**Design Discipline and Issuing Authority (IA)**

Documents have been prepared and issued by each Issuing Authority as follows:  
Architect (A), Professional Engineer – Structural (S), Professional Engineer –  
Mechanical (M), Professional Engineer – Electrical (E), Vertical Transportation (VT),  
Landscape Architect (L), Hardware (H), Professional Engineer – Civil (C), Security  
Consultant (SE), Audio-Visual Consultant (AV), Communications Consultant (COMM).

**END OF TABLE OF CONTENTS**

---

**1. GENERAL**

**1.1 AVAILABLE INFORMATION AVAILABLE TO BIDDERS \***

- 1.1.1 Investigation documents are available for review in Owner's purchasing documents.
- 1.1.2 Following Report(s) and document(s) are for information only. Neither Consultant nor Owner assumes any liability for items extracted from documents. These documents do not form part of Contract Documents

**1.2 REPORTS \***

- 1.2.1 Geotechnical Investigation Report:
  - .1 A copy of a geotechnical investigation report and related letters prepared by Owner's consultant for the Place of the Work are available for review. Refer to following:
    - .1 "Geotechnical Engineering Report – Dixie and Dockstader Road, Brampton, Ontario", dated 4 December, 2023, prepared by Grounded Engineering Inc.
- 1.2.2 Hydrogeological Report:
  - .1 A copy of a hydrogeological report and related letters prepared by Owner's consultant for the Place of the Work are available for review. Refer to following:
    - .1 "Hydrogeological Review Report – Dixie and Dockstader Road, Brampton, Ontario", dated 11 October, 2023, prepared by Grounded Engineering Inc.
- 1.2.3 Excess Soil Plan:
  - .1 A copy of a excess soil plan and related letters prepared by Owner's consultant for the Place of the Work are available for review. Refer to following:
    - .1 "Excess Soil Implementation Plan – Peel Region Paramedic Services Reporting Station, Brampton, Ontario", dated 31 August, 2023, prepared by Grounded Engineering Inc.
- 1.2.4 Building Code Report:
  - .1 A copy of a building code report and related letters prepared by Owner's consultant for the Place of the Work are available for review. Refer to following:

- 
- .1 “Building Code Outline Report – Paramedic Services Reporting Station, Brampton, Ontario”, dated 24 May, 2024, prepared by LMDG.
  - 1.2.5 Hydrant Flow Test Report:
    - .1 A copy of a hydrant flow test report and related letters prepared by Owner's consultant for the Place of the Work are available for review. Refer to following:
      - .1 “Hydrant Flow Test Report – Dixie and Dockstader, Brampton, Ontario”, dated 12 October, 2023, prepared by BA Fire Safety.
  - 1.2.6 Acoustic Report:
    - .1 A copy of an acoustic report and related letters prepared by Owner's consultant for the Place of the Work are available for review. Refer to following:
      - .1 “Acoustic, Noise and Vibration Control Basis of Design Report – Part of Block 5, Plan 43M-1907, Brampton, Ontario”, dated 26 March, 2024, prepared by Thornton Tomasetti.
  - 1.2.7 Storm Water Management Report:
    - .1 A copy of a storm water management report and related letters prepared by Owner's consultant for the Place of the Work are available for review. Refer to following:
      - .1 “SWM Pond Drawing, Employment Lands, Countryside Village”, dated August, 2012 (revised October, 2012), prepared by Schaeffers Consulting Engineers.
  - 1.2.8 OTTSWMM Analysis Report:
    - .1 A copy of a OTTSWMM analysis report and related letters prepared by Owner's consultant for the Place of the Work are available for review. Refer to following:
      - .1 “OTTSWMM Analysis Report, Countryside Villages Employment Block, City of Brampton”, dated December, 2011 (revised October, 2012), prepared by Schaeffers Consulting Engineers.
  - 1.2.9 LCA Report:
    - .1 A copy of an LCA report and related letters prepared by Owner's consultant for the Place of the Work are available for review. Refer to following:
      - .1 “Life Cycle Assessment Report – PRPS Reporting Station, Dockstader”, dated 9 September, 2024, prepared by Introba.

END OF SECTION

**1. GENERAL**

**1.1 Work Covered By Contract Documents**

- 1.1.1 Work of this Contract identified as Dockstader PRPS - 221033 includes furnishing labour, materials, equipment, services and other related expenses to complete requirements specified under Contract Documents.
- 1.1.2 General Project Description: The project consists of new construction for an EMS Station situated on a greenfield site, in compliance with the Ontario Building Code, 2012. The primary structures will include essential EMS facilities and support spaces with associated infrastructure. Project is to be designed and constructed as a post-disaster building.
- 1.1.3 Project is located at 6 Dockstader Road, Brampton, ON
- 1.1.4 Contract Type: Project is to be governed by a CCDC 2-2020 contract.
- 1.1.5 Without limiting generality of foregoing, Contractor is responsible for coordination of various parts of the Work so that no part is left in an unfinished or incomplete condition.

**1.2 Work By Owner Or Under Other Contracts**

- 1.2.1 Ensure full cooperation with separate contractors to enable smooth execution of such contracts without interference or delay to Work of this Contract. Coordinate Work of this Contract with work under separate contracts.
- 1.2.2 Immediately report defects, which affect quality and performance of the Work, in writing to Consultant. Commencement of parts of the Work of this Contract, in existing areas and in areas provided by other contractors, will be deemed to signify Contractor's acknowledgment and acceptance of those parts of the Work.
- 1.2.3 NIC Work: "NIC" refers to Work not performed or provided under this Contract. "NIC" signifies "Not In this Contract" or "Not a Part of Work by Contractor". NIC Work may be shown on Drawings and in scheduling amount of time and materials necessary for completion of Contract.

**1.3 Owner-Supplied / Contractor-Installed Products**

- 1.3.1 Owner Responsibilities:
  - .1 Order and pay for Owner-supplied Products not already in Owner's possession.

- 
- .2 Arrange and pay for delivery of Owner-supplied Products F.O.B. the site, within time frames required by Contractor's progress schedule. If delivered sooner than required by Contractor's latest progress schedule submitted to Owner, arrange and pay for delivery to a temporary storage location and subsequent delivery to the site.
  - .3 Advise Contractor in writing of the value of Owner-supplied Products for Contractor's insurance purposes.
  - .4 Arrange and pay for delivery to Contractor of reviewed Shop Drawings, Product data, samples, and manufacturer's installation instructions.
  - .5 Inspect deliveries jointly with Contractor.
  - .6 Submit claims for transportation damage.
  - .7 Arrange for replacement of damaged, defective or missing items identified at time of delivery.
  - .8 Arrange for manufacturer's field services.
  - .9 Arrange for delivery of manufacturer's warranties to Contractor for inclusion in operation and maintenance manual.
- 1.3.2 Contractor Responsibilities:
- .1 Designate in progress schedule, time frames for delivery of Owner-supplied Products to the site and for receipt of related submittals. If the site is not ready to receive delivery of Owner-supplied Products within the time frame indicated in the latest progress schedule submitted to Owner, arrange and pay for delivery to a temporary storage location and subsequent delivery to the site.
  - .2 Review all required submittals and notify Consultant of any observed discrepancies or anticipated problems.
  - .3 Ensure that course of construction insurance is adequate to cover Owner-supplied Products.
  - .4 Receive and unload Owner-supplied Products at the site.
  - .5 Inspect deliveries jointly with Owner. Record and notify Owner and Consultant of shortages and visibly damaged or defective items.
  - .6 Handle Owner-supplied Products at site, including uncrating and storage. Dispose of waste materials and debris.
  - .7 Take appropriate precautions to protect Owner-supplied Products from loss or damage.
  - .8 Repair or replace items damaged on site.
  - .9 Assemble, install, connect, adjust, and finish Owner-supplied Products as specified.

- .10 Arrange for inspections required by authorities having jurisdiction as specified.
- .11 Arrange for or perform testing as specified.
- .12 Workmanship warranty for installation.
- 1.3.3 The following Products will be supplied by Owner and installed by Contractor:
  - .1 Refer to Drawings and Equipment Schedules.

#### **1.4 Sustainability Targets**

- 1.4.1 Project is targeting CaGBC Zero Carbon Building Standard Version 3 and Region of Peel's Net Zero Emissions Standard.
- 1.4.2 Refer to Section 01 35 69 for additional requirements.

#### **1.5 Specifications Language, Style And Conventions**

- 1.5.1 Imperative Mood: Specifications are written in imperative mood and in streamlined form. Imperative language is directed to Contractor, unless stated otherwise.
  - .1 Complete sentences by reading "shall", " Contractor shall", "shall be", and similar phrases by inference. Where a colon (:) is used within sentences and phrases, read the words "shall be" by inference.
  - .2 Fulfill and perform all indicated requirements whether stated imperatively or otherwise.
  - .3 When used in the context of a Product, read the word "provide" to mean "supply and install to result in a complete installation ready for its intended use".
- 1.5.2 Specification Structure: Specifications are arranged using a modified CSI/CSC 3-part SectionFormat® structure in 3 broad "Parts": 1. General, 2. Products and 3. Execution.
  - .1 Installation Requirements: Specifications are not intended as detailed description of installation methods but serve to indicate particular requirements in completing the Work. Where Contract Documents do not Provide sufficient information for complete installation of item, then as supplement, comply with manufacturer's written instructions for quality of Work.
- 1.5.3 Singular and Gender References: Where items in Contract Documents are referred to in singular, provide as many as required to complete the Work. Words used in one gender only are intended to be inclusive.
- 1.5.4 Drawings and Schedules: Use for scope and arrangement understanding; refer to them for item locations unless otherwise stated in Specifications.

- 1.5.5 Text Characteristics: No implied emphasis for text colour or hyperlink features.
- 1.5.6 Hyperlinks: May lead to external information, not part of Contract Documents unless specifically indicated.
- 1.5.7 Division 00 and Division 01 Requirements: General provisions of the Contract, including General Conditions and Supplementary Conditions, apply to all sections of the Specifications. Similarly, requirements of Sections in Division 01 are applicable to the Work of all sections of the Specifications.

**1.6 Project Coordination And Division Of Work**

- 1.6.1 Division of the Work among Trade Contractors, Subcontractors, and Sub-sub-contractors is solely Contractor's responsibility. Consultant and Owner assume no responsibility to act as an arbiter to establish subcontract limits between Sections or Divisions of the Work.
- 1.6.2 Scope and Extent Coordination:
  - .1 Analyze Contract Documents to define the extent of the Work. Coordinate scope and extent of work for each trade. Coordinate work of all trades including construction sequence, schedule and interfacing of all work. Coordinate work of each trade as required for satisfactory and expeditious completion of The Work. Ensure components to be built in are supplied in time with setting Drawings and other related information.
  - .2 Coordinate construction operations included in different Sections of the Specifications to ensure efficient and orderly installation of each part of The Work. Coordinate construction operations, included in different Sections, that depend on each other for proper installation, connection, and operation.
  - .3 Schedule construction operations in sequence required to obtain the best results, where installation of one part of the Work depends on installation of other components, before or after its own installation. Make adequate provisions to accommodate items scheduled for later installation.
- 1.6.3 Specifications and Drawings Organization: Organization of Specifications into CSI/CSC MasterFormat® Divisions or into 3-part SectionFormat® is solely for Contractor's convenience. This organization is not intended to determine subcontract limits between Sections or Divisions of the Work.
  - .1 Arrangement of Specifications, Drawings or schedules, must not affect Contractor's control or responsibility for dividing the Work or establishing each trade's scope of work.

- .2 Claims for additional compensation due to disputes between trades resulting from Contractor's lack of coordination will not be permitted.

**1.7 Contract Documents For Construction Purposes**

- 1.7.1 Electronic Documents: Owner will supply Contractor with complete set of Contract Documents in PDF format prior to commencement of The Work. Contractor is permitted to print hard copies for construction purposes.
- 1.7.2 "IFC" Documents: Contractor acknowledges that Drawings and Specifications labeled as "Issued for Construction" or "IFC" represent Consultant's best effort at incorporating revisions issued during addenda and bidding or negotiation phase. In case of discrepancies, omission or conflict between "Issued for Construction" documents and Contract Documents, Contractor must promptly notify Consultant.

**1.8 Original Data Files**

- 1.8.1 Files Provided Consultant: Consultant will provide data files in their original format for Contractor's use during construction process and for preparation of as-built or record drawings upon receipt of signed disclaimer. Files will be provided in two stages:
  - .1 Initial Files: One set of files will be provided at start of construction to assist in preparing coordination and interference drawings, Shop Drawings, and documenting actual site conditions.
  - .2 Updated Files: Updated files will be provided before Substantial Performance of the Work, intended to aid in the finalization of as-built or record drawings.
- 1.8.2 Data Accuracy Disclaimer: Consultant makes no representations as to accuracy or completeness of files as they relate to Contract Drawings.
  - .1 Copy of Contract Documents for the purpose of creating As-Built Drawings and other documentation may not include changes issued as Addenda, Supplementary Instructions, or Change Orders.
- 1.8.3 Format: Consultant will provide the Contractor with complete set of data files in "Revit" format and as available from respective Subconsultants.
- 1.8.4 Licensing Agreements for Use of Digital Files:
  - .1 Contractor's Data Licensing Agreement: Contractor must execute a data licensing agreement in a form acceptable to both the Owner and Consultant. A copy of Consultant's typical agreement is provided in Appendix A.

- .2 Subcontractors and Third Parties' Agreement: Subcontractors and other parties granted access by Contractor to Consultant's original data files must also execute a data licensing agreement in a form acceptable to both the Owner and Consultant.
- .3 Refer to Consultant's BIM Data Disclaimer document appended to this Section for additional information.
- 1.8.5 Fee: One set of original data files may be obtained at no cost from Consultant.

**1.9 Documents At The Site**

- 1.9.1 Keep the following documents at Place of the Work, stored securely and in good order and available to Owner and Consultant in hard copy and digital form:
  - .1 Current Contract Documents, including Drawings, Specifications and addenda.
  - .2 Change Orders, Change Directives, and Supplementary Instructions.
  - .3 Reviewed Shop Drawings, Product data and samples.
  - .4 Field test reports and records.
  - .5 Construction progress schedule.
  - .6 Meeting minutes.
  - .7 Manufacturer's certifications.
  - .8 Permits, inspection certificates, and other documents required by authorities having jurisdiction.
  - .9 Current as-built drawings.
  - .10 Safety Data Sheets (SDS) for all controlled Products.

**1.10 Contractor's Use Of Premises**

- 1.10.1 Except as otherwise specified, Contractor has unrestricted use of Place of the Work from time of Contract award until Ready-for-Takeover.
- 1.10.2 Confine Construction Equipment, Temporary Work, storage of Products, waste products and debris, and all other construction operations to limits required by laws, ordinances, permits, and Contract Documents, whichever is most restrictive. Do not unreasonably encumber Place of the Work.
- 1.10.3 Refer to Section 01 14 00 for additional requirements.

**1.11 Discrepancies/Conflicts/Omissions**

- 1.11.1 If discrepancies, conflicts, or omissions in Drawings, Specifications, or other Contract Documents are suspected or if there is uncertainty

---

about their meaning or intent, such uncertainties must immediately be reported to Consultant.

- 1.11.2 Resolving Conflicting Specifications: In cases where Specifications require compliance with multiple requirements that establish different or conflicting quantities or quality levels, Contractor must adhere to most stringent requirement. Where requirements are stated differently, but have apparently equal effects, immediately notify Consultant and obtain instructions before proceeding.
- 1.11.3 Resolving Conflicting Reference Standards: If compliance with multiple reference standards is specified and such standards establish different or conflicting requirements for minimum quantities or quality levels, comply with most stringent requirement. Where requirements are stated differently, but have apparently equal effects, immediately notify Consultant and obtain instructions before proceeding.
- 1.11.4 Minimum Quantity or Quality Levels: Specified or illustrated quantities or quality levels represent minimum that must be provided or performed. Actual installation may meet minimum specified levels or exceed them within reasonable limits. Numeric values indicated are to be interpreted as minimum or maximum as appropriate. Uncertainties must be referred to the Consultant for clarification.
- 1.11.5 Comply with Consultant's written instructions or explanations and proceed accordingly. If Changes to the Work are suspected or required, refer to Section 01 26 00, for appropriate procedures to follow.

- 1.0** This Building Information Model (BIM) data is being provided at the request of and for the convenience of the recipient only. It may be incomplete, contain unintentional inaccuracies, or be partially obsolete. The user is further warned that, while all digital BIM data appears to be extremely accurate, this apparent accuracy is an artifact of the techniques used to generate it and is in no way intended to imply actual accuracy.
- 2.0** The drawings remain the contract documents. In the event of a discrepancy between model elements or between the model elements and the drawings, the model element author shall be notified. The user of this data takes full responsibility for the accuracy and correctness of all measurements, areas, inventories, etc. extracted from this data either manually or with the use of a computer.
- 3.0** The user is advised that any translation of BIM data from one computer system or environment to another can and often does result in the loss of important data. This loss can include but may not be limited to portions of text and dimensions, the existence, location or scale of symbols or other elements of graphics; the internal structure of data, including layers and data attributes; and the style or weight of lines. Diamond Schmitt Architects Incorporated makes no representations as to the usability of this BIM data on any system.
- 4.0** Users of the BIM data are advised to review all current versions, as well as subsequent versions, of project documentation for inconsistencies and revisions. It is the responsibility of the user to identify and make all required revisions or corrections to this data. Diamond and Schmitt Architects Incorporated will not routinely issue updates to BIM data.
- 5.0** By acceptance of this electronic media and the files it contains, the user agrees, to the fullest extent of the law, to indemnify and hold Diamond Schmitt Architects harmless from any damage, cost or liability, including but not limited to reasonable attorney's fees and cost of defense, arising from any changes made to these files by anyone other than Diamond Schmitt Architects Incorporated or from reuse of files and data without the prior written consent of Diamond Schmitt Architects Incorporated.

- 6.0** While reasonable care has been used to ensure that the transfer medium and the material are free of computer viruses, Diamond Schmitt Architects Incorporated accepts no responsibility for any loss or damage that might result from the transmission of computer viruses in this process.
- 7.0** The copyright of this BIM data belongs to Diamond Schmitt Architects Incorporated and it may not be altered, modified, copied, or transferred to another company or individual, either in part or whole, without express written permission from Diamond Schmitt Architects Incorporated. Diamond Schmitt Architects Incorporated grants the recipient non-exclusive license to use the BIM for construction purpose for this project only. The license includes the right to create a derivative model. Alterations are at the sole risk of the recipient making the alterations, and Diamond Schmitt Architects Incorporated shall have no responsibility for any alterations made.
- 8.0** Elements included in the BIM data such as, but not limited to, families, components, shared parameters, view templates, family templates and project templates are property of Diamond Schmitt Architects Incorporated and are protected by intellectual property laws including copyright laws. The recipient of the BIM data agrees to be bound by any such intellectual property and copyright laws and other than using it specifically for the above-mentioned project, shall not sell, transfer, modify, use, or otherwise incorporate these elements into its own office standards or it will be in violation of such laws.
- 9.0** If shop drawings are issued by the Contractor which appears to have made unaltered use of the BIM files issued by Diamond Schmitt Architects Incorporated, they will be returned without review. Under no circumstances can it be assumed that Diamond Schmitt Architects Incorporated working drawings are sufficiently detailed to become documents for final manufacturing (shop drawings).
- 10** The terms of this disclaimer are effective immediately upon the User's receipt of digital information.

**1. GENERAL**

- 1.1.1 Use of Site: Contractor is granted unrestricted use of Place of the Work for construction purposes, as defined by Contract boundaries. Owner retains right to enter the Place of the Work, to perform work using their own forces, or engage other contractors to perform work of Project in accordance with General Conditions and Supplementary Conditions of the Contract.
- 1.1.2 Construction Activities and Boundaries: Confine construction activities and materials to area indicated on Drawings and within property lines. Where temporary extension of boundaries is required by Contractor to perform work of this Contract, obtain permission from Owner, and perform such work at no additional cost to Owner.
  - .1 Additional Storage or Work Areas: Obtain and pay for use of additional storage or work areas needed for operations under Contract.
- 1.1.3 Restoration of Paving and Landscaping: Restore paving, sidewalks, curbs, landscaping, and grass damaged during construction to conditions existing before construction operations began.
- 1.1.4 Work on Public or Municipal Property: comply with regulations of municipality and authorities having jurisdiction including associated fees, permits, insurance or bonding required.
- 1.1.5 Prohibition on Smoking and Controlled Substances: A strict no-tobacco, no-vaping, no-alcohol and no-controlled substances policy is to be enforced on project site and on Owner's property.
- 1.1.6 Construction of Temporary Access and Egress:
  - .1 Design and maintain temporary access and egress routes, including stairs, runways, ramps or ladders and scaffolding, independent of finished surfaces; comply with safety and regulatory standards of Authorities Having Jurisdiction. Maintain temporary entrances to building(s) including enclosed hoardings as required.
  - .2 Bridge excavations with construction to safely support loads that could be imposed and provide personnel to assist in deliveries to building(s) as required.
- 1.1.7 Restriction of Site Access to Non-Construction Personnel: Limit site access strictly to authorized individuals, except for visitors authorized by Contractor.
- 1.1.8 Temporary Vehicular Access and Parking: Refer to Section 01 50 00.

**1. GENERAL**

**1.1 Cash Allowances**

- 1.1.1 Include in Contract Price specified cash allowances.
- 1.1.2 Cash allowances, unless otherwise specified, cover net cost to Contractor of services, products, construction machinery and equipment, freight, handling, unloading, storage, installation and other authorized expenses incurred in performing Work.
- 1.1.3 Contract Price, and not cash allowance, includes Contractor's overhead and profit in connection with such cash allowance.
- 1.1.4 Disbursements from Cash Allowances shall be authorized by Consultant in writing and by Change Order.
- 1.1.5 Contract Price will be adjusted by written order to provide for excess or deficit to each cash allowance.
  - .1 Where costs under a cash allowance exceed the amount of the allowance, unexpended amounts from other cash allowances may be reallocated to cover the shortfall.
- 1.1.6 Extend to Owner refunds, trade and quantity discounts which may be received in purchasing under Cash Allowances, except cash discounts for prompt payment.
- 1.1.7 Include progress payments on accounts of work authorized under cash allowances in Consultant's monthly certificate for payment.
- 1.1.8 Prepare schedule jointly with Consultant and Contractor to show when items called for under cash allowances must be authorized by Consultant for ordering purposes so that progress of Work will not be delayed.
- 1.1.9 At Consultant's request, obtain proposals for each allowance for use in making final selections. Include recommendations that are relevant to performing the Work.
- 1.1.10 Purchase products and systems selected by Consultant from the designated supplier.
- 1.1.11 Submit invoices, summary statements or delivery slips to show actual quantities of materials delivered to the site for use in fulfillment of each allowance.
- 1.1.12 Submit time sheets and other documentation to show labor time and cost for installation of allowance items that include installation as part of the allowance.
- 1.1.13 Coordinate and process submittals for allowance items in same manner as for other portions of the Work.

- 1.1.14 Unused Materials: Return unused materials purchased under an allowance to manufacturer or supplier for credit to Owner, after installation has been completed and accepted.
- .1 If requested by Consultant, retain and prepare unused material for storage by Owner. Deliver unused material to Owner's storage space as directed.
- 1.1.15 Examine products covered by an allowance promptly on delivery for damage or defects. Return damaged or defective products to manufacturer for replacement.
- 1.1.16 Coordinate materials and their installation for each allowance with related materials and installations to ensure that each allowance item is completely integrated and interfaced with related work.
- 1.1.17 Schedule of Cash Allowances: Provide cash allowances as follows:

No.	Cash Allowance Description	Amount
	<b>FF&amp;E</b> Cafeteria / Served Appliances: - Two (2) Traulsen G-Series Solid Door, 2 Section Refrigerators - Two (2) Miele G5006 U Active Dishwashers  Laundry Equipment - 1 x Tumble Dryer, UNIMAC Model# UT075NDNONBA3W0000. - 1 x Washer Extractor, UNIMAC Model# UWNO65T3LXU4001. - 1 x Firefighters PPE drying cabinet, UNIMAC, Model# UTGC6EDG4501W01. - 1x Georgia Steel & Chemical Co., Inc, Respirator washer, Model# GS5000.  Two (2) Ceiling Fans - Big Ass Fans Powerfoil X4	\$600,000.00

---

No.	Cash Allowance Description	Amount
	<b>Forklift Equipment - Raymond</b> - Two (2) Raymond Universal Stance Deep-Reach Trucks, Model 7500 DR32TT with two (2) Energys 18-E125D-15 batteries, two (2) FLT-KBP18Y & PSI-829157 battery accessories and two (2) Energys NIP3-HL-4CI chargers for each truck. - Two (2) Bravi Sprint Man-up Orderpickers - One (1) Raymond 8210 Pallet Truck Model 8210-TF45L 48`x 27`, with Bilingual Decals, Standard Warranty Coverage and one (1) Stryten PalletPro Maintenance-Free Battery-Pack (Model M900004S24ELEG)	\$200,000.00
	<b>Racking/Spider Shelving – Metric Storage Systems</b> - Sixty-Four (64) Bays Closed Spider Shelving 48"W X 24"D X 147"H - Each bay of racking has 13 shelves and base delivery and installation	\$55,000.00

No.	Cash Allowance Description	Amount
	<b>Pick Stations – Metric Storage Systems</b> - four (4) wb1 cabinets - 144"w x 30"d Rousseau cabinets w/ 2" s/s base , top leveling glides, 2 x 60"w cabinets w 2 x 12"h drawers & painted plastic bin panels - four (4) wb1 garbage cabinets - 84"w x 40"d x 52"h garbage cabinet with custom 12" Hole is s/s top with 1 garbage drawer, systems: - five (5) wb1 cabinets - 60"w x 40"d x 52"h cabinets with 2" s/s base, top leveling glides, 2 x 60"w x 12"h drawers & painted plastic bin panels - three (3) wb2 cabinets - 108"w x 40"d x 81"h cabinet with s/s top , 2 x 4" 1 x 10", 1 x 12" drawers - power fee - one (1) wb2 cabinet + leg - 108"wide x40"dx76"high cabinets w/ 2" s/s base, top Leveling glides, 2 x 60"w , 2 x 4", 1 x 10" , 1 x 12`` drawers & 1 x powerfeed and plastic bin panels - one (1) wb3 garbage cabinet - 84"w x 40"d x 56"h cabinet with custom 12" hole in s/s top with 1 garbage drawer, 1 x open leg and painted plastci bin panel, 3 x power feed - one (1) wb3 cabinet - 60"w x 40"d Rousseau cabinets w/ 2" s/s base, top leveling glides, 1 x 60"w cabinet with 2 x 12" drawers, 1 x open leg , 2 x power feed, painted Plastic bin panel. Over head cabinets - delivery and installation	\$105,000.00

No.	Cash Allowance Description	Amount
	<b>(PALETTE PICK) Palette Racking - Metric Storage Systems</b> - 65 bays of pallet racking as per design, 100" wide x 37' tall with 5 beam levels per bay with wire mesh decks in all skid locations. - Included safety fencing between double deep bays and single bay. 54 x 12" high floor mounted post guards, 8 x cross aisle guards for single run of racking on east wall, all hardware - Engineered stamped drawings for building permitting - Delivery and installation - Delivery, rental and pickup of scissor lifts and forklifts	\$170,000.00
	<b>Refueling Station Canopy above grade - Refer to drawings for details.</b>	\$400,000.00
	<b>Signage + Wayfinding</b>	\$200,000.00
	<b>Cardboard Baler - MDA Compaction Bullpak 1050 Vertical Baler</b> - 600-208v, 3 phase, 10hp motor - Bale full light - Bale ties (1 bundle) - Auto eject and wire guides - Electrical disconnect on panel - Delivered and installation At Region of Peel - 1 year warranty labour, 2 year on parts, 3 year on structure - (6) semi-annual PM's included with purchase	\$35,000.00
	<b>Inspection and Testing, Including Tab Balancing</b>	\$500,000.00
	<b>AV Equipment and Implementation</b>	\$500,000.00
	<b>TOTAL OF CASH ALLOWANCES</b>	<b>\$2,415,000.00</b>

2.1 Not Used

3 . EXECUTION

3.1 Not Used

END OF SECTION

## **1. GENERAL**

### **1.1 Definitions**

- 1.1.1 Substitution: In this Section “Substitution” means a Product, a manufacturer, or both, not originally specified in Contract Documents by proprietary name but proposed for use by Contractor in place of a Product, a manufacturer, or both, specified by proprietary name.
- 1.1.2 Substitutions for Cause: Substitution proposed due to altered Project conditions like product unavailability, regulatory changes, or warranty issues. Owner will consider cases where Contractor’s proposed products can demonstratively improve Project’s embodied carbon targets over specified baselines.
- 1.1.3 Substitutions for Convenience: Substitution proposed due to perceived benefits, that may not necessarily be required for fulfill Project requirements.

### **1.2 Restrictions On Substitutions**

- 1.2.1 Adherence to Specifications: Use specified materials and manufacturers unless otherwise stated.
- 1.2.2 Bidding Period:
  - .1 Where the bid documents specify particular Products by proprietary name, the Consultant may consider substitutions during the bidding period, provided such requests are received, in writing, at least 10 Working Days before the bid closing time and are in accordance with requirements specified in this Section. If, upon review with the Owner, a substitution is reviewed without objections, the substitute Product will be named in an addendum. Otherwise, bidders must consider the substitution request rejected.
- 1.2.3 Substitutions for Convenience: Generally not permitted.
- 1.2.4 Substitutions for Cause: Substitutions for Cause during construction period may be proposed by Contractor when the terms "or approved equivalent", "or approved equal" or similar terms are used. Do not construe such language as invitation to unilaterally provide a Substitution without Consultant’s prior acceptance in writing. Do not order or install Substitutions without Supplemental Instruction or Change Order.
- 1.2.5 Review Process: Consultant will promptly review a proposed Substitution for Cause, provided submission includes all information specified in this Section under Submission Requirements For Proposed Substitutions.

- 1.2.6 Acceptance Criteria: Consultant may accept a Substitution if it can be satisfied that:
  - .1 the proposed substitute Product is the same type as, is capable of performing the same functions as, interfaces with adjacent work the same as, and meets or exceeds the standard of quality, performance and, if applicable, appearance and maintenance considerations, of the specified Product,
  - .2 the proposed substitute manufacturer has capabilities comparable to the specified manufacturer, and
  - .3 the Substitution provides a benefit to Owner.
- 1.2.7 Invalid Reasons for Substitutions: Delay in ordering specified Product in adequate time to meet construction schedule is not a valid reason for Consultant to accept a Substitution.
- 1.2.8 Documentation of Changes: Accepted Substitutions will be documented through a Supplemental Instruction or Change Order. Refer to Section 01 26 00.
- 1.2.9 Reversion Restrictions: Do not revert to original specified Product or manufacturer without Consultant's prior written acceptance.

### **1.3 Submission Requirements For Proposed Substitutions**

- 1.3.1 Substitution Request Form: Use form appended to this Section for all Substitution requests. Failure to use specified form will result in Consultant rejecting Substitution.
- 1.3.2 Include with each proposed Substitution the following information:
  - .1 Identification of the Substitution, including product name and manufacturer's name, address, telephone numbers, and web site.
  - .2 Reason(s) for proposing the Substitution.
  - .3 A statement verifying that the Substitution will not affect the Contract Price and Contract Time or, if applicable, the amount and extent of a proposed increase or decrease in Contract Price and Contract Time on account of the Substitution.
  - .4 A statement verifying that the Substitution will not affect the performance or warranty of other parts of the Work.
  - .5 Manufacturer's Product literature for the Substitution, including material descriptions, compliance with applicable codes and reference standards, performance and test data, compatibility with contiguous materials and systems, and environmental considerations.
  - .6 Product samples as applicable.
  - .7 For items identified with specific embodied carbon targets or transparency documentation such as EPDs, demonstrate that

---

such items are below specified thresholds and have the required documentation.

- .8 A summarized comparison of the physical properties and performance characteristics of the specified Product and the Substitution, with any significant variations clearly highlighted.
- .9 Availability of maintenance services and sources of replacement materials and parts for the Substitution, as applicable, including associated costs and time frames.
- .10 If applicable, estimated life cycle cost savings resulting from the Substitution.
- .11 Details of other projects and applications where the Substitution has been used.
- .12 Identification of any consequential changes in the Work to accommodate the Substitution and any consequential effects on the performance of the Work as a whole. A later claim for an increase to the Contract Price or Contract Time for other changes in the Work attributable to the Substitution will not be considered.

### SUSTAINABLE INFORMATION

*Indicate below sustainable information that apply to this Product.*

#### MANUFACTURING LOCATION

What is the location of the manufacturing plant for this particular product?

#### ENVIRONMENTAL PRODUCT DECLARATION (EPD)

Does the product have a compliant environmental product declaration (EPD)? ☐ Yes  
☐ No

EPD Type: ☐ Industry Wide EPD ☐ Product Specific EPD

Indicate EPD expiry date: \_\_\_\_\_

#### MATERIALS AND RESOURCES

Does the product contain wood Products? ☐ Yes ☐ No

If yes, Indicate percentage of FSC Certified wood in product: \_\_\_\_\_

---

Indicate wood product low-emitting characteristics:

☐ No Added Urea Formaldehyde (NAUF) ☐ Ultra-low Emitting Formaldehyde (ULEF)

Does the product contain post-consumer or pre-consumer recycled content? ☐ Yes ☐ No

If yes, Indicate percentage of pre-consumer recycled content:

\_\_\_\_\_

If yes, Indicate percentage of post-consumer recycled content:

\_\_\_\_\_

#### **DISCLOSURE AND TRANSPARENCY**

Does the product participate in extended producer responsibility program? ☐ Yes ☐ No

Does the product have a "Declare" label with ingredient disclosure greater than 1000 ppm? ☐ Yes ☐ No

Does the product have a Fully Declare Health Product Declaration? ☐ Yes ☐ No

Is this product CDPH Emissions testing compliant? ☐ Yes ☐ No

Indicate product VOC content (g/l):

\_\_\_\_\_

#### **SUPPORTING DATA**

*Attached data includes product description, specifications, drawings, photographs, and performance and test data adequate for evaluation of the request; applicable portions of the data are clearly identified.*

Attached data also includes a description of changes to the Contract Documents that the proposed substitution will require for its proper installation

Supporting Data Attached: ☐ Drawings ☐ Product Data ☐ Samples ☐ Test Reports

#### **FOR INTERNAL USE ONLY**

Substitution approved - Make submittals in accordance with Section 01 25 00.  
Substitution approved as noted - Make submittals in accordance with Section 01 25 00.

Substitution rejected - Use specified materials.

---

**1.3     DECLARATIONS**

- 1.3.1 I/We the undersigned agree that the Owner reserves the right to accept or reject any or all the proposed substitution/alternatives and may request that materials specified in the Bidding and Contracting Documents be used.
- 1.3.2 I/We the undersigned understand that by submitting this Substitution Request, I/We assume full responsibility for ensuring that all requirements are considered.
- 1.3.3 I/We hereby certify that:
- .1 Proposed substitution has been fully investigated and determined to be equal or superior in all respects to specified product.
  - .2 Same warranty will be supplied for proposed substitution as for specified product.
  - .3 Same maintenance service and source of replacement parts, as applicable, is available.
  - .4 Proposed substitution will have no adverse effect on other trades and will not affect or delay progress schedule.
  - .5 Proposed substitution does not affect dimensions and functional clearances.
    - .1 Coordination, installation, and changes in the Work as necessary for accepted substitution will be complete in all respects.

END OF FORM

**1. GENERAL**

**1.1 Summary**

- 1.1.1 Purpose of Section: Section specifies administrative procedures related to modifying Contract by means of Change Orders, Change Directives, and Supplemental Instructions.
- 1.1.2 Read in conjunction with: CCDC 2-2020, Part 6, Changes in the Work and Supplementary Conditions.

**1.2 Schedule Of Labour Rates**

- 1.2.1 Prior to the first application for payment, submit for the Consultant's review a schedule of labour rates for all trades and classifications of trades, such as journeymen, apprentices, and foremen that will be employed in the Work. Provide a breakdown of payroll burden component of labour rates.
- 1.2.2 Labour rates shall reflect the salaries, wages, and benefits paid to personnel in the direct employ of the Contractor, Subcontractors, and sub-Subcontractors, stated as hourly rates, that will be used when:
  - .1 preparing price quotations for Change Orders, and
  - .2 determining the cost of work attributable to Change Directives.
- 1.2.3 Labour rates stated in the schedule of labour rates shall be consistent with rates that will actually be paid, and payroll burden costs that will actually be incurred, in the normal performance of the Work, during regular working hours. Labour rates shall not include any additional overhead and profit component.
- 1.2.4 Where collective agreements apply, the labour rates shall not exceed those established by collective agreement.
- 1.2.5 Obtain the Owner's written acceptance of the schedule of labour rates before submitting the first Change Order quotation.
- 1.2.6 Accepted schedule of labour rates will be used solely for evaluating Change Order quotations and cost of performing work attributable to Change Directives.
- 1.2.7 The Contractor may request amendments to the accepted schedule of labour rates if changes in the labour rates that will actually be paid, or payroll burden cost that will actually be incurred, in the normal performance of the Work can be demonstrated. Obtain the Owner's written acceptance of such changes.

---

**1.3 Schedule Of Equipment Rates**

- 1.3.1 Prior to the first application for payment, submit for the Consultant's review a schedule of equipment rates for Contractor owned Construction Equipment.
- 1.3.2 Equipment rates shall reflect the rates that will be used when:
  - .1 preparing price quotations for Change Orders, and
  - .2 determining the cost of work attributable to Change Directives.
- 1.3.3 Equipment rates stated in the schedule shall be consistent with local equipment rental market rates and shall not include any additional overhead and profit component.
- 1.3.4 Obtain the Owner's written acceptance of the schedule of equipment rates before submitting the first Change Order quotation.
- 1.3.5 Accepted schedule of equipment rates will be used solely for evaluating Change Order quotations and cost of performing work attributable to Change Directives.
- 1.3.6 The Contractor may request amendments to the accepted schedule of equipment rates if changes in local equipment rental market rates can be demonstrated. Obtain the Owner's written acceptance of such changes.

**1.4 Valuation Of Changes Based On Agreed Unit Prices**

- 1.4.1 The Consultant may, at the outset of the Contract or at any other time, request the Contractor to submit unit prices anticipated to be required in valuing changes in the Work.
- 1.4.2 The Contractor shall submit such unit prices promptly upon request.
- 1.4.3 The unit prices shall be valid for a specified duration agreed upon by Owner and Contractor.
- 1.4.4 The unit prices shall exclude all fees for overhead and profit and shall be subject to the percentage fees as noted in Supplementary Conditions.
- 1.4.5 The Consultant will evaluate the Contractor's quoted unit prices and, if accepted by the Owner in writing, the agreed unit prices shall be used to value subsequent proposed changes in the Work wherever they are applicable.

**1.5 Method Of Contract Price Adjustment - Change Orders**

- 1.5.1 Unless otherwise agreed, the adjustment of the Contract Price on account of a proposed change in the Work shall be based on a quotation for a fixed price increase or decrease to the Contract Price regardless of the Contractor's actual expenditures and savings.

- 1.5.2 If unit prices included in the stipulated price contract are applicable to the proposed change, the adjustment of the Contract Price shall be based on those unit prices, to the extent they apply.
- 1.5.3 Unless otherwise agreed, the adjustment of Unit Prices affected by a proposed change in the Work shall be based on a quotation for an increase or decrease to existing Unit Prices, or new Unit Prices, as applicable, regardless of the Contractor's actual expenditures and savings.

## **1.6 Change Order Procedures**

- 1.6.1 Any variation in the Contract involving a change in total amount of Contract Price or in Contract Time shall be initiated through Consultant in form of a proposed change in the Work (Contemplated Change Order / Contemplate Change Notice or CCO/CCN) describing work proposed under variation and requesting a quotation from contractor.
- 1.6.2 Upon issuance by the Consultant to the Contractor of a proposed change in the Work, and unless otherwise requested in the proposed change or unless otherwise agreed:
  - .1 Submit to the Consultant a fixed price quotation for the proposed change in the Work within 5 days after receipt of the proposed change in the Work.
  - .2 If requested in the proposed change, provide a detailed breakdown of the price quotation including the following to the extent applicable, with appropriate supporting documentation:
    - .1 Estimated labour costs, including hours and applicable hourly rates based on the accepted schedule of labour rates.
    - .2 Estimated Product costs, including Supplier quotations, estimated quantities and unit prices.
    - .3 Estimated Construction Equipment costs.
    - .4 Enumeration of all other estimated costs included in the price quotation.
    - .5 Estimated credit amounts for labour and Products not required on account of the proposed change.
    - .6 Fees, not exceeding the applicable percentages for overhead and profit as specified in this Section.
    - .7 Where applicable, Subcontractor quotations, also including a detailed breakdown of all of the above.
  - .3 Include in the quotation the increase or decrease to the Contract Time, if any, for the proposed change, stated in number of days.

- .4 Include in the quotation the number of days for which the quotation is valid.
- .5 The quotation will be evaluated by the Consultant and the Owner and, if accepted by the Owner, be documented in the form of a signed Change Order.

**1.7 Method Of Contract Price Adjustment - Change Directives**

- 1.7.1 Unless the Owner and the Contractor reach an earlier agreement on the adjustment to the Contract Price by means of a Change Order that cancels the Change Directive, the adjustment in the Contract Price for change carried out by way of a Change Directive shall be determined as specified in the General Conditions of Contract after the change in the Work is completed.

**1.8 Change Directive Procedures**

- 1.8.1 Change Directives (CD) are instructions for Contractor to carry out change in the Work, which will be included in a subsequent Change Order. Owner will issue Change Directives through the Consultant, providing a complete description of the required changes.
- 1.8.2 If a Change Directive is issued for a change in the Work for which a proposed change was previously issued, but no Change Order has yet been signed, the Change Directive shall cancel the proposed change and any Contractor quotations related to that change in the Work.
- 1.8.3 When proceeding with a change in the Work under a Change Directive, keep accurate records of daily time sheets for labour and Construction Equipment, and invoices for Product and Construction Equipment costs. Submit such records to the Consultant daily, until the Change Order superseding the Change Directive is issued.

**1.9 Supplemental Instructions**

- 1.9.1 The Consultant may issue Supplemental Instructions to provide clarifications to the Contract Documents, provide additional information, or make minor variations in the Work not involving adjustment in the Contract Price or Contract Time.
- 1.9.2 If the Contractor considers a Supplemental Instruction to require an adjustment in Contract Price or Contract Time, the Contractor shall promptly notify the Consultant and the Owner in writing and shall not proceed with any work related to the Supplemental Instruction pending receipt of a Change Order, a Change Directive, or, in accordance with the dispute resolution provisions of the General Conditions of Contract, a Notice in Writing of a dispute and instructions to proceed.

2 . **PRODUCTS**

2.1 **Not Used**

3 . **EXECUTION**

3.1 **Not Used**

END OF SECTION

---

**1. GENERAL**

**1.1 Summary**

- 1.1.1 Purpose of Section: Section specifies administrative procedures related to progress payments and final payment for The Work.
- 1.1.2 Read in conjunction with: CCDC 2-2020, Part 5, Payment and Supplementary Conditions.

**1.2 Schedule Of Values**

- 1.2.1 Initial Submission and Review: Prior to the first application for payment, submit for Consultant's review an initial schedule of values. Modify the initial schedule of values if and as requested by Consultant. Obtain Consultant's written acceptance of the initial schedule of values prior to the first application for payment.
- 1.2.2 Updated Schedule with Applications for Payment: Together with the first and all subsequent applications for payment, submit updated versions of the schedule of values to indicate the values, to the date of application for payment, of work performed and Products delivered to Place of the Work.
- 1.2.3 Format and Content: Provide the schedule of values in an electronic spreadsheet format based on format provided and content described in latest edition of CCDC 24 – A Guide to Model Forms and Support Documents or a format acceptable to Consultant and Owner.
- 1.2.4 Required Information in Schedule: Provide the schedule of values in an electronic spreadsheet format that provides for inclusion of the following information:
  - .1 Identifying information including title and location of the Work, name of Contractor, number and date of application for payment, and period covered by the application for payment.
  - .2 A work breakdown structure based on Contractor, Subcontractor and sub-Subcontractor work according to each Specification section, and material and labour breakdown. Include separate line items for closeout procedures including closeout submittals, demonstration and training, start-up and testing, and commissioning collectively valued at minimum 0.5% of Contract Price.
  - .3 Provisions for approved Change Orders, allowances, and unit price work so that the breakdown amounts indicated in the schedule of values aggregate to the current total Contract Price. Also provide for indicating the estimated value of Change

---

Directives within the schedule of values, separately from the current total Contract Price.

- .4 For each item in the work breakdown structure, provide as a minimum the following information, under headings as indicated:
  - .1 Breakdown Amount: A dollar amount, including an appropriate pro rata portion of Contactor's overhead and profit.
  - .2 Performed to Date: The value of Work performed and Products delivered to Place of the Work up to the date of the application for payment, stated as a percentage of the Contract Price and in dollars.
  - .3 Previously Performed: The value of Work performed and Products delivered to the Place of the Work for which payment has been previously certified, stated in dollars.
  - .4 Current Period: The value of Work performed and Products delivered to Place of the Work for which Contractor is currently applying for payment, stated in dollars.
  - .5 Balance to Complete: The value of Work not yet performed and Products not yet delivered to Place of the Work, stated in dollars.

### **1.3 Cash Flow Projection**

- 1.3.1 Prior to the first application for payment submit, for Consultant's review, a forecast of approximate monthly progress payments for each month of the Contract Time.
- 1.3.2 Submit revised cash flow forecasts at least monthly. Consultant may also require revised cash flow forecasts when required due to significant changes in rate of progress of the Work or significant changes in the Contract Price.

### **1.4 Workers' Compensation Clearance**

- 1.4.1 Submit proof of workers' compensation clearance (i.e. Workplace Safety and Insurance Board (WSIB)) with each application for payment.

### **1.5 Statutory Declarations**

- 1.5.1 Submit a statutory declaration in the form of CCDC 9A – Statutory Declaration of Progress Payment Distribution by Contractor with each application for payment except the first.

**1.6     Release Of Holdback**

- 1.6.1   Read in conjunction with: CCDC 2, 2020 GC 5.4 and Supplementary Conditions
- 1.6.2   In accordance, with requirements of Construction Act and General Conditions and Supplementary Conditions of the Contact, Owner may consider possibility of releasing holdback annually or on a phased basis, provided that requisite conditions have been satisfied.

**2 .     PRODUCTS**

**2.1     Not Used**

**3 .     EXECUTION**

**3.1     Not Used**

END OF SECTION

## **1. GENERAL**

### **1.1 Summary**

- 1.1.1 Purpose of Section: Section specifies administrative procedures related to project management, project coordination and project meetings.
- 1.1.2 Read in conjunction with: CCDC 2-2020, Part 3, Execution of the Work and Supplementary Conditions.

### **1.2 Contractor's List Of Personnel And Subcontractors**

- 1.2.1 Preparation and Submission: Prepare and submit a complete written list of individuals or firms proposed for each portion of the Work complete with Name, address, telephone number, and email address of entity. In addition, submit list of key personnel assignments, including superintendent and other personnel in attendance at Project site. Identify individuals and their duties and responsibilities; list addresses, telephone numbers, and e-mail addresses.
- 1.2.2 Displaying List: Display copies of list in Project meeting room, temporary field office, and in a prominent location. Maintain list up-to-date at all times.
- 1.2.3 Compatibility of Construction Team: Ensure compatibility within Project team, especially between Subcontractors. Owner takes no responsibility for incompatibility (labour and otherwise) among Subcontractors and Suppliers employed on the Project.
- 1.2.4 Superintendent Appointment: Appoint a senior member of staff as full-time superintendent, with full authority to commit Contractor to methods and construction schedules. Full-time superintendent shall actively participate in administration and maintenance of construction schedule. Do not replace superintendent without Owner's or Consultant's approval.

### **1.3 Contractor's Administrative Responsibilities For Meetings**

- 1.3.1 Unless otherwise indicated, Contractor's responsibilities for all project meetings are as follows:
  - .1 Schedule and conduct meetings throughout the course of The Work, including those requested at the call of Consultant or Owner, at Project site unless otherwise indicated.
  - .2 Prepare agenda for meetings. Distribute the agenda to all invited attendees.
  - .3 Inform participants and others involved, and individuals whose presence is required, of date and time of each meeting. Notify

Owner and Consultant of scheduled meeting dates and times a minimum of 5 working days prior to scheduled meeting dates and times.

- .4 Provide physical space and make arrangements for meetings.
- .5 Preside at meetings.
- .6 Record meeting minutes. Include significant proceedings and decisions. Identify actions by parties.
- .7 Distribute copies of minutes within three working days of meetings and transmit to meeting participants and, affected parties not in attendance.

#### **1.4 Construction Start-Up Meeting**

- 1.4.1 After award of Contract, but no later than 15 calendar days after award of Contract, request meeting of parties in Contract to discuss and resolve administrative procedures and responsibilities.
- 1.4.2 Distribute meeting agenda including relevant items pertaining to administrative, financial, scheduling, health and safety requirements.
- 1.4.3 Attendees:
  - .1 Authorized representative of Consultant, Subconsultants, Owner, Contractor, including superintendent, major Subcontractors, major Suppliers, and other concerned parties must be in attendance.
  - .2 Participants at the meeting must be familiar with Project and authorized to conclude matters relating to the Work.
- 1.4.4 Agenda: Discuss items of significance that could affect progress, including but not limited to the following:
  - .1 Tentative construction schedule and progress schedule.
  - .2 Building permit status.
  - .3 Bonds and insurance certificates.
  - .4 Critical work sequencing, and long-lead items.
  - .5 Designation of key personnel and their duties.
  - .6 Lines of communications.
  - .7 Procedures for processing field decisions and contract modifications including, but not limited to proposed changes (contemplated change orders), change orders, procedures, approvals required, mark-up percentages permitted, time extensions, overtime, and other administrative requirements.
  - .8 Procedures for RFIs.
  - .9 Procedures for testing and inspecting.

- .10 Procedures for processing applications for progress payment including, monthly progress claims, administrative procedures, photographs, and holdbacks.
- .11 Distribution of the Contract Documents.
- .12 Submittal procedures, including schedule of submission of shop drawings, samples, colour chips.
- .13 Preparation of closeout documents including, As-Builts, maintenance manuals, take-over procedures, and warranties.
- .14 Zero Carbon Building Standard requirements.
- .15 RoP Net Zero Emissions Standards
- .16 Climate resiliency requirements during construction
- .17 Mockups
- .18 Working hours.
- .19 Responsibility for temporary facilities and controls including but not limited to, site signage, offices, storage sheds, utilities, hoarding and similar temporary construction.
- .20 Procedures for moisture and mould control.
- .21 Construction waste management and recycling.
- .22 Office, work, and storage areas.
- .23 Equipment deliveries and priorities.
- .24 Health and Safety.
- .25 Security.
- .26 Progress cleaning and housekeeping procedures.
- .27 Owner-supplied products, where applicable.
- .28 Appointment of inspection and testing agencies or firms.
- .29 Insurances, and transcripts of policies.

## **1.5 Construction Progress Meetings**

- 1.5.1 Schedule regular bi-weekly construction progress meetings for the duration of the Work. Contractor shall prepare meeting agendas, chair the meetings, and record and distribute the minutes.
- 1.5.2 Arrange for and provide physical space for meetings, sufficient in size to allow seating for all meeting attendees.
- 1.5.3 Contractor shall record in the meeting minutes significant decisions and identify action items and action dates by attendees or the parties they represent.
- 1.5.4 Contractor shall distribute copies of minutes within three Working Days after each meeting to meeting attendees and any affected parties who may not be in attendance.
- 1.5.5 Ensure that Subcontractors attend as and when appropriate to the progress of the Work.

1.5.6 Agenda for each meeting shall include the following, as a minimum:

- .1 Approval of minutes of previous meeting.
- .2 Work progress since previous meeting.
- .3 Field observations, including any problems, difficulties, or concerns.
- .4 Construction progress schedule.
- .5 Submittals schedule.
- .6 Proposed changes in the Work.
- .7 Requests for information.
- .8 Site safety issues.
- .9 Other business.

**1.6 Preinstallation Meetings**

1.6.1 Conduct a preinstallation meeting at Project site before each construction activity when required by Specifications Sections and when required for coordination with other construction.

1.6.2 Attendees:

- .1 Invite Subcontractor and representatives of manufacturers and fabricators involved in, or affected, by the work of the trade involved and its coordination or integration with other materials and installations that have preceded or will follow.
- .2 Invite Consultant, Owner and inspection and testing company's representative who may elect to attend.

1.6.3 Agenda: Discuss following items as a minimum:

- .1 Work included.
- .2 Materials to be used.
- .3 Storage and handling of materials.
- .4 Installation procedures.
- .5 Sequence and quality control.
- .6 Project staffing.
- .7 Review of mockups.
- .8 Possible conflicts.
- .9 Compatibility requirements.
- .10 Time schedules.
- .11 Weather limitations.
- .12 Manufacturer's written instructions.
- .13 Warranty requirements.
- .14 Acceptability of substrates.
- .15 Temporary facilities and controls.

- 
- .16 Restrictions on areas of work and other matters affecting construction including space and access limitations.
  - .17 Regulations of authorities having jurisdiction.
  - .18 Testing and inspecting requirements.
  - .19 Coordination with other work.
  - .20 Required performance results.
  - .21 Protection of adjacent work.
  - .22 Protection of construction and personnel.
- 1.6.4 Reporting: Record significant conference discussions, agreements, and disagreements, including required corrective measures and actions.
- .1 Do not proceed with installation if the conference cannot be successfully concluded. Initiate whatever actions are necessary to resolve impediments to performance of The Work and reconvene the conference at earliest feasible date.

## **2 . PRODUCTS**

### **2.1 Not Used**

## **3 . EXECUTION**

### **3.1 Not Used**

END OF SECTION

## **1. GENERAL**

### **1.1 Summary**

- 1.1.1 Purpose of Section: Section specifies Contractor's responsibilities for preparation and submission of schedules and other documentation related to tracking construction progress.
  - .1 Schedules inform Owner and Consultant of actual progress versus planned progress and provide assurance that scheduling issues are being proactively identified and addressed in a timely manner, and that planned progress is being maintained as closely as possible.
- 1.1.2 Read in conjunction with: CCDC 2-2020, Part 3, Execution of the Work and Supplementary Conditions.

### **1.2 Construction Schedule**

- 1.2.1 Refer to CCDC 2, 2020, GC. 3.4 and Supplementary Conditions.
- 1.2.2 Format and Content:
  - .1 Submit a comprehensive, fully developed, detailed horizontal bar chart (GANTT) construction schedule with activities itemized to enable Owner and Consultant to monitor progress of The Work.
  - .2 Prepare schedule in the form of a Critical Path Method (CPM) Gantt chart using appropriate scheduling software (MS Project or similar)
  - .3 Provide a work breakdown structure identifying key activities, work packages, and major milestones, including long delivery Products, inspection and testing activities, preparation and review of mock-ups, Owner decisions for cash allowances, shutdown or closure activities, delivery of Owner supplied Products, Owner performed work, demonstration and training activities, and similar items, at a sufficient level of detail to effectively manage construction progress.
  - .4 Indicate milestone dates for Ready-for-Takeover and Substantial Performance of the Work as applicable.
  - .5 Constraints: Include constraints and work restrictions indicated in the Contract Documents including, but not limited to, phasing, work by Owner and Owner-supplied Products (if any), and work restrictions, and show how the sequence of the Work is affected.
- 1.2.3 Submission:

- 
- .1 Submit initial schedule to Owner and Consultant within 15 Working Days after Contract award.
  - .2 Submit schedule via e-mail as .pdf file.
  - .3 Consultant will review format and content of initial schedule and request necessary changes, if any, within 5 Working Days after receipt.
  - .4 If changes are required, resubmit finalized initial schedule within 5 Working Days after return of reviewed copy.
  - .5 Submit updated progress schedule monthly to Owner and Consultant, indicating actual and projected start and finish dates with report date line and progress, activity relationships, critical path, float, and baseline comparison to current progress.
    - .1 Review progress since the last meeting. Determine whether each activity is on time, ahead of schedule, or behind schedule, in relation to Contractor's Construction Schedule.
    - .2 Determine how construction behind schedule will be expedited and secure commitments from parties involved to do so.
  - .6 At progress meeting, discuss whether schedule revisions are required to ensure that current and subsequent activities will be completed within the Contract Time.
  - .7 Discuss construction schedule at progress site meetings, and identify activities that are behind schedule and provide measures to regain slippage.
  - .8 Revise schedule immediately after each meeting or other activity where revisions have been recognized or made. Issue updated schedule concurrently with the minutes of each such meeting.
  - .9 As the Work progresses, indicate completion percentage for each activity.
  - .10 Distribute copies of approved schedule to Consultant, Owner, separate contractors, testing and inspecting agencies, and other parties identified by Contractor with a need-to-know schedule responsibility.

### **1.3 Schedule Of Submittals**

#### **1.3.1 Format and Content:**

- .1 Prepare schedule identifying all required Shop Drawing, Product data, and sample submissions, including samples required for testing and including those for Owner supplied Products (if any).
- .2 Prepare schedule in electronic format.

- .3 Provide a separate line for each required submittal, organized by Specifications section names and numbers, and further broken down by individual Products and systems as required.
- .4 For each required submittal, show planned earliest date for return of reviewed submittal by Consultant and latest date for return of reviewed submittal without causing delay.
- .5 Allow time in schedule for resubmission of submittals, should resubmission be necessary.

1.3.2 Submission:

- .1 Submit initial schedule to Consultant within 20 Working Days after Contract award.
- .2 Submit schedule via e-mail as .pdf file.
- .3 Consultant will review format and content of initial schedule and request necessary changes, if any, within 5 Working Days after receipt.
- .4 If changes are required, resubmit finalized schedule within 5 Working Days after return of review copy.
- .5 Submit updated submittals schedule monthly to Owner and Consultant.

**1.4 Schedule Management**

- 1.4.1 A schedule submitted as specified and accepted by Consultant shall become the baseline schedule and shall be used as the baseline for updates.
- 1.4.2 At each regular progress meeting, review and discuss current construction progress and submittals schedules with Consultant and Owner, including activities that are behind schedule and planned measures to regain schedule slippage in key areas on or near the critical path.
- 1.4.3 Activities considered behind schedule are those with start or completion dates later than the dates shown on the baseline schedule.

**1.5 Recording Actual Site Conditions On As-Built Drawings**

- 1.5.1 For the purposes of this Section, the following definitions as defined by the Ontario Association of Architects Practice Tip – PT.14 Version 1.1 apply:
  - .1 As-built drawings: drawings usually prepared by Contractor as it constructs the project and upon which it documents the actual locations of building components and changes to the original contract documents. These, or a copy of same, are typically turned over to the Consultant or Owner at completion of the project.

- 
- .2 Record drawings: drawings usually prepared by the Consultant when contracted to do so. These are usually a composite of the original drawings, changes known to the Consultant and information taken from the Contractor's as-built drawings. Responsibility for preparation of record drawings may be delegated to Contractor if indicated as such in Contract Documents.
  - 1.5.2 Clearly label each drawing as "AS-BUILT DRAWING". Record information concurrently with construction progress. Do not conceal Work until required information is recorded.
  - 1.5.3 Accurately and neatly record deviations from Contract Documents, including addenda, Supplementary Instructions and Change Orders, caused by site conditions.
  - 1.5.4 Annotate with coloured felt tip marking pens, maintaining separate colours for each major system, for recording changed information. Digital annotation of as-built data is permitted.
  - 1.5.5 Clearly and legibly mark each item to record the actual construction, including but not limited to:
    - .1 Measured depths of foundation elements in relation to finished first floor datum.
    - .2 Measured horizontal and vertical locations of underground utilities and related components, referenced to permanent surface improvements.
    - .3 Measured locations of pipes, ducts, conduits, outlets, fixtures, access panels, and related components, referenced to visible and accessible features of the construction.
    - .4 Measured locations of interior utilities and related components, referenced to visible and accessible features of the construction.
    - .5 Field changes of dimensions and details.
    - .6 Changes made by Change Orders and Supplemental Instructions.
    - .7 References to Shop Drawings, where Shop Drawings show more detail.
    - .8 Field changes of dimension and detail.
    - .9 Details not shown on original Contract Drawings.
    - .10 Life Safety elements including, but not limited to:
      - .1 Smoke compartmentalization.
      - .2 Exit signage.
      - .3 Fire extinguishers.
      - .4 Fire alarm devices.

- .5 Pull stations.
- .6 Sprinkled areas.
- .11 Refer to Divisions 21, 22, 23 and Division 26 for supplementary requirements.
- 1.5.6 Maintain manufacturer's certifications, inspection certifications, field test records, required by individual specifications sections.
- 1.5.7 Store As-Built Drawings and other documentation separately from construction documents in a secure area. Provide appropriate filing cabinets, shelving, or racks for storage. Digital filing of as-built data is also permitted.
- 1.5.8 Label As-Built Drawings and other documentation with section numbers that correspond to Table of Contents of Project Manual. Clearly label each document "AS-BUILT" in legible font.
- 1.5.9 Maintain the As-Built Drawings and other documentation in legible and clean condition, free from damage or deterioration. As-built Drawings and other documentation must not be used for construction purposes.
- 1.5.10 Keep As-Built Drawings and other documentation readily available for inspection by Consultant.
- 1.5.11 Refer to Section 01 78 00 for additional requirements.

## **1.6 Photographic Documentation**

- 1.6.1 Preconstruction Photographs: Before commencement of the Work, take photographs of the Place of the Work and surrounding areas, including existing items to remain during construction, from different vantage points, as directed by Consultant. Submit video recording to supplement photographs to show existing conditions prior to start of The Work.
  - .1 Take additional photographs as required to flag excavation areas, or record settlement or cracking of adjacent structures, pavements, and improvements.
- 1.6.2 Concealed Work Photographs: Take photographs of concealed work, such as underground utilities, underslab services, piping, conduits, waterproofing, air barriers or vapour retarders, prior to installing or enclosing such work.
- 1.6.3 Periodic Construction Photographs: Arrange for periodic digital photography to document and provide a photographic record of the progress of the Work. Take digital progress photographs weekly from date of commencement of The Work until date of Ready-for-Takeover, sufficient to record the state of The Work.
- 1.6.4 Identify each photograph by project name and date taken. Maintain a key plan with each set to identify photographic locations.

- 
- 1.6.5 Submission: Submit .jpg format files in standard resolution via e-mail monthly with application for payment.
- .1 Submit photographs as originally recorded, without alteration, manipulation, editing, or modification.
  - .2 Metadata: Ensure photographs accurately provide date, time, and location data for each picture.
- 1.6.6 Do not use progress or any other Project photographs for promotional purposes without Owner's written consent.

**2 . PRODUCTS**

**2.1 Not Used**

**3 . EXECUTION**

**3.1 Not Used**

END OF SECTION

---

**1. GENERAL**

**1.1 Summary**

- 1.1.1 Purpose of Section: Section specifies administrative procedures for preparation and submission of Shop Drawings, Product Data and other documentation related to the Work.
- 1.1.2 Read in conjunction with: CCDC 2-2020, Part 3, Execution of the Work and Supplementary Conditions.

**1.2 Definitions**

- 1.2.1 Submittals: This refers to documents or items required by the Contract Documents to be provided by the Contractor, such as:
  - .1 Shop Drawings, samples, models, mock-ups to indicate details or characteristics, before the portion of the Work that they represent can be incorporated into the Work; and
  - .2 As-built drawings and manuals to provide instructions to the operation and maintenance of the Work.

**1.3 Administrative Requirements**

- 1.3.1 Provide submittals in the language of the Contract.
- 1.3.2 Submit specified submittals to Consultant for review. Submit with reasonable promptness and in orderly sequence so as to not cause delay in the Work. Failure to submit in ample time is not considered sufficient reason for an extension of Contract Time or for Product substitutions or other deviations from the Drawings and Specifications.
- 1.3.3 Where required by authorities having jurisdiction, provide submittals to such authorities for review and approval.
- 1.3.4 Do not proceed with Work affected by a submittal until review is complete.
- 1.3.5 Present Shop Drawings, Product data, and samples in SI metric units unless indicated otherwise.
- 1.3.6 Review submittals, provide verified field measurements where applicable, and affix Contractor's review stamp prior to submission to Consultant. Contractor's review stamp represents that necessary requirements have been determined and verified, and that the submittal has been checked and coordinated with requirements of the Work and Contract Documents.
- 1.3.7 Verify field measurements and that affected adjacent work is coordinated.

- 1.3.8 Submittals not meeting specified requirements will be returned with comments.
- 1.3.9 Do not propose Substitutions or deviations from Contract Documents via Shop Drawing, Product data and sample submittals. Consultant will return such submissions without review. Refer to Section 01 25 00 for Substitution Procedures.

#### **1.4 Submittal Procedures, Generally**

- 1.4.1 Schedule of Submittals: Refer to 01 32 00 - Construction Progress Documentation.
- 1.4.2 Administrative Requirements:
  - .1 Assemble submittals and transmit to Consultant by sending via email. Include PDF transmittal form. Include information in email subject line clearly identifying project name, project no, and submittal scope.
  - .2 Processing Time: Allow time for submittal review, including time for resubmittals, as follows.
    - .1 Time for review shall commence on Consultant's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
    - .2 Initial Review: Allow 10 working days for initial review of each submittal. Allow additional time if coordination with subsequent submittals is required. Consultant will advise Contractor when a submittal being processed must be delayed for coordination.
    - .3 Resubmittal Review: Allow 10 working days for review of each resubmittal.
  - .3 Deviations and Additional Information:
    - .1 On each submittal, clearly indicate deviations from requirements in the Contract Documents, including minor variations and limitations; include relevant additional information and revisions, other than those requested by Consultant on previous submittals.
    - .2 Indicate by highlighting on each submittal or noting on attached separate sheet.
    - .3 Delete information not applicable to project.
    - .4 Supplement standard information to provide details applicable to project.
    - .5 Identify options requiring selection by Consultant.

- 
- 1.4.3 Submittals Format: Submit electronic copies of each submittal unless otherwise indicated. Include the following information in each submittal:
- .1 Date and revision dates.
  - .2 Project title and number.
  - .3 Location(s) where product is to be installed, as appropriate.
  - .4 Other necessary identification.
  - .5 Remarks.
  - .6 Transmittal letter, containing:
    - .1 Date.
    - .2 Project title and number.
    - .3 Contractor's name and address.
    - .4 Unique submittal number, including revision identifier. Include Specification Section number with sequential alphanumeric identifier and alphanumeric suffix for resubmittals.
    - .5 Submittal purpose and description.
    - .6 Signature of transmitter.
    - .7 Other pertinent data.
  - .7 Contractor's stamp, signed by Contractor's authorized representative certifying approval of submissions, verification of field measurements and compliance with Contract Documents.

**1.5 Contractor's Review Process And Responsibility**

- 1.5.1 Submit to Consultant and to authorities having jurisdiction (as required), documents listed to be submitted for review. Submit promptly and in orderly sequence to not cause delay in Work.
- 1.5.2 Do not submit materials that are not identified in Contract Documents, such submissions will be returned without review.
- 1.5.3 Failure to submit documentation in ample time is not considered sufficient reason for increases to Contract Price or Contract Time. No claims for extension by reason of such default will be allowed.
- 1.5.4 Final approval of authorities having jurisdiction, where required, shall be obtained prior to submitting Shop Drawings or other documentation to Consultant.
- 1.5.5 Do not proceed with, or fabricate Work affected by specific submittals until review is complete.
- 1.5.6 Present Shop Drawings, Product Data, samples and mock-ups in SI Metric or Imperial units to match measurement system indicated on Drawings.

- 1.5.7 Review submittals prior to submission to Consultant. This review shall represent that necessary requirements have been determined and verified, and that each submittal has been checked and coordinated with requirements of Work and Contract Documents. Submittals not stamped, signed, and dated by the Contractor, and identified as to specific project will be returned without being examined and considered rejected.
- 1.5.8 Notify Consultant, in writing at time of submission, identifying deviations from requirements of Contract Documents stating reasons for deviations.
- 1.5.9 Verify field measurements and affected adjacent Work are coordinated. Confirm and coordinate requirements pertaining to fabrication processes, quantities, construction techniques, installation and similar information.
- 1.5.10 Contractor's responsibility for errors and omissions in submission is not relieved by Consultant's review of submittals.
- 1.5.11 Contractor's responsibility for deviations in submission from requirements of Contract Documents is not relieved by Consultant's review.
- 1.5.12 Record each review as well as inspection and testing reports in manner suitable for inclusion in closeout documentation and submission at completion of Project.
- 1.5.13 Keep one reviewed copy of each submission on site.

## **1.6 Consultant's Review And Responsibilities**

- 1.6.1 Consultant's General Review:
  - .1 Consultant will perform general review of The Work for general conformance with Contract Documents, Code and authorities having jurisdiction. Review includes review of Shop Drawings, review of field Work and review of reports produced by various inspection and testing agencies.
  - .2 Review of Contractors' submittals by Consultant is for sole purpose of ascertaining conformance with general concept.
  - .3 This review shall not mean that Consultant approves detail design inherent in submittals, responsibility for which shall remain with Contractor, and such review shall not relieve Contractor of responsibility for errors or omissions or of responsibility for meeting requirements of Contract Documents.
  - .4 Without restricting generality of foregoing, Contractor is responsible for dimensions to be confirmed and correlated at job site, for information that pertains solely to fabrication processes or to techniques of construction and installation and for co-ordination of Work of sub-trades.

1.6.2 Submittal Review and Actions: Consultant will review each submittal, indicate corrections or revisions required, and return annotated files to Contractor. Consultant will indicate, via markup on each submittal, the appropriate action, as follows:

- .1 "REVIEWED FOR GENERAL DESIGN" OR "REVIEWED AS NOTED": Upon review by Consultant, no apparent errors or omissions are discovered by Consultant, or only minor corrections are to be made. Copies will be returned to Contractor and fabrication and installation of Work may proceed.
- .2 "REVISE AND RESUBMIT": Make changes as Consultant may require, consistent with Contract Documents. When resubmitting, notify Consultant in writing of revisions other than those requested.
- .3 "REJECTED": Shop drawings are rejected. Noted copy will be returned and resubmission of corrected submittals, through same procedure indicated above, must be performed before fabrication and installation of Work proceeds.

1.6.3 Fabrication Guidelines:

- .1 Do not fabricate any part of the Work until Shop Drawings are reviewed as "REVIEWED FOR GENERAL DESIGN" or "REVIEWED AS NOTED".
- .2 Do not resubmit Shop Drawings indicated as "REVIEWED FOR GENERAL DESIGN" or "REVIEWED AS NOTED".
- .3 Resubmit Shop Drawings indicated as "REVISE AND RESUBMIT" with required changes and comments addressed. Insert letter "R" after Shop Drawing number on resubmitted Shop Drawings. Re-date and re-sign resubmitted Shop Drawings. Identify revisions from earlier submissions graphically on revised Shop Drawings;

## **1.7 Product Data**

1.7.1 Mark product data sheets to show applicable Products and options. Include the following:

- .1 Manufacturer's written recommendations, Product Specifications, and installation instructions.
- .2 Wiring diagrams showing factory-installed wiring.
- .3 Printed performance curves and operational range diagrams.
- .4 Testing by recognized testing agency.
- .5 Compliance with specified standards and requirements.

---

**1.8     Shop Drawings**

- 1.8.1 Provide Shop Drawings required by Contract Documents. Insert Contractor's review stamp complete with date and signature of Contractor's reviewer.
- 1.8.2 Do not base Shop Drawings on reproductions of the Contract Documents or standard printed data.
- 1.8.3 Include the following on Shop Drawings as applicable:
  - .1 Project-specific information, drawn accurately to scale.
  - .2 fabrication methods.
  - .3 layout, showing dimensions, including verified field dimensions, and clearances.
  - .4 plans, sections and details;
  - .5 materials thicknesses and finishes;
  - .6 setting, erection and sealing details.
  - .7 methods of securing, fastening and anchoring including field connections.
  - .8 capacities.
  - .9 performance characteristics.
  - .10 standards.
  - .11 operating weight.
  - .12 wiring diagrams.
  - .13 single line and schematic diagrams.
  - .14 relationship to adjacent work.
  - .15 engineer's stamp (as applicable)

**1.9     Delegated-Design (Professional Engineer's Shop Drawings)**

- 1.9.1 It must be understood that Drawings and details provided in Contract Documents are diagrammatic, and are intended to show design concept, aesthetics, interfacing requirements, configuration, and arrangement; they are not intended to identify or completely resolve problems of thermal and structural movements, assembly framing, engineering design, fixings and anchorages.
- 1.9.2 Where Specifications delegate design of a specific element or system to Contractor, Contractor must engage a registered professional engineer to fully design system including, sizing of additional supports, anchorages, and bracing as required for safe and secure installation.
  - .1 Professional Engineer's Specific Responsibilities:
    - .1 If required, submit "Confirmation of Commitment" forms to local authorities.

- .2 Design components requiring structural or other engineering performance.
- .3 Determine specific requirements for assemblies, connections, sizes, and joint spacing.
- .4 Produce, review, stamp, and sign Shop Drawings.
- .5 In addition to Shop Drawings, submit statement for each product and system assigned to Contractor. Clearly state that products and systems comply with performance and design criteria outlined in Contract Documents. Provide list of calculations upon request.
- .6 Inspect components during fabrication and erection.
- .7 Perform field review and submit field reports within three days of site visits.

**1.10 Samples**

- 1.10.1 Submit samples for Consultant's review in triplicate where specified in the technical Specifications. Label samples as to origin, Project name, and intended use.
- 1.10.2 Submit Samples for review of kind, colour, pattern, and texture and for a comparison of these characteristics between submittal and actual component as delivered and installed. Include name of manufacturer and Product name on label.
- 1.10.3 For each sample, exhibit materials and finishes, such as colour (including maximum colour range within each specified colour), sheen, tone, texture, range of blemishes and other markings. Where colour, pattern or texture is criterion, submit full range of samples.
- 1.10.4 Adjustments made on samples by Consultant are not intended to change Contract Price. If adjustments affect value of Work, state such in writing to Consultant prior to proceeding with Work.
- 1.10.5 Contractor may be asked to remove and discard Products for which samples have not been reviewed and accepted by Consultant.
- 1.10.6 Consultant selection from samples is not intended to change the Contract Price or Contract Time. If a selection would affect the Contract Price or Contract Time, notify Consultant in writing prior to proceeding with the Work.
- 1.10.7 Resubmit samples as required by Consultant to comply with Contract Documents.
- 1.10.8 Reviewed and accepted samples will establish the standard against which installed Work will be reviewed.
- 1.10.9 Colours:

- .1 Where a required colour, pattern or texture has not been specified, submit full range of available Products meeting other specified requirements.
- .2 Obtain direction on colours and gloss values in advance of need. If requested, submit samples for colour and gloss selection.
- .3 Follow colour schedule provided by Consultant and use colours and glosses designated.

#### **1.11 Miscellaneous Submittals**

1.11.1 When required by Contract Documents, submit informational and miscellaneous submittals required by Contract Documents (e.g. plans, reports, certifications, results, records, and similar submittals) for Consultant's review.

1.11.2 Test Reports:

- .1 Submit test reports in accordance with requirements of specification Sections and as requested by Consultant.
- .2 Reports must be signed by authorized official of testing laboratory and indicate that material, Product or system is identical to material, Product or system to be provided for Project, and has been tested in accordance with specified requirements.
- .3 Testing must have been within three years of date of Contract award.

1.11.3 Certificates:

- .1 Submit certificates in accordance with requirements of specification Sections and as requested by Consultant.
- .2 Statements must be printed on manufacturer's letterhead and signed by responsible officials of manufacturer of product, system or material, and attesting that product, system or material meets specification requirements.
- .3 Certificates must be project-specific, clearly indicated Project name, and dated after date of Contract award.

#### **1.12 Coordination/Interference Drawings**

1.12.1 For all locations, before commencing installation, prepare coordination/interference drawings showing relationship of items, including, but not limited to, structure, electrical, cable trays, communication system, ductwork, conduits, piping, sprinklers, ceiling supports and framing, communication and specialized equipment located within ceiling and shaft spaces.

- 
- 1.12.2 Contractor shall lead process of interference Drawings in coordination with mechanical, electrical or other Subcontractors as applicable.
- 1.12.3 Prepare Drawings indicating relationship of new and existing and/or unforeseen conditions including new construction or construction which existed prior to commencement of work in the area. For construction in existing areas, survey existing conditions. Show existing conditions on interference Drawings and coordinate such conditions with new work. Submit or post coordination/interference drawing files in PDF format in accordance with Shop Drawing requirements specified in this Section.
- .1 Provide Project-specific information, drawn accurately to a scale large enough to indicate and resolve conflicts. Do not base coordination/interference drawings on standard printed data.
  - .2 Use applicable Drawings as a basis for preparation of coordination/interference drawings. Prepare sections, elevations, and details as needed to describe relationship of various systems and components.
- 1.12.4 Consultant Review: Consultant will review coordination/interference drawings to confirm that, in general, the Work is being coordinated, but not for the details of the coordination, which are Contractor's responsibility. If Consultant determines that coordination/interference drawings are not being prepared in sufficient scope or detail, or are otherwise deficient, Consultant will so inform Contractor, who shall make suitable modifications and resubmit.
- 1.12.5 Installation shall proceed in accordance with final approved interference Drawings. Work carried out without final approved interference Drawings and which does not meet requirements specified in Contract Documents or specified ceiling heights shall be removed, re-coordinated and re-installed at no additional cost to Owner.
- 1.12.6 Coordination/Interference Drawing Organization: Organize coordination/interference drawings as follows:
- .1 Floor Plans and Reflected Ceiling Plans: Show architectural and structural elements, and mechanical, plumbing, fire-protection, fire-alarm, and electrical Work. Show locations of visible ceiling-mounted devices relative to acoustical ceiling grid. Supplement plan drawings with section drawings where required to adequately represent the Work.
  - .2 Plenum Space: Indicate subframing for support of ceiling and wall systems, mechanical and electrical equipment, and related Work. Locate components within plenums to accommodate

- 
- layout of light fixtures and other components indicated on Drawings. Indicate areas of conflict between light fixtures and other components.
- .3 Mechanical Rooms: Provide coordination/interference drawings for mechanical rooms, showing plans and elevations of mechanical, plumbing, fire-protection, fire-alarm, and electrical equipment.
  - .4 Structural Penetrations: Indicate penetrations and openings required for all disciplines.
  - .5 Slab Edge and Embedded Items: Indicate slab edge locations and sizes and locations of embedded items for metal fabrications, sleeves, anchor bolts, bearing plates, angles, door floor closers, slab depressions for floor finishes, curbs and housekeeping pads, and similar items.
  - .6 Mechanical and Plumbing Work: Show the following:
    - .1 Sizes and bottom elevations of ductwork, piping, and conduit runs, including insulation, bracing, flanges, and support systems.
    - .2 Dimensions of major components, such as dampers, valves, diffusers, access doors, cleanouts and electrical distribution equipment.
    - .3 Fire-rated enclosures around ductwork.
  - .7 Access Panels:
    - .1 Before commencing mechanical or electrical work after coordination with respective trades, prepare set of reflected ceiling plans indicating exact locations and sizes of access panels and doors. Prepare Drawings for areas/rooms designated by Consultant.
    - .2 Submit Drawings to Consultant for review. Allow Consultant to revise layout or quantity of access doors and panels, by relocating related building services a maximum of 2000 mm (6' - 7"), at no additional cost to Owner.
    - .3 Should a relocation exceed 2000 mm (6' - 7"), Contract Price will be adjusted in accordance with provisions for changes in Contract Documents.
    - .4 Finish access panels and doors to match adjacent wall and/or ceiling finish unless otherwise specified or indicated.
  - .8 Electrical Work: Show the following:
    - .1 Runs of vertical and horizontal conduit 32 mm (1-1/4 inches) in diameter and larger.

- .2 Light fixture, exit light, emergency battery pack, smoke detector, and other fire-alarm locations.
- .3 Panel board, switchboard, switchgear, transformer, busway, generator, and motor-control center locations.
- .4 Location of pull boxes and junction boxes, dimensioned from column center lines.
- .9 Fire-Protection System: Show the following:
  - .1 Locations of standpipes, mains piping, branch lines, pipe drops, and sprinkler heads.
- 1.12.7 Mechanical and Electrical Location Drawings: Mechanical and electrical Drawings indicate approximate locations diagrammatically. Prior to installation, request and obtain final locations and arrangement Drawings for mechanical and electrical items. Allow Consultant to adjust final locations within a 1500 mm (5') radius from diagrammatic position indicated, without change to Contract Price.
  - .1 In case of conflicts between locations of mechanical and electrical items, such as switches and fixtures, locations indicated on architectural Drawings shall take precedence.
  - .2 Align and cluster devices and fitments neatly in accordance with specified mounting heights, properly aligned horizontally and vertically.

**2 . PRODUCTS**

**2.1 Not Used**

**3 . EXECUTION**

**3.1 Not Used**

END OF SECTION

## 1. **GENERAL**

### 1.1 **Summary**

- 1.1.1 Purpose of Section: Section specifies general requirements pertaining to health and safety for the Work.
- 1.1.2 Read in conjunction with: CCDC 2-2020, Part 9, Protection of Persons and Property and Supplementary Conditions.

### 1.2 **Relevant Statutes And Regulations**

- 1.2.1 Ontario:
  - .1 Occupational Health and Safety Act - R.S.O. 1990, C. O.1 (as amended)
  - .2 Construction Projects - Ontario Regulation 213/91 (as amended)
  - .3 Asbestos on Construction Projects and in Buildings and Repair Operations - Ontario Regulation 278/05
  - .4 WHMIS Regulation - Ontario Regulation 860 (as amended)

### 1.3 **General Requirements**

- 1.3.1 Role of Constructor: Contractor must assume role of "Constructor" or "Principal Contractor" as defined under applicable health and safety regulations.
- 1.3.2 Health and Safety Plan: Prepare site-specific Health and Safety Plan before commencement of Work. Consultant's review of Health and Safety plan does not imply approval nor diminish Contractor's responsibility in adhering to requirements of Authorities Having Jurisdiction.
- 1.3.3 First Aid: Provide necessary equipment and facilities for first aid in compliance with requirements of applicable health and safety regulations.
- 1.3.4 Health and Safety Coordinator: Appoint knowledgeable and experienced coordinator responsible for training, enforcing, and monitoring the Health and Safety Plan.
- 1.3.5 Fire Safety Plan:
  - .1 Comply with Section 2.8 of Fire Code in force at Place of the Work.
  - .2 Develop Fire Safety Plan that includes designation of personnel, emergency procedures, fire hazard control, and maintenance of firefighting facilities.

- .3 Submission and Accessibility: Submit Fire Safety Plan to local Fire Department for approval and keep approved on-site in Fire Safety Plan a secure location.
- 1.3.6 Accident Reporting: Report all accidents causing injury to personnel or damage to property to Owner and provide detailed information.
- 1.3.7 Claim Reporting: Promptly report any claims related to accidents or damage to Owner. Provide detailed information.

## **2 . PRODUCTS**

### **2.1 Not Used**

## **3 . EXECUTION**

### **3.1 Not Used**

END OF SECTION

## **1. GENERAL**

### **1.1 Summary**

- 1.1.1 Section includes general requirements and procedures for achieving targets set for embodied carbon emissions required for certification under the CaGBC ZCB-Design standard.
- 1.1.2 Contractor is responsible for providing products and procedures necessary to support achieving ZCB-Design targets specified for Project. While Technical Specifications may specify requirements contributing to such targets, Contractor must provide additional materials and procedures necessary to achieve specified targets.

### **1.2 References**

- 1.2.1 Carbon Leadership Forum (CLF)
  - .1 North American Material Baselines Report, 2023.
- 1.2.2 Canadian Green Building Council (CaGBC)
  - .1 Zero Carbon Building – Design Standard
- 1.2.3 International Organization for Standardization (ISO)
  - .1 ISO 14025: Environmental labels and declarations — Type III environmental declarations — Principles and procedures
  - .2 ISO 14040: Environmental management — Life cycle assessment — Principles and framework
  - .3 ISO 14044: Environmental management — Life cycle assessment — Requirements and guidelines
  - .4 EN 15804: Sustainability of construction works, Environmental product declarations, Core rules for the product category of construction products
  - .5 ISO 21930: Sustainability in buildings and civil engineering works — Core rules for environmental product declarations of construction products and services

### **1.3 Definitions**

- 1.3.1 Embodied Carbon: The carbon dioxide (CO<sub>2</sub>) emissions associated with the manufacturing, transport, installation, use, and end-of-life of building materials.
- 1.3.2 Environmental Product Declaration (EPD): A standardized document providing data on the environmental impact of a product.
  - .1 Industry-Wide (Generic) EPD: Provide products with third-party certification (Type III), including external verification, in which

the manufacturer is explicitly recognized as a participant by the program operator. EPD must conform to ISO 14025, 14040, 14044, and EN 15804 or ISO 21930 and have at least a cradle to gate scope.

- .2 Product-Specific Declaration: A product with a publicly available, critically reviewed life-cycle assessment conforming to ISO 14044 that has at least a cradle to gate scope.
  - .3 Product-Specific Type III EPD: A product with a third-party certification, including external verification, in which the manufacturer is explicitly recognized by the program operator. EPD must conform to ISO 14025, 14040, 14044, and EN 15804 or ISO 21930 and have at least a cradle to gate scope.
- 1.3.3 Global Warming Potential (GWP): A metric used to quantify the impact of greenhouse gases in terms of CO<sub>2</sub> equivalents (kg CO<sub>2</sub>e).
- 1.3.4 Life Cycle Assessment (LCA): A systematic procedure for examining the inputs and outputs of materials and energy, and the associated environmental impacts throughout the product's life cycle.

#### **1.4 Embodied Carbon Targets**

- 1.4.1 Whole Building Embodied Carbon Target: Project is required to achieve a maximum carbon intensity of 350 kg CO<sub>2</sub> e/m<sup>2</sup> of built floor area or a minimum 20% improvement in embodied carbon over a functionally equivalent baseline modelled by Sustainability Consultant and included in the Contract Documents.
- 1.4.2 Embodied Carbon Targets for Individual Materials: Unless specified otherwise in individual Specification Sections, maximum GWP target values for individual materials for this project are those specified in CLF North American Material Baselines Report, current edition.
- 1.4.3 Embodied Carbon Baseline Model: Sustainability Consultant has prepared an embodied carbon model for Project. Embodied carbon model serves as a tool to establish a possible pathway to achieving Whole Building Embodied Carbon Target specified for this Project. Contractor will be responsible for reviewing and updating Baseline Model during construction with actual materials quantities used and products used in the work, to ensure compliance with embodied carbon targets set for project. Baseline model is attached to this Specification.

---

**1.5 Administrative Requirements**

- 1.5.1 Sustainability Kick-Off Meeting: Schedule pre-construction meeting at a time convenient for Owner, Consultant, and Contractor to discuss low-carbon construction requirements, strategies, and compliance with ZCB Standard.
- .1 Attendees must include:
    - .1 Authorized representatives of the Owner
    - .2 Owner's Commissioning Authority
    - .3 Architect and other consultants
    - .4 Contractor and superintendent
    - .5 Low-carbon design coordinator
    - .6 Major subcontractors
    - .7 Suppliers
    - .8 Other relevant parties
  - .2 Participants must be familiar with Project and authorized to make decisions regarding Work.
  - .3 Agenda: must cover significant items related to low-carbon design requirements, including:
    - .1 Low-carbon design targets
    - .2 General requirements for low-carbon design procurement and documentation
    - .3 Project closeout requirements and low-carbon design certification procedures
    - .4 Role of the Contractor's low-carbon design coordinator
    - .5 Construction operations, low-carbon design requirements, and restrictions
  - .4 Minutes: Record and distribute meeting minutes within three days of the meeting.

**1.6 Contractor Cooperation**

- 1.6.1 Coordinate with Sustainability Consultant to align embodied carbon reduction strategies for project and support ZCB certification requirements.
- 1.6.2 Cooperate with Consultant team and respond to questions and requests from Consultant and CaGBC regarding ZCB-Design requirements that are Contractor's responsibility, including those related to product selection, product qualities, or Contractor's procedures. Document responses as submittals.

1.6.3 Low-Carbon Sustainability Coordinator:

- .1 Engage an experienced professional to coordinate sustainability requirements. Low-Carbon Sustainability Coordinator must have received formal training in one of following courses:
  - .1 Low Carbon Training Foundations Course offered by CaGBC or partner organization available from: <https://lowcarbontraining.ca/>
  - .2 Equivalent LCA coursework offered by a reputable higher learning organization.
  - .3 Submit proof of training upon request.
- .2 Low-Carbon Sustainability Coordinator must be knowledgeable about ZCB-Design Standard.

**1.7 Submittals**

- 1.7.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.7.2 Preliminary Action Plan: Develop an Embodied Carbon Action Plan detailing strategies for reducing embodied carbon throughout project lifecycle, including procurement, and construction stages. Action Plan must include:
  - .1 Identification of major sources of embodied carbon.
  - .2 Specific strategies and materials to be used for reducing embodied carbon.
  - .3 Roles and responsibilities of team members.
- .2 Time submittal with submission of Schedule of Shop Drawings identified in Section 01 33 00.
- 1.7.3 Construction Activity Carbon Reduction Plan (CACRP): Develop and implement a CACRP to outline requirements for subcontractors, suppliers to track fossil fuel use of A4 and A5 emissions.
  - .1 Off-road Vehicles, Equipment, and Tools: Track and report fuel use or operating hours.
  - .2 Delivery Vehicles: Track and report total round-trip miles and vehicle types.
  - .3 Crew Transport: Track fuel use of shuttle buses from parking lots to the jobsite, if provided by the general contractor.
  - .4 Anti-Idling: Implement anti-idling measures to reduce non-productive idling.

- 
- .5 Best Management Practices: Consider equipment electrification, prioritizing Tier 4 final equipment, retrofitting older equipment with best available technology, using biofuel blends, delivery optimization, and using temporary electric power.
  - .6 Data Collection: Use technology to capture data efficiently, such as QR codes or webforms for logging information.
  - 1.7.4 Progress Submittals: Submit updated embodied carbon model on a monthly basis and compare actual construction and procurement activities with preliminary action plan.
    - .1 Compile and report a summary of applicable material quantities with supplier's locations.
    - .2 Bill of Materials: As soon as material sources are known, and at completion of an applicable scope of work, submit a bill of material report summarizing applicable material quantities and location where each material was obtained.
    - .3 Compiled report must present information in a unified format and in consistent units as described within this specification, to allow for final LCA model analysis by Sustainability Consultant.
  - 1.7.5 Environmental Product Declarations (EPDs): Technical Specifications identify products and materials requiring EPDs. As a minimum, EPDs must be prepared in accordance with ISO 14025, ISO 14040, ISO 14044, and EN/ISO 15804 or ISO 21930, and comply with the following:
    - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
    - .2 EPD Impact Categories:
      - .1 Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit.
      - .2 Must report Ozone Depletion Potential (ODP) in form of unit of kg CFC-11/ declared unit.
      - .3 Must report Acidification Potential (AP) in form of unit of kgSO<sub>2</sub>/ declared unit.
      - .4 Must report Eutrophication Potential (EP) in form of unit of kg N/ declared unit.
      - .5 Must report Photochemical Ozone Creation/Smog Formation Potential (SFP) in form of unit of kgO<sub>3</sub>/declared unit.
    - .3 As a minimum, collect EPDs for products in applicable material categories indicated in the baseline model. At a minimum, provide EPDs for products in the following categories:

- .1 Concrete
- .2 Steel (including structural steel, rebar, steel cold-rolled framing studs, light-gage steel studs)
- .3 Insulation
- .4 Wall and roof panels
- .5 Aluminum framing
- .6 Gypsum wall board
- .4 Product Options: When choice is at Contractor's option, prefer Products with compliant documentation. Product-specific Type III EPDs are preferred or Industry-wide EPD's.

**1.8 Closeout Submittals**

- 1.8.1 At project completion, submit a final embodied carbon report complete with relevant supporting data and EPDs to support ZCB-Design certification.

**1.9 Consultant's Embodied Carbon Baseline Model**

- 1.9.1 A copy of the embodied carbon baseline model prepared for the Project is attached to this Section. Refer to Specification Embodied Carbon Table dated 2024-06-12. This document forms an integral part of this Specification.

# 1 Executive Summary

The following executive summary provides an overview of the comprehensive Life Cycle Assessment (LCA) conducted for the Region of Peel Paramedic Services (PRPS) Reporting Station Docksteader in Brampton, ON. This LCA was undertaken to evaluate the embodied carbon of the proposed building.

The LCA includes the structural and envelope building elements. Most of the material takeoff was conducted using the architectural Revit model last updated June 6<sup>th</sup>, 2024, and the structural Revit model last updated June 6<sup>th</sup>. The LCA software tool used for the assessment is One Click LCA.

The building shall be designed to meet the Region of Peel Net Zero Emissions Building Standard for New Construction and achieve CaGBC Zero Carbon Building (ZCB) Design Standard version 3 certification. Below are the Canada Green Building Council Zero Carbon Building Standard targets for reference:

- The Zero Carbon Building Standard sets a maximum intensity of 500 kg CO<sub>2</sub>e/m<sup>2</sup> or 10% reduction from baseline and awards points for 20% reduction/350 kg CO<sub>2</sub>e/m<sup>2</sup> (1 point) and 40% reduction/240 kg CO<sub>2</sub>e/m<sup>2</sup> (2 points).
- This project is targeting 20% reduction/350 kg CO<sub>2</sub>e/m<sup>2</sup> for 1 impact and innovation point.

The assessment performed to date includes a sensitivity analysis with options for lower carbon options, which have been used to calculate a theoretically achievable embodied carbon performance. The design team will need to use their judgement to determine if these products are suitable for this project.

Table 1: Total Embodied Carbon Summary

Life Cycle Stage	Baseline	Proposed
Upfront Carbon (A1-A5) (t CO <sub>2</sub> e)	2996	2271
Upfront Carbon Intensity* (A1-A5) (kg CO <sub>2</sub> e/m <sup>2</sup> )	383	290
Percent Upfront Carbon Reduction (A1-A5)	-	24%
Embodied Carbon (Stage A-C)	3398	2673
Embodied Carbon Intensity* (Stage A-C)	434	341
Percent Embodied Carbon Reduction (A-C)	-	21%
External Impacts (Stage D)	-1056	-1056
Biogenic	450	450

\*Intensity calculations based on a life cycle assessment area of 7,826 m<sup>2</sup>.

Based on the analysis, this project can comply with the zero carbon building requirements achieving the target 20% reduction from the baseline.

## 2 Applicable Terms and Definitions

The following terms and definitions have been sourced from the “National guidelines for whole-building life cycle assessment” and the “Carbon Definitions for the Built Environment, Buildings & Infrastructure”.<sup>12</sup>

**Absolute Zero Carbon:** Eliminating all carbon emissions without the use of offsets.

**Baseline:** A benchmark derived from a single building; may be derived from a theoretical design or a constructed building.

**Benchmark:** Reference point against which comparisons can be made. (ISO 21678:2020)

**Benchmarking:** Process of collecting, analyzing and relating performance data of comparable buildings or other constructed assets. (ISO 21677:2020)

**Biogenic Carbon:** ‘Biogenic Carbon’ refers to the carbon removals associated with carbon sequestration into biomass as well as any emissions associated with this sequestered carbon. Biogenic carbon must be reported separately if reporting only upfront carbon but should be included in the total if reporting embodied carbon or whole life carbon.

**Biomass:** ‘Biomass’ is material of biological origin excluding material embedded in geological formations or transformed to fossilized material and excluding peat. (ISO 21930:2017)

**Carbon Neutral:** All carbon emissions are balanced with offsets based on carbon removals or avoided emissions.

**Contribution Analysis:** The process of grouping indicator results together in different ways to better understand what is driving them.

**Embodied Carbon:** ‘Embodied Carbon’ emissions of an asset are the total GHG emissions and removals associated with materials and construction processes throughout the whole life cycle of an asset (Modules A0-A5, B1-B5, C1-C4, with A2 assumed to be zero for buildings)

**Environmental Product Declaration (EPD):** Environmental declaration providing quantified environmental data using predetermined parameters and, where relevant, additional environmental information. (ISO 21930:2017)

**Greenhouse Gases (GHG):** ‘Greenhouse Gases’ are constituents of the atmosphere, both natural and anthropogenic, that absorb and emit radiation at specific wavelengths within the spectrum of infrared radiation emitted by the Earth’s surface, the atmosphere, and clouds.

**Life Cycle Assessment (LCA):** Compilation and evaluation of the inputs, outputs and potential environmental impacts of a product system throughout its life cycle. (ISO 21930:2017)

**Life Cycle Impact Assessment (LCIA):** Phase of LCA aimed at understanding and evaluation the magnitude and significance of the potential environmental impacts for a product system throughout the life cycle of the

<sup>2</sup> “Carbon Definitions for the Built Environment, Buildings & Infrastructure.” LETI [Online]. Available: [https://www.leti.uk/\\_files/ugd/252d09\\_04f3ex91a9a1a431b8dbaf35a0a1a81f3.pdf](https://www.leti.uk/_files/ugd/252d09_04f3ex91a9a1a431b8dbaf35a0a1a81f3.pdf) (accessed Jul. 26, 2023).

product. (ISO 21930:2017)

**Life Cycle Inventory (LCI) Analysis:** Phase of LCA involving compilation and quantification of inputs and outputs for a product throughout its life cycle.

**Net Zero (Whole Life) Carbon:** A 'Net Zero (whole life) Carbon' Asset is one where the sum total of all asset related GHG emissions, both operational and embodied, over an asset's life cycle (Modules A0-A5, B1-B8, C1-C4) are minimized, which meets local carbon, energy and water targets or limits, and with residual 'offsets', equals zero.

**Net Zero Embodied Carbon:** A 'Net Zero Embodied Carbon' asset is one where the sum total of GHG emissions and removals over an asset's life cycle (Modules A0-A5, B1-B5 and C1-C4) are minimized, which meets local carbon targets or limits (e.g kg CO<sub>2</sub>e/m<sup>2</sup>), and with additional 'offsets', equals zero.

**Net Zero Upfront Carbon:** A 'Net Zero Upfront Carbon' asset is one where the sum total of GHG emissions, excluding 'biogenic carbon', from Modules A0-A5 is minimized, which meets local carbon targets or limits (e.g kg CO<sub>2</sub>e/m<sup>2</sup>), and with additional 'offsets', equals zero.

**Operational Carbon:** Energy, Buildings – 'Operational Carbon – Energy' (Module B6) are the GHG emissions arising from all energy consumed by an asset in-use, over its life cycle.

**Reference Service Life (RSL):** Service life of a construction product which is known to be expected under a set of reference in-use conditions and which can form the basis for estimating the service life under other in-use conditions. (ISO 21930:2017)

**Reference Study Period:** The period over which the time-dependent characteristics of the object of assessment are analyzed. (EN15978:2011)

**Required Service Life:** Service life required by the client or through regulations. (EN 15978:2011)

**Sensitivity Analysis:** The process of changing a parameter in a LCA model and recalculating indicator results to determine its effect on the building.

**System Boundary:** Interface in the assessment between a building and its surroundings or other product systems. (EN 15978:2011)

**Upfront Carbon – Buildings:** 'Upfront Carbon' emissions are the GHG emissions associated with materials and construction processes up to practical completion (Modules A0-A5). Upfront carbon excludes the biogenic carbon sequestered in the installed products at practical completion.

**Whole-building LCA:** Life cycle assessment applied to a building-related functional equivalent (a whole building, or part of a building).

**Whole Life Carbon:** Whole Life Carbon' emissions are the sum total of all asset related GHG emissions and removals, both operational and embodied over the life cycle of an asset including its disposal (Modules: A0-A5; B1-B7; B8 optional; C1-C4, all including biogenic carbon, with A2 assumed to be zero for buildings).

## 3 Introduction

This section summarizes the methodology, scope, and purpose of the preliminary whole-building life cycle assessment (LCA) for the PRPS Reporting Station, located at the corner of Dixie Road and Dockstader Road in the City of Brampton, Ontario.

### 3.1 Purpose of Assessment

This assessment was conducted to provide an estimate of the whole life embodied carbon of the current design to inform further design and ensure compliance with ZCB v3. A contribution analysis identifies most contributing materials to the whole life embodied carbon. A sensitivity analysis extends beyond the contribution analysis and provides suggestions for reducing resource use and selection of resources with lower global warming potential.

### 3.2 Life Cycle Assessment Methodology

Though often considered alone, operational carbon is only part of a building's whole life carbon story. Embodied carbon represents the cradle-to-grave life cycle impacts of the products and materials used within a building: the effects of resource extraction, product manufacturing and transportation, building construction, product maintenance and replacement, and building demolition/deconstruction/disposal. In high-performance buildings, embodied carbon makes up a significant portion of a building's carbon footprint and can equal (or exceed) lifetime operational carbon emissions of the building. Trade-offs that improve building performance and reduce operational carbon, such as improved glazing and increased insulation, can often increase the associated embodied carbon; therefore, it is important to consider both together to understand whole-life carbon of a building and optimize design.

Life cycle assessments categorize the environmental impact of a building into various stages from raw material extraction to end of life. The separation of impacts into various categories can help inform which products or processes result in the largest impact at a certain point in time.

The stages, or modules, of a standard LCA are shown in Figure 1. For a new construction project, the accounting is relatively straightforward: the effects of all materials within the scope of the LCA are calculated for all life cycle stages and added together to calculate the total embodied carbon.

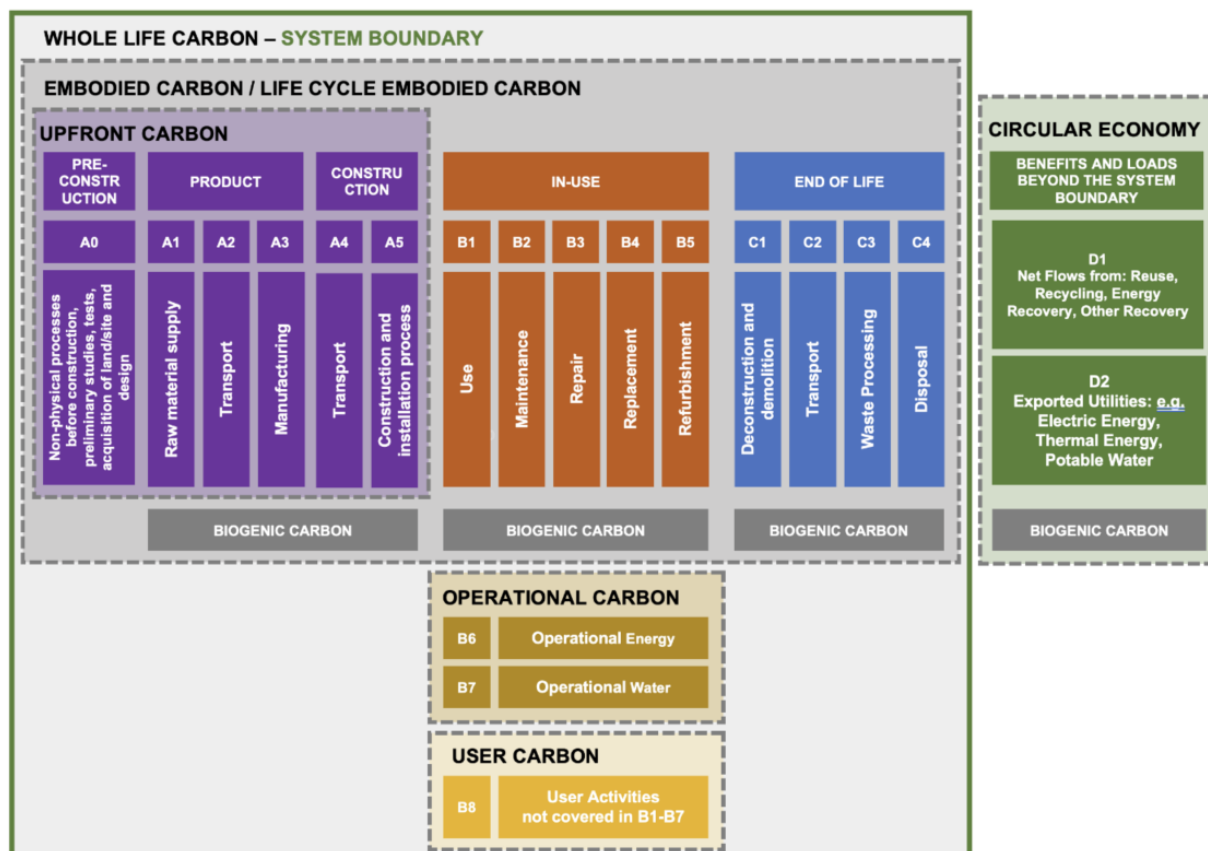

Figure 1: Life Cycle Modules from Carbon Definitions for the Built Environment, Buildings & Infrastructure developed by a working group with the Whole Life Carbon Network and adapted from BS EN 15978, BS EN 174742, PAS 2080: 206 and expected future updates.<sup>3</sup>

<sup>3</sup> "Carbon Definitions for the Built Environment, Buildings & Infrastructure." LETI [Online]. Available: [https://www.leti.uk/\\_files/ugd/252d09\\_04f3ex91a9a1a431b8dbaf35a0a1a81f3.pdf](https://www.leti.uk/_files/ugd/252d09_04f3ex91a9a1a431b8dbaf35a0a1a81f3.pdf) (accessed Jul. 26, 2023).

## 4 Details of Assessment

### 4.1 Data Sources

The LCA was developed from the Architecture Revit Model current as of June 6<sup>th</sup>, 2024, and the Structural Revit Model current as of June 6<sup>th</sup>, 2024. Modelling was conducted using One Click LCA. Quantity takeoffs were recorded using Revit. At this stage of the assessment, material assumptions were used for most product selections and quantities. Estimates based on industry knowledge were used, as described in Appendix A.

The environmental data has been sourced from environmental product declarations (EPDs) in One Click LCA. EPDs summarize the results of a life cycle assessment of a product or service. Most EPDs have been source from Ecoinvent, GaBi, and USLCI. In cases where no EPD was available, projected estimates were included instead.

### 4.2 Reference Study Period

The reference study period is the calculation period based on the declared service life of the building. Product replacements and maintenance are calculated for this period. The declared service life of 60 years was used for this assessment.

### 4.3 Scope of Assessment

The LCA is a preliminary assessment of the impact of envelope and structural elements only. Interior fit outs and finishes, MEP systems, and landscaping are outside the scope of this assessment and are not included. Appendix A describes the exact material takeoff in more detail.

Operational carbon was considered outside the scope of this LCA and is excluded from the results. Operational water use was not calculated and is excluded from overall life cycle effects.

### 4.4 System Boundary

The system boundary defines which life cycle assessment stages are included in the analysis. The life cycle stages have been identified by One Click LCA and Table 2 identifies the specific modules included in the assessment.

Table 2: Activities Included in the System Boundary

Module	Module/Activity	Included
<b>A1-A3</b>	Raw material supply, Transport, Manufacturing	
A1-A3	Production, building materials	×
<b>A4</b>	Transport	
A4	Transport to the building site	×
<b>A5</b>	Construction-Installation Process	
A5a	Site operations & site waste handling	
A5b	Site waste transportation	
A5c	Construction site – material wastage - materials	×
A5d	Construction site – material wastage - transport	×
A5e	Construction site – material wastage - waste	×
<b>B1</b>	Use	
<b>B2</b>	Maintenance	
<b>B3</b>	Repair	
<b>B4-B5</b>	Material Replacement and Refurbishment	
B4-5a	Material replacement - materials	×
B4-5b	Material replacement - transport	×
B4-5c	Material replacement - waste	×
<b>B6</b>	Operational energy	
<b>B7</b>	Operational Water	
<b>C1-C4</b>	End of life	
C1	Deconstruction/demolition	
C2	Transport to waste processing/disposal, building materials	×
C3	Waste processing, building materials	×
C4	Disposal, building materials	×
<b>D</b>	Benefits and loads beyond the building lifecycle (not included in totals)	
D	Installed materials – benefit	×

## 4.5 Gross Floor Area Estimate

Based on the “National guidelines for whole-building life cycle assessment”<sup>4</sup>, gross floor area (GFA) for a LCA should measure within the outside face of enclosing walls on each floor area. See Table 3 below for the GFA calculation and Appendix A for more detailed calculation.

Table 3: External Gross Floor Area Summary

Level	Area (m <sup>2</sup> )
<b>Floor 1</b>	5,381
<b>Floor 2</b>	1,808
<b>Floor 3</b>	637
<b>TOTAL</b>	<b>7,826</b>

<sup>4</sup> Bowick, O'Connor, Salazar, Meil, and Cooney, “National guidelines for whole-building life cycle assessment,” Canada.ca, <https://nrc-publications.canada.ca/eng/view/object/?id=f7bd265d-cc3d-4848-a666-8eeb1fbde910> (accessed Jul. 25, 2023).

## 4.6 Environmental Indicators

The life cycle assessment (LCA) has been conducted in accordance with the Life Cycle Carbon – Global tool. The life cycle assessment is compliant with EN 15978, EN 15804, ISO 14040, ISO 14044 and ISO 21929. For the purposes of this study, global warming potential and biogenic carbon are the only factors being compared.

### 4.6.1 External Impacts

Module D accounts for potential environmental benefits and loads that occur beyond the stages A-C. This may include the use of recycled material from the site, reuse of site material elsewhere, energy recovery, or exported energy. This category is used to understand the implications beyond the system boundary which may have further impact on initial design decisions.

### 4.6.2 Biogenic Carbon

Biogenic carbon refers to carbon dioxide (CO<sub>2</sub>) that is absorbed and released during the natural carbon cycle through the growth and decay of plants and other organic matter. Biogenic carbon is distinct from fossil carbon, which involves the release of CO<sub>2</sub> from long-term geological storage of carbon, such as burning fossil fuels like coal, oil, and natural gas.

In most LCAs, biogenic carbon is accounted for as carbon neutral. The carbon neutrality assumption assumes that biogenic carbon operates in a closed loop system. Plants and trees absorb CO<sub>2</sub> from the atmosphere through photosynthesis, and this carbon is stored in their biomass. An assumption is made that emissions released from harvest and use of biomass will be released back into the atmosphere in the same quantity and form as when absorbed (either naturally decomposed or burned). Therefore, there is no net increase in atmospheric carbon emissions.

While some may argue that biogenic carbon has negative effects of whole-life GWP because carbon is stored in the building, it is not accounted for as a reduction in GWP because:

- Biomass must come from certified sustainable sources (i.e. FSC wood) to be considered.
  - If not sustainability sourced, impacts on climate change and biodiversity loss can result from land use change and the various effects on the forest carbon cycle.
- The reuse/recyclability of many mass timber elements is limited because of the adhesives used in products (i.e. CLT, glulam, etc.). Therefore, at end of life, the carbon stored in the building could be released if the timber is landfilled and allowed to decompose. The opportunity to continue to store this carbon is limited to ensuring the building longevity or reuse of the structural members.

With the complexities of accounting for biogenic carbon, special consideration should be made under specific contexts, assumptions, and guidelines. Following international standard ISO 21930, biogenic carbon can be considered carbon neutral, however, it is recommended that biogenic carbon be reported to provide transparency in reporting.

Awareness of biogenic carbon and its potential value in reducing the GWP of a building. It is recommended to use design for disassembly principles (mechanical fasteners) to allow building materials to enter the circular economy.

# 5 Results

## 5.1 Baseline Whole Building Life Cycle Assessment

The DD-Stage LCA estimates a total global warming potential of 3398 t CO<sub>2</sub>e for the embodied carbon of the structure and enclosure using baseline GWPs for the proposed materials.

Table 4: Embodied Carbon During Life Cycle Stages

Stage	Stage Description	Embodied Carbon (t CO <sub>2</sub> e)	Carbon Intensity (kgCO <sub>2</sub> e/m <sup>2</sup> )	Biogenic Carbon (t CO <sub>2</sub> e)
A1-A3	Raw materials extraction, transport, and manufacturing	2693	344	450
A4-A5	Transportation to site and construction/installation process	303	-	-
A1-A5	"Upfront Carbon"	2996	383	450
B	Use phase, maintenance, repair, material replacement and refurbishment	189	-	-
C	End-of-life demolition and waste processing	213	-	-
A-C	"Embodied Carbon"	3398	434	-
D	External Impacts; reuse/recycling - not included in embodied carbon total	-1056	-	-

Figure 2: Comparison between all types of buildings.

Figure 3: Global warming potential by classification

Figure 4: Global warming potential by life cycle stage

Figure 5: Global warming kg CO<sub>2</sub>e by resource type, stages A-C

## 5.2 Most Contributing Materials and Low GWP Alternatives

Table 5 lists the materials with the highest upfront carbon (A1-A3) in the baseline scenario. Low GWP alternatives can be used to reduce overall upfront carbon.

Table 5: Embodied Carbon During Life Cycle Stages

Number	Resource	Cradle to Gate Impacts (A1-A3) (t CO <sub>2</sub> e)	Of Cradle to Gate (A1-A3)
1	Ready-mix concrete, Ontario industry average	575.2	26.9 %
2	Fabricated hollow structural steel sections, unpainted	572.4	26.8 %
3	Glass façade curtain wall system	178.8	8.4 %
4	Reinforcement steel (rebar), generic	157	7.3 %
5	XPS Insulation	130	6.1 %
6	Galvanized steel façade cladding panel	92.3	4.3 %
7	Roll formed aluminum cladding	85.9	4 %
8	Polyisocyanurate (PIR) roof insulation boards, coated glass faced (CGF)	74.5	3.5 %

Number	Resource	Cradle to Gate Impacts (A1-A3) (t CO <sub>2</sub> e)	Of Cradle to Gate (A1-A3)
9	Stone wool insulation board for exterior cavity wall and rainscreen applications, moisture resistant, with bitumen facing or no facing	41.9	2 %
10	Bitumen roofing membrane, panelized-asphaltic, P-A/T	38	1.8 %

### 5.2.1 Concrete

In the baseline scenario, concrete accounts for 575 tonnes of upfront carbon dioxide using the Ontario industry average EPDs. Less carbon-intensive concrete is readily available, and reductions are possible by setting “Allowable kgCO<sub>2</sub>e” limits. Alternative concrete mixes exist with higher supplementary cementitious material and other mix alternatives. Using the upper range of Lafarge ECOPact concrete alternatives, the project can save at least 105 tonnes CO<sub>2</sub>e compared to the current Ontario industry average benchmark. Further reductions are possible with higher supplementary cementitious material and/or extending cure times.

### 5.2.2 Structural Steel

Structural steel with 60% recycled content is used in the baseline scenario and accounts for 572 tonnes of upfront carbon dioxide. Structural steel with higher % recycled content and less energy intensive manufacturing processes (e.g. electric arc furnace rather than basic oxygen furnace) can save at least 434 tonnes CO<sub>2</sub>e reduction in emissions. Further reductions are possible by using products with EPDs that demonstrate lower GWP.

### 5.2.3 Rebar

Rebar with 60% recycled content accounts for 157 tonnes of upfront carbon dioxide in the baseline scenario. Locally produced rebar can be sourced with higher recycled content and reduce rebar upfront carbon by at least 82 tonnes. Further reductions are possible by using products with EPDs that demonstrate lower GWP.

### 5.2.4 Insulation

Extruded polystyrene (XPS) in the roof, slab on grade, and foundation walls contributes to a third of the total embodied carbon. In the baseline model, the Dow Highload 40 XPS material baseline embodied carbon intensity was used to determine the XPS GWP. The baseline is 11.19 kg CO<sub>2</sub>e /m<sup>2</sup> @RSI-1 (North America). There are alternative product options available, such as the Soprema XPS with an embodied carbon of 1.8 kg CO<sub>2</sub>e /m<sup>2</sup> @RSI-1 (Canada) and an 104 tonne reduction in upfront carbon.

The GWP of insulation can vary widely depending on material type, thermal resistance, and manufacturer; nuances which are difficult to capture through early-stage LCA modelling. Generally, rigid foam insulations such as extruded polystyrene (XPS) and spray foam insulation that use blowing agents have higher GWPs than loose fill and batt insulations of 4 kg CO<sub>2</sub>e / m<sup>2</sup> @RSI-1; however, all petroleum-based products have non-negligible carbon footprints because end-of-life processes typically involve incineration or landfill. Specific product EPDs should be reviewed before selecting insulation to allow only the most environmentally friendly options.

## 5.3 Proposed Building Whole Building Life Cycle Assessment

Specifying low carbon concrete, steel, and XPS can meet the 20% target, with a 21.3% or 725 tonnes carbon dioxide

reduction.

Refer to Appendix C for a detailed table showing the alternative product EPDs suggested for the proposed design.

Table 6: Embodied Carbon During Life Cycle Stages

Life Cycle Stage	Baseline	Proposed
Upfront Carbon (A1-A5) (t CO2e)	2996	2271
Upfront Carbon Intensity* (A1-A5) (kg CO2e/m²)	383	290
Percent Upfront Carbon Reduction (A1-A5)	-	24%
Embodied Carbon (Stage A-C)	3398	2673
Embodied Carbon Intensity* (Stage A-C)	434	341
Percent Embodied Carbon Reduction (A-C)	-	21%
External Impacts (Stage D)	-1056	-1056
Biogenic	450	450

\*Intensity calculations based on a life cycle assessment area of 7,826 m².

Stairs	Metal staircase has mass of 91 kg/step and 8000 kg/m <sup>3</sup>

## 3 Building Materials

ID	Component	Assembly Details	Quantities	Notes
3.1.1	EW1A/B- Metal Cladding System	Prefinished Metal Cladding Panel	21255 kg	Steel 8000 kg/m3
3.1.2	EW1A/B- Metal Cladding System	Engineered Cladding Rails	5314 kg	Assumed there are 2 rails in a 9m2 area and each rail is 0.15m*3m. Steel 8000 kg/m3
3.1.3	EW1A/B- Metal Cladding System	Insulation Type INS-1	443 m3	
3.1.4	EW1A/B- Metal Cladding System	Engineered 300mm Thermal Clip System	2044 kg	Steel 8000 kg/m3
3.1.5	EW1A/B- Metal Cladding System	Membrane Type AVBM-1	2214 m2	
3.2.6	EW2 - Metal Cladding System - Uninsulated	Prefinished Metal Cladding Panel	3575 kg	Steel 8000 kg/m3
3.2.7	EW2 - Metal Cladding System - Uninsulated	Engineered Cladding Rails	894 kg	Assumed there are 2 rails in a 9m2 area and each rail is 0.15m*3m. Steel 8000 kg/m3
3.3.8	EW3 - Solar Wall	22mm 24 Gauge Corrugated Perforated Rolled Steel Wall Cladding	4752 kg	Steel 8000 kg/m3
3.3.9	EW3 - Solar Wall	26 Gauge Galvanized Steel Solarwall Liner	3523 kg	Steel 8000 kg/m3
3.3.10	EW3 - Solar Wall	Insulation Type INS-1	196 m3	
3.3.11	EW3 - Solar Wall	Membrane Type AVBM-1	979 m2	
3.4.12	EW4 - Metal Panel Cladding System	Composite Metal Panel	0 m3	

ID	Component	Assembly Details	Quantities	Notes
3.4.13	EW4 - Metal Panel Cladding System	Engineered Cladding Rails	202 kg	Assumed there are 2 rails in a 9m2 area and each rail is 0.15m*3m. Steel 8000 kg/m3
3.4.14	EW4 - Metal Panel Cladding System	Insulation Type INS-1	17 m3	
3.4.15	EW4 - Metal Panel Cladding System	Engineered 300mm Thermal Clip System	78 kg	Steel 8000 kg/m3
3.4.16	EW4 - Metal Panel Cladding System	Membrane Type AVBM-1	84 m2	
3.5.17	EW5 - Composite Metal Panel - Uninsulated	Composite Metal Panel	1 m3	
3.5.18	EW5 - Composite Metal Panel - Uninsulated	Engineered Cladding Rails	4369 kg	Assumed there are 2 rails in a 9m2 area and each rail is 0.15m*3m. Steel 8000 kg/m3
3.6.19	EW6 - Stone Panel Cladding	Sintered Stone Panel	8 m3	
3.6.20	EW6 - Stone Panel Cladding	Engineered Cladding Rails	3074 kg	Assumed there are 2 rails in a 9m2 area and each rail is 0.15m*3m. Steel 8000 kg/m3
3.6.21	EW6 - Stone Panel Cladding	Insulation Type INS-1	38 m3	
3.6.22	EW6 - Stone Panel Cladding	Engineered 300mm Thermal Clip System	177 kg	Steel 8000 kg/m3
3.6.23	EW6 - Stone Panel Cladding	Membrane Type AVBM-1	12 m2	
3.7.24	EW7 - Roof Parapet and Curb - Inside Face	SBS Roof Membrane	89 m2	
3.7.25	EW7 - Roof Parapet and Curb - Inside Face	Polyisocyanurate Insulation	9 m3	
3.8.26	EW8 - Corrugated Metal Cladding	Corrugated Aluminum Cladding	22674 kg	Aluminum 2700 kg/m3
3.8.27	EW8 - Corrugated Metal Cladding	Engineered Cladding Rails	504 kg	Assumed there are 2 rails in a 9m2 area and each rail is

ID	Component	Assembly Details	Quantities	Notes
				0.15m*3m. Steel 8000 kg/m3
3.8.28	EW8 - Corrugated Metal Cladding	Insulation Type INS-1	42 m3	
3.8.29	EW8 - Corrugated Metal Cladding	Membrane Type AVBM-1	210 m2	
3.9.30	EW10 - Glass Faced Rainscreen Cladding Panel	Glass Faced Rainscreen Panel	66 m2	
3.9.31	EW10 - Glass Faced Rainscreen Cladding Panel	Engineered Cladding Rails	158 kg	Assumed there are 2 rails in a 9m2 area and each rail is 0.15m*3m. Steel 8000 kg/m3
3.9.32	EW10 - Glass Faced Rainscreen Cladding Panel	Insulation Type INS-1	13 m3	
3.9.33	EW10 - Glass Faced Rainscreen Cladding Panel	Engineered Cladding Rails	1054 kg	Assumed there are 2 rails in a 9m2 area and each rail is 0.15m*3m. Steel 8000 kg/m3
3.9.34	EW10 - Glass Faced Rainscreen Cladding Panel	Membrane Type AVBM-1	66 m2	
3.13.35	MS1 - Steel Stud Back-Up Wall	Exterior Sheathing Board	0 m3	
3.13.36	MS1 - Steel Stud Back-Up Wall	Lateral Load-Bearing Cold Formed Metal Framing	96 kg	Assumed 18 gauge steel and 400mm o.c.
3.13.37	MS1 - Steel Stud Back-Up Wall	Gypsum Board	0 m3	
3.42.38	MS2 - Steel Stud Back-Up Wall	Exterior Sheathing Board	36 m3	
3.42.39	MS2 - Steel Stud Back-Up Wall	Lateral Load-Bearing Cold Formed Metal Framing	11226 kg	Assumed 18 gauge steel and 400mm o.c.
3.42.40	MS2 - Steel Stud Back-Up Wall	Gypsum Board	36 m3	
3.43.41	MS3 - Steel Stud Back-Up Wall	Exterior Sheathing Board	16 m3	
3.43.42	MS3 - Steel Stud Back-Up Wall	Lateral Load-Bearing Cold Formed Metal Framing	5871 kg	Assumed 18 gauge steel and 400mm o.c.

ID	Component	Assembly Details	Quantities	Notes
3.43.43	MS3 - Steel Stud Back-Up Wall	Gypsum Board	16 m3	
1.14.44	FW1 - Typical CIP Concrete Foundation Wall	16 Gauge 316 Stainless Steel Flashing to Grade	0 m3	
1.14.45	FW1 - Typical CIP Concrete Foundation Wall	XPS Insulation	21 m3	
1.14.46	FW1 - Typical CIP Concrete Foundation Wall	Damp Proofing Membrane	142 m2	
1.44.47	FW2 - CIP Foundation Wall	XPS Insulation	109 m3	
1.45.48	FW3 - CIP Foundation Wall	XPS Insulation	2 m3	
6.37.49	Concrete Column	Concrete Column	24 m3	Baseline 35MPa concrete with air & 0.40 w/cm (C-1) GU 25 SL
5.19.50	38mm Steel Roof Deck	Steel Deck	18645 kg	Multiply by 1.3 for corrugation. Steel 8000 kg/m3
2.18.51	64mm Concrete Topping on Steel Deck	Min. Depth Poured-In Place Concrete	1 m3	
2.18.52	64mm Concrete Topping on Steel Deck	Steel Deck	151 kg	Multiply by 1.75 for corrugation. Steel 8000 kg/m3
2.48.53	75mm Concrete Topping	Self-Levelling Concrete Topping	147 m3	
2.48.54	75mm Concrete Topping	Rebar	442 kg	3 kg/m3
5.49.55	76mm Steel Roof Deck	Steel Deck	62899 kg	Multiply by 1.75 for corrugation. Steel 8000 kg/m3
2.47.56	89mm Concrete Topping on Steel Deck	Min. Depth Poured-In Place Concrete	234 m3	
2.47.57	89mm Concrete Topping on Steel Deck	Steel Deck	33818 kg	Multiply by 1.75 for corrugation. Steel 8000 kg/m3
1.50.58	100 Slab	Foundation Slab	1 m3	
1.50.59	100 Slab	Rebar	66 kg	55 kg/m3
1.51.60	150 Deep	Foundation Slab	13 m3	

ID	Component	Assembly Details	Quantities	Notes
1.52.61	317 Deep	Foundation Slab	0 m3	
1.52.62	317 Deep	Rebar	19 kg	60 kg/m3
1.53.63	250 Slab	Foundation Slab	9 m3	55 kg/m3
1.16.64	SOG1 - 175	XPS Insulation	279 m3	
1.16.65	SOG1 - 175	Damp Proofing Membrane	2785 m2	
1.16.66	SOG1 - 175	Foundation Slab	487 m3	
1.16.67	SOG1 - 175	Rebar	26806 kg	55 kg/m3
1.17.68	SOG2 - 125	XPS Insulation	59 m3	
1.17.69	SOG2 - 125	Damp Proofing Membrane	592 m2	
1.17.70	SOG2 - 125	Foundation Slab	74 m3	
1.17.71	SOG2 - 125	Rebar	3700 kg	50 kg/m3
1.54.72	SOG2 - 175	XPS Insulation	26 m3	
1.54.73	SOG2 - 175	Damp Proofing Membrane	255 m2	
1.54.74	SOG2 - 175	Foundation Slab	45 m3	
1.54.75	SOG2 - 175	Rebar	2454 kg	55 kg/m3
1.55.76	SOG3 - 175	XPS Insulation	133 m3	
1.55.77	SOG3 - 175	Damp Proofing Membrane	1325 m2	
1.55.78	SOG3 - 175	Foundation Slab	232 m3	
1.55.79	SOG3 - 175	Rebar	12753 kg	55 kg/m3
1.56.80	SOG5 - 175	XPS Insulation	23 m3	

ID	Component	Assembly Details	Quantities	Notes
1.56.81	SOG5 - 175	Damp Proofing Membrane	226 m2	
1.56.82	SOG5 - 175	Foundation Slab	40 m3	
1.56.83	SOG5 - 175	Rebar	2175 kg	55 kg/m3
1.57.84	SOG6 - 240	XPS Insulation	23 m3	
1.57.85	SOG6 - 240	Damp Proofing Membrane	226 m2	
1.57.86	SOG6 - 240	Foundation Slab	54 m3

1.36.88	Footing	Footing	210 m3	
1.36.89	Footing	Rebar	14571 kg	
1.40.90	Foundation Slab	Foundation Slab	143 m3	
1.40.91	Foundation Slab	Rebar	17134 kg	
1.41.92	Wall Foundation	Wall Foundation	200 m3	
1.41.93	Wall Foundation	Rebar	10085 kg	
9.21.94	S1 - Interlocking Metal Panel Soffit	Fibreglass Faced Gypsum Sheathing	2 m3	
9.21.95	S1 - Interlocking Metal Panel Soffit	Polyethylene Vapour Barrier	96 m2	10mm
9.21.96	S1 - Interlocking Metal Panel Soffit	Insulation Type INS-1	19 m3	
9.21.97	S1 - Interlocking Metal Panel Soffit	Galvanized Steel Girts	38 kg	Assumed there is 1 rail per 1m2 with cross section area of 1.3*0.025 and length of 1m. Steel 8000 kg/m3
9.21.98	S1 - Interlocking Metal Panel Soffit	Interlocking Pre-Finished Galvanized Metal Panel	553 kg	Multiply by 1.2 for corrugation. Steel 8000 kg/m3
9.58.99	S2 - Interlockig Metal Panel Soffit - Uninsulated	Fibreglass Faced Gypsum Sheathing	1 m3	
9.58.100	S2 - Interlockig Metal Panel Soffit - Uninsulated	Polyethylene Vapour Barrier	46 m2	10mm
9.58.101	S2 - Interlockig Metal Panel Soffit - Uninsulated	Galvanized Steel Girts	18 kg	Assumed there is 1 rail per 1m2 with cross section area of 1.3*0.025 and length of 1m. Steel 8000 kg/m3

ID	Component	Assembly Details	Quantities	Notes
9.58.102	S2 - Interlockig Metal Panel Soffit - Uninsulated	Interlocking Pre-Finished Galvanized Metal Panel	264 kg	Multiply by 1.2 for corrugation. Steel 8000 kg/m3
5.22.103	R1 - SBS Membrane - Low Slope	SBS Roof Membrane	5126 m2	2-Ply
5.22.104	R1 - SBS Membrane - Low Slope	Asphaltic Roof Protection Board	67 m3	
5.22.105	R1 - SBS Membrane - Low Slope	Polyisocyanurate Insulation	1302 m3	
5.22.106	R1 - SBS Membrane - Low Slope	Polyethylene Vapour Barrier	5126 m2	10mm
5.22.107	R1 - SBS Membrane - Low Slope	Fibreglass Faced Gypsum Sheathing	82 m3	
5.23.108	R2 - SBS Membrane - Low Slope, Reduced Insulation	SBS Roof Membrane	49 m2	2-Ply
5.23.109	R2 - SBS Membrane - Low Slope, Reduced Insulation	Asphaltic Roof Protection Board	1 m3	
5.23.110	R2 - SBS Membrane - Low Slope, Reduced Insulation	Polyisocyanurate Insulation	6 m3	
5.23.111	R2 - SBS Membrane - Low Slope, Reduced Insulation	Polyethylene Vapour Barrier	49 m2	10mm
5.23.112	R2 - SBS Membrane - Low Slope, Reduced Insulation	Fibreglass Faced Gypsum Sheathing	1 m3	
4.24.113	Door - Swing Single Framed	Heavy Metal Door	34 m2	
4.27.114	Glazed Aluminum Framed Door	Glazed Aluminum Framed Door	108 m2	
4.25.115	Industrial Door	Industrial Door	59 m2	
4.29.116	CW3 - Vestibule Curtain Wall	Curtain Wall	114 m2	
4.11.117	CW2 - IGU in Insulated Fibreglass Frame	Curtain Wall	222 m2	IGU in Fibreglass Frame - Okalux, Bird Frit on Surface
4.10.118	CW1 - IGU in Insulated Fibreglass Frame	Curtain Wall	412 m2	IGU in Fibreglass Frame - Bird Frit on Surface
7.31.119	Stair - Folded Metal - Wood Tread	Wood Tread	1 m3	
7.33.120	Stair - Folded Metal - Stringer	Metal Tread	2 m3	
6.35.121	Steel Column	Steel Column	89540 kg	7850 kg/m3
6.38.122	Steel Framing	Steel Framing - HSS	248675 kg	
6.38.123	Steel Framing	Steel Framing - OWSJ	3219 kg	
7.32.124	Stair - Cast-in-place	Cast-in-place Concrete	1 m3	Baseline 25MPa concrete without air GU 10 SL

ID	Component	Assembly Details	Quantities	Notes
7.39.125	Rebar	Rebar	63 kg	60 kg/m3
3.59.126	Shear Wall	Shear Wall	165 m3	
3.59.127	Shear Wall	Rebar	14886 kg	90 kg/m3
3.60.128	Above Grade Concrete Wall	Above Grade Concrete Wall	337 m3	
3.60.129	Above Grade Concrete Wall	Rebar	16846 kg	50 kg/m3

# Appendix B: Contribution Analysis

## Appendix B: Baseline Upfront Carbon Breakdown by Material

Component	Cradle to gate impacts (A1-A3) (tCO2e)	Of cradle to gate (A1-A3) (%)
Ready-mix concrete, Ontario industry average	575	28
Fabricated hollow structural steel sections, unpainted	572	27.9
Glass façade curtain wall system	179	8.7
Styrofoam insulation	130	6.3
Galvanized steel façade cladding panel	92	4.5
Roll formed aluminum cladding	86	4.2
Polyisocyanurate (PIR) roof insulation boards, coated glass faced (CGF)	75	3.6
Reinforcement steel (rebar), generic	71	3.5
Stone wool insulation board for exterior cavity wall and rainscreen applications, moisture resistant, with bitumen facing or no facing	42	2
Bitumen roofing membrane, panelized-asphaltic, P-A/T	38	1.9
SBS polymer-modified bitumen membrane roofing, self-adhered	36	1.7
Sintered stone slabs, for internal and external cladding	30	1.5
Fabricated hot-rolled structural steel sections, unpainted	30	1.4
Hot-dip galvanized steel sheets	26	1.3
EPDM waterproofing membrane	25	1.2
Gypsum plaster board, regular	22	1.1
Bitumen-polymer membrane, moisture control layer	13	0.6
Aluminium framed double glazed doors, per m2	9	0.4
Steel, stainless, 304	7	0.3
Insulated glass unit (IGU), two or more panels	5	0.2
Roll formed steel cladding	5	0.2
Expanded polystyrene (EPS)	4	0.2
Double metal door (for technical premises, cellars, service ...)	3	0.2
Aluminium composite panel, polyethylene core	3	0.1
PIR (polyisocyanurate foam) insulation panels, unfaced, generic	2	0.1
Industrial and garage doors from steel panels, per m2	2	0.1
Gypsum board with glass mat sheathing	1	0

## **1. GENERAL**

### **1.1 Summary**

- 1.1.1 Purpose of Section: Section specifies minimum quality requirements for the Work.
- 1.1.2 Read in conjunction with: CCDC 2-2020, Part 3, Execution of the Work and Supplementary Conditions.

### **1.2 Regulatory Requirements**

- 1.2.1 Building Code Information:
  - .1 Project has been designed and must be constructed in accordance with requirements of Ontario Building Code, 2012 including any amendments (The Building Code or "OBC").
  - .2 Building Code Occupancy Classification: {{occupancy type}}.
- 1.2.2 Compliance with Laws: Contract Documents including Drawings, Specifications and other information for the Work are intended to comply with federal, provincial and municipal laws, by-laws, regulations and other requirements of authorities having jurisdiction. Perform Work in accordance with such requirements.
  - .1 Specific design and performance requirements listed in specifications or indicated on Drawings may exceed minimum requirements established by referenced Building Code; these requirements will govern over the minimum requirements listed in Building Code.
  - .2 Where OBC or Contract Documents do not cover a specific requirement, which is covered by the National Building Code of Canada, latest edition (or NBC), conform to requirements of NBC including its related supplements.
  - .3 Where Specifications do not provide sufficient details for a particular item of work indicated on Drawings or Schedules, conform to minimum standards indicated in Building Code, and in the absence of more restrictive requirements comply with specifications, installation methods, and standards of workmanship indicated in OBC, Part 9 "Housing and Small Buildings".

### **1.3 Design Requirements For Post Disaster Buildings**

- 1.3.1 All new construction associated with this Project is designated under the Ontario Building Code as "Post-Disaster". Post-disaster building means a building that is essential to the provision of services in the event of a disaster.

- 1.3.2 Provide fitments, restraints and attachment to meet post-disaster design requirements in accordance with OBC for designated seismic category. In addition, conform to requirements of CSA S832. Refer to Section 13 48 50 for additional requirements.
- 1.3.3 Employ the services a Professional Engineer to design seismic restraints and connections for Project based on anticipated ground motion, soil type in specific geographic area and occupancy category.
- 1.3.4 Refer to Structural Drawings for seismic sensitivity values.

#### **1.4 Permits, Certificates And Transcripts**

- 1.4.1 Required Documentation Prior to Commencement of the Work:
  - .1 Ensure permits, licenses and certificates included under specific Sections are provided as specified. Forward copies of permits to Owner and Consultant before commencing Work.
- 1.4.2 Building Permit Acquisition and Display:
  - .1 Building permit application and fee payment has been made by Consultant on behalf of Owner.
  - .2 Contractor must display building permit and other relevant permits in visible location at Place of the Work.
- 1.4.3 Contractor's Responsibilities for Other Permits:
  - .1 Except as otherwise noted, Contractor is responsible for applying for, obtaining, and covering fees for other necessary permits, licenses, certificates, inspections, and approvals mandated by Authorities Having Jurisdiction or Contract Documents.

#### **1.5 Abbreviations And Acronyms**

- 1.5.1 Commonly Assigned Meanings: Words and phrases in these Specifications or in other Contract Documents that are not expressly defined in the General Conditions or Supplementary Conditions of the Contract must be interpreted based on their common meanings within the specific context in which they are used. When interpreting these terms, take into account specialized usage within various trades and professions relevant to the terminology. Refer uncertainties to Consultant.

#### **1.6 Minimum Qualification Requirements**

- 1.6.1 Where Specifications use the term "experienced" in the context of qualifications, the following minimum criteria must be applied; individual Specification Sections may specify additional requirements.
- 1.6.2 Manufacturer Qualifications:

- 
- .1 Experience: Manufacturer must have a minimum of 10 years' experience in producing systems similar to those specified for the Project.
  - .2 Capabilities: Manufacturer must demonstrate successful in-service performance and have adequate production capacity.
  - .3 Additional Requirements: Must meet qualification, warranty, and technical or factory-authorized service representative requirements.
- 1.6.3 Fabricator Qualifications:
- .1 Experience: Fabricator should have at least 10 years' experience in producing products similar to those indicated for the Project.
  - .2 Capabilities: Fabricator must have a record of successful in-service performance and sufficient production capacity.
- 1.6.4 Welder Qualifications:
- .1 Certification: Welders must be certified per CSA W47.1 and CSA W59-M, with a minimum certification level of "Division 1" or "Division 2".
  - .2 Operators: Must be qualified per CSA W47.1 for work specified in Contract Documents, with a minimum certification level of "Class O".
  - .3 Inspectors and Supervisors: Must meet CSA W178.1 and CSA W178.2 qualifications and be certified by the Canadian Welding Bureau for "Category (a), Buildings".
  - .4 Documentation: Submit copies of welding certificates to Consultant prior to Work commencement.
- 1.6.5 Installer Qualifications:
- .1 Experience: Installer should have at least 5 years' experience in installing systems similar to those specified for the Project and, where applicable, be certified by the manufacturer.
- 1.6.6 Professional Engineer Qualifications:
- .1 Credentials: Must be a member in good standing of the Professional Engineers Ontario (PEO) and legally qualified to practice in the jurisdiction where the Project is located.
  - .2 Experience: Not less than 5 years' experience in providing engineering services of similar scope.
  - .3 Insurance: as noted in the Owner's supplementary conditions.
  - .4 Restrictions: Engineers opting for "Mandatory Disclosure" or "Suggested Disclosure" approaches as permitted by PEO are not eligible to work on this Project.
- 1.6.7 Surveyor Qualifications:

- .1 Credentials: Must be a member in good standing of the Association of Ontario Land Surveyors and legally qualified to practice in the jurisdiction where the Project is located.
  - .2 Experience: Not less than 5 years' experience in providing professional land surveying services of similar scope.
- 1.6.8 Manufacturer's Technical Representative Qualifications:
- .1 Credentials: Must be an authorized, trained, and manufacturer-approved representative to observe and inspect the installation of products similar to those specified for the Project.
- 1.6.9 Testing and Inspecting Agency Qualifications:
- .1 Credentials: Must be an SCC-accredited laboratory or independent agency acceptable to Owner and Consultant with experience and capability to conduct testing and inspection indicated, as documented according to ASTM E329, and with additional qualifications specified in individual sections. Where required by authorities having jurisdiction, testing agency must be acceptable to such authorities.

## **1.7 Quality Control**

- 1.7.1 Contractor's Quality Control: Quality Control is Contractor's responsibility. Use qualified personnel trained and experienced in managing and executing quality assurance and quality control procedures as required for the Project.
- 1.7.2 Contractor-Requested Testing: Testing and inspection requested by Contractor but not required by Contract Documents are Contractor's responsibility.
- 1.7.3 Manufacturer's Field Services: Engage factory-authorized service representatives for inspection and observation as specified in Contract Documents or required by manufacturer. Responsibilities include participation in preinstallation meetings, examination of conditions, verification of materials, observation of installation activities, and submission of written reports.
- 1.7.4 Removal and Replacement of Rejected Work: Promptly remove and replace defective Work rejected by Consultant. Promptly repair damage caused by removals or replacements.
- 1.7.5 Equipment and Systems: Refer to Divisions 21, 22, 23, and 26 for detailed requirements.

## **1.8 Independent Inspection And Testing Agencies**

- 1.8.1 Appointment and Payment: Section 01 21 00 – Allowances designates an amount for retaining and paying independent inspection and testing agencies. These agencies will inspect, test, or perform quality control reviews of parts of the Work. The following

are specifically excluded from the inspection and testing allowance and must be included in Contract Price:

- .1 Inspection and testing mandated by laws, ordinances, rules, regulations, or orders of public authorities.
  - .2 Inspection and testing conducted solely for Contractor's convenience or own quality control.
  - .3 Testing, adjustment, and balancing of conveying systems, mechanical and electrical equipment and systems.
  - .4 Mill tests and certificates of compliance.
  - .5 Inspections and tests specifically designated as Contractor's responsibility in Divisions 02 – 49 of the Specifications.
- 1.8.2 Contractor's Responsibility: Employment of inspection and testing agencies by Owner does not relieve Contractor from responsibility to perform the Work in accordance with Contract Documents.
- 1.8.3 Cooperation with Inspection and Testing Agencies:
- .1 Allow and arrange for inspection and testing agencies to have access to the Work, including access to off-site manufacturing and fabrication plants.
  - .2 Submit test samples required for testing in accordance with schedule of submittals specified in Section 01 32 00 – Construction Progress Documentation.
  - .3 Provide labour, Construction Equipment and temporary facilities to obtain and handle test samples on site.
- 1.8.4 Notification for Required Inspection and Testing: For inspection and testing required by Contract Documents or by authorities having jurisdiction, provide Consultant and inspection and testing agencies with timely notification in advance of required inspection and testing.
- 1.8.5 Reporting:
- .1 Contractor's Reporting Obligation: For inspection and testing required by Contract Documents or by regulatory requirements, and performed by Contractor retained inspection and testing agencies, submit to Consultant and Owner copies of reports. Submit within three Working Days after completion of inspection and testing.
  - .2 Owner's Reporting Requirements: For inspection and testing performed by Owner retained inspection and testing agencies, copies of inspection and testing agency reports will be provided to Contractor.

## **1.9 Mock-Ups**

- 1.9.1 General Requirements: Before starting Work specified in technical Specifications, prepare mock-ups for Consultant's review. Obtain

---

Consultant's acceptance before proceeding with corresponding Work.

- 1.9.2 Size and Location: If mock-up location is not indicated in the Drawings or Specifications, locate where directed by Consultant on site.
- 1.9.3 Notification: Inform Consultant minimum 5 working days prior to mock-up construction.
- 1.9.4 Supervision: For mock-up construction, use supervisory personnel and workers who will perform similar tasks on Project.
- 1.9.5 Aesthetic and Workmanship Range: Demonstrate intended aesthetic effects and quality.
- 1.9.6 Revisions and Review:
  - .1 Modify mock-up as required until Consultant acceptance is obtained. Address unsatisfactory conditions identified in preliminary review and modify mock-ups as necessary. Allow time in schedule for multiple reviews.
  - .2 Accepted mock-ups establish an acceptable standard for the Work.
  - .3 Acceptance of mock-ups does not imply acceptance of deviations from requirements of Contract Documents, unless such deviations are confirmed in writing by Consultant.
  - .4 Unless otherwise specified in the technical Specifications, accepted mock-ups forming part of the Work may remain as part of the Work.
- 1.9.7 Protection and Removal:
  - .1 Protect mock-ups from damage until the Work they represent is complete.
  - .2 Remove mock-ups only when the Work they represent is complete or when otherwise directed by Consultant.
- 1.9.8 Specific Requirements:
  - .1 In-Situ Mock-ups: Refer to Technical Specifications.
  - .2 Building Envelope Mock-ups: Build on-site mock-ups of exterior envelope assemblies, as specified in individual Specification Sections.

## **1.10 Special Requirements For Acoustic Construction**

- 1.10.1 Ensure construction of all assemblies is airtight. Responsibility for airtight construction falls on Contractor. Employ pertinent details for airtightness and coordinate work between trades to ensure airtightness is achieved. Conform to requirements of ASTM E497.
- 1.10.2 Representative details for airtight penetrations, recessed elements, edges, etc. are shown on Drawings. Specific materials and

components to be used to accomplish airtight detailing are specified in the technical Specifications (Divisions 02 - 49). Bring to attention of Consultant any condition that may require special details or materials in order to achieve airtightness.

1.10.3 Requirements specified in this Section are to be read in conjunction with other requirements stipulated in Contract Documents. They do not in any way negate or supersede other provisions stipulated elsewhere in Contract Documents.

1.10.4 General STC ratings: Provide airtight partitions and ceilings in locations indicated to meet required minimum Sound Transmission Class (STC) ratings. Coordinate work of various Subcontractors to avoid "short circuiting" of the STC ratings.

1.10.5 Generally conform to the following:

- .1 Unless indicated otherwise, build walls to underside of structure.
- .2 In STC-rated walls, provide smoke-rated and fire-rated sealants tested by manufacturer to provide required acoustic ratings.
- .3 Ensure walls and partitions are sealed along the ceiling, floor and column joints.
- .4 Ensure holes in any layer of gypsum board are filled with drywall compound.
- .5 Caulk or mud each drywall layer individually around its entire perimeter.
- .6 Ensure penetrations are fully sealed, air tight, using drywall collars, drywall compound and/or fire rated caulking.
- .7 Provide to be light gauge steel gauge (25 gauge or higher). If lower (thicker) gauge studs are required then resilient channel or acoustic clips (Genie Clips) must be installed on one side of the wall.
- .8 As far as practical, minimize additional studs in walls.
- .9 Do not locate more than one electrical box within the same stud cavity. If additional electrical boxes are required, then a moldable putty pad such as 3M Fire Barrier Moldable PuttyPad MPP+ or equivalent is required for all boxes.
- .10 Do not install drywall to pass between rooms; suitably break (separate) drywall to at Tees, cross and corner junctions to avoid direct link between the two rooms.
- .11 No walls are to have any bridging between double walls. If bridging is to be used, then a resilient channel must be installed on one side of the wall.
- .12 No steel studs are to have a bracing bar within the studs. If they require a bracing bar, then resilient channel must be installed on one side of the wall.

- 
- 1.10.6 Carefully locate and treat ducts, grilles, diffusers, electrical outlets, boxes and other similar mechanical and electrical devices.
  - 1.10.7 Build and Install all construction joints, structural penetrations, mechanical and electrical duct penetrations, pipe and conduit penetrations, electrical boxes and fixtures, cabinets, doors, access panels, windows, frames, supports, etc. in such manner as to prevent sound transmission and flanking.
  - 1.10.8 Provide lintels, extra frames, blocking, escutcheons, grouting, gaskets, packing, caulking, dense putties, taping, filling, etc. as required to stop sound transmission. Use flexible sealant or acoustical gasket to seal between assemblies and dissimilar surfaces.
  - 1.10.9 Extend construction to a minimum of 3 mm (1/8") and a maximum of 13 mm (1/2") of adjacent construction or penetrations to Provide suitable space for packing and caulking.
  - 1.10.10 Cut openings in construction accurately for electrical boxes, piping, ductwork and other penetrating elements. Leave enough space around such elements so they remain free of rigid connection with the surrounding construction.
  - 1.10.11 Prior to packing and caulking penetrations, verify that all penetrating elements such as piping and ductwork are free and clear of the opening to be packed and caulked.
  - 1.10.12 Where multiple layers of gypsum board are used, stagger all joints in adjacent layers for a minimum of 610 mm (24").
  - 1.10.13 Where resilient channels are used as part of a demising wall assembly, ensure that screws do not "short-circuit" the resilient channels, by passing through the gypsum board into the studs.
  - 1.10.14 Where gypsum board ceilings are used for sound control, there should be no penetrations through the gypsum board ceiling layers. Lighting should ideally be surface mounted. If flush mounted lights must be used, each light should be boxed in on the back side with two layers of gypsum board.
  - 1.10.15 Apply all acoustical sealants and caulks in accordance with manufacturer's instructions and requirements of ASTM C919.
  - 1.10.16 Airtight construction requirements for the Project include, but are not limited to the following:
  - 1.10.17 Partition Bases: Provide continuous bead of acoustical sealant at all locations where gypsum board meets structural floor or roof (this includes all sides of partitions). Depth of sealant to be equal thickness of gypsum layer or layers.
  - 1.10.18 Partition Heads: Provide the same detail as for bases at flat structure. Refer to Drawings for details for other conditions.

- 
- 1.10.19 Partition or Ceiling Joints at Dissimilar Materials: Provide continuous bead of acoustical sealant at all locations where gypsum board meets dissimilar material. Depth of sealant to be equal thickness of gypsum layer or layers.
  - 1.10.20 Pipe, Duct, Conduit, or Structural Penetrations: In accordance with requirements of Division 21,22,23,26 and 27.
  - 1.10.21 Electrical Boxes: Provide acoustical putty pad continuously around boxes. Refer to Divisions 26 and 27 for additional requirements.
  - 1.10.22 Electrical, Lighting, or Other Recessed Boxes Over 100 mm x 100 mm (4" x 4"): Provide one layer of 13 mm (5/8") gypsum board continuous around the back of such boxes. Caulk or tape all joints and caulk all conduit penetrations with acoustical sealant. Refer to Divisions 26 and 27 for additional requirements.
  - 1.10.23 Vibration Isolation: Vibration isolate all pieces of mechanical/electrical equipment that can rotate or vibrate. As a minimum, vibration isolation should be selected to meet ASHRAE requirements.

## **2 .    PRODUCTS**

### **2.1    Not Used**

## **3 .    EXECUTION**

### **3.1    Not Used**

END OF SECTION

## **1. GENERAL**

### **1.1 Reference Standards**

- 1.1.1 “Reference standards” means consensus standards, trade association standards, guides, and other publications expressly referenced in Contract Documents.
- 1.1.2 Where an edition or version date is not specified, referenced standards shall be deemed to be the latest edition or revision issued by the publisher at the time of bid closing. However if a particular edition or revision date of a specified standard is referenced in an applicable code or other regulatory requirement, the regulatory referenced edition or version shall apply.
- 1.1.3 Reference standards establish minimum requirements. If Contract Documents call for requirements that differ from a referenced standard, the more stringent requirements shall govern.
- 1.1.4 If compliance with two or more reference standards is specified and the standards establish different or conflicting requirements, comply with the most stringent requirement. Refer uncertainties to Consultant for clarification.
- 1.1.5 Unless the Contract Documents include more stringent requirements, applicable construction industry standards have the same force and effect as if bound or copied directly into the Contract Documents to the extent referenced. Such standards are made a part of the Contract Documents by reference.
- 1.1.6 Copies of Standards: Each entity engaged in construction on Project should be familiar with industry standards applicable to its construction activity. Copies of applicable standards are not bound with the Contract Documents. Where copies of standards are needed to perform a required construction activity, obtain copies directly from publication source.

### **1.2 Standards Producing Industry Organizations**

- 1.2.1 The following associations and organizations are cited in specification sections with acronym, name, and Internet URL addresses as follows:
- 1.2.2 Canadian Organizations:

Abbreviation /Acronym	Name	Website
ACEC	Association of Consulting Engineers of Canada	<a href="http://www.acec.ca">www.acec.ca</a>

Abbreviation /Acronym	Name	Website
AWMAC	Architectural Woodwork Manufacturers Association of Canada	www.awmac.com
CaGBC	Canada Green Building Council	www.cagbc.org
CCA	Canadian Construction Association:	www.cca-acc.com

### **1.3 List Of Standards**

<b>Standard No.</b>	<b>Standard Name</b>
AAMA 1304	Voluntary Specification For Determining Forced Entry Resistance Of Side-Hinged Door Systems
AAMA 1503	Voluntary Test Method For Thermal Transmittance And Condensation Resistance Of Windows, Doors And Glazed Wall Sections
AAMA 1503.1	Thermal Transmittance And Condensation Resistance Of Windows, Doors And Glazed Wall Sections
AAMA 2603	Voluntary Specification, Performance Requirements And Test Procedures For Pigmented Organic Coatings On Aluminum Extrusions And Panels (With Coil Coating Appendix)
AAMA 2604	Voluntary Specification, Performance Requirements And Test Procedures For High Performance Organic Coatings On Aluminum Extrusions And Panels (With Coil Coating Appendix)
AAMA 2605	Voluntary Specification, Performance Requirements And Test Procedures For Superior Performing Organic Coatings On Aluminum Extrusions And Panels (With Coil Coating Appendix)
AAMA 501	Methods Of Test For Exterior Walls
AAMA 501.1	Standard Test Method For Water Penetration Of Windows, Curtain Walls And Doors Using Dynamic Pressure
AAMA 501.2	Quality Assurance And Water Field Check Of Installed Storefronts, Curtain Walls And Sloped Glazing Systems
AAMA 501.4	Recommended Static Test Method For Evaluating Curtain Wall And Storefront Systems Subjected To Seismic And Wind Induced Inter-Story Drifts.
AAMA 501.4	Recommended Static Test Method For Evaluating Curtain Wall And Storefront Systems Subjected To Seismic And Wind Induced Interstory Drifts
AAMA 501.7	Recommended Static Test Method For Evaluating Windows, Window Wall, Curtain Wall And Storefront Systems Subjected To Vertical Inter-Story Movements
AAMA 501.8	Standard Test Method For Determination Of Resistance To Human Impact Of Window Systems Intended For Use In Psychiatric Applications

AAMA 503	Field Testing Of Newly Installed Storefronts, Curtain Walls, And Sloped Glazing Systems
AAMA 507	Standard Practice For Determining The Thermal Performance Characteristics Of Fenestration Systems In Commercial Buildings
AAMA 508	Voluntary Test Method And Specification For Pressure Equalized Rainscreen Wall Cladding Systems
AAMA 609 & 610	Cleaning And Maintenance Guide For Architecturally Finished Aluminum
AAMA 611	Voluntary Specification For Anodized Architectural Aluminum
AAMA 701/702	Voluntary Specification For Pile Weatherstripping And Replaceable Fenestration Weatherseals
AAMA 800	Voluntary Specifications And Test Methods For Sealants
AAMA 804.1	Voluntary Specification For Ductile Back-Bedding Glazing Tapes
AAMA 912	Voluntary Specification For Non-Residential Fenestration Building Information Modeling (BIM)
ACI 315	Details And Detailing Of Concrete Reinforcement
AISC 370	Structural Stainless Steel Buildings
AISI 304	Stainless Steel
AISI S100	North American Specification For The Design Of Cold-Formed Steel Structural Members
ANSI 51	Idmtl Overcurrent Protection
ANSI A108	Installation Of Ceramic Tile
ANSI A108.1	Installation Of Ceramic Tile With Portland Cement Mortar
ANSI A108.11	American National Specifications For The Installation Of Ceramic Tile
ANSI A108.13	American National Specifications For The Installation Of Ceramic Tile
ANSI A108.1A	American National Specifications For The Installation Of Ceramic Tile
ANSI A118.1	American National Standard Specifications For Dry-Set Cement Mortar.(Forming Part Of ANSI A108/A118/A136.1)
ANSI A118.10	American National Standard Specifications For Load Bearing, Bonded, Waterproof Membranes For Thin-Set Ceramic Tile And Dimension Stone Installation.(Forming Part Of ANSI A108/A118/A136.1)
ANSI A118.11	American National Standard Specifications For EGP (Exterior Glue Plywood) Latex-Portland Cement Mortar.(Forming Part Of ANSI A108/A118/A136.1)
ANSI A118.7	High Performance Cement Grouts For Tile Installation
ANSI A118.9	Test Methods And Specifications For Cementitious Backer Units

ANSI A118.12	Crack Isolation Membranes For Thin-Set Ceramic Tile And Dimension Stone Installations
ANSI A118.15	Compliant Mortars
ANSI A118.3	American National Standard Specifications For Chemical Resistant, Water Cleanable Tile-Setting And -Grouting Epoxy And Water Cleanable Tile-Setting Epoxy Adhesive.
ANSI A118.4	American National Standard Specifications For Modified Dry-Set Cement Mortar.(Forming Part Of ANSI A108/A118/A136.1)
ANSI A137.1	American National Standards Specifications For Ceramic Tile
ANSI A137.3	Specifications For Gauged Porcelain Tile And Gauged Porcelain Tile Panels/Slabs (Material And Installation Standards)
ANSI A208.2	Medium Density Fiberboard (MDF) For Interior Applications
ANSI A208.2	Medium Density Fiberboard (MDF) Standard For Interior Applications
ANSI A326.3	Dynamic Coefficient Of Friction (Dcof) Of Hard Surface Flooring Materials
ANSI Standard 61	Drinking Water System Components – Health Effects
ANSI Z 124.3	Plastic Lavatories
ANSI Z124.3	Plastic Lavatories (Superseded By IAPMO Z124-2017)
ANSI Z245.2	Stationary Compactors - Safety Requirements For Installation, Maintenance, And Operation
ANSI Z97.1	Safety Glazing Materials Used In Buildings – Safety Performance Specifications And Methods Of Test
ASTM A780	Standard Practice For Repair Of Damaged And Uncoated Areas Of Hot-Dip Galvanized Coatings
ASTM A1008/A1008M	Cold Rolled, Carbon Steel
ASTM A1011/A1011M	Hot-Rolled, Steel Sheet And Strip And Coils Of Carbon Steel, Structural Steel, High-Strength Low-Alloy Steel, High-Strength Low-Alloy Steel With Improved Formability, And Ultra-High Strength Steel
ASTM A36/A36M	Standard Specification For Carbon Structural Steel
ASTM A53/A53M	Standard Specification For Pipe, Steel, Black And Hot-Dipped, Zinc-Coated, Welded And Seamless
ASTM A123/A123M	Standard Specification For Zinc (Hot-Dip Galvanized) Coatings On Iron And Steel Products
ASTM A167	Standard Specification For Stainless And Heat-Resisting Chromium-Nickel Steel Plate, Sheet, And Strip (WITHDRAWN)
ASTM A176	Standard Specification For Stainless And Heat-Resisting Chromium Steel Plate, Sheet, And Strip (Withdrawn)

ASTM A240/A240M	Standard Specification For Chromium And Chromium-Nickel Stainless Steel Plate, Sheet, And Strip For Pressure Vessels And For General Applications
ASTM A268/A268M	Standard Specification For Seamless And Welded Ferritic And Martensitic Stainless Steel Tubing For General Service
ASTM A269	Standard Specification For Seamless And Welded Austenitic Stainless Steel Tubing For General Service
ASTM A307	Standard Specification For Carbon Steel Bolts, Studs, And Threaded Rod 60000 PSI Tensile Strength
ASTM A325	Standard Specification For Structural Bolts, Steel, Heat Treated, 120/105 Ksi Minimum Tensile Strength (Withdrawn 2016)
ASTM A500/A500M	Standard Specification For Cold-Formed Welded And Seamless Carbon Steel Structural Tubing In Rounds And Shapes
ASTM A510	Standard Specification For General Requirements For Wire Rods And Coarse Round Wire, Carbon Steel, And Alloy Steel
ASTM A653/A653M	Standard Specification For Steel Sheet, Zinc-Coated (Galvanized) Or Zinc-Iron Alloy-Coated (Galvannealed) By The Hot-Dip Process
ASTM A666	Standard Specification For Annealed Or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, And Flat Bar
ASTM A780	Standard Practice For Repair Of Damaged And Uncoated Areas Of Hot-Dip Galvanized Coatings
ASTM A924/A924M	Standard Specification For General Requirements For Steel Sheet, Metallic-Coated By The Hot-Dip Process
ASTM B209/B209M	Standard Specification For Aluminum And Aluminum-Alloy Sheet And Plate
ASTM B210	Standard Specification For Aluminum And Aluminum-Alloy Drawn Seamless Tubes
ASTM B221/B221M	Standard Specification For Aluminum And Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, And Tubes
ASTM B247	Standard Specification For Aluminum And Aluminum-Alloy Die Forgings, Hand Forgings, And Rolled Ring Forgings
ASTM B308/B308M	Standard Specification For Aluminum-Alloy 6061-T6 Standard Structural Profiles
ASTM B456	Standard Specification For Electrodeposited Coatings Of Copper Plus Nickel Plus Chromium And Nickel Plus Chromium
ASTM B633	Standard Specification For Electrodeposited Coatings Of Zinc On Iron And Steel
ASTM B117	Standard Practice For Operating Salt Spray (Fog) Apparatus
ASTM B221	Standard Specification For Aluminum And Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, And Tubes
ASTM C33	Standard Specification For Concrete Aggregates

ASTM C39	Standard Test Method For Compressive Strength Of Cylindrical Concrete Specimens
ASTM C109/C109M	Standard Test Method For Compressive Strength Of Hydraulic Cement Mortars (Using 2-In. Or 50 mm Cube Specimens)
ASTM C150/C150M	Standard Specification For Portland Cement
ASTM C170	Standard Test Method For Compressive Strength Of Dimension Stone
ASTM C190	Standard Test Method For Tensile Strength Of Hydraulic Cement Mortars
ASTM C272	Standard Test Method For Water Absorption Of Core Materials For Sandwich Constructions
ASTM C475	Standard Specification For Joint Compound And Joint Tape For Finishing Gypsum Board
ASTM C501	Standard Test Method For Relative Resistance To Wear Of Unglazed Ceramic Tile By The Taber Abraser
ASTM C595	Standard Specification For Blended Hydraulic Cements
ASTM C957	Standard Specification For High-Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane With Integral Wearing Surface
ASTM C979	Standard Specification For Pigments For Integrally Colored Concrete
ASTM C1047	Standard Specification For Accessories For Gypsum Wallboard And Gypsum Veneer Base
ASTM C1002	Standard Specification For Steel Self-Piercing Tapping Screws For Application Of Gypsum Panel Products Or Metal Plaster Bases To Wood Studs Or Steel Studs
ASTM C1021	Standard Practice For Laboratories Engaged In Testing Of Building Sealants
ASTM C1036	Standard Specification For Flat Glass
ASTM C1048	Standard Specification For Heat-Strengthened And Fully Tempered Flat Glass
ASTM C1087	Standard Test Method For Determining Compatibility Of Liquid-Applied Sealants With Accessories Used In Structural Glazing Systems
ASTM C1115	Standard Specification For Dense Elastomeric Silicone Rubber Gaskets And Accessories
ASTM C1127	Standard Guide For Use Of High Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane With An Integral Wearing Surface
ASTM C1135	Standard Test Method For Determining Tensile Adhesion Properties Of Structural Sealants
ASTM C1172	Standard Specification For Laminated Architectural Flat Glass
ASTM C1177/1177M	Standard Specification For Glass Mat Gypsum Substrate For Use As Sheathing

ASTM C1178	Standard Specification For Coated Glass Mat Water-Resistant Gypsum Backing Panel
ASTM C1184	Standard Specification For Structural Silicone Sealants
ASTM C1280	Standard Specification For Application Of Exterior Gypsum Panel Products For Use As Sheathing
ASTM C1281	Standard Specification For Preformed Tape Sealants For Glazing Applications
ASTM C1305	Standard Test Method For Crack Bridging Ability Of Liquid-Applied Waterproofing Membrane
ASTM C1311	Standard Specification For Solvent Release Sealants
ASTM C1330	Standard Specification For Cylindrical Sealant Backing For Use With Cold Liquid-Applied Sealants
ASTM C1378	Standard Test Method For Determination Of Resistance To Staining
ASTM C1382	Standard Test Method For Determining Tensile Adhesion Properties Of Sealants When Used In Exterior Insulation And Finish Systems (EIFS) Joints
ASTM C1396	Standard Specification For Gypsum Board
ASTM C1401	Standard Guide For Structural Sealant Glazing
ASTM C144	Standard Specification For Aggregate For Masonry Mortar
ASTM C1503	Standard Specification For Silvered Flat Glass Mirror
ASTM C156	Standard Test Method For Water Loss (From A Mortar Specimen) Through Liquid Membrane-Forming Curing Compounds For Concrete
ASTM C1652	Standard Test Method For Measuring Optical Distortion In Flat Glass Products Using Digital Photography Of Grids
ASTM C1708	Standard Test Methods For Self-Leveling Mortars Containing Hydraulic Cements
ASTM C171	Standard Specification For Sheet Materials For Curing Concrete
ASTM C207	Standard Specification For Hydrated Lime For Masonry Purposes
ASTM C216	Standard Specification For Facing Brick (Solid Masonry Units Made From Clay Or Shale)
ASTM C219	Standard Terminology Relating To Hydraulic And Other Inorganic Cements
ASTM C267	Standard Test Methods For Chemical Resistance Of Mortars, Grouts, And Monolithic Surfacing And Polymer Concretes
ASTM C373	Standard Test Methods For Determination Of Water Absorption And Associated Properties By Vacuum Method For Pressed Ceramic Tiles And Glass Tiles And Boil Method For Extruded Ceramic Tiles And Non-Tile Fired Ceramic Whiteware Products

ASTM C501	Standard Test Method For Relative Resistance To Wear Of Unglazed Ceramic Tile By The Taber Abraser
ASTM C509	Standard Specification For Elastomeric Cellular Preformed Gasket And Sealing Material
ASTM C510	Standard Test Method For Staining And Color Change Of Single- Or Multicomponent Joint Sealants
ASTM C518	Standard Test Method For Steady-State Thermal Transmission Properties By Means Of The Heat Flow Meter Apparatus
ASTM C587	Standard Specification For Gypsum Veneer Plaster
ASTM C612	Standard Specification For Mineral Fiber Block And Board Thermal Insulation
ASTM C627	Standard Test Method For Evaluating Ceramic Floor Tile Installation Systems Using The Robinson-Type Floor Tester
ASTM C631	Standard Specification For Gypsum Veneer Plaster
ASTM C645	Standard Specification For Non Structural Steel Framing Members
ASTM C754	Standard Specification For Installation Of Steel Framing Members To Receive Screw-Attached Gypsum Panel Products
ASTM C780	Standard Test Method For Preconstruction And Construction Evaluation Of Mortars For Plain And Reinforced Unit Masonry
ASTM C794	Standard Test Method For Adhesion-In-Peel Of Elastomeric Joint Sealants
ASTM C834	Standard Specification For Latex Sealants
ASTM C840	Standard Specification For Application And Finishing Of Gypsum Board
ASTM C864	Standard Specification For Dense Elastomeric Compression Seal Gaskets, Setting Blocks, And Spacers
ASTM C919	Standard Practice For Use Of Sealants In Acoustical Applications
ASTM C920	Standard Specification For Elastomeric Joint Sealants
ASTM C954	Standard Specification For Steel Drill Screws For The Application Of Gypsum Panel Products Or Metal Plaster Bases To Steel Studs From 0.033 In. (0.84 Mm) To 0.112 In. (2.84 Mm) In Thickness
ASTM D226	Standard Specification For Asphalt-Saturated Organic Felt Used In Roofing And Waterproofing
ASTM D790	Standard Test Methods For Flexural Properties Of Unreinforced And Reinforced Plastics And Electrical Insulating Materials
ASTM D1056	Standard Specification For Flexible Cellular Materials -- Sponge Or Expanded Rubber
ASTM D843	Standard Specification For Nitration Grade Xylene

ASTM D1187	Standard Specification For Asphalt-Base Emulsions For Use As Protective Coatings For Metal
ASTM D1308	Standard Test Method For Effect Of Household Chemicals On Clear And Pigmented Organic Finishes
ASTM D1335	Standard Test Method For Tuft Bind Of Pile Yarn Floor Coverings
ASTM D1411	Standard Test Methods For Water-Soluble Chlorides Present As Admixtures In Graded Aggregate Road Mixes (Withdrawn 2018)
ASTM D1622	Standard Test Method For Apparent Density Of Rigid Cellular Plastics
ASTM D1709	Standard Test Methods For Impact Resistance Of Plastic Film By The Free-Falling Dart Method
ASTM D1876	Standard Test Method For Peel Resistance Of Adhesives (T-Peel Test)
ASTM D1970	Standard Specification For Self-Adhering Polymer Modified Bituminous Sheet Materials Used As Steep Roofing Underlayment For Ice Dam Protection
ASTM D2047	Standard Test Method For Static Coefficient Of Friction Of Polish-Coated Flooring Surfaces As Measured By The James Machine
ASTM D2240	Standard Test Method For Rubber Property-Durometer Hardness
ASTM D2244	Standard Practice For Calculation Of Color Tolerances And Color Differences From Instrumentally Measured Color Coordinates
ASTM D245	Standard Practice For Establishing Structural Grades And Related Allowable Properties For Visually Graded Lumber
ASTM D2487	Standard Practice For Classification Of Soils For Engineering Purposes (Unified Soil Classification System)
ASTM D2822	Standard Specification For Asphalt Roof Cement, Asbestos Containing (Withdrawn 2016)
ASTM D2842	Standard Test Method For Water Absorption Of Rigid Cellular Plastics
ASTM D3019	Standard Specification For Lap Cement Used With Asphalt Roll Roofing, Non-Fibered, And Fibered
ASTM D3936	Standard Test Method For Resistance To Delamination Of The Secondary Backing Of Pile Yarn Floor Covering
ASTM D4068	Standard Specification For Chlorinated Polyethylene (CPE) Sheeting For Concealed Water-Containment Membrane
ASTM D4073	Standard Test Method For Tensile-Tear Strength Of Bituminous Roofing Membranes
ASTM D412	Standard Test Methods For Vulcanized Rubber And Thermoplastic Elastomers-Tension

ASTM D4214	Standard Test Methods For Evaluating The Degree Of Chalking Of Exterior Paint Films
ASTM D4258	Standard Practice For Surface Cleaning Concrete For Coating
ASTM D4263	Standard Test Method For Indicating Moisture In Concrete By The Plastic Sheet Method
ASTM D4355	Standard Test Method For Deterioration Of Geotextiles By Exposure To Light, Moisture, And Heat In A Xenon Arc-Type Apparatus
ASTM D4397	Standard Specification For Polyethylene Sheeting For Construction, Industrial, And Agricultural Applications
ASTM D4491	Standard Test Methods For Water Permeability Of Geotextiles By Permittivity
ASTM D4533	Standard Test Method For Trapezoid Tearing Strength Of Geotextiles
ASTM D4541	Standard Test Method For Pull-Off Strength Of Coatings Using Portable Adhesion Testers
ASTM D4632	Standard Test Method For Grab Breaking Load And Elongation Of Geotextiles
ASTM D4751	Standard Test Methods For Determining Apparent Opening Size Of A Geotextile
ASTM D4833	Standard Test Method For Index Puncture Resistance Of Geomembranes And Related Products
ASTM D523	Standard Test Method For Specular Gloss
ASTM D5252	Standard Practice For The Operation Of The Hexapod Tumble Drum Tester
ASTM D5385	Standard Test Method For Hydrostatic Pressure Resistance Of Waterproofing Membranes
ASTM D5417	Standard Practice For Operation Of The Vettermann Drum Tester
ASTM D543	Standard Practices For Evaluating The Resistance Of Plastics To Chemical Reagents
ASTM D570	Standard Test Method For Water Absorption Of Plastics
ASTM D5848	Standard Test Method For Mass Per Unit Area Of Pile Yarn Floor Coverings
ASTM D6135	Standard Practice For Application Of Self-Adhering Modified Bituminous Waterproofing (Withdrawn)
ASTM D6241	Standard Test Method For Static Puncture Strength Of Geotextiles And Geotextile-Related Products Using A 50-Mm Probe
ASTM D6506	Standard Specification For Asphalt Based Protection Board For Below-Grade Waterproofing
ASTM D6693	Standard Test Method For Determining Tensile Properties Of Nonreinforced Polyethylene And Nonreinforced Flexible Polypropylene Geomembranes

ASTM D698	Standard Test Methods For Laboratory Compaction Characteristics Of Soil Using Standard Effort (12,400 Ft-Lbf/Ft <sup>3</sup> (600 Kn-M/M <sup>3</sup> ))
ASTM D7877	Standard Guide For Electronic Methods For Detecting And Locating Leaks In Waterproof Membranes
ASTM D792	Standard Test Methods For Density And Specific Gravity (Relative Density) Of Plastics By Displacement
ASTM D8231	Standard Practice For The Use Of A Low Voltage Electronic Scanning System For Detecting And Locating Breaches In Roofing And Waterproofing Membranes
ASTM D882	Standard Test Method For Tensile Properties Of Thin Plastic Sheeting
ASTM D903	Standard Test Method For Peel Or Stripping Strength Of Adhesive Bonds
ASTM E96/E96M	Standard Test Methods For Gravimetric Determination Of Water Vapor Transmission Rate Of Materials
ASTM E154	Standard Test Methods For Water Vapor Retarders Used In Contact With Earth Under Concrete Slabs, On Walls, Or As Ground Cover
ASTM E283	Standard Test Method For Determining Rate Of Air Leakage Through Exterior Windows, Skylights, Curtain Walls, And Doors Under Specified Pressure Differences Across The Specimen
ASTM E330	Standard Test Method For Structural Performance Of Exterior Windows, Doors, Skylights And Curtain Walls By Uniform Static Air Pressure Difference
ASTM E1155	Standard Test Method For Determining FF Floor Flatness And FL- Floor Levelness Numbers
ASTM E1186	Standard Practices For Air Leakage Site Detection In Building Envelopes And Air Barrier Systems
ASTM E331	Standard Test Method For Water Penetration Of Exterior Windows, Skylights, Doors, And Curtain Walls By Uniform Static Air Pressure Difference
ASTM E488	Standard Test Methods For Strength Of Anchors In Concrete Elements
ASTM E497	Standard Practice For Installing Sound-Isolating Lightweight Partitions (Withdrawn 2008)
ASTM E514	Standard Test Method For Water Penetration And Leakage Through Masonry
ASTM E699	Standard Specification For Agencies Involved In Testing, Quality Assurance, And Evaluating Of Manufactured Building Components
ASTM E1233	Standard Test Method For Structural Performance Of Exterior Windows, Doors, Skylights, And Curtain Walls By Cyclic Air Pressure Differential

ASTM E1300	Standard Practice For Determining Load Resistance Of Glass In Buildings
ASTM E1332	Standard Classification For Rating Outdoor-Indoor Sound Attenuation
ASTM E1425	Standard Practice For Determining The Acoustical Performance Of Windows, Doors, Skylight, And Glazed Wall Systems
ASTM E1643	Standard Practice For Selection, Design, Installation, And Inspection Of Water Vapor Retarders Used In Contact With Earth Or Granular Fill Under Concrete Slabs
ASTM E1745	Standard Specification For Plastic Water Vapor Retarders Used In Contact With Soil Or Granular Fill Under Concrete Slabs
ASTM E2016	Standard Specification For Industrial Woven Wire Cloth
ASTM E2099	Standard Practice For Specification And Evaluation Of Pre-Construction Laboratory Mockups Of Exterior Wall Systems
ASTM E2178	Standard Test Method For Determining Air Leakage Rate And Calculation Of Air Permeance Of Building Materials
ASTM E2190	Standard Specification For Insulating Glass Unit Performance And Evaluation
ASTM E2486	Standard Test Method For Impact Resistance Of Class PB And PI Exterior Insulation And Finish Systems (EIFS)
ASTM E331	Standard Test Method For Water Penetration Of Exterior Windows, Skylights, Doors, And Curtain Walls By Uniform Static Air Pressure Difference
ASTM E413	Classification For Rating Sound Insulation
ASTM E547	Standard Test Method For Water Penetration Of Exterior Windows, Skylights, Doors, And Curtain Walls By Cyclic Static Air Pressure Difference
ASTM E662	Standard Test Method For Specific Optical Density Of Smoke Generated By Solid Materials
ASTM E783	Standard Test Method For Field Measurement Of Air Leakage Through Installed Exterior Windows And Doors
ASTM E84	Standard Test Method For Surface Burning Characteristics Of Building Materials
ASTM E90	Standard Test Method For Laboratory Measurement Of Airborne Sound Transmission Loss Of Building Partitions And Elements
ASTM F1249	Standard Test Method For Water Vapor Transmission Rate Through Plastic Film And Sheeting Using A Modulated Infrared Sensor
ASTM F1344	Standard Specification For Rubber Floor Tile
ASTM F1859	Standard Specification For Rubber Sheet Floor Covering Without Backing

ASTM F1860	Standard Specification For Rubber Sheet Floor Covering With Backing
ASTM F2170	Standard Test Method For Determining Relative Humidity In Concrete Floor Slabs Using In Situ Probes
ASTM F2285	Standard Consumer Safety Performance Specification For Diaper Changing Tables For Commercial Use
ASTM F3010	Standard Practice For Two-Component Resin Based Membrane-Forming Moisture Mitigation Systems For Use Under Resilient Floor Coverings
ASTM F3131	Standard Specification For Epoxy / Cotton Raw Materials For The Use In Bearing Cages
ASTM F925	Standard Test Method For Resistance To Chemicals Of Resilient Flooring
ASTM F970	Standard Test Method For Measuring Recovery Properties Of Floor Coverings After Static Loading
ASTM G21	Standard Practice For Determining Resistance Of Synthetic Polymeric Materials To Fungi
ASTM G22	Standard Practice For Determining Resistance Of Plastics To Bacteria (Withdrawn)
AWS A5.10	Bare Aluminum & Aluminum-Alloy Welding Electrodes & Rods
AWS D1.3	Specification For Welding Sheet Steel In Structures
BHMA A156	Door Standards
BHMA A 156.9	American National Standard For Cabinet Hardware
CAN/CSA A3000	Cementitious Materials Compendium, Includes Update No. 1 And Errata
CAN/CSA A371	Masonry Construction For Buildings
CAN/CSA G164	Hot Dip Galvanizing Of Irregularly Shaped Articles
CAN/ULC S101	Standard Methods Of Fire Endurance Tests Of Building Construction And Materials
CAN/ULC S102	Standard Method Of Test For Surface Burning Characteristics Of Building Materials And Assemblies
CAN/ULC S102.2	Method Of Test For Surface Burning Characteristics Of Flooring, Floor Coverings, And Miscellaneous Materials And Assemblies
CAN/ULC S104	Standard Method For Fire Tests Of Door Assemblies
CAN/ULC S109	Standard Method For Flame Tests Of Flameresistant Fabrics And Films
CAN/ULC S114	Standard Method Of Test For Determination Of Non-Combustibility In Building Materials
CAN/ULC S134	Standard Method Of Fire Test Of Exterior Wall Assemblies
CAN/ULC S702	Mineral Fibre Thermal Insulation For Buildings (Withdrawn Replaced With CAN/ULC S702.1 And S702.2)

CAN/ULC S716.1	Standard For Exterior Insulation And Finish Systems (EIFS) – Materials And Systems
CAN/ULC S716.3	Standard For Exterior Insulation And Finish Systems (EIFS) – Design Application
CAN/ULC S741	Standard For Air Barrier Materials - Specification
CAN/ULC S742	Standard For Air Barrier Assemblies – Specification
CGSB 1-GP-48M	Primer, Marine, For Steel
CGSB 4.2	Textile Test Methods Table Of Contents, Moisture Regain Values, SI Units Used In CAN/CGSB-4.2-M And Fibre, Yarn, Fabric, Garment And Carpet Properties
CGSB 11-GP-3M	Rigid Panels
CGSB 12.1-M	Tempered Or Laminated Safety Glass
CGSB 12.9	Spandrel Glass
CGSB 25.20	Surface Sealer For Floors
CGSB 82.6	Doors, Mirrored Glass, Sliding Or Folding, Wardrobe
CGSB 148.1	Methods Of Testing Geosynthetics Conditioning Geosynthetics For Testing
CSA A23.1	Concrete Materials And Methods Of Concrete Construction
CSA A23.2	Methods Of Test For Concrete
CSA A82.22	Gypsum Plasters
CSA A165	CSA Standards On Concrete Masonry Units
CSA A179	Mortar And Grout For Unit Masonry
CSA A23.4	Precast Concrete – Materials And Construction
CSA A370	Connectors For Masonry
CSA A371	Masonry Construction For Buildings
CSA A440.2	Fenestration Energy Performance/User Guide To CSA A440.2:19, Fenestration Energy Performance
CSA A440.6	High Exposure Fenestration Installation
CSA A440S1	Canadian Supplement To AAMA/WDMA/CSA 101/I.S.2/A440-17, NAFS – North American Fenestration Standard/Specification For Windows, Doors, And Skylights
CSA A460	Bird-Friendly Building Design
CSA A82	Fired Masonry Brick Made From Clay Or Shale
CSA A500	Building Guards
CSA A3000	Cementitious Materials Compendium
CSA B111	Wire Nails, Spikes And Staples
CSA B651	Accessible Design For The Built Environment
CSA G164	Hot Dip Galvanizing Of Irregularly Shaped Articles
CSA G30.3-M	Cold Drawn Steel Wire For Concrete Reinforcement

CSA G40.20	General Requirements For Rolled Or Welded Structural Quality Steel
CSA G40.21	General Requirements For Rolled Or Welded Structural Quality Steel / Structural Quality Steel
CSA O121	Douglas Fir Plywood
CSA O141	Softwood Lumber
CSA O151	Canadian Softwood Plywood
CSA O80.1	Preservative Treatment Of All Timber Products By Pressure Processes
CSA O153-M	Poplar Plywood
CSA O188	Standard Test Methods For Mat-Formed Wood Particleboards And Waferboard
CSA S136	North American Specification For The Design Of Cold-Formed Steel Structural Members And S136.1-16, Commentary On North American Specification For The Design Of Cold-Formed Steel Structural Members
CSA S157/S157.1	Strength Design In Aluminum
CSA S16	Design Of Steel Structures
CSA S304	Design Of Masonry Structures
CSA S413	Parking Structures
CSA W178.1	Certification Of Welding Inspection Organizations
CSA W178.2	Certification Of Welding Inspectors
CSA W186	Welding Of Reinforcing Bars In Reinforced Concrete Construction
CSA W47.1	Certification Of Companies For Fusion Welding Of Steel
CSA W47.2	Certification Of Companies For Fusion Welding Of Aluminum
CSA W48	Filler Metals And Allied Materials For Metal Arc Welding
CSA W48.1-M	Carbon Steel Covered Electrodes For Shielded Metal Arc Welding
CSA W59	Welded Steel Construction
CSA W59.2	Welded Aluminum Construction
CSA Z259	Fall Protection Equipment
CSA Z271	Design Of Suspended Access Equipment
CSSBI 61	Product Certification Standard - Cold Formed Steel Framing Members
DASMA 108	Standard Method For Testing Sectional Garage Doors, Rolling Doors And Flexible Doors: Determination Of Structural Performance Under Uniform Static Air Pressure Difference
DIN EN 14179-1	Glass In Building - Heat Soaked Thermally Toughened Soda Lime Silicate Safety Glass

EPA 832	Storm Water Management For Construction Activities: Developing Pollution Prevention Plans And Best Management Practices
EPA Method 24	Determination Of Volatile Matter Content, Water Content, Density, Volume Solids, And Weight Solids Of Surface Coatings
ISO 10545	Ceramic Tiles –Part 13: Determination Of Chemical Resistance

**3 .     EXECUTION**

**3.1     Not Used**

END OF SECTION

## **1. GENERAL**

### **1.1 Summary**

- 1.1.1 Purpose of Section: Section specifies responsibilities for temporary facilities and controls for the Work.
- 1.1.2 Read in conjunction with: CCDC 2-2020, Part 3, Execution of the Work; specifically, GC 3.3 and Supplementary Conditions.

