.3 Adhere top layer to resilient shock absorbing underlayment on-site with polyurethane adhesive.

.4 Size: Manufacturer's standard-size square tile, not less than 610 mm (24 inches) square. Sheet Products may be used in lieu of tile subject to conformance with performance and aesthetic requirements of specifications.

.5 Total Thickness: Not less than 18 mm with minimum 6 mm top layer.

.6 Colour and Pattern: As selected by Consultant from manufacturer's full range

.7 Acceptable Products: “MondoArmor Strength” by Mondo Inc. or Equivalent.

2.4 ACCESSORIES

.1 Border Tiles: Interlocking, beveled-edge tiles, of same material as floor tile, with bevels that transition from thickness of floor tile to surface below it, with straight outside edges, and for use where floor covering corners and edges do not abut vertical surfaces.

.2 Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated. Do not use gypsum based materials.

.1 Underlayment: “Ultra/Plan” by Mapei Inc. or approved equivalent by Ardex Engineered Cements (or Equivalent).

.2 Patching Compound:”Plani/Patch” by Mapei Inc. or approved equivalent by Ardex Engineered Cements (or Equivalent).

.3 Sub-Floor Filler for smoothing, patching, filling cracks, holes, voids and depressions: Fast setting cementitious patching compound requiring water only to produce cementitious paste to manufacturer's recommendations. Provide" Plani/Patch" by Mapei Inc. or Equivalent by Ardex Engineered Cements (or Equivalent).

.4 Moisture Reduction Barrier: Application of systems for reduction of moisture vapour transmission and alkalinity control for concrete slab required to receive floor covering specified under this Section to be as follows:

.1 Moisture Vapour Emission Rate (MVER) Range: Ensure items provided are capable of treating high moisture vapour transmitting concrete surfaces up to 11.34 kg/93 m^2 (25 lbs/1000 sq ft) in 24 hours; maximum relative humidity: 100%; as determined by ASTM F1869 test.

.2 Final Product selection to suit the conditions encountered at the time of installation. Where applicable, Provide the manufacturer's floor leveling systems for use with specified Products.

.3 Provide 1 of the following:

.1 "Planiseal Series – Moisture Barrier Systems" by MAPEI Inc.;
.2 "Ardex Moisture Control Systems" by Ardex Engineered Cements;
.3 "Koester VAP I - 2000" by Koester USA Moisture Control System.
.4 Approved proprietary Equivalent moisture control system recommended in writing by floor covering manufacturer and approved by the Consultant in order to authenticate floor covering warranties.

.5 Reducing Strips: Provide rubber reducing strips as manufactured by The Johnsonite Rubber Co. or Roppe or Flexco (or Equivalent). Provide materials in thicknesses to suit adjacent flooring.

.6 Primers and Adhesives: Low-VOC, waterproof of types recommended by rubber flooring manufacturer and compatible with applied curing material for specific material on applicable substrate, above, on or below grade.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify the Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work. Comply with the manufacturer's recommendations including the following:

.1 Substrates conditions (clean, dry, free of depressions, raised areas or other defects which would telegraph through the installed resilient material).

.2 Temperature of resilient materials and substrate.

.3 Moisture conditions and adhesive bond tests.

.4 Confirmation that curing, hardening, and sealing compounds have not been used on concrete. Remove such compounds before proceeding

.5 Confirmation that vapor barrier below slab has been installed for applications on concrete slabs-on-grade or below grade. Do not proceed with work unless written confirmation of such conditions is received and submitted.

.2 Pre-installation Testing:

.1 Calcium Chloride Test:

.1 Perform calcium chloride test in accordance with requirements of ASTM F1869 immediately prior to installation of linoleum flooring for moisture on concrete floors around perimeter of areas, at columns, and where moisture may be anticipated.

.2 Conduct 1 test for every 93 m² (1000 sq ft) of flooring. Moisture emission from concrete floor shall not exceed 1.5 kg/93 m² (3.5 lbs/1000 sq ft) in 24 hours. Do not proceed with installation until moisture problems have been corrected. Provide results to the Consultant in writing prior to commencement of the installation.

.2 Relative Humidity Test:

.1 Perform relative humidity test in accordance with requirements of ASTM F2170 using in situ probes and measure internal relative humidity of slab. Ensure concrete slab and air space above floor slab are at service temperature and that relative humidity of area is similar to the Project's final conditions for 48 hours prior to measuring concrete relative humidity.

.2 Conduct minimum of 3 tests for first 1,000 sq.ft and one additional test for each 1,000 sq.ft. Conduct one test near the center and others around the perimeter of area.

.3 Ensure relative humidity probe test results do not exceed 75% unless recommended otherwise by the flooring manufacturer(s) in writing. Do not proceed with installation until moisture problems have been corrected. Provide results to th eConsultant prior to commencement of installation.

.3 Acidity and Alkalinity Test:

.1 Conduct pH test in accordance with ASTM F710 to ensure alkali salt residue is within limitations acceptable to manufacturer and to avoid adhesive failure, discoloration, shrinkage and softening of floor covering.

.2 If pH results are higher than acceptable to manufacturer, neutralize floor prior to the beginning of installation. Neutralize floor by sanding, vacuuming and by application of water and mild muriatic acid as recommended by manufacturer. Retest to ensure pH levels have been neutralized.

.3 Provide acidity and alkalinity test at same frequency and at each location in which calcium chloride and relative humidity testing is performed. Do not proceed with installation until acidity problems have been corrected. Provide results to the Consultant prior to commencement of installation.

3.2 PREPARATION

.1 Clean athletic flooring substrates free of loose and adhered material perfectly clean and in accordance with athletic the flooring manufacturer's instructions.

.2 Ensure concrete substrates are dry after performing tests as specified herein before using methods recommended by athletic flooring and adhesive manufacturers, and that they exhibit no alkalinity, carbonization, dusting or scaling.

.3 Remove subfloor ridges and bumps to make substrate flush with adjacent subfloor.

.4 Moisture Barrier:

.1 Apply moisture reduction barrier at following locations:

.1 Basement slabs and Slabs-on-grades (regardless of pre-installation moisture testing results)

.2 Suspended slabs where slab moisture contents are above those recommended by floor covering manufacturers at time of installation after performing pre-installation testing.

.2 Prior to applying moisture barrier, mechanically prepare concrete substrate using dustless approved method to ICRI requirements to CSP (Concrete Surface Profile) #2 (Diamond Cup Ground) or #3 (Shotblasted).

.3 Apply moisture barrier in accordance with manufacturer's recommendations across entire surface being treated including up to and around perimeter of restrained surfaces such as walls and columns.

.4 Do not proceed with work until unsatisfactory conditions have been resolved.

.5 Fill depressions, dished areas, low spots, voids, gaps, cracks, joints, holes and other substrate defects with underlayment, flat, even and flush with adjacent substrate.

.6 Provide cementitious underlayment to achieve a flat substrate to within 3 mm (1/8") total maximum deviation along 3000 mm (10') straight edge applied omni-directionally over entire floor area.

.7 Provide a flat, smooth 600 mm (24") wide underlayment strip at junction of athletic flooring with other finish flooring materials for a flush transition at the meeting edge. Feather strip edges to conceal perimeters.

3.3 INSTALLATION

.1 Install flooring as recommended by the material manufacturer.

.2 Locate junctions of dissimilar flooring between rooms (i.e. same material but different colour, or different material) at door opening centrelines.

.3 Do not Provide athletic flooring beneath permanently concealed portions of the Work of Section 06 40 00 unless indicated otherwise.

.4 Loose lay tiles over area to be covered in staggered pattern and with tile pattern running as directed by the Consultant. Make cuts to fit tile at perimeter and at penetrations.

.5 Apply adhesive and embed tiles. Do not pressure fit tiles. Remove excess adhesive.

.6 Install flooring flush with floor plates, cleanout covers and other fitments in floor.

.7 Roll floor diagonally to expel entrapped air.

.8 Weigh down tile seams and corners if recommended by manufacturer until adhesive has set.

3.4 CLEANING

.1 Remove adhesive from surface of flooring as work progresses.

.2 Protect newly laid flooring from construction traffic for a period of 7 Days to allow flooring to bond firmly. Do not wash newly laid floor covering for minimum of 7 Days after installation to allow adhesive to set and dry. Afterwards, thoroughly clean surfaces in accordance with manufacturer's directions using cleaners as recommended by material manufacturer.

.3 Provide and maintain necessary protection of finished athletic flooring and bases. Replace damaged athletic flooring and bases with new materials at no additional cost.

END OF SECTION

SEE ADD#15
Q#366

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and the Supplementary Conditions of the Contract;

.2 Division 1 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide seamless resin flooring including but not limited to the following:

.1 Solvent-free, two-component epoxy coating system.

.2 Fluid-Applied Flooring – Thin Coat System

.3 Fluid-Applied Flooring – Self-Leveling, Chemical-Resistant

.4 Fluid-Applied Flooring – Chemical-Resistant

.5 Auxiliary materials required for a complete installation.

.2 Related Requirements: Specifications throughout the entirety of the Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Installation Meetings:

.1 Prior to starting the work of this Section, convene a pre-installation meeting at the Project site to review the Project requirements and site conditions with pertinent parties. Conform to requirements of Section 01 30 00.

1.6 SUBMITTALS

.1 Product Data: Submit manufacturer's literature and data sheets for each type of material provided under this Section for the Project in accordance with requirements of Section 01 30 00. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warnings of maintenance practices or cleaning agents detrimental to specified materials.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Section 01 70 00, for adhesives, sealants and any other material designated by Consultant.

.3 Shop Drawings: Submit Shop Drawings for the work of this Section in accordance with Division 01.

