manufacturer's capacity rating install the next larger size or substitute with cable slings at no additional cost to the Owner.
- 3.2.5 J-hooks shall be installed in coordination with other building services and without interruption to the Owner or surrounding Owners within the building.

### 3.3 **Velcro Wraps**

- 3.3.1 Velcro Wraps shall be installed at every J-hook, between every pair of J-hooks or within 2' of a J-hook to neatly bundle cabling.
- 3.3.2 Velcro Wraps shall be installed every 3' to neatly bundle cabling installed in cable tray.
- 3.3.3 Velcro Wraps shall be installed every 6" to neatly bundle cabling at all locations on cabinets and enclosures.

### 3.4 **Fire Stopping**

- 3.4.1 For all fire stopping requirements refer to Section 28 00 13 – Fire Stopping.

3.5 **Grounding**

- 3.5.1 For all grounding and bonding requirements refer to Section 28 05 26 – Grounding and Bonding for Electronic Safety and Security.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.
- 1.1.2 Where labelling schemes are not provided the Electronic Safety and Security Contractor shall develop a labelling scheme with the Electronic Safety and Security Consultant prior to the installation of any permanent labels on the Electronic Safety and Security Systems components.

### **1.2 Cable Labelling**

- 1.2.1 All cabling runs shall be labelled in two (2) locations at each end of the cable.

### **1.3 Active Equipment Labelling**

- 1.3.1 Each piece of active equipment, such as servers, controllers, etc. shall be labelled with one label on the front and one label on the back (where applicable).

### **1.4 Labelling Schemes**

- 1.4.1 The Electronic Safety and Security Contractor will be responsible to confirm labelling schemes with the Electronic Safety and Security Consultant prior to preparation and installation of any labelling.

Access Control:

A/CN-Ca-D

where: CN = Controller Number  
Ca = Cable Number  
D = Door Number (as per drawing)

Video Surveillance:

C/Cam-Ca

where: Cam = Camera Number (as per drawing)  
Ca = Cable Number

Active Equipment:

E/ID

where: E = Equipment Type (Controller, Control Panel, etc.)  
ID = Identification Number (1, 2, 3, etc.)

## **2 PRODUCT**

### **2.1 Cable and Active Equipment Labelling**

- 2.1.1 All products shall meet UL 969 standards and be rated for indoor or outdoor use as applicable to the installation.

- 2.1.2 Cable labels shall be self-laminating, vinyl with white printing area and sized to allow label to wrap around 2.5 times minimum. Labels also shall be sized to suit the labelling requirement maintaining a minimum 10-point font size.
- 2.1.3 Active equipment labels shall be adhesive style made of polyester with a white printing area and sized to suit the designated label location. Labels shall be printed with a minimum ¼" high font.
- 2.1.4 All equipment cabinets labels shall be black lamacoid plates with white 60-point Arial Narrow, engraved upper case letters enclosed by white border.
- 2.1.5 Labels should be visible during the installation of and normal maintenance of the infrastructure. Labels should be resistant to the environmental conditions at the point of installation (such as moisture, heat, or ultraviolet light) and should have a design life equal to or greater than that of the labelled component.
- 2.1.6 Provide vinyl substrate with a white printing area and black print. If cable jacket or equipment is white, provide cable label with printing area that is any other color than white, preferably orange, or yellow – so that the labels are easily distinguishable.

### **3 EXECUTION**

#### **3.1 General**

- 3.1.1 Supply and install labels for all cables and all active and passive devices.
- 3.1.2 All labels shall be printed on a laser printer. No handwritten labels shall be accepted.
- 3.1.3 All temporary labels shall be removed from cables and equipment prior to commissioning.

#### **3.2 Cable Labels**

- 3.2.1 Cable labels shall be installed on clean and dry cable and mounted within 100mm or 4" of each end of each cable.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 Warranty and Service Agreement**

- 1.2.1 All equipment, materials, and labour shall be guaranteed for a period of 1 year from the date of final acceptance by the Owner.
- 1.2.2 Provide any software maintenance updates or upgrades at no additional cost to the Owner for this period.
- 1.2.3 Perform two (2) scheduled preventative maintenance site visits per year during the warranty period.
- 1.2.4 Response Times - Normal business hours shall be 8 AM to 5 PM Monday through Friday. Calls for service before noon shall be responded to on-site before the end of the day. Calls after noon shall be responded to on-site by noon the following business day.
- 1.2.5 Provide extra costs for time outside of normal business hours if the Owner requires emergency service.
- 1.2.6 Submit an all-inclusive Annual Maintenance Agreement cost for years 2, 3, 4 and 5, including two (2) preventative maintenance sites visits per year.
- 1.2.7 Submit normal and after-hours labour costs and typical costs for equipment for items not covered under the Warranty, like: Acts of God, vandalism, misuse.

## **2 PRODUCT**

### **2.1 Not applicable to this Section.**

## **3 EXECUTION**

### **3.1 General**

- 3.1.1 The Electronic Safety and Security Consultant reserves the right to witness test any or all of the systems as required. The Electronic Safety and Security Contractor will provide (3) day notice prior to starting testing in any particular phase of the project.
- 3.1.2 The Electronic Safety and Security Contractor shall arrange and include all time required to tour site with manufacturer in order to warranty the systems. This includes for additional visits if required.
- 3.1.3 The Electronic Safety and Security Engineer's Representative shall make general reviews at the job site and shall review the following for configuration:
  - .1 Quality of construction
  - .2 Adherence to design requirements

.3 Conformance with shop drawings and submittal information.

3.1.4 Commissioning

.1 The Electronic Safety and Security Contractor shall identify all components, functions and systems that shall be commissioned.

.2 The Electronic Safety and Security Contractor shall develop device checklists, functional test forms and system integration test forms that shall be executed by the Electronic Safety and Security Contractor.

.3 Each device checklist shall include but not limited to:

.1 Unique identifier of each device and component of the respective system

.2 Location of device

.3 Name of commissioning agent

.4 Name of witness

.5 Date of commissioning

.6 For each device, all function and performance requirements indicated in the relative system specifications sections of this document, all function and performance requirements indicated on all associated drawings, all industry standard tests, all manufacturer recommended tests, all test that are required to confirm that the respective device is in proper working order.

.7 Confirmation of device tests performed

.8 Confirmation of tests passed or failed and related comment

.4 Each functional test form shall include but not limited to:

.1 Identification of system under test

.2 Location of system

.3 Name of commissioning agent

.4 Name of witness

.5 Date of commissioning

.6 For each system, all function and performance requirements indicated in the relative system specifications sections of this document, all functions indicated on all associated drawings, all industry standard functional tests, all manufacturer recommended functional tests and all functional tests that are required to confirm that the respective system is in proper working order.

.7 Confirmation of functional tests performed

.8 Confirmation of tests passed or failed and related comment

.5 Systems Integration Functional Test Forms

Each system integration test form shall include but not limited to:

.1 Identification of systems under test

- 
- .2 Location of systems
  - .3 Name of commissioning agent
  - .4 Name of witness
  - .5 Date of commissioning
  - .6 All integrated function and performance requirements that are indicated in the electronic safety and security system integration specifications section of this document, all integrated functions indicated on all associated drawings, all industry standard integration functional tests, all manufacturer recommended integrated functional tests and all integrated functional tests that are required to confirm that the respective systems are integrated and are in proper working order.
  - .7 Confirmation of integrated functional tests performed
  - .8 Confirmation of tests passed or failed and related comment
  - .6 The Electronic Safety and Security Contractor shall forward the device checklists, functional test forms and systems integration test forms to the Electronic Safety and Security Consultant for review and approval prior to commencing commissioning.
  - .7 Pre-Start-up Test
    - .1 The Electronic Safety and Security Contractor shall perform prestart-up tests to verify that the devices and systems that are to be commissioned are powered, calibrated, operational, and ready for device and functional testing.
  - .8 Perform Device Tests
    - .1 The Electronic Safety and Security Contractor shall perform device tests for all devices in accordance with the device checklists.
  - .9 Perform Functional Tests
    - .1 The Electronic Safety and Security Contractor shall perform functional tests for all devices and systems in accordance with the functional test forms
  - .10 Glass Break Simulator
    - .1 The glass break simulator shall be a portable, battery-operated tester that ensures reliable locating and testing of glass break detectors.
    - .2 The glass break simulator:
    - .3 Generate plate or tempered glass sound samples.
    - .4 Include a 7.6mm (3") full range speaker that accurately reproduces the full range of frequencies generated by shattering glass.
    - .5 Single or automatic / continuous sound (sound every 10

seconds) operation.

- .11 Perform System Integration Tests
  - .1 The Electronic Safety and Security Contractor shall perform system integration functional tests for all devices and systems in accordance with the system integration functional test forms.
- .12 Perform Retests as Necessary
  - .1 For all failed tests, the Electronic Safety and Security Contractor shall make all necessary repairs and perform retests. Failure of the integrated test may require the retest of one or more individual tests. Repairs and retests shall be by the Electronic Safety and Security Contractor until all tests are passed.
- .13 Turnover
  - .1 The Electronic Safety and Security Contractor shall prepare a comprehensive commissioning report that include but not limited to completed device checklists, completed functional test forms, completed systems integration functional test forms with measured data. The commissioning report shall be submitted along with system operation and maintenance manuals for review and approval by the Electronic Safety and Security Consultant.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 Purpose**

- 1.2.1 The buildings and facilities Access Control System primary function is to protect the assets. The contents of this document are critical and are considered confidential. This information shall not be disclosed to anyone other than authorized personnel.

### **1.3 General**

- 1.3.1 All equipment and materials used shall be standard components that are regularly manufactured and used in the manufacturer's system.
- 1.3.2 All systems and components shall have been thoroughly tested and proven in actual use.
- 1.3.3 All systems and components shall be provided with the availability of a toll-free (U.S. and/or Canada), 24-hour technical assistance program (TAP) from the manufacturer. The TAP shall allow for immediate technical assistance for either the dealer/installer or the end user at no charge for as long as the product is installed.
- 1.3.4 The Access Control system shall allow for modular expansion of 15% on day one (1) of a fully operational system.
- 1.3.5 All systems and components shall be provided with a one-day turnaround repair express and 24-hour parts replacement. The repair and parts express shall be guaranteed by the manufacturer on warranty and non-warranty items.
- 1.3.6 The access control system shall be an inter-connected group of components consisting of but not limited to the following devices:
  - .1 Controllers
  - .2 Communication devices
  - .3 Access control software
  - .4 Readers
  - .5 Fobs or cards
  - .6 Door locks
  - .7 Lock power supplies
  - .8 Personal computers
  - .9 Servers
- 1.3.7 The system shall have of the following functions:

- 
- .1 Regulate and monitor access at system-controlled doors.
  - .2 Control access to elevator floors and monitor elevator floor button activity.
  - .3 Monitor connected detectors (supervised and auxiliary inputs) with the ability to arm and disarm them manually or automatically.
  - .4 Control event-initiated devices connected to system outputs, such as alarms or video recorders, with the ability to automatically or manually arm or disarm them.
  - .5 Report an alarm condition.
  - .6 Distribute an annunciated alarm condition via an email notification off-site.
  - .7 Establish a hierarchy of alarm types to prioritize handling alarm conditions.
  - .8 Maintain a comprehensive database recording all site activity.
  - .9 Integrate with the closed-circuit television system (CCTV).
  - .10 Operate a fully integrated photo badge and verification module allowing for a complete ID badging operation.
  - .11 Interface with intrusion controllers.
  - .12 Remotely access the Client software via the Internet or a corporate intranet with a WEB module.

#### 1.3.8 Building Integration

- .1 The system shall be capable of integrating multiple buildings within one collective access control/alarm monitoring entity whether the buildings are in relative proximity or at distant locations. The access control system's design shall further allow expansion or modification within existing buildings or the integration of new buildings at any time.
- .2 The system shall be structured to provide a continually expandable growth path from the capabilities and features specified within this document without the necessity of exchanging previously installed controllers or software.

#### 1.3.9 Communication Modes

- .1 The software application modules shall be designed to communicate to the access control units using one or a combination of the following connection modes:
  - .2 Network (TCP/IP)
  - .3 Internet

#### 1.3.10 Multiple System Users

- 
- .1 The system shall support multiple system user workstations with access to the system database. The number of concurrent users shall only be limited by the software licensing agreement.
  - .2 The software shall provide selectable controls to govern individual user activity with log on accounts and passwords. System user activity shall be recorded to the database and accessible for operator audit and review.
  - .3 The system software shall provide an application that allows multiple users remote connectivity via a corporate intranet or the Internet to input and manage selective system functions.
  - .4 Provide (1) Server and Seven (7) Client Software licences (4 to be deployed on site and 3 for future owner's use).

#### 1.3.11 Cardholder Access

- .1 Access shall be governed by controlled entry point (doors) using an assigned credential, such as a token or card, that is presented to a sensing device referred to as a card reader.
- .2 At least one token or card shall be supplied for each individual who requires access through the controlled doors.
- .3 The system shall support the following reader formats:
  - .1 Proximity (125 kHz)
  - .2 Mifare Contactless Smart Card
  - .3 FIPS-201, FIPS201-PIV & TWIC
  - .4 Large Card Format (up to 75 bits)
  - .5 HID Corporate 1000
  - .6 Radio frequency transmitter/HID proximity combination
  - .7 Biometrics
  - .8 Contactless Smart Card & iClass
  - .9 Personal Identification Number (PIN) only
  - .10 Magnetic Stripe
  - .11 Barcode
- .4 Each Fob/card shall be internally encoded with an individual number. The system shall provide the means to enter these numbers into a database for transmission to each controller.
- .5 The reader shall be capable of scanning the internal number encoded in each token and transmit this information to the controller.
- .6 The controller shall process the card/token data and unlock the appropriate controlled door only if the card/token is determined to be valid for access through that door.
- .7 Where heightened and more stringent security is required, the system shall offer one of the following additional facilities to be available:

- 
- .1 A keypad can be used in tandem with a proximity reader. A cardholder would be required to present a valid token and/or enter a Personal Identification Number (PIN) code to gain access. Only one (1) reader port shall be used when both a reader and a keypad are in place.
  - .2 A combination biometric/Mifare smartcard reader can be used whereby the physical biometrics of the cardholder must match the biometric data stored on the card for 1 to 1 identification before access is granted.
  - .8 Where PIN codes are used, they shall be randomly created by the access control software. An operator shall have the ability to change PIN codes with a minimum 5-digit key number controlling algorithm process.
  - .9 An access request at a reader shall be determined based on the following conditions. Should any of the conditions be false, access would be denied. This shall result in an 'Access Denied' event recorded in the database.
    - .1 Is the card valid for this day?
    - .2 Is the card valid for this time?
    - .3 Is today a holiday? If yes, is the card valid for this holiday?
    - .4 Does the PIN match the card presented?
    - .5 Is the card valid for this site?
    - .6 Is the card valid for this door?
  - .10 Doors shall be unlocked for valid cardholders requesting entry within one second following the reader scan regardless of all other system activity.

#### 1.3.12 Door Identification and Control

- .1 The system shall provide the means to identify each portal or door that is controlled by a controller with a unique alpha description and provide the following controls or functions:
  - .1 User-defined door relay unlock time of 2 to 99 seconds, adjustable in 1 second increments.
  - .2 User-defined door held open time of 2 to 99 seconds, adjustable in 1 second increments.
  - .3 Controllers shall automatically re-lock the controlled portal when the door is sensed as closed or when the door relay unlock time expires.
  - .4 Provide a handicap accessibility feature such that an access control relay can be connected to a door operator with separate door time settings.
  - .5 Provide a pre-alert that advises when a door remains open at the half interval of the door held open time.
  - .6 Each controller shall provide a dedicated request to exit input

- 
- for each door (i.e., motion request to exit device, an exit button, etc.).
  - .7 Control a door where a reader and keypad are used conjointly with the following access modes:
    - .1 Card or Keypad – Only 1 of the two is used to gain entry
    - .2 Card Only – Only the reader is used to gain entry
    - .3 Card and Keypad – The reader and keypad are used to gain entry
  - .2 The above access modes may be set to time zones with the ability to automatically institute a change in the access mode at any time within a 24-hour clock to satisfy security requirements.
  - .3 Monitor the status of all doors controlled by controllers with the status stated in one of the following conditions:
    - .1 Locked
    - .2 Unlocked
  - .4 Provide a manual override to lock or unlock doors controlled by the access control units.
  - .5 Provide a programmable facility to automatically unlock and relock specified doors during an assigned time zone to allow access without the use of a token or card.
  - .6 Provide a safety mechanism 'First Person In' to prevent assigned doors programmed for auto unlock from unlocking at the start of a designated time zone until a valid token is first presented by an authorized cardholder.

#### 1.3.13 Local Anti-Pass Back Mode

- .1 The system shall allow doors to be 'anti-pass back' enabled. Local anti-pass back is restricted to monitoring and enforcing IN/OUT conditions at doors connected to the same access control unit.
- .2 The 'anti-pass back' function shall have a manual override.
- .3 The system shall have multiple modes of local anti-pass back:
  - .1 Hard Mode – designated cardholders are denied access on violating anti- pass back enforcement
  - .2 Soft Mode – designated cardholders are allowed access but an anti-pass back violation is reported
  - .3 Timed Mode – designated cardholders are denied access on violating anti- pass back enforcement except anti-pass back enforcement is based on a time interval (can be employed on a single reader)
  - .4 Executive (Stealth) Mode – excludes designated cardholders from anti- pass back enforcement

---

#### 1.3.14 Alarm Monitoring Functions

- .1 The system shall provide forced entry detection at secure door locations. A forced entry shall be generated immediately whenever the door is opened without authorization.
- .2 Authorization shall be determined by token or card or request to exit transaction at the door or by command from the host system as described.
- .3 The system shall provide door held open detection at controller-controlled doors. A door held open event shall be generated immediately whenever the door is held open longer than its specified time limit.
- .4 The system shall feature the provision to monitor auxiliary and supervised input points or detection zones. The system shall be capable of detecting state changes between four distinct conditions for each of these points:
- .5 Alarm
  - .1 Secure
  - .2 Trouble due to open circuit wiring
  - .3 Trouble due to short circuit wiring
- .6 The system shall also have the provision for reader supervision when connected with a "heartbeat capable" reader to detect and report one of the following alarm conditions:
  - .1 Reader communication failure
  - .2 Reader tamper alarm
- .7 When any change of state on an input point is detected, the computer shall be notified and shall generate a message stating the nature of the alarm, the location, and the time. The computer shall record the alarm such that it can be later retrieved for an audit report.

#### 1.3.15 Control Of Event Initiated Devices

- .1 The system shall have the ability to control event-initiated devices that respond to alarm events. Said devices may be armed or disarmed automatically by user-defined time zones or armed and disarmed manually by operator intervention.
- .2 The condition for each alarm output shall be user-defined to include any of the following:
  - .1 Forced entry at a system-controlled door
  - .2 Door held open time violation of a system-controlled door
  - .3 Monitored alarm point detects a violation
- .3 The system shall provide an alarm in the event a controller is tampered with.

---

1.3.16 Communication Failures

- .1 The system shall notify Client workstations of any communication failures with controllers or the communication application.
- .2 The system software shall provide full integration of all system components for overall access control management. The system software shall be regulated by individuals deemed as system operators. The system software shall include the following specifications.

1.3.17 User Interface

- .1 The software user interface shall be based on Windows® conventions and standards. The main screen shall have pull down menus as well as quick buttons for direct access to frequently used functions.
- .2 The software shall provide multiple language interfaces:
  - .1 English
  - .2 French
- .3 The software shall be designed to allow each operator to select a language of his or her preference and at any time change languages without having to exit and re-start the software. The software further supports concurrent operators to work with different interface languages simultaneously and have access to context- sensitive help in the operator's choice of language.
- .4 The software shall employ keyboard shortcuts for rapid access to certain functions.
- .5 The operator shall be able to run the system software in a minimized state and still receive notification of alarm events.
- .6 The system interface shall provide formatted forms for facility management. These forms shall provide the user with the ability to add, edit, delete, or view site-specific information including instructions pertaining to alarms and emergencies.
- .7 The system shall provide the operator with the ability to add, edit or view the following functions:
  - .1 site information and access control units
  - .2 minimum 511 door groups and 511 elevator groups
  - .3 door and elevator group access levels and associated time zones for each door and elevator floor
  - .4 cardholder records
  - .5 administrator/operator records
  - .6 readers/doors in the system
  - .7 elevator information
  - .8 time zones, schedules, holiday (3) types, and holiday dates
  - .9 alarm response instructions and contacts

- 
- .10 manual overrides & system utilities
  - .8 The system shall further provide the operator with the facility to define, view, and print summaries based on system-wide activity recorded by the database.
- 1.3.18 System Software Requirements
- .1 The system shall be based on independent, intelligent devices that are interconnected and communicate to a rack mount IBM-compatible Access Control System Servers with the following minimum specifications:
    - .2 Central Processing Unit: Intel Pentium Dual Core 2.2 GHz or higher.
    - .3 2048MB (2GB) DDR II 800MHz PC6400 Memory
    - .4 Dual 250GB SATA II 7200RPM, 16MB Cache Hard Drives, in a Raid 1 Array
    - .5 USB Port: 4
    - .6 COM Port: 1
    - .7 8X Slim CD-RW/DVD Combo Optical Drive
    - .8 Mouse or compatible pointing device
    - .9 Removable Media Storage Device such as a CD/DVD Writer for database backup
    - .10 Network Interface Card (NIC) with TCP/IP protocol
    - .11 Graphics card that supports 1024 x 768 or higher screen resolution
    - .12 Operating System: as required
    - .13 1U Rackmount Chassis with a 250W Power Supply
    - .14 Provide all servers in all configurations as required for a complete and operational access control system.
- 1.3.19 Software Architecture
- .1 The system software shall be designed so that it may be installed on a single PC or on multiple PCs and in both circumstances capable of operating on a LAN/WAN (TCP/IP) from any communication node on the network.
  - .2 The system software shall be modular in design and consist of the following standard components:
    - .1 Client (Operator Input/Monitoring/Reporting)
    - .2 communication manager
    - .3 database engine – SQL Server 2014 SP1 c/w all cumulative update builds
  - .3 The system shall support upgrading to full SQL.
-

---

1.3.20 Client Software

- .1 Event processing, data entry, system management functions, and auditing system activity shall be performed from a PC with the Client software module.
- .2 The system shall support multiple concurrent Client operators commensurate with the license agreement.
- .3 The system software shall have the capability to program and monitor remote site systems simultaneously.
- .4 The system software shall support digital signature capture devices with integrated software.
- .5 The system software shall provide the means of streaming site activity data to a serially connected device such as a pager.
- .6 Alarm Annunciation and Processing
  - .1 System occurrences deemed as violations shall be articulated as alarm events at the computer.
  - .2 The system software shall allow assigning user-defined names for any reader port or input point to distinguish its location for the benefit of the operator.
  - .3 The system shall further provide the following alarm notification/processing:
    - .4 Display the alarm in an alarm events window which cites crucial alarm information for expedient alarm handling.
    - .5 An alarm notification pop-up window shall come to the foreground so long as the access control client program is running.
    - .6 An audible warning sounds.
    - .7 The system shall provide a designated form with specific alarm event information and instructions accessible to the operator. The information shown shall include:
      - .1 Alarm time
      - .2 Alarm type
      - .3 User-defined description
      - .4 Location
      - .5 Alarm response instructions
      - .6 Alarm contacts
      - .7 Alarm response comments
    - .8 It shall be possible for the operator to 'Acknowledge' an alarm clearing it from the alarm events window or 'Pend' an alarm for further investigation.
    - .9 The operator shall be provided with the means to cite and save commentary on the disposition of an alarm event.

- 
- .10 The system shall be integrated with the CCTV system and shall provide all operators with the means to view is located still images captured by the associated cameras during the alarm event.
  - .11 As an additional aid to the alarm event, the system shall provide all operators with the option to open a floor map to pinpoint the location of the door or device that tripped the alarm. Complete floor maps/plans of all floors where access control system device/s are located shall be provided, imported, and integrated in the access control system to provide such functions.
  - .12 The system shall allow the operator to examine information for all alarms currently waiting for processing one at a time without acknowledging them and/or clear all alarms in the system.
  - .13 The system database shall log each occurrence of an alarm event.
  - .14 The system operator shall be furnished with the means to view current or pending alarms or search for alarms by device type, by a specific controller, by alarm type, by site name, or by a date range.
  - .15 The system shall incorporate the ability to email an alarm or critical message to a device that has an Internet email address.
  - .16 The system shall provide the means to establish a hierarchy of alarm priority levels to assist operators in determining an alarm's degree of importance. The system shall allow user-defined properties to be assigned to each alarm priority:
    - .1 Each alarm priority can be assigned to an access control unit, a door, an auxiliary input, a supervised input, or an optional input device with each device assigned to a specific alarm type or group of alarm types.
    - .2 Each alarm priority can be assigned a unique description with customized display characteristics.
    - .3 Each alarm priority can be assigned to a system time zone to regulate when the alarm priority is in effect. When the time zone is not in effect, the alarm is still reported but without its assigned properties.
    - .4 Each alarm priority can be routed to specific logged on system operators at specific computers.
    - .5 Each alarm priority can be assigned a sound (WAV) file to audibly annunciate the alarm priority so as to assist the operator in distinguishing the level of alarm importance
  - .17 In the event of AC power failure to the access control units, the system software shall have the means to report the AC power failure as an alarm with user-selectable time duration before
-

- 
- the alarm is tripped.
- .18 Where keypads are installed, the system shall offer a “duress” alarm type. A distressed cardholder would press the designated duress key then enter the PIN code. The system would allow access and annunciate a duress alarm for an expedient response to the situation.
- .7 Building Emergencies/Evacuations/Lockdowns
- .1 The system shall provide the means to automatically generate a printed card IN/OUT status report which can be used in emergencies or building evacuations to determine who is in and out of the building.
- .1 The card IN/OUT status report printout can be set to specified timed intervals for continuous updating until the emergency or situation is resolved.
- .2 The card IN/OUT status report can be emailed for remote location notification.
- .2 The system shall offer an optional standalone executable “lockdown” application designed to turn off one or multiple time zones to affect a lockdown.
- .1 The lockdown shall be designed to be triggered on a transaction type event such as a card presentation at a reader for rapid reaction to an emergency situation.
- .2 The system shall be able to lockdown all doors regulated by the time zone that has been turned off for maximum system- wide control.
- .8 Cardholders
- .1 The system software shall offer system-defined fields and user-defined fields to identify each cardholder.
- .2 The system shall also provide the ability to insert a digital photograph on each cardholder record (optional). The photographs may be inserted on ID cards or displayed while observing on-line transactions to enhance security protocols.
- .3 The system shall store cardholder images in the database and said images shall be preserved/updated to the database during backup operations.
- .4 The system shall provide the ability to designate cardholders with a temporary status and restrict the card to a defined date range and/or a maximum number of uses. At the conclusion of the date range or when the number of uses reaches zero, the system shall render the card inactive and deny further entry.
- .5 An operator shall be able to view from each individual cardholder record the last 25 transactions over the previous 7 days for auditing, investigating activity, or locating a cardholder’s whereabouts.
-

- 
- .6 The system shall furnish a mechanism to load blocks of numerically- sequenced cards with the same facility code for expedient card loading.
- .7 Where multiple sites exist, the system shall provide the means to quickly copy cardholder records to alternative sites. Each cardholder who requires access to multiple sites shall require only one card to access all authorized sites.
- .8 In the event a card is lost or stolen or upon employment termination, the system shall allow a card to be cancelled and rendered invalid within seconds.
- .9 As an alternative to permanently deleting a card, the system shall allow a cardholder record to be designated as 'Archived'. While the archived status is in effect, the record is maintained in the database, but the card is invalid and denied entry to all previously authorized access points. The archived status shall remain in effect until it is re-activated by an operator.
- .10 In order to locate and review cardholder records, the system shall provide extensive search capabilities that allow broad latitude of cardholder search criteria to retrieve one or multiple cardholder records. The system shall also include a search criterion entitled 'Not Used Since' that lists inactive cards based on a defined date for maintaining up-to-date records.
- .11 The system shall be capable of exporting cardholder records in Acrobat® PDF format for the benefit of non-system users.
- .12 The system shall also offer a time saving mechanism to import and export cardholder records as CSV files with other external databases. This allows transferring cardholder records to and from the access control database reducing data entry.
- .13 The system shall provide a facility to view an access level summary for individual cardholders to determine which system regulated doors and elevator floors are and are not accessible to the cardholder.
- .9 Time Zones and Schedules
- .1 The system shall provide minimum 256 time zones (254 are user- definable) and minimum 512 schedules (510 are user-definable) for door and elevator control and input, and output points.
- .2 Each time zone and schedule shall be configurable within a minimum seven (7) day week.
- .3 The system shall offer minimum three (3) holiday schedules which can be used as overrides to regular time zones and schedules for statutory holidays, special occasions, plant shutdowns etc.
- .4 The system shall support a minimum of sixty-four (64) holiday dates that the three (3) holiday schedules can be assigned to.
-

- 
- When a holiday date is in effect, the assigned holiday type schedule overrides the time zone for that date. The system shall further provide a facility to specify recurring holidays eliminating the need of resetting those holidays each year.
- .5 If holidays have been specified, the system shall be capable of listing all holiday dates and types.
- .6 The system shall automatically invoke a holiday schedule when the system clock matches any date defined as a holiday. A holiday schedule shall override all other time zones and schedules. Access shall be predicated on the times and authorizations of the holiday schedule for the stated holiday date. At the start of the next non-holiday calendar date the system shall invoke the regular time zone settings and access conditions.
- .10 Door And Elevator Group Access Levels
- .1 The system shall allow creating minimum 511 door groups and 511 elevator groups of which each cardholder may be assigned to minimum 2 door groups and minimum 2 elevator groups.
- .2 The system shall as a means for providing greater security and control segregate door and elevator groups into separate entities with independent time zones and access levels.
- .3 The system shall provide the following three access levels for door groups and elevator groups:
- .1 24-hour access
- .2 No access
- .3 Access based on a time zone
- .11 System Operators
- .1 The system shall provide the means to maintain a secure administrative environment. Only operators given an administrator account with a unique User ID and Password are permitted access to the system software.
- .2 Unauthorized individuals shall be denied access to the system software.
- .3 The system shall provide a means of setting discretionary operator functionality for each user account.
- .4 The system shall allow each operator individualized access for adding, editing, deleting, and viewing database information, as well as interrogating and issuing commands to the controllers depending on the functions enabled in the operator's account.
- .5 The system shall support an unlimited number of system operator accounts. Passwords shall not be displayed or printed by the system at any time during usage. It shall be possible to change passwords at any time.
- .6 The system shall provide the means of tracking operator

---

activity with the capability of generating a detailed summary.

.12 Manual Overrides

- .1 The system shall furnish an operator with manual control of doors from a Client computer as detailed below:
  - .1 Unlock a door and leave it unlocked
  - .2 Unlock a door momentarily, such that it automatically re- locks after the normal door relay unlock interval
  - .3 Lock a door
  - .4 Unlock or lock all doors controlled by a selected controller
  - .5 Unlock or lock all doors for the currently logged on site
  - .6 Schedule a timed unlock period for a specified door
- .2 The system shall provide an operator with the ability to manually override elevator floor control by toggling individual or all floors to secured or unsecured. The system shall allow the operator to restore the elevator floors to their regulated state.
- .3 The system shall provide an operator with the means to manually arm or disarm auxiliary and supervised inputs and outputs. The system shall allow the operator to restore the inputs to their regulated state.

.13 Other Control

- .1 The system shall provide a function which allows a designated cardholder to independently invoke a change of state for specified doors and devices when a card is presented at a specified reader.
- .2 The system shall be able to lock or unlock doors on an unscheduled basis, arm or disarm points connected to devices such as motion sensors, lock out other cardholders to prevent false alarms, implement a supervisory override to restrict access, or control lights, HVAC systems etc.
- .3 The system shall be capable of either toggling a door's lock/unlock state or toggling a time zone's off/on state and shall offer the following multiple modes of operation:
  - .1 Door Toggle
  - .2 Time Zone Toggle with Cardholder Lockout
  - .3 Time Zone Toggle with Cardholder Lockout and Exit Delay
  - .4 Time Zone Toggle without Cardholder Lockout

.14 Daylight Savings

- .1 The system shall provide an interface that allows the operator to set daylight savings hours. After operator input and controller uploading, the system shall update all access control units with

the time changes. The system shall not be dependent on an adjustment of the computer's clock to affect the time changes.

.15 Site Management Activity Reports

.1 The system shall furnish the operator with the capability of transposing site activity recorded by the database into any of the following report types:

- .1 Transaction Report
- .2 System Log Entry Report
- .3 Alarm Listings Report
- .4 Cumulative Hours Report
- .5 Card In/Out Status Report
- .6 Deleted Cardholder Reports

.2 The system shall furnish the operator with the ability to filter reports based on specifying relevant field criteria.

.3 In the case of Transaction Reports, the system shall be capable of allowing an operator to automatically schedule the system software to self- generate a formatted report. The system shall further provide a mechanism to automatically send the report to a specified email address.

.4 To allow reports to be distributed to non-system users, the system software shall have the ability to save reports in Acrobat® PDF format and in some instances CSV format.

.5 Where a controlled enter/exit environment exists, the system shall provide the means to generate a cumulative hour's report (optional) specifying when cardholders entered and exited access points.

.6 Where a controlled enter/exit environment exists, the system shall also be capable of providing a cardholder status report as to whether the card is in or out.

.7 The system shall provide the operator with a report previewer to review the results of the specified report request.

.16 System Settings Reports

.1 The system shall furnish the operator with the capability of generating system settings reports including the following summaries:

- .1 Site Setup Report
- .2 Reader Access Level Report
- .3 Cardholder Report
- .4 System Users Report

.2 To allow reports to be distributed to non-system users, the system software shall have the ability to save reports in Acrobat® PDF format and in some instances CSV format.

- 
- .3 The system shall provide the operator with a report previewer to review the results of the specified report request.
  - .17 Printing Reports and System Information
    - .1 The system shall provide print capabilities on transaction reports and other system information.
    - .2 The system shall allow the operator to direct a print request to the printer interfaced with the Windows® operating system. The report shall be fully formatted complete with report name, headings, page numbers, time and date, and site name.
    - .3 The system shall be capable of monitoring printer status. The operator shall be advised whenever the printer is not available.
  - .18 On-Line Transactions
    - .1 The system shall provide the capability for an operator to view site transactions as each event occurs for enhanced facility security. The operator shall be able view up to 3 separate on-line transaction windows simultaneously.
    - .2 The operator shall have the capability of using an array of filters to list only the desired transactions or transaction types on screen.
    - .3 The system shall allow an operator to view transactions for remote sites in different time zones in real time.
    - .4 The system shall provide the capability to show photos and details of cardholders enacting the transaction.
    - .5 The on-line transaction window shall have a “card enrollment” function in which an operator shall have the convenience of enrolling an unregistered card that has been presented at a reader.
  - .19 System Status
    - .1 The software shall provide the means to list all PCs and associated access control applications currently logged on the system.
  - .20 Communication and Polling
    - .1 The system shall use a communication manager module to direct communication between the system database and the controllers. The communication manager shall have the following attributes for robust and flexible system communication:
      - .2 The system can be configured with multiple communications managers for maximum communication efficiencies.
      - .3 The communication manager can be configured as a Windows™ service or as an application.
      - .4 Minimum 5 communication managers may be installed on 1 PC/server to economize on communication efficiencies.
-

- 
- .5 The communication manager shall allow a user-defined polling frequency within a system allotted time range to adjust communication efficiency for sites with heavier activity.
  - .6 The communication manager shall allow a user-defined look-back time within a system allotted time range to view site transactions.
  - .7 The communication application shall be designed to regulate data flow in multiple installation configurations to poll all sites, individual sites, or specified controllers within individual sites.
  - .21 Database Management
    - .1 The system shall record all operator input data, all operator tasks, all site(s) activity, and all alarm events to database. The database shall be ODBC compliant.
    - .2 System-wide database information shall be stored on a hard drive within the host computer. The system database storage capacity shall be limited only by the hard disk capacity or the limitation of the server application.
    - .3 The system database information shall be distributed among the controllers as well as stored on the access control system server.
    - .4 The system shall advise the operator when the database has reached 75% of its maximum allowable size.
    - .5 The system shall have the provision to automatically upload to the controllers added, edited, or deleted database information that pertains to time zones, cardholders, operators, or access levels without operator intervention.
    - .6 The system interface shall advise the operator whenever the controllers require uploading other changes made to the database. This ensures all devices operate according to the most current information. The system shall provide the capability to perform database uploads to the controllers on demand.
    - .7 The system shall provide the facility to automatically backup the database on a user-defined schedule. During the backup of the database file, there shall be no interruption to the system and the on-going collection of data.
    - .8 The system shall provide the operator with the option to automatically purge old database backup files based on a "days lapsed" format. The system shall further provide the option of viewing in CSV format the average number of daily transactions for the specified purge-files date range.
    - .9 Database files can be backed up onto another medium such as a writable CD while the database events continue to be recorded without interruption to the collection of system activity.
    - .10 The contents of the database shall be available to operators for
-

- 
- retrieving site information in user-defined reports.
- .11 The system shall be capable of exporting and importing the cardholder segment of the database in CSV format. The system shall further provide the option to automatically schedule the software to import cardholder CSV files by time and day.
- .22 Database Disaster Recovery
- .1 The system shall include a disaster recovery utility as a means of recovering site data in the event that the database is lost because of file corruption, computer malfunction, or hard disk breakdown.
- .2 The disaster recovery utility shall download data stored in the access control units and retrieve crucial site information including all or partial cardholder names to the database in a quick and timely manner to re-establish full operation of the access control system.
- .3 The disaster recovery utility shall be able to recover data from all controllers whether they are located on one site or multiple sites.
- .23 Remote Internet/Intranet Access
- .1 The system shall provide an Internet/Intranet Access application that allows remote connectivity for managing system functions.
- .2 The Internet/Intranet application shall have user ID and password authentication for secure log on.
- .3 The Internet/Intranet application shall include the following functions:
- .1 Add, edit, or delete cardholder records
- .2 Show or modify door group and elevator group access levels
- .3 Manually toggle elevator floor buttons to secure and unsecure
- .4 Format and produce transaction reports
- .5 View door status, lock, unlock, or pulse system-controlled doors
- .4 The Internet/Intranet application shall be programmed with an automatic logout function. After a lapsed time of mouse or keystroke inactivity, the application automatically logs the user out to protect the site from potential unauthorized user activity.
- .24 CCTV and Video Control System
- .1 The system shall provide a CCTV application module to integrate with a closed-circuit camera system within the access control system. The camera system shall not be proprietary to

---

the access control system.

- .2 The system shall allow the display of a live video feed with photo verification enabled simultaneously.
- .3 The CCTV application shall provide the operator with the ability to program cameras to various commands such as pan, tilt, zoom, and pre-positions.
- .4 The operator shall be able to program cameras to activate on selected alarm events.
- .5 The operator shall have the ability to view a live video feed with camera selection and view mode options or retrieve historical video from past alarm events.
- .6 The operator shall have the option to open multiple CCTV screens simultaneously for enhanced monitoring capabilities.
- .7 The system shall interface with a compatible Digital Video Recorders (DVR), Network Video Recorders (NVR), IP addressable cameras, and RS-232 platform multiplexers. DVRs and NVRs shall provide the ability to view the recorded images for an alarm event pinpointing the exact event that was recorded during the alarm.

#### 1.3.21 Output Module

- .1 The system shall provide an optional module that outputs data in a flat file format (CSV) that can be integrated with 3rd party software.

#### 1.3.22 ASCII Output

- .1 The system shall provide a facility to output data serially in ASCII format.

#### 1.3.23 On-Line Help, Manuals, and Setup Aids

- .1 The system shall provide context-sensitive help and shall be presented in the same language as the user interface on the Client module:
  - .1 English
  - .2 French
- .2 The on-line help shall be context sensitive whereby, when the operator presses a designated key, the relevant help screen opens.
- .3 The system shall include a hard copy of a software installation guide.
- .4 The system's Client application shall have a setup function that directs the operator through the process of setting up a site.

#### 1.3.24 Automatic System Start-up

- .1 The Access Control System shall provide automatic communication manager start-up such that no operator action shall be required to start the system after a power off condition.

---

## **2 PRODUCT**

### **2.1 Manufactures**

2.1.1 Acceptable Manufactures are: Amag, HID, Bosch and Assa Abloy

### **2.2 Door Controller**

2.2.1 All products and materials used must be Commercial grade and compatible with the access control system

2.2.2 The controllers shall be modular POE single or double door controllers and provided as indicated on drawings.

2.2.3 Controllers shall be powered via 15.4 Watt POE and provide 12V output for remote devices.

2.2.4 Controllers shall have no relays or moving parts and provide an on-board LCD to provide local configuration, troubleshooting and testing.

2.2.5 Controllers for locations without drop ceiling shall have built in Request to Exit (REX) motion sensor.

2.2.6 Controller for locations with drop ceiling the Request to Exit (REX) motion sensor and integral local Piezo busser shall be mounted below the drop ceiling.

2.2.7 Controllers shall be:

Specified Product:

	Model No.	Details
Amag	M2150	Symmetry Door Controller

Parts showed above are for reference only, additional components may be required.

### **2.3 Proximity Card Readers**

2.3.1 The proximity card reader shall be a black in colour.

2.3.2 The reader shall be combo style suitable for mounting on standard 1104 electrical box or mullion as indicated on drawings.

Specified Product:

	Model No.	
HID	Signo40	Wall locations
HID	Signo20	Mullion locations

Parts showed above are for reference only, additional components may be required.

### **2.4 Access Cards and Key-Fobs**

2.4.1 All Credentials shall be HID iCLASS® Card 2080 or equivalent.

2.4.2 Proximity cards shall be standard readily available cards.

---

Specified Product:		
	Quantity	Type
HID	200	Card

## **2.5 Request to Exit Detector**

### **2.5.1 Minimum Features/Specifications**

- .1 Detector Type: Passive infrared
- .2 Filter Technology: Digital Signal Processing (DSP)
- .3 Detector Lens: Curtain-type Fresnel lens
- .4 Detection Range:
  - Narrow Targeting Area: 3 m (10 ft)
  - Whole Body: 6 m (20 ft)
- .5 Piezo Buzzer: 90 dB at 28 VDC, 5-28 VDC,
- .6 Main Relay Contacts: SPDT, 1A max @ 30 VDC max
- .7 Main Relay Timer: Adjustable, 0.5 to 60 seconds
- .8 Main Relay Recycle Timer: Fixed, 0.75 seconds off
- .9 Lock Control Relay: -state relay, N.C., 2A max @ 30 VDC, timed at 2 seconds fixed
- .10 Tamper Switch: N.C., 100 mA max @ 30 VDC max
- .11 Indicator Light: Red/Green LED
- .12 Mounting: Optional back plate for mounting on a standard single-gang electrical box
- .13 REX colour to be confirmed before purchase and shall be coordinated with the Interior Designer and Client.