### **1.2 Temporary Utilities**

- 1.2.1 General: Provide temporary utilities as specified and as otherwise necessary to perform the Work expeditiously. Remove temporary utilities after use.
- 1.2.2 Temporary Water Supply:
  - .1 Arrange and pay for a temporary supply of water required during construction. Arrange and pay for necessary water supply connections and disconnections.
- 1.2.3 Temporary Heating And Ventilation
  - .1 Arrange and pay for temporary heating and ventilation required during construction.
  - .2 Vent construction heaters in enclosed spaces to the outside or use flameless type of construction heaters.
  - .3 Provide temporary heat for the Work as required to:
    - .1 Facilitate progress of Work.
    - .2 Protect the Work against dampness and cold.
    - .3 Prevent moisture condensation on surfaces, freezing, or other damage to finishes or stored Products.
    - .4 Maintain specified minimum ambient temperatures and humidity levels for storage, installation and curing of Products.
    - .5 After building is enclosed, maintain interior temperature of minimum 10 degrees C.
  - .4 Provide temporary ventilation for the Work as required to:
    - .1 Prevent accumulations of fumes, exhaust, vapours, gases and other hazardous, noxious, or volatile substances in enclosed spaces, as required to maintain a safe work environment meeting applicable regulatory requirements.
    - .2 Ventilate temporary sanitary facilities.

- .5 Do not use permanent building heating and ventilation systems during construction.

1.2.4 Temporary Electrical Power and Lighting

- .1 Arrange and pay for temporary power and lighting required during construction. Arrange and pay for necessary connections and disconnections of temporary power and lighting in accordance with regulatory requirements. . Temporary power for equipment requiring more capacity than above is responsibility of Contractor.
- .2 Do not use permanent building lighting systems during construction.

**1.3 Construction Facilities**

- 1.3.1 Generally: Provide temporary construction facilities as necessary for performance of the Work and in compliance with applicable regulatory requirements.

- .1 Maintain temporary construction facilities in good condition for the duration of the Work.
- .2 Remove temporary construction facilities from Place of the Work when no longer required.

1.3.2 Construction Parking

- .1 Provision for parking is Contractor's responsibility. Make required arrangements to provide temporary parking areas for construction personnel.
- .2 Owner will not be responsible for parking fines incurred by Contractor, Subcontractors or their employees.

1.3.3 Vehicular Access

- .1 Provide and maintain adequate access to Place of the Work.
- .2 Existing roads at Place of the Work may be used for access to Place of the Work, provided Contractor assumes responsibility for any damage caused by construction traffic, and prevents or promptly cleans up any mud tracking or material spillage.

1.3.4 Traffic Control

- .1 Do not block public roads, or impede traffic during the course of the Work, unless otherwise permitted. If necessary to temporarily block traffic, Provide and pay for trained personnel acceptable to authorities having jurisdiction to direct traffic as required.
- .2 Manage construction traffic by using designated roads and by providing trained flag persons to direct public traffic as appropriate.

- 
- .3 Do not block streets, walkways or allow their use for parking by construction crew or visitors except with approved specific permission from appropriate authorities and in accordance with stipulated standing regulations and restrictions.
  - 1.3.5 Site Offices
    - .1 Provide temperature controlled and ventilated office, with suitable lighting, of sufficient size to accommodate site meetings.
  - 1.3.6 Sanitary Facilities:
    - .1 Provide and maintain temporary sanitary facilities for use by workers in compliance with applicable health and safety legislation, and requirements of authorities having jurisdiction. Provide portable, weatherproof toilets, serviced at least weekly, unless noted otherwise. Keep sanitary facilities clean and fully stocked with the necessary supplies.
    - .2 Do not use newly installed or constructed permanent washroom facilities during construction.
  - 1.3.7 Temporary Fire Protection:
    - .1 Provide and maintain fire protection systems to the satisfaction of relevant authorities, the local fire department, the Consultant, the Owner, and insurance agents.
    - .2 Access and Identification: Maintain clear access routes to exits, fire line valves, hoses, and portable fire extinguishers. Ensure devices are visibly marked.
    - .3 Fire Extinguishers: Provide and maintain ULC-labeled fire extinguishers in prominent locations in accordance with requirements of authorities having jurisdiction.
    - .4 Tarpaulin Use: Only fire-resistant tarpaulins are permitted.
    - .5 Hot work: Comply with CSA W117.2.
    - .6 Flammable Materials Storage and Handling:
      - .1 Prohibit bulk storage of flammable liquids on site.
      - .2 Store flammable liquids in approved containers and keep combustibles away from the building.
      - .3 Transport and dispose of flammable materials safely.
    - .7 Fire Risk Mitigation:
      - .1 Familiarize workers with fire-fighting equipment locations and usage.
      - .2 Suspend work if fire protection deficiencies are found.
      - .3 Wet areas before and after hot work operations where feasible, or use fire-retardant materials where wetting is impractical.

- .8 Fire Watch Requirements:
  - .1 Provide continuous fire watch for each of following activities:
    - .1 open flame activities (e.g. soldering, welding and similar operations).
    - .2 shutdown of fire detection system.
    - .3 shutdown of sprinkler system.
    - .4 any other situation that Consultant may deem appropriate.
  - .2 Equip fire watchers with fire extinguishers and assign them solely to fire watch duties.
  - .3 Fire Reporting Immediately report any fire to the fire department and Consultant, regardless of whether it has been extinguished or not.

1.3.8 Elevators

- .1 Do not use newly installed permanent elevators for construction purposes.

1.3.9 Temporary Safety Signs: Install directional signs as necessary to inform the public and individuals seeking entrance to Project area. Provide safety signs in accordance with requirements of authorities having jurisdiction. Conform to CAN/CSA-Z321.

**1.4 Temporary Barriers And Enclosures**

- 1.4.1 Generally: Provide temporary barriers and enclosures necessary to protect the public and to secure Place of the Work during performance of the Work.
  - .1 Comply with applicable regulatory requirements.
  - .2 Maintain temporary barriers and enclosures in good condition for the duration of the Work.
  - .3 Remove temporary barriers and enclosures from Place of the Work when no longer required.
- 1.4.2 Fencing: Erect temporary security and safety site fencing of minimum type and height specified enclosing entire site. Maintain site fencing in good repair until removed, subject to applicable regulatory requirements.
- 1.4.3 Minimum height: Not less than 2.4 m (8 ft)
- 1.4.4 Material Specifications: chain-link fencing with privacy barriers
- 1.4.5 Access Gates: Provide lockable access gates as required to facilitate construction access.
- 1.4.6 Exterior Hoarding: Erect temporary exterior site hoarding to comply with applicable regulatory requirements. As a minimum, comply with the following:

- .1 Minimum height: Not less than 2.4 m (8 ft)
  - .2 Material Specifications:
    - .1 Use lumber framing and, minimum 19 mm thick exterior grade plywood.
    - .2 Paint public side of hoarding in colour selected by Consultant with one coat primer and two coats of exterior paint. Maintain public side of hoarding clean and in good repair until removed.
  - .3 Access Gates: Provide lockable access gates for Construction Equipment and lockable pedestrian doors as required to facilitate construction access.
  - .4 Pedestrian Walkways: Erect and maintain pedestrian walkways including roof and side covers, complete with pedestrian signage and electrical lighting.
- 1.4.7 Protection of Building Finishes
- .1 Provide necessary temporary barriers and enclosures to protect completed or partially completed finished surfaces from damage during performance of the Work.

**1.5 Temporary Controls**

- 1.5.1 Generally: Provide temporary controls as necessary for performance of the Work and in compliance with applicable regulatory requirements.
- .1 Maintain temporary controls in good condition for the duration of the Work.
  - .2 Remove temporary controls and Construction Equipment used to provide temporary controls from Place of the Work when no longer required.
- 1.5.2 Plant Protection:
- .1 Protect trees and other plant material designated to remain on site or on adjacent properties as indicated on Drawings.
  - .2 Protect trees and shrubs susceptible to damage during construction by encasing with protective wood framework from grade to height of at least 1 m, unless otherwise required by authorities having jurisdiction.
  - .3 For trees designated to remain, protect roots inside dripline from disturbance or damage during excavation and grading. Avoid traffic, dumping and storage of materials over root zones.
  - .4 Minimize stripping of topsoil and vegetation.
- 1.5.3 Dust and Particulate Control:
- .1 Implement and maintain dust and particulate control measures in accordance with applicable regulatory requirements.

- 
- .2 Execute Work by methods that minimize dust from construction operations and spreading of dust on site or to adjacent properties.
  - .3 Provide temporary enclosures to prevent extraneous materials resulting from sandblasting or similar operations from contaminating air beyond immediate work area.
  - .4 Cover or wet down dry materials and rubbish to prevent blowing dust and debris. Provide dust control for temporary roads.
  - .5 Use appropriate covers on trucks hauling fine, dusty, or loose materials.
- 1.5.4 Dewatering:
- .1 Provide temporary drainage and pumping as necessary to dewater excavations, trenches, foundations, and other parts of the Work. Maintain such areas free of water arising from groundwater or surface run-off, as required to keep them stable, dry, and protected from damage due to flooding.
  - .2 Maintain standby equipment necessary to ensure continuous operation of dewatering system.
  - .3 Do not pump water containing suspended materials or other harmful substances into waterways, sewers or surface drainage systems. Treat or dispose of such water in accordance with applicable regulatory requirements.
- 1.5.5 Site Drainage:
- .1 Maintain grades to ensure proper site drainage.
  - .2 Prevent surface water runoff from leaving the site except as otherwise provided by site grading and stormwater management plan.
  - .3 Prevent precipitation from infiltrating or from directly running off stockpiled materials. Cover stockpiled materials with an impermeable liner during periods of work stoppage including at end of each Working Day.
  - .4 Control surface drainage from cuts and fills, from borrow and waste disposal areas, from stockpiles, staging areas, and other work areas as required to prevent erosion and sedimentation.
  - .5 Control surface drainage by ensuring that gutters are kept open and water is not directed across or over pavements or sidewalks, except through pipes or properly constructed troughs. Ensure that runoff from unfinished areas is intercepted and diverted to suitable outlets.
- 1.5.6 Erosion and Sediment Control:
- .1 Minimize amount of bare soil exposed at one time. Stabilize disturbed soils as quickly as practical to minimize erosion. Remove accumulated sediment resulting from construction

activity from adjoining surfaces, drainage systems, and watercourses, and repair damage caused by soil erosion and sedimentation.

- .2 Provide and maintain appropriate temporary measures such as silt fences, straw bales, ditches, geotextiles, drains, berms, terracing, riprap, temporary drainage piping, sedimentation basins, vegetative cover, dikes, and other measures that may be required to prevent erosion and migration of silt, mud, sediment, and other debris.
- .3 Do not disturb existing embankments or embankment protection.
- .4 Periodically inspect erosion and sediment control measures to detect evidence of erosion and sedimentation. Promptly take corrective measures when necessary.
- .5 If soil and debris from site accumulate in ditches or other low areas, remove accumulation and restore area to original condition.

1.5.7 Pollution Control:

- .1 Take measures to prevent contamination of soil, water, and atmosphere through uncontrolled discharge of noxious or toxic substances and other pollutants, potentially causing environmental damage.
- .2 Be prepared, by maintaining appropriate materials, equipment, and trained personnel on site, to intercept, clean up, and dispose of spills or releases that may occur. Promptly report spills and releases that may occur to:
  - .1 authority having jurisdiction,
  - .2 person causing or having control of pollution source, if known, and
  - .3 Owner and Consultant.
- .3 Contact manufacturer of pollutant, if known and applicable, to obtain safety data sheets (SDS) and ascertain hazards involved and precautions and measures required in cleanup or mitigating actions.
- .4 Take immediate action to contain and mitigate harmful effects of the spill or release.

2 . PRODUCTS

2.1 Not Used

3 . EXECUTION

3.1 Not Used

END OF SECTION

## **1. GENERAL**

### **1.1 General**

- 1.1.1 Provide Products that are not damaged or defective, and suitable for purpose intended, subject to specified requirements. If requested by Consultant, furnish evidence as to type, source and quality of Products provided.
- 1.1.2 Unless otherwise specified, maintain uniformity of manufacture for like items throughout.
- 1.1.3 Permanent manufacturer's markings, labels, trademarks, and nameplates on Products are not acceptable in prominent locations, except where required by regulatory requirements or for operating instructions, or when located in mechanical or electrical rooms.

### **1.2 Product Options**

- 1.2.1 Subject to the provisions of Section 01 25 00 – Substitution Procedures:
  - .1 Wherever a Product or manufacturer is specified by a single proprietary name, provide the named Product only.
  - .2 Wherever more than one Product or manufacturer is specified by proprietary name for a single application, provide any one of the named Products.
- 1.2.2 Wherever a Product is specified by reference to a standard only, provide any Product that meets or exceeds the specified standard. If requested by Consultant, submit information verifying that the proposed Product meets or exceeds the specified standard.
- 1.2.3 Wherever a Product is specified by descriptive or performance requirements only, provide any Product that meets or exceeds the specified requirements. If requested by Consultant, submit information verifying that the proposed Product meets or exceeds the specified requirements.

### **1.3 Product Ingredient Disclosure And Environmental Transparency**

- 1.3.1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
- 1.3.2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
- 1.3.3 Health Product Declaration open Standard,

- 1.3.4 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
- 1.3.5 International Living Future Institute Declare
- 1.3.6 Other approved framework.
- 1.3.7 When multiple Products are specified, give preference to Products with compliant documentation.

**1.4 Product Availability And Delivery Times**

- 1.4.1 Promptly upon Contract award and periodically during construction, review and confirm Product availability and delivery times. Order Products in sufficient time to meet the construction progress schedule and the Contract Time.
- 1.4.2 If a specified Product is no longer available, promptly notify Consultant. Consultant will take action as required.
- 1.4.3 If delivery delays are foreseeable, for any reason, promptly notify Consultant.
  - .1 If a delivery delay is beyond Contractor's control, Consultant will provide direction.
  - .2 If a delivery delay is caused by something that was or is within Contractor's control, Contractor shall propose actions to maintain the construction progress schedule for Consultant's review and acceptance.

**1.5 Storage, Handling, And Protection**

- 1.5.1 Store, handle, and protect Products during transportation to Place of the Work and before, during, and after installation in a manner to prevent damage, adulteration, deterioration and soiling.
- 1.5.2 Comply with manufacturer's instructions for storage, handling and protection.
- 1.5.3 Store packaged or bundled Products in original and undamaged condition with manufacturer's seals and labels intact. Do not remove from packaging or bundling until required in Work.
- 1.5.4 Comply with the requirements of the workplace hazardous materials information system (WHMIS) regarding use, handling, storage, and disposal of hazardous materials, including requirements for labeling and the provision of material safety data sheets (MSDS).
- 1.5.5 Store Products subject to damage from weather in weatherproof enclosures.
- 1.5.6 Store sheet Products on flat, solid, supports and keep clear of ground. Slope to shed moisture.
- 1.5.7 Remove and replace damaged Products.

---

**1.6     Indoor Air Quality**

- 1.6.1 Select Products for use in the Work that affect indoor air quality as little as possible. Provide adequate ventilation during installation of finishing materials to avoid deleterious effects on indoor air quality. Specifically, select Products for installation within air-handling and distribution systems to minimize the introduction of pollutants into building's fresh air supply.
- 1.6.2 Choose odourless Products wherever possible. Where odourless Products are not available, provide additional ventilation during construction period to encourage off-gassing of materials to their minimum levels prior to occupancy of building.
- 1.6.3 Products and materials incorporated in the Work must be as free as possible of VOCs and emissions. Products emitting benzene, mercury, lead, or other known toxic compounds are not permitted.
- 1.6.4 Adhesives, sealants, paints and coatings applied on site and used in the building's interior must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.2–2017, using the applicable exposure scenario.
- 1.6.5 In addition to emissions criteria specified above, adhesives, sealants, paints and coatings applied on site and used in the building's interior must meet VOC limits established by authorities having jurisdiction and following VOC content limits:
  - .1 Paints and Coatings:
    - .1 Flat Paints and Coatings: 50 g/L.
    - .2 Nonflat Paints and Coatings: 50 g/L.
    - .3 Dry-Fog Coatings: 150 g/L.
    - .4 Primers, Sealers, and Undercoaters: 100 g/L.
    - .5 Rust-Preventive Coatings: 100 g/L.
    - .6 Zinc-Rich Industrial Maintenance Primers: 100 g/L.
    - .7 Pretreatment Wash Primers: 420 g/L.
    - .8 Clear Wood Finishes, Varnishes: 275 g/L.
    - .9 Clear Wood Finishes, Lacquers: 275 g/L.
    - .10 Floor Coatings: 50 g/L.
    - .11 Shellacs, Clear: 730 g/L.
    - .12 Shellacs, Pigmented: 550 g/L.
    - .13 Stains: 100 g/L.
  - .2 Adhesives and Sealants:
    - .1 Wood Glues: 30 g/L.

- 
- .2 Metal-to-Metal Adhesives: 30 g/L.
  - .3 Adhesives for Porous Materials (Except Wood): 50 g/L.
  - .4 Subfloor Adhesives: 50 g/L.
  - .5 Plastic Foam Adhesives: 50 g/L.
  - .6 Carpet Adhesives: 50 g/L.
  - .7 Carpet Pad Adhesives: 50 g/L.
  - .8 VCT and Asphalt Tile Adhesives: 50 g/L.
  - .9 Cove Base Adhesives: 50 g/L.
  - .10 Gypsum Board and Panel Adhesives: 50 g/L.
  - .11 Rubber Floor Adhesives: 60 g/L.
  - .12 Ceramic Tile Adhesives: 65 g/L.
  - .13 Multipurpose Construction Adhesives: 70 g/L.
  - .14 Fiberglass Adhesives: 80 g/L.
  - .15 Contact Adhesive: 80 g/L.
  - .16 Structural Glazing Adhesives: 100 g/L.
  - .17 Wood Flooring Adhesive: 100 g/L.
  - .18 Structural Wood Member Adhesive: 140 g/L.
  - .19 Special-Purpose Contact Adhesive (Used to Bond Melamine-Covered Board, Metal, Unsupported Vinyl, Rubber, or Wood Veneer 1/16 Inch or Less in Thickness to Any Surface): 250 g/L.
  - .20 Top and Trim Adhesive: 250 g/L.
  - .21 Plastic Cement Welding Compounds: 250 g/L.
  - .22 ABS Welding Compounds: 325 g/L.
  - .23 CPVC Welding Compounds: 490 g/L.
  - .24 PVC Welding Compounds: 510 g/L.
  - .25 Adhesive Primer for Plastic: 550 g/L.
  - .26 Sheet-Applied Rubber Lining Adhesive: 850 g/L.
  - .27 Aerosol Adhesive, General-Purpose Mist Spray: 65 percent by weight.
  - .28 Aerosol Adhesive, General-Purpose Web Spray: 55 percent by weight.
  - .29 Special-Purpose Aerosol Adhesive (All Types): 70 percent by weight.
  - .30 Other Adhesives: 250 g/L.
  - .31 Architectural Sealants: 250 g/L.

- .32 Sealant Primers for Nonporous Substrates: 250 g/L.
  - .33 Sealant Primers for Porous Substrates: 775 g/L.
  - .34 Modified Bituminous Sealant Primers: 500 g/L.
  - .35 Other Sealant Primers: 750 g/L.
- 1.6.6 Install HVAC system filtration media in accordance with Mechanical Specifications. Ensure that the filtration media efficiency meets the specified minimum requirements. If Mechanical Specifications do not specify minimum filtration media efficiency, use filters with Minimum Efficiency Reporting Value (MERV) of 13 or better. If system cannot accommodate MERV 13 due to functional requirements, use highest MERV rating possible acceptable for the system.
- 1.6.7 Take measures to prevent entry of dust into HVAC system throughout construction phase.
- 1.6.8 Consider using electrically powered equipment on-site in lieu of gas or propane powered equipment to reduce possibility of carbon monoxide sickness and odours of gas or propane spreading throughout building.

## **2 . PRODUCTS**

### **2.1 Not Used**

## **3 . EXECUTION**

### **3.1 Not Used**

END OF SECTION

**1 . GENERAL**

**1.1 Submittals**

- 1.1.1 Submit name and address of registered land surveyor performing survey work.
- 1.1.2 Submit to Owner and Consultant the survey of the Work prepared and issued by a registered land surveyor on completion of the building footings and foundations, as required by authorities having jurisdiction, and on completion of the Work.

**1.2 Survey Reference Points**

- 1.2.1 Locate and confirm permanent reference points prior to starting site work. Preserve and protect permanent reference points on site during construction.
- 1.2.2 Do not change or relocate reference points without prior written notice to Consultant.
- 1.2.3 Report to Consultant when a reference point is lost or destroyed, or requires relocation because of necessary changes in grades or locations. Require registered land surveyor to replace reference points in accordance with original survey.

**1.3 Survey Requirements**

- 1.3.1 Establish sufficient permanent benchmarks on site, referenced to established benchmarks by survey control points.
- 1.3.2 Confirm that existing survey reference points are in accordance with Owner's survey and property limits.
- 1.3.3 Establish initial lines and levels for building layout.
- 1.3.4 Maintain a complete, accurate log of control and survey work as it progresses. Record locations with horizontal and vertical data in project record documents.

**1.4 Existing Utilities And Structures**

- 1.4.1 Before commencing excavation, drilling or other earthwork, establish or confirm location and extent of all existing underground utilities and structures in work area.
- 1.4.2 Promptly notify Consultant if underground utilities, structures, or their locations differ from those indicated in Contract Documents or in available project information. Consultant will provide appropriate direction.

- 1.4.3 Record locations of maintained, re-routed and abandoned utility lines.

**1.5 Verification Of Existing Conditions**

- 1.5.1 Where work specified in any Section is dependent on the work of another Section or Sections having been properly completed, verify that work is complete and in a condition suitable to receive the subsequent work. Commencement of work of a Section that is dependent on the work of another Section or Sections having been properly completed, means acceptance of the existing conditions.
- 1.5.2 Verify that ambient conditions are suitable before commencing the work of any Section and will remain suitable for as long as required for proper setting, curing, or drying of Products used.
- 1.5.3 Ensure that substrate surfaces are clean, dimensionally stable, cured and free of contaminants.
- 1.5.4 Notify Consultant in writing of unacceptable conditions.

END OF SECTION

---

**1. GENERAL**

**1.1 Summary**

- 1.1.1 Except where otherwise specified in technical Specifications or otherwise indicated on Drawings, comply with requirements of this Section.

**1.2 Manufacturer's Instructions**

- 1.2.1 Install, erect, or apply Products in strict accordance with manufacturer's instructions.
- 1.2.2 Notify Consultant, in writing, of conflicts between Contract Documents and manufacturer's instructions where, in Contractor's opinion, conformance with Contract Documents instead of the manufacturer's instructions may be detrimental to the Work or may jeopardize the manufacturer's warranty.
- 1.2.3 Do not rely on labels or enclosures provided with Products. Obtain written instructions directly from manufacturers.
- 1.2.4 Provide manufacturer's representatives with access to the Work at all times. Render assistance and facilities for such access so that manufacturer's representatives may properly perform their responsibilities.

**1.3 Concealment**

- 1.3.1 Conceal pipes, ducts, and wiring in floors, walls and ceilings in finished areas:
- .1 after review by Consultant and authority having jurisdiction, and
  - .2 where locations differ from those shown on Drawings, after recording actual locations on as-built drawings.
- 1.3.2 Provide incidental furring or other enclosures as required.
- 1.3.3 Notify Consultant in writing of interferences before installation.

**1.4 Fastenings - General**

- 1.4.1 Provide metal fastenings and accessories in same texture, colour and finish as adjacent materials.
- 1.4.2 Prevent electrolytic action and corrosion between dissimilar metals and materials by using suitable non-metallic strips, washers, sleeves, or other permanent separators to avoid direct contact.
- 1.4.3 Use non-corrosive fasteners and anchors for securing exterior work and in spaces where high humidity levels are anticipated.

- 1.4.4 Space anchors within individual load limit or shear capacity and ensure they provide positive permanent anchorage.
- 1.4.5 Keep exposed fastenings to a minimum, space evenly and install neatly.
- 1.4.6 Do not use fastenings or fastening methods that may cause spalling or cracking of material to which anchorage is made.

**1.5 Fastenings - Equipment**

- 1.5.1 Use fastenings of standard commercial sizes and patterns with material and finish suitable for service.
- 1.5.2 Bolts shall not project more than one diameter beyond nuts.

**1.6 Fire Rated Assemblies**

- 1.6.1 When penetrating fire rated walls, ceiling, or floor assemblies, completely seal voids with fire-stopping materials, smoke seals, or both, in full thickness of the construction element as required to maintain the integrity of the fire rated assembly.

**1.7 Location Of Fixtures, Outlets And Devices**

- 1.7.1 Consider location of fixtures, outlets, and devices indicated on Drawings as approximate.
- 1.7.2 Locate fixtures, outlets, and devices to provide minimum interference, maximum usable space, and as required to meet safety, access, maintenance, acoustic, and regulatory, including barrier free, requirements.
- 1.7.3 Promptly notify Consultant in writing of conflicting installation requirements for fixtures, outlets, and devices. If requested, indicate proposed locations and obtain approval for actual locations.

**1.8 Protection Of Completed Work And Work In Progress**

- 1.8.1 Adequately protect parts of the Work completed and in progress from any kind of damage.
- 1.8.2 Promptly remove, replace, clean, or repair, as directed by Consultant, work damaged as a result of inadequate protection.
- 1.8.3 Do not load or permit to be loaded any part of the Work with a weight or force that will endanger the safety or integrity of the Work.

**1.9 Remedial Work**

- 1.9.1 Notify Consultant of, and perform remedial work required to, repair or replace defective or unacceptable work. Ensure that properly qualified workers perform remedial work. Coordinate adjacent affected work as required.

**1 . GENERAL**

**1.1 Request For Cutting, Patching And Remedial Work**

- 1.1.1 Submit written request in advance of cutting, coring, or alteration which affects or is likely to affect:
  - .1 Structural integrity of any element of the Work.
  - .2 Integrity of weather-exposed or moisture-resistant elements.
  - .3 Efficiency, maintenance, or safety of any operational element.
  - .4 Visual qualities of sight-exposed elements.
  - .5 Work of Owner or other contractors.
  - .6 Warranty of Products affected.
- 1.1.2 Include in request:
  - .1 Identification of Project.
  - .2 Location and description of affected work, including drawings or sketches as required.
  - .3 Statement on necessity for cutting or alteration.
  - .4 Description of proposed work, and Products to be used.
  - .5 Alternatives to cutting and patching.
  - .6 Effect on work of Owner or other contractors.
  - .7 Written permission of affected other contractors.
  - .8 Date and time work will be executed.

**1.2 Products**

- 1.2.1 Unless otherwise specified, when replacing existing or previously installed Products in the course of cutting and patching work, use replacement Products of the same character and quality as those being replaced.
- 1.2.2 If an existing or previously installed Product must be replaced with a different Product, submit request for substitution in accordance with Section 01 25 00 - Substitution Procedures.

**1.3 Preparation**

- 1.3.1 Inspect existing conditions in accordance with Section 01 71 00 - Examination and Preparation.
- 1.3.2 Provide supports to ensure structural integrity of surroundings; provide devices and methods to protect other portions of the Work from damage.
- 1.3.3 Provide protection from elements for areas that may be exposed by uncovering work.

---

**1.4     Existing Utilities**

- 1.4.1 When breaking into or connecting to existing services' utilities, execute the Work at times directed by local governing authorities, with a minimum of disturbance to the Work, pedestrian and vehicular traffic, and ongoing Owner operations.
- 1.4.2 Where the Work involves breaking into or connecting to existing services, give authority having jurisdiction and Owner at least 48 hours notice for necessary interruption of mechanical or electrical services.
- 1.4.3 Maintain excavations free of water.
- 1.4.4 Keep duration of interruptions to a minimum.
- 1.4.5 Carry out interruptions after regular working hours of occupants, preferably on weekends, unless Owner's prior written approval is obtained.
- 1.4.6 Protect and maintain existing active services. Record location of services, including depth, on as-built drawings.
- 1.4.7 Construct or erect barriers in accordance with Section 01 50 00 – Temporary Facilities and Controls as required to protect pedestrian and vehicular traffic.

**1.5     Cutting, Patching, And Remedial Work**

- 1.5.1 Coordinate and perform the Work to ensure that cutting and patching work is kept to a minimum.
- 1.5.2 Perform cutting, fitting, patching, and remedial work including any required excavation and fill, to make the affected parts of the Work come together properly and complete the Work.
- 1.5.3 Provide openings in non-structural elements of the Work for penetrations of mechanical and electrical work.
- 1.5.4 Perform cutting by methods to avoid damage to other work
- 1.5.5 Provide proper surfaces to receive patching, remedial work, and finishing.
- 1.5.6 Perform cutting, patching, and remedial work using competent and qualified specialists familiar with the Products affected, in a manner that neither damages nor endangers the Work.
- 1.5.7 Do not use pneumatic or impact tools without Consultant's prior approval.
- 1.5.8 Ensure that cutting, patching, and remedial work does not jeopardize manufacturers' warranties.
- 1.5.9 Refinish surfaces to match adjacent finishes. For continuous surfaces refinish to nearest intersection. For an assembly, refinish entire unit.

- 1.5.10 Fit work to pipes, sleeves, ducts, conduit, and other penetrations through surfaces with suitable allowance for deflection, expansion, contraction, acoustic isolation, and firestopping.
- 1.5.11 Maintain fire ratings of fire rated assemblies where cutting, patching, or remedial work is performed. Completely seal voids or penetrations of assembly with firestopping material to full depth or with suitably rated devices.

## **2 . PRODUCTS**

### **2.1 Not Used**

## **3 . EXECUTION**

### **3.1 Not Used**

END OF SECTION

---

**1. GENERAL**

**1.1 Regulatory Requirements**

- 1.1.1 Comply with applicable regulatory requirements when disposing of waste materials.
- 1.1.2 Obtain permits from authorities having jurisdiction and pay disposal fees where required for disposal of waste materials and recyclables.

**1.2 General Cleaning Requirements**

- 1.2.1 Provide adequate ventilation during use of volatile or noxious substances. Do not rely on building ventilation systems for this purpose.
- 1.2.2 Use only cleaning materials recommended by manufacturer of surface to be cleaned, and as recommended by cleaning material manufacturer.
- 1.2.3 Prevent cross-contamination during the cleaning process.
- 1.2.4 Notify the Consultant of the need for cleaning caused by Owner or other contractors.

**1.3 Progressive Cleaning And Waste Management**

- 1.3.1 Maintain the Work in a tidy and safe condition, free from accumulation of waste materials and construction debris.
- 1.3.2 Provide appropriate, clearly marked, containers for collection of waste materials and recyclables.
- 1.3.3 Remove waste materials and recyclables from work areas, separate, and deposit in designated containers at end of each Working Day. Collect packaging materials for recycling or reuse.
- 1.3.4 Remove waste materials and recyclables from Place of the Work at least daily.
- 1.3.5 Clean interior building areas prior to start of finish work and maintain free of dust and other contaminants during finishing operations.
- 1.3.6 Schedule cleaning operations so that resulting dust, debris and other contaminants will not fall on wet, newly finished surfaces nor contaminate building systems.
- 1.3.7 Clear snow and ice from public sidewalks as required to comply with applicable municipal regulatory requirements.

---

**1.4 Final Cleaning**

- 1.4.1 Before final cleaning, arrange a meeting at Place of the Work to determine the acceptable standard of cleaning. Ensure that Owner, Consultant, Contractor and cleaning company are in attendance.
- 1.4.2 Remove from Place of the Work surplus Products, waste materials, recyclables, Temporary Work, and Construction Equipment not required to perform any remaining work.
- 1.4.3 Provide professional cleaning by a qualified, established cleaning company.
- 1.4.4 Lock or otherwise restrict access to each room or area after completing final cleaning in that area.
- 1.4.5 Re-clean as necessary areas that have been accessed by Contractor's workers prior to Owner occupancy.
- 1.4.6 Remove stains, spots, marks, and dirt from finished surfaces, electrical and mechanical fixtures, furniture fitments, walls, and floors.
- 1.4.7 Clean and polish finishes and equipment, including but not limited to glass, mirrors, hardware, tile, stainless steel, chrome, porcelain enamel, baked enamel, plastic laminate, and other finished surfaces, as well as mechanical and electrical fixtures. Replace broken, scratched, or otherwise damaged glass.
- 1.4.8 Remove dust from lighting reflectors, lenses, lamps, bulbs, and other lighting surfaces.
- 1.4.9 Vacuum clean and dust exposed wall, floor, and ceiling surfaces, behind grilles, louvres and screens, above suspended ceiling tiles.
- 1.4.10 Clean mechanical, electrical, and other equipment. Replace filters for mechanical equipment if equipment is used during construction.
- 1.4.11 Remove waste material and debris from crawlspaces and other accessible concealed spaces.
- 1.4.12 Remove stains, spots, marks, and dirt from exterior facades.
- 1.4.13 Clean and sweep roofs, clear roof drains, and clean gutters and downspouts.
- 1.4.14 Clean exterior sidewalks, steps, driveways, roads, and other paved surfaces as applicable. Remove snow and ice if required.
- 1.4.15 Use leaf blowers to clean landscaped surfaces.

**1.5 Waste Management And Disposal**

- 1.5.1 Dispose of waste materials and recyclables at appropriate municipal landfills and recycling facilities in accordance with applicable regulatory requirements.
- 1.5.2 Do not burn or bury waste materials at Place of the Work.

- 1.5.3 Do not dispose of volatile and other liquid waste such as mineral spirits, oil, paints and other coating materials, paint thinners, cleaners, and similar materials together with dry waste materials or on the ground, in waterways, or in storm or sanitary sewers. Collect such waste materials in appropriate covered containers, promptly remove from Place of the Work, and dispose of at recycling facilities or as otherwise permitted by applicable regulatory requirements.
- 1.5.4 Cover or wet down dry waste materials to prevent blowing dust and debris.

## **2 . PRODUCTS**

### **2.1 Not Used**

## **3 . EXECUTION**

### **3.1 Not Used**

END OF SECTION

## **1. GENERAL**

### **1.1 Summary**

- 1.1.1 Purpose of Section: Section details integrated testing of fire protection and life safety systems in accordance with OBC and CAN/ULC S1001 to verify performance and interconnectivity of integrated systems to ensure they function cohesively in emergency situations.
- .1 Scope of Section is limited to testing of interconnections between life safety and/or fire protection systems as required by OBC Division B, Subsection "Integrated Fire Protection and Life Safety Systems". Refer to technical Specification Sections for individual testing and commissioning requirements for systems.
- 1.1.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.2 Definitions**

- 1.2.1 Commissioning: Owner-driven process ensuring that all building systems and components operate according to project requirements and construction documents.
- 1.2.2 Integrated Systems Testing: a code requirement specifically for fire protection and life safety systems to verify and document their interconnections and operational performance in accordance with design criteria.
- 1.2.3 FPLS: Fire Protection and Life Safety.

### **1.3 Preinstallation Meetings**

- 1.3.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.3.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:

- .1 Review progress of related construction activities and preparations for particular activity under consideration.
- .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.4      Coordination**

- 1.4.1 Collaborate with Subcontractors responsible for equipment or systems subject to testing under this Section, to ensure comprehensive testing and documentation of interface and integration between various fire protection and life safety systems provided under those divisions.

**1.5      Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Proposed Integrated Testing Plan: Submit detailed test plan prepared by Integrated Testing Coordinator and complying with CAN/ULC S1001, highlighting testing protocols, schedules, and identifying involved parties. As a minimum, integrated testing plan must include:
  - .1 Functional objectives of system integrations
  - .2 Sequence of operations – normal and off-normal
  - .3 Test protocol and procedures
  - .4 Procedure for notifying building occupants.
  - .5 Alternative measures – notifications and safety protocols for ensuring occupant safety during testing.
  - .6 Phased occupancy requirements, where applicable.
  - .7 Where required, submit testing plan to Authorities Having Jurisdiction for review.
- 1.5.3 Pre-Testing Confirmation: Submit confirmation from design professionals and installing contractors indicating that systems are installed correctly and functional.
  - .1 Where required, sufficient notification to Authorities Having Jurisdiction to witness integrated systems testing.

---

**1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Final Integrated Systems Testing Report:
  - .1 Submit documentation providing results of implementation of integrated testing plan final in accordance with section 7 of CAN/ULC-S1001. Report must include:
    - .1 Integrated testing plan,
    - .2 Completed initial integration testing forms with test results,
    - .3 Re-test integration testing forms, if necessary,
    - .4 Pre-integration testing verification documentation for relevant systems.
  - .2 Distribute copies of the final report as follows:
    - .1 One copy to each relevant authority having jurisdiction,
    - .2 One copy to Consultant,
    - .3 One copy to Owner.

**1.7 Quality Assurance**

- 1.7.1 Integrated Testing Coordinator: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that indicated, and whose work has resulted in construction with a track record of successful in-service performance.
  - .1 Integrated Testing Coordinator must be a knowledgeable and experienced individual, firm, corporation, or organization responsible for developing and implementing the integrated testing plan. Where a firm, corporation, or organization is responsible for integrated fire protection and life safety systems testing, a representative of that firm, corporation, or organization shall be designated as the integrated testing coordinator.

**1.8 Preparation Of Integrated Testing Plan**

- 1.8.1 Develop integrated test plan as described in section 5 of CAN/ULC-S1001.
- 1.8.2 Collaborate with relevant Consultants to obtain necessary design performance criteria for integrating fire protection and life safety systems. This includes, but is not limited to :
  - .1 building floor plans,
  - .2 details of control sequences for different systems,

- 
- .3 mechanical and electrical riser diagrams, if relevant,
  - .4 operating and testing instructions from the trade contractors involved,
  - .5 alternative solutions to prescribed requirements of OBC or standards from the relevant Consultant.
- 1.8.3 Develop integrated testing plan to include, but not be limited to, following:
- .1 Objectives for the functionality of system integrations,
  - .2 Operational sequence for the integrated elements of the fire protection and life safety systems, including:
    - .1 Normal operating conditions,
    - .2 Fire condition operations,
    - .3 Procedures for informing occupants about the testing of integrated systems,
  - .3 Safety management protocols, including safety guidelines and notifications, to ensure the safety of occupants and workers during system testing,
  - .4 For phased building testing, include additional procedures for:
    - .1 Testing each area of the building at different times for staged occupancy permits,
    - .2 Final testing of whole building once phased areas are complete, including scenarios where areas may be occupied concurrently.
  - .5 Append test procedures for each system-to-system integration as separate sections or as appendix.
  - .6 Provide workflow diagram in test plan to depict system dependencies, clearly showing sequence and relationships between different systems.
  - .7 Provide testing schedule with overall construction schedule, marking important dates for potential participation of parties in witnessing tests.
  - .8 Present initial draft of test plan to Consultant(s) for review. Following feedback and necessary revisions, submit revised draft to Authority Having Jurisdiction.
  - .9 In case of design changes in fire protection and life safety equipment or systems affecting integration, revise integrated test plan accordingly and submit for Consultant review before implementation.

---

**1.9     Testing Procedures**

- 1.9.1 Develop test procedures and test forms in accordance with requirements of section 6 and section 7 of CAN/ULC-S1001 and as specified herein or in technical specifications.
- 1.9.2 Testing must include functional objectives of system integrations and sequence of operations under normal and off-normal conditions in accordance with CAN/ULC S1001.
- 1.9.3 Use simulations for tests for non-restorable systems or situations where actual testing could be hazardous.

**1.10    Execution**

- 1.10.1 Execute integrated testing program according to sections 6 and 7 of CAN/ULC-S1001.
- 1.10.2 Prior to starting tests, ensure necessary documentation for installation verification, acceptance testing, notifications, and required inspections by authorities of individual life safety equipment and systems are in place.
- 1.10.3 Notify relevant authorities having jurisdiction about testing schedule and invite them to participate or witness tests.
- 1.10.4 Employ temporary installation measures needed for testing. Maintain log detailing each temporary measure, its installation date, and specific integration test it is meant to support.
- 1.10.5 Planning Phase:
  - .1 Installing Subcontractors for each integrated system to submit documents detailing integration performance of systems.
  - .2 Identified deficiencies are to be documented and forwarded to respective installing Subcontractors for resolution.
- 1.10.6 Implementation Phase:
  - .1 Execute test protocol and procedures as established in planning phase.
  - .2 Ensure procedure for notifying building occupants is in place, considering alternative measures for occupant safety during testing.
  - .3 Consider phased occupancy plans and safety of personnel during testing, as applicable.
- 1.10.7 Pre-Testing Requirements: Prior to actual integrated systems testing, complete following pre-testing steps:
  - .1 Obtain written confirmation from installing Subcontractors that they acceptance testing and integrity of installation is confirmed.
  - .2 Secure confirmation from installing contractors regarding correct installation of systems.

- .3 Establish and document occupant notification procedures.
- .4 Provide sufficient notification to authorities having jurisdiction to witness integrated systems testing, where required.

1.10.8 Sequence of Testing Events

- .1 Ensure sequence of testing events aligns with integrated testing plan developed during planning phase.
- .2 Start with functional testing of individual systems to ensure their independent operability.
- .3 Proceed to integrated system tests, where interoperation and collective response of systems to various scenarios is to be verified.
- .4 In event of test failure, initiate corrective measures and re-test affected systems until compliance is achieved.

**1.11 Adjusting**

- 1.11.1 Restore systems to standard operational state after successful integrated testing. If temporary measures were used, remove such measures and update log to record removal date. Include log in final test report.

**1.12 Demonstration And Training**

- 1.12.1 Train Owner's maintenance personnel to adjust, operate, and maintain life safety systems integration. Demonstration and training must include:
- .1 Function of integration,
  - .2 Integration method – whether hardwired, network communication, or operating protocols,
  - .3 Type of information – data, commands, monitoring,
  - .4 Temporary measures for future retesting.

**1.13 Schedule Of Integrated Systems Testing**

- 1.13.1 Applicable portions of the Work subject to testing include, but are not limited to:
- .1 Division 08 - Openings
    - .1 Electromagnetic Locking Devices
    - .2 Door hold-open devices
    - .3 Automatic Fire Shutters
  - .2 Division 14 - Conveying Equipment
    - .1 Elevators
    - .2 Emergency Elevators
  - .3 Division 11 - Equipment

- 
- .1 Dust Collection Systems
  - .2 Spark Arrest Systems.
  - .4 Division 21 - Fire Suppression
    - .1 Sprinkler Systems
    - .2 Standpipe Systems
    - .3 Fire Pumps
    - .4 Water Supply Control Valves
    - .5 Freeze Protection Systems
    - .6 Fixed Fire Suppression Systems
    - .7 Cooking Equipment Fire Suppression Systems
  - .5 Division 22 - Plumbing
    - .1 Water Supply
  - .6 Division 23 - Heating, Ventilating, and Air Conditioning (HVAC)
    - .1 Smoke dampers,
    - .2 Motorized fire dampers,
    - .3 Smoke Control Pressurization Systems
    - .4 Smoke Control Smoke Exhaust Systems
    - .5 Freeze protection systems (for water-based fire protection piping)
  - .7 Division 25 - Integrated Automation
    - .1 Building Automation System
  - .8 Division 26 – Electrical
    - .1 Emergency power distribution systems.
    - .2 Emergency lighting control systems.
  - .9 Division 27 - Communications
    - .1 Audio/Visual Control System
  - .10 Division 28 - Electronic Safety and Security
    - .1 Fire Alarm System (including sequence of operation)
    - .2 Smoke alarm systems
    - .3 Security systems
    - .4 Notification systems,
    - .5 Hazardous protection monitoring.

END OF SECTION

---

**1. GENERAL**

**1.1 Summary**

- 1.1.1 Purpose of Section: Section specifies administrative procedures for contract closeout.
- 1.1.2 Read in conjunction with: CCDC 2-2020, Part 12, Owner Takeover and Supplementary Conditions.

**1.2 Ready-For-Takeover**

- 1.2.1 The prerequisites to attaining Ready-for-Takeover of the Work are described in the General Conditions of the Contract.

**1.3 Inspection And Review Before Ready-For-Takeover**

- 1.3.1 Contractor's Inspection: Before applying for the Consultant's review to establish Ready-for-Takeover of the Work:
  - .1 Ensure that the specified prerequisites to Ready-for-Takeover of the Work are completed.
  - .2 Conduct an inspection of the Work to identify defective, deficient, or incomplete work.
  - .3 Prepare a comprehensive and detailed list of items to be completed or corrected.
  - .4 Provide an anticipated schedule and costs for items to be completed or corrected.
- 1.3.2 Consultant's Review: Upon receipt of the Contractor's application for review, together with the Contractor's list of items to be completed or corrected, the Consultant will review the Work. The Consultant will advise the Contractor whether or not the Work is Ready-for-Takeover and will provide the Contractor with a list of items, if any, to be added to the Contractor's list of items to be completed or corrected. Provide the Consultant with a copy of the Contractor's revised list.
- 1.3.3 Consultant's Review: Upon receipt of the Contractor's application for review, together with the Contractor's list of items to be completed or corrected, the Consultant and the Contractor shall arrange a mutually satisfactory agreed date and time to jointly review the Work. The Consultant will advise the Contractor whether or not the Work is Ready-for-Takeover. Add additional items, if any, to the Contractor's list of items to be completed or corrected. Provide the Consultant with a copy of the revised list.
- 1.3.4 Maintain the list of items to be completed or corrected and promptly correct or complete defective, deficient and incomplete work. The

Contractor's inspection and Consultant's review procedures specified above shall be repeated until the Work is Ready-for-Takeover and no items remain on the Contractor's list of items to be completed or corrected.

- 1.3.5 When the Consultant determines that the Work is Ready-for-Takeover, the Consultant will notify the Contractor and the Owner in writing to that effect.

**1.4 Prerequisites To Final Payment**

- 1.4.1 After Ready-for-Takeover of the Work and before submitting an application for final payment in accordance with the General Conditions of Contract:

- .1 Correct or complete all remaining defective, deficient, and incomplete work.
- .2 Remove from the Place of the Work all remaining surplus Products, Construction Equipment, and Temporary Work.
- .3 Perform final cleaning and waste removal necessitated by the Contractor's work performed after Ready-for-Takeover, as specified in Section 01 74 00 – Cleaning and Waste Management.

**1.5 Partial Owner Occupancy**

- 1.5.1 Owner reserves right to occupy and use portions of premises, whether partially or entirely completed, or whether completed on schedule or not, Provided such occupancy does not interfere with Contractor's continuing the Work. Partial occupancy or installation of equipment by Owner does not imply acceptance of the Work in whole or in part, nor shall it imply acknowledgment that terms of Contract are fulfilled.
- 1.5.2 If partial Owner occupancy of a part of the Work is required before the date of Ready-for-Takeover of the entire Work of the Contract, the provisions of this Section shall apply, to the extent applicable, to that part of the Work that the Owner intends to occupy.

**1.6 Substantial Performance Of The Work**

- 1.6.1 The prerequisites to, and the procedures for, attaining substantial performance of the Work, or similar such milestone as provided for in the The Construction Act, shall be:
- .1 independent of those for attaining Ready-for-Takeover of the Work, and
  - .2 in accordance with the The Construction Act.
- 1.6.2 Procedures: Comply with requirements of The Construction Act and generally with the following:

- 
- .1 Notification: Provide written notice to Owner and Consultant at least 60 days in advance of anticipated date of Substantial Performance of the Work.
  - .2 Contractor Self-Inspection: conduct inspection of Work, identify deficiencies and defects, and repair as required to conform to Contract Documents. Notify Consultant in writing of satisfactory completion of Contractor's inspection and submit verification that corrections have been made. Request Consultant's inspection.
  - .3 Consultant / Contractor Joint Inspection: Consultant and Contractor will inspect Work and identify defects and deficiencies and record such deficiencies on a deficiency list. Contractor must correct Work as directed.
  - .4 Deficiency List Submission: Prepare and submit a list of items that have been completed and items that remain to be corrected indicating value of each item on list and reasons why the Work is incomplete.
  - .5 Submittals Prior to Substantial Performance: Verify contractual requirements for Substantial Performance certification and submit necessary documents at least 10 days prior to established date for Substantial Performance. As a minimum, the following must be submitted:
    - .1 Certificates from authorities having jurisdiction, permitting Owner unrestricted use of the Work and access to services and utilities. Include occupancy permits, operating certificates, and similar documentation.
    - .2 Closeout submittals specified in Section 01 78 00, including operation and maintenance manuals necessary for immediate operation and maintenance of the Work.
    - .3 Copy of as-built Drawings completed to date.
    - .4 Testing, adjusting, and balancing records.
  - .6 Completion Tasks: As a minimum the following must be completed prior to requesting Consultant's final inspection. Submit written certificates that following tasks have been performed:
    - .1 Work: completed and inspected for compliance with Contract Documents.
    - .2 Defects: corrected and deficiencies completed.
    - .3 Equipment and systems: tested, adjusted, and balanced and fully operational.
    - .4 Certificates required by Authorities Having Jurisdiction (e.g. Boiler Inspection Branch, Fire Marshall, Utility companies etc.): submitted.

- .5 Operation of systems: demonstrated to Owner's personnel.
- .6 Commissioning of systems: completed and copies of final Commissioning Report submitted to Consultant .
- .7 Work: complete and ready for final inspection.
- .7 Final Inspection:
  - .1 Upon finishing of completion tasks above, request final inspection of the Work by Consultant.
  - .2 If in Owner's or Consultant's opinion, Work remains incomplete, complete outstanding items and request re-inspection.
- .8 Declaration of Substantial Performance: If Consultant considers deficiencies and defects corrected and requirements of Contract substantially performed, make application for Certificate of Substantial Performance.
- .9 Commencement of Lien and Warranty Periods: date of Owner's acceptance of submitted declaration of Substantial Performance to be date for commencement for warranty period and commencement of lien period unless required otherwise by The Construction Act.
- .10 Final Payment:
  - .1 When Consultant considers final deficiencies and defects corrected and requirements of Contract met, make application for final payment.
  - .2 If Work remains deemed incomplete by Consultant , complete outstanding items and request re-inspection.
- .11 Payment of Holdback: after issuance of Certificate of Substantial Performance of Work, submit application for payment of holdback amount in accordance with requirements of the Contract.

**1.7 Final Cleaning**

- 1.7.1 Read in conjunction with: Section 01 74 00.
- 1.7.2 Perform final cleaning and waste-removal operations in accordance with local laws and ordinances, as well as Federal and Provincial and local environmental regulations.
- 1.7.3 Cleaning Personnel: Use experienced workers or professional cleaners for final cleaning tasks.
- 1.7.4 Cleaning Standards: Each surface or unit must be cleaned to condition expected in an average commercial building cleaning and maintenance program.

- 
- 1.7.5 Manufacturer's Instructions: Comply with manufacturer's written instructions for cleaning processes.
  - 1.7.6 Cleaning Agents: Use cleaning materials and agents recommended by manufacturer or fabricator of surface being cleaned. Do not use cleaning agents that are potentially hazardous to health, property, or that could damage finished surfaces.
    - .1 Toxicity: Products must be labeled as 'low-hazard' or 'safer' by an ISO 14024-compliant (Type 1) Ecolabel, or other recognized third-party certification.
    - .2 Compliance with Green Seal GS-37: Generally, use cleaning products that comply with Green Seal GS-37. If GS-37 is not applicable to specified cleaning product, select products that comply with the California Code of Regulations regarding maximum allowable VOC levels.
    - .3 Ingredient Disclosure and Safety: Products must have ingredients disclosed through a Safety Data Sheet (SDS). No ingredients should be present at 100 ppm (0.01%) or above that are classified with GHS codes and hazard statements: H311, H312, H317, H334, H340, H350, H360, H372.

## 2 . **PRODUCTS**

### 2.1 **Not Used**

## 3 . **EXECUTION**

### 3.1 **Not Used**

END OF SECTION

## 1. **GENERAL**

### 1.1 **Definitions**

1.1.1 For the purposes of this Section, the following definitions as defined by the Ontario Association of Architects Practice Tip – PT.14 Version 1.1 apply:

- .1 As-built drawings: drawings usually prepared by Contractor as it constructs the project and upon which it documents the actual locations of building components and changes to the original contract documents. These, or a copy of same, are typically turned over to the Consultant or Owner at completion of the project.
- .2 Record drawings: drawings usually prepared by the Consultant when contracted to do so. These are usually a composite of the original drawings, changes known to the Consultant and information taken from the Contractor's as-built drawings. Responsibility for preparation of record drawings may be delegated to Contractor if indicated as such in this Section.

### 1.2 **Operation And Maintenance Manual**

1.2.1 Preparation: Prepare a comprehensive operation and maintenance manual, in the language(s) of the Contract, using personnel qualified and experienced for this task.

1.2.2 Submission Timing: Submit an initial draft of the operation and maintenance manual for Consultant's review. If required by Consultant's review comments, revise manual contents and resubmit for Consultant's review. If required, repeat this process until Consultant accepts the draft manual in writing.

1.2.3 Operation And Maintenance Manual Format:

- .1 Organize data in the form of an instructional manual.
- .2 Hard Copies:
  - .1 Number of Copies: Submit 2 of final version to Owner.
  - .2 Binders: vinyl, hard covered, three D-rings, loose leaf, 216 x 279 mm, with spine and face pockets. When multiple binders are used, correlate data into related consistent groupings. Identify contents of each binder on spine.
  - .3 Cover: Identify each binder with typed or printed title "Operation and Maintenance Manual for Dockstader PRPS", and subject matter of contents.

- 
- .4 Arrange content by systems or process flow, under Section numbers and sequence of Table of Contents.
  - .5 Provide tabbed fly leaf for each separate Product or system, with typed description of Product and major component parts of equipment.
  - .6 Text: Manufacturer's printed data, or typewritten data.
  - .7 Drawings: provide with reinforced punched binder tab. Bind in with text; fold larger drawings to size of text pages.
  - .3 Electronic Copies:
    - .1 Submission Media: Submit final version to Owner on electronic media acceptable to Owner. When permitted by Owner, digitally transfer files using a secure cloud storage system.
    - .2 Format: Provide electronic copy of Operation and Maintenance Manual in PDF format.
      - .1 Use electronic files prepared by manufacturer where available. If scanning of paper documents is necessary, configure scanned file for minimum readable file size.
      - .2 Bookmarking: Individual documents must be bookmarked based on file names. Name document files to correspond to system, subsystem, and equipment names used on table of contents.
      - .3 Group documents for each system and subsystem into bookmarked files.
    - .3 Shop Drawings: Provide electronic copy of Shop Drawings in manual as 1:1 scaled files in both .dxf and PDF format.
- 1.2.4 Operation And Maintenance Manual Contents:
- .1 General Contents:
    - .1 Table of contents for each volume.
    - .2 Introductory information including:
      - .1 Date of manual submission.
      - .2 Complete contact information for Consultant, subconsultants, other consultants, and Contractor, with names of responsible parties.
      - .3 Schedule of Products and systems indexed to content of volume.
    - .3 For each Product or system, include complete contact information for Subcontractors, Suppliers and manufacturers, including local sources for supplies and replacement parts.

- 
- .4 Product Data: mark each sheet to clearly identify specific products, options, and component parts, and data applicable to installation. Delete or strike out inapplicable information. Supplement with additional information as required.
  - .5 Reviewed Shop Drawings.
  - .6 Permits, certificates, letters of assurance and other relevant documents issued by or required by authorities having jurisdiction.
  - .7 Warranties.
  - .8 Operating and maintenance procedures, incorporating manufacturer's operating and maintenance instructions, in a logical sequence.
  - .9 Training materials as specified in Section 01 79 00 - Demonstration and Training.
  - .2 Equipment And Systems:
    - .1 Each Item of Equipment and Each System: include description of unit or system and component parts. Give function, normal operation characteristics, and limiting conditions. Include performance curves, with engineering data and tests, and complete nomenclature and commercial number of replaceable parts.
    - .2 Panel Board Circuit Directories: provide electrical service characteristics, controls, and communications.
    - .3 Include installed colour coded wiring diagrams.
    - .4 Operating Procedures: include start-up, break-in, and routine normal operating instructions and sequences. Include regulation, control, stopping, shut-down, and emergency instructions. Include summer, winter, and any special operating instructions.
    - .5 Maintenance Requirements: include routine procedures and guide for trouble-shooting; disassembly, repair, and reassembly instructions; and alignment, adjusting, balancing, and checking instructions.
    - .6 Provide servicing and lubrication schedule, and list of lubricants required.
    - .7 Include manufacturer's printed operation and maintenance instructions.
    - .8 Include sequence of operation by controls manufacturer.
    - .9 Provide original manufacturer's parts list, illustrations, assembly drawings, and diagrams required for maintenance.

- 
- .10 Provide installed control diagrams by controls manufacturer.
  - .11 Provide Contractor's coordination drawings, with installed colour coded piping diagrams.
  - .12 Provide charts of valve tag numbers, with location and function of each valve, keyed to flow and control diagrams.
  - .13 Provide list of original manufacturer's spare parts, current prices, and recommended quantities to be maintained in storage.
  - .14 Include testing and balancing reports.
  - .15 Include additional content as specified in technical Specifications sections.
  - .3 Products And Finishes:
    - .1 Include Product data, with catalogue number, options selected, size, composition, and colour and texture designations. Provide information for re-ordering custom manufactured Products.
    - .2 Instructions for cleaning agents and methods, precautions against detrimental agents and methods, and recommended schedule for cleaning and maintenance.
    - .3 Include an outline of requirements for routine and special inspections and for regular maintenance to ensure that on-going performance of the building envelope will meet the initial building envelope criteria.
    - .4 Include additional content as specified in technical Specifications sections.
  - .4 Warranties:
    - .1 Separate each warranty with index tab sheets keyed to Table of Contents listing.
    - .2 List each warrantor with complete contact information.
    - .3 Verify that documents are in proper form and contain full information. Ensure that warranties are for the correct duration and are in Owner's name.
    - .4 Include maintenance bond(s), if any.

### **1.3 Contractor's As-Built Drawings**

- 1.3.1 Submit final as-built drawings as specified in Section 01 32 00 – Construction Progress Documentation to Consultant.
  - .1 Hard Copies: Submit 2 of as-built drawings to Consultant.

- .2 Electronic Copies: Submit electronic copy of As-Built Drawings in PDF format on electronic media acceptable to Owner. When permitted by Owner, digitally transfer files using a secure cloud storage system.

#### **1.4 Project Record Drawings**

- 1.4.1 Include cost of preparing record Drawings in Contract Price.
- 1.4.2 Consultant's Review: Consultant will review as-built Drawings to determine if general scope of changes, additional information recorded, and quality of drafting are generally acceptable.
- 1.4.3 Transfer of Information: After Consultant's review and acceptance, transfer information marked up on as-built drawings during progress of work to a master set of record drawing files as provided by Consultant. Incorporate Consultant's comments provided during Consultant's review of as-built drawings. Mark revised drawings as "RECORD DRAWINGS for Dockstader PRPS".
- 1.4.4 Format: Submit completed record drawings as follows:
  - .1 Hard Copies: Submit of record drawings to Consultant.
  - .2 Electronic Copies: Submit electronic copy of record drawings in PDF format on electronic media acceptable to Owner. When permitted by Owner, digitally transfer files using a secure cloud storage system.

#### **1.5 Spare Parts, Maintenance Materials, And Special Tools**

- 1.5.1 Supply spare parts, maintenance materials, and special tools in quantities specified in technical Specifications sections.
- 1.5.2 Ensure spare parts and maintenance materials are new, not damaged nor defective, and of same quality, manufacturer, and batch or production run as installed Products.
- 1.5.3 Provide tags for special tools identifying their function and associated Product.
- 1.5.4 Deliver to and store items at location directed by Owner at Place of the Work. Store in original packaging with manufacturer's labels intact and in a manner to prevent damage or deterioration.
- 1.5.5 Catalogue all items and submit to Consultant an inventory listing organized by Specifications section. Include Consultant reviewed inventory listing in operation and maintenance manual.

2 . **PRODUCTS**

2.1 **Not Used**

3 . **EXECUTION**

3.1 **Not Used**

END OF SECTION

## **1 . GENERAL**

### **1.1 WPAM Project Handover Requirements**

- 1.1.1 Upon project completion, the Vendor will provide a summary of information related to new or modified changes to the building and/or property in the form of:
  - .1 Record drawings;
  - .2 Space statistics;
  - .3 Building component list;
  - .4 Equipment list; and
  - .5 Asbestos abatement documentation (if applicable).
- 1.1.2 The listed deliverables will be submitted to the Agency's project manager, no later than 5 weeks following project substantial completion of each Phase. If the deliverables are not completed as described herein, they will be returned to the Vendor for correction and resubmission to the Agency, at no additional cost to the Agency
- 1.1.3 The Phases are as described below:
  - .1 Stage 1: Substantial Performance (Building occupancy), this includes the new building, site services and completed landscape works.
  - .2 Stage 2: Park phase completion covering the balance landscape works, demolition & park works.

### **1.2 Record Drawings**

- 1.2.1 Provide 'record' drawings' for all affected building systems.
- 1.2.2 For major renovations or new builds, provide a full drawings set complete with all building systems;
- 1.2.3 The drawings shall be provided as follows:
  - .1 In AutoCAD (2013) and PDF formats to protect professional stamps,
  - .2 Via flash drive,
  - .3 Indicating a revision line and date (mm/dd/yy).
  - .4 Without protection, and
  - .5 Including all X-ref drawings
  - .6 AutoCAD drawings shall be provided with professional stamps removed for the use of the Agency.
- 1.2.4 AutoCAD drawings will be in AutoCAD (2013) format and will follow a prescribed Agency standard:

- 
- .1 Metric drawing templates (see "Standard ACAD Drawings Package") containing:
    - .1 Text standards & font styles
    - .2 Layer states
    - .3 Layers
    - .4 Line types
    - .5 Metric title blocks (216 x 279, 279 x 432, 609 x 914, 914 x 1219)
  - .2 All submitted electronic drawings must follow the master layering list provided ( see "Standard ACAD Drawings Package") in order to be accepted into the ROP environment.
  - .3 Plot style files (see "Standard ACAD Drawings Package")
  - .4 AutoCAD drawings shall contain a company logo of the author in the drawings' title block. The title block and its format and contents shall be provided in accordance with the sample provided by the Agency (see "Standard ACAD Drawings Package").
  - .5 Drawing files are to be named using the following naming convention:

DOCTYPE - SUBJECT - YYYYMMDD

EX: A1 - LEGEND, GENERAL NOTES & DRAWING

LIST - 20170314.dwg

### **1.3 Space Statistics**

- 1.3.1 Provide a table of Gross Building Areas (GBA) calculated to 1996BOMA standards for all new or modified spaces.

### **1.4 Building Components**

- 1.4.1 Obtain a copy of the template ("Project Components and Costs.xls") from the Owner, Provide the following on the template:
  - .1 Provide an itemized MS Excel list of building components that have been installed or replaced. This same list will require any applicable warranties for each component;
  - .2 Components are categorized by Unifomat Code, and have a pre-defined drop-down list;
  - .3 Provide a description of the scope of work with respect to each component. This includes a detailed scope of final work, location of installation, percent replaced or number of units replaced;
  - .4 Provide the associated expected life cycle;

- .5 Provide associated component quantity and cost. Base construction cost is to be entered, not including any markups or premiums.

**1.5 Building Equipment**

- 1.5.1 Obtain a copy of the template ("Equipment Template for Consultants.xls") from the Owner, Provide the following on the template:
- .1 Provide an itemized list of existing equipment to be replaced;
  - .2 Provide an itemized list of new equipment;
  - .3 Complete all fields for each equipment (ie. building name, address, location within the building, model, serial number, specifications, warranties).

**1.6 Asbestos Abatement**

- 1.6.1 Provide a completed Asbestos Abatement Form for each abated building component.
- 1.6.2 Provide an asbestos test report, if performed as part of the project.

**1.7 Appendices**

- 1.7.1 Refer to Real Property Asset Management – Master Drawings Management documents appended to this Section. Requirements indicated therein form an integral part of this Section.

**2 . PRODUCTS – NOT APPLICABLE**

**3 . EXECUTION – NOT APPLICABLE**

END OF SECTION

## Real Property Asset Management Master Drawings Management

### Drawings Standard

#### Record Drawings

All drawings submitted to the Region of Peel, Real Property Asset Management Division will follow a prescribed Agency standard. The Vendor is not to stray from the Agency's drawing standards.

Drawings shall be submitted as follows:

- In AutoCAD (2013) and in PDF format;
- Via flash drive;
- Without protection.

Drawings shall include:

- A revision line and date (yyyy / mm / dd);
- All external references (X-Ref), drawings and image files;
- AutoCAD drawings shall be provided with professional stamps removed for the use of the Agency;
- PDF drawings shall be provided with professional stamps.

The prescribed standard includes the following:

- Metric drawing templates ("*ROPTitleblocksMetric\_Revised2017.dwg*") containing:
  - Text standards & font styles
  - Layer states
  - Layers
  - Line types
  - Metric title blocks (216 x 279, 279 x 432, 609 x 914, 914 x 1219)
- All submitted electronic drawings must follow the master layering list provided in order to be accepted by the Agency.
- Plot style files to be used are Presentation.ctb, ROP-WkgDwgStd - Full Size.ctb, ROP-WkgDwgStd - Half Size.ctb
- AutoCAD drawings shall contain the company logo of the author in the drawings' title block. The title block and its format and contents shall be provided in accordance with the sample provided by the Agency. ("*ROPTitleblocksMetric\_Revised2017.dwg*")
- Record Drawing files are to be named using the following naming convention:

*DOCTYPE- SUBJECT- YYYYMMDD.dwg*

YYYYMMDD is the year, month and day of the last revision or issue of the drawing.

Examples: A1 - LEGEND\_GENERAL NOTES & DRAWING LIST- 20170314.dwg

### General Layers

<u>Layer</u>	<u>Weight</u>	<u>Colour</u>	<u>Line</u>	<u>Content / Notes</u>
0	L	8	Continuous	Xref's and mixed layer blocks
DEFPOINTS	n/a		Continuous	ROP non-plot layer
G-BORDER	TEXT - M	5	Continuous	Title sheet borders - this layer is always on
G-BORDTXT	TEXT - M	4	Continuous	Title block text - this layer is always on
G-NORTH	TEXT - M	5	Continuous	Freeze this layer when north arrow is not required

### Grid Layers

<u>Layer</u>	<u>Weight</u>	<u>Colour</u>	<u>Line</u>	<u>Content / Notes</u>
GRID-COLS	XL	254	Centre	Structural Grid lines
GRID- DIM	TEXT - M	4	Continuous	Grid bubbles and dimensions

### Details, Elevations and Sections Layers

<u>Layer</u>	<u>Weight</u>	<u>Colour</u>	<u>Line</u>	<u>Content / Notes</u>
DET-XL	XL	14	Continuous	Extra light lines
DET-L	L	8	Continuous	Light lines
DET-M	M	4	Continuous	Medium lines
DET-H	H	7	Continuous	Heavy lines
DET-XH	XH	3	Continuous	Extra heavy lines
DET-XLHID	XL	6	Hidden	Extra light hidden lines
DET-LHID	L	32	Hidden	Light hidden lines
DET-LHID2	L	1	Hidden2	Light hidden lines 2
DET-HATCH	XL	6	Continuous	Hatching
DET-HATCHSCR	SCR	11	Continuous	Screened hatching
DET-REF	TEXT - L	1	Boundary2	Detail section and detail cross ref.
DET-SYM	TEXT - L	8	Continuous	bubbles and lines
DET-TXT	TEXT - M	42	Continuous	Detail symbols
DET-DIM	TEXT - M	12	Continuous	Detail text
				Detail dimensions

Note: for building sections, use the Envelope and Interior Groups layering systems for the section cut. For information beyond, use the following Elevation and Detail layers.

### Architectural Layers - Envelope Layers

<u>Layer</u>	<u>Weight</u>	<u>Colour</u>	<u>Line</u>	<u>Content / Notes</u>
A-ENCURT	XL	6	Continuous	Building envelope curtain walls
A-ENDOOR	L	1	Continuous	Building envelope doors, jambs and interior metal screens
A-ENEQPM	M	4	Continuous	Building envelope equipment
A-ENSILL	L	32	Continuous	Building envelope sill lines
A-ENSTAIR	L	8	Continuous	Building envelope exterior stairs and railings

A-ENSTAIRH	XL	254	Hidden2	Building envelope stair height, Face of stair riser
A-ENWALL	H	7	Continuous	Building envelope wall profile lines
A-ENWALLC	XL	14	Continuous	Building envelope wall composition or cavity lines
A-ENWALLH	L	8	Hidden	Building envelope slab openings, soffits & bulkheads over
A-ENWALLP	M	5	Continuous	Building envelope partial height wall profile lines (off on ceiling plans)
A-ENWIN	L	62	Continuous	Building envelope windows
A-ENHATCH	XL	14	Continuous	Building envelope hatching
A-ENHATCHSCR	SCR	11	Continuous	Building envelope screened hatching
A-ENREF	TEXT - L	8	Boundary2	Section and detail cross ref. bubbles and lines
A-ENSYM	TEXT - L	1	Continuous	Building envelope symbols
A-ENDIM	TEXT - M	12	Continuous	Building envelope dimensions
A-ENTXT	TEXT - M	74	Continuous	Building envelope text

#### Architectural Layers - Roof Layers

A-RFEQPM	L	8	Continuous	Roof top equipment, condensers, exhaust hoods
A-RFOUTL	L	32	Continuous	Roof parapet, perimeter below light line weight
A-RFOUTM	M	5	Continuous	Roof parapet, perimeter medium line weight
A-RFSTAIR	M	12	Continuous	Stairs, railings and guards on roof
A-RFSTAIRH	XL	14	Hidden2	Roof Stair height, Face of stair riser
A-RFWALK	L	1	Continuous	Pavers and walkways on roof/balcony, heli-pads

#### Architectural Layers - Interior Layers

A-ACC	L	8	Continuous	Washroom accessories and toilet partitions
A-APP	L	62	Continuous	Appliances
A-APPHID	L	32	Hidden2	Appliances below counter
A-DOOR	L	1	Continuous	Interior doors and jambs
A-EQPM	M	5	Continuous	Equipment, elevator cars
A-FIRE	M	12	Various	Fire related separations
A-GLAZ	M	4	Continuous	Full height partitions with glazing
A-MILL	M	74	Continuous	Millwork lines
A-MILLH	L	62	Continuous	Millwork above
A-MILLH2	XL	254	Continuous	Millwork below counters
A-STAIR	L	8	Continuous	Interior stairs
A-STAIRH	XL	254	Continuous	Interior Stair height, Face of stair riser
A-WALL	H	7	Continuous	Full height partition profile lines
A-WALLC	XL	14	Continuous	Wall composition or cavity lines (off on rcp's)
A-WALLH	L	8	Continuous	Interior slab openings, soffits & bulkheads over
A-WALLP	M	5	Continuous	Interior partial height wall profile lines (off on ceiling plans)
A-HATCH	XL	14	Continuous	Interior hatching
A-HATCHSCR	SCR	30	Continuous	Interior screened hatching

A-REF	TEXT - L	62	Boundary2	Section and detail cross ref. bubbles and lines
A-SYM	TEXT - L	32	Continuous	Interior symbols
A-DIM	TEXT - M	74	Continuous	Interior dimensions
A-TXT	TEXT - M	12	Continuous	Interior text
A-RMNAM	TEXT - M	4	Continuous	Room names
A-RMNUM	TEXT - M	4	Continuous	Room numbers

#### Architectural Layers - Ceiling Layers

A-CACC	L	32	Continuous	Ceiling access panel
A-CBULK	M	5	Continuous	Soffits and bulkheads
A-CEQPM	M	4	Continuous	Ceiling equipment (tv's, interior signage)
A-CHEAD	H	2	Continuous	Door and window headers (interior and envelope)
A-CL	L	62	Continuous	Edges of finishes and skylights
A-CLHID	L	1	Hidden	Hidden lines
A-CTBAR	L	8	Continuous	T-bar suspension or ceiling tiles
A-CHATCH	XL	191	Continuous	Ceiling hatching
A-CHATCHSCR	SCR	11	Continuous	Ceiling screened hatching
A-CREF	TEXT - L	1	Boundary2	Section and detail cross ref. bubbles and lines
A-CSYM	TEXT - L	8	Continuous	Ceiling symbols
A-CDIM	TEXT - M	5	Continuous	Ceiling dimensions
A-CTXT	TEXT - M	74	Continuous	Ceiling text
A-CRMNUM	TEXT - M	12	Continuous	Room numbers

Note: Room names not required for Ceiling Plans. Use room numbers only.

#### Architectural Layers - Area Layers

A-AREAGROSS	H	142	Continuous	Gross floor area
A-AREARENT	M	12	Continuous	Rentable area
A-AREAUSE	M	4	Continuous	Useable area
A-AREACORE	M	74	Continuous	Building core area
A-AREACONST	H	9	Continuous	Construction area, building outline or footprint
A-AREACOMN	M	5	Continuous	Common area
A-AREAATCH	XL	191	Continuous	Area hatching
A-AREAATCHSCR	SCR	11	Continuous	Area screened hatching
A-AREATXT	TEXT - M	4	Continuous	Area text
A-AREADIM	TEXT - M	12	Continuous	Area dimensions

**1 . GENERAL**

**1.1 General**

- 1.1.1 Comply with CCDC-2 and GC 12.3 / SC.49 Warranty and Supplementary Conditions.
- 1.1.2 Unless indicated otherwise, standard one-year warranty must commence from the date of Ready-for-Takeover.
- 1.1.3 Owner will notify Consultant in writing immediately upon discovering defects during warranty period.
- 1.1.4 During month prior to conclusion of one-year warranty period, inspection of project must be conducted the Owner's representative, Consultant, and Contractor. Contractor must address defects arising from faulty materials or workmanship without delay.
- 1.1.5 Upon expiry of one-year warranty period, Contractor must transfer all extended warranties provided by Subcontractors to Owner, with formal notification of this assignment to relevant Subcontractors.

**1.2 Extended Warranties**

- 1.2.1 Provide extended warranties outlined in Technical Specifications. Extended warranties must begin immediately after expiry of contractual one-year warranty and must be co-signed by the manufacturers or suppliers. Submission of extended warranties is responsibility of Contractor.
- 1.2.2 If validity of extended warranties is contingent upon proper maintenance and servicing of specified elements, provide comprehensive maintenance and servicing plan to Owner in Operation and Maintenance Manuals specified in Section 01 78 00.

**2 . PRODUCTS**

**2.1 Not Used**

**3 . EXECUTION**

**3.1 Not Used**

END OF SECTION

**1. GENERAL**

**1.1 Summary**

- 1.1.1 Demonstrate and provide training to Owner's personnel on operation and maintenance of equipment and systems prior to scheduled date of Ready-for-Takeover.
- 1.1.2 Owner will provide list of personnel to receive training and will coordinate their attendance at agreed upon times.
- 1.1.3 Coordinate and schedule demonstration and training provided by Subcontractors and Suppliers.

**1.2 Submittals**

- 1.2.1 Submit proposed dates, times, durations, and locations for demonstration and training of each item of equipment and each system for which demonstration and training is required. Allow sufficient time for training and demonstration for each item of equipment or system, or time as may be specified in technical Specifications.
- 1.2.2 Consultant and Owner will review submittal and advise Contractor of any necessary revisions.
- 1.2.3 Submit report(s) within 5 Working Days after completion of demonstration and training:
  - .1 identifying time and date of each demonstration and training session,
  - .2 summarizing the demonstration and training performed, and
  - .3 including a list of attendees.
- 1.2.4 Training video: Submit video record of demonstration and training together with report.

**1.3 Prerequisites To Demonstration And Training**

- 1.3.1 Testing, adjusting, and balancing has been performed in accordance with Contract Documents.
- 1.3.2 Equipment and systems are fully operational.
- 1.3.3 Copy of completed operation and maintenance manual is available for use in demonstration and training.
- 1.3.4 Conditions for demonstration and training comply with requirements specified in technical Specifications.

---

**1.4     Demonstration And Training**

- 1.4.1 Demonstrate start-up, operation, control, adjustment, trouble-shooting, servicing, and maintenance of each item of equipment and system.
- 1.4.2 Review operation and maintenance manual in detail to explain all aspects of operation and maintenance.
- 1.4.3 Prepare and insert additional information in operation and maintenance manual if required.

END OF SECTION

## **1. GENERAL**

### **1.1 Summary**

- 1.1.1 Work Included: Provide labour, materials, products, equipment and services to complete the exterior enclosure performance and testing work specified herein. This includes, but is not necessarily limited, to:
- .1 Below-grade construction, including foundation walls and slabs-on-grade.
  - .2 Above-grade construction, including:
    - .1 exterior opaque wall materials and assemblies;
    - .2 roofing systems, including steep-slope and low-slope roofing;
    - .3 outdoor plazas, planters and plaza paving systems and assemblies over occupied spaces; and
    - .4 openings and glazed assemblies including windows, doors, curtain wall and sloped glazing systems.
  - .3 Interface and penetration conditions (flashings, expansion joints and sealants) between each of the materials, components and systems that comprise the above and below-grade building exterior enclosure.
- 1.1.2 This Section includes the general design and performance requirements for the work of Sections which comprise the building enclosure portion of the Work. The requirements specified in this Section shall be read in conjunction with other requirements specified in Contract Documents.
- 1.1.3 This Section also outlines the process for independent, third-party verification that the installed performance of the building enclosure meets or exceeds the minimum performance requirements stipulated in the Contract Documents for this Project.
- .1 Provision of inspection and testing services do not relieve Contractor of responsibility for compliance with Contract Document requirements.
  - .2 Specified inspections, tests, and related actions do not limit Contractor's quality-control procedures that facilitate compliance with Contract Document requirements.
  - .3 Use of testing to discover deficiencies will not be permitted where Contractor's quality-control procedures would make these tests unnecessary.

---

## 1.2 **References**

### 1.2.1 The following definitions apply to this Section:

- .1 "Post-Disaster Building": means a building that is essential to provision of services in event of a disaster. This facility is classified as post disaster as defined in the OBC.
- .2 "Operational and Functional Component" and "OFC": means components within building which are directly associated with the function and operation of the facility. OFCs consist of architectural components, building services components, and building contents. Items specified herein may be designated as OFCs and may need to be designed in accordance with performance requirements specified herein and in Section 13 48 50.
- .3 "Building enclosure" and "Building Enclosure": means the part of the building that physically separates the exterior environment from the interior environment. It includes above-grade walls and openings, below-grade walls, slabs, roofs, and the various components and accessories used to achieve continuity and physical connections and transitions between various assemblies.
- .4 "Air Barrier Assembly": means a collection of Air Barrier Materials (i.e. self-adhered sheet air barriers, liquid applied membranes, medium density sprayed polyurethane foam, mechanically fastened commercial building wraps and boardstock air barriers) and Air Barrier Accessories (i.e. sealants, tapes and transition membranes) assembled together to form a continuous barrier to air infiltration into the environmental separator.
- .5 "Air Barrier Material": means a primary material that controls the movement of air into and out of a building.
- .6 "Air Barrier Accessory": means the materials or products which are used to connect different Air Barrier Materials to form a continuous air barrier assembly.
- .7 "Vapour Retarder": means a membrane that reduces the rate at which water vapor can move through a material. The materials the ability to retard the diffusion of water vapor is measured in units known as "perms" or permeability.
- .8 "Vapour Barrier": means material or system within the building construction assembly that impedes water vapour transmission to less than 72 ng/(s-sq.m-Pa) when tested in accordance with ASTM E96 to prevent the accumulation of moisture having potential to cause deterioration of the Building Enclosure.

- .9 "Class 1 Vapour Barrier": means material or system within the building construction assembly that impedes water vapour transmission to less than 5.72 ng/(s-sq.m-Pa) when tested in accordance with ASTM E96 to prevent the accumulation of moisture having potential to cause deterioration of the Building Enclosure.
  - .10 "Testing with Sealed Openings": means testing with intentional openings sealed means that mechanical openings are purposely closed off. Mechanical systems that are intended to be sealed with dampers are only sealed by closing the damper, with no additional sealing provided. Windows and doors are left in the closed and locked position.
  - .11 "Enclosure-Only Testing": similar to sealed openings approach, except all mechanical penetrations are temporarily masked to completely prevent air leakage through them.
  - .12 "Guarded Testing": means a compartmentalized version of a Whole Building Air Test in order to permit testing during the construction phase. All parameters required in a Whole Building Air Test apply.
  - .13 "Whole Building Air Testing": means the testing of the airtightness of a building by means of an air pressure test (airtightness test or "blower door test") which determines the overall remaining leakage of a building.
- 1.2.2 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.3 Administrative Requirements**

- 1.3.1 Pre-Installation Meetings: arrange pre-installation meetings attended by third-party inspection and testing company, Consultant, and Subcontractors whose work is directly associated with or impacted by Building Enclosure activities prior to starting work on the Building Enclosure.
- .1 Quality Management Plan: review Contractor's quality control plan, and confirm that approaches to quality control and quality assurance procedures are coordinated with third-party inspection and testing company monitoring and testing requirements.
  - .2 Document and Product Review: review Contract Documents and confirm compatibility between overlapping and adjacent components supplied and installed by multiple parties who are contributing different Products associated with the assembly of the Building Enclosure.

- 
- 1.3.2 Scheduling: Schedule construction of sample panels, mock-ups, associated pre-construction and during construction and post-construction testing thereof to account for site-specific installation conditions. Ensure sufficient time is accounted for notifying witnesses of testing, and to permit corrections to proposed construction methods without negatively impacting the Construction Schedule.
- 1.3.3 Role of the Consultant: Consultant is the registered professional of record and is responsible for responding to the Owner's stated project requirements and providing statements of compliance to the Authorities Having Jurisdiction indicating that the objectives of building code functional statements for Building Enclosure performance are met.
- .1 Consultant will rely on third-party inspection and testing company reports in conjunction with the Contractor's field quality control reports to provide opinion on Building Enclosure performance.
- 1.3.4 Role of the third-party inspection and testing company:
- .1 Third-party inspection and testing company will schedule and arrange testing during construction of the Building Enclosure and provide observation during installation of Building Enclosure components in accordance with their contract with Owner.
- .2 Third-party inspection and testing company must assist in establishing best-practice installation procedures for Products forming the Building Enclosure.
- .3 Third-party inspection and testing company must assist in establishing methods for corrective action where site conditions or actual installation result in non-conforming Building Enclosure performance.
- .4 Third-party inspection and testing company will perform testing as directed by the Owner and Consultant and will schedule with Contractor mutually agreed timing for access to site and performance of their activities.
- .5 Third-party inspection and testing company will make recommendations for correction to observed deficiencies to Consultant. Consultant will make final recommendation for any assembly modifications to Contractor.
- 1.3.5 Role of the Contractor:
- .1 Provision and coordination of trades, and sequence of construction to ensure total performance of Building Enclosure from substructure to walls and to roof, including proper insulation depths, continuity of air barrier system joints,

- 
- junctures and transitions between materials, assemblies of materials, and products.
- .2 Identify a site supervisor to fulfill the "Air Boss" role at Construction Start-Up meeting from the Contractor team. This individual to be solely responsible to ensure continuity of the air barrier is maintained, communicating requirements of airtightness to trades on site and addressing concerns or inquiries back to Consultant or Testing & Inspection team via Request for Information process.
  - .3 Organize trades training for any individuals working on, adjacent to, or penetrating through the air barrier. Training to be repeated on an ongoing basis when new trades working within proximity of the air barrier join the subject development.
  - .4 Organize preconstruction meetings between trades involved in, working adjacent to, or running services through any portion of the entire Building Enclosure system to discuss where each trade scope begins and ends, responsibility and sequence of installation for proper insulation, waterproofing, air-tight joints, junctures, and transitions between materials, products and assemblies of products specified in different sections.
  - .5 Build mock-ups satisfactory to Consultant and third-party inspection and testing company of each assembly type including, junctures, and transitions between products, materials and assemblies.
  - .6 Cooperate with agencies performing required inspections, tests, and similar services, and provide reasonable auxiliary services as requested. Notify Consultants required to review and third-party inspection and testing company a minimum of 10 Business Days in advance of operations to permit assignment of personnel.. Auxiliary services required include, but are not limited to, following:
    - .1 Provision of access to the Work.
    - .2 Provision of incidental labour and facilities necessary to facilitate inspections and tests.
    - .3 Provision of adequate quantities of representative samples of materials that require testing or assistance in taking samples.
    - .4 Delivery of samples to testing laboratories.
    - .5 Provision of security and protection of samples and test equipment at Project Site.

---

**1.4 Submittals**

**1.4.1 Product Data:**

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the exterior enclosure commissioning work and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Include recommendations for product application and use.
- .3 Include test data substantiating that products comply with requirements.

**1.4.2 Shop Drawings:** Submit Shop Drawings indicating material characteristics, details of construction, connections, and relationship with adjacent construction.

- .1 Energy Simulation: Submit energy simulation data conforming to the following:
  - .1 Performance of Glazing: simulated using WINDOW (latest edition) software by Lawrence Berkley Laboratories ("LBL").
  - .2 Performance of Framing (opaque and glazed assemblies): simulated using THERM software by LBL.
- .2 Simulations must be carried out by a qualified simulator and summary reports must bear seal of a Professional Engineer and clearly demonstrate materials used to reduce thermal bridging in the field and at the interfaces of Building Enclosure assemblies.
- .3 Alternatively test results based on testing in accordance with AAMA 1503.1 may be submitted in lieu of energy simulation to verify performance.

**1.4.3 Contractor's Quality Control Plan:** submit quality control plan before pre-construction conference, describing approach to maintaining material and installation quality including the following:

- .1 Lists of third-party standards, guidelines or reference documents forming part of proposed construction best-practices used to achieve specified performance requirements;
- .2 Substrate preparation and installation of air barrier and vapour retarding membranes;
- .3 Treatment of transitions between Building Enclosure components and their penetrations (including doors, frames, glazing, flashings, louvers and other penetrations);
- .4 Confirmation of compatibility between Building Enclosure components;

- .5 Proposed list of observations and tests forming a part of Contractor's quality assurance and quality control activities;
  - .6 Methods for addressing corrective action plans and addressing deficient or incompatible installation procedures;
  - .7 Format and frequency of reports, records of pre-construction meetings and site modifications; and
  - .8 Proposed construction schedule indicating stages of Building Enclosure construction and potential dates for Consultant's, and third-party inspection and testing company's review activities.
- 1.4.4 Manufacturer's Certificates: Submit third-party verification stating conformance with Project requirements, including any material compatibility or limitations specific to Project conditions.
- 1.4.5 Test and Evaluation Reports: Submit reports indicating test methods and results, and stating specifically which attributes apply to the products supplied to the Project.
- 1.4.6 Manufacturer's Installation Instructions: Submit written installation requirements stating required workmanship practices to achieve assembly performance required for the Project.

## **1.5 Closeout Submittals**

- 1.5.1 Maintenance Schedule: Submit summary table that indexes Building Enclosure components requiring maintenance and indicates frequency at which each component requires repair or replacement (i.e. replacement of sealants, gaskets, glazing units, paints or coatings and similar components).
- 1.5.2 Operation and Maintenance Data: Submit operation and maintenance data for each component listed in aforementioned schedule including the following as a minimum:
- .1 Product Data Sheets as specified in this Section.
  - .2 Extended Warranty Information: Include warranties for products, equipment, components, and sub-components whose duration exceeds one year. Include warranties on components with the system they are a part of. Reference all specific operation and maintenance procedures that must be performed to keep warranty valid.
  - .3 Sources of Material: Include reference to contact information where specific materials can be obtained.
  - .4 Installation and Maintenance Instructions: Submit information for each material, component or system.

---

**1.6      Quality Assurance**

- 1.6.1 Mock-Ups: Construct mock-ups of each assembly as specified in this Section, including junctures, transitions and interfaces to establish baseline quality for installation and workmanship, and to evaluate enclosure-related constructability and performance, with a specific emphasis on required coordination of Subcontractors and sequencing necessary to ensure that performance of enclosure materials, components, systems, assemblies, and interfaces meets or exceeds requirements of Contract Documents.
- .1 Required Mock-ups: Provide “first installation” in-situ or on site mock-up (as determined by Consultant) of each major Building Enclosure system, including:
    - .1 Each below grade underslab and vertical waterproofing system.
    - .2 Each type of horizontal waterproofing system enclosing occupied space below.
    - .3 Each substantially different type of vertical enclosure assembly (including associated air barriers, insulation, and support materials) including, but not limited to precast concrete assemblies, masonry assemblies, curtain wall and glazed assemblies, and rain screen cladding assemblies.
    - .4 Each low-slope and each steep-slope roofing assembly.
  - .2 Extent of Mock-ups: Ensure extent of each mock-up includes interface of various materials and systems, both between various major assemblies (e.g. foundation waterproofing connection to wall assembly) and between various materials in the same assembly (e.g. interface between window and wall).
    - .1 Wall mock-ups must be minimum of 10 sq. m (100 sq. ft.) and extend one full structural bay wide by one full story high plus additional height as required to connect to assemblies below and above. Ensure mock-up includes typical exterior wall-to-interior floor slab connection. In addition, conform to the following:
    - .3 Curtain Wall Systems, Entrances and Windows: minimum of two full sized unit within rough opening demonstrating installation of transition membranes, sealants and flashings.
    - .4 Masonry Unit Panels: assemble a test panel including placement of a single opening (window and/or door) demonstrating installation of joint sealants and flashings, and placement of vents and weeps.

- 
- .5 Air Barrier Membranes: apply air barrier membrane to minimum area of 36 sq.m (390 sq. ft), including placement of a single opening (window and/or door) demonstrating overlaps, adhesion to substrates, and compatibility with adjacent materials.
  - .6 Cladding Panels (each type): assemble a test panel including placement of a single opening (window and/or door) demonstrating progressive installation, attachment to substrate, installation of insulation, joint sealants, and placement of flashings and closure strips.
    - .1 Roof mock-ups must be minimum of 10 sq. m (100 sq. ft.) and include parapet or roof edge conditions, as well as typical pipe, supports, and similar penetrations.
    - .2 Horizontal below-grade waterproofing or slab-on-grade vapour retarder mock-ups must be minimum of 10 sq. m (100 sq. ft.) and include edge conditions and typical penetration details.
    - .3 Vertical below-grade waterproofing (foundation wall waterproofing) mock-ups must include typical edge, termination, and penetration details.
    - .4 Solar wall assembly mock-ups must be minimum of 10 sq. m (100 sq. ft.) and include penetration details, installation of insulation, attachment to substrate, installation of insulation, joint sealants, and placement of flashings and closure strips.
  - .7 Sequencing Requirements: Stage each component within mock-ups so that each layer of construction can be reviewed and tested as required to verify performance before succeeding layers of materials are applied.
  - .8 Post Mock-Up Debrief: arrange for post mock-up debrief meetings attended by Contractor, Owner, third-party inspection and testing company, Consultant, and Subcontractors whose work is directly associated or impacted by Building Enclosure activities.
    - .1 Schedule debrief meeting immediately after testing results and observations of the mock-ups is completed.
    - .2 Incorporate lessons-learned arising from observed conditions and testing into Contractor's quality control plan.
  - .9 Modifications to Mock-Ups: mock-ups may require modifications to account for site conditions and compatibility between adjacent materials and assemblies.

- .1 Provide corrective actions as required to obtain acceptance. Repair mock-ups which are permitted to form a part of the final construction that have been damaged or that failed testing.

## **2 . PRODUCTS**

### **2.1 Design And Performance Requirements**

2.1.1 Statement of Building Enclosure Design Intent: The design intent of this building's enclosure is to provide exterior floor, wall, and roof assemblies which prevent uncontrolled air and vapour infiltration into the building; eliminate water infiltration (including condensation) into conditioned spaces; and provide thermal insulation continuity to minimize cold bridging. Products and assemblies used to perform these functions must be technically sound, durable and serviceable.

.1 Design Assumptions:

- .1 Climate Zone: ASHRAE Climate Zone 6a
- .2 Ambient Interior Air Temperature:
  - .1 Occupied Spaces:
    - .1 Heating: 21°C (70°F)
    - .2 Cooling: 23°C (73°F)
  - .2 Vehicle/Supervisor Bay:
    - .1 Heating: 21°C (70°F)
    - .2 Cooling: 26°C (78°F)
  - .3 Electrical/Mechanical Rooms:
    - .1 Cooling: 25°C (77°F)

2.1.2 General Assembly Performance:

- .1 Assemblies described in Contract Documents are expected to achieve the minimum performance requirements specified in this Section as verified by inspection and testing. Performance criteria identified in this Section shall supersede other criteria identified in other parts of Contract Documents.
- .2 Comply with applicable building code, and other regulations and requirements of Authorities Having Jurisdiction, in design, engineering, fabrication and installation of the Work.
- .3 Drawings and details are diagrammatic and are only intended to show design concept, aesthetics, interfacing requirements, configuration, components and arrangements. They are not intended to identify or solve completely problems of thermal and structural movements, assembly framing, engineering design, fixings and anchorages.

- 
- .4 When difficult-to-construct material connections occur within Building Enclosure construction, advise Consultant at once so that details can be reviewed and installation methodologies confirmed. Poor installation of difficult-to-construct detail is not acceptable.
  - .5 Building Enclosure assemblies shall comply with requirements of OBC Supplementary Standard SB-10 and Region of Peel Net Zero Emissions Building Standard for New Construction.
  - .6 Design of Building Enclosure assemblies is based on "Rain Screen" principle. The definition of the rain screen principle for the purpose of these Specifications is "as advocated by National Research Council of Canada".
    - .1 This approach is founded on the premise that multiple-element protection is necessary in most situations to achieve effective control, by means of a first line of defense that minimizes rainwater passage into wall by minimizing number and size of holes and managing driving forces acting on wall; a second line of defense that intercepts all water that gets past first line of defense and effectively dissipates it to exterior.
    - .2 All voids between assembly components as well as those between components and structure shall have:
      - .1 Gaskets, baffles, overlaps, seals and compartmentalization as required to provide a barrier "Rain Screen" to effectively prevent excessive rain water entry into any of Building Enclosure cavities but allow pressure moderation of cavity air spaces.
      - .2 Low permeability Vapour Barriers to minimize vapour diffusion, where required.
      - .3 Air barriers and seals as required to prevent entry of interior building air into Building Enclosure cavities, and exterior air into building. Air barriers and seals shall be able to withstand wind design pressures.
      - .4 Thermal separators, isolators and seals placed to eliminate direct contact between interior humid air and a cold surface or structural component to prevent condensation and ice build-up on surfaces during cold weather.
  - .7 Air Barrier Continuity:
    - .1 This Project incorporates design principles of positive air and vapour leakage control at Building Enclosure line. Drawing details illustrate continuity of air barrier/vapour

retarder at penetrating elements such as door, window and louver frames.

- .2 In order to maintain continuity of Air Barrier Assemblies, interfacing of various building elements requires close coordination by all trades involved with exterior building elements.
- .3 Air-barrier assembly extends nominally from foundation line, vertically along exterior walls and to positively contact with roof air barrier/vapour retarder or roofing membrane as applicable. Continuity also extends to waterproofing at podium areas, and to inner surface of glazing units. Provide a continuous, unbroken and non-perforated air and vapour seal to totally enclose Building Enclosure and to separate interior and exterior environments.
- .4 Manufacturers of window and door frames must ensure correctly designed and positioned metallic legs, extensions or recesses are provided at thermal break line to facilitate connections of rigid or flexible transition materials prior to setting these elements in their allotted openings.
- .5 Penetrations of air barrier and paths of air infiltration / exfiltration must be sealed.
- .6 Air barrier system shall have following characteristics:
  - .1 It must be continuous, with all joints sealed.
  - .2 It must be structurally supported to withstand positive and negative air pressures applied to Building Enclosure.
  - .3 Connection shall be made between:
    - .1 Foundation and walls.
    - .2 Walls and windows or doors.
    - .3 Different wall systems.
    - .4 Wall and roof.
    - .5 Wall and roof over unconditioned space.
    - .6 Walls, floor and roof across construction, control and expansion joints.
    - .7 Walls, floors and roof to utility, pipe and duct penetrations.
  - .4 Materials: materials used for air barrier system in opaque wall assemblies shall comply with CAN/ULC S741 and shall have an air permeance not exceeding  $0.02 \text{ L}/(\text{s}\cdot\text{m}^2)$  ( $0.004 \text{ cfm}/\text{ft}^2$ ) under

---

a pressure differential of 75 Pa (1.57 psf) when tested in accordance with ASTM E2178.

- 2.1.3 Whole Building ('enclosure-only testing' and with 'sealed openings' testing results): less than 0.6 air changes per hour (ACH) under a pressure differential of 50 Pa (1.04 psf).
- 2.1.4 Air Leakage Criteria (in-situ): The air leakage of individual assemblies must not exceed the criteria specified in individual technical specification sections when tested in the field in accordance with ASTM E783.
- 2.1.5 Thermal Performance Criteria: install insulation materials to maintain continuity of performance of the Building Enclosure meeting thermal resistance or thermal conductance ratings specified below:
  - .1 Values provided are imperial measurements unless indicated otherwise.
  - .2 Roofing Assemblies:
    - .1 Nominal R-Value: Minimum R45
    - .2 Assembly U-value: Maximum U-0.022
  - .3 Opaque Wall Assemblies Above-Grade:
    - .1 Nominal R-Value: Minimum R30
    - .2 Assembly U-value: Maximum U-0.033
  - .4 Curtain Wall and Glazed Assemblies:
    - .1 Maximum U-Value: 0.20 (including glass and framing)
    - .2 Solar Heat Gain Coefficient: Maximum 0.30
  - .5 Skylights:
    - .1 Maximum U-Value: 0.47 (including glass and framing)
    - .2 Solar Heat Gain Coefficient: Maximum 0.36
  - .6 Slabs-on-Grade:
    - .1 Nominal: Minimum R30
    - .2 Assembly U-value: Maximum U-0.033
- 2.1.6 Water Infiltration: There must be no water penetration beyond boundary of watertightness defined for fenestration system when following assemblies are tested in the field in accordance with the test method described in Part 3 of this Section.
- 2.1.7 Thermal Bridging: Ensure wall assembly and interface details are thermally broken and meet the OBC SB-10 requirements for continuous insulation to reduce structural connections which create thermal bridging.

- .1 As a minimum, provide materials to minimize or prevent thermal bridging at the following locations and interfaces:
  - .1 Cladding and insulation attachment at opaque wall assemblies.
  - .2 At-grade transitions.
  - .3 Slab-edges and transitions.
  - .4 Glazing-to-wall transitions.
  - .5 Interior-to-exterior wall intersections.
  - .6 Assembly corners.
  - .7 Parapets.
  - .8 Roof penetrations and transitions.
  - .9 Exterior-to-interior structural components.

## **2.2 Service Providers**

- 2.2.1 The following service providers may be acceptable subject to conformance to requirements of Contract Documents:
  - .1 Exp inc.
  - .2 Intertek Testing Services
  - .3 UL CLEB
- 2.2.2 Comparable providers to those listed herein offering equivalent services in Consultant's opinion, and subject to Consultant's review, will be considered provided they meet the requirements of this Specification.

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, for compliance with requirements for installation tolerances, supports, and other conditions affecting performance of the Work.

### **3.2 Preparation**

- 3.2.1 Protect construction from weather and other sources of moisture that are deleterious to the tested assemblies.
- 3.2.2 Repair or replace Building Enclosure components that are damaged as a consequence of exposure to weather conditions deleterious to the final construction.

---

### **3.3     Workmanship**

- 3.3.1 Install materials and systems according to best-practices relating to quality of workmanship, and coordination and installation of specified Products to maintain continuity of the Building Enclosure.
- .1 Treatment of Penetrations: Use methods for making and sealing penetrations to maintain continuity of vapour, water and air control assemblies.
    - .1 Ensure mechanical and electrical work scheduled installed/modified within exterior Building Enclosure system is properly tied into Building Enclosure and does not compromise performance of Building Enclosure.
    - .2 Ensure mechanical and electrical penetrations through Building Enclosure are sealed against air leakage and water penetration and are designed to prevent condensation within exterior Building Enclosure system.
    - .3 Ensure mechanical water piping that is installed/modified within exterior wall system is free of leaks and protected from freezing.
    - .4 All penetrations through vapour, water and air control assemblies must be fully sealed according to manufacturer instructions.
  - .2 Modification of Installation: Identify installation difficulties and make modification to installation to account for site conditions that differ from manufacturer's standard detailing or testing results. Make such modifications to reduce or eliminate potential for installation deficiencies.
  - .3 Sequencing and Compatibility: Confirm compatibility between Products provided by different parties or that are used to join dissimilar components. Sequence such transitions and overlap materials to ensure they shed water to the exterior face of the Building Enclosure.
  - .4 Workmanship: Train installers on Building Enclosure best-practices and provide them with update when modifications occur resulting from changes to site conditions and testing results.

### **3.4     Field Quality Control (Performance Testing)**

- 3.4.1 The objective of performance testing is to demonstrate that each Building Enclosure system, and system-to-system interface meets or exceeds the performance requirements of the Contract Documents and the Building Enclosure Design Intent specified in this Section.

- .1 Unless otherwise indicated, costs associated with initial performance testing shall be paid by Owner through cash allowance.
  - .2 Costs associated with re-testing caused by failure of the Building Enclosure tests, during mock-up review or during the construction phase, shall be the responsibility of the Contractor.
- 3.4.2 Contractor's Collaboration: third-party inspection and testing company will coordinate with Contractor's schedule and make themselves aware of current work. Third-party inspection will bring to attention of the Consultant and Contractor any observation or testing requirement forming a part of their scope of auditing services, but not less than those listed in this Section.
- .1 Access to Site: Contractor must provide reasonable access to the Project site, and any personnel or equipment required to assist third-party inspection and testing company in performance of their service and maintain site safety.
  - .2 Services: Contractor must provide electrical, water or other utilities or services required by third-party inspection and testing company for performance of their work.
  - .3 Scheduling and Coordination:
    - .1 Contractor must coordinate sequence of testing activities to accommodate required inspection and testing services with minimum delay.
    - .2 Contractor must coordinate construction activities to avoid removing and replacing construction to accommodate observations and tests required by third-party inspection and testing company.

### **3.5 Non-Conformance**

- 3.5.1 Non-conformance and deficiencies identified during periodic site visits or performance testing shall be resolved as follows:
- .1 Third-party inspection and testing company will record the results of the performance test or its site visit observation in a report. All deficiencies or non-conformance issues shall be noted as action items on a punch-list and reported to Contractor through Consultant.
  - .2 Corrections of identified minor deficiencies may be made during the site visit at the discretion of third-party inspection and testing company. In such cases the deficiency and associated resolution will be documented in the field report.
  - .3 As site visits or tests progress and a deficiency is identified, the third-party inspection and testing company will discuss the

issue with Contractor and Consultant for follow-up and resolution.

- .1 Third-party inspection and testing company shall document deficiency and Contractor's response.
- .2 Contractor shall correct the deficiency and notify third-party inspection and testing company and Consultant in writing that issue is resolved and/or product, material or assembly is ready to be retested.
- .3 Contractor shall reschedule the test and the test shall be repeated. This process shall be repeated until test results meet or exceed requirements of Contract Documents.
- .4 Contractor shall be responsible for costs associated with re-testing.
- .4 Conformance will only be deemed complete upon successful performance testing and review by third-party testing and inspection agent.

### **3.6 Air Infiltration Testing**

- 3.6.1 Read in conjunction with Testing Responsibility Matrix in Section 01 91 15
- 3.6.2 Glazed Assemblies (curtain wall and punched windows):
  - .1 Test Method(s): pressurized chamber testing in accordance with ASTM E783.
  - .2 Scope of Testing: Mock-up (first installation) and during construction phase.
  - .3 Frequency: minimum 3 tests per system as selected by Consultant.
  - .4 Success Criteria: Not to exceed leakage rate indicated in Section 08 44 13.
- 3.6.3 Opaque Wall Assemblies (including transitions to adjacent systems, field of air barrier and penetrations):
  - .1 Test Method(s): Refer to Testing Responsibility Matrix in Section 01 91 15
  - .2 Scope of Testing: Mock-up (first installation) and during construction phase.
  - .3 Frequency: As determined by third-party inspection and testing company.
  - .4 Success Criteria: Not to exceed leakage rate indicated in Section 07 27 14.
- 3.6.4 Whole Building Air Leakage Testing:
  - .1 Test Method(s):

- .1 Fan pressurization testing in accordance with ASTM E779 or orifice blower door testing in accordance with ASTM E1827 or EN 13829 Method A
- .2 Smoke Tracer: third-party inspection and testing company may include observations using smoke tracer or theatrical fog in accordance with ASTM E1186 in conjunction with building pressurization to confirm anomalies identified using infrared scanning or to differentiate thermal bridging effects.
- .2 Frequency:
  - .1 At completion of air barrier work, and prior to installation of insulation ('enclosure-only testing').
  - .2 At completion of mechanical systems work, upon systems start-up ('sealed openings testing').
- .3 Success Criteria: As specified in this Section.

### **3.7 Water Penetration Testing**

- 3.7.1 Read in conjunction with Testing Responsibility Matrix in Section 01 91 15
- 3.7.2 Glazed Assemblies (curtain wall and punched windows):
  - .1 Test Method(s): pressurized chamber testing in accordance with ASTM E1105
  - .2 Scope of Testing: Mock-up (first installation) and during construction phase.
  - .3 Frequency: minimum 3 tests per system as selected by Consultant.
  - .4 Success Criteria: No leakage at 720 Pa (15 psf) pressure differential.
- 3.7.3 Tubular Skylights:
  - .1 Test Method(s): Refer to Testing Responsibility Matrix in Section 01 91 15
  - .2 Scope of Testing: Mock-up (first installation) and during construction phase.
  - .3 Frequency: as selected by Consultant.
  - .4 Success Criteria: No leakage.
- 3.7.4 Opaque Wall Assemblies including auxiliary components such as louvers, expansion joints and similar components:
  - .1 Test Method(s): Water-spray test in accordance with AAMA 501.2 at transitions, corners, penetrations determined by Consultant.

- .2 Scope of Testing: Mock-up (first installation) and during construction phase.
- .3 Frequency: Minimum three (3) locations as selected by Consultant.
- .4 Success Criteria: No leakage.

### **3.8 Thermal Performance Verification**

- 3.8.1 Read in conjunction with Testing Responsibility Matrix in Section 01 91 15
- 3.8.2 Wall Assemblies including openings and auxiliary components such as louvers, expansion joints and similar components:
  - .1 Test Method(s): Thermographic scan in accordance with ASTM C1060 or CAN/CGSB 149-GP-2MP.
  - .2 Frequency: To be performed for all wall assemblies.
  - .3 Success Criteria: Insulation is at full thickness and continuous in all cavities. No unacceptable thermal bridging.
- 3.8.3 Roof Assemblies:
  - .1 Test Method(s): Thermographic scan in accordance with ASTM C1153.
  - .2 Frequency: To be performed for all roof assemblies.
  - .3 Success Criteria: Insulation is at full thickness and continuous. No thermal anomalies associated with wet insulation.

### **3.9 Adhesion Testing**

- 3.9.1 Read in conjunction with Testing Responsibility Matrix in Section 01 91 15
- 3.9.2 Air Barrier Membrane Testing:
  - .1 Test Method(s): Pull-off testing in accordance with ASTM D4541.
  - .2 Frequency: As determined by third-party inspection and testing company.
  - .3 Success Criteria: Pull-off strength of membrane conforms to manufacturer's published data.
- 3.9.3 Sealants Adhesion Tests:
  - .1 Test Method(s):
    - .1 Destructive: in accordance with Method A, Field-Applied Sealant Joint Hand Pull Tab, in Appendix X1 in ASTM C1193 or Method A, Tail Procedure, in ASTM C1521.
    - .2 Non-destructive: in accordance with ASTM C1521, using Nondestructive Spot Method.

- .3 For joints with dissimilar substrates, verify adhesion to each substrate separately.
- .2 Frequency: As determined by third-party inspection and testing company.
- .3 Success Criteria: Sealant adhesion passes sealant manufacturer's field-adhesion hand-pull test published data.

**3.10 Repair And Protection**

- 3.10.1 Repair damaged construction and restore substrates and finishes following observation, testing, sample taking and similar services. Repair surfaces immediately after testing and sampling is completed to prevent damage to assemblies resulting from moisture diffusion or air leakage.
- 3.10.2 Protection of Installed Products: take necessary precautions to prevent puncturing, tearing, weakening or damaging of Building Enclosure membranes during construction; and immediately repair damage as directed by Consultant.

**END OF SECTION**

## **1. GENERAL**

### **1.1 Section includes, but is not limited to:**

- 1.1.1 Building Enclosure Commissioning, testing and documentation.
- 1.1.2 Audit testing and the commissioning auditor.

### **1.2 Summary**

- 1.2.1 The design intent of the building enclosure is to provide exterior floor, wall, and roof assemblies which prevent uncontrolled air, vapour, and water infiltration and include products and assemblies that are technically sound, durable and serviceable. This section includes requirements for non-structural commissioning of the building enclosure, including, but not limited to the following:
  - .1 Below-grade construction, including foundation walls and slabs-on-grade.
  - .2 Above-grade construction, including: exterior wall materials and assemblies; sloped and low-slope roofing, outdoor plazas, planters and plaza paving systems and assemblies over occupied space, as well as glazed window, curtain wall and sloped glazing systems.
  - .3 Interface conditions (flashings, expansion joints, sealant) between each of the materials, components and systems that comprise the above and below- grade building exterior enclosure.
- 1.2.2 The purpose of the building enclosure commissioning (BECx) is to provide a process for independent, third-party verification that the installed performance of the building enclosure meets or exceeds the minimum performance requirements set forth by the Contract Documents for this project. The materials, components, systems, and assemblies that comprise the above and below-grade building exterior enclosure will be evaluated and tested as outlined in this Section, as well as in accordance with each of the technical Sections associated with the design and construction of the building enclosure.

### **1.3 Related Requirements**

- 1.3.1 The General Conditions of Contract, Division 01 General Requirements and all Addenda thereto form an integral part of and must be read in conjunction with the requirements of this Section.
- 1.3.2 Sections of work which may have requirements related to this Section include, but are not limited to:
  - .1 Substitution Procedures Section 01 25 00

## **1.5 Definitions and Abbreviations**

- 1.5.1 Consultant: Consultant-of-Record or Architect-of-Record for this project.
- 1.5.2 Building Enclosure: The physical separator between the interior and exterior environments of a building. Typical building enclosure components include the base floor systems, below-grade wall systems, above-grade wall systems (including windows and doors), and the roof systems.

- 
- 1.5.3 Building Enclosure Commissioning (BECx): The process of inspecting and testing building components and assemblies to ensure the installed performance of the building enclosure meets or exceeds the minimum performance requirements set forth by the Contract Documents.
  - 1.5.4 Building Enclosure Commissioning Authority (BECxA): The Party retained by the Commissioning Authority which will manage the BECx process, develop and stipulate the BECx requirements, and validate that the components and assemblies are designed, constructed, and tested to meet requirements set forth in the in the Contract Documents.
  - 1.5.5 Building Enclosure Commissioning Plan (BECxP): Project-specific protocol developed by the BECxA, which outlines the BECx process for all related components and assemblies. This document will identify the Commissioning Team and include comprehensive checklists and general schedule of all tasks involved in the BECx, including design reviews, construction observations, mock-up construction and testing, whole building air leakage testing, and technical reports that will be produced over the course of the Project.
  - 1.5.6 Building Enclosure Commissioning Report: The final deliverable from the BECx process, this document includes a full summary report with appropriate documentation including the following information: a narrative describing the BECx items and issues found, a summary and list of enclosure systems and components included in the commissioning program, a description of non-compliant conditions noted during site observations with follow up documentation on the means and methods to resolve, and summary results of building performance testing.
  - 1.5.7 Building Enclosure Commissioning Team: Owner and their consultants, Contractor, Consultant, Commissioning Authority, Building Enclosure Commissioning Authority.
  - 1.5.8 Commissioning Authority (CxA): The Party responsible for coordinating and carrying out the entire scope of the commissioning process. The Commissioning Authority collaborates with the BECxA to accomplish the building enclosure commissioning.
  - 1.5.9 Contract Documents: Documents governing the responsibilities and relationships between Parties involved in the design and construction of this project, including (but not limited to): Agreements/Contracts, Drawings and Specifications, Addenda, Change Orders, BECx Plan (for reference only).
  - 1.5.10 Construction Documents: Refers to the Contract Documents that dictate the details of construction.
  - 1.5.11 Contractor: As used herein, 'Contractor' is a general reference to the installing Party and can therefore refer to the General

---

Contractor, Project Manager, subcontractors, or vendors as inferred by its usage.

**1.6 Building Enclosure Commissioning Authority Scope of Services/Responsibilities**

- 1.6.1 CxA will engage a qualified BECxA to perform all consulting services, including design reviews, collaborative meetings, quality assurance observations, site mock-up reviews and field testing, unless specified otherwise.
- 1.6.2 Prior to commencement of construction, develop a Building Enclosure Commissioning Plan (BECxP) for this project, which outlines the BECx process for all related components and assemblies. This document will identify the Commissioning Team and include a comprehensive checklist and general schedule of all tasks involved in the BECx, with responsibilities assigned, including planning meetings, design reviews, construction observations, mock-up construction and testing, fenestration testing, and whole building air leakage testing, and technical reports that will be produced over the course of the Project.
- 1.6.3 During construction phase, deliverables to the CxA and Owner will include the following:
  - .1 Photograph-based quality assurance reports
  - .2 Technical memoranda
  - .3 Written recommendations for proposed solutions of deficiencies noted
  - .4 Checklists, completed by the Contractor and all applicable building enclosure subtrades, with annotation of deficiencies
  - .5 Submittals for all field testing to be performed
  - .6 Comprehensive technical reports for all field testing performed and witnessed at site.
- 1.6.4 Review project drawings and specifications at 90% design complete for constructability and conformance with respect to air, water, and vapor barriers of the exterior building enclosure. Prepare a written report along with marked up drawing sheets.
- 1.6.5 Review and comment on submittals from the Contractor for compliance with the building enclosure requirements set forth in the Contract Documents. Note that the BECxA does not have the authority to accept or reject submittals.
- 1.6.6 Schedule a pre-construction commissioning conference prior to start of the construction of the building enclosure, at a time convenient to the Owner, Contractor, and Consultant. The BECxA

- 
- will conduct the meeting to review commissioning responsibilities and personnel assignments.
- .1 Attendees: Authorized representatives of Owner, all Contractors whose work is relevant to the building enclosure, Commissioning Authority, Consultant, and other concerned parties shall attend the conference. All participants at the conference shall be familiar with Project and authorized to conclude matters relating to commissioning.
  - .2 Agenda: Discuss items of significance that could affect progress including the following:
    - .1 Building Enclosure Commissioning Plan and related specifications
    - .2 Tentative construction schedule per Contractor
    - .3 Phasing
    - .4 Critical work sequencing
    - .5 Designation of key personnel and their duties
    - .6 Mock-up construction and testing
    - .7 Procedures for testing and inspecting
    - .8 Submittal procedures
    - .9 Preparation of record documents
    - .10 The process for correcting deficient work
    - .11 Maintenance requirements to maintain enclosure
  - 1.6.7 Observe construction of building enclosure work and report progress and deficiencies. Provide a report of each site visit, including a list of observed deficiencies and discrepancies, to CxA, Owner and General Contractor.
  - 1.6.8 Inspect the air barrier assembly for continuity and integrity at the follow locations in the building prior to 5% completion of each:
    - .1 Roof-wall intersections
    - .2 Fenestration flashing
    - .3 Fenestration installation
    - .4 Bottom of wall (wall-to-foundation connection)
    - .5 Connection of dissimilar wall and roof assemblies
    - .6 Isolation of interior rooms such as mechanical and paint rooms
    - .7 Wall and roof penetrations
  - 1.6.9 Facilitate, perform or observe mock-up field testing of exterior building enclosure components and assemblies, as required by the Contract Documents. Document construction of commissioned
-

components at the completion of mock- up testing and provide a technical report with this information to CxA and Owner.

- 1.6.10 Participate (in person if conducted during BECxA observation of building enclosure work, or remotely if not) in periodic BECxA meetings to review and discuss issues and concerns related to the building enclosure noted by the Consultant of Record, the CxA, BECxA, and the Owner.
- 1.6.11 Facilitate, perform or observe field tests identified to be accomplished by the "Testing Agency" in the Sections identified in Part 3. After all air barrier components are installed, facilitate and perform whole building air tightness testing in accordance with the Contract Specifications. Testing shall consist of both performance and diagnostic evaluations. Document test results and provide to the CxA and Owner.
- 1.6.12 BECxA to compile submissions for the Building Enclosure Systems Manual as provided by the Contractor and Consultant. See Clause 1.7.13.
- 1.6.13 Prepare BECxA Report and deliver to CxA and Owner.

## **1.7 Contractor Responsibilities**

- 1.7.1 The Contractor shall be responsible for controlling the quality of the building system construction on a day-to-day basis.
- 1.7.2 Furnish copies of all submittals, shop drawings, manufacturer's literature, installation instructions, maintenance information, schedules, warranties, or other information as requested. Note that it is the Consultant and Contractor's responsibility to approve or reject submittals and shop drawings.
- 1.7.3 Provide access to work, including scissor/boom lifts and/or scaffolding and/or swing stages, and coordinate scheduling with the BECxA to perform BECxA tasks.
- 1.7.4 Provide qualified personnel for assistance in completing the commissioning inspections and tests for elements of the building enclosure.
- 1.7.5 Provide a power and water source for completing the commissioning tests for elements of the building enclosure.
- 1.7.6 The Contractor shall be responsible for constructing testing chambers to facilitate air and water leakage testing, at the locations and methods determined collaboratively with the project team.
- 1.7.7 Submit a copy of the General Contractor's project and site-specific Quality Assurance program to be implemented for construction for review prior to beginning of construction.

- 
- 1.7.8 Participate and ensure all subcontractors utilized for work on the building enclosure participate in the Preconstruction Meeting with the design and construction teams, Owner's representatives, CxA and BECxA.
  - 1.7.9 Complete and participate in the construction of on-site mock-ups including elements of the building exterior enclosure, as identified in individual sections of the specifications in Divisions 2 through 9.
  - 1.7.10 Provide personnel to be present and have a representative present from each trade and/or subcontractor associated with installing the systems during mock-up performance testing. Personnel who are to be completing work in the field are to be utilized to participate in the construction of on-site mock-ups of building enclosure assemblies as required by the Construction Documents, and to have a representative present during inspection and testing of mock-ups. If deficiencies are observed within the mock-up, provide labor and materials to repair or reconstruct the mock-up such that deficiencies do not exist and mock-up passes field testing.
  - 1.7.11 Schedule and conduct periodic BECx meetings with a representative present from each trade and/or subcontractor to review and discuss issues and concerns related to the building enclosure noted by the Consultant of Record, the CxA, BECxA, and the Owner and what action will be taken to address the noted non-conformances. Maintain a summary of non-conformances and current status.
  - 1.7.12 Reimburse Owner for additional testing and inspections if building enclosure systems and mock-ups are not constructed per Construction Documents.
  - 1.7.13 Prepare the building enclosure to be in the "Closed" position as directed by the BECxA for whole building Air Barrier Testing.
  - 1.7.14 If the building fails the Air Barrier Tests, BECxA will coordinate with the Testing Agency to perform diagnostics to identify deficiencies and sources of air leakage. Trades related to deficiencies shall provide labor and materials to adequately repair these areas.
  - 1.7.15 Contractor to coordinate with the Consultant as required to provide the Building Enclosure Systems Manual submittals. The Building Enclosure Systems manual will be included as part of the Operations and Maintenance Manual. This Systems Manual includes the following items, as related to the building enclosure:
    - .1 Identification of installed exterior enclosure components, assemblies, systems, and equipment.
    - .2 Certificate of completion, certifying that exterior enclosure assemblies, systems, equipment and associated controls are complete and ready for testing.

- 
- .3 As-built drawings, including a copy of all details and drawings that were installed as part of any addendums or change orders directives.
  - .4 Project specifications, including all accepted product substitutions and any additional specifications as part of addendums or change order directives.
  - .5 A copy of all accepted change orders.
  - .6 A copy of all shop drawings with the Consultant's mark-ups, showing the as- built conditions.
  - .7 A copy of all warranties, organized by product, and all product manufacturer's letters indicating the product as appropriate to the use for the application installed at this project.
  - .8 A master product list summarizing all products used on the project for construction of the building enclosure, organized by tabs in a binder, including the following:
    - .1 Product name
    - .2 Product manufacturer
    - .3 Catalog or other applicable number for ordering
    - .4 Manufacturer's contact information, including the contact information for the technical representatives
    - .5 Product color
    - .6 Supplier contact information
  - .9 Product installation instructions, including instructions supplied with any of the shop drawings
  - .10 Manufacturer's product maintenance guide
  - .11 Manufacturer's checklist for periodic review/maintenance plan
  - .12 All submittals pertinent to BECx.
- 1.7.16 The Building Enclosure Systems Manual shall be developed for each major building exterior enclosure system including, but not limited to:
- .1 Roof systems (including parapets, penetrations, curbs, etc.)
  - .2 Exterior wall systems (all types)
  - .3 Windows
  - .4 Doors
  - .5 Sealants
  - .6 Building expansion joint accessories (roof and wall)
  - .7 Flashings
  - .8 Curtain walls/window walls, storefronts

- .9 Below-grade waterproofing
- .10 Planters and planted areas adjacent to building enclosure
- .11 Floors (slab-on-grade, crawlspace, etc.)
- .12 Any other special building enclosure system, equipment and controls.

## **1.8 Consultant Responsibilities**

- 1.8.1 Provide paper and electronic copies of project drawings and specifications to the BECx A.
  - .1 Clearly illustrate the continuous air barrier boundary on additional plan and section sheets, as required. Boundary to include integrated floor/slab, walls, and roof/ceiling assemblies.
  - .2 Clearly define air barrier materials and assemblies for each component on drawings and in related specifications. Specified air barrier materials and assemblies should meet the requirements set forth in applicable Divisions of the Specification.
  - .3 Provide surface area calculations for the air barrier boundary.
  - .4 Provide details illustrating integration of air barrier materials at all transitions (e.g., roof-to-wall, wall-to-floor, building expansion joints, exterior doors and windows, etc.).
  - .5 Provide as-built drawings and specifications to the BECx A.
- 1.8.2 Provide written responses to design review comments from the CxA or other parties as requested.
- 1.8.3 Attend pre-construction commissioning conference.
- 1.8.4 Perform submittal review, construction observation, as-built drawing preparation, etc. as contracted.
- 1.8.5 Coordinate resolution of system deficiencies identified during BECx according to contract documents.

## **1.9 Consultant Responsibilities**

- 1.9.1 Submit manufacturer's product literature in accordance with Contract Documents.

---

**2 . PRODUCTS – NOT USED**

**3 . EXECUTION**

**3.1 General Requirements**

3.1.1 Systems to be commissioned: Refer to the Related Documents and Sections identified in 1.3 for specific requirements. The systems and elements to be commissioned include, but are not limited to:

- .1 Roof systems (including parapets, penetrations, curbs, etc.)
- .2 Exterior wall systems (all types)
- .3 Curtain walls/window walls, storefronts
- .4 Windows
- .5 Skylights
- .6 Doors
- .7 Sealants
- .8 Building expansion joint accessories (roof and wall)
- .9 Flashings
- .10 Below-grade waterproofing
- .11 Floors (slab-on-grade)
- .12 Any other special building enclosure system, equipment and controls.

3.1.2 Contractors shall provide sufficient notice to the BECxA regarding their completion schedule for the mock-up assemblies or enclosure.

3.1.3 Mock-up Testing Requirements

- .1 Mock-up tests will be performed by the BECxA per Contract Documents in order to verify component and assembly performance prior to commencing with construction or during the first phase of construction.
- .2 Contractors shall provide sufficient notice to the BECxA regarding their completion schedule for the mock-up assemblies or exterior enclosure systems. The BECxA will schedule field testing through the Contractor and CxA.
- .3 If mock-ups do not pass initial testing, Contractor shall provide labor and materials to repair mock-up until a successful test is achieved.
- .4 Add an alternate to do testing on a partially complete building.

---

### **3.2 Site Reviews and Reporting**

- 3.2.1 The Cx Authority will develop a preliminary schedule for site reviews, based on the project schedule produced and maintained by the Contractor. The schedule will include milestones for site reviews, and those which will include mock-ups.
- 3.2.2 During site reviews the Contractor shall provide to the Cx Authority access to building enclosure components and systems listed in section 3.1.1 above and to corresponding Contractor's sheets for review and copying.
- 3.2.3 The Contractor shall review this information and advise the Consultant when a project milestone is forthcoming that will require review by the Cx Authority.
- 3.2.4 The Contractor shall provide 1 weeks' notice of a pending review. The Cx Authority will schedule the review accordingly, and subsequently coordinate with the Contractor.

### **3.3 Building Enclosure Mock-Ups**

- 3.3.1 Building enclosure mock-ups specified shall be used primarily for determining interface detailing of building enclosure components, to ensure performance and durability, and to set standards with the crews performing the work. The Consultant may specify their own mock-ups to review other requirements, including appearance.
- 3.3.2 Mock-ups shall be constructed for review by the Cx Authority, Consultant, Owner, and others on the Cx Team, as deemed necessary. Locations and type of mock-ups shall be determined at site collaboratively with the project team.
- 3.3.3 Mock-Ups shall demonstrate how the pertinent components in the construction detail will interface to satisfactorily manage heat, air, and moisture to result in an assembly that is durable and performs as intended.
- 3.3.4 The Contractor shall make necessary additions and modifications to mock-ups as requested by the Cx Authority and Consultant until final acceptance is obtained. Documentation of mock-ups by the Cx Authority will be accomplished via regular site review memos.
- 3.3.5 Construction of the mock-up assemblies shall be under the supervision of the same personnel who will be employed for the subsequent work.
- 3.3.6 If a change in personnel completing the work is planned, the Contractor shall ensure the knowledge and skills obtained during the mock-up and subsequent construction are transferred effectively to new personnel.

---

**3.4     Building Enclosure Testing**

- 3.4.1 Testing shall be attended by the Cx Authority, Consultant, Owner, and others on the Cx Team, as deemed necessary. Locations shall be determined at site collaboratively with the project team.
- 3.4.2 Assemblies being tested shall be complete to an extent that permits the Cx Authority and Cx Team to decide regarding whether the assembly or component will effectively and permanently control the tested phenomena. For example, an assembly being tested for water tightness must have all membranes, flashings and sealants associated with the precipitation control layer complete, but not necessarily those components associated with the thermal control layer, as the latter should not substantially impact the precipitation control function of the assembly.
- 3.4.3 Localized calibrated nozzle water penetration testing shall be completed as follows:
  - .1 All localized nozzle water penetration testing shall be performed in accordance with the most recent iteration of AAMA 501.2: Quality Assurance and Diagnostic Water Leakage Field Check of Installation Storefronts, Curtain Walls, and Sloped Glazing Systems.
  - .2 The number of tests and test locations shall be selected by the BECxA.
    - .1 Curtain Walls: Minimum of one (1) curtain wall module test specimen interfacing with adjacent wall assemblies at 10%, 25%, and 75% construction completion. Test specimen to include, head, sill and jambs interfacing with adjacent wall assemblies, minimum 50 linear feet in length.
    - .2 Tubular Skylight: Test minimum one (1) tubular skylight at 10% construction completion. Test specimen to include, head, sill and jambs interfacing with adjacent wall assemblies, minimum 50 linear feet in length.
  - .3 Testing to be performed by the 'Testing Agency'.
  - .4 The test apparatus will be provided by the 'Testing Agency'.
  - .5 Hose and water source with at least 30 psi pressure at the hose outlet shall be provided by the Contractor.
  - .6 Reporting for water penetration testing shall be done in the form of a regular site review memo. The reporting shall identify pertinent items, such as:
    - .1 Locations and photos of the testing;
    - .2 Description of the test apparatus and methodology;

- 
- .3 Environmental conditions during testing;
  - .4 Results of the testing ("Pass" or "Fail");
  - .5 Summary of potential reasons for "failure" (if appropriate);
  - .6 Recommendations for follow-up action.
- .7 Deficiencies or non-conformance identified in all tests will be identified and tracked in the Cx Log maintained by the CxA, as described above.
- 3.4.4 Chamber water penetration shall be performed in accordance with the most recent iteration of ASTM E1105: Standard Test Method for Determination of Water Penetration of Installed Exterior Windows, Skylights, Doors and Curtain Walls, by Uniform or Cyclic Static Air Pressure Differential. Testing shall be completed as follows:
- .1 The number of tests and test locations shall be selected by the BECxA.
    - .1 Curtain Wall: Test minimum one (1) curtain wall module (including fixed, operable and spandrel unit) at 10%, 25%, and 75% construction completion. Curtain wall test specimen to include horizontal expansion joint.
    - .2 Tubular Skylight: Test minimum one (1) tubular skylight at 10% construction completion.
  - .2 Testing to be performed by the 'Testing Agency'.
  - .3 The test apparatus will be provided by the 'Testing Agency'.
  - .4 Testing chambers required for building enclosure pressurization shall be constructed by the Contractor at locations selected by the BECxA.
  - .5 Construct test chambers in accordance with the most recent iteration of ASTM E1105: Standard Test Method for Determination of Water Penetration of Installed Exterior Windows, Skylights, Doors and Curtain Walls, by Uniform or Cyclic Static Air Pressure Difference.
  - .6 All localized water penetration testing shall be performed in accordance with the most recent iteration of ASTM E1105: Standard Test Method for Determination of Water Penetration of Installed Exterior Windows, Skylights, Doors and Curtain Walls, by Uniform or Cyclic Static Air Pressure Difference.
  - .7 The procedure used for water penetration testing shall be Procedure A— Test under uniform static air pressure difference. The test apparatus used shall be an interior-

mounted depressurization chamber with exterior-mounted water spray system.

- .8 The level of pressurization for localized water penetration testing shall be determined by the BECx Authority in accordance with the Canadian Supplement to AAMA/WDMA/CSA 101/I.S.2/A440/NAFS 2011 - North American Fenestration Standard Specification for Windows, Doors, and Skylights.
  - .9 Additional levels of pressurization may be requested or specified by the Consultant and or Owner. If additional levels of pressurization are provided, testing shall be first performed at the lowest level of pressurization. The pressure shall be increased until completion of testing at all pressures, or failure.
  - .10 Reporting for water penetration testing shall be done in the form of a regular site review memo. The reporting shall identify pertinent items, such as:
    - .1 Locations and photos of the testing;
    - .2 Description of the test apparatus and methodology;
    - .3 Environmental conditions during testing;
    - .4 Results of the testing ("Pass" or "Fail");
    - .5 Summary of potential reasons for "failure" (if appropriate);
    - .6 Recommendations for follow-up action.
  - .11 Deficiencies or non-conformance identified in all tests will be identified and tracked in the Cx Log maintained by the BECxA, as described above.
- 3.4.5 Chamber air leakage testing shall be in completed accordance with the most recent iteration of ASTM E783: Standard Test Method for Field Measurement of Air Leakage Through Installed Exterior Windows and Doors. Testing to be completed as follows:
- .1 The number of tests and test locations shall be selected by the BECx. Test locations are to be coordinated with ASTM E1105 test locations.
  - .2 Testing chambers required for building enclosure pressurization shall be constructed by the Contractor. The BECxA and Contractor shall coordinate on the type of chamber required, as it varies with testing types and locations.
  - .3 Where quantitative testing of a fenestration assembly is performed, the test chamber shall be constructed in accordance with ASTM E783: Standard Test Method for Field Measurement of Air Leakage Through Installed Exterior Windows and Doors.

- 
- .4 The level of pressurization for localized air leakage testing shall be determined by ASTM E783.
  - .5 Additional levels of pressurization may be requested or specified by the Consultant and Owner. If additional levels of pressurization are provided, testing shall be first performed at the lowest level of pressurization. The pressure shall be increased until completion or failure.
  - .6 Reporting for air leakage testing shall be done in the form of a regular site review memo, where practical. The reporting shall identify pertinent items, such as:
    - .1 Locations and photos of the testing;
    - .2 Description of the test apparatus and methodology;
    - .3 Environmental conditions during testing;
    - .4 Results of the testing ("Pass" or "Fail");
    - .5 Summary of potential reasons for "failure" (if appropriate);
    - .6 Recommendations for follow-up action.
  - .7 Deficiencies or non-conformance identified in all tests will be identified and tracked in the log maintained by the Cx Authority, as described above.
- 3.4.6 Qualitative localized sealant adhesion testing shall be completed as follows:
- .1 Perform five (5) tests for every 1000 feet (305m) of joint length for each kind of sealant and joint substrate. Perform one (1) test for every 1000 feet (305m) thereafter.
  - .2 Where qualitative testing of a wall assembly is performed, the test shall be conducted in accordance with ASTM C1521-19.
  - .3 Reporting for adhesion testing shall be done in the form of a regular site review memo, where practical. The reporting shall identify pertinent items, such as:
    - .1 Locations and photos of the testing;
    - .2 Description of the test apparatus and methodology;
    - .3 Environmental conditions during testing;
    - .4 Results of the testing ("Pass" or "Fail");
    - .5 Summary of potential reasons for "failure" (if appropriate);
    - .6 Recommendations for follow-up action.
  - .4 Deficiencies or non-conformance identified in all tests will be identified and tracked in the log maintained by the BECxA, as described above.
- 3.4.7 Qualitative water leakage testing of horizontal waterproofing membrane shall be completed as follows:

- 
- .1 Where qualitative water leakage testing of a roof assembly is performed, Electric Field Vector Mapping (EFVM) testing shall be tested in accordance with ASTM D7877-14.
  - .2 The number of tests and test locations shall be selected by the BECxA. Minimum one (1) test per roof assembly.
  - .3 Testing to be performed by the 'Testing Agency'.
  - .4 The test apparatus will be provided by the 'Testing Agency'.
  - .5 Reporting for water leakage testing shall be provided by the testing agency. The reporting shall identify pertinent items, such as:
    - .1 Locations and photos of the testing;
    - .2 Description of the test apparatus and methodology;
    - .3 Environmental conditions during testing;
    - .4 Results of the testing ("Pass" or "Fail");
    - .5 Summary of potential reasons for "failure" (if appropriate);
    - .6 Recommendations for follow-up action.
  - .6 Deficiencies or non-conformance identified in all tests will be identified and tracked in the log maintained by the BECxA, as described above.
- 3.4.8 Quantitative localized adhesion testing of membranes and coatings shall be completed as follows:
- .1 Where quantitative testing of a wall assembly is performed, the test on a metal or gypsum substrate shall be conducted in accordance with ASTM D4541-09. Where quantitative testing of a wall assembly is performed, the test on a concrete substrate shall be conducted in accordance with ASTM D7234-19.
  - .2 The number of tests and test locations shall be selected by the BECxA. Minimum two (2) tests per membrane and substrate type.
  - .3 Reporting for adhesion testing shall be done in the form of a regular site review memo, where practical. The reporting shall identify pertinent items, such as:
    - .1 Locations and photos of the testing;
    - .2 Description of the test apparatus and methodology;
    - .3 Environmental conditions during testing;
    - .4 Results of the testing ("Pass" or "Fail");
    - .5 Summary of potential reasons for "failure" (if appropriate);
    - .6 Recommendations for follow-up action.

- 
- .4 Deficiencies or non-conformance identified in all tests will be identified and tracked in the log maintained by the BECxA, as described above.
- 3.4.9 Whole Building Pressurization Testing shall be performed as follows:
- .1 Testing to be performed by the 'Testing Agency'.
  - .2 The appropriate apparatus and test method shall be chosen by the 'Testing Agency'.
  - .3 To acquire meaningful test data, it may be necessary to subdivide subsections of the building. Test enclosures that are entirely composed of subsections separated by interior partitions, floors, or both may be tested as a single zone by maintaining baseline relationships between subsections throughout testing.
  - .4 All whole building air testing shall be performed as outlined in the following standards:
    - .1 ASTM E1827 - Standard Test Methods for Determining Airtightness of Buildings Using an Orifice Blower Door
    - .2 ASTM E779 - Standard Test Method for Determining Air Leakage Rate by Fan Pressurization
    - .3 ASTM E1258 - Standard Test Method for Airflow Calibration of Fan Pressurization Devices
    - .4 ASTM E1186 - Standard Practices for Air Leakage Site Detection in Building Enclosures and Air Barrier Systems
  - .5 The testing agency to submit a building specific testing plan based on the test specifications for the project. Plan to identify the purpose for the test. Testing plan to reference any air tightness requirements for the building.
  - .6 Reporting for Whole Building Pressurization Testing shall be done in the form of a testing report. The reporting shall identify pertinent items, such as:
    - .1 Locations and photos of the testing;
    - .2 Phasing/sub-dividing the building
    - .3 Description of the test apparatus, gauges and other equipment
    - .4 Testing methodology;
    - .5 Identify areas of masking for 'intentional openings'
    - .6 Interior and exterior environmental conditions during testing;

- 
- .7 Differential pressure measurements across the building enclosure;
  - .8 Criteria and Results of the testing ("Pass" or "Fail");
  - .9 Summary of potential reasons for "failure" (if appropriate);
  - .10 Recommendations for follow-up action.
  - .11 Deficiencies or non-conformance identified in all tests will be identified and tracked in the log maintained by the BECxA, as described above.
- .7 Testing agency to co-ordinate with BECxA authority and Contractor during Construction phase.
- 3.4.10 Qualitative full-building thermography testing shall be performed as follows:
- .1 Infrared thermography shall be conducted on the building after the building enclosure and HVAC system has been completed.
  - .2 The initial thermographic scan shall be performed when the building is positively pressurized. A second thermographic scan shall be performed when the building is negatively pressurized. The level of pressurization will be determined by the project team.
  - .3 The Contractor is responsible for operating the HVAC systems as required to provide the necessary pressurization during thermographic scanning activities.
  - .4 Infrared thermography will be the primary method used to qualitatively identify air barrier and insulation issues and will also help to identify other problematic hygrothermal phenomena.
  - .5 All thermography shall be performed as outlined in the following standards:
    - .1 ASTM C1060 Standard Practice for Thermographic Inspection Insulation Installations in Enclosure Cavities of Frame Buildings.
    - .2 ASTM C1153: Standard Practice for Location of Wet Insulation in Roofing Systems Using Infrared Imaging
  - .6 Reporting for thermography will be included in the regularly issued Commissioning Logs.
  - .7 Deficiencies or non-conformance identified during thermography will be identified and tracked in the log maintained by the BECxA, as described above.
-

3.4.11 The Contractor shall support the BECxA and CxA in performing additional testing during regular site reviews, which will be documented in the form of regular site review memos.

#### 3.4.12 Testing Responsibility Matrix

<b>System:</b>	<b>Test:</b>	<b>Testing Agency to be retained by:</b>	<b>Testing Agency Name:</b>	<b>Test to be performed when:</b>
Fenestration systems (Windows, doors, curtain walls, storefront systems)	AAMA 501.2 Calibrated nozzle water penetration testing.	Owner	TBC & Contractor	Mock-ups are constructed.
Fenestration systems (Windows, doors, curtain walls, storefront systems)	ASTM E1105: Chamber water penetration testing.	Owner	TBC & Contractor	Mock-ups and testing chambers are constructed.
Fenestration systems (Windows, doors, curtain walls, storefront systems)	ASTM E783: Chamber air leakage testing.	Owner	TBC & Contractor	Mock-ups and testing chambers are constructed.
Horizontal Waterproofing	ASTM D7877-14: Electro Field Vector Mapping	Owner	TBC	Horizontal waterproofing is fully/partially completed
Exterior Sealants	ASTM C1521-19: Sealant Adhesion Test	Owner	TBC & Contractor	Regular progress of sealant installation
Wall Membrane	ASTM D4541-09: Adhesion of membrane to metal/gypsum Substrate ASTM D7234-19: Adhesion of membrane to	Owner	TBC & Contractor	Regular progress of membrane installation

	concrete substrate			
Building Air Barrier	ASTM E779, ASTM E1186, ASTM E1258, ASTM E1827: Whole Building Pressurization Test	Owner	TBC & Contractor	Regular progress of building enclosure construction or at full building enclosure construction completion
Building Air Barrier, Thermal Insulation and Horizontal Waterproofing	ASTM C1060: Infrared thermography scan	Owner	Entuitive & Contractor	Building enclosure and HVAC systems are fully completed.

### **3.5 Final Report**

- 3.5.1 Reporting for identification, correction and close-out of deficiencies will be like that described above for regular field reviews.
- 3.5.2 This report will be provided to the Consultant, Owner, Contractor, and other project team members, as required.
- 3.5.3 The Consultant and Contractor shall review the Final Cx Report and carry out action items as deemed necessary to ensure compliance with the Contract Documents.
- 3.5.4 An additional review may be required to confirm close-out of remaining deficiencies. If this is required, the BECx and Cx Authority shall advise the project team.

### **3.6 Final Report**

- 3.6.1 The commissioning authority will compile the maintenance manual from information provided by the entire commissioning team. The maintenance manual to include all the information necessary to operate, maintain, and re-commission all envelope systems. Specifically, the Systems Manual will include:
  - .1 Executive Summary – developed by the BECxA
  - .2 Owner's project requirements – Final update provided by the Owner.
  - .3 Basis of design – Final update provided by the design team.
  - .4 System Description – Final update provided by the design team.
  - .5 Construction record documents and specifications – Final update provided by the design team.

- .6 Approved submittals – Final digital copies provided by the Contractor.
- .7 As-built drawings – Provided by the Contractor.
- .8 Operations and Maintenance manuals – Provided by the Contractor.
- .9 Preventative Maintenance Plan – Provided by the Contractor.
- .10 Final Cx Report – Provided by the CxA.

END OF SECTION

**1. GENERAL****1.1 Scope of Work**

1.1.1 The intent of the commissioning process is to verify that the project's systems are installed, calibrated and perform according to the owner's project requirements, basis of design, and construction documents. Commissioning is a quality control process that enhances the delivery of a project. It is comprised of a series of functional steps and associated deliverables; it is not an event that can be shown on a schedule. The Commissioning Process does not relieve any contractors from their obligations to complete all portions of work in a satisfactory manner. Systems include those identified in each respective section of this project's construction documents and at minimum the following:

- .1 Mechanical Systems
  - .1 Heating systems
  - .2 Cooling systems
  - .3 HVAC
  - .4 Domestic cold water
  - .5 Domestic hot water and recirculation
  - .6 Sanitary waste and venting
  - .7 Storm drainage
  - .8 Compressed air
  - .9 Natural Ventilation
  - .10 Environmental Monitoring Systems
  - .11 Fire Protection
- .2 Electrical Systems
  - .1 Grounding
  - .2 Electrical distribution – general, life safety & non-life safety
  - .3 Lighting, and lighting controls
  - .4 Digital Power Metering
  - .5 EV Charging
  - .6 Lightning Protection
  - .7 Emergency lighting
  - .8 Communications – cabling, racks, rooms & environment, audio visual
  - .9 Electronic Safety and Security – Access control, intercom, video surveillance, fire alarm, panic/duress systems

**1.2 Related Documents**

- 1.2.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this Section.
- 1.2.2 OPR (Owner Project Requirements) prepared by Owner
- 1.2.3 BOD (Basis of Design) documentation prepared by the Consultant respectively contain requirements that apply to this Section.
- 1.2.4 Industry standards and guidelines are a guide to the commissioning process and are hereby incorporated and will be applied as appropriate. Reference standards and guidelines include, but are not limited, to the following:
- 1.2.5 References:
  - .1 Commissioning Plan

**1.3 Commissioning Plan**

- 1.3.1 The Commissioning Process Specification outlines the roles and responsibilities of the Contractors. As a separate document, the Commissioning Plan will provide a broader outline of the entire commissioning process. The Cx Authority (CxA) will post the Commissioning Plan on a document share site for review and use by the Cx Team.
- 1.3.2 Impact on Contractor Responsibility: The Cx Process does not reduce the responsibility of the installing contractors to provide a finished and fully functioning product.

**1.4 Contractor's Responsibilities**

- 1.4.1 General
  - .1 Contractors providing and/or installing equipment and systems included but not limited to the 'Scope of Work' above are required to participate fully in the Commissioning Process.
  - .2 Participating Contractors shall include all costs to complete the Cx requirements in their contract price including all costs for Sub-Contractors, vendors, suppliers, materials, meetings, lifts, ladders, safety equipment, radios.
  - .3 Participating Contractors shall ensure acceptable representation, with the means and authority to prepare, coordinate and execute the Commissioning Process as described in the contract documents.
  - .4 Contractors shall participate in the resolution of system deficiencies identified during the commissioning process,

according to the contract documents and the Cx Authority's project Cx Requirements.

- .5 The Contractor works with the Sub-Contractor in each discipline in developing, coordinating and scheduling start-up plans
- .6 The Contractor coordinates the Sub-Contractor's work schedules and staffing to ensure that the qualified technician(s) are available and present during the agreed upon schedules and for enough duration to complete procedures, tests, adjustments, and/or problem resolutions, during Performance Verification.

#### 1.4.2 Contractor's Commissioning Representative (CCR)

- .1 Each Contractor participating in the Cx Process will each designate a single-point contact person to work with the Cx Authority and the Commissioning Team to coordinate Installation, Testing, Startup, Proving/Testing and Functional Verification activities, ensure timely execution of Cx Procedures and prompt resolution of issues.
- .2 Contractor Commissioning Representative shall submit names of sub-contractors (Mechanical, Electrical, TAB and BAS) commissioning representatives to Cx Authority in the early months of construction start.
- .3 Contractor and Subcontractor commissioning representatives will attend and fully participate in Commissioning, Integrated Systems Testing (IST) and TAB related meetings.
- .4 The CCR shall be the Contractor's Project Manager, Field Superintendent or similar with authority to do the following:
  - .1 Make decisions regarding commissioning activities and issues
  - .2 Schedule technicians for participation in commissioning activities
  - .3 Interface between the Commissioning Team and the Contractor's, vendors and suppliers.
- .5 The CCR will be responsible for coordinating the Contractor's participation in the Cx Process. As part of this role, the CCR shall:
  - .1 Schedule, facilitate and coordinate all Commissioning Meetings
  - .2 Keep the Consultant, and/or Cx Authority apprised of the Contractor's progress, schedules and other matters impacting execution of the Commissioning Procedures.

- .3 Coordinate the Contractor's work schedules and staffing to ensure that the qualified technician(s) are available and present during the agreed upon schedules and for enough duration to complete procedures, tests, adjustments, and/or problem resolutions.

#### 1.4.3 Field Technicians/Tradespersons

- .1 Each Contractor shall provide qualified field technicians who are trained and familiar with installation, operation and troubleshooting of systems and equipment being commissioned for participation in the commissioning activities outlined in this document.
- .2 Contractors shall arrange for and provide technicians from their Sub-Contractors, vendors and suppliers where specified and where Contractor's own personnel lack the required training or experience necessary to ensure that all commissioned equipment and systems are correctly installed and fully functional.
- .3 System performance problems and discrepancies may require additional technician time, Cx Authority time, reconstruction of systems, and/or replacement of system components. The additional technician time shall be made available for subsequent Cx periods at no cost to the Cx Authority until the required system performance is obtained
- .4 The Cx Authority reserves the right to question the appropriateness and qualifications of the technicians relative to each item of equipment, system, and/or sub-system. Qualifications of technicians shall include expert knowledge relative to the specific equipment involved.

#### 1.4.4 Manufacturer's Involvement

- .1 The Contractor shall obtain manufacturers installation, start-up and operations instructions prior to start-up of components, equipment and systems.
  - .1 Compare completed installation with manufacturer's published data, record discrepancies, and review with manufacturer.
  - .2 Modify procedures detrimental to equipment performance and review same with manufacturer before start-up.
- .2 Integrity of warranties:
  - .1 Use manufacturer's trained start-up personnel where specified elsewhere in other divisions or required to maintain integrity of warranty.

.2 Verify with manufacturer that testing as specified will not void warranties.

.3 Qualifications of manufacturer's personnel:

.1 Experienced in design, installation and operation of equipment and systems.

.2 Ability to interpret test results accurately.

.3 Ability to report results in clear, concise, logical manner.

## **1.5 Contractor Coordination & Scheduling**

### **1.5.1 Commissioning Meetings**

.1 Commissioning Orientation (Kick-Off) Meeting

.1 This meeting will be scheduled by the Contractor and coordinated with the Consultant and Cx Authority after awarding of contracts but prior to the start of construction of the systems included in the commissioning scope.

.2 The Cx Authority will work with the Contractor who coordinates this initial Commissioning Orientation Meeting for the Prime Contractors and selected Sub-Contractors to familiarize all parties with the Cx process, and to ensure that the roles and responsibilities of each party are clearly understood.

.2 On-going Commissioning Progress Meetings

.1 These meetings will be scheduled by the Contractor and coordinated with the Consultant and Cx Authority. The purpose of these meetings will be to coordinate and schedule Contractor Cx activities, review Contractor Cx activity status, verify Cx Authority's Project Requirement achievements, and discuss status and resolution of Cx issues. Meeting frequency will be determined by the CxA. Minutes from the commissioning meetings will be recorded and distributed by the Contractor to the full commissioning team.

## **1.6 Commissioning Authority Responsibilities**

1.6.1 The CxA works with the Cx team which typically has representation from the following:

.1 Owner

.2 Project Manager

.3 Facilities Manager

.4 Architectural Consultant

- .5 Mechanical Consultant
- .6 Electrical Consultant
- .7 Contractors Commissioning Representative
- .8 Mechanical Subcontractor
- .9 Electrical Subcontractor
- .10 TAB Subcontractor
- .11 BAS Subcontractor
- 1.6.2 Prepare an initial Commissioning Plan. The Commissioning Plan (Cx Plan) is a dynamic document that is continuously updated through Design, Construction and Warranty. Updates shall be provided by the Consultant / Contractor during and post construction. The Cx Plan shall identify commissioning team member(s) / their responsibilities, by name, firm, and trade specialty, for performance of each commissioning task. Scheduled commissioning process activities shall be coordinated with overall Project schedule.
- 1.6.3 Participate in the commissioning team meetings for monitoring progress, coordination and communication. The Contractor responsibilities include arranging for facilities, preparing agenda and attendance lists, and notifying participants. The Contractor shall prepare and distribute minutes to commissioning team members and attendees within 5 workdays of the commissioning meeting.
- 1.6.4 At the beginning of the construction phase, the Cx Authority shall coordinate through the Contractor and may conduct an initial construction-phase coordination meeting for reviewing the commissioning process activities and establishing tentative schedules for operation and maintenance submittals; operation and maintenance training sessions; TAB Work; and Project completion.
- 1.6.5 The Cx Authority will observe and review construction for compliance with the OPR, BoD, and Contract Documents, and report deficiencies. In addition to inspect systems and equipment installation for adequate accessibility for maintenance and component replacement or repair.
- 1.6.6 The Cx Authority will review the Mechanical and Electrical schematics, drawings and specifications for the inclusion of electrical, fuel, water, and thermal energy meters. Meters should be shown on the schematic and tracked on a metering list with an ID reference. All meters will be required to have their own specific reference.
- 1.6.7 The Cx Authority will review submittals associated with building's energy related systems including but not limited to meters, energy analysis software and control drawings for compliance to OPR.

- 1.6.8 The Cx Authority develops equipment and systems functional performance test procedures. Items of non-compliance in material, installation, or setup are corrected at the Contractor's expense, and the system is retested.
- 1.6.9 The Cx Authority may assist with problem solving, non-conformance or deficiencies, but ultimately that responsibility resides with the Contractor and the Consulting Engineers.
- 1.6.10 The Cx Authority will assemble the interim & final commissioning documentation, including the commissioning report.
- 1.6.11 Review contractors training plan, training schedule, demonstration session(s) for Owner.
- 1.6.12 The Cx Authority will review equipment or systems deferred due to Seasonal conditions
- 1.6.13 The Cx Authority will submit final report at end of warranty period.

## **2 . PRODUCTS**

### **2.1 Test Equipment – General**

- 2.1.1 The Contractor /Sub-contractor responsible for each Test Procedure shall provide all tools, equipment and instrumentation required for execution of that Procedure.
- 2.1.2 A list of all tools and equipment with valid calibration certificates to be used during Cx shall be submitted to the Cx Authority for review and approval prior to the start of execution.
- 2.1.3 Standard tools, testing equipment and instrumentation required for execution of Pre-Functional Procedures, Pre-startup Testing, Startup Procedures, and Post-startup Testing shall be provided by the Contractor responsible for the equipment being tested.
- 2.1.4 Testing equipment and instrumentation used for execution of Test Procedures shall be of sufficient quality and accuracy to test and/or measure system performance with the tolerances with specified in the Specifications. If not otherwise noted, the following minimum requirements apply:
  - .1 Temperature sensors and digital thermometers: certified calibration within the past year to an accuracy of 0.5°C and a resolution of + or - 0.1 °C. Pressure sensors: accuracy of + or - 2.0% of the value range being measured (not full range of meter) and calibrated within the last year.
  - .2 Electrical meters (voltage, current, etc.) shall be true RMS and shall have been calibrated within the last year.
  - .3 Other sensors (RH, CO, CO<sub>2</sub>, etc.) shall have been calibrated within the last 6 months.

2.1.5 All test equipment and instrumentation used for testing procedures shall be calibrated according to the manufacturer's and/or calibrator recommended intervals and when dropped or damaged.

2.1.6 Calibration tags shall be affixed or certificates readily available.

## **2.2 Test Equipment - Special, Proprietary, or Unique**

2.2.1 Equipment and software including that for testing required by any contractor, vendor or equipment manufacturer for programming, start-up, or other testing activity whether specified or not, shall be provided for use during verification and at no additional cost to the Cx Authority.

## **2.3 BAS Hardware and Software Support**

2.3.1 The BAS Contractor shall provide the Cx Authority with hardware & software needed to connect to, communicate with and command the BAS from both the front-end operator workstation and the field panels and controllers at no additional charge to the Cx Authority. Use of hardware and software provided under this section may be limited to the duration of the Cx Process at the BAS Contractor's discretion but shall not be terminated until completion of the Cx Process including resolution of all outstanding construction phase issues and successful execution of Post-Occupancy phase commissioning activities.

2.3.2 Hardware and software covered under this requirement includes, but is not limited to:

- .1 Communication modules, software keys, remote access and similar hardware needed for communication from a laptop computer or PDA to field panels or controllers
- .2 Proprietary cables required for communication between laptop computers or PDAs to field panels or controllers
- .3 Proprietary software needed to communicate to field panels or controllers such as HVAC Pro, Metasys, Commissioning Tool, etc.
- .4 Passwords, access levels and similar software permissions necessary for execution of the Cx Process.
- .5 Software and hardware manuals for all control system hardware and software provided to the Cx Authority.

2.3.3 The BAS Contractor shall adhere to the client's naming convention standard for labelling monitoring points.

2.3.4 The BAS Contractor shall also provide technical support to the Cx Authority as reasonably requested by the Cx Authority regarding BAS hardware and software.

**2.4 Data Collection**

- 2.4.1 The BAS system must be configured for collection of trend log data for all measured and calculated monitoring points. Data shall be provided in Comma Separated Value (.CSV) for Excel file format (.xls).
- 2.4.2 Control points such as temperature, pressure, Change of Value (COV) requiring automatic trending and logging on the server for a minimum of one year will detailed once a points list is available from the design team.

**3 . EXECUTION****3.1 Commissioning Process - Construction Phase:**

- 3.1.1 The documented procedures which comprise the construction-phase commissioning process activities includes the following:
- .1 Contractors shall provide access to the shop drawings, coordination drawings, equipment cut-sheets, schematics, in-progress record drawings, etc. to assist the CxA in execution of the Cx process.
  - .2 Contractor installation QA/QC monitoring is conducted during the installation of equipment to verify that equipment is installed per the contract documents and is ready for startup. Construction checklists are provided by the Cx Authority and completed/filled in by the Contractors.
    - .1 Installed equipment matches the specifications and approved submittals
    - .2 Equipment is installed per the specifications, drawings and manufacturer's recommendations
    - .3 Utility connections to equipment, such as electrical, steam, chilled water, etc. have been successfully completed
    - .4 Equipment is ready for start-up
    - .5 The Cx Authority will provide oversight to the Contractors during the execution of the Construction Checklists and will periodically review the Contractors' in-progress Checklists for accuracy, completeness and to verify that checklists are being kept up to date
    - .6 The Contractors shall regularly review and update the appropriate Checklists so that installation issues are identified early in the construction process.
    - .7 Construction Checklists shall be substantially complete and reviewed by the Cx Authority prior to

- 
- equipment start-up. Exceptions to this requirement will be at the Cx Authority's discretion.
- .8 The Contractor shall provide all tools, test equipment and instrumentation required for completion of the Construction checklists.
- .3 Contractor Pre-Startup Testing consists of normally specified Contractor testing such as hydrostatic or pneumatic leak testing of ductwork and piping and megger and bump testing of electrical equipment. Documentation submissions will be per the specific M&E specification sections.
- .4 Start-up checklists ensure that startup is performed per the equipment manufacturer's recommended procedures and those startup activities and data are documented for future reference.
- .1 Contractor equipment installation and Contractor Pre-startup Testing has been fully completed and documented prior to startup.
- .2 Ensuring that all required utilities are available prior to startup.
- .3 Ensuring that the appropriate personnel have been identified and scheduled to participate including vendors, manufacturer's representatives, other trades, etc.
- .4 Tools, test equipment and/or instrumentation required for startup will be available
- .5 Startup procedures meet the equipment manufacturer's recommendations. Complete Construction checklists provided by the Cx Authority.
- .6 For equipment requiring startup by the equipment manufacturer, vendor or representative submit reports to the Cx Authority. Attached reports to the Construction Checklist provided by the Cx Authority.
- .7 The contractor will submit documentation for all equipment which has had a Factory Testing prior to on site startup. Attached reports to the Construction Checklist provided by the Cx Authority.
- .8 All Startup Forms will be submitted to the Engineer & Cx Authority for review and acceptance upon completion
- .5 Contractor TAB (Test Adjust and Balance) Plan to be developed in accordance with AABC or NEBB standards and submitted to the Cx Authority (via the CM) no later than

---

30 days prior to scheduled Start up shall include a narrative and technical detail identifying the relevant systems, components, instrumentation, and sequence of work. This Plan shall also indicate evidence of all presets in preparation.

- .1 Participate in verification of the TAB report, which will consist of repeating any selected measurement contained in the TAB report where required by the Cx Authority for sampling or diagnostic purposes.
- .2 TAB Contractor shall comply with the requirements listed in the Controls & Instrumentation paragraph below. The TAB Contractor shall coordinate with the controls Contractor to ensure that changes made to the control system during TAB (flow coefficients, duct areas, Temperatures, pressure differentials etc.) are archived and become the default or initial values for these parameters. Both Preliminary Reports for approval and final TAB Reports shall provide physical evidence of Point-to-Point Checkouts
- .3 All DDC Points commands and responses reporting properly and values reflect calibrated adjustments. Final reported values, when accepted by the Cx Authority, will serve as Functional Performance Testing evidence.
- .4 The TAB Contractor will provide technicians and instrumentation to support the field verification
- .6 Contractor Functional Performance Test (CFPT) consists of normally specified contractor testing activities occurring after startup including test, adjust and balance (TAB) of ventilation and hydronic systems, control system point-to-point testing and testing of BAS sequences of operation. The Cx Authority provides oversight during the execution and documentation of these tests to ensure successful system operation.
  - .1 Cx Authority activities and requirements related to Contractor Functional Performance Testing / procedures are in addition to the testing / procedure's requirements specified in other Divisions of these specifications. These do not reduce the Contractor's responsibility for successfully completing and documenting all testing / procedures requirements outlined elsewhere in these specifications.

- 
- .2 All test forms will be fully completed and maintained by the Contractor per the requirements of this specification.
  - .3 Control Sequence Checkout. Contractor shall verify that the control system programming matches the specified sequences of operation. For these checkouts, the Contractor shall simulate actual operating conditions for the various operating modes being tested (heating, cooling, etc.) by false-loading systems, adjusting setpoints and similar techniques.
  - .4 Tune all Control Loops to obtain the fastest stable response without unreasonable hunting, offset or overshoot. Record tuning parameters and response test results for each control loop and provide trend reports to document results. Trend logs shall show both steady-state operation and response to setpoint changes.
  - .5 Test All Alarms and Safeties. Record all alarm parameters and alarm messages. Document all alarms and safeties have been tested and are functioning properly.
  - .6 The Contractor responsible for the BAS shall work with the TAB Contractor(s) to make sure that changes to the BAS made during TAB, such as flow coefficients, flow setpoints and duct areas, pressure differentials are permanently archived in the BAS and become the initial or default values for their respective controllers.
  - .7 Proving procedures and tests which are rejected by the Cx Authority due to incomplete or illegible Contractor documentation shall be repeated by the Contractor and new Contractor Documents shall be prepared to the CxA satisfaction at no additional costs to the Owner.
  - .8 The Contractor shall provide all tools, test equipment and instrumentation required for completion of the Post-startup Testing / Procedures.
  - .9 The Contractor shall provide a written list of instrumentation which will be used for Post-startup Testing / Procedures indicating instrument make, model number, serial number, range, accuracy and calibration date to the Owner prior to the start of testing.

- 
- .10 Contractors shall be responsible for maintaining a tracking system to monitor the progress of their installation, start-up & proving/testing activities. This tracking system will be submitted to the CxA and will include spreadsheet-based tracking forms and/or sets of drawings which will be marked-up by the contractor to indicate status of specified activities.
- .7 Functional Performance Test (FPT) consists of determining if equipment, sub-systems and major systems operate in accordance with the design intent. Specific issues, which will be evaluated in these procedures, include equipment capacity & efficiency, operation of safeties and interlocks, control system operation, stability and tuning. All Contractor Functional Performance Testing work including debugging is to be completed prior to Functional Performance Test verification by the Cx Authority.
- .1 The role of the Cx Authority is to sample witness systems functional operation by documenting the performance. During this phase of Construction, the systems are to have been fully contractor verified through all sequences and operations normal to the Project.
- .2 Equipment-level functional operation will be used to verify operation and capacity of selected equipment such as boilers, chillers cooling towers, pumps, exhaust fans, air handling units, etc.
- .3 System-level functional operation will verify the following aspects of system operation:
- .1 System operation under both normal and alternate operating conditions and modes
- .2 Interactions between equipment and sub-systems
- .3 Operation of safeties and interlocks
- .4 Control system operation, response time, stability and tuning
- .5 System response to abnormal and/or emergency conditions such as fire, equipment failure and power outages
- .4 The Cx team will, in a joint effort, coordinate and schedule FPT activities.
- .5 Scheduling of FPTs shall be contingent on notification from the Contractor(s) to the Cx Authority that equipment and systems are ready for checkout.
-

- 
- .6 Other prerequisites for execution of FPTs shall include the following
    - .1 All Construction Checklists, Contractor Pre-startup Testing and Startup Checklists and Procedures have been completed and documented
    - .2 TAB has been completed and reports submitted
    - .3 Issues Log items affecting equipment or system performance, or operation have been resolved
  - .7 Prior to executing of Functional Performance Test script, the controls Contractor shall ensure that the following items are completed, debugged, validated and forward all documentation:
    - .1 Point-to-point checkouts listing command and response values
    - .2 Verify that network communication between all devices and systems is established
    - .3 Sequence of Operation checkouts
    - .4 Printed and annotated trend logs and histories establishing acceptable operation including
      - .1 Stable control
      - .2 Recovery from upset/changes (e.g., from setback)
      - .3 Special and/or seasonal modes
      - .4 Emergency and alarm modes including loss/restoration of power.
  - .8 FPT on individual equipment shall be completed by the Cx Authority. FPTs on complete systems (i.e. chilled water system, hot water heating system, etc.) and sub-systems (i.e. terminal unit controls, etc.) shall be completed by the Cx Authority and the Contractor responsible for providing the BAS in collaboration.
  - .9 The Cx Authority will lead the execution of the FPTs and will document and provide results of the testing.
  - .10 Contractor activities during FPT execution will include the following:
    - .1 Starting/stopping equipment
    - .2 Energizing/de-energizing electrical distribution gear

- 
- .3 Opening/closing valves and dampers
  - .4 Manipulating BAS inputs, outputs and setpoints
  - .5 Setup, collection and downloading of BAS trend data
  - .6 Taking measurements and recording data and observed issues (deviations from the design documents) onto the Test checklists provided by the Cx Authority.
  - .11 Contractors shall conduct seasonal FPTs. This includes performing FPTs on equipment during the season it is intended to operate (i.e. test cooling equipment during the peak cooling season and test heating equipment during the peak heating season, etc.).
  - .12 Tools, test equipment and instrumentation required for completion of the FPTs shall be provided by the Contractor except for special-purpose or proprietary tools, test equipment and instrumentation which will be provided by the manufacturer of the equipment being tested.
  - .8 Non-conformance to performance verification requirements
    - .1 Should equipment, system components, and associated controls be incorrectly installed or malfunction during Cx, correct deficiencies, re-verify equipment and components within the unfunctional system, including related systems as deemed required by the Owner, to ensure effective performance.
    - .2 Costs for corrective work, additional tests, inspections, to determine acceptability and proper performance of such items to be borne by Contractor. Above costs to be in form of progress payment reductions or hold-back assessments.
  - .9 Owner Demonstration and Instruction (Training) will be provided and coordinated by the Contractor and overseen by the Cx Authority to help ensure that the Owner is adequately prepared to operate and maintain the facility at turnover.
  - .10 Refer to related Mechanical specification division
  - .11 Refer to related Electrical specification division
  - .12 Provide one electronic pdf copy of operation and maintenance data, to the Commissioning Authority
-

**3.2 Integrated Systems Testing (IST) of Fire Protection And Life Safety Systems**

- 3.2.1 The testing will be carried in in accordance with Integrated Testing Plan, Matrix and:
- .1 The Ontario Building Code
  - .2 CAN/ULC S1001-11 Standard for Integrated Systems Testing of Fire Protection and Life Safety Systems
  - .3 Individual Contractor and Consultant, Test Certificates, Letters and Reports
- 3.2.2 The integrated testing will demonstrate proper operation and inter-relationship between the Life Safety systems per original design but not limited to;
- .1 Fire alarm systems
  - .2 Sprinkler & standpipes systems
  - .3 Fire pumps
  - .4 Elevator recalls
  - .5 Emergency power
  - .6 Emergency lighting
  - .7 Smoke and fire shutters and dampers
- 3.2.3 Integrated Systems Testing will be executed under guidance of the Prime Consultant who will assume the responsibility of the testing and will confirm the procedure was carried per the approved design intent.

**3.3 Demonstration and Training**

- 3.3.1 Operator and Occupant Training will be provided and coordinated by the Contractor and overseen by the Owner/CxA to help ensure that the Owner is adequately prepared to manage and interact with the complex HVAC control system, including demand control ventilation, natural ventilation with automatic window operation, and continuous optimization for energy consumption at turnover. This training will support the long-term performance and sustainability goals of the building, particularly in achieving and maintaining Net-Zero Emission (NZE) standards. Scheduling of Training is to be confirmed in writing no later than the earlier of either Substantial Completion or as this Project requires.
- 3.3.2 Building Operators Training:
- .1 Comprehensive System Overview: Provide detailed training sessions on the HVAC system's design, operation, and control logic, including demand control ventilation and natural ventilation systems. The training should cover all

system components and their integration into the Building Management/Automation System (BMS/BAS).

- .2 Simulation-Based Training: Conduct training using simulation tools that model various environmental conditions (e.g., temperature, humidity, air quality) to demonstrate how the system responds. Operators should be able to simulate and predict system behavior under different scenarios.
- .3 Control System Management: Train operators on the BMS/BAS interface, including monitoring, data interpretation, and making adjustments. Focus on how to optimize energy use and indoor environmental quality while maintaining comfort and safety.
- .4 Continuous Monitoring and Retro-Commissioning: Develop and deliver training on the procedures for continuous system monitoring, including data logging, performance analysis, and periodic retro-commissioning. Operators should learn how to re-test and fine-tune the system to ensure ongoing compliance with NZE standards.
- .5 Emergency Response Training: Include scenario-based drills or simulations that prepare operators to handle sudden changes in environmental conditions (e.g., high winds, poor outdoor air quality) and the corresponding system responses.

#### 3.3.3 Occupant Training:

- .1 System Interaction Education: Educate building occupants on how to interact with the HVAC system, emphasizing the impact of their actions on system performance and energy efficiency. Provide clear guidelines on optimal use of the system.
- .2 Indoor Environmental Quality Awareness: Offer training that highlights the importance of maintaining good indoor air quality and how the HVAC system's automatic functions, such as window operations, are designed to enhance comfort and safety.
- .3 Feedback Mechanisms: Establish and train occupants on how to use feedback mechanisms to report comfort levels and system performance issues. This feedback will be crucial for ongoing adjustments and system improvements.

#### 3.3.4 Development of Training Materials and Documentations:

- .1 Simulation and Procedure Documentation: Create detailed training materials, including simulation procedures that building operators can follow. These materials should

outline step-by-step instructions for testing the system under various conditions and making necessary adjustments.

- .2 Record-Keeping Protocols: Provide guidelines for maintaining thorough documentation of all training sessions, simulations, system adjustments, and performance data. This documentation should be structured for easy access and future reference during retro-commissioning.

3.3.5 The contractor shall carry the following:

- .1 Thoroughly instruct Facilities Manager in safe operation of systems and equipment after installation of Work.
- .2 Coordinate with Owner and arrange training program and schedule for instruction times. Submit training schedule to Owner and Cx Authority one week prior to training of each system.
- .3 Hire qualified service engineers and manufacturers' representatives to instruct Facilities Manager on specialized portions of installation, such as the following;
  - .1 Air Handling Units/Ventilation Systems
  - .2 Cooling systems
  - .3 Exhaust Air Systems
  - .4 Pumps
  - .5 VFD'S
  - .6 Electric Boiler
  - .7 Air Source Heat Pump System
  - .8 Radiant Slab System
  - .9 Building Automation System
  - .10 BAS Sequences of Operation
  - .11 Fire Protection systems
  - .12 Chemical treatment system
  - .13 Gas Monitoring (CO/Hydrogen)
  - .14 Refrigerant Detection
  - .15 Domestic Water Heaters
  - .16 Domestic Water Booster Pumps
  - .17 Life Safety Systems
  - .18 Security Systems
  - .19 Lighting Controls
  - .20 Electrical systems
  - .21 Fire alarm systems
  - .22 Power Distribution and Emergency Power.
  - .23 Audio Visual System

3.3.6 Submit to Cx Authority complete record of instructions as part of maintenance instructions and data book given. For each instructional period, include:

- .1 Date
- .2 System and equipment involved
- .3 Names of persons giving instructions
- .4 Names of persons being instructed
- .5 Other persons present.
- .6 Carry out training of staff and instruction of Facilities Manager within a period of 30 days.
- .7 Permit the Cx Authority and Owner usage of systems prior to Substantial Performance for testing and learning operational procedures.
- .8 At the end of training, obtain and submit to Commissioning Authority, signed statement of Facilities Manager stating they understand system and equipment installation, operation, and maintenance requirements.

#### 3.3.7 Training agendas

- .1 For each piece of equipment or system a written training agenda shall be provided by the contractors. The agenda shall cover the following elements:
  - .1 Equipment (included in training).
  - .2 Intended audience
  - .3 Location of training
  - .4 Objectives
  - .5 Subjects covered (description, duration of discussion, special methods, etc.)
  - .6 Duration of training on each subject
  - .7 Instructor for each subject
  - .8 Methods (classroom lecture, video, site walk-through, actual operational demonstrations, written handouts, etc.)
  - .9 Instructor and qualifications.

#### 3.3.8 Training process and content shall

- .1 As appropriate, normally start with classroom-type sessions followed by hands-on training on each piece of equipment, which shall illustrate the various modes of operation, including startup, shutdown, fire/smoke alarm, power failure, etc.
- .2 During any demonstration, should the system fail to perform in accordance with the requirements of the operation and maintenance (O&M) manuals or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.

- .3 Follow the outline in the table of contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.

3.3.9 Training Shall Include the Following:

- .1 Use of the printed installation, operation and maintenance instruction material included in the O&M manuals.
- .2 A review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover, as applicable, and any emergency procedures.
- .3 The Mechanical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not controlled by the central control system.
- .4 Discussion of relevant health and safety issues and concerns.
- .5 Discussion of warranties and guarantees.
- .6 Common troubleshooting and maintenance issues, problems and solutions.
- .7 Explanatory information included in the O&M manuals and the location of all related plans and manuals in the facility.
- .8 Discussion of any peculiarities of equipment installation or operation.
- .9 Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and preventative maintenance for all pieces of equipment.
- .10 Training shall occur after functional testing and piping and equipment labeling are complete.

**3.4 Acceptance Phase**

- 3.4.1 Satisfactory completion and documentation of the Commissioning Process Activities described in this specification shall be considered prerequisites for system acceptance.
- 3.4.2 At no time will acceptance be made for individual pieces of equipment. Final acceptance will only be for systems that will operate as intended in the basis of design and the design intent.

### 3.5 Occupied Phase

- 3.5.1 Cx Authority will return to site at 10 months into the 12-month period and review with facility staff the current building operation and condition of outstanding issues related to the original and seasonal commissioning.

## END OF SECTION

### EXHIBIT 01 91 00-1, COMMISSIONING PROCESS DEFINITIONS

Commissioning Authority (CxA): An independent person or firm retained by the owner and not otherwise associated with the Consultant team members or contracting team members. The CxA initiates the overall commissioning process and observes the tasks necessary to complete the commissioning process. The Contractor performs the duties associated with the commissioning for this Project.

Project Manager (PM): The contracting and managing authority for the Owner over the design and/or construction of the project.

Consultant: The prime consultant (architect) and/or sub-consultants who comprise the design team, generally the mechanical engineer and the electrical engineer.