.1 Ensure Shop Drawings indicate material characteristics, dimensions, details of construction, joint layouts including movement joints, connections and relationship with adjacent construction.

.4 Samples: Submit 300 mm x 300 mm (12" x 12") sample of flooring for approval. Submit additional samples until approval is obtained. Make changes in aggregate mix as required to secure correct colour and texture. Label sample(s) with Project name and number, applicator, names of material and manufacturer, area where material will be applied, date of sample, colour, gloss, texture and aggregate mix proportion.

.5 Site Quality Control Submittals: Submit a diagram of the area showing the locations and results of each of the following tests as required by pre-installation testing:

.1 Calcium chloride test

.2 Acidity and alkalinity test

.3 Relative humidity test

1.7 QUALITY ASSURANCE

.1 Qualifications:

.1 Manufacturers: Provide Products for the work of this Section by a manufacturer with a minimum 10 years' experience in the manufacture of such materials.

.2 Installers: Provide work of this Section executed by competent installers with a minimum 5 years' experience in the application of the Products, systems and assemblies specified herein and with the approval and training of the Product manufacturers.

.3 Inspection and Testing Company: Retain services of an independent inspection and testing company acceptable to the Consultant to perform testing on concrete substrates to identify moisture levels in slabs. The independent inspection and testing company will be required to submit the results of tests performed to the Consultant for verification.

.2 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from 1 source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.

.3 Mock-ups: At site, in area designated by Consultant, erect sample floor area 1 m2 (10 sq ft) by required thickness as per Specifications for each type of flooring, including moisture barrier and waterproofing membrane where applicable, primer and necessary number of coats to obtain specified finish, showing colour range, bond and quality of work. Show colour range, sheen level, bond and final quality of work. Ensure Mock-up erected illustrates minimum 2 outside corners and 2 inside corner of integral cove base.

1.8 DELIVERY, STORAGE AND HANDLING

.1 Deliver materials to site in original, unopened containers with manufacturer's labels and seals intact. Labels shall identify manufacturer's name, brand name of Product, grade and type, application directions and shelf life and/or expiry date of Product.

.2 Store materials in a dry area between 10°C (50°F) and 30°C (86°F), away from direct sunlight and fire hazards.

.3 Handle and store materials in accordance with manufacturer's printed directions.

.4 Store flammable materials in safe, approved containers to eliminate fire hazards and remove from site at end of each work shift.

.5 Do not use materials that have been stored for period of time exceeding maximum recommended shelf life of materials.

1.9 PROJECT CONDITIONS

.1 Environmental Requirements:

.1 Verify concrete slab is smooth, sound, clean, free of any compounds or curing agents detrimental to topping and any materials used to correct contour of concrete slab shall be compatible with epoxy topping system.

.2 Do not apply flooring over substrate materials that contain over 3% moisture. Obtain approval of flooring manufacturer of moisture content of subfloors before proceeding with application.

.3 Maintain well-lit and well-ventilated area.

.4 Comply with the flooring manufacturer's directions for maintenance of substrate temperatures, ventilation and other conditions required to execute and protect work.

1.10 WARRANTY

.1 The Contractor warrants the work of this Section for a period of 2 years from Substantial Performance of the Work against defects and/or deficiencies in accordance with the General Conditions of the Contract.

.1 Promptly correct any defects or deficiencies which become apparent within this warranty period, to the satisfaction of the Consultant and at no expense to the Owner. Defects include but are not limited to: discolouration, fading, pinholes, cracking, peeling and leaking. Damage due to the structural failure of base, water seepage or abnormal abuse is excepted.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of following manufacturers (or Equivalent) may be acceptable subject to conformance to requirements of Drawings, schedules and Specifications:

.1 Mapei Inc.

.2 NEOGARD®

.3 Niagara Protective Coatings;

.4 PurEpoxy.

.5 Sherwin Williams High Performance Flooring

.6 Sika Canada Inc.

.2 Substitution Limitations: No further substitutions are acceptable.

2.2 DESIGN AND PERFORMANCE REQUIREMENTS

.1 Provide resinous flooring products manufactured and tested in accordance with ASTM C722, except modified as follows:

.2 Troweled-applied liquid flooring systems.

.1 Epoxy-Based Systems:

.1 Thickness: as specified.
.2 Minimum compressive strength: 40 MPa (6000 psi) at 7 days; ASTM C579.
.3 Minimum tensile strength: 10 MPa (1500 psi) at 7 days; ASTM C307.
.4 Minimum flexural strength: 17 MPa (2500 psi) at 7 days; ASTM C580.
.5 Shrinkage: maximum of 0.5%; ASTM C531.
.6 Water absorption: maximum of 1.0%; ASTM C413.
.7 Static coefficient of friction: minimum 0.5; ASTM D2047.
.8 Dynamic coefficient of friction: minimum 0.42; ANSI A326.3 when tested using the BOT 3000 Digital Tribometer
.9 Chemical Resistance (immersion): ASTM C267.
.10 Chemical Resistance (spot): ASTM D1308.
.11 Fungi Growth (ASTM G21): Minimum Class 1 Rating.
.12 Mould Growth (ASTM D3273): Minimum Class 10 Rating.
.13 Pull-off Strength: 100% substrate failure in accordance with ASTM D4541 or ACI 503R.

.2 Urethane Systems Requirements:

.1 Thickness: as specified.
.2 Minimum compressive strength: 40 MPa (6000 psi) at 7 days; ASTM C579.
.3 Minimum tensile strength: 7 MPa (1000 psi) at 7 days; ASTM C307.
.4 Minimum flexural strength: 14 MPa (2000 psi) at 7 days; ASTM C580.
.5 Shrinkage: maximum of 0.5%; ASTM C531.
.6 Water absorption: maximum of 1.0%; ASTM C413.
.7 Static coefficient of friction: minimum 0.5; ASTM D2047.
.8 Dynamic coefficient of friction: minimum 0.42; ANSI A326.3 when tested using the BOT 3000 Digital Tribometer
.9 Chemical Resistance (immersion): ASTM C267.
.10 Chemical Resistance (spot): ASTM D1308.
.11 Fungi Growth (ASTM G21): Minimum Class 1 Rating.
.12 Mould Growth (ASTM D3273): Minimum Class 10 Rating.
.13 Pull-off Strength: 100% substrate failure in accordance with ASTM D4541 or ACI 503R.

.3 Broadcast and Slurry Broadcast Liquid Flooring Systems.

.1 Epoxy-Based Systems Requirements:

.1 Thickness: as specified.
.2 Minimum tensile strength: 10 MPa (1500 psi) at 7 days; ASTM D638.
.3 Minimum flexural strength: 14 MPa (2000 psi) at 7 days; ASTM D790.
.4 Water absorption: maximum of 1.0%; ASTM C413.
.5 Static coefficient of friction: minimum 0.5; ASTM D2047.
.6 Chemical Resistance (spot): ASTM D1308.
.7 Fungi Growth (ASTM G21): Minimum Class 1 Rating.
.8 Mould Growth (ASTM D3273): Minimum Class 10 Rating.

.2 Urethane Systems Requirements:

.1 Thickness: as specified.
.2 Minimum tensile strength: 7 MPa (1000 psi) at 7 days; ASTM D638.
.3 Minimum flexural strength: 10 MPa (1500 psi) at 7 days; ASTM D790.
.4 Water absorption: maximum of 1.0%; ASTM C413.
.5 Static coefficient of friction: minimum 0.5; ASTM D2047.
.6 Chemical Resistance (spot): ASTM D1308.
.7 Fungi Growth (ASTM G21): Minimum Class 1 Rating.
.8 Mould Growth (ASTM D3273): Minimum Class 10 Rating.

.9 Pull-off Strength: 100% substrate failure in accordance with ASTM D4541 or ACI 503R.

.4 Self-leveling flooring systems.

.1 Epoxy-Based Systems Requirements:

.1 Thickness: as specified.
.2 Minimum tensile strength: 10 MPa (1500 psi) at 7 days; ASTM D638.
.3 Minimum flexural strength: 14 MPa (2000 psi) at 7 days; ASTM D790.
.4 Maximum shrinkage: 0.5%; ASTM C531.
.5 Maximum water absorption: 1.0%; ASTM C413.
.6 Minimum coefficient of friction: 0.5; ASTM D2047.
.7 Chemical Resistance (spot): ASTM D1308.
.8 Fungi Growth (ASTM G21): Minimum Class 1 Rating.
.9 Mould Growth (ASTM D3273): Minimum Class 10 Rating.
.10 Pull-off Strength: 100% substrate failure in accordance with ASTM D4541 or ACI 503R.

.2 Urethane Systems Requirements:

.1 Thickness: as specified.
.2 Minimum tensile strength: 7 MPa (1000 psi) at 7 days; ASTM D638.
.3 Minimum flexural strength: 10 MPa (1500 psi) at 7 days; ASTM D790.
.4 Maximum shrinkage: 0.5%; ASTM C531.
.5 Maximum water absorption: 1.0%; ASTM C413.
.6 Minimum coefficient of friction: 0.5; ASTM D2047.
.7 Chemical Resistance (spot): ASTM D1308.
.8 Fungi Growth (ASTM G21): Minimum Class 1 Rating.
.9 Mould Growth (ASTM D3273): Minimum Class 10 Rating.
.10 Pull-off Strength: 100% substrate failure in accordance with ASTM D4541 or ACI 503R.

.5 Reaction to fire:

.1 Ensure that floor finishes specified in this Section do not exceed a maximum of 300 for flame spread rating and a maximum 300 for smoke developed classification when tested in accordance with CAN/ULC S102.2, unless otherwise indicated.

.2 Critical Radiant Flux: 0.22 W/sq. cm or greater per NFPA 253.

