  - .2 Environmental Loads: Such as wind, snow, rain, hydrostatic, and seismic as applicable.
  - .3 Loads from Temperature and Moisture Loads: Including expansion, contraction, deflection, deformation, creep, shrinkage, settlement, and differential movement.
  - .4 Fire Loads: as determined by fire performance testing specified.
- 2.2.4 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.2.5 Building Enclosure Design Principle: Exterior envelope construction for this Project is based on "Rain Screen" design principle, as recommended by National Research Council of Canada. Face sealed assemblies are not permitted.
- .1 Continuity: Maintain integrity and continuity of building enclosure's thermal, air, and vapour control layers at all times by using appropriate insulation, air barriers, vapour retarders to tie work of this Section with adjacent construction.
  - .2 Design for compartments to achieve appropriate pressure equalization in exterior cladding system.
- 2.2.6 Incorporate means of draining moisture to exterior. Drainage system must provide clear, internal paths of drainage of trapped moisture within aluminum plate assemblies to exterior of wall assemblies.

- 
- 2.2.7 System must discharge water in manner that avoids staining of architectural finishes, formation of puddles or formation of icicles.
- 2.2.8 Skylights must be tested and labeled in accordance with AAMA/WDMA/CSA 101/I.S.2/A440.
- .1 Classification: Class CW-PG80, for 914 mm by 914 mm (36 inches by 36 inches) gateway size.
  - .2 Air Infiltration: maximum of 0.3 L/s/m<sup>2</sup> (0.06 cfm/ft<sup>2</sup>) at 75 Pa when tested according to ASTM E283.
  - .3 Water Resistance: no uncontrolled water leakage at pressure differential of 580 Pa (12.11 psf) or 15% of design pressure per ASTM E331.
  - .4 Uniform Load: No breakage, permanent damage to fasteners, hardware parts, or damage that renders the daylighting system inoperable or causes excessive permanent deflection when tested at a positive load of 11.52 kPa (240.6 psf) or negative load of 7.66 kPa (160 psf), to ASTM E330.
- 2.2.9 Thermal Transmittance: U-Factor, not exceeding 0.47<sub>IP</sub> BTU/hr.ft<sup>2</sup>deg F when simulated per NFRC 100 and NFRC 200 using applicable testing, modelling and validation protocols.
- 2.2.10 Structural Loads:
- .1 Wind Loads: As indicated by structural design data on Drawings.
  - .2 Snow Loads: As indicated by structural design data on Drawings.
  - .3 Concentrated Live Loads: 1112 N (250 lbf) applied to framing members at locations that will produce greatest stress or deflection.
  - .4 Seismic Loads: As indicated by earthquake design data on Drawings.
  - .5 Load Combinations: Calculate according to requirements of applicable code indicated on Drawings.
- 2.2.11 Self-Ignition Temperature: > 343 degrees C (650 degrees F) per ASTM D1929.
- 2.2.12 Smoke Density: Maximum 75 per ASTM D2843.
- 2.2.13 Rate of Burn and Extent of Burn: Minimum CC-2 Classification with less than 62 mm/min (2.5 inches/min) per ASTM D635.
- 2.2.14 Fall Protection Performance: Passes fall protection test: No penetration of dome or curb cap when subjected to 318.2 kg (700 lb)/60 second static load test and 318.2 kg (700 lb)/610 mm (2-foot) impact drop test in accordance with OSHA 29 CFR 1926 Subpart M (Fall Protection) 1926.501(b)(4)(i); 1926.501(i)(2); and 1926.501(b)(4)(ii).

2.2.15 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

- .1 Temperature Change (Range): 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.

## **2.3     Tubular Skylight**

2.3.1 Description: Transparent roof-mounted skylight dome and self-flashing curb, reflective tube, and ceiling level diffuser assembly, transferring sunlight to interior spaces; complying with ICC AC-16.

2.3.2 Diameter: 740 mm (29 inch)

2.3.3 Dual Dome Glazing: Type DPP.

- .1 Outer Dome Glazing: 3.2 mm (0.125 inch) minimum thickness, vacuum-formed polycarbonate classified as CC1 material; UV inhibiting; (100 percent UVC, 100 percent UVB, and 98.8 percent of the range of UVA transmission).
- .2 Inner Dome Glazing: CC2, 1 mm (0.040 inch) minimum thickness, copolyester (PETG) polyethylene terephthalate with glycol;.

2.3.4 Seals:

- .1 Inner Dome Seal: Adhesive back closed cell foam seal 3.2 mm (0.125 inch) or 4.8 mm (0.188 inch) tall by 9.5 mm (0.375 inch) wide.
- .2 Dome Assembly Seal: Adhesive-backed pile weather-strip, 8.9 mm (0.350 inch) tall by 4.8 mm (0.187 inch) wide.

2.3.5 Transfer Zone:

- .1 Extension Tubes: Aluminum sheet, thickness 0.5 mm (0.018 inch) conforming to ASTM B 209 with Tab-Lock tube joint structural connection system.
- .2 Reflective Tubes:
  - .1 Reflective 610 mm (24 inch) extension tube, Type EXX or Type EL with total length of run as indicated on the Drawings.
  - .2 Belt Alignment Tab aligns Tube Belt on tube in the correct location.
- .3 Interior Finish: Manufacturer's standard Infrared reduction technology designed to produce high visible light transmittance with low infrared (IR) transmission.
  - .1 Color: a\* and b\* (defined by CIE Lab\* color model) not to exceed +/- 2 as determined in accordance with ASTM E308.

- 
- 2.3.6 Tab-Lock: manufacturer's standard device designed to capture adjoining tube or tube connector using periodic opposing hooks integrated in the tube perimeter with mating retention detents.
- 2.3.7 Tube Belt: Sheet-metal belt 50.8 mm (2 inch) wide by 724 mm (28.5 inch) nominal diameter by 0.5 mm (0.022 inch) thick CS-B AZ-50 ASTM A792 with 2.5 mm (0.10 inch) diameter stainless steel type 302 ASTM A313 torsion spring actuated toggle clamp.
- .1 Designed to retain Tab-Lock tube joint structural connection system; stiffens linear tube assembly; and prevents tube rotation or disengagement under normal use. Includes locking tab to prevent unintentional Tube Belt Latch opening due to handling, service, vibration, or normal operation or use.
- 2.3.8 Bottom Assembly: Amplifier Assembly for Tubes Not Penetrating Ceilings (Open Ceiling): Type A, 914 mm (36 inch) diameter amplifier diffuser assembly attached directly to bottom of tube.
- .1 Amplifier: Conical shaped assembly 602 mm (23.7 inches) tall, 724 mm (28.5 inches) upper diameter, and 914 mm (36 inches) lower diameter.
  - .2 Amplifier collimates incident light. Light reflects off two successively angled facets designed to mix the light to reduce glare and to correct the incident angle by 15 degrees and 25 degrees successively, thereby improving the transmission efficiency through the diffuser lens by reducing retro-reflection due to first surface refraction and concentrating the distribution of light by reducing the cone of illumination relative to the incident angle correction.
  - .3 Assembly comprised of three multifaceted segments to be joined together with 15 - 3 mm (0.125 Inch) rivets.
  - .4 Tube Connect Slots at upper perimeter receive six Tab-Lock Hook features from adjoining tube for mechanical tube engagement.
- 2.3.9 Amplifier Diffuser Belt: Sheet-metal belt 50.8 mm (2 inch) wide by 914 mm (36 inch) nominal diameter by 0.5 mm (0.022 inch) thick CS-B AZ-50 ASTM A792 with 2.5 mm (0.10 inch) diameter stainless steel Type 302 ASTM A313 torsion spring actuated toggle clamp.
- .1 Designed to retain tab-Lock tube joint structural connection system; stiffens linear tube assembly; and prevents tube rotation or disengagement under normal use. Includes locking tab to prevent unintentional Latch opening due to handling, service, vibration, or normal operation or use.
- 2.3.10 Diffuser Lens: Lens: CC2, Type L2, Prismatic lens designed to maximize light output and diffusion. Visible Light Transmission must be greater than 90 percent at 2.5 mm (0.100 inch) thick and complying with OBC Article 3.1.13.4.

- .1 Diffuser Collar: Attached to diffuser lens; 0.45 mm (0.018 inch) nominal thickness aluminum.
- .2 Diffuser Seal: "L" shaped EPDM closed cell foam, 21.8 mm (0.86 inch) wide by 34.8 mm (1.37 inch) tall by 4.1 mm (0.16 inch) thick to minimize condensation and bug, dirt, and air infiltration per ASTM E283.
- .3 Diffuser Band: Stainless steel diffuser band, 6.4 mm (0.25 inch) wide by 0.5 mm (0.020 inch) thick stainless steel Type 201 ASTM A666, for enhanced seal performance and protection.

2.3.11 Basis-of-Design: "SkyVault M74DS" as manufactured by Solatube.

## **2.4     Accessory Materials**

- 2.4.1 Fasteners: Same material as metals being fastened, non-magnetic steel, non-corrosive metal of type recommended by manufacturer, or injection molded nylon.
- 2.4.2 Suspension Wire: Steel, annealed, galvanized finish, size and type for application and ceiling system requirement.
- 2.4.3 Sealant: Polyurethane or copolymer based elastomeric sealant as provided or recommended by manufacturer.
- 2.4.4 Insulating Materials: Specified in Section 07 21 00, Thermal Insulation.
- 2.4.5 Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos, formulated for 0.762-mm (30-mil) thickness per coat.

## **2.5     Fabrication**

- 2.5.1 Fabricate aluminum components before finishing.
- 2.5.2 Fabricate aluminum components that, when assembled, have the following characteristics:
  - .1 Profiles that are sharp, straight, and free of defects or deformations.
  - .2 Accurately fitted joints with ends coped or mitered.
  - .3 Internal guttering systems or other means to drain water passing joints, condensation occurring within framing members, and moisture migrating within skylight to exterior.
  - .4 Physical and thermal isolation of glazing from framing members.
  - .5 Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
- 2.5.3 Fabricate aluminum sill closures with weep holes and for installation as continuous component.

- 2.5.4 Reinforce aluminum components as required to receive fastener threads.
- 2.5.5 Weld aluminum components in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.
- 2.5.6 After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

### **3 .     EXECUTION**

#### **3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

#### **3.2     Installation**

- 3.2.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Coordinate installation with substrates, air and vapor retarders, roof insulation, roofing membrane, and flashing to ensure that each element of the Work performs properly, and that finished installation is weather tight.
- 3.2.3 Install flashing to produce weatherproof seal with curb and overlap with roofing system termination at top of curb.
- 3.2.4 Provide thermal isolation when components penetrate or disrupt building insulation. Pack fibrous insulation in rough opening to maintain continuity of thermal barriers.
- 3.2.5 Coordinate attachment and seal of perimeter air and vapor barrier material.
- 3.2.6 Do not install damaged components.
- 3.2.7 Fit joints between aluminum components to produce hairline joints free of burrs and distortion.
- 3.2.8 Where metal surfaces of tubular unit skylights will contact incompatible metal or corrosive substrates, including preservative-treated wood, provide permanent separation as recommended by manufacturer
- 3.2.9 Align device free of warp or twist, maintain dimensional tolerances.

- 3.2.10 Inspect installation to verify secure and proper mounting. Test each fixture to verify operation, control functions, and performance. Correct deficiencies.

**3.3     Field Quality Control**

- 3.3.1 Inspection and Testing: As specified in Section 01 83 16 and Section 01 91 15.

3.3.2

**3.4     Protection**

- 3.4.1 Protect tubular skylights from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.

- 3.4.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.

- 3.4.3 Promptly replace tubular skylights work damaged during construction that cannot be satisfactorily repaired.

**3.5     Cleaning And Waste Management**

- 3.5.1 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.

- 3.5.2 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **PART 1 – GENERAL**

### **1.1 WORK INCLUDED**

- .1 Furnish, deliver and install finish hardware.
- .2 It is intended that the following list of hardware will cover finish hardware to complete the project. Bring to the Consultants attention any omissions, discrepancies that will affect work in this section during the bidding period.

### **1.2 RELATED SECTIONS**

- .1 General Requirements Division 1
- .2 06 40 00 Architectural Woodwork
- .3 08 11 13 Steel and Doors and Frames
- .4 08 11 70 Glazed Interior Aluminum Doors and Frames
- .5 08 14 16 Flush Wood Doors
- .6 08 44 13 Glazed Aluminum Curtain Wall
- .7 Division 26 Electrical
- .8 Division 28 Electronic Safety and Security

### **1.3 PRODUCTS SUPPLIED BUT NOT INSTALLED IN THIS SECTION**

- .1 Power supplies, compressor/control boxes, junction boxes installed by Division 26.

### **1.4 REFERENCES**

- .1 Door and Hardware Institute - Recommended locations for Architectural Hardware for Standard Steel Doors and Frames
- .2 Door and Hardware Institute - Recommended locations for Architectural Hardware for Flush Wood Doors
- .3 CSDMA-Recommended Dimension Standards for Commercial Steel Doors and Frames (Hardware Locations)

- .5 Door and Hardware Institute - Sequence Format for Hardware Schedule
- .6 Door and Hardware Institute - Key Systems and Nomenclature
- .7 Door and Hardware Institute - Abbreviations and Symbols used in Architectural Door and Hardware Schedules and Specifications
- .8 Door and Hardware Institute – Installation Guide for Doors and Hardware
- .9 Ontario Building Code 2012

### **1.5 SUBMITTALS**

- .1 Updated Finish Hardware Schedule:  
Submit submittals in accordance with Section 01 30 00 Submittal Procedures. Prepare detailed hardware schedules in Door and Hardware (DHI) vertical format as detailed in Reference 1.4.4.
- .2 Product Data:  
Submit in a three-ring binder six (6) copies of product data sheets with the finish hardware schedule showing items of hardware to be used on the project.
- .3 Samples:  
When requested in writing, provide (to the Consultants Site Office) one sample of each hardware item complete with fasteners, within thirty (30) calendar days of award of a purchase order. Samples to be clearly labeled with their hardware schedule designation and manufacturers' name and model number. Samples will be incorporated into the work.
- .5 Templates:  
Submit templates within to related trades when requested.
- .6 Keying Schedule:  
After a keying meeting between representatives of the Owner, furnish a keying schedule listing the levels of keying as well as an explanation of the key system's function, the key symbols used, and the door numbers controlled. Utilize "Door and Hardware Institute - Key Systems and Nomenclature" as a guideline for nomenclature, definitions, and approach for selecting the optimal keying system. Provide 3 copies of keying schedule for review prepared and detailed in accordance with referenced DHI publication. Include schematic keying diagram and index each key to unique door designations. Index keying schedule by door number, keyset, hardware heading number, cross keying instructions, and special key stamping instructions. Provide one complete bitting list of key cuts and one key system schematic illustrating system usage and expansion. Forward bitting list, key cuts and key system schematic directly to Owner, by means as directed by Owner.
- .7 Wiring Diagrams  
Co-ordinate with related trades, meet with the owner and security provider and submit a written description of the functional use (mode of operation) of electrical hardware products specified. Include operation for ingress, egress, fire alarm, and after hours use where applicable. Include door and frame elevations showing the location of each item of electrical hardware to be installed, mode of operation including a diagram showing number and size of conductors. Indicate on elevation drawing items provided by related trades, include for back boxes, and 120V power sources. Provide point to point drawings showing terminal connections necessary for a complete installation.
- .8 Operations and Maintenance Data  
Prior to Substantial Completion, furnish to the owner, two (2) copies of an owner's operation and maintenance manuals in a three-ring binder with the following information:
  1. Name of hardware distributor, address and contact name
  2. Copy of final "as-built" finish hardware schedule
  3. As installed "wiring diagrams, elevations, risers, point to point"
  4. Copy of final keying schedule
  5. Copy of floor plans with keying nomenclature assigned to door numbers as per the approved keying schedule
  6. Catalogue cut sheets and product specifications for each product
  7. Parts list for each product
  8. Installation instructions and templates for each product

## **1.7 QUALITY ASSURANCE**

- .1 Review installation procedures with the Contractor's Designated Installers. Hold

instruction meetings with installers prior to installation and subsequent review meetings during the installation period. Submit minutes of meetings to the Consultant.

- .2 Substitutions  
Only approved products specified are accepted. Make substitution requests in accordance with Division 1. Include product data and indicate benefit to the project.
- .3 Supplier Qualifications  
Successful hardware distributor to have a minimum of five (5) years' experience in the door and hardware industry. Distributor to have on staff an Architectural Hardware Consultant (A.H.C.) whose name will be listed on the hardware schedule title page submittal and will be responsible for scheduling, detailing, (see Reference 1.5.4) ordering and co-ordination of the finishing hardware for this project. If so, requested by the Consultant and or installer this individual will be required to visit the jobsite for any installation problems that may occur.
- .4 Designated Installers  
Hardware Installers must have a minimum of five (5) years' experience in installation of hardware. Provide verification of installer's qualification to Consultant for approval. Installers to attend review meetings with the Hardware Distributor.

## 1.8 DELIVERY, STORAGE AND HANDLING

- .1 Marking and Packaging  
Mark cartons with heading number, door number, and key-set symbol where applicable in original packaging provided by the manufacturer. Pack packaged hardware in suitable wrappings and containers to protect it from damage during shipping and storage. Enclose accessories, fastening devices and other loose items with each applicable item of hardware.
- .2 Delivery  
Deliver hardware to related trades.
- .3 Storage  
Store in a clean, dry room with lockable man door and adequate shelving to permit organization so item numbers are readily visible.

## 1.9 WARRANTY

- .1 Furnish warranties by the accepted manufacturers:

Hardware Item	Length of Warranty
Mortise Hinges	1 year
Continuous Hinges	Lifetime
Electrified Continuous	1 Year
Pivot Sets	2 years
Locks ND Mechanical	10 years
Locks ND Electro-Mechanical	3 years
Exit Devices (98/99 33/35A) Mechanical)	10 Years
Exit Devices (98/99 33/35A) Electromechanical)	3 Years
Door Closers - Mechanical	10 years
Door Closers – Mechanical – High Security	15 years
Door Closers – Mechanical 4020 series	30 years
Door Closers – Mechanical 4040XP series	30 years
Door Closers – Mechanical 1460 series	30 years
Door Operators - Electro Mechanical	2 years
Electric Hold Open Devices - Electro mechanical	2 years
Overhead Stops/Holders	10 year

Floor/Wall stops	1 year
Electric Strikes	5 years
Key Switches/Power Supplies	1 year
Electromagnetic Locks	Lifetime
Gasketing (ZERO)	5 years
Power Supplies	3 years

#### 1.10 MAINTENANCE

##### .1 Maintenance Service

After the building is occupied arrange an appointment with the maintenance staff from the Region of Peel for instruction of proper use, servicing, adjusting and lubrication of hardware furnished. Submit to the consultant a list of attendees and meeting date.

##### .2 Extra Materials

Furnish the following items in proper manufacturer's cartons once the job has been completed:

1. 5 of each installation tool used for locks/passage/privacy, type of door closers, and exit devices.

#### PART 2 – PRODUCTS

##### 2.1 MANUFACTURERS

Products listed in the hardware groups are from the manufacturers listed below:

ITEM	MANUFACTURER NAME
Full Mortise Hinges	Ives
Continuous Hinges	Ives
Locksets, Latchsets/Deadbolts	Schlage
Cylinders	Schlage
Exit Devices	Von Duprin
Keypad Locks	Schlage
Pivots	Ives
Surface/Flush Bolts	Ives
Door Closers	LCN
Overhead Door Holders/Stops	Glynn Johnson
Door Pulls/Flatware	Ives
Wall/Floor Stops	Ives
Weather/Smoke/Sound Seals	Zero
Door Sweeps/Thresholds	Zero
Automatic Door Operators/Actuators	LCN
Keyswitch/Magnetic Locks	Schlage Electronics
Electric Strikes	Von Duprin
Access Controllers	Schlage Electronics
Power Supplies	Schlage Electronics, Von Duprin

##### 2.1 MATERIALS

###### 1. Screws and Fasteners:

Screws and fasteners to be matching finish to their product and to be manufacturer's standard. Door closers, door holders and exit devices installed on fire rated wood doors and hollow metal doors to be attached with fasteners to meet NFPA 80 requirements.

###### 2. Materials-Acceptable Manufacturers (Note: Supply products in a given category from the same manufacturer):

###### .1 Mortise Hinges

### 1.1.1

Provide five knuckle bearing hinges with NRP option on reverse bevel doors with locking hardware. Hinge width to accommodate door closer projection, door trim and allow for 180-degree swing. Doors up to 2286mm (90") in height, supply 3 hinges, doors greater than 2286mm in height add one hinge for every additional 760mm of door height. Doors 915mm (36") wide and less furnish 114mm (4-1/2") high hinges, doors greater than 915mm (36") wide furnish 127mm (5") high hinges, heavy weight or standard weight as specified. Supply ferrous (steel), stainless steel material for all interior and/or fire-rated doors and stainless steel for exterior doors.

As Specified: Ives Hinges, 5BB1, 5BB1HW

#### .2 Continuous Hinges:

Provide Ives heavy duty edge mount/edge guard continuous gear type aluminum hinges. Ives aluminum hinges tested and approved to UL 10C (90 minutes). Material 6063-T6 aluminum, clear satin finish (628). Aluminum geared hinges certified to ANSI 156.26 Grade 1. Hinge length to suit door height. Hinge length 25mm (1") less door height.

Supply as Specified: Ives 112XY

#### .3 Surface/Flush Bolts/Co-Ordinators:

##### **Manual Flush Bolts-Metal Doors:**

Manual flush bolt for metal doors to be cUL listed for 3-hour fire doors with 13mm (1/2") diameter bolt tip with 19mm (3/4") throw. Standard rod length to be 305mm (12"), supply longer length rods to suit higher door heights. Provide dustproof strikes with flush bolts that incorporate a bottom bolt.

Supply as Specified: Ives FB458 series.

##### **Automatic Flush Bolts- Wood Doors:**

Automatic flush bolts for wood doors to be fully automatic cUL listed for 90min fire doors, low actuation forces-top bolt has not spring tension, non -handed with 19mm (3/4") throw with a 22mm (7/8") vertical adjustment. Models with auxiliary fire latch that eliminates the bottom bolt for cUL listed doors (20min only). Provide dustproof strikes with auto flush bolts that incorporate bottom bolt.

Supply as Specified: Ives FB40 series

##### **Constant Latching Flush Bolts-Metal Doors:**

Constant latching flush bolts for metal doors to be cUL listed for 3-hour fire doors. Inactive door remains latched until the active door is opened, releasing the automatic bottom bolt and then the top bolt can be manually released. Inactive door will relatch automatically. Standard rod length 305mm (12"), supply longer rod length to suit higher door heights. Non-Handed with fire-rated models with auxiliary fire latch to eliminate the use of a bottom bolt. Provide dustproof strikes with flush bolts that incorporate bottom bolt.

Supply as Specified Ives FB50 series

##### **Co-Ordinators and Filler Bars**

cUL listed for installation on labeled frames. COR series co-ordinator channels and fillers made of aluminum, furnished in 628 finish. Provide co-ordinators of correct size for use on pairs of doors when one door is required to close before the other. Provide filler bar to suit opening width to maintain architecturally clean lines. Provide mounting brackets for other soffit applied hardware. Co-ordinator units to be equipped with an override feature which allows the active door to close under extreme pressure.

Supply as Specified: Ives COR Series Bar Co-ordinators

#### **.4 Locksets/Deadlocks/Privacy Sets:**

##### **Cylindrical:**

Extra heavy duty residential, commercial, institutional and industrial applications. Latch bolts to be steel with minimum 13mm (½") throw deadlocking on keyed functions. 19mm (¾") throw anti-friction latchbolt on pairs of fire doors. Provide manufacturer's standard wrought box strike for each latch or lock, with curved lip extended to protect frame. Locks and latchsets tested to exceed 8,000,000 cycles. Provide mox connections for electrified functions as a standard. Lock case to be steel, incorporate one-piece spring cage and spindle. Precision solid brass 6-pin cylinder with nickel silver keys available in Schlage keyways. Levers to be solid with no plastic inserts.

Supply as Specified: Schlage "ND" series

##### **Hospital Latches:**

Hospital latches to be supplied with paddles engraved "PUSH" and "PULL". Provide hospital latches with standard 127mm (5") backset, unless noted otherwise, with 13mm (½") latch throw. Provide proper latch throw of UL listing at pairs. Provide standard ASA strike unless extended lip strikes are necessary to protect trim. Mount trim with push paddle mounted up and pull paddle mounted down except at psychiatric or security areas provide both paddles mounted down, unless noted otherwise.

##### **Keypad Locks-Stand Alone Battery Operated:**

##### **Cylindrical:**

Heavy-duty cylindrical type with standard 13mm (½") throw latch bolt with chassis that will accommodate standard 161 cylindrical lock prep. Locksets shall be provided from the factory with the appropriate handing. Outside escutcheon to contain a 12-button keypad to support 500 user capacity with tri-coloured LED's and audible indicators to provide information on activation, operational system status, system error conditions and low power conditions. Electrical operation to be battery operated capable of 80,000 operating cycles using four non-proprietary "AA" alkaline batteries. Keypad lock to be capable of operation for exterior applications, operating temperature -35 to 66 degrees Celsius.

Supply as Specified: Schlage Electronics CO-100CY series

#### **.5 Exit Devices/Device Trims/Mullions:**

##### **Narrow Style:**

Exit device to be cUL listed for panic hardware and fire exit hardware. Supply exit devices and fire exit devices featuring coil compression springs on device mechanism subassemblies and dead latching mechanisms for active latch bolts. Supply exit devices with smooth mechanism case and "the quiet one" fluid

dampener to eliminate noise associated with exit device operations. Non-handed device with touchpad assemblies with no exposed fasteners and cast end caps, reinforced aluminum with stainless steel touchpad and raised edge to minimize pinching. Doors greater than 950mm wide supply long bar exit devices, doors greater than 2134mm (84") high supply extension rods were required. Fits door stiles as narrow as 45mm (1 3/4").

Supply as Specified: Von Duprin 35A series

#### **Heavy Duty**

Exit device to be cUL listed for panic hardware and fire exit hardware. Supply panic hardware and fire exit devices featuring coil compression springs on device mechanism subassemblies and dead latching mechanisms for active latch bolts. Supply exit devices with smooth mechanism case and "the quiet one" fluid dampener to eliminate noise associated with exit device operations. Non-handed device with touchpad assemblies with no exposed fasteners and cast end caps, reinforced aluminum with stainless steel touchpad and raised edge to minimize pinching. Roller strikes to be standard on rim and surface vertical rod devices, mortise exit devices (626) complete with strikes that match the same finish as the device. Doors greater than 950mm (37-13/32") wide supply long bar exit devices, doors greater than 2134mm (84") high supply extension rods for surface vertical rod series. 1,000,000cycle testing independently certified by ETL.

Supply as Specified: Von Duprin 98 series

#### **Exit Device Trim**

Supply device trim featuring recessed cylinder mounting and coil compression spring design with shear pin protection for lever designs. Similar lever designs for exits as specified for locksets.

Supply as Specified Von Duprin 996 series

### **.6 Door Closers:**

Door closers to have the following features (see separate closer sections below for further information):

- Fully hydraulic, rack and pinion action with high strength cast iron cylinders and one-piece forged steel pistons.
- Include high efficiency, low friction pinion bearings.
- Hydraulic fluid of a type requires no seasonal adjustments, ULTRA X TM fluid has constant temperature control from -35 degrees Celsius to +49 degrees Celsius.
- Hydraulic regulation controlled by tamper-proof, non-critical screw valves, adjustable with a hex wrench.
- Separate adjustments for backcheck, general speed and latch speed.
- Door closers with special template (ST-) numbers include required associated product, information sheets and instructions
- Size 1 manual door closers to provide less than 5 pounds opening force on a 900mm door leaf.
- Door closer with Pressure Relief Valves are not accepted.
- Door closer bodies, arms, covers to be powder coated
- Closers with powder coat finishes to exceed a minimum 100-hour salt spray test, as described in ANSI A156.18 and ASTM B117.
- Closers detailed with plated finishes to include plated covers (or finish plates), arms and visible fasteners.

#### **Medium Duty Mechanical (Interior/Exterior):**

Non-sized (1-6) and non-handed cylinder body to have 32mm (1 ¼") piston diameter with 16mm (5/8") single heat-treated shaft. Track closer cylinder body non-sized (2-4) or (1-2). Closers to have stamped main arm and forearm (forged steel main arm and forearm EDA and CUSH type arms). Optional arms to be interchangeable within the series of closers, except track arm type closers. Track arm type closers to have single lever arm with low friction track and roller assembly and provisions for an optional bumper to assist backcheck.

Supply as Specified: LCN1460 HD series

**Heavy Duty Mechanical (Top Jamb Mount):**

Non-sized (1-5) and handed cylinder body to have 38mm (1 1/2") piston diameter with 17mm (11/16") double heat-treated shaft and certified to exceed ten million (10,000,000) full load operating cycles by a recognized independent testing laboratory. Track closers sized 1,3 or 4. Closers to have forged steel main arm. Optional arms to be interchangeable within the series of closers, except track arm type closers. Track arm type closers to have single lever arm with low friction track and roller assembly and provisions for an optional bumper to assist backcheck. Provide drop plates, brackets, long rod and shoe or adapters for arms as to suit details.

Supply as Specified: LCN 4020 series

Supply as Specified: LCN 4040XP series

**Heavy Duty Mechanical (Parallel Arm Mount):**

Non-sized (1-5) and handed cast iron cylinder body to have 38mm (1 1/2") piston diameter with 17mm (11/16") double heat-treated shaft and certified to exceed ten million (10,000,000) full load operating cycles by a recognized independent testing laboratory. Track closers sized 1,3 or 4. Closers to have forged steel main arm and forearms. Optional arms to be interchangeable within the series of closers, except track arm type closers. Track arm type closers to have single lever arm with low friction track and roller assembly and provisions for an optional bumper to assist backcheck.

Supply as Specified: LCN 4110 series

**Heavy Duty Single Point Hold-Open (Pull and Push Side Mount):**

Non-sized (1-4) and non-handed cast iron cylinder body to have 38mm (1 1/2") piston diameter with 17mm (11/16") double heat-treated shaft with adjustable single-point hold open function controlled by solenoid assembly located in a head frame mounted track. Track arm to have single lever arm with low friction track and roller assembly. Unit to have a momentary on/off switch board assembly for testing door release and provides over-voltage protection.

Supply as Specified: LCN 4040SE series

**"NOTE: LOW ENERGY OPERATORS SUPPLIED AND INSTALLED BY THIS SECTION"**

**Medium Duty Electric Operator**

Provide non-handed low energy automatic operator units that are electro-mechanical design. Tested to minimum of 3 million cycles. In the event of a power loss or failure, the control box will save the installation settings thru Non-Volatile Memory. Operates between -34 deg. C and +71 deg. C. Powered by DC motor working through reduction gears. Door can be manually operated with

power on or off without damage to operator. Provide variable adjustments, including opening, closing and backcheck speeds, backcheck and latch position, and adjustable hold open delay from 2-30 seconds. Provide units with semi concealed on/off toggle switch, selectable push and go function to activate power operator, power assist closing, electric lock delay, LED illuminated power indicator and logic terminals to interface with accessories. Provide full length aluminum header, drop plates, brackets, long rod and shoe or adapters for arms as to suit details.

Supply as Specified: LCN 9131, 9142 Series

**Heavy Duty Electric Operator**

Provide low energy automatic operator units that are electro-mechanical design. Powered by DC motor working through reduction gears. Spring force closing. Motor is off when door is in closing mode. Door can be manually operated with power on or off without damage to operator. Provide variable adjustments, including opening and closing speed adjustment. Provide units with manual off/auto/hold-open switch, push and go function to activate power operator, vestibule interface delay, electric lock delay, hold-open delay adjustable from 2 to 30 seconds, and logic terminal to interface with accessories, mats, and sensors. Provide full length aluminum header, drop plates, angle brackets, or adapters for arms to suit details. Sequence operation of exterior and vestibule doors with automatic operators to allow ingress or egress through both sets of openings, consult with owner.

Supply as Specified: LCN 9542, series c/w keyswitch or rocker 8310-806K/R

**.7 Actuators:**

**Wall Type**

Wall plate switch to be hard-wired actuator with round, stainless steel touch plate in either 114mm (4-1/2") or 152mm (6") diameters. Engraved blue filled handicap symbol conforms to most accessibility codes. Units to include heavy grade components for vandal resistant mounting and weather resistant switch standard.

Supply as specified: LCN 8310-8528310-876 (152mm) escutcheon

**.8 Overhead Door Stops/Holders:**

**Heavy Duty Surface Mounted:**

Surface overhead stops/holders to be stainless steel base, non-handed for single-acting doors with a heavy-duty channel/slide-arm design and offset jamb bracket to allow for simple field modifications of functions. Channel to be surface mounted to the door with thru bolts and the jamb bracket is surface mounted to the frame soffit.

Supply as Specified: Glynn-Johnson 90 series

**Heavy Duty Concealed Mounting:**

Concealed overhead stops/holders to be stainless steel base, non-handed for single or double-acting doors with a low-profile channel, mortised in the door and jamb bracket is mortised in the doorframe. Unit to be fully concealed when door is in the closed position. Units to be field adjustable for function changes if required.

Supply as Specified: Glynn-Johnson 100 series

**.9 Door Pulls/Flatware/Coat Hooks:**

Door Pulls are to be 19mm (7/8"), 25mm (1") diameter  
Flatware to be of stainless-steel material, 1mm (.050 gauge).

Supply as Specified: 8103EZHD, 8145EZHD (Door Pull) mounting as indicated in the hardware sets.

Ives 8200 B-NH-A tape mounting for installation, sizes as specified in hardware groups  
Ives 8400 B-NH-A, tape mounting for installation (Kickplates 40mm (1-5/8") less door width single door and 25mm (1") less door width double doors)

**.10 Floor/Wall Stops:**

**Floor Stops:**

Floor stops to be heavy-duty cast dome stop constructed of brass/bronze with grey, non-marring rubber bumper.

Supply as Specified: Ives FS439

**Wall Stops (No Button on Locking Hardware):**

Wall stops to be constructed of stainless-steel base with special retainer cup that makes the rubber stop tamper resistant. Convex design of rubber bumper.

Supply as Specified: Ives WS406/407CVX

**Wall Stops (Projecting Button on Locking Hardware):**

Wall stops to be constructed of stainless-steel base with special retainer cup that makes the rubber stop tamper resistant. Concave rubber bumper to avoid damage to locks with projecting buttons.

Supply as Specified: Ives WS406/407CCV

**.11 Weather/Smoke/Sound Seals:**

Supply as Specified: Zero 429AA (head seal)

Note: Mount head seal prior to soffit mounted hardware.

Zero 328AA-S (jamb seal, head/jamb seal)

Zero 188SBK (head/jamb seal)

Zero 364AA (door bottom)

**.12 Thresholds/Weatherstrip/Door Sweeps:**

Supply as Specified: Zero 8192AA (Door Sweep)  
Zero 626A-223(Threshold)

Note: Threshold depth to suit site conditions (wall/frame/partition depth, overlap of floor finishes, floor grilles, etc.) Specified threshold indicated as basis for design purposes.

**.13 Keyswitch/Electric Strikes/Magnetic Locks/Power Supplies, Power Transfers, Mortar Guards. Schlage ENGAGE™:**

**Keyswitch:**

Keyswitch housing to be cast zinc to protect against vandalism, housing to provide a concealed rear mounting attachment which cannot be compromised when the cylinder is attached with a set screw. Standard stainless-steel cover plate.

Supply as Specified: Schlage Electronics 650 series

**Electric Strikes:**

Grade 1, electric strikes to be cUL listed burglary-resistant and electric strike for fire doors and frames. A label for single doors and B label for double doors. Electric strikes to be stainless steel construction, non-handed available in 12V or 24V AC or DC with continuous duty solenoid and accept 19mm (3/4") throw latchbolts. Strike box to be adjustable to compensate for any misalignment of the door or frame with two-piece plug connector for ease of installation.

Supply as Specified: Von Duprin 6000 series

**Magnetic Locks:**

Electromagnetic locks to be non-handed, field selectable dual voltage 12/24VDC with a holding force that meets or exceeds 1500lbs and certified to UL1034 and UL10C. Electromagnetic locks to be powered by filtered and regulated power supply. Electromagnetic locks to be furnished with magnetic bond sensor, door position switch and relock time delay standard. Operating temperature range from 0 to 49-degree Celsius. Provide filler bars and angles to mount maglocks as per frame details.

Supply as Specified: Schlage Electronics M490P

**Power Supplies:**

Power supplies to be tested and certified to meet UL294. Universal 120-240 VAC input, low voltage DC output, regulated and filtered. Power supplies to have 2A, 4A, 6A output, 12/24VDC field selectable with jumper. Provide emergency release terminals, where required, that allow the release of devices upon activation of the fire alarm system complete with fire alarm input for initiating "no delay" exiting mode. Power supply to be flat mounting design and polarized locking connections for additional option boards specified.

Supply as Specified: Schlage Electronics PS-902, PS-904, PS-906

**Electro-Magnetic Door Holders:**

Provide floor and wall mounted units to hold door in open position and to release and automatically close under fire alarm conditions. Electromagnet shall be protected against transients and voltage surges up to 600 volts. Power requirements, tri-voltage field selectable, 12, 24VDC, 120VAC.

Supply as Specified: LCN-SEM 7800 series

**Power Transfer**

Provide a means to transfer power from frame to door stile. Devices shall be reversible and allow a full 180° door swing with 114mm x 114mm (4 1/2" x 4 1/2") butt hinges or 19mm (3/4") offset pivots. When door is in closed position, transfer unit shall be concealed. Transfer units shall contain ten 24awg UL approved conductors. Rating: 10 Amps at 24 VDC (Class 1 low voltage)

Supply as Specified: Von Duprin EPT

**Mortar Guards:**

Provide and supply to hollow metal supplier to weld in place TA 6400 series by Thomas Access Control at frame locations where electrified hardware components are to be mounted. Provide handing of mortar guard boxes to the hollow metal frame supplier. Hollow Metal frame supplier is responsible for ensuring the proper location of required mortar boxes.

**Molex Connectors:**

Where scheduled in the hardware sets, provide each item of electrified hardware and wire harnesses with sufficient number and wire gauge with standardized Molex plug connectors to accommodate electric function of specified hardware. Provide Molex connectors that plug directly into connectors from harnesses, electric locking and power transfer devices. Provide through-door wire harness for each electrified locking device installed in a door and wire harness for each electrified hinge, electrified continuous hinge, electrified pivot, and electric power transfer for connection to power supplies.

**Junction Box:**

Provide high quality NEMA 1, junction box to provide convenient installation for electrified hardware. Units are surface mounted 254mm (10") high, 254mm (10") wide, 152mm (6") deep and includes hinged door with twist turn lock, 20 position terminal strips to accept 24 to 12 gauge wire.

Supply as Specified: Von Duprin JB7

**Electric Washroom Accessories:**

Provide electric washroom accessories to compete the installation of automatic door operators for universal and barrier free washroom requirements

Supply as Specified: Camden - Push to lock, CM-400/8  
Camden – LED annunciator CM-AF500  
Camden – Advanced Logic Relay CX-33  
Camden – Emerg. Call Kit CX-WEC10

## 2.3 FINISHES

- .1 Unless otherwise specified, finishes to be brushed chrome (BHMA 626/652).

Finishes are specified as follows:

ITEM	BHMA#	DESCRIPTION	BASE MATERIAL
Hinges	630	satin stainless steel	stainless steel
Continuous Hinges	689	anodized aluminum	aluminum
Continuous Hinges	630	satin stainless steel	stainless steel
Lock Trim	626	satin chrome plated	brass/bronze
Exit Devices	626	satin chrome plated	brass/bronze
Door Closer	689	powder coat aluminum	steel
Door Pulls	630	satin stainless steel	stainless steel
Protective Plate	630	satin stainless steel	stainless steel
<b>Door Stops/holders</b>			
Overhead	630	satin stainless steel	stainless steel
Wall/Floor	626	satin chrome plated	brass/bronze
Thresholds	628	anodized aluminum	aluminum

---

Weatherstrip	628	anodized aluminum	aluminum
<b>Miscellaneous</b>			
Key Switches	630	satin stainless steel	stainless steel
Electric Strikes	630	satin stainless steel	stainless steel
Magnetic Locks	628	anodized aluminum	aluminum

## 2.4 CYLINDERS, KEYING SYSTEMS AND KEY

- .1 Provide temporary construction keying system during construction period. Permanent keys will be furnished to the Owner's Representative prior to occupancy. The Owner or Owner's Security Agent will void the operation of the construction keys.
- .2 Permanent cylinders to be keys to be provided by owner.

**Keying requirements to be confirmed by owner.**

## PART 3 – EXECUTION

### 3.1 EXAMINATION

- .1 Ensure that doors and frames are prepared and reinforced to receive finish hardware prior to installation.
- .2 Ensure that door frames and finished floor are plumb and level to permit proper engagement and operation of hardware.
- .3 Verify power is run to door opening requiring electrified hardware.
- .4 Submit in writing a list of deficiencies determined as part of inspection required in 3.1.1 and 3.1.2 to supervising consultant prior to installation of finished hardware. Correct door frame installation before proceeding with finish hardware installation.

### 3.2 INSTALLATION

- .1 Hardware Installers must have a minimum of five (5) years' experience in installation of hardware.  
Provide verification of installer's qualification to Consultant for approval. Installers to attend review meetings conducted by the hardware distributor.
- .2 Install hardware at mounting heights as specified in the manufacturer's templates or specific references in approved hardware schedule or approved elevation drawings.
- .3 Where mounting height is not otherwise specified, install hardware at mounting heights as indicated in 1.4.1, 1.4.2.
- .4 Install hardware using only manufacturer supplied and approved fasteners in strict adherence with manufacturers published installation instructions.
- .5 Ensure locksets / latchsets / deadlocks are of the correct hand before installation to ensure that the cylinder is in the correct position. **Handing is part of installation procedure.**
- .6 Ensure that exit devices are of the correct hand and adjust device cam/drive screw for proper outside trim function prior to installation. Handing is part of installation procedure.
- .7 Follow manufactures installation instructions. Adjustment of door closers is inclusive of spring power, closing speed, latching speed and back-check, valve screws to achieve

---

backcheck (4040, 4040XP series) at the time of installation.

- .8 Adjust delayed action door closers to forty (40) second delay for barrier free accessibility and movement of materials. Time period to be approved by Owner.
- .9 Install head seal weatherstrip prior to installation of soffit mounted hardware. Trim cut and notch thresholds and saddles neatly to minimally fit the profile of the door frame. Install thresholds and saddles in a bed of caulking completely sealing the underside from water and air penetration.
- .10 Counter sink through bolt of door pull under push plate during installation.
- .11 Install blocking material in cavities of metal and wood stud walls and partitions. Located concave and convex type door bumpers at the appropriate height to properly contact protruding door trim.

### **3.3 FIELD QUALITY CONTROL**

- .1 Verify each door leaf opens closes and latches. Inspect fire rated openings to ensure they are installed in compliance with NFPA 80 requirements. Test access control system and electrified hardware devices for proper operation with owner to sign off on verification of operation. Verify electric door release hardware operates to close the door upon activation of the fire alarm system.
- .2 Perform bi-monthly on-site inspections during hardware installation and provide inspection reports listing progress of work, unacceptable work and corrective measures. Repair or replace as directed by the Consultant.
- .3 Before completion of the work but after the hardware has been installed, submit a certificate to the Consultant stating that final inspection has been made and that hardware has been checked for installation and operation.

### **3.4 ADJUSTING AND CLEANING**

- .1 Check and make final adjustments to each operating item of hardware on each door to ensure proper operation and function.
- .2 Adjust doors with self-closing devices or automatic closing devices for operation after the HVAC system is balanced and adjusted. Adjust spring power of non sized door closers to close and latch the door.
- .3 Hardware to be left clean and free of disfigurements.
- .4 Instruct owner personnel in the operation, adjustment and maintenance of hardware.
- .5 Check locked doors against approved keying schedule.

### **3.5 PROTECTION**

- .1 Protect hardware from damage during construction. Wrap locks, panic hardware, and fire exit hardware, door pull trim with kraft paper or plastic bubble materials to protect finish from damage until date of substantial completion. Remove and reinstall or where necessary, use temporary hardware to maintain finish in new condition and maintain manufacturer's warranty.

### **3.6 HARDWARE GROUPS**

END

## MODE OF OPERATION

DOOR IS NORMALLY CLOSED AND UNLOCKED.

TO ENTER PRESS EXTERIOR ACTUATOR OR PULL LEVER TO OPEN DOOR.

ONCE INSIDE PRESS PUSH TO LOCK BUTTON TO DISABLE EXTERIOR ACTUATOR AND ELECTRIC STRIKE.

WHEN OUTSIDE ACTUATOR IS DISABLED ANNUNCIATOR INDICATES THE "OCCUPIED WHEN LIT".

TO EXIT PRESS INTERIOR ACTUATOR OR ROTATE LEVER AND PUSH TO OPEN DOOR.

IN THE EVENT OF EMERGENCY PRESS EMERGENCY ASSISTANCE BUTTON OR USE MECHANICAL KEY TO PROVIDE ACCESS.

WHEN BUTTON IS PRESSED AN AUDIBLE ALARM WILL SOUND AND ANNUNCIATOR INDICATES "ASSISTANCE REQUESTED" AND ELECTRIC STRIKE RELEASES TO ALLOW ENTRY.

IN THE EVENT OF FIRE ALARM OR LOSS OF POWER DOOR REMAINS LOCKED.

FREE EGRESS AT ALL TIMES.

**1. GENERAL**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

**1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the Window Operators work specified herein. This includes, but is not necessarily limited, to:
  - .1 Window actuators for all operable windows.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

**1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.4 Preinstallation Meetings**

- 1.4.1 General Requirements and Procedures for Project Meetings: In accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section, as well as representatives from manufacturers and fabricators involved in or affected by installation. Notify Consultant and Owner of scheduled meeting dates in advance.

- .2 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 General Requirements and Procedures for Submittals: In accordance with Section, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for Window Operators work specified in this Section.
- 1.5.3 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.4 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.5 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.

.2 Indicate field-measured dimensions on Shop Drawings.

1.5.6 Samples:

.1 Initial Selection Samples: Submit initial selection samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.

**1.6 Quality Assurance**

1.6.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least years' experience manufacturing such materials.

1.6.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.

.1 Certification: Installer must be trained and certified by manufacturer.

1.6.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

1.6.4 Mock-Ups: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

.1 Location: In-situ (i.e. first installation), as directed on site by Consultant.

.2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.

.3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.7 Delivery, Storage And Handling**

1.7.1 General Product Requirements: In accordance with Section, Common Product Requirements. Deliver, store and handle window operators materials in accordance with manufacturer's written instructions.

1.7.2 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

1.7.3 Store materials in off-ground, in clean, dry, well-ventilated area.

1.7.4 Replace defective or damaged materials with new.

**1.8 Field Conditions**

1.8.1 Field Measurements: Verify actual dimensions of construction contiguous with Window Operators by field measurements before fabrication.

**1.9 Warranty**

1.9.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of Window Operators that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

- .1 Warranty Period: 5 years from date of Substantial Performance of The work.
- .2 Warranty Scope: Materials only

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 Automated Fenestration Inc.
- .2 Window Master Industries
- .3 Approved equivalent

2.1.2 Substitution Limitations: Conforming to requirements of Section 01 25 00.

**2.2 Window Operators**

2.2.1 Motorized Window Actuators: WMX/WMU/WMB actuators by Window Master Clearline Inc. or equivalent and mounted with matching coordinated brackets.

- .1 Provide minimum one motorized actuator per operable window. Total number of actuators to be based on window size, weight, glass thickness and window movement and must be confirmed by the manufacturer.
- .2 Provide 24v DC window actuators . Motors and all low voltage system components shall be Underwriter Laboratory (UL) recognized or listed.

- .3 Coordinate voltage drop calculation with Division 26 for wire runs to actuators to ensure adequate power for synchronized motor operation in each room.
- .4 Coordinate wiring (correctly sized for voltage drop), conduit, connectors, junction boxes, electrical enclosures, and required fuses with Division 26.
- .5 Characteristics:
  - .1 Voltage Supply: 24V DC (max. 10% ripple)
  - .2 Open Circuit Voltage: max. 36 VDC
  - .3 Actuator Max Stroke: from 500-1000 mm
  - .4 Traction Force: 100-1500 N
  - .5 Locking Force: 3000 N
  - .6 Power: Max 24W
  - .7 Current consumption: 0.5-5Amp per actuator
- .6 Colour: to be selected by Consultant at a later date.
- .7 Basis-of-Design: "Motorized Window Actuator" by WindowMaster Industries or approved equivalent.

## **2.3 Actuator Control**

### **2.3.1 Programmable 24V DC Window Actuators:**

- .1 Provide programmable 24V DC window actuators suitable for surface or concealed installation in comfort ventilation applications.
- .2 Ensure actuators have a reverse function to prolong weather seal life and are programmable for adjusting tractive force and closing pressure, considering factors such as hinges, window type, and application.

### **2.3.2 Actuators and Control Panels:**

- .1 Actuator Position Feedback: Provide two-way communication between the actuator and the control panel for precise position feedback, enabling accurate control and a security indicator for open windows.

### **2.3.3 Pressure Safety Function: Equip actuators with a pressure safety function to monitor for entrapment. Use microprocessors within the actuator to monitor electrical current and window position in real-time with less than 1 mm accuracy.**

- .1 Ensure actuator can detect and respond to obstructions in the window's path by reversing to release the object. Adjust the pressure safety sensitivity based on factors such as window size, weight, configuration, and hinge type, to maintain system performance throughout the building's life.

- 2.3.4 Fault Indication: Enable two-way communication between the actuator and control panel for early detection of errors in actuator operation or wiring.
- 2.3.5 Synchronization Function: Ensure actuators operate fully synchronized, with two actuators working together on one window within a tolerance of less than 2 mm (0.08 in). Actuators must communicate directly to adjust their speed and maintain synchronization.

## **2.4 Materials**

- 2.4.1 Aluminum: Alloy and temper recommended by aluminum producer and finisher for use and finish indicated, and with not less than the strength and durability of alloy and temper designated below:
  - .1 Aluminum: Extruded Bars and Shapes: to ASTM B221, alloy 6063-T6.
  - .2 Aluminum: Plate and Sheet: to ASTM B209, alloy 6061-T6.

## **2.5 Finishes**

- 2.5.1 Generally: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes. Protect finishes by applying a strippable, temporary protective covering before shipping.

# **3 . EXECUTION**

## **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

## **3.2 Installation**

- 3.2.1 General Requirements: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Install components in plumb, level and square. Maintain dimensional tolerances and alignment with surrounding construction.

## **3.3 Adjusting**

- 3.3.1 Adjust moving parts for smooth and uniform operation.

- 3.3.2 Testing and Commissioning: Perform commissioning of window operator systems upon completion of Work of this Section.

**3.4 Protection**

- 3.4.1 Protect Window Operators from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.4.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.4.3 Promptly replace Window Operators work damaged during construction that cannot be satisfactorily repaired.

**3.5 Cleaning And Waste Management**

- 3.5.1 General Requirements for Cleaning and Waste Management: In accordance with Section, Cleaning and Waste Management.
- 3.5.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.5.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the general requirements for glass and glazing work specified herein.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 08 81 23 – Exterior Glass and Glazing Requirements
  - .2 Section 08 81 26 – Interior Glass and Glazing Requirements

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.

- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for general requirements for glass and glazing work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
- 1.5.4 Delegated Design Submittals:
  - .1 Engineering design completion of general requirements for glass and glazing work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.
- 1.5.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.

- .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.7 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:
  - .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
  - .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).

## **1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for general requirements for glass and glazing to be included in building operation and maintenance manual.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

## **1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.7.3 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years'

experience providing engineering services of similar kind, scope, and complexity.

.1 Professional Engineer's Responsibility:

- .1 production and review of Shop Drawings,
- .2 design and certification of general requirements for glass and glazing, including attachments for building construction, in accordance with applicable codes and regulations,
- .3 stamping and signing of each Shop Drawing and associated calculations

1.7.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

1.7.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
- .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle glass and glazing materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.
- 1.8.6 Comply with insulating-glass manufacturer's written recommendations for venting and sealing units to avoid hermetic seal ruptures due to altitude change.

**1.9 Field Conditions**

- 1.9.1 Environmental Restrictions: Do not proceed with glazing when ambient and substrate temperature conditions are outside limits permitted by glazing material manufacturers and when glazing channel substrates are wet from rain, frost, condensation, or other causes.
- 1.9.2 Field Measurements: Verify actual dimensions of construction contiguous with general requirements for glass and glazing by field measurements before fabrication.
- 1.9.3 Do not install glazing sealants when ambient and substrate temperature conditions are outside limits permitted by sealant manufacturer or below 7 deg C (44 deg F).

**1.10 Warranty**

- 1.10.1 Refer to Section 08 81 23 for exterior glass and glazing requirements.
- 1.10.2 Refer to Section 08 81 26 for interior glass and glazing requirements.

**2 . PRODUCTS**

**2.1 Performance / Design Criteria**

- 2.1.1 Glass Thickness and Strength:
  - .1 Unless indicated otherwise, Provide minimum 6 mm (1/4 inch) thick glass. Increase glass thicknesses as required to meet project-specific loading requirements based on engineering design.
  - .2 Unless otherwise indicated, Provide fully tempered glass or heat-strengthened glass, Kind FT or Kind H complying with ASTM C1048 or equivalent to CAN/CGSB 12.1-M; complying with testing requirements in ANSI Z97.1, Class A and 16 CFR 1201 for Category II materials. Annealed glass used without heat-strengthening is not acceptable.
  - .1 Fabrication Process: By horizontal (roller-hearth) process with roll-wave distortion parallel to bottom edge of glass as installed unless otherwise indicated on Drawings and Schedules or in the following applications:
    - .1 glass units with ceramic frit and base dimensions greater than 2134 mm (84 inch),
    - .2 clear 13 mm (1/2 inch) thick glass with base dimensions greater than 2134 mm (84 inch),
    - .3 other configurations with base dimensions > 2440 mm (96 inch).

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**08 80 05  
General Requirements  
For Glass And Glazing**

- 
- .2 Visual Distortion: Ensure glass is tempered by the horizontal toughening process only and conforms to the following roll wave factor (RW) limits measured in accordance with ASTM C1652 requirements:
    - .1 Roller Wave Distortion Tolerance: Maximum peak-to-valley tolerance of 0.08 mm (0.03 inch) in central area of glass and 0.20 mm (0.008 inch) within 292 mm (11.5 inch) of a leading or trailing edge
    - .2 Maximum bow and warp: 1/32" per lineal foot.
  - .3 Heat-Soaking: Provide in-line heat soaking of tempered glass in accordance with BS EN 14179 (2 hour dwell at 290°C±10°C) for glass used in following applications:
    - .1 Where required by the Ontario Building Code (Supplementary Standard SB-13)
    - .2 Tempered glass used in glazed railings and balustrades, where the glass assembly is not laminated
    - .3 Statistical heat-soaking is not acceptable.
  - .3 Glass thicknesses and heat treatments indicated in Contract Documents are minimum requirements. Confirm glass thicknesses and heat treatments, verified by analysis and engineering design, as required to meet performance and testing requirements specified in this Section.
  - .4 Glazing details shown are for convenience of detailing only and are to be confirmed relative to cited standards and final framing details.
  - .5 Installed glazing systems shall withstand normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, or installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other
  - .6 All exterior glazing (i.e. glazing forming part of the building envelope of the project) must consist at least of double-glazed units with 90% argon-fill, and low-e coating on surface no. 2. Provide such glazing whether specifically indicated on Drawings or not (e.g. where not specifically called out for exterior door assemblies or other miscellaneous openings).
- 2.1.2 Thermal and Optical Performance Properties: Provide glass with performance properties specified, as indicated in manufacturer's published test data, based on procedures indicated below:
- .1 For monolithic-glass lites, properties are based on units with lites 6.0 mm thick.

- 
- .2 For insulating-glass units, properties are based on units of thickness indicated for overall unit and for each lite.
  - .3 U-Factors: Center-of-glazing values, according to NFRC 100 and based on LBL's WINDOW 5.2 computer program, expressed as Btu/sq. ft. x h x deg F).
  - .4 Solar Heat-Gain Coefficient and Visible Transmittance: Center-of-glazing values, according to NFRC 200 and based on LBL's WINDOW 5.2 computer program.
  - .5 Visible Reflectance: Center-of-glazing values, according to NFRC 300.
- 2.1.3 Professional Engineering Design and Certification:
- .1 Design glass, including comprehensive engineering analysis according to CAN/CGSB-12.20 or equivalent to ASTM E1300 by a Professional Engineer licensed to practice in the Province of Ontario, using the design criteria indicated.
- 2.1.4 All glazing within 1070 mm of the finished floor that surrounds interior and exterior openings 600 mm or more in height from the finished floor shall be designed as a guard. This glazing shall be tempered or laminated.
- 2.1.5 Glazing acting as guards from either the interior or exterior must withstand the loads specified in the Ontario Building Code, the requirements of CAN/CSA A500 and applicable loads specified in this section.
- 2.1.6 Visibility of Glazing: Unless design is specifically indicated on Drawings, provide films on all fully glazed transparent doors, sidelights and panels that are mullion-less as follows:
- .1 Minimum height: 50 mm (2 inches)
  - .2 Extent: full width of the door, sidelight or panel.
  - .3 Placement: between 1350 mm (53 inches) and 1500 mm (60 inches) above the floor. Provide consistent placement height throughout project.
- 2.1.7 VOC Content and Emissions:
- .1 VOC Emissions: For applicable items in this Section, comply with CDPH Standard Method v1.2–2017 (CA Spec 01350) and ensure products are certified per UL 2818, SCS Global Gold, or equivalent.
  - .2 VOC Content Requirements: Wet-applied materials used in scope of this Section must conform to the following:
    - .1 Paints and Coatings: SCAQMD Rule 1113 or CARB SCM.

- .2 Adhesives and Sealants: SCAQMD Rule 1168.
- .3 Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

## **2.2     Basic Glass Materials**

- 2.2.1 Clear Annealed Float Glass: ASTM C1036, Type I, Class 1 (clear), Quality-Q3.
- 2.2.2 Tempered Glass: ASTM C1048 Type I; Quality-Q3; Class I (clear); Kind FT or equivalent to CAN/CGSB-12.1. Perform heat strengthening using horizontal tong free method; surface compression not less than 69 MPa (10,000 psi). Glazing must comply with testing requirements in 16 CFR 1201 for Category II materials.
- 2.2.3 Heat-Strengthened Glass: ASTM C1048 Type I; Quality-Q3; Class I (clear) unless otherwise indicated; Kind HS or equivalent to CAN/CGSB-12.1. Perform heat strengthening using horizontal tong free method; surface compression between 24.1 MPa (3,500 psi) and 51.7 MPa (7,500 psi), but preferably not more than 34.5 MPa (5,000 psi) .
- 2.2.4 Laminated Glass: ASTM C1172 and complying with testing requirements in 16 CFR 1201 for Category II materials, and with other requirements specified in this Section. Use materials that have a proven record of no tendency to bubble, discolour, or lose physical and mechanical properties after fabrication and installation.
  - .1 Construction: Unless indicated otherwise, laminate glass with interlayer to comply with interlayer manufacturer's written recommendations and specifications indicated for individual assemblies.
  - .2 Interlayer Thickness: Provide thickness indicated in specific assemblies and as needed to comply with requirements, but not less than 1.5 mm (60 mil).
  - .3 Assembly thickness: As specified in individual Specifications.
  - .4 Interlayer Colour: Clear unless otherwise indicated.
- 2.2.5 Fire-Rated Glass: to CAN/ULC S104 for door assemblies and CAN/ULC S106 for window assemblies.
  - .1 Film-Faced Ceramic Glazing: Clear, ceramic flat glass; 5-mm (3/16-inch) nominal thickness; faced on one surface with a clear glazing film; complying with testing requirements in 16 CFR 1201 for Category II materials (safety glazing).
  - .2 Laminated Ceramic Glazing: Laminated glass made from 2 plies of clear, ceramic flat glass; 8-mm (5/16-inch) total nominal

thickness; complying with testing requirements in 16 CFR 1201 for Category II materials (safety glazing).

- .3 Fire-Resistive Glass: Laminated glass made from multiple plies of uncoated, clear glass; with intumescent interlayers or fully transparent, heat-absorbing gel; complying with testing requirements in 16 CFR 1201 for Category II materials (safety glazing).

- .4 Wire Glass: Not permitted.

2.2.6 Ultraclear (low-iron) Glass: Fully tempered glass complying with other requirements specified in this Section and with visible light transmission not less than 91 percent.

2.2.7 Mirrors: ASTM C1503, or equivalent to CAN/CGSB-12.5; manufactured using copper-free, low-lead mirror coating process. Provide Mirror Select Quality; annealed glass with film backing as specified.

2.2.8 Glazing Films: Refer to Section 08 87 00.

## **2.3 Glazing Gaskets**

2.3.1 Dense Compression Gaskets (aluminum framing): Molded or extruded gaskets of profile and hardness required to maintain watertight seal, made from one of the following:

- .1 Silicone complying with ASTM C1115.
- .2 Acceptable Products: "VISIONstrip" by Tremco or approved equivalent.

2.3.2 Soft Compression Gaskets: Extruded or molded, closed-cell, integral-skinned silicone gaskets complying with ASTM C509, Type II, black; of profile and hardness required to maintain watertight seal.

- .1 Application: Use where soft compression gaskets will be compressed by inserting dense compression gaskets on opposite side of glazing or pressure applied by means of pressure-glazing stops on opposite side of glazing.

2.3.3 At fire-rated glazed doors and partitions, use similar sized fire-rated silicone as recommended by fire-rated glass manufacturer and identical to Product used in test assembly to obtain rating.

## **2.4 Glazing Sealants**

2.4.1 General:

- .1 Compatibility: Provide glazing sealants that are compatible with one another and with other materials they will contact, including glass products, seals of insulating-glass units, and glazing channel substrates, under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience.

- 
- .2 Suitability: Comply with sealant and glass manufacturers' written instructions for selecting glazing sealants suitable for applications indicated on Drawings and Schedules and for conditions existing at time of installation.
  - .3 Sealants used inside the weatherproofing system shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
  - .4 Colours of Exposed Glazing Sealants: As selected by Consultant from manufacturer's full range.
- 2.4.2 Glazing Sealant: Neutral-curing silicone glazing sealant complying with ASTM C920, Type S, Grade NS, Class 50, Use NT.
- .1 Acceptable Products:
    - .1 "DOWSIL 795 or DOWSIL 995" by Dow Chemical of Canada ULC
    - .2 "SilGlaze II SCS2800 or SilPruf NB SCS9000 or SilPruf SCS2000 or UltraPruf II SCS2900" by GE Advanced Materials - Silicones
    - .3 "864" or "895" or "898" by Pecora Corporation
    - .4 "SikaSil-C995" by Sika Corporation, Construction Products Division
    - .5 "Spectrem 2" or "Spectrem 3" by Tremco Incorporated
  - .2 Applications: Interior structural glazing applications.
- 2.4.3 Glazing Sealant: Neutral-curing silicone glazing sealant complying with ASTM C920, Type S, Grade NS, Class 25, Use NT.
- .1 Acceptable Products:
    - .1 "Dowsil 799" by Dow Chemical of Canada ULC
    - .2 "UltraGlaze SSG4000" or "UltraGlaze SSG4000AC" by GE Advanced Materials - Silicones
    - .3 "Tremsil 200" by Tremco Incorporated
  - .2 Applications: Non-structural sealing for butt-glazing in interior applications.
- 2.4.4 Glazing Sealants for Fire-Rated Glazing Acceptable Products: Products that are approved by testing agencies that listed and labeled fire-resistant glazing products with which they are used for applications and fire-protection ratings indicated on Drawings and Schedules.

## **2.5     Glazing Tapes**

- 2.5.1 Back-Bedding Mastic Glazing Tapes: Preformed, butyl-based, 100 percent solids elastomeric tape; nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod as recommended in writing by tape and glass manufacturers for application indicated; and complying with ASTM C1281 and AAMA 800 for products indicated below:
- .1 AAMA 806.3 tape, for glazing applications in which tape is subject to continuous pressure.
  - .2 AAMA 807.3 tape, for glazing applications in which tape is not subject to continuous pressure.
  - .3 Acceptable Products: "POLYshim II Tape" by Tremco or approved equivalent.

## **2.6     Miscellaneous Glazing Materials**

- 2.6.1 General: Provide products of material, size, and shape complying with referenced glazing standard, requirements of manufacturers of glass and other glazing materials for application indicated on Drawings and Schedules, and with a proven record of compatibility with surfaces contacted in installation.
- 2.6.2 Cleaners, Primers, and Sealers: Types recommended by sealant or gasket manufacturer.
- 2.6.3 Setting Blocks: Elastomeric EPDM material with a Shore, Type A durometer hardness of 85, plus or minus 5.
- 2.6.4 Spacers: Elastomeric EPDM blocks or continuous extrusions of hardness required by glass manufacturer to maintain glass lites in place for installation indicated on Drawings and Schedules.
- 2.6.5 Edge Blocks: Elastomeric EPDM material of hardness needed to limit glass lateral movement (side walking).
- 2.6.6 Cylindrical Glazing Sealant Backing: ASTM C1330, Type O (open-cell material), of size and density to control glazing sealant depth and otherwise produce optimum glazing sealant performance.
- 2.6.7 Perimeter Insulation for Fire-Resistive Glazing: Product that is approved by testing agency that listed and labeled fire-resistant glazing product with which it is used for application and fire-protection rating indicated on Drawings and Schedules.

## **2.7     Fabrication**

- 2.7.1 General Glass Fabrication Requirements: ASTM C1036, Type I, Quality-Q3, Class I (clear) or equivalent to CAN/CGSB-12.2.
- 2.7.2 Fabricate glazing units in sizes required to fit openings indicated on Drawings and Schedules for Project, with edge and face clearances, edge and surface conditions, and bite complying with

written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.

2.7.3 Clean-cut or flat-grind vertical edges of butt-glazed monolithic lites to produce square edges with slight chamfers at junctions of edges and faces.

2.7.4 Grind smooth and polish exposed glass edges and corners.

### **3 . EXECUTION**

#### **3.1 Examination**

3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

3.1.2 Examine framing, glazing channels, and stops, with Installer present, for compliance with the following:

- .1 Manufacturing and installation tolerances, including those for size, squareness, and offsets at corners.
- .2 Presence and functioning of weep systems.
- .3 Minimum required face and edge clearances.
- .4 Effective sealing between joints of glass-framing members.

3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Preparation**

3.2.1 Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings not firmly bonded to substrates.

3.2.2 Examine glazing units to locate exterior and interior surfaces. Label or mark units as needed so that exterior and interior surfaces are readily identifiable. Do not use materials that will leave visible marks in the completed work.

#### **3.3 Installation**

3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.

---

**3.4     Glazing**

- 3.4.1 Comply with combined written instructions of manufacturers of glass, sealants, gaskets, and other glazing materials, unless more stringent requirements are indicated on Drawings and Schedules, including those in referenced glazing publications.
- 3.4.2 Adjust glazing channel dimensions as required by Project conditions during installation to provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances.
- 3.4.3 Protect glass edges from damage during handling and installation. Remove damaged glass from Project site and legally dispose of off Project site. Damaged glass is glass with edge damage or other imperfections that, when installed, could weaken glass and impair performance and appearance.
- 3.4.4 Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction testing.
- 3.4.5 Install setting blocks in sill rabbets, sized and located to comply with referenced glazing publications, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.
- 3.4.6 Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.
- 3.4.7 Provide spacers for glass lites where length plus width is larger than 1270 mm (50 inches).
  - .1 Locate spacers directly opposite each other on both inside and outside faces of glass. Install correct size and spacing to preserve required face clearances, unless gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and to comply with system performance requirements.
  - .2 Provide 3-mm (1/8-inch) minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.
- 3.4.8 Provide edge blocking where indicated on Drawings and Schedules or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by glass manufacturer and according to requirements in referenced glazing publications.
- 3.4.9 Set glass lites in each series with uniform pattern, draw, bow, and similar characteristics.
- 3.4.10 Set glass lites with proper orientation so that coatings face exterior or interior as specified.

- 3.4.11 Where wedge-shaped gaskets are driven into one side of channel to pressurize sealant or gasket on opposite side, provide adequate anchorage so gasket cannot walk out when installation is subjected to movement.
- 3.4.12 Square cut wedge-shaped gaskets at corners and install gaskets in a manner recommended by gasket manufacturer to prevent corners from pulling away; seal corner joints and butt joints with sealant recommended by gasket manufacturer.

### **3.5     Tape Glazing**

- 3.5.1 Position tapes on fixed stops so that, when compressed by glass, their exposed edges are flush with or protrude slightly above sightline of stops.
- 3.5.2 Install tapes continuously, but not necessarily in one continuous length. Do not stretch tapes to make them fit opening.
- 3.5.3 Cover vertical framing joints by applying tapes to heads and sills first and then to jambs. Cover horizontal framing joints by applying tapes to jambs and then to heads and sills.
- 3.5.4 Place joints in tapes at corners of opening with adjoining lengths butted together, not lapped. Seal joints in tapes with compatible sealant approved by tape manufacturer.
- 3.5.5 Do not remove release paper from tape until right before each glazing unit is installed.
- 3.5.6 Apply heel bead of elastomeric sealant.
- 3.5.7 Center glass lites in openings on setting blocks and press firmly against tape by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings.
- 3.5.8 Apply cap bead of elastomeric sealant over exposed edge of tape.

### **3.6     Gasket Glazing (Dry)**

- 3.6.1 Cut compression gaskets to lengths recommended by gasket manufacturer to fit openings exactly, with allowance for stretch during installation.
- 3.6.2 Insert soft compression gasket between glass and frame or fixed stop so it is securely in place with joints miter cut and bonded together at corners.
- 3.6.3 Installation with Drive-in Wedge Gaskets: Center glass lites in openings on setting blocks and press firmly against soft compression gasket by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings. Compress gaskets to produce a weathertight seal

without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket manufacturer.

3.6.4 Installation with Pressure-Glazing Stops: Center glass lites in openings on setting blocks and press firmly against soft compression gasket. Install dense compression gaskets and pressure-glazing stops, applying pressure uniformly to compression gaskets. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket manufacturer.

3.6.5 Install gaskets so they protrude past face of glazing stops.

### **3.7 Sealant Glazing (Wet)**

3.7.1 Install continuous spacers, or spacers combined with cylindrical sealant backing, between glass lites and glazing stops to maintain glass face clearances and to prevent sealant from extruding into glass channel and blocking weep systems until sealants cure. Secure spacers or spacers and backings in place and in position to control depth of installed sealant relative to edge clearance for optimum sealant performance.

3.7.2 Force sealants into glazing channels to eliminate voids and to ensure complete wetting or bond of sealant to glass and channel surfaces.

3.7.3 Tool exposed surfaces of sealants to provide a substantial wash away from glass.

### **3.8 Protection**

3.8.1 Protect glass and glazing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.

3.8.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.

3.8.3 Promptly replace glass and glazing work damaged during construction that cannot be satisfactorily repaired.

### **3.9 Cleaning And Waste Management**

3.9.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.

3.9.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.

- 3.9.3 Wash glass on both exposed surfaces in each area of Project not more than four days before date scheduled for inspections that establish date of Substantial Performance of the Work. Wash glass as recommended in writing by glass manufacturer.
- 3.9.4 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the exterior glass and glazing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Curtain walls.
  - .2 Glazing in openings (doors, windows, and similar components) forming part of building envelope.
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 08 80 05 – General Requirements for Glass and Glazing

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Definitions**

- 1.4.1 Glass Manufacturers: Firms that produce primary glass, fabricated glass, or both, as defined in referenced glazing publications.
- 1.4.2 Glass Thicknesses: Indicated by thickness designations in millimeters according to ASTM C1036.
- 1.4.3 Glazing cavity: Space between lites of an insulating-glass unit.

---

**1.5     Preinstallation Meetings**

- 1.5.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.5.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.6     Submittals**

- 1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.6.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for exterior glass and glazing work specified in this Section.
- 1.6.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
- 1.6.4 Delegated Design Submittals:
  - .1 Engineering design completion of exterior glass and glazing work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.

- 
- .3 Submit copy of structural calculations upon request by Consultant.
  - 1.6.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
    - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
    - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
    - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
  - 1.6.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
    - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
    - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
  - 1.6.7 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:
    - .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
    - .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).
  - 1.6.8 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
    - .1 As a minimum submit samples of the following:
      - .1 Insulating glass
      - .2 Submit glazing accessory samples in accordance with Division 01 for gaskets and sealants, in 300-mm (12-inch) lengths. Install sealant Samples between two strips of material representative in colour of the adjoining framing system.
  - 1.6.9 Glazing Schedule: Submit glazing schedule list of glass types and thicknesses for each size opening and location. Use same designations indicated on Drawings and Schedules.

---

**1.7     Informational Submittals**

- 1.7.1 Product Certificates: Submit product certificates in accordance with Division 01 for glass and glazing products, from manufacturer.
- 1.7.2 Test and Evaluation Reports: Submit test reports based on evaluation of comprehensive tests performed by a qualified testing agency, for insulating glass, glazing sealants and glazing gaskets.
  - .1 Provide adhesion test reports on metal and glass tested in accordance with ASTM C794, 14 Day cure and 7 Day submersion.
  - .2 Submit test report for tensile adhesion properties of structural silicone sealants in accordance with test method procedures conforming to ASTM C1135.
  - .3 Submit compatibility test reports on gaskets, spacers, setting blocks materials in contact with structural sealants to ensure compatibility with sealant in accordance with ASTM C1087.
  - .4 Submit test data substantiating that stress on silicone sealants when exposed to maximum specified wind load does not exceed 20 psi and provides minimum safety factor of 2-1/2:1.
  - .5 Provide to sealant manufacturer, Shop Drawings showing size of lites, design loads and sealant dimensions for sealant manufacturer's evaluation and statement on stress.
  - .6 For glazing sealants, provide test reports based on testing current sealant formulations within previous 36-month period.
  - .7 If requested provide test report for resistance to wear and staining in accordance with ASTM C501 and ASTM C1378 respectively.

**1.8     Closeout Submittals**

- 1.8.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.8.2 Operating and Maintenance Data: Submit care and maintenance instructions for exterior glass and glazing to be included in building operation and maintenance manual.
- 1.8.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.9     Quality Assurance**

- 1.9.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.9.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and

---

Schedules, and whose work has resulted in construction with a track record of successful in-service performance.

- .1 For exterior glazing applications, Provide qualified installer who employs glass installers for this Project who are certified under “Window Wise” program of the Siding and Window Dealers Association of Canada.
- 1.9.3 Sealant Testing Agency Qualifications: An independent testing agency qualified according to ASTM C1021 to conduct the testing indicated.
- 1.9.4 Professional Engineer’s Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years’ experience providing engineering services of similar kind, scope, and complexity.
  - .1 Professional Engineer’s Responsibility:
    - .1 production and review of Shop Drawings,
    - .2 design and certification of exterior glass and glazing, including attachments for building construction, in accordance with applicable codes and regulations,
    - .3 stamping and signing of each Shop Drawing and associated calculations
- 1.9.5 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.9.6 Insulating-Glass Certification Program: Permanently marked either on spacers or on at least one component lite of units with appropriate certification label of FGIA/IGMAC.
- 1.9.7 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

---

**1.10 Delivery, Storage And Handling**

- 1.10.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.10.2 Deliver, store and handle exterior glass and glazing materials in accordance with manufacturer's written instructions.
- 1.10.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.10.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.10.5 Replace defective or damaged materials with new.
- 1.10.6 Comply with insulating-glass manufacturer's written recommendations for venting and sealing units to avoid hermetic seal ruptures due to altitude change.

**1.11 Field Conditions**

- 1.11.1 Environmental Restrictions: Do not proceed with glazing when ambient and substrate temperature conditions are outside limits permitted by glazing material manufacturers and when glazing channel substrates are wet from rain, frost, condensation, or other causes.
- 1.11.2 Field Measurements: Verify actual dimensions of construction contiguous with exterior glass and glazing by field measurements before fabrication.
- 1.11.3 Do not install glazing sealants when ambient and substrate temperature conditions are outside limits permitted by sealant manufacturer or below 7 deg C (44 deg F).

**1.12 Warranty**

- 1.12.1 Manufacturer's Extended Warranty for Low-E Coated-Glass: Manufacturer's standard form in which coated-glass manufacturer agrees to replace coated-glass units that deteriorate within specified warranty period. Deterioration of coated glass is defined as defects developed from normal use that are not attributed to glass breakage or to maintaining and cleaning coated glass contrary to manufacturer's written instructions. Defects include peeling, cracking, and other indications of deterioration in coating.
  - .1 Warranty Period: 10 years from date of Substantial Performance of the Work.
- 1.12.2 Manufacturer's Extended Warranty on Insulating Glass: Manufacturer's standard form in which insulating-glass manufacturer agrees to replace insulating-glass units that deteriorate within specified warranty period. Deterioration of insulating glass is defined as failure of hermetic seal under normal use that is not attributed to glass breakage or to maintaining and

cleaning insulating glass contrary to manufacturer's written instructions. Evidence of failure is the obstruction of vision by dust, moisture, or film on interior surfaces of glass.

.1 Warranty Period: 10 years from date of Substantial Performance of the Work.

1.12.3 Manufacturer's Extended Warranty for Laminated glass Units: Warrant laminated glass against defects and deficiencies in accordance with General Conditions of the Contract. Promptly correct defects or deficiencies which become apparent within warranty period, to satisfaction of Consultant and at no additional expense. Defects include but are not limited to: deterioration, edge separation, delamination, material obstructing vision glass and blemishes exceeding those allowed by GANA (LGSA) standards. Upon notification of such deterioration within the warranty period, Provide full replacement of glass units showing defects at no additional cost to Owner.

.1 Warranty Period: 5 years from Substantial Performance of the Work

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 Cardinal Glass Industries: <https://www.cardinalcorp.com/>
- .2 Guardian Industries Corporation:  
<http://www.guardian.com/us/en>
- .3 Viracon: <https://www.viracon.com/>
- .4 Vitro Architectural Glass (formerly PPG Industries, Inc.):  
<https://www.vitroglazings.com/>
- .5 Saint-Gobain Glass: <https://www.saint-gobain-glass.com/>

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

2.2.1 VOC Content and Emissions:

- .1 VOC Emissions: For applicable items in this Section, comply with CDPH Standard Method v1.2–2017 (CA Spec 01350) and ensure products are certified per UL 2818, SCS Global Gold, or equivalent.
- .2 VOC Content Requirements: Wet-applied materials used in scope of this Section must conform to the following:

- .1 Paints and Coatings: SCAQMD Rule 1113 or CARB SCM.
- .2 Adhesives and Sealants: SCAQMD Rule 1168.
- .3 Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

## **2.3 Glass Materials**

- 2.3.1 Refer to Section 08 80 05 for additional information.

## **2.4 Insulating-Glass Units, Generally**

- 2.4.1 Factory-assembled units consisting of sealed lites of glass separated by a dehydrated glazing cavity, qualified according to ASTM E2190 or equivalent to CAN/CGSB-12.8, and complying with other requirements specified.
  - .1 Sealing System: Dual seal, with polyisobutylene and silicone primary and secondary.
    - .1 Basis-of-Design (Silicone Secondary Seal): DOWSIL 982 by Dow Chemical of Canada ULC.
  - .2 Spacer: Stainless steel or Polypropylene covered stainless steel or Thermally broken aluminum.
    - .1 Basis-of-Design: "CHROMATECH ULTRA" by Roll-Tech A/S; <http://www.rolltech.dk>
  - .3 Desiccant: Molecular sieve or silica gel, or blend of both.

## **2.5 Insulating Glass Unit, Triple Glazed – Bird-Friendly (GL1A)**

- 2.5.1 Total unit thickness: 44 mm (1-3/4 in)
- 2.5.2 Exterior lite: Minimum 6 mm (1/4 in) thick, heat-strengthened glass unless indicated otherwise. Provide heat-soaked tempered glass where glass must be fully tempered based on thermal stress analysis for project.
  - .1 Thickness: Thickness indicated must be considered minimum. Increase thickness as required based on engineering design and analysis.
  - .2 Glass Substrate: "Starphire low-iron" by Vitro Architectural Glass (formerly PPG)
  - .3 Low E coating: on surface No. 2.
    - .1 Low E Basis-of-Design: "Solarban 72" by Vitro Architectural Glass (formerly PPG) or approved equivalent meeting aesthetic and performance criteria.

- .4 Bird-Friendly Coating: Acid-etched types, on surface No. 1 and complying with CSA A460 and City of Brampton Bird-Friendly Guidelines.
  - .1 Pattern: 5 mm (0.2 inch) diameter round dots, 50 mm x 50 mm (2 x 2 inch) diagonal spacing.
  - .2 Basis-of-Design Products: "AviProtek®" by Walker Glass/ Vitro Architectural Glass (formerly PPG) or approved equivalent meeting aesthetic and performance criteria:
    - .1 "Guardian Bird1st™ Etch" by Guardian Glass.
    - .2 "Surface One Eco-etch®" by Skyline Design.
    - .3 "PreAirSecur Etch with LowE #2" by Prelco.
- 2.5.3 Air Space 1: 14.3 mm (6/16 in.) argon filled (minimum 90% argon, 10% air)
- 2.5.4 Middle Lite: Minimum 6 mm (1/4 in) thick, heat-strengthened glass unless indicated otherwise. Provide heat-soaked tempered glass where glass must be fully tempered based on thermal stress analysis for project.
  - .1 Thickness: Thickness indicated must be considered minimum. Increase thickness as required based on engineering design and analysis.
  - .2 Glass Substrate: "Starphire low-iron" by Vitro Architectural Glass (formerly PPG)
- 2.5.5 Air Space 2: 14.3 mm (6/16 in.) argon filled (minimum 90% argon, 10% air)
- 2.5.6 Interior lite: Minimum 6 mm (1/4 in) fully-tempered unless indicated otherwise.
  - .1 Glass Substrate: "Starphire low-iron" by Vitro Architectural Glass (formerly PPG)
  - .2 Low E coating: on surface No. 5.
    - .1 Low E Basis-of-Design: "Sungate 400" by Vitro Architectural Glass (formerly PPG) or approved equivalent meeting aesthetic and performance criteria.
- 2.5.7 Performance Criteria (not including bird-frit):
  - .1 Visible Light Transmittance: 60 percent minimum.
  - .2 Exterior Solar Reflectance: 56 percent maximum +/- 1.
  - .3 Winter Nighttime U-Factor: 0.13 maximum.
  - .4 Solar Heat Gain Coefficient: 0.25 maximum.

## **2.6 Insulating Glass Unit - Triple Glazed – Guard Loads (GL1B)**

- 2.6.1 Total unit thickness: 44 mm (1-3/4 in)

- 
- 2.6.2 Exterior lite: Minimum 6 mm (1/4 in) thick, heat-strengthened glass unless indicated otherwise. Provide heat-soaked tempered glass where glass must be fully tempered based on thermal stress analysis for project.
- .1 Thickness: Thickness indicated must be considered minimum. Increase thickness as required based on engineering design and analysis.
  - .2 Glass Substrate: "Starphire low-iron" by Vitro Architectural Glass (formerly PPG)
  - .3 Low E coating: on surface No. 2.
    - .1 Low E Basis-of-Design: "Solarban 72" by Vitro Architectural Glass (formerly PPG) or approved equivalent meeting aesthetic and performance criteria.
  - .4 Bird-Friendly Coating: Acid-etched types, on surface No. 1 and complying with CSA A460 and City of Brampton Bird-Friendly Guidelines.
    - .1 Pattern: 5 mm (0.2 inch) diameter round dots, 50 mm x 50 mm (2 x 2 inch) diagonal spacing.
    - .2 Basis-of-Design Products: "AviProtek®" by Walker Glass/Vitro Architectural Glass (formerly PPG) or approved equivalent meeting aesthetic and performance criteria:
      - .1 "Guardian Bird1st™ Etch" by Guardian Glass.
      - .2 "Surface One Eco-etch®" by Skyline Design.
      - .3 "PreAirSecur Etch with LowE #2" by Prelco.
- 2.6.3 Air Space 1: 14.3 mm (6/16 in.) argon filled (minimum 90% argon, 10% air)
- 2.6.4 Middle Lite: Minimum 6 mm (1/4 in) thick, heat-strengthened glass unless indicated otherwise. Provide heat-soaked tempered glass where glass must be fully tempered based on thermal stress analysis for project.
- .1 Thickness: Thickness indicated must be considered minimum. Increase thickness as required based on engineering design and analysis.
  - .2 Glass Substrate: "Starphire low-iron" by Vitro Architectural Glass (formerly PPG)
- 2.6.5 Air Space 2: 14.3 mm (6/16 in.) argon filled (minimum 90% argon, 10% air)
- 2.6.6 Interior lite: Minimum 6 mm (1/4 in) fully-tempered, laminated unless indicated otherwise to meet OBC Guard Loads.
- .1 Glass Substrate: "Starphire low-iron" by Vitro Architectural Glass (formerly PPG)
  - .2 Low E coating: on surface No. 5.

- .1 Low E Basis-of-Design: "Sungate 400" by Vitro Architectural Glass (formerly PPG) or approved equivalent meeting aesthetic and performance criteria.

2.6.7 Performance Criteria:

- .1 Visible Light Transmittance: 60 percent minimum.
- .2 Exterior Solar Reflectance: 17 percent maximum +/- 1.
- .3 Winter Nighttime U-Factor: 0.21 maximum.
- .4 Solar Heat Gain Coefficient: 0.25 maximum.

**2.7 Insulating Glass Unit, Translucent, Double Glazed – Bird-Friendly (GL2)**

2.7.1 Total unit thickness: 44 mm (1.75 in)

2.7.2 Exterior lite: Minimum 6 mm (1/4 in) thick, heat-strengthened glass unless indicated otherwise. Provide heat-soaked tempered glass where glass must be fully tempered based on thermal stress analysis for project.

- .1 Thickness: Thickness indicated must be considered minimum. Increase thickness as required based on engineering design and analysis.
- .2 Glass Substrate: Clear
- .3 Light Diffusing Veil: on surface No. 2 and No. 3.
- .4 Bird-Friendly Coating: Acid-etched types, on surface No. 1 and complying with CSA A460 and City of Brampton Bird-Friendly Guidelines.

- .1 Pattern: 5 mm (0.2 inch) diameter round dots, 50 mm x 50 mm (2 x 2 inch) diagonal spacing.

2.7.3 Air Space: Filled with aerogel.

2.7.4 Interior lite: Minimum 6 mm (1/4 in) fully-tempered unless indicated otherwise.

- .1 Glass Substrate: Clear

2.7.5 Performance Criteria:

- .1 Visible Light Transmittance: 9-40 percent.
- .2 Winter Nighttime U-Factor: 0.11 maximum.
- .3 Solar Heat Gain Coefficient: 0.30-0.37 maximum.

2.7.6 Basis-of-Design: "Soleragel T R9 + Aerogel" by Advanced Lazing

**2.8 Insulating Glass Unit, Double Glazed (GL3)**

2.8.1 Total unit thickness: 25 mm (1 in)

2.8.2 Exterior lite: Minimum 6 mm (1/4 in) thick, heat-strengthened glass unless indicated otherwise. Provide heat-soaked tempered glass

where glass must be fully tempered based on thermal stress analysis for project.

- .1 Thickness: Thickness indicated must be considered minimum. Increase thickness as required based on engineering design and analysis.
- .2 Glass Substrate: "Starphire low-iron" by Vitro Architectural Glass (formerly PPG)
- .3 Low E coating: on surface No. 2.
  - .1 Low E Basis-of-Design: "Solarban 60" by Vitro Architectural Glass (formerly PPG) or approved equivalent meeting aesthetic and performance criteria:
    - .1 "SN 68" by Guardian Industries
    - .2 "VE 1-2M" by Viracon
    - .3 "LoE2-272" by Cardinal Glass Industries.
    - .4 "COOL-LITE SKN 176" II by Saint-Gobain Glass
  - .2 Bird-Friendly Coating: Acid-etched types, on surface No. 1 and complying with CSA A460 and City of Brampton Bird-Friendly Guidelines.
    - .1 Pattern: 5 mm (0.2 inch) diameter round dots, 50 mm x 50 mm (2 x 2 inch) diagonal spacing.
    - .2 Basis-of-Design Products: "AviProtek®" by Walker Glass/ Vitro Architectural Glass (formerly PPG) or approved equivalent meeting aesthetic and performance criteria:
      - .1 "Guardian Bird1st™ Etch" by Guardian Glass.
      - .2 "Surface One Eco-etch®" by Skyline Design.
      - .3 "PreAirSecur Etch with LowE #2" by Prelco.
- 2.8.3 Air Space: 13 mm (1/2 in.) argon filled (minimum 90% argon, 10% air)
- 2.8.4 Interior lite: Minimum 6 mm (1/4 in) fully-tempered unless indicated otherwise.
  - .1 Glass Substrate: "Starphire low-iron" by Vitro Architectural Glass (formerly PPG)
- 2.8.5 Performance Criteria:
  - .1 Visible Light Transmittance: 74 percent minimum.
  - .2 Exterior Solar Reflectance: 11 percent maximum +/- 1.
  - .3 Winter Nighttime U-Factor: 0.24 maximum.
  - .4 Solar Heat Gain Coefficient: 0.41 maximum.

---

**2.9      Glazing Materials And Accessories**

- 2.9.1 Provide products of material, size, and shape complying with referenced glazing standard, requirements of manufacturers of glass and other glazing materials for application indicated on Drawings and Schedules, and with a proven record of compatibility with surfaces contacted in installation.
- 2.9.2 Refer to Section 08 80 05 for additional requirements.

**2.10     Fabrication**

- 2.10.1 General Glass Fabrication Requirements: ASTM C1036, Type I, Quality-Q3, Class I (clear) or equivalent to CAN/CGSB-12.2.
- 2.10.2 Fabricate glazing units in sizes required to fit openings indicated on Drawings and Schedules for Project, with edge and face clearances, edge and surface conditions, and bite complying with written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.

**3 .      EXECUTION**

**3.1      Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Examine framing, glazing channels, and stops, with Installer present, for compliance with the following:
  - .1 Manufacturing and installation tolerances, including those for size, squareness, and offsets at corners.
  - .2 Presence and functioning of weep systems.
  - .3 Minimum required face and edge clearances.
  - .4 Effective sealing between joints of glass-framing members.

**3.2      Preconstruction Testing**

- 3.2.1 Preconstruction Adhesion and Compatibility Testing: Test each glazing material type, tape sealant, gasket, glazing accessory, and glass-framing member for adhesion to and compatibility with elastomeric glazing sealants.
  - .1 Testing will not be required if data are submitted based on previous testing of current sealant products and glazing materials matching those submitted.
  - .2 Use ASTM C1087 to determine whether priming and other specific joint-preparation techniques are required to obtain

rapid, optimum adhesion of glazing sealants to glass, tape sealants, gaskets, and glazing channel substrates.

- .3 Test no fewer than eight Samples of each type of material, including joint substrates, shims, sealant backings, secondary seals, and miscellaneous materials.
- .4 Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
- .5 For materials failing tests, submit sealant manufacturer's written instructions for corrective measures including the use of specially formulated primers.

### **3.3 Installation**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Refer to Section 08 80 05 as supplemented by requirements specified in this Section.

### **3.4 Preparation**

- 3.4.1 Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings not firmly bonded to substrates.
- 3.4.2 Examine glazing units to locate exterior and interior surfaces. Label or mark units as needed so that exterior and interior surfaces are readily identifiable. Do not use materials that will leave visible marks in the completed work.

### **3.5 Protection**

- 3.5.1 Protect exterior glass and glazing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.5.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.5.3 Promptly replace exterior glass and glazing work damaged during construction that cannot be satisfactorily repaired.

### **3.6 Cleaning And Waste Management**

- 3.6.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.

- 
- 3.6.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
  - 3.6.3 Wash glass on both exposed surfaces in each area of Project not more than four days before date scheduled for inspections that establish date of Substantial Performance of the Work. Wash glass as recommended in writing by glass manufacturer.
  - 3.6.4 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the interior glass and glazing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Glazing for interior applications including, but not limited to:
    - .1 swing doors, borrowed lites and screens.
    - .2 sliding doors, manual and automatic.
    - .3 custom mirrors.
    - .4 all-glass screens and entrances.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 08 80 05 – General Requirements for Glass and Glazing

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Definitions**

- 1.4.1 Glass Manufacturers: Firms that produce primary glass, fabricated glass, or both, as defined in referenced glazing publications.

1.4.2 Glass Thicknesses: Indicated by thickness designations in millimeters according to ASTM C1036.

1.4.3 Glazing cavity: Space between lites of an air-gap unit.

## **1.5 Preinstallation Meetings**

1.5.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.

1.5.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.

- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.6 Submittals**

1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.

1.6.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for interior glass and glazing work specified in this Section.

1.6.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:

- .1 Include plans, elevations, sections and details as applicable.
- .2 Indicate field-measured dimensions on Shop Drawings.

1.6.4 Delegated Design Submittals:

- 
- .1 Engineering design completion of interior glass and glazing work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.
- 1.6.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.7 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:
- .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
  - .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).
- 1.6.8 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
- .1 As a minimum submit samples of the following:
    - .1 Specialty and decorative glazing materials.

- 1.6.9 Glazing Schedule: Submit glazing schedule list of glass types and thicknesses for each size opening and location. Use same designations indicated on Drawings and Schedules.

**1.7 Closeout Submittals**

- 1.7.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.7.2 Operating and Maintenance Data: Submit care and maintenance instructions for interior glass and glazing to be included in building operation and maintenance manual.
- 1.7.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.8 Quality Assurance**

- 1.8.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.8.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.8.3 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
- .1 Professional Engineer's Responsibility:
- .1 production and review of Shop Drawings,
- .2 design and certification of interior glass and glazing, including attachments for building construction, in accordance with applicable codes and regulations,
- .3 stamping and signing of each Shop Drawing and associated calculations
- 1.8.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.8.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
- .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.9 Delivery, Storage And Handling**

- 1.9.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.9.2 Deliver, store and handle interior glass and glazing materials in accordance with manufacturer's written instructions.
- 1.9.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.9.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.9.5 Replace defective or damaged materials with new.

**1.10 Field Conditions**

- 1.10.1 Environmental Restrictions: Do not deliver or install interior glass and glazing until building is enclosed, wet work is complete, and HVAC system is operational and will maintain temperature and relative humidity levels equal to occupancy levels for remainder of construction period.
- 1.10.2 Field Measurements: Verify actual dimensions of construction contiguous with interior glass and glazing by field measurements before fabrication.
- 1.10.3 Do not install glazing sealants when ambient and substrate temperature conditions are outside limits permitted by sealant manufacturer or below 7 deg C (44 deg F).

**1.11 Warranty**

- 1.11.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of interior glass and glazing that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Warranty Period: Not less than 5 years from date of Substantial Performance of The work.

---

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

.1 Fire-rated Glazing:

- .1 Nippon Electric Glass Co., Ltd. / Technical Glass Products (TGP)
- .2 Pilkington Group Limited / Technical Glass Products (TGP)
- .3 Safti First
- .4 Schott North America, Inc.
- .5 Vetrotech Saint-Gobain

.2 Glazing Sealant:

- .1 Dow Chemical of Canada ULC
- .2 GE Advanced Materials - Silicones
- .3 Pecora Corporation
- .4 Sika Corporation, Construction Products Division
- .5 Tremco Incorporated

.3 Ultraclear (low-iron) Glass:

- .1 Cardinal Glass
- .2 Guardian Glass Industries
- .3 Pilkington North America
- .4 Saint-Gobain Glass
- .5 Vitro Architectural Glass (formerly PPG Industries, Inc.)

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

2.2.1 Unless indicated otherwise, all interior glazing to ultraclear / 'low-iron' type.

2.2.2 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on glass framing members and glazing components.

2.2.3 VOC Content and Emissions:

- .1 VOC Emissions: For applicable items in this Section, comply with CDPH Standard Method v1.2–2017 (CA Spec 01350) and ensure products are certified per UL 2818, SCS Global Gold, or equivalent.

- .2 VOC Content Requirements: Wet-applied materials used in scope of this Section must conform to the following:
  - .1 Paints and Coatings: SCAQMD Rule 1113 or CARB SCM.
  - .2 Adhesives and Sealants: SCAQMD Rule 1168.
  - .3 Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

**2.3     Glass Materials, Generally**

- 2.3.1 Refer to Section 08 80 05.

**2.4     Tempered Glass (GL10)**

- 2.4.1 Low-iron, ASTM C1048 Type I; Quality-Q3; Class I (clear); Kind FT or equivalent to CAN/CGSB-12.1. Perform heat strengthening using horizontal tong free method; surface compression not less than 69 MPa (10,000 psi). Glazing must comply with testing requirements in 16 CFR 1201 for Category II materials.
- 2.4.2 Refer to Drawings for thickness.
- 2.4.3 Acceptable Low-Iron Products:
  - .1 Optiwhite - Pilkington North America
  - .2 Starphire Ultra-Clear Glass - Vitro Architectural Glass
  - .3 Guardian UltraClear - Guardian Industries Corp.
  - .4 Diamant - Saint-Gobain Glass

**2.5     Laminated Glass (GL11, GL12, GL13)**

- 2.5.1 Low-iron, ASTM C1172, and complying with testing requirements in 16 CFR 1201 for Category II materials, and with other requirements specified in this Section. Use materials that have a proven record of no tendency to bubble, discolour, or lose physical and mechanical properties after fabrication and installation.
- 2.5.2 Construction: Unless indicated otherwise, laminate glass with interlayer to comply with interlayer manufacturer's written recommendations and specifications indicated for individual assemblies.
  - .1 Interlayer Thickness: Provide thickness indicated in specific assemblies and as needed to comply with requirements, but not less than 1.5 mm (60 mil). Provide ionoplast (SGP) interlayer at guards, and PVB at other locations.
  - .2 Assembly thickness: Refer to Drawings for thickness.
  - .3 Refer to Section 08 87 00, Glazing Surface Films for applied films.

.4 Interlayer Colour: Clear unless otherwise indicated.

2.5.3 Acceptable Low-Iron Products:

- .1 Optiwhite - Pilkington North America
- .2 Starphire Ultra-Clear Glass - Vitro Architectural Glass
- .3 Guardian UltraClear - Guardian Industries Corp.
- .4 Diamant - Saint-Gobain Glass

**2.6 Fire-Rated Glass (GL14)**

2.6.1 Following types are acceptable: to CAN/ULC S104 and CAN/ULC S106.

.1 Film-Faced Type: Clear, ceramic flat glass; 13-mm (1/2-inch) nominal thickness; faced on one surface with a clear glazing film; complying with testing requirements in 16 CFR 1201 for Category II materials.

.1 Acceptable Products:

- .1 "FireLite NT" by Nippon Electric Glass Co., Ltd.  
(distributed by Technical Glass Products)
- .2 "Pyran Platinum F" by Schott North America, Inc.  
(McGrory Glass),
- .3 "Keralite F" by Vetrotech Saint-Gobain

.2 Laminated glass made from multiple plies of uncoated, clear glass; with intumescent interlayers or fully transparent, heat-absorbing gel; complying with testing requirements in 16 CFR 1201 for Category II materials and CAN/ULC S101.

.1 Acceptable Products:

- .1 "Pyrobel" by AGC (McGrory Glass),
- .2 "PyroStop" by Pilkington Group Limited  
(distributed by Technical Glass Products)
- .3 "SGG Contraflam" or "SGG Swissflam" by  
Vetrotech Saint-Gobain (McGrory Glass),
- .4 "SuperLite II" by Safli First

**2.7 Glazing Materials And Accessories**

2.7.1 Provide products of material, size, and shape complying with referenced glazing standard, requirements of manufacturers of glass and other glazing materials for application indicated on Drawings and Schedules, and with a proven record of compatibility with surfaces contacted in installation.

2.7.2 Refer to Section 08 80 05 for additional requirements.

---

**2.8     Fabrication**

- 2.8.1 General Glass Fabrication Requirements: ASTM C1036, Type I, Quality-Q3, Class I (clear) or equivalent to CAN/CGSB-12.2.
- 2.8.2 Fabricate glazing units in sizes required to fit openings indicated on Drawings and Schedules for Project, with edge and face clearances, edge and surface conditions, and bite complying with written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.
- 2.8.3 Mirrors:
  - .1 Cutouts: Fabricate cutouts for notches and holes in mirrors without marring visible surfaces. Locate and size cutouts so they fit closely around penetrations in mirrors.
  - .2 Seal edges of mirrors with edge sealer after edge treatment to prevent chemical or atmospheric penetration of glass coating.
  - .3 Require mirror manufacturer to perform edge treatment and sealing in factory immediately after cutting to final sizes.
  - .4 Apply film backing with adhesive coating over mirror backing paint as recommended in writing by film-backing manufacturer to produce a surface free of bubbles, blisters, and other imperfections.
- 2.8.4 Decorative Glass:
  - .1 Fabricate decorative glass and provide other glazing products in sizes required to glaze openings indicated on Drawings and Schedules for Project, with edge and face clearances, edge and surface conditions, and bite complying with recommendations of product manufacturer and referenced glazing standard.
  - .2 Clean cut or flat grind vertical edges of butt-glazed lites in a manner that produces square edges with slight kerfs.
- 2.8.5 Glazing Film: Apply glazing squarely aligned to glass edges, uniformly smooth, and free from tears, air bubbles, wrinkles, and rough edges in pattern indicated on reviewed Shop Drawings and with graphic images as indicated to the back face of clean glass, according to manufacturer's written instructions, including surface preparation and application temperature limitations.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

- 3.1.2 Examine framing, glazing channels, and stops, with Installer present, for compliance with the following:
  - .1 Manufacturing and installation tolerances, including those for size, squareness, and offsets at corners.
  - .2 Presence and functioning of weep systems.
  - .3 Minimum required face and edge clearances.
  - .4 Effective sealing between joints of glass-framing members.

### **3.2     Preparation**

- 3.2.1 Clean glazing channels and other framing members receiving glass immediately before glazing. Remove coatings not firmly bonded to substrates.
- 3.2.2 Examine glazing units to locate interior surfaces. Label or mark units as needed so that interior and interior surfaces are readily identifiable. Do not use materials that will leave visible marks in the completed work.

### **3.3     Installation**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Refer to Section 08 80 05 as supplemented by requirements specified in this Section.

### **3.4     Film Application**

- 3.4.1 Install film in accordance with manufacturer's instructions. Cut film edges neatly and square at a uniform distance of 3 mm (1/8 inch) to 1.5 mm (1/16 inch) of glazing sealants.
- 3.4.2 Apply slip solution on glass and adhesive to facilitate proper positioning of film.
- 3.4.3 Apply film to glass and spray film with slip solution.
- 3.4.4 Squeegee from top to bottom of window. Spray slip solution to film and squeegee again.
- 3.4.5 Bump film edge with lint-free towel wrapped around edge of a 5-way tool.
- 3.4.6 Upon completion of application, allow 30 days for moisture from film installation to dry, and to allow film to dry with no moisture dimples when viewed under normal viewing conditions.
- 3.4.7 In exterior applications, Provide edge sealing as recommended by manufacturer.

- 3.4.8 In security applications, Install film attachment system according to manufacturer's instructions. Provide minimum bead overleap as required to ensure impact-resistance specified in this Section can be achieved.

### **3.5 Mirror Installation**

- 3.5.1 Install mirrors to comply with mirror manufacturer's written instructions and with referenced GANA publications. Mount mirrors accurately in place in a manner that avoids distorting reflected images.
- 3.5.2 Provide a minimum air space of 3 mm (1/8 inch) between back of mirrors and mounting surface for air circulation between back of mirrors and face of mounting surface.
- 3.5.3 Wall-Mounted Mirrors: Install mirrors with mastic and mirror hardware. Attach mirror hardware securely to mounting surfaces with mechanical fasteners installed with anchors or inserts as applicable. Install fasteners so heads do not impose point loads on backs of mirrors.
- .1 Install mastic as follows:
- .1 Apply barrier coat to mirror backing where approved in writing by manufacturers of mirrors and backing material.
- .2 Apply mastic to comply with mastic manufacturer's written instructions for coverage and to allow air circulation between back of mirrors and face of mounting surface.
- .3 After mastic is applied, align mirrors and press into place while maintaining a minimum air space of 3 mm (1/8 inch) between back of mirrors and mounting surface.

### **3.6 Protection**

- 3.6.1 Protect interior glass and glazing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.6.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.6.3 Promptly replace interior glass and glazing work damaged during construction that cannot be satisfactorily repaired.

### **3.7 Cleaning And Waste Management**

- 3.7.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.

- 
- 3.7.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
  - 3.7.3 Wash glass on both exposed surfaces in each area of Project not more than four days before date scheduled for inspections that establish date of Substantial Performance of the Work. Wash glass as recommended in writing by glass manufacturer.
  - 3.7.4 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Glazing Surface Films specified herein. This includes, but is not necessarily limited, to:
  - .1 Glazing films as specified in this Section.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
  - .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 08 80 05 General Requirements for Glass and Glazing

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Preinstallation Meetings**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will

follow. Advise Consultant and Owner in advance of scheduled meeting dates.

- .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
- .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

## **1.5 Submittals**

1.5.1 Product Data: Submit product data in accordance with Division 01 for the following:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Glazing Surface Films work and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Provide documentation confirming that adhesive used on for specified films is Pressure Sensitive Adhesive (PSA) allowing for removal of film at end of useful life.
- .3 Low-Emitting Materials: Submit certifications indicating compliance with the following:
  - .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017 "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers", using the applicable exposure scenario.
  - .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).
  - .4 Submit copy of installation, storage and maintenance instructions.

1.5.2 Product Disclosure and Transparency:

- .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
- .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
  - .1 Health Product Declaration open Standard,
  - .2 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,

- .3 International Living Future Institute Declare
- .4 Other approved framework.
- .3 When multiple Products are specified, give preference to Products with compliant documentation.
- 1.5.3 Test Reports: Submit copy of test report demonstrating compliance with requirement specified in this Section.
- 1.5.4 Samples: Submit samples of the following items:
  - .1 For each film specified, provide two samples representing actual film colour and pattern.

## **1.6 Quality Assurance**

- 1.6.1 Manufacturer Qualifications: Provide Products for Work of this Section by manufacturer with minimum 10 years' experience in the manufacture of such materials.
- 1.6.2 Installer Qualifications: For the work of this Section, engage an entity with at least 5 years' experience in installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
  - .1 Upon request, submit documentation confirming that installer is authorized by manufacturer to perform Work specified in this section.
- 1.6.3 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from 1 source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.
- 1.6.4 Mock-Ups: Provide mock-up as required to demonstrate quality of workmanship.
  - .1 Location: to be determined on site by Consultant.
  - .2 Do not proceed with remaining work until workmanship, colour, and sheen are confirmed by Consultant.
  - .3 Refinish mock-up area as required to produce acceptable work.

## **1.7 Delivery, Storage And Handling**

- 1.7.1 Deliver, store and handle materials in accordance with manufacturer's written instructions .
- 1.7.2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

1.7.3 Storage and Handling Requirements: Store materials in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.

1.7.4 Replace defective or damaged materials with new.

**1.8 Site Conditions**

1.8.1 Maintain environmental conditions (temperature, relative humidity, and ventilation) within manufacturer-specified parameters. Do not install products in conditions that exceed the manufacturer's recommended limits.

**1.9 Warranty**

1.9.1 Extended Warranty: Repair or replace Glazing Surface Films that fail in materials or workmanship within specified warranty period.

- .1 Warranty Period: Five years from Substantial Performance of the Work.
- .2 Defects include, but are not limited to: loss of peel adhesive, excessive hazing and similar defects under normal use conditions.

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 3M c/o Convenience Group;  
<https://www.conveniencegroup.com/>
- .2 Solyx Films; <https://www.solyxfilms.com/>
- .3 Madico Window Films; <https://madico.com/>
- .4 Saint-Gobain Solar Gard LLC; <https://www.solargard.com/>

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Regulatory Requirements**

2.2.1 Fire Performance Criteria: Glazing surface films specified in this Section must comply with following criteria based on testing performed by a recognized testing agency acceptable to Authorities Having Jurisdiction.

- .1 Test Method: CAN/ULC-S102/S102.2 with following results:
  - .1 Flame-Spread Rating: not more than 25.
  - .2 Smoke-Developed Classification: not more than 55.

---

**2.3     Design And Performance Requirements**

- 2.3.1 Abrasion Resistance: film must have an abrasion-resistant surface coating that results in less than a 2% increase in transmitted light haze when evaluated in accordance with ASTM D1044 utilizing 100 cycles, 500 grams weight, and CS10F Calibrase Wheel.
- 2.3.2 UV Light Rejection: Minimum of 99 percent UV light rejection (300 - 380 nm) per ASTM E903.

**2.4     Privacy Film**

- 2.4.1 Translucent, dimensionally stable cast PVC film, with pressure-sensitive clear adhesive back for adhering to glass and releasable protective backing.
  - .1 Thickness: minimum 0.08 mm (3.2 mil)
  - .2 Basis-of-Design: "Scotchcal Dusted Crystal" by 3M Canada or approved equivalent.

**2.5     Printable Decorative Glazing Film**

- 2.5.1 Optically-clear, dimensionally stable cast PVC film, with pressure-sensitive clear adhesive back for adhering to glass and releasable protective backing.
  - .1 Thickness: minimum 0.05 mm (2 mil)
  - .2 Use: Exterior and interior applications.
  - .3 Outdoor Durability: Not less than five years.
  - .4 Graphic: To be supplied by Consultant at a later date.
  - .5 Printing method: As recommended by film manufacturer to authenticate warranties.
  - .6 Overlamine: As recommended by film manufacturer for specific conditions.
  - .7 Basis-of-Design: "Scotchcal Clear View Graphic Film" or "Scotchcal Electrocut Graphic Film" (in double-sided applications) by 3M Canada or approved equivalent.

**2.6     Accessories**

- 2.6.1 Adhesive: Manufacturer's standard low-VOC pressure-sensitive adhesive (PSA) for application conditions. Clear Dry Adhesives (CDA) are not permitted.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions

---

which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

**3.2      Preparation**

- 3.2.1 Thoroughly clean surfaces prior to installation. Prepare surfaces according to manufacturer's recommendations for achieving the optimal results for substrates under project conditions.

**3.3      Film Installation**

- 3.3.1 Install in accordance with manufacturer's instructions.
- 3.3.2 Cut film edges neatly and squarely at a consistent distance of 3 to 1.5 mm (1/8 to 1/16 inch) from window sealant. Replace blade tips every three to four cuts.
- 3.3.3 Spray a slip solution onto the window glass and adhesive to facilitate proper film placement.
- 3.3.4 Apply film to glass and lightly mist with slip solution.
- 3.3.5 Squeegee window from top to bottom. Spray slip solution onto film and squeegee again.
- 3.3.6 Rake film edge with lint-free towel wrapped around the edge of five-way tool.
- 3.3.7 Allow 30 days for moisture from film installation to dry thoroughly, and allow film to dry flat with no moisture dimples when viewed under normal viewing conditions.
- 3.3.8 Provide edge sealing of film in exterior applications.

**3.4      Cleaning And Protection**

- 3.4.1 Remove left over material and debris from Work area. Use necessary means to protect film before, during, and after installation.
- 3.4.2 Touch-up, repair or replace damaged products before Substantial Performance of the Work.
- 3.4.3 After application of film, wash film using common window cleaning solutions, including ammonia solutions, 30 days after application.
- 3.4.4 Protect film from scratching film by avoiding use of abrasive cleaning agents and bristle brushes. Utilize synthetic sponges or soft cloths.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### 1.2 **Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Fixed Louvers work specified herein. This includes, but is not necessarily limited, to:
- .1 Fixed, extruded-aluminum louvres.
  - .2 \Blank-off panels for louvres
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
- .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 08 11 13, Hollow Metal Doors and Frames for louvres in hollow-metal doors.
    - .2 Section 08 14 16, Flush Wood Doors for louvres in flush wood doors.
    - .3 Section 09 91 13, Exterior Painting for field painting louvres.

### 1.3 **References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### 1.4 **Definitions**

- 1.4.1 Louvre Terminology: Definitions of terms for metal louvres contained in AMCA 501 apply to this Section unless otherwise defined in this Section or in referenced standards.
- 1.4.2 Horizontal Louvre: Louvre with horizontal blades (i.e., the axis of the blades is horizontal).
- 1.4.3 Vertical Louvre: Louvre with vertical blades (i.e., the axis of the blades is vertical).

- 1.4.4 Drainable-Blade Louvre: Louvre with blades having gutters that collect water and drain it to channels in jambs and mullions, which carry it to bottom of unit and away from opening.
- 1.4.5 Wind-Driven-Rain-Resistant (Storm-resistant) Louvre: Louvre that provides specified wind-driven-rain performance, as determined by testing according to AMCA 500-L.
- 1.4.6 Windborne-Debris-Impact-Resistant Louvre: Louvre that provides specified windborne-debris-impact resistance, as determined by testing according to AMCA 540.

## **1.5      Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for the following:
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Fixed Louvers work and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 For louvres specified to bear AMCA seal, include printed catalog pages showing specified models with appropriate AMCA Certified Ratings Seals.
- 1.5.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for louvres and accessories. Include plans, elevations, sections, details, and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.
  - .1 Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion.
  - .2 Show mullion profiles and locations.
- 1.5.3 Samples: Submit samples in accordance with Division 01 for each type of metal finish required.
- 1.5.4 Professional Engineer's Stamped Shop Drawings and Submittals: For louvres indicated to comply with structural and seismic performance requirements and design criteria, including analysis data signed and sealed by the qualified Professional Engineer responsible for their preparation.

## **1.6      Informational Submittals**

- 1.6.1 Product Test Reports: Submit product test reports test reports based on evaluation of comprehensive tests performed according to AMCA 500-L by a qualified testing agency or by manufacturer and witnessed by a qualified testing agency, for each type of louvre and showing compliance with performance requirements specified.

- 1.6.2 Sample Warranties: Submit sample warranties in accordance with Division 01 for extended warranties specified in this Section..

**1.7 Quality Assurance**

1.7.1 Welding Qualifications:

- .1 Provide welding in accordance with CSA W59-M performed by a fabricator and mechanics fully approved by the Canadian Welding Bureau as specified herein.
- .2 Ensure fabricator is fully certified by Canadian Welding Bureau for fusion welding of steel structures to CSA W47.1 and for fusion welding of aluminum to CSA W47.2.

- 1.7.2 Source Limitations: Obtain fixed louvres from single source from a single manufacturer where indicated to be of same type, design, or factory-applied colour finish.

**1.8 Field Conditions**

- 1.8.1 Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

**1.9 Warranty**

- 1.9.1 Extended Warranty for Finishes: Repair or replace components on which finishes fail in materials or workmanship within specified warranty period.

- .1 Deterioration includes, but is not limited to, the following:
  - .1 Colour fading more than 5 Hunter units when tested according to ASTM D2244.
  - .2 Chalking in excess of a No. 8 rating when tested according to ASTM D4214.
  - .3 Cracking, checking, peeling, or failure of paint to adhere to bare metal.
- .2 Warranty Period: 10 years from date of Substantial Performance of the Work.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Airolite Company, LLC (The).
- .2 Construction Specialties, Inc.
- .3 Greenheck Fan Corporation.

- .4 Nystrom, Inc.
- .5 TenPlus
- .6 Ventex
- .7 E.H Price

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Performance Requirements**

2.2.1 Professional Engineering Design and Certification: Design louvres, including comprehensive engineering analysis by a Professional Engineer licensed to practice in the Province of Ontario, using structural performance requirements and design criteria indicated.

2.2.2 Structural Performance: Louvres shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of louvre components, noise or metal fatigue caused by louvre-blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building.

- .1 Wind Loads: Determine loads based on pressures as indicated on Drawings.
- .2 Limit louvre member deflection  $L/180$ .
- .3 Provide additional structural supports as required to adequately secure louvres within openings.
- .4 Vibration Control: Ensure louvre members do not vibrate when subjected to above wind loading. Provide integral bosses as required.

2.2.3 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.

- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
- .2 Refer to Structural Drawings for seismic sensitivity values.

2.2.4 Louvers shall be designed to withstand a 25 psf (100 mph wind equivalent) wind load. Louver performance shall be based on tests and procedures in accordance with AMCA publication 511 and comply with the requirements of the AMCA Certified Rating Program.

2.2.5 Louver performance shall be based on tests and procedures in accordance with AMCA publication 500-L. Louver blades and

---

frames shall be minimum 0.081 inch wall thickness. Louver assemblies shall be 4 inches deep with 39-degree stationary drainable blades. Louvers shall be welded construction.

- 2.2.6 Seismic Performance: Louvres, including attachments to other construction, shall withstand the effects of earthquake motions determined according to the requirements of the Ontario Building Code.
- 2.2.7 Louvre Performance Ratings (based on testing on a 1220 mm x 1220 mm (4 ft x 4ft) unit): Provide louvres complying with requirements specified, as demonstrated by testing manufacturer's stock units identical to those provided, except for length and width according to AMCA 500-L and AMC 511.
- 2.2.8 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.
  - .1 Temperature Change (Range): 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.
- 2.2.9 SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

## **2.3 Materials**

- 2.3.1 Aluminum Extrusions: ASTM B 221M (ASTM B 221), Alloy 6063-T5, T-52, or T6.
- 2.3.2 Aluminum Sheet: ASTM B 209M (ASTM B 209), Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.
- 2.3.3 Fasteners: Use types and sizes to suit unit installation conditions.
  - .1 Use hex-head or Phillips pan-head screws for exposed fasteners unless otherwise indicated.
  - .2 For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.
  - .3 For fastening galvanized steel, use hot-dip-galvanized steel or 300 series stainless-steel fasteners.
  - .4 For fastening stainless steel, use 300 series stainless-steel fasteners.
  - .5 For color-finished louvres, use fasteners with heads that match colour of louvres.
- 2.3.4 Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187.

---

**2.4     Horizontal, Wind-Driven-Rain-Resistant (Storm-Resistant) Louvre (LVR-1)**

- 2.4.1 Louvre Depth: As indicated on Drawings.
- 2.4.2 Frame and Blade Nominal Thickness: Not less than 1.52 mm (0.060 inch) for blades and 2.03 mm (0.080 inch) for frames.
- 2.4.3 Louvre Performance Ratings (based on testing on a 1220 mm x 1220 mm (4 ft x 4ft) unit):
  - .1 Free Area: Not less than 0.63 sq. m (6.76 sq. ft.) for 1220-mm- (48-inch-) wide by 1220-mm- (48-inch-) high louvre.
  - .2 Percent free area: Not less than 50.0%
  - .3 Free Area Velocity at Point of Beginning Water Penetration: Not less than 6.35 m/s (1250 fpm).
  - .4 Intake Pressure Drop: Not more than 91-Pa (0.37-inch wg) static pressure drop at 5.3 m/s (1050-fpm) free-area intake velocity.
  - .5 Exhaust Pressure Drop: Not more than 124-Pa (0.5-inch wg) static pressure drop at 6.9 m/s (1357 fpm) exhaust velocity.
  - .6 Wind-Driven Rain Performance: Class A - Not less than 99 percent effectiveness when subjected to a rainfall rate of 200 mm (8 inches) per hour.
- 2.4.4 AMCA Seal: Mark units with AMCA Certified Ratings Seal.
- 2.4.5 Basis-of-Design:
  - .1 4-inch louvre:
    - .1 "Model RS-4700" by Construction Specialties.
    - .2 "Model EHH401" by Greenheck
  - .2 5-inch louvre:
    - .1 "Model EHH501" by Greenheck
  - .3 7-inch louvre:
    - .1 "Model RS-7705" by Construction Specialties.
    - .2 "Model EHH701" by Greenheck

**2.5     Louvre Screens**

- 2.5.1 General: Provide screen at each exterior louvre.
  - .1 Screen Location for Fixed Louvres: Interior face.
  - .2 Screening Type: Bird screening.
- 2.5.2 Secure screen frames to louvre frames with stainless-steel machine screws, spaced a maximum of 150 mm (6 inches) from each corner and at 300 mm (12 inches) o.c.
- 2.5.3 Louvre Screen Frames: Fabricate with mitered corners to louvre sizes indicated.

- .1 Metal: Same type and form of metal as indicated for louver to which screens are attached. Reinforce extruded-aluminum screen frames at corners with clips.
- .2 Finish: Same finish as louver frames to which louver screens are attached.

2.5.4 Louvre Screening for Aluminum Louvers:

- .1 Bird Screening: Aluminum, 13-mm- (1/2-inch-) square mesh, 1.60-mm (0.063-inch) wire or flattened, expanded aluminum, 19 by 1.27 mm (3/4 by 0.050 inch) thick.

**2.6 Blank-Off Panels**

2.6.1 Insulated, Blank-Off Panels: Laminated panels consisting of an insulating core surfaced on back and front with metal sheets and attached to back of louver.

- .1 Thickness: Not less than 50 mm (2 inches) unless otherwise indicated on Drawings.
- .2 Metal Facing Sheets: Aluminum sheet, not less than 1-mm (0.039-inch) nominal thickness.
- .3 Insulating Core: Rigid, glass-fiber-board insulation or mineral wool insulation.
- .4 Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer's standard extruded-aluminum-channel frames, not less than 2.03-mm (0.080-inch) nominal thickness, with corners mitered and with same finish as panels.
- .5 Seal perimeter joints between panel faces and louver frames with gaskets or sealant.
- .6 Panel Finish: Same finish applied to louvers.
- .7 Attach blank-off panels with sheet metal screws.

**2.7 Fabrication**

- 2.7.1 Factory assemble louvers to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
- 2.7.2 Maintain equal louver blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.
- 2.7.3 Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.

- 2.7.4 Include supports, anchorages, and accessories required for complete assembly.
- 2.7.5 Provide vertical mullions of type and at spacings indicated, but not more than is recommended by manufacturer, or 1830 mm (72 inches) o.c., whichever is less.
  - .1 Fully Recessed Mullions: Where indicated, provide mullions fully recessed behind louvre blades. Where length of louvre exceeds fabrication and handling limitations, fabricate with close-fitting blade splices designed to permit expansion and contraction.
  - .2 Semirecessed Mullions: Where indicated, provide mullions partly recessed behind louvre blades so louvre blades appear continuous. Where length of louvre exceeds fabrication and handling limitations, fabricate with interlocking split mullions and close-fitting blade splices designed to permit expansion and contraction.
  - .3 Exposed Mullions: Where indicated, provide units with exposed mullions of same width and depth as louvre frame. Where length of louvre exceeds fabrication and handling limitations, provide interlocking split mullions designed to permit expansion and contraction.
  - .4 Exterior Corners: Prefabricated corner units with mitered and welded blades and with fully recessed mullions at corners.
- 2.7.6 Provide subsills made of same material as louvres for recessed louvres.
- 2.7.7 Join frame members to each other and to fixed louvre blades with fillet welds concealed from view unless otherwise indicated or size of louvre assembly makes bolted connections between frame members necessary.

## **2.8 Aluminum Finishes**

- 2.8.1 Finish louvres after assembly.
- 2.8.2 High-Performance Organic Finish: Three-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70percent PVDF resin by weight in both colour coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
  - .1 Colour and Gloss: As selected by Consultant from manufacturer's full range.

---

### **3 .     EXECUTION**

#### **3.1     Manufacturer's Instructions**

- 3.1.1 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.

#### **3.2     Examination**

- 3.2.1 Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- 3.2.2 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.3     Preparation**

- 3.3.1 Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

#### **3.4     Installation**

- 3.4.1 Locate and place louvres level, plumb, and at indicated alignment with adjacent work.
- 3.4.2 Use concealed anchorages where possible. Provide brass washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.
- 3.4.3 Form closely fitted joints with exposed connections accurately located and secured.
- 3.4.4 Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.
- 3.4.5 Protect unpainted galvanized and nonferrous-metal surfaces that are in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint or by separating surfaces with waterproof gaskets or nonmetallic flashing.
- 3.4.6 Install concealed gaskets, flashings, joint fillers, and insulation as louvre installation progresses, where weathertight louvre joints are required. Comply with Section 07 92 00, Joint Sealants for sealants applied during louvre installation.

#### **3.5     Field Quality Control**

- 3.5.1 Manufacturer Services: Arrange for Product manufacturer's technical representative to:

- 
- .1 meet and discuss installation procedures and unique conditions at the Place of the Work.
  - .2 inspect substrate surfaces and recommend solutions to accommodate adverse conditions.
  - .3 periodically visit and inspect installation and report unsatisfactory conditions to Contractor.
  - .4 attend final inspection and to submit written certification that Products, systems and assemblies have been installed in accordance with manufacturer's requirements.

**3.6 Adjusting And Cleaning**

- 3.6.1 Clean exposed louvre surfaces that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.
- 3.6.2 Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.
- 3.6.3 Restore louvres damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Consultant, remove damaged units and replace with new units.
  - .1 Touch up minor abrasions in finishes with air-dried coating that matches colour and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION

## **1. GENERAL**

### **1.1 GENERAL INSTRUCTIONS**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 SUMMARY**

- 1.2.1 This Section includes the following preinstallation tests to be performed on all concrete surfaces scheduled to receive non-breathable floor finishes:
  - .1 Substrate moisture testing.
  - .2 Substrate relative humidity testing.
  - .3 Substrate alkalinity testing.
  - .4 Perform preinstallation tests on concrete floor slabs placed below, on, and above grade, including suspended floor slabs.
  - .5 Unless otherwise indicated, perform preinstallation testing for the following types of non-breathable floor finishes:
    - .1 Traffic coatings.
    - .2 Resilient sheet flooring.
    - .3 Resilient tile flooring.
    - .4 Static-control resilient flooring.
    - .5 Resinous flooring.
    - .6 Carpet tile.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project must be read as a whole, and may be directly applicable to this Section.
  - .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 07 18 13 – Pedestrian Traffic Coating
    - .2 Section 07 18 16 – Vehicular Traffic Coating
    - .3 Section 09 65 18 - Resilient Linoleum Flooring.

.4 Section 09 68 13 - Carpet Tile

### **1.3 REFERENCES**

1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 – Reference Standards.

### **1.4 PRETESTING MEETING**

1.4.1 Conduct meeting at Project site. Conduct meeting with attendance and participation of the following:

- .1 Owner.
- .2 Consultant.
- .3 Interior Designer.
- .4 Contractor.
- .5 Flooring Installer(s).
- .6 Flooring manufacturer's representative.
- .7 Testing agency representative.
- .2 Review concrete substrate requirements for conditions affecting performance of flooring, including flooring manufacturer's recommendations regarding moisture, relative humidity and alkalinity tolerances and limits.
- .3 Review proposed locations and frequency of moisture, relative humidity and alkalinity tests.
- .4 Review testing agency's proposed methodology for performance of testing, and project conditions necessary to be implemented by Contractor in order to ensure optimum conditions under which tests should be performed.

### **1.5 SCHEDULING**

1.5.1 Perform initial tests only after allowing concrete to dry for a minimum of 90 days.

- .1 Ninety-day duration shall commence upon completion of curing of concrete, or upon removal of any subsequent standing water – whichever occurs last.
- .2 Provide separate line items in construction schedule to reflect the minimum 90-day drying period and the time necessary to perform the preinstallation testing.

1.5.2 Schedule testing not less than 2 or more than 4 weeks prior to scheduled flooring installation.

- 1.5.3 Comply with requirements in Division 01 Section "Construction Progress Documentation" for inclusion of concrete drying and preinstallation testing line items in Contractor's Construction Schedule.

**1.6 SUBMITTALS**

- 1.6.1 Test Reports: Submit report from Testing Agency for pre-installation tests results.
- 1.6.2 Data Loggers:
- .1 Provide manufacturer's spreadsheet for concrete relative humidity readings at a single location per grade level.
  - .2 Provide interior temperature and humidity data logger for room conditions at one location per floor.
- 1.6.3 Record Documents: Show locations of substrate moisture, relative humidity and alkalinity tests. Provide markups on floor plan indicating the location of each test and the dates tests were performed.

**1.7 QUALITY ASSURANCE**

- 1.7.1 Testing Agency Representative's Qualifications: An International Concrete Repair Institute Certified Concrete Moisture Testing Technician, Grade 1. Submit proof of qualification upon request by Consultant.

**1.8 FIELD CONDITIONS**

- 1.8.1 Areas of the building in which tests will be performed shall be maintained at the same temperature and humidity conditions as those anticipated during normal occupancy. These temperature and humidity levels shall be established and the HVAC system balanced for 48 hours prior to and during test period.
- 1.8.2 Do not perform tests until building is enclosed and weatherproof, wet work in space is completed and nominally dry, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

**2. PRODUCTS**

**2.1 TESTING MATERIALS**

- 2.1.1 Calcium Chloride Testing Kits: to ASTM F1869.
- 2.1.2 pH Meter: meeting requirements of ASTM F710.

- 2.1.3 Concrete Relative Humidity Meter: Meeting requirements of ASTM F2170.
- 2.1.4 Interior Temperature and Humidity Monitoring: Data logger system capable of documenting interior building conditions during testing periods up to 72 hours using a printable chart format.

### **3 . EXECUTION**

#### **3.1 EXAMINATION**

- 3.1.1 Examine substrates, areas, and conditions where installation of floor coverings will occur, with Installer present, for compliance with manufacturer's requirements. Verify that substrates and conditions are satisfactory for performance of preinstallation testing and comply with requirements specified.
- 3.1.2 Proceed with testing only after unsatisfactory conditions have been corrected.

#### **3.2 PREPARATION**

- 3.2.1 Mechanically remove laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants that might impair or compromise testing procedure and test results with a diamond-tooled grinder. Grind an area of at least 20 by 20-inches in the area each moisture test is to be placed.
  - .1 Tests sites shall be cleaned not less than 24 hours prior to the placement of test kits.
- 3.2.2 Broom and vacuum clean substrates to be covered immediately before installing test kits. Do not proceed with installation until unsatisfactory conditions have been corrected.

#### **3.3 PREINSTALLATION TESTING, GENERAL**

- 3.3.1 Testing shall be performed by qualified personnel of the Testing Agency.
- 3.3.2 Cost of testing shall be included in Contract Price.
- 3.3.3 Test Report Documentation:
  - .1 Provide a diagrammatic floor plan of the building indicating each test site location. Designate each test site by a unique number or letter identifier.
  - .2 Test Report Form: Use form included at the end of this Section, or substantially similar form furnished by Testing Agency. Test reports shall include the following minimum information, in tabular form:
    - .1 General Information:

- 
- .1 Name of Project.
  - .2 Name of Testing Agency.
  - .3 Name and title of Testing Agency Representative.
  - .4 Test site identifier, correlated to identifier on floor plan, and on concrete surface near test placement.
  - .5 Location of each test, by Room number designation on Drawings.
  - .2 Calcium Chloride Tests:
    - .1 Date and time of preparation of the test sites.
    - .2 Weight of moisture kits, and date and time kits were set in place.
    - .3 Date and time moisture kits were gathered, and post-weight of kit.
    - .4 Elapsed time of test duration.
    - .5 Total weight gain of each test kit.
    - .6 Moisture vapour emission rate (MVER).
  - .3 Relative Humidity Tests:
    - .1 Date and time RH test sleeves were set in place.
    - .2 Depth of hole in inches, from top of slab.
    - .3 Date and time relative humidity and temperature of ambient conditions were documented.
    - .4 Date and time relative humidity and temperature of concrete were documented.
    - .5 Make, model, and last calibration date of the instrument used to make the measurements.
  - .4 Concrete pH Tests: Record pH level of concrete surface at test site.
- 3.3.4 Provide 3 tests for the first 1,000 square feet of floor area plus one 1 additional test for each 1,000 square feet thereafter. Locate tests in various parts of the floor area including the center of the floor and sites of potential moisture such as the perimeter of the floor, joints, or cracks.
- 3.3.5 Install a data logger to record temperature and humidity during entire testing process at a minimum of one data logger per floor level.

### **3.4 SUBSTRATE MOISTURE TESTING**

- 3.4.1 General: Perform pre-installation moisture testing of the concrete slab by calcium chloride test in accordance with ASTM F1869 prior to the application of flooring products at slab on grade areas only.
- 3.4.2 Determine the change in weight of moisture-absorbing anhydrous calcium chloride and represent the amount of moisture transmitting out of the concrete slab area.

- .1 Express the value in pounds as the equivalent weight of water that is emitted from a 1,000 square foot concrete slab surface area in a 24 hour period of time.
- 3.4.3 Conduct tests by making three (3) site visits as follows:
  - .1 Site Visit No. 1 (Day 1):
    - .1 Locate and prepare test sites for:
      - .1 ASTM F1869 tests (minimum 20 inches by 20 inches)
    - .2 Remove contaminants and mechanically prepare test sites.
    - .3 Install data logger system to monitor interior temperature and relative humidity
  - .2 Site Visit No. 2 (minimum 24 hours after preparation of test sites):
    - .1 Pre-weigh test kits (maximum 20 minutes prior to setting). Scale shall report weight to 0.1 grams. Record weight and start time.
    - .2 Set moisture test kits in place and cover with dome.
    - .3 Verify operation of data logger system.
    - .4 Record ambient indoor temperature and relative humidity.
  - .3 Site Visit No. 3 (60 to 72 hours after test kits are set in place):
    - .1 Post-weigh test kits (maximum 20 minutes after removing). Scale shall report weight to 0.1 grams. Record weight and end time.
    - .2 Remove data logger system.
    - .3 Record ambient indoor temperature and relative humidity.

### **3.5 SUBSTRATE RELATIVE HUMIDITY TESTING**

- 3.5.1 Substrate Relative Humidity Testing: Perform pre-installation relative humidity testing of the concrete slab by in situ probe test, prior to the application of flooring products in accordance with ASTM F2170 at all floor levels.
- 3.5.2 Install interior room data logger to record temperature and humidity during testing process at one location per grade level.
- 3.5.3 Conduct tests by making 2 site visits over the course of 4 calendar days as follows:
  - .1 Site Visit No. 1:
    - .1 Locate and drill holes. (Approximately 15 mm in diameter to a depth of 40 percent of the slab thickness. For slabs

on grade allowed to dry from top only and a depth of 20 percent of slab thickness. For suspended slabs allow to dry from both top and bottom, (decks not in metal pan). Hole diameter shall not exceed outside diameter of the insert able test sleeve by more than 0.04 inch. Drilling operation must be dry.

- .2 Vacuum holes to remove dust and debris.
- .3 Insert a hole liner, or sleeve, to the full depth of test hole, ensuring that the liner is capped or plugged at the end protruding from the concrete surface.
- .4 Record temperature and relative humidity in hole.
- .5 Record ambient indoor air temperature and relative humidity.
- .6 Connect pre-programmed data logger unit to record readings at one RH test location per grade level. Unit shall provide readings every hour for 72 hours total.
- .2 Site Visit No. 2, 72 hours after probe placement:
  - .1 Remove sleeve cap.
  - .2 Connect probe and digital meter.
  - .3 Read and record temperature and relative humidity in concrete at the test site.
  - .4 Record alkalinity of slab surface in vicinity of test site.
  - .5 Record temperature and relative humidity in hole.
  - .6 Record ambient indoor temperature and relative humidity.
  - .7 Disconnect data logger unit and retrieve test results.
- 3.5.4 Perform tests concurrently with, and in close proximity to, the calcium chloride tests.
- 3.5.5 Mark each test location directly on concrete surface using a black marker and identify on diagrammatic floor plans.

### **3.6 QUANTIFYING ALKALINITY LEVEL**

- 3.6.1 At each substrate relative humidity test site perform alkalinity test as follows:
  - .1 Place several drops of distilled or de-ionized water or liquid recommend by tester manufacturer onto concrete surface to form a puddle approximately 1 inch in diameter.
  - .2 Allow the water to set for approximately 60 seconds.
  - .3 Expose calibrated meter tip or pH strip into liquid and allow meter to calculate pH result for 15 seconds in accordance with manufactures recommendations.

3.6.2 Record and report results to the nearest hundredth.

### **3.7 TEST REPORTS**

3.7.1 Test Reports: Prepare and submit certified written reports that include the following:

- .1 Date of issue.
- .2 Project title and number.
- .3 Name, address, and telephone number of testing agency.
- .4 Dates and locations of test sites.
- .5 Test site number, corresponding to number on diagrammatic floor plan.
- .6 Names of individuals performing tests.
- .7 Description of the test method.
- .8 Complete test data.
- .9 Test results and an interpretation of test results.
- .10 Comments or professional opinion on whether tested Work complies with the Contract Document requirements.
- .11 Name and signature of testing agency representative.
- .12 Recommendations on retesting and reinspecting.

3.7.2 Acceptable test results for all flooring products:

- .1 75% RH.
- .2 Less than 9.0 pH.
- .3 Manufacturer's tolerances may vary, notify Owner and Consultant in writing of unacceptable conditions. Installation of flooring deems acceptance of on-site conditions for a warranted installation.

3.7.3 Submit a certified written report of each test to Consultant, with copy to Contractor. Interpret tests and state in each report whether tested and inspected work complies with or deviates from the Contract Documents.

- .1 Provide test results in format shown at end of this section.

### **3.8 REPAIR AND PROTECTION**

3.8.1 General: On completion of testing, repair damaged construction and restore substrates and finishes.

- .1 Provide materials and comply with installation requirements specified in other Specification Sections. Restore patched areas so that they are as invisible as possible.

3.8.2 Repair and protection are Contractor's responsibility, regardless of the assignment of responsibility for testing services.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the CCDC 5B-2010 Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the tactile warning surfacing work specified herein. This includes, but is not necessarily limited to:
- .1 Surface-applied detectable warning indicators.
  - .2 Surface-applied detectable warning tiles.
  - .3 Carborundrum inserts.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Preinstallation Meetings**

- 1.4.1 Preinstallation Conference: Conduct conference at Project site.

### **1.5 Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for each type of product.
- 1.5.2 Samples for Verification: Submit samples of verification in accordance with Division 01, for each type of tactile warning surface, in manufacturer's standard sizes unless otherwise indicated, showing edge condition, truncated-dome pattern, texture, colour, and cross section; with fasteners and anchors.

### **1.6 Closeout Submittals**

- 1.6.1 Maintenance Data: Submit maintenance data in accordance with Division 01, for tactile warning surfacing, to include in maintenance manuals.

---

**1.7     Quality Assurance**

1.7.1 Mock-ups: Build mock-ups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for materials and execution.

- .1 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

**1.8     Warranty**

1.8.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 .     PRODUCTS**

**2.1     Design And Performance Requirements**

2.1.1 Accessibility Requirements: Comply with applicable provisions in OBC, CSA B651, ISO/TC 59/SC16 N140 and AODA for tactile warning surfaces.

- .1 For tactile warning surfaces composed of multiple units, provide units that when installed provide consistent side-to-side and end-to-end dome spacing that complies with requirements.

2.1.2 Source Limitations: Obtain each type of tactile warning surfacing, joint material , setting material , anchor , and fasteners from single source with resources to provide materials and products of consistent quality in appearance and physical properties.

2.1.3 Surface-Burning Characteristics: Per CAN/ULC-S102/S102.2 with results indicated below. Mark products with appropriate testing agency labels.

- .1 Flame-Spread Index: 25.
- .2 Smoke-Developed Index: 50 or less.

**2.2     Detectable Warning Indicators**

2.2.1 Material Tag: This item is noted as "TWS1" on Drawings and Schedules.

2.2.2 Accessible truncated-dome detectable warning indicators configured for setting in concrete surfaces, with slip-resistant surface treatment on domes and field of indicators.

- .1 Stainless-Steel Plate and Sheet: ASTM A 240/A 240M or ASTM A 666, Type 316L.
- .2 Finish and Colour: AISI #4.

- .3 Dome Spacing and Configuration: Manufacturer's standard compliant spacing to meet accessibility guidelines and as confirmed by Consultant through Shop Drawing review.
- .4 Basis-of-Design: "Small Tactile Indicators UAS-SS2218" by Urban Access Solutions or approved equivalent by Kinesik.

## **2.3 Detectable Warning Tiles**

- 2.3.1 Material Tag: This item is noted as "TWS2" on Drawings and Schedules.
- 2.3.2 Surface-Applied Detectable Warning Tiles: Accessible truncated-dome detectable warning concrete tiles configured for surface application on existing concrete walkway surfaces, with slip-resistant surface treatment on domes, field of tile, and beveled outside edges.
  - .1 Material: Cast-fibre-reinforced polymer concrete tile or Molded glass- and carbon-fibre-reinforced polyester meet fire performance criteria indicated.
  - .2 Colour: Refer to Finish Schedule on Drawings.
  - .3 Shapes and Sizes: As indicated on Drawings.
  - .4 Dome Spacing and Configuration: Manufacturer's standard compliant spacing to meet accessibility guidelines and as confirmed by Consultant through Shop Drawing review.
  - .5 Mounting: Adhered and fastened to existing concrete substrate.
  - .6 Basis-of-Design: "AccessTile FR" by Kinesik or approved equivalent by Urban Access Solutions.

## **2.4 Carborundrum Inserts**

- 2.4.1 Material Tag: This item is noted as "TWS3" on Drawings and Schedules.
- 2.4.2 Carborundrum Strips: soft textured, non-mineral, medium resilient surface bonded to a pressure-sensitive adhesive backed plastic film. For barefoot-or shoe-traffic areas.
  - .1 Colour: Contrasting colour as selected by Consultant to suit Ontario Building Code requirements.
  - .2 Size: 50 mm wide

## **2.5 Accessories**

- 2.5.1 Fasteners and Anchors: Manufacturer's standard as required for secure anchorage of tactile warning surfaces, noncorrosive and compatible with each material joined, and complying with the following:

- .1 Fastener Heads: For nonstructural connections, use flathead or oval countersunk screws and bolts with tamper-resistant heads, colored to match tile.
- 2.5.2 Adhesive: As recommended by manufacturer for adhering tactile warning surfacing unit to concrete substrates.
- 2.5.3 Sealant: As recommended by manufacturer for sealing perimeter of tactile warning surfacing unit.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify that concrete substrate is in suitable condition to begin installation according to manufacturer's written instructions. Verify that installation of tactile warning surfacing will comply with accessibility requirements upon completion.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Installation Of Tactile Warning Surfacing**

- 3.2.1 Prepare substrate and install tactile warning surfacing according to manufacturer's written instructions unless otherwise indicated.
- 3.2.2 Place tactile warning surfacing units in dimensions and orientation indicated.
- 3.2.3 Tactile Warning Indicators:
  - .1 Drill hole in the substrate appropriate size for stem to fit. Clean hole of debris by air blowing.
  - .2 Ensure hole is deep enough to embed stem for entire length.
  - .3 Set indicator in adhesive as recommend by manufacturer. Inset indicator flush with surface.
  - .4 Protect installed indicators from traffic until adhesive has set.
- 3.2.4 Detectable Warning tiles:
  - .1 Lay out detectable warning tiles as indicated and mark concrete subsubstrates.
  - .2 Prepare existing surface by grinding and cleaning as recommended by manufacturer.
  - .3 Apply adhesive to back of tiles in amounts and pattern recommended by manufacturer, and set tiles in place. Firmly seat tiles in adhesive bed, eliminating air pockets and establishing full adhesion to concrete substrate. If necessary, temporarily apply weight to tiles to ensure full contact with concrete.

- 
- .4 Install anchor devices through face of tiles and into concrete substrate using anchors located as recommended by manufacturer. Set heads of anchors flush with top surface of mat.
  - .5 Protect installed tiles from traffic until adhesive has set.

**3.3 Cleaning And Protection**

- 3.3.1 Remove and replace tactile warning surfacing that is broken or damaged or does not comply with requirements in this Section. Remove in complete sections from joint to joint unless otherwise approved by Consultant. Replace using tactile warning surfacing installation methods acceptable to Consultant.
- 3.3.2 Protect tactile warning surfacing from damage and maintain free of stains, discoloration, dirt, and other foreign material.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Gypsum Board Assemblies work specified herein. This includes, but is not necessarily limited, to:
- .1 Interior gypsum board.
  - .2 Exterior gypsum board for ceilings and soffits.
  - .3 Gypsum board shaft wall assemblies.
  - .4 Non-load-bearing steel framing.
  - .5 Tile backing panels.
  - .6 Trim accessories.
  - .7 Joint treatment materials.
  - .8 Auxiliary materials.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
- .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 06 16 00, Sheathing for gypsum sheathing for exterior walls.
    - .2 Section 09 30 00, Tiling for cementitious backer units installed as substrates for ceramic tile.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 Steel Thickness:
- .1 Base Steel Thickness: Thickness of bare steel exclusive of coatings.

- .2 Design Thickness: Target or "nominal" thickness used to determine structural properties of the cold formed Products.
- .3 Minimum Thickness: Design thickness minus minimum allowable under-tolerance required by CSA S136 (95% of design thickness) or material specification; whichever is more stringent.
- .4 Designation Thickness: For the purposes of this specification; thicknesses provided will be minimum base steel thicknesses in accordance with CSA S136 and determined by the following table:

Designation Thickness	Minimum Base Steel Thickness		Gauge No. (For reference Only)	Colour
(mils)	(in)	(mm)	Ga	
18	0.0179	0.455	25	Not Painted
33	0.0329	0.836	20	White
43	0.0428	1.087	18	Yellow
54	0.0538	1.367	16	Green
68	0.0677	1.72	14	Orange

## **1.5 Administrative Requirements**

### **1.5.1 Coordination:**

- .1 Coordinate installation of anchorages and steel weld plates and angles for casting into concrete. Supply setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

### **1.5.2 Preinstallation Meetings:** Conduct preinstallation meeting at Place of the Work prior to installation. Review requirements of Contract Documents and coordination requirements with other trades.

## **1.6 Action Submittals**

### **1.6.1 Product Data:** Submit product data in accordance with Division 01 for each type of product.

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Gypsum Board Assemblies work and include product characteristics, performance criteria, physical size, finish and limitations.

### **1.6.2 Samples:** Submit samples in accordance with Division 01 for the following products:

- .1 Trim Accessories: Full-size Sample in 300-mm- (12-inch-) long length for each trim accessory indicated in Contract Documents.
- .2 Textured Finishes: Manufacturer's standard size for each textured finish indicated in Contract Documents and on same backing for Work.
- 1.6.3 Professional Engineer's Stamped Shop Drawings and Submittals: Submit Professional Engineer's Stamped Shop Drawings and Submittals bearing Professional Engineer's seal and signature for all gypsum board assemblies 3m (9.8 ft) and over in height, and Products in this Section requiring engineering design. Include accompanying analysis data demonstrating compliance with performance requirements and design criteria.

**1.7 Informational Submittals**

- 1.7.1 Evaluation Reports: Submit evaluation reports in accordance with Division 01 for shaft wall assemblies and firestop tracks, from BMEC, CCMC, or equivalent to ICC-ES.

**1.8 Quality Assurance**

- 1.8.1 Steel Fabricator's Qualifications: Provide steel framing members from fabricator who can produce Products to meet requirements specified in this Section, and who is a member in good standing with the Canadian Sheet Steel Institute (CSSBI) or similar organization that provides verifiable code compliance program (e.g. Steel Framing Industry Association).
- 1.8.2 Mockups: Before beginning gypsum board installation, install mockups of at least 9 sq. m (100 sq. ft.) in surface area to demonstrate aesthetic effects and set quality standards for materials and execution.
  - .1 Install mockups for the following:
    - .1 Each level of gypsum board finish in this Section for use in exposed locations.
    - .2 Each texture finish indicated.
  - .2 Apply or install final decoration indicated, including painting and wallcoverings, on exposed surfaces for review of mockups.
  - .3 Simulate finished lighting conditions for review of mockups.
  - .4 Reviewed mockups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

---

**1.9     Delivery, Storage And Handling**

1.9.1 Store materials inside under cover and keep them dry and protected against weather, condensation, direct sunlight, construction traffic, and other potential causes of damage. Stack panels flat and supported on risers on a flat platform to prevent sagging.

**1.10    Field Conditions**

1.10.1 Environmental Limitations: Comply with ASTM C840 requirements or gypsum board manufacturer's written recommendations, whichever are more stringent.

1.10.2 Do not install paper-faced gypsum panels until installation areas are enclosed and conditioned.

1.10.3 Do not install panels that are wet, those that are moisture damaged, and those that are mould damaged.

.1 Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.

.2 Indications that panels are mould damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

**1.11    Warranty**

1.11.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 .    PRODUCTS**

**2.1     Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

.1 Gypsum Board

.1 CertainTeed Corp.

.2 CGC Inc.

.3 Georgia-Pacific Gypsum LLC.

.4 Continental Building Products.

.2 Metal Framing:

.1 Bailey Metal Products

.2 CGC Inc.

- .3 ClarkDietrich Building Systems
- .4 Approved equivalent manufacturer who is a member in good standing with CSSBI

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Performance Requirements**

- 2.2.1 Fire-Resistance-Rated Assemblies: for fire-resistance-rated assemblies, provide materials and construction identical to those tested in assembly indicated on Drawings and Schedules according to CAN/ULC-S101 or equivalent to ASTM E119 by an independent testing agency.
- 2.2.2 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.2.3 Shaft Wall Assemblies:
  - .1 Design and size partitions surrounding elevator shafts to accommodate structural members completely within the required fire resistance rated construction, while maintaining the shaft wall rating without interruption.
  - .2 Shaftwall system for elevator shafts shall not have pointed ends of screws penetrating into shaft.
  - .3 Ensure components are compatible and tested by approved independent testing facilities acceptable to authorities having jurisdiction.
  - .4 Ensure shaftwall framing, shaftliner, gypsum board and joint treatment materials Provide fire resistance rating as noted on Drawings and Schedules according to CAN/ULC-S101 or equivalent to ASTM E119 by an independent testing agency.
- 2.2.4 STC-Rated Assemblies: for STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated on Drawings and Schedules according to ASTM E90 and classified according to ASTM E413 by an independent testing agency.
  - .1 Lightweight gypsum board is not permitted.
- 2.2.5 Moisture-resistant gypsum board: Provide moisture resistant gypsum board at all wet areas and washrooms. Provide tile backer

board at walls surrounding showers. Refer to Drawings for exact locations.

- 2.2.6 Full-height partitions: Provide full-height partitions where noted on Drawings. As a minimum, Provide full height partitions at mechanical, electrical, security, and telecommunications rooms, stairs, elevator shafts, chases and washrooms, fire-rated walls, private offices, conference rooms, and break rooms.
- 2.2.7 System Deflections: Ensure partition design can accommodate following loadings with deflection not exceeding  $L/240$  in any direction:
  - .1 Minimum Lateral Load for Partitions: 0.24 kPA (5 psf)
  - .2 Minimum Lateral Load for Firewalls: 0.51 kPA (10 psf)
  - .3 Minimum Lateral Load for Elevator Shaft Walls: 0.73 kPA (15 psf)
  - .4 Reduce deflection to  $L/360$  for partitions where tile and similar brittle finishes are indicated to be installed.
  - .5 Increase stud gauges as required to accommodate deflections criteria noted in this Section.
- 2.2.8 Gypsum Ceilings: Design suspension system to support weight of mechanical and electrical items such as air grilles and lighting fixtures and similar components with deflection limited to  $L/360$ .
  - .1 Provide adequate support to allow rotation and relocation of light fixtures.
  - .2 Design sub-framing as necessary to accommodate, and to circumvent, conflicts and interferences where ducts or other equipment prevent regular spacing of hangers.
- 2.2.9 Reinforcing: Provide in-wall reinforcing where required to support manufactured component items such as washroom accessories, casework/millwork, wall mounted equipment and similar items.

## **2.3 Interior Gypsum Board**

- 2.3.1 Gypsum Wallboard (GB or GWB):
  - .1 Commercial-grade and fire-rated type: Type X to ASTM C1396/C 1396M.
    - .1 Thickness: 15.9 mm (5/8 inch).
    - .2 Long Edges: Tapered and featured (rounded or beveled) for prefilling.
  - .3 Acceptable Products:
    - .1 "ToughRock® Fireguard or Fireguard C" by Georgia-Pacific Canada, L.P.
    - .2 "Sheetrock Firecode or Firecode C Core" by CGC Inc.

- 
- .3 "Drywall Type X or Type C Gypsum Board" by CertainTeed Gypsum Canada Inc.
- 2.3.2 Gypsum Ceiling Board (PSH21): ASTM C1396/C 1396M.
- .1 Thickness: 12.7 mm (1/2 inch) anti-sag sheets. Provide Type X where indicated on Drawings or required to provide fire-resistance ratings.
  - .2 Long Edges: Tapered.
  - .3 Acceptable Products:
    - .1 "Sheetrock® - Regular Gypsum Panels" or "Sheetrock® - Sag-Resistant Interior Gypsum Ceiling Board" by CGC
    - .2 "ToughRock® Gypsum Boards" or "ToughRock® CD® Ceiling Board" by Georgia-Pacific Canada, L.P.
    - .3 "Interior Ceiling Gypsum Board" by CertainTeed
- 2.3.3 Fiberglass-Mat Moisture- and Mould-Resistant Gypsum Board – Paperless (GB-MR or MRGB or GBC1): ASTM C1658/C1658M and ASTM C1396/C 1396M. With moisture- and mould-resistant core and fiberglass-mat surfaces.
- .1 Core: As shown on Drawings.
  - .2 Long Edges: Tapered.
  - .3 Mould Resistance: ASTM D3273, score of 10 as rated according to ASTM D3274. Boards containing paper or other organic materials in their composition are not acceptable.
  - .4 Basis-of-Design Products: "SheetRock Brand Glass-Mat Panel – Mould Tough" by CGC
- 2.3.4 Impact-Resistant Gypsum Board (GB-AR or ARGB): ASTM C1629/C 1629M.
- .1 Impact resistance characteristics:
    - .1 Minimum Surface Abrasion: Level 1;
    - .2 Minimum Surface Indentation: Level 1,
    - .3 Minimum Soft body impact: Level 2.
    - .4 Minimum Hard body impact: Level 2.
  - .2 Core: As indicated on Drawings.
  - .3 Long Edges: Tapered.
  - .4 Mould Resistance: ASTM D3273, score of 10 as rated according to ASTM D3274.
  - .5 Provide for up to 1220mm on outer layer of gypsum partitions flanking corridors throughout.
  - .6 Basis-of-Design: "Fiberock® Brand AR Interior Panel" by CGC Inc.

---

**2.4     Tile Backing Panels**

2.4.1 Glass-Mat, Water-Resistant Backing Board: ASTM C1178/C 1178M, with manufacturer's standard edges.

.1 Acceptable Products:

- .1 "GlasRoc Tile Backer" by CertainTeed Corp.
- .2 "DensShield Tile Backer" by Georgia-Pacific Gypsum LLC
- .3 "USG Durock™ Glass-Mat Tile Backerboard" by CGC.

.2 Core: As indicated on Drawings

.3 Mould Resistance: ASTM D3273, score of 10 as rated according to ASTM D3274. Boards containing paper or other organic materials in their composition are not acceptable.

2.4.2 Cementitious Board - Backer Units: ANSI A118.9 and ASTM C1288 or 1325, with manufacturer's standard edges.

.1 Acceptable Products:

- .1 "FiberCement BackerBoard" by CertainTeed Corp.
- .2 "DUROCK Cement Tile Backer Board" by CGC
- .3 "PermaBase Board" by Unifix Inc.

.2 Thickness: 12.7 mm (1/2 inch).

.3 Mould Resistance: ASTM D3273, score of 10 as rated according to ASTM D3274.

**2.5     Gypsum Board Shaft Wall Assemblies**

2.5.1 Fire-Resistance Rating: As indicated on Drawings and Schedules .

2.5.2 STC Rating: As indicated on Drawings and Schedules .

2.5.3 Steel Framing Members: Comply with ASTM C645 requirements for metal unless otherwise indicated on Drawings and Schedules.

.1 Protective Coating: ASTM A653/A 653M, Z180 (G60), hot-dip galvanized unless otherwise indicated on Drawings and Schedules.

.2 Studs: Manufacturer's standard profile for repetitive members, corner and end members, and fire-resistance-rated assembly indicated on Drawings and Schedules.

.1 Depth: As indicated on Drawings and Schedules .

.2 Minimum Base-Metal Thickness: 0.84 mm (20 ga - 0.033 inch; Colour: White).

.3 Runner Tracks: Manufacturer's standard J-profile track with manufacturer's standard long-leg length, but at least 51 mm (2 inches) long and matching studs in depth.

- .1 Minimum Base-Metal Thickness: 0.84 mm (20 ga - 0.033 inch; Colour: White).
- .4 Elevator Hoistway Entrances: Manufacturer's standard J-profile jamb strut with long-leg length of 76 mm (3 inches), matching studs in depth, and not less than 0.84 mm (20 ga - 0.033 inch; Colour: White) thick.
- 2.5.4 Gypsum Shaftliner Board, Moisture- and Mold-Resistant Type X: ASTM C1396/C 1396M; manufacturer's proprietary fire-resistive liner panels with moisture- and mold-resistant core and surfaces.
  - .1 Acceptable Products:
    - .1 "ProRoc Moisture and Mold Resistant Shaftliner" by CertainTeed Corp.
    - .2 "Dens-Glass Ultra Shaftliner" by Georgia-Pacific Gypsum LLC
    - .3 "Firecheck Moldcheck Type X Shaftliner" by Continental Building Products.
    - .4 "Pabcore Mold Curb Shaftliner Type X" by PABCO Gypsum
    - .5 "Sheetrock Brand Mold Tough Gypsum Liner Panel" by CGC Inc.
  - .2 Thickness: 25.4 mm (1 inch).
  - .3 Long Edges: Double bevel.
  - .4 Mold Resistance: ASTM D3273, score of 10 as rated according to ASTM D3274.
- 2.5.5 Room-Side Finish: Gypsum board.
- 2.5.6 Shaft-Side Finish: Gypsum shaftliner board, Type X.
- 2.5.7 Insulation: Sound attenuation blankets.

## **2.6 Framing Systems**

- 2.6.1 Framing Members, General: Comply with ASTM C754 for conditions indicated on Drawings and Schedules.
  - .1 Steel Sheet Components: Comply with ASTM C645 requirements for metal unless otherwise indicated. Galvannealed products are not acceptable.
  - .2 Protective Coating: ASTM A653/A 653M, Z180 (G60), hot-dip galvanized unless otherwise indicated.
    - .1 Provide ASTM A653/A653M, G90 (Z275) in heavy moisture environments such as pools, showers and similar locations.
- 2.6.2 Studs and Runners: ASTM C645. Cold-formed galvanized-steel C-studs studs and runners or dimpled steel studs and runners.

- 
- .1 Steel Studs and Runners:
    - .1 Minimum Base-Metal Thickness: 0.45 mm (25 ga - 0.018 inch), unless otherwise indicated. Provide heavier thicknesses where required at unrestrained heights, to frame openings or for abuse/impact resistance requirements.
      - .1 Where studs are supporting abuse- and impact-resistant partitions, provide minimum 0.836 mm (20 ga - 0.032 inch).
      - .2 At framed openings, provide manufacturer's proprietary framed opening system as specified in this Section.
      - .3 Where stud gauges are required to be increased for unrestrained heights, provide specialty high capacity studs as specified herein.
    - .2 Ensure runners are of depth and base-metal thickness to match studs, unless indicated otherwise.
    - .3 Depth: As indicated on Drawings.
  - .2 Specialty High Capacity Studs:
    - .1 Cold-formed galvanized-steel C-studs as per ASTM C645 with minimum equivalent strength of 227 MPa (33 ksi) but acoustic characteristics equivalent to 0.45 mm (25 ga - 0.018 inch) studs.
    - .2 Ensure runners are of depth and base-metal thickness to match studs, unless indicated otherwise.
    - .3 Depth: As indicated on Drawings.
    - .4 Basis-of-Design: "B18 (Hard Board) Stud" by Bailey Metal Products or approved equivalent.
- 2.6.3 Slip-Type Head Joints: Where indicated on Drawings and Schedules as "deflection tracks", provide one of the following:
- .1 Deflection Track: Steel sheet top runner manufactured to prevent cracking of finishes applied to interior partition framing resulting from deflection of structure above; in thickness not less than indicated on Drawings and Schedules for studs and in width to accommodate depth of studs.
    - .1 Acceptable Products:
      - .1 "Multi-Slot Track complete with Bailey Top Deflection Clip (TDC)" by Bailey
      - .2 "Blazeframe DSL or MaxTrak Slotted Deflection Track" by Dietrich Metal Framing
      - .3 VertiClip SLD or VertiTrack VTD Series" by Steel Network Inc. (The)

- 
- .4 “Vertical Slip Track or Vertical Slip Track II” by Tell-  
ing Industries
  - .5 Approved equivalent.
- 2.6.4 Firestop Tracks: Top runner manufactured to allow partition heads to expand and contract with movement of the structure while maintaining continuity of fire-resistance-rated assembly indicated on Drawings and Schedules; in thickness not less than indicated on Drawings and Schedules for studs and in width to accommodate depth of studs.
- .1 Location: Provide at head-of-wall firestopping.
  - .2 Acceptable Products:
    - .1 "SERIES TTG Track Top Gasket" by Specified Technologies
    - .2 “CFS-TTS Firestop Top Track Seal” by Hilti or approved equivalent.
    - .3 Approved equivalent.
- 2.6.5 Metal Flat Strap and Backing Plate: Steel sheet for blocking and bracing in length and width indicated on Drawings and Schedules.
- .1 Minimum Base-Metal Thickness: 1.37 mm (16 ga - 0.054 inch)
  - .2 Location: Provide for blocking and bracing as required for fixture attachment.
  - .3 Basis-of-Design: “Backer Plate” by Bailey or approved equivalent.
- 2.6.6 Cold-Rolled Channel Bridging: Steel, 0.836 mm (20 ga - 0.032 inch) minimum base-metal thickness, with minimum 13-mm- (1/2-inch-) wide flanges.
- .1 Depth: Manufacturer’s standard but not less than 38 mm (1-1/2 inches).
  - .2 Location: As required for lateral bracing.
  - .3 Basis-of-Design: “Spazzer 9200 Bridging and Spacing Bar” by ClarkDietrich Building Systems or approved equivalent.
- 2.6.7 Cold-Rolled Furring Channels: 1.34-mm (16 ga - 0.053-inch; Colour: Green) uncoated-steel thickness, with minimum 13-mm- (1/2-inch-) wide flanges.
- .1 Depth: As indicated on Drawings.
- 2.6.8 Framed Openings: Manufacturer's proprietary shape used to form header beams and jambs, columns or posts, of web depths indicated, unpunched, with stiffened flanges and as follows:
- .1 Header and Jamb: Galvanized-steel, one-piece header and jamb studs complying with or exceeding requirements of ASTM C754.

- .2 Header Clip: Header bracket (HDSC). Provide attachment screw pattern per manufacturer's written instructions.
- .3 Header Flange Length: 76-mm (3-inch)
- .4 Jamb Flange Length: 76-mm (3-inch)
- .5 Minimum Yield Strength: 227 MPa (33 ksi).
- .6 Minimum Base-Steel Thickness: 1.087 mm (43 mils - 0.0428 inch - 18 ga – Colour: Yellow)
- .7 Basis-of-Design: “RedHeader PRO and Header Bracket (HDSC)” by Bailey Metal Products or approved equivalent.

## **2.7      Suspension Systems**

- 2.7.1 Tie Wire: ASTM A641/A 641M, Class 1 zinc coating, soft temper, 1.59-mm- (0.062-inch-) diameter wire, or double strand of 1.21-mm- (0.048-inch-) diameter wire.
- 2.7.2 Hanger Attachments to Concrete:
  - .1 Anchors: Fabricated from corrosion-resistant materials with holes or loops for attaching wire hangers and capable of sustaining, without failure, required loadings with appropriate safety factors as appropriate for the substrate.
  - .1 Uses: Securing hangers to structure.
  - .2 Type: Torque-controlled, expansion anchor
- 2.7.3 Wire Hangers: ASTM A641/A 641M, Class 1 zinc coating, soft temper, 4.12 mm (8ga - 0.16 inch; Colour: Orange) in diameter.
- 2.7.4 Flat Hangers: Steel sheet, minimum 25 by 5 mm (1 by 3/16 inch) by length required.
- 2.7.5 Carrying Channels: Cold-rolled, commercial-steel sheet with a base-metal thickness of 1.34 mm (0.053 inch) and minimum 13-mm- (1/2-inch-) wide flanges.
  - .1 Depth: As required for loadings, but not less than 38 mm (1-1/2 inch)
- 2.7.6 Furring Channels (Furring Members):
  - .1 Cold-Rolled Channels: 1.34-mm (16 ga - 0.053-inch; Colour: Green) uncoated-steel thickness, with minimum 13-mm- (1/2-inch-) wide flanges, 19 mm (3/4 inch) deep.
  - .2 Steel Studs and Runners: ASTM C645.
    - .1 Minimum Base-Metal Thickness: Not less than 0.45 mm (25 ga - 0.018 inch).
    - .2 Depth: As indicated on Drawings
- 2.7.7 Grid Suspension System for Gypsum Board Ceilings: At Contractor's option, following system may be used in lieu of traditional gypsum framing.

- .1 Provide ASTM C645, direct-hung system composed of main beams and cross-furring members that interlock.
  - .1 Acceptable Products:
    - .1 "Drywall Grid Systems" by Armstrong World Industries, Inc.
    - .2 "Drywall Grid System" by Chicago Metallic Corporation
    - .3 "Drywall Suspension System" by CGC Inc.

## **2.8 Auxiliary Materials**

- 2.8.1 Provide auxiliary materials that comply with referenced installation standards and manufacturer's written recommendations.
- 2.8.2 Laminating Adhesive: Adhesive or joint compound recommended for directly adhering gypsum panels to continuous substrate.
- 2.8.3 Fasteners for Steel Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.
- 2.8.4 Isolation Strip at Exterior Walls:
  - .1 Foam Gasket: Adhesive-backed, closed-cell vinyl foam strips that allow fastener penetration without foam displacement, 3.2 mm (1/8 inch) thick, in width to suit steel stud size.

## **2.9 Accessories**

- 2.9.1 Interior Trim: ASTM C1047.
  - .1 Material: paper-faced galvanized steel sheet.
  - .2 Shapes:
    - .1 Cornerbead.
    - .2 Bullnose bead.
    - .3 LC-Bead: J-shaped; exposed long flange receives joint compound.
    - .4 L-Bead: L-shaped; exposed long flange receives joint compound.
    - .5 U-Bead: J-shaped; exposed short flange does not receive joint compound.
    - .6 Expansion (control) joint.
    - .7 Curved-Edge Cornerbead: With notched or flexible flanges.
- 2.9.2 Exterior Trim: ASTM C1047.
  - .1 Material: Hot-dip galvanized steel sheet, plastic, or rolled zinc.
  - .2 Shapes:

- .1 Cornerbead.
  - .2 LC-Bead: J-shaped; exposed long flange receives joint compound.
  - .3 Expansion (Control) Joint: One-piece, rolled zinc with V-shaped slot and removable strip covering slot opening.
- 2.9.3 Aluminum Trim: Extruded accessories of profiles and dimensions indicated.
- .1 Aluminum: Alloy and temper with not less than the strength and durability properties of ASTM B221M (ASTM B221), Alloy 6063-T5.
  - .2 Finish: Corrosion-resistant primer compatible with joint compound and finish materials specified.
  - .3 Acceptable Manufacturers:
    - .1 Fry Reglet Corporation.
    - .2 Gordon, Inc.
    - .3 Pittcon Industries.

## **2.10 Joint Treatment Materials**

2.10.1 General: Comply with ASTM C475/C 475M.

2.10.2 Joint Tape:

- .1 Interior Gypsum Board: Paper.
- .2 Exterior Gypsum Soffit Board: Paper.
- .3 Glass-Mat Gypsum Sheathing Board: 10-by-10 glass mesh.
- .4 Tile Backing Panels: As recommended by panel manufacturer.

2.10.3 Joint Compound for Interior Gypsum Board: for each coat use formulation that is compatible with other compounds applied on previous or for successive coats.

- .1 Prefilling: At open joints, rounded or beveled panel edges, and damaged surface areas, use setting-type taping compound.
- .2 Embedding and First Coat: for embedding tape and first coat on joints, fasteners, and trim flanges, use drying-type, all-purpose compound.
  - .1 Use setting-type compound for installing paper-faced metal trim accessories.
- .3 Fill Coat: for second coat, use drying-type, all-purpose compound.
- .4 Finish Coat: for third coat, use drying-type, all-purpose compound.

- .5 Skim Coat: for final coat of Level 5 finish, use drying-type, all-purpose compound or high-build interior coating product designed for application by airless sprayer and to be used instead of skim coat to produce Level 5 finish.

2.10.4 Joint Compound for Exterior Applications:

- .1 Exterior Gypsum Soffit Board: Use setting-type taping compound and setting-type, sandable topping compound.
- .2 Glass-Mat Gypsum Sheathing Board: As recommended by sheathing board manufacturer.

2.10.5 Joint Compound for Tile Backing Panels:

- .1 Glass-Mat, Water-Resistant Backing Panel: As recommended by backing panel manufacturer.
- .2 Cementitious Backer Units: As recommended by backer unit manufacturer.
- .3 Water-Resistant Gypsum Backing Board: Use setting-type taping compound and setting-type, sandable topping compound.

**2.11 Acoustical Components**

2.11.1 Sound Attenuation Blankets: ASTM C665, Type I (blankets without membrane facing) produced by combining thermosetting resins with mineral fibers manufactured from glass, slag wool, or rock wool.

- .1 Fire-Resistance-Rated Assemblies: Comply with mineral-fiber requirements of assembly.
- .2 One of the following types are acceptable:
  - .1 Mineral Wool (in fire-rated partitions): CAN/ULC-S702.1/S702.2, Type 1; ASTM C553 (Type VII) and non-combustible in accordance with requirements of CAN/ULC-S114. Acceptable Products:
    - .1 "Rockwool AFB® evo" by Rockwool A/S
    - .2 "Thermafiber SAFB FF" Mineral Wool Insulation
    - .3 Approved equivalent.
  - .2 Mineral Glass Fibre (in non-fire-rated partitions): CAN/ULC-S702, Type 1; ASTM C553 (TYPE VII) and non-combustible in accordance with requirements of ULC CAN/ULC-S114. Acceptable Products:
    - .1 "EcoTouch™ QuietZone® PINK™ FiberGlas® Acoustical Batts" by Owens Corning Canada LP
    - .2 "Noise Reducer Sound Attenuation Insulations" by CertainTeed.
    - .3 "Sound-Shield Formaldehyde-Free Fiber glass Insulation" by Johns Manville.

.4 Approved equivalent.

2.11.2 Acoustical Joint Sealant: Manufacturer's standard nonsag, paintable, nonstaining latex sealant complying with ASTM C834. Product effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E90.

.1 Acceptable Products (gun-applied):

- .1 "Smoke N Sound Acoustical Sealant" by Specified Technologies, Inc.
- .2 "SHEETROCK Acoustical Sealant" by CGC Inc.
- .3 "QuietZone Acoustic Sealant" by Owens-Corning Canada Inc.
- .4 "Tremstop Acrylic Acoustical Sealant" by Tremco Ltd.
- .5 "SilentFX® Noise Proofing Sealant by CertainTeed Inc.
- .6 "QuietSeal Pro" by Pabco Gypsum.
- .7 "CP506 – Smoke and Acoustic Sealant" by Hilti (Canada) Limited
- .8 "Tecsound CLG 5900" by Soprema Canada

.2 Acceptable Products (sprayed-on):

- .1 "CP572 – Smoke and Acoustic Spray" by Hilti or approved equivalent.

### **3 . EXECUTION**

#### **3.1 Examination**

3.1.1 Gypsum Board Assemblies:

- .1 Examine areas and substrates including welded hollow-metal frames and framing, with Installer present, for compliance with requirements and other conditions affecting performance.
- .2 Examine panels before installation. Reject panels that are wet, moisture damaged, and mould damaged.

3.1.2 Shaft Walls:

- .1 Examine substrates to which gypsum board shaft wall assemblies attach or abut, with Installer present, including hollow-metal frames, elevator hoistway door frames, cast-in anchors, and structural framing. Examine for compliance with requirements for installation tolerances and other conditions affecting performance.

- .2 Examine panels before installation. Reject panels that are wet, moisture damaged, or mold damaged.

### **3.2 Preparation**

3.2.1 Suspended Assemblies: Coordinate installation of suspension systems with installation of overhead structure to ensure that inserts and other provisions for anchorages to building structure have been installed to receive hangers at spacing required to support the Work and that hangers will develop their full strength.

- .1 Furnish concrete inserts and other devices indicated to other trades for installation in advance of time needed for coordination and construction.

3.2.2 Sprayed Fire-Resistive Materials:

- .1 Before sprayed fire-resistive materials are applied, attach offset anchor plates or ceiling tracks to surfaces indicated to receive sprayed fire-resistive materials. Where offset anchor plates are required, provide continuous plates fastened to building structure not more than 610 mm (24 inch) o.c.
- .2 Coordinate with gypsum board shaft wall assemblies so both elements of Work remain complete and undamaged. Patch or replace sprayed fire-resistive materials removed or damaged during installation of shaft wall assemblies to comply with requirements specified in Section 07 81 00.
- .3 After sprayed fire-resistive materials are applied, remove only to extent necessary for installation of gypsum board assemblies and without reducing the fire-resistive material thickness below that which is required to obtain fire-resistance rating indicated on Drawings and Schedules. Where excessive to material has been damaged, Provide additional material to reinstate require fire-ratings. Protect adjacent fire-resistive materials from damage.

### **3.3 Installing Framed Assemblies**

3.3.1 Installation Standard: Comply with ASTM C754.

- .1 Gypsum Plaster Assemblies: Also comply with requirements in ASTM C841 that apply to framing installation.
- .2 Portland Cement Plaster Assemblies: Also comply with requirements in ASTM C1063 that apply to framing installation.
- .3 Gypsum Veneer Plaster Assemblies: Also comply with requirements in ASTM C844 that apply to framing installation.
- .4 Gypsum Board Assemblies: Also comply with requirements in ASTM C840 that apply to framing installation.

- 
- 3.3.2 Install framing and accessories plumb, square, and true to line, with connections securely fastened.
  - 3.3.3 Install supplementary framing, and blocking to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction.
  - 3.3.4 Install bracing at terminations in assemblies.
  - 3.3.5 Do not bridge building control and expansion joints with non-load-bearing steel framing members. Frame both sides of joints independently.
  - 3.3.6 Install framing system components in accordance with spacings indicated, but not greater than spacings required by referenced installation standards for assembly types.
    - .1 Single-Layer Application: As indicated on Drawings or required by horizontal deflection performance requirements unless otherwise indicated.
    - .2 Multilayer Application: As indicated on Drawings or required by horizontal deflection performance requirements unless otherwise indicated.
    - .3 Tile Backing Panels: As indicated on Drawings or required by horizontal deflection performance requirements unless otherwise indicated.
  - 3.3.7 Where studs are installed directly against exterior masonry walls or dissimilar metals at exterior walls, install isolation strip between studs and exterior wall.
  - 3.3.8 Install studs so flanges within framing system point in same direction.
  - 3.3.9 Install tracks at floors and overhead supports. Extend framing full height to structural supports or substrates above suspended ceilings except where partitions are indicated to terminate at suspended ceilings. Continue framing around ducts that penetrate partitions above ceiling.
    - .1 Slip-Type Head Joints: Where framing extends to overhead structural supports, install to produce joints at tops of framing systems that prevent axial loading of finished assemblies.
    - .2 Door Openings: Screw vertical studs at jambs to jamb anchor clips on door frames; install track section (for cripple studs) at head and secure to jamb studs.
      - .1 Install two studs at each jamb unless otherwise indicated.
      - .2 Install cripple studs at head adjacent to each jamb stud, with a minimum 13-mm (1/2-inch) clearance from jamb

---

stud to allow for installation of control joint in finished assembly.

- .3 Extend jamb studs through suspended ceilings and attach to underside of overhead structure.
- .3 Other Framed Openings: Frame openings other than door openings the same as required for door openings unless otherwise indicated. Install framing below sills of openings to match framing required above door heads.
- .4 Fire-Resistance-Rated Partitions: Install framing to comply with fire-resistance-rated assembly indicated and support closures and to make partitions continuous from floor to underside of solid structure.
  - .1 Firestop Track: Where indicated, install to maintain continuity of fire-resistance-rated assembly indicated.
- .5 Sound-Rated Partitions: Install framing to comply with sound-rated assembly indicated.
- .6 Curved Partitions:
  - .1 Bend track to uniform curve and locate straight lengths so they are tangent to arcs.
  - .2 Begin and end each arc with a stud, and space intermediate studs equally along arcs. On straight lengths of no fewer than two studs at ends of arcs, place studs 152 mm (6 inches) o.c.

3.3.10 Direct Furring:

- .1 Attach to concrete or masonry with stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced 600 mm o.c.

3.3.11 Z-Shaped Furring Members:

- .1 Except at exterior corners, securely attach narrow flanges of furring members to wall with concrete stub nails, screws designed for masonry attachment, or powder-driven fasteners spaced 600 mm o.c.
- .2 At exterior corners, attach wide flange of furring members to wall with short flange extending beyond corner; on adjacent wall surface, screw-attach short flange of furring channel to web of attached channel. At interior corners, space second member no more than 300 mm from corner and cut insulation to fit.

3.3.12 Installation Tolerance: Install each framing member so fastening surfaces vary not more than 3 mm (1/8 inch) from the plane formed by faces of adjacent framing.

---

**3.4 Installing Ceiling Suspension Systems**

- 3.4.1 Install suspension system components in accordance with spacings indicated, but not greater than spacings required by referenced installation standards for assembly types.
- .1 Hangers: 1200 mm o.c. minimum
  - .2 Carrying Channels (Main Runners): 1200 mm o.c. minimum
  - .3 Furring Channels (Furring Members): 400 mm o.c., unless otherwise indicated on Drawings.
- 3.4.2 Isolate suspension systems from building structure where they abut or are penetrated by building structure to prevent transfer of loading imposed by structural movement.
- 3.4.3 Suspend hangers from building structure as follows:
- .1 Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or suspension system.
    - .1 Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
  - .2 Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with locations of hangers required to support standard suspension system members, install supplemental suspension members and hangers in the form of trapezes or equivalent devices.
    - .1 Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced installation standards.
    - .2 Limit deflection to  $L/360$  unless otherwise required by loading requirements.
  - .3 Wire Hangers: Secure by looping and wire tying, either directly to structures or to inserts, eye screws, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause hangers to deteriorate or otherwise fail.
  - .4 Flat Hangers: Secure to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices and fasteners that are secure and appropriate for structure and hanger, and in a manner that will not cause hangers to deteriorate or otherwise fail.
  - .5 Do not attach hangers to steel roof deck.
  - .6 Do not attach hangers to permanent metal forms. Furnish cast-in-place hanger inserts that extend through forms.

- .7 Do not attach hangers to rolled-in hanger tabs of composite steel floor deck.
- .8 Do not connect or suspend steel framing from ducts, pipes, or conduit.
- 3.4.4 Fire-Resistance-Rated Assemblies: Wire tie furring channels to supports.
- 3.4.5 Grid Suspension Systems: Attach perimeter wall track or angle where grid suspension systems meet vertical surfaces. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.
- 3.4.6 Installation Tolerances: Install suspension systems that are level to within 3 mm in 3.6 m (1/8 inch in 12 feet) measured lengthwise on each member that will receive finishes and transversely between parallel members that will receive finishes.

### **3.5 Installing Drywall Penetration Barrier Mesh**

- 3.5.1 Install drywall-penetration barrier mesh as follows:
  - .1 Install barrier-mesh sheets with diamond running in direction most suitable.
  - .2 Install barrier-mesh clips to secure mesh to framing members.
  - .3 Join staggered mesh joints that occur on framing members.
  - .4 Overlapping mesh joints to achieve tie-in is acceptable.
  - .5 Install barrier-mesh sheets to join, begin, and terminate on framing members.
  - .6 Wire tie barrier-mesh sheets not joining on framing member shall with 18-gauge steel tie wire.
  - .7 Wire tying shall be no less frequent than mesh clip installation.

### **3.6 Applying And Finishing Panels, General**

- 3.6.1 Comply with ASTM C840.
- 3.6.2 Install ceiling panels across framing to minimize the number of abutting end joints and to avoid abutting end joints in central area of each ceiling. Stagger abutting end joints of adjacent panels not less than one framing member.
- 3.6.3 Install panels with face side out. Butt panels together for a light contact at edges and ends with not more than 1.5 mm (1/16 inch) of open space between panels. Do not force into place.
- 3.6.4 Locate edge and end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite

sides of partitions. Do not make joints other than control joints at corners of framed openings.

- 3.6.5 Form control and expansion joints with space between edges of adjoining gypsum panels.
- 3.6.6 Cover both faces of support framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chases braced internally.
  - .1 Unless concealed application is indicated on Drawings and Schedules or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 0.7 sq. m (8 sq. ft.) in area.
  - .2 Fit gypsum panels around ducts, pipes, and conduits.
  - .3 Where partitions intersect structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by structural members; allow 6.4- to 9.5-mm- (1/4- to 3/8-inch-) wide joints to install sealant.
- 3.6.7 Isolate perimeter of gypsum board applied to non-load-bearing partitions at structural abutments, except floors. Provide 6.4- to 12.7-mm- (1/4- to 1/2-inch-) wide spaces at these locations and trim edges with edge trim where edges of panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.
- 3.6.8 Attachment to Steel Framing: Attach panels so leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.
- 3.6.9 STC-Rated Assemblies: Seal construction at perimeters, behind control joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both faces of partitions at perimeters and through penetrations. Comply with ASTM C919 and with manufacturer's written recommendations for locating edge trim and closing off sound-flanking paths around or through assemblies, including sealing partitions above acoustical ceilings.
- 3.6.10 Install sound attenuation blankets before installing gypsum panels unless blankets are readily installed after panels have been installed on one side.

### **3.7 Applying Interior Gypsum Board**

- 3.7.1 Install interior gypsum board in the following locations:
  - .1 Regular Wallboard Type: Vertical surfaces unless otherwise indicated.
  - .2 Type X: Where required for fire-resistance-rated assembly and where noted on Drawings.

- 
- .3 Flexible Type: Apply in double layer at curved assemblies.
  - .4 Ceiling Type: Ceiling surfaces unless otherwise indicated.
  - .5 Abuse-Resistant and Impact-Resistant Type: As indicated on Drawings.
  - .6 Moisture- and Mould-Resistant Type: In wet locations, and for a minimum 2.4 m (8 ft) of a plumbing fixture. Provide tile backer where tile installation is scheduled.
  - .7 Acoustically Enhanced Type: Provide in lieu of regular gypsum board where 20 ga studs are scheduled to be installed. Do not provide in lieu of abuse-resistant or impact-resistant type.
- 3.7.2 Single-Layer Application:
- .1 On ceilings, apply gypsum panels before wall/partition board application to greatest extent possible and at right angles to framing unless otherwise indicated.
  - .2 On partitions/walls, apply gypsum panels horizontally (perpendicular to framing) unless otherwise indicated on Drawings and Schedules or required by fire-resistance-rated assembly, and minimize end joints.
    - .1 Stagger abutting end joints not less than one framing member in alternate courses of panels.
    - .2 Where ceiling height is greater than 2.46 m (8' – 1") or wall is 1220 mm (4 ft.) wide or less, install panels using parallel application (i.e. vertically) unless otherwise indicated on Drawings and Schedules or required by fire-resistance-rated assembly.
  - .3 On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.
  - .4 Fastening Methods: Apply gypsum panels to supports with steel drill screws.
- 3.7.3 Multilayer Application:
- .1 On ceilings, apply gypsum board indicated on Drawings and Schedules for base layers before applying base layers on walls/partitions; apply face layers in same sequence. Apply base layers at right angles to framing members and offset face-layer joints one framing member, 400 mm (16 inches) minimum, from parallel base-layer joints, unless otherwise indicated on Drawings and Schedules or required by fire-resistance-rated assembly.
  - .2 On partitions/walls, apply gypsum board indicated on Drawings and Schedules for base layers and face layers vertically (parallel to framing) with joints of base layers located

over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints, unless otherwise indicated on Drawings and Schedules or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.

- .3 On Z-furring members, apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.
  - .4 Fastening Methods: Fasten base layers and face layers separately to supports with screws.
- 3.7.4 Laminating to Substrate: Where gypsum panels are indicated on Drawings and Schedules as directly adhered to a substrate (other than studs, joists, furring members, or base layer of gypsum board), comply with gypsum board manufacturer's written recommendations and temporarily brace or fasten gypsum panels until fastening adhesive has set.
- 3.7.5 Curved Surfaces:
- .1 Install panels horizontally (perpendicular to supports) and unbroken, to extent possible, across curved surface plus 300-mm- (12-inch-) long straight sections at ends of curves and tangent to them.
  - .2 Fasten base layer to studs with screws 400 mm (16 inches) o.c. Center gypsum board face layer over joints in base layer, and fasten to studs with screws spaced 300 mm (12 inches) o.c.

### **3.8 Applying Exterior Gypsum Panels For Ceilings And Soffits**

- 3.8.1 Apply panels perpendicular to supports, with end joints staggered and located over supports.
- .1 Install with 6.4-mm (1/4-inch) open space where panels abut other construction or structural penetrations.
  - .2 Fasten with corrosion-resistant screws.

### **3.9 Applying Tile Backing Panels**

- 3.9.1 Glass-Mat, Water-Resistant Backing Panels: Comply with manufacturer's written installation instructions and install at showers, tubs, and locations indicated on Drawings and Schedules to receive tile. Install with 6.4-mm (1/4-inch) gap where panels abut other construction or penetrations.
- 3.9.2 Cementitious Backer Units: ANSI A108.11, at showers, tubs, and where indicated on Drawings and Schedules.

- 3.9.3 Where tile backing panels abut other types of panels in same plane, shim surfaces to produce a uniform plane across panel surfaces.

**3.10 Installing Shaft Walls**

- 3.10.1 General: Install gypsum board shaft wall assemblies to comply with requirements of fire-resistance-rated assemblies indicated on Drawings and Schedules, manufacturer's written installation instructions, and ASTM C754 other than stud-spacing requirements.
- 3.10.2 Do not bridge building expansion joints with shaft wall assemblies; frame both sides of expansion joints with furring and other support.
- 3.10.3 Install supplementary framing in gypsum board shaft wall assemblies around openings and as required for blocking, bracing, and support of gravity and pullout loads of fixtures, equipment, services, heavy trim, furnishings, wall-mounted door stops, and similar items that cannot be supported directly by shaft wall assembly framing.
- .1 Elevator Hoistway: At elevator hoistway-entrance door frames, provide jamb struts on each side of door frame.
  - .2 Reinforcing: Where handrails directly attach to gypsum board shaft wall assemblies, provide galvanized steel reinforcing strip with 20 ga (33 mil) minimum thickness of base metal (uncoated), accurately positioned and secured behind at least one layer of face panel.
- 3.10.4 Penetrations: At penetrations in shaft wall, maintain fire-resistance rating of shaft wall assembly by installing supplementary steel framing around perimeter of penetration and fire protection behind boxes containing wiring devices, elevator call buttons, elevator floor indicators, and similar items.
- 3.10.5 Isolate perimeter of gypsum panels from building structure to prevent cracking of panels, while maintaining continuity of fire-rated construction.
- 3.10.6 Firestop Tracks: Where indicated on Drawings and Schedules, install to maintain continuity of fire-resistance-rated assembly indicated on Drawings and Schedules.
- 3.10.7 Control Joints: Install control joints according to ASTM C840 and in specific locations approved by Consultant while maintaining fire-resistance rating of gypsum board shaft wall assemblies.
- 3.10.8 Sound-Rated Shaft Wall Assemblies: Seal gypsum board shaft walls with acoustical sealant at perimeter of each assembly where it abuts other work and at joints and penetrations within each assembly.

- 3.10.9 Cant Panels: At projections into shaft exceeding 102 mm (4 inches), install 13- or 16-mm- (1/2- or 5/8-inch-) thick gypsum board cants covering tops of projections.
- .1 Slope cant panels at least 75 degrees from horizontal. Set base edge of panels in adhesive and secure top edges to shaft walls at 610 mm (24 inches) o.c. with screws fastened to shaft wall framing.
  - .2 Where steel framing is required to support gypsum board cants, install framing at 610 mm (24 inches) o.c. and extend studs from the projection to shaft wall framing.
- 3.10.10 Installation Tolerance: Install each framing member so fastening surfaces vary not more than 3 mm (1/8 inch) from the plane formed by faces of adjacent framing.

**3.11 Installing Trim Accessories**

- 3.11.1 General: For trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.
- 3.11.2 Control Joints: Install control joints according to ASTM C840 and in specific locations approved by Consultant for visual effect.
- 3.11.3 Interior Trim: Install in the following locations:
- .1 Cornerbead: Use at outside corners unless otherwise indicated on Drawings and Schedules.
  - .2 LC-Bead: Use at exposed panel edges.
  - .3 Curved-Edge Cornerbead: Use at curved openings.
- 3.11.4 Exterior Trim: Install in the following locations:
- .1 Cornerbead: Use at outside corners.
  - .2 LC-Bead: Use at exposed panel edges.
- 3.11.5 Aluminum Trim: Install in locations indicated on Drawings.

**3.12 Finishing Gypsum Board**

- 3.12.1 General: Treat gypsum board joints, interior angles, edge trim, control joints, penetrations, fastener heads, surface defects, and elsewhere as required to prepare gypsum board surfaces for decoration. Promptly remove residual joint compound from adjacent surfaces.
- 3.12.2 Prefill open joints, rounded or beveled edges, and damaged surface areas.
- 3.12.3 Apply joint tape over gypsum board joints, except for trim products specifically indicated on Drawings and Schedules as not intended to receive tape.

- 
- 3.12.4 Gypsum Board Finish Levels: Finish panels to levels indicated on Drawings and Schedules below and according to ASTM C840:
- .1 Level 1: Ceiling plenum areas, concealed areas, and where indicated on Drawings and Schedules.
  - .2 Level 2: Panels that are substrate for tile.
  - .3 Level 4: At panel surfaces that will be exposed to view unless otherwise indicated on Drawings and Schedules .
- 3.12.5 Glass-Mat Gypsum Sheathing Board: Finish according to manufacturer's written instructions for use as exposed soffit board.
- 3.12.6 Glass-Mat Faced Panels: Finish according to manufacturer's written instructions.
- 3.12.7 Cementitious Backer Units: Finish according to manufacturer's written instructions.

**3.13     Protection**

- 3.13.1 Protect adjacent surfaces from gypsum board compound and promptly remove from floors and other non-gypsum board surfaces. Repair surfaces stained, marred, or otherwise damaged during gypsum board application.
- 3.13.2 Protect installed products from damage from weather, condensation, direct sunlight, construction, and other causes during remainder of the construction period.
- 3.13.3 Remove and replace panels that are wet, moisture damaged, and mould damaged.
- .1 Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
  - .2 Indications that panels are mould damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

END OF SECTION

---

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Tiling work specified herein. This includes, but is not necessarily limited, to:

- .1 Tile materials,
- .2 Trims and edging,
- .3 Mortar, adhesive and grout materials,

- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

- .1 Related requirements provided below are for convenience purposes only.
  - .1 Section 03 35 10 – Concrete Floor Finishing
  - .2 Section 05 51 00 – Metal Stairs
  - .3 Section 06 10 00 – Rough Carpentry
  - .4 Section 07 92 00 – Joint Sealers: for sealing of expansion, contraction, control, and isolation joints in tile surfaces.
  - .5 Section 09 21 16 – Gypsum Board Assemblies.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 General: Definitions in the ANSI A108 series of tile installation standards and in ANSI A326.3 apply to Work of this Section unless otherwise specified.
- 1.4.2 ANSI A108 Series: ANSI A108.01, ANSI A108.02, ANSI A108.1A, ANSI A108.1B, ANSI A108.1C, ANSI A108.4, ANSI A108.5,

ANSI A108.6, ANSI A108.8, ANSI A108.9, ANSI A108.10, ANSI A108.11, ANSI A108.12, ANSI A108.13, ANSI A108.14, ANSI A108.15, ANSI A108.16, and ANSI A108.17, which are contained in its "Specifications for Installation of Ceramic Tile."

- 1.4.3 Face Size: Actual tile size, excluding spacer lugs.
- 1.4.4 Module Size: Actual tile size plus joint width indicated.
- 1.4.5 Small Format Tile: Tiles having dimensions less than 100 mm x 100 mm.
- 1.4.6 Standard Format Tile: Tiles having dimensions from 100 mm x 100 mm and less than 400 mm x 400 mm.
- 1.4.7 Large Format Tile: Tiles having dimensions 400 mm x 400 mm and larger or weighing over 25 kg/sq.m (5 psf).
- 1.4.8 Gauged Porcelain Tiles/Panels: tiles with thickness ranging from 3 to 6.5mm. Gauged Porcelain Tiles are defined as tiles that measure less than 1m x 1m, while Gauged Porcelain Panels are equal to or larger than 1m x 1m.
- 1.4.9 Dry location or area: A location not normally subject to dampness.
- 1.4.10 Damp/wet location or area: Exterior or interior location that is normally or periodically subject to condensation of moisture in, on, or adjacent to, Work of this Section. This includes location in which water or other liquid can drip, splash, or flow on or against Work of this Section. This includes, but is not limited to, showers, drying areas, change rooms, kitchen areas, washrooms, and associated vestibules and corridors.

## **1.5 Administrative Requirements**

- 1.5.1 Preconstruction Meeting:
  - .1 Arrange a preconstruction meeting in accordance with Division attended by Contractor, Consultant, tile installer and tile supplier, mortar and grout representative, waterproofing membrane representative to discuss the following:
    - .1 Substrate and backing surfaces flatness requirements
    - .2 Installation techniques associated with specified materials
    - .3 Compatibility between specified materials and between adjacent materials
    - .4 Concerns arising from site conditions
    - .5 Concerns of the installer or supplier arising from as-constructed conditions
- 1.5.2 Coordination: Coordinate requirements for floor recesses and provide depth of required slab depressions to Division 03 before

---

placement of concrete accounting for mortar bed, bond coat and tile thickness where finished tile surfaces are indicated on Drawings and Schedules as being installed flush with adjacent floor finishes

**1.6     Action Submittals**

- 1.6.1 Product Data: Submit manufacturer's product data for each type of product specified; indicate compliance with specification and installation recommendations of manufacturer of products being used.
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Tiling work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.6.2 Shop Drawings: Submit shop drawings indicating the following:
  - .1 Special tile patterns or conditions affecting installation
  - .2 Locations transitions and intersections between differing materials
  - .3 Widths, details, and locations of expansion and contraction joints, and control and isolation joints in tile substrates and finished tile surfaces
- 1.6.3 Samples for Initial Selection: Submit samples for initial selection by Consultant:
  - .1 Tile: Manufacturer's colour charts consisting of actual tiles or sections of tiles showing the full range of colours, textures, and patterns available for each type and composition of tile indicated. Include Samples of accessories involving colour selection.
  - .2 Grout: Manufacturer's colour charts consisting of actual sections of grout showing the full range of colours available for each type of grout indicated.
- 1.6.4 Samples for Verification: Submit samples for verification to Consultant including sample sets showing full range of variations expected where products involve normal colour and texture variations:
  - .1 Trims: Submit full size units of each type of trim and accessory in each colour required for installation; minimum 150 mm lengths].
  - .2 Tiles: Submit two (2) pieces of each tile specified
  - .3 Panels: Submit 300 mm x 300 mm sized panel using specified material including coloured grout mounted on 19 mm thick plywood backer; include sample installation of perimeter

---

accessories, control or movement joints, and trims where applicable

**1.7 Informational Submittals**

1.7.1 Provide the following submittals during the course of the work

- .1 Certificates: Submit written statements from manufacturers indicating compatibility with respect to other manufacturer's materials where more than one manufacturer's products form a part of a single tile assembly
- .2 Master Grade Certificates: Submit for each shipment, type, and composition of tile, signed by tile manufacturer and Installer.

**1.8 Project Closeout Submittals**

1.8.1 Operations and Maintenance Data: Submit four (4) copies of TTMAC Maintenance Guide in accordance with Division 01, and additional information as follows:

- .1 Provide specific warning of any maintenance practice or materials that may damage or disfigure the finished Work.
- .2 Provide manufacturer's maintenance data sheets for floor sealers and other non tile maintenance materials and accessories

**1.9 Maintenance Materials Submittals**

1.9.1 Provide additional materials supplied to the installation in accordance with Division 01, and as follows:

- .1 Tile Maintenance Materials: Deliver 2% of total for each tile material used for the project, packaged neatly in original containers to prevent damage, from the same lot or batch with a minimum of 1 (one) box pieces of each colour and type use for the project; clearly marked to identify the following:
  - .1 Manufacturer and distributor's name.
  - .2 Material series name and stocking number
  - .3 Material description, including colour and pattern

**1.10 Quality Assurance**

1.10.1 Qualifications: Provide proof of qualifications when requested by Consultant:

- .1 Project Quality Standard: Tile Installation Manual published by the TTMAC, together with authorized additions and amendments will be used as a reference standard and forms part of this project specification.
- .2 Installer: Execute Work of this Section using a company employing qualified personnel skilled in ceramic tile installation,

that is a member in good standing of TTMAC at time of Bidding, having a minimum of five (5) years proven experience and having completed tile installations similar in material, design, and extent to that indicated for this Project

- .3 Supplier: Obtain each specified material from one source with resources to provide products from the same production run for each contiguous area consistent in quality, appearance and physical properties

#### 1.10.2 Mock-Ups

- .1 Provide required Mock-ups in accordance with Division 01, and as follows:
- .2 Construct mock-ups for each form of construction and finish required to verify selections made under Sample submittals and to demonstrate aesthetic effects and qualities of materials and execution
- .3 Mock-up one (1) typical washroom indicating tile pattern, grout colour and accessories indicated:
  - .1 Mock-up will be used to coordinate placement of miscellaneous specialties and other related components as well as clearances to adjacent appurtenances (electrical and mechanical fixtures) and finishes.
  - .2 Consultant will require modifications pertaining to aesthetics and placement of components that interfere with other materials or fixtures.
  - .3 When identified modifications to the mock-up are completed, reviewed, and accepted by the Consultant, they will form the standard of acceptance for the remainder of the Work.
- .4 Locate mock-ups where directed on site in the location and of the size indicated or, if not indicated, as directed by Consultant.
- .5 Notify Consultant seven (7) days in advance of the dates and times when mock-ups will be constructed.
- .6 Obtain Consultant's acceptance of mock-ups before proceeding with final unit of Work.
- .7 Accepted mock-ups in an undisturbed condition at the time of Substantial Performance may become part of the completed Work.

#### 1.10.3 Single Source Responsibility:

- .1 Source Limitations for Tile: Obtain tile of each type and colour or finish from single source or producer.

- .1 Obtain tile of each type and colour or finish from same production run and of consistent quality in appearance and physical properties for each contiguous area.
- .2 Source Limitations for Setting and Grouting Materials: Obtain ingredients of a uniform quality for each mortar, adhesive, and grout component from single manufacturer and each aggregate from single source or producer.
  - .1 Obtain setting and grouting materials, except for unmodified Portland cement and aggregate, from single manufacturer.
  - .2 Obtain waterproofing membrane, except for sheet products, from manufacturer of setting and grouting materials.
- .3 Source Limitations for Other Products: Obtain each of the following products specified in this Section from a single manufacturer:
  - .1 Stone thresholds.
  - .2 Waterproofing membrane.
  - .3 Crack isolation membrane.
  - .4 Cementitious backer units.
  - .5 Metal edge strips.

#### **1.11 Delivery, Storage, And Handling**

##### **1.11.1 Packaging Requirements: Packaging is required to list the following:**

- .1 Markings: Manufacturer's mark or trademark, product name and country of origin; also include on edge or back side of tile.
- .2 Quality: Indication of First Quality.
- .3 Type of Tile: Indicate tile type as described by relevant reference standard.
- .4 Dimensions: Tile sizing indicating nominal dimensions and working size, and whether sizing is modular or non-modular.
- .5 Surface: Indicating glazed or unglazed surface finish.
- .6 Additional Preparation: Indication of whether tiles require any site preparation or surface treatments.
- .7 Weight: Total dry weight that tile and packaging is not to exceed.

##### **1.11.2 Delivery and Acceptance Requirements: Deliver and store packaged materials in original containers with seals unbroken and labels intact until time of use in accordance with ANSI A108.1 for labelling sealed tile packages.**

- 1.11.3 Storage and Handling Requirements: Store materials to prevent damage or contamination to materials by water, freezing, foreign matter, and other causes; store cementitious materials in a dry area, and blocked off floor and ground surfaces.

**1.12 Site Conditions**

- 1.12.1 Ambient Conditions: Apply tile after completion of work by other Sections is complete; to surfaces sufficiently dry, clean, firm, level, plumb and free from oil or wax or any other material harmful to tile adhesion and as follows:

- .1 Temperature: Maintain tile materials and substrate temperature between TTMAC recommended minimum and maximum temperature range; unless indicated otherwise by manufacturer, as follows:

- .1 Tile and Cementitious Materials: Install tiles between 12 deg C (54 deg F) and 38 deg C (100 deg F), meeting installation material manufacturer's written recommendations.

- .2 Epoxy Materials: Install epoxy mortar and grouts between 18 deg C (65 deg F) and 35 deg C (95 deg F), meeting installation material manufacturer's written recommendations.

- .3 Curing Time: Maintain temperature range for 48 hours before and during installation and maintain temperature range until materials are fully set and cured in accordance with manufacturer's recommendations, and as follows:

- .1 Provide additional heat when there is a risk that surface temperatures may drop below minimum recommended temperatures.
- .2 Provide cooling or wait until temperature range is below maximum recommended temperatures; do not install materials when temperature is at or above maximum recommended temperature.

- 1.12.2 Ventilation: Maintain adequate ventilation where Work of this Section generates toxic gases or where there is a risk of raising relative humidity to levels that could damage building finishes and assemblies

**1.13 Warranty**

- 1.13.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

---

## **2 .     PRODUCTS**

### **2.1     Manufacturers**

- 2.1.1 Acceptable Mortar and Grout Manufacturers: tile mortar and grout materials from the following listed manufacturers are considered acceptable for use in this project:
- .1 Ardex Engineered Cements.
  - .2 Flextile Ltd.
  - .3 Kiesel GmbH.
  - .4 Laticrete International Inc.
  - .5 Mapei Inc.
  - .6 Proma Adhesives Inc.
  - .7 Custom Building Products
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2     Performance Requirements**

- 2.2.1 Provide tile products manufactured and tested in accordance with ANSI A108.1, ANSI A326.3, ANSI A137.3 or ISO 10545 as appropriate to the Basis-of-Design Materials listed on the Drawings.
- 2.2.2 Slip Resistance: Provide materials having a minimum Dynamic Coefficient of Friction (DCOF) of 0.42 wet in accordance with ANSI A326.3 when tested using the BOT 3000 Digital Tribometer.
- 2.2.3 Floor Traffic Load Bearing Performance: Provide installations rated for the following load bearing performance in accordance with ASTM C627 for ceramic tile installed on walkway surfaces:
- .1 Extra Heavy: Passes cycles 1 through 14
  - .2 Heavy: Passes cycles 1 through 12
  - .3 Moderate: Passes cycles 1 through 10
  - .4 Light: Passes cycles 1 through 6
  - .5 Residential: Passes cycles 1 through 3
- 2.2.4 Substrate and Backing Surface Flatness Tolerances: Section 03 35 10 establishes a flatness requirement for FF25 for slabs on grade for in place concrete and is considered as the starting flatness for work of this Section; final measurement for flatness and level using mortar bed or self levelling screed materials provided by this Section will be measured in same manner as specified in Section 03 35 10 to achieve the following:
- .1 Small Format Floor Tile: floor flatness as specified in Section 03 35 10.

- 
- .2 Standard Format Floor Tile: floor flatness measured to a minimum FF35; equivalent to 5 mm with no more than 2 gaps under a 3000 mm straightedge measurement.
  - .3 Large Format Floor Tile: floor flatness measured to a minimum of FF50; equivalent to 3 mm with no more than 2 gaps under 3000 mm straightedge measurement
  - .4 Wall Tiles: Provide wall levelling similar to that specified for floors for tiles having similar sizes listed above.
- 2.2.5 Factory Blending: For tile exhibiting colour variations within ranges, blend tile in factory and package so tile units taken from one package show same range in colours as those taken from other packages and match Samples reviewed by Consultant.
  - 2.2.6 Mounting: For factory-mounted tile, provide back- or edge-mounted tile assemblies as standard with manufacturer unless otherwise indicated.
- 2.3 Tile Materials (TL-#)**
- 2.3.1 Material Tag: This item is noted as "TL-#" on Drawings and Schedules.
  - 2.3.2 Basis-of-Design: Refer to Finish Schedule on Drawings.
- 2.4 Trims And Edging**
- 2.4.1 Trims: Provide tile trim shapes and profiles to match colour and finish of adjoining tile. Provide trims coordinated with sizes and coursing of adjoining flat tile where applicable and matching characteristics of adjoining flat tile. Provide shapes as follows, selected from manufacturer's standard shapes:
    - .1 Size: Coordinated with sizes and coursing of adjoining flat tile where applicable.
    - .2 Provide base cove, base cap, stair nosings, wainscot cap, external corners, internal corners and tapered transition as required.
  - 2.4.2 Straight Edge and Transition Strips: clear satin anodized edge strips, with height as required to suit tile installation; with integral perforated anchoring leg for setting the strip into the setting material and as follows:
    - .1 Same-height Transitions: Provide L-shaped profile with 3 mm (1/8") wide visible surface, integrated trapezoid-perforated anchoring leg, and integrated grout joint spacer.
      - .1 Acceptable Products: "Schluter-SCHIENE" by Schlüter Systems or approved equivalent.
    - .2 Varying-height (Sloped) Transitions: ADA compliant-type. Provide minimum width to height ratio to conform to barrier-free

requirements specified in CSA B651. Following types are acceptable:

- .1 Unless otherwise indicated, Provide profile with sloped exposed surface, 4 mm (5/32") tall leading edge, integrated trapezoid-perforated anchoring leg, and integrated grout joint spacer.
    - .1 Acceptable Products: "Schluter-RENO-U" by Schlüter Systems or approved equivalent.
  - .2 Ramps: Provide ramp profile with textured, sloped exposed surface, tapered leading edge, integrated trapezoid-perforated anchoring leg, and integrated grout joint spacer.
    - .1 Acceptable Products: "Schluter-RENO-RAMP/-K" by Schlüter Systems or approved equivalent.
  - .3 Tile-to-Carpet Transitions: Provide profile with sloped exposed surface, 6 mm (1/4") deep channel below exposed surface, integrated trapezoid-perforated anchoring leg, and integrated grout joint spacer.
    - .1 Acceptable Products: "Schluter®-RENO-TK" by Schlüter Systems or approved equivalent.
  - .3 Trims and edge-protection profiles (Outside corners - vertical applications – normal duty): Provide L-shaped aluminum profile with 3 mm (1/8") wide top section, integrated trapezoid-perforated anchoring leg, and integrated grout joint spacer.
    - .1 Acceptable Products: "Schluter-JOLLY" by Schlüter Systems or approved equivalent.
  - .4 Trims and edge-protection profiles (Outside corners vertical applications – heavy duty): Provide roll-formed stainless steel V-shaped profile with 37 mm (1-15/32") wide exposed surfaces joined by a symmetrically rounded corner, with integrated trapezoid-perforated anchoring legs.
    - .1 Acceptable Products: "Schluter-ECK-E" by Schlüter Systems or approved equivalent.
- 2.4.3 Thresholds: Fabricate to sizes and profiles indicated or required to provide transition between adjacent floor finishes; honed finish on exposed surfaces, size to suit door opening and frame width and as follows:
- .1 Bevel edges at 1:2 slope, with lower edge of bevel aligned with or up to 1.5 mm (1/16 inch) above adjacent floor surface. Finish bevel to match top surface of threshold. Limit height of threshold to 12.7 mm (1/2 inch) or less above adjacent floor surface.

2.4.4 Prefabricated Movement Joints: purpose made, having a Shore A Hardness of 35 or greater and elasticity of plus or minus 25% when used in accordance to TTMAC Detail 301MJ-2019/2021 and as follows:

- .1 Acceptable Products: "Schlüter – DILEX Series" by Schlüter Systems or approved equivalent. Specific profile as recommended by manufacturer.

## **2.5 Mortar, Adhesive And Grout Materials**

2.5.1 Primer: Low VOC, low viscosity primer as recommended by manufacturer to suit substrate and site conditions; provide proof of bonding ability of setting system where manufacturer recommends that a primer is not necessary to installation.

2.5.2 Surface Preparation Materials: Provide following underlayment materials:

- .1 Cementitious Mortar Bed or Leveling Screed: cement mortar screed for interior concrete floor preparation, repair and levelling from 19 mm (3/4") to 38 mm (1-1/2") thickness
  - .1 "ARDEX A38 Rapid Set Screed" by Ardex Engineered Cements.
- .2 Self Levelling and Smoothing Underlayment: Cementitious self levelling smoothing underlayment meeting or exceeding requirements of ANSI A108.1, Type 2 for levelling up to 50 mm (2 inch) and as follows:
  - .1 "ARDEX Liquid Backer Board" by Ardex Engineered Cements
  - .2 "Flex-Flo Plus" by Flextile Ltd.
  - .3 "Servoplan S 111" (40 mm) or "Servoplan E600" (80 mm) with "Servoplan Ki 1" by Kiesel GmbH.
  - .4 "NXT Level" with "NXT Primer" by Laticrete International Ltd.
  - .5 "Ultraplan 1 Plus" by Mapei Inc.
  - .6 "Pro Plan LC" or "Pro Plan CG" (for faster curing/setting) by Proma Adhesives Inc.
  - .7 "Tech Level 150" by Custom Building Products.