Construction Manager (CM): The firm responsible for day-to-day overall management of the project, serving as the bridge between the Owner and the Prime Contractors.

Contractor's Commissioning Representative (CCR): An individual or a firm that is hired by the contractor to manage the contractor's commissioning process related activities.

Prime Contractor: Any Contractor contracted directly to the Owner and responsible for coordinating commissioning requirements the Sub-Contractors, vendors, suppliers, etc. contracted through the respective Prime Contractor.

Sub-Contractors: The subcontractors to the Contractor(s) or vendors who provide and/or install building components and systems.

Test Adjust and Balancing (TAB) Contractor: A Sub of the mechanical and/or piping contractor, responsible for the testing and balancing of the systems.

Vendor: Supplier of equipment.

Commissioning Team: Those people responsible for working together in carrying out the commissioning process.

Owner's project requirements (OPR) a written document that details the ideas, concepts, and criteria determined by the owner to be important to the success of the project

Basis of Design (BOD) the information necessary to accomplish the owner's project requirements, including system descriptions, indoor environmental quality criteria, design assumptions, and references to applicable codes, standards, regulations, and guidelines

Acceptance Phase: Final phase of the construction occurring after successful execution of all required Cx Procedures and Final Operational Testing during which

---

system installation and operation is demonstrated to the Owner and Authority Having Jurisdiction for the purposes of achieving occupancy and accreditation.

**Commissioning Plan:** A document developed by the CxA that provides the structure, schedule, coordination and planning for the commissioning process.

**Commissioning Report:** The document that records the results of the commissioning process, including the as-built performance of the MEP system and the CxA documents all sign-offs.

**Commissioning Specifications:** The contract document, that details the Contractor's role and responsibilities for execution of the commissioning (Cx) process.

**Contract Documents:** The documents binding on parties involved in the construction of this project (drawings, specifications, change orders, amendments, contracts, etc.)

**Debugging:** Prior to CxA Witness phase of Functional Testing, a procedure or process of operating component(s) and / or system(s) in accordance with the intent of the Project's Documents. Where "debugging" appears in the Contract Documents, it requires that failures, inconsistencies, and non-conforming items be corrected.

**Factory Testing:** Testing of equipment by the equipment manufacturer's personnel usually conducted at the manufacturer's factory or assembly plant. Factory testing may be witnessed by an Owner's representative and/or other members of the Cx Team prior to releasing the equipment for delivery to the job site.

**Integrated Systems Test (IST):** A series of procedures including Smoke Mode Procedures and Emergency System Procedures used to evaluate building-wide operation of tested systems under simulated fires and power failure conditions. During the IST's emphasis is placed on evaluating interactions between building systems and transition of building systems between different operating modes.

**Seasonal testing:** Functional checkouts that are deferred until the system(s) will experience conditions closer to their design conditions.

---

**APPENDIX 1 – COMMISSIONING PLAN**

# COMMISSIONING PLAN

## Dockstader PRPS Reporting Station

September 23<sup>rd</sup>, 2024

**CDML Primary Contact:** Jaime Carmichael  
Senior Commissioning Consultant

1	2024-09-23	<i>Issued for Tender</i>

## Executive Summary

The process of Commissioning is A quality-focused process for enhancing the delivery of a project. The process focuses on upon verifying and documenting that the facility and all its systems and assemblies are planned, designed, installed, tested, operated, and maintained to meet the Owner's Project Requirements

The purpose of this document is to identify the scope, strategies and responsibilities for all the team members within the commissioning process for each phase of the project. This document describes how the commissioning process will be undertaken construction, acceptance and warranty phases. However, the Quality Control and Quality Assurance for activates related to design or construction are the responsibility of the those contracted to perform these activities.

The Commissioning Plan outlines the process, procedures, and standards for all parties involved in the project.

The goals of the Commissioning Plan are to identify and define the following:

- ☐ Commissioning Team Members
- ☐ Commissioning Team Members responsibilities for each Phase activity of the commissioning process
- ☐ Commissioning process activities to be conducting during the construction, acceptance and warranty phase of the project
- ☐ Systems to be verified.
- ☐ Acceptance criteria for the completion of verification process.

The Commissioning Provider (CDML) is not responsible for design concept, design criteria, compliance with codes, design or general construction scheduling, site safety, cost estimating, or construction management. The Commissioning Provider (CDML) may assist with problem-solving or resolving nonconformance or deficiencies, but ultimately that responsibility resides with the general contractor and the design professionals.

9      CDML Commissioning Team .....14

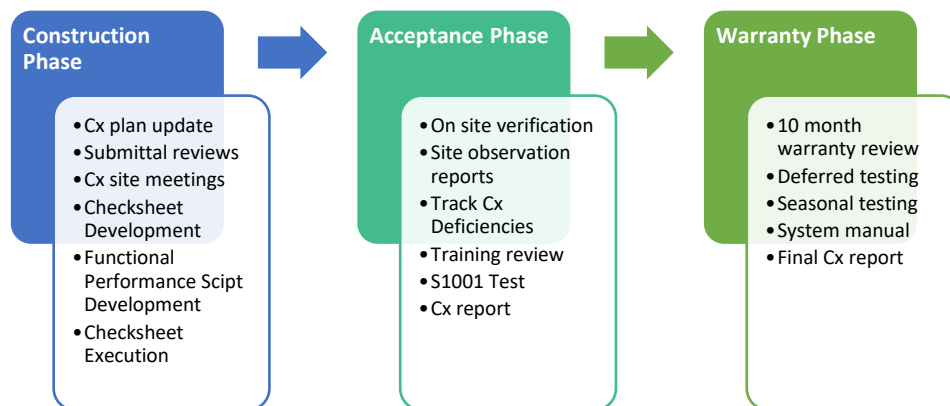

## 1 Introduction

CDML has been appointed as the independent Commissioning Authority for the Dockstader PRPS Reporting Station Project.

## 2 Overview

The commissioning plan's purpose is to define the scope of the project, outline CDML deliverables, and describe the assistance needed throughout the commissioning process. In addition, it provides major milestones and a definition of major tasks and load banks or other needs for the project.

The Commissioning Process Flowchart and Matrix graphically depicts the commissioning process and its flow from the Construction Phase through to the Warranty Phase.

### 2.1 Purpose of the Commissioning Plan

This plan does not provide a detailed explanation of testing procedures. The detailed testing requirements and procedures will be the pre-functional (construction) checklists, vendor startup forms and functional performance tests that will be developed with input from the design and construction teams. Final forms will be issued prior to equipment start-up and system testing.

Overview of the Commissioning Process to be executed on this project is as follows:

1. The Cx Plan has been written to define the process that is followed to ensure issues are found at the earliest timeframe in the project.
2. The process is intended to verify and document the facility systems function and interaction as intended. This will be accomplished through witnessing and documenting various tests to include:
  - a. Level 1 Factory Witness Test
  - b. Level 2 Installation and QA/QC inspections
  - c. Level 3 Startup tests
  - d. Level 4 Functional Performance Testing
  - e. Level 5 Integrated Systems Test

3. The Subcontractors and Vendors are responsible for the execution of the Commissioning process for level 2 and 3. Once these levels have been completed, CDML will start the Acceptance Phase of the project and complete Level 4 and Level 5.
4. Level 4 – Functional Performance Testing (FPT) starts after build issues have been closed. CDML performs the requires tests on the individual pieces of equipment / systems during this phase.
5. A major component of the commissioning process is the Integrated Systems Test (IST). This phase of commissioning is intended to verify that the emergency and redundant systems, will perform appropriately when called upon. The IST will be conducted after all factory and field component/system quality control, start-up, and test procedures have been completed. The goal of this testing is to verify the operation, proper interdependencies, redundancies, and fail-safe operation of all critical systems. IST is performed by CDML once commissioning issues are closed or determined that they will need to be pushed to Turnover Issues.

## 2.2 Overall Commissioning Scope

Commissioning is a systematic process of ensuring that all building systems perform interactively according to the design intent and the Owner's operational needs. Commissioning begins during the design and owner/design requirement phase reviews, and continues through construction, acceptance testing and then field-verification of the functional performance of the various electrical and mechanical components and systems.

Commissioning during the construction of this Project is intended to achieve the following specific objectives according to Contract Documents.

- Ensuring that equipment and systems are installed per project requirements and receive the required operational checkout by installing contractors and vendors.
- Verify and document proper functional performance and alarm reporting of the equipment and systems.

In general, CDML commissioning scope includes the following systems for the Dockstader PRPS Reporting Station (Note a greater breakdown of included Systems & Equipment will be built into the Commissioning Platform Cx Alloy (described further in this plan)):

- Elevator
- Fire Protection
- Plumbing & HVAC & BMS
  - Domestic Water
  - Domestic Hot Water
  - Sanitary Plumbing
  - Compressed Air
  - HVAC
  - Heating Systems
  - Cooling Systems
  - Natural Ventilation Systems
  - Environmental Monitoring Systems
- Electrical
  - Grounding
  - Electrical Distribution – General, Life Safety & Non-Life Safety
  - Digital Power Metering

- Lighting Control
  - EV Charging
  - Lightning Protection
  - Emergency Lighting
- Communications
  - Cabling, Racks, Rooms & Environment
  - Audio Visual
- Security & Safety
  - Access Control
  - Intercom
  - Video Surveillance
  - Fire Alarm
  - Panic / Duress Systems

## 2.3 Commissioning Roles

General descriptions of the commissioning roles are as follows:

<b>CxA (CDML):</b>	Coordinates the commissioning process including schedules and load bank plans, performs site observation visits, writes test procedures, oversees and documents performance tests, identifies and describes functional deficiencies, tracks and verifies resolution of deficiencies, and documents commissioning results throughout.
<b>Owner (ROP):</b>	Participates in the commissioning process and assist in design and operational discussions and discrepancy resolution as needed.
<b>GC (tbd):</b>	Facilitates the commissioning process, ensures that Subs perform their responsibilities, and integrates commissioning into the construction process and schedule.
<b>Sub-Contractors (tbd):</b>	Demonstrate proper system performance, provide labor, material, and equipment support throughout the commissioning process (may be performed by GC). Respond to issues and correct deficiencies as found.
<b>Eng/Arch (DSAI &amp; Project Partners):</b>	Provides Basis of Design documentation, sequences of operation, performs construction observations, reviews testing procedures and load bank plans for their ability to demonstrate design intent and achievement of performance criteria, approves O&M manual materials, and assist in resolving design questions and other operational and technical issues.
<b>Mfr. / Vendors:</b>	Provides documentation to facilitate the commissioning work including specified O&M data, sequences of operation and factory test results. Performs contracted startup, ongoing commissioning support and follow-up/warranty support throughout commissioning. Responds to issues and provides factory and field support, as need to correct deficiencies as found.

## 2.4 Responsibility Matrix

The following matrix tabulates the major commissioning process activities when they occur during the project and the commissioning team member roles and responsibilities for each activity. Additional details on each activity is detailed further in this document.

<b>R:</b>	Responsible	<b>A:</b>	Assist	<b>REV:</b>	Review/Comment	<b>AA:</b>	Accept/Approve
-----------	-------------	-----------	--------	-------------	----------------	------------	----------------

### 3 Design Phase Activities

#### 3.1 Design Reviews

CDML will review the Pre-Tender set of design specifications and drawings with the OPR and review from a perspective of:

- Errors and Omissions
- Good Engineering Practice
- The ability to test systems and equipment
- Accessibility and maintainability

CDML is not responsible for the design concept, design criteria or compliance with codes.

Design reviews will be issued in detailing the drawing/specification reviewed, the issue noted and the relevant commissioning team member that a response is required from. Issues resolution will be tracked until a satisfactory response is received.

### 4 Construction Phase Activities

#### 4.1 Construction Schedule

The General Contractor (GC) will provide the construction date milestones to the commissioning team so a commissioning schedule can be developed based on the construction schedule. The GC will work with CDML to incorporate the commissioning schedule into the construction schedule so both the construction and Acceptance Phase of commissioning meets the requirements of overall delivery schedule.

#### 4.2 Commissioning Scripts

Commissioning Scripts are tests and inspections that shall be used during the Construction and Acceptance Phases of commissioning. Commissioning Scripts shall be written in accordance with this commissioning plan. CDML will provide the Commissioning Scripts that are used during Levels 1 to 3 commissioning (Construction **Checklists** – See Below). CDML is responsible for the development of the Commissioning Scripts that are used during Levels 4 & 5 commissioning (Functional Performance **Tests**). All scripts shall be approved prior to use. As required, CDML will update the scripts with the comments and resubmit for final approval.

Commissioning tasks are not considered closed or complete until all of the required paperwork, reports, pictures, issues and test results have been provided to CDML.

##### 4.2.1 Construction Checklists

Construction checklists are important to verify that the equipment and systems are installed, energized and operational and that the contractor's functional performance testing may proceed. Each piece of equipment receives full QA/QC checkout by the contractor. No sampling strategies are used. In general, the contractor will complete construction checklists for all equipment and systems prior to formal functional performance testing of equipment or subsystems of the given system. The checklists will be monitored by the Commissioning Team and CDML during the construction phase.

CDML will provide the Construction checklists in electronic format for the project via CxAlloy. They detail installation and start-up check that should be reviewed on each piece of equipment. These sheets also detail the pre-requisites for functional performance testing.

### **4.3 Commissioning Meetings**

Commissioning (Cx) team meetings are essential to maintain the progress of the project and the momentum of the commissioning process. A kick-off meeting is conducted by CDML where the commissioning process is reviewed with the commissioning team members. Additional meetings will be required throughout construction, scheduled by CDML with necessary parties attending, to plan, scope, coordinate, schedule and review future activities and resolve problems. Frequency will vary throughout the construction as the Commissioning process requirements vary depending on what is happening on the construction site. Team members at meetings must be authorized to make commitments and decisions for their respective parties.

### **4.4 M&E Shop Drawing Reviews**

Review comments will focus on compliance with the OPR, integration coordination, accessibility and maintainability, O&M training and documentation requirements, and the ability to test and validate system operation. CDML requires access to all approved submittals after processing by the Design Team.

CDML will provide comments to the relevant design team per agreed communications protocol. The design team will consider the commissioning related comment(s).

### **4.5 Independent Electrical Testing Review**

A Third Party Electrical Testing Agent will be hired to perform all of the necessary electrical testing to include LV Cable meggering and torque verification, transformer testing, Protection relay testing, circuit breaker testing, earth resistivity, electrical equipment inspection, meter testing, and ground testing. An Electrical Testing Plan will be developed based on NETA ATS standard and submitted to CDML for review and approval. CDML will review the Independent Electrical Testing submittal and test forms to ensure all the proper tests will be completed and once the testing is complete CDML will review the final results to ensure all tests were completed correctly.

### **4.6 Equipment Start-up**

The General Contractor shall coordinate equipment and systems start-ups with their mechanical and electrical sub-contractors and their sub-trades such as controls, sheet-metal, fire alarm and the air/ water balancers. Sufficient notice for contractor, sub-contractors, equipment manufactures, and contractors testing agencies to plan, and coordinate work must be provided. CDML may attend equipment start up at our own discretion or as per CDML's contract scope.

The contractor shall submit start up procedures, data sheets and recording forms for review, a minimum of four weeks prior to execution of the start-up verification process. The start-up checklists shall be in the form supplied by the manufacturer or, if not available, they must record all necessary setting and checks conducted at start up to satisfy the manufactures warranty.

Issues noted during start up can be tracked on the commissioning issues log and addressed by the relative contractor for the start up to be deemed complete.

The Sub-Contractors and their manufacturers, suppliers or testing agencies shall provide all instrumentation and equipment necessary to conduct the tests. The Contractor shall advise the Engineer's Representatives or CDML of instrumentation to be used and the dates the instruments were calibrated and provide calibration certificates.

When the General Contractor has tested confirmed that the systems are operating and controlling per the design intent, and all prerequisites have been completed then functional performance verification/testing can be scheduled and coordinated with the parties referenced above, CDML, the Owner and Consultants.

## **5 Acceptance / Commissioning Phase**

### **5.1 Commissioning Schedule (Level 4 & 5)**

CDML will develop a commissioning schedule with tasks and deliverables to complete the commissioning process. The Schedule will be a living document and will be monitored throughout the project. At times commissioning includes some simultaneous electrical and mechanical testing, however daily coordination will occur to work together to fully execute the test scripts.

### **5.2 Testing and Balance Review**

The TAB Contractor will prepare a balancing report documenting that all air and hydronic systems have been adjusted and are within acceptable design values. CDML may carry accuracy check of the flowrates, after the Mechanical Engineer of Record reviewed and accepted the report. This check of accuracy will be conducted in conjunction with the TAB contractors using their instruments. CDML will verify that all required data has been collected, that the measured results follow the design documents, and that any non-compliance items have been resolved and rebalanced prior to the start of functional performance testing.

### **5.3 Pre-Requisites for Functional Performance Testing (Level 4)**

The following pre-requisite items are required prior to the start of functional performance testing (Level 4). In all cases documentation should be available for review in advance of the start of Level 4 commissioning.

1. The installing contractor has completed verification of installation of equipment per drawings, specifications and submittals.
2. The de-energized electrical testing and documentation has been completed.
3. The pre-energization steps and checklists were completed prior to energization.
4. The responsible startup personnel have completed startup of equipment per their requirements and/or project specifications.
5. Test and Balance has been completed on hydronic and air systems and preliminary reports are available for review.
6. The electrical and mechanical device/control contractors have tested their automation systems to verify proper control and alarm interface with related external systems and confirm operation per published sequences and/or specifications.
7. Equipment interfaces with BMS and/or EPMS systems have been verified and documentation is available for review.

### **5.4 Level 4 – Equipment, Subsystem and System Commissioning**

The purpose of the Functional Performance Testing (FPT) is to assure that all work has been complete as specified and that the systems are functional in the manner intended. CDML is responsible for the execution during Level 4 and the GC, Sub Trades and Vendors shall provide CDML with the required support to allow a successful completion of Level 4 Functional Performance Testing. During the level 4 testing, the GC will provide load banks and the sub trades will install.

Level 4 Functional Performance Testing Scripts will include;

1. The verification that all control system's sequences of operation (SOO) including failure scenarios meet the project and operational requirements. The system components will be checked to verify that they are responding in accordance with the SOO.
2. Verify interface with the site building automation and electrical power monitoring systems.
3. Performance parameters of the system will be verified at various operation conditions and load levels

FPT will be conducted as many times as necessary to successfully demonstrate to the satisfaction of CDML that the specified design criteria have been achieved. After a failure to a piece of equipment, the repair may require some or all of the test script to be repeated.

Testing will include testing for all modes of operation, maintenance, failure modes, capacity tests, recovery tests, and reporting and annunciation of alarms and abnormal conditions. All alarm and monitoring points shall be verified.

Acceptance testing procedures include the following;

1. Software Verification
2. Test and Commissioning of all graphic (EPMS, BAS) systems.
3. Building Automation System (BAS) and Electrical Power Monitoring System (EPMS) servers must be available for Level 4 FPTs. Under no circumstances can Level 4 testing commence without the permanent servers, networks & network switches & workstations in place & operational.
4. Level 4 Functional Performance Test must be done with the EPMS/BAS networks in their final configurations, on permanent servers, switches & networks. The associated workstations must be in place for the FPT.
5. CDML will properly record all tests and submit organized data and test documents after the tests have been performed.

CDML will provide level 4 commissioning scripts in advance of testing for review.

## **5.5 Commissioning Issues Log**

During construction phase CDML will document commissioning related issues on CxAlloy under Construction Issues. These issues will be distributed by CDML to the Commissioning Team. The Commissioning Team is expected to implement the necessary secondary circulation as necessary for resolution. The Construction Managers Cx Coordinator and CDML will track all issues raised to verify that they are dealt with in a timely manner and will circulate regular status reports to all members of the Commissioning Team.

During the Acceptance Phase, deficiencies identified during the verification and testing will be documented and reported to the Owner and commissioning team.

The issues log report will include all details of the components or systems found to be non-compliant with the parameters of the test plans. The report details the responsible party(s) required to comment/address the item raised.

## 5.6 Project Tracking

The project tracking will be done via CxAlloy a cloud-based program. This will consist of listing of all mechanical and electrical equipment to be tested as part of the project and the status of each piece of equipment. Once steps are completed the system/equipment is then considered verified.

## 5.7 Level 5 – Integrated Systems Testing - Overview

The purpose of an Integrated System Testing (IST) is to verify that the installation of the equipment and systems has been completed and complies with the Basis of Design and Owner's Requirements. The IST shall test the facility and how the interaction of other systems effects the overall operation of the facility. During this testing various operational and failure mode testing shall be completed. Some tests may be repeated from previous levels since this is the first time the complete facility is operating at its designed load as a complete system and the interaction of these systems may need to be observed.

The facility is to be in a turn over state with all installation, testing, issues and final cleaning completed prior to the IST. All issues are to be corrected and tested prior to the IST. The IST will be done in a turn over state. Once the IST is completed all settings, switches, valves and breaker set to their normal operational mode, then the site will be in the position where it can be turned over to Operations.

### **Integration Systems Test Scripts Include:**

1. CDML will develop Integrated Systems Test (IST) scripts that simultaneously validate the interdependency of each commissioned system during various facility events.
2. IST will prove the facility is capable of properly operating, recovering and maintaining environmental space conditions.
3. IST shall be conducted as many times as necessary to successfully demonstrate to the satisfaction of the EoR and CDML that the specified design criteria have been achieved. In some cases, a failure of a test and the repair of that failure may require the complete or partial steps of the IST to be repeated.

### **Level 5 – IST Process includes:**

1. Confirmation the facility is prepared for the IST testing by verifying and documenting the following;
  - a. All Level 4 test are completed successfully and closed.
  - b. All related Issues on the Cx Issues Log are completed and closed.
  - c. Site is completed and clean per the IST requirements.
  - d. The IST shall include performance and dynamic testing of individual and interdependent systems and address the following categories.
    - i. Battery and utility failure mode
    - ii. Operating modes to be tested and will include
      1. Loss of utility
      2. Return of utility source
      3. Manual modes
      4. Automatic modes
  - e. Verify upon transfer to standby generator all operating parameters to be within accepted ratings.
  - f. Radio communication will be established and protocol amongst testing personnel.

- g. This level of commissioning demonstrates how the site infrastructure, such as generators, HVAC units/systems and life-safety and other systems will likely perform as a system over the next 60 months.

## 5.8 Integrated Systems Testing of Fire Protection and Life Safety Systems (S1001)

The purpose of this Fire Protection and Life Safety Systems Integrated System Testing (IST) is to validate and document that the integrated operation/actions between the architectural, electrical, mechanical, systems and equipment react to life safety systems per the design intent.

The intent of this script is to verify proper operation of the current build. The tasks and tests contained in this script are to be performed after substantial completion of Vendor / Contractor executed Level 3 Commissioning (Equipment Start-up / Testing) and the CxA executed Level 4 Commissioning (Functional Performance Testing). Substantial completion of these phases in the commissioning process have verified that individual components, apparatus, subsystems and systems are deemed functional and ready for operation. During the performance of this script, evaluations of each system's performance will be made during and after each test procedure with respect to a systems' interface with other systems during the test procedure.

## 6 Turnover Activities

### 6.1 Operation and Maintenance Manual Reviews

As part of the commissioning process, CDML will review the O&M manual content to verify compliance with the OPR and Specifications. As required review comments will be issued to the relevant design team member per the agreed communications protocol. The Design team will incorporate the commissioning comments, at their discretion.

### 6.2 Training Plan

To achieve successful Operations & Maintenance (O&M) training delivery, CDML will be requesting that the General Contractor and the Sub trades develop a training plan that defines the roles and responsibilities of the project's Construction team, Subcontractors, Suppliers, Design Consultant, and end user as they relate to the training. The plan will include a schedule of training dates, agenda, times, locations, training provider and durations.

#### Common Training Topics – Building Operators

- General purpose of this system or equipment. What it serves.
- Important safety features and procedures
- Review of control drawings and schematics (have copies for attendees)
- Review of O&M Manuals, illustrating where verbal training information is found in writing (have copies for attendees)
- Startup, loading, normal operation, unloading, shutdown, unoccupied operation, seasonal changeover, etc., as applicable
- Integral controls (packaged): programming, troubleshooting, alarms, manual operation

### Common Training Topics – Building Operators

- Building automation controls (BAS): programming, troubleshooting, alarms, manual operation, interface with integral controls
- Interactions with other systems, operation during power outage and fire
- Relevant health and safety issues and concerns and special safety features
- Energy conserving operation and strategies
- Any special issues to maintain warranty
- Common troubleshooting issues and methods, control system warnings and error messages, including using the control system for diagnostics
- Special requirements of tenants for this equipment’s function
- Service, maintenance, and preventative maintenance (sources, spare parts inventory, special tools, etc.)
- Continuous system monitoring, including data logging, performance analysis, and periodic retro-commissioning.
- System behavior under different environmental conditions
- Emergency response to handle sudden changes in environmental conditions

### Common Training Topics – Occupants

- Impact of occupants’ actions on HVAC system performance and energy efficiency. Guidelines on optimal use of the system.
- Indoor Environmental Quality Awareness: the importance of maintaining good indoor air quality and how the HVAC system’s automatic functions
- Using feedback mechanisms to report comfort levels and system performance issues.

## 7 Warranty Phase Activities

### 7.1 Deferred / Seasonal Testing

Functional Performance Tests (FPTs) may need to be deferred until after Substantial Completion for a variety of reasons. The most common reasons include HVAC systems may need to have different weather conditions than those at the end of construction or verified systems may need to have a load put on them before testing can be considered meaningful. FPTs that occur after Substantial Completion will be conducted, documented, and tracked during the warranty phase.

#### 7.1.1 Unforeseen Deferred Tests

If any test cannot be completed due to the building structure, required occupancy condition, or other deficiency, the functional testing may be delayed upon approval of the owner. These tests are conducted in the same manner as the seasonal tests, as soon as possible.

### 7.1.2 Seasonal Testing

Seasonal variation in operations or control strategies may require additional testing during the opposite season to verify performance of the HVAC system and controls in heating or cooling mode. Trends set up during the acceptance phase testing will be reviewed. Tests are executed and documented, with deficiencies corrected by the appropriate contractors. Any final adjustments to the O&M manuals and as-built drawings due to the testing are also completed.

## 8 Final Commissioning Report

After completion of all commissioning activities, CDML will write a final report documenting the overall results of the commissioning process and recommending acceptance of the commissioning process and related documentation to the owner.

The final commissioning report will include an overview or summary of the commissioning process, signed off functional tests, the final commissioning issues log and resolutions, commissioning progress and field reports, a deferred testing log, an unresolved issues log, a lessons-learned evaluation, and concluding with a recommendation to accept the process as complete.

1	2024-09-23	<i>Issued for Tender</i>

## Executive Summary

The process of Commissioning is A quality-focused process for enhancing the delivery of a project. The process focuses on upon verifying and documenting that the facility and all its systems and assemblies are planned, designed, installed, tested, operated, and maintained to meet the Owner's Project Requirements

The purpose of this document is to identify the scope, strategies and responsibilities for all the team members within the commissioning process for each phase of the project. This document describes how the commissioning process will be undertaken construction, acceptance and warranty phases. However, the Quality Control and Quality Assurance for activates related to design or construction are the responsibility of the those contracted to perform these activities.

The Commissioning Plan outlines the process, procedures, and standards for all parties involved in the project.

The goals of the Commissioning Plan are to identify and define the following:

- ☐ Commissioning Team Members
- ☐ Commissioning Team Members responsibilities for each Phase activity of the commissioning process
- ☐ Commissioning process activities to be conducting during the construction, acceptance and warranty phase of the project
- ☐ Systems to be verified.
- ☐ Acceptance criteria for the completion of verification process.

The Commissioning Provider (CDML) is not responsible for design concept, design criteria, compliance with codes, design or general construction scheduling, site safety, cost estimating, or construction management. The Commissioning Provider (CDML) may assist with problem-solving or resolving nonconformance or deficiencies, but ultimately that responsibility resides with the general contractor and the design professionals.

9      CDML Commissioning Team .....14

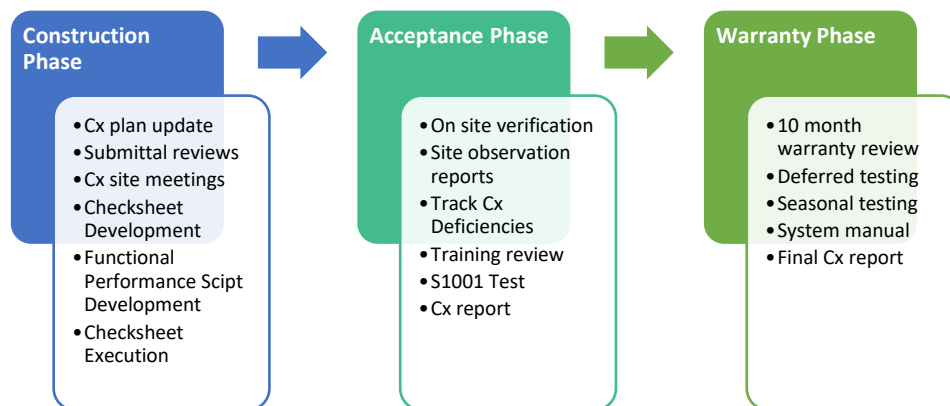

## 1 Introduction

CDML has been appointed as the independent Commissioning Authority for the Dockstader PRPS Reporting Station Project.

## 2 Overview

The commissioning plan's purpose is to define the scope of the project, outline CDML deliverables, and describe the assistance needed throughout the commissioning process. In addition, it provides major milestones and a definition of major tasks and load banks or other needs for the project.

The Commissioning Process Flowchart and Matrix graphically depicts the commissioning process and its flow from the Construction Phase through to the Warranty Phase.

### 2.1 Purpose of the Commissioning Plan

This plan does not provide a detailed explanation of testing procedures. The detailed testing requirements and procedures will be the pre-functional (construction) checklists, vendor startup forms and functional performance tests that will be developed with input from the design and construction teams. Final forms will be issued prior to equipment start-up and system testing.

Overview of the Commissioning Process to be executed on this project is as follows:

1. The Cx Plan has been written to define the process that is followed to ensure issues are found at the earliest timeframe in the project.
2. The process is intended to verify and document the facility systems function and interaction as intended. This will be accomplished through witnessing and documenting various tests to include:
  - a. Level 1 Factory Witness Test
  - b. Level 2 Installation and QA/QC inspections
  - c. Level 3 Startup tests
  - d. Level 4 Functional Performance Testing
  - e. Level 5 Integrated Systems Test

3. The Subcontractors and Vendors are responsible for the execution of the Commissioning process for level 2 and 3. Once these levels have been completed, CDML will start the Acceptance Phase of the project and complete Level 4 and Level 5.
4. Level 4 – Functional Performance Testing (FPT) starts after build issues have been closed. CDML performs the requires tests on the individual pieces of equipment / systems during this phase.
5. A major component of the commissioning process is the Integrated Systems Test (IST). This phase of commissioning is intended to verify that the emergency and redundant systems, will perform appropriately when called upon. The IST will be conducted after all factory and field component/system quality control, start-up, and test procedures have been completed. The goal of this testing is to verify the operation, proper interdependencies, redundancies, and fail-safe operation of all critical systems. IST is performed by CDML once commissioning issues are closed or determined that they will need to be pushed to Turnover Issues.

## 2.2 Overall Commissioning Scope

Commissioning is a systematic process of ensuring that all building systems perform interactively according to the design intent and the Owner's operational needs. Commissioning begins during the design and owner/design requirement phase reviews, and continues through construction, acceptance testing and then field-verification of the functional performance of the various electrical and mechanical components and systems.

Commissioning during the construction of this Project is intended to achieve the following specific objectives according to Contract Documents.

- Ensuring that equipment and systems are installed per project requirements and receive the required operational checkout by installing contractors and vendors.
- Verify and document proper functional performance and alarm reporting of the equipment and systems.

In general, CDML commissioning scope includes the following systems for the Dockstader PRPS Reporting Station (Note a greater breakdown of included Systems & Equipment will be built into the Commissioning Platform Cx Alloy (described further in this plan)):

- Elevator
- Fire Protection
- Plumbing & HVAC & BMS
  - Domestic Water
  - Domestic Hot Water
  - Sanitary Plumbing
  - Compressed Air
  - HVAC
  - Heating Systems
  - Cooling Systems
  - Natural Ventilation Systems
  - Environmental Monitoring Systems
- Electrical
  - Grounding
  - Electrical Distribution – General, Life Safety & Non-Life Safety
  - Digital Power Metering

- Lighting Control
  - EV Charging
  - Lightning Protection
  - Emergency Lighting
- Communications
  - Cabling, Racks, Rooms & Environment
  - Audio Visual
- Security & Safety
  - Access Control
  - Intercom
  - Video Surveillance
  - Fire Alarm
  - Panic / Duress Systems

## 2.3 Commissioning Roles

General descriptions of the commissioning roles are as follows:

<b>CxA (CDML):</b>	Coordinates the commissioning process including schedules and load bank plans, performs site observation visits, writes test procedures, oversees and documents performance tests, identifies and describes functional deficiencies, tracks and verifies resolution of deficiencies, and documents commissioning results throughout.
<b>Owner (ROP):</b>	Participates in the commissioning process and assist in design and operational discussions and discrepancy resolution as needed.
<b>GC (tbd):</b>	Facilitates the commissioning process, ensures that Subs perform their responsibilities, and integrates commissioning into the construction process and schedule.
<b>Sub-Contractors (tbd):</b>	Demonstrate proper system performance, provide labor, material, and equipment support throughout the commissioning process (may be performed by GC). Respond to issues and correct deficiencies as found.
<b>Eng/Arch (DSAI &amp; Project Partners):</b>	Provides Basis of Design documentation, sequences of operation, performs construction observations, reviews testing procedures and load bank plans for their ability to demonstrate design intent and achievement of performance criteria, approves O&M manual materials, and assist in resolving design questions and other operational and technical issues.
<b>Mfr. / Vendors:</b>	Provides documentation to facilitate the commissioning work including specified O&M data, sequences of operation and factory test results. Performs contracted startup, ongoing commissioning support and follow-up/warranty support throughout commissioning. Responds to issues and provides factory and field support, as need to correct deficiencies as found.

## 2.4 Responsibility Matrix

The following matrix tabulates the major commissioning process activities when they occur during the project and the commissioning team member roles and responsibilities for each activity. Additional details on each activity is detailed further in this document.

<b>R:</b>	Responsible	<b>A:</b>	Assist	<b>REV:</b>	Review/Comment	<b>AA:</b>	Accept/Approve

### 3 Design Phase Activities

#### 3.1 Design Reviews

CDML will review the Pre-Tender set of design specifications and drawings with the OPR and review from a perspective of:

- Errors and Omissions
- Good Engineering Practice
- The ability to test systems and equipment
- Accessibility and maintainability

CDML is not responsible for the design concept, design criteria or compliance with codes.

Design reviews will be issued in detailing the drawing/specification reviewed, the issue noted and the relevant commissioning team member that a response is required from. Issues resolution will be tracked until a satisfactory response is received.

### 4 Construction Phase Activities

#### 4.1 Construction Schedule

The General Contractor (GC) will provide the construction date milestones to the commissioning team so a commissioning schedule can be developed based on the construction schedule. The GC will work with CDML to incorporate the commissioning schedule into the construction schedule so both the construction and Acceptance Phase of commissioning meets the requirements of overall delivery schedule.

#### 4.2 Commissioning Scripts

Commissioning Scripts are tests and inspections that shall be used during the Construction and Acceptance Phases of commissioning. Commissioning Scripts shall be written in accordance with this commissioning plan. CDML will provide the Commissioning Scripts that are used during Levels 1 to 3 commissioning (Construction **Checklists** – See Below). CDML is responsible for the development of the Commissioning Scripts that are used during Levels 4 & 5 commissioning (Functional Performance **Tests**). All scripts shall be approved prior to use. As required, CDML will update the scripts with the comments and resubmit for final approval.

Commissioning tasks are not considered closed or complete until all of the required paperwork, reports, pictures, issues and test results have been provided to CDML.

##### 4.2.1 Construction Checklists

Construction checklists are important to verify that the equipment and systems are installed, energized and operational and that the contractor's functional performance testing may proceed. Each piece of equipment receives full QA/QC checkout by the contractor. No sampling strategies are used. In general, the contractor will complete construction checklists for all equipment and systems prior to formal functional performance testing of equipment or subsystems of the given system. The checklists will be monitored by the Commissioning Team and CDML during the construction phase.

CDML will provide the Construction checklists in electronic format for the project via CxAlloy. They detail installation and start-up check that should be reviewed on each piece of equipment. These sheets also detail the pre-requisites for functional performance testing.

### **4.3 Commissioning Meetings**

Commissioning (Cx) team meetings are essential to maintain the progress of the project and the momentum of the commissioning process. A kick-off meeting is conducted by CDML where the commissioning process is reviewed with the commissioning team members. Additional meetings will be required throughout construction, scheduled by CDML with necessary parties attending, to plan, scope, coordinate, schedule and review future activities and resolve problems. Frequency will vary throughout the construction as the Commissioning process requirements vary depending on what is happening on the construction site. Team members at meetings must be authorized to make commitments and decisions for their respective parties.

### **4.4 M&E Shop Drawing Reviews**

Review comments will focus on compliance with the OPR, integration coordination, accessibility and maintainability, O&M training and documentation requirements, and the ability to test and validate system operation. CDML requires access to all approved submittals after processing by the Design Team.

CDML will provide comments to the relevant design team per agreed communications protocol. The design team will consider the commissioning related comment(s).

### **4.5 Independent Electrical Testing Review**

A Third Party Electrical Testing Agent will be hired to perform all of the necessary electrical testing to include LV Cable meggering and torque verification, transformer testing, Protection relay testing, circuit breaker testing, earth resistivity, electrical equipment inspection, meter testing, and ground testing. An Electrical Testing Plan will be developed based on NETA ATS standard and submitted to CDML for review and approval. CDML will review the Independent Electrical Testing submittal and test forms to ensure all the proper tests will be completed and once the testing is complete CDML will review the final results to ensure all tests were completed correctly.

### **4.6 Equipment Start-up**

The General Contractor shall coordinate equipment and systems start-ups with their mechanical and electrical sub-contractors and their sub-trades such as controls, sheet-metal, fire alarm and the air/ water balancers. Sufficient notice for contractor, sub-contractors, equipment manufactures, and contractors testing agencies to plan, and coordinate work must be provided. CDML may attend equipment start up at our own discretion or as per CDML's contract scope.

The contractor shall submit start up procedures, data sheets and recording forms for review, a minimum of four weeks prior to execution of the start-up verification process. The start-up checklists shall be in the form supplied by the manufacturer or, if not available, they must record all necessary setting and checks conducted at start up to satisfy the manufactures warranty.

Issues noted during start up can be tracked on the commissioning issues log and addressed by the relative contractor for the start up to be deemed complete.

The Sub-Contractors and their manufacturers, suppliers or testing agencies shall provide all instrumentation and equipment necessary to conduct the tests. The Contractor shall advise the Engineer's Representatives or CDML of instrumentation to be used and the dates the instruments were calibrated and provide calibration certificates.

When the General Contractor has tested confirmed that the systems are operating and controlling per the design intent, and all prerequisites have been completed then functional performance verification/testing can be scheduled and coordinated with the parties referenced above, CDML, the Owner and Consultants.

## **5 Acceptance / Commissioning Phase**

### **5.1 Commissioning Schedule (Level 4 & 5)**

CDML will develop a commissioning schedule with tasks and deliverables to complete the commissioning process. The Schedule will be a living document and will be monitored throughout the project. At times commissioning includes some simultaneous electrical and mechanical testing, however daily coordination will occur to work together to fully execute the test scripts.

### **5.2 Testing and Balance Review**

The TAB Contractor will prepare a balancing report documenting that all air and hydronic systems have been adjusted and are within acceptable design values. CDML may carry accuracy check of the flowrates, after the Mechanical Engineer of Record reviewed and accepted the report. This check of accuracy will be conducted in conjunction with the TAB contractors using their instruments. CDML will verify that all required data has been collected, that the measured results follow the design documents, and that any non-compliance items have been resolved and rebalanced prior to the start of functional performance testing.

### **5.3 Pre-Requisites for Functional Performance Testing (Level 4)**

The following pre-requisite items are required prior to the start of functional performance testing (Level 4). In all cases documentation should be available for review in advance of the start of Level 4 commissioning.

1. The installing contractor has completed verification of installation of equipment per drawings, specifications and submittals.
2. The de-energized electrical testing and documentation has been completed.
3. The pre-energization steps and checklists were completed prior to energization.
4. The responsible startup personnel have completed startup of equipment per their requirements and/or project specifications.
5. Test and Balance has been completed on hydronic and air systems and preliminary reports are available for review.
6. The electrical and mechanical device/control contractors have tested their automation systems to verify proper control and alarm interface with related external systems and confirm operation per published sequences and/or specifications.
7. Equipment interfaces with BMS and/or EPMS systems have been verified and documentation is available for review.

### **5.4 Level 4 – Equipment, Subsystem and System Commissioning**

The purpose of the Functional Performance Testing (FPT) is to assure that all work has been complete as specified and that the systems are functional in the manner intended. CDML is responsible for the execution during Level 4 and the GC, Sub Trades and Vendors shall provide CDML with the required support to allow a successful completion of Level 4 Functional Performance Testing. During the level 4 testing, the GC will provide load banks and the sub trades will install.

Level 4 Functional Performance Testing Scripts will include;

1. The verification that all control system's sequences of operation (SOO) including failure scenarios meet the project and operational requirements. The system components will be checked to verify that they are responding in accordance with the SOO.
2. Verify interface with the site building automation and electrical power monitoring systems.
3. Performance parameters of the system will be verified at various operation conditions and load levels

FPT will be conducted as many times as necessary to successfully demonstrate to the satisfaction of CDML that the specified design criteria have been achieved. After a failure to a piece of equipment, the repair may require some or all of the test script to be repeated.

Testing will include testing for all modes of operation, maintenance, failure modes, capacity tests, recovery tests, and reporting and annunciation of alarms and abnormal conditions. All alarm and monitoring points shall be verified.

Acceptance testing procedures include the following;

1. Software Verification
2. Test and Commissioning of all graphic (EPMS, BAS) systems.
3. Building Automation System (BAS) and Electrical Power Monitoring System (EPMS) servers must be available for Level 4 FPTs. Under no circumstances can Level 4 testing commence without the permanent servers, networks & network switches & workstations in place & operational.
4. Level 4 Functional Performance Test must be done with the EPMS/BAS networks in their final configurations, on permanent servers, switches & networks. The associated workstations must be in place for the FPT.
5. CDML will properly record all tests and submit organized data and test documents after the tests have been performed.

CDML will provide level 4 commissioning scripts in advance of testing for review.

## **5.5 Commissioning Issues Log**

During construction phase CDML will document commissioning related issues on CxAlloy under Construction Issues. These issues will be distributed by CDML to the Commissioning Team. The Commissioning Team is expected to implement the necessary secondary circulation as necessary for resolution. The Construction Managers Cx Coordinator and CDML will track all issues raised to verify that they are dealt with in a timely manner and will circulate regular status reports to all members of the Commissioning Team.

During the Acceptance Phase, deficiencies identified during the verification and testing will be documented and reported to the Owner and commissioning team.

The issues log report will include all details of the components or systems found to be non-compliant with the parameters of the test plans. The report details the responsible party(s) required to comment/address the item raised.

## 5.6 Project Tracking

The project tracking will be done via CxAlloy a cloud-based program. This will consist of listing of all mechanical and electrical equipment to be tested as part of the project and the status of each piece of equipment. Once steps are completed the system/equipment is then considered verified.

## 5.7 Level 5 – Integrated Systems Testing - Overview

The purpose of an Integrated System Testing (IST) is to verify that the installation of the equipment and systems has been completed and complies with the Basis of Design and Owner's Requirements. The IST shall test the facility and how the interaction of other systems effects the overall operation of the facility. During this testing various operational and failure mode testing shall be completed. Some tests may be repeated from previous levels since this is the first time the complete facility is operating at its designed load as a complete system and the interaction of these systems may need to be observed.

The facility is to be in a turn over state with all installation, testing, issues and final cleaning completed prior to the IST. All issues are to be corrected and tested prior to the IST. The IST will be done in a turn over state. Once the IST is completed all settings, switches, valves and breaker set to their normal operational mode, then the site will be in the position where it can be turned over to Operations.

### Integration Systems Test Scripts Include:

1. CDML will develop Integrated Systems Test (IST) scripts that simultaneously validate the interdependency of each commissioned system during various facility events.
2. IST will prove the facility is capable of properly operating, recovering and maintaining environmental space conditions.
3. IST shall be conducted as many times as necessary to successfully demonstrate to the satisfaction of the EoR and CDML that the specified design criteria have been achieved. In some cases, a failure of a test and the repair of that failure may require the complete or partial steps of the IST to be repeated.

### Level 5 – IST Process includes:

1. Confirmation the facility is prepared for the IST testing by verifying and documenting the following;
  - a. All Level 4 test are completed successfully and closed.
  - b. All related Issues on the Cx Issues Log are completed and closed.
  - c. Site is completed and clean per the IST requirements.
  - d. The IST shall include performance and dynamic testing of individual and interdependent systems and address the following categories.
    - i. Battery and utility failure mode
    - ii. Operating modes to be tested and will include
      1. Loss of utility
      2. Return of utility source
      3. Manual modes
      4. Automatic modes
  - e. Verify upon transfer to standby generator all operating parameters to be within accepted ratings.
  - f. Radio communication will be established and protocol amongst testing personnel.

- g. This level of commissioning demonstrates how the site infrastructure, such as generators, HVAC units/systems and life-safety and other systems will likely perform as a system over the next 60 months.

## 5.8 Integrated Systems Testing of Fire Protection and Life Safety Systems (S1001)

The purpose of this Fire Protection and Life Safety Systems Integrated System Testing (IST) is to validate and document that the integrated operation/actions between the architectural, electrical, mechanical, systems and equipment react to life safety systems per the design intent.

The intent of this script is to verify proper operation of the current build. The tasks and tests contained in this script are to be performed after substantial completion of Vendor / Contractor executed Level 3 Commissioning (Equipment Start-up / Testing) and the CxA executed Level 4 Commissioning (Functional Performance Testing). Substantial completion of these phases in the commissioning process have verified that individual components, apparatus, subsystems and systems are deemed functional and ready for operation. During the performance of this script, evaluations of each system's performance will be made during and after each test procedure with respect to a systems' interface with other systems during the test procedure.

## 6 Turnover Activities

### 6.1 Operation and Maintenance Manual Reviews

As part of the commissioning process, CDML will review the O&M manual content to verify compliance with the OPR and Specifications. As required review comments will be issued to the relevant design team member per the agreed communications protocol. The Design team will incorporate the commissioning comments, at their discretion.

### 6.2 Training Plan

To achieve successful Operations & Maintenance (O&M) training delivery, CDML will be requesting that the General Contractor and the Sub trades develop a training plan that defines the roles and responsibilities of the project's Construction team, Subcontractors, Suppliers, Design Consultant, and end user as they relate to the training. The plan will include a schedule of training dates, agenda, times, locations, training provider and durations.

#### Common Training Topics – Building Operators

- General purpose of this system or equipment. What it serves.
- Important safety features and procedures
- Review of control drawings and schematics (have copies for attendees)
- Review of O&M Manuals, illustrating where verbal training information is found in writing (have copies for attendees)
- Startup, loading, normal operation, unloading, shutdown, unoccupied operation, seasonal changeover, etc., as applicable
- Integral controls (packaged): programming, troubleshooting, alarms, manual operation

### Common Training Topics – Building Operators

- Building automation controls (BAS): programming, troubleshooting, alarms, manual operation, interface with integral controls
- Interactions with other systems, operation during power outage and fire
- Relevant health and safety issues and concerns and special safety features
- Energy conserving operation and strategies
- Any special issues to maintain warranty
- Common troubleshooting issues and methods, control system warnings and error messages, including using the control system for diagnostics
- Special requirements of tenants for this equipment's function
- Service, maintenance, and preventative maintenance (sources, spare parts inventory, special tools, etc.)
- Continuous system monitoring, including data logging, performance analysis, and periodic retro-commissioning.
- System behavior under different environmental conditions
- Emergency response to handle sudden changes in environmental conditions

### Common Training Topics – Occupants

- Impact of occupants' actions on HVAC system performance and energy efficiency. Guidelines on optimal use of the system.
- Indoor Environmental Quality Awareness: the importance of maintaining good indoor air quality and how the HVAC system's automatic functions
- Using feedback mechanisms to report comfort levels and system performance issues.

## 7 Warranty Phase Activities

### 7.1 Deferred / Seasonal Testing

Functional Performance Tests (FPTs) may need to be deferred until after Substantial Completion for a variety of reasons. The most common reasons include HVAC systems may need to have different weather conditions than those at the end of construction or verified systems may need to have a load put on them before testing can be considered meaningful. FPTs that occur after Substantial Completion will be conducted, documented, and tracked during the warranty phase.

#### 7.1.1 Unforeseen Deferred Tests

If any test cannot be completed due to the building structure, required occupancy condition, or other deficiency, the functional testing may be delayed upon approval of the owner. These tests are conducted in the same manner as the seasonal tests, as soon as possible.

### 7.1.2 Seasonal Testing

Seasonal variation in operations or control strategies may require additional testing during the opposite season to verify performance of the HVAC system and controls in heating or cooling mode. Trends set up during the acceptance phase testing will be reviewed. Tests are executed and documented, with deficiencies corrected by the appropriate contractors. Any final adjustments to the O&M manuals and as-built drawings due to the testing are also completed.

## 8 Final Commissioning Report

After completion of all commissioning activities, CDML will write a final report documenting the overall results of the commissioning process and recommending acceptance of the commissioning process and related documentation to the owner.

The final commissioning report will include an overview or summary of the commissioning process, signed off functional tests, the final commissioning issues log and resolutions, commissioning progress and field reports, a deferred testing log, an unresolved issues log, a lessons-learned evaluation, and concluding with a recommendation to accept the process as complete.

## 9 CDML Commissioning Team

**1.0 GENERAL****1.1 Documents**

- 1.1.1 This Section, along with Drawings, forms part of the Contract Documents and is to be read, interpreted, and coordinated with all other parts.

**1.2 Description of Work Included**

- 1.2.1 Provide labour, materials, equipment, access, cooperation, coordination, and services to allow the testing of concrete and concrete reinforcement to be carried out by Testing Agency.
- 1.2.2 Scope of required quality assurance testing is described in this Section to inform Contractor of type and scope of testing on project and to allow Contractor to make appropriate allowances.
- 1.2.3 Contractor is responsible to schedule testing described, to coordinate construction schedules with Testing Agency, and to cooperate with Testing Agency in execution of this work.
- 1.2.4 Testing required for Contractor's own quality control or as noted in clause 1.6.3 will be paid for by Contractor.

**1.3 Related Work Specified Elsewhere**

- 1.3.1 Section 03 20 00 – Concrete Reinforcing
- 1.3.2 Section 03 30 00 – Structural Cast-in-Place Concrete

**1.4 Reference Standards**

- 1.4.1 Testing of concrete and reinforcement shall conform to requirements of the following Building Code and Standards unless otherwise required by this Specification:
- .1 Ontario Building Code - 2012 0 REG 88/19
  - .2 CSA A23.1/CSA A23.2 – Concrete Materials and Methods of Concrete Construction / Test Methods and Standard Practices for Concrete
  - .3 CSA-W59 – Welded Steel Construction (Metal Arc Welding)
  - .4 CSA-W178.1 – Certification of Welding Inspection Organizations
  - .5 ASTM A1044/A1044M – Standard Specification for Steel Stud Assemblies for Shear Reinforcement of Concrete
- 1.4.2 Revision date of referenced codes, standards, and guidelines shall be as indicated in the above referenced Building Code. Where no reference is made within the Building Code, the latest published edition shall be used.
- 1.4.3 Where the Standard is referenced in this Specification, it means documents specified in this clause and their referenced Standards.

- 1.4.4 Keep a copy of A23.1/A23.2 on site and available for reference for duration of the Work.
- 1.4.5 Where there are differences between the Specifications and Drawings and the codes, standards, or acts, the most stringent shall govern.

#### **1.5 Definitions - For This Section**

- 1.5.1 "Owner", "Contractor", and "Consultant" per the General Conditions and Definitions.
- 1.5.2 "Specialty Engineer" is a Professional Engineer registered in Ontario responsible for components designed by Contractor and who seals and signs shop drawings.
- 1.5.3 "Testing Agency" means a third party testing and inspection agency.
- 1.5.4 "Standard" and "Standards" mean reference standards listed under "Reference Standards" in this Section.

#### **1.6 Appointment of Testing Agency**

- 1.6.1 A CSA-approved Testing Agency shall be appointed to test concrete, reinforcement, and grout as per this Specification and shall include:
  - .1 Review of initial mix designs.
  - .2 Testing as outlined in Article 3.0.
- 1.6.2 Unless stated otherwise in Division 00 / Division 01, Testing Agency shall be engaged by Owner.
- 1.6.3 Contractor shall pay for testing not covered in clause 1.6.1, including but not be limited to:
  - .1 Review of Contractor-requested mix design changes.
  - .2 Waiting time incurred by Testing Agency in excess of 30 minutes.
  - .3 Testing required by Contractor for stripping of formwork, such as field-cured cylinders, etc.
  - .4 Additional costs due to overtime, shift work, holiday or weekend work, except that Owner will pay for holiday or weekend pickup when concrete was placed on a regular workday.
  - .5 Retesting or additional testing of concrete or reinforcement where tests have failed to meet specified requirements.

#### **1.7 Submittals**

- 1.7.1 Submit the following documents:
  - .1 Testing and Inspection Reports
    - .1 Reports shall be simultaneously distributed to the following parties:
      - .1 Consultant
      - .2 Contractor

- .3 Owner
- .2 Reports indicating defective works should be distributed immediately.
- .3 Reports shall be submitted within 5 business days.

## **2.0 DUTIES**

### **2.1 Responsibility of Contractor**

- 2.1.1 Cooperate fully with Testing Agency.
- 2.1.2 Give Testing Agency at least 24 hours prior notice of concrete placement.
- 2.1.3 Contractor is responsible to provide finished product that meets Specification. If initial tests indicate that concrete failed to meet Specification, Consultant will decide if additional testing is necessary. Testing shall be done by a CSA-approved Testing Agency but need not be Owner's agency. Proposed additional testing shall have prior approval of Consultant.
- 2.1.4 Strengths of cored samples must equal specified strength if tested dry or 85% of specified if tested wet, with wet or dry tests as per the Standard.

### **2.2 Responsibility and Duties of Testing Agency**

- 2.2.1 Testing Agency has authority to, and is expected to reject concrete not meeting Specifications.
- 2.2.2 Testing results and reviews performed by Testing Agency shall be submitted as noted in Article 1.7.
- 2.2.3 Testing Agency shall immediately notify Consultant if concrete is being placed without their notification, or if insufficient notice is provided.
- 2.2.4 Bring low 7-day, 28-day, and 56-day strength tests to immediate attention of Consultant and Contractor.
- 2.2.5 At completion of project, Testing Agency to provide a signed letter to Owner, with copy to Consultant, confirming that testing has been carried out per the Specifications and that Contractor and Consultant have been notified of any deficiencies in material properties.

## **3.0 TESTING – CONCRETE AND REINFORCEMENT**

### **3.1 General**

- 3.1.1 Number strength tests consecutively and mark cylinders as follows:
- 3.1.2 For 28 Day Mixes:
  - .1 7-Day Test: One cylinder marked "A28".
  - .2 28-Day Test: Two cylinders marked "B28" and "C28".

- 
- 3.1.3 For 56 Day Mixes (where required by Drawings, Specifications or when utilized to reduce embodied carbon in mixes):
- .1 28-Day Test: One cylinder marked "A56".
  - .2 56-Day Test: Two cylinders marked "B56" and "C56".
- 3.1.4 90-Day Test: (where required by Drawings, Specifications or when utilized to reduce embodied carbon in mixes):
- .1 28-Day Test: One cylinder marked "A90".
  - .2 56-Day Test: One cylinder marked "B90".
  - .3 90-Day Test: Two cylinders marked "C90" and "D90".
- 3.1.5 Test reports shall record:
- .1 Name of Project
  - .2 Date and time of sampling
  - .3 Name of supplier
  - .4 Delivery truck number
  - .5 Batch time and discharge time
  - .6 Identification of sampling and testing technicians
  - .7 Exact location in structure of concrete sampled
  - .8 Design strength of concrete sampled
  - .9 Admixtures, cement type, maximum aggregate size
  - .10 Air and concrete temperature
  - .11 Slump, and air content
- 3.1.6 Field-cured cylinders shall be marked "F".
- 3.1.7 Slump tests shall be performed prior to addition of superplasticizers.
- 3.1.8 Tests for slump and air content shall be taken with each strength test and as required by Specifications and Drawings.
- 3.1.9 Chloride ion tests shall be performed on first set of compressive test cylinders taken from first parking slab pour to show that chloride ion content of these mixes satisfies limits set out in CSA A23.1.

### **3.2 Regular Testing - Concrete**

- 3.2.1 To conform to the Standard, except each test shall consist of a minimum of three cylinders – as outlined in clause 3.1.
- 3.2.2 Testing for concrete with SCMs to reduce cement content (greater than 30% cement reduction as defined in Section 03 30 00) to conform to the Standard, except each test shall consist of four cylinders – one for 7-day strength, one for 28-day strength, and two for 56-day strength.
- 3.2.3 Concrete supplied from different plants or suppliers of same mix-type shall be considered different mixes for purposes of testing requirements.
- 3.2.4 Regular testing applied to all elements not listed in clause 3.3.

**3.3 Full-Time Testing - Concrete**

3.3.1 Full time testing shall apply to:

- .1 Concrete specified as exposure class C-1, C-XL, or C-2 in parking slab-on-grade locations.

3.3.2 Full time testing shall conform to the Standard and regular testing except:

- .1 Testing Agency shall have a representative on job site at all times that concrete requiring full time testing is being placed.
- .2 Test slump and air content from every truck and reject any concrete not within Specification.

3.3.3 For concrete mixes meeting 3.3.1.1, test compressive strength with a frequency not less than 1 test for every 25 cu. m. First and last batch of concrete to be placed each day shall always be tested.

3.3.4 Full time testing applies for duration of project as follows:

- .1 Provide full-time testing for elements listed in 3.3.1 and for each mix type by Supplier until satisfactory control of concrete mix is established by Testing Agency.
  - .1 For slump and air content, satisfactory performance shall be established from test results on not less than 5 consecutive batches of concrete placed.
- .2 Where Regular Testing has been initiated for a mix, Testing Agency shall resume Full Time Testing per 3.3.2 if any test fails to satisfy the Standard, agreed strength criteria, or as directed by Structural Consultant or Owner.
- .3 Where a mix type has not been utilized on project for more than 30 consecutive days, Full Time Testing shall apply until satisfactory compliance with this Standard is re-established.

**3.4 Field-Cured Cylinders**

3.4.1 Protect field-cured cylinders against wind and store on floor immediately below slab they represent unless floor below is heated. In that case, store cylinders on top of slab and cover with a plywood box. Cylinders are to be undisturbed at this location until picked up by Testing Agency. Do not store field-cured cylinders in temperature-controlled containers.

**3.5 Testing of Reinforcing Bars and Accessories**

3.5.1 Testing Agency shall, over duration of project, perform at least one tensile and bend test for each bar size and mill stamp used on project. Such testing shall comply with applicable CSA documents. Further testing may be requested at Consultant's discretion.

3.5.2 Testing Agency will select bars to be tested from reinforcing supplied to construction site, not from suppliers' yard. Cut bars to required length and replace shortened bars at no cost to Owner.

- 3.5.3 Supply mill certificates of chemical analysis in accordance with CSA G30.18R and G30.18W for all bar supplied to site.
- 3.5.4 Cut samples of mechanical splices and welded reinforcement as directed by Consultant. Replace mechanical splices and welded reinforcement cut out for testing.
- 3.5.5 When requested, provide samples of support accessories (chairs, bolsters, spacers) that are intended to be used.

**End of Section**

**1.0 GENERAL****1.1 Documents**

- 1.1.1 This Section, along with the Drawings, forms part of the Contract Documents and is to be read, interpreted, and coordinated with all other parts.

**1.2 Description of Work Included**

- 1.2.1 Provide all labour, materials, equipment, and services necessary to supply, erect, and strip formwork and falsework for poured-in-place concrete shown or indicated on Contract Drawings and Specifications.
- 1.2.2 Install anchor bolts, embedded metal, inserts, hangers, reglets, dovetail anchors, etc. supplied by applicable trades for casting into concrete, and assume responsibility for correct positioning within agreed tolerance and in accordance with drawings supplied by trades.
- 1.2.3 Install openings, sleeves, block-outs, etc. required by other trades and assume responsibility for correct positioning within agreed tolerance and in accordance with drawings supplied by trades.

**1.3 Related Work Specified Elsewhere**

- 1.3.1 Section 03 20 00 – Concrete Reinforcing
- 1.3.2 Section 03 30 00 – Structural Cast-in-Place Concrete

**1.4 Reference Standards**

- 1.4.1 Concrete formwork shall conform to requirements of the following Building Code and Standards unless otherwise required by this Specification:
- .1 Ontario Building Code - 2012 0 REG 88/19
  - .2 CSA A23.1/CSA A23.2 – Concrete Materials and Methods of Concrete Construction / Test Methods and Standard Practices for Concrete
  - .3 CSA A23.3 – Design of Concrete Structures
  - .4 CSA S269.1 – Falsework and Formwork
- 1.4.2 Revision date of referenced codes, standards, and guidelines shall be as indicated in the above referenced Building Code. Where no reference is made within the Building Code, the latest published edition shall be used.
- 1.4.3 Where the Standard is referenced in this Specification, it means documents specified in this clause and their referenced Standards.
- 1.4.4 Keep a copy of A23.1/A23.2 on site and available for reference for duration of the Work.
- 1.4.5 Where there are differences between the Specifications and Drawings and the codes, standards, or acts, the most stringent shall govern.

**1.5 Definitions - For This Section**

- 1.5.1 "Owner", "Contractor", and "Consultant" per the General Conditions and Definitions.
- 1.5.2 "Specialty Engineer" is a Professional Engineer registered in Ontario responsible for components designed by Contractor and who seals and signs shop drawings.
- 1.5.3 "Standard" and "Standards" mean reference standards listed under "Reference Standards" in this Section.

**1.6 Submittals**

- 1.6.1 Shop Drawings for Formwork, Falsework, and Re-Shoring
  - .1 Structural Drawings shall not be reproduced, in whole or in part, for use as shop drawings.
  - .2 Well in advance of construction, submit to Consultant drawings showing complete design of slab formwork, falsework, and re-shoring systems stamped by a qualified Professional Engineer licensed in the Province of Ontario.
  - .3 As a minimum, show the following:
    - .1 Stripping schedule;
    - .2 Sequence for installing re-shores;
    - .3 Number of slabs re-shored at any given time;
    - .4 Formwork details related to stripping and re-shoring;
    - .5 Locations of proposed construction joints; and
    - .6 Camber.
  - .4 When requested, submit written proposal for Consultant review as to how specified cambers are to be achieved in field.
  - .5 Opening information
    - .1 Submit drawings of structure showing formed holes, recesses, and sleeving required under all Sections.
  - .6 As-Built Drawings
    - .1 Mark on a complete set of final reproducible drawings any changes, additions, or deletions that occur during construction as a result of Contractor's work, change orders, or for any other reason.
  - .7 Sloping Roofs or Floors
    - .1 When requested, well in advance of construction, submit complete details of forming together with placing and compaction procedures for sloping roofs or floors, including details of construction and placing of top forms and top form panels.

**2.0 PRODUCTS****2.1 General**

2.1.1 Products shall satisfy requirements of the Standard unless otherwise specified herein or on Drawings.

**2.2 Materials****2.2.1 Form Material**

- .1 Exposed surfaces - High-density overlay form ply (Ainsworth 107 or preapproved equal), metal, plywood, or plywood lined. Plywood to conform to the Standard.
- .2 Unexposed surfaces - metal, plywood, or wood lumber to conform to the Standard.
- .3 Plywood and wood formwork materials shall conform to the Standard and be free from warp and sawn straight so lines and shapes will be accurately retained.
- .4 Un-lined forms for unexposed surfaces shall be made with a good grade of lumber or plywood and fitted so there will be no leakage of mortar.
- .5 Use metal forms, plywood lined forms, or plywood forms of sufficient structural strength for exposed surfaces. Plywood for lining shall be GIS exterior grade fir plywood with waterproof glue.
- .6 Proprietary and/or modular forming systems shall be designed so they do not interfere with specified placement of reinforcement or other embedded hardware and must be pre-approved by Consultant.

**2.2.2 Ties and Spreaders**

- .1 Use metal form ties that are adjustable in length to permit tightening of forms. Use only snap-off type of form ties, which will permit no metal within 25 mm (1") of concrete surface after removal. Twisted wire form ties are not acceptable.
- .2 Wood spreaders inside wall forms will not be permitted.

**2.2.3 Form Release Agent**

- .1 Use non-staining form release agent that is compatible with finishes and membranes specified elsewhere in Contract Documents.
- .2 Form release agents shall be delivered in manufacturer's sealed and trademarked containers and shall be guaranteed to provide, clean stain-free concrete release and not to interfere with future-applied coatings and finishes.
  - .1 Vegetable-Based: 100% biodegradable, zero-VOC, rapeseed - or soy-based

- .2 Water-Based: Biodegradable, maximum VOC content allowed: 55 g/L

### **3.0 EXEXECUTION**

#### **3.1 General**

- 3.1.1 Concrete formwork construction shall be in accordance with the Standard unless otherwise specified herein or on Drawings. Only workers who are skilled and experienced in their trade shall do the work.

#### **3.2 Lines and Levels**

- 3.2.1 Verify lines, levels, and column centers before proceeding with work and ensure that dimensions agree with Drawings.
- 3.2.2 Co-ordinate and co-operate with other trades in forming and setting of recesses, chases, sleeves, inserts, bolts, and hangers.

#### **3.3 Design of Formwork, Falsework, and Re-Shoring**

- 3.3.1 Conform to the Standard.
- 3.3.2 Design formwork and re-shoring to safely support vertical and lateral loads until they can be supported by structure. Design formwork for loads and lateral pressures recommended in CSA S269.1. Contractor assumes full responsibility for structural adequacy of forms to withstand concrete, environmental, and construction loads.
- 3.3.3 Design and provide shoring and bracing to excavations and underpinning to safely withstand lateral pressures to which they may be subjected.
- 3.3.4 See drawings for locations where reinforced concrete members are not structurally stable until walls and slabs intersecting with them have been constructed to specified level and concrete has reached at least 70% of specified strength.
- 3.3.5 Design shores for these slabs and walls to safely support total vertical and lateral loads until walls and slabs are complete and have reached 70% of specified strength. Design shores so they can be unloaded gradually.
- 3.3.6 As a minimum, work shall conform to the Standard. Refer to "Formwork for special Architectural finishes" in CSA A23.1 for architectural concrete.
- 3.3.7 Where concrete is exposed to view, forms are to be laid out so joints are kept to a minimum and located in an orderly and symmetrical arrangement wherever possible. Form ties shall be evenly spaced and located in straight horizontal and vertical lines. Spacing and location of form tie holes shall be detailed by Contractor and approved by Consultant. See architectural Drawings and Specifications for special requirements for architectural, or exposed, concrete.

- 3.3.8 Strength and rigidity of forms shall be such that they will not leak mortar or result in visible irregularities in finished concrete. In addition, deflection of facing materials between studs, as well as deflection of studs and walers, shall not exceed 0.0025 times the span.
- 3.3.9 Construct forms so finished concrete will conform to shape, dimensions, and tolerances specified in the Standard or on structural Drawing, whichever is most rigorous. They shall also incorporate cambers specified on structural Drawings. Movement resulting from form support deflection, closure of form joints, and elastic shortening of forms and shoring must be calculated and added to cambers indicated on Drawings. Coordination to achieve more rigorous tolerances on concrete dimensions required to accommodate geometric tolerance of various trades and finishes (cladding, structural steel, etc.) shall be completed by Contractor.
- 3.3.10 Construct forms so they may be dismantled and removed without damaging concrete.
- 3.3.11 Submit details of sequence and extent of formwork removal and re-shoring for Consultant review. Such details shall include magnitude of loads and location of re-shores at each level. Forms shall not be removed or adjusted until review is complete. Such review does not relieve Contractor of responsibility for formwork and safety during construction.
- 3.3.12 Set shores on wedges or use adjustable shores so they may be removed without causing undue strains in concrete.
- 3.3.13 Do not exceed safe capacity of structure with construction or shoring loads. Safe capacity of structure may be taken as design live load, as indicated on structural Drawings, multiplied by ratio of concrete strength at time of loading to specified concrete strength, but not greater than 1.0.

#### **3.4     Erection**

- 3.4.1 Sleeves and openings shown on structural Drawings must be confirmed with mechanical, electrical, and architectural Drawings. Report discrepancies to Consultant.
- 3.4.2 Sleeves and openings not shown on structural Drawings must be approved by Consultant.
- 3.4.3 Keep untreated forms moist to prevent shrinkage prior to placing of concrete and wet surface at time of placing.
- 3.4.4 Treated formwork surfaces shall have approved form coating applied in accordance with manufacturer's recommendations, prior to placing reinforcing steel. Remove excess form coating. Do not apply form release agent after reinforcing steel has been placed. Ensure reinforcing steel does not come in contact with form release oil.
- 3.4.5 Erect, support, brace, and maintain formwork to safely support vertical and lateral loads until they can be supported by structure.
- 3.4.6 Falsework erection shall be supervised by Professional Engineer responsible for its design.

3.4.7 Inspect forms prior to concrete pour to ensure they have been erected in conformance with formwork shop drawings.

3.4.8 Construction

- .1 Form footing sides unless footings are shown to be placed against undisturbed soil or unless excavation is left with vertical sides against which concrete can be directly cast.
- .2 Mark building, grid, or other lines on forms to permit accurate positioning of reinforcing steel.
- .3 Construct templates and supports to rigidly fix reinforcing dowels in forms prior to concreting.
- .4 Provide suitable markers to indicate location and configuration of continuing concrete members so dowels can be positioned accurately in relation to their position in continuing members.
- .5 Set anchor bolts, templates, steel connection units, hardware, or other inserts into forms and secure them rigidly so they do not become displaced during concreting. Set and secure these items to tolerances specified and required in appropriate Sections.
- .6 Build top forms on sloping concrete where required to prevent flow of concrete out of forms. Provide vents to top forms to permit air or bleed water to escape from forms.
- .7 Where concrete is poured against structural steel beams causing unbalanced horizontal pressures, provide sufficient horizontal support to resist such pressures and prevent deflection of steel beams.

**3.5 Tolerances**

- 3.5.1 Tolerances for concrete work shall conform to requirements of the Standard and Drawings.
- 3.5.2 Variations in building lines that result in extension of building over lot lines or restriction lines will not be permitted.
- 3.5.3 These tolerances are acceptable with regard to structural requirements. Interfacing tolerances may not be compatible with the above. Review and coordinate interfacing tolerances so various elements come together properly.

**3.6 Product Handling**

- 3.6.1 Protect formwork materials before, during, and after installation and protect installed work and materials of other trades.
- 3.6.2 In event of damage, immediately make required repairs or replacements necessary to approval of Consultant and at no cost to Owner.

**3.7      Removal of Formwork**

- 3.7.1 Forms shall not be removed until concrete has attained sufficient strength that no damage to strength or continuity of concrete will occur when forms are removed. Time for formwork removal of suspended concrete shall be approved by Consultant. See also requirements of Article 3.2.
- 3.7.2 Prying against face of concrete to remove forms is not allowed; only wooden wedges shall be used.
- 3.7.3 Where forms are being reused, thoroughly clean and retreat them.
- 3.7.4 Where possible, forms should be reused. Minimize damage to formwork so it can be reused.
- 3.7.5 Remove form ties carefully to avoid marking concrete and to allow for patching. Grout bottom of form tie hole to prevent rust staining.
- 3.7.6 As a minimum, conform to requirements of CSA S269.1 and the following:
- .1 Design of re-shore shall accommodate load distribution resulting from differences in stiffness between storeys such as slabs, transfer floors, and grade.
  - .2 Maintain re-shoring or formwork in place for minimum 28 days or longer as may be required for concrete to reach its specified 28-day strength.
  - .3 Do not strip within one and a half bays of construction joint until new concrete beyond construction joint has reached 75% of its specified 28-day strength.
  - .4 Provide and install adequate shoring to safely support horizontal or inclined members after 28-day specified strength is achieved where superimposed loads exceed design loads.
  - .5 Side forms for vertical members may be stripped as soon as concrete is sufficiently strong to stand unsupported and safely resist imposed loads.

**3.8      Construction Joints**

- 3.8.1 Obtain approval from RJC for location and details of construction joints not shown.

**3.9      Control Joints**

- 3.9.1 Construct control joints at locations indicated and in accordance with details shown.
- 3.9.2 Construct clean expansion joints free of foreign material, likely to impair proper operation of joint.
- 3.9.3 Provide non-extruding joint filler in expansion joints for full area between adjacent concrete members. Anchor filler material to adjacent member or between concrete members and adjacent members of other materials.
- 3.9.4 Where shown, provide waterstops in expansion joints.

**End of Section**

**1.0 GENERAL****1.1 Documents**

- 1.1.1 This Section, along with the Drawings, forms part of the Contract Documents and is to be read, interpreted, and coordinated with all other parts.

**1.2 Description of Work Included**

- 1.2.1 Provide all labour, materials, equipment, and services necessary to supply and install reinforcing steel work shown or indicated in Contract Drawings and Specifications including accessories such as hanger bars, spirals, wire ties, support bars, chairs, spacers, supports, or other devices required to position reinforcing properly.

**1.3 Related Work Specified Elsewhere**

- 1.3.1 Section 03 00 50 – Testing of Concrete  
1.3.2 Section 03 11 00 – Concrete Forming and Accessories  
1.3.3 Section 03 30 00 – Structural Cast-in-Place Concrete  
1.3.4 Section 05 12 00 – Structural Steel Framing

**1.4 Reference Standards**

- 1.4.1 Concrete reinforcing shall conform to requirements of the following Building Code and Standards unless otherwise required by this Specification:
- .1 Ontario Building Code - 2012 0 REG 88/19
  - .2 CSA A23.1/CSA A23.2 – Concrete Materials and Methods of Concrete Construction / Test Methods and Standard Practices for Concrete
  - .3 CSA A23.3 – Design of Concrete Structures
  - .4 ASTM A1064M – Standard Specification for Carbon-Steel Wire and Welded Wire Reinforcement, Plain and Deformed, for Concrete
  - .5 CSA G30.18 – Carbon Steel Bars for Concrete Reinforcement
  - .6 CSA W47.1 – Certification of Companies for Fusion Welding of Steel
  - .7 CSA S413 – Parking Structures
  - .8 Reinforcing Steel Institute of Canada (RSIC) – Manual of Standard Practice
  - .9 ASTM A820M – Standard Specification for Steel Fibers for Fiber-Reinforced Concrete
  - .10 ASTM C1116M – Standard Specification for Fiber-Reinforced Concrete

- 1.4.2 Revision date of referenced codes, standards, and guidelines shall be as indicated in the above referenced Building Code. Where no reference is made within the Building Code, the latest published edition shall be used.
- 1.4.3 Where the Standard is referenced in this Specification, it means documents specified in this clause and their referenced Standards.
- 1.4.4 Keep a copy of A23.1/A23.2 on site and available for reference for duration of the Work.
- 1.4.5 Where there are differences between the Specifications and Drawings and the codes, standards, or acts, the most stringent shall govern.

## **1.5 Definitions - For This Section**

- 1.5.1 "Owner", "Contractor", and "Consultant" per the General Conditions and Definitions.
- 1.5.2 "Specialty Engineer" is a Professional Engineer registered in Ontario responsible for components designed by Contractor and who seals and signs shop drawings.
- 1.5.3 "Standard" and "Standards" mean reference standards listed under "Reference Standards" in this Section.

## **1.6 Testing**

- 1.6.1 As per Section 03 00 50 - Testing of Concrete and Reinforcement.

## **1.7 Submittals**

- 1.7.1 Suppliers shall provide an embodied carbon breakdown for all reinforcing steel utilized in the project for review and approval:
  - .1 The breakdown shall be provided prior to ordering material indicating the total embodied carbon (kg CO<sub>2</sub>e).
  - .2 The breakdown shall also be provided at the end of the project with the values updated to reflect the final as-built quantities and resulting embodied carbon (kg CO<sub>2</sub>e).
  - .3 The breakdown shall be a tabular submittal showing quantities and embodied carbon based on accompanying EPDs as outlined below.
  - .4 Refer to Division 1 for the maximum allowable upfront (A1-A3) kgs of embodied carbon.
  - .5 The maximum embodied carbon for reinforcing steel shall not exceed 0.78 kg CO<sub>2</sub>e / kg.
- 1.7.2 Submit Environmental Product Declarations (EPDs) compliant with CSA-ISO 14025-07.
  - .1 Product EPDs must be third party certified, including external verification.

- .2 Alternatively with written approval producers may submit an industry average EPD in which the manufacturer is explicitly recognized as a participant by the program operator.
- 1.7.3 Submit third party certified documentation identifying the following information:
  - .1 global warming Potential (GWP in kg / tonne), CO<sub>2</sub>e;
  - .2 depletion of the stratospheric ozone layer, in kg CFC -11;
  - .3 acidification of land and water sources, in moles H<sup>+</sup> or kg SO<sub>2</sub>;
  - .4 eutrophication, in kg nitrogen or kg phosphate;
  - .5 formation of tropospheric ozone, in kg NO<sub>x</sub>, kg O<sub>3</sub>, or kg ethane;
  - .6 depletion of non-renewable energy resources, in MJ.
- 1.7.4 Submit documentation of recycled content of reinforcing bars. A breakdown of post-consumer and post-industrial recycled content should be specified. A mill certificate shall be provided.
- 1.7.5 Submit documentation of where the reinforcing bars were extracted, processed, and manufactured. Materials should be selected from within a 160 km (100 mile) radius.
- 1.7.6 Submit documentation during the closeout period indicating the amount of recycled scrap reinforcement noted in section 3.1.3.

## **2.0 PRODUCTS**

### **2.1 General**

- 2.1.1 Products shall satisfy requirements of the Standard unless otherwise specified herein or on Drawings.

### **2.2 Materials**

- 2.2.1 Reinforcing bars shall conform to the Standard unless otherwise specified herein or on Drawings.
- 2.2.2 Reinforcing bars to be welded shall conform to the Standard, G30.18W.
- 2.2.3 Reinforcing steel that is part of seismic load-resisting system to conform to the Standard, G30.18W.
- 2.2.4 Reinforcing bars to be provided by Gerdau Long Steel Rebar Steel Mill in Whitby, ON.
- 2.2.5 Welded wire fabric shall conform to the Standard; size and gauges as shown on Drawings.
- 2.2.6 Welded wire fabric for slabs shall be delivered in flat sheets.
- 2.2.7 In suspended parking slabs, bar support chairs shall be plastic or plastic coated.

- 2.2.8 Chairs, Bolsters, Bar Supports, Spacers: To CSA A23.1. In case of concrete exposed to view or weather, accessories shall be such that no metal is permitted to come closer than 40 mm (1-5/8") from a formed face and 50 mm (2") from a troweled surface. Use precast concrete supports for exposed concrete beams and soffits and concrete cast against soil/rock. Precast concrete supports shall be made of concrete of quality and strength at least equal to that specified for member in which they are used.
- 2.2.9 Steel fibers shall meet requirements of ASTM A820 Type 1, deformed fibers. Minimum ultimate tensile strength shall be 1036 MPa. Minimum aspect ratio shall be 80. Minimum fiber length shall be 60 mm. Maximum fiber diameter shall be 0.03 inches. Steel fibers shall be Dramix RC 80/60 BN manufactured by Bekaert Corporation.
- 2.2.10 Steel fiber concrete shall be proportioned as required in ASTM C1116, alternative 3, in consultation with fiber manufacturer based on required concrete properties indicated on Drawings and Specifications.

### **3.0 EXECUTION**

#### **3.1 General**

- 3.1.1 Concrete reinforcement work shall be in accordance with the Standards unless otherwise specified herein or on Drawings. Ensure work is executed only by workers skilled and experienced in their trade.
- 3.1.2 Notify Consultant at least 24 hours before concrete is placed so Consultant may review the work.
- 3.1.3 Place surplus reinforcing steel in area designated for recycling.
- 3.1.4 Identify with a tag each bundle of bars with a code mark corresponding to that appearing on bar list.
- 3.1.5 Bend reinforcement once only and at room temperature of 18°C. Do not straighten or re-bend reinforcement. Do not use bars with kinks or bends not shown on Drawings.
- 3.1.6 Replace bars that develop cracks or splits.
- 3.1.7 Non-galvanized reinforcement to be electrically isolated from galvanized steel including but not limited to reinforcement, hardware (sleeves, conduit), embedded plates, structural steel, or window washing anchors.
- 3.1.8 Williams All-Thread - Bar must not be welded or subjected to heat of torch or used as a ground.

#### **3.2 Field Bending**

- 3.2.1 Do not field bend reinforcement except where indicated or authorized in writing by Consultant.
- 3.2.2 When field bending is authorized, bend without heat, applying slow and steady pressure.

3.2.3 Replace bars that develop cracks or splits.

### **3.3 Construction Joints in Cast-in-Place Concrete**

3.3.1 Obtain acceptance from Consultant for details of construction joints not shown.

3.3.2 Continue reinforcement through joint in its normal position. Add additional reinforcement across joint as shown or directed. Where mechanical splice is required at construction joint, use of LENTON Formsaver type coupler manufactured by nVent or approved equivalent is appropriate.

### **3.4 Mechanical Splicing of Reinforcement**

#### **3.4.1 Tension Splices**

- .1 Provide mechanical tension splices at locations indicated. Where mechanical splice/coupler is indicated, correct type of coupler should be used. Typically standard coupler is appropriate. Transitional couplers to be provided whenever bar diameter changes. Provide positional couplers when both sides of bar cannot be rotated (hooks, bends, coupled both ends, etc.)
- .2 Unless noted otherwise, mechanical tension splices shall develop 120% of specified yield strength, but not less than 110% of actual yield strength, of reinforcement being spliced or of smaller bar if spliced bars are of different sizes.
- .3 Unless noted otherwise, mechanical tension splices shall develop specified tensile strength of reinforcement being spliced or of smaller bar if spliced bars are of different sizes.
- .4 In each concrete member, unless otherwise indicated, mechanical tension splices in adjacent bars shall be staggered not less than the greater of 800 mm or 40 bar diameters.
- .5 Install mechanical splices in accordance with manufacturer's requirements.

#### **3.4.2 Compression Splices**

- .1 Provide compression splices at locations indicated.
- .2 Non End-Bearing Mechanical Splices
  - .1 Unless noted otherwise, mechanical compression splices shall develop 120% of specified tensile yield strength, but not less than 110% of actual tensile yield strength of reinforcement being spliced or of smaller bar, if spliced bars are of different sizes.
  - .2 In each concrete member, stagger splices of adjacent bars by at least 800 mm.
- .3 End-Bearing Splices
  - .1 End bearing splices shall develop ultimate compressive strength of reinforcing bars spliced.

- .2 Accurately sawcut end bearing surfaces of bars to be spliced 90 degrees to axis of bar with a tolerance of 1-1/2 degrees.
- .3 In setting bars, rotate until angle between bearing surfaces is at minimum, but not more than 3 degrees of full bearing.
- .4 In each concrete member, stagger splices in adjacent bars by 800 mm but not less than 20 bar diameters.
- .4 Rebar End Welded to Plates
  - .1 Provide weld details for weldable couples where bars are specified to be end welded to plates, steel sections, etc. for amount specified in above sections.

### 3.5 Shop Drawings

- 3.5.1 Refer to Section 01 33 00 for submittals.
- 3.5.2 Allow at least two weeks for shop drawing review by Structural Engineer of concrete reinforcement, bar support, and accessories. Allow sufficient time for review, correction, fabrication, shipping to site, and placement.
- 3.5.3 Clearly indicate bar sizes, grades, spacing, location and quantities of reinforcing mesh, bar supports, and accessories, mechanical splices, and identifying code marks to permit correct placement without reference to structural drawings. Include total weight of materials being installed.
- 3.5.4 Placing drawings and bar lists will be reviewed for number and size of bars only. This review in no way relieves Contractor's responsibility for carrying out the Work in accordance with Drawings.
- 3.5.5 Substitution of imperial reinforcing sizes and grades will only be accepted if placing drawings showing imperial sizes are submitted for Consultant review. Approval must be obtained before work commences.
- 3.5.6 Clearly indicate placing order of reinforcement.
- 3.5.7 Prepare sections of congested joints to avoid site issues.
- 3.5.8 Prepare reinforcement shop drawings and bar lists taking into account openings and recesses shown on architectural, structural, mechanical, and electrical Drawings, and on sleeving shop drawings. Reinforcement shop drawings may only be reviewed if sleeving and conduit shop drawing are submitted in parallel.
- 3.5.9 Completely dimension openings, recesses, and sleeves, and relate to suitable grid lines and elevation datum.
- 3.5.10 Structural drawings are not prepared to be used as erection or shop drawings. However, electronic files or sepia's may be used by Contractor under following conditions:
  - .1 Copyright remains with Read Jones Christoffersen Ltd.
  - .2 Drawings will only be used for shop drawings for this project and not be put to any other use.

- 
- .3 Read Jones Christoffersen Ltd. assumes no liability for errors or omissions in drawings. Contractor assumes all risk and expenses associated with use of structural drawings in production of Contractor's work.
  - .4 References to Read Jones Christoffersen Ltd. must be deleted from title block.
  - .5 Contractor signs a release available from Read Jones Christoffersen Ltd. that addresses the above items in more detail.
- 3.5.11 Detail reinforcement in accordance with Contract Documents, CSA A23.1, CSA S304.1, and detailing standards in CRSI Manual of Standard Practice.
- 3.5.12 Where 10M top bars and welded wire fabric are shown, provide adequate chairs, bolsters, or supports so bars are not bent or displaced prior to or during concreting operation.
- 3.5.13 Detail sections to fully illustrate placement of concrete reinforcement at areas such as openings, change of levels, spandrel, stairs, and wherever else required.
- 3.5.14 Provide large-scale detail concrete sections at areas of steel concentrations, such as at intersections of beams and columns, column splices, or wherever else required.
- 3.5.15 Indicate placing sequence for reinforcement, such as intersections of beams and beams, slabs and beams, and within slabs.
- 3.5.16 Indicate minimum clearances between reinforcement and minimum concrete cover to reinforcement.
- 3.5.17 Indicate location and embedment of dowels.
- 3.5.18 Location, number, and type of support accessories, including support bars suitably sized and spaced to rigidly support weight of reinforcement and construction load.
- 3.5.19 Submit code marks or symbols used on reinforcement of each manufacturer so that RJC may identify grades and sizes of reinforcement.
- 3.5.20 Shop Drawings for Welding Reinforcement
- .1 When requested, submit drawings showing, as minimum, the following: locations, elevations, and size of welds; welding procedures and techniques; reports of chemical compositions; and verification of weldability, stamped as approved by Canadian Welding Bureau.
- 3.5.21 Shop Drawings for Mechanical Splices
- .1 Submit drawings showing, as minimum, the following: location, elevations, and size of splices; materials; and procedures.
- 3.5.22 Certificates
- .1 When requested, provide Consultant with certified copy of reports of reinforcing steel showing physical and chemical analysis minimum 4 weeks prior to commencing fabrication.

.2 When requested, provide test data from Canadian Testing Laboratory proving that each size and grade of reinforcement proposed meets Specification requirements. Reinforcement reviewed for use by Consultant shall be identified in a manner suitable to Consultant. Only steel that has been reviewed and accepted may be used in project. This analysis should be provided for each heat of steel.

.3 Provide Steel Fibers: Certification and test reports for each shipment of fibers.

#### 3.5.23 Substitutions

.1 Substitution of different size bars permitted only upon written acceptance of Consultant.

#### 3.5.24 As-Built Drawings

.1 Mark on a complete set of final reproducible drawings any changes, additions, or deletions that occur during construction as a result of Contractor's work, change orders, or for any other reasons.

### 3.6 **Fabrication**

3.6.1 Fabricate reinforcing to the Standard and Contract Documents.

3.6.2 Reinforcing bars shall be cold bent. Bars shall not be straightened or re-bent.

3.6.3 Colour code each bar to correspond with code mark appearing on bar list.

3.6.4 Steel stud assemblies for shear reinforcement shall be fabricated in accordance with ASTM A1044/A1044M.

### 3.7 **Product Delivery, Storage, and Handling**

3.7.1 Store reinforcement in a manner to prevent excessive rusting and fouling with dirt, grease, form-oil, and other bond-breaking coatings.

3.7.2 Reinforcement at time concrete is placed shall be free from excessive rusting, mud, oil, or other coatings that adversely affect its bonding capacity.

### 3.8 **Placing**

3.8.1 Reinforcing of size and shapes shown on structural Drawings shall be accurately placed in accordance with Drawings and requirements of the Standard.

3.8.2 Reinforcement shall be adequately supported by chairs, spacers, support bars, hangers, or other accessories, and secured against displacement within tolerances permitted in the Standard. Support devices contacting surfaces exposed to exterior shall be non-corroding.

3.8.3 Bars that are not part of structural design or Drawings, and whose only function is supporting other reinforcing in lieu of other support accessories, shall be considered accessories.

- 3.8.4 In suspended parking slabs, uncoated metal ties shall not extend more than 5.0 mm (3/16") into concrete cover.
- 3.8.5 Reinforcement shall be adequately tied and chaired to maintain it in specified location during pouring. Lifting of reinforcing or welded wire mesh into specified position during concrete pour will not be allowed.
- 3.8.6 Tolerances for bar placement shall be per the Standard. Tolerances shall not be used to justify use of chair, bolsters, or chair/support combinations that result in improper cover.
- 3.8.7 Williams All-Thread Bar must not be welded, subjected to high heat of torch, nor used as a ground.
- 3.8.8 Field cutting is to be done by abrasive wheel or band saw.
- 3.8.9 Prior to concreting, accurately place reinforcement, support, and secure against displacement, as indicated on reviewed placing drawings and in accordance with CSA A23.1. Tack welding of reinforcement to secure in place will not be permitted.
- 3.8.10 Set column anchor bolts and wall dowels prior to concreting with wooden templates or other approved means.
- 3.8.11 Do not 'wet set' reinforcement into fresh concrete.
- 3.8.12 Secure reinforcement in columns and walls using sufficient spacers on each face to maintain requisite distance between reinforcement and column or wall face and so vertical bars are plumb.
- 3.8.13 Where continuous drop panels or slab thickenings are noted on Drawings, place bottom slab reinforcement in bottom of continuous drop panel or slab thickening, unless noted otherwise on Drawings.
- 3.8.14 Where toppings are placed on waterproof membranes, vapour barriers, and the like, prevent reinforcement or tie wire from contacting these items.
- 3.8.15 Ensure that longitudinal bars in beams have adequate vertical spacing between layers in accordance with the Standard.
- 3.8.16 Pre-assemble column and beam cages as necessary. Do not "spring" or bend ties and stirrups to place longitudinal reinforcement.
- 3.8.17 Splice locations are subject to review by Consultant.

### **3.9 Welding**

- 3.9.1 Welding of reinforcing steel shall be in accordance with the applicable Standard.
- 3.9.2 Welding of concrete reinforcement shall be performed by workers who are approved by Canadian Welding Bureau in accordance with the Standard. Submit copies of Canadian Welding Bureau approved welding procedure and certificate of current operator qualification to Consultant prior to commencement of welding.
- 3.9.3 Welding to reinforcement is only permitted as indicated in Contract Documents or with prior written approval of Consultant.

**3.10     Construction Review**

- 3.10.1 No concrete shall be placed until Consultant has completed a review of reinforcement in place. Provide minimum 24 hours notice of time when reinforcement will be substantially in place and ready for Consultant's review. Provide minimum of 6 hours for review and any required remedial work prior to concrete placement.
- 3.10.2 Consultant's general review during construction and inspection and testing by Independent Inspection and Testing Companies reporting to Consultant are both undertaken to inform Owner of Contractor's performance and shall in no way augment Contractor's quality control or relieve Contractor of contractual responsibility.

**3.11     Tolerances**

- 3.11.1 Perform fabrication and setting so completed work will be within tolerances set out in CSA A23.1.
- 3.11.2 These tolerances are acceptable with regard to structural requirements. Interfacing tolerances may not be compatible with the above. Review and coordinate interfacing tolerances so various elements come together properly.

**End of Section**

**1.0 GENERAL****1.1 Documents**

- 1.1.1 This Section, along with the Drawings, forms part of the Contract Documents and is to be read, interpreted, and coordinated with all other parts.

**1.2 Description of Work Included**

- 1.2.1 Provide all labour, materials, equipment, and services necessary to supply and install cast-in-place concrete work shown or indicated in Contract Drawings and Specifications including concrete toppings, bases, sumps, curbs, posts, manholes, pits, paving, sidewalks, equipment bases or curbs, grouting of baseplates, etc.
- 1.2.2 Coordinate concrete placement fully with other trades. Confirm other related work, such as inserts, dowels, sleeves, reinforcement, etc., is complete before placing concrete.

**1.3 Related Work Specified Elsewhere**

- 1.3.1 Section 03 00 50 – Testing of Concrete and Reinforcement
- 1.3.2 Section 03 11 00 – Concrete Forming and Accessories
- 1.3.3 Section 03 20 00 – Concrete Reinforcing
- 1.3.4 Section 03 35 00 – Concrete Finishing
- 1.3.5 Section 05 12 00 – Structural Steel Framing
- 1.3.6 Section 05 31 00 – Steel Decking

**1.4 Reference Standards**

- 1.4.1 Concrete work shall conform to requirements of the following Building Code and Standards unless otherwise required by this Specification:
- .1 Ontario Building Code - 2012 0 REG 88/19
  - .2 CSA A23.1/CSA A23.2 – Concrete Materials and Methods of Concrete Construction / Test Methods and Standard Practices for Concrete
  - .3 CSA A23.3 – Design of Concrete Structures
  - .4 CSA S413 – Parking Structures
  - .5 CSA A3000 – Cementitious Materials Compendium
  - .6 ACI 347 – Guide to Formwork for Concrete
  - .7 CSA S269.1 – Falsework and Formwork
- 1.4.2 Revision date of referenced codes, standards, and guidelines shall be as indicated in the above referenced Building Code. Where no reference is made within the Building Code, the latest published edition shall be used.

- 1.4.3 Where the Standard is referenced in this Specification, it means documents specified in this clause and their referenced Standards.
- 1.4.4 Keep a copy of A23.1/A23.2 and ACI 506.2 on site and available for reference for duration of the Work.
- 1.4.5 Where there are differences between the Specifications and Drawings and the codes, standards, or acts, the most stringent shall govern.

## **1.5 Definitions - For This Section**

- 1.5.1 "Owner", "Contractor", and "Consultant" per the General Conditions and Definitions.
- 1.5.2 "Specialty Engineer" is a Professional Engineer registered in Ontario responsible for components designed by Contractor and who seals and signs shop drawings.
- 1.5.3 "Standard" and "Standards" mean reference standards listed under "Reference Standards" in this Section.

## **1.6 Submittals**

- 1.6.1 Keep a record at the job site showing time and place of each pour of concrete, together with a transit-mix delivery slip certifying contents of pour. Make the record available to the Owner for inspection upon request. Upon completion of this portion of work, submit placing records and delivery slips to the Owner.
- 1.6.2 Submit details of proposed methods of concrete curing and provisions for weather protection to the Consultant for review.
- 1.6.3 Submit plan locations and details of construction joints for the Consultant's review.
- 1.6.4 Certificates
  - .1 The concrete supplier shall have a current "Certificate of Ready Mixed (or Mobile Mix) Concrete Production Facilities," as issued by the National Ready Mixed Concrete Association (NRMCA). The certificate shall be submitted to the Consultant upon request.
  - .2 When requested, prior to beginning work and when any change in materials or source of supply is proposed, provide the following certificates prepared by an independent inspection company. The cost of this work shall be borne by the Contractor.
    - .1 Certification that all raw materials used in the production of concrete proposed for the work comply with requirements of the specifications and CSA A23.1. Specifically, the Contractor must confirm that aggregates used will not react with alkalis in the concrete to cause deleterious expansion.
    - .2 Certification that compressive strength, water-cement ratio, slump, entrained air content, and other specified properties will be met using the proposed mixes.

- .3 Certification that classes of exposure C-1, A-1, and C-XL will meet the 56-day limits specified in CSA A23.1 for the rapid chloride permeability test using the proposed mixes.
- .4 The concrete supplier shall submit representative chloride permeability test data distributed over a period of 56 days for concrete exposure classes C-1, A-1, and C-XL with and without calcium nitrite corrosion inhibitor or any other admixture containing ionic salts.
- .3 When requested, the concrete supplier shall submit their most current "Concrete Mix Design Statistical Analysis" records for the proposed concrete plant. These records shall indicate the concrete supplier's average strength, standard deviation, coefficient of variation and target strength, as per the requirements of CSA A23.1 and the NRMCA. Data included in this statistical analysis shall be from the last 12 months.
- .4 Concrete Quality Plan
  - .1 When requested, submit a complete "Concrete Quality Plan", in the format provided by the NRMCA.
- .5 Preconstruction Trial Batches
  - .1 A detailed trial-batching program shall be carried out as indicated below for the following concrete mixes:
    - .1 All HVSCM mixes
  - .2 The purpose of the program is to allow the concrete supplier to demonstrate that their proposed concrete mix design meets the requirements of the contract documents.
  - .3 The program is to gain data on strength, shrinkage, and modulus of elasticity.
  - .4 At least four weeks prior to the trial-batching program taking place, the concrete supplier shall submit a detailed plan outlining the methodology, extent of concrete quality testing, schedule, and the like for the trial-batching program.
  - .5 The trial-batching program, including all necessary tests, shall be carried out by the concrete supplier at no additional expense to the Owner.
  - .6 The trial-batching program and all related tests are to be witnessed by an independent inspection and testing company appointed by the Owner.
  - .7 The concrete supplier shall allow free access to representatives of this company to make checks and any additional tests they feel are necessary, on behalf of the Owner.
  - .8 The trial-batching program shall involve the production of at least three truckloads or 20 cu. m of the required concrete.

- .9 The time from batching to discharge shall be equivalent to the typical haul time that is anticipated between the batching plant and the job site.
- .10 Trial Batches
- .1 Laboratory trial mixes, followed by full-size batch tests, shall be made to demonstrate that the materials, mix formula, and production techniques chosen will produce concrete meeting the requirements for the job. The following properties, as applicable to the work, shall be evaluated in the trial: workability, air content, finishability, setting time, temperature development, hardened air-void parameters, strength, and durability. If recent and adequate test data exists, the Owner may waive this requirement. If materials or placing conditions change significantly, further trials may be necessary.
- .2 Contractor shall submit a list of proposed locations for trial pours to be completed.
- .3 Contractor shall conduct on-site trial pours with trial mixes of concrete noted in section 6.1.
- .11 As-Built Drawings
- .1 Mark on a complete set of final reproducible drawings any changes, additions, or deletions that occur during construction as a result of the Contractor's work, change orders, or for any other reason.
- 1.6.5 Submit Environmental Product Declarations (EPDs) compliant with CSA-ISO 14025:07 (R2022) for each concrete mix design product proposed on the project.
- .1 Product EPDs must be third party certified, including external verification, or alternatively producers may submit an industry-wide EPD in which the manufacturer is explicitly recognized as a participant by the program operator.
- .2 The maximum embodied carbon for each type of member utilized shall not exceed the values below unless approved by the Consultant.

Member Type	Maximum kg CO <sub>2e</sub> / m <sup>3</sup>	Product
Piers	270	Lafarge ECOPact GWP Range (Upper)
Topping on Steel Deck	215	Lafarge ECOPact GWP Range (Upper)
Topping	215	Lafarge ECOPact GWP Range (Upper)

Foundation Slab	270	Lafarge ECOPact GWP Range (Upper)
Footing	236	Lafarge ECOPact GWP Range (Upper)
Foundation Walls	326	Ontario Industry Average
Stairs	215	Lafarge ECOPact GWP Range (Upper)
Core Walls	270	Lafarge ECOPact GWP Range (Upper)

- 1.6.6 Submit third party certified documentation identifying the following information:
- .1 Global Warming Potential (GWP in kg / tonne), CO<sub>2</sub>e;
  - .2 Depletion of the stratospheric ozone layer, in kg CFC -11;
  - .3 Acidification of land and water sources, in moles H<sup>+</sup> or kg SO<sub>2</sub>;
  - .4 Eutrophication, in kg nitrogen or kg phosphate;
  - .5 Formation of tropospheric ozone, in kg NO<sub>x</sub>, kg O<sub>3</sub>, or kg ethane; and
  - .6 Depletion of non-renewable energy resources, in MJ.
- 1.6.7 Submit a letter stating the total weight and volume of all products that are extracted, manufactured, and purchased within 160 km (100 mile) radius.
- 1.6.8 Submit a letter stating the total weight and volume of waste (returned or unused concrete) diverted from landfills. Provide details of how the waste was recovered, reused, or recycled.

## 2.0 **PRODUCTS**

### 2.1 **General**

- 2.1.1 Products shall satisfy requirements of the Standard unless otherwise specified herein or on Drawings.
- 2.1.2 Provide samples of materials upon request.
- 2.1.3 All cast-in-place concrete to be Lafarge ECOPact GWP Range (Upper) except for foundation walls.

### 2.2 **Materials**

- 2.2.1 Aggregates shall be natural stone and conform to the Standard. If recycled aggregate is available:
- .1 Utilization shall be in elements as approved by the Structural Consultant.
  - .2 Use shall be limited to maximum 25% of mass proportion of total aggregates.

- .3 Recycled aggregates may be used if proven track record of acceptable use in concrete can be demonstrated. Aggregate shall meet requirements of ASTM C33.
- 2.2.2 Mixing water shall conform to the Standard.
- 2.2.3 Air entraining admixtures to the Standard.
- 2.2.4 Pozzolanic admixtures may be used and shall conform to the Standard.
- 2.2.5 Calcium chloride, as either a raw material or a constituent in other admixtures, shall not be used unless approved in writing by Consultant.
- 2.2.6 Curing compounds shall conform to Specification and also be compatible with specified floor hardeners, covering adhesives, and waterproofing compounds.
- 2.2.7 Grout shall be pre-approved, pre-mixed, and non-shrink conforming to the Standard. Exposed grout shall be non-staining, cement grey in colour.
- 2.2.8 Modulus of Elasticity (E): For each concrete mix design,
  - .1 average (mean) of Modulus of Elasticity (as measured by appropriate testing) at all times during construction is to be not less than value shown on structural Drawings, or not less than  $4,500\sqrt{f'c}$  MPa if no value is shown on structural Drawings.
- 2.2.9 Concrete: Normal density concrete with air-dry density of  $23 \pm 1$  kN/cu. m. Conform to CSA A23.1.
- 2.2.10 Cement Type: General Use Portland Cement (Type GU) or Low Heat of Hydration Portland Cement (Type LH) meeting requirements of CSA A3000.
- 2.2.11 Admixture:
  - .1 Corrosion Inhibiting Admixture: Calcium nitrite based corrosion inhibitor, "DCI" or "DCI(S)" by W.R. Grace & Co. or Masterlife CI 30 by BASF Construction Chemicals (or approved alternative), shall be added at rate of 10 L/cu. m of concrete where required on structural Drawings. Corrosion inhibitor shall contain  $30 \pm 3\%$  of calcium nitrite by weight. Selection of "DCI", "DCI(S)" or "CI 30" (or approved alternative) shall be as directed by admixture supplier, based on anticipated placing and curing conditions and specific concrete mix design selected.
- 2.2.12 Shrinkage Control Fibres: "Dramix" steel fibres by Bekaert or approved alternative, 60/1.05.
- 2.2.13 Bonding Agent: Use Sika Sikdur 32 epoxy bonding agent for bonded topping installations.
- 2.2.14 Curing Compound: Conform to CSA A23.1.
- 2.2.15 Grout Beneath Base Plates: Non-shrink, non-metallic, flowable grout, In Pakt or approved alternative having a compressive strength at 28 days of at least 35 MPa (5 ksi). Where grout is exposed to view or weather, use non-ferrous grout.

**2.2.16 Supplementary Cementing Materials (SCMs)**

- .1 It is anticipated that one or more supplementary cementing materials will have to be used in concrete to produce a mix with acceptable fresh and hardened concrete properties and acceptable thermal characteristics during hardening. Materials will be one or more of the following:
  - .1 Granulated blast furnace slag
  - .2 Fly-ash
  - .3 Silica fume
- .2 SCMs – fly ash, granulated blast furnace slag, or silica fume – shall comply with requirements of CSA A23.1 and A3000.
- .3 Supplier shall submit evidence satisfactory to Owner to demonstrate that storage and dispensing facilities for SCMs do not have deleterious effects on materials themselves. These facilities will not expose these materials to such effects as agglomeration or balling of particles, separation or change in effective particle size of solids in slurries, freezing and thawing, or excessive heat.

**2.2.17 Aggregates**

- .1 Concrete supplier shall demonstrate by appropriate tests and test results that aggregates chosen have potential to meet design strength requirements specified herein.
- .2 Coarse Aggregate: Crushed rock conforming to CSA A23.1. Maximum size of coarse aggregates shall be 20 mm but smaller maximum sizes may be used.
- .3 Fine Aggregate: Natural and conforming to CSA A23.1.

**2.2.18 Unshrinkable Fill**

- |    |   |                         |
|----|---|-------------------------|
| .1 | Cement Type   | General Use GU Portland |
| .2 | <u>Minimum</u> 24-Hour Strength   | 0.07 MPa (10 psi)       |
| .3 | <u>Maximum</u> 28-Day Strength  | 0.4 MPa (60 psi)        |
| .4 | Class of Exposure   | N/A                     |
| .5 | Size of Coarse Aggregate  | 20 mm to 40 mm          |
| .6 | Slump at Point of Discharge   | 150 mm to 200 mm        |
| .7 | Calcium chloride or pozzolanic mineral admixtures shall not be used. Air entraining admixtures may be added if desired. |                         |

---

### 3.0 EXECUTION

#### 3.1 General

- 3.1.1 Concrete work shall be in accordance with the Standard unless otherwise specified herein or on Drawings. Work shall be executed only by experienced and skilled workers.
- 3.1.2 Notify Consultant at least 24 hours before concrete is placed to allow Consultant to review the work.
- 3.1.3 Prior to initial supply of concrete to project, schedule a “Pre-Pour Meeting” as outlined in Concrete Supplier’s Concrete Quality plan.
- 3.1.4 Waste Management
  - .1 Designate location or uses for excess concrete prior to placing of concrete.
  - .2 Designate location for cleaning out concrete trucks prior to unloading of concrete. Options could include but are not limited to:
    - .1 Company-owned site for that purpose (meeting environmental standards).
    - .2 On-site area to be paved later in project.

#### 3.2 Mix Designs

- 3.2.1 Concrete mixes shall be proportioned by the supplier to meet the compressive strength, exposure class, and other performance specifications noted in the contract documents. In addition, concrete mix design shall satisfy the transport, placing, and finishing requirements of the Contractor. All concrete shall be normal weight unless noted otherwise. Concrete types are specified in accordance with CSA A23.1 Table “Alternate methods for specifying concrete”, Alternate 1.
- 3.2.2 Concrete mix design is the responsibility of the supplier, including the use of admixtures, alone or in combination. The supplier is also responsible for ensuring the plastic and hardened properties of the concrete meet the construction and specified requirements. This includes the long-term performance of the hardened mix.
- 3.2.3 Suppliers shall provide an embodied carbon breakdown for all concrete utilized in the project for review and approval:
  - .1 The breakdown shall be provided prior to the start of construction indicating the total embodied carbon (kg CO<sub>2</sub>e).
  - .2 The breakdown shall also be provided at the end of the project with the values updated to reflect the final as-built quantities and resulting embodied carbon (kg CO<sub>2</sub>e).
  - .3 The breakdown shall be a tabular submittal showing all mixes, quantities and embodied carbon based on accompanying EPDs as outlined below.

- .4 Refer to Division 1 for the maximum allowable upfront (A1-A3) kgs of embodied carbon.
- .5 The maximum embodied carbon for reinforcing steel shall not exceed 415 kg of CO<sub>2</sub>e / tonne.
- 3.2.4 Aggregates shall be natural stone and conform to the Standard. If recycled aggregate is available, use shall be limited to a maximum of 25% of the mass proportion of total aggregates. Recycled aggregates may be used if a proven track record of acceptable use in concrete can be demonstrated. All aggregate shall meet the requirements of ASTM C33.
- 3.2.5 The mix designs shall take full advantage of Supplementary Cementing materials (SCMs), such as fly ash, silica fume, and blast furnace slag, to reduce the cement content of concrete. SCMs shall conform to the Standard.
  - .1 The following information should be submitted in a letter signed by the Specialty Engineer representing the concrete supplier / manufacturer:
  - .2 The reduction in Portland cement from Base Mix to Actual SCM Mix (as a percentage of the base mix), where Base Mix is defined below. This can be submitted as a total reduction of Portland cement for all the concrete mixes used on the project.
  - .3 Note: The Portland Cement Content (kg/cu. m) for each Base Mix is to be calculated as follows:  
  

$$\text{Portland Cement Content of Base Mix (kg/cu m)} = \text{Design strength values in MPa at 28 days} \times K$$

Where  $K=10$  for non-air-entrained concrete, or  $K=12.5$  for air-entrained concrete
  - .4 The cement reduction percentages by element are to be used as minimum on this project. These percentage reductions in cement should be achieved without affecting cost or schedule for the project.
  - .5 Manufacturer of concrete admixtures to confirm compatibility of product with cement reduction/addition of SCM's percentages.
  - .6 Concrete mixes shall not have a SCM's in quantities, which lead to increased rates of carbonation.
- 3.2.6 Pump mix slumps shall also conform to the above.
- 3.2.7 Water/Cement ratios and air contents for exposure class shall be as per the Standard.
- 3.2.8 The proposed mixes shall be submitted to the Consultant and Testing Agency for review.
- 3.2.9 The mix designs shall note the constituents by the properties required by the structural drawings, and the structural elements for which the mix is to be used.

**3.3     Testing**

3.3.1 Per Section 03 00 50.

**3.4     Samples**

3.4.1 Contractor shall submit a list of proposed locations for trial pours to be completed (e.g. in footing elements, in the basement level, or in a section of the parking slab-on-grade).

3.4.2 Contractor shall conduct on-site trial pours with for all mixes noted in section 1.6.4.5.1. The trial pours shall include finishing and curing methods to establish appropriate techniques and durations for the project. The following properties shall be evaluated in the trial: workability, air content, finishability, setting time, temperature development, hardened air-void parameters, strength, and salt-scaling durability (as per modified standard). The Contractor shall repeat samples for any rejected work.

3.4.3 Finishers not sufficiently experienced with finishing high volume supplementary cementitious mixes (HVSCM's) such as, but not limited to high volume fly ash (HVFA) concrete shall practice slab finishing techniques on footing elements to gain the required experience.

**3.5     Placing of Concrete**

3.5.1 Conveying and placing of concrete is to conform to the Standard.

3.5.2 Consolidate concrete by means of vibrators of appropriate size operated by experienced workers.

3.5.3 Use of vibrators to transport concrete is not permitted.

3.5.4 Discard cement slurry used to prime concrete pumps and do not place in project.

3.5.5 Immediately before placing concrete, clean forms and reinforcement of foreign matter.

3.5.6 Maximum time limit of 120 min from time of initial mixing to complete discharge shall be observed. Exemptions to maximum time limit, if required, shall be agreed upon by Engineer, Owner, and concrete supplier prior to placement of concrete. In some circumstances, set retarders or hydration stabilizers may be used to extend discharge time.

3.5.7 During hot weather conditions, as defined by CSA A23.1, do not use concrete mixed more than 1 hour after introduction of mixing water.

3.5.8 Allow 24 hours minimum to elapse after placing concrete in columns, piers, or walls before placing concrete in beams or slabs supported thereon.

3.5.9 Prior to pouring concrete elements directly supported above, remove forms to such an extent to allow Architect/Owner/Engineer to review quality of exposed column surfaces. Provide necessary protection to exposed surfaces upon completion of review.

- 3.5.10 Place concrete on steel joist and steel deck floors in a manner that avoids piling up of concrete. Do not drop concrete directly from buckets, but employ suitable means of distribution. Wet down deck during hot weather prior to concreting.
- 3.5.11 Remove concrete spilled onto forms around hoisting equipment before depositing concrete in these areas.
- 3.5.12 Pumping Concrete
- .1 Pumping or pneumatic placing of concrete shall only be used if velocity of discharge is reduced to a point where no separation or scattering of concrete occurs, and consistency of mix has been designed to allow such a system with no adverse effects on quality of concrete.
  - .2 Excess grout or mortar used to lubricate pipelines, or washout water, must not be discharged into forms.

### **3.6 Openings and Inserts**

- 3.6.1 Notify trades sufficiently in advance to make provisions for openings, inserts, and fasteners. Cooperate with trades in forming and setting of slots, sleeves, bolts, dowels, hangers, inserts, conduits, clips, etc. Embedded hardware may be subject to review by Consultant.
- 3.6.2 Openings and sleeves shown on structural Drawings must be confirmed with mechanical, electrical, and architectural Drawings.
- 3.6.3 Openings and sleeves not shown on structural Drawings must be approved by Consultant.
- 3.6.4 Do not pass sleeves, ducts, pipes, or other openings through joists, beams, columns, or wall zones without written approval of Consultant.
- 3.6.5 Do not eliminate, cut, or displace reinforcement to accommodate hardware. If inserts cannot be located as specified, obtain approval of modifications by Consultant before placing concrete.

### **3.7 Construction and Control Joints**

- 3.7.1 Construction joints shall conform to the Standard except that for horizontal joints in walls, other than retaining walls, it will be sufficient to place fresh concrete on a clean rough surface unless directed otherwise by Consultant or otherwise noted on structural Drawings.
- 3.7.2 Joints in slabs-on-grade shall be located as indicated on structural and/or architectural Drawings. Unless noted otherwise on Drawings, a joint in slab-on-grade may be a pour joint, trowelled joint, saw cut, or other pre-approved method. Depth of joints shall be minimum 1/4 of thickness of slab. Saw cut joints are to be completed within 12 hours of placing. Submit alternative joint details in writing to Consultant.
- 3.7.3 Construction joints in walls and columns shall occur at top of slab and underside of slab/beam systems unless noted otherwise on structural Drawings.

- 3.7.4 Construction joints not shown in Drawings or Specifications shall be subject to approval of Consultant. Consultant may require keys or extra reinforcing to be provided at Consultant's discretion with associated costs borne by Contractor.
- 3.7.5 Existing concrete surface at construction joints shall be brought to a saturated surface dry condition immediately prior to placement of concrete.
- 3.7.6 Construction joints exposed to view may be subject to non-structural review by Consultant.
- 3.7.7 Unless noted otherwise on Drawings, control joints in walls are to be located at maximum spacing of 9 m (30') on center and detailed as indicated on structural Drawings.
- 3.7.8 Supply and install pre-molded waterstops in construction joints where indicated on Drawings. Weld joints to make watertight. Install waterstops in accordance with manufacturer's specifications and recommendations. Waterstop procedures require approval of Consultant.
- 3.7.9 Obtain approval from RJC for location and details of construction joints not shown.
- 3.7.10 Maximum length of concrete slab pour shall be 40 m (120'-0).
- 3.7.11 Maximum length of concrete foundation wall pour shall be 15 m (50').
- 3.7.12 Maximum height of concrete pour shall be 5 m (15'-0).
- 3.7.13 If construction joint (including joints around temporary openings) will be exposed in its permanent condition, such as in a parking garage, joint must be caulked as outlined under Materials section.

### **3.8 Curing and Protection**

- 3.8.1 Curing procedures shall be in accordance with the Standard. Alternate methods may be used, with Consultant's approval, providing they produce concrete that meets Contract Documents.
- 3.8.2 Cold and hot weather protection shall comply with the Standard or requirements on structural Drawings, whichever are more rigorous.
- 3.8.3 Concrete placed during extreme drying conditions shall satisfy A23.1.
- 3.8.4 (Reference Standard CSA A23.1/A23.2) Submit plan for curing to Owner, for review and approval, together with other tender documents. Prepare curing plan in accordance with the Standard, including:
  - .1 Method for protecting concrete from evaporation of surface moisture from fresh concrete.
  - .2 Type of curing material to be used.
  - .3 How surface will be kept moist and quality control requirements for keeping surface moist.
  - .4 Time of initiation and duration of curing.

.5 Provisions to address potential problems such as high winds and hot and cold weather.

.6 Limitations of access, if any, to surfaces being cured.

3.8.5 Concrete mixes that meet definition of HVSCM-1 and where classes of exposure C-1, A-1, F-1, S-1, and S-2 apply shall have Extended Curing. For other exposure classifications, concrete mixes that meet definition of HVSCM-1 or 2 shall have Additional Curing.

- $\text{HVSCM-1} = \text{FA}/40 + \text{S}/45 > 1.00$

- $\text{HVSCM-2} = \text{FA}/30 + \text{S}/35 > 1.00$

where FA = fly ash (Type F, CI1, or CH content of concrete (% mass of total cementing materials) and S = slag content of concrete (% mass of total cementing materials)

- Additional Curing = 7 days at  $> 10^{\circ}\text{C}$  for a time necessary to attain 70% of specified strength. When using silica fume concrete, additional curing procedures shall be used. See Standard.

- Extended Curing = wet-curing period of 7 days. Curing types allowed are ponding, continuous sprinkling, absorptive mat, or fabric kept continuously wet.

3.8.6 Obtain approval of Owner for proposed means of monitoring concrete curing conditions. Contractor is responsible for confirming completion of curing.

3.8.7 Protect concrete in accordance with CSA A23.1, concrete supplier's requirements, and as specified herein to prevent freshly deposited concrete from freezing, being exposed to abnormally high temperatures or temperature differentials, premature drying, and moisture loss for period of time necessary to develop specified properties of concrete.

3.8.8 Protection of Completed Work

.1 At all times during the work, protect exposed concrete, exposed masonry, and other exposed members from staining or becoming coated with concrete leakage due to continuing concreting operations. Members that become coated may be classified as defective by Consultant.

.2 Protect exposed members from staining due to rusting of reinforcement projecting beyond construction joints.

.3 Take suitable measures to prevent spalling and cracking damage occurring to structure due to water freezing in expansion joints, small holes, slots, or depressions, and take suitable measures to prevent damage occurring to foundations and the like due to frost action in soil or backfill.

- .4 Application of de-icing salts on completed work is not permitted.

#### 3.8.9 Wet Curing

- .1 Following provisions apply to slabs in following locations:
  - .1 Parking Garage
- .2 Basic Curing Period: Protect concrete from premature drying and extremes of temperatures, and wet cure at minimum temperature of 10°C for three consecutive days. Wet curing shall commence immediately after placement and finishing of concrete.
- .3 Additional Curing for Durability: Immediately following the Basic Curing Period, continue to wet cure concrete (at minimum temperature of 10°C for an additional four consecutive days or until concrete reaches 70% of its 28-day compressive strength, whichever is greater.
- .4 Wet curing is to be achieved using one or more technique as outlined in CSA A23.1.
- .5 If absorptive mat or fabric material is used, it is imperative that it be kept continuously wet by means of sprinklers, soaker hoses, or another acceptable means.
- .6 Use of curing compounds will not be permitted in these areas.
- .7 When requested, submit detailed description of procedures that will be employed to wet cure.
- .8 As a minimum, procedures shall indicate:
  - .1 method for protecting concrete from evaporation of surface moisture from fresh concrete;
  - .2 type of curing material to be used;
  - .3 how surface will be kept moist and quality control requirements for keeping surface moist;
  - .4 time of initiation and duration of curing;
  - .5 provisions to address potential problems such as high winds and hot and cold weather; and
  - .6 limitations of access, if any, to surfaces being cured.
- .9 Submit 300 mm x 300 mm (12" x 12") sample of each type of material (absorptive mat, fabric, plastic film, waterproof paper etc.) that will be used to wet cure concrete.

### 3.9 **Slabs-on-Grade**

- 3.9.1 Do not place concrete slabs-on-grade until specified sub-floor material has been placed, inspected, and approved.
- 3.9.2 Do not place concrete on a frozen sub-grade, or on one that contains frozen materials.

- 3.9.3 Do not place concrete on sub-grade that has been frozen and thawed until sub-grade has been reviewed by geotechnical engineer and approved. If, in geotechnical engineer's opinion, bearing capacity of sub-grade has been compromised, remove affected materials and replace with compacted granular fill at no additional cost to Owner.
- 3.9.4 Upon approval of placement of sub-floor material and setting of reinforcement, place and consolidate concrete, and finish and cure as specified herein.
- 3.9.5 Where slab-on-grade is exposed to de-icing chemicals, provide approved sealant at joint between slab-on-grade and abutting surfaces.
- 3.9.6 Saw-cut slab-on-grade as shown with maximum length between saw-cuts of 4.5 m (15' 0"). Arrange panels as shown or to Consultant's approval.
- 3.9.7 Carry out cutting in accordance with recommendations contained in CSA A23.1, but in any event between 6 and 18 hours after placement of concrete.
- 3.9.8 After period of at least 28 days, fill saw-cuts with mortar containing cement, sand, and latex bonding agent. Ensure that joints to be filled are clean, dry, and free of foreign matter.
- 3.9.9 Mask edges of saw-cuts as required to prevent concrete floors from becoming stained.
- 3.9.10 Construction joints may be provided in slabs-on-grade so that pours on any one day may be kept to reasonable sizes. Locate construction joints to the Consultant's approval.

### **3.10 Toppings**

- 3.10.1 Conform to CSA A23.1 and requirements noted below unless noted otherwise in Contract Documents.
- 3.10.2 Set screeds and bulkheads rigidly and accurately to prevent displacement during concreting.
- 3.10.3 Special provisions for bonded and unbonded toppings:
  - .1 Maximum pour size for bonded and unbonded toppings is to be limited to 100 sq. m.
  - .2 Maintain one-to-one length-to-width aspect ratio for all pours, where extent and geometry of topping permits.
  - .3 Toppings are to be poured in a "checkerboard" pattern to minimize effects of shrinkage. Adjacent sections of topping shall be poured no sooner than three days after adjoining section was poured.
  - .4 Ensure temperature of base course is 10°C minimum prior to pouring toppings.
  - .5 Provide hot and cold weather protection for toppings in accordance with CSA A23.1.
  - .6 Placing and Finishing Toppings

- .1 Place and finish toppings in accordance with CSA A23.1.
- .7 Curing
  - .1 Continuously wet cure bonded toppings for minimum seven days.
- .8 Jointing
  - .1 Bonded toppings do not require special provisions with respect to jointing provided provisions noted above are adhered to.
  - .2 Location of joints in topping shall match those in base course.

#### 3.10.4 Unbonded (Loose Laid) Toppings

- .1 Unbonded or loose laid toppings are constructed by applying topping mixture over a bond breaker and hardened concrete base, to which no bonding agent has been applied. By definition, unbonded toppings are specifically designed to not bond to concrete base.
- .2 Base Course Finishing and Preparation
  - .1 Base courses that are to receive unbonded or loose laid toppings are to be finished smooth by means of a steel trowel.
- .3 Placing and Finishing Toppings
  - .1 Place toppings on bond breaker and finish toppings in accordance with CSA A23.1.
- .4 Curing
  - .1 Cure unbonded toppings in accordance with CSA A23.1.
- .5 Jointing
  - .1 Unbonded toppings are to be sawcut, per typical detail for slabs-on-grade, at maximum spacing of 3.0 m (10 ft.) in both directions, unless noted otherwise. For toppings that are to receive hard architectural floor finishes, jointing shall be laid out in accordance with Architect's requirements and is subject to final approval by Architect.

3.10.5 Repair cracks in concrete toppings. Extent of repair and method of crack repair must meet requirements of flooring installation contractor and Owner.

### 3.11 Making Good

3.11.1 Where directed by Consultant, rectify temporary openings left in concrete construction around pipes, ducts, and the like using mortar of same proportions as surrounding work. Reinforce mortar with welded wire fabric where openings exceed 75 mm (3"). Roughen existing surfaces to receive mortar or apply suitable bonding agent such that mortar will be securely bonded to existing concrete.

**3.12     Unshrinkable Fill**

- 3.12.1 Unshrinkable fill is intended for use locally in place of granular backfill below slabs-on-grade or within excavations where compaction of granular material is difficult to achieve. It is not intended for use below footings or around foundation walls, tunnels, laterally loaded caissons, etc., where vertical and/or lateral structural bearing capacities are required. Obtain written approval from Consultant prior to using unshrinkable fill.
- 3.12.2 Place unshrinkable fill material at a slump between 150 and 200 mm (6" and 8"). Material shall flow into excavation to fill the entire space. Take care so no air is entrapped beneath horizontal projections or in other locations within excavation.
- 3.12.3 Where bracing, shoring, and/or sheeting is used to support sides of excavation or to prevent movements that could damage other services or adjacent pavements, this support system shall be removed as backfilling proceeds.
- 3.12.4 If excavation is within travelled portion of roadway, cover it for at least 24 hours with steel plate of sufficient strength to support traffic during this period. Where road traffic is not to be accommodated, cover backfilled excavation with wooden planking or other protection for users of road allowance until unshrinkable fill will support weight of an adult person.

**3.13     Grouting Beneath Base Plates**

- 3.13.1 Grout beneath plates bearing on concrete with approved non-shrink flowable grout. Conform with manufacturer's directions for mixing and placing grout. Completely fill voids below plates. Fill voids left by shims after shims are removed.
- 3.13.2 During cold weather, preheat base plates and footings and maintain temperature at minimum 12°C for 6 days after grouting.

**3.14     Concrete Work at Existing Structure**

- 3.14.1 Before proceeding with work in or adjacent to existing structure, verify that conditions are as indicated on Drawings. If they are not, advise RJC of discrepancies and do not proceed until RJC has given instructions.
- 3.14.2 Prior to proceeding with the work, determine exact founding elevations of existing footings adjacent to new work. Report findings to RJC before proceeding further.
- 3.14.3 Install footings adjacent to existing footings in sequences indicated, and against undisturbed soil as shown, and so stability of existing footings and existing slabs-on-grade are maintained at all times. Temporarily support existing foundations as required.
- 3.14.4 Where openings are shown to be cut into existing structure, drill at corners and saw-cut remainder so saw-cuts do not extend into structure to be retained. Overcutting may require major structural strengthening.

**3.15 Patching**

- 3.15.1 Repair and patch honeycombing, exposed reinforcement, and other defects at own cost to satisfaction of Consultant using procedure preapproved by Consultant. Exposed patching must also be accepted by Consultant.
- 3.15.2 Immediately after removal of forms, remove bolts, ties, nails, or other metal not specifically required for construction purposes or cut back to a depth of 25 mm (1") from surface of concrete.

**3.16 Tolerances**

- 3.16.1 Tolerances shall conform to the Standard or requirements on structural or architectural Contract Documents, whichever are more rigorous.
- 3.16.2 Variations in building lines that result in extension of building over lot lines or restriction lines will not be permitted.
- 3.16.3 These tolerances are acceptable with regard to structural requirements. Interfacing tolerances may not be compatible with the above. Review and coordinate interfacing tolerances so various elements come together properly.

**3.17 Finishing - Floors**

- 3.17.1 Finishing shall conform to CSA A23.1 - Section 7.7 as minimum. Take care during finishing to maintain cambers specified on structural Drawings. See also architectural Drawings and Specifications for additional finish requirements.
- 3.17.2 Unless noted otherwise, floor finishes shall be Class A "Conventional slab on grade and elevated floors" with and overall F-number FF = 20 and FL=15.

**3.18 Finishes - Formed Surfaces**

- 3.18.1 All formed surfaces shall be treated in accordance with CSA A23.1, Section 7.10 as a minimum. See also architectural Drawings and Specifications for additional finish requirements.

**3.19 Openings Through Structural Work**

- 3.19.1 If, after any part of structural work has been completed additional openings are required to be made through structure, inform Consultant. No opening, including cored sleeves, shall be made through completed work without authorization in writing from Consultant.
- 3.19.2 Where location of openings is approved, locate reinforcement by scanning or other positive means as required by Consultant and adjust location of opening so no reinforcement is cut unless specifically approved otherwise in writing by Consultant.
- 3.19.3 In case of precast concrete slabs, holes shall be cut or drilled only by precast concrete fabricator.

**3.20     Rejection of Defective Work**

3.20.1 In event that concrete tests do not conform to requirements of this Specification, or when conditions are such to cause doubt about safety of structure, testing of structure will be undertaken at direction of Consultant. This may entail further concrete tests, coring, or load testing per the Standard, or any other test Consultant deems suitable. Such test shall be made at expense of Contractor and to satisfaction of Consultant.

3.20.2 Where, in opinion of Consultant, material or workmanship fails to meet requirements of Specification, such work may be rejected. Replace or repair rejected work to approval of Consultant and at no additional cost to Owner.

**End of Section**

---

**1 . GENERAL**

**1.1 Intent**

1.1.1 Provide all articles, labour, materials, equipment, transportation, hoisting and incidentals noted, specified or required to complete the work of this Section.

**1.2 Work Included**

1.2.1 Finishing of exterior horizontal concrete surfaces.

**1.3 Related Sections**

1.3.1 Section 32 13 13 – Concrete Paving.

**1.4 References**

1.4.1 ASTM C309-06: Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete.

1.4.2 CSA A23.1-04: Concrete Materials and Methods of Concrete Construction. CSA A23.2-04: Methods of Test and Standard Practices for Concrete.

1.4.3 CSA A23.2-04: Methods of Test and Standard Practices for Concrete.

**1.5 Quality Assurance**

1.5.1 Applicator: person or firm specializing in commercial concrete floor finishing, and with five years documented experience.

**1.6 Project Conditions**

1.6.1 Perform Work only when environmental conditions are as specified in Section 32 13 13 – Concrete Paving.

1.6.2 Ensure that adequate temporary heating is provided as required for cold weather work.

**2 . PRODUCTS**

**2.1 Materials**

2.1.1 Hardener: non-metallic type, Diamag 7 by Sika Canada Inc., Sealtight Type R-Premixed by W. R. Meadows, or Maximent by Degussa.

2.1.2 Water: as specified in Section 03 30 00.

2.1.3 Non Silca- White Lightning.

**3 . EXECUTION**

**3.1 Examination**

3.1.1 Verify existing conditions are ready to receive work.

- 3.1.2 Verify concrete does not contain admixtures which would be incompatible with floor hardener materials or other applied finishes.
- 3.1.3 Beginning of application implies acceptance of existing site conditions.

## 3.2 **Finishing**

### 3.2.1 Exterior finishes

- .1 Broom Finish:
  - .1 After float and or Trowel finishing, flat surfaces to be broom-finished shall be slightly roughed by light brooming with a stiff brush or broom to a uniform non-skid surface to the satisfaction of the Consultant. Textured Broom Finish, when indicated, will have a random swirl, stiff brush finish. Finished surfaces, unless otherwise indicated, shall be true in all planes within 8 mm in 3 m as determined by a 3 m straightedge placed anywhere in the concrete.
- .2 All sidewalks, plazas and patio flat surfaces are to be broom finished.
- .2 Trowel Finish:
  - .1 After float finishing, surfaces to be trowel-finished shall be power-trowelled and finally hand-trowelled once the surface has hardened sufficiently. Finished surfaces shall be true in all planes within 5 mm in 3 m as determined by a 3 m straightedge placed anywhere on the slab. The surface shall have a smooth, even, dense texture free from blemishes.
- .3 Sandblast Finish (applied to Smooth-Formed Concrete):
  - .1 Report to the Consultant, in writing, all defects of surfaces or work prepared by other trades and on unsatisfactory site conditions. Thoroughly examine all surfaces scheduled to be sandblasted to see that they are satisfactory and not liable to impair performance or appearance.
  - .2 Commencement of work shall imply total acceptance of surface and site conditions.
  - .3 Protect work of other trades from damage resulting from the work of this Section. Mask off edges at junction with other materials and with non-sandblasted concrete as required. Make good any resulting damage, to the satisfaction of the Consultant, at no additional cost to the Owner. All concrete surfaces where called for shall be sandblasted so that the resulting surfaces shall have a uniform appearance to match the sample area approved by the Consultant for the class of finish.
  - .4 Execute the work using the required gun technique, proceeding progressively over the entire area being finished to produce a uniform even texture throughout with the same degree of aggregate exposure as that of the approved sample area.
  - .5 Class of Aggregate Exposure shall be as follows:
    - .1 Class 1 (Brush): matrix removed - approx. 0.8 mm: a one-pass brush blast which will remove the cement matrix and expose the fine aggregate.

- .2 Class 2 (Light): matrix removed - approx. 1.6 mm: exposes additional fine aggregate and possibly the edges of some coarse aggregate.
- .3 Class 3 (Medium): matrix removed - approx. 6 mm: exposes the coarse aggregate around the edges.
- .4 Class 4 (Heavy): matrix removed - approx. 9.5 mm: exposes additional coarse aggregate; surface is rugged and uneven.
- .4 Promptly, as the work proceeds and upon completion, clean-up and remove rubbish and surplus material from the Place of the Work. Leave the work area broom clean at the end of each Working Day.

### **3.3 Curing**

- 3.3.1 Cure concrete to CSA A23.1/A23.2.
- 3.3.2 Curing of exposed surfaces shall commence as soon as the concrete has hardened sufficiently to prevent surface damage. Curing of concrete surfaces shall be achieved using one or more of the following methods:
  - .1 ponding or continuous sprinkling;
  - .2 absorptive mat or fabric kept continuously wet;
  - .3 4 mil thick polyethylene plastic film;
  - .4 other moisture-retaining methods as approved by the Consultant.
- 3.3.3 Basic Curing: moist cure concrete for a period of either three days at a minimum temperature of 10 degrees C or for the time necessary to attain 35% of the specified 28 day compressive strength of the concrete.
- 3.3.4 Cure air-entrained concrete an additional four consecutive days (for a total of seven days) at a minimum temperature of 10 degrees C or for the time necessary to attain 70% of the specified 28 day compressive strength of the concrete.
- 3.3.5 The basic curing time shall be extended on all structural concrete until the concrete has achieved sufficient strength for structural safety. (70% of the specified 28 day compressive strength of the concrete unless otherwise directed by the Consultant.)
- 3.3.6 When the air temperature is above 27 degrees C, perform curing to CSA A23.1.
- 3.3.7 During freezing weather, terminate water curing of concrete 12 hours before the end of the protection period.
- 3.3.8 Moisture cure fibre-reinforced slabs for a minimum of 7 days.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the concrete floor sealing work specified herein. This includes, but is not necessarily limited, to:
  - .1 General requirements for concrete floor sealing.
  - .2 Concrete sealers and other topical treatments for concrete.
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 03 30 00 - Cast-in-place Concrete
  - .2 Section 03 35 00 – Concrete Finishing.
  - .3 Section 07 92 00 - Joint Sealants.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.

- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

#### **1.5 Administrative Requirements**

- 1.5.1 Coordination: Coordinate with concrete floor placement and concrete floor curing, and other work having a direct bearing on work of this section.
  - .1 Review Specification for work included under this Section and determine complete understanding of requirements and responsibilities relative to work included, storage and handling of materials, materials to be used, installation of materials, sequence and quality control, Project staffing, restrictions on areas of placement and other matters affecting construction, to permit compliance with intent of this Section.

#### **1.6 Submittals**

- 1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.6.2 Product Data: Submit product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for concrete floor sealing work specified in this Section.
- 1.6.3 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.

- .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
- .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.4 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.5 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with VOC Emissions and VOC Content requirements specified in this Section.
- 1.6.6 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
- 1.7 **Closeout Submittals**
  - 1.7.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
  - 1.7.2 Operating and Maintenance Data: Submit care and maintenance instructions for concrete floor sealing to be included in building operation and maintenance manual.
  - 1.7.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.
- 1.8 **Quality Assurance**
  - 1.8.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
  - 1.8.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
  - 1.8.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and

secondary materials from sources recommended by manufacturers of primary materials.

1.8.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
- .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .3 Provide mock-up area, approximately 10 sq. m (100 sq. ft.) under conditions similar to those which will exist during actual placing, with coatings applied.
- .4 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.9 Delivery, Storage And Handling**

- 1.9.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.9.2 Deliver, store and handle concrete floor sealing materials in accordance with manufacturer's written instructions.
- 1.9.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.9.4 Replace defective or damaged materials with new.

**1.10 Site Conditions**

- 1.10.1 Ambient Conditions:
  - .1 Do not finish floors until interior heating system is operational or a minimum ambient temperature of 10 Deg C (50 Deg F) can be maintained.
  - .2 Ensure concrete substrate is within moisture limits prescribed by flooring manufacturer.
- 1.10.2 Ventilation: Sufficient to prevent injurious gases from temporary heat or other sources affecting concrete.

**1.11 Warranty**

- 1.11.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

---

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 CPD Construction Products.
- .2 Euclid Chemical Canada Ltd.
- .3 Master® Builders Solutions
- .4 Sika Canada Inc.
- .5 W.R. Meadows Inc., Canada

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

2.2.1 Perform Work in accordance with CSA-A23.1/A23.2.

2.2.2 Coordinate with finish flooring Supplier and installer to ensure adequate slab flatness is provided for floor finish scheduled to be installed on slab.

2.2.3 Static Coefficient of Friction: Ensure floor surfaces are stable, firm and slip resistant after completing finishing procedures (where exposed). Provide Products with the following minimum values as determined by ASTM D2047 unless otherwise indicated on Drawings and Schedules:

- .1 Level Surfaces: Minimum 0.6.
- .2 Ramp Surfaces: Minimum 0.8.

2.2.4 Coordinate with finish flooring Supplier and installer to ensure adequate slab flatness is provided for floor finish scheduled to be installed on slab.

2.2.5 Ensure concrete is finished to achieve the following tolerances:

- .1 Under raised access flooring, for surfaces scheduled to have thick-set tile: F (F<sub>F</sub>) 20 and F (F<sub>L</sub>) 15.
- .2 Under Resilient Finishes, Epoxy Finish and Carpeted Areas: F (F<sub>F</sub>) 25 and F (F<sub>L</sub>) 20.
- .3 Under Thin-set flooring, and concrete surfaces exposed to view (sealed concrete): F (F<sub>F</sub>) 35 and F (F<sub>L</sub>) 25.
- .4 Polished concrete surfaces: F (F<sub>F</sub>) 45 and F (F<sub>L</sub>) 35.

2.2.6 VOC Content and Emissions:

- .1 VOC Emissions: For applicable items in this Section, comply with CDPH Standard Method v1.2–2017 (CA Spec 01350) and ensure products are certified per UL 2818, SCS Global Gold, or equivalent.

- .2 VOC Content Requirements: Wet-applied materials used in scope of this Section must conform to the following:
  - .1 Paints and Coatings: SCAQMD Rule 1113 or CARB SCM.
  - .2 Adhesives and Sealants: SCAQMD Rule 1168.
  - .3 Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

## **2.3 Concrete Floor Hardeners**

- 2.3.1 Do not use floor hardeners with air-entrained concrete.
- 2.3.2 Non-Metallic Hardener: Factory pre-mixed dry shake/ dry powder abrasion resistant hardener.
  - .1 Emery Aggregate Hardeners
    - .1 MOH Hardness Scale: Minimum 8.
    - .2 Acceptable Products:
      - .1 "Surflex E" by Euclid Chemical Canada Ltd.
      - .2 "Emeri-Crete SH" by Sika Canada Inc.
      - .3 Approved equivalent.
    - .3 Use in following locations: Ambulance parking garage throughout.

## **2.4 Penetrating Concrete Floor Sealers And Densifiers**

- 2.4.1 Material Tag: This item is noted as "CS-1" on Drawings and Schedules.
- 2.4.2 Blend of silicate and siliconate polymers that penetrate concrete surfaces and chemically react to provide an increase in surface density, durability, and abrasion resistance.
  - .1 Acceptable Products:
    - .1 "Euco Diamond Hard" by Euclid Chemical,
    - .2 "Sikafloor 3S" by Sika Canada Inc.,
    - .3 "CPD Hard-Cure" by CPD Construction Products
    - .4 "Liqui Hard Ultra" by W.R. Meadows Inc., Canada
    - .5 MasterKure HD 200WB (formerly "Kure n Harden") by Master Builders Solutions Canada Inc. (Formerly BASF Canada Inc.)

## **2.5 Accessories**

- 2.5.1 Wet Cure Blanket: Clear polyethylene film to ASTM C171, minimum thickness 0.15 mm complying with maximum allowable moisture loss requirements of ASTM C156.

2.5.2 Concrete Slab Joint Filler: Two (2) component epoxy or polyurea, load-bearing, self-levelling concrete slab joint Filler, 100% solids compound, with a minimum Shore A Hardness of 80, colour to match slab colour

.1 Acceptable Products (Polyurea):

- .1 "Euco QWIKjoint UVR (Polyurea)" by Euclid Canada
- .2 "MasterSeal CR 100" by Master Builders Solutions Canada Inc. (Formerly BASF Canada Inc.)
- .3 Approved equivalent.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Measure for floor flatness ( $F_F$ ) and floor levelness ( $F_L$ ) tolerances for floors to ASTM E1155/ASTM E1155M, within 48 hours after slab installation.
- 3.1.3 Correct the slab surface if the actual  $F$  ( $F_F$ ) or  $F$  ( $F_L$ ) number for the floor installation measures less than required.
- 3.1.4 Correct defects in the floor by grinding or removal and replacement of the defective work. Areas requiring corrective work will be identified. Re-measure corrected areas by the same process.

#### **3.2 Preparation Of Slabs**

- 3.2.1 After concrete has been placed, strike off concrete level and flush to screeds with true straight edge.
- 3.2.2 Immediately after striking off concrete, level and consolidate with wooden darby or bull float. Complete levelling and consolidation before free moisture (bleeding) rises to surfaces.
- 3.2.3 Wait until concrete stiffens sufficiently to sustain foot pressure with only about 6 mm (1/4") indentation.
- 3.2.4 Float concrete with hand float or with power float. If free bleeding water remains on surface at this time, remove it before floating.
- 3.2.5 For concrete exposed to view, rub exposed sharp edges of concrete with carborundum to produce 3 mm radiused edges unless otherwise indicated. Refer to Section 03 30 00 for additional requirements.

- 3.2.6 Use mechanical stripping to remove chlorinated rubber or existing surface coatings.
- 3.2.7 Use protective clothing, eye protection, respiratory equipment during stripping of chlorinated rubber or existing surface coatings.
- 3.2.8 Power screed interior exposed floor slabs with mechanical vibratory screeding equipment. Machine float and machine trowel floor surfaces to smooth, level and dense surfaces free from trowel marks, ridges and depressions, except where specified otherwise. Refer to Section 03 30 00 for additional requirements.
- 3.2.9 Power screed exterior frost slabs with mechanical vibratory screeding equipment. Float using magnesium floats and trowel to level and dense surfaces and finish to sidewalk "swirl" texture.
- 3.2.10 Use hand held vibrators and hand screed, float and trowel areas where power equipment is inaccessible, to same density and surface quality specified for floors finished with power operated equipment.

**3.3 Sawcutting And Filling Of Control Joints And Construction Joints**

- 3.3.1 Saw cut control joints (contraction joints) to CSA-A23.1/A23.2, 24 hours maximum after placing of concrete, and before concrete develops random contraction cracks. Do not postpone sawing operations beyond these time limitations.
- 3.3.2 Refer to Section 03 30 00 for joint requirements for structural work. For other requirements, provide control joints in unreinforced slabs, spaced at maximum 4.5 m on centre in square patterns.
  - .1 Construct control joints for a depth equal to no more than one-fourth of concrete thickness. Do not cut through reinforcement, heating systems and other embedded items.
  - .2 Form control joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades, minimum 3 mm wide, ensuring cutting action will not tear, abrade, or otherwise damage surface.
  - .3 Continuously spray water on saw blade during sawing. Grind edges of sawcuts to eliminate burrs; do not grind to bevel or chamfer joint edges.
  - .4 After sawing and grinding, clean joints with jet of water and blow-out with compressed air. Immediately broom clean, residue caused by sawing operation as work progresses.
  - .5 When cleaned joints are dry and prior to traffic being allowed over area, install temporary filler using polyethylene rope in such joints to prevent contamination.
- 3.3.3 Install joint-filler strips at junctions with slabs-on-grade and vertical surfaces, such as column pedestals, foundation walls, grade

beams, and other locations, as indicated on Drawings and Schedules.

- .1 Do not fill isolation joints, construction joints and control joints sooner than 120 Days after concrete placement. Execute joint sealing during cool, dry ambient conditions when slab is in contracted state to minimize future joint separation at sealant filled joints.
  - .2 Ensure joints are clean and sound. Remove oil, dirt, debris, paint and other materials that may be a bond breaker. Remove temporary filler from sawcut joints. Clean joints and blow with compressed air.
- 3.3.4 Extend joint fillers full width and depth of joint, terminating flush with finished concrete surface, unless otherwise indicated on Drawings and Schedules. Overfill joints during placement. Cut flush or grind flush with floor within 24.

### **3.4      Protection And Curing**

- 3.4.1 Protect concrete floor sealing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades. Comply with CSA A23.1/A23.2 for cold-weather protection and hot-weather protection during curing.
- 3.4.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.4.3 Promptly replace concrete floor sealing work damaged during construction that cannot be satisfactorily repaired.
- 3.4.4 Curing Methods: Cure formed and unformed concrete for at least seven days, or until minimum structural strength of concrete indicated in Section 03 30 00, and as required by CSA A23.1/CSA 23.2 (Table 2) for exposure class and floor finishes specified.

### **3.5      Floor Surface Treatment**

- 3.5.1 Apply dry shake hardener to manufacturer's written instructions on floor surfaces.
- 3.5.2 Apply sealer to manufacturer's written instructions on floor surfaces.
- 3.5.3 After floor treatment is dry, seal control joints and joints at junction with vertical surfaces with sealant.
- 3.5.4 Clean overspray. Clean sealant from adjacent surfaces.

### **3.6      Tolerances**

- 3.6.1 Slab flatness tolerances: in accordance with CSA A23.1 (Table 22) and scheduled floor covering manufacturer's recommendations.

**3.7 Repair/Restoration**

- 3.7.1 Remove and replace concrete that does not comply with requirements in this Section.
- 3.7.2 Protect finished installation in accordance with manufacturer's instructions.

**3.8 Field Quality Control**

- 3.8.1 Manufacturer Services:
- .1 Employ services of a trained concrete technician from staff of surface hardener manufacturer to give assistance to this Section in proper use of material during initial periods of installation.
- 3.8.2 Non-Conforming Work: Replace damaged work which cannot be satisfactorily repaired, restored or cleaned, to satisfaction of Consultant at no cost to Owner.
- 3.8.3 Independent inspection and testing company may be appointed by Owner to carry out inspection and testing as directed by Consultant.
- 3.8.4 Remove defective materials and completed work which fail tests and replace as directed by Consultant.

**3.9 Floor Finishing Schedule**

<b><u>Scheduled Floor Finish</u></b>	<b><u>Concrete Finish Required</u></b>	<b><u>Hardener</u></b>	<b><u>Curing/Sealing Method*</u></b>
Carpet	Steel Trowel	None Required	Curing/sealing compound or Water or poly curing
Resilient Flooring	Steel trowel	None Required	Curing/sealing compound or Water or poly curing
Trowel Applied Composition Flooring (Epoxy, Urethane Acrylic, Neoprene, Polyester):	Steel trowel in accordance with CSA A23.1.	If recommended by composition flooring material manufacturer	Poly curing
Liquid Applied Rubber or Plastic Membrane (Mechanical Waterproofing):	Steel trowel in accordance with CSA A23.1	None required	Water or poly curing
Loading dock and other areas scheduled to receive shake hardened concrete finish	float finish followed by swirl steel trowel	non-metallic shake	Curing/sealing compound or Water or poly curing
Exposed concrete pedestrian ramps	one way broom finish for slip resistance	None Required	Curing/sealing compound or Water or poly curing
Thinset Ceramic and Quarry Tile, and Clay Tile	Steel trowel in accordance with CSA A23.1	None required	Water or poly curing
Ceramic and Quarry Tile, Clay Tile and Brick Tile over mortar bed	Steel trowel followed by blastrack in accordance with CSA A23.1	None required	Water or poly curing
Exposed Concrete	Steel trowel in accordance with CSA A23.1	Non-Metallic Hardener as required.	Curing/sealing compound

---

<b><u>Scheduled Floor Finish</u></b>	<b><u>Concrete Finish Required</u></b>	<b><u>Hardener</u></b>	<b><u>Curing/Sealing Method*</u></b>
Interior Stairs and Ramps	Swirled	Non-Metallic Hardener as required.	Curing/sealing compound or Water or poly curing
Concrete to receive water repellent coating	fine textured float finish	None required	Curing/sealing compound or Water or poly curing

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Polished Concrete Finishing work specified herein. This includes, but is not necessarily limited, to:
- .1 Polished concrete finishing
  - .2 Auxiliary materials for a complete construction.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
- .1 Refer to Section 03 30 00 and 03 35 10 for concrete requirements for polished concrete, including concrete materials, mixture design, placement procedures, initial finishing, and curing.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 Design Reference Sample: Sample designated by Consultant in the Contract Documents that reflects acceptable surface quality and appearance of polished concrete.

### **1.5 Preinstallation Meetings**

- 1.5.1 Preinstallation Conference: Conduct conference at Project site.
- .1 Before submitting design mixtures, review concrete design mixture and examine procedures for ensuring quality of concrete materials. Require representatives of each entity directly concerned with polished concrete to attend, including the following:
    - .1 Contractor's superintendent.

- .2 Independent testing agency responsible for concrete design mixtures.
- .3 Ready-mix concrete manufacturer.
- .4 Cast-in-place concrete subcontractor.
- .5 Polished concrete finishing Subcontractor.
- .2 Review cold- and hot-weather concreting procedures, curing procedures, construction joints, concrete repair procedures, concrete finishing, and protection of polished concrete.

**1.6 Action Submittals**

- 1.6.1 Product Data: Submit in accordance with Division 01 for the following:
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Polished Concrete Finishing work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.6.2 Shop Drawings and Concrete Floor Polishing Schedule: Submit plan showing polished concrete surfaces and schedule of polishing operations for each area of polished concrete before start of polishing operations. Include locations of all joints, including construction joints, contraction joints (control joints) and scoring.
- 1.6.3 Samples: Submit in accordance with Division 01 for each type of product requiring colour selection.

**1.7 Informational Submittals**

- 1.7.1 Concrete Floor Protection Plan: Develop a concrete protection procedure which addresses the following procedures:
  - .1 Communication of protection plan to subcontractors and vendors.
  - .2 Procedures for cleaning up slab spills, including use of and availability of cleaning chemicals and absorptive materials at Site.

**1.8 Quality Assurance**

- 1.8.1 Installer Qualifications: A firm experienced in performing polished concrete finishing similar in material, design, and extent to that indicated for this Project with minimum five years experience, whose work has resulted in applications with a record of successful in-service performance, and that employs workers trained by manufacturer.
  - .1 Submit proof of current certification with manufacturer upon request.

- 
- 1.8.2 Field Sample Panels: After approval of verification sample and before casting concrete, produce field sample panels to demonstrate the approved range of selections made under Sample submittals. Produce a minimum of three sets of full-scale panels, approximately 1200 by 1200 mm minimum, to demonstrate the expected range of finish, colour, and appearance variations.
- .1 Locate panels as indicated or, if not indicated, as directed by Consultant.
  - .2 Maintain field sample panels during construction in an undisturbed condition as a standard for judging the completed Work.
  - .3 Demolish and remove field sample panels when directed.
- 1.8.3 Mock-ups: Before casting concrete, build mock-ups to verify selections made under Sample submittals and to demonstrate typical joints, surface finish, tolerances, and standard of workmanship. Build mock-ups to comply with the following requirements, using materials indicated for the completed Work:
- .1 Build mock-ups in the location and of the size indicated or, if not indicated, as directed by Consultant.
  - .2 Demonstrate curing, finishing, and protecting of polished concrete.
  - .3 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.
- 1.8.4 Source Limitations for Polished Concrete Finishing Materials: Obtain concrete floor liquid treatment products of one manufacturer with resources to provide products of consistent quality in physical properties and resulting appearance.

**1.9 Delivery, Storage, And Handling**

- 1.9.1 Deliver and store products in manufacturer's unopened packaging with labels intact until ready for installation.
- 1.9.2 Store materials off the ground or on pallets, under cover and in a cool, dry location, out of direct sunlight, in accordance with manufacturer's recommendations.
- 1.9.3 Maintain copies of current safety data sheets of components on site. Provide personnel with appropriate safety data information and training as it relates to the specific chemical compounds to be utilized.
- 1.9.4 Close areas to traffic during floor application and after application for time period recommended in writing by manufacturer. Provide temporary protection as specified herein.

- 1.9.5 Protect completed slab to prevent damage by the other trades during floor completion for minimum period of 6 months.

**1.10 Project Conditions**

- 1.10.1 Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.
- 1.10.2 Ensure that substrate materials are dry and free of contaminants. Do not commence with the application unless substrate conditions are suitable.
- 1.10.3 Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.
- .1 Hydraulic powered equipment must be diapered to avoid staining of the concrete.
  - .2 Ensure trades do not park vehicles on slab. If necessary, provide drop cloths under vehicles.
  - .3 Ensure no pipe cutting machine is used on floor slab.
  - .4 Do not place steel on interior slab to avoid rust staining.
  - .5 Ensure acids and acidic detergents do not encounter slab.
  - .6 Always protect slab.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- .1 Curecrete Distribution, Inc./Advanced Floor Products.
  - .2 CPD Construction Products
  - .3 Day1/Lythic
  - .4 Euclid Chemical Canada Ltd.
  - .5 Prosoco
  - .6 W.R. Meadows Inc., Canada
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Design And Performance Requirements**

- 2.2.1 Perform Work in accordance with CSA-A23.1/A23.2 and ACI 310.1.
- 2.2.2 Concrete must finished to achieve the following tolerances: F (F<sub>F</sub>) 45 and F (F<sub>L</sub>) 35.

- 2.2.3 Slab surface must have a consistent look and exhibit a finish that has no evidence of streaking or burnish marks.
- 2.2.4 White residue or hazy appearance is not acceptable.
- 2.2.5 Aggregate Exposure: Concrete Polishing Council - Class A: "Cement Fines" finish (85 – 95 % Cement Fines; 5 – 15 % Fine Aggregate)
- 2.2.6 Polish Level: Concrete Polishing Council - Level 3: Polished.
- 2.2.7 Slip Resistance: finished installation must a minimum Dynamic Coefficient of Friction (DCOF) of 0.42 in accordance with ANSI A326.3 when tested using the BOT 3000 Digital Tribometer and with minimum 0.6 coefficient of friction in accordance with ASTM D2047.
- 2.2.8 Provide flooring products (sealers, densifiers, etc.) complying with CDPH Standard Method for VOC Emissions ( California Specification 01350) for indoor air quality requirements in accordance with UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or other third-party certification agency.

## **2.3 Polished Concrete Flooring System**

- 2.3.1 Material Tag: This item is noted as "POL" on Drawings and Schedules.
- 2.3.2 Penetrating Liquid Floor Treatments for Polished Concrete Finish: Clear, waterborne solution of inorganic silicate or silicate materials and proprietary components; odorless; that penetrates, hardens, and is suitable for polished concrete surfaces.
  - .1 Basis-of-Design:
    - .1 "Consolideck LS" by Prosoco Inc.
    - .2 "Retro-Plate 99" by Curecrete Distribution, Inc./Advanced Floor Products.
    - .3 "Euco Diamond Hard" by Euclid Chemical Canada Ltd.
    - .4 "Liqui-Hard® Concrete Densifier and Chemical Hardener" by W.R. Meadows of Canada
    - .5 "Cipadeck L" by CPD Construction Products
- 2.3.3 Film Forming Protective Treatments: General purpose film forming sealer to treat surfaces to increase resistance damage from water, staining, and abrasion and is suitable for natural polished concrete surfaces.
  - .1 Basis-of-Design (Medium Gloss):
    - .1 "Consolideck PolishGuard" by Prosoco Inc.
    - .2 "RetroGuard" by Curecrete Distribution, Inc./Advanced Floor Products.
    - .3 "Bellatrix" by W.R. Meadows of Canada

- .4 "UltraGuard" by Euclid Chemical Canada Ltd.
- .5 "Cipadeck Shield" by CPD Construction Products

**2.4 Polished Concrete Flooring with Epoxy Topcoat**

- 2.4.1 Material Tag: This item is noted as "EP-3" on Drawings and Schedules.
- 2.4.2 Epoxy Topcoat for Polished Concrete: 100% solids, 2-component epoxy topcoat with gloss finish.
  - .1 Performance Criteria:
    - .1 Tensile Strength: 20 MPa (2900 psi) (ASTM D638).
    - .2 Tensile Elongation: 10% at break (ASTM D638).
    - .3 Impact Resistance: Pass 160 in./lb. (ASTM D2794).
    - .4 Abrasion Resistance: 84 mg loss (ASTM D4060, Taber Abrasion, C-17 Wheel, 1000 cycles).
    - .5 Water Spotting Resistance: Excellent.
    - .6 Bacterial and Fungal Resistance: Does not support growth.
    - .7 Resistance to Battery Acid: Resistant if cleaned within 24 hours.
  - .2 Composition: Two-component, 100% solids epoxy coating.
    - .1 Mix Ratio: 2 parts A to 1 part B by volume.
    - .2 Viscosity (Mixed): 900 cps.
    - .3 Solids Content: 100%.
    - .4 Mixed Weight (Density): 1.2 kg/L (10 lb./US gal).
    - .5 Pot Life: 30 minutes at 23°C (74°F).
    - .6 Thin Film Set Time: 12-16 hours.
    - .7 Foot Traffic (Re-coat Time): 16 hours.
    - .8 Light Vehicular Traffic: 24 hours.
    - .9 Full Cure and Maximum Resistance: 7 days.
    - .10 Hardness (Shore D): 80 (ASTM D2240).
- 2.4.3 Primer: As recommend by manufacturer.
- 2.4.4 Non-Slip Aggregate: Provide properly graded, dry, contaminant-free grit for broadcast into topcoat as required for non-slip surfaces.
- 2.4.5 Basis-of-Design: "Zeradur 100" by Zeraus or approved equivalent.
- 2.4.6 Colour: refer to Finish Schedule on Drawings.

---

**2.5     Auxiliary Materials**

- 2.5.1 Joint Sealants: Provide joint sealants, backings, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer, based on testing and field experience.
- 2.5.2 Water: Potable
- 2.5.3 Temporary Concrete Floor Protection: Provide at all locations upon completion of construction activities. Provide with required accessories for a complete installation.
  - .1 Roll Dimensions (W x L): 38 in x 100 ft (965 mm x 30.5 m). 317 sq ft (29.5 sq m).
  - .2 Acceptable Products: 'Ram Board Plus: Model # RB PLUS 38-100 Ram Board Plus' as manufactured by Ram Board.

**2.6     Equipment**

- 2.6.1 Auto Scrubber Machine: For cleaning operations.
- 2.6.2 Hand Grinder or stand-up edger for edge grinding/polishing.
- 2.6.3 Grinding/Polishing Equipment:
  - .1 Dry grinding/polishing machines complete with dust extraction system, including HEPA filtration vacuum.
- 2.6.4 Diamond Segments:
  - .1 Use heads from the same manufacturers throughout the entirety of the project.
- 2.6.5 Diamond Heads Types:
  - .1 Metal Diamonds: 80 or 150.
  - .2 Hybrid Style Diamonds: 50 or 100.
  - .3 Resin Bonded, Phenolic Diamonds: 100, 200, 400, 800, 1500, and 3000 (if necessary).
- 2.6.6 Burnishing Machine and Burnishing Pads: to produce specified results.
- 2.6.7 Burnishing Machine: High speed burnisher, generating pad speeds of 1,500 RPM or higher, as recommended by protective treatment manufacturer. Dust skirt must be installed at time of work.
- 2.6.8 Burnishing Pads: as recommended by protective treatment manufacturer.

---

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrate, with installer present, for conditions affecting performance of finish. Correct conditions detrimental to timely and proper work. Do not proceed until unsatisfactory conditions are corrected.
- 3.1.2 Prior to application, verify that floor surfaces are free of construction laitance.
- 3.1.3 Commencement of Work implies acceptance of existing conditions.

#### **3.2 Preparation**

- 3.2.1 Remove remaining saw cut residue, form glue, texture overspray, paint drippings, and other built-up material on floor surface with non-powered, hand-held tools and mild cleaning chemicals that will not damage or mar concrete surface.
- 3.2.2 Repair, patch and fill cracks, voids, defects and damaged areas in surface as approved by Consultant. Allow repair materials to cure completely before application of product.
- 3.2.3 Power-sweep floor area with dust-free equipment.
- 3.2.4 Treat oil spots with oil emulsifier and oil absorbent materials to remove oils from below concrete surface. Scrub oil spot areas and remove liquids with vacuum.
- 3.2.5 Scrub floor with automatic scrubber capable of a minimum of 80 pounds head pressure.
- 3.2.6 Moisture Testing: Prior to commencement of polished concrete finishing, test floors to receive polished concrete finishing for moisture vapour emission.
  - .1 Perform tests so that each test area does not exceed 93 sq. m (1000 sq. ft.). Perform no fewer than three tests for the first 93 sq. m. (1000 sq. ft.) and an additional test for each additional 93 sq. m. (1000 sq. ft.). Ensure test areas are evenly spaced.
  - .2 Anhydrous Calcium Chloride Test: Conform ASTM F1869. Proceed with installation only after substrates have maximum moisture-vapour emission rate of 2.25 kg of water/93 sq. m (5 lb of water/1000 sq. ft.) in 24 hours, unless otherwise recommended in writing by manufacturer.

#### **3.3 Polishing**

- 3.3.1 Perform polishing operations on concrete floor substrates which are at least 45 days old, unless specifically approved by manufacturer.

- 3.3.2 Apply polished concrete finish system to cured and prepared slabs to match accepted mockup.
- .1 Machine grind floor surfaces to receive polished finishes level and smooth and to depth required to reveal aggregate to match approved mockup.
  - .2 Apply penetrating liquid floor treatment for polished concrete in polishing sequence and according to manufacturer's written instructions, allowing recommended drying time between successive coats.
  - .3 Apply penetrating stain for polished concrete in polishing sequence and according to manufacturer's written instructions.
  - .4 Continue polishing with progressively finer-grit diamond polishing pads to gloss level, to match approved mockup.
  - .5 Control and dispose of waste products produced by grinding and polishing operations.
  - .6 Neutralize and clean polished floor surfaces.

**3.4 Epoxy Coating Application.**

- 3.4.1 Comply with manufacturer's instructions.
- 3.4.2 Mixing: Mix components in accordance with manufacturer's instruction.
- 3.4.3 Coating Application: Apply primer coat at 5 mils thickness or use coating product as self-priming coat. Allow primer to dry and firm up before applying the topcoat. Apply topcoat at 10-12 mils thickness with notched squeegee.
- 3.4.4 For non-slip surfaces, broadcast aggregate into wet topcoat and back-roll to encapsulate.
- 3.4.5 Curing: Allow the coating to cure for 16 hours before allowing foot traffic, 24 hours before light vehicular traffic, and 7 days before full service.
- 3.4.6 Keep water and detergent off floor until fully cured.

**3.5 Joint Filling**

- 3.5.1 Prepare, clean, and install joint filler according to manufacturer's written instructions.
- 3.5.2 Remove dirt, debris, saw cuttings, laitance, curing compounds, sealers and other foreign materials from joints. Leave contact faces of joints clean and dry.
- .1 Clean inner joint walls mechanically using dustless dry-cut saw, or similar tool, to the full depth of saw cuts and 2 inch minimum depth in construction joints so as to remove any form release agents, curing compounds, sealer residues, and other surface

contaminations that may interfere with bond of the specified joint filler material. Then clean dust and debris from mechanically prepared joints by vacuuming joint.

- 3.5.3 Install semirigid joint filler full depth in saw-cut joints and at least 50 mm (2 inches) deep in formed joints. Overfill joint and trim joint filler flush with top of joint after hardening. Concave joints are not acceptable.
- 3.5.4 Scoring: Score decorative jointing in concrete surfaces 1.6 mm (1/16 inch) deep with diamond blades to match pattern indicated. Rinse until water is clear.
  - .1 Joint Width: 10 mm (3/8 inch)

### **3.6 Repairs, Protection, And Cleaning**

- 3.6.1 Repair damaged finished surfaces of polished cast-in-place architectural concrete when approved by Consultant. Match repairs to colour, texture, and uniformity of surrounding surfaces and to repairs on approved mockups.
  - .1 Remove and replace polished cast-in-place architectural concrete that cannot be repaired to Consultant's approval.
  - .2 Ensure concrete scrubbing is performed with cleaners approved in writing by manufacturer.
- 3.6.2 Protect polished cast-in-place architectural concrete from staining, laitance, and contamination during remainder of construction period.
- 3.6.3 Protect surfaces of polished cast-in-place architectural concrete from contamination by oil, grease, hydraulic fluid, paint, adhesives, flux, and other contaminants.
  - .1 Diaper hydraulic powered equipment to avoid staining of concrete.
  - .2 Do not park vehicles on polished floor.
  - .3 Do not perform pipe cutting on polished floor.
  - .4 Do not store metals subject to oxidation on polished floor.
  - .5 Inform trades that concrete slab must be protected.
- 3.6.4 Covering: After completion of polishing, protect polished floors from subsequent construction activities with protective covering to permit hardener and densifier to activate.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the architectural precast concrete work, including but not limited to:
  - .1 PCONC-1: Non-composite insulated concrete walls at building foundations (FW1) with connector and insulation system as specified; minimum 100 mm thick.
  - .2 PCONC-2: Non-insulated, monolithic architectural precast concrete cladding units: Unit composition: minimum 225 mm thick precast panels tied to cast-in-place concrete curb and structural steel structure (EW9).
- 1.2.2 Related Documents
  - .1 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.
- 1.3.2 Definitions:
  - .1 Design Reference Sample: Sample of approved architectural precast concrete colour, finish and texture, preapproved by Consultant.

### **1.4 Administrative Requirements**

- 1.4.1 Preinstallation Conference: Conduct conference at Project site to comply with requirements in 01 31 19 with the Contractor, applicable subcontractors, Product supplier and Consultant. As a minimum:
  - .1 Review methods and procedures related to installation, including manufacturer's written instructions;

- .2 Examine substrate conditions and all embedded plates and anchors for compliance with manufacturers installation requirements;
  - .3 Review temporary protection measures required during and after installation.
- 1.4.2 Sequencing: Supply loose connection hardware and anchorage items to be embedded in or attached to other construction without delaying the Work. Provide locations, setting diagrams, templates, instructions, and directions, as required, for installation.

**1.5 Submittals**

- 1.5.1 Provide submittals in accordance with requirements of 01 33 00.
- 1.5.2 Product Data: Submit manufacturer's product data and installation instructions for each material and product used.
- 1.5.3 Design Mixtures: For each precast concrete mixture. Include compressive strength and water-absorption tests.
- 1.5.4 Shop Drawings: Detail fabrication and installation of architectural precast concrete units. Indicate locations, plans, elevations, dimensions, shapes, and cross sections of each unit. Indicate joints, reveals, and extent and location of each surface finish. Indicate details at building corners.
- .1 Shop drawings shall bear the seal and signature of a professional engineer licensed to design structures and registered in the Province of the Place of the Work.
  - .2 Indicate separate face and backup mixture locations and thicknesses.
  - .3 Indicate welded connections by standard symbols. Detail loose and cast-in hardware and connections.
  - .4 Indicate locations, tolerances, and details of anchorage devices to be embedded in or attached to structure or other construction.
  - .5 Indicate locations, extent, and treatment of dry joints if two-stage casting is proposed.
  - .6 Include plans and elevations showing unit location and sequence of erection for special conditions.
  - .7 Indicate location of each architectural precast concrete unit by same identification mark placed on panel.
  - .8 Indicate relationship of architectural precast concrete units to adjacent materials.
  - .9 Indicate locations and details of stone facings, anchors, and joint widths.

- 
- .10 Design Modifications: If design modifications are proposed to meet performance requirements and field conditions, submit design calculations and Shop Drawings. Do not adversely affect the appearance, durability, or strength of units when modifying details or materials and maintain the general design concept.
  - .11 If requested, Provide comprehensive engineering analysis signed and sealed by the qualified professional engineer responsible for its preparation. Show governing panel types, connections, and types of reinforcement, including special reinforcement. Indicate location, type, magnitude, and direction of loads imposed on the building structural frame from architectural precast concrete.
- 1.5.5 Samples: Submit for each type of finish indicated on exposed surfaces of architectural precast concrete units, in sets of 3, illustrating full range of finish, colour, and texture variations expected; approximately 305 mm x 305 mm x 305 mm (12 by 12 by 2 inches).
- .1 When other faces of precast concrete unit are exposed, include Samples illustrating workmanship, colour, and texture of backup concrete as well as facing concrete.
  - .2 Connections and special prefabricated inserts may be required by the Consultant to be tested as part of the work of this Section. Provide complete design calculations, if requested.
  - .3 Submit 600 mm square panels for approval of each type, colour and finish of precast concrete. When the correct colour and finish has been achieved provide 2 additional matching samples for each type, colour and finish. The Consultant will retain one panel. Keep the second panel in the shop as a production guide and the third on the site of the Project.
  - .4 Work shall match the approved samples.
  - .5 The first unit produced of each unit type will be examined by the Consultant and if satisfactory will be approved. The quality of finish shall be equivalent to that of the corresponding Design Reference Sample panel representing the finish of the unit. If the quality of the precast concrete unit is not satisfactory to the Consultant, make the corrections necessary and produce a second unit for the Consultant's review. Set aside the accepted unit of each type and use as standard by which the remainder of the Work is judged. Remove rejected panels from the site.
- 1.5.6 Range Samples: After sample panel approval and before fabricating architectural precast concrete units, produce a minimum of 3 sets of samples, approximately 1.5 m<sup>2</sup> (16 sq. ft.) in area, representing anticipated range of each colour and texture on

Project's units. Following range sample, maintain one set of samples at Project site and remaining sample sets at manufacturer's plant as colour and texture approval reference.

- 1.5.7 Welding certificates: Submit certificates conforming to CSA W47 and CSA W49.
- 1.5.8 Material Certificates: Submit for the following items, signed by manufacturers:
  - .1 Cementitious materials.
  - .2 Reinforcing materials and prestressing tendons.
  - .3 Admixtures.
  - .4 Bearing pads.
  - .5 Structural-steel shapes and hollow structural sections.
- 1.5.9 Field quality-control test and special inspection reports: Submit after each visit by manufacturer's representative.

## **1.6 Quality Assurance**

- 1.6.1 Manufacturer/Supplier Qualifications: firm that assumes responsibility for engineering architectural precast concrete units to comply with performance requirements. This responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer registered to practice in the Province of the Place of the Work.
  - .1 Companies with a proven record of satisfactory installation of projects similar in size and nature will be acceptable subject to the Consultant's approval.
  - .2 Use precast manufacturers who are certified under the Canadian Precast Prestressed Concrete Institute (CPCI) Certification Program.
  - .3 Use precast manufacturers who have experience in manufacturing precast architectural non-insulated panels specified for this Project for a minimum of five (5) years, and with a record of successful in service performance.
- 1.6.2 Installer Qualifications:
  - .1 Precast concrete work shall be performed by mechanics having a minimum of 5 years documented experience in the placing and finishing of precast concrete. Submit proof of experience to Consultant.
  - .2 Erect work using workmen skilled in this trade, set plumb, true and square, with joints parallel and uniform and align all horizontal joints with each other and all vertical joints with each other and in accordance with Drawings and reviewed shop drawings.

1.6.3 Mockups: After sample panel and range sample approval but before production of architectural precast concrete units, construct full-sized mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

- .1 Build mock-up of typical wall section, incorporating the precast architectural non-insulated panel, face finish, support framing and anchoring, substrate materials, and adjacent materials including flashing, doors, windows and trim.
- .2 Provide a minimum of one (1) full scale panel to demonstrate the expected range of finish, colour and texture.
- .3 Approved mockups may become part of the completed Work if undamaged at time of Substantial Performance of the Work, and will form the basis for acceptance for the remainder of the project.
- .4 Approval of mockups does not constitute approval of deviations from the Contract Documents unless such deviations are specifically approved by Consultant in writing.
- .5 Notify Consultant a minimum seven (7) days prior to mock-up construction.

## **1.7 Delivery, Storage, And Handling**

- 1.7.1 Deliver architectural precast concrete units in such quantities and at such times to limit unloading units temporarily on the ground.
- 1.7.2 Support units during shipment on nonstaining shock-absorbing material.
- 1.7.3 Store units with adequate dunnage and bracing and protect units to prevent contact with soil, to prevent staining, and to prevent cracking, distortion, warping or other physical damage.
- 1.7.4 Place stored units so identification marks are clearly visible, and units can be inspected.
- 1.7.5 Handle and transport units in a position consistent with their shape and design in order to avoid excessive stresses which would cause cracking or damage.
- 1.7.6 Lift and support units only at designated points shown on Shop Drawings.

## **1.8 Site Conditions**

- 1.8.1 Prior to fabrication verify existing condition affecting the work and take field measurements necessary to ensure a perfect fit of all precast panels.

- 1.8.2 Prior to erection, examine areas which are to receive the work and report deficiencies and misalignments to the Contractor for correction.

**1.9 Warranty**

- 1.9.1 Warrant the work of this Section against defects in materials and workmanship for a period of 5 years including but not limited to spalling, cracking, splitting, deformation, loosening of exposed aggregates due to water freezing, improper materials, workmanship or arrangement.
- 1.9.2 Warrant work under this Section whether or not any portion has been assigned or subcontracted. In the case of work performed by Subcontractors and where warranties are specifically required, secure such additional written warranties and deliver to the Owner. Leave panels clean and free from all blemishes.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Manufacturers/Suppliers: Subject to compliance with requirements, provide products by one of the following:
- .1 Advanced Precast Inc; [www.advancedprecastinc.com](http://www.advancedprecastinc.com)
  - .2 Res Precast Inc., [www.resgroup.ca](http://www.resgroup.ca)
  - .3 Stubbe's Precast; [www.stubbes.org](http://www.stubbes.org)
  - .4 Tri Krete Precast; [www.tri-krete.com](http://www.tri-krete.com)
- 2.1.2 Basis-of-Design: This Specification is based on "mix 2-DD-W-SI-P-P-8 #1414" by Res Precast.
- 2.1.3 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Description**

- 2.2.1 Design and Performance Requirements:
- .1 Design precast architectural non-insulated panels, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
  - .2 Structural Performance: Provide architectural precast concrete units and connections capable of withstanding the following design loads within limits and under conditions indicated.
    - .1 Design and fabricate panels, brackets and anchorage devices so that when installed they compensate for

- 
- dimensional differences in structure to which they are secured.
- .2 Compensate for structural deflection of L/360 due to live load and distortion of structure, under design criteria conditions, without imposing load on panel assembly.
  - .3 Sustain precast panel loads, and superimposed wind, snow and rain loads, and seismic loads, without exceeding deflection of L/360.
  - .4 Permit no water infiltration into the building under design loads.
- .3 Loads: As indicated on Drawings and Structural Documents.
- .4 Design framing system and connections to maintain clearances at openings, to allow for fabrication and construction tolerances, to accommodate live-load deflection, shrinkage and creep of primary building structure, and other building movements.
- .1 Ensure anchors, lifting hooks, shear bars, fastening devices, spacers and other inserts or fittings, including devices required for support and attachment of *work* of this Section are recommended or designed by manufacturer for complete and rigid installation.
- .5 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- .6 Thermal Movements: Provide for in-plane thermal movements resulting from annual ambient temperature changes of 49 deg C (120 deg F)
- .7 Thermal Design:
- .1 Design non-insulated wall panels using core which does not promote capillary action.
  - .2 Provide modified rain screen design based on two sealant beads and joints consisting of weather seal near exterior face and air/vapour barrier seal close to interior face of panel.

- .3 Design exterior weather barrier to shed majority of water from joint and interior air/vapour seal to demarcate line and Provide pressure equalization between interior and exterior of building skin. Provide vent and drain to outside air cavity between two joint sealants.

2.2.2 Design Standards: Comply with CSA-A23.3 and C.P.C.I. Metric Design Manual," applicable to types of architectural precast concrete units indicated.

2.2.3 Welding: Qualify procedures and personnel according to CSA W47 and CSA W59.

## **2.3 Fabricated Units**

2.3.1 Fabricate precast concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with CSA A23.4 product tolerances as well as position tolerances for cast-in items.

2.3.2 Panel faces shall be free of joint marks, grain, and other obvious defects. Corners, including false joints shall be uniform, straight, and sharp.

2.3.3 Finish: Match Consultant's design reference sample.

2.3.4 General Material Requirements: Generally provide concrete materials of identical performance as those specified in Section 03 30 00, Cast-in-Place Concrete except concrete shall have minimum compressive strength of 35 MPa at 28 days when tested in accordance with ASTM C39/C39M and maximum absorption of 6% when tested in accordance with CSA A23.1/A23.2. Precast concrete units shall contain entrained air controlled at 5% +/- 1%, when tested in accordance with ASTM C97 at time of batching. Stockpile sufficient quantity of materials to ensure uniformity of precast concrete work.

## **2.4 Materials**

2.4.1 Molds: Rigid, dimensionally stable, non-absorptive material, warp and buckle free, that will provide continuous and true precast concrete surfaces within fabrication tolerances indicated; nonreactive with concrete and suitable for producing required finishes.