.3 Flammability: Self-extinguishing in accordance with ASTM D635.

2.3 EPOXY FLOORING SYSTEM (SR-1)

.1 Components: Two-part system consisting of Part A (Clear) and Part B (Clear to amber).

.1 VOC Content: 75.4 g/L.

.2 Solids Content:

.1 By Volume: 100%

.2 By Weight: 100%

.3 Density:

.1 Part A: 1.05 - 1.10 kg/L (Clear), 1.10 - 1.15 kg/L (Colors)

.2 Part B: 0.9 - 1.0 kg/L

.4 Viscosity @ 25°C (77°F):

.1 Part A: 1200-1400 cP (Clear), 1400-1600 cP (Colors)

.2 Part B: 150-350 cP

.5 Mechanical Properties:

.1 Bond Resistance: > 300 PSI (substrate rupture) per ASTM D4541

.2 Hardness (Shore D): 85-90 per ASTM D2240

.3 Tensile Strength: 5500 PSI per ASTM D638

.4 Compressive Strength: 14000 PSI per ASTM D695

.5 Abrasion Resistance: 0.10 g per ASTM D4060 (CS17, 1000 cycles, 1000 g)

.6 Elongation: 6.7% per ASTM D638

.6 Thermal and Environmental Properties:

.1 Service Temperature: -4°F to 122°F (-20°C to 50°C)

.2 Resistance to Mold: Rated 10 (ASTM D3273)

.3 Resistance to Fungi: Rated 0 (ASTM G21)

.7 Cove base: integral type, height as indicated on Drawings.

.8 Acceptable System: “PE-100”by PurEpoxy. No substitutions.

.9 Colour: As selected by Consultant from manufacturer’s full range including solid colour, flakes systems and metallic systems.

2.4 EPOXY FLOORING – THIN-COAT (SR-2)

.1 System Description: two component, solid colour, high solids, low viscosity, self-priming, smooth, glossy epoxy finish and integral cove base.

.2 System Description: Chemical-resistant, low viscosity, self-priming, smooth, flooring system for use over properly prepared concrete substrates.

.1 System Type: Epoxy-based.

.2 Overall System Thickness: Not less than 0.76 mils (30 mils)

.3 Cove base: integral type, height as indicated on Drawings.

.4 Primer: as recommended by manufacturer.

.5 Color and Pattern: As selected by Consultant from manufacturer's full range at a later date.

.6 Sheen: semi-gloss, unless otherwise indicated.

.7 Wearing Surface: Manufacturer’s standard wearing surface meeting slip-resistance performance specified herein.

.3 Basis-of-Design System: “Sikafloor® 261” by Sika Canada Inc.

.4 Acceptable Equivalent Systems:

.1 “Durex® Epotel GSC” by Durabond Technical Coatings

.2 “Mapefloor I 302 SL” by Mapei Corp

.3 “CG32” or “CG65” or “CG 125” or “CG 250 Troweled” by NEOGARD®

.4 “General Polymers 3579” (Clear) “General Polymers 3746” (Opaque/colours) “General Polymers 4687” (Opaque/colours), by Sherwin Williams High Performance Flooring.

2.5 FLUID-APPLIED FLOORING – SELF-LEVELLING (SR-3)

.1 System Description: Chemical-resistant, self-leveling, resin-based, monolithic flooring system for use over properly prepared concrete substrates.

.1 System Type: Urethane-cement based.

.2 System Classification (ASTM C722): Self-levelling (SL)

.1 Minimum compressive strength: 50 MPa (7250 psi) at 7 days; ASTM C579.
.2 Minimum tensile strength: 12 MPa (1740 psi) at 7 days; ASTM C307.
.3 Minimum flexural strength: 20 MPa (2900 psi) at 7 days; ASTM C580.
.4 Maximum shrinkage: 0.5%; ASTM C531.
.5 Maximum water absorption: 1.0%; ASTM C413.
.6 Minimum coefficient of friction: 0.5; ASTM D2047.
.7 Chemical Resistance (spot): ASTM D1308.
.8 Fungi Growth (ASTM G21): Minimum Class 1 Rating.
.9 Mould Growth (ASTM D3273): Minimum Class 10 Rating.
.10 Pull-off Strength: 100% substrate failure in accordance with ASTM D4541 or ACI 503R.
.11 Overall System Thickness: 3 mm (1/8 inch)
.12 Primer: as recommended by manufacturer.
.13 Body/Grout Coats: urethane cement resin complete with manufacturer's standard aggregates.
.14 Color and Pattern: As selected by Consultant from manufacturer's full range at a later date
.15 Sheen: semi-gloss, unless otherwise indicated.
.16 Wearing Surface: Manufacturer’s standard wearing surface meeting slip-resistance performance specified herein.

.2 Basis-of-Design System:

.1 Base coat: “TREMfloor SL” by Tremco or approved equivalent.

.2 Topcoat: TREMfloor FC or approved equivalent.

2.6 ROLLER APPLIED EPOXY FLOORING – CHEMICAL RESISTANT (SR-4)

.1 2-component, solvent and silicone-free, multi coat, roller/squeegee applied, seamless flooring system with low gloss and slip resistance:

.2 System Description:

.1 Prime coat: manufacturer’s standard epoxy-based coat.

.2 Wear coat: manufacturer’s standard epoxy-based coat.

.3 Top Coat: manufacturer’s standard epoxy-based coat.

.4 Overall System Thickness: 0.58 mm (23 mils). Provide manufacturer’s standard self-levelling system to ensure installation is smooth and level.

.5 Color and Pattern: As selected by Consultant from manufacturer's full range at a later date

.6 Sheen: to be selected by Consultant at a later date.

.7 Wearing Surface: Manufacturer’s standard wearing surface meeting slip-resistance performance specified herein.

.3 Acceptable Systems:

.1 “Sikafloor® Fastflor CR®” by Sika Canada Inc.

.2 “MasterTop 1216” by BASF Canada Inc.

.3 “CG 32” by NEOGARD®

.4 “Resuflor 3579 Primer” and Resuflor 3741” by Sherwin Williams High Performance Flooring.

2.7 ACCESSORIES

.1 Primer: 100% solids, type recommended by manufacturer for substrate and body coats indicated.

.2 Waterproofing Membrane: type recommended by manufacturer for substrate and primer and body coats indicated. Provide in all locations with a drain.

.3 Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated. Do not use gypsum based materials.

.1 Underlayment: “Ultra/Plan” by Mapei Inc. or approved equivalent by Ardex Engineered Cements (or Equivalent).

.2 Patching Compound:”Plani/Patch” by Mapei Inc. or approved equivalent by Ardex Engineered Cements (or Equivalent).

.4 Divider Strips: white alloy zinc, 'L' shape; thickness as required to suit floor thickness,

.5 Cove Strips: As recommended by flooring manufacturer.

.6 Slip Resistant Additive (SRA): Manufacturer’s standard material for use with or as a component part of coating on horizontal surfaces to Provide slip resistance.

.7 Joint Sealant and backers: CAN/CGSB-19.24-M, Type 1, Class B, multi-component modified urethane base chemical curing material compatible with floor finish and as recommended by flooring manufacturer.

.1 Provide preformed, closed cell, compressible joint backer strips Compatible with sealant, primer, flooring and substrate. Minimum 20 shore 'A' hardness; tensile strength: between 140 kPa and 200 kPa. Sizes and shapes to suit various conditions, diameter 25% greater than joint width.

.8 Moisture Reduction Barrier: Application of systems for reduction of moisture vapour transmission and alkalinity control for concrete slab required to receive floor covering specified under this Section to be as follows:

.1 Moisture Vapour Emission Rate (MVER) Range: Ensure items provided are capable of treating high moisture vapour transmitting concrete surfaces up to 11.34 kg/93 m2 (25 lbs/1000 sq ft) in 24 hours; Maximum Relative humidity: 100%; as determined by ASTM F1869 test.

.2 Final Product selection to suit condition encountered at time of installation. Where applicable, Provide manufacturer’s floor leveling systems for use with specified Products.

.3 Provide 1 of following:

.1 "Planiseal Series – Moisture Barrier Systems" by MAPEI Inc.;
.2 "Ardex Moisture Control Systems" by Ardex Engineered Cements;
.3 "Koester VAP I - 2000" by Koester USA Moisture Control System.
.4 Approved proprietary Equivalent moisture control system recommended in writing by floor covering manufacturer and approved by the Consultant in order to authenticate floor covering warranties.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify the Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

.2 Concrete Substrates: Provide sound concrete surfaces free of laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants incompatible with seamless resin flooring.

.1 Old Concrete:

.1 Clean surface using BLASTRAC, sand blasting, or diamond grinding with 30 grit or coarser.
.2 Remove oils and fats prior to application.

.2 New Concrete:

.1 Allow curing for at least 30 days.
.2 Perform surface preparation using BLASTRAC, sand blasting, or diamond grinding with 30 grit or coarser.
.3 Apply a primer to reduce out-gassing and promote adhesion.

.3 Pre-installation Testing: Inspect and test concrete surfaces and immediately advise to Consultant in writing of unsatisfactory conditions which may affect performance or appearance of finished surfaces.

.1 Tensile Bond Strength Test: Ensure concrete surface have minimum 1.5 MPa (210 psi) tensile bond strength when tested in accordance with ASTM C1583 prior to flooring application.

.2 Acidity/Alkalinity and Adhesion Testing:

.1 Conduct pH test to ensure alkali salt residue is within limitations acceptable to manufacturer and to avoid adhesive failure, discoloration, shrinkage and softening of floor covering.
.2 If pH results are higher than acceptable to manufacturer, neutralize floor prior to beginning of installation. Neutralize floor by sanding, vacuuming and by application of water and mild muriatic acid as recommended by manufacturer. Retest to ensure pH levels have been neutralized.
.3 Proceed with installation only after substrates pass testing.