2.5.3 Wall Tile Systems: Provide the following setting materials:

- .1 Thin Set Interior Installation: Dry set mortar meeting or exceeding requirements of ANSI A118.4, or ANSI A118.11 sag-resistant formulated for thin and medium set applications, factory sanded mortar consisting of Portland cement, sand and additives requiring only addition of potable water for installation complete with bond enhancing latex additive and as follows:

- .1 "ARDEX X 5 Thin Set Mortar" by Ardex Engineered Cements
- .2 "56SR Non-Sag Mortar" by Flextile Ltd.
- .3 "Servolight S2 SuperTec" (walls and floors), "Servolight" (walls), "Servoflex Trio SuperTec" (floors only) by Kiesel GmbH.
- .4 "4XLT" by Laticrete International Ltd.
- .5 "Keraflex Plus" by Mapei Inc.
- .6 "Pro Flex SF" or "Pro P151 SF" by Proma Adhesives Inc.
- .7 "VersaBond LFT" Custom Building Products.
- .2 Large/Heavy Format Tile or Gauged Porcelain Panel Interior Installation: Dry set mortar meeting or exceeding requirements of ANSI A118.15, sag-resistant formulated for thin set applications, factory sanded mortar consisting of Portland cement, sand and additives requiring only addition of potable water for installation complete with bond enhancing latex additive and as follows:
  - .1 "ARDEX X77 Microtec™", with "ARDEX E90 additive™" where needed by Ardex Engineered Cements.
  - .2 "66 Flexlite Premium Wall and Floor Lightweight Mortar" by Flextile Ltd with the addition of water and equal parts "43 Acrylic latex mortar additive" by Flextile Ltd.
  - .3 "Servolight S2 SuperTec" by Kiesel GmbH.
  - .4 "Multimax Lite" (mixed with water only) by Laticrete International Ltd.
  - .5 "Kerabond T/Keralastic" (for 2-component:cement with latex additive) or "Ultralite S2" (for single component: water) by Mapei.
  - .6 "ProLite LFT" by Custom Building Products.
- .3 Glass Tile Interior Installation: mortar meeting or exceeding requirements of ANSI A118.4, sag-resistant formulated for thin and medium set applications, factory sanded mortar consisting of Portland cement, sand and additives requiring only addition of potable water for installation complete with bond enhancing latex additive and as follows:
  - .1 "ARDEX S48™" by Ardex Engineered Cements
  - .2 "66 Flexlite Premium Wall and Floor Lightweight Mortar" by Flextile Ltd.
  - .3 "ServoStar 3000 white" (normal set), "Servostar 4000 White" (fast set); non-sag or "Servolight S2 SuperTec"

---

light grey,walls and floors, "Servoflex Trio SuperTec"  
(floors only), light grey by Kiesel GmbH.

- .4 "Glass Adhesive Mortar" by Laticrete
- .5 "Adesilex P10" by Mapei Inc.
- .6 "Pro HPX White" by Proma Adhesives Inc.
- .7 "Glass Tile Premium Thin set" by Custom Building Products

2.5.4 Adhesive Systems: Provide the following materials:

- .1 Epoxy Adhesive: Thin set adhesive system using 100% solids epoxy resin and epoxy hardener meeting or exceeding the requirements for ANSI A108.1; stain proof, chemical resistant and having high temperature resistance and water cleanable, and as follows:
  - .1 "ARDEX WA" by Ardex Engineered Cements
  - .2 "Flex-Epoxy 100 setting mortar" by Flextile Ltd.
  - .3 "Okapox royal" walls and floors by Kiesel GmbH.
  - .4 "Latapoxy 300" by Laticrete International, Inc.,
  - .5 "Kerapoxy 410" by Mapei Inc.
  - .6 "Pro Grout Xtreme" By Proma Adhesives Inc.
  - .7 "EBM – Lite" by Custom Building Products

2.5.5 Tile Grout Systems: Provide the following materials:

2.5.6 Material Tag: This item is noted as "GR-#" on Drawings and Schedules

- .1 Colours: Colours will be selected from manufacturer's full range.
- .2 Grout Sealer: Penetrating sealer as recommended by grout manufacturer to suit grout selected.
  - .1 "Bullet Proof StoneTech" by Laticrete or approved equivalent.
- .3 Sanded Polymer Modified Grout: Factory blended stain resistant polymer modified portland cement meeting or exceeding requirements of ANSI A118.7, specifically formulated for joints greater than 3 mm in width and as follows:
  - .1 "ARDEX FL Grout" by Ardex Engineered Cements
  - .2 "Flextile 600 Series Polymer Modified Grout" by Flextile Ltd.
  - .3 "Servoperl royal" universal, high performance grout by Kiesel GmbH.

- 
- .4 "Permacolor Grout" or "Permacolor Select" by Laticrete International Inc.
  - .5 "Ultracolor® PlusFA " (Fast Set) by Mapei Inc.
  - .6 "Pro Grout Sanded" by Proma Adhesives Inc.
  - .7 "Poly Blend Sanded" by Custom Building Products
  - .4 Unsanded Polymer Modified Grout: Factory blended stain resistant polymer modified portland cement meeting or exceeding requirements of ANSI A118.7, specifically formulated for joints less than or equal to 3 mm in width and as follows:
    - .1 "ARDEX FG-C Grout" by Ardex Engineered Cements
    - .2 "Flextile 500 Series Polymer Modified Grout" by Flextile Ltd.
    - .3 "Servoperl royal" universal, high performance grout by Kiesel GmbH.
    - .4 "Permacolor Select unsanded" by Laticrete International Inc.
    - .5 "Keracolor-U" or "Ultracolor® Plus" (Fast Set) by Mapei Inc.
    - .6 "Pro Grout Unsanded" by Proma Adhesives Inc.
    - .7 "Poly Blend Unsanded" by Custom Building Products
  - .5 Chemical-Resistant Epoxy Grout: Water cleanable, chemical resistant, factory blended modified portland cement compound with 100% epoxy additives and hardeners meeting or exceeding requirements of ANSI A118.3 and as follows:
    - .1 "ARDEX WA" by Ardex Engineered Cements
    - .2 "Epoxy Grout Flex-Epoxy 100" by Flextile Ltd.,
    - .3 "Okapox royal " wall and floor by Kiesel GmbH.
    - .4 "SPECTRALock Pro Gout" by Laticrete International, Inc.
    - .5 "Kerapoxy CQ" by Mapei Inc.
    - .6 "Pro Grout Xtreme" by Proma Adhesives Inc.
    - .7 "CEG – Lite" by Custom Building Products
  - .6 RTU Grout: colour consistent, no efflorescence and stain resistant acrylic based grout meeting or exceeding specific tests of ANSI A118.3 and as follows
    - .1 "ColourMax Plus Grout" by Flextile Ltd.
    - .2 "READY-TO-USE" by Laticrete International Ltd.
    - .3 "Pro Grout Xtreme" by Proma Adhesives Inc.
    - .4 "Flexcolor CQ" by Mapei Inc.

- .5 "Fusion Pro" by Custom Building Products

## **2.6 Accessories**

2.6.1 Crack Isolation Membranes: Load bearing, membrane meeting requirements of ANSI A118.12; thickness as recommended by manufacturer to accommodate in-plane substrate movement of 10 mm (1/8 inch) in thin set applications meeting or exceeding requirements of ANSI A108.1 and as follows:

- .1 Acceptable premanufactured self-adhering membranes:
  - .1 "1000 Flexilastic Crack Isolation Membrane" by Flextile Ltd.
  - .2 "Blue 929 " waterproofing membrane system with "fiberglass cloth reinforcement" by Laticrete International, Inc.
  - .3 "Pro MBR XD" by Proma Adhesives Inc.
  - .4 "Crack Buster Pro" by Custom Building Products
- .2 Acceptable liquid applied, lightweight fabric reinforced membranes:
  - .1 "ARDEX 8+9 Waterproofing & Crack Isolation Membrane with SK Mesh" by Ardex Engineered Cements
  - .2 "WP-980 Waterproofing & Crack Isolation Membrane with Reinforcing Fabric" by Flextile Ltd.
  - .3 "Servoflex DMS 1K SuperTec and Crack Isolation Membrane" by Kiesel GmbH.
  - .4 "Hydro Ban" or "Fracture Ban SC" waterproofing membrane system with Laticrete's fiberglass cloth reinforcement by Laticrete International, Inc.
  - .5 "Mapelastix CI" by Mapei Inc.
  - .6 "Custom 9240 Waterproofing Antifracture Membrane" by Custom Building Products

2.6.2 Waterproofing Membranes: Load bearing, membrane meeting requirements of ANSI A118.10; thickness as recommended by manufacturer to accommodate in-plane substrate movement of 3 mm (1/8 inch) in thin set applications meeting or exceeding requirements of ANSI A108.1 and as follows:

- .1 Acceptable liquid applied, lightweight fabric reinforced membranes (commercial applications):
  - .1 "ARDEX 8+9 Waterproofing & Crack Isolation Membrane with SK Mesh" by Ardex Engineered Cements
  - .2 "Flextile WP-980 Waterproofing & Crack Isolation Membrane with Reinforcing Fabric" by Flextile Ltd.

- 
- .3 “Servoflex DMS 1K SuperTec and Crack Isolation Membrane” by Kiesel GmbH.
  - .4 “Laticrete 9235” waterproofing membrane system with Laticrete's fiberglass cloth reinforcement by Laticrete International, Inc.
  - .5 “Mapelastic™ 315” by Mapei Inc.
  - .6 “Pro MBR XD” by Proma Adhesives Inc.
  - .7 “Custom 9240 Waterproofing Antifracture Membrane” by Custom Building Products
  - .2 Acceptable liquid applied membranes (residential applications):
    - .1 “ARDEX SK1 Waterproofing & Crack Isolation Membrane” by Ardex Engineered Cements
    - .2 “WP-900 Hydro-Bloc Waterproofing & Crack Isolation Membrane” by Flextile Ltd.
    - .3 “Servoflex DMS 1K SuperTec” by Kiesel GmbH.
    - .4 “Hydro Ban” by Laticrete International, Inc.,
    - .5 “Aqua Defense” by Mapei Inc.
    - .6 “Custom 9240 Waterproofing Antifracture Membrane” or “Redgard” by Custom Building Products
  - 2.6.3 Uncoupling Membranes (for all large-format tiles): Load bearing, pre-manufactured membrane meeting requirements of ANSI A118.12; thickness as recommended by manufacturer to accommodate in-plane substrate movement of 3 mm (1/8 inch) in thin set applications meeting or exceeding requirements of ANSI A108.1 and as follows:
    - .1 “Flexbone” by Ardex Engineered Cements
    - .2 “FlexMat” by Flextile Ltd.
    - .3 “Strata Mat” or “Strata Mat XT” by Laticrete International, Inc
    - .4 “Schluter 'DITRA XL'” Schluter Systems.
    - .5 “Mapeguard UM” by Mapei, Inc.
    - .6 “Redgard Uncoupling Mat” by Custom Building Products
  - 2.6.4 Latex Additive: Formulated for use in Portland cement mortars and grouts.
  - 2.6.5 Water: Potable, clean and free of chemicals and contaminants detrimental to mortar or grout mixes.
  - 2.6.6 Joint Sealant: As specified in Section 07 92 00
  - 2.6.7 Sealer: Meeting or exceeding requirements of CAN/CGSB 25.20, Type as recommended by tile manufacturer.

---

**2.7     Mixes**

2.7.1 Mix premanufactured mortars and grouts in accordance with referenced standards, and mortar and grout manufacturers' written instructions; mix site mixed materials as follows:

- .1 Scratch Coat (by volume): Mix 1 part Portland cement, 4 parts sand, and latex additive where required by TTMAC Detail

2.7.2 Site mix proportioned mortar and grout materials as follows:

- .1 Bond Coat (by volume): Mix 1 part Portland cement, 4 parts sand, and latex additive where required by TTMAC Detail.
- .2 Slurry Bond Coat: Mix Portland cement and water to a creamy paste consistency. Include latex additive where required by TTMAC Detail.
- .3 Mortar Bed for Walls (by volume): Mix 1 part Portland cement, 4 parts sand, and latex additive where required by TTMAC Detail.
- .4 Leveling Coat (by volume): Mix 1 part Portland cement, 4 parts sand, and latex additive where required by TTMAC Detail.
- .5 Mortar Bed for Floors: 1 part Portland cement, 4 parts sand, and latex additive where required by TTMAC Detail; when mixed with water the mortar bed shall be of such a consistency and workability that will allow maximum compaction during tamping of the mortar bed, and achieve a minimum compressive strength of 15 MPa after 28 days. A stronger mix can be achieved by adding latex to the water

2.7.3 Adjust water volume depending on moisture content of sand to obtain consistency and workability

**3 .     EXECUTION**

**3.1     Examination**

3.1.1 Examine materials ordered for the project before delivering to the site; open boxes and confirm that materials match accepted samples, are free from defects and breakage detrimental to final appearance and installation, and as follows:

- .1 Consultant will only accept Grade 1 Standard, materials appearing on site factory marked as seconds or discounted or that are not consistent with materials submitted for review will be rejected.
- .2 Replace unacceptable materials at no additional cost to the Owner; order replacement materials using most expedient delivery method to minimize effect on construction schedule.

---

3.1.2 Examine substrates, areas, and conditions where tile will be installed for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile and confirm the following:

- .1 Verify that substrates for bonding tile are firm; dry; clean; free from oil, waxy films, and curing compounds; and are within starting flatness tolerances as specified in Section 03 35 10, and are ready for application of levelling materials specified in this Section.
- .2 Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of Work, and similar items located in or behind tile have been completed before installing tile.
- .3 Verify that joints and cracks in tile substrates are coordinated with tile joint locations; adjust joints in consultation with Consultant where joints are not coordinated
- .4 Notify Consultant in writing of any conditions that are not acceptable; do not proceed with installation until unsatisfactory conditions have been corrected.

## **3.2 Preparation**

3.2.1 Protection: Protect surrounding work from damage or disfiguration arising from work of this Section.

3.2.2 Surfaces: Thoroughly clean substrate surfaces receiving tile finishes to remove grease, oil or dust film, and other contaminants affecting bond of materials within bonding systems and as follows:

- .1 Clean back of each tile before installation to remove surface contaminants and cutting residue, firing release dust and other debris detrimental to bond and final surface appearance.

3.2.3 Blending: For tile exhibiting colour variations, verify that tile has been factory blended and packaged so tile units taken from one package show same range of colours as those taken from other packages and match approved Samples reviewed by Consultant. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.

3.2.4 Surface Levelling: Fill cracks, holes, and depressions in concrete substrates for tile floors with trowelable leveling and patching compound specifically recommended by tile-setting material manufacturer.

- .1 Apply Levelling Bed Mortar or Self Levelling Mortar to make backing surfaces flat and true to tolerances in plane listed for performance requirements with additional requirements as follows:

- .1 Install levelling materials wherever a slight substrate irregularity exists.
- .2 Use self levelling materials for thicknesses less than 8 mm where thin set tile methods are used.
- .3 Use mortar bed levelling materials for thicknesses 8 mm and greater.

### **3.3 Installation Of Tile Backing Panel**

- 3.3.1 Install panels and treat joints according to ANSI A108.11 and manufacturer's written instructions for type of application indicated. Use polymer-modified dry-set mortar for bonding material unless otherwise directed in manufacturer's written instructions.

### **3.4 Installation Of Waterproofing Membrane**

- 3.4.1 Prepare substrates to receive waterproofing membrane by applying a reinforced mortar bed that complies with ANSI A108.1A and is sloped 1:50 (1/4 inch per foot) toward drains.
- 3.4.2 Install waterproofing membrane to comply with ANSI A108.13 and manufacturer's written instructions to produce waterproofing membrane of uniform thickness that is bonded securely to substrate.
- 3.4.3 Allow waterproofing membrane to cure and verify by testing that it is watertight before installing tile or setting materials over it.
- 3.4.4 Membranes: Apply waterproofing membranes in accordance with TTMAC and manufacturer's instructions. Provide waterproofing membrane to decks, floors, walls, steps and ramps to tiles applied in the following locations:
  - .1 kitchens, laundry areas, and other wet locations as noted on Drawings.

### **3.5 Installation Of Uncoupling Membrane**

- 3.5.1 Install uncoupling membrane to comply with manufacturer's written instructions to produce membrane of uniform thickness that is bonded securely to substrate.
- 3.5.2 Allow uncoupling membrane to cure before installing tile or setting materials over it.
- 3.5.3 Provide uncoupling membrane to decks, floors, steps and ramps to tiles applied in the following conditions:
  - .1 Large format tile and other locations as noted on Drawings.

---

### **3.6     Installation Of Tile**

3.6.1 Install tiling in accordance with requirements of TTMAC Tile Installation Manual 2019/2021 (TMAC- Specification Guide 09 30 00;) and parts of ANSI A108 Series of tile installation standards that apply to types of bonding and grouting materials, and to methods required for complete tile installation.

3.6.2 Extend tile work into recesses and under or behind equipment and fixtures to form a complete covering without interruptions:

- .1     Terminate Work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.
- .2     Make cut edges smooth, even and free from chipping.
- .3     Do not split tile.
- .2     Accurately form intersections and returns; perform cutting and drilling of tile without marring visible surfaces:
  - .1     Cut, drill, and fit tile to accommodate work of other trades penetrating or abutting work of this Section.
  - .2     Carefully grind cut edges of tile abutting trim, finish, or built in items for straight aligned joints.
  - .3     Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so that plates, collars, or covers overlap tile and to provide a uniform joint appearance.
- .3     Lay tile in pattern indicated on Drawings and as follows:
  - .1     Align joints when adjoining tiles on floor, base, walls, and trim are the same size.
  - .2     Lay out tile Work and center tile sites in both directions in each space or on each wall area.
  - .3     Centre tile patterns between control and movement joints; notify Consultant for further instructions where tile patterns do not align with control or movement joints.
  - .4     Cut tile accurately and without damage.
  - .5     Smooth exposed cut edges with abrasive stone, where exposed
  - .6     Chipped or split edges are not acceptable.
  - .7     Minimum tile width is half unit size unless specifically indicated otherwise on Drawings.
  - .8     Adjust tile layout to minimize tile cutting.
  - .9     Provide uniform joint widths.

- 
- .10 Make joints between tile sheets the same width as joints within tile sheets so joints between sheets are not apparent in finished Work.
  - .11 Slope floor tile towards floor drains in thick-bed mortar installations.
  - .12 Lay out tile wainscots to next full tile beyond dimensions indicated on Drawings and Schedules.
  - .4 Bonding Bed: Set tile in place while bond coat is wet and tacky and as follows:
    - .1 Adjust amount of bonding materials placed on substrates based on temperature and humidity to prevent skinning over of bonding materials.
    - .2 Use sufficient bond coat to provide a minimum 80% contact for tiles smaller than 300 mm x 300 mm and areas having Residential or Light Load Bearing Performance requirements with bonding material evenly dispersed and pressed into back of tile; refer to back buttering requirements for larger materials and installations having Moderate or higher Load Bearing Performance requirements.
    - .3 Notch bond coat in horizontal straight lines and set on freshly placed bonding material while moving (sliding) tile back and forth at 90° to notches.
    - .4 Verify that corner and edges are fully supported by bonding material.
    - .5 Set tiles to prevent lippage greater than 1 mm over a 3 mm grout joint.
    - .6 Keep two-thirds of grout joint depth free of bonding materials.
    - .7 Clean excess bonding materials from tile surface prior to final set.
    - .8 Sound tiles after bonding materials have cured and replace hollow sounding tile before grouting.
  - .5 Back Buttering: Obtain 100% mortar coverage in accordance with applicable requirements for back buttering of tile in referenced TTMAC and ANSI A108 series of tile installation standards for the following applications:
    - .1 Glass tile
    - .2 Exterior tile
    - .3 Tile in wet areas including, but not limited to:
      - .1 Showers
      - .2 Laundries
    - .4 Tile installed with chemical resistant mortars and grouts.
    - .5 Tile having tiles 300 mm or larger in any direction.
    - .6 Tile having tiles with raised or textured backs.

- 
- .7 Tile having tile installation rated for Heavy or Extra Heavy Duty.
  - .8 All porcelain tiles with more than 20% of the tile backs covered with firing release.
  - .6 Install prefabricated edge strips and control joints at locations indicated on Drawings and Schedules or where exposed edge of floor tile meets different flooring materials and exposed substrates
  - .7 Protect exposed edges of floor tile with properly sized transition strips, use sloped reducer strips where uneven transitions between 6 mm and 13 mm occur.
  - .8 Control and Movement Joints: Install control joints and expansion joints in tile work in accordance with TTMAC Detail 301MJ-2019/2021; keep control and expansion joints free of bonding materials and as follows:
    - .1 Cut tiles to establish line of joints; sawn joints after installation of tiles will not be acceptable to Consultant.
    - .2 Locate joints in tile surfaces directly above joints in concrete substrates.
    - .3 Provide floor control joints over structural control joints.
    - .4 Install prefabricated joint profiles in accordance with manufacturer's written instructions, set with top surface of joint profile slightly below top surface of tile.
    - .5 Prepare joints and apply sealants in accordance with requirements of Section 07 92 00.
    - .6 Keep control and movement joints free from setting materials.
    - .7 Form an open joint for sealant in tile wherever a change in backing material occurs, at all vertical interior corners, around penetrating pipes and fixtures, and where tile abuts other materials or fixtures.

Environment	Minimum	Maximum	Joint Width
Interior/Shaded	4800 mm	6100 mm	6 mm min.
Interior/Sunlight	2400 mm	3700 mm	6 mm min.
Exterior/Normal	2400 mm	3700 mm	10 mm min.
Exterior/Excessive	2400 mm	3000 mm	13 mm min.

- .9 Grouting: Install grout in accordance with manufacturer's written instructions, the requirements of TTMAC, and as follows:
  - .1 Allow proper setting time before application of grout.
  - .2 Pre-seal or wax tiles requiring protection from grout staining.
  - .3 Force grout into joints to a smooth, dense finish.
  - .4 Remove excess grout in accordance with manufacturer's written instructions and polish tile with clean cloths

- .10 Joint Widths: Unless otherwise indicated, install tile with the following joint widths:
  - .1 Pressed Floor Tile: 3.2 mm (1/8 inch).
  - .2 Glazed Wall Tile: 3.2 mm (1/8 inch).
  - .3 Porcelain Tile (unless indicated otherwise): 3.2 mm (1/8 inch).
  - .4 Porcelain Tile (with rectified edges): 1.6 mm (1/16 inch)
- .11 Stone Thresholds: Install stone thresholds in same type of setting bed as adjacent floor unless otherwise indicated.
- .12 Floor Sealer: Apply floor sealer to grout joints in tile floors according to floor-sealer manufacturer's written instructions. As soon as floor sealer has penetrated grout joints, remove excess sealer and sealer from tile faces by wiping with soft cloth.

### **3.7 Cleaning And Protection**

3.7.1 Cleaning: Clean tile surfaces so they are free of foreign matter using manufacturer recommended cleaning products and methods after completion of placement and grouting and as follows:

- .1 Remove grout residue from tile as soon as possible.
- .2 Unglazed tile may be cleaned with acid solutions only when permitted by tile and grout manufacturer's written instructions, but no sooner than 10 days after installation; protect metal surfaces, cast iron, and vitreous plumbing fixtures from effects of acid cleaning.
- .3 Flush surface with clean water before and after cleaning.
- .4 Remove temporary protective coating by method recommended by coating manufacturer that is acceptable to brick and grout manufacturer; trap and remove coating to prevent it from clogging drains.

3.7.2 Protection: Leave finished installation clean and free of cracked, chipped, broken, unbonded, or other tile deficiencies as follows:

- .1 Protect finished areas from traffic until setting materials have sufficiently cured in accordance with TTMAC requirements.
- .2 Protect floor areas from traffic after grouting is completed in accordance with manufacturer's written instructions.

### **3.8 Interior Ceramic Tile Installation Schedule**

3.8.1 Interior Floor Installations, Concrete Subfloor: 311F-2019/2021

- 
- .1 Provide waterproofing membrane over concrete where indicated on Drawings or where required. Provide tile bonded to concrete where membrane is not indicated or required.
  - .2 Provide uncoupling membrane over concrete where indicated on Drawings or where required. Provide tile bonded to concrete where membrane is not indicated or required.
  - .3 If required by tile manufacturer and tile size, provide medium bed mortar installation in accordance with 310F-2019/2021

**3.8.2 Interior Floor Installations, Large Format Tile: 329LFT-2019/2021**

- .1 Provide uncoupling membrane over substrate at all locations.
- .2 Provide waterproofing membrane over substrate where indicated on Drawings or where required. Provide tile bonded to substrate where membrane is not indicated or required.

**3.8.3 Interior Wall Installations, Masonry or Concrete: 303W-2019/2021**

- .1 Provide waterproofing membrane over concrete where indicated on Drawings or where required. Provide tile bonded to concrete where membrane is not indicated or required.

**3.8.4 Interior Wall Installations, Studs or Furring:**

- .1 Gypsum Board (Dry Areas): 304W-2019/2021
- .2 Cementitious Backer Unit (Wet or Dry Areas): 305W-2019/2021 (unless indicated otherwise); 306W-2019/2021 (tub enclosures)
- .3 Fibreglass Mat Gypsum Board (Wet or Dry Areas): 305W-2019/2021 (unless indicated otherwise); 306W-2019/2021 (tub enclosures)
- .4 Large Format Tile: 330LFTW-2019/2021
- .5 Provide waterproofing membrane over substrate where indicated on Drawings or where required. Provide tile bonded to substrate where membrane is not indicated or required.

**3.8.5 Shower Receptor Installations: 319SR-2019/2021.**

- .1 Provide waterproofing membrane over substrate where indicated on Drawings or where required. Provide tile bonded to substrate where membrane is not indicated or required.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Acoustical Panel Ceilings work specified herein. This includes, but is not necessarily limited, to:
- .1 Acoustical panels
  - .2 Metal suspension systems
  - .3 Accessories
  - .4 Metal edge moldings and trims
  - .5 Acoustical sealants
  - .6 Auxiliary materials required for a complete installation..
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
- .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 05 50 00, Metal Fabrications for additional supports and reinforcing for ceiling assemblies.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Preinstallation Meetings**

- 1.4.1 Preinstallation Conference: Conduct conference at Project site.

### **1.5 Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for each type of product indicated.
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Acoustical Panel Ceilings work and

include product characteristics, performance criteria, physical size, finish and limitations

- 1.5.2 Samples: Submit samples in accordance with Division 01 for each exposed product and for each colour and texture specified, 150 mm (6 inches) in size.
- .1 Samples for Initial Selection: For components with factory-applied finishes.
  - .2 Samples for Verification: For each component indicated and for each exposed finish required, prepared on Samples of sizes indicated below:
    - .1 Acoustical Panels: Set of 150-mm- (6-inch-) square Samples of each type, colour, pattern, and texture.
    - .2 Exposed Suspension-System Members, Moldings, and Trim: Set of 150-mm- (6-inch-) long Samples of each type, finish, and colour.
    - .3 Clips: Full-size seismic clips.
- 1.5.3 Professional Engineer's Stamped Shop Drawings and Submittals: Submit Professional Engineer's Stamped Shop Drawings and Submittals in accordance with Division 01 for seismic restraints for ceiling systems.
- .1 Include design calculations for seismic restraints including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

## **1.6 Informational Submittals**

- 1.6.1 Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
- .1 Ceiling suspension-system members.
  - .2 Structural members to which suspension systems will be attached.
  - .3 Method of attaching hangers to building structure.
    - .1 Supply layouts for cast-in-place anchors, clips, and other ceiling attachment devices whose installation is specified in other Sections.
  - .4 Carrying channels or other supplemental support for hanger-wire attachment where conditions do not permit installation of hanger wires at required spacing.
  - .5 Size and location of initial access modules for acoustical panels.
  - .6 Items penetrating finished ceiling and ceiling-mounted items including the following:

- .1 Lighting fixtures.
- .2 Diffusers.
- .3 Grilles.
- .4 Speakers.
- .5 Sprinklers.
- .6 Access panels.
- .7 Perimeter moldings.
- .7 Show operation of hinged and sliding components covered by or adjacent to acoustical panels.

1.6.2 Certificates:

- .1 Submit independent test data and design tables for each type of insert to be employed on this Project for hanger supports.
- .2 Obtain approval of electrical utility authorities having jurisdiction for support of light fixtures, by ceiling grid and supports, to satisfy requirements of electrical inspection department of local electrical authority. Adjust grid, fixing devices and support hangers as required to obtain approval.
- .3 Submit written confirmations to Divisions 22, 23 and 26, when requested by Consultant, that suspended ceiling is capable of supporting additional weight of mechanical and electrical fixtures.

**1.7 Closeout Submittals**

- 1.7.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for finishes to include in maintenance manuals.

**1.8 Maintenance Material Submittals**

- 1.8.1 Supply extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - .1 Acoustical Ceiling Units: Full-size panels equal to 2 percent of quantity installed.
  - .2 Suspension-System Components: Quantity of each exposed component equal to 2 percent of quantity installed.

**1.9 Quality Assurance**

- 1.9.1 Source Limitations: Obtain each type of acoustical ceiling panel and its supporting suspension system from single source from single manufacturer.
- 1.9.2 Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

- 1.9.3 Mock-ups: Build mock-ups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for materials and execution.
- .1 Build mockup of typical ceiling area as shown on Drawings.
  - .2 Approval of mock-ups does not constitute approval of deviations from the Contract Documents contained in mock-ups unless Consultant specifically approves such deviations in writing.
  - .3 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

**1.10 Delivery, Storage, And Handling**

- 1.10.1 Deliver acoustical panels, suspension-system components, and accessories to Project site and store them in a fully enclosed, conditioned space where they will be protected against damage from moisture, humidity, temperature extremes, direct sunlight, surface contamination, and other causes.
- 1.10.2 Before installing acoustical panels, permit them to reach room temperature and a stabilized moisture content.

**1.11 Field Conditions**

- 1.11.1 Environmental Limitations: Do not install acoustical panel ceilings until spaces are enclosed and weathertight, wet-work in spaces is complete and dry, work above ceilings is complete, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- .1 Pressurized Plenums: Operate ventilation system for not less than 48 hours before beginning acoustical panel ceiling installation.

**1.12 Warranty**

- 1.12.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2. PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- .1 Armstrong World Industries Canada Ltd.; [www.armstrong.com](http://www.armstrong.com)
  - .2 CGC/USG Inc.; [www.cgcinc.com](http://www.cgcinc.com)

- .3 CertainTeed Canada; [www.certainteed.com](http://www.certainteed.com)
- .4 Rockfon; [www.rockfon.com](http://www.rockfon.com)

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Performance Requirements**

- 2.2.1 Acoustical Panel Standard: Provide manufacturer's standard panels according to ASTM E1264 and designated by type, form, pattern, acoustical rating, and light reflectance unless otherwise indicated.
- 2.2.2 Design suspension system to support safely and without distortion entire ceiling system and superimposed loads of:
  - .1 lighting fixtures,
  - .2 Air supply diffusers, boots, fire alarm grilles and exhaust and return air grilles;
- 2.2.3 Coordinate installation and cooperate with Mechanical and Electrical Subcontractors, to accommodate mechanical and electrical items, or any other work required to be incorporated in or coordinated with the ceiling system.
- 2.2.4 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.2.5 Surface-Burning Characteristics: Comply with CAN/ULC-S102/S102.2 or equivalent to ASTM E84 (subject to approval by authorities having jurisdiction); testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
  - .1 Flame-Spread Index: Class A (25) according to ASTM E1264.
  - .2 Smoke-Developed Index: 50 or less.

## **2.3 Acoustical Panels - Smooth, Lightly Textured**

- 2.3.1 Material Tag: This item is noted as "ACT-#" on Drawings and Schedules.
- 2.3.2 Type and Form: Type IV, mineral base with membrane-faced overlay; Form 2 or Type XX.
- 2.3.3 Colour: White.
- 2.3.4 Light Reflectance (LR): Not less than 0.85.

- 2.3.5 Ceiling Attenuation Class (CAC): Not less than 35.
- 2.3.6 Noise Reduction Coefficient (NRC): Not less than 0.90
- 2.3.7 Edge/Joint Detail: Beveled, kerfed, and rabbeted long edges and square, butt-on short edges
- 2.3.8 Modular Size: Refer to Drawings.
- 2.3.9 Basis-of-Design Products: Refer to Drawings.

## **2.4 Metal Suspension System**

- 2.4.1 Metal Suspension-System Standard: Provide manufacturer's standard, direct-hung, metal suspension system and accessories according to ASTM C635/C635M and designated by type, structural classification, and finish indicated.
  - .1 High-Humidity Finish: In locations subject to high moisture such as pools and showers, provide coating tested and classified for "severe environment performance" according to ASTM C635/C635M.
- 2.4.2 Wide Face, Standard Exposed Steel Suspension System: Main and cross runners roll formed from cold-rolled steel sheet; prepainted, hot-dip galvanized with prefinished 24-mm- (15/16-inch-) wide metal caps on flanges.
  - .1 Structural Classification: Heavy-duty system.
  - .2 End Condition of Cross Runners: Override (stepped) or butt-edge type.
  - .3 Cap Finish: Painted to match colour of acoustical unit.
  - .4 Acceptable Products:
    - .1 "DONN DX Quick Release" by CGC/USG Inc,
    - .2 "Prelude XL" by Armstrong World Industries,
    - .3 "Chicago Metallic 1200 System" by Rockfon,
    - .4 "Classic Stab System" by CertainTeed Canada.
  - .5 Acceptable Products (Fire-rated Systems):
    - .1 "Series DXL Fire-Rated Systems" by CGC Inc.,
    - .2 "Prelude XL Fireguard" by Armstrong World Industries,
    - .3 "Chicago Metallic 1250 Fire-Front" by Rockfon.
    - .4 "Firesecure Stab System" by CetainTeed Canada

## **2.5 Accessories**

- 2.5.1 Attachment Devices: Size for five times the design load indicated in ASTM C635/C635M, Table 1, "Direct Hung," unless otherwise indicated. Comply with seismic design requirements.

- 
- .1 Anchors in Concrete: Anchors of type and material indicated below, with holes or loops for attaching hangers of type indicated and with capability to sustain, without failure, loads imposed by ceiling construction as determined by limit states design, as determined by testing according to ASTM E488/E488M or ASTM E1512 as applicable, conducted by a qualified testing and inspecting agency.
  - .1 Corrosion Protection: Carbon-steel components zinc plated according to ASTM B633, Class SC 1 (mild) service condition.
  - .2 Corrosion Protection: Stainless-steel components complying with ASTM F593 and ASTM F594, Group 1 Alloy 304 or 316.
- 2.5.2 Wire Hangers, Braces, and Ties: Provide wires as follows:
- .1 Zinc-Coated, Carbon-Steel Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper.
  - .2 Stainless-Steel Wire: ASTM A580/A580M, Type 304, nonmagnetic.
  - .3 Size: Wire diameter sufficient for its stress at three times hanger design load (ASTM C635/C635M, Table 1, "Direct Hung") will be less than yield stress of wire, but not less than 2.69-mm- (0.106-inch-) diameter wire.
- 2.5.3 Hanger Rods: Mild steel, zinc coated or protected with rust-inhibitive paint.
- 2.5.4 Flat Hangers: Mild steel, zinc coated or protected with rust-inhibitive paint.
- 2.5.5 Angle Hangers: Angles with legs not less than 22 mm (7/8 inch) wide; formed with 1-mm- (0.04-inch-) thick, galvanized-steel sheet complying with ASTM A653/A653M, Z275 (G90) coating designation; with bolted connections and 8-mm- (5/16-inch-) diameter bolts.
- 2.5.6 Hold-Down Clips: Manufacturer's standard hold-down.
- 2.5.7 Impact Clips: Manufacturer's standard impact-clip system designed to absorb impact forces against acoustical panels.
- 2.5.8 Seismic Clips: Manufacturer's standard seismic clips designed to Seismic
- 2.5.9 Stabilizer Bars: Manufacturer's standard perimeter stabilizers designed to accommodate seismic forces.
- 2.5.10 Seismic Struts: Manufacturer's standard compression struts designed to accommodate seismic forces.
- 2.5.11 Clean-Room Gasket System: Where indicated, provide manufacturer's standard system, including manufacturer's standard

antimicrobial gasket and related adhesives, tapes, seals, and retention clips, designed to seal out foreign material from and maintain positive pressure in clean room.

## **2.6      Metal Edge Moldings And Trim**

2.6.1 Roll-Formed, Sheet-Metal Edge Moldings and Trim: Type and profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that comply with seismic design requirements; formed from sheet metal of same material, finish, and colour as that used for exposed flanges of suspension-system runners.

- .1 Edge moldings shall fit acoustical panel edge details and suspension systems indicated and match width and configuration of exposed runners unless otherwise indicated.
- .2 For lay-in panels with reveal edge details, provide stepped edge moulding that forms reveal of same depth and width as that formed between edge of panel and flange at exposed suspension member.
- .3 For circular penetrations of ceiling, provide edge moldings fabricated to diameter required to fit penetration exactly.
- .4 Acceptable Products:
  - .1 "Compasso Trim" by USG/CGC Inc.
  - .2 "AXIOM" by Armstrong World Industries.
  - .3 "Infinity Trim" by Rockfon.
  - .4 "Terminus Perimeter Trim" by CertainTeed Canada

2.6.2 Extruded-Aluminum Edge Moldings and Trim: Where indicated, provide manufacturer's extruded-aluminum edge moldings and trim of profile indicated or referenced by manufacturer's designations, including splice plates, corner pieces, and attachment and other clips, complying with seismic design requirements.

- .1 Clear Anodic Finish: AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.
- .2 Baked-Enamel or Powder-Coat Finish: Minimum dry film thickness of 0.04 mm (1.5 mils). Comply with ASTM C635/C635M and coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.
- .3 Acceptable Products:
  - .1 "Compasso Trim" by USG/CGC Inc.
  - .2 "AXIOM" by Armstrong World Industries.
  - .3 "Infinity Trim" by Rockfon.

- .4 "Terminus Straight Perimeter Trim" by CertainTeed Canada

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, including structural framing to which acoustical panel ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage and with requirements for installation tolerances and other conditions affecting performance of acoustical panel ceilings.
- 3.1.2 Examine acoustical panels before installation. Reject acoustical panels that are wet, moisture damaged, or mold damaged.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Preparation**

- 3.2.1 Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders unless otherwise indicated, and comply with layout shown on reflected ceiling plans.
- 3.2.2 Layout openings for penetrations centered on the penetrating items.

#### **3.3 Installation**

- 3.3.1 Install acoustical panel ceilings according to ASTM C636/C636M , and ASTM E580 for seismic design requirements, and manufacturer's written instructions.
- 3.3.2 Suspend ceiling hangers from building's structural members and as follows:
- .1 Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.
  - .2 Splay hangers only where required to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
  - .3 Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension-system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices.

- 
- .4 Secure wire hangers to ceiling-suspension members and to supports above with a minimum of three tight turns. Connect hangers directly to structure or to inserts, eye screws, or other devices that are secure and appropriate for substrate and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
  - .5 Secure flat, angle, channel, and rod hangers to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices that are secure and appropriate for both the structure to which hangers are attached and the type of hanger involved. Install hangers in a manner that will not cause them to deteriorate or fail due to age, corrosion, or elevated temperatures.
  - .6 Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, or anchors that extend through forms into concrete.
  - .7 When steel framing does not permit installation of hanger wires at spacing required, install carrying channels or other supplemental support for attachment of hanger wires.
  - .8 Do not attach hangers to steel deck tabs.
  - .9 Do not attach hangers to steel roof deck. Attach hangers to structural members.
  - .10 Space hangers not more than 1200 mm (48 inches) o.c. along each member supported directly from hangers unless otherwise indicated; provide hangers not more than 200 mm (8 inches) from ends of each member.
  - .11 Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards.
- 3.3.3 Secure bracing wires to ceiling suspension members and to supports with a minimum of four tight turns. Suspend bracing from building's structural members as required for hangers, without attaching to permanent metal forms, steel deck, or steel deck tabs. Fasten bracing wires into concrete with anchors.
- 3.3.4 Install edge moldings and trim of type indicated at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical panels.
- .1 Apply acoustical sealant in a continuous ribbon concealed on back of vertical legs of moldings before they are installed.
  - .2 Screw attach moldings to substrate at intervals not more than 400 mm (16 inches) o.c. and not more than 75 mm (3 inches) from ends. Miter corners accurately and connect securely.
  - .3 Do not use exposed fasteners, including pop rivets, on moldings and trim.

- 3.3.5 Install suspension-system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.
- 3.3.6 Install acoustical panels with undamaged edges and fit accurately into suspension-system runners and edge moldings. Scribe and cut panels at borders and penetrations to provide precise fit.
  - .1 Arrange directionally patterned acoustical panels as follows:
    - .1 As indicated on reflected ceiling plans.
  - .2 For square-edged panels, install panels with edges fully hidden from view by flanges of suspension-system runners and moldings.
  - .3 For reveal-edged panels on suspension-system runners, install panels with bottom of reveal in firm contact with top surface of runner flanges.
  - .4 For reveal-edged panels on suspension-system members with box-shaped flanges, install panels with reveal surfaces in firm contact with suspension-system surfaces and panel faces flush with bottom face of runners.
  - .5 Paint cut edges of panel remaining exposed after installation; match colour of exposed panel surfaces using coating recommended in writing for this purpose by acoustical panel manufacturer.
  - .6 Install seismicclips in areas indicated; space according to panel manufacturer's written instructions unless otherwise indicated.
  - .7 Install clean-room gasket system in areas indicated, sealing each panel and fixture as recommended by panel manufacturer's written instructions.
  - .8 Protect lighting fixtures and air ducts according to requirements indicated for fire-resistance-rated assembly.

### **3.4 Erection Tolerances**

- 3.4.1 Suspended Ceilings: Install main and cross runners level to a tolerance of 3 mm in 3.6 m (1/8 inch in 12 feet), non-cumulative.
- 3.4.2 Moldings and Trim: Install moldings and trim to substrate and level with ceiling suspension system to a tolerance of 3 mm in 3.6 m (1/8 inch in 12 feet), non-cumulative.

### **3.5 Field Quality Control**

- 3.5.1 Testing Agency: Contractor must engage a qualified testing agency to perform tests and inspections.
  - .1 Testing agency will perform the following tests and inspections of completed installations of acoustical panel ceiling hangers and anchors and fasteners in successive stages and when

installation of ceiling suspension systems on each floor has reached 20 percent completion, but no panels have been installed. Do not proceed with installations of acoustical panel ceiling hangers for the next area until test results for previously completed installations of acoustical panel ceiling hangers show compliance with requirements.

- .1 Within each test area, testing agency will select one of every 10 power-actuated fasteners and postinstalled anchors used to attach hangers to concrete and will test them for 890 N (200 lbf) of tension; it will also select one of every two postinstalled anchors used to attach bracing wires to concrete and will test them for 1957 N (440 lbf) of tension.
- .2 When testing discovers fasteners and anchors that do not comply with requirements, testing agency will test those anchors not previously tested until 20 pass consecutively and then will resume initial testing frequency.
- .2 Acoustical panel ceiling hangers, anchors, and fasteners will be considered defective if they do not pass tests and inspections.
- .3 Prepare test and inspection reports.

### **3.6 Cleaning**

- 3.6.1 Clean exposed surfaces of acoustical panel ceilings, including trim, edge moldings, and suspension-system members. Comply with manufacturer's written instructions for cleaning and touchup of minor finish damage.
- 3.6.2 Remove and replace ceiling components that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Acoustical Wood Ceiling Assemblies work specified herein. This includes, but is not necessarily limited, to:
- .1 Linear wood grille ceiling systems
  - .2 Metal suspension systems
  - .3 Accessories
  - .4 Metal edge moldings and trims
  - .5 Acoustical sealants
  - .6 Auxiliary materials required for a complete installation..
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
- .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 05 50 00, Metal Fabrications for additional supports and reinforcing for ceiling assemblies.
    - .2 Section 09 51 13, for ceilings consisting of mineral-base acoustical ceilings.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Preinstallation Meetings**

- 1.4.1 Preinstallation Conference: Conduct conference at Project site.

### **1.5 Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for each type of product indicated.

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Acoustical Wood Ceiling Assemblies work and include product characteristics, performance criteria, physical size, finish and limitations
  - .2 Certificates for Credit MR 7: Chain-of-custody certificates certifying that products specified to be made from certified wood comply with forest certification requirements. Include evidence that mill is certified for chain of custody by an FSC-accredited certification body.
    - .1 Include statement indicating costs for each certified wood product.
- 1.5.2 Samples: Submit samples in accordance with Division 01 for each exposed product and for each colour and texture specified, 150 mm (6 inches) in size.
- .1 Samples for Initial Selection: For components with factory-applied finishes.
  - .2 Samples for Verification: For each component indicated and for each exposed finish required, prepared on Samples of sizes indicated below:
    - .1 Acoustical wood panel ceilings: Set of 150-mm- (6-inch-) square Samples of each type, colour, pattern, and texture.
    - .2 Exposed Suspension-System Members, Moldings, and Trim: Set of 150-mm- (6-inch-) long Samples of each type, finish, and colour.
- 1.5.3 Professional Engineer's Stamped Shop Drawings and Submittals: Submit Professional Engineer's Stamped Shop Drawings and Submittals in accordance with Division 01 for seismic restraints for ceiling systems.
- .1 Include design calculations for seismic restraints including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

## **1.6 Informational Submittals**

- 1.6.1 Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
- .1 Ceiling suspension-system members.
  - .2 Structural members to which suspension systems will be attached.
  - .3 Method of attaching hangers to building structure.

- .1 Supply layouts for cast-in-place anchors, clips, and other ceiling attachment devices whose installation is specified in other Sections.
  - .4 Carrying channels or other supplemental support for hanger-wire attachment where conditions do not permit installation of hanger wires at required spacing.
  - .5 Size and location of initial access modules for acoustical wood panel ceilings.
  - .6 Items penetrating finished ceiling and ceiling-mounted items including the following:
    - .1 Lighting fixtures.
    - .2 Diffusers.
    - .3 Grilles.
    - .4 Speakers.
    - .5 Sprinklers.
    - .6 Access panels.
    - .7 Perimeter moldings.
  - .7 Show operation of hinged and sliding components covered by or adjacent to acoustical wood panel ceilings.
- 1.6.2 Certificates:
- .1 Submit independent test data and design tables for each type of insert to be employed on this Project for hanger supports.
  - .2 Obtain approval of electrical utility authorities having jurisdiction for support of light fixtures, by ceiling grid and supports, to satisfy requirements of electrical inspection department of local electrical authority. Adjust grid, fixing devices and support hangers as required to obtain approval.
  - .3 Submit written confirmations to Divisions 22, 23 and 26, when requested by Consultant, that suspended ceiling is capable of supporting additional weight of mechanical and electrical fixtures.

**1.7 Closeout Submittals**

- 1.7.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for finishes to include in maintenance manuals.

**1.8 Maintenance Material Submittals**

- 1.8.1 Supply extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

- .1 Acoustical Ceiling Units: Full-size panels equal to 2 percent of quantity installed.
- .2 Suspension-System Components: Quantity of each exposed component equal to 2 percent of quantity installed.

**1.9 Quality Assurance**

- 1.9.1 Source Limitations: Obtain each type of acoustical ceiling panel and its supporting suspension system from single source from single manufacturer.
- 1.9.2 Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
- 1.9.3 Mock-ups: Build mock-ups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for materials and execution.
  - .1 Build mockup of typical ceiling area as shown on Drawings or directed by Consultant on site.
  - .2 Approval of mock-ups does not constitute approval of deviations from the Contract Documents contained in mock-ups unless Consultant specifically approves such deviations in writing.
  - .3 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

**1.10 Delivery, Storage, And Handling**

- 1.10.1 Deliver acoustical wood panel ceilings, suspension-system components, and accessories to Project site and store them in a fully enclosed, conditioned space where they will be protected against damage from moisture, humidity, temperature extremes, direct sunlight, surface contamination, and other causes.
- 1.10.2 Before installing acoustical wood panel ceilings, permit them to reach room temperature and a stabilized moisture content.

**1.11 Field Conditions**

- 1.11.1 Environmental Limitations: Do not install acoustical wood panel ceiling ceilings until spaces are enclosed and weathertight, wet-work in spaces is complete and dry, work above ceilings is complete, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
  - .1 Ensure HVAC system is operating and maintaining temperature between 16 and 32 deg C (60 and 90 deg F) and relative

humidity between 25 and 55 percent during the remainder of the construction period.

- .2 Conform to requirements of North American Architectural Woodwork Standards (NAAWS) Section 2.

#### **1.12 Warranty**

- 1.12.1 Warrant work of this Section for period of 3 years against defects and deficiencies in accordance with General Conditions of the Contract. Promptly correct defects or deficiencies which become apparent within warranty period, to satisfaction of Consultant and at no additional expense. Defects include but are not limited to: buckling, opening of seams, bond failure and extensive colour fading.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 9Wood;
  - .2 ACGI;
  - .3 Architectural Components Group, Inc;
  - .4 Armstrong World Industries Canada Ltd.;
  - .5 Atkar North America
  - .6 CertainTeed;
  - .7 CGC/USG Inc.;
  - .8 Geometrik;
  - .9 Topakustik;
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance Requirements**

- 2.2.1 Design suspension system to support safely and without distortion entire ceiling system and superimposed loads of:
  - .1 lighting fixtures,
  - .2 Air supply diffusers, boots, fire alarm grilles and exhaust and return air grilles;
- 2.2.2 Coordinate installation and cooperate with Mechanical and Electrical Subcontractors, to accommodate mechanical and

electrical items, or any other work required to be incorporated in or coordinated with the ceiling system.

- 2.2.3 Professional Engineer's Design and Certification: Employ the services of a Professional Engineer licensed to practice in the Province of Ontario carrying professional liability insurance, and who is experienced in providing engineering services of similar kind, scope and complexity; to design and certify seismic restraints for ceiling systems.
- 2.2.4 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.2.5 Surface-Burning Characteristics: Comply with CAN/ULC-S102/S102.2 or equivalent to ASTM E84 (subject to approval by authorities having jurisdiction); testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
  - .1 Flame-Spread Index: 25 or less on any surface exposed by cutting through in any direction.
  - .2 Smoke-Developed Index: 50 or less.
- 2.2.6 Provide materials that comply with requirements of AWMAC's North American Architectural Woodwork Standards (NAAWS) for each type of woodwork and quality grade specified, unless otherwise indicated on Drawings and Schedules.
  - .1 Grade: Premium.

## **2.3 Materials**

- 2.3.1 Core: Medium-density fiberboard panels or manufacturer's equivalent cores complying with ANSI A208.2, made from softwood fibers, synthetic resins, and fire-retardant chemicals mixed together at time of panel manufacture to achieve flame-spread index of 25 or less and smoke-developed index of 50 or less per CAN/ULC-S102/S102.2 or equivalent to ASTM E 84.
- 2.3.2 Wood Veneer: Minimum 0.8 mm (0.03") thick, Grade A or Grade AA in accordance with requirements of AWMAC AWS Section 4 to match approved samples and containing no open joints, face depression, glue stain, patches, plastic repair or other manufacturing irregularities or defects.
  - .1 Species: As specified in this Section.

2.3.3 High-Pressure Decorative Laminate: NEMA LD 3, grades as indicated on Drawings and Schedules or, if not indicated on Drawings and Schedules, as required by woodwork quality standard.

- .1 Basis-of-Design: As specified in this Section.
- .2 Acceptable Manufacturers: Products from the following manufacturers may be acceptable for inclusion into The Work:
  - .1 Arborite; Division of ITW Canada, Inc.
  - .2 Formica Corporation.
  - .3 Nevamar Company, LLC; Decorative Products Div.
  - .4 Panolam Industries International Incorporated.
  - .5 Wilsonart International; Div. of Premark International, Inc

## **2.4 Linear Wood Grille Ceiling System**

2.4.1 Material Tag: This item is noted as "APN-1" on Drawings and Schedules.

2.4.2 Core: Fire-retardant MDF core or manufacturer's standard fire-retardant equivalent core

2.4.3 Facing:

- .1 High-Pressure Decorative Laminate (PLAM): Grade HGP.
  - .1 Colours, Patterns, and Finishes: Refer to Finish Schedule on Drawings.

2.4.4 Configuration: Wood Backer.

- .1 Where radial applications are indicated on Drawings, Provide manufacturer's standard radiused backer.

2.4.5 Module size: not less than 305 mm wide by 2.4 m long (12" x 96 inches)

- .1 Blade Width: not less than 25 mm (1 inch)
- .2 Blade Height: Not less than 100 mm (4 inches)
- .3 Provide blades in one continuous length. Finger joints are not permitted.

2.4.6 Edge Profile: As selected by Consultant during Shop Drawing Review.

2.4.7 Fire Performance: Class A, as specified in this Section.

2.4.8 Noise Reduction Coefficient (NRC): Not less than 0.8

2.4.9 Finish: Manufacturer's standard protective clear coat.

2.4.10 Acoustic Insulation: Black-coated, unfaced, glass-fiber or mineral wool insulation complying with ASTM C 553, not less than 25-kg/cu. m (1.5-lb/cu. ft.) density, treated to be nondusting, and as follows:

- .1 Thickness: Not less than 25 mm (1 inch)
- .2 Basis-of-Design: "SelectSound Black Acoustic Blanket" by Owens Corning or approved equivalent.

2.4.11 Basis-of-Design: Refer to Finish Schedule on Drawings.

## **2.5 Metal Suspension System**

2.5.1 Metal Suspension-System Standard: Provide manufacturer's standard, direct-hung, metal suspension system and accessories according to ASTM C635/C635M and designated by type, structural classification, and finish indicated.

2.5.2 Wide Face, Standard Exposed Steel Suspension System: Main and cross runners roll formed from cold-rolled steel sheet; prepainted, hot-dip galvanized with prefinished 24-mm- (15/16-inch-) wide metal caps on flanges.

- .1 Structural Classification: Heavy-duty system.
- .2 End Condition of Cross Runners: Override (stepped) or butt-edge type.
- .3 Cap Finish: Painted to match colour of acoustical unit.
- .4 Acceptable Products:
  - .1 "DONN DX Quick Release" by CGC/USG Inc,
  - .2 "Prelude XL" by Armstrong World Industries,
  - .3 "Chicago Metallic 1200 System" by Rockfon,
  - .4 "Classic Stab System" by CertainTeed Canada.

## **2.6 Accessories**

2.6.1 Attachment Devices: Size for five times the design load indicated in ASTM C635/C635M, Table 1, "Direct Hung," unless otherwise indicated. Comply with seismic design requirements.

- .1 Anchors in Concrete: Anchors of type and material indicated below, with holes or loops for attaching hangers of type indicated and with capability to sustain, without failure, loads imposed by ceiling construction as determined by limit states design, as determined by testing according to ASTM E488/E488M or ASTM E1512 as applicable, conducted by a qualified testing and inspecting agency.
  - .1 Corrosion Protection: Carbon-steel components zinc plated according to ASTM B633, Class SC 1 (mild) service condition.

2.6.2 Wire Hangers, Braces, and Ties: Provide wires as follows:

- .1 Zinc-Coated, Carbon-Steel Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper.

- .2 Stainless-Steel Wire: ASTM A580/A580M, Type 304, nonmagnetic.
- .3 Size: Wire diameter sufficient for its stress at three times hanger design load (ASTM C635/C635M, Table 1, "Direct Hung") will be less than yield stress of wire, but not less than 2.69-mm- (0.106-inch-) diameter wire.
- 2.6.3 Hanger Rods: Mild steel, zinc coated or protected with rust-inhibitive paint.
- 2.6.4 Flat Hangers: Mild steel, zinc coated or protected with rust-inhibitive paint.
- 2.6.5 Angle Hangers: Angles with legs not less than 22 mm (7/8 inch) wide; formed with 1-mm- (0.04-inch-) thick, galvanized-steel sheet complying with ASTM A653/A653M, Z275 (G90) coating designation; with bolted connections and 8-mm- (5/16-inch-) diameter bolts.
- 2.6.6 Seismic Clips: Manufacturer's standard seismic clips designed to secure acoustical wood panel ceilings in place during a seismic event.
- 2.6.7 Seismic Stabilizer Bars: Manufacturer's standard perimeter stabilizers designed to accommodate seismic forces.
- 2.6.8 Seismic Struts: Manufacturer's standard compression struts designed to accommodate seismic forces.

## **2.7 Metal Edge Moldings And Trim**

- 2.7.1 Roll-Formed, Sheet-Metal Edge Moldings and Trim: Type and profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that comply with seismic design requirements; formed from sheet metal of same material, finish, and colour as that used for exposed flanges of suspension-system runners.
  - .1 Edge moldings shall fit acoustical wood panel ceiling edge details and suspension systems indicated and match width and configuration of exposed runners unless otherwise indicated.
  - .2 For lay-in panels with reveal edge details, provide stepped edge moulding that forms reveal of same depth and width as that formed between edge of panel and flange at exposed suspension member.
  - .3 For circular penetrations of ceiling, provide edge moldings fabricated to diameter required to fit penetration exactly.
  - .4 Acceptable Products:
    - .1 "Compasso Trim" by USG/CGC Inc.
    - .2 "AXIOM" by Armstrong World Industries.

- .3 "Infinity Trim" by Rockfon.
- 2.7.2 Extruded-Aluminum Edge Moldings and Trim: Where indicated, provide manufacturer's extruded-aluminum edge moldings and trim of profile indicated or referenced by manufacturer's designations, including splice plates, corner pieces, and attachment and other clips, complying with seismic design requirements.
  - .1 Clear Anodic Finish: AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.
  - .2 Baked-Enamel or Powder-Coat Finish: Minimum dry film thickness of 0.04 mm (1.5 mils). Comply with ASTM C635/C635M and coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.
  - .3 Acceptable Products:
    - .1 "Compasso Trim" by USG/CGC Inc.
    - .2 "AXIOM" by Armstrong World Industries.
    - .3 "Infinity Trim" by Rockfon.
    - .4 "Terminus Straight Perimeter Trim" by CertainTeed Canada

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, including structural framing to which acoustical wood panel ceiling ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage and with requirements for installation tolerances and other conditions affecting performance of acoustical wood panel ceiling ceilings.
- 3.1.2 Examine acoustical wood panel ceilings before installation. Reject acoustical wood panel ceilings that are wet, moisture damaged, or mold damaged.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Preparation**

- 3.2.1 Measure each ceiling area and establish layout of acoustical wood panel ceilings to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders unless otherwise indicated, and comply with layout shown on reflected ceiling plans.

3.2.2 Layout openings for penetrations centered on the penetrating items.

**3.3 Installation**

3.3.1 Install acoustical wood panel ceiling ceilings according to ASTM C636/C636M and manufacturer's written instructions.

.1 Fire-Rated Assembly: Install fire-rated ceiling systems according to tested fire-rated design.

3.3.2 Suspend ceiling hangers from building's structural members and as follows:

- .1 Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.
- .2 Splay hangers only where required to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
- .3 Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension-system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices.
- .4 Secure wire hangers to ceiling-suspension members and to supports above with a minimum of three tight turns. Connect hangers directly to structure or to inserts, eye screws, or other devices that are secure and appropriate for substrate and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
- .5 Secure flat, angle, channel, and rod hangers to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices that are secure and appropriate for both the structure to which hangers are attached and the type of hanger involved. Install hangers in a manner that will not cause them to deteriorate or fail due to age, corrosion, or elevated temperatures.
- .6 Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, or anchors that extend through forms into concrete.
- .7 When steel framing does not permit installation of hanger wires at spacing required, install carrying channels or other supplemental support for attachment of hanger wires.
- .8 Do not attach hangers to steel deck tabs.
- .9 Do not attach hangers to steel roof deck. Attach hangers to structural members.

- .10 Space hangers not more than 1200 mm (48 inches) o.c. along each member supported directly from hangers unless otherwise indicated; provide hangers not more than 200 mm (8 inches) from ends of each member.
- .11 Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards.
- 3.3.3 Secure bracing wires to ceiling suspension members and to supports with a minimum of four tight turns. Suspend bracing from building's structural members as required for hangers, without attaching to permanent metal forms, steel deck, or steel deck tabs. Fasten bracing wires into concrete with anchors.
- 3.3.4 Install edge moldings and trim of type indicated at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical wood panel ceilings.
  - .1 Apply acoustical sealant in a continuous ribbon concealed on back of vertical legs of moldings before they are installed.
  - .2 Screw attach moldings to substrate at intervals not more than 400 mm (16 inches) o.c. and not more than 75 mm (3 inches) from ends. Miter corners accurately and connect securely.
  - .3 Do not use exposed fasteners, including pop rivets, on moldings and trim.
- 3.3.5 Install suspension-system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.
- 3.3.6 Install acoustical wood panel ceilings with undamaged edges and fit accurately into suspension-system runners and edge moldings. Scribe and cut panels at borders and penetrations to provide precise fit.
  - .1 Arrange directionally patterned acoustical wood panel ceilings as follows:
    - .1 As indicated on reflected ceiling plans.
  - .2 Seal cut edges of panel remaining exposed after installation; match colour of exposed panel surfaces using coating recommended in writing for this purpose by acoustical wood panel ceiling manufacturer.
  - .3 Protect lighting fixtures and air ducts according to requirements indicated for fire-resistance-rated assembly.

### **3.4 Erection Tolerances**

- 3.4.1 Suspended Ceilings: Install main and cross runners level to a tolerance of 3 mm in 3.6 m (1/8 inch in 12 feet), non-cumulative.

- 3.4.2 Moldings and Trim: Install moldings and trim to substrate and level with ceiling suspension system to a tolerance of 3 mm in 3.6 m (1/8 inch in 12 feet), non-cumulative.

**3.5 Cleaning**

- 3.5.1 Clean exposed surfaces of acoustical wood panel ceiling ceilings, including trim, edge moldings, and suspension-system members. Comply with manufacturer's written instructions for cleaning and touchup of minor finish damage.
- 3.5.2 Remove and replace ceiling components that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.

END OF SECTION

## **1 . GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Resilient Base And Accessories work specified herein. This includes, but is not necessarily limited, to:
- .1 Thermoplastic-rubber base.
  - .2 Rubber stair accessories.
  - .3 Rubber moulding accessories.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Action Submittals**

- 1.4.1 Product Data: Submit product data in accordance with Division 01 for each type of product.
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Resilient Base And Accessories work and include product characteristics, performance criteria, physical size, finish and limitations
- 1.4.2 Samples: Submit samples in accordance with Division 01 for each exposed product and for each colour and texture specified, not less than 300 mm (12 inches) long.

### **1.5 Maintenance Material Submittals**

- 1.5.1 Supply extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
- .1 Supply not less than 3 linear m (10 linear feet) for every 150 linear m (500 linear feet) or fraction thereof, of each type, colour, pattern, and size of resilient product installed.

---

**1.6     Quality Assurance**

- 1.6.1 Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
- .1 Coordinate mockups in this Section with mockups specified in other Sections.

**1.7     Delivery, Storage, And Handling**

- 1.7.1 Store resilient products and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 10 deg C (50 deg F) or more than 32 deg C (90 deg F).

**1.8     Field Conditions**

- 1.8.1 Maintain ambient temperatures within range recommended by manufacturer, but not less than 21 deg C (70 deg F) or more than 35 deg C (95 deg F), in spaces to receive resilient products during the following time periods:
- .1 48 hours before installation.
- .2 During installation.
- .3 48 hours after installation.
- 1.8.2 After installation and until Substantial Performance of the Work, maintain ambient temperatures within range recommended by manufacturer, but not less than 13 deg C (55 deg F) or more than 35 deg C (95 deg F).
- 1.8.3 Install resilient products after other finishing operations, including painting, have been completed.

**1.9     Warranty**

- 1.9.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 .     PRODUCTS**

**2.1     Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- .1 AB; American Biltrite.
- .2 Armstrong World Industries, Inc.
- .3 Flexco.
- .4 Johnsonite; A Tarkett Company.

- .5 Mondo Rubber International, Inc.
- .6 Nora Systems, Inc.
- .7 Roppe Corporation, USA.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Performance Requirements**

2.2.1 Provide Products free from blisters, cracks, chipped edges and corners, embedded foreign matter or other defects as required to complete flooring installation and to meet following minimum requirements:

- .1 Chemical resistance (ASTM F925): Pass
- .2 Fire-Test-Response Characteristics:
  - .1 Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm per ASTM E648.

## **2.3 Thermoplastic-Rubber Base (RB-1)**

2.3.1 Material Tag: This item is noted as "RB-1" on Drawings and Schedules.

2.3.2 Product Standard: ASTM F1861, Type TP (rubber, thermoplastic).

- .1 Group: I (solid, homogeneous).
- .2 Style and Location:
  - .1 Style A, Straight: Provide in areas with carpet.
  - .2 Style B, Cove: Provide in areas with resilient flooring.
  - .3 Style D, Sculptured: Provide in areas indicated.

2.3.3 Thickness: Not less than 3.2 mm (0.125 inch).

2.3.4 Height: 102 mm (4 inches).

2.3.5 Lengths: Cut lengths 1219 mm (48 inches) long or coils in manufacturer's standard length.

2.3.6 Outside Corners: Job formed or preformed.

2.3.7 Inside Corners: Job formed or preformed.

2.3.8 Colours: Refer to Finish Schedule on Drawings.

2.3.9 Basis-Of-Design: Refer to Finish Schedule on Drawings.

## **2.4 Flooring Transition Trim**

2.4.1 Material Tag: This item is noted as "TR-#" on Drawings and Schedules.

2.4.2 Locations: Transitions between flooring types where indicated on Drawings and Schedules.

2.4.3 Colours and Patterns: Refer to Finish Schedule on Drawings.

2.4.4 Basis-of-Design: Refer to Finish Schedule on Drawings.

## **2.5 Installation Materials**

2.5.1 Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by resilient-product manufacturer for applications indicated.

2.5.2 Adhesives: Water-resistant type recommended by resilient-product manufacturer for resilient products and substrate conditions indicated.

2.5.3 Stair-Tread Nose Filler: Two-part epoxy compound recommended by resilient stair-tread manufacturer to fill nosing substrates that do not conform to tread contours.

2.5.4 Metal Edge Strips: Extruded aluminum with mill finish of width shown, of height required to protect exposed edges of flooring, and in maximum available lengths to minimize running joints.

## **3 . EXECUTION**

### **3.1 Examination**

3.1.1 Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.

.1 Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of resilient products.

3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

.1 Installation of resilient products indicates acceptance of surfaces and conditions.

### **3.2 Preparation**

3.2.1 Prepare substrates according to manufacturer's written instructions to ensure adhesion of resilient products.

3.2.2 Ensure substrates are permanently dry, clean, smooth, and structurally sound. Surfaces must be free of dust, loose particles, solvents, paint, grease, oil, wax, alkali, sealing/curing compounds, old adhesive, and any other foreign material, which could affect the installation and adhesive bond to substrate.

- 3.2.3 Concrete Substrates for Resilient Stair Accessories: Prepare horizontal surfaces according to ASTM F710.
- .1 Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
  - .2 Remove substrate coatings and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
  - .3 Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrate alkalinity falls within range on pH scale recommended by manufacturer in writing, but not less than 5 or more than 9 pH.
  - .4 Moisture Testing: Proceed with installation only after substrates pass testing according to manufacturer's written recommendations, but not less stringent than the following:
    - .1 Perform anhydrous calcium chloride test according to ASTM F1869. Proceed with installation only after substrates have maximum moisture-vapour emission rate of 1.36 kg of water/92.9 sq. m (3 lb of water/1000 sq. ft.) in 24 hours.
    - .2 Perform relative humidity test using in situ probes according to ASTM F2170. Proceed with installation only after substrates have maximum 75 percent relative humidity level.
- 3.2.4 Fill cracks, holes, depressions and similar irregularities in substrates with trowelable leveling and patching compound; remove bumps and ridges to produce a uniform and smooth substrate.
- 3.2.5 Do not install resilient products until they are the same temperature as the space where they are to be installed.
- .1 At least 48 hours in advance of installation, move resilient products and installation materials into spaces where they will be installed.
- 3.2.6 Immediately before installation, sweep and vacuum clean substrates to be covered by resilient products.

### **3.3 Resilient Base Installation**

- 3.3.1 Comply with manufacturer's written instructions for installing resilient base.
- 3.3.2 Apply resilient base to walls, columns, pilasters, casework and cabinets in toe spaces, and other permanent fixtures in rooms and areas where base is required.

- 3.3.3 Install resilient base in lengths as long as practical without gaps at seams and with tops of adjacent pieces aligned.
- 3.3.4 Tightly adhere resilient base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates. Use manufacturer's recommended adhesives and trowels for substrates encountered.
- 3.3.5 Do not stretch resilient base during installation.
- 3.3.6 On masonry surfaces or other similar irregular substrates, fill voids along top edge of resilient base with manufacturer's recommended adhesive filler material.
- 3.3.7 Preformed Corners: Install preformed corners before installing straight pieces.
- 3.3.8 Job-Formed Corners:
  - .1 Outside Corners: Use straight pieces of maximum lengths possible and form with returns not less than 76 mm (3 inches) in length.
    - .1 Form without producing discoloration (whitening) at bends.
  - .2 Inside Corners: Use straight pieces of maximum lengths possible and form with returns not less than 76 mm (3 inches)() in length.
    - .1 Miter or cope corners to minimize open joints.

### **3.4 Resilient Accessory Installation**

- 3.4.1 Comply with manufacturer's written instructions for installing resilient accessories.
- 3.4.2 Resilient Stair Accessories:
  - .1 Use stair-tread-nose filler to fill nosing substrates that do not conform to tread contours.
  - .2 Tightly adhere to substrates throughout length of each piece.
  - .3 For treads installed as separate, equal-length units, install to produce a flush joint between units.
- 3.4.3 Resilient Moulding Accessories: Butt to adjacent materials and tightly adhere to substrates throughout length of each piece. Install reducer strips at edges of floor covering that would otherwise be exposed. Center transitions in cased openings and under door leafs at door openings unless indicated otherwise.

### **3.5 Cleaning And Protection**

- 3.5.1 Comply with manufacturer's written instructions for cleaning and protecting resilient products.

- 3.5.2 Perform the following operations immediately after completing resilient-product installation:
  - .1 Remove adhesive and other blemishes from exposed surfaces.
  - .2 Sweep and vacuum horizontal surfaces thoroughly.
  - .3 Damp-mop horizontal surfaces to remove marks and soil.
- 3.5.3 Protect resilient products from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.
- 3.5.4 Cover resilient products subject to wear and foot traffic until Substantial Performance of the Work.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Resilient Linoleum Flooring work specified herein. This includes, but is not necessarily limited, to:
- .1 Linoleum sheet flooring.
  - .2 Prefabricated cove base.
  - .3 Auxiliary materials required for a complete installation.
  - .4 Reducing strips and thresholds at junction with adjacent finishes.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 09 65 13, Resilient Base and Accessories for resilient base, reducer strips, and other accessories installed with linoleum floor covering.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Administrative Requirements**

- 1.4.1 Pre-Installation Meetings: Conduct pre-installation meeting to verify project requirements, substrate conditions, manufacturer's installation and floor care recommendations and manufacturer's warranty requirements.

### **1.5 Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for each type of product indicated.

- 
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Resilient Linoleum Flooring work and include product characteristics, performance criteria, physical size, finish and limitations
  - 1.5.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for each type of linoleum flooring.
    - .1 Include flooring layouts, locations of seams, coving details, edges, columns, doorways, enclosing partitions, built-in furniture, cabinets, and cutouts.
    - .2 Show details of special patterns.
    - .3 Show treatment where flooring meets dissimilar materials and all other special conditions.
    - .4 Submit diagram of areas and results showing location and results of each preconstruction test.
  - 1.5.3 Samples: Submit samples in accordance with Division 01 for the following:
    - .1 Each exposed product and for each colour and pattern specified in manufacturer's standard size, but not less than 150 mm (6-inch) square sections.
    - .2 Heat-Welding Bead: Include manufacturer's standard-size Samples, but not less than 230 mm (9 inches) long, of each colour required.
  - 1.6 **Closeout Submittals**
    - 1.6.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for each type of floor covering to include in maintenance manuals.
  - 1.7 **Maintenance Material Submittals**
    - 1.7.1 Supply extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
      - .1 Floor Tile: Supply one box for every 50 boxes or fraction thereof, of each type, colour, and pattern of floor tile installed.
      - .2 Sheet Flooring: Supply not less than 3 linear m (10 linear feet) for every 150 linear m (500 linear feet) or fraction thereof, in roll form and in full roll width for each type, colour, and pattern of sheet flooring installed.
      - .3 Accessories: No less than 3 linear m (10 linear feet) for each 500 linear feet or fraction thereof each different type and color installed.

---

**1.8 Quality Assurance**

- 1.8.1 Installer Qualifications: An entity that employs installers and supervisors who are trained or certified by flooring manufacturer and who are competent in techniques required by manufacturer for flooring installation and seaming methods indicated with not less than five years' experience.
- .1 Submit proof of training upon request.
- 1.8.2 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from one source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.
- 1.8.3 Mock-ups: Build mock-ups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for materials and execution.
- .1 Coordinate mock-ups in this Section with mock-ups specified in other Sections.
- .1 Size: Minimum 10 sq. m (100 sq. ft.) for each type, colour, and pattern in locations directed by Consultant.
- .2 Approval of mock-ups does not constitute approval of deviations from the Contract Documents contained in mock-ups unless Consultant specifically approves such deviations in writing.
- .3 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

**1.9 Delivery, Storage, And Handling**

- 1.9.1 Deliver and store materials undamaged in original wrappings or containers, with manufacturer's labels and seals intact. Store materials in warm and dry area.
- 1.9.2 Store flooring and installation materials in dry spaces protected from the weather, with ambient temperatures maintained within range recommended by manufacturer, but not less than 18 deg C (65 deg F) or more than 32 deg C (90 deg F).
- .1 Floor Tile: Store on flat surfaces.
- .2 Sheet Flooring: Store rolls upright.

**1.10 Field Conditions**

- 1.10.1 Maintain ambient temperatures within range recommended by manufacturer, but not less than 21 deg C (70 deg F) or more than 35 deg C (95 deg F), in spaces to receive flooring during the following periods:
- .1 7 days before installation.

- .2 During installation.
- .3 7 days after installation.
- 1.10.2 After installation and until Substantial Performance of the Work, maintain ambient temperatures within range recommended by manufacturer, but not less than 18 deg C (65 deg F) or more than 35 deg C (95 deg F).
- 1.10.3 Close spaces to traffic during flooring installation.
- 1.10.4 Close spaces to traffic for 72 hours after flooring installation.
- 1.10.5 Install flooring after other finishing operations, including painting, have been completed.
- 1.10.6 Do not begin substrate evaluation and preparation until stable, conditioned environments have been established as described in this section.
- 1.10.7 Areas to receive flooring must have adequate lighting to allow for proper inspection and preparation of the substrate, installation of the flooring and final inspection.
- 1.10.8 Field Measurements: Verify actual measurements and openings by field measurements before fabrication. Show recorded measurements on Shop Drawings. Coordinate field measurements and fabrication schedule with construction progress to avoid construction delays.

## **1.11 Warranty**

- 1.11.1 Extended Warranty: Provide manufacturer's full system warranty which includes repair or replacement of flooring installations that fail in materials or workmanship within specified warranty period.
  - .1 Warranty Period:
    - .1 Flooring Material Warranty: 10 years from date of Substantial Performance of the Work.
    - .2 Workmanship Warranty: 5 years from date of Substantial Performance of the Work.
    - .3 Prefabricated cove base: 15 years from date of Substantial Performance of the Work.
  - .2 Failures include, but not limited to, tearing, cracking, separation, deterioration or loosening from substrate, seam failure, ripples, bubbling or puckering. Upon notification of such installation deficiencies, within warranty period, make necessary repairs or replacement at no cost to Owner.

---

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Forbo Flooring, Inc.;
- .2 Gerflor Canada (previously Armstrong World Industries, Inc);
- .3 Tarkett Inc.;

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance Requirements**

2.2.1 Provide Products free from blisters, cracks, chipped edges and corners, embedded foreign matter or other defects as required to complete flooring installation and to meet design requirements.

2.2.2 Use sheet flooring from consecutive manufacturing process to maintain consistent colour match between adjacent sheets. Replace installed products in areas showing undue colour variation, in the opinion of the Owner or Consultant.

2.2.3 Fire-Test-Response Characteristics: Provide linoleum flooring with fire-test-response characteristics as determined by testing identical products according to ASTM E648 or NFPA 253 by a qualified testing agency.

- .1 Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm.
- .2 Flammability & Smoke (CAN/ULC S102.2): not more than 300 (Flame Spread) and not more than 500 (Smoke Developed)

### **2.3 Linoleum Sheet Flooring**

2.3.1 Material Tag: This item is noted as "MRM-#" on Drawings and Schedules.

2.3.2 Linoleum Sheet Flooring: homogeneous linoleum composition complete with high performance double layered surface finish conforming to ASTM F2034, Type I, linoleum sheet with backing or Type III, linoleum sheet with special backing.

- .1 Roll Size: In manufacturer's standard length, but not less than 2 m (6' – 6") by maximum length available to minimize seams.

2.3.3 Thickness: Minimum 2.5 mm (0.10 inch).

2.3.4 Heat-Welding Bead: For seamless installation, solid-strand product of linoleum flooring manufacturer.

- .1 Colours: As selected by Consultant from manufacturer's full range to contrast with or match linoleum flooring.

2.3.5 Backing: Jute

2.3.6 Colours and Patterns: Refer to Finish Schedule on Drawings.

2.3.7 Topcoat: Provide pre-sealed and pre-finished UV-cured, protective, liquid floor coating as standard by linoleum flooring manufacturer which does not require additional sealing after installation.

2.3.8 Basis-of-Design: Refer to Finish Schedule on Drawings.

## **2.4 Installation Materials**

2.4.1 Trowelable Leveling and Patching Compounds: Latex-modified, portland-cement-based or blended hydraulic-cement-based formulation provided or approved by linoleum flooring manufacturer for applications indicated. Do not use gypsum-based materials.

2.4.2 Adhesives: Water-resistant type recommended by flooring and adhesive manufacturers to suit products and substrate conditions indicated.

- .1 Use adhesives that have a VOC content of not more than 50 g/L when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

- .2 Acceptable Products:

- .1 For substrates with internal relative humidity up to 80%: Forbo 660 Adhesive or approved equivalent as recommended in writing by manufacturer.
- .2 For substrates with internal relative humidity up to 85%: as recommended in writing by manufacturer.
- .3 For substrates with internal relative humidity up to 95%: as recommended in writing by manufacturer.

2.4.3 Prefabricated-Flash-Cove-Base: Fabricated from same sheet flooring material and dye lots in maximum practical lengths.

- .1 Cove Strip: 25 mm (1 inch) radius provided or approved by manufacturer with 38 mm x 38 mm (1-1/2 inch x 1-1/2 inch) formed puncture resisting aluminum reinforcing bonded to back of base.
- .2 Cap Strip: Square resilient cap as selected by Consultant.
- .3 Riser: As indicated on Drawings
- .4 Toe: to be selected by Consultant during Shop Drawing review.
- .5 Acceptable Manufacturers: FlashCove Prefabricated Cove Bases Inc; or approved equivalent.

2.4.4 MVE-Control System: ASTM F3010-qualified, fluid-applied, two-component, epoxy-resin, membrane-forming system; formulated for

application on concrete substrates to reduce MVER to level required for installation of floor coverings indicated and acceptable to manufacturers of floor covering products indicated, including adhesives.

- .1 MVE-Control System Capabilities: Capable of suppressing MVE without failure where installed on concrete that exhibits the following conditions:
    - .1 Relative Humidity: Up to 100 percent when tested according to ASTM F2170 using in situ probes.
  - .2 Substrate Primer: Provide MVE-control system manufacturer's concrete-substrate primer if required for system indicated by substrate conditions.
  - .3 Acceptable Products: Approved proprietary moisture control system recommended in writing by floor covering manufacturer and approved by Consultant in order to authenticate floor covering warranties.
- 2.4.5 Resilient Edge Strips: Provide resilient cap for cove resilient floor covering, nosings for resilient floor covering, reducer strips, and transition strips with tapered or bull nose edge not less than 25 mm (1") wide, colored to match flooring or as selected by Consultant from available colours.
- 2.4.6 Metal Edge Strips: Strips shall be of width shown and of required thickness to protect the exposed edge of the flooring with units in maximum length available to minimize the number of joints.

### **3 .     EXECUTION**

#### **3.1     Examination**

- 3.1.1 Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.
  - .1 Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of flooring.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2     Preparation**

- 3.2.1 Prepare substrates according to linoleum flooring manufacturer's written instructions to ensure adhesion of flooring.
- 3.2.2 Concrete Substrates: Prepare according to ASTM F710.

- 
- .1 Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
  - .2 Remove substrate coatings and other substances that are incompatible with flooring adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by linoleum flooring manufacturer. Do not use solvents.
  - .3 Concrete substrates must be cured per the concrete manufacturer's recommendations with minimum compressive strength of 21 MPa (3,000 psi) and minimum dry density of 2400 kg/cu. m (150 lbs/cu. ft). Refer to Division 3 for patching, repairing crack materials and leveling compounds with Portland cement-based compounds and for cast-in-place concrete, concrete toppings, and cementitious underlayments.
  - .4 Alkalinity and Adhesion Testing: Perform tests recommended by linoleum flooring manufacturer. Proceed with installation only after substrate alkalinity falls within range on pH scale recommended by manufacturer in writing, but not less than 5 or more than 10 pH.
  - .5 Bond Testing: Conduct testing in accordance with the manufacturer's recommendations in various locations throughout area where flooring is to be installed. Perform sufficient tests to evaluation of entire area where material will be installed.
  - .6 Substrate Porosity Testing: Conduct testing in accordance with ASTM F3131 and manufacturer's recommendations in various locations throughout area where flooring is to be installed. Perform sufficient tests to evaluation of entire area where material will be installed.
    - .1 Evaluation of results: Water must penetrate into substrate within 5 to 20 minutes to be considered acceptable. If water penetrates too rapidly or too slowly, make adjustments to substrate to provide proper surface profile.
    - .2 Where substrates are determined to be overly porous, dusty or generally insufficient, provide primer according to the manufacturer's recommendations to regulate porosity level of substrate.
  - .7 Moisture Testing:
    - .1 Perform tests so that each test area does not exceed 93 sq. m (1000 sq. ft.), and perform no fewer than three tests in each installation area and with test areas evenly spaced in installation areas.
    - .2 Anhydrous Calcium Chloride Test: ASTM F1869. Proceed with installation only after substrates have

maximum moisture-vapour emission rate of 1.36 kg of water/93 sq. m (3 lb of water/1000 sq. ft.) in 24 hours.

- .3 Relative Humidity Test: Using in-situ probes, ASTM F2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement.
  - .4 Do not proceed with installation until moisture problems have been corrected.
- 3.2.3 Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound; remove bumps and ridges to produce a uniform and smooth substrate.
  - 3.2.4 Do not install flooring until materials are the same temperature as space where they are to be installed.
    - .1 At least 72 hours in advance of installation, move flooring and installation materials into spaces where they will be installed.
  - 3.2.5 Immediately before installation, sweep and vacuum clean substrates to be covered by flooring.

### **3.3 Application Of Mve-Control System**

- 3.3.1 Apply MVE-control system to all basement slabs and slabs-on-grades (regardless of pre-installation moisture testing results). At other location, apply MVE-control system where moisture contents are above those recommended by manufacturer at time of installation.
- 3.3.2 Prepare and clean substrates according to MVE-control system manufacturer's written instructions to ensure adhesion of system to concrete.
- 3.3.3 Remove coatings and other substances that are incompatible with MVE-control system and that contain soap, wax, oil, or silicone, using mechanical methods recommended in writing by MVE-control system manufacturer. Do not use solvents.
- 3.3.4 Provide concrete surface profile complying with ICRI 310.2R or CSP 3 by shot blasting using apparatus that abrades the concrete surface with shot, contains the dispensed shot within the apparatus, and recirculates the shot by vacuum pickup.
- 3.3.5 After shot blasting, repair damaged and deteriorated concrete according to MVE-control system manufacturer's written instructions.
- 3.3.6 Protect substrate voids and joints to prevent resins from flowing into or leaking through them.
- 3.3.7 Fill surface depressions and irregularities with patching and leveling material.

- 3.3.8 Fill surface cracks, grooves, control joints, and other nonmoving joints with crack-filling material.
- 3.3.9 Allow concrete to dry, undisturbed, for period recommended in writing by MVE-control system manufacturer after surface preparation, but not less than 24 hours.
- 3.3.10 Before installing MVE-control systems, broom sweep and vacuum prepared concrete.
- 3.3.11 Install MVE-control system according to ASTM F3010 and manufacturer's written instructions to produce a uniform, monolithic surface free of surface deficiencies such as pin holes, fish eyes, and voids.

### **3.4     Installation, General**

- 3.4.1 Comply with manufacturer's product technical data, including product technical bulletins, installation recommendations and floor care recommendations.
- 3.4.2 Scribe and cut flooring to butt neatly and tightly to vertical surfaces and permanent fixtures, including built-in furniture, cabinets, pipes, outlets, edgings, thresholds, door frames, and nosings.
- 3.4.3 Extend flooring into toe spaces, door reveals, closets, and similar openings.
- 3.4.4 Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on flooring as marked on substrates. Use chalk or other nonpermanent marking device.
- 3.4.5 Install flooring on covers for telephone and electrical ducts and similar items in installation areas. Maintain overall continuity of colour and pattern between pieces of flooring installed on covers and adjoining flooring. Tightly adhere flooring edges to substrates that abut covers and to cover perimeters.
- 3.4.6 Adhere flooring to substrates using a full spread of adhesive applied to substrate to produce a completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.
  - .1 Immediately roll the flooring in all directions using a 45 kg (100 lb) roller to ensure proper adhesive transfer. Additional rolling may be required during adhesive setup to the material is flat and fully adhered.
  - .2 Use three-section wall roller or steel seam roller at walls, under toe kicks or anywhere where full weight of 45 kg (100 lb) roller cannot access or be applied.
- 3.4.7 Heat-Welded Seams: For seamless installation, comply with ASTM F1516. Rout joints and heat weld with welding bead to fuse sections permanently into a seamless flooring installation. Prepare,

weld, and finish seams to produce surfaces flush with adjoining flooring surfaces.

### **3.5 Linoleum Sheet Flooring Installation**

- 3.5.1 Unroll linoleum sheet flooring and allow it to stabilize before cutting and fitting.
- 3.5.2 Lay out linoleum sheet flooring as follows:
  - .1 Maintain uniformity of flooring direction.
  - .2 Minimize number of seams; place seams in inconspicuous and low-traffic areas, at least 152 mm (6 inches) away from parallel joints in flooring substrates.
  - .3 Match edges of flooring for colour shading at seams.
  - .4 Avoid cross seams.
  - .5 Eliminate deformations that result from hanging method used during drying process (stove bar marks).
- 3.5.3 Installation of Prefabricated Base:
  - .1 Before installing base, fill cracks and irregularities with a filler recommended by base manufacturer.
  - .2 Dry-fit prefabricated cove base and cap. Cut and fit material to required lengths. Mitre-cut inside and outside corners.
  - .3 Scribe glue line on walls and floor at edge of prefabricated cove base material.
  - .4 Apply adhesive in full spread (100% coverage on 2 surfaces) for full length of prefabricated cove base material. Apply prefabricated cove base to wall surface straight and level.
  - .5 Slide metal base cap behind prefabricated cove base material.
  - .6 Hand roll prefabricated cove base material onto wall and floor surface removing bumps, ripples and fishmouths. Remove excess adhesive.
  - .7 Heat weld seams (vertical and horizontal) in prefabricated cove base material.

### **3.6 Cleaning And Protection**

- 3.6.1 Comply with manufacturer's written instructions for cleaning and protecting linoleum flooring.
- 3.6.2 Perform the following operations immediately after completing linoleum flooring installation:
  - .1 Remove adhesive and other blemishes from surfaces.
  - .2 Sweep and vacuum surfaces thoroughly.
  - .3 Damp-mop surfaces to remove marks and soil.

- 3.6.3 Protect linoleum flooring from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.
- 3.6.4 After allowing drying room film (yellow film caused by linseed oil oxidation) to disappear, cover linoleum flooring until Substantial Performance of the Work.

**3.7 Field Quality Control**

- 3.7.1 Manufacturer's Field Services: Provide manufacturer's field service consisting of product use recommendations and periodic site visit for inspection of product installation in accordance with manufacturer's recommendations.

**3.8 Demonstration And Training**

- 3.8.1 Engage manufacturer to demonstrate cleaning and maintenance procedures to Owner in accordance with requirements of Section 01 70 00. Review methods and procedures related to floor care and warranty requirements.
- 3.8.2 Include in Contract Price, cost for initial maintenance procedures, and execute procedures after flooring installation as recommended by flooring manufacturer. Initial maintenance to be conducted by installer or floor care professionals who are certified by manufacturer.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Resilient Athletic Flooring work specified herein. This includes, but is not necessarily limited, to:
  - .1 Interlocking, rubber floor tile.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
  - .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 09 65 13 "Resilient Base and Accessories" for wall base and accessories installed with resilient athletic flooring.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Administrative Requirements**

- 1.4.1 Pre-Installation Meetings: Conduct pre-installation meeting to verify project requirements, substrate conditions, manufacturer's installation and floor care recommendations and manufacturer's warranty requirements.
- 1.4.2 Coordination: Coordinate layout and installation of flooring with floor inserts for gymnasium equipment.

### **1.5 Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for each type of product indicated.
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Resilient Athletic Flooring work and

---

include product characteristics, performance criteria, physical size, finish and limitations

1.5.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for each type of resilient athletic flooring. Show installation details and locations of the following:

- .1 Border tiles.
- .2 Floor patterns.
- .3 Locations of floor inserts for athletic equipment installed through flooring.

1.5.3 Samples: Submit samples in accordance with Division 01 for the following:

- .1 For each exposed product and for each type, colour, and pattern specified, 150-mm- (6-inch-) square in size and of the same thickness indicated for the Work.

**1.6 Closeout Submittals**

1.6.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for each type of floor covering to include in maintenance manuals.

**1.7 Maintenance Material Submittals**

1.7.1 Supply extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

- .1 Floor Tile: Supply no fewer than 1 box for each 50 boxes or fraction thereof, of each type, colour, pattern, and size of floor tile installed.

**1.8 Quality Assurance**

1.8.1 Flooring Installer Qualifications: An experienced installer who has completed flooring installations using methods indicated for this Project and similar in material, design, and extent to that indicated for this Project; who is acceptable to manufacturer; and whose work has resulted in installations with a record of successful in-service performance.

- .1 Submit proof of training upon request.

1.8.2 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from one source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.

1.8.3 Mock-ups: Build mock-ups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for materials and execution.

- .1 Coordinate mock-ups in this Section with mock-ups specified in other Sections.
  - .1 Size: Minimum 10 sq. m (100 sq. ft.) for each type, colour, and pattern in locations directed by Consultant.
- .2 Approval of mock-ups does not constitute approval of deviations from the Contract Documents contained in mock-ups unless Consultant specifically approves such deviations in writing.
- .3 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

**1.9 Delivery, Storage, And Handling**

- 1.9.1 Deliver materials in original packages and containers, with seals unbroken, bearing manufacturer's labels indicating brand name and directions for storing.
- 1.9.2 Store materials to prevent deterioration.
  - .1 Store tiles on flat surfaces.
  - .2 Store rolls upright.

**1.10 Field Conditions**

- 1.10.1 Adhesively Applied Products:
  - .1 Maintain temperatures during installation within range recommended in writing by manufacturer, but not less than 21 deg C (70 deg F) or more than 35 deg C (95 deg F), in spaces to receive flooring 48 hours before installation, during installation, and 48 hours after installation unless longer period is recommended in writing by manufacturer.
  - .2 After postinstallation period, maintain temperatures within range recommended in writing by manufacturer, but not less than 18 deg C (65 deg F) or more than 35 deg C (95 deg F).
  - .3 Close spaces to traffic during flooring installation.
  - .4 Close spaces to traffic for 48 hours after flooring installation unless manufacturer recommends longer period in writing.
- 1.10.2 Install flooring after other finishing operations, including painting, have been completed.
- 1.10.3 Do not begin substrate evaluation and preparation until stable, conditioned environments have been established as described in this section.
- 1.10.4 Areas to receive flooring must have adequate lighting to allow for proper inspection and preparation of the substrate, installation of the flooring and final inspection.

- 1.10.5 Field Measurements: Verify actual measurements and openings by field measurements before fabrication. Show recorded measurements on Shop Drawings. Coordinate field measurements and fabrication schedule with construction progress to avoid construction delays.

**1.11 Warranty**

- 1.11.1 Extended Warranty: Provide manufacturer's full system warranty which includes repair or replacement of flooring installations that fail in materials or workmanship within specified warranty period.

.1 Warranty Period:

- .1 Flooring Material Warranty: 10 years from date of Substantial Performance of the Work.
- .2 Workmanship Warranty: 5 years from date of Substantial Performance of the Work.
- .2 Failures include, but not limited to, tearing, cracking, separation, deterioration or loosening from substrate, seam failure, ripples, bubbling or puckering. Upon notification of such installation deficiencies, within warranty period, make necessary repairs or replacement at no cost to Owner.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

.1 INTERLOCKING, RUBBER FLOOR TILE

- .1 Johnsonite/Tarkett;
- .2 Mondo America
- .3 Edgewood Flooring
- .4 Pliteq

- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Performance Requirements**

- 2.2.1 Provide Products free from blisters, cracks, chipped edges and corners, embedded foreign matter or other defects as required to complete flooring installation and to meet design requirements.
- 2.2.2 Fire-Test-Response Characteristics: Provide flooring with fire-test-response characteristics as determined by testing identical products

according to ASTM E648 or NFPA 253 by a qualified testing agency.

- .1 Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm.

## **2.3     Interlocking Rubber Floor Tiles**

- 2.3.1 Material Tag: This item is noted as "RSF-1" on Drawings and Schedules.
- 2.3.2 Description: Resilient floor interlocking tile system with interdependent ring impact pedestals.
- 2.3.3 Material: Rubber or Recycled-rubber compound.
- 2.3.4 Tile Interlock: Hidden
- 2.3.5 Traffic-Surface Texture: Smooth
- 2.3.6 Size: 610 mm x 610 mm (24 inches x 24 inches)
- 2.3.7 Thickness: 32mm (1-1/4 inch)
- 2.3.8 Tile Weight: 10kg (22 lb) per tile
- 2.3.9 Colour and Pattern: Refer to Finish Schedule on Drawings.
- 2.3.10 Basis-of-Design: Refer to Finish Schedule on Drawings.

## **2.4     Accessories**

- 2.4.1 Trowelable Leveling and Patching Compounds: Latex-modified, portland-cement-based or blended hydraulic-cement-based formulation provided or approved by resilient rubber flooring manufacturer for applications indicated. Do not use gypsum-based materials.
- 2.4.2 Adhesives: Water-resistant type recommended in writing by manufacturer for substrate and conditions indicated.
  - .1 Provide two-part, solvent-free, low VOC polyurethane adhesive "PU 105" by Mondo America Inc. or approved equivalent recommended in writing by floor covering manufacturer and approved by Consultant in order to authenticate floor covering warranties.
- 2.4.3 Game-Line and Marker Paint: Complete system including primer, if any, compatible with flooring and recommended in writing by flooring and paint manufacturers for use indicated.
- 2.4.4 MVE-Control System: ASTM F3010-qualified, fluid-applied, two-component, epoxy-resin, membrane-forming system; formulated for application on concrete substrates to reduce MVER to level required for installation of floor coverings indicated and acceptable to manufacturers of floor covering products indicated, including adhesives.

- .1 MVE-Control System Capabilities: Capable of suppressing MVE without failure where installed on concrete that exhibits the following conditions:
  - .1 Relative Humidity: Up to 100 percent when tested according to ASTM F2170 using in situ probes.
- .2 Substrate Primer: Provide MVE-control system manufacturer's concrete-substrate primer if required for system indicated by substrate conditions.
- .3 Acceptable Products: Approved proprietary moisture control system recommended in writing by floor covering manufacturer and approved by Consultant in order to authenticate floor covering warranties.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates, with Installer present, for compliance with requirements for installation tolerances, moisture content, and other conditions affecting performance of the Work.
  - .1 Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of resilient products.
  - .2 Minimum tolerance required prior to application is 3 mm in 3 m (1/8 inch in 10-foot radius) using straight edge measurements.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Preparation**

- 3.2.1 Prepare substrates according to manufacturer's written instructions to ensure adhesion of flooring.
- 3.2.2 Concrete Substrates: Prepare according to ASTM F710.
  - .1 Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
  - .2 Remove substrate coatings and other substances that are incompatible with flooring adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by resilient rubber flooring manufacturer. Do not use solvents.
  - .3 Concrete substrates must be cured per the concrete manufacturer's recommendations with minimum compressive strength of 21 MPa (3,000 psi) and minimum dry density of

- 
- 2400 kg/cu. m (150 lbs/cu. ft). Refer to Division 3 for patching, repairing crack materials and leveling compounds with Portland cement-based compounds and for cast-in-place concrete, concrete toppings, and cementitious underlayments.
- .4 Bond Testing: Conduct testing in accordance with the manufacturer's recommendations in various locations throughout area where flooring is to be installed. Perform sufficient tests to evaluation of entire area where material will be installed.
  - .5 Alkalinity Testing: Perform pH testing according to ASTM F710. Proceed with installation only if pH readings are not less than 7.0 and not greater than 8.5.
    - .1 Perform tests so that each test area does not exceed 93 sq. m (1000 sq. ft.), and perform no fewer than three tests in each installation area and with test areas evenly spaced in installation areas.
    - .2 Anhydrous Calcium Chloride Test: ASTM F1869. Proceed with installation only after substrates have maximum moisture-vapour emission rate of 1.36 kg of water/92.9 sq. m (3 lb of water/1000 sq. ft) in 24 hours, unless otherwise recommended in writing by floor covering manufacturer.
    - .3 Relative Humidity Test: Using in-situ probes, ASTM F2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement, unless otherwise recommended in writing by floor covering manufacturer.
    - .4 Do not proceed with installation until moisture problems have been corrected.
- 3.2.3 Remove substrate coatings and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended in writing by manufacturer. Do not use solvents.
- 3.2.4 Use trowelable leveling and patching compound to fill cracks, holes, and depressions in substrates.
- 3.2.5 Move flooring and installation materials into spaces where they will be installed at least 48 hours in advance of installation unless manufacturer recommends a longer period in writing.
- .1 Do not install flooring until it is the same temperature as space where it is to be installed.
- 3.2.6 Sweep and vacuum clean substrates to be covered by flooring immediately before installation. After cleaning, examine substrates

for moisture, alkaline salts, carbonation, and dust. Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.3 Application Of Mve-Control System**

- 3.3.1 Apply MVE-control system to all basement slabs and slabs-on-grades (regardless of pre-installation moisture testing results) and to other locations where moisture contents are above those recommended by manufacturer at time of installation.
- 3.3.2 Prepare and clean substrates according to MVE-control system manufacturer's written instructions to ensure adhesion of system to concrete.
- 3.3.3 Remove coatings and other substances that are incompatible with MVE-control system and that contain soap, wax, oil, or silicone, using mechanical methods recommended in writing by MVE-control system manufacturer. Do not use solvents.
- 3.3.4 Provide concrete surface profile complying with ICRI 310.2R or CSP 3 by shot blasting using apparatus that abrades the concrete surface with shot, contains the dispensed shot within the apparatus, and recirculates the shot by vacuum pickup.
- 3.3.5 After shot blasting, repair damaged and deteriorated concrete according to MVE-control system manufacturer's written instructions.
- 3.3.6 Protect substrate voids and joints to prevent resins from flowing into or leaking through them.
- 3.3.7 Fill surface depressions and irregularities with patching and leveling material.
- 3.3.8 Fill surface cracks, grooves, control joints, and other nonmoving joints with crack-filling material.
- 3.3.9 Allow concrete to dry, undisturbed, for period recommended in writing by MVE-control system manufacturer after surface preparation, but not less than 24 hours.
- 3.3.10 Before installing MVE-control systems, broom sweep and vacuum prepared concrete.
- 3.3.11 Install MVE-control system according to ASTM F3010 and manufacturer's written instructions to produce a uniform, monolithic surface free of surface deficiencies such as pin holes, fish eyes, and voids.

### **3.4 Flooring Installation, General**

- 3.4.1 Comply with manufacturer's product technical data, including product technical bulletins, installation recommendations and floor care recommendations.

- 3.4.2 Scribe, cut, and fit flooring to butt neatly and tightly to vertical surfaces, equipment anchors, floor outlets, and other interruptions of floor surface.
- 3.4.3 Extend flooring into toe spaces, door reveals, closets, and similar openings unless otherwise indicated.
- 3.4.4 Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating subfloor markings on flooring. Use nonpermanent, nonstaining marking device.

### **3.5 Floor Tile Installation**

- 3.5.1 Lay out tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half tile at perimeter.
  - .1 Lay tiles square with room axis or in pattern indicated on Drawings.
- 3.5.2 Discard broken, cracked, chipped, or deformed tiles.
- 3.5.3 Tile Matching: Match tiles for colour and pattern by selecting tiles from cartons in same sequence as manufactured and packaged if so numbered.
- 3.5.4 Adhered Floor Tile: Adhere products to substrates using a full spread of adhesive applied to substrate to comply with adhesive and flooring manufacturers' written instructions, including those for trowel notching, adhesive mixing, and adhesive open and working times.
  - .1 Provide completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.
- 3.5.5 Free-Lay Tile: Place flooring at locations indicated with units securely interconnected and fully seated on substrate to form a smooth, level surface.

### **3.6 Field Quality Control**

- 3.6.1 Manufacturer's Field Services: Provide manufacturer's field service consisting of product use recommendations and periodic site visit for inspection of product installation in accordance with manufacturer's recommendations.

### **3.7 Demonstration And Training**

- 3.7.1 Engage manufacturer to demonstrate cleaning and maintenance procedures to Owner in accordance with requirements of Section 01 70 00. Review methods and procedures related to floor care and warranty requirements.

- 3.7.2 Include in Contract Price, cost for initial maintenance procedures, and execute procedures after flooring installation as recommended by flooring manufacturer. Initial maintenance to be conducted by installer or floor care professionals who are certified by manufacturer.

**3.8 Cleaning And Protection**

- 3.8.1 Perform the following operations immediately after completing flooring installation:
- .1 Remove adhesive and other blemishes from flooring surfaces.
  - .2 Sweep and vacuum flooring thoroughly.
  - .3 Damp-mop flooring to remove marks and soil after time period recommended in writing by manufacturer.
- 3.8.2 Protect flooring from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period. Use protection methods recommended in writing by manufacturer.
- .1 Do not move heavy and sharp objects directly over flooring. Protect flooring with plywood or hardboard panels to prevent damage from storing or moving objects over flooring.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Tile Carpeting work specified herein. This includes, but is not necessarily limited, to,:
  - .1 carpet tile.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
  - .1 Section 09 65 13, Resilient Base and Accessories for resilient wall base and accessories installed with carpet tile.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Preinstallation Meetings**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
  - .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.

- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
- .5 Review methods and procedures related to carpet tile installation including, but not limited to, the following:
  - .1 Review delivery, storage, and handling procedures.
  - .2 Review ambient conditions and ventilation procedures.
  - .3 Review subfloor preparation procedures.

## **1.5      Action Submittals**

1.5.1 Product Data: Submit product data in accordance with Division 01 for each type of product.

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Tile Carpeting work and include product characteristics, performance criteria, physical size, finish and limitations
- .2 Include manufacturer's written data on physical characteristics, durability, and fade resistance.
- .3 Include installation recommendations for each type of substrate.

1.5.2 Shop Drawings: Show the following:

- .1 Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet tiles.
- .2 Carpet tile type, colour, and dye lot.
- .3 Type of subfloor.
- .4 Type of installation.
- .5 Pattern of installation.
- .6 Pattern type, location, and direction.
- .7 Pile direction.
- .8 Type, colour, and location of insets and borders.
- .9 Type, colour, and location of edge, transition, and other accessory strips.
- .10 Transition details to other flooring materials.

1.5.3 Samples: Submit samples in accordance with Division 01 for each of the following products and for each colour and texture required. Label each Sample with manufacturer's name, material description, colour, pattern, and designation indicated on Drawings and in schedules.

- .1 Carpet Tile: Full-size Sample.
- .2 Exposed Edge, Transition, and Other Accessory Stripping: 300-mm- (12-inch-) long Samples.

- 1.5.4 Product Schedule: Submit product schedule in accordance with Division 01 for carpet tile. Use same designations indicated on Drawings.

**1.6 Informational Submittals**

- 1.6.1 Product Test Reports: Submit product test reports in accordance with Division 01 for carpet tile, for tests performed by a qualified testing agency.
- 1.6.2 Sample Warranty: Submit sample warranty in accordance with Division 01 for special warranty.

**1.7 Closeout Submittals**

- 1.7.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for carpet tiles to include in maintenance manuals. Include the following:
- .1 Methods for maintaining carpet tile, including cleaning and stain-removal products and procedures and manufacturer's recommended maintenance schedule.
  - .2 Precautions for cleaning materials and methods that could be detrimental to carpet tile.

**1.8 Maintenance Material Submittals**

- 1.8.1 Supply extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
- .1 Carpet Tile: Full-size units equal to 5 percent of amount installed for each type indicated, but not less than 8.3 sq. m (10 sq. yd.).

**1.9 Quality Assurance**

- 1.9.1 Installer Qualifications: An experienced installer who is certified by the International Certified Floorcovering Installers Association at the Commercial II certification level.
- 1.9.2 Fire-Test-Response Ratings: Where indicated, provide carpet tile identical to those of assemblies tested for fire response according to NFPA 253 by a qualified testing agency.
- 1.9.3 Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
- .1 Build mockups at locations and in sizes shown on Drawings.
  - .2 The following Products may be acceptable for inclusion into The Work, approved mockups may become part of the

---

completed Work if undisturbed at time of Substantial Performance of the Work.

**1.10 Delivery, Storage, And Handling**

1.10.1 Comply with CRI 104.

**1.11 Field Conditions**

1.11.1 Comply with CRI 104 for temperature, humidity, and ventilation limitations.

1.11.2 Environmental Limitations: Do not deliver or install carpet tiles until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at occupancy levels during the remainder of the construction period.

1.11.3 Do not install carpet tiles over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive and concrete slabs have pH range recommended by carpet tile manufacturer.

1.11.4 Where demountable partitions or other items are indicated on Drawings and Schedules for installation on top of carpet tiles, install carpet tiles before installing these items.

**1.12 Warranty**

1.12.1 Special Warranty for Carpet Tiles: Manufacturer agrees to repair or replace components of carpet tile installation that fail in materials or workmanship within specified warranty period.

.1 Warranty does not include deterioration or failure of carpet tile due to unusual traffic, failure of substrate, vandalism, or abuse.

.2 Failures include, but are not limited to, more than 10 percent edge raveling, snags, runs, loss of face fiber, and delamination.

.3 Warranty Period: 10 years from date of Substantial Performance of the Work.

**2 . PRODUCTS**

**2.1 Carpet Tile**

2.1.1 Material Tag: This item is noted as "CPT-1A" and "CPT-1B " on Drawings and Schedules.

2.1.2 Colour and Pattern: Refer to Finish Schedule on Drawings.

2.1.3 Fiber Content: 100 percent nylon 6.

2.1.4 Pile Characteristic: Level-loop pile.

- 2.1.5 Pile Thickness: 1.8mm (0.07 inch) for finished carpet tile
- 2.1.6 Stitches: 10.8 per inch
- 2.1.7 Gage: 5/64
- 2.1.8 Total Weight: 3115.1 g/sq m (91.9 oz/sq yd) for finished carpet tile.
- 2.1.9 Primary Backing/Backcoating: Manufacturer's standard composite materials.
- 2.1.10 Secondary Backing: Manufacturer's standard material.
- 2.1.11 Underlayment: For CPT-1A, manufacturers standard 12.5mm (1/2 inch) acoustic/shock absorbing underlayment.
- 2.1.12 Size: 610 by 610 mm (24 by 24 inches).

## **2.2 Installation Accessories**

- 2.2.1 Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by carpet tile manufacturer.
- 2.2.2 Adhesives: Water-resistant, mildew-resistant, nonstaining, pressure-sensitive type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed carpet tile and is recommended by carpet tile manufacturer for releasable installation.
  - .1 Adhesives shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
  - .2 Adhesives shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- 2.2.3 Metal Edge/Transition Strips: Extruded aluminum with mill finish of profile and width shown, of height required to protect exposed edge of carpet, and of maximum lengths to minimize running joints.

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for maximum moisture content, alkalinity range, installation tolerances, and other conditions affecting carpet tile performance. Examine carpet tile for type, colour, pattern, and potential defects.

- 
- 3.1.2 Concrete Subfloors: Verify that concrete slabs comply with ASTM F 710 and the following:
- .1 Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by carpet tile manufacturer.
  - .2 Subfloor finishes comply with requirements specified in Section 03 30 00, Cast-in-Place Concrete for slabs receiving carpet tile.
  - .3 Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.
- 3.1.3 For wood subfloors, verify the following:
- .1 Underlayment over subfloor complies with requirements specified in Section 06 10 00, Rough Carpentry.
  - .2 Underlayment surface is free of irregularities and substances that may interfere with adhesive bond or show through surface.
- 3.1.4 For metal subfloors, verify the following:
- .1 Underlayment surface is free of irregularities and substances that may interfere with adhesive bond or show through surface.
- 3.1.5 For painted subfloors, verify the following:
- .1 Perform bond test recommended in writing by adhesive manufacturer.
- 3.1.6 For raised access flooring systems, verify the following:
- .1 Access floor substrate is compatible with carpet tile and adhesive if any.
  - .2 Underlayment surface is flat, smooth, evenly planed, tightly jointed, and free of irregularities, gaps greater than 3 mm (1/8 inch), protrusions more than 0.8 mm (1/32 inch), and substances that may interfere with adhesive bond or show through surface.
- 3.1.7 Proceed with installation only after unsatisfactory conditions have been corrected.

## **3.2 Preparation**

- 3.2.1 General: Comply with CRI 104, Section 6.2, Site Conditions; Floor Preparation, and with carpet tile manufacturer's written installation instructions for preparing substrates indicated on Drawings and Schedulesto receive carpet tile installation.

- 3.2.2 Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, depressions, and protrusions in substrates. Fill or level cracks, holes and depressions 3 mm (1/8 inch) wide or wider and protrusions more than 0.8 mm (1/32 inch)() unless more stringent requirements are required by manufacturer's written instructions.
- 3.2.3 Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by carpet tile manufacturer.
- 3.2.4 Clean metal substrates of grease, oil, soil and rust, and prime if directed by adhesive manufacturer. Rough sand painted metal surfaces and remove loose paint. Sand aluminum surfaces, to remove metal oxides, immediately before applying adhesive.
- 3.2.5 Broom and vacuum clean substrates to be covered immediately before installing carpet tile.

### **3.3 Installation**

- 3.3.1 General: Comply with CRI 104, Section 14, Carpet Modules, and with carpet tile manufacturer's written installation instructions.
- 3.3.2 Installation Method: As recommended in writing by carpet tile manufacturer.
- 3.3.3 Maintain dye lot integrity. Do not mix dye lots in same area.
- 3.3.4 Cut and fit carpet tile to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet tile manufacturer.
- 3.3.5 Extend carpet tile into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.
- 3.3.6 Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.
- 3.3.7 Install pattern parallel to walls and borders.
- 3.3.8 Stagger joints of carpet tiles so carpet tile grid is offset from access flooring panel grid. Do not fill seams of access flooring panels with carpet adhesive; keep seams free of adhesive.

### **3.4 Cleaning And Protection**

- 3.4.1 Perform the following operations immediately after installing carpet tile:

- 
- .1 Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet tile manufacturer.
  - .2 Remove yarns that protrude from carpet tile surface.
  - .3 Vacuum carpet tile using commercial machine with face-beater element.
- 3.4.2 Protect installed carpet tile to comply with CRI 104, Section 16, Protecting Indoor Installations.
- 3.4.3 Protect carpet tile against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated on Drawings and Schedules or recommended in writing by carpet tile manufacturer.

END OF SECTION

## **1 . GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Sound Absorbing Wall And Ceiling units work specified herein. This includes, but is not necessarily limited, to:
  - .1 Sound-absorbing ceiling panels.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
  - .1 Section 05 50 00 - Metal Fabrications
  - .2 Section 07 21 00 - Thermal Insulation
  - .3 Section 09 21 16 - Gypsum Board Assemblies
  - .4 Section 09 51 13 - Acoustical Panel Ceilings

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Submittals**

- 1.4.1 Product Data: Submit product data for each type of fabric facing, panel edge, core material, and mounting indicated.
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Sound Absorbing Wall And Ceiling units work and include product characteristics, performance criteria, physical size, finish and limitations

1.4.2 Product Disclosure and Transparency:

- .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
- .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
  - .1 Health Product Declaration open Standard,
  - .2 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
  - .3 International Living Future Institute Declare
  - .4 Other approved framework.
- .3 When multiple Products are specified, give preference to Products with compliant documentation.

1.4.3 Shop Drawings: Submit Shop Drawings for sound-absorbing wall units. Include mounting devices and details; details at panel head, base, joints, and corners; and details at ceiling, floor base, and wall intersections. Indicate panel edge and core materials.

- .1 Include elevations showing panel sizes and direction of fabric weave and pattern matching.

1.4.4 Samples : Submit samples for verification for the following products, prepared on Samples of size indicated below:

- .1 Fabric: Full-width by approximately 900-mm- (36-inch-) long Sample, but not smaller than required to show complete pattern repeat, from dye lot to be used for the Work, and with specified treatments applied. Mark top and face of fabric.
- .2 Assembled Panels: Approximately 900 by 900 mm (36 by 36 inches), including joints and mounting methods.

**1.5 Quality Assurance**

1.5.1 Source Limitations: Obtain sound-absorbing wall units from single source from single manufacturer.

1.5.2 Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials, fabrication, and installation.

- .1 Build mockup of typical wall area as directed by Consultant. Include intersection of wall and ceiling, corners, and perimeters.

- .2 Review of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Consultant specifically approves such deviations in writing.

**1.6 Delivery, Storage, And Handling**

- 1.6.1 Comply with fabric and sound-absorbing wall unit manufacturers' written instructions for minimum and maximum temperature and humidity requirements for shipment, storage, and handling.
- 1.6.2 Deliver materials and units in unopened bundles and store in a temperature-controlled dry place with adequate air circulation.

**1.7 Project Conditions**

- 1.7.1 Environmental Limitations: Do not install sound-absorbing wall units until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work at and above ceilings is complete, and ambient temperature and humidity conditions are maintained at the levels indicated on Drawings and Schedules for Project when occupied for its intended use.
- 1.7.2 Lighting: Do not install sound-absorbing wall units until a permanent level of lighting is provided on surfaces to receive the units.
- 1.7.3 Air-Quality Limitations: Protect sound-absorbing wall units from exposure to airborne odors, such as tobacco smoke, and install units under conditions free from odor contamination of ambient air.
- 1.7.4 Field Measurements: Verify locations of sound-absorbing wall units and actual dimensions of openings and penetrations by field measurements before fabrication.

**1.8 Warranty**

- 1.8.1 Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of sound-absorbing wall units that fail in materials or workmanship within specified warranty period.
  - .1 Failures include, but are not limited to the following:
    - .1 Acoustical performance.
    - .2 Fabric sagging, distorting, or releasing from panel edge.
    - .3 Warping of core.
  - .2 Warranty Period: Two years from date of Substantial Performance of the Work.

---

## **2 . PRODUCTS**

### **2.1 Performance Requirements**

- 2.1.1 Fire-Test-Response Characteristics: Provide sound-absorbing wall units meeting the following as determined by testing identical products by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
- .1 Surface-Burning Characteristics: As determined by testing per CAN/ULC-S102/S102.2.
    - .1 Flame-Spread Index: 25 or less.
    - .2 Smoke-Developed Index: 450 or less.
- 2.1.2 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.

### **2.2 Sound-Absorbing Ceiling Units**

- 2.2.1 Material Tag: This item is noted as "ACP-2" on Drawings and Schedules.
- 2.2.2 Manufacturer's standard panel construction consisting of facing material laminated to front face, edges, and back edge border of core.
- .1 Mounting: Back mounted with manufacturer's standard suspension system, secured to substrate.
  - .2 Core: Manufacturer's standard.
  - .3 Acoustical Performance: Sound absorption NRC of not less than 0.75 according to ASTM C423 for Type A mounting according to ASTM E795.
  - .4 Edge Construction: Manufacturer's standard chemically hardened core with no frame.
  - .5 Thickness: 27 mm 1 (1-1/16 inches)
  - .6 Finish: manufacturers standard acoustically transparent textured coating.
  - .7 Basis-of-Design Product: Refer to Finish Schedule on Drawings.

---

**2.3     Fabrication**

- 2.3.1 Use manufacturer's standard construction except as otherwise indicated on Drawings and Schedules; with facing material applied to face, edges, and back border of dimensionally stable core; and with rigid edges to reinforce panel perimeter against warpage and damage.
- 2.3.2 Dimensional Tolerances of Finished Units: Plus or minus 1.6 mm (1/16 inch) for the following:
- .1 Thickness.
  - .2 Edge straightness.
  - .3 Overall length and width.
  - .4 Squareness from corner to corner.
  - .5 Chords, radii, and diameters.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Examine fabric, fabricated units, substrates, areas, and conditions, for compliance with requirements, installation tolerances, and other conditions affecting performance of sound-absorbing wall units.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2     Installation - Ceilings**

- 3.2.1 Install sound-absorbing ceiling units in locations indicated with edges in alignment with walls and other units, faces flush, and scribed to fit adjoining work accurately at borders and at penetrations.
- 3.2.2 Comply with sound-absorbing ceiling unit manufacturer's written instructions for installation of units using type of mounting devices indicated. Mount units securely to supporting substrate.
- 3.2.3 Align fabric pattern and grain with adjacent units.
- 3.2.4 Provide seismic bracing as required.

**3.3     Installation Tolerances**

- 3.3.1 Variation from Plumb and Level: Plus or minus 1.6 mm (1/16 inch).
- 3.3.2 Variation of Panel Joints from Hairline: Not more than 1.6 mm (1/16 inch) wide.

---

**3.4     Cleaning**

- 3.4.1   Clip loose threads; remove pills and extraneous materials.
- 3.4.2   Clean panels on completion of installation to remove dust and other foreign materials according to manufacturer's written instructions.

END OF SECTION

---

**1. GENERAL**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

**1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Exterior Painting work specified herein. This includes, but is not necessarily limited, to:
- .1 Painting of all exterior exposed elements noted on Room Finish Schedule and noted on Drawings including following substrates:
    - .1 Concrete
    - .2 Steel.
    - .3 Galvanized metal.
    - .4 Aluminum (not anodized or otherwise coated).
    - .5 Wood.
    - .6 Fibre-cement board.
  - .2 Where an item or surface is not specifically mentioned on Drawings, and is not excluded, Provide same finish as similar adjacent materials or surfaces.
  - .3 Do not paint excluded components indicated herein.
- 1.2.2 Work Excluded:
- .1 Do not paint pre-finished metal.
  - .2 Do not paint chrome, stainless steel, vinyl, plastic laminate and aluminum surfaces throughout unless specified otherwise.
  - .3 Do not paint equipment furnished completely prime- and finish painted by manufacturer unless required to have field painting over factory finish in order to produce common corporate colour as identified in room finish schedule.
  - .4 Do not paint over ULC, FM or other code required labels or equipment identification plates.
- 1.2.3 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.

- .1 Section 05 12 00, Structural Steel Framing for shop priming of metal substrates with primers specified in this Section.
- .2 Section 09 91 23, Interior Painting for surface preparation and the application of paint systems on interior substrates.

### **1.3     References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4     Definitions**

- 1.4.1 Gloss Level 1 (Flat or Matte): Not more than 5 units at 60 degrees and 10 units at 85 degrees, according to ASTM D523.
- 1.4.2 Gloss Level 2 (Velvet): Not more than 10 units at 60 degrees and 10 to 35 units at 85 degrees, according to ASTM D523.
- 1.4.3 Gloss Level 3 (Eggshell): 10 to 25 units at 60 degrees and 10 to 35 units at 85 degrees, according to ASTM D523.
- 1.4.4 Gloss Level 4 (Satin): 20 to 35 units at 60 degrees and not less than 35 units at 85 degrees, according to ASTM D523.
- 1.4.5 Gloss Level 5 (Semi-gloss): 35 to 70 units at 60 degrees, according to ASTM D523.
- 1.4.6 Gloss Level 6 (Gloss): 70 to 85 units at 60 degrees, according to ASTM D523.
- 1.4.7 Exposed: This refers to items visible in completed Work.
- 1.4.8 Surface Preparation: This refers to means of cleaning or treating of surface to be painted to ensure best possible bond between surface and painting applied. Surface preparation methods include, but are not limited to:
  - .1 Ensure preparation and workmanship conforms to MPI Painting Manual requirements
  - .2 Removal of surface contaminants that will affect performance of painting including but not limited to: oil, grease, salts, dust, dirt, rust, rust scale, mill scale, and old coatings where applicable.
  - .3 Removal of surface imperfections including without limitations: weld spatter, sharp edges, burrs, silvers, laminations, pits, porosities and crevices.
  - .4 Preparation of surfaces to Provide anchor profile or surface profile to improve mechanical bonding of coating to prepared surface by increasing surface area.

---

**1.5     Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for each type of product. Include preparation requirements and application instructions.
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Exterior Painting work and include product characteristics, performance criteria, physical size, finish and limitations
- 1.5.2 Samples: Submit samples in accordance with Division 01 for each type of paint system and in each colour and gloss of topcoat.
- .1 Submit full range colour sample chips to indicate where colour availability is restricted.
  - .2 Submit Samples (brushouts) on rigid backing, 200 mm (8 inches) square.
    - .1 3 mm (1/8 inch) plate steel for finishes over metal surfaces.
    - .2 13 mm (1/2 inch) plywood for finishes over wood surfaces.
    - .3 50 mm (2 inch) concrete block for finishes over concrete surfaces.
  - .3 Step coats on Samples to show each coat required for system.
  - .4 Label each coat of each Sample.
  - .5 Label each Sample for location and application area.
  - .6 Retain reviewed samples on-site to demonstrate acceptable standard of quality for appropriate on-site surface.
- 1.5.3 Product List: Submit product list in accordance with Division 01 for each product indicated on Drawings and Schedules, include the following:
- .1 Cross-reference to paint system and locations of application areas. Use same designations indicated on Drawings and in schedules.
  - .2 Printout of current "MPI Approved Products List" for each product category specified, with the proposed product highlighted.
  - .3 Colour Numbers
  - .4 MPI Environmentally Friendly Classification System Rating
  - .5 Manufacturer's Safety Data Sheets (SDS)
  - .6 VOC content.

---

**1.6 Informational Submittals**

- 1.6.1 Test reports: Provide certified test reports for paint from approved independent testing laboratories, indicating compliance with specifications for specified performance characteristics and physical properties.
- .1 Lead, cadmium and chromium: presence of and amounts.
  - .2 Mercury: presence of and amounts.
  - .3 Organochlorines and PCBs: presence of and amounts.

**1.7 Closeout Submittals**

- 1.7.1 Operation and Maintenance Data: Provide operation and maintenance data for painting materials for incorporation into manual. Include the following cross-referenced to paint system and locations of application areas:
- .1 Product name, type and use.
  - .2 Manufacturer's product number.
  - .3 Colour names and numbers
  - .4 MPI Environmentally Friendly classification system rating.

**1.8 Maintenance Material Submittals**

- 1.8.1 Supply extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
- .1 Paint: 5 percent, but not less than 3.8 L (1 gal.) of each material and colour applied.
- 1.8.2 Paint must be boxed and in sealed, unopened cans in undamaged condition, with name of manufacturer, contents, type and colour clearly indicated on a label securely adhered to can.

**1.9 Quality Assurance**

- 1.9.1 Qualifications: Provide work of this Section executed by competent installers with membership in good standing in MPI, OPCA and/or PDCA having a minimum of 5 years' experience in application of Products, systems and assemblies specified and with approval and training of Product manufacturers.
- .1 Qualified journeypersons as defined by local jurisdiction to be engaged in painting work.
  - .2 Apprentices may be employed provided they work under direct supervision of qualified journeyperson in accordance with trade regulations.
- 1.9.2 Mockups: Apply mockups of each paint system directed on Site and each colour and finish selected to verify preliminary selections

made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

- .1 Consultant will select one surface to represent surfaces and conditions for application of each paint system specified.
    - .1 Vertical and Horizontal Surfaces: Provide mock-ups of at least 9 sq. m (100 sq. ft.).
    - .2 Other Items: Consultant will designate items or areas required.
  - .2 Final approval of colour selections will be based on mockups.
    - .1 If preliminary colour selections are not approved, apply additional mockups of additional colours selected by Consultant at no added cost to Owner.
  - .3 Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Consultant specifically approves such deviations in writing.
  - .4 Reviewed mockups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.
- 1.9.3 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from one source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.
- .1 Use single brand of paint chosen throughout work of this Section, except where specified otherwise.

## **1.10 Delivery, Storage, And Handling**

- 1.10.1 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- .1 Imprint containers with labels indicating the following:
    - .1 Type of paint or coating.
    - .2 Compliance with applicable standard.
    - .3 Colour number in accordance with established colour schedule.
- 1.10.2 Store materials not in use in tightly covered containers in well-ventilated areas with ambient temperatures continuously maintained at not less than 7 deg C (45 deg F).
- .1 Maintain containers in clean condition, free of foreign materials and residue.
  - .2 Remove rags and waste from storage areas daily.

- .3 Keep materials away from excessive heat or direct rays of the sun.
- .4 Remove used cloths from building at the end of every working shift and when not in use.

1.10.3 Fire Prevention:

- .1 Prevent fire or explosion caused by improper storage of paints, solvents, rags, and similar items. Store hazardous materials in location and in manner approved by local fire authority.
- .2 Post "No Smoking" signs in areas of storage and mixing. Provide and maintain CO<sub>2</sub> fire extinguishers of minimum 9 kg (20 lb) capacity.

**1.11 Field Conditions**

- 1.11.1 Apply paints only when temperature of surfaces to be painted and ambient air temperatures are between 18 and 35 deg C (65 and 95 deg F).
- 1.11.2 Do not apply paints when relative humidity exceeds 85 percent; at temperatures less than 3 deg C (5 deg F) above the dew point and rising; or to damp or wet surfaces.

**1.12 Warranty**

- 1.12.1 Warrant Work of this Section for period of 2 years against defects and deficiencies in accordance with General Conditions of the Contract.
- 1.12.2 Promptly correct defects or deficiencies which become apparent within warranty period, to satisfaction of Consultant and at no expense to Owner.
- 1.12.3 Defects include but are not limited to: material shrinkage, cracking, splitting, bubbling, blistering and delamination resulting from defective materials or poor workmanship.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 Benjamin Moore & Co. (Canada).
  - .2 Cloverdale Paint.
  - .3 Coronado Paint/Corotech/Insl-x .
  - .4 Dulux Paints (Canada).

- .5 PPG Architectural Finishes, Inc.
- .6 Sherwin-Williams Company (The).

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Performance Requirements**

2.2.1 MPI Standards: Unless indicated otherwise, Provide products that comply with MPI standards indicated and that are listed in its "MPI Approved Products List." Functionally and aesthetically equivalent Products that do not meet requirements of MPI standards may be considered, provided they meet requirements of this Specification and are reviewed by the Consultant.

2.2.2 Unless otherwise specified herein, all painting work shall be in accordance with MPI Premium Grade finish requirements

2.2.3 Material Compatibility:

- .1 Provide materials for use within each paint system that are compatible with one another and substrates indicated on Drawings and Schedules, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
- .2 For each coat in a paint system, provide products recommended in writing by manufacturers of topcoat for use in paint system and on substrate indicated on Drawings and Schedules.

2.2.4 Standard of Acceptance:

- .1 Walls: no defects visible from a distance of 900 mm (3 ft) at 90 deg to surface when viewed using final lighting source.
- .2 Soffits: no defects visible from floor at 45 deg to surface when viewed using final lighting source.
- .3 Final coat to exhibit uniformity of colour and uniformity of sheen across full surface area.

## **2.3 Finishes**

2.3.1 Material Tag: This item is noted as "PT-#" on Drawings and Schedules.

2.3.2 Colours: refer to Finish Schedule on Drawings.

---

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates and conditions, with Applicator present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.
- 3.1.2 Maximum Moisture Content of Substrates: When measured with an electronic moisture meter as follows:
  - .1 Concrete: 12 percent.
  - .2 Masonry (Clay and CMU): 12 percent.
  - .3 Wood: 15 percent.
- 3.1.3 Wood Substrates: Inspect work to ensure surfaces are smooth, free from machine marks and that nailheads have been countersunk.
- 3.1.4 Verify suitability of substrates, including surface conditions and compatibility with existing finishes and primers.
- 3.1.5 Proceed with coating application only after unsatisfactory conditions have been corrected.
  - .1 Application of coating indicates acceptance of surfaces and conditions.

#### **3.2 Preparation**

- 3.2.1 Comply with manufacturer's written instructions and recommendations in "MPI Manual" applicable to substrates indicated on Drawings and Schedules.
- 3.2.2 Clean substrates of substances that could impair bond of paints, including dust, dirt, oil, grease, and incompatible paints and encapsulants.
  - .1 Remove incompatible primers and reprime substrate with compatible primers or apply tie coat as required to produce paint systems indicated on Drawings and Schedules.
- 3.2.3 Concrete Substrates: Remove release agents, curing compounds, efflorescence, and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces to be painted exceeds that permitted in manufacturer's written instructions.
- 3.2.4 Steel Substrates: Remove rust, loose mill scale, and shop primer, if any. Clean using methods recommended in writing by paint manufacturer but not less than the following:
  - .1 SSPC-SP 3, "Power Tool Cleaning."
- 3.2.5 Decorative Metals: Blast clean removing minimum 0.037 mm to 0.050 mm (1.5 - 2 mil) scale, rust and other foreign matter from

metal surface using grit abrasive to SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."

3.2.6 Galvanized Steel:

- .1 Hot Dipped Galvanized Steel (Unweathered): Allow to weather minimum of 26 weeks and clean to SSPC-SP16. Remove silicates or similar surface treatments or any deposits of white rust by sanding or similar abrasive methods (bronze wool).
  - .1 Use of acetic acid to prepare galvanized surfaces is not acceptable.
  - .2 Clean chromate passivated galvanized metal surface contamination by washing with appropriate chemical solution compatible with finish specified such as MPI #25.
- .2 Galvanized Steel (Weathered): Remove dust, dirt, grease, oxides and other foreign material and clean to SSPC-SP16 specified herein prior to coating.
- .3 Galvanized Steel (Pre-Treated - Non-Crystal Appearance): Follow manufacturer's recommendations for preparation, priming and coating of pre-treated galvanized steel.

3.2.7 Shop-Primed Steel Substrates: Clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with the same material as used for shop priming to comply with SSPC-PA 1 for touching up shop-primed surfaces.

3.2.8 Galvanized-Metal Substrates: Remove grease and oil residue from galvanized sheet metal fabricated from coil stock by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied paints.

3.2.9 Aluminum Substrates: Remove loose surface oxidation.

3.2.10 Wood Substrates:

- .1 Scrape and clean knots, and apply coat of knot sealer before applying primer.
- .2 Before applying primer, apply coat of knot sealer recommended in writing by topcoat manufacturer for exterior use in paint system indicated. Sand surfaces that will be exposed to view, and dust off.
- .3 Prime edges, ends, faces, undersides, and backsides of wood.
- .4 After priming, fill holes and imperfections in the finish surfaces with putty or plastic wood filler. Sand smooth when dried.

3.2.11 Plastic (PVC or similar): Solvent clean to SSPC-SP1. Sand lightly with No. 120 sandpaper and remove dust.

---

**3.3     Mixing**

- 3.3.1 Mix and prepare paint materials in accordance with manufacturer's directions for particular material and coat to be applied. If reducing is required, do so in accordance with recommendations of manufacturer for particular material and coat.
- 3.3.2 Tint undercoats and each finish coat with correct type colours, for identification of each succeeding coat.
- 3.3.3 Clean containers used for storage, mixing and application of materials free of foreign materials and residue.

**3.4     Application**

- 3.4.1 Apply paints according to manufacturer's written instructions and to recommendations in "MPI Manual."
  - .1 Use applicators and techniques suited for paint and substrate indicated on Drawings and Schedules.
  - .2 Paint surfaces behind movable items same as similar exposed surfaces. Before final installation, paint surfaces behind permanently fixed items with prime coat only.
  - .3 Paint both sides and edges of exterior doors and entire exposed surface of exterior door frames.
  - .4 Paint entire exposed surface of window frames and sashes.
  - .5 Do not paint over labels of independent testing agencies or equipment name, identification, performance rating, or nomenclature plates.
  - .6 Primers specified in painting schedules may be omitted on items that are factory primed or factory finished if acceptable to topcoat manufacturers.
- 3.4.2 Tint undercoats same color as topcoat but tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of same material are to be applied. Provide sufficient difference in shade of undercoats to distinguish each separate coat.
- 3.4.3 If undercoats or other conditions show through topcoat, apply additional coats until cured film has a uniform paint finish, colour, and appearance.
- 3.4.4 Apply paints to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and colour breaks.

**3.5     Equipment**

- 3.5.1 Read Divisions 21, 22, 23 and Division 26 for their requirements and further instruction on painting Mechanical and Electrical work

and perform such work under supervision of respective Mechanical and Electrical Divisions.

- 3.5.2 Paint finished area exposed conduits, piping, hangers, ductwork and other mechanical and electrical equipment with colour and finish to match adjacent surfaces, except as indicated.
- 3.5.3 Do not paint over nameplates.
- 3.5.4 Keep sprinkler heads free of paint.
- 3.5.5 Paint inside of ductwork where visible behind grilles, registers and diffusers with primer and one coat of matt black paint.
- 3.5.6 Paint both sides and edges of backboards for telephone and electrical equipment before installation. Leave equipment in original finish except for touch-up as required, and paint conduits, mounting accessories and other unfinished items.
- 3.5.7 Do not paint exterior transformers and substation equipment.

### **3.6 Cleaning And Protection**

- 3.6.1 At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.
- 3.6.2 After completing paint application, clean spattered surfaces. Remove spattered paints by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.
- 3.6.3 Protect work of other trades against damage from paint application. Correct damage to work of other trades by cleaning, repairing, replacing, and refinishing, as approved by Consultant, and leave in an undamaged condition.
- 3.6.4 At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.
- 3.6.5 Protect finished areas subject to contact during drying by posting "Wet Paint" signs and barring from traffic where necessary.
- 3.6.6 Leave storage areas clean and free from evidence of occupancy.
- 3.6.7 Collect waste paint by type and provide for delivery to recycling or collection facility. Recycle empty paint cans.
- 3.6.8 Make Good any damage to building surfaces or furnishings resulting from painting operations at no cost to Owner.

### **3.7 Exterior Finish Painting (Pt) Schedule**

- 3.7.1 Substrate: Exterior Asphalt Pavement Marking – Latex Traffic Marking Paint (EXT 2.1A):
  - .1 Primer: As recommended by manufacturer.
  - .2 Finish Coats: Apply water-based traffic paint (MPI #97) coats in strict accordance with manufacturer's instructions:

- 
- .1 "Setfast® Traffic Marking Paint" by Sherwin Williams
  - .2 "Zoneline Traffic and Zone Marking Paint (11-53)" by PPG - Pittsburgh Paint
  - .3 "Ennis Traffic Standard Dry – Waterborne Marking Paints" by Benjamin Moore
- 3.7.2 Substrate: Concrete Vertical Surfaces (including undersides of balconies, soffits, etc.) - Latex Finish (EXT 3.1A as amended):
- .1 Regular Type:
    - .1 Primer: 1 coat alkali resistant, WB primer (MPI #3):
      - .1 "Loxon Concrete & Masonry Primer, <100 g/L" by Sherwin Williams
      - .2 "Perma-Crete Alkali Resistant Primer (4-603)" by PPG - Pittsburgh Paint
      - .3 "Ultra Spec High Build Masonry Primer K609" by Benjamin Moore
    - .2 Finish Coats: 2 coats exterior latex coating (MPI #10)
      - .1 "A-100 Exterior Latex, <50 g/L" by Sherwin Williams
      - .2 "Speedhide Exterior 100% Acrylic" by PPG - Pittsburgh Paint
      - .3 "K447 Ultra Spec Exterior Flat Finish - Zero VOC" by Benjamin Moore
- 3.7.3 Substrate: Concrete Vertical Surfaces (including undersides of balconies, soffits, etc.) – Textured Latex Aggregate Finish (EXT 3.1N as amended):
- .1 Primer: As recommended by manufacturer.
  - .2 Finish Coats: Apply textured latex aggregate paint (MPI #41 and #42) coats in strict accordance with manufacturer's instructions:
    - .1 "UltraCrete Textured Masonry Topcoat, <50 g/L" by Sherwin Williams.
    - .2 "Perma-Crete Acrylic Texture Coating" by PPG - Pittsburgh Paint
- 3.7.4 Substrate: Concrete Block Masonry - Latex Finish (EXT 4.2A as amended):
- .1 Regular Type:
    - .1 Primer: 1 coat exterior block filler (MPI #4):
      - .1 "Loxon Block Surfacer, <100 g/L" by Sherwin Williams
      - .2 "Speedhide Hi Fill Acrylic Block Filler (6-15)" by PPG - Pittsburgh Paint

- 
- .3 "Ultra Spec Masonry Block Filler K571" by Benjamin Moore
  - .2 Finish Coats: 2 coats exterior latex coating (MPI #10, #15)
    - .1 "A-100 Exterior Latex, <50 g/L" by Sherwin Williams
    - .2 "Speedhide Exterior 100% Acrylic Flat" by PPG - Pittsburgh Paint
    - .3 "Ultra Spec Exterior Flat Finish K447" by Benjamin Moore
  - 3.7.5 Substrate: Structural Steel and Miscellaneous Ferrous Metals – WB Light Industrial Coating (EXT 5.1M as amended):
    - .1 Primer: 1 coat rust inhibitive primer (MPI #107):
      - .1 "Pro Industrial Pro-Cryl Universal Metal Primer, <100 g/L" by Sherwin Williams
      - .2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint
      - .3 "KP04 Super Spec High Performance Acrylic Metal Primer" by Benjamin Moore
    - .2 Finish Coats: 2 coats WB light industrial coating (MPI #163)
      - .1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams
      - .2 "Pitt-Tech Plus DTM Acrylic Enamel" by PPG - Pittsburgh Paint
      - .3 "Ultra Spec HP D.T.M. Acrylic Semi-Gloss FP29" by Benjamin Moore
  - 3.7.6 Substrate:
    - .1 Repair of Galvanized Metals: Touch-up damaged surfaces with zinc-rich coating.
      - .1 Primer: 1 coat organic zinc-rich epoxy primer:
        - .1 "Zinc Clad 5" by Sherwin Williams
        - .2 "Aquapon Zinc Rich Epoxy" by PPG - Pittsburgh Paint
        - .3 "Corotech Organic Zinc Rich Primer V170" by Benjamin Moore
    - .2 Galvanized Steel: WB Light Industrial Coating (EXT 5.3J as amended):
      - .1 Primer: 1 coat rust inhibitive primer (MPI #134):
        - .1 "Pro Industrial Pro-Cryl Universal Metal Primer, <100 g/L" by Sherwin Williams
        - .2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint

- 
- .3 "Ultra Spec HP D.T.M. Primer FP04" by Benjamin Moore
  - .2 Finish Coats: 2 coats WB light industrial coating (MPI #163)
    - .1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams
    - .2 "Pitt-Tech Plus DTM Acrylic Enamel" by PPG - Pittsburgh Paint
    - .3 "Ultra Spec HP D.T.M. Acrylic Semi-Gloss FP29" by Benjamin Moore
  - 3.7.7 Substrate: Steel (High Heat) including heat exchangers, breeching, pipes, flues, stacks etc. – Heat Resistant Enamel – Maximum 205 deg C (400 deg F) (EXT 5.2A as amended):
    - .1 Primer: As recommended by manufacturer.
    - .2 Finish Coats: Apply heat resistant enamel (MPI #21) coats in strict accordance with manufacturer's instructions:
      - .1 "Heat Flex Hi Temp 500" by Sherwin Williams
      - .2 "Ameron PSX Engineered Siloxane" by PPG
      - .3 Approved equivalent by Benjamin Moore
  - 3.7.8 Substrate: Aluminum – WB Light Industrial Coating (EXT 5.4G as amended):
    - .1 Primer: 1 coat rust inhibitive primer (MPI #134):
      - .1 "Pro Industrial Pro-Cryl Universal Metal Primer, <100 g/L" by Sherwin Williams
      - .2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint
      - .3 "Ultra Spec HP D.T.M. Primer FP04" by Benjamin Moore
    - .2 Finish Coats: 2 coats WB light industrial coating (MPI #163)
      - .1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams
      - .2 "Pitt-Tech Plus DTM Acrylic Enamel" by PPG - Pittsburgh Paint
      - .3 "Ultra Spec HP D.T.M. Acrylic Semi-Gloss FP29 (MPI 153)" by Benjamin Moore
  - 3.7.9 Substrate: Wood – Opaque Latex Finish:
    - .1 Glue Laminated Lumber (EXT 6.1L as amended),
      - .1 Primer: 1 coat exterior wood latex primer (MPI #6)
        - .1 "Exterior Latex Wood Primer, <100 g/L" by Sherwin Williams
        - .2 "Seal Grip Acrylic Universal Primer" by PPG - Pittsburgh Paint

- 
- .3 "Fresh Start High-Hiding All-Purpose Primer K046" by Benjamin Moore
  - .2 Finish Coats: 2 coats exterior latex coating (MPI #10, #11, #15)
    - .1 "A-100 Exterior Latex, <50 g/L" by Sherwin Williams
    - .2 "Speedhide Exterior 100% Acrylic" by PPG - Pittsburgh Paint
    - .3 "K447/K448/K449 Ultra Spec Exterior" by Benjamin Moore
  - .2 Dimension Lumber including but not limited to columns, beams, exposed joists, underside of decking, siding, fencing etc. (EXT 6.2M as amended)
    - .1 Primer: 1 coat exterior wood latex primer (MPI #6)
      - .1 "Exterior Latex Wood Primer, <100 g/L" by Sherwin Williams
      - .2 "Seal Grip Acrylic Universal Primer" by PPG - Pittsburgh Paint
      - .3 "K169 Super Spec Latex Exterior Primer" by Benjamin Moore
    - .2 Finish Coats: 2 coats exterior latex coating (MPI #10, #11, #15)
      - .1 "A-100 Exterior Latex, <50 g/L" by Sherwin Williams
      - .2 "Speedhide Exterior 100% Acrylic" by PPG - Pittsburgh Paint
      - .3 "K448 Ultra Spec Exterior" by Benjamin Moore
  - .3 Dressed Lumber including but not limited to doors, door and window frames, casings, battens, smooth fascias etc. (EXT 6.3L as amended)
    - .1 Primer: 1 coat exterior wood latex primer (MPI #6)
      - .1 "Exterior Latex Wood Primer, <100 g/L" by Sherwin Williams
      - .2 "Seal Grip Acrylic Universal Primer" by PPG - Pittsburgh Paint
      - .3 "K169 Super Spec Latex Exterior Primer" by Benjamin Moore
    - .2 Finish Coats: 2 coats exterior latex coating (MPI #10, #11, #15)
      - .1 "A-100 Exterior Latex, <50 g/L" by Sherwin Williams
      - .2 "Speedhide Exterior 100% Acrylic" by PPG - Pittsburgh Paint
      - .3 "K448 Ultra Spec Exterior" by Benjamin Moore

- 
- .4 Wood Paneling including but not limited to plywood siding, fascias, soffits etc. (EXT 6.4K as amended)
    - .1 Primer: 1 coat exterior wood latex primer (MPI #6)
      - .1 "Exterior Latex Wood Primer, <100 g/L" by Sherwin Williams
      - .2 "Seal Grip Acrylic Universal Primer" by PPG - Pittsburgh Paint
      - .3 "K169 Super Spec Latex Exterior Primer" by Benjamin Moore
    - .2 Finish Coats: 2 coats exterior latex coating (MPI #10, #11, #15)
      - .1 "A-100 Exterior Latex, <50 g/L" by Sherwin Williams
      - .2 "Speedhide Exterior 100% Acrylic" by PPG - Pittsburgh Paint
      - .3 "K448 Ultra Spec Exterior" by Benjamin Moore
  - 3.7.10 Substrate: Wood – Fire-retardant Coating:
    - .1 Primer: As recommended by manufacturer.
    - .2 Finish Coats: Apply ULC approved fire-retardant (MPI #126) coats in strict accordance with manufacturer's instructions:
      - .1 "Flame Control" by Sherwin Williams (Not MPI #126) or approved equivalent.
  - 3.7.11 Substrate: Plaster/Stucco/EIFS (Walls and Soffits) – Latex (EXT 9.1J as amended)
    - .1 Regular Type:
      - .1 Primer: 1 coat exterior primer (MPI #4):
        - .1 "Loxon Concrete & Masonry Primer, <100 g/L" by Sherwin Williams
        - .2 "Speedhide Hi Fill Acrylic Block Filler" by PPG - Pittsburgh Paint
        - .3 "K206 Super Spec High Build Interior/Exterior Block Filler" by Benjamin Moore
      - .2 Finish Coats: 2 coats exterior latex coating (MPI #10, #11, #15)
        - .1 "A-100 Exterior Latex, <50 g/L" by Sherwin Williams
        - .2 "Speedhide Exterior 100% Acrylic" by PPG - Pittsburgh Paint
        - .3 "K448 Ultra Spec Exterior" by Benjamin Moore

END OF SECTION

---

**1. GENERAL**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

**1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Interior Painting work specified herein. This includes, but is not necessarily limited, to:

- .1 Painting of all interior exposed elements noted on Room Finish Schedule and noted on Drawings including following substrates:
  - .1 Concrete masonry units (CMU).
  - .2 Steel.
  - .3 Galvanized metal.
  - .4 Aluminum (not anodized or otherwise coated).
  - .5 Wood.
  - .6 Gypsum board.
  - .7 Plaster.
- .2 Where an item or surface is not specifically mentioned on Room Finish Schedules or on Drawings, and is not excluded, Provide same finish as similar adjacent materials or surfaces.
- .3 Do not paint excluded components indicated herein.

1.2.2 Work Excluded:

- .1 Do not paint pre-finished metal.
- .2 Do not paint chrome, stainless steel, vinyl, plastic laminate and aluminum surfaces throughout unless specified otherwise.
- .3 Do not paint interior surfaces of steel tanks and stacks.
- .4 Do not paint sprayed fire-resistant materials.
- .5 Do not paint equipment furnished completely prime- and finish painted by manufacturer unless required to have field painting over factory finish in order to produce common corporate colour as identified in room finish schedule.
- .6 Do not paint over ULC, FM or other code required labels or equipment identification plates.

1.2.3 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.

- .1 Section 05 12 00, Structural Steel Framing for shop priming of metal substrates with primers specified in this Section.
- .2 Section 09 91 13, Exterior Painting for surface preparation and the application of paint systems on exterior substrates.

### **1.3     References**

1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4     Definitions**

- 1.4.1 Gloss Level 1 (Flat or Matte): Not more than 5 units at 60 degrees and 10 units at 85 degrees, according to ASTM D523.
- 1.4.2 Gloss Level 2 (Velvet): Not more than 10 units at 60 degrees and 10 to 35 units at 85 degrees, according to ASTM D523.
- 1.4.3 Gloss Level 3 (Eggshell): 10 to 25 units at 60 degrees and 10 to 35 units at 85 degrees, according to ASTM D523.
- 1.4.4 Gloss Level 4 (Satin): 20 to 35 units at 60 degrees and not less than 35 units at 85 degrees, according to ASTM D523.
- 1.4.5 Gloss Level 5 (Semi-gloss): 35 to 70 units at 60 degrees, according to ASTM D523.
- 1.4.6 Gloss Level 6 (Gloss): 70 to 85 units at 60 degrees, according to ASTM D523.
- 1.4.7 Exposed: This refers to items visible in completed Work. In case of closets, cabinets and drawers, it includes their interiors.
- 1.4.8 Surface Preparation: This refers to means of cleaning or treating of surface to be painted to ensure best possible bond between surface and painting applied. Surface preparation methods include, but are not limited to:
  - .1 Ensure preparation and workmanship conforms to MPI Painting Manual requirements
  - .2 Removal of surface contaminants that will affect performance of painting including but not limited to: oil, grease, salts, dust, dirt, rust, rust scale, mill scale, and old coatings where applicable.

- .3 Removal of surface imperfections including without limitations: weld spatter, sharp edges, burrs, silvers, laminations, pits, porosities and crevices.
- .4 Preparation of surfaces to Provide anchor profile or surface profile to improve mechanical bonding of coating to prepared surface by increasing surface area.
- 1.4.9 Dry location or area: A location not normally subject to dampness.
- 1.4.10 Damp/wet location or area: Location that is normally or periodically subject to condensation of moisture in, on, or adjacent to, Work of this Section. This includes location in which water or other liquid can drip, splash, or flow on or against Work of this Section. This includes, but is not limited to, showers, drying areas, change rooms, kitchen areas, washrooms, and associated vestibules and corridors.

## **1.5      Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for each type of product. Include preparation requirements and application instructions.
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Interior Painting work and include product characteristics, performance criteria, physical size, finish and limitations
- 1.5.2 Samples: Submit samples in accordance with Division 01 for each type of paint system and in each colour and gloss of topcoat.
  - .1 Submit full range colour sample chips to indicate where colour availability is restricted.
  - .2 Submit Samples (brushouts) on rigid backing, 200 mm (8 inches) square.
    - .1 3 mm (1/8 inch) plate steel for finishes over metal surfaces.
    - .2 13 mm (1/2 inch) plywood for finishes over wood surfaces.
    - .3 50 mm (2 inch) concrete block for finishes over concrete or concrete masonry surfaces.
    - .4 13 mm (1/2 inch) gypsum board for finishes over gypsum board and other smooth surfaces.
  - .3 Step coats on Samples to show each coat required for system.
  - .4 Label each coat of each Sample.
  - .5 Label each Sample for location and application area.

- 
- .6 Retain reviewed samples on-site to demonstrate acceptable standard of quality for appropriate on-site surface.
  - 1.5.3 Product List: Submit product list in accordance with Division 01 for each product indicated on Drawings and Schedules, include the following:
    - .1 Cross-reference to paint system and locations of application areas. Use same designations indicated on Drawings and in schedules.
    - .2 Printout of current "MPI Approved Products List" for each product category specified, with the proposed product highlighted.
    - .3 Colour Numbers
    - .4 MPI Environmentally Friendly Classification System Rating
    - .5 Manufacturer's Safety Data Sheets (SDS)
    - .6 VOC content.
  - 1.6 Informational Submittals**
    - 1.6.1 Test reports: Provide certified test reports for paint from approved independent testing laboratories, indicating compliance with specifications for specified performance characteristics and physical properties.
      - .1 Lead, cadmium and chromium: presence of and amounts.
      - .2 Mercury: presence of and amounts.
      - .3 Organochlorines and PCBs: presence of and amounts.
  - 1.7 Closeout Submittals**
    - 1.7.1 Operation and Maintenance Data: Provide operation and maintenance data for painting materials for incorporation into manual. Include the following cross-referenced to paint system and locations of application areas:
      - .1 Product name, type and use.
      - .2 Manufacturer's product number.
      - .3 Colour names and numbers
      - .4 MPI Environmentally Friendly classification system rating.
  - 1.8 Maintenance Material Submittals**
    - 1.8.1 Supply extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
      - .1 Paint: 5 percent, but not less than 3.8 L (1 gal.) of each material and colour applied.

- 1.8.2 Paint must be boxed and in sealed, unopened cans in undamaged condition, with name of manufacturer, contents, type and colour clearly indicated on a label securely adhered to can.

**1.9 Quality Assurance**

- 1.9.1 Qualifications: Provide work of this Section executed by competent installers with membership in good standing in MPI, OPCA and/or PDCA having a minimum of 5 years' experience in application of Products, systems and assemblies specified and with approval and training of Product manufacturers.
- .1 Qualified journeypersons as defined by local jurisdiction to be engaged in painting work.
  - .2 Apprentices may be employed provided they work under direct supervision of qualified journeyperson in accordance with trade regulations.
- 1.9.2 Mockups: Apply mockups of each paint system directed on Site and each colour and finish selected to verify preliminary selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
- .1 Consultant will select one surface to represent surfaces and conditions for application of each paint system specified.
    - .1 Vertical and Horizontal Surfaces: Provide mock-ups of at least 9 sq. m (100 sq. ft.).
    - .2 Other Items: Consultant will designate items or areas required.
  - .2 Final approval of colour selections will be based on mockups.
    - .1 If preliminary colour selections are not approved, apply additional mockups of additional colours selected by Consultant at no added cost to Owner.
  - .3 Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Consultant specifically approves such deviations in writing.
  - .4 Reviewed mockups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.
- 1.9.3 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from one source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.
- .1 Use single brand of paint chosen throughout work of this Section, except where specified otherwise.

---

**1.10     Delivery, Storage, And Handling**

1.10.1 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

- .1 Imprint containers with labels indicating the following:
  - .1 Type of paint or coating.
  - .2 Compliance with applicable standard.
  - .3 Colour number in accordance with established colour schedule.

1.10.2 Store materials not in use in tightly covered containers in well-ventilated areas with ambient temperatures continuously maintained at not less than 7 deg C (45 deg F).

- .1 Maintain containers in clean condition, free of foreign materials and residue.
- .2 Remove rags and waste from storage areas daily.
- .3 Keep materials away from excessive heat or direct rays of the sun.
- .4 Remove used cloths from building at the end of every working shift and when not in use.

1.10.3 Fire Prevention:

- .1 Prevent fire or explosion caused by improper storage of paints, solvents, rags, and similar items. Store hazardous materials in location and in manner approved by local fire authority.
- .2 Post "No Smoking" signs in areas of storage and mixing. Provide and maintain CO<sub>2</sub> fire extinguishers of minimum 9 kg (20 lb) capacity.

**1.11     Field Conditions**

1.11.1 Apply paints only when temperature of surfaces to be painted and ambient air temperatures are between 18 and 35 deg C (65 and 95 deg F). When required, Provide heating facilities to maintain ambient air and substrate temperatures above 10 deg C for 24 hours before, during and after paint application until paint has cured sufficiently.

1.11.2 Provide ventilation to remove odours, evaporating solvents and moisture. Maintain adequate ventilation at all times to control excessive humidity. Provide continuous ventilation for 7 days after completion of application of paint.

1.11.3 Do not apply paints when relative humidity exceeds 85 percent; at temperatures less than 3 deg C (5 deg F) above the dew point and rising; or to damp or wet surfaces.

- 1.11.4 Paint and finish work items in clean, dust-free, properly ventilated and adequately lit areas (minimum 100 lx (9.3 ft candles)).

**1.12 Warranty**

- 1.12.1 Warrant Work of this Section for period of 2 years against defects and deficiencies in accordance with General Conditions of the Contract.
- 1.12.2 Promptly correct defects or deficiencies which become apparent within warranty period, to satisfaction of Consultant and at no expense to Owner.
- 1.12.3 Defects include but are not limited to: material shrinkage, cracking, splitting, bubbling, blistering and delamination resulting from defective materials or poor workmanship.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- .1 Benjamin Moore & Co. (Canada).
  - .2 Cloverdale Paint.
  - .3 Coronado Paint/Corotech/Insl-x .
  - .4 Dulux Paints (Canada).
  - .5 PPG Architectural Finishes, Inc.
  - .6 Sherwin-Williams Company (The).
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Performance Requirements**

- 2.2.1 MPI Standards: Unless indicated otherwise, Provide products that comply with MPI standards indicated and that are listed in its "MPI Approved Products List." Functionally and aesthetically equivalent Products that do not meet requirements of MPI standards may be considered, provided they meet requirements of this Specification and are reviewed by the Consultant.
- 2.2.2 Unless otherwise specified herein, all painting work shall be in accordance with MPI Premium Grade finish requirements
- 2.2.3 Material Compatibility:
- .1 Provide materials for use within each paint system that are compatible with one another and substrates indicated on

Drawings and Schedules, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.

- .2 For each coat in a paint system, provide products recommended in writing by manufacturers of topcoat for use in paint system and on substrate indicated on Drawings and Schedules.

2.2.4 Minimum Coat Thickness: Unless indicated otherwise, Minimum coat thicknesses for the work of this Section are as follows:

- .1 Latex and Acrylics (Interior): 0.03 mm (1.2 mils) DFT/coat.
- .2 Epoxies (Interior): 0.076 mm (3 mils) DFT/coat.
- .3 Urethanes (Interior): 0.076 mm (3 mils) DFT/coat.

2.2.5 Standard of Acceptance:

- .1 Walls: no defects visible from a distance of 900 mm (3 ft) at 90 deg to surface when viewed using final lighting source.
- .2 Soffits: no defects visible from floor at 45 deg to surface when viewed using final lighting source.
- .3 Final coat to exhibit uniformity of colour and uniformity of sheen across full surface area.

2.2.6 Except as noted herein or indicated on Room Finish Schedule, paint interior walls and ceiling surfaces accordance with the following criteria over appropriate prime / sealer coat:

- .1 All areas (except as noted): standard performance low odour/low VOC interior, institutional latex.
- .2 High-traffic areas including bathrooms and stairwells: "scuff-resistant" low odour/low VOC interior, institutional latex
- .3 Commercial wet areas including, locker rooms, kitchenettes, change rooms, janitor rooms, shower rooms: High performance epoxy modified latex or water-based epoxy.

## **2.3 Finishes (PT-#)**

2.3.1 Material Tag: This item is noted as "PT-#" on Drawings and Schedules.

2.3.2 Unless indicated otherwise, gloss values for the work of this Section are as follows:

- .1 Walls: Eggshell or Satin.
- .2 Trim and Doors: Semi-gloss.
- .3 Ceilings: Flat.

2.3.3 Colours: Refer to Finish Schedule on Drawings.

---

### **3 .    EXECUTION**

#### **3.1    Examination**

- 3.1.1 Examine substrates and conditions, with Applicator present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.
- 3.1.2 Maximum Moisture Content of Substrates: When measured with an electronic moisture meter as follows:
  - .1 Concrete: 12 percent.
  - .2 Masonry (Clay and CMU): 12 percent.
  - .3 Wood: 15 percent.
  - .4 Gypsum Board: 12 percent.
- 3.1.3 Gypsum Board Substrates: Verify that finishing compound is sanded smooth. Inspect surfaces to ensure there is no "nail popping", screw recessed are recessed, and surface is free of breaks and imperfections.
- 3.1.4 Wood Substrates: Inspect work to ensure surfaces are smooth, free from machine marks and that nailheads have been countersunk.
- 3.1.5 Spray-Textured Ceiling Substrates: Verify that surfaces are dry.
- 3.1.6 Verify suitability of substrates, including surface conditions and compatibility with existing finishes and primers.
- 3.1.7 Proceed with coating application only after unsatisfactory conditions have been corrected.
  - .1 Application of coating indicates acceptance of surfaces and conditions.

#### **3.2    Preparation**

- 3.2.1 Comply with manufacturer's written instructions and recommendations in "MPI Manual" applicable to substrates indicated on Drawings and Schedules.
- 3.2.2 Remove hardware, covers, plates, and similar items already in place that are removable and are not to be painted. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and painting.
  - .1 After completing painting operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.
- 3.2.3 Clean substrates of substances that could impair bond of paints, including dust, dirt, oil, grease, and incompatible paints and encapsulants.

- 
- .1 Remove incompatible primers and reprime substrate with compatible primers or apply tie coat as required to produce paint systems indicated on Drawings and Schedules.
  - 3.2.4 Concrete Substrates: Remove release agents, curing compounds, efflorescence, and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces to be painted exceeds that permitted in manufacturer's written instructions.
  - 3.2.5 Masonry Substrates: Remove efflorescence and chalk. Do not paint surfaces if moisture content or alkalinity of surfaces or mortar joints exceed that permitted in manufacturer's written instructions.
  - 3.2.6 Steel Substrates: Remove rust, loose mill scale, and shop primer, if any. Clean using methods recommended in writing by paint manufacturer but not less than the following:
    - .1 SSPC-SP 7/NACE No. 4, "Brush-off Blast Cleaning."
  - 3.2.7 Metal Stacks, Breeching, Piping: Blast clean to 0.037 mm to 0.050 mm (1.5 - 2 mil) profile using grit abrasive to SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
  - 3.2.8 Decorative Metals: Blast clean removing minimum 0.037 mm to 0.050 mm (1.5 - 2 mil) scale, rust and other foreign matter from metal surface using grit abrasive to SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
  - 3.2.9 Galvanized Steel:
    - .1 Hot Dipped Galvanized Steel (Unweathered): Allow to weather minimum of 26 weeks and clean to SSPC-SP16. Remove silicates or similar surface treatments or any deposits of white rust by sanding or similar abrasive methods (bronze wool).
      - .1 Use of acetic acid to prepare galvanized surfaces is not acceptable.
      - .2 Clean chromate passivated galvanized metal surface contamination by washing with appropriate chemical solution compatible with finish specified such as MPI #25.
    - .2 Galvanized Steel (Weathered): Remove dust, dirt, grease, oxides and other foreign material and clean to SSPC-SP16 specified herein prior to coating.
    - .3 Galvanized Steel (Pre-Treated - Non-Crystal Appearance): Follow manufacturer's recommendations for preparation, priming and coating of pre-treated galvanized steel.
  - 3.2.10 Shop-Primed Steel Substrates: Clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with the same material as used for shop priming to comply with SSPC-PA 1 for touching up shop-primed surfaces.

- 3.2.11 Galvanized-Metal Substrates: Remove grease and oil residue from galvanized sheet metal fabricated from coil stock by mechanical methods to produce clean, lightly etched surfaces that promote adhesion of subsequently applied paints.
- 3.2.12 Aluminum Substrates: Remove loose surface oxidation.
- 3.2.13 Wood Substrates:
  - .1 Scrape and clean knots, and apply coat of knot sealer before applying primer.
  - .2 Sand surfaces that will be exposed to view, and dust off.
  - .3 Prime edges, ends, faces, undersides, and backsides of wood.
  - .4 After priming, fill holes and imperfections in the finish surfaces with putty or plastic wood filler. Sand smooth when dried.
- 3.2.14 Cotton or Canvas Insulation Covering Substrates: Remove dust, dirt, and other foreign material that might impair bond of paints to substrates.
- 3.2.15 Plastic (PVC or similar): Solvent clean to SSPC-SP1. Sand lightly with No. 120 sandpaper and remove dust.

### **3.3     Mixing**

- 3.3.1 Mix and prepare paint materials in accordance with manufacturer's directions for particular material and coat to be applied. If reducing is required, do so in accordance with recommendations of manufacturer for particular material and coat.
- 3.3.2 Tint undercoats and each finish coat with correct type colours, for identification of each succeeding coat.
- 3.3.3 Clean containers used for storage, mixing and application of materials free of foreign materials and residue.

### **3.4     Application**

- 3.4.1 Apply paints according to manufacturer's written instructions and to recommendations in "MPI Manual."
  - .1 Use applicators and techniques suited for paint and substrate indicated on Drawings and Schedules.
  - .2 Paint surfaces behind movable equipment and furniture same as similar exposed surfaces. Before final installation, paint surfaces behind permanently fixed equipment or furniture with prime coat only.
  - .3 Paint front and backsides of access panels, removable or hinged covers, and similar hinged items to match exposed surfaces.

- .4 Do not paint over labels of independent testing agencies or equipment name, identification, performance rating, or nomenclature plates.
- .5 Primers specified in painting schedules may be omitted on items that are factory primed or factory finished if acceptable to topcoat manufacturers.
- 3.4.2 Tint each undercoat a lighter shade to facilitate identification of each coat if multiple coats of same material are to be applied. Tint undercoats to match colour of topcoat, but provide sufficient difference in shade of undercoats to distinguish each separate coat.
- 3.4.3 If undercoats or other conditions show through topcoat, apply additional coats until cured film has a uniform paint finish, colour, and appearance.
- 3.4.4 Apply paints to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and colour breaks.

### **3.5 Equipment**

- 3.5.1 Read Divisions 21, 22, 23 and Division 26 for their requirements and further instruction on painting Mechanical and Electrical work and perform such work under supervision of respective Mechanical and Electrical Divisions.
- 3.5.2 Paint finished area exposed conduits, piping, hangers, ductwork and other mechanical and electrical equipment with colour and finish to match adjacent surfaces, except as indicated.
- 3.5.3 Do not paint over nameplates.
- 3.5.4 Keep sprinkler heads free of paint.
- 3.5.5 Paint inside of ductwork where visible behind grilles, registers and diffusers with primer and one coat of matt black paint.
- 3.5.6 Paint both sides and edges of backboards for telephone and electrical equipment before installation. Leave equipment in original finish except for touch-up as required, and paint conduits, mounting accessories and other unfinished items.
- 3.5.7 Do not paint interior transformers and substation equipment.
- 3.5.8 Painting Fire Suppression, Plumbing, HVAC, Electrical, Communication, and Electronic Safety and Security Work:
  - .1 Paint the following work where exposed in Boiler room, mechanical and electrical rooms and similar equipment rooms:

- 
- .1 Exposed conduits, hangers, ductwork and other mechanical and electrical equipment.
  - .2 Equipment, including panelboards and switch gear.
  - .3 Uninsulated metal piping.
  - .4 Uninsulated plastic piping.
  - .5 Pipe hangers and supports.
  - .6 Metal conduit.
  - .7 Plastic conduit.
  - .8 Tanks that do not have factory-applied final finishes.
  - .9 Duct, equipment, and pipe insulation having cotton or canvas insulation covering or other paintable jacket material.
  - .2 Paint the following work where exposed in occupied spaces:
    - .1 Equipment, including panelboards.
    - .2 Uninsulated metal piping.
    - .3 Uninsulated plastic piping.
    - .4 Pipe hangers and supports.
    - .5 Metal conduit.
    - .6 Plastic conduit.
    - .7 Duct, equipment, and pipe insulation having cotton or canvas insulation covering or other paintable jacket material.
    - .8 Other items as directed by Consultant.
  - .3 Paint portions of internal surfaces of metal ducts, without liner, behind air inlets and outlets that are visible from occupied spaces.
  - .4 Other unfinished areas: leave exposed conduits, piping, hangers, ductwork and other mechanical and electrical equipment in original finish and touch up scratches and marks.

### **3.6     Core And Shell Spaces**

- 3.6.1 Provide paint systems as specified in this Section to interior exposed elements in “finished” areas as noted on Room Finish Schedule. In unfinished areas, Provide minimum one coat of primer whether or not this is indicated on Room Finish Schedule.

---

**3.7 Field Quality Control**

3.7.1 Dry Film Thickness Testing: Owner may engage the services of a qualified testing and inspecting agency to inspect and test paint for dry film thickness.

.1 Contractor shall touch up and restore painted surfaces damaged by testing.

.2 If test results show that dry film thickness of applied paint does not comply with paint manufacturer's written recommendations, Contractor shall pay for testing and apply additional coats as needed to provide dry film thickness that complies with paint manufacturer's written recommendations.

**3.8 Cleaning And Protection**

3.8.1 At end of each workday, remove rubbish, empty cans, rags, and other discarded materials from Project site.

3.8.2 After completing paint application, clean spattered surfaces. Remove spattered paints by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.

3.8.3 Protect work of other trades against damage from paint application. Correct damage to work of other trades by cleaning, repairing, replacing, and refinishing, as approved by Consultant, and leave in an undamaged condition.

3.8.4 At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

3.8.5 Protect finished areas subject to contact during drying by posting "Wet Paint" signs and barring from traffic where necessary.

3.8.6 Leave storage areas clean and free from evidence of occupancy.

3.8.7 Collect waste paint by type and provide for delivery to recycling or collection facility. Recycle empty paint cans.

3.8.8 Make Good any damage to building surfaces or furnishings resulting from painting operations at no cost to Owner.

**3.9 Interior Standard Performance Finish Painting (Pt) Schedule**

3.9.1 Concrete Substrates, Nontraffic Surfaces (INT 3.1A as amended):

.1 Institutional Low-Odor/VOC Latex System:

.1 Prime Coat: one coat alkali-resistant primer (MPI #3)

.1 "Loxon Concrete & Masonry Primer, <100 g/L" by Sherwin Williams

.2 "Seal Grip Acrylic Universal Primer Sealer " by PPG Architectural

.3 "Ultra Spec Masonry Acrylic Sealer K608" by Benjamin Moore

- 
- .4 "Gripper Acrylic Universal Primer/ Sealer by Dulux Paints
  - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC, (MPI #143, MPI #144, #145)
    - .1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams
    - .2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG Architectural
    - .3 "Ultra Spec 500 Interior Finish, 0g/L" by Benjamin Moore
    - .4 "Ultra Zero VOC" by Dulux Paints
- 3.9.2 Concrete Substrates, Traffic Surfaces:
- .1 Latex Floor Enamel System:
    - .1 Prime Coat: one coat floor paint, latex (MPI #60)
      - .1 "Armorseal Tread-Plex - 100% Acrylic Water Based Floor Coating" by Sherwin Williams.
      - .2 "Water-Based Polyurethane Floor Enamel" by Dulux Paints
    - .2 Topcoats: two coats, Floor paint, latex, (MPI #60)
      - .1 "Armorseal Tread-Plex - 100% Acrylic Water Based Floor Coating" by Sherwin Williams.
      - .2 "Water-Based Polyurethane Floor Enamel" by Dulux Paints
  - .2 Epoxy Floor System: two-component polyamine epoxy
    - .1 Prime Coat: one coat water-based epoxy coating
      - .1 "Armorseal 8100 Water-Based Epoxy Floor Coating" by Sherwin Williams.
      - .2 "Aquapon WB EP Water-Based Epoxy" by PPG Architectural
    - .2 Topcoats: two coats, water-based epoxy coating
      - .1 "Armorseal 8100 Water-Based Epoxy Floor Coating" by Sherwin Williams.
      - .2 "Aquapon WB EP Water-Based Epoxy" or "Perma-Crete Please Seal WB Inter/ Ext Clear Sealer 4-6200XIC by PPG Architectural
  - .3 Provide manufacturer's standard slip resistant additive (SRA) consisting of rubber aggregate, clean/washed silica sand or ground walnut chips (interior dry areas only) for use with or as a component part of paint on horizontal surfaces as required to provide slip resistance. Provide at rate recommended by manufacturer to achieve minimum 0.6 rating per ASTM D2047.
- 3.9.3 CMU Substrates:

- 
- .1 Institutional Low-Odor/VOC Latex System (INT 4.2E as amended):
    - .1 Block Filler: one coat Block filler, latex, interior/exterior, (MPI #4)
      - .1 "PrepRite Block Filler, 45 g/L" by Sherwin Williams
      - .2 "Speedhide Hi Fill Acrylic Block Filler" by PPG Architectural
      - .3 "Ultra Spec Masonry Block Filler K571" by Benjamin Moore
      - .4 "PRO Latex Blockfiller" by Dulux Paints
    - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC, (MPI #143, MPI #144, #145)
      - .1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams
      - .2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG Architectural
      - .3 "Ultra Spec 500 Interior Finish, 0g/L" by Benjamin Moore
      - .4 "Ultra Zero VOC" by Dulux Paints
  - 3.9.4 Steel Substrates (Non-galvanized):
    - .1 Doors, Frames and Miscellaneous Metals - Water-Based Light Industrial Coating System (INT 5.1B as amended)
      - .1 Prime Coat: One coat Primer, rust-inhibitive, water based (MPI #107).
        - .1 "Pro Industrial Pro-Cryl Universal Primer, <50 g/L" by Sherwin Williams
        - .2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG Architectural
        - .3 "Ultra Spec HP D.T.M. Primer FP04" by Benjamin Moore
      - .2 Topcoats: two coats, Light industrial coating, interior, water based (MPI #151):
        - .1 "Pre-catalyzed Waterbased epoxy, <50 g/L" by Sherwin Williams
        - .2 "Corotech Pre-Catalyzed Waterborne Epoxy" by Benjamin Moore
        - .3 "Pitt-Glaze WB Pre-Catalyzed WB Acrylic Epoxy" by PPG Architectural
  - 3.9.5 Galvanized-Metal Substrates:
    - .1 Doors, Frames and Miscellaneous Metals - Water-Based Light Industrial Coating System (INT 5.1B as amended)
      - .1 Prime Coat: One coat Primer, rust-inhibitive, water based (MPI #107).
        - .1 "Pro Industrial Pro-Cryl Universal Primer, <50 g/L" by Sherwin Williams

- 
- .2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG Architectural
  - .3 "Ultra Spec HP D.T.M. Primer FP04" by Benjamin Moore
  - .2 Topcoats: two coats, Light industrial coating, interior, water based (MPI #151):
    - .1 "Pre-catalyzed Waterbased epoxy, <50 g/L" by Sherwin Williams
    - .2 "Corotech Pre-Catalyzed Waterborne Epoxy" by Benjamin Moore
    - .3 "Pitt-Glaze WB Pre-Catalyzed WB Acrylic Epoxy" by PPG Architectural
  - 3.9.6 Aluminum (Not Anodized or Otherwise Coated) Substrates:
    - .1 Prime Coat: One coat Primer, rust-inhibitive, water based (MPI #76, MPI #95, MPI #107).
      - .1 "Pro Industrial Pro-Cryl Universal Primer, <50 g/L" by Sherwin Williams
      - .2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG Architectural
      - .3 "Ultra Spec HP D.T.M. Primer FP04" by Benjamin Moore
    - .2 Topcoats: two coats, Light industrial coating, interior, water based (MPI #147, MPI #153):
      - .1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams
      - .2 "Pure Performance Interior Latex Zero VOC" by PPG Architectural
      - .3 " Ultra Spec 500 Waterborne Interior Finish, 0g/L " by Benjamin Moore
      - .4 "Lifemaster Interior Acrylic" by Dulux Paints
  - 3.9.7 Painted wood substrates: Including wood trim, architectural woodwork, doors, frames and wood-based panel products indicated to be painted (INT 6.3V as amended).
    - .1 Prime Coat: One coat, multi-purpose latex interior primer sealer (MPI #39)
      - .1 "Prep Rite Pro Block Primer-Sealer, 0 g/L" by Sherwin Williams
      - .2 "Seal Grip Acrylic Universal Primer" by PPG Architectural
      - .3 "Insl-x Aqua Lock AQ-0400" " by Benjamin Moore
      - .4 "Gripper Acrylic Universal Primer/ Sealer by Dulux Paints

- 
- .2 Topcoats: two coats acrylic Interior, Institutional Low Odor/VOC (MPI #147)
    - .1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams
    - .2 "Pure Performance Interior Latex Zero VOC" by PPG Architectural
    - .3 "Ultra Spec 500 Waterborne Interior Finish, 0g/L" by Benjamin Moore
    - .4 "Lifemaster Interior Acrylic" by Dulux Paints
  - 3.9.8 Stained wood substrates: Including wood trim, architectural woodwork, doors, frames and wood-based panel products indicated to be stained (INT 6.3E as amended).
    - .1 Prime Coat: One coat, interior wood stain (semi-transparent) (MPI #90)
      - .1 "Minwax Wood Finish Stain, <250 g/L" by Sherwin Williams
      - .2 "Olympic Low VOC Oil Wood Stain" by PPG Architectural
      - .3 "Professional Wood Finishes Interior Fast Dry Oil Stain" by Dulux Paints
    - .2 Topcoats: two coats acrylic Interior, Institutional Low Odor/VOC (MPI #56, MPI #57)
      - .1 "Minwax Waterbased UrethaneClear, <275 g/L" by Sherwin Williams
      - .2 "Olympic Oil Based Polyurethane" by PPG Architectural
      - .3 "Professional Wood Finishes Polyurethane Oil Based Varnish" by Dulux Paints
  - 3.9.9 Wood Substrates, Traffic Surfaces:
    - .1 Latex Floor Paint System:
      - .1 Prime Coat: Primer sealer, waterbased, interior (MPI #60)
        - .1 "Armorseal Tread-Plex - 100% Acrylic Water Based Floor Coating" by Sherwin Williams
      - .2 Topcoats: two coats, Floor paint, acrylic latex, (MPI #60)
        - .1 "Armorseal Tread-Plex - 100% Acrylic Water Based Floor Coating" by Sherwin Williams.
        - .2 "Water-Based Polyurethane Floor Enamel" by Dulux Paints
    - .2 Provide manufacturer's standard slip resistant additive (SRA) consisting of rubber aggregate, clean/washed silica sand or ground walnut chips (interior dry areas only) for use with or as

a component part of paint on horizontal surfaces as required to provide slip resistance. Provide at rate recommended by manufacturer to achieve minimum 0.6 rating per ASTM D2047.

3.9.10 Fiberglass and Plastic Substrates:

- .1 Institutional Low-Odor/VOC Latex System:
  - .1 Prime Coat: Primer, bonding, water based (MPI #17).
    - .1 "Extreme Bond Waterborne Bonding Primer" by Sherwin Williams
    - .2 "Seal-Grip Acrylic Universal Primer/ Sealer" by PPG Architectural – Pittsburgh Paints
    - .3 "Gripper Acrylic Universal Primer/ Sealer by Dulux Paints
    - .4 "Insl-x Stix Bonding Primer SXA-110" by Benjamin Moore
  - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC, (MPI #143, MPI #144, #145)
    - .1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams
    - .2 "Pure Performance Interior Latex Zero VOC" by PPG Architectural
    - .3 "Ultra Zero VOC" by Dulux Paints
    - .4 "Ultra Spec 500 Waterborne Interior Finish, 0g/L" by Benjamin Moore

3.9.11 Gypsum Board Substrates:

- .1 Regular Gypsum Board: Institutional Low-Odor/VOC Latex System (INT 9.2M as amended):
  - .1 Prime Coat: One coat Primer sealer, interior, institutional low odor/VOC (MPI #149).
    - .1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L" by Sherwin Williams
    - .2 "Pure Performance Interior Latex Primer 9-900" by PPG Architectural
    - .3 "K534 Ultra Spec 500 Waterborne Interior Primer Sealer" by Benjamin Moore
    - .4 "Ultra Zero VOC Interior Primer/ Sealer" by PPG Architectural- Dulux Paints
  - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC, (MPI #143, MPI #144, #145)
    - .1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams
    - .2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG Architectural
    - .3 "Ultra Spec 500 Interior Finish, 0g/L" by Benjamin Moore
    - .4 "Ultra Zero VOC" by Dulux Paints

- 
- .2 Fiberglass-Mat Faced Gypsum Board Walls (Moisture resistant gypsum board, abuse resistant gypsum board, impact resistant gypsum board)
    - .1 Primer: One coat high build surfacer (Minimum DFT: as recommended by manufacturer but not less than 10 mils)
      - .1 "Builders Solution, <50 g/L" by Sherwin Williams
      - .2 "Speedhide Maxbuild High Build Drywall Surfacers" by PPG Architectural
      - .3 "X-pert High Build Primer/Sealer 11020A" by Dulux Paints
    - .2 Sealing Coat: One coat multi-purpose latex interior primer sealer (MPI #39) as recommended by manufacturer:
      - .1 "Prep Rite Pro Block Primer-Sealer, 0 g/L" by Sherwin Williams
      - .2 "Insl-X Prime All Multi-Surface Latex Primer Sealer" by Benjamin Moore
      - .3 "Seal Grip Interior/Exterior Acrylic Universal Primer/Sealer" by PPG Architectural.
    - .3 Topcoats: two coats, latex, interior, institutional low odor/VOC, (MPI #143, MPI #144, #145)
      - .1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams
      - .2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG Architectural
      - .3 "Ultra Spec 500 Interior Finish, 0g/L" by Benjamin Moore
      - .4 "Ultra Zero VOC" by Dulux Paints
- 3.9.12 Spray-Textured Ceiling Substrates:
- .1 Latex (Flat) System:
    - .1 Prime Coat: Latex, interior, flat, (Gloss Level 1) (MPI #53).
      - .1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L" by Sherwin Williams
      - .2 "Pure Performance Interior Latex Primer 9-900" by PPG Architectural
      - .3 "K534 Ultra Spec 500 Waterborne Interior Primer Sealer" by Benjamin Moore
      - .4 "Ultra Zero VOC Interior Primer/ Sealer" by PPG Architectural- Dulux Paints
    - .2 Topcoats: two coats, Latex, interior, flat, (Gloss Level 1) (MPI #53).
      - .1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams

- 
- .2 "Pure Performance Interior Latex Zero VOC 9-line"  
by PPG Architectural
  - .3 "Ultra Spec 500 Interior Finish, 0g/L" by Benjamin  
Moore
  - .4 "Ultra Zero VOC" by Dulux Paints
- 3.9.13 Cotton or Canvas Insulation-Covering Substrates: Including pipe  
and duct coverings.
- .1 Institutional Low-Odor/VOC Latex System:
    - .1 Prime Coat: One coat Primer sealer, interior, institutional  
low odor/VOC (MPI #50).
      - .1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L"  
by Sherwin Williams
      - .2 "Pure Performance Interior Latex Primer 9-900" by  
PPG Architectural
      - .3 "K534 Ultra Spec 500 Waterborne Interior Primer  
Sealer" by Benjamin Moore
      - .4 "Ultra Zero VOC Interior Primer/ Sealer" by PPG  
Architectural- Dulux Paints
    - .2 Topcoats: two coats, latex, interior, institutional low  
odor/VOC, (MPI #143, MPI #144, #145)
      - .1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams
      - .2 "Pure Performance Interior Latex Zero VOC 9-line"  
by PPG Architectural
      - .3 "Ultra Spec 500 Interior Finish, 0g/L" by Benjamin  
Moore
      - .4 "Ultra Zero VOC" by Dulux Paints

**3.10 Interior High-Performance Painting (Pt-E) Schedule**

- 3.10.1 Concrete Substrates, Nontraffic Surfaces (INT 3.1G as amended):
- .1 Epoxy Modified Latex System:
    - .1 Prime Coat: As recommended by topcoat manufacturer.
    - .2 Topcoats: two coats coats water-based epoxy (MPI  
#115)
      - .1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L"  
by Sherwin Williams
      - .2 "Corotech Acrylic Epoxy V450" by Benjamin Moore
      - .3 "Aquapon WB EP Water-Based Epoxy" by PPG Ar-  
chitectural
- 3.10.2 CMU Substrates:
- .1 Epoxy Modified Latex System (INT 4.2J as amended):
    - .1 Block Filler: one coat Block filler, latex,  
interior/exterior, (MPI #4)
      - .1 "PrepRite Block Filler, 45 g/L" by Sherwin Williams

- 
- .2 "Speedhide Hi Fill Acrylic Block Filler" by PPG Architectural
  - .3 "Ultra Spec Masonry Block Filler K571" by Benjamin Moore
  - .4 "PRO Latex Blockfiller" by Dulux Paints
  - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC, (MPI #115, MPI #215)
    - .1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L" by Sherwin Williams
    - .2 "Pitt Glaze Acrylic Epoxy" (NOT MPI APPROVED) by PPG Architectural
    - .3 "Cornado 1138 Line" by Benjamin Moore
- 3.10.3 Steel Substrates (Non-galvanized):
- .1 Epoxy-Modified Latex (over w.b. rust-inhibitive primer) (INT 5.1K as amended)
    - .1 Prime Coat: One coat Primer, rust-inhibitive, water based (MPI #107).
      - .1 "Pro Industrial Pro-Cryl Universal Primer, <50 g/L" by Sherwin Williams
      - .2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG Architectural
      - .3 "Ultra Spec HP D.T.M. Primer FP04" by Benjamin Moore
    - .2 Topcoats: two coats, water-based epoxy (MPI #115)
      - .1 "Pro Industrial Zero VOC B73 Series, Waterbased Epoxy, 0 g/L" by Sherwin Williams
      - .2 "Cornado 1138 Line" by Benjamin Moore
      - .3 "Aquapon WB EP Water-Based Epoxy" by PPG Architectural
- 3.10.4 Galvanized-Metal Substrates:
- .1 Epoxy-Modified Latex (over w.b. rust-inhibitive primer) (INT 5.1K as amended)
    - .1 Prime Coat: One coat Primer, rust-inhibitive, water based (MPI #107).
      - .1 "Pro Industrial Pro-Cryl Universal Primer, <50 g/L" by Sherwin Williams
      - .2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG Architectural
      - .3 "Ultra Spec HP D.T.M. Primer FP04" by Benjamin Moore
    - .2 Topcoats: two coats, water-based epoxy (MPI #115)
      - .1 "Pro Industrial Zero VOC B73 Series, Waterbased Epoxy, 0 g/L" by Sherwin Williams
      - .2 "Cornado 1138 Line" by Benjamin Moore

- .3 "Aquapon WB EP Water-Based Epoxy" by PPG Architectural

3.10.5 Gypsum Board Substrates:

- .1 Regular Gypsum Board: Epoxy Modified Latex System (INT 9.2F as amended):

- .1 Prime Coat: One coat Prep Rite Pro Block Primer-Sealer, 0 g/L sealer (MPI #50).

- .1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L" by Sherwin Williams

- .2 "Pure Performance Interior Latex Primer 9-900" by PPG Architectural

- .3 "K534 Ultra Spec 500 Waterborne Interior Primer Sealer" by Benjamin Moore

- .4 "Ultra Zero VOC Interior Primer/ Sealer" by PPG Architectural- Dulux Paints

- .2 Topcoats: two coats, latex, interior, institutional low odor/VOC, (MPI #115, MPI#151, MPI#153)

- .1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L" by Sherwin Williams

- .2 "Pitt Glaze Acrylic Epoxy" by PPG Architectural (MPI 151/153) PPG Architectural

- .3 "Corotech Acrylic Epoxy V450" by Benjamin Moore

- .2 Fiberglass-Mat Faced Gypsum Board Walls (Moisture resistant gypsum board, abuse resistant gypsum board, impact resistant gypsum board)

- .1 Primer: One coat high build surfacer (Minimum DFT: as recommended by manufacturer but not less than 10 mils)

- .1 "Builders Solution, <50 g/L" by Sherwin Williams

- .2 "Speedhide Maxbuild High Build Drywall Surfer" by PPG Architectural

- .3 "X-pert High Build Primer/ Sealer 11020A" by Dulux Paints

- .2 Sealing Coat: One coat multi-purpose latex interior primer sealer (MPI #39) as recommended by manufacturer:

- .1 "Prep Rite Pro Block Primer-Sealer, 0 g/L" by Sherwin Williams

- .3 Topcoats: two coats, latex, interior, institutional low odor/VOC, (MPI #115, MPI#151, MPI#153)

- .1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L" by Sherwin Williams

- .2 "Pitt Glaze Acrylic Epoxy" by PPG Architectural (MPI 151/153) PPG Architectural

- .3 "Corotech Acrylic Epoxy V450" by Benjamin Moore

### **3.11 Miscellaneous Substrates And Specialty Systems**

#### **3.11.1 "Scuff-Resistant" Low Odour/Low VOC Interior, Institutional Latex**

- .1 Concrete Substrates, Nontraffic Surfaces
  - .1 Prime Coat: one coat alkali-resistant primer (MPI #3)
    - .1 "Loxon Concrete & Masonry Primer, <100 g/L" by Sherwin Williams
    - .2 "Ultra Spec® Masonry Interior / Exterior 100% Acrylic Masonry Sealer" by Benjamin Moore
    - .3 "Primemaster Primer/Sealer," by Master Coating Technologies
  - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC "scuff-resistant" acrylic.
    - .1 "ProMar 200 HP Zero VOC, 0 g/L" by Sherwin Williams
    - .2 "Ultra Spec® SCUFF-X™ Finish" by Benjamin Moore
    - .3 "Scuffmaster ScrubTough," by Master Coating Technologies.
- .2 CMU Substrates:
  - .1 Block Filler: one coat Block filler, latex, interior/exterior, (MPI #4)
    - .1 "PrepRite Block Filler, 45 g/L" by Sherwin Williams
    - .2 "Ultra Spec Masonry Block Filler K571" by Benjamin Moore
  - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC "scuff-resistant" acrylic.
    - .1 "ProMar 200 HP Zero VOC, 0 g/L" by Sherwin Williams
    - .2 "Ultra Spec® SCUFF-X™ Finish" by Benjamin Moore
    - .3 "Scuffmaster ScrubTough," by Master Coating Technologies.
- .3 Gypsum Board Substrates (ensure Level 5 finish is provided):
  - .1 Prime Coat: One coat Primer sealer, interior, institutional low odor/VOC (MPI #149).
    - .1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L" by Sherwin Williams
    - .2 "K534 Ultra Spec 500 Waterborne Interior Primer Sealer" by Benjamin Moore
    - .3 "Primemaster Primer/Sealer," by Master Coating Technologies

- 
- .2 Topcoats: two coats, latex, interior, institutional low odor/VOC "scuff-resistant" acrylic.
    - .1 "ProMar 200 HP Zero VOC, 0 g/L" by Sherwin Williams
    - .2 "Ultra Spec® SCUFF-X™ Finish" by Benjamin Moore
    - .3 "Scuffmaster ScrubTough," by Master Coating Technologies.
  - 3.11.2 "Odour Eliminating" Low Odour/Low VOC Interior, Institutional Latex
    - .1 Concrete Substrates, Nontraffic Surfaces
      - .1 Prime Coat: one coat alkali-resistant primer (MPI #3)
        - .1 "Loxon Concrete & Masonry Primer, <100 g/L" by Sherwin Williams
      - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC "odour-eliminating" latex.
        - .1 "Harmony Interior Latex — Odor Eliminating Technology, 0 g/L" by Sherwin Williams
    - .2 CMU Substrates:
      - .1 Block Filler: one coat Block filler, latex, interior/exterior, (MPI #4)
        - .1 "PrepRite Block Filler, 45 g/L" by Sherwin Williams
      - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC "scuff-resistant" acrylic.
        - .1 "Harmony Interior Latex — Odor Eliminating Technology, 0 g/L" by Sherwin Williams
    - .3 Gypsum Board Substrates:
      - .1 Prime Coat: One coat Primer sealer, interior, institutional low odor/VOC (MPI #149).
        - .1 "Harmony Interior Latex Primer — Odor Eliminating Technology, 0 g/L" by Sherwin Williams
      - .2 Topcoats: two coats, latex, interior, institutional low odor/VOC "odour-eliminating" latex.
        - .1 "Harmony Interior Latex — Odor Eliminating Technology, 0 g/L" by Sherwin Williams
  - 3.11.3 Ferrous Exposed Ceilings and Decking (including bar joists) above 6096 mm (20' – 0") – Water-based Dry Fall (INT 5.1CC as amended)
    - .1 Prime coat: Shop-applied Q.D primer (MPI #275): Refer to Section 05 12 00.
    - .2 Topcoats: One coat water based dry fall coating (MPI #118, MPI#226)

- 
- .1 "Low VOC Waterborne Acrylic Dryfall, <50 g/L" by Sherwin Williams
  - .2 "Speedhide Interior Latex Dryfall" by PPG Architectural
  - .3 "Latex Dryfall Eggshell " by Benjamin Moore
  - .4 "Spraymaster DTM Waterborne Dryfall # 10112" by Dulux Paints
- 3.11.4 Galvanized Exposed Ceilings and Decking (including bar joists) above 6096 mm (20' – 0") – Water-based Dry Fall (INT 5.1CC as amended)
- .1 Top Coats: 2 coats water based dry fall coating (MPI #118, MPI#226)
    - .1 "Low VOC Waterborne Acrylic Dryfall, <50 g/L" by Sherwin Williams
    - .2 "Speedhide Interior Latex Dryfall" by PPG Architectural
    - .3 " Latex Dryfall Eggshell" by Benjamin Moore
    - .4 "Spraymaster DTM Waterborne Dryfall # 10112" by Dulux Paints
- 3.11.5 Steel (High Heat) including heat exchangers, breeching, pipes, flues, stacks etc. – Heat Resistant Enamel – Maximum 205 deg C (400 deg F) (INT 5.2A as amended):
- .1 Primer: As recommended by manufacturer.
  - .2 Topcoats: Apply heat resistant enamel (MPI #21) coats in strict accordance with manufacturer's instructions:
    - .1 "Heat Flex Hi Temp 500" by Sherwin Williams
    - .2 "Ameron Engineered Siloxane PSX 892HS" by PPG Architectural
    - .3 Pitt-Therm Air Dry Silicone" by Dulux Paints

END OF SECTION

---

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Visual Display Surfaces work specified herein. This includes, but is not necessarily limited, to:
- .1 Markerboards.
  - .2 Tackboards.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 Tackboard: Framed or unframed, tackable, visual display board assembly.
- 1.4.2 Visual Display Board Assembly: Visual display surface that is factory fabricated into composite panel form, either with or without a perimeter frame; includes chalkboards, markerboards, and tackboards.
- 1.4.3 Visual Display Surface: Surfaces that are used to convey information visually, including surfaces of chalkboards, markerboards, tackboards, and surfacing materials that are not fabricated into composite panel form but are applied directly to walls.

### **1.5 Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for the following:

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**10 11 00  
Visual Display Surfaces**

- 
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Visual Display Surfaces work and include product characteristics, performance criteria, physical size, finish and limitations.
    - .2 Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for visual display surfaces.
  - 1.5.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for visual display surfaces. Include plans, elevations, sections, details, and attachments to other work.
    - .1 Show locations of panel joints.
    - .2 Show locations of special-purpose graphics for visual display surfaces.
    - .3 Include sections of typical trim members.
    - .4 Wiring Diagrams: Submit wiring diagrams in accordance with Division 01 for power, signal, and control wiring.
  - 1.5.3 Samples for Initial Selection: Submit samples for initial selection in accordance with Division 01 for each type of visual display surface indicated, for units with factory-applied colour finishes, and as follows:
    - .1 Actual sections of porcelain-enamel face sheet and tackboard assemblies.
    - .2 Include accessory Samples to verify colour selected.
  - 1.5.4 Samples for Verification: Submit samples for verification in accordance with Division 01 for each type of visual display surface indicated.
    - .1 Visual Display Surface: Not less than 215 by 280 mm (8-1/2 by 11 inches), mounted on substrate indicated on Drawings and Schedules for final Work. Include one panel for each type, colour, and texture required.
    - .2 Trim: 152-mm- (6-inch-) long sections of each trim profile.
    - .3 Accessories: Full-size Sample of each type of accessory.
  - 1.5.5 Product Schedule: Submit product schedule in accordance with Division 01 for visual display surfaces.
  - 1.5.6 Product Test Reports: Based product test reports on evaluation of comprehensive tests performed by a qualified testing agency, for surface-burning characteristics of fabrics.
  - 1.5.7 Maintenance Data: Submit maintenance data in accordance with Division 01 for visual display surfaces to include in maintenance manuals.
  - 1.5.8 Warranties: Sample of special warranties.

---

**1.6 Quality Assurance**

- 1.6.1 Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of motor-operated, sliding visual display units required for this Project.
- 1.6.2 Source Limitations: Obtain visual display surfaces from single source from single manufacturer.
- 1.6.3 Surface-Burning Characteristics: As determined by testing identical products according to CAN/ULC-S102/S102.2 or equivalent to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
  - .1 Flame-Spread Index: 25 or less.
  - .2 Smoke-Developed Index: 450 or less.
- 1.6.4 Electrical Components, Devices, and Accessories: Listed and labeled as defined in CSA C22 SERIES AND NFPA 70, by a qualified testing agency, and marked for intended location and application.
- 1.6.5 Mockups: Build mockups to verify selections made under sample submittals and to demonstrate appearance and aesthetic effects and set quality standards for installation.
  - .1 Approved mockups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.
- 1.6.6 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
  - .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

**1.7 Delivery, Storage, And Handling**

- 1.7.1 Deliver factory-built visual display surfaces, including factory-applied trim where indicated, completely assembled in one piece without joints, where possible. If dimensions exceed maximum manufactured panel size, provide two or more pieces of equal

length as acceptable to Consultant. When overall dimensions require delivery in separate units, prefit components at the factory, disassemble for delivery, and make final joints at the site.

- 1.7.2 Store visual display surfaces vertically with packing materials between each unit.

**1.8 Project Conditions**

- 1.8.1 Environmental Limitations: Do not deliver or install visual display surfaces until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above ceilings is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
- 1.8.2 Field Measurements: Verify actual dimensions of construction contiguous with visual display surfaces by field measurements before fabrication.
- .1 Allow for trimming and fitting where taking field measurements before fabrication might delay the Work.

**1.9 Warranty**

- 1.9.1 Special Warranty for Porcelain-Enamel Face Sheets: Manufacturer's standard form in which manufacturer agrees to repair or replace porcelain-enamel face sheets that fail in materials or workmanship within specified warranty period.
- .1 Failures include, but are not limited to, the following:
- .1 Surfaces lose original writing and erasing qualities.
- .2 Surfaces exhibit crazing, cracking, or flaking.
- .2 Warranty Period: Life of the building.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- .1 MARKERBOARD ASSEMBLIES
- .1 Porcelain-Enamel Markerboards:
- .1 AARCO Products, Inc.
- .2 ADP Lemco, Inc.
- .3 Bangor Cork Company, Inc.
- .4 Claridge Products and Equipment, Inc.
- .5 Marsh Industries, Inc.; Visual Products Group.

.6 Platinum Visual Systems; a division of ABC School Equipment, Inc.

.7 PolyVision Corporation; a Steelcase company.

.2 TACKBOARD ASSEMBLIES

.1 A-1 Visual Systems.

.2 AARCO Products, Inc.

.3 ADP Lemco, Inc.

.4 Bangor Cork Company, Inc.

.5 Claridge Products and Equipment, Inc.

.6 EverProducts by Glenroy Inc.

.7 Forbo;

.8 Marsh Industries, Inc.; Visual Products Group.

.9 Platinum Visual Systems; a division of ABC School Equipment, Inc.

.10 PolyVision Corporation; a Steelcase company.

.11 Tri-Best Visual Display Products.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Materials, General**

2.2.1 Porcelain-Enamel Face Sheet: Manufacturer's standard steel sheet with porcelain-enamel coating fused to steel; uncoated thickness indicated.

.1 Matte Finish: Low reflective; chalk wipes clean with dry cloth or standard eraser.

2.2.2 Natural Cork Sheet: Seamless, single-layer, compressed fine-grain cork sheet; bulletin board quality; face sanded for natural finish with surface-burning characteristics indicated.

2.2.3 Hardboard: ANSI A135.4, tempered.

2.2.4 Particleboard: ANSI A208.1, Grade M-1

2.2.5 Fiberboard: ASTM C 208.

2.2.6 Extruded Aluminum: ASTM B 221M (ASTM B 221), Alloy 6063.

**2.3 Markerboard Assemblies**

2.3.1 Porcelain-Enamel Markerboards: Balanced, high-pressure, factory-laminated markerboard assembly of three-ply construction consisting of backing sheet, core material, and 0.53-mm- (0.021-inch-) thick, porcelain-enamel face sheet with low-gloss finish.

.1 Particleboard Core: 9.5 mm (3/8 inch) thick; with 0.61-mm- (0.024-inch-) thick, galvanized-steel sheet backing.

- .2 Laminating Adhesive: Manufacturer's standard, moisture-resistant thermoplastic type.
- .3 Acceptable Products:
  - .1 "System 300" manufactured by Panel Products
  - .2 "Series 800" manufactured by Claridge

## **2.4 Tackboard Assemblies**

- 2.4.1 Natural-Cork Tackboard: 6-mm- (1/4-inch-) thick, natural cork sheet factory laminated to 6-mm- (1/4-inch-) thick jute backing.
- 2.4.2 Colour: Refer to Finish Schedule on Drawings.
- 2.4.3 Basis-of-Design: "Bulletin Board" as manufactured by Forbo or approved equivalent.

## **2.5 Markerboard And Tackboard Accessories**

- 2.5.1 Aluminum Frames and Trim: Fabricated from not less than 1.57-mm- (0.062-inch-) thick, extruded aluminum; standard size and shape.
  - .1 Field-Applied Trim: Manufacturer's standard, snap-on trim with no visible screws or exposed joints.
  - .2 Factory-Applied Trim: Manufacturer's standard.

## **2.6 Fabrication**

- 2.6.1 Porcelain-Enamel Visual Display Assemblies: Laminate porcelain-enamel face sheet and backing sheet to core material under heat and pressure with manufacturer's standard flexible, waterproof adhesive.
- 2.6.2 Natural-Slate Chalkboards: Surface slate panels to a natural plane. Grind and hone to smooth, uniform finish equivalent to that obtained by minimum 180 grit and maximum 220 grit.
  - .1 Cut joints straight and true. Space joints symmetrically. Fit and match panels before shipment to provide continuous, uniform writing surface.
  - .2 Length: Supply panels approximately equal in length with permissible variation not more than 75 mm (3 inches) in either direction of equal spacing. Allow 6-mm (1/4-inch) clearance at trim in length and width for fitting. Provide lengths of panels in each space as follows:
    - .1 Up to 1.5 m (5 feet); one panel.
    - .2 More than 1.5 m (5 feet) but less than 2.7 m (9 feet); two panels.
    - .3 More than 2.7 m (9 feet) but less than 4.1 m (13.5 feet); three panels.

- .4 More than 4.1 m (13.5 feet) but less than 5.5 m (18 feet); four panels.
  - .5 More than 5.5 m (18 feet) but less than 6.9 m (22.5 feet); five panels.
  - .6 More than 6.9 m (22.5 feet) but less than 8.2 m (27 feet); six panels.
- 2.6.3 Visual Display Boards: Factory assemble visual display boards unless otherwise indicated.
- .1 Where factory-applied trim is indicated, trim shall be assembled and attached to visual display boards at manufacturer's factory before shipment.
- 2.6.4 Factory-Assembled Visual Display Units: Coordinate factory-assembled units with trim and accessories indicated. Join parts with a neat, precision fit.
- .1 Make joints only where total length exceeds maximum manufactured length. Fabricate with minimum number of joints, as indicated on approved Shop Drawings.
  - .2 Provide manufacturer's standard vertical-joint spline system between abutting sections of markerboards.
  - .3 Provide manufacturer's standard mullion trim at joints between markerboards and tackboards of combination units.
  - .4 Where size of visual display boards or other conditions require support in addition to normal trim, provide structural supports or modify trim as indicated on Drawings and Schedules or as selected by Consultant from manufacturer's standard structural support accessories to suit conditions indicated.
- 2.6.5 Modular Visual Display Boards: Fabricated with integral panel clips attached to core material.
- 2.6.6 Aluminum Frames and Trim: Fabricate units straight and of single lengths, keeping joints to a minimum. Miter corners to a neat, hairline closure.
- .1 Where factory-applied trim is indicated, trim shall be assembled and attached to visual display units at manufacturer's factory before shipment.

## **2.7 General Finish Requirements**

- 2.7.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- 2.7.2 Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

- 2.7.3 Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

**2.8     Aluminum Finishes**

- 2.8.1 Clear Anodic Finish: AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.

**2.9     Visual Display Surface Schedule**

- 2.9.1 Visual Display Board (VDS-1): Factory assembled.
- .1 Markerboard: Porcelain-enamel markerboard assembly.
    - .1 Colour: White.
  - .2 Corners: Square.
  - .3 Width: 2440 mm (96 inches)
  - .4 Height: 1220 mm (48 inches)
  - .5 Mounting: Wall.
  - .6 Mounting Height: As indicated on Drawings.
  - .7 Factory -Applied Aluminum Trim: Manufacturer's standard with clear anodic finish.
- 2.9.2 Tackboard (TKB-1): Factory assembled.
- .1 Tack Surface: Natural-cork tackboard assembly.
    - .1 Colour: As selected by Consultant from full range of industry colours.
  - .2 Corners: Square.
  - .3 Width: 2440 mm (96 inches)
  - .4 Height: 1220 mm (48 inches)
  - .5 Mounting: Wall.
  - .6 Mounting Height: As indicated on Drawings.
  - .7 Edges: Concealed by trim.
    - .1 Factory-Applied Aluminum Trim: Manufacturer's standard style, with powder-coat finish.
    - .1 Colour: White

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances, surface

conditions of wall, and other conditions affecting performance of the Work.

- 3.1.2 Examine roughing-in for electrical power systems to verify actual locations of connections before installation of motor-operated, sliding visual display units.
- 3.1.3 Examine walls and partitions for proper preparation and backing for visual display surfaces.
- 3.1.4 Examine walls and partitions for suitable framing depth where sliding visual display units will be installed.
- 3.1.5 Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2 Preparation**

- 3.2.1 Comply with manufacturer's written instructions for surface preparation.
- 3.2.2 Clean substrates of substances that could impair the performance of and affect the smooth, finished surfaces of visual display boards, including dirt, mold, and mildew.
- 3.2.3 Prepare surfaces to achieve a smooth, dry, clean surface free of flaking, unsound coatings, cracks, defects, projections, depressions, and substances that will impair bond between visual display surfaces and wall surfaces.
- 3.2.4 Prepare recesses for sliding visual display units as required by type and size of unit.

### **3.3 Installation, General**

- 3.3.1 General: Install visual display surfaces in locations and at mounting heights indicated on Drawings, or if not indicated, at heights indicated below. Keep perimeter lines straight, level, and plumb. Provide grounds, clips, backing materials, adhesives, brackets, anchors, trim, and accessories necessary for complete installation.

### **3.4 Installation Of Field-Fabricated Visual Display Boards And Assemblies**

- 3.4.1 Field-Assembled Visual Display Units: Coordinate field-assembled units with grounds, trim, and accessories indicated. Join parts with a neat, precision fit.
  - .1 Make joints only where total length exceeds maximum manufactured length. Fabricate with minimum number of joints, as indicated on approved Shop Drawings.
  - .2 Provide manufacturer's standard vertical-joint spline system between abutting sections of markerboards.

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**10 11 00  
Visual Display Surfaces**

- .3 Provide manufacturer's standard mullion trim at joints between markerboards and tackboards of combination units.
  - .4 Where size of visual display boards or other conditions require support in addition to normal trim, provide structural supports or modify trim as indicated on Drawings and Schedules or as selected by Consultant from manufacturer's standard structural support accessories to suit conditions indicated.
- 3.4.2 Natural-Slate Chalkboards: Align and level joints between adjoining panels and apply manufacturer's recommended joint-filler compound. Hone and finish joints to continuous even plane.

**3.5 Installation Of Factory-Fabricated Visual Display Boards And Assemblies**

- 3.5.1 Visual Display Boards: Attach visual display boards to wall surfaces with egg-size adhesive gobs at 400 mm (16 inches) o.c., horizontally and vertically.
- 3.5.2 Visual Display Boards: Attach concealed clips, hangers, and grounds to wall surfaces and to visual display boards with fasteners at not more than 400 mm (16 inches) o.c. Secure both top and bottom of boards to walls.
- .1 Field-Applied Aluminum Trim: Attach trim over edges of visual display boards and conceal grounds and clips. Attach trim to boards with fasteners at not more than 610 mm (24 inches) o.c.
    - .1 Attach chalktrays to boards with fasteners at not more than 300 mm (12 inches) o.c.
  - .2 Field-Applied Wood Trim: Install trim according to requirements in Section 06 40 00, Architectural Woodwork.

**3.6 Cleaning And Protection**

- 3.6.1 Clean visual display surfaces according to manufacturer's written instructions. Attach one cleaning label to visual display surface in each room.
- 3.6.2 Touch up factory-applied finishes to restore damaged or soiled areas.
- 3.6.3 Cover and protect visual display surfaces after installation and cleaning.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.
- 1.1.3

### **1.2 Summary**

- 1.2.1 Work Included: Provide labour, materials, products, equipment and services to complete the Wire Mesh Partitions work specified herein. This includes, but is not necessarily limited, to:
  - .1 Wire mesh partitions.
  - .2 Wire mesh storage lockers.
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout the entirety of Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 As defined in ASTM E2016:
  - .1 Intermediate Crimp: Wires pass over one and under the next adjacent wire in both directions, with wires crimped before weaving and with extra crimps between the intersections.
  - .2 Lock Crimp: Deep crimps at points of the intersection that lock wires securely in place.

---

**1.5     Submittals**

- 1.5.1 General Requirements and Procedures for Submittals: In accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit product data for the following:
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the wire mesh partitions work and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for wire mesh items.
- 1.5.3 Product Disclosure and Transparency:
  - .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
  - .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
    - .1 Health Product Declaration open Standard,
    - .2 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
    - .3 International Living Future Institute Declare
    - .4 Other approved framework.
  - .3 When multiple Products are specified, give preference to Products with compliant documentation.
- 1.5.4 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Section 01 77 00, for adhesives, sealants and any other material designated by Consultant.
- 1.5.5 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
  - .3 Include clearances required for operation of moving components such as doors.
  - .4 Supply location template drawings for items supported or anchored to permanent construction.
- 1.5.6 Delegated Design Submittals:

- 
- .1 Engineering design completion of WIRE MESH PARTITIONS work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.
- 1.5.7 Initial Selection Samples: Submit initial selection samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
- 1.5.8 Welding Certificate: Submit certification for welding firms and welders to verify compliance with welding qualifications specified in this section.
- 1.5.9 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide regional (i.e., North American) EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.10 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.11 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:

- .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
- .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).

**1.6      Closeout Submittals**

- 1.6.1 General Requirements and Procedures for Closeout Submittals: in accordance with Section 01 77 00, Closeout Procedures.
- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for wire mesh partitions to be included in building's operation and maintenance manual.