Specified Product:

	Model No.	
Bosch	DS160 Series	REX Sensor

Parts showed above are for reference only, additional components may be required.

## **2.6 Request to Exit Button**

- ### **2.6.1 REX color to be confirmed before purchase and shall be coordinated with the Architect and Client.**

Specified Product:

	Model No.
Assa	DRB002NS
Abloy	Series

Parts showed above are for reference only, additional components may be required.

---

## **2.7 Access Control Panel Enclosures**

- 2.7.1 All access control panels/enclosures shall be provided to house all controllers.
- 2.7.2 All access control panels/enclosures shall be a single key locking metal box.
- 2.7.3 Size as required
- 2.7.4 Equipped with door tamper switch. Connect each door tamper switch to the access control system.
- 2.7.5 The quantity and size of access control panels/enclosures shall not exceed the real estate provided for mounting access control panels/enclosures. Refer to contract drawings and coordinate as such.

## **2.8 Access Control Software**

- 2.8.1 The Electronic Safety and Security Contractor shall supply a site software.
- 2.8.2 The ESS Contractor shall integrate the site software with the Owner's centralised server.
- 2.8.3 The ESS Contractor shall coordinate all the software and integration requirements on site with Owner.

Specified Product:

	Model No.	
Amag	Symmetry Version	Software
	9.1 & above	

Parts showed above are for reference only, additional components may be required.

## **2.9 Electric Locks**

- 2.9.1 All electric locks provided by others.
- 2.9.2 Electronic locking devices shall have a separate power supply to support the locks specified below. The unit shall incorporate integral battery charging capabilities and a fused line voltage input for a minimum of eight (8) individual locks. All power supplies shall be equipped with optional battery pack for up to 48 hours. The unit shall be equipped with a fire alarm system interface as required.

## **2.10 Peripheral Devices**

- 2.10.1 Door Contacts (Steel)
  - .14 1" dia. contact for use in steel doors.
  - .15 Flush or surface mount as required
  - .16 Self-lock mounting
  - .17 Rugged Construction
- 2.10.2 Door Contacts (Wood)

- .18 3/8" dia. contact for use in wood doors.
- .19 Flush or surface mount as required
- .20 "Wings" protect contact reed from being crushed from swelling wood
- .21 Installed quickly in over drilled holes
- .22 Superior false alarm immunity
- 2.10.3 Door Contacts (Overhead Door)
  - .23 Miniature and low-profile design
  - .24 Stainless steel armoured cable for added security and reliability
  - .25 Aluminium bar stock to resist corrosion in harsh environments
  - .26 Floor or track mount as required

### **3 EXECUTION**

#### **3.1 Coordination**

- 3.1.1 The Electronic Security Systems Contractor (ESSC) shall assume control and accountability for furnishing and installing all electronic security systems as hereafter specified.
- 3.1.2 The ESSC shall be responsible for the systems specified in this Section, including coordination with related trades.
- 3.1.3 The ESSC shall coordinate all work and submittal details with the electronic door hardware supplier to ensure proper sizing of control equipment and shall be responsible for proper sizing of interface equipment (i.e., relays, contact ratings, etc.) to eliminate interface problems.
- 3.1.4 Related work required to be provided:
  - .1 Door Hardware/ Electronic Locks coordination for system operation and interface
  - .2 Electrical Works
  - .3 Control Work and/or annunciation
  - .4 All 120 Volt wiring and connections from power panels to terminal strips in electronic low-voltage panels, power supplies and devices
  - .5 All raceway, conduit to the device(s), including all back boxes and pull strings and the installation of all special back boxes.

#### **3.2 Controller and Peripheral Devices**

- 3.2.1 Provide and install access control panels/enclosures as required to house and protect all controllers.
- 3.2.2 All controllers and peripheral devices shall be installed and configured in accordance with manufacturer's installation instructions and recommendations, as per the Owner's requirements and as per contract drawings and specifications.

- 3.2.3 Coordinate the exact mount location of peripheral device devices with the electrical contractor to ensure that all conduits and back boxes are installed in the optimal locations.
- 3.2.4 Coordinate exact mounting locations of all controllers on site with security Engineer's Representative and client.
- 3.2.5 Supply and install all peripheral devices as indicated on contract drawings and documents.
- 3.2.6 Refer to Architectural Door and Door Hardware Schedules and ensure that each peripheral device is coordinated with its respective door and door hardware.
- 3.2.7 All peripheral devices shall be compatible with the access control system.
- 3.2.8 Submit shop drawings of all peripheral devices to the Security Engineer's Representative for approval prior to procurement and installation.
- 3.2.9 Allow for "needs assessment sessions" with client to determine the exact mode/s of operation of each peripheral device.
- 3.2.10 Configure each peripheral device and each controller to suit the client's requirements.

### **3.3 Power Supply**

- 3.3.1 Supply and install power supplies as required for a fully functional access control system. Power supplies shall include but not limited to all controller power supplies, all electric lock power supplies and all peripheral device power supplies.
- 3.3.2 All power supplies shall be installed to manufactures recommendations and as required to furnish a fully functional access control system.
- 3.3.3 All power supplies shall be sized to facilitate connection of each electrified lock and each powered device to separately fused power output.

### **3.4 Electric Locks**

- 3.4.1 All electric locks shall be supplied and installed by the door hardware contractor.
- 3.4.2 Electrified locks shall include but not limited to:
  - .1 Electric strikes
  - .2 Magnetic locks/Maglocks
  - .3 Electric mortise locks
  - .4 Electric latch retraction
- 3.4.3 Coordinate with the door hardware contractor and electrical contractor, make all wire connections to all electric locks as required for a complete access control system.
- 3.4.4 Supply and install wiring as required for complete operation all access control devices and systems.
- 3.4.5 Include for all costs and work associated with acquiring permits for all magnetic locks.

---

### **3.5 Installation**

- 3.5.1 Install all system components and appurtenances in accordance with the respective manufacturer's specifications, referenced practices, guidelines, and applicable codes. Furnish all necessary interconnections, services, and adjustments required for a complete and operable system as specified. Control signal, communications, and data transmission line grounding shall be installed as necessary to preclude ground loops, noise, and surges from adversely affecting system operation.
- 3.5.2 Install the wiring system and integrate the system as indicated in this specification. All wiring is to be installed in dedicated conduit throughout. Wiring shall not be pulled into conduits or placed in raceways, compartments, outlet boxes, junction boxes, or similar fittings with other building wiring.
- 3.5.3 All low voltage wiring outside the control console, cabinets, boxes, and similar enclosures, shall be plenum rated where required by code.
- 3.5.4 All wiring conductors shall be individually numbered and each cable or wiring group being extended from a panel or cabinet to a building mounted device shall be identified with the name and number of the particular device.
- 3.5.5 All exposed wiring inside and outside the control console, cabinets, boxes, and similar enclosures, shall be dressed down neatly and secured with wiring cleats or wire ties.
- 3.5.6 All exposed metallic flexible conduit and armored cable shall be dressed down neatly and secured with low profile, metal fasteners.
- 3.5.7 All cabinets, boxes, and similar enclosures containing security system components and/or cabling and which are easily accessible to employees or to the public shall be provided with a lock. Boxes above ceiling level in occupied areas of the building shall not be considered to be accessible.
- 3.5.8 All junction boxes and small device enclosures below ceiling level and easily accessible to employees or the public shall be covered with a suitable cover plate and secured with tamper proof screws.
- 3.5.9 End-of-Line resistors shall be installed at the field device location and not at the controller panel location.
- 3.5.10 System devices identified on building drawings are intended to generally indicate areas where such devices are to be located. Determine and coordinate the final locations of these devices on site with the electrical contractor to ensure that all conduits and associate Back boxes are located where respective devices will be installed. Be responsible for all costs resulting from failure to execute the above.
- 3.5.11 Riser diagrams are schematic and do not show every conduit, wire box, fitting, or other accessories. Provide such materials as necessary for a complete and functioning installation. Install in accordance with referenced codes and these specifications. Use weatherproof equipment or covers where installed in areas exposed to weather.

- 
- 3.5.12 All equipment shall be mounted with sufficient clearance to meet all applicable codes and facilitate observation and testing. All equipment shall be securely fastened with appropriate fittings to ensure positive grounding and be free of ground loops.
  - 3.5.13 Determine conductor requirements for each device in accordance with the Contract Documents and manufacturer requirements.
  - 3.5.14 Install cable in accordance with Security System manufacturer requirements
  - 3.5.15 Neatly route cables parallel or perpendicular to building lines.
  - 3.5.16 Provide J hooks and other cable support systems (spaced at regular intervals) within accessible ceiling spaces. Fasten cables to the cable support systems and provide strain relief to protect cables and ensure compliance with required cable bends.
  - 3.5.17 Keep free-air cables a minimum of 18" from high voltage (120 VAC and above) circuits (e.g. light fixtures, wire run parallel with conduit, transformers, electric panels, etc.).
  - 3.5.18 Run cables at least six inches from the communications cable plant, intercom wires, input/output wires, and siren wires.
  - 3.5.19 Route wire and cable as required preventing interference and signalling contamination of both Security System cable and cable associated with other systems. Coordinate the routing of wire and cable requiring isolation from power, radio frequency (RF), telephone, etc.
  - 3.5.20 Provide sleeves and code compliant fire proofing techniques for all penetrations of fire rated partitions, masonry walls, and slabs, where the penetrations are made by or used for installation of Security Systems.
  - 3.5.21 Separate high voltage (120 VAC and above) cables from low voltage cables within enclosures
  - 3.5.22 Run wire and cable continuous from device location to the final point of termination. No mid-run cable splices will be allowed
  - 3.5.23 Bundle and tie wire and cable with cable ties.
  - 3.5.24 Cover exposed high voltage (120 VAC and above) power terminations within DGP's, power distribution cabinets and other security enclosures.

### **3.6 Labelled frames, Door and Enclosures**

- 3.6.1 In no instance shall any UL labeled door, frame or enclosure be drilled, cut, penetrated, or modified in any way.

### **3.7 Manufacturer's Field Services**

- 3.7.1 Provide manufacturer's field services for final system checkout and acceptance testing as required.

### **3.8 Protection**

- 3.8.1 Protect installed products until completion of project.

---

**END OF SECTION**

---

## 1 **GENERAL**

### 1.1 **Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### 1.2 **General**

#### 1.2.1 Systems Minimum Requirements

- .1 All intercom station and duress alarm station shall be connected via IP based network and be able to be connected in such a manner to create a single system. All necessary data and audio routing between the exchanges shall be via IP and only require the necessary VoIP software licenses based on the system design. No additional proprietary hardware will be necessary to do the networking via IP between exchanges
- .2 System shall consist of duplex master stations with direct access buttons. Each master shall be capable of calling all other stations in the system unless specifically blocked or restricted through programming.
- .3 All master station shall be desk mounted.
- .4 Substations shall be flush or surface mounted, tamper and weather resistant where needed and located as required for direct access calling to control room masters.
- .5 All features and functions shall be programmed on site with a standard PC via IP.

#### 1.2.2 System Requirement

- .1 Call-Related Functions:
  - .1 Video Door Station Call: A designated group of master stations can be called from any video door station; any designated master can answer the call. 170 degrees view from the door station camera can be viewed from the master station and zoom and pan/tilt operations are functional.
  - .2 Sub Station Call: A designated group master stations can be called from any substations; any designated master can answer the call. External speaker and emergency call button can also be added.
  - .3 Group Call/All Call: A designated group of up to the full capacity of the system with any mix of master stations and door stations can be called from a master station. System needs to be pre-programmed to function.
- .2 Transfer-Related Function:
  - .1 Call (Communication) Transfer: A master station can transfer a conversation to any master station within the system.

- .3 Call Forwarding-Related Functions:
  - .1 Call Forwarding: Incoming calls can be automatically forwarded to another receiving station or telephone. The receiving station number or telephone number can be registered at the original forwarding station. Unit number will be assigned to each telephone number.
  - .2 Time-Based Call Forwarding: All incoming calls to the original station can be automatically rerouted to a designated master station or telephone number during a specific period of the day.
  - .3 No Answer Call Forwarding: Calls to the original station are automatically rerouted to a designated receiving station if the called party does not respond within a pre-set period of time.
- .4 Monitoring-Related Functions:
  - .1 Monitoring: Any door, room or substation can be monitored from a master station. A master station can also disable this function if monitoring is not necessary.
  - .2 Scan Monitoring: Any pre-programmed door stations or room sub stations can be scan monitored.
- .5 Priority Call-Related Functions:
  - .1 Priority Call: Any call from the master station or substation can be pre- programmed with priority level based on normal call, priority call, and urgent call. Urgent call will have the highest priority within individual calls.
  - .2 Mobile App for cell phones and tablets
  - .3 Identify visitors, unlock doors, and talk between stations from a smart phone or tablet. The Mobile app shall be available for Android™ and iOS® devices.

## **2 PRODUCT**

### **2.1 Intercom Substation**

- 2.1.1 Avigilon Video Intercom Reader Pro, Flush Mount.

### **2.2 Intercom System Management Software**

- 2.2.1 Provide intercom system management software to facilitate complete administration and operation of intercom system.

## **3 EXECUTION**

### **3.1 Installation**

- 3.1.1 Upon project commencement, the Contractor shall provide qualified technical personnel on- site. Personnel shall be present on each consecutive working day until the system is fully functional and ready to begin the testing phase of this project.

- 
- 3.1.2 During the installation process the contractor shall maintain an up-to-date set of as-built shop drawings, which shall always be available for review by the client and/or Engineer's Representatives. This set of documents should be clearly annotated with as-built data as the work is performed. These documents will be reviewed as part of the approval process when evaluating payment request applications. At a minimum, the drawings should contain the following information:
- .1 Quantity and location of all equipment installed.
  - .2 Cable and wire runs along with the designation tags assigned to each.
  - .3 Wiring diagrams that indicate terminal strip layout, identification, and terminations.
  - .4
- 3.1.3 The contractors Project Manager shall maintain continuous coordination with the Engineer's Representatives. The engineers shall be kept informed of the progress and all conflicts that arise during the course of this project.
- 3.1.4 Coordinate with the electrical contractor; provide to the electrical contractor all proprietary intercom substation back boxes for rough in.
- 3.1.5 Provide and install all wiring as required.
- 3.1.6 All installation, configuration, setup, program, and related work shall be performed by technicians thoroughly trained by the manufacturer in the installation and service of the equipment provided.
- 3.1.7 Install all devices and wiring as recommended by the intercom system manufacture.
- 3.1.8 Provide and install all miscellaneous hardware for a complete turnkey intercom system.
- 3.1.9 Provide and install all master intercom stations and intercom substations as indicated on contract documents.
- 3.1.10 Coordinate with the owner, configure, and program the intercom system as required to suit operations of the facility as directed by the owner.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 General**

- 1.2.1 All equipment and materials used shall be standard components that are regularly manufactured and used in the manufacturer's system.
- 1.2.2 The security video system shall be an IP network-based, fully distributed digital video system. The security video system will utilize local area networks (LAN) as a transmission medium for video, configuration, as well as storage of all data. The security video system shall provide full video control at control station, with additional full selection capability at any point within the network from a workstation. The security video system shall provide unlimited expansion capability for the addition or modification of video inputs. The system design is based on a Network Video CCTV system and components.
- 1.2.3 The security video system shall allow for modular expansion of 15% on day one (1) of a fully operational system.
- 1.2.4 Security contractor shall carry cost for the relocations of all interior CCTV cameras 30ft horizontally and 15ft vertically to determine the final mounting location and viewing angle.
- 1.2.5 The contractor shall provide all security video cameras, pan/tilt/zoom (PTZ) cameras, mounts, housings, power supply systems, network cables, connectors, equipment racks, monitors and consoles, computer-controlled network switchers, workstations, network video recorders, encoders, decoders, displays, and all other hardware and software to provide a fully operational system.
- 1.2.6 Video Management System Performance Requirements

- .1 Configurations

- The network video management system shall be an integrated hardware and software platform that serves as the CCTV surveillance system management tool. The Video Surveillance system shall be Internet Protocol (IP) based system complete with IP CCTV cameras, Network Video Recorders (NVRs), CCTV System Server, CCTV System Video Management Client and Server Software to facilitate management of all NVRs and CCTV cameras as well as to facilitate viewing of all video stream for all CCTV cameras from multiple client workstation computers via a TCP/IP data network.

- .2 Basic architecture

- The system shall optionally be integrated with Security Management System (SMS). The TCP/IP network interconnects cameras, servers and Stations and associated equipment.

- .3 Integration with Security Management System (SMS)

- 
- .2 The Video Surveillance System (VSS) shall be integrated with Security Management System for building management and security-related applications and provide the following:
    - .1 Alarms and events shall initiate recordings. These recordings shall show what happened before an alarm/event occurred.
    - .1 The Video Surveillance System shares the SMS user interface (Station)
    - .2 Users can view the Video Surveillance System videos on any Station on the network.
    - .3 Video Surveillance System uses SMS security features to define each operator's viewing rights.
    - .4 The Video Surveillance System alarms and events are automatically sent to SMS or for inclusion in the Alarm and Event Summaries.
    - .5 Recordings associated with SMS alarms and/or events can be viewed directly from the SMS Alarm or Event Summary.
    - .6 An operator Station can control dedicated surveillance monitors.
  - .3 Alarms can be associated with video content and displayed on video alarm monitors.
    - .1 Video Surveillance System shall be capable of integration with legacy CCTV equipment or take full advantage of open TCP/IP network technologies to deliver software-based camera switching, control and digital recording. The Video Surveillance System will have open architecture and integrate with third-party products and applications.
    - .2 Video Surveillance System shall be capable of redundant configuration where video streams shall be capable of being redirected in the event of failure to minimize disruption and ensure uninterrupted recording.
    - .3 The user interface

Video Surveillance System includes an easy-to-use Web-based interface which runs on standard Windows computers. The video displays will be accessed using either Station or Internet Explorer.
    - .4 Network architecture options

The Video Surveillance System shall be capable of utilizing Conventional design that has no physical or logical protection between the various types, VLAN and a network dedicated to security system
    - .5 Video Surveillance System Data Transmission

The Video Surveillance System will utilize both Multicasting and Unicast transmission techniques
    - .6 Network management

The Video Surveillance System will have as minimum an appropriate set of network management tools that provide information such as but not limited to Network utilization, Warning if utilization reaches a user-defined threshold and Notification if a switch fails.
    - .7 Security
-

The NVMS will provide a range of security features and supports both domain and workgroup security. The NVMS shall support internet explorer security, operator-based security and workstation-based security.

**.8 Video Surveillance System servers**

The Video Surveillance System servers shall store the configuration and runtime information of system, distribute status information to the clients, accepts requests from the clients to view video, connects to video sources, transmit video from the cameras to the clients and store recorded video.

**.9 Recording Parameters**

The CCTV system including the CCTV system server and network video recorders shall be sized and equipped to record all video streams from all CCTV cameras with no latency as follows:

All CCTV resolution shall be 1080P at 7 – 15 frames per second for a period of 31 days.

**Viewing Parameters**

The CCTV system including the CCTV system server and network video recorders shall be sized and equipped to view video streams from CCTV cameras with no latency as follows:

Minimum 64 cameras at 4CIF resolution and 7 frames per second and

Simultaneously minimum 96 cameras at 720P resolution and 7 frames per second on Main CCTV and alarm Monitors

**.10 Recording and Viewing Parameters shall be concurrent.**

**.11 Custom applications and scripts**

The Video Surveillance System shall allow custom application and scripts to integrate with other applications.

**.12 Supporting video intercoms**

The Video Surveillance System shall support intercom functionality.

**1.2.7 Client shall provide PC workstation**

**1.2.8 System Function Requirements**

- .1** Provided equipment, wiring and other materials for a complete turnkey CCTV system as shown and as specified. The systems shall be modular and expandable to an unlimited number of cameras.
- .2** The system shall consist of State-of-the-art interior and exterior IP dome CCTV cameras c/w lenses as required to facilitate the required field of views, local or remote power supplies, camera mounts as required, dome housing, dome housing complete with blower and heater, Network Video Recorders, CCTV System Servers, Video Management Client and Server Software and associated licence.
- .3** The Video Surveillance/CCTV systems shall provide fully integrated NVRs and camera management interface for command-and-control video surveillance that supports the following functionality:
- .4** Support network connectivity to multiple NVRs, servers, and network connected client workstations.
- .5** The communications interface between the NVRs, servers, and network connected client workstations shall be via 10/100/1000Mb Ethernet connectivity using industry standard TCP/IP protocol.

- 
- .6 The Video Surveillance/CCTV systems shall provide multi-window video management consoles for real time video device monitoring and control from any central management station. NVRs, cameras and assigned pre-sets shall be displayed alphabetically and grouped by facility in a navigation pane for easy operator access.
  - .7 Operators shall be able to simultaneously view and control multiple live video cameras across multiple NVR units. Camera control shall be mouse driven on-screen and shall support pan, tilt, zoom, iris, focus, and camera pre-set call-up functions.
  - .8 Operators shall be able to perform quick recall video playback on any selected camera view to request last 15sec, 30sec, 1min, 2min, 5min, or selection from last 4 events listed for the selected camera.
  - .9 Operators shall be able to access, and playback recorded video events with on-screen controls that support play forward, play reverse, fast forward, fast reverse, single frame advance, single frame reverse, pause, stop, and variable speed control functions.
  - .10 Operators shall be able to playback tagged video events stored locally on NVR units, based on date, time, alarm, event, text, and motion search queries from an embedded history/archive database.
  - .11 Operators shall be able to save still image snapshots to file in the jpg file format from any live or recorded playback video stream.
  - .12 Operators shall be able to save video clips to file in native or AVI file formats from any live or recorded playback video stream.
  - .13 Operators shall be able to create and burn evidence CDs of selected video clips with required video player.
  - .14 The Video Surveillance/CCTV system shall support request for live and recorded video transmission from NVR units at various resolutions and display sizes, independent of actual NVR resolution setting for local recorded video. Such a feature shall be user configurable to facilitate network adaptability.
  - .15 The Video Surveillance/CCTV system shall allow the assignment of CCTV cameras and pre-sets to Video Surveillance/CCTV system alarm and card access events; for automating real-time camera control, automatic live video pop-up on alarm, video event tagging and providing quick access to live and recorded video from any central management station.
  - .16 The Video Surveillance/CCTV systems shall provide simultaneous support for multi- vendor video drivers.
  - .17 The Video Surveillance/CCTV system shall monitor status of all NVR units for processing and reporting Online / Offline status, Record status, Disk capacity status, Camera video loss and Camera alarm.

---

## **2 PRODUCT**

### **2.1 Manufactures**

- 2.1.1 Acceptable Manufactures are Avigilon.

### **2.2 General**

- 2.2.1 All products and materials must be new and approved in the shop drawing submittals. Provide all equipment for a complete and operational IP based Security CCTV System Provide client with the necessary licenses as required for a complete and operational IP based video surveillance system
- 2.2.2 All Exterior devices shall be sealed and protected against weather conditions including heat, cold, moisture, dust, and sand.

### **2.3 Video Surveillance System Server**

- 2.3.1 Enterprise Central Management Server complete with multi-Core Processor, RAID 5 Storage, and Redundant Power Supply or equivalent.
- 2.3.2 Details shown on drawings are for reference only the Security contractor shall verify exact quantities required.

### **2.4 Network Video Recorder (NVR)**

- 2.4.1 Details shown on drawings are for reference only the Security contractor shall verify exact quantities required.
- 2.4.2 The CCTV system network video recorder shall be a professional enterprise solution suited for commercial use and complete with the following features:
  - .1 Real-time full motion video per channel
  - .2 Synchronous audio for every channel of video
  - .3 PC Decode feature will output cameras to additional screens connected to video card, both on Server and Client computer.
  - .4 MPEG-4 and H.264 compression technology
  - .5 Live View: Real-Time minimum 30fps per channel
  - .6 Recording: Real-Time minimum 30fps per channel
  - .7 Records compatible Megapixel IP Cameras at up to 5MP
  - .8 Outputs at minimum 1920x1080 (1080P).
- 2.4.3 Software and Hardware
  - .1 Multi-zone motion detecting (entire frame or up to 12 detection zones per channel) with Privacy Mask option
  - .2 Four recording modes: Continuous recording, Motion Detection, External Sensor, or Sensor/Motion
  - .3 Alarm email message auto-sending with photo attachment
  - .4 SMS Text message auto-sending when using a modem

- 
- .5 Hardware watchdog support with auto-reboot
  - .6 Position and color configurable OSD & Logo with Date/Time stamp
  - .7 Digital Watermarks
    - .1 It is a requirement for all exported recordings and exported audit logs to be digitally signed. This is required to prove authentication (origin of the recording and audit log) and integrity (exported recording and audit log have not been altered or tampered with).
    - .2 The NVMS system shall provide a default digital certificate for signing the exported recordings and audit logs. Customization shall also be provided to allow for the user to supply his/her own digital certificate.
    - .3 A utility shall be provided to display the exported recording, view the audit log, and verify the digital signatures. A visual indication shall be provided to whether the exported recording and audit log have been altered or tampered with.
    - .4 P/T/Z/F & Speed Dome control through software or keyboard - no additional hardware required. Protocols shall be as required to facilitate complete operation of all CCTV cameras.
  - .8 Search/playback by date/time directory (random-access)
    - .1 Advanced Smart Search: only search footage within a designated area in playback mode instead of viewing countless hours of video
    - .2 Backup options include CD, DVD, USB, Network, Remote Backup, Blu- Ray
    - .3 Viewing live video
    - .4 Receiving and transmitting audio
    - .5 Recording administration
    - .6 Playing back recorded video
    - .7 Save recorded video sequences
    - .8 Export recorder video sequences (MPG, AVI, other)
    - .9 PTZ telemetry
  - .9 Alarm events
    - .1 SNMP Interfaces: system status, major alarms
    - .2 Sequence view of camera pre-set positions
    - .3 Modifying settings for a camera
    - .4 Modifying recording settings for a camera
    - .5 Adding and deleting cameras
    - .6 Creating schedules for recordings and video motion detection
    - .7 Modifying video motion detection settings and tuning
    - .8 Archiving mechanisms (automation of archiving)
-

- .9 Report capabilities
- .10 Network
  - .1 DDNS for dynamic IP addresses
- .11 Remote access, administration, and recording on client computer through NVR Client on LAN (network) or WAN (Internet)
- .12 View multiple locations from one NVR Client
  - .1 Bi-directional two-way remote communications between multiple NVR servers in various locations
  - .2 Remote view and PTZ Control on Mobile Phone or PDA use iPhone App or Android App
  - .3 NVR Client's Compatible OS: Windows 8, Windows 7 Windows XP, 2000, Server, Vista, 7, including 64-bit compatibility with remote NVR Client or Linux OS.
- .13 Expansion / Option
  - .1 Video management Software (VMS)
- .14 Hot-Swap Hard Drive Bays with RAID Levels 5 redundancy.
- .15 The Total quantity of network video recorders shall not exceed 12 Rack units of rack space.
- .16 Redundant Power Supply.

#### 2.4.4 Indoor Fixed CCTV Camera

- .1 Minimum features:
  - Image Sensor – CMOS Progressive Scan
  - Lens – As required to facilitate required field of view.
  - Minimum Light Sensitivity – 0.25 LUX Color and .005 LUX Black and White
  - Video Compression – H.264, Motion JPEG
  - Minimum Video Resolution (Pixels) 1920x1080 (2 Mega Pixels)
  - Intelligent Video – Motion Detection, Tamper Alarm,
  - Security – Level Passwords, IP Filtering, HTTPS Encryption, IEEE 802.1X,
  - Network – IPv4/v6, QoS
  - Power – Power over Ethernet IEEE 802.3af/802.3at Type 1 Class 2, max. 4.8 W, typical 3.5 W
  - Operating conditions - 0 °C to 50 °C (32 °F to 122 °F) Humidity 10–85% RH (non-condensing)
  - Application Programming Interface - Open software integration, ONVIF Profile
  - Intelligent video - Video motion detection, Active tampering alarm
  - Form Factor - Tamper and vandal resistant housing and tinted smoked bubble
  - Mounting – as required

#### Specified Product:

Brand	Model No.	Comment
Avigilon	H5A-D	Surface Mount
Avigilon	H5A-DC	In-Ceiling Mount

---

Parts showed above are for reference only, additional components may be required.

#### 2.4.5 Indoor 180 Degrees CCTV Camera

##### .1 Minimum features:

Image Sensor – CMOS Progressive Scan  
Lens –f=4.44 - 142.6 mm, 1.6 - 4.41, Autofocus, 62.8° - 2.23° horizontal angle of view  
Minimum Light Sensitivity – 0.3 LUX Color and .003LUX Black and White  
Pan/Tilt/Zoom Pan - 360° endless, 0.05° – 450°/s Tilt: 180°, 0.05° – 450°/s 32x  
Optical zoom and 12x Digital zoom, Total 384x zoom E-flip, 256 pre-sets, Tour recording, Guard tour, Control queue, On-screen directional indicator, Set new pan 0°  
Video Compression – H.264, Motion JPEG  
Minimum Video Resolution (Pixels) 1920x1080 (3 x 2 Mega Pixels)  
Image settings - Wide dynamic range (WDR), Highlight compensation, Manual shutter time, Compression, Color, Brightness, Sharpness, White balance, Exposure control, Exposure zones, Backlight compensation, Fine tuning of behavior at low light, Rotation, Text, and image overlay, 32 individual 3D privacy masks, Image freeze on PTZ, Automatic defog  
Intelligent Video – Motion Detection, Tamper Alarm,  
Wide Dynamic Range  
Electronic image stabilization function  
Adaptive IR option  
Automatic defog function  
Security – Level Passwords, IP Filtering, HTTPS Encryption, IEEE 802.1X,  
Network – IPv4/v6, QoS  
Power – Power over Ethernet IEEE 802.3af/802.3at Type 2 Class 4, max. 26 W, typical 11.1 W  
Operating conditions - -40 °C to 50 °C (-58 °F to 122 °F) Humidity 10-100% RH (condensing)  
Application Programming Interface - Open software integration, ONVIF Profile  
Intelligent video - Video motion detection, Active tampering alarm  
Form Factor Tamper and vandal resistant housing and clear smoked bubble  
Mounting – as required  
Other – Tamper and vandal resistant housing and clear bubble with integrated heater and blower.

##### Specified Product:

Brand	Model No.	Comment
Avigilon	9C-H4A-3MH-180	Multi-Sensor

Parts showed above are for reference only, additional components may be required.

#### 2.4.6 Indoor 360 Degrees CCTV Camera

##### .1 Minimum features:

Image Sensor – CMOS Progressive Scan  
Lens –f=4.44 - 142.6 mm, 1.6 - 4.41, Autofocus, 62.8° - 2.23° horizontal angle of view  
Minimum Light Sensitivity – 0.3 LUX Color and .003LUX Black and White  
Pan/Tilt/Zoom Pan - 360° endless, 0.05° – 450°/s Tilt: 180°, 0.05° – 450°/s 32x  
Optical zoom and 12x Digital zoom, Total 384x zoom E-flip, 256 pre-sets, Tour

recording, Guard tour, Control queue, On-screen directional indicator, Set new pan 0°

Video Compression – H.264, Motion JPEG

Minimum Video Resolution (Pixels) 1920x1080 (4 x 2 Mega Pixels)

Image settings - Wide dynamic range (WDR), Highlight compensation, Manual shutter time, Compression, Color, Brightness, Sharpness, White balance, Exposure control, Exposure zones, Backlight compensation, Fine tuning of behavior at low light, Rotation, Text and image overlay, 32 individual 3D privacy masks, Image freeze on PTZ, Automatic defog

Intelligent Video – Motion Detection, Tamper Alarm,

Wide Dynamic Range

Electronic image stabilization function

Adaptive IR option

Automatic defog function

Security – Level Passwords, IP Filtering, HTTPS Encryption, IEEE 802.1X,

Network – IPv4/v6, QoS

Power – Power over Ethernet IEEE 802.3af/802.3at Type 2 Class 4, max. 26 W, typical 11.1 W

Operating conditions - -40 °C to 50 °C (-58 °F to 122 °F) Humidity 10-100% RH (condensing)

Application Programming Interface - Open software integration, ONVIF Profile

Intelligent video - Video motion detection, Active tampering alarm

Form Factor Tamper and vandal resistant housing and clear smoked bubble

Mounting – as required

Other – Tamper and vandal resistant housing and clear bubble with integrated heater and blower.

Specified Product:

Brand	Model No.	Comment
Avigilon	12C-H4A-4MH-360	Multi-Sensor

Parts showed above are for reference only, additional components may be required.

#### 2.4.7 Outdoor Fixed CCTV Camera

##### .1 Minimum features:

Image Sensor – CMOS Progressive Scan

Lens – As required to facilitate required field of view

Minimum Light Sensitivity – 0.2 LUX Color and .004 LUX Black and White

Video Compression – H.264, Motion JPEG

Minimum Video Resolution (Pixels) 1920x1080 (2 Mega Pixels)

Intelligent Video – Motion Detection, Tamper Alarm,

Wide Dynamic Range

Security – Level Passwords, IP Filtering, HTTPS Encryption, IEEE 802.1X,

Network – IPv4/v6, QoS

Power – Power over Ethernet IEEE 802.3af/802.3at Type 1 Class 2, max. 4.8 W, typical 3.5 W

Operating conditions - -40 °C to 55 °C (-40 °F to 131 °F) Humidity 10-100% RH (condensing)

Application Programming Interface - Open software integration, ONVIF Profile

Intelligent video - Video motion detection, Active tampering alarm

Form Factor - Tamper and vandal resistant housing and clear bubble

Mounting – as required

Other – Tamper and vandal resistant housing and clear bubble with integrated heater and blower

Specified Product:

Brand	Model No.	Comment
Avigilon	H5A-DO	

Parts showed above are for reference only, additional components may be required.

#### 2.4.8 Outdoor 180 Degrees CCTV Camera

##### .1 Minimum features:

Image Sensor – CMOS Progressive Scan

Lens –f=4.44 - 142.6 mm, 1.6 - 4.41, Autofocus, 62.8° - 2.23° horizontal angle of view

Minimum Light Sensitivity – 0.3 LUX Color and .003LUX Black and White

Pan/Tilt/Zoom Pan - 360° endless, 0.05° – 450°/s Tilt: 180°, 0.05° – 450°/s 32x

Optical zoom and 12x Digital zoom, Total 384x zoom E-flip, 256 pre-sets, Tour recording, Guard tour, Control queue, On-screen directional indicator, Set new pan 0°

Video Compression – H.264, Motion JPEG

Minimum Video Resolution (Pixels) 1920x1080 (3 x 2 Mega Pixels)

Image settings - Wide dynamic range (WDR), Highlight compensation, Manual shutter time, Compression, Color, Brightness, Sharpness, White balance, Exposure control, Exposure zones, Backlight compensation, Fine tuning of behavior at low light, Rotation, Text, and image overlay, 32 individual 3D privacy masks, Image freeze on PTZ, Automatic defog

Intelligent Video – Motion Detection, Tamper Alarm,

Wide Dynamic Range

Electronic image stabilization function

Adaptive IR option

Automatic defog function

Security – Level Passwords, IP Filtering, HTTPS Encryption, IEEE 802.1X,

Network – IPv4/v6, QoS

Power – Power over Ethernet IEEE 802.3af/802.3at Type 2 Class 4, max. 26 W, typical 11.1 W

Operating conditions - -40 °C to 50 °C (-58 °F to 122 °F) Humidity 10-100% RH (condensing)

Application Programming Interface - Open software integration, ONVIF Profile

Intelligent video - Video motion detection, Active tampering alarm

Form Factor Tamper and vandal resistant housing and clear smoked bubble

Mounting – as required

Other – Tamper and vandal resistant housing and clear bubble with integrated heater and blower.

H4AMH-AD-DOME1

Parts showed above are for reference only, additional components may be required for mounting, performance, etc.

#### 2.4.10 Power Supply

- .1 All CCTV cameras shall be powered by POE.

### 3 **EXECUTION**

#### 3.1 **General**

3.1.1 The Electronic Safety and Security Contractor shall assume control and accountability for furnishing and installing all video surveillance system as specified hereafter.

3.1.2 The Electronic Safety and Security Contractor shall be responsible for the systems specified in this Section, including coordination with related trades.

- .1 Related work required to be provided:

---

Communications (IT)

Electrical Works

All 120 Volt wiring and connections from power panels to terminal strips in electronic low-voltage panels, power supplies and devices.

All raceway, conduit to the device(s), including all back boxes and pull strings and the installation of all special back boxes.

#### 3.1.3 Camera Accessories

- .1 Provide and install camera housing and mounting accessories for complete operation of the videos surveillance system.
- .2 Coordinate the exact mount location of devices with the electrical contractor to ensure that all conduits and back boxes are installed in the optimal locations.
- .3 Coordinate exact mounting locations of all cameras on site with security Engineer's Representative and client.
- .4 Submit shop drawings to the Security Engineer's Representative for review prior to procurement and installation.
- .5 Allow for "needs assessment sessions" with client to determine the exact camera settings.

#### 3.1.4 Power supply

- .1 Supply and install power supplies as required for a fully functional video Surveillance System.
- .2 All power supplies shall be installed to manufacturer's recommendations.

#### 3.1.5 Installation

- .1 Supply, install, configure, and configure all CCTV system wiring, devices, and software as required for a complete and operational CCTV System.
- .2 All camera installation, configuration, setup, program, and related work shall be performed by technicians thoroughly trained by the manufacturer in the installation and service of the equipment provided.
- .3 Provide all camera brackets as required for each camera's application.
- .4 Carefully follow instructions in documentation provided by the manufacturer to ensure all steps have been taken to provide a reliable, easy-to-operate system.
- .5 All equipment shall be tested and configured in accordance with instructions provided by the manufacturer prior to installation.
- .6 All firmware found in CCTV System active devices shall be the latest and most up to date provided by the manufacturer.
- .7 All equipment requiring users to log on using a password shall be configured with user/site- specific password/passwords. No system/product default passwords shall be allowed.

- 
- .8 Final CCTV camera viewing requirements to be determined by owner. Coordinate with the owner and obtain viewing parameters for each CCTV Camera. Adjust all CCTV cameras to meet the owner's requirements.
  - .9 Adjust each CCTV camera to obtain the best quality image or CCTV camera image that is acceptable to the client.
  - .10 All domes must have the password protection feature enabled to protect against unauthorized changes to dome programming. All PTZ domes will be operated in continuous mode running an operator defined pattern, pre-set tour, or combination pattern/pre-set tour. PTZ dome movement criteria are to be coordinated with the System Operator(s) and Design Engineer's Representative to ensure camera coverage meets defined needs. PTZ domes must be programmed for "auto-resume" after a pre-defined time period, and on power-up.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Section Includes:**

- 1.1.1 Materials and installation for a complete and functional fire alarm system.
- 1.1.2 Control panel to carry out fire alarm and protection functions including receiving alarm signals, initiating single stage alarm, supervising system continuously, actuating zone annunciators, and initiating trouble signals.
- 1.1.3 Trouble signal devices.
- 1.1.4 Power supply facilities.
- 1.1.5 Manual alarm stations.
- 1.1.6 Automatic alarm initiating devices.
- 1.1.7 Audible signal devices.
- 1.1.8 End-of-line devices.
- 1.1.9 Annunciators.
- 1.1.10 Visual alarm signal devices.
- 1.1.11 Ancillary devices.

**1.2 Related Sections**

- 1.2.1 Section 01 33 00 – Submittal procedure
- 1.2.2 Section 01 78 00 – Closeout procedure
- 1.2.3 Section 01 91 00 General Commissioning requirements
- 1.2.4 Section 26 05 00 – Common Work Results – Electrical
- 1.2.5 Section 26 05 21.02 – Wires and Cables
- 1.2.6 Section 26 05 34 – Conduits, conduit fastenings and conduit fittings

**1.3 References**

- 1.3.1 Province of Ontario:
  - .1 Ontario Building Code
  - .2 Ontario Fire Code
  - .3 Ontario Electrical Safety Code
- 1.3.2 Health Canada/Workplace Hazardous Materials Information System (WHMIS):
  - .1 Material Safety Data Sheets (MSDS).
- 1.3.3 Underwriter's Laboratories of Canada (ULC), latest versions of:

- .1 CAN/ULC-S524, Standard for the Installation of Fire Alarm Systems.
  - .2 CAN/ULC-S525, Audible Signal Device for Fire Alarm Systems.
  - .3 CAN/ULC-S526, Visual Signal Devices for Fire Alarm Systems.
  - .4 CAN/ULC-S527, Control Units.
  - .5 CAN/ULC-S528, Manual Pull Stations for Fire Alarm Systems.
  - .6 CAN/ULC-S529, Smoke Detectors for Fire Alarm Systems.
  - .7 CAN/ULC-S530, Heat Actuated Fire Detectors for Fire Alarm Systems.
  - .8 CAN/ULC-S531, Standard for Smoke Alarms.
  - .9 CAN/ULC-S536, Standard for Inspection and Testing of Fire Alarm Systems
  - .10 CAN/ULC-S537, Standard for Verification of Fire Alarm Systems.
- 1.3.4 National Fire Protection Agency:
- .1 NFPA 72, National Fire Alarm Code.
  - .2 NFPA 90A, Installation of Air Conditioning and Ventilating Systems.

#### **1.4 Submittals**

##### **1.4.1 Product Data:**

- .1 Submit manufacturer's printed product literature, specifications and datasheet in accordance with Section 01 33 00 - Submittal Procedures.
- .2 Submit two copies of Workplace Hazardous Materials Information System (WHMIS) Material Safety Data Sheets (MSDS) in accordance with Section 01 33 00 - Submittal Procedures.

##### **1.4.2 Shop Drawings:**

- .1 Submit shop drawings stamped and signed by professional engineer licensed in the province of Ontario and in accordance with Section 01 33 00 - Submittal Procedures.
  - .1 Shop Drawings: Stamped and signed by professional engineer registered or licensed in Ontario, Canada.
- .2 Include:
  - .1 Layout of equipment.
  - .2 Zoning.
  - .3 Complete wiring diagram, including schematics of modules.

1.4.3 Quality Assurance Submittals: Submit following in accordance with Section 01 33 00 - Submittal Procedures.

- .1 Certificates: Submit certificates signed by manufacturer certifying that materials comply with specified performance characteristics and physical properties.
- .2 Instructions: Submit manufacturer's installation instructions.
- .3 Manufacturer's Field Reports: Manufacturer's field reports specified.