.3 Moisture Testing:

.1 Calcium Chloride Test: Perform calcium chloride test in accordance with requirements of ASTM F1869 immediately prior to installation of resilient flooring for moisture on concrete floors around perimeter of areas, at columns, and where moisture may be anticipated.

.1 Perform 1 test for every 93 m² (1000 sq ft) of flooring.
.2 Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 1.5 kg/93 m² (3.5 lbs/1000 sq ft) in 24 hours.
.3 Provide results to Consultant in writing prior to commencement of installation.
.4 Do not proceed with installation until moisture problems have been corrected.

.2 Relative Humidity Test: Perform relative humidity test in accordance with requirements of ASTM F2170 using in situ probes and measure internal relative humidity of slab.

.1 Ensure concrete slab and air space above floor slab are at service temperature and that relative humidity of area is similar to Project's final conditions for 48 hours prior to measuring concrete relative humidity.

.2 Conduct minimum of 3 tests for first 1,000 sq.ft and one additional test for each 1,000 sq.ft. Conduct one test near center and others around perimeter of area.

.3 Proceed with installation only after substrates have a maximum 75% relative humidity measurement.

.4 Provide results to Consultant in writing prior to commencement of installation.

.5 Do not proceed with installation until moisture problems have been corrected.

.4 Moisture Barrier Application:

.1 Apply moisture reduction barrier at following locations:

.1 Basement slabs and Slabs-on-grades (regardless of pre-installation moisture testing results)

.2 Suspended slabs where slab moisture contents are above those recommended by floor covering manufacturers at time of installation after performing pre-installation testing.

.2 Apply moisture barrier in accordance with manufacturer's recommendations across entire surface being treated including up to and around perimeter of restrained surfaces such as walls and columns.

.3 Do not proceed with work until unsatisfactory conditions have been resolved.

.5 Remove sub-floor ridges and bumps. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound and remove bumps and ridges to produce a uniform and smooth substrate. Prohibit traffic until filler has cured.

.6 Treat control joints and other nonmoving substrate cracks to prevent cracks from reflecting through seamless resin flooring according to manufacturer's written instructions.

.7 Vacuum, prime and seal substrate to flooring manufacturer's recommendations.

3.2 PREPARATION

.1 Comply with ASTM C811 requirements unless manufacturer's written instructions are more stringent.

.2 Clean subfloor free of laitance, oil, grease and other foreign matter detrimental to flooring application. Ensure concrete substrate surface is sound, with deteriorated concrete removed, cleaned, and replaced to suit design requirements. Ensure cleaned surfaces are dust free, sound and unbruised. Blow clean control joints, sawcuts and cracks with compressed air and grout with material compatible with floor coating materials.

.3 Repair, joint spalling, surface spalling, and cracks prior to placement seamless flooring. Seal joints and when required repair cracks with epoxy injection method.

.4 Use surface preparation equipment or mechanical methods recommended by system manufacturer. Prepare concrete floors over entire area with steel shot blasting or other method recommended by manufacturer.

.5 Remove uneven joints, rough areas and projections off surfaces. Ensure surface is hard, sound and roughened to irregular surface with weak concrete removed and surface holes and voids exposed. Equip dry blasting machine with vacuum to minimize dust.

.6 Ensure shot blasting exposes cracks in concrete surface. For cracks less than 1.5 mm (1/16") employ crack reinforcing tape in accordance manufacturer's recommendations. Repair cracks, holes or other deficiencies in accordance with manufacturer's recommendations.

.7 Ensure masonry backing surfaces for cove bases are free of voids and irregularities. Fill recessed joints with recommended epoxy plaster.

.8 Obtain the Consultant's approval of prepared substrate prior to installation of flooring.

.9 Mix components and prepare materials according to flooring manufacturer's written instructions.

3.3 INSTALLATION

.1 Apply components of seamless resin flooring system according to manufacturer's written instructions to produce a uniform, monolithic wearing surface of thickness indicated with integral cove bases, uninterrupted except at divider strips, sawn joints or other types of joints required.

.2 Apply flooring with care to ensure no laps, pin holes, voids, crawls, skips or other marks or irregularities are visible, and to Provide uniform appearance.

.3 Thickness:

.1 Primer: 10 mils (150 ft²/gal)

.4 Finish Coat:

.1 Solid Color: 16 mils (100 ft²/gal)

.2 Flakes System: 13 mils (120 ft²/gal)

.3 Metallic System: 40 mils (40 ft²/gal)

.5 Site Tolerances: Finish seamless flooring surfaces to produce plumb and level floor, or straight where sloped to drains, within tolerance of 3 mm in 3 m (1/8" in 10').

3.4 FIELD QUALITY CONTROL

.1 Inspection:

.1 The Owner may engage an independent inspection and testing company to inspect the work of this Section. Give at least 2 weeks notice of starting work to inspection and testing company and allow inspector free access.

.2 Tests may include thickness, compressive strength and chemical resistance as specified in requirements of this Specification.

.3 If test results show applied materials do not comply with the requirements specified herein, pay for testing, remove noncomplying materials, prepare surfaces coated with unacceptable materials, and reapply flooring materials to comply with requirements.

.2 Manufacturer's Field Services: Ensure flooring manufacturer representative's presence at pre-construction site meeting and on site Day flooring application is commenced and periodically thereafter, to ensure work is properly performed.

3.5 CLEANING

.1 Touch up and refinish minor defects in work. Refinish entire coated surface areas where finish is damaged or otherwise unacceptable.

.2 Remove promptly as work progresses spilled or splattered coating materials from adjacent surfaces. Clean floors on completion of work. Do not mar surfaces while removing splatters.

3.6 PROTECTION

.1 Protect completed work from traffic for at least 1 week to allow proper curing of floor finish. Protect work from any trades using area after completion of installation.

.2 Protect adjacent surfaces from damage resulting from work of this Section. If necessary, cover or mask adjacent surfaces to those receiving flooring including fixtures and equipment.

.3 Replace materials soiled by coatings during application and storage, and from which stains cannot be completely removed at no extra cost.

.4 Erect barriers to prevent entry and presence of workers not performing work of this Section during application of flooring and for 48 hours following completion of application.

.5 Post "No Smoking" signs while work is in progress and curing. Ensure spark-proof electrical equipment is used in areas where flammable materials are being applied. Prevent use of open flames or equipment that may cause sparks during this phase of work.

END OF SECTION

SEE ADD#16
Q#380

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and the Supplementary Conditions of the Contract.

.2 Division 01 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide carpet tile including but not limited to the following:

.1 carpet tile.

.2 resilient accessories.

.3 metal edge strips.

.4 moisture reduction barrier.

.2 Related Requirements: Specifications throughout the entirety of the Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Installation Meetings:

.1 Prior to starting work of this Section, convene a pre-installation meeting at the Project site to review the Project requirements and site conditions with pertinent parties. Conform to requirements of Division 01.

1.6 SUBMITTALS

.1 Product Data: Submit manufacturer's literature and data sheets for each type of material provided under this Section for the Project in accordance with requirements of Division 01. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to specified materials.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Division 01, for adhesives, sealants and any other material designated by consultant.

.3 Shop Drawings: Submit Shop Drawings and layout Drawings in accordance with Division 01. Ensure Shop Drawings indicate material characteristics, seam layouts, direction of run, details of construction, connections and relationship with adjacent construction. Do not Install carpet tile until layout Drawings are approved.

.4 Samples:

.1 Submit 2 representative samples of each material specified herein indicating visual characteristics and finish. Include range samples if variation of finish is anticipated. As a minimum submit:

.1 450 mm x 450 mm (18" x 18") sample of each carpet tile specified.
.2 300 mm (12”) long sample of each exposed edge stripping and accessory item.

.2 The Consultant may take random samples of carpet tiles as installation progresses for comparison with approved samples. If, in opinion of the Consultant, such samples fail to meet the standards of approved samples, remove tiles and replace with approved tiles as required at no cost to the Owner.

.5 Maintenance Data: Submit maintenance instructions in triplicate for insertion into maintenance manuals in accordance with Division 01. Ensure instructions give specific warnings of maintenance or cleaning practices or materials which may damage carpeting.

1.7 MAINTENANCE MATERIAL SUBMITTALS

.1 Extra Materials: Supply the following quantity of maintenance material in accordance with Division 01:

.1 Deliver to the Consultant and store where directed 5% of each colours selected suitably labelled in boxes. Identify Product name, colour, quantity and locations where used in the Project (room name and numbers).

.2 Retain waste cuttings over 1m^2 (10 sq ft) and hand over to the Owner.

1.8 QUALITY ASSURANCE

.1 Applicator Qualifications: Provide the work of this Section executed by competent installers with a minimum 5 years experience in the application of the Products, systems and assemblies specified here and with the approval and training of the Product manufacturers.

.2 Mock-Up: In area designated by Consultant, provide sample installation of each colour of at least 9 m2 (100 sq ft) showing colour matching. Make changes as required until approved. When approved, sample area shall represent minimum acceptable standard for work. Remove sample installation when directed unless sample area can be satisfactorily incorporated into work.

1.9 DELIVERY, STORAGE AND HANDLING

.1 Delivery and Acceptance Requirements: Deliver cartons of carpet tile to site clearly tagged to show installation location.

.2 Storage and Handling Requirements:

.1 Comply with CRI - Carpet Installation Standard 2011. Store adhesive, carpet tapes and similar items in heated area maintained at minimum temperature of 10 deg C (50 deg F) or at such temperature as recommended by the Product manufacturer.