**1.7      Quality Assurance**

- 1.7.1 Qualification:
  - .1 Manufacturers: Provide Products for Work of this Section by manufacturer with minimum 10 years' experience in the manufacture of such materials.
  - .2 Installers: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
  - .3 Installer's responsibilities include fabricating and installing wire mesh items and providing professional engineering services needed to assume engineering responsibility.
  - .4 Engineering Responsibility: Preparation of data for wire mesh items, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in assemblies similar to those indicated on Drawings and Schedules for this Project.
- 1.7.2 Welding Qualifications: Qualify procedures and personnel in accordance with the following:
  - .1 Steel: to CSA W47.1 and CSA W59
  - .2 Aluminum: to CSA W47.2 and CSA W59.2
  - .3 Stainless Steel: to CSA W47.1 (Annex K) and CSA W59
- 1.7.3 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from 1 source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.

---

**1.8     Delivery, Storage And Handling**

- 1.8.1 Deliver, store and handle wire mesh partitions in accordance with manufacturer's written instructions.
- 1.8.2 deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.3 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.4 Replace defective or damaged materials with new.
- 1.8.5 Inventory wire mesh partition door hardware on receipt and provide secure lockup for wire mesh partition door hardware delivered to Project site.
- 1.8.6 Tag each item or package separately with identification and include basic installation instructions with each item or package.
- 1.8.7 Keys: Submit keys for door locks to Owner at Substantial Performance of the Work.

**1.9     Project Conditions**

- 1.9.1 Field Measurements: Verify actual dimensions of construction contiguous with wire mesh units by field measurements before fabrication.

**1.10    Warranty**

- 1.10.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 .     PRODUCTS**

**2.1     Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 Apex Iron Works, LLC
  - .2 Eagle Steel Inc.
  - .3 Indiana Wire Products
  - .4 SpaceGuard Products, Inc.
  - .5 Standard Wire & Steel Works
  - .6 WIPCO Div. of Jesco Industries, Inc.
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

---

**2.2     Design/Performance Criteria**

- 2.2.1 Design partition system to provide for movement of components without damage, undue stress on fasteners or other detrimental effects, when subject to design loads.
- 2.2.2 Design system to accommodate construction tolerances, deflection of building structural members, and clearances of intended openings.
- 2.2.3 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.

**2.3     Materials**

- 2.3.1 Steel Wire: to ASTM A510M (ASTM A510).
- 2.3.2 Steel Plates, Channels, Angles, and Bars: to ASTM A36/A36M or equivalent to CSA G40.20/G40.21.
- 2.3.3 Cold-Rolled Steel Sheet: to ASTM A1008/A 1008M, Commercial Steel (CS), Type B.
- 2.3.4 Square Steel Tubing: to ASTM A500, cold-formed structural-steel tubing or equivalent to CSA G40.20/G40.21.
- 2.3.5 Galvanized Steel Sheet: to ASTM A653/A 653M, Commercial Steel (CS), Type B; with Z275 (G90) zinc (galvanized) coating.
- 2.3.6 Panel-to-Panel Fasteners: Manufacturer's standard steel bolts, nuts, and washers.
- 2.3.7 Postinstalled Expansion Anchors: With capability to sustain, without failure, load imposed within factors of safety indicated, as determined by testing per ASTM E488, conducted by a qualified independent testing agency.

**2.4     Standard-Duty Wire Mesh Partitions**

- 2.4.1 Mesh: No. 10 ga (3.5-mm, 0.135-in.) diameter, intermediate-crimp steel wire woven into 38-mm (1-1/2-in.) diamond mesh.
- 2.4.2 Horizontal Framing: 25 by 13 mm (1 in. by ½ in) or greater, minimum 3 mm thick steel channels or thicker.
- 2.4.3 Vertical Frames: 32 mm by 13 mm (1-1/4 in. by 1/2 in.) or greater; minimum 14 ga. or thicker roll formed "C" type steel channels. Provide series of slotted holes for securing to adjacent panels and post.

- 
- 2.4.4 Horizontal Reinforcement Members: Provide two 19 mm by 10 mm (3/4 in x 3/8 in) or greater; minimum 12 ga. steel channel toe riveted or bolted together through mesh and welded to vertical frames.
- 2.4.5 Panels: Manufacture single panels up to 1520 mm (160 in.) wide and 3658 mm (144 in.) high consisting of horizontal and vertical members specified in this Section mortised and tenoned at corners with diamond mesh securely attached to frames.
- .1 Locate lower horizontal member at maximum 95 mm (3.75 in.) from bottom of panel to create maintenance sweep space. Attach center reinforcement bars as required.
- 2.4.6 Hinged Doors: Construct of the same materials as panels, with 32 mm x 3 mm (1-1/4 in by 1/8 in) flat steel bar cover on sides. Supply complete with necessary mounting and locking hardware to install and operate.
- .1 Provide minimum of three 3 in. x 3 in. butt hinges per doors. Increase hinges as required based on door height.
- .1 Padlock Arrangement: Lug(s) to be welded, bolted, or riveted securely to system.
- .2 Cylinder Lock: Mortise type with keyed different cylinder operated by key outside and recessed turn knob inside.
- 2.4.7 Corner post (for 90 degree corner): minimum 32 mm (1-1/4 in.) by 32 mm (1-1/4 in.) by 3 mm (1/8 in.) steel angle or square tube.
- 2.4.8 Vertical Stiffeners (For partitions greater than 3.6 m (12 ft.) in height):
- .1 From 3.6 m (12 ft) to 4.87 m (16 ft) in height: Minimum 6 mm (1/4 in.) by 50 mm (2 in.) flat steel.
- .2 From 4.87 m (16 ft) to 7.32 m (24 ft) in height: Minimum 8 mm (5/16 in.) by 76 mm (3 in.) flat steel required.
- .3 When height exceeds 7.32 m (24 ft): 76 mm (3 in.) steel channel welded to base plate required
- 2.4.9 Line Post: Minimum 76 mm (3 in.) steel channel welded to base plate. Provide every 3 to 6 m (10 to 20 feet) on center to adequately stiffen long partition runs.
- 2.4.10 Top Capping Channel/Rail: When ceilings are not present, ensure steel channel is through bolted to or u-bolted around top horizontal frame member per the manufacturer's recommended spacing. Channels must be cut to length to cover above panel-to-panel intersections whenever possible.
- 2.4.11 Floor Sockets: Die Cast base shoes to be used whenever a post is not present on panel-to-panel connections at the floor.
- 2.4.12 Accessories:

- .1 Sheet Metal Base: Not less than 1.5-mm- (0.060-in.-) thick, cold-rolled steel sheet.
- .2 Adjustable Filler Panels: Not less than 1.5-mm- (0.060-in.-) thick, cold-rolled steel sheet; capable of filling openings from 50 to 300 mm (2 to 12 in.).
- .3 Wall Clips: Manufacturer's standard, cold-rolled steel sheet; allowing up to 25 mm (1 in.) of adjustment.

2.4.13 Finish: Baked-enamel finish or Powder-coated finish

- .1 Colour: As selected by Consultant from manufacturer's full range.

**2.5      Wire Mesh Storage Lockers**

- 2.5.1 Unit Sizes: As shown on Drawings.
- 2.5.2 Mesh: No. 10 ga (3.5-mm, 0.135-in.) diameter, intermediate-crimp steel wire woven into 38-mm (1-1/2-in.) diamond mesh.
- 2.5.3 Wall Panels: 32-by-32-by-3-mm (1-1/4-by-1-1/4-by-1/8-in.) steel angle framing on top, bottom, and back sides, and 76-by-3-mm (3-by-1/8-in.) cold-rolled steel flat bar framing on front side; with wire mesh welded to framing.
- 2.5.4 Backs: 0.7-mm- (0.027-in.-) thick, metallic-coated steel sheet.
- 2.5.5 Tops: Fabricated from same mesh and framing as doors.
- 2.5.6 Doors: Fabricated from same mesh as wall panels, with framing fabricated from 32-by-32-by-3-mm (1-1/4-by-1-1/4-by-1/8-in.) steel angles on 4 sides; with wire mesh welded to framing. Include door strike and padlock hasp.
- 2.5.7 Finish: Baked-enamel finish or Powder-coated finish unless otherwise indicated.
  - .1 Colour: As selected by Consultant from manufacturer's full range.

**2.6      Fabrication**

- 2.6.1 Fabricate assemblies of framed sections; to sizes and profiles required; with framing members fitted, reinforced and braced to suit design requirements.
- 2.6.2 Fit and assemble in largest practical sections for delivery to Project Site, ready for installation.
- 2.6.3 Fabricate items with joints tightly fitted and secured.
- 2.6.4 Grind exposed welds smooth and flush with adjacent finish surface. Ease exposed edges to small uniform radius.
- 2.6.5 Make exposed joints flush and hairline.

- 2.6.6 Provide components required for anchorage. Fabricate anchorage and related components of same material and finish as framing members.

## **2.7     General Finish Requirements**

- 2.7.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- 2.7.2 Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- 2.7.3 Clean surfaces of rust, scale, grease, and foreign matter before finishing. Clean material using a two to three stage wash system immediately prior to finishing.

## **3 .     EXECUTION**

### **3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Examine floors for suitable conditions where wire mesh items will be installed.
- 3.1.3 Examine walls to which wire mesh items will be attached for properly located blocking, grounds, and other solid backing for attachment of support fasteners.
- 3.1.4 Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2     Installation**

- 3.2.1 General Requirements: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Install components in plumb, level and square. Maintain dimensional tolerances and alignment with surrounding construction.
- 3.2.3 Install partitions and gates plumb and level, accurately fitted, properly aligned, securely fastened, and free from distortion or defects.

- 3.2.4 Install field bracing as necessary to provide rigid, secure installation.

**3.3 Adjusting And Cleaning**

- 3.3.1 Adjust moving components for smooth operation without binding.
- 3.3.2 Adjust locks to provide smooth and secure operation.
- 3.3.3 Remove and replace defective work including doors and framing that are warped, bowed, or otherwise unacceptable.
- 3.3.4 Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Section 09 painting.
- 3.3.5 Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.

**3.4 Tolerances**

- 3.4.1 Maximum Variation from Plumb or Level: 6 mm (1/4 in.) in total partition height.
- 3.4.2 Maximum Misalignment from True Position: 6 mm (1/4 in.).

**3.5 Protection**

- 3.5.1 Protect wire mesh partitions from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.5.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.5.3 Promptly replace wire mesh partitions work damaged during construction that cannot be satisfactorily repaired.

**3.6 Cleaning And Waste Management**

- 3.6.1 General Requirements for Cleaning and Waste Management: in accordance with Section 01 74 00, Cleaning.
- 3.6.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.6.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Operable Panel Partitions work specified herein. This includes, but is not necessarily limited, to:
- .1 Operable acoustical panels.
  - .2 Seals.
  - .3 Panel finish facings.
  - .4 Suspension systems.
  - .5 Manually operated, acoustical panel partitions.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 05 50 00, Metal Fabrications for supports that attach supporting tracks to overhead structural system.
  - .2 Section 09 21 16, Gypsum Board Assemblies for fire-rated assemblies and sound barrier construction above the ceiling at track.
  - .3 Electrical and communications Sections for electrical service and connections for motor operators, controls, and limit switches and for system disconnect switches.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 NIC: Noise Isolation Class.
- 1.4.2 NRC: Noise Reduction Coefficient.
- 1.4.3 STC: Sound Transmission Class.

---

**1.5 Preinstallation Meetings**

- 1.5.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
  - .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

**1.6 Action Submittals**

- 1.6.1 Product Data: Submit product data in accordance with Division 01 for the following:
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Operable Panel Partitions work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.6.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for operable panel partitions.
- .1 Include plans, elevations, sections, details, and attachments to other work.
  - .2 Indicate stacking and operating clearances. Indicate location and installation requirements for hardware and track, blocking, and direction of travel.
  - .3 Include diagrams for power, signal, and control wiring.
- 1.6.3 Samples for Initial Selection: Submit samples for initial selection in accordance with Division 01 for each type of exposed material, finish, covering, or facing.
- .1 Include Samples of accessories involving colour selection.
- 1.6.4 Samples for Verification: Submit samples for verification in accordance with Division 01 for each type of exposed material, finish, covering, or facing, prepared on Samples of size indicated below:
- .1 Panel Facing Material: Manufacturer's standard-size unit, not less than 75 mm (3 inches) square.

- .2 Panel Edge Material: Not less than 75 mm (3 inches) long.
- .3 Hardware: One of each exposed door-operating device.
- 1.6.5 Professional Engineer's Stamped Shop Drawings and Submittals: Submit Professional Engineer's Stamped Shop Drawings and Submittals in accordance with Division 01 for operable panel partitions.
  - .1 Include design calculations for seismic restraints.

**1.7 Informational Submittals**

- 1.7.1 Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
  - .1 Partition track, track supports and bracing, switches, turning space, and storage layout.
  - .2 Suspended ceiling components.
  - .3 Structural members to which suspension systems are attached.
  - .4 Size and location of initial access modules for acoustical tile.
  - .5 Items penetrating finished ceiling, including the following:
    - .1 Lighting fixtures.
    - .2 HVAC ductwork, outlets, and inlets.
    - .3 Speakers.
    - .4 Sprinklers.
    - .5 Smoke detectors.
    - .6 Access panels.
  - .6 Plenum acoustical barriers.
- 1.7.2 Setting Drawings: Submit setting Drawings in accordance with Division 01 for embedded items and cutouts required in other work, including support-beam, mounting-hole template.
- 1.7.3 Seismic Qualification Certificates: Submit seismic qualification certificates in accordance with Division 01 for operable panel partitions, tracks, accessories, and components, from manufacturer. Include seismic capacity of partition assemblies to remain in vertical position during a seismic event and the following:
  - .1 Basis for Certification: Indicate whether certification is based on analysis, testing, or experience data, according to ASCE/SEI 7.
  - .2 Detailed description of partition anchorage devices on which the certification is based and their installation requirements.
- 1.7.4 Product Certificates: Submit product certificates in accordance with Division 01 for each type of operable panel partition.

- .1 Include approval letter signed by manufacturer acknowledging Owner-furnished panel facing material complies with requirements.

1.7.5 Product Test Reports: Submit product test reports in accordance with Division 01 for each operable panel partition, for tests performed by a qualified testing agency.

1.7.6 Sample Warranty: Submit sample warranty in accordance with Division 01 for manufacturer's special warranty.

## **1.8 Closeout Submittals**

1.8.1 Operation and Maintenance Data: Submit operation and maintenance data in accordance with Division 01 for operable panel partitions to include in maintenance manuals.

- .1 In addition to items specified in Section 01 78 00, Closeout Submittals, include the following:

- .1 Panel finish facings and finishes for exposed trim and accessories. Include precautions for cleaning materials and methods that could be detrimental to finishes and performance.
- .2 Seals, hardware, track, track switches, carriers, and other operating components.
- .3 Electric operator and controls.

## **1.9 Maintenance Material Submittals**

1.9.1 Supply extra materials, from the same production run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

- .1 Panel Finish-Facing Material: Supply full width in quantity to cover both sides of two panels when installed.

## **1.10 Quality Assurance**

1.10.1 Manufacturer Qualifications: A qualified manufacturer that is certified for chain of custody by an FSC-accredited certification body.

1.10.2 Vendor Qualifications: A vendor that is certified for chain of custody by an FSC-accredited certification body.

1.10.3 Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

## **1.11 Delivery, Storage, And Handling**

1.11.1 Protectively package and sequence panels in order for installation. Clearly mark packages and panels with numbering system used on Shop Drawings. Do not use permanent markings on panels.

---

**1.12 Warranty**

1.12.1 Special Warranty: Manufacturer agrees to repair or replace components of operable panel partitions that fail in materials or workmanship within specified warranty period.

.1 Failures include, but are not limited to, the following:

.1 Faulty operation of operable panel partitions.

.2 Deterioration of metals, metal finishes, and other materials beyond normal use.

.2 Warranty Period: Three years from date of Substantial Performance of the Work.

**2. PRODUCTS**

**2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

.1 Moderco Inc.

.2 Modernfold, Inc.

.3 Panelfold Inc.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Performance Requirements**

2.2.1 Professional Engineering Design and Certification: Engage a Professional Engineer licensed to practice in the Province of Ontario, as defined in Section 01 40 00, Quality Requirements, to design seismic bracing of tracks to structure above.

2.2.2 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.

.1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.

.2 Refer to Structural Drawings for seismic sensitivity values.

2.2.3

2.2.4 Acoustical Performance: Provide operable panel partitions tested by a qualified testing agency for the following acoustical properties according to test methods indicated:

- .1 Sound-Transmission Requirements: Operable panel partition assembly tested for laboratory sound-transmission loss performance according to ASTM E 90, determined by ASTM E 413, and rated for not less than the STC indicated.
- 2.2.5 Fire-Test-Response Characteristics: Provide panels with finishes complying with one of the following as determined by testing identical products by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
  - .1 Surface-Burning Characteristics: Comply with CAN/ULC-S102/S102.2 or equivalent to ASTM E 84 or UL 723; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
    - .1 Flame-Spread Index: 25 or less.
    - .2 Smoke-Developed Index: 450 or less.
  - .2 Fire Growth Contribution: Complying with acceptance criteria of local code and authorities having jurisdiction when tested according to NFPA 265 Method B Protocol or NFPA 286.
- 2.2.6 Electrical Components, Devices, and Accessories: Listed and labeled as defined in CSA C22 SERIES AND NFPA 70, by a qualified testing agency, and marked for intended location and application.

## **2.3 Operable Acoustical Panels (PTN)**

- 2.3.1 Operable Acoustical Panels: Partition system, including panels, seals, finish facing, suspension system, operators, and accessories.
- 2.3.2 Panel Operation: Manually operated, paired panels.
- 2.3.3 Panel Construction: As required to support panel from suspension components and with reinforcement for hardware attachment. Fabricate panels with tight hairline joints and concealed fasteners. Fabricate panels so finished in-place partition is rigid; level; plumb; aligned, with tight joints and uniform appearance; and free of bow, warp, twist, deformation, and surface and finish irregularities.
- 2.3.4 Dimensions: Fabricate operable acoustical panel partitions to form an assembled system of dimensions indicated on Drawings and Schedules and verified by field measurements.
  - .1 Panel Width: As indicated.
- 2.3.5 STC: 56
- 2.3.6 Panel Weight: 59 kg/sq. m (12 lb/sq. ft.)
- 2.3.7 Panel Thickness: Not less than 102 mm (4 inches).
- 2.3.8 Panel Materials:

- .1 Steel Frame: Steel sheet, manufacturer's standard nominal minimum thickness for uncoated steel.
- .2 Steel Face/Liner Sheets: Tension-leveled steel sheet, manufacturer's standard minimum nominal thickness for uncoated steel.
- 2.3.9 Panel Closure: Manufacturer's standard unless otherwise indicated.
  - .1 Final Closure: Horizontally expanding panel edge with removable crank.
- 2.3.10 Hardware: Manufacturer's standard as required to operate operable panel partition and accessories; with decorative, protective finish.
  - .1 Hinges: Concealed (invisible)
- 2.3.11 Basis-of-Design: "Encore Paired Panel" by Modernfold or approved equivalent.

## **2.4     Seals**

- 2.4.1 General: Provide seals that produce operable panel partitions complying with performance requirements and the following:
  - .1 Manufacturer's standard seals unless otherwise indicated.
  - .2 Seals made from materials and in profiles that minimize sound leakage.
  - .3 Seals fitting tight at contact surfaces and sealing continuously between adjacent panels and between operable panel partition perimeter and adjacent surfaces, when operable panel partition is extended and closed.
- 2.4.2 Vertical Seals: Deep-nesting, interlocking steel astragals mounted on each edge of panel, with continuous PVC acoustical seal.
- 2.4.3 Horizontal Top Seals: Manufacturers standard automatic operable top seal.
- 2.4.4 Horizontal Bottom Seals: Manufacturer's standard continuous-contact seal exerting uniform constant pressure on floor.

## **2.5     Panel Finish Facings**

- 2.5.1 General: Provide finish facings for panels that comply with indicated fire-test-response characteristics and that are factory applied to operable panel partitions with appropriate backing, using mildew-resistant nonstaining adhesive as recommended by facing manufacturer's written instructions.
  - .1 Apply one-piece, seamless facings free of air bubbles, wrinkles, blisters, and other defects, with invisible seams complying with Shop Drawings for location, and with no gaps

or overlaps. Horizontal butted edges are not permitted. Tightly secure and conceal raw and selvage edges of facing for finished appearance.

- .2 Match facing pattern 1830 mm (72 inches) above finished floor.

2.5.2 Vinyl-Coated Fabric Wall Covering: Manufacturer's standard, mildew-resistant, washable, vinyl-coated fabric wall covering; complying with CFFA-W-101-D for type indicated; Class A.

- .1 Antimicrobial Treatment: Additives capable of inhibiting growth of bacteria, fungi, and yeasts.
- .2 Color/Pattern: Refer to Drawings for Finish Schedule.

2.5.3 Cap-Trimmed Edges: Protective perimeter-edge trim with tight hairline joints concealing edges of panel and finish facing, finished as follows:

- .1 Steel, Painted: Finished with manufacturer's colour as selected by Consultant from manufacturer's full range.

2.5.4 Trimless Edges: Fabricate exposed panel edges so finish facing wraps uninterrupted around panel, covering edge and resulting in an installed partition with facing visible on vertical panel edges, without trim, for minimal sightlines at panel-to-panel joints.

## **2.6 Suspension Systems**

2.6.1 Tracks: Steel or aluminum with adjustable steel hanger rods for overhead support, designed for operation, size, and weight of operable panel partition indicated. Size track to support partition operation and storage without damage to suspension system, operable panel partitions, or adjacent construction. Limit track deflection to no more than 2.54 mm (0.10 inch) between bracket supports. Provide a continuous system of track sections and accessories to accommodate configuration and layout indicated on Drawings and Schedules for partition operation and storage.

- .1 Panel Guide: Aluminum guide on both sides of the track to facilitate straightening of the panels; finished with factory-applied, decorative, protective finish.
- .2 Head Closure Trim: As required for acoustical performance; with factory-applied, decorative, protective finish.

2.6.2 Carriers: Trolley system as required for configuration type, size, and weight of partition and for easy operation; with ball-bearing wheels.

- .1 Multidirectional Carriers: Capable of negotiating intersections without track switches.

2.6.3 Track Intersections, Switches, and Accessories: As required for operation, storage, track configuration, and layout indicated on

---

Drawings and Schedules for operable panel partitions, and compatible with partition assembly specified. Fabricate track intersections and switches from steel or aluminum.

- .1 Curve-and-Diverter Switches: Allow radius turns to divert panels to an auxiliary track.
  - .2 L Intersections: Allow panels to change 90 degrees in direction of travel.
  - .3 T Intersections: Allow panels to pass through or change 90 degrees to another direction of travel.
  - .4 X Intersections: Allow panels to pass through or change travel direction full circle in 90-degree increments, and allow one partition to cross track of another.
  - .5 Multidirectional Switches: Adjustable switch configuring track into L, T, or X intersections and allowing panels to be moved in all pass-through, 90-degree change, and cross-over travel direction combinations.
  - .6 Center carrier stop.
- 2.6.4 Aluminum Finish: Mill finish or manufacturer's standard, factory-applied, decorative finish unless otherwise indicated.
- 2.6.5 Steel Finish: Manufacturer's standard, factory-applied, corrosion-resistant, protective coating unless otherwise indicated.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine flooring, structural support, and opening, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of operable panel partitions.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Installation**

- 3.2.1 General: Comply with ASTM E 557 except as otherwise required by operable panel partition manufacturer's written installation instructions.
- 3.2.2 Install operable panel partitions and accessories after other finishing operations, including painting, have been completed in area of partition installation.
- 3.2.3 Install panels from marked packages in numbered sequence indicated on Shop Drawings.

- 3.2.4 Broken, cracked, chipped, deformed, or unmatched panels are not acceptable.
- 3.2.5 Broken, cracked, deformed, or unmatched gasketing or gasketing with gaps at butted ends is not acceptable.
- 3.2.6 Light-Leakage Test: Illuminate one side of partition installation and observe vertical joints and top and bottom seals for voids. Adjust partitions for alignment and full closure of vertical joints and full closure along top and bottom seals. Perform test and make adjustments before NIC testing.

### **3.3 Field Quality Control**

- 3.3.1 NIC Testing: Engage a qualified testing agency to perform tests and inspections.
  - .1 Testing Extent: Testing agency shall randomly select one operable panel partition installation(s) for testing.
  - .2 Testing Methodology: Perform testing of installed operable panel partition for noise isolation according to ASTM E 336, determined by ASTM E 413, and rated for not less than NIC indicated. Adjust and fit partitions to comply with NIC test method requirements.
- 3.3.2 An operable panel partition installation will be considered defective if it does not pass tests and inspections.
- 3.3.3 Prepare test and inspection reports.

### **3.4 Adjusting**

- 3.4.1 Adjust operable panel partitions, hardware, and other moving parts to function smoothly, and lubricate as recommended by manufacturer.
- 3.4.2 Adjust pass doors and storage pocket doors to operate smoothly and easily, without binding or warping.
- 3.4.3 Verify that safety devices are properly functioning.

### **3.5 Demonstration**

- 3.5.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain operable panel partitions.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Corner Guards work specified herein. This includes, but is not necessarily limited, to:
- .1 Corner guards and end-wall guards,
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Administrative Requirements**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
  - .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

---

**1.5     Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for the following:
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Corner Guards work and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Include construction details, material descriptions, impact strength, fire-test-response characteristics, dimensions of individual components and profiles, and finishes for each corner guard.
- 1.5.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for each corner guard showing locations and extent. Include sections, details, and attachments to other work.
- 1.5.3 Samples : Submit samples in accordance with Division 01 for each type of corner guard indicated.
- .1 Include similar Samples of accent strips and accessories involving colour selection.

**1.6     Closeout Submittals**

- 1.6.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for each corner guard to include in maintenance manuals.
- .1 Include recommended methods and frequency of maintenance for maintaining optimum condition of plastic covers under anticipated traffic and use conditions. Include precautions against using cleaning materials and methods that may be detrimental to plastic finishes and performance.

**1.7     Maintenance Material Submittals**

- 1.7.1 Supply extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
- 1.7.2 Include mounting and accessory components. Replacement materials shall be from same production run as installed units.

**1.8     Quality Assurance**

- 1.8.1 Installer Qualifications: An employer of workers trained and approved by manufacturer.
- 1.8.2 Single source responsibility: Provide components of corner guard system manufactured by same company to ensure compatibility of color, texture and physical properties.

---

**1.9 Delivery, Storage, And Handling**

1.9.1 Store corner guards in original undamaged packages and containers inside well-ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.

- .1 Maintain room temperature within storage area at not less than 21 deg C (70 deg F) during the period plastic materials are stored.
- .2 Keep plastic sheet material out of direct sunlight.
- .3 Store plastic corner guard components for a minimum of 72 hours, or until plastic material attains a minimum room temperature of 21 deg C (70 deg F).
  - .1 Store corner-guard covers in a vertical position.

**1.10 Project Conditions**

1.10.1 Environmental Limitations: Do not deliver or install corner guards until building is enclosed and weatherproof, wet work is complete and dry, and HVAC system is operating and maintaining temperature at 21 deg C (70 deg F) for not less than 72 hours before beginning installation and for the remainder of the construction period.

**1.11 Warranty**

1.11.1 Extended Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of corner guards that fail in materials or workmanship within specified warranty period.

- .1 Failures include, but are not limited to, the following:
  - .1 Structural failures.
  - .2 Deterioration of plastic and other materials beyond normal use.
- .2 Warranty Period: 3 years from date of Substantial Performance of the Work.

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Construction Specialties, Inc; [www.c-sgroup.com](http://www.c-sgroup.com)
- .2 InPro Corporation.; [www.inprocorp.com](http://www.inprocorp.com)
- .3 Korogard Wall Protection Systems; <http://www.koroguard.com>

.4 Pawling Corporation. <http://www.pawling.com>

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Regulatory Requirements**

2.2.1 Surface-Burning Characteristics: Provide corner guards with surface-burning characteristics as determined by testing identical products per CAN/ULC-S102/S102.2:

- .1 Flame spread 25 or less;
- .2 Smoke development 150 or less.

2.2.2 Regulatory Requirements: Comply with applicable provisions in CSA B651.

## **2.3 Design And Performance Requirements**

2.3.1 As far as practical and unless otherwise indicated, Provide PVC-free corner guard materials at all locations except egress corridors as required to meet fire-resistance characteristics stipulated by authorities having jurisdiction.

- .1 At egress corridors, a minimal amounts of PVC-based corner guard materials if permitted to comply with requirements of Authorities Having Jurisdiction.

2.3.2 Ensure corner guard systems do not contain materials capable of supporting growth of bacteria, fungi or other disease-causing organism, or encourage the harbourage of insects or mites.

2.3.3 Use components containing which retard mildew and bacterial growth.

2.3.4 Ensure corner guard systems do not, to any appreciable degree, develop or discharge any electrostatic charge.

2.3.5 Final securement method to be selected based upon construction of supporting wall or partition and manufacturer's recommendations. Provide additional reinforcing as required, fastenings, and necessary anchorage for building in of products. Coordinate with Section 05 50 00 and Section 09 21 16.

2.3.6 Ensure manufactured units do not have attached plates, or imprinted or labeled with manufacturer's name or trademark.

2.3.7 Ensure edges of sheet metal which are accessible to users or maintenance personnel are pneumatically sanded to yield smooth safe edges with no sharpness.

2.3.8 Verify that installed products function properly, and adjust them accordingly to ensure satisfactory operation.

---

**2.4     Stainless Steel Corner Guards**

2.4.1 Flush-Mounted, Stainless Steel Corner Guards: Fabricated from one-piece, formed Type 304 stainless steel with formed edges.

- .1 Material Tag: This item is noted as "CG-01" on Drawings and Schedules.
- .2 Thickness: Minimum 1.6 mm (0.0625 inch).
- .3 Height: 1500 mm (60 inches)
- .4 Finish: Directional satin, No. 4
- .5 Mounting: Manufacturer's standard adhesive.
- .6 Basis-of-Design: "SSCG-FM" by Inpro Corp or approved equivalent.

2.4.2 Surface-Mounted, Stainless Steel Corner Guards : Fabricated from one-piece, formed Type 304 stainless steel with formed edges.

- .1 Material Tag: This item is noted as "CG-02" on Drawings and Schedules.
- .2 Thickness: Minimum 1.6 mm (0.0625 inch).
- .3 Height: 1500 mm (60 inches)
- .4 Finish: Directional satin, No. 4
- .5 Mounting: Manufacturer's standard adhesive.
- .6 Basis-of-Design Products:
  - .1 90 deg: "CO-8 (89 mm wing)" by Construction Specialties or approved equivalent.
  - .2 135 deg: "CO-8M (89 mm wing)" by Construction Specialties Ltd.
  - .3 End-of-wall Protector: "SCO-8 (89 mm wing)" by Construction Specialties Ltd.

**2.5     Accessories**

2.5.1 Fasteners: Concealed aluminum, nonmagnetic stainless-steel, or other noncorrosive metal screws, bolts, and other fasteners compatible with items being fastened. Exposed fasteners are not permitted.

2.5.2 Adhesive: As recommended by impact-resistant plastic corner guard manufacturer and that complies with sustainability objectives of the project.

**2.6     Fabrication**

2.6.1 Fabricate corner guards to comply with requirements indicated for design, dimensions, and member sizes, including thicknesses of components.

- 2.6.2 Fit and assemble work of this Section in shop where possible. Execute according to details and reviewed Shop Drawings. Where shop fabrication is not possible, execute trial assembly in shop.
- 2.6.3 Fabricate finished work free from distortion, weld splatter and defects detrimental to appearance and performance.
- 2.6.4 Do not expose trademarks or labels on finished surfaces.
- 2.6.5 Fabricate components with tight seams and joints with exposed edges rolled. Provide surfaces free of wrinkles, chips, dents, uneven coloration, and other imperfections. Fabricate members and fittings to produce flush, smooth, and rigid hairline joints.

## **2.7 Finishes**

- 2.7.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
  - .1 Remove tool and die marks and stretch lines, or blend into finish.
  - .2 Grind and polish surfaces to produce uniform finish, free of cross scratches.
  - .3 Run grain of directional finishes with long dimension of each piece.
  - .4 When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
- 2.7.2 Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation.
- 3.1.2 Verify gypsum board substrate smooth, plumb and true, free of waves bulges and within tolerances specified in Section 09 21 16.
- 3.1.3 Examine walls to which impact-resistant corner guard will be attached for blocking, grounds, and other solid backing that have been installed in the locations required for secure attachment of support fasteners.

- 3.1.4 For corner guards attached with adhesive or foam tape, verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.
- 3.1.5 Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2      Preparation**

- 3.2.1 Ensure substrate is dry, well-sealed and free of dirt, loose paint, wax and grease. Glossy surfaces may require sanding or priming before installation to help promote adhesion.
- 3.2.2 Complete finishing operations, including painting, before installing impact-resistant corner guard system components.
- 3.2.3 Before installation, clean substrate to remove dust, debris, and loose particles.

### **3.3      Installation**

- 3.3.1 Conform to manufacturer's printed instructions for accurate, secure installation.
- 3.3.2 Provide work of this Section true to dimensions, square, plumb, level and free from distortion or defects detrimental to appearance and performance.
- 3.3.3 Provide work of this Section tightly fitted and level and flush to adjacent surfaces and components.
- 3.3.4 Insulate between dissimilar metals, and metal and masonry materials to prevent electrolysis.
- 3.3.5 Install corner guards in locations and at mounting heights indicated on Drawings and Schedules.
- 3.3.6 Provide splices, mounting hardware, anchors, and other accessories required for a complete installation.
- 3.3.7 Provide anchoring devices to withstand imposed loads. Provide all necessary reinforcing, including but not limited to steel stud backup and securely fasten components to suit design requirements.
- 3.3.8 Adjust end and top caps as required to ensure tight seams.
- 3.3.9 Install top and edge moldings, corners, and divider bars as required for a complete installation.
- 3.3.10 Remove material showing evidence of coming loose or showing any blisters, imperfect seams, wrinkles, dried adhesive, or other imperfections, and apply new material.

**3.4     Cleaning**

- 3.4.1 Immediately after completion of installation, clean covers and accessories using a standard, ammonia-based, household cleaning agent.

**3.5     Protection**

- 3.5.1 Cover finished surfaces and protect exposed corners and areas vulnerable to damage by persons or by movement of materials, tools or equipment.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Protective Wall Covering work specified herein. This includes, but is not necessarily limited, to:
  - .1 Sheet wall protection (stainless steel)
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Administrative Requirements**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
  - .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

---

**1.5     Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for the following:
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Protective Wall Covering work and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Include construction details, material descriptions, impact strength, fire-test-response characteristics, dimensions of individual components and profiles, and finishes for each impact-resistant wall protection unit.
- 1.5.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for each impact-resistant wall protection unit showing locations and extent. Include sections, details, and attachments to other work.
- 1.5.3 Samples : Submit samples in accordance with Division 01 for each type of impact-resistant wall protection unit indicated.
- .1 Include similar Samples of accent strips and accessories involving colour selection.

**1.6     Closeout Submittals**

- 1.6.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for each impact-resistant wall protection unit to include in maintenance manuals.
- .1 Include recommended methods and frequency of maintenance for maintaining optimum condition of plastic covers under anticipated traffic and use conditions. Include precautions against using cleaning materials and methods that may be detrimental to plastic finishes and performance.

**1.7     Quality Assurance**

- 1.7.1 Installer Qualifications: An employer of workers trained and approved by manufacturer.
- 1.7.2 Single source responsibility: Provide components of wall protection system manufactured by same company to ensure compatibility of color, texture and physical properties.
- 1.7.3 Mock-ups: Provide Mock-ups in locations designated by Consultant and as required to demonstrate quality of workmanship. Maintain Mock-ups during construction in an undisturbed condition as a standard for judging the completed work.

**1.8 Delivery, Storage, And Handling**

1.8.1 Store impact-resistant wall protection units in original undamaged packages and containers inside well-ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.

- .1 Maintain room temperature within storage area at not less than 21 deg C (70 deg F) during the period plastic materials are stored.
- .2 Keep plastic sheet material out of direct sunlight.
- .3 Store plastic wall protection components for a minimum of 72 hours, or until plastic material attains a minimum room temperature of 21 deg C (70 deg F).

**1.9 Project Conditions**

1.9.1 Environmental Limitations: Do not deliver or install impact-resistant wall protection units until building is enclosed and weatherproof, wet work is complete and dry, and HVAC system is operating and maintaining temperature at 21 deg C (70 deg F) for not less than 72 hours before beginning installation and for the remainder of the construction period.

**1.10 Warranty**

1.10.1 Extended Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of impact-resistant wall protection units that fail in materials or workmanship within specified warranty period.

- .1 Failures include, but are not limited to, the following:
  - .1 Structural failures.
  - .2 Deterioration of plastic and other materials beyond normal use.
- .2 Warranty Period: 3 years from date of Substantial Performance of the Work.

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Construction Specialties, Inc; [www.c-sgroup.com](http://www.c-sgroup.com)
- .2 InPro Corporation.; [www.inprocorp.com](http://www.inprocorp.com)
- .3 Korogard Wall Protection Systems; <http://www.koroguard.com>

.4 Pawling Corporation. <http://www.pawling.com>

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Regulatory Requirements**

2.2.1 Surface-Burning Characteristics: Provide impact-resistant, plastic wall protection units with surface-burning characteristics as determined by testing identical products per CAN/ULC-S102/S102.2

.1 Flame spread 25 or less;

.2 Smoke development 150 or less.

2.2.2 Regulatory Requirements: Comply with applicable provisions in CSA B651.

## **2.3 Design And Performance Requirements**

2.3.1 As far as practical and unless otherwise indicated, Provide PVC-free wall protection materials at all locations except egress corridors as required to meet fire-resistance characteristics stipulated by authorities having jurisdiction.

.1 At egress corridors, use minimal amounts PVC-based wall protection materials as indicated on Drawings and Schedules.

2.3.2 Ensure wall protection systems do not contain materials capable of supporting growth of bacteria, fungi or other disease causing organism, or encourage the harbourage of insects or mites.

2.3.3 Use components containing which retard mildew and bacterial growth.

2.3.4 Ensure wall protection systems do not, to any appreciable degree, develop or discharge any electrostatic charge.

2.3.5 Final securement method to be selected based upon construction of supporting wall or partition and manufacturer's recommendations. Provide additional reinforcing as required, fastenings, and necessary anchorage for building in of products. Coordinate with Section 05 50 00 and Section 09 21 16.

2.3.6 Ensure manufactured units do not have attached plates, or imprinted or labeled with manufacturer's name or trademark.

2.3.7 Ensure edges of sheet metal which are accessible to users or maintenance personnel are pneumatically sanded to yield smooth safe edges with no sharpness.

2.3.8 Verify that installed products function properly, and adjust them accordingly to ensure satisfactory operation.

---

**2.4     Stainless Steel Wall Protection**

- 2.4.1 Material Tag: This item is noted as "WP" on Drawings and Schedules.
- 2.4.2 ASTM A240, High impact, rigid sheet stainless steel wall cladding, with matching wall covering accessory trim pieces, outside edge caps, joint covers, inside corner and outside corners.
  - .1 Sheet Size: Maximum practical sizes to minimize seams unless otherwise indicated on Drawings.
  - .2 Sheet Thickness: Minimum 1.2 mm (18 ga.)
  - .3 Height: 1200 mm (48 inches)
  - .4 Installation: mounted to substrates using adhesive methods. Use of exposed fasteners is not acceptable.
  - .5 Trim: Manufacturer's standard, matching moldings and trim complete with division bars between panels, inside and outside corners and cap mouldings as required for complete installation.
  - .6 Finish: AISI No. 4, brushed finish.
  - .7 Acceptable Products: "SS Wall Panels" by InPro Corporation

**2.5     Accessories**

- 2.5.1 Provide Prefabricated, injection-molded or otherwise matching end caps and inside and outside corners with concealed splices, cushions, mounting hardware, division bars between panels, and other accessories as required.
- 2.5.2 Fasteners: Concealed aluminum, nonmagnetic stainless-steel, or other noncorrosive metal screws, bolts, and other fasteners compatible with items being fastened. Exposed fasteners are not permitted.
- 2.5.3 Adhesive: As recommended by impact-resistant manufacturer and that complies with sustainability objectives of the project.

**2.6     Fabrication**

- 2.6.1 Fabricate impact-resistant wall protection units to comply with requirements indicated for design, dimensions, and member sizes, including thicknesses of components.
- 2.6.2 Fit and assemble work of this Section in shop where possible. Execute according to details and reviewed Shop Drawings. Where shop fabrication is not possible, execute trial assembly in shop.
- 2.6.3 Fabricate finished work free from distortion, weld splatter and defects detrimental to appearance and performance.
- 2.6.4 Do not expose trademarks or labels on finished surfaces.

- 2.6.5 Fabricate components with tight seams and joints with exposed edges rolled. Provide surfaces free of wrinkles, chips, dents, uneven coloration, and other imperfections. Fabricate members and fittings to produce flush, smooth, and rigid hairline joints.

## **2.7 Finishes**

- 2.7.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
  - .1 Remove tool and die marks and stretch lines, or blend into finish.
  - .2 Grind and polish surfaces to produce uniform finish, free of cross scratches.
  - .3 Run grain of directional finishes with long dimension of each piece.
  - .4 When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
- 2.7.2 Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation.
- 3.1.2 Verify gypsum board substrate is smooth, plumb and true, free of waves bulges and within tolerances specified in Section 09 21 16.
- 3.1.3 Examine walls to which impact-resistant wall protection will be attached for blocking, grounds, and other solid backing that have been installed in the locations required for secure attachment of support fasteners.
- 3.1.4 For impact-resistant wall protection units attached with adhesive or foam tape, verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.
- 3.1.5 Proceed with installation only after unsatisfactory conditions have been corrected.

---

**3.2      Preparation**

- 3.2.1 Ensure substrate is dry, well-sealed and free of dirt, loose paint, wax and grease. Glossy surfaces may require sanding or priming before installation to help promote adhesion.
- 3.2.2 Complete finishing operations, including painting, before installing impact-resistant wall protection system components.
- 3.2.3 Before installation, clean substrate to remove dust, debris, and loose particles.

**3.3      Installation**

- 3.3.1 Conform to manufacturer's printed instructions for accurate, secure installation.
- 3.3.2 Provide work of this Section true to dimensions, square, plumb, level and free from distortion or defects detrimental to appearance and performance.
- 3.3.3 Provide work of this Section tightly fitted and level and flush to adjacent surfaces and components.
- 3.3.4 Insulate between dissimilar metals, and metal and masonry materials to prevent electrolysis.
- 3.3.5 Install impact-resistant wall protection units level, plumb, and true to line without distortions. Do not use materials with chips, cracks, voids, stains, or other defects that might be visible in the finished Work.
- 3.3.6 Install impact-resistant wall protection units in locations and at mounting heights indicated on Drawings and Schedules.
- 3.3.7 Provide splices, mounting hardware, anchors, and other accessories required for a complete installation.
- 3.3.8 Provide anchoring devices to withstand imposed loads. Provide all necessary reinforcing including but not limited to steel stud backup and securely fasten components to suit design requirements.
- 3.3.9 Adjust end and top caps as required to ensure tight seams.
- 3.3.10 Install top and edge moldings, corners, and divider bars as required for a complete installation.
- 3.3.11 Apply sheet wall protection covering in maximum widths carefully matched for colour, pattern, texture. Avoid shading. Thoroughly wash off excess adhesive from material and adjoining surfaces as work proceeds.
- 3.3.12 Neatly and closely fit wall protection materials around switches, light outlets, grilles, trim and similar items. Carry wall covering into reveals, jambs, and heads of openings.

- 3.3.13 Take care to ensure wall protection coverings are fully on the wall at inside corners, without coving or subsequently pulling away from the wall.
- 3.3.14 Apply material to outside corners in a manner which will prevent gathering of air beneath the material on each side of the corner. No joints are allowed within 150 mm (6") of any corner.
- 3.3.15 Remove material showing evidence of coming loose or showing any blisters, imperfect seams, wrinkles, dried adhesive, or other imperfections, and apply new material.

**3.4     Cleaning**

- 3.4.1 Immediately after completion of installation, clean plastic covers and accessories using a standard, ammonia-based, household cleaning agent.
- 3.4.2 Remove excess adhesive using methods and materials recommended in writing by manufacturer.

**3.5     Protection**

- 3.5.1 Cover finished surfaces and protect exposed corners and areas vulnerable to damage by persons or by movement of materials, tools or equipment.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the washroom accessories work specified herein. This includes, but is not necessarily limited, to:
  - .1 Commercial Washroom Accessories
  - .2 Hygiene and Custodial Accessories
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Submittals**

- 1.4.1 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for washroom accessories work specified in this Section.
- 1.4.2 Schedule: Submit washroom accessory schedule, indicating the type and quantity to be installed in each washroom. Use room numbers as indicated on the Drawings.

---

**1.5 Closeout Submittals**

- 1.5.1 Operating and Maintenance Data: Submit care and maintenance instructions for washroom accessories to be included in building operation and maintenance manual.

**1.6 Quality Assurance**

- 1.6.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.6.2 Single Source Responsibility: Provide products of same manufacturer for each type of accessory unit and for units exposed to view in same areas, unless otherwise acceptable to Consultant. Key units alike unless indicated otherwise.

**1.7 Delivery, Storage, And Handling**

- 1.7.1 Deliver, store and handle materials and products in strict compliance with manufacturer's instructions and recommendations. Protect from damage.
- 1.7.2 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.7.3 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.7.4 Replace defective or damaged materials with new.

**1.8 Warranty**

- 1.8.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of washroom accessories that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
- .1 Warranty Period for Mirrors: 10 years from date of Substantial Performance of The work.
  - .2 Warranty Period for Hand Dryers: 5 years from date of Substantial Performance of The work.
  - .3 Other accessories: Manufacturer's standard.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 ASI Group Canada;
- .2 Bobrick Washroom Equipment of Canada Ltd.;
- .3 Frost Products Limited;

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Regulatory Requirements**

2.2.1 Accessibility Requirements: Comply with requirements applicable in the jurisdiction of the project, including but not limited to CSA B651 and OBC requirements as applicable.

## **2.3 Design/Performance Requirements**

2.3.1 Stainless Steel Quality: Use high-quality stainless steel (Type 304 or Type 302) for washroom accessories. Provide ANSI No. 4 mechanical brushed finish unless indicated otherwise. Ensure vertical grain direction for visual consistency and ease of cleaning. Maintain consistency in components. Provide material thicknesses as specified.

2.3.2 Reinforcing Material: Use commercial quality cold rolled galvanized sheet steel (ASTM A653/A653M) with zinc coating designation Z275 (G90). Minimum thickness: 0.912 mm (20 gauge).

2.3.3 Provide specified washroom accessories with indicated options. Verify model numbers before installation.

2.3.4 Accommodation for Semi-recessed Mounting: Provide stainless steel collars for semi-recessed mounting when unit depth exceeds wall cavity depth. Ensure flush appearance in the finished Work.

2.3.5 Anti-Tampering Measures: Provide unobtrusive anti-tampering design features to prevent theft or damage.

2.3.6 Compliance with Accessibility Guidelines: Install accessories at heights and locations that comply with barrier-free codes and guidelines including, but not limited to the OBC and CSA B651.

2.3.7 Durability and Lifespan: Provide accessories designed for high-usage environments. Ensure accessories are resistant to cleaning chemicals.

2.3.8 Ease of Maintenance: Design accessories for easy maintenance. Accessories must simplify supply of replenishment and replacement or repair processes for parts.

## **2.4 Grab Bars**

2.4.1 Manufacturer's standard grab bar with following characteristics:

- .1 Material: Type-304 stainless steel

- .2 Finish: Satin
- .3 Surface: Slip-resistant
- .4 Wall Thickness: 1.2mm (18-gauge)
- .5 Outside Diameter: 38mm (1-1/2") unless indicated otherwise.
- .6 Clearance from wall: 38mm (1-1/2")
- .7 Mounting Flanges: Concealed, stainless steel plate with 0.8mm (22-gauge) flange covers.
- 2.4.2 Straight Grab Bar (WA1.1, WA1.2, WA1.3):
  - .1 Length: 600mm (24 inches)
  - .2 Acceptable Products:
    - .1 Model No. B-5806 by Bobrick
- 2.4.3 L-Shaped Grab Bar, 90 deg Grab Bar (WA1.4):
  - .1 Size: 762 mm x 762 mm (30 in x 30 in)
  - .2 Acceptable Products:
    - .1 Model No. B-6898.99 by Bobrick
    - .2 Model No. 3807-4P by ASI Group Canada.
    - .3 Model No 1003-P by Frost
- 2.4.4 Swing up Grab Bar (WA1.5):
  - .1 Outside diameter: 32 mm (1-1/4 in)
  - .2 Size: 762 mm (30 in)
  - .3 Acceptable Products:
    - .1 Model No. B-4998.99 by Bobrick
    - .2 Model No. 3513P by ASI Group Canada.
    - .3 Model No 1055-S by Frost

## **2.5 Mirrors (WA17.1)**

- 2.5.1 One-piece mirror with satin-finished Type 304 stainless steel frame with polished corners, beveled mirror edge, galvanized steel back, theft-resistant mounting, and concealed wall hanger.
  - .1 Hanging Brackets: Integral horizontal hanging brackets located at top and bottom.
  - .2 Glass: Minimum 6 mm (1/ in) No.1 quality float glass
  - .3 Mounting: Concealed wall hanger to prevent mirror from pulling away from wall.
  - .4 Mirror Size: 460 mm x 910 mm (18 in x 36 in)
  - .5 Acceptable Products:
    - .1 Model No. B-2908 by Bobrick

---

**2.6     Sanitary Napkin Vendor (WA 8.1)**

2.6.1 Napkin/tampon vendor with mechanical operation, no batteries or electricity required, allowing for dispensing of sanitary napkins and tampons with following characteristics:

- .1 Dispensing Mechanisms: Combination for sanitary napkins and tampons.
- .2 Operation: Mechanical, no batteries or electricity required.
- .3 Field Convertibility: Convertible for changing coin denomination.
- .4 Construction: All-welded, Type-304 stainless steel, #4 satin finish.
- .5 Flange: Adjustable escutcheon type, semi- or fully recessed installation.
- .6 Door: 1.2mm (18-gauge), three 90° return edges, bottom edge hemmed.
- .7 Hinge: Concealed, full-length stainless steel piano hinge
- .8 Locks: Two tumbler locks, keyed like other washroom accessories
- .9 Coin Box: Equipped with tumbler lock, keyed differently than door locks.

2.6.2 Acceptable Products:

- .1 Model No. B-3500 by Bobrick or approved equivalent as follows:
- .2 Mode No. 6468 by ASI.

**2.7     Sanitary Napkin Disposal (WA5.1):**

2.7.1 Type-304 stainless steel sanitary napkin disposal with all-welded construction, satin finish, tumbler lock, self-closing panel, and removable 0.7-gal capacity polyethylene receptacle.

- .1 Toilet Partition Mounted Type:
  - .1 Model No. B-4354 by Bobrick
  - .2 Model No. 6471 by ASI

**2.8     Waste Paper Receptacle (WA 5.2)**

2.8.1 Recessed waste receptacle with following characteristics:

- .1 Material: Type-304 stainless steel with welded construction
- .2 Finish: Satin finish on exposed surfaces
- .3 Waste Receptacle: Minimum capacity of 45.5-L (12-gal.).
- .4 Acceptable Products:
  - .1 Model No. B-35643 by Bobrick

---

**2.9      Combination Paper Towel Dispenser/ Waste Receptacle (WA2.1)**

2.9.1 Recessed paper towel dispenser and waste receptacle capable of dispensing C-fold or multifold paper towels with following characteristics:

- .1 Material: Type-304 stainless steel with welded construction
- .2 Finish: Satin finish on exposed surfaces
- .3 Waste Receptacle: Minimum capacity of 6.1-L (1.6-gal.).
- .4 Acceptable Products:
  - .1 Model No. B-36903 by Bobrick

**2.10     Paper Towel Dispenser**

2.10.1 Roll Paper Towel Dispenser (Automatic) (WA3.2):

- .1 Partition-mounted automatic roll paper towel dispenser, Type 304 stainless steel, all welded construction. Dispenses jumbo non-perforated rolls with adjustable paper length and delay settings.
- .2 Dispensing Mechanism: Towels are automatically dispensed when hands are placed under opening.
- .3 Power: Input 120 volt AC, output 6 volt DC power supply, hardwired to building.
- .4 Basis-of-Design: "109-70S" by Frost or approved equivalent.

2.10.2 Roll Paper Towel Dispenser (Manual) (WA3.3):

- .1 Surface-mounted roll-paper-towel dispenser with touch-free pull mechanism and durable resin construction.
- .2 Material: Type-304 stainless steel with welded construction
- .3 Finish: Satin finish on exposed surfaces
- .4 Acceptable Products:
  - .1 Model No. B-4262 by Bobrick

**2.11     Toilet Tissue Dispensers (WA3.1)**

2.11.1 Toilet Tissue Dispenser, Twin Jumbo Roll:

- .1 Type-304 stainless steel, partition-mounted dual-sided, multi-roll toilet tissue dispenser with high-impact ABS spindles and heavy-duty internal springs.
- .2 Basis-of-Design: "Model B-2892" by Bobrick or approved equivalent.

**2.12     Automatic Soap Dispenser (WA9.1)**

2.12.1 Capacity: 1000 mL or 1200 mL cartridge.

2.12.2 Soap Level Indicator: Equipped with a transparent cover to monitor the amount of soap available in the dispenser.

2.12.3 Basis-of-Design: "TF2CHR" by DEB or approved equivalent.

**2.13 Shower Soap Dispenser (WA9.2)**

2.13.1 Surface-mounted soap dispenser, Type 316 stainless steel body with satin finish.

2.13.2 Valve: Black molded plastic push button.

2.13.3 Operation Force: 22.2N (5 pounds)

2.13.4 Capacity: 1.2 L (40 fl oz)

2.13.5 Acceptable Products:

.1 Model No. B-818615 by Bobrick

**2.14 Hand Sanitizer Dispenser (WA9.3)**

2.14.1 Automatic wall-mounted soap-sanitizer dispenser, Type 304 stainless steel with satin finish.

2.14.2 Capacity: 850 mL (30 fl oz)

2.14.3 Soap Level Indicator: Equipped with clear acrylic refill-indicator window.

2.14.4 Acceptable Products:

.1 Model No. B-2012 by Bobrick

**2.15 Robe / Clothing Hooks (WA13.2)**

2.15.1 Double Robe Hook: Type-304 stainless steel satin finish with minimum 22 gauge (0.8mm), flange, concealed mounting bracket secured to wall plate with stainless steel setscrew and caps.

.1 Acceptable Products:

.1 Model 842.34.010. by Haefele

**2.16 Baby Changing Station (WA11.1)**

2.16.1 ASTM F2285, Surface-mounted baby changing station with controlled opening/closing, and no exposed hinges.

.1 Exterior: 18-gauge satin stainless steel.

.2 Interior: high-density polyethylene.

.3 Operation: Concealed pneumatic cylinder for controlled opening/closing.

.4 Straps: Replaceable, snap-lock, nylon.

.5 Load Capacity: Load capacity: Not less than 1.33 kN (298 lbs-f)

.6 Instructions: Universal graphics, multiple languages.

.7 Braille Label: Required.

2.16.2 Acceptable Products: "Model No. KB110-SSRE" by Koala Kare Products or approved equivalent.

**2.17 Folding Shower Seats (WA10.1)**

2.17.1 Folding shower seat with one-piece solid plastic laminate seat designed to lock in upright position when not in use with following characteristics:

- .1 Capacity: Designed to support 227 kg (500 lbs) in compliant installations.
- .2 Seat Thickness: 8mm (5/16")
- .3 Seat Surface: Plastic laminate matte-finish melamine with ivory-colored face sheets and black phenolic-resin core
- .4 Seat Attachment: Secured to frame with stainless steel carriage bolts and acorn nuts.
- .5 Acceptable Products:
  - .1 "Model B-5191" by Bobrick

**2.18 Mop Rack With Shelf (WA14.2)**

2.18.1 Description: Type 304 satin finish stainless steel, wall-mounted shelf with mop holders.

- .1 Shelf dimensions: 1.2mm (18 gauge) thickness, 205mm (8") deep
- .2 Edges: 19mm (3/4") return edges, front edge hemmed for safety
- .3 Acceptable Products:
  - .1 "Model No. B-239" by Bobrick Washroom Equipment

**2.19 Shower Curtain Rods With Curtains (WA12.1)**

2.19.1 Extra-heavy-duty shower curtain rod manufactured from Type 304, 18-8 stainless steel with 25 mm (1 inch) O.D. tubing with satin finish complete with curtain hooks and and shower curtain.

2.19.2 Acceptable Products:

- .1 "Model No. B-207 (Shower Curtain Rod) complete with B-204-2 (Shower Curtain) and B-204-1 (Shower Curtain Hooks)" by Bobrick Washroom Equipment

**2.20 Shower Shelf (WA12.2)**

2.20.1 Description: wall-mounted stainless-steel shelf with 18-gauge thickness and welded mounting brackets and hemmed front edges.

- .1 Shelf Depth: 205mm (8 inches)
- .2 Shelf size: 406 mm (16 inches)

---

2.20.2 Acceptable Products:

- .1 "Model No. B-295" by Bobrick

**2.21 Janitor's Shelf (WA13.4)**

2.21.1 Description: wall-mounted stainless-steel shelf with 18-gauge thickness and welded mounting brackets and hemmed front edges.

- .1 Shelf Depth: 205mm (8 inches)
- .2 Shelf size: 610 mm (24 inches)

2.21.2 Acceptable Products:

- 2.21.3 "Model No. B-298-24" by Bobrick

**2.22 Automatic Hand Dryer (WA7.1)**

2.22.1 Construction: Polycarbonate casing and anti-tamper fasteners; water ingress protection: IP24.

2.22.2 Mounting: Surface mounted on ABS/PBT plastic backplate/mounting bracket, maximum 100 mm (4 in) projection from wall.

2.22.3 Filtration: 99.97% particulate efficiency HEPA filter with anti-microbial coating.

2.22.4 Operation: Touch-free capacitive sensor activation,

2.22.5 Hand dry time: 12 seconds or less.

2.22.6 Rated operating noise power: 79 db(A) or less.

2.22.7 Electrical Requirements: 110-127 V AC, 12 A, 1000 W. Coordinate with Division 26, Electrical; Standby Power Consumption: <0.5 W.

2.22.8 Acceptable Products: "Airblade V Electric hand dryer" (Model HU02); Item No. 307174-01 (sprayed nickel LV) by Dyson.

**2.23 Fabrication**

2.23.1 Fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with full-length, continuous hinges. Equip units for concealed anchorage and with corrosion-resistant backing plates.

2.23.2 Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to Owner.

---

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Prior to commencing work, verify actual site conditions and location of adjacent materials. Notify appropriate parties in writing of conditions that may compromise proper installation of materials.
- 3.1.2 Do not begin activities of this Section until unacceptable conditions have been resolved.

#### **3.2 Installation**

- 3.2.1 Install accessories according to manufacturers' written instructions, using fasteners appropriate to substrate indicated on Drawings and Schedules and recommended by unit manufacturer, including the following:
  - .1 Verify blocking has been installed properly.
  - .2 Verify location does not interfere with door swings or use of fixtures.
  - .3 Comply with manufacturer's recommendations for backing and proper support.
  - .4 Use fasteners and anchors suitable for substrate and project conditions.
  - .5 Install units rigid, straight, plumb, and level, in accordance with manufacturer's installation instructions and approved shop drawings.
  - .6 Conceal evidence of drilling, cutting, and fitting to room finish.
  - .7 Test for proper operation.
- 3.2.2 Grab Bars: Install to withstand a downward load of at least 1.3 kN (293 lbf), when tested according to ASTM F 446.

#### **3.3 Cleaning And Protection**

- 3.3.1 Clean exposed surfaces of compartments, hardware, and fittings using methods acceptable to the manufacturer.
- 3.3.2 Touch-up, repair or replace damaged products until Substantial Performance of the Work.

#### **3.4 Adjusting And Cleaning**

- 3.4.1 Adjust accessories for unencumbered, smooth operation. Replace damaged or defective items.
- 3.4.2 Remove temporary labels and protective coatings.
- 3.4.3 Clean and polish exposed surfaces according to manufacturer's written recommendations.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Documents**

- 1.1.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

**1.2 Summary**

- 1.2.1 Section Includes:
- .1 Knocked-down corridor lockers.

**1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.4 Preinstallation Meetings**

- 1.4.1 Preinstallation Conference: Conduct conference at Project site.

**1.5 Action Submittals**

- 1.5.1 Product Data: For each type of product.
- .1 Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of metal locker.
- 1.5.2 Shop Drawings: For metal lockers.
- .1 Include plans, elevations, sections, and attachment details.
  - .2 Show locker trim and accessories.
  - .3 Include locker identification system and numbering sequence.
- 1.5.3 Samples: For each colour specified, in manufacturer's standard size.
- 1.5.4 Samples for Initial Selection: Manufacturer's colour charts showing the full range of colours available.
- 1.5.5 Samples for Verification: For the following products, in manufacturer's standard size:
- .1 Lockers and equipment.
- 1.5.6 Product Schedule: For lockers.

---

**1.6 Informational Submittals**

- 1.6.1 Sample Warranty: Submit sample warranties in accordance with Division 01 for special warranties specified in this section..

**1.7 Closeout Submittals**

- 1.7.1 Maintenance Data: For adjusting, repairing, and replacing locker doors and latching mechanisms to include in maintenance manuals.

**1.8 Maintenance Material Submittals**

- 1.8.1 Supply extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

- .1 The following metal locker hardware items equal to 10 percent of amount installed for each type and finish installed, but no fewer than five units:

- .1 Locks.
- .2 Blank identification plates.
- .3 Hooks.

**1.9 Quality Assurance**

- 1.9.1 Source Limitations: Obtain metal lockers and accessories from single source from single locker manufacturer.

- .1 Obtain locks from single lock manufacturer.

**1.10 Delivery, Storage, And Handling**

- 1.10.1 Do not deliver metal lockers until spaces to receive them are clean, dry, and ready for their installation.

**Field Conditions**

- 1.10.2 Field Measurements: Verify actual dimensions of recessed openings by field measurements before fabrication.

**1.11 Coordination**

- 1.11.1 Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of work specified in other Sections to ensure that metal lockers can be supported and installed as indicated.

**1.12 Warranty**

- 1.12.1 Extended Warranty: Repair or replace components of metal lockers that fail in materials or workmanship, excluding finish, within specified warranty period.

- .1 Failures include, but are not limited to, the following:
  - .1 Structural failures.
  - .2 Faulty operation of latches and other door hardware.
- .2 Damage from deliberate destruction and vandalism is excluded.
- .3 Warranty Period for Knocked-Down Metal Lockers: Ten years from date of Substantial Performance of the Work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 ASI Group Canada.
  - .2 Dasco Storage Solutions.
  - .3 Hadrian Inc.
  - .4 General Storage Systems
  - .5 Shanahan's Limited
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Design And Performance Requirements**

- 2.2.1 Accessibility Standard: For lockers indicated to be accessible, comply with applicable provisions in CSA B651.
- 2.2.2 Build lockers on a unit principle with common intermediate uprights separating units.
- 2.2.3 Fabricate metal lockers by assembling at Project site using manufacturer's nuts, bolts, screws, or rivets.
- 2.2.4 Locker Configurations:
  - .1 As indicated on Drawings.

### **2.3 Materials**

- 2.3.1 Cold-Rolled Steel Sheet: ASTM A1008/A1008M, Commercial Steel (CS), Type B, suitable for exposed applications.

### **2.4 Corridor Lockers (LKR)**

- 2.4.1 Doors: 1.90-mm (0.075-inch - 14 ga) nominal-thickness steel sheet outer door panel and 0.91-mm (20 ga) inner door panel; formed into channel shape with double bend at vertical edges and with right-angle single bend at horizontal edges.

- 
- .1 Reinforcement: Manufacturer's standard reinforcing angles, channels, or stiffeners for doors more than 381 mm (15 inches) wide; welded to inner face of doors.
  - .2 Stiffeners: Manufacturer's standard full-height stiffener fabricated from not less than 1.21-mm (0.048-inch - 18 ga) nominal-thickness steel sheet; welded to inner face of doors.
  - .3 Door Style: Vented panel as follows:
    - .1 Concealed Vents: Slotted perforations in top and bottom horizontal door return flanges.
- 2.4.2 Body: Assembled by riveting or bolting body components together. Fabricate from unperforated steel sheet with thicknesses as follows:
- .1 Sloped Tops, Bottoms, and Intermediate Dividers: not less than 0.61-mm (0.024-inch - 24 ga) nominal thickness, with single bend at sides.
  - .2 Backs and Sides: not less than 0.61-mm (0.024-inch - 24 ga) nominal thickness, with full-height, double-flanged connections.
  - .3 Shelves: not less than 0.61-mm (0.024-inch - 24 ga) nominal thickness, with double bend at front and single bend at sides and back.
- 2.4.3 Door Frames: Channel formed; fabricated from not less than 1.52-mm (0.060-inch - 16 ga) nominal-thickness steel sheet; lapped and factory welded at corners; with top and bottom main frames factory welded into vertical main frames. Form continuous, integral, full-height door strikes on vertical main frames.
- .1 Cross Frames between Tiers: Channel formed and fabricated from not less than same material as main frames; welded to vertical main frames.
  - .2 Frame Vents: Fabricate face frames with vents.
- 2.4.4 Hinges: Welded to door and attached to door frame with no fewer than two factory-installed rivets per hinge that are completely concealed and tamper resistant when door is closed; fabricated to swing 180 degrees; self-closing.
- .1 Continuous Hinges: Manufacturer's standard, steel, full height.
- 2.4.5 Recessed Door Handle and Latch: Stainless steel cup with integral door pull, recessed so locking device does not protrude beyond door face; pry and vandal resistant.
- .1 Multipoint Latching: Finger-lift latch control designed for use with built-in combination locks, built-in key locks, or padlocks; positive automatic latching and prelocking.
  - .2 Latching Mechanism: Manufacturer's standard, rattle-free latching mechanism and moving components isolated to prevent metal-to-metal contact, and incorporating a prelocking

device that allows locker door to be locked while door is open and then closed without unlocking or damaging lock or latching mechanism.

2.4.6 Locks: As follows:

- .1 Combination Padlock: Key-controlled, three-number dialing combination locks; capable of five combination changes.

2.4.7 Identification Plates: Manufacturer's standard, etched, embossed, or stamped aluminum plates, with numbers and letters at least 10 mm (3/8 inch) high.

2.4.8 Equipment: Provide each locker with an identification plate and the following equipment:

- .1 Single-Tier Units : Shelf, one ceiling hook, and two wall hooks.

2.4.9 Continuous Zee Base: Fabricated from not less than 1.52-mm (0.060-inch - 16 ga) nominal-thickness steel sheet.

- .1 Height: 102 mm (4 inches) unless otherwise indicated on Drawings. .

2.4.10 Recess Trim: Fabricated from not less than 1.21-mm (0.048-inch - 18 ga) nominal-thickness steel sheet.

2.4.11 Filler Panels: Fabricated from not less than 1.21-mm (0.048-inch - 18 ga) nominal-thickness steel sheet.

2.4.12 Boxed End Panels: Fabricated from not less than 1.52-mm (0.060-inch - 16 ga) nominal-thickness steel sheet.

2.4.13 Finished End Panels: Fabricated from not less than 0.61-mm (0.024-inch - 24 ga) nominal-thickness steel sheet to cover unused penetrations and fasteners, except for perimeter fasteners, at exposed ends of nonrecessed metal lockers; finished to match lockers.

2.4.14 Center Dividers: Fabricated from not less than 0.61-mm (0.024-inch - 24 ga) nominal-thickness steel sheet.

2.4.15 Basis-of-Design: "Excalibur" as manufactured by Dasco Storage Solutions.

**2.5 Finish**

2.5.1 Manufacturer's standard 2 mm hybrid epoxy/polyester baked enamel or powder coat applied to ensure uniform thickness and baked to cure.

- .1 Colour: As selected by Consultant from manufacturer's full range.

---

**2.6      Fabrication**

- 2.6.1 Fabricate metal lockers square, rigid, without warp, and with metal faces flat and free of dents or distortion. Make exposed metal edges safe to touch and free of sharp edges and burrs.
- 2.6.2 Form body panels, doors, shelves, and accessories from one-piece steel sheet unless otherwise indicated.
- 2.6.3 Provide fasteners, filler plates, supports, clips, and closures as required for complete installation.
- 2.6.4 Fabricate each metal locker with an individual door and frame; individual top, bottom, and back; and common intermediate uprights separating compartments.
- 2.6.5 Accessible Lockers: Fabricate to conform to requirements of the Ontario Building Code and CSA B651.

**2.7      Accessories**

- 2.7.1 Interior equipment:
  - .1 Shelf at single tier lockers 1524 mm (60 inches) or higher.
  - .2 3 wall hooks and one ceiling hook in single tier lockers less than 460 mm (18 inches) deep.
  - .3 Coat rod instead of ceiling hook in single tier lockers 460 mm (18 inches) deep or more.
  - .4 3 wall hooks and one ceiling hook double tier lockers
  - .5 3 wall hooks at 305 mm (12 inch) wide triple tier lockers.
  - .6 4 wall hooks at 380 mm (15 inches) and wider triple tier lockers.
  - .7 Number Plates: Polished aluminum number plate riveted to door face with black numerals 13 mm (1/2 inch) high.
- 2.7.2 Fasteners: Zinc- or nickel-plated steel, slotless-type, exposed bolt heads; with self-locking nuts or lock washers for nuts on moving parts.
- 2.7.3 Anchors: Material, type, and size required for secure anchorage to each substrate.
  - .1 Provide nonferrous-metal or hot-dip galvanized anchors and inserts on inside face of exterior walls, and in wet areas, for corrosion resistance.
  - .2 Provide toothed-steel or lead expansion sleeves for drilled-in-place anchors.

---

### **3 .    EXECUTION**

#### **3.1    Examination**

- 3.1.1 Examine walls and floors or support bases, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- 3.1.2 Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2    Installation**

- 3.2.1 Install lockers level, plumb, and true; shim as required, using concealed shims.
  - .1 Anchor locker runs at ends and at intervals recommended by manufacturer, but not more than 910 mm (36 inches) o.c. Using concealed fasteners, install anchors through backup reinforcing plates, channels, or blocking as required to prevent metal distortion.
  - .2 Anchor single rows of metal lockers to walls near top of lockers and to floor.
  - .3 Anchor back-to-back metal lockers to floor.
- 3.2.2 Trim: Fit exposed connections of trim, fillers, and closures accurately together to form tight, hairline joints, with concealed fasteners and splice plates.

#### **3.3    Adjusting**

- 3.3.1 Clean, lubricate, and adjust hardware. Adjust doors and latches to operate easily without binding. Verify that integral locking devices operate properly.

#### **3.4    Protection**

- 3.4.1 Protect metal lockers from damage, abuse, dust, dirt, stain, or paint. Do not permit use during construction.
- 3.4.2 Touch up marred finishes, or replace metal lockers that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by locker manufacturer.

END OF SECTION

**1. GENERAL**

**1.1 Section Includes**

- 1.1.1 Provide labour, materials, products, equipment and services to complete the Exterior Sun Control Devices work specified herein. This includes, but is not necessarily limited to:
- .1 Exterior sun shades at building exterior.
  - .2 Framing and associated anchorage.
  - .3 Auxiliary materials required for a complete installation.
- 1.1.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

**1.2 References**

- 1.2.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.3 Administrative Requirements**

- 1.3.1 Pre-Installation Meetings:
- .1 Prior to starting work of this Section, convene a pre-installation meeting at the Project site to review the Project requirements and site conditions with pertinent parties. Conform to requirements of Section 01 31 00.

**1.4 Action Submittals**

- 1.4.1 Product Data: Submit in accordance with Division 01 for the following:
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Exterior Sun Control Devices work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.4.2 Product Disclosure and Transparency:
- .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
  - .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials

to at least 0.1% (1000ppm) and conforming to one of the following:

- .3 Health Product Declaration open Standard,
  - .4 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
  - .5 International Living Future Institute Declare
  - .6 Other approved framework.
  - .7 When multiple Products are specified, give preference to Products with compliant documentation.
- 1.4.3 Shop Drawings: Submit in accordance with Division 01 for sun control devices and accessories. Include plans, elevations, sections, details, and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.
- 1.4.4 Samples: Submit samples in accordance with Division 01 for each type of metal finish required.

## **1.5 Quality Assurance**

- 1.5.1 Welding Qualifications:
- .1 Provide welding in accordance with CSA W59-M performed by a fabricator and mechanics fully approved by the Canadian Welding Bureau as specified herein.
  - .2 Ensure fabricator is fully certified by Canadian Welding Bureau for fusion welding of steel structures to CSA W47.1 and for fusion welding of aluminum to CSA W47.2.
- 1.5.2 Fabricator qualifications. A firm experienced in producing fencing/infill/gate products similar to those indicated for the Project and with a record of successful in-service performance.
- 1.5.3 Source Limitations: Obtain sun control devices from single source from a single manufacturer where indicated to be of same type, design, or factory-applied colour finish.
- 1.5.4 Licensed Professionals: Employ a full time structural Professional Engineer registered in the Province of Ontario, and carrying liability insurance as noted in the Owner's supplementary conditions, to:
- .1 design the components of the work of this Section requiring structural performance,
  - .2 be responsible for full assemblies and connections,
  - .3 be responsible for determining sizes, yield strengths, gauge thicknesses and joint spacing to allow thermal movement and loading of components in accordance with applicable codes and regulations,
  - .4 be responsible for production and review of Shop Drawings,
  - .5 inspect the Work of this Section during fabrication and erection,

- .6 stamp and sign each Shop Drawing, and
- .7 provide site administration and inspection of this part of the Work.

1.5.5 Mock-ups: Provide mock-ups in locations designated by Consultant and as required to demonstrate quality of workmanship. Maintain mock-ups during construction in an undisturbed condition as a standard for judging the completed work.

**1.6 Field Conditions**

1.6.1 Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

**1.7 Warranty**

1.7.1 Extended Warranty for Finishes: Repair or replace components on which finishes fail in materials or workmanship within specified warranty period.

- .1 Deterioration includes, but is not limited to, the following:
- .2 Colour fading more than 5 Hunter units when tested according to ASTM D2244.
- .3 Chalking in excess of a No. 8 rating when tested according to ASTM D4214.
- .4 Cracking, checking, peeling, or failure of paint to adhere to bare metal.

1.7.2 Warranty Period: 10 years from date of Substantial Performance of the Work.

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into the Work, provided they meet requirements of Contract Documents.

- .1 Construction Specialties; [www.c-sgroup.com](http://www.c-sgroup.com)
- .2 Levolux; [www.levolux.com](http://www.levolux.com)
- .3 TenPlus Architectural Products; [www.tenplus-online.com](http://www.tenplus-online.com)

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Regulatory Requirements**

- .1 Design shall be based on Limit States Design principles using factored loads and resistance. Resistance and resistance

---

factors shall be determined in accordance with the OBC and CSA S136 requirements.

**2.3     Design and Performance Requirements:**

- 2.3.1 Professional Engineering Design and Certification: Design sun control devices, including comprehensive engineering analysis by a Professional Engineer licensed to practice in the Province of Ontario, using structural performance requirements and design criteria indicated.
- 2.3.2 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.3.3 Structural Performance: Sun control devices shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of sun control device components, noise or metal fatigue caused by sun control device-blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building.
- 2.3.4 Solar Control: Angle and pitch louvers to prevent direct sunlight penetration above 45° or as required to meet specific aesthetic or performance criteria.
- 2.3.5 Wind Loads: Determine loads based on pressures as indicated on Drawings.
- 2.3.6 Limit deflection of members and framing to L/360.
- 2.3.7 Vibration Control: Ensure sun control device members do not vibrate when subjected to above wind loading.
- 2.3.8 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.
  - .1 Temperature Change (Range): 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.
- 2.3.9 SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

**2.4     Materials**

- 2.4.1 Steel Plates, Shapes, and Bars: ASTM A 36/A 36M or equivalent to CSA G40.20/G40.21, Grade 300W..

- 2.4.2 Aluminum Extrusions: ASTM B 221M (ASTM B 221), Alloy 6063-T5, T-52, or T6.
- 2.4.3 Aluminum Sheet: ASTM B 209M (ASTM B 209), Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.
- 2.4.4 Fasteners: Use types and sizes to suit unit installation conditions.
  - .1 Use hex-head or Phillips pan-head screws for exposed fasteners unless otherwise indicated.
  - .2 For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.
  - .3 For fastening galvanized steel, use hot-dip-galvanized steel or 300 series stainless-steel fasteners.
  - .4 For fastening stainless steel, use 300 series stainless-steel fasteners.
  - .5 For color-finished sun control devices, use fasteners with heads that match colour of sun control devices.
- 2.4.5 Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187.
- 2.4.6 Grout: Non-shrink type, pre-mixed compound consisting of non-metallic aggregate, cement, and water-reducing and plasticizing additives.

## **2.5 Aluminum Sunshades (SS#)**

- 2.5.1 Sunshades: Assemblies consisting of manufacturer's standard outrigger brackets, louvers, and fascia, designed for attachment to curtain wall with mechanical fasteners.
- 2.5.2 Orientation: Horizontal.
- 2.5.3 Projection from Wall: As indicated on Drawings
- 2.5.4 Carrier Arms: Extruded aluminum with hidden fasteners.
- 2.5.5 Fastening: Stainless steel (316 grade), compatible with system and specific site conditions.
- 2.5.6 Louver Width: Refer to Drawings.
- 2.5.7 Profile: To be selected by Consultant.
- 2.5.8 Finish: Custom powder-coated finish as selected by Consultant. Submit samples for review. Allow Consultant to select final finish from manufacturer's full range.
- 2.5.9 Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
- 2.5.10 Steel Reinforcement: As required by manufacturer.

2.5.11 Basis-of-Design: "INFINITY ALUMINUM AEROFOIL" by Levlux or approved equivalent.

## **2.6 Aluminum Finishes**

2.6.1 Finish sun control devices after assembly.

2.6.2 High-Performance Organic Finish: Three-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70percent PVDF resin by weight in both colour coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

.1 Manufacturer's standard powder coating of performance equivalent to AAMA 2605 is acceptable in lieu of high-performance organic finish specified in this Section.

## **3 . EXECUTION**

### **3.1 Examination**

3.1.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify the Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

3.1.2 Examine substrates and openings, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

### **3.2 Preparation**

3.2.1 Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

### **3.3 Installation**

3.3.1 Comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.

3.3.2 Locate and place sun control devices level, plumb, and at indicated alignment with adjacent work.

3.3.3 Use concealed anchorages where possible.

3.3.4 Form closely fitted joints with exposed connections accurately located and secured.

- 3.3.5 Provide perimeter reveals and openings of uniform width for sealants and joint fillers.
- 3.3.6 Protect unpainted galvanized and nonferrous-metal surfaces that are in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint or by separating surfaces with waterproof gaskets or nonmetallic flashing.

### **3.4 Field Quality Control**

- 3.4.1 Manufacturer Services: Arrange for Product manufacturer's technical representative to:
  - .1 meet and discuss installation procedures and unique conditions at the Place of the Work.
  - .2 inspect substrate surfaces and recommend solutions to accommodate adverse conditions.
  - .3 periodically visit and inspect installation and report unsatisfactory conditions to Contractor.
  - .4 attend final inspection and to submit written certification that Products, systems and assemblies have been installed in accordance with manufacturer's requirements.

### **3.5 Adjusting and Cleaning**

- 3.5.1 Clean exposed sun control device surfaces that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.
- 3.5.2 Restore sun control devices damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, remove damaged units and replace with new units.
- 3.5.3 Touch up minor abrasions in finishes with air-dried coating that matches colour and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the Security Mirrors And Domes specified herein. This includes, but is not necessarily limited, to:
- .1 Security mirrors and domes,
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Submittals**

- 1.4.1 General Requirements and Procedures for Submittals: in accordance with Section 01 33 00, Submittal Procedures.
- 1.4.2 Product Data: Submit Product characteristics, performance criteria, physical size, finish, and limitations for Security Mirrors And Domes work specified in this Section.
- 1.4.3 Shop Drawings: Submit Shop Drawings indicating material characteristics, details of construction, connections, and relationship with adjacent construction.

### **1.5 Quality Assurance**

- 1.5.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.5.2 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and

secondary materials from sources recommended by manufacturers of primary materials.

**1.6 Delivery, Storage And Handling**

- 1.6.1 Deliver, store and handle materials in accordance with manufacturer's written instructions .
- 1.6.2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.6.3 Storage and Handling Requirements: Store materials in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.
- 1.6.4 Replace defective or damaged materials with new.

**1.7 Warranty**

- 1.7.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The work, provided they meet requirements of Contract Documents.
  - .1 CR Laurence
  - .2 DuraVision Mirror Systems
  - .3 Approved equivalent.
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Indoor Acrylic Vision Dome Mirrors (DM)**

- 2.2.1 Material: 3 mm (1/8") thick vacuum-coated acrylic producing sharp, clear images and capable of being ceiling mounted.
- 2.2.2 Installation method: screw mount
- 2.2.3 90 deg Vision Mirrors:
  - .1 Size: 600 mm x 600 mm (24 inch x 24 inch) - up to 10 m viewing distance
  - .2 Basis-of-Design: "Quarter Dome Convex Mirror" by DuraVision or approved equivalent.

---

**2.3     Accessories**

- 2.3.1 Provide manufacturer's standard suspension kit for attachment to ceilings.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

**3.2     Installation**

- 3.2.1 Install security mirrors and domes in accordance with manufacturer's instructions.

**3.3     Cleaning And Protection**

- 3.3.1 Upon completion clean mirrors with soft, damp cloth or chamois, wiping gently.

**END OF SECTION**

**1 . General**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

**1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the vehicle washing equipment work specified herein. This includes, but is not necessarily limited, to:
  - .1 Rollover vehicle washing system
  - .2 Vehicle cleaning station
  - .3 Auxiliary materials required for a complete installation
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

**1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.4 Submittals**

- 1.4.1 Product Data: Submit in accordance with Division 01 for the following:
  - .1 Vehicle wash system.
  - .2 Vehicle wash station
- 1.4.2 Shop Drawings: Submit detailed shop drawings showing all components, plumbing and electrical connections.
- 1.4.3 Operation and Maintenance Data: Submit complete set of operating and maintenance manuals, including installation drawings.

**1.5     Warranty**

- 1.5.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 .     Products**

**2.1     Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- .1 CustomKraft
  - .2 Istobal
  - .3 Approved equivalent.
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2     Rollover Vehicle Washing System**

- 2.2.1 Provide vehicle washing system with easy access to programmable controller and with following features:
- .1 Total vehicle coverage for vehicles up to 2895 mm (114 inches) high.
  - .2 Dimensions: Refer to Drawings.
  - .3 Operation: Manufacturer's standard entry system.
- 2.2.2 Materials
- .1 Structural Components:
    - .1 Hot-dip galvanized steel for durability and corrosion resistance.
  - .2 Brushes: Three (3) brushes, colour to be selected by Consultant at a later date.
  - .3 Finishes: Powder-coated, colour to be selected by Consultant at a later date.
- 2.2.3 Electrical Requirements
- .1 Electrical Service:
    - .1 Provide power as required by the manufacturer's specifications.
  - .2 Control Systems:
    - .1 PLC based control system for operation and diagnostics.
- 2.2.4 Accessories
- .1 On-board lighted signs and pictograms.

- .2 Vinyl wrap for customization.
- .3 High-pressure wheel-wash system.
- 2.2.5 Basis-of-Design: "Flex 5 XL – 3 Brushes" by Istobal or Consultant approved equivalent.
- 2.2.6 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.

## **2.3 Vehicle Cleaning Station**

- 2.3.1 Characteristics:
  - .1 Dimensions:
    - .1 Single-sided: 762 mm wide x 762 mm deep x 2032 mm tall (30 in wide x 30 in deep x 80 in tall).
    - .2 Double-sided: 1219 mm wide x 1575 mm deep x 1626 mm high (48 in wide x 62 in deep x 64 in high).
  - .2 Frame and Tanks: Stainless steel with automatic proportioning valves.
  - .3 Electric Motor: Baldor 5 hp, 3 phase (Super E).
  - .4 Pump: CAT pump with lifetime warranty manifold.
  - .5 Drive: Direct drive.
  - .6 Controls: Meter box with digital timer and rotary switch.
  - .7 Pressure Gauge: 907 kg liquid-filled (2000 lbs).
  - .8 Trigger Gun: Safety trigger gun.
- 2.3.2 Standard Features
  - .1 Variable Frequency Drive (VFD) accepts single or three-phase input.
  - .2 High-pressure wash system providing 15 liters per minute (4 gpm) up to 11700 kPa (1700 psi).
  - .3 Foam Brush: Air-operated diaphragm pump with hog's hair bristles.
- 2.3.3 Basis-of-Design: "Wash-Me Express" by CustomKraft or Consultant approved equivalent.

---

**3 .     Execution**

**3.1     Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, including equipment bases; accurate placement, pattern, and orientation of anchor bolts; critical dimensions; and other conditions affecting performance of the Work.
- 3.1.2 Examine roughing-in for electrical, plumbing and communication systems to verify actual locations of connections before parking control equipment installation.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2     Installation**

- 3.2.1 Install vehicle washing equipment in strict accordance with manufacturer's instructions and as required for complete and integrated installation.

**3.3     Adjusting**

- 3.3.1 Adjust vehicle washing equipment to function smoothly, and lubricate as recommended by manufacturer.
- 3.3.2 After completing installation of exposed, factory-finished equipment, inspect exposed finishes and repair damaged finishes.

**3.4     Demonstration**

- 3.4.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain equipment.

End Of Section

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Loading Dock Equipment work specified herein. This includes, but is not necessarily limited, to:
- .1 Vertical-storing dock levelers.
  - .2 Frame-type dock shelters.
  - .3 Steel finishes.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 03 30 00, Cast-in-Place Concrete
  - .2 Section 05 50 00, Metal Fabrications
  - .3 Section 08 33 24, Overhead Coiling Doors for coiling and other overhead doors electrically interlocked to dock levelers.
  - .4 Division 26 for electrical wiring for, and connections to, loading dock equipment.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Definitions**

- 1.4.1 Operating Range: Maximum amount of travel above and below the loading dock level.
- 1.4.2 Working Range: Recommended amount of travel above and below the loading dock level for which loading and unloading operations can take place.

---

**1.5     Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for each type of product indicated on Drawings and Schedules. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for loading dock equipment. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Loading Dock Equipment work and include product characteristics, performance criteria, physical size, finish and limitations
- 1.5.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for loading dock equipment. Include plans, elevations, sections, details, and attachments to other work.
- .1 Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
- .2 Wiring Diagrams: Submit wiring diagrams in accordance with Division 01 for power, signal, and control wiring.
- 1.5.3 Samples for Initial Selection: Submit samples for initial selection in accordance with Division 01 for each type of dock -shelter fabric indicated on Drawings and Schedules.
- 1.5.4 Samples for Verification: Submit samples for verification in accordance with Division 01 for each type of dock-shelter fabric indicated on Drawings and Schedules.
- 1.5.5 Welding certificates.
- 1.5.6 Product Test Reports: Based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing agency; indicate compliance of dock levelers with requirements in MH 30.1 for determining rated capacity, which is based on comprehensive testing within last two years of current products.
- .1 Submittal Form: According to MH 30.1, Appendix A.
- 1.5.7 Operation and Maintenance Data: Submit operation and maintenance data in accordance with Division 01 for loading dock equipment to include in operation and maintenance manuals.
- 1.5.8 Warranty: Submit sample warranty in accordance with Division 01 for manufacturer's special warranty. .

---

**1.6     Quality Assurance**

- 1.6.1 Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
  - .1 Maintenance Proximity: Not more than two hours' normal travel time from Installer's place of business to Project site.
- 1.6.2 Source Limitations: Obtain loading dock equipment from single source from single manufacturer.
- 1.6.3 Welding Qualifications: Qualify procedures and personnel according to the following:
  - .1 AWS D1.1/D1.1M, "Structural Welding Code - Steel."
  - .2 AWS D1.3, "Structural Welding Code - Sheet Steel."
- 1.6.4 Electrical Components, Devices, and Accessories: Listed and labeled as defined in CSA C22 SERIES AND NFPA 70, by a qualified testing agency, and marked for intended location and application.
- 1.6.5 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
  - .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
  - .5 Inspect and discuss electrical roughing-in, equipment bases, and other preparatory work specified elsewhere.
  - .6 Review sequence of operation for each type of loading dock equipment.
  - .7 Review coordination of interlocked equipment specified in this Section and elsewhere.
  - .8 Review required testing, inspecting, and certifying procedures.

**1.7     Delivery, Storage, And Handling**

1.7.1 Store and handle dock shelters in a manner to avoid significant or permanent damage to fabric or frame.

- .1 Comply with manufacturer's written instructions for minimum and maximum temperature requirements for storage.

**1.8     Project Conditions**

1.8.1 Field Measurements: Verify actual dimensions of construction contiguous with loading dock equipment, including, by field measurements before fabrication.

**1.9     Warranty**

1.9.1 Special Warranty for Dock Levelers: Manufacturer's standard form in which manufacturer agrees to repair or replace dock-leveler components that fail in materials or workmanship within specified warranty period.

- .1 Failures include, but are not limited to, the following:
  - .1 Structural failures including cracked or broken structural support members, load-bearing welds, and front and rear hinges.
  - .2 Faulty operation of operators, control system, or hardware.
  - .3 Deck plate failures including cracked plate or permanent deformation in excess of 6 mm (1/4 inch) between deck supports.
  - .4 Hydraulic system failures including failure of hydraulic seals and cylinders.
- .2 Warranty Period for Structural Assembly: 10 years from date of Substantial Performance of the Work.
- .3 Warranty Period for Hydraulic System: Five years from date of Substantial Performance of the Work.
- .4 Warranty shall be for unlimited usage of leveler for the specified rated capacity over the term of the warranty.

**2 .     PRODUCTS**

**2.1     Materials**

2.1.1 Steel Plates, Shapes, and Bars: ASTM 36/A 36M.

2.1.2 Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from steel plate complying with ASTM A 572/A 572M, Grade 380 (55).

2.1.3 Steel Tubing: ASTM A 500, cold formed.

- 2.1.4 Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

## **2.2 Vertical-Storing Dock Levelers**

- 2.2.1 General: Recessed, hinged-lip-type, vertical-storing dock levelers designed for permanent installation in shallow concrete pits preformed in the edge of loading platform; of type, function, operation, capacity, size, and construction indicated on Drawings and Schedules; and complete with controls, safety devices, and accessories required.
- .1 Basis-of-Design Product: "RHV-5000 with Safe-T-Pit" by Rite-Hite or comparable product by one of the following:
    - .1 SPX Dock Products - Serco.
- 2.2.2 Standard: Comply with MH 30.1, except for structural testing to establish rated capacity.
- 2.2.3 Rated Capacity: Capable of supporting minimum gross load of 15,000 lbs without permanent deflection or distortion.
- 2.2.4 Platform: Not less than 6-mm- (1/4-inch-) thick, nonskid steel plate.
- .1 Platform Size: As indicated on Drawings.
- 2.2.5 Hinged Lip:
- .1 Acceptable Product: "Smooth Transition Dok System" by Rite-Hite.
- 2.2.6 Function: Dock levelers shall compensate for differences in height between truck bed and loading platform.
- .1 Vertical Travel: Operating range above platform level of sufficient height to enable lip to extend and clear truck bed before contact with the following minimum working range:
    - .1 Above Adjoining Platform: As indicated on Drawings.
    - .2 Below Adjoining Platform: As indicated on Drawings
  - .2 Automatic Vertical Compensation: Floating travel of ramp with lip extended and resting on truck bed shall compensate automatically for upward or downward movement of truck bed during loading and unloading.
  - .3 Automatic Lateral Compensation: Tilting of ramp with lip extended and resting on truck bed shall compensate automatically for canted truck beds of up to 102 mm (4 inches) over width of ramp.
  - .4 Lip Operation: Manufacturer's standard mechanism that automatically extends and supports hinged lip on ramp edge with lip resting on truck bed over dock leveler's working range,

allows lip to yield under impact of incoming truck, and automatically retracts lip when truck departs.

.1 Length of Lip Extension: 508 mm (20 inches).

2.2.7 Hydraulic Operating System: Electric control from a remote-control station; fully hydraulic operation. Electric-powered hydraulic raising and hydraulic lowering of ramp. Equip leveler with a packaged unit including a unitized, totally enclosed, nonventilated electric motor, pump, manifold reservoir, and valve assembly of proper size, type, and operation for capacity of leveler indicated on Drawings and Schedules. Provide a hydraulic velocity fuse connected to main hydraulic cylinder to limit loaded ramp's free fall to not more than 76 mm (3 inches). Provide mechanical lock that prevents leveler from lowering without hydraulic pressure.

.1 Remote-Control Station with Emergency Stop: Multibutton control station with an UP button of the constant-pressure type and an emergency STOP button of the momentary-contact type, enclosed in NEMA ICS 6, Type 12 box. Ramp raises by depressing and holding UP button; ramp lowers at a controlled rate by releasing UP button. All ramp movement stops, regardless of position of ramp or lip, by depressing STOP button. Normal operation resumes by engaging a manual reset button or by pulling out STOP button.

.1 Master Panel: Control panel with integral fused disconnecting means for operating dock leveler, dock door, and truck restraints.

.2 Independent Lip Operation: Electric-powered hydraulic raising and lowering of lip, controlled independent of raising and lowering of ramp.

2.2.8 Construction: Fabricate dock-leveler frame, platform supports, and lip supports from structural- or formed-steel shapes. Weld platform and hinged lip to supports. Fabricate entire assembly to withstand deformation during both operating and stored phases of service. Chamfer lip edge to minimize obstructing wheels of material-handling vehicles.

2.2.9 Accessories:

.1 Interlock: Leveler will not operate while overhead door is in open position and truck restraint is not engaged.

.2 Curb Angles: 76-by-76-by-6-mm (3-by-3-by-1/4-inch) galvanized-steel curb angles for edge of recessed leveler pit, with 13-mm- (1/2-inch-) diameter by 152-mm- (6-inch-) long concrete anchors welded to angle at 152 mm (6 inches) o.c.

2.2.10 Finish: Corrosion resistant finish.

---

**2.3     Frame-Type Dock Shelters**

2.3.1 General: Dock shelters designed to form a seal with sides and top of truck body while leaving entire width and height of truck's rear opening unobstructed; of type, size, and construction indicated on Drawings and Schedules.

.1 Basis-of-Design Product: "Eclipse Dock Shelter" by Rite-Hite Corporation or approved equivalent.

2.3.2 Door Opening Size: As indicated on Drawings.

2.3.3 Rigid-Frame Type: Fabricated from translucent, fabric-covered side and top panels attached to fixed supporting framework. Provide head and side curtains with built-in flexible stays, wind straps between head curtain and side frame, pleated protectors on head curtain, and a yellow aim patch on side curtains. Slope head frame from center for drainage. Provide replaceable, fabric-covered, tapered, foam-bottom pads and protective steel bumpers of size and type required for application shown.

2.3.4 Flexible-Frame Type: Fabricated from fabric-covered side and top panels attached to retractable supporting framework with independent spring-tension extension arms. Provide head and side curtains with built-in flexible stays, pleated protectors on head curtain, and a yellow aim patch on side curtains. Provide replaceable, fabric-covered, tapered, foam-bottom pads of size and type required for application shown.

2.3.5 Head-Pad Height: As indicated on Drawings.

2.3.6 Construction: Fabricate framework, pads, bumpers, fabric for curtains and panels, and other components to sizes and shapes indicated on Drawings and Schedules or required to fit door opening sizes shown and allow for not less than 457 mm (18 inches) of truck-body penetration when truck is docked.

.1 Steel Framework: Zinc-plated steel tubing of size and thickness standard with manufacturer, with joints welded.

.2 Top and Side Panels: White, translucent vinyl, weighing 4272 g/sq. m (14 oz./sq. ft.).

.3 Cover Fabric: Manufacturers standard friction-resistant fabric.

.1 Colour: As selected by Consultant from manufacturer's full range.

.4 Pleated Protectors: Overlapping layers of same fabric as cover.

2.3.7 Accessories:

.1 Buffer flaps.

.2 Bottom filler curtain.

.3 Bottom seal pads.

---

**2.4     General Finish Requirements**

2.4.1    Finish loading dock equipment after assembly and testing.

**2.5     Steel Finishes**

2.5.1    Galvanizing: Hot-dip galvanize components as indicated to comply with the following:

- .1    ASTM A 123/A 123M or equivalent to CAN/CSA-G164 for iron and steel loading dock equipment.
- .2    ASTM A 153/A 153M or ASTM F 2329 for iron and steel hardware for loading dock equipment.

2.5.2    Galvanized-Steel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat in manufacturer's standard colour.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1    Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of loading dock equipment.
- 3.1.2    Examine roughing-in for electrical systems for loading dock equipment to verify actual locations of connections before equipment installation.
- 3.1.3    Examine walls and floors of pits for suitable conditions where recessed loading dock equipment is to be installed. Pits shall be plumb and square and properly sloped for drainage from back to front of loading dock.
- 3.1.4    Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2     Preparation**

- 3.2.1    Coordinate size and location of loading dock equipment indicated on Drawings and Schedules to be attached to or recessed into concrete or masonry, and Supply anchoring devices with templates, diagrams, and instructions for their installation.
- 3.2.2    Set curb angles in concrete edges of dock-leveler recessed pits with tops flush with loading platform. Fit exposed connections together to form hairline joints.
- 3.2.3    Set curb angles in concrete edges of truck-leveler recessed pits with tops flush with driveway. Fit exposed connections together to form hairline joints.

3.2.4 Place self-forming pan system for edge-of-dock levelers in proper relation to loading platform before pouring concrete.

3.2.5 Clean recessed pits of debris.

**3.3     Installation**

3.3.1 General: Install loading dock equipment, including control stations and accessories as required for a complete installation.

.1 Rough-in electrical connections according to requirements specified in Division 26 Sections.

3.3.2 Truck Levelers: Attach truck levelers securely to driveway construction with expansion anchors and bolts.

3.3.3 Dock Shelters: Attach dock shelters securely to building structure in proper relation to openings, dock bumpers, and dock levelers to ensure an effective seal of dock-shelter curtains with sides and top of truck body when trucks are positioned against dock bumpers.

**3.4     Adjusting**

3.4.1 Adjust loading dock equipment to function smoothly and safely, and lubricate as recommended by manufacturer.

3.4.2 Test dock levelers for vertical travel within operating range indicated on Drawings and Schedules.

3.4.3 After completing installation of exposed, factory-finished loading dock equipment, inspect exposed finishes and repair damaged finishes.

**3.5     Demonstration**

3.5.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain loading dock equipment.

END OF SECTION

---

**1. GENERAL**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

**1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the automotive lifts specified herein. This includes, but is not necessarily limited, to:
  - .1 Heavy-duty four-post truck lift system.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
  - .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 03 30 00 - Cast-in-Place Concrete
    - .2 Section 05 50 00 - Metal Fabrications
    - .3 Division 26 Electrical

**1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.4 Preinstallation Meetings**

- 1.4.1 General Requirements and Procedures for Project Meetings: In accordance with Section 01 31 00, Project Management and Coordination.

- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
- .1 Ensure attendance of Subcontractor performing work of this Section, as well as representatives from manufacturers and fabricators involved in or affected by installation. Notify Consultant and Owner of scheduled meeting dates in advance.
  - .2 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 General Requirements and Procedures for Submittals: In accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for automotive lifts work specified in this Section
- 1.5.3 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.4 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.

- 
- .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
    - 1.5.5 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
      - .1 Indicate field-measured dimensions on Shop Drawings.
      - .2 Provide templates for anchors and bolts anchored to permanent construction
    - 1.5.6 Product Test Reports: Indicate compliance of dock lifts with requirements in MH 30.1 for determining rated capacity.
    - 1.5.7 Delegated Design Submittals:
      - .1 Engineering design completion of automotive lifts work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
      - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
      - .3 Submit copy of structural calculations upon request by Consultant.
    - 1.5.8 Certificates:
      - .1 Manufacturer Certificate: Submit certificate signed by automotive lifts manufacturer certifying that product meets all requirements in regards to functionality, appearance and safety specifications.
      - .2 Welding Certificate: Submit certification for welding firms and welders to verify compliance with welding qualifications specified in this section.
  - 1.6 **Closeout Submittals**
    - 1.6.1 General Requirements and Procedures for Closeout Submittals: In accordance with Section 01 78 00, Closeout Submittals.
    - 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for Automotive lifts to be included in building's operation and maintenance manual.
    - 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.
  - 1.7 **Quality Assurance**
    - 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.

- 
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- .1 Certification: Installer must be trained and certified by manufacturer.
- 1.7.3 Welding Qualifications: Qualify procedures and personnel in accordance with the following:
- .1 Steel: to CSA W47.1 and CSA W59
- .2 Aluminum: to CSA W47.2 and CSA W59.2
- .3 Stainless Steel: to CSA W47.1 (Annex K) and CSA W59.
- 1.7.4 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance as noted in the Owner's supplementary conditions and has at least 5 years' experience providing engineering services of similar kind, scope, and complexity.
- .1 Professional Engineer's Responsibility:
- .1 production and review of Shop Drawings,
- .2 design and certification of Automotive Lifts, including attachments for building construction, in accordance with applicable codes and regulations,
- .3 stamping and signing of each Shop Drawing and associated calculations.
- 1.7.5 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

**1.8 Delivery, Storage and Handling**

- 1.8.1 General Product Requirements: In accordance with Section 01 61 00, Common Product Requirements. Deliver, store and handle automotive lifts materials in accordance with manufacturer's written instructions.
- 1.8.2 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.3 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.4 Replace defective or damaged materials with new.

---

**1.9     Field Conditions**

1.9.1 Field Measurements: Verify actual dimensions of construction contiguous with automotive lifts by field measurements before fabrication.

**1.10    Warranty**

1.10.1 Extended Warranty: Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of automotive lifts that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

- .1 Warranty Period: 5 years from date of Substantial Performance of The work.
- .2 Warranty Scope: Materials and workmanship

**2 .     PRODUCTS**

**2.1     Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 BendPak Inc.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2     Performance / Design Criteria**

2.2.1 Lift Standard: Comply with ANSI/ALI ALCTV and ANSI/UL 201.

2.2.2 Electrical Components, Devices, and Accessories (motorized doors): Listed and labeled as defined in CSA C22 Series, by a qualified testing agency, and marked for intended location and application.

**2.3     Automotive lift**

2.3.1 Product Description: Automotive lift capable of accommodating vehicles up to Class 7 semi-trucks.

- .1 Lifting Capacity: 12,247 kgs (27,000 lbs)
- .2 Max Lifting Height: 1,765 mm (69.5 inches)
- .3 Width and Length: 3, 899 mm (153.5 inches) x 7,944 mm (312.75 inches)
- .4 Drive-Thru Clearance: 2,769 mm (109 inches)
- .5 Locking Positions: 9

- .6 Lock Spacing: every 152 mm (6 inches)
- .7 Lifting Time: 75 seconds
- .8 Motor: 220 VAC/ 60 Hz/ 1 Ph

2.3.2 Metals: exposed metal surfaces and fastening materials must comply with minimum requirements of ASTM A123/A123M, ASTM A143/A143M, and ASTM A153/A153M.

- .1 Basis-of-Design: "HDS-27" by BendPak.

## **2.4     Operation**

- 2.4.1 Operating System: Hydraulic lift with remote push-button control. Provide packaged unit including enclosed motor, pump, manifold reservoir, and valve assembly.
- 2.4.2 Control Station: Multibutton station in NEMA ICS 6, Type 12 box. Provide constant-pressure "up" button for raising; lowering is achieved by releasing button. Provide emergency stop button to halt movement, and manual reset or pull to resume.

## **2.5     Accessories**

- 2.5.1 Rolling Jacks: Manufacturer's standard system for lifting wheels off runways to accommodate wheel and brake service.

## **2.6     Finishes**

- 2.6.1 Baked-Enamel or Powder-Coat Finish: Manufacturer's standard baked-on finish consisting of prime coat and thermosetting topcoat. Comply with coating manufacturer's written instructions for cleaning, pretreatment, application, and minimum dry film thickness.

# **3 .     EXECUTION**

## **3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Examine roughing-in for electrical systems for automotive lift to verify actual locations of connections before installation.
- 3.1.3 Examine walls and floors of pits for suitable conditions where automotive lift is to be installed.
- 3.1.4 Electrical Connections: Rough-in electrical connections according to requirements in Division 26.

---

**3.2     Installation**

- 3.2.1 General Requirements: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Install components in plumb, level, square, and warp- and twist-free manner while maintaining dimensional tolerances and alignment with the surrounding construction.

**3.3     Startup Service**

- 3.3.1 Engage a factory-authorized service representative to perform startup service.
- 3.3.2 Perform installation and startup checks according to manufacturer's written instructions.
- 3.3.3 Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

**3.4     Adjusting**

- 3.4.1 Adjust hardware and moving parts to function smoothly so that lifts operate easily, free of warp, twist, or distortion.
- 3.4.2 Lubricate bearings and parts as recommended by manufacturer.

**3.5     Demonstration**

- 3.5.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain automotive lift.

**3.6     Protection**

- 3.6.1 Protect automotive lift from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.6.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.6.3 Promptly replace automotive lift damaged during construction that cannot be satisfactorily repaired.

**3.7     Cleaning and Waste Management**

- 3.7.1 General Requirements for Cleaning and Waste Management: In accordance with Section 01 74 00, Cleaning and Waste Management.

- 
- 3.7.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.7.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 GENERAL INSTRUCTIONS**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 SUMMARY**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the appliances and equipment work specified herein. This includes, but is not necessarily limited, to:
  - .1 Appliances and equipment indicated on appliance schedule.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 06 40 00, Architectural Woodwork.
  - .2 Division 22, Plumbing.
  - .3 Division 26, Electrical.

### **1.3 REFERENCES**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 PREINSTALLATION MEETINGS**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.

- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Discuss issues including, but not limited to, power, water and utility requirements.
  - .2 Coordination with built-in dimensions along with shipping and delivery schedules.
  - .3 Review progress of related construction activities and preparations for particular activity under consideration.
  - .4 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 SUBMITTALS**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for appliances and equipment work specified in this Section.
  - .1 Include manufacturer's installation instructions.
- 1.5.3 Schedule: Submit appliance schedule using same designations indicated on Drawings for all appliances used on project. Include manufacturer's name and product number, and location within Project.

## **1.6 CLOSEOUT SUBMITTALS**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for appliances and equipment to be included in building operation and maintenance manual.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

---

**1.7 QUALITY ASSURANCE**

- 1.7.1 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.

**1.8 DELIVERY, STORAGE AND HANDLING**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle appliances and equipment materials in accordance with manufacturer's written instructions.
- 1.8.3 deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

**1.9 FIELD CONDITIONS**

- 1.9.1 Environmental Restrictions: Do not deliver or install appliances and equipment until building is enclosed, wet work is complete, and HVAC system is operational and will maintain temperature and relative humidity levels equal to occupancy levels for remainder of construction period.
- 1.9.2 Field Measurements: Verify actual dimensions of construction contiguous with appliances and equipment by field measurements before fabrication.

**1.10 Warranty**

- 1.10.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 . PRODUCTS**

**2.1 MANUFACTURERS**

- 2.1.1 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 PERFORMANCE / DESIGN CRITERIA**

- 2.2.1 Provide appliances with labels complying with CSA, cUL, CGA, and other standards required by authorities having jurisdiction.
- 2.2.2 Electrical Appliances: Must be listed and labelled to CSA C22.1 by a qualified testing agency.

- 2.2.3 Gas-Fueled Appliances: Must have CSA Blue Star mark.
- 2.2.4 Product Options: Where product is at Contractor's option, prefer appliances that qualify for the ENERGY STAR program.

### **2.3 APPLIANCES**

- 2.3.1 Refer to Equipment Schedule for list of appliances. Provide quantities, physical dimensions, colors, and electrical characteristics indicated.
- 2.3.2 For Owner-supplied appliances, refer to Division 01 for Owner's and Contractor's responsibilities.

## **3 . EXECUTION**

### **3.1 EXAMINATION**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

### **3.2 INSTALLATION**

- 3.2.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Unwrap, level, and support appliances. Install items square, plumb, and free from defects.
- 3.2.3 Securely anchor units to supporting construction with concealed fasteners.
- 3.2.4 Place free-standing units after finishes are complete; provide adequate clearances for operation.
- 3.2.5 Anti-Tip Devices: Install for each appliance according to manufacturer's written instructions.

### **3.3 START-UP SERVICE**

- 3.3.1 Perform operation tests on all equipment to ensure components, controls, safety devices, and attachments function correctly and as specified before final acceptance.

---

**3.4     PROTECTION**

- 3.4.1 Protect appliances and equipment from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.4.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.4.3 Promptly replace appliances and equipment work damaged during construction that cannot be satisfactorily repaired.

**3.5     CLEANING AND WASTE MANAGEMENT**

- 3.5.1 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.5.2 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

**1 .        GENERAL**

**1.1        General Instructions**

- 1.1.1    Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2    Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

**1.2        Summary**

- 1.2.1    Provide labour, materials, products, equipment and services to complete the Facility Fall Protection work specified herein. This includes, but is not necessarily limited, to:
- .1    Design, supply and installation of fall protection equipment,
  - .2    Design, supply and installation of window washing equipment
  - .3    Auxiliary materials required for a complete installation.
- 1.2.2    Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

**1.3        References**

- 1.3.1    Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.4        Administrative Requirements**

- 1.4.1    Pre-installation Meetings: Conduct pre-installation meeting to verify project requirements, manufacturer's installation instructions and manufacturer's warranty requirements.
- 1.4.2    Sequence with other Work and Comply with window washing equipment manufacturer's written recommendations for sequencing construction operations.

---

**1.5     Action Submittals**

- 1.5.1     Product Data: Submit product data in accordance with Division 01 for each type of product indicated on Drawings and Schedules. Include preparation requirements and application instructions.
- .1     Submit manufacturer's instructions, printed product literature and data sheets for the Facility Fall Protection work and include product characteristics, performance criteria, physical size, finish and limitations
- 1.5.2     Shop Drawings: Submit Shop Drawings in accordance with Division 01
- .1     Submit shop drawings showing complete layout and configuration of window cleaning and suspended maintenance system, including components and accessories. Clearly indicate design and fabrication details, hardware, and installation details.
- .2     Include installation and rigging instructions and:
- .1     Required restrictive working usage and general safety notes.
- .2     Non-restrictive working usage and general safety notes.
- .3     Submit Shop Drawings including analysis data, complying with performance requirements and design criteria, signed and sealed by the Professional Engineer licensed to practice in the Province of Ontario responsible for their preparation.

**1.6     Information Submittals**

- 1.6.1     Quality Assurance Submittals:
- .1     Test Reports: Certified test reports showing compliance with specified performance characteristics and physical properties.
- .2     Certificates: Product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .3     Submit manufacturer's installation instructions and manufacturer's field reports specified in this Section.

**1.7     Closeout Submittals**

- 1.7.1     Submit standard manufacturer warranty documents specified.
- 1.7.2     Operation and Maintenance Data: Submit Operation and Maintenance data for installed products in accordance with Division 01.
- .1     Include:
- .1     Manufacturer's instructions covering maintenance requirements and parts catalog giving complete list of

repair and replacement parts with cuts and identifying numbers.

- .2 One copy of system Equipment Manual & Inspection Log Book, with "Initial Inspection - Certification for Use" and "Inspection Sign-Off" forms completed.
- .3 Two copies of reduced, laminated "as-built shop drawing" showing equipment locations and details. Ensure drawing is posted adjacent exits to roof.

## **1.8 Quality Assurance**

### **1.8.1 Qualifications:**

- .1 Installer: experienced (minimum two years experience) in performing work of this section who has specialized in installation of work similar to that required for this project.
- .2 Manufacturer: capable of providing field service representation during construction and approving application method.
  - .1 Ensure manufacturer has minimum five years experience in manufacturing fall protection, window washing and suspended equipment system components similar to or exceeding requirements of project.
  - .2 Manufacturer's Insurance: Ensure manufacturer carries liability insurance as noted in the Owner's supplementary conditions.
- .3 Welding: to be executed by certified welders in accordance with CSA W59 and CSA W47.2 requirements.

1.8.2 Single Source Responsibility: Ensure materials specified herein are provided by a single manufacturer to ensure sole source responsibility.

## **1.9 Delivery, Storage And Handling**

1.9.1 Ordering: Comply with manufacturer's ordering instructions and lead time requirements to avoid construction delays.

### **1.9.2 Delivery:**

- .1 Deliver materials in manufacturer's original packaging with identification labels intact and in sizes to suit project.

### **1.9.3 Storage and Protection:**

- .1 Store materials protected from exposure to harmful weather conditions and at temperature conditions recommended by manufacturer.

---

**1.10 Project Conditions**

1.10.1 Installation Location: Assemble and erect components only when temperatures are above 5 deg C (40 deg F)

**1.11 Warranty**

1.11.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Ankor Engineering Systems Inc.;
- .2 Atlas Anchor Systems Ltd.;
- .3 Pro-Bel Enterprises Limited;
- .4 SSI – Suspended Stages;
- .5 Thaler Metal Industries Ltd

2.1.2 Basis-of-Design: This Specification is based on Products by Pro-Bel Enterprises. Comparable systems from manufacturers listed herein offering functionally equivalent Products will be considered provided they meet the requirements of this Specification.

2.1.3 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Regulatory Requirements**

2.2.1 Comply with Ontario Building Code, specifically clause 4.4.4.1. Anchor Systems on Building Exterior (to be provided where any portion of the roof is more than 8 m (26'-3") above adjacent ground level).

2.2.2 Comply with the requirements of the Occupational Health and Safety Act (O/reg 59/90 as amended by 523/92, and O/reg 213/91 as amended by 631/94).

**2.3 Design Performance Requirements**

2.3.1 Subcontractor awarded work of this Section is responsible for structural and performance design, fabrication and installation of facility fall protection in compliance with requirements of the Contract Documents, applicable codes at time of award and ordinance and requirement of local officials.

- 2.3.2 Facility fall protection design is based on mutually agreed upon design and details as submitted by Subcontractor for final review by Consultant. Drawings covering work of this Section show design intent and are diagrammatic in nature. Drawings also show some general building standards for tying into adjacent building trades, which are to be completed and coordinated by this Section. In addition to Specification requirements, final design and performance of facility fall protection and approval by authorities having jurisdiction is responsibility of this Section.
- 2.3.3 Professional Engineering Design and Certification: Design facility fall protection systems, including comprehensive engineering analysis by a Professional Engineer licensed to practice in the Province of Ontario, in accordance with requirements of Ontario Building Code, and using performance requirements and design criteria indicated on Drawings and Schedules in this Section.
- 2.3.4 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.3.5 Design, install and test system in conformance with CAN/CSA-Z91, CAN/CSA 271 and CAN/CSA Z259 Series and ensure anchor components and equipment supports comply with the following structural requirements:
- .1 Fall Arrest Safety Anchors: designed to a maximum fall arresting force of typically 8.0 kN (1800 lbs) when wearing a body harness with a safety factor of 2 without any permanent deformation and to 22.24 kN (5000 lbs) against fracture or detachment.
- 2.3.6 Steel design to conform to CAN/CSA-S16.1 and CSA S136.
- 2.3.7 Locate anchorages to suit suspension equipment that will be used on building with respect to items such as reach, spacing, roof edge condition and similar items.

## **2.4 Materials**

- 2.4.1 Stainless Steel: ASTM A167, Type 304. Flashings, coverings and casing shall be stainless steel. Stainless steel components, Type 316.
- 2.4.2 Welding Materials: CSA W48.1-M and CSA W59-M.

- 2.4.3 Galvanized Steel Components: Carbon steel to CSA G40.21, Grade 300W, hot dipped after fabrication and with zinc chromate coating to CAN/CGSB-1.132-M applied over zinc.
- 2.4.4 Steel Components: CSA G40.21, Type 300W.
- 2.4.5 Bolts, Nuts and Washers: Stainless steel conforming to ASTM A325M.

## **2.5 Safett And Tie-Back Anchors**

- 2.5.1 Safety U-bars: Type 304 stainless steel with yield strength of 240 MPa (35 Ksi). U-bar to be not less than 19 mm (3/4") diameter material with 38 mm (1-1/2") eye opening.
- 2.5.2 Securement bolts: mild steel, Type 300W with yield strength of 300 MPa (44 Ksi), hot dipped galvanized to CSA G164.
- 2.5.3 Hollow steel section (HSS) piers: mild steel, Type 300W with yield strength of 350 MPa (50 Ksi). Wall thickness to suit application, hot dipped galvanized to CSA G164.
- 2.5.4 Base plate and all other sections: galvanized mild steel with yield strength of 300 MPa (44 Ksi). Thickness and securement to suit application.
- 2.5.5 Seamless spun aluminum flashing (for steel pier anchors): Type 6061-T6 alloy to ASTM B221 with deck flange flashed to CRCA recommendations. Seal top of aluminum flashing with conformable mastic tape and torch applied heat-shrink rubber collar flashing.
- 2.5.6 Miscellaneous bolts, nuts and washers: mild steel, Type 300W with yield strength of 300 MPa (44 Ksi), hot dipped galvanized to CSA G164 or Type 304 stainless steel with yield strength of 240 MPa (35 Ksi).

## **2.6 Horizontal Lifeline System**

- 2.6.1 Cable: 8 mm (5/16") dia, Type 316 stainless steel with minimum breaking strength of 85 kN (19,125 lbs.), complete with permanently swaged cable ends.
- 2.6.2 Data Plate: cable system entry points to be equipped with prominently displayed non-corrosive data plate clearly stating Maximum Service Capacity and Number of Users.
- 2.6.3 Standard Intermediate support brackets: multi-position Type 316 stainless steel with reinforcing end caps and suitable for installation at any height. Secured using 13 mm (1/2") dia. fasteners.
- 2.6.4 Mobile Intermediate support brackets: multi-position, Type 316 stainless steel for working both sides of sloped roof at ridge point.

- 2.6.5 Corner units: manufacturer's standard 90 deg or 135 deg flexible corner units as required.
- 2.6.6 End terminal hardware: stainless steel swaged termination at one end and stainless steel tensioner with shock absorber at other end, as required.
- 2.6.7 Lanyard cable runner: Type 316 stainless steel with automatic runner bypass for continuous "hands-free" operation that can be inserted or removed anywhere on the cable.
- 2.6.8 Harness: manufacturer's standard "hands-free" full body harness and lanyard complete with shock absorber.

## **2.7 Davits**

- 2.7.1 Davit Booms: rigged, aluminum sections of engineered length and size to suit application, equipped with: carrying handles; stainless steel rolling trolley on outboard end, designed to carry 1000 lbs (4.5 kN) vertical service load, minimum.
  - .1 Ensure non-corrosive UV resistant data plate stating Maximum Service Capacity of boom, Manufacturer's Name, Serial No., Manufacturing Date, rated load and other pertinent information is prominently displayed.
- 2.7.2 Davit Masts: Round tubular steel section capable of rotating through 360° with carrying handles and connecting pins.
- 2.7.3 Davit Arms: Davits to be demountable, portable, capable of being easily and quickly broken down into pieces weighing 80 lbs (36.3 kg) maximum.
  - .1 Ensure davit arm booms equipped with rolling trolleys or friction trolleys have stops to prevent detachment from boom. Provide hoisting winches and dolly wheels.
- 2.7.4 Davit Bases: Round, mild steel, hollow section piers, Type 350W with 50 Ksi (350 MPa) minimum yield strength, hot dipped galvanized to ASTM A123/A123M with 0.75 inches (19 mm) diameter U-bar safety anchor, and securement to suit application.
- 2.7.5 Acceptable Material: Pro-Bel Group, Davit System

## **3. EXECUTION**

### **3.1 Manufacturers Instructions**

- 3.1.1 Compliance: Comply with manufacturer's written data, including product technical bulletins, product catalog installation instructions and technical data sheets.

---

**3.2     Examination**

3.2.1     Site Verification of Conditions:

- .1     Verify that substrate conditions which have been previously installed under other sections or contracts, are acceptable for product installation in accordance with manufacturer's instructions prior to installation of equipment.
- .2     Inform Consultant of unacceptable conditions immediately upon discovery.
- .3     Proceed with installation only after unacceptable conditions have been remedied.

**3.3     Preparation**

- 3.3.1     Ensure structure or substrate is adequate to support complete equipment system.
- 3.3.2     Ensure structural steel to receive safety anchors has adequate bearing surface as indicated on shop drawings and has 100% welds between anchors and structural steel.

**3.4     Installation**

- 3.4.1     Coordinate equipment work with work of other trades, for proper time and sequence to avoid construction delays.
- 3.4.2     Install equipment plumb and level in accordance with manufacturer's written instructions.
- 3.4.3     Accurately fit and align, securely fasten and install free from distortion or defects.
- 3.4.4     Deform threads of tail end of anchor studs after nuts have been tightened to prevent accidental removal and vandalism.
- 3.4.5     At anchor locations, *Provide* seamless flashings. Fabricate flashings to suit roofing conditions. Seal top of anchor with 1-piece watertight cap. Rubber gaskets, grommets and "pitch pans" are not permitted.
- 3.4.6     Coordinate fall arrest anchor system installation with roofing and flashing Work specified under roofing Section. Ensure integrity of roofing and flashing systems.
- 3.4.7     Seal between assemblies and adjacent materials to ensure watertight installations. Do sealing Work in accordance with Section 07 92 00.
- 3.4.8     Track Works: Install tracks straight, true and level, with 0.125 inches (3 mm) maximum step deviation and in accordance with manufacturer's written instructions

---

**3.5     Field Quality Control**

- 3.5.1     Manufacturer's Field Services: Have manufacturer's technical representative schedule site visits to review work as follows:
- .1     After delivery and storage of products.
  - .2     When preparatory work for which work of this Section depends is complete, but before installation begins.
  - .3     during progress of work at 25% and 60% of completion.
  - .4     Upon completion of work, after cleaning is carried out.
- 3.5.2     Testing: Test on site 100% of all anchors using load cell test apparatus in accordance with manufacturer's written recommendations and CSA requirements.
- 3.5.3     Complete "Initial Inspection - Certification for Use" form included in Equipment Manual and Inspection Log Book provided by manufacturer.

**3.6     Final Cleaning**

- 3.6.1     Do cleanup in accordance with Division 01.
- 3.6.2     Upon completion, remove surplus and excess materials, rubbish, tools and equipment.

**3.7     Protection**

- 3.7.1     Protect installed product from damage during construction in accordance with Division 01.
- 3.7.2     Make good damage to adjacent materials caused by equipment installation.

**3.8     Maintenance And Cleaning**

- 3.8.1     Train Owner's personnel in the use of the fall arrest anchor system under Division 1 requirements.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Waste Compactors And Destructors work specified herein. This includes, but is not necessarily limited, to:
- .1 One-cylinder baling system and associated safety equipment.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Division 26 Sections for electrical service connections.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Submittals**

- 1.4.1 Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories.
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Waste Compactors And Destructors work and include product characteristics, performance criteria, physical size, finish and limitations
- 1.4.2 Shop Drawings: Drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:
- .1 Roughing-in dimensions, service connection details, and locations of field connections.
  - .2 Required clearances for equipment service and operation.
  - .3 Setting drawings, templates, and directions for installing anchor bolts and other anchorages.

1.4.3 Maintenance Data: Submit maintenance data in accordance with Division 01 for baling systems to include in maintenance manuals. In addition to items specified in Section 01 78 00, Closeout Submittals, include the following:

- .1 Operating and maintenance instructions.
- .2 Parts inventory list.
- .3 Purchase source for operating and maintenance materials.
- .4 Emergency information.
- .5 Name, address, and telephone number of manufacturer's service representative whose location is nearest to Project site.

## **1.5 Quality Assurance**

1.5.1 Manufacturer Qualifications: Manufacturer must have a minimum of 5 years of experience producing baling systems of similar scope and complexity.

1.5.2 Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

- .1 Maintenance Proximity: Not more than two hours' normal travel time from Installer's place of business to Project site.

1.5.3 Electrical Components, Devices, and Accessories: Listed and labeled as defined in CSA C22 SERIES by a testing agency acceptable to authorities having jurisdiction.

## **1.6 Delivery, Storage, and Handling**

1.6.1 Delivery: Deliver materials in manufacturer's original packaging, with labels intact.

1.6.2 Storage: Store baling system components in a dry, protected area to prevent damage or deterioration.

1.6.3 Handling: Handle materials with care to avoid damage.

## **1.7 Maintenance Service**

1.7.1 Initial Maintenance Service: Beginning at Substantial Performance of the Work, provide 12 months' full maintenance by skilled employees of baling system Installer.

- .1 Schedule regular surveillance and preventive maintenance visits at seven-day intervals for three months and at one-month intervals for nine months.
- .2 Repair or replace worn or defective components; and lubricate, clean, and adjust equipment as required for proper equipment operation. Use replacement parts and

---

maintenance supplies that were used in the manufacture and installation of the original equipment.

**1.8     Warranty**

- 1.8.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 .     PRODUCTS**

**2.1     Manufacturers**

- 2.1.1 Basis-of-Design: Materials specified in this Section are based on "Baler 1050" as supplied by MDA Compaction.
- 2.1.2 Substitutions: Refer to Section 01 25 00.

**2.2     Baling System**

- 2.2.1 Certifications: Baling system must be certified under CSA C22.2 NO. 14-05 and UL 508A standards.
- 2.2.2 Description: Manufacturer's standard vertical packaged units with components, options, and accessories needed to comply with requirements and provide complete functional systems.
- 2.2.3 Dimensions:
- .1 Baler Dimensions: 1395 mm x 1395 mm x 2591 mm (52-5/8" W x 93" H x 139-5/8" D).
  - .2 Bale Size: 1524 mm W x 1219 mm H x 762 mm D (60" W x 48" H x 30" D).
  - .3 Bale Weight: Up to 1000 lbs.
- 2.2.4 Key Features:
- .1 Mobility: System can be moved with a pallet truck.
  - .2 Bale Ready Light: Integrated indicator light for bale readiness.
  - .3 Control Panel: Includes QR code linking to video tutorials, electrical, and hydraulic diagrams.
  - .4 Loading Door: Equipped with bearings for smooth operation and automatic opening at the end of the cycle.
  - .5 Submerged Pump: Operates at a noise level of 85 dB.
  - .6 PowerPak: Mounted on hinges for easy access.
  - .7 Interchangeable Parts: All moving parts are removable and compatible with balers from the same series, regardless of size.
- 2.2.5 Bullpen:
- .1 Function: Mobile belt that secures the bale ejection area.

- .2 Operation: Magnetic contact prevents ejection unless the Bullpen is lowered.

2.2.6 Bullguard:

- .1 Function: Automatic barrier protecting the operator during bale ejection.
- .2 Operation: Repositions automatically when the ejection door opens.

2.2.7 Bullhorn:

- .1 Function: Prevents ram from subsiding during door opening.
- .2 Safety Mechanism: Interlocks with the ram, with three devices to ensure stability.

2.2.8 Safety Management System:

- .1 Certification: CSA approved, compliant with CAT.III safety standards.
- .2 Features: Includes a safety relay that monitors electrical operations to prevent system bypassing.

2.2.9 Automatic Bale Ejection: System activates upon door opening.

2.2.10 Wire Guides: Provides alignment for wire placement.

2.2.11 Heating Element: Heats oil and control box for outdoor operations during winter.

**2.3 Fabrication**

2.3.1 Fabricate baling systems with smooth, eased exposed edges.

2.3.2 Fabricate bins, hoppers, chutes, compaction chambers, unit bodies, and similar components of steel plate with welded joints. Reinforce with structural-steel members sized and spaced to withstand impacts and pressures of normal operations and to prevent excessive long-term development of waves and valleys.

2.3.3 Fabricate equipment with replaceable parts at points of normal wear.

2.3.4 Provide electrical devices, controls, and materials of type and quality recommended by NEMA for applications indicated on Drawings and Schedules. See Division 26 Sections for power characteristics and service to equipment, including disconnect switches.

**3. EXECUTION**

**3.1 Examination**

3.1.1 Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances, clearance

---

requirements, service rough-ins, and other conditions affecting performance of work.

- .1 Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2     Installation**

- 3.2.1 Set baling systems level, plumb, properly aligned, and securely in place. Anchor as required for secure operation.
- 3.2.2 Complete field assembly with joining methods recommended in writing by manufacturer.
- 3.2.3 Connect electrical components as specified in Division 26. Ensure compliance with CSA and UL standards.

**3.3     Start-up**

- 3.3.1 Test baling system, including safety features, to confirm proper operation.

**3.4     Adjustments And Cleaning**

- 3.4.1 Adjustments: Make necessary adjustments to ensure the system operates smoothly.
- 3.4.2 Cleaning: Clean baler and surrounding area after installation.

**3.5     Demonstration**

- 3.5.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain baling systems. Refer to Section 01, Demonstration and Training.

END OF SECTION

---

**1. GENERAL**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

**1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Roller Window Shades work specified herein. This includes, but is not necessarily limited, to:
- .1 Manually operated roller shades
  - .2 Motor-operated roller shades.
  - .3 Shadeband materials.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
- .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 06 10 00, Rough Carpentry for wood blocking and grounds for mounting roller shades and accessories.
    - .2 Section 07 92 00, Joint Sealants for sealing the perimeters of installation accessories for light-blocking shades with a sealant.

**1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.4 Action Submittals**

- 1.4.1 Product Data: Submit product data in accordance with Division 01 for the following:
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Roller Window Shades work and include product characteristics, performance criteria, physical size, finish and limitations.

- 
- .2 Include styles, material descriptions, construction details, dimensions of individual components and profiles, features, finishes, and operating instructions for roller shades.
    - 1.4.2 Shop Drawings: Show fabrication and installation details for roller shades, including shadeband materials, their orientation to rollers, and their seam and batten locations.
      - .1 Motor-Operated Shades: Include details of installation and diagrams for power, signal, and control wiring.
    - 1.4.3 Samples: Submit samples in accordance with Division 01 for each exposed product and for each colour and texture specified, 250 mm (10 inches) long.
    - 1.4.4 Samples for Verification: Submit samples of verification in accordance with Division 01 for each type of roller shade.
      - .1 Shadeband Material: Not less than 76 mm (3 inches) square. Mark inside face of material if applicable.
      - .2 Installation Accessories: Full-size unit, not less than 250 mm (10 inches) long.
    - 1.4.5 Roller-Shade Schedule: Use same designations indicated on Drawings.
  - 1.5 **Closeout Submittals**
    - 1.5.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for roller shades to include in maintenance manuals.
  - 1.6 **Maintenance Material Submittals**
    - 1.6.1 Supply extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
      - .1 Roller Shades: Full-size units equal to 5 percent of quantity installed for each size, colour, and shadeband material indicated on Drawings and Schedules, but no fewer than two units.
  - 1.7 **Quality Assurance**
    - 1.7.1 Installer Qualifications: Fabricator of products.
    - 1.7.2 Mockups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for materials and execution.
      - .1 Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Consultant specifically approves such deviations in writing.

- .2 Reviewed mockups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

**1.8 Delivery, Storage, And Handling**

- 1.8.1 Deliver roller shades in factory packages, marked with manufacturer, product name, and location of installation using same designations indicated on Drawings.

**1.9 Field Conditions**

- 1.9.1 Environmental Limitations: Do not install roller shades until construction and finish work in spaces, including painting, is complete and dry and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
- 1.9.2 Field Measurements: Where roller shades are indicated on Drawings and Schedules to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operating hardware of operable glazed units through entire operating range. Notify Consultant of installation conditions that vary from Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

**1.10 Warranty**

- 1.10.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 Altex/SunProject;
  - .2 Draper Inc.
  - .3 Elite Window Fashions
  - .4 Hunter Douglas Contract.
  - .5 Lutron Electronics Co., Inc.
  - .6 Silent Gliss USA, Inc.
  - .7 Solarfactive® Legrand.
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

---

**2.2 Regulatory Requirements**

- 2.2.1 Roller shades specified in this Section must conform to the Corded Window Coverings Regulations (SOR /2019-97) under the Canada Consumer Product Safety Act and ANSI/WCMA A100.1-2018, including requirements for flexible, chain-loop devices; lead content of components; and warning labels.

**2.3 Performance/Design Criteria**

- 2.3.1 Provide manually-operated roller window shade systems that provide easy lifting, finger-tip control, with infinite positioning so shade can stop and hold at any position within window opening. Provide limit stops to prevent shade from being raised or lowered too far.
- 2.3.2 System must be designed to operate without reachable chains. Where chains are provided, they must not exceed 40% of total shade length, and must be provided with a chain-retainer secured to window jambs or sills. In residential buildings (houses and condominiums), chains must not exceed 220 mm.
- 2.3.3 Design systems such that removal does not require disassembly of entire shade unit.
- 2.3.4 Provide units consisting of factory assembled roller window shade units with end brackets, shade roller tubes, extruded fasciae, hembars, fabrics, fastenings, anchorages and accessories specified and required. Treat steel elements for corrosion resistance.
- 2.3.5 Provide roller tube that operates smoothly and of sufficient diameter and thickness to prevent excessive deflection.
- 2.3.6 Motorization:
- .1 Electrical Components must be listed and labeled in accordance with CSA C22.1, validated by a Nationally Recognized Testing Laboratory (NRTL), and tested to the Canadian Electrical Code and National Electrical code standards. Approved certifications are CSA, UL and ULC.
  - .2 Motors: Manufacturer's standard tubular type, enclosed in roller assembly capable of accommodating total shade width, drop and weight capacity.
    - .1 Unless indicated otherwise, provide motors that are line voltage 120V AC 60Hz, or low voltage 24V DC hardwired, wired into power enclosures for low voltage or into building electrical system for line voltage. In renovation projects, provide systems that plug into standard AC electrical outlets that are concealed from view. Battery-operated systems are not acceptable.

- 
- .2 When required supply low voltage data cable wiring from motor controls to network intelligent motors. Coordinate operator wiring requirements, wiring scope of work and electrical characteristics with building electrical system to be managed by general contractor.
  - .3 Motors must be capable of operating at or below 45 dBA when measured at 915 mm (3 ft) from center of shade. There must be no audible clicks when motors start and stop.
  - .4 Provide mechanical or encoder based adjustable limit switches, interlocked to motor controls and set to automatically stop motion of shades when shades are fully raised or lowered.
  - .3 Shade Controls: Final shade operation will be confirmed during Shop Drawing review.
    - .1 Motorized roller window shades must be able to be controlled by wall-mounted individual/group switches or remote controls.
    - .2 For shade controls, coordinate operator wiring requirements, wiring scope of work and electrical characteristics with building electrical system to be managed by general contractor.
    - .3 System must be capable of being connected to Building Automation Systems, low voltage lighting control system, timer controls, sun sensor controls, or AV control system. To be determine during shop drawing review.
    - .4 System must provide interface to communicate with both wired and wireless inputs.
  - .4 Acceptable Motorization Manufacturer: Somfy Systems, Inc. or approved equivalent.
  - 2.3.7 Where motorized shades are provided in the Project, ensure manual roller window shades match motorized roller window shades in appearance and quality.
  - 2.3.8 Fabrics:
    - .1 Provide shade fabric that hangs flat without buckling or distortion. When trimmed, edges must be straight without ravelling. Unguided roller shade cloth must roll true and straight without shifting sideways more than 3 mm (1/8") in either direction due to wrap distortion or weave design.
    - .2 Flame Retardance of fabric: certified by an independent laboratory to pass the Small Scale Vertical Burn

Requirements of CAN/ULC S109 or NFPA 701, small scale test.

- .3 Provide fabrics complying with CDPH Standard Method for VOC Emissions (California Specification 01350) for indoor air quality requirements in accordance with UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or other third-party certification agency.

## **2.4     Single-Roller Manually Operated Shades**

- 2.4.1 Material Tag: This item is noted as "RS-1" on Drawings and Schedules.
- 2.4.2 Spring Operating Mechanisms: Roller contains spring sized to accommodate shade size indicated on Drawings and Schedules. Provide with positive locking mechanism that can stop shade movement at each half-turn of roller and with manufacturer's standard pull.
  - .1 Pole: Manufacturer's standard type in length required to make operation convenient from floor level and with hook for engaging pull.
- 2.4.3 Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated on Drawings and Schedules without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.
  - .1 Roller Drive-End Location: As indicated on reviewed Shop Drawings.
  - .2 Direction of Shadeband Roll: Reverse, from front of roller.
  - .3 Shadeband-to-Roller Attachment: Manufacturer's standard method.
- 2.4.4 Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated on Drawings and Schedules.
- 2.4.5 Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers into a multiband shade that is operated by one roller drive-end assembly.
- 2.4.6 Shadebands:
  - .1 Shadeband Material: Light-filtering fabric.
  - .2 Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.
    - .1 Type: Exposed with endcaps.

- .2 Colour and Finish: As selected by Consultant from manufacturer's full range.

2.4.7 Installation Accessories:

- .1 Front Fascia: Aluminum extrusion that conceals front and underside of roller and operating mechanism and attaches to roller endcaps without exposed fasteners.
  - .1 Height: Manufacturer's standard height required to conceal roller and shadeband when shade is fully open, but not less than 102 mm (4 inches).
- .2 Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure.
  - .1 Height: Manufacturer's standard height required to enclose roller and shadeband when shade is fully open, but not less than 76 mm (3 inches).
- .3 Endcap Covers: To cover exposed endcaps.
- .4 Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.
  - .1 Height: Manufacturer's standard height required to enclose roller and shadeband when shade is fully open, but not less than height indicated on Drawings.
  - .2 Provide pocket with lip at lower edge to support acoustical ceiling panel.
- .5 Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.
- .6 Side Channels: With light seals and designed to eliminate light gaps at sides of shades as shades are drawn down. Provide side channels with shadeband guides or other means of aligning shadebands with channels at tops.
- .7 Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed.
- .8 Installation Accessories Colour and Finish: As selected from manufacturer's full range.

**2.5 Double-Roller Manually Operated Shades**

- 2.5.1 Material Tag: This item is noted as "RS-2" on Drawings and Schedules.

- 
- 2.5.2 Crank-and-Gear Operating Mechanisms: Sealed gearbox drive system controlled by crank handle.
    - .1 Crank-Handle Type: Detachable.
    - .2 Crank-Handle Length: Manufacturer's standard.
  - 2.5.3 Spring Operating Mechanisms: Roller contains spring sized to accommodate shade size indicated on Drawings and Schedules. Provide with positive locking mechanism that can stop shade movement at each half-turn of roller and with manufacturer's standard pull.
    - .1 Pole: Manufacturer's standard type in length required to make operation convenient from floor level and with hook for engaging pull.
  - 2.5.4 Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated on Drawings and Schedules without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.
    - .1 Double-Roller Mounting Configuration: Side by side or Offset, outside roller over and inside roller under as noted on Drawings.
    - .2 Shadeband-to-Roller Attachment: Manufacturer's standard method.
  - 2.5.5 Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller mounting configuration, roller assemblies, operating mechanisms, installation accessories, and installation locations and conditions indicated on Drawings and Schedules.
  - 2.5.6 Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers into a multiband shade that is operated by one roller drive-end assembly.
  - 2.5.7 Inside Shadebands:
    - .1 Shadeband Material: Light-filtering fabric.
    - .2 Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.
      - .1 Type: Exposed with endcaps.
      - .2 Colour and Finish: As selected by Consultant from manufacturer's full range.
  - 2.5.8 Outside Shadebands:
    - .1 Shadeband Material: Light-blocking fabric.
    - .2 Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.
      - .1 Type: Exposed with endcaps.

- .2 Colour and Finish: As selected by Consultant from manufacturer's full range.

2.5.9 Installation Accessories:

- .1 Front Fascia: Aluminum extrusion that conceals front and underside of roller and operating mechanism and attaches to roller endcaps without exposed fasteners.
  - .1 Shape: L-shaped.
  - .2 Height: Manufacturer's standard height required to conceal roller and shadeband when shade is fully open, but not less than 76 mm (3 inches).
- .2 Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure.
  - .1 Height: Manufacturer's standard height required to enclose roller and shadeband when shade is fully open, but not less than 102 mm (4 inches).
- .3 Endcap Covers: To cover exposed endcaps.
- .4 Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.
  - .1 Height: Manufacturer's standard height required to enclose roller and shadeband when shade is fully open, but not less than height indicated on Drawings.
  - .2 Provide pocket with lip at lower edge to support acoustical ceiling panel.
- .5 Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.
- .6 Side Channels: With light seals and designed to eliminate light gaps at sides of shades as shades are drawn down. Provide side channels with shadeband guides or other means of aligning shadebands with channels at tops.
- .7 Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed.
- .8 Installation Accessories Colour and Finish: As selected from manufacturer's full range.

---

**2.6     Motor-Operated, Single-Roller Shades**

2.6.1 Material Tag: This item is noted as "RS-3" on Drawings and Schedules.

2.6.2 Motorized Operating System: Provide factory-assembled, shade-operator system of size and capacity and with features, characteristics, and accessories suitable for conditions indicated on Drawings and Schedules, complete with electric motor and factory-prewired motor controls, power disconnect switch, enclosures protecting controls and operating parts, and accessories required for reliable operation without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with building electrical system.

.1 Electrical Components: Listed and labeled as defined in CSA C22 Series, by a qualified testing agency, and marked for intended location and application.

.2 Electric Motor: Manufacturer's standard tubular, enclosed in roller.

.1 Electrical Characteristics: Provide motors that are line voltage 120V AC 60Hz, or low voltage 24V DC hardwired, wired into power enclosures for low voltage or into building electrical system for line voltage.

.3 Remote Control: Electric controls with NEMA ICS 6, Type 1 enclosure. Provide the following for remote-control activation of shades:

.1 Individual/Group Control Station: Maintained-contact, three-position, rocker-style, wall-switch-operated control station with open, close, and center off functions for individual and group control.

.2 Colour: As selected by Consultant from manufacturer's full range.

.4 Crank-Operator Override: Crank and gearbox operate shades in event of power outage or motor failure.

.5 Limit Switches: Adjustable switches interlocked with motor controls and set to stop shades automatically at fully raised and fully lowered positions.

.6 Operating Features:

.1 Group switching with integrated switch control; single faceplate for multiple switch cutouts.

.2 Capable of interface with multiroom control system.

.3 Capable of accepting input from building automation control system.

- 
- .4 Override switch.
  - 2.6.3 Rollers: Corrosion-resistant steel or extruded-aluminum tubes of diameters and wall thicknesses required to accommodate operating mechanisms and weights and widths of shadebands indicated on Drawings and Schedules without deflection. Provide with permanently lubricated drive-end assemblies and idle-end assemblies designed to facilitate removal of shadebands for service.
    - .1 Roller Drive-End Location: As indicated on reviewed Shop Drawings.
    - .2 Direction of Shadeband Roll: Regular, from back of roller.
    - .3 Shadeband-to-Roller Attachment: Manufacturer's standard method.
  - 2.6.4 Mounting Hardware: Brackets or endcaps, corrosion resistant and compatible with roller assembly, operating mechanism, installation accessories, and mounting location and conditions indicated on Drawings and Schedules.
  - 2.6.5 Roller-Coupling Assemblies: Coordinated with operating mechanism and designed to join up to three inline rollers into a multiband shade that is operated by one roller drive-end assembly.
  - 2.6.6 Shadebands:
    - .1 Shadeband Material: Light-filtering fabric.
    - .2 Shadeband Bottom (Hem) Bar: Steel or extruded aluminum.
      - .1 Type: Exposed with endcaps.
      - .2 Colour and Finish: As selected by Consultant from manufacturer's full range.
  - 2.6.7 Installation Accessories:
    - .1 Front Fascia: Aluminum extrusion that conceals front and underside of roller and operating mechanism and attaches to roller endcaps without exposed fasteners.
      - .1 Height: Manufacturer's standard height required to conceal roller and shadeband when shade is fully open, but not less than 102 mm (4 inches).
    - .2 Exposed Headbox: Rectangular, extruded-aluminum enclosure including front fascia, top and back covers, endcaps, and removable bottom closure.
      - .1 Height: Manufacturer's standard height required to enclose roller and shadeband when shade is fully open, but not less than 76 mm (3 inches).
    - .3 Endcap Covers: To cover exposed endcaps.

- .4 Recessed Shade Pocket: Rectangular, extruded-aluminum enclosure designed for recessed ceiling installation; with front, top, and back formed as one piece, end plates, and removable bottom closure panel.
    - .1 Height: Manufacturer's standard height required to enclose roller and shadeband when shade is fully open, but not less than height indicated on Drawings.
    - .2 Provide pocket with lip at lower edge to support acoustical ceiling panel.
  - .5 Closure Panel and Wall Clip: Removable aluminum panel designed for installation at bottom of site-constructed ceiling recess or pocket and for snap-in attachment to wall clip without fasteners.
  - .6 Side Channels: With light seals and designed to eliminate light gaps at sides of shades as shades are drawn down. Provide side channels with shadeband guides or other means of aligning shadebands with channels at tops.
  - .7 Bottom (Sill) Channel or Angle: With light seals and designed to eliminate light gaps at bottoms of shades when shades are closed.
  - .8 Installation Accessories Colour and Finish: As selected from manufacturer's full range.
- 2.6.8 Acceptable Motorization Manufacturer: Somfy Systems, Inc. or approved equivalent.

## **2.7 Shadeband Materials**

- 2.7.1 Shadeband Material Flame-Resistance Rating: Comply with NFPA 701 and CAN/ULC S109. Testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
- 2.7.2 Shadeband materials shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- 2.7.3 Solar Control (Light-Filtering) Fabric (3% openness): Woven fabric, stain and fade resistant.
  - .1 Type: PVC-coated fiberglass (approximately 65% PVC-coated fiberglass; 35% fiberglass).
  - .2 Microbial Resistance, ASTM E2180 and ASTM G21: Pass.
  - .3 Thickness: Not less than 0.45 mm (0.0178 inches)
  - .4 Mesh Weight: Not less than 350 g/sq.m (10.3 oz/sq. yd)
  - .5 Openness Factor: 3 percent.

- .6 Colour: to be selected by Consultant.
  - .7 Use with: RS-1, RS-2, and RS-3
  - .8 Acceptable Products: "TexScreen 9103" by ALTEX or approved equivalent.
- 2.7.4 Blackout (Light-Blocking) Fabric (0% openness): Opaque fabric, stain and fade resistant.
- .1 Type: Polyester with foamed-acrylic backing (PVC-free).
  - .2 Microbial Resistance, ASTM E2180 and ASTM G21: Pass.
  - .3 Thickness: Not less than 0.75 mm (0.030 inches)
  - .4 Weight: Not less than 470 g/sq.m (13.83 oz/sq. yd)
  - .5 Colour: to be selected by Consultant.
  - .6 Use with: RS-2
  - .7 Acceptable Products: "Shearweave 7000" by Phifer or "Avila Twilight" by Mermet Corp. or approved equivalent.

## **2.8 Roller-Shade Fabrication**

- 2.8.1 Product Safety Standard: Fabricate roller shades to comply with WCMA A 100.1, including requirements for flexible, chain-loop devices; lead content of components; and warning labels.
- 2.8.2 Unit Sizes: Fabricate units in sizes to fill window and other openings as follows, measured at 23 deg C (74 deg F):
- .1 Between (Inside) Jamb Installation: Width equal to jamb-to-jamb dimension of opening in which shade is installed less 6 mm (1/4 inch) per side or 13-mm (1/2-inch) total, plus or minus 3.1 mm (1/8 inch). Length equal to head-to-sill or -floor dimension of opening in which shade is installed less 6 mm (1/4 inch), plus or minus 3.1 mm (1/8 inch).
  - .2 Outside of Jamb Installation: Width and length as indicated on Drawings and Schedules, with terminations between shades of end-to-end installations at centerlines of mullion or other defined vertical separations between openings.
- 2.8.3 Shadeband Fabrication: Fabricate shadebands without battens or seams to extent possible except as follows:
- .1 Vertical Shades: Where width-to-length ratio of shadeband is equal to or greater than 1:4, provide battens and seams at uniform spacings along shadeband length to ensure shadeband tracking and alignment through its full range of movement without distortion of the material.

---

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, operational clearances, and other conditions affecting performance of the Work.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Roller-Shade Installation**

- 3.2.1 Install roller shades level, plumb, and aligned with adjacent units according to manufacturer's written instructions.
  - .1 Opaque Shadebands: Located so shadeband is not closer than 51 mm (2 inches) to interior face of glass. Allow clearances for window operation hardware.
- 3.2.2 Electrical Connections: Connect motor-operated roller shades to building electrical system.

#### **3.3 Adjusting**

- 3.3.1 Adjust and balance roller shades to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.

#### **3.4 Cleaning And Protection**

- 3.4.1 Clean roller-shade surfaces after installation, according to manufacturer's written instructions.
- 3.4.2 Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that roller shades are without damage or deterioration at time of Substantial Performance of the Work.
- 3.4.3 Replace damaged roller shades that cannot be repaired, in a manner approved by Consultant, before time of Substantial Performance of the Work.

#### **3.5 Demonstration**

- 3.5.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain motor-operated roller shades.

END OF SECTION

---

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Design-Build Contract and Subcontracts, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Entrance Floor Grilles work specified herein. This includes, but is not necessarily limited, to:
- .1 Floor grilles
  - .2 Frames.
  - .3 Support system.
  - .4 Drain pans.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Coordination**

- 1.4.1 Coordinate size and location of recesses in concrete to receive floor grilles and frames.

### **1.5 Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for the following:
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Entrance Floor Grilles work and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for entrance floor grilles and foot grilles.
- 1.5.2 Product Disclosure and Transparency:

- 
- .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
  - .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
    - .1 Health Product Declaration open Standard,
    - .2 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
    - .3 International Living Future Institute Declare
    - .4 Other approved framework.
  - .3 When multiple Products are specified, give preference to Products with compliant documentation.
- 1.5.3 Shop Drawings:
- .1 Items penetrating floor grilles and frames, including door control devices.
  - .2 Divisions between grille sections.
  - .3 Perimeter floor moldings.
- 1.5.4 Samples: Submit samples in accordance with Division 01 for the following products, in manufacturer's standard sizes:
- .1 Floor Grille: Assembled section of floor grille.
  - .2 Frame Members: Sample of each type and colour.
- 1.6 Closeout Submittals**
- 1.6.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for floor grilles and frames to include in maintenance manuals.
- 1.7 Field Conditions**
- 1.7.1 Field Measurements: Indicate measurements on Shop Drawings.
- 1.8 Warranty**
- 1.8.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

---

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Balco, Inc.
- .2 Crowder, K. N. Manufacturing, Inc.
- .3 C/S Group.
- .4 Pawling Corporation; Architectural Products Division.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Entrance Flooring, Generally**

2.2.1 Regulatory Requirements: Comply with applicable provisions in OBC and CSA B651

2.2.2 Slip Resistance: Provide materials having a minimum 0.6 coefficient of friction in accordance with ASTM D2047.

### **2.3 Stainless Steel Floor Grilles**

2.3.1 Provide manufacturer's standard floor-grille assemblies consisting of treads of type and profile indicated on Drawings and Schedules, interlocked or joined together by cross members, and with support legs (if any) and other components needed to produce a complete installation.

2.3.2 Structural Performance: Provide floor grilles and frames capable of withstanding the following loads and stresses:

- .1 Wheel load of 4.45 kN (1000 lb) per wheel.

2.3.3 Grille: Type 304 stainless steel, minimum 15.97 mm (5/8") deep, with electronically welded wires measuring 2.28mm (0.090") x 3.81mm (0.150") and spaced 3.68mm (0.145") apart.

2.3.4 Stainless Steel Finish: ASTM A480/A480M No. 4.

2.3.5 Frames: Provide manufacturer's standard frames of size and style for grille type.

2.3.6 Support System: Level Bed Applications: Provide manufacturer's standard, vinyl cushion support system.

2.3.7 Drain Pans: Provide manufacturer's standard, 1.52-mm (16 ga) thick, galvanized steel sheet drain pan. Coat bottom of pan with protective coating recommended by manufacturer.

2.3.8 Size: As noted on Drawings.

- 2.3.9 Basis-of-Design: "GridLine® G6" by Construction Specialties, Inc. or approved equivalent.

**2.4 Fabrication**

- 2.4.1 Shop fabricate floor grilles to greatest extent possible in sizes as indicated on Drawings and Schedules. Unless otherwise indicated on Drawings and Schedules, provide each grille as a single unit; do not exceed manufacturer's recommended maximum sizes for units that are removed for maintenance and cleaning. Where joints in grilles are necessary, space symmetrically and away from normal traffic lanes.
- 2.4.2 Fabricate frame members in single lengths or, where frame dimensions exceed maximum available lengths, provide minimum number of pieces possible, with hairline joints equally spaced and pieces spliced together by straight connecting pins.

**3 . EXECUTION**

**3.1 Examination**

- 3.1.1 Examine substrates and floor conditions for compliance with requirements for location, size, minimum recess depth, and other conditions affecting installation of floor grilles and frames.
- 3.1.2 Examine roughing-in for drainage piping systems to verify actual locations of piping connections before floor grille and frame and drain pan installation.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2 Installation**

- 3.2.1 Install recessed floor grilles and frames and drain pans to comply with manufacturer's written instructions at locations indicated on Drawings and Schedules and with top of floor grilles and frames in relationship to one another and to adjoining finished flooring as recommended by manufacturer. Set floor-grille tops at height for most effective cleaning action. Coordinate top of floor-grille surfaces with doors that swing across grilles to provide clearance under door.

**3.3 Protection**

- 3.3.1 After completing frame installations, provide temporary filler of plywood or fiberboard in floor-grille recesses and cover frames with plywood protective flooring. Maintain protection until

---

construction traffic has ended and Project is near Substantial  
Performance of the Work.

END OF SECTION

**1 .     General**

**1.1     General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

**1.2     Summary**

- 1.2.1 Provide seismic control assemblies for operational and functional components including but not limited to following:
  - .1 Work in this Section includes supplying and installing complete seismic restraint systems for architectural components. Work in this Section may also include the seismic restraint design and/or equipment/product certifications to be submitted for review by the registered design professional.
  - .2 Architectural assemblies or components requiring seismic restraint include, but are not limited to, the following:
    - .1 nonstructural exterior wall components,
    - .2 interior partitions and infill walls,
    - .3 suspended ceiling assemblies and bulkheads,
    - .4 exit doors, and overhead doors,
    - .5 roof accessories, and similar components,
    - .6 wall-mounted components weighing more than 9 kg (20 lbs)
    - .7 Owner-supplied, Contractor-installed equipment,
    - .8 other components needing seismic restraints and listed in Contract Documents.
- 1.2.2 Related Requirements: Specifications throughout entirety of Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

**1.3     References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.4     Administrative Requirements**

- 1.4.1 Sequencing: Coordinate installation with the work of related Sections referenced herein.

.1 Prior to start of work, arrange for Project site meeting of parties associated with work of this Section.

- 1.4.2 Scheduling:

- .1 Prior to commencing work of this Section, arrange for manufacturer's technical representative to review with Contractor and Consultant procedures to be adopted and conditions under which work shall be performed. Inspect surfaces to determine adequacy of existing and proposed conditions.
- .2 Co-operate fully with other Subcontractors on the Work and promptly proceed with work of this Section as rapidly as job conditions permit.
- .3 Co-operate with those performing the work of other Sections for application of all miscellaneous specialties.
- .4 Supply items to be built-in in ample time to be incorporated into work of other Subcontractors, together with measurements and other information required for location of it.

**1.5     Submittals**

- 1.5.1 Product Data: Submit manufacturer's literature and data sheets for each type of material provided under this Section for Project in accordance with requirements of Division 01. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to specified materials.

- 1.5.2 Material Safety Data Sheets: Submit MSDS for inclusion in operation and maintenance manual without limitations for adhesives, sealants and any other material later designated by Consultant.

- 1.5.3 Shop Drawings: Submit in accordance with Division 01 and indicating following:
- 1.5.4 Submit complete seismic restraint design, consisting of calculations, restraint selection, installation details, and other documentation signed and sealed by Professional Engineer stipulated herein. Seismic restraint Shop Drawings shall be prepared and overseen by a Professional Engineer as specified herein experienced in designing seismic restraints for operational and functional components as required by the Authority Having Jurisdiction
- 1.5.5 Where walls, floors, slabs, or supplementary steel work is used for seismic restraint, submit details of acceptable attachment methods for equipment and components; including spacing, static loads, and seismic loads at all attachment and support points. Obtain approval of Consultant prior to installation.
- 1.5.6 Provide specific details of seismic restraints and anchors; include number, size, and locations for each piece of equipment; provide details of suspension supports and restraints for equipment hung from ceiling.

## **1.6 Quality Assurance**

- 1.6.1 Qualifications:
  - .1 Manufacturers:
    - .1 Provide work of this Section by a specialty consultant or equipment manufacturer designated to develop seismic restraint system and perform seismic calculations in accordance with requirements of OBC, standards stipulated herein and additional requirements particular to this Section.
    - .2 Ensure equipment manufacturer or specialty consultant specified herein designs, recommends, reviews, and supervises installation of proposed seismic restraint design and connection methods for entire Project, excluding work associated with Divisions 20, 21, 22, 23 & 26.
  - .2 Installers: Provide work of this Section executed by competent installers with minimum 5 years experience in the application of Products, systems and assemblies specified and with approval and training of the Product manufacturers.
- 1.6.2 Licensed Professionals: Employ a full time structural Professional Engineer registered in the Province of Ontario, carrying minimum

professional liability insurance as noted in the Owner's supplementary conditions to:

- .1 design the components of the work of this Section requiring structural performance,
- .2 be responsible for full assemblies and connections,
- .3 be responsible for determining sizes, yield strengths, gauge thicknesses and joint spacing to allow thermal movement and loading of components in accordance with applicable codes and regulations,
- .4 be responsible for production and review of Shop Drawings,
- .5 inspect the work of this Section during fabrication and erection,
- .6 stamp and sign each Shop Drawing,
- .7 provide site administration and inspection of this part of the Work, and
- .8 submit certificate validating seismic assessment and field review of this part of the Work

1.6.3 Single Source Responsibility: Ensure materials specified herein are designed and provided by a single seismic restraint manufacturer to ensure sole source responsibility for performance of seismic restraints used.

## **1.7 Delivery, Storage And Handling**

1.7.1 Delivery and Acceptance Requirements:

- .1 Comply with material manufacturer's ordering instructions and lead time requirements to avoid delays.

## **1.8 Warranty**

1.8.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

## **2 . Products**

### **2.1 Description**

2.1.1 Design and Performance Requirements:

- .1 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**13 48 50  
Seismic Control  
Assemblies For  
Operational And  
Functional Components**

- 
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
  - .2 Drawings covering work of this Section may show design intent and profiles that are diagrammatic in nature. Drawings may also show general building standards for seismic restraint of operational and functional components, which are to be completed and coordinated by this Section. Drawings are not intended to identify or solve completely problems of structural or seismic movements, assembly framing, engineering design, fixings and anchorages
  - .3 Requirements of this seismic restraint Section are in addition to other requirements specified elsewhere for the support and attachment of operational and functional components. Nothing on Contract Documents shall be interpreted as justification to waive requirements of this Section.
  - .4 In addition to Contract Documents requirements, final design and performance of seismic control and restraint assemblies of operational and functional components and their approval by Authorities Having Jurisdiction is the responsibility of the contractor performing the work of this Section.
  - .5 Design seismic restraint system and clearly indicate attachment points to building structure and design forces (in X, Y, and Z direction) at the attachment points in accordance with OBC for designated seismic hazard values for location of Project as listed in Supplementary Standard SB-1. Design anchorage in accordance with ACI 318, Appendix D.
  - .6 Provide attachment loading values to Professional Engineer specified herein for verification of attachment methods and building's structure ability to accept imposed loading. Base seismic restraint design on actual OFC data (dimensions, weight, center of gravity, and similar criteria) obtained from submittals or item manufacturers. Ensure that equipment manufacturer verifies that attachment points on equipment and components can accept combination of seismic loading and other loads imposed.
  - .7 Design seismic restraint system in accordance with OBC requirements and requirements of CAN/CSA S832 based non-exhaustively on the following:

- .1 Anticipated ground motion (including spectral response acceleration as defined by local codes and Authorities Having Jurisdiction);
- .2 Soil type in specific geographic area
- .3 Importance Factor of Building (i.e 1.5 for post-disaster buildings)
- .4 Specific element of component factor
- .5 Height factor
- .6 Element's or component's response modification factor
- .7 Element's or component's weight.
- .8 For each element or component identified herein determine seismic risk rating score (low, moderate or high) and provide mitigation and reduction procedures in accordance with CAN/CSA S832.
- .9 Include in seismic analysis calculated dead loads, static seismic loads, and capacity of materials utilized for connection of the equipment or system to building structure. Detail anchoring methods, bolt diameter, embedment and welded length. Ensure seismic restraint devices are designed to accept, without failure, forces through components or system's center of gravity.

## **2.2 Materials**

- 2.2.1 Provide manufacturer's standard recommended materials or proprietary systems for seismic bracing and restraint to meet requirements of local codes and Authorities Having Jurisdiction based on design and performance criteria stipulated herein. Provide materials with full published ratings, verified through third party testing and bearing OSHPD pre-approval for use in the State of California.

## **3 . Execution**

### **3.1 Examination**

- 3.1.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

- 3.1.2 Evaluation and Assessment: Notify seismic restraint system manufacturer's representative prior to installing seismic restraint devices. Seek manufacturer's guidance regarding unusual installation procedures.

### **3.2     Installation**

- 3.2.1 Install seismic restraint systems in strict accordance with the manufacturer's written instructions and submittal data specified herein.
- 3.2.2 Ensure installation of seismic restraints do not cause change of position of OFCs resulting in detrimental stresses or misalignment.
- 3.2.3 Coordinate work with other trades to avoid rigid contact with building elements. Bring to attention of Consultant and structural consultant prior to installation, conflicts with other trades that may result in rigid contact with equipment due to inadequate space or other unforeseen conditions.
- 3.2.4 Install ceiling suspension and connections components ensuring hanger rods are not subject to bending in accordance with requirements of ASTM E580.
- 3.2.5 Do not brace seismic restraint system to 2 different structures, such as a wall and a ceiling.
- 3.2.6 Unless otherwise indicated by seismic consultant specified herein, Provide following seismic mitigation measures to following building elements:
- .1 Partitions:
- .1 In buildings with flexible structural frames, anchor partitions to only structural element, such as a floor slab, and separate such partition by physical gap from other structural elements.
- .2 Properly anchor masonry walls to the structure for restraint, so as to carry lateral loads imposed due to earthquake along with their own weight and other lateral forces.
- .2 Ceilings And Lighting Fixtures:
- .1 At regular intervals, laterally brace suspended ceilings against lateral and vertical movements, and provide with a physical separation at the walls.
- .2 Independently support and laterally brace lighting fixtures. Refer to applicable portion of lighting Specifications.

.3 Facades And Glazing:

- .1 Do not install concrete masonry unit filler walls in a manner that can restrain the lateral deflection of the building frame. Provide a gap with adequately sized resilient filler to separate the structural frame from the non-structural filler wall.
- .2 Tie brick veneers to a separate wall that is independent of the steel frame as shown on construction drawings to ensure strength against applicable seismic forces at the project location.
- .3 Install attachments to structure for all façade materials as shown on construction drawings to ensure strength against applicable seismic forces at the project location.

.4 Storage Racks, Cabinets, And Bookcases:

- .1 Install storage racks to withstand earthquake forces and anchored to the floor or laterally braced from the top to the structural elements.
- .2 Anchor filing cabinets that are more than 2 drawers high to the floor or walls, and equip all drawers with properly engaged, lockable latches.
- .3 Anchor bookcases that are more than 30 inches high to the floor or walls, and equip any doors with properly engaged, lockable latches.

**3.3 Field Quality Control**

3.3.1 Manufacturers' Field Services:

- .1 Upon completion of installation of seismic restraint system, have manufacturer's local representative inspect completed system and report in writing any installation errors, improperly selected seismic devices, or other faults which could affect system performance. Perform corrective measures until final approval is granted at no additional cost to Owner.
- .2 Submit, upon request by Consultant, letter of certification signed by Professional Engineer specified herein, substantiating that seismic restraint materials have been properly installed.

**3.4 Cleaning**

- 3.4.1 Upon completion of installation of seismic restraint materials and before Substantial Performance of the Work, clean debris beneath

---

OFCs and leave the Place of the Work in a clean and acceptable condition.

End of Section

**1. GENERAL****1.1 General instructions****1.1.1 Read and conform to:**

- .1 Division 1 requirements and documents referred to therein.

**1.2 Scope****1.2.1 Provide labour, materials, products, equipment and services necessary for the:**

- .1 Supply and installation of a single machine-room-less traction passenger elevator and as specified in Section 14 21 23.
- .2 Maintenance of the elevators in accordance with Section 14 01 20 until one year following Substantial Performance of the installation.

**1.3 Maintenance: warranty period****1.3.1 Provide labour, materials, products, equipment and services necessary for the maintenance of the elevating devices in accordance with Section 14900.****1.3.2 This maintenance to begin at Substantial Performance and end 12 months after Substantial Performance.****1.3.3 Costs for this maintenance are to be included in the project costs.****1.4 Definitions of terms****1.4.1 The term "Owner" as used herein, refers to Region of Peel.****1.4.2 The term "architect", as used herein, refers to Diamond Schmitt Architects.****1.4.3 The term "consultant", "elevator consulting engineer", "consulting engineer" or "engineer", as used herein, refers to KJA Consultants Inc.****1.4.4 The term "elevator contractor" or "contractor", as used herein, refers to any person, partners, firm or corporation having a contract with the Owner to furnish labour and materials for the execution of the work herein described.****1.4.5 The term "sub-contractor", as used herein, refers to any person, partners, firm or corporation having a contract with the contractor to furnish labour and materials for the execution of the work herein described.****1.4.6 The term "inspecting authorities", as used herein, refers to authorized agents of governments and of insurance groups which are charged with the responsibility of carrying out periodic inspections and tests on vertical transportation equipment.****1.4.7 The term "provide", as used herein, means to supply and install new equipment.****1.4.8 The term "Code", as used herein, refers to the latest edition of the CAN/CSA-B44 Safety Code for Elevators and Escalators, with updates and including Nonmandatory Appendices (which are deemed mandatory herein), as adopted by the Authority Having Jurisdiction.**

- 1.4.9 All terms in the specifications that are not otherwise defined shall have the definitions as given in the Code.

**1.5 Operation and maintenance manual**

- 1.5.1 Supply to the Consultant and Owner prior to the Substantial Performance inspection, operation and maintenance manuals.
- 1.5.2 The project shall not be deemed to have reached Substantial Performance until the complete operation and maintenance manuals have been approved by the Consultant or Owner.
- 1.5.3 Upon acceptance by the Consultant or Owner, provide three copies of the operation and maintenance manuals per group in one of the following formats, as selected by the Owner.
- .1 Print and bind hard copies of which two will be given to the Owner and one will be placed in the respective machine room; OR
  - .2 Provide an electronic copy in PDF format on an unprotected digital storage device (such as a USB).
- 1.5.4 The operation and maintenance manual shall incorporate, at a minimum:
- .1 A cover page including project title, address;
  - .2 An index;
  - .3 Contact details for the respective parties;
  - .4 A warranty letter signed by a representative of the contractor having authority to bind the company;
  - .5 Controller and drive manuals, including:
    - .1 A description of the controller user interface;
    - .2 The installation and user's manuals;
    - .3 A list of fault and error codes, including an explanation of meanings and corrective actions;
    - .4 Troubleshooting and diagnostic procedures, methods of use and the adjustment of programmable parameters together with their settings at the time of final adjustment.
  - .6 As-built wiring diagrams;
  - .7 The operation of the equipment including special features, dispatching sequences, and such items as intercom systems and security systems;
  - .8 Step-by-step instructions for the operation for special features such as Firefighters' Emergency Operation, Independent service and Emergency Power service;
  - .9 As-built diagrams and drawings of operating panels (e.g. car panels, central control consoles) with descriptions of the function of switches and indicators;
  - .10 A copy of the final submission to the Authority Having Jurisdiction;

- .11 A copy of the final inspection report from the Authority Having Jurisdiction;
- .12 Operation and maintenance manuals for other major components where applicable, including:
  - .1 Door operator;
  - .2 Emergency brake;
  - .3 Communication system;
  - .4 Safeties & governor;
  - .5 Hoist machine & motor;
  - .6 Cylinders;
  - .7 Hydraulic pump machine and internal components;
  - .8 Hall kiosks, including step-by-step instructions for re-programming;
  - .9 In-car monitors, position indicators and display screens, including step-by-step instructions for re-programming;
  - .10 Hall kiosk special screen features and codes (i.e. to call a specific car to a floor, to call a specific car to a floor for cleaning or other maintenance functions, etc.).
  - .13 Supplier and part name for other parts (ex: travelling cable, restrictors, retainers, interlocks, car top inspection station, guide means, etc.), excluding minor or generic items such as screws, bolts, hinges, etc;
  - .14 Full instructions for any special maintenance procedure, repair protocol, adjustment or test not addressed by Code (including the A17.2 and the Elevator Industry Field Employee's Safety Handbook);
  - .15 Manufacturer's recommended maintenance intervals for each major component.
  - .16 A copy of the Maintenance Control Program.

## **1.6 Coordination with other trades**

- 1.6.1 Where the work joins another trade, provide drawings showing the actual dimensions and the method of joining the work to the work of the other trade and information such as anchors, templates and details for cast-ins.
- 1.6.2 Provide access and assistance as required, at no extra charge, in relation to work by other trades.

---

**1.7 Fixture type**

- 1.7.1 Provide, unless otherwise indicated in the Specifications or Drawings, signal fixtures, such as push buttons and position indicators, from your standard range of products.
- 1.7.2 Provide push buttons with metal targets.
- 1.7.3 Provide, unless otherwise indicated in the Specifications or Drawings, signal fixtures in an illumination colour selected by the Owner.
- 1.7.4 Submit illustrations of those types available and provide at least one physical button sample of the type selected by the Owner for final approval.

**1.8 Finishes: stainless steel**

- 1.8.1 Provide, unless otherwise indicated in the Specifications or Drawings, Exelsior XL Blend 'S' stainless steel for high-traffic applications for visible natural metal finishes.
- 1.8.2 Arrange, unless otherwise indicated in the Specifications or Drawings, that the brush or grain direction of finishes of visible natural metals be in the vertical direction (for horizontal sections the brush or grain shall be in the direction of the longer surface dimension).
- 1.8.3 Remove all protective film prior to turnover of the unit to the Owner.

**1.9 Progress payments**

- 1.9.1 Progress payments will be based on the percentage of the work complete as determined by the Consultant.
- 1.9.2 Ten percent of the contract value will be assigned to the provision of manuals and close-out documents and the correction of deficiencies.
- 1.9.3 A 10% holdback will apply to payments, this holdback to be released within a period as set out in the applicable legislation.

**1.10 Acceleration of the Work**

- 1.10.1 If the Work falls behind the schedule, take action as necessary to meet the schedule, including, but not limited to, extra personnel and overtime work.
- 1.10.2 Pay any costs associated with this action unless the delay is caused by acts of government, riot, civil commotion, war, malicious mischief, act of God or any cause beyond the control of the contractor.

**1.11 Acknowledgments**

- 1.11.1 The proposer acknowledges that the proposer has found no discrepancies nor any ambiguities in the specifications.

**1.12 Assignments**

- 1.12.1 Do not assign nor sublet the contract without the written consent of the Owner.
- 1.12.2 Do not assign any payment due or to become due as a result of this contract without the written consent of the Owner.

**1.13 Certificates of inspection**

- 1.13.1 Obtain and pay for certificates of approval and all other necessary permits and inspections.
- 1.13.2 Prior to Substantial Performance, arrange and pay for an acceptance inspection of the equipment by a government authority or, if that is not available, by a recognized independent private professional inspection organization.
- 1.13.3 Submit, prior to Substantial Performance, the acceptance inspection report.
- 1.13.4 Should more than one inspection for a licence or approval be required due to deficient work by others give sufficient advance notice of such deficient work to allow the Work to be completed prior to the time of the subsequent inspection.
- 1.13.5 If sufficient advance notice of such deficient work has not been given, assume the cost of the additional inspections.

**1.14 Changes in Work**

- 1.14.1 The Owner, without invalidating the contract, may order extra work or make changes by altering, adding to, or deducting from the Work, the contract sum being adjusted as agreed.
- 1.14.2 Execute all such work under the conditions of the original contract except that any claim for extension of time caused thereby shall be adjusted at the time of ordering such change.
- 1.14.3 The Consultant shall have authority to make minor changes in the Work, not involving extra cost and not inconsistent with the purpose of the contract.
- 1.14.4 Otherwise do no extra work nor make any change unless in pursuance of written order from the Owner.

**1.15 Clean-downs**

- 1.15.1 Provide clean-downs of all construction dust and debris (i.e. control/machine room, hoistway, cab, escalator interior, etc.) to occur as follows:
  - .1 Prior to turnover inspection of an individual elevator by the Authority Having Jurisdiction;
  - .2 Once upon building substantial completion, at the commencement of the warranty period.

---

**1.16 Claims for extra cost**

- 1.16.1 Provide any claims for extra cost due to instructions or otherwise, to the Owner in writing within a reasonable time after the instructions and in any event before proceeding with the work.
- 1.16.2 No such claim shall be valid unless so made and authorized in writing by the Owner.

**1.17 Codes and ordinances**

- 1.17.1 Supply equipment and do work in accordance with building codes, by-laws, regulations and requirements of the local, provincial and federal authorities in effect at the time of the execution of the work.
- 1.17.2 Supply equipment and do work in accordance with the Code, and any other code which may govern the requirements of the installation.
- 1.17.3 Provide labour and material, whether or not specifically mentioned in this specification, that may be necessary to provide an installation conforming to the applicable codes and regulations.
- 1.17.4 Prior to submission of the proposal and throughout the duration of work, give prompt notification in writing of any regulations or requirements known to be in process which might affect the acceptability of the work.
- 1.17.5 If changes in codes or regulations result in extra costs, those taking effect subsequent to the date of proposal submission shall be treated as an extra to the contract.
- 1.17.6 Requirements of the Authority Having Jurisdiction applicable at the time of proposal submission shall be deemed to be included in the contract, unless specifically excluded herein.
- 1.17.7 Should changes in codes, changes in legislative requirements or changes to the requirements of the Authority Having Jurisdiction be announced prior to the date of proposal submission but with a delayed adoption date, those changes shall be deemed to be included in the contract, unless specifically excluded herein.

**1.18 Completion schedule**

- 1.18.1 Submit with the proposal, a detailed schedule including specific dates for equipment delivery times, start of site work, completion of each unit and resolution of all noted deficiencies.
- 1.18.2 During the construction period give the following information to the Consultant:
  - .1 Revisions, if necessary, to the completion schedule;
  - .2 A progress report every month showing the progress being made and the percentage of the job completed;
  - .3 Two weeks advance notice for inspection by the Consultant.
- 1.18.3 Schedule a job site meeting every two weeks during the construction period.

**1.19 Contract Documents**

- 1.19.1 The Contract Documents shall consist of general conditions, instructions to bidders, the Drawings, Specifications (including alternates and addenda) and completion schedules.
- 1.19.2 Execute the work in accordance with the Owner's contract documents, any supplemental conditions and these specifications.
- 1.19.3 Where there is a conflict between the documents the Owner's contract documents will take precedence over the other documents and any supplemental conditions will take precedence over these specifications.

**1.20 Defective work and non-performance**

- 1.20.1 The Owner reserves the right to correct any defective work and to charge the cost to the contractor.
- 1.20.2 Should the contractor fail to execute any of the Work set out in the contract the Owner reserves the right to do the Work and to charge the cost to the contractor.
- 1.20.3 The Owner reserves the right to withhold payment in the event of non-performance or to pay only for that portion of the Work that has been executed.
- 1.20.4 The Owner will give reasonable notice in writing prior to taking such action unless the defective work or non-performance prejudice the safety of people or the installation.

**1.21 Drawing and sample submittals**

- 1.21.1 Drawing and sample submittals are required for exposed finishes and fixtures.
- 1.21.2 Submit for review samples of metals, glass, paint colours, plastic laminates and finishes, of 200 mm (8") by 300 mm (12") approximate size, properly identified as to project, location and material.
- 1.21.3 Submit for review, as a minimum, the following:
  - .1 General arrangements;
  - .2 Details of areas where the work joins the work of other trades;
  - .3 Machine room layouts showing the location of the equipment;
  - .4 Hoistway layouts showing the location of the equipment, car platform dimensions, cab interior dimensions and net inside cab area;
  - .5 Hoistway sections showing overhead, pit equipment, car and frame and entrances;
  - .6 Cab details including the cab shell, platform, interior panels, ceiling, entrance, lighting and finishes;
  - .7 Details of control panels such as central control consoles or fire control panels showing the layout and detailing the design of switches and indicator lights;
  - .8 Details of intercom system station types detailing the controls;
  - .9 Details of any display devices complete with examples of proposed displays, symbols and layout;

.10 Fixture brochures.

1.21.4 Show on the general arrangement or separately, details of frames, doors, sills and supports, lanterns and gongs, including views showing the relationship of hall stations, lanterns and entrances.

1.21.5 Provide as built information at job completion prior to Substantial Performance.

1.21.6 Reviews do not include the checking of measurements and do not imply approval of variations from the specifications.

## **1.22 Electrical diagrams**

1.22.1 Supply wiring diagrams and data as required for the execution of the Work including schematics for speed control, dispatching system, interfaces, printed circuit boards.

1.22.2 Incorporate, as part of the schematic diagrams, a reference index ('road map') giving the location of electrical components and wiring interconnections for relay coils, relay contacts, field equipment, integrated circuits and other such devices, so that the position on the schematics of any of these items can be readily determined.

1.22.3 Supply, prior to the Substantial Performance inspection, three prints and one reproducible of the wiring and schematic diagrams revised to show changes that have been made.

1.22.4 If changes are subsequently made to the wiring or control, supply an additional two sets of marked-up prints of the schematics and field wiring diagrams showing the changes.

## **1.23 Environmental considerations**

1.23.1 Where practicable, recycle material replaced in the course of the work.

1.23.2 Provide a list of materials to be removed from site and their proposed recycling or disposal location for approval prior to commencing work.

1.23.3 Where practicable, provide new materials manufactured by methods that do not adversely affect the environment by, for example, generating residual deposits of heavy elements and greenhouse gases.

1.23.4 Use materials on site, such as low VOC (Volatile Organic Compound) adhesives and paint, that will not negatively affect the in-building environment.

## **1.24 Equipment insurance**

1.24.1 The Owner's insurance policy covers equipment actually in place in the building and accepted by the Owner.

1.24.2 All other material and equipment is not included in the Owner's policy and such material and equipment is stored at the Contractor's own risk.

**1.25 Equipment moving**

- 1.25.1 Provide floor protection and bracing so that equipment moving causes no damage to the building.

**1.26 Failure to perform**

- 1.26.1 If the contractor shall neglect to prosecute the work properly or fail to perform any provision of the contract, the Owner after ten days written notice to the contractor may, without prejudice to any other remedy the Owner may have, make good such deficiencies and may deduct the cost therefrom from payment due to the contractor.

**1.27 Generic maintenance**

- 1.27.1 Arrange that the equipment can be maintained and adjusted by any competent elevator company without the use of proprietary tools, information or equipment or, if such tools, information or equipment are required, provide them (these shall become the property of the Owner).
- 1.27.2 Do not incorporate any running time, cycle counters or trip counters that would cause the equipment to shut down or alter its operation in any way.

**1.28 Hoistway protection**

- 1.28.1 Provide, maintain and, after the Work is complete, remove any partitions required in the hoistway.
- 1.28.2 Provide, maintain and, after the Work is complete, remove protective hoarding required at openings into the hoistway.

**1.29 Inability to complete contract**

- 1.29.1 Should there be a reasonable doubt that the work will be completed within the scheduled time because of labour disputes or any other cause, the Owner reserves the right, at the Owner's option, to cancel the contract.
- 1.29.2 In the event this option is exercised, the payments for the work shall be made on a pro rata basis for materials and labour supplied to the time of cancellation and such material and work performed shall become the property of the Owner.
- 1.29.3 Prior to exercising this option, the Owner shall give two weeks notice in writing of intention to cancel.

**1.30 Information with proposal**

- 1.30.1 Provide the following information, where relevant, with the proposal:
- .1 The model and manufacturer of such items as solid state drives, fixtures, control systems, door operators and other purchased material (with the exception of miscellaneous minor items);
  - .2 The current rating of the solid state drives;
  - .3 The KVA rating of the transformers feeding the solid state drives;
  - .4 Certification from an independent testing laboratory detailing the line pollution generated by the solid state drives;

- .5 Certification from an independent testing laboratory detailing the extent to which the control systems are protected against external electromagnetic radiation;
- .6 Brochures, descriptions and manuals (where applicable) for the major items;
- .7 Renderings or samples of the fixtures and exposed materials;
- .8 Detailed completion schedule for the work;
- .9 A copy of your health and safety policy as issued to your employees;
- .10 Mechanic and team regular and overtime hourly rates.

**1.31 Inspection and acceptance**

- 1.31.1 Furnish a team of competent personnel to assist the Consultant with an inspection of each elevating device prior to Substantial Performance to verify that the work is in compliance with the Specifications.
- 1.31.2 If the results of these inspections do not meet the requirements of the Specifications, make the appropriate corrections, and provide, as set out above, for another inspection.

**1.32 Key switches**

- 1.32.1 Where possible supply switches and keys compatible with the vertical transportation equipment portfolio of the Owner, unless otherwise noted herein.
- 1.32.2 Engrave or mechanically fasten collar rings to clearly mark key-switch functions, positions and key required.
- 1.32.3 Prior to placing any units into service for the public, provide to the Owner six copies of each key-switch key type defined in the Code as being Security Group 2, 3 and 4.
- 1.32.4 Engrave the key number on each key provided to the Owner and group the keys by Security Group and key type.

**1.33 Labour laws**

- 1.33.1 Comply with applicable provisions of federal, provincial and local labour laws and with applicable union regulations.

**1.34 Liability insurance**

- 1.34.1 Provide, during the period this contract is in force, premises liability, including public liability insurance and property damage insurance in the amount of \$5,000,000 inclusive, to be covered against any claims for damage to property or for personal injury, including death, which may arise from operation under this contract, whether such operation is by yourself or by any sub-contractor or anyone directly or indirectly employed by you.
- 1.34.2 Upon completion of the contract, have in force a completed operations and products liability insurance, in the amount of \$5,000,000 inclusive, to be covered against any claims for damages to property or for personal injury, including death, which may arise after the premises liability is terminated.

- 1.34.3 Maintain the insurance in force for a minimum period of two years after completion of the contract.
- 1.34.4 List the Owner as an additional insured.
- 1.34.5 The certificates shall state that the insurance will not become ineffective without sufficient written notice to the Owner.
- 1.34.6 Submit certificates of such insurance with the Owner before work is begun.

**1.35 Liens and affidavits**

- 1.35.1 The final payment and any part of the retained percentage shall not become due until a complete release of liens arising out of this contract or receipts in full in lieu thereof have been delivered to the Owner.
- 1.35.2 Furnish an affidavit to the Owner that the release or receipts include labour and materials for which a lien could be filed.
- 1.35.3 If any lien remains unsatisfied after all payments are made, refund to the Owner monies that the Owner may be compelled to pay in discharging such a lien, including costs and reasonable legal fees.

**1.36 Maintenance tasks**

- 1.36.1 Perform and bring all routine maintenance tasks required by the Inspecting Authorities up to date (i.e. monthly, quarterly, semi-annual, annual, 5-year, Category 1, Category 3, Category 5 requirements, etc.) prior to turning over the elevator for public use.
- 1.36.2 Arrange for Category 5 test bench marking with the Henning alternative testing tool or approved equivalent tools.
- 1.36.3 Complete the Category 5 test bench marking at the same time that full speed and full load testing is performed.
- 1.36.4 Provide electronic records confirming the successful completion of the tests.

**1.37 Materials and workmanship**

- 1.37.1 Provide all new materials and equipment.
- 1.37.2 Install equipment in a neat, accurate, workmanlike manner.

**1.38 Measurements**

- 1.38.1 In the execution of the work, verify all dimensions with the actual conditions in order to do a perfect job.

**1.39 Operation by persons with physical disabilities**

- 1.39.1 Ensure that controls and fixtures comply with Appendix E of the Code.

---

**1.40 Operating environment**

- 1.40.1 Provide material and equipment to function normally within the requirements of the specifications when the ambient temperature is between 5.0 and 32.0 degrees Celsius (41 and 90 degrees Fahrenheit).
- 1.40.2 Provide material and equipment to function normally and within the requirements of the specifications when the ambient relative humidity is between 25% and 95% non-condensing.
- 1.40.3 Provide material and equipment to function normally and within the requirements of the specifications when the supply voltage is within minus 10% and plus 10% of the nominal voltage and the frequency is within 5% of the nominal frequency.
- 1.40.4 Provide equipment needed to meet the specified voltage operating parameters (e.g. filters, isolation transformers, transient voltage surge suppression, etc.).
- 1.40.5 Arrange that the equipment meet the seismic requirements.
- 1.40.6 Perform necessary equipment adjustments related to building compression up to and including building compression of 2mm (0.08 in.) over a 4,000 mm (157.5 in.) floor-to-floor height.

**1.41 Organization chart**

- 1.41.1 Provide to the Owner an organization chart from the local supervisory level up.
- 1.41.2 Provide to the Owner the names, positions and experience of the field and supervisory personnel associated with this project.
- 1.41.3 During the course of the work when organization changes are made, provide the Owner with updated information.

**1.42 Overtime premium**

- 1.42.1 In the event that the Owner, for whatever reason, pays for overtime worked to complete the work as set out in the Specifications, the Owner will pay the added cost of the overtime.
- 1.42.2 The added cost shall be the difference between the overtime cost and straight time cost at contract rates.
- 1.42.3 Obtain from the Owner prior written authorization for overtime to be worked and chargeable, as described above, to the Owner, this authorization to be for specific amounts and for specific times.
- 1.42.4 Submit time sheets for such overtime worked for approval to the Owner or the designated representative of the Owner within 48 hours of the time that such overtime is worked.
- 1.42.5 If the procedures as set out above are not followed, assume the costs of the time worked.

**1.43 Owner's General Terms and Conditions**

1.43.1 Abide by the Owner's General Terms and Conditions.

1.43.2 Where there is a conflict between the Owner's General Terms and Conditions and these specifications the Owner's Terms and Conditions take precedence.

**1.44 Parts**

1.44.1 Supply parts on request for a period of fifteen years subsequent to Substantial Performance of the project, at then prevailing prices.

1.44.2 Where purchased components are used, ensure that the original manufacturer's name and component designation are clearly marked on the part or in the parts catalogue.

**1.45 Patents**

1.45.1 Hold and save the Owner and its officers, agents, servants and employees harmless from liability due to patent or copyright infringement arising from the use of, in the performance of the work or in the completed installation, any invention, process, article, or appliance.

**1.46 Payment withheld**

1.46.1 Approval for payment may be withheld to such extent as may be necessary on account of:

- .1 Defective work not remedied;
- .2 Claims filed or reasonable evidence indicating probable filing of claims;
- .3 Failure of contractor to make payments properly to sub-contractors or for material and labour;
- .4 Failure to work to schedule;
- .5 A reasonable doubt that the contract can be completed for the balance then unpaid;
- .6 Damage to the building or another contractor by the elevator contractor or one of their subcontractors.

1.46.2 When the above grounds are removed, payment will be made for amount withheld.

**1.47 Personnel**

1.47.1 Supervise personnel so that they present a neat appearance and their movement in the building is within the requirements of their work.

1.47.2 Provide uniforms and photo identification for personnel.

1.47.3 The Owner reserves the right to reject or refuse access to personnel or contractors at its sole discretion.

1.47.4 Assign and maintain a dedicated service representative to the work, this representative to be responsible for liaison with the Owner and the Consultant.

1.47.5 Assign and maintain a dedicated service supervisor to the work, this supervisor to be responsible for technical communications with the Owner and the Consultant.

**1.48 Pre-inspection check list**

1.48.1 Upon completion of each group, review each page of the specifications and initial each page at the bottom left to indicate that the work has been completed in compliance with the Specifications.

1.48.2 Submit this initialled copy of the Specifications to the Consultant prior to requesting an inspection by the Consultant.

**1.49 Preliminary information**

1.49.1 Submit, within 30 working days after awarding of contract, the information and details, including reactions, power requirements, ventilation requirements, cutouts, access requirements, light and outlet locations, quantity, location and size of external wires required to inter-connect the equipment, and all other information required to complete the work to be performed by others in conjunction with the installation of the equipment.

**1.50 Protection of the Work and property**

1.50.1 Maintain protection of the Work and protect the Owner's property from injury or loss arising out of the execution of this contract.

1.50.2 Make good any injury or loss caused by the Contractor's agents or employees.

1.50.3 Take all necessary precautions to ensure that the Work is done in a manner that does not endanger any person.

**1.51 Removal of rubbish**

1.51.1 Remove rubbish, keep the building and premises clean during the progress of the work, and leave the premises at completion in perfect condition as far as the work under the specifications is concerned.

**1.52 Request for payment**

1.52.1 Submit applications for payment with the necessary data, information, waivers and affidavits including certificates of compliance and appropriate statutory declaration.

**1.53 Singular and plural**

1.53.1 In all cases singular and plural shall be interchangeable and shall be applied as required to meet the sense and intent of the Specifications.

1.53.2 Where the singular is employed it shall be interpreted as necessary, unless otherwise indicated, to apply to all equipment and devices required to produce a complete installation.

**1.54 Special tools and access codes**

- 1.54.1 If any special tools (i.e. tools that are not readily purchased from a hardware supplier) are used to maintain or adjust the equipment or are required for any aspect of the work on the equipment, list these tools with details on the proposal form and provide such tools to the Owner prior to Substantial Performance.
- 1.54.2 If any access codes are used to maintain or adjust the equipment or are required for any aspect of the work on the equipment (including the reading and resetting of error codes and logs) list these access codes with details on the proposal form and provide such access codes to the Owner prior to Substantial Performance.
- 1.54.3 Do not change the access codes without the written consent of the Owner and, when changed, provide to the Owner the new access codes.

**1.55 Subcontractors**

- 1.55.1 Bind subcontractors to all applicable portions of the Specifications.
- 1.55.2 The contractor shall be responsible for all actions and all work performed by its subcontractors to the same extent as the contractor is itself responsible under the Specifications.

**1.56 Submission of proposal**

- 1.56.1 Submission of a proposal will be considered presumptive evidence that the proposer is conversant with local facilities and conditions, requirements of the Contract Documents and of pertinent provincial and local codes, state of labour and material markets, and in the proposal has made due allowance for all contingencies.

**1.57 Taxes**

- 1.57.1 Include applicable local, provincial and federal taxes or assessments in effect at the time of the signing of the contract.
- 1.57.2 Show on the proposal form the amount of each tax included.
- 1.57.3 The Contractor is liable for the above mentioned taxes or assessments whether or not specifically mentioned in his proposal or in the final contract document.
- 1.57.4 In the event new taxes or assessments, to become due on completion of the contract, are imposed after the signing of the contract these are to be paid, in addition to the original contract amount, by the Owner to the Contractor, who in turn is to pay them to the proper authorities.
- 1.57.5 In the event taxes or assessments in effect at the signing of the contract should be revoked before consummation of the contract rebate to the Owner the amount of such taxes and assessments included in the original contract.

---

**1.58 Technical seminar**

- 1.58.1 Before the time of Substantial Performance, arrange with the Owner to provide a seminar for the Owner's staff.
- 1.58.2 Include in the seminar a complete review of the documentation, operation of the equipment and demonstration of any special features including programming of any display devices.

**1.59 Trade marks**

- 1.59.1 Do not apply trade marks visible to the general public on any piece of equipment.

**1.60 Unit inspection by the Consultant**

- 1.60.1 Advise the Consultant in writing two weeks prior to the completion of a unit so as to arrange an inspection by the Consultant at a mutually convenient time.
- 1.60.2 Assist the Consultant in the performance of this inspection to verify that performance figures, workmanship and equipment furnished are in compliance with the Specifications.
- 1.60.3 Provide the necessary test weights to carry out full load tests and a team of competent persons to assist the Consultant in making the necessary tests and inspections.

**1.61 Warranty of work**

- 1.61.1 Warrant that the materials, performance and workmanship are in accordance with the industry standard in every respect.
- 1.61.2 Make good defects not due to improper use which may develop within one year from the date of Substantial Performance of the project.
- 1.61.3 Warrant that the equipment performs to the standards set out herein.
- 1.61.4 Neither the final payment nor any provision of the Contract Documents diminishes the responsibility for negligence or faulty materials or workmanship within the extent and period provided by law.
- 1.61.5 Upon written notice remedy defects and pay expenses for damage to others resulting from defects.

**1.62 Withdrawal or rejection of proposals**

- 1.62.1 The Owner reserves the right to reject any or all proposals or to waive any conditions.
- 1.62.2 Proposals may not be withdrawn until sixty days after the scheduled date for the receipt of the proposals.

**1.63 Work by other trades**

1.63.1 In the event that work by other trades is required and work by others as set out herein is in conflict with or inadequate for your equipment or design, so state on the proposal form with all necessary details.

1.63.2 If no exceptions are noted on the proposal form, pay the costs of all modifications necessary to suit your equipment and design.

**1.64 Work completion and maintenance turnover**

1.64.1 At the completion of the work and prior to turning over the unit for public use:

- .1 So as to ensure a smooth and harmonious turnover, arrange with the existing elevator maintenance provider a walkthrough of the installation, this walkthrough to be carried out jointly by your supervisor and the existing elevator maintenance provider's maintenance supervisor.
- .2 Provide to the Owner and Consultant the Test Data Forms signed by both your supervisor and the existing elevator maintenance provider's supervisor together with a signed confirmation that the work has been checked by both parties and both parties are in agreement that the work has been completed satisfactorily and poses no problems for ongoing maintenance.

**1.65 Work site protection**

1.65.1 Provide, maintain and, after the work is complete, remove protective hoarding around the work site.

1.65.2 Arrange the protective hoarding so as to prevent public access to the work site.

**1.66 Work under division 02 (Site Preparation)**

1.66.1 A lockable storage space during the installation period.

**1.67 Work under division 03 (Concrete)**

1.67.1 Properly framed hoistways with a variation from nominal well dimensions of not more than +25 mm (1").

1.67.2 A structure designed for the following estimated reactions (including a provision for impact) generated by each device:

per unit	Reactions at the car buffer (kN)		Reactions at the counterweight buffer (kN)		Reactions in the overhead (kN)	
Elevator	138	31,000	116	26,000	147	33,000

1.67.3 Gross openings for hoistway entrances exceeding the clear door dimensions by 250 mm (10") on each side and above.

- 1.67.4 Blocking in of entrance frames following installation.
- 1.67.5 Supports for the sill support angles, flush with the inside hoistway wall, a minimum of 150 mm (6") in depth, capable of sustaining a minimum unit load equivalent to the capacity of the elevator.
- 1.67.6 Adequate support for the guide rail fastenings and installation of guide rail bracket inserts where required.
- 1.67.7 Sleeves and coring for electric ducts and oil lines in the hoistway, machine space and control space as required.
- 1.67.8 Pockets, as required, to permit fastening of rail brackets to building structure. Pockets to be filled after brackets installed.
- 1.67.9 Fire-resistant control/machine room with a concrete floor and access door.

**1.68 Work under division 04 (Masonry)**

- 1.68.1 Grouting under hoistway sills.

**1.69 Work under division 05 (Metals)**

- 1.69.1 Supports for the guide-rails at each floor and in the overhead.
- 1.69.2 For machine -room-less elevators, for hoistway walls not made of concrete, intermediate supports for the guide-rails where guide-rail reinforcement cannot be installed by the elevator contractor and where floor heights exceed 3650 mm (12' 0").
- 1.69.3 A hoisting beam at the top of the hoistway parallel to the hoistway doors and located in the middle of the hoistway plan, and capable of sustaining a 35 kN (7,500 lb) load.
- 1.69.4 An access ladder in the elevator pit.

**1.70 Work under division 07 (Thermal and Moisture Protection)**

- 1.70.1 Means to limit the presence of water, gases and odours in the pit.
- 1.70.2 Waterproofing of the pit.

**1.71 Work under division 08 (Doors and Windows)**

- 1.71.1 For the elevator control/machine room, a full height self-locking and self-closing access door.

**1.72 Work under division 09 (Finishes)**

- 1.72.1 Initial painting of the control/machine room floors.
- 1.72.2 Sealing of the control/machine room ceilings and walls to reduce dust.
- 1.72.3 Painting of the hoistway entrances, where required.
- 1.72.4 Tile flooring for the elevator cabs.

**1.73 Work under Division 22 (Plumbing)**

- 1.73.1 A pit drain with connection to the building drainage system, drains to have a capacity of 11.3 m<sup>3</sup>/h (3,000 gal/h) per shared elevator hoistway having a positive means to prevent water, gases and odours from entering the hoistway.
- 1.73.2 A cover for the pit drains secured to and level with the pit floor.
- 1.73.3 Any sprinkler systems employing water if installed in the machine rooms, control rooms or hoistway to be arranged to operate at a higher temperature (approximately 20% higher) than the fire alarm sensors.
- 1.73.4 If required by the applicable regulations, means to limit the presence of smoke in the hoistway of the designated firefighters' elevator.

**1.74 Work under Division 15 (Mechanical)**

- 1.74.1 Heating and cooling in order to maintain continuously (i.e. 24 hours a day) a temperature of greater than 13 degrees Celsius and less than 29 degrees Celsius based on the estimated heat generated by the elevator equipment as follows:

	control room		top of hoistway	
	kW	BTU/hr	kW	BTU/hr
Elevator	0.8	2,750	0.5	1,750

- 1.74.2 Do not locate ventilation equipment directly above elevator equipment and ensure air conditioning exhaust ducts do not direct conditioned air directly onto elevator wire ropes.

**1.75 Work under division 26 (Electrical)**

- 1.75.1 A grounded power supply sufficient to start and run each unit at rated speed and capacity, and including the following:
  - .1 A disconnect means located in view of the elevator controller near the access to the control/machine room.
  - .2 For machine-room-less elevators, a disconnect means located in view of the elevator equipment at the top of the hoistway.
  - .3 Wiring between the disconnect and the elevator power input point (elevator transformer or controller).
  - .4 Protection of the feeder cables for designated firefighters' elevators.
  - .5 The power supply should be capable of absorbing the regenerated power from the system where necessary.

- 1.75.2 A power supply capable of supplying for each unit the following estimated starting and running currents in amperes based on the power supply noted:

Full load up currents	Power supply (V)	Starting current (Amps)	Running current (Amps)
Elevator	600	30	12

- 1.75.3 In the elevator control/machine room, one 15 A 120 V, single phase circuit breaker for each elevator, located adjacent to the lock side of the control/machine room door, to power cab ventilation and lighting equipment, the power for the lighting circuit being derived from the emergency power supply if available.
- 1.75.4 In the elevator control/machine room, one 15 A 120 V, single phase circuit breaker for each elevator, located adjacent to the lock side of the control/machine room door, to power the cab interior duplex GFCI receptacle and auxiliary equipment (e.g. camera).
- 1.75.5 An auxiliary disconnect contact with wiring to the controller, to indicate if the disconnect is on or off.
- 1.75.6 In the elevator control/machine room, protected LED lights controlled by a switch located adjacent to the lock side of the space access door, located at approximately 2500 mm (8') from floor level as required to give a minimum illumination of 200 lx at floor level and within the controller, the power for the lighting circuit being derived from the emergency power supply if available.
- 1.75.7 In the elevator control/machine room, duplex GFCI receptacles mounted on the wall and spaced at approximately 5000 mm (16') intervals.
- 1.75.8 In the elevator control/machine room, a duplex GFCI receptacle (to power intercommunication equipment) mounted on a controller and connected to the emergency power supply if available.
- 1.75.9 In the elevator pit, duplex GFCI receptacles mounted on the wall, spaced at approximately 5000 mm (16') intervals and located clear of elevator equipment.
- 1.75.10 In the elevator pit, protected LED lights, controlled by a light switch located adjacent to the pit entrance, located clear of elevator equipment to give a minimum illumination of 100 lx at pit level, the lowest lamps to be within 500 mm (20") of the pit floor. The power for the lighting circuit to be derived from the emergency power supply if available.
- 1.75.11 In the elevator overhead of machine-room-less elevators, protected LED lights, located in front of and behind the machine and associated equipment as required to give a minimum illumination of 200 lx on the equipment. The light switch to be located in the hoistway at the point of entry. The power for the lighting circuit to be derived from the emergency power supply if available.
- 1.75.12 In the elevator overhead of machine-room-less elevators, duplex GFCI receptacles mounted on the wall and spaced at approximately 5000 mm (16') intervals.

## Procurement Section

- 
- |         |   |
|---------|---|
| 1.75.13 | Fire alarm initiating devices (FAIDs) on the recall floor.  |
| 1.75.14 | Fire alarm initiating devices (FAIDs) on all other floors.  |
| 1.75.15 | Fire alarm initiating devices (FAIDs) at the top of the hoistway.   |
| 1.75.16 | Fire alarm initiating devices (FAIDs) in the pit.   |
| 1.75.17 | Fire alarm initiating devices (FAIDs) in the control/machine space.   |
| 1.75.18 | A connection from the fire alarm initiating devices (FAIDs) on the recall floor to the elevator controller.   |
| 1.75.19 | A connection from the fire alarm initiating devices (FAIDs) on all other floors to the elevator controller.   |
| 1.75.20 | A connection from the fire alarm initiating devices (FAIDs) at the top of the hoistway to the elevator controller.  |
| 1.75.21 | A connection from the fire alarm initiating devices (FAIDs) in the pit to the elevator controller.  |
| 1.75.22 | A connection from the fire alarm initiating devices (FAIDs) in the control/machine space to the elevator controller.  |
| 1.75.23 | An active telephone line to the control/machine room, capable of operating during a power failure for a minimum of four hours. An internet connection in the machine/control room, capable of operating during a power failure for a minimum of four hours. Do not mount auxiliary equipment such as security controllers or elevator telephone cabinets on elevator controller cabinets. |
| 1.75.24 | Where applicable, a security system for the elevator and associated car and hall card readers.  |
| 1.75.25 | Where applicable, a closed circuit camera system for the elevator.  |
| 1.75.26 | Conduit between the elevator hoistway, control/machine room and any remote equipment locations, terminated outside the hoistway at the basement level (or other level designated by the Owner) at a junction box (junction box to be provided by the elevator contractor).  |
| 1.75.27 | Pulling of wire between the elevator hoistway, control/machine room and any other remote equipment locations.   |
| 1.75.28 | Coordinate with the elevator contractor any controller interconnections needed for the security system and associated card readers.   |
| 1.75.29 | Electric power during erection, for illumination, operations of tools and hoist, starting, testing and adjusting.   |

## **2. SEPARATE PRICES**

### **2.1 Separate price submission requirements**

2.1.1 Submit prices to provide the following:

### **2.2 Maintenance: five years**

2.2.1 Provide full maintenance of the equipment for a period of five years beginning at the end of the maintenance included in the contract.

2.2.2 The services agreement will continue on a month-to-month basis at the expiration of the original term unless notice in writing is provided by either party, at least 60 days in advance of the expiration date, notifying the other party of their intent to not continue with the services agreement beyond the original term mandate or any subsequent monthly mandates.

2.2.3 Provide this service at a flat monthly price without escalation.

2.2.4 Provide this service in conformity with the Maintenance Specifications.

**END OF SECTION**

## 1. GENERAL

### 1.1 General instructions

#### 1.1.1 Read and conform to:

- .1 Division 1 requirements and documents referred to therein.

### 1.2 General requirements

- 1.2.1 Conform to Section Section 14 00 00.

### 1.3 Scope

- 1.3.1 Provide labour, materials, products, equipment and services necessary for the full maintenance of the equipment.

### 1.4 Definition of terms

- 1.4.1 The term "Owner", as used herein, refers to Region of Peel.
- 1.4.2 The term "Consultant", "elevator consulting engineer", "consulting engineer" or "engineer", as used herein, refers to KJA Consultants Inc.
- 1.4.3 The term "elevator contractor" or "contractor", as used herein, refers to any person, partners, firm or corporation having a contract with the Owner to furnish labour and materials for the execution of the work herein described.
- 1.4.4 The term "sub-contractor", as used herein, refers to any person, partners, firm or corporation having a contract with the contractor to furnish labour and materials for the execution of the work herein described.
- 1.4.5 The term "inspecting authorities", as used herein, refers to authorized agents of governments and of insurance groups which are charged with the responsibility of carrying out periodic inspections and tests on vertical transportation equipment.
- 1.4.6 The term "unit", as used herein, means any elevator, dumbwaiter, escalator, platform lift, moving walk or similar device mentioned in this Specification.
- 1.4.7 The term "Code", as used herein, refers to the CAN/CSA-B44-19 Safety Code for Elevators and Escalators with updates and including Nonmandatory Appendices (which are deemed mandatory herein).
- 1.4.8 All terms in the Specifications that are not otherwise defined shall have the definitions as given in the Code.

### 1.5 Purpose

- 1.5.1 The purpose of the maintenance program is to maintain the equipment in substantially new condition, to secure the Owner's equity and to provide safe, trouble-free service.

---

**1.6 Regulatory authority submissions**

- 1.6.1 Complete any submissions to the regulating authorities that may be necessary for the continuing use and operation of the equipment.

**1.7 Contract duration**

- 1.7.1 Provide full maintenance on the equipment to the maintenance procedures set out in the Specifications for such periods as may be defined in the Contract Documents.

**1.8 Minimum standard**

- 1.8.1 As a minimum standard, perform to the Specifications and to the Code.  
1.8.2 Maintain the equipment at all times in the same or better condition as at the commencement of the maintenance work.

**1.9 Reliability**

- 1.9.1 Ensure that the average number of callbacks does not exceed 6.0 per elevator per year.  
1.9.2 Ensure that the average number of entrapments does not exceed 1.5 per elevator per year.  
1.9.3 Ensure that the average number of callbacks does not exceed 3.0 per escalator per year.

**1.10 Extra to contract work**

- 1.10.1 Give any claims for extra to contract work, due to instructions or otherwise, to the Owner in writing within a reasonable time after the work is completed.  
1.10.2 No such claim shall be valid unless so made and authorized by the Owner.  
1.10.3 Where extra to contract work is approved and done at the Owner's expense:  
.1 Bill the work at hourly rates in accordance with the Contract.  
.2 Do not charge for more than a total of forty (40) minutes of travel time per site visit.  
.3 Do not add miscellaneous charges (e.g. mileage, parking charges, truck charges, sundry charges, fuel charges, etc.).  
1.10.4 For extra to contract work in buildings that are more than 75 kilometers driving distance away from the city center of a city with a population of more than 50,000:  
.1 Bill the work at hourly rates in accordance with the Contract.  
.2 Charge travel time based on the lesser of the actual time traveled or the shortest travel time to the nearest city with a population of more than 50,000.  
.3 Charge travel expenses based on the lesser of the actual distance traveled or the shortest travel distance to the nearest city with a population of more than 50,000.  
.4 Do not add miscellaneous charges (e.g. hotels, parking charges, truck

charges, sundry charges, etc.).

- .5 Charge mileage at a rate that does not exceed the prevailing tax deduction rate established by federal tax authorities.

#### **1.11 Regular hours of work**

- 1.11.1 Regular hours of work are from 07:00 to 17:00 Monday to Friday, excluding holidays.
- 1.11.2 Carry out noisy work, work creating excessive odours or work that creates a disturbance to the building tenants outside of regular hours or at such other times as selected by the Owner and include in your submission the costs for such overtime work.

#### **1.12 Defective work and non-performance**

- 1.12.1 The Owner reserves the right to correct defective work and to charge the cost to the Contractor.
- 1.12.2 Should the contractor fail to execute any of the Work set out in the contract the Owner reserves the right to do the Work and to charge the cost to the Contractor.
- 1.12.3 The Owner reserves the right to withhold payment in the event of non-performance or to pay only for that portion of the Work that has been executed.
- 1.12.4 The Owner will provide 30 days notice in writing prior to taking such action, except where the defective work or non-performance prejudice the safety of people or the installation, in which case the Owner need only provide 5 days notice in writing.
- 1.12.5 The Contractor may correct the defective work within the notice period but shall provide confirmation in writing to the Owner prior to the end of the notice period, or the Contractor shall still bear direct charges incurred by the Owner to correct the defective work.

#### **1.13 Contract cancellation**

- 1.13.1 The Owner may elect, at its option, to cancel the contract prior to its normal termination:
- .1 If the maintenance is not executed in accordance with the Specifications, as evidenced by the report of a recognized independent elevator consultant, and if, within four weeks of written notice, the necessary corrective action has not been completed;
- .2 If there is a continuing failure to perform as evidenced by more than two negative reports in any twelve month period with no positive or neutral reports in the same twelve month period. (A negative report is one which defines the level of contract performance as less than 95% of the specified requirements.)
- 1.13.2 In the event of such cancellation, the Owner may, at its option, elect to use another company to restore the equipment to the Specifications standards and to charge the cost of this to the elevator contractor.

- 1.13.3 The Owner has the option to cancel the contract upon one month's written notice if there is a significant change in the circumstances of the contract (e.g. a change in ownership of the equipment, a modernization or replacement at the Owner's cost of equipment components, a change in ownership of the maintenance company); this option to be available to the Owner for a period of three months from the date on which the changed circumstances become known to the Owner.

**1.14 Protection of the Work and property**

- 1.14.1 Maintain protection of the Work and protect the Owner's property from injury or loss arising out of the execution of this contract.
- 1.14.2 Make good any injury or loss caused by the Contractor's agents or employees.
- 1.14.3 Take all necessary precautions to ensure that the Work is done in a manner that does not endanger any person.