1.4.4 Closeout Submittals:

- .1 Submit maintenance and engineering data for incorporation into manual specified in Section 01 78 00 - Closeout Submittals in accordance with ANSI/NFPA 20.
- .2 Authority of Jurisdiction will delegate authority for review and approval of submittals required by this Section.
- .3 Submit to Authority of Jurisdiction two sets of approved submittals and drawings immediately after approval but no later than 15 working days to prior to final inspection.
- .4 Submit the following:
  - .1 Manufacturer's Data for:
    - .1 Control panel and modules.
    - .2 Storage batteries.
    - .3 Battery charger.
    - .4 Manual pull stations.
    - .5 Heat detectors.
    - .6 Open-area smoke detectors.
    - .7 Duct smoke detectors.
    - .8 Alarm bells.
    - .9 Alarm horns.
    - .10 Visible appliances.
    - .11 Main annunciator.
    - .12 Remote annunciator panel.
    - .13 Graphic annunciator panel.
    - .14 Master fire alarm boxes.
    - .15 Auxiliary transmitter.
    - .16 Master box pedestal.
    - .17 Radio master box pedestal.
    - .18 Master box.
    - .19 Radio master box location light.
    - .20 Radio fire alarm master box.
    - .21 Radio fire alarm auxiliary transmitter.
    - .22 Radio fire alarm interface panel.
    - .23 Combination auxiliary transmitter and interface panel.
    - .24 Freeze protection thermostatic switch.
    - .25 Electro-magnetic door holder-releases.

- .26 Valve tamper switches.
- .27 Wiring.
- .28 Ground rods.
- .29 Conduit.
- .30 Outlet boxes.
- .31 Fittings for conduit and outlet boxes.
- .32 Trouble buzzer.
- .33 Projected beam smoke detector.
- .34 Surge suppression devices.
- .35 Mark data which describe more than one type of item to indicate which type will be provided.
- .36 Submit one original for each item and clear, legible, first-generation photocopies for remainder of specified copies.
- .2 System Wiring Diagrams:
  - .1 Submit complete wiring diagrams of system showing points of connection and terminals used for electrical connections in the system.
  - .2 Show modules, relays, switches and lamps in control panel.
- .3 Design Data - Power Calculations:
  - .1 Submit design calculations new work specified to substantiate that battery capacity exceeds supervisory and alarm power requirements.
  - .2 Show comparison of detector power requirements per zone versus control panel smoke detector power output per zone in both standby and alarm modes.
  - .3 Show comparison of notification appliance circuit alarm power requirements with rated circuit power output.
- .4 Instructions for Operation:
  - .1 Projected beam smoke detector.
- .5 Schedules:
  - .1 Conductor wire marker schedule.
- .6 Test Reports:
  - .1 Verification report to conform to CAN/ULC - S537

## 1.5 **Quality Assurance**

### 1.5.1 Qualifications:

- .1 Installer to be a company or person specializing in fire alarm system installations with five years documented experience approved by manufacturer.

### 1.5.2 Provide services of representative or technician from manufacturer of system, experienced in installation and operation of type of

system being provided, to supervise installation, adjustment, preliminary testing, and final testing of system and to provide instruction to project personnel.

1.5.3 Extra Materials:

- .1 Provide maintenance materials in accordance with Section 01 78 00 - Closeout Submittals.

1.5.4 Maintenance Service:

- .1 Provide one year's free maintenance with two inspections by manufacturer during warranty period. Inspection tests to conform to CAN/ULC-S536. Submit inspection report to Engineer.

**1.6 Delivery, Storage and Handling**

1.6.1 Packing, shipping, handling and unloading:

- .1 Deliver, store and handle in accordance with Section 01 61 00 - Common Product Requirements.
- .2 Deliver, store and handle materials in accordance with manufacturer's written instructions.

**2 . PRODUCTS**

**2.1 Materials**

- 2.1.1 Equipment and Devices: ULC listed and labelled and supplied by single manufacturer.
- 2.1.2 Power supply shall be in accordance with CAN/ULC-S524.
- 2.1.3 Audible signal devices shall be in accordance with CAN/ULC-S525.
- 2.1.4 Visual signal devices shall be in accordance with CAN/ULC-S526.
- 2.1.5 Control unit shall be in accordance with CAN/ULC-S527.
- 2.1.6 Manual pull stations shall be in accordance with CAN/ULC-S528.
- 2.1.7 Thermal detectors shall be in accordance with CAN/ULC-S530.
- 2.1.8 Smoke detectors shall be in accordance with CAN/ULC-S529.
- 2.1.9 Smoke alarms shall be in accordance with CAN/ULC-S531.

**2.2 System Operation: Single Stage - Signals Only**

- 2.2.1 Single Stage Operation.
- 2.2.2 Operation to Actuation Following:
  - .1 Manual station.
  - .2 Heat detector.

- .3 Smoke detector.
- .4 Automatic fire sprinkler system.
- .5 Fire extinguishing system.
- .6 Fire standpipe system.
- 2.2.3 Actuation of single operation device to initiate following:
  - .1 Building evacuation alarm devices to operate continuously.
- 2.2.4 Actuation of any supervisory device to:
  - .1 Cause electronic latch to lock-in supervisory state at central control unit and data gathering panel/transponder.
  - .2 Indicate respective supervisory zone at central control unit and remote annunciator.
  - .3 Cause audible signal at central control unit to sound.
  - .4 Activate common supervisory sequence.
- 2.2.5 Resetting alarm device not to return system indications/functions back to normal until control unit is reset.
- 2.2.6 Trouble on system to:
  - .1 Indicate circuit in trouble at central control unit.
  - .2 Activate "system trouble" indication, buzzer and common trouble sequence. Acknowledging trouble condition to silence audible indication; visual indication to remain until trouble is cleared and system is back to normal.
- 2.2.7 Troubles on System: Suppressed during course of alarm.
- 2.2.8 Trouble condition on any circuit in system not to initiate alarm conditions.

## **2.3 Control Panel**

- 2.3.1 Central Control Unit (CCU):
  - .1 Suitable for DCLA communication style shall be in accordance with CAN/ULC-S524.
  - .2 Features specified are minimum requirements for microprocessor-based system with digital data control and digital multiplexing techniques for data transmission.
  - .3 Minimum capacity of 250 500 1,000 2,000 3,000 addressable monitoring and 250 500 1,000 addressable control/signal points. Points may be divided between two communication channels in distributed system, each channel operating independently of other. Faults on one communication channel not to affect operation of other channel.
  - .4 System to provide for priority reporting levels, with fire alarm points assigned highest priority, supervisory and monitoring lower priority, and third priority for troubles. Possible to

- 
- assign control priorities to control points in system to guarantee operation or allow emergency override as required.
- .5 Integral power supply, battery charger and standby batteries.
  - .6 Basic life safety software shall be retained in a non-volatile Erasable Programmable Read-Only-Memory (EPROM). Extra memory chips shall be easily field-installed. Random-Access-Memory (RAM) chips in panel to facilitate password-protected field editing of simple software functions (i.e. zone labels, priorities) and changing of system operation software.
  - .7 Circuitry to continuously monitor communications and data processing cycles of microprocessor. Upon failure, audible and visual trouble indication to activate.
  - .8 Communication between CCU and remote DGP's/TPR's to be supervised, DCLA. Should communications fail between CCU and remote units, audible and visual trouble to be indicated at CCU. Data communication to be binary DC, baseband, time-division multiplex, half-duplex. Each data channel shall be capable of communicating up to distance of 3,000 m.
    - .1 Communication between nodes in networked system to be supervised, DCLA. Should communications fail between any two nodes, other nodes on loop to continue to communicate with each other and programmed functions on communicating nodes to continue operating.
  - .9 Support up to four RS-232-C I/O ports. CCU output to be parallel ASCII with adjustable baud rates to allow interface of any commercially available printer, terminal or PC.
  - .10 Equipped with software routines to provide Event-Initiated-Programs (EIP); change in status of one or more monitor points, may be programmed to operate any or all of system's control points.
  - .11 Software and hardware to maintain time of day, day of week, day of month, month and year.
  - .12 On-board, 20-column, DC strip printer, thermal head with automatic paper take-up, and silent operation; operational while system is operating on standby power. Expanded font available for selected printing conditions.
  - .13 Printer to record activities on system controlled by EIA RS-232-C link from within CCU.
-

- .14 Software to operate variable sensitivity addressable smoke detectors and annunciate their status and sensitivity settings at control panel.

## **2.4 Data Gathering Panels (DGP's)/Transponders**

- 2.4.1 Fire control modules shall be distributed throughout building in separately enclosed units (DGP's) and interconnected to central control unit utilizing multiplex data transmission techniques.
- 2.4.2 Modules shall be concentrated in single central location in modular central control panel.
- 2.4.3 Fire alarm integrated DGP's shall be microprocessor based, provide interface between standard alarm input/output devices and central control unit.
- 2.4.4 Each DGP shall be circuitry with the ability to detect failure in communication with CCU resulting from faults in communication wiring. In event of loss of communication with CCU, DGP capable of operating in stand-alone mode. In this mode, DGP capable of reacting to connected input devices, and apply stand-alone programming to determine state of connected outputs. Stand-alone programming instructions: independent of, but capable of executing same type of algorithms as, that of CCU.
- 2.4.5 Each DGP shall be a self-contained unit, with integral power supply, battery charger and standby batteries. Short circuit, over voltage, and brown-out monitoring to protect powered components by automatically switching to standby batteries whenever trouble condition exists in power supply.
- 2.4.6 Addressable DGP's
  - .1 DGP's shall be addressable type, provide two-way data communication with up to 30 ,90, 128 addressable devices/interface modules, utilizing digital poll/response protocol communication format. Each addressable device: uniquely identified by own address, set at time of installation.
  - .2 Addressable DGP's shall have stand-alone capability.
  - .3 Interface modules shall facilitate the connection of non-addressable devices (i.e. flow switch) to addressable DGP; provided in different types for connection to monitoring devices (i.e. flow/tamper switch), signalling devices (i.e. bells, horns), and control functions (i.e. fan shutdown, door release); communicate with addressable DGP over minimum number of wires (specified by manufacturer).
  - .4 Addressable DGP's shall be self-contained, as specified.

- .5 Possible to connect variable-sensitivity addressable smoke detectors together with other addressable devices to same addressable communication loop

## **2.5 Power Supplies**

- 2.5.1 120 V, 60 Hz as primary source of power for system.
- 2.5.2 Voltage regulated, current limited distributed system power.
- 2.5.3 Primary power failure or power loss (less than 102 V) will activate common trouble sequence.
- 2.5.4 Interface with battery charger and battery to provide uninterruptible transfer of power to standby source during primary power failure or loss.
- 2.5.5 During normal operating conditions fault in battery charging circuit, short or open in battery leads to activate common trouble sequence and standby power trouble indicator.
- 2.5.6 Standby batteries shall be sealed, maintenance free.
- 2.5.7 Continuous supervision of wiring for external initiating and alarm circuits to be maintained during power failure.

## **2.6 Initiating/Input Circuits**

- 2.6.1 Receiving circuits for alarm initiating devices such as manual pull stations, smoke detectors, heat detectors and water flow switches, wired in DCLA configuration to central control unit and DGP's/transponders.
- 2.6.2 Alarm receiving circuits (active and spare) shall be compatible with smoke detectors and open contact devices.
- 2.6.3 Actuation of alarm initiating device shall cause system to operate as specified in "System Operation".
- 2.6.4 Receiving circuits for supervisory, N/O devices. Devices shall be wired in DCLA configuration to central control unit DGP's/transponders.
- 2.6.5 Actuation of supervisory initiating device shall cause system to operate as specified in "System Operation".

## **2.7 Alarm Output Circuits**

- 2.7.1 Alarm output circuit shall be connected to signals, wired in Class A configuration to central control unit DGP's/transponders.
  - .1 Signal circuits' operation to follow system programming; capable of sounding bells chimes horns continuously at 20 spm. Each signal circuit shall be rated at 2 A, 24 VDC; fuse-protected from overloading/overcurrent.
  - .2 Manual alarm silence, automatic alarm silence and alarm silence inhibit to be provided by system's common control.

---

**2.8 Auxiliary Circuits**

- 2.8.1 Auxiliary contacts for control functions.
- 2.8.2 Actual status indication (positive feedback) from controlled device.
- 2.8.3 Alarm and supervisory trouble on system to cause operation of programmed auxiliary output circuits.
- 2.8.4 Two sets of separate contacts for elevator capture to main floor of egress and to alternate floor of egress.
- 2.8.5 Upon resetting system, auxiliary contacts to return to normal or to operate as pre-programmed.
- 2.8.6 Fans shall stagger-started upon system reset; timing circuit to separate starting of each fan or set of fans connected to auxiliary contact on system.
  - .1 Timing circuit shall be controlled by CCU.
- 2.8.7 Auxiliary circuits shall be rated at 2 A, 24 VDC or 120 VAC, fuse-protected.

**2.9 Wiring**

- 2.9.1 Twisted copper conductors shall be rated 600 V.
- 2.9.2 To initiating circuits shall be 18 AWG minimum, and in accordance with manufacturer's requirements.
- 2.9.3 To signal circuits shall be 16 AWG minimum, and in accordance with manufacturer's requirements.
- 2.9.4 To control circuits shall be 14 AWG minimum, and in accordance with manufacturer's requirements.

**2.10 Manual Alarm Stations**

- 2.10.1 Addressable Manual Pull Station:
  - .1 Pull lever, break glass rod, semi-flush wall mounted type, single action, single stage, electronics to communicate station's status to addressable module/transponder over two wires and to supply power to station. Station address to be set on station in field.

**2.11 Automatic Alarm Initiating Devices**

- 2.11.1 Heat detectors, fixed temperature, rated 57°C.
- 2.11.2 Thermal fire detectors, combination fixed temperature and rate of rise, non-restorable fixed temperature element, self-restoring rate of rise, fixed temperature 57°C, rate of rise 8.3°C per minute.
- 2.11.3 Addressable thermal fire detectors, combination fixed temperature and rate of rise, non-restorable fixed temperature element, self-restoring rate of rise, fixed temperature 57°C, rate of rise 8.3°C per minute.

- .1 Electronics to communicate detector's status to addressable module/transponder.
- .2 Detector address to be set on detector base in field.
- 2.11.4 Smoke detector shall be photoelectric type air duct type with sampling tubes with protective housing.
  - .1 Twist-lock type with fixed base.
  - .2 Wire-in base assembly with integral red alarm LED, and terminals for remote alarm LED.
- 2.11.5 Addressable Smoke Detector:
  - .1 Photoelectric type.
  - .2 Electronics to communicate detector's status to addressable module/transponder.
  - .3 Detector address to be set on detector base in field.
- 2.11.6 Addressable Variable-Sensitivity Smoke Detectors:
  - .1 Photoelectric type.
  - .2 Electronics to communicate detector's status to addressable module/transponder.
  - .3 Detector address to be set on detector base in field.
  - .4 Sensitivity Settings: Three settings, determined and operated by control panel. No shifting in detector sensitivity due to atmospheric conditions (dust, dirt) within certain parameters.
  - .5 Ability to annunciate minimum of two levels of detector contamination automatically with trouble condition at control panel.

## **2.12 Audible Signal Devices**

- 2.12.1 Bells shall be surface mounted, single stroke, polarized, 24 V DC, 150mm, 85 dB.
- 2.12.2 Bells shall be vibrating type, gongs of special alloy steel, 24 V DC, 150 mm, 85 dB.
- 2.12.3 Horns shall be 85 dB, weatherproof surface mounting, 24 V DC.

## **2.13 Visual Alarm Signal Devices**

- 2.13.1 Strobe type shall be flashing , red , 24 V DC.
- 2.13.2 Designed for surface mounting on as indicated.

## **2.14 End-Of-Line Devices**

- 2.14.1 End-of-line devices to control supervisory current in alarm circuits and signalling circuits, sized to ensure correct supervisory current for each circuit. Open ,short or ground fault in any circuit will alter

supervisory current in that circuit, producing audible and visible alarm at main control panel and remotely as indicated.

**2.15 Remote Annunciators**

2.15.1 LED Remote alphanumeric type, with designation cards to indicate zones.

2.15.2 Display:

- .1 Alarms and troubles for alarm initiating circuits.
- .2 Supervisory alarms and troubles for supervisory initiating circuits.
- .3 Common system trouble.

2.15.3 Trouble Buzzer:

- .1 Acknowledging trouble at main panel to silence trouble buzzers in system.

2.15.4 Supervised, with LED test button and alarm acknowledge button.

2.15.5 Minimum wiring configuration with main panel and other remote annunciators.

**2.16 Graphic Display**

2.16.1 Passive type.

**2.17 Remote Printer**

2.17.1 System Printer shall give a hard copy record of system events complete with following features:

- .1 120 V AC, 60 Hz.
- .2 80 columns.
- .3 120 cps.
- .4 Utilizes fan fold paper.
- .5 Connected to RS-232 output at central control panel.

**2.18 Remote Terminal**

2.18.1 CRT screen shall be 120 V, 60 Hz, to incorporate 100% solid state circuitry, with 30 cm screen and front mounted controls for brightness, contrast, vertical and horizontal hold and power ON/OFF switch.

**2.19 As-Built Riser Diagram**

2.19.1 Fire alarm system riser diagram shall be in glazed frame on black lamicoid sheet with bevelled edges, white lettering and designations, minimum size 600 mm x 600 mm.

## **2.20 Ancillary Devices**

2.20.1 Remote relay unit to initiate fan shutdown.

## **3 . EXECUTION**

### **3.1 Examination**

3.1.1 Verification of Conditions: Verify conditions of substrates previously installed under other Sections or Contracts are acceptable for fire alarm installation in accordance with manufacturer's written instructions.

1. Visually inspect substrate in presence of Engineer.
2. Inform Engineer of unacceptable conditions immediately upon discovery.
3. Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Engineer.

### **3.2 Installation**

3.2.1 Install systems in accordance with CAN/ULC-S524 and TB Fire Protection Standard.

3.2.2 Install central control unit and connect to AC power supply, AC DC standby power.

3.2.3 Install manual alarm stations and connect to alarm circuit wiring.

3.2.4 Locate and install detectors and connect to alarm circuit wiring. Mount detectors more than 1 m from air outlets. Maintain at least 600 mm radius clear space on ceiling, below and around detectors. Locate duct type detectors in straight portions of ducts.

3.2.5 Connect alarm circuits to main control panel.

3.2.6 Install signal bells chimes horns and visual signal devices and connect to signalling circuits.

3.2.7 Connect signalling circuits to main control panel.

3.2.8 Install end-of-line devices at end of alarm and signalling circuits.

3.2.9 Install remote annunciator panels and connect to annunciator circuit wiring.

3.2.10 Install door releasing devices.

3.2.11 Install remote relay units to control fan shutdown.

3.2.12 Sprinkler System: Wire alarm and supervisory switches and connect to control panel.

3.2.13 Room Detection System:

- .1 Install detectors and make necessary connections between room detection panel and main fire alarm panel.
- .2 Locate and install audible signals visual alarms.

- .3 Locate and install detectors under raised floor. Fasten to steel brackets approximately 300 mm above sub- floor level to clear cables and conduits.
- 3.2.14 Connect fire suppression systems to control panel.
- 3.2.15 Splices are not permitted.
- 3.2.16 Provide necessary raceways, cable and wiring to make interconnections to terminal boxes, annunciator equipment and CCU, as required by equipment manufacturer.
- 3.2.17 Ensure that wiring is free of opens, shorts or grounds, before system testing and handing over.
- 3.2.18 Identify circuits and other related wiring at central control unit, annunciators, and terminal boxes.

### **3.3 Field Quality Control**

- 3.3.1 Perform tests in accordance with Section 26 05 00 - Common Work Results for Electrical and CAN/ULC-S537.
- 3.3.2 Fire Alarm System:
  - .1 Test such device and alarm circuit to ensure manual stations, thermal and smoke detectors sprinkler system transmit alarm to control panel and actuate first stage alarm general alarm ancillary devices.
  - .2 Check annunciator panels to ensure zones are shown correctly.
  - .3 Simulate grounds and breaks on alarm and signalling circuits to ensure proper operation of systems.
  - .4 Addressable Circuits System Style DCLA:
    - .1 Test each conductor on all DCLA addressable links for capability of providing three or more subsequent alarm signals on each side of single open-circuit fault condition imposed near midmost point of each link. Operate Acknowledge/Silence switch after reception of each of the three signals. Correct imposed fault after completion of each series of tests.
    - .2 Test each conductor on all DCLA addressable links for capability of providing three or more subsequent alarm signals during ground-fault condition imposed near midmost point of each link. Operate
    - .3 Acknowledge/Silence switch after reception of each of the three signals. Correct imposed fault after completion of each series of tests.
- 3.3.3 Provide final PROM program re-burn for system incorporating program changes made during construction.

---

**3.4 Cleaning**

3.4.1 Progress Cleaning: Clean in accordance with Section 01 74 00 – Cleaning and Waste Management.

.1 Leave Work area clean at end of each day.

3.4.2 Final Cleaning: Upon completion remove surplus materials, rubbish, tools and equipment in accordance with Section 01 74 00 – Cleaning and Waste Management.

.1 Place materials defined as hazardous or toxic waste in designated containers.

**3.5 Protection**

3.5.1 Protect installed products and components from damage during construction.

3.5.2 Repair damage to adjacent materials caused by fire alarm system installation.

**3.6 Closeout Activities**

3.6.1 Provide on-site lectures and demonstration by fire alarm equipment manufacturer to train operational personnel in use and maintenance of fire alarm system.

**3.7 Maintenance**

3.7.1 Provide individual price on tender form for subsequent PROM re-burns. Price shall be good for one years from date of project completion.

3.7.2 Provide individual price on tender form for temporary program changes during construction period, to include zone labels, control functions, system operation.

**END OF SECTION**

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 General**

- 1.2.1 All equipment and materials used shall be standard components that are regularly manufactured and used in the manufacturer's system.
- 1.2.2 All systems and components shall have been thoroughly tested and proven in actual use.
- 1.2.3 All systems and components shall be provided with the availability of a toll-free (U.S. and Canada), 24-hour technical assistance program (TAP) from the manufacturer. The TAP shall allow for immediate technical assistance for either the dealer/installer or the end user at no charge for as long as the product is installed.
- 1.2.4 All systems and components shall be provided with a one-day turnaround repair express and 24-hour parts replacement. The repair and parts express shall be guaranteed by the manufacturer on warranty and non-warranty items.

## **2 PRODUCT**

### **2.1 Manufactures**

- 2.1.1 Acceptable Manufactures are Code Blue and Bosch

### **2.2 General**

- 2.2.1 All equipment shall be rated for continuous operation. Environmental conditions (i.e., temperature, humidity, wind, and seismic activity) shall be taken under consideration at each facility and site location prior to installation of the equipment.
- 2.2.2 All equipment shall operate on 120 or 240 volts alternating current (VAC); 50 hertz (Hz) or 60 Hz Alternating Current (AC) power system unless documented otherwise in subsequent sections listed within this spec. All equipment shall have a battery back-up source of power that will provide 12 hours (hrs.) of run time in the event of a loss of primary power to the security systems until a backup generator comes on-line.
- 2.2.3 The Electronic Personal Protection System (hereafter referred to as "EPPS") shall be designed, installed, and programmed in a manner that will allow for ease of operation, programming, servicing, maintenance, testing, and upgrading of the system.
- 2.2.4 The Electronic Safety and Security Contractor shall provide the Contracting Officer with written verification, that the type of wire/cable being provided is recommended and approved by the OEM.

- 2.2.5 When interfacing with other communications or security subsystems the Electronic Safety and Security Contractor shall utilize interfacing methods that are approved by the Contracting Officer. At a minimum, an acceptable interfacing method requires not only a physical and mechanical connection, but also a matching of signal, voltage, and processing levels with regard to signal quality and impedance. The interface point must adhere to all standards described herein.
- 2.2.6 Systems shall be scalable and allow expansion as required.
- 2.2.7 Wireless systems shall use ultrasonic, infrared or radio frequency waves to link distributed transmitters and receivers. Specific characteristics of particular site will determine best application. The Electronic Safety and Security Contractor is responsible for determining best system using prediction program to determine where readable signals can be obtained and identify "dead spots".
- 2.2.8 All hardwired alarms, switches, and junction boxes shall be protected from tampering and include line supervision.
- 2.2.9 The installation and placement of intercom units and emergency-call boxes in strategic locations shall also require that signage be posted near these devices. The signage shall communicate the location of the device and its unique identification number, and brief instruction on how to access/use the device. The signage may appear on the device, on a pole or wall near the device location and shall be printed in a manner that is easily read during daylight and hours of darkness.

### 2.3 **Equipment**

- 2.3.1 All systems shall be designed to provide continuous electrical and communications supervision of the complete and entire system.
- 2.3.2 Noise filters and surge protectors shall be provided for all intercommunications equipment to ensure protection from primary AC power surges and to ensure noise interference is not induced into low voltage data circuits.
- 2.3.3 All alarm and initiating and signaling circuits shall be supervised for open circuits, short circuits, and system grounds. Main and Uninterrupted Power Supply (UPS) power circuits shall be supervised for any change in operating conditions (e.g., low battery, primary to back up battery, and UPS online). When an open, short, or ground occurs in any system circuit, an audible and visual fault alarm signal shall be initiated at the master control station and all remote locations.
- 2.3.4 Control Unit: Shall consist of the components to constantly monitor and verify alarm activation; identify zone of activation and location of activation.
- 2.3.5 Audible Signal Device for Duress-Panic: Provides alarm activation and audible sound for alarms, as well as supervisory and trouble signals that shall be distinctive.
- 2.3.6 Assessment: This capability shall consist of electronic devices required to verify the validity of alarms visually and audibly. Assessment also includes providing indication of tampering, fail-safe, low battery, and power losses.

- 
- 2.3.7 Alarm Monitoring and Reporting: Shall annunciate information to at least two (2) separate locations. The alarms shall maintain the capability to respond with local and remote visible and audible signals upon activation of an alarm. The alarms shall have the capability of operating in a silent mode, alerting personnel monitoring the system that the device has been activated.
- 2.3.8 The intercom and duress panic alarm systems shall be provided with normally acceptable speech intelligibility, defined as a score of at least 70% in accordance with ANSI S3.2
- 2.4 **Duress-Panic Alarms:**
- 2.4.1 Housing shall be a rugged corrosion-resistant housing of stainless steel or Acrylonitrile Butadiene Styrene (ABS) molded plastic or similar material that is weather and dust proof.
- 2.4.2 Actuating device shall include a minimum of a plunger button whose head is recessed from the face/front edge of the housing and be designed to avoid accidental activation using either a switch guard or two (2) button activation system (Pressing 2 buttons simultaneously).
- 2.4.3 No Wireless stationary devices will meet the same specifications as Personal Duress/Panic Alarms.
- 2.4.4 Alarm switch/button shall lock-in upon activation until manually reset with key or manufacture provided device.
- 2.4.5 The switch shall be a positive-acting double-pole switch.
- 2.4.6 Duress/Panic alarms shall meet UL 305 Standard for Panic Alarms. To reduce the possibility of false alarms and ensure installation functionality UL 636 Standard for Holdup Alarms standards shall be met.
- 2.4.7 Components:
- .1 Transmitter
  - .2 Locator subsystem
  - .3 Receiver
  - .4 Software
- 2.4.8 Wiring will be four (4) conductors #18 American Wire Gauge (AWG).
- 2.4.9 Duress-Panic Alarm Technical Characteristics:
- |                   |  |
|-------------------|--|
| Temperature Range | 0° to 110°F (-17.8°C to 43.3°C)  |
| Operational life  | Rated for 10,000 activations   |
| Actuator          | Wall mounted: Single button with Switch guard OR Dual button with activation lock.<br>Desk mounted: Dual button with activation lock |
| LED               | Bi-color – on and activated  |
- 2.4.10 Shall be capable of being mounted for hand use in a manner that is unable to be viewed by the public.
-

- 2.4.11 They shall also annunciate at the Physical Access Control System and Database Management, monitored by a central station, or direct connect to local police, depending on local ordinance requirements.
- 2.4.12 On activation of an Alarm, the system will send a message to the client paging system, indicating date, time, and location of alarm. This shall be user configurable for future expansion of the system, at no cost to the client.
- 2.4.13 On activation of an Alarm, the system shall send an email to indicate date, time, and location of the alarm. This system shall be capable of sending email to multiple recipients and be user configurable for future expansion of the system, at no cost to the client.

## 2.5 **Code Blue Station**

- 2.5.1 The unit shall be a two-piece construction, with both pieces constructed of 12 gauge, 304 grade stainless steel, with a custom-designed, and microphone/speaker.
- 2.5.2 A 0.187" thick transparent lens formed of clear polycarbonate shall be inserted into the housing behind the opening.
- 2.5.3 Tamper resistant proprietary fasteners shall be used. It shall not be possible to acquire the custom-designed bit from any other source.
- 2.5.4 The unit button and strobe configuration and programming shall be coordinated with Owner.

### .1 Specified Product:

Manufacturer	Model No.	Location	Colour
Code Blue	CB 6-f	Indoors	Stainless

## 3 **EXECUTION**

### 3.1 **Installation**

- 3.1.1 System installation shall be in accordance with manufacturer's instructions and using appropriate installation manual for each type of subsystem designed, engineered, and installed.
- 3.1.2 Concealed duress/panic devices shall be mounted in such a way that their location is only known by the person having knowledge of the activating device location. No wiring shall be exposed to identify the location of the activation device.
- 3.1.3 Subsequent to installation, clean each system component of dust, dirt, grease, or oil incurred during installation in accordance to manufacture instructions.
- 3.1.4 Provisions shall be made for systems in high-noise areas or areas with electrical interference environments.

- 3.1.5 Adjustment/Alignment/Synchronization: Contractor shall prepare for system activation by following manufacturer's recommended procedures for adjustment, alignment, or programming. Prepare each component in accordance with appropriate provisions of the component's installation, operations, and maintenance instructions.

**3.2 Field Quality Control**

- 3.2.1 Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation and supervise pretesting, testing, and adjusting of video surveillance equipment.
- 3.2.2 Inspection: Verify that units and controls are properly installed, connected, and labeled, and that any interconnecting wires and terminals are identified.
- 3.2.3 Test Schedule: Schedule tests after pretesting has been successfully completed and system has been in normal functional operation for at least 14 days. Provide a minimum of 10 days' notice of test schedule.
- 3.2.4 Operational Tests: Perform operational system tests to verify that system complies with Specifications. Include all modes of system operation. Test equipment for proper operation in all functional modes.
- 3.2.5 Remove and replace malfunctioning items and retest as specified above.
- 3.2.6 Record test results for each piece of equipment.
- 3.2.7 Retest: Correct deficiencies identified by tests and observations and retest until specified requirements are met.

**3.3 Protection**

- 3.3.1 Protect installed products until completion of project.
- 3.3.2 Touch-up, repair or replace damaged products before Substantial Completion.

**3.4 Demonstration**

- 3.4.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain EPPS equipment.
- .1 Train Owner's maintenance personnel on procedures and schedules for troubleshooting, servicing, and maintaining equipment.
- .2 Demonstrate methods of determining optimum alignment and adjustment of components and settings for system controls.
- .3 Review equipment list and data in maintenance manuals.
- .4 Conduct a minimum of four (4) x one (1) hour end user training sessions.

**3.5 Commissioning**

- 3.5.1 Provide commissioning documentation in accordance with the requirements of Section 28 08 00 – COMMISSIONING OF ELECTRONIC SAFETY AND SECURITY SYSTEMS for all inspection, start up, and contractor testing required above and required by the System Readiness Checklist provided by the Commissioning Agent.
- 3.5.2 Components provided under this section of the specification may be tested as part of a larger system. Refer to Section 28 08 00 – COMMISSIONING OF ELECTRONIC SAFETY AND SECURITY SYSTEMS and related sections for contractor responsibilities for system commissioning.

**3.6 Adjusting**

- 3.6.1 Occupancy Adjustments: When requested within 6 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions and to optimize performance of the installed equipment. Tasks shall include, but are not limited to, the following:
  - .1 Check cable connections (where relevant).
  - .5 Check proper operation of all detectors / sensors.
  - .6 Re-locate end-point equipment if necessary.
  - .7 Provide a written report of adjustments and recommendations.

**END OF SECTION**

---

## **1 GENERAL**

### **1.1 Work Included**

- 1.1.1 Conform to Section 28 00 03 – General Specifications and Requirements for Electronic Safety and Security.

### **1.2 General**

- 1.2.1 The following systems shall be integrated on a single common IP network via respective servers; controllers and a common data switch to provide integrated functions as described in this specifications document and on Contract Drawings.
  - .1 Access Control
  - .2 Video Surveillance/CCTV
  - .3 Intercom
  - .4 Electronic Personal Protection System
- 1.2.2 Personal computers (Referred to as Central Management Stations) shall be provided at locations indicated on contract drawings. Each personal computer shall be equipped with all required, hardware, client and or server software; software licence and shall facilitate remote administration of all systems as described in the contract documents.
- 1.2.3 These "performance" specifications are to be translated into specific equipment and systems depicting products which the Contractor proposes to use.
- 1.2.4 The functions of each Central Management Stations shall include but not limited to:
  - .1 View, monitor and administer the access control, CCTV, intercom and electronic personal protection systems via interactive graphical map of the facility.
  - .2 Monitor and administer access control, CCTV, intercom and electronic personal protection systems devices via interactive graphical map of the facility.
  - .3 Administration of credentials.
  - .4 View, monitor and administer video streams from each CCTV camera.
  - .5 Display single and/or multiple video streams from multiple CCTV camera simultaneously.
  - .6 Functions described in all sections of this specifications.
  - .7 The systems shall be modular and expandable as herein specified or as the Owner may direct up to full system capacity.
- 1.2.5 All hardware, client and or server software; software licence shall be provided and installed and configured on the Central Management Stations, all servers, and controllers to facilitate the following integrated functions:

---

**.1 Access Control and CCTV System**

The access control system shall be integrated with the CCTV system so that upon presentation of an invalid card at a card reader, forced entry at a secured door or door held open beyond pre-set acceptable duration, the access control system shall signal the CCTV System to display the video streams from the CCTV camera with view of the respective door. The video stream shall be displayed immediately on each Central Management Station Monitor following the event. It shall be possible to display the video stream in full screen format or reduces size format.

**.1 Access Control and Intercom System**

The access control system shall be integrated with intercom systems to the so that upon activation of an intercom or duress alarm station the alarm is graphically announced and displayed immediately on each Central Management Station Monitor following the event. Each alarm shall have a unique address indicating the location of the alarm on a graphical map of the facility.

The access control system shall be integrated with intercom systems to facilitate the remote opening of access-controlled doors via the intercom master station.

**.2 Access Control and Electronic Personal Protection System**

The access control system shall be integrated with electronic personal protection systems to the so that upon activation of an electronic personal protection device is graphically announced and displayed immediately on each Central Management Station Monitor following the event. Each alarm shall have a unique address indicating the location of the alarm on a graphical map of the facility.

Integration for Access Control and Electronic Personal Protection system shall be coordinated with Owner.

**.3 Video Surveillance/CCTV and Intercom System with duress alarm functions**

The Video Surveillance/CCTV shall be integrated with the Intercom system so that to upon activation of an intercom or a duress alarm station the intercom system shall signal the CCTV System to display the video streams from the CCTV camera with view of the respective activated intercom or duress alarm station. The video stream shall be displayed immediately on each Central Management Station Monitor following the event. Each alarm shall have a unique address indicating the location of the alarm on a graphical map of the facility.

**.4 Video Surveillance/CCTV and Electronic Personal Protection System**

The Video Surveillance/CCTV shall be integrated with the electronic personal protection system so that to upon activation of an electronic personal protection device the electronic personal protection system shall signal the CCTV System to display the video streams from the CCTV camera with view of the respective activated electronic personal protection device. The video stream shall be displayed immediately on each Central Management Station Monitor following the event. Each alarm shall have a unique address indicating the location of the alarm on a graphical map of the facility. Integration for Video Surveillance/CCTV and Electronic Personal Protection system shall be coordinated with Owner.

---

## **2 PRODUCT**

### **2.1 Central Management Station Computer**

2.1.1 The monitoring equipment for video surveillance and access control systems, when installed in the security systems furniture shall be placed on a shelf so that the equipment is not sitting on the floor to avoid any potential water damage due to flooding.

2.1.2 The monitoring computer for video surveillance and access control systems shall have the following minimum specifications:

Processors:	Intel Core i7-5960X 8-Core 3.0GHz Desktop Processor
Memory:	16GB 1600MHz DDR4 Memory
Video Cards	4 x (HDMI with DVI and 2GB RAM)
Optical Drivers	DVD+/-RW Drive
Boot Hard Drives:	1TB 3.5inch SATA
Monitors:	2 x 27" displays complete with stand
USB Ports:	Minimum 4
Security Hardware:	Chassis Intrusion Switch Option
Warranty:	3 Year
Mouse:	USB 2-Button Laser Mouse
Operating System:	Windows 8.1 Pro, 64-bit English
Software:	MS office 2013
Audio Inputs	Two 3.5 mm stereo jacks
Audio Outputs	One 3.5 mm stereo jack
Network Specifications	Interface Gigabit Ethernet RJ-45 port, (1000Base-T)
Form Factor	Desktop
UPS Backup	1500VA UPS

## **3 EXECUTION**

### **3.1 Installation**

3.1.1 Install system in accordance with manufacturer's instructions.

### **3.2 Field Quality Control**

3.2.1 Test in accordance with manufacturer's testing procedures.

### **3.3 Manufacturer's Field Services**

3.3.1 Provide manufacturer's field services for final system checkout and acceptance testing as required.

### **3.4 Protection**

3.4.1 Protect installed products until completion of project.

3.4.2 Repair or replacement damaged products before Substantial Completion.

---

**END OF SECTION**

**1. GENERAL****1.1 Summary**

- 1.1.1 Provide labour, materials, products, equipment, and services to complete the excavation, grading and backfill for work in areas within the limits of Construction specified herein.

**1.2 Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.3 References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

**1.4 EXISTING CONDITIONS**

- 1.4.1 Examine subsurface investigation reports.
- 1.4.2 Any on-site soils encountered by the Contractor that are suspected as being contaminated shall be brought to the attention of the Consultant for testing, prior to its removal from the site as per Special Provision On-Site and Excess Soil Management, GN133SP.
- 1.4.3 It is the Contractor's responsibility to verify all utilities prior to any site activity. Known underground, surface/overhead utility lines and buried objects are as indicated on Contract Drawings.
- 1.4.4 If upon excavating to the specified elevations, it is found that existing conditions are not fulfilled, adjust the excavations accordingly, but only with the written authorization of the Consultant.

**1.5 SUBMITTALS**

- 1.5.1 A minimum of 14 days prior to imported fill (earth borrow) material being used (if required), a list of intended borrow sources and tonnage that is expected to be used from each source shall be

---

provided to the Geotechnical Engineer to allow time for sampling and testing.

1.5.2 Shop drawings:

1.5.3 Submit shop drawings in accordance with Section 01 33 00 indicating:

1.5.4 Adjacent construction, elevations, sections and details, dimensions, and relationship to adjacent construction.

1.5.5 Include shoring design for excavations, design calculations (if requested), design concept, construction method, sequence and means by which existing structures, utilities and equipment will be protected; Location of in-use, maintained, re-routed and abandoned underground lines.

1.5.6 Reports:

1.5.7 Submit written laboratory test reports for each material proposed for backfill. All imported "Soil" must be sampled in accordance with O.Reg. 406/19 sampling frequency, under the supervision of a Qualified Person (Ref. Special Provision).

1.5.8 Submit written field inspection and test report results after each inspection. Submit dewatering methods 30 days in advance for review by Consultant.

1.5.9 Submit Dewatering Plan 30 days in advance for review by Consultant.

1.5.10 The Contractor shall provide the completed Excess Soil Destination Assessment Report (ESDAR) 30 Days after award to the Region. Five Days in advance of any excavation, the report shall be reviewed for acceptance by the Region. See Special Provision On-Site and Excess Soil Management, GN133SP.

1.5.11 Submit to Consultant details of locations where surplus soils and other materials are to be disposed of or reused. Include each disposal/reuse Site and type of surplus soil or other material, location of the disposal/reuse Site, operator's name and business address, type of license under which Site operates, and criteria used by Site to access suitability of surplus material for disposal. See Special Provision On-Site and Excess Soil Management, GN133SP.

1.5.12 Submit to Consultant, within 48 hours of a load of surplus soil or other material leaving the Site, a daily register recording the time and place of disposal/reuse of each load signed by a representative of the disposal site. Such documentation must be submitted before payment for excavation will be made. See Special Provision On-Site and Excess Soil Management, GN133SP.

1.5.13 Within 21 Days of the completion of soil movement, the Contractor's QP shall provide an Excess Soil Implementation Report, as per Special Provision On-Site and Excess Soil Management, GN133SP.

## **1.6 QUALITY ASSURANCE**

1.6.1 All shop drawings to be signed and sealed by a Professional Engineer licensed in Province of Ontario and having experience in design and inspection of shoring, bracing and underpinning required to complete Work.

## **1.7 SITE CONDITIONS**

1.7.1 Cultural heritage resources: If Cultural Heritage Resources (such as archaeological sites, artifacts, building and structural remains, and/or human burials) are encountered during performance of Work, contact Consultant immediately and suspend Work in immediate area until assessment has been completed by Ministry of Tourism, Culture and Sport. Perform required measures to mitigate negative impacts on found resources to acceptance of Consultant.

## **1.8 PROTECTION**

1.8.1 Existing buried utilities and structures:

.1 Size, depth and location of existing utilities and structures as indicated are for guidance only. Completeness and accuracy are assumed, not guaranteed. The Contractor is responsible for location of all underground utilities, piping, abandoned services, etc.

.2 Prior to construction, the Contractor shall contact all utility companies for the location of their respective plant.

.3 Prior to construction Contractor shall have authorities stake out utility locations to prevent disturbance during Work, establish location and state of use of buried utilities and structures.

.4 During construction, the Contractor shall be responsible for protecting all utilities as per the requirements of the utility. Contractor shall maintain all locates during the duration of work. Repair to any damaged utility plant shall be the Contractor's responsibility and at the Contractor's expense.

.5 Confirm locations of buried utilities by careful test excavations. Hand digs test excavations as necessary.

.6 Maintain and protect from damage, water, sewer, gas, electric, telephone and other utilities and structures encountered. Obtain permission of Consultant before moving or otherwise disturbing utilities or structures.

- .7 Where utility lines or structures exist in area of excavation obtain direction of Consultant before removing or rerouting.
- .8 Record location of maintained or re-routed and abandoned underground lines for record keeping purposes and transposing to the as-built version of the Contract Drawings.
- .9 Temporarily cover local existing catch basins and maintenance holes to prevent entry of earth or debris in accordance with Section 31 25 00 - Erosion and Sediment Control. Ensure adequate surface drainage in affected area is maintained.
- .10 Protect Work or work of other Contractors/Contracts in progress or completed and protect existing properties, stored Products, services, utilities, trees, landscaping and natural features from damage.
- .11 Protect the Owner's existing property, stored products, services, and utilities.
- .12 Protect excavations against flooding and damage and install and maintain appropriate warning devices during construction and during time when Work is closed down for any cause.
- .13 Protect bottom of excavations that will support foundations, slabs, pavements etc. from frost or freezing.
- .14 Keep access roads clear of debris and dirt resulting from Work of this Section to acceptance of Authorities having jurisdiction.
- .15 Protect trenches or any open excavations, maintaining warning devices during construction and periods of inactivity.