.2 Handling: Comply with the adhesive and carpet tile manufacturer's directions for use of adhesive. Observe open time limits for adhesives and place lids on open cans when not

being used. Under no circumstances contaminate or thin adhesives with water or solvents, unless specifically directed by manufacturer in writing.

1.10 PROJECT CONDITIONS

.1 Ambient Conditions:

.1 Provide ventilation system in the area to be carpeted to ensure adequate (min 1 air change each hour) extraction of VOC's and other contaminants. In occupied buildings, the existing ventilation system may not be used for this purpose.

1.11 WARRANTY

.1 The Contractor warrants the work of this Section for period of 5 years from Substantial Performance of the Work against defects and/or deficiencies in accordance with the General Conditions of the Contract. Promptly correct any defects or deficiencies which become apparent within this warranty period, to he satisfaction of the Consultant and at no additional expense to the Owner. Defects include but are not limited to: buckling, opening of seams, bond failure, extensive colour fading and loss of more than 10% of pile fibre in any area.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of following manufacturers (or Equivalent) may be acceptable subject to conformance to requirements of Drawings, schedules and Specifications:

.1 Carpet Tile (CPTT):

.1 Interface Carpet
.2 Mohawk Group
.3 Shaw Contract Group

.2 Substitution Limitations: This Specification is based on interface Products. Comparable Products from manufacturers listed herein offering functionally, aesthetically equivalent Products in Consultant’s opinion and subject to the Consultant’s review will be considered provided they meet the requirements of this Specification.

2.2 REGULATORY REQUIREMENTS

.1 Fire Performance Characteristics: Provide carpet certified by ULC or WHPS, having identical properties to those tested for following fire performance characteristics, in accordance with requirements test method indicated below. Identify carpet with appropriate markings of applicable testing and inspecting organization.

.1 Critical Radiant Flux (ASTM E648): > 0.45 watts/cm2 – Class I

.2 Smoke Developed (ASTM E662): ≤ 450

.3 Fire-test response characteristics: conforming to CAN/ULC-S101-M and CAN/CGSB-4.162-M.

2.3 MATERIALS

.1 Carpet Tile (CPTT): Provide 300 mm x 914 mm (12inch X 36 inch) “Expedition Style – Seismic Wave ” by Mohawk Group Collection or equivalent complete with manufacturer’s proprietary soil protection treatment meeting characteristics specified herein with following characteristics:

.1 Construction: Tufted Textured Loop or multi-level pattern loop

.2 Fiber: Duracolor® Tricor Premium Nylon

.3 Dye method: 100% solution dyed

.4 Backing: manufacturer’s standard treatment.

.5 Protective treatments: manufacturer’s standard treatment.

.6 Pattern repeat: none

.7 Colour: to be selected by Consultant at a later date from manufacturer’s full range.

.8 Laying Patterns: As indicated on reviewed Shop Drawings.

.2 Miscellaneous Accessories:

.1 Adhesive, Seam Sealer, Seam Tape: Non-solvent based, water-resistant, non-toxic type as recommended by the carpet manufacturers for their carpet.

.2 Tools: Paint roller and tray, seam roller, steel measuring tape, chalk line (use white chalk) and carpet knife.

.3 Thresholds: Aluminum, screw-down type as recommended by carpet manufacturer, colours selected by the Consultant from manufacturers' standard range. Provide necessary carpet thresholds, adapters, cove caps, edge guards, edge strips and stair nosings (if applicable) as required to suit design requirements.

.3 Moisture Reduction Barrier: Application of systems for reduction of moisture vapour transmission and alkalinity control for concrete slab required to receive floor covering specified under this Section to be as follows:

.1 Moisture Vapour Emission Rate (MVER) Range: Ensure items provided are capable of treating high moisture vapour transmitting concrete surfaces up to 11.34 kg/93 m^2 (25 lbs/1000 sq ft) in 24 hours; Maximum Relative humidity: 100%; as determined by ASTM F1869 test.

.2 Final Product selection to suit condition encountered at time of installation. Where applicable, Provide the manufacturer’s floor leveling systems for use with specified Products.

.3 Provide 1 of following:

.1 "Planiseal Series – Moisture Barrier Systems" by MAPEI Inc.;
.2 "Ardex Moisture Control Systems" by Ardex Engineered Cements;
.3 "Koester VAP I - 2000" by Koester USA Moisture Control System.
.4 Approved proprietary Equivalent moisture control system recommended in writing by floor covering manufacturer and approved by Consultant in order to authenticate floor covering warranties.

.4 Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated. Do not use gypsum based materials.

.1 Underlayment: “Ultra/Plan” by Mapei Inc. or approved equivalent by Ardex Engineered Cements (or Equivalent).

.2 Patching Compound:"Plani/Patch" by Mapei Inc. or approved equivalent by Ardex Engineered Cements (or Equivalent).

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify the Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

3.2 PREPARATION

.1 Ensure floor is clean and free of cracks and protrusions. Remove dirt, paint, debris, grease, oil and loose toppings or finishes. Grind smooth ridges and high spots in concrete surfaces to be carpeted. Ensure moisture content of concrete slabs meet the carpet tile manufacturer's recommendations.

.2 Pre-Installation Testing:

.1 Acidity and Alkalinity Test:

.1 Conduct pH test to ensure alkali salt residue is within limitations acceptable to manufacturer and to avoid adhesive failure, discoloration, shrinkage and softening of floor covering.

.2 If pH results are higher than acceptable to manufacturer, neutralize floor prior to beginning of installation. Neutralize floor by sanding, vacuuming and by application of water and mild muriatic acid as recommended by manufacturer. Retest to ensure pH levels have been neutralized.

.2 Relative Humidity Test:

.1 Perform relative humidity test in accordance with requirements of ASTM F2170 using in situ probes and measure internal relative humidity of slab. Ensure concrete slab and air space above floor slab are at service temperature and that relative humidity of area is similar to the Project's final conditions for 48 hours prior to measuring concrete relative humidity.

.2 Conduct minimum of 3 tests for first 1,000 sq.ft and one additional test for each 1,000 sq.ft. Conduct one test near center and others around perimeter of area.

.3 Ensure relative humidity probe test results do not exceed 75% unless recommended otherwise by flooring manufacturer(s) in writing. Do not proceed with installation until moisture problems have been corrected. Provide results to the Consultant prior to commencement of installation.

.3 Fill gaps or cracks more than 2 mm (1/16") wide and minor depressions with latex compound. Grind protrusions smooth.

.4 Vacuum clean floors prior to installation.

.5 Moisture Barrier:

.1 Apply moisture reduction barrier at following locations:

.1 Basement slabs and Slabs-on-grades (regardless of pre-installation moisture testing results)

.2 Suspended slabs where slab moisture contents are above those recommended by floor covering manufacturers at time of installation after performing pre-installation testing.

.2 Prior to applying moisture barrier, mechanically prepare concrete substrate using dustless approved method to ICRI requirements to CSP (Concrete Surface Profile) #2 (Diamond Cup Ground) or #3 (Shotblasted).

.3 Apply moisture barrier in accordance with the manufacturer's recommendations across entire surface being treated including up to and around perimeter of restrained surfaces such as walls and columns.

.4 Do not proceed with the work of this Section until unsatisfactory conditions have been resolved.

3.3 INSTALLATION

.1 Comply with CRI Carpet Installation Standard 2011. Refer to the Drawings for areas where carpet tile is to be installed. Install work of this Section after other trades have completed their work and just prior to completion of the Work, unless otherwise instructed by the Consultant.

.2 Do not commence work in areas where illumination is not characteristic of final illumination

.3 Commencement of work: Refer to the Drawings and Room Finish Schedule for areas where carpet is to be installed. Install work of this Section after other trades have completed their work and just prior to completion of the Work, unless otherwise instructed by the Consultant.

.4 Measuring: Determine centre of room using standard tile-laying methods. Resulting quadrants should meet at right angles. Offsetting centre chalk line may become necessary to insure that perimeter tiles will be at least half-size or larger.

.5 Pile Direction: Install carpet tiles to achieve monolithic appearance with arrows on back pointing in same direction.

.6 Laying Out: To prevent movement of tiles during initial stages and to insure straight lines and square corners, create an anchor line by laying strips of adhesive alongside each centre chalk line. Lay tiles accurately and firmly along centre lines in selected quadrant. Additional tiles within quadrant should be installed by "stair-step" technique. In some cases, due to partitions, "starting" point is centre of the room. Carpet tiles are to be installed up to partitions, not under partition.

.7 Checking Tightness: Measure areas to ensure tight installation. Measure over 11 tiles to attain cumulative space "gained" over 10 joints. The gain must not be greater than 6 mm (1/4").

.8 Alignment: As tiles are butted against each other, frequently check at joints to ensure proper alignment. Do not Install tiles that seem out of true more than 1.5 mm (1/32").

.9 Control Grid: To prevent tiles from shifting in larger areas, about every 6 m (20') to 9 m (30') both in length and width directions, anchor row of tiles. Use texturing paint roller to apply narrow strip of adhesive under "control" tiles.

.10 Joints: Take care when butting 1 tile against another. Avoid excessive pressure on joining tiles as it may cause tiles to "peak" or "buckle". Brush back face pile should and "tip" tile into place, to avoid pile being caught in joint.

.11 Perimeter Tiles: Lay last whole tile closest to wall and perimeter cuts on adhesive. Accurately cut and tightly fit perimeter tiles against vertical fixed surface such as walls. In event of open perimeter design, Provide fixed reducer strip anchored to floor as necessary to lock tile area in place.

.12 Cutting: Cut tiles from back, using template for fitting around columns or at room perimeter. Only activate electrical floor outlets after carpet installation. Surface-mark affected tiles with tape.