**1.15 Liability insurance**

- 1.15.1 Provide, during the period this contract is in force, premises liability, including public liability insurance and property damage insurance in the amount of \$5,000,000 inclusive, to be covered against any claims for damage to property or for personal injury, including death, which may arise from operation under this contract, whether such operation is by yourself or by any sub-contractor or anyone directly or indirectly employed by you.
- 1.15.2 Upon completion of the contract, have in force a completed operations and products liability insurance, in the amount of \$5,000,000 inclusive, to be covered against any claims for damages to property or for personal injury, including death, which may arise after the premises liability is terminated.
- 1.15.3 Maintain the insurance in force for a minimum period of two years after completion of the contract.
- 1.15.4 List the Owner as an additional insured.
- 1.15.5 The certificates shall state that the insurance will not become ineffective without sufficient written notice to the Owner.
- 1.15.6 Submit certificates of such insurance with the Owner before work is begun.

**1.16 Assignments**

- 1.16.1 Do not assign nor sublet the contract without the written consent of the Owner.
- 1.16.2 Do not assign any payment due or to become due as a result of this contract without the written consent of the Owner.

**1.17 Access codes**

- 1.17.1 If the contract is cancelled, provide to the Owner, for those elevators and escalators or components that have access codes or access tools for commissioning, programming or other purposes, the access tools and a hard copy listing of the access codes.

1.17.2 If the Owner provides access codes or access tools, preserve these codes and tools confidential for use only on the particular equipment for which the Owner has provided them.

1.17.3 Change access codes only when authorized in writing by the Owner.

#### **1.18 Directives**

1.18.1 Advise the Owner of directives received from the Inspecting Authorities and from the Regulatory Authorities.

1.18.2 Carry out directives from the Inspecting Authorities and from the Regulatory Authorities within the period of time set out on the directives, working in overtime if necessary to meet the required date, except for those items that are:

- .1 The responsibility of the Owner;
- .2 Directives resulting from changes to the existing regulations.

#### **1.19 Payment**

1.19.1 Submit invoices at the end of each month for the work performed in that month.

1.19.2 Invoices will be paid when the assigned work has been completed and the Consultant has been notified by the Contractor to that effect.

1.19.3 The invoice will be paid only if the maintenance work for the month has been executed as confirmed in the report data; otherwise there will be no payment made for the month.

1.19.4 The invoice will be paid only if deficiencies outstanding for more than two months have been corrected; otherwise there will be no payment made for the month.

1.19.5 The invoice will be paid only if those directives that are the responsibility of the elevator contractor have been addressed within the required time limit; otherwise there will be no payment made for the month.

#### **1.20 Maintenance fee reduction**

1.20.1 If the regular maintenance is not carried out for any unit for any given month issue a credit for the maintenance for that unit for that month.

#### **1.21 Delay in making repairs**

1.21.1 Execute promptly the necessary repairs to return non-functioning units to service.

1.21.2 Return units to service when answering service calls unless return visits are necessary for additional troubleshooting or to source replacement parts.

1.21.3 Where return visits are necessary, promptly return to the site on the next business day upon availability of the necessary replacement parts.

---

**1.22 Deficiencies not corrected**

- 1.22.1 If there is a failure to carry out instructions of the inspecting authorities (except for those items that are the responsibility of the Owner and directives resulting from changes to the existing codes) within the period of time allowed by the authorities issue a credit to the Owner for any costs, including the cost of the inspecting authority reinspection, incurred by the Owner as a result of this failure.

**1.23 Coordination with Owner**

- 1.23.1 Before each routine maintenance visit contact a representative specified by the Owner.
- 1.23.2 Discuss the operation of the equipment with the Owner's representative and take immediate action on problems.
- 1.23.3 Should a problem be of a nature that cannot be satisfactorily resolved during the inspection or trouble call, report back to the Owner's representative to explain why it was not possible to correct the problem and when the problem will be resolved.

**1.24 Routine maintenance**

- 1.24.1 Provide labour, materials, products, equipment and services necessary to complete maintenance testing and inspections required by the Authority Having Jurisdiction at the appropriate intervals.
- 1.24.2 Where required, perform the following:
- .1 All Category 1 tasks at intervals not to exceed 12 months.
  - .2 All Category 3 tasks at intervals not to exceed 36 months.
  - .3 All Category 5 tasks at intervals not to exceed 60 months.
- 1.24.3 All other maintenance tasks required by Code with no prescribed frequency shall be completed at intervals not to exceed 12 months.
- 1.24.4 Perform periodic maintenance inspections once every three months, at a minimum.
- 1.24.5 In the course of the examination, should faulty parts be discovered replace them at once, and should any unusual operations or noises be found take corrective action immediately.
- 1.24.6 Schedule parts showing excessive wear for replacement on the next regular examination.

**1.25 Personnel**

- 1.25.1 Supervise personnel so that they present a neat appearance and their movement in the building is within the requirements of their work.
- 1.25.2 Provide uniforms and photo identification for personnel.
- 1.25.3 The Owner reserves the right to reject or refuse access to personnel or contractors at its sole discretion.

- 1.25.4 Assign and maintain a dedicated service representative to the work, this representative to be responsible for liaison with the Owner and the Consultant.
- 1.25.5 Assign and maintain a dedicated service supervisor to the work, this supervisor to be responsible for technical communications with the Owner and the Consultant.

#### **1.26 Repairs**

- 1.26.1 For scheduled repair work, outside of the regular maintenance procedure, give the Owner at least two weeks prior notice.
- 1.26.2 For unscheduled repair work, outside of the regular maintenance procedure, give the Owner immediate notice.
- 1.26.3 Communicate, in writing, the status of repairs to the Owner at the beginning and close of the normal working day.
- 1.26.4 Where possible indicate the time required for completion of repairs.

#### **1.27 Mis-adjustment**

- 1.27.1 Do not change any of the adjustments in such a way as to lead to a deterioration of the equipment performance.
- 1.27.2 Do not, in the course of routine maintenance or trouble shooting, re-adjust any of those settings which affect either the performance or the safety of the equipment.
- 1.27.3 Should it appear that some setting has changed or some problem has arisen such as to alter the performance of the equipment, arrange that a qualified adjuster with the appropriate tools, manuals and training make the necessary re-adjustments in an organized, systematic way.
- 1.27.4 Do not allow ad hoc adjustments to the equipment.

#### **1.28 Safety devices**

- 1.28.1 At no time permit the equipment to operate while any of the safety devices, mechanical or electrical are in-operative.

#### **1.29 Codes and ordinances**

- 1.29.1 Supply equipment and do work in accordance with building codes, by-laws, regulations and requirements of the local, provincial and federal authorities in effect at the time of the execution of the work.
- 1.29.2 Supply equipment and do work in accordance with the Code, and any other code which may govern the requirements of the installation.
- 1.29.3 Provide labour and material, whether or not specifically mentioned in this specification, that may be necessary to provide an installation conforming to the applicable codes and regulations.
- 1.29.4 Prior to submission of the proposal and throughout the duration of work, give prompt notification in writing of any regulations or requirements known to be in process which might affect the acceptability of the work.

- 1.29.5 If changes in codes or regulations result in extra costs, those taking effect subsequent to the date of proposal submission shall be treated as an extra to the contract.
- 1.29.6 Requirements of the Authority Having Jurisdiction applicable at the time of proposal submission shall be deemed to be included in the contract, unless specifically excluded herein.
- 1.29.7 Should changes in codes, changes in legislative requirements or changes to the requirements of the Authority Having Jurisdiction be announced prior to the date of proposal submission but with a delayed adoption date, those changes shall be deemed to be included in the contract, unless specifically excluded herein.

**1.30 Equipment defects**

- 1.30.1 Should a defect in the equipment or the design of the equipment become apparent based on experience with this installation or similar installations elsewhere, advise the Owner immediately in writing setting out the steps to be taken to correct the problem.
- 1.30.2 Forward to the Owner copies of any memoranda, internal or external, published or unpublished, dealing with actual or potential flaws in the equipment and design.

**1.31 Call-back service**

- 1.31.1 Include, as part of the maintenance program, regular and emergency call-back service.
- 1.31.2 Provide regular and emergency call-back service 24 hours per day, seven days per week.
- 1.31.3 An emergency is a situation such as:
  - .1 An entrapment;
  - .2 An incident;
  - .3 An accident;
  - .4 A shut down of more than one elevator in a group;
  - .5 The absence of elevator service to a floor.
- 1.31.4 At the time the call is placed the Owner may choose to indicate that the call can be handled during regular hours; otherwise, answer the call immediately whether it be in overtime or regular time.
- 1.31.5 Respond only to calls placed by the Owner except in the case of emergency calls.
- 1.31.6 Provide an answering service staffed twenty-four hours per day.
- 1.31.7 Provide, where applicable, an answering service inclusive of two-way non-verbal communication and the means to monitor video.
- 1.31.8 Ensure that calls received by the answering service are transmitted immediately to a responsible person for action.

1.31.9 Provide regular call-back response within a maximum of two hours from the time a call is placed until the arrival of a maintenance person at the site.

1.31.10 Provide emergency call-back response within a maximum of 45 minutes from the time a call is placed until the arrival of a maintenance person at the site.

**1.32 Maintenance: assistance for inspections & testing**

1.32.1 Provide all necessary co-operation and assistance to allow inspections of the equipment by the Consultant and by the Inspecting Authorities.

1.32.2 Provide all necessary co-operation and assistance, either in regular time or overtime, to allow testing of those systems associated with the equipment such as smoke detectors, fire detectors, heat detectors, emergency power, firefighters emergency operation, communication systems, security systems and other systems ancillary to the equipment.

1.32.3 In the event that this requires the supply of one crew for more than an average of three hours per unit per year, submit a request to the Owner for an extra to contract payment.

1.32.4 Should the tests fail because of problems with the elevator or escalator equipment provide any necessary additional assistance at no extra charge.

**1.33 Safety inspections**

1.33.1 Carry out instructions of the inspecting authorities within the period of time allowed by the authorities or, if no period is designated, 30 days of notice of deficiency except for those items that are the responsibility of the Owner and directives resulting from changes to the existing codes.

**1.34 Manufacturers' parts**

1.34.1 Supply replacement parts identical in make and model to the original parts where at all possible.

1.34.2 Where identical parts are not available or a better substitute is available submit the alternative part for the approval of the Owner.

**1.35 Substitute parts**

1.35.1 Where items visible to the general public, in particular exposed finishes and fixtures, are to be replaced, submit drawings, photographs or samples, as required, in ample time for consideration and review.

1.35.2 Submit samples of metals, plastic laminates and finishes properly identified as to project, location and material.

1.35.3 Supply materials in accordance with the reviewed samples.

1.35.4 The review does not include the checking of measurements nor the approval of variations from the Specifications or the Contract Documents.

---

**1.36 Parts stocked locally**

- 1.36.1 Arrange that the following spare parts are available on site (in a metal cabinet with a baked enamel finish), in a service vehicle or from the local maintenance office and allow the Owner, at his request, to inspect these parts:
- .1 Hall fixtures: two complete hall station assemblies (with call registered light assemblies), four button heads, and a hall lantern of each type;
  - .2 Car operating panel fixtures: three complete car push button switch assemblies (with call registered light assemblies), four button heads, and one position indicator;
  - .3 Car door equipment: two car door sheaves and one set of door gibs;
  - .4 Hall door equipment: one complete hoistway door closer assembly, two interlocks, four hall door sheaves, and two sets of door gibs;
  - .5 Three fuses of each size used in the controller and in the main line disconnect;
  - .6 Relays: one complete relay of each type with spare contacts and coils;
  - .7 An adequate supply of cleaning solvent, wipers, general purpose oil and door operator oil.

**1.37 Parts available as required**

- 1.37.1 Arrange that the following spare parts are available within 48 hours on site and provide to the Owner, at their request, the methods and procedures used to ensure that this delivery time can be met:
- .1 A printed circuit board of each type used, completely assembled and verified;
  - .2 One complete door operator assembly;
  - .3 One complete door protective device assembly;
  - .4 One complete roller guide assembly of each size used;
  - .5 Spares for parts used in quantity on the equipment in the ratio of one spare for every 100 such parts.

**1.38 Tools maintained locally**

- 1.38.1 Arrange that the following tools are available in a service vehicle or from the local maintenance office and allow the Owner, at their request, to inspect these tools:
- .1 One blower;
  - .2 One door pressure gauge;
  - .3 One rechargeable fluorescent portable light;
  - .4 Signs stating "REGULAR MAINTENANCE BEING PERFORMED";
  - .5 One vacuum cleaner;
  - .6 One step ladder;
  - .7 Twelve cable pullers;
  - .8 Two chain blocks or lift pulls;

- .9 Two sets of feeler gauges;
- .10 One sound level meter;
- .11 A micrometer;
- .12 One F.E.T. volt-ohm-millimeter;
- .13 One paging unit for each maintenance mechanic;
- .14 Four wire rope slings;
- .15 One stop watch;
- .16 One tachometer;
- .17 Test weights totaling 2000 kg (4500 lb) and a hand cart for transportation.

**1.39 Parts cabinet**

- 1.39.1 Provide a maintenance parts cabinet in the machine room.
- 1.39.2 Provide a cabinet of steel finished in baked enamel and of a minimum 0.15 cubic metres capacity.

**1.40 Building log**

- 1.40.1 Complete required entries for building log systems.

**1.41 Maintenance log book**

- 1.41.1 Provide a maintenance log in a permanently bound journal having pre-numbered pages.
- 1.41.2 Indicate in the journal the following information: date, time, name of maintenance technician, regular maintenance, regular time callback, over time callback, action taken, work completed, and further repairs required.
- 1.41.3 The journal is the property of the Owner.
- 1.41.4 Maintain the journal current, on the premises, and available for inspection by the Owner at any time.
- 1.41.5 Make entries in ink, legibly, consecutively and without blanks.

**1.42 Time tickets**

- 1.42.1 Indicate the section of the normal maintenance schedule on each time ticket with details of the portion of the section completed.
- 1.42.2 Submit time tickets for each call-back detailing the cause of the call-back and the action taken.
- 1.42.3 If electronic time tickets are used, make these tickets accessible to the owner through internet at all times.

---

**1.43 Accidents and claims**

- 1.43.1 In the event of an accident causing death, personal injury or property damage, arising out of or in connection with the equipment or the performance of the Work whether on or adjacent to the site, advise the Owner immediately giving a verbal report and submit to the Owner within 24 hours of the accident signed written reports from each of the maintenance personnel involved.
- 1.43.2 In the event of an injury to anyone working on or using the equipment, take whatever immediate action is necessary to aid the injured person and to prevent further injury to others.

**1.44 Maintenance manual**

- 1.44.1 Supply to the Owner and the Consultant at the start of the contract a maintenance manual.
- 1.44.2 Incorporate in the manual a description of the controller user interface, fault and error codes, troubleshooting and diagnostic procedures, methods of use and the adjustment of programmable parameters together with their settings at the time of final adjustment.
- 1.44.3 Update the maintenance manual annually and supply to the Owner and Consultant a copy of the updated maintenance manual.

**1.45 Electrical diagrams**

- 1.45.1 Supply wiring diagrams and data as required for the execution of the Work including schematics for speed control, dispatching system, interfaces, printed circuit boards.
- 1.45.2 Incorporate, as part of the schematic diagrams, a reference index ('road map') giving the location of electrical components and wiring interconnections for relay coils, relay contacts, field equipment, integrated circuits and other such devices, so that the position on the schematics of any of these items can be readily determined.
- 1.45.3 Supply, prior to the Substantial Performance inspection, three prints and one reproducible of the wiring and schematic diagrams revised to show changes that have been made.
- 1.45.4 If changes are subsequently made to the wiring or control, supply an additional two sets of marked-up prints of the schematics and field wiring diagrams showing the changes.

**1.46 Maintenance Control Program**

- 1.46.1 Provide to the Owner and the Consultant a copy of the Maintenance Control Program for each device type.
- 1.46.2 During the course of the maintenance contract update the Maintenance Control Program as necessary and forward to the Owner and the Consultant a copy of the updated Maintenance Control Program.

- 
- 1.46.3 The Maintenance Control Program is the property of the Owner.
- 1.46.4 Store the Maintenance Control Program on site in accordance with the requirements of the Authority Having Jurisdiction.
- 1.46.5 Do not use electronic Maintenance Control Programs without explicit permission of the Owner.
- 1.46.6 Execute the maintenance in accordance with these specifications and the Maintenance Control Program.
- 1.46.7 As a minimum, perform tasks as required by the Authority Having Jurisdiction at the appropriate intervals.
- 1.46.8 Where maintenance and testing frequencies in the Maintenance Control Program are less frequent than the intervals defined in these specifications, these specifications shall take precedence and such frequencies shall be reflected in each device-specific Maintenance Control Program.
- 1.46.9 The Owner may approve changes to these specifications provided that the minimum requirements of the Authority Having Jurisdiction are respected.
- 1.46.10 In advance of performing Category 5 testing, submit to the Owner and Consultant a written plan outlining:
- .1 Step-by-step instructions of how the testing will be performed;
  - .2 Names and qualifications of personnel selected to perform the testing;
  - .3 Incremental testing procedures;
  - .4 Alternative testing means, if applicable and accepted by the Authority Having Jurisdiction;
  - .5 Schedule of the work.
- 1.46.11 As part of the Category 5 testing:
- .1 Perform pre-testing of the safeties prior to full load testing by testing application of the safeties at inspection speed with no load in the cab.
  - .2 Perform alternative testing and provide the results to the Owner in an acceptable electronic format (e.g. PDF), and provide a hard copy printout in the Maintenance Control Program, for record keeping and to establish a baseline for future testing.
  - .3 Take reasonable steps to protect the cab finishes from damage (i.e. laying down plywood or using rubberized weights).
  - .4 If completion of the test on an elevator requires that adjacent elevators in the same group be removed from service, perform the testing outside of regular hours at a time approved by the Owner.
  - .5 If testing is performed prior to submitting an adequate plan and receiving approval from the Owner, or testing deviates from the requirements herein, the Contractor is responsible for correcting any and all damage that may result from the testing (i.e. including building damage).
  - .6 The contractor is responsible to repair or replace any elevator components that may be damaged or fail as a result of testing.

**1.47 Annual report**

1.47.1 Each year, on the anniversary date of the contract, submit to the Owner a report consisting of the following items:

- .1 A complete summary of the activity for the year including, but not limited to, call backs, repair work, complaints;
- .2 A certification that the various items listed herein were checked at the specified times and that they were found to be functioning correctly or, if not functioning correctly, notations of the problems and the corrective action taken;
- .3 An evaluation of the standard of maintenance for the year as compared to prior years and to the standards of the industry for similar installations.

**1.48 Software and firmware updates**

1.48.1 Check each January with the control manufacturer for software and firmware updates.

1.48.2 Advise the Owner of the status of these updates.

1.48.3 Obtain and install updates.

**1.49 Major parts replacement report: elevator**

1.49.1 Each year, on the anniversary date of the contract, submit to the Owner a report on the anticipated life expectancy of the major equipment components and the budget provisions for their replacement, including following items:

- .1 Elevator suspension means;
- .2 The machine.

1.49.2 Six months prior to termination of the maintenance contract, submit to the Owner a report on the major equipment components that will require replacing in the next five years and, if these components will not be replaced before the end of the contract, reimburse the Owner for the usage on a prorated basis based on the expected lifespan of the equipment.

**1.50 Consultant's inspections**

1.50.1 From time to time the Consultant will carry out inspections to verify that the Work is being carried out in accordance with the specifications and with industry standards.

1.50.2 The Consultant will prepare a report listing deficiencies.

1.50.3 Carry out such maintenance, repair and replacement to correct the deficiencies listed on the Consultant's Report within 30 days or, if it is anticipated that the corrective measures will require more time, advise the Consultant of this and obtain their approval of the extension.

**1.51 Maintenance tasks: electric elevators**

1.51.1 Check the following elements during each periodic maintenance visit:

- .1 Car ride and general operation;
- .2 Levelling;
- .3 Hall and car door operation;
- .4 Alarm bell;
- .5 Communication system;
- .6 Door open button;
- .7 Door force (maximum of 135 Newtons [30 lb]);
- .8 Door re-opening device;
- .9 Position indicators;
- .10 Car operating panel devices;
- .11 Commutator brushes.

1.51.2 Perform the following duties at least once every six months:

- .1 Clean pit;
- .2 Clean tops of car;
- .3 Clean the machine removing any oil from the gland packing drip tray;
- .4 Check and lubricate the governor tension sheave;
- .5 Check and lubricate the governor;
- .6 For oil buffers, check the buffers and the buffer oil;
- .7 For chain compensation, check the chain fastening and the chain release safety switch.
- .8 For group operation, check the door open pause times to ensure that they are consistent from one car to another in a group;
- .9 Check the door open pause time cancellation (i.e. monitor) circuit;
- .10 Check the load weighing devices;
- .11 Check the suspension means and governor rope.

1.51.3 Perform the following duties at least once every year:

- .1 Check the machine and motor;
- .2 Check and lubricate machine bearings, where necessary, in accordance with manufacturer's recommendations;
- .3 Check the operation of the emergency brake;
- .4 Check suspension means hitches;
- .5 Inspect suspension means for wear in accordance with standards for elevator suspension means inspection;
- .6 Lubricate the hoist ropes and compensation ropes in accordance with the rope manufacturer's recommendations;
- .7 Check suspension means tension and adjust if necessary;
- .8 Check for stretch in the suspension means and remove buffer blocks or

- 
- shorten suspension means if required;
- .9 Clean the machine with vacuum and blower;
  - .10 Check the tachometer;
  - .11 Check rotating electrical equipment connections;
  - .12 Remove the covers of the car operating panels and check the internal components and connections;
  - .13 Lubricate and clean car door tracks;
  - .14 Clean control room and control room floor;
  - .15 Check the car door contacts;
  - .16 Check the hoistway door interlocks.
  - .17 Check the car door rollers and eccentrics;
  - .18 Check the car door clutch assembly;
  - .19 Check door operator, clean and lubricate pivot points;
  - .20 Clean guide rails and guide rail fastenings;
  - .21 Vacuum hoistway from top to bottom;
  - .22 Replace the filters on the controller air inlets;
  - .23 Clean and check safety mechanism;
  - .24 Perform a test of the safeties;
  - .25 Check sheaves and shafts for soundness and wear;
  - .26 Check the terminal slowdown device;
  - .27 Strip, clean and lubricate the brake;
  - .28 Check that the brake stops the elevator from full speed in the up direction with an average deceleration of approximately 0.1g without shock or jar;
  - .29 Check to ensure that the brake spring setting is correct;
  - .30 Ensure that the brake operates quietly so that no noise can be detected either in the elevator cab, at the top floor landing or outside the closed machine room door;
  - .31 For oil buffers, check the buffer oil levels, check for water in the oil and test the buffers;
  - .32 Check travelling cables for wear;
  - .33 Check hangers and junction box connections;
  - .34 Check guide rail fastenings;
  - .35 Check the speed, acceleration and jerk profiles and if necessary adjust the drive parameters;
  - .36 Measure performance parameters (noise levels, vibration, operating times) and re-adjust if required;
  - .37 Check components and fastenings that under failure might create a dangerous situation (e.g. sheave bolts and welds, gear bolts, car slings et cetera);
  - .38 As required, clean and paint machine room and pit floor (perform not less

---

than once every five years);

- .39 Check the emergency power or battery lowering device operation.
- .40 Check the emergency fire recall operation.
- .41 Check the functioning of the in Firefighters' Emergency Operation.
- .42 Submit a report to the Owner confirming that the annual checks have been carried out, listing the items checked and the measured performance parameters.

1.51.4 When replacing the elevator suspension means:

- .1 Ensure that the number of rope rotations does not exceed:
  - .1 1.5 rotations per 30.5 m (100 ft.) for a 1:1 roping arrangement;
  - .2 3 rotations per 30.5 m (100 ft.) for a 2:1 roping arrangement.
- .2 Use wedge type cable clamps for suspension means;
- .3 Within six to eight weeks, inspect the suspension means and shorten as necessary.

**END OF SECTION**  
**END OF DIVISION**

**1. GENERAL****1.1 General instructions**

1.1.1 Read and conform to:

.1 Division 1 requirements and documents referred to therein.

**1.2 General requirements**

1.2.1 Conform to Section Section 14 00 00.

**1.3 Scope**

1.3.1 Provide a single machine-room-less traction passenger elevator having the following characteristics.

Passenger Elevator		
number of units	1	
designation	-	
application	passenger	
rated speed (m/s, fpm)	0.76	150
capacity (kg, lb)	1360	3000
motor power (kW, HP)	8	10
operation	Simplex	
machine type	Machine-room-less traction	
machine location	Within hoistway	
drive type	Solid state regenerative	
emergency brake	Provide	
car governor	Provide	
counterweight governor	None	
roping ratio	2:1	
control system	Microprocessor	
control location	Within control room	
front entrances	L1, L2	
rear entrances	None	
door type	Single speed side opening	
hoistway door fire resistance	1.5 hours	
lobby sill material	Aluminum	
cab sill material	Aluminum	
entrance width (mm, ")	1067	42
entrance height (mm, ")	2135	84
entrance markings	Provide	
cab width (mm, ")	2030	80

cab depth (mm, “)	1450	57
cab height (mm, “)	2360	93
car door restrictor	Provide	
door safety retainers	Provide	
entrance protection	B44-19 compliant	
door operator	Closed-loop	
interlocks	Provide	
main car station	Applied	
auxiliary car station	None	
verbal annunciation	Provide	
car position indicator	Digital	
cab emergency lighting	Provide	
cab communication	Hands-free phone	
two-way video communication	Provide	
in-cab video display system	None	
car closed circuit camera	Provisions	
car call security	Provisions	
hall call security	None	
hall stations (typical)	Single riser	
hall stations (main floor)	Single riser	
hoistway access switches	Provide	
cab ventilation	Provide	
cab finishes	Provide	
hall door finish (typical)	Stainless steel	
hall door finish (main floor)	Stainless steel	
car door finish	Stainless steel	
hall lanterns	None	
in-car lanterns	Provide	
hall position indicator	None	
lobby panel	None	
CACF panel	None	
central control monitor	None	
car top inspection station	Provide	
load weighing device	Provide	
car guiding	Sliding shoes	
counterweight guiding	Sliding shoes	
guide rails	Provide	
compensation	None	
emergency recall (phase I)	Automatic	

firefighter's operation (phase II)	Provide
emergency power	Battery-rescue device
car top railing	Provide
operating time	16.0 seconds
acceleration rate	0.8 m/s/s

## 2. PRODUCTS

### 2.1 Dimensions

2.1.1 Provide equipment to suit the control room, hoistway, pit and overhead dimensions shown on the architectural drawings.

### 2.2 Prone stretcher requirement

2.2.1 Arrange the elevator to meet the requirement for accommodating and providing adequate access for a patient stretcher 2010 mm (79") long by 610 mm (24") wide in the prone position.

### 2.3 Speed

2.3.1 Arrange the elevators to run under any condition of loading, except the case of overload, within 1.5 percent of the rated speed.

### 2.4 Machine: MRL (Machine-Room-Less)

- 2.4.1 Provide a machine of the single-wrap traction type including an AC motor, electromechanical brake, sheave shaft and traction sheave properly aligned.
- 2.4.2 Mount the machine in the hoistway.
- 2.4.3 Provide a machine with a proven record, over a period of at least seven years, of satisfactory operation on other installations of the same speed, capacity and counterweighting.
- 2.4.4 Provide equipment which will deliver its rated output continuously with a temperature rise not to exceed 50 degrees C (122 degrees F).
- 2.4.5 Provide, as a minimum, Class B insulation.
- 2.4.6 Submit with the proposal the horsepower and torque ratings of the elevator motor.
- 2.4.7 Provide a traction sheave to suit the suspension means.
- 2.4.8 Provide a brake actuated switch to indicate to the control system the state of the brake: that is, lifted or applied.
- 2.4.9 Provide sound and vibration isolation pads or springs arranged so that there is no solid contact between the machine and the building structure.

---

**2.5 Brake spring**

- 2.5.1 After the brake is adjusted for correct operation and prior to the performance of safety tests and checks by the inspecting authorities, seal it with a numbered seal so as to prevent un-authorized re-adjustment and record the date and seal number in the log book.

**2.6 Elevator suspension means**

- 2.6.1 Provide elevator suspension means such that the addition of 50 per cent of the rated load to the car cab will cause no more than a 0.04 per cent elongation in the suspension means.
- 2.6.2 Where multiple suspension elements are used in parallel to share a load, ensure that the elements are all from one manufacturing run.
- 2.6.3 Provide sufficient removable counterweight buffer blocking to allow adjustment for suspension means stretch without requiring shortening of the suspension means.
- 2.6.4 Where the suspension means do not permit for measurement of wear or visual observation of replacement conditions, provide a method to establish the preventative replacement condition(s).
- 2.6.5 Where wire hoist ropes are utilized:
- .1 Provide means during and after installation to prevent the ropes turning; do not use swivel connections.
  - .2 Ensure that the number of rope twists do not exceed the manufacturer's recommendations.
  - .3 Adjust the rope tension of each rope to the average of the set plus or minus 5%.
  - .4 Use wedge type cable clamps.
- 2.6.6 Where combustible suspension means are utilized (such as noncircular elastomeric-coated or polyurethane-coated steel belts):
- .1 Provide suspension means meeting not less than an FT-1 rating when tested to the vertical burn test requirements of UL 62, CSA C22.2 No 49 or approved equivalent.
- 2.6.7 Suspension means shall be designed for not less than 2,500,000 trips based on site-specific equipment and arrangement.
- 2.6.8 Where suspension means replacement criteria are based on trip counts, the replacement criteria shall be not less than 2,000,000 trips.
- 2.6.9 A "trip" shall be defined as travel starting at one floor and ending at any other floor, with no stops at intervening floors.

---

**2.7    Solid state motor drive: regenerative**

- 2.7.1 Provide a regenerative solid state drive to control the speed of the elevator.
- 2.7.2 Provide circuits to cause the elevator to regenerate power, under negative load conditions, to the normal building power supply with a minimum 0.95 power factor.
- 2.7.3 Provide dynamic braking resistors arranged to absorb power regenerated under negative load conditions when the elevator runs on the building's emergency power generator.
- 2.7.4 Provide a drive system to meet the EN12015 standards and the recommended guidelines of IEEE-519 for generated harmonics and power factor measured at the disconnect switch.
- 2.7.5 Provide pre-torquing.
- 2.7.6 Arrange that the system in responding to a unit step function does not overshoot by more than 21 percent.
- 2.7.7 Arrange that the error signal does not, in normal operation, exceed 2.5 percent.
- 2.7.8 Provide means to shut down the unit in the event that the error signal exceeds 5.0 percent.
- 2.7.9 Provide means to limit the increase in noise level during acceleration to less than 12 decibels (A scale) as measured in the centre of the machine room.
- 2.7.10 Provide electronic feedback circuits to limit the current through the motor and the solid state power devices.
- 2.7.11 Arrange that under low voltage conditions the unit does not exceed the current limits.
- 2.7.12 Provide safety circuits to prevent runaway in the event of closed loop feedback circuit failure.
- 2.7.13 Arrange these circuits so that:
  - .1 With a partial or complete loss of the feedback signal the elevator will come to a stop before the governor jaws are tripped;
  - .2 If the elevator is in the levelling zone with the door interlock circuit open, the elevator will come to a stop prior to leaving the levelling zone.
- 2.7.14 Test these circuits by opening the feedback circuit while the elevator is running at contract speed no load up and while the elevator is levelling into the floor no load up.
- 2.7.15 Provide means for dissipating the heat generated by solid state devices.
- 2.7.16 Provide safety circuits to shut down the unit in the event of overheating.
- 2.7.17 Design the equipment so that power loss or power fade (brownout) does not cause fuses to blow.
- 2.7.18 Provide means to protect the solid state power devices against surge currents.
- 2.7.19 Provide filters and circuits to reduce the line pollution so that the distortion generated by the solid state power device is within the following limits as measured at the disconnect switch:
  - .1 The 5th harmonic voltage does not exceed 6 percent;

- .2 The 5th harmonic current does not exceed 20 percent;
  - .3 The total harmonic voltage does not exceed 10 percent;
  - .4 The total harmonic current does not exceed 25 percent;
  - .5 Line voltage notching of duration greater than 1 millisecond is less than three per cent of the peak sine wave voltage measured from zero reference;
  - .6 The notch depth is less than 10 per cent;
  - .7 The notch duration is less than 2 milliseconds.
- 2.7.20 Provide filters and circuits to reduce the electromagnetic noise level at any frequency with the elevator running, to not more than 0.1 db above the ambient electromagnetic noise level (with the elevator stopped), as measured in the centre of the machine room using a calibrated radio frequency receiver designed in accordance with CSA Standard C108.1.1 together with a calibrated rod or loop antenna.
- 2.7.21 Provide filters and circuits to reduce the electromagnetic noise level at 10 KHz with the elevator running, to not more than 0.01 db above the ambient electromagnetic noise level (with the elevator stopped), as measured in the centre of the machine room using a calibrated radio frequency receiver designed in accordance with CSA Standard C108.1.1 together with a calibrated rod or loop antenna.
- 2.7.22 Arrange the equipment so that any vibration generated is not transmitted directly to the building structure.

## **2.8 Solid-state hardware**

- 2.8.1 Mount solid-state devices, except for high power silicon controlled rectifiers, on removable printed circuit boards.
- 2.8.2 Gold plate the contact points of edge connectors.
- 2.8.3 Use G10 glass epoxy with minimum equivalent 57 gram (2 ounce) copper.
- 2.8.4 Coat the circuits with tin-lead.
- 2.8.5 Provide a solder resist screen.
- 2.8.6 Provide plated through holes for double sided boards.
- 2.8.7 Make all connections to the printed circuits on the printed circuit boards by means of properly dimensioned pads.
- 2.8.8 Do not provide "patched" connections.
- 2.8.9 Design solid-state devices for a high level of noise immunity.
- 2.8.10 Incorporate electrical noise suppression devices in the power supplies and the inputs and outputs associated with the solid-state circuits.
- 2.8.11 Provide filters and circuits to limit the generated electromagnetic noise level at any frequency to not more than 0.1 db above the ambient electromagnetic noise level, as measured in the centre of the machine room using a calibrated radio frequency receiver designed in accordance with CSA Standard C108.1.1 together with a calibrated rod or loop antenna.

- 2.8.12 Provide filters and circuits to limit the generated electromagnetic noise level at 10 KHz to not more than 0.01 db above the ambient electromagnetic noise level, as measured in the centre of the machine room using a calibrated radio frequency receiver designed in accordance with CSA Standard C108.1.1 together with a calibrated rod or loop antenna.

## **2.9 Auxiliary slowdown devices**

- 2.9.1 Provide auxiliary slowdown devices compatible with the solid state speed control and so arranged that, if the normal slowdown devices fail to operate correctly, the elevator will be brought to a controlled stop at the terminal landing with an acceleration not exceeding 0.3 g.
- 2.9.2 Arrange the control circuits so that, if the auxiliary slowdown devices were required to act to stop the elevator, the elevator parks at the terminal landing until the system is checked by a maintenance technician.

## **2.10 Position transducer**

- 2.10.1 Provide a position transducer device to transmit to the control system the position of the elevator.
- 2.10.2 Arrange that the device transmit a minimum of 10 counts per 25 mm (1") of travel.
- 2.10.3 Provide a device having an overall precision within  $\pm 1.0$  mm ( $\pm 0.04$ ").
- 2.10.4 Arrange the elevator controls so that the output from this device is read at least every 5 ms.
- 2.10.5 Transmit the signal from this device either in serial format using a standard protocol (e.g, CAN) or in parallel format using low impedance (less than 10 kilohms) inputs.
- 2.10.6 If the transducer is a relative (pulse counter) type rather than an absolute encoder type:
- .1 Provide gray encoding so as to indicate the direction of movement of the car and to offset 'false' counts caused by vibration;
  - .2 In the event of a counter error reset the position with an accuracy within  $\pm 2.5$  mm ( $\pm 0.1$ ") by returning the car at low speed to a fixed point in the hoistway.

## **2.11 Emergency machine dual brake**

- 2.11.1 Provide an emergency braking device to prevent uncontrolled movement of the elevator.

---

**2.12 Governor: automatic reset**

- 2.12.1 Provide an automatic reset governor located so that it can be maintained from the top of the elevator car and tested without special access arrangements.
- 2.12.2 Arrange that the governor, once tripped, will be reset when the car is moved up off the car safeties.

**2.13 Controller**

- 2.13.1 Provide a micro-processor based controller designed to give the required operation as herein specified.
- 2.13.2 Mount panels securely on substantial, self supporting steel frames designed for floor or wall mounting.
- 2.13.3 Provide completely enclosed controllers with covers.
- 2.13.4 Do not mount equipment on the covers unless:
  - .1 Its wiring is designed to support bending caused by opening and closing the cover;
  - .2 Its wiring is protected against damage;
  - .3 If damage happens to the equipment mounted on the cover or the wiring of this equipment, the unit will continue to operate normally.
- 2.13.5 Where relays are used, provide those having a design electrical life and mechanical life equivalent to thirty years operation in the given application, with their contacts designed for maximum conductivity and wiping action.
- 2.13.6 Install wiring on the controller, whether control or field wiring, in a neat workmanlike order and make connections to studs and terminals by means of solder or solderless lugs, or similar connecting devices.
- 2.13.7 Mark relays, contactors, fuses, printed circuit boards and other components clearly and permanently with designations as shown on the schematics.
- 2.13.8 Mount the designations for plug in components on the controller adjacent to the component; do not mount the designation on the plug in component.
- 2.13.9 Provide a written guarantee from the control manufacturer that software and firmware updates will be provided for not less than 20 years at no charge to the Owner.
- 2.13.10 Install the controller in a dedicated control room and not within the hoistway.

**2.14 Computing devices**

- 2.14.1 Where computing devices are used, such as micro-processors or mini-computers, along with associated devices, design to the following requirements:
  - .1 Isolate the inputs from external devices (such as push-buttons) and isolate the outputs to external devices (such as indicators) by means of relays or optical devices;
  - .2 Provide the control program on read-only-memory with spare capacity to allow for future programming modifications and extensions;

- .3 Provide crystal regulation of frequency;
- .4 Provide for separate regulated power supplies to serve each micro-processor system.

## **2.15 Speed control**

- 2.15.1 Design and adjust the equipment so that the average acceleration over the period of constant acceleration is  $0.8 \text{ m/s}^2$  ( $2.6 \text{ ft/s}^2$ ) plus or minus 10%.
- 2.15.2 Design and adjust the equipment so that the average change in acceleration (jerk) is  $1.4 \text{ m/s}^3$  ( $4.6 \text{ ft/s}^3$ ) plus or minus 10%.
- 2.15.3 Design and adjust the equipment so that the rated speed is maintained with an accuracy of 1.5 percent.

## **2.16 Power interruption restart**

- 2.16.1 Provide means so that the elevator system will restart automatically in the event of power interruption.
- 2.16.2 Where volatile memories are provided for position and other data necessary to the continuing operation of the elevators, provide means of preserving this data on power failure or fading ('brownout') for a minimum of four hours and means of automatic recovery upon restoration of normal power.

## **2.17 Control circuits grounding**

- 2.17.1 Arrange the control circuits so that one side of the control power supply for external circuits is grounded to facilitate testing and trouble shooting.
- 2.17.2 An external circuit is defined as one wired outside micro-processors or solid-state devices, as for example, buttons, relays, lights, display screens, position indicators, lanterns, kiosks, limits, locks and such similar devices.
- 2.17.3 Arrange that accidental grounding in the control system will not defeat the safety circuits.

## **2.18 Main floor elevator markings**

- 2.18.1 Provide at the main floor, for each elevator designated as a Firefighter's Elevator, a suitable symbol such as a Firefighter's Hat.
- 2.18.2 Provide at the main floor for each elevator alphanumeric symbols indicating the designation of the elevator.
- 2.18.3 Provide markings as selected by the Owner.
- 2.18.4 Provide samples for review.

---

**2.19 Entrance floor markings**

- 2.19.1 Provide, on each hall entrance jamb, raised tactile and braille metallic markings to designate the floor.
- 2.19.2 Provide markings as selected by the Owner.
- 2.19.3 Provide samples for review.

**2.20 Floor marking: hoistway**

- 2.20.1 Identify each landing by means of markings on the inside of the hoistway.
- 2.20.2 Use a stencil to ensure that the floor markings are neat and uniform in appearance.
- 2.20.3 Provide numerals and letters approximately 100 mm (4") high and of a clearly contrasting colour to the colour of the doors and fascias.

**2.21 Door type: single speed side opening**

- 2.21.1 Provide car and hoistway doors of the single-speed side opening, horizontal sliding type.

**2.22 Door friction**

- 2.22.1 Adjust the doors so that with the door closing device disconnected, the doors can be started into motion, from any position, with a force of less than 25 newtons (six pounds) per door panel applied horizontally at the mid-point of the door in line with the direction of movement of the door.

**2.23 Entrance: fire rating**

- 2.23.1 Provide entrances bearing a 1.5 hours fire rating approved by authorities having jurisdiction.
- 2.23.2 Provide a closure, including interlock mechanism and associated wiring, capable of operating for a period of at least one hour when the assembly is subjected to the standard fire exposure tests.

**2.24 Entrances**

- 2.24.1 Provide entrances consisting of frames, jambs, sills, sill support angles and brackets, struts, headers, fascias, toe guards, and sight guards and doors of approved design and size complete with guides and bumpers and all other items necessary to provide a completed installation.
- 2.24.2 Construct the doors of sheet steel a minimum of 1.3 mm (18 gauge) thick.

**2.25 Entrance installation**

- 2.25.1 Assume undivided responsibility for the entire installation of the entrances.
- 2.25.2 Handle, store, protect, install the entrances and associated equipment.
- 2.25.3 Set door frames in perfect alignment with the elevator car platform.

- 2.25.4 Fasten frames and headers to structural supports.
- 2.25.5 Set frames and sills in place prior to building walls.
- 2.25.6 Install frames within 1 mm (0.04") of plumb and sills within 2 mm (0.08") of level over the entrance width.
- 2.25.7 Fasten frames securely at the sill and header.
- 2.25.8 Fasten sills securely to the building structure by means of a support angle or substantial brackets.
- 2.25.9 Install struts, fascias, toe guards and other associated equipment required to complete the installation of the entrances.

**2.26 Entrance finish: stainless steel**

- 2.26.1 Provide stainless steel entrances finished so that spot welds or other surface defects will not show under reflected light.

**2.27 Entrances: door hardware**

- 2.27.1 Supply hoistway door hardware consisting of door hangers and tracks, interlocks, door closers, relating mechanism, operating linkages, gibs, and all other hardware necessary for the installation and operation of the hoistway doors.
- 2.27.2 Provide heavy duty constant force door closers at the main floor to minimize stack-effect from impacting elevator door operation and provide heavy duty constant force door closers at any other high stack-effect elevator lobbies.
- 2.27.3 Supply, for each sliding panel, sheave type, two point suspension hangers.
- 2.27.4 Supply sheaves not less than 75 mm (3") in diameter with ball bearings, properly sealed to retain grease lubrication, and mounted on stands arranged for direct attachment to the panels.
- 2.27.5 Equip hangers with adjustable ball bearing rollers to take the up-thrust of the doors.
- 2.27.6 Arrange the tracks and sheaves so that there is no metal to metal contact, and so that the doors operate properly without any regular lubrication.
- 2.27.7 Design all door hardware for a minimum of noise.

**2.28 Car door restrictor**

- 2.28.1 Provide a car door restrictor to mechanically prevent the opening of the car door from inside the cab unless the elevator is in the door unlocking zone.
- 2.28.2 Provide a device that does not require electrical or electronic components to function.

---

**2.29 Car and hoistway door safety retainers**

- 2.29.1 Provide safety retainers at the top and bottom of horizontally sliding doors to retain the closed door panel in position if the primary guiding means fail.
- 2.29.2 Provide retainers that will prevent the displacement of the door panel top and bottom by more than 20 mm (0.8") when the door panel is subjected to a force of 5 000 N (1130 lbf) applied towards the hoistway at right angles to the panel over an area of 300 mm by 300 mm (12" by 12") at the centre of the panel.
- 2.29.3 Provide retainers that will withstand, without detachment or permanent deformation, a force of 1 000 N (225 lbf) applied upward at any point along the width of the door panel together with an additional concurrent force of 1 100 N (250 lbf) applied at right angles to the door at the centre of the panel over an area of 300 mm by 300 mm (12" by 12").
- 2.29.4 Arrange that the retaining means are not involved in the guiding of the panel and are not subjected to wear or stress during normal door operation.

**2.30 Hoistway entrance lunar key access**

- 2.30.1 Provide lunar key access for each hoistway entrance.
- 2.30.2 Provide a protective metal sleeve for each circular lunar key hole (where applicable).

**2.31 Reopening devices and detection of objects**

- 2.31.1 Provide a reopening device and entrance protection capable of detecting objects in the door path and objects approaching the doors.
  - .1 In jurisdictions that have adopted B44-19 or earlier, provide equipment in accordance with B44-19 Section 2.13.5.
  - .2 In jurisdictions that have adopted B44-22, provide equipment in accordance with B44-22 Section 2.13.5.
- 2.31.2 Arrange the doors to reopen (or remain open) when an object is detected.
- 2.31.3 Position detection receivers and emitters, when installed on the door, at least 25 mm (1") back from the leading edge of the doors to prevent accidental damage.
- 2.31.4 Provide a signal on the unit or in the machine room to indicate that a failure has occurred.
- 2.31.5 Supply a device, reliable and consistent in operation, not affected by dust or temperature changes, and having inherent long term reliability with minimum maintenance.
- 2.31.6 Arrange that the operation of the devices will not be affected by adjacent reflective, shiny or glass surfaces.
- 2.31.7 For a transom-mounted reopening device, if new cab interiors are being provided, install the device recessed into the transom substantially flush with the surface (i.e. do not surface mount).

**2.32 Door operator (harmonic)**

- 2.32.1 Provide a heavy duty door operator to open and close the car and hoistway doors simultaneously.
- 2.32.2 Provide either:
  - .1 An alternating current motor, either standard or linear induction type, with associated variable voltage and variable frequency solid state drive to control the speed and torque of the door operator, or;
  - .2 A direct current motor with associated solid state drive to control the speed and torque of the door operator.
- 2.32.3 Provide as a minimum a 375 W (0.5 HP) motor.
- 2.32.4 Provide dual drive arms for centre-opening doors.
- 2.32.5 Provide a solid state door operator control incorporating negative feedback circuits for position, acceleration, velocity and torque.
- 2.32.6 Provide event logging with non-volatile memory so as to retain the event log under power-off conditions.
- 2.32.7 Provide fully automatic installation algorithm profiles that self-adjust the motion profile for the relevant parameters.
- 2.32.8 Provide an output from the door control for a pre-start command to the elevator speed control system.
- 2.32.9 Provide optical isolation for input and output signals.
- 2.32.10 Provide signal line short circuit protection.
- 2.32.11 Provide a serial input to the door control to allow adjustment of speed, acceleration, torque and pre-start point using a notebook computer or keypad.
- 2.32.12 Provide the keypad or software for a standard notebook computer.
- 2.32.13 Arrange that the settings for the door operator can be uploaded to the keypad or notebook computer and then downloaded to another identical operator.
- 2.32.14 Provide an average door closing speed of 300 mm (12") per second, respecting the parameters for door force and door inertia as set out in the elevator code.
- 2.32.15 Provide an average door opening speed of 700 mm (28") per second.
- 2.32.16 Provide, either in the door operator control or in the main elevator control, means to automatically recycle the doors in the event that they stall during the opening or closing operations.
- 2.32.17 Design the door operator and associated components for a minimum of noise.

---

**2.33 Car door equipment**

- 2.33.1 Provide car door header, hangers and tracks, door closers, door electrical contacts, master door operators, and all incidental devices necessary for the correct operation of the doors.
- 2.33.2 Provide, for each sliding car door panel, sheave type, two point suspension hangers.
- 2.33.3 Provide sheaves not less than 80 mm (3.25") in diameter with ball bearings, properly sealed to retain grease lubrication, and mounted on stands directly attached to the panels.
- 2.33.4 Equip hangers with adjustable ball bearing rollers to take the up-thrust of the doors.
- 2.33.5 Arrange the tracks and sheaves so that there is no metal to metal contact, and so that the doors operate properly without any regular lubrication.
- 2.33.6 Design all door equipment and associated components for a minimum of noise.

**2.34 Car station**

- 2.34.1 Provide one main car operating panel.
- 2.34.2 Provide in the panel the devices required for normal automatic operation, including the following:
  - .1 Floor push buttons;
  - .2 Door open button;
  - .3 Door close button;
  - .4 Alarm button;
  - .5 Emergency communication button.
- 2.34.3 Number the car call buttons to correspond to the floor served.
- 2.34.4 Provide in conjunction with the car buttons a call registered light for each button to be lighted when the button is pressed and extinguished when the car stops at the selected floor.
- 2.34.5 Secure tactile markings using hidden fasteners.
- 2.34.6 Provide a Firefighters' Emergency Operation cabinet on the main car station in accordance with the Code.
- 2.34.7 Provide a locked service cabinet, its size and location to match the Firefighters' Emergency Operation cabinet, containing the following:
  - .1 Light key switch;
  - .2 Fan key switch;
  - .3 Independent service key switch;
  - .4 Inspection key-switch;
  - .5 Voice annunciation on/off key-switch;
  - .6 Emergency lighting test switch;
  - .7 GFCI duplex receptacle (Run the wires for this receptacle separately from the wires for the other car light and ventilation equipment and connect it

---

to a separate breaker in the machine room).

- 2.34.8 Provide, only when required by the prevailing codes, a stop switch located in the service cabinet, arranged to stop the elevator and to duplicate the functions of the alarm button.
- 2.34.9 Engrave the car station with markings and signage such as car capacity, elevator number and other markings required by the prevailing codes and local regulations including remote location of device licenses where available.
- 2.34.10 Ensure that engravings and button designations are easily read when viewed at an angle from any normal standing position in the elevator cab within arms reach of the car station.
- 2.34.11 Hinge the car station faceplate so that it can be swung open towards the adjacent cab side wall to allow access for servicing of the inner components of the car station.
- 2.34.12 Provide a hinge capable of supporting without distortion a test weight of minimum 11 kg resting on the panel non-hinged edge with the panel swung open.
- 2.34.13 Secure the car station in the closed position using countersunk spanner head fasteners or approved equivalent.
- 2.34.14 Arrange the car station so that it can be swung open without interference from the cab flooring, cab wall, cab handrails or other cab appurtenances.

## **2.35 Signal lights**

- 2.35.1 Provide LED position indicators and call registered lights having a minimum contrast ratio of 8:1 throughout a life expectancy greater than 100,000 hours.
- 2.35.2 The contrast ratio is to be determined by subtracting the brightness of the indicator background from the brightness of the marking and then dividing the result by the brightness of the background.
- 2.35.3 Arrange that the variation in intensity and contrast ratio between position indicators does not exceed 5 percent.
- 2.35.4 Arrange that the variation in intensity and contrast ratio between call registered lights does not exceed 5 percent.
- 2.35.5 All measurements are to be made in ambient lighting conditions meeting Code requirements.

## **2.36 Automatic cab lighting and fan control**

- 2.36.1 Arrange that the cab lights and fan are turned off in not more than five minutes when:
  - .1 The elevator is level at a floor;
  - .2 The elevator doors are closed;
  - .3 The elevator has not been selected to answer a call;
  - .4 The elevator is on automatic operation;
  - .5 The elevator safety circuit (including interlocks) is intact.

- 2.36.2 Ensure cab lighting has an efficacy of not less than 35 lumens per Watt.
- 2.36.3 Should any of the above conditions no longer obtain or when emergency communication devices are initiated, turn the car lights and fan on within 0.5 seconds.

**2.37 Car position annunciator**

- 2.37.1 Provide automatic verbal announcement to announce the floors and to provide floor passing tones.
- 2.37.2 Provide a unit to meet the requirements of the Code.
- 2.37.3 Provide means in the service cabinet to adjust the volume over a range from 55 and 70 decibels.
- 2.37.4 Use a female voice for the announcements.

**2.38 Car position indicator**

- 2.38.1 Provide a digital car position indicator mounted in each car operating panel.
- 2.38.2 Arrange the indicator to display a number or symbol at least 50 mm (2") high.
- 2.38.3 Indicate the position of the car at all times, corresponding to the landing through which the car is passing or at which it is stopped.
- 2.38.4 Provide an LCD position indicator screen or a segmented display using light emitting diodes with a minimum of 16 segments per character.
- 2.38.5 Arrange the circuits so as to provide continuous indication of car position.

**2.39 Emergency lighting**

- 2.39.1 Provide a back-up battery power system for alarm bell operation and emergency cab lighting.
- 2.39.2 Install the emergency lighting lamp at the top or upper reaches of the car station unless otherwise required by the site Architectural cab design.
- 2.39.3 Provide a lighting level of at least 11 lux of illumination at the car operating panels for a minimum period of four hours, using at least four LED lamps of equal rating.
- 2.39.4 Cause the lamps to be immediately energized in the event of a power failure or electrical fault de-energizing the normal elevator lighting circuit.
- 2.39.5 Provide for the automatic disconnection of the lamps and the automatic recharging of the lighting unit when normal power is restored to the elevator lighting circuit.
- 2.39.6 Provide a rechargeable battery of the hermetically sealed type, or of a type which provides a reserve of electrolyte, capable of operating unattended and requiring no addition of water or electrolyte for a period of not less than ten years, with provision for visual checking of the electrolyte level without opening the battery or removing caps or fittings.

- 2.39.7 Arrange the battery charging to operate automatically upon restoration of normal power to the unit, to remain in operation until the battery is fully recharged and to maintain the battery at full rated capacity at all times when the unit is not in operation.
- 2.39.8 Provide a pilot lamp to indicate that the normal power supply to the unit and battery charging is in operation.
- 2.39.9 Arrange that the unit can be conveniently tested and operated manually.
- 2.39.10 Install the unit as part of the car so that it is not readily removed.
- 2.39.11 Do not provide portable equipment.
- 2.39.12 Install the lamp fixture above the car station.
- 2.39.13 Provide an emergency lighting test switch in the car service cabinet or behind the car swing return.

## **2.40 Telephone: hands-free operation**

- 2.40.1 Provide a hands-free telephone with automatic dialer capable of initiating and receiving calls.
- 2.40.2 Integrate the telephone into the car station.
- 2.40.3 Provide a push button to initiate the telephone connection.
- 2.40.4 Arrange that the telephone connection can be initiated by an external call.
- 2.40.5 Provide an indicator light to confirm that communication has been established.
- 2.40.6 Pierce the car station for the push button and indicator light with the indicator light mounted flush with the panel.
- 2.40.7 Provide a speaker/microphone for communication.
- 2.40.8 Pierce the car station in front of the speaker with multiple holes 3 mm (1/8") in diameter to allow passage of sound to and from the speaker.
- 2.40.9 Identify the telephone and the button with a raised symbol and Braille.
- 2.40.10 Provide wiring for the telephone from the cab to the machine room.
- 2.40.11 Provide a communication station in the machine room.
- 2.40.12 Connect the wiring on the car to a terminal block mounted in or adjacent to the telephone box.
- 2.40.13 Terminate the wiring in the machine room at a separate enclosed external terminal block mounted on the controller.
- 2.40.14 Provide the terminal block and its enclosure and locate it so that personnel other than elevator mechanics can easily run their conduit and wiring to these terminals without interfering with or touching the elevator wiring or controls.
- 2.40.15 Where more than one controller is in a common machine room bring wiring to one common terminal block.
- 2.40.16 Clearly mark the terminal block.

- 2.40.17 Provide wiring of the twin conductor shielded type with grounded shields.
- 2.40.18 Provide equipment and wiring compatible with and acceptable to the telephone company providing service to the project.
- 2.40.19 Provide material and labour as necessary so as to ensure that the communication system meets the requirements of the Code.

**2.41 Two-way communication system: verbal and non-verbal**

- 2.41.1 Provide a two-way emergency communication system that permits verbal and non-verbal communication.
- 2.41.2 Provide a VoIP system (Voice over Internet Protocol) or approved alternative.
- 2.41.3 Integrate the system into the car station.
- 2.41.4 For verbal communication:
  - .1 Provide a speaker/microphone for communication.
  - .1 Utilization of the hands-free telephone system, including speaker/microphone, is acceptable provided it is compatible and all requirements are met.
- 2.41.5 For non-verbal communication:
  - .1 Provide a camera inside the elevator cab to permit authorized persons to observe the entire surface area of the elevator cab floor.
  - .2 Provide the video coverage required to meet the Code via a streaming service.
  - .3 Ensure that the video streaming service is only initiated by the operator and that streaming is stopped once terminated by the operator.
  - .4 Ensure that video recordings are not stored off-site (including "cloud"-based servers).
  - .5 If buffering of the video (or any other temporary storage for streaming purposes) is required, ensure that the video is immediately deleted at the end of the video streaming session.
  - .6 Install the camera in the elevator ceiling or in the car station and protect it from damage caused by impact.
  - .1 Utilization of existing closed circuit camera systems installed inside the elevator is acceptable provided it is compatible and all requirements are met.
  - .7 Provide a LCD display screen in the car station.
  - .1 Utilization of the car position indicator for the LCD screen is acceptable provided it is compatible and capable of displaying the car position during communication.
  - .8 Arrange the display screen to show authorized personnel when an emergency communication call is placed.
  - .9 Arrange the display screen to display the elevator cab floor surface area,

text messages transmitted by authorized personnel and text messages transmitted by passengers inside the elevator.

- .10 Provide means for the passengers inside the elevator to communicate non-verbally with authorized personnel by:

.1 A QWERTY style button input on the car station; or

.2 YES or NO buttons on the car station.

2.41.6 Provide a back-up battery power system for the communication system capable of operating the system for 4 hours in the event of a power failure.

2.41.7 Initiate the emergency communication system when the push-button on the car station for two-way emergency communication is pressed.

2.41.8 Arrange that the emergency communication system connection can be initiated by an external call.

2.41.9 Provide an indicator light to confirm that communication has been established.

2.41.10 Arrange the emergency communication system to dial to a location within the building staffed by authorized personnel when activated and, if not answered within 45 seconds, automatically forward the call to an off-site location staffed 24 hours per day by authorized personnel.

2.41.11 Provide, to authorized personnel, information that identifies where the call is coming when an emergency communication call is made.

2.41.12 Provide audible and visual communication failure signals within the same housing as the emergency recall switches and indicators and provide a key-switch in this housing to allow authorized personnel to temporarily deactivate the audible signal.

2.41.13 Supply wiring as necessary to connect the system to the elevator system.

2.41.14 Connect the wiring on the car to a terminal block mounted in or adjacent to the telephone box.

2.41.15 Terminate the wiring in the machine room at a separate enclosed external terminal block mounted on the controller.

2.41.16 Provide the terminal block and its enclosure and locate it so that personnel other than elevator mechanics can easily run their conduit and wiring to these terminals without interfering with or touching the elevator wiring or controls.

2.41.17 Where more than one controller is in a common machine room bring wiring to one common terminal block.

2.41.18 Clearly mark the terminal block.

2.41.19 Provide wiring of the twin conductor shielded type with grounded shields.

2.41.20 Provide equipment and wiring compatible with and acceptable to the telephone/IT company providing service to the project.

- 
- 2.41.21 Provide material and labour as necessary so as to ensure that the communication system meets the requirements of the Code.
  - 2.41.22 Provide any incidental elevator material and elevator work necessary to obtain a complete functioning communication system.
  - 2.41.23 Do not ground the system to an alternating current circuit.
  - 2.41.24 If the connecting wiring requires conduit external to the elevator hoistways and machine rooms coordinate with and assist as necessary the trades executing this work (these other trades are responsible for the provision of the conduit and the pulling of the wiring supplied by the elevator contractor).
  - 2.41.25 Provide standard, readily available hardware components.
  - 2.41.26 Submit for review brochures, details, wiring diagrams and description of the communication system.

**2.42 Web-based monitoring service**

- 2.42.1 Provide a web-based monitoring service to enable authorized personnel to initiate cab video monitoring or initiate non-verbal two-way communication.
- 2.42.2 Provide this monitoring service to the Owner for the maintenance period included herein (whether in the base scope or as an itemized or separate price).
- 2.42.3 If the web-based monitoring service requires fees for continued usage beyond the maintenance period included herein, such fees shall not exceed \$15 per device per month (adjusted annually from the date of substantial performance by an amount not to exceed the previous year's "all items" percentage change in the Consumer Price Index).
- 2.42.4 Ensure that the monitoring system does not require any other special licences, services, subscription or fees to remain functional.
- 2.42.5 Ensure that the monitoring service functions with the current version of all major operating systems and browsers.
- 2.42.6 Ensure that the monitoring system does not require the installation of any proprietary software.
- 2.42.7 Make the web-based monitoring service available to any call answering service selected by the Owner (including other elevator contractors), regardless of which company maintains the elevator equipment.
- 2.42.8 Guarantee that the web-based service shall be provided and maintained for not less than 15 years.

**2.43 Closed circuit camera security system**

- 2.43.1 A closed circuit camera (CCTV) will be installed in the cab by others.
- 2.43.2 Provide wiring from the camera in the cab to a designated point in the machine room as follows.

- 2.43.3 Provide one RG6/U stranded centre conductor coaxial cable and one pair 18 gauge stranded conductor cable within an overall braided shield or such other interconnections as may be required by the CCTV contractor.
- 2.43.4 Run the interconnecting wiring from the elevator security interface box in the machine room to the top of the elevator cab.
- 2.43.5 Provide an excess loop of 3050 mm (10') of cable at either end.
- 2.43.6 Provide a cable access hole in the top of the cab at the camera location.
- 2.43.7 Provide a 110 vac power source on the cab to power the camera.
- 2.43.8 Provide assistance to the CCTV contractor for the installation of the camera.

## **2.44 Security system**

- 2.44.1 Provide for the installation of an elevator card reader security system.
- 2.44.2 Provide accessible space, mounting supports and wiring for a security antenna in the cab main front return panel.
- 2.44.3 Provide a free space 100 mm (4") in height, 175 mm (7") in width and 75 mm (3") in depth centred behind the car panel insert for the security antenna installation.
- 2.44.4 Provide in front of the security antenna a translucent polycarbonate cover.
- 2.44.5 Provide an elevator security interface box in the machine room, complete with terminal blocks and wiring space for the interconnection of the security system to the elevator control system.
- 2.44.6 Provide wiring from the car station card reader to the security interface box using standard connectors.
- 2.44.7 Interface with the security system using serial data transfer.
- 2.44.8 Provide a signal, unique for each car call, to the security system when a car call "request" (which could either be by means of a button or touch screen) is entered and enter the car call when a return signal is received from the security system validating the request.
- 2.44.9 Arrange that the elevator system functions without restriction by the security system when Firefighters' Emergency Operation is operative.
- 2.44.10 Until such time as the security system is installed, arrange that the elevator system functions without restriction by the security system.
- 2.44.11 Provide any incidental elevator material and elevator work necessary to obtain a complete functioning elevator security system.
- 2.44.12 Submit for review, interface box drawings, location drawings and electrical schematics.

---

**2.45 Hall push button stations: single riser**

- 2.45.1 Provide a single riser of hall push button stations.
- 2.45.2 Provide one station for each floor.
- 2.45.3 Provide at the intermediate floors, for each station, up and down push buttons located one above the other and call registered lights.
- 2.45.4 Provide at the upper terminal and lower terminal, for each station, a single button and call registered light.
- 2.45.5 Illuminate the call registered light only when there is an elevator in service to respond to the call.
- 2.45.6 Provide communication, emergency power and firefighters' switches, indicators and devices as necessary in the stations.
- 2.45.7 Secure the hall push button stations to the wall using countersunk spanner head fasteners or approved equivalent.

**2.46 Hoistway access switch**

- 2.46.1 Provide hoistway access switches in accordance with the Code.
- 2.46.2 Locate the switches in the entrance frame or in the sight guard in an inconspicuous place.
- 2.46.3 Locate the switches on the same side of the entrance frame as the pick-up roller assembly.

**2.47 Cab ventilation**

- 2.47.1 Provide an exhaust fan capable of developing 30 pascals (0.1" H<sub>2</sub>O) static pressure differential with a minimum capacity of 165 litres per second (350 cfm).
- 2.47.2 Provide a two speed motor for the fan with the speed control located in the car operating panel.
- 2.47.3 Ensure that the cab ventilation does not consume over 0.33 W/cfm at maximum speed.

**2.48 Cab: standard finishes**

- 2.48.1 Provide a cab including the following items:
  - .1 A reinforced metal cab shell allowing the use of the elevator without interior finishes;
  - .2 A ceiling finished in white baked enamel;
  - .3 Returns, transom, car door jamb, lintel and door finished in stainless steel;
  - .4 Aluminum car sill;
  - .5 A 3 mm (1/8") thick aluminum plate over a wooden sub-floor;
  - .6 For non-access walls, 19 mm (3/4") thick plywood panels covered with Scottish Quad pattern panels, with stainless steel reveals and binders;
  - .7 A solid suspended ceiling made of stainless steel panels, the number and dimensions of ceiling panels to correspond with the number and width of

- panels on adjacent cab walls;
- .8 A LED light fixture in each suspended ceiling panel;
- .9 Recess for tile flooring to be installed by others, flush with the car sill;
- .10 Flat stainless steel handrails of a thickness of at least 6 mm (1/4"), a height of 50 mm (2"), located at the maximum height allowed by Appendix E of the Code, extending the full length of non-access walls and with tapers at the ends;;
- .11 Hooks for protective pads.

2.48.2 Provide vandal-resistant finishes.

2.48.3 Supply any other material and labour necessary to provide a completed, installed cab including mounting strips, stay plates, base and sound-deadening material.

2.48.4 Provide cut-outs to accommodate the elevator equipment.

2.48.5 Submit for review shop drawings showing the finishes and design.

#### **2.49 Protective pads**

2.49.1 Provide protective pads covering all exposed wall surface, attached to inconspicuous pad hooks at the top of the cab and reaching to within 100 mm (4") of the car floor.

2.49.2 Provide stitched cut-outs within the pads to provide visibility and access to fixtures.

#### **2.50 Hall lanterns and gongs**

2.50.1 Provide hall lanterns complete with electronic gongs at each entrance to indicate the future direction of the elevator.

2.50.2 Provide a single light for the fixture at the upper terminal.

2.50.3 Provide a single light for the fixture at the lower terminal.

2.50.4 Provide separate up and down lights for the fixture at the intermediate landing.

2.50.5 Arrange the lanterns so that as soon as a car has reached a predetermined distance from the floor, and is going to stop at the floor, the corresponding hall lantern illuminates and the gong operates.

2.50.6 Arrange the controls so that the hall lantern provides a minimum five second advance notice of the arrival of a car.

2.50.7 Maintain the hall lantern illuminated until the car has stopped and the door open time has elapsed.

2.50.8 Do not illuminate the hall lantern on a door re-open unless the re-open is caused by a reversal of direction of travel of the car.

2.50.9 Arrange the operation of the lanterns and gongs to comply with requirements of Appendix E of the Code.

2.50.10 Sound the tone once to indicate the up direction and twice to indicate the down direction.

- 
- |         |   |
|---------|---|
| 2.50.11 | Provide LEDs for illumination.  |
| 2.50.12 | Design the fixture so that the lamps may be readily changed.  |
| 2.50.13 | Do not mount any equipment to the covers; arrange that the covers can be removed completely without disturbing the electric wiring. |
| 2.50.14 | Locate the centre-line of the fixture a minimum of 1830 mm (72") above the floor.   |
| 2.50.15 | Provide lanterns of minimum 60 mm (2.4") size in the smallest direction.  |
| 2.50.16 | Provide means to adjust the gong volume in a range from 55 and 70 decibels.   |

**2.51 In car lanterns and gongs: applied**

- |        |  |
|--------|--|
| 2.51.1 | Provide in car lanterns complete with electronic gongs at each side of the elevator cab entrance to indicate the future direction of the elevator.   |
| 2.51.2 | Mount the lanterns on the car entrance columns.  |
| 2.51.3 | Arrange the lanterns and circuits so that as the car doors start to open in response to a call, the lanterns illuminate and the gong strikes.  |
| 2.51.4 | Sound the gong once to indicate the up direction and twice to indicate the down direction.   |
| 2.51.5 | Maintain the lantern illuminated until the car has stopped and the door open time has elapsed.   |
| 2.51.6 | Do not illuminate the lantern on a door re-open unless the re-open is caused by a reversal of direction of travel of the car.  |
| 2.51.7 | Arrange the operation of the lanterns and gongs to comply with requirements for persons with physical disabilities.  |
| 2.51.8 | Provide LEDs for illumination.   |
| 2.51.9 | Design the fixture so that the lamps may be readily changed. Do not mount any equipment to the covers; arrange that the covers can be removed completely without disturbing the electric wiring. |

**2.52 Car inspection devices**

- |        |  |
|--------|--|
| 2.52.1 | Provide, on the top of the car, a fixed lamp receptacle, with switch, outfitted with wire clamp guards, and a GFI duplex receptacle with safety ground connection.   |
| 2.52.2 | Provide, on the top of the car, an inspection station consisting of an emergency stop button, up, down and common inspection running buttons, on-off switch for the door operator and other devices necessary for top-of-car inspection operation. |

**2.53 Load weighing device**

- 2.53.1 Provide means to measure the load in the car within an accuracy of  $\pm 4\%$  of the elevator capacity.
- 2.53.2 Provide one of the following types of devices:
- .1 A device consisting of four strain gauge load cells located at each corner of the car platform and supporting a free floating car platform and cab with summing circuits to calculate the actual load under varying conditions of eccentric loading;
  - .2 If a flexible material is used for the car floor covering, a device consisting of membrane or similar switches located under the floor covering so as to indicate pressure at every 150 mm (6") by 150 mm (6") square of the floor with summing circuits to calculate from these switches the actual load in the car;
  - .3 A strain gauge device located on the crosshead arranged to measure the deflection of the crosshead and thus determine the load in the car;
  - .4 A device consisting of four strain gauge load cells supporting the weight of the elevator machine with summing circuits to calculate the actual load under varying load conditions;
  - .5 A device consisting of strain gauges mounted in the brake shoe pins so arranged as to measure the torque acting on the brake with summing circuits to calculate the actual load under varying load conditions;
  - .6 A Hall-effect device to measure the vertical movement of the cab on the supports as the load in the cab changes;
  - .7 A device to measure the tension in the elevator lift ropes and thus determine the load in the car.
- 2.53.3 Arrange that the output signal from the load weighing device be connected as an input to the speed control system.
- 2.53.4 Arrange the speed control system so that the output from this device is read, for purposes of pre-torque, after the doors are sufficiently closed that no further passengers can enter or leave and prior to the interlock circuit closing.
- 2.53.5 Transmit the signal from this device either in serial RS232C or current loop format or in parallel format using low impedance (less than 10 kilohms) inputs.
- 2.53.6 Arrange that the speed control system provide to the elevator motor sufficient torque, immediately prior to and during movement of the elevator, to offset the unbalanced load as determined by the load weighing device.
- 2.53.7 Arrange the speed control so that the elevator when leaving a floor does not move in the reverse direction for more than 3 mm (1/8").
- 2.53.8 Arrange that the load weighing device automatically resets itself when the control logic determines with certainty that the car is empty.
- 2.53.9 Arrange that the automatic reset occurs at least once every 24 hours.

---

**2.54 Sliding guides**

- 2.54.1 Equip the car and counterweight with spring-loaded sliding guides mounted at both the top and the bottom of the car and counterweight frame.
- 2.54.2 Provide guide shoes of the self-aligning, self lubricating, swivel type with metal body and removable non-metallic liners to ensure smooth and quiet operation.

**2.55 Guide rails**

- 2.55.1 Provide standard section guide rails with tongued and grooved joints.
- 2.55.2 Provide guide rails of structural strength and rigidity sufficient to limit the horizontal deflection of the guide at any point to less than 0.6 mm (0.025") under normal conditions of operation.
- 2.55.3 Use substantial machined finished plates to form the rail joints.
- 2.55.4 Erect guide rails with a variation of not more than 1.6 mm (0.06") over any 6 m (20') section and with a maximum variation of not more than 0.8 mm (0.03") in 25 mm (1").
- 2.55.5 Install guide rails in a strong and substantial manner using brackets affixed to the building structure.
- 2.55.6 Clamp the guides to the bracket with clips.
- 2.55.7 Arrange each clip so as to resist a vertical force of less than 4500 N (1000 pounds) and so as to allow the rail to slide if the vertical force exceeds 9000 N (2000 pounds).
- 2.55.8 Arrange the clips to prevent any horizontal movement of the rail.
- 2.55.9 Extend rails to within less than 300 mm (12") and more than 150 mm (6") of the underside of the overhead slab.
- 2.55.10 Use all standard length rails unless shorter lengths are required to avoid bracket locations or to complete the rail run at the top of the hoistway.
- 2.55.11 Install and locate the rails so that joints do not interfere with the supporting brackets and clamps.

**2.56 Traction elevator emergency power device**

- 2.56.1 Provide a device to automatically move the elevator to a floor in the event of power failure.
- 2.56.2 Arrange that when normal power fails, sufficient power is provided by the device to lift the brake, cause the elevator to move to a floor, open the doors and then remove the elevator from service until normal power is restored.
- 2.56.3 Provide batteries complete with charging system to power the unit.
- 2.56.4 Provide batteries having a minimum life expectancy of ten years.

**2.57 Fascias**

- 2.57.1 Provide fascias to meet, as a minimum, the requirements of the Code.
- 2.57.2 Unless a car door interlock is provided and the strength of the car door meets the applicable requirements of the Code:
  - .1 Provide fascias from the header of one entrance to the sill of the entrance above for the complete travel of the elevator including any express zone;
  - .2 Provide fascias extending below the sill of the lowest landing and above the header of the highest landing.
- 2.57.3 Provide fascia plates extending on each side at least 75 mm (3") beyond the clear openings.
- 2.57.4 Provide fascia plates of sheet steel of minimum 1.5 mm (16 gauge) thickness.
- 2.57.5 Reinforce fascia plates properly.
- 2.57.6 Provide all necessary supports required to secure fascia plates in place.

**2.58 Car platform**

- 2.58.1 Provide a car platform of sufficient size to accommodate the cab and to give the required inside net area assuming typical 50 mm (2") wall thickness and 180 mm (7") for doors, sill and return.
- 2.58.2 Provide a car platform with a structural steel frame filled with wood, aluminum or steel flooring having a depression to receive the finished floor.
- 2.58.3 Mount the car platform on isolating pads to prevent the transmission of noise and vibration from the car frame to the car platform.
- 2.58.4 Install the equipment in such a way that there is no direct metal connection between the car platform or the car cab and the car frame except metallic flex, where required, run in such a way as to provide vibration isolation.

**2.59 Car frame**

- 2.59.1 Provide a car frame of steel channels and angles securely welded, bolted or riveted and substantially reinforced and braced so as to relieve the car enclosure of all strains.

**2.60 Cab installation**

- 2.60.1 Assume undivided responsibility for the entire installation of the cab.
- 2.60.2 Handle, store, protect and install the cab and all associated equipment.
- 2.60.3 Install the elevator cab on the platform plumb and in alignment with the hoistway entrances.
- 2.60.4 Sound isolate the cab from the car frame.
- 2.60.5 Provide additional material and labour as required for handling, storing and installing the cab so as to provide a complete job.

---

**2.61 Car top guard**

- 2.61.1 For the safety of the technicians working on the top of the car, provide a car top guard consisting of the following.
- 2.61.2 Provide car top guard to meet, as a minimum, the requirements of the Code.
- 2.61.3 Provide a continuous guard around the sides and rear of the car top.
- 2.61.4 Provide a solid kickplate at the bottom of the guard rail extending from the car top to a height of 150 mm to prevent objects on the car top from falling over the side of the car.
- 2.61.5 Bolt the car top guard components together so that, if necessary, the guard can be temporarily removed.
- 2.61.6 Finish the guard with two coats of rust inhibiting primer and one finished coat of enamel.
- 2.61.7 So as to preserve the cab isolation affix the car top guard either to the cab top or to the car sling and frame but not to both.
- 2.61.8 If the car top guard is affixed to the car sling provide, where necessary, supports to the cab using vibration isolated mountings so arranged as to preserve the cab isolation.
- 2.61.9 If the car top guard is affixed to the cab provide, where necessary, supports to the car sling and uprights using vibration isolated mountings so arranged as to preserve the cab isolation.
- 2.61.10 Ensure that the installation of the car top guard does not reduce the overhead clearances to less than allowed by Code.

**2.62 Counterweight balance**

- 2.62.1 Statically balance the counterweight so that, at the centre of the travel, with the top guiding means removed, the counterweight hangs in the centre of the rails.
- 2.62.2 Arrange the equipment so that there is, in this position, with the guiding means properly adjusted, no pressure upon the guides.
- 2.62.3 Adjust the guiding means so that the pressure upon any guide at any point in the travel does not exceed 110 Newtons (25 pounds).

**2.63 Counterweight**

- 2.63.1 Provide a counterweight to counterbalance the elevator for smooth and economical operation.
- 2.63.2 Contain the weights in a structural steel frame.
- 2.63.3 Make the counterweight equal to the weight of the complete elevator car plus between 40 percent and 50 percent of the rated load.
- 2.63.4 In the elevator pit, where required by Code, provide counterweight guards as follows:
  - .1 Provide metal guards on all open sides of the counterweight except for:
    - .1 The side facing the elevator car where there is no space greater than 500 mm (20 in.).

- .2 In the pit where the bottom of the counterweight resting on its compressed buffer is 2130 (84 in.) or more above the pit floor.
  - .2 Provide guards extending from the lowest part of the counterweight assembly, when the counterweight is resting on the fully compressed buffer, to not less than 2100 (83 in.) and not more than 2450 (96 in.) above the pit floor.
  - .3 Provide guards for the full width of the area being guarded.
  - .4 Provide guards fastened to a metal frame and braced to be equal in strength and stiffness to 2 mm (0.074 in.) thick sheet steel.
  - .5 Where perforated metal guards are provided, they shall reject a ball 25 mm (1 in.) in diameter.
- 2.63.5 In the elevator hoistway, where required by Code, provide counterweight guards as follows:
- .1 Provide metal guards, where a counterweight is located between elevators, on the side next to the adjacent elevator.
  - .2 Provide guards that will not reduce the clearance between the guard and the counterweight below 25 mm (1 in.) when subjected to a force of 450 N (100 lbf) applied over an area of 100 mm x 100 mm (4 in. X 4 in.) at any location.
  - .3 Where perforated metal guards are provided, they shall reject a ball 25 mm (1 in.) in diameter and be made from material equal to or stronger than 1.110 mm (0.0437 in.) diameter wire.

## **2.64 Car balance**

- 2.64.1 Statically balance the car so that, at the centre of the travel, with the top guiding means removed, the car hangs in the centre of the rails.
- 2.64.2 Arrange the equipment so that there is, in this position, with the guiding means properly adjusted, no force upon the guides.
- 2.64.3 Make this test with empty car and car doors closed.
- 2.64.4 Locate and adjust devices such as the compensating devices, travelling cable hangers and cab balancing weights so that the force upon any guide at any point in the travel does not exceed 110 Newtons (25 pounds) with empty car and car doors closed.

## **2.65 Sheaves and supporting beams**

- 2.65.1 Provide sheaves, together with supporting beams or channels, necessary to obtain proper lead of the ropes to car and counterweight, accurately machined and grooved for the diameter of the ropes used.
- 2.65.2 Design and arrange the sheaves so that they can be readily serviced or removed.
- 2.65.3 Provide sound and vibration isolation pads or springs arranged so that there is no solid contact between the sheaves and the building structure.

---

**2.66 Pit equipment**

- 2.66.1 Provide buffer extensions, support beams, work platform with ladder as necessary to accommodate the pit depth.
- 2.66.2 Where there is space below the hoistway that is accessible to persons, conform to section 2.6 or 3.6 of the Code.

**2.67 Limit switch dowelling**

- 2.67.1 After the final limit switches are adjusted and prior to the performance of safety tests and checks by the inspecting authorities, fasten, by throughbolting or dowelling, the final limit switches and final limit switch brackets so as to minimize the possibility of future incorrect adjustment.

**2.68 Car ride**

- 2.68.1 Arrange that the horizontal acceleration front to rear or side to side measured in the car with the elevator travelling, with a load of less than 10 per cent of capacity, from top to bottom and bottom to top does not exceed  $0.15 \text{ m/s}^2$  ( $0.5 \text{ ft/s}^2$ ) measured between two consecutive points of opposite value.
- 2.68.2 Arrange that the vertical acceleration measured in the car with the elevator travelling, with a load of less than 10 per cent of capacity, from top to bottom and bottom to top at contract speed, does not exceed  $0.10 \text{ m/s}^2$  ( $0.3 \text{ ft/s}^2$ ) measured between two consecutive points of opposite value.

**2.69 Painting**

- 2.69.1 Ensure that machine room and hoistway equipment, except for machined surfaces and non-rusting surfaces, is protected with two coats of a rust inhibiting primer of a neutral colour, each coat of 25 micron minimum thickness.
- 2.69.2 Paint the pit floor.

**2.70 External connections**

- 2.70.1 Provide a junction box on the external wall of the hoistway at a point to be designated later for connections for such items as telephones, CCTV, lobby panels, monitor systems, to external locations such as the NOT USED.
- 2.70.2 Locate this box as instructed and provide clearly marked terminal blocks for the wiring connections.
- 2.70.3 Supply the required wiring for the connections from this box to the external locations (provision of external conduit and pulling of wiring by others).

**2.71 Travelling cable**

- 2.71.1 Provide travelling cables with flame-retarding and moisture-resisting outer covers and stranded conductors.
- 2.71.2 Supply cables approved for elevator use.

2.71.3 Provide in the travelling cables:

- .1 14 AWG (1.5 square mm) conductors for current-carrying circuits;
- .2 18 AWG (0.75 square mm) conductors for signal circuits;
- .3 20 AWG (0.5 square mm) shielded pair conductors with shielding for telecommunications circuits and data circuits;
- .4 one RG6/U stranded centre conductor coaxial cable and one pair 18 gauge stranded conductor cable within an overall braided shield for closed-circuit television.

2.71.4 Provide ten percent additional minimum spare signal and current-carrying wires in each cable.

2.71.5 Terminate cables using terminal blocks or suitable connectors having identifying numbers to facilitate replacement and service.

2.71.6 Suspend light weight cables using a wire mesh sleeve to relieve strain in the individual conductors and heavier cables using a steel supporting strand if the suspended weight exceeds 35 kg (seventy-five pounds).

## **2.72 Electric wiring**

2.72.1 Provide wiring required to interconnect the equipment.

2.72.2 Provide copper wire.

2.72.3 Provide insulated wiring having a flame retarding and moisture resisting outer cover.

2.72.4 Where flexible conduit is used, supply it in aluminium.

2.72.5 Provide travelling cable to connect car operating panels and other car operating devices to the controller in the machine room.

2.72.6 Where shielded wire is specified, provide wire of not less than 0.52 mm<sup>2</sup> area (20 gauge) having individually shielded pairs with 100% shielding.

2.72.7 Provide colour or number coded wires in multiwire cables.

2.72.8 Provide waterproof terminal labels.

2.72.9 Provide stranded field wire except for the individual wires in multiwire cables which may be either stranded or solid.

## **3. EXECUTION**

### **3.1 Operation: simple**

3.1.1 Provide a micro-processor based simplex control for the elevator.

---

**3.2 Operation: call response**

- 3.2.1 Store all hall and car calls in the control memory until answered.
- 3.2.2 Cancel a call when it is answered by a car.
- 3.2.3 Stop a running car at the first landing for which a car call is registered.
- 3.2.4 Stop a running car for a hall call registered for the same direction as the car is travelling, subject to higher priority assignments and to load in the car.

**3.3 Operation: dispatch recovery**

- 3.3.1 If a hall call remains registered for longer than 60 seconds and within that period the cars are not running, dispatch all cars and run without dispatch delay or assignment until all registered hall calls are cancelled.
- 3.3.2 Prevent nuisance car calls by:
  - .1 Not allowing car calls to be registered below the current position of an up travelling car;
  - .2 Not allowing car calls to be registered above the current position of a down travelling car;
  - .3 Or, by cancelling car calls when the car reverses direction.

**3.4 Operation: call initiation**

- 3.4.1 Control the elevator automatically by buttons in the car, marked to correspond with the respective landings served, and by the call buttons at the landing stations.
- 3.4.2 Register a call by momentary pressure of a button.

**3.5 Operation: high & low call return**

- 3.5.1 Cause the car to proceed to the calls until it has come to the limit of calls placed in the direction in which it is travelling, and having done this, subject to the assignment of the dispatch system, to reverse direction.
- 3.5.2 Do not stop the car, except in the case of high and low return, for hall calls in the opposite direction to the direction of the car.

**3.6 Operation: coincident calls**

- 3.6.1 Assign a hall call to an elevator with a car call at the same floor if the elevator is travelling in the same direction as the hall call.

**3.7 Operation: direction reversal**

- 3.7.1 Cause a car without registered car calls, arriving at a floor where both up and down hall calls are registered, to initially respond to the hall call in the direction that the car was travelling.
- 3.7.2 If, subsequent to the stop at this landing, there are no car or hall calls registered such as to require immediate travel in the same direction as before stopping at that landing, cause the car to close its doors, immediately reopen them and respond to the hall call in the opposite direction.

**3.8 Operation: fault recovery**

- 3.8.1 Provide a recovery circuit arranged to take the elevator at low speed to the next floor in the event of an overspeed condition, overload trip, or other similar fault condition.
- 3.8.2 Do not implement the recovery circuit if the movement of the car would endanger the passengers in the car.
- 3.8.3 Provide a circuit separate from the normal speed control circuits, with power derived through separate controls and limited in power by resistance or fixed devices to an appropriate low level.
- 3.8.4 Do not use, in this circuit, any solid state or other device which could fail in a mode that would allow an increase in applied power.
- 3.8.5 Upon arrival of the car level at the next floor, cause the doors to open and remain open, and turn off the car lights.
- 3.8.6 Leave the elevator in this state until the fault is corrected and the car restored to service.

**3.9 Operation: independent service**

- 3.9.1 Provide independent service.
- 3.9.2 On independent service:
  - .1 Remove the car from the automatic supervisory control system;
  - .2 Arrange the circuits so that the car does not respond to hall calls;
  - .3 Render the hall lanterns (if provided) inoperative;
  - .4 Cause the car to park with its doors open;
  - .5 Arrange the controls so that the car responds to any car calls registered if a button is held until the doors are closed and the interlocks made-up;
  - .6 Cause the doors to reopen if the button is released at any time up to the point at which the elevator starts to move;
  - .7 Render inoperative the normal door protective devices;
  - .8 Arrange the controls so that the attendant can select direction of travel;
  - .9 Cancel all registered car calls when the direction reverses or a car call is answered.
  - .10 Arrange the independent service operation so that it does not override security features or security systems.

**3.10 System clock**

- 3.10.1 Where operations or functions are subject to clock control or require clock input, provide a solid state clock.
- 3.10.2 Provide, in the machine room or at the central control console, means to indicate the current clock time.

- 3.10.3 Provide, in the machine room or at the central control console, means to readily reset the clock time.
- 3.10.4 Provide crystal regulation of frequency and voltage control adequate to maintain the time within an accuracy of plus or minus five seconds per month.
- 3.10.5 Provide software to automatically adjust the time for changes from standard to daylight saving time and from daylight saving time to standard time.
- 3.10.6 Provide battery back-up to maintain for a period of at least 24 hours accurate clock time in the event of power loss.

**3.11 Door protective device by-pass (nudging)**

- 3.11.1 Should a door protective device be operated continuously for more than 20 seconds after the elapse of the normal door open time, cause the doors to close slowly under reduced power and operate a buzzer in the car panel as a warning to the person obstructing the door.
- 3.11.2 Cause the 20 seconds to be reduced to 6 seconds until a normal door cycle is performed.

**3.12 Door open pause time**

- 3.12.1 Arrange the circuits so that when the car is stopped in response to a hall call the doors remain open a predetermined length [approximately 5 seconds for an elevator whose entrances are within 3 metres (10') of the hall push button and approximately 6 seconds for an elevator whose entrances are further than 3 metres (10') from the hall push button].
- 3.12.2 Arrange that this predetermined length of time is reduced to approximately 0.7 seconds if a person moves through the entrance (as indicated by the actuation of the door protective device).
- 3.12.3 Unless otherwise specified (e.g. to allow for advance hall lantern warning), arrange the circuits so that when the car is stopped in response to a car registered call the doors remain open a predetermined length of time (approximately 3 to 4 seconds).
- 3.12.4 Make the times separately adjustable over a range from 0.25 seconds to 15 seconds.
- 3.12.5 Arrange the circuits so that the door open pause time is cancelled if a car call button is pressed or the door close button is pressed.

**3.13 Operation: door protective device**

- 3.13.1 Arrange the door protective device so that, should it detect a person or any object in its path, at any point during the door closing operation, it will cause the doors to return to the open position.
- 3.13.2 Adjust both the detection device and the door operation so that an object or person in the way of the door will cause the doors to reverse without the door panel of either hall or car doors actually striking the object or person.

**3.14 Noise level: hoistway**

- 3.14.1 During an elevator operating cycle, including brake lift and brake application, arrange that the noise level in the hoistway is not more than 63 dBA measured at no closer than 1 m (3.3') from the hoist machine, and not more than 58 dBA measured at no closer than 1 m (3.3') outside the hoistway at the top landing.
- 3.14.2 Measure this noise level using an ANSI type 2 sound level meter on the "A" scale with an "F" response.

**3.15 Noise level: door operation**

- 3.15.1 Arrange the equipment so that the noise level, as measured within the cab, does not exceed 60 decibels at any time during a full door open, door close and door reversal cycle.
- 3.15.2 Initiate the door reversal by triggering the door protective device.
- 3.15.3 Measure the noise level using an ANSI type 2 sound level meter on the "A" scale with an "F" response.

**3.16 Noise level: cab**

- 3.16.1 Arrange that, with the elevator travelling from one end of the hoistway to the other, the noise level as measured within the elevator cab does not exceed 55 dBA for traction elevators and 58 dBA for hydraulic elevators.
- 3.16.2 Measure this noise level with an ANSI type 2 sound level meter on the "A" scale with an "F" response.

**3.17 Cab fan: operation**

- 3.17.1 Arrange that there is no discernible vibration in the car with the fan operating.
- 3.17.2 Arrange that the noise level developed by the fan, measured in the car with the fan running, does not exceed 55 dBA.
- 3.17.3 Measure this noise level with an ANSI type 2 sound level meter on the "A" scale with an "F" response.

**3.18 Noise level: control and machine room**

- 3.18.1 Design the equipment so that the noise level with the elevator running, as measured by a meter positioned in the centre of the control and machine rooms, does not exceed 80 decibels.
- 3.18.2 Measure this noise level using an ANSI type 2 sound level meter on the "A" scale with an "F" response.

**3.19 Transmitted vibration**

- 3.19.1 Arrange that the dose value of the transmitted vibration generated by the machine and associated sheaves in the frequency range from 0 to 100 Hz is less than 0.2 in any single axis and that the average of the dose values of the three axes is less than 0.15.

- 3.19.2 Measure the vibration over a period of ten seconds in both directions of travel at contract speed with empty car.
- 3.19.3 Record the vibration using an accelerometer transducer mounted on the machine beam adjacent to the machine.
- 3.19.4 Process the accelerometer output through a low pass digital or analogue filter to delete frequencies above 100 Hz.
- 3.19.5 Record the accelerations from 0 Hz to a minimum 200 Hz in the vertical axis and the two horizontal axes.
- 3.19.6 Calculate the vibration dose value by integrating the fourth power of the acceleration in m/s/s over the ten second period, dividing by the number of samples, and taking the fourth root of the result.

### **3.20 Levelling**

- 3.20.1 Cause the car to stop automatically at floor level, without overshoot, regardless of load or direction of travel so that the car sill is level, within 6 mm (1/4"), with respect to the hoistway sill.
- 3.20.2 When the elevator cab is stopped at a floor, correct for over travel or under travel or movement of the cab away from the floor, by returning the car imperceptibly to floor level.

### **3.21 Brake**

- 3.21.1 Arrange the brake to stop the elevator with full load in the car from full speed in the down direction with an average deceleration of approximately  $1.2 \text{ m/s}^2$  ( $4.0 \text{ ft/s}^2$ ) without shock or jar.
- 3.21.2 Adjust the brake to hold a minimum of 125 percent of the contract load.
- 3.21.3 Design and adjust the brake so that when it operates no noise can be detected either in the elevator cab, at the top floor landing or outside the closed machine room door.

### **3.22 Speed control**

- 3.22.1 Design and adjust the equipment so that the average acceleration over the period of constant acceleration is  $0.8 \text{ m/s}^2$  ( $2.6 \text{ ft/s}^2$ ) plus or minus 10%.
- 3.22.2 Design and adjust the equipment so that the average change in acceleration (jerk) is  $1.4 \text{ m/s}^3$  ( $4.6 \text{ ft/s}^3$ ) plus or minus 10%.
- 3.22.3 Design and adjust the equipment so that the rated speed is maintained with an accuracy of 1.5 percent.

### **3.23 Safety tests**

- 3.23.1 Arrange the safety so that the car stops at both no load and full load on a safety test without excessive acceleration and without damage to the equipment.

**3.24 Test data form: traction**

- 3.24.1 After completion of the Work, and prior to the inspection by the Consultant, submit a test data form certifying that the unit is complete and ready for inspection.
- 3.24.2 Arrange that this form be signed by the person responsible for the performance of the Work.
- 3.24.3 Include a check list of the items in the specifications as well as other performance data such as door times, operating times, brake-to-brake times, starting, running, stopping currents and voltages, slowdown and limit switch settings, governor settings, and, in general, settings of any adjustable devices.
- 3.24.4 List on this form safety devices, together with their settings and indicate whether they have been checked and adjusted.
- 3.24.5 Submit a soft copy of the data form in PDF (Acrobat Reader) format.

**3.25 Operating time**

- 3.25.1 Adjust the equipment so that the elapsed time to travel one typical floor does not exceed the time shown in the data table.
- 3.25.2 Measure this time under the following conditions:
  - .1 A typical floor height of less than 4000 mm (13');
  - .2 Floor levelling accuracy of  $\pm 6$  mm (1/4");
  - .3 Start time when the fully opened doors begin to close;
  - .4 Stop time when the car is stopped level with the next floor and the car and hall doors are 800 mm (32") open;
  - .5 Time measured with full load in the car and in both directions of travel;
  - .6 Power door operation for the hall and car doors conforms to the elevator code requirements.
- 3.25.3 Adjust the equipment so that the operating time is compatible with dependable, consistent operation without undue wear or excessive maintenance and so that this operating time can be readily maintained over the life of the elevator installation.
- 3.25.4 Adjust the equipment so that, with the control functioning so as to give the required time, the elevator operates under smooth acceleration and retardation and provides a comfortable and agreeable ride.

**3.26 Firefighters' Emergency Operation: automatic recall**

- 3.26.1 Provide Firefighters' Emergency Operation including:
  - .1 Phase I automatic Emergency Recall Operation;
  - .2 Phase I Emergency Recall Operation to an alternate level;
  - .3 Phase II Emergency In-Car Operation.

---

3.26.2 Provide switches and indicators in the hall and car stations as required by Code.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2 Scope of Work**

- 1.2.1 Fire Suppression Contractor shall retain Professional Engineer registered in Province of Ontario to provide engineering design and field review services including signed and sealed CAD fire suppression drawings and hydraulic calculations.
- 1.2.2 The following specification is a "Performance Type" specification outlining the standard of the installation. The detailed design of the fire protection system shall be provided by the Fire Protection System Contractor and their Professional Engineer. This includes all fire suppression systems and requirements in this specification.
- 1.2.3 Fire Suppression Contractor's Professional Engineer shall provide field reviews of work on site as work progresses and provide Field Review Reports.
- 1.2.4 Submit documentation to Authorities Having Jurisdiction, arrange for, pay for and obtain trade permits prior to commencing installation work on site.
- 1.2.5 Obtain static and residual water supply pressure information from utility or municipality in writing and submit copy of information with shop drawings. If this information is not available, arrange for, pay for and perform hydrant flow test.
- 1.2.6 Fire Suppression Contractor shall install systems as outlined below and indicated on drawings throughout buildings including:
- .1 Wet sprinkler systems in heated areas.
  - .2 Dry sprinklers.
  - .3 Standpipe systems.
  - .4 Portable fire extinguishers.
  - .5 Piping servicing remote fire department siamese connections.
  - .6 Hangers and seismic bracing as indicated on drawings and as required by NFPA 13.
- 1.2.7 Refer to Code Consultant or Alternative Solution reports, obtain copies through Architect and provide fire suppression systems outlined therein.
- 1.2.8 Connect to dedicated fire suppression water main located as indicated on drawings.

- 1.2.9 Fire Suppression Contractor responsible for all work downstream of flange in water entry room.
- 1.2.10 Provide Commissioning, Identification, Insulation and Heat Tracing for fire suppression systems as described in associated specification Sections.

### **1.3 Codes, Bylaws, Standards and Approvals**

- 1.3.1 Installation, workmanship and testing shall conform to the following standards:
  - .1 Ontario Building Code.
  - .2 Ontario Fire Code.
  - .3 National Fire Protection Association NFPA 10 - Standard for Portable Fire Extinguishers.
  - .4 National Fire Protection Association NFPA 13 - Standard for the Installation of Sprinkler Systems.
  - .5 National Fire Protection Association NFPA 14 - Standard for the Installation of Standpipe and Hose Systems.
  - .6 National Fire Protection Association NFPA 25 - Standard for the inspection, testing and maintenance of water-based fire protection systems. Copy of standard must be inserted into maintenance manuals at completion of project.
- 1.3.2 Installation shall be subjected to design approval and inspection of Authority Having Jurisdiction.
- 1.3.3 System components shall be of one Manufacturer. Normally, materials and devices listed by nationally recognized fire test laboratories will be acceptable.

### **1.4 Document Submittals**

- 1.4.1 Provide a copy of Letters of Assurance signed and sealed by Fire Suppression Contractor's Registered Professional Engineer to Introba.
- 1.4.2 Submit a copy of static and residual water supply pressure information to Introba. Water supply date to be less than 12 months old at date of sprinkler permit application.
- 1.4.3 Submit digital copy drawings of fire suppression sprinkler systems, fire suppression standpipes, clean agent suppression systems, and other fire suppression or fire extinguishing systems designed by the contractor's design team and EOR to Introba for review.
- 1.4.4 Submit hydraulic calculations for water-based fire suppression sprinkler and standpipe systems to Introba for review.
- 1.4.5 Su
- 1.4.6 Submit "Contractor's Material and Test Certificate" for each underground and each aboveground section or zone of work in

accordance with Authority Having Jurisdiction test procedure requirements, to Consultant and local Authority Having Jurisdiction minimum of 10 working days prior to Occupancy.

- 1.4.7 Submit Backflow Prevention Test Certificate for backflow prevention devices to Introba for review.
- 1.4.8 Submit signed letter from firestopping installation firm on company letterhead certifying penetrations of fire suppression piping through vertical and horizontal rated separations have been firestopped in accordance with CAN4-S115. Refer to Submittals in Section 23 05 05 Firestopping for additional requirements to Introba for review.
- 1.4.9 Obtain from Electrical Contractor and submit copy of Fire Alarm Verification Certificate to the Consultant and Authority Having Jurisdiction minimum of 10 working days prior to Occupancy.
- 1.4.10 Submit maintenance data for systems and arrange for inclusion in project Fire Protection/Mechanical Maintenance and Operations Manuals as outlined below to Introba for review.
- 1.4.11 Submit As-Built (Record) Drawings, signed and sealed to Introba and Authority Having Jurisdiction at completion of project.
- 1.4.12 Submit Product Literature and shop drawings as noted below.
- 1.4.13 Submit samples as noted below.

## **1.5 Shop Drawings**

- 1.5.1 Submit a complete set of Product Literature and shop drawings as indicated below to Introba for review of the following items:
  - .1 Piping materials.
  - .2 Valves, fittings and couplings.
  - .3 Fire department Siamese connections.
  - .4 Backflow preventer.
  - .5 Sprinkler zone manifolds.
  - .6 Sprinkler heads and escutcheon plates.
  - .7 Fire extinguishers and cabinets.
  - .8 Fire hose valves.
  - .9 Heat Tracing Components.
  - .10 Insulation Materials.
  - .11 Firestopping component data sheets and ULC or Warnock Hersey listings.
  - .12 Hangers and Seismic Bracing.
- 1.5.2 Product literature to identify all pertinent features of the particular version/model of product to allow for review.
- 1.5.3 Incomplete and submittals not identifying the specific product will be rejected.

---

**1.6 Maintenance Data**

- 1.6.1 Provide maintenance data for fire suppression systems complete with Table of Contents and coordinate with plumbing and HVAC trades for incorporation into designated section of project Mechanical Operation and Maintenance Manual. Refer to 23 05 00. Include a digital copy in PDF format with Table of Contents linked to applicable section or using bookmarks.
- 1.6.2 Include complete copy of National Fire Protection Association NFPA-25, Standard for the Inspection, Testing and Maintenance of Water-Based Fire Protection Systems.
- 1.6.3 Detailed instructions for normal maintenance of installed equipment including operational procedures, frequency of operational checks, service instruction and troubleshooting instructions. Information provided must be suitable for incorporation into Fire Department's operation manual if requested by Authority Having Jurisdiction.
- 1.6.4 Local source of supply for each item of equipment, indicating Manufacturer's and local supplier's company names, addresses, phone numbers, faxes and e-mails.
- 1.6.5 Labelling and identification schedules.
- 1.6.6 Valve schedule including location, service type and normal position.
- 1.6.7 Warranties, certificates and miscellaneous reports.
- 1.6.8 Manufacturer's operating and maintenance brochures, including wiring diagrams.
- 1.6.9 Comprehensive description of operation of systems, including function of each item of equipment in system.
- 1.6.10 Lubrication schedule, indicating recommended lubricants and grades (grease or oil), for lubricated equipment components.
- 1.6.11 Shop drawings for components as listed in Shop Drawings clauses above.
- 1.6.12 Documentation as listed in Document Submittals clauses above.

**1.7 Connection Fees**

- 1.7.1 Arrange and pay for Municipal connection fees for new dedicated fire suppression water connection to Municipal water supply system if required for fire hydrant.

**1.8 Pipe, Fittings and Couplings**

- 1.8.1 Responsibility for including for pipe, fittings, couplings valves, nipples, drains, test connections and accessory pipe work for complete installation is to be included in this Section of work within base tender price.
- 1.8.2 No extra cost will be considered based on failure of Contractor to allow for extra pipe, fittings and pipe work as required during

construction to provide offsets to avoid structural components, and coordinate with other piping services, ductwork, cable trays, conduits or other obstacles.

- 1.8.3 All grooved joint couplings, fittings, valves, and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components.
- 1.8.4 All castings used for coupling housings, fittings, valve bodies, etc., shall be date stamped for quality assurance and traceability.
- 1.8.5 All mechanical jointing systems shall be spot-checked and inspected by the supplier's factory trained representative and inspection reports shall be provided along with materials and test certificates.

## **1.9 Sprinklers**

- 1.9.1 Responsibility for allowing for sprinklers for complete installation shall be included in base tender price. Layout on drawings shows general intention of work and sprinkler locations with respect to other ceiling elements such as ceiling tiles, lights and diffusers. However, Contractor shall provide additional sprinklers as required.
- 1.9.2 No extra cost will be considered based on failure of Contractor to allow extra sprinklers as required during construction to conform to NFPA requirements and Authority Having Jurisdiction.
- 1.9.3 Sprinklers shall be referred to on drawings, submittals, and other documentation, by the sprinkler identification or model number as specifically published in the appropriate agency listing or approval. Trade names or other abbreviated designations shall not be allowed.

## **1.10 Clean Up**

- 1.10.1 Leave systems operating with work areas clean to satisfaction of Consultant, Architect or Owner's Representative at completion of project.

## **2. PRODUCTS**

### **2.1 General**

- 2.1.1 Materials shall be ULC Listed and meet project pressure rating for intended service and shall be supplied in original factory packaging. Manufacturer and brand for all pipe and fittings shall match and be based on one brand or manufacturer.

### **2.2 Hangers and Supports**

- 2.2.1 Hangers and supports including seismic restraints shall be ULC Listed and shall conform to appropriate NFPA standards.

- 2.2.2 Toggle hangers, strap hangers, and concrete inserts are unacceptable.
- 2.2.3 Power/powder actuated fastenings and drop-in anchors are not permitted to be used for tensile loading (i.e. suspension of mechanical equipment) or for seismic anchorage and/or restraint.

### **2.3 Firestopping**

- 2.3.1 Provide firestopping materials listed in accordance with CAN4-S115 at pipes penetrating horizontal and vertical fire rated separations. Refer also to Section 23 05 00 for additional requirements.
- 2.3.2 Refer to Section 23 05 05 Firestopping for firestop requirements.

### **2.4 Miscellaneous Metal related to Fire Protection System**

- 2.4.1 Miscellaneous metal related to fire suppression systems including metal back up plates, stands, brackets and supports for roof, floor or wall supported equipment and piping systems is part of this Section of work.
- 2.4.2 Provide two coats of heavy red oxide primer to steel components after fabrication, and touch-up on site after installation.
- 2.4.3 Hot Dipped galvanizing is required for all components that are exposed to the exterior elements.

### **2.5 Backflow Prevention Stations**

- 2.5.1 Provide ULC Listed backflow prevention assembly, type as required by the Authority Having Jurisdiction (i.e. double check valve assembly (DCVA), double check detector assembly (DCDA)).
- 2.5.2 Backflow prevention device shall be complete with OS and Y inlet and outlet shut-off valves if project requires a fire pump. In projects without a fire pump, butterfly isolation valves can be presented as an alternative, subject to the approval of the Engineer of Record.
- 2.5.3 Backflow prevention stations shall be in accordance with:
  - .1 Ontario Water Works Association Cross Connection Control Manual.
  - .2 CAN/CSA-B64.10-11 CAN/CSA-B64.10.1-11 Standard.
  - .3 Manual for the Selection and Installation of Backflow Prevention Devices.
  - .4 Manual for the Maintenance and Field Testing of Backflow Prevention Devices.
  - .5 Ontario Building Code – Part 7 Plumbing.
  - .6 EPA's Cross Connection Control Manual.
  - .7 AWWA Canadian Cross Connection Control Manual.
- 2.5.4 Isolation valves shall be provided with supervisory switches connected to supervisory signals at fire alarm system.

- 2.5.5 Reduced Pressure Backflow Preventers are required on systems for all glycol systems and systems with water cisterns requirements.

### **3 . EXECUTION**

#### **3.1 Grading and Drainage of Piping**

- 3.1.1 Provide low point drains on wet trapped piping greater than 5 US gal (19 L).
- 3.1.2 Grade fire suppression piping to be drained through drain cocks.
- 3.1.3 Pipe sprinkler system drains to floor drains in mechanical/service rooms.
- 3.1.4 Provide Drum Drips on dry systems in areas subject to freezing.
- 3.1.5 Dry System Grading:
  - .1 Branch Line must be pitched a minimum of ½" (15 mm) per 10'-0" (3 m) of pipe.
  - .2 Mains must be pitched a minimum of ¼" (6 mm) per 10'-0" (3m) of pipe.

#### **3.2 Building Movement**

- 3.2.1 Install piping systems, including take-offs installed within building, so piping and connected equipment will not be distorted by expansion, contraction or building settlement.
- 3.2.2 Provide offsets, Flex Joints, and/or piping expansion components at building expansion joints, building seismic joints and firewalls as required by NFPA 13.
- 3.2.3 For water systems, flexible couplings may be used in header piping to accommodate thermal growth and contraction, and for the elimination of expansion loops. In accordance with manufacturers installation instructions and as approved by the Engineer.
- 3.2.4 Provide seismic anchors where necessary to control pipe expansion and pipe movement.

#### **3.3 Pipe Sleeves and Escutcheons**

- 3.3.1 Supply and installation of pipe sleeves and escutcheons for fire suppression system piping is included in this Section of work.
- 3.3.2 Do not cast piping into concrete walls, slabs or masonry walls.
- 3.3.3 At exterior wall or slab penetrations, provide sleeves minimum 2 nominal pipe diameters larger than pipe (i.e. a 10" (250 mm) sleeve for nominal 6" (150 mm) diameter pipe).
- 3.3.4 Install pipe concentric with sleeves.

- 3.3.5 Remove plastic sleeves, where they are used, and prior to installation of pipe penetration. Resulting hole shall be classified as sleeves except in wet areas.
- 3.3.6 Provide minimum Schedule 10 steel pipe sleeves where piping penetrates masonry walls.
- 3.3.7 Extend sleeves 2" (50 mm) above floor slabs in wet areas. Wet areas include but not limited to penthouse equipment rooms, janitor's rooms, utility rooms and washrooms.
- 3.3.8 Seal penetrations through aboveground exterior walls, and underground exterior walls and slabs including slabs on grade, where no hydrostatic pressure exists, with flexible, non-hardening, weatherproof caulking compound. Seal around exterior circumference of sleeves and annular space between pipes and sleeves.
- 3.3.9 Provide Link Seal type wall gasket to seal exposed sides of opening between pipe and sleeve on foundation walls with caulking fill. Provide water proofing mastic seal on concealed side of opening.
  - .1 Acceptable Sealing Products: Garlock Link-Seal, Metraflex MetraSeal.
- 3.3.10 Install chrome-plated escutcheons on exposed piping passing through walls, floors and ceilings in finished areas.
- 3.3.11 Risers for fire suppression systems with horizontal branch takeoffs passing through sleeves set rigidly in structure adjacent to risers shall be set to accommodate long term structural movement.

### **3.4 Firestopping**

- 3.4.1 Provide firestopping to CAN4-S115 at pipes penetrating horizontal and vertical rated separations.
- 3.4.2 Smooth finished surface in neat workmanlike appearance.
- 3.4.3 Where ULC listed for fire protection CPVC sprinkler pipe may be used. Materials in contact with CPVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- 3.4.4 Refer to Section 23 05 05 Firestopping for firestop requirements.

### **3.5 Core Drilling**

- 3.5.1 Fire Suppression Contractor shall be on site and coordinate sleeves and block-out requirements in accordance with project construction schedule to minimize coring.
- 3.5.2 Arrange and pay for costs of core drilling required for fire suppression systems in this Section.
- 3.5.3 Verify location of existing service runs and structural reinforcement within existing concrete floors and walls prior to core drilling and cutting. Core drilling and cutting of structural building components

shall only take place upon receipt of specific written approval of Structural Consultant. Repairs that may be required to existing services damaged during core drilling is included in this Section.

- 3.5.4 Penetrations up to 6" (150 mm) nominal pipe size in pre-cast concrete may be cored on site as per Fire Suppression Contractor. Larger penetrations shall be located and arranged for in pre-cast work with pre-cast Manufacturer prior to shipping to site.

### **3.6 Backflow Prevention Stations**

- 3.6.1 Install backflow prevention stations in complete accordance with "Ontario Water Works Association Cross Connection Control Manual". Mount backflow preventers maximum 5'-0" (1.5 m) above floor level for servicing.
- 3.6.2 Complete testing of backflow prevention devices shall be carried out under this Section of work prior to final acceptance of fire suppression systems. Submit certificate signed and witnessed that testing was satisfactorily completed and include copy in project Mechanical Operation and Maintenance Manual.

### **3.7 Hangers and Supports**

- 3.7.1 Provide hangers and supports as outlined in NFPA including supports to secure piping to restrict movement upon activation of fire suppression systems including activation of fire pumps and charging of systems through fire department Siamese connections.
- 3.7.2 Power/powder actuated fastenings and drop-in anchors are not permitted to be used for tensile loading (i.e. suspension of fire protection equipment) or for seismic anchorage and/or restraint.

### **3.8 Pressure Gauges**

- 3.8.1 Provide pressure gauges at the following locations and additional gauges as required by NFPA, Authority Having Jurisdiction and system configuration:
- .1 Water entry valve station both upstream and downstream of backflow preventer.
  - .2 Upstream and downstream of pumps.
  - .3 At top of fire suppression standpipe and sprinkler risers.
  - .4 Upstream and downstream of Primary Pressure Regulating valve assemblies.

### **3.9 System Pressure Ratings**

- 3.9.1 The system pipe, components, fittings valves etc. to meet the following maximum pressure rating requirements:
- .1 Low pressure system: 12.07 bar (175 psi (1,210 kPa)).

- .2 Mid pressure system: between 12.07 bar (175 psi (1,210 kPa)) and 20.6 bar (300 psi (2,068 kPa)).
  - .3 High pressure system: 20.6 bar (300 psi (2,068 kPa)).
- 3.9.2 System pressure in excess of those listed above require appropriately rated components (i.e. schedule 40 pipe, high pressure couplings, flanged connections, etc.).

### **3.10 Test and Inspection**

- 3.10.1 Fire Suppression Contractor shall provide testing of fire suppression and fire extinguishing systems including furnish labour, materials, equipment and instruments necessary for required tests. Work shall be subject to review by Consultant, Owner's Representative, and Authority Having Jurisdiction.
- 3.10.2 Provide testing for fire suppression piping, equipment and systems in accordance with NFPA 25 – Standard for the inspection, testing and maintenance of water-based fire protection systems, including the following:
- .1 Wet sprinkler systems.
  - .2 Dry sprinkler systems.
  - .3 Deluge sprinkler systems.
  - .4 Standpipes systems.
  - .5 Megger testing of heat tracing systems.
- 3.10.3 Tests on fire suppression systems shall include pressure tests and conform to standard of Authority Having Jurisdiction. Fire Department Siamese connection and fire pump test header lines shall also be hydrostatically tested.
- 3.10.4 Provide completed copies of Contractor's Material and Test Certificates for Aboveground Piping, and for Underground Piping, on a per zone basis, as per NFPA 13.
- 3.10.5 Fire Pump Manufacturer's authorized Representative shall provide testing of fire pump and jockey pump systems, including submission of report.
- 3.10.6 Manufacturer's authorized Representatives shall provide testing of pre-action, deluge, and/or clean agent fire suppression or fire extinguishing systems, including submission of report for each system.
- 3.10.7 Provide minimum 3 working days' notice for projects within 100 km (60 miles) of Introba Office and minimum of 5 working days' notice for projects greater than 100 km (60 miles) of Introba Office, in advance of making required tests.

---

**3.11 Substantial Completion Requirements**

3.11.1 The following items must be completed with documentation prior to the date of Substantial Completion:

- .1 Fire protection system Engineer of Record inspection reports, including the most recent report has been made and submitted to the Consultant.
- .2 All seismic restraints checked and verified, a report submitted to the Consultant by the suppliers Fire Protection Contractor's Ontario Registered Engineer.
- .3 Fire Protection Contractor's Contractor Materials and Test Certificates submitted for above and below grade piping on a per zone basis.
- .4 Electrical Contractor's fire alarm system test and verification report has been submitted and copied to this Consultant.
- .5 Heat Trace Report for Sprinkler System that includes megger and capacitance tests on trace cable with verification from supplier for each circuit to this consultant.
- .6 Fire pump commissioning report submitted to this Consultant.
- .7 Special protection system commissioning report submitted to this Consultant.
- .8 All fire alarm shutdowns and emergency start-ups for HVAC systems have been tested, verified and commissioned, with a report submitted to this Consultant.
- .9 Backflow preventer/check valves at fire protection water supply has been tested, verified and commissioned, with a report submitted to this Consultant.
- .10 Final As-built Record drawings have been submitted to this Consultant for review.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 Also refer to Section 21 07 19 Fire Suppression Piping Insulation.

### 1.2 Scope of Work

- 1.2.1 In addition to piping and systems listed in Section 23 07 19, heat tracing for freeze protection on fire suppression piping systems in exterior or unheated areas, including the following:
  - .1 Fire suppression piping.
  - .2 Combined domestic water and fire suppression piping.
- 1.2.2 Provide heat trace controllers and coordinate with Electrical for monitoring of heat tracing systems as dedicated trouble signal on fire alarm annunciator panel.

## 2. PRODUCTS

### 2.1 Protection of Wet Fire Protection Systems from Freezing

- 2.1.1 Piping freeze protection system shall conform to CSA and ULC Standards in accordance with Electrical code requirements and the requirements of Ontario Fire Code and Ontario building Code.
- 2.1.2 System shall be complete with power connections, grommets, splices, end seals, splices and tee components in accordance with the Manufacturer's requirements complete with sealants.
- 2.1.3 Provide voltage monitor device for connection to fire alarm panel upon failure of heat tracing or power supply to heat tracing.
- 2.1.4 Alarm point on fire alarm annunciator panel shall consist of indicator light, audible alarm and test switch.
- 2.1.5 The self-regulating, heating cable.
- 2.1.6 The heating cable and controller shall be part of a ULC Listed (ULC category: VGNJ7)3for fire protection (mains and branch lines).
- 2.1.7 Manufacturer to provide connection kits for power, splice, tee and end seal.
- 2.1.8 All Splices, Tees & End Seals shall be installed above the insulation per Canadian Electrical Code (applicable edition).
- 2.1.9 Power Connection Kits shall be NEMA 4X rated to prevent water ingress and corrosion.

- 
- 2.1.10 Connection kits shall be UV stabilized for installation outdoors.
- 2.1.11 Connections kits shall be ULC Listed.
- 2.1.12 Heating cable shall be attached to metal fire sprinkler piping with manufacturer specified connections. Use of metal zip ties is prohibited for the attachment of the heating cable to the fire sprinkler piping.
- 2.1.13 Contractor shall provide Heating Tracing Labels every 10'-0" (3 m), opposite sides of pipe to identify fire sprinkler piping with heat tracing cable installed on it.
- 2.1.14 Controller
- .1 Unit shall be ULC approved for use on fire sprinkler piping including surge suppression.
  - .2 Unit shall operate at 100-277 VAC and rated @ 30A per circuit.
  - .3 Unit shall include a High-Resolution Display with integral display heater, front panel capacitive touch switches & LED Indication of Power, Load & Alarm.
  - .4 Unit shall include ON/OFF, PID or Manual power control with a selectable Soft Start program.
  - .5 Unit shall include two (2) sensors per circuit with one (1) for ambient temperature control and one (1) for monitoring on the Heat Tracing.
  - .6 Unit shall include 2 x common alarm outputs (1 x AC, 1 x DC), Alarms for Low/High Temperature & Current, GFEP (Ground Fault Equipment Protection), and Sensor Failure.
  - .7 Unit shall be housed in a NEMA 4X, fiberglass enclosure with hinged door.
- 2.1.15 Temperature Sensors
- .1 Provide one, 100 ohm, three wire, line sensing, temperature sensor 3" (80 mm) L x 3/16" (4.5 mm) D probe. Unit shall include 50'-0" (15 m) pigtail wire in a stainless steel sheath to protect wiring and 1/2" (15 mm) conduit fitting.
  - .2 Provide one, 100 ohm, three wire, ambient sensing, temperature sensor with copper sheathed probe with vented guard. Unit shall include 1/2" (15 mm) NPT fitting for mounting into conduit fitting by others.
- 2.1.16 Extent of tracing shall be to provide complete coverage of wet standpipe or sprinkler piping in unheated area. Coverage and attachment of cable to piping, fittings and valve bodies shall be in accordance with Manufacturer's recommendations.
-

- 
- 2.1.17 Provide pipe insulation on heat traced piping in accordance with Section 21 07 19 – Fire Suppression Piping Insulation or manufacturers requirements.
  - 2.1.18 The heat output shall be based on ambient air temperature of 8.6°F (-13°C).
  - 2.1.19 Insulation to be minimum 1" (25 mm) thick fibreglass media with suitable protection. On piping larger than 3" (80 mm), minimum of 2" (50 mm) thick fibreglass media shall be used. Provide full metal jacket on piping susceptible to damage in parkades.
  - 2.1.20 Heating circuits shall be thermostatically controlled and continuously monitored for loss of incoming supply voltage, loss of control power, ground fault and continuity.
  - 2.1.21 Provide ambient air-sensing thermostat protected from direct sunlight and moisture and complete with lockable enclosure.
  - 2.1.22 Provide voltage monitor device for connection to fire alarm panel upon failure of heat tracing or power supply to heat tracing.
  - 2.1.23 Alarm point on fire alarm annunciator panel shall consist of indicator light, audible alarm and test switch.
  - 2.1.24 Acceptable products: Chromalox, Raychem or ULC listed for fire protection equivalent.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 General

- 1.2.1 Provide identification on fire suppression piping, equipment and systems including the following:
- .1 Wet sprinkler systems (mains).
  - .2 Dry sprinkler systems (mains).
  - .3 Standpipes systems.
  - .4 Piping with heat tracing cables.
- 1.2.2 Identification of all fire suppression systems must comply with the requirements of the applicable NFPA Standard where the requirements of that standard exceed these specifications.

### 1.3 Equipment Identification

#### 1.3.1 Manufacturer's Nameplates:

- .1 Each piece of manufactured equipment shall have metal nameplate, with raised or recessed letters. Mechanically fasten plate to equipment.
- .2 Manufacturer's nameplates shall indicate Manufacturer's name, equipment model, size, serial number and electrical characteristics and pertinent information for any other service connections.
- .3 Include Underwriters' Laboratories Canada (ULC) or Canadian Standards Association (CSA) registration logos and those of other agencies, as required by respective agencies.
- .4 Nameplates shall be located so they are easily read. Do not insulate or paint over name plates.

#### 1.3.2 System Nameplates:

- .1 Each piece of equipment shall be identified with its equipment schedule identification, e.g. fire pump FP-1, dry pipe valve DVP-1, zone control valve ZCV-1.
- .2 Identification letters shall be 2" (50 mm) high black letters on white background, sized to suit label or provide laminated plastic plates with black face and white centre of minimum size 3½" (90 mm) x 1½" (40 mm) x ⅜" (2.5 mm) engraved

with ¼" (6.0 mm) high lettering. Use 1" (25 mm) high lettering for major equipment.

- .3 Identify systems, and areas or zones of building being serviced.

#### 1.4 **Apply nameplates securely in conspicuous places**

##### 1.4.1 Piping Identification:

- .1 Each piping system shall be colour coded for identification and labelled with system identification code letters, including pressure, if applicable, and directional flow arrow in accordance with Pipe Identification Colour Schedule.
- .2 Identifying piping (pipe markers and direction arrows) at the following locations:
  - .1 Adjacent to major valves and where valves are in series at no more than 6'-6" (2.0 m) intervals.
  - .2 At least once in each room and 50'-0" (15 m) maximum spacing in open areas.
  - .3 On both sides where piping passes through walls, partitions and floors.
  - .4 Adjacent to major changes in direction.
  - .5 At point of entry and leaving each pipe chase and/or confined space and piping accessible at each access opening.
  - .6 At beginning and end points of each run and at each piece of equipment in each run.
- .3 Identification labels may be stencilled. Identification arrows, labels and letters may be vinyl cloth (Brady B500) or vinyl film (Brady B946), with adhesive compatible with surface temperature.
- .4 Identification colour bands for primary and secondary colours to indicate the type and degree of hazard shall be applied to overlap a minimum of 6" (150 mm). Ends to be stapled. Bands shall be Brady B550 vinyl cloth tape or Brady B946 vinyl tape, with adhesive compatible with surface temperature.
- .5 Identification may consist of semi-rigid plastic vinyl labels with surface printing. On pipes larger than 6" (150 mm) diameter total O.D., these labels shall be saddle style, and shall ship complete with 33½" (850 mm) long nylon cable ties for each label. Standard of acceptance: SMS Coil-Mark (<http://www.smillieltd.ca/pdfDocs/Identification-Systems/Coil-Mark.pdf>).

1.4.2 Valve Tags:

- .1 Provide valve identification tags and secure them using non-ferrous chain, braided band or plastic band (suitable for temperature). Tags may be of brass, aluminum, metalphoto, lamacoid or fibreglass, stamped or engraved, of 1" (25 mm) minimum diameter. Tags may also be 1 1/4" (32 mm) square, two-ply plastic with engraved black characters on white background. Standard of acceptance: SMS valve tags (<http://www.smillieltd.ca/pdfDocs/Identification-Systems/PHSVT.pdf>).
- .2 Valves to be tagged include:
  - .1 Valves within water entry and fire pump rooms.
  - .2 Valves on main piping.
  - .3 Valves on controlling standpipes.
  - .4 All floor zone control valves.
  - .5 Drain valves.
  - .6 Low point drains.
- .3 Schedule valve numbers using sequential numbering system indicating location, service and the normal position (open or closed). Numbers shall be prefixed by letter "FP" indicating valve is for fire protection.

**1.5 Ceiling Access Identification**

- 1.5.1 Secure 1/4" (6.0 mm) self-adhesive coloured dots (Brady Quik Dots or Avery Data Dots) to ceiling to identify location of access to equipment concealed above ceiling, according to the following schedule:

	Colour
Concealed equipment and cleaning access	Yellow
Control Equipment, including control valves	Black
Fire protection, including sprinkler equipment and drains	Red

- 1.5.2 When T-bar ceilings are installed, adhere coloured dots to T-bar framing, adjacent to panel to be removed.

**1.6 Identification Schedules**

- 1.6.1 Submit schedules of the following for review prior to framing:
- .1 Pipe Identification Colours.
  - .2 Valves.
  - .3 Ceiling Access Identification Colours.

1.6.2 Schedules will be required in water entry and/or fire pump room. Frame schedules under glass in matching frames and hang where directed.

- .1 Include one copy of schedules in each operating maintenance manual.

#### 1.7 Pipe Identification Colour Schedule

Service	Identification Lettering	Primary Colour	Secondary Colour
Fire Combined Standpipes	FP-SPR/S.P.	red	white
Fire Alternative Solution	FP-AL	red	white
Fire Sprinkler lines	FP-SPR	red	white
Fire Sprinkler lines (Dry)	FP-SPR (DRY)	red	white

#### 1.8 Pipe Identification Banding Colours

1.8.1 Letters:

- .1 ½" (15 mm) high - NPS 1¼ (32 mm) pipe and smaller.
- .2 1" (25 mm) high - NPS 1½ (40 mm) to NPS 2½ (65 mm) pipe.
- .3 2" (50 mm) high – NPS 3 (80 mm) and larger pipe.

1.8.2 Bands:

- .1 1½" (40 mm) wide, except arrow bands 2" (50 mm) wide.

1.8.3 Colours:

- .1 Horizontally hatched - primary colour.
- .2 Vertically hatched - secondary colour.
- .3 Black letters and arrows on yellow primary colour.
- .4 Background, white letters and arrows or red, blue or green backgrounds.

#### 1.9 Buried Piping Identification/Markers

1.9.1 Metallic Pipe: Provide continuously printed 4" (100 mm) wide x 0.15" (4 mm) thick "Blaze Orange" plastic tape with printing indicating type of service of buried pipe. Place tape at ±12" (300 mm) above buried pipe in backfill.

1.9.2 Non-Metallic Piping: Provide detectable multi-ply tape consisting of aluminum foil core between two (2) layers of 4" (100 mm) x 0.15" (4 mm) thick "Blaze Orange" plastic tape with printing indicating type of service of buried pipe. Place tape at ±12" (300 mm) above buried pipe in backfill lifts.

1.9.3 Where multiple small pipes are buried in a common trench and do not exceed an overall width of 18" (450 mm), install a single tape line marker.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 Also refer to Section 21 08 00 Commissioning of Fire Suppression.

1.2 **Scope of Work**

- 1.2.1 Refer to Section 23 05 93 Testing, Adjusting and Balancing for HVAC. Comply with requirements of that Section of work as related to general requirements, products and execution.
- 1.2.2 In addition to systems listed in Section 23 05 93, provide testing, adjusting and balancing for fire suppression piping, equipment and systems in accordance with NFPA 25 – Standard for the inspection, testing and maintenance of water based fire protection systems, including the following:
  - .1 Wet sprinkler systems.
  - .2 Dry sprinkler systems.
  - .3 Standpipes systems.
  - .4 Carbon dioxide fire extinguishing systems.
  - .5 Megger testing of heat tracing systems.
- 1.2.3 Fire Suppression Contractor shall provide testing, adjusting and balancing of fire suppression and fire extinguishing systems.
- 1.2.4 Provide completed copies of Contractor's Material and Test Certificates for Aboveground Piping, and for Underground Piping, as per NFPA 13.
- 1.2.5 Manufacturer's authorized Representatives shall provide testing, adjusting and balancing of pre-action, deluge, clean agent, foam-water and/or carbon dioxide fire suppression or fire extinguishing systems, including submission of report for each system.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 Also refer to Section 21 05 33 Heat Tracing for Fire Suppression Piping.

### 1.2 Scope of Work

- 1.2.1 Provide piping insulation on wet fire suppression piping systems in exterior or unheated areas, including the following:
  - .1 Heat traced fire suppression piping.
  - .2 Heat traced combined domestic water and fire suppression piping.

### 1.3 General

- 1.3.1 Provide thermal insulation on piping, valves, and fittings, as called for and as scheduled. Note items listed that do not require insulation.
- 1.3.2 Journeyman insulation applicators with red seal or TQ designation in the heat and frost trade shall supervise the insulation work. This project requires the Mechanical Insulation Contractor to provide a BCICA Quality Insurance Certificate (QAC). The Mechanical Insulation Contractor shall register with BCICA and shall be in full compliance with the requirements of the QAC Program. Materials must be installed by tradespersons with a Red Seal or TQ Designation in the Heat and Frost Trade as detailed in the QAC Program.
- 1.3.3 Be responsible for ensuring sufficient space is provided to allow proper installation of insulation materials.
- 1.3.4 Install insulation and related materials and accessories in accordance with the suppliers and manufacturers recommended installation instructions and BCICA Standards where the specification exceeds BCICA Standards, this specification overrides the BCICA requirements.

### 1.4 Regulatory Requirements

- 1.4.1 Flame spread ratings and smoke developed classifications shall be as required by British Columbia Building Code, CAN/ULC-S102 and NFPA 90A. Generally, the flame spread rating throughout the material shall not exceed 25 and the smoke developed classification shall not exceed 50. Materials shall not flame, smoulder, glow, or smoke at temperature they are exposed to at service.

- 
- 1.4.2 Minimum insulation thickness and insulating values shall be in accordance with the schedule in this section.
- 1.4.3 Fibreglass pipe insulation shall comply with:
- .1 CAN/ULC-S102.
  - .2 CCG F1-304 (plain only).
  - .3 CBSB 51-GP-9M.
  - .4 CGSB 51-GP52M (jacket).
  - .5 ASTM C 547, Type I, Type IV.
  - .6 STM C 585 – Standard for inner and outer diameters.
  - .7 ASTM C 795 – Insulation in contact with austenitic stainless steel.
  - .8 ASTM C 1136 (jackets; Type I, II, III, IV).
  - .9 ASTM E-84, Surface Burning Characteristics, 25/50 Flame/Smoke.
  - .10 CAN/ULC-S102 “Test for Surface Burning Characteristics of Building Materials”.
- 1.4.4 PVC Fittings and Jacketing shall comply with:
- .1 CAN/CGSB – 51.53-95.
  - .2 CAN/ULC-S102.
- 1.4.5 All insulation products shall be formaldehyde-free.

## **1.5 Qualifications**

- 1.5.1 Submit Manufacturer’s documentation (and samples when requested) for materials, applications and finishing methods to establish they satisfy this specification and meet applicable code requirements, before commencing work.
- 1.5.2 Refer to Section 23 05 05 Firestopping for firestop requirements.

## **1.6 Quality Assurance**

- 1.6.1 Installer qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program.
- 1.6.2 Surface-Burning Characteristics: For insulation and related materials, UL/ULC Classified per UL723 or meeting ASTM E 84, by testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesives, mastic, tapes and cement material containers, with appropriate markings of applicable testing agency.
- .1 Insulation installed indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.

- 
- .2 Insulation installed outdoors: Flame spread index of 75 or less, and smoke-developed index of 150 or less.
  - 1.6.3 Formaldehyde free: Third party certified with UL Environment Validation.
  - 1.6.4 Recycled content: A minimum 50 percent recycled glass content.
  - 1.6.5 Bio soluble: As determined by research conducted by the International Agency for Research on Cancer (IARC) supported by revised reports from the National Toxicology Program (NTP) and the California Office of Environmental Health Hazard Assessment. Certified by European Certification Board for Mineral Wool Products (EUCB).
  - 1.6.6 Low emitting materials: For all thermal and acoustical applications of Glass Mineral Wool Insulation Products, provide materials complying with the testing and products requirements of UL Greenguard Gold Certification.
  - 1.6.7 Living building challenge-declare red list free.
- 1.7 Definitions**
- 1.7.1 "CONCEALED" means insulated mechanical services in trenches, chases, furred spaces, shafts and hung ceilings (services in tunnels **are not** considered to be concealed).
  - 1.7.2 "EXPOSED" will mean not concealed, to include line of sight elements above 'cloud ceilings' and include piping in parkades, inside the building in unheated zones, and on roof or outside the walls.
- 1.8 Connections to Existing Piping**
- 1.8.1 Make good existing insulation disturbed or removed to facilitate alterations and additions to existing piping.
- 1.9 Heat Traced Piping**
- 1.9.1 Piping subject to freezing is specified to be heat traced. Insulation shall cover heat tracing, allow for oversized insulation as required for heat trace element thickness.

## **2. PRODUCTS**

### **2.1 Materials**

- 2.1.1 Products shall not contain lead, mercury or mercury compounds, if possible. They shall be UL Greenguard Gold or Indoor Advantage Gold, if possible.
- 2.1.2 Products shall be validated by UL/E to be formaldehyde free.

2.1.3 Products shall contain no less than 50% recycled content.

## **2.2 Pre-Formed Pipe Covering**

### **2.2.1 Mineral Fibre:**

- .1 Type I (849°F (454°C)) or Type IV (982°F (528°C)); Thermal conductivity at 75°F – 0.019 BTU/hr/ft/°F (24°C – 0.033 W/M/°C).
- .2 Glass mineral wool bonded with a bio-based thermosetting resin.
- .3 UL/ULC classified for Earthwool, FHC 25/50 per ASTM E84 for Redi-Klad. Living building challenge-declare red list free for Rediklad pipe or unjacketed Earthwool pipe only.
- .4 Comply with ASTM C585, ASTM C411, ASTM C795 and ASTM C547, Type I and Type IV, **without factory-applied jacket.**
- .5 Products shall be validated by UL/E to be formaldehyde free and have an EPD.
- .6 With integral vapour barrier jacketed and longitudinal lap.
- .7 Compatible with piping material.

## **2.3 Firestopping and Smoke Seal Materials**

2.3.1 Refer to Section 23 05 05 Firestopping for firestop requirements.

## **2.4 Accessories**

### **2.4.1 Insulation Fastenings:**

- .1 16 ga (1.61mm) galvanized wire or 16 ga (1.61 mm) thick copper wire as commercially available.

### **2.4.2 Jacket Fastenings:**

- .1 Thermocanvas and All Service:
  - .1 Staples (flare type), compatible jacket finishing tape, contact adhesives recommended by the jacket manufacturer.
- .2 Metal Jackets
  - .1 Sheet metal screws, pop rivets, bands.
- .3 PVC Jacket and Fitting Covers:
  - .1 PVC self-adhesive tape, plastic pop rivets, bonding cement.

### **2.4.3 Adhesives:**

- .1 Flexible elastomeric and flexible closed cell insulation adhesive.
- .2 Vapour barrier jacket adhesive.

- 
- .3 Fabric adhesive, to insulation pipe covering.
  - 2.4.4 Coatings:
    - .1 Vapour barrier coating on reinforcing membrane or on insulating cement.
    - .2 Flexible elastomeric and flexible closed cell insulation finish coating.
  - 2.4.5 Finish Jackets:
    - .1 Thermocanvas Jacket.
    - .2 All Service Jacket (with 0.0019" (0.3 mm) minimum thick foil).
    - .3 PVC Finishing Jacket (minimum 0.015" (0.38 mm) thick).
    - .4 Aluminum Jacket:
      - .1 22 ga (0.64 mm) thick stucco embossed or smooth aluminum jacketing with longitudinal slip joints and 0.0019" (0.3 mm) end laps with factory applied protective liner on interior surface.
  - 2.4.6 Pre-Formed Fitting Covers:
    - .1 Aluminum Fitting Covers:
      - .1 22 ga (0.64 mm) thick, die shaped components with factory applied protective liner on interior surface.
    - .2 PVC Fitting Covers:
      - .1 0.02" (0.50 mm) thick pre-moulded one-piece covers.

## **2.5 Scope of Insulation**

- 2.5.1 Fire protection pipes, fittings, valves:
  - .1 Insulate the following systems, unless otherwise noted:
    - .1 All drains, lines, stacks, fire standpipes and sprinkler mains in unheated areas (insulation shall cover heat tracing cables).
    - .2 Water valves, flanges, PRVs, check valves.
    - .3 Sprinkler/standpipe system from domestic water connection point to 16'-0" (5.0 m) downstream or to inlet alarm valve, whichever is less, using preformed fiberglass pipe insulation complete with continuous vapour barrier.
  - .2 DO NOT insulate the following, unless otherwise noted:
    - .1 Piping used exclusively for fire protection (unless in unheated spaces).
- 2.5.2 Pipe penetrations through walls and floors:

- .1 Material for stuffing, sealing and caulking of pipe penetrations shall be supplied and installed under this section.

## 2.6 **Pipe Insulation Schedule and Thickness Table – inches (mm)**

2.6.1 'Inside' means within the heated building envelope. Everywhere else is considered outside and unheated space.

Service	Design Operating Temperature	PIPE SIZE				
		< NPS 1 (25 mm)	NPS 1 (25 mm) & NPS 1¼ (32 mm)	NPS 1½ (40 mm) to NPS 3 (80 mm)	NPS 4 (100 mm) to NPS 6 (150 mm)	> NPS 6 (150 mm)
Self-Regulated Heat Traced Fire Protection Piping	Below 65°F (18°C)	1½" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)

Note 1: All piping forming part of the fire protection systems and located outside the building envelope shall be insulated. At a minimum of 2x thickness above. (This includes parkades and all/any unheated spaces within the building).

## 3. **EXECUTION**

### 3.1 **Application**

- 3.1.1 Apply insulation to piping only after tests have been made and systems accepted.
- 3.1.2 Apply insulation and insulation finish so finished product is smooth in finish, with the longitudinal seams concealed from view. Apply piping insulation materials, accessories and finishes in accordance with Manufacturer's recommendations. Pre-formed pipe fitting insulation sections shall be used on all elbows, tees and pipe joint/flange fittings. Where pre-formed insulation sections cannot be used or sourced, insulate to BCICA standards, including oversize insulation at mechanical pipe joints.
- 3.1.3 On piping NPS 2½ (65 mm) and larger with insulation and vapour barrier, install high density insulation above hanger shield. Insert to be slightly longer than length of shield. Maintain integrity of vapour barrier over full length of pipe without interruption at sleeves, fittings and supports. Provide oversize Clevis hangers as required. See Section 23 05 29.
- 3.1.4 Insulation and vapour barrier shall be continuous through both rated and non-rated separations.

- 3.1.5 Provide sealed bevelled cut-outs at all ball valve handles to allow free movement of handle without tearing insulation.
- 3.1.6 Provide high density insulation and shields at all riser clamps/seismic sway bracing connection locations for all cold piping with continuous vapour barrier.

### **3.2 Insulation Termination Points**

- 3.2.1 Terminate insulation 3" (80 mm) back from all uninsulated fittings to provide working clearance and terminate insulation at 90° and finish with reinforced scrim cloth vapour barrier mastic system. Cover onto pipe and over the insulation vapour barrier. The use of pre-formed PVC end caps and pre-formed PVC fittings are also acceptable.
- 3.2.2 Cut back insulation at 45° and finish with silicone caulking sealant around base of pressure gauges and flow switches.

### **3.3 Vertical Risers**

- 3.3.1 On vertical pipe over 3" (80 mm) provide insulation supports welded or bolted to pipe, directly above lowest pipe fitting. Thereafter, locate on 15'-0" (4.5 m) centres.

### **3.4 Cold Application 50°F (10°C) and Less**

#### **3.4.1 Piping:**

- .1 Install low/medium temperature pipe insulation with integral vapour barrier jacket to pipe and hold in place by securing jacket flap. Seal flaps with vapour barrier adhesive. Pipe insulation with integral self-sealing vapour barrier jacket does not require additional fastening.
- .2 Install strips of vapour barrier jacket over butt joints with vapour barrier adhesive. Over wrap butt strips by 50% for insulation OD 12" (300 mm) and above apply strip on 10" (250 mm) centres for additional securement.
- .3 Install strips of vapour barrier jacket over butt joints with vapour barrier adhesive. Over wrap butt strips by 50% for insulation OD 12" (300 mm) and above apply strip on 10" (250 mm) centres for additional securement. (Note: accessory items such as, but not limited to, thermometers, probes, actuators, etc. shall be insulated and sealed. Hangers shall be insulated from where they carry the pie to the point of attachment to the structure).

#### **3.4.2 Fittings:**

- .1 Insulate fittings to thickness of adjacent pipe insulation with section of pipe insulation mitred to fit tightly, or pre-formed insulation fittings (Shur-Fit), apply reinforcing membrane embedded barrier coating and apply finish vapour barrier

---

coating. No insert or flexible blanket fitting insulation permitted.

3.4.3 Unions, Flange and Victaulic Fittings:

- .1 Insulate cold unions and flanges with oversized pipe insulation or mitred blocks to thickness of adjacent pipe covering, apply reinforcing membrane embedded in barrier coating and final coating of vapour barrier mastic.

**3.5 Pipe Insulation Finishes**

3.5.1 "Concealed" insulation in horizontal and vertical service spaces will require no further finish.

3.5.2 "Concealed" pipe insulation in damp locations, e.g. pipe trenches, shall have vapour barrier jacket, vapour sealed.

3.5.3 "Exposed" flexible insulation shall be painted with heavy brush coating of foam plastic white insulation coating.

3.5.4 Where KEEN Insulated Fittings and valve covers (available from Shur-Fit Products) have been used, no further finish is required.

3.5.5 "Exposed" insulation inside building shall be finished as follows:

- .1 Premium Finish (PVC Covers) PF-5 BCICA Standard:
  - .1 Over factory applied integral all-service type jacket on pipe insulation, apply PVC jacket.
  - .2 Over insulated fittings apply PVC fitting covers. Over insulated valve bodies, valves bonnets, strainers and flanges apply purchased PVC covers or field fabricate from PVC sheeting secured with solvent bonding cement.
- .2 Premium Finish with Canvas Wrap: BCICA PF-2 standard finish fabric with two coats of fabric coating. Canvas re-covering shall be applied with a minimum overlap of 1" (25 mm), and finished with two coats of flexible fabric paint, white.
- .3 Economy Finish:
  - .1 Apply pipe insulation with integral all-service type jacket. Cover longitudinal and circumferential joints with jacket finishing tape neatly applied. Alternately, secure jacketing longitudinal joint using integral self-sealing lap. Cover circumferential joints with jacket finishing butt strips. Over wrap strips by 50%. For insulation OD 12" (300 mm) apply trips on 10" (250 mm) centres for additional securement. PVC 0.02" (0.50 mm) thick should not be used as vapour barrier alone. Should have 'ASJ' or mastic system under it. Over insulation on

---

short pipe runs and piping adjacent to fittings, valves, etc., jacket to be field applied.

- .2 Over insulated fittings apply tack coat of vapour barrier mastic and embed reinforcing membrane and cover with same mastic. Over insulated valve bodies, valve bonnets, strainers and flanges, apply all-service jacketing using necessary fastenings and jacket finishing tape and with reinforced mastic system on irregular surfaced.

3.5.6 "Exposed" outdoor insulation shall be finished as follows to BCICA PF-4 Standard:

- .1 Insulation shall have vapour barrier jacket.
- .2 Over pipe insulation jacket apply aluminum weather protecting jacket. The longitudinal seam shall be located to shed water. Secure the jacket using necessary metal banding on approximately 10" (250 mm) centres and at the overlaps. Screws are not permitted on cold operating systems.
- .3 Over insulated fittings, valve bodies, valve bonnets, strainers and flanges, apply metal jacket or pre-formed metal fittings to provide complete jacket system. Secure with necessary fastenings.
- .4 Seal outdoor jacketing watertight.

3.5.7 Provide Pacific Pressed fitting covers (available from Shur-Fit Products) for insulated grooved pipe.

### **3.6 Firestopping and Smoke Seals**

3.6.1 Refer to Section 23 05 05 Firestopping for firestop requirements.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

1.2 **General**

- 1.2.1 Be responsible for the performance and commissioning of equipment supplied in Fire Protection. Commissioning is process of advancing installation static completion to full working order in accordance with contract documents and design intent. It is activation of completed installation.
- 1.2.2 In consultation with General Contractor, ensure sufficient time is allowed and fully identified on construction schedule for proper commissioning of mechanical systems.

1.3 **Scope of Work**

- 1.3.1 Provide testing, commissioning of fire suppression piping, equipment and systems including the following:
- .1 Wet sprinkler systems.
  - .2 Dry sprinkler systems.
  - .3 Standpipes systems.
  - .4 Heat tracing systems.
- 1.3.2 Fire Suppression Contractor shall provide testing of fire suppression and fire extinguishing systems.
- 1.3.3 Manufacturer's authorized Representative shall provide commissioning of the heat tracing systems, including submission of report for each system.

2. **PRODUCTS: NOT USED**

3. **EXECUTION**

3.1 **Commissioning and Demonstration**

- 3.1.1 Submit schedule for commissioning phase of work. Schedule shall show:
- .1 Equipment start-up schedule.
  - .2 Submission dates for documents required prior to substantial completion.

- 
- .3 Timing of various phases of commissioning, testing, and demonstration process.
  - 3.1.2 Commissioning is concluded when the fire protection system is operational and is in working order and acceptable for use. Work will include the following:
    - .1 Wet sprinkler systems.
    - .2 Dry sprinkler systems.
    - .3 Standpipes systems.
    - .4 Carbon dioxide fire extinguishing systems.
    - .5 Heat tracing systems.
  - 3.1.3 At conclusion of commissioning, demonstrate operation of systems to consultant and to Owner's Operating Staff.
  - 3.1.4 The verification process shall include the demonstration of the following:
    - .1 Ease of access provided for servicing pump(s) and valves.
    - .2 Location of and opening and closing of access panels.
    - .3 Operation of alarm and protective devices.
    - .4 Operation of equipment and systems under each mode of operating, and failure, including:
      - .1 Pumps.
      - .2 Valves.
  - 3.1.5 At completion of the commissioning, testing, and demonstration, submit the following to Consultant:
    - .1 Letter certifying that work specified is complete, clean and operating in accordance with specification and drawings.
    - .2 Completed copies of commissioning check sheets, copies of start-up reports from specialty Contractors and Vendors and functional performance test sheets.
    - .3 Record drawings as specified.
    - .4 Fire Suppression Contractor shall provide testing of fire suppression and fire extinguishing systems.
    - .5 Manufacturer's authorized Representatives shall provide commissioning of pre-action, deluge, clean agent, foam-water and/or carbon dioxide fire suppression or fire extinguishing systems, including submission of report for each system.
    - .6 Manufacturer's authorized Representative shall provide commissioning of the heat tracing systems, including submission of report for each system.

**END OF SECTION**

## 1. GENERAL

### 1.1 General

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 Scope of Work

- 1.2.1 Scope of work consists of the following:
- .1 Fire suppression standpipe system.
  - .2 Combined fire suppression standpipe/fire suppression sprinkler system.
- 1.2.2 Provide fire suppression standpipe system piping as indicated on drawings including fire department connections, fire pump test header/flow meters, risers, hose connections, hose stations, hose cabinets, roof hydrants, sprinkler zones, drain risers and other inlets and outlets that require piping connections for water-based fire suppression systems.
- 1.2.3 Connect fire suppression standpipe system piping to receive water supply from **dedicated fire suppression system main** located as indicated on drawings.
- 1.2.4 Coordinate with Architectural Division of work for enclosing those portions of fire suppression standpipe system risers located within scissor stairwells that supply 2½" (65 mm) fire department hose connections.

### 1.3 Related Work

- 1.3.1 Refer to Section 21 13 00 Fire Suppression Sprinkler Systems where combined fire suppression standpipe/fire suppression sprinkler system is involved, for requirements of work considered fire suppression sprinkler portion of system.
- 1.3.2 Coordinate with Electrical for connection of supervised isolation valves to supervisory signals, flow switches to alarm signals, and supervisory switches to supervisory signals on fire alarm system.
- 1.3.3 Refer to Section 21 05 33 for heat tracing and Section 21 07 19 insulation.

### 1.4 Fire Department Hose Threads

- 1.4.1 Unless noted otherwise nominal 1½" (40 mm) hose threads shall be 1½" (40 mm) NPSH and 2½" (65 mm) hose threads shall be 2½" (65 mm) BCT threads for fire department connections, standpipe hose connections, hose stations, and fire hose cabinet valves.

- 1.4.2 Municipal fire department requirements shall supersede above specifications.

## **2. PRODUCTS**

### **2.1 General**

- 2.1.1 Pipes, fittings, couplings, valves, devices and materials used in fire suppression standpipe system shall be of approved type, and from a single brand/manufacturer.
- 2.1.2 System components shall be rated for working pressure not less than maximum pressure to be developed at their corresponding locations within systems under any condition, including pressure that occurs when permanently installed fire pump is operating at shut-off pressure.
- .1 Refer to Section 21 05 06 for fire suppression system pressure ratings.

### **2.2 Piping and Fittings – Above Ground**

- 2.2.1 Combined potable water and fire suppression standpipe system portion of piping upstream of approved double check valve assembly backflow prevention device:
- .1 Pressure ratings to be in accordance with Section 21 05 06.
- .2 Special Class, ductile iron pipe, cement mortar lined, ULC Listed, minimum Class 54 to ANSI/AWWA C150/A23.50 and C151/A21.51, with rigid radius cuts grooves for use with cut grooved end mechanical joint couplings to form rigid joint.
- .3 Asphalt seal coating on inside of cement mortar lining to NSF-61 for use in potable water systems and specifically designed for use with ductile iron pipe surfaces.
- .4 Stainless steel track head bolts and stainless steel nuts.
- .5 Ductile iron fittings for AWWA size pipe, with rigid radius grooves in accordance with ANSI/AWWA C-606, NSF-61 Listed cement mortar Type 2 lining, and bituminous coating. Rated 350 psi (2,415 kPa) working pressure.
- .6 Acceptable Products must be ULC Listed for use in fire suppression systems.
- 2.2.2 Standpipe System Piping:
- .1 Fire suppression standpipe system piping (downstream of backflow preventer) shall be steel pipe, black or hot dipped galvanized, standard weight or light wall, material and IPS dimensions conforming to NFPA 14 and ASTM A53, ASTM A135 or ASTM A795.

- .2 Utilize minimum Schedule 40 wall thickness steel pipe for threaded or cut grooved joining methods up to 350 psi (2,415 kPa).

2.2.3 Standpipe Systems Fittings:

- .1 Compatible with piping material.
- .2 Listed for maximum pressures in system, but not less than 175 psi (1,210 kPa) working pressure.
- .3 Fittings shall be extra heavy pattern where pressures exceed 175 psi (1,210 kPa) except as specifically noted in NFPA-14.
- .4 Steel welding fittings shall comply with latest edition of ANSI B16.9 and B16.25 and ASTM A234.
- .5 Grooved end fittings, couplings and gaskets shall be of one Manufacturer.
- .6 The couplings shall consist of two ductile iron housing segments, pressure responsive gasket, and zinc-electroplated steel bolts and nuts.
  - .1 Rigid Type: Housings shall be case with offsetting angle-pattern bolt pads to provide rigidity and system support and hanging in accordance with NFPA 13. Couplings shall be fully installed at visual pad-to-pad offset contact (tongue and recess type couplings, or any coupling that requires exact gapping of bolt pads on each side of the coupling at specified torque ratings are not allowed).
    - .1 1¼" (32 mm) through 8" (200 mm): Installation-Ready, for direct slab installation without field disassembly.
  - .2 Flexible Type: For use in locations where vibration attenuation and stress relief are required, and for seismic applications.
- .7 Acceptable Products must be ULC Listed for use in fire suppression systems.

**2.3 Piping and Fittings – Below Ground**

2.3.1 Underground 4" (100 mm) and larger outside or inside building:

- .1 Pipe:
  - .1 Centrifugally spun cement lined cast-iron pipe with push-on rubber ring type joints for 200 psi (1,380 kPa) working pressure.
  - .2 Ductile iron cement lined Class 50 or Class 52 pipe with push-on rubber rings, or mechanical joints for 200 psi (1,380 kPa) working pressure in accordance with ANSI/AWWA C151/A21.51.

- .3 IPEX "Blue Brute" PVC Ring-Tite Class 150 pipe to AWWA Standard C-900. Materials in contact with CPVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- .2 Fittings:
  - .1 Cast-iron with push-on or mechanical joints for 200 psi (1,380 kPa) working pressure.
  - .2 Fittings provided with integral tie lugs. Weld on lugs is not acceptable.
  - .3 Tie rods, bolts and nuts shall conform to ASTM specifications. Bolts shall have American Standard course screw threads with Class 2 free fit. Rolled threads are not acceptable.
- .3 Underground pipelines to or from fire department Siamese connections or fire pump test connections shall conform to aforementioned specification.
- .4 Polyvinyl chloride (PVC) piping used for underground water supply lines shall adapt to approved non-plastic material prior to penetration through exterior building wall or floor slab. Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- .5 Where ULC Listed CPVC pipe is installed underground, pipe and fittings shall meet ASTM D2774 – Standard recommended practice for underground installation of thermoplastic pressure piping, as well we ASTM F645 – Standard guide for selection design and installation of thermoplastic water pressure piping systems. Acceptable for pipe sizes ¾" (20 mm) to 3" (80 mm) only. Materials in contact with CPVC pipe and fittings shall comply with Manufacturers compatibility documentation.

## **2.4 System Valves**

- 2.4.1 Gate – 175 psi (1,210 kPa) - ULC listed:
  - .1 ½" (15 mm) – 2" (50 mm): ULC listed and meeting project pressure rating requirements.
  - .2 2½" (65 mm) and Larger: ULC listed and meeting project pressure rating requirements.
- 2.4.2 Butterfly/Ball - 175 psi (1,210 kPa) - ULC listed:
  - .1 ½" (15 mm) – 2" (50 mm): Slow close butterfly valve with weatherproof actuator and indicator and integral supervisory switch.
  - .2 4" (100 mm) – 12" (300 mm): complete with weatherproof actuator, gear operator and indicator.

- .1 The stem on butterfly valves shall be offset from the disc centerline to provide full 360-degree circumferential seating, and the seat shall be pressure responsive.
- 2.4.3 Check - 175 psi (1,210 kPa) - ULC listed:
  - .1 2½" (65 mm) and larger: for all grooved end valves.
  - .2 Provide spool piece to ensure full check valve opening where adjacent alarm or gate valve.
- 2.4.4 Pressure Reducing - ULC listed:
  - .1 2½" (65 mm) In-Line Valve: Modulating piston type, field adjustable, pressure reducing valve, meeting space requirements. Acceptable Products: Zurn Z-5000 series or approved ULC listed alternative acceptable to the Consultant.
  - .2 4" (100 mm) – 8" (200 mm) In-Line Valve: Pilot operated type pressure reducing valve, meeting space requirements.
    - .1 Maximum outlet pressure, 165 psi (1,140 kPa).
  - .3 If pressure reducing valve is left in normally open position it shall be provided with either integral or separate supervisory switch.
  - .4 Outlet pressures on pressure reducing valves shall be set at 100 psi (690 kPa), unless otherwise indicated, at a discharge rate of 100 USgpm (6.3 L/s) for 1½" (40 mm) size and 500 USgpm (31.5 L/s) for 2½" (65 mm) size.
  - .5 Pressure reducing valves supplying two or more outlet connections shall be modulating piston type.
  - .6 Use of factory set pressure reducing valves is not recommended due to variability in water supply pressures that may change bonnet settings when the fire protection system is commissioned.
- 2.4.5 Pressure ratings to be in accordance with Section 21 05 06.
- 2.4.6 Grooved end valves shall be of one Manufacturer.

## **2.5 Hose Connections**

- 2.5.1 Fire department hose connection angle valves located in exit stairwells (and other locations as indicated on drawings).
- 2.5.2 Angle Valves:
  - .1 System Pressures less than 175 psi (1,210 kPa).
  - .2 ULC listed, 2½" (65 mm), forged brass, male outlet angle valve, rough chrome finish with red wheel handle, threaded brass cap and chain, 300 psi (2,070 kPa) rated.
- 2.5.3 Pressure regulating angle valves, for inlet pressures greater than 175 psi (1,210 kPa) to limit static and residual pressures:

- .1 Outlet pressure shall be set to a minimum of 100 psi (690 kPa) and maximum of 175 psi (1,210 kPa).
- .2 ULC listed and meeting project pressure rating requirements and space requirements, 2½" (65 mm), cast brass, angle valve, satin chrome finish with red wheel handle, threaded brass cap and chain, 400 psi (2,760 kPa) rated. Capable of field adjustment of the pressure. Not for installations in valve cabinets or hose cabinets.
- .3 ULC listed, 2½" (65 mm), cast brass, angle valve, satin chrome finish with red wheel handle, threaded brass cap and chain, 400 psi (2,760 kPa) rated. Factory set and not capable of field adjustment of the pressure. Use for installations where required to be installed in valve cabinets or hose cabinets.

## **2.6 Valve Cabinets**

2.6.1 Valve cabinets complete with hose connection angle valves, generally in floor areas outside of exit stairwells as indicated on the drawings:

- .1 Wall mounted valve only cabinet.
  - .1 14" (350 mm) wide x 14" (350 mm) high x 8" (200 mm) deep cabinet.
  - .2 Fully recessed steel cabinet with ½" (15 mm) turn back frame for 8" (200 mm) wall depth.
  - .3 Full length semi-concealed piano hinges for 180° swing.
  - .4 Flush stainless steel door latch with no exposed fasteners.
  - .5 18 ga (1.31 mm) baked enamel corrosion protected steel tub.
  - .6 14 ga (1.99 mm) baked enamel corrosion protected fully glazed steel door with 3/16" (4.8 mm) tempered glass panel. Doors hinged as indicated on drawings.
  - .7 Grey prime coated enamel finish ready for field painting; reconfirm colour with Architect prior to ordering.
  - .8 ULC listed cabinet.
  - .9 Valve: Refer to Subsection 2.5 and project drawings.
- .2 Refer to section above for pressure restricting hose valves and pressure regulating hose valves for system inlet pressures greater than 100 psi (690 kPa).

## **2.7 Hose Stations**

2.7.1 Hose stations and fire hose cabinets (FHC):

- .1 Recessed wall mounted combination double hose valve and extinguisher cabinet.
- .2 30" (762 mm) wide x 30" (750 mm) high x 8" (200 mm) deep cabinet.
- .3 Fully recessed steel cabinet with ½" (15 mm) turn back frame for 8" (200 mm) wall depth.
- .4 Full length semi-concealed piano hinges for 180° swing.
- .5 Flush stainless steel door latch with no exposed fasteners.
- .6 18 ga (1.31 mm) baked enamel corrosion protected steel tub.
- .7 14 ga (1.99 mm) baked enamel corrosion protected fully glazed steel door with ⅜" (5 mm) tempered glass panel. Doors hinged as indicated on drawings.
- .8 Grey prime coated enamel finish ready for field painting; reconfirm colour per Architect prior to ordering.
- .9 ULC listed, 1½" (40 mm), forged brass, male outlet, angle valve with hydrovent, rough chrome finish with red wheel handle, threaded brass cap and chain, 300 psi (2,070 kPa) rated.
- .10 ULC listed, 2½" (65 mm), forged brass, male outlet, angle valve, rough chrome finish with red wheel handle, threaded brass cap and chain, 300 psi (2,070 kPa) rated.
- .11 100'-0" (30 m) of ULC listed 1½" (40 mm) diameter ULC listed polyurethane lined fire hose and 1½" (40 mm) chrome-plated forged brass combination nozzle.
- .12 Appropriate aluminum alloy spanner wrench.
- .13 10 lb (4.5 kg) ABC dry chemical multipurpose fire extinguisher.
- .14 Refer to section above for pressure restricting hose valves and pressure regulating hose valves for system inlet pressures greater than 100 psi (690 kPa).

## **2.8 Fire Department Siamese Connections**

- 2.8.1 Refer to Section 21 13 00 Fire Suppression Sprinkler Systems.

## **2.9 Roof Hydrants**

- 2.9.1 Flush mounted fire department wall hydrant outlet connections at main roof level:
- .1 Flush mounted fire department wall hydrant outlet connection, cast brass body, no clapper valves, 4" (100 mm) inlet, 2 - 2½" (65 mm) outlet ports with brass plugs and chains. Threads per local Fire Department.
  - .2 Wall escutcheon plate 15" (375 mm) x 9" (225 mm) marked with 1" (25 mm) high raised letters "WALL HYDRANT."

- .3 ULC listed 4" (100 mm) non-rising stem cast-iron gate valve.
- .4 Brass valve control with valve stem coupling, steel extension rod, 1½" (40 mm) wall sleeve with lock nut, adaptor, brass cap and chain.
- .5 Wall escutcheon plate 7" (180 mm) x 7" (180 mm) marked with 1" (25 mm) high raised letters "VALVE CONTROL."

2.9.2 Acceptable Products: ULC listed meeting project pressure requirements.

## **2.10 Ball Drips**

2.10.1 Solid brass ¾" (20 mm) male threaded auto ball drips.

## **2.11 Air Vent**

2.11.1 An air vent is required near the high point(s) in the systems to allow air to be removed from that section of the fire protection system.

2.11.2 The following means are acceptable:

- .1 Manual valve, minimum ½" (15 mm) size,
- .2 Automatic air vent, or
- .3 Other ULC approved means

## **2.12 Extra Material Requirements:**

2.12.1 Provide two (2) of hose nozzles and hoses.

# **3 . EXECUTION**

## **3.1 Water Supply Connections**

- 3.1.1 Coordinate interface of scope of work with scope of Plumbing Contractor's work, Site Services Contractor's work, or municipal water connections, including scheduling of installation and exact locations of connections.
- 3.1.2 If water supply connections are in place prior to commencement of work, connect to and adapt to water supply connection and provide required material and size adapters, offsets, fittings, tie rods, thrust blocks, seismic restrains and other provisions for complete installation.
- 3.1.3 If this scope of work is provided prior to water supply connections being in place, provide capped connections, complete with tie rods, thrust bocks, seismic restraints and other provisions for complete installation. Clearly mark locations of capped ends both on as-built drawings and on site.

---

**3.2 Piping and Fittings**

- 3.2.1 Provide thrust blocks and tie rods on underground sections of piping.
- 3.2.2 Welding shall be done in shop with welding fittings, and in accordance with welding procedures outline in NFPA 14. Field welding is not permitted.
- 3.2.3 Provide flanged pattern fittings for piping 8" (200 mm) diameter and larger and at fire department connections.
- 3.2.4 Groove joints shall be installed in accordance with the manufacturer's latest published installation instructions. The gaskets shall be suitable for the intended service and shall be molded and produced by the coupling manufacturer.
  - .1 The coupling manufacturer's factory-trained representative shall provide on-site training for the Contractor's field personnel in the proper use of grooving tools and installation of grooved joint products. The representative shall periodically visit the job site to ensure best practices in grooved joint installations are being followed. (A distributor's representative is not considered qualified to conduct the training.)
- 3.2.5 Provide expansion joints or flexible couplings at building expansion joints, building seismic joints and as otherwise necessary.
  - .1 For water systems, Victaulic or VGS (Viking Grooved System) flexible couplings may be used in header piping to accommodate thermal growth and contraction, and for the elimination of expansion loops. (In accordance with Victaulic/VGS installation instructions and as accepted by the Consultant.) If expansion loops are required, use Victaulic/VGS flexible couplings in the loops.
- 3.2.6 ULC listed CPVC buried pipe shall be installed in accordance with manufactures recommendations and requirements and as follows:
  - .1 The general installation procedure detailed here applies to ULC listed CPVC Fire Sprinkler pressure pipe that has solvent cement joints in size range ¾" (20 mm) – 3" (80 mm).
  - .2 Trenching: water filled pipe should be buried at least 12" (300 mm) below the maximum expected frost line.
  - .3 The trench bottom should be continuous, relatively smooth and free of rocks. Where ledge rock, hardpan or boulders are encountered, it is necessary to pad the trench bottom using a minimum of 4" (100 mm) of tamped earth or sand beneath the pipe as a cushion and for protection of the pipe from further damage.
  - .4 Sufficient cover must be maintained to keep external stress levels below acceptable design stress. Reliability and safety

of service is of major importance in determining minimum cover.

- .5 After ULC listed CPVC pipe has been solvent welded, pipe shall be snaked according to the following recommendations beside the trench during its required drying time. BE ESPECIALLY CAREFUL NOT TO APPLY ANY STRESS THAT WILL DISTURB THE UNDRIED JOINT.
- .6 Backfilling Underground pipe shall be thoroughly inspected and tested for leaks prior to backfilling. Backfilling should only be done early in the morning during hot weather when the line is fully contracted and there is no chance of insufficiently dried joints being subject to contraction stresses. The pipe shall be uniformly and continuously supported over its entire length on firm, stable material. Blocking shall not be used to change pipe grade or to intermittently support pipe across excavated sections.
- .7 Backfill materials free of rocks with a particular size of 1/2" (15 mm) or less shall be used to surround the pipe with 6" (150 mm) or 8" (200 mm) of cover.
- .8 Backfill shall be placed in layers. Each soil layer should be sufficiently compacted to uniformly develop lateral passive soil forces during the backfill operation. The pipe shall be under pressure, 15 psi (103 kPa) to 25 psi (170 kPa) during the backfilling process.
- .9 Sand and gravel containing a significant proportion of fine-grained material, such as silt and clay, shall be compacted by hand or, preferably by mechanical tamper.
- .10 Where the ULC listed CPVC pipe rises up through a slab on grade, provide a schedule 40 pipe sleeve sized to allow a 1/2" (15 mm) minimum to 1" (25 mm) maximum annular gap to be sealed with ULC listed CPVC caulk and walk® firestopping sealant.
- .11 Materials in contact with CPVC pipe and fittings shall comply with Manufacturers compatibility documentation.

### 3.3 **System Isolation Valves**

- 3.3.1 Provide ULC listed supervisory switch on isolation valves and zone valve controlling flow of water throughout fire suppression standpipe systems, for connection to supervisory signal on fire alarm system.
- 3.3.2 Provide isolation valves at base of each standpipe riser where building has more than one standpipe riser.

---

**3.4 Flow Switches**

- 3.4.1 Provide ULC listed flow switch in mechanical room on main riser to fire suppression standpipe systems, for connection to trouble signal on fire alarm system.

**3.5 Pressure Gauges**

- 3.5.1 Provide 3½" (90 mm) pressure gauge complete with isolation/drain valve at top of each standpipe riser.

**3.6 Flushing of Standpipe Systems**

- 3.6.1 Flush underground water mains and fire department Siamese connection lines before connection to fire suppression standpipe systems.
- 3.6.2 Flush pipe lines until effluent is clear and free of debris.
- 3.6.3 Provide proper drainage for flushing operation.

**END OF SECTION**

---

**1. GENERAL**

**1.1 General**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2 Description of Work**

1.2.1 Combined automatic sprinkler systems/wet standpipe systems.

1.2.2 Wet sprinkler systems.

1.2.3 Dry sprinkler systems.

**1.3 Sprinkler Contractor Qualifications**

1.3.1 Sprinkler Contractors intending to bid this project shall submit the following information not less than seven days before close of Sub-Trade tenders for Consultant review for acceptance. ANY FIRM THAT DOES NOT COMPLY WILL NOT BE ACCEPTED BY CONSULTANT.

- .1 List previous projects of similar scope with dates projects were executed, contract value and references.
- .2 Outline depth of firm including principals, years of operation, address and phone number.
- .3 List name of job site supervisor and provide resume of their specific work experience.
- .4 Name of individual who will prepare shop drawings and hydraulic calculations.

1.3.2 Contractor shall be regularly engaged in installation of sprinkler systems.

**1.4 Quality Assurance**

1.4.1 Provide sprinkler systems throughout building, in accordance with listed codes, bylaws, standards and approvals including NFPA 13, Ontario Building Code and Ontario Fire Code.

1.4.2 Obtain copy of Code Consultant's report and include equivalency requirements, glazing system requirements and other works described relative to fire suppression sprinkler systems.

1.4.3 Sprinkler fitter with Province of Ontario Tradesman Qualifications in sprinkler installations shall be on site at all times during system installation.

1.4.4 All grooved joint couplings, fittings, valves, and specialties shall be the product of a single Manufacturer. Grooving tools shall be of the same Manufacturer as the grooved components.

- 1.4.5 All castings for coupling housings, fittings, valve bodies, etc., shall be date stamped for quality assurance and traceability.

**1.5 Related Work**

- 1.5.1 Refer to Section 21 12 00 Fire Suppression Standpipes where combined fire suppression standpipe/fire suppression sprinkler system is involved, for requirements of work considered to be fire suppression standpipe portion of system.
- 1.5.2 Refer to Section 21 05 33 Heat Tracing for Fire Suppression Piping and Section 21 07 19 Fire Suppression Piping Insulation for area subject to freezing.
- 1.5.3 Coordinate with Electrical for connection of supervised isolation valves to supervisory signals, flow switches to alarm signals, and supervisory switches to supervisory signals on fire alarm system.
- 1.5.4 Coordinate work of this Section with HVAC trades, plumbing trades, electrical trades and ceiling trades.

**1.6 Sprinkler System Shop Drawings**

- 1.6.1 Fire suppression Sub-Contractor's Registered Professional Engineer shall prepare electronic AutoCAD fire suppression sprinkler system drawings, to scale. Drawings prepared by Consultant were done to show general features of systems, and general concepts of arrangement and locations of sprinklers and piping.
- 1.6.2 Fire suppression Sub-Contractor and Registered Professional Engineer shall include for sprinklers as required to fully comply with NFPA 13, Ontario Building Code and the Ontario Fire Code
- 1.6.3 Indicate on drawings information required by Authority Having Jurisdiction, including features of building construction, direction and size of beams, ceiling configurations, partition locations, light fixtures (noting the depths of surface mounted light fixtures where these occur) and diffuser locations.
- 1.6.4 Stipulate positions and elevations of sprinklers relative to floor elevation, temperature rating of sprinklers, spacing and types of hangers, drains and low point drains, test and flushing connections, types of sprinkler alarms, locations and types of sprinkler control valves, backflow preventers and other essential features of piping systems.
- 1.6.5 Sprinkler products shall be referred to on drawings, submittals, and other documentation, by the sprinkler identification or model number as specifically published in the appropriate agency listing or approval. Trade names or other abbreviated designations shall not be allowed.

- 
- 1.6.6 Include detailed sprinkler plans and hydraulic calculations as described in NFPA 13.
  - 1.6.7 Only shop drawings that have been reviewed, signed and sealed by fire suppression Sub-Contractor's Registered Professional Engineer shall be submitted.
  - 1.6.8 Submit additional signed and sealed sets of shop drawings as requested by Owner for their use and for review by their insurer, and incorporate requirements indicated during review process.
  - 1.6.9 Submit to Authority Having Jurisdiction for review and/or approval, complete sets of shop drawings and hydraulic calculations for each area.
  - 1.6.10 Arrange for, pay for and obtain fire suppression system/sprinkler permit prior to commencing fire suppression system installation.
  - 1.6.11 Submit sealed seismic brace design details for the actual installation conditions and sealed Letter of Assurance from the Contractor's seismic bracing design engineer to Introba.
  - 1.6.12 Submit shop drawings for the following items:
    - .1 Piping materials.
    - .2 Valves, fittings and couplings.
    - .3 Fire department Siamese connections.
    - .4 Backflow preventer.
    - .5 Sprinkler zone manifolds.
    - .6 Dry pipe, pre-action and deluge valves.
    - .7 Supervisory switches.
    - .8 Flow switches.
    - .9 Pressure switches.
    - .10 Sprinkler heads and escutcheon plates.
    - .11 Fire extinguishers and cabinets.
    - .12 Firestopping component data sheets and ULC or Warnock Hersey listings.
    - .13 Test headers.
    - .14 Flow Meter equipment.
    - .15 Fire hose valves.
    - .16 Heat Tracing Components.
    - .17 Insulation Materials.
    - .18 Hangers and Seismic Bracing.

---

## 2. PRODUCTS

### 2.1 General

- 2.1.1 Pipes, fittings, couplings, valves, devices and materials used in fire suppression standpipe system shall be of Code approved or acceptable type.
- 2.1.2 System components shall be rated for working pressure not less than maximum pressure to be developed at their corresponding locations within systems under any condition, including pressure that occurs when permanently installed fire pump is operating at shutoff pressure.
  - .1 Refer to Section 21 05 06 for fire suppression system pressure ratings.

### 2.2 Sprinkler Piping and Fittings – Above Ground

#### 2.2.1 Piping:

- .1 Steel pipe, black or hot dipped galvanized, standard weight or light wall, material and IPS dimensions conforming to NFPA 13 and ASTM A53, ASTM A135 or ASTM A795.
- .2 Seamless copper tube to ASTM B75, seamless copper water tube to ASTM B88, wrought seamless tube to ASTM B251 of wall thickness Type “K”, “L” or “M”. Brazing filler metal (Classification BCuP-3 or BCuP-4) to AWS A5.8.
- .3 Ductile iron pipe or copper pipe for combined potable water and fire suppression system upstream of ULC listed backflow prevention device, as per Section 21 12 00.
- .4 ULC listed CPVC for fire protection is acceptable when and where Fire Protection Contractor can show that they have certified training and 5 years of successful installations. Materials in contact with CPVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- .5 Provide copper pipe where specifically indicated on drawings.

#### 2.2.2 Fittings:

- .1 Compatible with piping material and suitable for maximum pressures in system, but not less than 175 psi (1,210 kPa) working pressure.
- .2 Welded fittings shall conform to ANSI B16.5, B16.9, B16.11 and B16.25 and ASTM A234.
- .3 Threaded fittings conforming to ANSI B16.1, B16.3, and B16.4 are acceptable on minimum Schedule 40 steel pipe up to 6” (150 mm) diameter and minimum Schedule 30 steel pipe for 8” (200 mm) diameter and larger and shall have ULC corrosion resistance ratio of 1.00 or greater.

- .4 Grooved end fittings shall be short-pattern ductile iron conforming to ASTM A536, and shall provide full flow design. Fittings, couplings and gaskets shall be of one Manufacturer and shall provide a rigid joint.
- .5 Couplings shall consist of two ductile iron housing segments, pressure responsive gasket, and zinc-electroplated steel bolts and nuts.
  - .1 Rigid Type: Housings shall be cast with offsetting angle-pattern bolt pads to provide rigidity and system support and hanging in accordance with NFPA 13. Couplings shall be fully installed at visual pad-to-pad offset contact (tongue and recess type couplings, or any coupling that requires exact gapping of bolt pads on each side of the coupling at specified torque ratings, are not allowed).
    - .1 1¼" (32 mm) through 8" (200 mm): Installation-Ready, for direct stab installation without field disassembly.
    - .2 Flexible Type: For use in locations where vibration attenuation and stress relief are required, and for seismic applications.
- .6 Branch connections may be provided by bolted mechanical branch connection complete with synthetic rubber gaskets approved for line service.
- .7 Outlet tees shall have cast upper and lower housings and may be used for up to 1" (25 mm) branch outlets and individual sprinklers.
- .8 Pressfit Systems or systems utilizing Schedule 5 pipe and cold drawn carbon steel fittings with integral synthetic O-ring are not acceptable.
- .9 For dry pipe systems, use flush seal coupling gasket in rigid and flexible couplings where required by NFPA 13.
- .10 Gaskets for couplings:

Fire Protection Service	Temp. Range
Dry Systems	Ambient
Freezer Applications	-40°F (-40°C) to 0°F (-18°C)
Water/Wet Systems	Ambient

- .11 Submit requests for consideration of other products or systems in accordance with submittal procedures, prior to closing of tender.
- .12 Acceptable Products must be ULC Listed for use in fire suppression systems.

## **2.3 Hangers & Seismic Bracing**

2.3.1 Provide hanger locations based on piping materials and NFPA Standards. All hangers and their components shall be ferrous.

- .1 Steel Pipe, except threaded lightwall.
- .2 1" (25 mm), 1¼" (32 mm): Maximum Spacing 12'-0" (3.6 m).
- .3 1½" (40 mm) and larger: Maximum spacing 15'-0" (4.5 m).
- .4 Threaded Lightwall: Maximum Spacing 12'-0" (3.6 m).
- .5 Copper Pipe: ¾" (20 mm) to 1" (25 mm), - 8'-0" (2.4 m), 1¼" (32 mm) & 1½" (40 mm) - 10'-0" (3.0 m), 2" (50 mm) to 3" (80 mm) - 12'-0" (3.6 m), 4" (100 mm) or larger 15'-0" (4.5 m).
- .6 ULC listed CPVC Pipe: ¾" (20 mm) - 5'-0" (1.5 m), 1" (25 mm) - 6'-0" (1.8 m), 1¼" (32 mm) - 6'-6" (2.0 m), 1½" (40 mm) - 7'-0" (2.1 m), 2" (50 mm) - 8'-0" (2.4 m), 2½" (65 mm) - 9'-0" (2.7 m), 3" (80 mm) - 10'-0" (3.0 m).
- .7 Ductile Iron Pipe: 15'-0" (4.5 m).

2.3.2 Provide sway-bracing as required by NFPA and indicated on supplied engineered fire protection shop drawings.

- .1 4-way sway braces required at top of risers.
- .2 Lateral braces cannot exceed 40'-0" (12.2 m) on centre or as indicated on drawing or seismic brace calculations.
- .3 Longitudinal braces cannot exceed 80'-0" (24.4 m) on centre or as indicated on drawing or seismic brace calculations.

## **2.4 Sprinkler Piping and Fittings – Below Ground**

2.4.1 If piping is required to be routed below grade, refer to Section 21 12 00 Fire Suppression Standpipes and contact Consultant.

## **2.5 Valves**

2.5.1 Gate - 175 psi (1,210 kPa) - ULC Listed:

- .1 ½" (15 mm) - 2" (50 mm): ULC listed and meeting project pressure requirements.
- .2 2½" (65 mm) and Larger: ULC listed and meeting project pressure requirements.

2.5.2 Butterfly/Ball - 175 psi (1,210 kPa) - ULC Listed:

- .1 ½" (15 mm) - 2" (50 mm): with weatherproof actuator and supervisory switches.
- .2 2" (50 mm) - 12" (300 mm): with weatherproof actuator and factory installed double throw/double pole supervisory switches.
  - .1 The stem on butterfly valves shall be offset from the disc centerline to provide full 360-degree circumferential seating, and the seat shall be pressure responsive.

- 
- .3 4" (100 mm) - 12" (300 mm): ULC listed and meeting project pressure requirements.
  - 2.5.3 Pressure Regulating Sprinkler Zone Control Valve - 400 psi (2,760 kPa) - ULC Listed:
    - .1 Zurn 5000 Series cast brass, straight pattern valve, rough brass finish with red wheel handle, female threaded outlet, 400 psi (2,760 kPa) rated. Capable of field adjustment of pressure.
  - 2.5.4 Test and Drain Valves -175 psi (1,210 kPa) - ULC Listed:
    - .1 1" (25 mm) and 2" (50 mm): tapped gauge outlet and integrated sight glass.
    - .2 1" (25 mm) and 1¼" (32 mm): tapped ¼" (6 mm) gauge outlet, and integrated sight glass.
  - 2.5.5 Check - 175 psi (1,210 kPa) - ULC Listed:
    - .1 2½" (65 mm) and Larger: ULC listed and meeting project pressure requirements.
    - .2 Provide spool piece to ensure full check valve opening where adjacent to alarm or gate valve.
  - 2.5.6 Wet Sprinkler Pipe Valve Station:
    - .1 The wet sprinkler station shall be ULC listed for automatic wet sprinkler systems.
    - .2 Valve internal components shall be replaceable without removing the valve from the installed position.
    - .3 Valves shall be externally resettable.
  - 2.5.7 Valves shall be ULC listed for fire suppression systems.
  - 2.5.8 Where working pressure exceeds 150 psi (1,034 kPa) provide 300 psi (2,070 kPa) valves.
  - 2.5.9 Grooved end valves shall be of one Manufacturer.
  - 2.5.10 Drain valves shall be provided with hose end adaptors complete with caps and chains, and auxiliary drains shall be provided with drum drip.
  - 2.5.11 Dry Sprinkler Valve Station:
    - .1 The dry sprinkler valve station shall be ULC listed for automatic dry sprinkler systems.
    - .2 The dry valve station shall be complete with ULC, air compressor, excess pressure device, accelerator(s), starter, motor, disconnect valves, pressure gauges, electric alarm and water motor gong, all controls, etc., to NFPA standards. Electrical shall wire all motors, switches, etc.
    - .3 Valve internal components shall be replaceable without removing the valve from the installed position.
    - .4 Valves shall be externally resettable.

- .5 Required air pressure shall be 13 psi (90 kPa).

**2.6 Sprinkler Zone Control Manifolds**

- 2.6.1 The wet sprinkler station shall be ULC listed for automatic wet sprinkler systems.
- 2.6.2 Valve internal components shall be replaceable without removing the valve from the installed position.
- 2.6.3 Valves shall be externally resettable.

**2.7 Wet Sprinkler Zone Control Valve Cabinets**

- 2.7.1 Sprinkler Zone Control Valve Assemblies:
- .1 Cabinet shall be ULC listed recessed wall mounted 30" (750 mm) wide x 30" (750 mm) high x 8" (200 mm) deep cabinet.
  - .2 Fully recessed steel cabinet with ½" (15 mm) turn back frame for 12" (300 mm) wall depth.
  - .3 Full length semi-concealed piano hinges for 180° swing.
  - .4 Flush stainless steel door latch with no exposed fasteners.
  - .5 18 ga (1.31 mm) baked enamel corrosion protected steel tub.
  - .6 14 ga (1.99 mm) baked enamel corrosion protected full metal steel door. Doors hinged as indicated on plans, or if not shown, orient to maximize cabinet access and not obstruct exit doors or exit routes.
  - .7 Grey prime coated enamel finish ready for field painting; reconfirm colour per Architect prior to ordering.

**2.8 Sprinklers**

- 2.8.1 Quick Response sprinklers required in all Light Hazard Occupancies.
- 2.8.2 Sprinkler body shall be integrally cast with hex-shaped wrench boss to reduce the risk of damage during installation.
- .1 Wrenches shall be provided by the sprinkler manufacturer to directly engage the wrench boss on the fire sprinkler.
- 2.8.3 Sprinklers with rubber O-rings are not acceptable.
- 2.8.4 Upright: Plain brass, quick response, glass bulb in unfinished mechanical and service rooms without ceilings.
- 2.8.5 Upright: Chrome-plated, quick response, glass bulb in finished rooms and spaces without ceilings such as atriums, skylights and sprinklered exterior covered areas.
- 2.8.6 Extended coverage brass uprights in parkade, and storage areas.

- 
- 2.8.7 Recessed Pendent: Recessed, quick response, glass bulb, chrome-plated finish on sprinklers and escutcheons in finished areas with ceilings except noted below.
  - 2.8.8 Concealed Pendant: Concealed, quick response, chrome-plated flat cover plate, at locations as indicated on drawings.
  - 2.8.9 Extended coverage recessed pendants, chrome-plated in finished ceilings. Extended coverage is not permitted in unfinished shell spaces.
  - 2.8.10 Recessed Horizontal Sidewall: Recessed, quick response, glass bulb, chrome-plated finish on sprinklers and escutcheons.
  - 2.8.11 Extended Throw Sidewall: Recessed, glass bulb, quick response, chrome-plated finish on sprinklers and escutcheons.
  - 2.8.12 Dry Horizontal Sidewall: Recessed, glass bulb, quick response, chrome finish on sprinklers and escutcheons.
  - 2.8.13 Intermediate Temperature and High Temperature Sprinklers: Provide at top of each elevator shaft, elevator machine rooms and electrical rooms and other required locations as per NFPA 13, complete with wire guards.
  - 2.8.14 Dry Sprinklers: Provide dry pendant or dry sidewall sprinklers where serving exterior area or area subject to freezing from wet sprinkler system piping.
  - 2.8.15 Institutional Sprinklers: Pendant or sidewall institutional sprinklers with breakaway release mechanism for confined areas such as psychiatric rooms, holding cells and prison inmate areas.
  - 2.8.16 Sprinklers in exposed areas subject to viewing by occupants shall be chrome-plated finish with chrome-plated escutcheons. Sprinklers in service spaces, mechanical and electrical rooms and other such spaces shall be brass finish.
  - 2.8.17 Escutcheon plates shall allow accessible (T-bar) ceilings to be removed without removing sprinklers. Construction consists of cup and skirt, cup retaining sprinkler and skirt the removable portion around exterior perimeter of cup that covers tile hold. Finished escutcheon installation shall not project more than ¼" (6 mm) below finished ceiling surface. Recessed two-piece escutcheons and single piece escutcheons that are specifically manufactured with sprinklers to permit escutcheons and ceiling tile removable without sprinkler removal are acceptable. Escutcheons shall match sprinkler finish, be of same Manufacturer as sprinkler and coordinate with architectural features.
  - 2.8.18 Provide wire sprinkler guards in areas such as mechanical rooms, service rooms, elevator shafts, below lower level stair landings, gymnasiums, exterior locations, etc., where sprinklers are susceptible to mechanical damage or vandalism.

- 2.8.19 Escutcheons and guards shall be listed, supplied, and approved for use with the sprinkler, by the sprinkler Manufacturer.
- 2.8.20 Sprinklers shall be ULC listed for use in occupancies in which they are to be installed.
- 2.8.21 Sprinklers shall be quick response, unless otherwise noted.
- 2.8.22 Sprinklers shall be for commercial/institutional applications unless stated otherwise. Residential sprinklers are only permitted in residential areas of residential buildings including adjoining corridors.
- 2.8.23 Flexible sprinkler drops are to align with those identified on the approved design drawings.

## **2.9 Flow Switches**

- 2.9.1 ULC listed flow switches suitable for 24 V DC with one set of normally open and one set of normally closed contacts, time delay feature and paddle indicator specifically chosen and ULC listed for size of pipe in which flow switch is mounted.
- 2.9.2 Flow switch test and drain assembly immediately downstream of each flow switch in addition to normal inspector's test connections required by NFPA 13.
- 2.9.3 Flow switches shall be manufactured specifically for sprinkler systems rated minimum 175 psi (1,210 kPa).

## **2.10 Pressure Switches**

- 2.10.1 ULC listed pressure switches where indicated on drawings. Pressure switches shall be suitable for 24 V DC contact rating unless otherwise specified, rated minimum 175 psi (1,210 kPa).

## **2.11 Supervisory Switches**

- 2.11.1 ULC listed supervisory switches, complete with 1 set of normally open contacts and 1 set of normally closed contacts, or 2 sets of SPDT contacts.
- 2.11.2 Switches shall be suitable for 24 V DC contact rating unless otherwise specified, rated minimum 175 psi (1,210 kPa).
- 2.11.3 Looped cable devices are not acceptable.
- 2.11.4 Approved valves with integral and/or factory installed indicators and supervisory controls are acceptable products.

## **2.12 Air Vent**

- 2.12.1 An air vent is required near the high point(s) in the systems to allow air to be removed from that section of the fire protection system.
- 2.12.2 The following means are acceptable:
  - .1 Manual valve, minimum ½" (15 mm) size,

- .2 Automatic air vent, or
- .3 Other ULC approved means.

## 2.13 Air Compressors

2.13.1 Select air compressors for capacity as determined by hydraulic calculation design of dry sprinkler systems. Confirm electrical characteristics with electrical drawings and specifications.

2.13.2 If not hard-wired air compressor switch to be provided with a lockable type switch.

## 2.14 Spare Sprinklers

2.14.1 Provide red baked enamel steel cabinet containing minimum of two spare sprinklers of each pattern, but in addition, not less than the following of all types:

Number of Sprinklers	Total Spares
up to 300	6 minimum
300 - 1000	12 minimum
over 1000	24 minimum

## 2.15 Fire Department Siamese Connections

2.15.1 Provide Fire Department Connections (FDCs) as follows (refer to drawings for locations):

- .1 Sprinkler/Standpipe: main entrance.
- .2 Sprinkler/Standpipe: remote connection.
- .3 Size: 4" (100 mm) or 6" (150 mm) piping.
- .4 Finish: **Chrome-plated** for all exposed surfaces.

2.15.2 Flush mounted fire department Siamese inlet connections at or near main building entrance:

- .1 Flush mounted fire department Siamese connection, cast brass body, double 2½" (65 mm) clapper valves, 2" (50 mm) - 2½" (65 mm) inlet ports with brass plugs and chains, 4" (100 mm) or 6" (150 mm) outlet, integral ball drip. Threads per local Fire Department.
- .2 Wall escutcheon plate 15" (375 mm) x 9" (225 mm) marked with 1" (25 mm) high raised letters for primary information and 5/8" (16 mm) for secondary information detailing:
  - .1 Primary Information:
    - .1 "AUTO SPKR STANDPIPE".
    - .2 LEVEL: X TO XX
    - .3 MAX. PRESSURE: XXX PSI (XXXX kPa)
  - .2 Secondary Information:
    - .1 ADDRESSES SERVED

2.15.3 Free standing sidewalk fire department Siamese inlet connections near main building entrance:

- .1 Free standing fire department Siamese inlet connection, cast brass angle body, double 2½" (65 mm) clapper valves, 2" (50 mm) - 2½" (65 mm) inlet ports with brass plugs and chains, 4" (100 mm) or 6" (150 mm) outlet. Threads per local Fire Department.
- .2 Base escutcheon plate 15" (380 mm) x 9" (225 mm) marked with 1" (25 mm) high raised letters "AUTO SPKR STANDPIPE."

2.15.4 Stortz Connection, **4" (100 mm)** outlet.

- .1 Size: 4" (100 mm) or 6" (150 mm) piping.
- .2 Wall escutcheon plate 15" (375 mm) x 9" (225 mm) marked with 1" (25 mm) high raised letters **AUTO SPKR STANDPIPE.**

2.15.5 Pressures must be labeled on plate.

2.15.6 At the low-point near each fire department connection, install a 90-degree elbow with drain connection to allow for system drainage to prevent freezing.

## **2.16 EXTRA STOCK MATERIALS:**

2.16.1 Provide sprinkler cabinet with twelve (12) extra sprinkler heads.

2.16.2 Provide metal storage cabinet in Level 0 Mechanical Room.

2.16.3 Tools: Provide suitable wrenches for each sprinkler type.

## **3 . EXECUTION**

### **3.1 Fire Suppression Sprinkler Systems**

3.1.1 Supply and install fire suppression sprinkler systems throughout building, in accordance with listed codes, bylaws, standards and approvals, including NFPA 13, Ontario Building Code and Ontario Fire Code.

3.1.2 Test sprinkler systems to listed requirements and submit certificate stating that such testing has been carried out and approved.

3.1.3 Provide inspector's test valves and drain pipes at remote points in system to NFPA 13 requirements.

3.1.4 Provide sectional drains in piping greater than 5 US gal (19 L). Drum drips required on all dry system sectional drains.

3.1.5 Supply and install fire suppression sprinkler systems in accordance with piping configuration indicated on engineered drawings. Any

deviations to sprinkler system must be approved by Introba's Fire Protection Engineer of Record.

- 3.1.6 Supply and install fire suppression sprinkler systems in accordance with general piping configuration indicated on drawings. Sprinkler Contractor shall hydraulically calculate sprinkler systems in accordance with the following provisions:
- .1 Calculations shall be responsibility of and signed and sealed by fire protection Sub-Contractor's Registered Professional Engineer. Submit Letters of Assurance to Consultant and Authority Having Jurisdiction in accordance with the Ontario Building Code and Ontario Fire Code.
  - .2 Such calculations shall be based on general piping configuration indicated on drawings.
  - .3 Water supply hydraulic data shall be confirmed in writing by Contractor with water utility or municipal authority prior to submission of shop drawings.
- 3.1.7 Supply and Installation of sprinkler systems on basis of hydraulic calculations shall be responsibility of fire suppression Sub-Contractor and their Registered Professional Engineer.
- 3.1.8 Locate sprinklers in general conformance with locations indicated on sprinkler design drawings. For exact locations, refer to architectural reflected ceiling plans. In absence of reflected ceiling plans, sprinklers shall be installed at centre point, quarter point and/or third point in long dimension of ceiling tiles, and in centre point of short dimension of ceiling tiles, and/or in line with other ceiling elements, light fixtures, diffusers, audio devices and other fittings, in symmetrical and aesthetic pattern acceptable to Architect. Coordinate sprinkler layout with architectural, structural, electrical and mechanical HVAC ceiling elements.
- 3.1.9 Sprinkler bulb protector shall be removed by hand after installation. Do not use tools or any other device(s) to remove the protector that could damage the bulb in any way.
- 3.1.10 Do not install sprinklers that have been dropped, damaged, or show a visible loss of fluid. Never install sprinklers with cracked bulbs.
- 3.1.11 Submit to Consultant completed Contractor's Material and Test Certificate for fire suppression systems on a per zone basis and provide copy in project Mechanical Operation and Maintenance Manuals.
- 3.1.12 Submit to consultant completed backflow preventer test certificate.
- 3.1.13 Submit to consultant completed alarm verification certificate.

### **3.2 Pipe and Fittings**

- 3.2.1 Welding shall be done in shop using welding fittings. Field welding is not permitted.

- 3.2.2 Flanged pattern fittings shall be used for piping 8" (200 mm) diameter and larger, and at valve stations and fire department connections.
- 3.2.3 Provide expansion joints or flexible couplings at building expansion joints, building earthquake joints, building firewalls and other locations as necessary.
- 3.2.4 Grooved end components including vales, fittings and couplings shall be of one Manufacturer and shall be installed in accordance with Manufacturer's instructions.
  - .1 Grooved coupling Manufacturer's factory trained Representative shall provide on-site training for Contractor's field personnel in the use of grooving tools and installation of grooved joint products. Representative shall periodically visit the jobsite and review Contractor is following best recommended practices in grooved product installation. (A Distributor's Representative is not considered qualified to conduct the training or jobsite visit(s).)
- 3.2.5 Proprietary products shall be installed in accordance with Manufacturer's instructions and piping shall be clearly marked at each joint to indicate pipe insertion depth.
- 3.2.6 Tie rods shall only be used in conjunction with fittings possessing integral tie lugs.
- 3.2.7 Tie rods complete with their associated nuts and bolts shall be coated with two coats of asphaltic paint after installation.

### **3.3 Pipe Pitch-Dry Systems**

- 3.3.1 Branch lines, pitch pipe ½" (15 mm) every 10'-0" (3.0m).
- 3.3.2 Mains, pitch pipe ¼" (6 mm) every 10'-0" (3.0m).
- 3.3.3 Provide drum drips at dry system low points (sectional drains).

### **3.4 Flushing of Sprinkler Systems**

- 3.4.1 Flush underground water mains and fire department Siamese connection lines before connection to fire suppression standpipe systems.
- 3.4.2 Flush pipelines until effluent is clear and free debris.
- 3.4.3 Rate of flushing flows shall be as indicated in NFPA 13.
- 3.4.4 Provide proper drainage for flushing operation.

### **3.5 Flow Switches**

- 3.5.1 Provide pipe drain connections from test valves to open discharge at floor drains, service sinks, or other discharge points acceptable to Owner or Consultant.

- 3.5.2 Conduct tests in conjunction with Electrical on each device to ensure indication of “alarm” signal and correct location and labelling on fire alarm system.

**3.6 Supervisory Switches**

- 3.6.1 Install supervisory switches on valves supplying fire suppression sprinkler systems inside the building perimeter.
- 3.6.2 Conduct tests in conjunction with Electrical on each device to ensure indication of “supervisory” signal and correct location and labelling thereof on fire alarm system.

**3.7 Fire Department Siamese Connections**

- 3.7.1 Mount centre line at 18” (457 mm) to 48” (1,220 mm) above adjacent ground, sidewalk or grade surface unless indicated otherwise on drawings. Install escutcheon plates true and level.
- 3.7.2 Seal perimeter of the escutcheon plates to building face with clear, water resistant, silicone caulking in neat manner.

**3.8 Electrical Equipment Protection from Water**

- 3.8.1 Sprinkler piping and sprinklers are to be installed in various areas containing electrical equipment as indicated on drawings.
- 3.8.2 Responsibility for water damage to electrical equipment in these areas from sprinkler system installation whether due to testing or leakage prior to Owner’s acceptance of building shall be responsibility of this Section.
- 3.8.3 Provide and install in this Section of work minimum 20 ga (1.00 mm) sheet metal protective hoods individually located over electrical equipment susceptible to water damage upon release of sprinklers in electrical areas. Such electrical equipment shall include transformers, equipment with ventilation grilles and other switchgear with openings that allow water entry into equipment. Protective hoods shall be sloped to shed water and shall project horizontally beyond equipment perimeter and shall not be integrally mounted on equipment unless prior approval obtained from electrical authorities. Holes through protective hoods that cannot be avoided, shall be sealed with waterproof sealing compound.
- 3.8.4 No piping shall be installed in Electrical Rooms. Only the sprinkler branch and head serving the Electrical Room may be installed in the electrical as per BICSI.

**3.9 Installation of Pre-Action System Detectors**

- 3.9.1 Provision of detection system and connection to pre-action system control panel will be done under electrical Division 26.

3.9.2 120 volt AC supply will be provided to pre-action system control panel under Division 26.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 **Reference Standards**

1.2.1 National Fire Protection Association, NFPA 10 Standard for Portable Fire Extinguishers.

1.2.2 Ontario Building Code.

1.2.3 Ontario Fire Code.

### 1.3 **Shop Drawings and Products Data**

1.3.1 Submit shop drawings and product data for fire extinguishers and extinguisher cabinets.

### 1.4 **Maintenance Data**

1.4.1 Provide maintenance data for incorporation into Mechanical Operation and Maintenance Manuals.

## 2. **PRODUCTS**

### 2.1 **Recessed Cabinet with 5lb (2.3 kg) Extinguisher (FE-1)**

2.1.1 Recessed extinguisher cabinet, fire rated.

2.1.2 8" (200 mm) x 17" (425 mm) x 5" (125 mm) cabinet.

2.1.3 Semi-recessed steel cabinet with turn back frame for 4.75" (120 mm) wall or fully recessed steel cabinet with turn back frame for 5.5" (140 mm) wall.

2.1.4 Full length semi-concealed piano hinges for 180° swing.

2.1.5 Flush stainless steel door latch with no exposed fasteners.

2.1.6 18 ga (1.31 mm) steel tub.

2.1.7 16 ga (1.61 mm) steel door and trim with optional  $\frac{3}{16}$ " (4.5 mm) clear tempered glass (-G-T).

2.1.8 Grey Prime coated finish ready for field painting.

2.1.9 5 lb (2.3 kg) ABC Dry Chemical multi-purpose fire extinguisher.

### 2.2 **Surface Mounted Cabinet with 5 lb (2.3 kg) Extinguisher (FE-2)**

2.2.1 Surface mount extinguisher cabinet.

2.2.2 20½" (515 mm) x 8½" (215 mm) x 6" (150 mm) cabinet.

- 2.2.3 Semi-recessed steel cabinet with turn back frame for 4 $\frac{3}{4}$ " (120 mm) wall thickness, or fully recessed steel cabinet with turn back frame for 6 $\frac{3}{4}$ " (170 mm) wall thickness.
- 2.2.4 Full length semi-concealed piano hinges for 180° swing.
- 2.2.5 Flush stainless steel door latch with no exposed fasteners.
- 2.2.6 18 ga (1.31 mm) steel tub.
- 2.2.7 5 lb (2.3) kg ABC Dry Chemical multi-purpose fire extinguisher.

**2.3 Recessed Cabinet with 10 lb (4.5 kg) Extinguisher (FE-3)**

- 2.3.1 Recessed extinguisher cabinet, fire rated.
- 2.3.2 9" (225 mm) wide x 24" (600 mm) high x 6" (150 mm) deep cabinet.
- 2.3.3 Semi-recessed steel cabinet with turn back frame for 4" (100 mm) wall thickness.
- 2.3.4 Full length semi-concealed piano hinges for 180° swing.
- 2.3.5 Flush stainless steel door latch with no exposed fasteners.
- 2.3.6 18 ga (1.31 mm) steel tub.
- 2.3.7 16 ga (1.61 mm) steel door and trim with optional  $\frac{3}{16}$ " (4.5 mm) clear tempered glass (-G-T).
- 2.3.8 Grey prime coated finish ready for field painting.
- 2.3.9 10 lb (4.5 kg) ABC dry chemical multipurpose fire extinguisher.

**2.4 Surface Mounted Cabinet with 10 lb (4.5 kg) Extinguisher (FE-4)**

- 2.4.1 Surface mount extinguisher cabinet.
- 2.4.2 10 $\frac{1}{2}$ " (265 mm) wide x 24" (600 mm) high x 6 $\frac{1}{4}$ " (156 mm) deep cabinet.
- 2.4.3 Surface mount steel cabinet.
- 2.4.4 18 ga (1.31 mm) steel tub.
- 2.4.5 Plexiglas panel, break glass hammer and instruction decal.
- 2.4.6 White baked enamel finish.
- 2.4.7 10 lb (4.5 kg) ABC dry chemical multipurpose fire extinguisher.

**2.5 Clean Agent Fire Extinguishers (FE-CA)**

- 2.5.1 Clean agent portable handheld fire extinguishers.
- 2.5.2 Extinguisher shell factory hydrostatically tested to 60 psi (4,140 kPa) and leak tested at factory.
- 2.5.3 Stainless steel shell and non-magnetic valve, hose and nozzle.
- 2.5.4 Large colour-coded pressure gauge.
- 2.5.5 Easy grip handle with ring pin and retention chain.

- 2.5.6 Factory charged with FE-36 that is colourless, odourless, electrically non-conductive, residue free, low toxicity agent with zero ozone depletion potential.
- 2.5.7 Size FE13 extinguisher with 2A:10BC rating.
- 2.5.8 Surface mounted, white baked enamel steel extinguisher cabinet, complete with Plexiglas panel and attached break glass hammer.

**2.6 Type “K” Fire Extinguishers (FE-K)**

- 2.6.1 Recessed extinguisher cabinet, fire rated.
- 2.6.2 9” (225 mm) wide x 24” (600 mm) high x 6” (150 mm) deep cabinet.
- 2.6.3 Semi-recessed steel cabinet with turn back frame for 4” (100 mm) wall thickness.
- 2.6.4 Full length semi-concealed piano hinges for 180° swing.
- 2.6.5 Flush stainless steel door latch with no exposed fasteners.
- 2.6.6 18 ga (1.31 mm) steel tub.
- 2.6.7 16 ga (1.61 mm) steel door and trim with optional  $\frac{3}{16}$ ” (4.5 mm) clear tempered glass (-G-T).
- 2.6.8 Grey prime coated finish ready for field painting.
- 2.6.9 Surface mount extinguisher cabinet.
- 2.6.10 10  $\frac{1}{2}$ ” (265 mm) wide x 24  $\frac{1}{4}$ ” (600 mm) high x 6  $\frac{1}{4}$ ” (156 mm) deep cabinet.
- 2.6.11 Surface mount steel cabinet.
- 2.6.12 18 ga (1.31 mm) steel tub.
- 2.6.13 Plexiglas panel, break glass hammer and instruction decal.
- 2.6.14 White baked enamel finish.
- 2.6.15 1.59 gal (6 L) Class K wet chemical fire extinguisher, chrome plates.

**2.7 Pressurized Water Fire Extinguishers**

- 2.7.1 2.5 US gal (9.5 L) capacity, pressurized water type, stainless steel construction with **mounting brackets**.

**2.8 Carbon Dioxide Fire Extinguishers (FE-CO)**

- 2.8.1 Hose and horn discharge, self-closing lever or squeeze grip operated, insulated handle, fully charged and complete with mounting brackets and charge indicator.

**2.9 Multi-Purpose Dry Chemical Fire Extinguishers**

- 2.9.1 Pressurized with hose and shutoff nozzle or integral shutoff nozzle and **mounting brackets** suitable for Class A, B and C fires; charge indicator.

---

**3 . EXECUTION**

**3.1 Installation**

- 3.1.1 Install fire extinguishers in cabinets at locations as indicated on drawings.
- 3.1.2 Coordinate locations of fire extinguisher cabinets with framing trades in order to facilitate recessed and semi-recessed installations.
- 3.1.3 Mount fire extinguishers and cabinets such that top of extinguisher is 4'-0" (1.2 m) above floor.
- 3.1.4 Install fire extinguisher cabinet doors, glazing panels and fire extinguishers in cabinets prior to project substantial completion review by Consultant.

**3.2 Identification**

- 3.2.1 Identify fire extinguishers in accordance with recommendations of NFPA 10.
- 3.2.2 Attach tag or label to fire extinguishers, indicating month and year of installation, with space for recording subsequent service dates.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **General**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 General Conditions, Supplements, Amendments and this section shall govern plumbing sections (i.e. 22 00 00 to 22 99 99 sections) of work (read in conjunction with the Instructions to Tenderers or Bidders). This section covers items common to 22 00 00 series sections and is intended only to supplement the requirements of Division 1.
- 1.1.3 Plumbing drawings are diagrammatic and approximately to scale. They establish scope of plumbing work and general location and orientation of plumbing facilities. Plumbing facilities shall be installed generally in locations and generally along routings shown, close to building structure with minimum interference with services. Piping shall be concealed within walls, ceilings or other spaces and shall be routed to maximize head room and intended use of space through which they pass, unless specifically noted otherwise.
- 1.1.4 Coordinate with the Electrical Contractor for all required electrical connections to plumbing equipment and accessories. Where alternate or substituted equipment requires an electrical connection, the contractor shall include all costs to provide a complete operating system.
- 1.1.5 Refer to 23 05 00 for complete details for applicable Common Work Results not detailed in this section.

### 1.2 **Related Work**

- 1.2.1 Electrical Division 26
- 1.2.2 Trenching and Backfilling Division 33

### 1.3 **Codes, Standards and Approvals**

- 1.3.1 Installation, workmanship and testing shall conform to the following standards:
  - .1 Ontario Building Code.
  - .2 CSA B149.1, Natural Gas and Propane Installation Code.
  - .3 All products shall be UL/ULC classified in accordance with NSF/ANSI/CAN-61 for potable water service and certified to the no/low lead standard of NSF/ANSI/CAN-372.

### 1.4 **Shop Drawings**

- 1.4.1 Refer to 23 05 00 for complete details of submission requirements.

1.4.2 Shop drawings are required for all materials and equipment including, but not limited to, the following:

- .1 Cleanouts and access panels.
- .2 Floor drains.
- .3 Hot water tanks and heaters.
- .4 Hydrants/hose bibbs.
- .5 Plumbing fixtures.
- .6 Pumps and controls.
- .7 Roof drains.
- .8 Trap primers.
- .9 Valves.
- .10 Water hammer arrestors.
- .11 Compressor units.
- .12 Firestopping.

**1.5 Maintenance Data**

- 1.5.1 Refer to Section 23 05 00 Common Work Results for HVAC.
- 1.5.2 Comprehensive description of operation of systems, including function of each item of equipment within systems.
- 1.5.3 Operating electrical switchgear schedule indicating location of equipment.
- 1.5.4 Lubrication schedule indicating recommended lubricants and grades (grease or oil) for lubricated equipment components.

**1.6 Record Drawings (As Built Drawings)**

- 1.6.1 Section 23 05 00 Common Work Results for HVAC shall apply to Plumbing Systems.
- 1.6.2 In addition, as a minimum, during the construction period, keep on site clean set of drawing marked up, IN COLOUR, to reflect as built state, for examination by Consultant on regular basis. Include elevations, rough-in details and details and detailed locations of hidden services, including locations of maintenance items and their associated identification code (i.e. Values). Underground services and/or concealed piping shall be dimensionally located and noted (use gridlines or structure as the reference).
- 1.6.3 At the time of 'Substantial Completion' submit to Consultant one complete full sized COLOUR photocopy of Record Drawing information produced as per above section.

**1.7 Temporary Usage of Plumbing Equipment**

1.7.1 Plumbing equipment and systems shall not be used without written permission of Consultant and under no circumstances shall be used prior to testing and inspection.

**1.8 Acoustical Treatment**

1.8.1 This project includes special acoustical requirements to ensure low noise levels in noise sensitive areas. The Contractor shall, in particular, give careful consideration to equipment selection and pay close attention to detail during the rough-in stage in order to assure maximum acoustical benefit.

- .1 Conference rooms.
- .2 Library.
- .3 Private offices.
- .4 Quiet rooms.
- .5 Study/testing rooms.

**2 . PRODUCTS**

**2.1 Access Doors**

2.1.1 Refer to Common Work Results for HVAC Section 23 05 00 for access door/access panel requirements.

**2.2 Cleanouts**

- 2.2.1 Cleanouts shall be full size for pipe sizes up to 4" (100 mm) and not less than 4" (100 mm) on larger sizes. Cleanouts installed inside finished areas shall all be of same shape, either round or square.
- 2.2.2 Cleanouts passing through waterproofed floor or slab on grade subject to hydrostatic pressure shall have a clamping collar clamped to floor membrane.
- 2.2.3 Pipe Manufacturers' cleanouts are acceptable for vertical installation at base of soil and waste stacks or rainwater leaders only.
- 2.2.4 Make cleanouts with Barrett type fitting with bolted cover plate and gasket, fitting that has threaded plug, or cleanout ferrule installed in wye or extended wye.
- 2.2.5 Outside area and vehicle area cleanouts shall be heavy duty construction and have fully exposed scoriated cover. Acceptable Product: Zurn Z1400, Jay R Smith 4231 Series, Wade 6000-Z Series.
- 2.2.6 Lino or lino tiled area cleanouts shall have centre portion of cover recessed to receive tile that matches adjoining tile. Acceptable

Product: Zurn DNE 1400-X or ZN 1400-TX, Jay R Smith 4140, Wade 6000-1 Series.