## **2 . PRODUCTS**

### **2.1 MATERIALS**

- 2.1.1 Granular A and Granular B: OPSS.MUNI 1010 – Aggregates – Base, Subbase Select Subgrade, and Backfill Material
- 2.1.2 Clear Stone: OPSS.MUNI 1004 – Aggregates - Miscellaneous
- 2.1.3 Native Fill: Clean (meeting the MECP Table 3 Site Condition Standards for Industrial/commercial/community (ICC) land use), native soil, excavated at *Place of Work*, as selected and approved by Geotechnical Engineer, free of organic material including roots and tree or shrub material, particles larger than 100 mm (4”), foreign or building debris, chemicals, and infectious substances detrimental to plants, free of deleterious matter, and provided moisture content of fill is controlled and provided fill is capable of being compacted to required density.
- 2.1.4 Imported Fill (Earth Borrow): fill material containing no organic material, foreign matter, roots, rocks over 100mm (4”) in diameter,

building debris and toxic material in accordance with OPSS.MUNI 212. Demonstrate that such fill is compactable to a density of 98% Standard Proctor Maximum Dry Density (SPMDD), that it is maintained within 2% of optimum moisture content at time of compaction and meets the MECP Table 3 Site Condition Standards for Industrial/commercial/community (ICC) land use.

### **3 . EXECUTION**

#### **3.1 DEWATERING**

3.1.1 In accordance with OPSS.MUNI 517 and 518 except for the following notes and modifications:

- .1 Do not obstruct flow of surface drainage or natural water courses
- .2 Protect open excavations against flooding and damage due to surface run-off.
- .3 Submit for Consultant's approval details of the proposed dewatering or heave prevention methods such as temporary sumps, pumping, dikes, well points, or any other means.
- .4 Dispose of excess water in a manner not detrimental to public and private property, or any portion of work completed or under construction
- .5 Obtain letter of conditional approval from Authorities Having Jurisdiction to dispose of groundwater into sewer drainage system. Apply for and pay for water disposal permit.
- .6 Keep excavations and trenches free of water throughout construction period.

3.1.2 Groundwater removal:

- .1 Lower groundwater level and maintain at depth below lowest point of excavation to ensure a dry stable surface.
- .2 Dewater to prevent loss of soil and maintain stability of sides and bottom of excavation and of adjacent structures.
- .3 Dispose of water in conformance with applicable by-laws and in a manner not detrimental to public and private property, or portion of Work completed or under construction.
- .4 Supply and install flocculation tanks, settling basins, or other treatment facilities to remove suspended solids or other materials before discharging to sewers, water courses or drainage areas in accordance with authorities having jurisdiction. Perform testing on settlement tank discharge to confirm that effluent meets sewer bylaw requirements. Locate tanks to acceptable area determined by Consultant.

.5 Should method of dewatering fail to achieve conditions specified above, Consultant reserves right to revise methods and procedures at no cost to Owner.

3.1.3 Surface water removal:

.1 Remove surface run-off in a manner that will prevent loss of soil and maintain stability of sides and bottom of excavation. Obtain Consultant's approval of dewatering method to be used.

.2 Discharge surface water into existing storm drainage system to acceptance of Consultant and local authorities.

**3.2 LINES AND ELEVATIONS**

3.2.1 Establish lines and elevations from Control Points shown on Contract Drawings.

3.2.2 Have lines and elevations established by Registered Ontario Land Surveyor or qualified Civil Engineer Licensed in Province of Ontario.

3.2.3 Protect and maintain Control Points and Benchmark as long as they are required.

**3.3 STRIPPING OF TOPSOIL**

3.3.1 Do not handle topsoil while in wet or frozen condition or in manner in which soil composition is adversely affected.

3.3.2 Commence topsoil stripping of areas as directed by the Consultant after area has been cleared of brush, weeds and grasses. All material cleared shall be removed from site and shall conform to O.Reg. 409/19.

3.3.3 Strip topsoil to depths as directed by the Consultant. Avoid mixing topsoil with subsoil.

3.3.4 Stockpile topsoil in locations directed by Consultant. Stockpile to height not exceeding 3 m.

3.3.5 Dispose of unused topsoil.

**3.4 EXCAVATION**

3.4.1 Completed Excavation in accordance with OPSS.MUNI.206, except to the following notes and modifications:

3.4.2 Remove concrete, masonry, paving, demolished foundations and rubble and other obstructions encountered during excavation Work.

3.4.3 Removal of existing boulders and/or concrete elements up to a size of 1 m<sup>3</sup> encountered below existing grade while excavated are included as part of the Work. Notify Consultant at each time of occurrence when existing boulders and/or concrete elements greater than 1 m<sup>3</sup> are encountered below existing grade, providing detailed record of each occurrence in writing. This record must be

approved by the Consultant before claims for extras will be considered.

- 3.4.4 Do not disturb soil within drip line of trees or shrubs that are to remain. If excavating through roots, excavate by hand and cut roots with sharp axe or saw in a manner acceptable to authorities having jurisdiction.
- 3.4.5 Excavate to required lines and grades shown on Contract Drawings with allowance for subsequent Work including shoring, bracing and formwork. Make excavation clean and clear of loose material and true to size.
- 3.4.6 Protect stockpiles of fill against contamination and moisture absorption.
- 3.4.7 Trim, and remove loose material, debris and organic material from excavations. Where material at bottom of excavation is disturbed, remove disturbed material and re-compact to density equal to or better than undisturbed soil or backfill with lean concrete as directed by Consultant.
- 3.4.8 When excavations are complete, prior to commencement of subsequent Work, request Consultant for inspection of excavation Work.
- 3.4.9 Sub-excavation may be required where soft/loose material and organic matter are encountered, and shall be properly replaced with suitable approved backfill, as approved by the Geotechnical Engineer, compacted to 98% SPMDD. Notify the Geotechnical Engineer of the sub-excavation and record quantities removed.
- 3.4.10 Over-excavation due to Contractor error will be rectified and properly replaced with suitable approved backfill, as approved by the Geotechnical Engineer, compacted to 98% SPMDD without additional compensation.

### **3.5 EXCAVATED MATERIAL DISPOSAL**

- 3.5.1 Except for material to be used as select fill, immediately remove and dispose of excavated material from Site as per Special Provision On-Site and Excess Soil Management – GN133SP
- 3.5.2 Remove and dispose of construction rubble, abandoned gas, water and sewer pipes, valves, valve boxes and fittings, maintenance holes, frames and covers and other material which may be encountered during excavation but not indicated on Contract Drawings.
- 3.5.3 Comply with the waste management plan developed by the Contractor for the Work in accordance with Section 01 74 00. Comply with the directions of the Contract Administrator regarding waste management disposal activities.

- 3.5.4 Dispose of surplus and unsuitable excavated material offsite, as per OPSS.MUNI 180, revision date November 2021 and O. Reg 406/19.
- 3.5.5 Excess material resulting from trenching and excavation may be re-used as select fill provided it meets or exceeds the requirements of select fill and if approved by the Consultant. Any material that is not approved for re-use shall be transported and disposed of at an approved waste disposal facility as per OPSS.MUNI 180, revision date November 2021, and O. Reg 406/19. Special Provision On-Site and Excess Soil Management – GN133SP.

### **3.6 GRADING**

- 3.6.1 Complete Grading in accordance with OPSS.MUNI.206, except to the following notes and modifications:
- 3.6.2 Prior to placing fill over existing ground, scarify surface to depth of 150 mm. Maintain fill and existing surface at approximately same moisture content to facilitate bonding.
- 3.6.3 Place material only on clean unfrozen surface, properly shaped and compacted and free from snow and ice. Ensure no frozen material is used in placing.
- 3.6.4 Grade as necessary to bring Work areas to required elevations. Supply additional material required to obtain new grade levels. Place and compact as specified.
- 3.6.5 Grade drainage ditches to elevations indicated on Contract Drawings.
- 3.6.6 Maintain positive drainage. Slope rough grade away from building 1:50 minimum.
- 3.6.7 Grade materials using methods which do not lead to segregation or degradation of aggregate.
- 3.6.8 Shape each layer to smooth contour and compact to specified density before succeeding layer is placed.
- 3.6.9 Remove and replace that portion of layer in which material becomes segregated during spreading.
- 3.6.10 Make graded areas smooth to profile, free of debris, with local excavations and depressions filled and compacted.
- 3.6.11 Do not disturb soil within branch spread of trees and shrubs remaining.
- 3.6.12 Cultivate entire area which is to receive topsoil to a depth of 100 mm. Repeat cultivation in those areas where equipment used for hauling and spreading has compacted soil.
- 3.6.13 Remove surface debris, roots, vegetation, branches and stones in excess of 50 mm in diameter.

**3.7 Subgrade Compaction**

- 3.7.1 After grading has been completed, scarify and mix subgrade surface to a depth of 300 mm unless otherwise shown on the drawings.
- 3.7.2 Remove unsuitable materials found during work. Replace with material approved by the Engineer.
- 3.7.3 Compact top 300 mm of subgrade soil to at least 98% SPMDD, or as directed by the Geotechnical Consultant.
- 3.7.4 Bring moisture content of soil to level required to achieve specified compaction. Add water or aerate as required.
- 3.7.5 Inspection of subgrade required by Geotechnical Consultant prior to placement of granular materials. The General Contractor is responsible for coordination of inspections with the Geotechnical Consultant.

**3.8 Proof Rolling of Subgrade**

- 3.8.1 Proof roll subgrade using standard roller of 45400 kg gross mass with four pneumatic tires each carrying 11350 kg and inflated to 620 kPa. Four tires arranged abreast with centre to centre spacing of 730 mm.
- 3.8.2 If use of non-standard proof rolling equipment is approved, Geotechnical Engineer to determine level of proof rolling.
- 3.8.3 Make sufficient passes with proof roller to subject every point on surface to three separate passes of loaded tire.
- 3.8.4 Where proof rolling reveals areas of defective subgrade reconstruct the defective work and repeat proof rolling.

**3.9 EMBANKMENTS**

- 3.9.1 Bench slopes greater than 4(H):1(V) or where shown on the drawings, to ensure proper bond between new materials and existing surfaces. Obtain prior approval from the Engineer of method to be used.
- 3.9.2 Scarify slopes of 4(H):1(V) and flatter 200 mm deep, after topsoil stripping, unless otherwise indicated on the drawings.
- 3.9.3 Break up or scarify existing pavement to sub-grade elevation as indicated.
- 3.9.4 Do not place material which is frozen nor place material on frozen surfaces.
- 3.9.5 Maintain crowned surface during construction to ensure ready run-off of surface water. Do not place material in free standing water.

- 3.9.6 Place and compact to full width in uniform layers not exceeding 200 mm loose thickness. The Engineer may authorize thicker lifts if specified compaction can be achieved.
- 3.9.7 Compact to density of not less than 95% maximum dry density in accordance with ASTM D698.
- 3.9.8 Bring moisture content of soil to level required to achieve specified compaction. Add water or aerate as required.

### **3.10 BACKFILLING**

- 3.10.1 Commence backfilling after areas of Work to be backfilled have been inspected.
- 3.10.2 Areas to be backfilled shall be free of debris, snow, ice, water, or frozen ground. Backfill material shall not be frozen or contain ice, snow or debris.
- 3.10.3 Backfill simultaneously each side of walls and other structures to equalize soil pressures.
- 3.10.4 Obtain Consultant's acceptance prior to placing backfill against foundation walls enclosing interior space.
- 3.10.5 Request reviews by Consultant and Geotechnical Engineer of excavation prior to beginning backfilling.
- 3.10.6 Where temporary unbalanced earth pressures are liable to develop on walls or other structures, erect bracing or shoring to counteract unbalance, and leave in place until removals is approved by Consultant.
- 3.10.7 Place and compact fill materials in continuous horizontal layers not exceeding 200 mm (8") loose depth.
- 3.10.8 Use backfilling methods to prevent disturbing or damaging buried services and site improvements.
- 3.10.9 Concrete Floor Slab: beneath moisture barrier granular lay (20mm clear stone – see section 32 11 16 Base and Subbase Courses), supply and install Granular B, Type 1, backfill compacted to 98% SPMDD.

### **3.11 RESTORATION**

- 3.11.1 Upon completion of Work, remove surplus materials and debris, trim slopes, and correct defects as directed by Consultant.
- 3.11.2 Replace topsoil and reinstate existing pavement, sidewalk, lawns and walks to elevation and condition which existed before excavation.
- 3.11.3 Clean and reinstate areas affected to acceptance of Consultant.
- 3.11.4 Restoration of the pavement structure of driveways as shown on Contract Drawings.

**3.12 TOLERANCES**

3.12.1 Tolerances in accordance with OPSS.MUNI.206.

**3.13 FIELD QUALITY CONTROL**

3.13.1 Conduct quality control in accordance with Section 01 40 00.

3.13.2 Submission of grade checks in accordance with OPSS.MUNI.206. Contract shall complete and submit form OPSF 206-1 to the Consultant.

3.13.3 In-situ tests and inspections:

3.13.4 Allow inspection and testing company to inspect and test subgrades and each fill or backfill layer. Proceed with subsequent earth moving only after test results for previously completed work comply with requirements.

3.13.5 Footing subgrade: at footing subgrades, at least one test of each soil stratum will be performed to verify design bearing capacities. Subsequent verification and approval of other footing subgrades may be based on a visual comparison of subgrade with tested subgrade when approved by the Consultant.

3.13.6 Inspections:

3.13.7 Determine prior to placement of fill that site has been prepared in compliance with requirements.

3.13.8 Determine that fill material and maximum lift thickness comply with requirements.

3.13.9 Determine, at the required frequency, that in-place density of compacted fill complies with requirements.

3.13.10 Testing:

3.13.11 Contractor shall use Method B according to OPSS 501 for quality control of compaction except for the following notes and modifications:

3.13.12 Building slab areas: at subgrade and at each compacted fill and backfill layer, at least one test for every 200 sq.m or less, but in no case fewer than three tests.

3.13.13 Foundation wall backfill: at each compacted backfill layer, at least one test for every 30 m or less of wall length, but no fewer than two tests.

**3.14 WORK WITHIN THE MUNICIPAL RIGHT-OF-WAY**

3.14.1 Obtain a Road Occupancy Permit from the Region of Peel for works within the Dixie Road Right-of-Way.

3.14.2 Obtain a Road Occupancy Permit from the City of Brampton for works within the Dockstader Road Right-of-Way.

- 3.14.3 All work within the Region's Right-of-Way shall be constructed according to the latest Region of Peel Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the Region of Peel, be used where no Region standard or specification is available.
- 3.14.4 All work within the City's Right-of-Way shall be constructed according to the latest City of Brampton Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the City, be used where no City standard or specification is available.
- 3.14.5 All work shall be completed according to the current Occupational Health and Safety Act and Regulations for Construction Projects. The General Contractor shall be deemed to be the Constructor as Defined in the Act.
- 3.14.6 All temporary Traffic Control and Signage during construction shall be according to the current Ontario Traffic Manual Book 7: Temporary Conditions Field Edition.
- 3.14.7 All areas disturbed during construction within the City or Region's right-of-way shall be restored to original or better condition and to the satisfaction of the Contract Administrator. Grassed areas shall be treated with 100 mm of topsoil and shall be sodded according to Region of Peel Standard Vol. 2.4.

**END OF SECTION**

## 1. GENERAL

### 1.1 Summary

- 1.1.1 Provide labour, materials, products, equipment and services to complete the for removal of excess materials as required for the work indicated on the Contract Drawings, including the requirements for excavation, backfilling of resulting trenches holes or pits specified herein.

### 1.2 Related Requirements

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

### 1.3 References

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

### 1.4 CLEARING AND GRUBBING

- 1.4.1 Clear and grub as necessary to remove trees and roots. Tag and adequately protect trees shown on Reference Design to be preserved.
- 1.4.2 The relocation of trees and shrubs shall be subject to approval by the project Landscape Architect or Consultant.
- 1.4.3 Where an excess material is a mixture of materials managed in compliance with the most stringent conditions associated with any of the constituent excess material.
- 1.4.4 Manage all excess materials so as to prevent their entry to waterbodies and other Environmentally Sensitive Areas except when re-used in accordance with the relevant municipal standards

## 2. PRODUCTS

- 2.1.1 N/A

---

**3 . EXECUTION****3.1 Preparation**

- 3.1.1 Contractor to inspect site and verify with Consultant all items designated for removal and items to be preserved.
- 3.1.2 Locate and protect all utility lines. Preserve in operating condition active utilities traversing the site.
- 3.1.3 Notify and obtain approvals from all agencies prior to commencing work.
- 3.1.4 Contractor to maintain vehicle and facility traffic in all stages of work.

**3.2 Protection**

- 3.2.1 All existing buried utilities and structures as well as existing buildings and surface features shall be protected in accordance with Section 31 00 00 – Excavating, Backfilling, and Compacting.

**3.3 Backfill**

- 3.3.1 Backfill in accordance with Section 31 23 33 - Trenching and Backfilling and Section 32 11 16 – Granular Base and Subbase Courses.

**3.4 Disposal of waste and surplus material**

- 3.4.1 Remove excess excavated material from the site, except material approved to be reused, at appropriate on-site locations as per Special Provision On-Site and Excess Soil Management, GN133SP.
- 3.4.2 The excess soil and fill material shall be disposed of at MECP approved soil treatment site, waste disposal site or any other appropriate disposal site meeting applicable regulations for excess soil and fill material disposal. Identify and propose an off-site disposal option or disposal facility meeting all applicable and current regulations for excess soil and fill material disposal.
- 3.4.3 Obtain all regulatory approvals, permits and any other requirements for off-site disposal. This includes requirements for all additional testing, such as any chemical analysis required by the current MECP guideline and Ontario Regulation 347.
- 3.4.4 Comply with the waste management plan developed by the Contractor for the Work in accordance with Section 01 74 00. Comply with the directions of the Contract Administrator regarding waste management and disposal activities.

**3.5 Restoration**

- 3.5.1 Leave site clean upon completion of work.

- 3.5.2 Reinstatement areas and existing works outside areas of demolition to conditions that existed prior to commencement of work or better to the satisfaction of the Region of Peel.

**END OF SECTION**

## 1. **GENERAL**

### 1.1 **Summary**

- 1.1.1 Provide labour, materials, products, equipment and services to complete the protection of trees and shrubs as well as removal if required specified herein.
- 1.1.2 A Tree Removal Permit is required for any street tree or any private tree with a diameter of 30 cm or more and must be obtained from the City of Brampton Urban Forestry.

### 1.2 **Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

### 1.3 **References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

### 1.4 **Scheduling**

- 1.4.1 Obtain approval from Consultant of schedule indicating commencement of work.

## 2. **PRODUCTS**

### 2.1 **Materials**

- 2.1.1 Obtain approval from Consultant of schedule indicating commencement of work.
- 2.1.2 Drainage Tile: 100 mm diameter corrugated plastic perforated tubing complete with snap couplings to CGSB 41-GP-31M.
- 2.1.3 Anti-desiccant: Commercial, wax-like emulsion.

- 2.1.4 Stakes: Metal 'T' bars @ 750 mm length for deciduous trees. Galvanized Turnbuckles with 150 mm long eyebolts or approved equal wire tightener. Pine stakes at 2,400 mm length, stained brown, for conifers.
- 2.1.5 Wire: 3 mm galvanized guy wire.
- 2.1.6 2 ply reinforced rubber hose: 12 mm dia.
- 2.1.7 Hoarding: Plastic snow fence and geotextile or as approved by Infrastructure & Development Services.

### **3 . EXECUTION**

#### **3.1 Identification and Protection**

- 3.1.1 Contractor shall protect all existing trees within the work areas. Should any tree conflict with the proposed works, the Consultant shall be notified immediately to determine a course of action. No trees shall be removed without written consent from the City of Brampton.
- 3.1.2 Contractor to install tree protection fencing as per OPSD 220.0010.
- 3.1.3 Protect plant and root systems from damage, compaction and contamination resulting from construction by erecting hoarding fence at the dripline of existing vegetation to be preserved to the satisfaction of Consultant.
- 3.1.4 Install 8' (2400 mm) length metal T-bars and wooden posts as per detail to support hoarding and fasten with wire fasteners.
- 3.1.5 Contractor to provide an on-site Arborist present to oversee the tree preservation measures outlined in this section and related sections. More specifically, the Arborist will supervise all tree cutting and pruning (above grade and below), as well as excavation which occur within the Tree Protection Zone (TPZ).
- 3.1.6 The Arborist must have International Society of Arboriculture (ISA) certification and have a minimum of 5 years arboricultural experience. Proof of certification or training will be submitted upon request.

#### **3.2 Transplanting**

- 3.2.1 Location and quantity of transplanting are to be approved by Consultant on site, prior to transplanting. Transplanted trees and shrubs are to be tagged prior to transplanting.
- 3.2.2 Location and limits of final transplanting location to be approved by Consultant prior to transplanting.

- 
- 3.2.3 For trees larger than 50 mm caliper transplant mechanically with tree spade approved by Consultant. Do not sever roots greater than 40 mm diameter except at greater than 500 mm below existing grade. Protect roots and cut roots cleanly with sharp disinfected tools.
  - 3.2.4 All roots balls to conform to "Canadian Standards for Nursery Stock", 7th edition, published by Canadian Nursery Landscape Association for size with respect to caliper.
  - 3.2.5 Construct earth saucer, mulch base of tree and guy according to standard horticultural practices.
  - 3.2.6 Backfill pits to 85% Standard Proctor Density. Avoid damage to trunk and roots of adjacent trees.
  - 3.2.7 Water plants immediately after transplanting and fertilize to maintain optimum soil moisture and fertility.
  - 3.2.8 Transplanting of trees is not to take place during the months of July or August, or during extreme weather conditions.

### **3.3 Maintenance during Warranty Period**

- 3.3.1 From time of acceptance by Consultant to end of warranty period, perform following maintenance operations:
  - .1 Water to maintain soil moisture conditions for optimum growth and health of plant material without causing erosion.
  - .2 Apply organic urea fertilizer in early spring at suppliers suggested rate.
  - .3 Remove dead, broken or hazardous branches from plant material.
  - .4 Submit monthly written reports to Consultant identifying:
  - .5 Maintenance work carried out.
  - .6 Development and condition of plant material.
  - .7 Preventative or corrective measures required which are outside Contractor's responsibility.

### **3.4 Pruning**

- 3.4.1 Prune crown to compensate for root loss while maintaining general form and character of plant.
- 3.4.2 All pruning of on-site trees shall be conducted by a qualified tree service contractor who is approved in advanced by the Arborist and Consultant.
- 3.4.3 Tree roots found to be in conflict of the site works will be pruned clearly by the Arborist and undertake those works according to the proper arboricultural practices.

- 
- 3.4.4 Trees will require interim watering between the time that the tree are root pruned and until elements are constructed as directed by the Arborist and Consultant.

**3.5 Anti-Dessicant**

- 3.5.1 Apply anti-desiccant to foliage where applicable and as directed by Consultant.

**END OF SECTION**

**1. GENERAL****1.1 Summary**

1.1.1 Provide labour, materials, products, equipment and services to complete the placement of engineered fill for grade raise and preloading specified herein.

1.1.2 Section excludes:

.1 Stripping and sub-excavation of topsoil, earth fill, organic soil, and unsuitable fill; see section 31 00 00 Excavating, Backfilling, and Compacting.

**1.2 Related Requirements**

1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.3 References**

1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.

1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.

1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

**1.4 Administrative Requirements**

1.4.1 Conduct a pre-installation meeting in accordance with Section 01 31 00.

.1 Independent inspection and testing company shall attend the pre-installation meeting.

**1.5 Submittals**

1.5.1 Submit required submittals in accordance with Section 01 33 00.

1.5.2 A minimum of 14 days prior to imported fill (earth borrow) material being used (if required), a list of intended borrow sources and tonnage that is expected to be used from each source shall be provided to the Geotechnical Engineer and Consultant to allow time for sampling and testing as per Special Provision On-Site and Excess Soil Management, GN133SP.

**1.5.3 Reports:**

1.5.4 Submit written laboratory test reports for each material proposed for fill.

1.5.5 Submit written field inspection and test report results after each inspection.

1.5.6 Survey of subgrade and finished ground elevations on completion of engineered fill, provided in a format compatible with AutoCAD 2023.

**1.6 Quality Assurance**

1.6.1 All shop drawings to be signed and sealed by a Professional Engineer licensed in Province of Ontario and having experience in design and inspection of shoring, bracing and underpinning required to complete Work.

**2 . PRODUCTS****2.1 MATERIALS****2.1.1 Engineered Fill:**

.1 Imported or Native Fill: fill material containing no organic material, foreign matter, roots, rocks over 100mm (4") in diameter, building debris and toxic material in accordance with OPSS.MUNI 212. Drying and careful site management will be required for fill to be compactable to a density of 98% Standard Proctor Maximum Dry Density (SPMDD).

.2 Granular B: OPSS.MUNI 1010 – Aggregates – Base, Subbase Select Subgrade, and Backfill Material

**3 . EXECUTION****3.1 Stockpiling**

3.1.1 Stockpile fill materials in areas to approval of geotechnical engineer. Stockpile granular materials in manner to prevent segregation. Protect stockpiled fill material from freezing.

3.1.2 Protect fill materials from contamination.

3.1.3 Smooth-blade stockpile to promote runoff and/or protect from excessive moisture take up.

**3.2 Surveying**

3.2.1 Survey subgrade ground elevations prior to placing engineered fill.

3.2.2 Survey ground elevations on completion of engineered fill placement.

**3.3 Lines and Elevations**

3.3.1 Boundaries of the engineered fill shall be established by a Registered Ontario Land Surveyor in the Province of Ontario, in consultation with the Geotechnical Engineer and Consultant.

3.3.2 Protect and maintain layout and offset stakes as long as they are required.

**3.4 Stripping of Topsoil**

3.4.1 See section 31 00 00 Excavating, Backfilling, and Compacting

**3.5 Excavation**

3.5.1 See section 31 00 00 Excavating, Backfilling, and Compacting

**3.6 Grading**

3.6.1 See section 31 00 00 Excavating, Backfilling, and Compacting

**3.7 Compaction**

3.7.1 Engineered fill material must be compacted to 98% SPMDD in maximum 150mm lift thicknesses.

3.7.2 After completion of compaction, the surface of engineered fill must be protected from disturbance from construction traffic.

**3.8 Proof Rolling**

3.8.1 Proof roll using standard roller of 45400 kg gross mass with four pneumatic tires each carrying 11350 kg and inflated to 620 kPa. Four tires arranged abreast with centre to centre spacing of 730 mm.

3.8.2 If use of non-standard proof rolling equipment is approved, Geotechnical Engineer to determine level of proof rolling.

3.8.3 Make sufficient passes with proof roller to subject every point on surface to three separate passes of loaded tire.

3.8.4 Where proof rolling reveals areas of defective fill, reconstruct the defective work and repeat proof rolling.

**3.9 Surcharge Fill and Removal for Preloading**

3.9.1 In areas where the grade is raised for more than 1.5m above the existing ground, a surcharge fill of 1.5m in thickness above the final grade shall be placed to preload the underlying weak soils.

- 3.9.2 The top of the surcharge fill should extend horizontally 6.0m beyond building walls (i.e. extend 6.0m into the building area) and then slope down at 1.5H:1V or flatter.
- 3.9.3 The surcharge fill shall be kept in place until a degree of consolidation of at least 70% is achieved for the underlying soils.
- 3.9.4 After the ground has been consolidated under the surcharge fill for the required preloading period, the surface fill can be removed.

### **3.10 Settlement Monitoring**

- 3.10.1 Settlement monitoring is required to confirm the required duration of preloading with the surcharge fill.
- 3.10.2 Ground settlement monitoring using settlement rods conducted at a minimum of 3 locations shall be installed on the top of native subgrade level or at the bottom of the engineered fill.
- 3.10.3 Initial sets of monitoring readings must be taken prior to the placement of fill above the instrument. During the fill placement preloading period, monitoring readings should be taken weekly, or at intervals as directed by the Geotechnical Engineer.
- 3.10.4 After removal of the surcharge fill, the settlement rods must be properly decommissioned.

### **3.11 Tolerances**

- 3.11.1 Tolerances in accordance with OPSS 206.

### **3.12 Field Quality Control**

- 3.12.1 Conduct quality control in accordance with Section 01 40 00.
- 3.12.2 Submission of grade checks in accordance with OPSS 206. Contract shall complete and submit form OPSF 206-1 to the Consultant.
- 3.12.3 In-situ tests and inspections:
  - .1 Allow inspection and testing company to inspect and test subgrades and each fill or backfill layer. Proceed with subsequent earth moving only after test results for previously completed work comply with requirements.
- 3.12.4 Inspections:
  - .1 Determine prior to placement of fill that site has been prepared in compliance with requirements.
  - .2 Determine that fill material and maximum lift thickness comply with requirements.
  - .3 Determine, at the required frequency, that in-place density of compacted fill complies with requirements.
- 3.12.5 Testing:

---

.1 Contractor shall use Method B according to OPSS 501 for quality control of compaction.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Summary

- 1.1.1 Provide labour, materials, products, equipment and services to complete the trenching, backfill, and compaction to accommodate underground pipes and sewers. For all other utilities, see respective specification sections pertaining to electrical and mechanical.
- 1.1.2 Compaction methods and material specifications for such Work are also detailed in this Section.

### 1.2 Related Requirements

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

### 1.3 References

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

### 1.4 Submittals

- 1.4.1 Submit shop drawings for temporary shoring design and erection in accordance with Section 01 33 00.
- 1.4.2 Shop drawings will include material grades, core thicknesses, connections, joints, method of anchorage, number of anchors, supports, details and accessories.
- 1.4.3 Ensure shop drawings are of uniform size and based on field measurements.
- 1.4.4 Shop drawings shall bear the stamp of a qualified professional engineer registered in the Province of Ontario.

### 1.5 Protection

- 1.5.1 The Contractor shall provide protection as per requirements of Section 31 00 00 - Excavating, Grading, and Backfilling

---

## 2. PRODUCTS

### 2.1 Materials

#### 2.1.1 Backfill:

- .1 See Section 31 00 00 – Excavating, Grading, and Backfilling

#### 2.1.2 Pipe Bedding:

- .1 Pipe bedding shall be Granular A material conforming to TS 1010 and TS 514, placed beneath and above pipe in accordance with the Contract Documents. Gradation to be within the limits specified when tested to ASTM C136 and ASTM C117. Refer to Section 32 11 16 - Granular Base and Subbase.

#### 2.1.3 Unshrinkable Fill:

- .1 Unshrinkable fill (U-fill), if required, shall be a very weak mixture of Portland Cement, concrete aggregate, and water to 0.4 MPa strength to 0.4 MPa cement stabilized backfill conforming to requirements of OPSS.MUNI 1359, such that the mix resists settlement when placed in trenches, but can be readily excavated if required.

#### 2.1.4 Embankment materials require approval by the Consultant.

#### 2.1.5 Material used for embankment shall not contain organic matter, frozen lumps, weeds, sod, roots, logs, stumps or any other unsuitable material.

### 2.2 Compaction Equipment

#### 2.2.1 Compaction equipment must be capable of obtaining required densities in materials on project.

#### 2.2.2 Compaction equipment not specified herein is to be efficiency proved at no extra cost and written approval must be received from Consultant before use.

## 3. EXECUTION

### 3.1 Preparations And Layout

#### 3.1.1 Establish extent of excavation.

#### 3.1.2 Set out all lines and levels as indicated in Contract Documents or as directed by the Consultant required for proper excavation.

#### 3.1.3 Maintain benchmarks, monuments and other reference points. Re-establish if disturbed or destroyed at no additional cost to the Owner.

#### 3.1.4 Prior to commencement of Site grading works, site alteration plans must be approved and all erosion and sediment control measures

shall be installed and operational. The Contractor shall maintain all erosion and sediment control measures until servicing construction is completed to the satisfaction of the Consultant and authorities having jurisdiction.

3.1.5 Dust control shall be applied by the contractor as required and/or when directed to do so by the Consultant or Authorities having jurisdiction.

3.1.6 Erosion control as specified in Section 31 25 00 – Erosion and Sediment Controls is the responsibility of the Contractor.

### **3.2 Utilities**

3.2.1 Prior to commencement of excavation work, establish location and extent of all underground utilities occurring in work area. Inform consultant immediately of any discrepancy from the information regarding utilities in the drawings provided.

3.2.2 Maintain, re-route or extend as required existing utility lines which pass through work area and which must remain. Pay all costs for this work except costs borne by utility companies.

3.2.3 Protect utility services uncovered by excavation.

3.2.4 Remove abandoned utility service lines encountered from areas of construction. Cap, plug or seal such lines and identify at grade with markers.

3.2.5 Accurately locate and record abandoned and active utility line re-routed or extended on as-built Contract Documents.

### **3.3 Stockpiling**

3.3.1 Temporarily stockpile granular fill materials in areas designated by Consultant. Stockpile granular fill materials in manner to prevent segregation and mixing.

3.3.2 Protect all granular fill materials from contamination.

### **3.4 Dewatering And Heave Prevention**

3.4.1 See Section 31 00 00 – Excavating, Grading, and Backfilling

### **3.5 Excavation**

3.5.1 See Section 31 00 00 – Excavating, Grading, and Backfilling

### **3.6 Trenching**

3.6.1 Trenching shall be carried out in accordance with OPSS 401.

3.6.2 Excavate trenches to lines and grades indicated and to a depth of 75 mm minimum below invert elevation and slope established for

---

pipe and backfill to invert elevation of pipe with specified granular material.

- 3.6.3 Unless otherwise authorized by Consultant, do not excavate more than 30 m of trench in advance of installation operations and do not leave open more than 15 m at end of day's operation. Remove unsuitable material from trench bottom to extent and depth as directed by Consultant.
- 3.6.4 If unstable soil conditions are encountered, excavate trenches to depth directed by Consultant and backfill to correct elevation with backfill material.
- 3.6.5 Remove loose material from bottom of trenches to ensure granular material is placed against undisturbed soil.
- 3.6.6 Compact bedding and grade as required for even and uniform support on each length of pipe.
- 3.6.7 Where excavating is required adjacent to and parallel with and below any footing, submit excavation and backfill procedures to Consultant for review prior to start of excavating.
- 3.6.8 Keep width of trenches to a minimum to ensure minimum span for pipe to be supported and minimum loading on buried pipes.
- 3.6.9 Any loose fill or other unsuitable material below pipe invert level must be removed and replaced with select on-site or imported fill as approved by the Geotechnical Engineer and compacted to 98% SPMDD.
- 3.6.10 Over-excavation or sub-excavation shall be properly replaced with granular material and compacted to 98% SPMDD.
- 3.6.11 Dispose of surplus and unsuitable excavated material offsite, as per OPSS.PROV 180, revision date November 2016 and O. Reg 406/19.
- 3.6.12 Excess material resulting from trenching and excavation may be re-used as select fill provided it meets or exceeds the requirements of select fill and if approved by the Consultant. Any material that is not approved for re-use shall be transported and disposed of at an approved waste disposal facility as per OPSS.PROV 180, revision date November 2016, and O. Reg 406/19.

### **3.7 Bedding And Material Surrounding Of Underground Services**

- 3.7.1 See Sections for details:
- 3.7.2 Site Water Utility Distribution Piping – Section 33 11 16
- 3.7.3 Fire Suppression Utility Water Distribution Piping – Section 33 11 19
- 3.7.4 Sanitary Utility Distribution Piping – Section 33 31 13

---

3.7.5 Storm Utility Drainage Piping – Section 33 41 00

**3.8 Backfilling And Compaction**

- 3.8.1 Backfilling and compaction shall be carried out in accordance with OPSS 401.
- 3.8.2 Do not proceed with backfilling operations until Consultant has inspected and approved installations.
- 3.8.3 Areas to be backfilled to be free from debris, snow, ice, water and frozen materials.
- 3.8.4 Place backfill material in uniform layers not exceeding 300 mm compacted thickness up to grades indicated. Compact each layer before placing succeeding layer.
- 3.8.5 Backfill shall be with select on-site excavated organic free silty clay fill or imported earth fill as approved by the Geotechnical Engineer and compacted to at least 98% SPMDD.
- 3.8.6 Place backfill uniformly and simultaneously on each side of pipe.
- 3.8.7 Compaction tests shall be conducted by a qualified Geotechnical Consultant to ensure compaction and stability of the fill and test results shall be submitted to the Consultant and the Region of Peel.

**3.9 Restoration**

- 3.9.1 Upon completion of the Work, immediately remove and dispose of waste materials and debris, replace topsoil, trim slopes, and correct defects as directed by Consultant.
- 3.9.2 Clean and reinstate areas affected by work as directed by Consultant.
- 3.9.3 All disturbed grassed areas shall be restored to original condition or better, with sod on minimum of 100 mm topsoil as per Region of Peel Standard Vol. 2.4.
- 3.9.4 Maximum slope for grade shall be 3(H):1(V).

**3.10 Quality Assurance And Testing**

- 3.10.1 Ensuring proper compaction techniques and adherence to the required densities will be the responsibility of the Contractor. Consultant shall appoint an independent testing company to be put under the cash allowance "Testing & Inspection", for checking and approval of the placement and compaction of granular materials. The Contractor will be responsible for payment of all costs associated with re-testing of materials if corrective actions are required to restore defective areas. The Contractor is required to coordinate with the Consultant and the testing company to ensure at least two (2) business days notice is given prior to placement and compaction of granular materials.

**3.11 Quality Control**

3.11.1 See OPSS 501 for Quality Control requirements.

**3.12 Work Within the Municipal Right-Of-Way**

3.12.1 Obtain a Road Occupancy Permit from the Region of Peel for works within the Dixie Road Right-of-Way.

3.12.2 Obtain a Road Occupancy Permit from the City of Brampton for works within the Docksteader Road Right-of-Way.

3.12.3 All work within the Region's Right-of-Way shall be constructed according to the latest Region of Peel Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the Region of Peel, be used where no Region standard or specification is available.

3.12.4 All work within the City's Right-of-Way shall be constructed according to the latest City of Brampton Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the City, be used where no City standard or specification is available.

3.12.5 All work shall be completed according to the current Occupational Health and Safety Act and Regulations for Construction Projects. The General Contractor shall be deemed to be the Constructor as Defined in the Act.

3.12.6 All temporary Traffic Control and Signage during construction shall be according to the current Ontario Traffic Manual Book 7: Temporary Conditions Field Edition.

3.12.7 All areas disturbed during construction within the City or Region's right-of-way shall be restored to original or better condition and to the satisfaction of the Contract Administrator. Grassed areas shall be treated with 100 mm of topsoil and shall be sodded according to Region of Peel Standard Vol. 2.4.

**END OF SECTION**

**1. GENERAL****1.1 Summary**

- 1.1.1 Provide labour, materials, products, equipment and services to complete the requirements for the supply, installation and maintenance of erosion and sediment control measures in accordance with the contract drawings and the guidelines outlined below in areas as necessary prior to commencing excavation operations.

**1.2 Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.3 References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

**2. PRODUCTS****2.1 MATERIALS**

- 2.1.1 Silt fence fabric shall be filter fabric geotextile – TerraFix Geosynthetics Inc 270R or Equivalent.
- 2.1.2 The stakes shall be of sufficient strength to satisfy silt fence barrier performance and maintenance requirements. The stakes shall be a minimum of 2.1 metres in length with a maximum spacing of 2 metres between stakes.
- 2.1.3 Using catch basin to match OPSS silt traps – Siltsack or Equivalent

---

### **3 . EXECUTION**

#### **3.1 INSTALLATION**

##### **3.1.1 Silt fence barrier:**

- .1 The Contractor shall Install silt fence as necessary to prevent sediment from passing from one side of the barrier to the other.
- .2 Posts shall be spaced a maximum of 2 metres apart and shall be driven vertically into the ground to a minimum of 900 millimetres.
- .3 A trench measuring millimetres approximately 300 millimetres wide by 300 millimetres deep shall be excavated along the entire line of stakes. The trench shall be on the side of the stakes where grading work is to be conducted.
- .4 The geotextile from the silt fence shall extend into the trench a minimum of 300 millimetres. The prefabricated silt fence shall be installed without sags and have an overlap of 450 millimetres wherever its length is extended.
- .5 The trench should be backfilled and tamped to existing grade so as to hold the base of the geotextile firmly in place. The completed silt fence barrier shall have a minimum height of 1200 millimetres above the ground surface.

##### **3.1.2 Using catch basin to match OPSS silt traps:**

- .1 Place Silksack or Equivalent as directed by the manufacturer's recommendations.

#### **3.2 MAINTENANCE**

- 3.2.1 All silt fences shall be inspected immediately after runoff event and at least daily during prolonged rainfall. Any required repairs shall be made immediately. The silt fence barriers shall be maintained in place, without gaps and without undermining, so as to prevent sediment passage through or under barrier. Silt fence barriers shall be maintained vertical without tears and without sagging and maintain a 450 millimetres overlap on seams.
- 3.2.2 Accumulated sediment shall be removed at the direction of the Consultant in a manner that avoids escape to the downstream side of the barriers. Sediment shall be removed to the level of the grade existing at the time of barrier installation and shall conform to the following:
- 3.2.3 Accumulated sediment shall be removed when it reaches a depth of one-half the height of the silt fence barrier.
- 3.2.4 Accumulated sediment shall be removed as necessary to perform maintenance repairs.

3.2.5 Accumulated sediment shall be removed immediately prior to the removal of the silt fence.

3.2.6 All collected sediments to be disposed of at an approved location, in accordance with O Reg 406/19 (On-Site and Excess Soil Management).

### **3.3 REMOVAL**

3.3.1 Silt fence barriers and catch basin cover shall be removed when, in the opinion of the Consultant, the measure is no longer required. Area disturbed by the installation and removal shall be restored to the original grade and to the satisfaction of the Consultant and sodded.

**END OF SECTION**

**1. GENERAL****1.1 Summary**

- 1.1.1 Provide labour, materials, products, equipment and services to complete the supply, placement, and compaction of granular materials.
- 1.1.2 Supply, place, shape, adjust water content and compact granular subbase and base.
- 1.1.3 Subbase shall be the granular course below the granular road/pavement base course and building.

**1.2 Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.3 References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

**2. PRODUCTS****2.1 Pavement Subbase**

- 2.1.1 Granular subbase materials shall be Granular 'B' conforming to OPSS.MUNI 1010. Granular 'B' may be either Type I or Type II with the exception that granular materials placed under structural elements be free of any reclaimed asphalt.

**2.2 Pavement Base**

- 2.2.1 Granular 'A', conforming to OPSS.MUNI 1010 with the exception that granular materials placed under structural elements, be free of any reclaimed asphalt (RAP).