2.4.2 Forms: Constructed of concrete, steel, fibreglass, reinforced plastic or plywood conforming to CSA-A23.1.

2.4.3 Form Liners: Units of face design, texture, arrangement, and configuration indicated.

- .1 Basis-of-Design: "1/21 B Malta" by Reckli

- .1 Maximum Depth : 100 mm thick with 50 x 50 mm vertically raked reveals.
- .2 Appearance: Mid-coarse chipped surface pattern.
- 2.4.4 Reinforcing Bars: CSA G30.18, Grade 400W, deformed.
- 2.4.5 Welded Wire Reinforcement: CSA-G30.18; size and gauge as indicated on reviewed Shop Drawings.
- 2.4.6 Prestressing Strand: uncoated, seven-wire, low-relaxation strand conforming to CSA A23.4.
- 2.4.7 Wythe Connectors: Low thermal conductivity types, manufactured to connect wythes of precast concrete panels and to carry stipulated loads.
- 2.4.8 Portland cement: Gray Portland Cement conforming to CAN/CSA-A3000 of one colour and from same mill.
- 2.4.9 Water: Potable and free from foreign materials in amounts harmful to concrete and embedded steel.
- 2.4.10 Silica Fume: ASTM C1240, amorphous silica.
- 2.4.11 Aggregates: CSA-A23.1/A23.2, ASTM C33, and ASTM C330.
  - .1 Face Mix Aggregates: Selected, hard, and durable; Provide aggregates for each type of exposed finish from a single source (pit or quarry).
- 2.4.12 Admixtures: in accordance with the manufacturer's directions. Do not use calcium chloride or admixtures containing calcium chloride.
  - .1 Fly Ash: Pozzolanic admixture meeting requirements of CSA A3001, Type recommended by panel manufacturer.
  - .2 Air entrainment admixture: in accordance with ASTM C260, refer to CSA A23.1, for location and exposure requirements.
  - .3 Water reducing admixtures in accordance with ASTM C494.
  - .4 Coloring Admixture: in accordance with ASTM C 979 and manufacturer's requirements.
- 2.4.13 Grout: sand-cement grout conforming to CSA-A23.1.
- 2.4.14 Bearing Pads: High density plastic or Neoprene, to ASTM D2240, smooth both sides.
- 2.4.15 Shims: Plastic or Steel.
- 2.4.16 Recessed Reglets: Stainless steel, shaped and flanged to remain in place once cast, foam plastic filled to eliminate wet concrete intrusion.

## **2.5 Support Devices**

- 2.5.1 Connecting and Supporting Devices:
  - .1 Stainless steel type 316 unless indicated otherwise.

- 
- .2 Hot dip galvanized plates, angles, items cast into concrete, items connected to steel framing members, and inserts: ASTM A123/A123M-09;
      - .3 Fasteners: ASTM A325.
    - 2.5.2 Miscellaneous Plates, Angles, Inserts: CAN/CSA-A23.1/A23.2.
    - 2.5.3 Protective Finish: Hot-dip galvanized to ASTM A123/A123M.
    - 2.5.4 Bolts, Nuts, and Washers: ASTM A307, or ASTM A325
    - 2.5.5 Prime Paint: CAN/CGSB-1.181, zinc rich paint.
  - 2.6 **Connector and Insulation system (Foundation Walls)**
    - 2.6.1 Connector Spacing: Manufacturer's standard spacing as determined by project requirements, but not more than 400 mm (16 in) on center in both directions.
    - 2.6.2 Fabrication: Pre-drilled insulation panels with precision-cut foam panels for openings and edge conditions.
    - 2.6.3 Insulation: Extruded polystyrene. Refer to Section 07 21 00.
      - .1 Insulation Thickness: As indicated on Drawings.
    - 2.6.4 Connectors: Manufacturer's standard connectors made from continuous glass fibers and vinyl ester polymer.
      - .1 Tensile Strength: Minimum 827 MPa (120,000 psi).
      - .2 Shear Strength: Minimum 4 kN (910 lbs) in double shear and 2 kN (450 lbs) in single shear.
    - 2.6.5 Concrete Wythe Thickness: As indicated on Drawings.
    - 2.6.6 Basis-of-Design: "Thermomass System NC" by Thermomass or approved equivalent.
  - 2.7 **Mixes**
    - 2.7.1 Proportion normal-weight concrete mixes to provide the following properties:
      - .1 Compressive Strength: Minimum 35 MPa at 28 days.
      - .2 Air Content: 5.5 to 7.5 percent for concrete exposed to freezing and thawing.
      - .3 Concrete Mixing: Comply with A23.4.
  - 2.8 **Fabrication**
    - 2.8.1 Fabricate architectural precast components to CSA-A23.4.
    - 2.8.2 Maintain plant records and quality control program during production of precast components. Make records available upon request.

- 2.8.3 Use rigid moulds, constructed to maintain precast components uniform in shape, size, and finish.
- 2.8.4 Utilize form liners in accordance with manufacturer's written instructions.
- 2.8.5 Maintain consistent quality during manufacture.
- 2.8.6 Fabricate connecting devices, plates, angles, items fit to steel framing members, inserts, bolts, and accessories. Fabricate to permit initial placement and final attachment.
- 2.8.7 Embed reinforcing steel, anchors, inserts plates, angles, and other cast-in items.
- 2.8.8 Design and locate hoisting devices so that they can be concealed when the structure is in service. These devices shall be treated so they will not corrode in service.
- 2.8.9 Cure components to develop concrete quality, and to minimize appearance blemishes such as non-uniformity, staining, or surface cracking. Cure according to CSA A23.4.
- 2.8.10 Minor patching in plant and field is acceptable, providing structural adequacy and appearance of components is not impaired.

## **2.9      Fabrication Tolerances**

- 2.9.1 Fabricate architectural precast concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with CSA A23.4 product tolerances as well as position tolerances for cast-in items.

## **2.10     Finishes**

- 2.10.1 Panel faces shall be free of joint marks, grain, and other obvious defects. Corners, including false joints shall be uniform, straight, and sharp. Finish exposed-face surfaces of architectural precast concrete units to match approved design reference sample and mockups and as follows:
  - .1 Design Reference Sample: Available at the offices of the Consultant. Allow for minimum of 2 colours for each precast panel type.
  - .2 For bidding purposes, base the design on the following:
    - .1 Mix Design: "2-DD-W-SI-P-P-8 #1414" by Resplast
  - .3 Minor modifications may be required to mix noted above to obtain final design acceptance based on design-reference sample and mock-up review. Submit range samples as noted herein.
- 2.10.2 Finish exposed top and bottom surfaces of architectural precast concrete units to match face-surface finish.

- 2.10.3 Finish exposed back surfaces of architectural precast concrete units by smooth, steel-trowel finish.
- 2.10.4 Finish unexposed surfaces of architectural precast concrete units by float finish.
- 2.10.5 Connecting Supporting Steel Devices: Hot dip galvanized unless indicated otherwise.

### **3 .     EXECUTION**

#### **3.1     Examination**

- 3.1.1 Examine supporting structural frame or foundation and conditions for compliance with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected. Manufacturer's Structural Engineer and General Contractor to sign off on building stability prior to precast erection.
- 3.1.3 Do not install precast concrete units until supporting cast-in-place building structural framing has attained minimum allowable design compressive strength or supporting steel or other structure is complete.

#### **3.2     Preparation**

- 3.2.1 Provide and install sufficient temporary bracing to brace precast components adequately, at all stages of construction, so that precast components will safely withstand loads to which they may be subjected. This temporary bracing shall remain in position until required connections have been completed. Any bracing required to the structural frame supporting the architectural precast concrete is to be provided by the General Contractor.

#### **3.3     Installation**

- 3.3.1 Erect precast work in accordance with CSA-A23.4.
- 3.3.2 Install clips, hangers, bearing pads, and other accessories required for connecting architectural precast concrete units to supporting members and backup materials.
- 3.3.3 Erect architectural precast concrete level, plumb, and square within specified allowable tolerances. Provide temporary supports and bracing as required to maintain position, stability, and alignment as units are being permanently connected.

- 
- .1 Install temporary steel or plastic spacing shims or bearing pads as precast concrete units are being erected. Tack weld steel shims to each other to prevent shims from separating.
  - .2 Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.
  - .3 Remove projecting lifting devices and grout fill voids within recessed lifting devices flush with surface of adjacent precast surfaces when recess is exposed.
  - .4 Unless otherwise indicated, maintain uniform joint widths of 19 mm (3/4 inch).
- 3.3.4 Connect architectural precast concrete units in position by bolting, welding, grouting, or as otherwise indicated on Shop Drawings. Remove temporary shims, wedges, and spacers as soon as practical after connecting and grouting are completed.
- .1 Do not permit connections to disrupt continuity of roof flashing.
- 3.3.5 Welding: Comply with applicable CSA Standards for welding, welding electrodes, appearance, quality of welds, and methods used in correcting welding work.
- .1 Protect architectural precast concrete units and bearing pads from damage by field welding or cutting operations, and provide noncombustible shields as required.
  - .2 Welds not specified shall be continuous fillet welds, using no less than the minimum fillet as specified by AWS.
  - .3 Clean weld-affected metal surfaces with chipping hammer followed by brushing, and apply a minimum 0.1 mm (4.0-mil) thick coat of galvanized repair paint to galvanized surfaces according to ASTM A 780.
  - .4 Remove, reweld, or repair incomplete and defective welds.
- 3.3.6 At bolted connections, use lock washers, tack welding, or other approved means to prevent loosening of nuts after final adjustment.
- .1 Where slotted connections are used, verify bolt position and tightness. For sliding connections, properly secure bolt but allow bolt to move within connection slot. For friction connections, apply specified bolt torque and check 25 percent of bolts at random by calibrated torque wrench.
- 3.3.7 Grouting Connections: Grout connections where required or indicated. Retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are completely filled. Place grout to finish smooth, level, and plumb with adjacent concrete surfaces. Keep grouted joints damp for not less than 24 hours after initial set. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.

---

**3.4     Erection Tolerances**

- 3.4.1 Erect architectural precast concrete units level, plumb, square, true, and in alignment without exceeding the noncumulative erection tolerances of CSA A23.4.

**3.5     Field Quality Control**

- 3.5.1 Special Inspections: Owner may engage a qualified special inspector to perform the following special inspections and prepare reports:
- .1 Erection of precast concrete members.
- 3.5.2 Field welds will be subject to visual inspections and nondestructive testing according to ASTM E 165 or ASTM E 709. High-strength bolted connections will be subject to inspections.
- 3.5.3 Repair or remove and replace work where tests and inspections indicate that it does not comply with specified requirements.
- 3.5.4 Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

**3.6     Repairs**

- 3.6.1 Repair architectural precast concrete units if permitted by Consultant. The Consultant reserves the right to reject repaired units that do not comply with requirements.
- 3.6.2 Mix patching materials and repair units so cured patches blend with colour, texture, and uniformity of adjacent exposed surfaces and show no apparent line of demarcation between original and repaired work, when viewed in typical daylight illumination from a distance of 6.1 m (20 feet).
- 3.6.3 Prepare and repair damaged galvanized coatings with galvanizing repair paint according to ASTM A 780.
- 3.6.4 Wire brush, clean, and paint damaged prime-painted components with same type of shop primer.
- 3.6.5 Remove and replace damaged architectural precast concrete units when repairs do not comply with requirements.

**3.7     Cleaning**

- 3.7.1 Clean surfaces of precast concrete units exposed to view.
- 3.7.2 Clean mortar, plaster, fireproofing, weld slag, and other deleterious material from concrete surfaces and adjacent materials immediately.

- 3.7.3 Clean exposed surfaces of precast concrete units after erection and completion of joint treatment to remove weld marks, other markings, dirt, and stains.
- .1 Perform cleaning procedures, if necessary, according to precast concrete fabricator's recommendations. Clean soiled precast concrete surfaces with detergent and water, using stiff fibre brushes and sponges, and rinse with clean water. Protect other work from staining or damage due to cleaning operations.
  - .2 Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes or damage adjacent materials.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the hydraulic cement underlayment work specified herein. This includes, but is not necessarily limited, to:
  - .1 polymer-modified, self-leveling, hydraulic cement underlayment for application below interior floor coverings to achieve slab levelness and flatness requirements required for installation of flooring materials.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Measurement And Payment**

- 1.4.1 Provision for hydraulic cement underlayment specified on this Section is based on a fixed price for installation of specified product at thickness of 10 mm (3/8 inch). Such cost must be included in Contract Price.

### **1.5 Preinstallation Meetings**

- 1.5.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.

- 1.5.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
    - .3 Review of substrate types, compatibility, substrate moisture testing, substrate texture, concrete surface profile (CSP), surface porosity, and flatness as well as environmental requirements for installation of hydraulic cement underlayment.
    - .4 Review of minimum and maximum thickness of hydraulic cement underlayment that can be installed, noting that unacceptable substrate levels must be corrected.
    - .5 Review of flooring finishes that must be applied subsequently and installation requirements of such floor finishes.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.6 Submittals**

- 1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.6.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for hydraulic cement underlayment work specified in this Section.
- 1.6.3 Qualification Data: Provide written documentation from manufacturer confirming that installer meets qualifications as specified and is eligible for manufacturer's warranty.

- 1.6.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.6 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:
- .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
  - .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).

**1.7 Closeout Submittals**

- 1.7.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.7.2 Operating and Maintenance Data: Submit care and maintenance instructions for hydraulic cement underlayment to be included in building operation and maintenance manual.
- 1.7.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.8 Quality Assurance**

- 1.8.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.

- 1.8.2 Installer Qualifications: Engage an entity with sufficient experience in installing work similar in material, design, and extent to that shown in Contract Documents, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.8.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

**1.9 Delivery, Storage And Handling**

- 1.9.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.9.2 Deliver, store and handle hydraulic cement underlayment materials in accordance with manufacturer's written instructions.
- 1.9.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.9.4 Store products in a dry area with temperature maintained between 10° and 29°C (50° and 85°F) and protect from direct sunlight.
- 1.9.5 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.9.6 Replace defective or damaged materials with new.

**1.10 Field Conditions**

- 1.10.1 Place hydraulic cement underlayments only when ambient temperature and temperature of substrates are between 10 and 29 deg C (50 and 85 deg F). These temperatures must also be maintained during and for 48 hours after the installation of products included in this Section.
- 1.10.2 Do not install material below 10°C (50°F) surface and air temperatures. Maintain such temperatures during installation and for at least 48 hours after installation of products specified in this section.
- 1.10.3 Do not apply if rain is expected within 6 to 8 hours or if freezing temperatures are expected within 24 hours of application. Such conditions may influence aesthetic and functional properties of cementitious materials.
- 1.10.4 Expedite installation on warm substrates and adhere to manufacturer's guidelines for installation in warm weather.

**1.11 Warranty**

- 1.11.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of hydraulic cement underlayment

that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

- .1 Warranty Period: Not less than 5 years from date of Substantial Performance of The work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 ARDEX Engineered Cements; [www.ardexamericas.com](http://www.ardexamericas.com)
- .2 CPD Construction Products; [www.cpd.ca](http://www.cpd.ca)
- .3 Laticrete; [www.laticrete.com](http://www.laticrete.com)
- .4 MAPEI Corporation; [www.mapei.com](http://www.mapei.com)
- .5 Maxxon; [www.maxxon.ca](http://www.maxxon.ca).

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

2.2.1 Hydraulic cement underlayments specified in this Section must comply with ASTM C1708.

### **2.3 Hydraulic Cement Underlayment**

2.3.1 Polymer-modified, self-leveling, hydraulic cement product that can be applied in minimum uniform thickness of 6 mm (1/4 inch) and that can be feathered at edges to match adjacent floor elevations.

- .1 Primary Binder: Product must use ASTM C150/C150M or CSA A3000, portland cement, or hydraulic or blended hydraulic cement as defined by ASTM C219. Gypsum-based products are not acceptable.
- .2 Compressive Strength: Not less than 27.6 MPa (4000 psi) at 28 days when tested according to ASTM C109/C109M.
- .3 Underlayment Additive: resilient-emulsion product from underlayment manufacturer, designed for use with underlayment on specified substrate and conditions.
- .4 Basis-of-Design Products: "V1200" by Ardex Engineered Cements.
  - .1 Acceptable Equivalents:
    - .1 "Level-Right FS 10" by Maxxon Canada
    - .2 "MAPEI Novaplan 2" by Mapei Corporation

- .3 "Topcrete SL" by CPD Construction Products
- .5 Aggregate: Well-graded, washed gravel, 3 to 9.5 mm (1/8 to 3/8 inch); or coarse sand as recommended by underlayment manufacturer.
- .6 Provide aggregate when recommended in writing by underlayment manufacturer for underlayment thickness required.

## **2.4 Auxiliary Materials**

- 2.4.1 Primer: Product of underlayment manufacturer recommended in writing for substrate, conditions, and application indicated.
- 2.4.2 Patching Compound: formulated from a blend of Portland cement and other hydraulic cement
  - .1 Acceptable Products:
    - .1 "Plani/Patch" by Mapei Inc.
    - .2 "Feather Finish" Ardex Engineered Cements.
    - .3 Approved equivalent.
- 2.4.3 Screed mortars: concentrate of additives mixed with sand and gravel, to form fast setting, high strength cement screed in preparation of thick fast-setting screeds or leveling coats, mortar beds, and slopes.
  - .1 Acceptable Products:
    - .1 "Topcem Premix with Planigrout AC," Accelerated Cure thick bed Screed and additive by Mapei Inc.
    - .2 "ARDEX AM100" by Ardex Engineered Cements
    - .3 Approved equivalent.
- 2.4.4 Water: Potable and at a temperature of not more than 21 deg C (70 deg F).
- 2.4.5 Semi-Rigid Joint Sealant for moving joints: As recommended by manufacturer. Provide
- 2.4.6 Joint Filler for Saw Cuts, Control Joints and Dormant Cracks: As recommended by manufacturer.

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

---

**3.2      Preparation**

- 3.2.1 Moisture testing: Test substrates in accordance with ASTM F2170. Rectify moisture-related issues or other conditions that might affect performance of underlayment or final floor covering. Do not proceed with installation until moisture-related issues and other deleterious conditions have been resolved.
- 3.2.2 General: Prepare and clean substrate according to manufacturer's written instructions.
- .1 Treat nonmoving substrate cracks according to manufacturer's written instructions to prevent cracks from telegraphing (reflecting) through underlayment.
- .2 Fill substrate voids to prevent underlayment from leaking.
- 3.2.3 Mechanically abrade surfaces to remove laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants in accordance with manufacturer's written instructions and to avoid underlayment bond impairment.
- 3.2.4 Adhesive Residues:
- .1 Prior to installation over adhesive residues on concrete, test adhesive for water-solubility.
- .2 Mechanically remove water-soluble adhesives to expose clean concrete.
- .3 Prepare non-water-soluble adhesives to a thin, firmly-bonded residue using the wet scraping technique, as recommended by Resilient Floor Covering Institute ([www.rfci.com](http://www.rfci.com)).
- .4 Ensure residue after scraping appears only as a transparent stain on concrete.
- 3.2.5 Metal Substrates: Mechanically remove, according to manufacturer's written instructions, rust, foreign matter, and other contaminants that might impair underlayment bond. Apply corrosion-resistant coating compatible with underlayment if recommended in writing by underlayment manufacturer.
- 3.2.6 Nonporous Substrates: For ceramic tile, quarry tile, and terrazzo substrates, remove waxes, sealants, and other contaminants that might impair underlayment bond, and prepare surfaces according to manufacturer's written instructions.
- 3.2.7 Adhesion Tests: After substrate preparation, test substrate for adhesion with underlayment according to manufacturer's written instructions

---

**3.3     Application**

- 3.3.1 Mix and apply underlayment components according to manufacturer's written instructions.
  - .1 Close areas to traffic during underlayment application and for time period after application recommended in writing by manufacturer.
  - .2 Coordinate application of components to provide optimum adhesion to substrate and between coats.
  - .3 At substrate expansion, isolation, and other moving joints, allow joint of same width to continue through underlayment.
- 3.3.2 Priming: Prime substrates in accordance with manufacturer's instructions for various substrate types; ensure proper application and drying times.
- 3.3.3 Apply underlayment to produce uniform, level surface.
  - .1 Mixing: Mix components in accordance with manufacturer's instructions. Respect proper water-to-product ratio and use appropriate mixing techniques.
  - .2 Apply a final layer without aggregate to product surface.
  - .3 Feather edges to match adjacent floor elevations.
- 3.3.4 Cure underlayment according to manufacturer's written instructions. Prevent contamination during application and curing processes.
- 3.3.5 Do not install floor coverings over underlayment until after time period recommended in writing by underlayment manufacturer.
- 3.3.6 Remove and replace underlayment areas that show a lack of bond with substrate, including areas that emit a "hollow" sound when tapped

**3.4     Protection**

- 3.4.1 Protect hydraulic cement underlayment from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.4.2 Prior to finish flooring installation, protect underlayment surface from abuse by other trades using plywood, Masonite or other protection course acceptable to underlayment manufacturer.
- 3.4.3 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.4.4 Promptly replace hydraulic cement underlayment work damaged during construction that cannot be satisfactorily repaired.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the masonry mortar and grout work specified herein. This includes, but is not necessarily limited, to:
  - .1 Pre-packaged dry combined materials
  - .2 Mixing procedures
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Submittals**

- 1.4.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.4.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for masonry mortar and grout work specified in this Section.
- 1.4.3 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs

conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:

- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.4.4 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.4.5 Samples: Submit selection and verification samples for Products requiring color, texture, or design selection. Provide manufacturer's list of finishes or color swatches for Consultant's review.
- .1 Submit two 300 mm (12 inch) size samples of coloured mortar.
- 1.4.6 Test Reports: submit certified test reports including sand gradation tests in accordance with CAN/CSA-A179 showing compliance with specified performance characteristics and physical properties.

## **1.5 Closeout Submittals**

- 1.5.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.5.2 Operating and Maintenance Data: Submit care and maintenance instructions for masonry mortar and grout to be included in building operation and maintenance manual.

## **1.6 Quality Assurance**

- 1.6.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.6.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.6.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and

secondary materials from sources recommended by manufacturers of primary materials.

1.6.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
- .2 Sealant Joint: Include sealant-filled joint at least 400 mm (16 inches) in each mock-up.
- .3 Additional Components: Provide wall structural supports, sheathing, air barriers, vapor retarder membranes, flashing, cavity drainage materials, and weep holes.
- .4 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .5 Reviewed mock-ups: may become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.7 Delivery, Storage And Handling**

- 1.7.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.7.2 Deliver preblended, dry mortar mix in moisture-resistant containers designed for use with dispensing silos. Store preblended, dry mortar mix in delivery containers on elevated platforms, under cover, and in a dry location or in covered weatherproof dispensing silos.

**1.8 Site Conditions**

- 1.8.1 Ambient Conditions: maintain materials and surrounding air temperature to the most stringent requirements of manufacturer's recommendations, and CAN/CSA A371.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
  - .1 King Packaged Materials (a Sika Company)
  - .2 Maxi-Mix
  - .3 Quikcrete

.4 Spec Mix

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Performance / Design Criteria**

2.2.1 Use only pre-blended, prepackaged dry combined materials (mortar and grout) mixed under controlled factory conditions or in site silo. Ingredients batching limitations to be within 1% accuracy. Hand mixing of bags and sand is not permitted.

2.2.2 Water Repellent Admixture: Provide water-repellent admixture to all exterior masonry units and mortar to yield resistance to water penetration in accordance with ASTM E514 (Class E water permeance)

## **2.3 Materials**

2.3.1 Portland Cement: CAN/CSA-A3001, Type GU - General use hydraulic cement (Type 10), unless indicated otherwise.

.1 Colour: Provide natural colour or white cement as required to produce mortar colour indicated on Drawings and Schedules. At architectural concrete masonry units, provide white colour cement.

## **2.4 Mortar**

2.4.1 Pre-Packaged Dry Combined Materials: CAN/CSA-A179, factory-packaged blend of dry cementitious materials, lime and dry sand, proportioned and blended at a manufacturing plant, and requiring only the addition of water, and mixing at construction site; with Types as follows (based on Property Specifications):

.1 Mortar for exterior masonry above grade:

.1 Load Bearing: Type S (Portland Cement/Lime).

.2 Non-Load Bearing: Type N (Portland Cement/Lime).

.2 Parapet walls: Type S (Portland Cement/Lime).

.3 Mortar for interior masonry:

.1 Load Bearing: Type S (Portland Cement/Lime).

.2 Non-Load Bearing: Type N (Portland Cement/Lime).

.4 Mortar for foundation walls, manholes, sewers, pavements, walks, patios and other exterior masonry at or below grade: type M or Type S.

2.4.2 Aggregate: CAN/CSA-A179

2.4.3 Water: clean and potable.

2.4.4 Hydrated Lime: to ASTM C207, Type S.

---

## **2.5     Auxiliary Materials**

### **2.5.1   Mortar Pigments: to ASTM C979.**

- .1   Composition: Utilize natural and synthetic iron oxides and chromium oxides, designed specifically for incorporation into mortar mixes. Employ only those pigments with a proven track record of satisfactory performance in masonry mortar.
- .2   Admixture Limit: Incorporate colouring admixture, ensuring it does not exceed 10% of the cement content by weight.
- .3   Masonry Cement Option: Alternatively, use integrally coloured masonry cement to achieve desired coloured mortar; match approved sample.
- .4   Admixtures: Ensure approvals for admixtures before application. Adhere strictly to recommendations provided by manufacturer.
- .5   Approved Manufacturers:
  - .1   BayFerrox
  - .2   Interstar Pigment, Admixture and Fibers
  - .3   Solomon Pigments
  - .4   Venator Pigments (formerly known as Rockwood Pigments)

### **2.5.2   Water-Repellent Admixture:   Low VOC, water-repellent mortar admixture intended for use with masonry units containing integral water repellent by same manufacturer.**

- .1   Acceptable Products:
  - .1   “RainBloc for Mortar” by ACM Chemistries
  - .2   “Rheopel Mortar Admixture” by Master Builders Solutions Canada Inc. (Formerly BASF Canada Inc.)
  - .3   “Dry-Block Mortar Admixture” by GCP Applied Technologies
  - .4   Approved equivalent.

## **2.6     Mortar Mixing**

- 2.6.1   Materials: Use only pre-packaged, dry combined materials that are pre-blended and pre-coloured, fabricated under stringent factory conditions or from on-site silo.
- 2.6.2   Mixing Procedure: Combine mortar ingredients as prescribed by CAN/CSA-A179 and in accordance with manufacturer’s instructions. Only prepare quantities that meet immediate needs.
- 2.6.3   Colour and Additives: Add mortar colour and additional admixtures in strict accordance with manufacturer's instructions; ensure consistent mix and colouration.

- 2.6.4 Equipment: Employ continuous silo mixer or a batch-type mixer, to CAN/CSA-A179.
- 2.6.5 Restricted Materials: inclusion of calcium chloride or any chloride-based admixtures is strictly prohibited.
- 2.6.6 Usage Window: Use mixed mortar within 2-hour time frame post-mixing. Mortar remaining unused after this period must be discarded.
- 2.6.7 Personnel: Contractor is obligated to designate a single individual responsible for mortar mixing for entire project. If there is change in designated personnel, mortar mixing operations must halt. Mixing can only resume once new individual receives adequate training and mortar mix undergoes testing.

**2.7     Grout Mixing**

- 2.7.1 Materials: Use only pre-packaged, pre-mixed, pre-bagged dry combined grout materials. Ensure materials are explicitly fabricated for indicated applications, and are either produced under strict factory conditions or sourced from on-site silo.
- 2.7.2 Compliance: to CSA A23.1/A23.2 and CAN/CSA-A179.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

**3.2     Preparation**

- 3.2.1 Plug clean-out holes with masonry units. Brace masonry for wet grout pressure.

**3.3     Mortar And Grout Work**

- 3.3.1 Do masonry mortar and grout work in accordance with CSA A371 and CAN/CSA-A179 except where specified otherwise.
- 3.3.2 Mix mortar and grout in accordance with manufacturer's instructions.
- 3.3.3 Clean mixing boards and mechanical mixing machine between batches.
- 3.3.4 Ensure mortar compressive strength is weaker than units it is binding.

- 3.3.5 Keep cavities clean of mortar droppings and other materials during construction.
- 3.3.6 Remove excess mortar from grout spaces.
- 3.3.7 Do not place grout until entire height of masonry to be grouted has attained enough strength to resist grout pressure.
- 3.3.8 Work grout into masonry cores and cavities to eliminate voids.
- 3.3.9 Comply with requirements in CAN/CSA-A371 for cleanouts and for grout placement, including minimum grout space and maximum pour height.
  - .1 Limit height of vertical grout pours to not more than 1.5m (60 inches).
  - .2 Do not install grout in lifts greater than 400 mm (16 inches), without consolidating grout by rodding.
  - .3 Do not displace reinforcement while placing grout.

#### **3.4     Tooling**

- 3.4.1 Provide joints in masonry, firmly pointed, compacted and tooled.
- 3.4.2 Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness unless otherwise indicated on Drawings and Schedules.
- 3.4.3 Cut joints flush for masonry walls to receive plaster or other direct-applied finishes (other than paint) unless otherwise indicated on Drawings and Schedules.
- 3.4.4 For parged masonry, provide raked joints, minimum 13 mm (1/2 inch) unless otherwise indicated on Drawings and Schedules.

#### **3.5     Cleaning**

- 3.5.1 Leave Work area clean at end of each day.
- 3.5.2 Remove droppings and splashings using clean sponge and water.
- 3.5.3 Clean masonry with low pressure clean water and soft natural bristle brush.
- 3.5.4 Upon completion remove surplus materials, rubbish, tools and equipment.

#### **3.6     Third-Party Inspection And Testing**

- 3.6.1 Owner reserves right to execute following procedure during underlayment application:
  - .1 Testing Engagement: Owner may engage a competent inspection and testing agency to evaluate underlayment material during application.
  - .2 Cost of testing: by Owner or via Cash Allowance.

- .3 Testing Method: to ASTM C780
- .4 Test results: to be relayed to Owner and Contractor for necessary actions.
- .5 Non-compliance Action: If materials fail to meet specified requirements, cost for retesting to be at Contractor's expense. Replace, at no extra cost to Owner, Products shown to not be in compliance with requirements of Contract Documents.

**3.7 Protection**

- 3.7.1 Protect masonry mortar and grout from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.7.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.7.3 Promptly replace masonry mortar and grout work damaged during construction that cannot be satisfactorily repaired.
- 3.7.4 Cover completed and partially completed work not enclosed or sheltered with waterproof covering at end of each work day. Anchor securely in position.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the masonry anchorage and reinforcing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Masonry ties,
  - .2 Joint reinforcement,
  - .3 Masonry anchors,
  - .4 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Definitions**

- 1.4.1 The following definitions as indicated in CSA A370 apply to this Section:
  - .1 Masonry Ties: masonry connectors used to interconnect the wythes of a masonry wall; or attach masonry veneer to its structural backing;
  - .2 Masonry Anchors: masonry connectors used to connect masonry walls to intersecting walls or to other structural

members, attach stone to its structural backing, or interconnect stone;

- .3 Masonry Fasteners: masonry connectors used to secure masonry ties and anchors to structural elements;
- .4 Repair Connectors: repair connectors used to restore or improve masonry construction.

## **1.5 Preinstallation Meetings**

- 1.5.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.5.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72-hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.6 Submittals**

- 1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.6.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for masonry anchorage and reinforcing work specified in this Section.
- 1.6.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Indicate on Shop Drawings, bar bending details, lists, reinforcement quantities, sizes, spacings, reinforcement

locations, and mechanical splices, with identifying code marks to permit correct placement.

- .2 Indicate sizes, spacings and locations of chairs, spacers and hangers.
- .3 Prepare reinforcement drawings in accordance with Reinforcing Steel Manual of Standard Practice - by Reinforcing Steel Institute of Canada. ANSI/ACI 315 and ACI 315R.

1.6.4 Delegated Design Submittals:

- .1 Engineering design completion of masonry anchorage and reinforcing work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
- .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
- .3 Submit copy of structural calculations upon request by Consultant.

1.6.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:

- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
- .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
- .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

1.6.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:

- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
- .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

**1.7 Closeout Submittals**

1.7.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.

1.7.2 Operating and Maintenance Data: Submit care and maintenance instructions for masonry anchorage and reinforcing to be included in building operation and maintenance manual.

---

**1.8     Quality Assurance**

- 1.8.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.8.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.8.3 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance as noted in the Owner's supplementary conditions and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
  - .1 Professional Engineer's Responsibility:
    - .1 production and review of Shop Drawings,
    - .2 design and certification of masonry anchorage and reinforcing, including attachments for building construction, in accordance with applicable codes and regulations,
    - .3 stamping and signing of each Shop Drawing and associated calculations
- 1.8.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.8.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Sealant Joint: Include sealant-filled joint at least 400 mm (16 inches) in each mock-up.
  - .3 Additional Components: Provide wall structural supports, sheathing, air barriers, vapor retarder membranes, flashing, cavity drainage materials, and weep holes.
  - .4 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .5 Reviewed mock-ups: may become part of the completed work if undisturbed at the time of Substantial Performance of The

---

work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.9 Delivery, Storage And Handling**

- 1.9.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.9.2 Deliver, store and handle masonry anchorage and reinforcing materials in accordance with manufacturer's written instructions.

**1.10 Site Conditions**

- 1.10.1 Make site measurements necessary for proper fit of members.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
  - .1 Blok Lok; a Hohmann & Barnard company.
  - .2 Fero Corporation.
  - .3 Heckmann Building Products Inc.;
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Performance / Design Criteria**

- 2.2.1 Design masonry anchorage and reinforcing as per CSA A370, Ontario Building Code, and CSA S304 with these stipulations:
  - .1 Size units to suit wall assembly thickness, factoring in sheathing, air barrier, vapour retarder membranes, and insulation, as applicable.
  - .2 Mechanical free play: Ensure single and multi-component ties have maximum free play of 1.2 mm (0.05 inches) in configuration or adjustment position, inclusive of play between tie components and structural backing.
  - .3 Displacement: Limit single and multi-component ties to maximum displacement of 2.0 mm (0.08 inches) under load of 0.45 kN (100 lbs.).
  - .4 Positive restraint: Equip adjustable ties with features that prevent disengagement in all adjustment positions.
  - .5 Corrosion and material compatibility: Use Type 304 stainless steel for anchoring, reinforcing materials, and accessories in exterior areas and high-moisture interior areas (relative

humidity above 75%, e.g., pools, showers). Use mill galvanized in interior areas.

- .6 Expansion joints: Ensure expansion joints accommodate wall system movement and interaction with building structure due to structural shifts, preventing damage, joint racking, seal breakage, or water ingress.
- .7 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.

## **2.3     Joint Reinforcement**

- 2.3.1 Conform to CAN/CSA A370 and to suit application.
- 2.3.2 Interior dry locations: Mill galvanized, cold drawn steel wire.
- 2.3.3 Interior high-moisture locations; Steel wire, hot dip galvanized: to ASTM A 641, Class 3 after fabrication.
- 2.3.4 Exterior locations: Stainless steel conforming to ASTM A 580, Type 304.
- 2.3.5 Provide ladder type reinforcement unless indicated otherwise. Where vertical reinforcement is not required in masonry walls, truss types are permitted.
- 2.3.6 Provide shop fabricated corners, intersections and curved configuration where required.
- 2.3.7 Single Wythe Joint Reinforcement:
  - .1 "220 Ladder Mesh" or "230 Ladder Tri-Mesh" or "240 Ladder-Twin-Mesh" or "250 Ladder Box-Mesh" by Hohmann & Barnard Inc.
  - .2 "BL-10, BL-11 or BL-12" ladder reinforcement by Blok-Lok Limited
  - .3 Approved equivalent.
- 2.3.8 Multiple Wythe Joint Reinforcement:
  - .1 "270 Ladder Eye-Wire" or "280 Dub'l Loop-Lok™" or "Tie-HVR-295V Anchor System - Ladder Type" by Hohmann & Barnard Inc.
  - .2 "BL-40 Adjustable Ladder Reinforcement" or "BL-42 Adjustable Ladder Reinforcement" by Blok-Lok Limited

.3 Approved equivalent.

**2.4 Masonry Anchors**

2.4.1 Conform to CAN/CSA A370 and to suit application.

**2.5 Fabrication**

2.5.1 Fabricate reinforcing in accordance with CSA-A23.1/A23.2 and Reinforcing Steel Manual of Standard Practice by the Reinforcing Steel Institute of Canada.

2.5.2 Fabricate connectors in accordance with CSA A370.

2.5.3 Obtain Consultant's confirmation for locations of reinforcement splices other than shown on reviewed Shop drawings.

2.5.4 Upon confirmation of Consultant, weld reinforcement in accordance with CSA W186.

2.5.5 Ship reinforcement and connectors, clearly identified in accordance with drawings.

**3 . EXECUTION**

**3.1 Examination**

3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

**3.2 Installation**

3.2.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.

3.2.2 Provide masonry connectors and reinforcement in accordance with CSA-A370, CSA-A371, CSA-A23.1/A23.2, and CSA-S304.1, unless indicated otherwise.

3.2.3 Prior to placing concrete, mortar, obtain Consultant confirmation of placement of reinforcement and connectors.

3.2.4 Install additional reinforcement to masonry as indicated.

**3.3 Bonding And Tying**

3.3.1 Bond walls of two or more wythes using metal connectors in accordance with CSA S304.1, CSA-A371, and as indicated.

- 3.3.2 Tie masonry veneer to backing in accordance with Ontario Building Code, CSA-S304.1, CSA-A371, and as indicated.

**3.4 Reinforced Lintels And Bond Beams**

- 3.4.1 Reinforce masonry lintels and bond beams as indicated.
- 3.4.2 Place and grout reinforcement in accordance with CSA-S304.1, CSA-A371 and CSA-A179.
- 3.4.3 Support and position reinforcing bars in accordance with CAN/CSA A371.

**3.5 Grouting**

- 3.5.1 Grout masonry in accordance with CSA-S304.1, CSA-A371 and CSA-A179, and as indicated.
- 3.5.2 Refer to Section 04 05 13 for additional requirements.

**3.6 Anchors**

- 3.6.1 Install metal anchors as indicated.

**3.7 Lateral Support And Anchorage**

- 3.7.1 Install lateral support and anchorage in accordance with CSA-S304.1 and as indicated.

**3.8 Movement Joints**

- 3.8.1 Ensure reinforcement is not continuous across movement joints unless otherwise indicated.

**3.9 Field Bending**

- 3.9.1 Do not field bend reinforcement and connectors except where indicated or authorized by Owner's Representative.
- 3.9.2 When field bending is authorized, bend without heat, applying a slow and steady pressure.
- 3.9.3 Replace bars and connectors which develop cracks or splits.

**3.10 Field Touch-Up**

- 3.10.1 Touch up damaged and cut ends of epoxy coated or galvanized reinforcement steel and connectors with compatible finish to provide continuous coating.

**3.11 Cleaning And Waste Management**

- 3.11.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.

- 3.11.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.11.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the concrete unit masonry work specified herein. This includes, but is not necessarily limited, to:
  - .1 Concrete masonry units.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.

- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for concrete unit masonry work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
  - .3 Masonry Units: Show sizes, profiles, coursing, and locations of special shapes.
- 1.5.4 Delegated Design Submittals:
  - .1 Engineering design completion of load-bearing and reinforced concrete unit masonry work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.
- 1.5.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.

- .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
- .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

**1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for concrete unit masonry to be included in building operation and maintenance manual.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.7.3 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance as noted in the Owner's supplementary conditions and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
  - .1 Professional Engineer's Responsibility:
    - .1 production and review of Shop Drawings,
    - .2 design and certification of concrete unit masonry, including attachments for building construction, in accordance with applicable codes and regulations,

- .3 stamping and signing of each Shop Drawing and associated calculations

1.7.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

1.7.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.

- .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.

- .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

## **1.8 Delivery, Storage And Handling**

1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.

1.8.2 Deliver, store and handle concrete unit masonry materials in accordance with manufacturer's written instructions and CSA A370.

1.8.3 Store masonry units on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied. If units become wet, do not install until they are dry.

## **1.9 Field Conditions**

1.9.1 Field Measurements: Verify actual dimensions of construction contiguous with concrete unit masonry by field measurements before fabrication.

1.9.2 Ambient Conditions: maintain materials and surrounding air temperature to the most stringent requirements of manufacturer's recommendations, and CAN/CSA A371.

## **1.10 Warranty**

1.10.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

---

## **2 .     PRODUCTS**

### **2.1     Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 Basalite Concrete Products;
- .2 Brampton Brick Limited;
- .3 Day & Campbell Limited.
- .4 Permacon;
- .5 Richvale York Block Inc.
- .6 Thames Valley Brick.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2     Performance / Design Criteria**

2.2.1 Masonry Standards: Comply with Canadian Masonry Contractors Association (CMCA) Masonry Practices Manual, CSA-S304.1, and CSA-A371.

2.2.2 Professional Engineer's Design and Certification: to design and certify load-bearing masonry units, masonry lintels, supports, and attachment to building structures in accordance with CSA S304.1.

2.2.3 Defective Units: While standards specified in this Section may permit a percentage of units with defects (e.g., chips, cracks) exceeding standard limits, do not incorporate units with defects if exposed in final Work.

2.2.4 Fire-Resistance: Use units that meet fire-resistance ratings indicated on Drawings and Schedules based on equivalent masonry thickness calculations, testing to CAN/ULC S101, or other methods approved by authorities having jurisdiction.

- .1 Classification: Same as classifications specified in this Section, except with modifications based on aggregate in units and equivalent unit thickness. For fire ratings equal to, or greater than 3 hours, use CAN/ULC-S101 certified units.

### **2.3     Concrete Masonry Units**

2.3.1 Concrete Block Masonry Units (CMU): Metric modular units to CSA A165 Series (CSA A165.1).

- .1 Classification: Provide normal weight units conforming to the following requirements unless otherwise indicated.
  - .1 Hollow Units: Type H/15/A/O (typical assemblies, < 75% of the gross cross-sectional area)

- .2 Semi-Solid Units: Type SS/15/A/O (sound-rated and fire-resistance rated assemblies,  $\geq 75\%$  but  $< 100\%$  of the gross cross-sectional area)
- .2 Provide H/15/C/O lightweight units where required for fire-rating requirements or at suspended slabs.
  - .1 Hollow Units: Type H/15/A/O (typical assemblies,  $< 75\%$  of the gross cross-sectional area)
  - .2 Semi-Solid Units: Type SS/15/A/O (sound-rated and fire-resistance rated assemblies,  $\geq 75\%$  but  $< 100\%$  of the gross cross-sectional area)
- .3 Provide “moisture-controlled” units (Moisture Content Facet: Type “M”) where masonry will be exposed to moisture or changes in humidity.
- .4 Dimensions: As noted on Drawings.
- .5 Special shapes: provide bull-nosed units for exposed corners. Provide purpose-made shapes for lintels, beams and bond beams. Provide additional special shapes as indicated or required.

## **2.4 Mortar And Grout Materials**

- 2.4.1 Conform to requirements of Section 04 05 13.

## **2.5 Reinforcement**

- 2.5.1 Conform to requirements of Section 04 05 19 - Masonry Anchorage and Reinforcing
- 2.5.2 Provide wire reinforcement to CSA A371 with corrosion protection to CSA S304, CSA G30.3-M and CSA A370.
- 2.5.3 Provide masonry reinforcements as required to improve performance of masonry walls and control shrinkage cracking. Fabricate reinforcing in accordance with CSA-A23.1/A23.2 and Reinforcing Steel Manual of Standard Practice by the Reinforcing Steel Institute of Canada.
  - .1 Spacing of Cross Rods, Tabs, and Cross Ties: Not more than 400 mm (16 inches) o.c.
  - .2 Provide in lengths of not less than 3 m (10 feet) , with prefabricated corner and tee units.

## **2.6 Auxiliary Materials**

- 2.6.1 Integral Water Repellent: Provide integral water repellent for all units unless indicated otherwise. Provide polymeric, integral water-repellent admixture, that does not reduce bond strength.
  - .1 Minimum performance: no visible water or leaks on back test specimen per ASTM E 514

.2 Acceptable Products:

- .1 "RainBloc" by ACM Chemistries, Inc.
- .2 "Rheopel Plus" by Master Builders Solutions Canada Inc.
- .3 "Dry-Block" by GCP Applied Technologies Inc.

2.6.2 Compressible Filler urethane filler to ASTM D1056, Grade 2A1, with minimum 35 percent compressibility.

2.6.3 Preformed Control-Joint Gaskets: SBS compound, to ASTM D 2000, Designation M2AA-805 designed to fit standard sash block and maintain lateral stability in masonry wall.

2.6.4 Bond-Breaker Strips: Asphalt-saturated, organic roofing felt complying with ASTM D 226, Type I (No. 15 asphalt felt).

2.6.5 Lateral Support Anchors: 12 ga thick metal plate, designed for block width and for optimal lateral shear resistance at top of masonry wall. Material to allow for slab vertical deflection above without transferring compressive loads to wall below.

- .1 Basis-of-Design: "BL-LSA Series" by Blok Lok or approved equivalent.

**2.7 Mortar And Grout Mixes**

2.7.1 Conform to requirements of Section 04 05 13.

**2.8 Tolerances**

2.8.1 Tolerances for standard concrete unit masonry tolerances in accordance with CAN/CSA-A165.1, supplemented as follows:

- .1 Maximum variation between units within specific job lot not to exceed 2 mm.
- .2 No parallel edge length, width or height dimension for individual unit to differ by more than 2 mm.
- .3 Out of square tolerance not to exceed 2 mm.

2.8.2 Tolerances for architectural concrete masonry units in accordance with CAN/CSA-A165.1, supplemented as follows:

- .1 Maximum variation in length or height between units within specific job lot for specified dimension not to exceed 2 mm.
- .2 No parallel edge length, width or height dimension for individual unit to differ by more than 2 mm.
- .3 Out of square tolerance not to exceed 2 mm.
- .4 Maximum variation in width between units within specific job lot for specified dimension not to exceed 2 mm.

---

### **3 .     EXECUTION**

#### **3.1     Examination**

- 3.1.1   Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2   Before installation, examine rough-in and built-in construction for piping systems to verify actual locations of piping connections.

#### **3.2     Installation**

- 3.2.1   Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2   Conform to requirements of CSA A371.
- 3.2.3   Build chases and recesses to accommodate items specified in this and other Sections.
- 3.2.4   Leave openings for equipment to be installed before completing masonry. After installing equipment, complete masonry to match the construction immediately adjacent to opening.
- 3.2.5   Use full-size units without cutting if possible. If cutting is required to provide a continuous pattern or to fit adjoining construction, cut units with motor-driven saws; provide clean, sharp, unchipped edges. Allow units to dry before laying unless wetting of units is specified. Install cut units with cut surfaces and, where possible, cut edges concealed.
- 3.2.6   Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint thicknesses and for accurate location of openings, movement-type joints, returns, and offsets. Avoid using less-than-half-size units, particularly at corners, jambs, and, where possible, at other locations.
- 3.2.7   Build around frames previously set and braced. Fill behind hollow frames within masonry walls with mortar or grout and embed anchors.
- 3.2.8   Fit masonry closely against electrical and plumbing outlets so collars, plates and covers overlap and conceal cuts.
- 3.2.9   Hollow Units: spread mortar setting bed from outside edge of face shells. Gauge amount of mortar on top and end of unit to create full joints, equivalent to shell thickness. Avoid excess mortar.

- 
- 3.2.10 Solid Units: apply mortar over entire vertical and horizontal surfaces. Avoid bridging of airspace between brick veneer and backup wall with mortar.
  - 3.2.11 Ensure compacted head joints. Use full or face-shell joint as indicated.
  - 3.2.12 Tamp units firmly into place.
  - 3.2.13 Do not adjust masonry units after mortar has set. Where resetting of masonry is required, remove, clean and reset units in new mortar.
  - 3.2.14 Unless indicated otherwise, tool joints as follows:
    - .1 Exterior: concave.
    - .2 Interior exposed: raked or concave as determined by Consultant during Shop Drawing review.
    - .3 Interior concealed: flush.
  - 3.2.15 After mortar has achieved initial set up, tool joints.
  - 3.2.16 Do not interrupt bond below or above openings.
  - 3.2.17 Bond Pattern for Exposed Masonry:
    - .1 Concrete block units:
      - .1 Bond: stack bond unless noted otherwise.
      - .2 Coursing height: 200 mm for one block and one joint.
    - .2 Do not use units with less than nominal 100-mm (4-inch) horizontal face dimensions at corners or jambs.
  - 3.2.18 Special Shapes:
    - .1 Install special units to form corners, returns, offsets, reveals and indents without cut ends being exposed and without losing bond or module.
    - .2 Install reinforced concrete block lintels over openings in masonry where steel or reinforced concrete lintels are not indicated.
    - .3 End bearing: not less than 200 mm, and as indicated on drawings.
  - 3.2.19 Stopping and Resuming Work: Stop work by racking back units in each course from those in course below; do not tooth. When resuming work, clean masonry surfaces that are to receive mortar before laying fresh masonry.
  - 3.2.20 Built-in Work: As construction progresses, build in items specified in this and other Sections. Fill in solidly with masonry around built-in items.
  - 3.2.21 Fill space between steel frames and masonry solidly with mortar unless otherwise indicated on Drawings and Schedules.

- 3.2.22 Where built-in items are to be embedded in cores of hollow masonry units, place a layer of metal lath, wire mesh, or plastic mesh in the joint below and rod mortar or grout into core.
- 3.2.23 Fill cores in hollow CMUs with grout 600 mm (24 inches) under bearing plates, beams, lintels, posts, and similar items unless otherwise indicated on Drawings and Schedules.
- 3.2.24 Build non-load-bearing interior partitions full height of story to underside of solid floor or roof structure above unless otherwise indicated on Drawings and Schedules.
  - .1 Install compressible filler in joint between top of partition and underside of structure above.
  - .2 Fasten partition top anchors to structure above and build into top of partition. Space anchors in accordance with requirements of CSA S304.1 and CSA A370.
  - .3 At fire-rated partitions, treat joint between top of partition and underside of structure above to comply with Section 07 84 10.

### **3.3 Control Joints And Movement Joints**

- 3.3.1 Install continuous movement joint fillers in movement joints at locations indicated on reviewed Shop Drawings, and generally as follows:
  - .1 Install control and expansion joint materials in unit masonry as masonry progresses. Do not allow materials to span control and expansion joints without provision to allow for in-plane wall or partition movement.
  - .2 Conform to requirements of NCMA TEK 10-2C
  - .3 Locations: Generally, Provide control joints at following locations:
    - .1 at column grid locations,
    - .2 at changes in wall height,
    - .3 at changes in wall thickness, such as at pipe and duct chases and pilasters,
    - .4 at (above) movement joints in foundations and floors,
    - .5 at (above and below) movement joints in roofs and floors that bear on a wall,
    - .6 near one or both sides of door and window openings unless other crack control measures are used, such as joint reinforcement or bond beams, and
    - .7 adjacent to corners of walls or intersections within a distance equal to half the control joint spacing
  - .4 Spacing: Ensure distance between joints does not exceed length to height ratio of 1.5:1 or 7.6 m (25 ft), whichever is less.

---

**3.4     Reinforcement**

3.4.1    Install reinforcing in accordance with Section 04 05 19.

**3.5     Connectors**

3.5.1    Install connectors in accordance with Section 04 05 19.

**3.6     Mortar Placement**

3.6.1    Place mortar in accordance with Section 04 05 13.

**3.7     Grout Placement**

3.7.1    Place grout in accordance with Section 04 05 19.

**3.8     Lintels**

3.8.1    Provide concrete or masonry lintels where shown and where openings of more than 300 mm (12 inches) for brick-size units and 600 mm (24 inches) for block-size units are shown without structural steel or other supporting lintels.

3.8.2    Provide minimum bearing of 200 mm (8 inches) at each jamb unless otherwise indicated on Drawings and Schedules.

**3.9     Parging**

3.9.1    Parge exterior faces of below-grade masonry walls, where indicated on Drawings and Schedules, in 2 uniform coats to a total thickness of 19 mm (3/4 inch). Dampen wall before applying first coat and scarify first coat to ensure full bond to subsequent coat.

3.9.2    Use a steel-trowel finish to produce a smooth, flat, dense surface with a maximum surface variation of 3 mm per 300 mm (1/8 inch per foot). Form a wash at top of parging and a cove at bottom.

3.9.3    Damp-cure parging for at least 24 hours and protect parging until cured.

**3.10    Repairing, Pointing, And Cleaning**

3.10.1    Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Install new units to match adjoining units; install in fresh mortar, pointed to eliminate evidence of replacement.

3.10.2    Pointing: During the tooling of joints, enlarge voids and holes, except weep holes, and completely fill with mortar. Point up joints, including corners, openings, and adjacent construction, to provide a neat, uniform appearance. Prepare joints for sealant application, where indicated on Drawings and Schedules.

---

**3.11 Cleaning And Waste Management**

- 3.11.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.11.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- .1 In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.
- .1 Allow mortar droppings on masonry to partially dry then remove by means of trowel, followed by rubbing lightly with small piece of block. Clean wall surface with suitable brush or burlap.
- .2 Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry as follows:
- .1 Remove large mortar particles by hand with wooden paddles and nonmetallic scrape hoes or chisels.
- .2 Test cleaning methods on sample wall panel; leave one-half of panel uncleaned for comparison purposes. Obtain Consultant's approval of sample cleaning before proceeding with cleaning of masonry.
- .3 Protect adjacent nonmasonry surfaces from contact with cleaner by covering them with liquid strippable masking agent or polyethylene film and waterproof masking tape.
- .4 Wet wall surfaces with water before applying cleaners; remove cleaners promptly by rinsing surfaces thoroughly with clear water.
- .5 Clean concrete masonry by cleaning method indicated on Drawings and Schedules in NCMA TEK 8-2A applicable to type of stain on exposed surfaces.
- 3.11.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.
- 3.11.4 Salvageable Materials: Unless otherwise indicated on Drawings and Schedules, excess masonry materials are Contractor's property. At completion of unit masonry work, remove from Project site.

**END OF SECTION**

## 1.0 **GENERAL**

### 1.1 **Documents**

1.1.1 This Section, along with the Drawings, forms part of the Contract Documents and is to be read, interpreted, and coordinated with all other parts.

1.1.2 Drawings include architectural, mechanical, and electrical Drawings.

### 1.2 **Description of Work Included**

1.2.1 Provide all labour, materials, equipment, access, cooperation, coordination, and services to allow testing of structural steel, open web steel joists, structural steel deck, and welds to be carried out by Testing Agency.

1.2.2 Scope of required quality assurance testing is described in this Section to inform Contractor of type and scope of testing on project and to allow Contractor to make appropriate allowances.

1.2.3 Testing required for Contractor's own quality control or as noted in clause 1.6.3 will be paid for by Contractor.

### 1.3 **Related Work Specified Elsewhere**

1.3.1 Section 05 12 00 – Structural Steel Framing

1.3.2 Section 05 31 00 – Steel Decking

1.3.3 Section 05 51 00 – Metal Stairs

### 1.4 **Reference Standards**

1.4.1 Testing of structural steel shall conform to requirements of the following Building Code and Standards unless otherwise required by this Specification:

- .1 Ontario Building Code - 2012 0 REG 88/19
- .2 CSA S16 – Limit States Design of Steel Structures
- .3 CSA W178.1 – Certification of Welding Inspection Organizations
- .4 CSA W59 – Welded Steel Construction (Metal Arc Welding)
- .5 CSA W47.1 – Certification of Companies for Fusion Welding of Steel Structures
- .6 CSA G40.20/G40.21 – General Requirements for Rolled or Welded Structural Quality Steel / Structural Quality Steel
- .7 CSA S136 – North American Specification for the Design of Cold-Formed Steel Structural Members
- .8 ASTM A6/A6M – Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling

- .9 CSSBI 10M – Standard for Steel Roof Deck
  - .10 CSSBI 12M – Standard for Composite Steel Deck
  - .11 RCSC Specification for Structural Joints Using ASTM A325 or A490 Bolts
  - .12 SDI Manual of Steel Construction with Steel Deck
  - .13 ASTM A653/A653M – Standard Specification for Sheet Steel, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
  - .14 ASTM A435/A435M – Standard Specification for Straight-Beam Ultrasonic Examination of Steel Plates
- 1.4.2 Revision date of referenced codes, standards, and guidelines shall be as indicated in the above referenced Building Code. Where no reference is made within the Building Code, the latest published edition shall be used.
- 1.4.3 Where the Standard is referenced in this Specification, it means documents specified in this clause and their referenced Standards.
- 1.4.4 Where there are differences between the Specifications and Drawings and the codes, standards, or acts, the most stringent shall govern.

## 1.5 **Definitions - For This Section**

- 1.5.1 “Owner”, “Contractor”, and “Consultant” per the General Conditions and Definitions.
- 1.5.2 “Structural Engineer” means a representative of Read Jones Christoffersen Ltd.
- 1.5.3 “Testing Agency” means a third-party testing and inspection agency.
- 1.5.4 “Non-Destructive Testing” means liquid penetrant (LP), magnetic particle (MP), ultrasonic (UT), or radiographic testing (RT) as determined appropriate by Testing Agency.
- 1.5.5 “Standard” and “Standards” mean reference standards listed under “Reference Standards” in this Section.

## 1.6 **Appointment of Testing Agency**

- 1.6.1 A CSA-Approved Testing Agency (approved under W178.1 - Building Category) shall be appointed to test structural steel and connections in accordance with Part **Error! Reference source not found.**
- 1.6.2 Unless stated otherwise in Division 0 / Division 1, Testing Agency shall be engaged by Owner.
- 1.6.3 Contractor shall pay for testing not covered in clause 1.6.1, including but not be limited to:
- .1 Testing of pre-approved connections not on structural Drawings and required by Contractor for ease of fabrication, transportation, or erection.

- .2 Additional costs due to overtime, shift work, and holiday or weekend work required to meet schedule.
- .3 Costs for retesting or additional testing due to work having failed to meet specified requirements.
- .4 Non-destructive testing will be performed on samples of work as outlined in the Specification. Repair and re-testing shall be done at Contractor's expense.
- .5 Deficiencies in work will trigger required additional testing.

## **2.0 DUTIES**

### **2.1 Responsibility of Contractor**

- 2.1.1 Cooperate fully with Testing Agency. Allow free access to all parts of the work for testing and review at all times.
- 2.1.2 Notify Testing Agency and Structural Engineer when work is ready for review.
- 2.1.3 Prior to commencement of work, provide schedule of shop fabrication and erection to Testing Agency and Structural Engineer. Changes in this schedule shall be communicated to these parties in a timely fashion.
- 2.1.4 Provide quantity takeoff of all members in project for use in determining number of members required for testing. This takeoff should also indicate divisions in which members are to be fabricated to aid in shop inspection planning.
- 2.1.5 Provide mill certificates in accordance with the Standard, properly correlated to elements being fabricated.
- 2.1.6 Make available non-destructive testing reports performed in shop during fabrication.
- 2.1.7 Prep areas requiring NDE to an acceptable level. Preparation includes, but is not limited to:
  - .1 Ultrasonic Testing (UT) to 300 mm away from weld by grinding off weld splatter and buffing area with wire wheel.
  - .2 Provision of necessary access platforms or scaffolding to allow inspections to be carried out.
- 2.1.8 Contractor is solely responsible to provide finished product that meets Specifications and Contract Documents. Testing is not carried out for Contractor's benefit, nor does it make Structural Engineer or Testing Agency guarantors of Contractor's work.

### **2.2 Responsibility and Duties of Testing Agency**

- 2.2.1 Testing Agency has authority to, and is expected to, reject any work not meeting Specifications.

- 2.2.2 Identify number, type, and locations of members, connections, studs, etc. to be tested and coordinate required shop and site visits.
- 2.2.3 Review structural Drawings and Specifications prior to carrying out work.
- 2.2.4 Provide testing per the Standards and this Specification.
- 2.2.5 Provide timely test reports to Structural Engineer, Consultant, and Contractor.

### **3.0 TESTING AND INSPECTION**

#### **3.1 General**

- 3.1.1 Structural Engineer may reject, at any time during progress of work, a piece of material or member which Structural Engineer may find defective or not in accordance with detailed drawings. This material may be rejected notwithstanding any previous acceptance; replace rejected components at no expense to Owner. In case of dispute, decision of Structural Engineer will be final.
- 3.1.2 If initial tests indicate that work failed to meet Specification, Structural Engineer will decide if additional testing is necessary. This testing shall be done by Owner's agency. Proposed additional testing shall have prior approval of Structural Engineer.
- 3.1.3 Non-destructive testing operators shall have Level II qualification as a minimum.

#### **3.2 Documents and Materials**

- 3.2.1 Confirm that fabricator and erector are certified to CSA W47.1 and that welders are properly qualified.
- 3.2.2 Review mill certificates for all types of material used in project to ensure they meet requirements of 05 12 00 and forward to Structural Engineer.
- 3.2.3 Confirm welding consumables provided will meet levels of strength, notch toughness, and quality of base member and that they are properly stored in shop and field.
- 3.2.4 Review bolt storage, handling, and installation procedures including pre-installation verification testing as required depending on types of bolts or washers to be used.
  - .1 Tension Control (TC) Bolts
    - .1 Carry out pre-installation verification in accordance with CSA S16 to confirm bolts will function as intended.
  - .2 Direct Tension Indicator (DTI) Washers
    - .1 Review fabricator installation procedures.
    - .2 General review for damage to washers prior to installation.
- 3.2.5 Review available non-destructive testing reports performed by Contractor.

- 3.2.6 Where more than one type of paint is specified, colour of each coat of paint shall differ so they can be visually identified after applications.
- 3.2.7 Obtain invoices and product data from steel supplier for purchase of specified primers and paints required for project. Circulate these documents to Structural and Architectural Consultants.

**3.3 Visual Testing (VT) of Members and Connections (Welded or Bolted)**

- 3.3.1 Perform visual testing of structural components, framing, and connections through a combination of shop and field visits to meet requirements below.
- 3.3.2 Visual Testing (VT) requirements above include but are not limited to verifying:
- .1 Grade markings on structural steel in fabricator's plant prior to fabrication.
  - .2 Dimensions, including cross-section, in relation to specified members (in-house plant QC may be relied upon to perform this task assuming testing agency is satisfied with level of QC being carried out).
  - .3 Locations of holes, cuts, fittings, and milling of member ends.
  - .4 Tolerances of joint preparation and fit up (bevel angle, etc.) to be in accordance with CSA S16.1, clause 28.5 Joints in Contact Bearing.
  - .5 Preheat and interpass temperatures based on approved welding procedures.
  - .6 Snug tight bolted connections are properly compacted and brought to snug tight condition progressing outward from most rigid part.
  - .7 Specified beam and / or truss camber and cambering procedure do not reduce member capacity.
  - .8 Erection tolerances meet tolerances of CSA S16.
  - .9 Joist and truss erection tolerances meet CSA S16 requirements, and report twisting, sweeping, and local damage.
  - .10 Adequate joist bearing on supporting structure as detailed in Drawings.
  - .11 Truss permanent top and bottom chord bridging and end connections are complete.
  - .12 Number of headed studs per beam and that stud placement is properly offset towards closest beam support within composite deck flutes per typical details.
  - .13 Steel surface preparation prior to priming and / or painting is in conformance with requirements of Structural and Architectural Specifications.
  - .14 Steel that is exposed or in unconditioned spaces, such as canopies, parapet walls, steel lintels, shelf angles, etc., are galvanized and or painted in accordance with Contract Documents.

- 3.3.3 Defects noted during Visual Testing (VT) work shall be reviewed using appropriate comprehensive Non-Destructive Evaluation (NDE), which shall be in addition to requirements in clause 3.4.

**3.4 Comprehensive NDE Testing of Connections (Welded or Bolted)**

- 3.4.1 Perform testing of connections through combination of shop and field visits to meet sampling required in Tables 1 and 2.

- 3.4.2 Requirements of Tables 1 and 2 include but are not limited to verifying:

- .1 At least one type of unique connection shall be tested irrespective of sampling requirements.
- .2 Bolt types conform to Drawings and Specifications prior to start of bolting operations and that pre-installation verification has been completed.
- .3 Bolted connections shall be tested in accordance with CSA S16 with minimum two bolts tested for each pre-tensioned connection.
- .4 For bolted connections that are indicated as pre-tensioned or slip critical, pre-installation verification testing is performed by inspector in cooperation with Contractor.
- .5 For bolted connections indicated as pre-tensioned or slip critical, Testing Agency shall be present during installation with sufficient frequency so pre-tensioning methods of RCSC 8.2.1, 8.2.3, or 8.2.4, as appropriate, are performed.
- .6 Welded connections shall be tested in accordance with Annex P of CSA S16 clause 9.5 with an inspection class of IC3 (Critical).
- .7 When overall length of weld is less than 900 mm, test entire length.
- .8 Splices not shown on structural drawings shall be 100% ultrasonically tested (UT) at Contractor's expense.

- 3.4.3 Post-installation review of bolts using following techniques:

- .1 Conventional bolts
  - .1 Turn of nut method marked on washer and bolt head or calibrated torque wrench.
- .2 Tension Control (TC) Bolts
  - .1 Post-installation review should be carried out to ensure bolt tip is sheared off at tension control point.
- .3 Direct Tension Indicator (DTI) Washers
  - .1 Post-installation review shall be carried out to ensure even bearing of connection and no obstructions are present that would cause uneven pressure to be applied to DTI.

**3.5 Testing of Steel Deck**

- 3.5.1 Provide visual testing (VT) of steel deck gauge and connections to meet requirements below.

Deck Type (Composite / Non-Composite)	Comments (Deck Gauge)	Individual Item Sample Size	
		Material Thickness	Connections
Non-Composite	22 Gauge	10%	30%
Non-Composite	20 Gauge	10%	40%
Non-Composite	$t > 20$ Gauge	10%	50%
Composite	$t \leq 20$ Gauge	10%	30%
Composite	$t > 20$ Gauge	10%	40%

3.5.2 Sampling of deck connections shall be in a representative fashion for equal distribution between support, seam, and edge connections.

3.5.3 Visual Testing (VT) requirements above include but are not limited to verifying:

- .1 Types of connections (welds) or fasteners (mechanical) and verify they meet what has been specified in engineering Drawings.
- .2 That welds align with supporting structure below and proper fusion has been achieved.
- .3 Verify that localized deck supports are provided at discontinuous deck ends that do not bear on structure due to framing interruptions.
- .4 Verify deck galvanizing per Specifications by taking random zinc thickness measurements of 10% of supplied galvanized deck. Touch up areas where testing has taken place with zinc rich paint.

3.5.4 If Testing Agency determines that quality of welds appear deficient, they shall request a weld quality control test in accordance with SDI Manual of Steel Construction with Steel Deck. Structural Engineer shall be immediately notified of this requirement and may request to be present at time of test.

### **3.6 Testing of Headed Studs and Deformed Bar Anchors**

3.6.1 Shop welded studs may be fillet welded. Field applied studs shall be applied using manufacturer's stud gun and procedures or shall be rejected.

3.6.2 Reinforcing bars (Rebar) butt welded to plates shall be tested per this Section and be weldable grade (W) reinforcing.

3.6.3 Welding of rebar shall be carried out by a welder with appropriate qualifications.

3.6.4 Qualification Testing is required on a sample specimen with materials representative of conditions used in construction prior to performing stud welding in accordance with CSA W59, Cl 6.3.

3.6.5 Contractor shall be responsible for performance of qualification testing to establish proper weld procedure. Submit written procedure based on this testing to testing and inspection company for review and acceptance prior to commencement of work.

3.6.6 Preproduction Testing: Before production welding with particular set-up and given size and type of stud, and at beginning of each day or shift's production, testing shall be performed on first two studs that are welded. Testing requirements shall be conducted per CSA W59 Cl 6.5.

3.6.7 Perform Visual Testing (VT) of studs and anchors through a combination of shop and field visits to meet requirements below.

<b>Structural Framing</b>	<b>Minimum Total % Connection Testing</b>
Beams & Joists	17.5%
Girders & Joist Girders	37.5%

3.6.8 Visual Testing requirements above include but are not limited to verifying:

- .1 Inspect number of studs per beam
- .2 Verifying stud placement in deck cell is located closest to nearest end of beam.

3.6.9 Studs and anchors shall be tested by bending to an angle of 30° towards direction of nearest end of member. Testing shall be completed through a combination of shop and field visits to meet requirements below.

<b>Structural Framing</b>	<b>Minimum Total % Connection Testing</b>
Beams & Joists	1.10%
Girders & Joist Girders	1.70%

3.6.10 Perform destructive testing of studs and anchors through a combination of shop and field visits to meet requirements below.

<b>Structural Framing</b>	<b>Minimum Total % Connection Testing</b>
Beams & Joists	0.40%
Girders & Joist Girders	0.55%

3.6.11 Bend (3.6.9) and destructive (3.6.10) testing shall be subject to following additional requirements.

- .1 Studs testing to destruction shall be replaced by Contractor and retested.
- .2 Failure of weld of any studs will be cause for rejection of stud welding and cause for further testing at Structural Engineer's discretion. This additional testing shall be at Contractor's expense.
- .3 A 10% or greater failure rate at welds of tested studs will be cause for rejection of all studs.
- .4 Replacement of failed or rejected studs shall be at Contractor's expense.

**Table 1: Single Piece Members**

<b>Structural Framing</b>	<b>Minimum Total % Connection Testing</b>
Columns & Base Plates	10%
Bracing	10%
Beams & Joists	7.5%
Girders	10%
Moment Connections	10%
Splices	100%
Section Reinforcement & Stiffeners	25%

**Table 2: Multi-Piece Members**

<b>Structural Framing</b>	<b>Minimum Total % Connection Testing</b>
Trusses & Joist Girders	15%
Field Reinforcing Work	30%

**End of Section**

## **1.0 GENERAL**

### **1.1 Documents**

- 1.1.1 This section, along with the drawings, forms part of the Contract Documents and is to be read, interpreted, and coordinated with all other parts.
- 1.1.2 Drawings include architectural, mechanical, and electrical drawings.

### **1.2 Description of Work Included**

- 1.2.1 Provide all labour, materials, equipment, and services to supply, design, and erect structural steel required and/or indicated on the drawings or specified herein, including the supply of plates and/or angles for support of masonry, embedded steel parts, headed stud, mechanical couplers; deformed bar anchors, wedge anchors, and epoxy anchors that will form the connection between the structural steel, open web steel joists and masonry or concrete; and reinforcement of steel deck openings. Report any discrepancies between structural, mechanical, electrical, and architectural drawings to the Consultant and Structural Engineer immediately.
- 1.2.2 Co-ordinate with Section 03 30 00 – Concrete Framework and Section 03 20 00 – Concrete Reinforcement for the design, supply, installation, and erection of embedded steel parts.
- 1.2.3 Co-ordinate with Section 05 21 00 – Open Web Steel Joists for the design, fabrication, supply, installation, and erection of open web steel joists.
- 1.2.4 Co-ordinate with Section 05 31 00 – Steel Deck for the design, supply, and installation of headed stud shear connectors for composite beams and girders, and where required on other beams, girders, and drag struts.

### **1.3 Related Work Specified Elsewhere**

- 1.3.1 Section 03 11 00 – Concrete Forming and Accessories
- 1.3.2 Section 03 20 00 – Concrete Reinforcing
- 1.3.3 Section 03 30 00 – Structural Cast-in-Place Concrete
- 1.3.4 Section 04 22 00 – Concrete Unit Masonry
- 1.3.5 Section 05 00 50 – Testing of Structural Steel
- 1.3.6 Section 05 21 00 – Steel Joist Framing
- 1.3.7 Section 05 31 00 – Steel Decking
- 1.3.8 Section 05 51 00 – Metal Stairs
- 1.3.9 Section 07 81 00 – Applied Fireproofing
- 1.3.10 Section 09 91 13 – Exterior Painting
- 1.3.11 Section 09 91 23 – Interior Painting

**1.4      Reference Standards**

1.4.1    Structural steel shall conform to the requirements of the following Building Code and Reference Standards unless otherwise required by this specification:

.1      Building Code

.1      Ontario Building Code - 2012 0 REG 88/19

.2      Reference Standards

.1      General

.1      CSA S16 – Design of Steel Structures

.2      CSA G40.20 – General Requirements for Rolled or Welded Structural Quality Steel

.3      CSA G40.21 – Structural Quality Steel

.4      ASTM A1085/A1085M – Standard Specification for Cold-Formed Welded Carbon Steel Hollow Structural Sections (HSS)

.5      CSA S136 – North American Specification for the Design of Cold-Formed Steel Structural Members

.6      ASTM A6/A6M – Standard Specification for General Requirements for Rolled Structural Steel Bars, Plates, Shapes, and Sheet Piling

.7      CISC Code of Standard Practice for Structural Steel

.8      ASTM A53 – Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless

.9      ASTM F3125/F3125M – Standard Specification for High Strength Structural Bolts and Assemblies, Steel and Alloy Steel, Heat Treated, Inch Dimensions 120 ksi and 150 ksi Minimum Tensile Strength, and Metric Dimensions 830 MPa and 1040 MPa Minimum Tensile Strength

.10     ASTM A325 – Standard Specification for Structural Bolts, Steel, Heat Treated 120 / 105 ksi Minimum Tensile Strength

.11     ASTM A490 – Standard Specification for Structural Bolts, Alloy Steel, Heat Treated 150 ksi Minimum Tensile Strength

.12     ASTM F1554 – Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength

.13     CSA W47.1 – Certification of Companies for Fusion Welding of Steel Structures

- .14 CSA W59 – Welded Steel Construction (Metal Arc Welding) (Metric version)
- .2 Surface Preparation and Finishes
  - .1 SSPC SP-6 – Commercial Blast Cleaning
  - .2 CSA G189 – Sprayed Metal Coatings for Atmosphere Corrosion Protection.
  - .3 CISC / CPMA Standard 1-73a – A Quick-Drying One-Coat Paint for Use on Structural Steel.
  - .4 Architectural Exposed Structural Steel shall conform to Appendix I of CISC Code of Standard Practice for Structural Steel.
- .3 Galvanizing
  - .1 ASTM A123/A123M – Standard Specification for Zinc (Hot-Dip Galvanizing) Coatings on Iron and Steel Products
  - .2 ASTM A143/A143M – Standard Practice for Safeguarding Against Embrittlement of Hot-Dip Galvanized Structural Steel Products and Procedure for Detecting Embrittlement
  - .3 ASTM A153/A153M – Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
  - .4 ASTM A384/A384M – Standard Practice for Safeguarding Against Warpage and Distortion During Hot-Dip Galvanizing of Steel Assemblies
  - .5 ASTM A385/A385M – Standard Practice for Providing High-Quality Zinc Coatings (Hot-Dip)
  - .6 ASTM A780/A780M – Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings
  - .7 CGSB-85-GP-16M – Painting Galvanized Steel
- 1.4.2 The revision date of all referenced codes, standards, and guidelines shall be as indicated in the above referenced Building Code. Where no reference is made within the Building Code, the latest published edition shall be used.
- 1.4.3 Where the Standard is referenced in this specification, it shall mean the documents specified in this clause and their referenced Standards.
- 1.4.4 Where there are differences between the specifications and drawings and the codes, standards, or acts, the most stringent shall govern.

## 1.5 **Definitions - For This Section**

- 1.5.1 “Owner”, “Contractor”, and “Consultant” as per the General Conditions and Definitions.

- 1.5.2 “Structural Engineer” shall mean a representative of Read Jones Christoffersen Ltd., herein also referred to as RJC.
- 1.5.3 “Specialty Structural Engineer” is a Professional Engineer registered in Ontario responsible for components designed by the Contractor and who seals and signs shop drawings.
- 1.5.4 “Testing Agency” shall mean the testing agency responsible to the Owner.
- 1.5.5 “Standard” and “Standards” shall mean the reference standards listed under “Reference Standards” in this section.

## **1.6 Qualifications**

- 1.6.1 Fabricator, erector, and all subcontractors performing structural steel work shall be certified under the requirements of Division 1, or Division 2.1 of W47.1. Fabricator and erector shall have in place a Quality Control Program satisfying the requirements of ISO 9001-2008 or another quality control program that is acceptable to the Consultant. In any case, the Quality Control Program shall satisfy the minimum requirements specified in the contract documents.
- 1.6.2 Design calculations shall be carried out by or under the direct supervision of a qualified Specialty Structural Engineer licensed in the Province of Ontario, with a minimum of five years Canadian experience in the design of structural steel work and connections including design of weldments, as appropriate.
- 1.6.3 Engineers responsible for welding design, procedures, and practice shall be certified in accordance with CSA W47.1, section 6.1.
- 1.6.4 Specialty Structural Engineers responsible for the design of steel work, connections, and the like, shall be insured in accordance with the Professional Engineers Ontario Act and shall be covered under a General Liability Insurance Policy in accordance with the Provisions of the Contract.
- 1.6.5 Structural steel fabricator shall have not less than five year(s) experience in the fabrication of structural steel and hold the CISC Steel Structures Certification under the CISC Quality Certification Program.
- 1.6.6 Erector shall not have less than ten year(s) experience in the erection of structural steel.

## **1.7 Examinations**

- 1.7.1 All dimensions shall be taken from the drawings and verified by field measurement (including verification of interfacing with existing structures). Be responsible for the correctness of such measurements and report to the Consultant and Structural Engineer in writing all discrepancies between measurements in the field and those shown on drawings prior to commencing work. Verify location of anchor rods and embedded steel, and ensure that work prepared by other trades is at a proper elevation, on line, level, and true.

**1.8 Submittals**

1.8.1 Suppliers shall provide an embodied carbon breakdown for all structural steel utilized in the project for review and approval:

- .1 The breakdown shall be provided prior to or during the ordering material indicating the total embodied carbon (kg CO<sub>2e</sub>).
- .2 The breakdown shall also be provided at the end of the project with the values updated to reflect the final as-built quantities and resulting embodied carbon (kg CO<sub>2e</sub>).
- .3 The breakdown shall be a tabular submittal showing all members, materials, quantities and embodied carbon based on accompanying EPDs as outlined below.
- .4 Refer to Division 1 for the maximum allowable upfront (A1-A3) kgs of embodied carbon.
- .5 The maximum embodied carbon for each type of member utilized shall not exceed the values below unless approved by the Consultant.

Member Type	Maximum kg CO <sub>2e</sub> / tonne	Product
Steel Plate	1710	CISC Industry Average
Rolled Structural Steel Sections	820	Structural steel product, hot-rolled, North America average, 7850 kg/m <sup>3</sup> (Gerdau)
HSS Sections	1860	CISC Industry Average
Metal Deck	1740	Steel roof and floor deck using electric arc furnace (EAF) technology, North America average, 7800 kg/m <sup>3</sup> (Nucor Corporation's Vulcraft Group)
Open Web Steel Joists	840	Fabricated open-web steel joists and joist girders, 7800 kg/m <sup>3</sup> (Nucor)

1.8.2 Submit Environmental Product Declarations (EPDs) compliant with CSA-ISO 14025-07.

- .1 Product EPDs must be third party certified, including external verification.

1.8.3 Alternatively with written approval producers may submit an industry average EPD in which the manufacturer is explicitly recognized as a participant by the program operator.

1.8.4 Submit third party certified documentation identifying products that demonstrate item 1 and as many of the remaining items as possible:

- .1 global warming Potential (greenhouse gases), CO<sub>2e</sub>;
- .2 depletion of the stratospheric ozone layer, in kg CFC -11;
- .3 acidification of land and water sources, in moles H<sup>+</sup> or kg SO<sub>2</sub>;

- 
- .4 eutrophication, in kg nitrogen or kg phosphate;
  - .5 formation of tropospheric ozone, in kg NOx, kg O3, or kg ethane; and
  - .6 depletion of non-renewable energy resources, in MJ.
- 1.8.5 Submit documentation of recycled content of structural steel. A breakdown of post-consumer and post-industrial recycled content should be specified. A mill certificate shall be provided.
- 1.8.6 Submit documentation of where the structural steel was produced, processed, and manufactured.
- 1.8.7 Quality Control Program
- .1 Include with the tender documents a copy of fabricator's and erector's standard Quality Control Program.
  - .2 Prior to commencement of the work, the Contractor, with the fabricator and erector, shall submit a complete Quality Control Program for this specific project for review by the Consultant. The fabricator and erector shall revise and resubmit the Program if required by the Consultant.
- 1.8.8 Qualifications of Specialty Structural Engineer
- .1 Submit appropriate documentation for each Professional Engineer who will be responsible for the steel work; including the erection and design of connections, weldments (qualification of the steel fabricators and erectors for welding under Canadian Welding Bureau requirement and CSA W186), and the like, verifying the minimum qualification requirements outlined in this specification.
- 1.8.9 Proof of Insurance
- .1 Submit proof of adequate insurance coverage for each Professional Engineer who will be responsible for the steel work, connections, and the like, as outlined in this section.
- 1.8.10 The Contractor shall submit, with the tender, written evidence of qualification of the steel fabricators and erectors for welding under Canadian Welding Bureau requirements.
- 1.8.11 The Contractor shall submit, with the tender, written evidence of ability to weld reinforcing steel to structural steel in accordance with CSA W186.
- 1.8.12 The Contractor shall submit, prior to the commencement of fabrication, copies of mill test reports properly correlated to the materials used on the project. The Contractor shall also review clause 2.1.1.3 and provide reports as required in order to demonstrate conformance with the chemical content parameters.
- 1.8.13 The Contractor shall make available all non-destructive testing reports, steel testing, and weld testing reports performed in the shop during fabrication by the steel fabricator.

- 1.8.14 The Contractor shall submit accurate surveys of steel erection as noted in this section, and on the structural drawings.
- 1.8.15 The Contractor shall submit manufacturer's literature and certification that shop paint, primer, coatings, and galvanization meets the performance standards specified herein and related specified work elsewhere.
- 1.8.16 The Contractor shall submit a description of welding procedures for use on structural steel a minimum one month prior to fabrication or use.
- 1.8.17 Provide a schedule of fabrication to the Consultant, Structural Engineer, and Testing Agency prior to the commencement of the fabrication.

## **1.9 Shop and Erection Drawings**

- 1.9.1 Specialty Structural Engineer(s) responsible for the structural steel work, connections, joist systems, and the like shall either:
  - .1 Seal and sign all necessary shop drawings, or
  - .2 Submit a sealed and signed letter prior to commencement of shop drawing preparation identifying who that fabricator's engineer is that has been retained by the steel fabricator to carry out the design of steel connections, and the like AND shall submit a second letter after shop drawing preparation is complete stating that the design of the steel work, for which they are responsible, has been completed in accordance with the contract documents and relevant building codes, standards and acts. The letter shall identify what was designed by the Professional Engineer(s) and list the final shop drawings by number with dates and revision numbers.
  - .3 If the Professional Engineer(s) choose to seal and sign the shop drawings, as noted above, all shop drawings must be sealed and signed, except for erection diagrams which only contain design information (member sizes, forces, loads and the like) which is shown on the structural drawings. If any field work details, notes to the erector, or notifications are made on the erection diagrams then they must be sealed and signed.
- 1.9.2 The structural drawing, any structural models, and electronic files shall not be reproduced in whole or in part, and shall not be used to prepare shop, erection, or setting drawings. Structural models and electronic files may be used by the Contractor under the following conditions:
  - .1 Copyright remains with Read Jones Christoffersen Ltd.
  - .2 The drawings will only be used for shop drawings for this project and not be put to any other use.
  - .3 Read Jones Christoffersen Ltd. assumes no liability for errors or omissions in the drawings. The Contractor assumes all risk and expenses associated with the use of structural drawings in the production of their work.

- 
- .4 References to Read Jones Christoffersen Ltd. must be deleted from the title block.
  - .5 The Contractor signs a release available from Read Jones Christoffersen Ltd. that addresses the above items in more detail.
  - 1.9.3 Structural drawings shall not be scaled.
  - 1.9.4 Submit structural steel connection design details shop, erection, field work details, and setting drawings for review by the Consultant.
  - 1.9.5 Connection Design Details:
    - .1 Submit “design” drawings for review summarizing the proposed connection details to be used on the project. These drawings to be prepared by or under supervision of the Specialty Structural Engineer and submitted for review before the start of shop drawing production. These design drawings shall show the complete connection and:
      - .1 How the connection assembly fits with the connected members.
      - .2 Sizes of plates, bolts, welds, etc.
      - .3 Capacities of the connection.
      - .4 Assumed eccentricities, lines of action of forces, etc.
  - 1.9.6 Erection Drawings
    - .1 Submit erection drawings for review prior to preparation of detailed shop drawings.
    - .2 Erection drawings shall clearly show all setting out dimensions for the structural steel frame, including dimensions that have been confirmed by site measurement. Dimensions shall be tied into relevant grid lines or reference points wherever possible.
  - 1.9.7 Shop Drawings
    - .1 Submit detailed shop drawings for all structural members that show the details necessary for the fabrication of the component parts of the structure.
    - .2 Shop drawings as a minimum, show the following:
      - .1 layout;
      - .2 member sizes;
      - .3 connection details, including member cuts and copes where applicable;
      - .4 bearing details;
      - .5 splice locations and details (splices not shown on the shop drawings will be rejected);
      - .6 truss details;
      - .7 holes;

- .8 camber;
- .9 finishes;
- .10 grade(s) of steel;
- .11 bolt or threaded fastener material grade, size, and designation;
- .12 weld type, size, extent, and if shop or field applied with AWS welding symbols as specified in the CSA W59 Appendix D and E;
- .13 sliding expansion joint bearing pad details, including materials, size, and thickness of pads; setting out dimensions; and load capacity;
- .14 Architectural clearance lines and finishes where connection and the like may encroach with other work.
- .3 Provide a shop drawing clearly locating all anchor rods, embedded plates, baseplates, etc.
- .4 Provide setting drawings, templates, and directions for the installation of anchor rods, plates, and other devices.
- .5 Review of the shop drawings by the Structural Engineer is intended as an assistance to the Contractor and does not relieve the Contractor of their responsibility for the completeness or accuracy of their work and its conformance with the contract documents.
- .6 Fabrication that commences prior to shop drawing review by the Structural Engineer is at the risk of the Contractor.
- .7 Clearly identify on the shop drawing all revisions, changes, or modifications.
- .8 Resubmit reviewed shop drawings where noted in the Read Jones Christoffersen Ltd.'s review stamp, or when the Contractor makes revisions for their own purposes.
- .9 The Contractor shall perform and submit a complete survey, before steel erection commences, of position and alignment at all points where construction by other trades will support steel elements, including but not limited to pockets, embedded plates, anchor rods, rebar, and base plates. Include plan location positions relative to the building gridlines, and elevations of bearing surfaces and tops of bolts/rods relative to building Datum elevation.
- .10 The Contractor shall perform and submit a preconstruction survey where new steel work relies on existing construction. The survey of the existing structures/construction shall be completed prior to completing and submitting shop drawings for the related works and prepared by a professional surveyor employed by the Contractor. This survey shall include but not be limited to:
  - .1 Dimensions and elevations.

- 
- .2 Exact location of mass timber members supporting steel framing.
  - .3 Concrete scanning at locations of attachment for embedded rebar, concrete, etc.
  - .11 The Contractor shall submit a steel erection procedure prepared by Contractor's Specialty Engineer. Procedure to include any loading and temporary connections to base building structure. Refer to temporary works on General Notes for more information. No deviation from the approved procedure will be permitted without prior written approval by the Specialty Engineer and review by RJC.
  - .12 The Contractor shall complete and submit a comprehensive survey of the as-constructed steel structure at each level adequate to assess if the structure has been built within specified tolerances. Surveys are to be submitted to the Contractor's Specialty Engineer for approval. If deviations from tolerances are found, Contractor to propose corrective measures to RJC for approval.
  - .13 Allow at least two weeks (10 working days) for shop drawing review by the Structural Engineer.
- 1.9.8 Field Work Details
- .1 Submit details for all field work in accordance with the requirements of Division 1.
  - .2 The location of field work details shall be clearly identified or referenced on the erection drawings.
  - .3 Prepare setting drawings showing dimensions and details for setting structural steel bearings, anchorages, assemblies and the like where they interface with other building components and support the work of this section.
  - .4 The steel contractor shall incorporate other trade's work as directed by the Construction Manager.
  - .5 Submit all non-prequalified welding procedures, stamped as approved by the Canadian Welding Bureau and correlated to the appropriate shop and erection drawings.
  - .6 Submit details of methods proposed to achieve and verify the specified tension to bracing members within the specified tolerance.
  - .7 Furnish Inspection Company with a copy of each shop, erection, and setting drawing bearing the Consultant's shop drawing stamp marked reviewed.

**1.10 Supply of Alternate Products**

- 1.10.1 Should the rolled sections or any other structural steel element shown on the drawings not be available or procurable, or should substitution for those sections be desired, sections of equivalent or greater mechanical properties (strength, stiffness, etc.) may be substituted if approved by RJC in writing. In such cases, full particulars thereof must be submitted prior to the closing of Bid. Material and structural section substitutions after the closing of Bid, if accepted, will be at the Contractor's cost.

**1.11 Testing and Field Review**

- 1.11.1 See Section 05 00 50 – Testing of Structural Steel.
- 1.11.2 Prior to the commencement of work, provide a schedule of shop fabrication to the Testing Agency.
- 1.11.3 The Contractor shall advise the Testing Agency of the scheduling of all shop and field work pertaining to this Project. The Contractor shall permit the testing agency full access to the fabrication shop and the site for the purpose of carrying out their work and shall provide assistance required to aid in the performance of the inspection and testing.
- 1.11.4 The Specialty Structural Engineer (or approved representative) responsible for shop drawings shall visit the site to review in place the connections and components to ensure that these connections and components substantially comply with the design drawings. The Specialty Structural Engineer shall then provide a sealed and signed letter to the Consultant and Structural Engineer to this effect.

**1.12 Storage and Handling**

- 1.12.1 The Contractor shall be responsible for the protection of all steelwork during fabrication, shipping, storage, and construction. All small bends and damage shall be reported to the Structural Engineer for instructions. Steel work that is bent, broken, or otherwise damaged shall be repaired or replaced by the Contractor prior to erection, to the satisfaction of the Structural Engineer, and at no cost to the Owner.
- 1.12.2 The Contractor shall be responsible for proper scheduling of delivery and erection for the structural steel in accordance with the construction schedule.
- 1.12.3 Store structural steel members at the site above ground on platforms, skids, or other devices so that ground dampness will not affect the bottom members of the stacks.
- 1.12.4 Steel that is stored outdoors after fabrication shall be protected from accumulations of standing water.
- 1.12.5 Other materials shall be stored in a weather tight and dry place until ready for use in the Work.
- 1.12.6 Packaged materials shall be stored in their original unbroken packages or containers.

**1.13 Coordination with Other Trades**

- 1.13.1 Supply all necessary instructions and drawings to other trades for setting bearing plates, anchor rods, and other members that are built in with the work of other trades. Provide punched holes for the convenience of other trades in attaching wood blocking or other materials. Coordinate with drawings of other disciplines for locations and details. Supply the necessary material in accordance to the construction schedule.

**2.0 PRODUCTS****2.1 Materials****2.1.1 Structural Steel**

- .1 All steel shall be new unless otherwise indicated and be of sizes and shapes listed in the current CISC Handbook or AISC Handbook and as indicated on the drawings.
- .2 Provide only new material (including bolts) manufactured in Canada, United States, United Kingdom, or EU country mills. New materials are to be in accordance with the Referenced Standards. New materials are to be traceable and records of mill test certificates are to be provided to the Consultant by the Contractor.
- .3 Structural steel members as specified herein or on the drawings shall contain a minimum of 20% recycled content.
- .4 Where sections identified are not available from Canada, United States, United Kingdom, or EU country mills, or where the Contractor chooses to use sections produced by other mills, provide new materials of minimum strength and minimum quality noted in the Reference Standard. For steel that is not produced by Canada, United States, United Kingdom, or EU country mills, the Contractor shall make written requests for approval of the alternate mill to the Consultant before proceeding with material procurement. The Consultant reserves the right to require physical test data, in addition to the mill test reports, proving that the steel from the proposed mill meets the specification requirements prior to approving. Steel must conform to the following:
  - .1 A total maximum boron content of 0.0008%.
  - .2 Each steel batch is to be tested to confirm the steel meets or exceeds the Reference Standards, and does not exceed the maximum boron specified in 2.1.3.1 above.
  - .3 Testing of the steel is to be performed in Canada by an ISO 17025 accredited testing laboratory.
- .5 It is preferable that structural steel members used come from an electric arc furnace. The fabricator may provide an alternate price for EAF versus other sources in \$/tonne for review by the client.

- 
- .6 Structural wide flange shapes (W) to conform to CSA G40.20/ G40.21 grade 345WM.
  - .7 Angles (L), plates, channels (C, MC) and miscellaneous beams (S, ST, M and MT) to conform to CSA G40.20/ G40.21 grade 350W.
  - .8 Square and rectangular hollow structural sections (HSS) to conform to ASTM A500 Grade C.
  - .9 Round hollow structural sections (HSS) to conform to ASTM A500 Grade C.
  - .10 Rolled plates and bars shall conform to CSA G40.20/ G40.21 grade 300W.
  - .11 Rolled structural steel sections, except HSS sections shall be hot-rolled, North America average, 7850 kg/m<sup>3</sup>, produced by Gerdau.
  - .12 Anchor Rods: Conform to ASTM F1554 Grade 36, 55, 105 unless otherwise noted or shown.
  - .13 Bolts, Nuts and Washers: Conform to ASTM F3125. Galvanized grade 325 bolts over 22 mm (7/8") diameter shall have a dry lubricant, such as Johnson's Stick Wax #140, on threads before installation.
  - .14 High Strength Bolts: High strength bolting shall be of North American manufacture and shall conform to the provisions of the Research Council on Structural Connections (RCSC) "Specifications for Structural Joints Using High-Strength Bolts", latest edition.

#### 2.1.2 Concrete Anchors

- .1 Headed studs shall meet the requirements of CSA W59 Appendix H.
- .2 Types A and B shall be Nelson anchors (or pre-approved equivalent) with fluxed ends and shall meet the mechanical properties as specified in ASTM A29, Grades 1010 to 1020. Studs to be automatically end welded with suitable stud welding equipment or shop fillet welded to develop full strength of the stud. Field fillet welded studs will be rejected.
- .3 Type C shall be deformed steel bars meeting the mechanical properties of ASTM A496 and shall be welded per the manufacturer's recommendations. Reinforcing steel bars with Lenton weldable couplers or pre-approved equal couplers to be used as specified on drawings.
- .4 Unless noted otherwise, all studs shall be considered to be Type B and shall have a length equal to the deck profile depth plus half of the concrete topping above the high flute.

#### 2.1.3 Shop Paint/Primer

- 
- .1 Ensure that the shop primer or paint and joint filler is compatible with spray fireproofing intumescent paint and/or the top coat paint system specified, where applicable.
  - .2 Shop Primer: To CISC/CPMA Standard 2-75.
  - .3 Hot Dip Galvanizing: To CSA G164, minimum zinc coating of 600 g/m<sup>2</sup>.
  - .4 Zinc-Rich Primer: Catha-Coat 302 as supplied by Devoe Coating Company (3 mils dry film thickness) or Carbozinc 11 as supplied by Carboline Company (2 to 3 mils dry film thickness or approved alternative).
  - .5 Epoxy Paint: Devran 224 HS high build epoxy coating (4 to 6 mils dry film thickness) or approved alternative.
  - .6 Zinc-Rich Touch-up Paint: Galvalite as supplied by ZRC Products Company or Galvafrid as supplied by W. R. Meadows Limited or approved alternative.
  - .7 "Corrosion Protective" Paint: Tenemec Series 394 Perimeprime or Sherwin Williams Macropoxy 646 or approved alternative. Refer to drawings for extent of steel work to receive this paint. All field-applied paints shall meet the requirements of Section 01 52 00. The maximum allowable VOC content for anti-corrosive paint is 250 g/L.
- 2.1.4 Any structural steel element outside the building envelope, within an enclosed unconditioned space, or exposed to weather shall be galvanized in accordance with CSA G164. Examples of this include, but are not limited to, canopies, cladding back-up structure, air-well, grating and supporting structure, brick support angles, and related framing materials.
  - 2.1.5 Welding consumables for all processes shall be fully approved by the Canadian Welding Bureau and certified by the manufacturers as complying with the requirements of this specification. Such certificates shall be not more than two years old.
  - 2.1.6 Welding electrode strengths to be equal to E49XX (E70XX) or better, and to be matched to base metal capacity.
  - 2.1.7 Grout for column bases shall be non-metallic, non-expanding, and non-shrink type with a minimum strength of 35 MPa (minimum) at 28 days, unless noted otherwise on the drawings. Grout may be placed in a dry pack or flowable consistency.

## **2.2 Design**

### **2.2.1 General**

- .1 Design connections and the like for the loads shown or implied in accordance with requirements of S16.
- .2 If the fabricator's engineer requires additional information or clarification to aid in the design of their work, they shall request this information in a timely and appropriate manner.

### 2.2.2 Connections

- .1 Unless otherwise noted, the fabricator's Specialty Structural Engineer shall design and be solely responsible for all connections between all steel members, including but not limited to columns, beams, girders, trusses, and braces, and between such members as spandrel angles and beams, hangers, stiffeners, etc. and their supporting members be they steel or concrete. The design of the plates or anchors into concrete will be by the Consultant for load and required in the final building loading condition (temporary loading conditions requiring enhancements shall be by the Contractor).
- .2 Unless otherwise noted, the fabricator's engineer shall also design and be responsible for specifying stiffeners, doubler plates, and the like required to maintain the local strength and stability of a member and where these stiffeners and doubler plates become an integral part of the connection or where they affect the connection of other steel framing members. Typical examples include but are not limited to cranked sections, moment connections between columns and beams, connections to hollow structural sections, and the like. Where connections are exposed to view, the detailing of stiffeners, double plates, and the like is subject to review by the Architect and should conform to Architectural Exposed Structural Steel referred to herein.
- .3 Use types of shop or field connections shown, or in the absence of such indication, use most appropriate type of connections.
- .4 Design connections to safely withstand the combined primary effects of axial forces, shear, moment, and torque, and any secondary effects due to welding and bolting configurations.
- .5 Where no axial force is shown for beam-to-column connections, connect beams framing into column such that the combined capacities of the connection are able to resist a total horizontal force of 2% of the factored axial load in the column, in each direction.
- .6 Unless otherwise noted, the design of all beams and girders is based on the assumption that fastener holes through flanges will not exceed 15% of the gross flange area. If the area of holes exceeds 15%, the member size shall be altered or reinforced accordingly unless the member can be shown to have sufficient capacity to resist the factored loads with the presence of holes.
- .7 Design connections for fastening together double angles used to resist compression, tension, or bending in such a way that the slenderness ratio of any component, based on its least radius of gyration and the distance between interconnections, shall not exceed that of the built-up member.
- .8 All statically loaded bolted connections shall be designed as snug tight (ST) joints.

- 
- .9 The following types of connections shall be designed as bearing connections but shall be pre-tensioned (PT):
    - .1 Connections for wind or seismic lateral load-resisting elements, such as those noted below or as noted on the structural drawings.
      - .1 Vertical or horizontal bracing
      - .2 Moment connections
      - .3 Truss connections
      - .4 Transfer beams
      - .5 Diaphragm collectors / struts
    - .2 Connections where bolts are subject to tensile or tensile and shear loadings.
    - .3 Connections of all framing providing lateral support to columns in buildings over 40 m in height.
  - .10 Design connections that are exposed to weather so that moisture, foreign matter, and the like cannot be trapped or gain entry to the interior of hollow built up members.
  - .11 Design and detail connections so as not to encroach upon architectural clearance lines or finishes.
  - .12 Where connections between beams and columns and the like result in a loss of bearing to the steel deck, design and provide support for the steel deck.
  - .13 Design connections that are to be cast into concrete to provide for the maximum deviation that can occur in erection and based upon the following:
    - .1 Specified steel erection tolerances,
    - .2 Maximum permissible tolerances in the location of inserts cast into concrete, specified in Section 03 11 00.
  - .14 The connection design shall be for the forces and loads shown on the drawings and shall allow for the effects of beam deflections. Provide a minimum of two 19 mm (3/4") ASTM F3125 Grade 325 bolts or an equivalent weld for all beam-to-girder and beam-to-column connections
  - .15 Provide separators for all double members in accordance with CSA S16.

#### 2.2.3 Temporary Work

- .1 The structure as shown on Contract Documents is designed to withstand the design loads only when all structural elements are installed and fully connected. Analysis of all components and assemblies under temporary configurations, including but not limited to stability, stresses, displacements, fabrication, shipping, handling,

erection (at various stages), and construction loads, are the sole responsibility of the Contractor.

- .2 Erection procedures and the design of all erection bracing and related provisions are the sole responsibility of the Contractor.
- .3 Prepare a detailed sequence of construction method statement outlining all key assumptions and design considerations during construction.
- .4 Coordinate the overall sequence of construction and construction schedule with the Construction Manager. Agree with Construction Manager on all keys milestones and corresponding dates, as well as critical assumptions that effect the temporary stability of structure.
- .5 Bracing members and anchor rod assemblies shown are for the finished structure and may not be adequate to resist temporary forces during construction.
- .6 Design erection bracing to safety resist all dead loads, live loads, lateral loads, constructions loads, and other loads imposed during construction.
- .7 Design erection bracing to limit inter-storey and total drift as required for construction purposes and ensure that inter-storey drift does not exceed  $h/400$  at the floors where cladding has been installed by the cladding contractor.
- .8 During erection, forces or reaction in the steel frame members and their connections might exceed those on which the final or permanent building design is based. Determine the magnitude of such erection forces and reactions and take such necessary measures to ensure that the safety and stability of the structure is maintained during construction.

### **3.0 EXECUTION**

#### **3.1 Fabrication**

- 3.1.1 Fabrication shall confirm to the requirements of CSA S16 and the reviewed shop drawings.
- 3.1.2 Fabricated units shall be straight and true, without sharp kinks or bends, and accurate to sizes shown.
- 3.1.3 Flame cut steel columns shall have their ends milled. Steel base plates supporting columns shall be flat.
- 3.1.4 Prior to fabrication of structural steel, take field measurements where connections are to be made to existing work. Take any and all necessary field measurement.
- 3.1.5 Modify installation methods and methods for connecting to suit site conditions found and to the approval of the Consultant.

- 
- 3.1.6 Unless noted otherwise, provide holes up to 12 mm (1/2") in diameter, as required, to permit the attachment of other materials. Ensure cross sectional area of section is not reduced by more than 10% at any point on its length.
- 3.1.7 Provide drain holes in closed sections to prevent water build-up during erection.
- 3.1.8 Provide vent and drain holes in assemblies with closed sections or closed fabricated spaces that are to be hot dipped galvanized to provide full exterior and interior galvanization. Vent and drain holes shall be provided to RJC for review prior to fabrication.
- 3.1.9 Thickness of baseplates 100 mm or greater is nominal and allows for a maximum reduction of 6 mm for milling to the requirements of CSA S16.
- 3.1.10 Visually inspect all plates and shapes for laminations. Replace plates or shapes that contain laminations..
- 3.1.11 Headed shear stud connectors and deformed bar anchors shall be applied in strict accordance with the manufacturer's instructions and the Standards or shop fillet welded as per the Standards. Procedural control to be in accordance with W59 as a minimum. Field fillet welds will be rejected.
- 3.1.12 Splices
- .1 Splices in members, other than those shown, that are provided for ease of fabrication or transportation shall not be permitted without Consultant's approval.
- .1 These connections shall be designed to develop the full strength and stiffness of the member.
- .2 Welded splices shall be subject to non-destructive testing as directed by the Structural Engineer for which the full cost of such testing shall be borne by the Contractor.
- .3 Bolted splices shall be designed to ensure slip is not permitted in the connection assembly so as to have the same performance as a welded splice.
- 3.1.13 Cambers
- .1 Fabrication of rolled steel sections without specified camber shall account for any natural mill camber and/or sweep resulting from manufacturing and result in the orientation of that camber in a positive upward direction.
- .2 Provide the indicated camber to trusses, beams, and girders in such a manner as to provide a uniform parabolic profile. Ensure that the method used to provide camber does not reduce the safe load carrying capacity or cause distortion of the members.
- .3 Camber stated on the drawings is the required camber after fabrication.

**3.1.14 Openings**

- .1 Conform to the requirements shown for location, size, reinforcement, and cutting of openings through structural steel.
- .2 No openings through structural steel members will be permitted without the written approval of RJC.

**3.1.15 Bending Steel Sections**

- .1 Bend sections to geometry noted on contract documents in such a manner as to provide a smooth uniform profile. Ensure that the method used to bend the steel sections does not reduce the safe load carrying capacity or cause distortion of the members.

**3.1.16 Holes and Cutting**

- .1 All holes shall be accurately drilled or punched. Burning or drifting unfair holes will not be permitted. Holes that must be enlarged shall be reamed. Holes for the attachment of work by others shall be provided as required. Drift pins will be allowed only to bring together the several parts for connection.
- .2 Holes shall be drilled or punched at right angles to the surface of the metal, or CNC-guided plasma or flame-cut in accordance with CISC Specifications.
- .3 Holes shall be provided in members to permit connections to the work of other trades or contracts, as directed and located by the Construction Manager.
- .4 The use of manual gas-cutting in the shop may be used only if automatic or semi-automatic methods are not deemed practical. All burned cuts shall be ground and cleaned to remove notches. Cope for pipes and ducts as shown.

**3.1.17 Bolts, Anchor Rods and Embedded Parts**

- .1 Drive bolts accurately into the holes without damaging the threads and heads. Bolt heads and nuts shall rest squarely against metal surfaces.
- .2 Where bolts are to be used on beveled surfaces having slopes greater than 1 in 20 with a plane normal to the bolt axis, provide beveled washers to give full bearing to the thread or nut.
- .3 Bolt threads or unfinished bolts shall be upset and non-pretensioned bolts shall be nominally tightened to prevent the nuts from backing off.
- .4 Unless noted otherwise, all high strength bolts shall be installed with full pretension using Turn-of-Nut Pretensioning, Twist-Off Type Tension Control Bolt Pretensioning, or Direct-Tension-Indicator (DTI) Pretensioning in accordance with the "Specification for Structural Joints Using High-Strength Bolts". Calibrated Wrench Pretensioning shall only be used where specifically approved by RJC.

- .5 Comply with special washer requirements of the RCSC, such as those related to slotted and oversize holes, and tapered flanges. DTI "washers" shall not be substituted for such required washers.
- .6 All high strength bolt assemblies (including Tension Control bolts and DTIs) used in pretensioned connections shall be verified in accordance with the Pre-Installation Verification section of the RCSC.
- .7 Clean and re-lubricate bolts and nuts that become dry or rusty before use, except Tension Control bolts must be re-lubricated by manufacturer.
- .8 Label and ship anchor rods and base plates in sets indicating size and locations of columns and deliver in ample time prior to the start of related concrete work. Furnish templates together with instructions for setting of anchor rods. Ascertain that anchor rods are set properly during the progress of the work.
- .9 Label and ship other embedded parts, parts with welded couplers, and the like with locations and deliver in ample time prior to the start of related concrete work. Furnish templates together with instructions for setting of embedded parts where applicable. Ascertain that embedded parts are set properly during the progress of the work.

#### 3.1.18 Welding of Structural Steel

- .1 Pre-Weld Inspection
  - .1 The surface to be welded and the filler material to be used shall be subject to inspection by quality control personnel before welding is performed.
- .2 Method and Type
  - .1 All welding indicated on the contract drawings shall be electric arc welding and shall comply in all respects with the codes and specifications herein noted covering the specifications for design, fabrication, and inspection of welded structures and the qualifications of welders and supervisors. The heat, input, length of weld, and sequence weld and cooling process shall be controlled to prevent distortions.

#### 3.1.19 Stiffeners

- .1 Provide welded stiffeners in all girders, columns, and beams at points of concentrated loads where required by S16 or where specifically shown on the drawings. Fitted stiffeners shall be ground to fit closely against bearing surfaces.
- .2 In locations of concentrated loads or bearing points shown on the drawings, these stiffeners shall be fabricated to transfer their full compressive capacity through the top and bottom flange connection

through end bearing, fabricated by CISC approved methods, or by welds where the welds are designed to transfer this load.

- 3.1.20 Remove and replace any work that is not acceptable to the Consultant, when and as directed. Such operation shall not become an extra charge to the Owner.
- 3.1.21 Where roof slopes exceed 5% and do not permit flush bearing of the steel deck on the beams, provide continuous 3 mm bent plates to the pitch and necessary to ensure full bearing of the steel deck. Coordinate with the deck supplier for the locations that will require these bent plates.

### 3.2 Cleaning and Priming

- 3.2.1 All structural steel shall have surface contamination (salts, oils, grease, drilling and cutting compounds), rust, and mill scale removed and an adequate surface profile provided in accordance with the minimum surface preparation noted in the table below.
- 3.2.2 All surface preparation should be coordinated with finishes specified by the Architect in Section 09 91 00 – Painting. Should the material data sheets require a more stringent level of surface preparation, this shall take precedence over the following minimum requirements.
- 3.2.3 Architecturally exposed structural steel (AESS) members shall be cleaned and primed when applicable in accordance and in coordination with the intumescent paint fireproofing or finished paint system procedure. Application to be coordinated with specification Section 09 91 00 – Painting and fireproofing specifications and structural documents.
- 3.2.4 Apply primers in accordance with the manufacturer's instructions.
- 3.2.5 Use paint prepared by manufacturer without thinning or adding admixtures. Execute painting on dry surfaces, free from rust, scale, or grease. Do not paint in temperatures lower than 8°C or as indicated within the paint manufacturer's specification and application procedures.
- 3.2.6 Where finish painting to parts inaccessible for finish painting after final assembly is required, apply two coats of paint during fabrication. Apply paint of two different colours so that missed areas can be detected.
- 3.2.7 Interior Structural Steel

- .1 The following structural steel shall be located completely within the building envelope.

Zone	Description	Exposure Conditions		Expected Finish (Arch to Specify)	Minimum Surface Preparation
		Conditioned Space	Condensation		
I1	Embedded in concrete, encased in masonry, or protected by membrane or non-corrosive contact type fireproofing.	Yes	No	Bare Steel	N/A

Zone	Description	Exposure Conditions		Expected Finish (Arch to Specify)	Minimum Surface Preparation
		Conditioned Space	Condensation		
I2	Enclosed in architectural finishes but not exposed to condensation.	Yes	No	1. Bare Steel 2. Primed	1. N/A 2. CISC/CMPA 1-73a 3. CISC/CMPA 2-75
I3	Exposed within building but not defined as AECS.	Yes	No	2. Primed and Painted	SP3
I3	Enclosed in architectural finishes in areas adjacent to façade that cannot be fully conditioned and could lead to condensation.	Yes	No	1. Primed 2. Primed and Painted	SP6
I4	Steel supporting members that penetrate building envelope (such as canopies, signage, etc.)	Yes / No	Yes	1. Primed and Painted 2. Galvanized	SP6
I5	Exposed in an enclosed area that is tempered or not conditioned.	No	Yes	1. Primed and Painted 2. Galvanized	SP6
I6	Interior space exposed to high humidity (such as laundry facilities, foot plants, breweries, wash areas, etc.)	Yes / No	Yes	1. Primed and Painted 2. Galvanized	SP6

- 2 Steel that will be non-intumescent paint fireproofed, zinc coated or galvanized, welded, receive shear studs, faying surfaces of slip resistant connections, and the underside of base plates and bearing plates steel shall not be primed unless specifically noted by the applied coating manufacturers specifications.

### 3.2.8 Exterior Structural Steel

Zone	Description	Expected Finish	Minimum Surface Preparation
E1	Standard exposure to exterior elements.	1. Primed and Painted 2. Galvanized	SP3
E2	Frequently exposed to fresh water. Involves condensation, splash, spray, or immersion.	1. Primed and Painted 2. Galvanized	SP6
E3	Frequently exposed to water with chlorides. Involves condensation, splash, spray, or immersion.	1. Primed and Painted 2. Galvanized	SP10

- 3.2.9 Provide the following touch-up for steel in an exterior exposure or which has a finish paint coat: After erection and after connections are completed, provide a field touch-up coat of primer to all surfaces that had no paint shop coat and have been chipped or scraped. Touch up with primer and paint all shop coat painted areas that have been chipped or scraped.

### 3.2.10 Hot Dip Galvanized Structural Steel

- 
- .1 When fabricating steel that is to be galvanized, it is recommended that uncoated electrodes be used wherever possible. The electrodes must still adhere to all CSA requirements referenced in previous sections.
  - .2 To ensure a high quality galvanized finish, the fabricator shall ensure that the following items are removed:
    - .1 Weld slag as well as welding flux residues
    - .2 Burrs (including those excessive rough edges derived from flame cutting)
    - .3 Heavy or probably extremely adherent type of mill scale
    - .4 Asphalt, vinyls, or epoxies
    - .5 Mill coatings like lacquers or varnishes (typically found on pipes)
    - .6 Sand, other impurities present on castings
    - .7 Thick or heavy grease or wax deposits
  - .3 The fabricator shall also avoid using the following items during the fabrication stage for steel that is to be galvanized:
    - .1 Welding rods high in silicon
    - .2 Anti-spatter sprays or materials
    - .3 Markers, crayon, or oil-based paints
  - .4 Should the fabricator desire to use the following items, they must provide a written proposal to the Structural Consultant that includes the proposed cleaning method and an approval letter from the galvanizer.
  - .5 The steel fabricator shall also be responsible for consulting each galvanizer to determine any other individual surface preparation requirements on a case-by-case basis.
  - .6 Painted materials or materials with a black lacquer coatings must first be abrasive shot blasted or wheel abraded.
  - .7 In cases where members that are galvanized are to have a secondary finish applied on top, ensure that the Architect and finish supplier are consulted about post galvanizing treatments including but not limited to surface smoothing, cleaning, preparation, and profiling.
  - .8 Provide the following touch-up for galvanized steel: After erection and after connections are completed, provide a field touch-up coat of zinc-rich paint to all surfaces that have been chipped or scraped.

**3.3     Erection**

- 3.3.1   At least 60 days prior to the commencing of steel erection, the Contractor shall hold a meeting to review the detailed requirements and staging for the steel erection. A detailed schedule should be developed with:
- .1     Construction Manager
  - .2     Steel Trades (Fabricator, Deck Contractor and Erector)
  - .3     Erector's Surveyor
  - .4     Project's Surveyor
  - .5     Concrete Contractor
  - .6     Curtain wall Contractor
  - .7     All Inspection and Testing Agencies
  - .8     Consultant
  - .9     Owner's Representative
- 3.3.2   Structural steel shall be assembled and erected in accordance with the approved erection drawings and specified reference Standards.
- 3.3.3   The erector is fully responsible for erection methods, equipment, workmanship, and safety precautions.
- 3.3.4   Confirm the setting of anchor rods and bearing plates and make an instrument survey to verify the setting prior to erection of steel members.
- .1     Column Base Plates: Column base plates shall be supported and aligned on steel shims or setting bolts. After the supported members have been plumbed and properly positioned, the anchor nuts shall be tightened in preparation for grouting. Wedges and shims shall be cut off flush with the edges of plates and shall be left in place. All base plates greater than 500 mm in any dimension shall be set on steel angle seats or shim packs.
- 3.3.5   Cutting or burning of baseplates to accommodate anchor rods shall be cause for rejection of baseplates. Costs associated with replacement or remedial work cause by field modifications of baseplates shall be covered by the steel fabricator.
- 3.3.6   The Contractor is responsible for providing all temporary bracing required to stabilize the work against wind, earthquake, and construction loads during all phases of the project. The timing of installation and removal of temporary bracing shall ensure the structure is true and plumb until completion of the building.
- 3.3.7   The Contractor shall be responsible for the design of all hooks, erection connections, and handling gear.
- 3.3.8   The Contractor shall ensure that all construction loads due to temporary storage of materials, erection equipment, or any other loads during the construction phase are adequately distributed so as to not exceed the capacity of any member.

- 
- 3.3.9 Proper fit up of members in compression is critical to ensure members are loaded correctly. Tolerance for joint fit up to be in accordance with CSA S16, clause 28.5 Joints in Contact Bearing.
- 3.3.10 Temporary bolts, clips, angles, etc. used to facilitate erection shall be removed unless noted otherwise on the drawings.
- .1 Splices: Fastening of splices of compression members shall be done after the abutting surfaces have been brought completely into contact. Splices will be permitted only where indicated on the contract drawings or the reviewed shop drawings.
- .2 Errors: Immediately report to the Contractor any errors in shop fabrication or deformations resulting from handling and transportation that prevent the proper assembly and fitting of parts or in the erection operation. Make suggestions for corrective work and obtain approval of the method of correction. Approved corrections shall be made expeditiously and costs shall be addressed in accordance with the terms of the Contract.
- 3.3.11 Structural steel work on concrete shall be carefully located at the proper grade and rigidly secured in place using steel shims. Spaces under the steel shall then be filled with non-shrink premix grout as soon as possible, and before placing any concrete toppings or precast concrete units.
- 3.3.12 The various members forming parts of complete frame or structure after being assembled shall be aligned and adjusted accurately before being fastened.

#### **3.4 Temporary Flooring**

- 3.4.1 Provide all temporary flooring, planking, and scaffolding necessary in connection with erection of structural steel or support of erection machinery in accordance with governing regulations and by-laws.

#### **3.5 Welding**

- 3.5.1 Welding shall be done by the shielded metal-arc method in accordance with the requirements CSA W59. The welding operators shall be currently certified under CSA W47.1 for the work they are performing.
- 3.5.2 Submit, when requested, welding procedures prepared and sealed by a Specialty Structural Engineer for review.
- 3.5.3 Surfaces to be welded shall be free from loose scale, rust, paint, or other foreign matter. Where weld material is deposited in two or more layers, each layer shall be cleaned before the next layer is deposited. Care shall be taken to minimize stresses due to heat expansion, contraction, and distortion by using proper sequence in welding and by approved methods.
- 3.5.4 Appearance, quality of welds made, and methods of correcting defective work shall be in accordance with CSA W59.
- 3.5.5 Welding of reinforcing bars to structural steel as per CSA W186.

**3.6     Completion**

- 3.6.1   The Specialty Structural Engineer responsible for the sealed shop drawings or their representative shall visit the site to review in place connections and components designed by that Specialty Structural Engineer to ensure substantial compliance with their sealed shop drawings. They shall then submit a sealed and signed letter of substantial compliance to the Consultant and Structural Engineer.
- 3.6.2   On completion of the work of this section, all protection erected in conjunction with the structural steel work shall be removed, all damage to this work and adjoining work shall be made good, and all surplus materials and debris and all tools, plant, and equipment shall be removed from the site.

**End of Section**

## 1.0 **GENERAL**

### 1.1 **Documents**

- 1.1.1 This Section, along with the Drawings, forms part of the Contract Documents and is to be read, interpreted, and coordinated with all other parts.
- 1.1.2 Drawings include architectural, mechanical, and electrical Drawings.
- 1.1.3 For definitions of Categories AESS 1, 2, 3, 4, and C as listed in AESS Matrix (see Table 1), refer to CISC Code of Standard Practice Appendix I.

### 1.2 **Description of Work Included**

- 1.2.1 This Section includes requirements regarding appearance and surface preparation of Architecturally Exposed Structural Steel (AESS) only. Refer to Section 05 12 00 for all other requirements regarding steel work not included in this Section. This Section applies to members noted on Architectural and Structural drawings as AESS. AESS members must also be identified by their category.

### 1.3 **Related Work Specified Elsewhere**

- 1.3.1 Section 05 00 50 – Testing of Structural Steel
- 1.3.2 Section 05 12 00 – Structural Steel Framing
- 1.3.3 Section 05 31 00 – Steel Decking
- 1.3.4 Section 09 91 23 – Painting

### 1.4 **Reference Standards**

- 1.4.1 Architecturally exposed structural steel shall conform to requirements of the following Standards unless otherwise required by the Specification:
  - .1 CISC Code of Standard Practice, Appendix I – Latest Edition
- 1.4.2 Where the Standard is referenced in this Specification, it means documents specified in this clause and their referenced Standards.

### 1.5 **Definitions - For This Section**

- 1.5.1 “Owner”, “Contractor”, and “Consultant” per the General Conditions and Definitions.
- 1.5.2 “Structural Engineer” means a representative of Read Jones Christoffersen Ltd., herein also referred to as RJC.
- 1.5.3 “Specialty Engineer” is a Professional Engineer registered in Ontario responsible for components designed by Contractor and who seals and signs shop drawings.
- 1.5.4 “Testing Agency” means the testing agency responsible to Owner.

- 1.5.5 “Standard” and “Standards” mean reference standards listed under “Reference Standards” in this Section.

**1.6 Qualifications**

- 1.6.1 Fabricator Qualifications: In addition to those qualifications listed in Section 05 12 00, engage a firm experienced in fabricating AESS similar to that indicated for this Project with a record of successful in-service performance, as well as sufficient production capacity to fabricate AESS (without delaying the Work).
- 1.6.2 Erector Qualifications: In addition to those qualifications listed in Section 05 12 00, engage an experienced Erector who has completed AESS work similar in material, design, and extent to that indicted for this Project and with a record of successful in-service performance.
- 1.6.3 Comply with applicable provisions of following Specifications and Documents:
- .1 CISC “Code of Standard Practice,” as amended herein.

**1.7 Examinations**

- 1.7.1 Take dimensions from Drawings and verify by field measurement. Be responsible for correctness of such measurements and report to Consultant and Structural Engineer in writing of discrepancies between field measurements and those shown on Drawings prior to commencing work. Verify location of anchor bolts and embedded steel, and confirm that work prepared by other trades is at proper elevation, on line, level, and true.

**1.8 Submittals**

- 1.8.1 Product Data for each type of product specified.
- 1.8.2 Submit, before starting work, qualification data for firms and persons to demonstrate their capabilities and experience. Include lists of completed projects names and address, names and addresses of Consultants and owners, and other information specified. For each project referenced, submit photographs showing detail of installed AESS.
- 1.8.3 Submit, before starting work, LEED supporting documentation in accordance with Division 01 LEED requirements for approval by Consultant.
- 1.8.4 Submit components/procedures of paint system for AESS as a single coordinated submittal. As minimum, identify required surface preparation, primer, intermediate coat (if applicable), and finish coat. All items shall be coordinated with finish coat specified in Section 09 91 23.
- 1.8.5 Submit, before starting work, detailed quality control (QC) plan to Consultant for shop and field work.
- 1.8.6 Submit, before starting work, detailed quality control (QC) plan to aid with inspection and approvals process and include:

- .1 A fabrication plan with completion of fabrication, delivery, and erection dates.
  - .2 A review form that includes for QC sign off by Consultant to clearly communicate remedial work required and or approval of each item.
  - .3 Provide revisions to dates in writing three days prior to milestones noted in plan to allow QC team to react accordingly.
- 1.8.7 Submit unit pricing breakdown matrix for the following items, which can be used as a reference in event that revisions are made to engineering drawings after tender close.
- .1 Welds by type utilized in shop drawings (time, cost, etc.)
  - .2 Member preparation (in-shop preparation required to produce required visual appearance of each member).

## **1.9 Shop Drawings**

- 1.9.1 Shop Drawings detailing fabrication of AESS components.
- .1 Provide erection drawings clearly indicating which members and connections are considered as AESS members, their category, and any associated preparation or finish requirements.
- 1.9.2 Include details that clearly identify requirements listed in Articles 3.1 “Fabrication” and 3.2.3 “Priming: Immediately after surface preparation, apply primer according to manufacturer’s instructions to provide dry film thickness of not less than 0.038 mm. Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
- .1 Stripe paint corners, crevices, bolts, welds, and sharp edges.
  - .2 Apply two coats of shop primer to surfaces that are inaccessible after assembly or erection.
- 1.9.3 Hot-Dip Galvanized Finish: Apply zinc coating by hot-dip process to AESS indicated for galvanizing according to CSA G164. Fabricate such that connections of assemblies are made in field with bolted connections. Provide galvanized finish on members and assemblies within range of colour and surface textures presented in visual samples where applicable.
- 1.9.4 Erection” of this Section. Provide connections for exposed AESS consistent with concepts shown on architectural or structural drawings.
- .1 Indicate welds by standard CWS symbols, distinguishing between shop and field welds, and show size, length, and type of each weld. Identify grinding, finish, and profile of welds as defined herein.
  - .2 Indicate where caulking or body filler will be utilized to provide visually continuous welds.
  - .3 Indicate type, size, finish, and length of bolts, distinguishing between shop and field bolts. Identify high-strength bolted slip-critical, direct-tensioned shear/bearing connections. Indicate to which side of connection bolt heads should be oriented.

- .4 Clearly indicate which surfaces or edges are exposed and what class of surface preparation is being used.
- .5 Indicate special tolerances and erection requirements as noted on Drawings or defined herein.

#### **1.10 Quality Assurance**

1.10.1 At least four weeks prior to commencing fabrication of any AESS, submit required samples (as defined below) for Consultant review and approval to demonstrate aesthetic effects as well as quality of material and execution.

1.10.2 Samples required shall be defined by Architect and can be in the form of:

- .1 3-D Renderings
  - .1 3-D renderings shall be prepared to scale and developed by fabricators manufacturing software utilized in production process.
- .2 Mock-Up Models of Structural Framing
  - .1 Mock-ups shall be constructed using exact materials and finishes as indicated in construction documents.
  - .2 Mock-ups shall be fabricated to full scale unless Consultant accepts smaller scale models.
  - .3 Viewing of mock-up shall take place at either project site or fabricator's shop as dictated by Architect.
  - .4 Retain and maintain mock-ups in an undisturbed condition until project is completed as a standard for judging completed work.
  - .5 Approved full-scale mock-ups may become part of completed work upon completion and approval of components similar to mock-up.
- .3 Physical samples of surface preparation and welds.
- .4 Site trips to projects of a similar nature completed by Contractor.
- .5 Other forms as dictated by Architect.

1.10.3 Demonstrate proposed range of aesthetic effects regarding each element listed under fabrication heading below.

1.10.4 Architect's approval of each mock-up is required before starting fabrication of similar final units. Notify Consultants one week in advance of dates and times when mock-ups will be available for review.

1.10.5 Fabricator shall allow for additional time required for rework associated with imperfections as noted in QC plan.

- 1.10.6 At least two weeks prior to delivery of AESS to site, schedule and conduct pre-installation meeting at project site. As minimum, meeting shall include Contractor, fabricator, erector, finish-painting subcontractor, and Consultant. Coordinate requirements for shipping, special handling, attachment of safety cables and temporary erection bracing, touch-up painting, and other requirements for AESS.

**1.11 Testing and Field Review**

- 1.11.1 Owner will engage an independent testing and inspecting agency to perform field inspections and tests and to prepare test reports. Refer to Section 05 12 00 for detailed testing requirements.

**1.12 Storage and Handling**

- 1.12.1 Contractor shall be responsible for proper scheduling of delivery and erection of AESS in accordance with construction schedule.
- 1.12.2 Store materials properly to prevent damage and permit easy access for inspection and identification. Keep steel members off ground by using pallets, platforms, or other supports. Protect steel members and packaged materials from erosion and deterioration. Use special care in handling to prevent twisting or warping of AESS members.
- 1.12.3 Handle, ship, and erect pre-painted finish pieces using padded slings or other methods, so they are not damaged. Provide padding as required to protect while rigging and aligning member's frames.
- 1.12.4 During handling, steel fabricator shall ensure members are not lifted or supported in ways that warp or twist members.
- 1.12.5 Remove field welding aids by grinding and blending as required to meet visual requirements.
- 1.12.6 Provide connections for temporary bracing, shoring, and safety cabling in locations that shall only be concealed from view in completed structure or where approved by Consultant. Methods of removing temporary erection devices and finishing AESS members shall be approved by Consultant prior to erection.
- 1.12.7 Erector shall check all AESS members upon delivery for twists, kinks, gouges, or other imperfections that might result in rejection of appearance of member. Coordinate remedial action with fabricator prior to erecting damaged steel.

**1.13 Coordination with Other Trades**

- 1.13.1 Supply necessary instructions and drawings to other trades for setting bearing plates, anchor bolts, and other members that are built in with work of other trades. Provide punched holes for convenience of other trades in attaching wood blocking or other materials. Coordinate with drawings of other disciplines for locations and details. Supply necessary material in accordance with construction schedule.

## 2.0 PRODUCTS

### 2.1 Materials

- 2.1.1 Unless noted otherwise, materials shall meet requirements in Division 5 Section Structural Steel.
- 2.1.2 High-Strength Bolts, Nuts, and Washers: Per Section 05 12 00, heavy hex heads and nuts. Provide standard carbon steel or cadmium-plated or mechanically galvanized finish as indicated on Drawings.
- 2.1.3 Primer: Fabricator's standard alkyd red oxide, rust-inhibiting primer.
- 2.1.4 Primer: Fast curing, universal modified alkyd, rust-inhibiting shop coat with good resistance to normal atmospheric corrosion. Primer shall comply with federal standards for VOC, lead, and chromate levels.
- 2.1.5 Primer: Acrylic water-soluble shop coat with good resistance to normal atmospheric corrosion. Primer shall comply with federal standards for VOC, lead, and chromate levels.
- 2.1.6 Primer: Fast-curing two-part epoxy. Primer shall comply with all federal standards for VOC, lead, and chromate levels.
- 2.1.7 Primer: Organic, epoxy/zinc-rich, meeting class B surface requirements for slip-critical connections. Primer shall comply with federal standards for VOC, lead, and chromate levels.
- 2.1.8 Primer: Inorganic zinc-rich meeting class B surface requirements for slip-critical connections. Primer shall comply with federal standards for VOC, lead, and chromate levels.
- 2.1.9 Galvanizing Repair Paint: High-zinc-dust-content paint for galvanizing welds and repair-painting galvanized steel, with dry-film coating not less than 90% zinc dust by weight.

### 2.2 Design

- 2.2.1 Unless noted otherwise, noted connections shall meet requirements in Division 5 Section Structural Steel.
- 2.2.2 Bolted connections shall have bolt heads aligned as indicated on approved shop erection drawings.
- 2.2.3 Weld connections shall have appearance and quality consistent with category and visual samples as applicable. Assemble and weld built-up sections by methods that will maintain alignment of members without warp exceeding tolerance of this Section.
- 2.2.4 Obtain Consultant's approval for appearance of welds in repaired or field modified work.

### 3.0 **EXECUTION**

#### 3.1 **Fabrication**

- 3.1.1 For special fabrication characteristic, see Table 1 - AESS Category Matrix.
- 3.1.2 Fabricate and assemble AESS in shop to greatest extent possible. Locate field joints in AESS assemblies at concealed locations or as approved by Consultant. Detail AESS assemblies to minimize field handling and expedite erection.
- 3.1.3 Fabricate AESS with surface quality consistent with AESS category and visual samples where applicable. Use special care in handling and shipping of AESS both before and after shop painting.
- 3.1.4 Splice members only where indicated on approved shop drawings or as agreed upon with written consent from Consultant.
- 3.1.5 In addition to special care used to handle and fabricate AESS, employ following fabrication techniques:
  - .1 Fabrication Tolerance: Fabricate steel to one-half normal tolerance as specified in CISC Code of Standard Practice Section 7.
  - .2 Welds Ground Smooth: Fabricator shall grind welds of AESS smooth. For groove welds, weld shall be made flush to surfaces each side and be within +1.5 mm, -0 mm of plate thickness.
  - .3 Contouring and Blending of Welds: Where fillet welds are indicated to be ground-contoured or blended, oversize welds as required and grind to provide smooth transition and to match profile on approved mock-up.
  - .4 Continuous Welds: Where welding is noted on Drawings, provide continuous welds of uniform size and profile.
  - .5 Minimize Weld Show-Through: At locations where welding on far side of exposed connection occurs, grind distortion and marking of steel to smooth profile with adjacent material.
  - .6 Close weld access holes.
  - .7 Coping and Blocking Tolerance: Maintain uniform gap of 3 mm  $\pm$  0.7 mm at all copes and blocks.
  - .8 Joint Gap Tolerance: Maintain uniform gap of 3 mm  $\pm$  0.7 mm.
  - .9 Piece Marks Hidden: Fabricate so piece marks are fully hidden in final structure or made with such media to permit full removal after erection.
  - .10 Mill Mark Removal: Fabricator shall deliver steel with no mill marks (stenciled, stamped, raised, etc.) in exposed locations. Mill marks shall be omitted by cutting of mill material to appropriate lengths where possible. Where not possible, fabricator can fill and/or grind to surface finish consistent with approved mock-up.

- .11 Grinding of Sheared Edges: Fabricator shall grind edges of sheared, punched, or flame-cut steel to match approved mock-up.
- .12 Rolled Members: Member specified to be rolled to final curved shape shall be fully shaped in shop and tied during shipping to prevent stress relieving. Distortion of web or stem, and of outstanding flanges or legs of angles, shall be visibly acceptable to Consultant from a distance of 6 m under any lighting condition determined by Consultant. Tolerances for vertical and horizontal walls of rectangular HSS members after rolling shall be specified dimension  $\pm 13$  mm.
- .13 Seal weld open ends of round and rectangular hollow structural section with 9.5 mm closure plates. Provide continuous, sealed welds at angle to gusset-plate connections and similar locations where AECS is exposed to weather.

### **3.2 Surface Preparation, Shop Priming, and Finishing**

- 3.2.1 Surface Preparation: Clean surfaces to be painted. Remove loose rust, loose mill scale, and spatter, slag, or flux deposits. Prepare surfaces according to SSPC Specifications as follows:
  - .1 SSPC-SP 1 "Solvent Cleaning"
  - .2 SSPC-SP 2 "Hand Tool Cleaning"
  - .3 SSPC-SP 3 "Power Tool Cleaning"
  - .4 SSPC-SP 6 "Commercial Blast Cleaning"
  - .5 Coordinate required blast profile with approved paint submittal prior to beginning surface preparation.
- 3.2.2 Shop-prime steel surfaces, except the following:
  - .1 Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to depth of 50 mm.
  - .2 Surfaces to be field welded.
  - .3 Surfaces to be high strength bolted with slip critical connections, if primer does not meet specified CISC slip coefficient.
- 3.2.3 Priming: Immediately after surface preparation, apply primer according to manufacturer's instructions to provide dry film thickness of not less than 0.038 mm. Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
  - .1 Stripe paint corners, crevices, bolts, welds, and sharp edges.
  - .2 Apply two coats of shop primer to surfaces that are inaccessible after assembly or erection.

- 3.2.4 Hot-Dip Galvanized Finish: Apply zinc coating by hot-dip process to AESS indicated for galvanizing according to CSA G164. Fabricate such that connections of assemblies are made in field with bolted connections. Provide galvanized finish on members and assemblies within range of colour and surface textures presented in visual samples where applicable.

### **3.3 Erection**

- 3.3.1 Obtain permission for torch cutting or field fabrication from Consultant. Finish sections thermally cut during erection to surface appearance consistent with visual samples as applicable.
- 3.3.2 Do not enlarge unfair holes in members by burning or by using drift pins. Ream holes that must be enlarged to admit bolts. Replace connection plates that are misaligned where holes cannot be aligned with acceptable final appearance.
- 3.3.3 Where access holes must be cut in web at intersection with flanges on W shapes and structural tees to permit field welding of flanges, they shall be filled. Filling shall be executed with proper procedures to minimize restraint and address thermal stresses in group 4 and 5 shapes.
- 3.3.4 Set AESS accurately in locations and to elevations indicated according to CSA S16 and as referenced in this Section.
- 3.3.5 In addition to special care used to handle and erect AESS, employ following erection techniques to meet requirements of this specified AESS category:
- .1 AESS Erection Tolerances: Erection tolerances shall meet requirements of standard frame tolerances for structural steel per Chapter 7 of CISC Code of Standard Practice.
  - .2 Welds Ground Smooth: Erector shall grind welds smooth in connections of AESS members. For groove welds, weld shall be made flush to surfaces of each side and be within + 1.5 mm, -0 mm of plate thickness.
  - .3 Contouring and Blending of Welds: Where fillet welds are indicated to be ground-contoured or blended, oversize welds as required; grind to provide smooth transition and to match profile on approved mock-up.
  - .4 Continuous Welds: Where noted on Drawings, provide continuous welds of uniform size and profile.
  - .5 Minimize Weld Show-Through: At locations where welding on far side of exposed connection occurs, grind distortion and marking of steel to smooth profile with adjacent material.
  - .6 Bolt Head Orientation: Orient bolt heads as indicated on Contract Documents. Where bolt-head alignment is specified, orientation shall be noted for each connection on erection drawings. Where not noted, bolt heads in a given connection shall be oriented to one side.

- .7 Removal of Field Connection Aids: Run-out tabs, erection bolts, and other steel members added to connections to allow for alignment, fit-up, and welding in field shall be removed from structure. Field groove welds shall be selected to eliminate need for backing bars or to permit their removal after welding. Remove welds at run-out tabs to match adjacent surfaces and ground smooth. Holes for erection bolts shall be plug welded and ground smooth.

**3.4 Welding**

- 3.4.1 Weld appearance (profile, quality, and finish) shall be consistent with category and visual markups, as applicable, approved prior to fabrication.

**3.5 Adjusting and Cleaning**

- 3.5.1 Cleaning and touch-up painting of field welds, bolted connections, and abraded areas of shop paint shall be finished to blend with adjacent surfaces of AESS. Such touch-up work shall be done in accordance with manufacturer's instructions as specified in Section 09 91 00.
- 3.5.2 Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780/A780M.

**NOTES**

- 1.1 Prior to blast cleaning, remove deposits of grease or oil by solvent cleaning, SSPC-SP 1.
- 1.2 Rough surfaces are to be deburred and ground smooth. Sharp edges resulting from flame cutting, grinding, and especially shearing are to be softened.
- 1.3 Intermittent welds are made continuous, either with additional welding, caulking, or body filler. For corrosive environments, joints should be seal welded. Seams of hollow structural sections shall be acceptable as produced.
- 1.4 Bolt heads in connections shall be on same side, as specified, and consistent from one connection to another.
- 1.5 Remove weld spatter, slivers, and surface discontinuities. Weld projection up to 2 mm is acceptable for butt and plug-welded joints.
- 2.1 Visual samples are either a 3-D rendering, physical sample, first-off inspection, scaled mock-up, or full-scale mock-up as specified in Contract Documents.
- 2.2 These tolerances are required to be one-half of those of standard structural steel as specified in CSA S16.
- 2.3 Members marked with specific numbers during fabrication and erection processes are not to be visible.
- 2.4 Welds should be uniform and smooth, indicating a higher level of quality control in welding process.
- 3.1 Mill marks are not to be visible in finished product.
- 3.2 Caulking or body filler is acceptable.
- 3.3 Seams shall be oriented away from view or as indicated in Contract Documents.
- 3.4 Matching of abutting cross-sections shall be required.
- 3.5 Characteristic is similar to 2.2 above. Clear distance of 3 mm between abutting members is required.
- 3.6 Hidden bolts may be considered.
- 4.1 HSS seams shall be treated so they are not apparent.
- 4.2 In addition to a contoured and blended appearance, welded transitions between members are also required to be contoured and blended.
- 4.3 Steel surface imperfections should be filled and sanded.
- 4.4 Back face of welded element caused by welding process can be minimized by hand grinding backside of weld. Degree of weld-through is a function of weld size and material.
- 4.5 Additional characteristics may be added for custom elements.

**End of Section**

## 1.0 **GENERAL**

### 1.1 **Documents**

- 1.1.1 This Section, along with the Drawings, forms part of the Contract Documents and is to be read, interpreted, and coordinated with all other parts.
- 1.1.2 Drawings include architectural, mechanical, and electrical Drawings.

### 1.2 **Description of Work Included**

- 1.2.1 Provide labour, materials, equipment, and services to supply, design, and erect open web steel joists required and/or indicated on Drawings or specified herein. Report discrepancies between structural, mechanical, electrical, and architectural Drawings to Consultant and Structural Engineer immediately.
- 1.2.2 Co-ordinate with Section 05 12 00 for design, fabrication, supply, installation, and erection of structural steel and accessories.
- 1.2.3 Co-ordinate with Section 05 31 00 for design, supply, and installation of headed stud shear connectors for composite beams and girders, and where required on other beams, girders, and drag struts.

### 1.3 **Reference Standards**

- 1.3.1 Structural steel shall conform to requirements of following Building Code and Standards unless otherwise required by this Specification:
  - .1 Ontario Building Code - 2012 0 REG 88/19
  - .2 CSA S16 – Design of Steel Structures
  - .3 CSA S136 – North American Specification for the Design of Cold-Formed Steel Structural Members
  - .4 CSA W47.1 – Certification of Companies for Fusion Welding of Steel Structures
  - .5 CSA W59 – Welded Steel Construction (Metal Arc Welding) (Metric version)
  - .6 CSA G40.20/G40.21 – General Requirements for Rolled or Welded Structural Quality Steel / Structural Quality Steel
  - .7 CSA G30.18 – Carbon Steel Bars for Concrete Reinforcement
  - .8 ASTM F1554 – Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength
  - .9 ASTM A193/A193M – Standard Specification for Alloy-Steel and Stainless Steel Bolting for High Temperature or High Pressure Service and Other Special Purpose Applications

- .10 ASTM F3125/F3125M – Standard Specification for High Strength Structural Bolts and Assemblies, Steel and Alloy Steel, Heat Treated, Inch Dimensions 120 ksi and 150 ksi Minimum Tensile Strength, and Metric Dimensions 830 MPa and 1040 MPa Minimum Tensile Strength
- .11 CISC / CPMA Standard 1-73a – A Quick-Drying One-Coat Paint for Use on Structural Steel.
- .12 SSPC SP-6 – Commercial Blast Cleaning
- 1.3.2 Revision date of referenced codes, standards, and guidelines shall be as indicated in the above-referenced Building Code. Where no reference is made within the Building Code, the latest published edition shall be used.
- 1.3.3 Where the Standard is referenced in this Specification, it means documents specified in this clause and their referenced Standards.
- 1.3.4 Where there are differences between the Specifications and Drawings and the codes, standards, or acts, the most stringent shall govern.

#### **1.4 Definitions - For This Section**

- 1.4.1 “Owner”, “Contractor”, and “Consultant” per the General Conditions and Definitions.
- 1.4.2 “Structural Engineer” means a representative of Read Jones Christoffersen Ltd., herein also referred to as RJC.
- 1.4.3 “Specialty Engineer” is a Professional Engineer registered in Ontario responsible for components designed by Contractor and who seals and signs shop drawings.
- 1.4.4 “Testing Agency” means the testing agency responsible to Owner.
- 1.4.5 “Standard” and “Standards” mean reference standards listed under “Reference Standards” in this Section.

#### **1.5 Qualifications**

- 1.5.1 Open web steel joist fabricator shall have minimum five years experience in fabrication of open web steel joists.
- 1.5.2 Erector shall have minimum five years experience in erection of open web steel joists.
- 1.5.3 Steel fabricators and erectors must be certified under requirements of CSA W47.1 as required by CSA S16.
- 1.5.4 Welding procedures, welders, and welding operations to be qualified in accordance with Canadian Welding Bureau Standards.

**1.6 Examinations**

- 1.6.1 Take dimensions from Drawings and verify by field measurement. Be responsible for correctness of such measurements and report to Consultant and Structural Engineer in writing of discrepancies between field measurements and those shown on Drawings prior to commencing work. Verify location of embedded steel and confirm that work prepared by other trades is at proper elevation, on line, level, and true.

**1.7 Submittals**

- 1.7.1 Submit, before starting work, written evidence of qualification of steel fabricators and erectors for welding under Canadian Welding Bureau requirements.
- 1.7.2 Submit, before starting work, written evidence of ability to weld reinforcing steel to structural steel in accordance with CSA W186.
- 1.7.3 When requested, submit copies of mill test reports properly correlated to materials used on project.
- 1.7.4 Suppliers shall provide an embodied carbon breakdown for all structural steel utilized in the project for review and approval:
- .1 The breakdown shall be provided prior to or during the ordering material indicating the total embodied carbon (kg CO<sub>2</sub>e).
  - .2 The breakdown shall also be provided at the end of the project with the values updated to reflect the final as-built quantities and resulting embodied carbon (kg CO<sub>2</sub>e).
  - .3 The breakdown shall be a tabular submittal showing all members, materials, quantities and embodied carbon based on accompanying EPDs as outlined below.
  - .4 Refer to Division 1 for the maximum allowable upfront (A1-A3) kgs of embodied carbon.
  - .5 The maximum embodied carbon for the steel joists shall not exceed 840 kg CO<sub>2</sub>e / tonne unless approved by the Consultant.
  - .6 Submit Environmental Product Declarations (EPDs) compliant with CSA-ISO 14025-07.
  - .7 Product EPDs must be third party certified, including external verification.
- 1.7.5 Alternatively with written approval producers may submit an industry average EPD in which the manufacturer is explicitly recognized as a participant by the program operator.
- 1.7.6 Submit third party certified documentation identifying products that demonstrate item 1 and as many of the remaining items as possible:
- .1 global warming Potential (greenhouse gases), CO<sub>2</sub>e;
  - .2 depletion of the stratospheric ozone layer, in kg CFC -11;
  - .3 acidification of land and water sources, in moles H<sup>+</sup> or kg SO<sub>2</sub>;

- 
- .4 eutrophication, in kg nitrogen or kg phosphate;
  - .5 formation of tropospheric ozone, in kg NO<sub>x</sub>, kg O<sub>3</sub>, or kg ethane;  
and
  - .6 depletion of non-renewable energy resources, in MJ.
- 1.7.7 Submit documentation of recycled content of the metal deck. A breakdown of post-consumer and post-industrial recycled content should be specified. A mill certificate shall be provided.
  - 1.7.8 Submit documentation of where the steel joists were produced, processed, and manufactured.
  - 1.7.9 Provide schedule of fabrication to Consultant, Structural Engineer, and Testing Agency prior to commencement of fabrication.
  - 1.7.10 Notify Consultant and Structural Engineer, in writing and before submission of shop drawings, as to which Specialty Structural Engineer will be designing and providing field review for components designed by Contractor.
  - 1.7.11 Submit shop drawings prepared under direction of Specialty Structural Engineer. Drawings of open web steel joists are to be sealed and signed by this Specialty Structural Engineer.
  - 1.7.12 Shop drawings to show complete shop and erection details necessary for fabrication and erection of joists, including connections, splices, and location, type, size, and extent of welds. Splices not shown on shop drawings will be rejected. Indicate welds, both shop and field, by AWS Welding Symbols as specified in CSA W59 Appendix D and E.
  - 1.7.13 Review of shop drawings by Structural Engineer is intended as an assistance to Contractor and does not relieve Contractor of responsibility for completeness or accuracy of work and its conformance to contract documents.
  - 1.7.14 Fabrication that commences prior to shop drawing review by Structural Engineer is at risk of Contractor.
  - 1.7.15 Clearly identify revisions, changes, or modifications on shop drawing.
  - 1.7.16 Resubmit reviewed shop drawings where noted in Read Jones Christoffersen Ltd.'s review stamp, or when Contractor makes revisions for own purposes.
  - 1.7.17 Allow at least two weeks for shop drawing review by Structural Engineer.
  - 1.7.18 Structural drawings are not prepared to be used as erection or shop drawings. However, electronic files or sepias can be used by Contractor under the following conditions:
    - .1 Copyright remains with Read Jones Christoffersen Ltd.
    - .2 Drawings will only be used for shop drawings for this project and not put to any other use.
    - .3 Read Jones Christoffersen Ltd. assumes no liability for errors or omissions in drawings. Contractor assumes all risk and expenses
-

associated with use of structural drawings in production of their work.

.4 References to Read Jones Christoffersen Ltd. must be deleted from title block.

.5 Contractor signs a release available from Read Jones Christoffersen Ltd. that addresses the above items in more detail.

## **1.8 Testing and Field Review**

1.8.1 See Section 05 00 50.

1.8.2 Prior to commencement of work, provide schedule of shop fabrication to Testing Agency.

1.8.3 If requested, submit certified mill tests in accordance with the Standards.

1.8.4 Advise Testing Agency of scheduling of all shop and field work pertaining to this Project. Permit testing agency full access to fabrication shop and site for purpose of carrying out their work and provide assistance required to aid in performance of inspection and testing.

## **1.9 Storage and Handling**

1.9.1 Protect joists during fabrication, shipping, storage, and construction. Handle steel joists at job site in a manner that prevents bending or damage of joist. Report small bends and damage to Structural Engineer for instructions. Do not use damaged joists. Replace or repair joists that are bent, broken, or otherwise damaged prior to erection, to satisfaction of Structural Engineer, and at no cost to Owner.

1.9.2 Co-ordinate proper scheduling for delivery and erection of joists in accordance with construction schedule.

1.9.3 Store joists at site above ground on platforms, skids, or other devices so that ground dampness will not affect bottom members of stacks. Do not stack joists to a height that will cause bending in bottom members.

1.9.4 Protect joists that are stored outdoors after fabrication from accumulations of standing water.

1.9.5 Store other materials in a weather tight and dry place until ready for use in Work.

1.9.6 Store packaged materials in their original unbroken packages or containers.

## **1.10 Coordination with Other Trades**

1.10.1 Provide punched holes for convenience of other trades in attaching wood blocking or other materials. Coordinate with drawings of other disciplines for locations and details. Supply necessary material in accordance with construction schedule.

**2.0 PRODUCTS****2.1 Materials**

- 2.1.1 Steel shall be new unless otherwise indicated and be of sizes and shapes listed in current CISC Handbook or AISC Handbook and as indicated on Drawings.
- 2.1.2 Steel to be to CSA G40.21.
- 2.1.3 Steel to be fabricated open-web steel joists and joist girders, 7800 kg/m<sup>3</sup>, produced by Nucor.
- 2.1.4 Primer for interior exposure not to receive a shop or field paint finish is to be to CISC/CPMA Standard 1-73a or other pre-approved, unless noted otherwise.
- 2.1.5 Primer used in multi-coat system where final shop or field paint finish is to be applied is to conform to Section 09 91 00 and be selected and pre-approved based on surface preparation, exposure conditions, and compatibility with subsequent coatings, unless noted otherwise.
- 2.1.6 Welding consumables for processes to be fully approved by Canadian Welding Bureau and certified by manufacturers as complying with requirements of this specification. Such certificates must be less than two years old.
- 2.1.7 Electrode strengths to be equal to E49XX (E70XX) or better.

**2.2 Design**

- 2.2.1 Unless otherwise noted, open web steel joists are to be designed by Contractor to reference Standards by Specialty Structural Engineer.
- 2.2.2 Open web steel joists spliced for ease of fabrication or transportation to have splices designed to develop full strength and stiffness of member. Splices are subject to non-destructive testing as directed by Structural Engineer. Cost for such testing to be borne by Contractor.
- 2.2.3 Provide separators for double members in accordance with CSA S16.
- 2.2.4 Design of bridging for steel joists to conform to requirements of CSA S16, unless otherwise indicated on Drawings. Refer to Drawings for areas of non-typical joist bridging and bracing.
- 2.2.5 Design joists of depth and spacing shown on Drawings and to carry loads shown on Drawings in accordance with CSA S16.
- 2.2.6 Unless noted otherwise, joists shall be designed to meet deflection requirements noted below.

**.1 Roof Joists**

Application	Loading	Limit	Max
Supporting finishes not susceptible to cracking	LL	Span / 300	25 mm
	Total	Span / 180	35 mm
Supporting finishes susceptible to cracking	LL	Span / 360	20 mm
	Total	Span / 240	30 mm

- 
- 2.2.7 If joists support green roof, solar panels, or similar loads, they shall be considered as dead load for purposes of calculating deflection.
  - 2.2.8 Line up openings and webs in adjacent to allow for passage of pipe, ducts, conduits, etc. Make allowance in joist design for support of pipes, ducts, conduits, etc.
  - 2.2.9 Upon request by Consultant or Authority Having Jurisdiction, submit calculations and such further proof as may be necessary to show that steel joist construction conforms to requirements set forth herein, as well as municipal building bylaws.
  - 2.2.10 Joist manufacturer may be required, at Structural Engineer's and Consultant's option, to demonstrate by testing or analysis, which includes effects of actual joint eccentricities, that joists provided have capacity to resist loads specified.
  - 2.2.11 In addition to point loads called for in governing building code, design joists for a 1.8 kN (0.4 kip) factored additional point load at any location on top chord and bottom chord (including effects of local bending) concurrent with other design loads. Over mechanical areas, additional point loads to be 4.5 kN (1.0 kip) factored. Additional point loads noted above on each chord need not be applied concurrently with each other.
  - 2.2.12 Joists shoes shall be designed for minimum roll over force of 4.5 kN (1.0 kip) and shall be connected to base structure for this force unless noted otherwise.
  - 2.2.13 Where joists frame into both sides of a support, extend top chord of joists to center of support, unless shown otherwise.
  - 2.2.14 Where joists frame into one side of a support, extend top chord of joists to far side of support, unless shown otherwise.
  - 2.2.15 Provide extended ends of joists as required to support edges of roofs, floors, walls, and where shown.
  - 2.2.16 Extended ends of joists to have load-carrying capacity at least equal to loads shown on Drawings.
  - 2.2.17 Provide bracing as required for lateral stability of bottom chords in compression due to wind uplift, bottom chord extensions, and other effects causing compression in bottom chord.

### **3.0 EXECUTION**

#### **3.1 Fabrication**

- 3.1.1 Fabrication to conform to requirements of CSA S16 and reviewed shop drawings.
- 3.1.2 Welding to be to CSA W59.
- 3.1.3 Joist work to be executed by skilled and experienced workers.

- 3.1.4 Fabricated units to be straight, true, without sharp kinks or bends, and accurate to sizes shown.
- 3.1.5 Refer to architectural Drawings for extent and location of architecturally exposed joist elements.
- 3.1.6 Provide bridging for steel joists conforming to requirements of CSA S16, unless otherwise indicated on Drawings. Refer to Drawings for areas of non-typical joist bridging and bracing.
- 3.1.7 Remove and replace work that is not acceptable to Consultant, when and as directed. Such operation is at own expense.
- 3.1.8 Joist and other steel members spliced for ease of fabrication are to develop full strength and stiffness of member.
- 3.1.9 Where roof slopes exceed 5% and do not permit flush bearing of steel deck on joist top chords, provide continuous 3 mm bent plates to pitch as necessary for full bearing of steel deck. Co-ordinate with deck supplier for locations that will require these bent plates.

### **3.2 Cleaning and Priming**

- 3.2.1 Thoroughly clean steel of loose mill scale, loose rust, oil, or dirt.
- 3.2.2 Prime architecturally exposed joists, related framing and bridging, and exterior steel.
- 3.2.3 Do not prime joists that will be encased in concrete, fireproofed, zinc coated, galvanized, or welded.
- 3.2.4 Shop prime all other steel joists.
- 3.2.5 Clean joists that will not receive a finish paint coat and are required to be primed for interior exposure in accordance with CISC/CPMA Standard 1-73 (minimum).
- 3.2.6 Clean joists to receive a shop or field paint finish in accordance with Section 09 91 23 or SSPC-SP 6 "Commercial Blast Cleaning", whichever produces a surface that has less rust and mill scale.
- 3.2.7 Apply primers in accordance with manufacturer's instructions.
- 3.2.8 Use paint prepared by manufacturer without thinning or adding admixtures. Execute painting on dry surfaces, free from rust, scale, or grease. Do not paint in temperatures lower than 8°C.
- 3.2.9 Where finish painting to parts inaccessible for finish painting after final assembly is required, apply two coats of paint during fabrication. Apply paint of two different colours so that missed areas can be detected.
- 3.2.10 Provide following touch up for steel in an exterior exposure or which has a finish paint coat: After erection and after connections are completed, provide a field touch-up coat of primer to surfaces that had no paint shop coat and have been chipped or scraped. Touch up with primer and paint shop coat painted areas that have been chipped or scraped.

**3.3     Erection**

- 3.3.1 Erector is fully responsible for erection methods, equipment, workmanship, and safety precautions.
- 3.3.2 Install temporary bracing required to stabilize work against wind, earthquake, and construction loads. Assume complete responsibility for extent and timing of removal of such bracing. Bracing members indicated on Drawings are required for finished structure and not considered adequate for temporary bracing. Failure to make proper and adequate provision for stresses occurring during erection from any causes whatsoever is responsibility of Contractor.
- 3.3.3 As erection progresses, securely connect work to take care of loads, including wind and seismic during erection. Failure to make proper and adequate provisions for loads during erection is responsibility of Contractor.
- 3.3.4 Contractor is responsible for design of all hooks, erection connections, and handling gear.
- 3.3.5 Whenever piles of materials, erection equipment, or other loads are carried during erection, make proper provisions to take care of stresses resulting from same. Adequately distribute construction loads to not exceed capacity of any joist.
- 3.3.6 Assemble and erect joists and bridging in accordance with approved erection drawings and specified reference Standards.
- 3.3.7 Co-ordinate with mechanical and electrical trades prior to erection of steel joists so that joists and bridging will not interfere with installation of mechanical and electrical equipment.
- 3.3.8 Support joists at two or more points during handling and erection.
- 3.3.9 Steel joists are to bear on beams in accordance with article 2.2, but in no case shall less than 65 mm be on supporting steel members. Connect to supporting steel with 5 mm x 30 mm long fillet weld at each side. Secure to bearing plates on masonry walls in same manner, bearing 100 mm minimum.
- 3.3.10 Plumb, level, and align individual joists as specified in CSA S16.
- 3.3.11 Remove temporary bolts, clips, angles, etc. used to facilitate erection unless noted otherwise on drawings.

**3.4     Joist Bridging**

- 3.4.1 Install bridging for steel joists conforming to requirements of CSA S16, unless otherwise indicated on Drawings. Refer to Drawings for areas of non-typical joist bridging and bracing.
- 3.4.2 Where required for stability of bottom chord, provide additional bridging. Such stability requirement to be designed by supplier using loads provided on Drawings.

- 3.4.3 Butt splice architecturally exposed joist bridging and bracing and grind splices smooth to receive finish painting as specified in Architectural Finishes. Lap splices in architecturally exposed bridging are not permitted.

**3.5 Welding**

- 3.5.1 Welding shall be done by shielded metal-arc method in accordance with requirements CSA W59. Welding operators shall be currently certified under CSA W47.1 for work they are performing.
- 3.5.2 Submit for review, when requested, welding procedures prepared and sealed by a Specialty Structural Engineer.
- 3.5.3 Surfaces to be welded are to be free from loose scale, rust, paint, or other foreign matter. Where weld material is deposited in two or more layers, clean each layer before depositing next layer. Take care to minimize stresses due to heat expansion, contraction, and distortion by using proper sequence in welding and by approved methods.
- 3.5.4 Appearance, quality of welds made, and methods of correcting defective work are to be in accordance with CSA W59.

**End of Section**

## 1.0 **GENERAL**

### 1.1 **Documents**

- 1.1.1 This Section, along with the Drawings, forms part of the Contract Documents and is to be read, interpreted, and coordinated with all other parts.
- 1.1.2 Drawings include architectural, mechanical, and electrical Drawings.

### 1.2 **Description of Work Included**

- 1.2.1 Provide labour, materials, closures, equipment, and services necessary to design, supply, fabricate, erect, and install steel deck and field-welded shear connectors to structural steel as indicated on Drawings and as hereinafter specified. Provide gauge metal formwork at deck edges for composite deck or concrete-filled deck and reinforcement for deck openings as required herein.
- 1.2.2 Co-ordinate with Section 05 12 00 for design, fabrication, supply, installation, and erection of structural steel and accessories.

### 1.3 **Related Work Specified Elsewhere**

- 1.3.1 Section 03 11 00 – Concrete Forming and Accessories
- 1.3.2 Section 03 20 00 – Concrete Reinforcing
- 1.3.3 Section 03 30 00 – Structural Cast-in-Place Concrete
- 1.3.4 Section 05 00 50 – Testing of Structural Steel
- 1.3.5 Section 05 12 00 – Structural Steel Framing
- 1.3.6 Section 05 12 50 – Architecturally Exposed Structural Steel
- 1.3.7 Section 05 21 00 – Steel Joist Framing
- 1.3.8 Section 05 51 00 – Metal Stairs

### 1.4 **Reference Standards**

- 1.4.1 Structural steel shall conform to requirements of following Building Code and Standards unless otherwise required by this Specification:
  - .1 Ontario Building Code - 2012 0 REG 88/19
  - .2 CSA S136 – North American Specification for the Design of Cold-Formed Steel Structural Members
  - .3 CSA W47.1 – Certification of Companies for Fusion Welding of Steel Structures
  - .4 CSA W59 – Welded Steel Construction (Metal Arc Welding) (Metric version)

- .5 ASTM A653/A653M – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
- .6 CSSBI 10M – Standard for Steel Roof Deck
- .7 CSSBI 12M – Standard for Composite Steel Deck

- 1.4.2 Revision date of referenced codes, standards, and guidelines shall be as indicated in the above-referenced Building Code. Where no reference is made within the Building Code, the latest published edition shall be used.
- 1.4.3 Where the Standard is referenced in this Specification, it means documents specified in this clause and their referenced Standards.
- 1.4.4 Where there are differences between the Specifications and Drawings and the codes, standards, or acts, the most stringent shall govern.

## **1.5 Definitions - For This Section**

- 1.5.1 “Owner”, “Contractor”, and “Consultant” per the General Conditions and Definitions.
- 1.5.2 “Structural Engineer” means a representative of Read Jones Christoffersen Ltd., herein also referred to as RJC.
- 1.5.3 “Specialty Structural Engineer” is a Professional Engineer registered in Ontario responsible for components designed by Contractor and who seals and signs shop drawings.
- 1.5.4 “Testing Agency” means the testing agency responsible to the Owner.
- 1.5.5 “Standard” and “Standards” mean reference standards listed under “Reference Standards” in this Section.

## **1.6 Qualifications**

- 1.6.1 Steel deck fabricator shall have minimum five projects experience in fabrication of steel deck and be a member of the Steel Deck Institute.
- 1.6.2 Erector shall have minimum five projects experience in erection of steel deck.
- 1.6.3 Certificates of Qualification for light gauge structural welding.
- 1.6.4 Deck erectors must be certified under requirements of CSA W47.1.

## **1.7 Examinations**

- 1.7.1 Examine and verify necessary measurements and dimensions of previously executed work that may affect work of this Contract.
- 1.7.2 Examine surfaces that work is to be placed on or against to confirm they are square, true, level, plumb, of correct slope or shape, and of proper surface to receive such work.
- 1.7.3 Report discrepancies to Consultant and Structural Engineer immediately so that instructions may be given for necessary remedial work.

- 1.7.4 Commencement of work shall be construed as acceptance of conditions and surfaces.

## **1.8 Submittals**

- 1.8.1 Submit shop drawings prepared under supervision of Specialty Structural Engineer. Drawings of components designed by Contractor shall be sealed and signed by this Specialty Structural Engineer.
- 1.8.2 Shop drawings shall show position, extent, type, and arrangement of units, their relationship to other materials, depth, core thickness, coating thickness, connections, openings, accessories, closures, light gauge formwork and reinforcement for openings, and complete stud shear connector details for composite beams.
- 1.8.3 Shop drawings for acoustic deck shall indicate reduction in strength and stiffness related to acoustic perforations.
- 1.8.4 Calculations and/or test data may be requested with shop drawings to justify deck design and shear connector design.
- 1.8.5 Show deck load capacities, including point load capacities, and for composite deck confirm these load capacities are compatible with zinc coating.
- 1.8.6 Suppliers shall provide an embodied carbon breakdown for all structural steel utilized in the project for review and approval:
- .1 The breakdown shall be provided prior to or during the ordering material indicating the total embodied carbon (kg CO<sub>2</sub>e).
  - .2 The breakdown shall also be provided at the end of the project with the values updated to reflect the final as-built quantities and resulting embodied carbon (kg CO<sub>2</sub>e).
  - .3 The breakdown shall be a tabular submittal showing all members, materials, quantities and embodied carbon based on accompanying EPDs as outlined below.
  - .4 The maximum embodied carbon for the steel joists shall not exceed 840 kg CO<sub>2</sub>e / tonne unless approved by the Consultant.
  - .5 The maximum embodied carbon for the deck shall not exceed 1740 kg CO<sub>2</sub>e / tonne unless approved by the Consultant.
- 1.8.7 Submit Environmental Product Declarations (EPDs) compliant with CSA-ISO 14025-07.
- .1 Product EPDs must be third party certified, including external verification.
- 1.8.8 Alternatively with written approval producers may submit an industry average EPD in which the manufacturer is explicitly recognized as a participant by the program operator.
- 1.8.9 Submit third party certified documentation identifying products that demonstrate item 1 and as many of the remaining items as possible:

- .1 global warming Potential (greenhouse gases), CO<sub>2</sub>e;
  - .2 depletion of the stratospheric ozone layer, in kg CFC -11;
  - .3 acidification of land and water sources, in moles H<sup>+</sup> or kg SO<sub>2</sub>;
  - .4 eutrophication, in kg nitrogen or kg phosphate;
  - .5 formation of tropospheric ozone, in kg NO<sub>x</sub>, kg O<sub>3</sub>, or kg ethane; and
  - .6 depletion of non-renewable energy resources, in MJ.
- 1.8.10 Submit documentation of recycled content of the metal deck. A breakdown of post-consumer and post-industrial recycled content should be specified. A mill certificate shall be provided.
- 1.8.11 Submit documentation of where the structural steel was produced, processed, and manufactured.

## **1.9 Testing and Field Review**

- 1.9.1 Per Section 05 00 50.

## **1.10 Storage and Handling**

- 1.10.1 Bundles of decking shall be stacked on wood blocking, clear of ground and tilted so that no water lies on material.

## **2.0 PRODUCTS**

### **2.1 General**

- 2.1.1 Products shall satisfy requirements of the Standard unless otherwise specified herein or on Drawings.

### **2.2 Materials**

- 2.2.1 Steel deck units shall be formed of zinc-coated sheet steel minimum CSSBI 10M Grade A with base steel nominal thickness of 0.76 mm or greater. Unless noted otherwise, zinc coatings for following conditions shall be:
- .1 Interior Exposure
    - .1 Floor Deck – ZF75 - Galvanneal
    - .2 Roof Deck – Z275 - Galvanized
  - .2 Exterior Exposed Deck – Z275 Galvanized.
- 2.2.2 Steel deck to be fabricated using electric arc furnace (EAF) technology, North America average, 7800 kg/<sup>3</sup>, produced by Nucor Corporation's Vulcraft Group.

- 
- 2.2.3 Touch-up paint for welds shall conform to CGSB –1.181 Ready-Mixed Organic Zinc Rich Coating.
  - 2.2.4 Cover plates, cell closures, etc. shall be of same material as deck with minimum nominal thickness of 0.76 mm.
  - 2.2.5 Deck shall conform to depths shown on Drawings. Deck receiving composite shear studs shall have average bottom flute width equal to twice deck depth.
  - 2.2.6 Shear stud connectors shall be Nelson headed anchors or other preapproved. Studs to be automatically end welded with suitable stud welding equipment in field. Fillet welded studs will be rejected.
  - 2.2.7 Steel deck to receive concrete topping shall be composite deck unless noted otherwise.
  - 2.2.8 Steel deck that is indicated to be painted on underside shall have factory-applied Perspectra Plus Series paint finish (ArcelorMittal Dofasco) unless otherwise specified. Painted steel deck shall be connected with mechanical fasteners that do not damage paint finish. Painted steel deck shall not be connected with welds. Painted deck to be co-ordinated with Section 05 12 50.
  - 2.2.9 Mechanical Fasteners
    - .1 At Structural Steel Support: Hilti X-ENP-19 L15, X-EDN19 THQ12, or X-EDNK22 THQ12 as recommended by manufacturer for application.
    - .2 At Structural Wood Support: 6 mm x 25 mm HHA weather-guard screws at 300 mm maximum centers at all bearing points (minimum 4 screws per sheet) for use on wood trusses.
    - .3 Deck Side Laps: No. 10 screws or Hilti S-SLC01 M HWH or S-SLC02 M HWH, as recommended by manufacturer for application, are acceptable (refer to Article 3.1 for execution).

## **2.3 Fabrication**

- 2.3.1 Composite steel deck shall be formed with integral locking lugs to provide mechanical lock between concrete and steel.
- 2.3.2 Steel deck shall have interlocking male and female side laps.
- 2.3.3 Provide cell closures where required by architectural drawings and specifications at open ends of cell runs at columns, openings, walls, etc., and where cells change direction.
- 2.3.4 For deck with concrete topping, provide necessary metal gauge formwork at deck edges for full deck and concrete depth to prevent leaking of concrete topping. This includes, but is not limited to, edges formed by building edges, openings framed by structural steel, elevator shafts, stairwells, and around webs and flanges of columns.

**2.4     Design**

- 2.4.1 Steel deck to be designed by Contractor to reference Standards and loads on Drawings unless otherwise noted.
- 2.4.2 Steel deck shall span over three or more supports unless prevented by structural steel layout.
- 2.4.3 Required deck material thickness may be greater than minimum thickness shown on Drawings.
- 2.4.4 Unless noted otherwise, metal deck shall be designed to meet deflection requirements noted below.

**.1     Floor Deck**

- .1 Support construction loading without temporary shoring and with deflection not exceeding span/180.
- .2 Deflection under live load shall be limited to span/360.

**.2     Roof Deck**

Application	Loading	Limit	Max
Supporting finishes susceptible to cracking	LL	Span / 360	10 mm
	Total	Span / 240	13 mm
Supporting finishes not susceptible to cracking	LL	Span / 300	12 mm
	Total	Span / 200	15 mm

- 2.4.5 If roof deck supports green roof, this load shall be considered a dead load for purposes of calculating deflection.
- 2.4.6 Unless noted otherwise, floor deck deflection under construction loading loads without temporary shoring shall be limited to Span/180.
- 2.4.7 Decking used as formwork shall conform to WCB formwork requirements.
- 2.4.8 Deck thickness, spacing of puddle welds or mechanical fasteners, and type and extent of side connections shall be proportioned to resist forces and loads shown on Drawings, or as designated on Drawings.
- 2.4.9 Where diaphragm loads are not shown on Drawings or where shear requirements are not provided, design of decking and its fastenings shall meet minimum diaphragm shear requirement of 5.0kN/m.
- 2.4.10 Shear stud connectors shall be designed for forces indicated on Drawings. If capacities of individual studs are reduced because of geometry of particular deck profile used, provide additional studs so that total shear transfer capacity provided is at least that indicated on Drawings.

**3.0     EXECUTION****3.1     Erection**

- 3.1.1 Erection of steel deck shall be carried out by personnel experienced in installation of steel deck.

- 
- 3.1.2 Obtain and verify dimensions at project site or from approved shop drawings.
  - 3.1.3 Contractor shall be solely responsible for accuracy of such measurements and precise fitting and assembly of finished product.
  - 3.1.4 Use special care in unloading, handling, and erecting deck to avoid bending, twisting, or otherwise distorting panels.
  - 3.1.5 Steel deck units shall be laid in accordance with approved shop drawings.
  - 3.1.6 At splice locations, steel decking shall be installed with sufficient laps so both pieces of deck are properly fastened to supporting member. As a minimum, over supporting members with uninterrupted top surfaces, such as W-beams and channels, lap shall be 100 mm and welds or deck fasteners shall be at or near centerline of supporting members. Over supporting members with interrupted top surfaces, such as OWSJs with double angle or hat-shaped top chords, each sheet shall extend minimum 25 mm past opposite edge of joist chord, and sheets shall lap not less than 100 mm total. In this case, welds or deck fasteners shall be centered on supporting surface nearer the end of top deck sheet. See General Notes and Typical Details for clarification.
  - 3.1.7 Metal closures and flashing shall be fastened in place by welding, sheet metal screws, or structural adhesive as recommended by decking manufacturer.
  - 3.1.8 Unless noted otherwise in Contract Documents, decking shall be fastened to structural supports and interconnected at sidelaps with minimum connection patterns:
    - .1 38 mm Deck Profiles
      - .1 Connect deck to structural support at first, third, fifth, and seventh low corrugations (36/4 connection configuration), at 300 mm (12") maximum centres, and at each side of each sheet. Connections are to be either minimum 19 mm (3/4") nominal diameter fusion weld or Hilti powder actuated fasteners Hilti X-ENP-19 L15, X-EDN19 THQ12, X-EDNK22 THQ12, or equivalent.
      - .2 Side lap connections of adjacent nested units shall be mechanically fastened (clinched) at 600 mm (24") maximum centres, welded using minimum 25 mm (1") nominal diameter fusion weld at 600 mm (24") maximum centres, or fastened with Hilti S-SLC01 M HWH, S-SLC02 M HWH, or equivalent at 900 mm (36") maximum centres.
      - .3 Discontinuous edge (side) connections shall be either a minimum 19 mm (3/4") nominal diameter fusion weld or Hilti powder actuated fasteners Hilti X-ENP-19 L15, X-EDN19 THQ12, X-EDNK22 THQ12, or equivalent spaced at 300 mm (12") centres maximum.
    - .2 76 mm Deck Profiles
-

- 
- .1 Connect deck to structural support at first, third, and fifth low corrugations (24/3 connection configuration), at 300 mm (12") maximum centres and at each side of each sheet. Connections are to be either minimum 19 mm (3/4") nominal diameter fusion weld or Hilti powder actuated fasteners Hilti X-ENP-19 L15, X-EDN19 THQ12, X-EDNK22 THQ12, or equivalent.
  - .2 Side lap connections of adjacent nested units shall be mechanically fastened (clinched) at 600 mm (24") maximum centres, welded using minimum 25 mm (1") nominal diameter fusion weld at 600 mm (24") maximum centres, or fastened with Hilti S-SLC01 M HWH, S-SLC02 M HWH, or equivalent at 900 mm (36") maximum centres.
  - .3 Discontinuous edge (side) connections shall be either minimum 19 mm (3/4") nominal diameter fusion weld or Hilti powder actuated fasteners Hilti X-ENP-19 L15, X-EDN19 THQ12, X-EDNK22 THQ12, or equivalent spaced at 300 mm (12") centres maximum.
  - .3 Powder actuated and screw fasteners are to be installed according to manufacturer's recommendations.
- 3.1.9 Mechanical fasteners may be substituted for welded fasteners as noted in this specification, provided written approval from RJC is received and is in accordance with execution requirements.
  - 3.1.10 When mechanical fasteners have been specified in Contract Documents, they may not be substituted for welded connection without written approval from RJC. Substitution of mechanical fasteners will also entail magnification of deck diaphragm design loads provided for mechanical fasteners. Provision is to be made by steel deck contractor/trade for increased design loads if a fastener substitution is desirable.
  - 3.1.11 Place steel deck on supporting steel framework and adjust to final position before permanently fastening. Bring each section to proper bearing. If supporting framework is not in proper alignment or at proper level, advise Consultant and Structural Engineer of such irregularities and do not make final placement until corrections are made.
  - 3.1.12 For steel deck that will not receive concrete topping, immediately after steel deck is welded in place, steel deck surface shall be inspected, and all areas where zinc coating has been burned by welding shall be covered by a suitable zinc enriched paint, applied to paint manufacturer's instructions.

- 
- 3.1.13 Cut openings in metal decking at locations shown on Drawings. These openings shall be located and dimensioned in cooperation with various trades at time of erecting steel deck. Unless noted otherwise, openings up to 150 mm (6") need not be reinforced. Openings between 150 mm (6") and 400 mm (16") in size shall be reinforced by this trade, using 75 mm x 75 mm x 5.0 mm x 1200 mm (48") steel angles welded to flutes on either side of those cut.
  - 3.1.14 Contractor shall accommodate erection and welding sequence of structural steel as required.
  - 3.1.15 Shear stud connectors to be applied in accordance with manufacturer's instructions and Standards. Procedural control to be in accordance with W59 as a minimum and tested in accordance with Section 05 00 50.
  - 3.1.16 Place studs in bottom flutes of steel deck on side closest to nearest end of beam.
  - 3.1.17 After welding studs, ceramic ferrule shall be removed and stud fillet visually inspected by operator. If fillet is less than 360° around base of stud, then stud is to be hammer tested by operator by bending stud 30° from the vertical away from side of no fillet. If weld fails, replace stud. Bent studs may be left bent.
  - 3.1.18 If studs are welded to steel plates or members with temperature below 0°C, 1 stud in each 100 is to be tested by operator by bending 30° from the vertical. This requirement is in addition to requirements of Section 05 00 50.
  - 3.1.19 No stud welding is to be done when base metal temperature is less than -15°C, when deck surface is wet, or when structural steel surface below deck is wet.
  - 3.1.20 Sound absorption insulation material shall be dry prior to installation and prior to application of roofing membrane.

### **3.2 Cover Plates and Closures**

- 3.2.1 Furnish, install, and weld in position, sheet metal cover plates to close openings between deck sections and columns and to cover gaps where deck sections abut or change direction.
- 3.2.2 For deck with concrete topping, install light gauge metal closures and edge strips necessary as formwork for concrete.
- 3.2.3 Install closures as required by architectural Drawings and Specifications.

### **3.3 Clean Up**

- 3.3.1 Clean up steel deck cuttings, strappings, packaging material, and other debris pertaining to steel deck units.
- 3.3.2 Remove debris and excess material at completion of erection of steel deck and leave work ready for other trades.

- 3.3.3 Touch up welds and other areas of damaged galvanizing with zinc rich paint.
- 3.3.4 Repair defects. Leave steel deck free of oil, grease, paint, and dirt.

**End of Section**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the structural metal stud framing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Wall studs subjected to lateral loads—with no axial loads other than their own weight and the weight of applied finishes.
  - .2 Additional components including, but not limited to steel bridging, top and bottom tracks, head, sill, and jamb members for wall openings; stud, bridging, and track connections; and top and bottom connections to the main structure to accommodate floor and roof deflections.
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Related Requirements**

- 1.4.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

- 1.4.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

## **1.5 Definitions**

### **1.5.1 Steel Thickness:**

- .1 Base Steel Thickness: Thickness of bare steel exclusive of coatings.
- .2 Design Thickness: Target or "nominal" thickness used to determine structural properties of the cold formed Products.
- .3 Minimum Thickness: Design thickness minus minimum allowable under-tolerance required by CSA S136 (95% of design thickness) or material specification; whichever is more stringent.
- .4 Designation Thickness: For the purposes of this specification; thicknesses provided will be minimum base steel thicknesses in accordance with CSA S136.

## **1.6 Preinstallation Meetings**

- 1.6.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.6.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72-hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

---

**1.7     Submittals**

- 1.7.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.7.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for structural metal stud framing work specified in this Section.
- 1.7.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
  - .3 Include all necessary shop details and erection diagrams. Indicate member sizes, locations, thicknesses exclusive of coating, coatings, and material types. Include connection details for attaching framing to itself and for attachment to the structure. Show splice details where permitted. Indicate dimensions, openings, requirements of related work and critical installation procedures. Show temporary bracing required for erection purposes.
  - .4 Submit on request copies of engineering calculations or data verifying the capacity of the members, including masonry connectors if specified, and the ability of the assemblies to meet the design requirements.
  - .5 Indicate design loads.
- 1.7.4 Welding certificates: Submit welding certificates showing compliance with CSA standards.
- 1.7.5 Delegated Design Submittals:
  - .1 Engineering design completion of structural metal stud framing work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.
- 1.7.6 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.

- .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
- .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.7.7 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.7.8 Welding Certificate: Submit certification for welding firms and welders to verify compliance with welding qualifications specified in this section.
- 1.7.9 Product Certification: Upon request, submit valid copy of product certification demonstrating compliance with CSSBI 61-21.

## **1.8 Closeout Submittals**

- 1.8.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.8.2 Operating and Maintenance Data: Submit care and maintenance instructions for structural metal stud framing to be included in building operation and maintenance manual.

## **1.9 Quality Assurance**

- 1.9.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 3 years' experience manufacturing such materials.
  - .1 Structural metal stud framing manufacturer must be member in good standing with CSSBI.
- 1.9.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.9.3 Welding Qualifications: Qualify procedures and personnel in accordance with the following:
  - .1 Steel: to CSA W47.1 and CSA W59
- 1.9.4 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries

professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.