- 2.2.7 Ceramic tile floor area cleanouts shall have fully exposed scoriated cover. Acceptable Product: Zurn DNE 1400 or ZN 1400-T, Jay R Smith 4020, Wade 6000-1 Series.
- 2.2.8 Terrazzo tile floor area cleanouts have centre portion cover to receive terrazzo to match adjoining terrazzo finish. Acceptable Product: Zurn ZN 1400-Z, Jay R Smith 4180, Wade 6000-1 Series.
- 2.2.9 Carpet area cleanouts shall be fully concealed with a small, raised marker. Acceptable Product: Zurn ZN 1400-CM, Jay R Smith 4020-Y, Wade 6000-1 Series.

### **2.3 Hangers and Supports**

- 2.3.1 Refer to Section 22 05 29 for Hangers and Supports for Plumbing Piping and Equipment.

### **2.4 Pipe Sleeves and Escutcheons**

- 2.4.1 Provide and locate pipe and duct sleeves.
- 2.4.2 Provide detailed information on openings required in pre-cast members for mechanical work. Cast holes larger than 4" (100 mm) diameter and field cut holes smaller than 3½" (90 mm) diameter.
- 2.4.3 Provide separate sleeves for piping passing through walls, floors, roof and ceilings. Sleeves shall be 20 ga (1.00 mm) galvanized iron and standard weight steel piping sleeves in concrete beams, foundation walls and footings. Plastic sleeves may be used in concrete wall form work where permitted by Authorities having Jurisdiction.
- 2.4.4 Sleeves shall be sized large enough to allow for movement due to expansion and to provide for continuous pipe insulation where not passing through fire rated assemblies.
- 2.4.5 Sleeves passing through basement walls or potentially wet floors shall be set with integral "puddle flanges".
- 2.4.6 Seal penetrations through aboveground exterior walls, and underground exterior walls and slabs including slabs on grade, where no hydrostatic pressure exists, with flexible, non-hardening, weatherproof caulking compound. Seal around exterior circumference of sleeves and annular space between pipes and sleeves.
- 2.4.7 Provide Link Seal type wall gasket to seal exposed sides of opening between pipe and sleeve on foundation walls with caulking fill. Provide water proofing mastic seal on concealed side of opening.
  - .1 Acceptable Sealing Products: Garlock Link-Seal, Metraflex MetraSeal.

- 2.4.8 For finished floor areas, provide pipe sleeves 1" (25 mm) above floor with annular fin.
- 2.4.9 Install chrome-plated escutcheons with set screws where insulated or uninsulated piping passes through finished floor, ceiling and wall surfaces. Copper piping shall not be in contact with ferrous metals. Use cast-iron or galvanized sheet metal escutcheons for equipment rooms.
- 2.4.10 Coordinate installation of concrete curbs around duct openings in mechanical room floors with General Contractor.
- 2.4.11 Provide plastic grommets, equivalent to Pipe Tytes or Greenlee 712-M, for pipes passing through metal stud partitions.

## **2.5 Pipe Bedding**

- 2.5.1 All buried piping inside the building below floors and slabs, except for footing drains, shall be supported on a bed of well compacted sand (i.e. 95% Modified Proctor Density). Bedding shall extend 6" (150 mm) below pipe and support pipe barrel, not joints and/or couplings. Before backfilling, complete line shall be inspected and approved by Authorities Having Jurisdiction.

## **3 . EXECUTION**

### **3.1 Pressure Piping Installation**

#### **3.1.1 General**

- .1 Install piping straight, parallel and close to walls and ceilings, with fall of not less than 1:50 for gravity piping and with slope to drain cocks, fixtures or equipment for pressure piping, unless otherwise indicated on drawings. Use standard fittings for direction changes. Provide drain cocks as required.
- .2 Install groups of piping parallel to each other, spaced to permit application of insulation, identification and service areas, on trapeze hangers.
- .3 Where pipe size differs from connection size to equipment, install reducing fitting close to equipment. Reducing bushings are not permitted.
- .4 Brass and copper pipe and tubing shall be free from surface damage. Replace damaged pipe or tubing.
- .5 Ream ends of pipe and tubes before installation.
- .6 Install copper pipe to not contact with dissimilar metal and not be crimped or collapsed. Joints on cast or ductile iron pressure service piping shall be made electrically conductive.

- .7 Install flanges or unions and shut-off valves to permit removal of equipment without disturbing piping systems.
- .8 Clean ends of pipes or tubing and recesses of fittings to be joined. Assemble joints without binding.
- .9 Install piping to connections at fixtures, equipment, outlets and other appurtenances requiring service. Trap and vent waste connections to fixtures. Grade all vents to drain back to waste piping.
- .10 Plug or cap pipe and fittings to keep out debris during construction.
- .11 Joint material shall be compatible with type of pipe used.
- .12 Non-corrosive lubricant or Teflon tape shall be applied on male thread of threaded joints.
- .13 Flush and clean out piping systems after testing.
- 3.1.2 Equipment Drainage:
  - .1 Install drain valves at low points.
  - .2 Extend equipment drain piping to discharge into floor or hub drain.
- 3.1.3 Expansion and Contraction and Building Seismic Joints:
  - .1 Support piping to prevent stress or strain.
  - .2 Install pressure piping with loops and offsets to permit expansion and contraction without damaging pressure piping system.
  - .3 Install pressure piping with expansion joints where space does not permit loops and offsets.
- 3.1.4 Buried Piping:
  - .1 Lay pipe on compacted bedding of clean, coarse sand, free from clay, snow or ice, organic matter or stones.
  - .2 Do not lay pipe in water or when conditions are unsuitable.

### **3.2 Plumbing System Acoustical Requirements**

- 3.2.1 Provide minimum ½" (15 mm) pipe size for suite fixtures, including supplies to faucets.
- 3.2.2 Ensure no rigid contact between pipes and supporting framing and gypsum wall board.
- 3.2.3 Do not secure piping to partition which forms part of adjacent suite.
- 3.2.4 Provide flexible connections for all fixtures.
- 3.2.5 Domestic pipes shall be wrapped in the area of the attachments with minimum ¼" (6.0 mm) thick Rubatex or Armaflex sleeving and secure over insulation using oversized clamps. If piping is insulated, this requirement is waived if clamps mount over insulation. Hard

plastic pipe sleeves are not acceptable. An alternate is to provide resilient pipe mounting system such as Acoustoplumb or HoldRite.

- 3.2.6 Tee take-offs serving back to back fixtures are not permitted. Divide supply lines at riser and feed each bathroom individually.
- 3.2.7 Supply, waste and vent pipe penetrations of gypsum wall board shall be  $\frac{1}{8}$ " (3.0 mm) to  $\frac{1}{4}$ " (6.0 mm) oversized, pipe centred in hole, gap caulked with silicone sealant and covered with escutcheon. This requirement does not eliminate need for firestopping. Refer to Section 23 05 05 Firestopping for firestop requirements.
- 3.2.8 Do not allow pipe work to contact gypsum wall board, framing, conduit, electrical or ductwork fans connected to room services. Exercise special care in furred down bathroom ceiling spaces.
- 3.2.9 Water supply lines penetrating floors must not contact structure.
- 3.2.10 Waste stacks and rainwater leaders shall not touch structure and shall be resiliently supported at floor penetration with neoprene pad isolators sized for minimum  $\frac{3}{8}$ " (9.5 mm) static deflection. Neoprene pad isolators shall be equal to Mason "Super W". Ensure piping does not touch framing or gypsum wall board.
- 3.2.11 Lavatory and bath wastes in back to back situations should be carried separately to waste stack; direct connections from back to back fixtures not acceptable.
- 3.2.12 Mount bathtubs on Mason "Super W" neoprene pad isolators sized for  $\frac{1}{8}$ " (3.0 mm) static deflection under full load conditions (i.e., tub full of water). For one person tub, use five pads with 30 durometer rating. Manufacturer shall ensure filled tub will not exceed pad rating. If continuous support is required, provide isolators between support and structure. Ensure supply and drain piping can accommodate changes in deflection between full and empty conditions. Provide seal around tub lip to accommodate isolator deflection.

### **3.3 Access Doors**

- 3.3.1 Install access doors at concealed cleanouts, traps, unions, expansion joints, valves, control valves, air vents, water hammer arrestors, special equipment, trap primers, vacuum breakers and other equipment for which periodic access will be required.
- 3.3.2 Locate access doors so concealed items are accessible for adjustment, operation, maintenance and replacement.
- 3.3.3 Do not locate access doors in feature walls or ceilings without prior approval of Consultant. Locate in service areas and storage rooms wherever possible.

### **3.4 Cleanouts**

- 3.4.1 Install cleanouts at the following locations:

- .1 Building drain leaving building on upstream side of exterior wall.
  - .2 Changes of direction of more than 90° in drainage piping.
  - .3 Nominally horizontal branch or building drain at intervals of not more than 25'-0" (7.5 m) for pipe sizes 2½" (65 mm) and less, 50'-0" (15 m) for 3" (80 mm) and 4" (100 mm) pipe sizes, and 100'-0" (30 m) for pipe sizes larger than 4" (100 mm).
  - .4 Fixture drain of a sink, kitchen piping or grease waste piping at intervals not exceeding 25'-0" (7.5 m).
  - .5 Base of soil or waste stacks and rainwater leaders.
  - .6 As called for by Ontario Building Code – Part 7 Plumbing.
- 3.4.2 Locate wall cleanouts 3" (80 mm) minimum above top of base board or minimum 8" (200 mm) above finished floor level where no baseboard.
- 3.4.3 Coordinate cleanout location with millwork and other obstructions; place in accessible location with sufficient clearance for rodding and cleaning.
- 3.4.4 Extend cleanouts to finished floor or wall unless exposed in basement room, pipe tunnel or accessible crawlspace.
- 3.4.5 Extend cleanouts in wet floor areas above floor in walls, or provide with gasketted, waterproofed tops.
- 3.4.6 Bring cleanouts on outside drains to grade and anchor in a concrete collar.
- 3.4.7 Locate cleanouts serving fixtures in Healthcare Facilities, Mortuaries, Laboratories and similar occupancies, where contamination by bodily fluids is likely, a minimum of 6" (150 mm) above flood level trim of fixture.

### **3.5 Hangers and Supports**

- 3.5.1 Refer to section 22 05 29 for Hangers and Supports for Plumbing Piping and Equipment.

### **3.6 Pipe Sleeves and Escutcheons**

- 3.6.1 Install chrome-plated escutcheon plate on exposed piping passing through walls, floors and ceilings in finished areas.
- 3.6.2 Sleeves shall be concentric with pipe and, except at fire separations, shall be sized to allow for the continuity of insulation.
- 3.6.3 Extend sleeves 2" (50 mm) above floor slabs in wet areas. Wet areas include equipment rooms, janitor's rooms, kitchen areas, utility rooms, bath areas and washrooms.
- 3.6.4 Extend sleeves through outside walls to 1" (25 mm) beyond the exterior face and caulk with flexible caulking compound.

- 3.6.5 Remove removable plastic sleeves are used prior to pipe penetration and sleeve the resulting hole.
- 3.6.6 Extra high vertical risers for cold water and hot water systems with many horizontal branch takeoffs passing through sleeves set in rigid structure adjacent to main risers, set sleeves to accommodate long term structural movement to avoid imposing stress on these systems.
- 3.6.7 Refer to Section 23 05 05 Firestopping for firestop requirements.

**3.7 Core Drilling and Cutting**

- 3.7.1 Arrange and pay for cost of core drilling and cutting for plumbing systems.
- 3.7.2 Verify location of existing service runs and structural reinforcement within existing concrete floors and walls prior to core drilling and cutting. Coring and cutting of structural building components shall only take place upon specific written approval of Structural Engineer. Provide repairs to existing services damaged as result of core drilling.
- 3.7.3 Penetrations up to 6" (150 mm) nominal pipe size in precast concrete may be cored on site by plumber. Locate larger penetrations and arrange to have pre-cored with pre-cast Manufacturer prior to shipping to construction site.

**3.8 Piping Expansion**

- 3.8.1 Install piping systems, including all take-offs, so that the piping and connected equipment will not be distorted by expansion, contraction or settling.
- 3.8.2 Install anchors where necessary to control expansion. Install expansion joints or loops on hot water piping where required.

**3.9 Testing and Inspection**

- 3.9.1 Refer to Section 22 05 93 – Testing, Adjusting and Balancing for Plumbing.
- 3.9.2 Furnish labour, materials, instruments, etc. necessary for required tests. Work shall be inspected by local plumbing inspector and review by Consultant.
- 3.9.3 Correct leaks by remaking joints. Retest systems until no leaks are observed.
- 3.9.4 Do not cover any plumbing system before being inspected and approved by Plumbing Inspector.
- 3.9.5 If plumbing system or part thereof is covered before being inspected or approved, Contractor will uncover system upon the direction of the Plumbing Inspector or Consultant.

---

**3.10 Project Photographs**

- 3.10.1 Provide digital photographs of all systems prior to covering.
- 3.10.2 Provide digital photographs in “jpeg” format to Consultant complete with text description of each photograph, including date, system type, materials used, and location/direction for sections of underground piping prior to backfilling. Submit photographs via email and/or disc as requested by Consultant. Individual email sizes not to exceed 7MB in size.
- 3.10.3 Provide additional digital photographs of work as requested by Consultant to assist in resolution of RFIs, prior to covering work.

**3.11 Substantial Completion Requirements**

- 3.11.1 The following items must be completed, with documentation, prior to the date of Substantial Completion:
  - .1 All pipe expansion compensators and flexible connections checked by Supplier with an inspection report submitted to the Commissioning Agent and this Consultant.
  - .2 Seismic restraints reviewed and inspected by the Suppliers/Contractors’ Ontario Registered Professional Engineer, with a report submitted to the Commissioning Agent and this Consultant.
  - .3 All plumbing fixtures have been tested, adjusted, cleaned and in proper operation.
  - .4 All plumbing access doors and panels are in place and not painted closed.
  - .5 Potable water systems have been cleaned, flushed, chlorinated, and copies of final chlorination and water quality tests have been submitted to the Commissioning Agent and this Consultant.
  - .6 All backflow prevention stations and devices have been tested, with test reports submitted to the Commissioning Agent and this Consultant.
  - .7 All domestic hot water recirculation systems have been balanced and maximum wait time at fixtures verified, with written balancing report submitted to the Commissioning Agent and this Consultant.
  - .8 Final plumbing Inspectors sign-off to be submitted to this Consultant.
  - .9 Final gas inspection sign-off to be submitted to this Consultant.
  - .10 Final As-built Record drawings have been submitted for review to this Consultant.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2 Scope of Work**

- 1.2.1 Refer to Section 23 05 13 Common Motor Requirements for HVAC Equipment. Comply with requirements of Section as related to general requirements, products and execution.
- 1.2.2 In addition to equipment and systems listed in Section 23 05 13, provide motors complying with requirements of Section 23 05 13 plumbing equipment including the following:
- .1 Domestic cold water booster pumps.
  - .2 Domestic hot water booster and/or recirculation pumps.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2 Scope of Work**

- 1.2.1 Refer to Section 23 05 20 Thermometers and Pressure Gauges for HVAC Piping. Comply with requirements of Section as related to general requirements, products and execution.
- 1.2.2 In addition to piping, equipment and systems listed in Section 23 05 20, provide thermometers and pressure gauges complying with requirements of Section 23 05 20, on plumbing piping systems and equipment including the following:
- .1 Domestic cold water.
  - .2 Domestic hot water and recirculation.
  - .3 Tanks, pumps, compressors, vacuum units and all other equipment.
- 1.2.3 Provide thermometers in brass or stainless steel wells at heat exchangers, water heaters, and other equipment intended to change temperature of fluid.
- 1.2.4 Provide pressure gauges complete with isolation ball valves on both sides of pressure reducing valves, backflow prevention stations, pumps, compressors and other equipment intended to change pressure of fluid. Provide snubbers for pressure gauges located adjacent to pumps or compressors.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 Refer to Section 22 05 48 Vibration Isolation for Plumbing Piping and Equipment

**1.2 Scope of Work**

- 1.2.1 Refer to Section 23 05 29 Hangers and Supports for HVAC Piping and Equipment. Comply with requirements of Section as related to general requirements, products and execution.
- 1.2.2 In addition to piping, equipment and systems listed in Section 23 05 29 provide hangers and supports complying with requirements of Section 23 05 29 on plumbing piping and equipment including:
  - .1 Domestic cold water.
  - .2 Domestic hot water and recirculation.
  - .3 Sanitary waste and venting.
  - .4 Storm drainage.
  - .5 Tanks, pumps, compressors, vacuum units and all other equipment.

**END OF SECTION**

**1 . GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 Refer to Section 22 07 19 Plumbing Piping Insulation.
- 1.1.3 Refer to Section 22 05 34 Hot Water Heat Tracing for Temperature Maintenance.

**1.2 Scope of Work**

- 1.2.1 Refer to Section 23 05 33 Heat Tracing for HVAC Piping. Comply with all requirements of Section as related to general requirements, products and execution.
- 1.2.2 In addition to piping and systems listed in Section 23 05 33 provide heat tracing for freezing protection complying with requirements of Section 23 05 33 on plumbing piping systems in exterior or unheated areas including the following:
  - .1 Domestic cold water.
  - .2 Domestic hot water and recirculation.
  - .3 Storm drainage piping and underside of drain bodies.

**2 . PRODUCTS**

**2.1 Pipe Heat Tracing**

- 2.1.1 Provide complete, CSA approved system of heat tracing on piping exposed outdoors where indicated.
- 2.1.2 Entire design and installation of system shall comply with Canadian Electrical Code and requirements of local inspection authority.
- 2.1.3 Provide necessary materials to provide complete system.
- 2.1.4 Use Raychem Chemelex Auto Trace self-regulating, shielded, jacketed cable type XL-TRACE (use XTV for hot water piping systems) or equal.
- 2.1.5 Acceptable Products: Raychem, Chromalox, Nuheat.

**3 . EXECUTION**

**3.1 Installation**

- 3.1.1 Install heat trace system in accordance with Manufacturer's instructions/recommendations and these specifications.

- 
- 3.1.2 Prior to installing heating cables, ensure pipe systems are complete and have passed tests.
  - 3.1.3 Cables to be secured to pipes using Raychem Type G554 glass cloth tape at 12" (300 mm) intervals.
  - 3.1.4 Follow Manufacturer's recommendations for installation of cable around valves and flanges.
  - 3.1.5 After pipes are traced, test prior to installation of pipe insulation.
  - 3.1.6 Provide suitable identification for those pipe systems provided heat tracing. At intervals of 20'-0" (6.0 m), provide on outside surface of insulation adhesive backed nameplate "Caution - Heat Tracing."

**END OF SECTION**

---

## 1. GENERAL

### 1.1 General

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 Related Work

1.2.1 Also refer to Section 22 07 19 Plumbing Piping Insulation.

1.2.2 Also refer to Section 22 05 33 Heat Tracing for Plumbing Piping.

### 1.3 Description of Work

1.3.1 Furnish and install complete CSA Certified and FM Approved system of heaters and components, listed specifically for maintaining domestic hot water temperatures at selected temperatures.

## 2. PRODUCTS

### 2.1 Heaters

2.1.1 Self-regulating heater shall consist of two 16 AWG nickel-coated radiation-cross-linked conductive polymer core, covered by radiation-cross-linked, polyolefin di-electric jacket surrounded by polymer-coated aluminum wrap, and enclosed in tinned copper braid of 14 AWG equivalent wire size. Braid shall be covered with (nominal) 40 mil polymer outer jacket, colour coded for easy identification. 105°F (40°C) to 122°F (50°C) (yellow) 105°F (40°C) to 140°F (60°C) (red) selected temperature range.

2.1.2 Cable shall have minimum cut-through resistance of 100lb per IEEE 515.1 and CSA 130-03 Resistance to Cutting Tests. Cable shall have minimum impact resistance of 10 ft-lbs per IEEE 515.1 and CSA 130-03 Impact Tests. Cable shall have minimum abrasion resistance of 2500 cycles per IEEE 515.1 Abrasion Test. Cable shall withstand crush resistance of 225 lbs per IEEE 515.1 Deformation Test and withstand crush resistance of 345 lbs per CSA 130-03 Crush Resistance Test.

2.1.3 Heater shall operate on line voltage of 208V and have option of operating on 208V or 240V with HWAT-ECO Controller.

2.1.4 Heating cable connection kits shall be CSA Certified and FM Approved for use as part of system to maintain hot water temperature. Component enclosures shall be rated NEMA 4X to prevent water ingress and corrosion. Installation shall not require

Installing Contractor to cut into heating cable core to expose bus wires. Connection systems requiring Installing Contractor strip bus wires or which use crimp or terminal blocks, shall not be acceptable. Connection kits except for power connection shall be installed under thermal insulation. End seal shall use silicone gel.

- 2.1.5 Provide complete installed system including at least one agency-approved electronic controller. Controller shall not be line sensing over-limit design. Controller shall be capable of setting different pipe temperatures based on ambient and voltage with 24 hour, 7 day/week programmable options, energy savings, BMS interface capabilities and flexible wiring configurations to operate individually or control up to eight additional controllers.
- 2.1.6 System shall maintain temperatures between 105°F (40°C) and 122°F (50°C) or 105°F (40°C) and 140°F (60°C) at 208V or 240V. Temperature shall be maintained by utilizing electronic controller with straight runs of heating cable on pipe.
- 2.1.7 Acceptable Products: Raychem HWAT 125°F (51.7°C) HWAT-Y2 (yellow) 140°F (60°C) HWAT-R2 (red), Hevi-Duty, Nelson, Thermon, Nuheat.
- 2.1.8 Fibreglass tape.
- 2.1.9 Acceptable Products: Raychem GT-66, Hevi-Duty, Nelson, Thermon, Nuheat.

### 3. **EXECUTION**

#### 3.1 **Installation**

- 3.1.1 Install self-regulating heaters and components on domestic hot water supply piping mains and risers and indicated on plans after piping has been pressure tested, before thermal insulation is applied. Secure heater to piping with fibreglass tape.
- 3.1.2 Apply “electric traced” signs to outside of thermal insulation jacketing. Comply with minimum label spacing and size requirements from Section 23 05 53 Identification for HVAC Piping and Equipment.

#### 3.2 **Pipe Insulation**

- 3.2.1 Provide minimum piping insulation in accordance with the following Pipe Insulation Thickness Table:

Copper Pipe Size (NPS)	Insulation Thickness
½	½" (15 mm)
¾	1" (25 mm)
1	1" (25 mm)

---

1 ¼	1½" (40 mm)
1 ½	1½" (40 mm)
2	2" (50 mm)
2 ½	2½" (65 mm)
3	3" (80 mm)

- 3.2.2 On pipe 1¼" (32 mm) and smaller, provide insulation oversized ¼" (6.0 mm) for properly installing insulation over heating cables. On pipes 3" (80 mm) and larger, thickness of insulation may be equal to pipe diameter with one heating cable or one-third of pipe diameter with two runs of heating cable.
- 3.2.3 Install system in accordance with drawings and Manufacturer's instructions. Installer is responsible to provide functional system installed in accordance with applicable local, provincial and National requirements. Protect each circuit with 30 mA ground-fault protection device.

### 3.3 Tests

- 3.3.1 After installation and before and after installing thermal insulation, test heater cables using 2500 VDC megger. Heater circuits shall be continuous and megger readings shall be minimum 1000 megaohm regardless of heater length. Repair or replace circuits yielding unacceptable readings.

**1. GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2 Scope of Work**

- 1.2.1 Refer to Section 23 05 48 Vibration Isolation for HVAC Piping and Equipment. Comply with requirements of Section as related to general requirements, products and execution.
- 1.2.2 In addition to piping, equipment and systems listed in Section 23 05 48 provide vibration isolation complying with requirements of Section 23 05 48 on plumbing piping and equipment including the following:
- .1 Domestic cold water.
  - .2 Domestic hot water and recirculation.
  - .3 Sanitary waste and venting.
  - .4 Storm drainage.
  - .5 Tanks, pumps, compressors, vacuum units and all other equipment.

## 1. GENERAL

### 1.1 Related Work

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 Scope of Work

1.2.1 Refer to Section 23 05 53 Identification for HVAC Piping and Equipment. Comply with requirements of Section as related to general requirements, products and execution.

1.2.2 In addition to piping, equipment and systems listed in Section 23 05 53, provide identification on plumbing piping, valves and equipment, including the following:

- .1 Domestic cold water.
- .2 Domestic hot water and recirculation.
- .3 Sanitary waste and venting.
- .4 Storm drainage.
- .5 Tanks, pumps, compressors, vacuum units and all other equipment.
- .6 Trap primer access points.

1.2.3 Identification of medical gas systems shall comply with requirements of applicable CSA Standard where requirements of standard exceed these specifications.

### 1.3 Pipe Identification Colour Schedule

Service	Identification Lettering	Background Colour	Letters Colour
Acid Waste	Acid	yellow	black
Boiler Blow Off Piping	-	yellow	black
Boiler Blowdown	-	yellow	black
Boiler Feed Water	B.F.W.	yellow	black
Chilled Water Return	CH.W.R.	green	white
Chilled Water Supply	CH.W.S	green	white
Cold Water Service	C.W.	green	white
Fire Combined Standpipes	SPR/S.P.	red	white
Compressed Air	COMP.A.	blue	white
Condensate - Medium Pressure	M.P.Cond.	yellow	black
Condensate - Low Pressure	L.P.Cond.	yellow	black
Condensate - Pumped	Pump.Cond.	yellow	black

<b>Service</b>	<b>Identification Lettering</b>	<b>Background Colour</b>	<b>Letters Colour</b>

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

1.1.2 Refer to Section 22 08 00 Commissioning of Plumbing.

**1.2 Scope of Work**

1.2.1 Refer to Section 23 05 93 Testing, Adjusting and Balancing for HVAC. Comply with requirements of Section as related to general requirements, products and execution.

1.2.2 In addition to the piping, equipment and systems listed in Section 23 05 93 provide testing adjusting and balancing complying with requirements of Section 23 05 93 for plumbing piping, equipment and systems including the following:

- .1 Domestic cold water.
- .2 Domestic hot water and recirculation.
- .3 Domestic tempered water and recirculation.
- .4 Sanitary waste and venting.
- .5 Storm drainage.
- .6 Tanks, pumps, compressors, vacuum units and all other equipment.
- .7 Trap primers.

1.2.3 Balancing of domestic hot water and tempered water recirculation systems by recognized balancing agency and submission of balancing report is mandatory.

1.2.4 Pressure test plumbing piping systems in accordance with specific requirements of specification sections for those systems.

1.2.5 Medical gas systems shall be tested and certified by certified independent testing agency selected by Owner and retained by Owner.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

1.1.2 Refer to Section 22 07 19 Plumbing Piping Insulation.

**1.2 Scope of Work**

1.2.1 Refer to Section 23 07 16 HVAC Equipment Insulation. Comply with requirements of Section as related to general requirements, products and execution.

1.2.2 In addition to piping, equipment and systems listed in Section 23 07 16, provide equipment insulation on plumbing equipment and systems including the following:

- .1 Domestic cold water storage tanks.
- .2 Domestic hot water storage tanks and heat exchangers.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 Be responsible for ensuring sufficient space is provided to allow proper installation of insulation materials.
- 1.1.3 Refer to Section 22 07 16 Plumbing Equipment Insulation.

**1.2 Scope of Work**

- 1.2.1 Refer to Section 23 07 19 HVAC Piping Insulation. Comply with requirements of Section as related to general requirements, products and execution.
- 1.2.2 In addition to piping and systems listed in Section 23 07 19 provide piping insulation on plumbing piping systems including the following:
  - .1 Domestic cold water.
  - .2 Domestic hot water and recirculation.
  - .3 Domestic tempered water and recirculation.
  - .4 Storm drainage piping and underside of drain bodies.
  - .5 Sanitary waste and P-traps, grey and black water systems in exterior and unheated areas.
  - .6 Offset waste piping, P-traps and supplies under wheelchair accessible lavatories and sinks.
  - .7 Provide foil faced flexible insulation on components requiring adjustment or servicing including booster pumps, meter sets, pressure reducing valves, valve bodies, strainers, etc.
  - .8 Sanitary vent stacks for last 10'-0" (3.0 m) prior to penetrating roof.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2 Scope of Work**

1.2.1 Refer to Section 23 08 00 Commissioning of HVAC. Comply with requirements of Section as related to general requirements, products and execution.

1.2.2 In addition to piping, equipment and systems listed in Section 23 08 00 provide commissioning complying with requirements of Section 23 08 00 plumbing piping, equipment and systems including the following:

- .1 Domestic cold water.
- .2 Domestic hot water and recirculation.
- .3 Sanitary waste and venting.
- .4 Storm drainage.
- .5 Compressed air.
- .6 Tanks, pumps, compressors, vacuum units and all other equipment.

**END OF SECTION**

## 1. **GENERAL**

### 1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 **Scope of Work**

- 1.2.1 Domestic water systems include domestic cold water, domestic hot water, domestic tempered water and domestic water re-circulation systems.
- 1.2.2 Domestic water piping shall be provided as depicted on drawings to all plumbing fixtures, appliances and equipment that require domestic water service.
- 1.2.3 New domestic water piping shall be connected to existing domestic water piping as indicated on drawings.
- 1.2.4 New domestic water piping shall be connected to exterior cold water building service as indicated on drawings.
- 1.2.5 Refer to "Common Work Results for Fire Suppression," Section 21 05 06 where domestic water supply and supply to fire suppression systems are combined in one common supply line.
- 1.2.6 Mechanical makeup water piping systems and force main or pressure waste water piping systems shall be constructed of materials, installed and tested as specified in this section.
- 1.2.7 Non-potable water systems shall be provided to the standards and requirements of this section.

### 1.3 **Codes, Standards and Approvals**

- 1.3.1 All products including fabricated assemblies/spools that will come in contact with domestic (potable) water shall be tested and certified to NSF/ANSI/CAN 61 and 372 for domestic cold and commercial hot water ratings (as applicable). Before any work commences, provide evidence of agency certification to these standards through official certification documents and/or online certification Listings including tested and Approved water contact temperature(s). Any products found to be non-compliant with these requirements shall be replaced at the contractor's expense.

### 1.4 **Cross Connection and Backflow Control**

- 1.4.1 Double check valve assemblies and reduced pressure principle backflow prevention devices shall have approval from the Foundation for Cross Connection Control.

- 1.4.2 Vacuum breakers shall conform to the requirements of CSA B64.5.
- 1.4.3 Following installation, test report completed by certified tester shall be submitted to Owner, indicating satisfactory operation of each device.
- 1.4.4 Tests shall be conducted 30 to 60 days prior to date of Substantial Completion.
- 1.4.5 Provide one repair kit for every cross-connection control device installed.

**1.5 Freeze Protection**

- 1.5.1 Provide freeze-proof hose bibbs where required due to ambient temperatures.

**2. PRODUCTS**

**2.1 General Standards:**

- 2.1.1 Piping and fittings shall be in accordance with current edition or applicable revisions of applicable codes or governing regulations. Pipe and pipe fittings must be of the same manufacturer for PVC, ABS, PEX and CPVC systems. All products shall be UL/ULC classified in accordance with NSF/ANSI/CAN-61 and NSF/ANSI-372 for both cold and hot potable water service. Materials in contact with PVC or CPVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- 2.1.2 Mechanical grooved pipe couplings, fittings, butterfly, ball and check valves, expansion joints, mechanical-Ts, pressure reducing valves, strainers, domestic water balancing and other products as manufactured and/or supplied by Victaulic Company, may be used for piping systems and mechanical equipment connections (in lieu of welded, flanged and threaded methods) (and also may be used as unions, seismic joints, flexible connections, expansion compensators and vibration reducers) in systems specified. Operating conditions shall be in the 32°F (0°C) to 250°F (121°C) temperature range according to the gasket or valve seat selected and working pressures as shown in the coupling Manufacturer's current product specifications, as detailed under specific systems specifications (subject to local code approval).

**2.2 Pipe and Fittings**

Size	Pipe	Fittings
------	------	----------

Domestic and Non-Potable Water Piping Below Grade (Inside and Outside Building)		
---	--	--

Size	Pipe	Fittings
To 3" (80 mm) 4" (100 mm) and Up	Type "K" soft copper Ductile iron	Flared tube Hub and spigot with mechanical clamp and rod on long radius bends or push on rubber gasket joints to CSA B131.10
Up to 2½" (65 mm)	Class 150 or Series 200 PVC	Solvent Joints/Schedule 40 fittings
3" (80 mm) and Up	Class 150 or Series 200 PVC	Hub and spigot with retainer glands and harness restraint devices at each thrust point. All rods and fasteners below grade shall be 306 stainless steel.
Domestic and Non-Potable Water Piping Above Grade		
All sizes	Certified Type "L" or Type "K" hard copper	Wrought bronze or cast brass with Silvacrite 100 lead free solder. Roll grooved copper may be used in lieu of sweated joints; roll grooves must be formed using "RR" rolls; grooved couplings to be installation ready complete with pre- lubricated center leg gaskets and housings with angle bolt pads to provide rigid joint. Gasket shall be grade – EHP. Victaulic 600 series Viega ProPress fittings.
	Cross-Linked Polyethylene (PEX). Restricted use – not to be routed in topping slabs.	Conform to CAN3-B137.5 and ASTM F-876 and F-877, Uponor Pre- sleeved AquaPEX tubing for in-slab service, fittings to ASTM F-1960. Uponor Aquapex, PureLink/AquaLink system.

Size	Pipe	Fittings
½" (15 mm) - 2" (50 mm)	Schedule 10 Stainless Steel	Pipe shall be IPS sized, conforming to ASTM-A-312, Type 304/304L or 316/316L. Tube is not acceptable. Stainless steel fittings ½" (15 mm) - 2" (50 mm) shall be precision cold drawn austenitic stainless steel housing complete with pipe stop and Vic-Press end connections, rated to 500 psi (3,450 kPa), with HNBR gasket, rated for - 20°F (-29°C) - 210°F (98°C), Vic-Press Schedule 10S Fittings and Valves. Viega ProPress fittings.
2" (50 mm) - 12" (300 mm)	Schedule 10 Stainless Steel	Pipe shall be IPS sized, conforming to ASTM A-312, Type 304/034L. Where Schedule 10 Stainless steel pipe is used 2" (50 mm) and above, all roll grooves must be formed using "RX" rolls . Couplings shall be specifically designed to provide a rigid joint for stainless steel. Joints shall be rated to minimum 300 psi (2,070 kPa) on Schedule 10S stainless steel pipe. Victaulic Style 807 rigid coupling for 2" (50 mm) – 6" (150 mm). Victaulic Style 889 rigid coupling for 8" (200 mm) – 12" (300 mm). For flange adapters, Victaulic Style 841 for sizes 2" (50 mm) – 4" (100 mm) and Style 445SS for sizes 6" (150 mm) – 12" (300 mm). Viega ProPress. Where pipe system flexibility or expansion compensation is required, contact Victaulic.

Size	Pipe	Fittings
4" (100 mm) and up	Grooved end cement lined ductile iron pipe grooved in accordance with AWWA Standard C606	Fittings for domestic cold water service shall be cement lined ductile iron, ASTM A-536, grade 65-45-12, conforming to requirements for AWWA C110 for center to end dimensions, AWWA C153 or AWWA 21.10/AWWA C110 for wall thickness and AWWA C606 rigid radius grooving dimensions for end preparation. Couplings shall be cast of ductile iron conforming to ASTM A-536 Supplied with Grade "M" FlushSeal® gasket for cold potable water service. Victaulic AWWA fittings and Style 31, 307 couplings and 341 flange adapters.

## 2.3 **Grooved Mechanical Pipe Couplings, Fittings and Valves**

- 2.3.1 Victaulic Piping Systems. Where the name Victaulic is used, it refers to Victaulic the Manufacturer.
- 2.3.2 The use of grooved end pipe, fittings, valves and couplings is acceptable for potable water in sizes 2" (50 mm) and larger.
- 2.3.3 When using the grooved piping concept, provide grooved end valves for isolation, balance, flow control and check service suitable for pipe type and end connection.
- 2.3.4 Gaskets:
  - .1 Gaskets in couplings for Copper and Stainless Steel piping to be Grade "P" Fluoroelastomer Blend rated for +0°F (-18°C) to +180°F (+82°C) for potable water service..
- 2.3.5 For Grooved Joints: Ensure that grooved pipes are in compliance with the current groove specifications and recommendations. Ensure that the "A" dimension (i.e. the area from the pipe end to the front edge of the groove) is clean and free from indentations, scores, seams, projections or roll marks for proper gasket sealing. Gasket style and elastomeric material (grade) verified as suitable for the intended service as specified. Ensure that correct tool and rolls are used for pipe being grooved. A pipe tape should be used to verify proper grooved dimensions.

- 
- .1 Grooved coupling Manufacturer's factory trained Representative shall provide on-site training for Contractor's field personnel in the use of grooving tools and installation of grooved joint products. Representative shall periodically visit the jobsite and review Contractor is following best recommended practices in grooved production installation. (Distributor's Representative is not considered qualified to conduct the training or jobsite visit(s).)
- 2.3.6 For copper systems, provide Installation-Ready couplings complete with pre-lubricated grade "P" Fluoroelastomer Blend center leg gaskets. Housings shall have angle bolt pads to provide rigid joints. Victaulic Style 607 coupling.
- 2.3.7 Provided copper system shall be manufactured to copper-tube dimensions. (Flaring of tube or fitting ends to accommodate alternate sized couplings is not permitted.)
- 2.3.8 For combined domestic/fire water line inside building, provide Victaulic 717 PPS Coated Check Valve and 7B2 Monitored BFV, joined with a Style 807 or 889 coupling complete with Grade "P" Fluoroelastomer Blend Gasket or Style 307 coupling where joining to AWWA pipe complete with FlushSeal® Halogenated Butyl gasket for potable water. See details for transition to incoming supply lines.
- 2.3.9 When transitioning from grooved end ductile iron pipe to grooved end copper pipe, provide style 647 di-electric water way.
- 2.3.10 On Domestic Ductile Iron Systems, provide Victaulic Series 861 MasterSeal™ for shutoff and Series 717 PPS for check and 732 PPS coated or Series 968-F for straining.
- 2.4 Viega Press Fittings**
- 2.4.1 Installation shall be to manufacturer's installation requirements using only manufacturer's press tool appropriate to the pipe and application.
- 2.4.2 Installer shall hold and maintain proper proof of training by qualified Viega representative and have available if requested.
- 2.5 Metal Protection**
- 2.5.1 All ferrous metal work buried underground shall be of stainless steel construction. Retainer rod, washers and nuts on underground water/pressure mains shall be 316 stainless steel, hangers shall be 316 stainless steel where used for piping supported below grade.
- 2.6 Valves**
- 2.6.1 Gate, globe, ball, butterfly valves shall be provided with stem extension to allow for proper insulation thickness. Stem extension

to stay stationary to ensure vapor barrier seal is not broken when valve is exercised.

2.6.2 Gate (for shut-off and isolation):

- .1 2" (50 mm) and smaller, bronze body, solid wedge disc, bronze or stainless steel trim, non-rising stem, 125 psi (860 kPa) rating.
  - .1 Acceptable Products:
    - .1 Solder Joint Type: Kitz 808, Red and White/Toyo 268AB LF.
    - .2 Threaded Joint Type: Kitz 807, Red and White/Toyo 268AB LF.
  - .2 2½" (65 mm) and larger, flanged ends cast-iron body, solid wedge disc, bronze or stainless steel trim, rising stem, outside screw and yoke.
    - .1 Acceptable Products: Jenkins 404, Kitz 72, Red and White/Toyo 421A/MAS W-10.

2.6.3 Ball (in lieu of gate valves or as specified):

- .1 2" (50 mm) and smaller, brass two piece body, blow-out proof stem, PTFE seats, brass chrome plate ball, lever handle operator, 150 psi (1,034 kPa) rating. 2½" (65 mm) and larger, American 4000 Flanged.
  - .1 Acceptable Products:
    - .1 Solder Joint Type: Red and White/Toyo 5049AB, Jenkins LF202J, Kitz 59, MAS B-4-LF .
    - .2 Threaded Joint Type: Red and White/Toyo 5044AB, Jenkins LF201J, Kitz 58, Victaulic 78BL, MAS B-3-LF.
    - .3 Pex Pipe clamp connection: Red and White 5017AB, 5015AB.
  - .2 2" (50 mm) and smaller, Stainless steel three-piece, swing-out design, PTFE seats, stainless steel ball, locking handle operator, 400 psi (2,758 kPa) rating.
    - .1 Acceptable Product:
      - .1 Vic-Press Series P569.
  - .3 1½" (40 mm) to 6" (150 mm), Stainless Steel two piece, end-entry valve, RTFE Seat, Stainless steel ball with Fluoroelastomer seals.
    - .1 Acceptable Product:
      - .1 Grooved Joint: Victaulic Series 726S.
      - .2 Flanged Butterfly (in lieu of gate valves or as specified):
  - .4 2½" (65 mm) and larger, 200 psi (1,380 kPa) rating, wafer style, threaded lug style cast-iron body, EPDM seat liner,

bronze disc, 416 stainless steel stem, 10 position lever lock handle operator on 6" (150 mm) diameter and smaller, handwheel worm gear operator on 8" (200 mm) diameter and larger, for installation between Class 125/150 flanges.

- .1 Acceptable Products:
  - .1 Wafer Style: Apollo WD141, Center Line Series200W (EPDM), Metraflex, MAS-D Series, Kitz DJ, Toyo 200L.
  - .2 Lug Style: Apollo LD141, Center Line Series 200L (EPDM), Metraflex, MAS-D Series, Kitz DJ, Toyo 200L.
  - .3 With "Victaulic" copper grooved end pipe system, use Victaulic style #608 cast brass body grooved valve with an EPDM encapsulated disk, 300 psi (2,070 kPa) rating.

2.6.4 Grooved Butterfly (in lieu of gate valves or as specified):

- .1 2" (50 mm) and larger, 300 psi (2,065 kPa) rating, grooved end, suitable for bi-directional and dead-end service to full rated pressure. Grooved end stainless steel body and disc. Disc shall be connected to the stem without the use of fasteners or pins and be offset from the disc centerline to provide a full 360° continuous contact with the seating surface when closed. Seat shall be pressure responsive, Grade P Fluoroelastomer.
  - .1 Acceptable Products
    - .1 For ductile iron grooved end pipe system, Victaulic series 861.
    - .2 For stainless steel grooved end pipe system, Victaulic Series 861.
  - .2 For copper grooved end pipe system, 2 1/2" (65 mm) and larger, 300 psi (2,065 kPa). Cast brass body complete with Aluminum bronze disc, with pressure responsive grade "P" Fluoroelastomer seat. Stem shall be offset from the disc centerline to provide complete 360-degree circumferential seating. Bubble tight, dead-end or bi-directional service.
    - .1 Acceptable products:
      - .1 Victaulic series 608N.

2.6.5 Globe (for throttling, bypass and make-up applications):

- .1 2" (50 mm) and smaller, bronze body, bronze or stainless steel trim, 125 psi (860 kPa) rating.
  - .1 Acceptable Products:
    - .1 Solder Joint Type with Bronze Bevel Type Disc: Kitz 12, Red and White/Toyo 212.

- 
- .2 Threaded Joint Type with Composition Type Disc:  
Kitz 03, Red and White/Toyo 220.
      - .2 2½" (65 mm) and larger, flanged ends, cast-iron body, bronze or cast-iron bevel-type disc, bronze or stainless steel trim, rising stem, outside screw and yoke, 125 psi (860 kPa) pressure rating.
        - .1 Acceptable Products: Jenkins 2342J, Kitz 76, Red and White/Toyo 400A.
  - 2.6.6 Check (for horizontal installation):
    - .1 2" (50 mm) and smaller, threaded joint type, bronze body, bronze or stainless steel swing disc holder with Teflon disc, 125 psi (860 kPa) rating.
      - .1 Acceptable Products: Kitz 19, Red and White/Toyo 236 AB LF.
    - .2 2½" (65 mm) and larger, grooved, stainless steel body, stainless steel disc, 300 psi (2065 kPa) pressure rating.
      - .1 Acceptable Products: Victaulic Series 816.
  - 2.6.7 Balance (for domestic hot water recirculation):
    - .1 2" (50 mm) and smaller, thermostatic balancing type, for maximum temperature of 250°F (120°C), maximum pressure of 200 psi (1,380 kPa), fixed non-adjustable or adjustable temperature setpoint, low lead construction throughout, temperature accuracy of +/-3°F (1.7°C).
      - .1 Acceptable Products: ThermOmega Tech CircuitSolver, Caleffi ThermoSetter™ 1164A series, TA Series 7TZ Therm Zero, Victaulic Series 7WT.
    - .2 1¼" (32 mm) and smaller, globe lock shield, for maximum system temperature, bronze body and trip, Teflon, polytetrafluoroethylene (PTFE), disc, female by male union connection, 100 psi (690 kPa) rating.
      - .1 Acceptable Products: Red and White/Toyo 9527/9529 AB LF, Tour and Anderson STAD Zero, Victaulic TA series 790 circuit balancing valve.
    - .3 1½" (40 mm) and larger, plug type, wrench adjustable stop, for maximum system temperature, semi-steel body, resilient plug seals, EPT or RS 55, maximum 250°F (120°C) operating temperature, 125 psi (860 kPa), threaded end connections for up to 2" (50 mm), flanged end connections on 2½" (65 mm) and larger.
      - .1 Acceptable Products: DeZurik 435 with 487 adjustable stop, Newman-Hattersley 170M or 171M, Oventop, Red-White 9574P .
-

---

2.6.8 Vacuum Relief (for hot water tanks installation):

- .1 Up to ½" (15 mm), 125 psi (860 kPa) rating.
  - .1 Acceptable Products: ½" (15 mm) Watts 36A, Cash Acme VR-801.
- .2 ¾" (20 mm) and larger, 125 psi (860 kPa) rating.
  - .1 Acceptable Products: ¾" (20 mm) Watts 36A, Cash Acme VR-801.

2.6.9 Pressure Reducing:

- .1 Potable Water System Pressure Reducing Valve:
  - .1 Provide pilot operated globe type pressure reducing valve with bronze strainer assembly to limit static water pressure to 80 psi (550 kPa) at any plumbing fixture on incoming water line to Plumbing Code requirements. Valve body and cover shall be ductile iron to ASTM A536, electro-statically applied fusion bonded epoxy coating. Strainer shall be Y pattern, ductile iron body and stainless steel screen. Provide low flow bypass where indicated. Basis of Design: Victaulic Series 972 PRV and Victaulic Series 968-F Strainer, Bermad.
  - .2 Domestic Hot Water Applications: Pressure reducing valve shall be rated to 225°F (107°C) minimum at required pressure.
- .2 Acceptable Products:
  - .1 ¼" (6.0 mm) to ⅜" (9.5 mm), 125 psi (860 kPa) rating: Watts 215, Singer.
  - .2 ½" (15 mm) to 2" (50 mm), 125 psi (860 kPa) rating: Victaulic Series 935-H, Watts 223LF, Braukmann, Conbraco, Cash Acme, Singer, Beeco, Zurn ZW 209.
  - .3 2½" (65 mm) and larger, 125 psi (860 kPa) rating: Victaulic Series 972, BCA 317 PR, Clayton 90 or 90B, Singer 106PR, Beeco, Zurn ZW 209, Bermad.
  - .4 All sizes: Cash Acme EB-25 Pressure Regulator.

2.6.10 Pressure Reducing Valve with Integral Low Flow Bypass:

- .1 1½" (40 mm) and larger, 125 psi (860 kPa) rating: Acceptable Products: Clayton, Singer, Wilkins, Beeco, Bermad.

2.6.11 Drain Valves and Hose Bibbs:

- .1 Hose Bibbs: Lockshield globe type with bronze body and trim suitable for maximum system operating pressure. Acceptable Products: Dahl 2316.

- .2 Drain Valves: Ball type with brass body, cap and chain and chrome-plated brass ball. Acceptable Products: Kitz 58CC, Dahl 50430 Series.
- .3 Stop and Drain Valves: R-W/Toyo W5046LF or Dahl 521 Series.

2.6.12 Solenoid:

- .1 Slow closing solenoid valve, forged brass body, Buna "N" disc, stainless steel parts, enclosure to suit environmental conditions, UL and CAS approved, 120 V. Acceptable Products: ASCO

2.6.13 Thermostatic Mixing:

- .1 On both upstream hot and cold supplies, in accessible location, provide positive swing check valves and strainers. This requirement in addition to check valve device common to mixing valve. Where required, provide access panel to check valves and strainers. Mixing valve to be equal to Watts LFUSG-B or Caleffi 5213 Series, Powers Hydroguard LFE480.
- .2 On both upstream hot and cold supplies, in accessible location, provide positive swing check valves and strainers. This requirement in addition to check valve device common to mixing valve. Where required, provide access panel to check valves and strainers. Mixing valve to be equal to Moen 104451 adjustable thermostatic mixing valve or Caleffi 5213 Series, Powers Hydroguard Series LFLM496 Adjustable.
- .3 On both upstream hot and cold supplies, in accessible location, provide positive swing check valves and strainers. This requirement in addition to check valve device common to mixing valve. Where required, provide access panel to check valves and strainers. Cabinet type mixing valve to be equal to Moen 15440 or Cash Acme Heatguard 145 Series thermostatic mixing valve complete with valving in stainless steel cabinet.
  - .1 Acceptable Product: Powers Hydroguard LFLM490 Series.

**2.7 Vacuum Breakers**

2.7.1 Pressure Type:

- .1 CSA approved, mechanically independent, spring loaded poppet type check valve with a downstream spring loaded air inlet valve, with upstream and downstream isolation valves and test cocks. Acceptable Products: Cla-Val 38-VB/AR, Conbraco 4V-500, Febco 765, Watts 800M4FR, Wilkins 720A.

2.7.2 Atmospheric Type:

- .1 CSA approved, bronze body, chrome plate finish where exposed. Acceptable Products: Conbraco 38-100, Febco 710/715A, Watts 288A, 288AC, Wilkins 35, Cash Acme V-101 Series.

2.7.3 Vacuum breakers size to match.

**2.8 Backflow Preventers**

2.8.1 Double check valve assembly (DCVA), factory assembled station to CSA B64.5. Acceptable Products: Watts Series 757, CXm F-72, Cla-Val D, D2, Conbraco 40-100, Febco 805, Wilkins 950, MBD-10.

2.8.2 Reduced pressure principle backflow prevention device (RPBP), with inlet and outlet shut-off valves, double check valve assembly, and differential relief outlet and repair/maintenance kit to CSA B64.10-M1984. Acceptable Products: Watts Series 909, CLA-Val RP, Conbraco 40-200, Febco 860, 867, 835YD, 825, Neptune 575, Wilkins 975, Beeco FRP Series.

**2.9 Strainers**

2.9.1 Provide 4 to 1 ratio of basket open area to connecting pipe cross-sectional area, 'Y' pattern, 304 stainless steel screen.

2.9.2 ¼" (6.0 mm) to 2" (50 mm), threaded ends, bronze body, 150 psi (1,034 kPa) rating.

- .1 Acceptable Products: Red and White/Toyo 380, Crane 988-½, Armstrong, Sarco (Canada), Kitz 15.

2.9.3 2½" (65 mm) and larger, grooved or flanged ends, ductile or cast-iron body, 150 psi (1,034 kPa) rating.

- .1 Acceptable Products: Victaulic Style 968-F, Red and White/Toyo 381, Crane 989-½, Armstrong, Sarco (Canada), Kitz 80, Mueller 758, MAS W-40.

**2.10 Water Hammer Arrestors**

2.10.1 Bellows or piston manufactured style with stainless steel casing and welded stainless steel besting bellow if of the bellows style. Site fabricated air chambers are unacceptable. Acceptable Products: Zurn Z-1700 Series bellows style, Jay R. Smith 5000 Series, Amtrol-Mini-Trol, Watts SS-Series, Precision Plumbing Products Inc. 316 piston type, Wade Bellows or Piston Type Shockstops.

**2.11 Thermometers and Pressure Gauges**

2.11.1 Refer to Section 22 05 20 Thermometers and Pressure Gauges for Plumbing.

---

**2.12 Temperature and Pressure Relief Valves**

2.12.1 Design: ASME rated for energy input to system and pressure rating of equipment.

2.12.2 Acceptable Products: Watts, Cash Acme, Apollo.

**2.13 Pipe Joints**

2.13.1 Solders and fluxes having lead content and self-cleaning acid type fluxes shall not be used.

2.13.2 Copper to steel or iron and flanged adaptors shall be brass, not copper.

2.13.3 All unions or similar interconnections between dissimilar metals shall be di-electric couplings.

.1 Copper silicon casting conforming to UNS C87850 with grooved and or/threaded ends. UL classified in accordance with NSF/ANSI/CAN-61 for potable water service and shall meet the low-lead requirements of NSF/ANSI/CAN-372.

.1 Standard of Acceptance: Victaulic Series 647.

2.13.4 Grooved Joints Lubricants: Lubricate gaskets with products supplied by the coupling manufacturer in accordance with published installation instructions. The lubricant shall be specifically for the gasket elastomer and system media.

**2.14 Air Vents**

2.14.1 Design: Automatic float type, 150 psi (1,034 kPa) maximum operating pressure.

2.14.2 Acceptable Products: Armstrong 11-AV, Maid-o-Mist 71, Taco 426, Amtrol, Metraflex Style MV-15, Caleffi 5020 MINICAL, Victaulic Bermad Model C30, C50-P or A71.

**2.15 Hydrants and/or Hose Bibbs: Refer to Schedule on drawings**

2.15.1 Acceptable Products: Zurn, Watts, Jay R Smith, Mifab, Wade.

**2.16 Trap Seal Primers**

2.16.1 Provide flow actuated type priming device piped to nearest fixture so device will introduce regulated amount of water into trap whenever fixture is used. Acceptable Products: Watts A200-T, Zurn, Watts, J R Smith 2699, Wade 2400 Series.

2.16.2 Provide pressure actuated type priming device piped when nearest fixture is remote to the floor drain requiring trap priming. Acceptable Products: Precision Plumbing Products Model P-1, Watts Series LFTP300.

2.16.3 Electronic type trap primers can only be used as an alternate product subject to prior acceptance by the consultant and confirmation that the contractor has coordinated with and allowed for electrical connections required. These are to be allowed for in parkades and remote floor drains where the nearest flushing fixture is further away than manufacturer's recommendation.

## **2.17 Water Softeners**

2.17.1 Duplex water softening equipment to remove hardness to not more than 5 parts per million (0.3 grains per US gal) of hardness as determined by ASTM standard soap test when operated at 80 USgpm (5.0 L/s) peak flow, 110 USgpm (7.0 L/s) continuous flow. System shall be designed to provide approximately 55,000 USgal (208,000 L) net of softened water between regenerations based upon hardness of 100 parts per million  $\text{CaCo}^3$  at intermittent flow rate of 150 USgpm (9.5 L/s).

2.17.2 Softener equipment shall be approved design by Manufacturer regularly engaged in production of water treatment equipment. Equipment shall be complete from supply connection of unsoftened water to discharge connection of softened water. Installation shall be fully supervised by experienced factory trained Representative.

2.17.3 Equipment shall consist of two pressure type softener tanks operating with fully automatic, self-contained, hydraulically operated lift turn valve, and brine tankage system.

### **2.17.4 Softener Tanks:**

- .1 36" (900 mm) diameter by 60" (1,500 mm) shell height with domed ends and supported with steel strap legs.
- .2 Manufactured of steel welded to ASME code specifications, galvanized inside and out, for working pressure of 150 psi (1,034 kPa) and hydrostatically tested at pressure of 50% in excess of working pressure.
- .3 Equipped with one 11" (280 mm) by 15" (325 mm) maintenance opening located in top head of tank and one 4" (100 mm) by 6" (150 mm) maintenance opening located in tank side near bottom.

### **2.17.5 Brine Tank:**

- .1 36" (900 mm) diameter by 48" (1,200 mm) high with cover.
- .2 Manufactured of steel, welded and galvanized inside and out.
- .3 Equipped with elevated salt plate for collection of brine and suitable chamber housing automatic air eliminator.

- 
- 2.17.6 Brine system automatically opens to introduce brine into softeners, close to prevent entry of air and refill brine tank with proper amount of water.
  - 2.17.7 Upper distributor baffle distributes incoming hard water uniformly, without permitting any jet action to disturb resin surface, and to take off backwash flow.
  - 2.17.8 Hydraulic automatically operated diaphragm valves control regeneration steps of backwash, brine draw and slow rinse, purge fast rinse and service. Diaphragm valves shall incorporate self-adjusting flow regulators to properly control flow rate during regeneration regardless of pressure fluctuations and shall open and close slowly to minimize water hammer and noise.
  - 2.17.9 Regeneration controlled by electronic sensor with manual over-ride which compensates for variation of water usage and hardness and is unaffected by water temperature changes. Alternator shall allow only one unit to be regenerated while other unit is in service. Indicating lights shall show status of each softener. Totalizing meter shall continuously measure amount of soft water produced.
  - 2.17.10 Provide each softener complete with 20 ft<sup>2</sup> (1.85 m<sup>2</sup>) of high capacity resinous type material having minimum exchange capacity of 300,000 grains when regenerated with 15 lb (6.8 kg) of salt per ft<sup>3</sup>.
  - 2.17.11 Furnish complete test kit to Owner for conducting soap test.
  - 2.17.12 Power connection provided by Electrical Division.
  - 2.17.13 Acceptable Products: Culligan Hi-Flo 50 Model HB-600.

**2.18 Indirect Hydronic Domestic Hot Water Heater and Storage Tank**

- 2.18.1 Tank to be ASME rated to 125 psi (860 kPa) and be lined with Polyshield polymer-lined (or equal approved glass lined tank). Tank to come complete with:
  - .1 ASME/CSA rated temperature and pressure relief valve.
  - .2 22" (550 mm) minimum access panel.
  - .3 Thermal insulation to ASHRAE 90.1-2010 Standards.
  - .4 Lifting lugs.
  - .5 Drain valve.
  - .6 De-stratification pump (Intra-tank circulator).
  - .7 Temperature and pressure gauges.
- 2.18.2 Heat exchange to be an ASME stamped double walled copper U-tube with non-ferrous baffles, rods and water-side tube sheets.
- 2.18.3 The unit shall come complete with the following controls and interlocks which shall be BACnet MSTP:

- .1 Upper and lower immersion thermostats.
- .2 Immersion temperature limiting device (high limit control).
- .3 Terminal for remote on/off control.

2.18.4 The unit is to be fully compliant with ASHRAE 90.1-2010.

2.18.5 Factory start-up of the unit will be required.

2.18.6 The warranty for the unit is to be five (5) years.

2.18.7 Acceptable Products: PVI, AO Smith, Viessmann, Bradford White, Niles.

## **2.19 Water Heater and Tank (Electric)**

2.19.1 Glass-lined, electric hot water heater and tank, **ASME construction**, CSA listed, rated for 150 psi (1,034 kPa) working pressure.

2.19.2 Plated copper elements, fully automatic controls, manually adjustable thermostat, 120 V control circuit powered by fused transformer.

2.19.3 Extra density, vermin proof, glass fibre insulation with heavy gauge steel jacket finished with baked enamel finish over bonderized undercoat.

2.19.4 Magnesium anode protection, heavy duty magnetic contactors and fuse protection against excessive current flows.

2.19.5 Refer to Schedule on drawings.

2.19.6 Acceptable Products: AO Smith, Ruud, Rheem, State, PVI, Bradford-White.

## **2.20 Hot Water Storage Tank**

2.20.1 ASME construction, steel tank, glass lined, magnesium anode protection, painted exterior, for 125 psi (860 kPa) working pressure.

2.20.2 Extra density, vermin proof, glass fibre insulation with heavy gauge steel jacket finished with baked enamel finish over bonderized undercoat.

2.20.3 Refer to Schedule on drawings.

2.20.4 Complete with legs for vertical or horizontal installation (refer to drawings).

2.20.5 Acceptable Products: AO Smith, A&R Tank Ltd., NST (Niles Steel Tank), Bradford-White.

2.20.6 Provide PVI Brand AquaPLEX Engineered Duplex Alloy for Domestic Hot Water Storage Tank. No anode or lining required for this specific material and brand. This vessel is also acceptable for use with immersion type heating elements as well as the following:

- .1 PVI Power VT and Tricon Condensing Water Heaters.

- .2 PVI TURBOPOWER 99 Condensing Water Heater.
- .3 PVI TURBOPOWER Gas, Oil, Gas/Oil Water Heaters.
- .4 PVI DURAWATT Electric Water Heater.
- .5 PVI Quickdraw Steam, Solar, and Boiler Water Heaters.

## **2.21 Expansion Tank for Domestic Hot Water System**

- 2.21.1 Welded carbon steel expansion tank, ASME construction, stainless steel connection, heavy duty butyl diaphragm, rigid polypropylene liner and integral floor stand, in accordance with NSF/ANSI/CAN-61 for potable water service and shall meet the low-lead requirements of NSF/ANSI/CAN-372.
- 2.21.2 Refer to Schedule on drawing.
- 2.21.3 Acceptable Products: Amtrol ST-60V-C Therm-x-trol, State, Sparco, Flexcon, Wessels.

## **2.22 Thermostatic Water Controllers**

- 2.22.1 Provide factory tested and assembled high/low flow thermostatic mixing valves complete with check valve, pressure reducing valve, volume control, shutoff valve and stem type thermometer on outlet; strainer stop check on inlet, mounted in lockable cabinet of 16 ga (1.61 mm) prime coated steel. Capacity, model and locations as scheduled.
- 2.22.2 Field assembled systems will be accepted only where Manufacturer's Representative provides setup services after assembly and certifies in writing that valve has been properly adjusted and assembled. Manufacturers shall provide a seven year warranty against all failures on the thermostatic elements.
- 2.22.3 For local thermostatic water controller with integral check stops, wall mounting bracket, rough chrome finish, removable cartridge with strainer and thermal motor. Provide one spare cartridge for each valve size on individual units.
- 2.22.4 Inlet hot temperature to valves will be 140°F (60°C) to 160°F (70°C). Outlet temperature shall be set to 105°F (40°C).
- 2.22.5 Acceptable Products: Lawler, Leonard, Symmons, Armstrong Digital Water Temperature Control, Cash Acme, Caleffi, Powers, Guardian.

## **2.23 Recirculation Pumps**

- 2.23.1 Pump between Heater and Tank:
  - .1 Bronze body, bronze impeller.
  - .2 Spring loaded coupler between motor and pump shaft, drip proof.

- .3 Bronze sleeve type bearing, resilient-mount.
- .4 Refer to Schedule on drawings.
- .5 Aquastat on tank to suit 115V rating.
- .6 Acceptable Products: Bell & Gossett, Armstrong, Taco, Grundfos, Wilo.

2.23.2 Building Recirculation Pumps:

- .1 Bronze body, bronze impeller.
- .2 Spring loaded coupler between motor and pump shaft, drip proof.
- .3 Bronze sleeve type bearing, resilient-mount.
- .4 Refer to Schedule on drawings.
- .5 Acceptable Products: Bell & Gossett, Armstrong, Taco, Grundfos, Wilo.

**2.24 Pressure Booster System**

- 2.24.1 Provide packaged [**duplex - sized for 40/60 split**] pressure boosting system factory assembled, tested and adjusted and shipped to job site as integral unit.
- 2.24.2 Lead pump operates continuously; lag pump operates on system demand. When lead pump fails to operate, lag pump starts automatically.
- 2.24.3 Lead pump operates continuously; second and third pumps operate on system demand; system shall alternate second and third pumps automatically. When lead pump fails to operate, start next pump in sequence automatically.
- 2.24.4 Provide time delay relay to prevent lag pump short cycling on fluctuating demands.
- 2.24.5 Provide sufficient flow through pump to prevent overheating during low flow periods.
- 2.24.6 Provide low pressure control to stop pump operation if incoming water pressure drops to atmospheric.
- 2.24.7 Provide each pump with switch to permit manual or automatic operation.
- 2.24.8 Provide combination pressure reducing/check valve to maintain constant system pressure.
- 2.24.9 Additional Equipment:
  - .1 Manual transfer switch for lead-lag control.
  - .2 Pressure switch to shut-off pumps on adequate city pressure.
  - .3 Drawdown/pressure tank.

- 2.24.10 Provide time clock for automatic day-night changeover. Day cycle, pumps to operate continuously with pressure maintained by pressure reducing valves. Night cycle, pumps to operate intermittently with pressure switch located in pressure tank operating pump for pre-determined, adjustable time period.
- 2.24.11 Refer to Schedule on drawings.
- 2.24.12 Acceptable Products: Plad, Taco, Armstrong, Bell & Gossett (Xylem), Wilo, Grundfos.

## **2.25 Water Meter**

- 2.25.1 Arrange and pay for supply and installation of water meter.
- 2.25.2 Water meter shall be **supplied by Contractor** and shall be to **City/Municipal** Standards.
- 2.25.3 Hermetically sealed direct reading centre sweep register, one-piece cast bronze main case, rotating disc measuring chamber with flow control adjustment, magnetically driven, rated for 150 psi (1,034 kPa) service, reading in ft<sup>3</sup> (m<sup>3</sup>) and flanged ends conforming to AWWA C700, AWWA C701 or AWWA C702. Acceptable Products: Neptune Trident 8, Rockwell, Hersey.
- 2.25.4 Provide self-generating remote meter reader to suit municipal requirements. Provide conduit from water meter location to remote reader location.
- 2.25.5 Acceptable Products:
  - .1 Up to 2" (50 mm): Schlumber Neptune T-10 Meter with ProRead ARB.
  - .2 Greater than 2" (50 mm): Neptune Tru/Flo Compound Meter with ProRead ARB, Neptune High Performance Turbine Meter.

## **2.26 Ultraviolet Water Disinfection System**

- 2.26.1 System shall include sterilizer, remote mounted control panel, biological filter, elapsed time meter and temperature alarm.
- 2.26.2 Manufacturer's agent shall provide start-up and commissioning of system and shall provide operating and maintenance instructions to Owner. Provide installation, operating and maintenance instructions for insertion into Operating and Maintenance Manuals.
- 2.26.3 Manufacturer's Representative shall verify capacity of UV dosage by sampling for UV transmittance at 254 nanometre wavelength in water using single beam ultraviolet filtered photometer.
- 2.26.4 Provide water sterilization using 2-lamp UV system. Germicidal lamps constructed of UV-transmitting quartz shall provide UV dosing level of 30,000 microwatt-sec/cm<sup>2</sup>. Electrical

---

Characteristics: 120 volt/60hz/100 watts. Minimum rated operating life 9000 h.

- 2.26.5 Contract UV chamber of 316 stainless steel and rated for 125 psi (860 kPa) operating pressure. Seals shall be compatible with potable water system.
- 2.26.6 Provide separate biological cartridge type filter upstream of UV sterilizer to remove suspended particulate.
- 2.26.7 Unit pressure drop to be negligible.
- 2.26.8 Automatic lamp power control. UV sensor transmitting 4-20 mA signal for continual monitoring of fluence rate, remote control panel, BAS compatible.

### 3. **EXECUTION**

#### 3.1 **Supply Piping (General)**

- 3.1.1 Upon completion, flush water piping systems with water before installing fixtures to remove any foreign material in piping. Clean plumbing fixtures and equipment and leave in good operating condition.
- 3.1.2 Provide connections as required, including shutoff valves with unions or flanges to equipment installed by other trades.
- 3.1.3 Ream pipes and tubes. Clean scale and dirt, inside and outside, before assembly. Remove foreign material from piping.
- 3.1.4 Clamp cast-iron water pressure pipe at fittings with  $\frac{3}{4}$ " (20 mm) 316 stainless steel threaded rods and fasteners complete with required pipe retainer glands, adapters and harnesses to secure pipe sections and fittings together; **OR provide proper anchors, thrust blocks and supports throughout.**
- 3.1.5 Reduce horizontal piping with eccentric reducer fittings installed to provide drainage and eliminate air pockets.
- 3.1.6 Wherever dissimilar metals are joined or supported, provide non-conducting type connections or hangers to prevent galvanic corrosion. Plastic or rubber mechanisms are acceptable for hangers and supports. Brass adapters and valves are acceptable for pipe connections.
- 3.1.7 Install piping to allow for expansion and contraction without stressing pipe or connected equipment.
- 3.1.8 Where grooved piping systems are utilized, contractor to coordinate with product supplier to provide piping system design services to accommodate thermal movement and/or differential settlement of the piping system, included but not limited to, risers and horizontal piping systems. The service includes a detailed schematic design

locating anchors, anchor loads, guides, expansion joints and any other required Victaulic components to accommodate movement. A calculation report showing thermal movement and accommodation shall also be provided. A design stamped by a qualified professional engineer where the project is being constructed is required.

- 3.1.9 Provide clearance for insulation and access to valves, air vents, drains and unions.
- 3.1.10 For Pex or Pex-Al Pex potable water piping, use only the pipe manufacturers matched connection and coupling accessories. Provide supplier training and sample inspection by supplier's representative for initial installation and mock-ups.
- 3.1.11 For grooved joints, pipe ends shall be clean and free from indentations, projections and roll marks in the area from pipe end to groove for proper gasket seating. The gasket style and elastomeric material (grade) shall be verified as suitable for the intended service as specified.
  - .1 Supplier factory trained Representative shall provide on-site training for Contractor's field personnel in the use of grooving tools and installation of grooved joint products. Representative shall periodically visit the jobsite and review Contractor is following best recommended practices in grooved product installation.
- 3.1.12 When joining grooved ductile to grooved copper a di-electric waterway is necessary. The groove by groove di-electric waterway shall be used.
- 3.1.13 No in-position welding of stainless steel pipe is permitted.

### **3.2 Concealed Supply Piping**

- 3.2.1 Install concealed water supply piping to plumbing fixtures, trim items, equipment, hose bibbs, etc. using cast brass 90° drop ear elbow or drop ear tees, as the piping design dictates.
- 3.2.2 Provide blocking within the concealed space and the elbows and tees shall be secured to the blocking using brass screws to provide a rigid installation.
- 3.2.3 Do not install pipe in any part of wall where temperature is less than 42°F (5.5°C) under winter design conditions.
- 3.2.4 Under no circumstances shall domestic cold water piping be routed in topping or floor slab.

### **3.3 Plumbing System Acoustical Requirements**

- 3.3.1 Minimum pipe size for suite fixtures, including supplies to faucets, shall be ½" (15 mm).

- 
- 3.3.2 Ensure no rigid contact between pipes and supporting framing and gypsum wall board.
  - 3.3.3 Do not secure piping to partition which forms part of adjacent suite.
  - 3.3.4 Wrap pipes with minimum ¼" (6.0 mm) thick Rubatex or Armaflex sleeving and secure over insulation using oversized clamps. If piping is insulated, this requirement is waved if clamps mount over insulation. Hard plastic pipe sleeves are not acceptable. An alternate is to provide resilient pipe mounting system such as Acoustoplumb or HoldRite
  - 3.3.5 Tee take-offs serving back to back fixtures are not permitted. Divide supply lines at riser and feed each bathroom individually.
  - 3.3.6 Carry lavatory and bath wastes in back to back situations separately to waste stack; direct connections from back to back fixtures not acceptable.
  - 3.3.7 Oversize supply, waste and vent pipe penetrations of gypsum wall board by ⅛" (3.0 mm) to ¼" (6.0 mm), pipe centred in hole, gap caulked with silicone sealant and covered with escutcheon. This requirement does not eliminate need for firestopping. Refer to Section 23 05 05 Firestopping for firestop requirements.
  - 3.3.8 Do not allow pipe work to contact gypsum wall board, framing, conduit, electrical or ductwork fans connected to room services. Exercise special care in furred down bathroom ceiling spaces.
  - 3.3.9 Ensure water supply lines penetrating floors do not contact structure.
  - 3.3.10 Ensure sleeves through slab are sized to allow for proper clearances to allow firestop and insulation installation.
  - 3.3.11 Waste stacks and rainwater leaders shall not touch structure. Provide resilient support at floor penetration with neoprene pad isolators sized for minimum ⅜" (9.5 mm) static deflection. Neoprene pad isolators shall be equal to Mason "Super W". Ensure piping does not touch framing or gypsum wall board.
  - 3.3.12 Mount bathtubs on Mason "Super W" neoprene pad isolators sized for ⅛" (3.0 mm) static deflection under full load conditions (i.e. tub full of water). For one person tub, use five pads with 30 durometer rating. Manufacturer shall ensure filled tub will not exceed pad rating. If continuous support is required, provide isolators between support and structure. Ensure supply and drain piping can accommodate changes in deflection between full and empty conditions. Provide seal around tub lip to accommodate isolator deflection.

### **3.4 Valve Installation**

#### **3.4.1 General:**

- 
- .1 Where possible, disassemble solder end joint valves before soldering. Cycle, 2 pcs solder valves prior to soldering. Solder in fully open position with wet rag to prevent seat damage.
  - .2 Where disassembly and the subsequent reassembly are impossible, give special regard to solder jointing. Ensure valve parts are not melted or deformed during soldering.
- 3.4.2 Shut-Off Valves:
- .1 Install shut-off or isolation valves at the following locations:
    - .1 Where water service enters building.
    - .2 At base of each building riser.
    - .3 At each main branch supply point. Provide valve on each outlet leg from tee or cross.
    - .4 At each single plumbing fixture. Satisfied by provision of fixture stop where called up.
    - .5 At each piece of equipment.
    - .6 At points indicated on drawings.
    - .7 Where required by plumbing code.
- 3.4.3 Balancing Valves:
- .1 Install balancing valves in hot water recirculating branch lines and branch connections to return mains as indicated on drawings.
- 3.4.4 Pressure Reducing Valves:
- .1 Pressure reducing valve stations shall consist of the following:
    - .1 High-flow or main pressure reducing valve shall be sized based at 8 ft/s flow rate and shall be provided with strainer, reducer if required and shut-off valve on inlet side and reducer if required and shut-off valve on outlet side.
    - .2 Low-flow pressure reducing valve shall be integrated with main pressure reducing valve, or shall be provided in a secondary bypass with strainer and shut-off valve on inlet side and shut-off valve on outlet side.
    - .3 Bypass around both pressure reducing valves with normally closed globe valve, which shall be same pipe size as incoming or outflowing building service, and pressure gauge and gauge cock on each side of globe valve. Bypass only PRV; do not bypass water meter or backflow prevention device.

- .2 Set main pressure reducing valve at 60 psi (415 kPa) outlet pressure.
- .3 Set small flow pressure reducing valve at 5 psi (35 kPa) higher outlet pressure than main pressure reducing valve.
- 3.4.5 Drain Valves:
  - .1 Provide drain valves at low points in system.
  - .2 Install drain valves,  $\frac{3}{4}$ " (20 mm) minimum, or line size where piping is smaller than  $\frac{3}{4}$ " (20 mm).
  - .3 Install hose-end adaptor, cap and chain on discharge side of each drain valve or pipe to drain where indicated.
- 3.4.6 Mixing:
  - .1 On up-stream hot and cold supplies, in accessible location, provide positive swing check valves and strainers. This requirement in addition to check valve device that is integral to mixing valve or downstream in mixed supply. Provide access panel to check valves and strainers.

### **3.5 Vacuum Breaker Installation**

- 3.5.1 Install at each fixture or item of equipment where contamination of domestic water system can occur and with CSA B64.10 requirements.
- 3.5.2 Vacuum breaker installation shall be in accordance with manual "Cross Connection Control Manual" published by Pacific Northwest Section of American Water Works Association.
- 3.5.3 Atmospheric type vacuum breakers shall be installed at least 12" (300 mm) above flood level rim of fixture.
- 3.5.4 Vacuum breakers serving fume hoods shall be installed outside fume hood.
- 3.5.5 Provide drainpan with water deflection enclosure on concealed pressure type vacuum breakers with drain line to appropriate drain.
- 3.5.6 Complete testing of vacuum breakers prior to final acceptance of plumbing systems. Certificate shall be submitted, signed and witnessed that testing was satisfactory.

### **3.6 Backflow Prevention Station Installation**

- 3.6.1 Install at each fixture or item of equipment where contamination of the water system can occur and in accordance with CSA B64.10 requirements.
- 3.6.2 Pipe differential relief outlet to drain.
- 3.6.3 Backflow prevention station shall be in accordance with manual "Cross Connection Control" published in the BC Section of American Water Works Association.

- 3.6.4 Complete testing of reduced pressure principle backflow prevention devices shall be carried out under this section of work prior to final acceptance of plumbing systems. Certificate shall be submitted signed and witnessed that testing was satisfactory.

**3.7 Strainer Installation**

- 3.7.1 Install strainer blow-off connections.
- 3.7.2 Blow-off connections shall be full drain size and shall include:
- .1 Up to 2" (50 mm) - nipple and cap (hot services).
  - .2 2½" (65 mm) and larger - nipple, globe valve and nipple (hot services).
  - .3 All sizes (cold services) - plug blow-off connection only.

**3.8 Flanges and Unions**

- 3.8.1 Provide on connections to pumps, reducing valves, control valves, fixtures, and equipment.
- 3.8.2 Connections up to and including 2" (50 mm) size shall be bronze union, 150 psi (1,034 kPa) rating with ground seat. All larger connections shall be flanged.
- 3.8.3 Unions not required in installations using grooved mechanical joint couplings. (Couplings shall serve as unions and disconnect points.)

**3.9 Pressure Gauges**

- 3.9.1 Install pressure gauge at all pump suction and discharge points at inlet and outlet of all major equipment having more than a 4 psi (25 kPa) pressure drop and at each pressure reducing station inlet and outlet.

**3.10 Water Hammer Arrestors**

- 3.10.1 Size in accordance with the Plumbing and Drainage Institute PD1-WH-201 sizing procedures.
- 3.10.2 Install on branch lines to flush valves, solenoid valves, self-closing faucets, quick closing valves on refrigeration, kitchen, laundry and other equipment incorporating solenoid valves.
- 3.10.3 Install at the tops of all domestic water vertical risers, and as shown on the drawings.

**3.11 Thermometers**

- 3.11.1 Install at domestic hot water storage tank inlet and outlet, and at heat exchanger inlet and outlets.

- 3.11.2 Locate for ease of readability with sensing elements directly in contact with flowing medium and immediately adjacent to sensing elements.
- 3.11.3 When installed to sense the water temperature in a pipe, install its sensing element in a non-ferrous, separable well filled with a heat conduction paste. Install the separable well in a form which minimizes the restriction to water flow, if necessary, in a section of oversized pipe.

### **3.12 Pipe Joints**

- 3.12.1 Install di-electric type couplings or fittings where copper or stainless steel piping and accessories connect to plumbing equipment such as steel storage tanks, pressure reducing stations and ductile iron pipe.
- 3.12.2 Where water service enters building, terminate at edge of building with Smith Blair standard sleeve coupling having stainless steel nuts and bolts. Bridge excavation with ductile iron pipe.
- 3.12.3 Tie rods shall only be used in conjunction with fittings possessing integral tie lugs.
- 3.12.4 Tie rods complete with their associated nuts and bolts shall be coated with two coats of asphaltic paint after installation.
- 3.12.5 Where plastic PEX piping systems are being used, the complete pipe joining "System" shall be entirely provided by the pipe Manufacturer (Uponor AquaPEX, PureLink/AquaLink).
- 3.12.6 All roll grooves on Stainless Steel Schedule 10 pipe must be formed using "RX" rolls.
- 3.12.7 All roll grooves on Copper tube must be formed using "RR" rolls.
- 3.12.8 Ensure minimum coupling pressure rating is 300 psi (2,065 kPa).
- 3.12.9 Viega press fittings shall be completed according to manufacturer's installation instructions using only manufacturer's press tool appropriate to the pipe and application.

### **3.13 Air Vents**

- 3.13.1 Install at high points in domestic hot water recirculation system.
- 3.13.2 Install on tees. Do not install on horizontal piping or radiused elbows.
- 3.13.3 Install ½" (15 mm) minimum isolating gate valve ahead of each air vent.
- 3.13.4 Pipe air vent discharge connections separately to nearest building drain using ¼" (6.0 mm) hard drawn copper.

---

**3.14 Hydrants and/or Hose Bibbs**

- 3.14.1 Provide operating keys to Owner for hose bibbs without attached handle.
- 3.14.2 Provide isolating shut-off valve upstream of hose bibbs.
- 3.14.3 Set exterior ground type hose bibb boxes flush and anchor in 18" (450 mm) square x 8" (200 mm) thick concrete collar set at 1" (25 mm) above surrounding grade.
- 3.14.4 Connect drain ports on floor mount type hose bibbs indirectly to drainage system where such drainage ports are located within confines of building.
- 3.14.5 Seal around perimeter of hose bibbs with silicone caulk. Where waterproof membrane is present, provide hose bibb with membrane clamp.

**3.15 Trap Seal Primer Valves**

- 3.15.1 Provide floor drain trap primers in water closet rooms and other areas connected to sanitary sewer in accordance with Provincial Plumbing Code and as designated on drawings. Pipe material shall be Type L copper, NSF-61 approved, polypropylene tubing or aquapex for buried and in-slab pipe connections.
- 3.15.2 Locate where readily accessible by maintenance staff.
- 3.15.3 Provide shutoff upstream to allow service without affecting other fixtures.
- 3.15.4 Provide minimum of 12"x12" (300 mm x 300 mm) access door at each trap primer location to access shutoff and primer.
- 3.15.5 Where electronic trap primers are used, the contractor shall include and allow for the complete installation and coordination with the electrical trade.

**3.16 Hot Water Tanks and Heaters**

- 3.16.1 Provide temperature and pressure relief valves. Install so that probe properly senses temperature. Pipe relief port full outlet size to drain. Position discharge at drain to prevent splash-over.
- 3.16.2 Provide vacuum relief valve and check valve on cold water supply.
- 3.16.3 Provide isolating valves at tank and heater water connections.
- 3.16.4 Provide corrosion resistant watertight pan under any hot water storage tank and/or hot water heater/storage tank in compliance with Ontario Building code
- 3.16.5 Provide Type B vents on gas fired units.
- 3.16.6 Provide Type A vents on positive discharge units.

---

**3.17 Recirculation Pumps**

3.17.1 Pump between Heater and Tank:

- .1 Install in accordance with Manufacturer's instruction.
- .2 Provide check valve on recirculation pump discharge and isolation valves up-stream of pump inlet and down-stream of check valve.
- .3 Provide electrical controls connection for the recirculation pump between heater and tank.

3.17.2 Building Recirculation Pump:

- .1 Coordinate with Electrical Division for provision of manual switch with wiring to pump.
- .2 Provide check valve on recirculation pump discharge and isolation valves upstream of pump inlet and downstream of check valve.
- .3 Coordinate with Controls division for connection to DDC system or a dedicated programmable clock.

**3.18 Water Booster Pump System**

- 3.18.1 Install in accordance with Manufacturer's instruction.
- 3.18.2 Provide electrical controls and connection between control panel and pumps.
- 3.18.3 Coordinate with Electrical Division for provision of power to control panel.
- 3.18.4 Provide pressure reducing valve on pump discharge.
- 3.18.5 Provide isolation valves and grooved couplings or flanges at inlet and discharge headers.

**3.19 Water Meters**

- 3.19.1 Approved meter rooms must provide vehicular access allow 10'-0" (3.0 m) vertical clearance from the City roadway to water meter station.
- 3.19.2 Install at location depicted on drawings, under no circumstances shall any other valves, backflow prevention, or any other fixture be placed upstream of the water meter.
- 3.19.3 Provide strainer on inlet to water meter between inlet valve and water meter.
- 3.19.4 Provide isolation valves on inlet to and outlet from water meter with valved bypass around the water meter connected to water system upstream of inlet valve and downstream of outlet valve. See Detail for UBC supplied by Utilities.
- 3.19.5 Wiring and conduit to remote reader by this section of work.

- 3.19.6 Provide test report from independent test agency to verify that meter and reader have been installed and set to read within acceptable limit of accuracy as set out in AWWA standards.

**3.20 Testing and Inspection**

- 3.20.1 Testing shall consist of hydraulic pressure testing at 200 psi (1,380 kPa) for 8 hours.
- 3.20.2 Comply with all requirements of Section 22 05 93 Testing, Adjusting and Balancing for Plumbing.

**3.21 Flushing and Chlorination of Water Lines**

- 3.21.1 Thoroughly flush water piping until free from scale, sediment and debris as soon as possible after system filled with water.
- 3.21.2 On completion of laying and testing, all water piping shall be pre-flushed, chlorinated and flushed again in accordance with AWWA C-651.
- 3.21.3 Retain firm, qualified to supervise and inspect chlorination and flushing procedures and perform chemical biological tests as required.
- 3.21.4 Mains shall be chlorinated to chlorine residual of not less than 10 ppm after standing for 24 hours. Hypochlorite and water are recommended as disinfectant. AWWA C-651 recommends amount of chlorine required.
- 3.21.5 Submit to Consultant certificate from testing firm that chlorination and flushing has been successfully completed.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 Scope of Work

- 1.2.1 Interior sanitary waste and vent piping shall be provided as indicated on drawings from plumbing fixtures to the
- .1 Exterior sanitary building service as indicated on drawings.
- 1.2.2 Interior storm drainage piping and rainwater leaders shall be provided as indicated on drawings from roof drains, area drains, planter drains and catch basins to the
- .1 Exterior storm building service as indicated on drawings.

## 2. PRODUCTS

### 2.1 Interior Drain Waste and Vent Pipe and Fittings

#### 2.1.1 Buried Pipe and Fittings:

- .1 Cast-iron pipe and fittings with mechanical joint stainless steel couplings to CAN/CSA-B70.
- .2 Acrylonitrile-Butadiene-Styrene (ABS) Drain Waste and Vent Pipe Fittings conforming to CAN/CSA-B181.1 or,
- .3 Polyvinyl Chloride (PVC) Drain Waste and Vent Pipe and Pipe Fittings conforming to CAN/CSA-B181.2. Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- .4 IPEX System 15 SDR-15 Polyvinyl Chloride (PVC) Drain Waste and Vent Pipe and Pipe Fittings conforming to CAN/CSA-B181.02 for underground and parkade drainage where hydrocarbons may be present. Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.

#### 2.1.2 Above Ground Pipe and Fittings:

- .1 Cast-iron pipe and fittings with mechanical joint stainless steel couplings to CAN/CSA-B70.
- .2 DWV copper drainage pipe with cast brass or wrought copper drainage pattern fittings with 50/50 Sn/Pb recessed Solder joints.

- 
- .3 IPEX System XFR, complete with approved firestopping accessories. Refer to Section 23 05 05 Firestopping. Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.
  - .4 IPEX System 15 complete with approved firestopping accessories. Refer to Section 23 05 05 Firestopping. System 15 is not allowed in high rise applications, in return air plenums or vertical service spaces. Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.
  - .5 Manufacturer of cast iron piping shall be certified to current standards of ISO-9001, ISO-14001, OHSAS-18001 Standards, and must be made in North America, with recycled content stated on submission materials.
    - .1 Acceptable Manufacturers: Bibby Ste-Croix, Tyler Pipe, AB+I.
  - .6 No HUB couplings shall be certified to the current standard of CSA B602 and 3rd party listed to the current standard of CAN/ULC-S102.2.
    - .1 Acceptable Products: Bibby St-Croix, Anaco, Tyler.
- 2.1.3 Pressurized Sanitary Storm (Force Main) Piping and Fittings
- .1 Copper Type K or L hard tempered with solder joint fittings (above grade only).
  - .2 IPEX Xirtec PVC Schedule 80 pipe and pipe fittings, or equivalent, complete with solvent joint fittings. Pipe and fittings shall meet minimum flame and smoke spread ratings for the building type and construction. Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.
  - .3 IPEX Xirtec CPVC Schedule 80 pipe and fittings, or equivalent, complete with solvent joint fittings for applications in high buildings and plenums which require a minimum flame spread rating of 25 and smoke developed classification of 50. Materials in contact with CPVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- 2.1.4 Additional Requirements:
- .1 Cast iron DWV system shall be connected with couplings that are certified to CSA-B-602 and third party listed to current CAN/ULC-S102.2 for flame and smoke spread ratings. Heavy-Duty, Shielded, Stainless Steel Couplings composed of a fully corrugated shield, a clamp assembly with a 3/8 inch gear screw tightened to 80 inch pounds,

neoprene gaskets and listed to comply with CSA-B60 and Third party listed to current standard of CAN/ULC-S102.2.

- .1 Manufacturers: Anaco/Husky HD 2000 (Bibby Ste-Croix) or equal.
- .2 Pressure waste piping from pumping stations and other equipment shall be pressure piping and fittings as specified for domestic water.
- .3 Plastic (PVC) piping where used underground shall adapt to approved pipe material prior to penetrating the building slab. Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- .4 Copper to cast-iron joints shall be male brass adaptors to tapped fittings.
- .5 Nipples shall be cast-iron or heavy brass.

## **2.2 Chemical Resistant Sewer Piping including Vent Piping**

2.2.1 Cast Iron Pipe: ASTM A 518/A 518M Corrosion Resistant High Silicon Iron Castings, hubless, service weight

- .1 Fittings: High silicon cast iron to same standard as piping.
- .2 Joints: CISPI 310, neoprene gaskets and stainless steel clamp and shield assemblies.

2.2.2 Glass Pipe: ASTM C1053

- .1 Fittings: ASTM C1053.
- .2 Joints: Stainless steel compression couplings with tetra-fluoroethylene seal ring.

2.2.3 FRPP and PVD Pipe: Polypropylene, flame retardant

- .1 Fire retardant polypropylene (FRPP) shall comply with, and be labeled to CSA standard CAN3-B181.3-M86, Polyolefin Laboratory Drainage Systems. FRPP shall be manufactured from resins meeting ASTM D4101 and conform to ASTM D2447 for dimensional tolerances.
- .2 PVDF pipe and fittings shall comply and be labeled to, plumbing standard ULC/ORD-C996.1-ASTM D3311 and ASTM D3222 and shall be manufactured from Kynar type 460 and 740 resins meeting a flame spread of less than 25, and a smoke developed rating of less than 50, under CAN/ULC-S102.2.
- .3 Fittings: Polypropylene.
- .4 Joints: Electrical resistance fusion or thermally fused with mandrel and plate.

---

**2.3 Drains**

- 2.3.1 Floor drains connected to the sanitary system shall include trap primer connections from local water supply points at sinks, lavatories and as shown on the drawings.
- 2.3.2 Provide drains as specified in Hose Bibb and Drain Schedule with lacquered cast-iron body (except as noted otherwise) and clamping collar.
- 2.3.3 Provide drains by single Manufacturer throughout.
- 2.3.4 Drains shall be 4" (100 mm) unless noted otherwise. Provide heavy duty H-20 bearing strength drain grates at all locations where vehicles and heavy traffic areas are located (including but not limited to entry vestibules, loading docks and aprons, maintenance garage bays, auto shop bays, metal shop bays, garbage rooms) and as indicated on the drawings.
- 2.3.5 Roof drains shall include domes, screens, drainage grids, etc. Plastic component parts are not acceptable.
- 2.3.6 Acceptable Products: Jay R. Smith, Zurn, Mifab, Wade, Watts.

**2.4 Submersible Sump Pumps**

- 2.4.1 Type: CSA approved, completely submersible, vertical, centrifugal. Pumps with sheet metal or plastic parts on impellers or casing will not be accepted.
- 2.4.2 Casing: Hermetically sealed of cast-iron or bronze.
- 2.4.3 Impeller: Non-clog of cast-iron or bronze. Sanitary pumps to pass 2" (50 mm) sphere. Storm pumps to pass 1" (25 mm) sphere.
- 2.4.4 Shaft: Stainless steel on ball bearings.
- 2.4.5 Seals: Ceramic and carbon; oil lubricated.
- 2.4.6 Motor: CSA approved for submersible operation complete with built-in automatic reset thermal overload protection
- 2.4.7 Controls
  - .1 Simplex System: Pressure switch inside control unit with oil isolated diaphragm.
  - .2 Duplex System: Provide CSA approved automatic alternator control panel and float switches (four) to alternate pump operation on average load and cut in second pump on rising level or pump failure. Panel shall be totally pre-wired complete with contacts, circuit breakers, pump run lights, HOA starters, selector switches, electronic alternator circuit devices, manual override circuit and transformers.
  - .3 Alarms: Separate float switch complete with contacts in panel for remote alarm installation. Provide high level alarm light and beeper with reset.

- .4 Provide BTL certified BACnet/IP for alarm and monitoring through BAS.
- 2.4.8 Electrical: Pumps and alarm shall be fitted with suitable length waterproof flexible cord with junction box for mounting in sump.
- 2.4.9 Slide Rail System
  - .1 Provide factory slide rail system with discharge shutoff valves outside sump operable through extended valve box assembly.
  - .2 Provide standard rail guides with pump and support brackets and check valve guide.
  - .3 Lift out check valve and sealing flange shall lift out with pump.
  - .4 Discharge and support elbow shall be mounted on sump base for rail and pump support.
  - .5 Sump cover and hatch shall be suitable for H-20 traffic loading with latch open cover for pump removal.
- 2.4.10 Acceptable Products: Myers, Zoeller, Barnes, Plad, Grundfos.
  - .1 Self-lubricating bearings.
  - .2 3" (80 mm) discharge.

## **2.5 Pressure Waste Valves**

- 2.5.1 Plug type: full port valve, flanged ends, screwed ends are acceptable for valves smaller than 2" (50 mm).
  - .1 Up to 2" (50 mm) size - Keystone round port Ballcentric valve with flanged ends, Homestead #1512 Ballcentric with flanged ends.
  - .2 2" (50 mm) and larger - Keystone round port Ballcentric valve with flanged ends, Homestead #1522 Ballcentric with flanged ends.
- 2.5.2 Check Valves:
  - .1 3" (80 mm) size and smaller: APCO rubber flapper, Terminal City outside lever and weight, ITT Flygt HDL Model 5087.
  - .2 4" (100 mm) size and larger: APCO series 6000 cushioned swing check valve complete with oil operated dash point, Terminal City outside lever and weight, ITT Flygt HDL Model 5087.

## **2.6 Stormceptor Unit**

- 2.6.1 Stormceptor Model STC-300 oil and grit separator complete with Jellyfish filter.
- 2.6.2 Designed, to remove minimum 80% and constructed average annual post-development TSS and remove maximum 40% of

average annual post-development TP based on average annual loadings from all storms less than or equal to 2 year/24 hour storm.

- 2.6.3 Unit to be LEED compliant to satisfy LEED Site Stormwater Management Credit SS6.2 and shall be certified by Ministry of Environment that meets MOE Protocol for definition of OGS.
- 2.6.4 Unit complete with bolt down manhole lid cover and ladder rungs for access.
- 2.6.5 26000 L storm water based on fifteen (15) minute rainfall intensity.
- 2.6.6 Remove minimum 80% TSS and minimum 40% TP based on the following runoff coefficient.

## 2.7 Oil Interceptor

- 2.7.1 The oil interceptor shall be concrete body oil interceptor, equipped with baffles, adjustable oil draw-off, steel H-20 load-rated manhole cover and frame and concrete manhole extensions with ladder rungs to suit buried depth up to grade.
- 2.7.2 Unit shall be equipped with flow control devices at inlet to unit installed as recommended by Manufacturer.
- 2.7.3 Valve controlling oil waste draw-off from interceptor shall be rising stem, threaded ends, double discs, threaded bonnet, 150 psi (1,034 kPa) gate valve suitable for use with oil.
- 2.7.4 Acceptable Products:
  - .1 4" (100 mm) inlet – Langley Concrete Type II Coalescing Plate Oil Interceptor with 16 mm Spacing.
  - .2 6" (150 mm) inlet – Langley Concrete Type II Coalescing Plate Oil Interceptor with 8 mm Spacing.
  - .3 8" (200 mm) inlet – Langley Concrete 4212 Coalescing Plate Oil Interceptor with 8 mm Spacing.
- 2.7.5 Terminate no-corrode riser above valve at OPW #104-AN 300 mm cast-iron manhole and set assembly in concrete collar flush with finish grade. Manhole cover plate shall be marked "WASTE OIL VALVE."

## 2.8 Catch Basins

- 2.8.1 Barrell and base: ASTM C478M, ASTM C478; precast concrete sections laid on cast-in-place reinforced concrete foundation pad, **[36" (900 mm)]** diameter with precast concrete top.
- 2.8.2 Inlet assembly: Two piece heavy duty cast steel or cast iron frame and grate with ground or machined grate and frame bearing surfaces.
  - .1 Curb gutter style: Rectangular grate and storm back, capacity 247 cu ft/s (7 cu m/s).

- .2 Standard: Round frame and grate with capacity 194 cu ft/s (5.5 cu m/s).
- .3 Manhole frame: Grate top, capacity 141 cu ft/s (4.0 cu m/s).
- 2.8.3 Minimum 4' (1,200 mm) cover over outlet and minimum 2' (600 mm) sump below outlet.
- 2.8.4 Acceptable products: AE Precast, Langley Precast, Fraserway Precast, Diamond Precast.

## 2.9 **Manholes Sumps**

- 2.9.1 Formed bottom manholes: ASTM C478M, ASTM C478; reinforced precast concrete sections laid on cast-in-place reinforced concrete foundation pad as specified in section 03 30 00
  - .1 Size 48" (1,200 mm) diameter.
  - .2 Cover: Standard cast iron with minimum sized pick hole and frame. Use heavy duty cover and frame in vehicular traffic areas.
  - .3 Steps: ¾" (20 mm) diameter galvanised steel on 16" (400 mm) centres.
- 2.9.2 Acceptable products: AE Precast, Langley Precast, Fraserway Precast, Diamond Precast.

## 3 . **EXECUTION**

### 3.1 **Floor Drains**

- 3.1.1 Install floor drains at low points to provide proper drainage.
- 3.1.2 Water piping from trap primer to floor drain shall be PEX tubing where cast into concrete and protected in a polyethylene sleeve where buried below slab. Provide Type L copper where exposed within building.

### 3.2 **Roof Drains**

- 3.2.1 Install roof drains at low points on roof to provide proper drainage. Coordinate with roofing Contractor.
- 3.2.2 Install in accordance with RCABC standards to maintain integrity of roof guarantee.
- 3.2.3 Install integral expansion joints where roof drains are installed directly above rainwater leaders.
- 3.2.4 Provide watertight seal in the gap between the flashing, pipe and lead cap on roof overflow drains to ensure water does not leak into the building interior during an overflow scenario.

- 3.2.5 Verify style of roof drain with roofing details prior to submitting shop drawings.

### **3.3 Sewage Pumps**

- 3.3.1 Control wiring between control panel and control devices shall be supplied by this Division. Control work shall be done in accordance with Electrical Specification, the Canadian Electrical Code and the Technical Safety BC requirements. Install electrical control wiring in metallic conduit.
- 3.3.2 Install pumps to Manufacturers' installation instructions.
- 3.3.3 Mount level regulators at elevations indicated.
- 3.3.4 Mount control panel within line of sight and within 32' (10 m) of sump chamber access cover.
- 3.3.5 Test control circuit operation after installation of pumps by filling pumping chamber at least twice.
- 3.3.6 Correct deficiencies in control circuit.
- 3.3.7 Provide intrinsically safe barriers for sump pumps located within parking garages, vehicle service or parking bays and in other areas which can receive fuels.
- 3.3.8 Provide heat tracing and minimum 1" (25 mm) thick pipe insulation for all sump pump discharge pipes where they run through an unheated space.

### **3.4 Safes, Flashing and Vent Terminals**

- 3.4.1 Terminate vent terminals minimum of 1" (25 mm) above water level at which roof drainage overflows through roof overflow scuppers or drains.
- 3.4.2 Cleanouts passing through walls or floors subject to hydrostatic pressure and waterproofed by means other than membrane shall be provided with clamping collars and flashings, tied directly to the cleanout clamping collar.
- 3.4.3 Supply flashings to cleanouts and drains. Securely fix flashing clamps and extend 12" (300 mm) beyond edge of cast-iron fittings.
- 3.4.4 Supply and install waterproofing membrane under built-up showers and mop sinks on floor not slab-on-grade. Safes shall extend across floors and up walls and curb to minimum height of 6" (150 mm) and shall be turned into floor drain flange, unless specifically noted otherwise. Seams shall be completed sealed. Treat both sides of safe with two coats of water waterproof sealant compatible with membrane.
- 3.4.5 Vent flashing minimum 18" (450 mm) x 18" (450 mm) base dimension shall terminate flush with top of 12" (300 mm) high vent

pipe and gap between flashing and pipe shall be closed with aluminum cap 3" (80 mm) high. Main flashing shall not be turned over pipe. Vent installation detail to be compliant with RCABC Standard Construction Detail 10.3.5.

- 3.4.6 Securely fix all roof drains and tie into roof membrane using membrane clamping collars. Installation to comply with RCABC Standard Construction Detail 10.3.6.

### **3.5 Piping**

- 3.5.1 Do not install ABS, PVC or other plastic piping upstream of kitchen grease interceptors, where high temperature waste is directed.
- 3.5.2 Do not install piping with glued joints at temperatures below those recommended by solvent Manufacturer.
- 3.5.3 Refer to Section 23 05 05 Firestopping for firestop requirements.
- 3.5.4 Joints to be connected with couplings as per Section 2.1.3.
- 3.5.5 Support horizontal runs and brace at intervals and points as recommended by the Manufacturer and/or local Authority Having Jurisdiction.
- 3.5.6 Support vertical stacks and assemblies and brace as recommended by the Manufacturer and/or local Authority Having Jurisdiction.

### **3.6 Testing and Inspection**

- 3.6.1 Tests on sanitary and storm systems shall consist of hydraulic pressure testing of 5 ft water column (30 kPa) minimum and 25 ft water column (75 kPa) maximum for 8 hours. Check for proper grade and obstruction with ball test.
- 3.6.2 Tests on sump pump discharge shall consist of hydraulic pressure testing of 50 psi (1,379 kPa) minimum for 8 hours.
- 3.6.3 Tests on sumps or tanks that receive sanitary sewage shall consist of filling sump with water to rim and have no drop in water level over 24 hours.
- 3.6.4 Air test in accordance with Plumbing Code may be used during freezing conditions.

### **3.7 Catch Basins, Sumps and Manholes**

- 3.7.1 For buried interceptors (all types), include interconnecting pipe installation when provided as part of the assembly by the supplier, and provide concrete pad(s) and hold down straps as indicated on manufacturers literature and installation instructions for buried interceptors.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 **Codes and Standards**

- 1.2.1 All products shall be UL/ULC classified in accordance with NSF/ANSI/CAN-61 for potable water service and certified to the no/low lead standard of NSF/ANSI/CAN-372.
- 1.2.2 Fixtures shall display CSA approval where CSA standard is available.
- 1.2.3 Plumbing fittings shall be to CAN/CSA B125, Plumbing Fittings.
- 1.2.4 Plumbing fixtures shall be to CAN/CSA B45, 'General Requirements for Plumbing Fixtures'.
- 1.2.5 Vitreous china plumbing fixtures shall be to CAN/CSA B45.1, 'Ceramic Plumbing Fixtures'.
- 1.2.6 Enamelled cast-iron plumbing fixtures shall be to CAN/CSA B45.2, 'Enamelled Cast-iron Plumbing Fixtures'.
- 1.2.7 Porcelain enamelled steel plumbing fixtures shall be to CAN/CSA B45.3, 'Porcelain Enamelled Steel Plumbing Fixtures'.
- 1.2.8 Stainless steel plumbing fixtures shall be to CAN/CSA B45.4, 'Stainless Steel Plumbing Fixtures'.
- 1.2.9 Plastic plumbing fixtures shall be to CAN/CSA B45.5, 'Plastic Plumbing Fixtures'.

### 1.3 **Colour**

- 1.3.1 Vitreous china fixtures shall be white unless otherwise noted.
- 1.3.2 Stainless steel fixtures shall be satin and/or mirror finish or combination thereof.
- 1.3.3 Exposed plumbing brass and metal work shall be heavy triple chromium plated.

### 1.4 **Quality**

- 1.4.1 Similar plumbing fixtures shall be by one manufacturer.
- .1 Standard of Acceptance: American Standard, Kohler, Caroma, Zurn Toto, Moen-Commercial.
- 1.4.2 Plumbing fixture supply brass shall be of one Manufacturer, unless otherwise specified.

- .1 Standard of Acceptance: American Standard, Kohler, Caroma, Zurn, Toto, Moen-Commercial, Delta-Commercial, Sloan.
- 1.4.3 Fixtures shall be free from flaws or blemishes. Surfaces shall be clear, smooth and bright and have dimensional stability.
- 1.4.4 Plumbing fixtures and trim shall be new, unless otherwise noted.
- 1.4.5 Visible or exposed parts, trim, supplies traps, tubing, nipples, escutcheons, check valves on diverter supply lines and valves to sanitary and/or kitchen fixtures shall be chrome-plated finish, unless otherwise noted.
- 1.4.6 Fittings shall have heavy duty stems.
- 1.4.7 Roof drains, floor drains: Standard of Acceptance: J.R. Smith, Zurn, Wade, Watts.

2 . **PRODUCTS: REFER TO SCHEDULE ON DRAWINGS**

3 . **EXECUTION**

3.1 **Fixture Installation**

- 3.1.1 Connect fixtures complete with specified trim supplied, drains, accessory piping, vented traps, stops or valves, reducers, escutcheons and fittings for proper installation of fixtures and supply fittings.
- 3.1.2 Provide necessary hangers, supports, brackets, reinforcements, steel back-up plates and floor flanges to set fixtures level and square. Mount fixtures so 200 lb (90 kg) mass will not loosen or distort mounting.
- 3.1.3 Provide minimum 18 ga (1.27 mm) circular stainless steel shrouds for concealing services dropping to island or bench fixtures from ceiling spaces complete with ceiling and counter flanges. Diameter shall be to accommodate services; however, shrouds shall be same diameter in one room or area.
- 3.1.4 Provide chrome-plated quarter turn mini ball valves for lavatories, sinks and tank type water closets.
- 3.1.5 ABS P-traps and waste arms are not permitted.
- 3.1.6 Water Closets:
  - .1 Floor mounted water closets shall be connected to waste utilizing brass or cast-iron floor flanges with lead stub or mechanical joint connections and wax seals.
  - .2 Polished chrome flexible pipe supplied with metal compression rings are acceptable for tank type water closets. Supply shall incorporate ½" (15 mm) inlet x ¾" (9.5

mm) compression outlet angle stop complete with 12" (300 mm) long flexible riser to fixture. PEX or other plastic supplies are not acceptable.

- .3 Provide 4" (100 mm) drain pipe connections and branch drains from all water closets. Use staggered wye connections at toilet branch drain connections; avoid flat double wye connections.
- .4 Provide extended spud pieces on handicapped water closets to accommodate closed toilet seat being raised.

3.1.7 Lavatories and Sinks:

- .1 Polished chrome flexible pipe supplied with metal compression rings are acceptable. Supply shall incorporate ½" (15 mm) inlet x ¾" (9.5 mm) compression outlet angle stop complete with 20" (500 mm) long flexible riser to fixture.
- .2 Control handles for two handle mixing faucets shall be positioned with cold control on right and hot control on left. Activation by rotating cold control handle clockwise and hot control handle counter clockwise.
- .3 Faucets shall be complete with nuts and tailpieces.
- .4 Provide gaskets and/or sealing washers to prevent entry of water into fixture trim, faucet holes or punchings in millwork.
- .5 Gooseneck spouts shall have clearance of 8" (200 mm) from nozzle tip to countertop, unless otherwise specified.
- .6 Plastic control handles and spouts are unacceptable.
- .7 Lavatory and sink P-traps shall be complete with either a cleanout or slip joint connection.

3.1.8 Urinals:

- .1 Piping, fittings and P-traps from urinals shall not be copper; vents above urinal rim may be copper.
- .2 Urinals shall have individual wastes.

**3.2 Fixture Trim Holes or Punchings**

- 3.2.1 Fixture punchings for faucets or other trim shall match holes necessary for specified trim.
- 3.2.2 Provide fixture and templates to applicable trades for holes and cut outs required in millwork.

**3.3 Walls and Floors**

- 3.3.1 Fixtures mounted on glazed tile surfaces shall have ground faces to finished surface.
- 3.3.2 Plumbing fixtures in contact with walls and floors, shall be sealed with Dow Corning anti-mildew 786 building sealant, made watertight and beaded smooth.

---

**3.4 Water Hammer Arrestors**

- 3.4.1 Provide water hammer arrestors or shock absorbers on fixtures with flush valves and/or quick closing valves or solenoid valves.

**3.5 Handicap Fixtures**

3.5.1 Water Closets:

- .1 Install wall hung water closets designed for handicap use with top of seat 17" (425 mm) to 19" (475 mm) above finished floor.
- .2 Install offset on handicap water closet flush valve connection to eliminate interference with grab bar mounting.
- .3 Install flush valve so handle is facing transfer or non-grab bar side of water closet.
- .4 Install flush valve so that hands free flush is coordinated to flush with the seat cover up.

3.5.2 Lavatories and Sinks:

- .1 Provide offset P-traps.
- .2 Supplies shall accommodate offset P-trap.
- .3 P-traps and waste arms shall be insulated with manufactured insulation kit or ½" (15 mm) of fibreglass insulation and finished with polyvinyl chloride jacket.
- .4 Acceptable Manufactured Products: Truebro 'Handi Lav-Guard,' Brocar Products Inc. 'Trap Wrap,' Sexauer 'Handi Lav-Guard' Plumberex 'Handy Shield'.

**END OF SECTION**

## 1. **GENERAL**

### 1.1 **Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 **Scope of Work**

1.2.1 Some items in this section relate to connecting to equipment supplied by Owner or other trades.

1.2.2 Responsibility for this equipment once delivered to site is included in this Section.

1.2.3 Unless otherwise noted, provide and install trim under this section of work for equipment supplied by Owner or other trades.

1.2.4 Provide escutcheons for wall and floor penetrations.

## 2. **PRODUCTS**

### 2.1 **Stoves, Range or Countertop**

2.1.1 Connect  $\frac{3}{4}$ " (20 mm) natural gas through shut-off valves, unions and pressure regulators.

### 2.2 **Dish Washer**

2.2.1 Connect  $\frac{1}{2}$ " (15 mm) hot water from adjacent kitchen sink complete with shut-off valve.

2.2.2 Connect waste to adjacent kitchen sink or garburator.

### 2.3 **Clothes Washers**

2.3.1 Connect hot and cold water complete with water hammer arrestors and automatic washer supply valves.

2.3.2 Acceptable Products: Waltec 29W521 Auto-Wash-Trol

### 2.4 **Fridges with Ice Machines**

2.4.1 Connect  $\frac{1}{2}$ " (15 mm) cold water through shut-off valve, union and coiled loop of copper tubing to permit pulling of fridge.

## 3. **EXECUTION**

### 3.1 **Valves**

3.1.1 Locate valves in accessible location.

---

**END OF SECTION**

1. **GENERAL**

1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

2. **PRODUCTS – NOT USED**

3. **EXECUTION**

- 3.1.1 Supply and install piping components - pipe fittings, valves, strainers, vacuum breakers, backflow preventers, unions and insulation - as indicated, specified or as recommended by equipment Manufacturer.
- 3.1.2 Arrange rough-in and piping connections to equipment, as recommended by equipment Manufacturer.
- 3.1.3 Chrome plate uninsulated piping and piping components exposed to view, unless otherwise indicated. Provide chrome plate escutcheons at wall and floor penetrations.
- 3.1.4 Connect equipment requiring plumbing connections.
- 3.1.5 Piping servicing kettles, ranges, etc., shall be neatly racked together with heating pipes and shall be minimum of 12" (300 mm) above floor.
- 3.1.6 Refer to kitchen Consultant's food facilities and plumbing drawings for details of equipment item numbers and rough-in locations.
- 3.1.7 Provide and install components under this section of work for kitchen equipment requiring plumbing connections that are supplied under other sections of work.
- 3.1.8 Gas pressure regulator settings indicated are for elevations up to 2,000' (610 m) above sea level. BTU input range shall be derated for the elevation above sea level if above 2,000' (610 m).

**END OF SECTION**

---

1. **GENERAL**

1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

2. **PRODUCTS**

2.1 **Compressed Air Pipe**

- 2.1.1 Above ground pipe and fittings inside building:

- .1 Schedule 5 steel pipe to ASTM A-135 Grade A (1008/1010 carbon steel) with interior zinc based coating and exterior 99.99% pure zinc galvanized coating with conversion coating and clear organic topcoat used in conjunction with Victaulic Pressfit fitting system. Acceptable Products: Allied Tube and Conduit's Air-Flo 300 steel pipe.
- .2 Schedule 5S stainless steel pipe to ASTM A-312, Type 304/304L, full finish annealed and certified for use with the Vic-Press 304™ piping system.
- .3 Schedule 40 galvanized steel inside and outside, ASTM A53 and CSA B63-1966 (R1971).
- .4 Type "K" or "L" hard drawn seamless copper tubing to ASTM B88.
- .5 125 psi (860 kPa) rating.
- .6 Conformity with ANSI B31 standards for steel, cast-iron, brass.
- .7 Do not use thread protection couplings, close nipples, running ripples or street elbows.

2.2 **Fittings**

- 2.2.1 Steel Pipe:

- .1 Coupling type fittings: Victaulic Pressfit with Grade T Nitrile O-ring.
- .2 Screwed of galvanized steel.
  - .1 2" (50 mm) and larger, 150 psi (1,034 kPa) to ASTM A-338-61.
  - .2 ¾" (19 mm) to 1-¾" (45 mm) to ASTM A-47-77.
  - .3 Plugs 300 psi (2,070 kPa) solid steel or forged to ASTM-105-77 Grade II.
- .3 Grooved end for galvanized steel pipe:

- 
- .1 Cast ductile iron to ASTM A-536-84.
  - .2 Wrought steel to ASTM A-234 WPB.
  - .3 Factory-fabricated steel ASTM A53.
  - .4 Ends per CSA B242-80.
  - .5 Victaulic.
  - .4 Welded:
    - .1 Forged steel (same weight as connecting pipe), butt type.
    - .2 Long radius elbows and reducing fittings.
    - .3 Welded Tees or Sweepolets: Branch connections except those less than half diameter of main.
    - .4 Threadolets or Weldolets: Branch connection less than half diameter of main.
    - .5 Caps: Standard weight seamless carbon steel to ASTM A181.7, Grade I and ANSI B16.5.
  - 2.2.2 Stainless Steel Pipe:
    - .1 Precision, cold drawn, austenitic stainless steel with elastomer O-ring seals.
    - .2 Victaulic Vic-Press 304™.
  - 2.2.3 Copper Pipe:
    - .1 Wrought copper fittings to ANSI B16.22 and 95.5 SN/Pb solder under 1" (25 mm), Silfos 1" (25 mm) and over. Grooved Victaulic fittings 2" (50 mm) and over.
  - 2.2.4 Grooved Joint Couplings:
    - .1 Steel Pipe: Victaulic Style 107N (rigid) and Style 177 (flexible); installation-ready, for direct stab installation without field assembly.
    - .2 Copper Tubing: Victaulic Style 607H; installation-ready, for direct stab installation without field disassembly. Flaring the adjoining tube or fitting ends to accommodate alternate sized couplings is not permitted.
    - .3 Provide with gaskets suitable for compressed air services.
  - 2.2.5 Unions
    - .1 Steel Pipe: Malleable iron, ground joint and brass to iron seat, 150 psi (1,034 kPa).
    - .2 Copper Pipe: Di-electric couplings or waterway fittings.
    - .3 Unions not required in installations using grooved mechanical joint couplings (couplings shall serve as unions and disconnect points).
  - 2.2.6 Flanges:
-

- .1 Steel Pipe: Raised face, steel weld-neck, lap or back-welded slip-on-type (flanges compatible with mating flange). Carbon steel bolts and nuts ASTM A307. Bolts full diameter of bolt holes, bolts in each hole.
- .2 Copper Pipe: Copper to iron flanges shall be brass.
- .3 Flange Adapter: Flat face, ductile iron housings with elastomer pressure responsive gasket, for direct connection to ANSI Class 125 or 150 flanged components. Victaulic Style 741.

## 2.3 Valves

- 2.3.1 Globe: 200 psi (1,380 kPa), wog.
  - .1 2" (50 mm) and smaller - Crane 14-½P, Jenkins 2032, Lunkenheimer 73-P5.
- 2.3.2 Valves shall be washed in hot solution of sodium carbonate or tri-sodium phosphate (10 lb (4.5 kg) per 26 USgal (100 L) of water).

## 2.4 Air Compressor

- 2.4.1 Provide two stage, duplex, air cooled, horizontal, reciprocating type, stationary air compressors, mounted on welded steel base, with provision for V-belt adjustment.
- 2.4.2 Compressor Regulation: Automatic dual control with time delay relay. Pressure switch shall operate to cut out at gauge pressure of 120 psi (827 kPa) with minimum differential gauge pressure of 100 psi (690 kPa) for start-stop operation and gauge pressure of 110 psi (760 kPa) for constant speed.
- 2.4.3 Control: operate base load machine at constant speed with automatic standby by other machine. Set for automatic start-stop. Provide lead lag change over.
- 2.4.4 Intercooler shall be air cooled with fan.
- 2.4.5 Provide each unit with safety valves, pressure gauge, moisture separator, moisture drain valve and automatic condensate trap.
- 2.4.6 Provide Aftercooler:
  - .1 Suitable for operation under gauge pressure of 135 psi (930 kPa) working pressure, complete with removable tube nests and tube plates, water inlet piping with automatic water valve.
  - .2 Suitable for cooling discharge air to within 51°F (11°C) of ambient air temperature, with compressors operating at specified capacity.
- 2.4.7 Provide replaceable cartridge type filter and silencer for each compressor.

- 2.4.8 Refer to schedule on drawings for capacities.
- 2.4.9 Acceptable Products: DeVilbiss Air Cooled, Atlas Copco Air Cooled, Ingersoll Air Cooled, Brunner Air Cooled, Broomwade Air Cooled, Kaeser.
- 2.4.10 Provide anti-vibration mounts. Transmissibility 5%.

## **2.5 Air Dryer**

- 2.5.1 Provide refrigerated compressed air dryer of self-contained hermetically sealed mechanical refrigeration type complete with water cooled heat exchanger, refrigeration compressor, automatic controls moisture removal trap, all internal wiring and piping and full refrigerant charge, ready for connections to power, water and drains. Refrigeration unit shall operate at 60% of time at all but maximum load conditions.
- 2.5.2 Valved bypass shall be installed around air dryer. Inlet and outlet connections shall be factory insulated.
- 2.5.3 Dryer Capacity: To match compressor at a gauge pressure of 690 100 psi (690 kPa), maximum gauge pressure of 125 psi (860 kPa) atmospheric dew point, -30°F (-34°C) entering air 95°F (35°C) 60% RH.

## **2.6 Air Receiver**

- 2.6.1 Provide 24" (600 mm) diameter by 72" (1,800 mm) horizontal tank built to CSA B51 and Provincial Regulations for working gauge pressure of 125 psi (860 kPa).
- 2.6.2 Inlet and outlet connections shall be ¾" (19 mm) diameter.
- 2.6.3 Fittings shall include adjustable pressure regulator, safety valve, gauge pressure range of 0 to 150 psi (1,034 kPa), 3" (75 mm) dial to CGSB 91-GP-1 Type A, Grade A, drain cock and automatic condensate trap.
- 2.6.4 Provide Provincial inspector's certificate, NB label or ASME label.
- 2.6.5 Tanks shall be shop primed.

## **2.7 Compressed Air Outlets**

- 2.7.1 Compressed Air Outlet CA-1: Wall mounted quick disconnect fitting with shut-off upstream of outlet.
- 2.7.2 Compressed Air Outlet CA-2: Air tool control complete with strainer, regulator, gauge, oiler and quick disconnect fitting. Provide shut-off upstream of outlet.
- 2.7.3 Compressed Air Outlet CA-3: Ceiling drop connection to 78" (2,000 mm) above floor complete with rigid piping take-off from top side of main and return bend to 20" (500 mm) below main. Adapt a lower

---

end of return bend to ½" (12 mm) industrial flexible compressed air hose with quick disconnect outlet with shut-off upstream of outlet.

**2.8 Lubricator**

- 2.8.1 In-line lubricators shall be 1" (25 mm) diameter.
- 2.8.2 Standard of Acceptance: DeVilbiss L-9660E.

**3 . EXECUTION**

**3.1 General**

- 3.1.1 Ream pipe ends.
- 3.1.2 Grade piping toward compressor and/or provide in-line water separators.
- 3.1.3 Exercise care with flux application to copper pipe joints to minimize excess inside completed joints.
- 3.1.4 Make screwed joints with full cut standard tapes pipe threads. Provide pipe dope or Teflon tape to male threads.
- 3.1.5 Grooved joints shall be installed in accordance with the Manufacturer's latest published installation instructions. Grooved ends shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove. Gaskets shall be of an elastomer grade suitable for the intended service, and shall be molded and produced by the coupling Manufacturer. Grooved coupling Manufacturer's factory trained Representative shall provide on-site training for Contractor's field personnel in the use of grooving tools and installation of grooved joint products. Representative shall periodically visit the jobsite and review Contractor is following best recommended practices in grooved product installation. (Distributor's Representative is not considered qualified to conduct training or jobsite visit(s)).
- 3.1.6 Install Vic-Press 304™ in accordance with Victaulic recommendations. Pipe shall be certified for use with the Vic-Press 304™ system, square cut 0.03" (0.06 mm), properly deburred, and cleaned. Pipe ends shall be marked with a gauge supplied by Victaulic. Use a Victaulic 'PFT' series tool with the proper sized jaw for pressing.
- 3.1.7 After pipe installation but before outlet valve installation blow line clear with dry air or nitrogen.

**3.2 Valves**

- 3.2.1 Valves shall be disassembled prior to soldering.
- 3.2.2 Install shut-off or isolation valves at the following locations:

- 
- .1      Base of each building air riser.
  - .2      Main branch supply point, provide valve on each outlet leg from tee or cross.
  - .3      Upstream of each air outlet and/or each equipment connection.
  - .4      Points as indicated on drawings.

**3.3      Tests and Inspection**

- 3.3.1      Tests on compressed air systems shall consist of air-pneumatic pressure tests of 200 psi (1,380 kPa) for 8 hours. Soap shall be used on all joint being tested pneumatically.

**END OF SECTION**

## **1. GENERAL**

### **1.1 Conformance**

- 1.1.1 General Conditions, Supplements and Amendments shall govern this Division (read in conjunction with Instruction to Tenderers / Bidders). This section covers items common to all sections of Mechanical work and is intended to supplement requirements of Division 01. Refer also to Sections 21 05 06 and 22 05 00.

### **1.2 Work Included**

- 1.2.1 Provide complete, fully tested and operational mechanical systems to meet requirements described herein, in complete accordance with applicable codes and ordinances.
- 1.2.2 "Provide" shall mean "Supply and Install" products and services specified.
- 1.2.3 Provide materials, equipment and plant, of specified performance and quality, with current models with published, certified ratings for which replacement parts are readily available.
- 1.2.4 Provide project management and on-site supervision to undertake administration, meet schedules, ensure performances, and coordination, and establish orderly completion and delivery of fully commissioned installation.
- 1.2.5 Follow Manufacturer's recommendations for installation, safety, access for inspection, maintenance and repairs. Provide access to motors, belts, filters and lubricating points. Install equipment to permit maintenance and disassembly with minimum disturbance to connecting piping or duct systems.
- 1.2.6 Most stringent requirements of this and other mechanical sections shall govern.
- 1.2.7 Work shall be in accordance with the Drawings and Specifications and their intent, complete with necessary components, including those not normally shown or specified, but required for complete installation.
- 1.2.8 Provide seismic restraints for required equipment, piping and ductwork.
- 1.2.9 Connect mechanical services to equipment furnished by Owner or other Sections, including start-up and test.

### **1.3 Standard of Acceptance**

- 1.3.1 Means that item named and specified by Manufacturer and/or catalogue number forms part of specification and sets standard regarding performance, quality of material and workmanship and

when used in conjunction with referenced standard, shall be deemed to supplement standard.

- 1.3.2 Acceptable product Manufacturers are listed within section where they are specified or in equipment schedules.
- 1.3.3 Where two or more items of equipment and/or material, of the same type, are required, provide products of single Manufacturer.
- 1.3.4 Visible Manufacturer's nameplate shall indicate Manufacturer's name, model number, serial number, capacity data, electrical characteristics and approval stamps.
- 1.3.5 Provide new materials and equipment not less than quality specified and of current models with published ratings and available replacement parts. Equipment shall have ULC, CSA or ASME nameplates as required by Authorities having jurisdiction.
- 1.3.6 Use same brand of Manufacturer throughout, unless otherwise specified, for each specification application of equipment or material.
- 1.3.7 Replace materials less than specified quality and relocate work incorrectly installed as determined by Consultant.

#### **1.4 Addition of Acceptable Manufacturers**

- 1.4.1 Equipment/material considered to satisfy specification, but of Manufacturer other than those named in section specifying equipment/material may be submitted in writing to Consultant for consideration not later than five working days prior to close of tender or bid depository Sub-Trade tender, whichever is earlier.
- 1.4.2 Addition of Manufacturer's names to specifications shall be by addendum only.
- 1.4.3 Provide complete technical and performance equivalency comparison to specified equipment to show that proposed equipment is equal to, or better than the specified equipment. At a minimum, provide a checklist or side by side comparison with the following information:
  - .1 Physical dimensions and installed weight.
  - .2 Electrical characteristics.
  - .3 Performance data.
  - .4 Acoustical data.
  - .5 Service space requirements.
  - .6 Components specifications breakdown (Fins material, tube material, casing material, operating components specifications, etc.)
  - .7 Maintenance requirements.

- .8 Use the technical specifications of the equipment in this specification as a checklist to show compliance/non-compliance.

## **1.5 Tender Inquiries**

- 1.5.1 Contractor queries during tender period shall be made in writing to Consultant. Contractor queries will be collected and suitable addenda issued for clarification. No verbal information will be issued by Consultant's office during tender. Tender queries may be emailed, mailed, or couriered to Consultant's office. No telephone questions will be answered.

## **1.6 Equipment List/Sub-Trades**

- 1.6.1 Unless requested otherwise, submit within seven days of contract award a list naming Sub-Contractors and Manufacturers of equipment to be used.
- 1.6.2 Equipment list shall be full list of materials intended for installation.

## **1.7 Detailed Price Breakdown**

- 1.7.1 Provide to Consultant within 30 days of award of Contract, separate materials and labour breakdown. Progress payments shall not be processed until breakdown is received as follows:
  - .1 Project start-up costs (shop drawings, permits, etc.).
  - .2 Insulation and firestopping.
  - .3 Vibration isolation.
  - .4 Seismic bracing.
  - .5 Plumbing.
  - .6 Commissioning.
  - .7 Fire protection.
  - .8 Hot water heating.
  - .9 Sheet metal.
  - .10 Controls.
  - .11 Verification of control systems.
  - .12 Balancing of air and water systems.
  - .13 Equipment and systems testing.
  - .14 Maintenance Manuals and Record Drawings.
- 1.7.2 Contractor to provide materials and labour breakdown for each point listed on Consultant's change notice. Contractor also to receive same from affected Sub-Trades and submit their breakdown. Additional information to be provided as per Consultant's request.

---

**1.8 Responsibilities**

- 1.8.1 Responsibility as to Division providing equipment or materials rests solely with General Contractor. Extras shall not be considered based on difference in interpretation of specifications as to which trade provides certain equipment or materials.
- 1.8.2 Visit site before tendering. Examine local and existing conditions on which work is dependent. No consideration will be granted for any misunderstanding of work to be done resulting from failure to visit site.
- 1.8.3 Ensure equipment does not transmit noise and/or vibration to other parts of building, as a result of poor installation practice.
- 1.8.4 Where Contract Documents do not contain sufficient information for proper selection of equipment for bidding, notify Consultant during tendering period.
- 1.8.5 Examine Consultants' (architectural, code, landscape, structural, civil, electrical, food services) drawings plus Code Consultant's report and work of other trades to ensure work can be carried out. Conflicts or additional work not covered by drawings and specifications shall be brought to attention of Consultant before start of work.
- 1.8.6 During freezing weather, protect materials such that no harm can be done to installations already in place and/or to materials and equipment on project.
- 1.8.7 On completion of work, tools and surplus waste materials shall be removed and work left clean and operating correctly.
- 1.8.8 Advise Consultant of specified equipment, material or installation which violates laws, ordinances or regulations.

**1.9 Coordination and Supervision**

- 1.9.1 Employ FULL-TIME superintendent until total completion and defects and deficiencies are rectified. An amount of **\$6,000.00** will be included in addition to deficiency holdback at substantial completion to ensure full-time superintendent remains on site until work is certified totally performed.
- 1.9.2 Check drawings of trades to verify space and headroom limitations for work to be installed. Coordinate work with trades and make changes to facilitate satisfactory installation.
- 1.9.3 Drawings are diagrammatic and approximately to scale unless detailed otherwise. They are not intended to show structural details or architectural features. Contract Documents establish scope, material and installation quality and are not detailed installation instructions.

- 1.9.4 Install distribution systems and equipment generally in locations and routes shown, close to building structure avoiding interference with other services or free space.
- 1.9.5 Work out interference problems on site with other trades and coordinate work before fabricating or installing any material or equipment. Where necessary, produce interference drawings. Ensure materials and equipment fit into allotted spaces and equipment can be properly serviced and replaced. Extras for improper coordination and removal of equipment to permit remedial work shall not be considered.
- 1.9.6 When open web structural joists are used, obtain structural shop drawings to ensure adequate space is available for installation of pipes and ductwork.
- 1.9.7 Coordinate with other divisions including, but not limited to the following:
  - .1 Electrical requirements for mechanical equipment and devices requiring electrical power and connection to fire alarm/annunciator panels for mechanical equipment.
  - .2 Mechanical services connection locations with kitchen, laundry and irrigation equipment.
- 1.9.8 Mechanical Contractor shall provide following services:
  - .1 Coordinate mechanical work.
  - .2 Follow up on material and equipment deliveries, review shop drawings and produce interference drawings.
  - .3 Ensure Sub-Trades are installing work properly.
  - .4 Ensure interconnecting phases with Mechanical are covered.
  - .5 Review cost breakdown, progress claims and cost submissions for mechanical work.
  - .6 Resolve and direct responsibility for warranty.
  - .7 Provide digital photographs of progress as specified.

#### **1.10 Inspection of Work**

- 1.10.1 Consultant Representative shall review work prior to being concealed. Piping below ground must be reviewed prior to covering.
- 1.10.2 Work shall be approved by authorities having jurisdiction.
- 1.10.3 Openings shall be sealed, in particular in fire rated walls and floors. Sealing shall be inspected prior to covering.

#### **1.11 Permits**

- 1.11.1 Obtain required permits and pay fees and comply with Provincial, Municipal and other legal regulations and bylaws applicable to work.

- 1.11.2 Arrange for inspection of work by authorities having jurisdiction. On completion of work, furnish final unconditional certificates of approval by inspecting authorities.
- 1.11.3 Contractors and Sub-Contractors responsible for installation of smoke control and sprinkler systems shall be made available to demonstrate sequence of operation and interconnection with other life safety/fire protection systems at coordinated site inspection with Authority Having Jurisdiction for occupancy permit.

#### **1.12 Codes, Regulations and Standards**

- 1.12.1 Mechanical work shall conform to the following codes, regulations and standards, and other codes in effect at time of award of Contract, and any others having jurisdiction. The applicable version of each code and standard shall apply unless otherwise specified in the contract documents:
  - .1 Bylaws.
    - .1 Local Building Bylaws.
  - .2 Canadian Council on Animal Care.
    - .1 Guide to the Care and Use of Experimental animals.
  - .3 Canadian Gas Association.
    - .1 National Standard of Canada CAN/CGA-B149.1 (latest edition). - Natural Gas Installation Code.
    - .2 National Standard of Canada CAN/CGA-B149.2-M95. - Propane Installation Code.
  - .4 SMACNA Publications
    - .1 HVAC Duct Construction Standards.
    - .2 Fire, Smoke and Radiation Damper Installation Guide.
    - .3 Guidelines for Seismic Restraints of Mechanical Systems.
- 1.12.2 Where specifications specifically indicate requirements more onerous than indicated codes, these requirements shall be incorporated.

#### **1.13 Warranty**

- 1.13.1 Equipment and systems shall be warrantied for one year. Provide written certifications to Owner. Provide extended warranty certificates on equipment as applicable and specified.
- 1.13.2 Use of equipment or systems during construction shall not alter warranty period or represent acceptance of work or equipment.
- 1.13.3 Warranty coverage shall include labour and material to correct defective equipment, workmanship, material and building damage caused by failure of same.

---

1.13.4 Warranties shall be effective from date of Substantial Completion.

**1.14 Workmanship**

1.14.1 Workmanship shall be in accordance with established practice and standards accepted and recognized by Consultant and Contractor.

1.14.2 Tradesmen engaged in installation of work covered within Mechanical shall be qualified in accordance with requirement of Tradesmen Qualification Act and pertinent licensing requirement required by Ministry of Municipal Affairs.

**1.15 Performance Verification of Installed Equipment**

1.15.1 Installed mechanical equipment may be subject to performance verification as specified herein if required by Consultant.

1.15.2 When performance verification requested, equipment shall be tested to determine compliance with specified performance requirements.

1.15.3 Consultant will determine by who shall carry out testing. When requested, Contractor shall arrange for services of independent testing agency.

1.15.4 Testing procedures shall be reviewed by Consultant.

1.15.5 Maintain building comfort condition when equipment removed from service or testing purposes.

1.15.6 Promptly provide Consultant with test reports.

1.15.7 Should test results reveal that originally installed equipment meets specified performance requirements, Owner will pay costs resulting from performance verification procedure.

1.15.8 Should test results reveal equipment does not meet specified performance, equipment will be rejected and the following shall apply:

- .1 Remove rejected equipment. Replace with equipment which meets requirements of Contract Documents, including specified performance requirements.
- .2 Replacement equipment may be subject to performance verification as well, using same testing procedures on originally installed equipment.
- .3 Contractor shall pay costs resulting from performance verification procedure.

**1.16 Drawings and Measurements**

1.16.1 Drawings are diagrammatic and are intended to indicate scope and general arrangement of work and are not detailed installation drawings. Do not scale drawings. Obtain accurate dimensions from Architectural and Structural drawings.

1.16.2 Consult Architectural drawings and details for exact locations of fixtures and equipment. Obtain this information from Consultant where definite locations are not indicated.

1.16.3 Take field measurements where equipment and material dimensions are dependent upon building dimensions.

**1.17 Interference Drawings**

1.17.1 Provide interference check Revit model to indicate coordination with other trades on site has been carried out, conflicts identified and resolutions found.

**1.18 Shop Drawings**

1.18.1 Submit shop drawings in the format and quantity specified in the general conditions for all equipment indicated and proposed for as ACCEPTABLE PRODUCT in the section where they are specified or in the equipment schedules. A comprehensive listing of mechanical equipment and materials complete with the expected submission dates shall be submitted to Consultant within 30 days of contract award. Consultant reserves right to modify list.

1.18.2 Shop drawings shall be submitted in electronic (PDF) form as discussed with Consultant in accordance with Guidelines on Shop Drawings including the following information:

- .1 Cover sheet.
- .2 Physical and dimensional data.
- .3 Service space requirements.
- .4 Electrical requirement data.
- .5 Performance data.
- .6 Manufacturers' specifications.
- .7 Installation instructions.
- .8 Starting instructions.
- .9 Maintenance instructions.
- .10 Operating instructions.

1.18.3 Fan and pump submissions shall include performance curves (charts are not acceptable).

1.18.4 Include radiated, discharge and inlet sound power levels for major pieces of mechanical equipment.

1.18.5 Do not include non-applicable information. Non-applicable information shall be removed entirely or crossed out from shop drawing.

1.18.6 Cover sheet shall include the following information:

- .1 Title, number of pages, Contractor, Supplier, Manufacturer, date of submission.

- .2 Place for Consultant's review stamp 4" (100 mm) x 3" (80 mm).
  - .3 Related parties involved in Contractor's pre-submission review (Mechanical and General Contractors).
  - .4 Related parties involved in Consultant's review.
  - .5 Area allocated for comments.
- 1.18.7 Maintain one complete copy of reviewed shop drawings on site in indexed 3-ring binder.
- 1.18.8 Shop drawings not prepared as described above shall not be reviewed by Consultant.
- 1.18.9 Do not order equipment or materials until shop drawings have been accepted by Consultant.
- 1.18.10 Related mechanical equipment and materials shall be submitted together (e.g. coils, heat exchangers, glycol pump, furnaces complete with cooling coil and condensing unit). Shop drawings not properly submitted with related equipment shall be held until related shop drawings submitted.
- 1.18.11 Submit in Imperial (SI Metric) units to match those specified.
- 1.18.12 Consultant's review of shop drawings shall not relieve Contractor from compliance with specified requirements. Installed materials and equipment shall meet specified requirements whether or not shop drawings are reviewed by Consultant.
- 1.18.13 Shop drawing review by Consultant shall provide the following certification: "Reviewed for general design and compliance with the contract documents. Dimensions and suitability for site condition are the responsibility of the Contractor. Coordinate electrical requirements with the Electrical Contractor. This review of drawing shall not relieve the Contractor from complying with the conditions of the contract documents."

#### **1.19 Duct and Pipe Mounted Control Equipment**

- 1.19.1 The following automatic control equipment will be supplied by Controls Contractor but installed by appropriate trade sections of Mechanical Contract:
- .1 Automatic control valves.
  - .2 Temperature control wells.
  - .3 Pressure tapings.
  - .4 Flow switches.
  - .5 Automatic control dampers.
  - .6 Static pressure sensors.
  - .7 Water check meters.
  - .8 Gas check meters.

- .9 BTU meters.

**1.20 Spare Parts**

1.20.1 Provide spare parts as follows:

- .1 One set of packing for each pump.
- .2 One casing joint gasket for each size pump.
- .3 One head gasket for each heat exchanger.
- .4 One glass for each gauge glass installed.
- .5 One set of V-belts for each piece of machinery.
- .6 One filter cartridge for each filter installed (pre- and final filters).

**1.21 Project Close-Out Requirements**

1.21.1 The project closeout requirements are specifically listed in each section of this specification. Refer to detailed specifications in each section for further, detailed requirements.

**1.22 Semi Final Inspection**

1.22.1 Perform the following before semi-final field review:

- .1 HVAC systems capable of operation with automatic controls in operation with alarms functional.
- .2 Tests on systems and equipment completed and certificates of approval obtained from Authorities.
- .3 Rough balance of **air** and **water** systems completed.
- .4 Firestopping completed. Refer to Section 23 05 05 Firestopping for firestop requirements.
- .5 Valve tagging completed and equipment, ductwork and piping identified. Escutcheons installed.
- .6 Equipment lubricated in accordance with Manufacturer's data.
- .7 Extended warranty form mailed to Manufacturer and copy provided to Owner.
- .8 Systems chemically cleaned and flushed, strainers cleaned and water treatment initiated. Equipment drains installed. Manufacturer's report on acceptability of treatment obtained.
- .9 Submit sample of Operating and Maintenance Manuals. [Arrange for Operation and Maintenance Instruction Seminar and submit schedule for approval.]
- .10 Ensure access doors suitably located and equipment accessible.
- .11 Written report submitted by Manufacturer's Representative on noise and vibration control devices including flexible

- connections. **Equipment alignment carried out by qualified millwright and certified report submitted.**
- .12 Seismic sway bracing and restraint systems installed.
  - .13 Check operation of plumbing systems and fixtures. Ensure fixtures are solidly supported.
  - .14 Fan plenums cleaned and permanent filters installed.
  - .15 Ensure electrical connections to mechanical equipment are complete and motor rotation correct.
  - .16 For packaged, self-contained HVAC equipment, Manufacturer's checkout list completed. Copies forwarded to Consultant and included in Maintenance Manuals.
  - .17 Turn all digital photography files over to Consultant with dates of photos and locations taken from.
  - .18 Verify that documentation for LEED® credits is complete.

### **1.23 Substantial Completion Requirements**

1.23.1 Consultant shall issue checklist for completion by Contractor before Substantial Completion Field Review. Provide written declaration that work is complete. The following items shall be complete before Substantial Completion Field Review:

- .1 Piping expansion compensators and flexible connections checked by Supplier – inspection report filed with Commissioning Agent.
- .2 Seismic restraints inspected by Suppliers' Professional Engineer and report has been filed with Commissioning Agent. Schedule S Letter of Assurance from Seismic Engineer submitted.
- .3 All access doors and panels are in place and not painted closed.
- .4 HVAC piping systems have been cleaned, flushed and all final strainer baskets are in place. Provide copy of test reports.
- .5 Steam piping has been cleaned, flushed and inspected for operational readiness.
- .6 Steam and pressure piping system As-builts submitted and complete with registration forms filled out for submission to Provincial Boiler and Pressure Vessel Authorities.
- .7 Boiler(s) started and efficiency checks performed by factory trained personnel, with start-up checklists and test sheets submitted and filed with the Commissioning Agent.
- .8 Chiller start-up sheets and performance check has been done by Suppliers' representative, reports file with Commissioning Agent.
- .9 Atrium smoke exhaust system has been tested and verified.

- .10 Exit Stair vestibule pressurization fans have been tested and verified.
  - .11 Ductwork has been cleaned, provide letter of verification to Commissioning Agent and this Consultant.
  - .12 Draft balancing reports have been submitted to this consultant.
  - .13 Commissioning Checklists for operational readiness and safety checks have been submitted to this Consultant.
  - .14 Controls pre-operational readiness checklists (end to end checks and sequences of operation) have been verified and submitted to this Consultant.
  - .15 All control devices have been calibrated and checked for proper operation. Submit report through Commissioning Agent.
  - .16 Final draft Mechanical Maintenance Manuals have been submitted for review to this Consultant.
  - .17 Draft Record drawings (marked up whiteprints or ACAD files) have been submitted to this Consultant for review.
  - .18 The most recent Site Review (inspection) Report has been re-submitted to this Consultant with all outstanding items either crossed off and initialled as "Done", and outstanding items noted with "Time to Complete" or "by others" with a clear statement of who the "others" are and that they have been alerted to perform the rectification of the deficient work.
  - .19 Confirmation that training sessions have been arranged and set up for the Owners' operating personnel for Controls and Systems Operation.
  - .20 Final certification of all medical gas systems has been performed and Certification Package from testing Agency has been forwarded to the Consultant.
  - .21 Refer to requirements in Section 21 05 06 and Section 22 05 00 for plumbing and fire protection systems.
- 1.23.2 Complete the Substantial Completion Checklist as attached as Appendix "A" of this section.
- 1.23.3 Complete Residential Unit Completion Checklist as attached as Appendix "B" of this Section for each residential unit and submit prior to requesting Substantial Completion.

#### **1.24 Deficiency Holdbacks and Deficiency Inspections**

- 1.24.1 Work under this Division, which is still outstanding when substantial completion is certified, will be considered deficient and a sum equal to minimum twice the estimated cost of completing that work will be held back.

---

## 2. PRODUCTS

### 2.1 Operating and Maintenance Manuals

- 2.1.1 Acceptable Agencies: MDT, KD Engineering Ltd., Western Mechanical Services, Inland Technical Services.
- 2.1.2 Provide services of acceptable agency to prepare proper documentation and instruction to Owner in operation and preventative maintenance of mechanical equipment and systems. Complete and turn over documentation two months before Substantial Completion. Provide proposed table of contents and first draft of General Systems Description to the consultant for review prior to preparing full O&M Binders.
- 2.1.3 Provide three 8.5" (215 mm) x 11" (275 mm) catalogue binders with hot stamped lettering front and spine. One copy of final manuals to remain with Consultant during warranty period.
- 2.1.4 Provide electronic format for Maintenance Manuals as well as hard copy, to contain all of the same content as the hard copy. The electronic format shall be arranged in a searchable, segmented format using PDF format with both Table of Contents linking and Bookmark formatting. Scanned material will not be accepted. Where possible and as available, include Maintenance and Operation videos from equipment Suppliers and Manufacturers that demonstrate Maintenance procedures.
- 2.1.5 Each binder shall be indexed with custom made tab dividers (9 point oriole Bristol divider paper stock) with sequentially numbered colour index tabs of laminated Mylar plastic as available from Tab colours shall be orange for 1.0, 1.1, 1.2, 1.2 ... series tabs, green for 2.0, 2.1, 2.2... series tabs, yellow for 3.0, 3.1, 3.2... series tabs, red for 4.0, 4.1... series tabs. The following indexing system shall be used:
  - .1 Tab 1.0 - Mechanical Systems: title page with clear plastic protection cover.
  - .2 Tab 1.1 - List of Mechanical Drawings: provide list of mechanical drawings.
  - .3 Tab 1.2 - Description of Systems: provide description of each system with summer or winter operating variances and controller operating setpoints.
  - .4 Tab 1.3 - Operating Division: provide operating description of each major component and how components interface with other components, operation of controls including operational sequences for summer or winter, troubleshooting sequences and safeguards to check if equipment goes offline.
  - .5 Tab 1.4 - Maintenance and Lubrication Division: provide preventative maintenance and lubrication schedule for each major component including weekly, monthly, semi-annual an

maintenance schedule requirements or pneumatic, electronic and DDC systems.

- .6 Tab 1.5 - List of Equipment Suppliers and Contractors: provide list of equipment suppliers and Contractors, including addresses and telephone numbers. Furnish list of spare parts for each piece of equipment such as bearings, seals v-belts, filters, etc.
  - .7 Tab 2.0, 2.1, etc. - Certification: provide copies of WHMIS safety data sheets. Include copy of test data, cleaning and chemical treatment program, analysis of system water taken at time system was put into operation, hydrostatic or air tests performed, equipment alignment certificates, copy of valve tag and pipe colour identification schedules and inspection approval certificates for plumbing and natural gas systems.
  - .8 Tab 3.0, 3.1, etc. - Shop Drawings and Maintenance Bulletins: provide materials received in compliance with Shop Drawings.
  - .9 Tab 4.0 - Balance Reports: provide copies of balance reports.
- 2.1.6 Submit documents to Consultant for review before turning over to Owner.
- 2.1.7 Obtain shop drawing information for Mechanical equipment and include in appropriate section.

## **2.2 Record Drawings and Digital Photographs**

- 2.2.1 Digital photographs of project shall be taken before covering or concealing underground piping and/or service in walls, concealed ceilings, furring or shafts. Photographs shall be emailed to the Consultant at **bhavin.degadwala@introba.com** with the Consultant's job number and project name clearly indicated on the email. Identify each photo with the date and location the photograph was taken from within the same email.
- 2.2.2 Prior to each FIELD REVIEW, the Contractor shall ensure one set of white prints clearly marked (for Consultant inspection) indicating any changes and deviations from Contract Documents, including any work by change orders and job instructions plus:
- .1 Alterations to ductwork, piping, mechanical equipment and associated work.
  - .2 Inverts of services at key points within building, entering and leaving building and at property line. Dimension to services in relation structure and building, entering and leaving building grid lines for buried services, manholes, catch basins and outside shutoff valves.
  - .3 Locations of concealed piping, conduit and equipment such as fire dampers, cleanouts, service valves and access doors.

- 2.2.3 If the marked up white prints are not available for inspection, 5% of the progress payment is automatically deducted.
- 2.2.4 Before substantial completion, turn marked up white prints (Record Drawings) over to consultant for Record Drawings. Include a cash allowance of **\$100.00** per sheet for the consultant to transfer marked up site changes to **REVIT** files, and for providing two sets of record drawings and electronic **REVIT** to the Owner. The contractor may provide the **REVIT** record drawings at their own cost under this cash allowance in lieu of having the consultant provide the **REVIT** services but only with the written acceptance from the consultant.

### 2.3 Access Doors

- 2.3.1 Acceptance Products: Zurn, Wade, Acudor, Can-Aqua, Milcor, Maxam, Van-Met.
- 2.3.2 Supply flush mounted access doors, for installation in ceilings and walls, to permit servicing of mechanical equipment and accessories, inspection of life safety or operating devices, and where specifically indicated.
- 2.3.3 Unless otherwise noted, access doors shall be minimum: 24" (600 mm) x 24" (600 mm) for body entry, 12" (300 mm) x 12" (300 mm) for hand entry, 8" (200 mm) x 8" (200 mm) for cleanout access. Access doors in building surfaces shall be at least as large as duct access panels accessed through them and shall be oversized when necessary. Size to suit masonry modules when located in masonry wall.
- 2.3.4 Locate access doors so concealed items are readily accessible for adjustment, operation and maintenance. Locate in service and storage areas wherever possible. Do not locate in paneled, feature or special finish walls, without prior approval of Consultant.
- 2.3.5 Access doors in fire separations of  $\frac{3}{4}$  hour rating and higher, and firewalls shall have compatible fire rating and ULC label with tamper-proof latch and be self-closing.
- 2.3.6 Minimum Requirements:
  - .1 180 degree door swing, mitered rounded safety corners flush welded, concealed hinges, screwdriver latches, and anchor straps or lugs to suit construction, steel prime coated.
  - .2 Plaster or wet wall construction: 14 ga (1.99 mm) bonderized steel flush with wall or ceiling type with concealed flange.
    - .1 Acceptable Product: Acudor PS-5030.
  - .3 Drywall construction in **all** areas only: 16 ga (1.61 mm) for 16" (400 mm) x 16" (400 mm) and smaller, 14 ga (1.99 mm) for 18" (450 mm) x 18" (450 mm) and larger bonderized steel face of wall type with concealed flange.
    - .1 Acceptable Product: Acudor DW-5040.

- .4 Masonry construction in all areas: 16 ga (1.61 mm) for 16" (400mm) x 16" (400mm) and smaller, 14 ga (1.99mm) for 18" (450mm) x 18" (450mm) and larger bonderized steel face of wall type with exposed flange.
  - .1 Acceptable Product: Acudor UF-5000.
- .5 Tile, ceramic tile, marble, terrazzo, plaster or wet wall construction in washrooms and other special areas: 14 ga (1.98 mm) stainless steel flush with wall or ceiling with concealed flange.
  - .1 Acceptable Product: Acudor PS-5030 stainless.
- .6 Acoustical tile ceiling and similar block materials: 14 ga (1.99 mm) bonderized steel recessed ceiling type.
  - .1 Acceptable Product: Acudor AP-5010 or AT-5020.
- .7 Feature wall construction: Recessed wall type selected to complement and conform with architectural module, treatment, or paneling, size shall conform to adjacent finished areas.

### 3. **EXECUTION**

#### 3.1 **Concealment**

- 3.1.1 Conceal piping, ductwork and conduit in partitions, walls, crawlspaces and ceiling spaces, unless otherwise noted.
- 3.1.2 Do not install piping and conduit in outside walls or roof slabs unless specifically indicated. When required, install them inside the building insulation.

#### 3.2 **Access**

- 3.2.1 Install work to be readily accessible for adjustment, operation and maintenance. Furnish access doors where required in building surfaces for installation by building trades.
- 3.2.2 Provide  $\frac{3}{4}$ " (20 mm) diameter brass/aluminum/stainless steel number tags or "Allflex" plastic tags with type or service and valve number stamped in black, secured to valve wheel with key chain for all valves. Provide typewritten valve directory giving number, service and location. For valves hidden in suspended ceilings, provide flexible plastic film with permanent pressure-sensitive adhesive type label on the ceiling grid indicating location of valves. Include in Maintenance Manuals and under glass, wall mounted, location determined by Consultant.

---

**3.3 Protection of Work**

- 3.3.1 Protect equipment and materials, stored or in place, from weather, moisture, dust and physical damage.
- 3.3.2 Mask machine surfaced finishes and edges. Secure covers over equipment openings and open ends of piping, ductwork and conduits, as installation progresses.
- 3.3.3 Equipment having operating parts bearing on machined surfaces, showing signs of rusting, pitting or physical damage will be rejected.
- 3.3.4 Refinish damaged or marred factory finish.
- 3.3.5 Air systems shall have temporary air filters installed before fans are operated. Install new air filters before system acceptance.

**3.4 Cutting, Patching, Digging, Canning and Coring**

- 3.4.1 Lay out cutting, patching, digging, canning and coring required to accommodate mechanical services. Coordinate with other Divisions.
- 3.4.2 Refer to Structural drawings for permissible locations of openings and permissible opening sizes in concrete floors and walls. Openings through Structural members shall not be made without approval of Consultant.
- 3.4.3 Be responsible for correct location and sizing of openings required under Mechanical, including pipe sleeves and duct openings. Allow oversized openings for fire dampers and pipe penetrations where insulation is specified.
- 3.4.4 Verify location of existing service runs and steel reinforcing within existing concrete floor and walls prior to core drilling and/or cutting. Cost of repairs to existing services and structural components damaged as a result of core drilling and cutting will not be considered.

**3.5 Fastening to Building Structure (also refer to Section 23 05 29 Hangers and Supports for HVAC Piping and Equipment.**

- 3.5.1 General:
  - .1 Do not use inserts in base material with compressive strength less than 2,000 psi (13,790 kPa). **Refer to structural drawings**
  - .2 Inserts shall have factor of safety of 4.
  - .3 Power/powder actuated fastenings and drop-in anchors are not permitted to be used for tensile loading (i.e. suspension of mechanical equipment) or for seismic anchorage and/or restraint.
- 3.5.2 Types:
  - .1 Cast-in-place type:

- 
- .1 Channel type - Burndy, Canadian Strut, Unistrut, Cantruss or Hilti Channel.
  - .2 Cast-in Anchor: Hilti KCM-WF and KCM-PD.
  - .3 Wedge type galvanized steel concrete insert, Grinnell Fig. 281 for up to 8" (200 mm) pipe size.
  - .4 Universal type malleable iron body insert, Grinnell Fig. 282 for up to 8" (200 mm) pipe size.
  - .5 Screw concrete insert, Grinnell Fig. 152 for up to 12" (300 mm) pipe size.
  - .2 Drilled, mechanical expansion type:
    - .1 Hilti HSL-3 or UCAN LHL heavy duty anchor for using in concrete with compressive strength not less than 2,840 psi (19.6 kPa).
    - .2 Hilti Kwik-Bolt-3 or UCAN WED stud anchor for concrete (do not use in seismic restraint applications).
    - .3 Hilti HDI or UCAN IPA drop-in anchor for concrete. Wherever possible, HDI's or drop-in anchors shall be avoided in tension zones of concrete (i.e. underside) due to cracking of concrete and reduced holding value.
    - .4 Hilti or UCAN Sleeve Anchor (medium and light duty) for concrete and masonry.
    - .5 Hilti Metal-HIT or UCAN Zamac pin bolt (light duty) for concrete and masonry
  - .3 Drilled, adhesive type:
    - .1 Hilti HVA or UCAN Adhesive Anchor consisting of anchor rod assembly with a capsule containing a two-component adhesive, resin and hardener.
    - .2 Hilti HY150- MAX-SD or RE500-SD consisting of anchor rod with a two part adhesive system.
    - .3 For use in concrete housekeeping bases (in vertical downward position) where distance to edge of concrete base could cause weakness if mechanical expansion type anchor were used.
    - .4 Rod assemblies shall extend minimum 2" (50 mm) into concrete slab below housekeeping bases.

### 3.5.3 Installation:

- .1 Drilling for inserts shall be performed using appropriate tool specifically designed for insert. Diameter and depth of each drilled hole shall be exact dimensions as specified by insert Manufacturer.
- .2 Refer to Manufacturer's recommendations for tightening torques to be applied to inserts.

- .3 Where specifically called for, drills shall include a dust vacuum system, Hilti DRS Dust Vacuum System.

**3.6 Service Penetrations in Rated Fire Separations**

- 3.6.1 Refer to Section 23 05 05 Firestopping for firestop requirements.

**3.7 Service Penetrations in Non-Rated Separations**

- 3.7.1 Piping, tubing, ducts, wiring, conduits, etc. passing through non-rated fire separations and non-rated walls and floors shall be tightly fitted and sealed on both sides of separation with silicon sealant to prevent passage of smoke and/or transmission of sound.
- 3.7.2 For compliance with LEED IEQ Pre-Requisite 2 – Environmental Smoke Control – A blower door test shall be conducted in accordance with ANSI/ASTM-E779-03, Standard Test Method for Determining Air Leakage Rate By Fan Pressurization and a progressive sampling methodology as defined in Chapter 4 (Compliance Through Quality Construction) of the Residential Manual for Compliance with California's 2001 Energy Efficiency Standards. Individual suite units must demonstrate an Equivalent Normalized Leakage Area of less than 1.65cm<sup>2</sup>/m<sup>2</sup> of enclosure area as per Can/CGSB-149.10-M86 calculation methodology.

**3.8 Pipe Sleeves**

- 3.8.1 Provide pipe sleeves for piping passing through rated walls and floors. Sleeves shall be concentric with pipe.
- 3.8.2 Pipes and ducts passing through fire rated separations that have no fire resistance (non-rated separations) do not require sleeve, but insulation at separation shall be wrapped with 24 ga (0.70 mm) thick galvanized sheet steel band for application of flexible caulking compound.
- 3.8.3 Pipe sleeves for floors and interior walls shall be minimum 24 ga (0.70 mm) thick galvanized sheet steel with lock seam joints.
- 3.8.4 Seal penetrations through aboveground exterior walls, and underground exterior walls and slabs including slabs on grade, where no hydrostatic pressure exists, with flexible, non-hardening, weatherproof caulking compound. Seal around exterior circumference of sleeves and annular space between pipes and sleeves.
- 3.8.5 Pipe sleeves for perimeter walls and foundation walls shall be cast-iron sleeve or Schedule 40 steel pipe with annular fin continuously welded at midpoint and protruding 6" (150 mm) beyond sleeve diameter. Annular fin shall be embedded into centre of wall.
- 3.8.6 Provide Link Seal wall gasket to seal exposed sides of opening between pipe and sleeve on foundation walls with caulking fill. Provide water proofing mastic seal on concealed side of opening.

- .1 Acceptable Sealing Products: Garlock Link-Seal, Metraflex MetraSeal.
- 3.8.7 Pipe sleeves for wet or wash down floor areas such as washrooms, janitors rooms, laboratories and mechanical equipment rooms shall be Schedule 40 steel pipe.
- 3.8.8 Except as otherwise noted, pipe sleeves are not required for holes formed or cored in interior concrete walls or floors.
- 3.8.9 Pipe sleeves shall extend 2" (50 mm) above floors in unfinished areas and wet areas and ¼" (6.0 mm) above floors in finished areas.
- 3.8.10 Pipe sleeves shall extend 1" (25 mm) on each side of walls in unfinished areas and ¼" (6.0 mm) in finished areas.
- 3.8.11 Pipe sleeves shall extend 1" (25 mm) beyond exterior face of building. Caulk with flexible caulking compound.
- 3.8.12 Sleeve Size: ½" (15 mm) clearance all around, between sleeve and pipe or between sleeve and pipe insulation.
- 3.8.13 Paint exterior surfaces of ferrous sleeves with heavy application of rust inhibiting primer.
- 3.8.14 Packing of Sleeves:
  - .1 Where sleeves pass through foundation walls and perimeter walls, space between sleeve and pipe or between sleeve and pipe insulation shall be caulked with waterproof fire retardant non-hardening mastic.
  - .2 Pack future-use sleeves with mineral wool insulation and then seal with ULC approved fire stop sealant for rated fire separations.

### **3.9 Escutcheons and Plates**

- 3.9.1 Provide on pipes passing through finished walls, partitions, floors and ceilings.
- 3.9.2 Plates shall be stamped steel, split type, chrome-plated or stainless steel concealed hinge, complete with springs, suitable for external dimensions of piping insulation. Secure to pipe or finished surface. For pipes passing through suspended ceilings and annulated piping passing through walls, outside diameter shall cover opening or sleeve.
- 3.9.3 Where pipe sleeve extends above finished floor, escutcheons or plates shall clear sleeve extension.

### **3.10 Equipment Supports**

- 3.10.1 Provide stands and supports for equipment and materials supplied.
- 3.10.2 Lay out concrete bases and curbs required under Mechanical. Coordinate with Division 3. All concrete work is under Division 3.

- 3.10.3 Concrete bases shall be minimum 4" (100 mm) thick, or as noted and shall project at least 6" (150 mm) outside bedplate, unless otherwise directed. Bases and curbs shall be keyed to floor and incorporate reinforcing bars and/or steel mesh. Chamfer edges of bases.
- 3.10.4 Equipment with bedplates shall have metal wedges places under edges of bedplates to raise them 1" (25 mm) above base after levelling. Wedges shall be left permanently in place. Fill space between bedplate and base with non-shrink grout - Embeco or In-Pakt.
- 3.10.5 Construct equipment supports of structural steel or steel pipe. Securely brace. Employ only welded construction. Bolt mounting plates to structure.
- 3.10.6 Support ceiling hung equipment with rod hangers and/or structural steel.

### **3.11 Equipment Installation**

- 3.11.1 Provide unions, grooved couplings and flanges to permit equipment maintenance and disassembly and to minimize disturbance to piping and duct systems and without interfering with building structure or other equipment.
- 3.11.2 Provide means of access for servicing equipment including permanently lubricated bearing.
- 3.11.3 Pipe equipment drains to floor drains
- 3.11.4 Line up equipment, rectangular cleanouts and similar items with building walls wherever possible.

### **3.12 Mechanical and Electrical Coordination of Responsibilities**

- 3.12.1 All starters motor control centres, etc., along with input and output power wiring shall be by the Electrical Contractor. This is with the exception of packaged equipment.
- 3.12.2 Packaged equipment shall have integral starters and only power feeders will be provided. The packaged equipment starters shall be provided by the Mechanical Contractor.
- 3.12.3 Electrical Contractor shall provide all remote disconnect switches.
- 3.12.4 All control wiring (including BAS), except fire alarm, shall be provided by the Mechanical Contractor. This also includes Mechanical 120 volt control wiring, and interlock, and control wiring between controls transformers and low voltage terminal equipment, including infrared flushometers and transformers.
- 3.12.5 Unless specifically noted otherwise, voltage for motors ½ HP and larger shall be 600 V 3-phase, and voltage for motors smaller than ½ HP shall be 120 V single-phase or 208 V 1- or 3-phase.

- 
- 3.12.6 All multi-speed motors shall be consequent pole, permanent split capacitor type unless specifically noted otherwise (e.g. electronically-commutated motors).
- 3.12.7 All motors for mechanical equipment shall be by the Mechanical Contractor.
- 3.12.8 Thermistor protection to be provided on motors 25 HP and larger using approved thermistors as part of the Mechanical Scope of Work.
- 3.12.9 Thermistors will be provided by Mechanical Contractor.
- 3.12.10 Electrical Contractor shall provide manual reset devices for motor starters for thermistor interface (only for starters that are provided by Electrical Contractor).
- 3.12.11 All fire alarm work shall be done by the Electrical Contractor. Electrical Contractor shall provide all relays for interface to control wiring for fan shutdown and fan start-up for air handling units used as part of the smoke control system(s) and any other hard-wired mechanical components connected for fire alarm interlocks.
- 3.12.12 Electrical Contractor shall wire smoke dampers with end switches to reflect open and closed status.
- 3.12.13 All end switches shall be provided by the Mechanical Contractor.
- 3.12.14 Electrical Contractor shall wire EP switches for smoke damper control. Life safety control wiring and relays to interface to general control wiring shall be provided by the Electrical contractor (refer to Mechanical Specification for type of smoke dampers that have been specified).
- 3.12.15 All relays required for Mechanical work shall be provided by the Mechanical Contractor.
- 3.12.16 Mechanical Contractor shall provide all pressure switches, supervisory valves, flow switches, dry pipe alarm valves, etc. for interface to fire alarm system. All wiring of these items shall be provided by the Electrical Contractor.
- 3.12.17 All electric tracing shall be by the Mechanical Contractor with power connections by the Electrical Contractor. All electric tracing shall be 208 V unless specifically noted otherwise. All electric tracing shall be self-limiting type of cable. Mechanical Contractor shall provide loads for the circuits to the Electrical Contractor for connection requirements.
- 3.12.18 Electric Resistance Heaters
- .1 All standalone electric heaters shall be supplied by the Mechanical Contractor and installed by the Electrical Contractor. Mechanical Contractor shall provide any form work for recessed heaters.

- .2 All standalone electric heaters (e.g. baseboard or force-flow) shall be supplied by the Electrical Contractor and installed by the Electrical Contractor. Mechanical Contractor shall provide any duct- or pipe-mounted heaters such as electric duct heaters or electric boilers.
- 3.12.19 All level switches for sump pumps shall be wired by the Mechanical Contractor.
- 3.12.20 Variable speed motor drive controllers and motors shall be installed by the Mechanical Contractor and be complete with load and line side filters/reactors.
  - .1 The controller shall be specified with the following characteristics:
    - .1 Line side voltage distortion shall not exceed 3%.
    - .2 Line side current distortion shall not exceed 10%.
    - .3 Line and load sides shall be provided with chokes to prevent any transient or harmonic distortion being backfed into the main power supply. Provide a 5% reactor on the line side and the output shall be provided with an output filter consisting of a reactor and a capacitor.
  - .2 Power for the VSD control circuit shall be taken from the line side contactor, but after the line side choke for the drive fault relay.
  - .3 Drive BX cabling shall be provided between the VFD and VFD motor.
  - .4 Refer to VFD mounting details on drawings which reflects the responsibilities for supply of power and control wiring.
- 3.12.21 Mechanical Contractor shall provide Transient Voltage Surge Suppressor for all of their microprocessor based equipment, i.e. BAS, etc.
- 3.12.22 Mechanical Contractor and controls contractor shall provide the Electrical Contractor with locations where power circuits are required for mechanical control systems, i.e. Electronic Devices (trap primers, infrared plumbing trim, etc.) control transformers BAS panels, etc.
- 3.12.23 Should the Mechanical Contractor change or modify motor sizes or electrically powered mechanical equipment from what is reflected on the Bid Documents during any stage of this project, they shall be responsible to cover all associated electrical costs for the changes, such as revised motor starter and feeds etc.

### **3.13 Miscellaneous Metal/Metal Fabrications**

- 3.13.1 Be responsible for miscellaneous steel work relative to Mechanical, including, but not limited to:

- .1 Support of equipment - including cooling tower
  - .2 Hanging, support, anchoring, guiding and relative work as it applies to piping, ductwork, heat exchangers, hot water storage tanks, expansion tanks, fans and mechanical equipment.
  - .3 Access platforms, ladders and catwalks.
  - .4 Pipe anchor and/or support posts.
  - .5 Ceiling ring bolts - secure to structure or steel supports.
  - .6 Pipe protection at columns in vehicle and receiving areas.
- 3.13.2 All steel work shall be primed and undercoat painted ready for finish under Division 9. Refer to drawings for details.
- 3.13.3 Coordinate with and comply with Section 05 50 00 Metal Fabrications.

### **3.14 Flashing**

- 3.14.1 Flash and counterflash where mechanical equipment passes through weather or water proofed walls, floors and roofs.
- 3.14.2 Flash, vent/soil pipes penetrating roofs with aluminum 18" (450 mm) x 18" (450 mm) (base dimension) sheet. Flashing shall terminate flush with top of 12" (300 mm) high vent pipe. Gap between flashing and pipe shall be closed with separate aluminum cap 3" (80 mm) high. Main flashing shall not be turned over pipe. For pipes through outside walls turn flange back into wall and caulk.
- 3.14.3 Flash floor drains over finished areas to floor waterproof membrane. Fasten floor membrane to drain clamp device.
- 3.14.4 Provide curbs for mechanical roof installations 8" (200 mm) minimum high above roof insulations. Flash and counterflash with galvanized steel or aluminum, made waterproof.
- 3.14.5 Provide continuous neoprene safes for built-up mop sinks, and shower stalls located above finished rooms. Solder at joints, flash into floor drains and turn up 6" (150 mm) into walls or to top of curbs and caulk into joints.

### **3.15 Di-Electric Couplings**

- 3.15.1 Provide wherever pipes of dissimilar metals are joined.
- 3.15.2 Provide insulating unions for pipe sizes NPS 2 (50 mm) and under and flanges for pipe sizes over NPS 2 (50 mm) .
- 3.15.3 Provide felt or rubber gaskets to prevent dissimilar metals contact.
- 3.15.4 Acceptable Products: Capital, Walter Vallet, EPCO, Victaulic Series 647.

---

**3.16 Lubrication of Equipment**

- 3.16.1 Lubricate new equipment prior to operating, except sealed bearings, which shall be checked.
- 3.16.2 Use lubricant recommended by Manufacturer for service.
- 3.16.3 Extend lubricating connections and sight glasses to outside of housings, where lubricating positions are not readily accessible.
- 3.16.4 Submit check list, showing that operated equipment has been lubricated prior to and during any temporary heating period and demonstration and instruction period.

**3.17 Painting**

- 3.17.1 Finish painting of piping and ductwork shall be carried out by other trades. Refer to Division 9 - Finishes.
- 3.17.2 Provide factory finish on manufactured items. At completion, touch up damaged surfaces to match original. Do not paint over nameplates.

**3.18 Equipment Protection and Clean-Up**

- 3.18.1 Protect equipment and material in storage, on site and after installation until final acceptance. Leave factory covers in place. Take special precautions to prevent entry of foreign material into working parts of piping and duct systems.
- 3.18.2 Mechanical equipment stored on site shall be kept in dry, heated and ventilated storage area.
- 3.18.3 Thoroughly clean piping, ducts and equipment of dirt, cuttings and other foreign material.
- 3.18.4 Protect bearings and shafts during installation. Grease shafts and sheaves to prevent corrosion. Supply and install necessary extended nipples for lubrication purposes.
- 3.18.5 Provide, install and maintain 30% efficient temporary filters to return and exhaust air openings from ceiling spaces to prevent air born dust from entering ducts, plenums and coils. Install filters to return air grilles when fans are operated and building is not clean.

**3.19 Start-Up**

- 3.19.1 Before starting equipment or systems, provide certificate stating plant is ready for start-up and the following conditions have been met.
  - .1 Safety controls installed and fully operational.
  - .2 Qualified personnel available to operate plant.
  - .3 Permanent electrical connections made to equipment.
  - .4 Boiler(s) started up and adjusted by Manufacturer's Representatives.

- .5 Chillers started up and adjusted by Manufacturer's Representative.
- .6 Air filters installed.
- .7 Pump and fan drives properly aligned by journeyman millwright.
- .8 Mechanical equipment rooms, including plenums, vacuum cleaned.

**3.20 Turnover Seminar for Operating Staff**

- 3.20.1 At completion of project, Mechanical Contractor shall organize and conduct **three** day seminar to instruct Owner and Representatives in operation and preventative maintenance of equipment and systems.
- 3.20.2 Provide services of qualified personnel, including Sub-Trades, major equipment suppliers and Consultant to attend seminar and instruct on his equipment or system(s). Seminar shall be chaired by Mechanical Contractor.
- 3.20.3 Mechanical Contractor shall submit agenda and list of Representatives to Consultant for approval 30 days before seminar. Confirm attendance by written notification to participants, followed by verbal confirmation before seminar date.
- 3.20.4 At seminar, submit final copies of Record Drawings and Operating and Maintenance Manuals to Owner.
- 3.20.5 Mechanical Contractor shall submit to Consultant, written follow-up of seminar complete with attendance list and signed acceptance from the operating staff representative indicating they have accepted the demonstrations and instructions. Coordinate with the commissioning agent for project deliverables.

---

**APPENDIX "A"**

**MECHANICAL CHECKLIST FOR SUBSTANTIAL COMPLETION**

Date: \_\_\_\_\_

Project No: \_\_\_\_\_

Project Name: \_\_\_\_\_

Mechanical Contractor: \_\_\_\_\_

Contractor is to initial all items that have been completed and email checklist back to Introba 48 hours prior to final review. For any items that are not applicable to your project, please mark "N/A" in the right side of the column.

**1. GENERAL**

- .1 Maintenance Manuals submitted to Consultant for review. \_\_\_\_\_
- .2 Letter of Completion from control sub-trade forwarded and documentation forwarded. \_\_\_\_\_
- .3 All certification, test and inspection certificates submitted (refer to requirements at the end of this checklist). \_\_\_\_\_
- .4 Record Drawings completed, checked and submitted for mechanical and plumbing. \_\_\_\_\_
- .5 Record Drawings completed, checked and submitted for fire protection. \_\_\_\_\_
- .6 Record Drawings completed, checked and submitted for heat reclaim system. \_\_\_\_\_
- .7 Confirm program for warranty period, including site visits and assistance to Owners for operations and maintenance and controls. Extended warranty forms completed. \_\_\_\_\_
- .8 Performance tests carried out. \_\_\_\_\_
- .9 Cleanup completed (air filters, strainers, etc.). \_\_\_\_\_
- .10 Confirm access to components (valves, dampers, etc.). \_\_\_\_\_
- .11 Thermometers, pressure gauges and filter gauges in place. \_\_\_\_\_
- .12 Flexible connections and isolators free from binding. \_\_\_\_\_
- .13 Painting, identification and valve tagging completed. \_\_\_\_\_
- .14 Equipment lubricated and accessible for maintenance. \_\_\_\_\_
- .15 Balancing completed or nearing completion. \_\_\_\_\_

- 
- |     |  |   |
|-----|--|---|
| .16 | Vibration and sound control checked.   | — |
| .17 | Pipe, duct and equipment identification completed.                               | — |
| .18 | Firestopping completed.  | — |
| .19 | “Residential Unit Completion Checklist” completed for each suite (see attached). | — |
- 2. PLUMBING**
- |     |  |   |
|-----|--|---|
| .1  | All backflow preventers installed and functioning.                   | — |
| .2  | Plumbing fixtures cleaned and water flows adjusted.                  | — |
| .3  | Proper access to all cleanouts confirmed.                            | — |
| .4  | Confirm that roof and floor drains are located at low points.        | — |
| .5  | Equipment drains taken to hub or funnel drain.                       | — |
| .6  | Expansion and contraction provisions satisfactory.                   | — |
| .7  | Domestic hot water system functioning properly.                      | — |
| .8  | Equipment and units isolated and provided with union or flanges.     | — |
| .9  | Thermometers and gauges installed.                                   | — |
| .10 | Gas connections to all equipment completed and inspected.            | — |
| .11 | Medical gas piping/outlets/manifolds/equipment tested and certified. | — |
| .12 | Medical gas alarms systems tested and certified.                     | — |
- 3. FIRE PROTECTION AND LIFE SAFETY SYSTEMS**
- |    |   |   |
|----|---|---|
| .1 | Sprinkler systems tested and inspected as per NFPA 13.  | — |
| .2 | Standpipe systems tested and inspected as per NFPA 14.  | — |
| .3 | Fire pump systems tested and inspected as per NFPA 20.  | — |
| .4 | Smoke control systems tested and inspected as per OBC requirements, including vestibule and stair pressurization systems. | — |
| .5 | Fire protection extinguishers installed.  | — |
| .6 | Spare sprinklers and cabinet provided.  | — |
- 4. HOT WATER HEATING/HYDRONIC SYSTEMS**
- |    |   |   |
|----|---|---|
| .1 | Chemical cleaned piping and treatment charged.                                | — |
| .2 | Expansion tank charged.   | — |
| .3 | Terminal units operating.   | — |
| .4 | Radiant panels have clearance for expansion and insulation backing installed. | — |
-

---

.5	Heating coils operating.	—
.6	Element fins combed and cleaned.	—
.7	Pumps running smoothly.	—
.8	Boiler test fired and results submitted.	—
<b>5.</b>	<b><u>CHILLED WATER SYSTEMS</u></b>	
.1	Chemical cleaned piping, feed pump installed and treatment charged.	—
.2	Expansion tank charged.	—
.3	Cooling coils operating.	—
.4	Pumps running smoothly.	—
.5	Chiller and tower isolators installed and units secured to mounting pads.	—
.6	Heat trace and freeze protection installed and tested.	—
.7	Refrigerant charged.	—
.8	Chiller controls tested and operating.	—
.9	Chiller commissioned test and results submitted.	—
.10	Leak exhaust system installed and tested.	—
<b>6.</b>	<b><u>STEAM PIPING AND BOILER SYSTEMS</u></b>	
.1	Chemical cleaned piping, feed pump installed and treatment charged.	—
.2	Steam traps cleaned and operating.	—
.3	Pressure reducing station trimmed and set.	—
.4	Condensate return and feed water systems tested.	—
.5	Boiler test fired and results submitted.	—
.6	Humidifier operation and modulation verified.	—
<b>7.</b>	<b><u>VENTILATION SYSTEMS</u></b>	
.1	Air handling equipment installed and commissioned.	—
.2	Equipment controls commissioned and tested.	—
.3	Ductwork and plenums cleaned.	—
.4	Air outlets adjusted.	—
.5	Clean air filters provided.	—
.6	Ductwork noises eliminated.	—
.7	Balancing dampers installed.	—
.8	Fire and smoke dampers installed and tested.	—

---

- 
- |     |  |   |
|-----|--|---|
| .9  | Drive pulley adjusted for design conditions. | — |
| .10 | Cooling coil condensate drains installed.    | — |
- 8. ROOFTOP HVAC EQUIPMENT**
- |    |   |   |
|----|---|---|
| .1 | Shipping blocks removed.                    | — |
| .2 | Sound levels confirmed as satisfactory.     | — |
| .3 | Start-up reports completed.                 | — |
| .4 | Controls check out and operate properly.    | — |
| .5 | Seismic attachments complete.               | — |
| .6 | Traps installed on condensate drains.       | — |
| .7 | Thermostats mounted and programmed.         | — |
| .8 | Roof-mounted exhaust fans secured on bases. | — |
- 9. DDC/CONTROLS SYSTEMS**
- |    |  |   |
|----|--|---|
| .1 | Panel layout sheets complete with point name, point address and wire identification number. One copy attached to each respective panel door. | — |
| .2 | All points tagged with point name, point address and panel number.   | — |
| .3 | “As-built” control drawings submitted.   | — |
| .4 | “As-built” program flowcharts submitted.   | — |
| .5 | “As-built” ladder wiring diagrams showing all hardware interlocks submitted.   | — |
| .6 | Complete Operator’s Manual submitted (including apparatus and Maintenance Manual for all sensors, transducers, solid state relays, etc.).    | — |
| .7 | Turnover seminar and instructions to Owner completed.  | — |

---

**CERTIFICATES AND LETTERS OF CERTIFICATION ARE REQUIRED FOR THE FOLLOWING:**

**Copies to be emailed to Introba and included in the Maintenance Manual as per Section 23 05 00.**

- .1 Plumbing, piping test certificates (water, sanitary and storm). —
- .2 Gas piping tests and certifications inspections from Gas Safety Branch and/or gas fitters form letter. —
- .3 Sprinkler system certification from the Sprinkler Engineer confirming system installation to NFPA 13 with seal. —
- .4 Contractors Material and Test Certificates for above-ground and below ground piping for sprinkler system. —
- .5 Verification of proper operation and indication of sprinkler system components on fire alarm panel. —
- .6 WHMIS requirements completed. —
- .7 Heating system pressure test certificates of installation. —
- .8 Certification of proper installation from Radiant Floor Heating System Contractor. —
- .9 Report on Chemical Treatment, glycol charging and test results submitted. —
- .10 Backflow preventer test certificates. —
- .11 Boiler start-up and combustion tests. —
- .12 Sealed certification from Seismic Engineer for seismic restraint system. —
- .13 Sealed certification from Vibration Isolation Agent for proper adjustment of spring curbs. —
- .14 Performance and start-up testing of heat reclaim system and certificate confirming installation in accordance with Manufacturer's recommendations. —
- .15 Megger and capacitance tests on trace cable with verification from supplier for each circuit. —
- .16 Start-up reports for each piece of refrigeration equipment and chiller. —
- .17 Letter of Completion from control sub-trade, including: —
  - .1 Seven day acceptance testing of control system completed.
  - .2 Control calibration check sheets.
  - .3 Confirmation of proper control and sequencing of components.
  - .4 Control system "as-built" with setpoints.
  - .5 Items under DDC system below.

---

.18 Smoke control system tested in accordance with British Columbia Fire Code  
and report issued. —

Date Returned to Introba: \_\_\_\_\_

Submitted By: \_\_\_\_\_

Signed By: \_\_\_\_\_

---

**DOCUMENTATION REQUIRED FOR  
MECHANICAL SUBSTANTIAL  
COMPLETION**

The following documents, or copies of, are to be submitted for release of the substantial completion of the project and release of Introba's Schedule C-B. These documents are to be submitted 48 hours prior to the Consultant walkthrough.

**The following must be submitted and cannot be accepted as a deficiency:**

1. Schedule C-B for Sprinklers.
2. Schedule C-S for Seismic Restraint and anchorage for Mechanical Equipment.
3. Commissioning Report.
4. Fire Alarm Verification Report.
5. Smoke Exhaust/Pressurization Fans Verification.
6. Parkade Fan Verification.
7. Fire Damper Test Letter from Contractor.
8. Municipal/City Plumbing Final Certificate.
9. Heat Trace Report for Sprinkler System.
10. Provincial Gas Inspection Certificate or sign off letter from gas fitter.
11. Firestop Shop Drawings and Material Data Sheet Submission.
12. Certificate for Chlorination of Domestic Water Systems.
13. Operation and Maintenance Manuals.

**The following items are to be submitted, but can be held as a deficiency and payment will be withheld until submissions are complete:**

1. HVAC Air Balancing Report.
2. Water Balancing Report of Hydronic Systems
3. Shop drawings for all mechanical equipment.
4. Refrigeration Contractor Certification Letter.
5. Material Test Certificates.
6. Warranty Letter from Mechanical Contractor for Warranty period.
7. As-built record drawings.
8. Photographs taken during construction and for underground services/concealed piping.

---

**APPENDIX "B"**

**RESIDENTIAL UNIT COMPLETION CHECKLIST**

This checklist is to be completed by Mechanical Contractor for each residential unit in building. Submit completed copies prior to requesting Semi-final Field Review.

FLOOR NUMBER: \_\_\_\_\_

UNIT NUMBER: \_\_\_\_\_

- \_\_\_\_\_ Plumbing fixtures cleaned. Acoustic isolators installed on water closets and jetted bathtubs
- \_\_\_\_\_ Hot and cold water supplied to each fixture; escutcheons and wall caps on all pipe penetrations through walls or cabinets.
- \_\_\_\_\_ Washroom exhaust fan functional (rattle free) on both timer and manual switch.
- \_\_\_\_\_ Kitchen range hood vent connected and operational.
- \_\_\_\_\_ Dryer vent connected and operational.
- \_\_\_\_\_ Natural gas connected to fireplace and cooktops. Gas lines purged.
- \_\_\_\_\_ Sprinkler escutcheons installed throughout and sprinklers secured.
- \_\_\_\_\_ Baseboard radiation cabinet complete and finish touched-up. Access panels installed at valves and vents. Joiner pieces, corners, and end caps and dampers secured.
- \_\_\_\_\_ Baseboard thermostats adjusted to maintain 70°F (21°C).
- \_\_\_\_\_ Temperature limit stops set at 115°F (46°C) on shower valve with main water heaters set at 125°F (52°C) supply temperature.

Checklist Completed by: \_\_\_\_\_

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Documents

- 1.1.1 Drawings and general provisions of Contract, including General and Supplementary Conditions and Division-1 Specification Section, apply to work specified in this section.

### 1.2 Definitions

- 1.2.1 Firestopping: Material or combination of materials used to retain integrity of fire-rated construction by maintaining an effective barrier against the spread of flame, smoke, and hot gases through penetrations in fire rated wall and floor assemblies.

### 1.3 General Description of the Work of this Section

- 1.3.1 Only tested firestop systems shall be used in specific locations as follows:
- 1.3.2 Penetrations for the passage of duct, piping, and other mechanical equipment through fire-rated vertical barriers (walls and partitions), horizontal barriers (floor/ceiling assemblies), and vertical service shaft walls and partitions.
- 1.3.3 Repetitive plumbing penetrations in fire-rated floor assemblies. Penetrations exist for the installation of tubs, showers, aerators and other plumbing fixtures.

### 1.4 Related Work of Other Sections

- 1.4.1 Coordinate work of this section with work of other sections as required to properly execute the work and as necessary to maintain satisfactory progress of the work of other sections, including:
- .1 Section 03 30 00 - Cast-In-Place Concrete
  - .2 Section 21 05 06 - Common Work Results for Fire Protection
  - .3 Section 23 05 00 - Common Work Results for HVAC
  - .4 Section 23 07 13 - Duct Insulation
  - .5 Section 23 07 16 - HVAC Equipment Insulation
  - .6 Section 23 07 19 - HVAC Piping Insulation
  - .7 Section 22 05 00 - Plumbing

### 1.5 References

- 1.5.1 Test Requirements: CAN/ULC-S115, "Standard Method of Fire Tests of Through Penetration Fire Stops".
- 1.5.2 Underwriters Laboratories of Canada (ULC) of Scarborough runs CAN/ULC-S115 under their designation of ULC-S115 and publishes

the results in their "FIRE RESISTANCE RATINGS DIRECTORY" that is updated annually.

- 1.5.3 Underwriters Laboratories (UL) of Northbrook, IL runs ASTM E-814 under their designation of UL 1479 and publishes the results in their "FIRE RESISTANCE DIRECTORY" that is updated annually. UL tests that meet the requirements of ULC-S115-M are given a cUL listing and are published by UL in their "Products Certified for Canada (cUL) Directory".
- 1.5.4 Omega Point Laboratories runs ASTM E-814 and publishes the results annually in their "Omega Point Laboratories Directory".
- 1.5.5 International Firestop Council Guidelines for Evaluating Firestop Systems Engineering Judgments
- 1.5.6 CAN/ULC-S102, Standard Test Method for Surface Burning Characteristics of Building Materials.
- 1.5.7 Test Requirements: ASTM G-21, "Standard Test for Determining Resistance of Synthetic Polymeric Materials to Fungi". Materials used under this section must carry a "Level 1" or lower test rating.
- 1.5.8 All major building codes: NBC, OBC, BCBC, and ABC.
- 1.5.9 NFPA 101 - Life Safety Code.

## **1.6 Quality Assurance**

- 1.6.1 A manufacturer's direct representative (not distributor or agent) to be on-site during initial installation of firestop systems to train appropriate contractor personnel in proper selection and installation procedures. This will be done per manufacturer's written recommendations published in their literature and drawing details.
- 1.6.2 Firestop System installation must meet requirements of CAN4-S115 tested assemblies that provide a fire rating as shown in Section 2.03 Clauses J & K.
- 1.6.3 Proposed firestop materials and methods shall conform to applicable governing codes having local jurisdiction.
- 1.6.4 Firestop Systems do not re-establish the structural integrity of load bearing partitions/assemblies, or support live loads and traffic. Installer shall consult the structural engineer prior to penetrating any load bearing assembly.
- 1.6.5 For those firestop applications that exist for which no ULC or cUL tested system is available through a manufacturer, a manufacturer's firestop custom detail derived from similar ULC or cUL system designs or other tests will be submitted to local authorities having jurisdiction for their review and approval prior to installation. Firestop custom detail drawings must follow requirements set forth by the International Firestop Council (September 7, 1994).

---

**1.7 Submittals**

- 1.7.1 Submit Product Data: Manufacturer's specifications and technical data for each material including the composition and limitations, documentation of ULC or cUL firestop systems to be used and manufacturer's installation instructions to comply with Section 1300.
- 1.7.2 Manufacturer's engineering judgment identification number and drawing details when no ULC or cUL system is available for an application. Engineer judgment must include both project name and contractor's name who will install firestop system as described in drawing.
- 1.7.3 Submit material safety data sheets provided with product delivered to job-site.
- 1.7.4 Submit signed letter from firestopping installation firm on company letterhead certifying penetrations of fire suppression piping through vertical & horizontal rated separations have been firestopped in accordance with ULC-S115.

**1.8 Installer Qualifications**

- 1.8.1 Engage an experienced Installer who is certified, licensed, or otherwise qualified by the firestopping manufacturer as having been provided the necessary training to install manufacturer's products per specified requirements. A manufacturer's willingness to sell its firestopping products to the Contractor or to an Installer engaged by the Contractor does not in itself confer qualification on the buyer.
- 1.8.2 The work is to be installed by a contractor with at least one of the following qualifications:
  - .1 FM 4991 Approved Contractor
  - .2 UL Approved Contractor
  - .3 Hilti Accredited Fire Stop Specialty Contractor (HAFSC)
- 1.8.3 Installer shall have minimum 3 years of experience with fire stop installation.

**1.9 Delivery, Storage, and Handling**

- 1.9.1 Deliver materials undamaged in manufacturer's clearly labeled, unopened containers, identified with brand, type, and ULC or cUL label where applicable.
- 1.9.2 Coordinate delivery of materials with scheduled installation date to allow minimum storage time at job-site.
- 1.9.3 Store materials under cover and protect from weather and damage in compliance with manufacturer's requirements.
- 1.9.4 Comply with recommended procedures, precautions or remedies described in material safety data sheets as applicable.
- 1.9.5 Do not use damaged or expired materials.

---

### 1.10 Project Conditions

- 1.10.1 Do not use materials that contain flammable solvents.
- 1.10.2 Scheduling
  - .1 Schedule installation of CAST IN PLACE firestop devices **after** completion of floor formwork, metal form deck, or composite deck but **before** placement of concrete.
  - .2 Schedule installation of other firestopping materials after completion of penetrating item installation but prior to covering or concealing of openings.
- 1.10.3 Verify existing conditions and substrates before starting work. Correct unsatisfactory conditions before proceeding.
- 1.10.4 Weather conditions: Do not proceed with installation of firestop materials when temperatures exceed the manufacturer's recommended limitations for installation printed on product label and product data sheet.
- 1.10.5 During installation, provide masking and drop cloths to prevent firestopping materials from contaminating any adjacent surfaces.

## 2. PRODUCTS

### 2.1 Firestopping, General

- 2.1.1 Provide firestopping composed of components that are compatible with each other, the substrates forming openings, and the items, if any, penetrating the firestopping under conditions of service and application, as demonstrated by the firestopping manufacturer based on testing and field experience.
- 2.1.2 Provide components for each firestopping system that are needed to install fill material. Use only components specified by the firestopping manufacturer and approved by the qualified testing agency for the designated fire-resistance-rated systems.
- 2.1.3 Firestopping Materials are either "cast-in-place" (integral with concrete placement) or "post installed." Provide cast-in-place firestop devices prior to concrete placement.

### 2.2 Acceptable Manufacturers

- 2.2.1 Subject to compliance with through penetration firestop systems listed in U.L.C Fire Resistance Directory – Volume III or UL Products Certified for Canada (cUL) Directory, provide products of the following manufacturers as identified below:
  - .1 Hilti (Canada) Corporation, Mississauga, Ontario
  - .2 1-800-363-4458/www.ca.hilti.com
  - .3 Nuco

- .4 3M
- .5 Tremco
- .6 JV Firestop

2.2.2 Alternatives not listed in Part 2.2.1 will not be accepted.

## 2.3 **Materials**

2.3.1 Use only firestop products that have been ULC-S115 tested for specific fire-rated construction conditions conforming to construction assembly type, penetrating item type, annular space requirements, and fire-rating involved for each separate instance.

2.3.2 Pre-Installed firestop devices for use with non-combustible and combustible pipes (closed and open systems) penetrating concrete floors and/or gypsum walls, the following products are acceptable:

- .1 Hilti Cast-In Place Firestop Device (CP 680-P)
  - .1 Add Aerator Adaptor when used in conjunction with aerator system.
- .2 Hilti Tub Box Kit (CP 681) for use with tub installations.
- .3 Hilti Cast-In Place Firestop Device (CP 680-M) for use with non-combustible penetrants.
- .4 Hilti Speed Sleeve (CP 653) for use with cable penetrations.
- .5 Hilti Firestop Drop-In Device (CFS-DID) for use with non-combustible and combustible penetrants.
- .6 Hilti Firestop Block (CFS-BL)
- .7 Acceptable Products: Nuco, 3M, Tremco, JV Firestop.

2.3.3 Sealants or caulking materials for use with non-combustible items including steel pipe, copper pipe, rigid steel conduit and electrical metallic tubing (EMT), the following products are acceptable:

- .1 Hilti Intumescent Firestop Sealant (FS-ONE MAX)
- .2 Hilti Self Leveling Firestop Sealant (CFS-S SIL SL)
- .3 Hilti Fire Foam (CP 620)
- .4 Hilti Flexible Firestop Sealant (CP 606)
- .5 Hilti Elastomeric Firestop Sealant (CFS-S SIL GG)
- .6 Acceptable Products: Nuco, 3M, Tremco, JV Firestop.

2.3.4 Sealants or caulking materials for use with sheet metal ducts, the following products are acceptable:

- .1 Hilti Elastomeric Firestop Sealant (CFS-S SIL GG)
- .2 Hilti Flexible Firestop Sealant (CP 606)
- .3 Hilti Intumescent Firestop Sealant (FS-ONE MAX)
- .4 Hilti Self Leveling Firestop Sealant (CFS-S SIL SL)
- .5 Acceptable Products: Nuco, 3M, Tremco, JV Firestop.

- 
- 2.3.5 Intumescent sealants or caulking materials for use with combustible items (penetrants consumed by high heat and flame) including insulated metal pipe, PVC jacketed, flexible cable or cable bundles and plastic pipe, the following products are acceptable:
- .1 Hilti Intumescent Firestop Sealant (FS-ONE MAX)
  - .2 Acceptable Products: Nuco, 3M, Tremco, JV Firestop.
- 2.3.6 Firestop collar or wrap devices attached to assembly around combustible plastic pipe (closed and open piping systems) tested to 50 Pa. differential, the following products are acceptable:
- .1 Hilti Firestop Collar (CP 643N)
  - .2 Hilti Firestop Collar (CP 644)
  - .3 Hilti Wrap Strips (CP 648E/648S)
  - .4 Acceptable Products: Nuco, 3M, Tremco, JV Firestop.
- 2.3.7 Materials used for large size/complex penetrations made to accommodate cable trays, multiple steel and copper pipes, electrical busways in raceways, the following products are acceptable:
- .1 Hilti Firestop Mortar (CP 637)
  - .2 Hilti Firestop Block (CFS-BL)
  - .3 Hilti Fire Foam (CP 620)
  - .4 Hilti Firestop Board (CP 675T)
  - .5 Acceptable Products: Nuco, 3M, Tremco, JV Firestop.
- 2.3.8 Non curing, re-penetrable materials used for large size/complex penetrations made to accommodate cable trays, multiple steel and copper pipes, electrical busways in raceways, the following products are acceptable:
- .1 Hilti Firestop Block (CFS-BL)
  - .2 Hilti Firestop Board (CP 675T)
  - .3 Acceptable Products: Nuco, 3M, Tremco, JV Firestop.
- 2.3.9 For blank openings made in fire-rated wall or floor assemblies, where future penetration of pipes, conduits, or cables is expected, the following products are acceptable:
- .1 Hilti FS 657 Fire Block (for walls and floors)
  - .2 Hilti CP 658T Firestop Plug (for walls and floors)
  - .3 Hilti CP 680 Cast-In Place Firestop Device (for floors only)
- 2.3.10 For penetrations through a Fire Separation wall provide a firestop system with a "F" Rating as determined by ULC or cUL as indicated below:

---

Fire Resistance Rating of Separation	Required ULC or cUL "F" Rating of Firestopping Assembly
30 minutes	20 minutes
45 minutes	45 minutes
1 hour	45 minutes
1.5 hours	1 hour
2 hours	1.5 hours
3 hours	2 hours
4 hours	3 hours

2.3.11 For combustible pipe penetrations through a Fire Separation provide a firestop system with a "F" Rating as determined by ULC or cUL which is equal to the fire resistance rating of the construction being penetrated.

2.3.12 For penetrations through a Fire Wall or horizontal Fire Separation provide a firestop system with a "FT" Rating as determined by ULC or cUL which is equal to the fire resistance rating of the construction being penetrated.

### 3 . **EXECUTION**

#### 3.1 **Preparation**

3.1.1 Verification of Conditions: Examine areas and conditions under which work is to be performed and identify conditions detrimental to proper or timely completion.

- .1 Verify penetrations are properly sized and in suitable condition for application of materials.
- .2 Surfaces to which firestop materials will be applied shall be free of dirt, grease, oil, rust, laitance, release agents, water repellents, and any other substances that may affect proper adhesion.
- .3 Provide masking and temporary covering to prevent soiling of adjacent surfaces by firestopping materials.
- .4 Comply with manufacturer's recommendations for temperature and humidity conditions before, during and after installation of firestopping.
- .5 Do not proceed until unsatisfactory conditions have been corrected.

#### 3.2 **Coordination**

3.2.1 Coordinate location and proper selection of cast-in-place Firestop Devices with trade responsible for the work. Ensure device is installed before placement of concrete.

- 3.2.2 Responsible trade to provide adequate spacing of field run pipes to allow for installation of cast-in-place firestop devices without interferences.

### **3.3 Installation**

- 3.3.1 Regulatory Requirements: Install firestop materials in accordance with ULC Fire Resistance Directory or UL Products Certified for Canada (cUL) Directory.
- 3.3.2 Manufacturer's Instructions: Comply with manufacturer's instructions for installation of through-penetration joint materials.
- .1 Seal all holes or voids made by penetrations to ensure an air and water resistant seal.
  - .2 Consult with mechanical consultant, project manager, and damper manufacturer prior to installation of ULC or cUL firestop systems that might hamper the performance of fire dampers as it pertains to duct work.
  - .3 Protect materials from damage on surfaces subjected to traffic.

### **3.4 Field Quality Control**

- 3.4.1 Examine sealed penetration areas to ensure proper installation before concealing or enclosing areas.
- 3.4.2 Keep areas of work accessible until inspection by applicable code authorities.
- 3.4.3 Perform under this section patching and repairing of firestopping caused by cutting or penetrating of existing firestop systems already installed by other trades.
- 3.4.4 Install a warning card that is clearly visible adjacent to all large and medium openings that may be re-penetrated. This card should contain the following information:
- .1 Warning that the opening has been fire stop protected
  - .2 Indicate the fire stop system used (ULC or cUL)
  - .3 F rating or FT rating
  - .4 Fire stop product(s) used
  - .5 Person to contact and phone number in case of modification or new penetration of fire stop system

### **3.5 Adjusting and Cleaning**

- 3.5.1 Remove equipment, materials and debris, leaving area in undamaged, clean condition.
- 3.5.2 Clean all surfaces adjacent to sealed holes and joints to be free of excess firestop materials and soiling as work progresses.

---

**END OF SECTION**

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 Quality Assurance

- 1.2.1 Motors shall be UL listed and CSA certified.
- 1.2.2 Full Voltage Start Applications:
- .1 All motors shall be in accordance with the National Electrical Manufacturers Association (NEMA) standards, and CSA C390. Motors also shall comply with applicable portions of Canadian Electrical Code.
- 1.2.3 Variable Frequency Drive and soft start applications:
- .1 Motors shall be in accordance with NEMA standards (MG-1) Part 31 and inverter duty class. Motors also shall comply with applicable portions of Canadian Electrical Code.
- .2 Motors connected to VFDs shall be wound using inverter spike resistant magnet wire capable of 1600V.
- 1.2.4 Electronic Commutation Motors (ECM) shall be provided in unitary equipment as specified in their respective sections (small fans, pumps, etc.).
- 1.2.5 Noise level of each motor shall comply with NEMA standards, less than 80 dBA at 39" (1 m).

### 1.3 Submittals

- 1.3.1 Submit data of test method used and motor efficiencies with shop drawings.

## 2. PRODUCTS

### 2.1 Electric Motors – General

- 2.1.1 Provide motors for mechanical equipment as specified.
- 2.1.2 Unless noted otherwise, provide open drip-proof, ball or roller bearing motors with grease fittings.
- 2.1.3 Motors shall have standard voltage ratings consistent with project distribution voltages. Motors less than ½ hp (0.37 KW) to be 120 volt, 60 cycle, single phase power. Motors ½ hp (0.37 KW) and larger to be 3 phase power and for scheduled voltage. Confirm

electric voltage, phase and starter requirements with electrical specification.

- 2.1.4 Motors shall be designed and manufactured to operate with  $\pm 10\%$  voltage and  $\pm 5\%$  frequency variations of the nameplate ratings.
- 2.1.5 Motors shall be rated for 1.15 service factor in 105°F (40°C) ambient environment.
- 2.1.6 Motors shall be standard 1750 RPM unless specifically scheduled otherwise.
- 2.1.7 Provide motors with terminal boxes, suitable for power connections.
- 2.1.8 Provide screw adjustable bases on belt-connected motors.
- 2.1.9 Motors shall be of capacitor start type when they may be manually cycled from starting switch, located in finished space.
- 2.1.10 Lubricate motors exposed to outdoor temperature with lubricants suitable for operation at the lowest temperature indicated by the Climatic Information contained in the National Building Code for the location in which they are installed.

## 2.2 **Electric Motors – Premium Efficient**

- 2.2.1 Motors shall be provided with premium efficiency inverter duty classification with non-wicking leads, class 'B' for motors and class 'F' for TEFC motors insulation (minimum). Provide motor shaft grounding for variable frequency driven motors for all VFD applications.

- .1 Premium efficiency open drip-proof motors shall have the following typical full load efficiencies (nominal):

HP	Premium Efficient - Minimum Efficiency (%)		
	3500 RPM 2 Pole	1750 RPM 4 Pole	1150 RPM 6 Pole
1	80.0	85.5	82.5
1.5	84.0	86.5	86.5
2	85.5	86.5	87.5
3	86.5	89.5	88.5
5	91.0	89.5	90.2
7.5	88.5	91.0	92.4
10	90.2	91.7	92.4
15	91.0	93.0	92.4
20	92.5	93.0	92.4

- .2 Premium efficiency inverter duty totally enclosed fan cooled motors shall have the following typical load efficiencies (nominal).

HP	Premium Efficient - Minimum Efficiency (%)		
	3500 RPM 2 Pole	1750 RPM 4 Pole	1150 RPM 6 Pole
1	n/a	85.5	81.5
1.5	85.5	85.5	86.5
2	85.5	85.5	87.5
3	87.5	88.5	88.5
5	89.5	89.5	89.5
7.5	91.0	91.7	91.7
10	91.7	91.7	91.7
15	91.7	92.4	91.7
20	92.4	93.0	92.4

2.2.2 ECM Motors (Electronic Commutation Motors) shall be provided for unitary equipment as specified in their respective sections. ECM motors shall be permanently lubricated complete with heavy duty ball bearings to match the device (fan, pump, equipment type) and pre-wired to the specific voltage and phase. Internal motor circuitry shall convert the supplied AC power to the motor DC power to operate the motor. Motor shall be speed controllable down to 20% of rated full speed. Speed shall be controlled by either a Potentiometer dial mounted at the motor, or by a 0-10V signal from controls. Motor shall be a minimum of 85% efficient at all speeds.

## 2.3 **Belt Drives**

2.3.1 Provide belt drives to the following requirements:

- .1 Steel, cast-iron or aluminum sheaves for motors less than  $\frac{3}{4}$  hp (0.56 KW).
- .2 Steel or cast-iron sheaves keyed to shafts, for motors  $\frac{3}{4}$  hp (0.56 KW) and larger.
- .3 For motors less than 10 hp (7.5 KW), provide standard adjustable pitch drive sheaves having  $\pm 10\%$  range. Use mid-position of range for specified RPM.
- .4 For motors 10 hp (7.5 KW) and larger, provide fixed pitch drive sheaves with split tapered bushing and keyway. Provide final drive sheaves of size to suit final balancing.

2.3.2 Match drive and driven sheaves.

2.3.3 V-belts shall conform with the American Belt Manufacturers standards. Multiple belts shall be matched sets.

2.3.4 Not less than 2-belt configuration is required for each drive for motors  $\frac{3}{4}$  hp (0.56 KW) and larger.

2.3.5 Minimum drive rating shall be 150% of nameplate rating of motor. Keep overhung loads within Manufacturer's design requirements on prime mover shafts.

- 2.3.6 Motor slide rail adjustment baseplate with double draw bolt shall allow for centre line adjustment.
- 2.3.7 Tension belts to manufactures recommendations before start-up and after 100 hours of operation using calibrated belt tensioning gauge.
- 2.3.8 Provide one spare set of belts for each piece of equipment with each belt separately identified for the equipment item served.

## **2.4 Shaft Couplings**

- 2.4.1 Shaft couplings shall be of the pin or jaw neoprene insert type, gear type, or flexing steel insert type and shall allow coupling inserts to be easily removed without disassembly of equipment.

## **2.5 Guards**

- 2.5.1 Provide removable protective guards on exposed V-belt drives and shaft couplings in accordance with Worker's Compensation Board requirements.
- 2.5.2 Guards for drives shall have:
  - .1 18 ga (1.31 mm) expanded metal screen welded to 1" (25 mm) steel angle frame.
  - .2 16 ga (1.61 mm) thick galvanized sheet metal tops and bottom.
  - .3 Removable sides(s) for servicing.
  - .4 1½" (40 mm) diameter holes on both shaft centres for insertion of tachometer.
  - .5 Sectionalize if necessary so one man can handle removal.
- 2.5.3 Provide means to permit lubrication and use of test instruments with guards in place.
- 2.5.4 Fabricate and install belt guards for V-belt drives to permit movement of motors for adjusting belt tension and for belt slap.
- 2.5.5 Provide removable "U" shaped guards for flexible couplings with 12 ga (2.75 mm) thick galvanized frame and 16 ga (1.61 mm) thick expanded mesh face.
- 2.5.6 Provide guards on unprotected fan inlets and outlets. Guards to be provided by fan Manufacturer.
- 2.5.7 Prime coat guards and finish paint to match equipment.
- 2.5.8 Secure guards to equipment allowing for ease of removal.

---

**3 . EXECUTION**

**3.1 Electric Motors**

- 3.1.1 Unless otherwise noted starters and protection devices will be included under Electrical Division.
- 3.1.2 Assist Electrical Division to ensure proper connection, correct thermal overload protection and correct motor controls.
- 3.1.3 Where starters included in this Division as integral part of packaged equipment, they shall contain thermal overload protection.

**3.2 Setting and Alignment**

- 3.2.1 Employ journeyman millwright to align V-belt drives and/or shaft coupling drives prior to initial start-up. Millwright shall check that centrifugal fan wheels are properly centered on fan shafts.
- 3.2.2 Align shaft couplings to within  $\pm 0.002"$  ( $\pm 0.051$  mm) after grouting is complete and piping system is operational.
- 3.2.3 Align V-belt drives using straight edge.
- 3.2.4 Submit certificate from millwright, certifying that shaft couplings and V-Belt drives have been aligned and centrifugal fan wheels centered prior to initial start-up and checked again after final system balance adjustment.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 Where integrated pump mounted and packaged pump/VFD units are used – refer to Section 23 21 23 Hydronic Pumps.

### 1.2 **Quality Assurance**

- 1.2.1 Variable speed drives (VSD) shall be UL/CSA/NRTL-C certified. Equipment supplied to site without proper certification will be immediately removed from site. Variable speed drives shall comply with the following standards:
  - .1 NEMA-250 Enclosures to 1000 V maximum.
  - .2 EN 50178 (LVD).
  - .3 EN 61800-3.
  - .4 EN 61000-2-1, EN 61000-4-2 (-3, -4, -5, -6)/A2.
  - .5 EN 60146-1-1/A1.
  - .6 IEEE-519.
  - .7 UL-608C Power Conversion.
- 1.2.2 VSDs shall be supplied by one Manufacturer.

### 1.3 **Shop Drawings**

- 1.3.1 Provide complete dimensional data, operating data, system setpoints, written detailed sequence of operation and engineering data, including wiring diagrams, electrical schematics, and programming instructions.
- 1.3.2 Provide drawings showing field installation of electrical, electronic and pneumatic component requirements.

### 1.4 **System Activation**

- 1.4.1 Provide services of qualified technician to set up variable speed motor control system on site. Include minimum of half (½) man day per system to adjust and monitor system operation in conjunction with Balancing Sub-Trade and Controls Sub-Trade **and Commissioning Agent**.
- 1.4.2 Provide written start-up report to the Engineer listing operating setpoints, characteristics and identification.
- 1.4.3 Provide two site inspections during the warranty period to check operation, maintenance and calibration of variable speed drive.

---

**1.5 Power Supply**

- 1.5.1 Variable speed system shall accept 3-phase line voltage as defined in Electrical.
- 1.5.2 The tolerate supply line voltage deviation for the VSD shall be as follows:
  - .1 208 to 240V: Undervoltage Trip 135V, Overvoltage Trip 312V.
  - .2 380 to 480V: Undervoltage Trip 247V, Overvoltage Trip 624 V.
  - .3 500 to 600V: Undervoltage Trip 325V, Overvoltage Trip 780V.
- 1.5.3 For 600V networks, the input voltage of the VSD shall be rated for 500V to 600V +/- 10% minimum VSDs rated 575V +/- or less shall not be acceptable.
- 1.5.4 Input frequency shall be to 60 Hz  $\pm 5\%$ . Provide current limiting devices to protect electronics from excessive current.

**1.6 DDC Interface**

- 1.6.1 The VFD shall have a TIA-485 port as standard. The standard VSD firmware shall include BACnet, Siemens P-1-FLN, Johnson N2 Metasys and Modbus serial communication protocols. Lonworks shall be available on an under the cover option board.
- 1.6.2 Provide remote operator interface to accept and transmit 4-20 milliamp, 0-10 VDC and 0-5 VDC signals to and from DDC system to control or monitor the following functions:
  - .1 Start/stop.
  - .2 Acceleration of variable speed drive unit.
  - .3 Deceleration of variable speed drive unit.
  - .4 Speed of drive.
  - .5 Failure of unit.
- 1.6.3 Monitoring shall also be provided by key pad operator on speed drive box complete with auxiliary displays.

**1.7 Warranty**

- 1.7.1 VSD shall be warrantied by Manufacturer for period of 36 months from date of commissioning. Warranty shall include parts, labour, travel costs and living expenses incurred by Manufacturer to provide factory authorized on-site service.

---

## 2. PRODUCTS

2.1 Acceptable Manufacturers: ABB, Danfoss, AC Tech, Reliance, Cerus (E.H. Price supplier), LG (BMS Consultants Inc. - 604-723-6340).