**2.3 Concrete Floor Slab Base Course**

- 2.3.1 200 mm of 19 mm clear crushed stone or Granular 'A' conforming to OPSS.MUNI 1004

**3 . EXECUTION****3.1 Placement**

- 3.1.1 Supply, place, shape and compact granular subbase as indicated in the Contract Documents in conformance with OPSS.MUNI 314, except where the following requirements specify otherwise:
- 3.1.2 Supply and place in lifts not exceeding 200 mm compacted thickness.
- 3.1.3 Do not mix granular subbase or base course with underlying materials.
- 3.1.4 Scarify and air-dry excess moisture or add and mix water as required to obtain the specified soil density. Control watering and rolling to prevent pumping of fines to the surface.
- 3.1.5 Compact Granular Subbase to a dense, uniform condition, free from ruts or excess deflection under construction traffic. Compact in accordance with OPSS.MUNI 501, Method A; compact to 100% Standard Proctor Maximum Dry Density (SPMDD).
- 3.1.6 Shape the surface to the lines and grades specified.
- 3.1.7 Supply, place, shape and compact granular base as indicated in the Contract Documents in conformance with OPSS.MUNI 314 and in the above-mentioned specifications, except where the following requirements specify otherwise:
- 3.1.8 Supply and place in lifts not exceeding 150 mm compacted thicknesses.
- 3.1.9 Do not mix granular base course with underlying materials.
- 3.1.10 Scarify and air-dry excess moisture or add and mix water as required to obtain the specified soil density. Watering and rolling must be controlled to prevent pumping of fines to the surface.
- 3.1.11 Shape the surface to the lines and grades specified. Finished surface shall be free of any ruts or irregularities. The finished surface shall be free from depressions exceeding 10 mm as measured in any direction with a 3.0 meter straight edge.
- 3.1.12 To prepare for placement of granular base, the completed subbase shall be shaped and smoothed to within  $\pm 25$  mm of design elevations and shall, on average, meet the lines and grades specified in the Contract Documents.

- 3.1.13 Compact Granular Base to a dense, uniform condition, free from ruts or excess deflection under construction traffic. Compact in accordance with TS 501, Method A; compact to 100% Standard Proctor Maximum Dry Density (SPMDD).
- 3.1.14 The final granular base elevations shall meet the approval of the Consultant prior to placement of the asphalt.
- 3.1.15 Repair failures in compacted granular base course at Contractor's expense.
- 3.1.16 Supply and install minimum 200 mm (8") base course of 20mm clear stone to underside of slab. Vibrate into place to achieve uniform support for concrete slab and place to allow maximum concrete floor slab thickness tolerance of +/- 10 mm (3/8") in accordance with CSA-A23.1-09.

### **3.2 Quality Control**

- 3.2.1 The Contractor shall carry out grade checks to ensure the finished granular courses are built within the specified tolerances as noted in OPSS.MUNI 314 and within this specification. The Contractor shall complete grade checks and submit form OPSF 314-1 to the Consultant.
- 3.2.2 If the finished grade or cross-section is not in accordance to the specifications, the Contractor is required to rectify the Works to the Consultant's approval without additional compensation.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Summary

- 1.1.1 Provide labour, materials, products, equipment, and services to complete the supply, placement and compaction of Hot Mix Asphalt Concrete Pavement to lines, grades and sections indicated in the Contract Documents. Prepare existing surfaces for asphalt placement.

### 1.2 Related Requirements

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

### 1.3 References

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

### 1.4 Coordinate With Others

- 1.4.1 Provide the Consultant with 48 hours prior notice before starting Hot Mix Asphalt Concrete Pavement.

### 1.5 Submittals

- 1.5.1 Provide the Consultant asphalt mix designs prior for approval prior to the starting of Hot Mixed Concrete Asphalt Pavement.

## 2. PRODUCTS

### 2.1 Hot Mix Asphalt

- 2.1.1 HL-3 Surface Course and HL-8 Base Course as per OPSS.MUNI 1150.
- 2.1.2 Heavy duty asphalt cement to be PG 58-28 grade and light duty asphalt cement to be PG 58-28 grade, conforming to CAN/CGSB-16.3-M90.

- 2.1.3 The Region of Peel uses performance graded asphalt cement (PGAC) as an asphalt binder.
- 2.1.4 Aggregate shall conform to OPSS.MUNI 1003 for all mixes.
- 2.1.5 Hot Mix Asphalt Concrete mix design shall be the responsibility of the Contractor and shall conform to OPSS.MUNI 1150. Contractor to submit to the Consultant, for review, the mix designs a minimum 10 days prior to commencing with paving operations.

## 2.2 Tack Coat

- 2.2.1 Tack coat to comply with OPSS.MUNI 310.

## 2.3 Joint Sealer

- 2.3.1 Joint sealer shall be rubberized asphalt conforming to ASTM D3405.

## 1.1 Equipment

- 2.3.2 Equipment to comply with OPSS.MUNI 301.
- 2.3.3 Pavers: mechanical, self-powered, pavers capable of spreading mix within specified tolerances, true to line, grade and crown indicated.
- 2.3.4 Rollers: sufficient number of rollers of type and weight to obtain specified density of compacted mix.
- 2.3.5 Equipment employed shall not cause overloading of structures. Temporary support shall be provided where necessary for the proper execution of the work.

## 2.4 PAVEMENT MARKINGS

- 2.4.1 Parking stall lines and hatching:
  - .1 Yellow
  - .2 Low VOC Acrylic Traffic Marking Paint, SetFast or approved equivalent
- 2.4.2 Accessibility parking:
  - .1 International Symbol of Access with blue background
  - .2 Preformed thermoplastic
- 2.4.3 Roadway markings:
  - .1 Including stop bars centreline, and crosswalks within the parking lot
  - .2 Thermoplastic

---

**3 . EXECUTION****3.1 General**

- 3.1.1 Pavement structure thickness shall be as directed in the Contract Drawings.
- 3.1.2 Step joints shall be used where proposed asphalt meets existing concrete asphalt as detailed on Contract Drawings.
- 3.1.3 Produce and supply Hot Mixed, Hot Laid Asphaltic Concrete in accordance with OPSS.MUNI 1150.
- 3.1.4 Place and compact Hot Mixed, Hot Laid Asphaltic Concrete in accordance with OPSS.MUNI 310, OPSS.MUNI 1101 and OPSS.MUNI 1151 and should be compacted to a minimum of 91% of the Maximum Relative Density (MDR) for SP 19.0 and 92% MDR for all other mixes.

**3.2 Protection**

- 3.2.1 Keep vehicular traffic off newly paved areas until paving surface temperature has cooled below 60°C. Do not permit stationary loads on pavement until 48 hours after placement.
- 3.2.2 All newly installed joints shall be protected from construction traffic until the joint material has cured.
- 3.2.3 Provide access to buildings as required. Arrange paving schedule so as not to interfere with normal use of premises.

**3.3 Quality Assurance**

- 3.3.1 Quality Assurance to be carried out in accordance with OPSS.MUNI 310.
- 3.3.2 Inspection and testing of asphalt pavement will be carried out on behalf of the Owner by designated Testing Laboratory.
- 3.3.3 The Contractor is required to cooperate with, and to provide access and samples to the Testing Laboratory. The Contractor shall give 48 hours advance notice for inspection and/or testing services.
- 3.3.4 Asphalt concrete will be tested in accordance with the Laboratory Procedures of the MTO. The following shall be tested:
- 3.3.5 In-situ compaction – with a nuclear density gauge.
- 3.3.6 Asphalt cement content – one sample from each mix and each day of production.
- 3.3.7 Gradation - one sample from each mix and each day of production.
- 3.3.8 In addition to the above, for the PG 58-28 (heavy and light duty) asphalt concrete mix, the recovered asphalt cement shall be performance graded. The performance grade of the asphalt cement is to be confirmed in writing by the testing laboratory.

3.3.9 Any work not accepted by the Consultant shall be immediately corrected by the Contractor to the Consultant's satisfaction. Contractor is responsible to reimburse the additional testing and inspection required due to non-conformance by the Contractor.

**3.4 Quality Control**

3.4.1 Quality Control to be carried out in accordance to OPSS.MUNI 310.

**3.5 Cleaning**

3.5.1 Upon completion of work, wash and sweep paving clean.

3.5.2 Remove debris and leave work site clean as to the satisfaction of the Contract Administrator.

**END OF SECTION**

**1. GENERAL****1.1 Summary**

- 1.1.1 Provide labour, materials, products, equipment and services to complete the supply, placement and compaction of Concrete Pavement to lines, grades and sections indicated in the Contract Documents and prepare existing surfaces for concrete placement.

**1.2 Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.3 References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

**1.4 Coordinate With Others**

- 1.4.1 Provide the Consultant with 48 hours prior notice before starting Concrete Pavement.

**1.5 Submittals**

- 1.5.1 The requirements for submissions and designs shall comply with the requirements stipulated in the referenced Specifications except as modified herein.
- 1.5.2 Provide the Consultant concrete mix designs prior for approval prior to the starting of Concrete Pavement.
- 1.5.3 Two (2) weeks prior to the start of the work, a complete mix design submission shall be provided for concrete of each specified compressive strength according to CSA A23.1. A separate mix design submission is also required within each strength level for:
- .1 Mixes where material proportions vary outside the tolerance identified below in this clause.

- 
- .2 Cast-in-place and slip-formed concrete.
  - .3 Mixes with different sources of materials.
  - .4 Mixes with different admixtures.
  - .5 Special purpose or unique mixes.
- 1.5.4 Submission of separate mix designs and separate supporting documentation is not required if concrete with the same mix design is to be supplied by multiple plants with the same sources of materials in the same proportions, however it must be supported in writing prior to use.
- 1.5.5 A new, complete mix design submission shall be provided prior to:
- .1 Changing sources of materials used in the concrete.
  - .2 Substituting a material or product for another from the same source.
  - .3 Adding a material to the concrete that was not on the original mix design (except retarder).
- 1.5.6 Adjusting the quantities of the stated materials in the concrete, outside of the following tolerances stated on Form B:
- .1 Cement: +/- 5% of quantity
  - .2 Supplementary cementing materials: 95% to 100% of quantity
  - .3 Admixtures: Dosage or range of dosage
  - .4 Water: Range
- 1.5.7 Material quantities may be varied within the tolerances identified above, without submission of a new mix design.
- 1.5.8 Removal of a material from the mix requires submission of a new mix design but does not require submission of supporting test data.
- 1.5.9 The submission process for new or modified mix designs is the same as for the original mix design.
- 1.5.10 Prior to starting the work, the Contractor shall supply the Contract Administrator with material safety data sheets (MSDS) for all the materials to be incorporated in the work.
- 1.5.11 The certificate of ready-mix facilities and/or the certificate of mobile mix concrete production facilities along with concrete mix details shall be submitted as required by OPSS 1350.
- 1.5.12 Details of the method of curing and curing materials (including manufacturers' literature, where applicable) shall be submitted to the Contract Administrator.
- 1.5.13 One copy of the concrete delivery ticket shall be submitted to the Contract Administrator for each load of concrete delivered.
- 1.5.14 The Contractor shall submit a Detailed Work Plan to the Contract Administrator a minimum of two (2) weeks or as per the Contract

---

Documents, prior to commencement of the work. The Detailed Work Plan shall include the following:

- .1 Health and Safety Plan including the company safety manual and emergency procedures.
  - .2 The Working Area layout.
  - .3 Materials, procedures, methods and schedule to be used to execute the paving work including, but not limited to, details on pavement cross-section, paving details, and pavement markings.
  - .4 Certification from the manufacturer that the supplied product meets the product specifications and is designed to withstand all conditions specific to the site where the materials will be installed and is suitable for the specified application.
  - .5 Product literature consisting of general product brochure, mixing instructions, and installation instructions for all materials in accordance with the Contract Documents.
- 1.5.15 Any concrete mix design and/or Work Plan shall be stamped by a Licensed Professional Engineer with Professional Engineering Experience in concrete design and authorized to perform such work by Professional Engineers Ontario (PEO).

## **2 . PRODUCTS**

### **2.1 General**

- 2.1.1 The materials for and the production of concrete paving shall comply with the requirements stipulated in the referenced Specifications except as modified herein.
- 2.1.2 The concrete pavement structure for this site shall be Plain Jointed Concrete Pavement (JPCP) with dowels as per OPSD 552.010 and OPSD 552.051. The dowels shall be as follows:
  - .1 For contraction/expansion/construction joints the dowels shall be 32 mm diameter glass-fiber reinforced polymer (GFRP), 450 mm long spaced at 300 mm.
  - .2 For longitudinal joint 15 mm diameter epoxy coated tie bar, 760 mm long at 600 mm shall be used.

### **2.2 Joint Filler**

- 2.2.1 Expansion joint filler material shall be bituminous fiberboard and in accordance with ASTM D1751.

### **2.3 Joint Sealant**

- 2.3.1 All joints shall be sealed with hot-poured rubberized asphalt cement.

- 2.3.2 Joints shall be allowed sufficient time to thoroughly dry before the application of the joint sealer

**2.4 Concrete Sealer**

- 2.4.1 Concrete sealer shall conform to NCHRP 244.

**1.2 Pavement Markings**

- 2.4.2 Parking stall lines and hatching shall be in accordance with OPSS.MUNI 710.

**3 . EXECUTION**

**3.1 General**

- 3.1.1 Construction shall comply with the requirements stipulated in the referenced Specifications, CSA 23.1-3 and CSA S413, except as modified herein.
- 3.1.2 Pavement structure thickness shall be as directed in the Contract Drawings.
- 3.1.3 Concrete shall be placed and consolidated according to CSA A23.1. The concrete delivering and spreading operations shall be coordinated as to provide a uniform rate of progress of the paving equipment.
- 3.1.4 The concrete shall be placed to the specified thickness, line and grade. The concrete shall be consolidated by 50 mm vibrators and other suitable tools to eliminate voids, honeycombing and entrapped air, especially against the formwork.
- 3.1.5 The transition between concrete pavement and hot mix asphalt pavement shall be completed in accordance with OPSD 555.010.

**3.2 Protection**

- 3.2.1 Keep vehicular traffic off newly paved areas until paving surface has fully cured. Do not permit stationary loads on pavement until fully cured.
- 3.2.2 Covers shall be used to provide protection to concrete during inclement weather.
- 3.2.3 Concrete road base protection as per OPSS.MUNI 1350.
- 3.2.4 All newly installed joints shall be protected from construction traffic until the joint material has cured.
- 3.2.5 Provide access to buildings as required. Arrange paving schedule so as not to interfere with normal use of premises.

**3.3 Quality Control**

- 3.3.1 Quality Control shall comply with the requirements stipulated in the referenced Specifications, CSA A23.2 and OPSS.MUNI 1350, except as modified herein.
- 3.3.2 Any work not accepted by the Consultant shall be immediately corrected by the Contractor to the Consultant's satisfaction. Contractor is responsible to reimburse the additional testing and inspection required due to non-conformance by the Contractor.
- 3.3.3 Any unacceptable testing, sampling, and/or results shall be re-done by the Contractor at no extra cost to the Region of Peel.

**3.4 Cleaning**

- 3.4.1 Upon completion of work, wash and sweep paving clean.
- 3.4.2 The Contractor shall remove any and all debris and leave the work site clean as to the satisfaction of the Contract Administrator.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Scope**

- 1.1.1 Provide all articles, labour, materials, equipment, transportation and incidentals noted, specified or required to complete the work of this Section.

**1.2 Work Included**

- 1.2.1 Precast Concrete Unit Paving at grade.  
1.2.2 Jointing Mortar  
1.2.3 Stabilized Setting Bed  
1.2.4 Base Aggregate

**1.3 Related Sections**

- 1.3.1 Section 32 13 13 – Concrete Paving  
1.3.2 Section 32 37 00 – Site Furnishings

**1.4 References**

- 1.4.1 CAN/CSA A231.2-95 (R2000): Precast Concrete Pavers.  
1.4.2 CAN/CSA A23.2A: Sieve Analysis of Fine and Coarse Aggregates.  
1.4.3 Interlocking Concrete Pavement Institute: ICPI Tech. Spec. No. 9.

**1.5 Submittals**

1.5.1 Precast Concrete Pavers

- .1 The Consultant will be provided with a representative full-size sample of each paver type, thickness, color, finish that indicate the range of color variation and texture expected in the finished installation. Accepted samples become the standard of acceptance for the work.

1.5.2 The Vendor will provide:

- .1 Manufacturer's certification of concrete pavers as having met applicable CSA standards or ICPI product certification.  
.2 Manufacturer's Environmental Product Declaration for Concrete Paver materials.  
.3 Manufacturer's catalogue containing product data, installation instructions, and material safety data sheets for the safe handling of the specified materials and products.  
.4 Manufacturer's product data sheets and installation guides for joint mortar and stabilized setting bed materials.  
.5 Sieve analysis tests for all granular materials.  
.6 Compaction test results for all sub grades, granular bases and sub bases.

- 1.5.3 Paving Installation Vendor:
- 1.5.4 Provide references for a minimum of three project similar in size and complexity, including contact information for the Owner, Client, or General Vendor.

**1.6 Delivery, Storage and Handling of Product**

- 1.6.1 The Vendor shall comply with manufacturer's ordering instructions and lead-time requirements to avoid construction delays.
- 1.6.2 Deliveries and paving schedule will be coordinated to minimize interference with normal use of buildings adjacent to paving.
- 1.6.3 Concrete pavers will be delivered to the site in steel-banded, plastic-banded or plastic-wrapped packaging capable of transfer by forklift or clamp lift.
- 1.6.4 Pavers will be unloaded at job site in such a manner that no damage occurs to the product. Materials should be protected such that they are kept free from mud, dirt, and other foreign materials.
- 1.6.5 Bedding and joint materials should be securely covered with waterproof covering if required to prevent exposure to rainfall or removal by wind.

**2 . PRODUCTS**

**2.1 Permeable Granular Base**

- 2.1.1 The granular sub base material shall consist of granular materials conforming to ASTM C 33 and gradation requirements of ASTM D 448 No. 57 in Table 1

Table 1  
Permeable Base Aggregate  
Gradation Requirements

ASTM No. 57	
Sieve Size	Percent Passing
1-1/2 in (37.5 mm)	100
1 in (25 mm)	95 to 100
1/2 in (12.5 mm)	25 to 60
No. 4 (4.75 mm)	0 to 10
No. 8 (2.36 mm)	0 to 5

**2.2 Stabilized Setting Bed**

- 2.2.1 Basis of Design:
  - .1 Rompox Trass Bed Compound and Adhesion Elutriant
  - .2 Available from: Romex North America, 214 - 3993 Henning Drive Burnaby V5C 6P7. Contact David Maxwell, (905) 334-2677.

- 2.2.2 Provide washed, clean, angular aggregates conforming to ASTM C 33 with gradation requirements of 4-8mm.
- 2.2.3 The Vendor will provide bedding and joint mortar that is clean, non-plastic, and free from deleterious or foreign matter, symmetrically shaped, natural or manufactured from crushed rock.
- 2.2.4 Limestone screenings, or stone dust shall not be used for the bedding layer. Mason sand, or sand conforming to CSA A179 shall not be used for the bedding layer.

## **2.3    Pavers**

### **2.3.1    Field Paver**

- .1    Basis of Design:
  - .1    Product: Promenade Ecoterra
  - .2    Size: 100mm x 300mm x 70mm
  - .3    Colour: Light Steel Grey Blend
  - .4    Pattern: Running Bond
  - .5    Available from: Unilock, 287 Armstrong Ave. Georgetown, ON L7G 4X6, 416-646-9000

### **2.3.2    Tactile Warning Paver**

- .1    Basis of Design:
  - .1    Product: Truncated Dome Paver
  - .2    Size: 305mm x 305mm x 70mm
  - .3    Colour: A-90
  - .4    Available from: Inspired By Architecture, Kingston, ON K7M 6N7. Attention: Chris Duncan, (613) 329-7911

### **2.3.3    Tactile Wayfinding Paver**

- .1    Basis of Design:
  - .1    Product: DB-1 Directional Bar
  - .2    Size: 305mm x 305mm x 70mm
  - .3    Colour: A-90
  - .4    Available from: Inspired By Architecture, Kingston, ON K7M 6N7. Attention: Chris Duncan, (613) 329-7911

### **2.3.4    Turfstone**

- .1    Basis of Design
  - .1    Product: Turfstone
  - .2    Size: 400mm x 600mm x 80mm
  - .3    Colour: Natural
  - .4    Available from: Unilock, 287 Armstrong Ave. Georgetown, ON L7G 4X6, 416-646-9000

- 2.3.5 Provide pavers meeting the minimum material and physical properties set forth in ASTM C 936, Standard Specification for Interlocking Concrete Paving Units.
- 2.3.6 Obtain written approval for substitutions if product is not available at the time of installation.

## **2.4 Edge Restraints**

- 2.4.1 Edge restraints shall be non-fastening Perma Loc Geo Edge, natural mill finish, extruded aluminum alloy and shall be installed where interlocking paving areas abut infiltration galleries and planting areas, as manufactured by Perma Loc Corporation, 13505 Barry Street, Holland MI 49424; tel: 800-365-9660; email: info@permaloc.com. Install as per manufacturers' recommendations (or approved equivalent).

## **3 . EXECUTION**

### **3.1 Installation**

- 3.1.1 Precast Unit pavers
  - .1 Interlocking paving stones will be installed by qualified vendors, including, but not limited to:
  - .2 Vendors with a current certificate from the Interlocking Concrete Pavement Institute Concrete Paver Installer Certification program.
  - .3 Vendors able to provide job references from projects of a similar size and complexity.
- 3.1.2 Pavers and bedding should not be installed under the following conditions:
  - .1 During heavy rain or snowfall.
  - .2 Over frozen base materials.
  - .3 Over frozen sand or saturated sand
- 3.1.3 The Vendor shall verify that sub grade and base preparation, compacted density installation and elevations conform to specified requirements:
  - .1 Compaction of the sub grade to a minimum of 95% Modified Proctor Density per ASTM D 1557.
  - .2 Compaction of the granular sub base and base to a minimum of 98% Modified Proctor Density per ASTM D 1557.
- 3.1.4 Mechanical tampers are recommended for compaction of soil sub grade and aggregate base in areas not accessible to large compaction equipment. Such areas can include those around lamp standards, utility structures, building edges, curbs, tree wells and other protrusions.
- 3.1.5 The Vendor shall verify that geotextiles, if applicable, have been placed according to drawings and specifications.
- 3.1.6 Prior to screeding the bedding layer, the recommended base surface tolerance should be  $\pm 3/8$  in. (10 mm) over a 10 ft. (3 m) straight edge.

---

See ICPI Tech Spec 2, Construction of Interlocking Concrete Pavements for further guidance on construction practices.

- 3.1.7 Spread bedding evenly over the base course and screed to a nominal 1 in. (25 mm) thickness, not exceeding 1 1/2 in. (40 mm) thickness. Spread bedding evenly over the base course and screed rails, using the rails and/or edge restraints to produce a nominal 1 in. (25 mm) thickness, allowing for specified variation in the base surface.
  - .1 Do not disturb screeded leveling base.
  - .2 Screeded area shall not substantially exceed that which is covered by pavers in one day.
  - .3 Do not use bedding sand or mortar to fill depressions in the base surface.
- 3.1.8 The elevations and surface tolerance of the base determine the final surface elevations of concrete pavers. The paver installation vendor shall not correct deficiencies in the base surface with additional bedding sand, mortar, or by other means. Therefore, the surface elevations of the base should be checked and accepted by the Vendor or designated party, with written certification to the paving subcontractor, prior to placing bedding and concrete pavers.
- 3.1.9 Lay pavers in pattern(s) shown on drawings. Place units hand tight without using hammers. Make horizontal adjustments to placement of laid pavers with rubber hammers as required. Provide joints between pavers between 1/16 in. and 3/16 in. (2 and 5 mm) wide. No more than 5% of the joints shall exceed 1/4 in. (6 mm) wide to achieve straight bond lines.
- 3.1.10 Joint (bond) lines shall not deviate more than  $\pm \frac{1}{2}$  in. (15 mm) over 50 ft. (15 m) from string lines.
- 3.1.11 Fill gaps at the edges of the paved area with cut pavers or edge units. Cut pavers with a wet or dry masonry saw. For vehicular applications, cut pavers should not be less than 1/3 of the original size of the paver. For pedestrian areas and driveways, the cut pieces should be no less than 10 mm wide.
- 3.1.12 All work within 6 ft. (2 m) of the laying face shall be left fully compacted with mortar filled joints at the end of each day or compacted upon acceptance of the work. Cover the laying face or any incomplete areas with plastic sheets overnight if not closed with cut and compacted pavers with joint mortar to prevent exposed bedding from becoming saturated from rainfall.
- 3.1.13 Remove excess joint mortar from surface when installation is complete, except when excess joint mortar should be allowed to remain on surface to protect pavers from damage from other trades. The Vendor will be responsible for removing excess material at the completion of construction or as directed by the Consultant.
- 3.1.14 Surfaces shall be broom clean after removal of excess joint mortar.

---

3.1.15 Edge restraints should be installed as per the drawings and manufacturer's recommendations, at the indicated elevations.

**3.2 Field Quality Control**

3.2.1 Surface tolerances on flat slopes should be measured with a rigid straightedge. Tolerances on complex contoured slopes should be measured with a flexible straightedge capable of conforming to the complex curves on the pavement surface.

3.2.2 The final surface tolerance from grade elevations shall not deviate more than  $\pm 3/8$  in. (10 mm) under a 10 ft (3 m) straightedge.

3.2.3 Check final surface elevations for conformance to drawings. For installations on a compacted aggregate base and soil sub grade, the top surface of the pavers shall be from 0 to 5 mm above adjacent hard surfaces, after compaction.

3.2.4 The surface elevation of pavers shall be 3 to 6 mm above adjacent drainage inlets, concrete collars or channels.

3.2.5 Lippage: There shall be no more than 3 mm difference in height between adjacent pavers.

**3.3 Cleaning, Sealing, and Joint Mortar Stabilization**

3.3.1 Precast Unit Pavers only

.1 If specified, special cleaners, sealers or joint stabilization materials shall be applied in accordance with manufacturer's recommendations.

**END OF SECTION**

**1. GENERAL****1.1 Summary**

- 1.1.1 Provide labour, materials, products, equipment and services to complete the installation of granular sub-base, base and concrete sidewalks, islands, curb and gutters as shown on the drawings.
- 1.1.2 For flush concrete curbs within the Landscape areas; see respective Landscape specifications.

**1.2 Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.3 References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

**1.4 Submittals**

- 1.4.1 Provide the Consultant concrete mix designs for approval prior to the placement of concrete on site.

**2. PRODUCTS****2.1 Materials**

- 2.1.1 Concrete sidewalks and pavements shall be in accordance with OPSS.MUNI 351 and City of Brampton Drawing 227
- 2.1.2 Concrete curb and gutter shall be in accordance with OPSS.MUNI 353.
- 2.1.3 Joint filler shall be in accordance with:
- 2.1.4 OPSS.MUNI 1308: Joint Filler in Concrete
- 2.1.5 OPSS 1212: Hot-Poured Rubberized Asphalt Joint Sealing Compound

**3 . EXECUTION****3.1 Base Inspection**

- 3.1.1 Obtain Geotechnical testing and inspection agency approval of granular base prior to placing concrete.

**3.2 Granular base**

- 3.2.1 Compact granular base under concrete sidewalk, curbs, and islands to 100% SPMDD.

**3.3 Concrete Pavements, islands, Curbs and Gutters**

- 3.3.1 Concrete sidewalk shall be 150 mm in depth as per City of Brampton Drawing 227 except where crossing laneways, roads and commercial/industrial/institutional driveways where sidewalks shall be 180 mm in depth.
- 3.3.2 All barrier curb within the site shall be constructed as per OPSD 600.110. Height of curb to be 150mm.
- 3.3.3 All curb cuts shall be in accordance with OPSD 600.110.
- 3.3.4 Obtain Geotechnical testing and inspection agency approval of granular base and reinforcing steel prior to placing concrete.
- 3.3.5 Immediately after floating, give sidewalk surface uniform broom finish to produce regular corrugations not exceeding 2 mm deep, by drawing broom in direction normal to centre line.
- 3.3.6 Provide edging as indicated with 10 mm radius edging tool.
- 3.3.7 Concrete islands:
- .1 Minimum width of 1.5 m in accordance with OPSD 504.010.
  - .2 Concrete surfaced islands shall have contraction joints to match adjacent curb joints.
  - .3 Concrete islands to have minimum of 150 mm upstand.

**3.4 Concrete tolerances:**

- 3.4.1 Concrete sidewalk tolerances for subgrade, base, and sidewalk placement to be in accordance with OPSS.MUNI 351.
- 3.4.2 Concrete curb tolerances in accordance with OPSS.MUNI 353.

**3.5 Expansion and Contraction Joints in Concrete:**

- 3.5.1 Install tooled transverse contraction joints after floating, when concrete is stiff, but still plastic, at intervals of 1.5 m.
- 3.5.2 Install joints as required to prevent concrete from cracking:
- 3.5.3 Provide expansion joints where length of concrete placing exceeds 15 m.

3.5.4 Provide expansion joints where the sidewalk abuts a rigid object or changes direction.

3.5.5 When roadway surface and sidewalk is adjacent to curb, make joints of curb, gutters and sidewalk coincide.

**3.6 Isolation Joints in Concrete:**

3.6.1 Install isolation joints around manholes and catch basins and along length adjacent to concrete curbs, catch basins, buildings, or permanent structures.

3.6.2 Install joint filler in isolation joints.

3.6.3 Seal isolation joints with sealant.

**3.7 Concrete Curing**

3.7.1 Curing compound shall be according to OPSS 1315.

3.7.2 Concrete sidewalks shall be cured using a membrane-curing compound applied according to OPSS.MUNI 904; application rate shall be 0.2 L/m<sup>2</sup>.

3.7.3 Concrete curbs shall be cured with one or more of the following methods in accordance to OPSS.MUNI 353:

- .1 Burlap and water
- .2 Moisture vapour barrier
- .3 White pigmented curing compound

**3.8 Surface Texturing**

3.8.1 Use moistened burlap drag or stiff bristled broom to produce nonslip concrete surface finish approved by Consultant, with fine granular texture free from disfigurations.

3.8.2 For large areas provide surface texture by transverse wire comb leaving grooves in surface of plastic concrete as per American Concrete Pavement Association publications.

3.8.3 Texturing to be straight, precise and not damaging to pavement edges.

**3.9 Protection**

3.9.1 Do not open concrete pavement to traffic or construction equipment until concrete reaches a minimum compressive strength of 20 MPa and joints have been sealed.

3.9.2 When placing concrete in lanes adjacent to existing concrete, operate placing equipment on rubber wheels or pads to prevent damage to existing surface.

**3.10 Sealing**

- 3.10.1 Seal joints before allowing vehicular traffic on new pavement.
- 3.10.2 Provide Consultant with copy of sealant manufacturer's instructions for application. Have sealant manufacturer's representative on site during initial sealing operation.
- 3.10.3 Just prior to sealing joint, clean with compressed air or flush with high pressure water to remove laitance, curing compound and protrusions of hardened concrete. Clean and dry by compressed air and vacuum to remove loose and foreign material.
- 3.10.4 Do not apply joint sealant in rainy weather or when ambient temperature is less than 5 degrees C.
- 3.10.5 Insert approved filler and bond breaking material in joint prior to applying sealant, then fill joint from bottom up with sealant to avoid trapping air.
- 3.10.6 Prepare sealant for application using equipment and methods approved by Consultant
- 3.10.7 Apply sealant strictly in accordance with manufacturer's recommendations with special attention to temperature ranges for safe heating and for application of hot poured sealants and cleanliness of concrete to be bonded.
- 3.10.8 On completion of first application of sealant, return and top up any underfilled areas.
- 3.10.9 Replace sealant which fails to bond to concrete or fails to cure properly, as directed by Consultant

**3.11 Defective Concrete**

- 3.11.1 Concrete is defective when:
  - .1 It contains: honeycombing, embedded debris, uncontrolled shrinkage cracking, or other surface defects.
  - .2 It is damaged by freezing.
  - .3 It is placed at too high temperature, without hot weather precautions/protection.
  - .4 Average 28 day strength of any three consecutive strength tests is less than specified minimum 28 day strength.
  - .5 Any 28 day strength test result is more than 3.5 MPa below the specified minimum 28 day strength.

**3.12 Repair/Restoration**

- 3.12.1 Repair of defective concrete work:
  - .1 Where defective concrete is identified by Consultant during plastic condition, repair using methods approved by Consultant.

- .2 Grind off high surface variations where directed by Consultant.
- .3 Remove and replace defective concrete where directed by Consultant.
- .4 Remove minimum 3 m of pavement by sawing through concrete across full lane width.
- .5 Replace with new concrete to this specification.
- .6 Construct contraction joint at boundary between sawn face of existing concrete and new concrete.
- .7 Install new dowel bars and tie bars between old and new concrete as directed.

### **3.13 Cleaning**

- 3.13.1 Upon completion of installation, remove surplus materials, rubbish, tools and equipment barriers.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Scope**

- 1.1.1 Provide all articles, labour, materials, equipment, transportation and incidentals noted, specified or required to complete the work of this Section.

**1.2 Work Included**

- 1.2.1 Supply and installation of benches, bollards, bicycle racks, bicycle repair station, bicycle lockers and planters.
- 1.2.2 Maintenance and Warranty.

**1.3 Related Sections**

- 1.3.1 Section 03 30 00 – Cast In Place Concrete
- 1.3.2 Section 32 14 13 – Unit Paving

**1.4 References**

- 1.4.1 ASTM Testing Standards:
- .1 ASTM B 108 – Standard Specification for Aluminum-Alloy Permanent Mold Castings.
  - .2 ASTM B 117 – Standard Practice for Operating Salt Spray (Fog) Apparatus.
  - .3 ASTM B 221 – Standard Specification for Aluminum-Alloy and Aluminum-Alloy Extruded Bars, Rod, Wire, Profiles and Tubes.
  - .4 ASTM D 522 – Standard Test Methods for Mandrel Bend Test of Attached Organic Coatings.
  - .5 ASTM D 523 – Standard Test Method for Specular Gloss.
  - .6 ASTM D 2247 – Standard Practice for Testing Water Resistance of Coatings in 100% Relative Humidity.
  - .7 ASTM D 2794 – Standard Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
  - .8 ASTM D 3359 – Standard Test Methods for Measuring Adhesion by Tape Test.
  - .9 ASTM D 3363 – Standard Test Method for Film Hardness by Pencil Test.

.4 ANSI/BIFMA X5.5-2008– Standard Test for Desk / Tables.

**1.5 Submittals**

- 1.5.1 Product Data: Supply manufacturer's product data, storage and handling requirements and recommendations, installation methods and available colours, patterns and textures for approval by the Consultant.
- 1.5.2 Shop drawings: Submit manufacturer's shop drawings, including plans and elevations, indicating overall dimensions, for approval by the Consultant.
- 1.5.3 Samples: Submit manufacturer's samples of materials, finishes, colours and anchoring systems for approval by the Consultant.
- 1.5.4 Warranty: Submit Manufacturer's standard warranty.

**1.6 Quality Assurance**

- 1.6.1 Manufacturer's Qualifications: Manufacturer regularly engaged in manufacture of site furnishings for a minimum of 30 years.
- 1.6.2 Product Support: Products are supported with complete engineering drawings and design patents.
- 1.6.3 Production: Orders are filled within a 40-day schedule.
- 1.6.4 Facility Operator: Welders and machine operators are certified.

**1.7 Delivery, Storage, And Handling**

- 1.7.1 Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.
- 1.7.2 Storage: Store materials in clean, dry area in accordance with manufacturer's instructions. Keep materials in manufacturer's original, unopened containers and packaging until installation.
- 1.7.3 Handling: Protect materials and finish during handling and installation to prevent damage.

**1.8 Warranty**

- 1.8.1 Warranty Information:
  - .1 Products will be free from defects in material and/or workmanship for period of three (3) years from the date of invoice.
  - .2 The warranty does not apply to damage resulting from accident, alteration, misuse, tampering, negligence, or abuse.
  - .3 The Manufacturer shall, at its option, repair, replace, or refund the purchase price of any items found defective upon inspection by an authorized Manufacturer's service representative.

---

## 2. PRODUCTS

### 2.1 Bicycle Equipment

#### 2.1.1 Bike Rack

- .1 Product: Flo
- .2 Metal: Stainless Steel
- .3 Quantity: 3.
- .4 Available From: Landscape Forms Inc. 431 Lawndale Ave.  
Kalamazoo, MI. 49048. Attention: Tracy Cook,  
[tracyc@landscapeforms.com](mailto:tracyc@landscapeforms.com).

#### 2.1.2 Bike Repair Station

- .1 Product: Fixit Plus
- .2 Metal: Powdercoat Steel
- .3 Colour: Iron Gray, RAL 7011
- .4 Options: 1 bike capacity with Air Kit 4
- .5 Quantity: 1
- .6 Available from: ABC Recreation. Paris, ON. (519) 442-7900.

#### 2.1.3 Bicycle Storage Locker

- .1 Product: Madlocker Narrow (MLN-1)
- .2 Metal: Powdercoat Steel
- .3 Colour: Storm Metallic
- .4 Options: Full Perforated Door
- .5 Quantity: 17
- .6 Available From: Graber Manufacturing Inc. 1080 Uniek Drive,  
Waunakee WI 53597. Attention: Kaitlyn Ellerman,  
[kellerman@madrax.com](mailto:kellerman@madrax.com).

### 2.2 Benches

#### 2.2.1 Feature Bench

- .1 Basis of Design: Plain Bench
- .2 Wood: Douglas Fir
- .3 Metal Frame: Pre-weathered Steel
- .4 Backrests & Armrests: Stainless Steel
- .5 Quantity: 8 – 4 Backless, 4 with Backrest & Armrests
- .6 Available From: Roburscape. LaSalette, ON Canada, N0E 1H0.  
Attention: John Scharringa, [jonathan@roburscape.com](mailto:jonathan@roburscape.com).

#### 2.2.2 Standard Bench

- .1 Product: MBE-0970-00023
- .2 Metal: Gunmetal Grey Powdercoat Aluminum
- .3 Wood: Thermally Modified Ash

- .4 Options: Backrest, arms at each end.
- .5 Quantity: 2
- .6 Available From: Maglin Site Furniture. 3-468 Innovation Way, Woodstock, ON N4V 0B9. Attention: Jeff Roddick, [jeff.roddick@maglin.com](mailto:jeff.roddick@maglin.com).

## 2.3 **Bollards & Poles**

### 2.3.1 Standard Bollard

- .1 Product: EP 7070
- .2 Metal: Powdercoat Aluminum
- .3 Colour: Meteor Gray, Semi-Gloss
- .4 Quantity: 18
- .5 Available From: Equiparc. 1001 James-Brodie St-Jean-sur-Richelieu, QC. J2X 0C1. Attention: Philippe Tetrault, [philippe.tetrault@equiparc.com](mailto:philippe.tetrault@equiparc.com).

### 2.3.2 Catenary Light Pole

- .1 Product: BEAM-12-6-4-C5-A0-B0-S8-CAT-BC-STD
- .2 Metal: Powdercoat Steel
- .3 Colour: Slate
- .4 Wood: Weathered Grey Accoya
- .5 Quantity: 2
- .6 Available From: Structura, represented by Salex. 435 Finchdene Square, Scarborough ON M1X 1B7.

## 2.4 **Amenity Furnishings**

### 2.4.1 Barbeque

- .1 Product: Weber Summit S-670 6-Burner Propane Gas Grill
- .2 Metal: Stainless Steel
- .3 Quantity: 1

### 2.4.2 Dining Table

- .1 Product: Nardi Tevere 210 Extendable Table
- .2 Colour: Antracite
- .3 Quantity: 1
- .4 Available From: Bum Commercial Furniture. 1-3270 South Service Road West Oakville, ON L6L 0B1.

### 2.4.3 Side Chairs

- .1 Product: Nardi Bit Side Chairs
- .2 Colour: Corallo
- .3 Quantity: 8
- .4 Available From: Bum Commercial Furniture. 1-3270 South Service Road West Oakville, ON L6L 0B1.

2.4.4 Lounge Chairs

- .1 Product: Nardi Doga Relax
- .2 Colour: Menta
- .3 Quantity: 2
- .4 Available From: Bum Commercial Furniture. 1-3270 South Service Road West Oakville, ON L6L 0B1.

2.4.5 Side Table - Nardi Step, 40cm Height.

- .1 Colour: Antracite
- .2 Quantity: 1
- .3 Available From: Bum Commercial Furniture. 1-3270 South Service Road West Oakville, ON L6L 0B1.

**3 .     EXECUTION**

**3.1     Installation**

- 3.1.1 Notify Consultant of source of material at least 7 days in advance of commencement of work to approve materials and layout of site furnishings. No work is to proceed without Consultant's approval.
- 3.1.2 Install furnishings square and plumb as shown on the drawing. All locations to be staked out and approved by the Consultant prior to installation.
- 3.1.3 Use stainless steel vandal proof hardware.
- 3.1.4 Surface Mounted Furnishings
  - .1 Surface Mount onto paving as specified by manufacturer.
- 3.1.5 Embedded Furnishings
  - .1 Installation on Unit Paving: Place threaded rods in stabilized subbase during installation of unit paving. Embed threaded rods 40mm into stabilized subbase by hand. Scribe unit paver the diameter of the threaded rod, plus 6mm. Backfill joint around threaded rod with approved mortar. Refer to Section 32 14 13 – Unit Paving.
  - .1 Do not damage radiant heat piping.
  - .2 Concrete Mounting: Embed as per manufacturer's recommendations.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Related Sections**

- 1.1.1 Section 32 92 20 – Seeding
- 1.1.2 Section 32 92 23 – Sodding
- 1.1.3 Section 32 93 10 - Planting

### 1.2 **References**

- 1.2.1 Ontario Provincial Standard Specification OPSS 802 November 2010.

### 1.3 **Testing**

- 1.3.1 All testing shall only be performed by an OMAFRA accredited commercial lab. Vendor to pay all costs of testing.
- 1.3.2 Test all stockpiled and imported topsoil for N, P, K, Mg, soluble salt content, organic matter and PH value in place and other requirements as noted on the drawings.
  - .1 Perform pH test to determine required lime treatments to bring pH value of soil within 6.0 to 7.5 levels.
- 1.3.3 Submit electronic copy of soil analysis and recommendations for review by the Consultant. Failure to test and provide appropriate documentation of test results may be considered grounds for rejection of a proposed growing medium and removal of such material at the Vendor's expense.
- 1.3.4 If required, adjust fertilizer requirements and other additives to conform to soil testing report recommendations.
- 1.3.5 The Vendor shall guarantee that the soil submitted for the laboratory testing is a representative sample taken (according to the lab recommendations) from the material that will be delivered to the site.