.1 Professional Engineer's Responsibility:

- .1 production and review of Shop Drawings,
- .2 design and certification of structural metal stud framing, including attachments for building construction, in accordance with applicable codes and regulations,
- .3 stamping and signing of each Shop Drawing and associated calculations

1.9.5 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

**1.10 Delivery, Storage And Handling**

- 1.10.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.10.2 Deliver, store and handle structural metal stud framing materials in accordance with manufacturer's written instructions.
- 1.10.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.10.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.10.5 Replace defective or damaged materials with new.

**1.11 Site Conditions**

- 1.11.1 Existing Conditions: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication.

**1.12 Warranty**

- 1.12.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
  - .1 Bailey Metal Products Limited
  - .2 Dass Metal Products

- .3 DCM Metal Corp
- .4 Trebor Building Products Ltd

2.1.2 Basis-of-Design: This Specification is based on Products by Bailey Metal Products Ltd. Products from other manufacturers listed in this Section offering functionally and aesthetically equivalent products may be acceptable subject to Consultant's approval.

2.1.3 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Performance / Design Criteria**

2.2.1 Architectural Drawings and details are diagrammatic and are only intended to show design concept, aesthetics, interfacing requirements, configuration, components and arrangements. They are not intended to identify or solve completely structural fixings, problems of thermal and structural movements, assembly framing, engineering design, and anchorages.

2.2.2 Design exterior envelope cladding systems based on rain screen principle advocated by NRCC and provide for drainage of water entering building envelope wall systems.

2.2.3 Work of this Section shall be designed by a professional engineer as specified herein.

2.2.4 Design shall be based on Limit States Design principles using factored loads and resistances.

2.2.5 Loads and load factors shall be in accordance with the Ontario Building Code. For wind load calculations the reference velocity pressure (q), shall be based on a 1 in 50 probability of being exceeded in any one year.

2.2.6 Resistances and resistance factors shall be determined in accordance with the Ontario Building Code and CAN/CSA-S136.

2.2.7 Conform to the requirements of fire-rated assemblies specified, which have been tested in accordance with CAN/ULC-S101. Provide fire resistance as noted on Drawings and based on tested ULC designs.

2.2.8 Design metal stud exterior wall systems and their connections to withstand, within acceptable deflection limitations, their own weight, the weight of sheathing, the loads imposed by the motion of operable elements and minimum design loads and combinations of loads due to live and dead loads including, but not limited to, pressure and suction of wind and internal pressure.

2.2.9 Stud depths are as shown on Drawings. Adjust stud material thickness and spacing as required by design and performance requirements. Use greater or lesser stud and joist depths only if approved by Consultant.

- 
- 2.2.10 Space wall studs at 400 mm maximum unless specified otherwise. Use lesser stud spacing if required by design and performance requirements.
- 2.2.11 Use wall studs with 1.087 mm (43 mils - 0.0428 inch - 18 ga) thickness unless specified otherwise. Use greater stud thickness if required by design and performance requirements or engineering design.
- 2.2.12 Minimum thickness for bridging channel: 1.087 mm (43 mils - 0.0428 inch - 18 ga). Use greater bridging channel design thickness if required by the design and performance requirements or engineering design.
- 2.2.13 Minimum thickness for clip angles: 1.367 mm (54 mils - 0.0538 inch - 16 ga). Use greater clip angle thickness if required by the design and performance requirements or engineering design.
- 2.2.14 Maximum flexural deflections under specified wind loads shall conform to the following:
- .1 Wall studs supporting masonry veneer: L/360 per CSA-S304.1
  - .2 Wall studs supporting other finishes: L/360.
  - .3 Deflection limit shall be such that integrity of air/vapour barrier will be maintained at design loading. Permanent deformation of members due to applied loads is not permitted.
  - .4 Notwithstanding limits specified herein, structural steel framing system shall not deflect under design loads sufficient to cause noise, breaking of sealants, or to break integrity of insulation thermal blanket or air/vapour barrier seal
- 2.2.15 Ensure connections are designed to:
- .1 Allow for the vertical deflection of structure.
  - .2 Compensate for frame shortening.
  - .3 Absorb vertical tolerances.
- 2.2.16 Prevent axial loads from being transferred to framing. Maintain minimum gap of 12mm (1/2 inch) at connections. Depending on anticipated structural movement, larger gap may necessary. Refer to Structural Drawings and Specifications prepared for additional requirements.
- 2.2.17 Free play in connections perpendicular to plane of framing must be limited to  $\pm 0.5$  mm relative to building structure.
- 2.2.18 Design components and assemblies to accommodate specified erection tolerances of structure.
- 2.2.19 Design bridging to prevent member rotation and member translation perpendicular to minor axis. Provide for secondary stress effects due to torsion between lines of bridging

- 2.2.20 Do not rely on collateral sheathing to help restrain member rotation and translation perpendicular to minor axis. Provide bridging at 1200 mm (40 inches) o.c. maximum. Space bridging at equal intervals over the span length of the member. Provide minimum of two rows of equally spaced bridging. Closer spacing may be required to satisfy structural requirements.
- 2.2.21 Design metal stud exterior wall system to support fenestration elements (i.e. windows, curtain walls and similar openings) and cladding loads and superimposed loads transferred from fenestration elements, window washing activities, and cladding loads.
- 2.2.22 Design responsibility for managing loads from exterior wall fenestration elements and cladding — both in terms of transferring such loads and supporting fenestration elements and cladding — falls under the scope of this Section.
- 2.2.23 Design anchorage and splice details for bridging.
- 2.2.24 Design for local loading due to anchorage of cladding and interior wall-mounted fixtures where shown.
- 2.2.25 Connections between wind-bearing steel stud members shall be by bolts, welding or sheet metal screws.
- 2.2.26 Provide head, sill and jamb members and connections to frame openings larger than 100 mm (4 inches) in any dimension.
- 2.2.27 Anchor top and bottom track to the structure at a maximum spacing of 813 mm (32 inches) o.c. Closer spacing may be required to satisfy structural requirements.
- 2.2.28 Thermal Movements: fabricate and install to prevent buckling, opening up of joints and overstressing of welds and fasteners under the following temperature conditions:
  - .1 Temperature Change: ambient temperature cycling of - 30 deg C (-22 deg F) to 82 deg C (180 deg F) over a 12-hour period.
- 2.2.29 Steel Stud Designations: Colour code studs to CSSBI Technical Bulletin Vol.7.

## **2.3 Steel Framing**

- 2.3.1 CSA S136, fabricated from ASTM A653/A653M, identified as to specification, grade, mechanical properties, coating type and thickness.
  - .1 Steel studs: CSA S136, fabricated from metallic coated steel, depth as indicated.
  - .2 Stud tracks: fabricated from same material and finish as steel studs, depth to suit.
  - .3 Bottom track: single piece.

- .4 Top track: two-piece telescoping.
- .5 Tension straps and accessories: as recommended by manufacturer.

## **2.4 Auxiliary Materials**

- 2.4.1 Zinc coated steel sheet: ASTM A653/A653M, with minimum Z275 (G90) designation coating.
- 2.4.2 Welding materials: to CSAW59 and certified by Canadian Welding Bureau.
- 2.4.3 Anchors: concrete expansion anchors or other suitable drilled type fasteners.
- 2.4.4 Bolts, nuts, washers: hot dipped galvanized to CAN/CSA G164, 600 g/m2 zinc coating.
- 2.4.5 Touch up primer: zinc rich, to CAN/CGSB 1 GP 181 or MPI #18.
- 2.4.6 Miscellaneous Steel Shapes including Plate and Hollow Sections: CSA G40.21, Grade 300W, or ASTM A36/A36M complete with shop applied primer of either CPMA/CISC 1-73 or CGSB 1-GP-140M.
- 2.4.7 Fasteners and Welds:
  - .1 Hot-dip galvanize anchors, bolts, nuts and washers to provide equal or better corrosion protection than corrosion protection used for metal framing members.
  - .2 Bolts and nuts shall conform to the requirements of ASTM A307 or ASTM A325. Provide washers.
  - .3 Welding electrodes shall be of the 490 MPa minimum tensile strength series (e.g. E49XX).
- 2.4.8 Exterior Sheathing: Refer to Section 06 16 00, Sheathing.

## **2.5 Fabrication**

- 2.5.1 Fabricate in accordance with reviewed shop and erection drawings.
- 2.5.2 Provide cutouts centred in the webs of members to accommodate services. Limit dimensions of unreinforced cutouts to suit design requirements and effects on the strength and stiffness of the members.
- 2.5.3 Fabricate structural metal stud framing and accessories plumb, square, and true to line, and with connections securely fastened, according to referenced specifications and standards, manufacturer's written instructions, and requirements in this Section.
- 2.5.4 Take field measurements and levels required to verify or supplement those shown on the Drawings for the proper layout and installation of the work. Coordinate dimensional tolerances in

adjacent building elements and confirm prior to the commencement of the work.

- 2.5.5 Reinforce, stiffen, and brace framing assemblies to withstand handling, delivery, and erection stresses. Lift fabricated assemblies to prevent damage or permanent distortion.
- 2.5.6 Accurately fit frames rigidly together at all joints, corners and mitres. Match components carefully to produce perfect continuity of line and design.
- 2.5.7 Fabrication Tolerances:
  - .1 Fabricate assemblies level, plumb, and true to line to a maximum allowable tolerance variation of 1:960 (1/8 inch in 10 feet) and as follows:
    - .1 Member Depth:  $\pm 0.76$  mm, ( $\pm 0.03$  inch).
    - .2 Flange Width:  $\pm 0.76$  mm ( $\pm 0.03$  inch) (where exterior board is attached directly to flange.) Minimum flange width shall be 32 mm (1-1/4 inch).
    - .3 Lip length: -0, +3 mm (+1/8 inch).
    - .4 Thickness: -0 mm (-0 inch).
    - .5 Corner Angles:  $\pm 3$  deg.
    - .6 Framing Length:  $\pm 3$  mm ( $\pm 1/8$  inch).
  - .2 Spacing: Space individual framing members no more than plus or minus 3 mm (1/8 inch) from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
  - .3 Squareness: Fabricate steel framing assembly to a maximum out-of-square tolerance of 3 mm (1/8 inch).

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

#### **3.2 Temporary Bracing**

- 3.2.1 Employ temporary bracing wherever necessary to withstand all loads applied to steel stud wall systems during erection and subsequent construction. Leave temporary bracing in place for wall system safety and integrity.

- 3.2.2 During erection, maintain a safety margin consistent with Ontario Building Code and CAN/CSA-S136 requirements. Ensure structure safety during this period.

### **3.3 Erection**

- 3.3.1 Methods of construction may be either piece by piece (stick-built) or by fabrication into panels (panelized) either on or off site.
- 3.3.2 Install studs at spacing indicated herein. Ensure studs seat into top and bottom tracks. Ensure gap between end of stud and web of track does not exceed 4.8 mm (3/16 inch).
- 3.3.3 Allow minimum 25 mm (1inch) minimum at top of framing for anticipated floor slab deflection, unless otherwise noted on Structural Drawings.
- 3.3.4 Wind bearing studs shall be erected true and plumb within the specified tolerances.
- 3.3.5 Cutting of members may be by saw or shear. Torch cutting is not permitted.
- 3.3.6 Reinforce cut-outs where the distance from the centerline of the cut-out to the end of the member is less than 300 mm. Submit the reinforcing detail to the Consultant for approval.
- 3.3.7 Replace members with localized damage.
- 3.3.8 Unless a closer spacing is shown on the shop drawings, anchor top and bottom tracks securely to structure at 813 mm (32 inch) o.c. maximum. Place one additional anchor within 102 mm (4 nches) of the end of each piece of track and additionally as required by the shop drawings.
- 3.3.9 Install additional studs at abutting walls, openings, terminations against other materials and on each side at corners unless explicitly detailed otherwise on the shop drawings.
- 3.3.10 Insulation equal to that specified shall be placed in jamb and header assemblies that will be non-accessible after their installation into the wall. Ensure that insulation is kept dry and not compressed.
- 3.3.11 Handling and lifting of prefabricated panels shall not cause permanent distortion to any member or collateral material.
- 3.3.12 Secure framing at top with sliding connection. Provide inner and outer track deflection head under steel beams and decks.

### **3.4 Fasteners And Welds**

- 3.4.1 Ensure that connected parts are in contact. Provide clamping before welding or installing screws as required.
- 3.4.2 Welds shall conform to CAN/CSA S136, CSA W59 and ANSI/AWS D1.3, whichever is applicable.

- 3.4.3 For material less than 3 mm thick, shop drawings may show nominal weld leg sizes. For such material, the effective throats of welds shall not be less than the thickness of the thinnest connected part.
- 3.4.4 Touch-up welds and coatings damaged by welding with zinc rich paint. Prior to touching-up prepare surface in accordance with paint manufacturer's recommendations.
- 3.4.5 Sheet metal screws shall be of minimum diameter indicated on Shop Drawings but not less than a #8.
- 3.4.6 Penetration of sheet metal screws beyond joined materials shall be not less than three exposed threads.
- 3.4.7 Sheet metal screw thread types, drilling capability and installation shall conform to manufacturer's recommendations.
- 3.4.8 Sheet metal screws covered by sheathing materials shall have low profile heads.
- 3.4.9 Install concrete anchors in accordance with manufacturer's recommendations.

### **3.5 Tolerances**

- 3.5.1 For the purpose of this section, camber is defined as the deviation from straightness of a member or any portion of a member with respect to its major axis, and sweep is defined as the deviation from straightness of a member or any portion of a member with respect to its minor axis.
- 3.5.2 For wind bearing studs, out of plumbness shall not exceed 1/500th of the member length.
- 3.5.3 Out of straightness (camber and sweep) shall not exceed 1/1000th of the member length.
- 3.5.4 For track, camber shall not exceed 1/1000th of the member length.
- 3.5.5 Squareness of prefabricated panels shall be not more than 3 mm out of square within the length of that panel.
- 3.5.6 Align adjacent or abutting members in the same plane to within  $\pm$  0.5 mm maximum.
- 3.5.7 Spacing of studs shall not be more than  $\pm$  3 mm from design spacing. The cumulative error in spacing shall not exceed the requirements of the finishing materials.

### **3.6 Field Quality Control**

- 3.6.1 Engineering Inspection Services: Provide field services by engineer specified in this Section consisting of periodic site visits for inspection of product installation in accordance with specifications.
  - .1 Field reviews shall include, but are not limited to: review of mill test reports, welded and screwed connections, connections to

the main structure, member sizes, location and material thickness, coating thickness, erection tolerances, and all field cutting.

- .2 Inspection provided in this section does not relieve the contractor of his responsibility for the performance of the contract. The Contractor is solely responsible for quality control and shall implement his own supervisory and quality control procedures.
  - .3 Materials or workmanship not conforming to the requirements of the contract may be rejected at any time during the progress of work at no cost to Owner even if Contractor has to destroy and rebuild other work as a result.
  - .4 As a minimum, schedule site visits to review work at stages listed:
    - .1 After delivery and storage of products, and when preparatory activities on which work of this Section depends is complete, but before installation begins.
    - .2 Twice during progress of work: at 25% and 60% complete.
    - .3 Upon completion of Work, after cleaning is carried out.
  - .5 Report any inconsistencies from manufacturer's recommendations immediately to Consultant.
- 3.6.2 Obtain field reports within three days of review and submit immediately to Consultant.

### **3.7 Protection**

- 3.7.1 Protect structural metal stud framing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.7.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.7.3 Promptly replace structural metal stud framing work damaged during construction that cannot be satisfactorily repaired.

### **3.8 Cleaning And Waste Management**

- 3.8.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.8.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.

- 
- 3.8.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

**1. GENERAL**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

**1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the metal fabrications work specified herein. This includes, but is not necessarily limited, to:
  - .1 Steel framing and supports for overhead doors and grilles.
  - .2 Steel framing and supports for mechanical and electrical equipment.
  - .3 Steel framing and supports for applications where framing and supports are not specified in other Sections.
  - .4 Elevator machine beams, hoist beams, and divider beams.
  - .5 Steel shapes for supporting elevator door sills.
  - .6 Sump pit covers.
  - .7 Metal ladders and ladder safety cages where shown on Drawings.
  - .8 Metal floor plate and supports.
  - .9 Miscellaneous steel trim including steel angle corner guards, steel edgings and loading-dock edge angles where shown on Drawings.
  - .10 Metal bollards.
  - .11 Shade canopy.
  - .12 Loose bearing and leveling plates for applications where they are not specified in other Sections.
  - .13 Steel framing and supports for washroom and shower accessories supporting downward loads, including shower seats, grab bars and change tables.
  - .14 Steel framing and supports for fire valve cabinets.

- .15 Miscellaneous sections and framing as required to complete the Work and as indicated in the Canadian Institute for Steel Construction (CISC) - Handbook of Steel Construction "Appendix F" for applications where framing and supports are not explicitly specified in this section.
  - .16 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3      References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4      Definitions**

- 1.4.1 Workmanship (as defined by AMP 555 – Draft Edition) for this Section must be in accordance with one of the following classes:
- .1 Class 1:
    - .1 Exposed surfaces are finished smooth with pits, mill marks, nicks and scratches filled or ground off. Defects are not apparent when painted or polished.
    - .2 Welds are concealed where possible. Exposed welds are ground to small radius with uniform sized coves unless indicated otherwise.
    - .3 Distortions are not visible to the naked eyes.
    - .4 Exposed joints are fitted to a hairline finish.
  - .2 Class 2:
    - .1 Exposed surfaces retain mill marks and moderate irregularities, but are generally not visible to the naked eye when viewed at 10 m (30 ft)
    - .2 Exposed welds are ground to a uniform sized cove.
    - .3 Exposed joints are fitted to a maximum gap of 1.6 mm (1/16 inch)
  - .3 Class 3:
    - .1 Exposed surfaces have no improvement from mill finish except preparation necessary for galvanizing, or priming.
    - .2 Exposed welds are not ground.
    - .3 Bolt, when used, may be exposed.

---

**1.5     Coordination**

- 1.5.1 Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written instructions to ensure that shop primers and topcoats are compatible with one another.
- 1.5.2 Coordinate installation of metal fabrications that are anchored to or that receive other work. Supply setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

**1.6     Preinstallation Meetings**

- 1.6.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.6.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.7     Submittals**

- 1.7.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.7.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for metal fabrications work specified in this Section.

- 
- 1.7.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
- .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
  - .3 Member sizes, locations, thickness (exclusive of coatings), metallic coatings and mechanical properties,
  - .4 Connection details for attaching framing to itself and to the structure,
  - .5 Dimensions, requirements of related work, and critical installation procedures,
  - .6 Temporary bracing required for erection purposes,
  - .7 Design loads,
  - .8 Welds indicated by welding symbols as defined in CSA-W59.
- 1.7.4 Delegated Design Submittals:
- .1 Engineering design completion of metal fabrications work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.
- 1.7.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.7.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

- 1.7.7 Welding Certificate: Submit certification for welding firms and welders to verify compliance with welding qualifications specified in this section.

**1.8 Closeout Submittals**

- 1.8.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.8.2 Operating and Maintenance Data: Submit care and maintenance instructions for metal fabrications to be included in building operation and maintenance manual.
- 1.8.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.9 Quality Assurance**

- 1.9.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 5 years' experience manufacturing such materials.
- 1.9.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.9.3 Welding Qualifications: Qualify procedures and personnel in accordance with the following:
- .1 Steel: to CSA W47.1 and CSA W59
  - .2 Aluminum: to CSA W47.2 and CSA W59.2
  - .3 Stainless Steel: to CSA W47.1 (Annex K) and CSA W59.
- 1.9.4 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
- .1 Professional Engineer's Responsibility:
    - .1 production and review of Shop Drawings,
    - .2 design and certification of metal fabrications, including attachments for building construction, in accordance with applicable codes and regulations,
    - .3 stamping and signing of each Shop Drawing and associated calculations
- 1.9.5 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and

secondary materials from sources recommended by manufacturers of primary materials.

1.9.6 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
- .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.10 Delivery, Storage And Handling**

- 1.10.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.10.2 Deliver, store and handle metal fabrications materials in accordance with manufacturer's written instructions.
- 1.10.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.10.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.10.5 Replace defective or damaged materials with new.

**1.11 Field Conditions**

- 1.11.1 Environmental Restrictions: Do not deliver or install metal fabrications until building is enclosed, wet work is complete, and HVAC system is operational and will maintain temperature and relative humidity levels equal to occupancy levels for remainder of construction period.
- 1.11.2 Field Measurements: Verify actual dimensions of construction contiguous with metal fabrications by field measurements before fabrication.

**1.12 Warranty**

- 1.12.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

---

## **2 .     PRODUCTS**

### **2.1     Performance / Design Criteria**

- 2.1.1 Delegated Design: Employ a qualified professional engineer, as specified in this Section, to design elements of this section requiring structural performance and based on the following:
  - .1 Steel Elements: to CSA S16, unless indicated otherwise.
  - .2 Cold-Formed Steel: to CSA S136.
  - .3 Aluminum: to CSA S157/S157.1
  - .4 Where components specified in this Section will be subject to upward or downward pull by human interaction (e.g. supports for grab bars, shower seats, etc.) provide elements capable of withstanding the following loads under conditions indicated:
    - .1 Minimum load ratings: 1.3 kN (292 lb-f)
    - .2 Maximum Deflection between supports: L/144 or 3 mm (1/8") whichever is less.
- 2.1.2 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.1.3 Metal Surfaces - Appearance:
  - .1 Provide materials with smooth, flat surfaces unless otherwise indicated. For metal fabrications exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.
    - .1 Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.
  - .2 Provide metal fabrications complying with the following classes as defined in this Section:
    - .1 Class 1 Workmanship: Items that are exposed to view in finished spaces in completed Work.
    - .2 Class 2 Workmanship: Items that are exposed to view in utility areas of the completed Work.
    - .3 Class 3 Workmanship: Items that are concealed from view in the completed Work

2.1.4 Exterior Metal Fabrications: fabricate and install to prevent buckling, opening up of joints and overstressing of welds and fasteners under the following temperature conditions:

- .1 Temperature Change: ambient temperature cycling of - 30 deg C (-22 deg F) to 82 deg C (180 deg F) over a 12 hour period.

## **2.2 Ferrous Metals**

- 2.2.1 Steel Plates, Shapes, and Bars: CSA G40.20/G40.21, Grade 350W or equivalent to ASTM A36/A36M
- 2.2.2 Rolled-Steel Floor Plate: ASTM A786/A786M, rolled from plate complying with ASTM A36/A36M or CSA G40.20/G40.21 or ASTM A283/A283M, Grade C or D.
- 2.2.3 Rolled-Stainless Steel Floor Plate: ASTM A793.
- 2.2.4 Steel Tubing: ASTM A500/A500M, cold-formed steel tubing.
- 2.2.5 Steel Pipe: ASTM A53/A53M, Standard Weight Schedule 40 unless otherwise indicated.
- 2.2.6 Slotted Channel Framing (Unistrut): Cold-formed metal box channels struts complying with MFMA-4.
  - .1 Size of Channels: As indicated on reviewed Shop Drawings.
  - .2 Material: Galvanized steel, ASTM A653/A653M, structural steel, Grade 230 (Grade 33), with Z275 (G90) coating; minimum 2-mm (0.079-in.) nominal thickness.

## **2.3 Non-Ferrous Metals**

- 2.3.1 Aluminum Plate and Sheet: ASTM B209M (ASTM B209), Alloy 6061-T6.
- 2.3.2 Aluminum Extrusions: ASTM B221M (ASTM B221), Alloy 6063-T6.
- 2.3.3 Aluminum-Alloy Rolled Tread Plate: ASTM B632/B632M, Alloy 6061-T6.
- 2.3.4 Aluminum Castings: ASTM B26/B26M, Alloy 443.0-F.
- 2.3.5 Stainless Steel Sheet, Strip, and Plate: ASTM A240/A240M or ASTM A666, Type 304 for interior and Type 316L for exterior.
- 2.3.6 Stainless Steel Bars and Shapes: ASTM A276/A276M, Type 304 for interior and Type 316L for exterior.

## **2.4 Fasteners**

- 2.4.1 General Requirements: Unless otherwise indicated, provide stainless steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B633 or ASTM F1941/F1941M, Class Fe/Zn 5, at exterior walls. Select fasteners for type, grade, and class required.

- 2.4.2 Steel Bolts and Nuts: Regular hexagon-head bolts, ASTM F568M, Property Class 4.6 (ASTM A307, Grade A); with hex nuts, ASTM A563M (ASTM A563); and, where indicated, flat washers.
- 2.4.3 Stainless Steel Bolts and Nuts: Regular hexagon-head annealed stainless steel bolts, ASTM F738M (ASTM F593); with hex nuts, ASTM F836M (ASTM F594); and, where indicated, flat washers; Alloy Group A1 (1) .
- 2.4.4 Anchor Bolts: ASTM F1554, Grade 36, of dimensions indicated; with nuts, ASTM A563M (ASTM A563); and, where indicated, flat washers.
  - .1 Hot-dip galvanize or provide mechanically deposited, zinc coating where item being fastened is indicated to be galvanized.
- 2.4.5 Anchors - General Requirements: Capable of sustaining, without failure, loads imposed with appropriate safety factors, as determined by testing in accordance with ASTM E488/E488M, conducted by a qualified independent testing agency.
- 2.4.6 Slotted-Channel Inserts: Cold-formed, hot-dip galvanized-steel box channels struts complying with MFMA-4, 41 by 22 mm (1-5/8 by 7/8 in.) by length indicated with anchor straps or studs minimum 75 mm (3 in.) long at maximum 200 mm (8 in.) o.c. Provide with temporary filler and tee-head bolts, complete with washers and nuts, all zinc-plated to comply with ASTM B633, Class Fe/Zn 5, as needed for fastening to inserts.

## **2.5 Auxiliary Installation Materials**

- 2.5.1 Welding materials: to CSA W59.
- 2.5.2 Welding electrodes: to CSA W48 Series.
- 2.5.3 Universal Shop Primer: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with CISC/ CPMA Standards 1-73a and 2-75 and MPI#79 and compatible with topcoat.
  - .1 Use primer containing pigments that make it easily distinguishable from zinc-rich primer.
- 2.5.4 Epoxy Zinc-Rich Primer: Complying with MPI#20 and compatible with topcoat.
- 2.5.5 Galvanizing Repair Paint: High-zinc-dust-content paint (not less than 93 percent) complying with SSPC-Paint 20 and compatible with paints specified to be used over it.
- 2.5.6 Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187/D1187M.

2.5.7 Shrinkage-Resistant Grout: Factory-packaged, nonmetallic, nonstaining, noncorrosive, nongaseous grout complying with ASTM C1107/C1107M with compressive strength of 15 MPa at 24 hours. Provide grout specifically recommended by manufacturer for interior and exterior applications.

.1 Acceptable Product: 'Sika Grout 212' by Sika Canada Inc., or approved equivalent.

2.5.8 Concrete: Comply with requirements in Section 03 30 00.

## **2.6 Fabrication - General Requirements**

2.6.1 Fabricate work square, true, straight, and accurate to required size, with joints closely fitted and properly secured.

2.6.2 Weld connections unless indicated otherwise.

2.6.3 Shop Assembly: Preassemble items in the shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

2.6.4 Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1 mm (1/32 in.) unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

2.6.5 Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

2.6.6 Form exposed work with accurate angles and surfaces and straight edges.

2.6.7 Weld corners and seams continuously to comply with the following:

.1 Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.

.2 Obtain fusion without undercut or overlap.

.3 Remove welding flux immediately.

.4 At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

2.6.8 Form exposed connections with hairline joints, flush and smooth, using concealed fasteners or welds where possible. Where exposed fasteners are required, use Phillips flat-head countersunk fasteners unless otherwise indicated. Locate joints where least conspicuous.

2.6.9 Fabricate seams and other connections that are exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

- 2.6.10 Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.
- 2.6.11 Provide for anchorage of type indicated; coordinate with supporting structure. Space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
- 2.6.12 Where units are indicated to be cast into concrete or built into masonry, equip with integrally welded steel strap anchors, 3.2 by 38 mm (1/8 by 1-1/2 in.), with a minimum 150-mm (6-in.) embedment and 50-mm (2-in.) hook, minimum 200 mm (8 in.) from ends and corners of units and 600 mm (24 in.) o.c., unless otherwise indicated.
- 2.6.13 Make exposed metal fastenings and accessories of same material, texture, colour and finish as base metal on which they occur unless otherwise shown or specified. Keep exposed fastenings to an absolute minimum evenly spaced and neatly laid out. Make fastenings of permanent type unless otherwise indicated.

## **2.7     General Finish Requirements**

- 2.7.1 Finish metal fabrications after assembly.
- 2.7.2 Finish exposed surfaces to remove tool and die marks and stretch lines, and to blend into surrounding surface.
- 2.7.3 Galvanize miscellaneous framing and supports at exterior locations; prime paint miscellaneous framing and supports at interior locations.

## **2.8     Steel And Iron Finishes**

- 2.8.1 Galvanizing: Hot-dip galvanize items to comply with ASTM A153/A153M for steel and iron hardware and with ASTM A 123/A 123M or equivalent to CAN/CSA-G164 for other steel and iron products.
  - .1 Do not quench or apply post-galvanizing treatments that might interfere with paint adhesion.
  - .2 Preparation for Shop Priming of Galvanized Items: After galvanizing, thoroughly clean galvanized surfaces of grease, dirt, oil, flux, and other foreign matter, and treat with metallic phosphate process.
- 2.8.2 Preparation for Shop Priming: Prepare surfaces to comply with requirements indicated below:
  - .1 Exterior Items: SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
  - .2 Items Indicated to receive Zinc-Rich Primer: SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
  - .3 Other Steel Items: SSPC-SP 3, "Power Tool Cleaning."

- .4 Galvanized-Steel Items: SSPC-SP 16, "Brush-off Blast Cleaning of Coated and Uncoated Galvanized Steel, Stainless Steels, and Non-Ferrous Metals."

2.8.3 Shop Priming:

- .1 Shop prime items not indicated to be galvanized unless they are to be embedded in concrete, sprayed-on fireproofing, or masonry, or unless otherwise indicated. Shop prime with universal shop primer unless indicated otherwise.
- .2 Apply shop primer to comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.
- .3 Stripe paint corners, crevices, bolts, welds, and sharp edges.

**2.9 Aluminum Finishes**

- 2.9.1 As-Fabricated Finish: AA-M12.
- 2.9.2 Clear Anodic Finish: AAMA 611, Class I, AA-M12C22A41.

**3 . EXECUTION**

**3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

**3.2 Installation**

- 3.2.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal fabrications. Set metal fabrications accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- 3.2.3 Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations.
- 3.2.4 Field Welding: Comply with CSA W59 and the following requirements:

- 
- .1 Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - .2 Obtain fusion without undercut or overlap.
  - .3 Remove welding flux immediately.
  - .4 At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
- 3.2.5 Fastening to In-Place Construction: Provide anchorage devices and fasteners where metal fabrications are required to be fastened to in-place construction. Provide threaded fasteners for use with concrete and masonry inserts, toggle bolts, through bolts, lag screws, and other connectors.
- 3.2.6 Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- 3.2.7 Corrosion Protection / Isolation Coating: Isolate aluminum from following components, by means of bituminous paint:
- .1 Dissimilar metals except stainless steel, zinc, or white bronze of small area.
  - .2 Concrete, mortar and masonry.
  - .3 Wood.
- 3.2.8 Provide separator membrane/mastic between steel and substrates of concrete, masonry, or dissimilar metals.
- 3.3 Installation Of Miscellaneous Framing And Supports**
- 3.3.1 General Requirements: Install framing and supports to comply with requirements of items being supported, including manufacturers' written instructions and requirements indicated on Shop Drawings.
- 3.3.2 Anchor supports securely to, and rigidly brace from, building structure.
- 3.4 Repairs**
- 3.4.1 Touchup Painting:
- .1 Immediately after erection, clean field welds, bolted connections, and abraded areas. Paint uncoated and abraded areas with same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
    - .1 Apply by brush or spray to provide a minimum 0.05-mm (2.0-mil) dry film thickness.
- 3.4.2 Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780/A780M.

---

**3.5     Metal Fabrication Schedule**

- 3.5.1 Provide steel framing and supports not specified in other Sections as needed to complete the Work.
- 3.5.2 Where items are required to be built into masonry, concrete or other work, supply such items to respective Sections with required anchors and accessories for building in.
- 3.5.3 Following Schedule is a list of principal items only and is not necessarily exhaustive. Review Drawings Sheet A053 for Miscellaneous Metals Schedule and other Specifications, including those pertaining to structural, mechanical, and electrical work, to determine full scope of metal fabrications required for this Project.
- 3.5.4 STEEL FRAMING AND SUPPORTS FOR GLASS DOORS, ENTRANCE AND PARTITIONS
  - .1 Fabricate and install partition framing such that, when installed, it is capable of supporting required deadloads and withstanding live loads imposed on it from operation of the partitions.
- 3.5.5 STEEL THRESHOLDS AND SUPPORTS FOR DOORS
  - .1 Fabricate and install door thresholds and supports such that, when installed, it is capable of supporting required deadloads and withstanding live loads imposed on it from operation of the doors.
- 3.5.6 ELEVATOR MACHINE BEAMS, HOIST BEAMS, DIVIDERS AND STEEL SHAPES SUPPORTING DOOR SILLS
  - .1 Provide elevator divider beams, doors and framing supports, and miscellaneous supports for elevators complying with requirements in Division 14 specifications
- 3.5.7 LATERAL SUPPORT FOR MASONRY WALLS
  - .1 Provide steel angles, minimum 75 mm x 75 mm x 6 mm thick, secured to underside of structure to anchor freestanding masonry. Unless indicated otherwise, space lateral support as follows:
    - .1 At loadbearing walls: Not exceeding 20 times the actual wall thickness.
    - .2 At non-loadbearing partitions: Not exceeding 36 times the actual wall thickness.
  - .2 Refer to structural Drawings for design of lateral supports, spacing and other requirements.
- 3.5.8 METAL LADDERS
  - .1 Comply with Ontario Ministry of Labour Fixed Access Ladders Engineering Data Sheet 2-04 and ANSI A14.3, except for elevator pit ladders.

- .2 For elevator pit ladders, comply with ASME A17.1/CSA B44 and requirements in Division 14 specifications.
- .3 Provide nonslip surfaces on top of each rung by coating with abrasive material metallically bonded to rung.
- .4 Provide platforms as indicated fabricated from welded or pressure-locked steel bar grating, supported by steel angles. Limit openings in gratings to no more than 12 mm (1/2 in.) in least dimension.
- .5 Galvanize exterior ladders, including brackets.
- .6 Prime paint interior ladders, including brackets and fasteners.

#### 3.5.9 LADDER SAFETY CAGES

- .1 Fabricate ladder safety cages to comply with ANSI A14.3. Assemble by welding or with stainless steel fasteners.
- .2 Provide primary hoops at tops and bottoms of cages and spaced maximum 6 m (20 ft.) o.c. Provide secondary intermediate hoops spaced maximum 1200 mm (48 in.) o.c. between primary hoops.
- .3 Fasten assembled safety cage to ladder rails and adjacent construction by welding or with stainless steel fasteners unless otherwise indicated.
- .4 Ladder Safety Cage Material: Steel.

#### 3.5.10 FLOOR TRENCH AND SUMP PIT COVERS

- .1 Fabricate from minimum 6-mm (1/4-in.) floor plate.
- .2 Provide anchors at 1200 mm on centre for embedding in concrete.
- .3 Supply trench covers in 1200 mm removable lengths.
- .4 Provide steel angle supports consisting of L 55 x 55 x 6 frame unless otherwise indicated.
- .5 Provide perimeter gasket for air tight seal at pits connected with sanitary drainage piping.

#### 3.5.11 MISCELLANEOUS STEEL TRIM

- .1 Fabricate units from steel shapes, plates, and bars of profiles shown with continuously welded joints and smooth exposed edges. Miter corners and use concealed field splices where possible.
- .2 Provide cutouts, fittings, and anchorages as needed to coordinate assembly and installation with other work.
- .3 Provide with integrally welded steel strap anchors for embedding in concrete or masonry construction.
- .4 Galvanize exterior miscellaneous steel trim.
- .5 Prime paint interior miscellaneous steel trim.

- .6 Surface Applied Corner Guards (Back-of-House): Provide corner guards fabricated from angles of sizes shown, or if not shown, of minimum 114 mm x 114 mm x 6 mm (4-1/2 in x 4-1/2 in x 6 mm) thick equal leg angles. Drill and countersink legs of angles, for fastening to substrates indicated, with holes spaced maximum 600 mm (24 in) on center. Provide corner guard lengths minimum 1200 mm (48 in) above finished floor level, if not otherwise indicated.
- .7 Cast-In Pit Angles and Edge Angles: Provide edge angles, and pit angles, fabricated from angles of size as shown, or required, with welded-on stud anchors spaced 600 mm (24 in) on center. Provide pit and edge angles in as long lengths as possible. Miter and weld corners and provide splice plates for alignment between sections.

#### 3.5.12 METAL BOLLARDS

- .1 Fabricate metal bollards from Schedule 40 steel pipe with galvanized finish, with high-visibility yellow paint finish and retro-reflective banding at top.
- .2 Cap bollards with 6.4-mm- (1/4-in.-) thick, steel plate with domed top, unless indicated otherwise on Drawings.
- .3 Where bollards are indicated to receive controls for door operators, provide cutouts for controls and holes for wire.
- .4 Where bollards are indicated to receive light fixtures, provide cutouts for fixtures and holes for wire.
- .5 Refer to Section 03 30 00 for concrete infill requirements.

#### 3.5.13 PEDESTALS AND BOLLARDS FOR MOUNTING DEVICES AND ACTUATORS

- .1 Provide bollards designed to support the installation of push plates, control devices, or access actuators.
- .2 Bollards must be fabricated from structural-grade steel, with provisions for wiring, device mounting, complete with stainless steel cladding.
- .3 Steel:
  - .1 Pipe: ASTM A53, Grade B, standard weight (Schedule 40) steel pipe, diameter as indicated on Drawings.
  - .2 Cap: Steel plate or dome cap, welded to the top of bollard.
  - .3 Mounting Bracket: Stainless steel or galvanized steel bracket for securing push plates or control devices.
  - .4 Finish: Hot-dip galvanized to ASTM A123 with stainless steel cladding.
- .4 Stainless Steel Cladding:

- .1 Cladding Material: ASTM A240, Type 316 stainless steel, minimum 2 mm thick.
- .2 Finish: Brushed No. 4 finish unless indicated otherwise.
- .3 Cladding to be wrapped around bollard with welded or mechanically fastened seams.
- .4 Ensure stainless steel cladding covers the entire exposed surface of bollard, including the top cap.
- .5 Dimensions: Refer to Drawings.
- .6 Device Mounting Provisions:
  - .1 Provide pre-drilled holes and internal conduits for wiring of devices, push plates, or access controls. Allow for easy access to wiring connections and maintenance of electrical components.
  - .2 Provide brackets or plates for mounting devices securely fastened to bollard and to accommodate required push plate sizes.
  - .3 Wiring Path: Provide internal raceways or conduit channels for routing power and control wiring to mounted devices. Coordinate with Division 26 and Division 28.
  - .4 Device mounting brackets to be fabricated from stainless steel to match cladding.

#### 3.5.14 STEEL WELD PLATES AND ANGLES

- .1 Provide steel weld plates and angles not specified in other Sections, for items supported from concrete construction as needed to complete the Work. Provide each unit with no fewer than two integrally welded steel strap anchors for embedding in concrete.

#### 3.5.15 MISCELLANEOUS FRAMING AND SUPPORTS

- .1 Fabricate units from steel shapes, plates, and bars of welded construction unless otherwise indicated. Fabricate to sizes, shapes, and profiles indicated and as necessary to receive adjacent construction.
  - .1 Fabricate units from slotted channel framing where indicated.
  - .2 Supply inserts for units installed after concrete is placed.

#### 3.5.16 PIPE RAILINGS

- .1 Steel pipe and stainless-steel pipe: to shapes and sizes as indicated.

- .2 Ergonomic design: constructed so as to be continually graspable along their entire length with no obstruction on or above them to break a handhold.
- .3 Galvanize exterior pipe railings after fabrication. Shop coat prime interior railings after fabrication.

#### **3.5.17 METAL STAIRS**

- .1 Refer to Section 05 51 00.

#### **3.5.18 METAL GRATINGS**

- .1 General: Produce metal bar gratings in accordance with the following:
  - .1 For Gratings Exposed to Non-Vehicular Loads: NAAMM MBG 531 Metal Bar Grating Manual.
  - .2 For Gratings Exposed to Vehicular Loads: NAAMM MBG 532 Heavy Duty Metal Bar Grating Manual.
- .2 Provide gratings including supplementary framing and supports to support specified loads. Provide gratings of welded type construction, rectangular pattern with plain surface bars in the same plane; accurately fabricated free from warps, twists or other defects affecting their serviceability or appearance. Fabricate gratings from ASTM A36 structural steel bars.
- .3 Fabricate cutouts in grating sections for penetrations required. Arrange layout of cutouts to permit grating removal without disturbing items penetrating gratings.
  - .1 Edge band openings in grating that interrupt 4 or more bearing bars with bars of same size and material as bearing bars.
  - .2 Do not notch bearing bars at supports to maintain elevation.
- .4 Galvanize metal bar gratings after fabrication.

#### **3.5.19 SHADE CANOPY**

- .1 Fabricate units with aluminum extrusions to sizes, shapes, and profiles indicated on Drawings and as necessary to receive adjacent construction.
- .2 Finish: Pre-painted in colour selected by Consultant at a later date.

**END OF SECTION**

---

**1. GENERAL**

**1.1 Related Documents**

- 1.1.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

**1.2 Summary**

- 1.2.1 Provide Work described in this Section and all ancillary components required for a complete installation. This includes but is not limited to the following: decorative metal.
- .1 Decorative mechanical grilles and screens.
  - .2 Miscellaneous decorative metal reveals and shapes including but not limited to: miscellaneous trims, fillers and closures in interior locations.

**1.3 Related Documents**

- 1.3.1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- 1.3.2 Specifications throughout all Divisions of the Project Manual are directly applicable to this Section, and this Section is directly applicable to them.

**1.4 References**

- 1.4.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.5 Administrative Requirements**

- 1.5.1 Preinstallation Meetings: Conduct conference at Project site to comply with requirements in 01 31 00.
- 1.5.2 Coordination:
- .1 Coordinate installation of anchorages for decorative metal items. Supply setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

---

**1.6     Submittals**

- 1.6.1 Provide submittals in accordance with requirements of 01 33 00.
- 1.6.2 Product Data: Submit manufacturer's product data and installation instructions for each material and product used.
- 1.6.3 Shop Drawings: Submit Shop Drawings for decorative metal items. Include plans, elevations, component details, and attachments to other work. Indicate materials and profiles of each decorative metal member, fittings, joinery, finishes, fasteners, anchorages, and accessory items.
  - .1 Provide templates for anchors and bolts specified for installation under other Sections.
- 1.6.4 Samples: Submit samples for each exposed finish and for each colour and texture required. Submit samples as follows:
  - .1 Minimum 300 mm long sections of linear shapes.

**1.7     Quality Assurance**

- 1.7.1 Fabricator Qualifications: A firm experienced in producing decorative metal similar to that indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.
- 1.7.2 Welding:
  - .1 Provide welding in accordance with CSA W59-M performed by a fabricator and mechanics fully approved by the Canadian Welding Bureau as specified herein.
  - .2 Ensure fabricator is fully certified by Canadian Welding Bureau for fusion welding of steel structures to CSA W47.1 and for fusion welding of aluminum to CSA W47.2.
  - .3 Conform to AWS D1.6, "Structural Welding Code--Stainless Steel."
- 1.7.3 Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
  - .1 Approved mockups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

**1.8     Delivery, Storage, And Handling**

- 1.8.1 Store decorative metal inside a well-ventilated area, away from uncured concrete and masonry, and protected from weather, moisture, soiling, abrasion, extreme temperatures, and humidity.
- 1.8.2 Deliver and store cast-metal products in wooden crates surrounded by sufficient packing material to ensure that products will not be cracked or otherwise damaged.

---

**1.9     Project Conditions**

1.9.1 Field Measurements: Verify actual locations of walls and other construction contiguous with decorative metal by field measurements before fabrication and indicate measurements on Shop Drawings.

**1.10    Warranty**

1.10.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 .     PRODUCTS**

**2.1     Description**

2.1.1 Supply architectural metals from highest architectural quality and various forms which are straight and true. Ensure there are no scratches, scars or creases, buckles, ripples or chatter marks and free from surface blemishes where exposed to view in finished unit. Provide finished surfaces suitable for polishing where required.

2.1.2 Exposed-to-view surfaces exhibiting pitting, seam marks, roller marks, oil-canning, stains, discolorations, or other imperfections on finished units are not acceptable.

**2.2     Materials**

2.2.1 Stainless Steel

- .1 Tubing: ASTM A554, Grade MT 304
- .2 Pipe: ASTM A312/A 312M, Grade TP 304
- .3 Sheet, Strip, Plate, and Flat Bar: ASTM A666, Type 304
- .4 Bars and Shapes: ASTM A276, Type 304
- .5 Unless otherwise indicated, stainless steel thickness to be minimum 1.2 mm (18 ga)
- .6 Welding Materials: CSA W59-M.

**2.3     Decorative Mechanical Grilles**

2.3.1 Fabricate decorative grilles from perforated stainless-steel sheet or plate of thickness, size, and pattern indicated on Drawings and Schedules.

2.3.2 Form perforations by punching, cutting, or drilling to produce openings of sizes and shapes indicated on Drawings and Schedules. Roll, press, and grind perforated metal to flatten and to remove burrs and deformations.

- 2.3.3 Drill and countersink grilles for mounting screws at 50 mm (2 inches) from corners and at 250 mm (10 inches) or less o.c.
- 2.3.4 Miter frame members at corners and connect with concealed splice plates welded to back of frames.
- 2.3.5 Drill and countersink frames for mounting screws at 100 mm (4 inches) from corners and at 400 mm (16 inches) or less o.c.
- 2.3.6 Finish: brushed stainless steel.

## **2.4     Auxiliary Materials**

- 2.4.1 Plywood Backing: Premium Grade, Douglas Fir plywood - CSA O121, or Western Softwood Plywood - CSA O151 or Poplar plywood - CSA O153-M in accordance with requirements of Section 06 10 00.
- 2.4.2 Fastener Materials: Unless otherwise indicated, Use fasteners of same basic metal as fastened metal, unless otherwise indicated. Do not use metals that are corrosive or incompatible with materials joined.
  - .1 Provide concealed fasteners for interconnecting components and for attaching them to other work, unless otherwise indicated or unless exposed fasteners are unavoidable.
- 2.4.3 Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187.
- 2.4.4 Adhesive: Manufacturer's recommended waterproof type suitable for adhering stainless steel surfaces to wood substrates.
  - .1 Double Sided Foam Tape: "3M 4004", 3M Double Sided Urethane Tape, 25 mm (1"), suitable for indoor use, capable to sustain 220 deg F, not affected by solvent and UV exposure, urethane foam with acrylic adhesive.
- 2.4.5 Sealants: Conforming to Section 07 92 00 and as recommended by manufacturer for applications indicated

## **2.5     Fabrication**

- 2.5.1 Assemble items in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- 2.5.2 Form decorative metal to required shapes and sizes, true to line and level with true curves and accurate angles and surfaces. Finish exposed surfaces to smooth, sharp, well-defined lines and arris.

- 2.5.3 Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- 2.5.4 Form simple and compound curves in bars and extruded shapes by bending members in jigs to produce uniform curvature for each configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces.
- 2.5.5 Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1 mm (1/32 inch), unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- 2.5.6 Mill joints to a tight, hairline fit. Cope or miter corner joints. Fabricate connections that will be exposed to weather in a manner to exclude water.
- 2.5.7 Provide weep holes where water may accumulate.
- 2.5.8 Provide necessary rebates, lugs, and brackets to assemble units and to attach to other work. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items, unless otherwise indicated.
- 2.5.9 Comply with CSA requirements for recommended practices in shop welding and brazing. Weld and braze behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded and brazed joints of flux, and dress exposed and contact surfaces.
- 2.5.10 Provide castings that are sound and free of warp, cracks, blowholes, or other defects that impair strength or appearance. Grind, wire brush, sandblast, and buff castings to remove seams, gate marks, casting flash, and other casting marks.

## **2.6 Finishes**

- 2.6.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- 2.6.2 Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- 2.6.3 Stainless-Steel Finishes
  - .1 Remove tool and die marks and stretch lines or blend into finish.
  - .2 Unless otherwise indicated, grind and polish surfaces to produce uniform finish indicated, free of cross scratches.

- .3 Run grain of directionally textured finishes with long dimension of each piece.
- .4 When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.
- .5 Grain direction shall be in one direction, generally, as indicated on Drawings or directed by Consultant.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of decorative metal.
  - .1 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Installation**

- 3.2.1 Provide anchorage devices and fasteners where needed to secure decorative metal to in-place construction.
- 3.2.2 Perform cutting, drilling, and fitting required to install decorative metal. Set products accurately in location, alignment, and elevation; measured from established lines and levels. Provide temporary bracing or anchors in formwork for items to be built into concrete, masonry, or similar construction.
- 3.2.3 Fit exposed connections accurately together to form tight, hairline joints or, where indicated, with uniform reveals and spaces for sealants and joint fillers. Where cutting, welding, and grinding are required for proper shop fitting and jointing of decorative metal, restore finishes to eliminate evidence of such corrective work.
- 3.2.4 Do not cut or abrade finishes that cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing, or provide new units as required.
- 3.2.5 Install concealed gaskets, joint fillers, insulation, and flashings as work progresses.
- 3.2.6 Restore protective coverings that have been damaged during shipment or installation. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at same location.
- 3.2.7 Field Welding: Comply with applicable CSA and AWS specification for procedures of manual shielded metal arc welding, for

appearance and quality of welds, and for methods used in correcting welding work. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Grind exposed welded joints smooth and restore finish to match finish of adjacent surfaces.

- 3.2.8 Corrosion Protection: Coat concealed surfaces of aluminum that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

### **3.3     Cleaning**

- 3.3.1 Unless otherwise indicated, clean metals by washing thoroughly with clean water and soap, rinsing with clean water, and drying with soft cloths.
- 3.3.2 Clean copper alloys according to metal finisher's written instructions in a manner that leaves an undamaged and uniform finish matching approved Sample.
- 3.3.3 Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material.
- 3.3.4 Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780.

### **3.4     Protection**

- 3.4.1 Protect finishes of decorative metal from damage during construction period with temporary protective coverings approved by decorative metal fabricator. Remove protective covering at time of Substantial Performance of the Work.
- 3.4.2 Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

**END OF SECTION**

---

**1. GENERAL**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

**1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the metal stairs work specified herein. This includes, but is not necessarily limited, to:
  - .1 Steel stairs with concrete-filled pans and non-slip treads.
  - .2 Industrial stairs with steel treads.
  - .3 Steel pipe and tube guards and handrails for metal stairs.
  - .4 Steel tube handrails for walls near metal stairs.
  - .5 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

**1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

**1.4 Coordination**

- 1.4.1 Installation of anchorages for metal stairs: Supply setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

---

**1.5     Preinstallation Meetings**

- 1.5.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.5.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.6     Submittals**

- 1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.6.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for metal stairs work specified in this Section.
- 1.6.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Show field-measured dimensions on Shop Drawings.
  - .3 In addition to minimum requirements indicate following:
    - .1 Large scale views of members, materials, connections, attachments, reinforcing, anchorages, and exposed fastening locations.
    - .2 Jointing details.
    - .3 Setting, sealing, securing, and anchoring techniques.

**.4 Field connection methods.**

**1.6.4 Delegated Design Submittals:**

- .1 Engineering design completion of metal stairs work is delegated to Contractor based on structural design criteria indicated in Contract Documents.**
- .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.**
- .3 Submit copy of structural calculations upon request by Consultant.**

**1.6.5 Embodied Carbon / Environmental Product Declarations (EPDs):** When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:

- .1 EPD Scope:** Must cover Cradle-to-Gate (A1 to A3) as a minimum.
- .2 EPD Impact Categories:** Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
- .3 Product Options:** Give preference to Products with compliant documentation when choice is at Contractor's option.

**1.6.6 Material Ingredient Disclosure:** When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:

- .1 Standard:** Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
- .2 Product Options:** Give preference to Products with compliant documentation when choice is at Contractor's option.

**1.6.7 Samples:** Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.

- .1 As a minimum submit samples of abrasive nosings to be used in Project.**

**1.6.8 Mill Certificates:** Submit mill certificates or data from a qualified independent testing agency with calibrated test equipment indicating steel complies with requirements, including base-metal thickness, yield strength, tensile strength, total elongation, chemical requirements, ductility, and metallic-coating thickness.

**1.6.9 Welding Certificate:** Submit certification for welding firms and welders to verify compliance with welding qualifications specified in this section.

---

**1.7     Closeout Submittals**

- 1.7.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.7.2 Operating and Maintenance Data: Submit care and maintenance instructions for metal stairs to be included in building operation and maintenance manual.

**1.8     Quality Assurance**

- 1.8.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.8.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.8.3 Welding Qualifications: Qualify procedures and personnel in accordance with the following:
  - .1 Steel: to CSA W47.1 and CSA W59
  - .2 Aluminum: to CSA W47.2 and CSA W59.2
  - .3 Stainless Steel: to CSA W47.1 (Annex K) and CSA W59.
- 1.8.4 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
  - .1 Professional Engineer's Responsibility:
    - .1 production and review of Shop Drawings,
    - .2 design and certification of metal stairs, including attachments for building construction, in accordance with applicable codes and regulations,
    - .3 stamping and signing of each Shop Drawing and associated calculations
- 1.8.5 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.8.6 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.

- .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.9 Delivery, Storage And Handling**

- 1.9.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.9.2 Deliver, store and handle metal stairs materials in accordance with manufacturer's written instructions.
- 1.9.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.9.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.9.5 Replace defective or damaged materials with new.

**1.10 Warranty**

- 1.10.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 . PRODUCTS**

**2.1 Regulatory Requirements**

- 2.1.1 Accessibility: Ensure the work of this Section complies with barrier-free requirements of the OBC, CAN/CSA-B651 and requirements of authorities having jurisdiction.

**2.2 Performance / Design Criteria**

- 2.2.1 Professional Engineering Design and Certification: Design metal stairs, including comprehensive engineering analysis by a Professional Engineer licensed to practice in the Province of Ontario, in accordance with requirements of Ontario Building Code, and using performance requirements and design criteria indicated on Drawings and Schedules in this Section.
- 2.2.2 Structural Performance of Stairs: Provide metal stairs capable of withstanding the effects of gravity loads and the following loads and stresses in accordance with OBC requirements (4.1.5. Live Loads Due to Use and Occupancy) within limits and under conditions indicated.

- 
- 2.2.3 Stair Framing: Capable of withstanding stresses resulting from railing loads in addition to loads specified above.
- 2.2.4 Limit deflection of treads, platforms, and framing members to L/360 or 6.4 mm (1/4 inch), whichever is less. Where stairs are intended to support tile, stone or other brittle materials, reduce deflection to L/720.
- 2.2.5 Structural Performance of Guards and Handrails: Guards and railings and guards shall withstand the effects of gravity loads according to the minimum requirements of the Ontario Building Code, CSA A500 and the following loads and stresses within limits and under conditions indicated:
- .1 Comply with requirements specified in OBC Clause 4.1.5.14. Loads on Guards and Handrails.
- 2.2.6 NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual," for class of stair designated, unless more stringent requirements are indicated on Drawings and Schedules.
- .1 Preassembled Stairs – Exits and Similar Locations: Commercial class.
- .2 Industrial Stairs - Service Spaces, Penthouses etc.: Industrial class.
- .3 Feature Stairs (Stair C): Architectural class.
- 2.2.7 At exposed connections, finish exposed welds of stairs, railings and guards and guards to comply with NOMMA's "Voluntary Joint Finish Standards" as follows:
- .1 Preassembled Stairs – Exits and Similar Locations: Type 2 welds; completely sanded joint, some undercutting and pinholes okay
- .2 Industrial Stairs - Service Spaces, Penthouses etc.: Type 3 welds; partially dressed weld with spatter removed.
- .3 Feature Stairs (Stair C): Architectural class; Type 1 welds: no evidence of a welded joint
- 2.2.8 Material Finish: Provide materials with smooth, flat surfaces unless otherwise indicated on Drawings and Schedules. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.
- 2.2.9 Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.
- 2.2.10 Exterior Elements: fabricate and install to prevent buckling, opening up of joints and overstressing of welds and fasteners under the following temperature conditions:

- .1 Temperature Change: ambient temperature cycling of - 30 deg C (-22 deg F) to 82 deg C (180 deg F) over a 12 hour period.

## **2.3 Metals**

- 2.3.1 Steel Plates, Shapes, and Bars: ASTM A 36/A 36M or equivalent to CSA G40.20/G40.21.
- 2.3.2 Steel Tubing: ASTM A 500 (cold formed) or ASTM A 513.
- 2.3.3 Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from plate complying with ASTM A 36/A 36M or equivalent to CSA G40.20/G40.21 or ASTM A 283/A 283M, Grade C or D.
- 2.3.4 Uncoated, Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, structural steel, Grade 170 (Grade 25), unless another grade is required by design loads; exposed.
- 2.3.5 Uncoated, Hot-Rolled Steel Sheet: ASTM A 1011/A 1011M, structural steel, Grade 205 (Grade 30), unless another grade is required by design loads.
- 2.3.6 Galvanized-Steel Sheet: ASTM A 653/A 653M, Z275 (G90) coating, structural steel, Grade 230 (Grade 33), unless another grade is required by design loads.
- 2.3.7 Aluminum Extrusions: ASTM B 221M (ASTM B 221), Alloy 6063-T6.
- 2.3.8 Aluminum Castings: ASTM B 26/B 26M, Alloy 443.0-F.

## **2.4 Prefilled Concrete Treads**

- 2.4.1 Concrete Materials and Properties: Comply with requirements in Section 03 30 00 "Cast-in-Place Concrete" for normal-weight, air-entrained, ready-mix concrete with minimum 28-day compressive strength of 20 MPa (3000 psi) and maximum aggregate size of 13 mm (1/2 inch) unless otherwise indicated.
- 2.4.2 Nonslip-Aggregate Concrete Finish: Factory-packaged abrasive aggregate made from fused, aluminum-oxide grits or crushed emery; rustproof and nonglazing; unaffected by freezing, moisture, or cleaning materials.
- .1 Plain Steel Welded-Wire Reinforcement: ASTM A1064/A1064M, galvanized steel, 152 by 152 mm (6 by 6 inches), W1.4 by W1.4, unless otherwise indicated on Drawings.
- 2.4.3 Reinforcement Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening welded-wire reinforcement in place.

- .1 Manufacture bar supports from steel wire, plastic, or precast concrete according to CRSI's "Manual of Standard Practice," of greater compressive strength than concrete.
- 2.4.4 For galvanized reinforcement, use galvanized wire or dielectric-polymer-coated wire bar supports.

## **2.5      Fabrication**

- 2.5.1 Provide complete stair assemblies, including metal framing, hangers, struts, railings and guards, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure.
  - .1 Join components by welding unless otherwise indicated on Drawings and Schedules.
  - .2 Use connections that maintain structural value of joined pieces.
  - .3 Fabricate treads and platforms of exterior stairs so finished walking surfaces slope to drain.
- 2.5.2 Preassembled Stairs: Assemble stairs in shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.
- 2.5.3 Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1 mm (1/32 inch) unless otherwise indicated on Drawings and Schedules. Remove sharp or rough areas on exposed surfaces.
- 2.5.4 Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- 2.5.5 Form exposed work with accurate angles and surfaces and straight edges.
- 2.5.6 Weld connections to comply with the following:
  - .1 Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
  - .2 Obtain fusion without undercut or overlap.
  - .3 Remove welding flux immediately.
  - .4 Weld exposed corners and seams continuously unless otherwise indicated on Drawings and Schedules.
- 2.5.7 Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated on Drawings and Schedules. Locate joints where least conspicuous.
- 2.5.8 Fabricate joints that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

---

**2.6     Fasteners**

- 2.6.1 General: Provide zinc-plated fasteners with coating complying with ASTM B 633 or ASTM F 1941M (ASTM F 1941), Class Fe/Zn 12 for exterior use, and Class Fe/Zn 5 where built into exterior walls. Select fasteners for type, grade, and class required.
- 2.6.2 Bolts and Nuts: Regular hexagon-head bolts, ASTM F 568M, Property Class 4.6 (ASTM A 307, Grade A); with hex nuts, ASTM A 563M (ASTM A 563); and, where indicated on Drawings and Schedules, flat washers.
- 2.6.3 Anchor Bolts: ASTM F 1554, Grade 36, of dimensions indicated on Drawings and Schedules; with nuts, ASTM A 563M (ASTM A 563); and, where indicated on Drawings and Schedules, flat washers.
  - .1 Provide mechanically deposited or hot-dip, zinc-coated anchor bolts for exterior stairs.

**2.7     Steel-Pan Stairs**

- 2.7.1 Fabricate stringers of steel channels, MC shapes, in sizes as required to support loadings. Provide closures for exposed ends of stringers where exposed.
- 2.7.2 Construct platforms of steel plate and miscellaneous framing members as needed to comply with performance requirements and to support loadings.
- 2.7.3 Weld stringers to headers; weld framing members to stringers and headers.
- 2.7.4 Form risers, subtread pans, and subplatforms to configurations shown from steel sheet of thickness needed to comply with performance requirements but not less than 3 mm (1/8 inch) thick. Weld to stringers.
- 2.7.5 Form landings from minimum 3 mm (1/8 inch) thick steel plate, reinforced by L-shaped members spaced at minimum 400 mm (16 inches) on centre.
- 2.7.6 Directly weld metal pans to stringers; locate welds on top of subtreads where they will be concealed by concrete fill. Do not weld risers to stringers.
- 2.7.7 Provide clip angles for fastening of furring channels, where applied finish indicated for underside of stairs and landings.
- 2.7.8 Extend stringers around mid landings to form steel base.
- 2.7.9 Shape metal pans to include nosing integral with riser.

**2.8     Metal Floor Plate Stairs**

- 2.8.1 Form treads and platforms to configurations shown from abrasive-surface floor plate of thickness needed to comply with performance

requirements indicated in this Section, but not less than 6 mm (1/4 inch).

- .1 Form treads with integral nosing and back edge stiffener. Form risers from steel sheet not less than 3 mm (1/8 inch) thick, welded to tread nosings and stiffeners and to platforms.
- .2 Form landings from minimum 6 mm (1/4 inch) thick steel plate, reinforced by L-shaped members spaced at minimum 400 mm (16 inches) on centre.
- .3 Weld steel supporting brackets to stringers and weld treads to brackets.
- .4 Fabricate platforms with integral nosings matching treads and weld to platform framing.

2.8.2 Metal Bar-Grating Stairs: form treads and platforms to configurations shown from metal bar grating; fabricate to comply with NAAMM MBG 531, "Metal Bar Grating Manual."

- .1 Fabricate treads and platforms from welded steel grating with 25-by-3-mm (1-by-1/8-inch) bearing bars at 11 mm (7/16 inch) o.c. and crossbars at 100 mm (4 inches) o.c.
- .2 Fabricate treads and platforms from welded steel grating with openings in gratings no more than 12 mm (1/2 inch) in least dimension.
- .3 Surface: Serrated.
- .4 Finish: Galvanized.
- .5 Fabricate grating treads with rolled-steel floor plate nosing and with steel angle or steel plate carrier at each end for stringer connections. Secure treads to stringers with bolts.
- .6 Fabricate grating platforms with nosing matching that on grating treads. Provide toeplates at open-sided edges of grating platforms. Weld grating to platform framing.]

## **2.9 Railings And Guards (GDRL2)**

2.9.1 Steel Tube Railings and guards and Guards: Fabricate railings and guards to comply with requirements indicated on Drawings and Schedules for design, dimensions, details, finish, and member sizes, including wall thickness of tube, post spacings, and anchorage, but not less than that needed to withstand loads indicated in this Section and in Ontario Building Code.

- .1 Material: 10 mm (3/8 inch) cold rolled sheet steel, stretcher levelled and fully pickled per ASTM A1008/A1008M-11, Grade CS Type A exposed.
  - .1 Finish: Matte oiled steel
- .2 Close exposed ends of railing members with prefabricated end fittings.

- .3 Provide wall returns at ends of wall-mounted handrails unless otherwise indicated on Drawings and Schedules. Close ends of returns unless clearance between end of rail and wall is 6 mm (1/4 inch) or less.
- 2.9.2 Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnecting components and for attaching to other work. Supply inserts and other anchorage devices for connecting to concrete or masonry work.
  - .1 Connect posts to stair framing by direct welding unless otherwise indicated on Drawings and Schedules.
  - .2 For galvanized railings and guards, provide galvanized fittings, brackets, fasteners, sleeves, and other ferrous-metal components.
  - .3 For nongalvanized railings and guards, provide nongalvanized ferrous-metal fittings, brackets, fasteners, and sleeves, except galvanize anchors embedded in exterior masonry and concrete construction.
- 2.9.3 Fillers: Provide fillers made from steel plate, or other suitably crush-resistant material, where needed to transfer wall bracket loads through wall finishes to structural supports. Size fillers to suit wall finish thicknesses and to produce adequate bearing area to prevent bracket rotation and overstressing of substrate.

## **2.10 Stair Nosings**

- 2.10.1 Non-slip inserts: Aluminum units with abrasive filler consisting of aluminum oxide, silicon carbide, or a combination of both, in an epoxy-resin binder. Fabricate units in lengths necessary to accurately fit openings or conditions.
  - .1 Basis-of-Design: "Supergrit 121BF" by Wooster Products Inc. or approved equivalent by one of the following:
    - .1 American Safety Tread Co., Inc.
    - .2 Amstep Products.
    - .3 Balco Inc.
  - .2 Provide anchors for embedding units in concrete as standard with manufacturer.
  - .3 Colour: As selected by Consultant from manufacturer's full range.
  - .4 Apply di-electric separator in the form of bituminous paint or clear lacquer to concealed surfaces of units set into concrete.

---

**2.11 Auxiliary Materials**

- 2.11.1 Welding Rods and Bare Electrodes: Select according to CSA specifications for metal alloy welded.
- 2.11.2 Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.
- 2.11.3 Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.
- 2.11.4 Galvanizing Repair Paint: High-zinc-dust-content paint complying with SSPC-Paint 20 and compatible with paints specified to be used over it.

**2.12 Finishes**

- 2.12.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- 2.12.2 Finish metal stairs after assembly.
- 2.12.3 Galvanizing: Hot-dip galvanize items exterior components to comply with ASTM A 153/A 153M for steel and iron hardware and with ASTM A 123/A 123M or equivalent to CAN/CSA-G164 for other steel and iron products.
  - .1 Do not quench or apply post galvanizing treatments that might interfere with paint adhesion.
  - .2 Fill vent and drain holes that will be exposed in finished Work, unless indicated on Drawings and Schedules to remain as weep holes, by plugging with zinc solder and filing off smooth.
- 2.12.4 Shop Primer:
  - .1 Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
  - .2 Universal Shop Primer (interior components): Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with MPI#79 and compatible with topcoat.
    - .1 Use primer containing pigments that make it easily distinguishable from zinc-rich primer.
  - .3 Epoxy Zinc-Rich Primer (exterior components, not otherwise galvanized): Complying with MPI#20 and compatible with topcoat.
    - .1 Acceptable Products: "Zinc Clad IV" by Sherwin Williams or approved equivalent.

- 2.12.5 Apply shop primer to uncoated surfaces of metal stair components, except those with galvanized finishes and those to be embedded in concrete or masonry. Comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.
- .1 Stripe paint corners, crevices, bolts, welds, and sharp edges.
  - .2 Apply one coat of shop primer except interior surfaces of pans.
  - .3 Apply two coats of primer of different colours to parts inaccessible after final assembly.

### **3 .     EXECUTION**

#### **3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

#### **3.2     Installation Of Stairs**

- 3.2.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Install in accordance with NAAMM, Metal Stair Manual.
- 3.2.3 Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.
- 3.2.4 Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.
- 3.2.5 Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete unless otherwise indicated on Drawings and Schedules.
- 3.2.6 Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.
- 3.2.7 Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip

galvanized after fabrication and are for bolted or screwed field connections.

- 3.2.8 Field Welding: Comply with requirements for welding in this Section.
- 3.2.9 Place and finish concrete fill for treads and platforms to comply with Section 03 30 00, Cast-in-Place Concrete.
  - .1 Install abrasive nosings with anchors fully embedded in concrete. Center nosings on tread width.
- 3.2.10 Install plumb and true in exact locations, using welded connections wherever possible to provide rigid structure. Provide anchor bolts, bolts and plates for connecting stairs to structure.
- 3.2.11 Hand items over for casting into concrete or building into masonry to appropriate trades together with setting templates.
- 3.2.12 Do welding work in accordance with CSA W59 unless specified otherwise.
- 3.2.13 Touch up shop primer to bolts, welds, and burned or scratched surfaces at completion of erection.

### **3.3 Installing Railings And Guards**

- 3.3.1 Adjust railing systems before anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated on Drawings and Schedules or, if not indicated on Drawings and Schedules, as required by design loads. Plumb posts in each direction. Secure posts and rail ends to building construction by anchoring posts to steel by welding directly to steel supporting members.
- 3.3.2 Attach handrails to wall with wall brackets. Use type of bracket with flange tapped for concealed anchorage to threaded hanger bolt. Provide bracket with 50-mm (2-inch) clearance from inside face of handrail and finished wall surface.
- 3.3.3 Locate brackets as indicated on Drawings and Schedules or, if not indicated on Drawings and Schedules, at spacing required to support structural loads.

### **3.4 Protection**

- 3.4.1 Protect metal stairs from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.4.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.

- 3.4.3 Promptly replace metal stairs work damaged during construction that cannot be satisfactorily repaired.

**3.5 Cleaning And Waste Management**

- 3.5.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.5.2 Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
- .1 Apply by brush or spray to provide a minimum 0.05-mm (2.0-mil) dry film thickness.
- 3.5.3 Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.
- 3.5.4 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.5.5 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the glazed decorative metal guards and handrails work specified herein. This includes, but is not necessarily limited, to:
  - .1 Interior decorative glass guards and handrails.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Coordination**

- 1.4.1 Coordinate installation of anchorages for guards and handrails. Supply setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver items to Project site in time for installation.

### **1.5 Preinstallation Meetings**

- 1.5.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.

- 1.5.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.6 Submittals**

- 1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.6.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for glazed decorative metal guards and handrails work specified in this Section:
- .1 Metal guards and handrails.
  - .2 Glass products including glazing cement and accessories.
  - .3 Sealant and tools for structural glass guards and handrails.
- 1.6.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
- .1 Include plans, elevations, sections, and attachment details.
- 1.6.4 Delegated Design Submittals:
- .1 Engineering design completion of glazed decorative metal guards and handrails work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.

- .3 Submit copy of structural calculations upon request by Consultant.
- 1.6.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.7 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
  - .1 Submit assembled system samples using full-size parts, including top rail, post, handrail, and glass-infill panels. Illustrate finishing methods at intersections.
- 1.6.8 Welding Certificate: Submit certification for welding firms and welders to verify compliance with welding qualifications specified in this section.

## **1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.7.3 Welding Qualifications: Qualify procedures and personnel in accordance with the following:
  - .1 Steel: to CSA W47.1 and CSA W59

- .2 Aluminum: to CSA W47.2 and CSA W59.2
- .3 Stainless Steel: to CSA W47.1 (Annex K) and CSA W59.
- 1.7.4 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
  - .1 Professional Engineer's Responsibility:
    - .1 production and review of Shop Drawings,
    - .2 design and certification of glazed decorative metal guards and handrails, including attachments for building construction, in accordance with applicable codes and regulations,
    - .3 stamping and signing of each Shop Drawing and associated calculations
- 1.7.5 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.7.6 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

## **1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle glazed decorative metal guards and handrails materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

**1.9     Field Conditions**

1.9.1 Field Measurements: Verify actual dimensions of construction contiguous with glazed decorative metal guards and handrails by field measurements before fabrication.

**1.10    Warranty**

1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of glazed decorative metal guards and handrails that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

.1 Warranty Period: Not less than Five years from date of Substantial Performance of The work.

**2 .     PRODUCTS**

**2.1     Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 CR Laurence
- .2 InKan Ltd.
- .3 Stella Glass Hardware
- .4 Wagner Companies

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2     Regulatory Requirements**

2.2.1 Accessibility: Ensure the work of this Section complies with barrier-free requirements of the OBC, CAN/CSA-B651 and requirements of authorities having jurisdiction.

**2.3     Performance / Design Criteria**

2.3.1 Employ a qualified professional engineer, as specified in this Section, to design elements of this section requiring structural performance based on the following:

- .1 Steel Elements: to CSA S16, unless indicated otherwise.
- .2 Cold-Formed Steel: to CSA S136.
- .3 Aluminum: to CSA S157/S157.1
- .4 Stainless Steel: to ANSI/AISC 370.

- 
- .5 Glass: to CAN/CGSB-12.20-M or ASTM E1300, subject to limitations indicated in Ontario Building Code.
- 2.3.2 Intended aesthetics: Drawings and Specifications provide requirements regarding system's aesthetic and performance criteria. Unless indicated otherwise, preserve intended aesthetic effects. For any proposed deviations, provide detailed explanation to Consultant for evaluation. Acceptance or rejection of proposed deviations rests solely with Consultant.
- 2.3.3 Support each section of top rail and handrail by a minimum of three glass panels or by other means so guards and railings will remain in place if any one glass panel fails. Support top rail and handrail ends such that guards and railings remains in place if end glass panel fails.
- 2.3.4 Structural Performance of Guards and Handrails: Ensure guards and railings withstand gravity load and other load combination effects specified in the Ontario Building Code, CSA A500, within conditions listed below:
- .1 Loads: comply with OBC Clause 4.1.5.14 Loads on Guards and Handrails.
- .2 Glass selection: comply with OBC Supplementary Standard SB-13.
- .3 Glass thickness: Glass thicknesses indicated in this section are minimums. Analyze Project loads and in-service conditions to determine final glass thicknesses to use to maintain or exceed performance criteria specified in this Section.
- 2.3.5 Material Compatibility:
- .1 Ensure solvents and elements in the glazing system do not affect bond properties of sealants and similar elements.
- .2 Use sealant materials compatible with other materials in glazing systems. If required, test for compatibility using methods such as ASTM C510, ASTM C794, ASTM C1087, or similar standards.
- .3 Use materials resistant to long-term UV light exposure.
- .4 Corrosion Control: Insulate metals and materials from direct contact with incompatible materials to prevent galvanic action and corrosion.
- 2.3.6 Material Finish: Provide materials with smooth, flat surfaces unless otherwise indicated on Drawings and Schedules. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

---

**2.4     General Requirements For Metals**

- 2.4.1 Metal Surfaces: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.
- 2.4.2 Brackets, Flanges, and Anchors: Same metal and finish as supported rails unless otherwise indicated.
- 2.4.3 Aluminum: Provide alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with strength and durability properties for each aluminum form required not less than that of alloy and temper designated below.
  - .1 Extruded Bars and Shapes, Including Extruded Tubing: ASTM B221M (ASTM B221), Alloy 6063-T5/T52.
  - .2 Drawn Seamless Tubing: ASTM B210M (ASTM B210), Alloy 6063-T832.
  - .3 Plate and Sheet: ASTM B209M (ASTM B209), Alloy 6061-T6.
  - .4 Die and Hand Forgings: ASTM B247M (ASTM B247), Alloy 6061-T6.
  - .5 Castings: ASTM B26/B26M, Alloy A356.0-T6.

**2.5     General Requirements For Glass And Glazing Products**

- 2.5.1 Glass Material Tag: This item is noted as "GL12" on Drawings and Schedules. Unless noted otherwise, provide low-iron glazing.
- 2.5.2 Glass used in glazed decorative metal guards and railings must comply with requirements of Ontario Building Code, "Supplementary SB-13 Glass in Guards" in accordance with requirements specified below. Final selection of glass in guards is at Contractor's option based on constraints specified in OBC SB-13, Table 2.1.1.1.
- 2.5.3 Edge Finishes:
  - .1 Exposed Glass Edges: Machine ground and polished edges.
  - .2 Butting Glass Edges: Flat ground edges.
- 2.5.4 Glazing Publications: Comply with written instructions of glass product manufacturers and organizations below unless more stringent requirements are indicated. See these publications for glazing terms not otherwise defined in this Section or in referenced standards.
  - .1 NGA/GANA Publications: "GANA Laminated Glazing Reference Manual" and "GANA Glazing Manual."
- 2.5.5 Glazing Cement and Accessories for Structural Glazing: Glazing cement, setting blocks, shims, and related accessories as recommended or supplied by manufacturer for installing structural glazing in metal subrails.

- .1 Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound.
  - .1 Water-Resistant Product: At exterior locations provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.
  - .2 Glazing gaskets for dry-glazing in lieu of glazing cement are acceptable provided they meet requirements of this Specification.
- 2.5.6 Sealant and Accessories for Glass Guards and Railings: Sealant, gaskets, setting blocks, shims, and related accessories as recommended or supplied by railing manufacturer for installing structural glazing in metal base channels.
- 2.5.7 Glazing Gaskets for Glass-Infill Panels: Glazing gaskets and related accessories as recommended or supplied by guards and railing manufacturer for installing glass-infill panels in guards and railings.

## **2.6 Finishes**

- 2.6.1 Metal Surfaces: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.
- 2.6.2 Brackets, Flanges, and Anchors: Same metal and finish as supported rails unless otherwise indicated.

## **2.7 Glazed Guard And Railings System Components (GDRL1)**

- 2.7.1 System configuration: Shoe-Supported System.
- 2.7.2 Material: Aluminum
- .1 Finish: Clear anodized
- 2.7.3 Rails, Channels, Posts and Hardware: Manufacturer's standard types for mounting as noted on reviewed Shop Drawings.
- 2.7.4 Handrail Brackets: To be selected by Consultant from manufacturer's full range.
- 2.7.5 Basis-of-Design:
- .1 Shoe: "CRL 8B" by C.R. Laurence or approved equivalent.
  - .2 Top Cap: "Aluminum Square Cap Rail - GRS20M" by C.R. Laurence or approved equivalent.

---

**2.8     Fasteners**

- 2.8.1 Fastener Materials: Unless otherwise indicated, provide the following:
- .1 Aluminum Components: Type 304 (for interior locations) or Type 316 (for exterior locations) stainless steel fasteners.
  - .2 Stainless Steel Components: Type 304 (for interior locations) or Type 316 (for exterior locations) stainless steel fasteners.
  - .3 Dissimilar Metals: Type 304 (for interior locations) or Type 316 (for exterior locations) stainless steel fasteners.
- 2.8.2 Fasteners for Anchoring to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring guards and railings to other types of construction indicated and capable of withstanding design loads.
- 2.8.3 Provide concealed fasteners for interconnecting railing components and for attaching railings to other work unless otherwise indicated.
- .1 Provide tamper-resistant flat-head machine screws for exposed fasteners unless otherwise indicated.
- 2.8.4 Post-Installed Anchors: Fastener systems with working capacity greater than or equal to design load, in accordance with an evaluation report acceptable to authorities having jurisdiction.

**2.9     Fabrication Of Metal Railings**

- 2.9.1 Fabricate railings to comply with requirements indicated for design on reviewed Shop Drawings, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.
- 2.9.2 Assemble railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
- 2.9.3 Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1 mm (1/32 inch) unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
- 2.9.4 Form work true to line and level with accurate angles and surfaces.
- 2.9.5 Fabricate connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate. Locate weep holes in inconspicuous locations.
- 2.9.6 Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.

- 2.9.7 Mechanical Connections: Connect members with concealed mechanical fasteners and fittings. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.
- .1 Fabricate splice joints for field connection using an epoxy structural adhesive if this is manufacturer's standard splicing method.
- 2.9.8 Form changes in direction as follows: As detailed on Drawings.
- 2.9.9 Bend members in jigs to produce uniform curvature for each configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.
- 2.9.10 Close exposed ends of hollow railing members with prefabricated end fittings.
- 2.9.11 Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, handrail brackets, miscellaneous fittings, and anchors to interconnect railing members to other work where indicated.
- .1 At brackets and fittings fastened to plaster or gypsum board partitions, provide crush-resistant fillers, or other means to transfer loads through wall finishes to structural supports and to prevent bracket or fitting rotation and crushing of substrate.
- 2.9.12 Provide inserts and other anchorage devices for connecting railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.
- 2.9.13 Make provisions in rails, panels and covers to allow for expansion and contraction, deflection and other movements of components and supporting structure.
- 2.9.14 Do not mark surface finishes with welds in back of exposed surfaces. Do not deform the exposed metal and finish in any way by welding. Remove all burrs.
- 2.9.15 Insulate contact surfaces to prevent electrolysis due to metal to metal contact or contact between metal and masonry or concrete.

**2.10 Fabrication Of Glass Panels**

- 2.10.1 Fabricate glass to sizes and shapes required; provide for proper edge clearance and bite on glazing panels.
- 2.10.2 Edge Finish: Grind smooth and flat polish exposed edges of glass, including those at open joints, to produce smooth, square edges with glass edge finishes.

---

**2.11 Metal Finish Requirements, General**

- 2.11.1 Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.
- 2.11.2 Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of Samples reviewed by Consultant. Variations in appearance of other components are acceptable if they are within the range of Samples reviewed by Consultant and are assembled or installed to minimize contrast.
- 2.11.3 Provide exposed fasteners with finish matching appearance, including colour and texture, of guards and handrails.

**3 . EXECUTION**

**3.1 Examination**

- 3.1.1 Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Examine plaster and gypsum board assemblies, where reinforced to receive anchors, to verify that locations of concealed reinforcements have been clearly marked for Installer. Locate reinforcements and mark locations if not already done.

**3.2 Installation, General**

- 3.2.1 Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Fit exposed connections together to form tight, hairline joints.
- 3.2.3 Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.
  - .1 Do not weld, cut, or abrade surfaces of railing components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
  - .2 Set posts plumb within a tolerance of 2 mm in 1 m (1/16 inch in 3 feet).

- .3 Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 5 mm in 3 m (1/4 inch in 12 feet).
- 3.2.4 Corrosion Protection: Coat concealed surfaces of aluminum that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.
- 3.2.5 Adjust railings before anchoring to ensure matching alignment at abutting joints.
- 3.2.6 Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

### **3.3 Installing Glass Panels**

- 3.3.1 Glass-Supported Railings: Install assembly to comply with railing manufacturer's written instructions.
  - .1 Attach base channel to building structure, then insert glass into base channel and bond with glazing cement unless glass was bonded to base and top rail channels in factory.
    - .1 Support glass panels in base channel at quarter points with channel-shaped setting blocks that also act as shims to maintain uniform space for glazing cement. Fill remaining space in base channel with glazing cement for uniform support of glass.
  - .2 Adjust spacing of glass panels so gaps between panels are equal before securing in position.
  - .3 Erect glass railings under direct supervision of manufacturer's authorized technical personnel.

### **3.4 Installing Handrails**

- 3.4.1 Apply handrails complying with manufacturer's written instructions for cutting, mounting, forming, welding, cleaning, applying end caps, and finishing.
- 3.4.2 Minimize number of joints in handrails by installing in lengths as long as possible. Allow for shortening of handrails caused by welding and splicing process; butt ends together to produce hairline joint.

### **3.5 Cleaning**

- 3.5.1 Clean aluminum and stainless steel by washing thoroughly with clean water and soap, rinsing with clean water, and wiping dry.
- 3.5.2 Clean and polish glass as recommended in writing by manufacturer. Wash both exposed surfaces in each area of Project not more than

---

four days before date scheduled for inspections that establish date of Substantial Performance of the Work.

**3.6      Protection**

- 3.6.1 Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Performance of the Work.
- 3.6.2 Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

**3.7      Cleaning And Waste Management**

- 3.7.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.7.2 Clean aluminum and stainless steel by washing thoroughly with water and soap, rinsing with clean water, and wiping dry.
- 3.7.3 Clean and polish glass as recommended in writing by manufacturer. Wash both exposed surfaces in each area of Project not more than four days before date scheduled for inspections that establish date of Substantial Performance of the Work.
- 3.7.4 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.7.5 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the rough carpentry work specified herein. This includes, but is not necessarily limited, to:
  - .1 Miscellaneous furring and blocking,
  - .2 Wood nailers, cants, curbs and fanning for roofing.
  - .3 Electrical and equipment mounting panels.
  - .4 Rough blocking in walls for support of wall-mounted items.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.

- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data:
  - .1 Where fire-retardant-treated carpentry is used, submit data for fire-retardant treatment from chemical treatment manufacturer, as well as certification from treating plant, that the treated materials meet requirements specified in this Section.
  - .2 Include data on physical properties of treated materials based on independent testing by a qualified testing agency.
- 1.5.3 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.4 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.

- .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

**1.6 Delivery, Storage And Handling**

- 1.6.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.6.2 Stack lumber flat with spacers between each bundle to provide air circulation. Provide for air circulation around stacks and under coverings.
- 1.6.3 Deliver interior wood materials that are to be exposed to view only after building is enclosed and weatherproof, wet work other than painting is dry, and HVAC system is operating and maintaining temperature and humidity at occupancy levels.

**1.7 Warranty**

- 1.7.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 . PRODUCTS**

**2.1 Regulatory Requirements**

- 2.1.1 Lumber identification: by grade stamp of an agency certified by Canadian Lumber Standards Accreditation Board conforming to the Standard Grading Rules for Canadian Lumber published by the National Lumber Grades Authority.
- 2.1.2 Plywood and wood-based composite panel construction identification: by grade mark in accordance with applicable CSA standards. Ensure plywood grading agency is certified by APA The Engineered Wood Association; <http://www.apawood.org>
- 2.1.3 Preservative Pressure-Treated and Fire-Retardant-Treated Wood and Plywood identification: by grade mark in accordance with the Canadian Wood Preservers Bureau and applicable ULC standards acceptable to authorities having jurisdiction.
- 2.1.4 Identify lumber by grade stamp of an agency certified by Canadian Lumber Standards Administration Board

**2.2 Performance / Design Criteria**

- 2.2.1 Visual Characteristics: Measure knots, checks, shakes and slope of grain in visually graded lumber in accordance with ASTM D245 with exceptions as noted under NLGA 120d.
- 2.2.2 Use chemical formulations that do not require incising, contain colorants, bleed through, or otherwise adversely affect finishes

when preservative or fire-retardant treatment is required for exposed items designated to receive a stained or natural finish.

- 2.2.3 Maximum moisture content for materials specified in this Section: 19%.
- 2.2.4 Do not use materials that are warped or do not comply with requirements specified herein.
- 2.2.5 VOC Content and Emissions:
  - .1 Composite Wood: must be ULEF or NAF type per CARB ATCM. Do not adhesives that contain urea-formaldehyde.

## **2.3 Lumber Materials**

- 2.3.1 Standard Lumber: to CSA O141, No. 2 White Pine, No. 2 Red Pine, or No. 1 Construction S-P-F, lumber with moisture content of 19% or less, kiln-dried, free from sap, shakes, splits, knots and other defects for furring, blocking, nailing strips, grounds, rough bucks, cants, backing and sleepers as applicable.
- 2.3.2 Surfacing: minimum S2S (surfaced 2 sides) in concealed locations; minimum S4S (surfaced 4 sides) in exposed locations.
- 2.3.3 Board sizes: "Standard" or better grade.
- 2.3.4 Dimension sizes: "Standard" light framing or better grade.
- 2.3.5 Consultant reserves the right to select species and appearance grades to suit design requirements.

## **2.4 Panel Materials**

- 2.4.1 Plywood: Following types are acceptable unless indicated otherwise:
  - .1 Douglas Fir Plywood (DFP): to CSA-O121, G2S, standard construction, minimum 19 mm (3/4 inch) thickness unless indicated otherwise on Drawings.
  - .2 Canadian Softwood Plywood (CSP): to CSA-O151 G2S, standard construction, minimum 19 mm (3/4 inch) thickness unless indicated otherwise on Drawings.
- 2.4.2 Exterior Locations: DFP or CSP as specified herein, exterior-grade construction, kiln-dried to a moisture content of 15% or less, minimum 19 mm (3/4 inch) thickness unless indicated otherwise on Drawings.

## **2.5 Preservative Wood Treatment**

- 2.5.1 Preservative Pressure-Treated Wood and Plywood: in accordance with CSA O80.1
  - .1 UC2: exterior wood elements unless indicated otherwise.
  - .2 UC4.1: exterior wood elements in contact with ground.

- 2.5.2 Provide chemical treatment acceptable to authorities having jurisdiction and containing no arsenic or chromium.
- 2.5.3 Application: Pressure treat following wood elements and other items indicated on Drawings to receive preservative wood treatments:
  - .1 Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, air barriers, vapour barriers, and waterproofing.
  - .2 Wood sleepers, blocking, and similar concealed members in contact with masonry or concrete.
  - .3 Wood framing and furring attached directly to the interior of below-grade exterior masonry or concrete walls.
  - .4 Wood sleepers supporting wood subflooring over concrete slabs in contact with ground or fill.
  - .5 Wood in direct contact with earth or concrete.
  - .6 At the junction of miscellaneous concrete elements and wood elements below grade.

## **2.6 Fire-Retardant-Treated Wood And Plywood**

- 2.6.1 Treatment: Provide chemical treatment acceptable to authorities having jurisdiction and containing no arsenic or chromium from one of the following manufacturers:
  - .1 Dircon; [www.dricon.com](http://www.dricon.com)
  - .2 FireFree; [www.firefree.com](http://www.firefree.com)
  - .3 Approved equivalent.
- 2.6.2 Surface Burning Characteristics: flame spread rating of 25 or less in accordance with CAN/ULC-S102.
  - .1 Do not damage or otherwise affect ULC Label.
- 2.6.3 Application: Provide fire-retardant-treatment for following wood elements and other items indicated on Drawings to receive treatment:
  - .1 Concealed blocking.
  - .2 Roof construction.
  - .3 Plywood backing panels.

## **2.7 Accessories**

- 2.7.1 Supply rough hardware to frame and fix rough carpentry including but not limited to bolts, anchors, nails, expansion shields and other fastenings required.
- 2.7.2 Wire Nails, Spikes and Staples: Conforming to CSA B111.

- 2.7.3 Exterior locations and treated lumber: Stainless steel nails, type 316. Nails that are plain-galvanized, electroplated, or made of aluminum are unacceptable.
- 2.7.4 Provide spiral thread nails except as indicated otherwise.
- 2.7.5 Bolts: ASTM A307, minimum 12 mm (½") complete with nuts and washers.
- 2.7.6 Proprietary fasteners (toggle bolts, expansion shields, screws, organic fibre plugs etc.): recommended for purpose by manufacturers.

### **3 .     EXECUTION**

#### **3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

#### **3.2     Preparation**

- 3.2.1 Treat surfaces with wood preservative or fire retardant treatments before installation.
- 3.2.2 Use dust collectors and high quality respirator masks when cutting or sanding wood panels.
- 3.2.3 Apply preservative by dipping or by brush to completely saturate and maintain wet film on surface for minimum 3-minute soak on lumber and 1-minute soak for plywood.
- 3.2.4 After cutting, drilling and fitting of fire-retardant treated or preservative-treated wood and plywood but before installation, apply 1 full coat of wood preservative to exposed surfaces, including ends of blocking, furring, nailers and rough carpentry. Retreat surfaces exposed by cutting, trimming or boring with liberal brush application of preservative or fire retardant before application.
- 3.2.5 Coordinate with other Sections providing blocking, nailing strips and trims as required for installation of The Work.

#### **3.3     Installation**

- 3.3.1 Comply with requirements indicated in OBC, Section 9.23 as supplemented by requirements specified in this Section.
- 3.3.2 Properly frame together parts of the work with members accurately cut to size, closely fitted, well spiked, and erected in a substantial manner, plumb, level, square and true to dimension.
- 3.3.3 Locate joints over bearing or supporting surfaces.

- 3.3.4 Provide running members full length wherever possible.
- 3.3.5 Design for expansion and contraction of the materials.
- 3.3.6 Frame, anchor, fasten, tie and brace members to provide necessary strength and rigidity.
- 3.3.7 Provide fasteners and rough hardware for a rigid and secure installation. In addition to mechanical fasteners, place continuous adhesive bead where appropriate in accordance with manufacturer's instructions.
- 3.3.8 Countersink bolts where necessary to provide clearance for other work.
- 3.3.9 Select exposed framing for appearance. Install lumber and panel materials so that grade-marks and other defacing marks are concealed or are removed by sanding where materials are left exposed.
- 3.3.10 Provide plywood, blocking, furring, nailers, rough carpentry, grounds and nailing strips, as required for proper installation and to support miscellaneous work indicated on Drawings to meet design requirements.

### **3.4 Plywood Backing Panels**

- 3.4.1 Install wood panels required for mechanical, electrical and communication trades for mounting of items including but not limited to control boards, panel boards, pull boxes, splitters, switches, wall-mounted switch gear, junction boxes, electrical cabinets, data control equipment, disconnect switches, fire alarm control equipment, lighting control equipment, sound/communication equipment and other similar devices.
- 3.4.2 Provide plywood backboard panels in one piece screw-fastened and securely mounted to wall surfaces by use of fire-retardant-treated wood strapping.
- 3.4.3 Ensure panel size and mounting height suit mechanical and electrical requirements and are acceptable to respective Consultants. Apply to all surfaces and edges of plywood panels 1 coat of fire-retardant wood preservative to surfaces and edges of plywood panels.

### **3.5 Roof Carpentry**

- 3.5.1 Install continuous wood nailers along roof control joints, building and roof expansion joints and around roof perimeters, curbs and roof openings at edges of insulation as shown on Drawings.
- 3.5.2 Install cut cant strips and continuous nailers on copings and curbs as detailed.
- 3.5.3 Secure using fasteners as specified herein.

- 3.5.4 Install roof walkways in coordination with roofing Section. Set sleepers and cleats on roof during roofing application and before installation of flood coat of asphalt and gravel surfacing.

**3.6     Protection**

- 3.6.1 Protect installed products and components from damage during construction.
- 3.6.2 Repair damage to adjacent materials caused by rough carpentry installation.

**3.7     Protection**

- 3.7.1 Protect rough carpentry from weather. If, despite protection, rough carpentry becomes sufficiently wet that moisture content exceeds that specified, apply borate treatment complying with requirements of authorities having jurisdiction in regards to toxicity.

**3.8     Cleaning And Waste Management**

- 3.8.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.8.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.8.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Design-Build Contract and Subcontracts, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the sheathing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Wall sheathing.
  - .2 Sheathing joint and penetration treatment.
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.

- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for sheathing work specified in this Section.
- 1.5.3 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.4 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

---

**1.6      Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for sheathing to be included in building operation and maintenance manual.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.7      Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

**1.8      Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle sheathing materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Stack panels flat with spacers beneath and between each bundle to provide air circulation. Protect sheathing from weather by covering with waterproof sheeting, securely anchored. Provide for air circulation around stacks and under coverings.

**1.9      Warranty**

- 1.9.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

---

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 CertainTeed Corporation
- .2 Georgia Pacific Gypsum Corporation
- .3 USG/CGC

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

2.2.1 Fire Rated Assemblies: For assemblies shown on Drawings that require with fire-ratings, use materials and construction methods validated through CAN/ULC-S101 testing by a testing and inspecting agency acceptable to authorities having jurisdiction.

- .1 Demonstration of compliance: Fire-rated assemblies must be either listed in ULC Certification Directories or bear cUL label "BXUV7 – Fire Resistance Ratings – CAN/ULC-S101 Certified for Canada".

### **2.3 Glass-Mat Gypsum Wall Sheathing**

2.3.1 Material Standards: ASTM C1177/1177M.

- .1 Do not use products with paper or organic facing materials.

2.3.2 Type and Thickness: Type X, 15.9 mm (5/8 inch) thick, or as indicated on Drawings.

2.3.3 Acceptable Products:

- .1 "DensGlass Sheathing" by Georgia Pacific Gypsum Corporation
- .2 "GlasRoc" by CertainTeed Corporation
- .3 "Securock" by CGC Inc.

### **2.4 Auxiliary Materials**

2.4.1 Fasteners: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.

- .1 Screws for Fastening Gypsum Sheathing to Cold-Formed Metal Framing: steel drill screws with appropriate length as recommended by sheathing manufacturer and with protective coating having salt-spray resistance exceeding 800 hours in accordance with ASTM B117.

- .2 For steel framing < 0.835 mm (0.0329 inch): Use screws complying with ASTM C1002.
- .3 For steel framing between 0.84 and 2.84 mm (0.033 and 0.112 inch) thick: Use screws complying with ASTM C954.
- 2.4.2 Sealant for Sheathing: silicone emulsion sealant as recommended by manufacturer and complying with ASTM C834, compatible with sheathing tape and sheathing.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

#### **3.2 Installation**

- 3.2.1 Compliance: Comply with ASTM C1280, GA-253 and with manufacturer's written instructions.
- 3.2.2 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.3 Material Quality: Do not use defective materials or small pieces that might compromise joint arrangements. Ensure panels do not span fewer than three support members.
- 3.2.4 Cutting: Cut panels at penetrations, edges, and other obstructions of work; fit tightly against abutting construction unless otherwise indicated on Drawings and Schedules.
- 3.2.5 Attachment: Securely attach to substrate by fastening as indicated; comply with manufacturer's instructions.
- 3.2.6 Coordination: Align wall sheathing installation with flashing and joint-sealant installation to prevent moisture penetration in wall assemblies. Do not bridge building expansion joints; match sheathing edges to structural support spaces. Coordinate sheathing installation with installation of materials installed over sheathing so sheathing is not exposed to precipitation or left exposed at end of the workday when rain is forecast.
- 3.2.7 Fastener Application: Ensure fastener heads sit tight against sheathing face without cutting into sheathing.

- 3.2.8 Sealant: Seal penetrations in sheathing in accordance with manufacturer's written instructions.

**3.3 Protection**

- 3.3.1 Protect sheathing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.3.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.3.3 Promptly replace sheathing work damaged during construction that cannot be satisfactorily repaired.

**3.4 Cleaning And Waste Management**

- 3.4.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.4.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.4.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the architectural woodwork work specified herein. This includes, but is not necessarily limited, to:
  - .1 Casework and associated hardware.
  - .2 Wood wall paneling
  - .3 Closet and utility shelving.
  - .4 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.

- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Administrative Requirements**

### **1.5.1 Coordination:**

- .1 Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of Work specified in other Sections to ensure that architectural woodwork and related items can be supported and installed as indicated.
- .2 Perform pre-wiring and partial mounting of electrical and audio/visual equipment and concealed wiring required. Finalize location of outlets and similar items with Consultant prior to installation.
- .3 Where woodwork is indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication, and indicate measurements on Shop Drawings.
- .4 Coordinate fabrication schedule with construction progress to avoid delaying the Work.
- .5 Locate concealed framing, blocking, and reinforcements that support woodwork by field measurements before being enclosed, and indicate measurements on Shop Drawings.

## **1.6 Submittals**

- 1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.6.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for architectural woodwork work specified in this Section.
- 1.6.3 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Section 01 78 00, for

adhesives, sealants and any other material designated by Consultant.

- 1.6.4 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
- .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
  - .3 material characteristics, details of construction, connections and relationship with adjacent construction.
  - .4 locations and sizes of cutouts and holes for plumbing and electrical fixtures, lavatories and similar items required in architectural woodwork; coordinate with appropriate trades.
  - .5 show connections, attachments, reinforcing, anchorage and location of exposed fastenings in accordance with NAAWS Section 1.
- 1.6.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.7 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
- .1 As a minimum submit samples of the following:
    - .1 For each colour of plastic laminate or wood veneer species selected (as applicable), submit manufacturer's standard 300 mm x 460 mm (12" x 18") chips.
    - .2 For each type of hardware.

---

**1.7     Closeout Submittals**

- 1.7.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.7.2 Operating and Maintenance Data: Submit care and maintenance instructions for architectural woodwork to be included in building operation and maintenance manual.
- 1.7.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.8     Quality Assurance**

- 1.8.1 Fabricator Qualifications: Provide Products for Work of this Section by casework fabricator with minimum 10 years' experience in the manufacture of such materials, and who has been a member of AWMAC in good standing for the previous 2 years.
- 1.8.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance, and who have been members of AWMAC in good standing for the previous 2 years.
- 1.8.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.8.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.9     Delivery, Storage And Handling**

- 1.9.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.9.2 Deliver, store and handle architectural woodwork materials in accordance with manufacturer's written instructions.

- .1 Cover and protect finished surfaces with heavy kraft paper and method acceptable to Consultant. Do not remove protective covers until immediately prior to final cleaning.
- .2 Where applicable, handle, store, and install fire-retardant-treated wood to comply with manufacturer's written instructions, including requirements for adhesives used to install woodwork.
- 1.9.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.9.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.9.5 Replace defective or damaged materials with new.

**1.10 Field Conditions**

- 1.10.1 Environmental Restrictions: Do not deliver or install architectural woodwork until building is enclosed, wet work is complete, and HVAC system is operational and will maintain temperature and relative humidity levels equal to occupancy levels for remainder of construction period.
- 1.10.2 Field Measurements: Verify actual dimensions of construction contiguous with architectural woodwork by field measurements before fabrication.

**1.11 Site Conditions**

- 1.11.1 Ambient Conditions: Ensure products are stored in climate-controlled areas with functional HVAC system and relative humidity and moisture content values that fall within the following range:
  - .1 Unless indicated otherwise:
    - .1 Moisture Content: 5-10%, Relative Humidity: 25-55%

**1.12 Warranty**

- 1.12.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of architectural woodwork that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Warranty Period: Not less than 3 years from date of Substantial Performance of The work.

**2 . PRODUCTS**

**2.1 Performance / Design Criteria**

- 2.1.1 Regulatory Requirements:

- 
- .1 Provide work in accordance with North American Architectural Woodwork Standards (NAAWS), latest edition, as published by the Architectural Woodwork Association of Canada (AWMAC), unless otherwise specified herein.
  - .2 All references to grades and terminology in this Section refer to grades defined in NAAWS and are incorporated into this Section by reference. Requirements specified in this Section govern and modify NAAWS.
  - .3 Unless indicated otherwise, Provide work of this Section in accordance with following NAAWS grades:
    - .1 Where plastic laminate facing is used: Custom.
    - .2 Where wood veneer or solid wood is used: Premium.
- 2.1.2 VOC Content and Emissions:
- .1 Composite Wood: must be ULEF or NAF type per CARB ATCM. Do not adhesives that contain urea-formaldehyde.
- 2.1.3 Design and Performance Requirements:
- .1 Architectural Drawings and details are diagrammatic and are only intended to show design concept, aesthetics, interfacing requirements, configuration, components and arrangements. They are not intended to identify or solve completely problems of thermal and structural movements, assembly framing, engineering design, fixings and anchorages.
  - .2 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
    - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
    - .2 Refer to Structural Drawings for seismic sensitivity values.
  - .3 Ensure architectural woodwork (e.g. wall cabinets, cabinet drawers and similar items) are capable of supporting structural loads without deflection in accordance with Casework Integrity Tests indicated in Appendix A of NAAWS.
    - .1 Minimum nominal thickness and material for cabinet components and shelf deflection, type of materials, thicknesses, span width, and total load distribution must conform to NAAWS "Section 10 - Casework" and be suitable for "schools, hospitals, and library" grades.
  - .4 Seal wood surfaces and edges unless indicated otherwise. Exposed wood cores are not permitted.

- 
- .5 Provide cabinets with flush overlay construction.
  - .6 Provide architectural woodwork such that no sharp edges are exposed.
  - .7 Incorporate required mechanical, electrical and communication services into architectural woodwork so that wires and pipes are hidden from view. Provide access panels to services to allow for future adjustment.
  - .8 Provide built-in valance lighting underneath all upper cupboards over countertops as indicated on Drawings;
  - .9 Doors, drawers, and other exposed architectural woodwork edges must be fitted with heat-applied, appropriately-sized ABS or other durable PVC-free edge strips. Plastic laminate-to-plastic laminate edges are not permitted.
  - .10 Provide locks for of doors and drawers as indicated on Drawings. Final lock locations will be established in consultation with Owner prior to occupancy. Provide locks keyed in accordance with Owner's keying requirements.
  - .11 Cores for architectural woodwork must be MDF unless indicated otherwise. At locations subject to moisture, provide veneer core plywood cores and substrates. Do not use veneer core plywood at cabinet door or drawer front components and wall or ceiling panels.
  - .12 Provide veneer core plywood with water-resistant adhesives to bottoms of sink cabinet boxes and other areas that may come into contact with water.
  - .13 Fire Retardant Treated Materials:
    - .1 Where fire-retardant-treated materials are indicated or required by authorities having jurisdiction, use materials impregnated with fire-retardant chemicals by pressure process or other means acceptable to Consultant to produce Products with flame-spread ratings of less than 25 when tested in accordance to CAN/ULC-S102.
    - .2 Use chemical formulations that do not require incising, contain colorants, bleed through, or otherwise adversely affect finishes when preservative or fire-retardant treatment is required for exposed items designated to receive a stained or natural finish.

## **2.2 Framing Lumber**

2.2.1 As specified in Section 06 10 00, Rough Carpentry.

2.2.2 Comply with requirements of "Section 03 – Lumber" of NAAWS.

---

**2.3 Panel Products**

- 2.3.1 Comply with requirements of "Section 04 – Sheet Products" of NAAWS.
- 2.3.2 Medium Density Fibreboard Core (MDF): to ANSI A208.2, Grade 155 unless indicated otherwise.
  - .1 Acceptable Products: "NU Green MR50 NAF MDF" by Uniboard or approved equivalent by one of the following:
    - .1 Sierra Pine Ltd; [www.sierrapine.com](http://www.sierrapine.com)
    - .2 Flakeboard Company Limited.; [www.flakeboard.com](http://www.flakeboard.com),
    - .3 Tafisa Canada and Company, Ltd.; [www.tafisa.ca](http://www.tafisa.ca).
- 2.3.3 Veneer Core Plywood:
  - .1 Softwood plywood: Premium Grade, Douglas Fir plywood - CSA O121, or Western Softwood Plywood - CSA O151 or Poplar plywood - CSA O153-M.
  - .2 Hardwood Plywood (wood cores): Conforming to ANSI/HPVA HP-1.
  - .3 Provide exterior grade, veneer core plywood with moisture-resistant adhesives at locations where sinks are scheduled to be installed and at other locations indicated on Drawings
  - .4 Provide veneer core (plywood) at following locations:
    - .1 architectural wood casework cores subject to moisture (where sinks are indicated),
    - .2 cabinet bases in contact with floor,
    - .3 other locations indicated on Drawings and Schedules

**2.4 Wood Face Veneer**

- 2.4.1 Material Tag: This item is noted as "WDVN-1" on Drawings and Schedules.
- 2.4.2 Comply with requirements of "Section 04 – Sheet Products" of NAAWS.
- 2.4.3 Face Grade: Minimum 0.8 mm (0.03") thick, Grade A in accordance with requirements of AWMAC NAAWS Section 4 to match approved samples and containing no open joints, face depression, glue stain, patches, plastic repair or other manufacturing irregularities or defects
- 2.4.4 Species, Slicing and Matching: Refer to Finish Schedule on Drawings.
- 2.4.5 Facing Adhesive: non-toxic adhesive complying with NAAWS "Adhesive Usage Guide" Appendix, as recommended by manufacturer for substrates encountered, containing no added

urea-formaldehyde, and meeting VOC content and emissions criteria specified in this Section.

- .1 Provide water-resistant adhesive in areas subject to moisture.
- .2 Provide fully waterproof where casework is installed in non-climate-controlled areas.
- .3 Contact cement is not permitted for application of wood veneers.

## **2.5 Plastic Laminate**

- 2.5.1 Material Tag: This item is noted as “WD-1” on Drawings and Schedules.
- 2.5.2 Comply with requirements of “Section 04 – Sheet Products” of NAAWS.
- 2.5.3 Provide high-pressure laminates (HPL) complying with requirements of ANSI/NEMA LD3 or ISO 4526 consisting of multiple layers of thermosetting resin-saturated Kraft paper in combination with a layer of decorative melamine-saturated paper, fused together under heat and pressure.
- 2.5.4 Colours and Finishes: Refer to Finish Schedule on Drawings.

## **2.6 Plastic-Laminate-Clad Casework**

- 2.6.1 Comply with requirements of “Section 10 – Casework” of NAAWS.
- 2.6.2 Casework Construction Type: Frameless construction with edge banded front edges
- 2.6.3 Interface Style: Flush Overlay unless otherwise indicated.
- 2.6.4 Core for Exposed Surfaces, Semi-Exposed Surfaces and Concealed Surfaces: Douglas Fir Plywood (DFP), refer to Section 06 10 00 – Rough Carpentry.
- 2.6.5 Cladding: high-pressure laminate as follows:
  - .1 Exposed Surfaces:
    - .1 Horizontal Surfaces Other Than Tops: HGP
    - .2 Vertical Surfaces: VGP.
    - .3 Finish: WD-2 as specified in this Section.
  - .2 Semi-Exposed Surfaces:
    - .1 Surfaces Other Than Drawer Bodies: VGP.
    - .2 Drawer Sides and Backs: VGP.
    - .3 Drawer Bottoms: HGP
    - .4 Finish: solid colour to match exposed surfaces
  - .3 Concealed Surfaces: BKL

2.6.6 Edgebanding: ABS or other durable PVC-free edgebanding colour-matched to plastic-laminate in colour, pattern, and finish with following minimum thicknesses:

- .1 Case bodies: minimum 0.5 mm (0.0197") thick,
- .2 Doors, drawer fronts, and false fronts: minimum 3 mm (1/8") thick.
- .3 Acceptable Manufacturers: Richelieu Hardware or Wilsonart or approved equivalent.

## **2.7 Wood Wall Panels**

2.7.1 Grade: Premium.

2.7.2 Panel Core Construction: Minimum 25 mm thick, fireretardant medium-density fiberboard (MDF). Panels shall have a flame-spread index of 25 or less and a smoke-developed index of 150 or less per CAN/ULC-S102/S102.2.

2.7.3 Exposed Faces:

- .1 WD-01 as specified in this Section

2.7.4 Fastener visibility: concealed fasteners assembly.

2.7.5 Exposed Panel Edges: to match exposed faces

2.7.6 Mounting System: Aluminum J-channel extrusions or Galvanized steel Z-clips.

## **2.8 Countertops And Backsplashes**

2.8.1 Comply with requirements of "Section 11 – Countertops and Horizontal Surfaces" of NAAWS.

2.8.2 Solid Surface Countertops: Refer to Section 06 61 16, Solid Polymer Fabrications.

## **2.9 Architectural Wood Casework Hardware And Accessories**

2.9.1 Provide stainless steel wood casework hardware meeting or exceeding applicable requirements indicated in ANSI/BHMA A156 Standards for Grade 1 hardware.

2.9.2 Slides

- .1 Light Duty Drawer Slides – 610 mm (24") wide or less, Capacity: 34.02 kg (75 lbs.):
  - .1 Side Mounted Telescoping Ball Bearing drawer slide, 3/4 extension (length as required to suit drawer size); Following products are acceptable: :
    - .1 Model No. Accuride – 2132 by Hafele; [www.hafele.com](http://www.hafele.com)
    - .2 Model No. KA 3432 – by Hettich; [www.hettich.com](http://www.hettich.com)

- 
- .3 Approved equivalent by Knap & Vogt;  
[www.knapandvogt.com](http://www.knapandvogt.com)
  - .2 Light Duty Drawer Slides – 610 mm (24") wide or less, Capacity:  
30 kg (66 lbs.):
    - .1 Under Mounted Telescoping Ball Bearing drawer slide,  
full extension (length as required to suit drawer size);  
Following products are acceptable: :
      - .1 "Model No. Tandem slide #560H Series" by  
Richelieu Hardware; [www.richelieu.com](http://www.richelieu.com)
      - .2 Model No. Quadro V6 by Hettich; [www.hettich.com](http://www.hettich.com)
      - .3 Approved equivalent by Knap & Vogt;  
[www.knapandvogt.com](http://www.knapandvogt.com) or by Hafele;  
[www.hafele.com](http://www.hafele.com)
  - .3 Medium Duty Drawer Slides – 610 mm (24") wide or less,  
Capacity: 40.82 kg (90 lbs.):
    - .1 Side Mounted Telescoping Ball Bearing drawer slide with  
full extension and 25 mm (1") over travel (length as  
required to suit drawer size); Following products are  
acceptable: :
      - .1 Model No. Accuride – 3834 by Hafele;  
[www.hafele.com](http://www.hafele.com)
      - .2 Model No. 8455 by Knap & Vogt;  
[www.knapandvogt.com](http://www.knapandvogt.com)
      - .3 Model No. KA 5632/1" OT by Hettich;  
[www.hettich.com](http://www.hettich.com)
  - .4 Medium Duty Drawer Slides – more than 610 mm (24") wide,  
Capacity 45.36 kg (100 lbs.)
    - .1 Side Mounted Telescoping Ball Bearing drawer slide with  
full extension (length as required to suit drawer size);  
Following products are acceptable: :
      - .1 Model No. Accuride – 3832 by Hafele;  
[www.hafele.com](http://www.hafele.com)
      - .2 Model No. 1375 by Knap & Vogt;  
[www.knapandvogt.com](http://www.knapandvogt.com)
      - .3 Model No. KA 5632 by Hettich; [www.hettich.com](http://www.hettich.com)
  - .5 Heavy Duty Drawer Slides – more than 610 mm (24") wide,  
Capacity: 68.04 kg (150 lbs.)
    - .1 Side Mounted Telescoping Ball Bearing drawer slide with  
full extension and 25 mm (1") over travel (length as  
required to suit drawer size); Following products are  
acceptable:
      - .1 Model No. Accuride – 3640 by Hafele;  
[www.hafele.com](http://www.hafele.com)

- 
- .2 Model No. 8505 by Knappe & Vogt;  
[www.knappeandvogt.com](http://www.knappeandvogt.com)
  - .3 Model No. KA 555 by Hettich; [www.hettich.com](http://www.hettich.com)
  - .6 Trash Bin Slides: Soft closing, manual, ball bearing full extension slides with over travel complete with powder-coated steel frame, plastic cover and plastic rails. Following products are acceptable: :
    - .1 Provide "EZ-Cargo Recycling Center, #366840100" by Richelieu Hardware; [www.richelieu.com](http://www.richelieu.com)
    - .2 "Side-Mount Trash Can" by Hafele; [www.hafele.com](http://www.hafele.com)
    - .3 "Bin.It DuoII 0049474" by Hettich; [www.hettich.com](http://www.hettich.com)
  - .7 Flipper Door Slides: Mount as shown on Drawings. Following products are acceptable:
    - .1 "Easy-down Flipper Door Slide for wood applications - Accuride 1155;
    - .2 "Model No. 408.22 Series" by Hafele; [www.hafele.com](http://www.hafele.com)
    - .3 Approved equivalent by Richelieu Hardware; [www.richelieu.com](http://www.richelieu.com).
  - .8 Lid Stays:
    - .1 "Duo Swing-up Fittings" by Hafele; [www.hafele.com](http://www.hafele.com)
    - .2 "Top box stay KLS 30/250" by Hettich; [www.hettich.com](http://www.hettich.com)
    - .3 Approved equivalent complete with lid/flap stay arm, side mounting cabinet bracket and door mounting bracket.
- 2.9.3 Cabinet Door Hinges and Stays:
- .1 Wood Door Hinges:
    - .1 Frameless Concealed Hinges (European Type): Self-closing concealed hinges with integrated soft close. Manufacturer's recommended number of hinges to suit door size and thickness.
    - .2 Opening angle: Minimum 160°, except Provide 110° at locations adjacent to walls to prevent wall damage.
    - .3 Acceptable Products: "Salice Concealed Hinges 200 and 300 Series" by Hafele; [www.hafele.com](http://www.hafele.com) or "Blum Concealed - Clip-Top Hinge" by Richelieu Hardware; [www.richelieu.com](http://www.richelieu.com) or "Intermat 9943" or "Intermat 9956" by Hettich; [www.hettich.com](http://www.hettich.com)
- 2.9.4 Door and Drawer Locks:
- .1 Cylinder Locks: Provide adjustable locking system with lock throw, orientation and size to suit cabinet size. Following products are acceptable: :

- .1 "Cylinder Module System; Model No. 232 Series" by Hafele; [www.hafele.com](http://www.hafele.com) complete with cam locks or deadbolt locks and cores as required to suit applications indicated.
  - .2 "Disc Tumbler Furniture Locks - Removacore" by CompX National complete with cam locks or deadbolt locks and cores as required to suit applications indicated
- 2.9.5 Handles (Doors and Drawers):
- .1 D-Pulls: Following products are acceptable:
    - .1 "Modern Steel Pull – 305" by Richelieu
- 2.9.6 Recessed Shelf Pilasters, Standards and Clips: Provide required accessories to mount wood or glass shelves. Following products are acceptable: :
- .1 "KV255" pilaster and "KV256" adjustable clip supports by Knappe & Vogt; [www.knappeandvogt.com](http://www.knappeandvogt.com)
  - .2 "120-10 Series" pilasters and "1903-2G" clip supports by Richelieu Hardware; [www.richelieu.com](http://www.richelieu.com)
- 2.9.7 Drawer and Hinged Door Bumpers: Provide 2 clear resilient, press-fit bumpers per door or drawer.
- 2.9.8 Closet Coat Rods: "KV660" by Knappe and Vogt Manufacturing Company, 27 mm (1-1/16") od stainless steel rod complete with "KV734 – Full Circle" polished chrome flanges. Size rods to suit closet widths.

## **2.10 Finishes**

- 2.10.1 Comply with requirements of "Section 05 – Finishing" of NAAWS.
- 2.10.2 Factory Finishing: As far as practical, ensure casework is factory finished unless otherwise indicated or unavoidable.
- .1 Defer only final touch-up, cleaning, and polishing until after installation.
  - .2 Touch up finishing work specified in this Section after installation of woodwork. Fill nail holes with matching filler where exposed.
- 2.10.3 Provide NAAWS System – 5, Varnish, Conversion or System – 7, Vinyl, Catalyzed finish unless indicated otherwise.
- 2.10.4 If staining is required or specified, match Consultant's control sample.
- 2.10.5 Prime unexposed surfaces including backs of casework elements that are against walls and their underside.

---

**2.11     Fabrication**

- 2.11.1 Fabricate joints accurately fitted, coped where possible, and well glued up. Fabricate joints mitered to proper fit and with alignments carefully matched.
- 2.11.2 Fabricate finished woodwork in single pieces where possible. Fabricate running members in longest practicable lengths.
- 2.11.3 Conceal fastenings. Set nails and countersink screws and apply matching wood filler to indentations. Sand smooth and leave ready to receive finish.
- 2.11.4 Fabricate exposed gables to match adjacent exposed finishes. Ensure adjacent parts of continuous facing work match in colour and pattern.
- 2.11.5 Install cabinet hardware for doors, shelves and drawers in shop. Recess shelf standards unless noted otherwise.
- 2.11.6 Provide cutouts for plumbing fixtures, inserts, appliances, outlet boxes and other fixtures. Coordinate with other Divisions.
- 2.11.7 Shop-assemble work for delivery to site in size that can be easily handled and to ensure passage through building openings.
- 2.11.8 Apply plastic-laminate or wood veneer (as applicable) to core materials in accordance with adhesive manufacturer's instructions. Ensure core and laminate profiles coincide to provide continuous support and bond over entire surface.
- 2.11.9 Provide balanced construction. Apply backing sheet to reverse side of cores.
- 2.11.10 Replace, rework and refinish components that do not meet NAAWS requirements for grades specified herein at no additional cost to Owner.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Verify that shop-fabricated work is ready for installation. Complete additional work as required, such as packing removal and back priming, before installing architectural woodwork.
- 3.1.3 Evaluation and Assessment: Commencement of work implies acceptance of previously completed work.

---

**3.2     Preparation**

- 3.2.1 Before installation, condition woodwork to average prevailing humidity conditions in installation areas.

**3.3     Installation**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Comply with requirements of "Section 14 – Installation" of NAAWS and other applicable requirements in corresponding product sections of NAAWS.
- 3.3.3 Assemble woodwork and complete fabrication at site to comply with fabrication requirements specified herein.
- 3.3.4 Scribe and cut woodwork to fit adjoining work. Refinish cut surfaces, and repair damaged finish at cuts. Mitre exposed corners and butt joints.
- 3.3.5 Anchor wood casework to built-in anchors or blocking or directly to substrates in order to thoroughly fix and anchor Work of this Section into position.
- 3.3.6 Secure wood casework with countersunk, concealed fasteners and blind nailing as required for complete installation. Provide heavy duty fixture attachments for wall mounted cabinets.
- 3.3.7 Use fine finishing nails or finishing screws, countersunk and filled flush with woodwork, for exposed fastening (where permitted), and matching final finish if transparent finishes are specified.
- 3.3.8 Scribe and cut as required to fit abutting walls and to fit properly into recesses and to accommodate piping, columns, fixtures, outlets or other projecting, intersecting or penetrating objects.
- 3.3.9 Cabinetry:
- .1 Install cabinets without distortion to ensure doors and drawers fit openings properly, and are accurately aligned.
  - .2 Adjust hardware to center doors and drawers in openings and to provide unencumbered operation.
  - .3 Install cabinets with no more than 3 mm in 2400 mm (1/8" in 8'-0") sag, bow, or other variation from straight line
  - .4 Maintain sequence matching of cabinets for plastic-laminate or wood veneer facings, and in accordance with NAAWS grade specified.

- .5 Fasten wall cabinets with toggle bolts through metal backing or metal framing behind wall finishes through their back, near top and bottom, at ends, and at no more than 400 mm (16") o.c.

3.3.10 Hardware and Accessories:

- .1 Install architectural wood casework hardware in accordance with NAAWS requirements and manufacturer's templates.
- .2 Fit hardware accurately and securely in accordance with manufacturer's written instructions.
- .3 Adjust architectural wood casework hardware to provide smooth operation and ensure clearances are maintained.
- .4 Provide lubricants required and use in manner to ensure smooth function of hardware consistent with manufacturer's recommendations.

3.3.11 Mechanical and Electrical Fittings:

- .1 Provide openings required to accommodate mechanical and electrical fittings as part of the Work of this Section.
- .2 Locate and Install lenses where indicated.
- .3 Mount lenses perfectly level or plumb.
- .4 Ensure lenses fit tightly without showing space or light leak between frame and lenses.
- .5 Refer to Divisions 21, 22 23, 26, 27 and 28 for additional requirements.

**3.4 Tolerances**

- 3.4.1 Comply with requirements of "Section 15 – Tolerances" of NAAWS.

**3.5 Protection**

- 3.5.1 Protect architectural woodwork from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.5.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.5.3 Promptly replace architectural woodwork work damaged during construction that cannot be satisfactorily repaired.

**3.6 Adjusting, Cleaning And Waste Management**

- 3.6.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.

- 3.6.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.6.3 Clean woodwork on exposed and semi-exposed surfaces. Touch up shop-applied finishes to restore damaged or soiled areas.
- 3.6.4 Repair damaged and defective woodwork, where possible, to eliminate functional and visual defects.
- 3.6.5 Where repair is not possible or practical, replace woodwork to satisfaction of Consultant and at no cost to Owner.
- 3.6.6 Adjust joinery for uniform appearance.
- 3.6.7 Clean, lubricate, and adjust moving and operating parts to function smoothly and correctly.
- 3.6.8 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Solid Surfacing Fabrications work specified herein. This includes, but is not necessarily limited, to:
- .1 Solid polymer surface countertops.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
- .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 06 40 00 – Architectural Woodwork

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Preinstallation Meetings**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
  - .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.

- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

## **1.5 Action Submittals**

- 1.5.1 Product Data: Submit product data in accordance with Division 01 for the following:
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Solid Surfacing Fabrications work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.5.2 Shop Drawings: Submit shop drawings in accordance with Division 01, for solid surfacing fabrications. Show materials, finishes, edge and backsplash profiles, methods of joining, and cutouts for plumbing fixtures.
  - .1 Show locations and details of joints.
  - .2 Show direction of directional pattern, if any.
  - .3 Include elevations, section details, and large scale details.
- 1.5.3 Samples: Submit samples in accordance with Division 01, selection and verification samples for each colour, pattern, and finish required.
  - .1 Submit a minimum 300 mm (12 inch) wide by 150 mm (6 inch) deep, full size sample for each type of countertop shown on Drawings. Sample must include at least one seam, edge profile and backsplash as detailed on Drawings.

## **1.6 Closeout Submittals**

- 1.6.1 Maintenance Data: Submit maintenance data in accordance with Division 01, for solid polymer surface fabrications to include in maintenance manuals. Include Product Data for care products used or recommended by Installer and names, addresses, and telephone numbers of local sources for products.

## **1.7 Quality Assurance**

- 1.7.1 Fabricator Qualifications: Shop that is certified by the solid surfacing material manufacturer, with minimum 5 years experience, and that employs skilled workers who custom-fabricate fabrications similar to that required for this Project, and whose products have a record of successful in-service performance.
  - .1 Upon request, submit solid polymer manufacturer's certification attesting to fabricator qualification approval.
- 1.7.2 Mock-ups: Build mock-ups to demonstrate aesthetic effects and to set quality standards for fabrication and execution.

- .1 Build mockup of typical fabrication where directed by Consultant.
- .2 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

**1.8 Delivery, Storage, And Handling**

- 1.8.1 Do not deliver materials to project site until areas are ready for installation. Do not deliver or install solid surfacing fabrications until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature and relative humidity at design levels during the remainder of the construction period
- 1.8.2 Deliver components and materials to the site undamaged, in containers clearly marked and labeled with manufacturer's name.
- 1.8.3 Store materials indoors with adequate precautions taken to prevent damage to finished surfaces.
- 1.8.4 Provide protective coverings to prevent physical damage or staining following installation, for duration of project.

**1.9 Field Conditions**

- 1.9.1 Field Measurements: Verify dimensions of fabrications by field measurements after base cabinets are installed but before fabrication is complete. Show recorded measurements on Shop Drawings.
- 1.9.2 Coordinate field measurements and fabrication schedule with construction progress to avoid construction delays
- 1.9.3 Adhesive: Acclimatize adhesives to occupancy room temperatures with maximum temperature not to exceed 24 deg C (75 deg F).

**1.10 Coordination**

- 1.10.1 Coordinate sizes and locations of plumbing, cut-outs, and other related work specified in other sections to ensure that solid surfacing fabrications can be supported and installed as indicated

**1.11 Warranty**

- 1.11.1 Manufacturer's Warranty: Manufacturer's standard materials-only warranty in which manufacturer agrees to Supply replacement materials that does not comply with requirements of this Section within specified warranty period.
  - .1 Warranty Period: 10 years from date of Substantial Performance of the Work.

---

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Products from the following manufacturer may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents:

- .1 Corian® by Dupont;
- .2 Formica
- .3 LG Hausys
- .4 Wilsonart LLC

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Regulatory Requirements**

2.2.1 Accessibility Requirements: Comply with requirements of CSA B651, the Ontario Building Code and AODA.

2.2.2 Food Equipment Material Compliance: to NSF/ANSI 51.

2.2.3 Fire testing results: Provide solid surfacing fabrications meeting the following as determined by testing identical products by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:

- .1 Surface-Burning Characteristics: As determined by testing per CAN/ULC-S102/S102.2 or equivalent to ASTM E84 subject to approval of authorities having jurisdiction.
  - .1 Flame-Spread Index: 25 or less.
  - .2 Smoke-Developed Index: 25 or less.

### **2.3 Design And Performance Requirements**

2.3.1 Only solid polymer sheets in 100 percent acrylic formulations complying with ICPA SS-1 are acceptable. Solid polymer sheets containing blends with polyester-based materials are not acceptable.

- .1 Exceptions: Solid polymer precast sinks are permitted to be of acrylic-polyester blends.

2.3.2 Materials must not be of coated, laminated, or of composite construction.

2.3.3 Veneered products consisting of a thin top layer of solid surfacing material with a structural substrate of plywood or particleboard are not acceptable.

2.3.4 Ensure superficial damage to a depth of 0.25 mm (0.010") is repairable by sanding and polishing.

---

**2.4     Solid Polymer Surface Sheet Material**

2.4.1 Material Tag: This item is noted as "SSM-01" on Drawings and Schedules.

2.4.2 Provide cast, nonporous, filled, homogeneous sheets composed of minimum 30% acrylic resin (Polymethyl Methacrylate) and +/- 70% blend of natural minerals with through-body colours, complying with ICPA SS-1 and having following physical and performance properties:

- .1 Tensile Strength: 6800 psi; ASTM D638.
- .2 Tensile Modulus:  $1.5 \times 10^6$  psi; ASTM D638.
- .3 Tensile Elongation: 0.4 percent minimum; ASTM D638.
- .4 Flexural Strength: 10,000 psi; ASTM D790.
- .5 Flexural Modulus:  $1.2 \times 10^6$  psi; ASTM D790.
- .6 Thermal Expansion Coefficient:  $1.37 \times 10^{-5}$  in./in. deg F; ASTM D696.
- .7 Hardness (Barcol Impressor): 60; ASTM D2583.
- .8 Impact Resistance: 144 in. drop with no fracture; NEMA LD-3, Method 3.8.
- .9 Izod Impact: 0.28 (ft-lb.)/in.; ASTM D256, Method A.
- .10 Light Resistance - Xenon: No effect; NEMA LD-3, Method 3.3.
- .11 Stain Resistance: Pass; ANSI Z124.3.
- .12 Wear and Cleanability: Pass; ANSI Z 124.3.
- .13 Fungi Resistance: Pass; ASTM G21.
- .14 Bacterial Resistance: Pass; ASTM G22.
- .15 Boiling Water Resistance: No effect; NEMA LD-3, Method 3.5.
- .16 High Temperature Resistance: No effect; NEMA LD-3, Method 3.6.
- .17 Weatherability: Delta E less than 5; ASTM G155.
- .18 Moisture Absorption: Less than 0.5 percent; ASTM D570, long term.
- .19 Specific Gravity: 1.7 gram/cm<sup>3</sup>; ASTM D792.

2.4.3 Thickness: Unless otherwise indicated, provide material in following thicknesses:

- .1 Horizontal applications: Not less than 12 mm (1/2 inch)
- .2 Vertical applications: Not less than 6 mm (1/4 inch)

2.4.4 Basis-of-Design: Refer to Finish Schedule on Drawings.

**2.5     Supports**

2.5.1 Provide structurally adequate, continuous perimeter support frames to ensure flatness and levelness of solid polymer fabrications.

Ensure materials are capable of providing support to inside corners and across spans. Following substrates are acceptable:

- .1 Plywood: Minimum 19 mm (3/4 inch) exterior softwood plywood complying with CSA O121 or CSA O151.
- .2 Provide supports spaced at minimum 457 mm (18 inches) on centre. Do not use a full wood underlayment as a support for horizontal sheets.
- .3 Restrict unsupported overhangs to 150 mm (6 inches) maximum.

## **2.6      Components**

2.6.1 Countertops and Work Surfaces: Components manufactured from solid polymer surfaces as specified herein and with following characteristics:

- .1 Thickness: 12 mm (1/2 inch) for horizontal surfaces, 6 mm (1/4 inch) for vertical surfaces.
- .2 Edge Detail: As selected by Consultant from manufacturer's full range.
- .3 Colours and Patterns: "Stonique" by Corian
  - .1 Provide minimum 50 mm (2 inch) wide reinforcing strip of polymer material under each horizontal countertop seam.
- .4 Backsplash: Radius coved with integral, inconspicuous seams

## **2.7      Accessory Materials**

2.7.1 Provide accessory products, as specified in this Section, manufactured by solid polymer manufacturer or products approved by the solid polymer manufacturer for use with the solid polymer materials being specified.

2.7.2 Joint Adhesive: Methacrylate-based, two-part adhesive kit to create permanent, inconspicuous, non-porous, hard seams and joints by chemical bond between solid polymer materials and components.

- .1 Colour: complementary to solid surfacing sheet material.
- .2 Acceptable Product: Manufacturer's standard type.

2.7.3 Elastomeric Sealant: ASTM C920, Type S (single component), Grade NS (nonsag), Mildew-resistant silicone sealant for filling gaps between countertops and terminating substrates in wet environment applications.

- .1 Colour: complementary to solid surfacing sheet material.
- .2 Acceptable Product: Manufacturer's standard type.

2.7.4 Mounting Hardware: Provide mounting hardware, including sink/bowl clips, inserts and fasteners for attachment of undermount sinks and lavatories.

**2.8     Fabrication**

- 2.8.1 Fabricate fabrications according to solid polymer surface manufacturer's written instructions and to the AWMAC "North American Architectural Woodwork Standards."
- 2.8.2 Fabricate components in shop, to greatest extent practicable, in sizes and shapes indicated according to approved shop drawings and manufacturer published fabrication requirements.
- 2.8.3 Form joint seams between solid surfacing components with specified seam adhesive. Completed joints inconspicuous in appearance and without voids. Provide joint reinforced if required by manufacturer for particular installation conditions.
- 2.8.4 Thermoform corners and edges to shapes and sizes indicated on Drawings, prior to seaming and joining. Cut components larger than finished dimensions and sand edges to remove nicks and scratches. Ensure no blistering, whitening and cracking of components during forming.
- 2.8.5 Provide holes and cutouts indicated on reviewed shop drawings. Rout cutouts and complete by sanding all edges smooth.
  - .1 Undercounter Plumbing Fixtures: Make cutouts for fixtures in shop using template or pattern furnished by fixture manufacturer. Form cutouts to smooth, even curves.
  - .2 Counter-Mounted Plumbing Fixtures: Prepare fabrications in shop for field cutting openings for counter-mounted fixtures. Mark tops for cutouts and drill holes at corners of cutout locations. Make corner holes of largest radius practical.
  - .3 Fittings: Drill fabrications in shop for plumbing fittings, undercounter soap dispensers, and similar items.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Examine substrates to receive solid polymer surface fabrications and conditions under which fabrications will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of fabrications.
- 3.1.2 Verify actual site dimensions and location of adjacent materials prior to commencing work.
- 3.1.3 Notify Consultant in writing of any conditions which would be detrimental to installation.
- 3.1.4 Proceed with installation only after unsatisfactory conditions have been corrected.

---

**3.2     Countertop Installation**

- 3.2.1 Install components plumb, level, rigid, scribed to adjacent finishes in accordance with reviewed Shop Drawings and Product installation details.
- 3.2.2 Install countertops deflections limited to L/360 or 3 mm (1/8") sag, bow or other variation from a straight line; whichever is less.
- 3.2.3 Form joint seams with specified seam adhesive. Seams to be inconspicuous in completed work. Seams in locations shown on reviewed shop drawings and acceptable to manufacturer. Promptly remove excess adhesive.
- 3.2.4 Mount plumbing fixtures to countertops using manufacturer's recommended adhesive, mounting hardware or colour-matched silicone sealant as applicable. Secure seam mounted bowls and sinks to countertops using colour matched joint adhesive.
  - .1 Coordinate connections of plumbing fixtures with Division 22 and ensure fittings and accessories are provided by Division 22.
- 3.2.5 Complete cutouts not finished in shop. Mask areas of fabrications adjacent to cutouts to prevent damage while cutting. Make cutouts to accurately fit items to be installed, and at right angles to finished surfaces unless beveling is required for clearance. Ease edges slightly to prevent snipping.
  - .1 Seal edges of cutouts in plywood substrates by saturating with clear sealers.
  - .2 Seal exposed plywood edges and faces by saturating with clear sealers.
- 3.2.6 Apply sealant to gaps at walls; at expansion joints between solid polymer components and joints between solid polymer components and other adjacent surfaces such as walls, floors, ceiling, and plumbing fixtures. Comply with Section 07 92 00.
  - .1 Sealant bead must be smooth and uniform in appearance and use the minimum size necessary to bridge any gaps between the solid surfacing material and the adjacent surface.
  - .2 Install continuous bead that runs the entire length of the joint being sealed.

**3.3     Tolerances**

- 3.3.1 Install fabrications level to a tolerance of 3 mm in 2.4 m (1/8 inch in 8 feet), 6 mm (1/4 inch) maximum. Do not exceed 0.4-mm (1/64-inch) difference between planes of adjacent units.
  - .1 Maximum Variation From True Dimension: 3 mm (1/8 inch).
  - .2 Maximum Offset From True Position: 3 mm (1/8 inch).

**3.4     Repair**

- 3.4.1   Repair minor imperfections and cracked seams and replace areas of severely damaged surfaces in accordance with manufacturer's recommendations.

**3.5     Cleaning**

- 3.5.1   Remove excess adhesive and sealant from visible surfaces.
- 3.5.2   Clean surfaces in accordance with manufacturer's care and maintenance instructions.

**3.6     Protection**

- 3.6.1   Provide protective coverings to prevent physical damage or staining following installation for duration of Project.
- 3.6.2   Protect surfaces from damage until date of Substantial Performance of the Work.

END OF SECTION

## **1 . GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the self-adhering sheet waterproofing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Modified bituminous sheet waterproofing at foundation walls.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.

- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for self-adhering sheet waterproofing work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
  - .3 Show locations and extent of waterproofing and details of substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, and other termination conditions.
- 1.5.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:

- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.6 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:
- .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
  - .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).
- 1.5.7 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback

**1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and employs installers and supervisors who are trained and approved by waterproofing manufacturer.
- 1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.7.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
- .2 Size: 9.3 sq. m (100 sq. ft.) in area.
- .3 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .4 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle self-adhering sheet waterproofing materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

**1.9 Field Conditions**

- 1.9.1 Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate.
  - .1 Do not apply waterproofing in snow, rain, fog, or mist.
- 1.9.2 Maintain adequate ventilation during preparation and application of waterproofing materials.

**1.10 Warranty**

- 1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of self-adhering sheet waterproofing that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Warranty Period: Not less than 10 years from date of Substantial Performance of The work.

- 1.10.2 Installer's Extended Warranty: Specified form, signed by Installer, covering Work of this Section, for warranty period of two years.
- .1 Warranty includes removing and reinstalling protection board, drainage boards, insulation, as required to perform repairs.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
- .1 Carlisle Coatings & Waterproofing Inc.;
- .2 CETCO Building Materials Group,
- .3 GCP Applied Technologies Inc.;
- .4 Henry Company Canada;
- .5 IKO Industries Ltd.;
- .6 Soprema Inc.
- .7 W.R. Meadows Inc., Canada;
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

- 2.2.1 Waterproofing System Integrity: Ensure compatibility between waterproofing system components. Do not allow waterproofing materials to touch chemically incompatible substances.
- 2.2.2 Waterproofing Application:
- .1 General Coverage: Apply waterproofing to below-grade elements subject to hydrostatic pressure that separate interior areas from ground in order to prevent water from entering into occupied or unoccupied building spaces. Waterproof entire width of footings and vertical surfaces adjacent to such spaces.
- .2 Protrusions and Penetrations: Ensure that pipes, drains, or other elements extending through substrates are waterproofed.
- .3 Footing Interfaces with Slab-on-Grade: Apply waterproofing atop footings where slabs-on-grade abuts them. Apply waterproofing in angle between toe footing and exterior face of below-ground walls receiving waterproofing.
- .4 Other locations: Apply waterproofing to other areas indicated on Drawings.
- 2.2.3 VOC Content and Emissions:

- .1 VOC Emissions: For applicable items in this Section, comply with CDPH Standard Method v1.2–2017 (CA Spec 01350) and ensure products are certified per UL 2818, SCS Global Gold, or equivalent.
- .2 VOC Content Requirements: Wet-applied materials used in scope of this Section must conform to the following:
  - .1 Paints and Coatings: SCAQMD Rule 1113 or CARB SCM.
  - .2 Adhesives and Sealants: SCAQMD Rule 1168.
  - .3 Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

## **2.3 Modified Bituminous Sheet Waterproofing**

- 2.3.1 Material Tag: This item is noted as “WPM-1” on Drawings and Schedules.
- 2.3.2 Modified Bituminous Sheet: self-adhering sheet with minimum 1.5-mm (60-mil) nominal thickness consisting of rubberized asphalt laminated to polyethylene-film reinforcement. Provide with release liner on adhesive side.
- 2.3.3 General Performance Requirements:
  - .1 Tensile Strength (Membrane): Minimum: 1.7 MPa (250 psi); ASTM D412, Die C (modified).
  - .2 Ultimate Elongation: Minimum: 300%; D412, Die C (modified).
  - .3 Low-Temperature Flexibility: Pass at -25°C (-13°F); ASTM D1970 or equivalent to CAN/CGSB-51.33.
  - .4 Crack Cycling: Remains unaffected after 100 cycles of 3 mm (1/8-inch) movement; ASTM C836.
  - .5 Puncture Resistance: Minimum: 180 N (40 lbf); ASTM E154.
  - .6 Water Absorption: Maximum: 0.2% weight gain after 48 hours of immersion at 21°C (70°F); ASTM D570.
  - .7 Water Vapour Permeance: Maximum: 2.9 ng/Pa x s x sq. m (0.05 perms); ASTM E96/E 96M (Water Method).
  - .8 Hydrostatic-Head Resistance: Minimum: 60 m (200 feet); ASTM D5385.
  - .9 Lap Peel Strength at 5°C (41°F): Minimum: 580 N/m (3.3 lbf/in).
  - .10 Acceptable Products:
    - .1 “Blueskin WP 200” by Henry Company Canada.
    - .2 “Colphene 3000” by Soprema Inc.
    - .3 “Mel-Rol” by W.R. Meadows Inc., Canada.

- .4 "AquaBarrier™ FP" by IKO Industries Ltd.
- .11 Formulation must be suitable for application with primer or surface conditioner, complying with VOC limits set by authorities having jurisdiction.

## **2.4 Auxiliary Materials**

- 2.4.1 Ensure auxiliary materials are specifically recommended by waterproofing manufacturer for intended use and are fully compatible with primary waterproofing system. Supply auxiliary materials required for a complete installation.
- 2.4.2 Surface Conditioner / Primer: liquid waterborne primer or surface conditioner, recommended for specified substrate by sheet-waterproofing material manufacturer. System must be suitable for prevailing weather conditions as recommended by waterproofing manufacturer.
- 2.4.3 Substrate Patching Membrane: low-viscosity, two-component modified asphalt coating.
- 2.4.4 Termination Sealant: manufacturer's recommended solvent-based rubberized bitumen or elastomeric mastic sealant designed for sealing top surface and edges of waterproofing membrane. Ensure compatibility with waterproofing membrane, substrate, insulation materials and components in contact with waterproofing membrane.
- 2.4.5 Protection Board: ASTM D6506; semirigid fiberglass or mineral-reinforced-asphaltic core board.
  - .1 Thickness: Nominal 3 mm (1/8 inch).
  - .2 Adhesive: rubber-based solvent type recommended by waterproofing manufacturer suitable for protection board type.
  - .3 Basis-of-Design: "Protectoboard" by IKO Industries Ltd. or approved equivalent.
- 2.4.6 Drainage Board: composite drainage board consisting of studded, non-biodegradable, molded-plastic-sheet drainage core with nonwoven, needle-punched geotextile facing laminated to one side of the core and polymeric film on other side.
  - .1 Acceptable Products:
    - .1 "DB 6200" by Henry Canada
    - .2 "Mel-Drain" by W.R Meadows
    - .3 "Sopradrain 10G" by Soprema Inc.
    - .4 "Delta-drain 6000" by Cosella-Dorken Products Inc
    - .5 "Aquadrain 15 XP" by CETCO Building Materials Group
- 2.4.7 Termination Bar: 25 mm (1 inch) stainless steel or aluminum.

---

2.4.8 Waterstop: Non-swelling/non-bentonite preformed sealant.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- .1 Verify that concrete has cured and aged for minimum time period recommended in writing by waterproofing manufacturer.
  - .2 Verify that substrate is visibly dry and within the moisture limits recommended in writing by manufacturer. Test for capillary moisture by plastic sheet method according to ASTM D4263.

#### **3.2 Surface Preparation**

- 3.2.1 Manufacturer's instructions: Comply with ASTM D4258 and with manufacturer's written instructions with regard to cleaning, treatment, and preparation of substrates. Ensure substrates are free of dust and are dry before applying waterproofing.
- 3.2.2 Masking: Mask off adjoining surfaces not receiving waterproofing to prevent spillage and overspray affecting other construction.
- 3.2.3 Contaminant Removal: Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
- 3.2.4 Irregularities: Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
- 3.2.5 Joints and Cracks Treatment:
- .1 Comply with ASTM D4258 unless indicated otherwise.
  - .2 For construction and contraction joints and cracks wider than 1.6 mm (1/16 inch), place sheet strips centered over cracks. Ensure width aligns with manufacturer's written instructions.
- 3.2.6 Bridging Joints:
- .1 Overlap sheet strips to bridge and cover isolation joints, expansion joints, deck-to-wall junctions, and deck-to-deck joints. Ensure width aligns with manufacturer's written instructions.
- 3.2.7 Corners, Flashings and Protrusions:
- .1 Comply with ASTM D6135 for preparation, priming, and treatment of inside and outside corners.

- .2 At intersections between footings and walls, extend membrane from corner in each direction or center membrane strip over corner.
  - .3 Use strips that are at least 900 mm (36 inches) wide; stagger seams between flashing and membrane.
  - .4 Apply flashing to protrusions, expansion joints, control joints, drains, and similar areas; extend flashing at least 150 mm (6 inches) onto membrane.
  - .5 Use termination mastic to seal flashing seams.
- 3.2.8 Termination and Penetrations Treatment:
- .1 Comply with ASTM D6135 for treatment and sealing of waterproofing terminations and penetrations.
  - .2 Prepare, fill, prime, and treat joints and cracks in substrates as specified in this Section.

### **3.3 Installation**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.

### **3.4 Modified Bituminous Sheet-Waterproofing Application**

- 3.4.1 Install modified bituminous sheets according to waterproofing manufacturer's written instructions and recommendations in ASTM D6135.
- 3.4.2 Priming: Apply primer to substrate at rate specified by manufacturer and allow to dry. Ensure priming is limited to areas that will have sheet waterproofing applied on the same day. Areas exposed for more than 24 hours must be reprimed.
- 3.4.3 Sheet Placement:
- .1 Position and adhere sheets firmly over waterproofing area.
  - .2 Align sheets correctly, maintaining minimum lap width of 64-mm (2-1/2 inches). Provide 150-mm (6 inches) end laps. Install sheets in a shingle fashion as required to shed water.
  - .3 Overlap, seal seams, and stagger end laps as required to ensure a watertight installation.
  - .4 Use 75 mm (3 inches) wide hand roller for rolling membrane.
  - .5 On concrete substrates, ensure membrane terminates in reglet or use termination bars. Coordinate with concrete trades to confirm final reglet locations so as to prevent unnecessary saw-cutting.

- .6 Ensure termination edges of sheet waterproofing are sealed with mastic as specified in this Section.
- 3.4.4 Transition to Adjacent Materials: Transition sheet waterproofing and auxiliary materials with adjacent waterproofing materials to ensure a watertight installation. At tie-in points, clean surfaces 300 mm (12 inches) back from transition and re-prime if necessary.
- 3.4.5 Repairs: Immediately repair tears, voids, and improperly lapped seams. Flatten and slit blisters or fishmouths. Use sheet waterproofing materials for patching purposes. Extend patches minimum 150 mm (6 inches) in all directions beyond the repair area.
- 3.4.6 Drainage Board: Waterproofing must be protected prior to backfilling using drainage boards.
  - .1 Ensure geotextile side of drainage board is facing away from substrate.
  - .2 Use non-penetrative methods such as adhesives to secure drainage boards.
  - .3 Overlap geotextile edges and ends for continuity.
  - .4 Mechanically fasten drainage board to foundation wall at 450 mm (18 inches) o.c. horizontally. Use minimum of two staggered rows.
  - .5 Take precautions to ensure waterproofing membrane is not punctured.
  - .6 Protect installed molded-sheet drainage boards during subsequent construction.

### **3.5 Field Quality Control**

- 3.5.1 Engage a site representative qualified by waterproofing membrane manufacturer to inspect substrate conditions, surface preparation, membrane application, flashings, protection, and drainage components, and to Supply reports to Consultant.

### **3.6 Protection**

- 3.6.1 Protect self-adhering sheet waterproofing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.6.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.6.3 Promptly replace self-adhering sheet waterproofing work damaged during construction that cannot be satisfactorily repaired.

---

**3.7     Cleaning And Waste Management**

- 3.7.1    Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.7.2    Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.7.3    Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the bonded blindside sheet waterproofing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Bonded blindside waterproofing for application to prepared substrates.
  - .2 Drainage boards and composites.
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 03 30 00 - Cast-in-Place Concrete for forms, water stops, and concrete placement.
  - .2 Division 31, for excavating and backfilling and excavation support and protection for permanent below-grade support systems that require blind-side waterproofing.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply.
- 1.3.2 ASTM International (ASTM)
  - .1 ASTM C578: Standard Specification for Rigid, Cellular Polystyrene Thermal Insulation
  - .2 ASTM D412: Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers-Tension

- .3 ASTM D570: Standard Test Method for Water Absorption of Plastics
  - .4 ASTM D903: Standard Test Method for Peel or Stripping Strength of Adhesive Bonds
  - .5 ASTM D1876: Standard Test Method for Peel Resistance of Adhesives (T-Peel Test)
  - .6 ASTM D1970: Standard Specification for Self-Adhering Polymer Modified Bituminous Sheet Materials Used as Steep Roofing Underlayment for Ice Dam Protection
  - .7 ASTM D5147: Standard Test Methods for Sampling and Testing Modified Bituminous Sheet Material
  - .8 ASTM D5385: Standard Test Method for Hydrostatic Pressure Resistance of Waterproofing Membranes
  - .9 ASTM D6506: Standard Specification for Asphalt Based Protection Board for Below-Grade Waterproofing
  - .10 ASTM E96: Standard Test Methods for Gravimetric Determination of Water Vapor Transmission Rate of Materials
  - .11 ASTM E154: Standard Test Methods for Water Vapor Retarders Used in Contact with Earth Under Concrete Slabs, on Walls, or as Ground Cover
- 1.3.3 International Organization for Standardization (ISO)
- .1 ISO 14025: Environmental labels and declarations — Type III environmental declarations — Principles and procedures

## **1.4 Administrative Requirements**

- 1.4.1 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site before beginning work on this Section to coordinate activities with related Subcontractors.
- .1 Notification: Where Consultant attendance is required; minimum 72 hour notice is required.
  - .2 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Review all project drawings to determine if the proposed details can be constructed as intended by the designer/specifier. Consider requiring a performance mock-up to validate the performance of the system. Read more about performance mock-ups [here](#).
    - .3 Examine system specifications.

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**07 13 33  
Bonded Blindside Sheet  
Waterproofing**

- .4 Verify each material selection and confirm product compatibility.
- .5 Inspect construction details; focus on tie-in areas.
- .6 Determine sequence for installation for various materials including concrete pour, insulation, blindside waterproofing and drainage boards.
- .7 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for bonded blindside sheet waterproofing work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Show locations and extent of waterproofing and details of substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, and other termination conditions.
- 1.5.4 Environmental and Material Transparency:
  - .1 Embodied Carbon / EPDs: When available, Submit EPDs conforming to ISO 14025 or equivalent standard; prioritize products with such documentation when choices are at Contractor's option.
  - .2 Material Ingredient Disclosure: When available, submit documentation identifying chemical inventories of materials to at least 0.1% (1000ppm) in accordance with HPD Open Standard, Cradle to Cradle (Basic v2/Bronze v3), ILFI Declare, or equivalent standard; products with such documentation when choices are at Contractor's option.
- 1.5.5 Certification Letter: Submit certification letter from waterproofing manufacturer confirming waterproofing materials supplied under this Section comply with requirements outlined in geotechnical report. Manufacturer must demonstrate acknowledgment of requirements set out in geotechnical and hydrogeological reports.

---

**1.6     Closeout Submittals**

- 1.6.1 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.7     Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with sufficient experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- .1 Installer must be trained and certified by waterproofing manufacturer. Submit proof of certification upon request.
- 1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.7.4 First Installation Review: Construct sample installations to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
- .2 Size: 9.3 sq. m (100 sq. ft.) in area.
- .3 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain such sample installations during construction in undisturbed condition.
- .4 Reviewed Sample Installations: may become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they comply with requirements outlined in Contract Documents.

**1.8     Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle bonded blindside sheet waterproofing materials in accordance with manufacturer's written instructions. deliver materials to site in original factory packaging, labelled with manufacturer's name and address. Store materials in off-ground, in clean, dry, well-ventilated area. Replace defective or damaged materials with new.

---

**1.9     Field Conditions**

1.9.1 Environmental Restrictions: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate.

.1 Do not apply waterproofing in snow, rain, fog, or mist.

1.9.2 Maintain adequate ventilation during preparation and application of waterproofing materials.

**1.10    Warranty**

1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of bonded blindside sheet waterproofing that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

.1 Warranty Period: Not less than 10 years from date of Substantial Performance of The work.

**2 .    PRODUCTS**

**2.1     Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 Carlisle Coatings and Waterproofing
- .2 GCP Applied Technologies
- .3 Henry Company Canada
- .4 Soprema Canada
- .5 Tremco Inc.
- .6 W.R Meadows

**2.2     Performance / Design Criteria**

2.2.1 Description: waterproofing membrane designed to form permanent mechanical or adhesive bond with fresh concrete.

2.2.2 Compatibility between components of waterproofing system is essential. Do not allow waterproofing materials to come in contact with chemically incompatible materials.

2.2.3 Acceptable Technologies: SBS sheet membrane or HDPE membrane or HDPE / Bentonite membrane. Final product selection and technology to be based on requirements outlined in

geotechnical and hydrogeological report. Supply required accessories, tapes, preformed shapes and auxiliary materials required for a complete waterproofing assembly.

**2.3      Bonded Blind-Side Waterproofing – Vertical Applications**

**2.3.1    Material Tag: This item is indicated as “WPM-2” on Drawings and Schedules.**

**2.3.2    General Performance Requirements:**

- .1 Low-Temperature Flexibility: Pass at -25°C (-13°F); ASTM D1970 or equivalent to CAN/CGSB-51.33.
- .2 Peel Adhesion to Concrete: 880 N/m (5 lbf/in.) minimum; ASTM D903; modified.
- .3 Lap Adhesion: Minimum: 880 N/m (5 lbf/in); ASTM D1876, modified.
- .4 Hydrostatic-Head Resistance: Minimum: 70 m (230 feet); ASTM D5385.
- .5 Lateral Water Migration Resistance: Pass at 70 m (230 feet) hydrostatic pressure; ASTM D5385, modified.
- .6 Puncture Resistance: 445 N (100 lbf) minimum; ASTM E154.
- .7 Water Vapour Permeance: Maximum: 5.1 ng/Pa x s x sq. m (0.09 perms); ASTM E96/E 96M (Water Method).
- .8 Water Absorption: Maximum: 0.2% weight gain after 48 hours of immersion at 21°C (70°F); ASTM D570.
- .9 Ultimate Elongation: Minimum: 300%.; D412, Die C (modified).
- .10 Thickness: Manufacturer's standard thicknesses required to meet performance criteria outlined in this Section. Generally, provide thicker membranes in horizontal applications.

**2.3.3    Acceptable Products – Vertical Applications:**

- .1 “Preprufe 160R” by GCP Applied Technologies
- .2 "Pre-Applied Waterproofing Membrane – HYDRASTOP " by W.R Meadows
- .3 "Colphene BSW Plus V" and “Colphene Flam 180” by Soprema Canada Inc.
- .4 “MIRAPLY-V” by Carlisle Coatings and Waterproofing
- .5 “Blueskin Preseal 320” and “Blueskin Preseal 435” by Henry Company Canada

**2.3.4    Alternative Bentonite System will also be considered acceptable as follows:**

- .1 Basis-of-design Products: “Voltex DS” by CETCO Building Materials Group.

---

**2.4     Bonded Blind-Side Waterproofing – Horizontal Applications**

**2.4.1     Material Tag: This item is indicated as “WPM-2” on Drawings and Schedules.**

**2.4.2     General Performance Requirements:**

- .1 Low-Temperature Flexibility: Pass at -25°C (-13°F); ASTM D1970 or equivalent to CAN/CGSB-51.33.
- .2 Peel Adhesion to Concrete: 880 N/m (5 lbf/in.) minimum; ASTM D903; modified.
- .3 Lap Adhesion: Minimum: 880 N/m (5 lbf/in); ASTM D1876, modified.
- .4 Hydrostatic-Head Resistance: Minimum: 70 m (230 feet); ASTM D5385.
- .5 Lateral Water Migration Resistance: Pass at 70 m (230 feet) hydrostatic pressure; ASTM D5385, modified.
- .6 Puncture Resistance: 445 N (100 lbf) minimum; ASTM E154.
- .7 Water Vapour Permeance: Maximum: 5.1 ng/Pa x s x sq. m (0.09 perms); ASTM E96/E 96M (Water Method).
- .8 Water Absorption: Maximum: 0.2% weight gain after 48 hours of immersion at 21°C (70°F); ASTM D570.
- .9 Ultimate Elongation: Minimum: 300%; D412, Die C (modified).
- .10 Thickness: Manufacturer's standard thicknesses required to meet performance criteria outlined in this Section. Generally, provide thicker membranes in horizontal applications.

**2.4.3     Acceptable Products – Horizontal Applications:**

- .1 "Preprufe 300R Plus Membrane" by GCP Applied Technologies
- .2 "Underslab Waterproofing Membrane - PRECON" by W.R Meadows
- .3 "Colphene BSW Plus H" and "Colphene Flam 180" as required for hydrostatic conditions and water table location by Soprema Canada Inc.
- .4 "MIRAPLY-H" by Carlisle Coatings and Waterproofing
- .5 "Blueskin Preseal 320" (mud slab required) or Blueskin Preseal 435" by Henry Company Canada

**2.4.4     Alternative Bentonite System will also be considered acceptable as follows:**

- .1 Basis-of-design Products: "Voltex DS" by CETCO Building Materials Group.

---

**2.5     Auxiliary Materials**

- 2.5.1 Supply auxiliary materials recommended by waterproofing manufacturer for intended use and compatible with sheet waterproofing.
- .1 Supply liquid-type auxiliary materials that comply with VOC limits of authorities having jurisdiction.
- 2.5.2 Primer: Liquid primer recommended for substrate by sheet-waterproofing material manufacturer.
- 2.5.3 Surface Conditioner: Liquid, waterborne surface conditioner recommended for substrate by sheet-waterproofing material manufacturer.
- 2.5.4 Liquid Membrane: Elastomeric, two-component liquid, cold fluid applied, of trowel grade or low viscosity.
- 2.5.5 Substrate Patching Membrane: Low-viscosity, two-component, modified asphalt coating.
- 2.5.6 Metal Termination Bars: Aluminum bars, approximately 25 by 3 mm (1 by 1/8 inch) thick, predrilled at 229-mm (9-inch) centers.
- 2.5.7 Protection board: ASTM D6506, semirigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners and as follows:
- .1 Thickness: 3 mm (1/8 inch), nominal, for vertical applications; 6 mm (1/4 inch), nominal, elsewhere.
- .2 Adhesive: Rubber-based solvent type recommended by waterproofing manufacturer for protection board type.
- 2.5.8 Mastic, Adhesives, and Detail Tape: Liquid mastic and adhesives, and adhesive tapes recommended by waterproofing manufacturer for covering cut edges, roll ends, penetrations and detailing.
- 2.5.9 Waterstop: Manufacturer's recommended hydrophilic waterstop for non-moving concrete construction joints. Coordinate with Division 03.
- 2.5.10 Preformed soil retention wall tieback cover: Manufacturer's recommended prefabricated detail for soil retention wall tiebacks.
- 2.5.11 Drainage Board: composite drainage board consisting of studded, non-biodegradable, molded-plastic-sheet drainage core with nonwoven, needle-punched geotextile facing laminated to one side of the core and polymeric film on other side.
- .1 Acceptable Products – Vertical Applications:
- .1 "DB 6200" by Henry Canada
- .2 "CCW MiraDRAIN 6000" by Carlisle Coatings & Waterproofing Inc.;
- .3 "Hydroduct 220" by GCP Applied Technologies Inc.

- .4 "Mel-Drain" by W.R Meadows
- .5 "Sopradrain 10G" by Soprema Inc.,
- .6 "Delta-drain 6000" by Cosella-Dorken Products Inc
- .2 Acceptable Products – Horizontal Applications:
  - .1 "CCW MiraDRAIN 9000" or "CCW MiraDRAIN 9900" by Carlisle Coatings & Waterproofing Inc..
  - .2 "Hydrodrain 700" by Hydrotech Membrane Corp.
  - .3 "DB 9000" by Henry Company.
  - .4 "Sopradrain 18-G" by Soprema Canada
  - .5 Approved equivalent.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
  - .1 Verify that concrete has cured and aged for minimum time period recommended in writing by waterproofing manufacturer.
  - .2 Verify that substrate is visibly dry and within the moisture limits recommended in writing by manufacturer. Test for capillary moisture by plastic sheet method according to ASTM D4263.
  - .3 For horizontal applications, verify that compacted subgrade is dry, smooth, sound, and ready to receive waterproofing sheet.
  - .4 For vertical applications, use concrete, plywood, insulation or other approved facing to sheet piling to provide support to membrane. Ensure board systems such as timber lagging are close butted to provide support and not more than 12 mm (1/2 inch) out of alignment.

#### **3.2 Surface Preparation**

- 3.2.1 Manufacturer's instructions: Comply with ASTM D4258 and with manufacturer's written instructions with regard to cleaning, treatment, and preparation of substrates. Ensure substrates are free of dust and are dry before applying waterproofing.
- 3.2.2 Ensure substrate is smooth, firm, and devoid of substances like mud, loose mortar, wires, fins, metal projections, or any obstructions that hinder membrane placement.

- 3.2.3 Contaminant Removal: Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
- 3.2.4 Irregularities:
  - .1 Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
  - .2 Use manufacturer's recommended products and accessories to bridge gaps or misalignments before applying waterproofing membranes.
  - .3 On wood lagging walls, maintain gaps no larger than 13 mm (1/2 inch) unless otherwise specified by manufacturer's instructions.
- 3.2.5 Install drainage boards as required by Drawings or manufacturer's instructions.

### **3.3 Installation**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Horizontal Substrates: Apply waterproofing membrane on prepared concrete mud slabs, or compacted earth or crushed stone. Where required to tie in to vertical waterproofing systems, turn membrane up inside face of slab formwork to attain a fully bonded system and allow tie-in to vertical waterproofing systems after removal of formwork.
- 3.3.3 Vertical Substrates: Apply waterproofing membrane to permanent formwork or lagging. Use appropriate mechanical fasteners at top of membrane at maximum 460 mm (18") on center or other method recommended by manufacturer to secure membrane.
- 3.3.4 Overlap and Sealing: Where sheet membranes are used, provide minimum 75 mm (3 inches) overlap between sheets. Stagger end laps as required by manufacturer's instructions. For roll ends and cut edges provide consistent 75 mm (3 inch) overlap.
- 3.3.5 Corners and Penetrations: Comply with ASTM D6135 and manufacturer's instructions.
- 3.3.6 Membrane Repair: Inspect membrane prior to commencing other construction processes. Clean contaminated areas and repair punctures or other damages with manufacturer's recommended tapes or membrane patches. Provide minimum 75 mm (3 inch) overlap.

- 3.3.7 Concrete Pour and Formwork Removal: Comply with manufacturer's recommended timelines for pouring concrete and protecting membranes.
- 3.3.8 Remove and replace applications of materials where inspection indicates that it does not comply with specified requirements.

### **3.4      Field Quality Control**

- 3.4.1 Engage a site representative qualified by waterproofing membrane manufacturer to inspect substrate conditions, surface preparation, membrane application, flashings, protection, and drainage components, and to supply reports to Consultant.
- 3.4.2 At minimum, ensure site representative is present on site at start of activities, 50% completion, and 90% completion.
- 3.4.3 Independent Inspection Company: Owner may engage an independent inspection service to ensure waterproofing materials installation complies with contract documents, manufacturer's guidelines, and site-specific requirements. Inspection Company to produce and provide reports and digital photographs from each inspection to Contractor, waterproofing installer, material manufacturer, and Consultant.
  - .1 Scope of inspections: must cover substrate examination, start of waterproofing installation, regular verifications, and final assessment before concrete or backfill is applied.
- 3.4.4 Correction: Correct deficient applications not passing tests and inspections, make necessary repairs, and retest as required to demonstrate compliance with requirements.
- 3.4.5 Perform additional testing and inspecting, at Contractor's expense, to determine compliance of replaced or additional work with specified requirements.

### **3.5      Protection**

- 3.5.1 Protect bonded blindside sheet waterproofing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.5.2 Do not permit foot or vehicular traffic on unprotected membrane.
- 3.5.3 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.5.4 Promptly replace bonded blindside sheet waterproofing work damaged during construction that cannot be satisfactorily repaired.

**3.6     Cleaning And Waste Management**

- 3.6.1    Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.6.2    Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the polymer modified cement waterproofing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Flexible polymer-modified cement waterproofing for application to cisterns and similar water-retention structures.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.

- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for polymer modified cement waterproofing work specified in this Section.
- 1.5.3 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.4 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.5 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:

- .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
- .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).

**1.6      Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.7      Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.7.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Size: 9.3 sq. m (100 sq. ft.) in area.
  - .3 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .4 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.8      Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.

- 1.8.2 Deliver, store and handle polymer modified cement waterproofing materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

**1.9 Project Conditions**

- 1.9.1 Weather Limitations: Proceed with application only when existing and forecasted weather conditions permit polymer-modified cement waterproofing to be performed according to manufacturer's written instructions.
  - .1 Do not apply waterproofing in snow, rain, fog, or mist.
- 1.9.2 Maintain adequate ventilation during preparation and application of waterproofing materials.
- 1.9.3 Ambient Conditions: Proceed with waterproofing work only when temperature is at least 5 deg C (40°F) and rising during work and curing periods. Ensure spaces are well-ventilated and free of water.

**1.10 Warranty**

- 1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of bonded blindside sheet waterproofing that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Warranty Period: Not less than 5 years from date of Substantial Performance of The work.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
  - .1 Durex
  - .2 Sika Canada Inc.
  - .3 W.R. Meadows Inc., Canada
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

---

**2.2     Performance / Design Criteria**

- 2.2.1 Waterproofing System Integrity: Ensure compatibility between waterproofing system components. Do not allow waterproofing materials to touch chemically incompatible substances.
- 2.2.2 VOC Content and Emissions:
- .1 VOC Emissions: For applicable items in this Section, comply with CDPH Standard Method v1.2–2017 (CA Spec 01350) and ensure products are certified per UL 2818, SCS Global Gold, or equivalent.
  - .2 VOC Content Requirements: Wet-applied materials used in scope of this Section must conform to the following:
    - .1 Paints and Coatings: SCAQMD Rule 1113 or CARB SCM.
    - .2 Adhesives and Sealants: SCAQMD Rule 1168.
    - .3 Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

**2.3     Flexible Cementitious Waterproofing**

- 2.3.1 Material Tag: This item is noted as “WPM-3” on Drawings and Schedules.
- 2.3.2 Two-component fiber-reinforced, highly flexible, breathable cementitious slurry designed for positive and negative waterproofing of concrete structures such as water-containing tanks, reservoirs, cisterns and similar elements. System must be vapour permeable.
- 2.3.3 General Performance Requirements:
- .1 Water Permeability: No leakage at 30 m (98.4 feet) hydraulic head; TTP 1411 or CE CRD-C 48.
  - .2 Water Vapour Permeance (ASTM E96): Minimum 697 ng/Pa.s.m<sup>2</sup> (12.8 perms); water method.
  - .3 Elongation: Not less than 20% per ASTM C190 or ASTM D412.
  - .4 Crack Spanning: Must be capable of spanning 1.6 mm (63 mils) cracks.
  - .5 Potable Water Containment: NSF/ANSI Standard 61 for potable water use.
- 2.3.4 Basis-of-Design Product: “Cem-Kote Flex ST” by W.R. Meadows Inc., Canada.
- .1 Acceptable Equivalents:
    - .1 “ECTOFLEX” by Durex.
    - .2 “SikaTop Seal-107” by Sika Canada

## **2.4     Accessory Materials**

### **2.4.1   Mesh and Fabrics:**

- .1   Reinforcing Mesh: Manufacturer's standard polymeric reinforcing fabric specifically designed for reinforcing cementitious coatings.
- .2   Crack Treatment Mesh: Manufacturer's standard polymeric reinforcing fabric specifically designed for treating and detailing cracks.

### **2.4.2   Mortars:**

- .1   Bonding Mortar: Manufacturer's standard cementitious bonding mortar suitable for improving bond at coves, protrusions and other locations recommended by manufacturer.
- .2   Patching Mortar: Manufacturer's standard cementitious repair mortar suitable for filling tie holes, honeycombs, reveals, and imperfections.
- .3   Plugging Mortar: Manufacturer's standard hydrophobic cementitious mortar. System must be vapour permeable while demonstrating resistance to liquid water. Do not use on surfaces exposed to vehicular traffic.
- .4   Finishing Mortar: Manufacturer's standard cementitious finish mortar recommended by manufacturer.

### **2.4.3   Portland Cement: CAN/CSA-A3001, Type GU.**

### **2.4.4   Sand: ASTM C144, ASTM C33 or CAN/CSA A3000 as recommended by manufacturer.**

### **2.4.5   Water: Potable.**

## **3 .     EXECUTION**

### **3.1     Examination**

- #### **3.1.1   Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.**
- .1   Verify that concrete has cured and aged for minimum time period recommended in writing by waterproofing manufacturer.
  - .2   Verify that substrate is visibly dry and within the moisture limits recommended in writing by manufacturer. Test for capillary moisture by plastic sheet method according to ASTM D4263.

### **3.2     Surface Preparation**

- #### **3.2.1   Manufacturer's instructions: Comply with ASTM D4258 and with manufacturer's written instructions regarding cleaning, treatment,**

and preparation of substrates. Ensure substrates are free of dust and are dry before applying waterproofing.

- 3.2.2 Ensure substrate is smooth, firm, and devoid of substances like mud, loose mortar, wires, fins, metal projections, or any obstructions that hinder membrane placement.
- 3.2.3 Contaminant Removal: Remove grease, oil, bitumen, form-release agents, paints, curing mortars, and other penetrating contaminants or film-forming coatings from concrete.
- 3.2.4 Do not allow waterproofing, patching, and plugging materials to enter reveals or annular spaces intended for resilient sealants or gaskets, such as joint spaces between pipes and pipe sleeves.
- 3.2.5 Stop active water leaks with plugging mortar according to waterproofing manufacturer's written instructions.
- 3.2.6 Repair damaged or unsatisfactory substrate with patching mortar according to manufacturer's written instructions.
- 3.2.7 Conduct bond test in accordance with manufacturer's according to manufacturer's written instructions.
- 3.2.8 Wash substrates with water before applying cementitious coating. Allow surfaces to reach saturated surface dry (SSD) state after washing.

### **3.3     Application**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Treatment of Joints and Cracks:
  - .1 Comply with ASTM D4258 unless indicated otherwise.
  - .2 Treat joints and cracks using reinforced flexible cementitious coating in accordance with manufacturer's instructions.
- 3.3.3 Corners, Flashings, and Protrusions Treatment: Comply with manufacturer's instructions for corners and protrusions treatment. Provide reinforcing as required.
- 3.3.4 Mixing: Mix two-component waterproofing system with water using mechanical mixer or manual mixing and as directed by manufacturer's instructions.
  - .1 Consistency: Ensure mixture reaches lump-free, homogeneous consistency. Comply with manufacturer's specified water-to-powder ratio. Do not overmix or add excessive water.
- 3.3.5 Apply in two coats as follows:

- .1 First coat: Use brush or roller to eliminate pinholes. Apply to thickness of 0.8 mm (1/32 in).
  - .2 Second coat: Use brush, roller, or spray. Apply to thickness of 0.8 mm (1/32 in).
  - .3 Achieve total application thickness of 1.6 mm (1/16 inch).
  - .4 Wait minimum of 30 minutes between coats or as recommended by manufacturer.
  - .5 Dampen surface between coats to protect against surface water evaporation.
  - .6 Final finish: smooth troweled.
- 3.3.6 Curing: Air-cure cementitious coating for minimum of 72 hours at 20 deg C (68 deg F) and 70-80% relative humidity before filling with water, or follow manufacturer's recommendations.
- 3.3.7 Extensions of Waterproofing Treatment:
- .1 Where columns are integral with walls scheduled to be waterproofed: extend for full height of column.
  - .2 For intersections of non-waterproofed interior walls and exterior walls receiving waterproofing: extend minimum of 600 mm (24 inches) onto interior walls.
  - .3 For locations where only horizontal surfaces are to be waterproofed: extend upward for minimum of 300 mm (12 inches) onto adjacent walls and columns.
  - .4 Water all surfaces within designated waterproofing areas, including trenches, chases, pits, and similar elements.

### **3.4 Field Quality Control**

- 3.4.1 Engage a site representative qualified by waterproofing membrane manufacturer to inspect substrate conditions, surface preparation, membrane application, flashings, protection, and drainage components, and to supply reports to Consultant.

### **3.5 Protection**

- 3.5.1 Protect polymer-modified cement waterproofing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.5.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or processes that can damage finishes, surfaces, or construction.
- 3.5.3 Promptly replace polymer-modified cement waterproofing work damaged during construction that cannot be satisfactorily repaired.

**3.6     Cleaning And Waste Management**

- 3.6.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.6.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.6.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the Crystalline waterproofing admixture work specified herein. This includes, but is not necessarily limited, to:
  - .1 Crystalline waterproofing admixture for application to elevator pits, sump pits and other locations noted on Drawings.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.

- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for Crystalline waterproofing admixture work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include manufacturer's standard details for treating substrate joints and cracks, flashings, penetrations, and other termination conditions.
- 1.5.4 Test Reports: Submit test reports from accredited independent laboratories confirming that the waterproofing system meets the performance requirements specified.
- 1.5.5 Mix Designs: Obtain mix designs from Section 03 30 00 and comply with administrative and submittal procedures referenced therein to ensure proper coordination of crystalline waterproofing admixture with concrete pour.
- 1.5.6 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

1.5.7 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:

- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
- .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

## **1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Warranty Documentation: Submit copy of extended warranties specified in this Section.

## **1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Manufacturer must be ISO 9001 certified and have a minimum of 10 years' experience in producing crystalline waterproofing additives. Manufacturer must provide field service representation during construction. Manufacturers unable to provide field support or performance test data as specified will not be considered.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

## **1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle Crystalline waterproofing admixture materials in accordance with manufacturer's written instructions.
- 1.8.3 deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

**1.9 Project Conditions**

1.9.1 Weather Limitations: Proceed with application only when existing and forecasted weather conditions permit Crystalline waterproofing admixture to be performed according to manufacturer's written instructions.

.1 Do not apply waterproofing in snow, rain, fog, or mist.

1.9.2 Maintain adequate ventilation during preparation and application of waterproofing materials.

1.9.3 Ambient Conditions: Proceed with waterproofing work only when temperature is at least 5 deg C (40°F) and rising during work and curing periods. Ensure spaces are well-ventilated and free of water.

**1.10 Warranty**

1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of bonded blindside sheet waterproofing that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

.1 Warranty Period: Not less than 5 years from date of Substantial Performance of The work.

.2 Warranty scope: Materials and workmanship.

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

.1 Euclid Canada.

.2 Kryton International

.3 Xypex Chemical Corporation.

.4 Penetron International Ltd.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Performance / Design Criteria**

2.2.1 Waterproofing System Integrity: Ensure compatibility between waterproofing system components. Do not allow waterproofing materials to touch chemically incompatible substances.

- 2.2.2 Compatibility: It is the responsibility of Contractor to verify compatibility of the crystalline additive with other admixtures or additives used in concrete mix. Coordinate with Section 03 30 00.

## **2.3 Crystalline Waterproofing Admixture**

- 2.3.1 Description: crystalline waterproofing and protection system that chemically forms a non-soluble crystalline structure within the concrete pores and capillaries. This system must seal concrete against liquid penetration from any direction and protect against environmental deterioration. The additive must include a Visual Detection System (VDS) to confirm its presence in hardened concrete.
- 2.3.2 Permeability Testing:
- .1 CRD-C48 Mod: Treated concrete samples must exhibit no measurable leakage when pressure tested to 1.05 MPa (150 psi) after 5 days.
  - .2 EN 12390-8: Treated samples must demonstrate an 80% reduction in permeability coefficient when exposed to 0.5 MPa of water pressure for 72 hours.
- 2.3.3 Sulfuric Acid Resistance: Independent testing must confirm that treated samples exhibit significantly lower mass loss compared to control samples when exposed to 7% sulfuric acid until the control sample reaches a 50% mass loss.
- 2.3.4 Sulfate Resistance: Independent testing must confirm that treated samples exhibit significantly lower mass loss compared to control samples after immersion in a concentrated sulfate solution for a minimum of 4 months.
- 2.3.5 Compressive Strength: At 28 days, treated concrete samples must exhibit equal or increased compressive strength compared to untreated control samples.
- 2.3.6 Potable Water Approval: The waterproofing material must have current, valid certification from NSF (NSF 61), DWI, or another recognized agency.
- 2.3.7 Visual Detection System (VDS): The additive must include a non-soluble Visual Detection System, detectable in hardened concrete for at least 6 months after casting.
- 2.3.8 Basis-of-Design Product: "C-500 Series" by Xypex

## **2.4 Mixing**

- 2.4.1 Add crystalline waterproofing additive to concrete at the time of batching. Comply with the manufacturer's instructions for dosage rate.

- 2.4.2 Adjust dosage based on project-specific conditions, such as enhanced chemical protection, or when using high percentages of supplementary cementitious materials. Consult with manufacturer for required dosage recommendations.

## **2.5 Accessory Materials**

### **2.5.1 Mortars:**

- .1 Patching Mortar: Manufacturer's standard cementitious repair mortar suitable for filling tie holes, honeycombs, reveals, and imperfections.
- .2 Plugging Mortar: Manufacturer's standard cementitious mortar.
- .3 Waterstops: Manufacturer's recommended PVC or expandable types. Coordinate with Division 03.

### **2.5.2 Portland Cement: CAN/CSA-A3001, Type GU.**

### **2.5.3 Sand: ASTM C144, ASTM C33 or CAN/CSA A3000 as recommended by manufacturer.**

### **2.5.4 Water: Potable.**

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

### **3.2 Application**

- 3.2.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Add crystalline waterproofing additive to the concrete at the time of batching. Ensure thorough mixing for a homogeneous distribution. Do not add dry powder directly to wet mixed concrete.
- 3.2.3 Construction and Cold Joints: Apply a slurry coat of crystalline concentrate to joint surfaces between concrete pours. Moisten surfaces prior to application and keep moist for 12 hours.
- 3.2.4 Sealing Strips: Apply sealing strips at construction joints where hydrostatic conditions exist. Follow manufacturer's instructions for groove preparation and application.

3.2.5 Form Tie Holes: Waterproof form tie holes in accordance with manufacturer's technical literature. Prepare and profile the area around the tie hole and fill with appropriate materials.

3.2.6 Repair of Defects: Repair cracks, construction joints, rock pockets, and other defects using manufacturer's recommended methods.