.13 Trimming and Gluing: Install carpet using full adhesive method (glue down) unless otherwise noted on the Drawings. Whenever tile is cut or trimmed, always adhere to floor.

3.4 CLEANING

.1 Immediately following installation, inspection and approval of work by the Consultant, vacuum clean carpet using pile lifter and remove debris.

.2 Waste Management Requirements:

.1 Comply with Government of Ontario Waste Management requirements. Accumulate surplus tile and waste daily and remove such materials to suitable recycling facility at completion of work.

3.5 PROTECTION

.1 Restriction of Traffic:

.1 Restrict traffic during installation. Upon completion of installation, do not allow traffic or movement of furniture onto carpet surface until installed area has been anchored at perimeter.

.2 Cover entire carpeted area with plastic covering held in place by masking tape at seams and stay-tacking around perimeter, if required by the Consultant.

.3 Do not remove carpet protection until directed by the Consultant.

.4 Hand over work free of blemishes and in perfect condition.

END OF SECTION

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and the Supplementary Conditions of the Contract.

.2 Division 01 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide fabric-wrapped acoustical panels including but not limited to following:

.1 fabric wrapped acoustic wall panels.

.2 Related Requirements: Specifications throughout the entirety of the Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Installation Meetings:

.1 Prior to starting work of this Section, convene a pre-installation meeting at the Project site to review the Project requirements and site conditions with pertinent parties. Conform to requirements of Division 01.

1.6 SUBMITTALS

.1 Product Data: Submit manufacturer's literature and data sheets for each type of material provided under this Section for the Project in accordance with requirements of Division 01. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to specified materials.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Division 01, for adhesives, sealants and any other material designated by Consultant.

.3 Shop Drawings: Submit Shop Drawings of the Work of this Section in accordance with Division 01. In addition to minimum requirements indicate the following:

.1 Include plans, sections and large scale details, and indicate components and methods of assembly, materials and their characteristics, fastenings, finishes, and other fabrication information required for work of this section. Indicate assembly joint lines.

.2 Submit coordination Drawings indicating locations of concealed grounds, cutouts, plates, and other required fabrications.

.3 Show relation to adjoining construction, details of outside and inside corners and door openings.

.4 materials, thicknesses and finishes.

.5 methods of setting, sealing, securing, field connections and anchorage.

.4 Samples: Submit samples in accordance with Division 01. Submit following samples in the sizes indicated:

.1 direct fastening system members minimum 300 mm (12") long

.2 suspension system members minimum 300 mm (12") long.

.3 panels minimum 300 mm (12") square and of specified thickness

.5 Test and Evaluation Reports: Prior to submitting Shop Drawings for the Work of this Section, submit the following:

.1 Fire-test-response characteristics: Manufacturer's test results and certificates illustrating installed wood wall panel systems meet fire-resistance ratings required for this Project.

.2 Acoustic Performance: Independent test data and certificate confirming system meets or exceeds specified STC, NRC and CAC ratings.

.6 Certificates:

.1 Obtain certificate from the Professional Engineer responsible for the design which includes seismic assessment and field review of this part of the Work, validating that work substantially complies with requirements of the OBC and that requisite field reviews have been completed.

.7 Maintenance Instructions: Submit maintenance instructions in accordance with Division 01. Submit maintenance instructions that specify warnings of any maintenance practice or materials which may damage or disfigure the Work of this Section.

1.7 MAINTENANCE MATERIAL SUBMITTALS.

.1 Extra Materials: Supply 2% surplus panel fabric from same production run as installed panels.

1.8 QUALITY ASSURANCE

.1 Applicator Qualifications: Provide the work of this Section executed by competent installers with a minimum of 5 years' experience in the application of the Products, systems and assemblies specified herein and with the approval and training of Product manufacturers.

.2 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from 1 source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.

.3 Mock-Ups: Provide Mock-ups in locations designated by Consultant and as required to demonstrate quality of workmanship. Maintain Mock-ups during construction in an undisturbed condition as a standard for judging the completed work. Conform to requirements of Division 01. Ensure Mock-ups are accepted prior to start of system application. Do not alter, move or destroy mock-up until work is completed and approved by Consultant.

1.9 WARRANTY

.1 The Contractor warrants the work of this Section for a period of 2 years from Substantial Performance of the Work against defects and deficiencies in accordance with the General Conditions of the Contract. Promptly correct defects or deficiencies which become apparent within this warranty period, to the satisfaction of the Consultant and at no additional expense to the Owner. Defects include but are not limited to: buckling, opening of seams, bond failure and extensive colour fading.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of following manufacturers (or Equivalent) may be acceptable subject to conformance to requirements of the Drawings, schedules and Specifications:

.1 Acoustical Wall Panels:

.1 Decoustics
.2 GWP Wallworks Group
.3 Wall Technology, Inc.
.4 Akustus
.5 EzoBord c/o Arysonics

.2 Panel Fabric:

.1 Carnegie

2.2 DESIGN AND PERFORMANCE REQUIREMENTS

.1 Design suspension system to support safely and without distortion, superimposed loads of:

.1 Lighting fixtures;

.2 Air Supply diffusers, boots, fire alarm grilles and exhaust and return air grilles;

.2 Design suspension system to support lighting fixtures according to regulations of local utility company and submit certification accordingly.

.3 Prepare panels for sprinkler head penetrations and suspension members of curtain tracks.

.4 Fire Performance Characteristics:

.1 Ensure materials listed in this Section are rated as Class A, when tested in accordance with ASTM E 1264, CAN/ULC S102 and for following characteristics:

.1 Flame Spread Rating: ≤ 25 on any surface exposed by cutting through in any direction
.2 Smoke Developed Index: ≤ 450

.2 Ensure materials provided for the Work of this Section have approved Product listing from organization acceptable to the Authorities Having Jurisdiction such as ULC, cUL or ITS.

.5 Acoustical Performance: Ensure assemblies are capable of providing specified NRC, STC and CAC ratings specified herein when tested in accordance with ASTM C423, ASTM E90 and ASTM E1414 respectively.

2.3 MANUFACTURED UNITS

.1 Acoustical Wall Panels (AWP-1): Not Used.

.2 Acoustical Wall Panels (AWP-2): Provide acoustical wall panels “Acoustical Wall Panel - AP” by Decoustics or Equivalent with following characteristics:

.1 Edges: Square

.2 Corners: Standard

.3 Core: 38 mm (1-1/2")

.4 NRC: Not less than 0.95

.5 Fabric Facing: Provide 100% fire-retardant “Meteor - Xorel” by Carnegie Fabrics (or Equivalent) in colour selected by the Consultant from manufacturer's full range.

.6 Mounting System: Provide concealed mechanical fastening clip-on wall mounting system complete with metal closures and trims specified herein as recommended by system manufacturer.

.7 Colours: Allow 3 colours to be selected by Consultant at a later date from manufacturer's full range.

2.4 AUXILIARY MATERIALS

.1 Furring Channels: Coordinate with Section 09 21 16. Provide 33 mils (0.0329” – 0.0836mm – 20ga) thick galvanized sheet steel furring channels (Z-clips). Zinc coating: Z275 (G90) in accordance with ASTM A653/653M. Screw channels: 67 mm (2-5/8") wide x 22 mm (7/8") deep.

.2 Supplementary Steel Supports and Reinforcing: In accordance with the requirements of Section 09 21 16.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Site Verification of Conditions:

.1 Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

.2 Inspect surfaces into which work of this Section is dependent for irregularities detrimental to installation and performance of work of this Section. Confirm that conditions are satisfactory prior to proceeding. Notify the Consultant in writing of conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

3.2 INSTALLATION

.1 Do not start installation until exterior glazing has been completed and exterior openings are closed in. Ensure wet work is completed and dried out to a degree acceptable to panel manufacturer before installation commences. Maintain uniform temperatures of at least 21 deg C (72 deg F) for 72 hours prior to commencement of the Work and maintain temperature until 72 hours after completion.

.2 Wall Panels:

.1 Install acoustical wall panels in locations indicated with vertical surfaces and edges plumb, top edges level and in alignment with other panels, faces flush, and scribed to fit adjoining work accurately at borders and at penetrations.

.2 Secure wall panels with concealed mechanical fastening mounting system in accordance with manufacturer's recommendations.

.3 Finish panel surface to match the Consultant's approved sample.

3.3 CLEANING

.1 After interior finishing work has been substantially completed or when directed by the Consultant, inspect wall panel work. Replace broken, chipped or damaged work. Reset loose units or units out of place and touch up marred surfaces with matching finishes. Upon completion of the Project, ensure finished surfaces are clean and free from dirt and other markings; in good condition subject to acceptance of the Consultant.

3.4 SITE QUALITY CONTROL

.1 Manufacturer's Services: Arrange for Product manufacturer's technical representative to:

.1 meet and discuss installation procedures and unique conditions at the Place of the Work.

.2 inspect substrate surfaces and recommend solutions to accommodate adverse conditions.

.3 periodically visit and inspect installation and report unsatisfactory conditions to Contractor.

.4 attend final inspection and to submit written certification Products, systems and assemblies have been installed in accordance with manufacturer's requirements.

3.5 DEMONSTRATION AND TRAINING

.1 Engage a factory-authorized service representative to train maintenance personnel to replace and maintain acoustical wall panels in accordance with requirements of Division 01.

END OF SECTION

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and the Supplementary Conditions of the Contract.

.2 Division 01 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide painting including but not limited to the following:

.1 Painting of all interior exposed elements noted on the Drawings and exterior exposed elements noted on the Drawings. Do not paint excluded components indicated herein. Where an item or surface is not specifically mentioned on the Drawings, Provide same finish as similar adjacent materials or surfaces.