### 1.4 **Stockpiling**

- 1.4.1 Topsoil shall be removed if required, stockpiled and managed according to Contract Documents. Stockpiles shall be constructed neatly with uniform surfaces. When required, the top surface shall be dished.

## 2. **PRODUCTS**

### 2.1 **Materials**

#### 2.1.1 Topsoil

- .1 Topsoil from all sources shall be fertile, friable, topsoil, free of: fragments larger than 75 mm in size; stones over 30 mm in diameter; debris; plants or their roots; sticks; noxious weed plants, stolons, seeds; salts; soil sterilants; chemical contaminants; toxic elements; or other materials detrimental to plant growth.

- 
- .2 All Topsoil shall have the following characteristics:
    - .1 Textural class of sandy loam based on the Canadian System of Soil Classification, to consist of 40-60% sand, 20-40% silt, and 6-10% clay; pH range of 6.0 – 7.5;
    - .2 Not less than 4% Organic Matter;
    - .3 Salt conductivity, salt less than 2.0 ms/cm (millisiemens/cm) Total Salts.
    - .3 Topsoil not meeting the minimum specification must be amended and retested. Fertilizer and mineral amendments must be made as per soil testing agency recommendations.
    - .4 Topsoil shall not be moved, delivered or worked on while in a frozen, wet, or muddy state or condition.
  - 2.1.2 Growing Medium – Planting Mixes for all planting beds and tree planting
    - .1 Planting Mix: shall be thoroughly combined prior to placement in planting bed areas and tree pits to the following proportions: 4 parts approved topsoil and 1 part organic amendment (compost, manure, peatmoss, etc).
    - .2 Amendments shall have the following characteristics: pH range of 5.5 – 8.0; a minimum of 60% Organic Matter; salt conductivity, salt less than 2.0 ms/cm (millisiemens/cm) Total Salts; maximum moisture content of 35%.
    - .3 Compost and manure shall meet the standards found in the Interim Guidelines for the Production and Use of Aerobic Compost in Ontario published by the Ontario Ministry of Environment and Energy (MOEE), and shall be virtually free from all viable weed seeds, or other plant reproductive parts, pathogens, chemicals or toxic contaminants. Physical contaminants such as rock, plastic, metal or glass shall be less than 0.5%. Total carbon to nitrogen ratio in the resulting growing medium shall not exceed 30:1.
    - .4 Mixes containing a significant amount of peat moss shall not be permitted to dry out. The moisture content of the peat moss at the time of mixing shall be not less than 60% to 75%.
  - 2.1.3 Soil Amendments
    - .1 All Soil Amendments to be applied as per soil test recommendations and Consultant's approval. All Soil Amendments shall be free from clay subsoil, sawdust, commercial wood products, stones, lumps, plants, sticks, weed stolons and seeds, chemical contaminants and other materials harmful to plant life.
    - .2 Organic Components
      - .1 Sphagnum Peat Moss shall be a horticultural grade. Peat Moss suitable for horticultural purposes should be medium to coarse shredded with a texture varying from porous to spongy fibrous and substantially homogeneous with a PH value between 3.4 and 5.5.
      - .2 Commercially prepared compost shall be virtually free from all viable weed seeds. Or other plant reproductive parts, pathogens,
-

chemicals or toxic contaminants. Physical contaminants such as rock, plastic, metal or glass shall be less than 0.5%. Total carbon to nitrogen ratio in the growing medium no to exceed 30:1.

- .3 Mushroom compost and/or animal manure and compost are to be pasteurized and leached with fresh water prior to installation (electrical conductivity not to exceed 2.0 mmhos/cm).
- .4 Bonemeal: raw bonemeal, finely ground with a minimum analysis of 4% nitrogen and 20% phosphoric acid.
- .3 Fertilizers
  - .1 All Fertilizers shall be a standard commercial brand, having a guaranteed N-P-K analysis meeting the requirements of the Canada Fertilizer Act and the CFQAP.
  - .2 All Fertilizers shall be granular, pelletized or pill form, and shall be dry and free flowing, unless specified.
  - .3 Fertilizer shall be packed in standard waterproof containers, clearly marked with the name of the manufacturer, weight and analysis.
  - .4 The types, formulations, and rates of application for fertilizers shall be as recommended by the laboratory soil specialist, based on the test results of the growing medium, and as approved by the Consultant.
  - .5 Substitution or variations in fertilizers and methods shall be made only upon pre-approval by the Consultant.
- .4 Lime:
  - .1 Limestone containing not less than 8% of calcium and magnesium carbonates combined, finely ground to pass a 10 mesh sieve with at least one half passing a 100 mesh sieve. Rate of application shall be determined after determining the pH of the topsoil.
- .5 Sand:
  - .1 Sharp, clean sand to OPSS 1002-3.
- .6 Geotextile
  - .1 Woven, polyester reinforcement geotextile: LINQ 300 or approved equal.
  - .7 Granular
    - .1 The drainage material shall be a free draining clear granular material of uniform particle size of 20 mm separated from the retained soil by a geotextile filter.

### **3 . EXECUTION**

#### **3.1 Topsoil and Fine Grading**

- 3.1.1 Submit topsoil testing analysis and recommendations to Consultant prior to hauling to and spreading topsoil on the work site. Failure to obtain

- 
- topsoil samples and testing and submitting soil analysis report will delay commencement of work until reports are submitted and reviewed by the Owner. Provide proof that specified topsoil amendments were carried out.
- 3.1.2 Obtain approval by the Consultant of prepared subgrades prior to hauling, placing and spreading of topsoil.
- 3.1.3 Topsoil obtained from designated stockpiles shall be amended by mechanical shredder; other methods of blending shall be reviewed and approved only by the Consultant.
- 3.1.4 Spread topsoil to the following minimum depths:
- .1 200 mm for all areas to be sodded;
  - .2 200 mm for areas to be seeded;
  - .3 Depth indicated is compacted depth.
- 3.1.5 Spread growing medium to the following minimum depths:
- .1 600 mm for all planting beds;
  - .2 Tree pits per drawings;
  - .3 Depth indicated is compacted depth.
- 3.1.6 Spread topsoil on prepared subgrade of the work site.
- 3.1.7 Fine grade topsoil to produce a smooth even surface, free debris, sod, stones and roots over 25mm in diameter.
- 3.1.8 Compact to 85% Standard Proctor Density.
- 3.1.9 Meet and match all existing sodded areas, curbs, sidewalks, manholes and catch basin frames, asphalt and other surface areas in a smooth, uniform line to the satisfaction of the Consultant.
- 3.1.10 Install growing medium for tree pits and planting beds as specified in Section 32 93 10 - Planting.
- 3.1.11 Maintain all soils so that they are erosion-free and put in place necessary protection measures as required. Correct all erosion as required prior to proceeding with work.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Related Sections**

- 1.1.1 Section 32 91 19 - Topsoil and Fine Grading

**1.2 Submittals**

- 1.2.1 The Consultant will be provided with a representative seed mix of the plant species and percentages, and seeding rates. Accepted seed mixes become the standard of acceptance for the work.

**1.3 Scheduling**

- 1.3.1 March 1 through June 29: Seeding during this period is appropriate but germination of a portion of the seed may not occur until the following season due to lack of cold stratification to break seed dormancy. Cover crop generally germinates within 2 to 3 weeks of seeding operation.
- 1.3.2 June 20 through August 30: Installation of native seed should be suspended unless supplemental watering can be provided, or unseasonably cool conditions persist.
- 1.3.3 October 1 through November 30: Seed on bare, graded surfaces must be protected with specified erosion control blankets on slopes. Seed drilled into existing vegetation or on flat ground not subject to erosion may need only minimal erosion protection. Less cover crop will be observed during the following spring due to frost damage.

**1.4 Delivery And Storage**

- 1.4.1 Deliver seed mixes in original containers showing:
- .1 Analysis of seed mixture.
  - .2 Percentage of pure seed.
  - .3 Year of production.
  - .4 Net weight.
  - .5 Date when tagged and location.

**1.5 Acceptance**

- 1.5.1 Seeded areas will be accepted by the Consultant at the end of the maintenance period provided that:
- .1 Seeded areas are properly established.
  - .2 Seeded areas are free of bare and dead spots and weed growth per the Performance Standards of this Section.
  - .3 Plants are healthy, dense, well-rooted, of good colour and in a vigorous growing condition.

- 1.5.2 Areas seeded in the fall will be accepted in the following spring, one month after the start of the growing season provided that the conditions of section 1.2.1 are fulfilled.

### **1.6 Performance Standards**

- 1.6.1 At least 90% of the seeded area shall be vegetated with cover crop species from the seed mix by July 30 following a spring seeding. If planting occurred in the fall or winter minimum cover crop is expected. Matting shall be reviewed in the spring to ensure that proper erosion control and seed protection is in place.
- 1.6.2 After one (1) full growing season coverage of non-cover crop species shall be at minimum 40%. There shall be no more than 0.25 square-meter of area devoid of vegetation, as measured by aerial visual review.
- 1.6.3 After two (2) full growing seasons, coverage of non-cover crop species shall be at minimum 75%. There shall be no more than 0.25 square-meter of area devoid of vegetation, as measured by aerial visual review.
- 1.6.4 At any time during the contract period no more than 10% (by aerial review) of seeded areas should be dominated by aggressive exotic species which include, but are not limited to, Reed Canary Grass (*Phalaris arundinacea*), Crab Grass (*Digitaria* spp.), Red Clover (*Trifolium* spp.), White or Yellow Sweet Clover (*Melilotus* spp.), Burdock (*Arctium minus*), Teasel (*Dipsacus sylvestris*), Canada Thistle (*Cirsium arvense*).
- 1.6.5 If these standards are not met, the Vendor shall be responsible for repair and supplemental seeding in accordance with the specifications.

## **2. PRODUCTS**

### **2.1 Materials**

#### **2.1.1 Seed**

- .1 Comply with Federal and Provincial seed laws having a minimum germination of 75% and minimum purity of 97%.
- .2 In packages individually labelled in accordance with 'Seeds Regulations' and indicating name of vendor, seed mix content, germination rate, and date bagged.
- .3 Seed to be cleaned and free from stems, chaff, fluff, bracts, leaves and weed seeds.
- .4 Species known to be invasive or potentially invasive by the Province of Ontario and Credit Valley Conservation shall not be used.

#### **2.1.2 Wet Meadow Seed Mix**

- .1 Basis of Design:
- .1 Grassland Bird Habitat Wet Meadow Seed Mix
- .2 Apply seed rate as per nursery recommendations.

- .3 Available from: St. Williams Nursery & Ecology Centre. 885 Norfolk County Highway 24 West, P.O. Box 150, St. Williams, Ontario, CA, N0E 1P0.
- 2.1.3 Dry Meadow Seed Mix
  - .1 Basis of Design:
    - .1 Dry Meadow Seed Mix
    - .2 Apply seed rate as per nursery recommendations.
    - .3 Available from: St. Williams Nursery & Ecology Centre. 885 Norfolk County Highway 24 West, P.O. Box 150, St. Williams, Ontario, CA, N0E 1P0.
- 2.1.4 Nurse Crop:
  - .1 Submit nursery recommended species suitable for each Seed Mix and planting season. Refer to Schedule for seeding windows.
- 2.1.5 Water: Potable, on site.
- 2.1.6 Hydraulic Mulch: Type A, as per OPSS 572.
- 2.1.7 Dry Mulch: Chopped Straw Mulch, as per OPSS 572.
- 2.1.8 Erosion Control Blanket: Terrafix S100B Straw Single Net, or approved equivalent.
- 2.1.9 Seed Drill for seed beds: Tye drill, Truax drill, or John Deere Rangeland drill.

### **3 . EXECUTION**

#### **3.1 Workmanship**

- .1 Do not perform work under adverse field conditions such as frozen soil, excessively wet or dry soil or soil covered with snow, ice or standing water.
- .2 Keep site well drained. Keep excavations dry.
- .3 Clean up immediately any soil or debris spilled onto pavement. Dispose of deleterious material off site.

#### **3.2 Preparation Of Surfaces**

- 3.2.1 Verify finished grades are correct and have been accepted by Consulting Engineer per approved grading plans.
- 3.2.2 Scarify soil surface to a depth of 25mm minimum of area to be seeded.
- 3.2.3 Seed bed surface must be free of all deleterious material and finished grade must be free of humps and hollows. Surface must be chain-harrowed to provide a fine, clump-free seed bed just prior to seeding.
- 3.2.4 Seed beds must receive an organic, pre-emergent herbicide application of Turf Maize, 98% Corn Gluten Meal, pre-emergent weed control per

---

manufacturer's recommendations and at least 2 weeks prior to the final cultivation before seeding.

### **3.3 Extent Of Seeding**

- 3.3.1 Areas to be seeded are shown on the drawings or disturbed by construction other than areas to be sodded, paved or installed as planting beds.

### **3.4 Seeding**

- 3.4.1 Seeding must occur when soil moisture is appropriate for seeding operation.
- 3.4.2 Seed shall not receive fertilizer.
- 3.4.3 Wet seed that is moldy or otherwise damaged in transit or storage shall not be used.
- 3.4.4 All drill seeding equipment shall be calibrated to deliver the seed at the rates and proportions specified in subsection 2.0. Equipment shall be operated in such a manner as to ensure complete coverage of the entire area to be seeded, and seed must be placed no deeper than 6 mm into prepared seedbed.
- 3.4.5 Sow one half of the required amount of seed in one direction and follow by sowing the other half at right angles to it. The last pass shall be at right angles to the slope.
- 3.4.6 In the case of late fall seeding, sufficiently protect all seeded areas from damage by erosion, pedestrians and vehicles.
- 3.4.7 After seeding operation is completed, supply and install an erosion control blanket per manufacturers specifications on all slopes exceeding 3:1.

### **3.5 Erosion Control**

- 3.5.1 Install according to manufacturer's specifications.

### **3.6 Maintenance During Establishment Period**

- 3.6.1 Maintain seeded areas from the time of installation until acceptance.
- 3.6.2 Water seeded area to maintain optimum soil moisture level for germination and continued healthy growth of plants. Control watering to avoid washouts.
- 3.6.3 Repair and reseed dead or bare spots to allow establishment of seed.
- 3.6.4 Check the site for broken branches, leaves, paper and similar material to keep the area reasonably clean at all times. Remove all extraneous material from the site. No material shall be burned on the site. Paved areas and lawns shall be kept clean at all times.
- 3.6.5 Maintain all seeded areas weed-free.

---

**3.7 Warranty**

- 3.7.1 Seeded areas shall be warrantied for one (1) year after preliminary acceptance.
- 3.7.2 Only seed which is rooted in place and exhibiting vigorous healthy growth at the time of inspection will be deemed to have met the terms of the Warranty.
- 3.7.3 Seeded areas which show deterioration, bare spots, or failure to take root and thrive, shall be re-seeded and maintained for an additional sixty (60) days according to all the requirements as described in this section.
- 3.7.4 Rills and gullies greater than 100mm in width shall be repaired immediately throughout the warranty period.

**END OF SECTION**

---

**1 . GENERAL**

**1.1 Work Included**

- 1.1.1 Supply and laying of sod.
- 1.1.2 Fertilizing.
- 1.1.3 Maintenance and clean-up of site.

**1.2 Related Work**

- 1.2.1 Section 32 91 19 – Topsoil and Fine Grading

**1.3 Scheduling**

- 1.3.1 Schedule sod laying to coincide with preparation of soil surface.
- 1.3.2 Schedule sod installation after planting.
- 1.3.3 Coordinate sod laying with work of other trades.

**1.4 Source Quality Control**

- 1.4.1 Source of sod is provided in this specification.
- 1.4.2 Alternate sources will not be accepted without written authorization.

**2 . PRODUCTS**

**2.1 Materials**

- 2.1.1 Number One Turfgrass Nursery Sod: Sod that has been especially sown and cultivated in nursery fields as turfgrass crop and is harvested with a mechanical sod cutter to a thickness of not less than 25 mm and not more than 40 mm, and is supplied in rolls of approximately 0.9 sq m in surface area. Quality and source to comply with standards outlined in Canadian Standards for Nursery Stock, 9th Edition, published by the Canadian Nursery Landscape Association.
  - .1 Number One Sod: Green Horizons Spectrum Sod or approved equivalent, grown solely from seed mixture of cultivars of Kentucky Bluegrass, Turf-Type Tall Fescue, Chewing Fescue, Hard Fescue, Red Fescue, Fine Fescue supplied by Green Horizons Sod Farms Cambridge, 1625 Kossuth Road, Cambridge, ON. (519) 653 7494; greenhorizonssod.com.
- 2.1.2 Sod establishment support: wooden pegs: 17 x 8 x 250 mm.
- 2.1.3 Water: potable, supplied on site.
- 2.1.4 Fertilizer:
  - .1 To Canada 'Fertilizers Act' and 'Fertilizers Regulations'.

- .2 Complete synthetic, slow release with minimum 50% of nitrogen content in ureaformaldehyde form.
- .3 Fertilizer Composition Ratio: 6-12-12.

### **3 . EXECUTION**

#### **3.1 Preparation**

- 3.1.1 Verify that grades are correct and prepared in accordance with Section 32 91 19 – Topsoil and Fine Grading. If discrepancies occur, notify Consultant and do not commence work until instructed.
- 3.1.2 Do not perform work under adverse field conditions such as frozen soil, excessively wet or dry soil or soil covered with snow, ice or standing water.
- 3.1.3 Fine grade surface free of humps and hollows to smooth, even grade, to contours and elevations indicated, surface to drain naturally.
- 3.1.4 Remove and dispose of weeds; debris; stones 50 mm in diameter and larger; and other deleterious materials; off site.
- 3.1.5 Cultivate approved fine grade to 25 mm depth immediately prior to sodding.

#### **3.2 Sod Placement**

- 3.2.1 Lay sod within 24 hours of being lifted.
- 3.2.2 Lay sod sections in rows, longitudinally, along contours of slopes, joints staggered. Butt sections closely without overlapping or leaving gaps between sections. Cut out irregular or thin sections with sharp implements.
- 3.2.3 Provide close contact between sod and soil by light rolling. Use of heavy roller to correct irregularities is not permitted.
- 3.2.4 Water sod no more than 6 mm per hour, beginning no later than 30 minutes after installation.

#### **3.3 Sod Placement On Slopes**

- 3.3.1 Start laying sod at bottom of slopes.
- 3.3.2 Lay sod sections longitudinally, along contours of slopes steeper than 3 horizontal to 1 vertical, and where indicated.
- 3.3.3 Peg sod on slopes to following pattern:
  - .1 100 mm below top edge, using 3 stakes evenly spaced per roll, for first sod sections along contours of slopes.
  - .2 Stake alternate rows.
  - .3 Drive pegs flush, but not below surface of sod sections.

---

**3.4 Fertilizing Program**

- 3.4.1 Apply fertilizer uniformly at 0.5 kg N/ha before sodding. 1-2-1 ratio.
- 3.4.2 Additional fertilizer applications may be required to properly establish turf. This is to be determined by Consultant.

**3.5 Maintenance – Installation To Acceptance**

- 3.5.1 Perform following operations from time of installation until acceptance:
- 3.5.2 Water sodded areas no more than 6 mm per hour to depth of 75 to 100mm. Watering should be daily for days 1-7 and every other day for day 8-14 to maintain optimum soil moisture condition until Substantial Performance. Monitor conditions and provide continued watering as required.
- 3.5.3 Cut grass, as many times as required at no additional cost to Owner until Substantial Performance to 60mm height when or prior to it reaching a height of 85mm. A minimum of three (3) mowings are required. Remove clippings which will smother grassed areas. Grass shall not be cut no sooner than 7 days after installation.
- 3.5.4 Maintain sodded areas 95% weed free via mechanical removal.
- 3.5.5 Check the site for broken branches, leaves, paper and similar material to keep the area reasonably clean at all times. Remove all extraneous material from the site. No material shall be burned on the site. Paved areas and lawns shall be kept clean at all times.
- 3.5.6 Damage resulting from erosion, washout, or any other cause shall be repaired immediately by the Contractor at no additional cost to the Owner.
- 3.5.7 Grass areas which show deterioration or bare spots shall be re-sodded within the maintenance period so that at no time does the grass show signs of wear.
- 3.5.8 Fertilize per 3.4 above.

**3.6 Acceptance**

- 3.6.1 Turfgrass Nursery Sod areas will be accepted provided that:
  - .1 Sodded areas are properly established.
  - .2 Sod is free of weeds, bare and dead spots.
  - .3 No surface soil is visible when grass has been cut to height of 60 mm.
  - .4 Sodded areas have been cut a minimum of two (2) times after sod has knit, approximately four (4) weeks after sod laying. Sodded areas must have been cut within 24 h prior to acceptance.
  - .5 Sodded areas have been fertilized. Consultant is to be notified 24 h in advance by the Contractor of when the fertilizer application is to be applied.

- 3.6.2 Areas sodded in fall will be accepted in following spring one month after start of growing season provided acceptance conditions are fulfilled.

**3.7 Maintenance – Warranty Period**

- 3.7.1 Perform following operations during the warranty period:

- .1 Water sodded areas in times of drought to maintain the turf in a healthy growing condition. Assume 5 waterings during the warranty period.
- .2 Replace dead areas of sod as required.
- .3 Fertilize as required.

**3.8 Warranty**

- 3.8.1 Sodded areas shall be warranted for one (1) year from the date of Substantial Performance.
- 3.8.2 Only sod which is rooted in place and exhibiting vigorous healthy growth at the time of inspection will be deemed to have met the terms of the warranty.
- 3.8.3 Sodded areas which show deterioration, bare spots, or failure to take root and thrive, shall be re-seeded and maintained for an additional sixty (60) days of growing season according to all the requirements as described in this section. The additional sixty (60) days shall be carried over into the following growing season where required.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Work Included**

- 1.1.1 Preparation of planting beds, spreading of topsoil and planting mix prior to planting operations.
- 1.1.2 Plant material including trees, shrubs, and perennials.
- 1.1.3 Pruning, guying and mulching of trees, shrubs and perennials.
- 1.1.4 Protection of trees, shrubs and surrounding areas.
- 1.1.5 Cleaning and reinstatement of the area of Work.
- 1.1.6 Warranty of plant material.

**1.2 Related Sections**

- 1.2.1 Section 32 91 19 – Topsoil and Fine Grading
- 1.2.2 Section 32 92 20 - Seeding
- 1.2.3 Section 32 92 23 – Sodding

**1.3 References**

- 1.3.1 Canadian Nursery and Landscape Association: Canadian Standards for Nursery Stock 9th Edition, 2017.
- 1.3.2 ANSI Z-133-1; American Standards for Tree Care Operations.
- 1.3.3 ANSI A-300; Tree Pruning Guidelines.
- 1.3.4 Landscape Ontario Horticultural Trades Association, Landscape Standards.

**1.4 Quality Assurance**

- 1.4.1 Soil media (Topsoil; Growing Medium) and organic amendments must be tested prior to supply and installation on site. Refer to Section 32 91 19 – Topsoil and Fine Grading for requirements.
- 1.4.2 The Work shall be carried out by specialist firms engaged in installing and planting landscape products with minimum 5 years' experience performing landscape work and using workers skilled in the various aspects of such work.
- 1.4.3 No substitutions for plant material as indicated on planting plan will be allowed unless written approval has been obtained from the Consultant as to type, variety and size. Proposed substitutions must be of similar species and of equal size as those originally specified.

**1.5 Delivery**

- 1.5.1 Plant material should be protected during delivery to prevent damage to branches, root ball or desiccation of leaves.

- 
- 1.5.2 Adequate protection and spacing shall be placed between trees so that trunks are not scarred, and branches are not broken.
  - 1.5.3 Plants should be transported in enclosed trucks or covered with a tarpaulin. For large material transported in open trucks, the trees shall be wrapped to prevent damage and windburn.
  - 1.5.4 Movement of container grown, ball and burlap (B&B) and wire-basketed (WB) plants should be restricted to closed van or well-covered trucks with mesh tarpaulin or similar material to protect the leaves or needles from windburn or desiccation.
  - 1.5.5 Dormant plants
    - .1 Deciduous – bare roots (only in dormant period or condition): Adequate protection shall be given to preserve the moisture around the root system. For short transit periods of 4 hours or less, the maximum temperature in the truck should not exceed 20° Celsius. In all cases and at all times, roots should be protected from frost, wind and sun, by such means as a closed van or tarped vehicle with wet straw or other suitable moisture-holding materials placed over the roots. The temperature shall be maintained as uniformly as possible at all times by mechanical or other means.
    - .2 Evergreens: It is recommended that rootballs not be subjected to freezing temperatures below -5 degrees Celsius for a period longer than 4 hours and that adequate protection from wind and sun be given to prevent desiccation.
  - 1.5.6 Non-Dormant Plants: Deciduous and Evergreens:
    - .1 Movement of container grown, ball and burlap (B&B) and wire-basketed (WB) plants should be restricted to closed van or well-covered truck with mesh tarpaulin or similar material to protect the leaves or needles from windburn or desiccation. If plants will be in transit for more than one day, they should be unloaded at interim points and stored away from direct sun for 24 hours at each interim point to avoid burning. When plants may be subject to wind during transportation and storage, tarpaulins and other protective measures may be supplemented by spraying the foliage with an antidesiccant prior to shipping.
  - 1.5.7 Unloading Procedures:
    - .1 BR (Bare Root): Roots should be covered and protected from frost, freezing, sun, and wind.
    - .2 Pots / Containers: Should be handled by the container only in order to reduce breakage of branches or leaves. Container plants shall not be held by the tops, stems or trunks.
    - .3 Ball & Burlap: Should be handled with caution to maintain the firmness of the root balls. Protect against damage to trunk, stems and branches.
    - .4 Trees should not be lifted by the trunk. Lift by attachments to the basket at three to four points or by supporting the tree below the rootball. Support the trunk as necessary to hold it in relation to the rootball to
-

prevent tearing of roots or loosening of the rootball. Support shall be such that the cambium is not damaged.

.5 All plants should be unloaded and checked immediately upon arrival and watered if necessary. The Contractor should be notified immediately both verbally and in writing of any plant damage.

.6 Plant material shall not be dropped, thrown or handled roughly.

#### **1.6 Handling and Storage**

1.6.1 Plants and roots shall be kept in a moist condition at all times. All plants shall be well protected against damage, extreme temperatures, desiccation and theft.

##### **1.6.2 Protection Against Stem and Branch Damage**

.1 During loading and unloading, transportation and planting, all trees should be protected against damage to the stems and branches. This is applicable especially to large wire-basketed trees.

.2 The bark should be protected against chafing from chains, cables, equipment or other trees by a wrapping of cardboard or burlap.

.3 Sudden or rapid movement of trees in transit or off-loading should be avoided. If the tree's branches are entangled with those of other trees, care shall be taken to separate them without damage to branches.

.4 If damage occurs, it shall be reported to the Consultant immediately. If the Consultant determines that the plant is acceptable despite the damage, proposed corrective measures should be carried out in accordance with arboricultural practices recognized by the International Society of Arboriculture. Shattered bark should be removed and broken branches should be pruned back to the appropriate branch collar or bud, with care to avoid the tearing of the stem bark.

##### **1.6.3 During Growing Season**

.1 All plants in Containers, Balled & Burlapped, or Wire Basket, if not planted immediately, shall be stored in a secure upright position. Care should be taken to provide enough space between plants so that light reaches all around to the bottom of the plant in order to avoid sunscald or burning when the plants are planted out.

.2 Balled & Burlapped Plants: Special attention should be given to the rootball, and unless weather is rainy or cool, rootballs shall be protected by heeling-in into material suitable (examples: straw, peat moss, topsoil) to protect them from drying out. Plants intended to be planted in the open shall not be kept stored in a building or any area of low light intensity for a prolonged period. All plants shall be kept well-watered and protected from extreme temperatures.

.3 Containerized plants shall be covered in a protective medium such as straw, peat moss or topsoil in extreme weather such as freezing or high dry heat. Plants shall not be kept stored in a building, truck, or any area of low light intensity for a prolonged period during the growing season.

.4 Plants shall not be taken directly from the greenhouse and planted in a drastically different environment. Such plants shall be acclimatized or "hardened off" against the environmental conditions of their final planting location (including plants originating from different geographical sources).

.5 Preparation for the new environment should include an appropriate period of storage in an intermediate environment, managing fertilizer applications to avoid excessive growth, and a graduated watering program.

1.6.4 During Dormant Period

.1 Plants shall be cared for according to the species requirements for winter protection, geographic location and hardiness.

**1.7 Acceptance**

- 1.7.1 Growing medium, fertility levels, depths and surface grading are as specified.
- 1.7.2 Plant quantities, species, sizes, quality and locations are as shown in the contract documents or as otherwise specified. All approved substitutions shall be noted. An approved list of substitutions shall be provided to the Consultant at the time of acceptance.
- 1.7.3 Install all plants properly, vertical and at the correct level relative to finished grade.
- 1.7.4 Trees are to be staked as shown on drawings, and otherwise as and where site conditions require.
- 1.7.5 Pruning is completed where required. All pruning cuts shall be made with a sharp tool.
- 1.7.6 Mulch is in place to the proper depth as required. Un-mulched areas are cultivated to leave a loose, friable, water-permeable surface. All planted areas are free of visible weeds, and substantially free of underground weed parts.
- 1.7.7 Garbage, paper, construction debris, broken branches and similar materials have been removed from all planting areas.
- 1.7.8 Only plant material that exhibits healthy growth, good leafing and branching habit, and are true to the botanical name, size and condition indicated on the plan, and are free from pests, disease, or damage shall be accepted.

---

### **1.8Warranty**

- 1.8.1 The Contractor shall warranty all plant materials for two (2) full growing seasons from date of Substantial Performance. The Consultant reserves the right to review all plant material any time during the warranty period and require replacements at that time, at the sole discretion of the Owner/Consultant.
- 1.8.2 All new plant materials used as replacement for unacceptable plant materials shall be of the same species, quality, size and requirements prescribed in the contract documents.
- 1.8.3 A plant shall be assumed to be acceptable when it is structurally sound, when it is well furnished with living foliage, when it has normal colour, when it shows adequate annual growth and formation of buds and when it is free from blight of any description. Plant material which exhibits die back of more than 10% of its branch area or has regrown from a bud or shoot shall be considered dead and unacceptable.
- 1.8.4 Plants which have died during the period of warranty shall be replaced at no cost to the Owner. Dead plant material replaced under warranty shall be removed from the Work site at the Contractor's expense.
- 1.8.5 Plant material replaced under warranty shall conform to all requirements of the original contract including the warranty of 24 months from the date of Substantial Performance.
- 1.8.6 Replacement of materials removed, broken or damaged due to circumstances beyond the Contractor's control after completion shall not be an obligation under this warranty.

### **1.9Required Tasks During Warranty Period**

- 1.9.1 Refer to Section 32 93 40 – Planting Maintenance.

## **2 . PRODUCTS**

### **2.1Plant Material**

- 2.1.1 Plant material: comply with Canadian Nursery and Landscape Association: Canadian Standards for Nursery Stock (2017), referring to:
  - .1 Standard container sizes.
  - .2 Digging standards.
  - .3 Rootball diameters, depths, weights.
  - .4 Recommended container sizes by plant type.
  - .5 Height relationship to caliper by type size and development of plant material and root ball.
  - .6 Age of plant.

- 2.1.2 All trees, shrubs and perennials to be No. 1 Grade. Plant material obtained from areas with milder climatic conditions from those of the site are only acceptable when used for spring planting.

## **2.2Topsoil And Growing Medium**

- 2.2.1 Topsoil and growing medium – refer to Section 32 91 19 – Topsoil and Fine Grading.

## **2.3Fertilizer And Amendments**

- 2.3.1 Organic components and fertilizers per Section 32 91 19 – Topsoil and Fine Grading.

## **2.4Fastening Accessories**

- 2.4.1 Tree supports
- .1 Steel Stakes: T-rail iron stakes 38 x 38 x 5 mm, 2000 mm high, primed with 1 brush coat of black zinc rich paint, to CGSB 1-GP-181M.
  - .2 Wood Stakes: 2400 or 600 x 50 x 50mm spruce survey stakes pointed at bottom end.
  - .3 Anchors: For support of large trees over 100 mm in caliper use “Duckbill” anchors, #68 or 88 as required.
- 2.4.2 Wire: new and free from bends or kinks, No. 10 galvanized steel wire for guying of trees. Wire shall not be used in conjunction with any tree ties that require the wire to encircle the trunk (encased or otherwise).
- 2.4.3 Turnbuckle: appropriate wire tightener by Spannfix, Langer or an accepted alternate, for use when guying.
- 2.4.4 Tree Fasteners: two-ply reinforced 13 mm diameter rubber garden hose, folded burlap strips or proprietary devices that do not encircle the trunk with wire.

## **2.5Maintenance Materials**

- 2.5.1 Tree Wrapping: Dewitt Tree Wrap (white polypropylene fabric).
- 2.5.2 Anti-Desiccant: wax-like emulsion to provide film over plant surfaces reducing evaporation but permeable enough to permit transpiration.
- 2.5.3 Wound dressing: horticulturally accepted non-toxic, non-hardening emulsion.
- 2.5.4 Organic Mulch: “Gro-Bark” Classic Cedar shredded bark mulch or accepted alternate.
- 2.5.5 Water: potable; on site.
- 2.5.6 Rodent Protection: ArborGuard Tree Protector.

## **2.6Source Quality Control**

- 2.6.1 General

- .1 Notify Consultant of source of material at least 7 days in advance of commencement of work and arrange plant material to be inspected, approved and tagged by the Consultant at the source. No work is to proceed without Consultant's approval.
- .2 Plant material must be approved by Consultant prior to planting.
- .3 Acceptance of plant material at its source does not prevent rejection on site prior to or after planting operations.

#### 2.6.2 Plant Material

- .1 Measure plants when branches are in their natural position. Height and spread dimensions refer to main body of plant and from branch tip to branch tip. Measure caliper 150 mm above ground level. Use trees and shrubs of No. 1 grade.
- .2 Label each plant as to type, grade and size.
- .3 All plant material shall be true to type and structurally sound. It shall be structurally sound, well- branched, healthy, vigorous, have a strong fibrous root system and be free of disease, insect infestation, rodent damage, sun scald, frost cracks, defects or injuries. Use trees with straight stems well and characteristically branched for species. Plants must have been transplanted or root pruned regularly but not later than 9 months prior to arrival on site.
- .4 Collected material dug from native stands or established wood lots shall not be accepted unless prior approval has been granted by the Consultant.
- .5 Trees of 3000mm height and larger and all conifers shall be delivered balled and burlapped or in wire baskets. Deciduous trees up to 3000 mm height and all shrubs shall not be supplied bare root unless noted on the plant material list. Plants which have been cut back from larger sizes to meet these specifications will not be accepted.
- .6 Plant material that has come out of dormant stage and is too far advanced will not be accepted unless due to special circumstances and Consultant's approval has been obtained.
- .7 The use of plant material that has been held in "cold storage" requires prior approval of the Consultant.
- .8 Plant material grown in more moderate hardiness zones than those in this contract will not be accepted.

#### 2.6.3 Bare Root Stock

- .1 Dig and move all bare root stock while dormant with the major portion of the fibrous root system provided.
- .2 All material shall be suitably packed for shipment to ensure that injury and drying out does not occur. Roots shall be packed in moist straw or another suitable material and wrapped with burlap or heavy paper.
- .3 Bare root material shall not be stored anywhere in excess of 24 hours unless properly "heeled in" and kept moist. All deciduous material which

has started to "leaf out" shall be sprayed with an approved anti-desiccant according to manufacturer's instructions.

2.6.4 Root Balled Stock

.1 All conifer, broad leaf evergreens and trees in excess of 3 metres height must have been dug with large firm ball. Base size of root ball for trees on caliper taken at 300 mm above ground level. A tree with 75 mm caliper requires root ball of 1 meter diameter. Increase diameter of root ball by 250 mm with each increase of 25 mm in caliper.

.2 Root balls of proper size must include 75 percent of fibrous and feeder root system. This excludes use of native trees grown in light sandy or rocky soil.

.3 Secure root balls with burlap, heavy twine and rope. Use 5 oz. Hessian burlap.

.4 Frozen root balls will be permitted, provided root balls are sufficiently protected to prevent breakage. Protect root balls against sudden changes in temperatures and exposure to heavy rainfall.

.5 Dig trees at their original location with root ball dimensions as specified, and to a depth to include 75 percent of the roots. Cleanly cut all roots at the outer edge of the root ball. Double burlap root balls in excess of 920 mm and drum-lace with 13mm rope at 200mm spacing. Wire baskets are an acceptable alternative.

.6 Root balls, trunks and branches of all trees and shrubs shall be protected from sun and wind while in transit and until planted.

.7 Thoroughly spray all deciduous trees which have broken into bud and all coniferous trees with an approved anti-desiccant to requirements of the manufacturer's instructions immediately upon delivery to the job site.

.8 Balled and burlapped material, or material in wire baskets shall NOT be stored on the site in excess of forty-eight hours without prior permission of the Consultant. If such storage is necessary, the plant material shall be protected with soil or a similar material to prevent drying out and shall be kept moist until it is planted.

2.6.5 Container Grown Stock

.1 Container grown stock is acceptable if containers were large enough for root development. Trees and shrubs must have grown in container for minimum of one growing season but not longer than two. Root system must be able to "hold" soil when removed from container. Plants that have become root bound are not acceptable.

.2 Container stock must have been fertilized with slow-release fertilizer. Soil mixture in container must consist of 6 parts loam soil, 3 parts peat moss and 1 part sand.

---

### 3 . **EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify field conditions are ready to receive work.
- 3.1.2 Contractor is responsible for all locates and related costs.
- 3.1.3 Clearly identify all plant material upon delivery to the site, using labels indicating species, size and supplier.
- 3.1.4 Beginning of installation implies acceptance of existing conditions.
- 3.1.5 Co-ordinate operations with appropriate trades and work.
- 3.1.6 Keep site clean and planting holes drained.
- 3.1.7 Erect physical protection barriers, silt fences, shade or erosion protection at the edge of the protection boundaries before any work occurs on site.
- 3.1.8 Physical protection barriers shall meet all applicable municipal by laws and regulatory requirements.
- 3.1.9 Protect adjacent walls, walks and utilities from damage or staining. Use 1/2" plywood to protect adjacent existing elements. Remove soil and debris spilled onto pavement immediately.

#### **3.2 Planting Time**

- 3.2.1 Perform planting during periods suitable with respect to weather conditions and locally accepted practice. Do not plant bare root plant material until all evidence of frost has left the ground site. Bareroot material shall not be planted between May 15 and October 15. Plant material imported from region with warmer climatic conditions may only be planted in early spring.
- 3.2.2 When permission has been obtained to plant deciduous plant material after buds have broken, spray plants with anti-desiccant to slow down transpiration.
- 3.2.3 Planting of coniferous evergreens with root balls may start after middle of August if interference with contract completion is not anticipated. Apply anti-desiccant to all evergreens before digging, where specified.
- 3.2.4 When permission has been obtained, trees and shrubs growing in containers may be planted throughout growing season.
- 3.2.5 Ensure that watering facilities are available. Take particular care and use anti-desiccant when planting during heat of summer.
- 3.2.6 Plant only under conditions that are conducive to health and physical conditions of plants.
- 3.2.7 Plant material noted by Consultant for spring planting only must be planted in dormant period.
- 3.2.8 Provide Consultant with planting schedule. Extending planting operations over long period using limited crew will not be acceptable.

- 3.2.9 Plant material specified, but not available at the time of Contract execution shall be ordered and planted in the fall or in the spring of the following year. Substitutions will only be considered by the Consultant if it is determined that the specified material will not be available at these later dates.

### **3.3Preparation – Layout And Staking**

- 3.3.1 Stake out locations of trees and outlines of areas to be planted with shrubs and perennials.
- 3.3.2 Do not commence excavation until staked locations have been reviewed and accepted by the Consultant.
- 3.3.3 Verify location of all underground utilities and services prior to any excavation. Pay for cost of repairs to any damaged utility or service caused by work of this Section, at no additional cost to Owner.

### **3.4Digging Of Plants**

- 3.4.1 Coniferous material shall not be dug bare root.
- 3.4.2 Plants specified or approved as "BR" (Bare Root) shall be dug and moved while dormant and in accordance with Canadian Nursery and Landscape Association Canadian Standards for Nursery Stock.
- 3.4.3 Plants specified or approved as "B&B" (Ball & Burlap) shall be dug and planted in accordance with Canadian Nursery and Landscape Association Canadian Standards for Nursery Stock.
- 3.4.4 Plants specified or approved as "Machine Dug into Wire Basket" shall be dug and planted in accordance with Canadian Nursery and Landscape Association Canadian Standards for Nursery Stock.

### **3.5Preparing Of Roots**

- 3.5.1 Before removing plants from containers for planting, the plants shall be well watered.
- 3.5.2 Roots have a tendency to grow in a circular pattern within plastic pots. When this is apparent outside roots should be gently loosened or vertically cut with a sharp knife in one or two places.

### **3.6Preparation For Planting**

- 3.6.1 Excavate planting beds to a depth of 600mm.
- 3.6.2 Preparation and depth of growing medium for trees shall follow drawings.
- 3.6.3 The transition of each tree planting area to shallower growing medium shall have a shallow angle.
- 3.6.4 Excavation of the subgrade below the root balls of trees shall be only as necessary to permit the bottom of the rootball to sit on undisturbed material or compacted fill such that the top of the rootball remains at the proper finished grade. Disturbed subgrade or fill below the rootball shall

be compacted to prevent settlement of the tree after planting. Excess excavated material shall be removed from the site.

- 3.6.5 Poor drainage or percolation should be reported to the Consultant. Planting pits or areas shall be tested by filling with water. If planting pits or areas do not drain adequately, measures such as penetrating the impervious layers, raising the planting grade, tree wells or adding drain lines should be employed.
- 3.6.6 Planting pits or areas excavated in fine soils or by mechanical means shall have all bottoms and sides scarified to ensure that they do not have glazed surfaces. Where the growing medium in a planting pit or area is different in texture, structure or organic content from the surrounding soil, the sides and bottom shall be scarified and the two materials thoroughly mixed to avoid an abrupt interface. Growing medium shall be free from interfaces or textural differences that could impede root development.