**3.3 Placing Concrete**

3.3.1 Comply with requirements of Section 03 30 00.

**3.4 Protection**

3.4.1 Protect installed product and finished surfaces from damage during construction.

3.4.2 Ensure compatibility of treated concrete with subsequently applied materials.

**3.5 Field Quality Control**

3.5.1 Conduct VDS examination within 28 days of placement. Alternatively, perform VDS evaluation on test specimens in a laboratory setting.

3.5.2 Examination for Defects: Inspect treated concrete for defects before covering. Repair identified defects in accordance with manufacturer's procedures.

3.5.3 Testing Procedure for Tanks and Foundation Work:

- .1 Testing: Fill tanks or expose foundation works to service conditions as soon as possible to monitor for leaks.
- .2 Monitoring: Monitor for self-healing of cracks and joints. Repair joints and cracks that do not self-heal using appropriate methods.
- .3 Repair: Repair static cracks or joints that fail to self-heal using manufacturer's recommended methods.

**END OF SECTION**

## **1 . GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the interior pedestrian traffic coatings work specified herein. This includes, but is not necessarily limited, to:
  - .1 Traffic coatings consisting of waterproofing membrane and top coats for interior pedestrian traffic for application in mechanical rooms, service rooms and similar locations.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.

- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for pedestrian traffic coatings work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include manufacturer's standard details for treating substrate joints and cracks, flashings, penetrations, and other termination conditions.
- 1.5.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:

- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.6 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:
- .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
  - .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).
- 1.5.7 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
- .1 As a minimum submit samples of the following: Provide stepped samples on backing large enough to illustrate buildup of pedestrian traffic coatings.

## **1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Maintenance Data: Submit maintenance data for pedestrian traffic coatings to include in maintenance manuals.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

## **1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and

secondary materials from sources recommended by manufacturers of primary materials.

- 1.7.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Apply each coating to at least 10 sq. m (100 sq. ft.) of each substrate to demonstrate surface preparation, joint and crack treatment, thickness, texture, colour, and standard of workmanship.
  - .3 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .4 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle pedestrian traffic coatings materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

**1.9 Project Conditions**

- 1.9.1 Weather Limitations: Proceed with application only when existing and forecasted weather conditions permit traffic coating to be performed according to manufacturer's written instructions.
  - .1 Do not apply traffic coating in snow, rain, fog, or mist.
- 1.9.2 Ambient Conditions: Proceed with traffic coating work only when temperature is at least 5 deg C (40°F) and rising during work and curing periods. Maintain adequate ventilation during preparation and application of traffic coating materials.
- 1.9.3 Do not install pedestrian traffic coating until items that will penetrate membrane have been installed.

---

**1.10 Warranty**

1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of pedestrian traffic coatings that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

- .1 Warranty Period: Not less than 2 years from date of Substantial Performance of The work.
- .2 Warranty scope: Materials and workmanship.

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 Sika Canada Inc.
- .2 Soprema Canada
- .3 Tremco Inc.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Performance / Design Criteria**

2.2.1 Waterproofing System Integrity: Ensure compatibility between waterproofing system components. Do not allow waterproofing materials to touch chemically incompatible substances.

2.2.2 Membrane Performance: ASTM C957, elastomeric traffic-bearing waterproofing membrane designed to withstand pedestrian traffic and stop water penetration under pressure.

2.2.3 Minimum crack bridging capabilities: 1.5 mm (1/16").

2.2.4 Diesel Fuel Resistance: For areas where traffic coating membrane will be exposed to diesel fuel, apply additional chemical-resistant protective coated to resist diesel fuel-induced damage.

2.2.5 Dynamic Coefficient of Friction (DCOF): system must exhibit minimum DCOF of 0.42 (wet), in accordance with ANSI A137.1 when tested with BOT 3000 Digital Tribometer.

2.2.6 Static Coefficient of Friction (SCOF): system must exhibit minimum SCOF of 0.6 in accordance with ASTM D2047.

- 2.2.7 Fire testing results: Minimum Flame-Spread Value of 25 or less and Smoke-Developed Value of 450 or less when tested in accordance with CAN/ULC S102.2.
- 2.2.8 Material Compatibility: Provide primers; base, intermediate, and topcoats; and miscellaneous materials that are compatible with one another and with substrate under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.
- 2.2.9 VOC Content and Emissions:
  - .1 VOC Content Requirements: Wet-applied materials used in scope of this Section must conform to the following:
    - .1 Paints and Coatings: SCAQMD Rule 1113 or CARB SCM.
    - .2 Adhesives and Sealants: SCAQMD Rule 1168.
    - .3 Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

## **2.3 Interior Pedestrian Traffic Coatings**

- 2.3.1 Material Tag: This item is noted as "SRTC" on Drawings and Schedules.
- 2.3.2 Primer: Manufacturer's standard polyurethane factory-formulated primer recommended for substrate and conditions indicated on Drawings and Schedules.
- 2.3.3 Waterproofing Membrane: two-component, solvent-free, elastomeric and crack bridging polyurethane waterproofing membrane.
  - .1 Thickness: As recommended by manufacturer for substrate and service conditions indicated on Drawings and Schedules, but not less than those indicated (measured excluding aggregate).
- 2.3.4 Topcoat: two-component, water-based epoxy coating suitable for application onto floors, walls, ceilings, machinery and equipment.
  - .1 Thickness: As recommended by manufacturer for substrate and service conditions indicated on Drawings and Schedules, but not less than those indicated (measured excluding aggregate).
  - .2 Colour: As selected at a later from manufacturer's full range.
- 2.3.5 Finish Coat (Chemical-Resistant): Sealing or finish coats. Test specimens of cured pedestrian traffic coating system are unaffected when tested according to ASTM D1308 for 50 percent immersion or

ASTM D543, Procedure A, for immersion or ASTM C267 for immersion.

2.3.6 Aggregate: Manufacturer's recommended Uniformly graded, washed silica sand or Walnut shell granules of particle sizes, shape, and minimum hardness recommended in writing by pedestrian traffic coating manufacturer.

.1 Spreading Rate: As recommended by manufacturer for substrate and service conditions indicated on Drawings and Schedules, but not less than the following:

2.3.7 Basis-of-Design System: "Vulkem 360NF/950NF" by Tremco Canada

.1 Acceptable Equivalents:

.1 "Alsan Trafik" by Soprema

.2 "Epo-Flex Mer II" by Sherwin Williams.

.3 "Kelmar® MERDEK LD" by Kelmar.

.4 "Mapefloor Parking Deck System" by MAPEI Corp.

.5 "Peda-Gard M Pedestrian Traffic Coatings" by Neogard

.6 "Sikafloor® Resoclad MRW Type II" by Sika Canada

## **2.4 Auxiliary Materials**

2.4.1 Joint Sealants: As recommended by traffic coating manufacturer and complying with requirements specified in Section 07 92 00, Joint Sealants.

2.4.2 Adhesive: Contact adhesive recommended in writing by pedestrian traffic coating manufacturer.

2.4.3 Reinforcing Strip: Fiberglass mesh recommended in writing by pedestrian traffic coating manufacturer.

2.4.4 Moisture Vapour Control System: Fluid-applied, two-component epoxy-resin system complying with ASTM F3010 designed to reduce moisture vapour emissions in concrete substrates.

.1 Performance: Capable of suppressing up to 100% RH when tested according to ASTM F2170.

.2 Substrate Primer: Use manufacturer's recommended primer as needed.

.3 Acceptable Products: Approved proprietary moisture control system recommended in writing by floor covering manufacturer and acceptable to Consultant in order to authenticate floor covering warranties.

.4 Alternative: Manufacturer's recommended moisture-tolerant primers may be used in lieu of moisture vapour control system

provided manufacturer approves such use for specific conditions in writing.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Begin coating application only after the following:
  - .1 minimum concrete curing and drying period recommended by pedestrian traffic coating manufacturer has passed,
  - .2 unsatisfactory conditions have been corrected, and
  - .3 surfaces are dry. Verify that substrates are visibly dry and free of moisture.

#### **3.2 Preparation**

- 3.2.1 Manufacturer's instructions: Comply with ASTM C1127 and with manufacturer's written instructions with regards to cleaning, treatment, and preparation of substrates. Ensure substrates are free of dust and are dry before applying traffic coating.
- 3.2.2 Masking: Mask off adjoining surfaces not receiving traffic coating to prevent spillage and overspray affecting other construction. Use patching materials to address substrate imperfections.
- 3.2.3 Irregularities: Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
- 3.2.4 Contaminant Removal: Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete. Do not acid etch.
- 3.2.5 Surface Profile: Roughen concrete using shot-blasting and provide ICRI CSP of 2 or greater as required by manufacturer's written instructions.
- 3.2.6 Concrete Repair: Repair damaged and deteriorated concrete according to pedestrian traffic coating manufacturer's written instructions.
- 3.2.7 Moisture Testing: Perform moisture testing in accordance with ASTM F2170. Verify that concrete substrates are dry and moisture-vapour emissions are within acceptable levels according to manufacturer's written instructions.

- .1 Maximum Permitted Relative Humidity: 75 percent; or as recommended by manufacturer.
- 3.2.8 Joints and Cracks Treatment: Comply with ASTM C1127 unless indicated otherwise. Provide manufacturer's recommended sealant materials.
- 3.2.9 Termination and Penetrations Treatment: Comply with ASTM C1127 for treatment and sealing of traffic coating terminations and penetrations.
  - .1 Apply sealant cants at floor-to-wall joints and penetrations.
  - .2 At movement joints, terminate with a manufacturer's recommended strips.
- 3.2.10 Prepare, fill, prime, and treat joints and cracks in substrates as specified in this Section

### **3.3 Pedestrian Traffic Coating Application**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Apply pedestrian traffic coating material according to ASTM C1127 and manufacturer's written instructions.
- 3.3.3 Primer Application: Prime substrate if required by manufacturer. Apply primer according to manufacturer's instructions.
- 3.3.4 Membrane Preparation: Mix multi-component systems in accordance with manufacturer's instructions. Ensure homogeneous mix free of air bubbles.
- 3.3.5 Membrane Application: Apply membrane to deck by spray gun, notched squeegee, or roller as recommended by manufacturer. Comply with manufacturer's instructions on application method, rate, number and thickness of coats, cure intervals, aggregate application, and cure time.
  - .1 Measure wet film thickness every 9 m<sup>2</sup> (100 ft<sup>2</sup>). Maintain thickness above minimum requirements specified in this Section.
- 3.3.6 Where work stoppage is required and may exceed 1 to 2 hours, terminate membranes in straight line. Prior to resuming, clean and prime (as needed) existing membrane minimum 150 mm (6 in.) from edge. Overlap new membrane 150 mm (6 in.) with existing membrane prior to continuing application.

- 3.3.7 Apply pedestrian traffic coatings to prepared wall terminations and vertical surfaces to height of not less than 100 mm (4 inches). Do not provide aggregate on vertical surfaces. Apply membrane over housekeeping pads as required to ensure continuity of system.
- 3.3.8 Cove Bases: Provide 13mm x 13mm (1/2 in x 1/2 in) cant to internal coves and angles with manufacturer's recommended sealant.
- 3.3.9 Cure pedestrian traffic coatings according to manufacturer's written recommendations. Prevent contamination and damage during application and curing stages.
- 3.3.10 Finish with a top coat and silica aggregate to as required to provide slip resistance.

### **3.4 Field Quality Control**

- 3.4.1 Engage site representative qualified by traffic coating membrane manufacturer to inspect substrate conditions, surface preparation, membrane application, flashings, protection, and drainage components, and to supply reports to Consultant upon completion of installation.
- 3.4.2 Notify Consultant or Owner 48 hours in advance of date and time of inspection.

### **3.5 Protection**

- 3.5.1 Protect pedestrian traffic coatings from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.5.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.5.3 Promptly replace pedestrian traffic coatings work damaged during construction that cannot be satisfactorily repaired.

### **3.6 Cleaning And Waste Management**

- 3.6.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.6.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.6.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the vehicular traffic coatings work specified herein. This includes, but is not necessarily limited, to:
  - .1 Vehicular traffic coatings where noted on Drawings.
  - .2 Pavement markings associated with traffic coatings.
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.

- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for vehicular traffic coatings work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include manufacturer's standard details for treating substrate joints and cracks, flashings, penetrations, and other termination conditions.
  - .2 Provide layout of pavement markings.
- 1.5.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:

- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
- .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.6 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:
  - .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
  - .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).
- 1.5.7 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
  - .1 As a minimum submit samples of the following: Provide stepped samples on backing large enough to illustrate buildup of pedestrian traffic coatings.

## **1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Maintenance Data: Submit maintenance data for pedestrian traffic coatings to include in maintenance manuals.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

## **1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of traffic coatings required for this Project.
- 1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

- 1.7.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Apply each coating to at least 10 sq. m (100 sq. ft.) of each substrate to demonstrate surface preparation, joint and crack treatment, thickness, texture, colour, and standard of workmanship.
  - .3 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .4 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle pedestrian traffic coatings materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

**1.9 Project Conditions**

- 1.9.1 Weather Limitations: Proceed with application only when existing and forecasted weather conditions permit traffic coating to be performed according to manufacturer's written instructions.
- .1 Do not apply traffic coating in snow, rain, fog, or mist.
- 1.9.2 Ambient Conditions: Proceed with traffic coating work only when temperature is at least 5 deg C (40°F) and rising during work and curing periods. Maintain adequate ventilation during preparation and application of traffic coating materials.
- 1.9.3 Do not install vehicular traffic coating until items that will penetrate membrane have been installed.

**1.10 Warranty**

- 1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits

to repair or replace components of vehicular traffic coatings that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

- .1 Warranty Period: Not less than 5 years from date of Substantial Performance of The work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 Sika Canada Inc.
- .2 Soprema Canada
- .3 Tremco Inc.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

2.2.1 Waterproofing System Integrity: Ensure compatibility between waterproofing system components. Do not allow waterproofing materials to touch chemically incompatible substances.

2.2.2 Membrane Performance: ASTM C957 and CSA S413, elastomeric traffic-bearing waterproofing membrane designed to withstand pedestrian traffic and stop water penetration under pressure.

2.2.3 Minimum crack bridging capabilities: 1.5 mm (1/16").

2.2.4 Ensure traffic topping accommodates normal substrate movement and seal expansion and control joints, construction material transitions, opening transitions, penetrations, and perimeter conditions without resultant moisture deterioration.

2.2.5 Diesel Fuel and Cleaning Chemical Resistance: For areas where traffic coating membrane will be exposed to diesel fuel or cleaning chemicals (Vehicle Bay, Pit Stop, Wash Bay, Bypass Bay, Wet Area, etc.), apply additional chemical-resistant protective coated to resist fuel and chemical induced damage.

2.2.6 Snow Plow Resistance: Where membranes are installed on top of parking structure or at any areas where they may be subject to snow plow blades, provide materials complying with CSA S413 and capable of resisting such abrasion.

2.2.7 Fire testing results: Minimum Flame-Spread Value of 25 or less and Smoke-Developed Value of 450 or less when tested in accordance with CAN/ULC S102.2.

- .1 Where membranes are installed on top of parking structure, provide materials complying with Class A ratings in accordance with CAN/ULC-S107.

2.2.8 VOC Content and Emissions:

- .1 VOC Content Requirements: Wet-applied materials used in scope of this Section must conform to the following:
  - .1 Paints and Coatings: SCAQMD Rule 1113 or CARB SCM.
  - .2 Adhesives and Sealants: SCAQMD Rule 1168.
  - .3 Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

**2.3 Traffic Coating – Type 1**

- 2.3.1 Material Tag: This item is noted as “EP-1” on Drawings and Schedules.
- 2.3.2 Primer: Manufacturer's standard factory-formulated primer recommended for substrate and conditions required. Provide moisture-tolerant primers in conditions where slab moisture content is above manufacturer's recommendations after performing testing.
- 2.3.3 Preparatory and Base Coats: Chemical-curing polyurethane-methacrylate (PUMA) modified coating
  - .1 Minimum thickness: As recommended by manufacturer; if not recommended, not less than 80 mils w.f.t. (measured excluding aggregate)
- 2.3.4 Wear Coat: Chemical-curing polyurethane-methacrylate (PUMA) modified coating
  - .1 Minimum thickness: As recommended by manufacturer; if not recommended, not less than 100 mils w.f.t. (measured excluding aggregate)
- 2.3.5 Top Coat: Chemical-curing polyurethane-methacrylate (PUMA) modified coating with UV inhibitors where used in exterior applications.
  - .1 Minimum thickness: As recommended by manufacturer; if not recommended, not less than 30 mils w.f.t. (measured excluding aggregate)
- 2.3.6 Aggregate: Aluminum-oxide grit of particle sizes, shape, and minimum hardness recommended in writing by traffic coating manufacturer.
  - .1 Spreading Rate: As recommended by manufacturer for substrate and service conditions required, but not less than the following: to refusal.

2.3.7 Basis-of-Design: "Vulkem PUMA EWS" by Tremco Canada or approved equivalent as follows:

- .1 "Sikalastic Pronto RB-5700 PUMA" by Sika Canada Inc.
- .2 "Alsan Trafik RS" by Soprema

## **2.4 Fluid-Applied Flooring – Self-Leveling (Traffic Coating – Type 2)**

2.4.1 Material Tag: This item is noted as "EP-2" on Drawings and Schedules.

2.4.2 System Description: Chemical-resistant, self-leveling, resin-based, monolithic flooring system for use over properly prepared concrete substrates.

- .1 System Type: Urethane-cement based.
  - .2 System Classification (ASTM C722): Self-levelling (SL)
    - .1 Minimum compressive strength: 50 MPa (7250 psi) at 7 days; ASTM C579.
    - .2 Minimum tensile strength: 12 MPa (1740 psi) at 7 days; ASTM C307.
    - .3 Minimum flexural strength: 20 MPa (2900 psi) at 7 days; ASTM C580.
    - .4 Maximum shrinkage: 0.5%; ASTM C531.
    - .5 Maximum water absorption: 1.0%; ASTM C413.
    - .6 Minimum coefficient of friction: 0.5; ASTM D2047.
    - .7 Chemical Resistance (spot): ASTM D1308.
    - .8 Fungi Growth (ASTM G21): Minimum Class 1 Rating.
    - .9 Mould Growth (ASTM D3273): Minimum Class 10 Rating.
    - .10 Pull-off Strength: 100% substrate failure in accordance with ASTM D4541 or ACI 503R.
  - .3 Overall System Thickness: 3 mm (1/8 inch)
  - .4 Primer: as recommended by manufacturer.
  - .5 Body/Grout Coats: urethane cement resin complete with manufacturer's standard aggregates.
  - .6 Color and Pattern: As selected by Consultant from manufacturer's full range at a later date
  - .7 Sheen: semi-gloss, unless otherwise indicated.
  - .8 Wearing Surface: Manufacturer's standard wearing surface meeting slip-resistance performance specified herein.
- 2.4.3 Basis-of-Design System:
- .1 Base coat: "TREMfloor SL" by Tremco or approved equivalent.
  - .2 Topcoat: TREMfloor FC or approved equivalent.

---

**2.5     Auxiliary Materials**

- 2.5.1 Joint Sealants: As recommended by traffic coating manufacturer and complying with requirements specified in Section 07 92 00, Joint Sealants.
- 2.5.2 Sheet Flashing: Nonstaining; minimum 1.5 mm (60 mils) thick sheet material recommended in writing by traffic coating manufacturer.
- 2.5.3 Adhesive: Contact adhesive recommended in writing by traffic coating manufacturer.
- 2.5.4 Reinforcing Strip: Fiberglass mesh recommended in writing by traffic coating manufacturer.

**2.6     Pavement Markings**

- 2.6.1 Pavement-Marking Paint: Latex, waterborne emulsion, lead and chromate free, ready mixed, complying with MPI 97 with drying time of less than 45 minutes.
  - .1 Colour: As selected by Consultant at a later date. Use blue for spaces barrier-free parking areas.
  - .2 Basis-of-Design: "Pro-Park" by Sherwin-Williams or approved equivalent.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Begin coating application only after the following:
  - .1 minimum concrete curing and drying period recommended by vehicular traffic coating manufacturer has passed,
  - .2 unsatisfactory conditions have been corrected, and
  - .3 surfaces are dry. Verify that substrates are visibly dry and free of moisture.

**3.2     Preparation**

- 3.2.1 Manufacturer's instructions: Comply with ASTM C1127 and with manufacturer's written instructions with regards to cleaning, treatment, and preparation of substrates. Ensure substrates are free of dust and are dry before applying traffic coating.

- 3.2.2 Masking: Mask off adjoining surfaces not receiving traffic coating to prevent spillage and overspray affecting other construction. Use patching materials to address substrate imperfections.
- 3.2.3 Irregularities: Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
- 3.2.4 Contaminant Removal: Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete. Do not acid etch.
- 3.2.5 Surface Profile: Roughen concrete using shot-blasting and provide ICRI CSP of 2 or greater as required by manufacturer's written instructions.
- 3.2.6 Concrete Repair: Repair damaged and deteriorated concrete according to vehicular traffic coating manufacturer's written instructions.
- 3.2.7 Moisture Testing: Perform moisture testing in accordance with ASTM F2170. Verify that concrete substrates are dry and moisture-vapour emissions are within acceptable levels according to manufacturer's written instructions.
  - .1 Maximum Permitted Relative Humidity: 75 percent; or as recommended by manufacturer.
  - .2 Do not proceed with installation until moisture-related issues are resolved.
- 3.2.8 Joints and Cracks Treatment: Comply with ASTM C1127 unless indicated otherwise. Provide manufacturer's recommended sealant materials.
- 3.2.9 Termination and Penetrations Treatment: Comply with ASTM C1127 for treatment and sealing of traffic coating terminations and penetrations.
  - .1 Apply sealant cants at floor-to-wall joints and penetrations.
  - .2 At movement joints, terminate with a manufacturer's recommended strips.
- 3.2.10 Prepare, fill, prime, and treat joints and cracks in substrates as specified in this Section

### **3.3 Vehicular Traffic Coating Application**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.

- 3.3.2 Apply vehicular traffic coating material according to ASTM C1127 and manufacturer's written instructions.
- 3.3.3 Primer Application: Prime substrate if required by manufacturer. Apply primer according to manufacturer's instructions.
- 3.3.4 Membrane Preparation: Mix multi-component systems in accordance with manufacturer's instructions. Ensure homogeneous mix free of air bubbles.
- 3.3.5 Membrane Application: Apply membrane to deck by spray gun, notched squeegee, or roller as recommended by manufacturer. Comply with manufacturer's instructions on application method, rate, number and thickness of coats, cure intervals, aggregate application, and cure time.
  - .1 Measure wet film thickness every 9 m<sup>2</sup> (100 ft<sup>2</sup>). Maintain thickness above minimum requirements specified in this Section.
- 3.3.6 Where work stoppage is required and may exceed 1 to 2 hours, terminate membranes in straight line. Prior to resuming, clean and prime (as needed) existing membrane minimum 150 mm (6 in.) from edge. Overlap new membrane 150 mm (6 in.) with existing membrane prior to continuing application.
- 3.3.7 Apply pedestrian traffic coatings to prepared wall terminations and vertical surfaces to height of not less than 100 mm (4 inches). Do not provide aggregate on vertical surfaces. Apply membrane over housekeeping pads as required to ensure continuity of system.
- 3.3.8 Cure pedestrian traffic coatings according to manufacturer's written recommendations. Prevent contamination and damage during application and curing stages.
- 3.3.9 Finish with top coat and aggregate as required to provide skid resistance.

### **3.4 Pavement Markings**

- 3.4.1 Do not apply traffic paint for striping and other markings until traffic coating has cured according to manufacturer's written recommendations.
- 3.4.2 Apply traffic paint for striping and other markings with mechanical equipment to produce uniform straight edges. Apply at manufacturer's recommended rates for a 0.38-mm- (15-mil-) minimum wet film thickness.

### **3.5 Field Quality Control**

- 3.5.1 Engage site representative qualified by traffic coating membrane manufacturer to inspect substrate conditions, surface preparation, membrane application, flashings, protection, and drainage

components, and to supply reports to Consultant upon completion of installation.

- 3.5.2 Notify Consultant or Owner 48 hours in advance of date and time of inspection.

**3.6 Protection**

- 3.6.1 Protect vehicular traffic coatings from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.6.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.6.3 Promptly replace vehicular traffic coatings work damaged during construction that cannot be satisfactorily repaired.

**3.7 Cleaning And Waste Management**

- 3.7.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.7.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.7.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the parking slab silane water repellents work specified herein. This includes, but is not necessarily limited, to:
  - .1 Penetrating silane water repellents for application to vehicle bays, loading dock, make ready vestibule and cylinder room.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Refer to 07 18 16 - Vehicular Traffic Coatings for membrane coatings applied to suspended slabs.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.

- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for water repellents work specified in this Section.
- 1.5.3 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.4 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

---

**1.6     Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.

**1.7     Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.7.4 Mock-Ups / First Installation Review: Apply test samples -ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Apply each coating to at least 1 sq. m (10 sq. ft.) of each substrate to demonstrate surface preparation, texture, colour, and standard of workmanship.
  - .3 Purpose: To set benchmarks for installation and to judge subsequent work. To ensure water repellent will not adversely affect concrete substrates.
  - .4 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.8     Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle water repellents materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

---

**1.9     Project Conditions**

1.9.1 Weather Limitations: Proceed with application only when existing and forecasted weather conditions permit traffic coating to be performed according to manufacturer's written instructions.

.1 Do not apply traffic coating in snow, rain, fog, or mist.

1.9.2 Ambient Conditions: Proceed with traffic coating work only when temperature is at least 5 deg C (40°F) and rising during work and curing periods. Maintain adequate ventilation during preparation and application of traffic coating materials.

1.9.3 Ensure concrete surfaces and mortars have cured for minimum of 28 days.

**1.10    Warranty**

1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of water repellents that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

.1 Warranty Period: Not less than 5 years from date of Substantial Performance of The work.

**2 .     PRODUCTS**

**2.1     Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

.1 Evonik Degussa Corporation

.2 Prosoco Inc.

.3 Sika Canada Inc.

.4 W.R. Meadows Inc., Canada

.5 Sherwin Williams

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2     Performance / Design Criteria**

2.2.1 Systems must comply with Alberta Transportation Specifications for Type 1b, or Type 1c.

2.2.2 Solids content range: 25% to 33%.

---

**2.3     Silane Penetrating Water Repellent**

- 2.3.1 Material Tag: This item is noted as “WRP” on Drawings and Schedules.
- 2.3.2 Description: Alkali-resistant, silane-based, hydrophobic penetrating sealer designed to penetrate concrete pores and capillaries to enhance durability and inhibit water and salt penetration in concrete structures. System must have minimum effects on appearance.
- 2.3.3 Basis-of-Design: “SL100 Water Repellent neat” by Prosoco
  - .1 Acceptable Equivalents:
    - .1 “Pentreat 244 40” by W.R. Meadows Inc., Canada
    - .2 “Sikagard® SN-40 Lo VOC” or “Sikagard 740 W” or “Sikagard SN-100” by Sika Canada Inc.
    - .3 “Baracade Silane 100 C” by Euclid Canada
    - .4 “SW-244-100VOC” by Sherwin Williams.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Begin coating application only after the following:
  - .1 minimum concrete curing and drying period recommended by water repellent manufacturer has passed,
  - .2 unsatisfactory conditions have been corrected, and
  - .3 surfaces are dry. Verify that substrates are visibly dry and free of moisture.

**3.2     Preparation**

- 3.2.1 Clean substrate to eliminate substances that might interfere with performance of water repellents. Conduct moisture content test in accordance with water-repellent manufacturer's written instructions.
- 3.2.2 Remove oils, curing compounds, and laitance that may hinder adhesion or penetration of water repellents.
- 3.2.3 Masking: Mask off adjoining surfaces not receiving traffic coating to prevent spillage and overspray affecting other construction.

---

**3.3     Installation**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Consult manufacturer's technical representative if written instructions are not applicable to Project conditions.
- 3.3.3 Number of coats: Minimum two.
  - .1 Horizontal Surfaces: Apply saturation coat to parking garage slabs at rate recommended by manufacturer use roller or low-pressure spray; ensure proper penetration into substrates. Prevent ponding; redistribute or remove excess if necessary.
  - .2 Vertical Surfaces: Apply water repellents at least 100 mm (4 inches) up vertical walls and columns intersection with garage slabs. Saturate surface in single application using spray equipment. Brush heavy runs and drips into surface until full absorption.
  - .3 Second Coat: Apply second coat perpendicular to first, as required by manufacturer. Comply with manufacturer's written instructions for drying time between coats. Do not overapply.

**3.4     Protection**

- 3.4.1 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.4.2 Promptly replace water repellents work damaged during construction that cannot be satisfactorily repaired.

**3.5     Cleaning And Waste Management**

- 3.5.1 After completing water repellent application, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other methods. Do not scratch or damage adjacent finished surfaces.
- 3.5.2 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.5.3 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.5.4 Immediately clean water repellent from adjoining surfaces and surfaces soiled or damaged by water-repellent application as work progresses

- 3.5.5 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

---

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the thermal insulation work specified herein. This includes, but is not necessarily limited, to:
  - .1 Foam-plastic board insulation.
  - .2 Mineral fibre board insulation.
  - .3 Flexible batt / blanket insulation.
  - .4 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.

- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for thermal insulation work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include insulation manufacturer's standard insulation fastening patterns and load tables.
- 1.5.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze

level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.

.2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

1.5.6 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback

#### **1.6 Closeout Submittals**

1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.

1.6.2 Warranty Documentation: Submit copy of extended warranties specified in this Section.

#### **1.7 Quality Assurance**

1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.

1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.

1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

#### **1.8 Delivery, Storage And Handling**

1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.

1.8.2 Deliver, store and handle thermal insulation materials in accordance with manufacturer's written instructions.

1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.

1.8.5 Replace defective or damaged materials with new.

#### **1.9 Warranty**

1.9.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

---

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

.1 Extruded-polystyrene board insulation (XPS)

.1 DuPont de Nemours Inc.

.2 Owens Corning.

.3 Soprema

.2 Glass-Fiber Insulation:

.1 Johns Manville.

.2 Knauf Insulation.

.3 Owens Corning.

.3 Mineral-Wool Insulation

.1 Rockwool Inc.

.2 Thermafiber.

.3 Johns Manville.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

2.2.1 Regulatory Compliance: Provide insulation materials tested and approved by agencies recognized by authorities having jurisdiction. Provide markings to indicate certification.

2.2.2 Combustible Materials: For combustible foam-plastic insulation or flammable vapour retarders, strictly comply with OBC requirements. Generally, combustible foam-plastic insulation and flammable vapour retarders must not be left exposed and must be protected by approved non-combustible thermal barriers.

2.2.3 Insulation in contact with ground: Insulation boards specified in this Section which are in contact with ground must not be affected by the action of soil and water and must behave in such a way that their insulating properties are not substantially reduced by moisture.

2.2.4 Required Insulation Thickness and Assembly R-Values: Refer to Drawings and Schedules. Unless specified otherwise, R-values indicated in this Section are measured in accordance with ASTM C518 and tested at 24 deg C (75 deg F) mean temperature.

2.2.5 Building Enclosure Design Principle: Exterior envelope construction for this Project is based on "Rain Screen" design principle, as recommended by National Research Council of Canada. Unless

specifically indicated otherwise, face sealed assemblies are not permitted.

- .1 Continuity: Maintain integrity and continuity of building enclosure's thermal, air, and vapour control layers at all times by using appropriate insulation, air barriers, vapour retarders to tie work of this Section with adjacent construction.
- .2 Air Sealing: Supplement building enclosure's primary air barrier and vapour retarder membranes by sealing openings and penetrations using low-density polyurethane foam sealants specified in this Section.
- .3 Material Compatibility: Before installation, review and confirm compatibility of material types, including insulation, adhesives, and substrates.

## **2.3      Below Grade Board Insulation**

### **2.3.1    Foundation Perimeter Insulation - XPS:**

- .1 Material Tag: This item is noted as "INS-3" on Drawings and Schedules.
- .2 Description: Extruded polystyrene board insulation complying with CAN/ULC-S701.1 Type 4 or equivalent to ASTM C 578.
- .3 General Performance Requirements:
  - .1 Minimum compressive strength: 210 kPa (30 psi).
  - .2 Thermal Resistance per 25 mm (in.): RSI 0.87 m<sup>2</sup> •°C/W (R5 ft<sup>2</sup> •h•°F/Btu) per ASTM C518.
  - .3 Water Absorption (ASTM D2842 or ASTM C272): Max 0.3 %
- .4 Location: Foundation walls below grade.
- .5 Basis-of-Design Products: "Sopra-XPS 30" by Soprema
- .6 GWP: ≤ 1.83 kgCO<sub>2</sub>e / 1 m<sup>2</sup> RSI as reported in Building Transparency EC3 Platform.

### **2.3.2    Under Slab High-Density Insulation Panels:**

- .1 Material Tag: This item is noted as "INS-4" on Drawings and Schedules.
- .2 Description: Extruded polystyrene board insulation complying with CAN/ULC-S701.1 Type 4 or equivalent to ASTM C 578.
- .3 General Performance Requirements:
  - .1 Minimum compressive strength: 276 kPa (40 psi).
  - .2 Thermal Resistance per 25 mm (in.): RSI 0.87 m<sup>2</sup> •°C/W (R5 ft<sup>2</sup> •h•°F/Btu) per ASTM C518.
  - .3 Water Absorption (ASTM D2842 or ASTM C272): Max 0.3 %

- .4 Location: Under concrete slabs-on-grade.
- .5 Basis-of-Design: "Sopra-XPS 40" (pedestrian traffic) or "Sopra-XPS 60" (vehicular traffic) by Soprema.
- .6 GWP:  $\leq 1.83 \text{ kgCO}_2\text{e} / 1 \text{ m}^2$  RSI as reported in Building Transparency EC3 Platform.
- .7 Note: In areas subject to vehicular traffic, increase compressive strength to minimum 414 kPa (60 psi) or as required to carry stipulated loads.

## **2.4 Mineral Wool Board Insulation**

2.4.1 Material Tag: This item is noted as "INS-1" on Drawings and Schedules.

- .1 Fire Performance:
  - .1 Maximum flame spread value: 15 in accordance with CAN/ULC-S102
  - .2 Smoke-developed value: 0 in accordance with CAN/ULC-S102
  - .3 Combustion Characteristics: Non-combustible per CAN/ULC-S114.
- .2 Cladding Applications: Medium-density mineral wool insulation conforming to CAN/ULC-S702.1 Type 1 or equivalent to ASTM C612.
  - .1 Nominal density: 64 kg/cu. m (4 lb/cu. ft.)
  - .2 Thermal Resistance per 25 mm (in.): RSI 0.75 m<sup>2</sup> •°C/W (R4.3 ft<sup>2</sup> •h•°F/Btu) per ASTM C518.
  - .2 Location: Panelized cladding systems such as metal cladding, cementitious cladding, wood cladding, composite cladding etc.
  - .3 Basis-of-Design Products: "CAVITYROCK Black" by Rockwool or approved equivalent as follows:
    - .1 "Thermafiber® RainBarrier™ Dark" by Owens Corning/Thermafiber
- .3 Curtain Wall Backpan Applications: Medium-density mineral wool insulation conforming to CAN/ULC-S702.1 Type 1 or equivalent to ASTM C612.
  - .1 Nominal density: 56 kg/m<sup>3</sup> (3.5 lb/cu. ft.)
  - .2 Thermal Resistance per 25 mm (in.): RSI 0.75 m<sup>2</sup> •°C/W (R4.3 ft<sup>2</sup> •h•°F/Btu) per ASTM C518.
  - .3 Location: Panelized cladding systems such metal cladding, cementitious cladding, wood cladding, composite cladding etc.

- .1 Basis-of-Design Products: "CAVITYROCK" by Rockwool or approved equivalent as follows:
- .2 "Thermafiber® RainBarrier™" by Owens Corning/Thermafiber
- .3 "JM CladStone™ Water & Fire Block Insulation" by Johns Manville

## **2.5 Roofing Board Insulation**

2.5.1 Polyisocyanurate insulation (INS-2): As specified in 07 52 16.

## **2.6 Foamed-In-Place Air Barriers Insulating Foam Sealants**

2.6.1 General Purpose Type (for application at gaps and cracks): semi-rigid single-component polyurethane sealant, to CAN/ULC-S710 and CAN/ULC-S711; and having the following properties:

- .1 Minimum Thermal Resistance (ASTM C518): RSI 0.73 per 25 mm (R4.2 per inch)
- .2 Core Density (ASTM D1622): minimum 24.03 kg/m<sup>3</sup> (1.5 pcf).
- .3 Fire Resistance (CAN/ULC S102): Flame spread < 15, Smoke Developed < 20.
- .4 Primer: As recommended by sealant manufacturer.
- .5 Acceptable Products:
  - .1 "Handi-Foam®" by Fomo Products, Inc.; [www.fomo.com](http://www.fomo.com)
  - .2 "GREAT STUFF PRO™ Series" Foam Sealant by DuPont de Nemours Inc.
  - .3 "CF-I XTW WD Extreme-Weather Foam Sealant by Hilti Inc.

## **2.7 Insulation Fasteners**

2.7.1 Types: Provide fasteners with demonstrated capability to retain securely insulation to substrates without damaging insulation and substrates.

2.7.2 Minimum Number of Fasteners: Final number and pattern of attachment to be determined by insulation board dimensions and cladding attachment system. For board insulation, provide not less than five fasteners per board (4 along perimeter and 1 in middle).

2.7.3 Fastener Requirements for Concrete and Masonry: For permanent attachment, use mechanical fasteners equipped with minimum 50 mm (2-inch) diameter washers.

- .1 Material: Use low-conductivity fasteners unless indicated otherwise.
- .2 Attachment Criteria: Select fasteners based on substrate type and manufacturer's recommendation to ensure fasteners can:

- .1 withstand applied pullout and shear loads;
- .2 prevent insulation tear-through under normal conditions;
- .3 have sufficient durability to last lifetime of installation.
- .3 Basis-of-Design: "X-IE-G 6 Insulation Fastener" by Hilti Inc.
  - .1 Acceptable Equivalent: "Ramset T3 Insulfast System" by ITW Construction Products; [www.ramset.ca](http://www.ramset.ca)
- 2.7.4 Fastener Requirements for Metal Framing: Perforated base insulation pins with stainless steel nails and 50 mm self-locking washers.
  - .1 Adhesive: to be compatible with air/vapour barrier membrane.
  - .2 Basis-of-Design: "Insulation Hanger" by Gemco or approved equivalent.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

#### **3.2 Preparation**

- 3.2.1 Clean substrates of substances that are harmful to insulation or that interfere with insulation attachment.

#### **3.3 Installation**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Use insulation that is free from damage, moisture, and contaminants, and not previously exposed to ice, rain, snow or other harmful substances.
- 3.3.3 Extend insulation to cover entire area to be insulated. Fit tightly around obstructions. Fill voids with insulation. Remove projections that might interfere with placement.
- 3.3.4 Ensure snug fit of insulation around electrical boxes, pipes, ducts, doors, windows, and other protrusions. Comply with local building regulations and safety codes for required clearances around electrical and heat-emitting devices. Seal penetrations in insulation

with compatible sealant and in accordance with manufacturer's instructions.

- 3.3.5 Use manufacturer's standard sizes to achieve thermal resistance requirements indicated on Drawings. As far as practical, install insulation in a single layer to achieve required thermal resistance criteria. In multi-layer applications, offset joints both vertically and horizontally.
- 3.3.6 Where insulation contains a facer with printed label, ensure printed side of boards face outward.

### **3.4 Below-Grade Insulation**

- 3.4.1 Vertical Application: Extend insulation minimum of 1200 mm (48 inches) below exterior grade line unless otherwise indicated on Drawings or by local energy codes.
- 3.4.2 Horizontal Application: Loosely lay insulation units on horizontal surfaces in accordance with manufacturer's written instructions. Stagger end joints and tightly abut insulation board. Extend insulation minimum of 1200 mm (48 inches) below exterior grade line unless otherwise indicated on Drawings or by local energy codes.

### **3.5 Above-Grade Board Insulation**

- 3.5.1 Panelized Systems (Cladding)
  - .1 Where horizontal Z-girts are indicated on Drawings, provide continuous galvanized steel framing members spaced at 610 mm (24 inches) to 1220 mm (48 inches) on center based on cladding weight. Permanently secure insulation with fasteners and washers as specified in this Section.
  - .2 For thermally broken systems, provide manufacturer's proprietary clips to reduce thermal bridging effects. Attach clips to vertical or horizontal rails as specified by manufacturer. Permanently secure insulation with fasteners and washers as specified in this Section.
- 3.5.2 Masonry Ties:
  - .1 Use wedges or clips over masonry ties for securing boards to backup wall. Fit board insulation around ties and backup wall.
  - .2 Where masonry ties do not have lack an insulation retention system, attach insulation boards using fasteners and washers as specified in this Section.
- 3.5.3 Curtain-Wall Construction
  - .1 Secure insulation within curtain wall using metal clips and straps or integral pockets within window frames. Maintain

---

specified cavity width between insulation and glass to prevent bowing from perimeter firestopping systems.

**3.6     Blanket / Batt Insulation**

- 3.6.1 Fitting and Placement : Provide batt insulation in dimensions that completely fill cavities formed by framing members. Secure insulation in cavities to achieve friction fit against adjacent framing members.
- 3.6.2 Clearances: Maintain minimum 76-mm (3-inch) clearance around recessed lighting fixtures not rated for insulation contact.
- 3.6.3 Support and Fastening: In metal-framed walls exceeding 2440 mm (96 inches) in height, mechanically support batt insulation. For faced batt insulation, tape flanges of insulation to metal stud flanges for support.

**3.7     Miscellaneous Voids**

- 3.7.1 Material Selection and Installation: Fill miscellaneous voids and cavity spaces where breaks occur in insulation with appropriate insulation to prevent gaps in thermal control layer continuity.
- 3.7.2 Loose-Fill Insulation: Compact insulation to density of approximately 40 kg/cu. m (2.5 lb/cu. ft.), equal to 40% of normal maximum volume.
- 3.7.3 Foamed-in-Place Air Barrier Sealants in concealed cavities: Use in accordance with manufacturer's guidelines and in conformance with CAN/ULC-S710.2.
  - .1 Use one-component foam for cracks or openings 6 mm to 50 mm wide.
  - .2 Use two-component foam sealant for gaps over 50 mm wide.
- 3.7.4 Continuity of Air Barriers and Vapour Retarders:
  - .1 Seal penetrations including vertical and horizontal penetrations through floors and walls.
  - .2 Seal roof-to-wall junctions.
  - .3 Seal roof scuppers and other mechanical equipment on roof.
  - .4 Seal window perimeters in walls, parapets, and at columns, as applicable.
  - .5 Seal exhaust vents and soffits.
  - .6 Seal interfaces in masonry, curtain wall systems, metal panels and between various cladding systems.
  - .7 Seal door heads, jambs, and thresholds.

---

**3.8     Thermal Bridging Mitigation**

- 3.8.1 General Guidelines: Implement following techniques to remediate thermal bridges at miscellaneous locations and to ensure insulation continuity.
- 3.8.2 Parapet Insulation: Extend wall insulation onto exterior face of parapet. Insulate interior cavity of parapet.
- 3.8.3 Above-to-Below Grade Transition: Butt the below-grade insulation tightly against above-grade insulation.
- 3.8.4 Punched Window Transitions: Align exterior wall insulation with thermal break in window frame. Extend insulation to window frame.
- 3.8.5 Curtain Wall Transitions: Align exterior insulation with thermal break in curtain wall frame. Extend insulation to curtain wall frame.
- 3.8.6 Miscellaneous Thermal Bridges
  - .1 For plumbing stack vents above the roof deck: provide a minimum of 50 mm insulation.
  - .2 Insulate body of roof drains and drainage pipes below roof deck.
  - .3 Extend below-grade insulation onto the vertical surfaces of columns and elevator sump pit walls.

**3.9     Protection**

- 3.9.1 Protect thermal insulation from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.9.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.9.3 Promptly replace thermal insulation work damaged during construction that cannot be satisfactorily repaired.
- 3.9.4 Special Measures for Foam Plastic Insulation:
  - .1 Limit exposure to UV radiation to duration needed for installation and concealment. Protect foam plastic board from UV radiation within 30 days of installation or according to manufacturer recommendations.
  - .2 Protect foam insulation against ignition risks. Do not deliver foam plastic board materials to project site before they are ready to be installed.
  - .3 Expedite installation and concealment of foam plastic board insulation in each construction area to minimize exposure.

---

**3.10     Cleaning And Waste Management**

- 3.10.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.10.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.10.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the spray-applied polyurethane foam insulation work specified herein. This includes, but is not necessarily limited, to:
  - .1 Closed cell, medium density spray applied polyurethane foam insulation applied to substrates indicated on Drawings.
  - .2 Self-adhering transition membranes at perimeter of rough openings, dissimilar materials, roof tie-ins, interface between structural components (beams, columns and sheathing) and control and/or expansion joints.
  - .3 Primers and sealants necessary to performance of spray-applied polyurethane foam insulation and self-adhering membrane materials.
  - .4 Formed metal insulation stops at rough openings, control and expansion joints, and at horizontal and vertical cavity wall firestopping.
  - .5 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
  - .1 Refer to Section 07 27 14 - Self-Adhered Air Barriers And Vapour Retarders for required coordination with sheet air barrier and vapour retarder materials to ensure continuity of air control and vapour control layers of building enclosure.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference

---

standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

**1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for spray-applied polyurethane foam insulation work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
  - .3 Indicate construction details, relationship with adjacent construction, and material characteristics, including joints, closures, and methods of anchorage.

- 
- 1.5.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.6 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:
- .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
  - .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).
- 1.5.7 Product Test Reports: Submit product test reports based on evaluation of comprehensive tests performed by a qualified testing agency, for each product.
- 1.5.8 Research/Evaluation Reports: For all Products specified in this Section submit CCMC or ULC evaluation reports for spray-applied polyurethane foam insulation confirming material has been evaluated and conforms to requirements of CAN/ULC S705.1.
- .1 Report must clearly indicate spray-applied polyurethane foam insulation's long-term thermal resistance (LTTR) based on testing performed in accordance with CAN/ULC S770.
- 1.5.9 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback

---

**1.6      Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for spray-applied polyurethane foam insulation to be included in building operation and maintenance manual.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.7      Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
  - .1 Employ only skilled mechanics having experience in the work specified, and having an understanding of the design principles of the thermal and vapour barriers which they are providing.
  - .2 Installers must be licensed by a certification organization complying with requirements of CAN/ULC S773.
  - .3 Installer's Photo ID substantiating certification must be available upon request.
- 1.7.3 Quality Assurance Program: Work of this Section is subject to quality assurance program conforming to requirements of CAN/ULC S705.2. Submit copy of quality assurance program upon request.
- 1.7.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.7.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Construct full size 3 x 3 m (10 ft x 10 ft) mock-up of spray-applied polyurethane foam insulation work to coordinate with the work of other building envelope sections in order to illustrate entire assembly including substrate preparation, transitions, and quality of workmanship. Include window and frame and sill,

insulation, building corner condition, junction with roof system and methods of interface with sealants.

- .3 Mock-Up Testing: Perform tests on mock-up to assess impact of spray-applied polyurethane foam insulation materials on adjacent sheet air barriers and vapor retarder membranes.
  - .1 Spray-applied polyurethane foam insulation and self-adhering membrane mock-ups will be used to perform following tests, which must be executed daily upon acceptance of mock-up:
    - .1 Foam material core density test
    - .2 Foam material adhesion/cohesion test
    - .3 Self-adhering transition test
  - .2 Documentation and Reporting: Record test results and submit recorded results for review. Report negative outcomes to Consultant and manufacturer immediately.
- .4 Mock-up Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .5 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

## **1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle spray-applied polyurethane foam insulation materials in accordance with manufacturer's written instructions. Comply with WHMIS requirements for use, handling, storage, and disposal of hazardous materials.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address and label indicating compliance with CAN/ULC S705.1.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.
- 1.8.6 Protect insulation materials from physical damage and from deterioration due to moisture, soiling, and other sources.

## **1.9 Field Conditions**

- 1.9.1 Environmental Limitations: Apply spray-applied polyurethane foam insulation within the range of ambient and substrate temperatures recommended by spray-applied polyurethane foam insulation manufacturer.

- .1 Temperature Limitations: Do not spray foam insulation in temperatures below -20°C ( 4 deg F) or above 35°C (95 deg F); consult manufacturer if there are significant temperature differences between ambient and substrate temperatures.
  - .2 Temperature Differential: Consult manufacturer if ambient temperature and substrate temperature differ by more than 17 deg, especially when spraying in heated interiors in winter.
  - .3 Relative Humidity: Do not apply foam when relative humidity exceed 80 percent.
  - .4 Wind Conditions: Do not apply spray polyurethane foam outdoors when wind speeds exceed 15 km/h (9.32 mph). Use windscreens if spraying in such conditions.
  - .5 Sun and shade: Consider substrate temperature differences between sun-exposed and shaded areas as they may affect reaction times. Follow sunpath during spray to ensure foam is sprayed on areas directly exposed to sun.
- 1.9.2 Protect surfaces, and in particular the building cladding finishes, from being marred or contaminated by the materials, by means of protective covers, boards, tapes and other approved means.
  - 1.9.3 Examine the work of other Sections where such work is closely associated with the work of this Section and report any damage done to the work of this Section.
  - 1.9.4 Protect the work of this Section from damage due to high-velocity winds until the building cladding or other permanent protection is in place.

**1.10 Warranty**

- 1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of spray-applied polyurethane foam insulation that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Warranty Period: Not less than 2 years from date of Substantial Performance of The work.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
  - .1 BASF Canada Inc.;

- .2 Carlisle Spray-applied polyurethane foam insulation;
- .3 Elastochem Chemicals;
- .4 Huntsman Building Solutions;
- .5 Icynene Inc.
- .6 Soprema Canada

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Performance / Design Criteria**

- 2.2.1 Regulatory Compliance: Provide insulation materials tested and approved by agencies recognized by authorities having jurisdiction. Provide markings to indicate certification.
- 2.2.2 Provide spray polyurethane foam insulation conforming to CAN/ULC-S705.1-18 and having CCMC Evaluation Report substantiating use as an air barrier system.
- 2.2.3 Provide equipment required for complete installation in accordance with requirements and recommendations of CAN/ULC S705.2 and equipment manufacturer's recommendations for specific type of application.
- 2.2.4 Combustible Materials: For combustible foam-plastic insulation, strictly comply with OBC requirements. Generally, combustible foam-plastic insulation must not be left exposed and must be protected by approved non-combustible thermal barriers.
- 2.2.5 Required Insulation Thickness and Assembly R-Values: as shown on Drawings and Schedules. Unless otherwise specified, R-values indicated in Contract Documents are LTTR values tested in accordance with CAN/ULC S770-15 at mean temperature of 24±2 deg C (75±2 deg F) and temperature difference of 22±2 deg C (72±2 deg F).
- 2.2.6 Mandatory LTTR Testing Requirement: Irrespective of whether Products experience less than 3% change in thermal resistance over 180-day period, all spray-applied polyurethane foam insulation materials specified in this Section must have undergone testing in accordance with LTTR method specified in CAN/ULC S770. Evidence results by means of evaluation report performed by inspection agency acceptable to Authorities Having Jurisdiction.
- 2.2.7 Building Enclosure Design Principle: Exterior envelope construction for this Project is based on "Rain Screen" design principle, as recommended by National Research Council of Canada. Unless specifically indicated otherwise, face sealed assemblies are not permitted.
  - .1 Continuity: Maintain integrity and continuity of building enclosure's thermal, air, and vapour control layers at all times

by using appropriate insulation, air barriers, vapour retarders to tie work of this Section with adjacent construction.

- .2 Air Sealing: Supplement building enclosure's primary air barrier and vapour retarder membranes by sealing openings and penetrations using low-density polyurethane foam sealants specified in this Section.
- .3 Air Leakage Criteria (system): Spray foam insulation must act as air barrier assembly. Air leakage of air barrier assembly must not exceed 0.2 L/(s·m<sup>2</sup>) under a pressure differential of 75 Pa (0.04 cfm/ft<sup>2</sup> @ 1.57 psf) when tested in accordance with CAN/ULC S742 (Minimum A1).
- .4 Material Compatibility: Before installation, review and confirm compatibility of material types, including insulation, adhesives, and substrates.

2.2.8 VOC Content and Emissions:

- .1 VOC Emissions: For applicable items in this Section, comply with CDPH Standard Method v1.2–2017 (CA Spec 01350) and ensure products are certified per UL 2818, SCS Global Gold, or equivalent.
- .2 VOC Content Requirements: Wet-applied materials used in scope of this Section must conform to the following:
  - .1 Paints and Coatings: SCAQMD Rule 1113 or CARB SCM.
  - .2 Adhesives and Sealants: SCAQMD Rule 1168.
  - .3 Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

**2.3 Spray-Applied Polyurethane Foam Insulation**

- 2.3.1 Material Tag: This item is noted as "INS-5" on Drawings and Schedules.
- 2.3.2 Material Description: closed cell, 2-component, spray-applied polyurethane foam insulation with non-ozone-depleting, hydrofluoro-olefin (HFO)-based blowing agent with global warming potential (GWP) of less than or equal to 1.
- 2.3.3 General Performance Requirements:
  - .1 Long-Term Thermal Resistance (CAN/ULC 770-09): Not less than RSI 1.8 at 50 mm thickness (R10.2 at 2 inches).
  - .2 CAN/ULC S742 Classification (air sealing characteristics): Class A1; ≤ 0.05 L/(s·m<sup>2</sup>) at 75 Pa (1.57 psf) air pressure differential (full system testing); or comparable result in accordance with CCMC 07272.

- .3 Compressive Strength: Not less than 203 kPa (29 psi)
  - .4 Apparent Core Density: Not less than 28 kg/cu. m (1.75 lbs/cu ft)
  - .5 Open cell content: Not more than 10 percent.
  - .6 Water Vapour Permeance (ASTM E96): Not more than 60 ng/Pa•s•m<sup>2</sup> (1.05 perm)
  - .7 Equipment: to CAN/ULC S705.2 and equipment manufacturer's recommendations for specific type of application.
  - .8 Surface Burning Characteristics (CAN/ULC S102 and CAN/ULC S127): <500.
- 2.3.4 Location: As shown on Drawings. Foam plastic insulation must be protected by a thermal barrier in accordance with OBC 3.1.5.12.
- 2.3.5 Basis-of-Design Products: "Walltite v.5" by BASF Canada Inc.
- .1 Acceptable Equivalents:
    - .1 "Heatlok Soya" by Huntsman Building Solutions
    - .2 "SealTite ECO" by Carlisle Spray-applied polyurethane foam insulation;
    - .3 "Sopra-SPF" by Soprema
    - .4 Approved equivalent.

## **2.4 Auxiliary Air Barrier And Vapour Retarder Products**

- 2.4.1 Material Tag: This item is noted as "AVBM-1" on Drawings and Schedules.
- 2.4.2 Use products approved by manufacturer for use in its system.
- 2.4.3 Transition Membrane: 1.0 mm thick, Self-adhering, SBS modified bitumen, sheet membrane complete with a cross-laminated polyethylene film.
- .1 Air Leakage (ASTM E283): < 0.005 L/s.m<sup>2</sup>@ 75 Pa.
  - .2 Vapour Permeance (ASTM E96): < 2.8 ng/Pa.m<sup>2</sup> (0.05 Perms).
  - .3 Low Temperature Flexibility (CGSB 37-GP-56M): -30°C.
  - .4 Elongation (ASTM D412 modified): 200%.
  - .5 Tensile Strength (ASTM D882) - 3.4 MPa @ 5000 psi
  - .6 Puncture Resistance (ASTM E154) -178N minimum
  - .7 Basis-of-Design Product: As specified by manufacturer.
- 2.4.4 Through-wall flashing: 1.0 mm thick, Self-adhering, SBS modified bitumen, sheet membrane complete with a cross-laminated polyethylene film.
- .1 Performance Requirements: Meeting or exceeding the properties of the transition membrane.
  - .2 Basis-of-Design Product: As specified by manufacturer.

---

**2.5     Accessories**

- 2.5.1 Ensure compatibility of auxiliary materials with spray-applied polyurethane foam insulation and transition membrane products manufacturers. Obtain written confirmation from manufacturers.
- 2.5.2 Primers: If required, Provide type recommended by insulation manufacturer and transition membrane manufacturer for surface conditions, application, and compatible with insulation and substrate.
- 2.5.3 Metal closures: cold-formed, galvanized steel sheet compliant with ASTM C645.
  - .1 Coating: Z275 hot-dip galvanized (G90) per ASTM A653/A653M or Class AZM150 (Class AZ50) aluminum-zinc-alloy per ASTM A792/A792M.
  - .2 Minimum thickness: 1.219 mm (18 ga.).
  - .3 Locations: at rough openings where insulation terminates.
    - .1 Fasten to masonry and concrete using fasteners recommended in writing by manufacturer. Minimize thermal bridges during installation.

**2.6     Sprayed Thermal Barrier**

- 2.6.1 Provide foamed-in-place urethane foam insulation complete with thermal barrier were indicated on Drawings or as required by Authorities Having Jurisdiction.
- 2.6.2 Use systems and products bearing classification ratings and listings from qualified testing agencies based on testing according to the following as applicable:
  - .1 CAN/ULC S101
  - .2 CAN/ULC S145
  - .3 CAN/ULC S124
  - .4 CCMC Evaluation Listing
- 2.6.3 Interior Applications:
  - .1 Damage-resistant, humidity-resistant, cementitious fire-protective coating specifically formulated for application over rigid urethane and polystyrene foam plastics. Coating must be compatible with insulation material.
  - .2 Basis-of-Design: "MONOKOTE® Z-3306 – Thermal Barrier" manufactured by GCP Applied Technologies Inc. or approved equivalent.
- 2.6.4 Exterior Applications:
  - .1 Manufacturer's standard liquid intumescent coating designed to act as thermal barrier and specifically designed for application

of sprayed foam insulation. System must be capable of being installed on exterior of building.

- .2 Basis-of-Design: "DC315" by International Fireproof Technology Inc. complete with manufacturer's recommended primers and topcoats.

- 2.6.5 Accessories and Ancillaries: Provide accessories to comply with manufacturer's recommendations and to meet fire resistance design and code requirements. Such accessories include, but are not limited to, required or optional items such as primers, bonding agents, mechanical attachments, top coats and application aids such as metal lath.

## **2.7 Equipment**

- 2.7.1 Provide equipment conforming to requirements of CAN/ULC-S705.2 and approved by foam manufacturer for type of application.

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Ensure surfaces are clean, dry, and compliant with CAN/ULC-S705.2.
- 3.1.2 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.3 Verify that substrate, adjacent materials are free of excess moisture, frost, oil, rust, and other foreign materials that may affect adhesion of insulation products.
- 3.1.4 Verify substrate surface is flat, free of honeycomb, fins, irregularities, materials or substances that may impede installation.
- 3.1.5 Protect adjacent surfaces and equipment against damage due to spray foam overspray beyond specified limits.
- 3.1.6 Ensure following elements are complete prior to applying spray polyurethane foam insulation system:
  - .1 Confirm installation of masonry anchoring system.
  - .2 Verify installation of opening closures.
  - .3 Ensure electrical or mechanical penetrations are complete.
  - .4 Ensure roofing membranes or waterproofing materials are installed.
  - .5 Air barrier and vapor barrier transition membranes must be in place.

- .6 Sub-girt framing members for exterior cladding must be complete.
- .7 Provide adequate protection for adjacent areas.

### **3.2     Preparation**

#### **3.2.1   Transition Membrane Installation, Generally:**

- .1 Install transition membranes before applying spray polyurethane foam insulation.
- .2 Use only membranes certified for use by spray polyurethane foam insulation system manufacturer. Where ambient temperatures are below 10 deg C (50 deg F), use self-adhering membranes formulated for cold applications. Supplement adhesion by mechanical fastening if adhesion is not adequate.
- .3 Install transition membranes in accordance with manufacturer's written instructions.

#### **3.2.2   Through-Wall Flashing Membrane:**

- .1 Prime surfaces in accordance with manufacturer's instructions. Re-prime surfaces not covered the same day
- .2 Install flashing membrane onto primed surface. Provide minimum 50 mm (2 inches) lap to all substrates.
- .3 Create return and end dam flashing membrane at intersecting wall openings
- .4 Apply specified termination mastic to treat terminations and redirect water flow away from building interiors.

#### **3.2.3   Transition Membrane Application**

- .1 Apply transition membranes at control joints, wall penetrations, dissimilar material connections, beams, rough openings, and roof parapets where differential movement may occur.
- .2 Apply transition membrane only onto primed surfaces.
- .3 Ensure full contact by rolling self-adhering transition membrane with steel or polypropylene hand roller.
- .4 Mechanically fasten membrane to window, door, and parapet blocking connections using metal bars or straps. At windows, extend membrane into rough window openings to connect to window thermal break. Minimize thermal bridging.
- .5 Overlap sheet membrane by minimum of 75mm (3 inches) on each connection substrate and 50mm (2 inches) at joints.
- .6 Seal cuts and terminations of membrane and end dam with termination sealant.

---

**3.3     Installation**

3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.

**3.4     Installation Of Spray-Applied Polyurethane Foam Insulation**

- 3.4.1 Install sprayed foam insulation in accordance with CAN/ULC-S705.2
- 3.4.2 Comply with insulation manufacturer's written instructions applicable to products and applications indicated.
- 3.4.3 Spray insulation to achieve uniform, monolithic density with no voids. Spray foam insulation only to indicated surfaces; protect other surfaces with drop sheets or masking tape.
- 3.4.4 Apply insulation in lifts of minimum 13 mm (1/2") thickness and maximum of 50 mm (2") thickness in single pass, unless specified in writing by manufacturer. Maintain tolerance of +6mm/-0mm in relation to specified thickness.
- 3.4.5 Extend insulation to envelop entire area to be insulated. Spray tightly around obstructions and fill voids. Do not permit formation of sub-layer air pockets during installation.
- 3.4.6 Maintain minimum clearance of 75mm (3 inches) from heat sources such as chimneys and lighting fixtures; do not spray inside electrical junction boxes.
- 3.4.7 Do not expose foam to open flames, cutting and welding torches, electric heaters, high intensity lamps, cigars or cigarettes.
- 3.4.8 Remove masking materials and overspray from adjacent areas immediately after foam surface has hardened.
- 3.4.9 Repair damaged areas in accordance with spray polyurethane foam insulation manufacturer's application guidelines.

**3.5     Fire Protection**

- 3.5.1 Post warning signs that are clearly visible in all sprayed areas. Do not expose rigid polyurethane cellular plastic to flames or other sources of intense heat. Conform to CAN/ULC-S705.2.
- 3.5.2 Cavity Wall Firestopping: Comply with OBC 3.1.11 – Fire Blocks in Concealed Spaces and as follows:
  - .1 Use 18ga galvanized sheet steel angles complying with ASTM A525 with minimum Z275 (G90) coating.
  - .2 Install preformed metal angles where cavity wall air space exceeds 25mm (1 inch).

- .3 Ensure dimensions allow horizontal section of angle to extend 12mm (1/2 inch) beyond surface of spray-applied polyurethane foam.
  - .4 Fill remaining space between metal firestopping and the inner face of the cladding with compressed mineral fiber having minimum 50% compression.
  - .5 Spacing and Locations:
    - .1 Vertical Spacing: Install preformed metal angles at intervals not exceeding 3 meters (10 ft) vertically and at every floor level.
    - .2 Horizontal Spacing: Install preformed metal angles at intervals not exceeding 20 meters (65 ft) horizontally.
- 3.5.3 Sprayed thermal barrier: Provide sprayed thermal barrier complying with CAN/S124M (minimum Class B) or CAN/ULC S101 (for non-sprinklered high buildings) in cases where foamed-in-place urethane foam insulation is not protected by one of the following:
- .1 Minimum 12.7 mm (1/2 inch) thick gypsum board, mechanically fastened to an independent supporting assembly.
  - .2 Lath and plaster, mechanically fastened to an independent supporting assembly.
  - .3 Masonry.
  - .4 Concrete.

### **3.6 Protection**

- 3.6.1 Protect spray-applied polyurethane foam insulation from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.6.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.6.3 Promptly replace spray-applied polyurethane foam insulation work damaged during construction that cannot be satisfactorily repaired.
- 3.6.4 Provide approved, non-staining means of protection for completed foam insulation work where required to protect work from mechanical, thermal, chemical and other damage by construction operations and traffic.
- 3.6.5 Maintain protection securely in place until completion of work. Remove protection when directed by Consultant.
- 3.6.6 Special Measures for Foam Plastic Insulation:
  - .1 Limit exposure to UV radiation to duration needed for installation and concealment. Protect foam plastic board from

UV radiation promptly after installation or according to manufacturer recommendations.

- .2 Protect foam insulation against ignition risks. Do not deliver foam plastic materials to project site before they are ready to be installed.
- .3 Expedite installation and concealment of foam plastic insulation in each construction area to minimize exposure.
- .4 Decontaminate and remove empty isocyanate containers from site daily.

### **3.7 Cleaning And Waste Management**

- 3.7.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.7.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.7.3 Waste Management and Disposal: Comply with CAN/ULC-S705.2 neutralization and disposal methods.

### **3.8 Field Quality Control**

- 3.8.1 Daily Site Testing Requirements: Conduct daily visual inspection, adhesion testing and density measurements as required by CAN/ULC S705.2 and manufacturer's application guidelines. Upon request submit copies of all completed forms to Consultant. As a minimum, comply with the following:
  - .1 Complete daily work record in accordance quality assurance program guidelines in order to document testing results and job site conditions. Update daily work record at beginning of each day, when changing material batches, and when changing locations within a given day.
  - .2 Density check: required daily, for every project, and for every batch.
  - .3 Adhesion/Cohesion test: required daily, for every project, and for every batch.
  - .4 Environmental tests: required daily for humidity, wind speed, substrate temperature and ambient temperature.
  - .5 Qualitative Inspections:
    - .1 Confirm proper substrate preparation.
    - .2 Ensure equipment is set to safe and proper operating parameters.
    - .3 Conduct ongoing visual and physical checks for cell size, spray pattern, foam color, and spray foam reactions.

- .4 Continuously measure installation thickness using depth gauge to meet minimum specified thicknesses.
  - .5 Ensure spray polyurethane foam achieves smooth and consistent surface.
- 3.8.2 Manufacturer's Services: Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions. Report any inconsistencies from manufacturer's recommendations immediately to Consultant.
- 3.8.3 Third Party Testing:
- .1 Permit access to site by manufacturer's third-party inspection company representative for technical assistance, verification of operator certification or confirmation of quality of polyurethane foam application.
  - .2 Arrange and pay for cost of site reviews/tests in accordance with third party testing inspection company's quality assurance program. As a minimum, schedule number of site reviews/tests in accordance with following schedule:

<b>Foam Coverage Area</b>	<b>Minimum No. of Inspections for Transition Membrane</b>	<b>Minimum No. of Inspections for Spray Foam</b>	<b>Minimum No. of Inspections for air barrier system</b>
3252 – 6503 m2 (35,000 – 70,000 sq ft)	1	1	2
6504 – 9755 m2 (70,001 – 105,000 sq ft)	2	2	4
9756 – 13,006 m2 (105,001 – 140,000 sq ft)	3	3	6
Over 13,006 m2 (140,000 sq ft)	Minimum 4. Additional may be required on a case-by basis	Minimum 4. Additional may be required on a case-by basis	Minimum 7. Additional may be required on a case-by basis

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the under-slab vapour retarders work specified herein. This includes, but is not necessarily limited, to:
  - .1 Puncture-resistant vapour retarders under-slabs-on-grade.
  - .2 Miscellaneous sealing materials and tapes to connect and seal openings, joints, protrusions and junctions.
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.

- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for under-slab vapour retarders work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
- 1.5.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.

- .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

- 1.5.6 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback

## **1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Warranty Documentation: Submit copy of extended warranties specified in this Section.

## **1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 3 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.7.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.7.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

## **1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle under-slab vapour retarders materials in accordance with manufacturer's written instructions.

- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

## **1.9 Warranty**

- 1.9.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of under-slab vapour retarders that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Warranty Period: Not less than 10 years from date of Substantial Performance of The work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
  - .1 GCP Applied Technologies; [www.gcpat.com](http://www.gcpat.com)
  - .2 Layfield Construction Products; [www.layfieldgroup.com](http://www.layfieldgroup.com)
  - .3 Stego Industries, LLC; [www.stegoindustries.com](http://www.stegoindustries.com)
  - .4 W.R. Meadows of Canada; [www.wrmeadows.com](http://www.wrmeadows.com)
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

- 2.2.1 Vapour Retarder System Integrity: Ensure compatibility between under-slab vapour retarder system components. Do not allow materials to touch chemically incompatible substances.
- 2.2.2 Unless indicated otherwise, provide vapour retarders under all slabs-on-grades.
- 2.2.3 Place under-slab vapour retarders on prepared subbases prior to placement of concrete slabs.
- 2.2.4 Ensure vapour retarder can resist effects of vapour penetration from ground through building enclosure within limitations specified in this Section.
- 2.2.5 Protrusions and Penetrations: Ensure that pipes, drains, or other elements extending through vapour retarders are adequately sealed.

---

**2.3     Under-Slab Plastic Vapour Retarder**

- 2.3.1 Material Tag: This item is noted as "VCM-02" on Drawings and Schedules.
- 2.3.2 Description: Resin based, sheet vapour retarder membrane conforming to ASTM E1745 (Class A) with following characteristics:
- .1 Water vapour permeance (ASTM E96 or ASTM F1249): less than 5.7 ng/s.m<sup>2</sup>.Pa (0.1 perms).
  - .2 Puncture resistance (ASTM D1709): over 2,200 grams (4.8 lbs).
  - .3 Tensile strength (ASTM E154): ≥ 8.77 kN per m (50 lbs force/inch)
  - .4 Minimum thickness: 0.25 mm (10 mils)
  - .5 Acceptable Products:
    - .1 "Perminator 15mil" by W. R. Meadows of Canada; [www.wrmeadows.com](http://www.wrmeadows.com)
    - .2 "Florprufe 120" by GCP Applied Technologies; [www.gcpat.com](http://www.gcpat.com)
    - .3 "Stego® Wrap" Vapor Barrier" by Stego Industries, LLC; [www.stegoindustries.com](http://www.stegoindustries.com)
    - .4 "VaporFlex" by Layfield Construction Products

**2.4     Auxiliary Materials**

- 2.4.1 Ensure auxiliary materials are specifically recommended by vapour retarder manufacturer for intended use and are fully compatible with under-slab vapour retarders. Supply auxiliary materials required for a complete installation.
- 2.4.2 Seam Tape: manufacturer's recommended high-density tape with pressure-sensitive adhesive; minimum 100 mm (4 inches) wide.
- 2.4.3 Pipe Collars: Construct pipe collars from vapour retarder material and pressure-sensitive tape in accordance with manufacturer's instructions.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

---

**3.2     Preparation**

- 3.2.1 Prepare surfaces in accordance with manufacturer's instructions.
- 3.2.2 Level, tamp, or roll earth or granular material beneath slab to ensure proper compaction.

**3.3     Installation**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Installation Standard: ASTM E1643.
- 3.3.3 Unroll vapour retarder with the longest dimension parallel with direction of concrete pour.
- 3.3.4 Cover footings with vapour retarder, ensuring sealing to foundation wall, grade beam, or slab at height equal to top of slab. Seal around utility and column penetrations to provide continuous vapour barrier.
- 3.3.5 Overlap joints minimum of 152 mm (6 inch) and seal with manufacturer's tape.
- 3.3.6 Seal penetrations (including pipes) with manufacturer's pipe boot.
- 3.3.7 Penetrations in vapour retarder are not permitted except for reinforcing steel and permanent utilities.

**3.4     Protection**

- 3.4.1 Protect under-slab vapour retarders from damage during installation of reinforcing steel, utilities, and concrete. Use reinforcing bar supports with bases designed to minimize risk of puncture to vapour retarder.
- 3.4.2 Promptly replace under-slab vapour retarders work damaged during construction that cannot be satisfactorily repaired.

**3.5     Repair And Inspection**

- 3.5.1 Inspect vapour retarder for damage and improper installation before concrete placement. Mark problem areas for correction before concrete placement.
- 3.5.2 Repair damaged areas by cutting patches of vapour barrier, overlapping damaged area minimum of 152 mm (6 inches) and taping all four sides with tape.

**3.6     Cleaning And Waste Management**

- 3.6.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.

- 3.6.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.6.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the self-adhering sheet air barriers and vapour retarders work specified herein. This includes, but is not necessarily limited, to:
  - .1 Self-adhering, sheet air barriers and vapour retarders.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 03 30 00 - Cast-In-Place Concrete.
  - .2 Section 04 22 00 – Concrete Unit Masonry.
  - .3 Section 06 16 00 - Sheathing.
  - .4 Section 07 42 13 – Aluminum Composite Material Wall Panels
  - .5 Section 07 42 19 – Solid Aluminum Plate Wall Panels
  - .6 Section 07 42 46 – PER Cementitious Cladding System
  - .7 Section 07 44 36 – Glass-Faced Rainscreen Cladding Systems
  - .8 Section 07 46 18 – Aluminum Interlocking Metal System

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

---

## **1.4 Definitions**

### **1.4.1 In accordance with CAN/ULC-S741 and CAN/ULC-S742:**

- .1 Air Barrier Accessory:** products designated to maintain air tightness between air barrier materials, air barrier assemblies and air barrier components, to fasten them to the structure of the building, or both (e.g., sealants, tapes, backer rods, transition membranes, fasteners/washers, ties, clips, staples, strapping, primers).
- .2 Air Barrier Assembly:** the combination of air barrier materials and air barrier accessories that are designated and designed within the environmental separator to act as a continuous barrier to the movement of air through the environmental separator.
- .3 Air Barrier Component:** pre-manufactured elements such as windows, doors and mechanical and electrical services that are installed in the environmental separator.
- .4 Air Barrier Material:** a building material with an air leakage characteristic not greater than  $0.02 \text{ L}/(\text{s}\cdot\text{m}^2)$  at 75 Pa pressure difference that is designed and manufactured to provide the primary resistance to airflow through an air barrier assembly.
- .5 Air Barrier System:** the combination of air barrier assemblies and air barrier components, connected by air barrier accessories, designed to provide a continuous barrier to the movement of air through an environmental separator.

## **1.5 Administrative Requirements**

### **1.5.1 Site Meetings:** Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.

- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow.** Advise Consultant and Owner in advance of scheduled meeting dates.
- .2 Agenda:** As a minimum, include the following:
  - .1 sequence of construction, coordination with substrate preparation, air barrier materials approved for use, compatibility of materials, coordination with installation of adjacent and covering materials, air leakage and bond testing, protection of installed materials and details of construction.**

- .2 Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
- 1.5.2 Sequencing:
- .1 Sequence work to permit installation of materials in conjunction with related materials and seals.
  - .2 Do not install air barrier material before the roof assembly has been sufficiently installed to prevent a buildup of water in the interior of the building.

## **1.6 Preinstallation Meetings**

- 1.6.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.6.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.7 Submittals**

- 1.7.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.

- 
- 1.7.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for self-adhering sheet air barriers and vapour retarders work specified in this Section.
- 1.7.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
- .1 Include plans, elevations, sections and details as applicable.
  - .2 Show locations and extent of air barrier assemblies, including details of typical conditions.
  - .3 Show intersections with other envelope assemblies and materials.
  - .4 Provide comprehensive details on bridging gaps in construction materials, treatments of inside and outside corners, and sealing of miscellaneous penetrations such as conduits, pipes, electric boxes, and similar elements.
  - .5 Provide details illustrating how air barrier materials interface with other materials forming part of air barrier system.
- 1.7.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.7.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.7.6 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback

---

**1.8      Closeout Submittals**

- 1.8.1 Closeout Submittals, generally: in accordance with Section 01 77 00, Closeout Procedures.
- 1.8.2 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.9      Quality Assurance**

- 1.9.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
  - .1 Manufacturer must have implemented program of continuous quality management conforming to requirements of ISO 9001 or similar equivalent system.
  - .2 Submit proof of certification upon request.
- 1.9.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
- 1.9.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.9.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Coordinate construction of mockups to permit inspection by Owner's testing agency of air barrier before external insulation and cladding are installed.
    - .1 Mock-Up Tests - Air Infiltration: As specified in Section 01 91 15.
  - .3 Include junction with roofing membrane, building corner condition, foundation wall intersection.
  - .4 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .5 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

---

**1.10 Delivery, Storage And Handling**

- 1.10.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.10.2 Deliver, store and handle self-adhering sheet air barriers and vapour retarders materials in accordance with manufacturer's written instructions.
- 1.10.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.10.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.10.5 Replace defective or damaged materials with new.

**1.11 Field Conditions**

- 1.11.1 Environmental Limitations:
  - .1 Install air barrier within range of ambient and substrate temperatures, and moisture content recommended by material manufacturer.
  - .2 Protect substrates from environmental conditions that affect air barrier performance.
  - .3 Do not apply air barrier to a damp or wet substrate or during snow, rain, fog, or mist.
  - .4 Do not leave membrane exposed to sunlight/UV for more than 30 days, unless otherwise recommended by manufacturer.
- 1.11.2 Maintain temperature and humidity recommended by materials manufactures before, during and after installation.
- 1.11.3 Field Measurements: Verify actual dimensions of construction contiguous with self-adhering sheet air barriers and vapour retarders by field measurements before fabrication.

**1.12 Warranty**

- 1.12.1 Extended warranty (Materials): Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of self-adhering sheet air barriers and vapour retarders that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Warranty Period: Not less than 5 years from date of Substantial Performance of The work.
- 1.12.2 Installation Warranty: Provide installation warranty, including all materials of the air barrier assembly, against failures including loss

of airtight seal, loss of watertight seal, loss of attachment, loss of cohesion/adhesion and failure to cure properly.

- .1 Warranty Period: Not less than 2 years from date of Substantial Performance of The work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 As specified in this Section.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

2.2.1 Air-Barrier Assembly: Provide air barrier assembly and seals with adjacent construction capable of functioning as an air barrier and liquid-water drainage plane. System must be able to discharge incidental condensation or water penetration to exterior.

2.2.2 Air Leakage Criteria: Assembly air leakage must not exceed 0.2 L/(s·m<sup>2</sup>) under pressure differential of 75 Pa (0.04 cfm/ft<sup>2</sup> @ 1.57 psf) in accordance with CAN/ULC S742 (Minimum A1).

2.2.3 Structural Performance: Air barrier assembly must be able to withstand combined design wind, fan, and stack pressures (positive and negative) on building envelope without damage or displacement. Assembly must be able to transfer required loads to structure effectively.

2.2.4 Movement Accommodation: Ensure assembly accommodates building material movements, and provides necessary accommodation for expansion and control joints. Include appropriate accessory materials for such joints, substrate changes, and perimeter conditions. Provide tie-ins to installed waterproofing and transitions at perimeter conditions.

2.2.5 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.

- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
- .2 Refer to Structural Drawings for seismic sensitivity values.

- 2.2.6 Joint Sealing and Tie-Ins: Install air barrier assembly in an airtight and flexible manner to air barrier materials of adjacent assemblies. Allow for relative movements due to thermal and moisture variations, creep, and anticipated seismic activity, if any.
- 2.2.7 Continuity of Seal: Unless otherwise specified, it is the responsibility of this Section to provide and maintain the continuity of air seal to adjacent and dissimilar materials. Ensure materials used provide positive support and continuity of for air barrier.
- .1 Connections to Adjacent Materials: Provide air barrier accessory materials to prevent air leakage at the following locations:
- .1 Foundation and walls, including penetrations, ties and anchors.
  - .2 Walls, windows, curtain walls, storefronts, louvers and doors.
  - .3 Different assemblies and fixed openings within those assemblies.
  - .4 Wall and roof connections.
  - .5 Floors over unconditioned space.
  - .6 Walls, floor and roof across construction, control and expansion joints.
  - .7 Walls, floors and roof to utility, pipe and duct penetrations.
  - .8 Seismic and expansion joints.
  - .9 All other potential air leakage pathways in the building envelope.
- 2.2.8 Unless otherwise noted, it is responsibility of this Section to Provide and maintain continuity of air seal to adjacent dissimilar materials. Provide materials to ensure positive support and continuity of air barrier.
- 2.2.9 Material Compatibility: Ensure compatibility between various types of air barriers and interfacing materials. Select a combination of base materials, transition, bridging and reinforcing membranes, adhesives, and accessories from specified materials. When cured, combinations of materials must be compatible with each other and offer bonding characteristics equivalent to shear strength of selected air barrier materials.

**2.3 Self-Adhering Sheet Air Barrier And Vapour Retarder**

- 2.3.1 Material Tag: This item is noted as "AVBM-1" on Drawings and Schedules.

2.3.2 Description: self-adhered membrane consisting of flexible facing material uniformly coated on one side with adhesive material and removable release liner. Use appropriate formulation — regular, high temperature, or low temperature — based on site conditions and within the temperature ranges specified by material manufacturer.

2.3.3 General Performance Requirements:

- .1 Material Air Permeance: Maximum 0.02 L/(s·m<sup>2</sup>) of surface area at 75 Pa (0.004 cfm/sq. ft. of surface area at 1.57 psf) pressure difference; CAN/ULC S741.
- .2 Vapour Permeance: Maximum 2.9 ng/Pa-s-m<sup>2</sup> (0.05 perm); ASTM E96/E 96M (Method B).
- .3 Puncture Resistance (ASTM E154): Minimum 178 N (40 lbf)
- .4 Tensile Strength (ASTM D882): 3.5 N/mm (20 lbf/in) or until substrate failure
- .5 Peel or Stripping Strength of Adhesive Bond (ASTM D903): Minimum 0.875 N/mm (5.0 lbf/in)
- .6 Lap Adhesion (ASTM D1876): Minimum 0.875 N/mm (5.0 lbf/in)
- .7 Low Temperature Flexibility (ASTM D1970 / ASTM D1970M): Pass at -20°F (-30°C)
- .8 Nail Sealability (ASTM D1970 / D1970M): Pass
- .9 Pull Adhesion (ASTM D4541): Minimum 110 kPa (16 Psi)
- .10 Tear Initiation and Propagation (ASTM D4073): Minimum 40 N (9.0 lbf)
- .11 Crack Bridging (ASTM C1305): Pass at -26°C (-15°F)
- .12 Ultimate Elongation: Minimum 200 percent; ASTM D412, Die C.
- .13 Water Absorption: Maximum 0.15 percent weight gain after 48-hour immersion at 21 deg C (70 deg F); ASTM D570.

2.3.4 Acceptable Products:

- .1 “Blueskin SA” by Henry Company
- .2 “AquaBarrier™ AVB AIR & VAPOUR BARRIER” by IKO Industries Ltd.
- .3 “Sopraseal Stick 1100T” by Soprema Inc.
- .4 “AcrlicStick SA” by IKO Industries Ltd.

**2.4 Accessory Materials**

2.4.1 Use accessory materials recommended by the air-barrier manufacturer to create a complete air-barrier assembly. Ensure compatibility with primary air-barrier membrane.

- 2.4.2 Primer: liquid waterborne or solvent-borne primer as recommended for substrate by air barrier material manufacturer. For primer-less products, submit certification from manufacturer confirming that Product can be installed without primer.
- 2.4.3 Termination Mastic: manufacturer's standard cold fluid-applied, trowel grade liquid material.
- 2.4.4 Flashing Tape: manufacturer's standard adhesive and pressure-sensitive adhesive tape.
- 2.4.5 Flashing Membrane: self-adhering, type recommended by manufacturer and compatible with air-barrier material. Provide for flashing at transitions, masonry through-wall flashings, and other locations requiring flashing.
- 2.4.6 Do not allow contact between air barrier materials and PVC, TPO, or EPDM materials such as single-ply roofing membranes, gaskets, and similar elements. Use compatible self-adhering separators such as butyl strips to avoid adverse reactions.
- 2.4.7 Sprayed Polyurethane Foam Sealant (for filling gaps, penetrations, and openings): one- or two-component, foamed-in-place, polyurethane foam sealant with density of 24 to 32 m<sup>3</sup> (1.5 to 2.0 pcf).
  - .1 Acceptable Products:
    - .1 "Zerodraft Air Sealant Foam and Insulating Sealant" by Zerodraft (Division of Canam Building Envelope Specialists Inc.).
    - .2 "Handi-Foam®" by Fomo Products, Inc.
    - .3 "GREAT STUFF PRO™ Series" Foam Sealant by DuPont de Nemours Inc.
    - .4 "Exo LEF" or "ExoAir Flex Foam" by Tremco Incorporated, an RPM company.
- 2.4.8 Joint Sealant: silicone, butyl or polyurethane sealant complying with ASTM C920 and confirmed in writing by manufacturer and demonstrated to have proper adhesion to air barrier materials.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation.
- 3.1.2 Ensure following conditions are met prior to proceeding:

- .1 Surfaces must be smooth, sound, dry, even, and free from excess mortar or contaminants and without large voids or sharp protrusions. .
- .2 Masonry joints must be flush, filled, and free of excess mortar on ties.
- .3 Confirm substrate dryness using ASTM D4263 moisture test. Address moisture issues before proceeding.
- 3.1.3 Verify sealant compatibility with proposed membrane through field peel-adhesion tests.
- 3.1.4 Commencement of work implies acceptance of previously completed work.

### **3.2 Surface Preparation**

- 3.2.1 Manufacturer's instructions: Comply with manufacturer's written instructions with regard to cleaning, treatment, and preparation of substrates.
- 3.2.2 Masking: Mask off adjoining surfaces not receiving air barrier to prevent spillage and overspray affecting other construction.
- 3.2.3 Contaminant Removal: Prepare surfaces by brushing, scrubbing, scraping, grinding, or using compressed air to eliminate contaminants.
- 3.2.4 Irregularities: Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
- 3.2.5 Gaps in substrate plane must be covered a smooth transition must be ensured from one substrate plane to another with galvanized steel sheet mechanically fastened to framing in order to provide continuous support for air barrier.
- 3.2.6 Prime substrates prior to installation of self-adhered sheet air barrier and sheet membrane transition strip flashings as recommended by manufacturer.
  - .1 Prime masonry and concrete substrates with appropriate primers.
  - .2 For glass-fiber surfaced gypsum sheathing, apply the necessary number of primer coats for adequate bond, allowing sufficient drying time between coats.
  - .3 Prime wood, metal, structural steel, sheet metal, and painted substrates.
  - .4 Prepare, treat, and seal surfaces at terminations and penetrations.

- .5 Ensure priming is limited to areas that will have sheet waterproofing applied on the same day. Areas exposed for more than 24 hours must be reprimed.

### **3.3 Installation Of Self-Adhering Sheets**

3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.

- .1 Install self-adhering sheet air barrier and accessory materials in a shingle fashion to ensure building envelope continuity.
- .2 Overlap air barrier sheets by minimum 50 mm (2 in.). Smoothly roll membrane onto substrate.
- .3 At end of each day, seal top edge of membrane to substrate.
- .4 Tie-in primary air barrier material to vertical and horizontal planes of roofs, concrete structures, windows, doors, curtain walls, storefronts, louvers, and other intersection conditions using accessory materials.

3.3.2 Seam Overlaps and Alignment:

- .1 Air Barrier Sheets:
  - .1 Apply and firmly adhere self-adhering sheets horizontally. Align accurately with uniform lap widths and end laps.
  - .2 Overlap and seal seams. Stagger end laps.
  - .3 Membrane sheets must shed water without interception. Where reverse laps occur, seal edges with termination mastic.
  - .4 Provide minimum 150 mm (6 in.) overlap at end laps and 75 mm (3 in.) at side laps.
  - .5 Roll membrane seams with roller.
- .2 Transition Materials:
  - .1 Apply transition material primer as required by the manufacturer, ensuring complete curing before application.
  - .2 Overlap transition material sheets by at least 50 mm (2 in.) or as recommended by the manufacturer. Roll all seams thoroughly.
  - .3 Overlap horizontally adjacent transition materials by at least 50 mm (2 in.), rolling all seams.

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**07 27 14  
Self-Adhering Sheet Air  
Barriers And Vapour  
Retarders**

- .4 At through-wall flashings, provide a 150 mm (6-in.) wide strip of membrane counterflashing.
- .5 Support movement at deflection and control joints with self-adhered membrane.
- .6 Provide transition material at building expansion and seismic joints, as applicable.

3.3.3 Bridging Gaps and Joints:

- .1 Bridge substrate cracks and joints by apply continuous self-adhering air barrier sheets over transition strips or flashing tapes in accordance with manufacturer's written instructions.
- .2 Bridge gaps over 25 mm (1 in.) with mechanically-fastened metal sheets or other transition materials approved by manufacturer in writing.
- .3 Fill perimeter frame surfaces of windows, curtain walls, storefronts, doors, and miscellaneous penetrations with foam sealant.

3.3.4 Joint Sealant Application:

- .1 Use termination mastic to seal exposed edges of air barrier sheet at seams, cuts, penetrations, and terminations not concealed by metal counter flashings or ending in reglets.
- .2 Apply joint sealants forming part of the air-barrier assembly within the manufacturer's recommended temperature ranges. Consult manufacturer when sealant cannot be applied within approved temperature ranges.

**3.4 Protection And Repairs**

- 3.4.1 Protect air barrier from contact with incompatible materials and sealants not approved by air-barrier manufacturer.
- 3.4.2 Protect air barrier from exposure to UV light and harmful weather exposure as required by manufacturer. If exposed to these conditions for more than 30 days, remove and replace air barrier or install additional, full-thickness, air-barrier application after repairing and preparing the overexposed membrane according to air-barrier manufacturer's written instructions.
- 3.4.3 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.4.4 Promptly replace self-adhering sheet air barriers work damaged during construction that cannot be satisfactorily repaired.

---

**3.5      Field Quality Control**

- 3.5.1 Engage a site representative qualified by air-barrier membrane manufacturer to inspect substrate conditions, surface preparation, membrane application, flashings, protection, and drainage components, and to Supply reports to Consultant.
- 3.5.2 Inspection and Testing: As specified in Section 01 83 16 and Section 01 91 15.

**3.6      Cleaning And Waste Management**

- 3.6.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning.
- 3.6.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.6.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Aluminum Composite Material Wall Panels work specified herein. This includes, but is not necessarily limited, to:
- .1 Custom-fabricated aluminum composite material wall panel system.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 06 16 00 - Sheathing.
  - .2 Section 07 21 00 - Thermal Insulation.
  - .3 Section 07 92 00 - Joint Sealants.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 ACM: aluminum composite material cladding formed by joining two thin metal skins to polyethylene or fire-retardant core and bonded under precise temperature, pressure, and tension.
- 1.4.2 PER: Pressure equalized rainscreen system; rainscreen system designed for no water intrusion with equal pressure between interior system cavity and outside cladding barrier.

### **1.5 Preinstallation Meetings**

- 1.5.1 Preinstallation Conference: Conduct conference at Project site.
- .1 Meet with Owner, Consultant, Owner's insurer if applicable, aluminum composite material panel Installer, aluminum

- composite material panel manufacturer's representative, structural-support Installer, and installers whose work interfaces with or affects aluminum composite material panels, including installers of doors, windows, and louvers.
- .2 Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
  - .3 Review methods and procedures related to aluminum composite material panel installation, including manufacturer's written instructions.
  - .4 Examine support conditions for compliance with requirements, including alignment between and attachment to structural members.
  - .5 Review flashings, special siding details, wall penetrations, openings, and condition of other construction that affect aluminum composite material panels.
  - .6 Review governing regulations and requirements for insurance, certificates, and tests and inspections if applicable.
  - .7 Review temporary protection requirements for aluminum composite material panel assembly during and after installation.
  - .8 Review procedures for repair of panels damaged after installation.
  - .9 Document proceedings, including corrective measures and actions required, and Supply copy of record to each participant.

## **1.6     Action Submittals**

- 1.6.1 Product Data: Submit product data in accordance with Division 01 for the following:
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Aluminum Composite Material Wall Panels work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.6.2 Shop Drawings:
  - .1 Include fabrication and installation layouts of aluminum composite material panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment assembly, trim, flashings, closures, and accessories; and special details.
  - .2 Accessories: Include details of the flashing, trim and anchorage, at a scale of not less than 1:10 (1-1/2 inches per 12 inches).

- 1.6.3 Samples : Submit samples in accordance with Division 01, for each type of exposed finish required, prepared on Samples of size indicated below.
  - .1 Aluminum composite material Panels: 305 mm (12 inches) long by actual panel width. Include fasteners, closures, and other aluminum composite material panel accessories.
- 1.6.4 Professional Engineer's Stamped Shop Drawings and Submittals: Submit Professional Engineer's Stamped Shop Drawings and Submittals in accordance with Division 01, for aluminum composite material wall panels, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- 1.6.5 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback

**1.7 Informational Submittals**

- 1.7.1 Sample Warranties: Submit samples warranties in accordance with Division 01 for extended warranties specified in this Section..

**1.8 Closeout Submittals**

- 1.8.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for aluminum composite material panels to include in maintenance manuals.

**1.9 Quality Assurance**

- 1.9.1 Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.
- 1.9.2 Mock-ups: Build mock-ups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
  - .1 Build mockup of typical aluminum composite material panel assembly including corner, soffits, supports, attachments, and accessories.
  - .2 Water-Spray Test: Conduct water-spray test of mockup of aluminum composite material panel assembly, testing for water penetration according to AAMA 501.2.
  - .3 Review of mock-ups does not constitute approval of deviations from the Contract Documents contained in mock-ups unless Consultant specifically approves such deviations in writing.
  - .4 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

---

**1.10 Delivery, Storage, And Handling**

- 1.10.1 Deliver components, aluminum composite material panels, and other manufactured items so as not to be damaged or deformed. Package aluminum composite material panels for protection during transportation and handling.
- 1.10.2 Unload, store, and erect aluminum composite material panels in a manner to prevent bending, warping, twisting, and surface damage.
- 1.10.3 Stack aluminum composite material panels horizontally on platforms or pallets, covered with suitable weathertight and ventilated covering. Store aluminum composite material panels to ensure dryness, with positive slope for drainage of water. Do not store aluminum composite material panels in contact with other materials that might cause staining, denting, or other surface damage.
- 1.10.4 Retain strippable protective covering on aluminum composite material panels during installation.

**1.11 Field Conditions**

- 1.11.1 Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of aluminum composite material panels to be performed according to manufacturers' written instructions and warranty requirements.

**1.12 Coordination**

- 1.12.1 Coordinate aluminum composite material panel installation with rain drainage work, flashing, trim, construction of soffits, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

**1.13 Warranty**

- 1.13.1 Extended Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of aluminum composite material panel systems that fail in materials or workmanship within specified warranty period.
  - .1 Failures include, but are not limited to, the following:
    - .1 Structural failures including rupturing, cracking, or puncturing.
    - .2 Deterioration of metals and other materials beyond normal weathering.
  - .2 Warranty Period: Five years from date of Substantial Performance of the Work.
- 1.13.2 Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace aluminum

composite material panels that show evidence of deterioration of factory-applied finishes within specified warranty period.

- .1 Exposed Panel Finish: Deterioration includes, but is not limited to, the following:
  - .1 Colour fading more than 5 Hunter units when tested according to ASTM D2244.
  - .2 Chalking in excess of a No. 8 rating when tested according to ASTM D4214.
  - .3 Cracking, checking, peeling, or failure of paint to adhere to bare metal.
- .2 Finish Warranty Period: 30 years from date of Substantial Performance of the Work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 3A Composites USA Inc/Alucobond
  - .2 Alcoa Inc./Reynobond
  - .3 ALPOLIC, Division of Mitsubishi Chemical America, Inc.
  - .4 Alucobond
- 2.1.2 Substitution Limitations: In accordance with requirements of Section, Substitution Procedures.

### **2.2 Performance Requirements**

- 2.2.1 Professional Engineer's Design and Certification: Employ the services of a Professional Engineer licensed to practice in the Province of Ontario carrying professional liability insurance, and who is experienced in providing engineering services of similar kind, scope and complexity; to design and certify aluminum composite material wall panel assemblies, including attachment to building construction.
- 2.2.2 Rain Screen Principle:
  - .1 Ensure system is designated as a "pressure-equalized rainscreen" system based on testing according to AAMA 508.
  - .2 Design exterior envelope cladding systems based on Rain Screen Principle advocated by NRCC and Provide for drainage of water entering building envelope wall systems.

- 
- .3 Design for compartments at corners to achieve appropriate pressure equalization in exterior cladding system.
  - .4 Provide gaskets, baffles, overlaps, seals and compartmentalization where required to achieve appropriate pressure equalization in exterior envelope cavity wall design. Maintain integrity of continuous air/vapour barrier system with adjacent surrounding air/vapour barrier.
  - .5 Incorporate means of draining moisture to exterior. Design drainage system to provide clear, internal paths of drainage of any trapped moisture within construction to exterior. Ensure weep water discharges in a manner that avoids staining of architectural finishes, collecting in puddles or formation of icicles.
- 2.2.3 Structural Performance: Provide aluminum composite material panel systems capable of withstanding the effects of the following loads, based on testing according to ASTM E330:
- .1 Wind Loads: As indicated on Drawings.
  - .2 Maximum Panel Deflection between supports:  $\leq L/180$
  - .3 Maximum Deflection of Individual Panels:  $\leq L/60$ .
  - .4 At connection points of framing members to anchors, anchor deflection in any direction shall not exceed 1.6 mm (1/16").
  - .5 Ensure stress on panel skin does not exceed manufacturer's recommended maximum value to avoid permanent deformation.
- 2.2.4 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.2.5 Air Infiltration: Air leakage of not more than 0.3 L/s per sq. m (0.06 cfm/sq. ft.) when tested according to ASTM E283 at the following test-pressure difference:
- .1 Test-Pressure Difference: 300 Pa (6.24 lbf/sq. ft.).
- 2.2.6 Water Penetration under Static Pressure: No water penetration when tested according to ASTM E331 at the following test-pressure difference:
- .1 Test-Pressure Difference: 300 Pa (6.24 lbf/sq. ft.).
- 2.2.7 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes by preventing buckling, opening

of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

- .1 Temperature Change (Range): 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.
- 2.2.8 System Fire Propagation Characteristics: Aluminum composite material aluminum composite material wall panel system passes CAN/ULC-S134.
- 2.2.9 Panel Fire Performance: Flame spread less than 25 and smoke developed less than 450, in accordance with CAN/ULC S102/S102.2 or equivalent to ASTM E84 (subject to approval by Authorities Having Jurisdiction).
- 2.2.10 Peel Strength: Provide aluminum composite material panels having not less than 100 N x mm/mm (22.5 in-lb/in.) when tested for bond integrity in accordance with ASTM D1781.

## **2.3 Aluminum Composite Material Wall Panels**

- 2.3.1 Material Tag: This item is noted as "EW4/EW5" on Drawings and Schedules.
- 2.3.2 Aluminum Composite Material Wall Panel Systems: Provide factory-formed and -assembled, aluminum composite material wall panels fabricated from two metal facings that are bonded to a solid, extruded thermoplastic core; formed into profile for installation method indicated. Include attachment assembly components, panel stiffeners, and accessories required for weathertight system.
  - .1 Panel Thickness: Not less than 4 mm (0.157 inch).
  - .2 Core: Fire retardant.
  - .3 Exterior Finish: Three-coat fluoropolymer.
  - .4 Colour: as indicated on Drawings.
- 2.3.3 Attachment Assembly Components: Formed from material compatible with panel facing.
- 2.3.4 Panel Fasteners: Self-tapping screws designed to withstand design loads. Provide concealed fasteners unless indicated otherwise. In conditions where exposed fasteners are acceptable to Consultant, ensure fasteners are obscured in panel joinery.
- 2.3.5 Basis-of-Design: "Alumitex" as manufactured by Elemex or approved equivalent.

## **2.4 Miscellaneous Materials**

- 2.4.1 Miscellaneous Metal Subframing and Furring: ASTM C645, cold-formed, metallic-coated steel sheet ASTM A653/A653M, Z275 hot-

dip galvanized (G90) coating designation or ASTM A792/A792M, Class AZM150 (Class AZ50) aluminum-zinc-alloy coating designation unless otherwise indicated.

- .1 Provide manufacturer's standard sections as required for support and alignment of Aluminum composite material aluminum composite material panel system.
  - .2 Minimum thickness: 1.219 mm (18 ga.).
  - .3 Transfer grid to be hat bars, Z-bars, adjustable Z-bars or combination thermal clip and Z-bar.
  - .4 Material visible after assembly of wall panel shall be finished to match panels.
- 2.4.2 Thermally-Broken Sub-framing: Low-conductivity thermally-broken, intermittent structural attachment insulation clips designed maintain insulation effectiveness, with adjustable depth and suitable for vertical and horizontal sub-girts.
- .1 Basis-of-Design: "Cascadia Clip" by Cascadia Windows
  - .2 Acceptable Products:
    - .1 "ISO Clip" by Northern Facades Ltd.
    - .2 "TAC Thermal Spacer" Exterior Technologies Group
    - .3 "TClip Thermally Broken Façade Substructure" by Engineered Assemblies
    - .4 "NVELOPE NV1 Cladding Attachment System" by SFS Group.
- 2.4.3 Panel Accessories: Provide components required for a complete, weathertight panel system including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of aluminum composite material panels unless otherwise indicated.
- 2.4.4 Fire Blocks: In accordance with OBC Article "3.1.11. Fire Blocks in Concealed Spaces" consisting of minimum 0.38 mm (28 ga) galvanized sheet steel complying with ASTM A653/A653M; minimum Z275 (G90) coating.
- 2.4.5 Flashing and Trim: Provide flashing and trim formed from same material as aluminum composite material panels as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Finish flashing and trim with same finish system as adjacent aluminum composite material panels.
- 2.4.6 Air Barrier/Vapour Retarder: As specified in Section 07 27 14.
- 2.4.7 Insulation: As specified in Section 07 21 00.

---

**2.5     Fabrication**

- 2.5.1 Fabricate and finish aluminum composite material panels and accessories at the factory, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.
- 2.5.2 Fabricate aluminum composite material panel joints with factory-installed captive gaskets or separator strips that provide a weathertight seal and prevent metal-to-metal contact, and that minimize noise from movements.
  - .1 Panel Tolerances:
    - .1 Panel Bow: Not to exceed 0.8% of panel overall dimension in width or length.
    - .2 Length & Width: +0 mm, -3.2 mm (1/8 inch).
    - .3 Squareness: 1.3 mm per linear m (0.02 inch per ft) .
- 2.5.3 Sheet Metal Flashing and Trim: Wherever practical at corners, jambs and abutments, no flashings will be permitted. Ensure panel is designed to include for these connections. Where flashings are unavoidable, fabricate flashing and trim to comply with manufacturer's recommendations and recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated.
  - .1 Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
  - .2 Seams for Aluminum: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.
  - .3 Seams for Other Than Aluminum: Fabricate nonmoving seams in accessories with flat-lock seams. Tin edges to be seamed, form seams, and solder.
  - .4 Sealed Joints: Form non-expansion, but movable, joints in metal to accommodate sealant and to comply with SMACNA standards.
  - .5 Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.
  - .6 Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal recommended in writing by metal panel manufacturer.
    - .1 Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal wall panel manufacturer for

application but not less than thickness of metal being secured.

## **2.6 Finishes**

- 2.6.1 Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- 2.6.2 Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of Samples reviewed by Consultant. Noticeable variations in same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of Samples reviewed by Consultant and are assembled or installed to minimize contrast.
- 2.6.3 Aluminum Panels and Accessories:
  - .1 Three-Coat Fluoropolymer: AAMA 2605. Fluoropolymer finish containing not less than 70 percent PVDF resin by weight in both colour coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
  - .1 Basis-of-Design: "Duranar XL" by PPG or approved equivalent.

## **3. EXECUTION**

### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, aluminum composite material panel supports, and other conditions affecting performance of the Work.
  - .1 Examine wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by aluminum composite material wall panel manufacturer.
  - .2 Examine wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by aluminum composite material wall panel manufacturer.
  - .3 Verify that air-barriers/vapour-retarders have been installed over sheathing or backing substrate to prevent air infiltration or water penetration.

- 3.1.2 Examine roughing-in for components and assemblies penetrating aluminum composite material panels to verify actual locations of penetrations relative to seam locations of aluminum composite material panels before installation.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2 Preparation**

- 3.2.1 Miscellaneous Supports: Install subframing, furring, thermally-broken subframing and other miscellaneous panel support members and anchorages according to ASTM C754 and aluminum composite material panel manufacturer's written recommendations.

### **3.3 Aluminum Composite Material Panel Installation**

- 3.3.1 Install aluminum composite material panels according to manufacturer's written instructions in orientation, sizes, and locations indicated on Drawings. Install panels perpendicular to supports unless otherwise indicated. Anchor aluminum composite material panels and other components of the Work securely in place, with provisions for thermal and structural movement.
  - .1 Shim or otherwise plumb substrates receiving aluminum composite material panels.
  - .2 Flash and seal aluminum composite material panels at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until air- or water-resistive barriers and flashings that will be concealed by aluminum composite material panels are installed.
  - .3 Install screw fasteners in predrilled holes.
  - .4 Locate and space fastenings in uniform vertical and horizontal alignment.
  - .5 Install flashing and trim as aluminum composite material panel work proceeds.
  - .6 Locate panel splices over, but not attached to, structural supports. Stagger panel splices and end laps to avoid a four-panel lap splice condition.
  - .7 Align bottoms of aluminum composite material panels and fasten with blind rivets, bolts, or self-tapping screws. Fasten flashings and trim around openings and similar elements with self-tapping screws.
  - .8 Provide weathertight escutcheons for pipe- and conduit-penetrating panels.
- 3.3.2 Fasteners:

- 
- .1 Install exterior metal cladding to structural supports by hidden mechanical fasteners, clips and perimeter framing extrusions
  - .2 Aluminum Panels: Use aluminum or stainless-steel fasteners for surfaces exposed to the exterior; use aluminum or galvanized-steel fasteners for surfaces exposed to the interior.
  - 3.3.3 Metal Protection: Where dissimilar metals contact each other or corrosive substrates, protect against galvanic action as recommended in writing by aluminum composite material panel manufacturer.
  - 3.3.4 Install attachment assembly required to support aluminum composite material wall panels and to provide a complete weathertight wall system, including subgirts, perimeter extrusions, tracks, drainage channels, panel clips, and anchor channels. Conform to AAMA 508. Do not apply sealants to panel joints unless otherwise indicated.
    - .1 Include attachment to supports, panel-to-panel joinery, panel-to-dissimilar-material joinery, and panel-system joint seals.
    - .2 Install panels using fabricator's standard assembly with vertical channel that provides support and secondary drainage assembly, draining at base of wall. Notch vertical channel to receive support pins. Install vertical channels supported by channel brackets or adjuster angles and at locations, spacings, and with fasteners recommended by manufacturer.
    - .3 Attach wall panels by inserting horizontal support pins into notches in vertical channels and into flanges of panels. Leave horizontal and vertical joints with open reveal.
    - .4 Install support assembly at locations, spacings, and with fasteners recommended by fabricator. Use Fabricator's standard horizontal tracks and vertical tracks that provide support and secondary drainage assembly, draining to the exterior at horizontal joints through drain tube.
    - .5 Attach routed-and-turned flanges of wall panels to perimeter extrusions with fabricator's standard fasteners.
    - .6 Install wall panels to allow individual panels to "free float" and be installed and removed without disturbing adjacent panels.
  - 3.3.5 Accessory Installation: Install accessories with positive anchorage to building and weathertight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.
    - .1 Install components required for a complete aluminum composite material panel assembly including trim, copings, corners, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items. Provide types indicated by aluminum composite material panel manufacturer; or, if not

indicated, provide types recommended in writing by aluminum composite material panel manufacturer.

- 3.3.6 Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that are permanently watertight.
- .1 Install exposed flashing and trim that is without buckling and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof performance.
  - .2 Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 3 m (10 feet) with no joints allowed within 605 mm (24 inches) of corner or intersection. Where lapped expansion provisions cannot be used or would not be sufficiently waterproof, form expansion joints of intermeshing hooked flanges, not less than 25 mm (1 inch) deep, filled with mastic sealant (concealed within joints).
- 3.3.7 Fire Blocks: Where cavities exceed 25 mm and contain combustible insulation or cladding materials, provide continuous fire blocks complying with OBC Article "3.1.11. Fire Blocks in Concealed Spaces" as specified in this Section and installed in cavity at every floor level and at intervals exceeding no more than 3m vertically.

### **3.4 Erection Tolerances**

- 3.4.1 Installation Tolerances: Shim and align aluminum composite material wall panel units within installed tolerance of 1:1000 (1 inch in 80 feet), non-accumulative, on level, plumb, and location lines as indicated, and within 5% offset of adjoining faces and of alignment of matching profiles.

### **3.5 Field Quality Control**

- 3.5.1 Testing Agency: Contractor must engage a qualified independent testing agency to perform field tests and inspections.
- 3.5.2 Water-Spray Test: After installation, test area of assembly as directed by Consultant for water penetration according to AAMA 501.2.
- 3.5.3 Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect completed aluminum composite material wall panel installation, including accessories.

- 3.5.4 Aluminum composite material wall panels will be considered defective if they do not pass test and inspections.
- 3.5.5 Additional tests and inspections, at Contractor's expense, are performed to determine compliance of replaced or additional work with specified requirements.
- 3.5.6 Prepare test and inspection reports.

**3.6 Cleaning And Protection**

- 3.6.1 Remove temporary protective coverings and strippable films, if any, as aluminum composite material panels are installed, unless otherwise indicated in manufacturer's written installation instructions. On completion of aluminum composite material panel installation, clean finished surfaces as recommended by aluminum composite material panel manufacturer. Maintain in a clean condition during construction.
- 3.6.2 After aluminum composite material panel installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.
- 3.6.3 Replace aluminum composite material panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Solid Aluminum Plate Wall Panels work specified herein. This includes, but is not necessarily limited, to:
- .1 Custom-fabricated solid aluminum plate wall panel system complete with extruded aluminum fins.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 06 16 00 - Sheathing.
  - .2 Section 07 21 00 - Thermal Insulation.
  - .3 Section 07 92 00 - Joint Sealants.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 PER: Pressure equalized rainscreen system; rainscreen system designed for no water intrusion with equal pressure between interior system cavity and outside cladding barrier.

### **1.5 Preinstallation Meetings**

- 1.5.1 Preinstallation Conference: Conduct conference at Project site.
- .1 Meet with Owner, Consultant, Owner's insurer if applicable, solid aluminum plate panel Installer, solid aluminum plate panel manufacturer's representative, structural-support Installer, and installers whose work interfaces with or affects solid aluminum

plate panels, including installers of doors, windows, and louvers.

- .2 Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
- .3 Review methods and procedures related to solid aluminum plate panel installation, including manufacturer's written instructions.
- .4 Examine support conditions for compliance with requirements, including alignment between and attachment to structural members.
- .5 Review flashings, special siding details, wall penetrations, openings, and condition of other construction that affect solid aluminum plate panels.
- .6 Review governing regulations and requirements for insurance, certificates, and tests and inspections if applicable.
- .7 Review temporary protection requirements for solid aluminum plate panel assembly during and after installation.
- .8 Review procedures for repair of panels damaged after installation.
- .9 Document proceedings, including corrective measures and actions required, and Supply copy of record to each participant.

## **1.6 Action Submittals**

- 1.6.1 Product Data: Submit product data in accordance with Division 01 for the following:
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Solid Aluminum Plate Wall Panels work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.6.2 Shop Drawings:
  - .1 Include fabrication and installation layouts of solid aluminum plate panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment assembly, trim, flashings, closures, and accessories; and special details.
  - .2 Accessories: Include details of the flashing, trim and anchorage, at a scale of not less than 1:10 (1-1/2 inches per 12 inches).
- 1.6.3 Samples : Submit samples in accordance with Division 01, for each type of exposed finish required, prepared on Samples of size indicated below.

- 
- .1 Solid aluminum plate Panels: 305 mm (12 inches) long by actual panel width. Include fasteners, closures, and other solid aluminum plate panel accessories.
  - 1.6.4 Professional Engineer's Stamped Shop Drawings and Submittals: Submit Professional Engineer's Stamped Shop Drawings and Submittals in accordance with Division 01, for solid aluminum plate wall panels, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
  - 1.6.5 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback
  - 1.7 Informational Submittals**
    - 1.7.1 Sample Warranties: Submit sample warranties in accordance with Division 01 for extended warranties specified in this Section..
  - 1.8 Closeout Submittals**
    - 1.8.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for solid aluminum plate panels to include in maintenance manuals.
  - 1.9 Quality Assurance**
    - 1.9.1 Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.
    - 1.9.2 Mock-ups: Build mock-ups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
      - .1 Build mockup of typical solid aluminum plate panel assembly including corner, soffits, supports, attachments, and accessories.
      - .2 Water-Spray Test: Conduct water-spray test of mockup of solid aluminum plate panel assembly, testing for water penetration according to AAMA 501.2.
  - 1.10 Delivery, Storage, And Handling**
    - 1.10.1 Deliver components, solid aluminum plate panels, and other manufactured items so as not to be damaged or deformed. Package solid aluminum plate panels for protection during transportation and handling.
    - 1.10.2 Unload, store, and erect solid aluminum plate panels in a manner to prevent bending, warping, twisting, and surface damage.
    - 1.10.3 Stack solid aluminum plate panels horizontally on platforms or pallets, covered with suitable weathertight and ventilated covering.

---

Store solid aluminum plate panels to ensure dryness, with positive slope for drainage of water. Do not store solid aluminum plate panels in contact with other materials that might cause staining, denting, or other surface damage.

- 1.10.4 Retain strippable protective covering on solid aluminum plate panels during installation.

**1.11 Field Conditions**

- 1.11.1 Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of solid aluminum plate panels to be performed according to manufacturers' written instructions and warranty requirements.

**1.12 Coordination**

- 1.12.1 Coordinate solid aluminum plate panel installation with rain drainage work, flashing, trim, construction of soffits, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

**1.13 Warranty**

- 1.13.1 Extended Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of solid aluminum plate panel systems that fail in materials or workmanship within specified warranty period.

- .1 Failures include, but are not limited to, the following:
  - .1 Structural failures including rupturing, cracking, or puncturing.
  - .2 Deterioration of metals and other materials beyond normal weathering.
- .2 Warranty Period: Five years from date of Substantial Performance of the Work.

- 1.13.2 Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace solid aluminum plate panels that show evidence of deterioration of factory-applied finishes within specified warranty period.

- .1 Exposed Panel Finish: Deterioration includes, but is not limited to, the following:
  - .1 Colour fading more than 5 Hunter units when tested according to ASTM D2244.
  - .2 Chalking in excess of a No. 8 rating when tested according to ASTM D4214.
  - .3 Cracking, checking, peeling, or failure of paint to adhere to bare metal.

- .2 Finish Warranty Period: 30 years from date of Substantial Performance of the Work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- 2.1.2 Basis-of-Design: "Alumitex™ AFS Plate" by Ontario Panelization or approved equivalent as follows:
  - .1 "Axiom Aluminum Plate Wall System" by Northern Facades/Flynn Canada Ltd.;
  - .2 "AM 3000" by Architectural Metals North America
  - .3 "SL-2000P" by Sobotec Ltd.;
- 2.1.3 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance Requirements**

- 2.2.1 Professional Engineer's Design and Certification: Employ the services of a Professional Engineer licensed to practice in the Province of Ontario carrying professional liability insurance, and who is experienced in providing engineering services of similar kind, scope and complexity; to design and certify solid aluminum plate wall panel assemblies, including attachment to building construction.
- 2.2.2 Rain Screen Principle:
  - .1 Ensure system is designated as a "pressure-equalized rainscreen" system based on testing according to AAMA 508.
  - .2 Design exterior envelope cladding systems based on Rain Screen Principle advocated by NRCC and Provide for drainage of water entering building envelope wall systems.
  - .3 Design for compartments at corners to achieve appropriate pressure equalization in exterior cladding system.
  - .4 Provide gaskets, baffles, overlaps, seals and compartmentalization where required to achieve appropriate pressure equalization in exterior envelope cavity wall design. Maintain integrity of continuous air/vapour barrier system with adjacent surrounding air/vapour barrier.
  - .5 Incorporate means of draining moisture to exterior. Design drainage system to provide clear, internal paths of drainage of any trapped moisture within construction to exterior. Ensure

weep water discharges in a manner that avoids staining of architectural finishes, collecting in puddles or formation of icicles.

- 2.2.3 Structural Performance: Provide solid aluminum plate panel systems capable of withstanding the effects of the following loads, based on testing according to ASTM E330:
- .1 Wind Loads: As indicated on Drawings.
  - .2 Maximum Panel Deflection between supports:  $\leq L/180$
  - .3 Maximum Deflection of Individual Panels:  $\leq L/60$ .
  - .4 At connection points of framing members to anchors, anchor deflection in any direction shall not exceed 1.6 mm (1/16").
  - .5 Ensure stress on panel skin does not exceed manufacturer's recommended maximum value to avoid permanent deformation.
- 2.2.4 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.2.5 Air Infiltration: Air leakage of not more than 0.3 L/s per sq. m (0.06 cfm/sq. ft.) when tested according to ASTM E283 at the following test-pressure difference:
- .1 Test-Pressure Difference: 300 Pa (6.24 lbf/sq. ft.).
- 2.2.6 Water Penetration under Static Pressure: No water penetration when tested according to ASTM E331 at the following test-pressure difference:
- .1 Test-Pressure Difference: 300 Pa (6.24 lbf/sq. ft.).
- 2.2.7 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
- .1 Temperature Change (Range): 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.
- 2.2.8 System Fire Propagation Characteristics: Solid aluminum plate solid aluminum plate wall panel system passes CAN/ULC-S134.
- 2.2.9 Panel Fire Performance: Flame spread less than 25 and smoke developed less than 450, in accordance with CAN/ULC

---

S102/S102.2 or equivalent to ASTM E84 (subject to approval by Authorities Having Jurisdiction).

**2.3     Metal Plate Wall Panels**

- 2.3.1 Material Tag: This item is noted as “EW11” on Drawings and Schedules.
- 2.3.2 Metal Plate Wall Panels: Provide factory-formed, metal plate wall panels fabricated from single sheets of metal formed into profile for installation method indicated. Include attachment assembly components, panel stiffeners, and accessories required for weathertight system.
  - .1 Nominal Joint Thickness: 13 mm (1/2 inch)
  - .2 Joint Type: Dry.
  - .3 Panels to have mechanically fastened 50 mm x 25 mm (2 x 1 inch) extruded aluminum tubes as noted on Drawings.
- 2.3.3 Panel Material: Aluminum Sheet: Tension-leveled, smooth aluminum sheet, ASTM B209M (ASTM B209)
  - .1 Thickness: Not less than 3 mm (0.118 inch) thick.
  - .2 Exterior Finish: Three-coat fluoropolymer.
  - .3 Colour: to be selected by Consultant from manufacturer's full range.
- 2.3.4 Attachment Assembly: Manufacturer's standard.
- 2.3.5 Panel Fasteners: Self-tapping screws designed to withstand design loads. Provide concealed fasteners unless indicated otherwise. In conditions where exposed fasteners are acceptable to Consultant, ensure fasteners are obscured in panel joinery.

**2.4     Miscellaneous Materials**

- 2.4.1 Miscellaneous Metal Subframing and Furring: ASTM C645, cold-formed, metallic-coated steel sheet ASTM A653/A653M, Z275 hot-dip galvanized (G90) coating designation or ASTM A792/A792M, Class AZM150 (Class AZ50) aluminum-zinc-alloy coating designation unless otherwise indicated.
  - .1 Provide manufacturer's standard sections as required for support and alignment of Solid aluminum plate solid aluminum plate panel system.
  - .2 Minimum thickness: 1.219 mm (18 ga.).
  - .3 Transfer grid to be hat bars, Z-bars, adjustable Z-bars or combination thermal clip and Z-bar.
  - .4 Material visible after assembly of wall panel shall be finished to match panels.

- 2.4.2 Thermally-Broken Sub-framing: Low-conductivity thermally-broken, intermittent structural attachment insulation clips designed maintain insulation effectiveness, with adjustable depth and suitable for vertical and horizontal sub-girts.
- .1 Basis-of-Design: "Cascadia Clip" by Cascadia Windows
  - .2 Acceptable Products:
    - .1 "ISO Clip" by Northern Facades Ltd.
    - .2 "TAC Thermal Spacer" Exterior Technologies Group
    - .3 "TClip Thermally Broken Façade Substructure" by Engineered Assemblies
    - .4 "NVELOPE NV1 Cladding Attachment System" by SFS Group.
- 2.4.3 Panel Accessories: Provide components required for a complete, weathertight panel system including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of solid aluminum plate panels unless otherwise indicated.
- 2.4.4 Flashing and Trim: Provide flashing and trim formed from same material as solid aluminum plate panels as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Finish flashing and trim with same finish system as adjacent solid aluminum plate panels.
- 2.4.5 Fire Blocks: In accordance with OBC Article "3.1.11. Fire Blocks in Concealed Spaces" consisting of minimum 0.38 mm (28 ga) galvanized sheet steel complying with ASTM A653/A653M; minimum Z275 (G90) coating.
- 2.4.6 Air Barrier/Vapour Retarder: As specified in Section 07 27 14.
- 2.4.7 Insulation: As specified in Section 07 21 00.

## **2.5 Fabrication**

- 2.5.1 Fabricate and finish solid aluminum plate panels and accessories at the factory, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.
- 2.5.2 Fabricate solid aluminum plate panel joints with factory-installed captive gaskets or separator strips that provide a weathertight seal and prevent metal-to-metal contact, and that minimize noise from movements.
- .1 Panel Tolerances:

- 
- .1 Panel Bow: Not to exceed 0.8% of panel overall dimension in width or length.
  - .2 Length & Width: +0 mm, -3.2 mm (1/8 inch).
  - .3 Squareness: 1.3 mm per linear m (0.02 inch per ft) .
- 2.5.3 Sheet Metal Flashing and Trim: Wherever practical at corners, jambs and abutments, no flashings will be permitted. Ensure panel is designed to include for these connections. Where flashings are unavoidable, fabricate flashing and trim to comply with manufacturer's recommendations and recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated.
- .1 Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
  - .2 Seams for Aluminum: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.
  - .3 Seams for Other Than Aluminum: Fabricate nonmoving seams in accessories with flat-lock seams. Tin edges to be seamed, form seams, and solder.
  - .4 Sealed Joints: Form non-expansion, but movable, joints in metal to accommodate sealant and to comply with SMACNA standards.
  - .5 Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.
  - .6 Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal recommended in writing by metal panel manufacturer.
- .1 Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal wall panel manufacturer for application but not less than thickness of metal being secured.

## **2.6 Finishes**

- 2.6.1 Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- 2.6.2 Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of Samples reviewed by Consultant. Noticeable variations in same piece are not acceptable. Variations in appearance of other

components are acceptable if they are within the range of Samples reviewed by Consultant and are assembled or installed to minimize contrast.

2.6.3 Aluminum Panels and Accessories:

- .1 Three-Coat Fluoropolymer: AAMA 2605. Fluoropolymer finish containing not less than 70 percent PVDF resin by weight in both colour coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
- .1 Basis-of-Design: "Duranar XL" by PPG or approved equivalent.

### 3 . **EXECUTION**

#### 3.1 **Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, solid aluminum plate panel supports, and other conditions affecting performance of the Work.
  - .1 Examine wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by solid aluminum plate wall panel manufacturer.
  - .2 Ensure structure is plumb to a tolerance of 1:1000 (1 inch in 80 ft).
  - .3 Examine wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by solid aluminum plate wall panel manufacturer.
  - .4 Verify that air-barriers/vapour-retarders have been installed over sheathing or backing substrate to prevent air infiltration or water penetration.
- 3.1.2 Examine roughing-in for components and assemblies penetrating solid aluminum plate panels to verify actual locations of penetrations relative to seam locations of solid aluminum plate panels before installation.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

#### 3.2 **Preparation**

- 3.2.1 Miscellaneous Supports: Install subframing, furring, thermally-broken subframing and other miscellaneous panel support

---

members and anchorages according to solid aluminum plate panel manufacturer's written recommendations.

### **3.3     Solid Aluminum Plate Panel Installation**

- 3.3.1 Install solid aluminum plate panels according to manufacturer's written instructions in orientation, sizes, and locations indicated on Drawings. Install panels perpendicular to supports unless otherwise indicated. Anchor solid aluminum plate panels and other components of the Work securely in place, with provisions for thermal and structural movement.
- .1 Shim or otherwise plumb substrates receiving solid aluminum plate panels.
  - .2 Flash and seal solid aluminum plate panels at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until air- or water-resistive barriers and flashings that will be concealed by solid aluminum plate panels are installed.
  - .3 Install screw fasteners in predrilled holes.
  - .4 Locate and space fastenings in uniform vertical and horizontal alignment.
  - .5 Install flashing and trim as solid aluminum plate panel work proceeds.
  - .6 Locate panel splices over, but not attached to, structural supports. Stagger panel splices and end laps to avoid a four-panel lap splice condition.
  - .7 Align bottoms of solid aluminum plate panels and fasten with blind rivets, bolts, or self-tapping screws. Fasten flashings and trim around openings and similar elements with self-tapping screws.
  - .8 Provide weathertight escutcheons for pipe- and conduit-penetrating panels.
- 3.3.2 Fasteners:
- .1 Install exterior metal cladding to structural supports by hidden mechanical fasteners, clips and perimeter framing extrusions
  - .2 Aluminum Panels: Use aluminum or stainless-steel fasteners for surfaces exposed to the exterior; use aluminum or galvanized-steel fasteners for surfaces exposed to the interior.
- 3.3.3 Metal Protection: Where dissimilar metals contact each other or corrosive substrates, protect against galvanic action as recommended in writing by solid aluminum plate panel manufacturer.
- 3.3.4 Install attachment assembly required to support solid aluminum plate wall panels and to provide a complete weathertight wall

system, including subgirts, perimeter extrusions, tracks, drainage channels, panel clips, and anchor channels. Conform to AAMA 508. Do not apply sealants to panel joints unless otherwise indicated.

- .1 Include attachment to supports, panel-to-panel joinery, panel-to-dissimilar-material joinery, and panel-system joint seals.
  - .2 Install panels using fabricator's standard assembly with vertical channel that provides support and secondary drainage assembly, draining at base of wall. Notch vertical channel to receive support pins. Install vertical channels supported by channel brackets or adjuster angles and at locations, spacings, and with fasteners recommended by manufacturer.
  - .3 Attach wall panels by inserting horizontal support pins into notches in vertical channels and into flanges of panels. Leave horizontal and vertical joints with open reveal.
  - .4 Install support assembly at locations, spacings, and with fasteners recommended by fabricator. Use Fabricator's standard horizontal tracks and vertical tracks that provide support and secondary drainage assembly, draining to the exterior at horizontal joints through drain tube.
  - .5 Attach routed-and-turned flanges of wall panels to perimeter extrusions with fabricator's standard fasteners.
  - .6 Install wall panels to allow individual panels to "free float" and be installed and removed without disturbing adjacent panels.
- 3.3.5 Accessory Installation: Install accessories with positive anchorage to building and weathertight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.
- .1 Install components required for a complete solid aluminum plate panel assembly including trim, copings, corners, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items. Provide types indicated by solid aluminum plate panel manufacturer; or, if not indicated, provide types recommended in writing by solid aluminum plate panel manufacturer.
- 3.3.6 Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that are permanently watertight.
- .1 Install exposed flashing and trim that is without buckling and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal

flashing and trim to fit substrates and to result in waterproof performance.

- .2 Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 3 m (10 feet) with no joints allowed within 605 mm (24 inches) of corner or intersection. Where lapped expansion provisions cannot be used or would not be sufficiently waterproof, form expansion joints of intermeshing hooked flanges, not less than 25 mm (1 inch) deep, filled with mastic sealant (concealed within joints).

- 3.3.7 Fire Blocks: Where cavities exceed 25 mm and contain combustible insulation or cladding materials, provide continuous fire blocks complying with OBC Article "3.1.11. Fire Blocks in Concealed Spaces" as specified in this Section and installed in cavity at every floor level and at intervals exceeding no more than 3m vertically.

### **3.4 Erection Tolerances**

- 3.4.1 Installation Tolerances: Shim and align solid aluminum plate wall panel units within installed tolerance of 1:1000 (1 inch in 80 feet), non-accumulative, on level, plumb, and location lines as indicated, and within 5% offset of adjoining faces and of alignment of matching profiles.

### **3.5 Field Quality Control**

- 3.5.1 Testing Agency: Contractor must engage a qualified independent testing agency to perform field tests and inspections.
- 3.5.2 Water-Spray Test: After installation, test area of assembly as directed by Consultant for water penetration according to AAMA 501.2.
- 3.5.3 Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect completed solid aluminum plate wall panel installation, including accessories.
- 3.5.4 Solid aluminum plate wall panels will be considered defective if they do not pass test and inspections.
- 3.5.5 Additional tests and inspections, at Contractor's expense, are performed to determine compliance of replaced or additional work with specified requirements.
- 3.5.6 Prepare test and inspection reports.

### **3.6 Cleaning And Protection**

- 3.6.1 Remove temporary protective coverings and strippable films, if any, as solid aluminum plate panels are installed, unless otherwise indicated in manufacturer's written installation instructions. On

completion of solid aluminum plate panel installation, clean finished surfaces as recommended by solid aluminum plate panel manufacturer. Maintain in a clean condition during construction.

- 3.6.2 After solid aluminum plate panel installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.
- 3.6.3 Replace solid aluminum plate panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the PER Cementitious Cladding System work specified herein. This includes, but is not necessarily limited, to:
- .1 Custom-fabricated cementitious cladding system.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 06 16 00 - Sheathing.
  - .2 Section 07 21 00 - Thermal Insulation.
  - .3 Section 07 27 14 – Self-Adhering Sheet Air Barriers and Vapour Retarders
  - .4 Section 07 92 00 - Joint Sealants.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 PER: Pressure equalized rainscreen system; rainscreen system designed for no water intrusion with equal pressure between interior system cavity and outside cladding barrier.

### **1.5 Preinstallation Meetings**

- 1.5.1 Preinstallation Conference: Conduct conference at Project site.
- .1 Meet with Owner, Consultant, Owner's insurer if applicable, cementitious cladding panel Installer, cementitious cladding panel manufacturer's representative, structural-support Installer, and installers whose work interfaces with or affects

cementitious cladding panels, including installers of doors, windows, and louvers.

- .2 Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
- .3 Review methods and procedures related to cementitious cladding panel installation, including manufacturer's written instructions.
- .4 Examine support conditions for compliance with requirements, including alignment between and attachment to structural members.
- .5 Review flashings, special siding details, wall penetrations, openings, and condition of other construction that affect cementitious cladding panels.
- .6 Review governing regulations and requirements for insurance, certificates, and tests and inspections if applicable.
- .7 Review temporary protection requirements for cementitious cladding panel assembly during and after installation.
- .8 Review procedures for repair of panels damaged after installation.
- .9 Document proceedings, including corrective measures and actions required, and Supply copy of record to each participant.

## **1.6 Action Submittals**

- 1.6.1 Product Data: Submit product data in accordance with Division 01 for the following:
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the PER Cementitious Cladding System work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.6.2 Shop Drawings:
  - .1 Include fabrication and installation layouts of cementitious cladding panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment assembly, trim, flashings, closures, and accessories; and special details.
  - .2 Accessories: Include details of the flashing, trim and anchorage, at a scale of not less than 1:10 (1-1/2 inches per 12 inches).
- 1.6.3 Samples : Submit samples in accordance with Division 01, for each type of exposed finish required, prepared on Samples of size indicated below.

- .1 Cementitious cladding Panels: 305 mm (12 inches) long by actual panel width. Include fasteners, closures, and other cementitious cladding panel accessories.
- 1.6.4 Professional Engineer's Stamped Shop Drawings and Submittals: Submit Professional Engineer's Stamped Shop Drawings and Submittals in accordance with Division 01, for cementitious claddings, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- 1.6.5 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback
- 1.7 Informational Submittals**
  - 1.7.1 Sample Warranties: Submit samples warranties in accordance with Division 01 for extended warranties specified in this Section..
- 1.8 Closeout Submittals**
  - 1.8.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for cementitious cladding panels to include in maintenance manuals.
- 1.9 Quality Assurance**
  - 1.9.1 Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.
  - 1.9.2 Mock-ups: Build mock-ups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
    - .1 Build mockup of typical cementitious cladding panel assembly including corner, soffits, supports, attachments, and accessories.
    - .2 Water-Spray Test: Conduct water-spray test of mockup of cementitious cladding panel assembly, testing for water penetration according to AAMA 501.2.
    - .3 Review of mock-ups does not constitute approval of deviations from the Contract Documents contained in mock-ups unless Consultant specifically approves such deviations in writing.
    - .4 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.
- 1.10 Delivery, Storage, And Handling**
  - 1.10.1 Deliver components, cementitious cladding panels, and other manufactured items so as not to be damaged or deformed. Package

cementitious cladding panels for protection during transportation and handling.

- 1.10.2 Unload, store, and erect cementitious cladding panels in a manner to prevent bending, warping, twisting, and surface damage.
- 1.10.3 Stack cementitious cladding panels horizontally on platforms or pallets, covered with suitable weathertight and ventilated covering. Store cementitious cladding panels to ensure dryness, with positive slope for drainage of water. Do not store cementitious cladding panels in contact with other materials that might cause staining, denting, or other surface damage.
- 1.10.4 Retain strippable protective covering on cementitious cladding panels during installation.

**1.11 Field Conditions**

- 1.11.1 Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of cementitious cladding panels to be performed according to manufacturers' written instructions and warranty requirements.

**1.12 Coordination**

- 1.12.1 Coordinate cementitious cladding panel installation with rain drainage work, flashing, trim, construction of soffits, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

**1.13 Warranty**

- 1.13.1 Extended Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of cementitious cladding panel systems that fail in materials or workmanship within specified warranty period.
  - .1 Failures include, but are not limited to, the following:
    - .1 Structural failures including rupturing, cracking, or puncturing.
    - .2 Deterioration of metals and other materials beyond normal weathering.
  - .2 Warranty Period: Five years from date of Substantial Performance of the Work.
- 1.13.2 Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace cementitious cladding panels that show evidence of deterioration of factory-applied finishes within specified warranty period.
  - .1 Exposed Panel Finish: Deterioration includes, but is not limited to, the following:

- .1 Colour fading more than 5 Hunter units when tested according to ASTM D2244.
- .2 Chalking in excess of a No. 8 rating when tested according to ASTM D4214.
- .3 Cracking, checking, peeling, or failure of paint to adhere to bare metal.
- .2 Finish Warranty Period: 30 years from date of Substantial Performance of the Work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Basis-of-Design: Materials specified in this Section are based on "Ceramitex Façade System" as supplied by Elemex with sintered stone cladding.
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance Requirements**

- 2.2.1 Professional Engineer's Design and Certification: Employ the services of a Professional Engineer licensed to practice in the Province of Ontario carrying professional liability insurance, and who is experienced in providing engineering services of similar kind, scope and complexity; to design and certify cementitious cladding assemblies, including attachment to building construction.
- 2.2.2 Rain Screen Principle:
  - .1 Ensure system is designated as a "pressure-equalized rainscreen" system based on testing according to AAMA 508.
  - .2 Design exterior envelope cladding systems based on Rain Screen Principle advocated by NRCC and Provide for drainage of water entering building envelope wall systems.
  - .3 Design for compartments at corners to achieve appropriate pressure equalization in exterior cladding system.
  - .4 Provide gaskets, baffles, overlaps, seals and compartmentalization where required to achieve appropriate pressure equalization in exterior envelope cavity wall design. Maintain integrity of continuous air/vapour barrier system with adjacent surrounding air/vapour barrier.
  - .5 Incorporate means of draining moisture to exterior. Design drainage system to provide clear, internal paths of drainage of any trapped moisture within construction to exterior. Ensure weep water discharges in a manner that avoids staining of

architectural finishes, collecting in puddles or formation of icicles.

- 2.2.3 Structural Performance: Provide cementitious cladding panel systems capable of withstanding the effects of the following loads, based on testing according to ASTM E330:
- .1 Wind Loads: As indicated on Drawings.
  - .2 Maximum Panel Deflection between supports:  $\leq L/180$
  - .3 Maximum Deflection of Individual Panels:  $\leq L/60$ .
  - .4 At connection points of framing members to anchors, anchor deflection in any direction shall not exceed 1.6 mm (1/16").
  - .5 Ensure stress on panel skin does not exceed manufacturer's recommended maximum value to avoid permanent deformation.
- 2.2.4 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.2.5 Air Infiltration: Air leakage of not more than 0.3 L/s per sq. m (0.06 cfm/sq. ft.) when tested according to ASTM E283 at the following test-pressure difference:
- .1 Test-Pressure Difference: 300 Pa (6.24 lbf/sq. ft.).
- 2.2.6 Water Penetration under Static Pressure: No water penetration when tested according to ASTM E331 at the following test-pressure difference:
- .1 Test-Pressure Difference: 300 Pa (6.24 lbf/sq. ft.).
- 2.2.7 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.
- .1 Temperature Change (Range): 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.
- 2.2.8 System Fire Propagation Characteristics: Cementitious cladding cementitious cladding system passes CAN/ULC-S134.
- 2.2.9 Panel Fire Performance: Flame spread less than 25 and smoke developed less than 450, in accordance with CAN/ULC

---

S102/S102.2 or equivalent to ASTM E84 (subject to approval by Authorities Having Jurisdiction).

## **2.3 Cementitious Cladding**

- 2.3.1 Material Tag: This item is noted as “EW6/PNL1” on Drawings and Schedules.
- 2.3.2 Panel Description: sintered stone system consisting of blend of Portland Cement, fibers and cementitious materials, extruded into panels and pre-finished with manufacturer’s standard UV-resistant finishing system.
- 2.3.3 Base Material: Cementitious matrix with fibreglass reinforcement conforming to EN-14411 or ANSI equivalent, suitable for exterior use.
- 2.3.4 Sintered Stone Thickness:
  - .1 EW6: Minimum 8 mm (5/16 inch)
  - .2 PNL1: Minimum 6 mm (1/4 inch)
- 2.3.5 Formed from material compatible with panel facing.
- 2.3.6 Fastener Appearance: concealed. Provide manufacturer’s standard fasteners designed to withstand design loads and pull-out strengths required for Project.
- 2.3.7 Basis-of-Design: “Ceramitex Façade System” as supplied by Elemex with sintered stone cladding.
  - .1 Finish: “Dekton - Chromica Baltic” by Consentino.
- 2.3.8 Acceptable Equivalent: Keith Panel Systems; System A-Edge.
  - .1 Finish: “Dekton - Chromica Baltic” by Consentino.

## **2.4 Miscellaneous Materials**

- 2.4.1 Miscellaneous Metal Subframing and Furring: ASTM C645, cold-formed, metallic-coated steel sheet ASTM A653/A653M, Z275 hot-dip galvanized (G90) coating designation or ASTM A792/A792M, Class AZM150 (Class AZ50) aluminum-zinc-alloy coating designation unless otherwise indicated.
  - .1 Provide manufacturer's standard sections as required for support and alignment of Cementitious cladding cementitious cladding panel system.
  - .2 Minimum thickness: 1.219 mm (18 ga.).
  - .3 Transfer grid to be hat bars, Z-bars, adjustable Z-bars or combination thermal clip and Z-bar.
  - .4 Material visible after assembly of wall panel shall be finished to match panels.

- 2.4.2 Thermally-Broken Sub-framing: Low-conductivity thermally-broken, intermittent structural attachment insulation clips designed maintain insulation effectiveness, with adjustable depth and suitable for vertical and horizontal sub-girts.
- .1 Basis-of-Design: "Cascadia Clip" by Cascadia Windows
  - .2 Acceptable Products:
    - .1 "ISO Clip" by Northern Facades Ltd.
    - .2 "TAC Thermal Spacer" Exterior Technologies Group
    - .3 "TClip Thermally Broken Façade Substructure" by Engineered Assemblies
    - .4 "NVELOPE NV1 Cladding Attachment System" by SFS Group.
- 2.4.3 Panel Accessories: Provide components required for a complete, weathertight panel system including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of cementitious cladding panels unless otherwise indicated.
- 2.4.4 Fire Blocks: In accordance with OBC Article "3.1.11. Fire Blocks in Concealed Spaces" consisting of minimum 0.38 mm (28 ga) galvanized sheet steel complying with ASTM A653/A653M; minimum Z275 (G90) coating.
- 2.4.5 Flashing and Trim: Provide flashing and trim formed from same material as cementitious cladding panels as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Finish flashing and trim with same finish system as adjacent cementitious cladding panels.
- 2.4.6 Air Barrier/Vapour Retarder: As specified in Section 07 27 14.
- 2.4.7 Insulation: As specified in Section 07 21 00.

## **2.5 Fabrication**

- 2.5.1 Fabricate and finish cementitious cladding panels and accessories at the factory, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.
- 2.5.2 Fabricate cementitious cladding panel joints with factory-installed captive gaskets or separator strips that provide a weathertight seal and prevent metal-to-metal contact, and that minimize noise from movements.
- .1 Panel Tolerances:

- .1 Panel Bow: Not to exceed 0.8% of panel overall dimension in width or length.
  - .2 Length & Width: +0 mm, -3.2 mm (1/8 inch).
  - .3 Squareness: 1.3 mm per linear m (0.02 inch per ft) .
- 2.5.3 Sheet Metal Flashing and Trim: Wherever practical at corners, jambs and abutments, no flashings will be permitted. Ensure panel is designed to include for these connections. Where flashings are unavoidable, fabricate flashing and trim to comply with manufacturer's recommendations and recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated.
- .1 Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
  - .2 Seams for Aluminum: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.
  - .3 Seams for Other Than Aluminum: Fabricate nonmoving seams in accessories with flat-lock seams. Tin edges to be seamed, form seams, and solder.
  - .4 Sealed Joints: Form non-expansion, but movable, joints in metal to accommodate sealant and to comply with SMACNA standards.
  - .5 Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.
  - .6 Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal recommended in writing by metal panel manufacturer.
- .1 Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal wall panel manufacturer for application but not less than thickness of metal being secured.

## **2.6 Finishes**

- 2.6.1 Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- 2.6.2 Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of Samples reviewed by Consultant. Noticeable variations in same piece are not acceptable. Variations in appearance of other

components are acceptable if they are within the range of Samples reviewed by Consultant and are assembled or installed to minimize contrast.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, cementitious cladding panel supports, and other conditions affecting performance of the Work.
  - .1 Examine wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by cementitious cladding manufacturer.
  - .2 Examine wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by cementitious cladding manufacturer.
  - .3 Verify that air-barriers/vapour-retarders have been installed over sheathing or backing substrate to prevent air infiltration or water penetration.
- 3.1.2 Examine roughing-in for components and assemblies penetrating cementitious cladding panels to verify actual locations of penetrations relative to seam locations of cementitious cladding panels before installation.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Preparation**

- 3.2.1 Miscellaneous Supports: Install subframing, furring, thermally-broken subframing and other miscellaneous panel support members and anchorages according to ASTM C754 and cementitious cladding panel manufacturer's written recommendations.

#### **3.3 Cementitious Cladding Panel Installation**

- 3.3.1 Install cementitious cladding panels according to manufacturer's written instructions in orientation, sizes, and locations indicated on Drawings. Install panels perpendicular to supports unless otherwise indicated. Anchor cementitious cladding panels and other components of the Work securely in place, with provisions for thermal and structural movement.

- 
- .1 Shim or otherwise plumb substrates receiving cementitious cladding panels.
  - .2 Flash and seal cementitious cladding panels at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until air- or water-resistive barriers and flashings that will be concealed by cementitious cladding panels are installed.
  - .3 Install screw fasteners in predrilled holes.
  - .4 Locate and space fastenings in uniform vertical and horizontal alignment.
  - .5 Install flashing and trim as cementitious cladding panel work proceeds.
  - .6 Locate panel splices over, but not attached to, structural supports. Stagger panel splices and end laps to avoid a four-panel lap splice condition.
  - .7 Align bottoms of cementitious cladding panels and fasten with blind rivets, bolts, or self-tapping screws. Fasten flashings and trim around openings and similar elements with self-tapping screws.
  - .8 Provide weathertight escutcheons for pipe- and conduit-penetrating panels.
- 3.3.2 Fasteners:
- .1 Install exterior metal cladding to structural supports by hidden mechanical fasteners, clips and perimeter framing extrusions
  - .2 Aluminum Panels: Use aluminum or stainless-steel fasteners for surfaces exposed to the exterior; use aluminum or galvanized-steel fasteners for surfaces exposed to the interior.
- 3.3.3 Metal Protection: Where dissimilar metals contact each other or corrosive substrates, protect against galvanic action as recommended in writing by cementitious cladding panel manufacturer.
- 3.3.4 Install attachment assembly required to support cementitious claddings and to provide a complete weathertight wall system, including subgirts, perimeter extrusions, tracks, drainage channels, panel clips, and anchor channels. Conform to AAMA 508. Do not apply sealants to panel joints unless otherwise indicated.
- .1 Include attachment to supports, panel-to-panel joinery, panel-to-dissimilar-material joinery, and panel-system joint seals.
  - .2 Install panels using fabricator's standard assembly with vertical channel that provides support and secondary drainage assembly, draining at base of wall. Notch vertical channel to receive support pins. Install vertical channels supported by

- 
- channel brackets or adjuster angles and at locations, spacings, and with fasteners recommended by manufacturer.
- .3 Attach wall panels by inserting horizontal support pins into notches in vertical channels and into flanges of panels. Leave horizontal and vertical joints with open reveal.
  - .4 Install support assembly at locations, spacings, and with fasteners recommended by fabricator. Use Fabricator's standard horizontal tracks and vertical tracks that provide support and secondary drainage assembly, draining to the exterior at horizontal joints through drain tube.
  - .5 Attach routed-and-turned flanges of wall panels to perimeter extrusions with fabricator's standard fasteners.
  - .6 Install wall panels to allow individual panels to "free float" and be installed and removed without disturbing adjacent panels.
- 3.3.5 Accessory Installation: Install accessories with positive anchorage to building and weathertight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.
- .1 Install components required for a complete cementitious cladding panel assembly including trim, copings, corners, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items. Provide types indicated by cementitious cladding panel manufacturer; or, if not indicated, provide types recommended in writing by cementitious cladding panel manufacturer.
- 3.3.6 Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that are permanently watertight.
- .1 Install exposed flashing and trim that is without buckling and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof performance.
  - .2 Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 3 m (10 feet) with no joints allowed within 605 mm (24 inches) of corner or intersection. Where lapped expansion provisions cannot be used or would not be sufficiently waterproof, form expansion joints of intermeshing hooked flanges, not less than 25 mm (1 inch) deep, filled with mastic sealant (concealed within joints).

- 3.3.7 Fire Blocks: Where cavities exceed 25 mm and contain combustible insulation or cladding materials, provide continuous fire blocks complying with OBC Article "3.1.11. Fire Blocks in Concealed Spaces" as specified in this Section and installed in cavity at every floor level and at intervals exceeding no more than 3m vertically.

**3.4 Erection Tolerances**

- 3.4.1 Installation Tolerances: Shim and align cementitious cladding units within installed tolerance of 1:1000 (1 inch in 80 feet), non-accumulative, on level, plumb, and location lines as indicated, and within 5% offset of adjoining faces and of alignment of matching profiles.

**3.5 Field Quality Control**

- 3.5.1 Testing Agency: Contractor must engage a qualified independent testing agency to perform field tests and inspections.
- 3.5.2 Water-Spray Test: After installation, test area of assembly as directed by Consultant for water penetration according to AAMA 501.2.
- 3.5.3 Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect completed cementitious cladding installation, including accessories.
- 3.5.4 Cementitious claddings will be considered defective if they do not pass test and inspections.
- 3.5.5 Additional tests and inspections, at Contractor's expense, are performed to determine compliance of replaced or additional work with specified requirements.
- 3.5.6 Prepare test and inspection reports.

**3.6 Cleaning And Protection**

- 3.6.1 Remove temporary protective coverings and strippable films, if any, as cementitious cladding panels are installed, unless otherwise indicated in manufacturer's written installation instructions. On completion of cementitious cladding panel installation, clean finished surfaces as recommended by cementitious cladding panel manufacturer. Maintain in a clean condition during construction.
- 3.6.2 After cementitious cladding panel installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.
- 3.6.3 Replace cementitious cladding panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION

## **1. GENERAL**

### **1.1 GENERAL INSTRUCTIONS**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; as well as the requirements of Division 01 Specifications and any additional documents mentioned in this Section.
- 1.1.2 The Contractor is solely responsible for distributing the Work among Subcontractors and Suppliers. The Consultant and Owner assume no responsibility for acting as arbiters or for establishing subcontract limits within Sections or Divisions of the Work. Any references to related work items in this Section are for convenience only.

### **1.2 SUMMARY**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the work specified herein. This includes, but is not necessarily limited, to:
  - .1 Linear metal soffit systems.
  - .2 Auxiliary materials required for a complete installation including, but not limited to, suspension systems, perimeter mouldings, trims and accessories.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole and may be directly applicable to this Section.
  - .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 07 46 13 – Steel Siding Panels.

### **1.3 REFERENCES**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 – Reference Standards.

### **1.4 ADMINISTRATIVE REQUIREMENTS**

- 1.4.1 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section, as well as representatives from manufacturers and fabricators involved in or affected by installation. Notify Consultant and Owner of scheduled meeting dates in advance.

- .2 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.
- 1.4.2 Coordination: Coordinate with Division 23, HVAC and Division 26, Electrical.
  - .1 Integration with Mechanical, Electrical and Security Systems: Ensure compatibility of light fixtures, air diffusers, sprinkler systems, and other soffit-mounted elements with linear metal soffits.

## **1.5 SUBMITTALS**

- 1.5.1 General Requirements and Procedures for Submittals: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for linear metal soffit work specified in this Section.
- 1.5.3 Embodied Carbon / Environmental Product Declarations (EPDs): submit product-specific EPD conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
- 1.5.4 Product Certificates: Submit certificates for indigenous materials, indicating location of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include distance to Project, means of transportation, and cost for each indigenous material.
- 1.5.5 Sustainability report: Submit corporate sustainability report for manufacturer of products specified in this Section identifying raw material sources.

- 
- 1.5.6 Shop Drawings: Submit Shop Drawings indicating material layouts, construction details, connections, and relationships with adjacent construction.
- .1 Ensure Shop Drawings are coordinated with other elements occurring within soffit assemblies.
  - .2 Shop Drawings must include hanger locations, suspension systems, access panels, light fixtures, diffusers and return grilles, changes in soffit height elevation, control joints, edge profiles and trims, life safety devices and other miscellaneous items that must be integrated with soffit system.
- 1.5.7 Delegated Design Submittals:
- .1 Engineering design completion of linear metal soffit work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.
- 1.5.8 Samples:
- .1 Initial Selection: For Products requiring colour, texture, or design selection, submit manufacturer's list of finishes or colour swatches for Consultant's selection.
  - .2 Verification Samples: Submit verification samples confirming colour and finish selections:
    - .1 Acoustical Panels: each type, colour, pattern, and texture; minimum 150 by 150 mm (6 by 6 in.) size.
    - .2 Exposed Suspension System, Mouldings, Trim: each type, finish, and colour; minimum 150 mm (6 in) long.
    - .3 Clips: Each type of hold-down and seismic clip

## **1.6 CLOSEOUT SUBMITTALS**

- 1.6.1 General Requirements and Procedures for Closeout Submittals: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for linear metal soffits to be included in operation and maintenance manual. Include precautions for use of and composition of cleaning materials detrimental to acoustic panels and accessories.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

---

**1.7     MAINTENANCE MATERIAL SUBMITTALS**

- 1.7.1 Panel Removal Tools: Provide Owner with acoustical soffit removal devices of type suitable for removal of linear metal soffit assemblies.

**1.8     QUALITY ASSURANCE**

- 1.8.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.8.2 Installer Qualifications: Engage an entity with experience installing, erecting, or assembling work similar in material, design, and extent to that shown, and whose work has resulted in construction with a track record of successful in-service performance.
- .1 Certification: Installer must be trained and certified by manufacturer.
- 1.8.3 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
- .1 Professional Engineer's Responsibility:
- .1 production and review of Shop Drawings,
- .2 design and certification of soffit, including attachments for building construction, in accordance with applicable codes and regulations,
- .3 stamping and signing of each Shop Drawing and associated calculations.
- 1.8.4 Single Source Responsibility: Obtain primary materials such as soffit panels and suspension assemblies from a single source by a single manufacturer, and secondary materials such as sealants from sources recommended by manufacturers of primary materials.
- 1.8.5 Mock-Ups: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
- .1 Location: In-situ (i.e., first installation), as directed on site by Consultant.
- .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .3 Reviewed mock-ups: may become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

---

**1.9 DELIVERY, STORAGE AND HANDLING**

- 1.9.1 General Product Requirements: in accordance with Section 01 61 00, Common Product Requirements. Deliver, store and handle linear metal soffit materials in accordance with manufacturer's written instructions.
- 1.9.2 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.9.3 Deliver linear metal soffit and accessories to Project site and store them in a fully enclosed, conditioned space where they will be protected against damage from moisture, humidity, temperature extremes, direct sunlight, surface contamination, and other causes.
- 1.9.4 Replace defective or damaged materials with new.

**2 . PRODUCTS**

**2.1 MANUFACTURERS**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
  - .1 Armstrong World Industries
  - .2 CGC/USG Inc.
  - .3 Hunter Douglas
  - .4 Rockfon

**2.2 PERFORMANCE / DESIGN CRITERIA**

- 2.2.1 Structural Performance: Provide linear metal soffit systems capable of withstanding effects of following loads, and stresses:
  - .1 Wind Loads: As indicated on Drawings, determined in accordance with requirements of Ontario Building Code for the geographical location of the project (1 in 50-year return probability), but not more than 0.96 kPa (20 psf).
  - .2 Seismic Performance:
    - .1 Design: linear metal soffit assemblies must withstand effects of earthquake motions in compliance with requirements of Ontario Building Code as validated by a Professional Engineer.
    - .2 Installation: Install system to requirements of ASTM E580 for Seismic Design Category D, E, F.
- 2.2.2 Surface Burning Characteristics: to ASTM E84, tested by a qualified agency. Products must be marked with certification of testing agency and demonstrate following characteristics:
  - .1 Flame-Spread Index: not more than 0

- .2 Smoke Developed Index: not more than 0

## **2.3 LINEAR METAL SOFFIT SYSTEM**

- 2.3.1 Material Tag: This item is identified as "S1/S2" on Drawings and Schedules.
- 2.3.2 General Description: manufacturer's standard linear metal soffit system conforming to ASTM E1264 consisting of metal soffit panels for installation in specialty suspension systems.
- 2.3.3 Material:
- .1 Aluminum: 0.61 mm (0.024 in) thick, conforming to ASTM B209/B209M; minimum 85% recycled content.
  - .2 Surface Quality: Exposed surfaces must be smooth, flat, and free from blemishes including pitting, seam marks, roller marks, roughness, stains, or discolorations.
- 2.3.4 Panel Configuration:
- .1 Width: 200 mm (8 in)
  - .2 Depth: 16 mm (5/8 inch)
  - .3 Length: Custom length cut to suit soffit dimensions (2436 mm / 96 in)
- 2.3.5 Edge Detail: Square unless indicated otherwise.
- 2.3.6 Perforations (M1 / SOLID): 0% open area
- 2.3.7 End Caps: To match linear metal soffit panels.
- 2.3.8 Filler Strips: Manufacturer's standard.
- .1 Finish: To match linear metal soffit panels.
- 2.3.9 Installation Pattern: As indicated on reviewed Shop Drawings..
- 2.3.10 Colours and Finishes:
- .1 Metallic Colour Finish: to match "Fluoropon Continuum Celestial Silver"
- 2.3.11 Basis-of-Design Products: "Armstrong Metalworks" by Armstrong World Industries or approved equivalent by manufacturers indicated in this Section.

## **2.4 SUSPENSION SYSTEMS**

- 2.4.1 Suspension Systems: manufacturer's specialty pre-slotted suspension systems, including carriers, runners, splice sections, connector clips, alignment clips, levelling clips, hangers, mouldings, trims, and other necessary components to support linear metal soffit and other soffit-supported elements.
- .1 Manufacturing standard: to ASTM C635/C635M.
  - .2 Structural Classification: Heavy-duty.

- 2.4.2 Attachment Devices: must be capable of supporting 5 times the design load specified in ASTM C635/C635M, Table 1, complete with load test data from an independent test laboratory certifying performance.
- 2.4.3 Wire Hangers, Braces, and Ties: galvanized, soft-annealed, mild steel wire conforming to ASTM A641/A641M, Class 1 zinc coating, soft temper; not less than 2.70 mm (12 ga) diameter.
- 2.4.4 Perimeter Detail: manufacturer's standard perimeter support framing.

## **2.5      ACCESSORIES AND AUXILIARY MATERIALS**

- 2.5.1 Provide necessary associated accessories and auxiliary materials required to provide complete installation of linear metal soffit work. Ensure such materials are recommended in writing by linear metal soffit manufacturer for intended use and are compatible with adjacent materials.
- 2.5.2 Exposed Metal Edge Mouldings and Trim: Provide manufacturer's standard components and accessories as required for concealment or trimming of soffit penetrations, edge pans and runners, fixture trim and adapters, fasciae at soffit height changes, and other conditions.
  - .1 Metal and Finish: to match linear metal soffit units unless otherwise indicated.
- 2.5.3 Access Panels: Manufacturer's standard access and inspection hatches designed to accommodate field cuts and fit with acoustical soffits.
- 2.5.4 Hold-Down Clips and Inserts: Manufacturer's standard hold-down clips and inserts required to secure linear metal soffit systems at perimeter and other locations required by manufacturer.
- 2.5.5 Seismic Clips: Manufacturer's standard seismic clips designed to secure linear metal soffit in place during seismic event demonstrating compliance to ASTM E580.

## **2.6      finishes**

- 2.6.1 Generally : Comply with requirements in NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for finish application and designation.
- 2.6.2 Surface Protection: Before shipping, protect exposed surfaces of linear metal soffit with removable, temporary protective covering that will not remain adhered to pans.

---

### **3 . EXECUTION**

#### **3.1 EXAMINATION**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation.
- 3.1.2 Review substrates, areas, and conditions, including faming required for installation of linear metal soffits. Check for compliance with installation tolerances and conditions that may detrimentally affect performance of linear metal soffits.
- 3.1.3 Examine linear metal soffits before installation. Reject linear metal soffits that are wet, moisture -damaged, or mould-damaged.
- 3.1.4 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 PREPARATION**

- 3.2.1 Measure each soffit area and establish layout of linear metal soffits to balance border widths at opposite edges of each soffit. Do not use less-than-half-width panels at borders unless otherwise indicated; comply with layout shown on reflected soffit plans.
- 3.2.2 Arrange for penetrations to be centered on items which they penetrate.

#### **3.3 INSTALLATION**

- 3.3.1 Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings.
- 3.3.2 Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.3 Installation standards:
  - .1 Linear metal soffits: in accordance with ASTM C636/C636M and CISCA's "Soffit System Handbook."
  - .2 Seismic installations: in accordance with ASTM E580.
- 3.3.4 Soffit Hangers Installation: Install hangers plumb; do not permit contact with insulation, sound blocking or other elements not forming part of linear metal soffit assembly.
- 3.3.5 Hanger Spacing: Space hangers at maximum 1220 mm (48 inches) on-center; provide closer placement near member ends as required and in accordance with manufacturer's instructions.
  - .1 Attach hangers to building's structural members. Do not attach to steel deck tabs, bottom chord of open web steel joists or steel roof deck.

- 3.3.6 Splaying: Only splay hangers to avoid obstructions when necessary; counteract horizontal forces with appropriate measures in accordance with ASTM C636/C636M and manufacturer's instructions.
- .1 Where hanger spacings are affected by ducts or other constructions within soffit plenum, provide additional supports as required to increase load-carrying capacity of soffit suspension system commensurate with actual center-to-center hanger distances used.
- 3.3.7 Perimeter Mouldings and Trim: Attach mouldings to substrates at manufacturer-specified intervals but not more than 406 mm (16 in) o.c.; ensure proper level alignment with soffit system. Visible fasteners on moldings and trim are not permitted.
- 3.3.8 Main Runners and Cross-Tees: Install runners and cross-tees square, securely interlocked, and free from damage. Ensure cross-tees are installed at right angles to main runners.
- .1 Tolerances: Ensure suspension system is level to within 6 mm in 3 m (1/4 in in 10 ft) and square to within 1.5 mm in 610 mm (1/16 in in 2 ft).
- 3.3.9 Soffit Installation:
- .1 Install soffits with flush, tight joints between adjoining units. Scribe and cut units for precise fit at room borders and around areas penetrating soffit. Provide pan splices as required.
- .2 Cut and fit linear metal soffit accurately around borders, interruptions, and penetrations, in accordance with manufacturer's instructions.
- .3 Joints Alignment: Align joints uniformly; follow room axes unless indicated otherwise on reflected soffit plans.
- .4 Provide end caps on visible ends of soffits, unless installation of perimeter trims is required. Provide filler strips as required.

### **3.4 PROTECTION**

- 3.4.1 Protect linear metal soffits from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.4.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer.
- 3.4.3 Do not use materials or processes that can damage finishes, surfaces, or construction.
- 3.4.4 Promptly replace Linear Metal Soffit Panels work damaged during construction that cannot be satisfactorily repaired.

---

**3.5     CLEANING AND WASTE MANAGEMENT**

- 3.5.1    Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.5.2    Clean exposed surfaces of linear metal soffits. Comply with manufacturer's written instructions for cleaning and touch up of minor finish damage.
- 3.5.3    Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 GENERAL INSTRUCTIONS**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 SUMMARY**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the glass-faced rainscreen cladding panels work specified herein. This includes, but is not necessarily limited, to:
  - .1 Glass-faced rainscreen cladding panel system.
  - .2 Accessories including sub-framing, associated flashings, closures, and sealants required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 REFERENCES**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 DEFINITIONS**

- 1.4.1 PER: Pressure equalized rainscreen system; rainscreen system designed for no water intrusion with equal pressure between interior system cavity and outside cladding barrier.

### **1.5 PREINSTALLATION MEETINGS**

- 1.5.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.

- 
- 1.5.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
    - .3 Review and finalize construction schedule and verify availability of materials, personnel, equipment, and facilities needed to make progress and avoid delays.
    - .4 Review methods and procedures for glass-faced rainscreen cladding panel installation, including manufacturer's instructions.
    - .5 Examine supports, including alignment and attachment to structural members.
    - .6 Review flashing, details, penetrations, openings, and conditions of other elements that may affect glass-faced rainscreen cladding panels.
    - .7 Discuss governing regulations, insurance, certificates, tests, and inspections as applicable.
    - .8 Review temporary protection requirements for glass-faced rainscreen cladding panels before, during and after installation.
    - .9 Discuss procedures repair procedures for glass-faced rainscreen cladding panels where permitted by Consultant.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

---

**1.6 SUBMITTALS**

- 1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.6.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for glass-faced rainscreen cladding panels work specified in this Section.
- 1.6.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Illustrate fabrication and installation layouts of glass-faced rainscreen cladding panels such as details of edge conditions, joints, panel profiles, corners, anchoring, attachment assembly, trims, flashings, closures, accessories and other special conditions.
  - .3 Scale for details of flashings, trims and anchorages: minimum 1:10 (1-1/2 inches per 12 inches).
  - .4 Indicate field-measured dimensions on Shop Drawings.
- 1.6.4 Effective R-Value Thermal Performance Report: Submit analysis report demonstrating that glass-faced rainscreen cladding assemblies, including framing components, as proposed by Contractor, meet thermal and structural performance requirements established by Contract Documents. As a minimum, report must include the following:
  - .1 Each wall's nominal R-value and effective R-value.
  - .2 Clip spacing (vertical and horizontal).
  - .3 Maximum allowable wind loads, demonstrating compliance with requirements specified in this Section.
  - .4 Cladding dead loads, demonstrating compliance with requirements specified in this Section.
  - .5 Fastener types.
- 1.6.5 Delegated Design Submittals:
  - .1 Engineering design completion of glass-faced rainscreen cladding panels work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.

- 1.6.6 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.7 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.8 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
- .1 As a minimum submit samples of the following:
    - .1 Glass-faced rainscreen cladding panels: Submit two (2), 305 mm (12 inches) long by actual panel width. Include fasteners, closures, and other glass-faced rainscreen cladding panel accessories demonstrating system's water-management and pressure-equalization characteristics.

## **1.7 CLOSEOUT SUBMITTALS**

- 1.7.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.7.2 Operating and Maintenance Data: Submit care and maintenance instructions for glass-faced rainscreen cladding panels to be included in building operation and maintenance manual.
- 1.7.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

---

**1.8 QUALITY ASSURANCE**

- 1.8.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.8.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
  - .1 Certifications: Installer must be certified by manufacturer. Submit proof of certification upon request.
- 1.8.3 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
  - .1 Professional Engineer's Responsibility:
    - .1 production and review of Shop Drawings,
    - .2 design and certification of glass-faced rainscreen cladding panels, including attachments for building construction, in accordance with applicable codes and regulations,
    - .3 stamping and signing of each Shop Drawing and associated calculations.
- 1.8.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.8.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Build mockup of typical glass-faced rainscreen cladding panel assembly including corner, soffits, supports, attachments, and accessories.
  - .3 Water-Spray Test: Conduct water-spray test of glass-faced rainscreen cladding panel assembly mockup for water penetration in accordance with AAMA 501.2.

- .4 Purpose: To perform testing and set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .5 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.9 DELIVERY, STORAGE AND HANDLING**

- 1.9.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.9.2 Deliver, store and handle glass-faced rainscreen cladding panels materials in accordance with manufacturer's written instructions.
- 1.9.3 Store panels horizontally on pallets in a dry, well-ventilated space, under temporary or permanent shelter.
- 1.9.4 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.9.5 Prevent contact with other materials to avoid staining, denting, or other damage to glass-faced rainscreen cladding panels.
- 1.9.6 Replace defective or damaged materials with new.

**1.10 FIELD CONDITIONS**

- 1.10.1 Field Measurements: Verify actual dimensions of construction contiguous with glass-faced rainscreen cladding panels by field measurements before fabrication.

**1.11 COORDINATION**

- 1.11.1 Coordinate glass-faced rainscreen cladding panel installation with rain drainage work, flashing, trim, construction of soffits, and other adjoining work to provide a leakproof, weather-tight, secure, and noncorrosive installation.

**1.12 WARRANTY**

- 1.12.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of glass-faced rainscreen cladding panels that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Failures include, but are not limited to, the following:
    - .1 Structural failures, including rupturing, cracking, or puncturing.

- .2 Deterioration of metals and other materials beyond normal weathering.
- .2 Warranty Period: Not less than 10 years from date of Substantial Performance of The work.
  - .1 Special Warranty on Finishes: not less than 30 from date of Substantial Performance of The work.

## **2 . PRODUCTS**

### **2.1 SYSTEMS AND FABRICATORS**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following fabricators may supply their systems for work this Section:
  - .1 Basis-of-Design: Materials specified in this Section are based on “StoVentec Glass” as supplied by Sto.
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 PERFORMANCE / DESIGN CRITERIA**

- 2.2.1 Glass-faced rainscreen cladding panel system must be designed to withstand project-specific design loads and their effects within constraints specified in this Section and Ontario Building Code without defects, damage, or failure, including but not limited to the following:
  - .1 Dead Loads: Including those transferred from structural elements.
  - .2 Environmental Loads: Such as wind, snow, rain, hydrostatic, seismic and earth pressures as applicable.
  - .3 Live Loads: Including those arising from use and occupancy.
  - .4 Loads from Temperature and Moisture Loads: Including expansion, contraction, deflection, deformation, creep, shrinkage, settlement, and differential movement.
  - .5 Fire Loads: as determined by fire performance testing specified.
- 2.2.2 Employ a qualified professional engineer, as specified in this Section, to design and certify aluminum panel assemblies, including attachment to building construction.
- 2.2.3 Intended aesthetics: Drawings and Specifications provide requirements regarding system’s aesthetic and performance criteria. Unless indicated otherwise, preserve intended aesthetic effects. For any proposed deviations, provide detailed explanation to Consultant for evaluation. Acceptance or rejection of proposed deviations rests solely with Consultant.
- 2.2.4 Moisture Control and Weathertightness:

- 
- .1 Air Infiltration: Air leakage of not more than 0.6 L/s/m<sup>2</sup> (0.12 cfm/sq. ft.) when tested according to ASTM E283 at 75 Pa (1.57 psf) test pressure differential.
  - .2 Water Penetration (Static Pressure): No water penetration when tested according to ASTM E331 at 300 Pa (6.24 psf) test pressure differential.
  - .3 Water Penetration (Dynamic Pressure): No water penetration when tested according to AAMA 501.1 at 300 Pa (6.24 psf) test pressure differential.
  - .4 Building Enclosure Design Principle: Exterior envelope construction for this Project is based on "Rain Screen" design principle, as recommended by National Research Council of Canada. Face sealed assemblies are not permitted.
    - .1 Continuity: Maintain integrity and continuity of building enclosure's thermal, air, and vapour control layers at all times by using appropriate insulation, air barriers, vapour retarders to tie work of this Section with adjacent construction.
    - .2 Design for compartments to achieve appropriate pressure equalization in exterior cladding system.
  - .5 Incorporate means of draining moisture to exterior. Drainage system must provide clear, internal paths of drainage of trapped moisture within Glass-faced rainscreen assemblies to exterior of wall assemblies.
  - .6 System must discharge water in manner that avoids staining of architectural finishes, formation of puddles or formation of icicles.
- 2.2.5 Structural Performance: Provide Glass-faced rainscreen panel systems capable of withstanding the effects of the following loads, based on testing according to ASTM E330:
- .1 Wind Loads: As indicated on Drawings, determined in accordance with OBC requirements (5.2.2.2. Determination of Wind Load) for the geographical location of the project (1 in 50-year return probability).
  - .2 Allowable deflection normal to the plane of the wall for back-up wall construction: L/300
  - .3 Design glass, including comprehensive engineering analysis according to CAN/CGSB-12.20 or equivalent to ASTM E1300 by a Professional Engineer licensed to practice in the Province of Ontario, using the design criteria indicated.
  - .4 Design Wind Pressures: Determine design wind pressures applicable to Project according to the requirements of the

Ontario Building Code, based on heights above grade indicated on Drawings.

- .5 Probability of Breakage for Glazing: Design glass for a probability of breakage not greater than 1 in 1000 for glass installed in sloped applications and 8 in 1000 for glass installed in vertical applications.
  - .6 Differential Shading: Design glass to resist thermal stresses induced by differential shading within glazing.
- 2.2.6 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.2.7 Thermal Movements: fabricate and install Glass-faced rainscreen panel systems to prevent buckling, opening up of joints and overstressing of welds and fasteners under the following temperature conditions:
- .1 Temperature Change: ambient temperature cycling of - 30 deg C (-22 deg F) to 82 deg C (180 deg F) over a 12 hour period.
  - .2 Account for thermal stresses, drilling impacts, or other causes before or during Glass-faced rainscreen installation. Implement handling and storage methods for Glass-faced rainscreen panels to reduce such stresses.
- 2.2.8 System Fire Propagation Characteristics: Wall assemblies containing Glass-faced rainscreen panels must meet requirements of CAN/ULC S134 within limits specified by Ontario Building Code but generally as follows:
- .1 Flaming on or in wall assembly: must not spread more than 5 m above opening.
  - .2 Heat flux during flame exposure: less than 35 kW/m<sup>2</sup> measured at 3.5 m above opening.

## **2.3 GLASS-FACED RAINSCREEN CLADDING PANELS**

- 2.3.1 Material Tag: This item is noted as "EW10" on Drawings and Schedules.
- 2.3.2 Glass Panel: pre-fabricated panel with 8mm (0.31 in) opaque, heat soaked and fully tempered glass fully bonded with silicone adhesive to manufacturer's standard 20 mm carrier profile.

- 2.3.3 Base Material: ASTM C1048 Type I; Quality-Q3; Class I (clear); Kind FT or equivalent to CAN/CGSB-12.1. Perform heat strengthening using horizontal tong free method; surface compression not less than 69 MPa (10,000 psi). Glazing must comply with testing requirements in 16 CFR 1201 for Category II materials.
- .1 Heat-Soaking: Provide in-line heat soaking of tempered glass in accordance with BS EN 14179 (2 hour dwell at 290°C±10°C)
- 2.3.4 Joint Type: Dry.
- 2.3.5 Surface Burning Characteristics:
- .1 Compliance: CAN/ULC S114.
- .2 Combustibility: Non-combustible.

## **2.4 AUXILIARY MATERIALS**

- 2.4.1 Wall Brackets: 2 mm stainless steel or minimum 3 mm aluminum x 70 mm – 320 mm sliding point brackets, and 2.5 mm stainless steel or minimum 3 mm aluminum x 70 mm – 320 mm fixed point brackets. Brackets to be spaced and connected to supporting structure as required in accordance with manufacturer's written instructions.
- 2.4.2 Vertical Profiles: T-Profiles made of aluminum alloy EN AW 6063 Temper 6 or EN AW 6005A Temper 5, with 2.7 mm x 90 mm plate and 2.4 mm x 52.7 mm leg, in lengths to 3 m, are attached to wall brackets using stainless steel screws. Wall brackets to be positioned. Spacing of T-Profiles to be as required by engineering analysis.
- 2.4.3 Panel Agraffe profiles: 62.5 mm x 28.8 mm, manufactured from aluminum alloy EN AW 6063 Temper 6 or EN AW 6005A Temper 5 and pre-mounted to carrier boards using stainless steel screws.
- 2.4.4 Metal Sub-framing and Furring: Minimum 1.219 mm (18 ga.) thick, cold-formed, galvanized sheet steel conforming to ASTM C645. Protective Coating: Hot-dip galvanized Z275 (G90) coating to ASTM A653/A653M.
- .1 Transfer Grid: Provide manufacturer's standard sections as required for support and alignment of glass-faced rainscreen cladding panel system consisting of hat bars, Z-bars, adjustable Z-bars or combination thermal clip and transfer grids as noted on Drawings.
- .2 Material visible after assembly: finished to match panels.
- 2.4.5 Thermally-Broken Sub-framing: Low-conductivity thermally-broken, intermittent structural attachment insulation clips designed maintain

insulation effectiveness, with adjustable depth and suitable for vertical and horizontal sub-girts.

- .1 Basis-of-Design: “Cascadia Clip” by Cascadia Windows
- .2 Acceptable Products:
  - .1 “ISO Clip” by Northern Facades Ltd.
  - .2 “TAC Thermal Spacer” Exterior Technologies Group
  - .3 “TClip Thermally Broken Façade Substructure” by Engineered Assemblies
  - .4 “NVELOPE NV1 Cladding Attachment System” by SFS Group.

**2.4.6 Panel Accessories:**

- .1 Perimeter Components and Trim: Use extruded or formed aluminum. Do not use galvanized steel clips or aluminum angles for panel-to-panel attachment. Fabricate flashings from glass-faced rainscreen cladding panel material and finish with same finish system as adjacent glass-faced rainscreen cladding panels.
  - .1 Locations: Generally, provide flashings at locations including, but not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, fasciae, parapet caps, soffits, reveals, and fillers as required to provide finished appearance and divert water away from wall assemblies.
- .2 Opening head and sill flashing:
  - .1 Material: Minimum 26 ga steel.
  - .2 Head Flashing: Attach with silicone or mechanical fasteners at top of opening, treated with air barrier.
  - .3 Sill Flashing: Attach with silicone at bottom, reinforced with additional fasteners.
- .3 Opening jamb detail:
  - .1 Material: Minimum 26 ga steel for jamb profile.
- .4 Accessories: Provide components required for a complete, watertight and airtight Glass-faced rainscreen cladding panel assembly including, but not limited to, trims, copings, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar elements. Match material and finish to glass-faced rainscreen cladding system unless otherwise indicated.

**2.4.7 Fire Blocks: Manufacturer’s standard to comply with OBC and ASTM E2307.**

- 2.4.8 Panel Fasteners: Self-tapping screws designed to withstand design loads. Provide exposed fasteners with heads matching colour of glass-faced rainscreen cladding systems by means of plastic caps or factory-applied coating. Provide EPDM or PVC sealing washers for exposed fasteners.
- 2.4.9 Air Barrier/Vapour Retarder: Manufacturer's standard as required for application and compatible with type specified in 07 27 14 - Self-Adhering Sheet Air Barriers and Vapour Retarders.
  - .1 Basis-of-Design: StoGuard VaporSeal R
- 2.4.10 Insulation: Manufacturer's standard as required for application and compatible with type specified in 07 21 00 - Thermal Insulation.

## **2.5 FABRICATION**

- 2.5.1 Factory Fabrication: Fabricate panels in accordance with manufacturer's instructions as required to meet performance requirements specified in this Section. Comply with indicated profiles, dimensions, and structural requirements specified in Contract Documents.
- 2.5.2 Visual Quality: Provide sharp, clean edges without displacement of glass-faced rainscreen cladding panels. Minimize oil canning.
- 2.5.3 Joints: Provide factory-installed captive gaskets or separator strips to ensure weathertightness and noise reduction.

## **2.6 FINISHES**

- 2.6.1 Protect mechanical and painted finishes on exposed surfaces from damage by applying strippable, temporary protective covering that will not remain adhered to panels in the field before shipping.
- 2.6.2 Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
- 2.6.3 Appearance of Finished Work: Noticeable variations in same piece of glass-faced rainscreen cladding are not acceptable. Variations in appearance of other components are acceptable if they are within range of Samples reviewed by Consultant and are assembled or installed to minimize contrast.

## **3 . EXECUTION**

### **3.1 EXAMINATION**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions

which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

- .1 Examine wall framing to verify that girts, angles, channels, studs, and other panel support members and anchorages have been installed within alignment tolerances required by glass-faced rainscreen cladding panel manufacturer.
  - .2 Examine wall sheathing to ensure that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by glass-faced rainscreen cladding panel manufacturer.
  - .3 Verify that air-barriers and vapour-retarders have been installed over sheathing or backing substrate to prevent air infiltration and water penetration.
- 3.1.2 Examine roughing-in for components and assemblies penetrating glass-faced rainscreen cladding panels to verify actual locations of penetrations relative to seam locations of glass-faced rainscreen cladding panels before installation.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2 PREPARATION**

- 3.2.1 Install subframing, furring, thermally-broken sub framing and other miscellaneous panel support members and anchorages according to ASTM C754 and glass-faced rainscreen cladding panel manufacturer's written recommendations.

### **3.3 INSTALLATION**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.3.2 Install panels perpendicular to supports unless otherwise indicated. Anchor glass-faced rainscreen cladding panels and other components of the Work securely in place, with provisions for thermal and structural movement.
- 3.3.3 Fasteners: Use aluminum or stainless-steel fasteners for surfaces exposed to the exterior; use aluminum or galvanized-steel fasteners for surfaces exposed to the interior.
- 3.3.4 Metal Protection: Where dissimilar metals contact each other or corrosive substrates, protect against galvanic action as recommended in writing by glass-faced rainscreen cladding panel manufacturer.