### 2.2 General Requirements

2.2.1 Provide variable speed drive (VSD) for each fan and pump (or fan and pump set) as specified,.

2.2.2 Variable speed drive shall be of pulse width modulated (PWM) type utilizing transistors and shall have the following minimum specifications:

- .1 VSD package shall provide the following minimum protective devices:
  - .1 208/230 volt systems shall include 5% impedance line and load reactors.
  - .2 460 volt systems:
    - .1 Shall include minimum 5% impedance line and load reactors for control of harmonics, 3% impedance load reactors when connected to NEMA MG1 Part 30 motors.
    - .2 No output filter is required when connected to NEMA MG1 Part 31 motors.
  - .3 575 volt systems:
    - .1 Shall include minimum 5% impedance line and load reactors for control of harmonics and LRC Snubber Filter where cable length between VSD and motor exceeds 10'-0" (3.0 m) and LC Sine Wave Output Filter where cable length between VSD and motor exceeds 15'-0" (4.5 m) where connected to NEMA MG1 Part 30 motors.
    - .2 No output filtering required when connected to NEMA MG1 Part 31 motors.
- .2 Provide incoming horsepower rated door interlock at padlockable disconnect switch. Also provide fast acting input line fuses where characteristics are coordinated with drive's electronic protection circuits to not blow under normal output faults such as overcurrent, short circuit or ground fault.
- .3 Provide line over and under voltage protection, phase loss protection and phase unbalance protection.
- .4 Provide protection against overvoltage on DC bus.
- .5 Provide inherent short circuit protection for line to line and line to ground faults. If either fault occurs on output of VSD, VSD shall shut-down without damaging power circuit

- 
- devices. Controllers utilizing fuses or isolation transformers to provide protection shall not be acceptable.
- .6 Provide electronic instantaneous overcurrent protection.
  - .7 Drive shall have continuous duty service factor of 110% of rated output current with I2t motor overload protection above 100% current.
  - .8 Minimum efficiency of 97% at maximum load and speed.
  - .9 Provide two separately adjustable acceleration and deceleration ramps from 1 to 999 seconds (0 to 110% speed).
  - .10 Provide controller internal thermal protection.
  - .11 Provide automatic restart after inverter fault trip. Drive shall attempt to restart automatically three times with lock-out after third attempt if restart has not occurred.
  - .12 Provide rotating motor restart feature complete with soft lock capability during start-up to allow motor/fan unit which has been shut-down or has fault tripped, but is still rotating, to be restarted. VSD shall restart motor at speed at which it is rotating and then re-accelerate to speed called for by speed reference signal.
  - .13 Provide auto-restart after power outage (provided run enable is maintained).
  - .14 Provide three frequency reject points with adjustable bandwidth from 0.5 to 9.9 Hz to prevent fan from operating at resonant speed.
  - .15 Provide automatic/manual signal follower for:
    - .1 4-20 mA.
    - .2 0-10 VDC.
    - .3 0-5 VDC.

**2.3 Controls: Provide door mounted and microprocessor driven, digital operator control module to allow station operations personnel to set up and monitor drive parameters, observe output speed, load, voltage and time, monitor status and fault information, date and time stamped, as detailed below:**

- 2.3.1 Read-out information shall be displayed with LCD alpha-numeric high resolution display or approved equal. Information being displayed shall be presented in "user friendly" descriptive word format. Use of coded or abbreviated displays shall not be acceptable.
- 2.3.2 Speed load (power) and output voltage shall be continuously displayed when in run mode. Three display values shall be user selectable from a menu.

- 
- 2.3.3 Direct keypad entry shall be provided to observe the following parameters:
- .1 Maximum speed setting.
  - .2 Minimum speed setting.
  - .3 Acceleration rate.
  - .4 Deceleration rate.
  - .5 Current limit – monitoring.
  - .6 Current limit – regenerating.
  - .7 Up to three pre-set operating speeds.
  - .8 Up to three frequency reject points to avoid operating at resonant speed points. Centre frequency and band width shall be displayed.
- 2.3.4 Direct keypad entry shall be provided to initially set or change above noted parameters and only after password entered by authorized personnel.
- 2.3.5 Provide diagnostics for operator online status information. Each of the following status points shall be indicated by individual LED or digital display
- .1 Power on.
  - .2 Ready.
  - .3 Run.
  - .4 Jog.
  - .5 Motor accelerating.
  - .6 Motor decelerating.
  - .7 Direction of rotation (forward or reverse) (if function enabled).
  - .8 Auto mode (if function enabled).
  - .9 Manual mode.
  - .10 Stop.
  - .11 Low reference (missing or zero speed reference).
  - .12 External trip (interlocks open).
  - .13 Power lost.
- 2.3.6 Provide fault diagnostics to simplify troubleshooting. Each of the following points shall be indicated by individual LED or digital display:
- .1 Lockout (fault shut-down after three restart attempts).
  - .2 Line fault (line over/under voltage, phase loss/unbalance).
  - .3 Controller over temperature.
  - .4 I2t motor overload protection.
  - .5 DC bus overvoltage.
  - .6 DC bus under voltage.

- .7 Auxiliary power supply fault.
  - .8 Output fault – Phase A.
  - .9 Output fault – Phase B.
  - .10 Output fault – Phase C.
- 2.3.7 Provide keypad accessibility to non-volatile fault history memory which is not operator erasable. Memory shall store the following data for each of ten most recent drive shut-downs:
- .1 Fault which caused shut-down.
  - .2 Output frequency at time of trip.
  - .3 Output voltage at time of trip.
  - .4 Output load (power) at time of trip.
  - .5 Whether load was accelerating or decelerating.
  - .6 Time and date fault occurred.
- 2.3.8 Provide the following control functions on door mounted keypad:
- .1 Run.
  - .2 Stop.
  - .3 Jog (enabled in stop mode only).
  - .4 Auto/manual (if auto mode is enabled).
  - .5 Forward/reverse (if function is enabled).
  - .6 Accelerate (manual mode).
  - .7 Decelerate (manual mode).
  - .8 Direct speed set (manual mode).
- 2.3.9 Provide terminals for interlocking of up to six external interlocks (e.g., Firestat, Freezestat, etc.).

## **2.4 Harmonics**

- 2.4.1 All VFD's for pumps and fans 25HP and above, shall have a passive filter installed upstream to reduce the total harmonic current distortion (THID) to %5 upstream of that specific VFD.
- 2.4.2 VSD installations shall meet IEEE 519 harmonics guidelines for control of harmonics. Total harmonic voltage distortion shall be below 5% for normal applications and below 3% for special applications such as hospitals and airports, at point of common coupling with utility power supply. Calculation to demonstrate compliance shall be included in shop drawing submission. Failure to confirm compliance shall result in rejection of products.

## **2.5 Manual Bypass**

- 2.5.1 Provide integral 3-contactor manual bypass in NEMA 1 enclosure wired and mounted with VSD to transfer motor from VSD to line power or from line to controller. Bypass circuitry shall be wired to

isolate VSD from line. Motor overload protection shall be provided in both drive and bypass mode.

### **3 . EXECUTION**

#### **3.1 General**

- 3.1.1 Install equipment in accordance with Manufacturer's instructions, details and procedure.
- 3.1.2 In HAND position, power applied to each VSD shall provide soft motor start. In AUTO position, power shall be applied to VSD for soft start only when signal from DDC system allows. Soft start means power consumption shall be fully ramped.
- 3.1.3 MANUAL/AUTO switch in AUTO positing shall cause motor to accelerate at a rate determined by stability component until speed controller setpoint has been attained.
- 3.1.4 Loss of power at VSD input terminals or fault conditions shall cause VSD to go into orderly shut-down. Resumption of power shall cause VSD to go into orderly automatic restart sequence and provide soft start for motor.
- 3.1.5 Short circuit sensed anywhere in motor control loop shall interrupt current flow.
- 3.1.6 Acceleration and deceleration shall be set during commissioning of DDC system to ensure spurious tripping does not occur during normal operations.

#### **3.2 Start-Up Service**

- 3.2.1 Start-up commissioning service shall include factory and/or authorized service agent, to provide the following:
- 3.2.2 Verification of contractor wire terminations to VSD and optional circuitry.
- 3.2.3 Verification of interface wiring to building energy management system.
- 3.2.4 Measurement of motor voltage and frequency.
- 3.2.5 Calibration check for minimum speed, maximum speed, acceleration and deceleration rates.
- 3.2.6 Start-up and verification form to be provided to the Consultant and the Commissioning Agent.

**END OF SECTION**

**1.    GENERAL**

**1.1    Related Work**

1.1.1 This Specification Section forms part of Contract Document and is to be read, interpreted and coordinated with other parts.

**1.2    Scope**

1.2.1 Flexible pipe connections.

1.2.2 Expansion joints and compensators.

1.2.3 Pipe loops, offset and swing joints.

**1.3    Reference Standard**

1.3.1 Conform to Standard of "Expansion Joint Manufacturers Association" and Manufacturer's recommendations.

**1.4    Shop Drawings**

1.4.1 Product data shall include Manufacturer, model number, pressure and temperature rating, axial, lateral and angular movement handled, nominal size and dimensions, details of construction and assembly.

**1.5    General Requirements**

1.5.1 Examine piping layout and notify Consultant of additional anchors, guides or expansion joints required to adequately protect system. Where the on-site pipe routing and configuration differs from the plans, reengage specialist supplier or engineer to verify that changes will not affect the installation as designed or recommend changes required.

1.5.2 Make provisions for expansion and contraction of pipe work. Piping shall be anchored and supported in such a manner that strain and/or weight does not bear on any apparatus and pipe branch connections. Expansion joints and compensators shall be installed and guided as per Manufacturer's recommendations. Equipment shall be connected with unions, grooved couplings or flanges to provide for easy removal. Where piping passes through walls or floor slabs sleeves shall be provided of sufficient size to accommodate expansion and pipe insulation without binding or crushing insulation or preventing expansion of piping.

---

## 2. PRODUCTS

### 2.1 Flexible Hoses – Braided

- 2.1.1 Phosphor bronze convoluted bellows with braided bronze sleeve or stainless steel convoluted bellows with braided stainless steel sleeve.
- 2.1.2 Suitable for system operating temperature and pressure.
- 2.1.3 Connections:
  - .1 NPS 2 (50 mm) and under, screwed connections
  - .2 NPS 2½ (65 mm) and over, flanged connections
- 2.1.4 Length shall be as recommended by Manufacturer, unless noted otherwise.
- 2.1.5 Acceptable Products:
  - .1 Flexonics Flex Con, Flextech Industries, Hydro Flex, Keflex, Vibra-Flo, Metraflex BBCT, Metraflex MLP.

### 2.2 Flexible Pipe Connectors – Low Temperature

- 2.2.1 Flexible pipe connectors complete with control rods, manufactured from polyester tire cords and bridge bearing quality neoprene or EPDM, cover and liner to CSA Standard CAN3-S6-M88. Provide flanges, bolts, etc. for outdoor installation.
- 2.2.2 Twin sphere design with reinforcing ring.
- 2.2.3 Suitable for a maximum temperature of 105°F (40°C) (chilled and condenser water systems only).
- 2.2.4 Safety factor for burst and flange pullout shall be a minimum of 3:1
- 2.2.5 Solid steel rings shall be used within face rubber flanged ends to prevent pullout.
- 2.2.6 Control rods shall have ½" (15 mm) thick neoprene or EPDM washer bushing large enough in diameter to take the thrust at 1,000 psi (6,895 kPa) maximum.
- 2.2.7 Use control rods on flexible pipe connectors serving piping system which are not anchored on both sides of the connector or when system pressure exceeds 150 psi (1,034 kPa).
- 2.2.8 Where grooved piping systems are used, three flexible type couplings may be used in lieu of flexible pipe connectors.
- 2.2.9 Acceptable Products:
  - .1 Mason Safeflex SFDEJ complete with Mason CR control rods, Flextech Industries, Unisource Ultra-Sphere U302 EPDM, Metraflex Double Cablesphere, Victaulic Style 177, 77, W77 couplings and Series 380/381/382 VIPDs.

---

**2.3 Flexible Pipe Connections – High Temperatures**

- 2.3.1 Double braided, heat resistant, up to 392°F (200°C) bronze braid, up to 446°F (230°C) stainless steel braid.
- 2.3.2 Chemically inert and resistant to steam and moisture.
- 2.3.3 Capacity to absorb 6" (150 mm) with length across flexible portion not less than six diameters.
- 2.3.4 Adapter union shall be **male, swivel**. Flanges shall be steel **Class 150**.
- 2.3.5 Acceptable Products:
  - .1 Anaconda, Flexonics.

**2.4 Expansion Compensators**

- 2.4.1 Copper Pipe Expansion Compensator - Low Pressure:
  - .1 Bronze or stainless steel convoluted bellows.
  - .2 Suitable for 60 psi (415 kPa) working pressures.
  - .3 ¾" (20 mm) to 1¼" (32 mm) diameter, suitable for ½" (15 mm) compression and ¼" (6 mm) extension.
- 2.4.2 Steel Pipe Expansion Compensator:
  - .1 Factory assembled unit, with stainless steel or phosphor bronze in carbon steel casing.
  - .2 Anti-torque groove in casing, internal pipe guide at both ends, full length internal liner.
  - .3 Suitable for 150 psi (1,034 kPa) operating pressure.
  - .4 Suitable for 1½" (40 mm) compression and ¼" (6 mm) extension.
  - .5 Acceptable Products:
    - .1 Adscos, Flexonics, Flextech Industries, Hydroflex, Metraflex, Vibra-Flo.

**2.5 Expansion Joints**

- 2.5.1 Bellow Type:
  - .1 For axial, lateral or angular movements.
  - .2 Bellows type, corrugated, packless.
  - .3 Designed for maximum operating pressure and temperature of \_\_\_\_psi (\_\_\_\_ kPa) and \_\_\_\_°F (\_\_\_\_°C).
  - .4 **External Internal** stainless steel guide sleeves.
  - .5 External machined cast-iron control rings, full circumference.
  - .6 **With Without** external guide rods.
  - .7 Flanged Welded ends.
  - .8 Shrouds over external surfaces for insulation.

- .9 Two sets of alignment guides on each side of expansion joint, spaced to Manufacturer's recommendations, complete with guiding cylinder and base, cast or fabricated spider.
- .10 Acceptable Products:
  - .1 Adsko, Anaconda, Flexonics, Hydro-Flex, Tube Turns, United Flexible, Vibra-Flo.
- 2.5.2 Sleeve Type:
  - .1 For axial movement.
  - .2 Slip type, located centrally between two anchors without bases.
  - .3 Designed for \_\_\_\_psi (\_\_\_\_kPa).
  - .4 Sleeve ends fitted with forged steel flanges.
  - .5 With drip connections.
  - .6 Accessories to permit repacking under full line service **from one side**.
  - .7 Two sets of alignment guides on each side of expansion joint, spaced to Manufacturer's requirement.
  - .8 Acceptable Products:
    - .1 Badger, Flexonic, Tube Turn, Yarway.
- 2.5.3 Grooved Type:
  - .1 For axial movement.
  - .2 Grooved type, located as indicated on drawings or per the manufacture's design between anchors.
  - .3 Designed to a minimum of 400 psi (2,760 kPa) to 12" (300 mm), maximum of 300 psi (2,068 kPa) for 14" (350 mm) – 24" (600 mm).
  - .4 Two sets of alignment guides on each side of expansion joint, spaced to Manufacturer's requirement.
  - .5 Selected compressed, neutral or expanded per the manufacture's design. External bracings are not to be removed until the system is fully pressurized.
    - .1 Acceptable products: Victaulic Style 155 Expansion Joint.

## 2.6 Anchors

- 2.6.1 Contractor and Engineer to confirm with the Structural Engineer that the structure is suitable for mounting of the Anchor and the load placed on the structure before level one is poured and prior to install.
- 2.6.2 Anchors shall be fabricated from mild steel plate and structural steel angle and channel sections, in accordance with ANSI B.31.
- 2.6.3 Anchors shall securely attach piping to structural members. Size anchors to accommodate forces due to pipe expansion and weight.

- 2.6.4 Where bolts secure anchor to structure, weld bolts to plate. Arrange anchors so that bolts are in shear not in tension.
- 2.6.5 Provide anchors on both sides of expansion devices, as indicated on drawings, and as required to control flexing of the piping system.
- 2.6.6 Fabricated structural anchors shall be engineered and sealed by a professional engineer in the jurisdiction where the project is located. Sealed shop drawings shall be submitted and reviewed by the engineer of record prior to installation.
- 2.6.7 Riser clamps are not suitable for use as anchors.
- 2.6.8 Where grooved piping systems are utilized, incorporate as required.

## **2.7 Expansion Loops**

- 2.7.1 Provide expansion loops as required.
- 2.7.2 Expansion loops shall be of welded construction with long radius elbows. Three legs of expansion loop shall be equal.
- 2.7.3 For grooved pipe systems, flexible couplings and fittings can be used to accommodate thermal expansion and contraction.. Contractor to coordinate with grooved product manufacturer for expansion loop design and design reviewed by the consultant prior to installation

## **2.8 Riser and Horizontal Thermal Movement Accommodation**

- 2.8.1 Where grooved piping systems are utilized, contractor to coordinate with manufacturer to provide piping system design services to accommodate thermal movement and/or differential settlement of the piping system, included but not limited to, risers and horizontal piping systems. The service includes a detailed schematic design locating anchors, anchor loads, guides, expansion joints and any other required grooved components to accommodate movement. A calculation report showing thermal movement and accommodation shall be provided. The design shall be sealed by a qualified professional engineer from the jurisdiction in which the project is being constructed is required.
- 2.8.2 Where grooved components are used for thermal expansion, the contractor shall use grooved product manufacturer's anchors.

## **2.9 Guides**

- 2.9.1 Pipe alignment guides shall be sized to accommodate pipe insulation.
- 2.9.2 Riser clamps are not acceptable for use as guides.
- 2.9.3 Acceptable Product: Metraflex Style IV Guides, Hyspan Series 9500.

---

### 3 . **EXECUTION**

#### 3.1 **Installation**

- 3.1.1 Install piping systems with due regard and provision for expansion avoiding strain damage to equipment and building. Provide adequate expansion and contraction for piping running horizontally across building expansion joints.
- 3.1.2 Only major expansion configuration and fittings have been shown on the drawings. Provide required additional compensators, loops and wing connection.
- 3.1.3 Provide two pipe guides per side of expansion joint or expansion loop so that movement takes place along axis of pipe only. Placement of guides shall be at a minimum of 4 and 14 pipe diameter from expansion joint.
- 3.1.4 Install welded expansion loops, cold sprung 50% of calculated expansion.
- 3.1.5 Install at least three elbows in branch connections. Where space does not permit 3 elbows, install braided flexible pipe connectors in accordance with Manufacturer's recommendations. Three elbow branch connections shall have sufficient developed length to ensure that excessive stresses are not generated in piping and shall be no less than 36" (900 mm).

#### 3.2 **Expansion Joints**

- 3.2.1 Install expansion joints where shown on drawings in strict accordance with Manufacturer's detailed installation instructions.
- 3.2.2 Be aware of temperature when expansion compensator is installed to properly establish the length.
- 3.2.3 Ensure that expansion joints are not damaged during hydrostatic testing.
- 3.2.4 Piping shall be tested hydrostatically with expansion joints in place using cold water.
- 3.2.5 Bellows Type:
  - .1 Install union on one end of each screwed expansion joint.
  - .2 Remove slippage bolts and spacers after installation.
  - .3 Locate expansion joint centrally between anchors and position guides to Manufacturer's specific requirement. Provide structure as required to properly mount guides.
  - .4 Ensure that piping is properly aligned through expansion joint, over full travel.
  - .5 Adjust installed length of expansion joint to suit ambient temperature at time of installation.

- .6 A Representative of Manufacturer shall be present when piping is energized.
- 3.2.6 Sleeve Type:
  - .1 Locate expansion joint centrally between anchors and position guides to Manufacturer's specific requirement. Provide structure as required to properly mount guides.
  - .2 Set and secure base, if base mounted. Provide structure as required.
  - .3 Ensure piping is properly aligned through expansion joint, over full travel.
  - .4 Adjust installed length of expansion joint to suite ambient temperature at time of installation.
  - .5 Pack joint for service.
- 3.2.7 Grooved Type:
  - .1 External bracings are not to be removed until the system is fully pressurized.
  - .2 A Representative of Manufacturer shall be present when piping is energized.

### **3.3 Anchors**

- 3.3.1 Contractor and Engineer to confirm with the Structural Engineer that the structure is suitable for mounting of the Anchor and the load placed on the structure before level one is poured and prior to install.

### **3.4 Guides**

- 3.4.1 Provide pipe alignment guides on each side of all expansion joints and/or expansion loops in accordance with manufacturer's requirements.
- 3.4.2 Riser clamps are not acceptable for use as guides.

### **3.5 Flexible Hoses – Braided**

- 3.5.1 Install braided flexible hoses where shown on drawings and as flexible connections to designated heating/cooling terminal units.
- 3.5.2 On screwed connections, install a union on one end.
- 3.5.3 Do not torque hose.
- 3.5.4 Ensure braided flexible hoses are not damaged during hydrostatic testing.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

2. **PRODUCTS**

2.1 **Flow Measure Devices – Liquid**

- 2.1.1 Flow measuring device to be sized to provide a read-out signal between 10 to 40 inches WG (2488 and 9954 PA).
- 2.1.2 When required minimum straight pipe lengths cannot be provided for in-line devices, use elbow or Venturi type devices.
- 2.1.3 Each element shall be completed with instrument shut-off valves with finger tight connections and identification tag and chain.
- 2.1.4 Each element shall be complete with chained metal tag showing element size, location, volume, and differential signals.
- 2.1.5 Acceptable Products:
- .1 Elbow Type - Measurell.
    - .1 NPS 2 (50 mm) and under: cast bronze elbow, screwed ends, 125 psi (860 kPa).
    - .2 NPS 2½ (65 mm) and over: steel elbow, welded ends, 125 psi (860 kPa).
    - .3 Schedule 40: all fluids closed circuit.
    - .4 Schedule 80: on open circuits.
  - .2 In-line type - Verabar, Accutube, Flo-Probe, Presco, Valitube.
    - .1 NPS 1½ (40 mm) and under: Verabar, Model C050 series, Schedule 40 pipe nipple with factory installed sensing probe.
    - .2 NPS 2 (50 mm) and over: Verabar, Model C100 series, standard insert sensor with ½" (15 mm) threaded weld coupling.
  - .3 Venturi type - Gerand, Preso.
    - .1 NPS 2 (50 mm) and under: brass screwed.
    - .2 NPS 2½ (65 mm) and over: cast-iron or steel, flanged, butt-welded or roll grooved couplings where permitted.
- 2.1.6 Provide direct read-out dial type meter complete with connecting hoses and calibration chart to read measured flow. Flow meter shall

be calibrated inches (mm) of water and shall be suitable for water/glycol. Calibrate for water systems and provide correction data for 40% glycol.

.1 Acceptable Products:

.1 Eagle Eye, Gerand, Preso, Western Meter Model SCL101.

## **2.2 Flow Measuring Devices – Liquid (Electronic Output)**

2.2.1 Flow meters shall be manufactured by Annubar, Model No. 1151DP, consisting of flow sensor, transducer, gauges, mounting flange and accessories.

2.2.2 Accuracy shall be  $\pm 0.2\%$  of calibrated span and  $\pm 1\%$  error. Permanent pressure loss shall not exceed 25% of pressure differential reading. Accuracy shall be consistent to turndown ratio 25 to 1. Flow fitting shall be diamond shape.

2.2.3 Each flow fitting shall be complete with identification tag, conversion chart, quick disconnect gauge fittings and shut-off cocks.

2.2.4 One differential meter shall be complete with hoses, shut-off fittings, bleed valves and carrying case.

2.2.5 Flow meters shall be selected for temperature and pressure of installation. Transducer shall be selected for maximum pressure drop range.

## **2.3 Steam Meters**

2.3.1 Mechanical Type:

.1 Steam pressure rated for 250 psi (1,725 kPa) and temperature to 450°F (232°C).

.2 Body - cast-iron, cast steel or bronze.

.3 Orifice plate, spindle, turbines, damping fan and reduction drive constructed of monel.

.4 Integral direct reading counter box to register in lb (kg) steam per hour.

.5 Accuracy:  $\pm 2\%$  - maximum flow to 1/6 of maximum flow.

.6 Meter sizes larger than NPS 4 (100 mm) to be mounted with by-pass arrangement.

.7 Where by-pass installation is required, include necessary valves, bends, stainless steel orifice plate and screwed flange adaptors.

.8 Standard of Acceptance:

.1 Kent Cambridge RS/C, BIF

2.3.2 Electronic Type:

.1 Minimum Requirements:

- .1 316 stainless steel body with vortex shedding element.
- .2 Suitable for "wafer" installation between flanges.
- .3 316 stainless steel body, flanges and vortex shedding element.
- .4 Steam pressure rated at 150 psi (1,034 kPa).
- .5 Explosion and vapour proof electrical housing.
- .6 Pulse **4 to 20 MA analog** output signal.
- .7 15 to 30 volts DC input.
- .8 Accuracy:  $\pm 1.6\%$  of actual steam flow rate.
- .2 Accessories:
  - .1 Pressure Transmitter - model IGP10-A20D1C-V2, span limits 0 - 150 psi (1,034 kPa).
  - .2 Mass Flow Computer - model 75MCA-FEEFC with field-mounted enclosure.
- .3 Standard of Acceptance:
  - .1 Foxboro Vortex flow meter - model 83W-A0\*S1SSTNA.
- .4 Note: Units available from Simark Controls LTD, Telephone: (877) 940-7772.

### 3. **EXECUTION**

#### 3.1 **Flow Measuring Devices – Liquid**

- 3.1.1 Install flow measuring devices in piping circuits to establish operational flow rates. Measuring devices shall be located where shown on drawings.
- 3.1.2 Install in accordance with Manufacturer's installation instructions and in correct size of pipe. Reduce pipe size as required.
- 3.1.3 Install isolating globe, ball or needle valves with  $\frac{1}{4}$ " (6 mm) male end SAE flare connection on pressure tapping connections.
- 3.1.4 Provide and install quick-connect gauge couplings.

#### 3.2 **Steam Meters**

- 3.2.1 Install steam meter complete with strainer and isolating valve, where shown on drawings in strict accordance with meter Manufacturer's installation instructions. Take care to observe minimum dimension requirements.
- 3.2.2 Connections to DP transmitters and DDC System to be done by Controls Contractor.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

2. **PRODUCTS**

2.1 **General**

- 2.1.1 Select thermometers and pressure gauges so that their operating range falls in middle half of scale range.

2.2 **Thermometers – Piping**

2.2.1 Acceptable Manufacturers:

- .1 Marsh, Moeller, Terice, Weiss, Weksler, Winters.

2.2.2 Minimum Requirements:

- .1 Thermometers to be in accordance with Canadian General Standards Board CGSB 14.4 - M88.  
.2 Pipe mounted stem type - mercury actuated, adjustable angle type.  
.3 Refer to flow schematics for location of pipe mounted thermometers and wells.

2.2.3 Case:

- .1 Stem type – Stainless Steel. Case shall be provided with clear glass or heat resistant plastic window.

2.2.4 Scale:

- .1 Stem type - 9" (225 mm) scale length.  
.2 White background with temperature range in black.  
.3 Dual Celsius and Fahrenheit scale.

2.3 **Thermometers – Duct/Panel Mounted**

2.3.1 Acceptable Manufacturers:

- .1 Moeller, Terice, Weiss, Weksler, Winters.

2.3.2 Minimum Requirements:

- .1 Thermometers to be in accordance with Canadian General Standards Board CGSB 14-GP-2a.  
.2 Duct mounted dial type - solid liquid filled with remote capillary element.

- .3 Panel mounted dial type (surface) type - vapour filled direct mounting.
- .4 Panel mounted dial type (flush) type - remote liquid filled capillary element.

2.3.3 Case:

- .1 Dial type - cast aluminum, black enamel steel or stainless steel with stainless steel or chrome-plated face ring.

2.3.4 Scale:

- .1 Dial type - nominal 4-½" (115 mm) unless otherwise indicated.
- .2 White background with temperature range in black.
- .3 Dual Celsius and Fahrenheit scale.

**2.4 Pressure Gauges – Piping**

2.4.1 Acceptable Manufacturers:

- .1 Marsh, Moeller, Trerice, Weiss, Winters.

2.4.2 Minimum Requirements:

- .1 Gauges to be in accordance with ANSI B40.1 Grade "A" level.
- .2 4-½" (115 mm) cast aluminum, black steel or stainless steel case, with stainless steel or chrome-plated face ring.
- .3 White background with pressure range in black.
- .4 Dual kPa and psig scale.
- .5 Phosphor bronze bourdon tube, silver brazed tip and socket ¼" (6 mm) NPT lower connection.
- .6 Rotary type bushed movement, silicone dampened to prevent pointer oscillation.
- .7 Gauges to be registered with Provincial Boiler and Pressure Vessel Safety Branches with CRN number.
- .8 ULC listed for use on fire protection systems.
- .9 Accuracy shall be 1% off full scale over the middle half of the scale.

2.4.3 Accessories:

- .1 Install needle valve ahead of each gauge.
- .2 Install an anti-syphon loop (suitable for steam pressure) ahead of each gauge on steam systems.

**2.5 Test Plugs for Pressure/Temperature**

- 2.5.1 Provide ¼" (6 mm) NPT solid brass test plug fitting complete with brass chain where indicated.

2.5.2 Test plugs shall be capable of receiving either pressure or temperature  $\frac{1}{8}$ " (3.0 mm) OD Dual seal core shall be Nordel suitable for temperature of 350°F (177°C) and shall be rated zero leakage from vacuum to 1,000 psi (6,895 kPa).

2.5.3 Provide 1 master test kit containing 2 test pressure gauge of suitable range, 1 gauge adaptor,  $\frac{1}{8}$ " (3.0 mm) OD probe and 2 stem pocket testing thermometers of suitable range.

2.5.4 Acceptable Products:

- .1 Sisco P/T Plugs.
- .2 Trerice.

## **2.6 Test Thermometer**

2.6.1 Hand over test thermometer in protective case to Owner during Owner's Demonstration and Instruction Period. Provide same make and type as permanently installed thermometers suitable for use with pipe mounted wells. 30°F (-1°C) to 140°F (60°C).

2.6.2 Obtain two signed receipts from Owner certifying that test thermometer has been received. Hand one over to Consultant.

## **2.7 Thermometer Wells**

2.7.1 For copper pipe use copper or bronze. For steel pipe use brass, separable socket,  $\frac{3}{4}$  NPT.

2.7.2 Thermowell to be registered with Provincial Boiler and Pressure Vessels Safety Branch with CRN number.

# **3 . EXECUTION**

## **3.1 General**

3.1.1 Install thermometers and gauges to be easily read from floor or platform. If this cannot be accomplished, install remote reading thermometers and gauges.

3.1.2 Install engraved lamaroid nameplates as specified in Section 23 05 53 - Identification (identifying medium).

## **3.2 Thermometers**

3.2.1 Install in wells on piping.

3.2.2 Install separable well to minimize restriction to flow and, if necessary, install in section of oversized pipe.

3.2.3 Install wells where indicated for use with test thermometers.

3.2.4 Install in locations as indicated and on inlet and outlet of:

- .1 Heat exchangers.

- 
- .2 Water heating and cooling coils.
  - .3 Water boilers.
  - .4 Chillers - condenser and chilled water.
  - .5 Cooling towers and fluid towers.
  - .6 Central system water source heat transfers.
- 3.2.5 Use extensions where thermometers are installed through insulation.

**3.3 Pressure Gauges**

- 3.3.1 Install the following locations:
- .1 Suction and discharge of pumps.
  - .2 Upstream and downstream of PRVs.
  - .3 Inlet and outlet of waterside of coils (excluding terminal unit coils) and heat exchangers
  - .4 In other locations indicated.
- 3.3.2 Use extensions where pressure gauges are installed through insulation.
- 3.3.3 Where single gauge is used to measure multiple points, provide needle valves to isolate each point, including pressure gauge.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 General

- 1.2.1 Provide hangers and supports to secure equipment in place, prevent vibration, protect against damage from earthquake, maintain grade, provide for expansion and contraction and accommodate insulation.
- 1.2.2 Provide insulation protection saddles on insulated piping.
- 1.2.3 Fabricate hangers, supports and sway braces in accordance with ANSI B31.1 and MSS-SP58.
- 1.2.4 Set inserts in position in advance of concrete work. Use grid system in equipment rooms.
- 1.2.5 Support from top of structural members. Where structural bearings do not exist or inserts are not in suitable locations, suspend hangers from steel channels or angles. Provide supplementary structural members, as necessary.
- 1.2.6 Do not suspend from metal deck.
- 1.2.7 Hangers for copper pipe shall be copper plated or plastic dipped unless pipe hangers bear on piping insulation (cold services).
- 1.2.8 All exterior roof mounted wire braces and supports/anchors/fittings shall be of aircraft grade stainless steel, with minimum cable size of 0.15" (4.0 mm) diameter.

## 2. PRODUCTS

### 2.1 Upper Attachments

- 2.1.1 Concrete:
- .1 Inserts for cast-in-place concrete: galvanized steel wedge or universal. ULC listed for pipe NPS  $\frac{3}{4}$  (20mm) through NPS 8 (200 mm) - Anvil Fig. 281 or 282, Hilti KCM-WF and KCM-PD.
  - .2 Carbon steel plate with clevis for surface mount: malleable iron socket with expansion case and bolt. Minimum two expansion cases and bolts for each hanger - Grinnell/Anvil, plate fig. 49, socket fig. 290 and Taylor plate fig. 166, socket fig. 64.

- 
- .3 Drilled concrete insert shall be Hilti Model HSL.
    - .1 Acceptable Products: Holdrite #121LD, #125, #205
  - .4 Inserts shall be ICBO approved.
  - .5 Power/powder actuated fastenings and drop-in anchors are not permitted to be used for tensile loading (i.e. suspension of mechanical equipment) or for seismic anchorage and/or restraint.
- 2.1.2 Steel Beam (Bottom Flange):
- .1 Cold piping NPS 2 (50mm) and under: ductile iron C clamp - Anvil fig. 92 with fig. 89X retaining clip, Taylor fig. 406 with fig. 416 retaining clips.
  - .2 Cold piping NPS 2½ (65 mm) and larger and hot piping: forged steel beam clamp - Anvil fig. 292, Holdrite #280, Holdrite #261, Taylor 450.
- 2.1.3 Steel Beam (Top):
- .1 Cold piping NPS 2 (50 mm) and under: ductile iron “top of beam” C clamp - Anvil fig. 92 with fig. 89X retaining clip, and Taylor fig. 406 with fig. 416 retaining clip.
  - .2 Cold piping NPS 2½ (65 mm) and larger and hot piping: steel jaw, hook rod with nut, spring washer and plain washer - Anvil fig. 227, Holdrite #261.
- 2.1.4 Steel Joist (Top Chord):
- .1 Cold piping NPS 2 (50 mm) and under: steel washer plate with double locking nuts - Anvil fig. 60, Taylor fig. 80.
  - .2 Cold piping NPS 2½ (65 mm) and larger and hot piping: steel washer plates with double locking nut, carbon steel clevis and malleable iron socket - Anvil: washer plate fig. 60, clevis fig 66, socket fig. 290, Holdrite #261 or #115 with #271 Silencer, Taylor: washer plate fig. 80, clevis fig. 67, socket fig. 64.
- 2.1.5 Steel Channel or Angle (Bottom):
- .1 Cold piping NPS 2 (50 mm) and under: malleable iron C clamp - Anvil fig. 86, Taylor fig. 301.
  - .2 Cold piping NPS 2½ (65 mm) and larger and hot piping: universal channel clamp - Anvil fig. 226.
- 2.1.6 Steel Channel or Angle (Top):
- .1 Cold piping NPS 2 (50 mm) and under: malleable iron “top of beam” C clamp - Anvil fig. 61.
  - .2 Cold piping NPS 2½ (65 mm) and larger and hot piping: steel jaw, hook rod with nut, spring washer and plain washer - Anvil fig. 227.
-

---

**2.2 Middle Attachments (Rod)**

2.2.1 Carbon steel black (electro-galvanized/cadmium plated for mechanical rooms) continuous threaded rod - Anvil fig 146, Myatt fig. 434, Taylor fig. 54.

**2.3 Pipe Attachments**

2.3.1 Cold piping, steel or cast-iron: hot piping steel, with less than 1" (25 mm) horizontal movement; hot piping, steel, with more than 12" (300 mm) middle attachment (rod) length: adjustable clevis - Anvil fig. 260, Taylor fig. 24.

2.3.2 Cold copper piping: hot copper piping with less than 1" (25 mm) horizontal movement; hot copper piping with more than 12" (300 mm) middle attachment (rod) length: adjustable clevis copper plated - Anvil fig. CT-65, Taylor fig. 52.

2.3.3 Suspended hot piping, steel and copper, with horizontal movement in excess of 1" (25 mm); hot steel piping with middle attachment (rod) 12" (300 mm) or less pipe roller - Grinnell/Anvil fig. 174 or Grinnell/Anvil fig. 181, Taylor fig. 93, up to NPS 6 (150 mm) and Anvil fig. 171, Taylor fig. 95 NPS 8 (200 mm) and larger.

2.3.4 Bottom supported hot piping, steel and copper: pipe roller stand - Anvil fig. 271, Taylor 2795.

2.3.5 Spring hangers; where required to offset expansion on horizontal runs which follow long vertical risers - Anvil fig. 171, Taylor fig. 95, single pipe roll hanger with Anvil fig. 178, Taylor fig. 178.

**2.4 Riser Clamps**

2.4.1 Steel or cast-iron pipe: **galvanized** carbon steel - Anvil fig. 261, Taylor fig. 82, or Myatt fig. 182.

2.4.2 Copper pipe: carbon steel copper finished - Anvil fig. CT-121, Taylor fig. 85.

2.4.3 Isolated Clamp – Holdrite #273 with 10 ga bearing plates and pads.

**2.5 Saddles and Shields**

2.5.1 Cold piping: NPS ¾ (20 mm) and under: high density insulation with uninterrupted vapour barrier.

2.5.2 Cold piping: NPS 1 (25 mm) and over: protection shield with high density insulation under shield with uninterrupted vapour barrier. - Kingspan "Kooltherm Insulated Pipe Support Inserts", Shur-Fit Pro-Pipe.

2.5.3 Hot piping: NPS 3 (75 mm) and under: insulation over pipe hanger, Holdrite Insulation Coupling hanger.

- 2.5.4 Hot piping: NPS 4 (100 mm) and over: protective saddle with insulation under saddle - Anvil fig. 160 to 166, Taylor fig. 70-77.

## **2.6 Wall Supports**

### **2.6.1 Horizontal pipe adjacent to wall:**

- .1 Angle iron wall brackets with specific hangers.
- .1 Acceptable Products: Holdrite #261, #280, #255 and #285.

### **2.6.2 Vertical pipe adjacent to wall:**

- .1 Exposed pipe wall support for lateral movement restraint - Anvil fig. 262 or 263, Taylor fig. 46.
- .2 Channel type support - Burndy, Canadian Strut, Cantruss or Unistrut (arrangement to be acceptable to BC Boiler Inspection Department).

## **2.7 Floor Supports**

### **2.7.1 Horizontal Pipe:**

- .1 Do not support piping from the floor unless specifically indicated.

### **2.7.2 Vertical Pipe:**

- .1 Mid-point of risers between floor slabs - adjustable fabricated steel supports. Refer to Section 23 05 49 Seismic Restraints.

## **3 . EXECUTION**

### **3.1 Hanger Spacing**

#### **3.1.1 Spacing and middle attachment (rod) diameter as specified in paragraphs below or as in table below, whichever is more stringent.**

- .1 Plumbing piping: most stringent requirements of the Plumbing Code or authority having jurisdiction.
- .2 Fire protection: to applicable fire code; toggle hangers are unacceptable.
- .3 For Gas Piping refer to Gas Code CAN/CGA-B149.1.
- .4 Flexible joint roll groove pipe: in accordance with table below, but not less than one hanger at joints.
- .5 Within 12" (300 mm) of each horizontal elbow, tee, joints, etc.
- .6 Provide oversize hangers and high density insulation and saddle for cold piping with vapour barrier to accommodate maintaining vapour barrier. Use Kingspan "Kooltherm

Insulated Pipe Support Inserts" or Shur-Fit Pro-Pipe high density insulation products.

3.1.2 Maximum hanger spacing table:

Pipe Size: NPS	Rod Diameter inches (mm)	Maximum Spacing Steel Pipe ft (m)	Maximum Spacing Copper Pipe ft (m)
½	⅜" (9.5 mm)	6'-0" (1.8 m)	5'-0" (1.5 m)
¾, 1	⅜" (9.5 mm)	8'-0" (2.4 m)	6'-0" (1.8 m)
1 ¼, 1 ½	⅜" (9.5 mm)	10'-0" (3.0 m)	6'-0" (1.8 m)
2	⅜" (9.5 mm)	10'-0" (3.0 m)	10'-0" (3.0 m)
2 ½, 3, 4	½" (15 mm)	10'-0" (3.0 m)	10'-0" (3.0 m)
5, 6, 8	⅝" (16 mm)	10'-0" (3.0 m)	
10, 12	⅞" (22 mm)	10'-0" (3.0 m)	

### 3.2 Hanger Installation

- 3.2.1 Offset hanger so that rod is vertical in operating position.
- 3.2.2 Adjust hangers to equalize load.
- 3.2.3 Install hanger to provide minimum 1" (25 mm) clear space between finished covering and adjacent work.
- 3.2.4 Install high density insulation and saddle for cold piping with vapour barrier to accommodate maintaining vapour barrier.
- 3.2.5 Support vertical piping at every other floor.
- 3.2.6 Where several pipes can be installed in parallel and at same elevation, provide multiple or trapeze hangers.
- 3.2.7 Where practical, support risers piping independently of connected horizontal piping.
- 3.2.8 Install plastic inserts between steel studs and piping.
- 3.2.9 For beam clamps, extend hanger rod tight to underside of beam with top bolt and washer.

### 3.3 Inserts

- 3.3.1 Use inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams wherever practical.
- 3.3.2 Set inserts in position in advance of concrete work. Provide reinforcement rod in concrete for inserts carrying piping over 4" (100 mm) or ducts over 60" (1,500 mm) wide.
- 3.3.3 Where concrete slabs form finished ceiling, finish inserts, flush with slab surface.

- 
- 3.3.4 Where inserts are omitted, drill through concrete slab from below and provide rod with recessed square plate and nut above slab, in concealed locations.
  - 3.3.5 Provide test mock-up for review.
  - 3.3.6 Provide inserts above chillers, pumps and sump pumps to permit equipment servicing. Provide an eyebolt.
  - 3.3.7 Inserts shall be installed in accordance with Manufacturer's recommendations and in no case closer than 7'-0" (2.1 m) apart.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Summary**

- 1.1.1 Section includes a complete pipe freeze protection system for above ground water piping consisting of a self-regulating heating cable, connection kits, electronic controller, and installation accessories.
- 1.1.2 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 **References**

- 1.2.1 Reference Standards
  - .1 UL515 – Electrical Resistance Heat Tracing for Commercial Applications
  - .2 IEEE 515.1-2012 Standard for the Testing, Design, Installation & Maintenance of Electric Resistance Trace Heating for Commercial Applications.
  - .3 CSA C22.2 No. 130-03 Requirements for Electrical Resistance Heating Cables & Heating Device Sets
  - .4 NFPA70 - National Electrical Code
  - .5 C22.1 – Canadian Electrical Code

### 1.3 **Submittals**

- 1.3.1 Product Data
  - .1 Heating cable data sheet
  - .2 UL, CSA, FM approval certificates for freeze protection for aboveground hydronic lines
  - .3 Pipe freeze protection design guide
  - .4 System installation and operation manual
  - .5 System installation details
  - .6 Connection kits and accessories data sheet
  - .7 Controller data sheet
  - .8 Controller wiring diagram
- 1.3.2 Shop Drawings
  - .1 Provide heat tracing circuit layout drawings indicating power connections, tees, end seal, cable length and circuit cable length.

### 1.4 **Quality Assurance**

- 1.4.1 Source Limitations: Obtain all heat tracing system cable & components from a single source from a single manufacturer.

---

1.4.2 Qualifications

- .1 Manufacturers
  - .1 Manufacturer to show minimum of ten (10) years of experience in manufacturing electric self-regulating heating cables.
  - .2 Manufacturer will be ISO-9001 registered.
  - .3 Manufacturer to provide products consistent with UL 515, CSA 22.2 No 130-03 and IEEE 515.1 requirements.

1.4.3 Certifications

- .1 The system (heating cable, connection kits, and controller) shall be UL Listed, CSA Certified and FM Approved for freeze protection of aboveground hydronic piping.

**1.5 Delivery, Storage, and Handling**

1.5.1 Delivery and Acceptance Requirements

- .1 Deliver and handle products to prevent their deterioration or damage due to moisture, temperature changes, contaminates or other causes.
- .2 Deliver products to site in original, unopened containers or packages with intact and legible manufacturers' labels identifying the following:
  - .1 Product and Manufacturer
  - .2 Length/Quantity
  - .3 Lot Number
  - .4 Installation and Operation Manual
  - .5 MSDS (if applicable)

1.5.2 Storage and Handling Requirements

- .1 Store the heating cable in a clean, dry location with a temperature range 0°F (-18°C) to 140°F (60°C).
- .2 Protect the heating cable from water damage by protecting all cables ends from water ingress.

**1.6 Warranty**

1.6.1 Manufacturer Warranty

- .1 Provide material and system warranty for all goods listed below for two (2) years from date of purchase against faulty workmanship and use of defective materials when such goods are properly installed, operated, and maintained according to product documentation.
  - .1 Heating Cables, connection kits & accessories

- .2 Thermostats, controllers, panels contactors, sensors and accessories.

## 2. PRODUCTS

### 2.1 Heat Tracing System

#### 2.1.1 Manufacturers

- .1 Basis of Design Manufacturer: Subject to compliance with requirements, provide Raychem heat tracing products of **Pentair Thermal Building Solutions**. Email: **thermal.info@pentair.com** Website: **www.pentairthermal.com**
- .2 Submit comparable products of one of the following for approval by Mechanical Engineer:
  - .1 Hevi-Duty, Nelson, Termon, Nuheat
  - .2 Submit request for substitutions in accordance with Instructions to Bidders and Division 01 General Requirements.

#### 2.1.2 Materials

- .1 Heating cables shall be Raychem model XL Trace, self-regulating type heating cables.
  - .1 The Raychem XL Trace Heating Cables shall be designed for the following voltage/wattage:
    - .1 208-277VAC – 12 watts/ft @ 50°F -12XL-2-CT
  - .2 The heating cables shall have a **FLUOROPOLYMER** outer insulating jacket with the following information clearly printed on the cable – cable model #, agency listings, meter marks & batch ID.
  - .3 The heating cable shall have a modified polyolefin inner jacket and a tinned-copper braid to provide a ground path and enhance the cables ruggedness.
  - .4 The heating cable shall consist of a continuous core of conductive polymer that is radiation cross-linked, extruded between two (2) 16 AWG nickel-plated copper bus wires.
  - .5 The heating cable shall be UL part of a UL Listed, CSA Certified and FM Approved system.
  - .6 Constant wattage cables are not acceptable.
- .2 Heating Cable Connection Kits
  - .1 Heating cable connection kits shall be Raychem model
    - .1 RayClic.
    - .2 FTC.

- 
- .2 Contractor shall provide power connections, splices/tees and end seal kits to properly connect & terminate the heating cable circuit along the specified length of above ground water piping.
  - .3 All splices, tees and crosses shall be installed underneath the pipe insulation with service loops installed to allow for future service of the piping.
  - .4 Connection kits shall be rated NEMA 4X to prevent water ingress and corrosion. All components shall be UV stabilized.
  - .5 Connection kits shall be UL Listed or CSA Certified.
  - .3 Attachment of Heating Cable
    - .1 Attachment method of heating cable to the piping shall be Raychem model
      - .1 GT-66 – general purpose, high temperature, glass filament tape for operation @ 40°F and above.  
Contractor to install heating cable to pipe every 12" (300 mm) by wrapping around the pipe & over the heating cable.
      - .2 GS-54 – general purpose, high temperature, glass filament tape for operation @ 40°F and below.  
Contractor to install heating cable to pipe every 12" (300 mm) by wrapping around the pipe & over the heating cable.
      - .3 AT-180 – aluminum tape, high temperature for all plastic piping for operation @ 32°F and above.  
Tape is installed lengthwise over the heating cable.
    - .2 Metal cable ties are not permitted.
  - .4 Identification of Heating Cable System
    - .1 Contractor shall provide & install Raychem model **ETL "Electric Heat Traced" labels** on exterior of pipe insulation every 10' (3.0 m) feet on opposite sides of the pipe for the entire length of heat traced piping.
    - .2 In addition, all splices, tees, crosses and power connections shall be labeled on the exterior of the pipe insulation indicating that presence of a connection kit.
  - .5 Control
    - .1 Contractor shall provide **ONE (1) Raychem model C910-485** controller for **each heat tracing circuit** as indicated on heat tracing schedule.
    - .2 See table below for complete list of required controller capabilities:

Supply Voltage	100VAC to 277VAC		
Enclosure	NEMA4X FRP	Operating Temp Range	-40°F - 140°F
Display	6 character alphanumeric LED		
Control	Relay Type: DP, mechanical	Voltage: 277VAC max	Current: 30 A @ 104°F
Control Algorithms	On/Off	Proportional Ambient Sensing Control for energy saving	
Monitoring			
	Temperature	Low Alarm: 0°F to 180°F	High Alarm: 0°F to 200°F
	Ground Fault	Alarm Range: 20mA - 100mA	Trip Range: 20mA - 100mA
	Current	Low alarm range: .3A to 30A or off	
	Autocycle Test	Interval: 1-240 minutes or 1-240 hours	
Temp Sensor Inputs	Quantity: Two (2)	Type: 100Ω, platinum 3 wire	
Alarm Outputs			
	AC Relay: Isolated solid state triac, SPST, 0.75A max, 100VAC to 277VAC nominal		
	Dry Contact Relay: Pilot duty, 48VAC/DC, 500mA maximum, 10VA max. resistive switching		
	Outputs: Normally Opened or Normally Closed		
Stored Parameters			
	Minimum Temperature	Maximum Temperature	Max. ground fault current
	Maximum Heater current	Contactor cycle count	Time in Use
Alarm Conditions			
	Low & high temperature	Low current	Ground fault alarm & trip
	RTD failure	Loss of programmed values	EMR failure
Communications			
	Protocol: Modbus RTU	Topology: daisy chain	26AWG shielded twisted pair

.6 Temperature Sensors

- .1 Contractor shall provide **ONE (1) Raychem model RTD-50CS**, 100Ω, platinum 3 wire RTD for ambient temperature sensing for each C910-485 Heat tracing controller.
- .2 Temperature sensor shall be installed as indicated on drawings.

.7 Approval

- .1 The complete heat trace system shall be listed by a NRTL for freeze protection of above ground, hydronic piping.

### **3 . EXECUTION**

#### **3.1 Examination**

##### **3.1.1 Verification of Conditions**

- .1 Prior to installation of heating cable system, verify that all piping which will be heat trace has passed all hydrostatic/pressure test and is signed off by consultant.

##### **3.1.2 Preinstalling Testing**

- .1 Prior to installing heating cable on the piping an insulation resistance test shall be performed by the installing contractor to ensure integrity of heating cable as describe in the operation & maintenance manual. Provide written assurance of test and letter to be filed in operation and maintenance manual.

#### **3.2 Preparation**

##### **3.2.1 Protection of in-Place Conditions**

- .1 All heating cable ends shall be protected from moisture ingress until cable is terminated.
- .2 Acceptable methods are heat shrinking or installing Rayclic-E end seals.

#### **3.3 Installation**

##### **3.3.1 Comply with manufacturer's recommendations in the XL-Trace System Installation and Operation Manual.**

##### **3.3.2 Install electric heating cable according to the drawings and the manufacturer's instructions. The installer shall be responsible for providing a complete functional system, installed in accordance with applicable national and local requirements.**

##### **3.3.3 Interface with Other Work**

##### **3.3.4 Connection of all electrical wiring shall be according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."**

##### **3.3.5 Grounding of controller shall be according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."**

##### **3.3.6 Pipe Insulation shall be according to Section 23 07 19 "HVAC Piping Insulation" and is required for a properly operating heat trace system.**

---

**3.4 Field Quality Control**

**3.4.1 Field Tests and Inspections**

- .1 The following test shall be performed after the heat cable has been installed but before the insulation and after insulating the piping. The results of both sets of tests shall be recorded as detailed in the Raychem Pipe Freeze Protection Installation and Maintenance Manual and included in submittals to owner:
  - .1 Continuity Test
  - .2 Insulation Resistance – 2500VDC
  - .3 Capacitance Check – Circuit Length Verification
  - .4 Power Check
  - .5 Ground Fault Test

**3.4.2 Non-Conforming Work**

- .1 Any heat tracing circuit which fails the any of the above test must be corrected prior to commissioning or startup of the system.

**3.5 System Start-Up**

- 3.5.1 Provide a factory-certified technician or manufacturer's representative for startup & commissioning of the heat tracing system and controller.
- 3.5.2 Coordinate all controller settings with mechanical engineer prior to programming the controller.
- 3.5.3 Provide commissioning report in submittals package to consultant for review, and for copy to be placed in the operations and maintenance manual.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 Provide vibration isolation on motor driven equipment, piping and ductwork, such that noise transmitted to occupied space by any other path than airborne is less than airborne noise transmitted from mechanical space to occupied space. The following are considered minimum requirements to meet this criterion.

### 1.2 Regulatory Requirements

- 1.2.1 Supply isolators and seismic restraints meeting the structural requirements of the **Ontario Building code and Ontario Fire Code<sup>3</sup>**, including Part 4 requirements with respect to seismic snubbers or provide equivalent requirements where integral seismic restraint is provided in isolators/bolting.
- 1.2.2 Provide vibration isolator housings as a safety guard with respect to isolated equipment and any contained compressed springs. Include "Fail Safe" Seismic restraint in vibration isolation designed to hold mechanical equipment and springs in place.

### 1.3 Shop Drawings, Qualifications and Submittals

- 1.3.1 Anchorage of equipment shall be certified by ON registered professional Structural Engineer who specializes in seismic restraint of resiliently mounted systems. Seismic integral isolation mounts or snubbers shall be approved and the associated OSHPD number clearly indicated on seismic device. Where OSHPD certification is not available, results of tests consistent with OSHPD procedures and approvals shall be submitted and certified by registered professional Structural Engineer.
- 1.3.2 Obtain relevant equipment information and provide shop and placement drawings for vibration isolation elements and steel bases for review before materials are ordered.
- 1.3.3 Provide attachment to both equipment and structure meeting specified forces involved. Attachment details to structure to be reviewed by Structural Consultant for project.
- 1.3.4 Submit samples of materials required to complete work of this section for inspection and review, as requested.
- 1.3.5 Post disaster dynamic analysis shall consist of computer printout where equipment has been modeled as single 3-dimensional rigid body composed of several rigidly attached lumped masses. For

---

purpose of analysis at each support, non-linear snubber/air or spring isolator combination may be replaced by single equivalent linear spring which is dependent upon displacement amplitude. System analysis must be conservative and consider six natural modes and associated frequencies. Resultant data shall be combination of modal responses presented in form of most probable value (RMS of six modes) and upperbound value sum of absolute values of six modes.

#### **1.4 General**

- 1.4.1 This project is deemed a post disaster facility.
- 1.4.2 Provide vibration isolation on motor driven equipment with motors of  $\frac{1}{2}$  hp (0.37 KW) and greater (as indicated on the motor nameplate) and on piping and ductwork, as specified herein. For equipment less than  $\frac{1}{2}$  hp (0.37 KW), provide vibration isolation grommets at support points.
- 1.4.3 Provide seismic restraint for equipment including seismic restraint related hardware (bolts and anchors) from point of attachment to equipment to attachment to structure. Required anchors shall be indicated on shop drawings and clearly identified for correct location and to be readily identified after installation. Provide clear instructions for installation.
- 1.4.4 Place isolators under equipment so minimum distance between adjacent corner isolators is at least equal to height of centre of gravity of equipment. Include height of centre of gravity on shop drawings. Otherwise, design for increased forces on supports, and submit design calculations with shop drawings for approval. In particular, provide chiller isolation meeting this requirement.
- 1.4.5 Ensure isolation systems have a vertical natural frequency less than one third of lowest forcing frequency, unless otherwise unspecified. Use dynamic stiffness correction factors for elastomers and do not exceed 60 durometer.
- 1.4.6 Isolators and restraining devices, factory supplied with equipment, shall meet requirements of this section. Isolation supplier to check with pump supplier for number and location of isolators and if there is requirement for structural or inertia bases.
- 1.4.7 Provide concrete inertia bases or structural steel bases, where specified or required by equipment Manufacturer, located between vibrating equipment and vibration isolation elements, unless equipment Manufacturer certifies direct attachment capabilities. Coordinate with Division 3 for provision of concrete work.
- 1.4.8 Coordinate with Division 3 for provision of housekeeping pads at least 4" (100 mm) high under isolated equipment, or greater thickness where specified. Provide minimum 12" (300 mm)

---

clearance between drilled inserts and edge of housekeeping pads. Housekeeping pads shall be tied to structure with reinforcement to meet Code seismic requirements.

- 1.4.9 For isolated equipment, design anchors, bolts, isolators and bases to meet Code requirements. For larger isolators, where Code requirement cannot be met by isolator housing, provide Type 6 seismic snubbers or Type 6P where post-disaster requirement is specified.
- 1.4.10 Use ductile materials in vibration and seismic restraint equipment.
- 1.4.11 Follow Structural Consultant's instructions for drilled inserts.
- 1.4.12 Coordinate with Section 23 33 00 "Air Duct Accessories" for ductwork connections to fans or plenums.
- 1.4.13 Provide flexible connectors between equipment and piping where required by Manufacturers to protect equipment from stress and reduce vibration in piping system. Meet connector Manufacturer's installation requirements as well as equipment Manufacturer's requirements.
- 1.4.14 Coordinate with Electrical for the provision of a minimum 180° hanging loop of flexible conduit for electrical connections to isolated equipment.
- 1.4.15 Supply isolators assembled and clearly labelled with instructions for installation by Contractor.

## 2. **PRODUCTS**

### 2.1 **Isolators – General**

- 2.1.1 Supply of vibration isolation equipment by one approved supplier with exception of isolators which are factory installed and are standard equipment with machinery. Confirm with Manufacturer that factory-installed isolators meet seismic requirements.
- 2.1.2 Select isolators at supplier's optimum recommended loading and do not load beyond limit specified in Manufacturer's literature.
- 2.1.3 Provide neoprene isolators and components using maximum 60 duro "Bridge bearing quality neoprene," as defined by CSA Standard CAN3-S6-M78. Ensure design of isolation and restraint elements allows adequate clearance to avoid binding.
- 2.1.4 Design springs "iso-stiff" ( $k_x/k_y = 1.0$  to  $1.5$ ) with a working deflection between 0.3 and 0.6 of solid deflection.
- 2.1.5 Provide hot dipped galvanized housings and neoprene coated springs, or other acceptable weather protection, for isolation equipment located outdoors or in areas where moisture may cause corrosion.

2.1.6 Elastomeric components in Type 1 and Type 2 isolation products and Type 6 and 6P seismic snubbers shall be bridge bearing neoprene meeting CSA Standard CAN3-S6 and CAN/CSA-S6-88. Durometer shall be defined per ASTM D 675 and within +/- of stated durometer. Minimum tensile strength (2,000 psi (13,790 kPa) for 40 durometer and 2,500 psi (17,240 kPa) for 50 and 60 durometer) and minimum elongation at break point (40 duro = 450%, 50 duro = 400% and 60 duro = 350%) to be per ASTM D 412. Tests for aging shall be per ASTM D 573 where, when tested in a 212°F oven for 70 hours, increase in hardness is no greater than 15%, tensile strength change does not exceed 15% and elongation to break is not reduced by more than 40%. Effects of ozone on product shall be as prescribed by ASTM D 1149 and material will show no cracks when tested. Compression set will be determined by ASTM 395, Method B and 40 duro product shall not exceed 40% and 50 and 60 duro product shall not exceed 25%. Compounding of the neoprene shall be in strict accordance with the Raw Material Supplier's formulation, in order to meet the above noted test procedures.

## **2.2 Isolators – Type 1, Pads**

2.2.1 Neoprene or neoprene/steel/neoprene pad isolators. Select Type 1 pads for minimum  $\frac{3}{32}$ " (2.5 mm) static deflection or greater. Use hold down bolts selected for seismic loads. Isolate bolts from base of unit using neoprene hemi-grommets. Avoid over-compressing grommets (e.g. use Hilti HVA adhesive set bolts, or equal, with steel washers and lock nuts, adjusted finger tight to hemi-grommets). Size bolt and hemi-grommet for minimum lateral clearance. Use grommets only on light-weight equipment.

2.2.2 Where use to isolate equipment having to be anchored to meet post disaster requirements, provide dynamic analysis as per clause 1.3.5 of this section.

2.2.3 Acceptable Products:

- .1 Mason Super W pads.
- .2 Mason Industries Type HG Hemi-Grommets.
- .3 EAR Grommets.
- .4 Kinetics Noise Control Inc. Type RSP.
- .5 Vibro-Acoustics Neo+.
- .6 Vibro-Acoustics Grommet Washers.

## **2.3 Isolators – Type 2, Rubber Floor Mounts**

2.3.1 Rubber/neoprene-in-shear isolators designed to meet specified seismic requirements. Select for 0.15" (4.0 mm) minimum static deflection and bolt to structure. Rubber isolators, provide protection

in design of isolator to avoid contact of rubber element to oil in mechanical room.

2.3.2 Where use to isolate equipment having to be anchored to meet post disaster requirements, provide dynamic analysis as per clause 1.3.5 of this section.

2.3.3 Acceptable Products:

- .1 Mason BR, maximum 50 durometer.
- .2 Kinetics Noise Control Inc. Type RD, RQ.
- .3 Vibro-Acoustics SRD.

## **2.4 Isolators – Type 3, Spring Floor Mounts**

2.4.1 Spring mounts complete with levelling devices, selected to achieve 1" (25 mm) deflection under load. Spring to incorporate minimum ¼" (6.0 mm) thick neoprene sound pad or cup having 0.05" (1.3 mm) minimum deflection under load. Design isolator to meet specified seismic requirements.

2.4.2 Where use to isolate equipment having to be anchored to meet post disaster requirements, provide dynamic analysis as per clause 1.3.5 of this section.

2.4.3 Acceptable Products:

- .1 Mason SSLFH.
- .2 Mason SSLR (for chillers and cooling towers only).
- .3 Kinetics Noise Control Inc. FLS.
- .4 Vibro-Acoustics SCSR

## **2.5 Isolators – Type 4, Hanger Mounts**

2.5.1 Spring hangers, complete with ¼" (6.0 mm) thick neoprene cup/bushing sized for 0.05" (1.3 mm) minimum deflection, or neoprene hangers.

2.5.2 Acceptable Products:

- .1 Mason HS.
- .2 Kinetics Noise Control Inc. SH.
- .3 Vibro-Acoustics SH

## **2.6 Isolators – Type 5, Air Springs with Seismic Snubbers**

2.6.1 Air springs complete with air spring levelling valves assembly and Type 6 seismic stops, seismic restraints.

2.6.2 Design to operate at maximum air pressure of 100 psi (690 kPa). Provide air compressor where necessary.

2.6.3 Suitable for outdoor installation.

2.6.4 Acceptable Products:

- .1 Mason MAS air mount, Mason No. WF-39368-3 valves.

**2.7 Isolators – Type 6, Seismic Snubbers**

2.7.1 Seismic snubbers complete with minimum  $\frac{1}{8}$ " (3.0 mm) neoprene brushing and  $\frac{1}{4}$ " (6 mm) air gap. Snubber to act omni-directionally. Ensure brushing can easily be turned by hand after installation.

2.7.2 Acceptable Products:

- .1 Manson Z-1225.  
.2 Kinetics Noise Control Inc. - HS Series.

**2.8 Isolators – Type 6P, "Post Disaster" Seismic Snubbers**

2.8.1 Seismic stop complete with  $\frac{3}{4}$ " (20 mm) neoprene bushing, 50 durometer maximum, and  $\frac{1}{8}$ " (3.0 mm) air gap with removable sleeve for accurate installation. Snubber shall be designed to act omni-directionally and keep acceleration to equipment during seismic event, below fragility level of equipment (Equipment to function after earthquake).

2.8.2 Acceptable Products:

- .1 Mason Z-1011.  
.2 Kinetics Noise Control Inc. - HS Series.

**2.9 Closed Cell Foam Gaskets/Neoprene Grommets – Type 7N**

2.9.1  $\frac{3}{4}$ " (20 mm) thick continuous perimeter closed cell foam gasket to isolate base of package equipment, AHUs, exhaust fans, etc. from concrete floors/roof curbs. Select width for nominal 3 psi loading under weight of equipment and allow for 25% compression  $\frac{3}{16}$ " (4.5 mm). Increase width of curb using steel shim to accommodate gasket. For light equipment such as exhaust fans, deflection should be a minimum of 0.05" (1.3 mm). Contractor to check fire rating requirements specified for project.

2.9.2 Acceptable Products:

- .1 American National Rubber-EPDM-SBR blend SCE 41 type neoprene.  
.2 Mason Industries Type HG Hemi-Grommets.  
.3 Kinetics Noise Control Inc. Neoprene/EPDM Grommets.  
.4 Vibro-Acoustics Grommet Washers.

**2.10 Spring Isolation Curb/Curb Mounted Rooftop – Type 7S**

2.10.1 Packaged air handling equipment, curb mounted shall be mounted on spring isolation curbs. Lower member shall consist of sheet metal "Z" section containing adjustable and removable springs (see Type 3 above) that support upper floating section. Upper frame must provide continuous support for equipment and must be captive to

resiliently resist wind and seismic forces. All directional neoprene snubber bushings shall be minimum  $\frac{1}{4}$ " (6 mm) thick. Steel springs shall be laterally stable and rest on  $\frac{1}{4}$ " (6 mm) neoprene acoustical pads. Hardware shall be plated and springs provided with rust-resistant finish. Curb's waterproofing shall consist of continuous galvanized flexible counter-flashing nailed over lower curb's waterproofing and joined at corners by EPDM bellows. Spring locations shall have access ports with removable waterproof covers. Lower curbs shall have provision for 2" (50 mm) of insulation. Roof curbs shall be built to seismically contain rooftop unit. Unit shall be solidly fastened to top floating rail, and lower "Z" section anchored to roof structure. Curb shall have anchorage OSHPD pre-approval "R" number attesting to maximum certified horizontal and vertical load ratings.

2.10.2 Acceptable Products:

- .1 Mason RSC.
- .2 Vibro-Acoustics ARTR.

**2.11 Pipe Riser Guide/Anchor – Type 8**

2.11.1 Telescoping all direction acoustical pipe anchor consisting of two concentric steel tubes separated by  $\frac{1}{2}$ " (15 mm) thick neoprene isolation material. Hot application isolators.

2.11.2 Acceptable Products:

- .1 Mason ADA and VSG (H), Metraflex Style IV Guides/PGQ.
- .2 Generator exhausts, PRV stations, etc. - CMT VA 50247/25 Cushions, CMT W302 isolators.

**2.12 Flexible Connectors – Type 9**

2.12.1 Twin sphere flexible connectors with floating flanges complete with grommets control rods.

2.12.2 Acceptable Products:

- .1 Mason MFTNC Connector.
- .2 Mason ACC Control Cables.
- .3 Unisource Ultra-Sphere U302 EPDM – only for service below 200°F (93°C) and 200 psig (1,380 kPa), up to 12" (300 mm) diameter.
- .4 Metraflex Double Cablesphere.

**2.13 Flexible Connectors – Grooved**

2.13.1 Where grooved piping systems are used, three grooved flexible type couplings may be used in lieu of a flexible connector for vibration attenuation at equipment connections in applicable piping systems.

---

The couplings shall be placed in close proximity to the source of the vibration.

**2.14 Concrete Inertia Bases**

- 2.14.1 Concrete inertia bases to be minimum of 1.5 times weight of isolated equipment. Base thickness shall be 1/12 of longest dimension of base, but no less than 6" (150 mm). Include with base, steel channel concrete form with required steel reinforcement (as determined by suppliers' Registered Professional Engineer). Provide additional steel as required by sleeves or inserts to receive equipment anchor bolts.
- 2.14.2 Use height saving brackets in mounting locations to maintain 1½" (40 mm) clearance below base.
- 2.14.3 Bases furnished with built-in motor slide rails. Motor location as specified/scheduled.
- 2.14.4 Acceptable Products:
  - .1 Mason Type K.
  - .2 Vibro-Acoustics CIB.

**2.15 Steel Bases**

- 2.15.1 Construct structural steel bases sufficiently rigid to keep deflection and misalignment within acceptable limits as determined by equipment Manufacturer.
- 2.15.2 Use height saving brackets in mounting locations to provide base clearance of 1½" (40 mm).
- 2.15.3 Bases furnished with built-in motor slide rails. Motor location as specified/scheduled.
- 2.15.4 Steel bases supplied as integral part of equipment to be supplied meeting above requirements.
- 2.15.5 Acceptable Products:
  - .1 Mason Type WF.
  - .2 Vibro-Acoustics DS.

**2.16 Grooved Connections to Pumps and AHU's**

- 2.16.1 3" (80 mm) to 12" (300 mm) Pump Connections. Enamel coated assembly, consisting of a Class 150 flange for pump connection, tri-service valve assembly consisting of a spring-actuated valve and butterfly valve with offset stem for 360-degree circumferential seating, and pipe spool with thermometer and pressure ports. Assembly comes with flexible couplings to accommodate vibration attenuation and stress relief. Assembly rated for working pressure to 300 psi (2,065 kPa).

- .1 Standard of Acceptance: Victaulic Series 380 Discharge Vibration Isolation Pump Drop.
- 2.16.2 3" (80 mm) to 12" (300 mm) Pump Connections. Enamel coated assembly, consisting of a suction diffuser with stainless steel basket and diffuser and Class 150 flange for pump connection, butterfly valve with offset stem for 360-degree circumferential seating, and pipe spool with thermometer and/or pressure ports. Assembly comes with flexible couplings to accommodate vibration attenuation and stress relief. Assembly rated for working pressure to 300 psi (2,065 kPa).
  - .1 Standard of Acceptance: Victaulic Series 381 Suction Vibration Isolation Pump Drop.
  - .2
- 2.16.3 3" (80 mm) to 12" (300 mm) Pump Connections. Enamel coated assembly, consisting of a 90-degree base elbow with Class 150 flange for pump connection, Wye pattern strainer with stainless steel perforated metal basket, butterfly valve with offset stem for 360-degree circumferential seating, and pipe spool(s) with thermometer and/or pressure ports. Assembly comes with flexible couplings to accommodate vibration attenuation and stress relief. Assembly rated for working pressure to 300 psi (2,065 kPa).
  - .1 Standard of Acceptance: Victaulic Series 382 Strainer Vibration Isolation Pump Drop.
- 2.16.4 2" (50 mm) through 6" (150 mm) Air Handling Unit Coil Supply and Return Connections. Enamel coated drop, consisting of ASTM A53 carbon steel pipe spool(s), straight and/or reducing tees or mechanical-T fittings, with base end cap with drain outlet and brass drain valve. Supply connections include a butterfly valve and Y-pattern strainer with PT ports, and the return connection includes a circuit balancing valve. Installation-ready, with flexible couplings to accommodate vibration attenuation and stress relief, rated for working pressure to 300 psi (2,065 kPa).
  - .1 Standard of Acceptance: Victaulic Series 385 Vibration Isolation Air Handling Unit Drop.

### 3. **EXECUTION**

#### 3.1 **Installation**

- 3.1.1 Execute work in accordance with specifications and in accordance with Manufacturer's instructions.
- 3.1.2 For equipment mounted on vibration isolators, provide minimum clearance of 2" (50 mm) to other structures, pipe equipment, etc.

- 
- 3.1.3 Before bolting isolators to structure, start equipment and balance so isolators can be adjusted to correct operating position before installing (seismically rated) anchors and/or welding.
  - 3.1.4 After installation and adjustment of isolators verify deflection under load to ensure loading within specified range and isolation is obtained.
  - 3.1.5 Where hold down bolts for isolators or seismic restraint equipment penetrates roofing membranes provide "gum cups" and sealing compound to maintain waterproof integrity of roof. Ensure sealing compound is compatible with isolator components such as neoprene. Coordinate with Roofing Sub-Contractor.
  - 3.1.6 Use Type 1 pads only where specified.
  - 3.1.7 Under equipment mounted on Type 3 mounts, which do not meet seismic requirement, provide Type 6 seismic snubbers.
  - 3.1.8 Provide Type 4 spring hangers for minimum static deflection of 1" (25 mm) for ceiling hung fans and air handling units, emergency generator exhaust piping and silencers, steam PRVs and any other vibrating sources.
  - 3.1.9 Provide Type 4 resilient hangers on piping, tanks, etc. connected to vibrating source, if piping is over NPS 1½ (40mm). Provide hangers for distance of 20'-0" (6 m) for NPS 2 (50 mm) pipe and 40'-0" (12.2 m) for NPS 10 (250 mm) pipe and chiller pipes. Isolate other pipe sizes for proportionate distance. Isolate piping serving cooling tower and chiller, including air-cooled chillers.
  - 3.1.10 Isolate pumps and axial fans rotating at more than 1170 RPM on Type 2 isolators.
  - 3.1.11 Use lowest RPM scheduled for two-speed equipment in determining isolator deflection.
  - 3.1.12 Provide concrete inertia bases on base mounted pumps unless pump Manufacturer certifies inertia base is not required. Only use pedestal support at pump intake pipe where inertia or steel base is large enough to support pedestal. Otherwise support piping using resilient hangers only.
  - 3.1.13 Provide concrete inertia bases on centrifugal fans where specified.
  - 3.1.14 Ensure pumps are installed and aligned so no piping loads are imposed on pump. Pumps and piping should be independently supported and aligned prior to final connection.
  - 3.1.15 Where ductwork, piping or boiler exhaust stacks, etc. connected to, or serving noise generating or vibrating equipment, is routed through walls, floors pipe chases, etc., to avoid contact with structure, future framing, drywall and other finishes which may

---

radiate noise. Use Type 2 and Type 8 mounts. Submit proposed details to meet this requirement.

- 3.1.16 Make no connections between mechanical room equipment and drywall partitions adjoining occupied spaces. Mount equipment designed for wall mounting on non-critical block work or concrete walls. Connect hangers to concrete structure only. Where structure is steel, connect to major structural beams only, or to structural angles with gussets attached to concrete shear walls. Do not attach to light framing members such as OWSJs. Do not connect to edge of beam flange (e.g. with clips). Weld nut or threaded sleeve to bottom flange at centre, directly below web, to accommodate threaded hanger rod.
- 3.1.17 Provide Type 8 resilient elements in pipe anchors, where pipe anchors are within 40'-0" (12.2 m) of vibrating source or if located in pipe chase.
- 3.1.18 Protect neoprene isolator components from overheating or use Type 8 mounts.
- 3.1.19 Be responsible for ensuring that flexible duct connections (see Section 23 33 00) are installed with minimum 1½" (40 mm) metal-to-metal gap. Use flanges to ensure that flexible connectors are clear of airstream.
- 3.1.20 Isolate variable frequency drive controller using isolators or soft grommets such that structure borne noise transmission to occupied space is less than airborne noise transmission. Controller supplier to provide isolation, including wiring connections, to control flanking noise transmission. Provide isolation meeting seismic requirements.
- 3.1.21 Provide stabilizing springs limiting movement at flexible connections to 25% of fabric width under steady state conditions and 40% at start-up.
- 3.1.22 Floor or Pier Mounted Equipment: Isolate floor or pier mounted equipment on Type 3 isolators, unless otherwise specified.
- 3.1.23 Slab On Grade Mounted Equipment: For equipment mounted on slab on grade use on Type 2 isolators unless otherwise specified.
- 3.1.24 Pumps: Mount in-line pumps on two Type 2 isolators under each support foot.
- 3.1.25 Pumps: Isolate 25 hp (18.6 KW) pumps and larger on Type 5 air mounts. For slab on grade installations, isolate pumps on Type 2 mounts.
- 3.1.26 Chillers: Mount slab on grade chillers on Type 2 isolators. Otherwise use Type 5 air mounts, including air cooled chillers. Submit details of pipe supports on roof and wall/roof penetration

- 
- 3.1.27 Air Compressors: Isolate control air compressor on Type 3 isolators and concrete inertia base.
- 3.1.28 Cooling Towers: Mount cooling towers on Type 3 isolators and Type 6 seismic restraints to meet seismic requirements. Provide steel base with minimum W150 beams to distribute cooling tower weight evenly over isolators and with cross bracing designed to meet seismic requirements. Check with cooling tower Manufacturer that proposed installation provides adequate support for towers. Submit shop drawings of proposed steel base/seismic restraint assembly for review by Structural Consultant.
- 3.1.29 Cooling Towers: Mount cooling towers on Type 1 neoprene/steel/neoprene sandwich pads, unless otherwise specified. Provide steel base with minimum W150 beams to distribute cooling tower weight evenly over isolators and with cross bracing to meet seismic requirements. Submit shop drawings of proposed steel base/seismic restraint assembly for review by Structural Consultant.
- 3.1.30 Where weight of equipment may change significantly due to draining as in cooling tower or chiller, provide limit stops to limit isolator extension.
- 3.1.31 Steam PRVs: Isolate steam Pressure Reducing Stations (PRVs) and upstream and downstream piping and equipment for a distance of 50'-0" (15 m) Use Type 4 hangers only where insulated from heat. Install PRV station pipe support frames on Type 8 isolators.
- 3.1.32 Pumps: Mount base mounted end suction pumps greater than 15kw (20HP) on concrete inertia pads. Mount base mounted in line pumps on Type 2 rubber floor mats. Mount all pumps greater than 5kw (7.5HP) on Type 3 spring floor mounts unless noted otherwise.
- 3.1.33 Rooftop Air Handling Units:
- .1 Isolate rooftop air handling units on 2" (50 mm) x 40'-0" (12.2 m) x ¾" (20 mm) Type 1 neoprene waffle pads. Space waffle pads for nominal 40 psi (276 kPa) under weight of rooftop unit.
  - .2 Use hold down bolts selected for seismic loads. Isolate bolts from base of unit using neoprene hemi-grommets. Avoid over-compressing pads/gasket. Use Hilti HVA adhesive set bolts, or equal, with steel washers and lock nuts, adjusted finger tight to hemi-grommets. Size bolts and hemi-grommet for minimum lateral clearance.
  - .3 Where underside of AHU is a return plenum, provide 1" (25 mm) x ¾" (20 mm) thick continuous perimeter, closed cell foam neoprene gasket (Type 7N) between pads.
  - .4 Isolate equipment within rooftop units in accordance with this section, including fans, compressors, pumps and piping.

Ensure structure borne transmission of noise from rooftop unit is less than airborne transmission.

3.1.34 Rooftop Air Handling Units: Utilize Type 7S Isolator to spring isolate entire unit from roof deck/structure.

### 3.2 Inspections

3.2.1 Supplier shall provide assistance to Contractor as necessary during course of installation of isolation equipment.

3.2.2 Supplier shall inspect complete installation after system start-up and establish isolators for each piece of equipment are properly installed and adjusted. Supplier shall submit statutory declaration to Consultant stating complete vibration isolation installation is in accordance with his drawings and instruction and operates to his satisfaction.

### 3.3 Pipe Isolation Schedule

Pipe Size	Isolated Distance from Equipment
1" (25 mm)	120 diameters (10' (3 m))
2" (50 mm)	90 diameters (15' (4.5 m))
3" (80 mm)	80 diameters (20' (6 m))
4" (100 mm)	75 diameters (25' (7.5 m))
6" (150 mm)	60 diameters (30' (9 m))
8" (200 mm)	60 diameters (40'" (12.2 m))
10" (250 mm)	54 diameters (45' (13.5 m))

### 3.4 Equipment Isolation Schedule

Isolated Equipment	Base		Isolator	
	Type	Thickness	Type	Deflection
HVAC Pumps				
Air Cooled Water Chiller				
Fluid Coolers				

**END OF SECTION**

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of the Contract Documents and is to be read, interpreted and coordinated with all other parts.
- 1.1.2 References: American National Standards Institute (ANSI) – ASME A13.1 Scheme for the Identification of Piping Systems.

### 1.2 Equipment Identification

#### 1.2.1 Manufacturer's Nameplates:

- .1 Each piece of manufactured equipment shall have metal nameplate, with raised or recessed letters. Mechanically fasten plate to equipment.
- .2 Manufacturer's nameplates shall indicate Manufacturer's name, equipment model, size, serial number and electrical characteristics and pertinent information for any other service connections.
- .3 Include Underwriters' Laboratories Canada (ULC) or Canadian Standards Association (CSA) registration logos and those of other agencies, as required by respective agencies.
- .4 Nameplates shall be located so they are easily read. Do not insulate or paint over name plates.

#### 1.2.2 System Nameplates:

- .1 Each piece of equipment shall be identified with its equipment schedule identification, e.g. supply fan SF-1, cooling coil CC-1, pump P-1.
- .2 Identification letters shall be 2" (50 mm) high black letters on white background, sized to suit label or provide laminated plastic plates with black face and white centre of minimum size 3½" (90 mm) x 1½" (40 mm) x ⅜" (2.5 mm) engraved with ¼" (6.0 mm) high lettering. Use 1" (25 mm) high lettering for major equipment.
- .3 Apply nameplates securely in conspicuous places, on cool surfaces.
- .4 Identify systems, and areas or zones of building being serviced.

### 1.3 Piping Identification

#### 1.3.1 Piping Identification:

- .1 Each piping system shall be colour coded for identification and labelled with system identification code letters, including

temperature and pressure, if applicable, and directional flow arrow in accordance with Pipe Identification Colour Schedule.

.2 Identifying piping (pipe markers and direction arrows) at the following locations:

- .1 Adjacent to major valves and where valves are in series at no more than 6'-6" (2.0 m) intervals.
- .2 At least once in each room and 50'-0" (15 m) maximum spacing in open areas.
- .3 Gas piping to be identified at 6'-6" (2.0 m) intervals in ceiling plenums.
- .4 On both sides where piping passes through walls, partitions and floors.
- .5 Adjacent to major changes in direction.
- .6 At point of entry and leaving each pipe chase and/or confined space and piping accessible at each access opening.
- .7 At beginning and end points of each run and at each piece of equipment in each run.

.3 Identification labels may be stencilled. Identification arrows, labels and letters may be vinyl cloth (Brady B500) or vinyl film (Brady B946), with adhesive compatible with surface temperature.

.4 Identification colour bands for primary and secondary colours to indicate the type and degree of hazard shall be applied to overlap a minimum of 6" (150 mm). Ends to be stapled. Bands shall be Brady B550 vinyl cloth tape or Brady B946 vinyl tape, with adhesive compatible with surface temperature.

.5 Identification may consist of semi-rigid plastic vinyl labels with surface printing. On pipes larger than 6" (150 mm) diameter total O.D., these labels shall be saddle style, and shall ship complete with 34" (850 mm) long nylon cable ties for each label. Standard of acceptance: SMS Coil-Mark (<http://www.smillieltd.ca/pdfDocs/Identification-Systems/Coil-Mark.pdf>)

1.3.2 Valve Tags:

- .1 Provide valve identification tags and secure them using non-ferrous chain, braided band or plastic band (suitable for temperature). Tags may be of brass, aluminum, metalphoto, lamicoid or fibreglass, stamped or engraved, of 1" (25 mm) minimum diameter. Tags may also be 1¼" (32 mm) square, two-ply plastic with engraved black characters

on white background. Standard of acceptance: SMS valve tags (<http://www.smillieltd.ca/pdfDocs/Identification-Systems/PHSVT.pdf>)

- .2 Valves to be tagged include:
  - .1 Valves on main piping circuits.
  - .2 Valves on major branch lines.
  - .3 Valves on minor branch lines in horizontal service spaces, vertical service spaces and mechanical equipment rooms.
  - .4 DO NOT TAG valves on control valve stations, steam trap stations, fixture stops, or system drain valves.
  - .5 Drain valves and hose bibbs on systems containing glycol.
  - .6 Control valves.
- .3 Schedule valve numbers using sequential numbering system indicating location, service and the normal position (open or closed). Numbers shall be prefixed by letter "P" or letter "H" indicating valve is on plumbing or heating service.

#### **1.4 Ductwork Identification**

- 1.4.1 Identify plenum access doors with accessed items, e.g. Filter F-1, Supply Fan SF-1, Cooling Coil CC-1.
- 1.4.2 Stencil on plenum doors, downstream from air filter bank, "Do not open when fan operating."
- 1.4.3 Identify ductwork in mechanical equipment rooms to denote system and/or zone served and air flow direction arrow.
- 1.4.4 Identify automatic control dampers concealed in ductwork. Identify "open" and "closed" position of operator arm on outside of duct or duct insulation.
- 1.4.5 Identify hazardous exhaust ducts, e.g. fume hood, radioactive exhaust at not greater than 10'-0" (3.0 m) and at least once in each partitioned space. Radioisotope exhaust ducts shall be marked with radiation-warning symbol.
- 1.4.6 Identification letters shall be 2" (50 mm) high black letters on white background. Flow arrows shall be 2" (50 mm) wide by 6" (150 mm) long black arrows on white background. Stencil over final finish only.

#### **1.5 Ceiling Access Identification**

- 1.5.1 Secure 1/4" (6.0 mm) self-adhesive coloured dots (Brady Quik Dots or Avery Data Dots) to ceiling to identify location of access to equipment concealed above ceiling, according to the following schedule:

	Colour
Concealed equipment and cleaning access	Yellow
Control Equipment, including control valves, dampers and sensors	Black
Fire and smoke dampers	Red
Fire protection, including sprinkler equipment and drains	Red
Heating/Chilled water, DCW, DHW isolation valves	Green
Pipe mounted equipment, other than fire, smoke and sprinkler equipment	Green

1.5.2 When T-bar ceilings are installed, adhere coloured dots to T-bar framing, adjacent to panel to be removed.

### 1.6 Duct Access Identification

1.6.1 Secure 2" (50 mm) high, Gothic style self-adhesive stick-on letters, (Letrasign or Brady Quick Align) on duct access panels to identify their usage, according to the following schedule:

	Colour	Letters
Cleaning and service access	black	C.A.
Controls, including sensors	black	C
Dampers (backdraft, balance and control)	black	D
Fire dampers	red	Fire Damper
Smoke dampers and detectors	red	S.D.

### 1.7 Tagging Identification

1.7.1 Secure engraved laminated plastic identification tags (black face and white centre) on the following items:

- .1 Temperature control instruments, gauges and panels, coordinated with control diagrams identification.
- .2 Electrical switchgear supplied under the Mechanical.
- .3 Refer also to Controls Sections.

### 1.8 Identification Schedules

1.8.1 Submit schedules of the following for review prior to framing:

- .1 Pipe Identification Colours.
- .2 Valves.
- .3 Ceiling Access Identification Colours.
- .4 Duct Access Identification Colours.

1.8.2 Schedules will be required in each major mechanical room and at least one schedule will be required on each floor having minor mechanical room. Frame schedules under glass in matching frames and hang where directed.

- .1 Include one copy of schedules in each operating maintenance manual.

**1.9 Pipe Identification Colour Schedule**

<b>Service</b>	<b>Identification Lettering</b>	<b>Background Colour</b>	<b>Letters Colour</b>
Acid Waste	Acid	yellow	black
Boiler Blow Off Piping	-	yellow	black
Boiler Blowdown	-	yellow	black
Boiler Feed Water	B.F.W.	yellow	black
Chilled Water Return	CH.W.R.	green	white
Chilled Water Supply	CH.W.S	green	white
Cold Water Service	C.W.	green	white
Fire Combined Standpipes	SPR/S.P.	red	white
Compressed Air	COMP.A.	blue	white
Condensate - Medium Pressure	M.P.Cond.	yellow	black
Condensate - Low Pressure	L.P.Cond.	yellow	black
Condensate - Pumped	Pump.Cond.	yellow	black
Condenser Water Return	C.W.R	green	white
Condenser Water Supply	C.W.S.	green	white
Cooling Tower Sump Water Supply	C.T.W.S.	green	white

Storm Drain	Storm	None	None

#### **1.10 Pipe Identification**

##### **1.10.1 Letters:**

- .1      ½" (15 mm) high – NPS 1¼ (32 mm) pipe and smaller.
- .2      1" (25 mm) high – NPS 1½ (40 mm) up to NPS 2½ (65 mm) pipe.
- .3      2" (50 mm) high – NPS 3 (80 mm) and larger pipe.

##### **1.10.2 Bands:**

- .1      1½" (40 mm) wide, except arrow bands 2" (50 mm) wide.

##### **1.10.3 Colours:**

- .1      Black arrows on yellow primary colour.
- .2      White arrows on red, blue or green backgrounds.

#### **1.11 Buried Piping Identification/Markers**

1.11.1 Metallic Pipe: Provide continuously printed 4" (100 mm) wide x 4 mil thick "Blaze Orange" plastic tape with printing indicating type of service of buried pipe. Place tape at ±12" (300 mm) above buried pipe in backfill.

1.11.2 Non-Metallic Piping: Provide detectable multi-ply tape consisting of aluminum foil core between two (2) layers of 4" (100 mm) x 4 mil thick "Blaze Orange" plastic tape with printing indicating type of service of buried pipe. Place tape at ±12" (300 mm) above buried pipe in backfill lifts.

1.11.3 Where multiple small pipes are buried in a common trench and do not exceed an overall width of 18" (450 mm), install a single tape line marker.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2 Work Included**

- 1.2.1 Adjust and balance hydronic systems.
- 1.2.2 Adjust and balance domestic cold water systems, domestic hot water recirculation system and plumbing mixing valves.
- 1.2.3 Adjust and balance air systems.
- 1.2.4 Perform acoustic measurements.
- 1.2.5 Confirm operation of Fire Protection and Smoke Control Systems.

**1.3 Intent**

- 1.3.1 Perform work as an integral part of contract.

**1.4 Quality Assurance**

- 1.4.1 Acceptable TAB Contractors are: MDT Systems, KD Engineering, Western Mechanical Services, and Flotech Mechanical.
- 1.4.2 Acceptable TAB firms shall be credentialed by international organizations such as AABC (Associated Air Balance Council) and the NEBB (National Environmental Balancing Bureau). Exceptions to credentialed TAB firms would require submittal to the Consultant for review and approval.
- 1.4.3 Procedures shall be in accordance with current edition of AABC's National Standards for Field Measurement and Instrumentation, Total System Balance or NEBB's Procedural Standards for TAB Environmental Systems.
- 1.4.4 Each Balancing TAB Sub-Trade (other than those with proper acceptance) intending to bid for work shall submit the following information not less than seven days before close of Sub-Trade tenders. ANY FIRM THAT DOES NOT COMPLY WILL NOT BE ACCEPTED BY CONSULTANT.
- .1 List previous projects of similar scope with dates projects were executed.
  - .2 Outline depth of firm including principals, years of operation, address and phone number.
  - .3 List instruments and procedures that will be used on project.
  - .4 List name of job site supervisor and provide resume of his/her specific work experience.

- .5      Provide sample of balance report on project of similar scope.

**1.5      Submittals**

- 1.5.1      Submit name of proposed TAB firm for approval within **seven** days of contract award.
- 1.5.2      Include qualifications, including name and qualification of individual certifying reports. Failure to submit name of TAB firm within required time period shall be cause for Consultant to select an alternative firm to carry out work at no change in contract price.
- 1.5.3      Within 14 days of request, TAB schedules and agenda shall be submitted for approval. TAB work shall not commence until approved.

**1.6      Procedures**

- 1.6.1      General: Before starting TAB work, review with Consultant methods and instruments to be used. Include descriptive data, procedure data and sample forms.
- 1.6.2      Descriptive Data: Review design concepts and general function of each system including associated equipment and operation cycles including BAS Systems sequence of operations. Confirm listing of flow and terminal measurements to be performed and selection points for proposed sound measurements.
- 1.6.3      Procedure Data: Outline procedures for taking test measurements to establish compliance with requirements. Specify type of instrument to be used, method of instrument application (by sketch) and correction factors.
- 1.6.4      Data sheets required as a minimum are as follows:
- .1      Air System Schematic Diagram.
  - .2      Air Moving Equipment Test Sheet.
  - .3      Exhaust Fan Test Sheet.
  - .4      Air Distribution / Outlets Test Sheet.
  - .5      Air Distribution Duct Traverse Test Sheet.
  - .6      Air Moving Equipment Static Pressure Profile Test Sheet.
  - .7      Hydronic System Schematic Diagram.
  - .8      Circulation Water Pump Data Sheet.
  - .9      Hydronic Distribution / Terminal Test Sheet.
  - .10      Covering comments sheet detailing systems balanced setpoints.
  - .11      Note: All test sheets shall include a Column detailing achieved results as a % of design.

---

**1.7 Cooperation**

1.7.1 TAB firm shall check and report defects or deficiencies that may affect balancing.

1.7.2 Mechanical Contractor shall cooperate with balancing firm to:

- .1 Provide sufficient time before final completion date so that TAB can be accomplished.
- .2 Provide labour and tools to make corrections without delay.
- .3 Place heating ventilating and air conditioning systems and equipment into full operation and continue operation.
- .4 Advise TAB firm of changes made to system during construction.
- .5 Install required test holes complete with removable and replaceable plugs.
- .6 Make necessary revisions to controls, dampers, fan and pump drives and consult with equipment Manufacturers as required to achieve specified systems performance.
- .7 Supply and install dampers as shown and where required to obtain final system balance.
- .8 Provide ladders scaffolds, tools and labour to assist work of balancing firm, including removing ceiling tiles and guards and adjusting pulleys and belts, replace when finished.
- .9 Control and/or equipment Manufacturer shall work with balancing firm when setting damper linkages and minimum outside air dampers. They shall be available for readjusting of dampers of controls improperly calibrated.
- .10 Set pressure regulating valves to operating and code conditions.
- .11 Check and set relief and safety valves to code requirements.
- .12 Clean strainers. Provide clean air filter immediately before air balancing.
- .13 Open fire dampers.
- .14 Change variable pitch pulley supplied on 15 hp (11 KW) motors and larger to fixed pulleys after air balance. Provide pulleys.
- .15 Provide drive changes required to suit final balance.

**1.8 Tests**

1.8.1 Give written 24 hour notice of date for tests.

1.8.2 Do not externally insulate or conceal work until tested and approved. Follow construction schedule and arrange for tests.

1.8.3 Conduct tests in presence of Consultant. Arrange for Owner's Representative to be present.

- 1.8.4 Bear costs including retesting and making good.
- 1.8.5 Refer to Piping Sections for specific test requirements.
- 1.8.6 Prior to tests, isolate equipment or other parts which are not designed to withstand test pressures.

## **2 . PRODUCTS**

### **2.1 Instruments**

- 2.1.1 Instruments for TAB of air and hydronic systems shall have been calibrated within six months and verified for accuracy before start of work.
- 2.1.2 Submit list of equipment to be used for balancing and calibration certificates for each instrument listed.

## **3 . EXECUTION**

### **3.1 General Procedures**

- 3.1.1 TAB to maximum flow deviation from specified values of 10% at terminal devices and -0% +5% at equipment or mean sound level deviation of 20 db. Provide air balancing volumes and settings for all air supply, exhaust and return air ducts and terminals regardless of whether a special air volume tag has been noted on the drawing.
- 3.1.2 Permanently mark setting on valves, splitters, dampers and other adjustment devices.
- 3.1.3 Take measurements to verify system TAB has not been disrupted or such disruption has been rectified.
- 3.1.4 At final field review, recheck random selections of data recorded in report. Recheck points or areas as selected and witnessed by Owner.
- 3.1.5 At completion, allow minimum two days for Consultant to witness test procedures and conduct tests for each system.
- 3.1.6 When building is occupied before completion, continue execution of work outside occupied hours.

### **3.2 Site Visits**

- 3.2.1 Schedule total of **5** site visits to correspond with site meetings held by Contractor. After each visit, submit written report to Contractor and Consultant. Site visits shall commence after start of air distribution work and be spread over remaining construction period to start of balancing.

- 3.2.2 Review of installation shall be made at scheduled visit and any additional dampers or valves required for proper balance shall be reviewed with Consultant and Contractors.
- 3.2.3 Allow for **5** visits to site to adjust systems for seasonal changes during warranty.

### **3.3 Acceptance**

- 3.3.1 Mechanical systems shall not be considered ready for final field review until TAB results are acceptable to Consultant.
- 3.3.2 If found that specified flows cannot be achieved on portions of system, actual conditions shall be reported to Consultant for consideration of correctable action before continuing TAB procedure.
- 3.3.3 If measured flow at final field review shows deviation of 10% at terminal devices, 5% at equipment or more or mean sound level deviation of 10 db or more from certified report listing, by more than 10% of selected areas, report shall be rejected.
- 3.3.4 If report rejected, systems shall be re-balanced and certified report submitted at no extra cost.

### **3.4 TAB Report**

- 3.4.1 Submit draft copies of reports before final acceptance of project. Provide [ ] copies of final report for inclusion in Operating and Maintenance Manuals.
- 3.4.2 Submit with report, fan and pump curves with operating conditions plotted.
- 3.4.3 Report shall be indexed as follows:
  - Section 1 Instrumentation and Measurement Procedures.
  - Section 2 System Data (Designed, Installed and Recorded), test sheets to be systems sequential.
- 3.4.4 Each system should include the following test sheets:
  - .1 System Schematics for both air and hydronic systems.
  - .2 Equipment test sheets.
  - .3 System distribution (inlet / outlets / valves) test sheets.
  - .4 Profile pressure test sheets.
  - .5 Comments sheet noting system setpoints.
    - .1 Section 3 Drawing.
    - .2 Section 4 Discussion of Results.
    - .3 Section 5 Warranty and Certification.

### **3.5 Air System Procedures**

- 3.5.1 Adjust duct and terminal balance dampers and adjust or change drive sheaves to balance supply, return and exhaust air systems to

provide design air qualities (within  $\pm 10\%$ ) at each outlet and inlet and maintain design relationship between outdoor and exhaust air system quantities.

- 3.5.2 Adjust air terminals to obtain optimum air distribution pattern.
- 3.5.3 Permanently mark final balance position on balance dampers and adjustable air turning devices by means of permanent custom adhesive stickers across balancing dampers to seal them in position.
- 3.5.4 Submit report to the Consultant indicating final fan rpm, motor operating amperages, system static pressure and final air quantities obtained.
- 3.5.5 Air systems shall be balanced with clean filters in place, at total 105 % to 110% of specified total airflow rates.

### **3.6 Hydronic System Procedures**

- 3.6.1 Balance liquid systems using surface temperature measuring instrument such as Alnor pyrometer or flow meter if installed. Adjust balance valves and balance fittings to obtain design flow rates or uniform temperature differences (on liquid side) across coils and heating/cooling elements acknowledging specified temperature drops and rises on air and water.
- 3.6.2 Permanently mark final balance position on the balance valves and balance fittings and lock memory stops.
- 3.6.3 Submit report to Consultant indicating final temperature drops and flows obtained.

### **3.7 Air System Procedures**

- 3.7.1 Execute air systems balancing for each air system in accordance with AABC and NEBB specifications and as described herein.
- 3.7.2 Make tests with supply, return and exhaust systems operating and doors and windows closed or in normal operation condition.
- 3.7.3 Test and adjust blower rpm/speed to design requirements.
- 3.7.4 Test and record motor full load amps.
- 3.7.5 Make air quantity measurements in supply and return ducts at each major air handling or rooftop system by pilot tube traverse of entire cross-sectional area. Take minimum of 16 readings on each air handler.
- 3.7.6 Test and record required and measured system static pressures, filter differential, coil differential and fan total static pressure.
- 3.7.7 Test and adjust systems for design recirculated airflows rates.
- 3.7.8 Test and adjust systems for design outdoor air quantities.

- 
- 3.7.9 Test and record entering air temperatures (DB heating) (DB/WB cooling).
  - 3.7.10 Test and record leaving air temperatures (DB heating) (DB/WB cooling).
  - 3.7.11 Adjust main supply and return ducts to design flow rates.
  - 3.7.12 Adjust zones to design, supply and return flow rates.
  - 3.7.13 Test and adjust each diffuser, grille and register to within 10% of design requirements.
  - 3.7.14 Identify each diffuser, grille and register as to location and area.
  - 3.7.15 Identify and list size, type and Manufacturer of diffusers, grilles, registers and testing equipment. Use Manufacturer's rating on equipment to make required calculations.
  - 3.7.16 Control and/or equipment Manufacturer shall set adjustments of automatically operated dampers to operate as indicated in cooperation with balancing firm.
  - 3.7.17 Adjust diffusers, grilles and registers to minimize drafts.
  - 3.7.18 Provide fire damper drop tests, in association with the sheet metal contractor in accordance with Section 23 33 00.
  - 3.7.19 Use volume control devices to regulate air quantities only to extent that adjustments do not create objectionable air motion or sound levels. Effect volume control by duct internal devices such as dampers and splitters.
  - 3.7.20 Vary total system airflow rates by adjustments of fan speeds. Vary branch air quantities by damper regulation.
  - 3.7.21 Provide system schematic with required and actual air flow rates at each outlet or inlet. Schematic shall include all fire dampers shown on drawings.
  - 3.7.22 Record installed fan drive assemblies, fan sheaves, motor sheaves and belts.
  - 3.7.23 Record each installed motor Manufacturer.
  - 3.7.24 Final balanced condition of each area shall include testing and adjusting of pressure conditions. Test and record building pressurization levels **in variable volume systems throughout full range of fan delivery rates**, under both heating and cooling conditions. Test pressure conditions at ground, intermediate and upper levels. Check front doors, exits and elevator shafts for airflow so that exterior conditions do not cause excessive or abnormal pressure conditions. Document abnormal building leakage conditions noted.
  - 3.7.25 Complete TAB to achieve positive building pressure unless otherwise instructed. Positive pressure relative to outside pressure

of 0.04" w.g. (10 Pa) minimum and 0.07" w.g. (18 Pa) maximum shall be achieved, measured with negligible outside wind velocity.

### **3.8 Hydronic System Procedures**

3.8.1 Preparation of System - Phase I: Hydronic system shall be prepared for TAB by Mechanical Contractor in the following manner:

- .1 Open valves, close bypass valves.
- .2 Determine water in system has been treated and is clean.
- .3 Check pump rotation.
- .4 Confirm expansion tanks are not air bound and system is full of water.
- .5 Confirm air vents at high points are installed properly and are operating freely and air is removed from circulation system.
- .6 Set temperature controls for full flow.
- .7 Check operation of automatic bypass valves.
- .8 Check and set operating temperature of equipment to design requirements.

3.8.2 TAB Procedure - Phase II:

- .1 Set pumps to proper flow rate.
- .2 Proportionally balance flow of water through equipment.
- .3 Record leaving water temperatures and return water temperatures and pressure drops through equipment. Reset to design temperatures.
- .4 Record water temperature at inlet side of terminals. Note rise or drop of temperatures from source.
- .5 Proportionally balance each terminal or in the absence of flow measuring commissioning valves balance each terminal based on temperature differential including a check and confirmation that all auto-flow valves are correctly installed, and are set at the correct flow.
- .6 Upon completion of flow readings and adjustments, mark settings and record data.
- .7 Coordinate shaving of pump impeller to pump operating condition on pumps larger than 2 hp (1.5 KW).

3.8.3 TAB Procedure - Phase III:

- .1 After adjustments to terminals, recheck settings at pumps. Readjust if required.
- .2 Read pressure drop through each terminal and set flow rate on call for full flow. Set pressure drop across bypass valve to match terminal full flow pressure drop.

---

**3.9 TAB Data**

3.9.1 TAB and equipment data shall be listed in Imperial (SI Metric) Units.

3.9.2 Air Handling Equipment Installation Data:

- .1 Arrangement, discharge and class.
- .2 Motor type, hp (KW), rpm (r/min), voltage, phase cycles and full load amps.
- .3 Location and local identification.

3.9.3 Air Handling Equipment Design Data:

- .1 Airflow rate (cfm (L/s)).
- .2 Static pressure (" w.g. (Pa)).
- .3 Motor hp (KW), rpm (r/min) and amps.
- .4 Outside airflow rate (cfm (L/s)).
- .5 Fan rpm (r/min).
- .6 Fan hp (KW).
- .7 Entering and leaving air dry and wet bulb temperatures (°F (°C)).

3.9.4 Air Handling Equipment Recorded Data

- .1 Airflow rate (cfm (L/s)).
- .2 Static pressure (" w.g. (Pa)).
- .3 Fan rpm (r/min).
- .4 Motor operating amps.
- .5 Entering and leaving air dry and wet bulb temperatures (°F (°C)).

3.9.5 Duct Air Quantities - Mains, Branches, Outside Air and Exhausts (Minimum and Maximum)

- .1 Duct sizes (at traverse normally) (inches (mm)).
- .2 Number of pressure readings.
- .3 Sum of velocity measurements.
- .4 Average velocity (ft/m (m/s)).
- .5 Duct recorded airflow rate (cfm (L/s)).
- .6 Duct design airflow rate (cfm (L/s)).

3.9.6 Air Inlets and Outlets:

- .1 Outlet identification, location and designation.
- .2 Application factors.
- .3 Design and recorded airflow rates (cfm (L/s)).

3.9.7 Building Pressurization Data

- .1 Outside air temperatures (°F (°C)).
- .2 Outside wind velocity (ft/m (m/s)).

- 
- .3 Building pressures plotted with respect to systems (" w.g. (Pa)).
  - .4 Supply air, return air and exhaust airflow rates (cfm (L/s)).
  - .5 Locations of pressure measuring points, inside and outside building.
  - 3.9.8 Pump Design Data
    - .1 Water flow rate (USgpm (L/s)).
    - .2 Pressure (ft of head (kPa)).
    - .3 Pump Motor rpm (r/min).
    - .4 Pump Motor hp (KW)
  - 3.9.9 Pump Installation Data
    - .1 Size.
    - .2 Drive type.
    - .3 Motor type, hp (KW), rpm (r/min), voltage phase, cycles and full load motor amps.
  - 3.9.10 Pump Recorded Data
    - .1 Discharge and suction pressures (full flow and no flow) (ft of head (kPa)).
    - .2 Pressure and total dynamic head (ft of head (kPa)).
    - .3 Water flow rate (from pump curves if metering not provided) (USgpm (L/s)).
    - .4 Motor amps.
  - 3.9.11 Expansion Tank Installation Data
    - .1 Manufacturer, size and capacity (inches (mm)) and USgal (L)).
    - .2 Pressure reducing valve setting (psi (kPa)).
    - .3 Pressure relief valve setting (psi (kPa)).
  - 3.9.12 Heating Equipment Design Data
    - .1 Heat transfer rate (mbh (kw)).
    - .2 Water flow rate (USgpm (L/s)).
    - .3 Entering and leaving water temperatures (°F (°C)).
    - .4 Water pressure drop (ft of head (kPa)).
  - 3.9.13 Heating Equipment Recorded Data
    - .1 Element type and identification (location and designation).
    - .2 Entering and leaving water temperatures (°F (°C)).
    - .3 Water pressure drop (ft of head (kPa)).
    - .4 Water flow rate (USgpm (L/s)).
  - 3.9.14 Heat Exchanger Design Data
    - .1 Manufacturer, model, and type.
-

- 
- .2 Water flow rates (tube and shell) (USgpm (L/s)).
  - .3 Inlet and outlet temperatures (°F (°C)) (tube and shell).
- 3.9.15 Heat Exchanger Recorded Data
- .1 Heated media flow rate (USgpm (L/s)).
  - .2 Heating media flow rate (USgpm (L/s)).
  - .3 Heated media entering and leaving temperatures (°F (°C)) and pressure drop (ft of head (kPa)).
  - .4 Heating media entering and leaving temperatures (°F (°C)) and pressure drop (psi (kPa)).
- 3.9.16 Air Heating and Cooling Equipment Design Data
- .1 Heat transfer rate (mbh (kw)).
  - .2 Water flow rate (USgpm (L/s)).
  - .3 Airflow rate (cfm (L/s)).
  - .4 Water pressure drop across coil (ft of head (kPa)).
  - .5 Air static pressure drop (" w.g. (Pa)).
  - .6 Entering and leaving water temperatures (°F (°C)).
  - .7 Entering and leaving air dry and wet bulb temperatures (°F (°C)).
- 3.9.17 Air Heating and Cooling Equipment Recorded Data
- .1 Element type and identification (location and designation).
  - .2 Entering and leaving air dry and wet bulb temperatures (°F (°C)).
  - .3 Entering and leaving water temperatures (°F (°C)).
  - .4 Water pressure drop across coil (ft of head (kPa)).
  - .5 Water pressure drop across bypass valve (ft of head (kPa)).
  - .6 Air static pressure drop (" w.g. (Pa)).
  - .7 Water flow rate (USgpm (L/s)).
  - .8 Airflow rate (cfm (L/s)).
  - .9 Adjusted temperature rise or drop (°F (°C)).
- 3.9.18 Water Chiller Design Data
- .1 Manufacturer and model.
  - .2 Motor type, hp (KW), rpm (r/min), voltage, cycles, phase and full load amps.
  - .3 Water flow rates (USgpm (L/s)).
  - .4 Water pressure drops (ft of head (kPa)).
  - .5 Entering and leaving water temperatures (°F (°C)).
- 3.9.19 Water Chiller Recorded Data
- .1 Water flow rates (USgpm (L/s)).
  - .2 Water pressure drops (ft of head (kPa)).
-

- .3 Entering and leaving water temperatures (°F (°C)).
- 3.9.20 Hydronic Heat Pump Design Data
  - .1 Manufacturer and Model.
  - .2 Fan and compressor motor type, hp, rpm, voltage cycle, phase and full load amps.
  - .3 Water flow rates (USgpm (L/s)).
  - .4 Water temperatures entering and leaving (°F (°C)).
  - .5 Airflow rates (cfm (L/s)).
  - .6 Entering and leaving air dry and wet bulb temperatures (°F (°C)).
  - .7 Static pressure (" w.g. (Pa)).
- 3.9.21 Hydronic Heat Pump Recorded Data
  - .1 Water flow rates (USgpm (L/s)).
  - .2 Water temperatures entering and leaving (°F (°C)).
  - .3 Airflow rates (cfm (L/s)).
  - .4 Entering and leaving air dry and wet bulb temperatures (°F (°C)).
  - .5 Static pressure (" w.g. (Pa)).
- 3.9.22 Sound Level Data
  - .1 Diagram or description of relationship of sound source to measuring instrument.
  - .2 Overall DB (A) level.
  - .3 Reading at each octave band frequency from 31.5 Hz to 16 kHz.
  - .4 NC curves plotted and compared to those recommended by ASHRAE or AABC publications.

### **3.10 Fire Protection and Smoke Control**

- 3.10.1 Mechanical Contractor shall test systems in conjunction with Electrical Contractor to ensure proper sequencing and monitoring of mechanical equipment and devices as indicated on drawings five days before application for Occupancy Permit. Make corrections to systems as required and retest deficient items. Provide written verification to Consultant that Fire Protection and Smoke Control Systems are operating with indication/control on Fire Alarm Panel.
- 3.10.2 Testing shall include but not be limited to the following:
  - .1 Stair and vestibule pressurization fans and associated motorized dampers.
  - .2 Smoke evacuation systems (fans and associated motorized dampers).
  - .3 Correct smoke damper positions indicated on fire alarm panel (open/closed).

- .4 Automatic shut-down of air systems connected to fire alarm panel and restarting of systems when panel returned to normal operation.
- 3.10.3 Mechanical Contractor shall be represented during final testing with Authorities having jurisdiction present.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2 General**

- 1.2.1 Provide external thermal insulation for plenums and ductwork where specified.
- 1.2.2 Provide internal acoustical insulation for plenums and ductwork where specified.
- 1.2.3 Journeyman insulation applicators shall supervise the insulation work.
- 1.2.4 Be responsible for ensuring sufficient space is provided for proper installation of insulation materials.
- 1.2.5 Install insulation with related materials and accessories in accordance with the manufacturer's recommended installation instructions.

**1.3 Regulatory Requirements**

- 1.3.1 Flame spread ratings and smoke developed classifications shall be as required by applicable code, CAN/ULC-S102 and NFPA 90A. Flame spread rating throughout material shall not exceed 25 and smoke developed shall not exceed 50. Materials shall not flame, smoulder, smoke, or glow at temperatures they are exposed to in service.
- 1.3.2 Minimum insulation thickness and insulating values shall be in accordance with NECB or ASHRAE Std 90.1 or as per the schedule in this specification, whichever is more stringent.
- 1.3.3 Glass mineral wool duct wrap shall comply with:
- .1 CAN/ULC-S102.
  - .2 CAN/CGSB-51.5M; Type II (FSK Facing).
  - .3 CAN/CBSB-51.11-92.
  - .4 CCG Low FS Laminate Cert. #GI-141.
  - .5 ULC Listed and classified.
  - .6 ASTM C 553; Type I, II III.
  - .7 ASTM C 1136; Type II (FSK and PSK facings only).
  - .8 ASTM C 1290; Specification for flexible fibrous glass blanket/HVAC ducts.
  - .9 ASTM E-84 Surface Burning Characteristics, 25/50 Flame/Smoke.

- 
- .10 CAN/ULC-S102 "Test for Surface Burning Characteristics of Building Materials".
- 1.3.4 Glass mineral wool insulation board shall comply with:
- .1 CAN/ULC-S102.
  - .2 CBSB 51-GP-10M.
  - .3 CGSB 51-GP-52M (facings).
  - .4 ASTM C 612.
  - .5 ASTM C 795.
  - .6 ASTM E-84 Surface Burning Characteristics, 25/50 Flame/Smoke.
  - .7 CAN/ULC-S102.
  - .8 ASTM C.1136 for Facings.
  - .9 ULC listed and classified.
- 1.3.5 Duct liner (internal lining) shall comply with:
- .1 CAN/ULC-S102.
  - .2 CAN/CGSB 51.11-92.
  - .3 ULC listed and classified.
  - .4 ASTM C 1071; Type I.
  - .5 NFPA 90A and 90B.
  - .6 Microbial Growth; ASTM C 1338, G21, G22.
- 1.3.6 Vapour Barriers
- .1 ASTM C755-20.
- 1.3.7 All insulation products shall be validated formaldehyde-free by a recognized third party.
- 1.4 Qualifications and Samples**
- 1.4.1 Submit Manufacturer documentation (and samples when requested) for materials, applications and finishing methods to establish they satisfy specification and meet applicable code requirements, before commencing work.
- 1.5 Definitions**
- 1.5.1 "Concealed" means insulated mechanical services in furred spaces, shafts and hung ceilings.
- 1.5.2 "Exposed" will mean not concealed.
- 1.6 Quality Assurance**
- 1.6.1 Surface-Burning Characteristics: For insulation and related materials, UL/ULC Classified per UL 723 or meeting ASTM E 84, by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic,

tapes, and cement material containers, with appropriate markings of applicable testing agency.

- .1 Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
  - .2 Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.
- 1.6.2 Formaldehyde Free: Third party certified with UL Environment Validation.
- 1.6.3 Biosoluble: As determined by research conducted by the International Agency for Research on Cancer (IARC) and supported by revised reports from the National Toxicology Program (NTP) and the California Office of Environmental Health Hazard Assessment. Certified by European Certification Board for Mineral Wool Products (EUCEB).
- 1.6.4 Recycled Content: A minimum of 50 percent recycled glass content certified and UL Validated.
- 1.6.5 Low Emitting Materials: For all thermal and acoustical applications of Glass Mineral Wool Insulation Products, provide materials complying with the testing and products requirements of UL GREENGUARD Gold Certification.
- 1.6.6 Products shall contain no polybrominated diphenyl ethers (PBDE) such as Penta-BDE, Octa-BDE or Deca-BDE fire retardants; whenever possible.

## 2. **PRODUCTS**

- 2.1 **Insulation products shall contain none of the following, Asbestos, Lead, Mercury, Formaldehyde or any related compounds. Insulation products shall be certified UL Green Guard Gold or 'Indoor Advantage Gold'. Insulation products shall contain 50% or more recycled content and provide verification.**

- 2.1.1 Insulation materials applied to carbon steel shall be Mass Load Corrosion Rate (MLCR) tested per ASTM 1617.
- 2.1.2 Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

## 2.2 **External Flexible Insulation**

- 2.2.1 External flexible glass fibre insulation with integral vapour barrier:
  - .1 Minimum density – 0.75 lb/ft<sup>3</sup> (12kg/m<sup>3</sup>).
  - .2 Thermal conductivity at 75°F - 0.024 BTU/hr/ft/°F (24°C - 0.042 W/m/°C).
  - .3 Acceptable Manufacturers:

- .1 Certainteed STD Ductwrap #75 FSK, Manson Alley-Wrap FSK, Owens Corning Soft.R.FSK Ductwrap, Knauf Atmosphere FSK Ductwrap with ECOSE technology, Johns-Manville Micro Lite FSK.

## 2.3 Duct Liner

### 2.3.1 Rigid Duct Liner:

- .1 Yellow or naturally coloured internal rigid glass mineral wool acoustical insulation with black sealer coating on one face.
- .2 Minimum sound absorption (NRC) of 0.70 as tested per ASTM C423 using Type "A" mounting.
- .3 Thermal conductivity at 75°F - 0.020 BTU/hr/ft/°F (24°C - 0.035 W/m/°C).
- .4 Acceptable Manufacturers:
  - .1 Certainteed Toughgard 300#, Manson Akousti-Liner R, Knauf Atmosphere Rigid Plenum Liner with ECOSE technology, Johns-Manville Permacoat R300, Owens Corning Quiet-R Rigid Coated Duct Liner.

### 2.3.2 Flexible Duct Liner:

- .1 Yellow or naturally coloured internal flexible glass fibre acoustical insulation with one face faced with non-woven fibreglass mat.
- .2 Minimum sound absorption (NRC) of 0.60 as tested per ASTM C423 using Type "A" mounting.
- .3 Thermal conductivity at 75°F - 0.023 BTU/hr/ft/°F (24°C - 0.040 W/m/°C).
- .4 Acceptable Manufacturers:
  - .1 Certainteed Toughgard Duct Liner 150# or Type 150, Manson Akousti-Liner, Knauf Duct Liner with ECOSE technology, Owens Corning Quiet-R Rotary Duct Liner.

### 2.3.3 Grease Duct Enclosure System Fire-Wrap:

- .1 For applications where NFPA-96 kitchen exhaust ducts are to be wrapped in a fire-rated material, provide Morgan Thermal Ceramics FireMaster® Fastwrap®-XL, 3M 615 PLUS or approved equivalent. Duct enclosure flexible blanket composed of high temperature fibers classified for applications to 2192°F (1200°C) and fully encapsulated in glass fiber reinforced foil faced finish. Must be ULC listed for 1 and 2 hour fire resistive enclosure protection, and for zero clearance for kitchen exhaust ducts. Minimum 1½" (40 mm) thick, 6 lbs/cu.ft. (96 kg/m<sup>3</sup>) density, Greenguard Microbial Resistance Listing, and compliant to IMC, NFPA-96, UMC and CMC. Frame and smoke spread rating less than 25/50.

Acceptable alternatives may be submitted for review, provided they meet or exceed the required compliances.

## **2.4 Accessories**

### **2.4.1 Insulation Adhesive:**

- .1 Bakelite 230-39, Childers CP-82, CP-56W, Design Polymerics DP2502, Foster 85-20, Polymer Glasstack #25, Robson Ticki-Tuff.

### **2.4.2 Vapour Barrier Tape (FSK):**

- .1 Finishing tape to meet flame spread rating and smoke developed classification requirements of applicable code and compatible with facing material, CAN/ULC-S102.
- .2 Foil, scrim and kraft paper FSK foil faced retarder tape complying with ASTM 1136 self-adhesive tape.

### **2.4.3 Vapour Barrier Adhesive:**

- .1 Bakor 230-21, Childers CP-82, Design Polymerics DP2502, Foster 85-20, 3M 4230.

### **2.4.4 Insulation Coating Water Based for Indoor Use:**

- .1 Foster 30-33/30-65; Childers CP 33/35.

### **2.4.5 Weather/Abuse Coating – for Outdoor Use:**

- .1 Aluminum: 26 ga. (0.55mm) thick with longitudinal slip joints and 2" (50mm) end laps, 0.4mm thick die shaped fitting covers with factory attached protective liner on interior surface.
- .2 3M VentureClad Insulation Jacketing System classified as zero permeability.

### **2.4.6 Reinforcing Membrane:**

- .1 Glass reinforcing membrane as commercially available.

### **2.4.7 Seal Coating, Fabric Adhesive and Fabric Coating:**

- .1 Bakor 120-09, Childers CP-50 AMV1, Design Polymerics DP3050, Foster 30-36/81-42.

## **2.5 Duct Insulation Schedule and Thickness**

- 2.5.1 External Flexible Insulation with vapour barrier. (Exposed within room which is being served by exposed ducts, do not require external insulation).

<b>Service</b>	<b>Thickness</b>
Cooling and heating supply ducts - where temperature difference between space where duct is located and design air temperature in duct is less than or equal to 40°F (22.2°C).	1" (25 mm)
All cooling and heating supply ducts - where the temperature difference between the space within which the duct is located and	1½" (40 mm)

Service	Thickness
the design air temperature in the duct is greater than 40°F (22.2°C).	
Outdoor air ductwork and plenums (from intake to mixing plenum).	2" (50 mm)
Combustion intake/relief air.	2" (50 mm)
Exhaust air discharge through roof (including sides and bottom of plenum).	2" (50 mm)
Exhaust air ductwork outside the building.	1" (25 mm)
All exhaust air ductwork from the outside wall or roof to 5'-0" (1.5 m) inside building.	1½" (40 mm)
Exhaust ductwork from ERV/HRV to wall	1" (25 mm)

#### 2.5.2 Internal Flexible Duct Liner

Service	Thickness
All ductwork where indicated by cross hatching.	1" (25 mm)
All supply ductwork in the mechanical room (From AHU discharge to duct shaft), or to 3 m beyond fan/mechanical room.	2" (50 mm)

#### 2.5.3 Internal Rigid Duct Liner

Service	Thickness
Built-up site fabricated air handling unit(s). Line sheet metal walls and tops from inlet dampers to discharge dampers. Do not line transverse walls containing coils, filters or fan discharge.	2" (50 mm)
Built-up site fabricated heat recovery exhaust unit(s). Line sheet metal walls and tops.	2" (50 mm)
Cold and hot supply air plenums. Line walls, tops and bottoms from discharge dampers to supply duct connections.	2" (50 mm)
All outdoor air plenums. Line sheet metal walls and top.	2" (50 mm)

### 3. EXECUTION

#### 3.1 Application

- 3.1.1 Apply external insulation to ductwork only after pressure tests have been made and systems accepted.
- 3.1.2 Apply insulation and insulation finish so finished product is uniform, smooth in finish, with longitudinal seams concealed from view. Apply ductwork insulation materials, accessories and finishes in accordance with Manufacturer's recommendations. Fix and supply duct insulation by staples, washer pins or wire wraps at minimum 24" (600 mm) centres. Use weld-pin washers where duct dimension is larger than 26" (650 mm) high or wide.

- 
- 3.1.3 Insulation and vapour barrier shall be continuous through non-rated separations.
- 3.1.4 Grease and fire rated flexible duct insulation shall be applied and installed in accordance with the Manufacturer's instructions.
- 3.1.5 Insulation and vapour barrier shall be continuous through non-rated separations. Where vapour barrier is indicated, seal joints, seams and penetrations in insulation at hangers, supports, anchors and other projections with vapour-barrier mastic.
- .1 Install insulation continuously through hangers and around anchor attachments.
  - .2 For insulation application where vapour barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachments to structure with vapour-barrier mastic. Install insulation continuously through hangers and around anchor attachments.
  - .3 Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
- 3.1.6 Install insulation with non-self-sealing factory-applied jackets as follows:
- .1 Draw jacket tight and smooth.
  - .2 Cover circumferential joints with 3" (80 mm) wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4" (100 mm) o.c.
  - .3 Overlap jacket longitudinal seams at least 1½" (40 mm). Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at **2" (50 mm) 4" (100 mm)]** o.c.
    - .1 For below ambient services, apply vapour-barrier mastic over staples.
    - .2 Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.
    - .3 Where vapor barriers are indicated, apply vapour-barrier mastic on seams and joints and at ends adjacent to duct flanges and fittings.
- 3.1.7 Cut insulation in a manner to avoid compressing insulation more than 25 percent of its nominal thickness.

---

**3.2 Insulation Termination**

- 3.2.1 Terminate insulation short of control, smoke and fire dampers so as not to interfere with operation, seal all edges to maintain continuous vapour barrier.
- 3.2.2 Terminate insulation 24" (600 mm) short of duct mounted electric heating coils.

**3.3 Insulation for Cooling Coil Headers and Return Bends**

- 3.3.1 Pack flexible mineral wool insulation around headers and return bends on all cooling coils in built up air handling units and at re-cool coils in terminal ductwork systems to control condensation

**3.4 External Flexible Insulation with Vapour Barrier**

- 3.4.1 On rectangular duct work and plenums, over 24" (600 mm) in width, spotweld pins ¼" (6 mm) longer than insulation thickness, one per square foot of duct minimum. If pins are installed in field, capacitor gun shall be used. Impale insulation over pins, and hold in place using metal or nylon clips (washers). Alternatively, use assembly consisting of welded pin with integral head washer welded in place over insulation (Clinched pins not acceptable).
- 3.4.2 Adhere foil faced vapour barrier tape over butt joints, raw edges, holding washers and other points of penetration of vapour barrier jacket on exposed hot and cold ducts and concealed cold ducts. Provide 16 ga (1.61 mm) wire wrap on 18" (450 mm) centers as additional exterior insulation reinforcing, to snug-tight so insulation is not crushed/compressed.

**3.5 Internal Flexible Duct Liner Application**

- 3.5.1 Adhere insulation with insulation adhesive applied to whole of metal surface, with the coating side of insulation exposed to airstream.
- 3.5.2 Ducts 24" (600 mm) in width and less require no further adhesion.
- 3.5.3 Duct sides and plenum panels greater than 24" (600 mm) in width shall have metal clips or pins adhered to metal surface at 12" (300 mm) centres to supplement adhesive. (Welding pins may be used provided capacitor type gun is used.) Impale insulation or pins or clips with coated side of insulation exposed to airstream and secured with holding washers. Cover holding washers with reinforcing membrane and insulation coating/sealer.
- 3.5.4 Seal transverse joints, raw edges, and other points of penetration of coating with reinforcing membrane and insulation coating/sealer.
- 3.5.5 Seal longitudinal and butt joints with insulation coating sealer.
- 3.5.6 No raw edges of internal insulation material shall be exposed to moving airstream. Provide 26 ga (0.55 mm) sheet metal nosing at

all leading edges of exposed lining to overlap insulation by at least 1" (25 mm) downstream.

3.5.7 Duct size indicated is inside dimension of the insulation. Metal duct sizes shall be increased to allow for internal acoustic insulation thickness. No external duct insulation is required when internal duct insulation provided.

3.5.8 Adhere Alpha Temp cloth over internal surface of acoustic insulation. Overlap edges and seal joints with insulation adhesive/coating/sealer.

### **3.6 Internal Rigid Duct Liner Application**

3.6.1 Adhere internal rigid duct liner in same manner as internal flexible duct liner.

3.6.2 Adhere Alpha Temp #1610/1067 UL Class #1 Material film over internal surface of acoustic insulation. Overlap edges and seal joints with insulation adhesive/coating/sealer.

3.6.3 Cover plenum wall insulation with galvanized perforated metal sheet having over 50% open area. Protective metal shall be held in place by securing it to projecting pins with washers.

3.6.4 Cover plenum wall insulation with solid galvanized sheet metal for 48" (1,200 mm) downstream from cooling coils.

3.6.5 Cover insulated walk on plenum floors with solid galvanized sheet metal to protect insulation from damage. Provide supports under sheet metal to prevent insulation and pins from being crushed.

3.6.6 Sheet metal and perforated sheet metal is under Section 23 31 00.

3.6.7 Duct size indicated is inside dimension of the insulation. Metal duct sizes shall be increased to allow for internal acoustic insulation thickness. No external duct insulation is required when internal duct insulation provided.

### **3.7 Ductwork Insulation Finishes**

3.7.1 "Concealed" ductwork insulation, in horizontal and vertical service spaces, will require no further finish.

3.7.2 "Exposed" ductwork insulation, in unfinished floor space will have no further finish.

3.7.3 "Exposed" duct insulation in warehouse type spaces shall be painted with one sealer coat of insulation coating.

3.7.4 "Exposed" ductwork insulation in finished floor spaces, fan rooms, **valve rooms** and shall be finished with two coats of white, foil-finishing, insulation coating.

3.7.5 "Exposed" duct work insulation outside the building shall have weatherproof finish. Finish ducts exposed to outdoors with

---

aluminum jacket. Caulk all joints on jacket for weatherproof finish. Locate longitudinal joints in least exposed position.

- 3.7.6 "Exposed" insulated duct work **outside** shall be recovered all around with aluminum jacketing. Exterior application shall be vapour sealed installation. Over insulation, apply 22 ga (0.64 mm) thick Childers corrugated aluminum. Moisture barrier shall be continuous across full width of jacketing. Longitudinal seams shall be located to shed water. Attach with holding straps at 6" (150 mm) on centres. Provide complete aluminum jacket system using installation procedures of the Manufacturer. Seal outdoor jacketing watertight.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2 General**

- 1.2.1 Provide thermal insulation for heating and cooling equipment as indicated and scheduled.
- 1.2.2 Journeyman insulation applicators shall supervise the insulation work.
- 1.2.3 Provide mechanical contractor wall and pipe spacing requirements before project begins. Be responsible for ensuring that sufficient space is provided for proper installation of insulation materials.
- 1.2.4 Minimum insulation thickness and insulating values shall be as per the schedule in this section.
- 1.2.5 Install insulation and related materials and accessories in accordance with the suppliers and manufacturers recommended installation instructions/

**1.3 Regulatory Requirements**

- 1.3.1 Flame spread ratings and smoke developed classifications shall be as required by applicable code and NFPA 90A. Flame spread rating throughout material shall not exceed 25 and smoke developed shall not exceed 50. Materials shall not flame, smoulder, glow, or smoke at temperatures they are exposed to in service.
- 1.3.2 Minimum insulation thickness and insulating values shall be in accordance with NECB or ASHRAE Std 90.1 or as per the schedule in this section, whichever is most stringent.
- 1.3.3 All insulation products shall be formaldehyde-free.
- 1.3.4 Vapour Barriers
- .1 ASTM C755-20.

**1.4 Qualifications and Samples**

- 1.4.1 Submit Manufacturer documentation (and samples when requested) for materials, applications and finishing methods to establish they satisfy specification and meet applicable code requirements, before commencing work.

---

## 1.5 Quality Assurance

- 1.5.1 Installer qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program.
- 1.5.2 Surface-Burning Characteristics: For insulation and related materials, UL/ULC Classified per UL723 or meeting ASTM E 84, by testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesives, mastic, tapes and cement material containers, with appropriate markings of applicable testing agency.
  - .1 Insulation installed indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
  - .2 Insulation installed outdoors: Flame spread index of 75 or less, and smoke-developed index of 150 or less.
- 1.5.3 Formaldehyde free: Third party certified with UL Environment Validation.
- 1.5.4 Recycled content: A minimum 50 percent recycled glass content.
- 1.5.5 Bio soluble: As determined by research conducted by the International Agency for Research on Cancer (IARC) supported by revised reports from the National Toxicology Program (NTP) and the California Office of Environmental Health Hazard Assessment. Certified by European Certification Board for Mineral Wool Products (EUCB).
  - .1 Low emitting materials: For all thermal and acoustical applications of Glass Mineral Wool Insulation Products, provide materials complying with the testing and products requirements of UL Greenguard Gold Certification.
- 1.5.6 Products shall contain no polybrominated diphenyl ethers (PBDE) such as Penta-BDE, Octa-BDE or Deca-BDE fire retardants; whenever available.

## 1.6 Definitions

- 1.6.1 "Exposed" equipment shall be considered to be exposed in boiler room, chiller room, valve room and fan rooms, and where line of sight visibility above "cloud ceilings" exists.

## 2. PRODUCTS

- 2.1 Insulation products shall contain none of the following, Asbestos, Lead, Mercury, Formaldehyde or any related compounds. Insulation products shall be certified UL Green Guard Gold or 'Indoor

---

**Advantage Gold'. Insulation products shall contain 50% or more recycled content and provide verification.**

- 2.1.1 Insulation materials applied to carbon steel shall be Mass Load Corrosion Rate (MLCR) tested per ASTM 1617.
- 2.1.2 Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

**2.2 Pre-formed Block and Board Insulation**

- 2.2.1 Mineral Fibre (High Temperature) Rigid:
  - .1 Thermal conductivity at 199°F – 0.027 BTU/hr/ft/°F (93° C - 0.046 W/m/°C).
  - .2 Acceptable Manufacturers:
    - .1 Roxul RHT-80, IIG Min Wool 1200, Thermafibre Industrial Board 8.016 Nominal Density, Knauf-Elevated temperature board with ECOSE technology.
- 2.2.2 Calcium Silicate (High Temperature) Rigid:
  - .1 Thermal conductivity at 199°F – 0.035 BTU/hr/ft/°F (93° C - 0.060 W/m/°C).
  - .2 Acceptable Manufacturers:
    - .1 IIG Thermo-12 Gold.
- 2.2.3 Perlite Insulation - High Temperature:
  - .1 Without integral jacket.
  - .2 Thermal conductivity
  - .3 Acceptable Products:
    - .1 Sproule WR-1200, Howred Goodtemp
- 2.2.4 Phenolic Insulation Rigid Board:
  - .1 With integral FRK jacket.
  - .2 Thermal conductivity at Flame spread and smoke density does not exceed 25/50 per CAN/ULC-S102 with or without integral jacket.

**2.3 Flexible Sheet Insulation**

- 2.3.1 Flexible Closed Cell
  - .1 Thermal conductivity at 199°F – 0.027 BTU/hr/ft/°F (93° C - 0.046 W/m/°C).
  - .2 Acceptable Manufacturers:
    - .1 Therma-Cel.
- 2.3.2 Flexible Foamed Elastomeric
  - .1 Thermal conductivity at 199°F – 0.027 BTU/hr/ft/°F (93° C - 0.046 W/m/°C).
  - .2 Acceptable Manufacturers:

- .1 F/R Armacell, Aerocell, K-Flex USA.

**2.4 Removable Insulation Covers**

- 2.4.1 Flexible mineral fibre or fibre glass fully enclosed on sides and edges with Alpha Maritex #8459-2-8S silicone fibre glass cloth suitable for temperatures involved with stainless steel wire mesh against hot surface, or acceptable equal. All products must conform to ASTM-C1965 and CAN/ULC-S102
- 2.4.2 Insulation covers laced in place with brass/stainless steel hooks and copper/stainless steel wire and be easily removed.

**2.5 Accessories**

- 2.5.1 Jacket Fastenings (Multi-Purpose):
- .1 Staples (flare type). Galvanized.
- .2 Compatible jacket finishing tape.
- 2.5.2 Corner Beads:
- .1 1½" (40 mm) x 1½" (40 mm) x 0.015" (0.37 mm) thick galvanized steel or aluminum.
- 2.5.3 Finish Jacket:
- .1 Thermocanvas Jacket:
- .1 Fattal's Thermocanvas, Robson Flamex FR Canvas
- .2 Metal Jacket:
- .1 ITW 24 ga (0.70 mm), Ideal products
- 2.5.4 Reinforcing Membrane:
- .1 Glass reinforcing membrane.
- 2.5.5 Reinforcing Mesh:
- .1 1" (25 mm) square galvanized wire mesh.
- 2.5.6 Insulating Cement:
- .1 Ryder Thermokote MW high temperature, or as commercially available.
- 2.5.7 Hard Finish Cement:
- .1 As commercially available.
- 2.5.8 Fabric Adhesive:
- .1 Bakor 120-18, Childers CP-52, Design Polymeric DP3050, Foster 30-36, Robson White Lag.
- 2.5.9 Fabric Coating:
- .1 Bakor 120-18, Childers CP-52, Design Polymeric DP3050, Foster 30-36, Robson White Lag.

## 2.6 Acoustic Lagging Material

- 2.6.1 Acoustic lagging material shall be equal to Vibrasonic Controls VSC-0-10NL-25RP Decoupled Blanket Barrier.
- 2.6.2 Material shall consist of 1 lb per square foot (0.042 kg/sq.m) Barium impregnated vinyl permanently and continuously affixed to a ¼" (6 mm) 2 lb density open cell polyester foam.
- 2.6.3 Barrier to have minimum STC of 27 with the following characteristics: 125HZ – 15dB; 250HZ – 19dB; 500 HZ – 21dB; 1000 HZ – 28 dB; 2000 HZ – 33dB; 4000 Hz – 37 dB.
- 2.6.4 Material to be tested and labelled to meet maximum 25/50 fire rating.

## 2.7 Equipment Insulation Schedule and Thickness

Equipment	Thickness	Scope
Boiler breeching	4" (100 mm) (2 x 2" (50 mm))	A
Boiler stack (s)	2" (50 mm)	A
Exterior boiler stacks, to CAN B149.1	4" (100 mm)	A
Condensate receiver tank(s)	2" (50 mm)	A
Condensate cooler shell(s)	2" (50 mm)	A
Chiller(s) (all components subject to condensation)	1" (25 mm)	B, D
Chilled water pump housings	1" (25 mm)	B, D
Deaerator shell and tower	2" (50 mm)	A
Domestic hot water storage tank(s)	2" (50 mm)	A
Domestic cold water meter(s)	1" (25 mm)	B, D
Expansion joints	2" (50 mm)	C
Flash tank	2" (50 mm)	A
Heat Exchanger(s) (shell, end and head)	2" (50 mm)	A
Humidifier separator bodies	2" (50 mm)	C
Oil heater (boiler)	1" (25 mm)	A
Steam pressure reducing valve	2" (50 mm)	C

**SCOPE A:** Pre-formed block insulation (high temperature).

**SCOPE B:** Flexible sheet insulation.

**SCOPE C:** Removable insulation cover.

**SCOPE D:** Pre-formed board insulation.

---

### 3. EXECUTION

#### 3.1 Application

- 3.1.1 Apply insulation to equipment only after connections are complete and tests made and systems accepted.
- 3.1.2 Apply insulation and insulation finish, securing it permanently to surfaces of equipment. Finish work so finished product is uniform in application and smooth in finish with edges protected and sealed.
- 3.1.3 When more than one layer of insulating material is used to achieve the specified thickness, stagger seams and joints to eliminate leakage paths.
- 3.1.4 Weld insulation attachment fittings to surfaces, as required, to completely secure block insulation with mechanical wire or strap fastenings. Some pressure vessels will not allow welding to surface, coordinate and confirm with equipment manufacturer.
- 3.1.5 Apply insulation to the equipment surface with the joints firmly butted and as close as possible to the equipment surface.

#### 3.2 Nameplates

- 3.2.1 Install insulation so that name and registration plates, cleanouts, manholes, inspection opening and gauge and controller tapings are uncovered. Cut back insulation around base of these items at 45° and finish with finishing cement, or mastic finish. When finishing with metal re-covering, provide mitred picture frame flashing, sealed and caulked around edges.
- 3.2.2 For cold water applications provide a plug made of elastomeric foam manufactured on site to cover the opening, friction fitted to allow easy removal and reinstallation.

#### 3.3 Insulation – Hot Applications

- 3.3.1 Apply high temperature insulation block and/or pre-formed/molded pipe insulation and secure firmly to surfaces with mechanical, wire or strap fastenings. Insulation shall be cut, shaped and fitted neatly to contours, without voids.
- 3.3.2 Insulation on equipment heads shall be fabricated in orange peel sections, and receive ½" (15 mm) trowel coat, dry thickness of insulating hard coat finishing cement, to provide smoothly contoured surface. Cement shall be reinforced with layer of reinforcing mesh or reinforcing membrane.
- 3.3.3 Apply high temperature mineral fibre rigid insulation to boiler breeching. Exterior application shall be sealed from moisture. Over insulation, apply 22 ga (0.64 mm) thick aluminum. The longitudinal seams shall be located to shed water. Attach with holding strap at 6" (150 mm) on centres. Provide complete aluminum jacket system

using parts, accessories and installation procedures of Manufacturer. Seal outdoor jacketing watertight. Overlap seams by minimum of 3" (80 mm). Apply expansion springs on bands where required.

**3.4 Insulation – Cold Applications**

- 3.4.1 Apply flexible sheet insulation on cold surfaces. Secure material and longitudinal and butt joints with foam plastic adhesive. Insulation shall be cut, shaped and fitted neatly to contours, without voids.
- 3.4.2 Chiller to be insulated in accordance with Manufacturer's recommendation.
- 3.4.3 Chiller flange insulation to be easily removable without damage.
- 3.4.4 Secure board insulation on ducts and flat surfaces with adhesive and pins. Seal vapour barrier finish joints with self-adhesive foil tape.

**3.5 Axial Fans – Insulation Wrap**

- 3.5.1 Axial fans, not in plenums shall have 2" (50 mm) thick pre-formed block insulation (Roxul Everwrap or equal) on casing held in place with ½" (15 mm) wide stainless steel banding.
- 3.5.2 Cover insulation with barium impregnated vinyl sheet complete with ¼" (6 mm) foamed elastomeric. Extend 6" (150 mm) beyond fan flexible connection backing and secure in place with ½" (15 mm) wide stainless steel banding.
- 3.5.3 Provide finished opening for electrical and lubrication openings.

**3.6 Block Insulation Finish**

- 3.6.1 Premium Finish (BCICA Premium 2 Standard):
  - .1 Over hard finish cement apply thermo canvas jacket using fabric adhesive. Finish fabric jacket with one coat of fabric coating.
- 3.6.2 Custom Finish:
  - .1 No further finish required on hard finish cement.

**3.7 Flexible Sheet Finish**

- 3.7.1 Insulated flexible sheet insulation shall be painted with heavy brush coating of foam plastic, white insulation coating.

**3.8 Acoustic Lagging Material**

- 3.8.1 Material shall be glued, foam side to underside of heat pumps and all exterior surfaces of heat pumps.
- 3.8.2 Where access/doors panels are involved, the complete surface area to be treated shall be first cut from a single piece of lagging material, the access area marked out, plus a minimum ½" (15 mm) around

---

perimeter, cut and then glued (foam side to metal) to the door/panel. Do not apply glue to the minimum ½" (15 mm) perimeter overhand section of the material. The main section can then be glued to the main surface being treated. Holes may be punched in the material to allow access to access bolts and material may be cut around hinges and handles.

- 3.8.3 Glue shall be an inexpensive contact adhesive such as LePages Contact Cement compatible with foam insulation. A liberal coat shall be applied to the metal surface but only a thin coat to the foam side of the lagging material. Put surfaces together **before** adhesive goes tack dry so that it can be manipulated neatly into place.
- 3.8.4 Use a non-hard setting caulk to caulk panel corners to ensure that the polyester decoupling layer is not visible.
- 3.8.5 Butt joints may be covered using any fire-rated film/PSA tape.
- 3.8.6 Where a number of identical units are involved, material shall be die-cut.
- 3.8.7 Scope of Acoustics Lagging:
  - .1 All water to air heat pump units suspended in ceiling.
  - .2 All fan coil units suspended in ceiling.
  - .3 Exposed in-line booster or exhaust fans suspended above occupied areas.

**END OF SECTION**

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 General

- 1.2.1 Provide thermal insulation on piping, valves, fittings and radiant ceiling panels, as called for and as scheduled. Note items listed that do not require insulation.
- 1.2.2 Journeyman insulation applicators with red seal or TQ designation in the heat and frost trade shall supervise the insulation work. This project requires the Mechanical Insulation Contractor to provide a BCICA Quality Insurance Certificate (QAC). The Mechanical Insulation Contractor shall register with BCICA and shall be in full compliance with the requirements of the QAC Program. Materials must be installed by tradespersons with a Red Seal or TQ Designation in the Heat and Frost Trade as detailed in the QAC Program.
- 1.2.3 Provide mechanical contractor wall and pipe spacing requirements before project begins and follow up with pipe installer about the proper pipe spacing.
- 1.2.4 Minimum insulation thickness and insulating values shall be in accordance with **ASHRAE Std 90.1** or as per the schedule in this section, whichever is most stringent.
- 1.2.5 Install insulation and related materials and accessories in accordance with the suppliers and manufacturers recommended installation instructions.

### 1.3 Regulatory Requirements

- 1.3.1 Flame spread ratings and smoke developed classifications shall be as required by British Columbia Building Code, CAN/ULC-S102 and NFPA 90A. Generally, the flame spread rating throughout the material shall not exceed 25 and the smoke developed classification shall not exceed 50. Materials shall not flame, smoulder, glow, or smoke at temperature they are exposed to at service.
- 1.3.2 Fibreglass pipe insulation shall comply with:
- .1 CAN/ULC-S102.
  - .2 CCG F1-304 (plain only).
  - .3 CBSB 51-GP-9M.
  - .4 CGSB 51-GP52M (jacket).

- .5 ASTM C 547, Type I, Type IV.
  - .6 STM C 585 – Standard for inner and outer diameters.
  - .7 ASTM C 795 – Insulation in contact with austenitic stainless steel.
  - .8 ASTM C 1136 (jackets; Type I, II, III, IV).
  - .9 ASTM E-84, Surface Burning Characteristics, 25/50 Flame/Smoke.
  - .10 CAN/ULC-S102 “Test for Surface Burning Characteristics of Building Materials”.
- 1.3.3 PVC Fittings and Jacketing shall comply with:
- .1 CAN/CGSB – 51.53-95.
  - .2 CAN/ULC-S102.
- 1.3.4 Vapour Barriers
- .1 ASTM C755-20.
- 1.3.5 All insulation products shall be formaldehyde-free.

#### **1.4 Qualifications and Samples**

- 1.4.1 Submit Manufacturer’s documentation (and samples when requested) for materials, applications and finishing methods to establish they satisfy this specification and meet applicable code requirements, before commencing work.
- 1.4.2 Refer to Section 23 05 05 Firestopping for firestop requirements.

#### **1.5 Quality Assurance**

- 1.5.1 Installer qualifications: Skilled mechanics who are registered apprentices or have successfully completed an apprenticeship program or another craft training program.
- 1.5.2 Surface-Burning Characteristics: For insulation and related materials, UL/ULC Classified per UL723 or meeting ASTM E 84, by testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesives, mastic, tapes and cement material containers, with appropriate markings of applicable testing agency.
- .1 Insulation installed indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
  - .2 Insulation installed outdoors: Flame spread index of 75 or less, and smoke-developed index of 150 or less.
- 1.5.3 Formaldehyde free: Third party certified with UL Environment Validation.
- 1.5.4 Recycled content: A minimum 50 percent recycled glass content.
- 1.5.5 Bio soluble: As determined by research conducted by the International Agency for Research on Cancer (IARC) supported by

revised reports from the National Toxicology Program (NTP) and the California Office of Environmental Health Hazard Assessment. Certified by European Certification Board for Mineral Wool Products (EUCEB).

- 1.5.6 Low emitting materials: For all thermal and acoustical applications of Glass Mineral Wool Insulation Products, provide materials complying with the testing and products requirements of UL Greenguard Gold Certification.
- 1.5.7 EPD Submittals: As certified by UL Environment.
- 1.5.8 Products shall contain no polybrominated diphenyl ethers (PBDE) such as Penta-BDE, Octa-BDE or Deca-BDE fire retardants, whenever possible.

## **1.6 Definitions**

- 1.6.1 "CONCEALED" means insulated mechanical services in trenches, chases, furred spaces, shafts and hung ceilings (services in tunnels **are are not** considered to be concealed).
- 1.6.2 "EXPOSED" will mean not concealed, to include line of sight elements above 'cloud ceilings' and include piping in parkades, inside the building in unheated zones, and on roof or outside the walls.

## **1.7 Connections to Existing Piping**

- 1.7.1 Make good existing insulation disturbed or removed to facilitate alterations and additions to existing piping.

## **1.8 Heat Traced Piping**

- 1.8.1 Piping subject to freezing is specified to be heat traced. Insulation shall cover heat tracing, allow for oversized insulation as required for heat trace element thickness.

# **2. PRODUCTS**

## **2.1 Materials**

- 2.1.1 Products shall not contain formaldehyde, asbestos, lead, mercury or mercury compounds, if possible. They shall be UL Greenguard Gold or Indoor Advantage Gold, if possible.
- 2.1.2 Products shall be validated by UL/E to be formaldehyde free.
- 2.1.3 Products shall contain no less than 50% recycled content.
- 2.1.4 Insulation materials applied to carbon steel shall be Mass Load Corrosion Rate (MLCR) tested per ASTM 1617.
- 2.1.5 Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C-795.

---

## 2.2 Pre-Formed Pipe Covering

### 2.2.1 Mineral Fibre - Low and Medium Temperature:

- .1 Type I (849°F (454°C)) or Type IV (982°F (528°C)); Thermal conductivity at 75°F – 0.019 BTU/hr/ft/°F (24°C – 0.033 W/M/°C)
- .2 Glass mineral wool bonded with a bio-based thermosetting resin.
- .3 UL/ULC classified for Earthwool, FHC 25/50 per ASTM E84 for Redi-Klad. Living building challenge-declare red list free for Rediklad pipe or unjacketed earthwool pipe only.
- .4 Comply with ASTM C585, ASTM C411, ASTM C795 and ASTM C547, Type I and Type IV, **factory-applied ASJ+SSL+ or ASJ-SSL**.
- .5 Products shall be validated by UL/E to be formaldehyde free and have an EPD.
- .6 With integral vapour barrier jacketed and longitudinal lap.
- .7 Acceptable products: Subject to compliance with requirements, provide Knauf Insulation; Earthwool 1000 degree pipe insulation with COSE technology or Earthwool Redi-Klad 1000 degree pipe insulation with ECOSE technology or comparable product by one of the following:
  - .1 Manson Alley K, Owens Corning ASJ/SSL-II, Johns Manville Micro-Lok AP-T Plus.

### 2.2.2 Calcium Silicate - High Temperature:

- .1 Without integral jacket.
- .2 Thermal Conductivity at 199°F – 0.034 BTU/hr/ft/°F (93°C - 0.059 W/m/°C).
- .3 Acceptable Products:
  - .1 IIG Thermo-12 Gold.

### 2.2.3 Perlite Insulation - High Temperature (over 662°F (350°C)):

- .1 Without integral jacket.
- .2 Thermal Conductivity at 194°F – 0.041 BTU/hr/ft/°F (90°C - 0.071 W/m/°C).
- .3 Acceptable Products
  - .1 IIG, Howred Goodtemp.

### 2.2.4 Rock Mineral Wool - High Temperature (over 662°F (350°C)):

- .1 With integral vapour barrier jacket and longitudinal lap.
- .2 Thermal conductivity at 199°F – 0.023 BTU/hr/ft/°F (93° C - 0.040 W/m/°C).
- .3 Acceptable Products:

- .1 Roxul ASJ/SL, ESLIN (Energy Savings Layered Insulation) by Visionary Industrial Insulation, Thermafiber, IIG.

2.2.5 Flexible Foamed Elastomeric:

- .1 Thermal conductivity at 75°F – 0.023 BTU/hr/ft/°F (24° C - 0.040 W/m/°C).
- .2 Acceptable Products:
  - .1 AP Armacell, K-Flex USA, Aerocell.

2.2.6 Flexible Closed Cell:

- .1 Thermal conductivity at 75°F – 0.021 BTU/hr/ft/°F (24° C - 0.036 W/m/°C).
- .2 Acceptable Products:
  - .1 Therma-Cel.

2.2.7 Phenolic Closed Cell - Rigid:

- .1 With integral vapour barrier jacket and longitudinal lap.
- .2 Thermal conductivity at 75°F – 0.011 BTU/hr/ft/°F (24° C - 0.019 W/m/°C).
- .3 Acceptable Products:
  - .1 Kingspan Kooltherm.

2.2.8 Polyiso Closed Cell – Rigid:

- .1 With integral vapor barrier jacket and longitudinal lap.
- .2 Thermal conductivity at 24°C - 0.019 W/m/°C.
- .3 Acceptable Products:
  - .1 Shur-Fit polysio with Mylar SSL (self-seal lap) vapor barrier.

**2.3 Firestopping and Smoke Seal Materials**

- 2.3.1 Refer to Section 23 05 05 Firestopping for firestop requirements.

**2.4 Accessories**

2.4.1 Insulation Fastenings:

- .1 16 ga (1.61mm) galvanized wire or 16 ga (1.61 mm) thick copper wire as commercially available.

2.4.2 Jacket Fastenings:

- .1 Thermocanvas and All Service:
  - .1 Staples (flare type), compatible jacket finishing tape, contact adhesives recommended by the jacket manufacture.
- .2 Metal Jackets
  - .1 Sheet metal screws, pop rivets, bands.

- 
- .3 PVC Jacket and Fitting Covers:
    - .1 PVC self-adhesive tape, plastic pop rivets, bonding cement.
  - 2.4.3 Adhesives:
    - .1 Flexible elastomeric and flexible closed cell insulation adhesive:
      - .1 Armstrong 520, Thermacell 1590, Rubatex R-373, Zipcoat 8A.
    - .2 Vapour barrier jacket adhesive:
      - .1 Bakelite 230-39, Childers CP-82, Epolux Cadoprene 400, Foster 85-20.
    - .3 Fabric adhesive, to insulation pipe covering:
      - .1 Bakelite 120-18, Childers CP-52, Epolux Cadalag 336, Foster 30-36, Robson White Lag.
  - 2.4.4 Coatings:
    - .1 Vapour barrier coating on reinforcing membrane or on insulating cement to achieve minimum 0.05 perm permeance of assembly:
      - .1 Bakor 120-09, Childers Chil-Out CP33/Chil-Perm CP35; Epolux Cadalag 336; Foster Vapour out 30-33/Vapor-Fas 30-65.
      - .2 Childers CP-30 (refrigeration suction lines only).
    - .2 Flexible elastomeric and flexible closed cell insulation finish coating to achieve minimum 0.05 perm permeance of assembly:
      - .1 Armstrong, Bakelite 120-13, Rubatex, Zipcoat.
  - 2.4.5 Finish Jackets:
    - .1 Thermocanvas Jacket:
      - .1 Fattal's Thermocanvas, Robson Flamex FR Canvas or Tai-Can Canvas.
    - .2 All Service Jacket (with 0.0019" (0.3 mm) minimum thick foil):
      - .1 Fattal's Fat-Lock ASJ, Fibreglass ASJ, Knauf ASJ+, Kingspan ASJ, Manson SPT, Johns Manville AP-T Plus, Owens Corning ASJ, Roxul ASJ.
    - .3 PVC Finishing Jacket (minimum 0.015" (0.38 mm) thick) with factory applied self seal lap:
      - .1 Shur-Fit Products SSL PVC Jacket, Proto PVC, Speedline PVC, Zeston PVC.
    - .4 Aluminum Jacket:
-

- 
- .1 26 ga (0.51 mm) thick stucco embossed or smooth aluminum jacketing with longitudinal slip joints and 0.0019" (0.3 mm) end laps with factory applied protective liner on interior surface.
    - .1 Shur-Fit Aluminum Jacket, ITW, Ideal products or other as commercially available.
    - .2 Pacific Pressed fitting covers (available from Shur-Fit Products) for the following:
      - .1 Grooved pipe fittings
      - .2 Insulated and clad refrigerant lines
  - 2.4.6 Reinforcing Membrane:
    - .1 Glass reinforcing membrane as commercially available: Foster Mast-A-Fab; Childers Chil-Glas #10; Pittsburgh Corning PC-79
  - 2.4.7 Insulating Cement:
    - .1 Ryder Thermokote MW high temperature, or as commercially available.
  - 2.4.8 Finishing Cement:
    - .1 Ryder Thermokote 1 FW.
  - 2.4.9 Pre-Formed Fitting Covers:
    - .1 Aluminum Fitting Covers:
      - .1 26 ga (0.51 mm) thick, die shaped components with factory applied protective liner on interior surface.
        - .1 Pacific Pressed Fitting Covers (Available from Shur-Fit Products), Childers Ell-Jacs, Ideal Weatherjacs, Shield-Ells or other as commercially available.
    - .2 PVC Fitting Covers:
      - .1 0.02" (0.50 mm) thick pre-moulded one-piece covers.
        - .1 Childers, Proto PVC, Speedline PVC, Zeston PVC, Fattal PVC.
  - 2.4.10 Pre-Formed Insulation Fittings:
    - .1 Shur-Fit, Keen Insulated Fittings, Moulded Acoustic Production or from insulation fabricators/manufacturers.
    - .2 Provide pre-molded elbows and fittings molded in two matching half sections of full thickness insulation as adjoining piping insulation. As an alternative, provide mitred sections of equivalent insulation in thickness, composition and density to that on straight pipe runs.
    - .3 Gouging out or thinning insulation thickness is not acceptable. Inserts, blanket or FSK duct wrap insulation is not acceptable and will be removed and replaced.
-

- .4 PVC and or aluminum coverings are to be molded to match fittings – alternatively oversized fittings and end caps may be used with mitred insulation sections, PVC and aluminum fitting covers are not considered to be vapour barriers unless completely vapour sealed.
  - .5 Canvas and mastic finish is required where codes do not allow PVC.
  - .6 KEEN Insulated fittings (available from Shur-Fit Products) for hot, cold, chilled, & HT fire protection systems for all grooved type pipe fittings and no further finish required in exposed indoor areas satisfy the above requirements.
  - .7 KEEN Insulated Fittings with Pacific Pressed fitting covers (available from Shur-Fit Products) for all outdoor applications of insulated grooved pipe satisfy the above requirements.
  - .8 KEEN Insulated Valve Covers (available from Shur-Fit Products) for all indoor insulated chilled water or domestic cold water systems satisfy the above requirements.
- 2.4.11 Pre-Insulated pipe supports:
- .1 Specified in section 23 05 29 Hangers and Supports for HVAC Piping and Equipment to be provided by mechanical contractor. Ensure mechanical contractor is aware of requirement for them to supply and install to avoid problems on site.
  - .2 Install Seismic Pro-Pipe insulated pipe (available from Shur-Fit Products) on all insulated lines requiring sway bracing or horizontal/vertical anchoring.
- 2.4.12 Insulated Victaulic, or other similar pipe system fittings:
- .1 KEEN Insulated Fittings (available from Shur-Fit Products) satisfy the above requirements.
- 2.4.13 Insulated balancing valves, strainers, or shut-off valves on DCW and CHWS/R lines:
- .1 KEEN Insulated Fitting service covers (available from Shur-Fit Products) satisfy the above requirements.
- 2.4.14 Insulated refrigerant lines or other outdoor piping or in areas exposed to physical abuse:
- .1 Pacific Pressed fitting cover (22ga (0.64mm)) Aluminum jacket. (Available from Shur-Fit Products)
  - .2 3M VentureClad Insulation Jacketing System classified as zero permeability. Installation shall be as per manufacturer's guidelines.

## **2.5 Scope of Insulation**

### **2.5.1 Heating Piping, Fittings and Valves:**

- .1 Insulate the following systems, unless otherwise noted:
  - .1 Hot water heating supply and return piping.
  - .2 Steam piping.
  - .3 Condensate piping.
  - .4 Boiler feed water piping.
  - .5 Antifreeze heating supply and return piping.
  - .6 Condenser water piping, outside building.
  - .7 Cooling tower sump, spray water, drain, overflow and chemical feed piping, outside building.
  - .8 Geo-exchange source side metal piping and components inside the building.
  - .9 Flexible branch connections to ceiling radiant heat panels.
  - .10 Hot gas piping.
  - .11 Trace heated drain lines from freezer and cold rooms.
- .2 DO NOT insulate the following, unless otherwise noted:
  - .1 Piping located within perimeter heating enclosures.
  - .2 Relief piping.
  - .3 Drain lines.
  - .4 Small branch risers to terminal heating elements just above floor level, from 6" (150 mm) below floor slab up to heating element.
  - .5 Flexible interconnections between ceiling radiant heating panels.
  - .6 Condenser water piping inside building.
  - .7 HDPE plastic geo-exchange piping inside the building.
- .3 Insulate the following valves and fittings if pipe is insulated using pre-formed fitting insulation sections, molded or mitred insulation to the full thickness insulation requirements. Duct wrap, fiber flexible insulation or inserts that do not match the same density and installed thickness of the pipe insulation schedule are not acceptable.:
  - .1 Elbows, tees, reducers.
  - .2 Valve bodies on the valves and check valves.
  - .3 Flanges.
  - .4 Strainers.
- .4 The following hot pipe fittings that operate at greater than 140°F (60°C) shall be coated with Thermolite - SG as per Manufacturer's specification to prevent skin burns:

- .1 Valves, NPS 2½" (65 mm) and smaller.
- .2 Valve bonnets.
- .3 Unions.
- .4 Drip legs.
- .5 Steam pressure reducing valves.
- .6 Steam traps.
- .7 Flexible connections.
- .8 Expansion Joints.
- .9 Check valve covers.

2.5.2 Chilled water piping, refrigerant piping, fittings and valves:

- .1 Insulate and vapour seal the following systems including the provision of vapour dams as indicated in Part 3 of this section, unless otherwise noted:
  - .1 Chilled water supply and return, including pump bodies, valve bodies and meters.
    - .1 Provide KEEN Insulated Valve Covers (available from Shur-Fit Products) or approved alternate w/removable port cover on all CHWS balancing valves.
  - .2 All refrigerant piping for comfort cooling.
  - .3 Refrigerant suction piping for product refrigeration.
  - .4 Antifreeze heat recovery piping.
- .2 DO NOT insulate the following, unless otherwise noted:
  - .1 Drain lines for sumps 60°F (15.6°C) and over.
- .3 Insulate and vapour seal the following fittings, if pipe is insulated. Duct wrap, fiber flexible insulation or inserts that do not match the same density and installed thickness of the pipe insulation schedule is not acceptable:
  - .1 Elbows, tees, reducers.
  - .2 Valves, (bodies and bonnets) except check valve covers.
  - .3 Strainers.
  - .4 Flanges
  - .5 Unions
  - .6 Chilled water pump bodies.

2.5.3 Plumbing pipes, fire protection pipes, fittings, valves:

- .1 Insulate the following systems, unless otherwise noted:

- .1 Domestic cold water system including meter body and booster pump bodies and including traps on handicapped lavatories.
- .2 Domestic hot water supply and recirculation piping.
- .3 Domestic tempered water supply and return.
- .4 Rainwater leaders and cast-iron fittings **for the full length from the roof drain body to connection to below grade storm sewer**, using preformed fibreglass pipe insulation complete with continuous vapour barrier. Roof drain bodies shall be insulated to same thickness as pipe.
- .5 All drains, lines, stacks, fire standpipes and sprinkler mains in unheated areas (insulation shall cover heat tracing cables).
- .6 Water valves, flanges, PRVs strainers, check valves.
- .7 Sprinkler/standpipe system from domestic water connection point to 16'-0" (4.8 m) downstream or to inlet alarm valve, whichever is less, using preformed fiberglass pipe insulation complete with continuous vapour barrier.
- .8 Interior irrigation/hose bibb supply piping.
- .2 DO NOT insulate the following, unless otherwise noted:
  - .1 Piping used exclusively for fire protection (unless in unheated spaces).
  - .2 Soil stacks, vents, etc.
  - .3 All special service piping, e.g., gas, compressed air, etc.
  - .4 Unions.
  - .5 Flexible connections or expansion joints (unless noted on drawings).
  - .6 Check valve covers.
  - .7 Strainer leg and basket covers.
  - .8 Flexible fixture connections.
- 2.5.4 Pipe penetrations through walls and floors:
  - .1 Material for stuffing, sealing and caulking of pipe penetrations shall be supplied and installed under this section.

## 2.6 **Pipe Insulation Schedule and Thickness Table**

- 2.6.1 'Inside' means within the heated building envelope. Everywhere else is considered outside and unheated space.

Service	Design Operating Temperature	PIPE SIZE				
		≤NPS 1 (25 mm)	NPS 1¼ (32 mm) to NPS 2 (50 mm)	NPS 2½ (65 mm) to NPS 4 (100 mm)	NPS 6 (150 mm) to NPS 8 (200 mm)	>NPS 8 (200 mm)
Chilled Water	≥40°F (≥4.4°C)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)
Condenser Water Inside Building	86°F (30°C) – 105°F (41°C)	None	None	None	None	None
Condenser Water Outside Building	86°F (30°C) - 105°F (41°C)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)
Cooling Tower Sump Spray Water Piping, Drain, Overflow, Chemical Feed (Outside Building)	90°F (32.2°C)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)
Refrigerant Suction and Hot Gas	<41°F (5°C)	1" (25 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)
Glycol Heat Recovery	50°F (10°C)	1" (25 mm)	1" (25 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)
Hot Water/Glycol Heating	105°F (40°C) -140°F (60°C)	1" (25 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)
	141°F (60°C) -200°F (93°C)	1½" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)
Hot Water/Glycol Heating	201°F (94°C) -250°F (120°C)	2½" (65 mm)	2½" (65 mm)	2½" (65 mm)	3" (80 mm)	3" (80 mm)
Heat Pump Water (inside building) (including geo- exchange side condenser water piping "Source Side")	15°F (-10°C) min to 55°F (13°C) max	1" (25 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)
Heat Pump Water (outside building) (where exposed and not buried)	30°F (-1°C) to 90°F (32°C)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)
Steam	up to 15 psi (103 kPa)	2½" (65 mm)	3" (80 mm)	3" (80 mm)	3" (80 mm)	3" (80 mm)

Service	Design Operating Temperature	PIPE SIZE				
		≤NPS 1 (25 mm)	NPS 1¼ (32 mm) to NPS 2 (50 mm)	NPS 2½ (65 mm) to NPS 4 (100 mm)	NPS 6 (150 mm) to NPS 8 (200 mm)	>NPS 8 (200 mm)
	(250°F (121°C))					
Steam	16 psi (110 kPa) to 120 psi (827 kPa) (350°F (176°C))	3" (80 mm)	4" (100 mm)	4½" (115 mm)	4½" (115 mm)	4½" (115 mm)
Steam Condensate (gravity)	212°F (100°C)	2½" (65 mm)	2½" (65 mm)	2½" (65 mm)	3" (80 mm)	3" (80 mm)
Steam Condensate (pumped)	180°F (82°C)	1½" (40 mm)	1½" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)
Generator Exhaust Pipe and Silencer	900°F (482°C)	3" (80 mm)	3" (80 mm)	3" (80 mm)	3" (80 mm)	3" (80 mm)
Generator Glycol Coolant Piping (inside building)	392°F (200°C)	2½" (65 mm)	2½" (65 mm)	2½" (65 mm)	2½" (65 mm)	2-½" (65 mm)
Continuous Cold Water Drainage	40°F (5°C)	½" (15 mm)	½" (15 mm)	½" (15 mm)	½" (15 mm)	½" (15 mm)
Drip Pan Drains - Unit Coolers	34°F (1°C) and above	None	None	None	None	None
Drip Pan Drains - Freezers	below 34°F (1°C)	½" (15 mm)	½" (15 mm)	½" (15 mm)	½" (15 mm)	½" (15 mm)
Drip Pan Drains - Freezers	heat traced	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)
Evaporator Drip Pan Drains	51°F (11°C) and above	None	None	None	None	None
Evaporator Drip Pan Drains, and Chilled Water Coil Drains	50°F (10°C) and lower	½" (15 mm)	½" (15 mm)	½" (15 mm)	½" (15 mm)	½" (15 mm)
Domestic Cold Water	Below 65°F (18°C)	½" (15 mm)	½" (15 mm)	½" (15 mm)	½" (15 mm)	½" (15 mm)
Domestic Hot and Tempered Water	105°F (40°C) - 140°F (60°C)	1" (25 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)	1½" (40 mm)

Service	Design Operating Temperature	PIPE SIZE				
		≤NPS 1 (25 mm)	NPS 1¼ (32 mm) to NPS 2 (50 mm)	NPS 2½ (65 mm) to NPS 4 (100 mm)	NPS 6 (150 mm) to NPS 8 (200 mm)	>NPS 8 (200 mm)
Supply and Recirculation	141°F (61°C) - 180°F (82°C)	1½" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)
Self-Regulated Heat Traced DHW Piping <sup>1</sup>	105°F (40°C) - 140°F (60°C)	1½" (40 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)	2" (50 mm)
Buried and Exterior Rainwater Storm Drainage	90°F (32.2°C)	None	None	None	None	None
Above Grade Interior Rainwater Storm Drainage including interior roof drain body.	Below 65°F (18°C)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)	1" (25 mm)

Note 1: Insulation for self-regulated heat traced DHW piping shall comply with this table or manufacturer's recommendation (whichever is more stringent).

Note 2: All piping forming part of the HVAC and plumbing systems and located outside the building envelope shall be insulated at a minimum of 2x thickness above. (This includes parkades and all/any unheated spaces within the building.)

### 3. EXECUTION

#### 3.1 Application

- 3.1.1 Apply insulation to piping only after tests have been made and systems accepted.
- 3.1.2 Apply insulation and insulation finish so finished product is smooth in finish, with the longitudinal seams concealed from view. Apply piping insulation materials, accessories and finishes in accordance with Manufacturer's recommendations. Pre-formed or molded pipe fitting insulation sections shall be used on all elbows, tees and pipe joint/flange fittings. Where pre-formed or molded insulation sections cannot be used or sourced, insulate to BCICA standards, including oversize insulation at mechanical pipe joints or mitred elbows.
  - .1 Provide KEEN Fabricated Fittings (available from Shur-Fit Products) for grooved pipe fittings where available.
- 3.1.3 On piping NPS 1 (25 mm) and larger with insulation and vapour barrier, install high density insulation above hanger shield. Insert to

be slightly longer than length of shield. Maintain integrity of vapour barrier over full length of pipe without interruption at sleeves, fittings and supports. Refer to Section 23 05 29.

- .1 Provide Pro-Pipe supports (available from Shur-Fit Products).
  - .2 Insulator shall back insulate supporting hardware 4X insulation thickness and vapor seal when pipe support penetrates the vapour barrier.
- 3.1.4 Insulation and vapour barrier shall be continuous through both rated and non-rated separations.
- 3.1.5 Mechanical to provide valve stem extensions on all insulated pipe so insulator can provide pipe covering or molded fittings to full thickness.
- 3.1.6 Provide high density insulation and shields at all riser clamps/seismic sway bracing connection locations for all cold piping with continuous vapour barrier.
- .1 Provide Seismic Pro-Pipe supports (available from Shur-Fit Products).

### **3.2 Insulation Termination Points**

- 3.2.1 Cold Application: All fittings shall be insulated. Terminate insulation 3" (80 mm) back from uninsulated connections to provide working clearance for serviceable locations and terminate insulation at 90° and finish with reinforced scrim cloth vapour barrier mastic system/sealer system extending over ASL and pipe/equipment connections. Cover onto pipe and over the insulation vapour barrier.
- 3.2.2 Hot Applications: As above or a breathable type mastic or sealer is acceptable.
- 3.2.3 Cut back insulation at 45° and finish with silicone caulking sealant around base of thermometer wells, pressure gauges, flow switches and pressure and control sensors.

### **3.3 Vertical Risers**

- 3.3.1 On vertical pipe over 3" (80 mm) provide insulation supports welded or bolted to pipe, directly above lowest pipe fitting. Thereafter, locate on 15'-0" (4.5 m) centres.

### **3.4 Hot Application 80°F (26.7°C) and Over**

- 3.4.1 Piping:
- .1 Install medium temperature pipe insulation with integral jacket to pipe and hold in place by stapling flap, with spreading staples at 3" (80 mm) centres. Pipe insulation with integral self-sealing jacket will not require additional fastening.

- .2 Install strips of vapour barrier jacket over butt joints and secure with reinforcing tape and mastic.
- 3.4.2 Fittings:
  - .1 Insulate fittings, to thickness of adjacent pipe insulation, with sections of pipe insulation mitred to fit tightly, or with pre-formed insulation fittings (Shur-Fit) or from insulation fabricator.
  - .2 Provide KEEN Insulated Fittings (available from Shur-Fit Products) for insulated grooved pipe fittings.
- 3.4.3 Valves, Strainers:
  - .1 Insulate valve bodies and strainers with fitted pipe insulation, or mitred blocks to thickness of adjacent pipe insulation or insulate with pre-formed insulation fittings (Shur-Fit) or from insulation fabricator. Valves, if not integral, shall be provided with stem extension to allow for proper insulation thickness by Mechanical Contractor. Stem extension to stay stationary to ensure vapor barrier seal is not broken when valve is exercised. Drains, blow-off plugs and caps shall be left uncovered.
  - .2 Provide KEEN Insulated Fittings (available from Shur-Fit Products) for insulated pipe fittings.
- 3.4.4 Flanges and Victaulic Fittings:
  - .1 Do not insulate flanges or grooved couplings on condenser/heat pump water piping inside building.
  - .2 Insulate flanges on condenser/heat pump water piping outside building.
  - .3 Insulate flanges with oversized pipe insulation or mitred blocks to thickness of adjacent pipe insulation. Insulation to overlap adjoining insulation at least 3" (80 mm).
  - .4 Insulate using pre-formed fitting, molded or mitred to the full thickness insulation requirements. Duct wrap, fiber flexible insulation or inserts that do not match the same density and installed thickness of the pipe insulation schedule is not acceptable.

### **3.5 Cold Application 50°F (10°C) and Less**

- 3.5.1 Piping:
  - .1 Install low/medium temperature pipe insulation with integral vapour barrier jacket to pipe and hold in place by securing jacket flap. Seal flaps with vapour barrier adhesive. Pipe insulation with integral self-sealing vapour barrier jacket does not require additional fastening.
  - .2 Install strips of vapour barrier jacket over butt joints with vapour barrier adhesive. Over wrap butt strips by 50% for

insulation OD 12" (300 mm) and above apply strip on 10" (250 mm) centres for additional securement. (Note: accessory items such as, but not limited to, thermometers, probes, valves, etc. shall be insulated and sealed. Hangers in contact with the pipe shall be back insulated from where they carry the pipe to 4 times the insulation thickness and vapour sealed).

- .3 Install vapour dams on chilled water piping over 2½" (65 mm) as indicated in the NAIMA Chilled Water Installation Guide 2015. Mastic coat insulation ends at every fourth section of insulation on straight pipe and allow to dry before piping is insulated and vapour sealed. Extend the mastic onto the pipe and extend the mastic up and onto the ASJ jacket. Apply 1" (25 mm) wide blue tape to indicate location of vapour dams. Vapour barrier tape shall provide minimum .02 perm vapour seal.

#### 3.5.2 Fittings:

- .1 Insulate fittings to thickness of adjacent pipe insulation with section of pipe insulation mitred to fit tightly, or pre-formed or moulded insulation fittings (Shur-Fit), apply reinforcing membrane embedded barrier coating and apply finish vapour barrier coating.
- .2 Provide KEEN Insulated (available from Shur-Fit products) fittings for insulated grooved pipe fittings.
- .3 Flexible insulation such as blanket inserts, flexible fibre or duct wrap will not be acceptable on cold piping.
- .4 Install vapour dams on chilled water fittings as indicated in the NAIMA Chilled Water Installation Guide 2015. Mastic coat insulation ends at all sides of all fittings and allow to dry before fittings are insulated and vapour sealed. Extend the mastic onto the fitting and extend the mastic up and onto the ASJ jacket. Apply 1" (25 mm) wide blue tape to indicate location of vapour dams. Vapour barrier tape to provide minimum .02 perm vapour seal.
- .5 All heat traced sanitary, storm and drainage piping, to cold pipe insulation thickness schedule.

#### 3.5.3 Valves, Strainers:

- .1 Insulate pump bodies, valve bodies, bonnets and strainers with fitted pipe insulation or mitred blocks to the same thickness as adjacent pipe insulation, apply reinforcing membrane embedded in barrier coating or insulate with pre-formed insulation fittings (Shur-Fit) or from insulation fabricator complete with vapour barrier. Valves, if not integral, shall be provided with stem extension to allow for proper insulation thickness by Mechanical Contractor. Stem

extension to stay stationary to ensure vapor barrier seal is not broken when valve is exercised. Drains, blow-off plugs and caps shall be left uncovered.

3.5.4 Unions, Flange and Victaulic Fittings:

- .1 Insulate cold unions and flanges with oversized pipe insulation or mitred blocks to thickness of adjacent pipe covering, apply reinforcing membrane embedded in barrier coating and final coating of vapour barrier mastic.

**3.6 Anti-Sweat Coating**

3.6.1 Coat with anti-sweat coating - "No Sweat" by Robson Thermal Mfg. Ltd. or approved alternate, the following uninsulated cold surfaces:

- .1 Connect surfaces of thermometers, pressure gauges, flow switches, controllers, etc.

3.6.2 The coating thickness shall be recommended by coating Manufacturer for system operation conditions.

**3.7 Pipe Insulation Finishes**

3.7.1 "Concealed" insulation in horizontal and vertical service spaces will require no further finish.

3.7.2 "Concealed" pipe insulation in damp locations, e.g., pipe trenches, shall have vapour barrier jacket, vapour sealed.

3.7.3 "Exposed" flexible insulation shall be painted with heavy brush coating of foam plastic white insulation coating.

3.7.4 Where KEEN Elastomeric Fittings and valve covers (available from Shur-Fit Products) have been used, no further finish is required.

3.7.5 "Exposed" insulation inside building shall be finished as follows:

- .1 Premium Finish (PVC Covers) PF-5 BCICA Standard:
  - .1 Over factory applied integral all-service type jacket on pipe insulation, apply PVC jacket.
  - .2 Over insulated fittings apply PVC fitting covers. Over insulated valve bodies, valves bonnets, strainers and flanges apply purchased PVC covers or field fabricate from PVC sheeting secured with solvent bonding cement.
- .2 Premium Finish with Canvas Wrap: BCICA PF-2 standard finish fabric with two coats of fabric coating. Canvas re-covering shall be applied with a minimum overlap of 1" (25 mm), and finished with two coats of flexible fabric paint, white.
- .3 Economy Finish (PF-3 BCICA Standard):
  - .1 Apply pipe insulation with integral all-service type jacket. Cover longitudinal and circumferential joints with

jacket finishing tape neatly applied. Alternately, secure jacketing longitudinal joint using integral self-sealing lap. Cover circumferential joints with jacket finishing butt strips. Over wrap strips by 50%. For insulation OD 12" (300 mm) apply trips on 10" (250 mm) centres for additional securement. PVC 0.02" (0.50 mm) thick should not be used as vapour barrier alone. Should have 'ASJ' or mastic system under it. Over insulation on short pipe runs and piping adjacent to fittings, valves, etc., jacket to be field applied.

- .2 Over insulated fittings apply tack coat of vapour barrier mastic and embed reinforcing membrane and cover with same mastic. Over insulated valve bodies, valve bonnets, strainers and flanges, apply all-service jacketing using necessary fastenings and jacket finishing tape and with reinforced mastic system on irregular surfaced. Alternatively install plain aluminum foil tape with a perm rating of .002 or better.

3.7.6 "Exposed" outdoor insulation **including in the parking garage** shall be finished as follows:

- .1 Insulation shall have vapour barrier jacket.
- .2 Over pipe insulation jacket apply aluminum weather protecting jacket. The longitudinal seam shall be located to shed water. Secure the jacket using necessary metal banding on approximately 10" (250 mm) centres and at the overlaps. Screws are not permitted on cold operating systems.
- .3 Over insulated fittings, valve bodies, valve bonnets, strainers and flanges, apply metal jacket or pre-formed metal fittings to provide complete jacket system. Secure with necessary fastenings.
- .4 Seal outdoor jacketing watertight.

3.7.7 Provide Pacific Pressed fitting covers (available from Shur-Fit Products) for insulated grooved pipe. On outdoor insulated pipe fittings PVC is not acceptable due to exposure to weather and UV rays.

3.7.8 Provide Pacific Pressed fitting covers (available from Shut-Fit Products) on outdoor insulated refrigerant lines. On outdoor insulated pipe fittings PVC is not acceptable due to exposure to weather and UV rays.

### **3.8 Refrigeration Suction Piping Outside Building**

3.8.1 Install flexible foamed elastomeric or flexible closed cell pre-formed piping insulation. Secure longitudinal and butt joints with adhesive.

Insulate fittings and components. To obtain the specified thickness, apply in layers with staggered joints.

3.8.2 Finish with flexible elastomeric or flexible closed cell insulation coating.

3.8.3 Re-cover outdoor exposed insulation with Aluminum jacket (Pacific Pressed (available from Shur-Fit Products) fitting covers.

**3.9 Firestopping and Smoke Seals**

3.9.1 Refer to Section 23 05 05 Firestopping for firestop requirements.

**3.10 Insulation Packing of Pipe Sleeves**

3.10.1 Tightly pack space between pipe sleeves and pipe or between pipe sleeve and pipe insulation with mineral wool insulation - Thermal Ceramics "Cerafibre" or Carborundum "Fibrefrac" to full depth of sleeve to prevent transmission of sound and/or passage of smoke.

**3.11 Insulation for Radiant Ceiling Panels**

3.11.1 Provide and install 3" (80 mm) thick 0.75 lb/ft<sup>3</sup> (12 kg/m<sup>3</sup>) flexible glass mineral wool insulation on top of hot water ceiling radiant heating panels. Insulation shall be faced on both sides with FSK (Foil, Scrim, Kraft) facing with edges sealed.

3.11.2 Application:

- .1 Cut insulation to fit dimension of back of panel and lay insulation on top of panel.
- .2 Insulation shall extend from edge to edge.
- .3 Insulation shall cover small piping located directly above the panel

**END OF SECTION**

---

1. **GENERAL**

1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

1.2 **Quality Assurance**

- 1.2.1 Commissioning shall be executed in accordance with intent of ASHRAE Guideline 1.1 – 2007 “HVAC and R Technical Requirements for the Commissioning Process”.

1.3 **General**

- 1.3.1 Be responsible for the performance and commissioning of equipment supplied in Mechanical. Commissioning is process of advancing installation static completion to full working order in accordance with contract documents and design intent. It is activation of completed installation.
- 1.3.2 In consultation with General Contractor, ensure sufficient time is allowed and fully identified on construction schedule for proper commissioning of mechanical systems.

2. **PRODUCTS: NOT USED**

3. **EXECUTION**

3.1 **Commissioning and Demonstration**

- 3.1.1 Submit schedule for commissioning phase of work. Schedule shall show:
- .1 Equipment start-up schedule.
  - .2 Submission dates for documents required prior to substantial completion.
  - .3 Timing of various phases of commissioning, testing, balancing and demonstration process.
- 3.1.2 Commissioning is concluded when air and water systems have been balanced and installation is in working order and acceptable for use. Work will include the following:
- .1 Balancing of air systems as specified in Section 23 05 93.
  - .2 Balancing of liquid systems as specified in Section 23 05 93.
  - .3 Adjust vibration isolators and earthquake restraints for optimum performance.

- 
- .4 Verification and certifications of sealing of HVAC penetrations through fire separations (rated and non-rated) and sound separations.
  - .5 Verification of water tightness of roof and exterior wall penetrations.
  - .6 Verification that coil drain pans operate.
  - .7 Set up automatic control valves/dampers and automatic temperature control devices.
  - .8 Testing and debugging of DDC System.
  - .9 Set up and test alarm and protective devices.
  - .10 Power failure test with emergency generator start-up.
  - .11 Calibration and adjustment of smoke venting and pressurization systems.
  - .12 BAS Trend Logging of temperature and humidity in specified areas.
- 3.1.3 At conclusion of commissioning, demonstrate operation of systems to Consultant and to Owner's Operating Staff. For demonstration and instruction to Operating Staff requirements, refer to following clause and Controls Systems Specification.
- 3.1.4 The verification process shall include the demonstration of the following:
- .1 Ease of access provided for servicing coils, motors, drives, fusible link fire dampers, smoke dampers, control dampers and damper operators.
  - .2 Location of and opening and closing of access panels.
  - .3 Operation of automatic controls dampers and automatic temperature control devices.
  - .4 Operation of alarm and protective devices.
  - .5 Proper response of mixing boxes and air valves to thermostats and volume adjustment controls.
  - .6 Operation of smoke dampers and smoke pressurization and removal provisions.
  - .7 Operability of randomly selected fire dampers.
  - .8 Noise level from typical mixing boxes and air valves under extreme operating conditions.
  - .9 Operation of equipment and systems under each mode of operating, and failure, including:
    - .1 DDC control features.
    - .2 Automatic controls including air compressors.
    - .3 Boilers and associated gas/oil fuel systems.
    - .4 Chiller(s) and cooling tower(s).

- 
- .5 Packaged air conditioners.
  - .6 Refrigeration systems.
  - .7 Heat recovery systems.
  - .8 Heat exchangers/immersion heaters.
  - .9 Pumps.
  - .10 Cabinet unit heaters.
  - .11 Unit heaters.
  - .12 Fans.
  - .13 Coils.
  - .14 Humidifiers.
  - .15 Tanks - domestic hot water, blowdown, condensate and expansion.
  - .16 Steam pressure reducing stations.
  - .17 Deaerator.
  - .18 Condensate return units.
  - .10 Energy meters for natural gas sub-metering, hydronic energy meters, water sub-meters, and electrical sub-meters to be tested, calibrated and verified in accordance with the Manufacturer's requirements and Government of Canada Weights and Measures Requirements.
- 3.1.5 At completion of the commissioning, testing, balancing and demonstration, submit the following to Consultant:
- .1 Letter certifying that work specified is complete, clean and operating in accordance with specification and drawings.
  - .2 Completed copies of commissioning check sheets, copies of start-up reports from specialty Contractors and Vendors and functional performance test sheets.
  - .3 Record drawings as specified.
  - .4 TSSA Boiler Inspection Department approval of boiler, pressure vessels and pressure piping installation.
  - .5 Fire Commissioner's approval of fuel oil installations.
  - .6 TSSA Gas Inspection Department approval of boiler and gas firing.
  - .7 List of alarm and protective devices tested, with the final operating settings.

### **3.2 Commissioning and Demonstration**

- 3.2.1 Provide services of approved independent specialist firm to coordinate commissioning process specified under this division and those items of other Divisions which interact with work of this Division, including complete life safety and fire protection system.

- 
- 3.2.2 Cooperation of all trades is essential for efficient and planned process. Team comprising the following is recommended:
- .1 Commissioning Coordinator.
  - .2 General Contractor.
  - .3 Mechanical Contractor's Supervisor.
  - .4 Mechanical Consultant.
  - .5 Building Owner's Representative.
  - .6 Mechanical Trades, especially Controls Contractor and Balancing Agency.
  - .7 Electrical.
- 3.2.3 Prepare commissioning statement for each of four phases indicated. Phases are as follows:
- .1 PHASE 1 - System readiness.
  - .2 PHASE 2 - System start-up, testing, balancing, etc.
  - .3 PHASE 3 - Verification of system performance.
  - .4 PHASE 4 - Demonstration and instruction.
- 3.2.4 Each phase is applicable to each major and/or separate system making up work in Mechanical plus Electrical interface as applicable.
- 3.2.5 Regular meetings shall be held during commissioning process. Minutes of meetings shall be issued to Contractors involved, Consultant and Owner's Representative.
- 3.2.6 Plan work to be specific in respect of personnel, schedule, review and laboratory tests.
- .1 Personnel: Assign direct overall charge of commissioning to commissioning coordinator fully qualified through practical experience and comprehensive knowledge of interactive nature of building systems and controls to understand complete system and to be available to carry project through to total completion. Person shall be responsible for Commissioning, Demonstration to Consultant and Owner and Certifications of Substantial and Total Performance.
  - .2 Schedule: Submit schedule, as part of construction schedule, for commissioning phase of work. Schedule shall show:
    - .1 Equipment start-up schedule.
    - .2 Submission dates for various documents required prior to substantial completion.
    - .3 Timing of various phases of commissioning, testing, balancing and demonstration process.
  - .3 Review: Within three months of commencing project work, person having direct overall charge of commissioning shall

---

review design intent and intended commissioning procedures with Consultant. Six months prior to date of scheduled substantial completion, submit detailed plan that addresses entire approach to commissioning process. Plan should be prepared specifically for project. Plan should include the following components:

- .1 Name and qualifications of commissioning coordinator/agent.
- .2 Itemized check lists for readiness, start-up and operational verification of equipment and systems.
- .3 Outline of proposed method of notification and correction of interim operational deficiencies operational deficiencies.
- .4 Outline of proposed demonstration and operator training program.
- .4 Troubleshooting: Where problems become apparent during commissioning, work at identification and resolution of these problems. Basic functions in trouble shooting are:
  - .1 What - Identification and definition of problem.
  - .2 Why - Determination and evaluation of causes.
  - .3 When - Determine time available to resolve problem.
  - .4 Involve Consultant in review of problem and proposed resolution.
  - .5 Coordinate remedial action with appropriate parties.
  - .6 Evaluate effectiveness of remedial action.

**END OF SECTION**

## **1. GENERAL**

### **1.1 Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.
- 1.1.2 Refer to Section 23 05 49 for required seismic restraint of piping.

### **1.2 Reference Standards**

- 1.2.1 Carry out piping system work in accordance with ASME/ANSI B31.9 code and CSA B51.
- 1.2.2 Grooved joint piping components shall conform to CSA B242 code.

### **1.3 Regulatory Requirements**

- 1.3.1 Components, products and fabrication techniques shall be provided in compliance with Regulations and Requirements of Ontario Regulation Boiler and Pressure Vessels, under the Technical Standards and Safety Act.
- 1.3.2 Installation, repair or alternations to pressure piping systems shall be performed by licensed Contractors Welders, certified for work in accordance with Regulations and Requirements of Ontario Regulation Boiler and Pressure Vessels, under the Technical Standards and Safety Act.
- 1.3.3 Field welding to be in accordance with procedures of CSA-W117.2 and current edition of ASME/ANSI B31.1 or B31.9 Code.

### **1.4 System Pressure Ratings**

- 1.4.1 Pipe Fittings:
  - .1 Piping system 125 psi (860 kPa) or less operating pressure – 125 psi (860 kPa) rating.
  - .2 Piping systems 126 psi (870 kPa) to 250 psi (1,725 kPa) operating pressure – 250 psi (1,725 kPa) rating.
- 1.4.2 Valves:
  - .1 Suitable for maximum system operating temperature and pressure.
  - .2 Triple duty valves (combination 3 in 1) at pump stations are prohibited.

### **1.5 Shop Drawings**

- 1.5.1 Submit detailed shop drawings of valves in accordance with Section 23 05 00. Shop drawings shall indicate make, model, location, type, size and pressure rating and Provincial CRN number.

- 1.5.2 Grooved joint couplings and fittings shall be shown on drawing and product submittals and shall be specifically identified with the applicable style or series designation.

## 2. **PRODUCTS**

### 2.1 **General**

- 2.1.1 Products shall be registered with regulatory authority in accordance with CSA B51.

### 2.2 **Pipe**

#### 2.2.1 Steel Pipe:

- .1 To NPS 10 (250 mm), Schedule 40 to ASTM A53 Grade B.
- .2 NPS 12 (300 mm) and over,  $\frac{3}{8}$ " (9.5 mm) wall thickness to ASTM A53 Grade B.
- .3 For the following system:
  - .1 Hot water heating.
  - .2 Glycol heating.
  - .3 Glycol heat recovery.
  - .4 Chilled water.
  - .5 Chemical feed.
  - .6 Heat pump water.
  - .7 Relief valve vents.
  - .8 Condenser water.
  - .9 Pressure drains.

#### 2.2.2 Stainless Steel Pipe: Schedule 10S to ASTM A312, Type 304/304L, suitable for and approved for use with Vic-Press 304™, Viega MegaPress or grooved.

- .1 . For the following system:
  - .1 Hot water heating.
  - .2 Glycol heating.
  - .3 Glycol heat recovery.
  - .4 Chilled water.
  - .5 Chemical feed.
  - .6 Heat pump water.
  - .7 Relief valve vents.
  - .8 Condenser water.
  - .9 Pressure drains.

- .10 Condensate drain lines.
- 2.2.3 Copper Pipe: to ASTM B88M-86, Type K, or L hard drawn copper tubing.
  - .1 Type L, hard drawn:
    - .1 Pressure drains to NPS 2 (50 mm).
    - .2 Domestic hot water pre-heat.
  - .2 Type L hard drawn may be used as an alternative to steel piping for the following systems:
    - .1 Hot water heating.
    - .2 Chilled water.
    - .3 Condenser water – open or closed circuit.
  - .3 Type K, hard drawn:
    - .1 Air vent overflow.
- 2.2.4 PVC Pipe: ASTM D1785, Schedule 40, and Schedule 80 for sizes 8" (200 mm) and larger or ASTM D2241, SDR 21 or 26:
  - .1 Fittings: ASTM D2466 or ASTM D2467, PVC.
  - .2 Joints: ASTM D2855, solvent weld.
  - .3 Grooved: Victaulic PGS-300 couplings and fittings.
  - .4 Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.

## 2.3 **Pipe Joints – Steel Piping**

- 2.3.1 NPS 2 (50 mm) and under: screwed fittings, except where otherwise noted, with Teflon tape and RectorSeal Teflon paste or pipe dope, Viega MegaPress in applicable applications.
- 2.3.2 NPS 2 (50 mm) and under: plain end pipe, QuickVic™ SD Installation-Ready™ Fittings for Carbon Steel Pipe. Pipe end preparation and installation training will be provided by manufacturer's rep.
- 2.3.3 NPS 2½ (65 mm) and over: welding fittings and flanges to CSA W47.1.
- 2.3.4 Flanges: raised face, steel weld neck, lap or back-welded slip on type. Use flat face for attachment to cast iron valves.
- 2.3.5 Victaulic Vic-Press and Viega MegaPress fittings with EPDM O-rings may be used on closed-circuit hot water heating up to 230°F (110°C) working temperature, and 200 psi (1,380) working pressure, glycol heating, glycol heat recovery, chilled water, heat pump water, condenser water-closed circuit systems.
- 2.3.6 Couplings to be installation-ready complete with pre-lubricated centre leg gaskets. Rigid couplings NPS 2 (50 mm) through NPS 12 (300 mm) to have shift limiting slant pad design, with torque

absorber, one-touch bolt tightening and bolt pad to bolt pad assembly. Couplings to have wide width Flush Seal Gaskets NPS 14 (350 mm) and larger with coupling housings that have lead-in chamfer on housing key section to mate with wedge-shaped grooves. Couplings will have two (2) symmetrical halves with no other loose parts. Couplings will have bolts of equal length and diameter.

- .1 Rigid Type NPS 2 (50 mm) to NPS 12 (300 mm): Installation-Ready, for installation without field disassembly, with grade EHP gasket rated to 250°F (120°C). Victaulic Style 107.
  - .2 Flexible Type: For use in locations where vibration attenuation and stress relief are required. Three flexible couplings may be used in lieu of flexible connector provided it meets vibration isolation requirements. The couplings shall be placed in close proximity to the source of the vibration. Victaulic Installation-Ready Style 177 to 250°F (120°C) for NPS 2 (50 mm) to NPS 8 (200 mm) or Victaulic Style 77 to 230°F (110°C) for NPS 10 (250 mm) to NPS 12 (300 mm) .
  - .3 NPS 14 (350 mm) and Larger: Victaulic AGS two-segment coupling series with lead-in chamfer on housing key and wide width Grade "E" FlushSeal® gasket.
    - .1 Rigid Type: Housing key shall fill the wedge shaped AGS groove and provide rigidity and system support and hanging in accordance with ANSI B31.1 and B31.9. Victaulic Style W07.
    - .2 Flexible Type: Housing key shall fit into the wedge shaped AGS groove and allow for linear and angular pipe movement. Victaulic Style W77.
  - .4 Flange Adapter: Flat face, ductile iron housings with elastomer pressure responsive gasket, for direct connection to ANSI Class 125 or 150 flanged components. Victaulic Style 741/W741.
    - .1 For connections to Class 300 flanged components in sizes to NPS 12 (300 mm), Victaulic Style 743.
- 2.3.7 Flange Bolts and Nuts, carbon steel: to ANSI B18.2.1 and ANSI B18.2.2.
- 2.3.8 Flange Gaskets:
- .1 Up to 125 psi (860 kPa) system pressure – non-asbestos gaskets for mating surfaces.
  - .2 Over 125 psi (860 kPa) system pressure – stainless steel spiral wound non-asbestos gaskets.

## **2.4 Pipe Fittings – Steel Pipe**

- 2.4.1 Pipe fittings, screwed, flanged or welded:

- .1 Cast-iron pipe flanges: Class 125 to ANSI B16.1.
  - .2 Cast-iron screwed fittings: Class 125 to ANSI B16.3.
  - .3 Steel pipe flanges and flanged fittings: to ANSI B16.5.
  - .4 Steel butt-welding fittings: to ANSI B16.9a.
  - .5 Unions, malleable iron ground joint type: Class 150 to ANSI B16.3
- 2.4.2 Fittings for roll grooved piping: Ductile iron to ASTM A536; wrought steel to ASTM A234 Grade WPB; or factory fabricated from steel pipe conforming to ASTM A53.
- .1 All grooved joint couplings, fittings, valves, and specialties shall be Victaulic.
  - .2 Grooving tools shall be of the same Manufacturer as the grooved components.
  - .3 All gasket coupling housings, fittings, valve bodies and discs shall be date stamped for quality assurance and traceability.
  - .4 Where grooved or press products are used, all products and valves shall be by the same manufacturer.

## **2.5 Pipe Joints – Stainless Steel Pipe**

- 2.5.1 Victaulic Vic-Press 304™ fittings with HNBR O-rings may be used on hot water heating up to 210°F (98°C) working temperature, domestic water, glycol heating, glycol heat recovery, chilled water, heat pump water, condenser water-closed circuit systems. Vic-Press system shall be rated to 500 psi (3,450 kPa).
- 2.5.2 Shop t-drill fittings are acceptable with headers having final design pressure and name permanently marked on each header.
- 2.5.3 No in-position welding of stainless steel pipe.

## **2.6 Pipe Joints – Copper Pipe**

- 2.6.1 All sizes soldered or brazed as specified in Part 3 Execution of this Section.
- 2.6.2 CTS 2 to CTS 8 – Victaulic Style 607 installation-ready rigid couplings with pre-lubricated center leg gaskets and housings with angle bolt pads to provide rigid joint and grade “EHP” gasket for temperature range -30°F (-34°C) to 250°F (120°C) may be used on hot water heating, heat pump, chilled water, and condenser water systems.
- .1 Couplings shall be manufactured to copper-tube dimensions. (Flaring of tube or fitting ends to accommodate alternate sized couplings is not permitted.)

## **2.7 Pipe Fittings – Copper Pipe**

- 2.7.1 Cast bronze: to ANSI B16.18.

- 2.7.2 Wrought copper bronze: to ANSI B16.22.
- 2.7.3 Roll grooved (non-flared) fittings by Victaulic.

## **2.8 Flanges – Copper Pipe**

- 2.8.1 Brass or bronze: to ANSI B16.15.
- 2.8.2 Cast-iron: to ANSI B16.4.
- 2.8.3 Victaulic Style 641 Flange Adapter.

## **2.9 Valves General**

- 2.9.1 Valves shall be of one Manufacturer where possible.
- 2.9.2 Provide valves with Manufacturer's name and pressure rating clearly marked on outside of body. Valves shall be suitable for service used.
- 2.9.3 All castings used for valve bodies shall be date stamped for quality assurance and traceability.
- 2.9.4 Valves shall have current Provincial CRN number.
- 2.9.5 Valves to be provided with stem extension to allow for proper insulation thickness. Stem extension to stay stationary to ensure vapor barrier seal is not broken when valve is exercised.
- 2.9.6 Include lock shield handles where shown or noted.
- 2.9.7 Provide valves located over 7'-0" (2.1 m) from floor in equipment room areas with chain operated sheaves. Extend chains to 6'-0" (1.8 m) above floor and hook to clips arranged to clear walking aisles.
- 2.9.8 Use non-rising stem valves where there is insufficient clearance for stem to rise.
- 2.9.9 Butterfly valves installed to permit removal of equipment, shall be threaded full lug type or grooved. Wafer type if additional pair of flanges is installed. The stem on butterfly valves shall be offset from the disc centerline to provide full 360-degree circumferential seating.
- 2.9.10 Isolation valves with rubber encapsulated discs or body will not be accepted for Hydronic water applications.

## **2.10 Gate Valves**

- 2.10.1 NPS 2 (50 mm) and Under, Screwed:
  - .1 Bronze body, rising stem, solid wedge disc, union or screwed bonnet.
  - .2 Acceptable Products:
    - .1 125 psi (860 kPa) – Crane 1700, Kitz 24, Nibco T-134, Toyo 293.
- 2.10.2 NPS 2 (50 mm) and Under, Soldered:

- .1 Bronze body, rising stem, solid wedge disc, screwed bonnet.
  - .2 Acceptable Products:
    - .1 200 psi (1,380 kPa) WOG – Crane 1700S, Kitz 44, Nibco S-134, Toyo 299.
- 2.10.3 NPS 2½ (65 mm) and Over, Flanged:
- .1 Cast-iron body, rising stem, OS and Y, solid wedge disc, bronze trim, bolted bonnet.
  - .2 Acceptable Products:
    - .1 125 psi (860 kPa) – Crane 465-½, Kitz 72, Nibco F-617-0, Toyo 421A.

## 2.11 **Globe Valves**

- 2.11.1 NPS 2 (50 mm) and Under, Screwed:
- .1 Bronze body, rising stem, renewable composition or bronze disc, union bonnet.
  - .2 Acceptable Products:
    - .1 125 psi (860 kPa) – Crane 1703, Kitz 03, Nibco T-235-Y, Toyo 220.
- 2.11.2 NPS 2 (50 mm) and Under, Soldered:
- .1 Bronze body, rising stem, renewable composition or bronze disc, screwed bonnet.
  - .2 Acceptable Products:
    - .1 200 psi (1,380 kPa) W.O.G. – Crane 1703S, Kitz 10, Toyo 212.

## 2.12 **Butterfly Valves**

- 2.12.1 NPS 2½ (65 mm) and Over - Flanged:
- .1 Ductile iron body with ductile iron plated or bronze disc, stainless steel stem and extended neck to clear minimum of 2" (50 mm) thick insulation.
  - .2 Threaded full lug type or wafer type (with or without integral flanges).
  - .3 Resilient EPT or EPDM seat.
  - .4 Operators (unless otherwise specified in Controls Section):
    - .1 NPS 6 (150 mm) and under – lever handle with minimum 10 position ratchet and disc position indicator.
    - .2 NPS 8 (200 mm) and over – worm gear operator.
  - .5 Acceptable Products:

- 
- .1 150 psi (2,070 kPa) WOG – Crane, Demco, Keystone, Kitz, Toyo, Nibco WD-2100 or LD-2100, MA Stewart 'D' Series, RWV 918 Series.
- 2.12.2 NPS 2 (50 mm) and Over – Steel Roll Grooved Piping:
- .1 Ductile iron body.
  - .2 Disc:
    - .1 Ductile Iron with Electroless nickel coating for NPS 2 (50 mm) through NPS 12 (300 mm).
    - .2 Aluminum bronze for NPS 2 (50 mm) through NPS 6 (150 mm).
    - .3 Stainless steel for NPS 2 (50 mm) through NPS 12 (300 mm).
    - .4 Ductile Iron with black PPS coated for NPS 14 (350 mm) through NPS 24 (600 mm).
  - .3 Seal:
    - .1 NPS 12 (300 mm) and Smaller: Pressure-responsive Grade 'E' – EPDM.
    - .2 NPS 14 (350 mm) and Larger: Disc-mounted Grade 'E' – EPDM.
  - .4 Stainless steel stem. (Stem shall be offset from the disc centreline to provide full 360-degree circumferential seating.)
  - .5 Grooved ends.
  - .6 Operators (unless otherwise specified in the Controls Section):
    - .1 NPS 8 (200 mm) and under – lever handle with minimum 10 position ratchet and disc position indicator.
    - .2 NPS 10 (250 mm) and over – worm gear operator.
  - .7 Acceptable Products:
    - .1 300 psi (2,070 kPa) WOG –
      - .1 NPS 12 (300 mm) and Smaller: Victaulic MasterSeal™.
      - .2 NPS 14 (350 mm) and Larger: Victaulic AGS-Vic300.
- 2.12.3 NPS 2-½ (65 mm) through NPS 6 (150 mm) – Copper roll grooved (non-flared) piping:
- .1 Cast brass body.
  - .2 Disc: Aluminum-bronze.
  - .3 Stem: Stainless steel, offset from the disc centerline to provide complete 360-degree circumferential seating.
-

- .4 Seat: Pressure-responsive elastomer (grade to suit the intended service).
- .5 Copper-tube dimensioned grooved ends.
- .6 Operator: lever handle with minimum 10 position ratchet and disc position indicator.
- .7 Acceptable Products:
  - .1 300 psi (4,140 kPa) CWP – Victaulic Series 608N.

## 2.13 **Ball Valves**

### 2.13.1 NPS 2 (50 mm) and Under, Screwed or QuickVic SD:

- .1 Forged brass or bronze body, double O-Ring design or Teflon packing, threaded cap, chrome plated solid bronze ball, PTFE seats, blow-out proof stem.
- .2 Ball valves for isolation service shall have large/full port.
- .3 Ball valves for balancing service shall have reduced port and memory stop valve handle.
- .4 Acceptable Products:
  - .1 600 psi (4,140 kPa) WOG – Crane F9202, Grinnell 3700, Kitz 58, Nibco T-585-70, Toyo 5044A.
  - .2 Victaulic Series P89 / P569.
  - .3 Red-White 5020 EZ Press for Type K or L copper when Pressfit fittings are used.

### 2.13.2 NPS 2 (50 mm) and Under, Soldered:

- .1 Forged brass or bronze body, double O-Ring design or Teflon packing, threaded cap, chrome plated solid bronze ball, PTFE seats.
- .2 Ball valves for isolation service shall have large/full port.
- .3 Ball valves for balancing service shall have reduced port and memory stop valve handle.
- .4 Acceptable Products:
  - .1 500 psi (3,450 kPa) WOG – Crane F9222, Kitz 59, Nibco S-585-70, Toyo 5049A, MAS B4.

## 2.14 **Balance Fittings and Valves**

### 2.14.1 NPS 1¼ (32 mm) and Under:

- .1 Bronze body and bronze trim, rising stem, renewable composition disc, globe type with memory stop, Lockshield, male or female union connections, angle and straight type.
- .2 Acceptable Products:
  - .1 100 psi (690 kPa) – Dahl 13000-M series, Toyo 250 or 251, Caleffi.

.2 Victaulic – Tour & Andersson - Style 786, 787.

2.14.2 NPS 1½ (40 mm) and Over:

- .1 Screwed connections up to NPS 2 (50 mm).
- .2 Flanged or grooved connections NPS 2½ (65 mm) and over.
- .3 Cast-iron body, non-lubricated eccentric plug with resilient coating EPT or RS 55, suitable for 250°F (120°C) operating temperature, stainless steel bearings, adjustable memory stop, plug type suitable for wrench adjustment.
- .4 Acceptable Products:
  - .1 175 psi (1,210 kPa) WOG – DeZurik 400, Keystone Ballcentric, Caleffi.
  - .2 Victaulic – Tour & Andersson - Style 786, 787, 789.

2.14.3 NPS 3 (80 mm) and Over:

- .1 Victaulic Vic-Plug Valve Series 377
- .2 Xylem Circuit Setter
- .3 Armstrong CBV
- .4 Victaulic – Tour & Andersson - Style 786, 787.
- .5 Wheatley GS
- .6 Oventrop
- .7 Danfoss
- .8 Red-White 9574

**2.15 Automatic Flow Control Valves and Coil Kits**

2.15.1 General: Devices shall automatically control required flow quantity between differential pressure ranges of 1 psi (7 kPa) to 87 psi (600 kPa) (pressure independent type auto-flow valves).

2.15.2 NPS 2 (50 mm) and Smaller:

- .1 Body forged brass ASTM B283 600 WOG, 250°F (120°C).
- .2 Return from coil: (downstream side of Temperature Control Valve) Combination assembly including:
  - .1 Body fitted with ball shut-off valve, hard chrome-plated, Teflon Ball Seals and EPDM or Viton O-Rings.
  - .2 Flow Cartridge shall be accessible, non-clogging 304SS piston type with + 5% accuracy.
  - .3 Two P/T Plugs, union for accepting temperature control valve (by Controls Contractor).
- .3 Return from Coil: (upstream side of Temperature Control Valve) Combination assembly including:
  - .1 Full port union with manual air vent and P/T test plug.
- .4 Supply to coil: Combination assembly including:

- .1 Ball valve, strainer P/T test plug and blow down drain valve.

2.15.3 NPS 2½ (65 mm) and Larger:

- .1 Body epoxy coated ductile iron ASTM A536 250 psi (1,725 kPa) 250°F (120°C).
- .2 Flow cartridges 304 SS moving parts in brass housing, 2 psi (14 kPa) to 87 psi (600 kPa), 25 USgpm (1.9 L/s) to 2,280 USgpm (144 L/s).
- .3 P/T Plugs, thermometer well and drain.

2.15.4 Provide dual hose temperature/pressure meter kit with flow conversion chart and carrying case.

2.15.5 Packaged coil components consisting of required coil valving, strainers, unions, hoses, etc., may be supplied. Victaulic Koil-Kit Series 799 or 79V, with Series 78U Union Port Fitting, Series 78Y Strainer/Ball Valve, Series 78T Union/Ball Valve, required 24" (600 mm) long braided hoses, and Series 793/794 Differential Pressure Controllers. The coil package shall be provided with a meter to be left with the Owner after installation.