### **3.7 Planting**

- 3.7.1 Planting shall not be performed during weather conditions that may adversely affect material.
- 3.7.2 Plants shall be planted so that after settlement the level of the adjacent growing medium surface matches the level of the original growing medium surface in the nursery. The soil mark on the stem or container soil level is an indication of this, and it shall be maintained on the finished level, allowing for settling of the growing medium after planting. The total depth of the root ball shall be planted in growing medium.
- 3.7.3 Plants shall be set plumb in the planting beds or in the centre of the pits, except where the plant's character requires variation from this.
- 3.7.4 Root balls shall be placed on the undisturbed subgrade to prevent settling.
- 3.7.5 If no other factors come into play, the plant should be oriented in the same direction that it was grown in the nursery. Face the lowest branch away from the greatest traffic (pedestrian and vehicular); and position the plant for best viewing.
- 3.7.6 Growing medium shall be placed preferably by hand in layers around the roots or ball. Each layer shall be carefully tamped so as to avoid injuring the roots or ball, or disturbing the position of the plant. The hole should be backfilled and gently tamped so that no air pockets are left around the ball.
- 3.7.7 When growing medium is up to about two-thirds of the rootball height, all ties shall be cut and the top one- third of burlap on B&B, plants shall be cut off or folded back carefully, so as not to disturb the rootball integrity. No burlap shall show above grade.
- 3.7.8 Growing medium should be moist in tree pits and beds at this stage. After the water has been absorbed, the backfilling shall be completed and tamped lightly. Any settling shall be brought up to the intended grade with growing medium.

- 
- 3.7.9 The trunk flare should be partially visible after the tree has been planted.
  - 3.7.10 All non-biodegradable containers and tying materials shall be removed. Biodegradable containers such as fibre tubs should be removed where possible, but trees dug BR and planted in tubs for summer planting (if not fully established at time of planting) can be planted with the fibre tub if the rim is removed below grade and large holes cut out on the sides.
  - 3.7.11 All string, rope, burlap and other restricting elements shall be cut and removed out to the perimeter of the rootball. For jute burlapped root balls, cut away top one half of wrapping and wire basket without damaging root ball. Do not fold burlap or wire basket into the whole. Contractor to photograph tree planting and have the Consultant inspect planting prior to backfilling.
  - 3.7.12 Top lacing shall not be left in place at the time of planting.
  - 3.7.13 A 100 mm raised saucer should be constructed over the rootball to enhance water infiltration into the rootball.
  - 3.7.14 All planting hole depths should only be dug deep enough to accommodate the root system or root mass at the desired depth relative to the surrounding grade. Plant tree with the root collar at the same level as the surrounding ground.
  - 3.7.15 The planting hole width should be at least 200cm in diameter for all trees and 30 cm wider than the perimeter of the rootball or root system for all shrubs.

### **3.8 Poorly Drained Soils**

- 3.8.1 Planting holes should only be dug deep enough to accommodate the root system or root mass at the desired depth relative to the surrounding ground. The tree should be planted with the root collar positioned 75 to 100 mm above the surrounding ground level as settlement may occur.
- 3.8.2 When planting where drainage correction is impractical or impossible, the root collar should be planted higher in relationship to the surrounding soil surface by 75-100 mm.
- 3.8.3 Planting Hole Depth: the width of the actual hole should be at least 30 cm wider around the perimeter of the root ball or root system.

### **3.9 Bare Root Planting – While Dormant Only**

- 3.9.1 Damaged or broken roots should be cut back to healthy remaining tissue. Roots should be spread evenly in the planting pit.
- 3.9.2 Growing medium shall be placed around the roots, gently shaking the tree so all the soil particles sift into the root system to ensure close contact with all roots and to prevent air pockets. Ensure adequate watering occurs immediately after planting.

---

**3.10 Watering**

3.10.1 Watering shall be carried out when required and with sufficient quantities relative to specific plant needs to prevent plants and the underlying growing medium from drying out. Plants shall be thoroughly watered at the time of planting and continue throughout the warranty period as required for plant establishment and vigor.

**3.11 Pruning**

3.11.1 Pruning at the time of planting, shall be limited to the minimum necessary to remove dead, diseased, broken or injured branches.

3.11.2 Any corrective pruning (double leader) shall be done in such a manner as to preserve the natural character of the plants.

3.11.3 Only clean, sharp tools shall be used. Tools should be sterilized between cuts of different plants.

3.11.4 All cuts shall be clean and cut to the branch collar, leaving no stubs.

**3.12 Tree Guards**

3.12.1 Supply and install tree guards per manufacturer's instructions. Only guards well secured into the soil will be accepted.

**3.13 Mulching**

3.13.1 Shrub and perennial planting beds to have 100mm depth of approved mulch supplied and installed continuous across entire planting bed.

3.13.2 Trees installed in lawn areas:

3.13.3 Mulched ring to be 2.0 m in diameter with 100mm mulch depth.

3.13.4 Avoid placing wood chip mulch directly in contact with the trunk. Do not under any circumstances mound mulch up against trunk.

3.13.5 Trees installed in existing turf/meadow areas:

3.13.6 Existing herbaceous and woody plant material to be removed from site, and existing soils to be loosened to 100 mm depth within diameter of mulched ring.

3.13.7 Mulched ring to be 2.0 m in diameter with 100mm mulch depth.

3.13.8 Avoid placing wood chip mulch directly in contact with the trunk. Do not under any circumstances mound mulch up against trunk.

**3.14 Stabilizing Trees**

3.14.1 Immediately following planting, trees shall be stabilized (when required or specified) using appropriate methods such that the crown of each tree is permitted free movement but normal forces such as wind, snow loading or forces applied by human hands will not disturb the buttress root system or cause the rootball to shift in the growing medium. Securing methods

include staking, guying, soil anchors, deadmen, and attachments to fixed elements.

- 3.14.2 A tree may not need to be stabilized if the subsoil and growing medium are stable and can hold the rootball in place and if the rootball is solid, contained in a wire basket, and shaped such that it can resist shifting.
- 3.14.3 All tree stabilization methods shall be such that they do not damage the tree.
- 3.14.4 Attachment to the tree shall be no higher than necessary to stabilize the rootball while permitting free movement of the tree's crown.
- 3.14.5 Ties shall be secured in position in accordance with manufacturer recommendations. Ties shall form a loose loop around the stake and loop in a figure "8" around the trunk of the tree. Guys shall be sufficiently tight to transfer support from the stake to the tree and to permit some movement for the development of proper trunk taper.
- 3.14.6 Stakes and anchoring devices shall be set deep enough that they will not move in the soil when subjected to wind and other normal forces. Stakes should be driven a minimum of 300 mm into undisturbed soil.
- 3.14.7 Stakes or anchors for guy wires shall be set below or flush with the soil surface so that they do not present a hazard, and guy wires shall be used only where they do not present a hazard. Guy wires shall be marked with flagging tape for visibility.
- 3.14.8 Stakes shall not be driven through or penetrate the rootball of the plant.
- 3.14.9 The following methods are recommended for staking and guying:
- 3.14.10 Deciduous trees up to 12-cm caliper and coniferous trees up to 3m height: two stakes per tree.
- 3.14.11 Deciduous trees larger than 12-cm caliper and coniferous trees larger than 3m height: three guy wires spaced equally around each tree.
- 3.14.12 Trees installed on roof decks or in planters may require special stabilization methods.
- 3.14.13 Except where stabilization of plants is directed to remain in place for longer periods due to special considerations, tree ties, stakes, guys etc. shall be removed one year after installation. In some cases (e.g., street trees), stakes might be left in place to protect the trees, but ties shall be removed.

### **3.15 Winter Wrapping**

- 3.15.1 Install Burlap wrap on conifers deemed susceptible to wind stresses between mid-November and mid-December and remove by mid-April.

**END OF SECTION**

**1 . GENERAL**

**1.1 Scope Of Work**

- 1.1.1 Provide all equipment, material and labour for the maintenance of trees, shrubs, and perennials to fulfil the requirements for the plant material warranty.
- 1.1.2 Work includes supply and install of plant replacements, weeding, watering, organic pest and disease control, growth control, organic fertilizing, cultivation, pruning, plant protection and mulching. This shall include all planted materials and replacement plant materials.
- 1.1.3 Prepare a maintenance schedule.
- 1.1.4 Prepare and submit monthly Maintenance Reports.

**1.2 Workmanship**

- 1.2.1 All work shall at least conform to the rules and custom of best trade practices; to be executed by skilled tradesmen well equipped and adequately supervised and performed in accordance with these guidelines.

**1.3 Supervision**

- 1.3.1 Supervisors shall have practical experience and knowledge of plant material, organic pest and disease control.

**1.4 Related Sections**

- 1.4.1 Section 32 93 10 – Planting

**1.5 References**

- 1.5.1 ANSI Z-133-1; American Standards for Tree Care Operations.
- 1.5.2 ANSI A-300; International Society of Arboriculture Best Management Practices - Tree Pruning Guidelines.
- 1.5.3 Landscape Ontario Horticultural Trades Association, Landscape Standards.

**1.6 Duration**

- 1.6.1 Landscape maintenance shall commence upon date of substantial completion and continue for two (2) full years following that date. Contractor is responsible for completion of all warranty deficiencies beyond the warranty end date if needed.

**1.7 Notification**

- 1.7.1 Notify the Consultant/Owner before undertaking pruning, and if any disease or insect problems arise.

---

## **2 . MAINTENANCE OF PLANTED AREAS**

### **2.1 Warranty Maintenance**

- 2.1.1 Provide all necessary maintenance to ensure the establishment and vigor of the plant material. This includes additional watering, watering at freeze up, treatments of disease or infestations within the City of Guelph pesticide use regulations, installing additional mulch to meet specified depths, maintaining all stakes, guys and rodent protection, and any other measures necessary to achieve the required plant health.
- 2.1.2 Remove all stakes, guards, guy wires, etc., remaining on plant material at end of warranty period, (the Consultant to inform the Contractor in writing if conditions warrant an extension on staking). If stakes are deemed necessary beyond the 2-year warranty period the Contractor will not be responsible for their removal.
- 2.1.3 Rodent guards are to remain in place at the end of the warranty period
- 2.1.4 Restore the site to original conditions from damage arising out of all replacement operations at no cost to the Owner.

### **2.2 Plant Replacements**

- 2.2.1 All plants that are dead, or not in a healthy, satisfactory growing condition, or which in any way do not meet the requirements of the specifications, shall be replaced by the Contractor at the Contractor's expense. All required replacements shall be as originally specified. Where plant material is replaced, the warranty period for the replacement shall be for two (2) years following the acceptance date of the replacement plant material. The Consultant or Owner reserves the right to extend Contractor's warranty responsibilities for an additional year if, at end of initial warranty period, plant condition is not sufficient to ensure future health. Such warranty shall not limit the Contractor's liability for defects that may arise beyond the warranty period.
- 2.2.2 All plant materials shall be reviewed at the beginning of each month from May to September in each year of warranty. Replacements shall be completed within 30 days of receipt of review reports outlining deficiencies.

### **2.3 Watering**

- 2.3.1 Regular and adequate watering shall be provided in order to promote healthy plant growth. Watering shall be such that the water penetrates the full depth of the growing medium.
- 2.3.2 It will be assumed that all plant materials shall be surface watered weekly, dependent on the occurrence of rainfall events and amounts. The Contractor is to provide a weekly watering schedule to the Consultant at the beginning of each week for coordination purposes. Scheduled applications of water shall be skipped only when rainfall has penetrated the soil fully as required and is to be communicated to the Consultant by

the Contractor for confirmation. Moisture shall be monitored to avoid overwatering or under-watering. It is the responsibility of the Contractor to ensure that the plant material does not become stressed in dry periods. Should plant materials die due to these dry conditions, the Contractor will be responsible for replacement, per the warranty obligations.

- 2.3.3 During extended periods of high temperatures and drought, additional watering may be required to promote plant establishment and healthy plant growth. It is the responsibility of the Contractor to ensure plant material does not become stressed in dry periods.

## **2.4 MAINTENANCE OF Planted Areas and Weed Control**

- 2.4.1 All planted areas including the base of all trees, shall have weeds removed on a regular basis. Frequency is expected to be at least once per month through the growing season.
- 2.4.2 Where and when applicable, bark mulch should be replaced, repaired or increased to the specified depth when required by erosion, decay, cultivation or vandalism.
- 2.4.3 Tree soil saucers shall be maintained to proper shape and depth.

## **2.5 Insect, Pest and Disease Control**

- 2.5.1 Contractor shall be responsible for detection, recognition and timely control of plant pests and diseases. Contractor shall have an up-to-date knowledge of the most effective integrated pest management practices, together with the ability to diagnose ailments. All equipment shall be in first class operating condition, completely free of any chemical residual from previous use.

## **2.6 Fertilizing**

- 2.6.1 It shall be the responsibility of the Contractor to maintain an adequate level of soil fertility through the application of suitable certified organic complete formulae fertilizers, together with control of soil acidity where and as required. Lime shall be applied to plant areas where acidity is excessive (i.e. below pH 4.5). No lime shall be applied where specific planting requires an acid condition.
- 2.6.2 Adding fertilizer to newly planted trees that are subjected to transplanting and drought stress may be ineffective for root production and can promote soft growth. If transplanted trees are fertilized, only slow-release fertilizer with  $\geq 50$  % water-insoluble nitrogen should be used. Fertilizer shall only be applied in order to correct nutrient deficiencies as required and included under this Item. Fertilizer application shall be subject to approval by the Consultant and shall be applied as per manufacturer's specifications.

---

**2.7     Protection of Trees**

2.7.1 All trees shall be protected against wind and snow damage by adequate staking, guying, tying or wrapping as conditions require. Guys, wire ties and stakes shall be examined at frequent intervals, and adjustments or renewals made to prevent abrasions or other damage to plants.

**2.8     Pruning**

2.8.1 Pruning shall be carried out in order to mitigate hazards, remove dead or broken branches or to ensure proper plant form, structure, vigour and restriction of disease.

2.8.2 Pruning shall be carried out in accordance with current International Society of Arboriculture Best Management Practices (ANSI A300).

2.8.3 Tools shall be sterilized after use on each plant to avoid transmission of disease from one plant to another

**3 .     EXECUTION**

**3.1     Schedule And Maintenance Records**

3.1.1 Work Schedule:

.1 Provide a preliminary schedule to the Consultant for review and approval outlining the maintenance tasks outlined in this Section to be undertaken through each year of the warranty period. These shall include as a minimum: fall/spring clean-up, garbage clean-up, pruning, weeding and watering. It is understood that disease/pest control and fertilizing cannot be scheduled.

3.1.2 Maintenance Reports:

.1 The Contractor shall prepare and provide to the Consultant and Owner monthly maintenance reports. Reports to be submitted within five (5) days after month's end.

.2 Submit a sample format of the monthly maintenance report to the Consultant at the beginning of project construction for review and approval.

.3 Each report shall indicate at minimum project name, date of site visits, areas of work, description of tasks completed, materials used, and outline of future work required, to indicate compliance with these specifications. Lack of information shall infer non-compliance and where there is no evidence of recorded work, this shall have a direct bearing on responsibilities.

**END OF SECTION**

**1. GENERAL****1.1 Summary**

- 1.1.1 Provide labour, materials, products, equipment and services to complete the installation of domestic watermain and appurtenances including inspection and testing.

**1.2 Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.3 References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

**1.4 Waste Management and Disposal**

- 1.4.1 Comply with the waste management plan developed by the Contractor for the Work in accordance with Section 01 74 00. Comply with the directions of the Contract Administrator regarding waste management and disposal activities.
- 1.4.2 Remove from site and dispose of packaging materials at appropriate recycling facilities.
- 1.4.3 Collect and separate for disposal paper, plastic, polystyrene, corrugated cardboard, packaging material in appropriate on-site bins for recycling in accordance with Waste Management Plan.
- 1.4.4 Separate for reuse and recycling and place in designated containers Steel, Metal, Plastic waste in accordance with Waste Management Plan.
- 1.4.5 Place materials defined as hazardous or toxic in designated containers.
- 1.4.6 Handle and dispose of hazardous materials in accordance with the CEPA, TDGA, Regional and Municipal regulations.

- 1.4.7 Ensure emptied containers are sealed and stored safely.
- 1.4.8 Divert unused metal and wiring materials from landfill to metal recycling facility as approved by Consultant.
- 1.4.9 Divert unused concrete materials from landfill in accordance with Waste Management Plan.
- 1.4.10 Dispose of unused asbestos cement pipe in accordance with regulations governing disposal of hazardous materials.
- 1.4.11 Divert unused aggregate materials from landfill in accordance with Waste Management Plan.
- 1.4.12 Dispose of unused disinfection material at official hazardous material collections site in accordance with Waste Management Plan
- 1.4.13 Do not dispose of unused disinfection material into sewer system, into streams, lakes, onto ground or in other location where they will pose health or environmental hazard.
- 1.4.14 Fold up metal banding, flatten and place in designated area for recycling.

## **2 . PRODUCTS**

### **2.1 Materials**

- 2.1.1 All material for watermain, hydrants and appurtenances, shall be according to the Region of Peel material/manufacture specifications as required by Section 3, Materials from Standard Specifications for Watermains.
- 2.1.2 PVC watermains shall be minimum DR 18 Class 235 (AWWA) C900-07 or Molecularly Oriented Polyvinyl Chloride (PVCO) pipes ranging in size from 100 mm to 300 mm in diameter pressure class 235 AWWA C909-09. PVC pipes ranging in size from 350 mm through 600 mm in diameter, shall be pressure rating 235, DR 18, according to AWWA C905-10.
- 2.1.3 Embedment material for flexible pipe shall be according to OPSD 802.010 and using Granular A according to OPSS.MUNI 1010 and compacted to minimum 98% of maximum dry density.
- 2.1.4 Minimum cover on watermains shall be 1.7 m.
- 2.1.5 All hydrants shall be constructed according to Section W.4.11 of the Region of Peel Standard Specifications for Watermains.
- 2.1.6 Hydrant Leads shall be minimum DR 18 Class 235 (AWWA) C900-07 or pressure Class 235 AWWA C909-09.

- 
- 2.1.7 All service connections shall be constructed according to W.4.13, W.4.15, W.4.16 of the Region of Peel Standard Specifications for Watermains.
  - 2.1.8 All curb and valve boxes to be located at street line.
  - 2.1.9 Mechanical thrust restraints shall be installed at all fittings, bends, tees, crosses, reducers and valves for all watermain sizes. Mechanical restraints at joints shall be installed at every pipe joint 6.1 m of either side of the valve for watermains 100 mm diameter or larger.
  - 2.1.10 All tees, plugs, horizontal, vertical bends, reducers and hydrants to have concrete thrust blocks according to W.4.6 of the Region of Peel Standard Specifications for Watermains and Region of Peel STD DWG 1-5-4 thru 1-5-7.
  - 2.1.11 Watermains must follow the Ontario Ministry of the Environment Procedure F-6-1 that governs the separation of sewers and watermains. A minimum vertical clearance of 0.30 m when crossing over and 0.5 m when crossing under sewers and all other utilities is required. Must also maintain 2.5 m horizontal separation with sewers.
  - 2.1.12 All valves less than 400 mm will be in a valve box according to Section W.4.10 of the Region of Peel Standard Specifications for Watermains. All valves 400 mm and larger shall be in a chamber.
  - 2.1.13 Corrosion protection systems shall be installed on all metallic pipes and appurtenances, water services and fittings according to Section W.3.1 of the Region of Peel Standard Specifications for Watermains
  - 2.1.14 Tracer wire installation shall be according to Section W.4.7 of the Region of Peel Standard Specifications for Watermains.
  - 2.1.15 Hydrostatic pressure test and leakage testing of the watermain shall be according to Section W.5.11 of the Region of Peel Standard Specifications for Watermains.
  - 2.1.16 The new watermain shall be isolated until bacteriological tests are satisfactory completed.
  - 2.1.17 Watermains 50mm in diameter are to be flushed and sampled only and do not require chlorination per Section W.5.3 of the Region of Peel Standard Specifications for Watermains.
  - 2.1.18 Disinfection of the watermain shall be according to Section W.5.3 of the Region of Peel Standard Specifications for Watermains and shall include all new water services larger than 50 mm diameter and larger.
  - 2.1.19 Regional in-service water valves, curb stops, fire hydrants can only be operated by Region of Peel staff.

- 
- 2.1.20 Tracer wire shall be installed on all PVC watermain per Section W.4.7 of the Region of Peel Standard Specifications for Watermains and shall be RWU90, AWG N0 10 single or seven strand, insulated copper wire with 60 mil of black, cross-linked polyethylene (XLPE) insulation specifically manufactured for direct burial applications.
- 2.1.21 All valve boxes on watermains less than 400 mm in diameter will be 130 mm regular style, sliding type box with guide plate and with 184 mm diameter cover. Valve boxes shall be Mueller Canada MVB – Bottom section only, or Bibby-Ste-Croix VB2200.
- 2.1.22 All valve boxes on watermains less than or equal to 300 mm in diameter will be 105 mm regular style, sliding type box with guide plate and with 149 mm diameter cover. Valve boxes shall be Mueller Canada MVB – Bottom section only, or Bibby-Ste-Croix VB1200.
- 2.1.23 Hydrants shall be; AVK Model 2780, Canada Valve Century, Clow-McAvery Brigadier M67, Mueller Modern Centurion. All hydrants shall be according to AWWA C502-05 and NSF/ANSI 61 for dry barrel hydrants and open counter clockwise. Hydrants will have tapped drain ports, 150 mm mechanical joint inlet with brass-to-brass fittings on the main valve seat, two 63.5 mm hose nozzles spread 180 degrees apart and a 114.3 mm pumper nozzle with a 100 mm ULC S543 approved Storz connection. Hydrants will be connected to the watermain using a 150 mm lead, 150 mm gate valve and anchor tee. Hydrants will be supplied for a minimum bury depth of 1.7 metres. Hydrant extensions required to adjust the length of the hydrant barrel are to be obtained from the hydrant manufacturer or approved supplier. Hydrant anti-tamper devices shall be manufactured according to Region specifications, as approved by the engineer. Hydrant paint will be high gloss exterior chrome yellow and shall be applied over a quality dry red oxide primer. Storz nozzles shall be painted black.
- 2.1.24 Watermain to be tested, flushed and disinfected in accordance with Region of Peel Standards and Specifications.

## **2.2 Watermain In Fill Areas**

- 2.2.1 Pipes are not to be laid on fill until the field density test reports have been submitted and approved by the Engineer.
- 2.2.2 Fill to be placed to a minimum of 600 mm above the watermain grades and to 3 m minimum on each side prior to watermain laying compacted to a minimum of 100% of maximum dry density in 300 mm lifts.
- 2.2.3 Soil Density shall be taken along centerline of the watermain and on lines 1.5 m on either side of the same at a maximum interval of 30 m. Tests to be taken at each 600 mm lift.

- 2.2.4 All hydrants, tees, valves, bends, plugs and each pipe joint are to be mechanically restrained.
- 2.2.5 Pipe joint deflections are not allowed.

### **3 . EXECUTION**

#### **3.1 Watermain Construction**

- 3.1.1 Install 200 mm diameter PVC watermain and connect to existing watermain as shown on the Contract Drawings.
- 3.1.2 All watermain bedding and backfill shall be in accordance with Section W.3.3, W.4.2 and W.4.3 of the Region of Peel Standard Specifications for Watermains.
- 3.1.3 The Contractor is advised that pursuant to an order issued by the Ontario Ministry of the Environment and Climate Change, all wet taps performed on Region watermains must be performed by, or under the supervision of, a Certified Operator in accordance with Ontario Regulation 128/04. The Region of Peel Standards respecting the performance and verification of wet taps shall be followed.

#### **3.2 Separation and Depth**

- 3.2.1 The top of all watermains shall be a minimum of 1.7 m below the finished grade.
- 3.2.2 Utility separation shall be according to Section 2.6 of the Region of Peel Watermain Design Criteria.
- 3.2.3 At all locations where the proposed watermain crosses under or above the existing sewers, or utilities, granular A bedding material is to extend from the lower pipe to the top of the upper pipe. Granular A to be compacted to minimum 98% of Maximum Dry Density.
- 3.2.4 Contractor to provide adequate support during construction between the new watermain and existing gas mains. Maintain 300 mm minimum vertical clearance between the new watermain and existing gas mains less than 300 mm in diameter. Maintain 600 mm minimum vertical clearance between the new watermain and existing gas mains equal to or greater than 300 mm in diameter.

#### **3.3 Testing On New Mains and Services**

- 3.3.1 All testing of new and existing watermains and service connections including cleaning, disinfection, hydro-static testing and sampling shall be carried out in accordance with the Region of Peel testing procedures described in section W.5.1 of the Region of Peel Standard Specifications for Watermains.

---

**3.4 Management of Excess Material**

- 3.4.1 Management of excess material shall be according to the Contract Documents.
- 3.4.2 All chlorinated water used for testing, flushing, or disinfecting watermains shall be disposed of safely.
- 3.4.3 The method of disposal of chlorinated water is subject to the approval of the Consultant.

**3.5 Work Within the Municipal Right Of Way**

- 3.5.1 Obtain a Road Occupancy Permit from the Region of Peel for works within the Dixie Road Right-of-Way.
- 3.5.2 Obtain a Road Occupancy Permit from the City of Brampton for works within the Dockstader Road Right-of-Way.
- 3.5.3 During the construction of watermain / services or sewer/ laterals close to an existing transmission watermain, Contractor to notify the Region of Peel at 905-791-7800 at Least 48 Hours Prior to Construction.
- 3.5.4 All work within the Region's Right-of-Way shall be constructed according to the latest Region of Peel Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the Region of Peel, be used where no Region standard or specification is available.
- 3.5.5 All work within the City's Right-of-Way shall be constructed according to the latest City of Brampton Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the City, be used where no City standard or specification is available.
- 3.5.6 All work shall be completed according to the current Occupational Health and Safety Act and Regulations for Construction Projects. The General Contractor shall be deemed to be the Constructor as Defined in the Act.
- 3.5.7 All temporary Traffic Control and Signage during construction shall be according to the current Ontario Traffic Manual Book 7: Temporary Conditions Field Edition.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Summary

- 1.1.1 Provide labour, materials, products, equipment and services to complete the construction of 200 mm diameter firemain and disinfection.

### 1.2 Related Requirements

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

### 1.3 References

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

### 1.4 Waste Management and Disposal

- 1.4.1 Comply with the waste management plan developed by the Contractor for the Work in accordance with Section 01 74 00. Comply with the directions of the Contract Administrator regarding waste management and disposal activities.
- 1.4.2 Remove from site and dispose of packaging materials at appropriate recycling facilities.
- 1.4.3 Collect and separate for disposal paper, plastic, polystyrene, corrugated cardboard, packaging material in appropriate on-site bins for recycling in accordance with Waste Management Plan.
- 1.4.4 Separate for reuse and recycling and place in designated containers Steel, Metal, Plastic waste in accordance with Waste Management Plan.
- 1.4.5 Place materials defined as hazardous or toxic in designated containers.
- 1.4.6 Handle and dispose of hazardous materials in accordance with the CEPA, TDGA, Regional and Municipal regulations.

- 1.4.7 Ensure emptied containers are sealed and stored safely.
- 1.4.8 Divert unused metal and wiring materials from landfill to metal recycling facility as approved by Consultant.
- 1.4.9 Divert unused concrete materials from landfill in accordance with Waste Management Plan.
- 1.4.10 Dispose of unused asbestos cement pipe in accordance with regulations governing disposal of hazardous materials.
- 1.4.11 Divert unused aggregate materials from landfill in accordance with Waste Management Plan.
- 1.4.12 Dispose of unused disinfection material at official hazardous material collections site in accordance with Waste Management Plan
- 1.4.13 Do not dispose of unused disinfection material into sewer system, into streams, lakes, onto ground or in other location where they will pose health or environmental hazard.
- 1.4.14 Fold up metal banding, flatten and place in designated area for recycling.

## 2 . **PRODUCTS**

### 2.1 **Materials**

- 2.1.1 All material for watermain, hydrants and appurtenances, shall be according to the Region of Peel material/manufacture specifications as required by Section 3, Materials from Standard Specifications for Watermains.
- 2.1.2 Minimum 300 mm diameter firemain shall be polyvinyl chloride (PVC) SDR 18.
- 2.1.3 Hydrants shall be; AVK Model 2780, Canada Valve Century, Clow-McAvity Brigadier M67, Mueller Modern Centurion. All hydrants shall be according to AWWA C502-05 and NSF/ANSI 61 for dry barrel hydrants and open counter clockwise. Hydrants will have tapped drain ports, 150 mm mechanical joint inlet with brass-to-brass fittings on the main valve seat, two 63.5 mm hose nozzles spread 180 degrees apart and a 114.3 mm pumper nozzle with a 100 mm ULC S543 approved Storz connection. Hydrants will be connected to the watermain using a 150 mm lead, 150 mm gate valve and anchor tee. Hydrants will be supplied for a minimum bury depth of 1.8 metres. Hydrant extensions required to adjust the length of the hydrant barrel are to be obtained from the hydrant manufacturer or approved supplier. Hydrant anti-tamper devices shall be manufactured according to Region specifications, as

approved by the engineer. Hydrant paint will be high gloss exterior chrome yellow and shall be applied over a quality dry red oxide primer. Storz nozzles shall be painted black.

- 2.1.4 PVC watermains shall be minimum DR 18 Class 235 (AWWA) C900-07 or Molecularly Oriented Polyvinyl Chloride (PVCO) pipes ranging in size from 100 mm to 300 mm in diameter pressure class 235 AWWA C909-09. PVC pipes ranging in size from 350 mm through 600 mm in diameter, shall be pressure rating 235, DR 18, according to AWWA C905-10.
- 2.1.5 Embedment material for flexible pipe shall be according to OPSD 802.010 and using Granular A according to OPSS.MUNI 1010 and compacted to minimum 98% of maximum dry density.
- 2.1.6 Minimum cover on watermains shall be 1.7 m.
- 2.1.7 All hydrants shall be constructed according to Section W.4.11 of the Region of Peel Standard Specifications for Watermains.
- 2.1.8 Hydrant Leads shall be minimum DR 18 Class 235 (AWWA) C900-07 or pressure Class 235 AWWA C909-09.
- 2.1.9 All service connections shall be constructed according to W.4.13, W.4.15, W.4.16 of the Region of Peel Standard Specifications for Watermains.
- 2.1.10 All curb and valve boxes to be located at street line.
- 2.1.11 Mechanical thrust restraints shall be installed at all fittings, bends, tees, crosses, reducers and valves for all watermain sizes. Mechanical restraints at joints shall be installed at every pipe joint 6.1 m of either side of the valve for watermains 100 mm diameter or larger.
- 2.1.12 All tees, plugs, horizontal, vertical bends, reducers and hydrants to have concrete thrust blocks according to W.4.6 of the Region of Peel Standard Specifications for Watermains and Region of Peel STD DWG 1-5-4 thru 1-5-7.
- 2.1.13 Watermains must follow the Ontario Ministry of the Environment Procedure F-6-1 that governs the separation of sewers and watermains. A minimum vertical clearance of 0.30 m when crossing over and 0.5 m when crossing under sewers and all other utilities is required. Must also maintain 2.5 m horizontal separation with sewers.
- 2.1.14 All valves less than 400 mm will be in a valve box according to Section W.4.10 of the Region of Peel Standard Specifications for Watermains. All valves 400 mm and larger shall be in a chamber.
- 2.1.15 Corrosion protection systems shall be installed on all metallic pipes and appurtenances, water services and fittings according to

---

Section W.3.1 of the Region of Peel Standard Specifications for Watermains

- 2.1.16 Tracer wire installation shall be according to Section W.4.7 of the Region of Peel Standard Specifications for Watermains.
- 2.1.17 Hydrostatic pressure test and leakage testing of the watermain shall be according to Section W.5.11 of the Region of Peel Standard Specifications for Watermains.
- 2.1.18 The new watermain shall be isolated until bacteriological tests are satisfactory completed.
- 2.1.19 Watermains 50mm in diameter are to be flushed and sampled only and do not require chlorination per Section W.5.3 of the Region of Peel Standard Specifications for Watermains.
- 2.1.20 Disinfection of the watermain shall be according to Section W.5.3 of the Region of Peel Standard Specifications for Watermains and shall include all new water services larger than 50 mm diameter and larger.
- 2.1.21 Regional in-service water valves, curb stops, fire hydrants can only be operated by Region of Peel staff.
- 2.1.22 Tracer wire shall be installed on all PVC watermain per Section W.4.7 of the Region of Peel Standard Specifications for Watermains and shall be RWU90, AWG N0 10 single or seven strand, insulated copper wire with 60 mil of black, cross-linked polyethylene (XLPE) insulation specifically manufactured for direct burial applications.
- 2.1.23 All valve boxes on watermains less than 400 mm in diameter will be 130 mm regular style, sliding type box with guide plate and with 184 mm diameter cover. Valve boxes shall be Mueller Canada MVB – Bottom section only, or Bibby-Ste-Croix VB2200.
- 2.1.24 All valve boxes on watermains less than or equal to 300 mm in diameter will be 105 mm regular style, sliding type box with guide plate and with 149 mm diameter cover. Valve boxes shall be Mueller Canada MVB – Bottom section only, or Bibby-Ste-Croix VB1200.
- 2.1.25 Watermain to be tested, flushed and disinfected in accordance with Region of Peel Standards and Specifications.

## **2.2 Watermain in Fill Areas**

- 2.2.1 Pipes are not to be laid on fill until the field density test reports have been submitted and approved by the Engineer.
- 2.2.2 Fill to be placed to a minimum of 600 mm above the watermain grades and to 3 m minimum on each side prior to watermain laying

compacted to a minimum of 100% of maximum dry density in 300 mm lifts.

2.2.3 Soil Density shall be taken along centerline of the watermain and on lines 1.5 m on either side of the same at a maximum interval of 30 m. Tests to be taken at each 600 mm lift.

2.2.4 All hydrants, tees, valves, bends, plugs and each pipe joint are to be mechanically restrained.

2.2.5 Pipe joint deflections are not allowed.

### **3 . EXECUTION**

#### **3.1 Firemain Construction**

3.1.1 Install 200 mm diameter PVC firemain and connect to main as shown on the Contract Drawings.

3.1.2 All watermain bedding and backfill shall be in accordance with Section W.3.3, W.4.2 and W.4.3 of the Region of Peel Standard Specifications for Watermains.

3.1.3 The Contractor is advised that pursuant to an order issued by the Ontario Ministry of the Environment and Climate Change, all wet taps performed on Region watermains must be performed by, or under the supervision of, a Certified Operator in accordance with Ontario Regulation 128/04. The Region of Peel Standards respecting the performance and verification of wet taps shall be followed.

#### **3.2 Separation and Depth**

3.2.1 The top of all firemains shall be a minimum of 1.7 m below the finished grade.

3.2.2 Utility separation shall be according to Section 2.6 of the Region of Peel Watermain Design Criteria.

3.2.3 At all locations where the proposed watermain crosses under or above the existing sewers, or utilities, granular A bedding material is to extend from the lower pipe to the top of the upper pipe. Granular A to be compacted to minimum 98% of Maximum Dry Density.

3.2.4 Contractor to provide adequate support during construction between the new watermain and existing gas mains. Maintain 300 mm minimum vertical clearance between the new watermain and existing gas mains less than 300 mm in diameter. Maintain 600 mm minimum vertical clearance between the new watermain and existing gas mains equal to or greater than 300 mm in diameter.

---

**3.3 Testing On New Mains and Services**

3.3.1 See section 33 11 16 Site Water Utility Distribution Piping.

**3.4 Work Within the Municipal Right Of Way**

3.4.1 Obtain a Road Occupancy Permit from the Region of Peel for works within the Dixie Road Right-of-Way.

3.4.2 Obtain a Road Occupancy Permit from the City of Brampton for works within the Docksteader Road Right-of-Way.

3.4.3 During the construction of watermain / services or sewer/ laterals close to an existing transmission watermain, Contractor to notify the Region of Peel at 905-791-7800 at Least 48 Hours Prior to Construction.

3.4.4 All work within the Region's Right-of-Way shall be constructed according to the latest Region of Peel Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the Region of Peel, be used where no Region standard or specification is available.

3.4.5 All work within the City's Right-of-Way shall be constructed according to the latest City of Brampton Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the City, be used where no City standard or specification is available.

3.4.6 All work shall be completed according to the current Occupational Health and Safety Act and Regulations for Construction Projects. The General Contractor shall be deemed to be the Constructor as Defined in the Act.

3.4.7 All temporary Traffic Control and Signage during construction shall be according to the current Ontario Traffic Manual Book 7: Temporary Conditions Field Edition.

**END OF SECTION**

## 1. **GENERAL**

### 1.1 **Summary**

- 1.1.1 Provide labour, materials, products, equipment and services to complete the installation, inspection and testing of gravity sanitary sewers and appurtenances.
- 1.1.2 Also included in this Section are closed circuit video inspections of as-constructed sewers as per OPSS.MUNI 409.

### 1.2 **Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

### 1.3 **References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

### 1.4 **Submittals**

- 1.4.1 Upon completion, submit a Certificate of Conformance sealed by a Qualification Verification Engineer to confirm that the following is in general conformance with the requirements of the Contract Documents:
  - .1 Work
  - .2 Material and Installations
  - .3 Inspection, testing, and test results

### 1.5 **Waste Management and Disposal**

- 1.5.1 Comply with the waste management plan developed by the Contractor for the Work in accordance with Section 01 74 00. Comply with the directions of the Contract Administrator regarding waste management and disposal activities.
- 1.5.2 Remove from site and dispose of packaging materials at appropriate recycling facilities.

- 
- 1.5.3 Collect and separate for disposal paper, plastic, polystyrene, corrugated cardboard, packaging material in appropriate on-site bins for recycling in accordance with Waste Management Plan.
  - 1.5.4 Separate for reuse and recycling and place in designated containers Steel, Metal, Plastic waste in accordance with Waste Management Plan.
  - 1.5.5 Place materials defined as hazardous or toxic in designated containers.
  - 1.5.6 Handle and dispose of hazardous materials in accordance with the CEPA, TDGA, Regional and Municipal regulations.
  - 1.5.7 Ensure emptied containers are sealed and stored safely.
  - 1.5.8 Divert unused metal and wiring materials from landfill to metal recycling facility as approved by Consultant.
  - 1.5.9 Divert unused concrete materials from landfill in accordance with Waste Management Plan.
  - 1.5.10 Dispose of unused asbestos cement pipe in accordance with regulations governing disposal of hazardous materials.
  - 1.5.11 Divert unused aggregate materials from landfill in accordance with Waste Management Plan.
  - 1.5.12 Dispose of unused disinfection material at official hazardous material collections site in accordance with Waste Management Plan
  - 1.5.13 Do not dispose of unused disinfection material into sewer system, into streams, lakes, onto ground or in other location where they will pose health or environmental hazard.
  - 1.5.14 Fold up metal banding, flatten and place in designated area for recycling.

## **2 . PRODUCTS**

### **2.1 Materials**

- 2.1.1 All material for sewer and appurtenances shall be according to Region of Peel material/manufacture specifications as required by Section S.3, Standard Specifications for Sanitary Sewers.
- 2.1.2 All polyvinyl chloride (PVC) sanitary sewer pipes and fittings shall conform to CSA B182.1 or CSA B182.2. All PVC sanitary sewer pipe shall have a maximum standard dimension ratio of 35 (SDR-35) and a minimum pipe stiffness of 320 kPa and shall be green in colour or any other color, but not white or blue.
- 2.1.3 Embedment material for flexible pipe shall be according to OPSD 802.010 and using Granular A native or Granular A RCM according

to OPSS 1010 and compacted to minimum 98% of maximum dry density.

- 2.1.4 Bedding for rigid pipe shall be class B bedding material according to OPSD 802.031 and using Granular A native or Granular A RCM bedding material according to TS 1010 and compacted to minimum 98% of maximum dry density.
- 2.1.5 Ultra-rib pipe is not permitted within the municipal right-of-way.
- 2.1.6 Maintenance holes shall be according to OPSD 701.010 (1200 mm), OPSD 701.011 (1500 mm), OPSD 701.012-1 (1800 mm) or OPSD 701.013 (2400 mm). Frame and cover shall be according to OPSD 401.010 Type A closed.
- 2.1.7 Maintenance hole chamber openings must be located on the upstream side of the maintenance hole.
- 2.1.8 Benching details shall be according to OPSD 701.021 or as shown on the drawings.
- 2.1.9 Sanitary maintenance holes shall have watertight frames and covers in ponding areas according to OPSD 401.030.
- 2.1.10 Reinforced concrete pipe shall be minimum 65-D, Height of fill to be verified using OPSD tables 807.010 and 807.030.
- 2.1.11 Non-reinforced concrete pipe 150 mm to 250 mm shall be Class 3. Height of fill to be verified using OPSD tables 807.040.
- 2.1.12 Connection detail for sewer pipe at maintenance holes shall be according to OPSD 708.020.
- 2.1.13 The minimum pipe size for sanitary sewer pipes shall be 200 mm diameter
- 2.1.14 Precast maintenance holes to comply with OPSS.MUNI 1351.
- 2.1.15 All manhole steps shall be in accordance with OPSD 405.010.
- 2.1.16 Ontario Concrete Pipe Association (OCPA) pre-benched manhole bases shall be used, where possible.
- 2.1.17 All sanitary manholes serving 200 mm diameter sewer pipes shall be provided with minimum 250 mm benching throughout and conform to OPSD 701.021. For manholes serving greater than 200 mm diameter sewer pipes, benching shall be to obvert.

### **3 . EXECUTION**

#### **3.1 Sanitary Sewer Construction**

- 3.1.1 Frames and covers shall be in accordance with OPSS.MUNI 1850.
- 3.1.2 Any loose fill or other unsuitable material below the pipe invert level must be removed and replaced with inorganic material compacted

to at least 95% Standard Proctor Maximum Dry Density (SPMDD) and to 98% SPMDD within 0.5m below the pipe invert level.

- 3.1.3 Minimum thickness of granular bedding below the invert of the pipes is 150mm, compacted to 98% SPMDD.
- 3.1.4 After installing the pipe on the bedding, a granular surround of approved cover material shall extend at least 300mm above the obvert of the pipe compacted to 98% SPMDD.
- 3.1.5 All sanitary manhole excavations shall be backfilled with Granular 'B' compacted to 98% Standard Proctor Maximum Dry Density (SPMDD).
- 3.1.6 All sanitary sewer excavations shall be backfilled with select on-site excavated organic free silty clay fill as approved by the Geotechnical Engineer, Granular 'B', or approved equivalent. Select on-site fill shall be placed in maximum 300mm thick layers at or near optimum moisture content (2%) to at least 98% SPMDD.
- 3.1.7 The sanitary sewer installation to be in V-trench and supported excavation.
- 3.1.8 Sanitary sewer service connections from the proposed building shall be installed at a minimum of 0.5% positive grade to the mainline storm sewer. Sanitary service connection pipe to be fitted with approved rubber gasket joints.
- 3.1.9 Where water bearing sand or silt occur, the sanitary sewer bedding shall consist of 20 mm crusher run limestone and the sanitary sewer joints shall be leak-proof, or wrapped with a water-proof membrane to prevent subgrade migration through leaky joints resulting from inadvertent faulty installation. The necessity for implementing these measures shall be assessed by the Geotechnical Engineer at the time of trench excavation.
- 3.1.10 Utility separation shall be according to Section 3.4.2 of the Region of Peel Linear Wastewater Standards.