- 3.3.5 Flash and seal glass-faced rainscreen cladding panels at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until air barriers, vapour retarders, and flashings that will be concealed by glass-faced rainscreen cladding panels are installed.
- 3.3.6 Provide weathertight escutcheons for pipe- and conduit-penetrating panels. Seal with manufacturer's recommended sealants.
- 3.3.7 Fasteners: Use aluminum or stainless-steel fasteners for surfaces exposed to the exterior; use aluminum or galvanized-steel fasteners for surfaces exposed to the interior.
- 3.3.8 Accessory Installation: Install accessories with positive anchorage to building and weathertight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.

### **3.4 ERECTION TOLERANCES**

- 3.4.1 Installation Tolerances: Shim and align glass-faced rainscreen cladding panel units within installed tolerance of 1:1000 (1 inch in 80 feet), non-accumulative, on level, plumb, and location lines as indicated, and within 5% offset of adjoining faces and of alignment of matching profiles.

### **3.5 FIELD QUALITY CONTROL**

- 3.5.1 Manufacturer's Field Service: Engage a site representative qualified by glass-faced rainscreen cladding panel manufacturer to inspect substrate conditions, surface preparation, panel application, flashings, protection, and drainage components, and to Supply reports to Consultant.
- 3.5.2 Glass-faced rainscreen cladding panels will be considered defective if they do not pass tests and inspections.
- 3.5.3 Additional tests and inspections, at Contractor's expense, are performed to determine compliance of replaced or additional work with specified requirements.
- 3.5.4 Prepare test and inspection reports.

### **3.6 PROTECTION**

- 3.6.1 Protect glass-faced rainscreen cladding panels from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.6.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in

writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.

- 3.6.3 Promptly replace glass-faced rainscreen cladding panels work damaged during construction that cannot be satisfactorily repaired.
- 3.6.4 Remove temporary protective coverings and strippable films as glass-faced rainscreen cladding panels are installed. On completion of glass-faced rainscreen cladding panel installation, clean finished surfaces as recommended by glass-faced rainscreen cladding panel manufacturer. Maintain in a clean condition during construction.

### **3.7 CLEANING AND WASTE MANAGEMENT**

- 3.7.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.7.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.7.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the steel siding panels work specified herein. This includes, but is not necessarily limited, to:
  - .1 Steel siding wall panels.
  - .2 Accessories including associated flashings, closures, sealants required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
  - .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 06 16 00 - Sheathing.
    - .2 Section 07 21 00 - Thermal Insulation.
    - .3 Section 07 92 00 - Joint Sealants.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Preinstallation Meetings**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.

- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
- .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
- .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
- .5 Meet with Owner, Consultant, metal panel Installer, metal panel manufacturer's representative, structural-support Installer, and installers whose work interfaces with or affects metal panels, including installers of doors, windows, and louvers.
- .6 Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
- .7 Review methods and procedures related to metal panel installation, including manufacturer's written instructions.
- .8 Examine support conditions for compliance with requirements, including alignment between and attachment to structural members.
- .9 Review flashings, special siding details, wall penetrations, openings, and condition of other construction that affect metal panels.
- .10 Review governing regulations and requirements for insurance, certificates, and tests and inspections if applicable.
- .11 Review temporary protection requirements for metal panel assembly during and after installation.
- .12 Review of procedures for repair of metal panels damaged after installation.
- .13 Document proceedings, including corrective measures and actions required, and Supply copy of record to each participant.

## **1.5 Action Submittals**

- 1.5.1 General Requirements and Procedures for Submittals: In accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit for each type of product.

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**07 46 13  
Steel Siding Panels And  
Soffits**

---

- .1 Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of panel and accessory.
- 1.5.3 Product Disclosure and Transparency:
  - .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
  - .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
    - .1 Health Product Declaration open Standard,
    - .2 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
    - .3 International Living Future Institute Declare
    - .4 Other approved framework.
  - .3 When multiple Products are specified, give preference to Products with compliant documentation.
- 1.5.4 Shop Drawings:
  - .1 Include fabrication and installation layouts of metal panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment system, trim, flashings, closures, and accessories; and special details.
- 1.5.5 Delegated Design Submittals:
  - .1 Engineering design completion of aluminum composite material wall panels work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.
- 1.5.6 Samples: Submit for each type of metal panel indicated on Drawings and Schedules with factory-applied finishes.
  - .1 Include Samples of trim and accessories involving colour selection.
  - .2 Metal Panels: 305 mm (12 inches) long by actual panel width. Include fasteners, closures, and other metal panel accessories.

- 1.5.7 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback

**1.6 Closeout Submittals**

- 1.6.1 Maintenance Data: Submit for metal panels to include in maintenance manuals.

**1.7 Quality Assurance**

- 1.7.1 Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.
- 1.7.2 Mock-ups: Build mock-ups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
  - .1 Build mock-up of typical metal panel assembly as designated on site by Consultant, including corner, supports, attachments, and accessories.
  - .2 Review of mock-ups does not constitute approval of deviations from the Contract Documents contained in mock-ups unless Consultant specifically approves such deviations in writing.
  - .3 Reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

**1.8 Delivery, Storage, And Handling**

- 1.8.1 Deliver components, metal panels, and other manufactured items so as not to be damaged or deformed. Package metal panels for protection during transportation and handling.
- 1.8.2 Unload, store, and erect metal panels in a manner to prevent bending, warping, twisting, and surface damage.
- 1.8.3 Stack metal panels horizontally on platforms or pallets, covered with suitable weathertight and ventilated covering. Store metal panels to ensure dryness, with positive slope for drainage of water. Do not store metal panels in contact with other materials that might cause staining, denting, or other surface damage.
- 1.8.4 Retain strippable protective covering on metal panels during installation.

**1.9 Field Conditions**

- 1.9.1 Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of metal panels to be performed according to manufacturers' written instructions and warranty requirements.

**1.10     Coordination**

- 1.10.1 Coordinate metal panel installation with rain drainage work, flashing, trim, construction of soffits, and other adjoining work to provide a leakproof, secure, and noncorrosive installation.

**1.11     Warranty**

- 1.11.1 Extended Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal panel systems that fail in materials or workmanship within specified warranty period.

- .1 Failures include, but are not limited to, the following:
  - .1 Structural failures including rupturing, cracking, or puncturing.
  - .2 Deterioration of metals and other materials beyond normal weathering.
- .2 Warranty Period: Two years from date of Substantial Performance of the Work.

- 1.11.2 Extended Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal panels that show evidence of deterioration of factory-applied finishes within specified warranty period.

- .1 Exposed Panel Finish: Deterioration includes, but is not limited to, the following:
  - .1 Colour fading more than 5 Hunter units when tested according to ASTM D 2244.
  - .2 Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
  - .3 Cracking, checking, peeling, or failure of paint to adhere to bare metal.
- .2 Finish Warranty Period: 20 years from date of Substantial Performance of the Work.

**2 .     PRODUCTS**

**2.1     Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- .1 Agway Metals Inc.;
  - .2 Morin; a Kingspan Group company;

.3 Vicwest;

.4 West-Form Metals;

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Design And Performance Requirements**

2.2.1 Structural Performance: Provide metal panel systems capable of withstanding the effects of the following loads in accordance with requirements of Ontario Building Code, and CSA-S136:

.1 Determine specified loads, principal and companion load factors, building importance category, and load distributions in accordance with requirements of Ontario Building Code.

.1 Wind Loads: Determined in accordance with OBC requirements for geographical location of project, with 1 in 50 year return probability.

.2 Design steel cladding components to be adequately interconnected and adequately fastened to structural supports to sustain loads.

.3 Deflection of sheet steel cladding components due to uniformly distributed specified loads (eg. wind, snow) shall not exceed 1/90 of the span for walls, nor 1/180 of the span for roofs.

.4 Deflection Limits: for uniformly distributed specified loads (eg. wind, snow), no greater than 1/180 of the span.

.5 Wherever structural framing permits, and subject to reasonable limitations for handling, design and fabricate cladding to span continuously over at least four structural supports (three spans).

2.2.2 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.

.1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.

.2 Refer to Structural Drawings for seismic sensitivity values.

2.2.3 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes by preventing buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

- .1 Temperature Change (Range): 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.

## **2.3 Materials**

- 2.3.1 Metallic-Coated Steel Sheet: Zinc-coated (galvanized) steel sheet; minimum Grade 230 complying with ASTM A653/A 653M, Z275 (G90) coating designation, or aluminum-zinc alloy-coated steel sheet complying with ASTM A792/A 792M, Class AZM150 (Class AZ50) coating designation; structural quality. Prepainted by the coil-coating process to comply with ASTM A755/A 755M.

## **2.4 Corrugated Metal Cladding**

- 2.4.1 Material Tag: This item is noted as "EW3" on Drawings and Schedules.
- 2.4.2 Provide factory-formed metal panels designed to be field assembled by lapping side edges of adjacent panels and mechanically attaching panels to supports using exposed fasteners in side laps. Include accessories required for weathertight installation.
- 2.4.3 Corrugated-Profile, Exposed-Fastener Metal Wall Panels: formed with alternating ribs spaced across width of panel.
  - .1 Rib Spacing: 68 mm (2-5/8 inches) o.c.
  - .2 Panel Coverage: 878 mm (34-1/4 inches)
  - .3 Panel Height: 22 mm (7/8 inch)
  - .4 Perforations: as per SolarWall requirements where indicated on Drawings.
  - .5 Nominal Thickness: As determined by Project-specified loadings, but not less than 0.71 mm (24ga - 0.028 inch).
  - .6 Acceptable Products: "7/8 Corrugated" by Vicwest or approved equivalent.
- 2.4.4 Exterior Panel Finish (PVDF): 2-coat fluoropolymer conforming to AAMA 2605 and containing minimum 70 % PVDF resin by weight.
  - .1 Basis-of-Design: "10 000 Series" by ArcelorMittal (Dofasco) or approved equivalent.
  - .2 Colour: as indicated on Drawings.

## **2.5 Metal Soffit Panels**

- 2.5.1 Refer to Section 07 42 96 – Linear Metal Soffit Panels.

## **2.6 Auxiliary Materials**

- 2.6.1 Miscellaneous Metal Subframing and Furring: Thermally-broken materials conforming to 07 21 60. Provide sections as required for support and alignment of metal panel system.

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**07 46 13  
Steel Siding Panels And  
Soffits**

- 
- 2.6.2 Screws: ANSI B18.6.4. Purpose made aluminum alloy or stainless steel.
- 2.6.3 Panel Accessories: Provide components required for a complete, weathertight panel system including trim, copings, fasciae, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of metal panels unless otherwise indicated on Drawings and Schedules.
- .1 Closures: Provide closures at eaves and rakes, fabricated of same metal as metal panels.
  - .2 Backing Plates: Provide metal backing plates at panel end splices, fabricated from material recommended by manufacturer.
  - .3 Closure Strips: Closed-cell, expanded, cellular, rubber or crosslinked, polyolefin-foam or closed-cell laminated polyethylene; minimum 25-mm- (1-inch-) thick, flexible closure strips; cut or premolded to match metal panel profile. Provide closure strips where indicated on Drawings and Schedules or necessary to ensure weathertight construction.
- 2.6.4 Thermally-Broken Sub-framing: Low-conductivity thermally-broken, intermittent structural attachment insulation clips designed maintain insulation effectiveness, with adjustable depth and suitable for vertical and horizontal sub-girts.
- .1 Basis-of-Design: "ISO Clip" by Northern Facades Ltd.
  - .2 Acceptable Products:
    - .1 "Cascadia Clip" by Cascadia Windows
    - .2 "TClip Thermally Broken Façade Substructure" by Engineered Assemblies
    - .3 "NVELOPE NV1 Cladding Attachment System" by SFS Group.
    - .4 Approved equivalent.
- 2.6.5 Flashing and Trim: Provide flashing and trim formed from same material as metal panels as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Finish flashing and trim with same finish system as adjacent metal panels.
- .1 Sealant Tape: Pressure-sensitive, 100 percent solids, gray polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape 13 mm (1/2 inch) wide and 3 mm (1/8 inch) thick.

- .2 Joint Sealant: ASTM C 920; elastomeric polyurethane or silicone sealant; of type, grade, class, and use classifications required to seal joints in metal panels and remain weathertight; and as recommended in writing by metal panel manufacturer.

## **2.7     Fabrication**

- 2.7.1 Fabricate and finish metal panels and accessories at the factory, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing. Comply with indicated profiles and with dimensional and structural requirements.
- 2.7.2 Provide panel profile, including major ribs and intermediate stiffening ribs, if any, for full length of panel.
- 2.7.3 Fabricate metal panel joints with factory-installed captive gaskets or separator strips that provide a weathertight seal and prevent metal-to-metal contact, and that minimize noise from movements.
- 2.7.4 Sheet Metal Flashing and Trim: Fabricate flashing and trim to comply with manufacturer's recommendations and recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated.

## **2.8     Finishes**

- 2.8.1 Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- 2.8.2 Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

# **3 .     EXECUTION**

## **3.1     Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, metal panel supports, and other conditions affecting performance of the Work.

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**07 46 13  
Steel Siding Panels And  
Soffits**

- .1 Examine wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by metal wall panel manufacturer.
- .2 Examine wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by metal wall panel manufacturer.
- .3 Verify that air- or vapour barriers have been installed over sheathing or backing substrate to prevent air infiltration or water penetration.
- 3.1.2 Examine roughing-in for components and systems penetrating metal panels to verify actual locations of penetrations relative to seam locations of metal panels before installation.
- 3.1.3 Commencement of work implies acceptance of previously completed work.

**3.2 Preparation**

- 3.2.1 Miscellaneous Supports: Install subframing, furring, and other miscellaneous panel support members and anchorages according to ASTM C 754 and metal panel manufacturer's written recommendations.

**3.3 Metal Panel Installation**

- 3.3.1 Install metal panels according to manufacturer's written instructions in orientation, sizes, and locations indicated on Drawings and Schedules. Install panels perpendicular to supports unless otherwise indicated on Drawings and Schedules. Anchor metal panels and other components of the Work securely in place, with provisions for thermal and structural movement.
  - .1 Shim or otherwise plumb substrates receiving metal panels.
  - .2 Flash and seal metal panels at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until air- or water-resistive barriers and flashings that will be concealed by metal panels are installed.
  - .3 Install continuous starter strips, corners, edgings, soffit, drip, cap, sill and window/door opening flashings as indicated.
  - .4 Install outside corners, fillers and closure strips with carefully formed and profiled work.
  - .5 Install siding and attachments sequentially from sill up, to manufacturer written instructions
  - .6 Attach components to allow for thermal movement.
  - .7 Install screw fasteners in predrilled holes.

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**07 46 13  
Steel Siding Panels And  
Soffits**

- .8 Locate and space fastenings in uniform vertical and horizontal alignment.
- .9 Install flashing and trim as metal panel work proceeds.
- .10 Provide weathertight escutcheons for pipe- and conduit-penetrating panels.
- .11 Apply joint sealant at junctions with adjoining work with sealant. Do work in accordance with Section 07 92 00 - Joint Sealants.

**3.3.2 Fasteners:**

- .1 Steel Panels: Use stainless-steel fasteners for surfaces exposed to the exterior; use galvanized-steel fasteners for surfaces exposed to the interior.

**3.3.3 Metal Protection:** Where dissimilar metals contact each other or corrosive substrates, protect against galvanic action as recommended in writing by metal panel manufacturer.

**3.3.4 Accessory Installation:** Install accessories with positive anchorage to building and weathertight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.

- .1 Install components required for a complete metal panel system including trim, copings, corners, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items. Provide types indicated on Drawings and Schedules by metal wall panel manufacturer; or, if not indicated on Drawings and Schedules, provide types recommended by metal panel manufacturer.

**3.3.5 Flashing and Trim:** Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible, and set units true to line and level as indicated on Drawings and Schedules. Install work with laps, joints, and seams that are permanently watertight.

- .1 Install exposed flashing and trim that is without buckling and tool marks, and that is true to line and levels indicated on Drawings and Schedules, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and achieve waterproof performance.

**3.4 Field Quality Control**

**3.4.1 Manufacturer's Field Service:** Engage a factory-authorized service representative to test and inspect completed metal wall panel installation, including accessories.

**CONSTRUCTION OF THE  
DOCKSTEADER PRPS  
REPORTING STATION**

**07 46 13  
Steel Siding Panels And  
Soffits**

- 3.4.2 Remove and replace metal wall panels where tests and inspections indicate that they do not comply with specified requirements.
- 3.4.3 Additional tests and inspections, at Contractor's expense, are performed to determine compliance of replaced or additional work with specified requirements.
- 3.4.4 Prepare test and inspection reports.

**3.5 Cleaning And Protection**

- 3.5.1 Remove temporary protective coverings and strippable films, if any, as metal panels are installed, unless otherwise indicated in manufacturer's written installation instructions. On completion of metal panel installation, clean finished surfaces as recommended by metal panel manufacturer. Maintain in a clean condition during construction.
- 3.5.2 After metal panel installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.
- 3.5.3 Replace metal panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the interlocking metal cladding work specified herein. This includes, but is not necessarily limited, to:
  - .1 Interlocking metal cladding for wall applications.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.

.3 Agenda:

- .1 Review progress of related construction activities and preparations for particular activity under consideration.
- .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .3 Review and finalize construction schedule and verify availability of materials, personnel, equipment, and facilities needed to make progress and avoid delays.
- .4 Review methods and procedures for interlocking metal cladding panel installation, including manufacturer's instructions.
- .5 Examine supports, including alignment and attachment to structural members.
- .6 Review flashing, details, wall penetrations, openings, and conditions of other elements that may affect interlocking metal cladding.
- .7 Discuss governing regulations, insurance, certificates, tests, and inspections as applicable.
- .8 Review temporary protection requirements for interlocking metal cladding before, during and after installation.
- .9 Discuss procedures repair procedures for interlocking metal cladding where permitted by Consultant.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for interlocking metal cladding work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.

- 
- .3 Include fabrication and installation layouts of interlocking metal cladding; details of edge conditions, joints, panel profiles, corners, anchorages, attachment system, trim, flashings, closures, and accessories; and special details.
  - .4 Scale for details of flashings, trims and anchorages: minimum 1:10 (1-1/2 inches per 12 inches).
  - 1.5.4 Delegated Design Submittals:
    - .1 Engineering design completion of interlocking metal cladding work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
    - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
    - .3 Calculation shall clearly indicate structural support type, spacing requirements of structural supports by zone, and fastener requirements.
    - .4 Calculate pullout, pullover, and shear strength of fasteners in accordance with test data published by the fastener manufacturer, utilizing applicable material safety factors.
    - .5 Submit copy of structural calculations upon request by Consultant.
  - 1.5.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
    - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
    - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
    - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
  - 1.5.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
    - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
    - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
  - 1.5.7 Effective R-Value Thermal Performance Report: Submit analysis report demonstrating that interlocking metal cladding assemblies,

including framing components, as proposed by Contractor, meet thermal and structural performance requirements established by Contract Documents. As a minimum, report must include the following:

- .1 Each wall's nominal R-value and effective R-value.
  - .2 Clip spacing (vertical and horizontal).
  - .3 Maximum allowable wind loads, demonstrating compliance with requirements specified in this Section.
  - .4 Cladding dead loads, demonstrating compliance with requirements specified in this Section.
  - .5 Fastener types.
- 1.5.8 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
- .1 As a minimum submit samples of the following:
    - .1 Include samples of trim and accessories involving colour selection.
    - .2 Interlocking metal cladding: Submit two (2), 305 mm (12 inches) long by actual panel width. Include fasteners, closures, and other accessories.
- 1.5.9 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback

## **1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for interlocking metal cladding to be included in building operation and maintenance manual.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

## **1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.

1.7.3 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.

.1 Professional Engineer's Responsibility:

- .1 production and review of Shop Drawings,
- .2 design and certification of interlocking metal cladding, including attachments for building construction, in accordance with applicable codes and regulations,
- .3 stamping and signing of each Shop Drawing and associated calculations

1.7.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

1.7.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
- .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .3 Water-Spray Test: Conduct water-spray test of aluminum siding plank assembly mockup, testing for water penetration according to AAMA 501.2.
- .4 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

## **1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle interlocking metal cladding materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

- 1.8.6 Retain strippable protective covering on interlocking metal cladding during installation.
- 1.8.7 Avoid direct contact with alkali-bearing material such as lime based cement, concrete/mortar.

**1.9 Field Conditions**

- 1.9.1 Field Measurements: Verify actual dimensions of construction contiguous with interlocking metal cladding by field measurements before fabrication.

**1.10 Warranty**

- 1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of interlocking metal cladding that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Failures include, but are not limited to, the following:
    - .1 Corrosion.
    - .2 Rupture.
    - .3 Perforation.
  - .2 Warranty Period: Not less than 20 years from date of Substantial Performance of The work.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
  - .1 Kalzip as supplied by Exterior Technologies Group.
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Performance / Design Criteria**

- 2.2.1 Interlocking metal cladding must be designed to withstand project-specific design loads and their effects within constraints specified in this Section and Ontario Building Code without defects, damage, or failure, including but not limited to the following:
  - .1 Dead Loads: Including those transferred from structural elements.
  - .2 Environmental Loads: Such as wind, snow, rain, hydrostatic, seismic and earth pressures as applicable.

- 
- .3 Live Loads: Including those arising from use and occupancy.
  - .4 Loads from Temperature and Moisture Loads: Including expansion, contraction, deflection, deformation, creep, shrinkage, settlement, and differential movement.
  - .5 Fire Loads: as determined by fire performance testing specified.
  - 2.2.2 Employ a qualified professional engineer, as specified in this Section, to design and certify aluminum siding plank assemblies, including attachment to building construction.
  - 2.2.3 Intended aesthetics: Drawings and Specifications provide requirements regarding system's aesthetic and performance criteria. Unless indicated otherwise, preserve intended aesthetic effects. For any proposed deviations, provide detailed explanation to Consultant for evaluation. Acceptance or rejection of proposed deviations rests solely with Consultant.
    - .1 Profile: Ensure uniform and matching profile.
  - 2.2.4 Building Enclosure Design Principle: Exterior envelope construction for this Project is based on "Rain Screen" design principle, as recommended by National Research Council of Canada. Face sealed assemblies are not permitted.
    - .1 Resistance to Water Penetration: Provide resistance to water penetration from the exterior.
    - .2 Venting and Drainage: Provide for venting and drainage of space immediately behind panel (or backing material) to permit escape of moisture.
    - .3 Continuity: Maintain integrity and continuity of building enclosure's thermal, air, and vapour control layers at all times by using appropriate insulation, air barriers, vapour retarders to tie work of this Section with adjacent construction.
  - 2.2.5 Structural Performance: Design interlocking metal cladding panels in accordance with the requirements of Ontario Building Code and CSA S157/S157.1.
    - .1 Wind Loads: As indicated on Drawings, determined in accordance with OBC requirements (5.2.2.2. Determination of Wind Load) for the geographical location of the project (1 in 50-year return probability).
    - .2 Maximum deflection of interlocking metal cladding components due to uniformly distributed loads:  $L/180$ .
    - .3 Panel structural properties are to be determined in accordance with latest edition of Aluminum Association's "Aluminum Design Manual-Specifications and Guidelines for Aluminum Structures"

- 
- 2.2.6 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.2.7 Design interlocking metal cladding and components to be adequately interconnected and adequately fastened to structural supports to sustain loads.
- 2.2.8 Design expansion joints to accommodate movement in cladding and between cladding and structure to prevent permanent distortion or damage to cladding.
- 2.2.9 Thermal Movements: fabricate and install interlocking metal cladding panels to prevent buckling, opening up of joints and overstressing of welds and fasteners under the following temperature conditions:
- .1 Temperature Change: ambient temperature cycling of - 30 deg C (-22 deg F) to 82 deg C (180 deg F) over a 12-hour period.
  - .2 Account for thermal stresses, drilling impacts, or other causes before or during interlocking metal cladding installation. Implement handling and storage methods for interlocking metal cladding to reduce such stresses.
- 2.2.10 System Fire Propagation Characteristics: Wall assemblies containing aluminum siding planks must meet requirements of CAN/ULC S134 within limits specified by Ontario Building Code but generally as follows:
- .1 Flaming on or in wall assembly: must not spread more than 5 m above opening.
  - .2 Heat flux during flame exposure: less than 35 kW/m<sup>2</sup> measured at 3.5 m above opening.
  - .3 Exemption: If permitted by Authorities Having Jurisdiction, compliance with CAN/ULC S134 may be waived provided aluminum planks can be demonstrated to be non-combustible when tested in accordance with CAN/ULC S114.

### **2.3 Interlocking Metal Cladding**

- 2.3.1 Material Tag: This item is noted as "EW1A, EW1B, EW2A, EW2B" on Drawings and Schedules.
- 2.3.2 Base Material: Extruded aluminum planks to ASTM B221/ ASTM B221M, 6063 T5 alloy as standard with manufacturer, with temper as required for forming and structural performance.

- 2.3.3 Configuration: interlocking metal panels.
- 2.3.4 Plank Width: 400 mm
- 2.3.5 Length: As required.
- 2.3.6 Corners: Factory finished.
- 2.3.7 Thickness: Not less than 1.19 mm (0.047 in) base metal thickness.
- 2.3.8 Fasteners: Concealed.
- 2.3.9 Exterior Panel Finish (PVDF): 3-coat fluoropolymer conforming to AAMA 2605 and containing minimum 70 % PVDF resin by weight for colour coat and clear topcoat.
  - .1 Colour / Pattern: Duranar XL Bright Silver
- 2.3.10 Basis-of-Design: "Kalzip FC 30/400" by Kalzip® or approved equivalent.

## **2.4 Auxiliary Materials**

- 2.4.1 Metal Sub-framing and Furring: Minimum 1.219 mm (18 ga.) thick, cold-formed, galvanized sheet steel conforming to ASTM C645.
  - .1 Protective Coating: Hot-dip galvanized Z275 (G90) coating to ASTM A653/A653M.
  - .2 Transfer Grid: Provide manufacturer's standard sections as required for support and alignment of aluminum plate panel system consisting of hat bars, Z-bars, adjustable Z-bars or combination thermal clip and transfer grids as noted on Drawings.
  - .3 Material visible after assembly: finished to match panels.
- 2.4.2 Thermally-Broken Sub-framing: Low-conductivity thermally-broken, intermittent structural attachment insulation clips designed maintain insulation effectiveness, with adjustable depth and suitable for vertical and horizontal sub-girts.
  - .1 Basis-of-Design: "Cascadia Clip" by Cascadia Windows
  - .2 Acceptable Products:
    - .1 "ISO Clip" by Northern Facades Ltd.
    - .2 "TAC Thermal Spacer" Exterior Technologies Group
    - .3 "TClip Thermally Broken Façade Substructure" by Engineered Assemblies
    - .4 "NVELOPE NV1 Cladding Attachment System" by SFS Group.
- 2.4.3 Accessories: Provide components required for a complete, weathertight panel system including trim, end caps, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match

material and finish of interlocking metal cladding unless otherwise indicated on Drawings and Schedules.

- .1 Provide starter strips, edge trim, outside and inside corner caps, and other items as recommended by siding manufacturer for building configuration.
  - .2 Plank Clips: Manufacturer's standard stainless-steel clips for field installation.
  - .3 Provide accessories made from the same material as adjacent siding unless otherwise indicated. Where accessories are exposed, match colour and finish of adjacent exposed elements.
- 2.4.4 Flashing and Trim: Provide flashing and trim formed from same material as interlocking metal cladding as required to seal against weather and to provide finished appearance. Finish flashing and trim with same finish system as adjacent interlocking metal cladding.
- 2.4.5 Fire Blocks: In accordance with OBC Article "3.1.11. Fire Blocks in Concealed Spaces" consisting of minimum 0.38 mm (28 ga) galvanized sheet steel complying with ASTM A653/A653M; minimum Z275 (G90) coating.
- 2.4.6 Panel Fasteners: Self-tapping screws designed to withstand design loads. Provide exposed fasteners with heads matching colour of interlocking metal cladding by means of plastic caps or factory-applied coating. Provide EPDM or PVC sealing washers for exposed fasteners.
- 2.4.7 Bird and Insect Screening: Aluminum mesh with minimum wire diameter of 0.30 mm (0.012 inch), painted as necessary to be concealed behind panel open joints. Screening must provide at least 50% open area.

## **2.5 Fabrication**

- 2.5.1 Factory Fabrication: Fabricate interlocking metal cladding in accordance with manufacturer's instructions as required to meet performance requirements specified in this Section. Comply with indicated profiles, dimensions, and structural requirements specified in Contract Documents.
- 2.5.2 Visual Quality: Provide sharp, clean edges without displacement of interlocking metal cladding. Minimize oil canning.

## **2.6 Finishes**

- 2.6.1 Protect mechanical and painted finishes on exposed surfaces from damage by applying strippable, temporary protective covering that will not remain adhered to panels in the field before shipping.

- 2.6.2 Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
- 2.6.3 Appearance of Finished Work: Noticeable variations in same piece of aluminum plate are not acceptable. Variations in appearance of other components are acceptable if they are within range of Samples reviewed by Consultant and are assembled or installed to minimize contrast.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
  - .1 Examine wall framing to verify that girts, angles, channels, studs, and other panel support members and anchorages have been installed within alignment tolerances required by aluminum plate panel manufacturer.
  - .2 Examine wall sheathing to ensure that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by aluminum plate panel manufacturer.
  - .3 Verify that air-barriers and vapour-retarders have been installed over sheathing or backing substrate to prevent air infiltration and water penetration.
- 3.1.2 Examine roughing-in for components and assemblies penetrating interlocking metal cladding to verify actual locations of penetrations relative to seam locations of interlocking metal cladding before installation.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Preparation**

- 3.2.1 Install subframing, furring, thermally-broken sub framing and other miscellaneous panel support members and anchorages according to ASTM C754 and aluminum plate panel manufacturer's written recommendations.

#### **3.3 Installation, General**

- 3.3.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation

instructions with additional installation requirements specified in this Section to produce specified work results.

- 3.3.2 Install panels perpendicular to supports unless otherwise indicated on Drawings and Schedules. Anchor interlocking metal cladding and other components of the Work securely in place, with provisions for thermal and structural movement.
- 3.3.3 Fasteners: Use aluminum or stainless-steel fasteners for surfaces exposed to the exterior; use aluminum or galvanized-steel fasteners for surfaces exposed to the interior.
- 3.3.4 Metal Protection: Where dissimilar metals contact each other or corrosive substrates, protect against galvanic action as recommended in writing by aluminum siding plank manufacturer.
- 3.3.5 Accessory Installation: Install accessories with positive anchorage to building and weathertight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.
- 3.3.6 Fire Blocks: Where cavities exceed 25 mm and contain combustible insulation or cladding materials, provide continuous fire blocks complying with OBC Article "3.1.11. Fire Blocks in Concealed Spaces" as specified in this Section and installed in cavity at every floor level and at intervals exceeding no more than 3m vertically.

### **3.4 Protection**

- 3.4.1 Protect interlocking metal cladding from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.4.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.4.3 Promptly replace interlocking metal cladding work damaged during construction that cannot be satisfactorily repaired.
- 3.4.4 Remove temporary protective coverings and strippable films as interlocking metal cladding are installed. On completion of aluminum plate panel installation, clean finished surfaces as recommended by aluminum plate panel manufacturer. Maintain in a clean condition during construction.

### **3.5 Cleaning And Waste Management**

- 3.5.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.5.2 After aluminum siding plank installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.

- 
- 3.5.3 Replace interlocking metal cladding that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.
  - 3.5.4 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
  - 3.5.5 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the modified bituminous membrane roofing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Conventional roof assembly system consisting of cap sheet materials, base-sheet materials, flashing membrane materials, support boards, insulation, and vapour retarders.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 06 10 00 - Rough Carpentry
  - .2 Section 07 21 00 - Thermal Insulation
  - .3 Section 07 62 00 - Sheet Metal Flashing and Trim.
  - .4 Section 07 92 00 - Joint Sealants
  - .5 Division 22, Plumbing

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

---

**1.4 Definitions**

- 1.4.1 Roofing Terminology: Refer to CRCA Specifications Manuals and ASTM D1079 for the definition of terms related to roofing work in this Section.

**1.5 Preinstallation Meetings**

- 1.5.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.5.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
    - .3 Review and finalize construction schedule and verify availability of materials, personnel, equipment, and facilities needed to make progress and avoid delays.
    - .4 Review methods and procedures for roofing installation, including manufacturer's instructions.
    - .5 Review structural loading limitations of roof deck during and after roofing.
    - .6 Examine supports, deck, and alignment and attachment to structural members.
    - .7 Review flashing, details, penetrations, openings, and conditions of other elements that may affect roofing system installation.
    - .8 Discuss governing regulations, insurance, certificates, tests, and inspections as applicable.
    - .9 Review temporary protection requirements for roofing system before, during and after installation.
    - .10 Discuss roof observation and repair procedures after roofing installation.

- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.6 Submittals**

- 1.6.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.6.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for modified bituminous membrane roofing work specified in this Section.
- 1.6.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
  - .3 Base flashings and membrane terminations.
  - .4 Tapered insulation, including slopes.
  - .5 Crickets, saddles, and tapered edge strips, including slopes.
  - .6 Insulation fastening patterns for corner, perimeter, and field-of-roof locations.
  - .7 Include coping design including fastening type and frequency.
- 1.6.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.6.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.

- .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
  - 1.6.6 Manufacturer's Certificate:
    - .1 Submit letter signed by manufacturer certifying that products meet or exceed specified requirements. Submit evidence of meeting performance requirements by submitting additional test and evaluation reports as well as conformance to applicable listings.
    - .2 Compatibility: Compatibility between components of roofing system is essential. Provide written declaration to Consultant stating that materials and components, as assembled in system, meet this requirement.
  - 1.6.7 Warranties: Submit copies of warranties specified in this Section for Consultant's review.
  - 1.6.8 System Test Reports: Submit reports substantiating conformance with requirements of CSA A123.21 based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified testing agency, for components of membrane roofing system.
  - 1.6.9 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback
- 1.7 Closeout Submittals**
  - 1.7.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
  - 1.7.2 Operating and Maintenance Data: Submit care and maintenance instructions for modified bituminous membrane roofing to be included in building operation and maintenance manual.
  - 1.7.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.
- 1.8 Quality Assurance**
  - 1.8.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 15 years' experience manufacturing such materials.
    - .1 Manufacturer shall employ trained technical service representatives, independent of sales.
    - .2 Manufacturer shall be an ISO 9001 registered company and provide a 'Quality Compliance Certificate (QCC)' for reporting/confirming tested values of modified bitumen membrane materials upon request.

- .3 Manufacturer's Representative: Contractor to arrange for a daily on-site technical representative of the manufacturer or a third-party roofing consultant to review substrate conditions and new roof system applications.
- 1.8.2 Installer Qualifications: A qualified firm that is approved, authorized, or licensed by membrane roofing system manufacturer to install manufacturer's product and that is eligible to obtain manufacturer's extended warranty specified in this Section.
  - .1 Installer must be approved by manufacturer for installing roof system and to authenticate warranties.
  - .2 Installer must have a minimum 10 years of experience in low sloped roofing systems.
  - .3 Installer must be an active member of Ontario Industrial Roofing Contractors Association (OIRCA) or CRCA.
- 1.8.3 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
  - .1 Mixing Products across from various manufacturers without manufacturer's or Consultant's written permission is not permitted.
- 1.8.4 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Construct mock-up 10 m<sup>2</sup> (100 sq ft.) minimum size showing typical lap joint, one inside corner and one outside corner.
  - .3 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
  - .4 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

## **1.9 Delivery, Storage And Handling**

- 1.9.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.9.2 Deliver, store and handle modified bituminous membrane roofing materials in accordance with manufacturer's written instructions.
- 1.9.3 Deliver roofing materials to Project site in original containers with seals unbroken and labeled with manufacturer's name, product

brand name and type, date of manufacture, approval or listing agency markings, and directions for storing and mixing with other components.

- 1.9.4 Store liquid materials in their original undamaged containers in a clean, dry, protected location and within the temperature range required by roofing system manufacturer. Protect stored liquid material from direct sunlight.

.1 Discard and legally dispose of liquid material that cannot be applied within its stated shelf life.

- 1.9.5 Protect roof insulation materials from physical damage and from deterioration by sunlight, moisture, soiling, and other sources. Store in a dry location. Comply with insulation manufacturer's written instructions for handling, storing, and protecting during installation.

- 1.9.6 Handle and store roofing materials and place equipment in a manner to avoid permanent deflection of deck.

#### **1.10 Field Conditions**

- 1.10.1 Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit roofing system to be installed according to manufacturer's written instructions and warranty requirements. Do not install roofing system during inclement weather that may affect adhesion, curing or sealing of membranes or components.

#### **1.11 Warranty**

- 1.11.1 Contractor's Warranty: Provide a two-year written warranty on CRCA standard warranty form, covering replacement or repair of defective roofing components, including membrane, flashing, insulation, and accessories, to maintain a watertight system at no expense to the Owner. Conduct necessary repairs during the warranty period without additional cost to the Owner. Perform a final inspection at warranty end and repair all defects. Emergency repairs by the Owner during the warranty period do not void the warranty.
- 1.11.2 Manufacturer's Warranty: Provide a 25-year, non-prorated, no dollar limit warranty covering labor, materials, and workmanship for the roofing system. This warranty must cover repairs for defects and leaks, be transferable at no cost, and allow for emergency repairs by the Owner without voiding the warranty.

---

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 Henry Company
- .2 IKO.
- .3 Johns Manville.
- .4 Siplast, Inc.
- .5 Soprema.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance / Design Criteria**

2.2.1 General Performance: installed membrane roofing and flashing system must remain watertight and withstand specified uplift pressures, thermally induced movement, and exposure to weather without failure due to defects in manufacture, fabrication, installation, or construction.

2.2.2 Wind Uplift Design Criteria: Roofing system must have undergone testing by a qualified testing and inspection agency to resist uplift pressure based on Ontario Building Code and CAN/CSA A123.21 requirements as follows:

- .1 Corner Uplift Pressure: -2.2 kPa
- .2 Perimeter Uplift Pressure: -1.2 kPa
- .3 Field-of-Roof Uplift Pressure: -0.9 kPa

2.2.3 Roof Fire Covering Classification: Conforming to CAN/ULC-S107 and to OBC 3.1.15.2.

2.2.4 Material Compatibility: Ensure compatibility between roofing system components and interfacing materials. Roof system must not adversely affect adjacent materials.

### **2.3 Cap Sheet Membrane**

2.3.1 **Modified Bitumen Membrane (Composite-reinforced), torched – High HRI:**

- .1 Classification: CSA A123.15, Type C, Grade 1 or 2.
- .2 Reinforcement: combination of polyester and glass fibres to ASTM D6162, having nominal weight of 160 g/m<sup>2</sup>
- .3 Top/bottom surfaces: Manufacturer's standard suitable for application indicated.
- .4 Granule colour: Bright white.

- .1 Solar Reflectance Index (SRI) (ASTM E1980)
  - .1 Initial SRI:  $\geq 82$
  - .2 3-year-aged SRI:  $\geq 64$ .
- .5 Application: Torched.
- .6 Basis-of-Design Products: "SOPRASTAR FLAM HD GR" by Soprema Inc or approved equivalent as follows:
  - .1 "DynaWeld FR CR (coated)" by Johns Manville
  - .2 "Armourcool Granular TP-HD " by IKO
  - .3 "Parafor 30 TG BW" by Siplast
  - .4 "modifiedPLUS® NP250gT4 with Solarflex Coating" by Henry Company

## **2.4 Base Sheet Membrane**

### **2.4.1 Modified Bitumen Membrane (Composite-reinforced), adhered in cold adhesive:**

- .1 Classification: CSA A123.15; Type C, Grade 3.
- .2 Reinforcement: combination of polyester and glass fibres to ASTM D6162, having nominal weight of 160 g/m<sup>2</sup>
- .3 Top/bottom surfaces: Manufacturer's standard suitable for application indicated.
- .4 Application: Fully adhered with hot-asphalt.
- .5 Basis-of-Design Products: "Colply Base 410" by Soprema Inc or approved equivalent as follows:
  - .1 "DynaLastic 180 S " by Johns Manville
  - .2 "Modiflex MP-HD-SS-BASE" by IKO
  - .3 "Paradiene 20 " by Siplast
  - .4 "modifiedPlus NP180 s/s" by Henry Company

## **2.5 Insulation Cover Board**

- 2.5.1 Manufacturer's standard type designed to protect insulation and provide firm substrate for roof installation:
- 2.5.2 Fire Response:
  - .1 Combustibility: non-combustible in accordance with CAN/ULC S114.
  - .2 Surface Burning Characteristics: Flame spread: 0 / Smoke developed: 0 in accordance with CAN/ULC S102.
- 2.5.3 Mould Resistance (ASTM D3273): Minimum 10 rating (no mould growth after four week).
- 2.5.4 Maximum Board Size: 1220 mm x 1220 mm (4 ft x 4 ft).

2.5.5 Mineral Fiber Insulation Board: to ASTM C726, Type I, Class 1, with rigid surface.

- .1 Basis-of-Design: "Soprarock DD Plus" by SOPREMA, Inc. or approved equivalent.

## **2.6 Roof Insulation**

2.6.1 Material Tag: This item is noted as "INS-2" on Drawings and Schedules.

### **2.6.2 Polyisocyanurate foam insulation board:**

- .1 Classification: CAN/ULC-S704, Type 2 and ASTM C 1289, Type II, Class 2, Grade 2 inorganic glass-fibre mat facer on both major surfaces. Organic facers are not permitted.
- .2 Compressive strength: minimum 138 kPA (20 psi).
- .3 Minimum RSI (R) Value: 1.0 per 25 mm (5.7 per 1") based on LTTR testing per CAN/ULC-S770.
- .4 Thickness: As indicated on Drawings and required to provide specified R-values.
- .5 Application: Fully adhered with hot-asphalt.
- .6 Basis-of-Design Products: "Sopra-ISO Plus" by SOPREMA, Inc. or approved equivalent as follows:
  - .1 "ENRGY 3® CGF" Johns Manville.
  - .2 "IKOTerm III" by IKO Industries Inc.
  - .3 "Paratherm Poly ISO" by Siplast
  - .4 Approved equivalent by Atlas Roofing Corporation.

2.6.3 Tapered Insulation: Provide factory-tapered insulation boards fabricated to slope of not less than 1:48 (1/4 inch per 12 inches) unless otherwise indicated. Refer to Drawings for specific slopes. Tapered insulation to be of identical composition as roof insulation board.

2.6.4 Provide preformed saddles, crickets, tapered edge strips, and other insulation shapes where indicated for sloping to drain. Fabricate to slopes indicated.

## **2.7 Roof Vapour Retarder**

2.7.1 Material Tag: This item is noted as "VCM-1" on Drawings and Schedules.

2.7.2 Description: minimum 0.80- mm (31.5-mil) thick, self-adhering-sheet vapour retarder consisting of tri-laminate woven polyethylene film laminated to layer of SBS-modified bitumen with slip-resisting surface and release film backing specifically designed for use in roofing assembly specified.

- .1 Basis-of-Design Products: "Sopralene 180 Sanded" by SOPREMA, Inc. or approved equivalent.
- 2.7.3 Primer: Low-VOC, water-based polymer emulsion primer as recommended by roofing membrane manufacturer.
- .1 Basis-of-Design Products: "Elastocol Stick Zero" or "Elastocol H2O" by SOPREMA, Inc. or approved equivalent as follows:
  - .1 "SAM LVC" by IKO Industries
  - .2 "TA 119" by Siplast
  - .3 "Blueskin LVC Primer" by Henry Company

## **2.8 Thermal Barrier (Roof Sheathing Board)**

- 2.8.1 Manufacturer's standard type designed to provide thermal barrier and provide firm substrate for vapour retarder installation:
- 2.8.2 Fire Response:
  - .1 Combustibility: non-combustible in accordance with CAN/ULC S114.
  - .2 Surface Burning Characteristics: Flame spread: 0 / Smoke developed: 0 in accordance with CAN/ULC S102.
- 2.8.3 Mould Resistance (ASTM D3273): Minimum 10 rating (no mould growth after four week).
- 2.8.4 Maximum Board Size: 1220 mm x 1220 mm (4 ft x 4 ft).
- 2.8.5 Following types are acceptable:
  - .1 Fibre-Reinforced Roof Sheathing Board: ASTM C1278/ASTM C1278M, cellulosic-fibre-reinforced, water-resistant gypsum substrate.
    - .1 Basis-of-Design Products: "Securock® - Brand Gypsum-Fiber Roof Board" by CGC Inc. or approved equivalent.
- 2.8.6 Adhesive: Insulation manufacturer's recommended bead-applied, low-rise, multicomponent urethane adhesive or full-spread spray-applied, low-rise, two-component urethane adhesive formulated to attach roof insulation to substrate or to another insulation layer
  - .1 Basis-of-Design Product: "Duotack" by SOPREMA, Inc.; or approved equivalent as follows:
    - .1 "Millenium Adhesive" by IKO Industries;
    - .2 "MJM Green 2-Part UIA Canister" by Johns Manville.

## **2.9 Flashing Membranes**

- 2.9.1 Flashing Base Sheet: SBS-modified asphalt sheet (reinforced with polyester fabric or composite glass fibre/polyester); smooth surfaced; suitable for application method specified.
  - .1 Classification: CSA A123.15; Type B or C.

- .2 Reinforcement: nonwoven polyester fibres to ASTM D6164, having nominal weight of 180 g/m<sup>2</sup> or combination of polyester and glass fibres to ASTM D6162, having nominal weight of 160 g/m<sup>2</sup>
  - .3 Top/bottom surfaces: Manufacturer's standard suitable for application indicated.
  - .4 Products: As recommended by roof manufacturer.
- 2.9.2 Flashing Cap Sheet: Identical to field roofing cap sheet membrane.
- 2.9.3 Liquid-Applied Flashing: Low-VOC resin-based, seamless, reinforced waterproofing system flashing that is compatible with adjacent materials.
- .1 Provide at all flashing details including, but not limited to, mechanical equipment, roof/wall penetrations and similar locations.
  - .2 Basis-of-Design Products: "Alsan Flashing" by Soprema Inc. or approved equivalent as follows:
    - .1 "MS Detail" by IKO Industries.
    - .2 "PermaFlash" by Johns Manville.
- 2.9.4 Flashing sheets shall extend a minimum of 150 mm (6 inches) beyond the cant strip onto the horizontal field of roof for base sheets and 200 mm (8 inches) for cap sheets.

## **2.10 Walkways**

- 2.10.1 Walkway Pads: Polyester reinforced SBS modified bitumen pads with slip-resisting mineral-granule surface, manufactured as a traffic pad for foot traffic and acceptable to roofing system manufacturer, 5 mm (3/16 inch) thick, minimum.
- .1 Pad Size: Manufacturer's standard type.
  - .2 Granule Colour: Contrasting colour as selected by Consultant at a later date.
- 2.10.2 Roof Pavers: CSA A23.1/A23.2 Heavyweight, hydraulically pressed, concrete units, square edged manufactured for use as plaza deck pavers; minimum average cube compressive strength 50 MPa (7250 psi), with no individual unit less than 45 MPa (6525 psi) . Additional reinforcement to be added at paver locations.
- .1 Size: 610 mm x 610 mm x 45 mm (24 inch x 24 inch x 1-3/4 inch)
  - .2 Finish: non-slip finish – shot blast.
  - .3 Colour: As selected by Consultant from manufacturer's full range.
    - .1 Colour Pigment Material Standard: Comply with ASTM C 979.

- .4 Freeze/Thaw Deicing Salt Resistance: Required.
- .5 Water Absorption: not greater than 5 percent.
- .6 SRI: Provide Products having minimum Solar Reflective Index (SRI) values as follows:
  - .1 Initial: Not less than 80
  - .2 3-year test results: Not less than 78.
- .7 Acceptable Products: "Solar Reflective Slabs" by Brooklin Concrete Products or approved equivalent.
- .8 Provide pavers at traffic concentration points (i.e. roof hatches, access doors, rooftop ladders, etc.), regardless of traffic frequency or whether or not these are explicitly indicated on Drawings.

2.10.3 Paver Supports:

- .1 Paver manufacturer's standard SBR rubber, high-density polyethylene, or polyurethane paver support assembly, including fixed-height, adjustable or stackable pedestals, shims, and spacer tabs for flush joint spacing sufficient to allow for expansion and contraction while avoiding tripping hazards.
  - .1 Acceptable Manufacturers:
    - .1 "Paver Pedestals" by SOPREMA, Inc.
    - .2 Approved equivalent by Bison Innovative Products
    - .3 Approved Equivalent.
  - .2 Polystyrene: Extruded polystyrene insulation as fabricated with both sides having a matrix of drainage, size as required to support pavers.
    - .1 Grooves: 13 mm x 13 mm (½" x ½"); staggered

**2.11 Auxiliary Materials**

- 2.11.1 Use accessory materials recommended by the modified bituminous membrane manufacturer to create a complete roof assembly. Ensure compatibility between materials.
- 2.11.2 Roof Hatches: Refer to Section 07 72 76 - Roof Access Hatches.
- 2.11.3 Equipment Supports: Provide required associated roofing accessories and supports as necessary to provide complete roofing work and support roof equipment shown on Drawings.
  - .1 Coordinate with Divisions 23, HVAC and Division 22, Plumbing. Coordinate dimensions with rough-in information or Shop Drawings of equipment to be supported.
  - .2 Acceptable Manufacturers: Thaler Metal Industries Ltd. Or approved equivalent.
- 2.11.4 Wood Nailer Strips: Comply with requirements in Section 06 10 00.

- 2.11.5 Mastic Sealant: CAN/CGSB-37.29, Polyisobutylene, plain or modified bitumen; nonhardening, nonmigrating, non-skinning, and nondrying.
- 2.11.6 Board Fasteners: Factory-coated steel fasteners and metal plates complying with corrosion-resistance provisions in FM Global 4470, designed for fastening roofing components to substrate; tested by manufacturer for required pullout strength, and acceptable to roofing system manufacturer.
- 2.11.7 Conductive Medium: Conductive primer is to be applied atop of cover board to ensure valid electronic leak detection (ELD) testing per ASTM D7877 and ATSM D8231.
  - .1 Acceptable Product: "Truground Conductive Primer" by Detec Systems or approved equivalent.

### **3 .     EXECUTION**

#### **3.1     Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Inspect materials for defects before installation.
- 3.1.3 Comply with safety regulations of Authority Having Jurisdiction.
- 3.1.4 Roof Openings and Penetrations:
  - .1 Ensure roof openings, penetrations are in place, curbs are set and braced.
  - .2 Ensure roof drain bodies are securely clamped in place.
- 3.1.5 Wood Cants, Blocking, Curbs, and Nailers:
  - .1 Ensure wood cants, blocking, curbs, nailers and similar components are securely anchored to roof deck at penetrations and terminations.
- 3.1.6 For Steel Decks:
  - .1 Verify surface plane flatness and fastening of steel roof deck. Coordinated with Section 05 31 00 - Steel Decking.
  - .2 Verify deck is securely fastened with no projecting fasteners.

#### **3.2     Preparation**

- 3.2.1 Design and selection of materials for temporary roofing are responsibilities of Contractor.

- 3.2.2 Clean substrate of dust, debris, moisture, and substances detrimental to roofing installation in accordance with manufacturer's written instructions. Remove sharp projections.
- 3.2.3 Prevent materials from entering and clogging roof drains and conductors.
- 3.2.4 Avoid spillage or migration of materials onto surfaces of other construction.
- 3.2.5 Remove roof-drain plugs when work is not in progress or when rain is forecast.

### **3.3 Installation, Generally**

- 3.3.1 Installation Compliance: Install roofing membrane system in accordance with roofing system manufacturer's written instructions, reviewed Shop Drawings and applicable recommendations in CRCA's Roofing Specification Manual.
- 3.3.2 Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.

### **3.4 Asphalt Heating**

- 3.4.1 Heat and apply roofing asphalt according to roofing system manufacturer's written instructions.
- 3.4.2 Asphalt Temperature: Heat asphalt to equiviscous temperature before application. Maintain asphalt within recommended temperature limits. Avoid heating near the flash point. Do not heat asphalt within 25 deg F (14 deg C) of flash point. Discard overheated asphalt.
- 3.4.3 Roofing Asphalt Application: Apply within  $\pm 25^{\circ}\text{F}$  ( $\pm 14^{\circ}\text{C}$ ) of equiviscous temperature.
- 3.4.4 Substrate-Joint Penetrations: Prevent asphalt and adhesives from damaging substrate joints or entering building during application.

### **3.5 Thermal Barrier (Roof Sheathing Board) Installation**

- 3.5.1 Install roof sheathing board with long joints in continuous straight lines, perpendicular to roof slopes and with end joints staggered between rows. Tightly butt roof sheathing boards together. Align panels without significant height differences.
- 3.5.2 For adhered applications: use adhesive specified in roof assembly's CSA A123.21 wind uplift test report.

### **3.6 Self-Adhering Sheet Vapour Retarder Installation**

- 3.6.1 Prime substrate as required by manufacturer. Ensure full adhesion by applying pressure during protective film removal.

- 3.6.2 Laps:
- .1 Minimum required side laps for each sheet: 100 mm (4 inches)
  - .2 Minimum required end laps for each sheet: 150 mm (6 inches), respectively.
  - .3 Seal laps by rolling.
- 3.6.3 Completely seal vapour retarder at terminations, obstructions, and penetrations to prevent air infiltration into roofing system.

**3.7 Insulation Installation**

- 3.7.1 Follow manufacturer's instructions for insulation installation. Do not install insulation boards displaying signs of moisture damage.
- 3.7.2 Install insulation using staggered layers to minimize thermal bridging.
- 3.7.3 Install insulation with long joints in a continuous straight line. Stagger end joints between rows.
- 3.7.4 Ensure that edges and ends between boards abut each other. Fill gaps exceeding 6 mm (1/4 inch) with insulation. Cut and fit insulation within 6 mm (1/4 inch) of nailers, projections, and penetrations.
- 3.7.5 Secure preformed 45-degree insulation cant strips at junctures of roofing membrane systems with vertical surfaces or angle changes exceeding 45 degrees.
- 3.7.6 Install tapered insulation under roofing to match slopes indicated on Drawings. Install insulation under roofing membrane to reach required thickness.
- 3.7.7 Provide two or more layers when overall insulation thickness is 75 mm (3 inches) or more.
- 3.7.8 Stagger joints of each succeeding layer at least 150 mm (6 inches) in each direction from joints of previous layer.
- 3.7.9 Trim surface of insulation as needed at roof drains. Ensure completed surface is flush and does not impede flow of water.
- 3.7.10 Install tapered edge strips at perimeter edges of roof that do not terminate at vertical surfaces.

**3.8 Cover Board Installation**

- 3.8.1 Install cover board over insulation to protect insulation from roof traffic. Ensure tight, staggered joints. Use adhesive specified in roof assembly's CSA A123.21 wind uplift test report.

**3.9 Roofing Membrane Installation**

- 3.9.1 Presence of Technical Personnel: Begin installation of roofing membrane only in the presence of roofing system manufacturer's

technical personnel. Cooperate with Owner's inspection and testing agencies as needed.

- 3.9.2 Slope Consideration: For roof slopes exceeding 1:12 (1 inch per 12 inches), install roofing membrane sheets parallel to slope. Comply with roofing manufacturers' instructions for steep slope installation. Backnail roofing membrane sheets to nailer strips in accordance with manufacturer's instructions.

3.9.3 Temporary Protection:

- .1 Coordinate roofing system installation to ensure insulation and other non-permanent components are protected against precipitation and are not left uncovered at end of workday or when rain is anticipated.
- .2 Provide tie-offs at the end of each day of work to cover exposed roofing sheets and insulation.
- .3 Complete terminations and base flashings; provide temporary seals to prevent water ingress into completed sections of roofing system.
- .4 Remove and discard temporary seals before starting work on adjoining roofing areas.

3.9.4 **Installation of Roofing Base Sheet Membrane:**

- .1 Procedure:
  - .1 Unroll roofing base sheets. Allow roofing base sheets to relax.
  - .2 Lay base sheet membrane over insulation cover board or substrate indicated.
  - .3 Start installation at low point of roof system and install base sheet according to manufacturer's instructions.
  - .4 Extend and terminate roofing base sheet beyond cants, where applicable.
- .2 Installation Method: As specified in this section.
- .3 Laps:
  - .1 Align roofing sheets accurately, without stretching, ensuring uniform side and end laps with staggered end laps.
  - .2 Bond and seal laps completely, leaving no voids.
  - .3 Repair tears and voids in laps and lapped seams that are not completely sealed.

3.9.5 **Installation of Roofing Cap Sheet Membrane:**

- .1 Procedure:
  - .1 Unroll roofing cap sheets. Allow roofing cap sheets to relax.

- .2 Apply cap sheet over base sheet, starting at low of roofing system.
- .3 Extend and terminate roofing cap sheets beyond cants, where applicable.
- .2 Installation Method: As specified in this section.
- .3 Laps:
  - .1 Accurately align roofing sheets, maintaining uniform side and end laps with staggered end laps.
  - .2 Bond and seal laps completely, leaving no voids.
  - .3 Repair tears and voids in laps and lapped seams that are not completely sealed.
  - .4 Install roofing sheets to ensure side laps and end laps shed water.

**3.10 Membrane Flashing Installation**

- 3.10.1 Install membrane flashing at roof penetrations, walls, and intersections.
- 3.10.2 Install base flashing over cant strips and other sloped and vertical surfaces, at roof edges, and at penetrations through roof. Secure to substrates according to roofing system manufacturer's written instructions.
- 3.10.3 Extend base flashing up walls or parapets a minimum of 200 mm (8 inches) above roofing membrane and 100 mm (4 inches) onto field of roofing membrane.
- 3.10.4 Mechanically fasten top of base flashing securely at terminations and perimeter of roofing. Seal top termination of base flashing.
- 3.10.5 Install roofing membrane cap-sheet flashing where metal flanges and edgings are set on membrane roofing according to roofing system manufacturer's written instructions.

**3.11 Walkway Installation**

- 3.11.1 Install walkway pads using units of size indicated or, if not indicated, of manufacturer's standard size according to walkway pad manufacturer's written instructions.

**3.12 Field Quality Control**

- 3.12.1 Roof Inspection: Contractor must have roof system manufacturer's technical personnel to inspect roofing during installation and on completion to confirm substrate conditions, surface preparation, membrane application, flashings, protection, and drainage components; and to supply reports to Consultant.

- 3.12.2 Roofing system will be considered defective if it does not pass tests and inspections.
- 3.12.3 Additional testing and inspecting, at Contractor's expense, will be performed to determine if replaced or additional work complies with specified requirements.
- 3.12.4 Roofs are to be tested via Electronic Leak Detection (ELD) as per ASTM D7877. Furnish report prepared by third party testing agency confirming entire roof area is deemed 'watertight'. Any noted breaches are to be repaired and retested prior to issuing report
  - .1 Basis-of-Design: Detec System or approved equivalent not necessitating a stainless steel mesh.

**3.13     Protection**

- 3.13.1 Protect modified bituminous membrane roofing from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.13.2 Promptly replace modified bituminous membrane roofing work damaged during construction that cannot be satisfactorily repaired.

**3.14     Cleaning And Waste Management**

- 3.14.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.14.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.14.3 Clean overspray and spillage from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.
- 3.14.4 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the sheet metal flashing and trim work specified herein. This includes, but is not necessarily limited, to:
  - .1 Exposed sheet metal flashing, trim, and fascia.
  - .2 Flashing accessories.
  - .3 Reglets.
  - .4 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
  - .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 04 22 00 – Concrete Unit Masonry.
    - .2 Section 07 27 14 – Self-Adhering Sheet Air Barriers and Vapour Retarders
    - .3 Section 07 52 16 - Modified Bituminous Membrane Roofing
    - .4 Section 08 44 13 - Glazed Aluminum Curtain Walls.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

## 1.4 Definitions

1.4.1 Sheet metal thicknesses: Where sheet metal thicknesses and gauges are specified in this Section, they must be in accordance with the following table.

Galvanized			Stainless			Copper			Aluminum		
Gauge	Nominal thickness		Gauge	Nominal thickness		ozs	Theoretical Thickness		Gauge	Standard thickness	
	in	mm		in	mm		in	mm		in	mm
28	0.019	0.48	28	0.015	0.38	10	0.0135	0.34	22	0.025	0.60
26	0.022	0.56	26	0.018	0.46	12	0.0162	0.42	20	0.032	0.80
24	0.028	0.71	24	0.024	0.61	16	0.0216	0.56	18	0.040	1.0
22	0.034	0.87	22	0.030	0.76	20	0.0270	0.68	16	0.051	1.2

## 1.5 Submittals

1.5.1 General Requirements and Procedures for Submittals: In accordance with Section 01 33 00, Submittal Procedures.

1.5.2 Product Data: Submit product data for the following:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the sheet metal flashing and trim work and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of panel and accessory.

1.5.3 Product Disclosure and Transparency:

- .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
- .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
  - .1 Health Product Declaration open Standard,
  - .2 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
  - .3 International Living Future Institute Declare
  - .4 Other approved framework.
- .3 When multiple Products are specified, give preference to Products with compliant documentation.

- 1.5.4 Samples: Submit samples for each type of metal panel indicated with factory-applied finishes.
  - .1 Submit two color charts and two finish sample chips from manufacturer's standard color and finish options for each type of finish indicated.
- 1.5.5 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback.

**1.6 Quality Assurance**

- 1.6.1 Fabricator's Qualifications: Ensure work of this Section is installed by a company specializing in sheet metal flashing work with five years documented experience and a member in good standing of CRCA.
- 1.6.2 Sealant Compatibility and Adhesion Testing: Use sealant manufacturer's standard test methods to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
- 1.6.3 Mock-ups: Provide Mock-ups in locations designated by Consultant and as required to demonstrate quality of workmanship. Maintain Mock-ups during construction in an undisturbed condition as a standard for judging the completed work. Coordinate with adjacent building envelope material mock-ups including roofing, cladding, insulation and air barrier work

**1.7 Delivery, Handling, And Storage**

- 1.7.1 Package and protect materials during shipment. Uncrate and inspect materials for damage, dampness, and wet-storage stains upon delivery to job site.
- 1.7.2 Remove from site and replace damaged materials that cannot be satisfactorily restored to like-new condition.
- 1.7.3 Handle sheet metal items to avoid damage to surfaces, edges, and ends.
- 1.7.4 Store materials in dry, weather-tight, ventilated areas until installation.

**1.8 Warranty**

- 1.8.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

---

## **2 .     PRODUCTS**

### **2.1     Design/Performance Criteria**

- 2.1.1 Design sheet metal flashing and trim assemblies to withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction in accordance with requirements of authorities having jurisdiction.
- 2.1.2 Finished sheet metal assemblies must form a weathertight enclosure without waves, warps, buckles, fastening stresses or distortion, while allowing for expansion and contraction without damage to the system.
- 2.1.3 Provide sheet metal items in 2400 to 3000 mm (8 to 10 ft.) lengths. Single pieces less than 2400 mm (8 ft) long may be used to connect to factory-fabricated inside and outside corners, and at ends of runs.
- 2.1.4 Factory fabricate corner pieces with minimum 300 mm (12 in) legs. Provide accessories and other items essential to complete the sheet metal installation.
- 2.1.5 Provide accessories made of the same or compatible materials as the items to which they are applied. Fabricate sheet metal items of the materials specified below and to the gauge, thickness, or weight Specified in this section.
- 2.1.6 Do not use lead or lead-coated sheet metals.
- 2.1.7 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.1.8 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes to prevent buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

### **2.2     Materials**

- 2.2.1 Following minimum gauges and / or weights for each metal is as follows:
  - .1 Prepainted Galvanized Steel: 0.71 mm (0.028 in., 24 ga.), commercial quality to ASTM A653/A653M with Z275 (G90) zinc

coating prepainted with baked on enamel with colours of proven durability for exterior exposure, to CSSBI Technical Bulletin No. 7, 5000 series.

- .1 Thickness tolerance: to ASTM A924/A924M  $\pm 0.08$  mm (0.003 in.) for sheet widths not exceeding 1500 mm (60 in.).
  - .2 Aluminium: 1 mm (0.04 in., 18 ga.) aluminium sheet, utility quality to CSA HA Series, plain or embossed finish.
    - .1 Thickness tolerance variation:  $\pm 0.06$  mm (0.0025 in.) based on 1200 mm (48 in.) wide sheet.
- 2.2.2 Sheet Metal Gauges: Unless otherwise indicated on the drawings, use the minimum gauges for the following conditions:
- .1 Fascia Metal: 0.87 mm (0.034 in., 22 ga.) prepainted galvanized sheet steel. Fabricate in minimum 2400 mm (96 in.) long, but not exceeding 3000 mm (10 ft.) long sections. Furnish with 150 mm (6 in.) wide joint cover plates.
  - .2 Counterflashing: 0.71 mm (0.028 in., 24 ga.) prepainted galvanized sheet steel.
  - .3 Other Flashings: 0.50 mm (0.0196 in., 26 ga.) prepainted galvanized sheet steel.
  - .4 Scuppers: 0.71 mm (0.028 in., 24 ga.) prepainted galvanized sheet steel with one piece deck flange, minimum 150 mm. Contour scuppers to cant strips.
  - .5 Hanging Gutters and Downspouts: 0.87 mm (0.034 in., 22 ga.) prepainted galvanized sheet steel. or as required to support loads.
  - .6 Copings: Unless indicated otherwise, provide 0.87 mm (0.034 in., 22 ga.) prepainted galvanized sheet steel. At curtain wall terminations and parapets, provide 3 mm (1/8 in) prefinished aluminum with AAMA 2605 coating to match curtain wall. Fabricate in minimum 2400 mm (96 in.) long, but not exceeding 3000 mm (10 ft.) long sections. Fabricate joint plates of same thickness as copings. Furnish with continuous cleats to support edge of external leg and interior leg. Miter corners, seal, and solder or weld watertight.
  - .7 Sill Flashing: 0.56 mm (0.022 in, 26 ga.) prepainted galvanized sheet steel.

## **2.3 Underlayment Materials**

### **2.3.1 Self-Adhering, High-Temperature Sheet Underlayment:**

- .1 Material Tag: This item is noted as "AVBM-2" on Drawings and Schedules.

- .2 Description: Minimum 0.76 mm (30 mils) thick, consisting of a slip-resistant polyethylene- or polypropylene-film top surface laminated to a layer of butyl- or SBS-modified asphalt adhesive, with release-paper backing; specifically designed to withstand high metal temperatures beneath metal roofing. Provide primer in accordance with underlayment manufacturer's written instructions.
- .3 Thermal Stability: ASTM D1970 or equivalent to CAN/CGSB-51.33; stable after testing at 116 deg C (240 deg F) or higher.
- .4 Low-Temperature Flexibility: ASTM D1970 or equivalent to CAN/CGSB-51.33; passes after testing at minus 29 deg C (20 deg F) or lower.
- .5 Basis-of-Design: "Blueskin PE200 HT" by Henry Company or approved equivalent as follows:
  - .1 "Grace Ultra" by GCP Applied Technologies.
  - .2 "Lastobond Shield HT" by Soprema.
- .6 Install self-adhering, high-temperature sheet underlayment over top of parapet walls, at flashing cricket, and where necessary for watertightness. Extend underlayment down the front and back sides of parapet wall to extent covered by metal cap/coping.

## **2.4 Flexible Flashing (Thru-Wall)**

- 2.4.1 Composite flashing product consisting of a pliable, adhesive rubberized-asphalt compound, bonded to a high-density, cross-laminated polyethylene film to produce an overall thickness of not less than 1.0 mm (0.039 in)
  - .1 Acceptable Products:
    - .1 "CCW-705-TWF Thru-Wall Flashing" by Carlisle Coatings & Waterproofing
    - .2 "Perm-A-Barrier Wall Flashing" by GCP Applied Technologies.
    - .3 "Blok Lok Airtight 40 Self Adhered Air and Vapour Barrier" by Hohmann & Barnard, Inc.
    - .4 "Air-Shield Thru-Wall Flashing" by W.R. Meadows Inc., Canada
    - .5 "Blueskin TWF" by Henry Company
    - .6 "AquaBarrier™ TWF" by IKO Industries Ltd.
    - .7 "ExoAir TWF" by Tremco Incorporated, an RPM company
    - .8 "Soprseal WFM" by Soprema Inc.
  - .2 Primer: as per manufacturer's recommendation.

- .3 Mechanical fasteners: recommended by flashing manufacturer to suit project requirements.

## **2.5     Liquid Flashing Materials**

- 2.5.1 Liquid-Applied Flashing: Low-VOC resin-based, seamless, reinforced waterproofing system flashing that is compatible with adjacent materials.
  - .1 Provide for waterproofing of atypical flashing details including, but not limited to, mechanical equipment, roof/wall penetrations and similar locations.
  - .2 Acceptable Products:
    - .1 "Alsan Flashing" by Soprema Inc.
    - .2 "MS Detail" by IKO Industries.
    - .3 "PermaFlash" by Johns Manville.

## **2.6     Accessories**

- 2.6.1 Provide materials and types of fasteners, solder, welding rods, protective coatings, separators, sealants, and other miscellaneous items as required for complete sheet metal flashing and trim installation and recommended by manufacturer of primary sheet metal unless otherwise indicated.
- 2.6.2 Isolation coating: to ASTM D1187, alkali resistant bituminous paint or epoxy resin solution to provide dielectric separation which will dry to be tack-free and withstand high temperatures.
- 2.6.3 Flashing Nails: #12 hot dipped zinc coated, annular ringed.
- 2.6.4 Plastic Cement: to ASTM D2822.
- 2.6.5 Lap Cement: to ASTM D3019.
- 2.6.6 Sealant: one component, elastomeric, chemical curing, to ASTM C920 with VOC content compliant with SCAQMD Rule #1168.
- 2.6.7 Fasteners: Same metal as sheet metal flashing or other noncorrosive metal as recommended by sheet metal manufacturer. Match finish of exposed heads with material being fastened. Confirm compatibility of fasteners and items to be fastened to avoid galvanic corrosion due to dissimilar materials.
- 2.6.8 Mastic Sealant: Polyisobutylene; non-hardening, non-skinning, nondrying, non-migrating sealant.
- 2.6.9 Epoxy Seam Sealer: Two-part, noncorrosive, aluminum seam-cementing compound, recommended by aluminum manufacturer for exterior and interior nonmoving joints, including riveted joints.

- 2.6.10 Adhesives: Type recommended by flashing sheet metal manufacturer for waterproof and weather-resistant seaming and adhesive application of flashing sheet metal.
- 2.6.11 Metal Accessories: Use sheet metal clips, straps, anchoring devices, and similar accessory units as required for installation of Work, matching or compatible with material being installed; noncorrosive, size and thickness required for performance.

## **2.7      Fabrication, Generally**

- 2.7.1 Form sections square, true and accurate to size, free from distortion and other defects detrimental to appearance or performance.
- 2.7.2 Backpaint sheet metal with bituminous paint on surface in contact with concrete, masonry, cementitious materials or dissimilar metal.
- 2.7.3 Provide coping and cap flashing at all parapets, and other flashing and trim where appropriate and necessary for a complete, weather-tight construction.
- 2.7.4 Sheet Metal Fabrication Standard: Fabricate units to comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, material, metal thickness, and other characteristics of item indicated.
- 2.7.5 Fabricate units that fit substrates and result in waterproof and weather-resistant performance once installed. Verify shapes and dimensions of surfaces to be covered before fabricating sheet metal.
- 2.7.6 Form exposed sheet metal without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems.
- 2.7.7 Seams: Fabricate nonmoving seams in sheet metal with flat-lock seams. Tin edges to be seamed, form seams, and solder.
- 2.7.8 Expansion Provisions: Space movement joints at maximum of 3 m (10-ft) with no joints allowed within 600 mm (24 in) of corner or intersection. Where lapped or bayonet-type expansion provisions in Work cannot be used or would not be sufficiently weatherproof and waterproof, form expansion joints of intermeshing hooked flanges, not less than 25 mm (1 in) deep, filled with mastic sealant (concealed within joints).
- 2.7.9 Sealed Joints: Form non-expansion, but movable, joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.
- 2.7.10 Separate metal from non-compatible metal or corrosive substrates by coating concealed surfaces at locations of contact with asphalt mastic or other permanent separation as recommended by manufacturer.

- 2.7.11 Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of sheet metal exposed to public view.
- 2.7.12 Fabricate cleats and attachment devices from same material as sheet metal component being anchored or from compatible, noncorrosive metal recommended by sheet metal manufacturer.
  - .1 Size Cleats and clips as recommended by SMACNA manual or sheet metal manufacturer for application but not less than thickness of metal being secured.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.1.2 Verify roof openings, curbs, pipes, sleeves, ducts, or vents through roof are solidly set, cant strips and reglets in place and nailing strips located.
- 3.1.3 Verify membrane termination and base flashings are in place, sealed and secure.
- 3.1.4 Notify Consultant of any unsatisfactory conditions. Do not proceed with this work until conditions have been corrected.
- 3.1.5 Commencement of work shall imply acceptance of conditions and substrates.

#### **3.2 Examination**

- 3.2.1 Site Verification of Conditions:
  - .1 Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.
- 3.2.2 Verify roof openings, curbs, pipes, sleeves, ducts, or vents through roof are solidly set, cant strips and reglets in place and nailing strips located.
- 3.2.3 Verify membrane termination and base flashings are in place, sealed and secure.
- 3.2.4 Notify Consultant of any unsatisfactory conditions. Do not proceed with this work until conditions have been corrected.

- 3.2.5 Commencement of work shall imply acceptance of conditions and substrates.

### **3.3 Preparation**

- 3.3.1 Field measure site conditions prior to fabricating work.
- 3.3.2 Install starter, edge strips and cleats before starting installation.
- 3.3.3 Install surface mounted reglets true to lines and levels. Seal top of reglets with sealant.
- 3.3.4 Insert flashings into reglets to form tight fit. Secure in place with plastic wedges. Seal flashings into reglets with sealant.
- 3.3.5 Secure flashings in place using concealed fasteners. Use exposed fasteners only in locations accepted by Consultant.
- 3.3.6 Apply plastic cement compound between metal flashings and felt flashings.
- 3.3.7 Fit flashings tight in place. Make corners square, surfaces true and straight in planes, and lines accurate to profiles.
- 3.3.8 Provide and maintain continuity of air barrier/vapour barrier to adjacent dissimilar materials. Seal to form weathertight seal between flashing and adjoining surfaces and between flashing and other work.

### **3.4 Installation**

- 3.4.1 Conform to drawing details included in CRCA manuals (FL series details) as applicable. Anchor sheet metal flashing and trim and other components of the Work securely in place, with provisions for thermal and structural movement. Use fasteners protective coatings, separators, sealants, and other miscellaneous items as required to complete sheet metal flashing and trim system.
- 3.4.2 Anchor units of Work securely in place, providing for thermal expansion of metal units; conceal fasteners where possible, and set units true to line and level as indicated. Install Work with laps, joints, and seams that will be permanently watertight and weatherproof.
- 3.4.3 Install exposed units that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
- 3.4.4 Install units to fit substrates and to result in waterproof and weather-resistant performance.
- 3.4.5 Expansion Provisions: Accommodate thermal expansion of exposed sheet metal. Space movement joints at maximum of 3 m (10 ft) with no joints allowed within 600 mm (24 in.) of corner or intersection. Where lapped or bayonet-type expansion provisions cannot be used or would not be sufficiently weatherproof and

- 
- waterproof, form expansion joints of intermeshing hooked flanges, not less than 25 mm (1 in.) deep, filled with mastic sealant (concealed within joints).
- 3.4.6 Soldered Joints: Clean surfaces to be soldered, removing oils and foreign matter. Pre-tin edges of sheets to be soldered to a width of 38 mm (1-1/2-in.), except where pre-tinned surface would show in finished Work.
- .1 Do not use torches for soldering. Heat surfaces to receive solder and flow solder into joint. Fill joint completely. Completely remove flux and spatter from exposed surfaces.
- 3.4.7 Sealed Joints: Form non-expansion, but movable, joints in metal to accommodate elastomeric sealant to comply with SMACNA standards. Fill joint with sealant and form metal to completely conceal sealant.
- .1 Use joint adhesive for nonmoving joints specified not to be soldered.
- 3.4.8 Seams: Install flat-lock seams at nonmoving seams. Tin edges to be seamed, form seams, and solder.
- 3.4.9 Separations: Separate metal from non-compatible metal or corrosive substrates by coating concealed surfaces, at locations of contact, with asphalt mastic or other permanent separation as recommended by manufacturer.
- 3.4.10 Install reglets to receive counter-flashing according to manufacturer's installation instructions. Select appropriate reglet configuration to assure a weather-tight installation.
- 3.4.11 Counter-flashings: Coordinate installation of counter-flashings with installation of assemblies to be protected by counter-flashing. Install counter-flashings in reglets or receivers. Secure in a waterproof manner by means of snap-in installation and sealant, lead wedges and sealant, interlocking folded seam, or blind rivets and sealant. Lap counter-flashing joints a minimum of 50 mm (2 in) and bed with sealant.
- 3.4.12 Parapet Scuppers: Continuously support scupper, set to correct elevation, and seal flanges to interior wall face, over cants or tapered edge strips, and under roofing membrane.
- .1 Anchor scupper closure trim flange to exterior wall and seal with elastomeric sealant to scupper.
- .2 Loosely lock front edge of scupper with conductor head.
- .3 Seal with elastomeric sealant exterior wall scupper flanges into back of conductor head.
- 3.4.13 Cap/Coping: Anchor to resist uplift and outward for wind zone indicated on Structural Drawings.

- .1 Interlock exterior bottom edge of coping with continuous cleats anchored to substrate at 600 mm (24-in) centers.
  - .2 Anchor interior leg of coping with screw fasteners and washers at 600 mm (24 in) centers.
  - .3 Splice joints to have 150 mm (6 in) wide concealed splice plates. Bed with sealant for watertightness.
  - .4 Provide shop welded, prefabricated corners. Provide continuous hold-down strips. Provide all fasteners in a finish and colour to match the coping.
- 3.4.14 Equipment Support Flashing: Coordinate equipment support flashing installation with roofing and equipment installation. Weld or seal flashing to equipment support member.
- 3.4.15 Roof-Penetration Flashing: Coordinate roof-penetration flashing installation with roofing and installation of items penetrating roof. Install flashing as follows:
- .1 Turn lead flashing down inside vent piping, being careful not to block vent piping with flashing.
  - .2 Seal and clamp flashing to pipes penetrating roof, other than lead flashing on vent piping.
- 3.4.16 Immediately after installation, clean exposed metal surfaces, removing substances that might cause corrosion of metal or deterioration of finishes.

### **3.5 Cleaning And Protection**

- 3.5.1 Remove temporary protective coverings and strippable films as sheet metal flashing and trim are installed unless otherwise indicated in manufacturer's written installation instructions. On completion of sheet metal flashing and trim installation, remove unused materials and clean finished surfaces as recommended by sheet metal flashing and trim manufacturer. Maintain sheet metal flashing and trim in clean condition during construction.
- 3.5.2 Replace sheet metal flashing and trim that have been damaged or that have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

**END OF SECTION**

---

**1. GENERAL**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

**1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the roof accessories work specified herein. This includes, but is not necessarily limited, to:
- .1 Roof hatches.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

**1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.4 Action Submittals**

- 1.4.1 Product Data: Submit in accordance with Division 01 for each type of roof accessory indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
- 1.4.2 Shop Drawings: Submit in accordance with Division 01 for roof accessories. Include plans, elevations, keyed details, and attachments to other work. Indicate dimensions, loadings, and special conditions. Distinguish between plant- and field-assembled work.

**1.5 Informational Submittals**

- 1.5.1 Coordination Drawings: Roof plans, drawn to scale, and coordinating penetrations and roof-mounted items. Show the following:
- .1 Size and location of roof accessories specified in this Section.
  - .2 Method of attaching roof accessories to roof or building structure.

- .3 Other roof-mounted items including mechanical and electrical equipment, ductwork, piping, and conduit.
- .4 Required clearances.

**1.6 Closeout Submittals**

- 1.6.1 Operation and Maintenance Data: Submit in accordance with Division 01 for roof accessories to include in operation and maintenance manuals.

**1.7 Coordination**

- 1.7.1 Coordinate layout and installation of roof accessories with roofing membrane and base flashing and interfacing and adjoining construction to provide a leakproof, weathertight, secure, and noncorrosive installation.
- 1.7.2 Coordinate dimensions with rough-in information or Shop Drawings of equipment to be supported.

**1.8 Warranty**

- 1.8.1 Special Warranty on Painted Finishes: Manufacturer's standard form in which manufacturer agrees to repair finishes or replace roof accessories that show evidence of deterioration of factory-applied finishes within specified warranty period.
- .1 Fluoropolymer Finish: Deterioration includes, but is not limited to, the following:
    - .1 Colour fading more than 5 Hunter units when tested according to ASTM D 2244.
    - .2 Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
    - .3 Cracking, checking, peeling, or failure of paint to adhere to bare metal.
  - .2 Finish Warranty Period: 20 years from date of Substantial Performance of the Work.

**2 . PRODUCTS**

**2.1 Roof Hatch**

- 2.1.1 Roof Hatches: Metal roof-hatch units with lids and insulated single-walled curbs, welded or mechanically fastened and sealed corner joints, continuous lid-to-curb counterflashing and weathertight perimeter gasketing, stepped integral metal cant raised the thickness of roof insulation, and integrally formed deck-mounting flange at perimeter bottom.

- 
- .1 Acceptable Manufacturers
    - .1 Babcock-Davis.
    - .2 Bilco Company (The).
    - .3 Nystrom.
    - .4 Approved equivalent.
  - 2.1.2 Type and Size: Single-leaf lid, 915 by 915 mm (36 by 36 inches).
  - 2.1.3 Loads: Minimum 1.9-kPa (40-lbf/sq. ft.) external live load and 0.95-kPa (20-lbf/sq. ft.) internal uplift load, but not less than calculated loadings for roofing membrane. .
  - 2.1.4 Hatch Material: Zinc-coated (galvanized) steel sheet, 2.01 mm (0.079 inch) thick.
    - .1 Finish: Baked enamel or powder coat.
    - .2 Colour: As selected by Consultant from manufacturer's full range.
  - 2.1.5 Construction:
    - .1 Insulation: Polyisocyanurate board.
    - .2 Hatch Lid: Opaque, insulated, and double walled, with manufacturer's standard metal liner of same material and finish as outer metal lid.
    - .3 Curb Liner: Manufacturer's standard, of same material and finish as metal curb.
    - .4 Fabricate curbs to minimum height of 300 mm (12 inches) unless otherwise indicated.
  - 2.1.6 Hardware: Stainless-steel spring latch with turn handles, butt- or pintle-type hinge system, and padlock hasps inside and outside.
    - .1 Provide two-point latch on lids larger than 2130 mm (84 inches).
  - 2.1.7 Safety Railing System: Roof-hatch manufacturer's standard system including rails, clamps, fasteners, safety barrier at railing opening, and accessories required for a complete installation; attached to roof hatch and complying with OHSa requirements and authorities having jurisdiction.
  - 2.1.8 Ladder-Assist Post: Roof-hatch manufacturer's standard device for attachment to roof-access ladder.
  - 2.1.9 Basis-of-Design: "Thermally Broken Roof Hatch – Type E-50-TB" by Bilco or approved equivalent.
  - 2.1.10 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

---

**2.2     General Finish Requirements**

- 2.2.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- 2.2.2 Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

**3 .     EXECUTION**

**3.1     Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of the Work.
- 3.1.2 Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.
- 3.1.3 Verify dimensions of roof openings for roof accessories.
- 3.1.4 Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2     Installation**

- 3.2.1 General: Install roof accessories according to manufacturer's written instructions.
  - .1 Install roof accessories level, plumb, true to line and elevation, and without warping, jogs in alignment, excessive oil canning, buckling, or tool marks.
  - .2 Anchor roof accessories securely in place so they are capable of resisting indicated loads.
  - .3 Use fasteners, separators, sealants, and other miscellaneous items as required to complete installation of roof accessories and fit them to substrates.
  - .4 Install roof accessories to resist exposure to weather without failing, rattling, leaking, or loosening of fasteners and seals.
- 3.2.2 Metal Protection: Protect metals against galvanic action by separating dissimilar metals from contact with each other or with corrosive substrates by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.

- .1 Coat concealed side of uncoated aluminum and stainless-steel roof accessories with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.
- .2 Underlayment: Where installing roof accessories directly on cementitious or wood substrates, install a course of felt underlayment and cover with a slip sheet, or install a course of polyethylene sheet.
- .3 Bed flanges in thick coat of asphalt roofing cement where required by manufacturers of roof accessories for waterproof performance.

3.2.3 Roof-Hatch Installation:

- .1 Install roof hatch so top surface of hatch curb is level.
- .2 Verify that roof hatch operates properly. Clean, lubricate, and adjust operating mechanism and hardware.
- .3 Attach safety railing system to roof-hatch curb.
- .4 Attach ladder-assist post according to manufacturer's written instructions.

3.2.4 Seal joints with methylmetacrylate roof flashing materials and elastomeric sealants as required by roof accessory manufacturer.

**3.3 Repair And Cleaning**

- 3.3.1 Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing according to ASTM A 780.
- 3.3.2 Clean exposed surfaces according to manufacturer's written instructions.
- 3.3.3 Clean off excess sealants.
- 3.3.4 Replace roof accessories that have been damaged or that cannot be successfully repaired by finish touchup or similar minor repair procedures.

END OF SECTION 07 72 76

---

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Applied Fireproofing work specified herein. This includes, but is not necessarily limited, to:
  - .1 Sprayed fire-resistive materials (SFRM).
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
  - .1 Section 07 81 23, Intumescent Fireproofing for mastic and intumescent fire-resistive coatings.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Preinstallation Meetings**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will

follow. Advise Consultant and Owner in advance of scheduled meeting dates.

- .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
- .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
- .5 Review products, design ratings, restrained and unrestrained conditions, densities, thicknesses, bond strengths, and other performance requirements.

## **1.5 Submittals**

1.5.1 General Requirements and Procedures for Submittals: In accordance with Section 01 33 00, Submittal Procedures.

1.5.2 Product Data: Submit product data for each type of product.

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Applied Fireproofing work and include product characteristics, performance criteria, physical size, finish and limitations.

1.5.3 Product Disclosure and Transparency:

- .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
- .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
  - .1 Health Product Declaration open Standard,
  - .2 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
  - .3 International Living Future Institute Declare
  - .4 Other approved framework.
- .3 When multiple Products are specified, give preference to Products with compliant documentation.

1.5.4 Shop Drawings: Submit framing plans, schedules, or both, indicating the following:

- .1 Extent of fireproofing for each construction and fire-resistance rating.

- .2 Applicable fire-resistance design designations of a qualified testing and inspecting agency acceptable to authorities having jurisdiction.
- .3 Minimum fireproofing thicknesses needed to achieve required fire-resistance rating of each structural component and assembly.
- .4 Treatment of fireproofing after application.
- 1.5.5 Fire Resistance Rating Listings: Submit listings from UL, ULC, or other accredited testing agency indicating type and size of steel member to receive intumescent fire-resistive coatings and minimum dry thickness (mils) to achieve specified fire resistance rating.
- 1.5.6 Samples: Submit samples for each exposed product and for each colour and texture specified, in manufacturer's standard dimensions in size.

## **1.6 Quality Assurance**

- 1.6.1 Installer Qualifications: A firm or individual certified, licensed, or otherwise qualified by fireproofing manufacturer as experienced and with sufficient trained staff to install manufacturer's products according to specified requirements.
- 1.6.2 Mockups: Build mockups to set quality standards for materials and execution.
  - .1 Build mockup of each type of fireproofing and different substrate and each required finish as shown on Drawings.
  - .2 Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Consultant specifically approves such deviations in writing.
  - .3 Reviewed mockups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.
- 1.6.3 Source Limitations: Obtain fireproofing from single source.

## **1.7 Preconstruction Testing**

- 1.7.1 Preconstruction Testing Service: Contractor must engage a qualified testing agency to perform preconstruction testing on field mockups of fireproofing.
  - .1 Provide test specimens and assemblies representative of proposed materials and construction.
- 1.7.2 Preconstruction Adhesion and Compatibility Testing: Test for compliance with requirements for specified performance and test methods.

- .1 Bond Strength: Test for cohesive and adhesive strength according to ASTM E736. Provide bond strength indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
- .2 Density: Test for density according to ASTM E605. Provide density indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
- .3 Verify that manufacturer, through its own laboratory testing or field experience, attests that primers or coatings are compatible with fireproofing.
- .4 Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
- .5 For materials failing tests, obtain applied-fireproofing manufacturer's written instructions for corrective measures including the use of specially formulated bonding agents or primers.

#### **1.8     Field Conditions**

- 1.8.1 Environmental Limitations: Do not apply fireproofing when ambient or substrate temperature is 5 deg C (41 deg F) or lower unless temporary protection and heat are provided to maintain temperature at or above this level for 24 hours before, during, and for 24 hours after product application.
- 1.8.2 Ventilation: Ventilate building spaces during and after application of fireproofing, providing complete air exchanges according to manufacturer's written instructions. Use natural means or, if they are inadequate, forced-air circulation until fireproofing dries thoroughly.

#### **1.9     Warranty**

- 1.9.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

### **2 .     PRODUCTS**

#### **2.1     Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 A/D Fire Protection Systems.
  - .2 Carboline Company.
  - .3 GCP Applied Technologies Inc.
  - .4 Isolatek International (Cafco)

- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Design And Performance Requirements**

- 2.2.1 Assemblies: Provide fireproofing, including auxiliary materials, according to requirements of each fire-resistance design and manufacturer's written instructions.
- 2.2.2 Fire-Resistance Design: Indicated on Drawings, tested according to CAN/ULC-S101 and in accordance with OBC Subsection 3.1.7 "Fire Resistance Rating". Identify products with appropriate markings of applicable testing agency.
- .1 Steel members in floor and roof construction are to be chosen from designs in which the load was calculated using the Limit States Design method.
  - .2 Beam or joists designs bearing the language "Load Restricted — Assembly evaluated in accordance with Working Stress Design methods" or similar Load Restricted language is not to be considered, unless specifically noted otherwise.
  - .3 Engineered Judgment: For assemblies not tested and rated in accordance with CAN/ULC-S101 or equivalent method, submit proposals based on related designs using accepted fireproofing design criteria acceptable to authorities having jurisdictions.
- 2.2.3 Low-Emitting Materials: Fireproofing used within the weatherproofing system shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- 2.2.4 Provide products containing no asbestos.
- 2.2.5 Ensure materials do not induce deterioration of members to which they are applied.
- 2.2.6 Ensure bonding agents, binders, accessories, cleaning solvents, aggregates and sealers are in accordance with base material manufacturer's recommendation.
- 2.2.7 Ensure mixing water is potable, clear and free from injurious amounts of oil, acid, alkali, organic matter, sediment or any other deleterious or stain-producing substances harmful to fireproofing materials.

## **2.3 Sprayed Fire-Resistive Materials (SFRM)**

- 2.3.1 SFRM Type 1 - Standard Durability: Manufacturer's standard, factory-mixed, lightweight, dry formulation, complying with

indicated fire-resistance design, and mixed with water at Project site to form a slurry or mortar before conveyance and application with following characteristics:

- .1 Bond Strength: Minimum 9.58-kPa (200 psf) cohesive and adhesive strength based on field testing according to ASTM E736.
- .2 Density: Not less than 240 kg/cu. m (15 pcf) and as specified in the approved fire-resistance design, according to ASTM E605.
- .3 Thickness: As required for fire-resistance design indicated, measured according to requirements of fire-resistance design or ASTM E605, whichever is thicker, but not less than 9 mm (0.375 inch).
- .4 Surface-Burning Characteristics: Comply with CAN/ULC S102 (or equivalent to ASTM E84, subject to acceptable by authorities having jurisdiction); testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
  - .1 Flame-Spread Index: 0.
  - .2 Smoke-Developed Index: 0.
- .5 Compressive Strength: Minimum 68.9 kPa (10 psi) according to ASTM E761.
- .6 Corrosion Resistance: No evidence of corrosion according to ASTM E937.
- .7 Deflection: No cracking, spalling, or delamination according to ASTM E759.
- .8 Effect of Impact on Bonding: No cracking, spalling, or delamination according to ASTM E760.
- .9 Air Erosion: Maximum weight loss of 0 g/sq. m (0 g/sq. ft.) in 24 hours according to ASTM E859.
- .10 Fungal Resistance: Treat products with manufacturer's standard antimicrobial formulation to result in no growth on specimens per ASTM G21.
- .11 Finish: Spray-textured finish.
- .12 Basis-of-Design: "Southwest Type 5GP" by Carboline Company.
- .13 Application: Interior fireproofing for structural components concealed above ceiling, or within wall, chase, or furred space Interior locations.

## **2.4 Auxiliary Materials**

- 2.4.1 Provide auxiliary materials that are compatible with fireproofing and substrates and are approved by ULC, UL or another testing

and inspecting agency acceptable to authorities having jurisdiction for use in fire-resistance designs indicated on Drawings and Schedules.

- 2.4.2 Substrate Primers: Primers approved by fireproofing manufacturer and complying with one or both of the following requirements:
  - .1 Primer and substrate are identical to those tested in required fire-resistance design by UL or another testing and inspecting agency acceptable to authorities having jurisdiction.
  - .2 Primer's bond strength in required fire-resistance design complies with specified bond strength for fireproofing and with requirements in ULC's "Fire Resistance Directory" or in the listings of another qualified testing agency acceptable to authorities having jurisdiction, based on a series of bond tests according to ASTM E736.
- 2.4.3 Bonding Agent: Product approved by fireproofing manufacturer and complying with requirements in UL's "Fire Resistance Directory" or in the listings of another qualified testing agency acceptable to authorities having jurisdiction.
- 2.4.4 Metal Lath: Expanded metal lath fabricated from material of weight, configuration, and finish required, according to fire-resistance designs indicated on Drawings and Schedules and fireproofing manufacturer's written recommendations. Include clips, lathing accessories, corner beads, and other anchorage devices required to attach lath to substrates and to receive fireproofing.
- 2.4.5 Reinforcing Fabric: Glass- or carbon-fiber fabric of type, weight, and form required to comply with fire-resistance designs indicated on Drawings and Schedules; approved and provided by fireproofing manufacturer.
- 2.4.6 Reinforcing Mesh: Metallic mesh reinforcement of type, weight, and form required to comply with fire-resistance design indicated on Drawings and Schedules; approved and provided by fireproofing manufacturer. Include pins and attachment.
- 2.4.7 Sealer: Transparent-drying, water-dispersible, tinted protective coating recommended in writing by fireproofing manufacturer for each fire-resistance design.
  - .1 Acceptable Product: as recommended by manufacturer.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrates and other

---

conditions affecting performance of the Work and according to each fire-resistance design. Verify compliance with the following:

- .1 Substrates are free of dirt, oil, grease, release agents, rolling compounds, mill scale, loose scale, incompatible primers, paints, and encapsulants, or other foreign substances capable of impairing bond of fireproofing with substrates under conditions of normal use or fire exposure.
  - .2 Objects penetrating fireproofing, including clips, hangers, support sleeves, and similar items, are securely attached to substrates.
  - .3 Substrates receiving fireproofing are not obstructed by ducts, piping, equipment, or other suspended construction that will interfere with fireproofing application.
- 3.1.2 Verify that concrete work on steel deck has been completed before beginning fireproofing work.
  - 3.1.3 Verify that roof construction, installation of roof-top HVAC equipment, and other related work is complete before beginning fireproofing work.
  - 3.1.4 On structural steel members to receive sprayed fire resistive materials, ensure corrosion protection primers and galvanized primers are not applied. If primed surfaces cannot be avoided, ensure primers are compatible with fireproofing materials and bond requirements.
  - 3.1.5 Conduct tests according to fireproofing manufacturer's written recommendations to verify that substrates are free of substances capable of interfering with bond.
  - 3.1.6 Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
  - 3.1.7 Proceed with installation only after unsatisfactory conditions have been corrected.

## **3.2 Preparation**

- 3.2.1 Cover other work subject to damage from fallout or overspray of fireproofing materials during application.
- 3.2.2 Clean substrates of substances that could impair bond of fireproofing.
- 3.2.3 For applications visible on completion of Project, repair substrates to remove surface imperfections that could affect uniformity of texture and thickness in finished surface of fireproofing. Remove minor projections and fill voids that would telegraph through fire-resistive products after application.

---

**3.3     Application**

- 3.3.1 Construct fireproofing assemblies that are identical to fire-resistance design indicated on Drawings and Schedules and products as specified, tested, and substantiated by test reports; for thickness, primers, sealers, topcoats, finishing, and other materials and procedures affecting fireproofing work.
- 3.3.2 Comply with fireproofing manufacturer's written instructions for mixing materials, application procedures, and types of equipment used to mix, convey, and apply fireproofing; as applicable to particular conditions of installation and as required to achieve fire-resistance ratings indicated on Drawings and Schedules.
- 3.3.3 Coordinate application of fireproofing with other construction to minimize need to cut or remove fireproofing.
  - .1 Do not begin applying fireproofing until clips, hangers, supports, sleeves, and other items penetrating fireproofing are in place.
  - .2 Defer installing ducts, piping, and other items that would interfere with applying fireproofing until application of fireproofing is completed.
- 3.3.4 Metal Decks:
  - .1 Do not apply fireproofing to underside of metal deck substrates until concrete topping, if any, has been completed.
  - .2 Do not apply fireproofing to underside of metal roof deck until roofing has been completed; prohibit roof traffic during application and drying of fireproofing.
- 3.3.5 Install auxiliary materials as required, as detailed, and according to fire-resistance design and fireproofing manufacturer's written recommendations for conditions of exposure and intended use. For auxiliary materials, use attachment and anchorage devices of type recommended in writing by fireproofing manufacturer.
- 3.3.6 Spray apply fireproofing to maximum extent possible. Following the spraying operation in each area, complete the coverage by trowel application or other placement method recommended in writing by fireproofing manufacturer.
- 3.3.7 Extend fireproofing in full thickness over entire area of each substrate to be protected.
- 3.3.8 Install body of fireproofing in a single course unless otherwise recommended in writing by fireproofing manufacturer.
- 3.3.9 For applications over encapsulant materials, including lockdown (post-removal) encapsulants, apply fireproofing that differs in colour from that of encapsulant over which it is applied.

- 3.3.10 Where sealers are used, apply products that are tinted to differentiate them from fireproofing over which they are applied.
- 3.3.11 Provide a uniform finish complying with description directed on Site for each type of fireproofing material and matching finish approved for required mockups.
- 3.3.12 Cure fireproofing according to fireproofing manufacturer's written recommendations.
- 3.3.13 Do not install enclosing or concealing construction until after fireproofing has been applied, inspected, and tested and corrections have been made to deficient applications.
- 3.3.14 Finishes: Where indicated on Drawings and Schedules, apply fireproofing to produce the following finishes:
  - .1 Manufacturer's Standard Finishes: Finish according to manufacturer's written instructions for each finish selected.
  - .2 Spray-Textured Finish: Finish left as spray applied with no further treatment.
  - .3 Rolled, Spray-Textured Finish: Even finish produced by rolling spray-applied finish with a damp paint roller to remove drippings and excessive roughness.
  - .4 Skip-Troweled Finish: Even leveled surface produced by troweling spray-applied finish to smooth out the texture and neaten edges.
  - .5 Skip-Troweled Finish with Corner Beads: Even, leveled surface produced by troweling spray-applied finish to smooth out the texture, eliminate surface markings, and square off edges.

#### **3.4 Field Quality Control**

- 3.4.1 Perform the tests and inspections of completed Work in successive stages. Do not proceed with application of fireproofing for the next area until test results for previously completed applications of fireproofing show compliance with requirements. Tested values must equal or exceed values as specified and as indicated on Drawings and Schedules and required for approved fire-resistance design.
- 3.4.2 Fireproofing will be considered defective if it does not pass tests and inspections.
- 3.4.3 Remove and replace fireproofing that does not pass tests and inspections, and retest.
- 3.4.4 Apply additional fireproofing, per manufacturer's written instructions, where test results indicate insufficient thickness, and retest.

---

3.4.5 Prepare test and inspection reports.

**3.5 Cleaning, Protecting, And Repairing**

- 3.5.1 Cleaning: Immediately after completing spraying operations in each containable area of Project, remove material overspray and fallout from surfaces of other construction and clean exposed surfaces to remove evidence of soiling.
- 3.5.2 Protect fireproofing, according to advice of manufacturer and Installer, from damage resulting from construction operations or other causes, so fireproofing will be without damage or deterioration at time of Substantial Performance of the Work.
- 3.5.3 As installation of other construction proceeds, inspect fireproofing and repair damaged areas and fireproofing removed due to work of other trades.
- 3.5.4 Repair fireproofing damaged by other work before concealing it with other construction.
- 3.5.5 Repair fireproofing by reapplying it using same method as original installation or using manufacturer's recommended trowel-applied product.

**3.6 Fireproofing Schedule**

- 3.6.1 Columns: Refer to Drawings.
- 3.6.2 Floor decks and floor supports: Refer to Drawings.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Intumescent Fire Protection work specified herein. This includes, but is not necessarily limited, to:
- .1 Mastic and intumescent fire-resistive coatings (IFRM).
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 07 81 00 , Applied Fireproofing for sprayed fire-resistive materials (SFRM).

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Preinstallation Meetings**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
  - .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.

- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
- .5 Review products, design ratings, restrained and unrestrained conditions, thicknesses, and other performance requirements.

## **1.5      Sequencing**

- 1.5.1 Sequence and coordinate application of intumescent fire-resistive coatings with related work specified in other Sections to comply with the following requirements:
  - .1 Coordinate installation of intumescent fire-resistive coatings with other items of work that may interfere with proper installation of coatings.
  - .2 Do not begin applying intumescent fire-resistive coatings until clips, hangers, supports, and other welded connections have been installed. Intumescent coatings manufacturer must approve in writing any clips, hangers, supports or connections that may be installed over coating using mechanical or adhesive devices.
  - .3 Provide temporary enclosures as necessary to prevent deterioration of intumescent fire-resistive coatings due to exposure to unfavorable environmental conditions.
  - .4 Take appropriate steps to avoid abrasion and other damage to the applied intumescent fire-resistive coatings during construction operations.
  - .5 not protect or conceal structural members to which intumescent fire-resistive coatings have been applied until each area has been inspected, tested, and corrections have been made to deficient areas.

## **1.6      Action Submittals**

- 1.6.1 Product Data: Submit product data in accordance with Division 01 for the following:
  - .1 Submit manufacturer's instructions, printed product literature and data sheets for the Intumescent Fire Protection work and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Mastic and intumescent fire-resistive coatings.
  - .3 Substrate primers.
  - .4 Reinforcing fabric.
  - .5 Reinforcing mesh.
  - .6 Topcoat.
- 1.6.2 Shop Drawings: Submit framing plans or schedules, or both, in accordance with Division 01 indicating the following:

- .1 Extent of fire protection for each construction and fire-resistance rating.
  - .2 Applicable fire-resistance design designations of a qualified testing and inspecting agency acceptable to authorities having jurisdiction.
  - .3 Minimum mastic and intumescent fire-resistive coating thicknesses needed to achieve required fire-resistance rating of each structural component and assembly.
  - .4 Treatment of mastic and intumescent fire-resistive coating after application.
- 1.6.3 Fire Resistance Rating Listings: Submit listings from UL, ULC, or other accredited testing agency indicating type and size of steel member to receive intumescent fire-resistive coatings and minimum dry thickness (mils) to achieve specified fire resistance rating.
- 1.6.4 Samples: Submit samples in accordance with Division 01 for each exposed product and for each colour and texture specified, in manufacturer's standard dimensions in size.

**1.7 Informational Submittals**

- 1.7.1 Product Certificates: Submit product certificates in accordance with Division 01 for each type of fireproofing.
- 1.7.2 Evaluation Reports: Submit evaluation reports in accordance with Division 01 for fireproofing, from CCMC or equivalent report from ICC-ES acceptable to authorities having jurisdiction.

**1.8 Quality Assurance**

- 1.8.1 Manufacturer Qualifications: Provide Products from manufacturer with local direct technical employee(s) (as distinct from distributors or authorized agents) readily available at Project site. Intumescent coatings must be manufactured under the follow-up services program of Underwriter's Laboratories (UL) or UL Canada (ULc) and bear the UL (and/or ULc) label mark).
- 1.8.2 Installer Qualifications: A firm or individual certified, licensed, or otherwise qualified by mastic and intumescent fire-resistive coating manufacturer as experienced and with sufficient trained staff to install manufacturer's products according to specified requirements.
- 1.8.3 Mock-ups: Build mock-ups to verify selections made under Sample submittals and to demonstrate aesthetic effects and to set quality standards for materials and execution.
- .1 Build mockup of each required finish as shown on Drawings.
  - .2 Extent of Mockups: Approximately 0.5 sq m (5 sq. ft.) of surface for each product indicated.

- .3 Notify Consultant one week in advance of the dates and times when mockups will be built.
- .4 Review of mock-ups does not constitute approval of deviations from the Contract Documents contained in mock-ups unless Consultant specifically approves such deviations in writing.
- .5 Retain and maintain mockups during construction in undisturbed condition as a standard for judging completed units of work.
- .6 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.

1.8.4 Source Limitations: Obtain fire protection from single source.

## **1.9 Delivery, Storage And Handling**

- 1.9.1 Deliver materials to Project in manufacturer's unopened packages, bearing manufacturer's labels, application instructions and certification labels for fire hazard and fire resistance classifications and other identifying data. Packages shall bear ULC, cUL or WH labels and seals for fire resistance ratings.
- 1.9.2 Deliver and store Products in dry, protected area off ground in original, undamaged sealed containers.
- 1.9.3 Store intumescent fire-resistive coatings protected from direct sunlight and maintained at a temperature as specified by the manufacturer. The product must not be frozen or stored at freezing temperatures. Identify and label material damaged due to improper storage, remove from Project site and properly discard.
- 1.9.4 Remove damaged packages found unsuitable for use and any materials which have come into contact with contaminants prior to use.

## **1.10 Field Conditions**

### **1.10.1 Environmental Limitations:**

- .1 Do not apply fire protection when ambient or substrate temperature is outside of range recommended by manufacturer, or less than 10 deg C (50 deg F) (whichever is less) unless temporary protection and heat are provided to maintain temperature at or above this level for 24 hours before, during, and for 24 hours after product application.
- .2 Do not install intumescent fire-resistive coatings when relative humidity is outside the limits established by the manufacturer. Consult manufacturer to determine precautions that may be implemented to prevent condensation from forming on the steel during application of fireproofing.

- 1.10.2 Ventilation: Ventilate building spaces during and after application of fire protection, providing complete air exchanges according to manufacturer's written instructions. Use natural means or, if they are inadequate, forced-air circulation until fire protection dries thoroughly.

**1.11 Warranty**

- 1.11.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- .1 Contego International Inc.
  - .2 Hilti, Inc.
  - .3 International Protective Coatings (Akzo Nobel).
  - .4 Isolatek International (Cafco)
  - .5 Sherwin Williams Company
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Performance Requirements**

- 2.2.1 Assemblies: Provide fire protection, including auxiliary materials, according to requirements of each fire-resistance design and manufacturer's written instructions.
- 2.2.2 Fire-Resistance Design: Indicated on Drawings, tested according to CAN/ULC-S101 or equivalent to ASTM E119 or UL 263 by a qualified testing agency in accordance with OBC Subsection 3.1.7 "Fire Resistance Rating". Identify products with appropriate markings of applicable testing agency.
- .1 Steel members are to be considered unrestrained unless specifically noted otherwise.
  - .2 Engineered Judgment: For assemblies not tested and rated in accordance with CAN/ULC-S101 or equivalent method, submit proposals based on related designs using accepted fireproofing design criteria acceptable to authorities having jurisdictions.
- 2.2.3 Provide products containing no asbestos.
- 2.2.4 Ensure materials do not induce deterioration of members to which they are applied.

- 2.2.5 Ensure bonding agents, binders, accessories, cleaning solvents, aggregates and sealers are in accordance with base material manufacturer's recommendation.
- 2.2.6 Ensure mixing water is potable, clear and free from injurious amounts of oil, acid, alkali, organic matter, sediment or any other deleterious or stain-producing substances harmful to fireproofing materials.
- 2.2.7 Low-Emitting Materials: Coatings shall comply with the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

**2.3 Interior-Grade Mastic And Intumescent Fire-Resistive Coating**

- 2.3.1 Material Tag: This item is noted as "IFRM-1" on Drawings and Schedules.
- 2.3.2 Mastic and Intumescent Fire-Resistive Coating: Manufacturer's standard, factory-mixed formulation, and complying with indicated fire-resistance design.
  - .1 Thickness: As required for fire-resistance design indicated, measured according to requirements of fire-resistance design.
  - .2 Surface-Burning Characteristics: Per CAN/ULC-S102/S102.2 with results indicated below. Mark products with appropriate testing agency labels.
    - .1 Flame-Spread Index: 0
    - .2 Smoke-Developed Index: 50 or less.
  - .3 Hardness: Not less than 60 Shore D durometer or 96 Shore A durometer hardness, according to ASTM D2240.
  - .4 Finish: As selected by Consultant from manufacturer's standard finishes.
    - .1 Colour and Gloss: As selected by Consultant from manufacturer's full range.
    - .2 Finish: "ARCHITECTURAL FINISH"
  - .5 Application: Designated for "interior general purpose" and "conditioned interior space purpose" use by a qualified testing agency acceptable to authorities having jurisdiction.
  - .6 Basis-of-Design: "Firetex FX5120" by Sherwin Williams or approved equivalent.

**2.4 Auxiliary Materials**

- 2.4.1 Provide auxiliary materials that are compatible with mastic and intumescent fire-resistive coating and substrates and are approved

by ULC, UL or another testing and inspecting agency acceptable to authorities having jurisdiction for use in fire-resistance designs indicated.

- 2.4.2 Substrate Primers: Primers approved by mastic and intumescent fire-resistive coating manufacturer which have been tested by manufacturer for compatibility in fire conditions and complying with required fire-resistance design by UL, ULC or another testing and inspecting agency acceptable to authorities having jurisdiction.
- 2.4.3 Reinforcing Fabric: Glass- or carbon-fibre fabric of type, weight, and form required to comply with fire-resistance designs indicated; approved and provided by mastic and intumescent fire-resistive coating manufacturer.
- 2.4.4 Reinforcing Mesh: Metallic mesh reinforcement of type, weight, and form required to comply with fire-resistance design indicated; approved and provided by mastic and intumescent fire-resistive coating manufacturer. Include pins and attachment.
- 2.4.5 Topcoat: Suitable for application over mastic and intumescent fire-resistive coating; of type recommended in writing by mastic and intumescent fire-resistive coating manufacturer for each fire-resistance design.
  - .1 Colour: To be selected by Consultant at later date, and may include custom colour not necessarily in manufacturer's standard range.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrates and other conditions affecting performance of the Work and according to each fire-resistance design.
  - .1 Verify that substrates are free of dirt, oil, grease, release agents, rolling compounds, mill scale, loose scale, incompatible primers, paints, and encapsulants, or other foreign substances capable of impairing bond of fire protection with substrates under conditions of normal use or fire exposure.
  - .2 Verify that objects penetrating fire protection, including clips, hangers, support sleeves, and similar items, are securely attached to substrates.
  - .3 Verify that substrates receiving fire protection are not obstructed by ducts, piping, equipment, or other suspended construction that will interfere with fire protection application.

- 3.1.2 Conduct tests according to mastic and intumescent fire-resistive coating manufacturer's written instructions to verify that substrates are free of substances capable of interfering with bond.
- 3.1.3 Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
- 3.1.4 Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2      Preparation**

- 3.2.1 Cover other work subject to damage from fallout or overspray of fire protection materials during application.
- 3.2.2 Clean substrates of substances that could impair bond of fire protection.
- 3.2.3 Prime substrates where included in fire-resistance design and where recommended in writing by mastic and intumescent fire-resistive coating manufacturer unless compatible shop primer has been applied and is in satisfactory condition to receive fire protection. Primer must be fully cured prior to installation of intumescent coating.
- 3.2.4 For applications visible on completion of Project, repair substrates to remove surface imperfections that could affect uniformity of texture and thickness in finished surface of fire protection. Remove minor projections and fill voids that would telegraph through fire-resistive products after application.

### **3.3      Application**

- 3.3.1 Construct fire protection assemblies that are identical to fire-resistance design indicated and products as specified, tested, and substantiated by test reports; for thickness, primers, topcoats, finishing, and other materials and procedures affecting fire protection Work.
- 3.3.2 Comply with mastic and intumescent fire-resistive coating manufacturer's written instructions for mixing materials, application procedures, and types of equipment used to mix, convey, and apply fire protection; as applicable to particular conditions of installation and as required to achieve fire-resistance ratings indicated.
- 3.3.3 Coordinate application of fire protection with other construction to minimize need to cut or remove fire protection.
  - .1 Do not begin applying fire protection until clips, hangers, supports, sleeves, and other items penetrating fire protection are in place.

- 
- .2 Defer installing ducts, piping, and other items that would interfere with applying fire protection until application of fire protection is completed.
  - 3.3.4 Install auxiliary materials as required, as detailed, and according to fire-resistance design and mastic and intumescent fire-resistive coating manufacturer's written instructions for conditions of exposure and intended use. For auxiliary materials, use attachment and anchorage devices of type recommended in writing by mastic and intumescent fire-resistive coating manufacturer.
  - 3.3.5 Spray apply fire protection to maximum extent possible. After the spraying operation in each area, complete the coverage by trowel application or other placement method recommended in writing by mastic and intumescent fire-resistive coating manufacturer.
  - 3.3.6 Extend fire protection in full thickness over entire area of each substrate to be protected.
  - 3.3.7 Install body of fire protection in a single course unless otherwise recommended in writing by mastic and intumescent fire-resistive coating manufacturer.
  - 3.3.8 Provide a uniform finish complying with description indicated for each type of fire protection material and matching finish approved for required mock-ups.
  - 3.3.9 Cure fire protection according to mastic and intumescent fire-resistive coating manufacturer's written instructions.
  - 3.3.10 Do not install enclosing or concealing construction until after fire protection has been applied, inspected, and tested and corrections have been made to deficient applications.
  - 3.3.11 Finishes: Where indicated, apply fire protection to produce the following finishes:
    - .1 Manufacturer's Standard Finishes: Finish according to manufacturer's written instructions for each finish selected.
    - .2 Spray-Textured Finish: Finish left as spray applied with no further treatment.
    - .3 Rolled, Spray-Textured Finish: Even finish produced by rolling spray-applied finish with a damp paint roller to remove drippings and excessive roughness.

### 3.4 Finishing Schedule

FINISH	APPLICATION	APPEARANCE	AREA OF USE
BASIC FINISH	Spray applied with no further treatment	Stippled, "orange peel" appearance	Concealed areas
COMMERCIAL FINISH	First coat spray applied, second coat thinned, topcoat spray applied	Uniform appearance with minor "orange peel" appearance	Visible areas viewed at distance greater than 6m
ARCHITECTURAL FINISH	First coat spray applied, sanded flat, second coat thinned, top coat spray applied	Smooth appearance	Visible areas viewed at distance less than or equal to 6m

### 3.5 Field Quality Control

- 3.5.1 Manufacturer's Services: Manufacturer's technical representative must be on site during start of installation and generally available on site as requested during the application process.
- 3.5.2 Inspections: Owner may engage a qualified independent testing agency to perform the following special inspections:
  - .1 Test and inspect as required by AWCI Technical Manual 12-B and NFCA 400 Field Quality Assurance Procedure.
- 3.5.3 Perform the tests and inspections of completed Work in successive stages. Do not proceed with application of fire protection for the next area until test results for previously completed applications of fire protection show compliance with requirements. Tested values must equal or exceed values as specified and as indicated and required for approved fire-resistance design.
- 3.5.4 Fire protection will be considered defective if it does not pass tests and inspections.
  - .1 Remove and replace fire protection that does not pass tests and inspections, and retest.
  - .2 Apply additional fire protection, per manufacturer's written instructions, where test results indicate insufficient thickness, and retest.
- 3.5.5 Prepare test and inspection reports.

**3.6     Cleaning**

- 3.6.1    Cleaning: Immediately after completing spraying operations in each containable area of Project, remove material overspray and fallout from surfaces of other construction and clean exposed surfaces to remove evidence of soiling.

**3.7     Protection**

- 3.7.1    Protect fire protection, according to advice of manufacturer and Installer, from damage resulting from construction operations or other causes, so fire protection is without damage or deterioration at time of Substantial Performance of the Work.

**3.8     Repairs**

- 3.8.1    As installation of other construction proceeds, inspect fire protection and repair damaged areas and fire protection removed due to work of other trades.
- 3.8.2    Repair fire protection damaged by other work before concealing it with other construction.
- 3.8.3    Repair fire protection by reapplying it using same method as original installation or using manufacturer's recommended trowel-applied product.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Firestopping And Smoke Seals work specified herein. This includes, but is not necessarily limited, to:
- .1 Through-penetration firestops:
    - .1 For openings created to allow a penetrating item such as piping, conduits, raceways, ducts, cable trays, cables, tubing or structural components to pass completely through a fire separation or fire-resistance rated assembly.
  - .2 Membrane penetration firestops:
    - .1 For openings where penetrating items such as piping, conduits, raceways, ducts, cable trays, cables, tubing, recessed components (e.g.: panels, electric boxes, devices) or structural components pass through only one membrane of a fire separation or fire-resistance rated assembly.
  - .3 Blank opening firestops:
    - .1 For openings created in a fire separation where the penetrating item has not yet been installed or has been removed.
  - .4 Construction joint firestops:
    - .1 For locations where adjacent fire separations or components of fire separations meet. These locations include: ceiling/wall and roof/wall joints, wall/wall joints at corners or in the same plane, wall/floor joints, floor/floor joints and ceiling/ceiling joints.
    - .2 Includes firestops for seismic joints, vertical control joints, expansion joints, and joints which occur at the tops and bottoms of fire separation walls.
    - .3 Includes firestops for head of wall to non-rated roof or floor assemblies.
  - .5 Building perimeter firestops:

- .1 For the space between a fire-resistance rated floor assembly and the curtain wall (e.g.: safing slot gaps).
  - .6 Auxiliary tested accessories such as sealants, insulation, damming materials, boards, primers, collars required to complete firestopping work, excluding those inside sealed mechanical and electrical assemblies.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 07 81 00, Applied Fireproofing

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 Fire Blocking: materials, components or system installed in a concealed space in the building to restrict the spread of fire and smoke in that concealed space or from that concealed space to an adjacent space.
- 1.4.2 Firestop: a material, component or system, and its means of support, used to protect gaps between fire separations, between fire separations and other construction assemblies, or used in openings where penetrating items wholly or partially penetrate fire separations, to restrict the spread of fire and smoke thus maintaining the fire-resistance continuity of a fire separation.
- 1.4.3 Firestop System: the combination of specific materials and/or devices required with the penetrating item(s), the assembly and the opening to assemble the firestop.
- 1.4.4 Intumescent: materials that expand with heat to prevent fire spread through fire separations.
- 1.4.5 Listed Firestop System: a specific field erected construction consisting of the assembly, firestop materials, any penetrating items and their means of support which have met the requirements for an F, FT, FH, FTH and/or L rating when tested in a fire-resistance rated assembly in accordance CAN/ULC-S115-18.
- .1 F-Rating: the amount of time a firestop system can remain in place without the passage of flame through the opening or the occurrence of flaming on the unexposed face of the firestop.

- .2 FT-Rating: a firestop system with an F-Rating for the required time period which can also resist the transmission of heat through the firestop during the same period and limit the rise in temperature on the unexposed face and/or penetrating item of the firestop.
- .3 FH-Rating: a firestop system with an F-Rating for the required time period which can also resist the force of a hose stream without developing openings for a prescribed period.
- .4 FTH-Rating: a firestop system with an FT-Rating for the required time period which also passed the hose stream test for a prescribed period.
- .5 L-Rating: largest test sample leakage rate, determined in accordance with CAN/ULC-S115.
- 1.4.6 Multi-penetration: two or more service penetrations through an opening in the fire separation.
- 1.4.7 Non-rated Fire Separation: fire separation acting as a barrier to the spread of smoke until a response is initiated such as the activation of a fire suppression system.
- 1.4.8 Single-penetration: single service penetration through an opening in the fire separation.
- 1.4.9 System Design Listing: document providing proof of testing with technical details, specifications and requirements that leads to the application of a specific listed firestop system.
- 1.4.10 Dry location or area: A location not normally subject to dampness.
- 1.4.11 Damp/wet location or area: Exterior or interior location that is normally or periodically subject to condensation of moisture in, on, or adjacent to, Work of this Section. This includes location in which water or other liquid can drip, splash, or flow on or against Work of this Section. This includes, but is not limited to, mechanical rooms, showers, drying areas, change rooms, kitchen areas, washrooms, and associated vestibules and corridors.

## **1.5 Administrative Requirements**

- 1.5.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.

- .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
- 1.5.2 Sequencing:
- .1 Proceed with installation only when submittals have been reviewed by Consultant.
  - .2 Firestops located in floor assemblies: install before interior partition erections.
  - .3 Metal deck bonding: unless noted otherwise on system design listing and manufacturer's installation instructions, firestopping to precede spray applied fireproofing to ensure required bonding.
  - .4 Pipe and duct insulation: Provide certified firestop system component.
  - .5 Ensure pipe and duct insulation installation precedes firestopping.
- 1.5.3 Coordination:
- .1 Coordinate construction of openings and penetrating items to ensure that Firestopping and smoke seals is installed according to specified requirements.
  - .2 Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate Firestopping and smoke seals.
  - .3 Do not cover up firestopping and smoke seal installations that will become concealed behind other construction until each installation has been examined by inspection and testing agency and authorities having jurisdictions as required.

## **1.6 Action Submittals**

- 1.6.1 Product Data: Submit product data in accordance with Division 01 for each type of product indicated on Drawings and Schedules.
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Firestopping And Smoke Seals work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.6.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for each Firestopping and smoke seals system. Include location and design designation of qualified testing and inspecting agency.

- 
- .1 Ensure Shop Drawings indicate material characteristics, details of construction, connections and relationship with adjacent construction. Submit complete and detailed Shop Drawings indicating ULC and/or cUL assembly number certification and material safety data sheets. In addition to minimum requirements, indicate following:
    - .1 Required temperature, hose stream and flame ratings,
    - .2 Material thicknesses,
    - .3 Installation methods,
    - .4 Primers,
    - .5 Damming materials as applicable.
  - .2 Coordinate and ensure shop Drawings for firestopping and smoke seals inside sealed mechanical and electrical assemblies are reviewed by Divisions 21, 22, 23 and 26 respectively.
- 1.6.3 Engineering Judgments (EJs):
- .1 Where there is no specific tested listed firestop system available from the manufacturer for a particular firestop configuration, review systems from other manufacturers to obtain a listed firestop system.
  - .2 Submit an Engineering Judgment (EJ) from the system manufacturer if there are no listed systems available from other manufacturers.
  - .3 Prepare and submit an EJ in accordance with best practices established in the following documents:
    - .1 IFC Guidelines for Evaluating Engineering Judgments.
    - .2 IFC Guidelines for Evaluating Engineering Judgments - Perimeter Fire Barrier Systems.
  - .4 For each EJ submitted, include:
    - .1 Project name, number and location.
    - .2 A description of the proposed system with detailed drawing.
    - .3 Installation instructions.
    - .4 Complete descriptions of critical elements for the firestop configuration.
    - .5 Copies of all referenced system design listings on which the EJ is based on.
    - .6 EJ issuer name and contact information.
    - .7 Date of issue of EJ with authorization signature of issuer.

- .8 Manufacturer letter stating their opinion, with supporting justification, that the EJ will perform as a firestop system were it to be subjected to the appropriate standard fire test method for the required fire rating duration.
- 1.6.4 Once the EJ has been reviewed, submit the EJ to the authority having jurisdiction for final approval.
- 1.6.5 EJ shall be issued only by firestop manufacturer's qualified technical personnel or in concert with the manufacturer by a knowledgeable registered Professional Engineer, a Fire Protection Engineer or an independent testing agency that provides testing and listing services for firestop systems similar to the EJ being contemplated.
- 1.6.6 EJ shall be based upon interpolations of previously tested firestop systems that are either sufficiently similar in nature or clearly bracket the conditions upon which the Engineering Judgment is to be given. Additional knowledge and technical interpretations based upon accepted engineering principles, fire science and fire testing guidelines (e.g.: ASTM E2032) may also be used as further support data.
- 1.6.7 EJ shall be based upon knowledge of the elements of the construction to be protected and understanding of the probable behaviour of that construction and the recommended firestop system protecting it were they to be subjected to the adequate standard fire test method for the required fire rating duration.
- 1.6.8 EJ shall be limited to the specific conditions and configurations upon which EJ was rendered and should be based upon reasonable performance expectations for the recommended firestop system under those conditions.
- 1.6.9 EJ shall be accepted only for a single specific job and location and should not be transferred to any other job or location without thorough and appropriate review of all aspects of the next job or location's circumstances.

**1.7 Closeout Submittals**

- 1.7.1 Submit in accordance with Section 01 78 00.
- 1.7.2 Operation and Maintenance Data: submit operation and maintenance data for incorporation into manual. Include:
  - .1 WHMIS Safety Data Sheets (SDS).
  - .2 Product data and manufacturer's installation and maintenance instructions for each product/system used on this project.
  - .3 Approved system design listings and Engineering Judgments.

- 
- .4 Matrix schedule listing all system design listings and Engineering Judgments with a description of their penetration or joint type.
  - .5 Manufacturer's field reports.
  - .6 Warranty information on firestop installations.
  - 1.7.3 As-built Drawings:
    - .1 Submit marked-up set of drawings to provide referencing system identifying the location of each firestop.
    - .2 Identify each penetration type firestop with their penetration identification number.
    - .3 Provide detailed drawings of system design listings for each type of firestop (i.e.: through-penetration, membrane penetration, blank opening, construction joint, building perimeter).
  - 1.7.4 Closeout Firestop Schedules:
    - .1 Submit complete firestop schedules for floors, walls and ceilings. Submit documentation for each application addressed.
    - .2 Indicate all penetration firestops and joint firestops through each reference wall, floor and ceiling in the schedules.
    - .3 Cross-reference firestop schedules with as-built drawings and indicate design listing numbers associated to each penetration firestop and joint firestop.
    - .4 As a minimum, indicate the following for through-penetration firestops and fire-resistive joint systems:
      - .1 Sequential Location Number
      - .2 Project Name
      - .3 Date of Installation
      - .4 Detailed description of the penetration's location
      - .5 Tested System or Engineered Judgment Number
      - .6 Type of assembly penetrated or type of construction joint.
      - .7 Detailed description of the sizes and types of penetrating items
      - .8 Lineal Footage of the joint (joint systems only)
      - .9 Size of opening or width of the joint
      - .10 Number of sides of assemblies addressed
      - .11 Hourly rating
      - .12 Installer's Name

---

**1.8      Maintenance Material Submittals**

**1.8.1   Firestop Documentation Software:**

- .1 Provide firestop documentation manager software capable of documenting and tracking firestop systems during construction, and during Owner's operation activities.
- .2 Software solution must be able to track and document every firestop system installed on project and subsequent additions, changes, or removals.
- .3 Software must have internet connectivity and able to operate on smartphone or tablet device (either iOS, Android or Windows capable) to capture relevant information in real-time.
- .4 As a minimum following is required to be tracked for each firestop application:
  - .1 Product installed,
  - .2 System installed,
  - .3 Date of installation,
  - .4 Location of penetration including notations on Architectural Drawings,
  - .5 Hourly ratings,
  - .6 Name of installer,
  - .7 Photos (pre-installation and post-installation),
  - .8 Inspection status.
- .5 Owner may require additional items to be tracked.
- .6 Basis-of-Design Software: "Hilti CFS-DM" by Hilti (Canada) Corporation or approved equivalent.

**1.9      Quality Assurance**

- 1.9.1   Installer Qualifications:** A firm experienced in installing Firestopping and smoke seals similar in material, design, and extent to that indicated on Drawings and Schedules for this Project, whose work has resulted in construction with a record of successful performance. Qualifications include having the necessary experience, staff, and training to install manufacturer's products per specified requirements. Manufacturer's willingness to sell its Firestopping and smoke seals products to Contractor or to Installer engaged by Contractor does not in itself confer qualification on buyer.
- .1 Installer must be recognized as a Member in Good Standing with the Firestop Contractors International Association (FCIA). Submit written proof of current membership.

- .2 Training: workers, including site supervisor, to have completed:
  - .1 Manufacturer training on the products/systems installed as part of this Section.
- .3 Certified Firestop Contractor: company certified with one of the following programs:
  - .1 ULC Qualified Firestop Contractor Program. Submit signed copy of ULC Qualified Firestop Contractor Program certificate.
  - .2 FM 4991 Approved Firestop Contractor. Submit signed copy of FM 4991 Approval certificate.
- 1.9.2 Single Source Responsibility: Provide products from a single manufacturer, to the greatest extent possible, to perform all firestopping work. Materials of different manufacturers will not be permitted without written authorization from Consultant.
  - .1 Materials of different manufacturers than allowed by the tested and listed system shall not be intermixed in the same firestop system or opening.
  - .2 Tested and listed, classified firestop systems are to be used. If another manufacturer has a tested and listed system, then that system shall be used prior to an Engineering Judgment (EJ) or Equivalent Fire Resistance Rated Assembly (EFRRA).
- 1.9.3 Mock-ups: Provide Mock-ups in locations designated by Consultant and as required to demonstrate quality of workmanship. Maintain Mock-ups during construction in an undisturbed condition as a standard for judging the completed work. Provide mock-up of typical firestopping system as shown on reviewed Shop Drawings.

#### **1.10 Delivery, Storage And Handling**

- 1.10.1 Packing, shipping, handling and unloading:
  - .1 Deliver, store and handle materials in accordance with Section 01 61 00.
  - .2 Deliver, store and handle materials in accordance with manufacturer's written instructions.
  - .3 Deliver materials to the site in undamaged condition and in original unopened containers, marked to indicate brand name, manufacturer, ULC markings, manufacturing date, shelf life expiry date.
- 1.10.2 Storage and Protection:
  - .1 Store materials in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.

- .2 Replace defective, expired or damaged materials with new.
- .3 Coordinate delivery of materials with scheduled installation dates to allow minimum storage time on site.
- .4 Comply with recommended procedures, precautions and measures described in WHMIS Safety Data Sheets (SDS).

**1.11 Project Conditions**

- 1.11.1 Environmental Limitations: Do not install Firestopping and smoke seals when ambient or substrate temperatures are outside limits permitted by Firestopping and smoke seals manufacturers or when substrates are wet because of rain, frost, condensation, or other causes.
- 1.11.2 Install and cure Firestopping and smoke seals per manufacturer's written instructions using natural means of ventilations or, where this is inadequate, forced-air circulation.

**1.12 Warranty**

- 1.12.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 3M Fire Protection Products.
  - .2 A/D Fire Protection Systems Inc.
  - .3 Hilti (Canada) Limited.
  - .4 PFP (Passive Fire Protection Partners)
  - .5 Tremco, Inc.; Tremco Fire Protection Systems Group.
- 2.1.2 Basis-of-Design: This specification is based on Products and Systems by Hilti (Canada) Corporation. Comparable Products from manufacturers listed herein, offering functionally, aesthetically equivalent products in Consultant's opinion and subject to Consultant's review will be considered provided they meet the requirements of this Specification
- 2.1.3 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

---

## **2.2 Regulatory Requirements**

2.2.1 Fire testing results: Firestopping and smoke seals shall comply with the following requirements:

- .1 Firestopping and smoke seals tests are performed by a qualified testing agency acceptable to authorities having jurisdiction.
- .2 Firestopping and smoke seals are identical to those tested per testing standard referenced in this Section. Provide rated systems complying with the following requirements:
  - .1 Firestopping and smoke seals products bear classification marking of qualified testing and inspecting agency.
  - .2 Classification markings on Firestopping and smoke seals correspond to designations listed by the following:
    - .1 ULC and UL in "Fire Resistance Directory."
    - .2 Intertek ETL SEMKO in its "Directory of Listed Building Products."
    - .3 ULC Guide No. 40 U19.

2.2.2 Provide systems selection and analysis, installation and inspection of firestop systems in accordance with the recommended practices detailed in the following guides:

- .1 FCIA Firestop Manual of Practice (MOP).

## **2.3 Design And Performance Requirements**

2.3.1 Provide firestopping and smoke seals that are produced and installed to resist spread of fire according to requirements indicated on Drawings and Schedules, resist passage of smoke and other gases, and maintain original fire-resistance rating of construction penetrated.

2.3.2 Non-rated fire separations: provide L-Rated smoke protection firestop system for application on both sides of separation.

2.3.3 Dynamic joints: where required, fire and smoke stop systems to be designed to accommodate a defined amount of movement to account for expansion or contraction in construction joints and mechanical piping, for movement in structural elements and to accommodate for movement and sound and vibration control in mechanical installations.

2.3.4 Insulated pipes and ducts: listed firestop system designed and tested with actual insulation materials penetrating the fire separation, as indicated on the system design listing.

2.3.5 Wet areas: water based products are unacceptable in wet areas or areas that may be subject to occasional water exposure or

flooding during and after construction. Products use in such areas must have a W-rating.

- 2.3.6 Architectural considerations: when exposed to view, firestop system to consider architectural finish, potential traffic, physical damage and exposure to moisture and heat. Provide firestop systems suitable for these conditions that meet conditions expected.
- 2.3.7 Environment considerations: materials selected to consider the environment in which they will be used during and after curing as well as the intended use of space. Firestop manufacturer to confirm compatibility of the proposed materials/products for the following cases:
  - .1 Spaces requiring resistance to infection and biological spread through assemblies.
  - .2 Spaces containing sensitive electronic equipment.
  - .3 Preventing contamination of laboratory and manufacturing environments.
- 2.3.8 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.3.9 Penetrations in Fire-Resistance-Rated Walls: Provide Firestopping and smoke seals with ratings determined per CAN/ULC-S115, based on testing at a positive pressure differential of 2.5 Pa (0.01-inch wg).
  - .1 Fire-resistance-rated walls include fire-rated partitions, smoke-barrier walls (0 hour partitions), and fire walls.
  - .2 F-Rating: Not less than the fire-resistance rating of constructions penetrated.
  - .3 L-Rating: Not exceeding 25 L/s per sq. m (5.0 cfm/sq. ft.) of penetration opening at 75 Pa (0.30-inch wg) at both ambient and elevated temperatures.
- 2.3.10 Penetrations in Horizontal Assemblies: Provide Firestopping and smoke seals with ratings determined per CAN/ULC-S115 or equivalent to ASTM E814 or UL 1479, based on testing at a positive pressure differential of 2.5 Pa (0.01-inch wg).
  - .1 Horizontal assemblies include fire-rated floors, floor/ceiling assemblies, and ceiling membranes of roof/ceiling assemblies.

- 
- .2 F-Rating: At least 1 hour, but not less than the fire-resistance rating of constructions penetrated.
  - .3 T-Rating: At least 1 hour, but not less than the fire-resistance rating of constructions penetrated except for floor penetrations within the cavity of a wall.
  - .4 L-Rating: Not exceeding 25 L/s per sq. m (5.0 cfm/sq. ft.) of penetration opening at 75 Pa (0.30-inch wg) at both ambient and elevated temperatures.
- 2.3.11 Penetrations in Smoke Barriers: Provide Firestopping and smoke seals with ratings determined per UL 1479.
- .1 L-Rating: Not exceeding 25 L/s per sq. m (5.0 cfm/sq. ft.) of penetration opening at 75 Pa (0.30-inch wg) at both ambient and elevated temperatures.
- 2.3.12 W-Rating: Provide Firestopping and smoke seals showing no evidence of water leakage when tested according to UL 1479 (minimum Class 1).
- .1 Provide firestop systems with "W" Water Resistance ratings (minimum Class 1), in addition to F, T and L ratings, where indicated or required by Authorities Having Jurisdiction.
- 2.3.13 Exposed Firestopping and smoke seals: Provide products with flame-spread and smoke-developed indexes of less than 25 and 450, respectively, as determined per CAN/ULC-S102/S102.2 or equivalent to ASTM E84.
- 2.3.14 Joints at Exterior Curtain-Wall/Floor Intersections: Provide fire-resistive joint systems with rating determined by CAN/ULC-S115 based on testing at a positive pressure differential of 2.5 Pa (0.01-inch wg) per ASTM E2307.
- .1 Fire-Resistance Rating: Equal to or exceeding the fire-resistance rating of the floor assembly.
  - .2 Rain and water resistance: provide perimeter joint sealant tested in accordance with ASTM D6904 with less than 1 hour tack free time as tested in accordance with ASTM C679
- 2.3.15 Low-Emitting Materials: Firestopping and smoke seals sealants and sealant primers shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- 2.3.16 Microbial and Fungal Resistance: Provide firestopping capable of achieving a Class 1 rating when tested in accordance with ASTM G21 for antibacterial and antifungal properties to inhibit growth of bacteria, mould, mildew and fungi.

2.3.17 Accessories: Provide components for each Firestopping and smoke seals system that are needed to install fill materials and to maintain ratings required. Use only those components specified by Firestopping and smoke seals manufacturer and approved by qualified testing and inspecting agency for firestopping indicated.

- .1 Permanent forming/damming/backing materials, including the following:
  - .1 Slag-wool-fiber or rock-wool-fiber insulation.
  - .2 Sealants used in combination with other forming/damming/backing materials to prevent leakage of fill materials in liquid state.
  - .3 Fire-rated form board.
  - .4 Fillers for sealants.
  - .5 Temporary forming materials.
  - .6 Substrate primers.
  - .7 Collars.
  - .8 Steel sleeves.

2.3.18 Compatibility: Firestopping and smoke seals systems shall be compatible with one another, with the substrates forming openings, and with penetrating items if any.

- .1 Ensure Firestop Materials coming directly in contact with plastic pipe or plastic coated wire have undergone Firestop Material compatibility testing by Systems manufacturer or pipe and wire manufacturer.
- .2 All firestop systems coming into contact with CPVC Piping (direct or indirect) shall be FBC system compatible (This includes spray applied Firestop materials as overspray onto CPVC Pipe)
- .3 Ensure materials and Products provided do not cause stresses, chemical or physical reactions, or other damages to penetrating items or adjacent materials.
- .4 Ensure compatibility of firestop system components with abutting dissimilar membranes, architectural coatings, finishes at floors, walls and ceilings. Check with manufacturer requirements of materials being installed.
- .5 Ensure firestop system exposed to ambient conditions do not deteriorate after curing during and after completion of construction.
- .6 Ensure firestopping systems do not affect structural integrity of load bearing walls and assemblies. Coordinate with Consultant prior to penetrating any load bearing assembly.

.7 Ensure firestopping systems do not affect acoustical performance of acoustical assemblies.

2.3.19 General Emissions Evaluation: Applicable Products (paints, coatings, adhesives, sealants, flooring, ceilings, walls or insulation) specified in this section, including auxiliary materials and accessories must be tested and determined compliant in accordance with California Department of Public Health (CDPH) Standard Method v1.2–2017 "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers", using the applicable exposure scenario.

2.3.20 VOC Content Requirements for Paints and Coatings: Paints and coatings wet-applied on site must meet the applicable VOC limits of the California Air Resources Board (CARB) Suggested Control Measure (SCM) for Architectural Coatings, or the South Coast Air Quality Management District (SCAQMD) Rule 1113. Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants.

2.3.21 VOC Content Requirements for Adhesives and Sealants: Adhesives and sealants wet-applied on site must meet the applicable chemical content requirements of SCAQMD Rule 1168. Methylene chloride and perchloroethylene must not be intentionally added in paints, coatings, adhesives, or sealants. Do not use adhesives that contain urea formaldehyde.

## **2.4 Materials**

2.4.1 Provide asbestos-free materials and systems capable of maintaining effective barrier against the passage of flame, smoke and water and the transmission of heat in compliance with requirements of CAN-ULC-S115 and not to exceed opening sizes for which they are intended, as indicated on System Design Listing.

2.4.2 Cast-in-Place Firestop Devices: Factory-assembled devices for use in cast-in-place concrete floors and consisting of an outer plastic sleeve lined with an intumescent strip, a radial or square extended flange attached to one end of the sleeve for fastening to concrete formwork.

2.4.3 Latex Sealants: Single-component latex formulations that do not re-emulsify after cure during exposure to moisture.

2.4.4 Firestop Devices: Factory-assembled collars formed from galvanized steel and lined with intumescent material sized to fit specific diameter of penetrant.

- 
- 2.4.5 Intumescent Composite Sheets: Rigid panels consisting of aluminum-foil-faced elastomeric sheet bonded to galvanized-steel sheet.
  - 2.4.6 Intumescent Putties: Nonhardening dielectric, water-resistant putties containing no solvents, inorganic fibers, or silicone compounds.
  - 2.4.7 Intumescent Wrap Strips: Single-component intumescent elastomeric sheets with aluminum foil on one side.
  - 2.4.8 Mortars: Prepackaged dry mixes consisting of a blend of inorganic binders, hydraulic cement, fillers, and lightweight aggregate formulated for mixing with water at Project site to form a nonshrinking, homogeneous mortar.
  - 2.4.9 Firestop Block: Ready-to-use, Non-curing, reusable solution intumescent flexible block designed to seal medium to large size openings.
  - 2.4.10 Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.
  - 2.4.11 Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below:
    - .1 Grade for Horizontal Surfaces: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces.
    - .2 Grade for Vertical Surfaces: Nonsag formulation for openings in vertical and other surfaces.
  - 2.4.12 Firestop Joint Spray: sprayable fire rated mastic for construction joint; maximum flexibility in accordance with ASTM E1966 and UL 2079; containing no halogens, solvents or asbestos; water based, paintable.
  - 2.4.13 Cementitious matrices: Capable of providing minimum 2758 kPa (400 psi) compressive strength when cured, to retard cable tray warping within firestop seal.
  - 2.4.14 Primers: As required by firestopping manufacturer and compatible with selected system and contiguous materials.
  - 2.4.15 Water: Potable
  - 2.4.16 Pipe and duct insulation and wrappings: compatible with firestopping systems.
  - 2.4.17 Intumescent pads: Permanently pliable type.
  - 2.4.18 Intumescent composite sheet: Composite sheet, strip or precut shapes.

- 2.4.19 Re-penetrable Sealants: Non curing, re-penetrable intumescent sealants, caulking or putty materials for use with flexible cable or cable bundles.
- 2.4.20 Accessories: Provide miscellaneous components needed to Install fill materials and to maintain ratings required. Use only components specified by penetration firestopping manufacturer and approved by qualified testing and inspecting agency. Accessories include, but are not limited to, the following items:
- .1 Permanent forming/damming/backing materials in accordance with manufacturer's recommendations, including the following:
    - .1 Slag-/rock-wool-fiber insulation.
    - .2 Sealants used in combination with other forming/damming/backing materials to prevent leakage of fill materials in liquid state.
    - .3 Fire-rated form board.
    - .4 Fillers for sealants.
  - .2 Temporary forming materials.
  - .3 Substrate primers.
  - .4 Collars.
- 2.4.21 Gypsum Products: The use of gypsum products for through-penetration firestopping is strictly prohibited.

## **2.5     Mixing**

- 2.5.1 For those products requiring mixing before application, comply with Firestopping and smoke seals manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated on Drawings and Schedules.

## **3 .     EXECUTION**

### **3.1     Examination**

- 3.1.1 Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of the Work.
- 3.1.2 Examine substrates, openings, voids, adjoining construction and conditions under which firestop is to be installed. Confirm compatibility of surfaces. Verify penetrating items are securely

fixed and properly located with proper space allowance between penetrations and surfaces of openings.

- 3.1.3 Confirm locations of exposed/non-exposed firestopping/smoke seal surfaces prior to application. Provide movement capability at movement joints in accordance with design requirements for movement joint.
- 3.1.4 Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2      Preparation**

- 3.2.1 Surface Cleaning: Clean out openings immediately before installing Firestopping and smoke seals to comply with manufacturer's written instructions and with the following requirements:
  - .1 Remove from surfaces of opening substrates and from penetrating items foreign materials that could interfere with adhesion of Firestopping and smoke seals.
  - .2 Clean opening substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with Firestopping and smoke seals. Remove loose particles remaining from cleaning operation.
  - .3 Remove laitance and form-release agents from concrete.
- 3.2.2 Priming: Prime substrates where recommended in writing by manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.
- 3.2.3 Masking Tape: Use masking tape to prevent Firestopping and smoke seals from contacting adjoining surfaces that will remain exposed on completion of the Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove stains. Remove tape as soon as possible without disturbing firestopping's seal with substrates.

### **3.3      Installation**

- 3.3.1 Comply with UL, ULC, and cUL, listings and manufacturer's instructions for type of material and condition of opening in each case. Consult with manufacturer to determine proper procedure for conditions not fully covered by printed instructions. Record in writing any oral instructions received, with copy to manufacturer.
- 3.3.2 Install Firestopping and smoke seals to comply with manufacturer's written installation instructions and published drawings for products and applications indicated on Drawings and Schedules.

- 3.3.3 Provide firestopping to all penetrations passing through fire resistance rated wall and floor assemblies and other locations as indicated on Drawings.
- 3.3.4 Remove excess firestopping material promptly as work progresses and upon completion. Provide leak-proof dams as required to seal openings and contain firestop until cured. Install damming in accordance with test design and manufacturer's instructions.

### **3.4      Identification**

- 3.4.1 Identify Firestopping and smoke seals with pressure-sensitive, self-adhesive, preprinted plastic labels. Attach labels permanently to surfaces adjacent to and within 150 mm (6 inches) of firestopping edge so labels will be visible to anyone seeking to remove penetrating items or firestopping. Include the following information on labels:
  - .1 The words "Warning - Firestopping and smoke seals - Do Not Disturb. Notify Building Management of Any Damage."
  - .2 Contractor's name, address, and phone number.
  - .3 Designation of applicable testing and inspecting agency.
  - .4 Date of installation.
  - .5 Manufacturer's name.
  - .6 Installer's name.
- 3.4.2 Identification labels and markings to be indelible for the expected service life of the installation.
- 3.4.3 Provide identification labels at each penetration.

### **3.5      Field Quality Control**

- 3.5.1 Manufacturer's services: A manufacturer's direct representative (not distributor or agent) must be on-site during initial installation of firestop systems to train appropriate contractor personnel in proper selection and installation procedures in accordance with manufacturer's written recommendations published in literature and drawing details.

### **3.6      Cleaning And Protection**

- 3.6.1 Clean off excess fill materials adjacent to openings as the Work progresses by methods and with cleaning materials that are approved in writing by Firestopping and smoke seals manufacturers and that do not damage materials in which openings occur.
- 3.6.2 Provide final protection and maintain conditions during and after installation that ensure that Firestopping and smoke seals is without damage or deterioration at time of Substantial

Performance of the Work. If, despite such protection, damage or deterioration occurs, immediately cut out and remove damaged or deteriorated Firestopping and smoke seals and install new materials to produce systems complying with specified requirements.

**3.7 Firestopping And Smoke Seals Schedule**

**3.7.1 Provide listed Firestop and smoke seal systems at:**

- .1 Penetrations through fire-resistance rated masonry, concrete, and gypsum board partitions and walls.
- .2 Edge of floor slabs at curtain wall and precast concrete panels.
- .3 Top of fire-resistance rated masonry and gypsum board partitions.
- .4 Intersection of fire-resistance rated masonry and gypsum board partitions.
- .5 Control and sway joints in fire-resistance rated masonry and gypsum board partitions and walls.
- .6 Penetrations through fire-resistance rated floor slabs, ceilings and roofs.
- .7 Openings and sleeves installed for future use through fire separations.
- .8 Around mechanical and electrical assemblies penetrating fire separations.
- .9 At expansion joints between fire-rated walls and other assemblies.
- .10 Openings around structural support members that penetrate floors/walls.
- .11 Openings and penetrations in fire rated walls or partitions containing fire doors.
- .12 Penetrations made through fire-resistant rated assemblies in existing facility buildings for, but not necessarily limited to, mechanical and electrical services.

**3.7.2 Firestopping and smoke seals at openings where reinstallation occurs: UL or cUL listed, Elastomeric or re-useable cementitious matrix or putty seal; do not use permanent cementitious seal at such locations.**

**3.7.3 Firestopping and smoke seals at openings around penetrations for electrical bus ducts, pipes, ductwork and other electrical and mechanical items requiring sound and vibration control or allowance for expansion, contraction and other movement: UL or cUL listed, Elastomeric seal; do not use a cementitious or rigid seal at such locations.**

- 3.7.4 Firestopping and smoke seals at joints and spaces designed and required to allow movement (building movement joints, deflection spaces, control joints, expansion joints, and similar locations): UL or cUL listed, flexible, elastomeric seal suitable to withstand required movement and capable of returning to original configuration without damage to seal and without adhesive or cohesive failure; do not use a cementitious or rigid seal at such locations.

JOINT TYPE	F-RATING (HR)	BASIS OF DESIGN UL/cUL SYSTEM	
		JOINT WIDTH LESS THAN OR EQUAL TO 2"	JOINT WIDTH GREATER THAN 2", LESS THAN OR EQUAL TO 6" <sup>4</sup>

\* SEE NOTE 3

\*\* Contact manufacturer for current UL/cUL-classified system or engineering judgment

NOTES:

1. Classified systems for 2" - 6" wide joints may be used for joints 2" wide and less.
2. Confirm that movement capabilities of the selected UL/cUL system meets or exceeds the specified movement range of the particular joint.
3. Systems marked with an asterisk (\*) are suitable for top-of-wall joints where the fluted metal deck has sprayed-on fireproofing. Verify with manufacturer prior to application.
4. Verify allowable joint width on specific UL/cUL system drawings.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Joint Sealants work specified herein. This includes, but is not necessarily limited, to:
- .1 Exterior joint sealants,
  - .2 Interior joint sealants,
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 04 22 00, Concrete Unit Masonry for masonry control and expansion joint fillers and gaskets.
  - .2 Section 07 92 00, Joint Sealants
  - .3 Section 08 80 05, General Requirements for Glass and Glazing for glazing sealants.
  - .4 Section 09 21 16, Gypsum Board Assemblies for sealing perimeter joints.
  - .5 Section 09 30 00, Tiling for sealing tile joints.
  - .6 Section 09 51 13, Acoustical Panel Ceilings for sealing edge moldings at perimeters with acoustical sealant.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Administrative Requirements**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.

- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
- .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
- .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

#### **1.5      Preconstruction Testing**

- 1.5.1 Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers, for testing indicated below, samples of materials that will contact or affect joint sealants.
  - .1 Use ASTM C794, ASTM C1087 or manufacturer's standard test method to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
  - .2 Stain Testing: Use ASTM C1248 to determine staining potential of silicone sealants in contact with porous and non-porous exterior cladding joint substrates.
  - .3 Submit minimum number of pieces required by sealant manufacturer of each kind of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
  - .4 Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
  - .5 For materials failing tests, obtain joint-sealant manufacturer's written instructions for corrective measures including use of specially formulated primers.
  - .6 Testing will not be required if joint-sealant manufacturers submit joint preparation data that are based on previous testing, not older than 24 months, of sealant products for adhesion to, and compatibility with, joint substrates and other materials matching those submitted.

#### **1.6      Action Submittals**

- 1.6.1 Product Data: Submit product data in accordance with Division 01 for the following:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Joint Sealants work and include product characteristics, performance criteria, physical size, finish and limitations.
- 1.6.2 Samples: Submit manufacturer's colour charts consisting of strips of cured sealants showing the full range of colours available for each product exposed to view.
  - .1 Verification samples: Submit samples of each type and colour of exposed joint sealant required. Provide fully cured joint sealant samples in 19 mm (3/4-inch) wide joints formed between two 300 mm (12-inch) long strips of materials to be sealed.
- 1.6.3 Joint-Sealant Schedule: Include the following information:
  - .1 Joint-sealant application, joint location, and designation.
  - .2 Joint-sealant manufacturer and product name.
  - .3 Joint-sealant formulation.
  - .4 Joint-sealant colour.
- 1.6.4 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback.

## **1.7 Informational Submittals**

- 1.7.1 Product Certificates: Submit product certificates in accordance with Division 01 for each kind of joint sealant and accessory, from manufacturer.
- 1.7.2 Sealant, Waterproofing, and Restoration Institute (SWRI) Validation Certificate: Submit Sealant, Waterproofing, and Restoration Institute (SWRI) Validation Certificate in accordance with Division 01 for each sealant specified to be validated by SWRI's Sealant Validation Program.
- 1.7.3 Preconstruction Compatibility and Adhesion Test Reports: From sealant manufacturer, indicating the following:
  - .1 Materials forming joint substrates and joint-sealant backings have been tested for compatibility and adhesion with joint sealants.
  - .2 Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.
- 1.7.4 Field-Adhesion Test Reports: Submit fire-adhesion test reports in accordance with Division 01 for each sealant application tested.
- 1.7.5 Warranties: Submit warranties in accordance with Division 01 for special warranties specified in this section..

---

**1.8      Quality Assurance**

- 1.8.1 Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
- 1.8.2 Source Limitations: Obtain each kind of joint sealant from single source from single manufacturer.
- 1.8.3 Mockups: Install sealant in mockups of assemblies specified in other Sections that are directed on Site to receive joint sealants specified in this Section. Use materials and installation methods specified in this Section.

**1.9      Project Conditions**

- 1.9.1 Do not proceed with installation of joint sealants under the following conditions:
  - .1 When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer or are below 5 deg C (40 deg F).
  - .2 When joint substrates are wet.
  - .3 Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated on Drawings and Schedules.
  - .4 Where contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

**1.10     Warranty**

- 1.10.1 Extended Manufacturer's Warranty: Manufacturer's standard form in which joint-sealant manufacturer agrees to Supply joint sealants to repair or replace those that do not comply with performance and other requirements specified in this Section within specified warranty period.
  - .1 Warranty Period:
    - .1 20 years from date of Substantial Performance of the Work for silicone sealants; include coverage against staining substrates exposed to view.
    - .2 Ten years from date of Substantial Performance of the Work for other polymer-modified (hybrid) sealants.
    - .3 Five years from date of Substantial Performance of the Work for polyurethane sealants.
    - .4 Two years from date of Substantial Performance of the Work for latex sealants.

---

## **2 . PRODUCTS**

### **2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Master Builders Solutions Canada Inc. (Formerly BASF Canada Inc.);
- .2 GE Silicones (Momentive Performance Materials)
- .3 Master Builders Solutions Canada Inc;
- .4 Pecora Corporation;
- .5 Sika Canada Inc.;
- .6 Tremco Incorporated.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Design And Performance Requirements**

2.2.1 Compatibility: Provide joint sealants, backings, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer, based on testing and field experience.

2.2.2 Liquid-Applied Joint Sealants: Comply with ASTM C920 and other requirements indicated on Drawings and Schedules for each liquid-applied joint sealant specified, including those referencing ASTM C920 classifications for type, grade, class, and uses related to exposure and joint substrates.

- .1 Suitability for Immersion in Liquids. Where sealants are indicated on Drawings and Schedules for Use I for joints that will be continuously immersed in liquids, provide products that have undergone testing according to ASTM C1247. Liquid used for testing sealants is deionized water, unless otherwise indicated on Drawings and Schedules.

2.2.3 Stain-Test-Response Characteristics: Where sealants are specified to be non-staining to porous substrates, provide products that have undergone testing according to ASTM C1248 and have not stained porous joint substrates indicated on Drawings and Schedules for Project.

2.2.4 Suitability for Contact with Food: Where sealants are indicated on Drawings and Schedules for joints that will come in repeated contact with food, provide products that comply with 21 CFR 177.2600.

- 2.2.5 Colours of Exposed Joint Sealants: As selected by Consultant from manufacturer's full range.

## **2.3 Exterior Joint Sealants**

- 2.3.1 Single component, nonsag, neutral curing silicone sealant, ASTM C920, Type S, Grade NS, Class 100/50 or Class 50 as required for applications and joint design, for Use NT or nonstaining silicone sealant according to ASTM C 1248.

- .1 Exterior joints in vertical surfaces and horizontal non-traffic surfaces as follows:

- .1 Construction joints in cast-in-place concrete.
- .2 Control and expansion joints in unit masonry.
- .3 Joints between different materials listed above.
- .4 Perimeter joints between materials listed above and frames of doors, windows and louvers.
- .5 Other joints as indicated on Drawings and Schedules.

- .2 Acceptable Products:

- .1 "Dowsil 790" or "Dowsil 795" or "Dowsil CCS" by Dow Chemical of Canada ULC
- .2 "Spectrem 1" or "Spectrem 2" by Tremco Incorporated
- .3 "Sikasil WS-290" or "Sikasil WS-295" by Sika Canada Inc.
- .4 "Silpruf SCS2000" or "Silpruf LM SCS2700" by GE Silicones (Momentive Performance Materials)
- .5 "890NST" or "864NST" by Pecora Corporation
- .6 Approved equivalent.

- 2.3.2 Single component, nonsag, low dirt pick-up, non-staining, neutral curing silicone sealant, ASTM C920, Type S, Grade NS, Class 100/50 or Class 50 as required for applications and joint design, for Use NT.

- .1 Exterior joints in vertical surfaces and horizontal non-traffic surfaces as follows:

- .1 Joints between plant-precast architectural concrete units.
- .2 Joints in stone masonry and cladding.
- .3 Joints in metal panel substrates.
- .4 Joints between different materials listed above.
- .5 Other joints as indicated on Drawings and Schedules.

- .2 Acceptable Products:

- 
- .1 "Spectrem 3" or "Spectrem 4 TS" by Tremco Incorporated
  - .2 "Dowsil 756 SMS" by Dow Chemical of Canada ULC
  - .3 "Silpruf NB SCS9000" by GE Silicones (Momentive Performance Materials)
  - .4 "Sikasil WS-290" or "Sikasil WS-295" by Sika Canada Inc
  - .5 Approved equivalent.
- 2.3.3 Single-Component, Nonsag, Traffic-Grade, Neutral-Curing Silicone Joint Sealant, ASTM C920, Type S, Grade NS, Class 100/50, for Use T.
- .1 Exterior joints in horizontal traffic surfaces as follows:
    - .1 Control and expansion joints in brick pavers.
    - .2 Isolation and contraction joints in cast-in-place concrete slabs.
    - .3 Joints between plant-precast architectural concrete paving units.
    - .4 Joints in stone paving units, including steps.
    - .5 Tile control and expansion joints.
    - .6 Joints between different materials listed above.
    - .7 Other joints as indicated on Drawings and Schedules.
  - .2 Acceptable Products:
    - .1 "Dowsil 790" or "Dowsil NS Parking Structure Sealant" by Dow Chemical of Canada ULC
    - .2 "Spectrem 800/900SL" by Tremco Incorporated
    - .3 "Sikasil -728 SL" or "Sikasil -728 NS" by Sika Canada Inc.
    - .4 "301 NS" or "311 NS" by Pecora Corporation
    - .5 Approved equivalent.
- 2.3.4 Single-Component or Multicomponent, Pourable, Traffic-Grade, Urethane Joint Sealant, ASTM C920, Type S or Type M, Grade P, Class 25 or Class 50 as required by joint design, for Use T.
- .1 Exterior joints in horizontal traffic surfaces subject to water immersion as follows:
    - .1 Joints in pedestrian plazas.
    - .2 Joints in swimming pool decks.
    - .3 Other joints as indicated on Drawings and Schedules.
  - .2 Acceptable Products:

- .1 "TH901" or "Vulkem 45 SSL" by Tremco Incorporated
  - .2 "MasterSeal SL1 or MasterSeal SL 2" by Master Builders Solutions"
  - .3 "Urexpan NR-201" by Pecora Corporation
  - .4 "Sikaflex - 1CSL" or "Sikaflex 2C SL " by Sika Canada Inc.
  - .5 Approved equivalent.
- 2.3.5 Single component, nonsag Acrylic latex Type S, ASTM C 920, class 25, Grade NS use NT.
- .1 Exterior expansion joints between tilt-up precast concrete panels
  - .2 Acceptable Products:
    - .1 "Tilt-Seal" by Master Builders Solutions"

## **2.4 Interior Joint Sealants**

- 2.4.1 Single component, nonsag, neutral curing silicone or urethane sealant, ASTM C920, Type S or Type M, Grade NS, Class 50, Class 35 or Class 25 as required for applications and joint design, for Use NT.
- .1 Interior joints in vertical surfaces and horizontal nontraffic surfaces as follows:
    - .1 Control and expansion joints on exposed interior surfaces of exterior walls.
    - .2 Perimeter joints of exterior openings.
    - .3 Tile control and expansion joints.
    - .4 Vertical joints on exposed surfaces of interior unit masonry and concrete walls and partitions.
    - .5 Joints on underside of plant-precast structural concrete beams and planks.
    - .6 Perimeter joints between interior wall surfaces and frames of interior doors, windows and elevator entrances.
    - .7 Other joints as indicated on Drawings and Schedules.
  - .2 Acceptable Products:
    - .1 "Dowsil 791" or "Dowsil 795" or "Dowsil CWS" by Dow Chemical of Canada ULC
    - .2 "Spectrem 2" or "Spectrem 3" or "Dymonic" or "Dymonic FC" by Tremco Incorporated
    - .3 "SilPruf LM SCS2700" by GE Silicones (Momentive Performance Materials)

- 
- .4 “890NST” or “890FTS” or “864NST” or “PCS” or “DnyaTrol I-XL” or “DynaTrol II” by Pecora Corporation
  - .5 “SikaSil WS-295” by Sika Canada Inc.
  - .6 Approved equivalent.
- 2.4.2 Mildew-Resistant, Single-Component, Nonsag, Silicone Joint Sealant, ASTM C920, Type S, Grade NS, Class 25, for Use NT
- .1 Mildew-resistant interior joints in vertical surfaces and horizontal nontraffic surfaces as follows:
    - .1 Joints between plumbing fixtures and adjoining walls, floors, and counters.
    - .2 Tile control and expansion joints.
    - .3 Other joints as indicated on Drawings and Schedules.
  - .2 Acceptable Products: Mildew-Resistant, Single-Component, Acid-Curing or Neutral Curing Silicone Joint Sealant, ASTM C920, Type S, Grade NS, Class 25, for Use NT.
    - .1 “Dowsil 786 Mildew Resistant” or “Dowsil Tub/Ceramic/Tile” by Dow Corning Corporation
    - .2 “Silicones; Sanitary SCS1700” by GE Silicones (Momentive Performance Materials)
    - .3 “Tremsil 200 Sanitary” by Tremco Incorporated
    - .4 “Sikasil GP/GP HT” by Sika Canada Inc.
    - .5 “898 NST” by Pecora Corporation
- 2.4.3 Nonsag, paintable, nonstaining latex complying with ASTM C834 or butyl rubber sealant complying with ASTM C1311.
- .1 Surface Burning Characteristics: Flame spread and smoke developed indexes not greater than 25 and 450, respectively.
  - .2 Interior acoustical joints in vertical surfaces and horizontal nontraffic surfaces as follows:
    - .1 Acoustical joints at top and bottom of gypsum board partitions; at top of masonry walls and through non fire-rated penetrations in gypsum and masonry walls.
    - .2 Other joints as indicated on Drawings and Schedules.
  - .3 Acceptable Products:
    - .1 “AC-20 FTR” or “AIS-919” by Pecora Corporation
    - .2 “SHEETROCK Acoustical Sealant” by CGC Inc.
    - .3 “QuietZone Acoustic Sealant” by Owens-Corning Canada Inc.
    - .4 “Tremco Acoustical Sealant” by Tremco Ltd.
    - .5 “QuietSeal” or “QuietSeal 350” by Serious Materials.

- 
- .6 "CP506 – Smoke and Acoustic Sealant" by Hilti
  - .7 "RCS20" by GE Silicones (Momentive Performance Materials)
  - .8 "MasterSeal NP520" by Master Builders Solutions
- 2.4.4 Acrylic latex or siliconized acrylic latex, ASTM C834, Type OP, Grade NF.
- .1 Interior non-acoustical joints in vertical surfaces and horizontal nontraffic surfaces as follows:
    - .1 Non-acoustical and non-moving joints between interior painted surfaces and adjacent materials.
  - .2 Acceptable Products:
    - .1 "MasterSeal NP520 by Master Builders Solutions"
    - .2 "AC-20+" by Pecora Corporation
    - .3 "Tremflex 834" by Tremco Incorporated
- 2.4.5 Single-Component or Multicomponent, Traffic-Grade, Silicone or Urethane Joint Sealant, ASTM C920, Type S or Type M, Class 25 or Class 50 as required by joint design, for Use T
- .1 Interior traffic joints as follows:
    - .1 Isolation joints in cast-in-place concrete slabs. Refer to Section 03 35 10 for filling of contraction joints.
    - .2 Acceptable Products:
      - .1 "Dowsil 790" by Dow Corning Corporation
      - .2 "301 NS" or "311 NS" "300 SL" or "310 SL" by Pecora Corporation
      - .3 "Spectrem 800/900SL" by Tremco Incorporated
      - .4 "Sikaflex - 1CSL or Sikaflex 2C SL" by Sika Canada Inc.
      - .5 "MasterSeal SL1" or "MasterSeal SL2" by Master Builders Solutions
- 2.4.6 Single-Component or Multicomponent, Traffic-Grade, Silicone or Urethane Joint Sealant, ASTM C920, Type S or Type M, Class 25 or Class 50 as required by joint design, for Use T
- .1 Interior traffic joints as follows:
    - .1 Control and expansion joints in stone flooring.
    - .2 Control and expansion joints in tile flooring.
    - .3 Other joints as indicated on Drawings and Schedules.
  - .2 Acceptable Products: As recommended by flooring manufacturer and conforming to TTMAC guidelines.
- 2.4.7 Single-Component Silicone complying with ASTM C920, Grade NS, Class 25 or butyl rubber sealant complying with ASTM C1311.

- .1 Interior traffic joints as follows:
    - .1 Concealed sealants for bedding thresholds and sills.
  - .2 Acceptable Products:
    - .1 "Dowsil 758" by Dow Corning Corporation
    - .2 "Tremco Butyl Sealant" by Tremco Incorporated
    - .3 "BC-158" or "BA-98" by Pecora Corporation
    - .4 "MasterSeal NP1" by Master Builders Solutions
- 2.4.8 Silicone glazing sealant, ASTM C920, Type S, Grade NS, Class 25, Use NT.
- .1 Glazing applications as follows:
    - .1 Non-structural sealing for butt-glazing in interior applications and other non-moving glazing joints.
  - .2 Acceptable Products:
    - .1 "Dowsil 799" or "Dowsil Glazing" by Dow Chemical of Canada ULC
    - .2 "UltraGlaze SSG4000" or "UltraGlaze SSG4000AC" by GE Silicones (Momentive Performance Materials)
    - .3 "Tremsil 200" by Tremco Incorporated
    - .4 "Sikasil - N Plus" by Sika Canada Inc.

## **2.5 Joint Sealant Backing**

- 2.5.1 General: Provide sealant backings of material that are nonstaining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated on Drawings and Schedules by sealant manufacturer based on field experience and laboratory testing.
- 2.5.2 Cylindrical Sealant Backings: ASTM C1330, Type C (closed-cell material with a surface skin) or Type B (bicellular material with a surface skin) or Type O (open-cell) as approved in writing by joint-sealant manufacturer for joint application indicated on Drawings and Schedules, and of size and density to control sealant depth and otherwise contribute to producing optimum sealant performance.
- 2.5.3 Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint-filler materials or joint surfaces at back of joint. Provide self-adhesive tape where applicable.

## **2.6 Miscellaneous Materials**

- 2.6.1 Primer: Material recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated

on Drawings and Schedules, as determined from preconstruction joint-sealant-substrate tests and field tests.

- 2.6.2 Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable of staining or harming joint substrates and adjacent nonporous surfaces in any way, and formulated to promote optimum adhesion of sealants to joint substrates.
- 2.6.3 Masking Tape: Nonstaining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine joints indicated on Drawings and Schedules to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Preparation**

- 3.2.1 Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions and the following requirements:
  - .1 Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by sealant manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.
  - .2 Clean porous joint substrate surfaces by brushing, grinding, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealants. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include, but are not limited to the following:
    - .1 Concrete.
    - .2 Masonry.
  - .3 Remove laitance and form-release agents from concrete.

- .4 Clean nonporous joint substrate surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants. Nonporous joint substrates include, include but are not limited to the following:
  - .1 Metal.
  - .2 Glass.
  - .3 Porcelain enamel.
  - .4 Glazed surfaces of ceramic tile.
- 3.2.2 Joint Priming: Prime joint substrates where recommended by joint-sealant manufacturer or as indicated on Drawings and Schedules by preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.
- 3.2.3 Masking Tape: Use masking tape where required to prevent contact of sealant or primer with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

### **3.3 Installation Of Joint Sealants**

- 3.3.1 General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated on Drawings and Schedules, unless more stringent requirements apply or are indicated.
- 3.3.2 Sealant Installation Standard: Comply with recommendations in ASTM C1193 for use of joint sealants as applicable to materials, applications, and conditions indicated on Drawings and Schedules.
- 3.3.3 Install sealant backings as recommended by joint sealant manufacturer to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.
  - .1 Do not leave gaps between ends of sealant backings.
  - .2 Do not stretch, twist, puncture, or tear sealant backings.
  - .3 Remove absorbent sealant backings that have become wet before sealant application and replace them with dry materials.
- 3.3.4 Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints to prevent three-sided adhesion.

- 
- 3.3.5 Install sealants using proven techniques that comply with the following and at the same time backings are installed:
- .1 Place sealants so they directly contact and fully wet joint substrates.
  - .2 Completely fill recesses in each joint configuration.
  - .3 Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.
- 3.3.6 Tooling of Nonsag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified in subparagraphs below to form smooth, uniform beads of configuration indicated on Drawings and Schedules; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.
- .1 Remove excess sealant from surfaces adjacent to joints.
  - .2 Use tooling agents that are approved in writing by sealant manufacturer and that do not discolour sealants or adjacent surfaces.
  - .3 Provide concave joint profile per Figure 8A in ASTM C1193, unless otherwise indicated on Drawings and Schedules.
  - .4 Provide flush joint profile where indicated on Drawings and Schedules per Figure 8B in ASTM C1193.
  - .5 Provide recessed joint configuration of recess depth and at locations indicated per Figure 8C in ASTM C1193.
    - .1 Use masking tape to protect surfaces adjacent to recessed tooled joints.
- 3.3.7 Acoustical Sealant Installation: At sound-rated assemblies and elsewhere as indicated on Drawings and Schedules, seal construction at perimeters, behind control joints, and at openings and penetrations with a continuous bead of acoustical sealant. Install acoustical sealant at both faces of partitions at perimeters and through penetrations. Comply with ASTM C919 and with manufacturer's written recommendations.

### **3.4 Field Quality Control**

- 3.4.1 Field-Adhesion Testing: Field test joint-sealant adhesion to joint substrates as follows:
- .1 Extent of Testing: Test completed and cured sealant joints as follows:
    - .1 Perform 5 tests for the first 300 m (1000 feet) of joint length for each kind of sealant and joint substrate.
    - .2 Perform 1 test for each 300 m (1000 feet) of joint length thereafter or 1 test per each floor per elevation.

- 
- .2 Test Method: Test joint sealants according to Method A, Field-Applied Sealant Joint Hand Pull Tab, in Appendix X1 in ASTM C1193 or Method A, Tail Procedure, in ASTM C1521.
    - .1 For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.
  - .3 Inspect tested joints and report on the following:
    - .1 Whether sealants filled joint cavities and are free of voids.
    - .2 Whether sealant dimensions and configurations comply with specified requirements.
    - .3 Whether sealants in joints connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each kind of product and joint substrate. Compare these results to determine if adhesion passes sealant manufacturer's field-adhesion hand-pull test criteria.
  - .4 Record test results in a field-adhesion-test log. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether joints were primed, adhesion results and percent elongations, sealant fill, sealant configuration, and sealant dimensions.
  - .5 Repair sealants pulled from test area by applying new sealants following same procedures used originally to seal joints. Ensure that original sealant surfaces are clean and that new sealant contacts original sealant.
- 3.4.2 Evaluation of Field-Adhesion Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other requirements indicated on Drawings and Schedules will be considered satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Retest failed applications until test results prove sealants comply with requirements indicated on Drawings and Schedules.

### **3.5     Cleaning**

- 3.5.1 Clean off excess sealant or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

---

**3.6     Protection**

- 3.6.1 Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Performance of the Work. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original work.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Steel Doors And Frames work specified herein. This includes, but is not necessarily limited, to:
- .1 Interior door and frames
  - .2 Exterior hollow-metal doors and frames
  - .3 Hollow-metal panels
  - .4 Frame anchors
  - .5 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
- .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 08 70 10, Finish Hardware for door hardware for hollow-metal doors.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 Minimum Thickness: Minimum thickness of base metal without coatings according to NAAMM-HMMA 803 or SDI A250.8.
- 1.4.2 Performance Levels and Duty-rating: Conform to NAMM/HMMA 805 as modified in this Section:
- .1 Standard Duty Assemblies:
    - .1 Door Frame: Minimum 1.06 mm (18 ga - 0.042 inch)
    - .2 Door Face: Minimum 1.06 mm (18 ga - 0.042 inch)
  - .2 Medium Duty Assemblies:

- .1 Door Frame: Minimum 1.34 mm (16 ga - 0.053 inch)
- .2 Door Face: Minimum 1.06 mm (18 ga - 0.042 inch)
- .3 Heavy Duty Assemblies:
  - .1 Door Frame: Minimum 1.34 mm (16 ga - 0.053 inch)
  - .2 Door Face: Minimum 1.34 mm (16 ga - 0.053 inch)

## **1.5 Administrative Requirements**

1.5.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.

- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
- .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
- .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

1.5.2 Coordination

- .1 Coordinate anchorage installation for Pressed Steel Frames. Supply setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors. Deliver such items to Project site in time for installation.

## **1.6 Action Submittals**

1.6.1 Product Data: Submit product data in accordance with Division 01 for the following:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Steel Doors And Frames work and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Include construction details, material descriptions, core descriptions, fire-resistance ratings, temperature-rise ratings, and finishes.

1.6.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01. Include the following:

- 
- .1 Indicate each type of door, frame, steel, construction and core clearly demonstrating the following:
    - .1 Elevations of each door type.
    - .2 Details of doors, including vertical- and horizontal-edge details and metal thicknesses.
    - .3 Frame details for each frame type, including dimensioned profiles and metal thicknesses.
    - .4 Locations of reinforcement and preparations for hardware.
    - .5 Details of each different wall opening condition.
    - .6 Details of anchorages, joints, field splices, and connections.
    - .7 Details of accessories.
    - .8 Details of moldings, removable stops, and glazing.
    - .9 Details of conduit and preparations for power, signal, and control systems.
  - .2 Indicate material thickness, mortises, reinforcements, anchorages, locations of exposed fasteners, openings (glazed, paneled or louvered) and arrangement of standard hardware.
  - .3 Include schedule identifying each unit, with door marks and numbers relating to Consultant's numbering on Drawings and Door Schedule.
- 1.6.3 Samples:
- .1 Submit samples for each type of exposed finish required, prepared on Samples of not less than 75 by 127 mm (3 by 5 inches).
  - .2 When requested by Consultant, submit fabrication Samples approximately 203 by 254 mm (8 by 10 inches) to demonstrate compliance with requirements for quality of materials and construction:
    - .1 Doors: Show vertical-edge, top, and bottom construction; core construction; and hinge and other applied hardware reinforcement. Include separate section showing glazing if applicable.
    - .2 Frames: Show profile, corner joint, floor and wall anchors, and silencers. Include separate section showing fixed hollow-metal panels and glazing if applicable.
- 1.6.4 Schedule: Provide a schedule of hollow-metal work prepared by or under the supervision of supplier, using same reference numbers for details and openings as those on Drawings. Coordinate with final Door Hardware Schedule.

---

**1.7     Informational Submittals**

- 1.7.1 Product Test Reports: Submit product test reports in accordance with Division 01 for each type of hollow-metal door and frame assembly, for tests performed by a qualified testing agency. As a minimum, submit the following test reports:
- .1 Confirmation that insulated doors supplied in exterior openings meet specified thermal resistance rating.
  - .2 Confirmation that acoustic door and frame assemblies provide the STC and sound TL values specified within the critical frequency range, as determined and scheduled by the Consultant.
  - .3 Ensure reports include name of testing authority, date of test, location of test facility, descriptions of test specimens, procedures used in testing and indicate compliance with acceptance criteria of test.

**1.8     Quality Assurance**

- 1.8.1 Manufacturers: Execute work in this Section by a manufacturer who is a member of CSDMA and NAAMM.
- .1 Ensure product is manufactured by a firm experienced in design and production of standard and custom commercial steel door and frame assemblies, integration of builders' or electronic hardware and glazing assemblies, and other items affecting work.
- 1.8.2 Supplier Qualifications: Ensure Product Supplier has Architectural Hardware Consultant (AHC) or person of equivalent experience, available at reasonable times to consult with Consultant, Contractor and Owner.
- 1.8.3 Installer Qualifications:
- .1 Provide work of this Section executed by competent installers with minimum 5 years' experience in the application of Products, systems and assemblies specified and with approval and training of Product manufacturers.
  - .2 Ensure retained installers are familiar with Product manufacturers specified herein and with ANSI/NFPA 80 requirements for installation of labeled fire rated steel doors, frames and hardware.
- 1.8.4 Welding:
- .1 Provide welding in accordance with CSA W59-M performed by a fabricator and mechanics fully approved by the Canadian Welding Bureau as specified herein.

- .2 Ensure fabricator is fully certified by Canadian Welding Bureau for fusion welding of steel structures to CSA W47.1 and for fusion welding of aluminum to CSA W47.2.
- 1.8.5 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from 1 source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.

## **1.9 Delivery, Storage, And Handling**

### **1.9.1 Delivery and Acceptance Requirements:**

- .1 Deliver hollow-metal work palletized, packaged, or crated to provide protection during transit and Project-site storage. Do not use nonvented plastic.
- .2 Provide additional protection to prevent damage to factory-finished units.
- .3 Deliver welded frames with two temporary shipping spreader bars across bottom of frames, tack welded to jambs and mullions. Temporary spreader bars are intended for shipping and handling purposes only, and must not be used for installation purposes.

### **1.9.2 Storage and Handling Requirements:**

- .1 Provide site storage and protection of materials in accordance with NAAMM-HMMA 840. Store items in dry, secure location on planks or dunnage.
- .2 Store Door and frame Products in vertical position, spaced with blocking. Cover materials to protect them from damage but in such a manner as to permit air circulation.
- .3 Immediately Make Good any damage acquired during shipping or handling. Clean scratches and touch up with rust-inhibitive primer. Replace damaged work which cannot be repaired, restored or cleaned.
- .4 For welded frames, weld in two temporary jamb spreaders per door opening to maintain proper alignment during shipment and handling. Do not use temporary jamb spreaders for installation.