2.15.6 Acceptable Products: Nexus, Griswold, Victaulic Series 76; Caleffi; Oventrop; Cocon-Q; RWV 9500/9520 Series and CK Series; Hays, Danfoss.

**2.16 Circuit Balancing Valves and Coil Kits**

2.16.1 NPS 2 (50 mm) and under: DZR Brass (Ametal) copper alloy body, screwed, 'Y' pattern globe.

2.16.2 NPS 2½ (65 mm) and over: Ductile-iron body, flanged or grooved, 'Y' pattern globe.

2.16.3 Maximum pressure 250 psi (1,725 kPa) and maximum temperature 250°F (120°C). To be selected and sized for a nominal pressure drop of 5 ft (1.5 m) head, typically one pipe size smaller than piping size.

2.16.4 Calibrated balancing valve with memory, positive shut-off, inlet and outlet pressure measuring connections with integral shutoffs and drains.

2.16.5 Calibration charts and adjustment tools to be included.

2.16.6 Provide differential pressure meter kit of same brand and Manufacture as balancing valves suitable for direct read-out complete with connection hoses suitable for system pressure. Meter to remain with Owner after installation.

2.16.7 Packaged coil components consisting of required coil valving, strainers, unions, hoses, etc., may be supplied. Victaulic Koil-Kit Series 799 or 79V, with Series 78U Union Port Fitting, Series 78Y Strainer/Ball Valve, Series 78T Union/Ball Valve, required 24" (600

mm) long braided hoses, and Series 793/794 Differential Pressure Controllers. The coil package shall be provided with a meter to be left with the Owner after installation.

2.16.8 Acceptable Products:

- .1 Bell and Gossett – Circuit Setter
- .2 ESBE – Circuit Setter
- .3 Victaulic / Tour and Andersson – Series 786H/787H/788/789 and Series 78KH
- .4 Armstrong – CBV
- .5 Wheatley – GS
- .6 Nexus
- .7 Caleffi
- .8 RWV 9500/9520 Series and CK series
- .9 Oventrop
- .10 Danfoss

**2.17 Swing Check Valves**

2.17.1 NPS 2 (50 mm) and under, screwed:

- .1 Bronze body, bronze swing disc, screw in cap, regrindable seat.
- .2 Acceptable Products:
  - .1 125 psi (860 kPa) – Crane 1707, Grinnell 3300, Kitz 22, Nibco T-413-B, Toyo 236.

2.17.2 NPS 2 (50 mm) and Under, Soldered:

- .1 Bronze body, bronze swing disc, screw in cap, regrindable.
- .2 Acceptable Products:
  - .1 Class 200 psi (1,380 kPa) WOG – Crane 1707S, Kitz 23, Nibco-S-413-B, Toyo 237.

2.17.3 NPS 1½ (40 mm) and Over, Grooved:

- .1 Ductile iron body, Grade 'E' – EPDM seat, stainless steel swing disc, coupled cap.
- .2 Acceptable Products:
  - .1 Class 300 psi (2,070 kPa) CWP – Victaulic Style 712, Mueller Steam.

2.17.4 NPS 2½ (65 mm) and Over, Flanged:

- .1 Cast-iron body, renewable or regrindable seat, bronze swing disc, bolted cap.
- .2 Acceptable Products:
  - .1 Class 125 psi (860 kPa) – Crane 373, Kitz 78, Nibco F-918, Toyo 435A.

---

**2.18 Silent Check Valves (Spring Type)**

**2.18.1 NPS 2 (50 mm) and Under, Screwed:**

- .1 Bronze body, bronze trim, stainless steel spring, (heavy duty spring in vertical down flow application).
- .2 Acceptable Products:
  - .1 Class 125 psi (860 kPa) – Conbraco 61-500, Durabla, Grinnell 3600, Muessco 203BP, Mueller Steam.

**2.18.2 NPS 2½ (65 mm) and Over:**

- .1 Cast steel, wafer style bronze trim, stainless steel spring (heavy duty spring in vertical down flow application).
- .2 Cast ductile iron, grooved end type, stainless steel spring and shaft, for use in horizontal or vertical applications.
- .3 Acceptable Products:
  - .1 125 psi (860 kPa) wafer style – Apco, Durabla, Duo-Chek II, Nibco W-910, M & G, Mueller.
  - .2 300 psi (2,070 kPa) with Grooved Ends: Victaulic 716, or 779 with venturi taps.
    - .1 For sizes NPS 14 (350mm) and over, Class 230 psi (1,586 kPa) with AGS grooved ends, Victaulic Series W715.

**2.19 Needle Valves**

- 2.19.1 Bronze body, screwed, globe type with cadmium plated steel stem.
- 2.19.2 Acceptable Products: Class 400 psi (2,760 kPa) – Crane 88/89, RP and C 60-100.
- 2.19.3 Application: Install needle valves where petcocks or manual vents are indicated.

**2.20 Radiator Valves**

- 2.20.1 Screwed bronze body with bronze trim, wheel handle, rising stem, renewable composition disc, male union connections, angle and straight type.
- 2.20.2 Acceptable Products: Class 100 psi (690 kPa) – Dahl 11041 or 11042, Dunham Bush 200B or 246B, Kitz 100 series, Sarco Type R or RP, Toyo 252 or 253, Oventrop.

**2.21 Thermostatic Radiator Valves**

- 2.21.1 Screwed nickel plated brass body, stainless steel spindle, EPDM rubber valve disc, straight and angle type.
- 2.21.2 Valves complete with sensors, operators and capillary tubing.
- 2.21.3 Remote sensors/operators to have 25'-0" (7.5 m) capillary tube.

- 2.21.4 Capillary tubing to be run concealed in walls and ceilings, sheathed in  $\frac{3}{4}$ " (20 mm) diameter plastic tubing.
- 2.21.5 Valves in public areas to have valve mounted operators with remote wall mounted sensors.
- 2.21.6 Valves on convector units to have valve mounted operators and sensors.
- 2.21.7 Acceptable Products: Danfoss.

**2.22 Drain Valves**

- 2.22.1 Globe type, bronze body with bronze trim and composition disc.
- 2.22.2 Acceptable Products: Crane 1703, Dahl 2343, Kitz 03, Nibco T-235-Y, Toyo 220, Caleffi.

**2.23 Hose Bibbs for Hydronic System Service**

- 2.23.1 Brass ball valve with forged brass cap and chain, NPS  $\frac{3}{4}$  (20mm) male, threaded hose end, Lockshield in public areas. Working pressure 250 psi (1,725 kPa) to 250°F (120 °C).
- 2.23.2 Acceptable Products: Crane F9202CC, Dahl #50-430 Dahl #50.430LS, Kitz 58CC, Red-White/Toyo 5046.

**2.24 Low-Loss Headers (Hydraulic Separators)**

- 2.24.1 Low loss headers (hydraulic separators) shall be equal to Viessmann models 80/20 and 400/200 to suit flow.
- 2.24.2 Acceptable products: Caleffi Hydro Cal.

**2.25 Heating Water Piping, Pre-Insulated Buried**

- 2.25.1 Steel Pipe: ASTM A53, Schedule 40 wall for all sizes up to 12" (300 mm) and over, black with factory applied AWWA C105 polyethylene jacket, and minimum 2" (50 mm) of factory applied rigid expanded foam insulation.
  - .1 Fittings: ASTM A234, forged steel welding type.
  - .2 Joints: AWS D1.1, welded.
  - .3 Casing: Polyurethane insulation with high density polyethylene jacket and heat shrink sleeves.
  - .4 Standard of Acceptance: Logstor Rohr, Perma-Pipe: Xtru-Therm
- 2.25.2 Copper Tubing: ASTM B88, Type [K,] [L,] annealed.
  - .1 Fittings: ASME B16.22, wrought copper.
  - .2 Joints: Solder, lead free, ASTM B32, 95-5 tin-antimony, or tin and silver, with melting range 430°F to 535°F (220°C to 280°C).

- .3 Casing: Minimum 2" (50 mm) polyurethane insulation with high density polyethylene jacket and heat shrink sleeves.

## **2.26 Chilled Water Piping, Buried**

- 2.26.1 Steel Pipe: ASTM A53, Schedule 40 wall for sizes up to 12" (300 mm) and over, black with factory applied AWWA C105 polyethylene jacket, and minimum 2" (50 mm) of factory applied rigid expanded foam insulation.
  - .1 Fittings: ASTM A234, forged steel welding type.
  - .2 Joints: AWS D1.1, welded.
  - .3 Casing: Polyurethane insulation with high density polyethylene jacket and heat shrink sleeves.
  - .4 Standard of Acceptance: Logstor Rohr, Perma-Pipe: Xtru-Therm.
- 2.26.2 Copper Tubing: ASTM B88, Type [K] [L] annealed.
  - .1 Fittings: ASME B16.22, wrought copper.
  - .2 Joints: Solder, lead free, ASTM B32, 95-5 tin-antimony, or tin and silver, with melting range 430°F to 535°F (220°C to 280°C)
  - .3 Casing: Polyurethane insulation with high density polyethylene jacket and heat shrink sleeves.
- 2.26.3 Ductile Iron Pipe: AWWA C151.
  - .1 Fittings: AWWA C110, ductile iron, standard thickness.
  - .2 Joints: AWWA C111, rubber gasket with ¾" (19 mm) diameter rods.
- 2.26.4 PVC Pipe: ASTM D1785, Schedule 40, and Schedule 80 for sizes 8" (200 mm) and larger, or ASTM D2241, SDR 21 or 26.
  - .1 Fittings: ASTM D2466, or ASTM D2467, PVC.
  - .2 Joints: ASTM D2855, solvent weld.
  - .3 Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- 2.26.5 PEX Piping System: Equal to Uponor EcoFlex jacketed pre-insulated piping system.
  - .1 Fittings and connectors to be same brand/supplier as piping system, nominally Uponor Wipex fittings.

## **2.27 Condenser Water Piping, Buried**

- 2.27.1 Steel Pipe: ASTM A53, Schedule 40 wall for sizes up to 12" (300 mm) and over, black with factory applied AWWA C105 polyethylene jacket, and minimum 2" (50 mm) of factory applied rigid expanded foam insulation.
  - .1 Fittings: ASTM A234, forged steel welding type.

- .2 Joints: AWS D1.1, welded.
  - .3 Casing: Polyurethane insulation with high density polyethylene jacket and heat shrink sleeves.
  - .4 Standard of Acceptance: Logstor Rohr, Perma-Pipe: Xtru-Therm.
- 2.27.2 Copper Tubing: ASTM B88, Type [K,] [L,] annealed.
- .1 Fittings: ASME B16.22, wrought copper.
  - .2 Joints: Solder, lead free, ASTM B32, 95-5 tin-antimony, or tin and silver, with melting range 430°F to 535°F (220°C to 280°C).
- 2.27.3 Ductile Iron Pipe: AWWA C151.
- .1 Fittings: AWWA C110, ductile iron, standard thickness.
  - .2 Joints: AWWA C111, rubber gasket with  $\frac{3}{4}$ " (20 mm) diameter rods.
- 2.27.4 PVC Pipe: ASTM D1785, Schedule 40 for pipes up to 4" (100 mm), and Schedule 80 for sizes over 4" (100 mm) diameter, or ASTM D2241, SDR 21 or 26.
- .1 Fittings: ASTM D2466 or ASTM D2467, PVC.
  - .2 Joints: ASTM D2855, solvent weld.
  - .3 Materials in contact with PVC pipe and fittings shall comply with Manufacturers compatibility documentation.
- 2.27.5 PEX Piping System: Equal to Uponor EcoFlex jacketed pre-insulated piping system.
- .1 Fittings and connectors to be same brand/supplier as piping system, nominally Uponor Wipex fittings.

### 3. **EXECUTION**

#### 3.1 **Piping**

- 3.1.1 Ream pipe ends. Clean scale and dirt, inside and outside before and after assembly. Remove welding slag or other foreign material from piping.
- 3.1.2 During construction, protect openings in piping and equipment, by capping or plugging to prevent entry of dirt.
- 3.1.3 Provide proper pipe spacing before project begins. Be responsible for ensuring that sufficient space is provided for proper installation of insulation materials.
- 3.1.4 Screw, weld, QVSD or groove (unless otherwise specified) piping systems up to NPS 2 (50 mm) .
- 3.1.5 Weld or groove (unless otherwise specified) all piping systems NPS 2½ (65 mm) and over.

- 3.1.6 Install piping to conserve headroom and space. Run exposed piping parallel to walls. Group piping wherever practical.
- 3.1.7 Avoid piping in exterior walls unless otherwise directed. If required, install this piping protected from outside by building insulation and vapour barrier.
- 3.1.8 Maintain minimum of 1" (25 mm) space between adjacent flanges or pipe insulation, whichever has larger diameter.
- 3.1.9 Provide clearance for installation of insulation and access for maintenance of equipment, valves and fittings.
- 3.1.10 Saddle type branch fittings may be used on mains, if branch line is half size or smaller than main. Whole saw or drill and ream main to maintain full inside diameter of branch line prior to welding saddle. Use correct hole saw size for Victaulic 920 Mechanical tees.
- 3.1.11 If welding, use long radius elbows.
- 3.1.12 Install thermometer wells and immersion sensor wells specified under Controls Section. Where wells restrict flow in small diameter pipes (NPS 1½ (40 mm) and smaller) install section of oversized pipe at least NPS 2 (50 mm) .
- 3.1.13 Remake leaking joints using new materials, do not caulk or cement leaking threaded joints.
- 3.1.14 Use eccentric reducers at pipe size changes, flush on top side, to permit positive venting and drainage.
- 3.1.15 Do not use thread protection couplings, close nipples, running nipples or street elbows.
- 3.1.16 Install di-electric type unions or flanges or Victaulic Style 647 Di-electric Waterways to "OPEN" type systems, where copper piping connects to steel.
- 3.1.17 Avoid locating water and drain piping over electrical equipment. Where unavoidable, provide galvanized drip pans under such pipe and weld piping and fittings. Provide drain and piping from drip pans to floor drain.
- 3.1.18 Bull head tees shall not be used for converging flows.

## **3.2 Pipe Grading**

- 3.2.1 Grade piping to provide positive drainage and venting. Slope as follows:
  - .1 Supply mains and branches – up in direction of flow, minimum 1:480 [1" (25 mm) in 40'-0" (12.2 m)].
  - .2 Return mains and branches – down in direction of flow, minimum 1:480 [1" (25 mm) in 40'-0" (12.2 m)].
  - .3 Reverse return supply and return mains – up in direction of flow, minimum 1:480 [1" (25 mm) in 40'-0" (12.2 m)].

- .4 Grade horizontal drainage and vent piping down in direction of flow, 2% minimum.
- .5 On closed system, equip low points with ¾" (20 mm) drain valves. Provide at high points on lines and equipment connections, collecting chambers and high capacity float operated air vents.

### **3.3 Grooved Joint Piping Systems**

- 3.3.1 Grooved joints shall be installed in accordance with Manufacturer's latest published installation instructions.
- 3.3.2 Grooved ends shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove.
- 3.3.3 Gaskets shall be elastomer grade suitable for intended service, and be molded and produced by coupling Manufacturer.
- 3.3.4 Grooved coupling Manufacturer's factory trained Representative shall provide on-site training for Contractor's field personnel in use of grooving tools and installation of grooved joint products.
- 3.3.5 Representative shall periodically visit jobsite and review Contractor is following best recommended practices in grooved product installation. (Distributor's Representative is not considered qualified to conduct training or jobsite visit(s).)

### **3.4 Soldering and Brazing**

- 3.4.1 Pressure fluid systems –SOLDER with 95/5 tin-antimony to ASTM B-32 Alloy Grade Sb5.
- 3.4.2 Non-pressure systems, (drains) SOLDER with 50/50 tin lead.
- 3.4.3 Piping connections to radiant ceiling panels, SOLDER with 95/5 tin-antimony to ASTM B-32 Alloy Grade Sb5.

### **3.5 Connections to Equipment and to Existing Piping**

- 3.5.1 Install unions, grooved couplings or flanges at connections to equipment and specialty components and at connecting points to existing systems which, for reasons of separation for testing, will require to be blind flanged or capped. Where dissimilar pipe and terminal connections are made (e.g. Pex Pipe to manifolds or terminal heating/cooling device) the entire connected assembly shall be warranted by the contractor.
- 3.5.2 Unions are not required in installations using grooved mechanical joint couplings. (Couplings shall serve as unions and disconnect points.)
- 3.5.3 Install removable sections of pipe with 12" (300 mm) spool pieces on suction side of end suction pumps and where required for ease of maintenance.

- 3.5.4 Connect to equipment in accordance with Manufacturer's instruction unless otherwise noted.
- 3.5.5 Arrange piping connections to allow ease of access and for removal of equipment.
- 3.5.6 Align and independently support piping connections adjacent to equipment to prevent piping stresses being transferred.
- 3.5.7 Do not reduce equipment connection sizes by bushing.
- 3.5.8 Branch connections to existing steel piping may be made using double strap service saddles – Smith Blair #313 or Dresser #91.

### **3.6 Drain Connections**

- 3.6.1 Pipe discharge from liquid relief valves, liquid safety valves, high capacity air vents, steam drip pan elbows, equipment blowdown, water columns, overflows and piping system drains to nearest building drain. Install brass, bronze or copper receiving funnel on drain where shown.
- 3.6.2 Drains for drain pans shall be DWV copper ASTM B306 1¼" (32 mm) minimum size.
- 3.6.3 Drain and vent piping shall be of same material as piping system connected, except where otherwise specified.
- 3.6.4 Where item being drained is under pressure, provide deep seal trap.

### **3.7 Expansion of Piping**

- 3.7.1 Install piping systems with due regard and provision for expansion, avoiding strain or damage to equipment and building. Provide adequate expansion and contraction for piping running across building expansion joints.
- 3.7.2 Only major expansion configuration and fittings have been indicated on drawings. Provide required additional compensators, loops and swing connections.
- 3.7.3 Where expansion loops are required, use Victaulic Style 177 and 77 couplings on the loops in accordance with Victaulic instructions and as approved by the Engineer is acceptable.
- 3.7.4 Provide anchors, where shown. Anchors shall be fabricated from mild steel plate and structural steel angle and channel sections, in accordance with ANSI B3.31.
- 3.7.5 Contractor and Engineer to confirm with Structural Engineer that structure is suitable for mounting of Anchors and load placed on structure before concrete is poured and prior to install.
- 3.7.6 Provide anchors on both sides of expansion devices, as indicated on drawings, and as required to control flexing of the piping system.
- 3.7.7 In welded systems where expansion loops are required use long radius elbows.

- 3.7.8 Install welded expansion loops, cold sprung 50% of calculated expansion.
- 3.7.9 Install at least three elbows in branch connections. Where space does not permit, install braided flexible pipe connectors in accordance with Manufacturer's recommendations. Three elbow branch connections shall have sufficient developed length to ensure excessive stresses are not generated in piping and in no case less than 36" (900 mm).

### **3.8 Valves**

- 3.8.1 Install valves with stems upright or angled 45° above horizontal unless approved otherwise.
- 3.8.2 Valves shall be provided with stem extension to allow for proper insulation thickness. Stem extension to stay stationary to ensure vapor barrier seal is not broken when valve is exercised.
- 3.8.3 Install control valves with stems upright unless approved otherwise and with adequate clearance for removal of actuators.
- 3.8.4 Use gate valves or ball valves NPS 2 (50 mm) and under to shut-off branch takeoffs and to isolate equipment.
- 3.8.5 Butterfly valves may be used as alternative to gate valves on glycol heating, hot water heating, chilled water, condenser water, heat pump and glycol heat recovery systems. Review glycol concentrations/service temperature with elastomers for compatibility.
- 3.8.6 Use globe valves to control flow in circuits except where balancing cocks are specifically specified.
- 3.8.7 Use plug type globe valves in control valve bypass connections.
- 3.8.8 Use plug cocks for balance valves in water return branch mains and branch connections to return mains and for shut-off and balancing on glycol circuits.
- 3.8.9 Install balance fittings or valves in return piping connections to each terminal heating and cooling unit, e.g. Radiators, unit heaters, fan coil units, heating and cooling coils. All balancing valves shall be sized on a nominal pressure drop of at least 5 ft (1.5 m) water column, typically one pipe size smaller than line size.
- 3.8.10 Install radiator valves in supply connections to each convection heating element.
- 3.8.11 Provide isolation valves in systems such that floor by floor for horizontal systems, risers in vertical system and zone areas on large horizontal system can be isolated.
- 3.8.12 Provide valves upstream of meters, gauges, automatic air vents, Flowtrex/Triple duty valves etc. for isolation purposes.

- 3.8.13 Use swing check valves, in horizontal and vertical upflow pipes and on discharge of pumps. Spring loaded water check valves shall be located 8 pipe diameters downstream of pumps or elbows.
- 3.8.14 Use silent check valves where specifically shown in vertical pipes with downward flow.

### **3.9 Drain Valves and Hose Bibbs**

- 3.9.1 Install drain valves and hose bibbs at each low point in piping system and at specific drain locations indicated on drawings.
- 3.9.2 Install NPS  $\frac{3}{4}$  (20 mm) hose bibbs at downfed terminal heating and/or cooling units.
- 3.9.3 Install NPS  $1\frac{1}{2}$  (40 mm) or NPS  $\frac{3}{4}$  (20 mm) on line sizes less than NPS  $1\frac{1}{2}$  (40 mm) drain valves/hose bibbs at low points in piping systems to facilitate draining.
- 3.9.4 Install drain valves in lieu of hose bibbs for systems operating at over 200°F (93°C).
- 3.9.5 Install hose end adaptor on discharge side of each drain valve or pipe to drain, where indicated.
- 3.9.6 Use NPS  $1\frac{1}{2}$  (40 mm) fire hose and connect to discharge side of drain valves to flush piping system during pipe cleaning process.
- 3.9.7 Install caps, with chains, on hose end adaptors, in public areas.

### **3.10 Piping Tests**

- 3.10.1 Notify Consultant and Inspection Authority Having Jurisdiction, 48 hours in advance of intended test dates.
- 3.10.2 Before testing piping, isolate equipment, which cannot withstand test pressure. Where dissimilar pipe and terminal equipment are connected (e.g. Pex Piping to manifolds or to perimeter heating/cooling elements), the Pex/dissimilar pipe connections shall be pressure tested prior to final component installation.
- 3.10.3 Do not insulate, backfill or conceal until tests have been completed and approved by inspection authorities.
- 3.10.4 Examine systems under test for leaks.
- 3.10.5 Joints shall remain dry during test. General sweating around weld shall be reason for rejection.
- 3.10.6 Remake leaking connections and joints.
- 3.10.7 Tests shall be limited to new piping and terminal units only.
- 3.10.8 New connections to existing piping shall be warranted.
- 3.10.9 Do not backfill any underground piping until it has been surveyed and documented by the [University] [Owner].
- 3.10.10 Initial Hydrostatic test:

- .1 150% of working pressure, but not less than 125 psi (860 kPa) for 1 working day.
- 3.10.11 Final Hydrostatic test:
  - .1 150% of working pressure, after piping connections to equipment are complete, maintain until entire piping system has been inspected.

### **3.11 Flushing and Cleaning**

- 3.11.1 Flushing and cleaning shall commence after piping tests are completed.
- 3.11.2 Install temporary bypass connections around terminal units before commencing chemical cleaning.
- 3.11.3 Chemically clean the following piping systems as recommended by approved professional chemical cleaning and treatment agency who shall supervise work:
  - .1 Heating hot water system(s).
  - .2 Glycol heating system(s).
  - .3 Chilled water system(s).
  - .4 Glycol heat recovery system(s).
  - .5 Heat pump water system(s).
  - .6 Condenser water system(s) (closed circuit).
- 3.11.4 Clean and flush out only with clean fresh water the following systems:
  - .1 Condenser water system(s) (open system).
- 3.11.5 Flush out traces of chemical with clean water after chemical cleaning is complete.
- 3.11.6 Install final connections to terminal units after flushing is complete.
- 3.11.7 Remove, clean and reinstall strainer baskets.
- 3.11.8 Submit report signed by principal of Agency, which certifies cleaning has been satisfactorily completed.

### **3.12 Chemical Treatment**

- 3.12.1 Chemically treat water systems in accordance with Section 23 25 00.

### **3.13 Testing and Balancing**

- 3.13.1 Test and balance piping systems in accordance with requirements of Section 23 05 93.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 Reference Standards

1.2.1 Provision of specialty components shall be in accordance with ANSI/ASME B31 Codes for Building Services Piping.

### 1.3 Regulatory Requirements

1.3.1 Water specialty components shall be provided in compliance with Regulations and Requirements of Province of Ontario Regulation Boiler and Pressure Vessels, under the Technical Standards and Safety Act.

### 1.4 System Pressure Ratings

1.4.1 Piping systems 125 psi (860 kPa) or less operating pressure - 125 psi (860 kPa) rating.

1.4.2 Piping systems 126 psi (870 kPa) to 250 psi (1,725 kPa) operating pressure – 250 psi (1,725 kPa) rating.

## 2. PRODUCTS

### 2.1 Air Vents Automatic – High Capacity Type

#### 2.1.1 Non-Serviceable Type:

- .1 Casing and internal parts suitable for system operating pressure and temperature.
- .2 Metal construction with outlet threaded to accept vent tubing connection.
- .3 Automatic float type.
- .4 Shraeder type venting valve.
- .5 Acceptable Products:
  - .1 50 psi (345 kPa) maximum operating pressure – Armstrong AW, Dole 75, Maid-O-Mist 6, Taco 426, Watson McDaniel AE 1800, Caleffi.
  - .2 75 psi (517 kPa) maximum operating pressure – Armstrong AW, Dole 75, Maid-O-Mist 6, Taco 426, Watson McDaniel AE 1800, Caleffi.

- .3 150 psi (1,034 kPa) maximum operating pressure – Armstrong AW, Maid-O-Mist 6, Taco 426, Watson McDaniel AE 1800, Caleffi.

## **2.2 Air Vents Manual – High Capacity**

### **2.2.1 Globe Type:**

- .1 Bronze Body, union bonnet, screwed, 450 Brinell hardened stainless steel trim and plug type disc.

### **2.2.2 Acceptable Products:**

- .1 Class 125 psi (860 kPa) – Crane 14-½ LP, Jenkins 2032, Lunkenheimer 73-PS, Toyo 214.
- .2 Class 200 psi (1,380 kPa) – Crane 212P, Jenkins 2050, Lunkenheimer 73-PS, Toyo 214.

## **2.3 Air Vents Manual – Radiator Type**

### **2.3.1 Needle Type:**

- .1 Bronze or steel body, screwed, needle valve.
- .2 Manual key operator.
- .3 125 psi (860 kPa) maximum operating pressure and 250°F (120°C) maximum operating temperature.
- .4 Acceptable Products:
  - .1 Maid-O-Mist 816, Caleffi.

### **2.3.2 Hydroscopic Type:**

- .1 Bronze or steel body, screwed hydroscopic discs.
- .2 Manual screwdriver or key operator.
- .3 Acceptable Products:
  - .1 50 psi (345 kPa) maximum operating pressure – Maid-O-Mist 72, Taco 417, Caleffi.
  - .2 75 psi (517 kPa) maximum operating pressure – Maid-O-Mist 72, Taco 417, Caleffi.

## **2.4 Air Separators**

- 2.4.1 Provide centrifugal, type with 125 psi (860 kPa) WSP steel tank, galvanized steel ¼" (6 mm) perforated strainer, perforated stainless steel air collector tube and drain connection.

- 2.4.2 Provide air and dirt separators including blow-down valve, skim valve, and automatic air vent. The separator must utilize an internal medium to aid in the separation of air and dirt entrained in the system. The separator must be constructed in accordance with the latest revision of the ASME Boiler and Pressure Vessel Code and stamped for the working pressure of the system.

- 2.4.3 Acceptable Manufacturers:

- .1 Armstrong, Bell + Gossett (Xylem), Spirotherm, Taco, Spirotech, Caleffi, Wessels.

## **2.5 Expansion Tanks – Diaphragm Type**

2.5.1 Expansion tanks with working pressure to 30 psi (207 kPa) and less than 24" (600 mm) in diameter.

- .1 Steel construction with sealed-in elastomer diaphragm suitable for up to 240°F (116°C).
- .2 Welding performed by certified, qualified welders.
- .3 Factory tested hydraulically to 75 psi (517 kPa).
- .4 Identification plate showing:
  - .1 Manufacturer's name.
  - .2 Expansion tank operating pressure, 30 psi (207 kPa).
  - .3 Hydraulic test pressure 75 psi (517 kPa).
  - .4 Date of manufacture.
- .5 Pre-charge via air charging valve to 12 psi (83 kPa).
- .6 Saddles for horizontal installation or base mount for vertical installation.
- .7 Acceptable Products: Armstrong, Watts, Amtrol/Extrol, Bell+Gossett (Xylem), Taco, Zilmet.

2.5.2 Expansion tanks with working pressure exceeding 30 psi (207 kPa) or with diameter exceeding 24" (600 mm).

- .1 Steel construction with sealed-in elastomer diaphragm suitable for up to 240°F (116°C).
- .2 Manufactured in accordance with requirements of ASME Section VIII, Pressure Vessels, Division 1, 125 psi (860 kPa) pressure rated.
- .3 Identification showing:
  - .1 Manufacturer's name:
  - .2 Capacity in litres.
  - .3 Hydraulic test pressure.
  - .4 Working pressure.
  - .5 Code stamping and ASME registered design.
- .4 Air pre-charged via air charging valve to 12 psi (83 kPa).
- .5 Saddles for horizontal installation or base amount for vertical installation.
- .6 Acceptable Products: Armstrong, Watts, Amtrol/Extrol, Bell+Gossett (Xylem), Taco, Flexcon, Wessels.

---

**2.6 Buffer Tanks**

- .1 Steel construction with vertical internal baffle to encourage proper mixing of fluid.
- .2 Design to suit either chilled water or hot water application with inlet and discharge ports.
- .3 Manufactured in accordance with requirements of ASME Section VIII, Pressure Vessels, Division 1, 125 psi (860 kPa) pressure rated.
- .4 Five year limited warranty
- .5 Flanged Connections
- .6 Lifting lugs
- .7 Red Oxide paint
- .8 Integral Automatic Air Vent
- .9 Factory installed 2" blow down valve and brass flushing cock.
- .10 Temperature and pressure gauge on shell
- .11 Inspection openings/manholes
- .12 Identification showing:
  - .1 Manufacturer's name:
  - .2 Capacity in litres and US gallons
  - .3 Hydraulic test pressure.
  - .4 Working pressure.
  - .5 Code stamping and ASME registered design.
- .13 Acceptable Products: AO Smith, Bell & Gossett (Xylem), Taco, Armstrong.

**2.7 Flexible Hose Assemblies**

- 2.7.1 Scope: For connection to air valve reheat coils, fan coil units etc.
- 2.7.2 EPDM rubber inner core, installation or base mount for vertical installation.
- 2.7.3 End connections are male solid NPT one end and male swivel NPT on the other end.
- 2.7.4 Suitable for hot water applications up to 230°F (110°C).
- 2.7.5 Acceptable Products: Unisource Manufacturing Inc., Nexus, H-P Flex, Metraflex Elastoflex/SST.

**2.8 Pressure Reducing Station – Cold Water**

- 2.8.1 Screwed, bronze or cast-iron body, suitable to 200 psi (1,380 kPa), composition seat.
- 2.8.2 Each reducing station to include:

- .1 Gate valve, strainer, union, pressure reducing valve, union gate valve.
- .2 Bypass with globe valve.
- .3  $\frac{3}{4}$ " (20 mm) relief valve.

2.8.3 Acceptable Products: Cashco, Watts, Cash Acme.

## **2.9 Pressure Relief Valves – Water**

2.9.1 Screwed, bronze body or cast-iron body with expanded outlet.

2.9.2 ASME rated.

2.9.3 Acceptable Products:

- .1 Bronze body: Watts 174A, NPS  $\frac{3}{4}$  (20 mm) to NPS 2 (50 mm) , Cash Acme F-30 or F-82, Apollo.
- .2 Iron body: Watts 740, NPS  $\frac{3}{4}$  x 1 (20 mm x 25 mm) to NPS 2 x 2 $\frac{1}{2}$  (50 mm x 65 mm), Cash Acme F-95, Apollo.

## **2.10 Pressure Relief Valves – Pump Bypass**

2.10.1 Hydraulically operated, single seated globe valve, controlled by a direct acting spring valve and diaphragm pilot valve.

2.10.2 Main and Pilot Valve - cast-iron body, stainless steel seat and reinforced synthetic rubber diaphragm.

2.10.3 Suitable for system operating temperature and pressure.

2.10.4 Connections:

- .1 NPS 2 (50 mm) and under, screwed.
- .2 NPS 2 $\frac{1}{2}$  (65 mm) and over, flanged.

2.10.5 Refer to drawings and/or schedules for flow rates (min., normal, max.) and relief pressure range or setpoint.

2.10.6 Acceptable Products:

- .1 Singer Model 106-RPS.

## **2.11 Pressure Relief Valves – Pump Bypass**

2.11.1 Differential pressure overflow valve to control pump pressure.

2.11.2 Screwed, bronze body with stainless steel spring.

2.11.3 Acceptable Products:

- .1 Braukmann DU 146.

## **2.12 Separator – Liquid/Solids**

2.12.1 Centrifugal – action vortex separator.

2.12.2 Carbon Steel constructed in accordance with ASME, Section VIII, Division 1 for pressure vessels.

2.12.3 Solids Recovery vessel with indicator package for notice of separator bag cleaning.

- 2.12.4 Pressure gauges with petcock valves on inlet and outlet connections.
- 2.12.5 Isolation valve at purge outlet connections.
- 2.12.6 Connection spool piece.
- 2.12.7 Standard of Acceptance:
  - .1 Lakos model HTX-0130 [150 USgpm (9.5 L/s) at 5 psi (35 kPa)] [Alternate: Vortisand H2F] [Alternate: Bernoulli BSP (Plastic) or Bernoulli BSS (Stainless Steel body)].

### 2.13 **Strainers**

- 2.13.1 NPS 2 (50 mm) and under: bronze body, screwed connections.
- 2.13.2 NPS 2½ (65 mm) and over: cast-iron body, flanged connections.
- 2.13.3 NPS 2 (50 mm) and over: Y or T type strainer with grooved ends with ductile iron body or factory fabricated steel body.
- 2.13.4 Suitable for maximum system operating pressure. Where system pressure exceeds 125 psi (860 kPa), use 250 psi (1,725 kPa) strainer bodies.
- 2.13.5 Basket Screen:
  - .1 Bronze, stainless steel or monel perforated screen.
  - .2 225 holes/in<sup>2</sup> (35 holes/cm<sup>2</sup>), 3/64" (1.2 mm) diameter perforations, 36% open area.
- 2.13.6 Acceptable Products:
  - .1 Armstrong, Metraflex LPD, Muesco, Spirax/Sarco, Toyo, Victaulic Series 730, 732 or W730 for all grooved end strainers.

### 2.14 **Suction Guide**

- 2.14.1 Integrated long radius elbow, strainer and suction entrance guide vanes.
- 2.14.2 Suitable for 150 psi (1,034 kPa) and 250°F (120°C).
- 2.14.3 Cast ductile iron body, stainless steel strainer, stainless steel guide vanes **[stainless steel for open systems]**.
- 2.14.4 Connections:
  - .1 NPS 2 (50 mm) and under, screwed.
  - .2 NPS 2½ (65 mm) and over, flanged or grooved.
- 2.14.5 Select for system flow rate and allowable pressure drop.
- 2.14.6 Acceptable Products:
  - .1 Armstrong Suction Guide, Bell and Gossett Suction Diffusers, Mech-Line, Taco Suction Diffuser, Victaulic 731 / W731 Series Suction Diffuser, Metraflex Suction Guide.

---

### 3. EXECUTION

#### 3.1 Air Vents – Automatic – High Capacity Type

- 3.1.1 Install automatic high capacity air vents at each high point in piping system and where indicated on drawings.
- 3.1.2 Install on tees and not on horizontal pipe runs or elbows.
- 3.1.3 Install ½" (15 mm) minimum isolating gate valve ahead of each air vent, unless air vent has integral shut-off valve.
- 3.1.4 Pipe air vent discharge connections (except for glycol) separately to nearest building drain using ¼" (6 mm) hard drawn copper tube. Label ends with permanent labels.
- 3.1.5 Pipe air vent discharge connections (except for glycol) separately to water-tight solder jointed 16 ga (1.61 mm) copper drain pan, using ¼" (6 mm) hard drawn copper tube where exposed and soft copper where concealed. Label ends with permanent labels.
- 3.1.6 Pipe air vent discharge connections from glycol circuit, separately back to glycol mixing tank, using ¼" (6 mm) hard drawn copper tube.

#### 3.2 Air Vents – Manual – High Capacity

- 3.2.1 Install manual air vents at high points in piping systems and where indicated on drawings.
- 3.2.2 Install on tees and not on horizontal pipe runs or elbows.
- 3.2.3 Install isolating gate valve ahead of each vent valve.
- 3.2.4 Pipe air vent discharge connections to nearest building drain.

#### 3.3 Air Vents Manual Radiator Type

- 3.3.1 Install manual/automatic low capacity air vents on return side of each water heating/cooling terminal element installed above connection to main piping.
- 3.3.2 Fit air vent on top of air collecting chamber of NPS ¾ (20 mm) pipe, 6" (150 mm) high.
- 3.3.3 Arrange air vents so screwdriver slots or key opening are easily accessible.
- 3.3.4 Drill access holes through radiation enclosures, where necessary.
- 3.3.5 DO NOT USE on glycol systems.

#### 3.4 Air Separator

- 3.4.1 Provide on suction side of system circulation pump.

#### 3.5 Air Scoop

- 3.5.1 Provide on suction side of system circulation pump.

---

**3.6 Combination Balance/Check Valves**

- 3.6.1 Install combination stop/balance/check valves on discharge of centrifugal pumps as indicated on drawings and/or where scheduled.
- 3.6.2 Install in accordance with Manufacturer's recommendations.
- 3.6.3 Minimum 5 pipe diameters from pump connections.

**3.7 Expansion Tank – Diaphragm Type**

- 3.7.1 Install expansion/contraction tanks at each location indicated on drawings and as scheduled.
- 3.7.2 Install gate valve in system connection.
- 3.7.3 Install globe valve in tank drain connection.

**3.8 Flexible Hoses Heat Pumps**

- 3.8.1 Install flexible hoses on supply and return loop water connections to each heat pump.
- 3.8.2 Install union on one end.
- 3.8.3 Use flexible hoses to bypass heat pumps during pipe cleaning.

**3.9 Flexible Pipe Connectors**

- 3.9.1 Install convoluted and arched pipe connectors, for misalignment connections, where indicated on drawings or required.
- 3.9.2 Install in accordance with Manufacturer's recommendations.
- 3.9.3 Three Victaulic Style 177 flexible couplings may be used in lieu of flexible connectors for vibration attenuation and stress relieve. The couplings shall be placed in close proximity to the source of the vibration.

**3.10 Pressure Reducing Stations – Cold Water**

- 3.10.1 Install water make-up stations for each hot water, chilled water and other closed water systems where indicated on drawings.
- 3.10.2 Pipe relief valve to drain.

**3.11 Pressure Relief Valves – Water**

- 3.11.1 Install pressure relief valve(s) on each heat exchanger to prevent over pressuring.
- 3.11.2 Select relief valves to relieve full heat input of heat supply side.
- 3.11.3 Pipe relief valve to drain.
- 3.11.4 Where one line vents several relief valves, cross sectional area shall equal sum of individual vent areas.

---

**3.12 Pressure Relief Valves – Pump Bypass**

3.12.1 Install pressure relief valves to relieve flow from supply main to return main where indicated on drawings.

**3.13 Separator – Liquids/Solids**

3.13.1 Provide straight run at inlet and outlet connections of at least 5 pipe diameters.

3.13.2 Install spool piece at outlet to permit internal service access.

**3.14 Strainers**

3.14.1 Install pipe line strainers where indicated on drawings.

3.14.2 Provide isolation valves on either side of strainer to permit cleaning without draining system.

3.14.3 Blowdown connections:

- .1 Strainers, NPS 2 (50 mm) and under – hot services: nipple and cap.
- .2 Strainers, NPS 2½ (65 mm) and over – hot services: nipple, globe valve and nipple.
- .3 Strainers, all sizes – cold services: plug.

**3.15 Suction Guide**

3.15.1 Install suction guides on suction of centrifugal pumps, where indicated on drawings and where scheduled in accordance with Manufacturer's recommendations.

3.15.2 "Start-up" strainer baskets must be removed prior to commissioning of systems.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Related Work**

1.1.1 This Specification Section forms part of Contract Documents and are to be read, interpreted and coordinated with other parts.

**1.2 Shop Drawings**

- 1.2.1 Submit shop drawings in accordance with Section 23 05 00.
- 1.2.2 Submit shop drawings of pump curves with operating points indicated. Include NPSH curve when applicable.
- 1.2.3 Submit motor efficiencies for motors 1 hp (0.746 KW) and over, refer to Section 23 05 13 for minimum efficiencies.

**1.3 Quality Assurance**

- 1.3.1 Ensure pumps operate at specified system fluid temperatures without binding and cavitation, are non-overloading in parallel or individual operation; operate within 25% of midpoint of published maximum efficiency curve.
- 1.3.2 Where pumps are operated in conjunction with others such as parallel pumps, show operating points on pump curve.
- 1.3.3 Under no circumstances use a triple duty flow/check valve (combination 3 in 1) on any pump station, provide a check valve, flow balancing valve and an isolation valve as separate pipeline installations.

**1.4 General**

- 1.4.1 Motors powered by variable speed drive controllers shall be EEMAC Class B with Type F insulation, have 1.15 service factor and be suitable to be driven by PWM variable speed drive controllers. Motor Manufacturer shall submit, in writing, confirmation motors are designed to withstand voltage peaks of 3.1 times the normal voltage and voltage rate of rise of 2000V/ $\mu$ s at frequency of 20 kHz.
- 1.4.2 Provide ECM motors complete with manual speed control switch, and 0-10V DC control signal terminal for variable speed control. See Section 23 05 13 for ECM motor requirements.
- 1.4.3 Acceptable Pump Products – General: Bell & Gossett, Armstrong, Taco, Grundfos.

---

## 2. PRODUCTS

### 2.1 General

- 2.1.1 Statically dynamically balance rotating parts.
- 2.1.2 Construction shall permit complete servicing without breaking piping or motor connections.
- 2.1.3 Pumps shall operate at 1750 r/min unless specified otherwise.
- 2.1.4 Domestic water pumps shall be all bronze construction.

### 2.2 In-Line Circulator Pumps

- 2.2.1 Suitable for maximum working pressure of 125 psi (860 kPa) and maximum temperature of 225°F (107°C).
- 2.2.2 Casing: Cast-iron radially split, with flanged connections. Supplied with matching companion flanges.
- 2.2.3 Impeller: Corrosion resistant cadmium plated steel **stamped brass or bronze**.
- 2.2.4 Shaft: Alloy steel with bronze sleeve bearing, integral thrust collar.
- 2.2.5 Seal Assembly: Mechanical.
- 2.2.6 Coupling: Flexible self-aligning.
- 2.2.7 Motor: Resilient mounted, drip proof, sleeve bearing.

### 2.3 Vertical In-Line Centrifugal Pumps

- 2.3.1 Suitable for maximum working pressure of 175 psi (1,210 kPa) and maximum temperature of 225°F (107°C).
- 2.3.2 Casing: Cast-iron radially split, single stage, flanged suction and discharge connections, separate tapped opening for venting, draining and gauge connections.
- 2.3.3 Impeller: Bronze dynamically balanced, keyed drive with locking nut.
- 2.3.4 Shaft: Stainless steel on split coupled pumps and carbon steel with bronze sleeve on close coupled pumps.
- 2.3.5 Seal Assembly: Inside unbalanced mechanical seal with factory installed seal flushing line.
- 2.3.6 Coupling: Close coupled on motors less than 7.5 hp (5.6 KW) and split couplers for motors 7.5 hp (5.6 KW) and larger to permit removal of seal without disturbing motor.
- 2.3.7 Motor: EEMAC Class B, squirrel cage induction, continuous duty, drip proof, ball bearings.
- 2.3.8 Accessories: Strainer/suction guide, discharge flow meter/shutoff valve.
- 2.3.9 Mounts: Seismic inline pump stands c/w vibration isolation pads. Vibro Acoustics SIPS.

---

**2.4 Base Mounted, Single Suction, Centrifugal Pumps**

- 2.4.1 Suitable for maximum working pressure of 175 psi (1,210 kPa) and maximum temperature of 225°F (107°C).
- 2.4.2 Casing: Cast-iron radially split, end suction, with back pull-out feature, flanged suction and discharge connections, tapped opening for venting, draining and gauge connections.
- 2.4.3 Impeller: Bronze enclosed type, keyed drive with locking nut.
- 2.4.4 Shaft: Carbon steel with stainless steel sleeve and grease/oil lubricated bearings.
- 2.4.5 Seal Assembly: Mechanical with factory installed seal flushing line.
- 2.4.6 Coupling: Flexible self-aligning. Coupling guard.
- 2.4.7 Motor: EEMAC Class B, squirrel cage induction, continuous duty, drip proof, ball bearings.
- 2.4.8 Base: Fabricated steel with drip tray under seal area and tapping for drain connection. Bases shall be stiff enough such that vibration isolators can be attached directly to base, without additional concrete inertia bases.
- 2.4.9 Accessories: In-line strainer on suction pipe, discharge flowmeter/shutoff valve.

**2.5 Boiler Feed Pumps**

- 2.5.1 Pump casing and flanges suitable for maximum working pressure of 580 psi (4,000 kPa).
- 2.5.2 Combination self-priming multi-stage turbine with initial centrifugal stage.
- 2.5.3 Low NPSH.
- 2.5.4 Cast-iron casting, bronze impellers, stainless steel shaft.
- 2.5.5 Grease lubricated ball bearing at drive end and sleeve bearing at suction end.
- 2.5.6 Packed stuffing box.
- 2.5.7 Direct drive with flexible coupling.
- 2.5.8 Steel base.

**2.6 Vertical Space Miser Split Coupled Centrifugal Pumps**

- 2.6.1 Suitable for a maximum working pressure of 125 psi (860 kPa) or 250 psi (1,720 kPa) depending on system pressure. Pumps shall have a balanced double volute design to reduce radial thrust and prolong seal and bearing life.
- 2.6.2 Casing: Ductile iron with top pull out capability and suction baffle to improve efficiency. Suction and discharge will be positioned to allow

for vertical piping without the need for elbows, guides or angle type valves.

- 2.6.3 Impeller: Cast bronze, enclosed, statistically, dynamically and hydraulically balanced and shall be factory trimmed to match the delivery conditions.
- 2.6.4 Shaft: One piece steel with bronze shaft sleeve.
- 2.6.5 Seal Assembly: Internal mechanical seal properly vented to the pump suction connection.
- 2.6.6 Coupling: Close coupled on motors less than 5.6 kW and split couplers for motors 5.6 kW and split rigid coupling, located onto the shafts via annular rings. Couplings relying on friction fit to tightening to maintain position on the shaft shall not be acceptable.
- 2.6.7 Motor: High efficiency drip proof, ball bearing.
- 2.6.8 Accessories.

## **2.7 Inline, Wet Rotor, Integrated VFD, Pipe Mounted Pump**

- 2.7.1 In-line pipe-mounted pumps with integrated VFD shall be Grundfos MAGNA® wet rotor, in-line, variable speed circulators.
- 2.7.2 The pump and motor shall be designed and built by the same manufacturer.
- 2.7.3 The Pumps shall be of quiet "Wet Rotor" design. Maximum noise level of the pump and motor shall be 54dB (A).
- 2.7.4 The pumps shall be able to operate at maximum 203°F (110°C) and minimum 59°F (15°C) water, continuously and at maximum 230°F (110°C) intermittently.
- 2.7.5 The head-capacity curve shall have a steady rise in head from maximum to minimum flow within the preferred operating region
- 2.7.6 The pump housing shall be Cast Iron, with laser welded stainless steel Impellers and Stainless Steel neck rings to minimize recirculation and maximise pump efficiency. Pumps shall have tungsten carbide sleeve bearings for extended life. Pumps for Domestic Hot Water application shall be of Stainless Steel housing.
- 2.7.7 The pump is to be connected directly to a single-phase 4- or 8-pole, synchronous, permanent-magnet motor (PM motor) and had to have been tested with the pump as one unit by the same manufacturer.
- 2.7.8 The Motor shall have a variable frequency drive integrated in the terminal box and a small control panel on the terminal box. The pump speed shall be controlled by the "Integrated Variable Frequency Drive". No additional devices (such as pressure transducer etc.) are to be required for control of the pumps.

- 
- 2.7.9 The motor shall be cooled by the pumped fluid and shall be self-ventilating. The stator housing shall have 8 drain holes to enable condensed water to escape
- 2.7.10 The terminal box shall be made of black composite material, shall have an Enclosure class of IP44 and shall have fiber optic indicator lights for operation indication and trouble shooting
- 2.7.11 The pump shaft shall be installed horizontally per manufacturer's recommendations. The required inlet pressure by the pump shall be available at the pump inlet
- 2.7.12 The following control modes are to be available:
- .1 Proportional Pressure control - The pump head is changed continuously in accordance with the water demand in the system.
  - .2 Constant Pressure control - A constant head is maintained, irrespective of water demand.
  - .3 AUTOADAPT - The differential pressure across the pump is automatically adjusted to match the flow requirements
- 2.7.13 The control panel on the terminal box should enable selection of the any of the above control modes without any external devices. The control panel should also enable setting desired Pressure set-point. The control panel should show an estimation of flow rate through the pump in 0-100% range.
- 2.7.14 The controller is to be capable of receiving a "Remote Start/Stop Signal" at a Digital Input for ON/OFF control by an external device (e.g. DDC or other BAS). The controller shall also have a Signal Relay that can be programmed for Fault or Operation indication to an external controller (e.g. DDC or other BAS)
- 2.7.15 The control shall have an optional Module that can receive 4-20mA speed signal for operation from an external device. The Module shall have the capability of connect two MAGNA pumps for Alternating between the pumps and for Duty/Standby operation.
- 2.7.16 Magna Communication Card
- .1 Supply complete with optional communication card – GENI MODULE that allows the following contact points:
    - .1 RS485 Connection for GENI BUS or other bus communication.
    - .2 0-10VDC External Analog Input:
      - .1 Via this input the pump can be controlled by an external controller using the following control modes:

- .1 Constant Curve: The external analog signal will control the pump SPEED within the range from the min speed to the upper limit selected speed.
- .2 Proportional or Constant Pressure Control: The external analog signal will influence the pressure setpoints set on the controller. 100% signal corresponds to Pressure Setpoint. Anything below 100% will reduce the setpoint to that percentage value.
- .3 External Signals for Forced Control to Minimum or Maximum Duty
- .4 Control of Twin-Head Pumps or Two Magna Pumps
  - .1 This allows connecting two MAGNA pumps so that they operate as a twin-head pumps in Master-Slave configuration.
  - .2 The pumps can be set to one of the following operating modes:
    - .1 Alternating Operation. Pump operation alternates every 24 hours. If the duty pump stops due to a fault, the other pump will start.
    - .2 Standby Operation. One pump is operating continuously. In order to prevent seizing-up, the other pump will start at a fixed frequency. If the duty pump stops due to a fault, the other pump will start.
    - .3 The operating modes are to be selected by means of a mechanical contact in each module.

## **2.8 Pump Integrated Variable Frequency Drive Motors**

- 2.8.1 Each motor shall be of the Integrated Variable Frequency Drive design consisting of a motor and a Variable Frequency Drive (VFD) built and tested as one unit by the same manufacturer.
- 2.8.2 The VFD shall be of the PWM (Pulse Width Modulation) design using current IGBT (Insulated Gate Bipolar Transistor) technology.
- 2.8.3 The VFD shall convert incoming fixed frequency three-phase AC power into a variable frequency and voltage for controlling the speed of motor. The motor current shall closely approximate a sine wave. Motor voltage shall be varied with frequency to maintain desired motor magnetization current suitable for centrifugal pump control and to eliminate the need for motor de-rating.

- 2.8.4 The VFD shall utilize an energy optimization algorithm to minimize energy consumption. The output voltage shall be adjusted in response to the load, independent of speed.
- 2.8.5 The VFD shall automatically reduce the switching frequency and/or the output voltage and frequency to the motor during periods of sustained ambient temperatures that are higher than the normal operating range. The switching frequency shall be reduced before motor speed is reduced.
- 2.8.6 An integral RFI filter shall be standard in the VFD.
- 2.8.7 The VFD shall have a minimum of two skip frequency bands which can be field adjustable.
- 2.8.8 The VFD shall have internal solid-state overload protection designed to trip within the range of 125-150% of rated current.
- 2.8.9 The integrated VFD motor shall include protection against input transients, phase imbalance, loss of AC line phase, over-voltage, under-voltage, VFD over-temperature, and motor over-temperature. Three-phase integrated VFD motors shall be capable of providing full output voltage and frequency with a voltage imbalance of up to 10%.
- 2.8.10 The integrated VFD motor shall have, as a minimum, the following input/output capabilities:
  - .1 Speed Reference Signal: 0-10 VDC, 4-20mA
  - .2 Digital remote on/off
  - .3 Fault Signal Relay (NC or NO)
  - .4 Fieldbus communication port (RS485)
- 2.8.11 The motor shall be Totally Enclosed Fan Cooled (TEFC) with a standard NEMA C-Face, Class F insulation with a temperature rise no higher than Class B.
- 2.8.12 The cooling design of the motor and VFD shall be such that a Class B motor temperature rise is not exceeded at full rated load and speed at a minimum switching frequency of 9.0 kHz.
- 2.8.13 Motor drive end bearings shall be adequately sized so that the minimum L10 bearing life is 17,500 hours at the minimum allowable continuous flow rate for the pump at full rated speed.

## **2.9 Pump Discharge Flow Meter**

- 2.9.1 Provide a Bell & Gossett (Xylem) Venturi Balance and Flow Measurement Valve with Integral Ball/Butterfly Valve.
  - .1 Acceptable Products: Taco Accu-flo; IMI Flow design UA or AF; Armstrong APV.

---

### 3 . **EXECUTION**

#### 3.1 **General**

- 3.1.1 Ensure pumps are installed so no piping or equipment loads are imposed on pump body. Provide stanchions or hangers for this purpose. Refer to Manufacturer's installation instructions for details.
- 3.1.2 Pumps shall be aligned by qualified millwright and alignment certified.
- 3.1.3 Check pump rotation.
- 3.1.4 Pipe drain tapping to floor drain.
- 3.1.5 "Start-up" strainer baskets in strainer/suction guides must be removed prior to commissioning of systems.
- 3.1.6 Provide air cock and drain connection on horizontal pump casings.
- 3.1.7 Provide line sized gate or butterfly valve and strainer or suction diffuser on suction side of pump. Provide line sized soft seated check valve and gate or butterfly valve on discharge side of pump.
- 3.1.8 Provide discharge flow meter/shutoff valve or way of measuring flow rate on pump discharge pipe.
- 3.1.9 Decrease from line size, with long radius reducing elbows or reducers.
- 3.1.10 Shave or replace pump impellers to meet actual operating conditions.
- 3.1.11 Where remote control panels are used, Contractor shall allow for wiring from panel to pumps.
- 3.1.12 Provide seismic restraints for pumps.
- 3.1.13 Secure control panels for seismic loads.
- 3.1.14 Where pumps are controlled by a variable speed drive, the minimum speed of the pump shall be set at  $\pm 40\%$  of rated RPM, or as directed by the pump supplier based on pump curve and minimum system flows and pressure requirements.

#### 3.2 **In-line Circulators**

- 3.2.1 Install as indicated by flow arrows.
- 3.2.2 Support at flanges on inlets and outlets of unit.
- 3.2.3 Install with bearing lubrication points accessible.

#### 3.3 **Base Mounted Type**

- 3.3.1 Place level, shim unit and grout.
- 3.3.2 Align coupling in accordance with Manufacturer's recommended tolerance.

---

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 **Scope**

- 1.2.1 Provide for cleaning and degreasing of systems that use glycol or water as heat transfer medium.
- 1.2.2 Provide for cleaning and disinfection of domestic hot and cold systems.
- 1.2.3 Provide temporary strainers, connections and by-pass lines as required.
- 1.2.4 Provide equipment to add chemicals to systems as specified herein.
- 1.2.5 Provide equipment to operate and control system as specified herein. Provide appropriate protection so capped off unused piping does not corrode.
- 1.2.6 Provide corrosion coupons for closed and open loop circulation systems as specified herein, to include testing and analysis at least twice in the first year of warranty
- 1.2.7 Piping systems to be chemically treated include the following systems:
- .1 Chilled water system(s).
  - .2 Hot water heating system(s).
  - .3 Heat pump water system(s).
  - .4 Glycol system(s).
- 1.2.8 Provide complete start-up and commissioning, including the amounts of chemicals and filter media change-outs sufficient to calibrate the system and provide supplies for the first year of warranty.

### 1.3 **Quality Assurance**

- 1.3.1 Water treatment chemicals and treatment process shall be supplied and performed by Contractor. Work shall be supervised by Water Treatment Specialist who, upon completion, shall certify process is satisfactory and submit report outlining cleaning operation and treatment process. Contractor shall provide name and supplier of chemical treatment specialist as part of post-tender submittals and progress claim breakdown.

---

**1.4 Reference Standards**

- 1.4.1 Provide HVAC water treatment in accordance with ASME Boiler Code Section VII, and requirements and standards of regulating authorities, except where specified otherwise.

**1.5 Submittals**

- 1.5.1 Submit shop drawings including proposed chemicals, quantities, procedures and equipment to be supplied. Provide written operating instructions and system schematics including MSDS data, and safe disposal instructions. Provide samples of testing record sheets with recommended water treatment testing schedule for the proposed treatment.
- 1.5.2 Provide written report containing log and procedure of system cleaning, giving times, dates, problems encountered and condition of water.
- 1.5.3 Submit written report containing test results and list of chemicals added every 14 days from time of commissioning to acceptance.
- 1.5.4 Notify Consultant 48 hours prior to chemical cleaning so work may be verified and reviewed.

**1.6 Water Treatment Service**

- 1.6.1 Water Treatment Specialist shall provide supervision of installations, set-up and adjustments and shall submit written report on system operations.
- 1.6.2 Chemicals, feed systems and test equipment shall be provided by Water Treatment Specialist.
- 1.6.3 Treatment chemicals shall not contain hydrazine.
- 1.6.4 Treatment chemicals shall be non-foaming.
- 1.6.5 Water Treatment Specialist shall instruct maintenance personnel before substantial completion. Written instructions of treatment, dosages, control charts and test procedures shall be included in maintenance manuals.
- 1.6.6 Water Treatment Specialist shall provide monthly visits to check chemical treatment, take water samples and recommend any changes to treatment, and provide written report for period of one year after substantial completion. Provide sufficient chemicals to treat system from time of commissioning to acceptance of building. Provide a stock of chemicals, filters and corrosion coupons suitable for 12 months normal operation or minimum **[5,000]** hours of operation for system volume.
- 1.6.7 Provide test kit suitable for chemical treatments used. Test kit shall be made available for on-site tests and provide Myron 3 range TDS meter to check conductivity. Hand kit over to Building Operator at project completion; obtain receipt.

- 1.6.8 Provide one mild steel and one copper corrosion coupon package to monitor corrosion rate for each open and closed systems.

## 2. PRODUCTS

### 2.1 Materials

#### 2.1.1 System Cleaner:

- .1 Sodium Metasilicate, Sodium Nitrite or acceptable equal and wetting agent compound, which in solution removes grease and petroleum products. Concentration level to be determined by Water Treatment Specialist (PACE Chemicals Ltd. – PURGEX L-24 or PURGEX L-27 for aluminium safe boilers or acceptable equal).

#### 2.1.2 Closed System Treatment (Hot Water, Chilled Water):

- .1 Borated Nitrite based corrosion inhibitor. Maintain levels at 60 – 100 ppm for organic PACE Chemicals Ltd. – BAR COR CWS-105, or at 700 – 1000 ppm of BAR COR CWS-55 (non-organic product) or acceptable equal (use WT-580/780 for aluminium safe boilers). The use of Nitrite only, or Sulphite only will not be accepted.

#### 2.1.3 Glycol System:

- .1 Charge hot water and/or heat recovery system(s) and chilled water system(s) with a **[40%]** solution (by volume) in water of inhibited propylene glycol equivalent to DOWFROST.

### 2.2 Equipment

#### 2.2.1 Chemical Feed System – Closed Systems (hot water heating, chilled water, heat pump and closed circuit condenser water):

- .1 Bypass Pot Feeder: Closed water systems shall have bypass chemical pot feeder with 2 gal (7.6 L) capacity, constructed of heavy-duty cast-iron or welded steel (suitable for 200 psi (1,380 kPa) working pressure), with quick opening cap and complete with NPS ¾ (20 mm) connections. Install isolating valves on inlet, outlet and drain.
- .2 Side Stream Filters: Closed systems shall have side stream filters. 304 L stainless steel or polypropylene plastic filter housing to accept 30 micron – 2½” (65 mm) x 10” (250 mm) long filter cartridges and complete with swing bolt lid. Minimum flow rate of 9 USgpm” (35 L/min). A Flow Indicator with stainless steel impeller shall be installed as per Manufacturer’s instructions. Include 10 filter replacement cartridges for each side stream filter unit.
- .3 Chemical Feed Piping shall be Schedule 40 black steel.

- .4 Provide make-up water meter equal to Neptune T-10, Neptune Trident 8 or Rockwell Hersey complete with electronic output for analogue flow monitoring by building automation system.
- .5 Corrosion Coupon and Holder Assembly:
  - .1 Mild steel **[copper]** corrosion coupon.
  - .2 Holder, NPS ¾ (20 mm) or NPS 1 (25 mm) connection.
  - .3 Provide malleable or cast-iron cross, NPS ¾ (20 mm) or NPS 1 (25 mm) connection.

#### 2.2.2 Glycol Feed System:

- .1 Automatic feed system with manual override, (Neptune Model G-50-1A, Axiom Model SF-100, or acceptable equal), comprising the following:
  - .1 Pump: 2 USgpm (7.5 L/min) at 100 psi (690 kPa), bronze gears, stainless steel shaft and carbon bearings, Buna N lip seals. Motor, 1725 rpm, 1/3 HP, 115/1/60 VAC. (Albany Model CEP93-3).
  - .2 Tank: 45 gal cylindrical, polyethylene tank with hinged poly cover, steel support stand with bottom mount pump shelf, required connections and agitator bracket.
  - .3 Agitator: Direct drive, 1725 rpm, ¼ HP, 115/1/60 VAC complete with bracket mount and stainless steel shaft and propeller (Neptune Model A-2).
  - .4 Pressure Switch: Glycol addition shall be controlled by adjustable pressure switch with high and low setpoints. When pressure in loop reaches low setpoint, pump shall start and feed glycol until high setpoint pressure is achieved and pump stops.
  - .5 Control Panel: NEMA 4X enclosure, 115/1/60 VAC and shall consist of the following:
    - .1 Power supply cord with moulded plug.
    - .2 H-O-A switch for pump motor.
    - .3 Pump "ON" indication.
    - .4 "LOW" tank level indication with audible alarm.
    - .5 Push button to silence.
    - .6 Contacts for remote connection.
  - .6 Accessories:
    - .1 Float switch for low level cut off of pump.
    - .2 Pressure switch.
    - .3 Relief valve piped back to tank.
  - .7 Provide pressure gauge located in discharge piping.

- 
- .8 Specific gravity hydrometer, Taylor Instruments Standard quality, Model H4130, scale range 1.000 – 1.200, divisions at 0.002 length 12" (300 mm).
  - .9 Provide chart showing specific gravity of specified solution by volume, at specified temperature.
- 2.2.3 Glycol Feed System (Secondary Antifreeze Heating, Heat Recovery Systems):
- .1 Manual feed system including the following:
    - .1 Tank: 45 gal (170 L) cylindrical, polyethylene tank or direct from drum with hinged poly cover and steel support stand with agitator bracket. (Neptune Model TM 50PT or acceptable equal).
    - .2 Agitator: Direct drive, 1725 rpm, ¼ HP, 115/1/60 VAC complete with stainless steel shaft and propeller (Neptune Model A-2 or acceptable equal). Mixer mounts to bracket supplied as part of tank stand.
    - .3 Pump: Hand operated fill pump, diaphragm style, 36 psi (250 kPa) minimum head, NPS ¾ (20 mm) connections, equivalent to Monarch L-30A.
    - .4 Provide pressure gauge located in discharge piping.
    - .5 Specific gravity hydrometer, Taylor Scientific Standard quality, Model 13-1715-00, scale range 1.000 – 1.200, divisions at 0.002, length 12" (300 mm).
    - .6 Provide chart showing specific gravity of specified solution by volume, at specified temperature.
- 2.2.4 Glycol Feed System for Solar Closed Loop
- .1 Glycol Feed System for Solar: Automatic Feed System (Axiom Model MF300-S).
    - .1 Pump: 0.6 USGpm (2.4 liter/min) at 50 psi (345 kPa), 115/1/60 VAC, with thermal cut-out, plug, and cord, capable of running dry without damage.
      - .1 Tank: 65 litre cylindrical, polyethylene tank with cover, pump suction hose with strainer, low level pump cut-out, diverter valve for air purging and agitation, and all required connections.
      - .2 Pressure Regulating Valve: Glycol addition shall be controlled by an adjustable pressure reducing valve, range 10 (115 kPa) - 255 psi (170kPa), complete with pressure gauge, strainer, check valve, union connection and ½" (15 mm) x 35" (875 mm) flexible outlet hose with check valve.
      - .3 Low Pressure Alarm: Low level alarm panel (Axiom R1A10-1 SAA), complete with remote monitoring contacts and selectable audio alarm.

---

**3 . EXECUTION**

**3.1 Glycol Antifreeze System**

- 3.1.1 Label drain valves with "GLYCOL – DO NOT DRAIN".
- 3.1.2 Pre-mix solution in mixing tank, demonstrate specific gravity of solution to Consultant at sample points and charge system(s) using feed pump. After system filled, check specific gravity of solution in each system. Leave mixing tank filled with specified glycol solution.

**3.2 Eye Wash Station**

- 3.2.1 Provide a self-contained eye wash station in the immediate area of chemical treatment storage and tanks. Secured to wall, equal to Haws model 7501 portable gravity fed eyewash.
- 3.2.2 Provide a plumbed eye wash station in the immediate area of chemical treatment storage and tanks. Wall mounted, equal to Guardian model G1814BC, complete with thermostatic mixing valve.

**END OF SECTION**

## **1. GENERAL**

### **1.1 Related Work**

1.1.1 This Specification Section forms part of Contract Document and is to be read, interpreted and coordinated with other parts.

### **1.2 Submittals**

1.2.1 Submit a schedule indicating the ductwork standards to be used, including metal gauges, joints and reinforcement, before construction of any ductwork.

### **1.3 Reference Standards**

1.3.1 The construction and installation of ductwork and plenums shall be in accordance with the following referenced SMACNA manuals and ASHRAE handbooks:

- .1 SMACNA - HVAC Duct Construction Standards.
- .2 SMACNA - HVAC Air Duct Leakage Test Manual.
- .3 ASHRAE - Handbook - Equipment Volume.

### **1.4 General**

- 1.4.1 Duct sizes on drawings indicate clear inside dimensions. For acoustically lined or internally insulated ducts, maintain inside duct dimensions.
- 1.4.2 Where duct sizes are shown in nominal metric sizes, round and oval duct sizes may be supplied in nearest available sizes in equivalent imperial units.
- 1.4.3 Provide for openings in correct locations through slabs and walls. Openings shall be planned to include installation of fire dampers at rated fire separations.
- 1.4.4 Where ducts penetrate roofs, provide roof curbs with flashing and counter flashing.
- 1.4.5 Arrange for 4" (100 mm) high by 4" (100 mm) wide concrete curbs around duct penetrations through floor slabs outside of duct shafts.
- 1.4.6 Project drawings are diagrammatic and efforts have been made to provide information regarding number of offsets and transitions, but all are not necessarily shown. Changes may be required in duct routings, elevation and duct shape to eliminate interference with structure and other services. Required adjustments shall be established when coordinating and field measuring work prior to fabrication and must be provided as part of contract and association costs must be considered and included.

- 1.4.7 Ductwork shall be clean and free from scale, corrosion and deposits. Ductwork shall be degreased and wiped clean of oil and other surface films with appropriate solvents prior to installation.
- 1.4.8 Ductwork shall be delivered clean to site and maintained in clean condition. Dirty ductwork shall be removed from site.
- 1.4.9 Where welding ductwork, welding shall be continuous with Everdur welding. Tack welding is unacceptable, except as specifically noted. Paint damaged areas with zinc coating after welding.
- 1.4.10 Where a combustible structure and/or there is a combustible ceiling plenum, that plenum shall not be used as an open plenum and all transfer air/return air shall be fully ducted, unless otherwise noted.

## 2. PRODUCTS

### 2.1 Galvanized Steel

- 2.1.1 Galvanized steel shall have 0.9 oz/ft<sup>2</sup> (275 g/m<sup>2</sup>) galvanizing coat both sides to ASTM A653-13.

### 2.2 Ductwork and Plenum Pressures

- 2.2.1 Provide ductwork and plenums of galvanized steel for static pressure categories listed below.

- .1 10" w.g. (2,500 Pa) static pressure:

- .1 Built up supply air plenums between inlet automatic control dampers and discharge automatic control dampers:

.1	INLET DAMPERS	DISCHARGE
	DAMPERS	

.2	CD	and	CD-
----	----	-----	-----

.3	CD	and	CD-
----	----	-----	-----

.4	CD	and	CD-
----	----	-----	-----

.5	CD	and	CD-
----	----	-----	-----

.6	CD	and	CD-
----	----	-----	-----

- .2 6" w.g. (1,500 Pa) static pressure:

- .1 Stair, vestibule and elevator pressurization ducts.

- .2 Smoke evacuation ducts.

- .3 Kitchen exhaust ducts.

- .4 Supply ductwork and plenums downstream from the discharge automatic control dampers listed below, up to the furthest smoke/fire dampers at the ends of supply duct risers ( emerging from duct shafts) or to supply duct smoke dampers in the walls of mechanical rooms.

.1	DISCHARGE DAMPERS
----	-------------------

.2	CD-
----	-----

- .3 CD-
- .4 CD-
- .5 CD-
- .6 CD-
- .3 4" w.g. (1,000 Pa) static pressure:
  - .1 Supply air ductwork downstream from supply air handling units discharge, to the upstream side of mixing boxes/air valves.
  - .2 Exhaust and return air ductwork downstream from return/exhaust air valves to return/exhaust fans and downstream from return/exhaust fans to air handling units and/or outdoor relief.
  - .3 Outdoor intake plenums in mechanical room(s).
- .4 2" w.g. (500 Pa) static pressure:
  - .1 Supply ductwork downstream from mixing boxes/air valves to terminal air outlets.
  - .2 Supply ductwork and plenums on systems without mixing boxes/air valves.
  - .3 Return air ductwork and plenums, except where otherwise specified.
  - .4 Exhaust and relief air ductwork and plenums, except where otherwise specified (welding/sawdust exhaust).
  - .5 Outdoor air ductwork and plenums, except as otherwise specified.

## 2.3 **Ductwork – Under 2" w.g. (500 Pa) Static Pressure**

- 2.3.1 Provide galvanized steel duct work for system operating pressures 2" w.g. (500 Pa) and less. Ductwork shall be constructed, reinforced, sealed and installed to withstand 1-½ times working static pressure.
- 2.3.2 Construct rectangular ductwork in accordance with SMACNA Duct Construction Standards Third Edition - 2005.
- 2.3.3 Nomasco "Ductmate System, Lockformer TDC" or Exanno "Nexus System" may be used for rectangular duct joints.
- 2.3.4 At least two opposite faces of rectangular ductwork shall be joined together using joint which cannot pull apart.
- 2.3.5 Construct rectangular duct fittings in accordance with Section 2 and 4, including Figures 4-1 to 4-9 of SMACNA Duct Construction Standards Third Edition - 2005, but excluding beaded crimp joints and snaplock seams.
- 2.3.6 Construct round ductwork in accordance with Section III, including Tables 3-1 to 3-15 and Figures 3-1 to 3-11, of SMACNA Duct

Construction Standards Third Edition - 2005, but excluding beaded crimp joints and snaplock seams.

- 2.3.7 Construct flat oval ductwork in accordance with Section 3.3 of SMACNA Duct Construction Standards Third Edition - 2005. Joints and seams shall be similar to those indicated for round ducts. Flat oval duct to be used for positive pressure application only.
- 2.3.8 Construct round and flat oval duct fittings in accordance with Section III of SMACNA Duct Construction Standards Third Edition - 2005. Round elbows shall have centreline radius of 1.0 times duct diameter. Sheet metal gauge of fittings and elbows shall have centreline radius of 1.0 times duct diameter. Sheet metal gauge of fittings and elbows shall not be less than thickness specified for longitudinal seam straight duct. Adjustable elbows are not permitted.
- 2.3.9 Cast-in slab ductwork shall be ECCODUCT® product, sizes as noted on the drawings.
  - .1 Acceptable Products: DDK – “In-Slab Duct System” – Reinforced Type, PacAire – “In-Slab Vent Duct System”.

## **2.4 Ductwork – 2” w.g. (500 Pa) and Greater Static Pressure**

- 2.4.1 Provide galvanized steel duct work for system operating pressures 2” w.g. (500 Pa) and over. Ductwork shall be constructed, reinforced, sealed and installed to withstand 1-½ times working static pressure.
- 2.4.2 Construct rectangular ductwork in accordance with SMACNA Duct Construction Standards Third Edition - 2005.
- 2.4.3 Nomasco “Ductmate System”, Exanno “Nexus System” or “Lockformer TDC, TDF system” may be used for rectangular duct joints.
- 2.4.4 Construct rectangular duct fittings in accordance with Section 2 and 4 of SMACNA Duct Construction Standards – Third Edition - 2005.
- 2.4.5 Construct round ductwork in accordance with Section III, including Tables 3-1 to 3-15 and Figures 3-1 to 3-11 of SMACNA Duct Construction Standards Third Edition - 2005.
- 2.4.6 Construct flat oval ductwork in accordance with Section 3.3, of SMACNA Duct Construction Standards Third Edition - 2005. Joints and seams shall be similar to those indicated for round duct. Flat oval duct to be used for positive pressure application only.
- 2.4.7 Construct round and flat oval duct fittings in accordance with Section III of SMACNA Duct Construction Standards Third Edition - 2005. Round elbows shall have centreline radius of 1.5 times duct diameter. Construct 90° elbows of not less than 5 tapered section. Seams and joints in round or oval duct fittings and elbows shall be spot welded lap seams at not more than 2” (50 mm) spacing and

inside seams sealed with approved duct sealant. If zinc coating is burned the steel during welding, joints shall be painted to prevent corrosion. Sheet metal gauges of fittings and elbows shall not be less than thickness specified for longitudinal seam straight duct, but suitably thick for welding methods used.

**2.5 Plenums – Under 2” w.g. (500 Pa) Static Pressure**

- 2.5.1 Provide galvanized steel low pressure plenums, suitable for 2” w.g. (500 Pa) positive or negative pressure, for central plant ventilating and air conditioning equipment.
- 2.5.2 Construct plenums in accordance with Chapter 9 of SMACNA Duct Construction Standards Third Edition - 2005.
- 2.5.3 Where building structure does not form bottom surface of walk-in plenum, fabricate plenum floor panels of 14 ga (1.99 mm) galvanized steel, with angle iron reinforcing to limit deflection of floor panels to ¼” (6 mm) under concentrated load of 250 lb (115 kg) at mid span.
- 2.5.4 Where plenum floors are internally lined, install 16 ga (1.61 mm) thick galvanized steel panel on top of insulation.
- 2.5.5 Apply silicone sealant CGE Silpruf 2000 series or Dow Corning 781/732 between plenum base angles and concrete or curbs before bolting together.
- 2.5.6 Reinforce openings in plenum walls with 1½” (40 mm) x 1½” (40 mm) x ⅜” (4.5 mm) angle iron, secured to main vertical and horizontal reinforcing angles.
- 2.5.7 Construct access door and casing around door as per SMACNA Standards, casing access doors, with angle iron frame sized to suit plenum wall. Doors constructed of 16 ga (1.61 mm) metal.
- 2.5.8 Arrange access doors to open against airflow and static pressure.
- 2.5.9 Weld joints on condensate drains pans. Construct pans of 16 ga (1.61 mm) thick stainless steel Type #302 or #304. Install 1¼” (40 mm) piping connection, complete with water seal at least 4” (100 mm) deep, from pan drain connection to nearest building drain. Install drain connections to completely drain pans.
- 2.5.10 Seal piping penetrations through plenum walls, with gland seals as detailed in SMACNA Duct Construction Standards - 2005.
- 2.5.11 Bulkheads mounting air filters and air coils shall be airtight to prevent air bypass around filters and/or coils.

**2.6 Plenums – 2” w.g. (500 Pa) and Greater Static Pressure**

- 2.6.1 Provide medium/high pressure galvanized steel plenums, suitable for specified pressures.

- 
- 2.6.2 Construct plenums in accordance with Chapter 9 of the SMACNA Duct Construction Standards Third Edition - 2005. If requested, pressure test plenums to specified static pressure (positive or negative) to demonstrate structural integrity.
- 2.6.3 Where building structure does not form bottom surface of walk-in plenum, fabricate plenum floor panels of 14 ga (1.99 mm) galvanized steel, with angle iron reinforcing to limit deflection of floor panels to 1/4" (6 mm) under concentrated load of 250 lb (115 kg) at mid span.
- 2.6.4 Where plenum floors are internally lined, install 16 ga (1.61 mm) thick galvanized steel panel on top of insulation.
- 2.6.5 Apply silicone sealant CGE Silpruf 2000 series or Dow Corning 781/732 between plenum base angles and concrete or curbs before bolting together.
- 2.6.6 Reinforce openings in plenum walls with 2" (50 mm) x 2" (50 mm) x 1/4" (6 mm) angle iron, secured to main vertical and horizontal reinforcing angles.
- 2.6.7 Construct access door and casing around door as per SMACNA Standards, casing access doors, with angle iron frame sized to suit plenum wall. Doors constructed of 16 gauge metal.
- 2.6.8 Arrange access doors to open against airflow and static pressure.
- 2.6.9 Weld joints on condensate drains pans. Construct pans of 16 ga (1.61 mm) thick stainless steel Type #302 or #304. Install 1 1/4" (32 mm) piping connection, complete with water seal, from pan drain connection to nearest building drain. Install drain connections to completely drain pans.
- 2.6.10 Water Seal Depth:
- .1 4" (100 mm) for 2" w.g. (500 Pa) systems.
  - .2 5" (125 mm) for 3" w.g. (750 Pa) systems.
  - .3 6" (150 mm) for 4" w.g. (1,000 Pa) systems.
  - .4 8" (200 mm) for 6" w.g. (1,500 Pa) systems.
  - .5 12" (300 mm) for 10" w.g. (2,500 Pa) systems.
- 2.6.11 Seal piping penetrations through plenum walls with gland seals as detailed in the SMACNA Duct Construction Standards Third Edition - 2005.
- 2.6.12 Bulkheads mounting air filters and air coils shall be airtight to prevent air bypass around filters and/or coils.

## **2.7 Ductwork – Aluminum**

- 2.7.1 The following ductwork shall be fabricated from aluminum:
- .1 Exhaust ductwork from showers/baths, as indicated in drawings.

- .2 Discharge ductwork through roof, where indicated on drawings.
- .3 Swimming pool/spa hot tub ductwork.
- 2.7.2 Low Pressure Aluminum ductwork shall be constructed in accordance with clause 2.2 "Ductwork - 2" w.g. (500 Pa) Static Pressure."
- 2.7.3 For round and rectangular aluminum ductwork, use four gauges heavier than scheduled in the SMACNA Duct Construction Standards, Third Edition (SMACNA 006-2006) for galvanized ductwork.
- 2.7.4 Aluminum shall be utility grade.
- 2.7.5 Support aluminum ductwork using aluminum straps, cadmium plated threaded rods, aluminum flat bar or aluminum angle hangers. Support shall be similar to specified for galvanized iron ductwork.

## **2.8 Ductwork – Stainless Steel – Rectangular**

- 2.8.1 The following rectangular ductwork shall be fabricated from stainless steel:
  - .1 Exhaust ducts carrying moisture such as Dishwasher, Cartwasher, Washer/Sanitizer. Exhaust duct from unit to discharge point.
  - .2 Duct sections containing duct mounted humidifiers.
  - .3 Where indicated on drawings.
- 2.8.2 Low pressure stainless steel ductwork shall be suitable for system operating pressures under 2" w.g. (500 Pa).
- 2.8.3 Material: 18 ga (1.27 mm), #304 stainless steel or #316L for fume hood exhaust ducts, with No. 2B finish where concealed and No. 4 finish exposed. Exposed areas shall include finished occupied areas of building but not mechanical rooms.
- 2.8.4 Do not cross break duct panels. Grade to drain as indicated.
- 2.8.5 Weld longitudinal seams and lateral joints and finish exposed seams and lateral joints by grinding smooth and buffing to finish of sheet. Do not penetrate stainless steel with screws, bolts and rivets.
- 2.8.6 Provide gasketed companion flange connections where necessary to connect to equipment. Flanged connections shall be made by slipping formed 14 ga (1.98 mm) thick matching stainless steel welded angle frame over end of duct, leaving space for continuously welding frame to duct on inside.
- 2.8.7 Provide escutcheon trim bands around duct ceiling penetrations.
- 2.8.8 Provide gasketed cleanouts (not smaller than 18" (450 mm) x 12" (300 mm), with formed 14 ga (1.98 mm) thick matching stainless steel welded angle reinforcing frames, inside of ductwork and not more than 20'-0" (6 m) intervals, changes in direction and base of

risers. Cleanouts shall be fastened with wing nuts at 6" (150 mm) centres. Cleanout openings shall terminate not less than 1½" (40 mm) from bottom of duct.

2.8.9 Gaskets shall be ⅛" (3 mm) thick Teflon or approved alternate.

2.8.10 Support exposed ductwork with 2" (50 mm) x 14 ga (1.98 mm) matching stainless steel (No. 4 finish) U-strap hangers on 8'-0" (2.4 m) centres.

2.8.11 Support concealed ductwork with 2" (50 mm) x 14 ga (1.98 mm) galvanized steel, U-strap hangers at 8'-0" (2.4 m) centres.

## **2.9 Ductwork – Stainless Steel – Round**

2.9.1 The following round ductwork shall be fabricated from stainless steel:

- .1 Exhaust ducts carrying moisture such as Dishwasher, Cartwasher, Washer/Sanitizer. Exhaust duct from unit to discharge point.
- .2 Duct sections containing duct mounted humidifiers.
- .3 Where indicated on drawings.

2.9.2 Material:

- .1 18 ga (1.27 mm), #316L stainless steel for fume hoods, #304 for other applications with No. 2B finish where concealed and No. 4 finish where exposed to room (except mechanical rooms) or exposed outdoors.

2.9.3 Fabrication:

- .1 Fume Hood exhaust ducts shall be constructed of 316L stainless steel to SMACNA Seal Class B Standards minimum. Joints on duct and fittings shall be butt seams continuously MIG welded. Lap type joints are not acceptable. Welded joint in exposed locations must be ground and polished.
- .2 Provide gasketed companion flanged joints and any required transitions for fume hood duct connections.
- .3 Provide escutcheon trim bands around duct ceiling penetrations.
- .4 Provide gasketed cleanouts (not smaller than 18" (450 mm) x 12" (300 mm), with formed 14 ga (1.98 mm) thick matching stainless steel welded angle reinforcing frames, inside of ductwork and not more than 20'-0" (6 m) intervals, changes in direction and base of risers. Cleanouts shall be fastened with wing nuts at 6" (150 mm) centres. Cleanout openings shall terminate not less than 1½" (40 mm) from bottom of duct.

2.9.4 Elbows:

- .1 Round duct elbows shall be made of mitred, welded matching stainless steel or stamped elbows of same material. Welded elbow thickness shall be 18 ga (1.27 mm). 90° elbows shall have minimum of five sections. Centreline radius shall be 1.5 times duct diameter.

2.9.5 Support:

- .1 Support exposed ductwork with 2" (50 mm) x 14 ga (1.98 mm) stainless steel (No. 4 finish), U-strap hangers at 8'-0" (2.4 m) centres.
- .2 Support concealed ductwork with 2" (50 mm) x 14 ga (1.98 mm) galvanized steel, U-strap hangers at 8'-0" (2.4 m) centres.

**2.10 Ductwork – Acoustically Lined**

- 2.10.1 Where rectangular ductwork is indicated acoustically insulated with flexible acoustic duct liner, it shall be installed in accordance with instructions, SMACNA Duct Construction Standards Third Edition – 2005. Duct sizes shown are inside duct liner.
- 2.10.2 Where round ductwork is indicated acoustically insulated, it shall consist of two concentric round ducts with 1" (25 mm) thick flexible fibrous glass duct liner between ducts. Inner duct shall be perforated and correspond to duct diameter noted on drawings. Outer duct shall be suitable for static pressure and shall be sealed airtight where it joins adjacent ductwork.

**2.11 Ductwork – Outdoors**

- 2.11.1 Internally or externally insulated supply, return and exhaust ducts (downstream of heat recovery coils) including silencers, located outdoors on roof, shall be constructed watertight.
- 2.11.2 Joints shall be caulked with water impervious sealant. TDC clips should be continuous on top and sides of ducts.
- 2.11.3 Top of finished product (waterproof membrane) shall be pitched to avoid pooling of water.
- 2.11.4 After pressure testing, exterior of ducts and duct silencers shall be wrapped with waterproof membrane. Membrane shall consist of SBS rubberized asphalt compound, integrally laminated to reinforced aluminum foil, providing waterproof membrane. Product similar to Bakor Foilskin.

**2.12 Plenum Insulation Covering**

2.12.1 Sheet Metal:

- .1 Provide 22 ga (0.85 mm) galvanized sheet metal covering on acoustically lined plenum walls for distance of 4'-0" (1.2 m) downstream from cooling coils.

2.12.2 Perforated Metal:

- .1 Provide 22 ga (0.85 mm) thick perforated galvanized sheet metal covering on acoustically lined plenum walls (except immediately adjacent to downstream side of cooling coils where it should not be perforated).

**2.13    Air Distribution Plates**

- 2.13.1 Provide perforated air distribution plates at discharge of supply fans if required to provide a balance flow of air through downstream filters and coils.
- 2.13.2 Modify and reposition plates as necessary to balance airflow through downstream filters and coils to  $\pm 10\%$

**2.14    Coil End Covers**

- 2.14.1 Provide coil end casings to eliminate coil frame air leakage.
- 2.14.2 Provide for cooling coil ends to drop condensate to coil drain pan. Insulate and vapour seal inside of coil end casing to prevent casing condensation and provide closure panels to retain insulation.

**2.15    Wire Mesh Screens**

- 2.15.1 Provide wire mesh screens in air intake openings.
- 2.15.2 Screens shall be constructed from aluminum wire 16 ga (1.29 mm) diameter.
- 2.15.3 Screen mesh shall be  $\frac{1}{2}$ " (15 mm).
- 2.15.4 Mount screens in 20 ga (0.81 mm) thick folded aluminum frames.

**2.16    Counter Flashings**

- 2.16.1 Counter flashings - galvanized sheet steel of 22 ga (0.85 mm) minimum thickness.
- 2.16.2 Counter flashings are attached to mechanical equipment and lap base flashings on roof curbs.
- 2.16.3 Joints in counter flashings shall be flattened and solder double seam. Storm collars shall be adjustable to draw tight to pipe with bolts. Caulk around top edge. Storm collars shall be used above roof jacks.
- 2.16.4 Vertical flange section of roof jacks shall be screwed to face of curb.

**3 .    EXECUTION**

**3.1    Ductwork and Plenum Installation**

- 3.1.1 Where duct contains a fire or smoke damper, construct duct so free area is maintained through damper.

- 
- 3.1.2 Where duct is internally insulated, enlarge duct to not reduce free area.
  - 3.1.3 Make taper of diverging transitions less than 20° and taper of converging transitions less than 30° in accordance with SMACNA Duct Construction Standards Third Edition - 2005. Maximum divergence upstream of equipment to be 30° and 45° convergence downstream.
  - 3.1.4 Make inside radius of rectangular duct elbow at least equal to duct width, measured in direction of radius. If space conditions do not permit full radius elbow, use square elbows with multi-blade turning vanes.
  - 3.1.5 Turning vanes shall be single wall type. Vanes in galvanized sheet metal ducts shall be constructed from galvanized steel, minimum thickness 22 ga (0.85 mm). Vanes shall be spaced at 1½" (40 mm) centres and shall turn through 90° with radius of 2" (50 mm). Vanes shall not include straight trailing edge. Vanes and runners in aluminum ducts shall be constructed from aluminum. Aluminum vanes shall be 18 ga (1.02 mm).
  - 3.1.6 For under 2" w.g. (500 Pa) pressure systems, install tie rods to limit maximum unsupported vane length to 36" (900 mm). Refer to Figure 2-4 of the SMACNA Duct Construction Standards Third Edition – 2005.
  - 3.1.7 For 2" w.g. (500 Pa) and greater pressure systems, install tie rods to limit maximum unsupported vane length to 18" (450 mm). Refer to Figure 2-4 of SMACNA Duct Construction Standards Third Edition - 2005
  - 3.1.8 Install duct necks before grilles, registers and diffusers and cushion heads after diffuser take-offs to suit site conditions.
  - 3.1.9 Where indicated, install adjustable air turning devices, where full radius take-off fittings cannot be installed, in accordance with SMACNA Duct Construction Standards Third Edition - 2005. Adjustment shall be accessible outside duct with lockable quadrant operator or through grille or register with key-operated worm gear mechanism.
  - 3.1.10 Cross-break or bead metal duct panels unless otherwise noted.
  - 3.1.11 Do not cross-break duct panels on 2" w.g. (500 Pa) and greater static pressure systems.
  - 3.1.12 Do not cross-break bottom duct panels when ductwork is handling moisture.
  - 3.1.13 Roof mounted ducts shall have standing seams and shall be sealed weather tight.
  - 3.1.14 Grade ductwork handling moist/humid air, minimum of 1" (25 mm) in 10'-0" (3.0m) back to source. At low points in ductwork, provide

- 
- 6" (150 mm) deep drain sump and 1¼" (32 mm) diameter drain connection with deep seal trap and pipe to drain.
- 3.1.15 Construct ductwork handling moisture with three sided bottom sections and separate top panel. Install three sided bottom sections and internally seal transverse joints with CGE Silicone Sealant "Silpruf". Then install top panels and seal top panel seams and joints.
- 3.1.16 Provide floor drains in outside air and humidifier sections with deep seal traps.
- 3.1.17 Provide moisture collection sections inside louvres for outside air and exhaust air.
- 3.1.18 Support ductwork using galvanized steel straps, cadmium plated threaded rods, flat bar or angle hangers. Attachments to structure shall be compatible with structure and selected for load of ductwork. Install ductwork hangers in accordance with Chapter 5 of SMACNA Duct Construction Standards Third Edition - 2005.
- 3.1.19 Support duct risers at base and each floor and not greater than 12'-0" (3.6 m) intervals.
- 3.1.20 Prior to fabrication of ductwork, coordinate and field measure to ensure complete installation respecting other services. Provide necessary fittings, offsets, and alternate construction methods to facilitate installation.
- 3.1.21 Arrange ductwork and plenums so duct and plenum mounted equipment can be removed.
- 3.1.22 Arrange access doors to open against airflow and static pressure.
- 3.1.23 Provide necessary baffling in manufactured or built-up mixed air plenums to ensure good mixed air temperature with variations of not more than  $\pm 9^{\circ}\text{F}$  ( $5.5^{\circ}\text{C}$ ) under operating conditions.
- 3.1.24 Ducts passing through non-rated fire separations, sound insulated walls and through non-rated walls and floors shall be tightly fitted and sealed on both sides of separation with silicon sealant to prevent passage of smoke and/or transmission of sound (ULC approved fire stop sealant is not required). Where ducts are insulated, provide 24 ga (0.70 mm) thick galvanized steel band tightly fitted around insulation and caulk to band.
- 3.1.25 During construction, protect openings in ductwork from dust infiltration by covering with polyethylene and protect floor outlet duct openings with metal caps.
- 3.1.26 Where ductwork passes through open web steel joists, coordinate with joist fabricator before fabricating ductwork.
- 3.1.27 Where ducts penetrate roofs, install sleeves and roof curb complete with flashing and counter flashing. Pack sleeves in roof with fibreglass insulation.
-

- 3.1.28 Provide drip pans under piping and shields for protection of electrical panels and equipment.
- 3.1.29 Unless noted otherwise, line builder's shafts and air plenums used as ducts and plenums with sheet metal.
- 3.1.30 In-slab ducts shall be sealed at all joints and fittings with two coats of low pressure duct sealer. Support cast-in-place ductwork on chairs and/or from rebar such that duct is at least 2" (50 mm) above bottom of slab, or as directed by the Structural Consultant. Grade duct to outside as much as possible and as far as possible. Avoid dips that create places for condensation to accumulate.

### **3.2 Ductwork and Plenum Cleaning**

#### **3.2.1 Responsibility:**

- .1 This Contractor shall be responsible for all ductwork installed under this contract being internally CLEAN, when handed over to Owner. This responsibility includes entire systems from outdoor air intakes to air terminals and from air terminals to relief outlets. It includes ductwork, lined and unlined, plenums and equipment within or connected to ducts and plenums.
- .2 Surfaces shall be considered clean when foreign materials capable of particulating and visible to naked eye are removed.

#### **3.2.2 Installation Procedure:**

- .1 Ductwork shall be wiped clean prior to installation.
- .2 LEED® Requirement: Oil film on sheet metal shall be removed before shipment to Work Site. Ducts shall be inspected to confirm that no oil film is present.
- .3 Close dampers immediately following installation, checking operation and retarding movement of contaminants through system.
- .4 Seal opening at end of each day and other times as site conditions dictate.
- .5 Floor opening to be capped with sheet metal or floor grilles plus 6 mils (0.15 mm) thick poly sheet.
- .6 Other openings to be covered with 6 mils (0.15 mm) thick poly sheet taped to be air tight.

#### **3.2.3 Cleaning Procedure:**

- .1 On completion of duct and plenum installation and prior to installation of air terminals and prior to balancing of air systems, but not until areas are substantially clean (floors have been swept and vacuumed) and "dirty" construction has been completed, employ an approved Cleaning Agency to vacuum clean the following:

- 
- .1 Air handling units.
  - .2 Plenums.
  - .3 Supply and return air ducts.
  - .4 Exhaust air ducts.
  - .2 Components within each system shall be thoroughly cleaned and include, but not be limited to, the following: coils, fans and motors, silencers, air terminals and mixing boxes/air valves.
  - .3 When connection to existing supply ductwork, clean existing supply ducts upstream from connection back to filters. Clean existing supply ductwork downstream from new connections to outlets.
  - .4 Cleaning shall generally be by high capacity power vacuum. High pressure compressed air, wire brushing and/or non-toxic solvent cleaning shall be used where dirt or scale cannot be removed otherwise. Coils shall be de-scaled.
  - .5 Cleaning Contractor shall be responsible for removing and replacing filter media. This Contractor will remove temporary filters and replace with new after cleaning system.
  - .6 Cleaning Contractor shall mark balancing damper positions before cleaning and return them to original position when cleaning completed unless system is still to be balanced.
  - .7 Reinstall grilles, registers and diffusers, removed for cleaning purposes.
  - .8 After duct systems have been cleaned, reseal if they are not being used. Provide filter media on return air terminals if return air fans are run after cleaning completed.
  - .9 Cleaning Agency shall perform full inspection of duct interior. Utilizing fibre optic borescope with dedicated light source, inspect interior ductwork surfaces, and ductwork accessories, including terminal units, mixing boxes/air valves, ductwork liners, duct-mounted coils, filters, dampers, humidifiers and other appurtenances within ductwork system.
  - .10 Spot checks will be made by Consultant during cleaning process to verify required standard is being met. When substantial completion is claimed, final spot checks will be made to verify ducts are clean. Make available to Consultant, fibre optic borescope with dedicated light source. If any ducts are found to be dirty, they shall be recleaned.
  - .11 Ducts serving very clean areas, served with 85% NBS or HEPA filters, shall be reviewed by Consultant utilizing equivalent of white glove wipe technique.

- 
- .12      Submit report from cleaning agency that certifies specified air systems have been cleaned.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

- 1.1.1 This Specification Section forms part of contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 Quality Assurance

- 1.2.1 Catalogued or published ratings shall be obtained from tests carried out by Manufacturer or from independent testing agency signifying adherence to codes and standards.
- 1.2.2 Flame and smoke spread ratings less than 25/50 and tested in accordance with CAN/ULC-S102 "Test for Surface Burning Characteristics of Building Materials".

## 2. PRODUCTS

### 2.1 Air Blenders

#### 2.1.1 Minimum Requirements:

- .1 Units factory built and tested.
- .2 Completely fixed devices, no moving parts.
- .3 12 ga (2.05 mm) thick aluminum, welded construction.
- .4 Blender mounted on discharge side of supply fans shall function as diffuser to maintain even velocity over entire face of final filters and coils.
- .5 Factory engineered and fabricated discharge cone/transition/diffuser assembly. Unit shall be built with flanges to fit fan discharge and outlet equipped with mounting plate to fit plenum walls.

#### 2.1.2 Standard of Acceptance:

- .1 Blender Products Inc.

### 2.2 Biosafety Cabinets – Manual Isolation Valves

#### 2.2.1 Minimum Requirements:

- .1 304 stainless steel - manual butterfly control valve.
- .2 Lockable handle with pointer to indicate percent open.
- .3 Valve plate with silicone gasket to ensure airtight shutoff.
- .4 Size to suit exhaust duct.

#### 2.2.2 Standard of Acceptance:

- .1 NuAire Model NU-940.

---

**2.3 Backdraft Dampers – Light Duty**

2.3.1 Minimum Requirements:

- .1 16 ga (1.61 mm) thick galvanized steel or 16 ga (1.61 mm) aluminum channel frame.
- .2 24 ga (0.51 mm) thick embossed aluminum blades.
- .3 Full blade length shafts, brass bearings.
- .4 Felt or neoprene anti-chatter blade strips.
- .5 Maximum blade height per section, 24" (600 mm), use multiples for larger dimensions.
- .6 Maximum blade length of 18" (450 mm), use multiples for larger dimensions.
- .7 Manufacturer's label.
- .8 Where balanced backdraft damper (BBD) is indicated, damper shall incorporate adjustable counter balance weight and lever.
- .9 Maximum pressure drop across damper at 800 ft/m (4 m/s) shall be 0.14" w.g. (35 Pa).

2.3.2 Standard of Acceptance:

- .1 EH Price CBD, Nailor, Ruskin, Westvent.

**2.4 Backdraft Dampers – Medium Duty**

2.4.1 Minimum Requirements:

- .1 16 ga (1.61 mm) galvanized steel or 16 ga (1.61 mm) aluminum channel frame.
- .2 14 ga (1.63 mm) aluminum blades, complete with stiffening ribs/bends.
- .3 Full blade length shafts, brass ball or nylon bearings.
- .4 Felt or neoprene anti-chatter blade strips.
- .5 Blade connecting linkage with eyelet and pin bearings.
- .6 Maximum blade length of 30" (750 mm), use multiples for larger dimensions.
- .7 Manufacturer's label.
- .8 Where balanced backdraft damper (BBD) is indicated, damper shall incorporate adjustable counter balance weight and lever.
- .9 Maximum pressure drop across damper at 800 ft/m (4 m/s) shall be 0.18" w.g. (45 Pa).

2.4.2 Standard of Acceptance:

- .1 Airolite 625, Penn CBD-6.

---

## 2.5 Balancing Dampers

2.5.1 Construction in accordance with SMACNA Duct Standards. PIN type balancing dampers are not permitted.

2.5.2 Minimum Requirements:

- .1 Rectangular ducts:
  - .1 Up to 12" (300 mm) deep - single blade (butterfly type).
  - .2 13" (325 mm) to 16" (400 mm) deep - two opposed blades, mechanically interlocked with pivots at quarter points.
  - .3 17" (425 mm) deep and over - multiple opposed blades, mechanically interlocked with blades not greater than 8" (200 mm) deep and pivots equally spaced.
- .2 Round Ducts:
  - .1 Single Blade (butterfly type).
- .3 Material:
  - .1 Minimum 16 ga (1.61 mm) thick galvanized steel blades on butterfly dampers.
  - .2 Minimum 16 ga (1.61 mm) thick galvanized steel blades on multi-blade dampers with rigidly constructed galvanized steel frame (no frame required on single blade dampers).
  - .3 Minimum 18 ga (1.27 mm) thick stainless steel blades for fume exhaust ducts.
- .4 Bearings:
  - .1 End bearings on low pressure single blade dampers above 12" (300 mm) diameter.
  - .2 Bearings on multiple blade dampers shall be bronze iolite type.
- .5 Operating Mechanism:
  - .1 Lockable quadrant type with end bearing on accessible rectangular ducts up to 16" (400 mm) deep and on accessible round ducts.
  - .2 Wide pitch screw mechanism type with crank operator on accessible rectangular ducts 17" (425 mm) and over in depth and on inaccessible rectangular and round ducts.
  - .3 Override limiting stops.
  - .4 No blade movement in set position.
- .6 Concealed Regulators:
  - .1 For drywall ceilings with no access panels, provide concealed balancing damper regulators embedded in

finished ceiling, mounted behind grilles, on or inside plenum slot diffusers and various other types of diffusers. Concealed damper regulator to be connected to balancing damper by means of flexible Bowden cable and installed flush with ceiling. Cover plate held in place with 2 screws and easily removed for damper adjustment. Concealed damper regulator similar to Young Regulator Co. Model No. 270-301. Provide necessary hardware, including Young Regulator balance damper model 5020-CC, Bowden cable and Young Regulator Model 030-12 wrench.

- .2 Drawing designation: D (CR).

## **2.6 Duct and Plenum Access**

### **2.6.1 Dimensions:**

#### **.1 Doors:**

- .1 20" (500 mm) wide x 54" (1,300 mm) high.
- .2 Head of door 70" (1,750 mm) above floor.

#### **.2 Panels:**

- .1 15" (375 mm) x 20" (500 mm).
- .2 Where far corners of the duct are closer than 20" (500 mm) and equipment within duct is closer than 12" (300 mm) size may be reduced to 16" (400 mm) x 12" (300 mm) or 18" (450 mm) x 10" (250 mm) elliptical.
- .3 Where space will not permit above dimensions they should be matched as closely as possible and additional access provided as required.

### **2.6.2 Products:**

- .1 Doors - construct in accordance with SMACNA Duct Standards Figure 6-12 except for latch type. 1½" (40mm) thick insulation.
- .2 Panels - Nailor Hart, Ventlok, 1" (25 mm) thick insulation.
- .3 Gaskets - neoprene or foam rubber.

### **2.6.3 Hardware:**

- .1 Panels up to 16" (400 mm) x 12" (300 mm) - 2 sash locks.
- .2 Panels – 15" (375 mm) x 20" (500 mm) - 4 sash locks.
- .3 Doors - piano hinge and Ventlok 310 latches complete with front and inside handles and front door pull.

---

## 2.7 Duct Connectors – Thermal Breaks

- 2.7.1 Provide flexible duct connections to provide thermal breaks in sheet metal ducts and plenums passing through or terminating at exterior of building. Install inside building.
- 2.7.2 Minimum Requirements:
- .1 Pre-assembled 3" (80 mm) long thermal barrier with 3" (80 mm) long, 24 ga (0.70 mm) galvanized steel duct connectors on each side of thermal break.
  - .2 Thermal break - heavy fibreglass fabric with elastomer coating.
- 2.7.3 Standard of Acceptance:
- .1 Duro Dyne "Durolon," Ventfabrics "Ventlon."

## 2.8 Duct Connectors – Vibration Isolation

- 2.8.1 Provide flexible duct connections to provide vibration isolation at duct and plenum connections to fan and air handling units. See Figure 2-19 SMACNA Duct Standards.
- 2.8.2 Minimum Requirements:
- .1 Pre-assembled 3" (80 mm) minimum long flexible connection with 3" (80 mm) long 24 ga (0.70 mm) galvanized steel duct connectors on each side of flexible connection. Flexible connector - fibre glass fabric with elastomer coating.
- 2.8.3 Centrifugal fans with 36" (900 mm) diameter and larger fan wheels, use 6" (150 mm) long flexible connection.
- 2.8.4 Do not install connectors on perchloric acid fume exhaust systems.
- 2.8.5 Standard of Acceptance:
- .1 Duro Dyne "Durolon," Dynair "Hypalon," Ventfabrics "Ventlon".

## 2.9 Ductwork – Flexible – Plain

- 2.9.1 Provide factory fabricated plain, flexible air ductwork for the following applications:
- .1 Connections to air terminals.
  - .2 Connections to downstream side of mixing boxes/air valves.
  - .3 Connections to round fire dampers (up to 12" (300 mm) diameter) min. 10" (250 mm) long to a maximum of 14" (350 mm) long. To act as fire damper access section.
- 2.9.2 Minimum Requirements:
- .1 Non-corrosive spirals wire reinforcing flexible vinyl coated fibreglass cloth membrane.
  - .2 Suitable for up to 10" w.g. (2,500 Pa) positive static pressure and 1" w.g. (250 Pa) negative static pressure.

- .3 UL or ULC labelled, Class 1, duct connector.
- .4 Flame spread rating not to exceed 25. Smoke developed rating not to exceed 50.

2.9.3 Standard of Acceptance:

- .1 Flexmaster FAB4, Thermaflex SLP10, ATPC UPC#017 Class 'O'.

**2.10 Ductwork – Flexible – Insulated**

2.10.1 Provide factory fabricated insulated flexible ductwork for the following application:

- .1 Connections to downstream side of variable volume and consistent volume mixing boxes, where indicated.
- .2 Connections to air terminals where indicated.

2.10.2 Minimum Requirements:

- .1 Flexible vinyl coated steel helix bonded to inner duct liner. Fibrous glass thermal insulation.
- .2 Outer jacket of metalized fire-resistant vapour barrier.
- .3 Suitable for up to 2" w.g. (500 Pa) positive static pressure and/or 1" w.g. (250 Pa) negative static pressure.
- .4 UL or ULC labelled, Class 1, duct connector.
- .5 Acoustically rated.

2.10.3 Standard of Acceptance:

- .1 Gladd-Flex ABL-181, Thermaflex M-KE, Wiremold WK, ATCO UPC #070.

**2.11 Ductwork and Plenum Sealers**

2.11.1 Provide water-based duct sealing compounds for use in fabrication of ductwork and plenum joints.

2.11.2 Low Pressure Systems - SMACNA Seal Classification B. Medium and High Pressure Systems - SMACNA Seal Classification A.

2.11.3 Standard of Acceptance:

- .1 Foster 32-19, Hardcast Versa Grip, Hardcast Foil Grip 1402, Robson's Duct Seal-WB, United Duct Sealer, Trans Continental Multi-Purpose.

2.11.4 Where accessible, apply sealer to inside of joints on ducts and plenums under positive pressure - e.g. discharge side of fans.

2.11.5 Apply sealer to outside of joints on ducts and plenums under negative pressure - e.g. suction side of fans.

**2.12 Fire Dampers**

2.12.1 Minimum Requirements:

- .1 Fire dampers shall be ULC or Warnock Hersey tested and shall bear testing agency's label.
- .2 Fire dampers shall meet requirements of National Building Code and authorities having jurisdiction.
- .3 Fire dampers shall be "dynamic," rated to close under airflow, where the air system runs during a fire alarm condition.
- .4 Fire dampers may be static type in applications where there is no airflow/air system is off in a fire alarm condition.
- .5 Mild steel, factory fabricated for fire rating requirement to maintain integrity of fire separation.
- .6 Fusible link actuated, weighted to close and lock in closed position when released or having negator-spring-closing operator for multi-leaf type in horizontal position with vertical airflow.
- .7 Fire dampers in low-pressure ductwork may be multi blade or curtain type.
- .8 Fire dampers in medium and high pressure ductwork shall be curtain type.
- .9 Curtain fire dampers shall be blades retained in recess so free area of connecting ductwork is not reduced.
- .10 Fusible Links: ULC approved with melting point of 165°F (74°C) on supply, return and exhaust air systems. Use fusible links with melting point of 286°F (141°C) on return and exhaust air systems if used for smoke venting.
- .11 Standard of Acceptance
  - .1 Static Type – Price FD, Type A, B, or C as required, Nailor, Controlled Air.
  - .2 Dynamic Type – Price FDD, Type A, B, or C as required, Nailor, Controlled Air.
- .12 Fire damper access panel/door in rigid ductwork shall be equal to Nailor 0800 type, with acoustic insulation of duct is lined, without insulation if duct is unlined.
- .13 The following air systems shall be equipped with static or dynamic fire dampers as noted:

Air System	Service	Static Type	Dynamic Type
AHU-xx			
AHU-yy			
AHU-zz			

## 2.13 Fire/Smoke Combination Dampers

### 2.13.1 Minimum Requirements:

- .1 Smoke dampers to be labelled to ULC Standard CAN/ULC S112.1-M90 and UL 555S.
- .2 Pivoted blade type.
- .3 Auxiliary operating shaft.
- .4 Galvanized steel frames, blades, gussets and blade stops.
- .5 Stainless steel jamb seals.
- .6 Silicone rubber blade seals.
- .7 Factory assembled caulked sleeve to required length (Contractor to advise).
- .8 ULC approved fusible links with melting point of 165°F (74°C) on supply, return and exhaust air systems. Use fusible links with melting point of 286°F (141°C) on return and exhaust air systems if used for smoke venting.
- .9 For dampers less than 2.7 ft<sup>2</sup> (0.25 m<sup>2</sup>) damper size shall be same size as duct size measured inside damper frame. Enlarge ducts to accommodate damper frames.
- .10 Smoke dampers shall be equipped with two CSA approved end switches linked directly to damper blade. End switches shall provide positive status indication of full open and full closed blade position. Mount switches in self-contained enclosure and wired outside of duct.
- .11 Actuators for smoke dampers shall be supplied with smoke dampers as single entity which meets applicable UL555 and UL 555s qualification for both dampers and actuators. Actuators shall be rated for 350°F (177°C) elevated temperature classification. Actuators shall be mounted so supply duct smoke damper fails to closed position and return/exhaust dampers fail to open position.
- .12 Actuators (unless otherwise noted) shall be 120/1/60. Coordinate with Electrical.

2.13.2 Standard of Acceptance:

- .1 Leakage Class II, Ruskin FSD-36, Price.

2.13.3 Standard of Acceptance:

- .1 Leakage Class I, Ruskin FSD-60, Price.

**2.14 Fire Dampers – Ceiling**

2.14.1 Minimum Requirements:

- .1 ULC tested and labelled.
- .2 Spring loaded heat retardant blanket or insulated damper blades.
- .3 165°F (74°C) fusible links.

- .4 Where diffuser/grille neck is smaller than diffuser/grille face area, provide UL listed CK 2000 thermal blanket over ceiling plenum side of exposed diffuser/grille.
- .5 Install above each diffuser/grill mounted in fire rated ceiling.
- .6 Provide transition plates (round to rectangular).

2.14.2 Standard of Acceptance:

- .1 Price, Ruskin CFSR, Nailor Hart.

**2.15 Fire Dampers – Combination Register Damper**

2.15.1 Minimum Requirements:

- .1 Warnock- Hersey tested and labelled.
- .2 Combined opposed blade damper with spring tensioned fusible link.
- .3 Fasten to 10 ga (3.51 mm) thick steel sleeve, welded with integral flange on register side.

2.15.2 Standard of Acceptance:

- .1 EH Price VCS-4, Tuttle & Bailey 90A.

**2.16 Fire Stop Flaps**

2.16.1 Minimum Requirements:

- .1 Single damper flap with spring catch.
- .2 ULC tested and labelled.
- .3 Construct of minimum 16 ga (1.61 mm) thick sheet steel with  $\frac{1}{16}$ " (<sub>16</sub>) thick on unexposed side and corrosion-resistance pins and hinges.
- .4 ULC approved fusible links with maximum melting point of 165°F (74°C).
- .5 Arranged not to reduce duct free area.

2.16.2 Standard of Acceptance:

- .1 Ruskin CFSF.

**2.17 Flow Measuring Devices - Air**

2.17.1 Flow Measuring Station:

- .1 16 ga (1.61 mm) thick galvanized steel casing with duct connecting flanges.
- .2 Aluminum honeycomb air straightening cell.
- .3 Total pressure sensors and static pressure sensors interconnected by copper manifolds.
- .4 Total and static pressure external ports with fittings for connecting to flow meter or control system.
- .5 Identification label listing unit size, design air quantity and direction of air flow.

- .6 Capable of 0-5000 fpm range, 2% of reading sensor airflow accuracy, complete with transmitter configuration to match DDC Controls connection and measurement requirements.
  - .7 Accessories:
    - .1 Magnehelic differential pressure gauge scaled in air volume cfm (L/s).
  - .8 Standard of Acceptance:
    - .1 Air Monitor Fan E and DAMD, EBTRON Gold GTx116-P+, Ebton Elf for ducts less than 14" (350 mm) diameter.
- 2.17.2 Airflow Probe (Duct or Fan Inlet):
- .1 Aluminum construction.
  - .2 Multiple traverse probes.
  - .3 Traverse probe to contain multiple total and static pressure sensors located along exterior surface of probe and internally connected to respective averaging manifolds.
  - .4 Threaded end support rod and mounting plate with gasket and signal fittings.
  - .5 Fan inlet probes (two per inlet) with dual end support swivel brackets suitable for mounting in fan inlet bell.
  - .6 Capable of producing an output signal linear and scaled to air volume (4-20 mADC, 0-10 VDC, 0-5VDC).
  - .7 Capable of local digital display of continuous indication of air volume.
  - .8 Standard of Acceptance:
    - .1 Air monitor VOLU-probe/7200AZ (Duct).
    - .2 Air monitor VOLU-probe/7200AZ (Fan Inlet).

## 2.18 **Implosion/Explosion Doors**

- 2.18.1 Doors shall be in accordance with WCB Regulations, constructed as per hinged access doors.
- 2.18.2 Latches shall be Brixon Safety Latches (Brixon Manufacturing Co., 859 North Prior Avenue, St. Paul, Minnesota, 55104).
- 2.18.3 Latches shall be complete with handles and have adjustable release force as follows:

Latch Model	Release Force Range
2H	5 lb (2.3 kg) to 33 lb (15 kg)
3H	20 lb (9.1 kg) to 180 lb (82 kg)
4H	44 lb (20 kg) to 260 lb (118 kg)

- 2.18.4 Refer to drawings for locations of implosion/explosion doors and required number of latches.
- 2.18.5 Provide heavy duty safety chains to limit door swings.

- 2.18.6 Adjust tensions on implosion/explosion door latches so door opens at static pressure differential not greater than 2" w.g. (500 Pa) above/below specified static pressure rating of duct or plenum.
- 2.18.7 Perform tension tests on doors to verify doors open at settings on latches.
- 2.18.8 Adjust tensions on latches and permanently mark final setting of adjustment screws.

## **2.19 Instrument Test Ports**

### **2.19.1 Application:**

- .1 Provide instrument test ports in each plenum access door (unless more than one door serves a plenum compartment).
- .2 Locate ports to permit easy reading of instruments.

### **2.19.2 Minimum Requirements:**

- .1 16 ga (1.61 mm) thick steel zinc plated after manufacture.
- .2 Cam lock handles with neoprene expansion plug and handle chain.
- .3 1" (25 mm) minimum inside diameter. Length to suit insulation thickness.
- .4 Neoprene mounting gasket.

### **2.19.3 Standard of Acceptance:**

- .1 Duro Dyne IP1 or IP2.

## **2.20 Anaesthetic Gas Scavenging Devices**

2.20.1 Nitrous oxide gas scavenging devices shall be provided as described below and shall be wall mounted where indicated on drawings and/or listed below.

2.20.2 Class 1 Anaesthetic Gas Scavenging devices complete with ¾" (20 mm) and 1¼" (32 mm) taper fitting for connection to standard anaesthetic gas disposal tubing. Device shall be suitable for connection to building exhaust system.

2.20.3 Outlet nameplate permanently colour coded in accordance with CSA Z305.1, and sealed behind protective Lexan cover.

2.20.4 Outlets to be single modular units designed for ganging of rough-in plates in field to form multiple units.

2.20.5 Chrome trim plate to provide automatic plaster adjustment from ½" (15 mm) to ⅞" (22 mm).

2.20.6 Outlet complete with ¾" (20 mm) OD Type L inlet supply tube which shall connect to building exhaust duct.

2.20.7 Standard of Acceptance: Tri-Tech Medical, Model M1133 recessed wall outlet.

2.20.8 Outlet Locations:

- .1 Maternal Care Program, LBRP rooms.
- .2 Bio-Medical Engineering.
- .3 Anaes Work Room.
- .4 Special Procedure Angio.

### 3 . **EXECUTION**

#### 3.1 **Biosafety Cabinets – Manual Valves**

- 3.1.1 Manual valve to be installed at exhaust connection to each biosafety cabinet.

#### 3.2 **Balancing Dampers**

- 3.2.1 Provide balancing dampers at points on low pressure supply, return and exhaust systems where branches are taken from larger duct as required for proper air balancing complete with 1" (25 mm) high stand-off bridges for operators to allow full, continuous duct insulation.
- 3.2.2 Provide balancing dampers at each run out to grille or diffuser.
- 3.2.3 Identify airflow direction and blade rotation and open and closed position
- 3.2.4 On round ductwork larger than 12" (300 mm) diameter and externally insulated rectangular ductwork, provide sheet metal bridge to raise quadrant type operator above insulation thickness (coordinate with Section 23 07 13). Provide open end bearing where bridges are used. Bridges on uninsulated round ducts shall be at least 1" (25 mm) high.
- 3.2.5 Where quadrant type operators are used, lever shall be arranged parallel with damper blade complete with 1" (25 mm) high stand-off bridge for operators to allow continuous duct insulation to be applied on the duct.

#### 3.3 **Backdraft Dampers**

- 3.3.1 Install backdraft dampers on exhaust and relief openings through building walls and roof on exhaust fans where control dampers are not called for or indicated.

#### 3.4 **Control Dampers – Automatic**

- 3.4.1 Packaged equipment specified to be complete with control dampers, shall include control dampers as normally supplied by equipment Manufacturer unless otherwise noted.
- 3.4.2 Other automatic control dampers are specified in Controls Sections.

- 3.4.3 Under this section be responsible for receipt, handling, storage and installation of control dampers supplied under Control or other Sections.
- 3.4.4 Indicated size of control dampers is dimension outside frame. Oversize ductwork to include depth of damper frame if pressure drop across damper exceeds 0.1" w.g. (25 Pa).
- 3.4.5 Control damper frames shall be fitted tightly into ductwork and sealed airtight.
- 3.4.6 Check that dampers are installed square and true. Ensure damper end linkages are easily accessible. Provide saw-cuts with black paint in the exposed ends of all damper shafts, aligned with damper blade for visual indication of damper blade position.
- 3.4.7 Do not install control dampers in thickness of wall unless otherwise indicated.

### **3.5 Duct and Plenum Access**

- 3.5.1 Locations: Provide access doors and panels as follows:
  - .1 Doors: Where indicated on drawings.
  - .2 Panels:
    - .1 Every 40'-0" (12.2 m) on ductwork.
    - .2 Base of each duct riser.
    - .3 Both side of equipment blocking duct e.g.
      - .1 Air flow measuring stations.
      - .2 Coils.
    - .4 At or to one side of other equipment in duct, e.g.
      - .1 Backdraft dampers (counter weight side).
      - .2 Balance dampers serving multiple outlets/inlets.
      - .3 Bearings (fans/motors).
      - .4 Control dampers.
      - .5 Control sensors.
      - .6 Fire dampers (rectangular ducts and round ducts 13" (325 mm) diameter and larger - latch side).
      - .7 Heat detectors (upstream from device).
      - .8 Smoke dampers (operator side).
      - .9 Smoke detectors (upstream from device).
    - .5 Panels need not be provided where access is available through door or register mounted to side of duct.
    - .6 Kitchen exhaust access requirement specified under "Ductwork - Kitchen - Exhaust."
  - .3 Patches:
    - .1 Where required for cleaning and where access panels are not specified e.g. on both sides of turning vanes.

- .4 Flexible duct - on round duct and round fire dampers up to 12" (300 mm) diameter.

- 3.5.2 Seal frames airtight.
- 3.5.3 Install to not interfere with airflow.
- 3.5.4 Install to provide access for service and cleaning.
- 3.5.5 Do not use sheet metal screws for attaching access panels to ductwork.
- 3.5.6 Round ducts 13" (325 mm) diameter and larger shall include a short collar for installation of access panels.
- 3.5.7 Small rectangular ducts shall be transitioned to minimum dimension across duct of 13" (325 mm) for installation of access panels.

### **3.6 Duct Connectors – Vibration Isolation**

- 3.6.1 Ensure flexible duct connectors do not reduce duct free area on suction side of fans.

### **3.7 Ductwork – Flexible**

- 3.7.1 Installed lengths shall be limited to 6 times duct diameter but not longer than 4'-0" (1.2 m).
- 3.7.2 Connect to ductwork and diffusers with stainless steel worm drive clamps or Panduit adjustable clamps or Thermaflex duct strap applied over two wraps of duct tape. Use stainless steel clamps on connections to fire dampers.
- 3.7.3 Minimum centreline radius of flexible ductwork bend shall be 1.5 time duct diameter, alternatively, sheet metal elbow may be used at branch takeoffs and boot diffuser connections.
- 3.7.4 Support with 1" (25 mm) x 22 ga (0.85 mm) galvanized steel straps at a maximum of 24" (600 mm). Straps shall completely encircle duct.
- 3.7.5 Support clear of ceiling assembly, light fixtures and hot surfaces.

### **3.8 Fire Dampers**

- 3.8.1 Install in accordance with the SMACNA Fire, Smoke and Radiation Damper Installation Guide for HVAC Systems - Fourth Edition 1992. Demonstrate fire damper drop test for **all 50% 25% 10%** of fire dampers installed in this project.
- 3.8.2 Fire damper sleeves must not extend more than 3" (80 mm) from wall on each side.
- 3.8.3 Fire dampers shall be installed within wall thickness of fire separation.
- 3.8.4 Wall openings sized to allow sleeve/damper expansion.

- 
- 3.8.5 Arrange dampers so linkages and locking catches are accessible from access side of fire damper. Provide an access panel at all fire dampers, complete with red stencilled "F.D" label.
  - 3.8.6 Install to close in direction of normal airflow.
  - 3.8.7 Size so free area of duct is maintained through assembly. All fire dampers shall be Type B – Blades of airstream, unless specifically noted otherwise or as required for specific installation.
  - 3.8.8 Install in galvanized steel sleeve, retained in place with retaining angles on four sides at each face of wall.
  - 3.8.9 Connect ductwork to damper sleeves using break-away duct joints on faces.

**3.9 Flow Measure Devices – Air**

- 3.9.1 Install in accordance with Manufacturer's recommendations. Minimum distance from air turbulence - producing fittings, transitions etc. shall be maintained.
- 3.9.2 Mount air volume gauges at height for easy visual inspection and install interconnection piping.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 Quality Assurance

1.2.1 Product of Manufacturer who regularly engages in production of such units and issues complete catalogue data on products.

### 1.3 Submittals

1.3.1 Submit shop drawings detailing attenuator data specified in schedule.

1.3.2 Provide engineering certification of sound attenuator performance (insertion loss, pressure drop **and regenerated noise** under stated operation conditions) certified by Professional Engineer and supported by test results, if required by Consultant.

## 2. PRODUCTS

### 2.1 Sound Attenuators

2.1.1 Minimum Requirements:

- .1 Fabricate attenuators to SMACNA Standards, air-tight at twice operating pressure, with sufficient strength to withstand normal handling, transportation installation and operational stresses and consistent with ductwork in which attenuator will be installed. Split spot welds or sagging insulation will result in rejection of sound attenuator.
- .2 The attenuators shall be inorganic, incombustible, impart no odours to air, and shall not erode due to airflow over internal surfaces.
- .3 If internal velocity through sound attenuator may cause erosion of insulation, provide glass fibre cloth to protect insulation from erosion.
- .4 Provide label on attenuators with Manufacturer's name and flow direction.
- .5 Paint attenuator inside and out with anti-rust prime coat paint.
- .6 Construct attenuators located outdoors of 18 ga (1.31 mm) galvanized steel, 20 ga (0.95 mm) stainless steel perforated liner. Provide internal horizontal baffle supports for insulation at 24" (600 mm) intervals. Provide drainage to avoid pooling

of moisture in attenuator. If media is wrapped in plastic, provide galvanized check wire between perforation and plastic to separate plastic from perforation by  $\frac{1}{8}$ " (3 mm) minimum. Provide details of similar local installation including letter from Manufacturer of insulation that their product can be used in an outdoor environment without significant deterioration.

- .7 Attenuators (where scheduled) shall be lined with Alfa temp cloth or equivalent. Acoustic ratings with lining shall be equal to standard attenuator.
- .8 Attenuators for corrosive fume applications shall be packless type units constructed of 316 stainless steel.
- .9 Attenuators for air systems with HEPA or 95% NBS filters shall be packless type units.
- .10 Attenuators downstream of kitchen exhaust hoods shall be packless type constructed of 304 stainless steel to suit duct system. Arrange baffles to avoid accumulations. Provide drain connections for cleaning.

2.1.2 Acceptable Products:

- .1 IAC, Vibron, Karfund, Vibro Acoustics, VAW Systems.

**2.2 Sound Attenuators (Packless)**

2.2.1 Minimum Requirements:

- .1 Submit certification with shop drawings that silencers can be used in typical fume hood corrosive applications, including systems exhausting radioactive isotopes.
- .2 Fabricate attenuators to SMACNA standards, air-tight at twice the operating installation and operational stresses. Non-continuous or rough welds will result in rejection of a sound attenuator.
- .3 The sound attenuators shall be **304 galvanized** steel with no cavities or insulation, which may trap or retain particles from the fume exhaust gases.
- .4 Measure sound attenuator performance, both aerodynamic and acoustical, by an approved laboratory. Supply details of testing methods used, if requested. Provide engineering certification of sound attenuator performance (insertion loss, pressure drop, and regenerated noise under stated operation conditions), if requested.
- .5 Provide labels on attenuators with Manufacturers name and flow direction.

2.2.2 Acceptable Products:

- .1 IAC, Vibron, Korfund, Vibro Acoustics, XAW. E. H. Price, VAW Systems.

---

**3 . EXECUTION**

**3.1 Sound Attenuators**

- 3.1.1 Inspect attenuators arriving on site to ensure they meet specified requirements. Report deficiencies to Manufacturer and Consultant.
- 3.1.2 Install attenuators in accordance with Manufacturer's instructions.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 **Quality Assurance**

- 1.2.1 Catalogued or published ratings shall be from tests carried out by Manufacturer or from independent testing agency signifying adherence to codes and standards.

### 1.3 **Submittals**

- 1.3.1 Fan shop drawings shall include sound rating data and fan curves showing operating point plotted on curves.
- 1.3.2 Fan shop drawings shall include motor efficiencies. Refer to Section 23 05 13 for minimum motor efficiencies.

### 1.4 **General**

- 1.4.1 Motors powered by variable speed drive controllers shall be EEMAC class B with Type F 'inverter duty' insulation, shall have 1.15 service factor on sine wave power, 1.0 service factor on PWM power and meet NEMA Code MG-1, 1993 Part 31.
- 1.4.2 Provide ECM DC motors complete with manual speed dial and 0-10V DC controls signal terminal for variable speed control. See Section 23 05 13 for ECM motor requirements.

## 2. **PRODUCTS**

### 2.1 **Air Curtain Units**

- 2.1.1 Base frame of 16 ga (1.61 mm) thick steel.
- 2.1.2 2-speed direct driven double inlet forward curved fans.
- 2.1.3 Fans balanced and rubber isolated.
- 2.1.4 Aluminum cover housing with inlet grille.
- 2.1.5 **Hot water** heating coil where scheduled.
- 2.1.6 Discharge grille with adjustable vanes integral with the unit or remote mounted in the ceiling. Provide duct extension for ceiling mounted units.
- 2.1.7 High-off-low fan switch integral with unit suitable for remote mounting.

- 2.1.8 Sound level 10'-0" (3.0 m) in front of the unit in free field shall not exceed 59 dBA on high speed and 54 dBA on low speed.
- 2.1.9 Unit shall be ULC listed and shall bear AMCA certified ratings seal.

## **2.2 Fans – General**

- 2.2.1 Provide fans selected for maximum efficiency and generating noise levels on site not exceeding levels indicated. If fans are not specified at maximum efficiency, advise mechanical Consultant before tendering and submit alternate price for maximum efficiency fans. If approval to supply noisier fans is not obtained prior to tendering, provide equipment meeting ASHRAE levels on site without loss in efficiency.
- 2.2.2 Submit fan sound power levels with shop drawings measured to applicable AMCA standards, or other data acceptable to Engineer. Provide test data, if requested. Indicate on shop drawings test configuration, including ductwork, and end reflection corrections applied to data and/or if such corrections have been omitted.
- 2.2.3 Fans: statically and dynamically balanced, constructed in conformity with AMCA-99-83. Dynamically balance fans to  $\frac{1}{16}$ " per second (1.5 mm/s) vibration amplitude, maximum measured on bearing housings. Provide fan shafts with critical speed at least 1.5 times operational speed.
- 2.2.4 Ratings: based on tests performed in accordance with AMCA 210, and ASHRAE 51-85. Unit shall bear AMCA certified rating seal.
- 2.2.5 Refer to drawings for motor position, rotation and discharge arrangements.
- 2.2.6 For motors less than 10 hp (7.5 KW) provide standard adjustable pitch drive sheaves +/- 10% range. Use mid-position of range for specified rpm (r/min).
- 2.2.7 For motors 10 hp (7.5 KW) and larger, provide fixed pitch drive sheaves with split tapered bushing and keyway. Provide final drive sheaves of size to suit final balancing.
- 2.2.8 Match drive and driven sheaves.
- 2.2.9 V-belts shall conform with American Belt Manufacturers standards. Multiple belts shall be matched sets.
- 2.2.10 Minimum drive rating shall be 150% of nameplate rating of motor.
- 2.2.11 Not less than 2-belt configuration required for motors  $\frac{3}{4}$  hp (0.56 KW) and larger.
- 2.2.12 Provide osha style belt guard with tachometer ports for belt drive fans.
- 2.2.13 Where fans are used for smoke exhaust, motor, bearings, operators, etc. shall be capable of three hours of operation at 482°F (250°C).

- 2.2.14 Bearings shall have minimum L-10 life of 100,000 hours based on maximum safe speed of fan class.
- 2.2.15 Where required, fans shall be treated to suit airstream in which they are used.
- 2.2.16 Provide secure attachment points for seismic restraints. Mounting brackets shall be suitable for seismic loading.

**2.3 Fans – Motors and Variable Speed Drives**

- 2.3.1 Fans with motors up to ½ hp (0.37 KW) shall be of a type suitable for variable speed control from a rheostat style controller. Use permanent split capacitor (PSC) motors or other suitable type.
- 2.3.2 Provide motors and variable frequency drive/motor assemblies generating noise levels which are imperceptible in occupied space, and outside building, relative to fan noise. Provide acoustical data confirming required performance prior to tendering. If approval is not obtained prior to tendering, provide equipment meeting specified imperceptible requirement without loss in efficiency.

**2.4 Fans – Axial (Constant Volume)**

2.4.1 Minimum Requirements:

- .1 Steel tubular casing, long type, with flanged ends and stationary guide vanes where scheduled.
- .2 Mounting feet.
- .3 Aluminum airfoil blade impeller with adjustable pitch angle.
- .4 Rotating parts factory statically and dynamically balanced.
- .5 Totally enclosed motor, direct drive.
- .6 Casing with externally mounted junction box.
- .7 Galvanized or prime and factory enamel coating over interior of casing, including steel accessories. Galvanized or prime coating over exterior parts of casing and steel components.
- .8 Provide extended lubricator for fan bearings ¾" (20 mm) diameter and larger.
- .9 Acceptable Products: Chicago, Penn/Barry, Joy, Woods.

2.4.2 Accessories:

- .1 Inlet bell and screen where scheduled or when not directly connected to ductwork on inlet side.
- .2 Inlet and outlet cones where scheduled and/or indicated on drawings.
- .3 Matching flanges.
- .4 Fans to be supplied adjusted for duty schedule.
- .5 Acoustic centre pod (where specified) in discharge cone shall be constructed from 23% open area perforated

galvanized steel packed with inorganic fibre under compression. Dimensions of pod as follows: length of pod to match length of discharge cone (with extension, if applicable, to reach downstream side of fan motor), diameter to match diameter of fan motor.

## **2.5 Fans – Axial (Variable Pitch in Motion)**

### **2.5.1 Minimum Requirements:**

- .1 Steel tubular casing, long type, with flanged ends and stationary guide vanes.
- .2 Aluminum airfoil blade impeller with controllable pitch mechanism.
- .3 Rotating parts factory statically and dynamically balanced.
- .4 Pneumatic actuator.
- .5 Totally enclosed motor, direct drive.
- .6 Casing with externally mounted junction box and external grease nipples.
- .7 Galvanized or prime and factory enamel coating over interior of casing, including steel accessories. Galvanized or prime coating over exterior parts of casing and steel components.
- .8 Acceptable Products: Chicago, Barry, Joy, Woods.

### **2.5.2 Accessories:**

- .1 Acoustic centre pod (where specified) in discharge cone shall be constructed from 23% open area perforated galvanized steel packed with inorganic fibre under compression. Dimensions of pod as follows: length of pod to match length of discharge cone (with extension, if applicable, to reach downstream side of fan motor), diameter to match diameter of fan motor.
- .2 Inlet and outlet cones where scheduled and/or shown on drawings.
- .3 Inlet bell and screen where scheduled.
- .4 Matching flanges

## **2.6 Fans – Cabinet**

- 2.6.1 Steel cabinet arranged for ducted inlet and outlet connections complete with duct collars (where shown) or ceiling exhaust opening complete with exhaust grille (where shown).
- 2.6.2 Acoustically insulated cabinet.
- 2.6.3 Centrifugal fan on rubber isolators.
- 2.6.4 Backdraft damper.
- 2.6.5 Access panel.

- 2.6.6 Integral motor thermal overload protection.
- 2.6.7 Motor disconnect plug and integral receptacle.
- 2.6.8 Solid state speed control – where scheduled.
- 2.6.9 Acceptable Products: Broan, Delta Breez, Nutone, Reversomatic, Penn/Barry, Panasonic, Air King, Lexton.

**2.7 Fans – Ceiling Exhaust**

- 2.7.1 Centrifugal blower, motor vibration isolated.
- 2.7.2 Built-in backdraft damper.
- 2.7.3 White plastic exhaust grille.
- 2.7.4 Adjustable hanger bracket.
- 2.7.5 Pre-wired outlet box, plug-in receptacle.
- 2.7.6 Solid state speed control – where scheduled.
- 2.7.7 Acceptable Products: Broan, Delta Breez, Nutone, Reversomatic, Penn/Barry, Panasonic, Air King, Lexton.

**2.8 Fans – Ceiling Ventilators**

- 2.8.1 Large diameter propeller blades, metal construction.
- 2.8.2 Baked enamel white finish.
- 2.8.3 Totally enclosed, permanently lubricated ball-bearing motors.
- 2.8.4 Arrange for downward blowing.
- 2.8.5 Manual, infinitely variable on/off speed control switch **one control for each fan.**
- 2.8.6 “Down-rod” suitable for suspension height.
- 2.8.7 Sound state speed control switch(es) where scheduled.
- 2.8.8 Acceptable Products: Banvil, Canarm, Wilcorp.

**2.9 Fans – Centrifugal**

- 2.9.1 Welded steel fan wheel with air foil **backward inclined** blades, unless otherwise specified.
- 2.9.2 Bearings: Heavy-duty pillow-block grease lubricated ball or roller self-aligning type.
- 2.9.3 Gasketed scroll access panel, secured with quick release fasteners.
- 2.9.4 ¾” (20 mm) scroll drain and brass plug.
- 2.9.5 Enamel painted steel fan wheels and inside scrolls.
- 2.9.6 Prime coat painted outside scroll including supports and steel accessories.
- 2.9.7 Rust preventative coating on fan shafts.

- 2.9.8 Drip proof motor.
- 2.9.9 On single inlet fans provide extended lubricators on inlet side bearings.
- 2.9.10 Belt drives.
- 2.9.11 Belt guards complete with tachometer holes.
- 2.9.12 Coupling guards.
- 2.9.13 Fan inlet safety screens.
- 2.9.14 Steel frame base and motor slide rails.
- 2.9.15 Acceptable Products: Penn/Barry, Twin-City, Chicago, Greenheck, Loren-Cook.

**2.10 Fans – Centrifugal (Plenum)**

- 2.10.1 Welded steel fan wheel with airfoil **backward inclined** blades, unless otherwise specified.
- 2.10.2 Bearings: Heavy-duty pillow-block grease lubricated ball or roller self-aligning type.
- 2.10.3 Gasketed scroll access panel, secured with quick release fasteners.
- 2.10.4 ¾" (20 mm) scroll drain and brass plug.
- 2.10.5 Enamel painted steel fan wheels.
- 2.10.6 Rust preventative coating on fan shafts.
- 2.10.7 Drip proof motor.
- 2.10.8 Fan assembly fully enclosed with expanded mesh screen, approved to WCB Standards.
- 2.10.9 Direct drive fans shall be designed specifically for the duty and allow for easy motor replacement. Provide heavy-duty mechanical coupling and bearings for arrangement 8 where called for.
- 2.10.10 Belt drives with belt guard's c/w tachometer holes.
- 2.10.11 Coupling guards.
- 2.10.12 Fan inlet safety screens.
- 2.10.13 Steel frame base and motor slide rails.
- 2.10.14 Acceptable Products: Penn/Barry, Twin-city, Chicago, Greenheck, Loren-Cook

**2.11 Fans – Mixed Flow In-Line**

- 2.11.1 Mixed flow In-Line fan, arrangement as scheduled.
- 2.11.2 Steel tubular casing with inlet and outlet collars for slip fit duct connections.
- 2.11.3 Welded steel stationary guide vanes.

- 2.11.4 Access door to provide cleaning and service access.
- 2.11.5 Rotating parts statically and dynamically balanced at factory.
- 2.11.6 Drip-proof motor, belt driven with adjustable motor base.
- 2.11.7 Heavy duty pillow block ball bearings. Extended lubricators.
- 2.11.8 Field rotatable housing.
- 2.11.9 Belt guard.
- 2.11.10 Acceptable Products: Fantech, Kanaflakt, Greenheck, Loren-Cook.

**2.12 Fans – Tubular In-Line Centrifugal**

- 2.12.1 Tubular In-Line centrifugal fan, arrangement as scheduled.
- 2.12.2 Steel tubular casing with flanged ends and stationary guide vanes with corrosion resistant finish.
- 2.12.3 Access door to provide cleaning and service access.
- 2.12.4 Non-overloading airfoil wheel.
- 2.12.5 Rotating parts factory statically and dynamically balanced.
- 2.12.6 Drip-proof motor, belt driven.
- 2.12.7 Heavy duty pillow block ball bearings. Extended lubricators.
- 2.12.8 Companion flanges; Ceiling brackets; Belt guard.
- 2.12.9 Acceptable Products: Greenheck, Loren-Cook, Penn/Barry, Twin-City.

**2.13 Fans – Mixed flow Induced Dilution Exhaust**

- 2.13.1 Submittals:
  - .1 Fan Manufacturer shall furnish certificate of guarantee stating fan, mixing plenum, outlet nozzle, stack extension if any, and related accessories specified have been pre-tested at factory and curves supplied with shop drawings have been de-rated for system effects created by accessories.
- 2.13.2 Minimum Requirements:
  - .1 Impellers shall be mounted directly to motor shaft to provide direct drive, arrangement 4 type fan. Motors shall be isolated from primary exhaust air stream and shall be visible and accessible from fan exterior for inspection and service.
  - .2 Mixed flow impellers shall consist of combination axial/backward curved blades and shall be of welded steel construction. Impellers shall have non-stall and non-overloading performance characteristics with stable operation anywhere on fan curves.
  - .3 Stationary discharge guide vane sections shall be provided to increase fan efficiencies.

- 
- .4 Fan dynamic balance not to exceed 0.5 mil, peak to peak, at blade pass area when operating at fan frequency. Vibration isolation shall be limited to rubber-in-shear pad type isolators.
  - .5 Fan assemblies shall be designed for mounting on conventional roof curb without need for guy wire supports.
  - .6 Discharges shall include twin FRP nozzles with passive third central stacks that are capable of generating aspiration. FRP shall be chemically and UV resistant.
  - .7 Steel entrainment windbands shall provide secondary induction of outside air. Induction shall take place downstream of fan impeller and shall not influence BHP or static pressure requirements. Windbands shall discharge up to 270% of design flow rates. Manufacturers shall publish discharge volumes for fans at specified primary exhaust flow.
  - .8 Non-ferrous inlet bell shall be provided to reduce sparking in event of motor bearing failure.
  - .9 Fans shall be modular construction and capable of being assembled on roof.
  - .10 PTFE gaskets shall be provided at companion flanged joints.
  - .11 Fasteners shall be 316 stainless steel.
  - .12 Bolted access door shall be provided for impeller inspection on each fan.
  - .13 Fans and accessories shall have internal drain systems to prevent rain water from entering building duct system.
  - .14 Electric motors shall be TEFC Mill & Chemical duty with 1.15 service factor and L-50 bearing life of 200,000 hours. Motors shall have sealed bearings up through 256T NEMA frame. Motors on BS-1 and larger fans shall be C-Face and foot mounted. Motors shall comply with efficiencies listed in ASHRAE 90.1.
  - .15 NEMA 3R non-fused disconnect switch shall be provided, mounted and wired to motor.
  - .16 Coatings-All steel and aluminum surfaces shall be prepared for coating by blasting or chemical etching. Coating shall be Epoxy (8-10 mils) for protection against weather, chemical vapours and splashes.

**2.13.3 Accessories:**

- .1 Inlet mixing plenums shall be provided by fan Manufacturer. Each plenum shall be sized to support weight and performance requirement of number of fans listed on schedule. Multiple fan plenums shall be insulated double wall construction with structural stiffeners or shall be

continuously welded, heavy gauge single wall construction. For single thickness plenums, coatings shall be same as specified for fans. Plenums shall be capable of supporting fan(s) without guy wires or supports. Plenums shall include hinged access doors and safety screens over primary air inlets. Primary air inlets shall be located on bottom or side as indicated on drawings. Unless otherwise specified, plenums shall be suitable for mounting on roof curbs.

- .2 Stainless safety screens shall be supplied over bottom primary air inlets.
- .3 Bypass dampers shall be provided with mixing plenums for outside air with primary exhaust. Dampers shall be opposed blade low leakage air foil control dampers with extended shaft for connection to operator. Dampers shall be aluminum construction. Rain hoods shall be provided with each damper.
- .4 Low leakage isolation dampers shall be constructed of aluminum air foil extrusions and coated with epoxy. Operators shall be 2 position, spring return and shall be 24 V or 110 V electric. Electric operator shall be factory wired (via a transformer when required) to fan disconnect switch to open when fan is energized and close via spring return when de-energized. When fan ships separate from plenum, wiring and conduit shall be factory supplied for easy connection in field.
- .5 Vortex breakers shall be provided on side inlet and multiple fan plenums.
- .6 Units shall be provided with attenuators.
  - .1 Outer shell of sound attenuator to be constructed of fibre reinforced plastic with minimum  $\frac{3}{16}$ " (4.5 mm) wall thickness.
  - .2 Attenuator to be packed with sound attenuating fibreglass. Acoustical media to be isolated from air stream by tedlar lining.
  - .3 Air passageway of attenuator to be lined with perforated metal.
  - .4 Attenuator must not increase height of fan unit. Acoustic screening may not be used.
  - .5 Attenuator must meet the following dynamic insertion losses as tested with fan unit:

Fan Size	63Hz	125Hz	250Hz	599Hz	1000Hz	2000Hz	4000Hz	8000Hz
TS-2	0	4	9	11	12	13	9	4
TS-3	8	7	12	15	15	13	10	6

Fan Size	63Hz	125Hz	250Hz	599Hz	1000Hz	2000Hz	4000Hz	8000Hz
TS-4	5	8	9	11	12	12	10	6

.6 Access to motor junction box of fan unit cannot be blocked by sound attenuator.

.7 Fan performance curves must include performance losses due to addition of sound attenuator per factory-tested data.

.7 14 ga (1.99 mm) galvanized steel seismic roof curb shall be provided with units to support fans/plenums. Curb shall be canted for rigidity in wind loads. Curb shall be 14" (350 mm) high. Curb shall include rigid fibreglass liner and wood nailer. Roof curbs shall be seismically secured to roof. When flashed to mounting curb it shall provide weatherproof whole.

2.13.4 Standard of Acceptance: Strobic Air – Tri-Stack

## 2.14 **Fans-In-Line Centrifugal**

2.14.1 In-line centrifugal fan with axial flow construction.

2.14.2 Square housing, steel with galvanized finish.

2.14.3 Access panel to provide cleaning and service access.

2.14.4 Backward inclined, non-overloading wheel.

2.14.5 Drip-proof motor.

2.14.6 Permanently lubricated pillow block ball bearings.

2.14.7 Rust preventative coating on shafts.

2.14.8 Belt or direct driven as scheduled.

2.14.9 Belt guard, motor cover, where externally belt driven.

2.14.10 Plug-in electrical disconnect switch, mounted on the outside of the fan housing.

2.14.11 Insulated housing lining.

2.14.12 Solid state speed controller where scheduled.

2.14.13 Acceptable Products: Greenheck, Loren-Cook, Delhi, Lau.

## 2.15 **Fans – Utility**

2.15.1 Steel wheel and reinforced scroll on integral supports.

2.15.2 Gasketed scroll access panel, secured with quick release fasteners.

2.15.3 ¾" (20 mm) scroll drain and brass plug.

2.15.4 Rust preventative coating on shaft.

2.15.5 Enamel painted fan wheels and scrolls.

2.15.6 Weatherproof enamelled cover for motor drive.

2.15.7 Belt driven sets with adjustable motor bed plate and variable pitch drive sheave.

2.15.8 Acceptable Products: Greenheck, Loren-Cook, Delhi, Lau.

**2.16 Fans – Propeller**

2.16.1 Formed steel or aluminum propeller blades.

2.16.2 Spun steel venture.

2.16.3 Grease lubricated ball bearings suitable for operating in any position.

2.16.4 Belt driven with adjustable drive sheave and belt guard or direct driven as scheduled.

2.16.5 Motor mounting brackets.

2.16.6 Totally enclosed motor.

2.16.7 Fan guard as scheduled.

2.16.8 Automatic backdraft dampers with gasketed edges as scheduled.

2.16.9 Acceptable Products: Greenheck, Loren-Cook.

**2.17 Fans – Roof Supply**

2.17.1 Centrifugal non-overloading wheel.

2.17.2 Belt or direct drive as scheduled.

2.17.3 Removable roof cap.

2.17.4 Louvered side panels.

2.17.5 Removable filters.

2.17.6 Integral base suitable for mounting on roof curb.

2.17.7 Vibration isolators.

2.17.8 Head mounted disconnect switch.

2.17.9 Roof curb.

2.17.10 Acceptable Products: Penn/Barry, Delhi, Lau, Greenheck, Loren-Cook, Muffan.

**2.18 Fans – Window/Wall**

2.18.1 Acceptable Products: Xpelair, Vent-Axia, Reversomatic.

2.18.2 Window Type:

- .1 Plastic casing and plastic outlet grille.
- .2 Plastic inlet electrically (or manual cord) operated shutters.
- .3 Two speed controller and starter with pilot light.

2.18.3 Wall Type:

- .1 Plastic wall box and outlet grille.
- .2 Plastic wall duct with fan.

- .3 Interior panel with electrically operated shutter.
- .4 Two speed controller and starter with pilot light.

## **2.19 Gauges – Air Pressure**

### **2.19.1 Ranges:**

- .1 Supply fans: 0 - 6" w.g. (1,500 Pa).
- .2 Return/exhaust fans: 0 - 2" w.g. (500 Pa).

### **2.19.2 Standard of Acceptance:**

- .1 Dwyer Series 2000.

## **3 . EXECUTION**

### **3.1 Air Curtains**

- 3.1.1 Air curtain units to be mounted as indicated on drawings (exposed above door or concealed above ceilings). On ceiling located units, install discharge grille supplied with unit in ceiling and connect to unit with duct extension.

### **3.2 Fans**

- 3.2.1 Install fans as indicated, complete with vibration isolators and seismic restraints as specified in Sections 23 05 48 and 23 05 49.
- 3.2.2 Install fans with flexible connections on inlet ductwork and on discharge ductwork. Ensure metal bands of connectors are parallel with minimum 1" (25 mm) flex between ductwork and fan during running.
- 3.2.3 Install connectors to be clear of air stream. Provide flange extensions as necessary. Ensure accurate alignment of duct of fan.
- 3.2.4 Provide safety screens where fan inlet or outlet is exposed.
- 3.2.5 Provide belt guards on belt driven fans.
- 3.2.6 Provide and install sheaves and belts required for final air balance.
- 3.2.7 Assist Balancing Agency in altering blade pitch angles as required for final air balance. Provide access to fan wheel for blade adjustment.
- 3.2.8 Mount floor mounted fans on 4" (100 mm) thick concrete housekeeping bases (bases under Division 3).
- 3.2.9 Mount roof mounted fans on curbs 8" (200 mm) minimum above roof.

### **3.3 Fans – Kitchen Hood Exhaust**

- 3.3.1 Installation of commercial cooling kitchen hood/canopy exhaust fans shall be in accordance with NFPA-96.

- 3.3.2 Adjust height of roof curb as may be required to ensure top of fan discharge is a minimum 40" (1.0 m) from roof.
- 3.3.3 Roof mounted exhaust fan shall be installed minimum of 10'-0" (3.0 m) away from fresh air intakes and properly lines located in horizontal plan. Wall terminations shall be in accordance with NFPA-96.
- 3.3.4 Provide interlocks between building fire alarm system, kitchen hood fire suppression system, normally closed gas supply solenoid to kitchen appliances, exhaust fan and make-up air unit.
- 3.3.5 Local switch shall be used to activate kitchen exhaust fan. If hood is equipped with time clock, local switch not required.
- 3.3.6 When exhaust fan is activated, make-up air unit for area shall be activated.
- 3.3.7 If make-up air unit is direct-fired unit, proof of exhaust fan operation is required prior to starting make-up air unit.
- 3.3.8 Upon activation of hood fire suppression system, gas valve shall close, and exhaust fan shall continue to operate. Exhaust fan operation to be verified with hood fire suppression system supplier to insure it conforms to requirements for specific suppression system supplied.
- 3.3.9 Hood fire suppression system panel shall signal main fire alarm panel to turn off make-up air unit for kitchen area.
- 3.3.10 Provide manual momentary contact switch with seal in relay contacts to open normally closed electric gas solenoid valve after loss of power due to fire alarm shut-down or building power loss.
- 3.3.11 Provide emergency shut-down push/pull switch to turn normally closed solenoid gas supply off to kitchen equipment.
- 3.3.12 In event that suppression system is supplied with mechanical gas valve, provision of reset and emergency shut-down switch is not required.
- 3.3.13 Switches are to be clearly identified with lamicaid labels.

**3.4 Fans – Mixed Flow Induced Dilution Exhaust**

- 3.4.1 Install fans on roof curb with 1" (25 mm) thick gasket (provided by fan Manufacturer) sized for  $\frac{1}{8}$ " (3 mm) deflection under weight of fans. Fan base to be securely fastened to curb by means of stainless steel bolts. Provide hemi-grommets (Mason HG) under hold-down bolts. Use lock nuts and ensure bolt can be turned by hand after lock nut secured.

**3.5 Gauges – Air Pressure**

- 3.5.1 Mount gauges for easy visual inspection.
- 3.5.2 Piping to be formed in true vertical/horizontal lines free from kinks.

---

3.5.3 Seal penetrations of plenums or ducts.

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

1.1.1 This Specification Section forms part Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 Quality Assurance

1.2.1 Catalogued or published ratings shall be those obtained from tests carried out by Manufacturer or those ordered by him from independent testing agency signifying adherence to codes and standards.

## 2. PRODUCTS

### 2.1 Single-Duct Variable Air Volume Box

#### 2.1.1 General:

- .1 Manufacturers, other than those listed in the acceptable products list, wishing to bid shall make detailed submission responding to each point outlined in specification in exact same form. Listing of valve for valve, taken from drawings, shall be included, showing design selection for alternate proposed with airflow capacities and minimum static pressure requirement.

#### 2.1.2 Minimum Requirements:

- .1 Rated to AHRI Standard 880 with ARI seal. Provide identical products to tested unit.
- .2 Air valves shall be supplied as factory assembly unit, comprising of basic unit, access section, reheat coil and attenuator, as specified – see Equipment Schedules on drawings.
- .3 At inlet velocity of 2,000 ft/m (10 m/s), differential static pressure required to operate any air valve size shall not exceed 0.15" w.g. (37 Pa) for any unit with attenuator section and without reheat coil.
- .4 Air valves shall incorporate multi-point flow sensor equal to flow measures as per 23 33 00. Cross flow sensor or button sensors are not acceptable.
- .5 Casing constructed from 22 ga (0.85 mm) thick galvanized steel. Provide attachment tabs on top of casings for ceiling hangers.
- .6 Pressure independent operation.

#### 2.1.3 Unit Internal Insulation:

- 
- .1 Standard Insulation:
    - .1 1" (25 mm) fibreglass insulation. Exposed face of insulation to be faced with non-woven mat. Exposed raw edges and joints to be sealed with galvanized metal.
  - .2 Special Insulation:
    - .1 ¾" (20 mm) thick FF Fibre Free Foam insulation. Exposed Insulation edges and corners covered with zinc coated metal angles.
  - 2.1.4 Control Dampers:
    - .1 Heavy gauge steel damper with peripheral gasket and self-lubricated bronze Oilite or Delrin bearings.
    - .2 Air leakage of closed damper shall not exceed 2% of nominal rating at 3" w.g. (750 Pa) inlet static pressure.
  - 2.1.5 Reheat Coils:
    - .1 Water reheat coils enclosed in galvanized steel casing and factory installed on air valves.
    - .2 Copper tubes and aluminum fins. Coil performance shall be in accordance with AHRI Standard 410 Forced Circulation Air Cooling and Air Heating Coils.
    - .3 Capacities as scheduled.
  - 2.1.6 Access Panels:
    - .1 8" (200 mm) x 5" (125 mm) lift-off galvanized access panel. Positive gasket seal and camlocks. Mounted in frame and located upstream of reheat coil on the top and bottom of air valve.
  - 2.1.7 Sound Attenuators:
    - .1 Standard Attenuator:
      - .1 Casing constructed from 22 ga (0.85 mm) thick galvanized steel. Provide attachment tabs on top of casing for ceiling hangers.
      - .2 Attenuator lined with 1" (25 mm) fibreglass insulation. Exposed face of insulation to be faced with non-woven mat. Exposed raw edges and joint to be sealed with glasfab and or metal nosing insulation coating/sealer.
    - .2 Special Attenuator:
      - .1 Casing constructed from 22 ga (0.85 mm) thick galvanized steel. Provide attachment tabs on top of casing for ceiling hangers.
      - .2 Attenuator lined with ¾" (20 mm) thick FF Fibre Free Foam insulation. Exposed insulation edges and corners covered with zinc coated metal angles.

2.1.8 Selection Range:

Inlet Size	Selection Range (cfm (L/s))	Minimum Turndown (cfm (L/s))
6" (150 mm)	80 cfm (38 L/s) - 380 cfm (180 L/s)	80 cfm (38 L/s)
8" (200 mm)	380 cfm (180 L/s) - 700 cfm (330 L/s)	148 cfm (70 L/s)
10" (250 mm)	700 cfm (330 L/s) - 1,165 cfm (550 L/s)	230 cfm (110 L/s)
13" (325 mm)	1,165 cfm (550 L/s) - 1,630 cfm (770 L/s)	320 cfm (150 L/s)
14" (350 mm)	1,630 cfm (770 L/s) - 2,120 cfm (1,000 L/s)	445 cfm (210 L/s)
16" (400 mm)	2,120 cfm (1,000 L/s) - 2,540 cfm (1,200 L/s)	580 cfm (275 L/s)

2.1.9 Acoustic Requirements:

- .1 Provide air valves as indicated on drawings and scheduled, such that noise criteria specified in Table 1 below are not exceeded under the following site conditions. Meet applicable Codes and other specified requirements.
  - .1 1.5" w.g. (375 Pa) static pressure on supply and return/exhaust units.
  - .2 Armstrong Cortega769 ceiling tile.
  - .3 Price SPD/ASPD series square plaque diffuser selected for 700 ft/m (3.56 m/s) neck velocity, as specified.
- .2 Conduct full mock-up tests with Representative air valves, suspended ceiling, diffuser and simulated room absorption, to demonstrate specified NC criteria will be met.
- .3 Submit proposed test details prior to testing. Test data to include measured noise level (as opposed to sound power) under mock-up conditions, as indicated in AHRI 880 – 2011 Performance Rating of Air Terminals, Figure 1, together with mock-up room details, dimensions and measured absorption (using reference sound source). Submit statement of test accuracy.
- .4 Provide measured data, together with details of added treatment required to meet criteria, e.g. Thermaflex MK-E lined flexible connector, additional treatment to control radiated noise, etc.

**Table No. 1**  
**Maximum Allowable Background Noise Levels, NC**

Max. NC	Areas
25-35	Operating Rooms, ICU/CCU, Patient Rooms

Max. NC	Areas
30-40	Wards, Corridors and Public Areas
30	Recovery Rooms
30	Isolation Rooms, Nurseries
35	Medical Imaging, Emergency, Treatment Areas, Laboratories
30	Director's Office/Manager's Office
30	Conference Room/Board Room/Library/Classrooms/Seminar rooms
35	Offices/Psych. Assessment/Counselling
35	Multi-purpose
35	Exam Rooms/Testing Rooms
45	Storage
--	Mechanical/Electrical/Communications

2.1.10 Air Valve Identification:

- .1 Manufacturer shall number air valves in accordance with numbers indicated on drawings. Secure 2" (50 mm) high, Gothic style, self-adhesive, black, stick-on letters (Letrasign or Brady Quick-Align) on one side and on bottom of air valves.

2.1.11 Controls and Actuators:

- .1 Microprocessor based controller and damper actuator will be supplied by Controls Contractor. Controller shall be provided in pre-assembled unit for mounting on air valve.
- .2 Controller and actuator shall be field mounted on air valve by Controls Contractor.
- .3 Controls arranged for pressure independent, constant volume operation or variable volume operation as noted.
- .4 Resettable to any air volume between zero and maximum rated volume.
- .5 External taps for balancing gauge.

2.1.12 Standard of Acceptance: EH Price SDV-5 (supply), SDV-5 (return/exhaust).

2.1.13 Acceptable Manufacturers: EH Price, Nailor, Kreuger, Titus.

**2.2 Air Terminal Units – Mixing Boxes**

2.2.1 General:

- .1 Manufacturers, other than those listed in acceptable Manufacturers list, wishing to bid shall make detailed submission responding to each point outlined in specification in exact same form.

---

2.2.2 Minimum Requirements:

- .1 Rated to AHRI Standard 880-2011, Performance Rating of Air Terminals with AHRI seal. Provide identical products to tested unit.
- .2 At inlet velocity of 2,000 ft/m (10 m/s), differential static pressure required to operate air valve shall not exceed 0.15" w.g. (37 Pa) for unit with attenuator section.
- .3 Mixing box shall incorporate multi-point cross grid flow sensors, with minimum 1.5x signal amplification, located in cold deck inlet and downstream in mixing section.
- .4 Casing constructed from 22 ga (0.85 mm) thick galvanized steel. Provide attachment tabs on top of casings for ceiling hangers.
- .5 Leakage through casing with 100% blocked discharge at 1" w.g. (250 Pa) maximum system pressure shall not exceed 2%.

2.2.3 Unit Internal Insulation:

- .1 1" (25 mm) fibreglass insulation. Exposed face of insulation to be faced with non-woven mat (Knauf Duct Liner EL or Owens Corning Areomat Duct Liner only). Exposed raw edges and joint to be sealed with metal noising insulation coating/sealer.

2.2.4 Control Dampers:

- .1 Heavy gauge steel damper with peripheral gasket and self-lubricated bronze oilite or Delrin bearings.
- .2 Air leakage past closed damper not to exceed 0.6 cfm (0.28 L/s) per 4" (100 mm) of blade circumference at 3" w.g. (750 Pa) inlet static pressure.

2.2.5 Flexibility:

- .1 Hot and cold inlet ports shall be capable of being reversed in the field.

2.2.6 Mixing:

- .1 Boxes shall mix hot and cold air streams to attain maximum temperature variation across discharge duct of 10% of difference between hot and cold ducts. Measurement shall be taken 6" (150 mm) straight downstream of box.

2.2.7 Box Identification:

- .1 Manufacturer shall number mixing boxes in accordance with numbers indicated on the drawings. Secure 2" (50 mm) high, Gothic style, self-adhesive, black, stick-on letters (Letrasign or Brady Quick-Align) on one side and on bottom.

2.2.8 Acoustical Performance:

- .1 With inlet static pressure of 1" w.g. (250 Pa) and up to flow quantities listed below, the generated noise from mixing boxes shall be free of audible pure tones and shall not exceed the following sound power levels (Lw re: 1 pW).

Octave Band			125	250	500	1000	2000	4000
Flow (cfm (L/S))	Size Inches (mm)							
200 cfm (95 L/S)	4" (100 mm)	Discharge	51	46	39	26	21	
200 cfm (95 L/S)	4" (100 mm)	Radiated	53	46	44	37	33	26
400 cfm (190 L/S)	6" (150 mm)	Discharge	62	56	50	36	27	23
400 cfm (190 L/S)	6" (150 mm)	Radiated	60	49	44	36	32	27
700 cfm (330 L/S)	8" (200 mm)	Discharge	64	60	53	40	31	30
700 cfm (330 L/S)	8" (200 mm)	Radiated	61	53	48	41	35	29
850 cfm (400 L/S)	9" (225 mm)	Discharge	65	59	52	38	31	36
850 cfm (400 L/S)	9" (225 mm)	Radiated	62	52	48	42	38	32
1,150 cfm(545 L/S)	10" (250 mm)	Discharge	68	60	54	40	32	38
1,150 cfm (545 L/S)	10" (250 mm)	Radiated	62	55	48	41	36	32
1,700 cfm (800 L/S)	12" (300 mm)	Discharge	69	62	55	44	38	41
1,700 cfm (800 L/S)	12" (300 mm)	Radiated	62	55	51	44	36	33
2,700 cfm (1,275 L/S)	14" (355 mm)	Discharge	69	65	59	44	45	48
2,700 cfm (1,275 L/S)	14" (355 mm)	Radiated	67	59	56	46	42	38

- .2 Discharge and radiated sound power data may be traded off by maximum of 2 decibels, i.e. if radiated noise in given octave band meets specifications within margin of 2 decibels, discharge noise may increase by 2 decibels.
- .3 Provide quietest mixing box for specified duty.

#### 2.2.9 Controls:

- .1 Microprocessor based controller and damper actuator will be supplied by the Controls Contractor.

#### 2.2.10 Standard of Acceptance: EH Price DDQ5000

### 2.3 Fan Terminal Units

#### 2.3.1 General:

- .1 Fan terminal units shall vary primary air supply in response to cooling demand and shall contain variable speed fan to deliver constant air volume to occupied space while mixing primary air and return plenum air.

**2.3.2 Minimum Requirements:**

- .1 Fan terminal unit shall be factory set to deliver design primary air volume.
- .2 Minimum and maximum primary air volume shall be field adjustable.
- .3 Primary air volume control regulator shall be pressure independent.
- .4 Galvanized steel casing enclosing air volume damper fan and heating coil.
- .5 Secure attachment points for seismic anchoring.
- .6 Casing acoustically lined with 1" (25 mm) thick glass fibre insulation. Exposed face of insulation faced with non-woven mat. Exposed raw edges and joints sealed with glasfab and/or metal nosing insulation coating/sealer.
- .7 Full sized bottom access panel in casing.
- .8 1" (25 mm) removable fibreglass filter for recalculating air stream.
- .9 Air volume damper leakage not to exceed 2% of rated airflow quantity at 1" w.g. (250 Pa) static air pressure.
- .10 Forward curved blower with direct drive split capacitor motor with infinitely adjustable motor speed control. Fan assembly to be isolated from casing.
- .11 Hot water heating coil with copper tubes and aluminum fins where scheduled.
- .12 Damper motors and coil control valves are specified in Controls Section.
- .13 Fans shall be energized when duct static pressure is sensed.
- .14 During unoccupied mode (zero primary system static pressure) primary air damper shall close and fan and heating coil shall be energized when call for heat).

**2.3.3 Box Identification:**

- .1 Manufacture shall number terminal boxes in accordance with numbers indicated on drawings. Number shall be painted in black on two sides and on bottom. Numbers shall be 2" (50 mm) high.

**2.3.4 Acoustical Performance:**

- .1 The Manufacturer shall submit acoustical performance data for all sizes of boxes supplied.

- .2 The test data shall be generated with pressure differential between inlet and outlet of 0.3" w.g. (75 Pa), 1" w.g. (250 Pa) and 2" w.g. (500 Pa).
- .3 Test data submitted shall include sound power levels through six octave bands, measured in accordance with ANSI standard SI.21-1972 and ADC 1062 R4.
- .4 Discharge and radiated sound power data should be included.

### 3. **EXECUTION**

#### 3.1 **Air Terminal Units – Air Valves**

- 3.1.1 Install in accordance with Manufacturers recommendations.
- 3.1.2 Arrange for suitable ceiling access to units. Provide access doors or locate near easily removable ceiling components.
- 3.1.3 Support air terminal units independently of ductwork.
- 3.1.4 Install units with minimum four duct diameters straight inlet duct, same size as inlet.
- 3.1.5 Where inlet flow deflections and/or turbulence alter factory calibration by more than 10%, installer shall field adjust the air volume calibration settings to compensate.
- 3.1.6 Provide seismic restraints in accordance with details in SMACNA Guidelines or alternatively slack cables.
- 3.1.7 Provide isolation valves, control valve and balancing valves on piping connections.

#### 3.2 **Air Terminal Units – Mixing Boxes**

- 3.2.1 Install in accordance with Manufacturer's recommendations.
- 3.2.2 Arrange for suitable ceiling access to units. Provide access doors or locate near easily removable ceiling components.
- 3.2.3 Support mixing boxes independently of ductwork.
- 3.2.4 Install units with a minimum of four duct diameters of straight inlet duct, same size as the inlet, upstream of the inlets.
- 3.2.5 Where inlet flow deflections and/or turbulence alter factory calibration by more than 10%, installer shall field adjust air volume calibration settings to compensate.
- 3.2.6 Provide seismic restraints in accordance with details in SMACNA Guidelines or alternatively slack cables.
- 3.2.7 Provide isolation valves, control valve and balancing valves on piping connections.

---

**3.3 Fan Terminal Units**

- 3.3.1 Install in accordance with Manufacturers recommendations.
- 3.3.2 Arrange for suitable ceiling access to units. Provide access doors or locate near easily removable ceiling components.
- 3.3.3 Support fan terminal units independently of ductwork.
- 3.3.4 Where inlet flow deflections and/or turbulence alter factory calibration by more than 10%, installer shall field adjust air volume calibration settings to compensate.
- 3.3.5 Install units with minimum four duct diameters straight inlet duct, same size as inlet.
- 3.3.6 Install on rubber in shear isolators.
- 3.3.7 Provide seismic restraints in accordance with details in SMACNA Guidelines or alternatively slack cables.
- 3.3.8 Provide flexible connections for heating coil piping and electrical connection.
- 3.3.9 Provide isolation valves, control valve and balancing valves on piping connections.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

1.2 **Quality Assurance**

1.2.1 Catalogued or published ratings shall be those obtained from tests carried out by Manufacturer or those ordered by him from independent testing agency signifying adherence to codes and standards.

2. **PRODUCTS**

2.1 **Air Terminals**

2.1.1 General:

- .1 Grilles, registers and diffusers shall be product of one Manufacturer.
- .2 Refer to drawings for sizes and air quantities.
- .3 Refer to schedules on drawings for details.
- .4 Base air outlet application on space noise level of NC 30 maximum.
- .5 Air terminals shall be checked for compatibility with ceiling types. Refer to Architectural reflected ceiling plans.
- .6 Manufacturer (other than design listed) shall match performance data and indicate specific comparison for each item, with shop drawing submission.
- .7 Ceiling mounted air terminals shall be provided with means for attachment of two seismic security wires at opposite corners on each air terminal.
- .8 Provide concealed baffles, where necessary, to direct air away from walls, columns or other obstructions within radius of air terminal operation.
- .9 Provide auxiliary frames for diffusers located in drywall ceilings and grilles mounted in gypsum walls in public areas. In other areas grilles should be attached to ductwork, or flanged to outside of the opening.
- .10 Standard of Acceptance for General Grilles, Registers and Diffusers: EH Price, Nailor, Titus, Krueger, Tuttle & Bailey.

---

**2.2 Air Terminals – Operating Room**

- 2.2.1 Installed air distribution system for operating rooms shall have been tested in accordance with “Recommended Procedure for the Determination of Microbiologic Air Cleanliness,” as published by American College of Surgeons, Committee on Operating Room Environment, and shall have met requirements for Class 1 Microbiologic Clean Air. Test data shall be included in shop drawing submission.
- 2.2.2 Manufacturer shall provide services of qualified Factory Engineer or technician to supervise adjustment and balancing of operating room system.
- 2.2.3 Standard of Acceptance: Kruger Sterilflo System.

**2.3 Air Terminals – HEPA Filter/Fan Units**

- 2.3.1 Self-Powered HEPA fan unit with solid state speed controller.
- 2.3.2 Airtight filter housing construction. Inlet air supply collar sealed to housing.
- 2.3.3 Extruded aluminum border mounting frame suitable for either gasketed T-bar or plaster ceiling installation.
- 2.3.4 Removable aluminum perforated faceplate with hinge clips to provide access to filters.
- 2.3.5 Hanger brackets at each corner.
- 2.3.6 Filter frame with high efficiency 99.97% HEPA filter.
- 2.3.7 10” (250 mm) diameter duct connection collar.
- 2.3.8 ECM - energy efficient motor.
- 2.3.9 Room sound level shall be less than 55 dBA, when measured at 30” (750 mm) from filter face at 90 ft/m (0.457 m/s) (average face velocity) in accordance with IEST RP-CC0022.2, Recommended Practice for Unidirectional Flow Clean-Air Devices.
- 2.3.10 Finish: White finish, border and face plate.
- 2.3.11 Standard of Acceptance:
  - .1 EH Price - Model FFU.

**2.4 Air Terminals – HEPA Filter Units**

- 2.4.1 Filter housing shall be stainless steel with continuously welded corners. Inlet collar shall be sealed to top of filter housing. Static pressure port shall be fitted to allow measurement of pressure drop across filter. Unit is to be factory sealed and tested to assure leakage is consistent with filter.
- 2.4.2 Border mounting frame suitable for either gasketed T- bar or plaster ceiling installation.

- 2.4.3 Frame shall have integral knife edge flange, which penetrates silicone gel to provide leak proof seal.
- 2.4.4 Removable stainless steel perforated faceplate with quick-release fasteners to provide access to filters.
- 2.4.5 Volume control damper shall be located in inlet collar. Remote cable operator shall be provided to adjust damper while filter in place.
- 2.4.6 Hanger brackets at each corner.
- 2.4.7 Filter shall be 99.97% HEPA. Filter shall be held in place by four cam type retracts, providing means of removing and replacing filters without disturbing filter housing in ceiling or duct connection.
- 2.4.8 Unit provided with test ports before and after filter so that filters can be tested for integrity using a scan test (CSA-Z317 requirement).
- 2.4.9 12" (300 mm) diameter duct connection collar.
- 2.4.10 Standard of Acceptance:
  - .1 EH Price - Model LFDCSS.

## **2.5 Louvres – Motorized**

- 2.5.1 Extruded aluminum: frame depth 4" (100 mm).
- 2.5.2 Blades limited to 45° to horizontal in open position.
- 2.5.3 Blades at 5" (125 mm) centres with up-turned rain stops on trailing edges.
- 2.5.4 Concealed motor operator.
- 2.5.5 Electric motor to be included (120/1/60).
- 2.5.6 Baked enamel finish to Consultant choice.
- 2.5.7 Removable 16 ga (1.29 mm) diameter aluminum wire bird screen with ½" (15 mm) mesh.
- 2.5.8 Standard of Acceptance:
  - .1 Airolite T645E.

## **2.6 Louvres – Stationary**

- 2.6.1 General:
  - .1 Extruded aluminum frames and blades.
  - .2 Welded construction with exposed joints ground flush and smooth or mechanically fastened with stainless steel fasteners.
  - .3 Lower assembly sealed and water tight.
  - .4 Removable 16 ga (1.29 mm) diameter aluminum wire bird screen with ½" (15 mm) mesh. Bird screen mounted in 20 ga (0.81 mm) thick aluminum folded frame. Frame to be installed inside louver.

- 
- .5 Factory applied baked enamel finish to Consultants colour choice.
  - .6 Mill finish.
  - .7 Anodized permanodic hard colour finish.
- 2.6.2 Specific:
- .1 Drawing designation - Type “\_\_\_”
  - .2 Frame 4” (100 mm) deep.
  - .3 4” (100 mm) deep blades inclined at 45° to the horizontal.
  - .4 Blades at 3½” (90 mm) on centres.
  - .5 Blades arranged with up-turned rain stops on trailing edges and drop channels on leading edges.
  - .6 Jamb drainage channels.
  - .7 Blades and frame 12 ga (2.05 mm) thick extruded aluminum.
  - .8 Standard of Acceptance: Airolite K6774, Nailor 445DB, C/S A4097, Ten Plus D4493.
- 2.6.3 Specific:
- .1 Drawing designation - Type “\_\_\_”
  - .2 Frame 6” (150 mm) deep.
  - .3 6” (150 mm) deep blades inclined at 45° to the horizontal.
  - .4 Blades at 3½” (90 mm) on centres.
  - .5 Blades arranged with up-turned rain stops on trailing edges and drop channels on leading edges.
  - .6 Jamb drainage channels.
  - .7 Blades and frame 12 ga (2.05 mm) thick extruded aluminum.
  - .8 Standard of Acceptance: Airolite K-6776, West Vent XT-635WV, Ten Plus D6403.
- 2.6.4 Specific:
- .1 Drawing designation - Type “\_\_\_”
  - .2 Frame 5” (125 mm) deep.
  - .3 Blades constructed in inverted “vee” style.
  - .4 Blades 5” (125 mm) deep, at 2” (50 mm) on centres.
  - .5 Standard of Acceptance: Airolite K-605, Westvent XT-520W, Ten Plus R5455.
- 2.6.5 Specific:
- .1 Frame 4” (100 mm) deep.
  - .2 Blades inclined at 45° to the horizontal.
  - .3 Blades at 5” (125 mm) on centres.
  - .4 Continuous blade appearance.
  - .5 Blades and frame 12 ga (2.05 mm) thick extruded aluminum.
  - .6 Standard of Acceptance: Airolite CB609.
-

---

**2.7 Louvered Penthouse**

- 2.7.1 Welded assembly including welded, mitred corners for continuous blade effect.
- 2.7.2 Louvres 4" (100 mm) deep at 4" (100 mm) centres at 45° to horizontal complete with curb cap frame and drip ledge on bottom.
- 2.7.3 Aluminum reinforcing angles on vertical louver sections and pitched roof sections.
- 2.7.4 ½" (15 mm) mesh aluminum wire bird screen on inside of louvers.
- 2.7.5 Undercoat insulation under roof.
- 2.7.6 Roof material shall be 12 ga (2.05 mm) thick aluminum.
- 2.7.7 Finish shall be baked enamel, colour to Consultant's choice.
- 2.7.8 Roof curb.

**2.8 Hoods – Gooseneck**

- 2.8.1 Galvanized steel construction.
- 2.8.2 Thickness and fabrication to ASHRAE and SMACNA standards.
- 2.8.3 ½" (15 mm) aluminum wire bird screen mounted in removable U-frame.
- 2.8.4 Mount unit on minimum 12" (300 mm) high curb base.

**2.9 Hoods – Roof – Relief/Intake**

- 2.9.1 Aluminum construction.
- 2.9.2 Shape as indicated.
- 2.9.3 ½" (15 mm) aluminum wire bird screen mounted in removable U-frame.
- 2.9.4 Factory baked enamel finish.
- 2.9.5 Roof curb.
- 2.9.6 Backdraft damper.

**2.10 Roof Vents**

- 2.10.1 Application: Kitchen range hood vent, exhaust fan vent, etc.
- 2.10.2 Minimum Requirements:
  - .1 26 ga (0.55 mm) galvanized metal construction with all joints soldered.
  - .2 Cantilevered lid on gable ends and flat roof flange.
  - .3 Minimum 14" (350 mm) high, size as indicated on the drawings.
- 2.10.3 Standard of Acceptance:
  - .1 Menzies Metal Products BUR Vents.

---

## 2.11 Range Hoods – Domestic

### 2.11.1 Minimum Requirements:

- .1 30" (750 mm) wide.
- .2 Aluminum washable filter.
- .3 Lights and light switch.
- .4 Solid state fan speed control.
- .5 Suitable for horizontal or vertical ducting.
- .6 Built-in backdraft damper and duct collar for use with 10" (250 mm) x 3-1/4" (86 mm) ducting.
- .7 Baked enamel finish to Consultant's colour choice.

### 2.11.2 Accessories:

- .1 Flush wall cap with aluminum grille.

### 2.11.3 Standard of Acceptance:

- .1 Broan-NuTone.

## 3 . EXECUTION

### 3.1 Air Outlets and Inlets

- 3.1.1 Provide grilles, registers, diffusers as schedule and as noted on the plans. Provide specific mounting type coordination with wall, floor and ceiling types as noted.
- 3.1.2 Install with cadmium plated screws in counter sunk holes where fastenings are visible.
- 3.1.3 Install ductwork as high as practical, using offsets where required to obtain maximum duct neck lengths for diffusers.
- 3.1.4 Refer to Architectural Reflected Ceiling plans for exact locations of air terminals, and coordination with ceiling type.
- 3.1.5 Paint ductwork behind grilles with matte black paint where duct or insulation surfaces are visible.
- 3.1.6 Attach registers and grilles to branch ducts with duct necks having minimum length to prevent grille or register damper from protruding into branch duct.
- 3.1.7 Where air terminals are installed in mechanical grid ceiling, provide minimum two 12 ga (2.75 mm) galvanized steel wire seismic security bridles at opposite corners of each air terminal and such that air terminal cannot fall.
- 3.1.8 Hand over door grilles to General Contractor for installation.

### 3.2 Louvres

- 3.2.1 Provide necessary flashing and counterflashing for louvres installed in walls.

- 
- 3.2.2 Caulk louvre and flashing and counterflashing to make installation water tight.
  - 3.2.3 Blank-off panels shall be constructed to SMACNA standards, minimum 20 ga (1.00 mm) sandwich panel with 1" (25 mm) thick fibreglass insulation.
  - 3.2.4 Blank-off panels shall have painted flat black enamel finish.
  - 3.2.5 Install backdraft dampers / motorized dampers at all louvres in accordance with requirements per ASHRAE 90.1 and as indicated on drawings.

**END OF SECTION**

---

**1 .      GENERAL**

**1.1      Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2      Filters – Quality Assurance**

1.2.1 Filters shall be by one Manufacturer.

1.2.2 Filter media shall be ULC listed and labelled, Class I or Class II.

1.2.3 Filters shall be suitable for air at 100% RH and air temperatures between 37°F (3°C) and 122°F (50°C).

1.2.4 Dust holding capacity: Air Filter Institute (AFI) Test.

1.2.5 Efficiency: based on ASHRAE 52-76, atmospheric dust spot efficiency. "Absolute filter" efficiency shall be tested with 0.3 Poly-alpha-olefin (PAO) smoke.

1.2.6 Representative filters shall have been tested by an independent test laboratory and test results shall be made available on request.

**2 .      PRODUCTS**

**2.1      Filters – General**

2.1.1 Mark filter identification on each filter.

2.1.2 Provide two sets of filter media (for each filter) - one for initial installation and one for handover to the Owner as a spare. This does not apply to HEPA filters. Obtain signed receipt.

2.1.3 Panel filter media used during "temporary heating" shall be replaced by new media on substantial completion.

2.1.4 Filters sections shall be designed for 500 ft/m (2.54 m/s) maximum air flow velocity.

2.1.5 Filters sizes shall conform to existing VGH - Physical Plant Standard. 24" (600 mm) x 24" (600 mm), 24" (600 mm) x 20" (500 mm), 24" (600 mm) x 12" (300 mm), or 12" (300 mm) x 12" (300 mm).

2.1.6 Roll type filters, automatic advance or otherwise will not be considered acceptable means of filtration.

2.1.7 Use of permanent washable type impingement filters not acceptable.

**2.2      Filters – Panel Type**

2.2.1 2" (50 mm) thick disposable pleated cotton media.

- 2.2.2 Enclosing frame shall be constructed from rigid, heavy-duty high wet strength beverage board with diagonal support members bonded to both sides of each pleat.
- 2.2.3 Efficiency: MERV 7 15 per ASHRAE Standard 52.2 and an average dust spot efficiency of 25% to 30% per ASHRAE Standard 52.1.
- 2.2.4 Standard of Acceptance: AAF AM-AIR 300, Farr 30/30.

**2.3 Filters – Final**

- 2.3.1 Disposable bag type with fine glass fibre media, self-inflating with holding frame and not requiring rigid support basket.
- 2.3.2 Efficiency: as scheduled.
- 2.3.3 Standard of Acceptance: AAF Dri-Pak, Farr N/S

**2.4 Filters – Final**

- 2.4.1 12" (300 mm) deep disposable pleated fine glass fibre media.
- 2.4.2 Rigid galvanized steel enclosing frame.
- 2.4.3 Efficiency: as scheduled.
- 2.4.4 Standard of Acceptance: AAF Varicel, Farr Riga-Flo

**2.5 Filters – Final (synthetic)**

- 2.5.1 Progressively structured filter medium made from unbreakable synthetic microfibre media, bag type filters.
- 2.5.2 Front frame made from corrosion resistant hard polyurethane foam.
- 2.5.3 Filter pockets self-supporting with integral wire struts, leak-free bonds.
- 2.5.4 Efficiency: as scheduled.
- 2.5.5 Standard of Acceptance: Viledon.

**2.6 Filters – HEPA**

- 2.6.1 HEPA filters shall be individually tested and certified.
- 2.6.2 Efficiency: as scheduled.

**2.7 11.5" (290 mm) deep disposable pleated fine glass fibre media with safe-edge aluminum separators.**

- 2.7.1 Rigid galvanized steel enclosing frame.
- 2.7.2 Neoprene expanded rubber gasket.
- 2.7.3 High capacity model.
- 2.7.4 Standard of Acceptance: Camfil/Farr Filtra 2000, Airguard Microguard 2000, Flandees Alpha 2000.

---

**2.8 Filters – High Efficiency Germicidal**

**2.8.1 Description:**

- .1 The filter system shall be comprised of three primary elements as manufactured by StrionAir Inc.: Disposable Filter Element, Filter Enhancement Module and Master Control Unit.
- .2 System shall have minimum filtration efficiency rating of MERV 15 per ASHRAE Standard 52.2. Rating shall be at face velocity of 500 ft/m (2.54 m/s). Independent test data shall be provided.
- .3 System shall be CSA 22.1, UL 867 rated.

**2.8.2 Filter to Filter Seal:**

- .1 Filters constructed of rigid plastic frame, vertical sides to contain knife-edges with closed cell foam gaskets. Orientation of lip and gasket are reversed on adjacent filters providing twin lip to gasket seals with minimal filter bypass.

**2.8.3 Filter to Rack Seal:**

- .1 Filter seals on downstream side of filter and upstream side of filter rack. Seal to be part of filter and not rack.

**2.8.4 System Command and Communications Modules (SCCM):**

- .1 Each SCCM shall have two power modules able to power up to 16 FEM units.
- .2 Each SCCM unit requires 120C power supply with local disconnect by Electrical. Mechanical to provide wiring from disconnect to SCCM module.
- .3 Each SCCM module will have one dry contact or 0 to 10 VDC output for alarm annunciation on BMS system.

**2.8.5 Disposable Filter Elements:**

- .1 Initial resistance shall not exceed 0.37" w.g. (92 Pa) at 500 ft/m (2.54 m/s) face velocity.
- .2 Filters shall be UL 900 class II rated.
- .3 Ultra-low-bypass Disposable Filter Element shall consist of mini-pleated microglass fibre filter media packs with conductive metal grid attached to downstream surface acting as downstream field electrode. Enclosing frame shall be constructed of moulded polymer with integrated gasket to eliminate side-to-side and top and bottom air bypass. Media pack shall be mechanically and chemically bonded to inside edge of enclosing frame.

**2.8.6 Filter Enhancement Modules (FEM):**

- .1 Each StrionAir Air Filter installation shall consist of one FEM unit per pre-filter.

- 
- .1 Modules shall be UL 5V rated.
  - .2 Filter Enhancement modules shall be composed of precision stamped stainless steel assembly acting as Ionization Array and assembly composed of high voltage cable held in tension by insulating polymer supports acting entirely as Upstream Field Electrode. These components shall be enclosed within UL94 5V rated extruded polymer frame.
  - .3 Each Filter Enhancement Modules shall consume average of 7 watts and maximum of 29 watts and draw no more than 0.2A at 120 VAC, depending upon operation conditions.
  - .4 Ionization, oxidative stress and static charge accumulation shall be used to achieve efficiency reported.
  - .5 Independent documentation proving filters meet specifications shall be provided. No Manufacturer generated testing results will be acceptable.
- 2.8.7 Maser Controls Unit (SCCM):
- .1 8 FEM units per System Command and Communication Modules (SCCM).
  - .2 Master Control Units shall contain power and control functions necessary to properly operate system Filter Enhancement Modules. Control Modules and supporting electronics shall be enclosed within NEMA 2 enclosure. External to enclosure shall be visually and physically accessible LED indicators of power functions and power on/off switch.
  - .3 Each Master Control Unit shall use power input of 115V/1/60 VAC, 60 Hz @ 3A. Master Control Units shall be BMS enabled.
  - .4 Each SCCM unit requires 120 V power supply with local disconnect (by Electrical). Mechanical to provide wiring from disconnect to SCCM module.
  - .5 Each SCCM modules shall have one dry contact or 0 to 10 VDC output for alarm annunciation on the BMS system.
- 2.8.8 Filter Rack:
- .1 Filter rack shall be extruded aluminum, low bypass S-Rack and manufactured by StrionAir. Filter racks shall be flat panel in configuration to enable side or downstream loading. Frames shall be cut to size and drilled for simple speed screw assembly into modules from sizes noted in schedules and plans. Tracks shall be permanently gasketed to eliminate air bypass. Where required, vertical support members shall be furnished to support horizontal members.
- 2.8.9 Standard of Acceptance: StrionAir GC Air Systems.

---

**2.9      Filters – Carbon**

- 2.9.1 General: Regenerative activated carbon in perforated multiple cells, complete with supporting frames, removable trays and one-piece gasketed removable grid.
- 2.9.2 Media: Activated carbon from coconut shell, 50-55 minute absorption capacity in accordance with standard accelerated chloropicrin test.
- 2.9.3 Test element: Each cell or bank of cells to be complete with detachable test elements to indicate extent of saturation of actual installation.

**2.10      Filters – Grease**

- 2.10.1 Media: 14 ga (1.99 mm) mesh steel screen, zinc electroplated, alternate layers of flat herringbone crimp, four layers per 1" (25 mm) rod reinforced, enclosed in 20 ga (0.95 mm) stainless steel frame.

**2.11      Filter – Holding Frames**

- 2.11.1 Built-up Frames:
  - .1 Provide separate holding frames for each bank of panel filters and each bank of final filters.
  - .2 Factory fabricated from 14 ga (1.99 mm) galvanized steel with spring retaining clips and neoprene gaskets.
- 2.11.2 Slide-In-Frames:
  - .1 Provide slide-in-channels for filters mounted in ductwork where noted. Provide hinged and gasketed access doors.

**2.12      Filter – HEPA Holding Frame**

- 2.12.1 Factory manufactured. Rigid galvanized steel casing, minimum 16 ga (1.61 mm) thick.
- 2.12.2 Frames to have high degree of sealing integrity. Filters shall fit tightly in housing with no air leakage between filters and between filters and housing.
- 2.12.3 HEPA frames shall be provided with filter locking mechanism.

**2.13      Filter Housings**

- 2.13.1 Factory manufactured. Rigid galvanized steel casing minimum 16 ga (1.61 mm) thick.
- 2.13.2 Housing to have a high degree to sealing integrity. Filters shall fit tightly in housing with no air leakage between filters and between filters and housing.
- 2.13.3 Extruded aluminum or steel tracks for slide-out, side withdrawal of filters.
- 2.13.4 Hinged access door for filter servicing.

2.13.5 Standard of Acceptance: AAF Poly-Seal, Cambridge Side-Flo, Farr Glide/Pack.

## **2.14 Filter Gauges**

2.14.1 Application:

- .1 Across each filter bank. (Provide two individual gauges for combined panel and final filter banks.)

2.14.2 Minimum Requirements:

- .1 Ranges:
  - .1 Panel filters: 0 - 1" w.g. (250 Pa).
  - .2 Final filters: 0 - 2" w.g. (500 Pa).

2.14.3 Standard of Acceptance:

- .1 Dwyer series 2000.
- .2 Dwyer Photohelic Series 3000.

## **3 . EXECUTION**

### **3.1 Filters**

- 3.1.1 Do not operate fan system connected to filter banks until filters (temporary or permanent) are in place. Provide new filters at handover to Owner. Replace filter used during construction.
- 3.1.2 Provide filter banks in arrangement shown with removal and access indicated. Demonstrate removal of filters prior to substantial completion.
- 3.1.3 Provide and install Dwyer filter pressure gauges across each filter installation.

### **3.2 HEPA Filter Testing**

- 3.2.1 Provide site demonstration that HEPA filter installation performs to specification. Simulate conditions using ASHRAE DOP test method. Filters to be replaced at no cost to Owner if performance tests indicate efficiency lower than specified.

### **3.3 Ecology Kitchen Exhaust Units**

- 3.3.1 Install units in accordance with recommendation of ULC, NFPA-96 and Manufacturer's instructions and as indicated.
- 3.3.2 Provide fan sheaves required for final air balance.
- 3.3.3 Transition exhaust duct to full inlet opening of filter section.
- 3.3.4 Exhaust duct connection to filter section to be continuously welded.
- 3.3.5 Control wiring between ecology unit and control panel by Control Contractor.

---

3.3.6 Unit to be seismically secured to roof curbs.

**3.4 Filter Gauges**

3.4.1 Mount gauges for easy visual inspection.

3.4.2 Piping to be formed in true vertical/horizontal lines free from kinks.

3.4.3 Seal penetrations of plenums or ducts.

**3.5 Filter Holding Frames**

3.5.1 Built-up frames shall be installed and bolted together (and sealed air-tight with specified duct and plenum sealers) to form filter bank.

3.5.2 Provide necessary reinforcing for filter banks over three frames high. Brace with vertical steel stiffeners, minimum 14 ga (1.99 mm) thick, riveted or bolted to frames and attached to top and bottom of plenum. When bolting frames together, provide spaces between holding frames as necessary to centre filters on coils (see drawing sections).

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

### 1.2 **Reference Standards**

1.2.1 Install packaged boiler(s) in accordance with current Regulations of the Province of Ontario, CSA B51, ASME Codes, CSA B140.7.2., CAN1-3., Canadian Electric Code, CSA B139, CSA B139S1, CAN1-B149.1, ANSI B31.1, except where specified otherwise.

### 1.3 **Submissions**

1.3.1 Submit certificate of inspection from Technical Standards and Safety Authority (TSSA).

### 1.4 **Shop Drawings**

1.4.1 Submit shop drawings as per Section 23 05 00.

1.4.2 Indicate components, assembly dimensions, weights and loadings, required clearances, location and size of field connections, valves, strainers and thermostatic valves required for complete system.

1.4.3 Submit product data indicated rated capacities, weights, specialities and accessories, electrical requirements and wiring diagrams, including heating surface area.

1.4.4 Submit Manufacturer's installation instructions.

### 1.5 **Start-Up**

1.5.1 Manufacturer's Representative to provide start-up and burner adjustment service and maintenance and operating instructions to Owner's maintenance staff. Test reports to be submitted for review and inclusion in maintenance manuals.

## 2. **PRODUCTS**

### 2.1 **Acceptable Manufacturers and Products**

2.1.1 As listed for the specified boiler type below.

### 2.2 **General**

2.2.1 Packaged Boiler: Complete with burner and necessary accessories and controls, and ready for attachment of water supply, return and drain piping, (including condensate drain on condensing boilers, fuel

- 
- piping, electrical connections, and chimney connection. UL/ULC labelled.
- 2.2.2 Designed and constructed in accordance with ASME Code requirements.
- 2.2.3 The pressure vessels shall bear Canadian Registration Number (CRN) for The Province of Ontario before being shipped from the factory.
- 2.2.4 Electrical components CSA approved.
- 2.2.5 Packaged boiler must receive factory tests to confirm construction, controls, and operation of unit. Boilers to be test fired before shipment.
- 2.2.6 Include boiler assembly and wiring diagrams and operating and maintenance manual with boiler package.
- 2.2.7 Check available drawings and ensure the proposed boiler will fit in space allotted and can be maintained and operated in normal manner.
- 2.2.8 Furnish electrically-heated **hot water** generator complete with standard equipment and accessories as described herein. Hot water generator shall be packaged type, factory assembled, wired and tested, UL listed and bear Underwriters' Laboratories label.
- 2.2.9 Immersion resistance type heating elements, copper sheathed, replaceable without special tools.
- 2.2.10 ASME designed pressure vessel and in accordance with CSA codes and the Provincial Boiler Code and Regulations.
- 2.2.11 Equip boiler with following trim controls, together with other controls and devices required to produce approved, safe and complete unit:
- .1 Conduit cabinet.
  - .2 Terminal blocks.
  - .3 Magnetic contactors.
  - .4 Control transformer.
  - .5 Control circuit on-off selector switch.
  - .6 Pilot light for each step of heating elements.
  - .7 One set of dry contacts for common alarm.
  - .8 Alarm horn mounted on control panel with silencing switch for reset.
  - .9 Inspection and cleanout holes.
  - .10 Pressure relief valve.
  - .11 Electronic low water control complete with alarm contacts.
  - .12 Pressure gauge.
  - .13 Temperature gauge (hot water boilers).
-

- 2.2.12 Boiler insulation: 2" (50 mm) glass fibre, covered with heavy gauge metal jacket finished with heat resistant enamel paint.
- 2.2.13 Electric Boiler Heating Elements: Water temperature regulated by modulating step controller with water temperature sensors operating between two adjustable temperature setpoints operates magnetic contactors which energize electric resistance heating elements. High limit control de-energizes heating elements at ...°F (...°C).
- 2.2.14 Standard of Acceptance:
  - .1 Steris/Amsco CES Series, A.O. Smith, SuperHot, Rudd, Chromalox.

### 2.3 **Boiler Sequence Control**

- 2.3.1 Hot Water Boiler Sequencing:
  - .1 Supply lead lag programming control to integrate multiple boiler installation and automatically sequence firing of boilers in balance with changing load conditions.
  - .2 Control shall automatically program individual boilers in or out of operation in response to temperature variations as sensed by temperature sensor installed in supply water header common to boilers.
  - .3 Temperature sensor, through controller, shall operate **three** ON-OFF pneumatic-electric (PE) switches, one for each boiler, each wired into its respective boiler control operating high limit cut-off (ON-OFF) control circuit. PE switches shall be sequenced (see below) at fall in flow water temperature to 200°F (93°C), 198°F (92°C), 196°F (91°C) respectively.
  - .4 Manual selector switch shall alternate **three** boilers through PE switches to the following sequence.

## 3. **EXECUTION**

### 3.1 **Installation**

- 3.1.1 Install boilers on 4" (100 mm) concrete housekeeping pad or concrete piers and level, as required.
- 3.1.2 Do not deviate from required service and maintenance clearances as required by code.
- 3.1.3 Mount unit level. Anchor boiler with bolts and inserts suitable for seismic loading.
- 3.1.4 Pipe relief valves and air vents on hot water boilers to floor drain.
- 3.1.5 Manufacturer's Representative shall:
  - .1 Certify installation in writing.
  - .2 Provide start-up and burner adjustment service.

- .3 Carry out on-site performance verification tests.
- .4 Provide maintenance and operating instructions.
- 3.1.6 Test reports to be submitted for review and inclusion in maintenance manuals.

### **3.2 Boiler Efficiency Test**

- 3.2.1 Test boiler in accordance with ASME short form test procedure after installation and hook-up but before handing units over to Owner. Forward to Consultant for approval appropriate data and calculations. Make alterations and repeat tests until test results prove each unit performs as specified. Make temporary connections, provide meters, equipment and instruments, provide engineering personnel required. Forward three copies of final approved test results to Consultant.

**END OF SECTION**

**1. GENERAL**

**1.1 Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to read, interpreted and coordinated with other parts.

**1.2 Quality Assurance**

1.2.1 Constructed in accordance with ASTM A653 / A653M-13 and Provincial Pressure Vessel regulations.

**1.3 Submittals**

1.3.1 Shop drawings shall include dimensions, locations and size of tapings, and performance data to compare with specification.

**2. PRODUCTS**

**2.1 Heat Exchangers – Plate and Frame – To be certified to ARI-400-2014.**

2.1.1 Suitable for maximum working pressure of 125 psi (860 kPa).

2.1.2 Frames: Carbon steel with baked epoxy enamel finish.

2.1.3 Guide Bars: Hard chrome-plated carbon steel with zinc treated carbon steel paint protected shroud.

2.1.4 Plates: Type 304 stainless steel.

2.1.5 Nozzles: Constructed of 316L stainless steel.

2.1.6 Gaskets: Nitrile or Ethylene propylene rubber.

2.1.7 Acceptable Products: Alfa Laval, Xylem (Bell & Gossett), Armstrong, Sondex, GEA, Taco.

**3. EXECUTION**

**3.1 Shell and Tube Heat Exchanger Installation**

3.1.1 Install level. Anchor heat exchangers and supports with bolts and inserts suitable for seismic loading.

3.1.2 Arrange piping so tube bundle can be removed after disconnecting two unions or flanges adjacent to head, without disturbing installed equipment or piping.

3.1.3 Install with safety relief valve piped to drain, **vacuum breaker**, hose bibb and drain valve.

3.1.4 Install thermometer wells with thermometers on inlet and outlet of water side.

3.1.5 Install pressure gauge on inlet and outlet pipes.

**3.2 Plate Type Heat Exchanger Installation**

3.2.1 Install level. Anchor heat exchangers and supports with bolts and inserts suitable for seismic loading.

3.2.2 Install with safety relief valve piped to drain, **vacuum breaker**, hose bibb and drain valve.

3.2.3 Install thermometer wells with thermometers on inlet and outlet of water side.

3.2.4 Install pressure gauge on inlet and outlet pipes.

---

1. **GENERAL**

1.1 **Related Work**

1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

1.2 **Quality Assurance**

1.2.1 Catalogued or published ratings shall be those obtained from tests carried out by Manufacturer or by independent testing agency signifying adherence to codes and standards.

1.3 **References**

1.3.1 AHRI 1060.

2. **PRODUCTS**

2.1 **Heat Recovery Ventilators – Flat Plate Type**

2.1.1 General:

- .1 Factory packaged, self-contained and pre-wired unit, CSA certified.
- .2 Packaged heat recovery ventilator consisting of flat plate heat exchanger, ventilation air fan, exhaust air fan, dampers, temperature sensors and controls, suitable for operation with low outdoor air temperatures to -22°F (-30°C).
- .3 Unit shall be constructed in accordance with CSA C22.2 and UL 1812 and shall carry the ETL and (C)ETL label of approval.
- .4 Insulation shall comply with NFPA 90A requirements for flame spread and smoke generation.
- .5 Tested and rated in accordance to AMCA 210, AHRI 1060 and ASHRAE 84, test procedures for airflow and thermal effectiveness.
- .6 Single point power connection only, voltage as identified in the schedules.
- .7 Units shall be run tested prior to shipment.
- .8 Unit shall be capable of providing constant volume at specified external static pressure at all fan operating speeds.

2.1.2 Unit Cabinet:

- .1 Unit shall include baked on, polyester pre-painted 20 ga (1.00 mm) galvanized steel finish. Warranty cabinet finish for

10 years against cracking, chipping, peeling, brazing or spotting.

- .2 Cabinet shall be insulated throughout with minimum 1" (25 mm) foil faced fire retardant material.
- .3 Painted galvanized metal cabinet, internally lined and insulated – suitable for outdoor installation where unit is exposed to outdoor environment.
- .4 Main access panel shall be hinged and provide access to components requiring servicing.
- .5 Outdoor and exhaust side filters with service access. Provide MERV 13 minimum efficient air filters.

**2.1.3 Fans:**

- .1 Supply air and exhaust air fans with single speed motors.
- .2 Fan ratings based on tests in accordance with AMCA Standard 210.
- .3 Fans selected to operate on stable, efficient part of fan curve when delivering air quantities scheduled against static pressure of system.
- .4 Fan blades shall be statically and dynamically balanced and tested prior to shipment.
- .5 Fan shall be provided with internal vibration isolation mounts.
- .6 Motors shall be continuous duty, permanently lubricated and matched to fan loads. Motor selection shall include 15% service factor.

**2.1.4 Flat Plate Heat Exchanger:**

- .1 Rugged aluminum or polypropylene flat plate heat exchanger designed for general purpose or corrosive applications and shall meet UL 94 HB flame spread test, and be removable from unit.
- .2 Cross leakage of less than 1%.
- .3 Fifteen year warranty on flat plate heat exchanger.

**2.1.5 Controls:**

- .1 Unit shall be provided with factory mounted and factory wired microprocessor control, requiring only field connection to building DDC system and/or remote sensing devices and wiring to unit mounted terminal strips.
- .2 Service connectors shall be quick disconnect type.
- .3 Unit circuitry shall allow dry contacts for occupancy control, remote fan interlock on call for ventilation, selection of low or high speeds, remote sensor contacts, interlock with building DDC system. Dry contacts for control functions to be building DDC system compatible.

- .4 Automatic defrost cycle.
- .5 Dirty filter contacts.
- 2.1.6 Accessories:
  - .1 Frost Control Options:
    - .1 Recirculation Defrost Cycle: Unit shall be equipped with recirculation defrost to prevent frost from forming on flat plate heat exchanger and to prevent negative pressure from occurring in building.
    - .2 Exhaust Only Defrost Cycle: Unit shall be equipped with exhaust only defrost to prevent frost from forming on flat plate heat exchanger and to maintain exhaust ventilation at all times.
    - .3 Damper Defrost: Unit shall have continuous damper operation on outdoor air inlet to prevent frost build-up.
  - .2 Corrosion resistant external finish, suitable for outdoor installation.
  - .3 Two speed fan.
  - .4 Duct-Mounted Smoke Sensor with controller for field installed control of fan operation.
  - .5 Flow Measuring Station.
  - .6 CO2 Controller: Non-dispersed infrared control shall be provided to trigger ventilation at levels above 1,000 ppm of CO2.
- 2.1.7 Standard of Acceptance: Venmar CES Inc., Munters/Deschamps, Innovent.

## **2.2 Heat Recovery Ventilators – Rotary Type**

- 2.2.1 General:
  - .1 Factory packaged, self-contained and pre-wired unit, CSA certified.
  - .2 Packaged heat recovery ventilator consisting of rotary type heat exchanger, ventilation air fan, exhaust air fan, necessary dampers, temperature sensors and controls, suitable for operation with low outdoor air temperatures (-40°F (-40°C)).
  - .3 Units shall be listed per UL 1995 and bear the UL label.
  - .4 Tested and rated in accordance to AMCA 210, AHRI 1060 and ASHRAE 84, test procedures for airflow and thermal effectiveness.
  - .5 Performance shall be as scheduled.
  - .6 Single point power connection only, voltage as identified in schedules.

- .7 Units shall be run tested prior to shipment.
- .8 Unit shall be capable of providing constant volume at specified external static pressure at all fan operating speeds.
- .9 Unit shall be warranted to be free from defects in material and workmanship for period of five years.

**2.2.2 Cabinet:**

- .1 Unit shall include pre-painted galvanized steel finish. Warranty finish for cabinet 10 years against cracking, chipping, peeling, brazing or spotting.
- .2 Panels exposed to weather shall be minimum of 18 ga (1.31 mm) galvanized steel.
- .3 Unit shall be internally lined galvanized sheet metal creating double wall.
- .4 Where top panels are jointed there shall be overlapping, standing seam to ensure positive weather protection.
- .5 Metal-to-metal seams shall be factory sealed, requiring no caulking at job site.
- .6 Unit base to be designed for curb mounting. Unit base shall overhang curb for positive seal against water run-off.
- .7 Cabinet shall be insulated throughout with minimum 1" (25 mm) foil faced fire retardant material.
- .8 Main access panels shall be hinged and provide access to components requiring servicing.
- .9 Outdoor and exhaust side filters with service access. Provide MERV 13 minimum efficient air filters.

**2.2.3 Fans:**

- .1 Supply air and exhaust air fans with separate single speed motors, in draw-through configuration.
- .2 Fan ratings are based on tests made in accordance with AMCA Standard 210.
- .3 Fans must be selected to operate on stable, efficient part of fan curve when delivering air quantities scheduled against static pressure of system.
- .4 Fan shafts shall be mounted in permanently lubricated, sealed ball bearing pillow blocks. Bearings shall be selected for minimum (L10) life in excess of 100,000 hours at maximum cataloged operating speeds.
- .5 Fan blades shall be statically and dynamically balanced and tested prior to shipment.
- .6 Fans shall be provided with internal vibration isolation mounts.

- .7 Motors shall be continuous duty, permanently lubricated and matched to fan loads. Motor selection shall include 15% service factor.
- .8 Adjustable sheaves on belt-driven fans with motors less than 10 hp (7.5 KW) shall allow independent balancing of exhaust and supply airflows.

**2.2.4 Energy Recovery Wheel:**

- .1 Wheel shall be enthalpy type for both sensible and latent heat recovery and be designed to ensure laminar flow. Energy recovery device shall transfer moisture entirely in vapour phase.
- .2 Energy transfer ratings shall be AHRI Certified to Standard 1060 and bear AHRI certification symbol for AHRI Air-to-Air Energy Recovery Ventilation Equipment Certification Program based. Ratings "in accordance with 1060" without certification are not acceptable.
- .3 Wheel design shall consist of removable segments for ease of service and cleaning. Wheel shall be constructed of lightweight polymer media to minimize shaft and bearing loads. Polymer media shall be mounted in stainless steel rotor for corrosion resistance.
- .4 Desiccant shall be silica gel for maximum latent energy transfer. Silica gel desiccant shall be permanently bonded to wheel media to retain latent heat capability after cleaning. Wheels with sprayed on desiccant coatings, or with desiccant applied after wheel formation are not acceptable.
- .5 Energy recovery drive belt material shall be high strength urethane and shall be factory installed in pre-stretched state, eliminating need for field belt tension adjustment.
- .6 Cross leakage of less than 1%.
- .7 Five year parts and labour warranty on heat exchanger material and heat wheel motor/turning system.

**2.2.5 Hot Water Coil:**

**2.2.6 Hot water coil shall be factory tested and rated in accordance with AHRI 410 Forced Circulation Air Cooling and Air Heating Coils.**

- .1 Coils shall have copper tubes with permanently expanded aluminums fins, 10 fins per inch or less.

**2.2.7 Electric Coil:**

- .1 Electric heat shall be UL listed and circuit fused per NEC over 48 amps.
- .2 Heater shall be multi-step control, factory wired and installed.
- .3 Control with be 24 V with class 2 transformer.

- .4      Airflow switch to shut-down heater if air flow stops.

2.2.8 Controls:

- .1      Unit shall be provided with factory mounted and wired control, requiring only field connection to building DDC system and/or remote sensing devices and wiring to unit mounted terminal strips.
- .2      Service connectors shall be quick disconnect type.
- .3      Unit circuitry shall have dry contacts for occupancy control, remote fan interlock on call for ventilation, selection of low or high speeds, remote sensor contacts, interlock with building DDC system. Dry contacts for control functions to be building DDC system compatible.
- .4      Controls will receive building DDC system on/off signal, and shall control operation of each fan independently.
- .5      Dirty filter contacts.
- .6      Rotary wheel independent speed control, building DDC system compatible.

2.2.9 Accessories:

- .1      Frost Control Options:
  - .1      Variable wheel speed: Unit shall have the energy recovery wheel speed controlled to prevent frost build-up on wheel.
  - .2      Inlet heater: Unit shall have electric heater on outdoor air inlet, in addition to wheel speed controlled to prevent frost build-up on energy recovery wheel, where wheel speed control is not adequate.
- .2      Corrosion resistant external finish suitable for outdoor installation.
- .3      Roof curb shall be full perimeter type, sized for site seismic zone, with gasketting provided for field installation between curb and unit base.
- .4      Two speed fan.
- .5      Duct-Mounted Smoke Sensor with controller for field installed control of fan operation.
- .6      Flow Measuring Station.
- .7      CO2 Controller: Non-dispersed infrared control shall be provided to trigger ventilation at levels above 1,000 ppm of CO2.
- .8      Weather hoods (on outdoor Models) shall be tested in accordance with AMCA Standard 500-L to prevent water penetration.