### **3.2 Manhole Adjustment**

- 3.2.1 Install and adjust manhole frames and grates of the existing and proposed manholes to match the proposed grading design, in accordance with OPSD 704.010.

### **3.3 Inspection And Testing**

- 3.3.1 All proposed sanitary sewer pipes will be inspected by the Consultant upon delivery. Those pieces not conforming to the requirements of the Specification will be rejected and must be immediately removed by the Contractor, who shall furnish all labour necessary to assist the Consultant or inspectors in inspecting the material.

- 3.3.2 All PVC sanitary sewer pipes shall pass a mandrel test (ring test) to confirm the proper pipe installation after the completion of backfilling on the pipe to the proposed finished grade or road elevation, prior to road or parking construction.
- 3.3.3 Video camera inspection of sanitary sewer is required as a condition of Substantial Performance and again at the end of the maintenance period, in accordance with OPSS.MUNI 409.

### **3.4 Coordination With City of Brampton**

- 3.4.1 The City's 250 mm sanitary sewer shall be exposed by hydro vac prior to installation of the proposed sewer connection.
- 3.4.2 A Region's construction administrator must be present on site to witness works related to the crossing of the Regional or City of Brampton Sewer sewer. Provide advance notice of 48 hours.

### **3.5 Work Within The Municipal Right-Of-Way**

- 3.5.1 Obtain a Road Occupancy Permit from the Region of Peel for works within the Dixie Road Right-of-Way.
- 3.5.2 Obtain a Road Occupancy Permit from the City of Brampton for works within the Dockstader Road Right-of-Way.
- 3.5.3 During the construction of watermain / services or sewer/ laterals close to an existing transmission watermain, Contractor to notify the Region of Peel at 905-791-7800 at Least 48 Hours Prior to Construction.
- 3.5.4 All work within the Region's Right-of-Way shall be constructed according to the latest Region of Peel Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the Region of Peel, be used where no Region standard or specification is available.
- 3.5.5 All work within the City's Right-of-Way shall be constructed according to the latest City of Brampton Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the City, be used where no City standard or specification is available.
- 3.5.6 All work shall be completed according to the current Occupational Health and Safety Act and Regulations for Construction Projects. The General Contractor shall be deemed to be the Constructor as Defined in the Act.
- 3.5.7 All temporary Traffic Control and Signage during construction shall be according to the current Ontario Traffic Manual Book 7: Temporary Conditions Field Edition.

---

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Summary

- 1.1.1 Provide labour, materials, products, equipment and services to complete the installation and testing necessary for the installation of gravity storm sewers, fittings, drain connections, manholes, frame and covers, safety grates catchbasins, oil grit separators, appurtenances, and connection with the existing storm sewer system.
- 1.1.2 Also included in this Section are closed circuit video inspections of as-constructed sewers as per OPSS.MUNI 409.

### 1.2 Related Requirements

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

### 1.3 References

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

### 1.4 Submittals

- 1.4.1 Contractor shall provide shop drawings for all manholes over 3600 mm diameter and all cast-in-place manholes.
- 1.4.2 Oil grit separators:
  - .1 Calculation for average annual total suspended solids (TSS) removal. Supporting calculations shall be stamped by a Professional Engineer licensed in the Province of Ontario.
  - .2 Alternative devices shall have features identical to or greater than the specified device, including: treatment chamber diameter, treatment chamber wet volume, sediment storage volume, and oil storage volume.

.3 Hydraulic report that verifies the system weir is sized correctly for the treatment flow rate and in addition, indicates the effect the OGS has on the hydraulic grade line.

.4 Manufacturer report estimating the OGS' maintenance frequency

## **1.5 Waste Management and Disposal**

- 1.5.1 Comply with the waste management plan developed by the Contractor for the Work in accordance with Section 01 74 00. Comply with the directions of the Contractor Administrator regarding waste management and disposal activities.
- 1.5.2 Remove from site and dispose of packaging materials at appropriate recycling facilities.
- 1.5.3 Collect and separate for disposal paper, plastic, polystyrene, corrugated cardboard, packaging material in appropriate on-site bins for recycling in accordance with Waste Management Plan.
- 1.5.4 Separate for reuse and recycling and place in designated containers Steel, Metal, Plastic waste in accordance with Waste Management Plan.
- 1.5.5 Place materials defined as hazardous or toxic in designated containers.
- 1.5.6 Handle and dispose of hazardous materials in accordance with the CEPA, TDGA, Regional and Municipal regulations.
- 1.5.7 Ensure emptied containers are sealed and stored safely.
- 1.5.8 Divert unused metal and wiring materials from landfill to metal recycling facility as approved by Consultant.
- 1.5.9 Divert unused concrete materials from landfill in accordance with Waste Management Plan.
- 1.5.10 Dispose of unused asbestos cement pipe in accordance with regulations governing disposal of hazardous materials.
- 1.5.11 Divert unused aggregate materials from landfill in accordance with Waste Management Plan.
- 1.5.12 Dispose of unused disinfection material at official hazardous material collections site in accordance with Waste Management Plan.
- 1.5.13 Do not dispose of unused disinfection material into sewer system, into streams, lakes, onto ground or in other location where they will pose health or environmental hazard.
- 1.5.14 Fold up metal banding, flatten and place in designated area for recycling.

---

**2 .            PRODUCTS****2.1        Materials**

- 2.1.1 All material for sewer and appurtenances shall be according to Region of Peel material/manufacture specifications as required by Section S.3, Standard Specifications for Sanitary Sewers.
- 2.1.2 All polyvinyl chloride (PVC) storm sewer pipes and fittings shall conform to CSA B182.1 or CSA B182.2. All PVC storm sewer pipe shall have a maximum standard dimension ratio of 35 (SDR-35) and a minimum pipe stiffness of 320 kPa. Storm sewers (mainline pipe) shall be green in colour while service connection pipe shall be white in colour.
- 2.1.3 Embedment material for flexible pipe shall be according to OPSD 802.010 and using Granular A native or Granular A RCM according to TS 1010 and compacted to minimum 98% of maximum dry density.
- 2.1.4 Bedding for rigid pipe shall be class B bedding material according to OPSD 802.031 and using Granular A native or Granular A RCM bedding material according to TS 1010 and compacted to minimum 98% of maximum dry density.
- 2.1.5 Ultra-rib pipe is not permitted within the municipal right-of-way.
- 2.1.6 Maintenance holes shall be according to OPSD 701.010 (1200 mm), OPSD 701.011 (1500 mm), OPSD 701.012-1 (1800 mm) or OPSD 701.013 (2400 mm). Frame and cover shall be according to OPSD 401.010 Type A closed.
- 2.1.7 Maintenance hole chamber openings must be located on the upstream side of the maintenance hole.
- 2.1.8 Benching details shall be according to OPSD 701.021 or as shown on the drawings.
- 2.1.9 Reinforced concrete pipe shall be minimum 65-D, Height of fill to be verified using OPSD tables 807.010 and 807.030.
- 2.1.10 Non-reinforced concrete pipe 150 mm to 250 mm shall be Class 3. Height of fill to be verified using OPSD tables 807.040.
- 2.1.11 Single Catchbasins shall be according to OPSD 705.010 complete with goss trap, where specified. Frame and cover shall be according to OPSD 400.070.
- 2.1.12 Double Catchbasin shall be according to OPSD 705.020 complete with goss trap, where specified.
- 2.1.13 Catchbasin leads to be 250 mm PVC DR 35 for single catchbasins and 300 mm PVC DR 35 for Double Catchbasins.
- 2.1.14 Connection detail for sewer pipe at catchbasins and maintenance holes shall be according to OPSD 708.020.

- 
- 2.1.15 All existing watermain and sewer pipes larger than 300 mm diameter shall be supported according to drawing OPSD 1007.01-4.
- 2.1.16 All manhole steps shall be in accordance with OPSD 405.010.
- 2.1.17 Ontario Concrete Pipe Association (OCPA) pre-benched manhole bases shall be used, where possible.
- 2.1.18 External drop structures shall be used in accordance with OPSD 1003.010 and 1003.020. Drop pipe diameter shall be one size less than sewer to a minimum pipe size of 450 mm diameter and shall be connected to the mainline storm sewer with tee or wye connection.
- 2.1.19 OGS 1 - Stormceptor EFO8 or approved equivalent.
- 2.1.20 Design Parameters:
- .1 Area of the site drainage into the unit is 0.76 hectares
  - .2 Imperviousness of the site is 90%
  - .3 Maximum Treatment Flow Rate 1700 L/s
  - .4 Total storage volume 12090L
  - .5 Hydrocarbon storage capacity 1070 L
  - .6 Maximum sediment capacity 8780 L

### **3 . EXECUTION**

#### **3.1 Sequencing of Construction**

- 3.1.1 Any components of the storm sewer and stormwater management system located within the site where the proposed grade is raised more than 1.5m in comparison to existing grade must be installed following the 'preload' process to allow for consolidation settlement of the weak underlying soils.
- 3.1.2 Components include all sewers, manholes, catchbasins, oil grit separators, and stormwater management facilities.

#### **3.2 Storm Sewer Construction**

- 3.2.1 During construction, all catch basins shall be equipped with temporary sediment control devices. All sediment control devices shall be removed once construction is completed.
- 3.2.2 All concrete storm sewer pipes attached to manholes shall be concrete encased from the manhole to the first pipe joint.
- 3.2.3 Any loose fill or other unsuitable material below the pipe invert level must be removed and replaced with inorganic material compacted to at least 95% Standard Proctor Maximum Dry

---

Density (SPMDD) and to 98% SPMDD within 0.5m below the pipe invert level.

- 3.2.4 Minimum thickness of granular bedding below the invert of the pipes is 150mm, compacted to 98% SPMDD.
- 3.2.5 After installing the pipe on the bedding, a granular surround of approved cover material shall extend at least 300mm above the obvert of the pipe, compacted to 98% SPMDD.
- 3.2.6 All manhole and catch basin excavations shall be backfilled with Granular 'B' compacted to 98% SPMDD.
- 3.2.7 All storm sewer excavations shall be backfilled with select on-site excavated organic free silty clay fill as approved by the Geotechnical Engineer, Granular 'B', or approved equivalent. Select on-site fill shall be placed in maximum 300mm thick layers at or near optimum moisture content (2%) to at least 98% SPMDD.
- 3.2.8 On-site excavated soils shall not be used in confined areas (around catch basins and laterals) where heavy compaction equipment cannot be operated.
- 3.2.9 All storm sewers and catch basin installation to be in V-trench and supported excavation. All services and structures located in trench cut shall be supported by compacted granular to undisturbed or structurally compacted ground.
- 3.2.10 Storm sewer service connections from the proposed building shall be installed at a minimum of 0.5% positive grade to the mainline storm sewer. Storm service connection pipe to be fitted with approved rubber gasket joints.
- 3.2.11 Where water bearing sand or silt occur, the storm sewer bedding shall consist of 20 mm crusher run limestone and the storm sewer joints shall be leak-proof or wrapped with a water-proof membrane to prevent subgrade migration through leaky joints resulting from inadvertent faulty installation. The necessity for implementing these measures shall be assessed by the Geotechnical Engineer at the time of trench excavation.
- 3.2.12 Utility separation shall be according to Section 3.4.2 of the Region of Peel Linear Wastewater Standards.

### **3.3 Manhole and Catch Basin Installation**

- 3.3.1 Install catch basins and manholes at locations indicated on the Drawings or as adjusted by the Consultant in the field prior to installation.
- 3.3.2 Construct units in accordance with details indicated, plumb and true to alignment and grade.

- 3.3.3 Pump excavation free of standing water and remove soft and foreign material before placing concrete base.
- 3.3.4 Set bottom section of precast unit in bed of cement mortar and bond to concrete slab or base. Make each successive joint watertight with the Consultant's approved rubber ring gaskets, bituminous compound, cement mortar, epoxy resin cement, or combination thereof.
- 3.3.5 Clean surplus mortar and joint compounds from interior surface of unit as work progresses.
- 3.3.6 Plug lifting holes with precast concrete plugs set in cement mortar or mastic compound.

### **3.4 Adjust Manhole and Catch Basin Adjustment**

- 3.4.1 Adjust manhole frames and grates of the existing and proposed manholes and catch basins to match the proposed grading design in accordance with OPSD 704.010.

### **3.5 OGS Installation**

- 3.5.1 Supply, place and compact 150 mm depth of 19 mm crusher run limestone base.
- 3.5.2 Supply and install oil and grit separator according to this specification.
- 3.5.3 Provide steps according to OPSD 405.020.
- 3.5.4 Provide safety platforms according to OPSD 404.020, where required.
- 3.5.5 Supply, place and compact 300 mm wide Granular B backfill all around structure, full height, above granular base material.
- 3.5.6 Backfill with Select Native Materials outside the Granular B envelope, and compact.

### **3.6 Inspection and Testing**

- 3.6.1 All proposed storm sewer pipes and catch basins will be inspected by the Consultant upon delivery. Those pieces not conforming to the requirements of the Specification will be rejected and must be immediately removed by the Contractor, who shall furnish all labour necessary to assist the Consultant or inspectors in inspecting the material.
- 3.6.2 All PVC storm sewer pipes shall pass a mandrel test (ring test) to confirm the proper pipe installation after the completion of backfilling on the pipe to the proposed finished grade or road elevation, prior to road or parking construction.

3.6.3 Video camera inspection of storm sewer is required as a condition of Substantial Performance and again at the end of the maintenance period, in accordance with OPSS.MUNI 409.

3.6.4 Quality Control requirements for compaction shall conform to OPSS.MUNI 501 Compacting.

### **3.7 Maintenance**

3.7.1 Contractor is responsible for performing maintenance on the oil and grit separators during warranty period following the recommendations of the supplier.

### **3.8 Work Within the Municipal Right-Of-Way**

3.8.1 Obtain a Road Occupancy Permit from the Region of Peel for works within the Dixie Road Right-of-Way.

3.8.2 Obtain a Road Occupancy Permit from the City of Brampton for works within the Dockstader Road Right-of-Way.

3.8.3 During the construction of watermain / services or sewer/ laterals close to an existing transmission watermain, Contractor to notify the Region of Peel at 905-791-7800 at Least 48 Hours Prior to Construction.

3.8.4 All work within the Region's Right-of-Way shall be constructed according to the latest Region of Peel Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the Region of Peel, be used where no Region standard or specification is available.

3.8.5 All work within the City's Right-of-Way shall be constructed according to the latest City of Brampton Standard Drawings and Specifications. Ontario Provincial Standard Drawings and Specifications may, subject to the approval of the City, be used where no City standard or specification is available.

3.8.6 All work shall be completed according to the current Occupational Health and Safety Act and Regulations for Construction Projects. The General Contractor shall be deemed to be the Constructor as Defined in the Act.

3.8.7 All temporary Traffic Control and Signage during construction shall be according to the current Ontario Traffic Manual Book 7: Temporary Conditions Field Edition.

**END OF SECTION**

**1. GENERAL****1.1 Summary**

- 1.1.1 Provide labour, materials, products, equipment and services to complete installation of Oil Grit Separator (OGS) device. Work includes supply and installation of concrete bases, precast sections, and the appropriate precast section with all internal components completely and correctly installed within the OGS device, water tight seals prior to arrival to the project site.

**1.2 Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.3 References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

**1.4 Shop drawings**

- 1.4.1 Shop drawings shall be submitted upon request with each order to the contractor then forwarded to the consulting engineer for review and acceptance. Shop drawings shall detail the precast concrete components and the precast concrete component detailing all OGS internal components pre-installed and watertight sealed at the precast facility prior to shipment, including the sequence for installation.

**1.5 Handling and Storage**

- 1.5.1 Prevent damage to materials during storage and handling.
- 1.5.2 Internal OGS device materials supplied by the Manufacturer for connection to the precast concrete shall be pre-fabricated and bolted to the precast and watertight sealed to the precast surface

prior to delivery to the project site to ensure Manufacturer's internal assembly process and quality control processes are fully adhered to, and to prevent damage to the materials on site. No exceptions will be accepted.

- 1.5.3 Follow all instructions labeled on precast concrete components during installation.

## **2. PRODUCTS**

### **2.1 General**

- 2.1.1 The separator shall be circular and constructed from the pre-cast concrete circular riser and slab components.
- 2.1.2 The concrete separator shall include a fiberglass insert bolted and sealed, watertight inside the concrete precast chamber, prior to delivery to the project site. The fiberglass insert must provide a lining for oil storage and retention as a secondary containment system within the OGS.
- 2.1.3 The separator shall be allowed to be specified as a bend or junction structure in the stormwater drainage system.
- 2.1.4 The OGS design parameters:

<b>OGS ID</b>	<b>Area (ha)</b>	<b>%- Impervious</b>	<b>OGS Type</b>	<b>OGS Model</b>
OGS 1	0.76	90%	Stormceptor STC or other accepted OGS	EFO8 or Equivalent

### **2.2 Precast Concrete Sections**

- 2.2.1 All precast concrete components shall be manufactured to a minimum live load of HS-20 truck loading or greater based on local regulatory specifications.
- 2.2.2 All precast concrete components shall be manufactured by a plant certified through the Ontario Plant Prequalification Program for the appropriate concrete products. In addition, the product must be approved through the OPS New Products Committee and listed as such with the Road Authority.
- 2.2.3 Precast bases shall be manufactured to the OPSD 701 series of specifications in accordance with its internal diameter.

**2.3 Gaskets**

- 2.3.1 Only profile neoprene or nitrile rubber gaskets in accordance to CSA A257.3-M92 will be accepted. Mastic sealants, butyl tape or Conseal CS-101 are not acceptable gasket materials.

**2.4 Frame and Cover**

- 2.4.1 Frame and covers shall be manufactured in accordance with OPSD 401.01 and shall be clearly embossed with manufacturer's product name.

**2.5 Concrete**

- 2.5.1 All concrete components shall conform to the appropriate CSA, OPSD, or ASTM specifications and shall be listed within the approved products to manufacture with the Ontario Plant Prequalification Certificate.

**2.6 Fiberglass**

- 2.6.1 The fiberglass portion of the water treatment device shall be constructed in accordance with the following standard: ASTM D-4097: Contact Molded Glass Fiber Reinforced Chemical Resistant Tanks.

**2.7 Ladders**

- 2.7.1 Ladder rungs to be provided upon request.

**2.8 Safety Grate**

- 2.8.1 A safety grate shall be installed within the chamber of the unit.

**2.9 Inspection**

- 2.9.1 All precast concrete sections shall be inspected to ensure dimensions, appearance, integrity of internal components, and quality of the product meets local municipal specifications and associated standards.

**3 . PERFORMANCE & DESIGN****3.1 General**

- 3.1.1 The OGS device shall remove oil and sediment from stormwater during frequent wet weather events and retain these pollutants within the device for later removal.

**3.2 Runoff Volume**

3.2.1 The OGS device shall be engineered, designed and sized to treat a minimum of 90 percent of the annual runoff volume determined from use of a minimum 15-year rainfall data set. Computations shall derive from widely accepted continuous simulation runoff models.

**3.3 Total Suspended Solids (TSS)**

3.3.1 The OGS device shall be capable of removing the Engineer-specified total suspended solids (TSS) load, without scouring previously captured pollutants.

**3.4 Sizing Methodology**

3.4.1 The OGS device shall be engineered, designed and sized to treat a minimum of 90 percent of the annual runoff volume using a widely accepted continuous simulation runoff model which uses rainfall data records which includes antecedent conditions as well as rainfall periods. Rainfall records should be comprised of 15-years of rainfall data or a longer continuous period if available for a given location, but in all cases at least a minimum of 5-years continuous rainfall. The Peclet Number is not an approved method or model for calculating TSS removal, sizing, or scaling OGS devices.

**1.2 Particle Size Distribution (PSD) for Sizing**

3.4.2 The OGS device shall be sized to remove the Engineer-specified total suspended sediment (TSS) load using the particle size distribution (PSD) in Table 3.5, in addition to adhering to section 3.2 of this specification. No alternative PSDs or deviations from Table 3.5 shall be accepted.

<b>1 Table 3.5 – Particle Size Distribution</b>		
<b>Particle Size Distribution to be used to size OGS</b>		
<b>Particle Diameter (Micron)</b>	<b>% by Mass of All Particles</b>	<b>Specific Gravity</b>
1000	5%	2.65
500	5%	2.65
250	15%	2.65
150	15%	2.65
100	10%	2.65
75	5%	2.65
50	10%	2.65
20	15%	2.65
8	10%	2.65
5	5%	2.65

2	5%	2.65
---	----	------

### 3.5 Verified Scour Testing

- 3.5.1 The OGS device shall have New Jersey Corporation for Advanced Technology (NJCAT) verification that the device is acceptable for on-line installation based on full-scale third-party scour testing performed with the device pre-loaded with the particle size distribution (PSD) illustrated in **TABLE 1 - Scour Test Particle Size Distribution**. Alternatively, the OGS device shall have Toronto and Region Conservation Authority (TRCA) verification of third-party scour testing performed in accordance with the Canadian ETV "Procedure for Laboratory Testing of Oil-Grit Separators."
- 3.5.2 Scour testing data from laboratory scour testing performed with the OGS device pre-loaded with a coarser PSD than the PSD shown in TABLE 1 (i.e. the coarser PSD has no particles in the 1 – 50 micron size range) shall not be acceptable for the determination of the device's suitability for on-line installation.

<b>TABLE 1 - Scour Test Particle Size Distribution<sup>1</sup></b>	
<b>Particle Size (Microns)</b>	<b>Percent by Mass of All Particles</b>
500 – 1000	5%
250 – 500	5%
100 – 250	30%
50 – 100	15%
8 – 50	25%
2 – 8	15%
1 – 2	5%
1. The Materials shall be hard, firm and inorganic with a specific gravity of 2.65. The various particle sizes shall be uniformly distributed throughout the material prior to use.	

### 3.6 Sediment Storage Capacity

- 3.6.1 Manufacturer's sediment storage capacity guidelines for the OGS device shall be confirmed by the Engineer to be adequate for the anticipated sediment loadings. Sediment loadings shall be determined by land-use and defined as a minimum of 450 kg of sediment (TSS) per impervious hectare of drainage area per year or greater as noted in the "Typical Urban Areas and Pollutant Yields (Sediment)" table below. The OGS device shall be specified as to

not require maintenance (sediment removal) more frequently than once per year.

**Typical Urban Areas and Pollutant Yields (Sediment) (Burton and Pitt, 2002)**

Pollutant	Pollutant Load by Land Use (Kg/ha/year)							
	Commercial	Parking Lot	Residential Density			Highways	Industrial	Shopping Centers
			High	Med.	Low			
TSS	1000	400	400	250	10	880	500	440

**Source: U.S. EPA Stormwater Best Management Practice Design Guide, Volume 1, Appendix D, Table D-1**

NOTE: to determine volume of adequate sediment storage capacity a bulk density of 1602 kg/m<sup>3</sup> (100 lbs/ft<sup>3</sup>) shall be applied.

**3.7 Petroleum Hydrocarbon Capture and Storage**

- 3.7.1 Petroleum hydrocarbon storage capacity in the OGS device shall be a minimum 35 gallons, or more as specified.
- 3.7.2 The OGS device internal hydrocarbon storage area shall include a minimum of 12 inches (305 mm) of double wall containment for the full circumference of the device to provide safe oil and other hydrocarbon material storage and ground water protection.

**3.8 Surface Loading Rate Scaling of Different Model Sizes**

- 3.8.1 The reference device for scaling shall be an OGS device that has been third-party laboratory tested and verified by NJCAT or TRCA. Other model sizes of the tested device shall be scaled such that the claimed TSS removal efficiency of the scaled device shall be no greater than the TSS removal efficiency of the tested device at identical **surface loading rate** (flow rate divided by settling surface area). Alternative scaling methodologies shall not be accepted without providing a minimum of three (3) full-scale third-party laboratory performance and scour testing of differing OGS model sizes. The Peclet Number is not an approved method for scaling OGS devices.

**4 . INSPECTION AND MAINTENANCE****4.1 General**

- 4.1.1 The OGS manufacturer shall provide an Owner's Manual upon request.
- 4.1.2 A Quality Assurance Plan that covers inspection and maintenance for up to 5 years shall be included with the OGS, and written into the COA.
- 4.1.3 Inspection of the OGS device, which includes determination of sediment depth and presence of petroleum hydrocarbons, shall be easily conducted from finished grade.
- 4.1.4 Sediment removal from the OGS shall be conducted using a standard maintenance truck and vacuum apparatus.
- 4.1.5 No confined space for sediment removal or inspection of screens or other internal components shall be required for normal annual inspection or maintenance activity.

**5 . EXECUTION****5.1 Concrete Installation**

- 5.1.1 The installation of the concrete OGS device should conform to state highway, provincial, or local specifications for the construction of manholes. Selected sections of a general specification that are applicable are summarized below.

**5.2 Excavation**

- 5.2.1 Excavation for the installation of the stormwater quality treatment device should conform to state highway, municipal or local specifications. Topsoil that is removed during the excavation for the stormwater quality treatment device should be stockpiled in designated areas and should not be mixed with subsoil or other materials. Topsoil stockpiles and the general site preparation for the installation of the water quality device should conform to state highway, provincial or local specifications.
- 5.2.2 The OGS device should not be installed on frozen ground. Excavation should extend a minimum of 12 inch (300 mm) from the precast concrete surfaces plus an allowance for shoring and bracing where required. If the bottom of the excavation provides an unsuitable foundation additional excavation may be required.
- 5.2.3 In areas with a high water table, continuous dewatering should be provided to ensure that the excavation is stable and free of water.

**5.3 Backfilling**

- 5.3.1 Backfill material should conform to state highway, municipal or local specifications. Backfill material should be placed in uniform layers not exceeding 12 inches (300 mm) in depth and compacted to state highway, provincial or local specifications.

**1.3 Water Quality Device (OGS) Construction Sequence**

- 5.3.2 The concrete water quality device is installed in sections in the following sequence:

- .1 aggregate base
- .2 base slab
- .3 treatment chamber section(s); shall include the internals bolted/secured to the precast walls and water tight sealed prior to arrival to the project site to ensure quality control
- .4 transition slab (if required)
- .5 bypass section
- .6 connect inlet and outlet pipes
- .7 riser section and/or transition slab (if required)
- .8 maintenance riser section(s) (if required)
- .9 frame and access cover
- .10 The precast base should be placed level at the specified grade. The entire base should be in contact with the underlying compacted granular material. Subsequent sections, complete with joint seals, should be installed in accordance with the precast concrete manufacturer's recommendations.
- .11 Adjustment of the stormwater quality treatment device can be performed by lifting the upper sections free of the excavated area, re-leveling the base, and re-installing the sections. Damaged sections and gaskets should be repaired or replaced as necessary. Once the stormwater quality treatment (OGS) device has been constructed, any lift holes must be plugged with mortar.

**5.4 Drop Pipe, Riser Pipe, And Oil Port**

- 5.4.1 Once the upper chamber has been attached to the lower chamber, the inlet drop tee, and riser pipe must be attached. If an oil port is included, this must be attached as well. Pipe installation instructions and required materials shall be provided with the insert.

**5.5 Inlet and Outlet Pipes**

- 5.5.1 Inlet and outlet pipes should be securely set into the upper chamber using grout or approved pipe seals (flexible boot connections, where

applicable) so that the structure is watertight. Non-secure inlets and outlets will result in improper performance.

**5.6 Frame and Cover or Frame and Grate Installation**

- 5.6.1 Precast concrete adjustment units should be installed to set the frame and cover at the required elevation. The adjustment units should be laid in a full bed of mortar with successive units being joined using sealant recommended by the manufacturer. Frames for the cover should be set in a full bed of mortar at the elevation specified.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Summary

- 1.1.1 Provide labour, materials, products, equipment and services to complete the installation of surface rain garden, underground storage tank, inlet structures, manholes, and outlet structures.
- 1.1.2 SWMF-1 (underground storage tank complete with outlet control structure as specified in the Contract Drawings)

### 1.2 Related Requirements

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

### 1.3 References

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

### 1.4 Abbreviations

- 1.4.1 SWMF – Stormwater Management Facilities
- 1.4.2 PP – Polypropylene
- 1.4.3 HDPE – High Density Polyethylene
- 1.4.4 PE – Polyethylene
- 1.4.5 PVC – Polyvinyl Chloride
- 1.4.6 ASTM – American Society for Testing and Materials
- 1.4.7 AASHTO – American Association of State Highway and Transportation Officials
- 1.4.8 TSS – Total Suspending Solids

### 1.5 Administrative Requirements

- 1.5.1 Preinstallation Meetings

.1 A preinstallation meeting between the general contractor and supplier representatives for both of the underground storage tanks is recommended to discuss the installation process and site constraints.

#### 1.5.2 Sequencing

.1 Any stormwater management facilities and their respective components located within the site where the proposed grade is raised more than 1.5m in comparison to existing grade must be installed following the 'preload' process to allow for consolidation settlement of the weak underlying soils. See section 31 23 23 Grade Raise and Preloading.

.2 Contractor is responsible for coordinating the installation of the subsurface drainage system with the installation of permanent structures on site.

.3 Construction loads for permanent structures may require the subsurface chamber system to be installed after the permanent structure(s) on site.

.4 Coordinate SWMF connections to on-site storm sewers

.5 Coordinate with building roof drainage systems

.6 Coordinate with other utility work.

### 1.6 **Submittals**

1.6.1 The following shall be submitted by the contractor in accordance with Section 01 33 00 Submittal Procedures:

1.6.2 Shop drawings for the underground storage tank, stamped by an Engineer, including:

.1 Access openings

.2 Ladder

.3 Watertight joints between precast units

1.6.3 Product Specifications for the following:

1.6.4

1.6.5 Infiltration chambers and end caps

1.6.6 PE pipe

1.6.7 Product Installation Instructions for the following:

1.6.8

1.6.9 Chambers and end caps

1.6.10 PE pipe

### 1.7 **Quality Assurance**

1.7.1 Qualifications

- .1 Manufacturers
- .2 Contractor to use a pre-cast box culvert
- .3 Chamber to be adequate for H-20 Highway Loading
- .4 Chamber to meet storage capacity of at least 447000 L
- .5 Chamber to include an ant-buoyancy collar

## **1.8 Delivery, Storage, and Handling**

- 1.8.1 Contractor shall check all materials upon delivery to assure that the proper culvert size and plastic pipe and pipe fittings have been received.
- 1.8.2 Contractor shall check the culverts for shipping damage prior to installation. Units that have been damaged must not be installed. Contractor shall contact culvert manufacturer immediately upon discovery of any damage. Culverts may be left palletized until the units are ready to be installed.
- 1.8.3 All culverts, pipe and pipe fittings shall be delivered to the site and unloaded with handling that conforms to the manufacturer's instructions for reasonable care.
- 1.8.4 Protect culvert and chamber fittings from dirt and damage.
- 1.8.5 All pipe and culvert shall be protected against impact, shock and free fall, and only equipment of sufficient capacity and proper design shall be used in the handling of the pipe. Storage of the pipe on the job shall be in accordance with the pipe manufacturer's recommendations.
- 1.8.6 Contractor shall refer to the fabric manufacturer's guidance handling and storage of fabric products on site.

## **2 . PRODUCTS**

### **2.1 Underground Storage Tank (SWMF1)**

- 2.1.1 SWMF1 shall be watertight and include an impermeable liner to prevent interactions with groundwater.
- 2.1.2 SWMF1 shall be installed with appropriate counter-buoyancy measures to withstand high groundwater conditions.

### **2.2 Infiltration Chamber System**

- 2.2.1 Chamber Options
  - .1 Only stormwater chamber systems evaluated by a licensed design engineer and found to meet AASHTO section 12.12 safety factors are allowed.

.2 The structural design of the chambers, the structural backfill, and the installation requirements shall ensure that the load factors specified in the AASHTO LFRD bridge design specifications, section 12.12, are met for: 1) Long-duration dead loads and 2) Short-duration live loads, based on the AASHTO design truck with consideration for impact and multiple vehicle presences.

.3 Infiltration chambers shall be designed, tested and allowable load configurations determined in accordance with ASTM F 2787, "Standard Practice for Structural Design of Thermoplastic Corrugated Wall Stormwater Collection Chambers". Load configurations shall include: 1) Instantaneous (<1 min) AASHTO design truck live load on minimum cover 2) Maximum permanent (75-yr) cover load and 3) Allowable cover with parked (1-week) AASHTO design truck.

#### 2.2.2 Performance

.1 Only chambers that are approved by the site design engineer will be allowed. Upon request by the site design engineer or owner, the chamber manufacturer shall submit a structural evaluation for approval before delivering chambers to the project site as follows:

.1 The structural evaluation shall be sealed by a registered professional engineer.

.2 The structural evaluation shall demonstrate that the safety factors are greater than or equal to 1.95 for dead load and 1.75 for live load, the minimum required by ASTM F 2787 and by sections 3 and 12.12 of the AASHTO LFRD bridge design specifications for thermoplastic pipe.

### 3. **EXECUTION**

#### 3.1 **Preparations**

##### 3.1.1 General (underground storage tank)

.1 Installing contractors are required to use and understand the latest manufacturer's installation instructions prior to beginning system installation.

.1 Chamber products must be designed and installed in accordance with the manufacturer's minimum requirements. Failure to do so will void the manufacturer's limited warranty.

.2 The contractor shall install all drainage structures, pipe and chambers in the locations shown on the design engineer's drawings. Pipe shall be of the type and sizes specified on the

drawings and shall be laid accurately to line and grade. Structures shall be accurately located and properly oriented.

.3 Chambers, pipe and drainage structures shall be inspected prior to installation and any defective or damaged product shall be replaced accordingly.

.4 Contact local underground utility companies prior to construction.

.5 The contractor must apply erosion and sediment control measures to protect the stormwater system during all phases of site construction per local codes and design engineer's specifications.

.6 Contractor to meet all manufacturer's requirements.

#### 3.1.2 Site Preparation

.1 Excavation must be free of standing water. Dewatering measures must be taken if required.

.1 When groundwater is present in the work area, dewater to maintain stability of in-situ and imported materials. Maintain water level below pipe bedding and foundation to provide a stable trench bottom.

.2 Prepare the underground storage tank and chamber bed's subgrade soil as outlined in the geotechnical engineering report. Requirement for subgrade soil bearing capacity should meet or exceed the chamber manufacturer's required allowable subgrade soil bearing capacity. The contractor must report any discrepancies with subgrade soil's bearing capacity to the geotechnical engineer.

.3 Contractor to meet all manufacturer's requirements.

### 3.2 Installation and Backfilling

3.2.1 Install chamber system flat or at constant slope between points an elevations indicated.

3.2.2 Construct fabric and stone foundation per chamber manufacturer's installation instructions.

3.2.3 See pipe manufacturer's installation instructions for pipe assembly.

3.2.4 The contractor must refer to the chamber manufacturer's installation instructions for a table of acceptable vehicle loads at various depths of cover. The contractor is responsible for preventing vehicles that exceed the chamber manufacturer's requirements from traveling across or parking over the chamber system. Temporary fencing, warning tape and appropriately located signs are commonly used to prevent unauthorized vehicles from entering sensitive construction areas.

- 
- 3.2.5 Refer to the chamber manufacturer's installation instructions for minimum requirements for backfill material above the stormwater chamber system.
  - 3.2.6 See pipe manufacturer's installation instructions for guidance on installing the plastic pipe fittings to the chamber system.
  - 3.2.7 Contractor to meet all underground tank manufacturer's requirements.

### **3.3 Protection**

- 3.3.1 Protect all inlets to the stormwater chamber system during construction.
- 3.3.2 All inlet and outlet structures should be protected against construction sediments.

### **3.4 Inspection and Maintenance**

- 3.4.1 Contractor is required to inspect and maintain the stormwater management facilities during the warranty period. Refer to the chamber manufacturer's Isolator Row Operation and Maintenance manual for guidance on inspection intervals during normal system operation.

**END OF SECTION**

**1. GENERAL****1.1 Summary**

- 1.1.1 Provide labour, materials, products, equipment, and services to complete the installation of corrugated steel pipe (CSP) culverts to grades as indicated in the Contract Documents.

**1.2 Related Requirements**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.3 References**

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.
- 1.3.4 OPSS.MUNI 421, November 2018
- 1.3.5 OPSS.MUNI 1801, November 2019

**1.4 Waste Management and Disposal**

- 1.4.1 Comply with the waste management plan developed by the Contractor for the Work in accordance with Section 01 74 00. Comply with the directions of the Contract Administrator regarding waste management and disposal activities.
- 1.4.2 Remove from site and dispose of packaging materials at appropriate recycling facilities.
- 1.4.3 Collect and separate for disposal paper, plastic, polystyrene, corrugated cardboard, packaging material in appropriate on-site bins for recycling in accordance with Waste Management Plan.
- 1.4.4 Separate for reuse and recycling and place in designated containers Steel, Metal, Plastic waste in accordance with Waste Management Plan.
- 1.4.5 Place materials defined as hazardous or toxic in designated containers.

- 
- 1.4.6 Handle and dispose of hazardous materials in accordance with the CEPA, TDGA, Regional and Municipal regulations.
  - 1.4.7 Ensure emptied containers are sealed and stored safely.
  - 1.4.8 Divert unused metal and wiring materials from landfill to metal recycling facility as approved by Consultant.
  - 1.4.9 Divert unused concrete materials from landfill in accordance with Waste Management Plan.
  - 1.4.10 Dispose of unused asbestos cement pipe in accordance with regulations governing disposal of hazardous materials.
  - 1.4.11 Divert unused aggregate materials from landfill in accordance with Waste Management Plan.
  - 1.4.12 Dispose of unused disinfection material at official hazardous material collections site in accordance with Waste Management Plan
  - 1.4.13 Do not dispose of unused disinfection material into sewer system, into streams, lakes, onto ground or in other location where they will pose health or environmental hazard.
  - 1.4.14 Fold up metal banding, flatten and place in designated area for recycling.

## **2 . PRODUCTS**

### **2.1 Materials**

- 2.1.1 Corrugated steel pipe per the standards described in OPSS.MUNI 421

## **3 . EXECUTION**

### **3.1 Installation**

- 3.1.1 Carry out the installation of the subdrainage system indicated in the Contract Documents in general conformance with OPSS.MUNI 421 and OPSS.MUNI 1801, except where the following requirements specify otherwise.
- 3.1.2 Subsection OPSS.MUNI 421.09 of OPSS.MUNI 421 shall also be amended by the addition by the following: Payment for the pipe culvert in metres shall also include the cost of supply, placement and compaction of bedding, backfill material, and existing pavement as specified.
- 3.1.3 Subsection OPSS.MUNI 421.10 of OPSS.MUNI 421 shall also be amended by the addition by the following: Payment for the pipe culvert in metres shall also include the cost of supply, placement

and compaction of bedding, backfill material, and existing pavement as specified.

## 1. GENERAL

### 1.1 Summary

- 1.1.1 Provide labour, materials, products, equipment, and services to complete the installation of perforated subdrainage pipe and fittings with granular filter and geotextile filter material to lines and grades as indicated in the Contract Documents.

### 1.2 Related Requirements

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.2.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

### 1.3 References

- 1.3.1 The latest published edition of a reference shall be applicable to this Project unless identified by a specific edition date.
- 1.3.2 All reference amendments adopted prior to the Bid Closing date of this Project shall be applicable to this Project.
- 1.3.3 All materials, installation and workmanship shall comply with all applicable requirements and standards.

### 1.4 Waste Management and Disposal

- 1.4.1 Comply with the waste management plan developed by the Contractor for the Work in accordance with Section 01 74 00. Comply with the directions of the Contract Administrator regarding waste management and disposal activities.
- 1.4.2 Remove from site and dispose of packaging materials at appropriate recycling facilities.
- 1.4.3 Collect and separate for disposal paper, plastic, polystyrene, corrugated cardboard, packaging material in appropriate on-site bins for recycling in accordance with Waste Management Plan.
- 1.4.4 Separate for reuse and recycling and place in designated containers Steel, Metal, Plastic waste in accordance with Waste Management Plan.
- 1.4.5 Place materials defined as hazardous or toxic in designated containers.
- 1.4.6 Handle and dispose of hazardous materials in accordance with the CEPA, TDGA, Regional and Municipal regulations.

- 1.4.7 Ensure emptied containers are sealed and stored safely.
- 1.4.8 Divert unused metal and wiring materials from landfill to metal recycling facility as approved by Consultant.
- 1.4.9 Divert unused concrete materials from landfill in accordance with Waste Management Plan.
- 1.4.10 Dispose of unused asbestos cement pipe in accordance with regulations governing disposal of hazardous materials.
- 1.4.11 Divert unused aggregate materials from landfill in accordance with Waste Management Plan.
- 1.4.12 Dispose of unused disinfection material at official hazardous material collections site in accordance with Waste Management Plan
- 1.4.13 Do not dispose of unused disinfection material into sewer system, into streams, lakes, onto ground or in other location where they will pose health or environmental hazard.
- 1.4.14 Fold up metal banding, flatten and place in designated area for recycling.

## **2 . PRODUCTS**

### **2.1 Materials**

- 2.1.1 Perforated subdrainage pipe, 150 mm diameter single wall corrugated (rigid) HDPE sub-drain coupled with geotextile sock shall be installed continuously under all curb and gutter.
- 2.1.2 Subdrainage pipe to be installed surrounded by 300mm of 19 mm clear stone.
- 2.1.3 Non-woven geotextile fabric, Terrafix 270R or equivalent, Class I, conforming to OPSS.MUNI 1860.

## **3 . EXECUTION**

### **3.1 Installation**

- 3.1.1 Carry out the installation of the subdrainage system indicated in the Contract Documents in general conformance with OPSS.MUNI 405, except where the following requirements specify otherwise.
- 3.1.2 Excavate trenches where shown on the Contract Drawings or where directed to do so by the Consultant.
- 3.1.3 Excavate subdrainage connector trenches to proposed catch basins. Break into and connect subdrain pipes to the catch basins

---

with good connections ensuring no exfiltration can occur. Grades must ensure drainage of perforated pipe into the catch basins.

- 3.1.4 Obtain approval of Consultant before placing geotextile fabric.
- 3.1.5 Install geotextile fabric into the trench, prior to installing any crushed rock. Fabric to be installed without folds and in close contact with sides and bottom of trench. Leave enough fabric projecting from the top of each side of the trench to be folded over the full width of the trench.
- 3.1.6 Supply, place, shape and compacted Granular base material at the bottom of subdrains followed by crushed rock layer to the top of the sub-base of the asphalt pavement as shown on details on Contract Drawings.
- 3.1.7 Supply and install perforated PVC pipe to lines and grades specified, complete with factory produced connectors as required.
- 3.1.8 Fold over the geotextile fabric projecting from each side of the trench onto the top of the crushed rock so as to create a double layer of fabric over the full width of the top of the trench.
- 3.1.9 Do not mix or contaminate the subdrainage granular material with soil or other material.
- 3.1.10 Do not excessively rut prepared subgrade surface while placing or shaping subdrainage granular material or subdrainage system. Reshape and re-compact rutted sections as required.