.2 Work Excluded:

.1 Do not paint pre-finished metal siding, fascia and soffit, coping cap flashing and similar components. Refer to dedicated trade Sections of the Specifications for special finishes specified therein and their effects on the work prescribed by this Section.

.2 Do not paint chrome, stainless steel, vinyl, plastic laminate and aluminum surfaces throughout unless specified otherwise.

.3 Do not paint internal surfaces of steel tanks and stacks.

.4 Do not paint sprayed fire-resistant materials.

.5 Do not paint equipment furnished completely prime and finish painted by manufacturer unless required to have field painting over factory finish to have one common corporate colour as identified in the Drawings.

.6 Do not paint over ULC, FM or other labels or equipment identification plates required by OBC or standards referenced therein.

.3 Related Requirements: Specifications throughout the entirety of the Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Definitions used in this Section:

.1 Exposed: This refers to items visible in completed Work. In case of closets, cabinets and drawers, it includes their interiors.

.2 Surface Preparation: This refers to a means of cleaning or treating of surfaces that are to be painted to ensure the best possible bond between the surface and the painting applied. Surface preparation methods include but are not limited to:

.1 Ensure preparation and workmanship conforms to MPI Painting Manual requirements

.2 Removal of surface contaminants that will affect performance of painting including but not limited to: oil, grease, salts, dust, dirt, rust, rust scale, mill scale, and old coatings where applicable.
.3 Removal of surface imperfections including without limitations: weld spatter, sharp edges, burrs, silvers, laminations, pits, porosities and crevices.
.4 Preparation of surfaces to Provide anchor profile or surface profile to improve mechanical bonding of coating to prepared surface by increasing surface area.

.2 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Installation Meetings:

.1 Prior to starting the work of this Section, convene a pre-installation meeting at the Project site to review the Project requirements and site conditions with pertinent parties. Conform to requirements of Division 01.

1.6 SUBMITTALS

.1 Product Data: Submit manufacturer's literature and data sheets for each type of material provided under this Section for the Project in accordance with requirements of Division 01. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to specified materials.

.1 Maintain a copy of the MPI's "Architectural Painting Specification Manual" latest edition on site during the performance of painting work.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Division 01, for adhesives, sealants and any other material designated by Consultant.

.3 Proposed Materials: Submit in writing a list of proposed materials prepared by paint manufacturer for approval, at least 60 Days before materials are required. Ensure list bears manufacturer's official certification that materials listed meet or exceed requirements specified herein.

.4 Qualification Data: Submit qualification data for independent paint inspection and testing agency retained for this Project illustrating agency's personnel credentials and experience on Projects of similar size and scope.

.5 Progress Reports:

.1 Arrange for the independent inspection and testing company's representative to visit the Site at intervals during Surface Preparation and paint coating application to ensure proper specified Surface Preparation is being performed, specified Product are being used, appropriate number of coats are being applied and specified finishing procedures are being carried out. Painting inspector shall prepare job progress reports at regular intervals. Submit copy of reports to Consultant.

.2 Upon completion of work, submit written reports and Inspection Company's confirmation that materials and application methods conform to manufacturers' requirements.

.6 Samples: Submit following samples of each color and material to be applied, with texture to simulate actual conditions, on representative samples of the actual substrate in sizes indicated.

.1 Brushouts: minimum 200 mm x 250 mm (8" x 10") of each colour required at least 30 Days prior to commencement of painting.

Substrate	Sample, Base Material
Concrete Masonry	Face of typical unit
Gypsum Board	Face of typical unit
Metal	Steel Plate
Woodwork	Wood (Submit sample panels of stain and varnish finish on each species of wood specified, minimum 300 mm (12") square and of specified thickness.)

.7 Product List: Conform to the requirements of Division 01 and submit a Schedule of Finishes listing the manufacturer's Product name and colour for each paint system. Upon completion, submit records of Products used. List Products in relation to finish systems and include the following:

.1 Product Name, Type and Use

.2 Manufacturer’s Product Number

.3 Colour Numbers

.4 MPI Environmentally Friendly Classification System Rating

.5 VOC Level (g/L)

.6 Manufacturer’s Safety Data Sheets (SDS)

1.7 QUALITY ASSURANCE

.1 Qualifications: Provide the work of this Section executed by competent installers with membership in good standing in OPCA and/or PDCA having a minimum of 5 years’ experience in the application of the Products, systems and assemblies specified herein and with the approval and training of Product manufacturers.

.2 Single Source Responsibility:

.1 Ensure primary materials provided in this Section are obtained from 1 source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.

.2 Provide paint and finishing materials for each procedure listed in Drawings from Products of a single manufacturer.

.3 Use single brand of paint chosen throughout the work of this Section, except where specified otherwise herein.

.3 Mock-Up: At site, with Painting Inspector present, Consultant will locate testing area to establish standard of workmanship, texture, gloss and coverage.

.1 Prepare surfaces and apply treatment to galvanized components for Consultant’s review. Do no painting until samples have been approved. Approved panels become standard of comparison for painting work on site.

.2 Apply 300 mm x 300 mm (12" x 12") samples of each finish on each type of surface to be coated with correct material, number of coats, colour, texture and degree of gloss required or apply full size test samples in areas designated by Consultant. Provide additional samples, if required, to obtain approval.

.3 Correct and refinish work which does not meet quality levels established by reviewed finishes at no expense to Owner. Reviewed full size sample panels may become integral part of finished work if undisturbed at time of Substantial Performance of the Work

1.8 DELIVERY, STORAGE AND HANDLING

.1 Review Product literature, MSDS, related safety data, proper disposal requirements and inform trades involved in the work of this Section.

.2 Deliver and store materials on site in the manufacturer's sealed and labeled containers. Imprint containers with batch numbers and colour identification.

.3 Store containers of paint, thinner and other volatile materials in well ventilated places where they will not be exposed to excessive heat or direct rays of the sun. Keep tightly closed when not in use. Remove used cloths from building at the end of every working shift and when not in use. Take precautions against spontaneous combustion by drenching with water or placing in air-tight covered metal containers.

.4 Prevent fire or explosion caused by improper storage of paints, solvents, rags, and similar items. Store hazardous materials in location and in manner approved by local fire authority.

.5 Post "No Smoking" signs in areas of storage and mixing. Strictly enforce this requirement. Provide and maintain CO_2 fire extinguishers of minimum 9 kg (20 lb) capacity. Repair damage to storage area or surrounding area at no cost to Owner.

.6 Protect finished areas subject to contact during drying by posting "Wet Paint" signs and barring from traffic where necessary.

.7 Leave storage areas clean and free from evidence of occupancy.

.8 Collect waste paint by type and Provide for delivery to recycling or collection facility. Recycle empty paint cans.

1.9 PROJECT CONDITIONS

.1 Paint and finish work items in clean, dust-free, properly ventilated and adequately lit areas (minimum 100 lx (9.3 ft candles).

.2 Maintain minimum interior temperature of 18 deg C (65 deg F) during application and drying of paint and maintain until building occupancy occurs.

.3 Do not undertake interior painting on surfaces where condensation has or will form due to presence of high humidity and lack of proper ventilation. Do not undertake painting unless substrate is a minimum of 3 deg C (5 deg F) above the dew point and rising.

.4 Substrate Moisture Content: Perform tests with electronic moisture meter to ensure compliance with manufacturer's recommendations. Unless otherwise recommended by substrate manufacturer, maximum moisture content for following materials is as follows:

.1 Concrete and Concrete Unit Masonry: Maximum 12 - 14% for solvent coatings and as recommended by manufacturer for each water based system.

.2 Gypsum Based Board: Maximum 12 - 14%.

.3 Wood: Maximum 15%.

.5 Temperature and Ventilation:

.1 Do not Provide paint under ambient and surface temperatures less than 15 deg C (59 deg F) in any instance for 24 hours before and during installation; and 7 Days after installation.

.2 Provide ventilation to remove odours, evaporating solvents and moisture. Maintain adequate ventilation at all times to control excessive humidity.

.3 Ensure adequate temporary ventilation is provided under Div 01 for protection of workers from toxic fumes.

1.10 WARRANTY

.1 The Contractor warrants the work of this Section for period of 2 years from Substantial Performance of the Work against defects and deficiencies in accordance with the General Conditions of the Contract.

.2 Promptly correct defects or deficiencies which become apparent within this warranty period, to the satisfaction of the Consultant and at no expense to the Owner. Defects include but are not limited to: material shrinkage, cracking, splitting, bubbling, blistering and delamination resulting from defective materials or poor workmanship.

1.11 MAINTENANCE

.1 Supply of Touch-up Paint: Supply to the Owner 1-4 litre can (1-1 gal) of each different type and colour of paint used on this Project.

.2 Paint shall be boxed and in sealed, unopened cans in undamaged condition, with name of manufacturer, contents, type and colour clearly indicated on a label securely adhered to can. Submit cans to Owner in accordance with requirements of Division 01.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of following manufacturers (or Equivalent) may be acceptable subject to conformance to requirements of Drawings, schedules and Specifications:

.1 Benjamin-Moore

.2 PPG - Pittsburgh Paints

.3 Sherwin Williams

.2 Substitution Limitations:

.1 Limit material selection to the Products selected from the manufacturers listed herein that comply with MPI systems indicated below and listed in the "MPI Approved Products List" and indicated by code numbers referred to in the Master Painter Institute Architectural Specification Manual, latest edition. Provide listed prime and finish coat materials unless otherwise recommended in writing by the paint manufacturer for each specific substrate.

.2 Only comparable Products from manufacturers listed herein will be considered provided they meet the requirements of this Specification, offering functionally, aesthetically equivalent Products in Consultant’s opinion and subject to Consultant’s review.

.3 Colour matching is not acceptable. Paint materials without manufacturer's label will not be allowed.