## **1.10 Field Conditions**

- 1.10.1 Verify actual opening sizes and field conditions by field measurement before fabrication. Submittal drawings must reflect measurements and conditions provided, and product manufactured accordingly. Coordinate field measurements with fabrication and construction schedules to avoid delays.

- 1.10.2 Verify that substrate conditions, whether existing or otherwise, are as detailed on Drawings, and are acceptable for product installation in accordance with manufacturer's instructions.
- 1.10.3 Do not proceed with fabrication without receipt of reviewed Shop Drawings and reviewed construction hardware schedule.

## **1.11 Warranty**

- 1.11.1 Warrant Work of this Section for period of one year from date of Substantial Performance of the Work against defects and deficiencies in accordance with General Conditions of the Contract. Promptly correct defects or deficiencies which become apparent within warranty period, to satisfaction of Consultant and at no expense to Owner.
- 1.11.2 Extended Rust-perforation Warranty: Standard manufacturer's standard form in which manufacturer agrees to repair finishes or replace doors that show evidence of excessive rusting within specified warranty period.
  - .1 Warranty Period: 5 years from date of Substantial Performance of the Work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 Artek Door Limited; [www.artekdoor.com](http://www.artekdoor.com)
  - .2 Baron Hollow Metal; [www.baronmetal.com](http://www.baronmetal.com)
  - .3 Daybar Industries Limited; [www.daybar.com](http://www.daybar.com)
  - .4 Fleming Door Products-Baron Door Products; an Assa Abloy Group company; [www.flemingdoor.com](http://www.flemingdoor.com).
  - .5 Gensteel Doors; [www.gensteeldoors.com](http://www.gensteeldoors.com)
  - .6 LMT Group inc.
  - .7 Trillium Steel Doors Ltd.
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Regulatory Requirements**

- 2.2.1 Labelling requirements:
  - .1 Provide label of recognized testing agency having factory inspection service, and constructed as listed or classified for

labeling in accordance with NFPA 80, listing authority's policies and label materials.

- .2 Listing must identify manufacturer.
- .3 Construct fire-rated doors and frames as listed for labeling in "Follow-Up Service Procedures/Factory Inspection Manuals" issued by listing agency.

2.2.2 Fire-Rated Door Assemblies:

- .1 Complying with NFPA 80 and listed and labeled by a qualified testing agency acceptable to authorities having jurisdiction for fire-protection ratings and temperature-rise limits indicated on Drawings and Schedules, based on testing according to CAN4-S104 or equivalent to NFPA 252 or UL 10C.

2.2.3 Fire-Rated, Frame Assemblies:

- .1 Complying with NFPA 80 and listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction for fire-protection ratings indicated on Drawings and Schedules, based on testing according to CAN4-S104 (Frames, transom and sidelight assemblies) and CAN4-S106 (window assemblies) or equivalent to NFPA 257 or UL 9.

2.2.4 Smoke- and Draft-Control Assemblies:

- .1 Provide an assembly with gaskets listed and labeled for smoke and draft control by a qualified testing agency acceptable to authorities having jurisdiction, based on testing according to UL 1784 and installed in compliance with NFPA 105.

2.2.5 Temperature Rise Rated Assemblies: Provide fire and temperature rise rated steel doors for those openings as determined and scheduled by Consultant.

- .1 As a minimum, Provide fire and temperature rise rated steel doors and frames at following locations and as indicated on Drawings and schedules:
  - .1 between dead end corridor and adjacent occupied spaces;
  - .2 between exit enclosures (stairs) and remainder of floor areas;
  - .3 in firewalls and other specific locations noted on Drawings or Schedules.

**2.3 Design And Performance Requirements**

- 2.3.1 Unless otherwise indicated, construct doors to be minimum 44.5 mm (1-3/4 inches) thick.
- 2.3.2 Construct doors to meet requirements of NAAMM-HMMA 861 and CSDMA specifications. Ensure door and frame Products are

fabricated in strict accordance with reviewed Shop Drawings. Ensure steel is free of scale, pitting, coil breaks, surface blemishes, buckles, waves and other defects.

2.3.3 Facilitate installation of electrical components complete with arrangement so conduits and wiring can be readily removed and replaced.

2.3.4 Ensure exterior door assemblies can meet the following performance requirements as a minimum:

- .1 Thermal resistance (R-Value)
  - .1 Nominal: Not less than RSI 1.94 K x sq. m/W (R11 deg F x h x sq. ft./Btu) in accordance with ASTM C518.
  - .2 Actual: Not less than RSI 0.6 K x sq. m/W (R3.4 deg F x h x sq. ft./Btu) in accordance with ASTM C1363.
- .2 Thermal transmittance (U value):
  - .1 Nominal: Not more than 0.5 W/(sq.m· K) (0.09 BTU/(sq.ft · deg F) in accordance with ASTM C518.
  - .2 Actual: Not more than 3.45 W/(sq.m· K) (0.29 BTU/(sq.ft · deg F) in accordance with ASTM C1363.
- .3 Air Infiltration: Maximum air leakage of 0.20 L/s per sq. m (0.04 cfm/sq. ft.) at a static-air-pressure differential of 75 Pa (1.57 lbf/sq. ft.).

## **2.4 Materials**

2.4.1 Metallic-Coated Steel Sheet: ASTM A653/A 653M, Commercial Steel (CS), Type B.

- .1 Interior doors and frames unless indicated otherwise: Comply with A 653/A 653M, Designation ZF 120 (A40)
- .2 Exterior doors and frames: Comply with ASTM A653, Designation Z275 (G90).

2.4.2 Frame Anchors: ASTM A879/A 879M, Commercial Steel (CS), 12G (04Z) coating designation; mill phosphatized.

- .1 For anchors built into exterior walls, steel sheet complying with ASTM A1008/A 1008M or ASTM A1011/A 1011M, hot-dip galvanized according to ASTM A153/A 153M, Class B.

2.4.3 Inserts, Bolts, and Fasteners: Hot-dip galvanized according to ASTM A153/A 153M.

2.4.4 Grout: ASTM C476, except with a maximum slump of 102 mm (4 inches), as measured according to ASTM C143/C 143M.

2.4.5 Mineral-Fiber Insulation: CAN/ULC S702 or equivalent to ASTM C665 (blankets without membrane facing); consisting of fibers manufactured from slag or rock wool; with maximum flame-spread

and smoke-developed indexes of 25 and 50, respectively; passing CAN/ULC-S114 or equivalent to ASTM E136 for combustion characteristics.

- 2.4.6 Glazing: Comply with requirements in Section 08 80 05, General Requirements for Glass and Glazing.
- 2.4.7 Bituminous Coating: Cold-applied asphalt mastic, compounded for 0.4-mm (15-mil) dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

## **2.5 Components**

### **2.5.1 Door Core Materials:**

- .1 Honeycomb: Structural small cell 25.4 mm (1 inch) maximum kraft paper 'honeycomb'. Weight: 36.3 kg (80 lb.) per ream minimum, density: 16.5 kg/m<sup>3</sup> (1.03 pcf) minimum, sanded to required thickness.
- .2 Polystyrene: Rigid extruded, fire retardant, closed cell board, Type 1 with a minimum density of 16 kg/m<sup>3</sup> (1.0 lbs/cu ft) and minimum R-value of RSI 1.05 (R6.0).
- .3 Polyurethane: CAN/ULC-S702, Rigid, polyurethane, board with a density of 32 kg/m<sup>3</sup> (2.0 lbs/cu ft) and minimum thermal resistance rating of RSI 1.92 (R11)
- .4 Steel stiffened core: Continuous vertically formed steel sections, full thickness of interior space between door faces.
  - .1 Stiffeners: Minimum thickness 0.6 mm (22 ga. - 0.026 in) spaced 152 mm (6 in) apart and securely fastened to both face sheets by spot welded spaced a maximum of 127 mm (5 in) o. c. vertically.
  - .2 Fill spaces between stiffeners with fiberglass core (interior locations) or polyurethane core (exterior locations) as specified herein.
- .5 Fire Door Cores: As required to provide fire-protection and temperature-rise ratings indicated on Drawings and Schedules.
  - .1 Temperature Rise Rated (TRR) Core: Ensure core composition provides fire protection rating and limits temperature rise on unexposed side of door to 121 deg C (250 deg F) above ambient temperature after 30 minutes and 250 deg C (421 deg F) after 60 minutes, as determined by OBC requirements in accordance with testing per CAN4-S104-M or equivalent to NFPA 252.

---

**2.6     Interior Doors And Frames**

2.6.1 Construct interior doors and frames to comply with the standards indicated in this Section for materials, fabrication, hardware locations, hardware reinforcement, tolerances, and clearances, and as specified.

2.6.2 Standard-Duty Doors and Frames:

.1 Physical Performance: Level C according to ANSI/SDI A250.4.

.2 Doors:

.1 Materials: Metallic-coated steel sheet, minimum 1.06 mm (18 ga - 0.042 inch); galvanized as specified herein.

.2 Edge Construction: Following constructions are acceptable:

.1 Full Flush; Mechanically interlocked, adhesive assisted and tack welded at top and bottom of door, 150 mm (6") on centre and above and below each edge cutout, filled with metal filler and ground smooth with no visible seams.

.2 Seamless; continuously welded and ground smooth with no visible seams.

.3 Core: Kraft-paper honeycomb.

.4 Basis-of-Design: "D-Series" by Fleming or approved equivalent.

.3 Frames:

.1 Materials: Metallic-coated steel sheet, minimum 1.06 mm (18 ga - 0.042 inch); galvanized as specified herein.

.2 Construction: Knocked down unless indicated otherwise.

.3 Basis-of-Design:

.1 "M Series" by Fleming or approved equivalent for frames occurring in masonry construction.

.2 "DW Series" by Fleming or approved equivalent for frames occurring in gypsum board construction.

.3 "EXP Series" by Fleming or approved equivalent for frames occurring in existing partitions.

.4 Exposed Finish: Factory-primed for site finishing.

.5 Locations: Service Closets (mechanical, plumbing, electrical etc.)

2.6.3 Heavy-Duty Doors and Frames:

.1 Physical Performance: Level A according to ANSI/SDI A250.4.

.2 Doors:

.1 Materials: Metallic-coated steel sheet, minimum 1.34 mm (16 ga - 0.053 inch); galvanized as specified herein.

- .2 Edge Construction: Seamless; continuously welded and ground smooth with no visible seams.
- .3 Core: Vertical steel stiffened
- .4 Basis-of-Design: "H-Series" by Fleming or approved equivalent.
- .3 Frames:
  - .1 Materials: Metallic-coated steel sheet, minimum 1.34 mm (16 ga - 0.053 inch); galvanized as specified herein.
  - .2 Construction: Face welded or full profile welded unless indicated otherwise.
  - .3 Basis-of-Design:
    - .1 "M Series" by Fleming or approved equivalent for frames occurring in masonry construction.
    - .2 "DW Series" by Fleming or approved equivalent for frames occurring in gypsum board construction.
    - .3 "EXP Series" by Fleming or approved equivalent for frames occurring in existing partitions.
  - .4 Exposed Finish: Factory-primed for site finishing.
  - .5 Locations: typical locations unless otherwise indicated.

## **2.7 Exterior Hollow-Metal Doors And Frames**

- 2.7.1 Construct exterior doors and frames to comply with the standards indicated in this Section for materials, fabrication, hardware locations, hardware reinforcement, tolerances, and clearances, and as specified.
- 2.7.2 Heavy-Duty Doors and Frames:
  - .1 Physical Performance: Level A according to ANSI/SDI A250.4.
  - .2 Doors:
    - .1 Materials: Metallic-coated steel sheet, minimum 1.34 mm (16 ga - 0.053 inch); galvanized as specified herein.
    - .2 Edge Construction: Seamless; continuously welded and ground smooth with no visible seams.
    - .3 Core: Polyurethane insulated, vertical steel stiffened.
    - .4 Basis-of-Design: "TRIO E-Series" by Fleming or approved equivalent.
  - .3 Frames:
    - .1 Materials: Metallic-coated steel sheet, minimum 1.34 mm (16 ga - 0.053 inch); galvanized as specified herein.
    - .2 Construction: Thermally-broken unless indicated otherwise.

- .3 Basis-of-Design: "TB Series" by Fleming or approved equivalent for frames occurring in masonry construction.
- .4 Exposed Finish: Factory-primed for site finishing.
- .5 Locations: Exterior openings indicated to receive hollow metal doors and pressed steel frames unless indicated otherwise

## **2.8 Hollow-Metal Panels**

- 2.8.1 Provide hollow-metal panels of same materials, construction, and finish as adjacent door assemblies.

## **2.9 Fabrication**

- 2.9.1 Fabricate hollow-metal work to be rigid and free of defects, warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for metal thickness. Where practical, fit and assemble units in manufacturer's plant. To ensure proper assembly at Project site, clearly identify work that cannot be permanently factory assembled before shipment.
  - .1 Provide factory-preparation and reinforcements for doors and frames including mortising, blanking, drilling and tapping for templated hardware only, in accordance with the reviewed hardware schedule and templates provided by hardware supplier.
  - .2 Reinforce doors and frames in factory only where required, for surface-mounted hardware, anchor hinges, thrust pivots, pivot reinforced hinges, or non-templated hardware. Perform drilling and tapping on site, at time of installation.
  - .3 Prior to shipment, mark each door and frame with identification number as shown on approved Shop Drawings.
- 2.9.2 Hollow-Metal Doors:
  - .1 Holes 12.7 mm (0.5") diameter and larger must be factory-prepared, except mounting and through-bolt holes, which are made on site, at time of hardware installation. Holes less than 12.7 mm (0.5") diameter will be factory-prepared only when required for device (for knob, lever, cylinder, thumb or turn pieces) or when holes overlap function holes.
  - .2 Vertical Edges for Single-Acting Doors: Bevel edges 3 mm in 50 mm (1/8 inch in 2 inches) unless otherwise required to suit finish hardware or door swings.
  - .3 Top Edge Closures:
    - .1 Exterior Locations: Sealed, flush PVC closures.
    - .2 Interior locations (hospitals): Sealed, flush steel closures, continuously welded.

- 
- .3 Interior locations (security locations): Non-sealed, flush steel closures.
  - .4 Interior locations (commercial buildings): Inverted steel closures.
  - .4 Bottom Edge Closures: Close bottom edges of door with end closures or channels of same material as face sheets.
    - .1 Exterior Locations: Sealed, flush PVC closures. Provide weep-hole openings in bottoms of exterior doors to permit moisture to escape. Seal joints in top edges of doors against water penetration.
    - .2 Interior locations (hospitals): Sealed, flush steel closures, continuously welded.
    - .3 Interior locations (security locations): Non-sealed, flush steel closures.
    - .4 Interior locations (commercial buildings): Inverted steel closures.
  - .5 Astragals: Provide overlapping astragal on one leaf of pairs of doors where required by NFPA 80 for fire-performance rating or where indicated on Drawings and Schedules. Extend minimum 19 mm (3/4 inch) beyond edge of door on which astragal is mounted or as required to comply with published listing of qualified testing agency.
- 2.9.3 Pressed Steel Frames: Where frames are fabricated in sections due to shipping or handling limitations, provide alignment plates or angles at each joint, fabricated of same thickness metal as frames.
- .1 Protect mortised cutouts in frames with steel guard boxes.
  - .2 Sidelight and Transom Bar Frames: Provide closed tubular members with no visible face seams or joints, fabricated from same material as door frame. Fasten members at crossings and to jambs by butt welding.
  - .3 Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners unless otherwise indicated.
  - .4 Grout Guards: Weld guards to frame at back of hardware mortises in frames to be grouted.
  - .5 Floor Anchors: Weld anchors to bottoms of jambs with at least four spot welds per anchor; however, for slip-on drywall frames, provide anchor clips or countersunk holes at bottoms of jambs.
  - .6 Jamb Anchors: Provide anchorage appropriate to floor, wall and frame construction. Locate each anchor immediately above or below each hinge reinforcement on hinge jamb and directly opposite strike jamb.
    - .1 Provide number and spacing of anchors as follows:

- 
- .1 Two anchors per jamb up to 1520 mm (60 inches) high.
  - .2 Provide additional anchor for each additional 760 mm (30 inches) of height or fraction thereof up to 3050 mm (120 inches) high.
  - .3 Provide four anchors per jamb plus one additional anchor per jamb for each 610 mm (24 inches) or fraction thereof above 3050 mm (120 inches) high.
  - .2 Frames in previously placed concrete, masonry or structural steel: Locate anchors not more than 150 mm (6 inches) from the top and bottom of each jamb, and intermediate anchors at 660 mm (26 inches) o.c. maximum.
  - .3 Frames in stud-Wall Type: Locate anchors not more than 457 mm (18 inches) from top and bottom of frame, and intermediate anchors at 813 mm (32 inches) o.c. maximum.
  - .4 Where frame product is installed prior to adjacent partition, securely attach floor anchor to the inside of each jamb profile.
    - .1 Provide each floor anchor with two (2) holes for securing to floor. For conditions that do not permit the use of floor anchors, provide additional wall anchor, located within 150 mm (6 inches) of base of jamb.
  - .7 Door Silencers: Except on weather-stripped and gasketed frames, drill stops to receive door silencers as follows. Keep holes clear during construction.
    - .1 Single-Door Frames: Drill stop in strike jamb to receive three door silencers.
    - .2 Double-Door Frames: Drill stop in head jamb to receive two door silencers.
    - .3 Exterior Door Frames: Thermally broken.
  - .8 Thermally-broken Frames (exterior locations)
    - .1 Fabricate thermally broken door frames in accordance with Shop Drawings. Fabricate thermally broken exterior door frames with two piece steel core sections separated with closed cell PVC thermal breaks to separate interior and exterior frame sections.
    - .2 Provide wall and floor anchors suitable for installation conditions. Anchoring devices must not permit thermal conductivity from exterior frames to interior frame sections.

- 
- .3 Ensure welds do not cause thermal transfers between interior and exterior surfaces of frame sections. Separate interior and exterior sections of thermally broken frames by continuous thermal break.
  - .4 Do not assemble thermally broken sections by means of screws, grommets or other fasteners.
  - .5 Insulate closed sections such as mullions or center rails in shop with specified insulation. Install Insulation of open sections such as jambs, heads and sills.
  - .6 Incorporate head drips of same gauge material as frame and plug weld at 150 mm (6") on center. Fill and sand smooth.
  - .9 Welded Type Frames (interior locations as noted herein):
    - .1 Frame products must be accurately mitered or mechanically jointed.
    - .2 Full Profile welded: punch-mitered - continuously welded on profile faces, rabbets, returns and soffit intersections, or saw-mitered - continuously welded on the profile faces, rabbets, returns, stops and soffit intersections.
      - .1 Punch or saw-mitered, at the manufacturer's discretion.
      - .2 All profile welded frame product exposed faces must be filled and ground to a smooth, uniform, seamless surface.
    - .3 Face welded: continuously welded on the profile faces, with exposed faces filled and ground to a smooth, uniform, seamless surface.
    - .4 Joints at mullions, sills and center rails:
      - .1 Must be coped accurately, butted and tightly fitted.
      - .2 At intersecting flush profile faces, be securely welded, filled and ground to a smooth, uniform, seamless surface.
      - .3 At intersecting recessed profile faces, be securely welded to concealed reinforcements, with exposed hairline face seams.
      - .4 At all other intersecting profile elements, have exposed hairline face seams.
    - .5 Glazing stops must be formed steel channels, minimum 16 mm (0.625 inch) height, accurately fitted, butted at corners and fastened to frame sections with counter-sunk oval head sheet metal screws.
  - .10 Knocked Down Type Frames (interior locations as noted herein):

- 
- .1 Ship knocked-down type frames unassembled.
  - .2 Provide frames with mechanical joints which inter-lock securely and provide functionally satisfactory performance when assembled and installed in accordance with the manufacturer's instructions.
- 2.9.4 Hardware Preparation: Factory prepare hollow-metal work to receive templated mortised hardware; include cutouts, reinforcement, mortising, drilling, and tapping according to SDI A250.6, CSDMA Specifications, Door Hardware Schedule, and templates. Refer to Section 08 70 10 for additional requirements:
- .1 Reinforce doors and frames to receive nontemplated, mortised, and surface-mounted door hardware.
  - .2 Comply with applicable requirements in BHMA A156.115 and CSDMA Specifications for preparation of hollow-metal work for hardware.
    - .1 Lock and Strike Reinforcements: 2.36 mm (12 ga - 0.093 inch) – high frequency types
    - .2 Hinge Reinforcements: 3.12 mm (10 ga - 0.123 inch) – high frequency types
    - .3 Flush Bolt Reinforcements: 2.36 mm (12 ga - 0.093 inch) – high frequency types
    - .4 Reinforcements for Surface Applied Hardware: 1.34 mm (16 ga - 0.053 inch)
    - .5 Top and Bottom Channels: 1.06 mm (18 ga - 0.042 inch)
    - .6 Steel Top Caps: 0.81 mm (20 ga - 0.032 inch)
    - .7 Mortar Guard Boxes: 0.66 mm (22 ga - 0.026 inch)
    - .8 Floor Anchors: 1.34 mm (16 ga - 0.053 inch)
    - .9 Wall Anchors:
      - .1 Masonry Strap Type: 1.06 mm (18 ga - 0.042 inch)
      - .2 Masonry Wire Type: 4.0 mm (0.156 inch) dia.
      - .3 Masonry Stirrup-Strap Type: 1.34 mm (16 ga - 0.053 inch)
      - .4 Stud Type: Designed to engage stud, welded to back of frames; not less than 1.0 mm (18 ga - 0.042 inch) thick.
      - .5 Existing Masonry /Concrete Wall Type: not less than 1.0 mm (18 ga - 0.042 inch) thick.
  - .3 Where electrified hardware is specified on Hardware Schedule, Provide CSA-approved system consisting of CSA-approved conduit, junction boxes and wire harnesses complete with modular plugs for coordinated connection directly to electrified hardware.

- 2.9.5 Stops and Moldings for Glazing: Provide accurately fitted stops and moldings around glazed lites and louvers where indicated on Drawings and Schedules. Form corners of stops and moldings with butted hairline joints.
- .1 Single Glazed Lites: Provide fixed stops and moldings welded on secure side of hollow-metal work.
  - .2 Multiple Glazed Lites: Provide fixed and removable stops and moldings so that each glazed lite is capable of being removed independently.
  - .3 Provide fixed frame moldings on outside of exterior and on secure side of interior doors and frames.
  - .4 Provide loose stops and moldings on inside of hollow-metal work.
  - .5 Coordinate rabbet width between fixed and removable stops with glazing and installation types indicated on Drawings and Schedules.
  - .6 Glass Trim (Screw Fixed or Snap-In Types): 0.81 mm (20 ga - 0.032 inch)
    - .1 For glazing up to 8 mm (5/16 inch) thick: steel glazing trim and snap-in glazing stops as specified herein.
    - .2 For glazing thicker than 8 mm (5/16 inch): steel glazing trim and screwed-in glazing stops as specified herein. Screws must be #6 x 1-1/4" oval head self-drilling type at 300 mm (12 inch) o.c. maximum.

## **2.10 Steel Finishes**

- 2.10.1 Prime Finish: Clean, pretreat, and apply manufacturer's standard primer.
- .1 Provide factory-applied touch up primer at areas where zinc coating has been removed during fabrication.
- 2.10.2 Factory Finish: Clean, pretreat, and apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat, complying with SDI A250.3.
- .1 Colour and Gloss: Match Consultant's sample.

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

- 3.1.2 Examine roughing-in for embedded and built-in anchors to verify actual locations before frame installation.
- 3.1.3 Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
- 3.1.4 Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2     Preparation**

- 3.2.1 Remove welded-in temporary shipping bars installed at factory. Restore exposed finish by grinding, filling, and dressing, as required to make repaired area smooth, flush, and invisible on exposed faces.
- 3.2.2 Drill and tap doors and frames to receive nontemplated, mortised, and surface-mounted door hardware.

### **3.3     Installation**

- 3.3.1 General: Install hollow-metal work plumb, rigid, properly aligned, and securely fastened in place. Comply with Drawings and manufacturer's written instructions.
- 3.3.2 Pressed Steel Frames: Install Pressed Steel Frames of size and profile indicated on Drawings and Schedules. Comply with NAAMM-HMMA 840 and CSDMA Specifications as required by standards specified.
  - .1 Set frames accurately in position; plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces, leaving surfaces smooth and undamaged.
  - .1 At fire-rated openings, install frames according to NFPA 80.
  - .2 Where frames are fabricated in sections because of shipping or handling limitations, field splice at approved locations by welding face joint continuously; grind, fill, dress, and make splice smooth, flush, and invisible on exposed faces.
  - .3 Install frames with removable stops located on secure side of opening.
  - .4 Install door silencers in frames before grouting.
  - .5 Remove temporary braces necessary for installation only after frames have been properly set and secured.
  - .6 Check plumb, square, and twist of frames as walls are constructed. Shim as necessary to comply with installation tolerances.

- 
- .7 Field apply bituminous coating to backs of frames that will be filled with grout agents.
  - .2 Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor, and secure with anchors.
  - .3 Metal-Stud Partitions: Solidly pack mineral-fiber insulation inside frames.
  - .4 Masonry Walls: Coordinate installation of frames to allow for solidly filling space between frames and masonry with grout.
  - .5 Concrete Walls: Solidly fill space between frames and concrete with mineral-fiber insulation.
  - .6 In-Place Concrete or Masonry Construction: Secure frames in place with anchors. Countersink anchors, and fill and make smooth, flush, and invisible on exposed faces.
  - .7 In-Place Stud Partitions: Secure slip-on drywall frames in place according to manufacturer's written instructions.
  - .8 Installation Tolerances: Adjust hollow-metal door frames for squareness, alignment, twist, and plumb to the following tolerances:
    - .1 Squareness: Plus or minus 1.6 mm (1/16 inch), measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
    - .2 Alignment: Plus or minus 1.6 mm (1/16 inch), measured at jambs on a horizontal line parallel to plane of wall.
    - .3 Twist: Plus or minus 1.6 mm (1/16 inch), measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
    - .4 Plumbness: Plus or minus 1.6 mm (1/16 inch), measured at jambs at floor.
- 3.3.3 Hollow-Metal Doors: Fit hollow-metal doors accurately in frames, within clearances specified below. Shim as necessary.
- .1 Non-Fire-Rated Steel Doors:
    - .1 Between Door and Frame Jambs and Head: 3.2 mm (1/8 inch) plus or minus 1.5 mm (1/16 inch).
    - .2 Between Edges of Pairs of Doors: 3.2 mm (1/8 inch) plus or minus 1.5 mm (1/16 inch).
    - .3 At Bottom of Door: Provide floor clearance for functional operation of doors of not less than 3.2 mm (1/8 inch) plus or minus 1.5 mm (1/16 inch), unless greater undercuts are indicated on Door Schedule or required for mechanical air flow.
  - .2 Fire-Rated Doors: Install doors with clearances according to NFPA 80.

- 
- .3 Smoke-Control Doors: Install doors and gaskets according to NFPA 105.
  - 3.3.4 Glazing: Comply with requirements in Section 08 80 05, General Requirements for Glass and Glazing and with hollow-metal manufacturer's written instructions.
    - .1 Secure stops with countersunk flat- or oval-head machine screws spaced uniformly not more than 230 mm (9 inches) o.c. and not more than 51 mm (2 inches) o.c. from each corner.
  - 3.4 Adjusting And Cleaning**
    - 3.4.1 Final Adjustments: Check and readjust operating hardware items immediately before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including hollow-metal work that is warped, bowed, or otherwise unacceptable.
    - 3.4.2 Remove grout and other bonding material from hollow-metal work immediately after installation.
    - 3.4.3 Metallic-Coated Surface Touchup: Clean abraded areas and repair with galvanizing repair paint according to manufacturer's written instructions.

END OF SECTION

## **1 . GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Design-Build Contract and Subcontracts, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the glazed interior aluminum doors and frames work specified herein. This includes, but is not necessarily limited, to:
- .1 Interior aluminum door and sidelite frames
  - .2 Interior aluminum swing doors,
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Administrative Requirements**

- 1.4.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.
  - .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
  - .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.

- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

1.4.2 Scheduling:

- .1 Ensure Product lead times does not exceed five weeks from taping of gypsum board around openings to avoid project delays and cost overruns.

**1.5 Action Submittals**

1.5.1 Product Data: Submit in accordance with Division 01 for the following:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the glazed interior aluminum doors and frames work and include product characteristics, performance criteria, physical size, finish and limitations.

1.5.2 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:

- .1 Include details for each frame type, including dimensioned profiles and metal thicknesses.
- .2 Include locations of reinforcements and preparations for hardware.
- .3 Include details of anchorages, joints, field splices, connections, and accessories.
- .4 Include details of moldings, removable stops, and glazing.

1.5.3 Delegated Design Submittals:

- .1 Engineering design completion of office fronts and screens work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
- .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of the Work for the following:
  - .1 Systems restrained at top and bottom only.
  - .2 Systems exceeding 3m in height or manufacturer's standard heights.
  - .3 Systems acting as guards.
  - .4 As required by Contract Documents.
- .3 Submit copy of structural calculations upon request by Consultant.

1.5.4 Product Disclosure and Transparency:

- 
- .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
  - .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
    - .1 Health Product Declaration open Standard,
    - .2 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
    - .3 International Living Future Institute Declare
    - .4 Other approved framework.
  - .3 When multiple Products are specified, give preference to Products with compliant documentation.
  - .4 Shop Drawings: Submit in accordance with Division 01 for interior aluminum doors and frames work. Include plans, elevations, sections, full-size details, anchorage, locations of accessory items and attachments to other work. Indicate field measurements on Shop Drawings.
- 1.5.5 Samples (for verification purposes): Submit Samples in accordance with Division 01 for units with factory-applied colour finishes. Submit two samples of each finish product specified, in minimum 76 mm by 127 mm (3 inches by 5 inches) sizes representing actual product colour.
- 1.5.6 Warranties: Submit sample of extended warranties specified in this Section for Consultant's review.
- 1.6 Closeout Submittals**
- 1.6.1 Maintenance Data: Submit operation and maintenance data for each type of glazed interior aluminum door and frame to include in maintenance manuals. Include warranty certificates.
- 1.7 Quality Assurance**
- 1.7.1 Installer Qualifications: Installation must be performed by an installer who has been trained or otherwise authorized by manufacturer.
- 1.7.2 Manufacturer Qualifications: Provide Products from a manufacturer with minimum 20 years of experience and capable of providing glazed interior aluminum doors and frames that meet or exceed performance requirements indicated.

- 1.7.3 Mock-ups: Build mock-ups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
- .1 Build mockup of typical wall area as directed by Consultant on site.
  - .2 Subject to compliance with requirements, reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of the Work.
- 1.7.4 Source Limitations: Obtain primary components of glazed interior aluminum doors and frames, including framing and accessories, from single manufacturer. Obtain secondary components and accessories from sources acceptable to manufacturer of primary materials.
- 1.7.5 Professional Engineer's Qualifications: For work requiring structural performance, employ Professional Engineer licensed to practice in Province of the Work who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
- .1 Professional Engineer's Responsibility:
    - .1 production and review of Shop Drawings,
    - .2 design and certification of interior aluminum office fronts and screens, including attachments for building construction, in accordance with applicable codes and regulations,
    - .3 stamping and signing of each Shop Drawing and associated calculations

**1.8 Delivery, Storage And Handling**

- 1.8.1 Deliver, store and handle materials and products in strict compliance with manufacturer's instructions and recommendations. Inspect components for damage upon delivery.
- 1.8.2 Storage: Store products in a secure enclosed area protected from the elements, in manufacturer's packaging until ready for installation.
- 1.8.3 Handling: Handle materials with care and avoid dents, scratches or damage to products. Remove labels, stickers or protection after installation.

**1.9 Project Conditions**

- 1.9.1 Field Measurements: Verify actual locations of openings by field measurements performed by the installer prior to commencement of fabrication. Ensure recorded measurements provided by the

---

installer are indicated on Shop Drawings. Coordinate field measurements and fabrication schedule with construction progress to avoid construction delays.

**1.10 Warranty**

1.10.1 Extended Warranty: Provide manufacturer's standard warranty which covers Products specified in this Section that fail in materials or workmanship within specified warranty period.

- .1 Warranty Period: 7 years from date of Substantial Performance of the Work.

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 PC350
- .2 Muraflex

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Regulatory Requirements**

2.2.1 Barrier-Free and Accessibility Requirements: Comply with applicable barrier-free provisions in the Ontario Building Code and CSA B651 and requirements of authorities having jurisdiction.

**2.3 Design/Performance Criteria**

2.3.1 Provide office fronts and screen components that precisely match dimensions, profiles, and connections to adjoining work as indicated on the Drawings.

2.3.2 Design Intent: Architectural Drawings and details are diagrammatic and are only intended to show design concept, aesthetics, interfacing requirements, configuration, components and arrangements. They are not intended to identify or solve completely problems of thermal and structural movements, assembly framing, engineering design, fixings and anchorages.

2.3.3 Deflection Limits: Limit deflection to 1/175 of clear span or 19 mm (3/4 inch), whichever is smaller.

- 2.3.4 Ensure aluminum systems are designed to withstand movements of supporting structure. Such movements may include, but are not limited to:
- .1 Story drift
  - .2 Twist
  - .3 Column shortening
  - .4 Long-term creep
  - .5 Deflection due to uniformly distributed and concentrated live loads.
- 2.3.5 Ceiling Heights: System to be designed to accommodate ceiling heights ranging from 2083 mm (82 in) to 3658 mm (144 in) without need for additional engineering.
- 2.3.6 Horizontal Widths: System to be designed to horizontal widths to be cut on-site, up to maximum of 3658 mm (144 in).
- 2.3.7 System Support: Ensure systems are self-supporting without need for additional structural supports or blocking.
- 2.3.8 On-Site Assembly: Systems to be stick-built on site and be cut and assembled to accommodate variations within openings.
- 2.3.9 System must allow for the following adjustments:
- .1 Ceiling adjustment range:  $\pm 19$  mm (3/4 in).
  - .2 Wall Start (Flush Wall) adjustment range:  $\pm 12$  mm (1/2 in).
  - .3 Traditional Wrap-Around adjustment range:  $\pm 16$  mm (5/8 in).
  - .4 Floor level adjustments:  $\pm 25$  mm (1 in).
- 2.3.10 Minimum Glass Thickness:
- .1 Applicability: Thicknesses specified below apply to interior glazing systems with fully tempered glass that is supported at the top and bottom only (i.e. not supported on four sides). Use engineering analysis to determine thicknesses for other glass types.
  - .2 Engineering Adjustments: Increase thickness as necessary based on final engineering calculations.

Unsupported Span	Open Joints	Linked Joints with silicone or permanent fastener
Up to 5 ft. (1.5 m)	10 mm (3/8")	10 mm (3/8")
5 ft. to 6 ft. (1.5 - 1.8 m)	10 mm (3/8")	10 mm (3/8")
6 ft. to 7 ft. (1.8 - 2.1 m)	12 mm (1/2")	10 mm (3/8")
7 ft. to 8 ft. (2.1 - 2.4 m)	12 mm (1/2")	12 mm (1/2")
8 ft. to 9 ft. (2.4 - 2.7 m)	16 mm (5/8")	12 mm (1/2")
9 ft. to 10 ft. (2.7 - 3 m)	16 mm (5/8")	12 mm (1/2")
Over 3 m	Use engineering analysis	Use engineering analysis

2.3.11 Glass acting as guards:

- .1 Engineering Requirements: Engineer glass, glazing, and framing to withstand minimum guard loads specified in OBC 4.1.5.14.
- .2 Guard Locations: Refer to OBC 3.3.1.17.(1), OBC 3.3.1.18.(6), and OBC 4.1.5.16.

2.3.12 Glass design and engineering: to CAN/CGSB 12.20 or ASTM E1300.

2.3.13 Wiring Accommodations: Ensure system is designed to accommodate electrical wiring, including, but not limited to, room booking device wiring, REX sensors, and similar components, through framing system.

2.3.14 Corrosion Control: Prevent galvanic action and other forms of corrosion by insulating metals and materials from direct contact with incompatible substances.

**2.4 Materials**

2.4.1 Aluminum Components:

- .1 Sheet and Plate: ASTM B209M (ASTM B209).
- .2 Extrusions: ASTM B221M (ASTM B221), Alloy and temper 6063-T5 or as recommended by aluminum frame manufacturer for strength, corrosion resistance, and application of required finish.
- .3 Thickness: not less than 3.2 mm (0.125 inch) on exposed surfaces, and 4.75 mm (0.187 inch) on internal webs.

2.4.2 Steel Members: Hot-dip galvanize all steel items to comply with the following:

- .1 ASTM A653/A653M for sheet steel,
- .2 ASTM A153/A 153M for steel and iron hardware,
- .3 ASTM A123/A 123M or CAN/CSA-G164 for other steel products.

**2.5 Aluminum Door And Sidelite Frames (SC04)**

2.5.1 Door and Glazing Frames: Manufacturer's standard glazing frame system designed for wrap-around installation based on wall thicknesses indicated on Drawings.

2.5.2 Framing Members: manufacturer's standard extruded-aluminum framing members formed from controlled 6063 T5 alloy billets.

- .1 Sheet and Plate: ASTM B209M (ASTM B209).
- .2 Extrusions: ASTM B221M (ASTM B221), Alloy and temper 6063-T5 or as recommended by aluminum frame manufacturer

for strength, corrosion resistance, and application of required finish.

- .3 Thickness: not less than 3.2 mm (0.125 inch) on exposed surfaces, and 4.75 mm (0.187 inch) on internal webs.

2.5.3 Frame and Trim: 44 mm (1 3/4 in).

2.5.4 Hardware: Prepare door framing according to templates provided by hardware supplier; refer to Section 08 70 10.

2.5.5 Reinforcements: Manufacturer's standard high-strength aluminum with non-staining, non-ferrous shims for aligning system components.

2.5.6 Finish: Powder-Coat Finish (AAMA 2603)

2.5.7 Joints: Glass-to-glass butt joint system with silicone sealant.

- .1 Silicone sealant: Single-Component, Nonsag, Silicone Joint Sealant: conforming to ASTM C920, Type S, Grade NS, Class 25.

- .2 Basis-of-Design: Dowsil "795" or Dowsil "791" or Dowsil "CWS "" by Dow Chemical of Canada or approved equivalent by Tremco.

2.5.8 Fabrication Method: Field-fabricated stick system.

2.5.9 Throat Size: to accommodate wall sizes.

2.5.10 Acceptable Products: "Elite Door Frame System, Profile P2" by PC350.

## **2.6 Swing Door Systems**

2.6.1 Provide manufacturer's standard 44.5-mm (1-3/4-inch) thick aluminum swing doors with extruded-aluminum tubular rail and stile members.

2.6.2 Door Design: Manufacturer's standard style.

2.6.3 Door Height: Refer to Door and Frame Schedule on Drawings.

2.6.4 Glazing Stops and Gaskets: Beveled, snap-on, extruded-aluminum stops and preformed gaskets.

2.6.5 Framing Members for sidelites, and transom frames: Manufacturer's standard extruded aluminum frames as specified in this Section, reinforced for hinges and strikes as required to support imposed operational loads.

2.6.6 Door Hardware: prepare doors and frames to accept hardware from separate hardware supplier, refer to Section 08 70 10.

2.6.7 Door Hardware Sets: Provide quantity, item, size, finish or colour as required by application. As a minimum, include hinges, closers,

push bars, handles, locking devices, automatic door bottoms, and weatherstripping as applicable and recommended by manufacturer.

2.6.8 Acceptable Door Systems: "Elite Door System" by PC350.

2.6.9 Wood Doors: Refer to Section 08 14 16, Flush Wood Doors.

## **2.7 Glazing**

2.7.1 Conform to minimum requirements in Section 08 80 05, General Requirements for Glass and Glazing.

2.7.2 Minimum Glass Thickness: Unless otherwise specified, Provide fully tempered glass, with appropriate stiffness to account for unsupported span of panels. Increase as required based on final engineering calculations.

2.7.3 Glass acting as guards: Provide glass, glazing, and framing engineered for minimum guard loads specified in OBC 4.1.5.14.

2.7.4 Guard Locations: As specified in OBC 3.3.1.17.(1), OBC 3.3.1.18.(6) and OBC 4.1.5.16.

## **2.8 Accessories**

2.8.1 Fasteners and Accessories: Manufacturer's standard non-corrosive, non-bleeding fasteners compatible with adjacent materials.

2.8.2 Glazing Gaskets: Manufacturer's standard elastomeric glazing gaskets, setting blocks, and shims or spacers.

2.8.3 Glazing Sealants: ASTM C920, Type S, Grade NS, Class 25, Use NT, permanently elastic, non-shrinking, and non-migrating silicone type recommended by manufacturer.

2.8.4 Mineral Wool: CAN/ULC-S702.1/S702.2, Type 1; non-combustible mineral wool tested in accordance with requirements of CAN/ULC-S114.

## **2.9 Fabrication**

2.9.1 Form sections true to detail, free from defects that could impair appearance, strength, or durability.

2.9.2 Ensure frames are tubular extruded shapes with sharp, well-defined corners, matching the overall assembled profiles detailed on Drawings.

2.9.3 Corners of formed work must be mitered and closely fitted. Internally caulk and seal corners of frames and joints exposed to water penetration with a material designed to resist high surface temperatures.

- 2.9.4 Fabricate frames with butt, mitered, or coped corners that are continuously welded with seamless face joints. Provide concealed corner reinforcements and alignment clips for precise connections.
- 2.9.5 Fabricate doors and frames with necessary internal reinforcements, cutouts, recesses, and mortising required for rigid assembly and hardware accommodation. Ensure connections provide adequate strength.
  - .1 Prepare frames to receive mortised and concealed hardware according to the final door hardware schedule and templates provided by hardware supplier.
  - .2 Reinforce frames for surface-applied hardware. Machine jambs, drill, tap, and prepare for hardware installation with concealed reinforcement plates secured within the frame using concealed screws.

**2.10 Finishes, Generally**

- 2.10.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for applying and designating finishes.
- 2.10.2 Complete mechanical finishes of flat sheet metal surfaces before fabrication, where possible.
- 2.10.3 After fabrication, finish all joints, bends, abrasions, and surface blemishes to match the sheet finish.
- 2.10.4 Protect mechanical finishes on exposed surfaces with a strippable, temporary protective covering before shipping.
- 2.10.5 Apply organic and anodic finishes to formed metal after fabrication unless specified otherwise.
- 2.10.6 Finish items after assembly.
- 2.10.7 Appearance Criteria: Acceptable variations in appearance of abutting or adjacent pieces are within one-half of the range of reviewed samples.
  - .1 Noticeable variations in the same piece are not acceptable.
  - .2 Variations in appearance of other components are acceptable if within the range of reviewed samples and assembled to minimize contrast.
- 2.10.8 Finish: Manufacturer's standard baked-enamel or powder-coat finish.
- 2.10.9 Colour and Gloss: White

---

### **3 .     EXECUTION**

#### **3.1     Examination**

- 3.1.1 Examine installations areas including, walls, floors, openings, and ceilings, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
  - .1 Verify that wall thicknesses do not exceed tolerances allowed by throat sizes required for installation.
  - .2 Verify rough opening dimensions, levelness of floors, and operational clearances.
  - .3 Verify that steel studs at openings have been installed inverted in order to accept jambs.
  - .4 Verify that openings have been provided unfinished.
  - .5 Verify that gypsum board provided around openings has been finished to a minimum Level 4 in accordance with ASTM C840 as specified in Section 09 21 16.
- 3.1.2 Do not proceed with installation unless unsatisfactory conditions have been corrected.

#### **3.2     Installation**

- 3.2.1 Comply with Drawings, Shop Drawings, and manufacturer's written instructions for installing glazed interior aluminum doors and frames, accessories, and other components.
- 3.2.2 Do not install defective or damaged parts or components. Return such component parts to manufacturer for repair or replacement.
- 3.2.3 Do not cut or trim component parts during installation in a manner that would damage finish, decrease strength or result in visual defects.
- 3.2.4 Use fasteners and anchors suitable for substrate and project conditions. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration.
- 3.2.5 Pack mineral wool insulation in frames to minimize sound transmission through the frame.
- 3.2.6 Install frames rigid, square, straight, plumb, and level. Fit joints to produce hairline joints free of burrs and distortion. Conceal evidence of drilling, cutting, and fitting.
- 3.2.7 Install gypsum board and extrusions in longest possible lengths, ensuring no component is less than 1220 mm (4 ft). Install components with no visible splices.

- 
- 3.2.8 Install operating components to produce smooth operation and tight fit at contact points. Install surface-mounted hardware according to manufacturers' written instructions using concealed fasteners.

**3.3 Adjusting, Cleaning, And Protection**

- 3.3.1 Hardware Adjustment: Adjust and lubricate hardware according to hardware manufacturer's written instructions for proper operation. Set self-closing mechanisms on doors such that they close from the 90 deg open position in no less than 4 seconds.
- 3.3.2 Touch-up, repair or replace damaged products.
- 3.3.3 Clean exposed surfaces of frames, hardware, and fittings

END OF SECTION

---

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Flush Wood Doors work specified herein. This includes, but is not necessarily limited, to:
- .1 Veneer-faced doors for transparent finish.
  - .2 Priming and finishing of wood doors.
  - .3 Factory fitting flush wood doors to frames and factory machining for hardware.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Glazing: Comply with requirements in Section 08 80 05, General Requirements for Glass and Glazing for glass view panels in flush wood doors.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Definitions**

- 1.4.1 Transparent Finish: A stain or a clear finish that allows the natural characteristics and color of the grain of the wood surface to show through the finish

### **1.5 Preinstallation Meetings**

- 1.5.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
- .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with

other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.

- .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
- .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

## **1.6     Action Submittals**

1.6.1 Product Data: Submit product data in accordance with Division 01 for the following:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Flush Wood Doors work and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Include details of core and edge construction and trim for openings. Include factory-finishing specifications.

1.6.2 Shop Drawings: Indicate location, size, and hand of each door; elevation of each kind of door; construction details not covered in Product Data; and the following:

- .1 Door schedule indicating door and frame location, type, size, fire protection rating, and swing.
- .2 Door elevations, dimension and locations of hardware, lite and louver cutouts, and glazing thicknesses.
- .3 Details of frame for each frame type, including dimensions and profile.
- .4 Details of electrical raceway and preparation for electrified hardware, access control systems, and security systems.
- .5 Dimensions and locations of blocking for hardware attachment.
- .6 Dimensions and locations of mortises and holes for hardware.
- .7 Clearances and undercuts.
- .8 Requirements for veneer matching.
- .9 Doors to be factory finished and application requirements.

1.6.3 Samples:

- .1 Factory finishes applied to actual door face materials, approximately 200 by 250 mm (8 by 10 inches), for each material and finish.

- .2 Plastic laminate, 150 mm (6 inches) square, for each colour, texture, and pattern selected.
- .3 Corner sections of doors, approximately 200 by 250 mm (8 by 10 inches), with door faces and edges representing actual materials to be used.
  - .1 Provide Samples for each species of veneer and solid lumber required.
  - .2 Provide Samples for each colour, texture, and pattern of plastic laminate required.
  - .3 Finish veneer-faced door Samples with same materials proposed for factory-finished doors.
- .4 Louver blade and frame sections, 150 mm (6 inches) long, for each material and finish specified.
- .5 Frames for light openings, 150 mm (6 inches) long, for each material, type, and finish required.

**1.7 Quality Assurance**

- 1.7.1 Fire-Rated Door Inspector Qualifications: Inspector for field quality-control inspections of fire-rated door assemblies shall comply with qualifications set forth in NFPA 80, Section 5.2.3.1 and the following:
  - .1 DHI's Certified Fire and Egress Door Assembly Inspector (CFDAI) certification.
- 1.7.2 Source Limitations: Obtain flush wood doors from single manufacturer.

**1.8 Delivery, Storage, And Handling**

- 1.8.1 Comply with requirements of referenced standard and manufacturer's written instructions.
- 1.8.2 Package doors individually in cardboard cartons and wrap bundles of doors in plastic sheeting.
- 1.8.3 Mark each door on top and bottom rail with opening number used on Shop Drawings.

**1.9 Field Conditions**

- 1.9.1 Environmental Limitations: Do not deliver or install doors until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and HVAC system is operating and maintaining temperature between 16 and 32 deg C (60 and 90 deg F) and relative humidity between 25 and 55 percent during remainder of construction period.

---

**1.10 Warranty**

1.10.1 Extended Warranty: Repair or replace doors that fail in materials or workmanship within specified warranty period.

.1 Failures include, but are not limited to, the following:

- .1 Delamination of veneer or facing.
- .2 Warping (bow, cup, or twist) more than 6.4 mm (1/4 inch) in a 1067-by-2134-mm (42-by-84-inch) section.
- .3 Telegraphing of core construction in face veneers exceeding 0.25 mm in a 76.2-mm (0.01 inch in a 3-inch) span.

.2 Warranty shall also include installation and finishing that may be required due to repair or replacement of defective doors.

.3 Warranty Period for Solid-Core Interior Doors: Life of installation.

**2 . PRODUCTS**

**2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Algoma-Marshfield; A Masonite company.
- .2 Baillargeon; A Masonite company.
- .3 Lambton Doors.
- .4 Marshfield Door Systems, Inc.; A Masonite company.
- .5 Mohawk Doors; a Masonite company.
- .6 VT Industries, Inc.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2 Performance Requirements**

2.2.1 Fire-Rated Wood Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency acceptable to authorities having jurisdiction, for fire-protection ratings and temperature-rise limits indicated on Drawings, based on testing at positive pressure in accordance with CAN4-S104 or equivalent to NFPA 252 (subject to approval by authorities having jurisdiction).

- .1 Smoke- and Draft-Control Door Assemblies: Listed and labeled for smoke and draft control by a qualified testing agency acceptable to authorities having jurisdiction, based on

---

testing in accordance with UL 1784 and installed in compliance with NFPA 105.

2.2.2 Quality Standard: Comply with WDMA I.S.1-A, "Architectural Wood Flush Doors and as follows in accordance with WDMA I.S.1-A Performance Grade:

- .1 Extra Heavy Duty: unless indicated otherwise
- .2 Standard Duty: Closets (not including janitor's closets) and private washrooms and where indicated on Drawings and Schedules.

**2.3 Interior Wood Veneer-Faced Doors And Transom Panels For Transparent Finish**

2.3.1 Construction: Five plies, hot-pressed bonded (vertical and horizontal edging is bonded to core), with entire unit abrasive planed before veneering.

2.3.2 Faces: Grade AA (premium), Single-ply wood veneer not less than 0.508 mm (1/50 inch) thick.

- .1 Species, Cut, and Match: Maple, quarter cut and slip matched.
- .2 Assembly of Veneer Leaves on Door Faces: Balance match.
- .3 Pair and Set Match: Provide for doors hung in same opening or separated only by mullions.
- .4 Room Match: Provide door faces of compatible colour and grain within each separate room or area of building.

2.3.3 Exposed Vertical and Top Edges: Applied wood edges of same species as faces and covering edges of crossbands as standard with WDMA.

- .1 Fire-Rated Single Doors: Provide edge construction with intumescent seals concealed by outer stile. Comply with specified requirements for exposed vertical edges.
- .2 Fire-Rated Pairs of Doors: Provide formed-steel edges and astragals with intumescent seals. Finish steel edges and astragals with baked enamel same colour as doors.

2.3.4 Core for Non-Fire-Rated Doors:

- .1 ANSI A208.1, Grade LD-1 or Grade LD-2 particleboard (density-range 28 – 32 lbs/cu.ft) or agrifibre doors as specified herein.
- .2 Provide doors with laminated-strand-lumber (LSL) or WDMA I.S. 10 structural-composite-lumber cores instead of particleboard cores for doors scheduled to receive exit devices (non-fire-rated).

2.3.5 Core for Fire-Rated Doors: As required to achieve fire-protection rating indicated on Drawings.

- .1 Blocking for Mineral-Core Doors: Provide composite blocking with improved screw-holding capability approved for use in doors of fire-protection ratings indicated on Drawings as needed to eliminate through-bolting hardware.
  - .2 At hinge stiles, provide laminated-edge construction with improved screw-holding capability and split resistance. Comply with specified requirements for exposed edges.
- 2.3.6 Basis-of-Design:
- .1 Non-Fire-rated Doors, unless indicated otherwise: "Model No. 8500-ME" / "Model No. 8500-ME-AF" by Baillargeon Doors or "5-FS8500-EME" by Lambton Door or approved equivalent.
  - .2 Doors scheduled to receive exit devices (non-fire-rated): "Model No. 6000-ME" or 5-UFLSL-ME by Lambton Doors or approved equivalent.
  - .3 Fire-rated Doors: "5045/5060/5090" by Baillargeon Doors or approved equivalent.

**2.4     Solid-Core Three-Ply Flush Wood Doors And Transom Panels For Opaque Finish**

- 2.4.1 Grade: Custom.
- 2.4.2 Construction: Three plies, hot-pressed bonded with MDO faces.
- .1 Apply MDO to standard-thickness, closed-grain, hardwood face veneers or directly to high-density hardboard crossbands.
- 2.4.3 Exposed Vertical and Top Edges: Same species as faces or a compatible species or applied wood edges of same species as faces and covering edges of crossbands as standard with WDMA.
- .1 Fire-Rated Single Doors: Provide edge construction with intumescent seals concealed by outer stile. Comply with specified requirements for exposed vertical edges.
  - .2 Fire-Rated Pairs of Doors: Provide formed-steel edges and astragals with intumescent seals. Finish steel edges and astragals with baked enamel same colour as doors.
- 2.4.4 Core for Non-Fire-Rated Doors:
- .1 ANSI A208.1, Grade LD-1 or Grade LD-2 particleboard (density-range 28 – 32 lbs/cu.ft) or agrifibre doors as specified herein.
  - .2 Provide doors with laminated-strand-lumber (LSL) or WDMA I.S. 10 structural-composite-lumber cores instead of particleboard cores for doors scheduled to receive exit devices (non-fire-rated).
- 2.4.5 Core for Fire-Rated Doors: As required to achieve fire-protection rating indicated on Drawings.

- .1 Blocking for Mineral-Core Doors: Provide composite blocking with improved screw-holding capability approved for use in doors of fire-protection ratings indicated on Drawings as needed to eliminate through-bolting hardware.
- .2 At hinge stiles, provide laminated-edge construction with improved screw-holding capability and split resistance. Comply with specified requirements for exposed edges.

## **2.5     Fabrication**

- 2.5.1 Factory fit doors to suit frame-opening sizes indicated.
  - .1 Comply with clearance requirements of referenced quality standard for fitting unless otherwise indicated.
  - .2 Comply with NFPA 80 requirements for fire-rated doors.
- 2.5.2 Factory machine doors for hardware that is not surface applied.
  - .1 Locate hardware to comply with DHI-WDHS-3.
  - .2 Coordinate with hardware mortises in metal frames, to verify dimensions and alignment before factory machining.
  - .3 For doors scheduled to receive electrified locksets, provide factory-installed raceway and wiring to accommodate specified hardware.
- 2.5.3 Metal Astragals: Factory machine astragals and formed-steel edges for hardware for pairs of fire-rated doors.
- 2.5.4 Transom and Side Panels:
  - .1 Fabricate matching panels with same construction, exposed surfaces, and finish as specified for associated doors.
  - .2 Finish bottom edges of transoms and top edges of rabbeted doors same as door stiles.
  - .3 Fabricate door and transom panels with full-width, solid-lumber, rabbeted, meeting rails.
  - .4 Provide factory-installed spring bolts for concealed attachment into jambs of metal door frames.
- 2.5.5 Openings: Factory cut and trim openings through doors.
  - .1 Light Openings: Trim openings with moldings of material and profile indicated.
- 2.5.6 Glazing: Factory install glazing in doors indicated to be factory finished. Comply with applicable requirements in Section 08 80 05, General Requirements for Glass and Glazing.
  - .1 Louvers: Factory install louvers in prepared openings.

## **2.6     Factory Finishing**

- 2.6.1 Comply with referenced quality standard for factory finishing.

- 2.6.2 Complete fabrication, including fitting doors for openings and machining for hardware that is not surface applied, before finishing.
- 2.6.3 Finish faces, all four edges, edges of cutouts, and mortises. Specifically, seal top and bottom edges, hardware preparation areas, mortises and hinges and lock areas.
- 2.6.4 Factory finish doors that are indicated on Drawings to receive transparent finish.
- 2.6.5 Transparent Finish: ANSI/WDMA I.S. 1A Grade: Premium
  - .1 Provide ANSI/WDMA I.S. 1A TR-8 UV Cured Acrylated Polyester/Urethane
  - .2 Staining: Match Consultant's sample.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine doors and installed door frames, with Installer present, before hanging doors.
  - .1 Verify that installed frames comply with indicated on Drawings and Schedules requirements for type, size, location, and swing characteristics and have been installed with level heads and plumb jambs.
  - .2 Reject doors with defects.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Installation**

- 3.2.1 Hardware: Refer to Section 08 70 10, Finish Hardware.
- 3.2.2 Installation Instructions: Install doors to comply with manufacturer's written instructions and referenced quality standard, and as indicated on Drawings and Schedules.
  - .1 Install fire-rated doors according to NFPA 80.
  - .2 Install smoke- and draft-control doors according to NFPA 105.
- 3.2.3 Job-Fitted Doors: Align and fit doors in frames with uniform clearances and bevels as indicated below; do not trim stiles and rails in excess of limits set by manufacturer or permitted for fire-rated doors. Machine doors for hardware. Seal edges of doors, edges of cutouts, and mortises after fitting and machining.
  - .1 Clearances: Provide 3.2 mm (1/8 inch) at heads, jambs, and between pairs of doors. Provide 3.2 mm (1/8 inch) from bottom of door to top of decorative floor finish or covering

---

unless otherwise indicated on Drawings and Schedules. Where threshold is shown or scheduled, provide 6.4 mm (1/4 inch) from bottom of door to top of threshold unless otherwise indicated on Drawings and Schedules.

- .2 Bevel non-fire-rated doors 3-1/2 degrees (1/8 inch in 2 inches) at lock and hinge edges.
  - .3 Do not fit and machine fire-rated doors on site.
- 3.2.4 Factory-Fitted Doors: Align in frames for uniform clearance at each edge. Comply with NFPA 80 for fire-rated doors.
- 3.2.5 Factory-Finished Doors: Restore finish before installation if fitting or machining is required at Project site.

### **3.3 Adjusting**

- 3.3.1 Operation: Rehang or replace doors that do not swing or operate freely.
- 3.3.2 Finished Doors: Replace doors that are damaged or that do not comply with requirements. Doors may be repaired or refinished if Work complies with requirements and shows no evidence of repair or refinishing.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Access Doors And Frames work specified herein. This includes, but is not necessarily limited, to:
- .1 Access doors and frames for walls and ceilings.
  - .2 Floor access doors and frames.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 07 72 76, Roof Access Hatched for roof hatches.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.4 Action Submittals**

- 1.4.1 Product Data: Submit product data in accordance with Division 01 for each type of product.
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Access Doors And Frames work and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Include construction details, fire ratings, materials, individual components and profiles, and finishes.
- 1.4.2 Shop Drawings:
- .1 Include plans, elevations, sections, details, and attachments to other work.
  - .2 Detail fabrication and installation of access doors and frames for each type of substrate.

- 1.4.3 Samples: Submit samples in accordance with Division 01 for each door face material, at least 75 by 125 mm (3 by 5 inches) in size, in specified finish.
- 1.4.4 Product Schedule: Provide complete access door and frame schedule, including types, locations, sizes, latching or locking provisions, and other data pertinent to installation.

## **1.5 Warranty**

- 1.5.1 Provide warranty covering the Work of this Section in accordance with Supplementary Condition SC49 / GC 12.3 WARRANTY.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
  - .1 Acudor Products, Inc.
  - .2 Babcock-Davis.
  - .3 Cendrex Inc.
  - .4 MIFAB, Inc.
  - .5 Milcor Inc.
  - .6 Nystrom, Inc.
- 2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### **2.2 Performance Requirements**

- 2.2.1 Fire-Rated Access Doors and Frames: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, according to CAN4-S104 or equivalent to NFPA 252 (subject to approval by authorities having jurisdiction) or UL 10B.
- 2.2.2 Door Size: Unless otherwise indicated, size doors as follows:
  - .1 Minimum 305 mm x 305 mm (12 inch x 12 inch) for single valves; 406 mm x 406 mm (16 inch x 16 inch) for groups of valves and 610 mm x 610 mm (24 inch x 24 inch) for body access.

### **2.3 Materials**

- 2.3.1 Steel Plates, Shapes, and Bars: ASTM A36/A36M or equivalent to CSA G40.20/G40.21.

- 2.3.2 Steel Sheet: Uncoated or electrolytic zinc coated, ASTM A879/A879M, with cold-rolled steel sheet substrate complying with ASTM A1008/A1008M, Commercial Steel (CS), exposed.
- 2.3.3 Galvanized Steel Sheet: ASTM A653/A653M, Commercial Steel (CS), Type B; with minimum Z180 (G60) or ZF180 (A60) metallic coating.
- 2.3.4 Stainless Steel Plate, Sheet, and Strip: ASTM A240/A240M or ASTM A666, Type 304. Remove tool and die marks and stretch lines, or blend into finish.
- 2.3.5 Stainless Steel Flat Bars: ASTM A666, Type 304. Remove tool and die marks and stretch lines, or blend into finish.
- 2.3.6 Aluminum Extrusions: ASTM B221M (ASTM B221), Alloy 6063.
- 2.3.7 Aluminum Sheet: ASTM B209M (ASTM B209), alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.
- 2.3.8 Frame Anchors: Same material as door face.
- 2.3.9 Inserts, Bolts, and Anchor Fasteners: Hot-dip galvanized steel according to ASTM A153/A153M or ASTM F2329.

**2.4 Flush Access Doors With Exposed Flanges**

- 2.4.1 Description: Face of door flush with frame, with exposed flange and concealed hinge.
- 2.4.2 Locations: Masonry walls.
- 2.4.3 Galvanized Steel Sheet for Door: Nominal 1.63 mm (0.064 inch), 16 gage, factory primed.
- 2.4.4 Frame Material: Same material, thickness, and finish as door.
- 2.4.5 Latch and Lock: Cam latch, screwdriver operated.
- 2.4.6 Acceptable Products:
  - .1 "UF-5000" by Acudor
  - .2 "NT" by Nystrom
  - .3 Approved equivalent.

**2.5 Flush Access Doors With Concealed Flanges (Gypsum Board)**

- 2.5.1 Description: Face of door flush with frame; with concealed flange for gypsum board installation and concealed hinge.
- 2.5.2 Locations: Gypsum board wall and ceiling.
- 2.5.3 Galvanized Steel Sheet for Door: Nominal 1.63 mm (0.064 inch), 16 gage factory primed.
- 2.5.4 Frame Material: Same material and thickness as door.

2.5.5 Latch and Lock: Cam latch, screwdriver operated.

2.5.6 Acceptable Products:

- .1 "DW-5040" by Acudor
- .2 "NW" by Nystrom
- .3 Approved equivalent.

**2.6 Recessed Access Doors (Tile Ready) With Concealed Flanges**

2.6.1 Description: Face of door to fit flush to frame. Provide frame with gypsum board beads for concealed flange installation.

2.6.2 Locations: Tile and stone applications where access doors are required.

2.6.3 Door Size: As noted on Drawings

2.6.4 Galvanized Steel Sheet for Door: Nominal 1.63 mm (0.064 inch), 16 gage

- .1 Finish: Factory finish.

2.6.5 Hardware: Cam latch, screwdriver operated.

2.6.6 Acceptable Products:

- .1 "AT-5020 Recessed Access Door" by Acudor
- .2 "RA" by Nystrom
- .3 Approved equivalent.

**2.7 Exterior Flush Access Doors**

2.7.1 Description: Weatherproof assembly, with face of door fit flush with frame and with exposed frame. Include extruded door gaskets and minimum 50-mm-thick (2-inch-thick) fiberglass insulation.

- .1 Air Infiltration: less than 0.01 cfm/ft<sup>2</sup> – ASTM E283
- .2 Water Penetration: no leakage at 15 psf – ASTM E331

2.7.2 Locations: Exterior walls where indicated.

2.7.3 Stainless Steel Sheet for Door: Nominal 1.59 mm (0.062 inch), 16 gage, ASTM A480/A480M No. 4 finish.

2.7.4 Frame Material: Same material, thickness, and finish as door.

2.7.5 Latch and Lock: Cam latch operated by handle, with keyed lock in handle.

2.7.6 Acceptable Products:

- .1 "ADWT" by Acudor
- .2 "XTA I-H" by Nystrom
- .3 Approved equivalent.

---

**2.8      Interior Flush Gypsum Access Doors With Concealed Flanges**

- 2.8.1 Description: Face of concealed-hinge door flush with frame, with concealed flange for gypsum board installation.
- 2.8.2 Locations: Gypsum board walls and ceilings.
- 2.8.3 Door and Frame Material: Unpainted gypsum, with extruded aluminum frames reinforced for hardware and fastenings.
- 2.8.4 Latch and Lock: Cam latch, screwdriver operated.
- 2.8.5 Acceptable Products:
  - .1 "Recessed Access Door #GFRG" by Acudor
  - .2 "Bauco-Plus II" by Bauco Access panel Solutions Inc.
  - .3 "RGB" by Nystrom

**2.9      Fire-Rated, Flush Access Doors With Exposed Flanges**

- 2.9.1 Description: Door face flush with frame, with a core of mineral-fibre insulation enclosed in sheet metal; with exposed flange, self-closing door, and concealed hinge.
- 2.9.2 Locations: Masonry walls.
- 2.9.3 Fire-Resistance Rating: Not less than that of adjacent construction.
- 2.9.4 Galvanized Steel Sheet for Door: Nominal 1.02 mm (0.040 inch), 20 gage, factory primed.
- 2.9.5 Frame Material: Same material, thickness, and finish as door.
- 2.9.6 Latch and Lock: Self-latching door hardware, operated by key.
- 2.9.7 Acceptable Products:
  - .1 "FW-5050" by Acudor
  - .2 "IT" by Nystrom
  - .3 Approved equivalent.

**2.10     Fire-Rated, Flush Access Doors With Concealed Flanges**

- 2.10.1 Description: Door face flush with frame, with a core of mineral-fibre insulation enclosed in sheet metal; with concealed flange for gypsum board installation, self-closing door, and concealed hinge.
- 2.10.2 Locations: Gypsum board Wall and ceiling.
- 2.10.3 Fire-Resistance Rating: Not less than that of adjacent construction.
- 2.10.4 Galvanized Steel Sheet for Door: Nominal 1.02 mm (0.040 inch), 20 gage, factory primed.
- 2.10.5 Frame Material: Same material, thickness, and finish as door.

2.10.6 Latch and Lock: Self-closing, self-latching door hardware, operated by key.

2.10.7 Acceptable Products:

- .1 "FW-5050-DW" by Acudor
- .2 "IW" by Nystrom
- .3 Approved equivalent.

## **2.11 Fabrication**

2.11.1 Provide access door and frame assemblies manufactured as integral units ready for installation.

2.11.2 Metal Surfaces: for metal surfaces exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

2.11.3 Doors and Frames: Grind exposed welds smooth and flush with adjacent surfaces. Supply attachment devices and fasteners of type required to secure access doors to types of supports indicated on Drawings and Schedules.

- .1 For concealed flanges with drywall bead, provide edge trim for gypsum board securely attached to perimeter of frames.
- .2 Provide mounting holes in frames for attachment of units to metal framing.
- .3 Provide mounting holes in frame for attachment of masonry anchors.

2.11.4 Recessed Access Doors: form face of panel to provide recess for application of applied finish. Reinforce panel as required to prevent buckling.

2.11.5 Latching Mechanisms: Supply number required to hold doors in flush, smooth plane when closed.

- .1 For cylinder locks, Supply two keys per lock and key all locks alike.
- .2 For recessed panel doors, provide access sleeves for each locking device. Supply plastic grommets and install in holes cut through finish.

## **2.12 Finishes**

2.12.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

2.12.2 Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

2.12.3 Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine substrates for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.

#### **3.2 Installation**

- 3.2.1 Comply with manufacturer's written instructions for installing access doors and frames.
- 3.2.2 Install doors flush with adjacent finish surfaces or recessed to receive finish material.

#### **3.3 Field Quality Control**

- 3.3.1 Fire-Rated Door Inspections: Inspect each fire-rated access door in accordance with NFPA 80, section 5.2.
  - .1 Repair or remove and replace installations where inspections indicate that they do not comply with specified requirements.
  - .2 Reinspect repaired or replaced installations to determine if replaced or repaired door assembly installations comply with specified requirements.
  - .3 Prepare and submit separate inspection report for each fire-rated access door indicating compliance with each item listed in NFPA 80.

#### **3.4 Adjusting**

- 3.4.1 Adjust doors and hardware, after installation, for proper operation.
- 3.4.2 Remove and replace doors and frames that are warped, bowed, or otherwise damaged.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the high speed roll-up doors work specified herein. This includes, but is not necessarily limited, to:
  - .1 High-speed roll-up door
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 08 70 10 – Finish Hardware

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
  - .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.

- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

## **1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for high speed roll-up doors work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
- 1.5.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze

level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.

- .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

1.5.6 Low-Emitting Materials: For applicable Products specified or used for activities of this Section (i.e., site-applied coatings, adhesives, and sealants), submit certifications from third-party organizations indicating compliance with following:

- .1 VOC Emissions: California Department of Public Health (CDPH) Standard Method v1.2–2017, using applicable exposure scenario.
- .2 VOC Content: SCAQMD Rule 1113 (for paints and coatings) and SCAQMD Rule 1168 (for adhesives and sealants).

1.5.7 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.

1.5.8 Welding Certificate: Submit certification for welding firms and welders to verify compliance with welding qualifications specified in this section.

## **1.6 Closeout Submittals**

1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.

1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for high speed roll-up doors to be included in building operation and maintenance manual.

1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

## **1.7 Quality Assurance**

1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.

1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.

1.7.3 Welding Qualifications: Qualify procedures and personnel in accordance with the following:

- .1 Steel: to CSA W47.1 and CSA W59
- .2 Aluminum: to CSA W47.2 and CSA W59.2

.3 Stainless Steel: to CSA W47.1 (Annex K) and CSA W59.

1.7.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

1.7.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

.1 Location: In-situ (i.e. first installation), as directed on site by Consultant.

.2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.

.3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

#### **1.8 Delivery, Storage And Handling**

1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.

1.8.2 Deliver, store and handle high speed roll-up doors materials in accordance with manufacturer's written instructions.

1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.

1.8.5 Replace defective or damaged materials with new.

#### **1.9 FIELD CONDITIONS**

1.9.1 Environmental Restrictions: Do not deliver or install high speed roll-up doors until building is enclosed, wet work is complete, and HVAC system is operational and will maintain temperature and relative humidity levels equal to occupancy levels for remainder of construction period.

1.9.2 Field Measurements: Verify actual dimensions of construction contiguous with high speed roll-up doors by field measurements before fabrication.

#### **1.10 WARRANTY**

1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of high speed roll-up doors that fail within specified warranty period. Manufacturer's extended warranty

is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

- .1 Warranty Period: Not less than 10 years from date of Substantial Performance of The work.

## 2. PRODUCTS

### 2.1 Manufacturers

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 Assa Abloy
- .2 Wayne Dalton
- .3 Approved equivalent

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

### 2.2 High-Speed Door (FIN-01)

2.2.1 Description: High-speed roll-up door for interior heavy-duty operations.

- .1 Lifetime Expectation: 1,000,000 cycles
- .2 Door Curtain:
  - .1 Material: 3-layers of PVC coated polyester with 2 layers of polyester weave.
  - .2 Operating Speed: Opening up to 55 inch/s, Closing at 40 inch/s.
  - .3 Colour: refer to Finish Schedule on Drawings.
- .3 Bottom Bar:
  - .1 Fully padded, break away bottom bar full width of the opening, sufficient to maintain bottom edge of curtain parallel to the door threshold.
  - .2 Finish: Powder coated safety yellow.
- .4 Guides:
  - .1 Description: Fully boated construction with full-height weather seal around entire perimeter of door.
  - .2 Material: Steel
  - .3 Finish: Powder coated safety yellow.
- .5 Door Header:
  - .1 Description: Top roll assembly fabricated of high strength steel barrel supported with powder coated high strength steel brackets at each end with self-aligning bearings.

- .2 Drum Barrel System: Minimum 6.625 inches (168.3 mm) diameter ASTM A 500 Grade B high strength steel pipe.
- .3 Brackets: Minimum 1/4 inch (6 mm) thick ASTM A 36 hot rolled steel with heavy-duty, self-aligning bearings with cast iron housings.
- .4 Springless System: No balancing springs or counterweights permitted.
- .5 Head frame provided with a single brush seal along the top of the door.
- .6 Hood: Top roll assembly enclosed with an external metal hood.
  - .1 Finish: Galvanized steel hood with black polyester top coat.
  - .2 Material: 22 gauge steel with intermediate supports as required.
- .7 Electric Door Operator: Heavy duty, rated up to 60 cycles per hour.
- .8 Basis-of-Design: "Model ADV-Xtreme 884" by Wayne Dalton or approved equivalent.

### 2.3 **Operation**

- 2.3.1 Operation: Electrically operated with power drive system, eliminating the need for ballast in the curtain or tension straps. Motor driven by a frequency inverter for smooth operation and longevity.
- 2.3.2 Control Unit: Direct-side mounted with the following features:
  - .1 Microprocessor based with variable frequency drive controller, capable of variable speed control in both up and down directions.
  - .2 System incorporates a Liquid Crystal Display (LCD) to display the system status.
  - .3 Capable of monitoring and reporting on a variety of operating conditions, including: Current operating status, Current command status, Current error status (if applicable), Hoist interlock status (if applicable), Service reminder status, and 24VDC status.
  - .4 Control system is housed in a NEMA 4X panel with built-in push buttons and main power padlock-able rotary disconnect switch.

## 3. **EXECUTION**

### 3.1 **Examination**

- 3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions

which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

**3.2 Installation**

- 3.2.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Door Operators: Connect door operators to electrical power distribution system.

**3.3 Adjusting**

- 3.3.1 Adjust hardware, moving parts, door operators, and controls to function smoothly, and lubricate as recommended by manufacturer; comply with requirements of applicable BHMA standards.
- 3.3.2 Readjust door operators and controls after repeated operation of completed installation equivalent to three days' use by normal traffic (100 to 300 cycles).

**3.4 Protection**

- 3.4.1 Protect high speed roll-up doors from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.4.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.4.3 Promptly replace high speed roll-up doors work damaged during construction that cannot be satisfactorily repaired.

**3.5 Cleaning And Waste Management**

- 3.5.1 Cleaning and Waste Management, generally: in accordance with Section 01 74 00, Cleaning and Waste Management.
- 3.5.2 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.5.3 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the overhead coiling doors work specified herein. This includes, but is not necessarily limited, to:
  - .1 Fire-rated, non-insulated overhead coiling service doors.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 05 50 00 - Metal Fabrications
  - .2 Section 09 91 23 - Interior Painting
  - .3 Section 11 13 00 - Loading Dock Equipment.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Administrative Requirements**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.
- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.

- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
- .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
- .3 Agenda:
  - .1 Review progress of related construction activities and preparations for particular activity under consideration.
  - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
- .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for overhead coiling doors work specified in this Section.
  - .1 Include construction details, material descriptions, dimensions of individual components, profiles for slats, and finishes.
  - .2 Include description of automatic-closing device and testing and resetting instructions.
  - .3 For motorized doors: Include rated capacities, operating characteristics, electrical characteristics, and furnished accessories.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
  - .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
  - .3 Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - .4 Include points of attachment and their corresponding static and dynamic loads imposed on structure.

- .5 Show locations of controls, locking devices, detectors, and other accessories.
- .6 Wiring Diagrams: Submit for power, signal, and control wiring.
- 1.5.4 Delegated Design Submittals:
  - .1 Engineering design completion of overhead coiling doors work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.
- 1.5.5 Fire-Rated Door Inspector: Submit documentation of compliance with NFPA 80, section 5.2.3.1.
- 1.5.6 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
  - .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.7 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
  - .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.8 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.

## **1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.

- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for overhead coiling doors to be included in building operation and maintenance manual.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.
- 1.6.4 As-Built Documents: Submit list of fire-rated door numbers and applicable room name and number to which door accesses.

## **1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.
  - .1 Installer must be trained and approved by the manufacturer.
- 1.7.3 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.
  - .1 Professional Engineer's Responsibility:
    - .1 production and review of Shop Drawings,
    - .2 design and certification of overhead coiling doors, including attachments for building construction, in accordance with applicable codes and regulations,
    - .3 stamping and signing of each Shop Drawing and associated calculations
- 1.7.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.
- 1.7.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
  - .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
  - .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.

- .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

**1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle overhead coiling doors materials in accordance with manufacturer's written instructions.
- 1.8.3 Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

**1.9 Field Conditions**

- 1.9.1 Field Measurements: Verify actual dimensions of construction contiguous with overhead coiling doors by field measurements before fabrication.

**1.10 Warranty**

- 1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of overhead coiling doors that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.
  - .1 Warranty Period: Not less than 2 years from date of Substantial Performance of The work.

**2 . PRODUCTS**

**2.1 Manufacturers**

- 2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:
  - .1 Assa Abloy.
  - .2 C.H.I. Overhead Doors.
  - .3 Cookson Company.
  - .4 Cornell Iron Works, Inc.
  - .5 Clopay Doors
  - .6 Dynamic Closures Corp.

- .7 McKeon Rolling Steel Door Company, Inc.
- .8 Overhead Door Corporation.
- .9 Raynor.
- .10 Wayne-Dalton Corp.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Regulatory Requirements**

2.2.1 Accessibility Standard: Comply with applicable provisions in CSA B651, the Ontario Building Code and the AODA.

## **2.3 Performance / Design Criteria**

2.3.1 Operation Cycles: Provide overhead coiling door components and operators capable of operating for not less than number of cycles indicated on Drawings and Schedules for each door. One operation cycle is complete when a door is opened from the closed position to the fully open position and returned to the closed position.

2.3.2 Electrical Components, Devices, and Accessories (motorized doors): Listed and labeled as defined in CSA C22 Series, by a qualified testing agency, and marked for intended location and application.

2.3.3 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.

- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
- .2 Refer to Structural Drawings for seismic sensitivity values.

## **2.4 Fire-Rated, Non-Insulated Overhead Coiling Service Doors**

2.4.1 Fire-Rated Door Assemblies: Must comply with NFPA 80. Ensure doors are listed and labeled by a qualified testing agency for fire ratings specified based on testing to CAN/ULC S104.

.1 Smoke Control: For doors in corridors, smoke barriers, and locations specified on Drawings and Schedules, provide doors tested to UL 1784, and listed and labeled with an "S" for smoke and draft control by a qualified testing agency.

- .1 Maximum air-leakage rate: 15.24 L/s x sq. m (3.0 cfm/sq. ft.) at 25 Pa (0.10 inch wg) under ambient and elevated temperature conditions.
- .2 Required Fire-Rating: Refer to Drawings and Schedules

2.4.2 Door Construction: Interlocking roll-formed slats with endlocks riveted to the ends of alternate slats to maintain slat alignment and prevent wear and design to provide required fire-ratings.

- .1 Slats:
  - .1 Galvanized Steel: galvanized steel to ASTM A653; manufacturer-recommended thickness to meet performance requirements, but not less than 22 ga.
  - .1 Steel Finish: Manufacturer's standard baked enamel coating with powder coated clear topcoat having pencil hardness of 2H or better in accordance with ASTM D3363.
  - .2 Colour: to be selected by Consultant at a later date
- .2 Endlocks: high-strength endlocks on alternate slats, each fastened with two 6.35 mm (1/4 in) rivets.
- .3 Bottom Bar: Manufacturer's standard material matching door construction in all respects.
- .4 Guides: Fabricate guides from minimum 6.35 mm (1/4 inch) galvanized steel angles. Provide removable guide stoppers to prevent excessive travel of curtain and bottom bar. Ensure side guide angles are removable to provide access for curtain installation and future maintenance service.
- .5 Counterbalance Shaft Assembly:
  - .1 Barrel: steel pipe designed to support curtain load with a maximum deflection of 2.5 mm per meter (0.03 inches per foot) of width.
  - .2 Spring Balance: Provide oil-tempered, heat-treated steel helical torsion spring assembly for door balance; ensure maximum operational effort does not exceed 110 N (25 lbs). Provide mechanism for applying and adjusting spring torque.
- .6 Brackets: Fabricated from minimum of 5 mm (3/16 inch) steel plate, with permanently lubricated ball or roller bearings at pivot points to support counterbalance shaft assembly and provide end closures.
- .7 Hood: material to match door curtain. Provide reinforcing at top and bottom edges and minimum 6.35 mm (1/4 inch) intermediate support brackets as required to prevent sagging.
- .8 Weatherstripping / Smoke Seals:
  - .1 Bottom Bar - Motorized Doors: combination smoke seal and sensing edge.
  - .2 Guides and Head: Replaceable, cUL-listed, nylon brush smoke seals applied to fascia side of curtain.

- 
- .9 Finish of exposed door components: to match door curtain slat in every respect unless specified otherwise.
  - 2.4.3 Motorized Door Operation: CSA or UL listed and labeled, size as recommended by manufacturer, capable of driving door at a speed of no less than 203 mm (8 inches) per second nor more than 305 mm (12 inches) per second.
    - .1 Motor Exposure: Interior.
    - .2 Type: Standard Use: Up to 20 cycles per day maximum, and 50,000 cycles for life of door.
    - .3 Horsepower: Variable, to be determined by door manufacturer based on door size and operational requirements, but not less than 1/3 hp.
    - .4 Power Supply: 115 VAC, single phase
    - .5 Control Station: NEMA 1 flush mount, 24 V control station with open, close and stop button.
    - .6 Additional Access Control: Refer to Division 28 and Division 11 for additional requirements regarding access control and interlocking with vehicle detection mechanisms.
    - .7 Emergency Operation:
      - .1 Manual Chain Hoist: For manual override in case of power or operational failure.
      - .2 Battery Backup: For doors intended for use in emergency situations, provide battery backup with programmable logic for minimum 10 operational cycles and extended standby.
    - .8 Obstruction-Detection Device: to UL325, Automatic photoelectric sensor with pneumatic sensor edge on bottom bar.
      - .1 Primary Entrapment Protection Devices: Photo eyes fully monitored, non-contact, infrared beam photo sensor system shall reverse a closing door to full open position when an obstruction is sensed; photo sensors shall be mounted no higher than 152 mm (6 inches) maximum above the floor.
      - .2 Ancillary Entrapment Protection Devices: Pneumatic sensing edge shall reverse a closing door to the full open position when an obstruction is sensed.
      - .3 Sensor Edge Bulb Colour: As selected by Consultant from manufacturer's full range.
    - .9 Limit Switch: Adjustable, linear screw-type cam limit switch for accurate door positioning and synchronization with operator.

.10 Location: Operator must fit within door coil area without protrusion.

2.4.4 Locking: Masterkeyable system. Coordinate with Section 08 70 10.

2.4.5 Basis-of-Design: "FireCurtain UCP" as manufactured by Raynor or approved equivalent.

## **2.5 Accessories**

2.5.1 Door Release Mechanism: internal electrical failsafe release device designed to function with no additional wiring or external components.

- .1 Trigger: automatic closure via connection to central fire alarm.
- .2 Closure Speed: Average of 300 mm (12 in) per second. Auto-closure after alarm trigger delayed by up to 10 seconds.
- .3 Provide internal solenoid brake to permit door to hold in position during use.
- .4 Closure speed to be governed via enclosed, variable rate centrifugal governor; no exposed mechanisms are permitted.
- .5 System to automatically reset failsafe release and operator after clearance of alarm without manual intervention.
- .6 Coordinate with Coordinate with Division 26 and Division 28 for disconnect switch, conduit, and wiring.

## **2.6 General Finish Requirements**

2.6.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

2.6.2 Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

# **3 . EXECUTION**

## **3.1 Examination**

3.1.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

3.1.2 Examine locations of electrical connections.

**3.2     Installation**

- 3.2.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.
- 3.2.2 Install overhead coiling doors, hoods, and operators at the mounting locations indicated on Drawings and Schedules for each door.
- 3.2.3 Accessibility: Install overhead coiling doors, switches, and controls along accessible routes in compliance with regulatory requirements for accessibility.
- 3.2.4 Fire-Rated Doors: Install according to NFPA 80.
  - .1 Smoke-Control Doors: Install according to NFPA 80 and NFPA 105.
- 3.2.5 Motorized Doors: Install according to UL 325.

**3.3     Startup Service**

- 3.3.1 Engage a factory-authorized service representative to perform startup service.
  - .1 Perform installation and startup checks according to manufacturer's written instructions.
  - .2 Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
  - .3 Test door release, closing, and alarm operations when activated by smoke detector or building's fire-alarm system. Test manual operation of closed door. Reset door-closing mechanism after successful test.
- 3.3.2 Fire-Rated Door Inspections: Inspect each fire-rated door in accordance with NFPA 80, section 5.2. Conduct minimum of two drop tests and resets for all activation methods, in accordance with NFPA 80 Section 5 requirements.
  - .1 Prepare and submit separate inspection report for each fire-rated door assembly indicating compliance with each item listed in NFPA 80.
- 3.3.3 Repair or remove and replace installations where inspections indicate that they do not comply with specified requirements.
- 3.3.4 Reinspect repaired or replaced installations to determine if replaced or repaired door assembly installations comply with specified requirements.

**3.4     Adjusting**

- 3.4.1 Adjust hardware and moving parts to function smoothly so that doors operate easily, free of warp, twist, or distortion.
- 3.4.2 Lubricate bearings and sliding parts as recommended by manufacturer.
- 3.4.3 Adjust seals to provide weathertight fit around entire perimeter.

**3.5     Demonstration**

- 3.5.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain overhead coiling doors.

**3.6     Protection**

- 3.6.1 Protect overhead coiling doors from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.
- 3.6.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.
- 3.6.3 Promptly replace overhead coiling doors work damaged during construction that cannot be satisfactorily repaired.

**3.7     Cleaning And Waste Management**

- 3.7.1 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.
- 3.7.2 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

**END OF SECTION**

---

**1 . GENERAL**

**1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.

**1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Sectional Doors work specified herein. This includes, but is not necessarily limited, to:
- .1 electrically operated sectional steel doors
  - .2 Tracks, supports, and accessories.
  - .3 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only.
- .1 Section 05 50 00, Metal Fabrications for miscellaneous steel supports.
  - .2 Section 09 91 13, Exterior Painting for finish painting of factory-primed doors.

**1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

**1.4 Action Submittals**

- 1.4.1 Product Data: Submit product data in accordance with Division 01 for the following:
- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Sectional Doors work and include product characteristics, performance criteria, physical size, finish and limitations.
  - .2 Construction details, material descriptions, dimensions of individual components, profile door sections, and finishes.
  - .3 Include rated capacities, operating characteristics, electrical characteristics, and furnished accessories.

- 
- 1.4.2 Shop Drawings: Submit Shop Drawings in accordance with Division 01 for each installation and for special components not dimensioned or detailed in manufacturer's product data. Include plans, elevations, sections, details, and attachments to other work.
- .1 Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
  - .2 Include points of attachment and their corresponding static and dynamic loads imposed on structure.
  - .3 Include details of provisions for assembly expansion and contraction and for excluding and draining moisture to the exterior.
  - .4 Wiring Diagrams: Submit wiring drawings in accordance with Division 01 for power, signal, and control wiring.
- 1.4.3 Samples: Submit Samples in accordance with Division 01 for manufacturer's finish charts showing full range of colours and textures available for units with factory-applied finishes.
- .1 Include similar Samples of accessories involving colour selection.
- 1.4.4 Professional Engineer's Stamped Shop Drawings and Submittals: Submit Professional Engineer's Stamped Shop Drawings and Submittals in accordance with Division 01 for sectional doors indicated on Drawings and Schedules to comply with performance requirements and design criteria, including analysis data signed and sealed by the Professional Engineer licensed to practice in the Province of Ontario responsible for their preparation.
- .1 Detail fabrication and assembly of seismic restraints.
  - .2 Summary of forces and loads on walls and jams.
- 1.5     Closeout Submittals**
- 1.5.1 Maintenance Data: Submit maintenance data in accordance with Division 01 for sectional doors to include in maintenance manuals.
- 1.6     Quality Assurance**
- 1.6.1 Installer Qualifications: Manufacturer's authorized representative who is trained and approved for both installation and maintenance of units required for this Project.
- 1.6.2 Source Limitations: Obtain sectional doors from single source from single manufacturer.
- .1 Obtain operators and controls from sectional door manufacturer.

---

**1.7     Warranty**

1.7.1 Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of sectional doors that fail in materials or workmanship within specified warranty period.

- .1 Failures include, but are not limited to, the following:
  - .1 Structural failures including, but not limited to, excessive deflection.
  - .2 Faulty operation of hardware.
  - .3 Deterioration of metals, metal finishes, and other materials beyond normal weathering and use; rust through.
  - .4 Delamination of exterior or interior facing materials.
- .2 Warranty Period: Five years from date of Substantial Performance of the Work.

1.7.2 Special Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components that show evidence of deterioration of factory-applied finishes within specified warranty period.

- .1 Warranty Period: 10 years from date of Substantial Performance of the Work.

**2 .     PRODUCTS**

**2.1     Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Assa Abloy
- .2 C.H.I. Overhead Doors.
- .3 Clopay Building Products; a Griffon company.
- .4 Overhead Door Corporation.
- .5 Raynor.
- .6 Richard-Wilcox
- .7 Thermostop
- .8 Wayne-Dalton Corp.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

---

**2.2     Regulatory Requirements**

- 2.2.1 Electrical Components, Devices, and Accessories: Listed and labeled as defined in CSA C22 by a qualified testing agency, and marked for intended location and application.
- 2.2.2 Accessibility Standard: Comply with applicable provisions in CSA B651, the Ontario Building Code.

**2.3     Performance Requirements**

- 2.3.1 Ensure sectional doors meet performance requirements specified without failure due to defective manufacture, fabrication, installation, or other defects in construction and without requiring temporary installation of reinforcing components.
  - .1 Fabricate sectional doors to comply with DASMA 102 unless otherwise indicated on Drawings and Schedules.
- 2.3.2 Professional Engineering Design and Certification: Design sectional doors, including comprehensive engineering analysis by a Professional Engineer licensed to practice in the Province of Ontario, in accordance with requirements of Ontario Building Code, and using performance requirements and design criteria indicated in this Section.
- 2.3.3 Structural Performance, Exterior Doors: Exterior sectional door shall withstand the wind loads, the effects of gravity loads, and loads and stresses within limits and under conditions indicated on Drawings and Schedules according to Ontario Building Code.
  - .1 Wind Loads: As indicated on Drawings for geographical location of project, but not less than uniform pressure (velocity pressure) of 960 Pa (20 lbf/sq. ft.), acting inward and outward.
  - .2 Deflection Limits: Design sectional doors to withstand design wind loads without evidencing permanent deformation or disengagement of door components. Deflection of door in horizontal position (open) shall not exceed 1/120 of the door width.
  - .3 Operability under Wind Load: Design sectional door to remain operable under design wind load, acting inward and outward.
- 2.3.4 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
  - .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
  - .2 Refer to Structural Drawings for seismic sensitivity values.

- 2.3.5 Air Infiltration: Maximum rate not more than indicated on Drawings and Schedules when tested according to ASTM E283.
  - .1 Air Infiltration: Maximum rate of 0.75 L/s per sq. m (0.15 cfm/sq. ft.) at 75 Pa when tested according to ASTM E283 or DASMA 105.
  - .2 Operation Cycles: Provide sectional door components and operators capable of operating for not less than number of cycles indicated on Drawings and Schedules for each door. One operation cycle is complete when a door is opened from the closed position to the fully open position and returned to the closed position.
- 2.3.6 Electrical Components, Devices, and Accessories: Listed and labeled as defined in CSA C22 Series, by a qualified testing agency, and marked for intended location and application.

## **2.4     High Performance Insulated Steel Door Assembly**

- 2.4.1 Generic Locations: Building Envelope.
- 2.4.2 Construct panels with a rigid polyurethane core foamed in place between metal skins. Ensure reinforcement with continuous steel plates for hinge attachment.
- 2.4.3 Provide steel sectional door formed with hinged sections with following characteristics:
  - .1 Door thickness: 100 mm (4 inches) with 16-gauge steel skins.
  - .2 Operation Cycles: Not less than 10,000.
  - .3 Curtain R-Value: Not less than R32
  - .4 Insulation: rigid polyurethane insulation with a minimum density of 41.0 kg/m<sup>3</sup> (2.56 lbs/ft<sup>3</sup>).
  - .5 Track Configuration: Refer to Drawings.
  - .6 Weatherseals: Fitted to bottom and top and around entire perimeter of door.
    - .1 Joint and Seal: tongue-and-groove joint with a true thermal break and double bubble-shaped weather seals. Mark II models may use a single seal.
    - .2 Perimeter Seals: Provide triple-lip flexible PVC perimeter weather seal in aluminum retainer.
    - .3 Bottom Seals: U-shaped PVC double weather seals in an aluminum retainer at the door bottom.
  - .7 Windows (GL4): Approximately 610 mm x 305 mm (24 inch x 12 inch) and spaced apart the approximate distance as indicated on Drawings installed with manufacturer's standard insulated glass.

- .8 Roller-Tire Material: Manufacturer's standard case-hardened steel.
- .9 Locking Device Assembly: inside slide lock, outside center lock with automatic latch
- .10 Counterbalance Type: Torsion spring.
- .11 Electric Door Operator: As specified in this Section.
- .12 Door Finish:
  - .1 Baked-Enamel or Powder-Coated Finish: Colour and gloss as selected by Consultant from manufacturer's full range.
  - .2 Finish of Interior Facing Material: Match finish of exterior section face.
- 2.4.4 Basis-of-Design Products: "Sentinel" by Thermostop or approved equivalent.

## **2.5 Corrosion-Resistant Aluminum Door Assembly**

- 2.5.1 Generic Locations: Car Wash
- 2.5.2 Construct corrosion-resistant panels with a rigid polyurethane core foamed in place between metal skins. Ensure reinforcement with continuous steel plates for hinge attachment.
- 2.5.3 Provide aluminum sectional door formed with hinged sections with following characteristics:
  - .1 Door thickness: 100 mm (4 inches)
  - .2 Operation Cycles: Not less than 10,000.
  - .3 Curtain R-Value: Not less than R32
  - .4 Insulation: rigid polyurethane insulation with a minimum density of 41.0 kg/m<sup>3</sup> (2.56 lbs/ft<sup>3</sup>).
  - .5 Track Configuration: Refer to Drawings.
  - .6 Weatherseals: Fitted to bottom and top and around entire perimeter of door.
    - .1 Joint and Seal: tongue-and-groove joint with a true thermal break and double bubble-shaped weather seals. Mark II models may use a single seal.
    - .2 Perimeter Seals: Provide triple-lip flexible PVC perimeter weather seal in aluminum retainer.
    - .3 Bottom Seals: U-shaped PVC double weather seals in an aluminum retainer at the door bottom.
  - .7 Windows (GL4): Approximately 610 mm x 305 mm (24 inch x 12 inch) and spaced apart the approximate distance as indicated on Drawings installed with manufacturer's standard insulated glass.

- .8 Roller-Tire Material: Manufacturer's standard case-hardened steel.
  - .9 Locking Device Assembly: inside slide lock, outside center lock with automatic latch
  - .10 Counterbalance Type: Torsion spring.
  - .11 Electric Door Operator: As specified in this Section.
  - .12 Door Finish:
    - .1 Baked-Enamel or Powder-Coated Finish: Colour and gloss as selected by Consultant from manufacturer's full range.
    - .2 Finish of Interior Facing Material: Match finish of exterior section face.
- 2.5.4 Basis-of-Design Products: "Alucent" by Thermostop or approved equivalent.

## **2.6 Tracks, Supports, And Accessories**

- 2.6.1 Tracks: Manufacturer's standard, galvanized-steel track system of configuration indicated on Drawings and Schedules, sized for door size and weight, designed for lift type indicated and clearances shown on Drawings, and complying with ASTM A653/A 653M for minimum Z180 (G60) zinc coating. Provide complete track assembly including brackets, bracing, and reinforcement for rigid support of ball-bearing roller guides for required door type and size. Slot vertical sections of track spaced 51 mm (2 inches) apart for door-drop safety device. Slope tracks at proper angle from vertical or design tracks to ensure tight closure at jambs when door unit is closed.
- 2.6.2 Track Reinforcement and Supports: Galvanized-steel track reinforcement and support members, complying with ASTM A36/A 36M or equivalent to CSA G40.20/G40.21 and ASTM A123/A 123M. Secure, reinforce, and support tracks as required for door size and weight to provide strength and rigidity without sag, sway, and vibration during opening and closing of doors.
- 2.6.3 Weatherseals: Replaceable, adjustable, continuous, compressible weather-stripping gaskets of flexible vinyl, rubber, or neoprene fitted to bottom and top of sectional door unless otherwise indicated on Drawings and Schedules.
- 2.6.4 Windows: Manufacturer's standard window units of type and size indicated on Drawings and Schedules and in arrangement shown. Set glazing in vinyl, rubber, or neoprene glazing channel for metal-framed doors and elastic glazing compound for wood doors, as required. Provide removable stops of same material as door-section frames.

---

**2.7     Hardware**

- 2.7.1 Provide heavy-duty, corrosion-resistant hardware, with hot-dip galvanized, stainless-steel, or other corrosion-resistant fasteners, to suit door type.
- 2.7.2 Hinges: Heavy-duty, galvanized-steel hinges of not less than 2.01-mm- (0.079-inch-) nominal coated thickness at each end stile and at each intermediate stile, according to manufacturer's written recommendations for door size. Attach hinges to door sections through stiles and rails with bolts and lock nuts or lock washers and nuts. Use rivets or self-tapping fasteners where access to nuts is not possible. Provide double-end hinges where required, for doors over 4.88 m (16 feet) wide unless otherwise recommended by door manufacturer.
- 2.7.3 Rollers: Heavy-duty rollers with steel ball-bearings in case-hardened steel races, mounted with varying projections to suit slope of track. Extend roller shaft through both hinges where double hinges are required. Provide 76-mm- (3-inch-) diameter roller tires for 76-mm- (3-inch-) wide track and 51-mm- (2-inch-) diameter roller tires for 51-mm- (2-inch-) wide track.
- 2.7.4 Push/Pull Handles: For push-up or emergency-operated doors, provide galvanized-steel lifting handles on each side of door.

**2.8     Locking Devices**

- 2.8.1 Slide Bolt: Fabricate with side-locking bolts to engage through slots in tracks for locking by padlock, located on single-jamb side, operable from inside only.
- 2.8.2 Locking Device Assembly: Fabricate with cylinder lock, spring-loaded deadbolt, operating handle, cam plate, and adjustable locking bars to engage through slots in tracks.
- 2.8.3 Chain Lock Keeper: Suitable for padlock.
- 2.8.4 Safety Interlock Switch: Equip power-operated doors with safety interlock switch to disengage power supply when door is locked.

**2.9     Counterbalance Mechanism**

- 2.9.1 Torsion Spring: Counterbalance mechanism consisting of adjustable-tension torsion springs fabricated from steel-spring wire complying with ASTM A229/A 229M, mounted on torsion shaft made of steel tube or solid steel. Provide springs designed for number of operation cycles indicated on Drawings and Schedules.
- 2.9.2 Cable Drums and Shaft for Doors: Cast-aluminum or gray-iron casting cable drums mounted on torsion shaft and grooved to receive door-lifting cables as door is raised. Mount counterbalance mechanism with manufacturer's standard ball-bearing brackets at

each end of torsion shaft. Provide one additional midpoint bracket for shafts up to 4.88 m (16 feet) long and two additional brackets at one-third points to support shafts more than 4.88 m (16 feet) long unless closer spacing is recommended by door manufacturer.

- 2.9.3 Cables: Galvanized-steel lifting cables with cable safety factor of at least 7 to 1.
- 2.9.4 Cable Safety Device: Include a spring-loaded steel or spring-loaded bronze cam mounted to bottom door roller assembly on each side and designed to automatically stop door if either lifting cable breaks.
- 2.9.5 Bracket: Provide anchor support bracket as required to connect stationary end of spring to the wall and to level the shaft and prevent sag.
- 2.9.6 Provide a spring bumper at each horizontal track to cushion door at end of opening operation.

## **2.10 Electric Door Operators**

- 2.10.1 Provide fail safe operator unit that is listed and approved for use on door. Provide electric door operator assembly of size and capacity recommended and provided by door manufacturer for door and "operation cycles" requirement specified, with electric motor and factory-prewired motor controls, starter, gear-reduction unit, solenoid-operated brake, clutch, remote-control stations, control devices, integral gearing for locking door, and accessories required for proper operation.
  - .1 Comply with CSA C22 SERIES.
  - .2 Provide control equipment complying with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6
  - .3 Usage Classification: Electric operator and components capable of operating for not less than number of cycles indicated for each door.
  - .4 Operator Location: As shown on Drawings.
  - .5 Emergency Manual Operation: Chain type.
  - .6 Obstruction-Detection Device: Automatic photoelectric sensor with pneumatic sensor edge on bottom bar.
    - .1 Primary Entrapment Protection Devices: NEMA 4 Monitored Photo Sensors, Photo eyes fully monitored, non-contact, photo beam reversing photo sensor system with NEMA 4 watertight enclosure shall reverse a closing door to the full open position when an obstruction is sensed; photo sensors shall be mounted no higher than 6 inches (152 mm) maximum above the floor.

- 
- .2 Ancillary Entrapment Protection Devices: Pneumatic sensing edge shall reverse a closing door to the full open position when an obstruction is sensed.
  - .3 Sensor Edge Bulb Colour: As selected by Consultant from manufacturer's full range.
  - .7 Remote-Control Station: Where shown on Drawings.
- 2.10.2 Door-Operator Type: Unit consisting of electric motor, gears, pulleys, belts, sprockets, chains, and controls needed to operate door and meet required usage classification. Provide one of the following types:
- .1 Trolley: Trolley operator mounted to ceiling above and to rear of door in raised position and directly connected to door with drawbar.
  - .2 Jackshaft, Center Mounted: Jackshaft operator mounted on the inside front wall above door and connected to torsion shaft with an adjustable coupling or drive chain.
  - .3 Jackshaft, Side Mounted: Jackshaft operator mounted on the inside front wall on right or left side of door and connected to torsion shaft with an adjustable coupling or drive chain.
- 2.10.3 Electric Motors: Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements unless otherwise indicated on Drawings and Schedules.
- .1 Motor Type and Controller: Reversible motor and controller (disconnect switch) for motor exposure indicated on Drawings and Schedules.
  - .2 Motor Size: Minimum size as indicated on Drawings and Schedules. If not indicated on Drawings and Schedules, large enough to start, accelerate, and operate door in either direction from any position, at a speed not less than 203 mm/s (8 in./sec.) and not more than 305 mm/s (12 in./sec.), without exceeding nameplate ratings or service factor.
- 2.10.4 Limit Switches: Equip each motorized door with adjustable switches interlocked with motor controls and set to automatically stop door at fully opened and fully closed positions.
- 2.10.5 Remote-Control Station: Momentary-contact, three-button control station with push-button controls labeled "Open," "Close," and "Stop."
- .1 Interior units: full-guarded, surface-mounted, heavy-duty type, with general-purpose NEMA ICS 6, Type 1 enclosure.
- 2.10.6 Emergency Operation Disconnect Device: Equip operator with hand-operated disconnect mechanism for automatically engaging manual operator and releasing brake for emergency manual operation while disconnecting motor without affecting timing of limit

switch. Mount mechanism so it is accessible from floor level. Include interlock device to automatically prevent motor from operating when emergency operator is engaged.

- 2.10.7 Motor Removal: Design operator so motor may be removed without disturbing limit-switch adjustment and without affecting emergency manual operation.

## **2.11 General Finish Requirements**

- 2.11.1 Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- 2.11.2 Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

## **3 . EXECUTION**

### **3.1 Examination**

- 3.1.1 Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrate construction and other conditions affecting performance of the Work.
- 3.1.2 Examine locations of electrical connections.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

### **3.2 Installation**

- 3.2.1 Install sectional doors and operating equipment complete with necessary hardware, anchors, inserts, hangers, and equipment supports; according to manufacturer's written instructions and as specified.
- 3.2.2 Tracks:
- .1 Fasten vertical track assembly to opening jambs and framing, spaced not more than 610 mm (24 inches) apart.
  - .2 Hang horizontal track assembly from structural overhead framing with angles or channel hangers attached to framing by welding or bolting, or both. Provide sway bracing, diagonal bracing, and reinforcement as required for rigid installation of track and door-operating equipment.
  - .3 Repair galvanized coating on tracks according to ASTM A780.
- 3.2.3 Power-Operated Doors: Install according to UL 325.

- 3.2.4 Accessibility: Install sectional doors, switches, and controls along accessible routes in compliance with regulatory requirements for accessibility.

**3.3     Startup Services**

- 3.3.1 Engage a factory-authorized service representative to perform startup service.
  - .1 Complete installation and startup checks according to manufacturer's written instructions.
  - .2 Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

**3.4     Adjusting**

- 3.4.1 Adjust hardware and moving parts to function smoothly so that doors operate easily, free of warp, twist, or distortion.
- 3.4.2 Lubricate bearings and sliding parts as recommended by manufacturer.
- 3.4.3 Adjust doors and seals to provide weathertight fit around entire perimeter.
- 3.4.4 Align and adjust motors, pulleys, belts, sprockets, chains, and controls according to manufacturer's written instructions.
- 3.4.5 Touch-up Painting: Immediately after welding galvanized materials, clean welds and abraded galvanized surfaces and repair galvanizing to comply with ASTM A780.

**3.5     Demonstration**

- 3.5.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain sectional doors.

END OF SECTION

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only.

### **1.2 Summary**

- 1.2.1 Provide labour, materials, products, equipment and services to complete the Sliding Automatic Entrances work specified herein. This includes, but is not necessarily limited, to:
  - .1 Exterior and interior, sliding, power-operated automatic entrances.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.
  - .1 Related requirements provided below are for convenience purposes only.
    - .1 Section 05 50 00 - Metal Fabrications.
    - .2 Section 08 44 13 - Glazed Aluminum Curtain Walls.
    - .3 Section 08 80 05 – General Requirements for Glass And Glazing.
    - .4 Division 26, Electrical.
    - .5 Division 28, Electronic Safety and Security.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

---

**1.4 Definitions**

- 1.4.1 AAADM: American Association of Automatic Door Manufacturers.
- 1.4.2 Activation Device: A control that, when actuated, sends an electrical signal to the door operator to open the door.
- 1.4.3 Safety Device: A control that, to avoid injury, prevents a door from opening or closing.
- 1.4.4 For automatic door terminology, refer to BHMA A156.10 for definitions of terms.

**1.5 Coordination**

- 1.5.1 Coordinate sizes and locations of recesses in concrete floors for recessed sliding tracks that control automatic entrances. Concrete, reinforcement, and formwork requirements are specified elsewhere.
- 1.5.2 Templates: Distribute for doors, frames, and other work specified to be factory prepared for installing automatic entrances.
- 1.5.3 Coordinate hardware with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish. Coordinate hardware for automatic entrances with hardware required for rest of Project.
- 1.5.4 Electrical System Roughing-in: Coordinate layout and installation of automatic entrances with connections to power supplies and access-control system.
- 1.5.5 System Integration: Integrate sliding automatic entrances with other systems as required for a complete working installation.
  - .1 Provide electrical interface control capability for activation of sliding automatic entrances by security access system on doors with electric locking.
  - .2 Provide electrical interface to deactivate door operators on activation of fire alarm system.
  - .3 Provide electrical interface to allow for remote monitoring of automatic entrance door panel status.

**1.6 Preinstallation Meetings**

- 1.6.1 Pre-installation Meetings: Schedule, and conduct pre-installation meeting at Project Site, in order to coordinate work of this Section, with work of related Subcontractors.
  - .1 Ensure attendance of Subcontractor performing work of this Section and representatives of manufacturers and fabricators involved in, or affected by, installation and coordination with other materials and installations that have preceded or will follow. Advise Consultant and Owner in advance of scheduled meeting dates.

- .2 Agenda: Review progress of other construction activities and preparations for the particular activity under consideration.
- .3 Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
- .4 Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.

## **1.7 Submittals**

1.7.1 General Requirements and Procedures for Submittals: In accordance with Section 01 33 00, Submittal Procedures.

1.7.2 Product Data: Submit product data for the following:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Sliding Automatic Entrances work and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for automatic entrances.
- .3 Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

1.7.3 Product Disclosure and Transparency:

- .1 Environmental Product Declarations (EPD): When available, submit Product-specific Type III EPD or industry-wide (generic) EPD conforming to ISO 14025 or other recognized environmental product declaration framework.
- .2 Material Ingredient Reporting: When available, submit documentation demonstrating chemical inventory of materials to at least 0.1% (1000ppm) and conforming to one of the following:
  - .1 Health Product Declaration open Standard,
  - .2 Cradle to Cradle v2 Basic level or Cradle to Cradle v3 Bronze level,
  - .3 International Living Future Institute Declare
  - .4 Other approved framework.
- .3 When multiple Products are specified, give preference to Products with compliant documentation.

1.7.4 Shop Drawings: Submit for sliding automatic entrances.

- .1 Include plans, elevations, sections, hardware mounting heights, and attachment details.

- .2 Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
- .3 Include diagrams for power, signal, and control wiring.
- .4 Indicate locations of activation and safety devices.
- .5 Include hardware schedule and indicate hardware types, functions, quantities, and locations.
- 1.7.5 Samples: Submit for units with factory-applied colour finishes.
  - .1 Include Samples of hardware and accessories involving colour or finish selection.
  - .2 Submit samples in manufacturer's standard sizes for each type of exposed finish required.
- 1.7.6 Sample Warranties: Submit sample warranties for special warranties specified in this section..

**1.8 Closeout Submittals**

- 1.8.1 Operation and Maintenance Data: Submit maintenance data for automatic entrances, safety devices, and control systems to include in operation and maintenance manuals.

**1.9 Quality Assurance**

- 1.9.1 Manufacturer Qualifications: A manufacturer with Company Certificate issued by AAADM indicating that manufacturer has a Certified Inspector on staff.
- 1.9.2 Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation and maintenance of units required for this Project and who employs a Certified Inspector.
  - .1 Certified Inspector Qualifications: Certified by AAADM.
- 1.9.3 Source Limitations for Automatic Entrances: Obtain each type of door, frame, operator and sensor components specified in this Section from a single source, same manufacturer unless otherwise indicated.
- 1.9.4 Emergency Exit door requirements: Comply with requirements of authorities having jurisdiction for automatic entrance doors serving as a required means of egress.

**1.10 Project Conditions**

- 1.10.1 Field Measurements: Verify actual dimensions of openings to receive automatic entrances by field measurements before fabrication and indicate on shop drawings.

**1.11 Warranty**

1.11.1 Extended Warranty: Repair or replace components of automatic entrances that fail in materials or workmanship within specified warranty period.

- .1 Failures include, but are not limited to, the following:
  - .1 Structural failures including, but not limited to, excessive deflection.
  - .2 Faulty operation of operators, controls, and hardware.
  - .3 Deterioration of metals, metal finishes, and other materials beyond normal weathering and use.
- .2 Warranty Period: Two years from date of Substantial Performance of the Work.

1.11.2 Extended Warranty for Finishes: Repair or replace components on which finishes fail in materials or workmanship within specified warranty period.

- .1 Deterioration includes, but is not limited to, the following:
  - .1 Colour fading more than 5 Hunter units when tested according to ASTM D2244.
  - .2 Chalking in excess of a No. 8 rating when tested according to ASTM D4214.
  - .3 Cracking, checking, peeling, or failure of paint to adhere to bare metal.
- .2 Warranty Period: 10 years from date of Substantial Performance of the Work.

**2. PRODUCTS**

**2.1 Manufacturers**

2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.

- .1 Assa Abloy
- .2 Horton Automatics
- .3 Stanley Access Technologies
- .4 Record USA

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

---

## **2.2     Performance Requirements**

- 2.2.1 Employ the services of a Professional Engineer licensed to practice in the Province of Ontario carrying professional liability insurance, and who is experienced in providing engineering services of similar kind, scope and complexity; to design and certify automatic entrances.
- 2.2.2 Electrical Components, Devices, and Accessories: Listed and labeled as defined in CSA C22 Series, by a qualified testing agency, and marked for intended location and application.
- 2.2.3 Power-Operated Door Standard: BHMA A156.10 and UL 325.
- 2.2.4 Automatic door equipment must accommodate medium to heavy pedestrian traffic.
- 2.2.5 Entrapment Force Requirements:
  - .1 Power Operated Sliding Doors: Not more than 30 lbf (133 N) required to prevent stopped door from closing.
  - .2 Sliding doors provided with a breakaway device shall require no more than 50 lbf (222N) applied 25 mm (1 inch) ( ) from the leading edge of the lock stile for the breakout panel to open.
- 2.2.6 Energy Code Requirements: Sliding automatic entrances that are required to meet construction energy code requirements in those districts that have adopted ASHRAE 90.1-2010/2013 and OBC SB10 shall have been evaluated based on methodology in accordance with the following National Fenestration Rating Council (NFRC) standards:
  - .1 NFRC 100, NFRC 200-, and NFRC 500 and ASTM 283.
- 2.2.7 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.
  - .1 Temperature Change: 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.
- 2.2.8 Operating Temperature Range: Automatic entrances shall operate within - 29 to + 50 deg C (minus 20 to plus 122 deg F).
- 2.2.9 Air Infiltration: Maximum air leakage through fixed glazing and framing areas of 5 L/s x sq. m (1 cfm/sq. ft.)] of fixed entrance-system area when tested according to ASTM E283 at a minimum static-air-pressure difference of 75 Pa (1.57 lbf/sq. ft.).

## **2.3     Bi-Parting Automatic Sliding Doors**

- 2.3.1 Description: manufacturer's standard automatic entrance door assemblies, including doors, sidelights, framing, headers, carrier assemblies, roller tracks, door operators, activation and safety devices, and accessories required for a complete installation.

- 2.3.2 Framing Members: Manufacturer's standard extruded aluminum reinforced as required to support imposed loads.
- 2.3.3 Stile and Rail Design: to be selected by Consultant during Shop Drawings review.
- 2.3.4 Traffic Pattern: Two-way.
- 2.3.5 Locking: Electrified slide lock - Fail Safe: The slide lock is to unlock the sliding function upon loss of power.; ensure compatibility with security systems and facilitate integration.
- 2.3.6 Emergency Breakaway Capability: Sliding leaves and sidelights.
- 2.3.7 Mounting and Configuration: As noted on Drawings.
- 2.3.8 Finish: Class II, Clear Anodic Finish
- 2.3.9 Basis-of-Design:
  - .1 Exterior of Vestibule (Building Envelope): "Dura-Glide™ GreenStar 3000" by Stanley Access Technologies or approved equivalent.
  - .2 Interior of Vestibule and other Interior Locations: "Dura-Glide™ 3000" by Stanley Access Technologies or approved equivalent.

## **2.4     Telescoping (3 Panels) Automatic Sliding Doors**

- 2.4.1 Description: manufacturer's standard automatic entrance door assemblies, including doors, sidelights, framing, headers, carrier assemblies, roller tracks, door operators, activation and safety devices, and accessories required for a complete installation.
- 2.4.2 Traffic Pattern: Two-way.
- 2.4.3 Locking: Electrified slide lock - Fail Safe: The slide lock is to unlock the sliding function upon loss of power.; ensure compatibility with security systems and facilitate integration.
- 2.4.4 Stile and Rail Design: to be selected by Consultant during Shop Drawings review.
- 2.4.5 Emergency Breakaway Capability: Sliding leaves and sidelights.
- 2.4.6 Mounting and Configuration: As noted on Drawings.
- 2.4.7 Finish: Class II, Clear Anodic Finish
- 2.4.8 Basis-of-Design: "Dura-Glide™ 5300" by Stanley Access Technologies or approved equivalent.

## **2.5     Smoke-Sealed Automatic Entrance**

- 2.5.1 Smoke- and Draft-Control Assemblies: to UL 1784.
- 2.5.2 Provide manufacturer's standard automatic entrances, including doors, sidelites, framing, headers, carrier assemblies, roller tracks,

door operators, controls, and accessories required for a complete installation.

- 2.5.3 Required at door type "D104B" as indicated on Drawings.
- 2.5.4 Configuration: 3-panel telescoping sliding doors with three sliding leaves , transom, sidelites on each side as shown on Drawings.
  - .1 Traffic Pattern: Two way.
  - .2 Emergency Breakaway Capability: Sliding leaves only.
  - .3 Mounting: as shown on Drawings.
- 2.5.5 Controls: Activation and safety devices according to BHMA standards.
  - .1 Activation Device: Motion sensor mounted on each side of door header to detect pedestrians in activating zone and to open door.
- 2.5.6 Finish: Finish framing, door(s), and header with Class I, clear anodic finish.
- 2.5.7 Basis-of-Design: "Dura-Care 7500A Telescoping Automatic ICU Door" by Stanley Access Technologies or approved equivalent.

## **2.6 Entrance Components**

- 2.6.1 Stile and Rail Sliding Panels and Sidelites:
  - .1 Material: Extruded Aluminum, Alloy 6063-T5.
  - .2 Door panels shall have a minimum 3.2 mm (.125 inch) structural wall thickness including adjoining horizontal members and perimeter frames where applicable.
  - .3 Door Construction shall be by means of an integrated corner block with 3/8 inch all-thread through bolt from each stile.
  - .4 Glass stops shall be 15.8 mm (.062 inch) wall thickness and shall provide security function as a standard by means of a fixed non-removable exterior section with glazing to be performed from the interior only.
  - .5 Full breakout sliding entrances shall include two interlocks per moving panel securing the leading stile of the sidelite and the butt stile of the sliding door panel together.
- 2.6.2 Vertical Stiles shall be medium stile 102 mm (4 inch) .
- 2.6.3 Bottom Rails shall be 178 mm (7 inch) .
- 2.6.4 Weather-Stripping: Slide-in type, replaceable pile mohair seals retained by the aluminum extrusions. The following types of weather-stripping are required: complementing weather-stripping on the joining vertical stiles of the sidelite and sliding door panels, complementing weather-stripping on the lead edge of the lock stiles of bi-parting doors, single pile weather-stripping between the carrier

and the header, single pile weather-stripping on the lead edge stile of single slide door panels, dual pile weather-stripping on the pivot stile of breakout sidelite panels, and dual pile weather-stripping on the butt stile of fixed sidelite panels. Bottom rails shall be provided with an adjustable nylon sweep.

- 2.6.5 Door Seals: High pile mohair weather stripping on the lock stile of the sliding doors, integrated mohair weather stripping with vinyl fin on the joining vertical stiles of the sidelite and sliding door panels, and expandable foam inserts in leading stile of sidelite panels at pockets for interlocks. Bottom rails shall be provided with a concealed adjustable nylon sweep.

.1 Smoke sealing capacity to be provided here required at FRR.

- 2.6.6 Headers: Fabricated from minimum 3.2-mm- (0.125-inch-) thick extruded aluminum and extending full width of automatic entrance units to conceal door operators and controls. Provide hinged or removable access panels for service and adjustment of door operators and controls. Secure panels to prevent unauthorized access.

- 2.6.7 Brackets and Reinforcements: High-strength aluminum with nonstaining, nonferrous shims for aligning system components.

- 2.6.8 Signage: As required by cited BHMA standard.

.1 Provide sign materials with instructions for field application after glazing is installed.

- 2.6.9 Glazing: comply with Section 08 80 05 General Requirements for Glass and Glazing.

.1 Exterior door: Insulating glass units to match curtain wall glazing in all respects.

.2 Interior door: Fully tempered glass as specified in Section 08 81 23, Exterior Glass and Glazing.

## **2.7 Door Operators And Controls**

- 2.7.1 Provide operators and controls, which include activation and safety devices, according to BHMA standards, for condition of exposure, and for long-term, maintenance-free operation under normal traffic load for type of occupancy indicated.

- 2.7.2 Door Operators: Provide door operators of size recommended by manufacturer for door size, weight, and movement.

.1 Door Operator Performance: Door operators shall open and close doors and maintain them in fully closed position when subjected to Project's design wind loads.

- 2.7.3 Motion Sensors: Self-contained, K-band-frequency, microwave-scanner units; fully enclosed by their plastic housings; adjustable to

provide detection-field sizes and functions required by BHMA A156.10.

- 2.7.4 Presence Sensors: Self-contained, active-infrared scanner units; adjustable to provide detection-field sizes and functions required by BHMA A156.10. Sensors shall remain active at all times.
- 2.7.5 Photoelectric Beams: Pulsed infrared, sender-receiver assembly for recessed mounting. Beams shall not be active when doors are fully closed.
- 2.7.6 Electrical Interlocks: Unless units are equipped with self-protecting devices or circuits, provide electrical interlocks to prevent activation of operator when door is locked, latched, or bolted.

## **2.8     Hardware**

- 2.8.1 Provide units in sizes and types recommended by automatic entrance and hardware manufacturers for entrances and uses indicated. Finish exposed parts to match door finish unless otherwise indicated.
- 2.8.2 Breakaway Device for Power-Operated Doors: Device that allows door to swing out in direction of egress to full 90 degrees from any operating position. Maximum force to open door shall be as stipulated in this Section. Interrupt powered operation of door operator while in breakaway mode.
- 2.8.3 Automatic Locking: Electrically controlled device mounted in header that automatically locks sliding door in closed position, preventing door panels from sliding manually. Provide fail-safe operation if power fails.
  - .1 Power Interruption: Lock shall be disengaged, allowing doors to slide manually.
  - .2 Means of Egress: Standard breakaway feature.
- 2.8.4 Weather Stripping: Replaceable components.
  - .1 Sliding Type: AAMA 701/702, made of wool, polypropylene, or nylon woven pile with nylon-fabric or aluminum-strip backing.

## **2.9     Fabrication**

- 2.9.1 Factory fabricate automatic entrance components to designs, sizes, and thicknesses indicated and to comply with indicated standards.
  - .1 Form aluminum shapes before finishing.
  - .2 Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

- 
- .3 Use concealed fasteners to greatest extent possible. Where exposed fasteners are required, use countersunk Phillips flat-head machine screws.
    - .1 Where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration, use self-locking devices.
    - .2 Reinforce members as required to receive fastener threads.
  - .4 Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.
- 2.9.2 Framing: Provide automatic entrances as prefabricated assemblies. Complete fabrication, assembly, finishing, hardware application, and other work before shipment to Project site.
- .1 Fabricate tubular and channel frame assemblies with welded or mechanical joints. Provide subframes and reinforcement as required for a complete system to support required loads.
  - .2 Perform fabrication operations in manner that prevents damage to exposed finish surfaces.
  - .3 Form profiles that are sharp, straight, and free of defects or deformations.
  - .4 Provide components with concealed fasteners and anchor and connection devices.
  - .5 Fabricate components with accurately fitted joints, with ends coped or mitered to produce hairline joints free of burrs and distortion.
  - .6 Fabricate exterior components to drain water passing joints, condensation occurring within framing members, and moisture migrating within system to exterior. Provide anchorage and alignment brackets for concealed support of assembly from building structure.
  - .7 Allow for thermal expansion of exterior units.
- 2.9.3 Doors: Factory fabricated and assembled in profiles indicated. Reinforce as required to support imposed loads and for installing hardware.
- 2.9.4 Door Operators: Factory fabricated and installed in headers, including adjusting and testing.
- 2.9.5 Glazing: Fabricate framing with minimum glazing edge clearances for thickness and type of glazing indicated, according to GANA's "Glazing Manual."

- 2.9.6 Hardware: Factory install hardware to greatest extent possible; remove only as required for final finishing operation and for delivery to and installation at Project site. Cut, drill, and tap for factory-installed hardware before applying finishes.
- .1 Provide sliding-type weather stripping, mortised into door, at perimeter of doors and breakaway sidelites.
- 2.9.7 Controls: Factory install activation and safety devices in doors and headers as required by BHMA A156.10 for type of door and direction of travel.

**2.10 General Finish Requirements**

- 2.10.1 Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
- 2.10.2 Apply organic and anodic finishes to formed metal after fabrication unless otherwise indicated.
- 2.10.3 Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of Samples reviewed by Consultant and are assembled or installed to minimize contrast.

**3 . EXECUTION**

**3.1 Examination**

- 3.1.1 Examine conditions, with Installer present, for compliance with requirements for installation tolerances, header support, and other conditions affecting performance of automatic entrances.
- 3.1.2 Examine roughing-in for electrical systems to verify actual locations of power connections before automatic entrance installation.
- 3.1.3 Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2 Installation**

- 3.2.1 Install automatic entrances according to manufacturer's written instructions and cited BHMA A156.10 for direction of pedestrian travel, including signage, controls, wiring, and connection to the building's power supply.
- .1 Do not install damaged components. Fit frame joints to produce hairline joints free of burrs and distortion. Rigidly secure nonmovement joints. Seal joints watertight.

- .2 Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape recommended by manufacturer for this purpose.
- .3 Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous coating.
- 3.2.2 Entrances: Install automatic entrances plumb and true in alignment with established lines and grades without warp or rack of framing members and doors. Anchor securely in place.
  - .1 Install surface-mounted hardware using concealed fasteners to greatest extent possible.
  - .2 Set headers, carrier assemblies, tracks, operating brackets, and guides level and true to location with anchorage for permanent support.
  - .3 Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within system to exterior.
  - .4 Level recesses for recessed thresholds using nonshrink grout.
- 3.2.3 Door Operators: Connect door operators to electrical power distribution system.
- 3.2.4 Controls: Install and adjust activation and safety devices according to manufacturer's written instructions and cited BHMA standard for direction of pedestrian travel. Connect control wiring according to Division 26, Electrical.
- 3.2.5 Glazing: Install glazing as specified in Section 08 80 05 General Requirements for Glass and Glazing.
- 3.2.6 Sealants: Comply with requirements specified in Section 07 92 00 - Joint Sealants to provide weathertight installation. Seal perimeter of framing members with sealant.
- 3.2.7 Signage: Apply signage on both sides of each door and breakaway sidelite, as required by cited BHMA standard for direction of pedestrian travel.
- 3.2.8 Wiring within Automatic Entrance Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's written limitations on bending radii. Provide and use lacing bars and distribution spools.

### **3.3 Field Quality Control**

- 3.3.1 Certified Inspector: Contractor must engage a Certified Inspector to test and inspect components, assemblies, and installations, including connections.

- 
- .1 Test and inspect each automatic entrance, using AAADM inspection forms, to determine compliance of installed systems with applicable BHMA standards.
    - .2 Automatic entrances will be considered defective if they do not pass tests and inspections.
  - 3.3.2 Prepare test and inspection reports.
  - 3.4 Adjusting**
    - 3.4.1 Adjust hardware, moving parts, door operators, and controls to function smoothly, and lubricate as recommended by manufacturer; comply with requirements of applicable BHMA standards.
      - .1 Adjust exterior doors for tight closure.
  - 3.5 Cleaning**
    - 3.5.1 Clean glass and metal surfaces promptly after installation. Remove excess glazing and sealant compounds, dirt, and other substances. Repair damaged finish to match original finish.
  - 3.6 Demonstration**
    - 3.6.1 Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain automatic entrances.

END OF SECTION

## **1. GENERAL**

### **1.1 Summary**

1.1.1 Provide labour, materials, Products, equipment and services to complete the glazed aluminum curtain wall work specified herein. This includes, but is not necessarily limited, to:

- .1 curtain wall framing, anchors, glass, glazing, panels, insulation, sealants, windows, doors and other components required for a complete system and its installation, either directly or by reference.
- .2 metal framing for glass, panels and other components indicated on drawings and forming part of the work of this section.
- .3 anchors, brackets and attachments
- .4 air barrier interfaces
- .5 auxiliary materials required for a complete installation.

1.1.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section.

### **1.2 References**

1.2.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to Section 01 42 19 for list of standards used in Specifications.

### **1.3 Submittals**

1.3.1 Product Data: Submit product data in accordance with Division 01 for the following:

- .1 Submit manufacturer's instructions, printed product literature and data sheets for the Glazed Aluminum Curtain Walls work and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.

1.3.2 Shop Drawings: Submit Shop Drawings indicating the following:

- .1 Scaled elevations and sections. Provide full-scale sections when required for clarity.
- .2 Include, as applicable, hardware schedule, sheet metal and glass thicknesses, metal finishes, and other pertinent information necessary for thorough evaluation of work of this Section.

- .3 Provide clear indications of field connections and anchorages, as well as relationships to work of other Sections, as required to coordinate with other building trades.
  - .4 Provide information on fastening and sealing methods and other Product joinery to ensure proper field installation and performance.
  - .5 Air Barrier Interface Detailing: Indicate details of air barrier interface materials, accessories, fastening, seals, and relationship to The Work as necessary to coordinate The Work with other building trades.
    - .1 Air barrier interface details must clearly indicate plane of primary air and water resistance of (a) air barrier system, and (b) the curtain wall framing to which it attaches.
    - .2 Manufacturer's literature must clearly indicate intended plane of primary air and water resistance for curtain wall system.
  - .6 Do not start fabrication or installation of work of this Section until Shop Drawings have been reviewed by Consultant.
- 1.3.3 Curtain Wall Design Completion Delegated to Contractor:
- .1 Submit Shop Drawings for the work of this Section that bear the stamp of a Professional Engineer registered in the Province of Ontario, and as noted in the Owner's supplementary conditions.
  - .2 Professional Engineer's Responsibility:
    - .1 Professional Engineer must be responsible for production and review of Shop Drawings, including full curtain wall design and design of components requiring structural performance in accordance with applicable codes and regulations, as well as stamping and signing of each Shop Drawing and associated calculations.
  - .3 Structural Calculations: Submit, upon request, copies of structural calculations performed by curtain wall Subcontractor's Professional Engineer in connection with design and detailing of curtain system.
- 1.3.4 Samples:
- .1 Submit samples for units with factory-applied colour finishes. Where finishes involve colour and texture variations, include sample sets showing the full range of variations expected.
  - .2 Fabrication Sample: Submit fabrication sample of each vertical-to-horizontal intersection of assemblies, made from 300 mm (12-inch) lengths of full-size components and displaying details of joinery, including concealed welds, anchorage, expansion provisions, glazing and flashing and drainage.
- 1.3.5 Energy Simulation:

- 
- .1 Performance of Glazing: simulated using WINDOW (latest edition) software by Lawrence Berkley Laboratories (LBL).
  - .2 Performance of Framing: simulated using THERM software by LBL using CAN/CSA A440.2 calculation methods.
  - .3 Simulations must be carried out by a qualified simulator and summary reports must bear seal of a Professional Engineer.
  - .4 Thermal performance of curtain wall framing and spandrel based on relevant framing modules (including effects of frame and glass area) must have a maximum U value as specified in this Section.
  - .5 Alternately test results based on testing in accordance with AAMA 1503.1 may be submitted in lieu of energy simulation to verify performance.
- 1.3.6 Statistical Glass Breakage Analysis: Submit statistical glass breakage analysis substantiating glass breakage risk criteria and conformance with requirements specified in this Section.
  - 1.3.7 Preconstruction Sealant Compatibility and Adhesion Testing: Submit test results of compatibility testing specified in this Section.
  - 1.3.8 Sample Warranties: Submit manufacturer's sample warranties for extended warranties specified in this Section.
  - 1.3.9 Test and Evaluation Reports: Submit certified test reports on performance of curtain wall systems and components demonstrating compliance with requirements of this Section.
  - 1.3.10 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback.

#### **1.4 Closeout Submittals**

- 1.4.1 Maintenance Data: Submit maintenance data for glazed aluminum curtain walls to include in maintenance manuals.
- 1.4.2 Maintenance Data for Structural Sealant: For structural-sealant-glazed curtain walls to include in maintenance manuals. Include ASTM C1401 recommendations for post-installation-phase quality-control program.

#### **1.5 Quality Assurance**

- 1.5.1 Installer Qualifications: An entity that employs installers and supervisors who are trained and reviewed by manufacturer. Entity must specialize in erection of glazed aluminum curtain wall components and must have successfully produced work similar in design and extent to that required for the project, in not less than three Projects of similar scope, and whose work has resulted in

construction with a record of successful in-service performance for a period of 10 years.

- .1 Ensure installer has sufficient production capacity, organized quality control and testing procedures, and published written and illustrated installation manuals, to produce and properly Install curtain wall system without causing delay in progress of The Work.
- 1.5.2 Welding: performed by skilled and qualified mechanics licensed in accordance with local building regulations and in conformance with CSA W47.1 for steel and CSA W47.2 for aluminum.
- 1.5.3 Preconstruction Adhesion and Compatibility Testing for Sealants: Submit samples of each glazing material type, tape sealant, gasket, glazing accessory, and glass-framing member that are near or touch structural or nonstructural sealants of structural glazed system to manufacturer of glazing sealant for testing.
  - .1 Compatibility: Test materials or components using ASTM C1087.
  - .2 Adhesion: Test for adhesion or lack of adhesion of a structural sealant to the surface of another material or component using ASTM C1135.
  - .3 Submit no fewer than pieces of each type of material, including joint substrates, shims, joint-sealant backings, secondary seals, and miscellaneous materials.
  - .4 Schedule sufficient time for testing and analyzing results to prevent delaying The Work.
  - .5 For materials failing tests, obtain sealant manufacturer's written instructions for corrective measures, including the use of specially formulated primers.
  - .6 Testing will not be required if data based on previous testing of current sealant Products match those submitted.
- 1.5.4 Single-source responsibility: Obtain curtain-wall system components, such as framing, operable windows (as applicable), entrances, sun control devices (as applicable), and other components and accessories, from a single manufacturer or from sources reviewed by primary curtain wall manufacturer.
- 1.5.5 Testing Laboratory Qualifications: ASTM E699-qualified for testing and accredited by AAMA, SCC, IAS, or ILAC Mutual Recognition Arrangement as complying with ISO/IEC 17025 and specifically qualified to conduct laboratory and field performance tests required in this Section.
  - .1 Performance tests conducted in curtain wall Supplier's laboratories must be performed by accredited laboratory

---

personnel and witnessed and validated by a licensed Professional Engineer.

**1.6 Field Visual Mock-Up Of Exterior Curtain Wall System**

- 1.6.1 Construct mock-ups to verify selections made under Sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation. Provide required labour and materials to construct mock-up.
- 1.6.2 Build mock-up on site complete with glass, aluminum framing, adjacent cladding materials, anchors, connections, flashings, sealants, and joint fillers as noted on final Shop Drawings.
- 1.6.3 Alignment and fit of curtain wall systems and components, including visual mockups, installed curtain wall systems, and related trim and accessories, must be assessed in natural light with an unaided eye at a distance of 3 m (10 ft) from the outermost or innermost surface.
- 1.6.4 Use techniques that represent those to be used on The Work. Do not enclose interior side of wall with interior finishes and insulation materials.
- 1.6.5 Review of mock-ups does not constitute approval of deviations from Contract Documents contained in mock-ups unless Consultant specifically accepts such deviations in writing.
- 1.6.6 Reviewed mock-ups may become part of the completed Work if undisturbed at time of Substantial Performance of The Work.
- 1.6.7 Build mock-up of typical wall area as directed on site.

**1.7 Delivery, Storage And Handling**

- 1.7.1 Conform to AAMA CW-10, "Care and Handling of Architectural Aluminum from Shop to Site," for handling of materials.
- 1.7.2 Identify curtain wall system components after fabrication. Ensure packaging protects curtain wall components from damage during transport and hoisting.
- 1.7.3 Materials must not be exposed to damage from moisture, foot traffic, or the operations of other trades. Stack materials such that they do not bend or are subjected to excessive pressure or abrasion.
- 1.7.4 Aluminum, stainless steel, and other metal components susceptible to galvanic action must be stored in a clean, dry location away from uncured concrete and masonry. Cover with water-resistant paper, tarpaulin, or polyethylene sheeting to permit air to circulate within covering.
- 1.7.5 Keep handling on-site to a minimum. Take special precautions to avoid damaging the finishes of materials.

---

**1.8 Project Conditions**

- 1.8.1 Field Measurements: Verify dimensions of supporting structure by field measurements before fabrication so that curtain wall work will be accurately designed, fabricated and fitted to the structure. Indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying The Work.
- 1.8.2 Established Dimensions: Where field measurements cannot be made without delaying The Work, establish dimensions and proceed with fabricating curtain wall work without field measurements. Coordinate supporting structure construction to ensure actual dimensions correspond to established dimensions.

**1.9 Warranty**

- 1.9.1 Extended Assembly Warranty: Repair or replace components of glazed aluminum curtain wall that do not comply with requirements or that fail in materials or workmanship within specified warranty period.
- .1 Failures include, but are not limited to, the following:
    - .1 Structural failures including, but not limited to, excessive deflection.
    - .2 Noise or vibration created by wind and thermal and structural movements.
    - .3 Deterioration of metals, metal finishes, and other materials beyond normal weathering.
    - .4 Water penetration through fixed glazing and framing areas.
    - .5 Failure of operating components.
  - .2 Warranty Period: 10 years from date of Substantial Performance of The Work.
- 1.9.2 Extended Warranty for Finishes, Anodized Finishes: Standard form in which manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of anodized finishes within specified warranty period.
- .1 Deterioration includes, but is not limited to, the following:
    - .1 Colour fading more than 5 Delta E units when tested in accordance with ASTM D2244.
    - .2 Chalking in excess of a No. 8 rating when tested in accordance with ASTM D4214.
    - .3 Cracking, peeling, or chipping.
  - .2 Warranty Period: 10 years from date of Substantial Performance of The Work.

- 1.9.3 Extended Warranty on Insulating Glass: Manufacturer's standard form in which insulating-glass manufacturer agrees to replace insulating-glass units that deteriorate within specified warranty period.
- .1 Deterioration of insulating glass is defined as: failure of hermetic seal under normal use that is not attributed to glass breakage or to maintaining and cleaning insulating glass contrary to manufacturer's written instructions. Evidence of failure is the obstruction of vision by dust, moisture, or film on interior surfaces of glass.
  - .2 Warranty Period: 10 years from date of Substantial Performance of The Work.
- 1.9.4 Extended Warranty on Laminated Glass: Manufacturer's standard form in which laminated-glass manufacturer agrees to replace laminated-glass units that deteriorate within specified warranty period.
- .1 Deterioration of laminated glass is defined as: defects developed from normal use that are not attributed to glass breakage or to maintaining and cleaning laminated glass contrary to manufacturer's written instructions. Defects include edge separation, delamination materially obstructing vision through glass, and blemishes exceeding those allowed by referenced laminated-glass standard.
  - .2 Warranty Period: Five years from date of Substantial Performance of The Work.
- 1.9.5 Extended Warranty on Sealants: Manufacturer's standard form in which joint-sealant manufacturer agrees to Supply joint sealants to repair or replace those that do not comply with performance and other requirements specified in this Section within specified warranty period.
- .1 Warranty Period: 20 years from date of Substantial Performance of The Work.

## **2 . PRODUCTS**

### **2.1 Manufacturers**

- 2.1.1 Products from the following manufacturers may be acceptable for inclusion into The Work, provided they meet requirements of Contract Documents.
- .1 Alumaticor
  - .2 Flynn Group of Companies
  - .3 Harmon;
  - .4 Kawneer North America; an Alcoa company.

.5 Oldcastle Building Envelope.

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

## **2.2 Description**

2.2.1 Glazed aluminum curtain wall defined in this Section and forming part of the exterior building enclosure is as follows:

### **.1 CW-1 (2SSG):**

- .1 Framing: Manufacturer's extruded- or formed-aluminum framing members of thickness required and reinforced as required to support imposed loads.
- .2 Construction: Thermally-broken.
- .3 Sightlines: 63.5 mm (2-1/2 inches)
- .4 Back Section: As noted on Drawings.
- .5 Pressure Plate: Aluminum or as required to meet thermal performance requirements.
- .6 Glazing System: 2-sided SSG - Retained mechanically with gaskets on two sides and structural sealant on two sides.
- .7 Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
- .8 Steel Reinforcement: As required by manufacturer.
- .9 Locations: As noted on Drawings
- .10 Basis-of-Design: "Thermawall 2600" by Alumicor or approved equivalent.

### **.2 CW-2 (4SSG):**

- .1 Framing: Manufacturer's extruded- or formed-aluminum framing members of thickness required and reinforced as required to support imposed loads.
- .2 Construction: Thermally-broken.
- .3 Sightlines: 63.5 mm (2-1/2 inches)
- .4 Back Section: As noted on Drawings.
- .5 Glazing System: 4-sided SSG - Retained with structural sealant on four sides.
- .6 Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
- .7 Steel Reinforcement: As required by manufacturer.
- .8 Locations: As noted on Drawings

- .9 Basis-of-Design: "Thermawall 2600" by Alumicor or approved equivalent.

## **2.3 Design And Performance Requirements**

- 2.3.1 Curtain wall system must meet or exceed requirements specified in AAMA CWM-19 (Curtain Wall Design Manual, 2019).
- 2.3.2 Indicative Design Concept:
- .1 Information on Drawings and in Specifications establishes requirements for aesthetic effects and performance characteristics of assemblies.
  - .2 Information noted on Drawings is to be considered diagrammatic and conveys only aesthetic effects as indicated by governing dimensions, arrangements, alignment, and profiles of components and assemblies in relation to sightlines, each other, and adjacent construction.
  - .3 Do not alter intended aesthetic effects except with Consultant's express permission. Maintain general design concept without changing the size, profiles, or alignment of the components.
  - .4 Variations in details or materials must not have an adverse effect on appearance, durability, or strength of components, nor subject building structure to excessive stress or deflection.
  - .5 Submit detailed explanatory data to Consultant for review if changes are proposed.
- 2.3.3 Demonstration of Compliance: demonstrated by submitting appropriate manufacturer's standard test reports, calculations, and other documentation.
- 2.3.4 Provision For Thermal Movement:
- .1 Curtain wall system must be designed to accommodate expansion and contraction of component materials caused by exterior metal surface temperatures ranging from -35 deg C (-31 deg F) to 85 deg C (185 deg F) without buckling, excessive stress on glass, joint seal failure, excessive stress on structural elements, damaging loads on fasteners, performance reduction, or other detrimental effects.
- 2.3.5 Structural Design:
- .1 Curtain wall system must be designed to withstand specified design wind pressures specified in this Section. Compliance must be demonstrated by calculations performed in accordance with accepted engineering practice as established by OBC, AA, CISC, AISC, and AAMA, as applicable for materials in question.
  - .2 Wind Loads: Design curtain wall systems to withstand wind loads acting perpendicular to plane of wall based on Limit States Design and a 1 in 50-year return period in accordance

- 
- with requirements of the Ontario Building Code and Cladding Wind Load Study for the geographical location of the Project.
- .3 Air barrier interfaces must be designed to withstand same design wind load as air barrier systems to which they attach.
- 2.3.6 Seismic Performance: Provide products and systems specified in this Section to withstand the effects of earthquake motions in accordance with OBC 4.1.8.18 and CAN/CSA S832.
- .1 Professional engineer specified in Division 01 and referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems.
- .2 Refer to Structural Drawings for seismic sensitivity values.
- 2.3.7 Deflection Limitations: Deflection of framing member in direction perpendicular to plane of wall when subject to design loads specified:
- .1 Span of 4.1 m (13'-6") or less: Maximum  $L/175$
- .2 Span over 4.1 m (13'-6"): Maximum  $L/240 + 6 \text{ mm } (1/4")$
- .3 Unsupported cantilevers:  $2L/175$
- .4 At plastered surfaces or gypsum board subjected to bending: Maximum  $L/360$ .
- .5 Dead Loads: Deflection of framing member in direction parallel to plane of wall when subject to design loads specified when carrying its full dead load:
- .1 Not to exceed an amount which will reduce the glass bite below 75% of design dimension, or reduce edge clearance to less than 25% of design dimension, or 3 mm (1/8 inch) whichever is greater.
- .2 Do not permit permanent deformation (set) in metal framing work. Permanent deformation, fastener, weld, or gasket failure, component breakage or disengagement must not occur under wind loading equal to 1.5 times the wind loads (positive or negative). Permanent deformation is defined as deflection without recovery exceeding  $1/1000$  span.
- .6 Minimum clearance of framing member between itself and top of fixed panel, glass or other fixed parts part immediately below: minimum 3 mm (~0.12 in).
- .7 Minimum between framing member and operable window or door: minim 1.5 mm (~0.05 in).
- 2.3.8 Uniform Structural Loads and Testing Requirements: in accordance with ASTM E330 for criteria specified in this Section.

- 
- .1 When tested at 150% of uniform design wind pressures acting inward and outward, there must be no glass breakage, damage to fasteners or anchors, hardware parts, or actuating mechanisms; no malfunctioning of windows, doors, and operating hardware; and no permanent deformation of main framing members exceeding 0.2% of clear span.
- 2.3.9 Maintenance Equipment Loading:
- .1 Integrated window washing tie backs must be designed to withstand loads generated by window washing stages, but not less than 2.67kN applied in any direction.
  - .2 Anchor points must not require special cut-outs in insulating glass units, or mechanical additions to the curtain wall's interior and exterior surfaces or induce stresses that could damage the exterior and interior seals, break glass, or similar elements.
  - .3 Parapet copings to be designed for window washing loads and incidental man loads.
- 2.3.10 Lateral Drift: curtain wall system and anchorages must be capable of withstanding lateral drift due to wind loads or seismic loads as demonstrated by testing in accordance with AAMA 501.4.
- 2.3.11 Inter-Story Vertical Movement: Curtain wall system and building anchorages must accommodate vertical design displacement at mid-point between columns caused by live loads and caused by deflection of floor slabs due to the weight of occupants, materials, equipment, construction, or other elements supported by structure, as well as column shortening, creep, differential thermal expansion and contraction, seismic movement, or window washing equipment loads. Compliance must be demonstrated by testing in accordance with mandatory provisions of AAMA 501.7.
- 2.3.12 Structural Sufficiency of Guards: Where work of this Section is required to be acting as a guard pursuant to OBC Clause 3.3.1.17, Provide glass, glazing and framing compliant with OBC Clause 4.1.5.14, 4.1.5.16 and OBC Standard SB-13. As a minimum, system must withstand the effects of gravity loads according to the minimum requirements of the Ontario Building Code and CSA A500.
- 2.3.13 Thermal Transmittance:
- .1 Vision areas and framing (triple glazed): fixed light areas of curtain wall, including glass and metal framing, must have an overall thermal transmittance, or U-Factor, not exceeding 0.20<sub>IP</sub> BTU/hr.ft<sup>2</sup>deg F when simulated per NFRC 100 and NFRC 200 using applicable testing, modelling and validation protocols.
  - .2 Alternate Compliance: Simulation per AAMA 507 or tests in accordance with AAMA 1503.

- 2.3.14 Condensation Resistance: No condensation to be allowed based on the design parameters. Condensation analysis to be submitted confirming dew point remains within exterior 'wet' zones of curtain wall design and not being formed on interior surfaces.
- 2.3.15 Air infiltration through curtain wall: must not exceed 0.2 L/s-m<sup>2</sup> (0.04 cfm/ft<sup>2</sup>) of fixed wall area plus permissible allowance specified for operable windows and doors within test area when tested in accordance with ASTM E283 at static air pressure difference of 300 Pa (~6.26 psf).
- 2.3.16 Water Penetration:
- .1 Water Penetration under Static Pressure: There must be no uncontrolled water penetration when curtain wall system is tested per ASTM E331 at 20% of maximum inward and outward acting design wind pressure, but not less than 300 Pa (6.26 psf) or greater than 720 Pa (15.03 psf).
  - .2 Water Penetration under Dynamic Pressure: There must be no uncontrolled water penetration when curtain wall system is tested per AAMA 501.1 at 20% of maximum inward and outward acting design wind pressure, but not less than 300 Pa (6.26 psf) or greater than 720 Pa (15.03 psf).
  - .3 Provisions must be made for water entering system from the exterior to be drained back to exterior.
  - .4 Maximum Water penetration: No uncontrolled water penetrating assemblies or water appearing on assemblies' normally exposed interior surfaces from sources other than condensation. Water leakage does not include water controlled by flashing and gutters or water that is drained to exterior.
- 2.3.17 Pressure-Equalized Design: System must be pressure-equalized.
- .1 Provide rain screen at weeps to exterior.
  - .2 Vertical compartmentalization must be provided at a minimum of every two floors.
  - .3 Install pressure-equalized and drained sill starters at base of curtain wall.
- 2.3.18 Sound Transmission:
- .1 Performance tests in accordance with ASTM E90 and ASTM E1425.
  - .2 Classification and Determination of Ratings: based on acoustical performance in accordance with ASTM E413 (STC) and ASTM E1332 (OITC).

---

**2.4     Metals**

- 2.4.1 Aluminum Alloys: conform to requirements of Aluminum Association's, "Specifications for Aluminum Structures," and in accordance with following standards:
- .1 Minimum thickness: 1.8 mm (0.070 inch)
  - .2 Sheet and plate: to ASTM B209/B209M.
  - .3 Extruded bars, rods, shapes and tubes: to ASTM B221/B221M.
  - .4 Welding rods and bare electrodes: to CSA W48 and AWS A5.10/5.10M.
  - .5 Structural Profiles: to ASTM B308/B308M.
  - .6 Alloy and Temper: 6063-T5 or 6063-T6 Alloy as recommended by glazed aluminum curtain wall manufacturer for strength, corrosion resistance, and application of required finish.
  - .7 Other alloys may be acceptable, subject to review and acceptance by Consultant.
- 2.4.2 Carbon Steel: conform to requirements of CISC's "Code of Standard Practice for Structural Steel" or CSA S136/ AISI S100 and following standards:
- .1 Structural shapes, plates and bars: ASTM A36/A36M or equivalent to CSA G40.20/G40.21.
  - .2 Commercial sheet and strip, cold rolled, (Grades A, B and C): to ASTM A1008/A1008M.
  - .3 Commercial sheet and strip, hot rolled, (Grades A, B, C and D): to ASTM A1011/A1011M.
  - .4 Other alloys may be acceptable, subject to review and acceptance by Consultant.
- 2.4.3 Stainless Steel: conform to requirements of CSA S136/ AISI S100 and following standards:
- .1 Sheet, strip, and plate, chromium stainless steel: ASTM A176
  - .2 Sheet, strip, plate, and flat bar, annealed or cold-worked austenitic stainless steel: ASTM A666
  - .3 Seamless and welded tubing, ferritic and martensitic stainless steel: ASTM A268/A268M
  - .4 Seamless and welded tubing, austenitic stainless steel: ASTM A269
  - .5 Stainless Steel Grade: Type 304 in interior locations, Type 316L in exterior locations.
  - .6 Other alloys may be acceptable, subject to review and acceptance by Consultant.

2.4.4 Fasteners: Conform to AAMA TIR-A9. Fasteners must be compatible with materials they are attached to. Metal fasteners must be manufactured from stainless steel.

- .1 Exposed fasteners on finished surfaces: Phillips screw heads unless otherwise indicated.
- .2 Colour: Where exposed, fasteners must match colour of adjacent framing members.

## **2.5 Protection Of Metals**

2.5.1 Galvanized coatings on carbon steel anchors and reinforcing concealed after completion of installation, or exposed only to interior:

- .1 Steel sheet, hot-dip zinc-coated (galvanized) or zinc-iron alloy-coated (galvannealed) to ASTM A653/A653M, minimum Z275 (G90) coating.
- .2 Miscellaneous steel Products, zinc hot-dip galvanized coatings to ASTM A123/A123M.

2.5.2 Non-galvanized steel anchors and reinforcing concealed after completion of installation, or exposed only to the interior:

- .1 Manufacturer's standard zinc-rich, corrosion-resistant prime as recommended by SSPC for use in Environmental Zone 1B (exteriors, normally dry), and comply with SSPC-PS Guide No. 12.00.
- .2 Select surface preparation methods in accordance with recommendations in SSPC-SP COM, and prepare surfaces in accordance with applicable SSPC standard.

2.5.3 Preformed mastic tape: to AAMA 804.1.

2.5.4 Strippable Metal Surface Coverings: Use appropriate covering only for protection during fabrication. To avoid covering melting on aluminum surfaces, remove prior to outdoor exposure.

## **2.6 Glass And Glazing Materials**

2.6.1 Provide glass and glazing materials in accordance with Section 08 80 05.

2.6.2 Glass and glazing materials must meet applicable performance requirements specified in this Section.

2.6.3 Setting blocks used to support glass: In accordance with IGMA TM-3000 or GANA's Glazing Manual unless otherwise specified.

- .1 Materiality: Elastomeric material of 85 +/-5 Shore A durometer hardness. Neoprene blocks are not permitted.
- .2 Place blocks in positions shown on reviewed Shop Drawings. Ensure setting block material is reviewed by glass fabricator to

ensure compatibility with sealants, low-e or reflective coatings, and applied films.

- .3 Setting blocks must uniformly support all lites of glazing and must not obstruct venting or draining of glazing cavity.

2.6.4 Edge blocks necessary for centering the glass and preventing lateral “walking”:

- .1 Materiality: Elastomeric material of 60+/-10 Shore A durometer hardness. Neoprene blocks are not permitted.
- .2 Place blocks in positions shown on reviewed Shop Drawings. Ensure setting block material is reviewed by glass fabricator to ensure compatibility with sealants, low-e or reflective coatings, and applied films.

2.6.5 Glass and glazing materials must be held in proper plane and maintain proper face clearance by means of continuous glazing gaskets, tapes, or wet glazing with spacers. Glazing materials must extend around the entire perimeter of opening and Provide required level of resistance to air and water infiltration. Wet sealants must be compatible with materials with which they are in contact.

2.6.6 Back-bedding tapes, expanded cellular glazing tapes, toe beads, heel beads and cap beads: in accordance with requirements of AAMA 800. Glazing gaskets must be resistant to shrinkage and weathering, and compatible with materials with which they are in contact.

2.6.7 Structural silicone sealant (where used): in accordance with ASTM C1184.

- .1 Only chemically curing silicone sealant specifically formulated, tested and marketed for structural sealant glazing is acceptable for use in structural sealant-glazed applications.
- .2 Structural silicone sealant glazing systems must be designed, tested, applied, installed and inspected in accordance with ASTM C1401.
- .3 Materials and finishes in contact with structural silicone must be tested for compatibility and reviewed by the sealant manufacturer for intended application.
- .4 Gaskets in continuous contact with structural silicone must be extruded silicone or compatible material.

**2.7 Framing**

2.7.1 Provision must be made in glazing pocket of framing for minimum clearances for thickness and type of glass and glazing shown. Ensure clearances are in accordance with GANA Glazing Manual, glass fabricator’s recommendations, or governing OBC

requirements. Glass must be edge blocked if necessary, to prevent contact with metal framing.

- 2.7.2 Unless indicated otherwise, framing must be designed to Provide for glazing and re-glazing from the outside.
- 2.7.3 Framing must accommodate windows and doors and other components shown on Drawings and Schedules.

## **2.8 Flashings**

- 2.8.1 Flashings and other materials used internally or externally: corrosion resistant, non-staining, non-bleeding and compatible with adjoining materials.
- 2.8.2 Materiality: Dead-soft, 0.457-mm- (0.018-inch-) thick stainless steel, ASTM A240/A240M of type recommended by manufacturer.

## **2.9 Air Barrier Interface Components / Silicone Transition Sheet**

- 2.9.1 Material Tag: This item is noted as "AVBM-4" on Drawings and Schedules.
- 2.9.2 Provide engineered transition assemblies for connections between building's air barrier system to curtain wall system, including accessories, fastening devices, perimeter sheets, sealants, adhesive, and tapes, as shown on reviewed Shop Drawings and specified in this Section, as required to maintain air barrier continuity:
  - .1 Acceptable Products: "DOWSIL™ Silicone Transition Strip & System" by Dow Chemical Company of Canada or "Proglaze ETA" by Tremco Commercial Sealants & Waterproofing.

## **2.10 Aluminum Panel Systems**

- 2.10.1 Pressure-Equalized Rain Screen Wall Cladding (PRWC) systems: in accordance with AAMA 508 when tested per ASTM E331.
- 2.10.2 Custom fabricated from minimum 3 mm (1/8 inch) thick, tension-leveled, smooth aluminum sheet, conforming to ASTM B209M (ASTM B209). Provide concealed anchorage devices and reinforcements as required to erect metal panels and copings to exterior wall framing systems and as required to maintain the specified flatness tolerances.
- 2.10.3 Edge Construction and Profiles: as required to secure metal panels and copings to exterior wall framing systems and provide air, vapour and water tight seal complying with the performance requirements specified in this Section. Corners to be welded and ground smooth prior to final finishing.

- 2.10.4 Flatness Tolerances: Oil canning is not permitted. Ensure anchorage devices, cover stiffeners (if any), and reinforcements are not visible in the finished (exposed) faces of panels and copings.
- .1 Panel Bow: Not to exceed 0.8% of panel overall dimension in width or length.
  - .2 Length & Width: +0 mm, -3.2 mm (1/8 inch).
  - .3 Squareness: 1.3 mm per linear m (0.02 inch per ft) .
- 2.10.5 Finishing: After forming metal panels and copings but before finishing, remove abrasions, scratches, die markings, and dents.
- 2.10.6 Apply sound deadening (dielectric separator) on the back side of metal panels.
- 2.10.7 Finish: To match adjacent curtain wall members.

## **2.11 Venting Windows**

- 2.11.1 Manufacturer's standard units, complying with AAMA/WDMA/CSA 101/I.S.2/A440, with self-flashing mounting fins, and as follows:
- .1 Window Type: As indicated on Drawings
  - .2 Minimum Performance Class: AW
  - .3 Minimum Performance Grade: 60.
  - .4 Hardware: Manufacturer's standard; of aluminum, stainless steel, die-cast steel, malleable iron, or bronze.
  - .5 Limit Devices: Concealed friction adjustor and adjustable stay bar limit devices designed to restrict sash opening.
    - .1 Limit clear opening to 100 mm (4 inches) for ventilation; with custodial key release.
  - .6 Weather Stripping: Provide full-perimeter weather stripping for each operable sash unless otherwise indicated.
  - .7 Motorized Window Operators: Refer to Section 08 75 16 – Window Operators.
  - .8 Insect Screens: Provide removable insect screen on each operable exterior sash, with screen frame finished to match window unit, complying with SMA 1004 or SMA 1201, and as follows:
    - .1 Fabric: Manufacturer's standard aluminum wire fabric or glass-fibre mesh fabric.
  - .9 Glazing: Same as adjacent glazed aluminum curtain-wall glazing.
  - .10 Finish: Match adjacent glazed aluminum curtain-wall finish.
  - .11 Basis-of-Design: "Unit Vent 1350" by Alumicor or approved equivalent.

---

**2.12     Sun Control Devices**

2.12.1 Refer to Section 10 71 13.

**2.13     Entrance Door Systems**

2.13.1 Thermally Enhanced Doors (Doors forming part of the building envelope): Provide manufacturer's standard thermally enhanced glazed entrance doors for manual-swing operation.

- .1 Door Construction: 57.2-mm (2-1/4-inch) overall thickness, with minimum 3.2-mm- (0.125-inch-) thick, extruded-aluminum tubular rail and stile members. Mechanically fasten corners with reinforcing brackets that are deeply penetrated and fillet welded or that incorporate concealed tie rods.
- .2 Glazing Stops and Gaskets: snap-on, extruded-aluminum stops and preformed gaskets. Provide nonremovable glazing stops on outside of door.
- .3 Door Hardware Provide entrance door hardware and entrance door hardware sets indicated in door and frame schedule for each entrance door to comply with requirements in this Section. Refer to Section 08 70 10 for additional requirements.
- .4 Basis-of-Design: "Phantom Door" by Alumicor or approved equivalent.

**2.14     Accessories**

2.14.1 Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.

- .1 Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
- .2 Reinforce members as required to receive fastener threads.

2.14.2 Thermal Separators and Thermal Barriers: as required to meet thermal requirements specified in this Section. Provide continuous low-conductance thermal separation. Design structural thermal barriers in accordance with and in compliance with AAMA TIR-A8 requirements.

2.14.3 Framing anchors: must Provide for three-way adjustment to accommodate fabrication and construction tolerances and be structurally adequate to carry loads of curtain wall units as well as applicable wind, maintenance and other design loads. Anchors must allow for thermal movement, and meet the structural requirements specified in this Section.

- .1 Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with

ASTM A 123/A 123M or equivalent to CAN/CSA-G164 or ASTM A153/A153M requirements.

- .2 Provide insulation between steel material and aluminum material to prevent galvanic action.
- .3 Basis-of-Design Products: "HTA Anchor Channels" by Halfen or "HAC" by Hilti Canada or approved equivalent.

2.14.4 Bituminous Paint: Cold-applied asphalt-mastic paint containing no asbestos, formulated for 0.762-mm (30-mil) thickness per coat.

## **2.15 Fabrication**

- 2.15.1 All parts of the curtain wall system must be of the materials, design, sizes and thicknesses, subject to commercial tolerances, shown or called for on reviewed Shop Drawings, cited in references, and specified herein.
- 2.15.2 Methods of fabrication and assembly, however, unless otherwise specifically stated, are at manufacturer's discretion.
- 2.15.3 For purposes of this Section, "unit" is defined as curtain wall system assembly one lite wide by one storey high, whether assembled and glazed in factory or field. Allowable tolerances for multi-span wall systems or larger bays of curtain wall must be increased accordingly.
- 2.15.4 In the absence of a reviewed visual mockup, documentation of which must include defined limits of cumulative tolerances, acceptable variation from nominal position, fit and alignment shall be determined by adding allowable variations cited in referenced standards for all components, substrates and assemblies (i.e. "built-up" tolerances).
- 2.15.5 Joints in Metal Work: exposed work must be carefully matched to produce continuity of line and design, with all joints, unless otherwise shown or specified, being accurately fitted and rigidly secured.
- 2.15.6 Shop Assembly: As far as practicable, all fitting and assembly work must be done in the factory.
- 2.15.7 Welding: in accordance with CSA recommendations and must be done with electrodes and by methods recommended by Suppliers of the metals being welded. Type, size and spacing of welds must be as shown on reviewed Shop Drawings.
  - .1 Welds behind finished surfaces: done as to minimize distortion and discoloration on finished side.
  - .2 Weld spatter and welding oxides on finished surfaces must be removed by de-scaling and grinding.
  - .3 Protect glass and finished aluminum surfaces from weld spatter.

2.15.8 Sealing / Sealant Materials in Fabrication: must be used in accordance with recommendations of manufacturer of material and joints to be sealed and in accordance with design and tolerances shown on reviewed Shop Drawings.

**2.16 Component Tolerances**

2.16.1 Provide component dimensions and tolerances as indicated below.

2.16.2 Dimensional Tolerances of Extruded Aluminum Profiles: must be within limits established by AA "Standards and Data," or as defined in manufacturers' quality assurance documents, whichever is more stringent.

2.16.3 Cutting and Machining: must be within limits defined in manufacturers' quality assurance documents and installation manuals.

2.16.4 Assembly and Glazing: must be within the limits defined in manufacturers' quality assurance documents, installation manuals, and the GANA Glazing Manual, whichever is more stringent.

2.16.5 Overall Curtain Wall System Tolerances (excluding installation and substrates):

- .1 Factory assembled framing and trim:
  - .1 Overall Size: For singular rectangular curtain wall units or assembled framing, overall size of any unit or daylight opening, within a framing system must not deviate from dimensions indicated on Drawings by more than the following:
    - .1  $\pm 1.5$  mm (1/16 in) for all dimensions 1830 mm (72 in) and under;
    - .2  $\pm 3.0$  mm (1/8 in) for all dimensions between 1830 mm (72 in) and 3660 mm (144 in); and
    - .3  $\pm 4.5$  mm (3/16 in) for all dimensions greater than 3660 mm (144 in).
  - .2 These requirements do not apply to diagonal measurements.
  - .3 Measurement is must be taken an ambient temperature of 21 deg C +/- 10 deg C (~70 deg F +/- 18deg F) with system fully installed and glazed, in non-displaced openings.
- .2 For singular non-rectangular specimens: overall size must not deviate from dimensions indicated on the Drawings by more than  $\pm 6.0$  mm (~0.25 in).
- .3 Alignment of Framing and Trim Members:

- .1 Maximum offset from true alignment between two identical exposed members, abutting end to end in line within an assembly: 1.5 mm (~0.06 in).
- .2 Maximum variation from co-planar alignment between two exposed members at corner joinery within an assembly: 2 degrees.
- .3 Maximum variation in nominal joint width between exposed members within an assembly 1.5 mm (~0.06 in) not including purposeful gaps for drainage, expansion, and movement accommodation, or variation due to installation tolerances.

## **2.17 Aluminum Finishes**

2.17.1 Finish of Exposed Aluminum Components: in accordance with the appropriate AAMA voluntary guide specification as follows:

- .1 Building Exterior: AA M10 C21 or C22 A41; AAMA 611 Class I Clear Anodizing.
- .2 Building Interior: AA M10 C21 or C22 A31; AAMA 611 Class II Clear Anodizing.
- .3 Finishes on exposed metal parts of windows and doors specified in this Section or adjacent to work of this Section, excluding hardware, must be same finish as that specified for the curtain wall framing.

2.17.2 Finish of Unexposed Aluminum Components: provided with pre-treatment, flash anodize or organic paint finish to improve sealant adhesion.

2.17.3 Dissimilar Material Protection: Where aluminum or carbon steel surfaces are to be in contact with each other or in contact with dissimilar materials such as masonry or concrete, and where hot dip galvanizing of carbon steel is incompatible with component parts because of galvanic action or component fabrication tolerances provide one of the following:

- .1 Bituminous Paint: Cold-applied, non-sagging, asphalt-mastic paint complying with SSPC-Paint 12 requirements, except containing no asbestos. Apply in two coats for an overall minimum dry film thickness of 25 mils.
- .2 Zinc Rich Primer: Organic zinc-rich primer, complying with SSPC-Paint 20.

---

### **3 . EXECUTION**

#### **3.1 Examination**

- 3.1.1 Examine areas, with Subcontractor present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- 3.1.2 Proceed with installation only after unsatisfactory conditions have been corrected.
- 3.1.3 Examination of Lines, Elevations and Structure:
  - .1 Obtain building perimeter offset line for each floor, and ensure it is plumb with lines on floors above and below.
  - .2 Before beginning installation, visually inspect entire extent of structure affecting installation for work of this Section.
  - .3 If errors in location of offset lines or benchmarks are discovered, or conditions in structure that will prevent proper execution of work of this Section, report conditions to in writing to Consultant promptly.
  - .4 Stop installation until errors and unsatisfactory conditions have been corrected.
- 3.1.4 Air Barrier Systems Adjacent to Curtain Wall:
  - .1 Ensure that air barriers adjacent to curtain wall are undamaged, and satisfactory to receive accessories, fastening devices, perimeter sheets, sealants, adhesive and tapes, as detailed on Drawings and specified herein.
- 3.1.5 Commencement of work implies acceptance of in-place conditions.

#### **3.2 Installation**

- 3.2.1 Comply with manufacturer's written instructions.
- 3.2.2 Do not install defective components. Fit joints to produce hairline, burr- and distortion-free joints.
- 3.2.3 Curtain wall framing and preassembled framed units: erected plumb and true, in proper alignment and relation to established lines and grades, as specified herein and shown on the reviewed shop and erection Drawings. Solidly anchor non-moving joints.
- 3.2.4 Do not install damaged components. Fit joints to produce hairline joints free of burrs and distortion. Rigidly secure nonmovement joints.
- 3.2.5 Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.
- 3.2.6 Seal joints watertight unless otherwise indicated.

**3.2.7 Metal Protection:**

- .1 Where aluminum is in contact with dissimilar metals, protect against galvanic action by painting contact surfaces with primer, applying sealant or tape, or installing nonconductive spacers as recommended by manufacturer for this purpose.
- .2 Where aluminum is in contact with concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

**3.2.8 Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within glazed aluminum curtain wall to exterior.**

**3.2.9 Anchorage of curtain wall to building structure: in accordance with the reviewed Shop Drawings and reviewed engineering calculations. Anchors must meet requirements specified in this Section.**

**3.2.10 Field Welding: Welds and adjacent metal areas must be thoroughly cleaned and finished or protected as specified in this Section.**

- .1 Weld components in concealed locations to minimize distortion or discoloration of finish.
- .2 Take special care to prevent fires and to protect glass and other finished surfaces from damage by weld spatter.

**3.2.11 Use of Sealant Materials in Installation: conform to requirements of Section 07 92 00.**

- .1 Materials specified must be used in strict accordance with manufacturer's printed instructions and applied only by mechanics specially trained or experienced in their use.
- .2 Before applying sealant, all mortar, dirt, dust, moisture and other foreign matter must be completely removed from surfaces it will contact.
- .3 Adjoining surfaces must be left with clean and neat appearance. Sealing compounds must be tooled to fill the joint and Provide finished surfaces.

**3.2.12 Field Glazing: Unless otherwise specified, conform to recommendations of GANA Glazing Manual.**

- .1 Glazing materials other than glass: in accordance with recommendations of the material manufacturers.
- .2 Tapes must not be applied to either side of glass to indicate that an opening has been glazed.

**3.2.13 Windows, Doors and Operable Components: securely anchored in place to a straight, plumb and level condition, without distortion, in accordance with reviewed Shop Drawings. Weather stripping**

contact and hardware movement must be checked, and final adjustment made for proper operation and performance of units

### **3.3 Installation Of Structural Glazing**

- 3.3.1 Prepare surfaces that will contact structural sealant in accordance with sealant manufacturer's written instructions, to ensure compatibility and adhesion. Preparation includes, but is not limited to, cleaning and priming surfaces.
- 3.3.2 Set glazing into framing in accordance with sealant manufacturer's and framing manufacturer's written instructions and standard practice. Use a spacer or backer as recommended by manufacturer.
- 3.3.3 Set glazing with proper orientation, so that coatings face exterior or interior as specified.
- 3.3.4 Hold glazing in place using temporary retainers of type and spacing recommended by manufacturer, until structural sealant joint has cured.
- 3.3.5 Apply structural sealant to completely fill cavity, in accordance with sealant manufacturer's and framing manufacturer's written instructions and in compliance with local codes.
- 3.3.6 Apply structural sealant at temperatures indicated by sealant manufacturer for type of sealant.
- 3.3.7 Allow structural sealant to cure in accordance with manufacturer's recommendations.
- 3.3.8 Clean and protect glass as indicated in Section 08 80 05, General Requirements for Glass and Glazing.

### **3.4 Installation Of Weatherseal Sealant**

- 3.4.1 After structural sealant has completely cured, remove temporary retainers and insert backer rod between lites of glass, as recommended by sealant manufacturer.
- 3.4.2 Install weatherseal sealant to completely fill cavity, in accordance with sealant manufacturer's written instructions, to produce weatherproof joints.

### **3.5 Tolerances**

- 3.5.1 Variation from nominal position of overall unit as indicated on reviewed Shop Drawings as follows:
  - .1 Level (Horizontal measurement): 3 mm per m, (~0.12 in. per foot), not to exceed 3 mm (~0.12 in) maximum.
  - .2 Plumb (Vertical measurement): 3 mm per m (~0.12 in. per foot), not to exceed 3 mm (~0.12 in) maximum

- 
- .3 True (In-plane measurement): 3 mm per m (~0.12 in. per foot), not to exceed 3 mm (~0.12 in) maximum
  - .4 Straight/True (Straightness): 1.5 mm per m (~0.06 in. per foot), not to exceed 1.5 mm (~0.06 in) maximum
  - .5 Square (Diagonal measurement): 3 mm (~0.12 in) maximum for units up to 1.9 sqm (~20.5 sqft); 6 mm (~0.24 in.) maximum for units over 1.9 sqm (~20.5 sqft)
  - .6 Maximum variation from plane or location of overall unit, as shown on reviewed Shop Drawings: 3 mm per 3600 mm (~0.12 in. per 11.81 ft) of length or 12 mm (~0.47 in) in any total length.
  - .7 Installation tolerances do not include component or alignment tolerances specified in this Section.
- 3.5.2 Field assembled framing and trim: same deviations as specified in this Section for factory-assembled framing and trim.
- 3.5.3 Panels: installed plumb and true in proper alignment and relation to the curtain wall framing or the established lines and grades as shown on the reviewed Shop Drawings.
- 3.6 Field Quality Control**
- 3.6.1 Inspection and Testing: As specified in Section 01 83 16 and Section 01 91 15.
- 3.6.2
- 3.7 Cleaning**
- 3.7.1 Remove debris caused by, or incidental to, installation promptly.
- 3.7.2 Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas. Paint uncoated and abraded areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
- 3.7.3 Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.
- 3.7.4 On completion of installation, carefully clean metal work.
- 3.7.5 Replace damaged work which cannot be satisfactorily repaired, restored or cleaned, to satisfaction of Consultant at no cost to Owner.

**END OF SECTION**

## **1. GENERAL**

### **1.1 General Instructions**

- 1.1.1 Read and conform to: The general provisions of the Contract, including General and Supplementary Conditions; and the requirements of Division 01 Specifications and any additional documents referred to in this Section.
- 1.1.2 Contractor is solely responsible for dividing the Work among Subcontractors and Suppliers. Consultant and Owner assume no responsibility to act as arbiters or to establish subcontract limits between Sections or Divisions of the Work. Any references to related work items contained in this Section are provided for convenience only

### **1.2 Summary**

- 1.2.1 Provide labour, materials, Products, equipment and services to complete the tubular skylights work specified herein. This includes, but is not necessarily limited, to:
  - .1 Tubular skylights.
  - .2 Auxiliary materials required for a complete installation.
- 1.2.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:
  - .1 Section 07 21 00, Thermal Insulation: insulation materials field installed with tubular skylights.
  - .2 Section 07 62 00, Sheet Metal Flashing and Trim: metal flashings installed at perimeters of assemblies.
  - .3 Section 07 92 00, Joint Sealants: sealants installed at perimeters of tubular skylights.

### **1.3 References**

- 1.3.1 Reference Standards: Unless otherwise indicated in this Section or the Building Code, the latest published editions of reference standards as of the Project's Bid Closing deadline apply. Refer to 01 42 19 - Reference Standards.

### **1.4 Preinstallation Meetings**

- 1.4.1 Project Meetings, generally: in accordance with Section 01 31 00, Project Management and Coordination.

- 1.4.2 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.
- .1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.
  - .2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.
  - .3 Agenda:
    - .1 Review progress of related construction activities and preparations for particular activity under consideration.
    - .2 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.
  - .4 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.
  - .5 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

**1.5 Submittals**

- 1.5.1 Submittals, generally: in accordance with Section 01 33 00, Submittal Procedures.
- 1.5.2 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for tubular skylights work specified in this Section.
- 1.5.3 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
- .1 Include plans, elevations, sections and details as applicable.
  - .2 Indicate field-measured dimensions on Shop Drawings.
- 1.5.4 Delegated Design Submittals:
- .1 Engineering design completion of tubular skylights work is delegated to Contractor based on structural design criteria indicated in Contract Documents.
  - .2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.
  - .3 Submit copy of structural calculations upon request by Consultant.

- 1.5.5 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:
- .1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.
  - .2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO<sub>2</sub>e/declared unit as a minimum.
  - .3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.6 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:
- .1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.
  - .2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.
- 1.5.7 Samples: Submit selection and verification samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
- 1.5.8 Submit for Consultants review, QA checklist used as part of installation process. Make modifications to QA checklist based on Consultant feedback.

**1.6 Closeout Submittals**

- 1.6.1 Closeout Submittals, generally: in accordance with Section 01 78 00, Closeout Submittals.
- 1.6.2 Operating and Maintenance Data: Submit care and maintenance instructions for tubular skylights to be included in building operation and maintenance manual.
- 1.6.3 Warranty Documentation: Submit copy of extended warranties specified in this Section.

**1.7 Quality Assurance**

- 1.7.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.
- 1.7.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and

Schedules, and whose work has resulted in construction with a track record of successful in-service performance.

1.7.3 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.

.1 Professional Engineer's Responsibility:

- .1 production and review of Shop Drawings,
- .2 design and certification of tubular skylights, including attachments for building construction, in accordance with applicable codes and regulations,
- .3 stamping and signing of each Shop Drawing and associated calculations

1.7.4 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

1.7.5 Mock-Ups / First Installation Review: Construct mock-ups to verify selections made under submittals, demonstrate aesthetic effects, and to set quality standards for fabrication and installation.

- .1 Location: In-situ (i.e. first installation), as directed on site by Consultant.
- .2 Purpose: To set benchmarks for installation and to judge subsequent work. Maintain Mock-ups during construction in undisturbed condition.
- .3 Reviewed mock-ups: May become part of the completed work if undisturbed at the time of Substantial Performance of The work, provided they are undisturbed, and comply with requirements outlined in Contract Documents.

## **1.8 Delivery, Storage And Handling**

- 1.8.1 Product Requirements, generally: in accordance with Section 01 61 00, Common Product Requirements.
- 1.8.2 Deliver, store and handle tubular skylights materials in accordance with manufacturer's written instructions.
- 1.8.3 deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- 1.8.4 Store materials in off-ground, in clean, dry, well-ventilated area.
- 1.8.5 Replace defective or damaged materials with new.

---

**1.9     Field Conditions**

1.9.1 Field Measurements: Verify actual dimensions of construction contiguous with tubular skylights by field measurements before fabrication.

**1.10    Warranty**

1.10.1 Extended warranty: Submit for Owner's review and acceptance, manufacturer's extended warranty in which manufacturer commits to repair or replace components of tubular skylights that fail within specified warranty period. Manufacturer's extended warranty is in addition to, and does not supersede, any other rights that Owner may have under Contract Documents.

- .1 Warranty Period: For daylighting device, manufacturer's standard 10 year warranty.
- .2 Warranty Period: For electrical parts, manufacturer's standard 5 year warranty.

**2 .    PRODUCTS**

**2.1     Manufacturers**

2.1.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

- .1 Kingspan Light+Air
- .2 Solatube
- .3 Velux

2.1.2 Substitution Limitations: In accordance with requirements of Section 01 25 00, Substitution Procedures.

**2.2     Performance / Design Criteria**

2.2.1 Provide tubular skylights, including anchorage, capable of withstanding, without failure, the effects of the following:

- .1 Structural loads.
- .2 Thermal movements.
- .3 Movements of supporting structure.
- .4 Dimensional tolerances of building frame and other adjacent construction.

2.2.2 Failure includes the following:

- .1 Deflection exceeding specified limits.
- .2 Water leakage.
- .3 Thermal stresses transferred to building structure.

- 
- .4 Noise or vibration created by wind and thermal and structural movements.
  - .5 Framing members transferring stresses, including those caused by thermal and structural movements, to glazing.
  - .6 Loosening or weakening of fasteners, attachments, and other components.
  - .7 Sealant failure.
- 2.2.3 Tubular daylighting systems must be designed to withstand project-specific design loads and their effects within constraints specified in this Section and Ontario Building Code without defects, damage, or failure, including but not limited to the following:
- .1 Dead Loads: Including those transferred from structural elements.