2.2.10 Standard of Acceptance: Greenheck Model: ERCH.

**3 . EXECUTION**

**3.1 Heat Recovery Ventilators Installation**

- 3.1.1 Install in accordance with Manufacturer's recommendations.
- 3.1.2 Start-up Heat Recovery Ventilators in accordance with Manufacturer's start-up instructions. Provide start-up report to Consultant, and include in O & M manual.

**END OF SECTION**

---

**1.      GENERAL**

**1.1      Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

**1.2      Quality Assurance**

- 1.2.1 Unit and major components shall be product of same Manufacturers regularly engaged in production of such units who issues complete catalogue data on such products.

.1 Standard of Acceptance: Engineered Air, Haakon, Huntair, Scott Springfield, Annexair

- 1.2.2 Unit shall be factory built, and carry necessary approvals. Coils shall be water tested and AHRI certified. Fan(s) shall be run and tested to performance. Test results shall be submitted for vibration, sound and airflow performance.

- 1.2.3 Allow travel costs for Consultant to inspect unit(s) at factory prior to shipping. Provide 5 working days' notice to Consultant to schedule trip.

- 1.2.4 Review project schedule and ensure shop drawing submission and review unit delivery is compatible with project requirements. Allow minimum of 6 weeks for shop drawing review process.

- 1.2.5 Manufacturers shall provide construction methods to achieve sound data as specified and provide data obtained by either:

.1 AMCA lab simulation.

.2 Test data of actual unit.

.3 Sound data shall be measured and provided in accordance with AHRI Standard 260P.

**1.3      Submittals**

- 1.3.1 Provide technical information relevant to product being provided, including but not limited to information indicated in schedules.

- 1.3.2 Product data shall include dimensions, weight, capacities, certifications, casing construction details, gauges and finishes of material.

- 1.3.3 Submit fan curve details, showing operating points at clean filter, dirty filter and mid-point loaded filter with parameters specified. Select fans at maximum efficiency for specified duty.

- 1.3.4 Submit sound power levels for air handling unit inlet and outlet and casing radiation at rated capacity in accordance with AMCA.

- 1.3.5 Shop drawings shall include motor efficiencies. Refer to Section 23 05 13 for minimum motor efficiencies.
- 1.3.6 Submit each air-handling unit on separate 1:25 scale drawing showing construction details and dimensions of entire unit and internal components.
- 1.3.7 Submit Manufacturer's recommended installation instructions.

#### **1.4 Variable Speed Drives**

- 1.4.1 Motors powered by variable speed drive controllers shall be EEMAC Class B with Type F insulation, shall have 1.15 service factor and shall be suitable to be driven by PWM variable speed drive controllers. Motor Manufacturer shall submit in writing confirmation that motors are designed to withstand voltage peaks of 1400V and voltage rate of rise of 2000V/microsecond at frequency of 20 kHz.

## **2 . PRODUCTS**

### **2.1 Air Handling Unit – Custom Built**

#### **2.1.1 General:**

- .1 Factory fabricated and assembled modular components as indicated. Field fabrication of units will not be accepted. Field assembly of unit sections is acceptable if unit cannot be installed as single unit. Include for cost of any field assembly.
- .2 Overall dimensions and configurations are to be as indicated on drawings. However, this does not absolve Manufacturer from responsibility for engineering, operational integrity and performance of unit provided.
- .3 Unit shall carry necessary approvals.
- .4 Refer to schedules for capacity requirements/design parameters/component type. Other features normally required to complete and safe operation are implicit requirement and shall be included.

#### **2.1.2 Electrical:**

- .1 Wiring shall be factory CSA approved.
- .2 Complete factory power wiring in EMT conduit from motors and lights to point power connections.
- .3 Provide one 120 V/1/Phase connection to junction box for marine lights.
- .4 Provide power connections from each fan motor to junction boxes on outside of unit casing.
- .5 Electrical Contractor to provide disconnects, starters and power wiring to unit junction boxes. If variable speed drives are used Electrical shall wire to disconnect switches (could

be integral on VSD) and from disconnect switches to VSDs and from VSDs to motor junction boxes. If disconnect is placed between VSD and motor, auxiliary sets of contacts are required to let VSD know it has been shut-off.

- .6 Provide power connections from each fan motor to VSDs and to junction boxes on outside of unit casing for indoor units.
- .7 Provide factory installed empty 1" (25 mm) conduit throughout length of unit with J-boxes in each section for Control Contractor's use.

**2.1.3 Mounting Frame:**

- .1 Casings shall be supported on welded structural channel supports designed for support of entire unit without deflection.
- .2 Steel base shall be suitable for seismically bolting unit to roof curbs or housekeeping pads or welding unit to embedded steel plates in concrete roof curbs or housekeeping pads/curbs.
- .3 Integral lifting lugs for hoisting.
- .4 Unit(s) shall be mounted on metal seismic roof curb(s) provided with unit(s). Roof curbs shall be seismically secured to roof. When flashed to mounting curb unit shall provide weatherproof whole.
- .5 Unit(s) shall mate to concrete mounting curb provided under Division 3. When flashed to mounting curb unit shall provide weatherproof whole.
- .6 Provide suitable means for seismically securing units.

**2.1.4 Floor:**

- .1 Plenum floors shall be rigid of welded construction using, as minimum, structurally reinforced 12 ga (2.75 mm) MS checker plates; be free from dishing and be formed as drain pan with standing upturned angle. Seams and corners shall be continuously welded. Floor shall be completely flooded after assembly and written certification submitted by Manufacturer that there are no leaks.
- .2 Floor shall be finished with two-component epoxy polyamide non-skid paint.
- .3 Pipe/duct penetrations through floor shall have minimum 1½" (40 mm) sleeve up-stand, welded.
- .4 Removable open gratings shall be provided over floor openings.
- .5 Underside of base shall be insulated with 2" (50 mm) thick 4 lb/ft³ (64 kg/m³) density glass fibre acoustic insulation.

**2.1.5 Drain Pans:**

- .1 Coil drain pans of 16 ga (1.59 mm) minimum stainless steel shall be recessed into floor and shall be integral part of floor paneling, minimum of 6" (150 mm) and 2" (50 mm) deep respectively with welded corners. Drain pans under each 'wet' coil must extend upstream and downstream as required to ensure no carryover. Drain pans shall also extend under cold coil headers and return bends.
- .2 Drain pan shall be sloped to outlet and outlet pipe bottom invert shall be below bottom of pan. Drain pan shall be provided with interior 1¼" (32 mm) copper pipe drain piped to outside of unit.
- .3 Provide drain pans under coil banks to allow for cleaning. Cap drain connections at exterior of unit for dry coils.
- .4 Provide information to Contractor indicating minimum required exterior trap depths.

2.1.6 Casing:

- .1 Rooftop unit(s) shall be weatherproof and equipped for installation outdoors. This shall include prevention of infiltration of rain and snow into unit.
- .2 Unit casing shall be minimum 16 ga (1.61 mm) galvanized sheet metal. Finish coat shall be air-dry enamel, to exposed surfaces. Colour to Architects choice for rooftop units.
- .3 Units shall be tested to 3% leakage at 1.5 times operating pressure.
- .4 Generally, with structurally framed units, walls and roofs shall be of interlocking construction, with at least two breaks at each interlocking joint. Joints shall be secured by sheet metal screws or pop rivets.
- .5 Wall joints shall be broken in, roof joints shall be broken out for rigidity. Joints shall be caulked with water impervious sealant (Weatherman 222).
- .6 Required holes in casing for controls, electrical, piping etc. shall have grommets. Seal factory utilized openings neatly and airtight. Site sealed openings shall be to standard set by Manufacturer.
- .7 Provide radiused bell mouth duct outlet connections for supply plenum installations and for plug fan inlet.
- .8 Insulate interior walls with 2" (50 mm) thick, 3 lb/ft³ (48 kg/m³) min. density glass fibre neoprene coated acoustic insulation. Edges of insulation shall be covered with metal Z bars. Insulation pins shall be secure and ends trimmed and covered with neoprene caps.
- .9 Interior face of insulated walls shall be covered with 22 ga (0.85 mm) unpainted perforated galvanized steel liner (except immediately downstream from cooling coils).

- 
- .10 Provide 22 ga (0.85 mm) galvanized sheet metal covering on acoustically lined plenum walls for 4'-0" (1.2 m) downstream from cooling and heat extract coils.
  - .11 Provide marine lights with protective metal cage and glass seals in unit compartments complete with extra-long life krypton bulbs (60 W min.) or compact fluorescent lamps of equivalent wattage. Provide vapour proof fluorescent lights in corridors. Light switches with indicator lights shall be installed outside next to each plenum door.
  - .12 Provide duplex receptacle in any service corridor.
  - .13 Provide motor lifting rail for motors over 25 hp (18.6 KW).
- 2.1.7 Access Doors:
- .1 Access doors shall be provided for access to internal parts, fully lined, with welded steel door frame and Ventlock310 latches complete with front and inside handles and front door pull. Arrange access doors so they open against airflow and static pressure. Door seal shall be closed cell neoprene bulb type.
  - .2 Doors shall be 24" (600 mm) wide by 60" (1,500 mm) high unless casing size requires shorter door or equipment removal requires wider door.
  - .3 Access doors shall include 10" (250 mm) diameter windows. Windows should be maximum of 67" (1,650 mm) from roof or mechanical room floor.
  - .4 Exterior access doors shall be hollow-core insulated metal doors with 1 $\frac{3}{4}$ " (45 mm) thickness, set in formed metal frames. Two ventlock handles and lock set, which shall be equivalent to Corbin-Mortised manufacture.
  - .5 Provide rain excluding seals and gutters for external access doors.
- 2.1.8 Fans:
- .1 Fan sections shall be equipped with structural steel channels located under isolator loads to add rigidity, eliminate floor deflection, and distribute loads to perimeter structural channel.
  - .2 Centrifugal fans shall be rated in accordance with AMCA Standard Test Code Bulletin 210. Fans shall bear AMCA sticker.
  - .3 Fans and fan assemblies shall be dynamically balanced during factory test run.
  - .4 Fan shafts shall be selected for stable operation at least 25% below first critical RPM.
  - .5 Backwardly inclined and airfoil fans shall be used.
-

- 
- .6 Bearings: Heavy-duty pillow-block grease lubricated ball or roller self-aligning type. Bearings shall have an average life of 200,000 hours at design operating conditions in accordance with AMSI B3.15. Inboard bearing lube line shall be extended to outboard bearing.
  - .7 Bearing support shall be from rigid structural steel base frame. Frame shall be internally isolated and seismically restrained from fan cabinet structural frame.
  - .8 Drives shall be adjustable on fans with motors 5 hp (3.7 KW) or smaller. On fans with motors above 5 hp (3.7 KW) fixed drive shall be provided. Include for one sheave change per fan, during air balance procedure.
  - .9 Drives shall be selected for 150% of motor nameplate horsepower and include 2 belts minimum.
  - .10 Sheaves shall be keyed to drive shafts.
  - .11 Motor mounting shall be adjustable.
  - .12 Plenum fan assemblies fully enclosed with expanded mesh screen, approved to Workplace Safety and Insurance Board (WSIB) Standards.
  - .13 Belt drive with belt guards complete with tachometer holes.
  - .14 Fan inlet safety screens.
- 2.1.9 Vibration Isolation:
- .1 Vibration isolators and seismic restraints shall be in strict accordance with Section 23 05 48. Substitute vibration isolators will be accepted.
- 2.1.10 Control Dampers:
- .1 Control dampers to be T.A. Morrison – (1000) airfoil or Ruskin CD-50.
  - .2 Control dampers to be located inside unit so damper actuators are accessible from inside unit.
  - .3 For mixing plenums, arrange dampers to enhance mixing of air streams.
- 2.1.11 Coils – Liquid:
- .1 To be supplied by unit Manufacturer as scheduled.
    - .1 Coil Casings: Material to match unit casing. Provide insulated sheet metal housings over cooling coil return bends. Blank-off plates as required.
    - .2 Heating coils: ARI tested to 250 psi (1,725 kPa) as per ARI Test Code. Pitched in unit casing for drainage. Copper tube mechanically expanded into aluminum fins. Performance as scheduled.

- 
- .3 Cooling coils: Tested to 250 psi (1,725 kPa) as per ARI test code. Copper tube mechanically expanded into aluminum fins. Performance as scheduled.
  - .2 Coils (except cooling coil) shall be fully enclosed within casing and mounted on epoxy primed and painted angle iron racks manufactured to allow coils to slide out. No air bypass around coils will be permitted.
  - .3 Support racks for cooling coils shall be 304 Stainless Steel.
  - .4 Removable coil access panel(s) to permit removal of coil through casing wall. Provide individual access panel for each coil section to allow removal of one coil without affecting connections to any other unit component.
- 2.1.12 Louvres/Hoods:
- .1 Outside louvres and hoods with 1" (25 mm) birdscreen.
- 2.1.13 Humidifiers – Steam:
- .1 Stainless steel steam jacketed dispersing manifold with internal noise attenuating screen,
  - .2 Stainless steel separating chamber.
  - .3 Steam control valve with pneumatic or electric actuator. Coordinate with Controls Contractor.
  - .4 Y type strainer and inverted bucket trap.
  - .5 Electric temperature switch, field installed, to prevent cold start-up of humidifier.
  - .6 Length and number of manifolds as scheduled.
  - .7 Humidifier supplier to be responsible to ensure humidifier tube spacing and location are selected to ensure complete steam absorption before reaching coil bank or filters.
- 2.1.14 Filter Service Ladders:
- .1 Provide rolling ladders in each filter compartment for servicing of pre-filter and final filters.
  - .2 Minimum Requirements:
    - .1 Constructed from lightweight electric welded steel tubing with press formed safety steps.
    - .2 Spring loaded casters which retract to lock ladder or raise unit for mobility of unit and rubber tipped feet.
    - .3 Safety rails to comply with WSIB Standards and regulations.
    - .4 4 steps including platform and platform height of 38" (950 mm).
- 2.1.15 Filters – General:
- .1 Filter media shall be ULC listed, Class I or Class II.
-

- .2 Filters: suitable for air at 100% RH and air temperatures between 37°F (3°C) and 122°F (50°C).
- .3 Efficiency: based on ASHRAE 52-76, atmospheric dust spot efficiency.
- .4 Dust holding capacity: Air Filter Institute (AFI) Test.
- .5 Representative filters shall have been tested by independent test laboratory and test results made available on request.
- .6 Filter identification shall be clearly marked on each filter.
- .7 Provide two sets of filter media (for each filter) – one for installation and one for handover to Owner as spare. Obtain signed receipt.
- .8 Filter holding frames fabricated from 16 ga (1.61 mm) galvanized steel with spring retaining clips and neoprene gaskets.
- .9 No air bypass around filter frames will be allowed. Provide access space for servicing filters. Install filter slide rails and doors for side access where required.
- .10 Each filter section shall be designed to receive standard sized filters only. Use of odd-sized filters is not permitted.

2.1.16 Filters – Panel Type:

- .1 Minimum Requirements:
  - .1 2" (50 mm) thick disposable pleated cotton media.
  - .2 Enclosing frame shall be constructed from rigid, heavy duty high wet strength beverage board with diagonal support members bonded to both sides of each pleat.
  - .3 Efficiency: 25% to 30%.
- .2 Standard of Acceptance:
  - .1 AAF AM-AIR 300, Farr 30/30.

2.1.17 Filters – Final:

- .1 Minimum Requirements:
  - .1 12" (300 mm) deep disposable pleated fine glass fibre media.
  - .2 Rigid galvanized steel enclosing frame.
  - .3 Efficiency: as scheduled.
- .2 Standard of Acceptance:
  - .1 AAF Varicel, Farr Riga-Flo.

2.1.18 Filter Gauges:

- .1 Application:
  - .1 Across each filter bank. Provide 2 individual gauges for combined panel and final filter banks.

- .2 Minimum Requirements:
  - .1 Ranges: Panel filters – 0 - 1" w.g. (250 Pa), Final filters: 0 - 2" w.g. (500 Pa).
- .3 Sensing probes and shut-off vent valves for each filter bank. Provide space between filter banks for pressure sensing.
- .4 Standard of Acceptance:
  - .1 Dwyer Series 2000.
  - .2 Dwyer Photohelic Series 3000 (Where filter pressure drop is monitored by the BMS).

2.1.19 Implosion/Explosion Doors:

- .1 Doors shall be in accordance with Workplace Safety and Insurance Board (WSIB) Standards and regulations, constructed as for hinged access doors.
- .2 Latches shall be Brixon Safety Latches (Brixon Manufacturing Co., 859 North Prior Avenue, St. Paul, Minnesota, USA, 55104).
- .3 Latches shall be complete with handles and shall have adjustable release force as follows:

LATCH MODEL	RELEASE	FORCE	RANGE
2H	5 lb (2.3 kg)		To 33 lb (15 kg)
3H	20 lb (9.1 kg)		To 180 lb (82 kg)
4H	44 lb (20 kg)		To 180 lb (118 kg)
	.4	Refer to drawings for locations of implosion/explosion doors and required number of latches.	
	.5	Provide heavy duty safety chains to limit door swings.	
	.6	Adjust tensions on implosion/explosion door latches so doors open at static pressure differential not greater than 2" w.g. (500 Pa) above/below specified static pressure rating of plenum.	
	.7	Perform tension tests on doors to verify that doors open at settings on latches.	
	.8	Adjust tensions on latches, and permanently mark final setting of adjustment screws.	

2.1.20 Heat Recovery Units:

- .1 Provide packaged heat recovery units or sections as specified in schedules.
- .2 Provide access to unit for cleaning.
- .3 Provide integral drain pan in floor under entire unit with exterior drain connection.

- 
- .4 Provide by-pass dampers for:
    - .1 100% outside air flow not through unit.
    - .2 100% by-pass of warm air stream (return air) when not needed.
    - .3 Freeze/frost protection.
  - 2.1.21 Variable Speed Controllers:
    - .1 For smaller VSDs which are suitable for unit mounting provide suitable stand-off panels on outside of AHU casing for field mounting of variable speed drive units. Provide rubber grommet isolators at attachment points to AHU casing.
  - 2.1.22 Plenum Cleanliness:
    - .1 Wash clean plenums and corridor areas before shipping.
  - 2.1.23 Duct Connectors - Vibration Isolation:
    - .1 Provide flexible duct connections to provide vibration isolation at duct or plenum connections to fan units. See Figure 2-19 SMACNA HVAC Duct Construction Standards, 1975.
    - .2 Minimum Requirements:
      - .1 Pre-assembled 3" (80 mm) minimum long flexible connection with 3" (80 mm) long, 24 ga (0.70 mm) galvanized steel duct connectors on each side of flexible connection.
    - .3 Standard of Acceptance:
      - .1 Duron Dyne "Durolon", Ventfabrics "Ventlon".
  - 2.1.24 Dampers:
    - .1 Opposed type blade for modulating dampers unless otherwise indicated: parallel type blade for two position dampers unless otherwise indicated. Extruded aluminum or formed galvanized steel blades, frames, gussets and blade stops.
    - .2 Shafts - galvanized or SS steel with keyways for securing blades to shafts hardware - keyed to prevent blade slippage and provide smooth blade movement.
    - .3 Assemblies - rigid and adequately braced with corner gussets.
    - .4 Maximum frame dimensions - 48" (1,200 mm) wide and 48" (1,200 mm) high, unless otherwise indicated. Apply multiple equal modules for larger sized dampers.
    - .5 Bearings and seals - suitable for exposure to minimum of -20°F (-29°C) on outside air and exhaust air dampers and maximum of 200°F (93°C) for interior dampers.

- .6 Maximum blade width - 8" (200 mm).
- .7 Low leakage type with blade and frame seals for intake and exhaust (air outlets maximum leakage in closed position shall be 4 cfm/ft<sup>2</sup> (20 L/s per m<sup>2</sup>) of face area at 1" w.g. (250 Pa) pressure differential, equal to Ruskin SD50 dampers).
- .8 Check dampers are installed square and true and blades close tightly against seals and stops.
- .9 Ensure damper end-linkages are easily accessible.
- .10 Provide additional drive shaft bearing if drive shaft longer than 3" (80 mm).
- .11 Do not install dampers within thickness of wall.

**2.1.25 Fire/Smoke Combination Dampers:**

- .1 Minimum Requirements:
  - .1 Pivoted blade type Ruskin FSD-60.
  - .2 ULC tested and labelled.
  - .3 Class II leakage rated.
  - .4 1-½ hour minimum fire rating.
  - .5 Auxiliary operating shaft.
  - .6 Galvanized steel frames, blades, gussets and blade stops.
  - .7 Stainless steel jamb seals.
  - .8 ULC approved fusible links with melting point of 160°F (70°C) on supply, return and exhaust air systems.
  - .9 Damper end switches - one for open position and one for closed position.

**2.1.26 Spray Wash:**

- .1 Heat recovery being the essence of equipment, maintenance of clean surfaces for efficient heat exchange, as well as area 1 m upstream for servicing is paramount.
- .2 Provide necessary spray wash facility integrated with wash down system provided with cooking hoods being served by respective heat recovery unit.
- .3 Coordinate with Manufacturer of hoods to ensure complete integration.
- .4 Wash system shall include, but not be limited:
  - .1 Time controllable wash cycle.
  - .2 Hot water solenoid valve(s).
  - .3 Detergent pump and injection system with storage tank.
  - .4 Manual shut-off and drain valves, for system(s) servicing.

- .5 Automatic dumping of water systems for freeze protection.
- .6 Utility connections, e.g. power, drain, water (H and C), conduit for DDC controls extended into unit service corridor.
- .7 Wash manifold positioned on both sides of exhaust section - pressure equalized. Wash manifold for face and bypass damper.
- .8 Spray nozzles to be easily accessible for servicing.
- .9 Cleanouts provided for drainage piping cleaning - accessible.
- .10 Water run surfaces protected against corrosion (by material choice or surface coating(s), i.e. stainless steel or epoxy coated galvanized steel.
- .11 Surfaces drain, particularly floors, to eliminate standing water.
- .12 Belt guards.

**2.1.27 Plenum Leakage Test:**

- .1 Leakage test each plenum to ensure zero leakage across supply and exhaust plenum walls and across separating wall plenums to corridors, to a static pressure 2" w.g. (500 Pa) in excess of plenum design static pressure.
- .2 Use equipment capable of demonstrating leakage.

**2.1.28 Plenum Cleanliness:**

- .1 Wash clean plenums and corridor areas before shipping.

**2.1.29 Filters – General:**

- .1 Filter media shall be UL listed, Class I or Class II.
- .2 Filters: suitable for air at 100% RH and air temperatures between 37°F (3°C) and 122°F (50°C).
- .3 Efficiency: based on ASHRAE 52-76, atmospheric dust spot efficiency.
- .4 Dust holding capacity: Air Filter Institute (AFI) Test.
- .5 Representative filters shall have been tested by an independent test laboratory and test results shall be made available on request.
- .6 Filter identification shall be clearly marked on each filter.
- .7 Provide two sets of filter media for each filter - one for installation and one for handover to the Owner as spare. Obtain signed receipt.
- .8 Filter holding frames fabricated from 16 ga (1.61 mm) galvanized steel with spring retaining clips and neoprene gaskets.

---

2.1.30 Filters - Panel Type:

- .1 Minimum Requirements:
  - .1 2" (50 mm) thick disposable pleated cotton media.
  - .2 Enclosing frame shall be constructed from rigid, heavy duty high wet strength beverage board with diagonal support members bonded to both sides of each pleat.
  - .3 Efficiency: 25% to 30%.
- .2 Standard of Acceptance:
  - .1 AAF AM-AIR 300, Farr 30/30.

2.1.31 Filters – Final:

- .1 Minimum Requirements:
  - .1 12" (300 mm) deep disposable pleated fine glass fibre media.
  - .2 Rigid galvanized steel enclosing frame.
  - .3 Efficiency: as scheduled.
- .2 Standard of Acceptance:
  - .1 AAF Varicel, Farr Riga-Flo.

2.1.32 Fresh Air Intake Cowl:

- .1 Fresh air intake cowl shall be sized for maximum inlet air velocity of 200 ft/m (1.01 m/s).
- .2 It shall be equipped with:
  - .1 Intake bird screen.
  - .2 Manifold collecting plenum with bottom inlets and slide dampers. Dampers in place in overall systems balancing process.

2.1.33 Gauges - Air Pressure:

- .1 Application:
  - .1 Across each filter bank. (Provide 2 individual gauges for combined panel and final filter banks).
  - .2 Across the following fans:
    - .1 SF-1, EF-1: SF-2, EF-2.
  - .3 Across heat recovery coil supply air side and exhaust air side.
- .2 Minimum Requirements:
  - .1 Ranges:
    - .1 Panel filters: 0 - 1" w.g. (250 Pa).
    - .2 Final filters: 0- 2" w.g. (500 Pa).
    - .3 Supply fans: 0 - 6" w.g. (1,500 Pa).
    - .4 Exhaust fan: 0 - 2" w.g. (500 Pa).
    - .5 Heat recovery coil: 0 - 1" w.g. (250 Pa).

- .2 Accessories:
  - .1 Copper or aluminum tubing.
  - .2 Static pressure pick-up tips.
  - .3 Mounting assembly.
  - .4 Plastic vent valves.
- .3 Standard of Acceptance:
  - .1 Dwyer Series 2000.

2.1.34 Ancillary Features:

- .1 Exterior access doors shall be hollow-core insulated metal doors with 1 $\frac{3}{4}$ " (45 mm) thickness, set in formed metal frames. Two ventlock handles and lock set, which shall be equivalent to Corbin-Mortised manufacture.
- .2 Provide rain excluding seals and gutters for access doors.
- .3 Service corridors shall be provided with:
  - .1 Minimum of two lights with wire casing wired in conduit to switches.
  - .2 Duplex receptacles for service tool operation.
  - .3 Separate 120 V circuit to power DDC control panel.
- .4 Power supply to heat recovery unit shall be:
  - .1 One 3 phase 600V service for power.
  - .2 One 1 phase 120 V service for lighting and other uses.
  - .3 One 1 phase 120 V service for receptacles.

### 3 . **EXECUTION**

#### 3.1 **Unit Installation**

- 3.1.1 Where air units are fabricated and shipped in component sections, components shall be field assembled using bolted, gasketed companion flanges to make single airtight unit. Test for leakage and seal as required.
- 3.1.2 Install units as indicated and to Manufacturers' recommendations.
- 3.1.3 Maintain proper clearance around equipment to permit performance of service maintenance, coil removal and repair.
- 3.1.4 Make ductwork, piping, and wiring connections to unit in accordance with drawings.
- 3.1.5 Pipe from condensate drains to **[roof]** drain complete with trap. Install unit so curb / housekeeping pad height sufficient to accommodate depth of 'P' trap.
- 3.1.6 Install suspended unit with bracing or cable restraints to accommodate seismic loading.

- 
- 3.1.7 Seismically secure floor/roof mounted AHUs to curbs or housekeeping pads by either bolting or welding to embedded steel plates. Ensure curbs/housekeeping pads are securely attached to structure.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and are to be read, interpreted and coordinated with other parts.

### 1.2 **Scope**

- 1.2.1 Provide a complete radiant heating and cooling system as shown on the drawings and as specified herein.
- 1.2.2 Coordinate installation of control system outlined in Section 25 .

### 1.3 **Quality Assurance**

- 1.3.1 Manufacturer's Qualifications for Radiant Heating and Cooling System Components: Firms regularly engaged in manufacture of radiant heating and cooling system products and tools of the types, materials, and sizes required; whose products have been in satisfactory use in similar service for not less than 5 years.
- 1.3.2 Installer's Qualifications: Installer must have completed a certified training program or be a certified Contractor by one of the listed acceptable Manufacturers, and shall have at least two years of successful installation experience on projects with radiant heating and cooling piping systems similar to that required for this project.
- 1.3.3 Codes and Standards: Comply with local, state and federal laws and ordinances.
- 1.3.4 All radiant heat and cooling system components shall be provided by one Manufacturer.
- 1.3.5 Provide 25 year Manufacturer's guarantee against manufacturing defects on materials installed within ceiling or topping. Installer shall provide five year warranty against faulty workmanship.
- 1.3.6 Radiant heating and cooling installer shall provide water balancing downstream of each independent circuit to achieve design water flows.
- 1.3.7 Radiant surface temperatures shall not exceed 91°F (33°C) at design heat output or be less than dew point at design cooling output.

### 1.4 **Submittals**

- 1.4.1 Shop Drawings:
- .1 Submit Manufacturer's technical product data and installation instructions for radiant slab piping materials and products for approval before ordering and/or installing any of the system components.

- .2 Radiant system installer shall provide detailed shop drawings including piping/capillary mat layouts and equipment locations including the following information:
  - .1 For each radiant heating and cooling system submit:
    - .1 Space identification.
    - .2 Radiant zone and loop schedule pipe/capillary mat layouts.
    - .3 Active pipe length per circuit.
    - .4 Pipe type, size, installation details, spacing and length of each loop.
    - .5 Manifold lengths, space requirements and mounting details.
    - .6 Pumps, controls, control units and zone motors; thermostat and manifold locations.
    - .7 Miscellaneous accessories such as air vents, flow meters, drain valves and pressure bypass.
    - .8 Electrical requirements and locations of power supply required; transformers.
    - .9 Pressure test certificates signed by radiant heating and cooling system installer and General Contractor stating initial and final pressure and time of test as well as space temperature during installation shall be provided to Consultant prior to concealing the system (pouring, topping or concrete for in-slab applications). Include copies in Mechanical Maintenance Manuals.

## 1.5 **Coordination**

- 1.5.1 Mechanical Contractor shall coordinate with General Contractor to schedule installation of radiant heating and cooling system.
- 1.5.2 Tube spacing shall not exceed specified value to ensure even surface temperatures.
- 1.5.3 Verify exact location, space requirements and access details for manifolds and control unit before start of work.

## 2. **PRODUCTS**

### 2.1 **Radiant Slab Heating and Cooling System**

- 2.1.1 Standard of Acceptance: Uponor, Rehau, Giacomini, Watts Radiant or X-PERT, HeatLink (PEX-a).
- 2.1.2 Radiant Slab Piping:
  - .1 Radiant slab piping shall be flexible high molecular cross-linking polyethylene piping (PEX) complete with oxygen diffusion barrier, DN15 203°F (95°C) i.d., 5/8" (16 mm) o.d.

Maximum operating pressure and temperature; 100 psi (690 kPa) and 205°F (96°C), respectively.

- .2 PEX piping shall be manufactured in accordance with the Engle method, the Dow-Corning method or the Sioplas method or electron beam processing method in accordance with ASTM F876, F877-85.
  - .3 Oxygen diffusion barrier shall comply with DIN 4726 requirements and shall limit oxygen diffusion through PEX piping walls to less than 0.04g/m<sup>3</sup>/day at 105°F (40°C).
- 2.1.3 For slab-on grade installations the sub-slab insulation shall be minimum 2" (50 mm) thick Type V, 100 psig compressive strength rigid insulation. Coordinate with Architectural and Structural details and plans.

## **2.2 Supply and Return Manifolds**

- 2.2.1 Provide modular supply and return manifolds of cast bronze or stainless steel construction as used in typical radiant heating and cooling systems complete with wall support brackets, end caps, automatic air vents, hose bibbs, thermometers; supply module with built in shutoff valves and return module with flow regulating and balancing valves complete with flow indication. Headers to be modular (3 to 13 circuits) with O-ring seals for each header.
- 2.2.2 Manifolds to be placed in an accessible manifold housing. Housing to be a pre-manufactured metal access box. Doors are to be hinged to allow for unobstructed access.
- 2.2.3 Refer to Architectural details for specific requirements for access door design.
- 2.2.4 All loop numbers to be marked on radiant loop pipe before connecting to manifold. Space identification and loop number is to be printed and placed on each pipe and where it connects to the supply and return header. All loops must be clearly identified to allow for future balancing.
- 2.2.5 Manifolds to be protected during construction from dirt, dust or concrete during the pour (i.e., by using a plastic wrap).

## **3. EXECUTION**

### **3.1 Radiant Slab Heating and Cooling System Installation**

- 3.1.1 Radiant piping shall be installed in strict accordance with all applicable code requirements and with the piping Manufacturer's installation instructions. Allow for sufficient installation assistance and site supervisions by the piping Manufacturer's Representative.

- 
- 3.1.2 System operating parameters, number of supply and return manifolds and number of individual loops shall be as indicated on the drawings.
  - 3.1.3 Spacing and length of individual radiant slab piping loops shall be as shown on drawings. Maximum loop length shall not exceed 328 ft (100 m) for ½" (15 mm) per pipe unless specified otherwise. Loop length limits for ⅝" (16 mm) per 492 ft (150 m), and for ¾" (20 mm) per is 722 ft (220 m), based on a maximum per loop friction of 25 ft (7.5m).
  - 3.1.4 Ensure that the minimal piping bend radius is not less than the minimum allowable bend radius for the given pipe size as specified by the Manufacturer. Typically, minimum bend radius shall be at least eight times the outside pipe diameter.
  - 3.1.5 Radiant heating and cooling piping installed on top of structural concrete slab shall be secured to the slab by suitable fastening method approved by the piping Manufacturer. Where the tubing is to be installed in a structural slab, provide 6" (150 mm) x 6" (150 mm) steel mesh, wired to re-bar to act as a mounting mat for the radiant tubing. Coordinate mesh elevation in slab for low level (radiant ceiling) or higher level (radiant floor) application.
  - 3.1.6 Where the tubing is to be installed in a topping slab, the tubing shall be tied to the 6" (150 mm) x 6" (150 mm) steel mesh, stapled into the base slab/flooring such that the tube has at least 1" (25 mm) coverage over top of the tube to the finished surface of the topping.
  - 3.1.7 For PEX piping, piping loop connections at the supply and return manifolds shall be made with compression type fittings supplied by the piping Manufacturer. Provide tube band supports where loops are connected to the manifolds.
  - 3.1.8 For PP piping all piping connections shall be by heat fusion or approved heat fusion to threaded fittings.
  - 3.1.9 Piping to be fully enclosed in a protective elbow or straight conduit where it penetrates into the slab, or where it penetrates control or expansion joints in the concrete slab as per Manufacturer's recommendations. The protective conduit shall extend at least 6" (150 mm) on either side.
  - 3.1.10 All individual radiant heating and cooling piping circuits shall be laid in a configuration as show on the drawings as single continuous piping loops with no splices in the concrete slab.
  - 3.1.11 All radiant heating and cooling piping damage requiring replacement or repair shall be reported to the Consultant who will evaluate the reported damage and will decide at his/her discretion if a replacement of the entire damaged loop is required or if an in-slab piping repair can be authorized. No in-slab piping repairs are to be made without a written authorization of the Consultant. If in-slab

repair joints are authorized, only brass insert compression couplings approved by the Manufacturer are to be used. All in-slab repairs shall be made in strict accordance with the Manufacturer's instructions and shall be inspected, pressure tested and approved by the Manufacturer's Representative and the Engineer and clearly recorded on the as-built drawings. The manufacturer's representative shall confirm in writing that the repairs will not void any product certifications for the piping.

- 3.1.12 Closely coordinate radiant heating and cooling piping payout with other trades. Avoid sanitary drain piping penetrations, electrical conduit penetrations, partition wall anchors, furniture anchors, etc. through floor assemblies.
- 3.1.13 In all areas where other trades will be drilling, coring or anchoring other equipment, furniture or structures to the slab, the Contractor shall mark locations of in-slab piping on the concrete slab surface to avoid penetration of fasteners used (i.e., Hilti, Ramset, etc.).
- 3.1.14 The radiant heating and cooling system shall not be used for temporary heating until the structural slabs are sufficiently cured and until all controls and safety devices are in place and in working order.
- 3.1.15 Thoroughly clean, degrease and flush the new system. System cleaning to be in accordance with the specifications and/or Manufacturer's recommendations.
- 3.1.16 Pressure test system to minimum of 100 psi (690 kPa) for period of not less than 12 hours prior to placing concrete. During concrete pouring, pressure shall be checked at regular intervals to ensure no leakage has occurred.
- 3.1.17 No in-slab pipe joints shall be allowed.

### **3.2 Hydrostatic/Air Testing**

- 3.2.1 Pressure test radiant piping by using minimum 80 psi (550 kPa) to maximum 100 psi (690 kPa) hydrostatic test shall commence immediately following the respective loop and header installation. The radiant system piping shall remain pressurized until the substantial completion.
- 3.2.2 Hydrostatic pressure test is a more reliable indicator of a potential problem and is therefore, the preferred method. However, caution is required when installing radiant system during winter with structure and system exposed to climatic elements and freezing temperatures. It is the Contractor's responsibility to protect the integrity of the system by thoroughly purging it with compressed air until it is completely dry and reverting to air pressurization during cold weather.
- 3.2.3 The system will be maintained under pressure while topping is being poured. Initial pressure at start of pour shall be recorded. Log

---

pressures at 12 hour intervals for 48 hours after pour and forward test information to Consultant. Include copies in Mechanical Maintenance Manuals.

**3.3 Testing, Balancing and Warranties**

- 3.3.1 Contractor is responsible to make all necessary adjustments to the radiant heating and cooling system equipment and controls and shall ensure system is properly tested, balanced and operating.
- 3.3.2 Balance the entire radiant heating and cooling system to flows specified on the drawings.
- 3.3.3 Submit detailed balancing report indicating recorded flows, pressure and temperature drops for each of the radiant loops and the entire system.
- 3.3.4 Submit a detailed test and inspection report of the radiant slab piping system signed by the radiant piping Manufacturer's Representative.
- 3.3.5 A 25 year limited warranty (in writing) must be issued by the radiant piping Manufacturer.
- 3.3.6 Adjust loop flow rates and educate occupants during first year of operation to ensure occupants are satisfied with their system.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Related Work**

- 1.1.1 This Specification Section forms part of Contract Documents and is to be read, interpreted and coordinated with other parts.

2. **PRODUCTS**

2.1 **Humidifiers - Electric**

2.1.1 CSA approved.

2.1.2 Steam generator section:

- .1 Self-contained disposable cylinder microprocessor controlled electrode steam generator containing lattice electrodes.
- .2 Auto-Adaptive control system to monitor and optimize water conductivity, fill and drain rate.
- .3 LED display panel to indicate unit operating parameters, including current draw, humidistat demand, steam production, capacity limitation and fault messages (including end of cylinder life).
- .4 Drain and fill solenoid valve with built-in strainer, pressure reducing and flow regulating orifice.
- .5 Primary voltage terminal block contactors and thermal overload protection.
- .6 Fuse protected primary-to-24 V control transformer and low voltage terminal strip.
- .7 Humidifier to be suitable for control by ON/OFF 24 V humidistat.
- .8 Cabinets 16 ga (1.61 mm) steel cabinet with enamel finish and three separate compartments for plumbing, low voltage and high voltage, with lockable access doors.
- .9 Wall mounting bracket.
- .10 Factory tested package assembly.
- .11 Provide one replacement cylinder for each circuit of each humidifier.

2.1.3 Steam Distributor:

- .1 Suitable for application with specified humidifier.
- .2 Length as required, suitable for insertion in duct as indicated on drawings.

- .3 Unit to incorporate condensate separator and return leg.
- 2.1.4 Accessories:
  - .1 Duct mounted ON/OFF hi-limit humidistat, 15% to 90% RH range.
  - .2 Duct mounted pressure differential switch, for air proving interlock.
- 2.1.5 Standard of Acceptance: Nortec NH Series, Pure Humidifier, DriSteem Vaporstream, Neptonic.

## **2.2 Humidifiers - Evaporative**

- 2.2.1 Casing: Galvanized steel reinforced and braced for seismic loading. Access doors.
- 2.2.2 Drain Tank: Welded black steel, prime coated inside and out with zinc chromate, iron oxide, phenolic resin paint.
- 2.2.3 Filters: Two row (wet and dry)
- 2.2.4 Water Inlet: Float valve assembly with brass rod, float ball and valve.
- 2.2.5 Spray Pumps: Centrifugal pump with brass impeller, in galvanized well; built-in overload protection. Refer to pump Schedule.
- 2.2.6 Distribution System: PVC piping.
- 2.2.7 Gasket and flange pipe penetrations, inspection panels, access doors and other openings in unit casing.

## **3 . EXECUTION**

### **3.1 Humidifiers - Electric Installation**

- 3.1.1 Installation to be checked and started by factory Representative.
- 3.1.2 Refer to Manufacturer's installation manual for installation of unit.
- 3.1.3 Confirm electrical service requirements of unit corresponds with available services.
- 3.1.4 Install unit to ensure adequate clearances for servicing.

### **3.2 Humidifiers - Evaporative Installation**

- 3.2.1 Place unit on neoprene cork pad same size as unit tank. Flash and counter flash with 20 ga (1.00 mm) galvanized iron, entering and leaving sides to eliminate exposure of cork to water.
- 3.2.2 Provide bleed line from sump drain to nearest floor drain, complete with globe valve (and solenoid valve).
- 3.2.3 Bolt spray pump directly to tank fitting.
- 3.2.4 Insulate exterior of unit as specified for ductwork.

- 3.2.5 Secure unit to structure with bolts and rubber grommets suitable for seismic loading.

**END OF SECTION**

---

1. **GENERAL**

1.1 **Conformance**

- 1.1.1 All Sections of Division 21, 22, 23 and 25. Specifications form part of Contract Documents and are to be read, interpreted and coordinate with all parts. Conform to General Conditions and Division 00, 01, instructions to Bidders, Contract General Conditions and Supplements thereto form part of this Division and contain items related to mechanical work.

1.2 **Codes references and Standards**

- 1.2.1 The most current Ontario Building Code at time of the Standard's intended use, including Amendments.
- 1.2.2 National Research Council Canada (NRCC), National Energy Code for Building 2015.
- 1.2.3 Canadian Electrical Code, CE code, or CSA C22.1 (the latest edition).
- 1.2.4 American Society of Heating, Refrigerating and Air Conditioning Engineers, Inc. (ASHRAE):
- 1.2.5 ANSI/ASHRAE 135-2008, BACnet – Data Communication Protocol for Building Automation and Control Networks, including amendments.
- 1.2.6 Consumer Electronics Association (CEA): CEA 709.1-2021, Control Network Protocol Specification.
- 1.2.7 Canadian Standards Association (CSA): CSA C22.2 No. 45, CSA C22.2 No. 75, CSA C22.2 No. 83.
- 1.2.8 Region of Peel, Digital and Information Services Department – RFP Information Security Requirements Document.

1.3 **Work Included**

- 1.3.1 Complete system of automatic controls.
- 1.3.2 Electronic facilities management/DDC control system.
- 1.3.3 Control devices, components, wiring and material.
- 1.3.4 Instructions to Owner.
- 1.3.5 Provide all system source Codes (programming) to Owner.
- 1.3.6 Bidders shall provide compliance/non-compliance and partial compliance statement for each item in this specification and sign off on each item of the specified items. Where non-compliant, the bidder shall provide an explanation and date on alternative provisions.

---

**1.4 Quality Assurance**

- 1.4.1 Provide a complete system of automatic controls for mechanical systems by firms employing certified journeymen who specialize in this type of work and have proof of completing five projects of similar size and complexity.
- 1.4.2 Provide complete system of automatic controls for mechanical systems. The equipment shall be one Manufacturer and shall be installed by certified mechanics and electricians regularly employed by the Manufacturer, or the Manufacturer's approved system integrator.
- 1.4.3 It is the Contractor's responsibility to provide all items required to complete the installation, including but not limited to, all computer software and hardware, operator input/output devices, remote panels, sensors, controls, required to meet the performance requirements as set forth in this Section. The Contractor shall provide all wiring piping, raceways, conduit, installation supervision and labour, including calibration, adjustments and checkouts necessary for a complete and operational system. Acceptable Controls Vendors are as follows:
  - .1 Delta
  - .2 Johnson Controls
  - .3 Trane

**1.5 Submittals**

- 1.5.1 Submit shop drawings in accordance with Section 23 05 00.
- 1.5.2 Provide damper shop drawings which include data such as location, arrangement, velocities and static pressure drops for each system. Provide data for all control valve sizing including pressure drops with control valve shop drawing submission.
- 1.5.3 Include complete operating data, component setpoints, system drawings, wiring diagrams, installed program flow charts and program listing, written detailed sequences of operation and engineering data on each control system component. Include sizing as requested. Components are to be labelled and identified as to use. Submit to Mechanical Contractor for inclusion in Operating and Maintenance Manuals.
- 1.5.4 Provide, in addition to shop drawing submittals, a detailed list of maintenance instructions including daily, weekly, monthly and annual maintenance requirements for each component of the automatic control system. Copy to be included in the Mechanical Maintenance Manuals in the Maintenance and Lubrication Tab.
- 1.5.5 Label components on drawings and identify as to function.

- 1.5.6 Submit CDs, including backup CDs, with up-to-date programs in each controller. Provide original program CDs for each software package complete with validated registrations.

**1.6 Substantial completion Test Procedures**

- 1.6.1 Before the seven day acceptance test may begin, the DDC system must be completely operational including the following:
- .1 Every point shall be checked end-to-end to ensure accuracy and integrity of the system. Each point shall appear on a points list (to be prepared by the Contractor) and be signed off by both persons involved in the commissioning procedure.
  - .2 Basic control strategies shall be written in user-friendly control language. Major system problems preventing accurate control shall be reported in writing by the Contractor.
  - .3 Provide program flow charts for installed program.
  - .4 The measured variable, controlled variable and setpoint if calculated of each control loop should be placed on a 15 minute continuous trend for at least 24 hours to prove stability of loop.
  - .5 Each space sensor should be placed on a three hour trend for 100 samples.
  - .6 Run time totalizer should be set on all digital outputs.
  - .7 Load/save of panel programs must be demonstrated.
  - .8 All features of system shall be exercised
  - .9 Operator shall be briefed on operation of system, using a minimum of one 8 hour work day.
  - .10 A trend in one panel will be set up for a point from another panel. This point should also be trended in its own panel for the same intervals. Comparison of the two trends will indicate if any communication problems are occurring during the seven day test.
  - .11 Related binary inputs/outputs and related status points shall be connected to show alarm condition.

**1.7 Documentation**

- 1.7.1 The following documentation must be in place before completion of the test and substantial acceptance is granted:
- .1 Panel layout sheets complete with point name, point address and wire identification number. One copy attached to each respective panel door.
  - .2 All points tagged with point name, point address and panel number.

- .3 As-built control drawings.
- .4 As-built Eclipse program flow charts.
- .5 As-built ladder wiring diagrams showing all hardware interlocks.
- .6 Complete Operator's Manual.
- .7 Apparatus and Maintenance Manual for all sensors, transducers, solid state relays, etc.
- .8 Electrical approval certificate.
- .9 All of the above information with the exception of No.2 (point tags) shall be bound and presented in manuals, which are to be handed over to the Owner together with the Operating and Maintenance Manuals.

1.7.2 Once the above basic requirements are met and all other features of the system are complete and acceptable, substantial completion shall be granted. A deficiency list shall be prepared and holdbacks applied. All deficiencies shall be corrected prior to total acceptance. Warranty shall start from total acceptance.

## **1.8 Owner Orientation**

- 1.8.1 At completion, provide minimum of 3 day instruction period for operating personnel regarding control operation, calibration and unit operation. Instruction shall include but not limited to the following, user must be able to access all menus, change setpoints and ratios, acknowledge alarms and maintenance time reminders, access one panel from another, and follow program flow charts. This is in addition to Section 23 05 00 requirements.
- 1.8.2 The training session shall not be part of the system commissioning.
- 1.8.3 Submit training program to Consultants four weeks prior to substantial completion for their review and comments.
- 1.8.4 At the end of all the training sessions, obtain training completion form from Owner and submit report to Consultants.

## **1.9 Warranty**

- 1.9.1 On completion of mechanical system installation, Controls Contractor shall warranty complete control system as specified from defective material and workmanship for a period of one year.
- 1.9.2 In addition to the service required for call-backs, the Controls Contractor shall provide four complete inspections, consisting of at minimum of one 8 hour/day times four seasonal visits and as required for post occupancy adjustments. One in each session to adjust the controls as required with written reports submitted to the Engineer. Provide notification of when inspections are to be done.
- 1.9.3 Check and recalibrate all thermostats, sensors, damper and valve stroke and transducers at final year end inspection.

---

**1.10 System Activation**

- 1.10.1 Submit control calibration check sheets. Check sheets to include unit identification, DDC panel tag number, controlled point tag number, sensed point tag number, actuator controlled setpoint, ratio, reset settings, interlock devices (i.e., limiting relays) and respective settings.
- 1.10.2 Provide attendance as required by Balancing and Commissioning Agents to set damper linkages; adjust to and set variable volume control and tracking devices and static pressure controls. Verify outdoor air flow rate at eight damper positions to ensure damper position corresponds to flow rate. Control calibrate algorithm to match air flow and damper position.
- 1.10.3 Adjust and calibrate all room sensors. Confirm proper operation of all terminal box and radiation valve control and sequencing.

**2 . PRODUCTS**

**2.1 General**

- 2.1.1 Provide control systems consisting of operator's devices, indicating devices, interface equipment and other apparatus required to operate mechanical system and to perform functions specified. Identify all components in field by plastic nameplate, and/or non-rip point baggage tags.
- 2.1.2 Provide materials and field work necessary to connect control components factory supplied as part of packaged equipment.
- 2.1.3 Unless specified otherwise, provide fully proportional components.
- 2.1.4 Provide labelled terminal strip connection in each unit and panel connection to external controls.

**2.2 Electrical Components, Wiring and Conduit**

- 2.2.1 Wiring and Conduit:
  - .1 By Electrical Trade:
    - .1 All power supply wiring to mechanical equipment.
    - .2 All power supply wiring and conduit to main control panels.
    - .3 All smoke detectors and wiring associated with life safety shut-down and start-up of air handling systems.
  - .2 By Mechanical Trade:
    - .1 All control system low voltage wiring.
    - .2 Conduits for control wiring and components associated with the mechanical work. All low and line voltage

control wiring shall be in EMT conduit in accordance with Electrical specifications.

- .3 All low and line voltage control wiring and conduit for specified motor interlocks.
- .4 Power wiring from electrical panel to control transformers distributed round the building.

#### 2.2.2 Components

##### .1 By Electrical Trade

- .1 All disconnect switches except as specified in Mechanical Equipment Schedules.
- .2 All motor protection switches, magnetic starters and contactors.
- .3 All line voltage relays to power and control mechanical equipment.
- .4 All wiring to and from variable speed drives supplied by mechanical trade.

##### .2 By Mechanical Trade:

- .1 All temperature control systems components and packaged equipment controls, relays and transformers.
- .2 All disconnect switches, relays, transformers as specified in Mechanical Equipment Schedules.
- .3 All thermostats, dampers, damper motors, timer clocks and control panels.
- .4 All low voltage transformers to power mechanical equipment controls.
- .5 All power wiring (120 V/1 Ph) to controls transformers, control panels and control devices requiring 120 V/1 Ph power wiring (infrared flush meters etc.)

#### 2.2.3 Minimum Wiring Requirements

- .1 All exposed wiring and wiring located above removable, acoustic ceiling tiles shall be run in plenum rated, 18 gauge, two wire, twisted, shielded pair. Two wire twisted pair shall be acceptable for sensor wiring or output; coaxial cable shall be acceptable for transmission wiring. Plenum rated wiring not in EMT conduit shall be run neatly bunched in J-hooks in a rectilinear fashion, running parallel to building. Cable lines must be run at least 12" (300 mm) above ceiling. Where controls cables and wiring is run through, or in "exposed ceilings", all wiring and cables shall be run in conduit. Where permission has been gained to run in a cable tray, only then can conduit be deleted, except for branches from the cable and individual run-outs.

- .2 Alternating current wiring over 24 V, both line and low voltage, shall not be run in the same conduit or cable with direct current signals. Direct current signals include communications wiring, analog input wiring, digital input wiring and analog output wiring. 24 V AC and 0-10 V DC may be run together.
- .3 Low voltage direct current wiring shall be 2-wire shielded, twisted pair, minimum 18 gauge.
- .4 Line voltage alternating current wiring shall be copper conductor, minimum 16 gauge.
- .5 Low voltage alternating current wiring shall be copper conductor, minimum 18 gauge.
- .6 Under no circumstances shall the Mechanical Controls Trade run controls cabling or wiring in the Electrical cable tray system without prior written permission from the Electrical Consultant and the Electrical Contractor. Unless otherwise agree or directed, all control cabling and wiring shall be run independently in conduits and/or separate raceways to be provided by the Controls Trade for their own use.

## 2.3 **Controllers**

- 2.3.1 The stand along digital control panels shall be microprocessor based, multi-tasking, multi-user, real-time digital control processors capable of operating independently of other controllers in the network. All unitary controllers, air handling unit controllers and VAV controllers shall operate as stand alone controllers.
- 2.3.2 Each standalone panel shall consist of modular hardware with plug-in enclosed processors, communication controllers, power supply and input/output modules. All plug-in printed circuit boards shall allow flexibility in application and rapid repair. All wiring within the standalone panels shall be labelled and run in raceway to accommodate servicing. The control panel shall contain a battery backed real time clock synchronized with other real time clocks in the network.
- 2.3.3 Surge and Transient Protection: Isolation shall be provided at all network terminations, as well as all field point terminations, to suppress induced voltage transients consistent with IEEE Standard 587-1980.
- 2.3.4 Analog to digital and digital to analog conversions shall have a minimum of 12 bit resolution.
- 2.3.5 All input points shall be universal in nature, allowing their individual function definition to be assigned through the application software. All unused input points must be available as universally definable at the discretion of the Owner. If the input points are not fully universal

---

in nature, unused points must be equal in quantity between analog inputs and digital inputs.

- 2.3.6 Allow 10% minimum 10% spare capacity in each DDC 'Building Controller', and 'Application Specific Controllers' control panels for all point types.
- 2.3.7 All control sequences programmed into the standalone digital controller shall be stored in non-volatile memory, which is not dependent upon the presence of a battery, to be retained. Power failures shall not cause the standalone digital controller memory to be lost, nor shall there be any need for batteries to be recharged or replaced to maintain the integrity of the controller database.
- 2.3.8 Any mechanical equipment which is required to operate on emergency power shall be controlled by a controller that is supplied by emergency power circuit connected to backed up generator and UPS power. The UPS power shall be provided by the Controls Contractor unless specifically noted otherwise in Electrical documentation. The DDC system shall monitor the generator and transfer switch so that appropriate action can be taken to the DDC system in the event of emergency power operation. Allow for all Electrical equipment.
- 2.3.9 All sensing inputs shall be provided via the following industry standards:
- .1 0 to 10 VDC
  - .2 4 to 20 mA.
  - .3 Resistance signals (1000 ohms, 10k Thermistor – nickel or platinum RTD's).
  - .4 Binary inputs shall be provided with filtering to eliminate false signals resulting from input bouncing.
  - .5 Counter inputs shall monitor dry contact pulses with an input resolution of 1 Hz minimum.
- 2.3.10 Digital outputs shall provide SPDT output contracts and be capable of directly switching the following voltages:
- .1 24 VAC at 36 VA operating/360 VA inrush.
  - .2 102 VAC at 180 VA operating/1800 VA inrush.
  - .3 240 VAC at 180 VA operation/1800 VA inrush.
- 2.3.11 Digital outputs shall be optically isolated from the controller's electronic circuit.
- 2.3.12 Control panel diagnostics shall consist of built-in, continuous operational and board level tests, software control sequence analysis and alarm exception logging. Light emitting diodes and/or the alphanumeric display shall annunciate hardware failures and control program errors or problems.

- 2.3.13 Provide one individual standalone control panel for every mechanical system. Where mechanical equipment items provide system redundancy, failure of the panel shall not result in failure of control of multiple mechanical equipment items.
- 2.3.14 The standalone control panels shall interface to additional panels of equipment as required to meet the performance specification. Each standalone panel shall be provided with an interface port for the hand held operator's terminal.
- 2.3.15 Any remote panel malfunction shall not affect the proper operation of the system or other remote panels.
- 2.3.16 All stand-alone control panels shall give full access to programming while communicating from a remote location (over the Internet/Intranet).

## **2.4 Field Control Devices**

### **2.4.1 Temperature Sensors:**

- .1 Shall be resistance type and shall be either 2-wire 1000 ohm nickel RTD or 2-wire 1000 ohm platinum RTD or 10K thermister type. Sensor shall have service tool communicating jack for interface with laptop computer service tool for adjustment and troubleshooting.
- .2 Shall be available for room, duct, outside or well mounting with proper ranges to suit application.
- .3 Shall give an end-to-end accuracy of not less than  $\pm 0.45^{\circ}\text{F}$  ( $\pm 0.25^{\circ}\text{C}$ ).
- .4 All room sensors shall be surface mount and complete with integral LCD display (room temperature, setpoint temperature, occupancy mode and fan status where override is specified),  $\pm 5.4^{\circ}\text{F}$  ( $\pm 3^{\circ}\text{C}$ ) setpoint adjustment and occupancy mode override push button and service tool communication jack for interface with laptop computer or service tool for adjustment and troubleshooting.
- .5 Outdoor air sensor shall be provided with solar shields and perforated plate to minimize solar and wind effects and transmitter shall be NEMA 3R construction.
- .6 Duct sensors shall be in insertion type complete with locking nut and mounting plate. Mounting box shall be weatherproof for all outdoor applications. Where duct dimension is greater than 48" (1,200 mm) averaging sensors complete with capillary support shall be used.
- .7 Immersion wells shall be of stainless steel materials for steam and domestic water systems and brass for other applications. Heat transfer compound shall be compatible with sensor. Sensor to be spring loaded construction with

---

compression fitting for (20 mm) stainless steel sheathed construction.

- .8 HVAC Dual-Temp analogue temperature gauge and electrical temperature well: in lieu of providing separate analogue pipe temperature gauges thermowells and DDC pipe temperature thermowells, the controls contractor shall supply Wika brand dual-temp thermometer/transmitter, Model TR40/TW15 complete with TI.52 dial gauge. Supplier contact: JB5A, 604-590-8866, [www.wika.ca](http://www.wika.ca)
- .9 In-slab temperature sensors shall be stainless steel immersion wells with thermistor type sensor, installed in a standard 100 x 100 junction box with either top (floor) access or bottom of slab access.

#### 2.4.2 Motor Current Sensors

- .1 Shall have linear output proportional to the motor current draw.
- .2 Sensor shall connect to the controller by means of a 2-wire cable.
- .3 Sensor shall have dual HI/LO range selector.
- .4 Sensor shall have an accuracy of 1% of full scale, maximum response time of 100 milliseconds and a loading error not greater than .25% with a 1 megaohm load.

#### 2.4.3 Differential Pressure Sensors

- .1 Shall vary the output voltage with changes in differential pressure.
- .2 Shall connect to the controller by means of a 2-wire cable.
- .3 Shall have an end-to-end accuracy of not less than  $\pm 1\%$  of span including non-linearity and hysteresis.

#### 2.4.4 Static pressure sensors shall:

- .1 Vary the output voltage with changes in static pressure.
- .2 Connect to the controller by means of a 2-wire cable.
- .3 Have an end-to-end accuracy of not less than  $\pm 1\%$  of span including non-linearity and hysteresis.

#### 2.4.5 Humidity sensors shall:

- .1 Be equipped with non-interactive span and zero adjustment complete with 2-wire isolated loop powered 4-20 mA 0-100% linear proportional output. Sensing probe shall be constructed of Type 304 stainless steel.
- .2 Have a control range of 20% to 80%.
- .3 Have an accuracy of plus or minus 3% RH over an ambient temperature range of 70°F (21°C) to 80.6°F (27°C).

#### 2.4.6 Airflow measuring stations shall:

- .1 Vary the output voltage with changes in supply and return airflow. The airflow traverse probe, which shall be capable of producing steady non-pulsating signals, consists of multiple total and static pressure sensors placed at equal distances as per ASHRAE Standards for duct traversing.
  - .2 Connect to the controller by means of a 2-wire cable.
  - .3 Have end-to-end accuracy for variable volume control of not less than  $\pm 0.05\%$  of the airflow.
  - .4 Acceptable Manufacturers: Air Monitor Corp., Tek-Air Systems Inc., Ebtron Gold Series - G7x116 P+, or Ebtron Elf for  $\leq 14"$  (350 mm)  $\varnothing$  ducts.
- 2.4.7 Room Occupancy Sensors – Wattstopper C1-12, C1-24 Passive Infrared HVAC/BAS Ceiling Sensor or Equal
- .1 12 VDC or 24 VAC/VDC supply power, UL/ULC listed.
  - .2 Complete with five (5) year warranty, dual element, temperature compensated pyro-electric sensor.
  - .3 Complete with time delay adjustment 30 seconds to 30 minutes.

## **2.5 Transducers**

- 2.5.1 Electronic to pneumatic transducers shall:
- .1 Have linear output pressure proportional to the input signal, either voltage or current.
  - .2 Connect to the controller by means of a 2-wire cable.
  - .3 Have an end-to-end accuracy of not less than  $\pm 1\%$  of span including non-linearity and hysteresis.
  - .4 Have supply air filter to eliminate moisture and particulate contamination.

## **2.6 Line Filters**

- 2.6.1 The line filter shall be rated at 3A, 250 VAC, 50/60 Hz and shall be capable of filtering out electromagnetic interference.

## **2.7 Residential Suite Programmable Thermostat/Controller**

- 2.7.1 The controller shall be capable of controlling a 6 port modulating valve for heating/cooling, and a variable airflow ECM fan.
- 2.7.2 Controller shall come complete with:
- .1 7 day programmable digital thermostat.
  - .2 0-10 VDC output to control fan speed.
  - .3 0-10 VDC output to control 6 port control valve.
  - .4 LCD screen showing room temperature set point, time, day, and related schedule and status.

- 2.7.3 Controller shall control FCU in line with the sequence of operation noted later in the specification.
- 2.7.4 Specification based on Spartan TE256 controller.

**2.8 6 Port Control Valves**

- 2.8.1 Provide 6 port control valves to serve all fan coil units.
- 2.8.2 Valves shall be characterized to provide a linear change in flow rate through the stroke of the valve. The travel shall include a deadband to ensure no cross over between HW and CHW.
- 2.8.3 Valves shall fail in last position.
- 2.8.4 Valves to come complete with a modulating 24V actuator.
- 2.8.5 Valves based on Spartan SV601 control valves.

**2.9 Control Valves**

- 2.9.1 Provide valves in accordance with general valve specification with maximum 3 psi pressure drop.
- 2.9.2 Valves shall "fail-safe", spring return to normal position. 2-way and 3-way valves for liquids shall have either equal percentage or linear characteristics. Size 2-way valve operators to close against maximum pump shutoff head. Control valve coefficient shall be determined with the valve in the 100% open position. Control valves using a limited stroke to create the required flow coefficient shall not be acceptable.
- 2.9.3 All control valves shall be threaded type. All valve bodies shall have a replaceable packing gland.
- 2.9.4 Control valves shall be globe type with modulating electronic actuator. Base bid valve for fan coil shall be SIEMENS SSD61U 0-10vDC actuator with MZ series body. Actuators for valves on larger coils in air handlers shall have spring return to normal position. 2-way and 3-way valves for liquids shall have equal percentage characteristic. Minimum shut off head leakage shall not exceed 1% of full design flow.
  - .1 Acceptable Product: Belimo CCV Characterized Control Valve.
- 2.9.5 Steam valves shall have modified linear characteristics. Provide separate valves for each bank of coil. Provide two valves in parallel where steam loads exceed 1500 lb/hr (0.19 kg/s). Capacities for two valves in parallel shall be 1/3 - 2/3 load capacities sequenced with pilot positioner so that smaller valve opens first. Size low pressure valves for approximately 10 psi (70 kPa) inlet pressure and 5 psi (35 kPa) pressure drop.

---

**2.10 Pressure Independent Control Valves (PIV's)**

- 2.10.1 Provide valves in accordance with general valve specification with maximum 3 psi (20 kPa) pressure drop.
- 2.10.2 Valves shall 'fail-safe', spring return to normal position. 2-way and 3-way valves for liquids shall have either equal percentage or linear characteristics. Size 2-way valve operators to close against maximum pump shutoff head. Control valve coefficient shall be determined with the valve in the 100% open position. Control valves using a limited stroke to create the required flow coefficient shall not be acceptable.
- 2.10.3 All control valves shall be threaded type. All valve bodies shall have a replaceable packing gland.
- 2.10.4 Control valves shall be pressure independent against a differential pressure of 5-50PSI with modulating electronic actuator.
- 2.10.5 Acceptable product: Belimo PICV, Griswold PICV and Tour and Anderson PICV

**2.11 Dampers**

- 2.11.1 Automatic dampers shall be 14 ga (1.63 mm) extruded aluminum multiple blade mounted to 4" (100 mm) extruded aluminum flanged frame. Frame shall be installed with polystyrene on all four sides. Frame seals shall be of extruded TPE. Individual blades shall be internally insulated **thermally** broken extruded aluminum not exceeding 8" (200 mm) in width or in length with interlocking edges and compressible seals. Blade gaskets shall be of extruded EPDM. Provide oil impregnated bronze or nylon bearings with additional thrust bearings for vertical blades. Dampers exposed to outside air or used as exterior isolation dampers shall be AMCA rated for leakage less than 4 cfm per ft<sup>2</sup> (21 l/s per m<sup>2</sup>) against 4" w.g. (1,000 Pa) static pressure differential. Dampers exposed to outside air or used as exterior isolation dampers shall be equal to TAMCO Series 9000. Dampers for return or recirculating air shall be AMCA rated for leakage less than 10.3 cfm per ft<sup>2</sup> (52 l/s per m<sup>2</sup>) against 4" w.g. (1,000 Pa) static pressure differential. Dampers shall be equal to TAMCO Series 1000.
- 2.11.2 Mixing dampers of parallel blade construction arranged to mix streams.
- 2.11.3 Dampers have less than 0.5% leakage and be equal to Ruskin CD-36.

**2.12 Damper Operators**

- 2.12.1 Piston or gear driving type damper operators with spring return to "fail-safe" in normally open or normally closed position. Non-mechanical forms of fail-safe operation are not acceptable.

- 2.12.2 Damper actuators shall be electronic direct-coupled over the shaft. Actuators shall have electronic overload or digital rotation sensing circuitry to prevent damage to the actuator. Mechanical end switches and magnetic clutches are not acceptable.
- 2.12.3 Proportional actuators shall accept a 0-10 VDC or 0-20 mA control input signals and shall provide a 2-10 VDC or 4-20 mA position feedback signals. Pulse width modulating control is acceptable.
- 2.12.4 All modulating actuators shall have an external built-in switch to allow the reversing of direction of rotation.
- 2.12.5 Damper operators used for emergency and life safety systems shall be fail-safe closed on power failure for all VAV boxes associated with the smoke evacuation systems.

**2.13 Variable Air Volume Terminal Unit Digital Controllers**

- 2.13.1 Digital controllers shall be configurable, stand alone, networked direct digital controllers consisting of a microprocessor, power supply, actuator, integral dead-ended differential pressure transducer and operation/application system software in a single integrated package complete with manual positioning. The digital controllers shall utilize proportional plus integration algorithm for the space temperature control drops.
- 2.13.2 Digital controllers shall comply with ASHRAE Standard 90.1 and shall include compliant interface for ASHRAE Standards 62.1 -2007.

**2.14 Air Compressor and Receiver**

- 2.14.1 Provide duplex, belt-driven air compressor and tank unit complete with starters, overloads, belt guards, silencers, flexible connections, air cleaner, automatic and manual drain assemblies, oil and particle filter 0.5 microns and pressure reducing and pressure relief valves. Each compressor to be sized for 100% of system demand.
- 2.14.2 Combined size of one compressor and storage tank shall limit compressor starts at six maximum per hour and 1/3 running time.
- 2.14.3 The DDC system shall be set to operate each compressor alternatively with provision for the second compressor to cut in on demand. Cycle compressors through pressure switch. If one compressor fails, the other automatically maintains 100% system pressure.
- 2.14.4 Provide refrigerated, non-cycling air dryer, complete with automatic drain trap assembly and capacity to lower dewpoint to 5°F (-15°C) at 20 psi (140 kPa). Mount unit in discharge air line from tank.
- 2.14.5 Provide all regulators, controls and switching devices required to provide for a night setback control system.

---

## 2.15 Air Piping

- 2.15.1 Piping, Type "K", hard or soft drawn copper or polyethylene plastic tubing. Plastic tubing must meet current FR requirements.
- 2.15.2 Use copper for all control air lines where:
- .1 Lines are subject to damage or temperatures in excess of 93°C.
  - .2 Lines are run adjacent to heating pipes.
  - .3 Lines are not readily accessible.
  - .4 Life support or warning systems (control air-to-fire and smoke dampers) are to be controlled.
  - .5 Lines are exposed in boiler and fan rooms.
- 2.15.3 In fan and boiler rooms, bundled plastic tubing or single plastic tubing in tray or conduit with suitable junction boxes may be used.
- 2.15.4 Run exposed piping only in storage rooms and similar areas; install in neat manner with proper support.
- 2.15.5 Install **pressure gauges** on branch lines to each controller and signal lines at each transmitter except individual room controllers.
- .1 CO sensor to be used in parkade and garages.
  - .2 Combustible gas sensor to be used in electrical room located in parkade and in mechanical rooms where propane is used.
  - .3 Oxygen sensor to be used in refrigeration m/c rooms.

## 2.16 Special Gas Monitoring System

### 2.16.1 CO/Hydrogen Sensors

- .1 General: Dual channel, self-contained gas detection system for the monitoring of carbon monoxide and propane/gasoline vapours, housed in a wall mount, drip-proof PVC enclosure with hinged, secured door. System power shall be 24 VDC or 24 VAC (nominal). A CSA certified, totally enclosed step down transformer shall be supplied as required to reduce voltage from 120 V.
- .2 Sensors: The system shall have one integral electrochemical CO sensor and one remote analog transmitter with a solid-state combustible gas sensor. The measurement range shall be 0 – 200 ppm CO in air and 0-50% LEL C<sub>3</sub>H<sub>8</sub> (Propane) in air. Area of monitoring coverage shall be 5,000 ft<sup>2</sup> (464.51 m<sup>2</sup>) to 7,000 ft<sup>2</sup> (650 m<sup>2</sup>) per sensor.
- .3 *Monitors*: The monitor shall provide a tri-colour indicating light for power, low alarm, high alarm and fault condition, audible alarm with silence push-button and two SPDT dry contact alarm relays rated 5 amps at 240 VAC each. There shall be a LED digital display of concentration. The system

must meet WCB workplace hazardous gas exposure standards. System controller shall be capable of supporting up to 128 digital transmitters on a RS-485 communication bus. System shall support analog output modules (eight 4-20 mA outputs per module) and relay output modules (eight 5 A SPDT relays per digital network (two low voltage power wires and a twisted pair for the communication bus). System power requirement is 100 to 240 VAC, 47 to 63 Hz. The controller shall provide a circuit test button to allow the user to confirm system operation and exhaust fan control from the panel. The controller shall also provide a push-button to allow the user to override the system control and operate exhaust fans continuously for 15-minute segments to evacuate air from specific parts of the building. The controller shall automatically test the electrochemical CO sensor failure. The controller shall provide automatic "calibration due" notification to the end user. Connect to DDC system to provide alarms.

- .4 System Operation: System relays are normally energized in non-gas-alarm state so they act in fail-safe operation. Upon detection of 50 ppm CO in air or 10% LEL C<sub>3</sub>H<sub>8</sub>, the system shall illuminate the Low alarm LED and any relays programmed to respond to low gas alarm shall de-energize activating single-speed exhaust fans or low speed of 2-speed exhaust fans plus makeup air fans. Upon detection of 100 ppm CO in air or 20% LEL C<sub>3</sub>H<sub>8</sub>, the system shall illuminate the high alarm LED, the system audible alarm will be activated and any relays programmed to respond to high gas alarm shall de-energize activating high speed of 2-speed exhaust fans or remote alarm devices. Audible alarm can be silenced from the front panel push button. In the event of a fail condition, the system audible alarm shall be activated and the fail LED on the front panel shall flash red.

2.16.2 Provide QEL Model QTS-2000 CSA approved carbon dioxide gas monitoring system with remote solid state carbon dioxide sensors. The system shall consist of a central control monitor panel in a wall mount NEMA 12 enclosure with slide-out control modules and corresponding remote mount solid-state sensors completely with protective guard.

- .1 Acceptable Products: QEL, Armstrong Monitoring Corp.

2.16.3 Monitoring Panel

- .1 Panel shall be complete with:
  - .1 Dual alarm trip points.
  - .2 Relays for alarm actuation and control of ventilation fans and auxiliary alarms.

- 
- .3 Indicating light for power on, low/high alarms of failure and an audible alarm with silence button.
  - .4 Manual test capability by push button.
  - .5 Alarms shall have adjustable time delay from five to ten minutes before activation.
  - .6 Alarms shall have dead band to ensure CO, NO<sub>2</sub>, O<sub>2</sub> or gas levels have dropped below trip point before auto reset.
  - .7 Units shall operate on 120 volt AC power supply.
- 2.16.4 The remote sensor shall receive power from the control monitor panel and send:
- .1 4-20 mA signal corresponding to 0-500 ppm CO with an accuracy of 5 ppm,
  - .2 1-5VDC signal corresponding to 0-50% LEL combustible gas,
  - .3 4-20 mA signal corresponding to 0-25% O<sub>2</sub> to the control panel,
  - .4 4-20 mA signal corresponding to 0-2500 ppm CO<sub>2</sub> to the control panel; and,
  - .5 4-20 mA signal corresponding to 0-5 ppm NO<sub>2</sub> to the control panel.
- 2.16.5 The control panel shall provide status LED display and two levels of alarm for each sensor with the following alarms:
- .1 Low Carbon Monoxide Alarm set at 25 ppm CO.
  - .2 Low Combustible Gas Alarm set at 10% LEL.
  - .3 Low Oxygen Alarm set at 19% O<sub>2</sub>.
  - .4 Low Nitrogen Dioxide Alarm set at 0.7 ppm NO<sub>2</sub>.
  - .5 High Carbon Monoxide Alarm set at 100 ppm CO.
  - .6 High Combustible Gas Alarm set at 20% LEL.
  - .7 High Nitrogen Dioxide Alarm set at 1.0 ppm NO<sub>2</sub>.
  - .8 Sub-Normal Oxygen Alarm set at 17% O<sub>2</sub>.
  - .9 High Carbon Dioxide Alarm set at [ ] ppm CO<sub>2</sub>
- 2.16.6 The alarm signals shall activate the following relays to:
- .1 Energize exhaust fans when low CO, low O<sub>2</sub>, low NO<sub>2</sub> and low LEL alarms occur.
  - .2 Energize exhaust fans and audible alarm when high CO, sub-normal O<sub>2</sub>, high NO<sub>2</sub> and high LEL alarms occur.
- 2.16.7 The system shall energize the exhaust fans on sensing loss of signal from sensor and/or under range signal from the fail relay.
- 2.16.8 Sensors shall be warrantied for two years and sensor life shall be three years.

2.16.9 Install system in complete accord with Manufacturer's recommendations.

## 2.17 **Energy Meters**

2.17.1 BTU meters shall be tamper-proof and equal to ISTA Energy meter complete with building DDC system interface for monitoring heating and or cooling consumption. The system shall consist of temperature sensors, flowmeters and electronic calculating unit. System shall be rated for 3 VDC with power convertors connected to 24 VAC. Battery shall be rated for a minimum operating life of six years. Provide individual meter analogue output and trending for each meter

.1 Acceptable Products: Badger Meter, Kamstrup, Danfoss, Onicon.

2.17.2 Temperature sensing thermal element shall be made out of platinum for fast response time with resistance at 500 ohms at 32°F (0°C) and 700 ohms at 212°F (100°C).

2.17.3 Flow meters shall be multi-wing turbine type with pulse output and rate for 250 psi (1,720 kPa) at 205°F (96°C), with a minimum accuracy requirement of ±1.0% at low end of flow range.

2.17.4 Electronic calculating units shall be solid state fluid density compensated calculation module, complete with non-resettable LCD display and stepping switch for flow, temperature and kwhr [BTU] readings.

2.17.5 Energy meters shall be calibrated and commissioned in accordance with the Government of Canada Weights and Measures Requirements, and comply with EU Standard EN1434.

2.17.6 Energy and Sub-Metering Schedule

TAG METER #	SERVICE	TYPE	RANGE	OUTPUT UNITS	NOTES

2.17.7 Energy Dashboard

.1 Provide a minim 44" (1,100 mm) flat screen monitor complete with energy dashboard graphics software, energy reporting software and organized trendlogging of electricity, water, gas, in breakdowns as described by the Energy/Flow/House Metering Schedule above. Provide a minimum of three (3) years of database storage capability based on a maximum of five (5) minute sampling rate of all points and metering.

- .2 Compare generation and consumption for electrical, gas and water resources.
- .3 Instantly translate energy and water use into dollars and CO<sub>2</sub> emissions and savings.
- .4 Showcase building green features alongside real-time resource use date.
- .5 Show real-time weather conditions.
- .6 Display introductory or explanatory text and Client/Owner logo welcoming visitors to the dashboard.
- .7 Display photographs pertaining to the building featured in the dashboard.
- .8 Automatically and randomly transition between photographs at specified intervals, ensure that the dashboard is constantly changing during every visit.
- .9 Compare current consumption with past consumption on the same screen.
- .10 Display 50 automatically rotating, randomly displayed green “tips” (with an input from the Owner). Green “tips” will be short, to-the-point messages accompanied by a large image relevant to the feature “tip” Green “tips” will focus primarily on the building related resource use, but will also include references to land, transpiration, and waste related environmental concerns.
- .11 Showcase building and building’s green features via the dashboard.
- .12 Enable users to selected from intuitive thumbnail-based menu screen, or display features by automatic rotation.
- .13 Showcase the HVAC systems, lighting and day-lighting controls, electrical district heating and water consumption, landscaping and building envelope design.

## **2.18 Alarm Annunciator**

- 2.18.1 Provide alarm panel with individual indication, horn, silence acknowledge switch and test switch. Alarm panel to be hardware in addition to software alarms as specified in this section. At alarm condition indicator light shall flash and alarm sound. Depressing acknowledge switch shall stop horn, but alarm condition indicated by continuous light until trouble condition cleared. Should second alarm occur before first has cleared, sound alarm again.
- 2.18.2 Locate panels in locations as described below to serve duplicate functions of primary alarms:
  - .1 Building Managers Office
- 2.18.3 Provide alarm points complete with required initiating equipment for signalling to alarm panel for the following conditions:

- .1 No water (glycol) flow.
  - .2 Low air temperature.
  - .3 Controls compressor failure.
  - .4 Sump pumps (high level).
  - .5 Boiler failure (common point for multiple boilers).
  - .6 Low heating water (glycol) temperature.
  - .7 Cooling tower dump (overridden by auto-dump switch).
  - .8 Condensate tank (high and low levels, one or both; if both are separate, alarms required).
  - .9 Low humidity.
  - .10 High humidity.
  - .11 Expansion tank low level/low pressure/high pressure.
  - .12 No flow on air systems (air heating systems).
  - .13 Off normal temperature.
- 2.18.4 Provide dry contacts for common alarm initiating point for use by others.
- 2.18.5 Alarm panel wiring shall be in tray or neatly placed and securely fastened.

**2.19 Carbon Dioxide Monitoring and Detection System for Indoor Air Quality (ISO-9002 Certified Sensors)**

- 2.19.1 Provide UL and CSA labelled Vulcan VA-201T series Model 90DM3 infrared cell type carbon dioxide transmitter with LCD Display and connected to DDC system. Provide one sensor per VAV control box as indicated on the drawings or **two sensors shall be installed for each office floor**. Allow for connection of sensor to DDC system architecture and provide 24 volt transformer and low voltage wiring from nearest VAV or fan coil unit electrical junction box.
- 2.19.2 The remote sensor shall receive 24 volt power and send 4-20 mA signal corresponding to 0-2000 ppm CO<sub>2</sub> to the DDC system.
- 2.19.3 Sensor shall be warrantied for five years.
- 2.19.4 Install system in complete accord with Manufacturer's recommendations. Manufacturer's agent shall provide complete commissioning of sensors.

**3 . FACILITIES MANAGEMENT SYSTEM (DDC SYSTEM)**

**3.1 General Description**

- 3.1.1 The facilities management system shall be comprised of a distributed control network of independent standalone digital controllers (DDC) interconnected in a communicating network to provide facility wide access and sharing of information.

- 3.1.2 The distributed network shall be a modular design. Network expansion shall be accomplished by adding standalone control modules to the network.
- 3.1.3 A local area network (LAN) shall be provided for high-speed data transmission.
- 3.1.4 At each building entry and exit point, the wire communications trunk wiring shall be protected with a transient surge protection device. Transient surge protection is not necessary if the communication trunk, external to the building, is fibre optic in nature.

### **3.2 Communications**

- 3.2.1 The local area network (LAN) shall be a peer-to-peer, token passing network, utilizing packetized transmissions, error checking and distributed error recovery. Single or multiple standalone control panel failures shall not cause loss of communication between active control panels connected on the LAN. Full communications shall be sustained as long there are at least two operational standalone control panels active on the LAN.
- 3.2.2 Each LAN-connected control panel shall be equipped with a communications watchdog to automatically shut-down the control panel in the event that it is monopolizing communications. Removal of a control panel from the LAN shall be annunciated and logged to as an exception report. Error recovery and communication initialization routines shall be resident in each connected device.
- 3.2.3 The primary local area network shall be capable of operating at data transmission rates greater than 10MB Ethernet between primary mechanical system controller and the operator interfaces. Unitary controllers may run on RS 485 or MS/TP network.
- 3.2.4 Network communications with video display terminals, host computers, printers and auto-answer/auto-dial telephone shall be provided through a RS-232C standard interface port.

### **3.3 Software**

- 3.3.1 Provide standalone panel containing a complete software development system. The software development system shall consist of a graphical programming language containing complete libraries of control algorithms for DDC, Energy Management and Facilities Management functions. These resident libraries of algorithms shall be drawn from for the creation of the application programming of each individual standalone control panel. The programming environment shall provide context-sensitive help menus and instructions for all operations and applications.
- 3.3.2 Multi-level user access shall be provided with user access codes available at each level.

- 
- 3.3.3 Point names shall be defined using alphanumeric characters expandable to 32 characters to provide an English language description to the point function.
  - 3.3.4 All point names shall be acceptable to the operating personnel.
  - 3.3.5 The stand alone control panel shall be capable of generating sorted alarm, trend log, energy management, maintenance time reminder and exception log reports on a prioritized basis. Segregated report generation shall be invoked by manual request, time of day, calendar, accumulated run time or event occurrence.
  - 3.3.6 Provide enough data storage and memory capacity in the operator workstation to accommodate a minimum of **6 months** worth of trend logs for all rooms, main HVAC plant equipment and special points as listed in the sequence of operation or as listed below:
    - .1 Change room temperatures
    - .2 Fans, Pumps, Boilers, Chillers
    - .3 Room Temperature
    - .4 Main hydronic supply and return temps
    - .5 Main AHU SAT and OAT temps.
  - 3.3.7 All licensing and firmware upgrades required to edit create, and modify graphics, programing, and configuration.
  - 3.3.8 All software to be installed with the latest version or as specified by the owner.
  - 3.3.9 All software shall be maintained at N-1 at the time of substantial completion of work through to the end of the warranty period. Updates shall be included and considered as a standard part of the upkeep of the BAS system during the warranty period to maintain this N-1 integrity.
  - 3.3.10 Use new products the manufacturer is currently manufacturing and selling for use in new installations.
  - 3.3.11 Project sites shall not be used as product test sites for beta testing or otherwise, unless explicitly approved in writing by the owner. The contractor to confirm in writing that spare parts will be made available for at least five years after completion of this contract.
  - 3.3.12 All building automation system installations require an Electrical Safety Authority inspection.
  - 3.3.13 Provide disaster recovery plan that will allow systems to remain operational in case of building automation system failure. To be reviewed during submittal review.
  - 3.3.14 All hardware points (input and output) must have installed capability of being manually overridden at the front end or at the local controller.

- 3.3.15 Integrate hardware and software override operations, including override panels, as outlined in points list. To be approved by the Region of Peel.
- 3.3.16 Contractors are responsible for verifying that site equipment (i.e., HVAC, lighting, etc.) that is connected to the building automation system is operational in an unchanged state from its original operation. Consultant must verify that equipment testing has occurred prior to and at the completion of the installation.
- 3.3.17 The Tridium Controller (JACE) shall be licensed to the Region of Peel for an initial 5-year period.
- 3.3.18 All BAS controllers shall incorporate the Niagara Framework (THE MOST RECENT EDITION)™ platform with Niagara Tridium with Jace controller being the front end of the BAS.
- 3.3.19 The data base shall be stored on the Niagara Tridium Controller which serves as the Graphical User Interface. The EC-BOS Controller is a Distech Tridium Based Controller.
- 3.3.20 Installer must be licensed TRIDIUM system integrator. License shall be OPEN and on the name of the Region of Peel.
- 3.3.21 BAS controllers shall be protected against electrical noise of 5 to 120 Hz and from keyed radios up to 5 W at 1 m (3 ft) and is subject to change as radio technology evolves in the facilities.
- 3.3.22 BAS controllers shall be able to operate at 90% to 110% of nominal voltage rating and shall perform an orderly shutdown below 80% nominal voltage.

#### **3.4 DDC Control**

- 3.4.1 The network of standalone control panels shall individually perform setpoint reset, ramping functions, 2-position ON/OFF control, PID loop control, linear sequencing, rotating sequencing, binary sequencing, HI/LO/AVE selection, energy dead band and thermostat controls as required to control their connected systems of equipment.

#### **3.5 Energy Management Control**

- 3.5.1 The network of standalone control panels shall individually perform time of day scheduling, optimum start/stop, enthalpy optimization and all control optimization strategies, such as supply air reset and soft start ramp-up, for their connected systems of equipment.
- 3.5.2 Coordination of strategies involving multiple systems of equipment shall be performed by sharing of necessary data between the standalone control panels on the communicating network.

---

**3.6 Facilities Management Control**

- 3.6.1 The Owner shall be provided the ability to read-out temperature and other values and to adjust specific items from localized, as well as remote centralized location.
- 3.6.2 Maintenance time reminders based on totalized run time, calendar date, exception occurrence or manual request.
- 3.6.3 Facility Diagnostics: The facilities management system shall provide diagnostic reports of the following types, for specific systems of equipment as specified:
- .1 *Alarm Occurrence Status*: When specified alarm conditions occur, provide a report printout listing the status of specific items associated with the equipment generating the alarm. Report shall be routed to a specific printer or combination of printers. Report shall record the time the status information was taken and shall allow operational personnel to use this information to diagnose the alarm situation.
  - .2 *Alarm Occurrence Development Report*: For specific systems of equipment the facilities management system shall record a continuous log of the values of selected variables. Upon occurrence of an alarm, or some specific combination of performance conditions, the report will be printed, showing the status of each of these variables for each of the 15 minutes immediately prior to the occurrence of the triggering condition.
- 3.6.4 Telecommunications Support
- .1 The entire facilities management system network shall be able to share one or multiple auto-dial/auto-answer modems for automatic dial out reporting of alarms, exception and report information via the dial up telephone network.
  - .2 Provide and implement an auto-dial/auto-answer modem in the system of control panels for purposes of remote diagnostics and notification of desired exceptions and alarms. Dial-up telephone line shall be provided by the Owner. Modem shall provide for the following functions:
    - .1 Access to the entire facility control system by the Contractor to provide service and diagnostic support.
    - .2 Access by the Owner from off-site for similar purposes and for remote operation, monitoring and adjustment of facility functions.
    - .3 Auto-dial-out of desired exceptions to a remote site, or to an Owner-specified set of phone numbers for business-hours or off-hours reporting.

---

**3.7 Distributed Access**

- 3.7.1 The Owner shall be provided with facilities management system information through the following methods:
- .1 Simultaneous multi-user operation.
  - .2 Distributed access – at every control panel.
  - .3 Distributed documentation.
  - .4 Historical documentation logging-printer or disk for exceptions.
  - .5 Facility-wide access-LAN connected standalone control panels.
  - .6 Facility operation documentation.
  - .7 Overrides logging.
  - .8 System log-in documentation.
  - .9 System database modification documentation.
  - .10 Local historical alarm documentation.

**3.8 DDC Database Upload/Download**

- 3.8.1 The system shall have the capability of uploading and downloading the entire facilities Management System database on the system hard drive. This shall be accomplished via direct connection or a modem link.
- 3.8.2 The information shall be easily uploaded to the controllers in the event of a catastrophic memory failure. Database uploads shall be easily accomplished through menu selections and shall NOT require the operator to understand this system's operating system.
- 3.8.3 Downloading of database information shall be accomplished in the same manner as a database upload.
- 3.8.4 Monitor: Point values, current status, time schedules and any other definable point attribute such as setpoint, throttling range, etc. shall be accessible and displayable on the CRT.
- 3.8.5 Change: Current states, setpoint and any other definable point attribute shall be accessible and have the capability of being changed using the computer keyboard.
- 3.8.6 Provide a 'Coppercube' historian software and enough storage media to accommodate up to 1000 trend logs of at least 2 weeks duration. **The historian package must be fully compatible with the delta inteliweb system.**

**3.9 Override**

- 3.9.1 Setting: Current states and setpoints shall have the capability of being overridden for a certain user defined time periods by a user with the correct access level. The override period shall be user selectable to start/stop at any time up to one year in advance. The

user shall have the ability to program multiple overrides for the same or different zones or points. Overrides shall be verified (in real time) and read back to the user to positive confirmation of the setting.

- 3.9.2 Call-back: The user shall have the option of entering a telephone number for each individual override where the system can call to confirm the expiration of the override. This feature shall allow the user the option of extending the override interval without interruption of equipment operation or comfort levels.

### 3.10 Graphics Software

- 3.10.1 The system shall be provided with a complete user-friendly graphics interface system for each mechanical unit on DDC control. Provide Owner with one registered copy of the graphics software.

- 3.10.2 The Colour CRT Library: Shall contain Contractor prepared, dynamically updated displays for each schematic and each control systems' program flowchart included in the point schedule. A library of standard symbols shall be included with the following as a minimum:

Chiller	Pump	Boiler
Convertor	2-way control valve	3-way control valve
Damper	Check Valve	Motor
Fan	Coil	Filter
Damper motor	Pipe	Duct
Switch	Sensor	Air measuring device
Air quality sensor	Average duct sensor	Temperature sensor

- 3.10.3 Dynamic Updating: Online data displayed as an integral part of a schematic shall be updated not less than every five seconds with the exception of alarm/'change of state information, which shall be updated upon its receipt at the operator's terminal. Critical alarms shall be annunciated at the operator's terminal with both an audible alarm and a "pop-up" graphical display which interrupts the current operation.

- 3.10.4 Information Screen Display: Individual schematics and control, program flowcharts shall include where applicable:

- .1 Status of monitored and controlled on/off points.
- .2 Current value of analog input.
- .3 Current value of the setpoint and the DDC output for each control loop.
- .4 Identification for each point.
- .5 Current state of each control loop (computer auto/computer manual).
- .6 Schematic and systems identification.
- .7 Alarm/normal indication.

- .8 Point alarm lock-out status.
  - .9 Equipment symbolic information (pump, fan, etc.).
  - .10 All points pertinent to one system shall be show on one screen.
  - .11 Symbols shall have the ability to change colour depending on the status.
- 3.10.5 Online Directory: A directory of schematics and symbols shall be available to the operator.
- 3.10.6 Trending: Shall be provided to collect and store samples of the value of a point (i.e., temperature). The operator shall be able to create up to 250 trend logs containing up to 4 points. The sample frequency shall be selectable for each trend log between 15 seconds and 99 hours. The ability to graphically display up to 8 points on the screen simultaneously, print a log or store on disk in an ASCII format that can be imported into a standard spreadsheet program shall be provided. The ability to indefinitely retain the contents of a trend log in the controller or automatically transfer the contents of a trend log to a disk storage or printer shall be provided.
- 3.10.7 Command from Graphic: Shall be provided to directly issue commands to a point identified by a mouse on the graphics screen.
- 3.10.8 Provide interface with City water meter to DDC system for water flow measurement.

### 3.11 web-based operator interface

- 3.11.1 It is the desire of the Owner to achieve seamless integration with selected building system and subsystems on a TCP/IP high speed bandwidth network which must be able to receive BACnet information from the control system BACnet server. IN this regard it will be the responsibility of the Division 15 Controls Contractor to include all needed equipment, material, software, installation and programming, start-up and debugging labour for a fully functioning DDC acting as the integrating head end with the following minimum functions and capabilities as part of the base tender price.
- 3.11.2 For building operator interface, the DDC shall provide a web-based graphical interface that allows operator access to the DDC data via the Internet, Extranet or Intranet. The interface shall use the HTML based ASP pages to send and receive data from the DDC to the browser. Tenant interface (unique to each user) shall be provided through activation of a desktop application dialogue (DAD) residing on the taskbar in the system tray which connects to the web server providing the following features:
- .1 Zone temperature and zone setpoint adjustments.
  - .2 Zone fan coil unit override capability including enabling primary plant (chillers, pumps, ventilation controls system

- 
- associated to the floor in which the floor is being implemented).
- .3 On/off control of lighting in the overridden zone as an expandable option.
  - .4 Automatic calculation and display of the Tenant's billing amounts which will be charged by the Landlord for implementation of the Tenant's override command. Tenant to be prompted to "Proceed" or "Cancel Request" before implementing override function.
- 3.11.3 The web server pages will use the same graphics for the server database. The web server HTML web pages shall not be created separately.
- 3.11.4 A separate web server computer will be supplied. The web server shall use Microsoft's IIS server 4.0 with Windows NTS, or IIS 5.0 with Windows 2000 and support browser access via Microsoft Internet Explorer 5.0 (or higher), or Navigator Netscape 6.0 (or higher).
- 3.11.5 A separate web server computer, similar to the minimum requirements as specified under 3.5 "Central Server" to be provided.
- 3.11.6 All information exchanged over the Internet shall be optionally encrypt and secure via SSL.
- 3.11.7 Access to the web interface must be password protected. A user's rights and privileges to points and graphics will be the same as those assigned at the DDC workstation. An option will exist to only allow users "read" access via the web browser, while maintaining "command" privileges via the DDC workstation.
- 3.11.8 Commissioning of the web interface shall not require modifications or creation of HTML or ASP pages. All graphics available at the DDC graphical workstation shall be available to users via a web browser.
- 3.11.9 The web-based interface shall provide the following functionality to users, based on their access and privilege rights as a minimum:
- .1 Logon Screen: Allows the user to enter their user name, password and domain name for logging into the web server, thus providing fully integrated security access and privileges with DDC workstation.
  - .2 Alarm Display: A display of current DDC alarms to which the user has access will be displayed. Users will be able to acknowledge and erase active alarms and link to additional alarm information including alarm messages, and informational and memo text. Any alarm acknowledgements initiated through the web interface will be written to the DDC central workstation activity log.
  - .3 Graphic Display: Display of system graphics available in the DDC workstation will be available for viewing over the web

- 
- browser. Software that requires creation of “web” graphics in order to display them via the browser interface will not be acceptable. A graphic selector list will allow users to select any graphics to which they have access. Graphic displays will automatically refresh the latest change of values. Users will have the ability to command and override points from the graphic display as determined by their user accounts rights.
- .4 Point Details: Users will have access to point detail information including operational status, operational priority, physical address and alarm limits, for point objects to which they have access rights.
- .5 Point Commanding: Users will be able to override and command points they have access to via the web browsers interface. Any commands or override and command points they have access to via the web browser interface. Any commands or overrides initiated via the web browser interface will be written to the DDC central workstation activity log.
- 3.11.10 The web server licensing options will allow concurrent use by minimum 100 but expandable to 500 browsers connections.
- 3.11.11 Internet connections, IS services, shall be provided by the Owner as required to support the web access feature.
- 3.11.12 THE TCP/IP NETWORK: It is unknown at this time if the Owner wishes the DDC Web server to reside on their TCP/IP company Internet/Intranet network. Therefore, the Tendering Controls Contractors are to show a separate credit for possible exclusion of the TCP/IP network. In the event that the Owners do provide this network for the Controls Contractors to utilize, it will not absolve this Contractor from assuming full responsibility for achieving systems integration functionality as herein specified:
- .1 The TCP/IP network shall include a PC Windows 2000 service complete with PC 600 MHz processor, 512 MB Ram, 300 MB plus of publishing space, all CAT 5 cabling, in all Routers, 3COM or Cisco Hardware Firewall, Network 100 MB + Bandwidth 100 MB Active Hub with expansion capabilities (to handle PCs on system).
- .2 No more than 20 Workstation Clients per subnet.
- 3.11.13 CAPABILITIES OF INTEGRATION: Subject to the building systems and subsystems and equipment selected by the Owner, it will be possible as a minimum for the integrated DDC system to establish (locally or remotely via the web) Lighting Schedules, execute on/off lighting control, or to observe lighting status. Security access system will be able to exercise zone lighting or HVAC equipment run times by simply swiping a card. View digital CCTB images of selectable locations. The DDC web interface will be able

to create transactional logs for Tenant billing purposes based on equipment run times and usage allocations. Connected to the buildings' energy meter, run utility consumption text and graphical generate reports for direct tenant billings.

- 3.11.14 Given the large volume of information integrated systems generated; provide a comprehensive software method of automatically managing the collection, sorting and purge of historical relational systems' information. If this capability is not normally provided within the functionality of the base DDC tender, then provide this capability as part of the standalone PC software subsystem connected to the TCP/IP network.

#### **4 . EXECUTION**

##### **4.1 General**

- 4.1.1 Check and verify location of exposed control sensors with the drawings and room finish details before installation.
- 4.1.2 All temperature control and interlock wiring shall be installed in conduit unless otherwise noted on the plans. Power or interlock wiring shall be run in separate conduit from sensor and communications wiring.
- 4.1.3 Control sensors or thermostats located in public areas, change rooms or washrooms shall be a bland stainless steel cover type. Where noted, thermostats in suites shall have concealed setpoint adjustment without thermometer.
- 4.1.4 Low limit and freeze protection thermostats shall be hardwired to the fan motor starter. The vapour tension element shall be installed in a serpentine pattern across the complete coil face. For larger coil areas use two thermostats wired in series.
- 4.1.5 All thermostat bulbs in water lines shall be installed in separable wells, packed with heat conductive compound.
- 4.1.6 Install damper motors on the outside of the ducts. Do not install motors in the air stream.
- 4.1.7 Install line filters on all DDC control panel power supplies.
- 4.1.8 Provide a standalone DDC controller for each mechanical system (each air handling unit, boiler system, etc.).

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Related Documents**

- 1.1.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

### 1.2 **Summary**

- 1.2.1 This Section includes refrigerant monitors and notification appliances.

### 1.3 **Definitions**

- 1.3.1 AEL: Acceptable Environmental Level.  
1.3.2 BMS: Building Management System (DDC System)  
1.3.3 LCD: Liquid-crystal display.  
1.3.4 LED: Light-emitting diode.  
1.3.5 TLV: Threshold Limit Value.

### 1.4 **System Description**

- 1.4.1 Provide a refrigerant gas detection system where indicated and as required for indoor chiller and refrigerant devices rooms, containing a series of detection points located in areas where refrigerant from a leak is likely to accumulate and / or be sensed. Include analyzer, sequencer and interface control panels(s), filters, sensors, alarm signaling devices, piping and all components necessary for a complete operational system.
- 1.4.2 System shall provide various stages of alarming and control chiller room mechanical ventilation in accordance with sequence of operation at values not to exceed specified TLV. System shall be capable of detecting the presence of the refrigerants(s) actually used on this project. System shall be capable of detecting, indicating, alarming, shutting down equipment, interfacing to building automation and security systems, as specified below, on contract documents, and per applicable codes, standards, and regulations.
- 1.4.3 Under circumstances directed by regulations for mechanical equipment room design, refrigerants requiring LEL monitoring below 4% by volume, shall employ the appropriate sensing technology and conform to Class 1, Division 2, Electrical Code requirements. When refrigerant groups A2, A3, B2 other than NH3, and B3 are used, follow appropriate guidelines indicated in regulations concerning area classification requirements.

1.4.4 Monitoring shall be employed to provide minimum two (2) points of area sampling and (1) point of relief vent monitoring for each chiller. Additionally, monitoring shall be provided for any pit areas located in the chiller mechanical room. Diluted samples due to ventilation air flow currents shall employ multi-point monitoring techniques strategically located according to regulation guidelines. System design considerations shall also incorporate leak detection monitoring sensing locations for early warning indication to prevent a major loss of refrigerant without alarm, should a leak occur. Where multiple refrigerant types are used, it is the system suppliers' responsibility to properly select the quantity and type of refrigerant detectors and multi-point sequential sampling systems required to safely monitor the equipment room. Provide components and system safety and interface logic as outlined following without exception. Provide number of sampling points as indicated on plans with 20% spare sample point capability on analyzer and expansion module.

## **1.5 Submittals**

### **1.5.1 Product Data:**

- .1 For each type of refrigerant monitor, include refrigerant sensing range in ppm, temperature and humidity range, alarm outputs, display range, furnished specialties, installation requirements, and electric power requirement.

### **1.5.2 Shop Drawings:**

- .1 Air-Sampling Tubing: Size, routing, and termination including elevation above finished floor.
- .2 Wiring Diagrams: Power, signal, and control wiring.

1.5.3 Coordination Drawings: Include machinery-room layout showing location of monitoring devices and air-sampling tubing with filter/inlet locations in relation to refrigerant equipment.

1.5.4 Product Certificates: For monitoring devices, signed by product manufacturer.

1.5.5 Field quality-control test reports.

1.5.6 Operation and Maintenance Data: For refrigerant monitoring equipment to include in emergency, operation, and maintenance manuals.

## **1.6 Coordination**

1.6.1 Coordinate refrigerant detection and alarm system with refrigerant contained in refrigeration equipment for compatibility.

---

**1.7 Extra Materials**

- 1.7.1 Provide all necessary calibration gas and hardware for two years operation in a portable case. Turn over to Owner after successful system start up.

**2. PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Subject to compliance with requirements, provide products by one of the following:
- .1 Ino-Tek, Romeo, Michigan.

**2.2 Control Panel and Control Panel Equipment**

- 2.2.1 Analyzer: Provide NEMA 4 wall mount enclosure. Analyzer shall employ infrared sensor macro light pipe gas cell technology, to provide sensing down to one (1) part per million (ppm) and shall be compound specific and calibrated for refrigerant as specified below or required per chiller manufacturer's requirement. Analyzer shall have capability to be switched to monitor, at a future date, another refrigerant type by changing one part and recalibration. (i.e. CFC-11 to HCFC-123, etc.) Provide menu driven microprocessor based electronics with user friendly programming allowing operator to select alarm setpoints, auto zero frequency, latched or unlatched alarms, and to program sample distance in feet for each sample point. Analyzer shall automatically select sequencing and sample dwell time based on programmed distance to each sample point. First level warning alarm shall comply with recommended AEL of 10 ppm +/- 1 ppm. Base analyzer unit shall be capable of monitoring one (1) or four (4) sample points with expansion capability to four (4), seven (7) or eleven (11) sample points. LCD digital display shall show concentration levels from all four sample points simultaneously. Readout for seven (7) or eleven (11) point monitoring systems shall sequence with sample point being monitored. Flashing alarm LCD indication shall be provided for alarm level #1, #2, #3, malfunction, flow loss, and zero cycle. Auto zero calibration can be initiated manually at the monitor or automatically at preprogrammed user selectable intervals, or remotely from a dry contact input. Analyzer shall automatically zero by drawing air from an uncontaminated air source. Include built in sample pump. Differential pressure flow loss indication will occur when flow goes below 500 ml/min. Analyzer outputs available shall be Common Alarm Level 1, 2, and 3 contacts, Malfunction, (4) 4-20 mADC analog signals (1 for each channel) and a RS-485 output of refrigerant level available for input into BMS. Analyzer inputs shall be external zero initiate and external alarm reset. Contact rating 240 vac, 5 amp resistive or 2 amp inductive. Power requirements 75

---

watts. Unit shall be insensitive to vibration and shall provide for a continuous sample. Intermittent dump and purge, batch type sampling with long response times shall not be acceptable. Response time shall be twenty (20) seconds to ninety-nine (99%) percent minimum. Malfunction relay is de-energized on heater out of control, chopper failure, pump flow loss, analyzer low flow or malfunction alarm. Provide expansion card with three (3) alarm contacts for each channel. Group common alarm contacts so as to make most common operating sense. Common alarm output signal shall be provided for relief vent monitoring. All sample points shall have individual alarm setpoint adjustment capability whether standard common alarms or individual expansion board is used.

2.2.2 Local Interface Panel: Include all alarm logic, system interlocks, interface relays, alarm reset with remote capability, alarm test, trouble relay, etc. as outlined below and on drawings. All control system interlocks and logic shall be provided in local interface panel.

2.2.3 System shall be configured to provide additional dry contact alarm contacts and output signals for control or for interface as follows and noted on drawings:

- .1 With building management system:
  - .1 Maintenance dry alarm contact.
  - .2 AEL level; low leak warning dry alarm (first level) contact.
  - .3 TLV - TWA level; high level danger dry alarm (second level) contact.
  - .4 STEL level; high level danger dry alarm (third level) contact available; use only when noted.
  - .5 (1) 4-20 ma/dc process concentration signal for each channel.
  - .6 On systems greater than four (4) channels (1) 4-20 ma/dc signal shall provide for continuous ppm readout and (1) 4-20 ma/dc signal shall provide for stepped channel indication.
  - .7 RS - 485 signal.
  - .8 Common chiller relief vent alarm as grouped per analyzer.
- .2 With chiller room ventilation system direct interlock required:
  - .1 Direct interlock to Purge Air Supply and Exhaust Fan starter control circuit. Purge Mode.
  - .2 Direct interlock to Purge Mode damper controls.
- .3 With combustion equipment located in chiller room direct:
  - .1 Direct interlock to shut down at TLV-TWA level.

- 
- 2.2.4 Alarms shall be provided at the AEL and TLV-TWA level, and also for malfunction. At the AEL level, the system shall actuate the warning amber beacon and the audible horn and an alarm signal shall be sent to Physical Plant Central Control. At the TLV-TWA level, the system shall activate the purge ventilation system, energize the red beacon, sound the refrigerant leak audible alarm, shut down area combustion equipment, and send an alarm signal to contact Facilities Manager and Building Security Office via page. If a system malfunction shall occur, a blue beacon shall be energized at the locations indicated on the drawings and at the interface panel with no audible alarm at this level, and an trouble alarm signal shall be sent to Physical Plant Central Control. Provide dry alarm contacts for each alarm level for interface to the BMS. All control system interlocks and logic shall be provided in local interface panel. Where indicated; third level contacts shall be used to initiate area ventilation prior to TLV level so as to prevent shutdown of combustion equipment. Relief vent alarm shall indicate via common contact to the BMS and provide for local alarm horn only at interface panel and interface panel pilot light indication. No alarm beacons shall be energized on relief vent alarm. Analyzer display shall indicate which channel is in alarm.
- 2.2.5 Purge Ventilation: Upon system reset, the alarm beacons shall be deactivated only if the area monitored has returned to a safe condition. The purge ventilation system shall remain activated for 30 minutes after the alarm condition has cleared. A panel mounted pilot light shall indicate that the purge ventilation system is still activated. Provide a manual selector switch for "Auto - Manual On" purge fan control.
- 2.2.6 Alarm Relays: Provide plug in type, two (2) per channel (level 1 & 2) wired to DPDT isolated 5 amp terminal. Relays shall be de-energized during normal operation and shall energize upon alarm. Alarm contacts shall be available for each point of alarm from each sensing point back to the BMS and shall be used to energize various devices and equipment as outlined above and on the drawings. Alarm levels shall be field adjustable. Alarms will be provided at the AEL level, TLV-TWA level, and for malfunction from the interface panel.
- 2.2.7 Alarm Reset: Provide push button reset switch on front of interface control panel to acknowledge and silence or reset the self-latching alarm circuit. The alarm beacons and horns shall remain on until the system is reset from the panel face or from remote reset pushbutton. The alarms shall stay latched to prevent them from automatically resetting when the toxic condition goes away. This control logic shall be provided for in the interface panel.
- 2.2.8 Alarm Test: Provide push button switch inside interface control panel to test alarm circuitry and panel indicators. During test

---

function, output signals to the BMS and combustion shutdown shall be disabled.

- 2.2.9 Trouble Relay: Provide one (1) common malfunction relay for system interface to building security or BMS. Relay shall be energized in normal operation, de-energized due to malfunction at any channel.
- 2.2.10 Pilot Light Indication: Provide panel indication for power on, zone alarm status where applicable, alarm status for relief vent alarms, and purge fan status.
- 2.2.11 Power Supply: Provide terminals for dedicated 115 vac, 60 Hz. input power supply. Power all alarm and warning devices and remote indication control panel from this control panel circuit. All remote field devices associated with this system shall be 120 vac or as indicated.
- 2.2.12 Tagging: Provide "Lamacoid" tag, red background with ½" (12 mm) high white letters at each remote visual and audible device. Anchor tag to wall adjacent to wall mounted devices, suspend with brass security chain adjacent to ceiling mounted devices.
- 2.2.13 Tags located inside and outside mechanical room shall be inscribed as follows:
- .1 DANGER - REFRIGERANT R-\_\_\_\_
  - .2 BLUE - REFRIGERANT LEAK DETECTION MALFUNCTION.
  - .3 AMBER - CAUTION - REFRIGERANT LEAK DETECTED.
  - .4 RED - DANGER - REFRIGERANT LEAK DETECTED. UNSAFE TO ENTER ROOM WITHOUT PROPER BREATHING APPARATUS.
  - .5 NOTIFY BUILDING ENGINEER OR SECURITY IMMEDIATELY UPON INDICATION OF ANY ALARM.
- 2.2.14 Tags located near horn inside mechanical room shall be inscribed as follows:
- .1 DANGER - REFRIGERANT R-\_\_\_\_
  - .2 LEAVE ROOM IMMEDIATELY IF HORN SOUNDS.
  - .3 NOTIFY BUILDING ENGINEER OR SECURITY IMMEDIATELY UPON INDICATION OF ANY ALARM.
- 2.2.15 Balance of tag information must comply with CFR requirements and provide emergency action required upon entering or leaving the premises. Indicate on tag the remote reset pushbuttons. All tag information shall be provided by the system supplier.
- 2.2.16 Provide alarm horns and beacons equal to Federal Signal brand/type where indicated on drawings. Beacons shall be strobe, three color; blue, amber, and red in mechanical room; amber and red in areas outside mechanical room and outdoors. Alarm beacons

shall be located at each entrance to mechanical room and in clear view in event of alarm. Beacon assemblies outdoors shall be NEMA 4 rated. Where pilot lights are used for annunciation purposes use Allen - Bradley; push-to-test or equal.

- 2.2.17 Remote Reset: Provide minimum (1) remote reset pushbutton assembly at main entrance to mechanical room and additional where indicated on drawings to allow reset / silence from safe location. Remote pushbutton station shall be compatible with room decor. Signs at remote reset assembly shall denote a safe and unsafe response action relating to local beacons and entrance to monitored area upon depressing remote reset pushbutton. Upon reset, if the area monitored has been purged to a safe level the beacons shall be deactivated and safe entry shall be permitted.
- 2.2.18 Calibration Gas 3-Way Valve Assembly: Provide between analyzer and sequencing assembly or sample line when all analyzer sample lines are utilized, clearly identified and tagged, to allow admission of calibration zero and span gas directly into analyzer without disconnecting sample tubing.
- 2.2.19 Portable Leak Check Stations: System shall be supplied with device to pinpoint specific refrigerant leak location after system has alarmed and identified leak has occurred. Device shall allow maintenance personnel to pinpoint exact location of refrigerant leak to perform required repairs. One (1) portable leak check station shall be mounted at each chiller and at locations as indicated on drawings. Provide portable leak check station device Model #LC-10 as manufactured by Ino-Tek, Romeo, MI or approved equal.
- 2.2.20 Filters: Inlet sample filter shall be mounted at each area sample point and each relief vent sample point. Provide two (2) years of spare filter elements figuring one (1) element per sample point for every (3) months of operation. Provide wall or uni-strut mountable filter bracket assembly with sample filter and direct compression fitting connection to installer supplied 1/4" (6 mm) o.d. copper sample line as indicated on the drawings.

### **3 . EXECUTION**

#### **3.1 Installation**

- 3.1.1 Comply with ASHRAE 15, Technical Standards & Safety Authority (TSSA) requirements, and Workplace Safety and Insurance Board (WSIB) Standards.
- 3.1.2 Install air-sampling inlets, or diffusion type monitors in pits, tunnels, or trenches in machinery room that are accessible to personnel.
- 3.1.3 Floor mount diffusion-type monitor, sensor/transmitters, or air-sampling inlets on slotted channel frame 12" (300 mm) to 18" (450

- 
- mm) above the floor in a location near the refrigerant source or between the refrigerant source and the ventilation duct inlet.
- 3.1.4 Wall mount air-sampling multiple-point monitors with top of unit 60" (1,525 mm) above finished floor.
- 3.1.5 Run air-sampling tubing from monitor to air-sampling point, in size as required by monitor manufacturer. Install tubing with maximum unsupported length of 36" (915 mm), for tubing exposed to view. Terminate air-sampling tubing at sampling point with filter recommended by monitor manufacturer.
- 3.1.6 Install air-sampling tubing with sufficient slack and flexible connections to allow for vibration of tubing and movement of equipment.
- 3.1.7 Purge air-sampling tubing with dry, oil-free compressed air before connecting to monitor.
- 3.1.8 Number-code or color-code air-sampling tubing for future identification and service of air-sampling multiple-point monitors.
- 3.1.9 Extend air-sampling tubing from exhaust part of multiple-point monitors to outside.
- 3.1.10 Extend air-sampling tubing from outdoors to outdoor inlet connection of NDIR monitors. Terminate air-sampling tubing at outdoor inlet location with filter recommended by monitor manufacturer.
- 3.1.11 Place warning signs inside and outside each door to the refrigeration equipment room. Sample wording: "AUDIBLE AND VISUAL ALARM SOUNDING INDICATES REFRIGERANT DETECTION - ENTRY REQUIRES SCBA."
- 3.1.12 Audible Alarm-Indicating Devices: Install at each entry door to refrigeration equipment room, and position not less than 6" (150 mm) below the ceiling. Install horns on flush-mounted back boxes with the device-operating mechanism concealed behind a grille.
- 3.1.13 Visible Alarm-Indicating Devices: Install adjacent to each alarm horn at each entry door to refrigeration equipment room, and position at least 6" (150 mm) below the ceiling.
- 3.1.14 System supplier shall have turnkey responsibility to provide mechanical and electrical installation, provide on-site installation supervision, and properly locate sampling points after review of chiller room air flow and ventilation patterns.
- 3.1.15 Sample locations indicated on drawings are approximate and must be field verified by system manufacturer with air flow profile tests. Air flow profile tests shall be turned over to owner as part of the safety certification documentation. Final location of sample points shall be determined after all chiller room ventilation systems and equipment have been installed, and properly balanced. It is the

system suppliers responsibility to insure that enough sample points exist to properly monitor air samples both under normal ventilation conditions and under purge ventilation conditions. Air profile test should indicate air flow pattern prior to alarm and after alarm to insure that safe monitoring exists under both conditions.

- 3.1.16 Install equipment in accordance with applicable codes and manufacturer's printed instructions. Route conduits and tubing as required to make neat and operating system. Sample inlet tubing shall be 1/4" o.d. rigid copper, properly supported, and run neatly parallel with, or at right angles to building construction. Tubing shall be void of kinks, sags and other irregularities. All bends shall be made with a tube bender.

### **3.2 Field Quality Control**

#### **3.2.1 General**

- .1 Prior to project completion and when directed by Owner's Representative, manufacturer factory trained representative shall program, start up, thoroughly test and calibrate, set alarm threshold levels, and verify that system is in compliance with operational sequence. Should corrections be required to any system, and after corrections have been completed, system shall be re-tested.
- .2 Assist Security Office and Physical Plant Maintenance Department in development of emergency procedures.
- .3 Tests shall be witnessed by Owner or his designated representative and a letter shall be submitted certifying system performance.

#### **3.2.2 Safety Certification:**

- .1 Furnish Owner with written report certifying that work has been accomplished with results. Provide Safety Certification documentation to the owner including the following: Air Flow Profile Report for each sample point location, Calibration Report with before and after results of each analyzer, Alarm / Interface Report stating all threshold levels, alarm and interface action at each level of alarm with field verification report, Safety Training Checklist, and List of all owner attendees.
- .2 Near end of warranty period of operation, provide similar service as described above complete with written report. Should a control or device be suspect in its operation or function, this deficiency shall be reported to operating personnel, documented in report, and replaced.

- 3.2.3 Post Construction On Site Service: Each six months after final acceptance until warranty expires, systematically inspect, examine, clean and adjust when necessary, detector, panels, relays, self-

---

contained breathing apparatus, and accessories pertaining to system. Provide updated pertinent reports.

**3.3 Demonstration**

- 3.3.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain refrigerant detection devices. Refer to requirements in Division 01 Section "Demonstration and Training."

**END OF SECTION**

---

## 1. GENERAL

### 1.1 Related Work

1.1.1 This Section of the Specification forms part of the Contract Documents and is to be read, interpreted and coordinated with all other parts.

### 1.2 Definitions and Abbreviations

1.2.1 The following are abbreviations used throughout the section defining computerized control systems specified herein or defined on plans:

- |     |            |   |
|-----|------------|---|
| .1  | BAS        | Building Automation System  |
| .2  | SAP        | Stand Alone Panel – generic term that applies to BC, AAC, ASC       |
| .3  | DI         | Digital Input   |
| .4  | DO         | Digital Output  |
| .5  | AI         | Analog Input  |
| .6  | AO         | Analog Output   |
| .7  | HVAC       | Heating, Ventilation, Air Conditioning                              |
| .8  | MCC        | Motor Control Centre  |
| .9  | DDC        | Direct Digital Control  |
| .10 | LAN        | Local Area Network  |
| .11 | OS         | Operating System  |
| .12 | OT         | Operating Terminal  |
| .13 | PC         | Personal Computer   |
| .14 | OWS        | BACnet Operator Work Station – same as B-OWS                        |
| .15 | Native     | Native BACnet   |
| .16 | BC         | BACnet Building Controller – same as B-BC                           |
| .17 | AAC        | BACnet Custom Application Controller – same as B-AAC                |
| .18 | ASC        | BACnet Application Specific Controller – same as B-ASC              |
| .19 | SS         | BACnet Smart Sensor – same as B-SSEthernet – BACnet TCP/IP Ethernet |
| .20 | MS/TP      | BACnet Master-Slave/Token Passing                                   |
| .21 | PTP        | BACnet Point-to Point Protocol                                      |
| .22 | Gateway    | BACnet Gateway  |
| .23 | Micropanel | Generic term that applies to AAC and ASC                            |

- 1.3.2 Institute of Electrical and Electronic Engineers – IEEE 472, IEEE 587.
- 1.3.3 National Institute of Standards and Technology – NISTIR 6392 GSA Guide to Specifying Interoperable Building Automation and Control Systems Using ANSI/ASHRAE Standard 135-1995, BACnet.
- 1.3.4 Native BACnet – Native BACnet means that no translation software will be used internal to the OWS, BC, AAC, and ASC to convert from a proprietary protocol to BACnet Standard Object Types, Standard Application Services and devices. Gateways are not native BACnet.
- 1.3.5 BACnet Gateways.

**1.4 Scope of Work**

- 1.4.1 Supply, installation and mounting of all hardware (unless specifically stated otherwise).
- 1.4.2 Supply and mounting of sensor elements and associated hardware, wiring or piping connecting sensors to SAPs.
- 1.4.3 Wiring connecting to SAPs to transducers, fire alarm and smoke control.
- 1.4.4 Supply and wiring connection of solid state relays and relays to terminal connections at MCCs and to SAPs.
- 1.4.5 Supply and installation of SA's comprising of BC's, AAC's, and ASC's.
- 1.4.6 The Controls Sub-Contractor will do the complete installation of all sensors, associated control panels, relays, transducers, actuators, flow switches, gauges, air receivers, SAP computer board, associated power supplies, conduit, wiring, tubing, and all other control devices including isolation room panels, and all terminations.
- 1.4.7 The Controls Sub-Contractor will participate and provide coordination required between the Client, the Consultant, and other Sub-Contractors where controls are involved and the Commissioning Agent.
- 1.4.8 The Controls Sub-Contractor will provide verification and commissioning as follows:
  - .1 End to end continuity checks will be performed on all wiring and control tubing.
  - .2 All sensors, transducers, relays, actuators, control valves and dampers will be calibrated and operationally checked by this Sub-Contractor.
  - .3 Provide a point checkout sheet for verification of system. This Sub-Contractor to initial each point as it is verified.

- 1.4.9 The controls Sub-Contractor will test the SAP computer hardware and operator consoles.

## **2 .      PRODUCTS**

### **2.1      System Description**

- 2.1.1 A complete, fully tested, commissioned and operational Native BACnet Building Automation Systems (BAS) utilizing fully electronic Direct Digital Control (DDC\_ to meet the requirements described herein and in complete accordance with applicable codes and ordinances.
- 2.1.2 The system software and control devices shall be fully compatible with the System programs and hardware, latest BACnet versions.
- 2.1.3 Unless specified otherwise, provided proportional plus integral electronic components.
- 2.1.4 The design, installation, supervision and labour services, calibration, software programming and de-bugging, checkout and commissioning required for the BAS.
- 2.1.5 Supply and installation of electronic packaged zone controllers for terminal unit control.
- 2.1.6 Devices, components, wiring and materials as required for a fully operating control system.
- 2.1.7 Include full graphics operating package with modification of existing site graphics and navigation sequences via customized software programming.
- 2.1.8 Instruction to the Facility's maintenance and operating personnel.
- 2.1.9 Complete system documentation including:
- .1 As-built site diagrams showing location of wiring and panels and system architecture.
  - .2 Operating and Maintenance Manuals.

### **2.2      Cable**

- 2.2.1 Primary Data transmission cable shall be CAT 5 Ethernet cable.

### **2.3      Electronic Terminal Equipment (AAC) Controllers**

- 2.3.1 Each zone controller will be microprocessor-based, multi-tasking, real-time digital control processor. The zone controllers will monitor space temperature sensors and control operation of terminal air valves, air valve reheat coils, fan coil units, and perimeter radiant panels in the corresponding zone.
- 2.3.2 Each zone controller will have sufficient memory to support its own operating system and data base including:

- .1 Control functions.
- .2 Energy management applications.
- .3 Interface with operator portable personal computer.
- 2.3.3 Zone controller panels will have the following features:
  - .1 Setpoint adjustments
  - .2 Modify gain and offset constants.
  - .3 Program parameter adjustments
  - .4 Trend log displays edit/create trend logs through DDC system main panels.
- 2.3.4 Zone controllers shall NOT be mounted in ceiling spaces.

## **2.4 Electronic Air Valve Controls, Sensors & Actuators.**

- 2.4.1 Control Sub-Contractor shall include for the supply and installation of pressure sensors, operators and standalone controllers for the air valves.
- 2.4.2 Control components shall be pre-assembled for testing and performance verification prior to arrival on site.
- 2.4.3 Multipoint cross flow sensors shall be supplied by air valve Manufacturer.
- 2.4.4 Flow transducer shall be a full differential pressure unit not hot wire or thermister type.
- 2.4.5 Electronic operators shall be provided for air valve dampers with piston or gear driven type damper operators.
- 2.4.6 Air valve damper motors shall be Belimo LM24-T floating control or approved equal.
- 2.4.7 Damper operators shall operate with floating point signal for full modulation.
- 2.4.8 Damper operators shall be rigidly attached to the support structure and linkage shall have no "slop".
- 2.4.9 These control components shall be field tested with air valve for testing and performance verification.
- 2.4.10 Submit written test data for the terminal unit controllers for each size of air valve and fan coil unit.
- 2.4.11 Supply air temperature measurement shall be provided on each air valve with reheat coils.

## **2.5 DDC System Functions**

- 2.5.1 The DDC system shall utilize "BACnet open architecture" and have as proven Operator Control Language (OCL), which will be capable of reading the value, and/or status of all control devices from any other user defined combination of calculations and logical expressions.

- 
- 2.5.2 All Sap's and BACnet Gateways shall conform to the BACnet Protocol Implementation Conformance Specification.
- 2.5.3 Other mandatory monitoring and control features of the DDC system are:
- .1 Levels of Access:
    - .1 Include administrative process for full editing, creating, and modifying abilities. Permissions structure for users.
    - .2 The Region of Peel must be provided the ability to create profiles or roles to operate the system.
    - .3 All default passwords and administrator passwords must be provided to the Supervisor, Technical Services, RPAM:
      - .1 Administrator- Full access, includes adding, editing, deleting other users.
      - .2 Specialist- Editing, Modifying all control points. Creation of trending, and general reports.
      - .3 Operator- Modifying limited control points.
      - .4 Users - Read only access.
    - .4 Level 1: To allow assignment of Level 1 and Level 2 passwords. Creation of new system operators, ability to create, delete and modify system components, modify selected system components, and alarm levels, and generally full system access. – This is granted to Administrator and Specialist
    - .5 Level 2: To allow command and override of system components, alarm acknowledgement, monitor system, display information including alarm messages, graphics, points log, help menus. – This is granted to Operator and Users.
  - .2 Operator defined digital and analog alarms and automatic alarm condition reporting.
  - .3 Auto lockout of alarms when alarmed system is shut-down.
  - .4 Direct keyboard override of all digital and analog outputs, with an indication of the display of any point that is operating under keyboard override.
  - .5 Addition, detection, definition and modification of points and point types from operator keyboard.
  - .6 Trend log graphing of user selected points and times.
  - .7 Run time totalization.
- 2.5.4 The DDC system shall have the capability to be taken off line in the event of failure or for maintenance and returned to operation without the need for entering any portion of the software program manually. To accomplish this, an off-line disk storage device shall be utilized to provide software backup and reload.

- 
- 2.5.5 On-site backup and verification of the entire system, with full applications software, shall be less than 10 seconds per SAP.
  - 2.5.6 The DDC system shall be provided with automatic protection from any power failure of up to 72 hours duration.
  - 2.5.7 The protection shall at a minimum include continuous real-time clock operation and automatic system restart-upon power return. System will be tested to confirm rated hours.
  - 2.5.8 Panel replacement shall be possible without any hardware notification. Describe replacement procedure in technical data submitted.
  - 2.5.9 Any panel malfunction shall not affect the operation of the multi-panel system.
  - 2.5.10 Indicate how points located on one panel can be accessed and utilized by another panel. Explain any limitations of the above.
  - 2.5.11 Each BC and AAC standard panel proposed shall have enough random access memory for all of the following:
    - .1 Trend Logs – two for each input and output point connected to the panel with 100 samples each.
    - .2 Controllers – two for each output point connected to the panel.
    - .3 Variables – three for each output point connected to the panel. Variables are “virtual points” (as opposed to physical points) but which have all the attributes of real or physical points.
    - .4 Operator Control Language (OCCL) – twenty syntactically correct lines each with at least 4 operators, for each output point connected to the panel, or TEN (1) syntactically correct lines, each with at least four operators, for each output point connected to the panel, if the OCL has the ability to call common routines or use wild card commands.
    - .5 Descriptor – one for each user definable point, real or virtual, in the panel. In addition, on multi-panel systems, every descriptor in the system must be accessible from a single I/O port.
    - .6 Time Schedules – one set for every 3 output points connected to the panel.
    - .7 Totalizers – one for each digital point in the panel.
  - 2.5.12 Processing Speed
    - .1 Effective Panel Processing Speed – Maximum permissible executions time is half a second. Execution time is defined as the time it takes the stand alone panel CPU to execute all application software in the panel, from some point in the software back to the same point, assuming full memory

usage, while simultaneously responding to operator or terminal display requests and carrying out normal inter-panel communications averaged over a one – minute period. This will be done by setting up a counter in each panel and monitoring the counting rate.

- .2 Effective System Processing Speed – This applies to multi-panel systems only. System processing speed is intended to address inter-panel communication and will be checked by evaluating system display response. This will be done by setting up a display of all panel counters and checking how frequently each countered update on the refreshed display.
- .3 Displays shall load real time current values, not stored values, within ten seconds. Every counter shall show an updated value on the display within sixty seconds at the previous update appearing. Provide confirmation that required system processing speed will be achieved.

#### 2.5.13 DDC System Igniter-Panel Communication

- .1 Means shall be provided to ensure communication integrity. Provide detail of the system.
- .2 To prevent damage to the system, each data highway line shall be provided with a means of isolation, either optically or by some other means. Provide detail of protection system in proposal.

#### 2.5.14 Sensors and Associated Equipment

- .1 BAS shall be supplied with all sensors, relays and associated equipment to fully connect the listed DDC points. Field point installation shall be performed in a neat and orderly fashion with all components marked or labelled to correspond with the making or labelling in the as-built drawings.
- .2 All sensors and controllers shall be of commercial grade and shall be installed according to the Manufacturer's recommendations. Provide full details of all sensors and controllers proposed, including their range and accuracy.

## 2.6 System Structure

2.6.1 The Building Automation System (BAS) architecture shall consist of the following installed in communication and main mechanical rooms:

- .1 Standalone DDC system main panels.
- .2 Standalone DDC system terminal equipment (zone) controllers.
- .3 Provide plug-in access for remote or lap-top computer at each panel using the same software as resides on the central workstation.

---

## 2.7 DDC System Panels

### 2.7.1 References:

- .1 National Institute of Standards and Technology – NISTIR 6392 GSA Guide to Specifying Interoperable Building Automation and Control Systems Using ANSI/ASHRAE Standard 135-1995, BACnet.

### 2.7.2 DDC Panel Types:

- .1 BC minimum capabilities equivalent to the BACnet Building Controller (B-BC).
- .2 AAC Local Control Unit minimum capabilities equivalent to the BACnet Custom Application Specific Controller (B-AAC).
- .3 ASC Terminal Control Unit minimum capabilities equivalent to the BACnet Application Specific (B-ASC).
- .4 AAC Room Control Unit minimum capabilities equivalent to the BACnet Custom Application Specific Controller (B-AAC).
- .5 SS Smart Sensor minimum capabilities equivalent to the BACnet Smart Sensor (B-SS).

### 2.7.3 DDC Panel Applications – This section describes the mechanical systems that shall be connected to the different DDC panel types.

- .1 BC main function is to provide direct control of all main central mechanical systems such as chillers, cooling towers, heat exchangers, domestic hot water, fan systems etc. The BC's shall directly reside on the primary Ethernet LAN.
- .2 AAC function is to provide control for miscellaneous HVAC components in remote mechanical rooms such as rooftop units, fan coils, unit ventilators, VAV, etc., AAC's shall reside on the secondary RS485 MS/TP network.
- .3 All DDC panels shall meet the minimum requirements set out in this section.

## 2.8 BC BACnet Overview

### 2.8.1 A BC (B-BC) is a native BACnet, general purpose, field programmable controller capable of carrying out a variety of building automation and control tasks. It enables the specification of the following:

- .1 Data Sharing:
  - .1 Ability to provide the values of any of its BACnet objects.
  - .2 Ability to retrieve the values of BACnet objects from other devices.
  - .3 Ability to allow modification of all of its BACnet objects by another device.
- .2 Alarm and Event Management:

- 
- .1 Generation of alarm / event notifications and the ability to direct them to recipients.
  - .2 Maintain a list of unacknowledged alarms / events.
  - .3 Notification of other recipients that the acknowledgement has been received.
  - .4 Adjustment of alarm / event parameters.
  - .3 Scheduling:
    - .1 Ability to schedule output actions, both in the local device and in other devices, both binary and analog, based on date and time.
  - .4 Trending:
    - .1 Collection of delivery of (time, value) pairs.
  - .5 Device of Network Management
    - .1 Ability to respond to information about its status.
    - .2 Ability to respond to requests for information about any of its objects.
    - .3 Ability to respond to communication control messages.
    - .4 Ability to synchronize its internal clock upon request.
    - .5 Ability to perform re-initialization upon request.
    - .6 Ability to upload configuration and allow it to be subsequently restored.
    - .7 Ability to command half-routers to establish and terminate connections.
  - 2.8.2 Provide sufficient number of BC's to fully meet all requirements of this specification plus specified spare point capacity. An Ethernet gateway connecting the WAN to the building BC is NOT acceptable.
  - 2.8.3 BC to be standalone intelligent controller, BC panel to:
    - .1 Be microprocessor based, multi-tasking, multi-user, real-time digital control processors capable of supervising other low level programmable controllers through secondary networks.
    - .2 Consist of modular hardware with plug-in processors, communication controllers, power supplies, I/O modules.
    - .3 Provide MS/TP BACnet LAN port for local AAC/ASC network.
    - .4 Provide on-board LAN interface for Ethernet BACnet peer-to-peer communication between BC's and at least **[1]** RS-232C serial data communication ports to support simultaneous operation of multiple operator I/O devices such as industry standard printers, lap-top work-stations, PC work-stations and BC-mounted or portable OT's. One

- 
- RS-232C data port will support point-to-point PTP BACnet protocol.
- .5 Allow temporary use of portable devices without interrupting normal operation of permanently connected modems, printers, OT's.
  - .6 Interface field sensors via local I/O terminations located on BC located in processor cabinet.
  - .7 In standalone mode execute programmable logic control (direct digital or closed loop process control) of associated HVAC equipment without interacting with other processors or OWS's.
- 2.8.4 Dial-up Communications:
- .1 Auto-dial/auto-answer communications to allow BC/s to communicate with remote OW's on non-contributions basis via telephone lines.
  - .2 To analyze and set priorities for all alarms to minimize of calls. Non-critical alarms to be buffered in memory and reported as group or until operator manually requests upload of alarms.
- 2.8.5 Spare Capacity
- .1 Provide 20% spare point capacity on panels with greater than 32 I/O and 10% spare capacity on panels with less than 32 I/O.
- 2.8.6 Programming and Energy Management Routines:
- .1 Time of day scheduling.
  - .2 Calendar based scheduling.
  - .3 Holiday scheduling.
  - .4 Temporary schedule overrides.
  - .5 Optimal start.
  - .6 Optimal stop.
  - .7 Supply air reset.
  - .8 Duty cycling.
  - .9 Night setback.
  - .10 Chilled water and condenser water reset.
  - .11 Heating water reset.
- 2.8.7 All programs to be executed automatically without need for operator intervention.
- 2.8.8 Programming languages:
- .1 Shall meet requirements specified in Custom Programming Capability Specification Section.
- 2.8.9 Priority Level:
-

- .1 BC shall provide for 16 levels of priority from all outputs. The priority levels shall conform to the BACnet object specifications.

2.8.10 Trend Logging:

- .1 All trend log information shall be stored at BC and not at OWS.

## 2.9 **AAC BACnet Overview**

2.9.1 An AAC (B-AAC) is a general purpose, field programmable controller capable of carrying out a variety of building automation and control tasks. It enables the specification of the following:

- .1 Data Sharing:
  - .1 Ability to provide the values of any of its BACnet objects.
  - .2 Ability to retrieve the values of BACnet objects from other devices.
  - .3 Ability to allow modification of all of its BACnet objects by another device.
- .2 Alarm and Event Management:
  - .1 Generation of alarm / event notifications and the ability to direct them to recipients.
  - .2 Maintain a list of acknowledged alarms / events.
  - .3 Notifying other recipients that the acknowledgement has been received.
  - .4 Adjustment of alarm / event parameters.
- .3 Scheduling:
  - .1 Ability to schedule output actions, both in the local device and in other devices, both binary and analog, based on date and time.
- .4 Trending:
  - .1 Collection and delivery of (time, value) pairs.
- .5 Device and Network Management:
  - .1 Ability to respond to information about its status.
  - .2 Ability to respond to requests for information about any of its objects.
  - .3 Ability to respond to communication control messages.
  - .4 Ability to synchronize its internal clock upon request.
  - .5 Ability to perform re-initialization upon request.
  - .6 Ability to upload its configuration and allow it to be subsequently restored.

- 
- .7 Ability to command half-routers to establish and terminate connections.
  - 2.9.2 Provide sufficient number of AAC's to fully meet all requirements of this specification plus specified spare point capacity.
  - 2.9.3 AAC to be stand-alone intelligent controller. AAC panel to:
    - .1 Be microprocessor based, multi-tasking, multi-user, real-time digital control processors capable of supervising other lower level programmable controllers through secondary networks.
    - .2 Consist of modular hardware with plug-in processors, communication controllers, power supplies, I/O modules.
  - 2.9.4 Provide MS/TP BACnet Lan port for local ASC network.
  - 2.9.5 Provide on-board LAN interface for MS/TP BACnet peer-to-peer communication between AAC's and at least [1] RS-232C serial data communication port to support operation of operator I/O devices such as industry standard printers, lap-top work-stations, PC work-stations and AAC-mounted or portable OT's. RS-232C data port, will support point to point PTP BACnet protocol.
  - 2.9.6 Allow temporary use of portable devices without interrupting normal operation of permanently connected modems, printers, OT's.
  - 2.9.7 Interface field sensors directly to I/O terminations located on AAC in processor cabinet.
  - 2.9.8 In standalone mode execute programmable logic control (direct digital or closed loop process control) of associated HVAC equipment without interacting with other processors or OWS's.
  - 2.9.9 Spare Capacity:
    - .1 Provide 10% spare point capacity for each AAC without additional cards, terminals or a minimum of one spare input and one spare output.
    - .2 If AAC is used for unitary equipment then no spare capacity is required unless identified on points list.
  - 2.9.10 Programming and Energy Management routines:
    - .1 AAC to provide the following energy management routines:
      - .1 Time of day scheduling.
      - .2 Calendar based scheduling.
      - .3 Holiday scheduling.
      - .4 Temporary schedule overrides.
      - .5 Optimal start.
      - .6 Optimal stop.
      - .7 Supply air reset.
      - .8 Duty cycling.

.9 Night setback.

2.9.11 All programs to be executed automatically without need for operator intervention.

2.9.12 Programming languages:

.1 Shall meet requirements specified in Custom Programming Capability Specification Section.

2.9.13 Priority Level:

.1 AAC shall provide for 16 levels of priority from all outputs. The priority levels shall conform to the BACnet object specifications.

2.9.14 Trend Logging:

.1 All trend log information shall be stored at AAC and not at BC or OWS.

## 2.10 ASC BACnet Overview

2.10.1 ASC BACnet overview: An ASC (B-ASC) is a controller with limited resources relative to an AAC. It is intended to use in a specific application and supports limited programmability. It enables specification of the following:

.1 Data Sharing:

.1 Ability to provide the values of any of its BACnet objects.

.2 Ability to allow modification of some or all of its BACnet objects by another device.

.2 Alarm and Event Management:

.1 None

.3 Scheduling:

.1 None

.4 Trending:

.1 None.

.5 Device and Network Management:

.1 Ability to respond to information about its status.

2.10.2 ASC to be standalone intelligent controller. ASC panel to:

.1 Be microprocessor based, real-time digital control processors.

.2 Consist of modular hardware with communication controllers, power supplies, I/O modules.

.3 Provide on-board LAN interface for MS/TP BACnet peer-to-peer communication between ASC's and at least **[1]** RSS-232C serial data communication port to support operation of operator I/O devices such as industry standard printers, lap-

- 
- top work-stations, PC work-stations and ASC-mounted or portable OTs.
- .4 Allow temporary use of portable devices without interrupting normal operation of permanently connected modems, printers, OTs.
  - .5 Interface field sensors directly to I/O terminations located on ASC in processor cabinet.
- 2.10.3 In standalone mode execute programmable logic control (direct digital or closed loop process control) of associated terminal equipment without interacting with other processors or OWS's.
- 2.10.4 Spare Capacity:
- .1 Provide 10% spare point capacity for each ASC without additional cards, terminals.
  - .2 If ASC is used for terminal equipment then no spare capacity is required unless identified on points list.
- 2.10.5 Programming and Energy Management Routines:
- .1 ASC to provide for the following energy management routines:
    - .1 Temporary schedule overrides.
    - .2 Supply air reset.
    - .3 Night setback.
  - .2 All programs to be executed automatically without need for operator intervention.
  - .3 Programming languages:
    - .1 Firmware based application specific program utilizing full BACnet objects and functionality.
- 2.10.6 Priority Level:
- .1 ASC shall provide for 1 level of priority from all outputs.
- 2.10.7 Trend Logging:
- .1 All trend log information shall be stored at AAC or BC not ASC.

## **2.11 Custom Programming Capability**

### **2.11.1 Programming Languages:**

- .1 All GCL General Control Language software to be programmed in general control type or high-level control language supporting full BACnet objects and functionality.

**END OF SECTION**

---

## 1. **GENERAL**

### 1.1 **Summary**

1.1.1 Detailed narrative description of Sequence of Operation of each system.

- .1 Control Description Logic (CDL) for each system.
- .2 Input/Output Point Summary Tables for each system.

### 1.2 **References**

1.2.1 Public Works and Government Services Canada (PWGSC) / Real Property Branch / Architectural and Engineering Services.

- .1 MD250005-2009 200, Energy Management of Control Systems (EMCS) Design Manual, English.
- .2 Shared Services BC Client Comfort Design Manual (CCS Manual) – See SSBC Integrated Workspace Solutions (IWS) Standards and Manuals.

### 1.3 **Sequencing**

1.3.1 This section defines the sequence of operation for the mechanical systems that are to be executed by the DDC system and shall be read in conjunction with the Controls DDC Section 25 05 01.

1.3.2 The control sequences contain a general description of the intent of the operation of the systems to be controlled. The Contractor shall review individual systems to ensure equipment and life safety interlocks are not overridden.

1.3.3 The control sequences shall be interpreted in conjunction with the respective system configuration schematics, layout and details shown on the drawings.

1.3.4 The relationships between the points, systems and building are described in the control sequences.

1.3.5 Not all points are shown on the drawings. All points, sensors and transmitters required to implement the control sequences described herein and/or listed in the drawings, are to be provided regardless of whether shown or not.

1.3.6 Review with the Consultant during the shop drawing stage to finalize control sequences for each system.

### 1.4 **Standard Routines**

1.4.1 On a power interruption at a control panel, the equipment controlled by that panel shall turn-off as if to signal to stop equipment had been given. On a return from power failure, the equipment shall restart in an orderly fashion with time delays between each major system.

During power failure, the emergency generator starts, power shall be directed to specific equipment. Refer to motor list for mechanical equipment that requires emergency power. Life and safety system shall start first.

- 1.4.2 If the power interruption has been to multiple control panels, equipment start-up shall be delayed between control panels.
- 1.4.3 Control sequences shall be executed if the associated equipment is running, whether the sequence is initiated manually (for example, an operator is positioning a motor starter in the hand position) or the DDC system.
- 1.4.4 The DDC System shall not override any safety interlocks.

#### **1.5 Alarm and Event Messages**

- 1.5.1 System error occurs when the status point does not correspond to the commanded status (or is outside of accepted deviation from setpoints) and generation of an alarm message is required.
- 1.5.2 When the DDC system identifies a sensor as “failed” it shall disable the input point and place all outputs dependent on the disabled input to a safe state. An alarm message shall be output for each occurrence at the alarm printers.
- 1.5.3 Coordinate with the Engineer on the wording of event messages to be generated. Provide an alarm data DDC system sheet and complete the specified columns providing information on the point name, alarm type, high limit, low limit and alarm reference conditions.

#### **1.6 Setpoints, Schedules and Hours of Operation**

- 1.6.1 The setpoints, schedules and hours of operation indicated in the sequences of operation are for initial set-up of the system. During the commissioning process and building operation the setpoints and schedules are to adjusted as deemed necessary to optimize system operation.
- 1.6.2 All setpoints, schedules and hours of operation shall be operator on-line definable.

#### **1.7 Motor Control**

- 1.7.1 When points are utilized for motor run time totalization, either to generate a maintenance alarm or for equipment switchover, a virtual point shall be used and reset to zero after the specified run time.
- 1.7.2 Programming the Sequence of Operation
  - .1 For operating sequences, the Contractor shall provide an outline of the proposed programming approaches and examples to the Engineer for review.

- .2 Where hydronic pumps are controlled from variable speed drive(s), the minimum speed of the pump shall be  $\pm 40\%$  of rated full speed RPM, or as directed by the pump supplier and balancing agent to meet minimum system flow and pressure requirements.

## 2. **BUILDING SPECIFIC SEQUENCE OF OPERATIONS**

### 2.1 **CONTRACTOR REVIEW OF SEQUENCES**

- 2.1.1 As part of the control's submittal process, the DDC Contractor shall formally state "The sequences shall be programmed as written" or it shall describe any deviations. In particular, the contractor shall annotate any:
  - .1 Apparent errors in the sequence logic
  - .2 Control logic which might lead to equipment damage or violate manufacturer warranties
  - .3 Control logic elements which cannot be implemented due to the equipment submitted on by others.
  - .4 Limitations due to VE, phasing, or owner requirements which could conflict with the design intent on the contract documents.

### 2.2 **SEQUENCE MODIFICATIONS DUE TO EQUIPMENT OR OEM CONTROLS LIMITATIONS**

- 2.2.1 Typically, the equipment specified is open to competition and as a result, there can be slight variations among various manufacturers that may impact the sequence of operations. It is common for there to be with limitations of OEM controls or slight discrepancies in the points provided.
- 2.2.2 If minor specifics of the OEM controls differ slightly but still meet the design intent, then the following applies:
  - .1 Network architecture, where provided by the EOR takes precedence over specific points. Substations of serial network comm where ethernet is designed is not acceptable. Note: topology variations through use of routers/repeaters/servers or manufacturer specific network products to best suit project conditions are the means and methods of the DDC contractor.
  - .2 Specified precision or particular attributes of OEM sensors may be relaxed or amended on limited, case by case basis to accommodate what the factory feels is best to run their equipment.
  - .3 The absence of sensors whose function is vital to the execution of the sequence of operations is not considered

---

acceptable. Contractor to provide additional DDC controller to supplement the OEM controls if required to execute the sequence. This is particularly applicable for:

- .4 Central plant equipment, air source heat pumps, and all associated CHW & HHW pumps.
- .5 DOAS, ERV, fan coils
- .6 Trench fan coil units.
- .7 This must be brought the attention of the EOR during submittal process so that it can be properly approved.
- .8 Approved changes need to be incorporated into the as-builts as the final sequence of operations. Functional and performance tests are then to be an accurate reflection of the OEM controls sequence as implemented for this specific project.

#### 2.2.3 Zone Groups

- .1 Each system shall be broken into separate Zone Groups composed of a collection of one or more zones served by a single air handler.
- .2 Each Zone Group shall be capable of having separate occupancy schedules and Operating Modes from other Zone Groups.
- .3 All zone groups are subject to owner approval.
- .4 All zones in each Zone Group shall be in the same Operating Mode at all times. If one zone in a Zone Group is placed in any mode other than Unoccupied Mode (due to override, sequence logic, or scheduled occupancy) all zones in that Zone Group shall enter that mode.
- .5 A Zone Group may be in only one mode at any given time.

#### 2.2.4 Zone Group Assignments

- .1 As a default, all VAV terminal units served by an DOAS shall be in a zone group. Further subdivision by floor, or wing could be necessary for a given project.
- .2 Each zone served by a fan-coil or single-zone air handler shall be its own Zone Group.
- .3 All networking closets, mechanical and electrical rooms served by the air handler shall be a single Zone Group.
- .4 Each radiant manifold and associated temperature sensors are considered a zone group.
- .5 Each ERV is considered its own zone group.
- .6 VRF or VRV FCU may be in groups or considered independent. Contractor to send RFI if the nature of the branch selector or CU is not clear.

- 
- .7 Operable & manual window groups or natural ventilation zones may or may not coincide with mechanical equipment. Contractor to send RFI for all instances for proper verification of priority and overlap.
- 2.2.5 Building Operating Modes
- .1 Occupied Mode:
    - .1 This is set based on user adjustable schedule.
    - .2 A thermostat with an override input may initiate occupied mode outside of the pre-set schedule.
    - .3 Schedule shall accommodate user provided holidays.
  - .2 Morning Warm-Up Mode:
    - .1 The design intent is for the BMS to begin warming the building so that it can be comfortable at the start of occupied mode.
    - .2 The start time of warmup mode is initiated by user provided schedule.
    - .3 Zones where the window switch indicates that a window is open shall be ignored.
    - .4 During morning warm up, set all zone setpoints to initial setpoint of 76°F (adj) OR an alternative approach is to set all terminal unit dampers to full open.
    - .5 Enable the DOAS and HHW plant to run.
    - .6 Allow economizer(s) to provide for 100% recirculation air if OAT < RAT.
  - .3 Morning Cool-Down Mode:
    - .1 The design intent is for the BMS to begin cooling the building so that it can be comfortable at the start of occupied mode.
    - .2 The start time of warmup mode is initiated by user provided schedule.
    - .3 Zones where the window switch indicates that a window is open shall be ignored.
    - .4 During cool down mode, set all zone setpoints to initial setpoint of 69°F (adj) OR an alternative approach is to set all terminal unit dampers to full open.
    - .5 Enable the DOAS and CHW plant to run.
    - .6 Allow economizer(s) to provide for 100% recirculation air if OAT > RAT.
  - .4 Freeze Protection Mode (as applicable):

- 
- .1 During Unoccupied Mode, if any single zone falls below 38°F, the Zone Group shall enter Morning Warm-Up Mode until all zones are above 45°F.
  - .5 Night Flush Mode (as applicable) only where motorized control for the Windows are available:
    - .1 The design intent is for the BMS to begin cooling the building so that it can be comfortable at the start of occupied mode.
    - .2 This mode will run to a manually schedule set by the owner and enabled for operation automatically by the BMS. Full sequence details of building cooling anticipation is described elsewhere in this sequence.
    - .3 100% outside is to be used to pre-cool the thermal mass of the building. CHW or mechanical cooling equipment to remain locked out.
    - .4 Air side equipment with access to outside air to run a fan best efficiency point as described on the manufacturer submittal data.
    - .5 All terminal units to open to full position.
    - .6 All zones intended to benefit from this sequence to be given an initial setpoint of 65°F (adj).
    - .7 When all night flush participating zones have achieved their target setpoint for 2 hours (adj) then night flush is completed, and all equipment can return to normal unoccupied mode.
  - .6 Night setback mode:
    - .1 Off-business hours based on user provided schedule.
    - .2 The unit will run at relaxed setpoints as the expectation is that afterhours staff (cleaning/ janitorial) will have jackets or other non-business attire. Typical zone setpoints of 72°F should have 10°F (adj) added/subtracted from occupied mode setpoints. SF & RF to run as normal.
  - .7 Unoccupied Mode:
    - .1 When the Zone Group is not in any other mode.
    - .2 For the purposes of this document, Unoccupied Mode assumes the building is unpopulated AND it is favorable for the maximum amount of equipment to be off.
    - .3 However, for many buildings, unoccupied mode may need to be essentially like occupied mode with very relaxed setpoints. This is particularly relevant in extreme climates or where central plant sizing does not

- 
- lend itself to quick morning warm-up or cool-down times.
- .4 Example: the weekend setpoints in Alaska over the weekend may need to be set to 45°F to prevent freeze related damage, and so that the morning warmup mode has a chance to function as intended.
- .5 For clarification purposes regarding this project: Unoccupied Mode is intended to refer to a mode where equipment may be safely turned off fully. DDC contractor to use discretion and apply sequences as required.
- .8 Control Loops
- .1 Unless otherwise indicated, control loops shall be enabled and disabled based on the status of the system being controlled to prevent wind-up.
- .2 When a control loop is enabled or re-enabled, it and all its constituents (such as the proportional and integral terms) shall be set initially to a Neutral value.
- .3 A control loop in Neutral shall correspond to a condition that applies the minimum control effect, i.e. valves/dampers closed, VFDs at minimum speed, etc.
- .4 The term “control loop” or “loop” is used generically for all control loops. These will typically be PI loops. Proportional plus integral plus derivative gains are not required on all loops. Do not use the derivative term on any loops unless field tuning is not possible without it.
- .5 Unless specifically indicated otherwise, the following guidelines shall be followed:
- .6 To avoid abrupt changes in equipment operation, the output of every control loop shall be limited by a user adjustable maximum rate of change, with a default of 25% per minute.
- .7 All setpoints, timers, deadbands, PID gains, etc. listed in sequences shall be adjustable by the user with appropriate access level whether indicated as adjustable in sequences or not. Software points shall be used for these variables. Fixed scalar numbers shall not be embedded in programs except for physical constants and conversion factors.
- .8 All hardware points, not just inputs, should be capable of being overridden for purposes of testing and commissioning. For example, the commissioning agent should be able to command damper positions, valve

positions, fan speeds, etc. directly through BMS overrides.

- .9 Trim & Respond (T&R) Setpoint Reset Logic
  - .1 Trim & Respond setpoint reset logic and zone/system reset Requests where referenced in sequences shall be implemented as described below.
  - .2 A “Request” is a call to reset a supply pressure or supply temperature setpoint. These are typically generated by equipment downstream of central service equipment; such as terminal units requesting pressure from an DOAS supply fan.
  - .3 For each type of request, there must be complimentary variables to augment its use.
  - .4 Requests can be amplified or negated with an Importance Multiplier. Multiply the number of Requests by the Importance Multiplier and send to the system/plant that serves the zone/system. A value of zero causes the requests from that zone or system to be ignored. A value greater than one can be used to effectively increase the number of requests from the zone/system based on the critical nature of the spaces served. Importance Multiplier (default = 1)
  - .5 Request-Hours accumulates the integral of requests (prior to adjustment of Importance Multiplier) to help identify zones/systems that are driving the reset logic. Rogue zone identification is particularly critical in this context, since a single rogue zone can keep the Trim & Response loop at maximum, and prevent it from saving any energy.
  - .6 Request-Hours. Every x minutes (default 5 minutes), add x/60 times the current number of Requests to this request-hours accumulator point. The request-hours point is reset to zero upon a global command from the system/plant serving the zone/system – this global point simultaneously resets the request-hours point for all zones/systems served by this system/plant.
  - .7 Cumulative%-Request-Hours. This is the zone/system Request Hours divided by the zone/system run-hours (the hours in any Mode other than Unoccupied Mode) since the last reset, expressed as a percentage.
  - .8 For each upstream system or plant setpoint being controlled by a T&R loop, define the following variables. Initial values are defined in system/plant sequences below. Values for trim, respond, time step, etc. shall be tuned to provide stable control.

Variable	Definition
Device	Associated Equipment or System
SP0	Initial setpoint
SPmin	Minimum setpoint
SPmax	Maximum setpoint
Td	Delay timer
T	Time step
I	Number of Ignored Requests
R	Number of Requests from zones/systems
SPtrim	Trim amount
SPres	Respond amount (must be opposite in sign to SPtrim)
SPres-max	Maximum response per time interval (must be same sign as SPres)

- .9 Note that it is recommended that  $|SPres| > |SPtrim|$  so that the reset logic does not get stuck at a value, as can happen if SPres and SPtrim are equal in absolute value. The number of Ignored Request (I) should be set to zero for critical zones or air handlers.
- .10 Trim & Respond logic shall reset setpoint within the range SPmin to SPmax. When the associated device (e.g. fan, pump) is off, the setpoint shall be SP0. The reset logic shall be active while the associated device is proven on, starting Td after initial device start command. When active, every time step T, trim the setpoint by SPtrim. If there are more than I Requests, respond by changing the setpoint by  $SPres * (R-I)$ , (i.e. the number of Requests minus the number of Ignored Requests), but no more than SPres-max. In other words, every time step T:
  - .11 Change setpoint by SPtrim
  - .12 also change setpoint by  $(R-I)*SPres$  but no larger than SPres-max

- 
- .13 Where multiple DP sensors are placed in the system, requests shall be aggregated according the DP they are associated with.
  - .14 Example, if a building has East and West risers, these would have requests that correspond to different exposures. It would not make sense to reset the West wing DP based on requests made by the East wing, or vise versa.
  - .15 DDC contractor to create T&R logic for each resettable setpoint, then use comparator logic so that the highest output of those logic sets shall be mapped to the equipment providing service (supply fan, pump, etc).
  - .16 Note: each of these branch or riser setpoint ranges need to be determined by the air and water balancer as they will all be unique. Example: a roof of multiple DOASs with very high gpm rates could span 5-20 psi while a lobby radiant manifold that also has to be served would only require 3-8psi. These will run at very different times for very different reasons, the requests of each type need to be correctly applied to their respective ranges.
- .10 Alarms
- .1 Levels of alarm in order of priority
    - .1 Level 1: Critical/life safety
    - .2 Level 2: Significant equipment failure
    - .3 Level 3: Non-critical equipment failure/operation
    - .4 Level 4: Energy conservation monitor
    - .5 Level 5: Maintenance indication, notification
  - .2 All alarms generated by the BMS shall include at least the following information:
    - .1 Date and time of the alarm
    - .2 Level of the alarm
    - .3 Description of the alarm
    - .4 Equipment tags for the units in alarm
    - .5 Possible causes of the alarm, if provided by the fault detection routines
    - .6 The Source which serves the equipment in alarm
- .11 Outdoor Air Temperature Sensing
- .1 When there are multiple outdoor air temperature sensors, the system shall use the valid sensor that most accurately represents the outdoor air conditions at the equipment being controlled.
  - .2 Outdoor air temperature sensors at air handler outdoor air intakes shall be considered valid only when the

supply fan is proven on and unit is in Occupied Mode or any other Mode in which the economizer is enabled.

- .3 The outdoor air temperature used for graphics display, optimum start, plant lockout, and other global sequences shall be the average of all valid sensor readings. If there are four or more valid outdoor air temperature sensors, discard the highest and lowest temperature readings.
  - .4 If the control drawings indicate a weather station is to be provided, this is to be used as a global point that will be passed as a virtual point to all equipment. Note: this global point would not take the place of a hardwired OAT sensor being used to control an economizer. The weather station shall be displayed on the front end and trended on 15 min intervals. These trends to be auto-exported monthly in .csv format to the email of an admin user.
- .12 Equipment Staging and Rotation
- .1 Automatic Even Wear Rotation
  - .2 The automatic even wear rotation presented in the following section is written using the basis of equipment run time to determine position in the queue for staging and is triggered only during a stage up or stage down event. These sequences will provide the most even run time across multiple pieces of equipment.
  - .3 Lead/lag: Unless otherwise noted, parallel staged devices (such as pumps, towers) that are not redundant shall be lead/lag alternated when more than one is off or more than one is on so that the device with the most operating hours is made the later stage device and the one with the least number of hours is made the earlier stage device.
  - .4 For example, assuming there are three devices, if all three are off or all are on, the staging order will simply be based on run hours from lowest to highest. If two devices are on, the one with the most hours will be set to be stage 2 while the other is set to stage 1; this may be the reverse of the operating order when the devices were started. If two devices are off, the one with the most hours will be set to be stage 3 while the other is set to stage 2; this may be the reverse of the operating order when the devices were stopped.
  - .5 Lead/standby: Unless otherwise noted, parallel devices (such as pumps, towers) that are 100% redundant shall be lead/standby alternated when more than one is off

so that the device with the most operating hours is made the later stage device and the one with the least number of hours is made the earlier stage device.

- .6 For example, assuming there are three devices, if all three are off, the staging order will be based on run hours from lowest to highest. If devices run continuously, lead/standby shall switch at an operator-specified runtime; standby device shall first be started and proven on before former lead device is changed to standby and shut off.
- .13 Exceptions
  - .1 Operators with appropriate access level shall be able to manually command staging order via software points overriding the Even Wear or Periodic Rotation logic above, but not overriding the In Alarm or Hand Operation logic below.
  - .2 In Alarm: If the lead device has a fault condition or has been manually switched off, a Level 2 alarm shall be generated and the device shall be set to the last stage position in the lead/lag order until alarm is reset by operator. Staging position of remaining devices shall follow the prevailing (Even Wear or Periodic Rotation) logic. A device in alarm can only automatically move up in the staging order if another device goes into alarm. Fault conditions include the following:
    - .1 Variable Speed Fans and Pumps
      - .1 VFD critical fault is ON
      - .2 Status point not matching its on/off point for 3 seconds after a time delay of 15 seconds while the device is commanded on, or
      - .3 Supervised HOA at control panel in OFF position, or
      - .4 Loss of power (e.g. VFD DC Bus voltage = zero)
    - .2 Constant Speed Fans and Pumps
      - .1 Status point not matching its on/off point for 3 seconds after a time delay of 15 seconds while the device is commanded on, or
      - .2 Supervised HOA at control panel in OFF position
    - .3 Hand Operation: If a device is on in Hand (e.g. via an HOA switch or local control of VFD), the device shall be set to the lead device and a Level 4 alarm shall be generated. The device will remain as lead

until the alarm is reset by the operator. Hand operation is determined by:

- .4 Variable Speed Fans and Pumps
  - .1 Status point not matching its on/off point for 15 seconds while the device is commanded off.
  - .2 VFD in local "hand" mode
  - .3 Supervised HOA at control panel in ON position
- .5 Constant Speed Fans and Pumps
  - .1 Status point not matching its on/off point for 15 seconds while the device is commanded off.
  - .2 Supervised HOA at control panel in ON position
  - .3 Chillers: Chiller is manually turned on as indicated by the status of the local/auto switch from chiller gateway.
- .14 Air Economizer High Limits
  - .1 Economizer shall be disabled whenever the outdoor air conditions exceed the economizer high limit setpoint as specified by local code. Setpoints vary by energy standard, climate zone, and economizer high limit control device type.
- .15 Damper/Valve Position
  - .1 Knowledge of damper and valve position are required for proper generation of Trim & Respond reset requests.
  - .2 The following are acceptable methods for determining position:
  - .3 Analog actuator. Position may be assumed to be equal to AO signal sent to actuator.
  - .4 Floating actuator. Provide position feedback via analog input.
- .16 VFD Speed Points
  - .1 The speed analog output sent to VFDs shall be configured such that 0% speed corresponds to 0 Hz and 100% speed corresponds to maximum speed configured in the VFD.
  - .2 Minimum speed setpoints for all VFD-driven equipment shall be determined in accordance with the test and balance specifications. Controls contractor shall coordinate with balance contractor.

- .3 For each piece of equipment, the minimum speed shall be stored in a single BMS software point. In case of a hard-wired VFD interface, the minimum speed shall be the lowest speed command sent to the drive by the BMS.
- .17 Miscellaneous
  - .1 The term “proven” (i.e. “proven on”/ “proven off”) shall mean that the equipment’s measured feedback point matches the state set by the equipment’s command point.
  - .2 Values for all points, including real (hardware) points used in control sequences shall be capable of being overridden by the user with appropriate access level (e.g. for testing and commissioning). If hardware design prevents this for hardware points, they shall be equated to a software point and the software point shall be used in all sequences.

## 2.3 **DOMESTIC HOT WATER**

- .1 Domestic hot water storage tank heating pumps P-1 and P-2 shall operate continuously. Three-way mixing valves on heating water to each tube bundle shall be modulated to maintain a domestic water temperature in storage tanks hwt-1 and hwt 2 of 145°F (62.5°C).
- .2 The DDC shall monitor the status of all circulators through a current tap and issue alarm if failure is detected.
- .3 The DDC system shall monitor the run time on the circulating pumps and generate maintenance time reminders at the Manufacturers’ recommended frequency levels.

## 2.4 **HEAT PUMP SYSTEMS**

- .1 Water Loop System
- .2 The heat pump is normally enabled from the DDC. The source side and load side circulation pumps are started first through DDC. Upon proof of water flow in the respective source side and load side loops the heat pump is enabled.
- .3 Heat Pump Operation
- .4 The heat pump operates in cooling-mode or in heating mode only.
- .5 Depending on the cooling/heating demand, the heat pump operates to meet the “load side” primary loop

supply water temperature setpoint as calculated by DDC.

## **2.5 DOAS – GLYCOL – DEHUMIDIFICATION/HUMIDIFICATION**

### **2.5.1 General**

- .1 All programming performed by custom DDC controller.
- .2 DOAS SF will control to duct supply pressure.
- .3 DOAS RF will control to building pressure.
- .4 Heat exchanger core dampers will allow 100% OSA when conditions are favorable or re-direct air flow through the heat exchanger when heat recovery or pre-cooling is favorable.
- .5 Coils provide tempered air.

### **2.5.2 Modes**

- .1 Occupied mode – business hours based on user provided schedule. Default value 7am to 5pm, mon-Friday.
- .2 Morning warm up mode – not applicable
- .3 Morning cool down – not applicable
- .4 Night flush – not applicable
- .5 Night setback mode – The unit will run at relaxed setpoints as the expectation is that afterhours staff (shipping/receiving, janitorial, stocking) will have jackets or other non-business attire. Typical zone setpoints of 72°F should have 10°F (adj) added/subtracted from occupied mode setpoints. SF & RF to run as normal.
- .6 Unoccupied Mode - When the Zone Group is not in any other mode. For the purposes of this document, Unoccupied Mode assumes the building is unpopulated AND it is favorable for the maximum amount of equipment to be off. This is true for the majority of buildings in milder climates such as Ashrae climate zone 1. Enter this mode based on user provided schedule to turn the unit completely off.

### **2.5.3 Exhaust & outdoor air dampers**

- .1 The exhaust and outdoor air dampers shall be fully open when the unit is enabled to run and fully closed when the unit is disabled.
- .2 Building pressurization control is not with EA dampers.

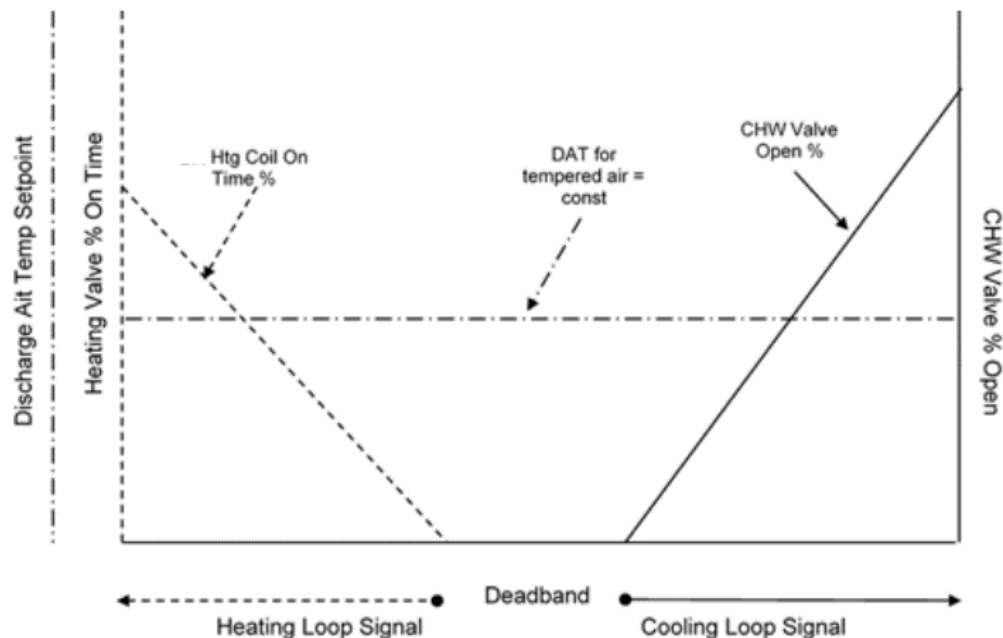

### **2.5.4 Supply fan operation**

- .1 For DOAS with VAV, maintain .5" duct static with PI loop control.
- .2 DOAS will always control to supply duct dp.

### **2.5.5 Demand control ventilation**

- .1 Note: applicable for DOAS with IAQ or space CO2 sensors. This SOO is separate from VAV with space CO2.
- .2 Design intent is to influence potentially uncomfortable indoor air quality levels in the space. Direct control for a space of this nature deemed unfeasible.
- .3 DDC contractor to establish a baseline for ambient space CO2. Default value of 400 ppm (adj).
- .4 When the space CO2 has reached 400 ppm (adj) above ambient, use a P only loop to begin resetting the DOAS supply cfm setpoint higher in 10% increments.
- .5 Full DOAS cfm setpoint should correspond to 1500 ppm (adj).

#### 2.5.6 Supply air temp control

- .1 Figure above: the axis and corresponding lines have similar dash types. As the heating and cooling loop signals increase the CHW and Heating valves will open more or be on longer to maintain a constant tempered air setpoint.
- .2 Use a PI loop to modulate the CHW control valve to maintain discharge air temp at setpoint across the range of supply cfm. Controls contractor to provide tuning for stable operation across the range of supply fan air flows.
- .3 Heating valve may use pulse width modulation to achieve a discharge air temp setpoint with dead band of  $\pm 1.5^{\circ}\text{F}$  (adj).

- 
- .4 Use pressure sensor downstream of coil as a safety to prevent excessively low pressure from entering return line.
  - .5 Refer to mechanical schedule for tempered air setpoints.
  - .6 Supply air temp setpoint subject to user adjustable setpoints corresponding to each building mode.
- 2.5.7 Glycol pump control
- .1 When the CHW valve is open more than 5% enable the pump to run.
  - .2 Pump controls to maintain constant differential pressure across the valve farthest DOAS valve.
  - .3 Refer to manufacture data for pump min speed to prevent surging.
  - .4 Disable pump immediately if pressure differential raises above 25 psi (adj).
  - .5 The pumps are redundant, not staged. Pumps shall rotate as described in the general section of the sequence.
  - .6 Note: see CO2 HX control section for associated details with that equipment.
- 2.5.8 Humidifiers
- .1 When fan is running and air flow switch proves air flow, line voltage room humidistat reset from outdoors maintains humidity level of 30 percent by cycling unit fan two-way steam valve.
  - .2 When supply fan is running air flow switch proves air flow, humidistat located in return air, reset from outdoors modulates normally closed humidifier valve. Set outdoor reset to 50 percent relative humidity at 21 degrees C (70 degrees F) and 30 percent relative humidity at minus 20 degrees C (minus 30 degrees F).
- 2.5.9 Exhaust fan operation
- .1 Note: see mechanical schedule for application.
  - .2 Exhaust fan for DOAS 1 shall control with PI loop for exhaust duct pressure.
  - .3 As the large entry doors are expected to be use quite frequently, programmer may use rolling average of building pressure sensor on 2 min (adj) intervals OR ramp rate programming blocks at their discretion to dampen the response of the exhaust fans.
  - .4 Default building pressure initially set to .03" (adj).
  - .5 Cap the exhaust fan speed to be no more than the supply fan speed at all times.
- 2.5.10 Economizer hx & bypass operation

- .1 During non-economizer operation the bypass damper shall remain open and the face damper closed to bypass the HX core.
- .2 The economizer HX will provide heat recovery when conditions are favorable for the desired supply air temp setpoint. Favorable conditions diagramed schematically below:

- .3 Figure above: x-axis is OAT, y-axis is RAT, with ideal supply air temp centered (SAT\_sp) at 71°F (adj). 100% RA through HX core is shown in cross hatch shaded regions. White space indicates 100% OA provided.
  - .4 Anytime OA is in the ideal moderate temp range of 68°F < OAT < 74°F, use 100% OAT. (alternatively stated as SAT\_sp = 71°F with 3°F deadband).
  - .5 RA should be passed through the HX core when OA & RA conditions are inside of the cross shaded regions
- .1 Sample Boolean logic for binary open/close dampers is provided below. It essentially breaks the graph above into quadrant areas, which then only need one additional comparator to know the correct choice as the

hatched space is either above or below the slope of a lines intersecting at the SAT\_sp.

- .2 Variables:
  - .1 OAT = outdoor air temp
  - .2 RAT = return air temp
  - .3 SAT\_sp = supply air temp setpoint
  - .4 db = deadband
- .3 IF  $OAT > (SAT\_sp + db)$ , AND  $RAT > SAT\_sp$ , AND  $RAT < OAT$ , then close bypass dampers to send RA through the hx core, else use 100% OA.
- .4 IF  $OAT > (SAT\_sp + db)$ , AND  $RAT < SAT\_sp$ , AND  $RAT > ((-1 * OAT) + (2 * SAT\_sp))$ , then close bypass dampers to send RA through the hx core, else use 100% OA.
- .5 IF  $OAT < (SAT\_sp - db)$ , AND  $RAT > SAT\_sp$ , AND  $RAT < ((-1 * OAT) + (2 * SAT\_sp))$ , then close bypass dampers to send RA through the hx core, else use 100% OA.
- .6 IF  $OAT < (SAT\_sp - db)$ , AND  $RAT < SAT\_sp$ , AND  $RAT > OAT$ , then close bypass dampers to send RA through the hx core, else use 100% OA.

#### 2.5.11 Cooling Coil Valve:

- .1 The controller shall measure the supply air temperature and modulate the cooling coil valve to maintain its cooling setpoint.
- .2 The cooling shall be enabled whenever:
  - .1 Outside air temperature is greater than 60 °F (adj.).
  - .2 AND the supply air temperature is above cooling setpoint.
  - .3 AND the fan status is on.
- .3 The cooling coil valve shall open to 50% (adj.) whenever the freezestat is on.

#### 2.5.12 Heating Coil Valve:

- .1 The controller shall measure the supply air temperature and modulate the heating coil valve to maintain its heating setpoint.
- .2 The heating shall be enabled whenever:
  - .1 Outside air temperature is less than 65 °F (adj.).
  - .2 AND the supply air temperature is below heating setpoint.
  - .3 AND the fan status is on.

- .3 The heating coil valve shall open to 100% (adj.) whenever the freezestat is on.

#### 2.5.13 Resets

- .1 When the majority of FCU that are served by the same DOAS are working full speed to provide cooling, the building could be better served by resetting the DOAS SAT down.
- .2 However, because the DOAS supply air will also be sent directly to the space, the reset may not go too low or there will be reheating.
- .3 Each FCU to generate an SAT reset request based on fan speed. When the fans reach 95% speed generate a temp reset request. Release the request when fan speed drops below 75%. When the sum of the requests represent that 75% of the FCUs are essentially maxed out, reset the DOAS SAT down but 2°F.
- .4 Requests are to be reset at the end of every day.
- .5 REQUESTS
- .6 When the CHW valve opens more than 5%, send request for cooling to the glycol HX for CHW production.
- .7 When the heating coil valve opens, send request for heating to the CO2 skid.

#### 2.5.14 Alarms

- .1 Maintenance interval alarm when fan has operated for more than 1,500 hours. Reset interval counter when alarm is acknowledged.
- .2 Fan alarm is indicated by the status being different from the command for a period of 60 seconds, send alarm.
- .3 If the measured supply air flow rate varies from the desired air flow rate by more than 10% (adj) for more than 5 min (adj) a supply air flow rate alarm will be sent.
- .4 When filter DP is above high limit setpoint for more than 1 hour (adj) send alarm.
- .5 If air is passing through economizer hx when conditions are not favorable, send alarm at front end.
- .6 If dampers do not match their commanded state, send alarm at front end.
- .7 If supply air temp is more than 3°F (adj) outside of setpoint for more than 15 min (adj), send alarm at front end.
- .8 When any valve does not match its commanded state, send alarm at front end.
- .9 If refrigerant (not normal space CO2) leak detectors rise above their trigger threshold, send highest level of alarm.

#### 2.5.15 Trends

- .1 The following trends should be made on 15min intervals and auto-exported to an admin user in .csv or .xml format:
  - .1 Discharge, return, outside air temp
  - .2 Bypass and face dampers command and feedback
  - .3 Supply fan speed, remote DP, SF cfm, KEF status.
  - .4 Return fan speed, building pressure
  - .5 OA relative humidity, DX dehumidification valve position, DX heating valve position
  - .6 SAT, CHW valve position
  - .7 All IAQ sensor

## 2.6 AIR TERMINAL UNITS

### 2.6.1 Application

- .1 This section applies to all single zone systems and sub-zones of air handling systems, such as VAV boxes, and VAV diffusers, etc.

### 2.6.2 Occupancy schedule

- .1 Control contractor to obtain in written occupancy schedules from the Owner for each zone group. The Owner must approve the final schedules prior to controls completion.
- .2 The default schedule shall be 8AM – 8PM.

### 2.6.3 Outdoor air ventilation requirements

- .1 The minimum outdoor airflow for each zone shall be scheduled on the drawings. This applies to Vocc-min and Varea-min.
- .2 Vocc-min: Zone minimum outdoor airflow for occupants, ASHRAE 62.1 prescribed CFM-per-occupant requirements.
- .3 Varea-min: Zone minimum outdoor airflow for building area, ASHRAE 62.1 prescribed CFM-per-ft2 requirements.

### 2.6.4 Minimum outdoor air

- .1 For every zone that requires mechanical ventilation, the zone minimum outdoor airflows and setpoints shall be calculated depending on the governing standard or code for outdoor air requirements. Zones that do not require mechanical ventilation may disregard this section.
- .2 Outdoor air setpoints shall be calculated as follows:
  - .1 Note: also see zone ventilation requirements section.
  - .2 For each zone in Occupied Mode, calculate the zone minimum outdoor air setpoints, which are used at the DOAS level for minimum outdoor air control.
  - .3 Zone-Abs-OA-min is equal to

- .1 Varea-min if the zone has a CO2 sensor.
- .2 Varea-min if the zone has an occupancy sensor and is unpopulated.
- .3 Zero if the zone has a window switch and the window is open.
- .4 Zone-Des-OA-min otherwise.
- .4 CO2 Setpoints
  - .1 Setpoints assume an ambient concentration of 400 ppm; if the system includes an ambient CO2 sensor, subtract 400 from these setpoints and add the ambient CO2 sensor reading.

#### 2.6.5 Zone temperature setpoints

- .1 Each zone shall have separate occupied and unoccupied heating and cooling setpoints.
  - .1 The software shall prevent:
    - .1 The heating setpoint from exceeding the cooling setpoint minus 1°F (i.e. the minimum difference between heating and cooling setpoints shall be 1°F).
    - .2 The unoccupied heating setpoint from exceeding the occupied heating setpoint.
    - .3 The unoccupied cooling setpoint from being less than the occupied cooling setpoint.
  - .2 Where the zone has a local setpoint adjustment knob/button
    - .1 The setpoint adjustment offsets established by the occupant shall be software points that are persistent (e.g. not reset daily), but the actual offset used in control logic shall be adjusted based on limits and modes as describe below.
    - .2 The adjustment shall be capable of being limited in software.
      - .1 As a default, the active occupied cooling setpoint shall be limited between 72°F and 80°F.
      - .2 As a default, the active occupied heating setpoint shall be limited between 65°F and 72°F.
  - .3 The active heating and cooling setpoints shall be independently adjustable, respecting the limits and anti-overlap logic described above. If zone thermostat provides only a single setpoint adjustment, then the adjustment shall move both the active heating and cooling setpoints upwards or downwards by the same amount, within the limits described above.

- .4 The adjustment shall only affect occupied setpoints in Occupied Mode, and shall have no impact on setpoints in all other modes.

#### 2.6.6 Demand limiting

- .1 A final approved demand control strategy must be approved by the governing utility company before implementation; DDC contractor responsible for understanding the contents of such plan as it relates to the contract documents. DDC Contractor is responsible to check all contract documents and Owner provided requirement to verify additional specifics concerning demand control for this project. In the event that discrepancies exist, Contract for RFI EOR or relevant governing body for clarification(s).
- .2 The system shall be capable of receiving demand limiting signals from the local utility. This section is a thermostat-based reset only and should not be confused as being the final or complete demand strategy for this project. Demand control strategies outside of the BMS, such as lighting, could exist for this project and not covered in this section.
- .3 Cooling Demand Limit Setpoint Adjustment: The active cooling setpoints for all zones shall be increased when a demand limit is imposed on the associated Zone Group. The operator shall have the ability to exempt individual zones from this adjustment through the normal BMS user interface. Changes due to demand limits are not cumulative.
  - .1 At Demand Limit Level 1, increase setpoint by 1°F.
  - .2 At Demand Limit Level 2, increase setpoint by 2°F.
  - .3 At Demand Limit Level 3, increase setpoint by 4°F.
- .4 Heating Demand Limit Setpoint Adjustment: The active heating setpoints for all zones shall be decreased when a demand limit is imposed on the associated Zone Group. The operator shall have the ability to exempt individual zones from this adjustment through the normal BMS user interface. Changes due to demand limits are not cumulative.
  - .1 At Demand Limit Level 1, decrease setpoint by 1°F.
  - .2 At Demand Limit Level 2, decrease setpoint by 2°F.
  - .3 At Demand Limit Level 3, decrease setpoint by 4°F.
- .5 At the onset of demand limiting, the local setpoint adjustment value shall be frozen. Further adjustment of the setpoint by local controls shall be suspended for the duration of the demand limit event.

#### 2.6.7 Hierarchy of setpoint adjustments

- .1 The following adjustment restrictions shall prevail in order from highest to lowest priority:

- 
- .1 Setpoint overlap restriction
  - .2 Absolute limits on local setpoint adjustment
  - .3 Window switches
  - .4 Demand limit
  - .5 Occupancy sensors: Change of setpoint by occupancy sensor is added to change of setpoint by any demand limits in effect.
  - .6 Local setpoint adjustment: Any changes to setpoint by local adjustment are frozen at the onset of the demand limiting event and remain fixed for the duration of the event. Additional local adjustments are ignored for the duration of the demand limiting event.
  - .7 Scheduled setpoints based on Zone Group mode
- 2.6.8 After hours local override
- .1 When thermostat override buttons are depressed, the call for Occupied Mode operation shall be sent up to the Zone Group control for 60 minutes.
  - .2 This is to be an optional feature subject to owner approval. This need not be applied to all thermostats, only those of the owner's choosing. If not specifically mentioned in the sequence of operations or elsewhere in the project documents, this is not a required feature.
- 2.6.9 Zone alarms
- .1 Zone temperature alarms
  - .2 High temperature alarm
    - .1 If the zone is 3°F above cooling setpoint for 10 minutes, generate Level 3 alarm.
    - .2 If the zone is 5°F above cooling setpoint for 10 minutes, generate Level 2 alarm.
  - .3 Low temperature alarm
    - .1 If the zone is 3°F below heating setpoint for 10 minutes, generate Level 3 alarm.
    - .2 If the zone is 5°F below heating setpoint for 10 minutes, generate Level 2 alarm.
  - .4 Suppress zone temperature alarms as follows:
    - .1 After zone setpoint is changed
    - .2 While Zone Group is in Warm-up or Morning Cool-Down Modes.
  - .5 For zones with an importance multiplier of zero for its static pressure reset, SAT reset, or Hot Water reset Trim & Respond loops.
-

- .6 For zones with CO2 sensors:
  - .1 CO2 sensors: If the CO2 concentration is less than 300 ppm, or the zone is in Unoccupied Mode for more than 2 hours and zone CO2 concentration exceeds 600 ppm, generate a Level 3 alarm. The alarm text shall identify the sensor and indicate that it may be out of calibration.
  - .2 If the CO2 concentration exceeds setpoint plus 10% for more than 10 minutes generate a Level 3 alarm.

#### 2.6.10 Testing/commissioning overrides

- .1 As applicable for the project commissioning needs, provide the ability to individually command all control outputs to demonstrate proper functionality.
- .2 VAV Examples:
  - .1 Force zone airflow setpoint to max/zero, Vcool-max, Vmin, Vheat-max
  - .2 Force reheat coil valve full open/closed
- .3 Fan Coil Unit examples:
  - .1 Force fan to full speed, min speed, max cool
  - .2 Force CHW valve full open/closed
  - .3 Force HHW valve full open/closed
- .4 VAV Box Controllable Minimum (as applicable)
  - .1 There is the potential for the VAV minimum cfm to be lower than what the VAV flow ring or DDC controller can measure. This is particularly common when demand control is in use and the area minimum cfm is lower than the cfm that the terminal unit can reliably measure.
  - .2 For these instances, it is acceptable to use partial on/off control of the VAV sometimes referred to as time averaged control.
  - .3 Over a 10min period, the average of the VAV on time should equal the scheduled cfm.
  - .4 Example: if the controllable minimum is 200cfm and the box is meant to deliver 100cfm, the VAV could be in open at 200cfm for half the time in 10 min period so that the average cfm over 10 min is 100cfm.
  - .5 Assistance of the TAB contractor may be required to determine what the controllable minimum of the VAV is if manufacturer data is not available.

## 2.7 EXHAUST-VAV UNIT/ EXHAUST VAV DAMPER

### 2.7.1 General

- .1 The Exhaust-VAV regulates the exhaust cfm to track the sum of the supply terminal units serving the zone.
- .2 They do not control the heating/cooling load in the space.
- 2.7.2 Control logic and schematic
  - .1 Control logic is depicted schematically in the figure below and described in the following sections.

- .2 Figure above: the solid line for the E-VAV is plotted with offset next to an imaginary dashed line with 45deg slope. Design intent is for the E-VAV to track linearly with the sum of the supply terminal unit cfm.
- .3 The VAV damper shall be modulated by a PI control loop to maintain the measured airflow at the ventilation cfm setpoint.
- 2.7.3 Alarms
  - .1 Low airflow. If the measured airflow is less than 70% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 3 alarm.
  - .2 Airflow sensor calibration. If the fan serving the zone has been off for 10 minutes and airflow sensor reading is above 20 CFM, generate a Level 3 alarm.

- .3 Leaking damper. If the damper position is 0% for 10 minutes and airflow sensor reading is above 50 CFM while the fan serving the zone is proven on, generate a Level 4 alarm.

#### 2.7.4 System requests

- .1 Air Pressure Requests (as applicable)
- .2 If the damper position is greater than 85%, send 1 Request until the damper position is less than 75%,
- .3 Else if the damper position is less than 75%, send 0 Requests.

#### 2.7.5 Trends

- .1 The following trends should be made on 15min intervals and auto exported to an admin user in .csv or .xml format:
  - .1 Damper position
  - .2 Cfm & cfm setpoint

### 2.8 **FAN COIL UNITS – CHW& HHW**

#### 2.8.1 General

- .1 The hydronic FCU will provide heating and cooling in 2 stages.
- .2 The first stage is to raise/lower the discharge air temp to the max/min as shown on the mech dwg schedules.
- .3 If the zone still cannot be satisfied, then the FCU will ramp up fan speed while maintaining the max/min DAT to provide additional heating/cooling.

#### 2.8.2 Supply fan and air temperature control

- .1 Supply air temperature shall be controlled to setpoint using a control loop whose output is mapped to sequence the hot water valve and/or chilled water valve as shown in the diagram below.

- .2 Figure above: there are two axes on the graph above. The line style of the axis corresponds to the associated line on the graph. The dashed line corresponds to the FCU DAT. The solid lines correspond to the FCU cfm.
- .3 The design airflow setpoints for each zone shall be scheduled on the drawings for cooling max, heating max, and design min cfm. TAB support to determine what speeds provide the appropriate cfm may be required if any kind of AFMS or flow ring is not shown on the controls diagrams.
- .4 The HHW and CHW valve(s) shall be modulated with a PI loop to maintain the discharge temperature at setpoint across the range of air flow.
- .5 When the zone is in cooling, the cooling loop shall maintain space temperature at the heating setpoint as follows:
  - .1 From 0% - 50%, the cooling loop output shall reset the discharge air temperature from the current thermostat setpoint to the min discharge air temp as shown on the mech dwgs.
  - .2 From 51% - 100%, if lowering the discharge air temperature to the min setpoint is not enough to satisfy the zone, the cooling loop output shall reset the active airflow setpoint from the min airflow setpoint to the max cooling airflow setpoint.

- .6 When the zone is in deadband, the active airflow setpoint shall be the min airflow setpoint and all coil valves shall be closed.
- .7 When the zone is in heating, the heating loop shall maintain space temperature at the heating setpoint as follows:
  - .1 From 0% - 50%, the heating loop output shall reset the discharge air temperature from the current thermostat setpoint to the max discharge air temp as shown on the mech dwgs.
  - .2 From 51% - 100%, if raising the discharge air temperature to the max setpoint is not enough to satisfy the zone, the heating loop output shall reset the active airflow setpoint from the min airflow setpoint to the max cooling airflow setpoint.
- .8 When lighting control system determines that the zone is unpopulated for more than 15min, thermostat setpoints shall revert to relaxed values that are +/- 4°F (adj) from prior setpoint. If the DOAS or overall building mode is in cooling, then 4°F added, if the DOAS or overall building mode is in heating then 4°F subtracted.

#### 2.8.3 Alarms

- .1 Generate a maintenance alarm when fan has operated for more than 1500 hours or as recommended by the product manufacturer. Reset interval counter when alarm is acknowledged.
- .2 High space temperature: if thermostat rises more than 5°F above setpoint for 10 minutes, send alarm.
- .3 If supply fan fails to reach commanded state for more than 5 min, send alarm.
- .4 Generate an alarm if drip pan sensor for fan coil units senses excessive water is in the drip pan.
- .5 Generate a maintenance alarm when the filter DP has exceeded threshold of .2' w.c. (adj).

#### 2.8.4 System requests

- .1 HHW Pressure Requests
  - .1 If the HHW valve position is greater than 85%, send 1 Request until the HHW valve position is less than 75%
  - .2 Else if the HHW valve position is less than 75%, send 0 Requests.
- .2 CHW Pressure Requests
  - .1 If the CHW valve position is greater than 85%, send 1 Request until the CHW valve position is less than 75%
  - .2 Else if the CHW valve position is less than 75%, send 0 Requests.

2.8.5 Trends

- .1 The following trends should be made on 15min intervals and auto-exported to an admin user in .csv or .xml format:
  - .1 Discharge air temp & setpoint
  - .2 CHW & HHW valve position
  - .3 Fan speed & setpoint
  - .4 Space thermostat temp & setpoint

2.8.6 Window contacts (as applicable, see controls diagrams)

- .1 For FCU with manually operable windows, if any window opens in the space, disable the unit from running until window is closed.
- .2 If windows are automatically controlled, refer to automated window control sequence for integration to shut down associated zones.

2.8.7 Occupancy sensor or integration (as applicable, see controls diagrams)

- .1 For FCU if all the zones associated with an FCU are unoccupied, set back the thermostats to a relaxed setpoint +/- 4 deg (adj) from present value.

**2.9 ELECTRICAL ROOMS AND TELEPHONE ROOMS**

- 2.9.1 On room temperatures above 25 degrees C (77 degrees F) turn on Fan Coil Unit that is designed for the Electrical rooms and telephone rooms.
- 2.9.2 Modulate chilled water valve to maintain room temperature setpoint
- 2.9.3 On room temperatures above 32 degrees C (90 degrees F), signal alarm at BMS.

**2.10 ELEVATOR MACHINE ROOMS**

- 2.10.1 On room temperatures above 25 degrees C (77 degrees F) turn on Fan Coil Unit that is designed for the Electrical rooms and telephone rooms.
- 2.10.2 Modulate chilled water valve to maintain room temperature setpoint
- 2.10.3 On room temperatures above 32 degrees C (90 degrees F), signal alarm.

**2.11 EXHAUST FAN – DDC SCHEDULE CONTROLLED**

- 2.11.1 Unless noted otherwise, all exhaust fans will have a minimum of schedule control through the BMS.
- 2.11.2 Exhaust fan shall run at Max Speed when the air handler that serves the space (directly or by transfer air) is in Occupied Mode and the air handler supply fan is proven on.

2.11.3 Janitor's closet, Copy Room, Restrooms, and Pavilion restroom and vending exhaust fans shall be connected to BMS for time schedule control. They shall initially be given independent schedule capability. The initial schedule shall be set to match building occupancy schedule.

2.11.4 Alarms

- .1 Generate a Level 5 maintenance alarm when fan has operated for more than 3000 hours. Reset interval counter when alarm is acknowledged.
- .2 Fan alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status.
  - .1 Commanded on, status off: Level 2
  - .2 Commanded off, status on: Level 4

**2.12 UNIT HEATERS**

2.12.1 Single temperature electric room thermostat maintains constant space temperature of 68 °F (20 °C) by cycling unit fan motor.

2.12.2 Single temperature thermostat on return heating water line from floor mounted cabinet heaters de-energizes unit on temperatures below 95 °F (35 °C).

2.12.3 Integral thermostat continues fan operation until element temperature falls below 38 degrees C (100 degrees F).

**2.13 TRENCH CONVECTORS – CHW/HHW**

2.13.1 General

- .1 The perimeter trench convector shall have its own thermostat and modulate independently to satisfy the perimeter zones.
- .2 Adjacent trench convectors to be grouped together to operate in unison. Refer to zone diagram on the floor plans.

2.13.2 Control logic is depicted schematically in the figure below and described in the following sections.

- .1 When the Zone is in heating/cooling, the heating/cooling loop output shall maintain space temperature at setpoint as follows:
  - .1 Trench convector control valve shall be fully open.
  - .2 From 0% - 100%, the heating/cooling loop output shall modulate the trench convector fan speed to satisfy the perimeter thermostat.

- .2 When the zone is in deadband, the fan shall be off, and all valves shall be closed.
- .3 If change over valves are shown on the controls diagram, these must all be normally closed when the fans are off to prevent excessive bypass of the supply to the return.
- .4 Trench convectors shall be locked out from operation when any manual or automatic windows are proven open.

#### 2.13.3 Alarms

- .1 Maintenance interval alarm when fan has operated for more than 1,500 hours. Reset interval counter when alarm is acknowledged.
- .2 Fan alarm is indicated by the status being different from the command for a period of 60 seconds, send alarm.
- .3 If space temp is not met for more than 10 min (adj) send alarm.
- .4 Drip pan overflow sensor (provided with trench convectors): if this sensor in the condensate pan detects switches on, lock out the cooling valve and send a high 3 alarm. Release the cooling coil lockout when overflow is no longer detected at the sensor.

#### 2.13.4 System Requests

- .1 None for this equipment.

#### 2.13.5 Trends

- .1 The following trends should be made on 15min intervals and auto-exported to an admin user in .csv or .xml format:
  - .1 CHW & HHW valve position
  - .2 Fan command & status (where applicable)
  - .3 Space thermostat temp & setpoint

### 2.14 **LIGHTING CONTROLS & ELECTRICAL VAULT MONITORING**

- 2.14.1 The electrical room monitor and lightening systems shall each be controlled by a standalone DDC control system communicating on a building automation system local area network.
- 2.14.2 The DDC shall provide outputs for two lighting circuits per floor on Levels 1 through to 20 with connection to electrical relay in the typical floor electrical room.
- 2.14.3 The DDC shall monitor kilowatt demand, power factor, amperage (by phase), volts (by phase), and transformer temperature and generate alarms when out of standard operating parameters as determined by Building operations.

### 2.15 **DOOR AIR CURTAIN HEATERS**

- 2.15.1 Door air curtains shall operate based on a door contact on the overhead doors.
- 2.15.2 If outdoor air temperature is about 50°F (10°C) door heater shall not operate.
- 2.15.3 Supply air temperature shall be controlled based on outdoor air temperature.
- 2.15.4 Provide status and alarm at BMS.

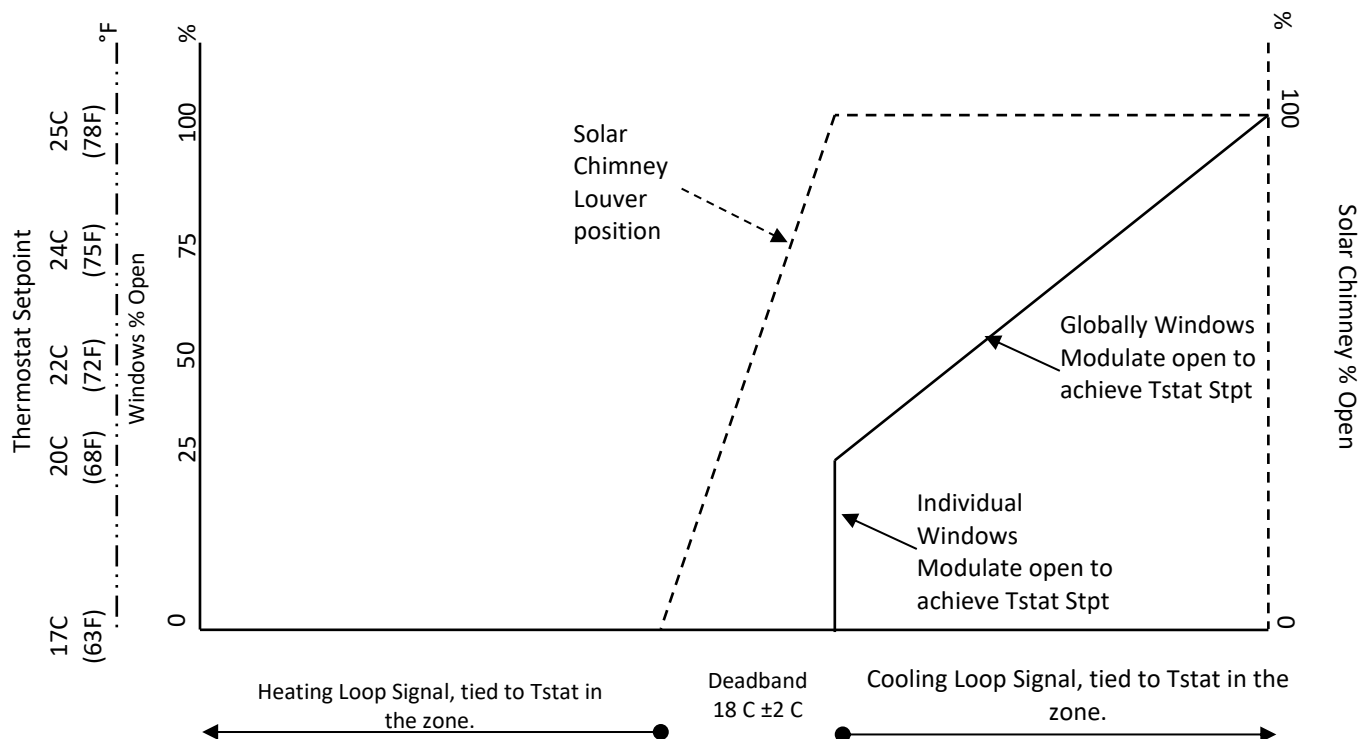

### 2.16 **NATURAL VENTILATION - MOTORIZED WINDOWS & SOLAR CHIMNEY**

- 2.16.1 Thermostats and other sensors in zones with motorized windows control shall be provided by the window masters with read only points connected to BMS.
- 2.16.2 Thermostats to have fully customizable touch screen and custom overlay to indicate the window control function.
- 2.16.3 Thermostat screen colour to change based on indoor air temperature (IAT) and outdoor air temperature (OAT) to inform users as to whether to open/close windows. Each thermostat to be programmable to different conditions.
  - .1 Green: IAT > 21°C and 10°C < OAT < 21°C
  - .2 Yellow: IAT > 18°C or 5°C < OAT < 27°C

- 
- .3 Red:  $18^{\circ}\text{C} > \text{IAT}$  or  $5^{\circ}\text{C} > \text{OAT} > 29^{\circ}\text{C}$  or when sensing rain or outdoor air high humidity with dew point above  $16^{\circ}\text{C}$ .
- 2.16.4 DDC to monitor and trend log if windows are open. For windows with actuators with position feedback window status can be taken for the actuator control system.
- 2.16.5 Window Master NV Embedded® shall be used for indoor climate control during the Natural Ventilation (NV) mode.
- .1 The BMS shall communicate all the weather station data point to the window master control panel and NV Embedded software interface as required. As an integrated part of a BMS, NV Embedded® will receive data from the BMS and control the operable windows based on the BMS data using KNX, BACnet and Modbus protocols.
- .2 The ventilated zones of the building are defined by the openable windows and thermostat zones as depicted on the drawings. Refer to architectural drawings for openable window schedule. All windows in a natural ventilation zone to operate in unison. There is no need have windows within a ventilation zone to operate individually.
- .3 Each NV zone shall have a manual override switch and internal temperature sensor with humidity and a CO2 sensor to validate minimum ventilation during NV operation both in the shoulder season and summer mode.
- .1 At regular intervals through the BMS, the sensors transmit the measured values for internal CO2, temperature and relative humidity (RH) to the NV Embedded® as well as the measurement readings from the weather station. If the changes in the measurement values are less than the specified limits, then NV Embedded® only performs new calculations and adjustments at the intervals to reposition the windows. Should the changes be larger than the specified limits, NV Embedded® will make an adjustment instantly.
- .2 The operable windows shall be automatically controlled by the NV Embedded® system and can be overridden by occupants for a defined period.
- .4 The manual override switches shall provide building occupants the opportunity to monitor their local indoor climate and to override the automatic control of the windows. The BMS through the NV Embedded® interface shall log data 24 hours a day for an entire annual cycle in each relevant zone in relation to thermal comfort and air quality. This data is to be correlated and tracked and displayed as a graphical summary of each space.

- 
- .5 Occupancy modes shall be determined by the BMS scheduling program and communicated to NV Embedded® to control the indoor climate in three different occupancy modes: 'Building Occupied'; 'Building Unoccupied Secured'; 'Building Unoccupied'.
- .1 A set of parameters, like temperature setpoints and limitation on the opening amount of the windows for security or weather shall be assigned to each of the building occupancy modes.
- .2 This shall also apply to things like night purge periods.
- .6 Window Master NV Embedded® shall be used for the automatic control of indoor climate control during the Natural Ventilation (NV) mode.
- .1 The NV Embedded® system shall use algorithms to automatically regulate the position of operable windows vents based on the following parameters: temperature, CO2 and humidity; wind speed, wind direction; wind pressure coefficients algorithms; and temperature difference between inside and outside BMS sensor measurements.
- .2 When outside conditions are favorable for cooling, window control system will modulate windows to provide natural ventilation automatically, users will not need manually open them.
- .1 Favorable conditions satisfied when all of the following conditions are met:
- .1 Building must be in occupied mode
- .2  $18 \text{ deg C (adj)} < \text{OSAT} < 24 \text{ deg C (adj)}$
- .3 Wind speed  $< 20 \text{ mph}$
- .4 No rain detected
- .2 BMS control system to display when conditions are favorable or unfavorable in every natural ventilation zone with a wall mounted LCD
- .3 The NV Embedded® system shall automatically define upper comfort limits based on the outdoor temperature. The comfort limit is based on the maximum allowable Air Change Rate (ACH) in the ventilated space. The ventilation schedule shall be based on occupied summer and shoulder season days to ventilate on a programable schedule or only when required, as well as the length of the venting and opening degree of the operable windows.
- .4 BMS shall operate the DOAS minimum winter ventilations system during the winter Heating season.

The BMS shall ensure through the interface with the NV Embedded® that the openable windows are not activated during the heating season. The exception to this is the fire alarm override smoke control when activated by the fire alarm panel.

- .5 The NV Embedded® system shall automatically control the window position system based on indoor, outdoor conditions for different specific weather scenarios. The control algorithm shall take into account Building Occupied'; 'Building Unoccupied Secured'; 'Building Unoccupied'; wind speed and direction; rain and wind conditions during rain.
- .6 The NV Embedded® system shall automatically control summer NV mode and the shoulder season NV mode.
  - .1 The automatically controlled operable windows will be regulated based on temperature control as apriority however, the system shall still account for factors such as air quality and humidity by regulating the temperature setpoint accordingly.
  - .2 During temperature control, the windows shall be opened based on the indoor temperature with an upper limit for the maximal allowable air change rate based on the outdoor temperature to ensure

good comfort while achieving ASHRAE ventilation standard. In demand for cooling, the actuated windows will automatically open to provide passive cooling.

- .1 When the temperature in the space reaches 20 deg, the windows will open to 25%
  - .2 When the temperature rises to 22 deg, the windows will open to 50%.
  - .3 When the temperature rises to 24 deg, the windows will open to 75%.
  - .4 If the temperature rises to 25 deg, the windows will fully open.
  - .5 As the temperature drops, the NV Embedded® system shall instruct automated openings to close in as per the same temperatures.
- .3 The rate at which the operable windows are opened shall depend on the applicable wind conditions (wind speed, wind direction and wind pressure coefficients). At higher wind speed the windows will open at a slower rate to avoid discomfort. The windows will close at a fast rate as it is more important to quickly reduce the window opening to avoid discomfort.
  - .4 During temperature control, the system shall account for the CO2 concentration in the ventilated space by reducing the temperature set point. The original setpoint shall be reduced by a parameter value multiplied with the current CO2 level, when the level rises above the CO2 threshold as defined by the relevant edition of ASHRAE Standard 62.1 – Ventilation for Acceptable Indoor Air Quality.
  - .5 During temperature control, the system shall account for the humidity in the ventilated space by reducing the temperature set point. The original setpoint shall be reduced by a parameter value multiplied with the current humidity level, when the level rises above the humidity threshold as defined by the relevant edition of ASHRAE Standard 62.1- Ventilation for Acceptable Indoor Air Quality.
  - .6 A minimum allowable ventilation temperature threshold shall be defined such that high CO2 and RH effects do not lower the temperature limit below ventilation requirements outlined ASHRAE Standard 62.1-2019 – Ventilation for Acceptable Indoor Air Quality

- 
- .7 Window actuators to be closed and locked out for 30 min (adj) by the window control system upon detection of rain.
- .7 The NV Embedded® system shall automatically control the NV comfort and minimum ventilations the shoulder season mode.
- .1 In the shoulder season mode, the ventilation will be regulated by a demand driven pulse control. Pulse ventilation means that the windows are opened for a short period of time and then closed again.
- .2 The ventilation is performed when the CO2 or humidity values exceeds the configured thresholds. The ventilation pulse duration and the interval between the pulses are calculated from the actual measured values and parameter settings. The maximum window opening is limited by the outdoor temperature and the wind speed.
- .3 The demand-driven pulse ventilation shall be used in combination with the HRV ventilation only when the system temperature requirements can be satisfied without the BMS utilizing the hot water heating system. As the two ventilation strategies are controlled entirely independent of each other the BMS shall be programmed to ensure when the demand pulse ventilation system working with the HRV is not utilized when hot water heating in any thermal zone is required. The BMS shall send a signal to disable the pulse ventilation and operate only the HRV ventilation only during a heating mode as per the relevant edition of ASHRAE 90.1 – Energy Standard for Buildings Except Low-Rise Residential Buildings.
- .4 The demand-driven pulse ventilation when enabled shall operate if the CO2 and/or RH level is higher than the defined threshold. If the temperature exceeds the defined maximum temperature, the amount of ventilation is gradually increased. If the temperature drops below the defined minimum temperature, the windows are closed completely in one step. A maximum and minimum duration of the pulse ventilation during demand-driven pulse ventilation shall be established. The actual pulse ventilation duration shall calculate from the measured values and thresholds for CO2 and RH and influential parameters. If the desired CO2 and RH level is reached before the ending of the max. pulse limit, the windows will close.
-

- 
- .8 The NV Embedded® system shall automatically control the NV night cooling.
- .1 The night cooling shall be connected to the Unoccupied Secured mode. The window opening shall not be open more than 100 mm during the night purge mode.
  - .2 The night cooling shall be performed by defining setpoint-offsets for the summer mode. When the system enters the 'Unoccupied secure mode' outside working hours, it shall automatically activate the new setpoint generated by the defined offset to perform the night cooling. Night cooling setpoint =  $24^{\circ}\text{C} - 6^{\circ}\text{C} = 18^{\circ}\text{C}$
  - .3 In the shoulder season, the system can be in Winter mode during the night and summer mode during the day. This ensures that night cooling is not used during the night even though the system is in summer mode during the day.
  - .4 As an integrated part of a BMS, NV Embedded® shall receive a sensor data from the BMS and determine when to night cool.
    - .1 The design intent is to cool the slab passively as much as possible when cooling will be required the next day.
    - .2 BMS contractor to coordinate with security vendor to make sure open windows do not set off any intrusion detection alarms.
    - .3 The need for night flush is defined as following:
    - .4 If the day is between April and October (adj),
    - .5 AND, if the OSAT high for the present day is greater than 82 deg F (adj), then there is a very good chance tomorrow will also be solidly warm, so night flush will be beneficial.
    - .6 Provide admin user the ability to cancel or schedule night flush independent of the above logic.
    - .7 To execute night flush:
    - .8 If need for night flush is satisfied,
    - .9 AND there is no rain,
    - .10 And if  $40^{\circ}\text{deg} < \text{OSAT} < 65^{\circ}\text{deg}$ ,
    - .11 At 12am (adj) open all windows determined acceptable for night flush.
    - .12 When the slab temp sensor reaches 62 deg (Adj),
    - .13 OR if it the time strikes 4am (adj),
    - .14 Close the windows.

- 
- .15 If slab temp was not reached during the night flush time frame, send email alarm to the effect of "consider using longer night flush duration".
  - .9 The NV Embedded® system shall automatically control the manual override
    - .1 Occupants may be allowed to manually close windows through the NV Embedded manual override switch accessible in the ventilated zones.
      - .1 Users may be allowed to manually close windows through the manual override switch rather than a traditional wall switch in case noise, pollen, dust, or unforeseeable circumstances cause open windows to be undesirable.
      - .2 The user shall be able to manually command the windows to open or close to a set %opening, between 0% and 100% with 25% intervals. Motorized windows for manual control shall be grouped together in the ventilated zones.
      - .3 Users will not be allowed to manually override windows open at the room override switch if outside conditions are not favorable for natural ventilation as this does more harm than good.
      - .4 The user shall be able to select a 'window closed' function, which will shut the windows until the override control reinstates the automatic control
      - .5 After a defined period (30 min adjustable) the NV Embedded® system will override the manual control and regulate the operable openings based on the relevant conditions.
- 2.16.6 Window Control LCD display
- .1 BMS control contractor to provide wall mounted graphical electronic LCD display, location to be approved by Architect. Single graphical display shall include each natural ventilation zone (see drawings). Thermostat is not the preferred method of display for central control. LCD will also be for displaying all outdoor sensors and if the air conditions are favorable for natural ventilation. LCD will display the following:
    - .1 All weather station sensor present values from building mounted BMS weather station