2.2 REGULATORY REQUIREMENTS

.1 Conform to the *Occupational Health and Safety Act* (Ontario), Regulation 851 and other requirements of local Authorities Having Jurisdiction for storage, mixing, application and disposal of paint and related waste materials.

.2 For temporary scaffolding, ladders and other construction accessories, conform to the Occupational Health and Safety Act (Ontario), Regulation 851, and other requirements of Authorities Having Jurisdiction, as amended.

.3 Fire Hazard Classification: As determined by ULC testing in accordance with CAN/ULC S102/S102.2 shall not exceed following:

.1 Flame Spread: 0.

.2 Fuel Contributed: 15.

.3 Smoke Developed: 10.

.4 Provide coatings from specified MPI designations which are in accordance with Canadian Volatile Organic Compound (VOC) Concentration Limits for Architectural Coatings Regulations.

.5 Comply with toxic trace limitations stipulated by Authorities Having Jurisdiction in accordance with requirements of CAN/CGSB-1.500.

2.3 DESIGN AND PERFORMANCE REQUIREMENTS

.1 Acceptable materials, workmanship and all items affecting the Work of this Section are to be in accordance with the MPI's "Architectural Painting Specification Manual", latest edition, and "Maintenance and Repainting Specification Manual", latest edition. Painting work to be in accordance with MPI Premium Grade finish requirements.

.2 Only materials (primers, paints, coatings, varnishes, stains, lacquers, fillers, and similar coating materials.) listed in the MPI Approved Product List are acceptable for use on this Project.

.3 Provide other materials such as linseed oil, shellac, thinners and solvents, of the highest quality Product of an MPI listed manufacturer and compatible with paint materials being used as required.

.4 Provide paint materials with good flowing and brushing properties and dry or cure free of blemishes, sags, air entrapment, and other similar effects.

.5 Where required, ensure paints and coatings meet flame spread and smoke developed ratings designated by OBC requirements and Authorities Having Jurisdiction.

.6 Paint applied on materials which from time to time will become hot, such as convector covers and similar items, to be approved by paint manufacturer for particular condition.

.7 Paint materials will be rated under Environmental Notation System (ENS) with acceptable VOC ranges as listed in the MPI Approved Product List under "E" ranges. Use only materials having a minimum MPI "Environmentally Friendly "E2" or "E3" rating based on VOC (EPA Method 24) content levels

.8 As far as practical, factory mix paint for immediate application without thinning or alteration at site. Do not alter or thin any paint without manufacturer's written approval.

.9 All accent walls to have a level 5 finish before painting begins. Refer to Section 09 21 16, Gypsum Board.

.10 The Consultant reserves right to refuse paint or finishing material if in Consultant's opinion materials are not suitable or adequate for proposed use.

2.4 MATERIALS

.1 Topcoat and Intermediate Coat Thickness:

.1 Latex & Acrylics (Interior): 0.03 mm (1.2 mils) DFT/coat.

.2 Epoxies (Interior): 0.076 mm (3 mils) DFT/coat.

.3 Urethanes (Interior and Exterior): 0.076 mm (3 mils) DFT/coat.

.2 Gloss and Sheen Ratings: The following gloss terms used herein shall have the following values in accordance with ASTM D523 based on the MPI recommended gloss reflectance guidelines:

Gloss Term	Gloss Level	Gloss Value
Flat or Matte	G1	0 to 5 units at 60 degrees and max 10 units at 85 degrees
Velvet	G2	0 to 10 units at 60 degrees and max 10 to 35 units at 85 degrees
Eggshell	G3	5 to 25 units at 60 degrees and 10 to 35 units at 85 degrees
Satin	G4	20 to 35 units at 60 degrees and min 35 units at 85 degrees
Semi-Gloss	G5	35 to 70 units at 60 degrees
Gloss	G6	70 to 85 units at 60 degrees

.3 Gloss Values:

.1 As later selected by the Consultant:

.1 Walls: egg shell or satin.
.2 Trim and doors: Semi-gloss.
.3 Ceilings: Flat

.4 Colours: Consultant will select colours at a later date. Refer to Drawings.

.1 Colours of Latex Paint (PT):

.1 Maximum of 5 colours, of which no more than 4 colours will be dark accent colours. No more than 4 colours will be used per room for walls and ceilings, with a different colour for painted doors and frames. Deep tint accent colours may be used on doors and similar panels scheduled for painting.
.2 Reveals, coves and bulkheads and valances may have colour different than main colour in room.
.3 Final colours selected will not necessarily be colours found on standard colour charts of manufacturer whose Products have been accepted for use.

.2 Colour of Epoxy Paint (PT-E): The Consultant will select maximum 5 colours for epoxy paint from manufacturer's standard colour range.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Verification of Surface Conditions:

.1 Do work only when surfaces and conditions are satisfactory for production of quality work. Report to the Consultant in writing any surfaces which are found to be unsatisfactory. Commencement of the work implies acceptance of substrate surfaces.

.2 Ensure temperature of surfaces to be finished is between 10 deg C and 20 deg C (50 deg F and 68 deg F) and surfaces are dry and free of dirt, grease or other contaminants that may affect applied finish.

.3 Verify moisture content of surfaces with electronic moisture metre. Do not proceed without written directions if moisture reading is higher than 12 - 15%.

.4 Conform to manufacturer's requirements and those listed below for following substrates:

.1 Steel substrates: Do not apply coatings over moisture or when surface temperature is not at least 3 deg C (5 deg F) above dew point and rising.
.2 Wood substrates: Do not stain or paint if moisture reading is higher than 12%. Inspect work to ensure surfaces are smooth, free from machine marks and that nailheads have been countersunk.
.3 Cast-in-place concrete substrates: Allow to cure for 60 to 90 Days before proceeding with priming.
.4 Concrete: Inspect and accept or reject filled-in surface blow holes.
.5 New masonry substrates: Allow to cure for 30 to 90 Days. Ensure moisture content is below 12% and test for alkalinity and neutralize (pH 6.5 - 7.5) before proceeding with priming.
.6 Gypsum board substrates: Inspect to ensure joints are completely filled and sanded smooth. Inspect surfaces for following defects and ensure corrective measures have been taken prior to commencing painting work:

.1 "nail popping".
.2 screw heads not recessed and taped.
.3 breaks in surface or other imperfections.

3.2 PREPARATION

.1 Verify that each substrate is dry and not frozen and free from tool and sandpaper marks, dust, rust, insects, grease and other foreign matter liable to impair finished work.

.2 Prepare defective surfaces to obtain a satisfactory substrate and in accordance with paint manufacturer's instructions.

.3 Prior to painting, sweep areas dust-free.

.4 Clean soiled surfaces to be painted.

.5 Protection:

.1 Provide scaffolding, staging, platforms and ladders, as required for execution of work. Erect scaffolding to avoid interference with work of other trades. Comply with Occupational Health and Safety Act (Ontario) and other Authorities Having Jurisdiction.

.2 Provide drop cloths or adequate plastic sheets to protect floors in areas assigned for storage and mixing of paints.

.3 Protect work of other Sections being performed by trades against paint splattering and Make Good at own expense any such damage.

.4 Remove finish hardware, electrical switch and outlet covers, receptacle plates, fittings and fastenings, to protect from paint splatter. Mask items not removable. Use sufficient drop cloths and protective coverings for full protection of floors, furnishings, mechanical, electrical and special equipment, all other components of building which do not require painting or to be removed, from paint spotting and other soiling. Re-Install items when paint is dry. Clean any components that are paint spotted or soiled.

.5 Keep waste rags in covered metal drums containing water and remove from building at end of each Day.

.6 Prohibit traffic, where possible, from areas where painting is being carried out and until paint is cured. Post “wet paint” or other warning signage during and on completion of work. Provide also warning signs at all points of entry to areas where painting is applied.

.7 When handling solvent coating materials, wear approved vapour/particulate respirator as protection from vapours. Dust respirators do not provide protection from vapours.

.6 Surface Preparation: Comply with MPI RSP 1, MPI RSP 4, SSPC SP1, 2, or 3 as applicable for surface cleaning.

.1 Prepare surfaces in accordance with SSPC or MPI standards. Change rags frequently to avoid contaminant spread.

.2 Ferrous Metal: Clean to SSPC-SP1/2/3. Remove rust, prime bare metal.

.3 Structural Steel/Miscellaneous Steel: Remove contaminants to SSPC-SP7 or SSPC-WJ4 LPWC.

.4 Decorative Metals: Remove scale, rust to SSPC-SP6.

.5 Galvanized Steel: Allow unweathered steel to weather, clean to SSPC-SP16. No acetic acid use.

.6 Weathered Galvanized Steel: Clean to SSPC-SP16.

.7 Pre-Treated Galvanized Steel: Follow manufacturer's preparation guidelines.

.8 Woodwork: Determine species, grain, moisture content. Sand and clean for finish application.

.9 Plastic (PVC): Solvent clean to SSPC-SP1, sand lightly.

.10 Previously Finished Surfaces: Clean, strip defective paint, flatten gloss, prepare for new finishes.

.11 Concrete Surfaces: Verify moisture content, etch if necessary, rinse and dry. Prepare floors as per manufacturer.

.12 Gypsum Board: Inspect for defects, clean, sand, prime as necessary.

3.3 MIXING

.1 Mix and prepare paint materials in accordance with manufacturer’s directions for particular material and coat to be applied. If reducing is required, do so in accordance with recommendations of manufacturer for particular material and coat.

.2 Mix primer-sealer with a certain amount of colour coat in proportions recommended by manufacturer of material actually used. Tint undercoats and each finish coat with correct type colours, for identification of each succeeding coat.

.3 Clean containers used for storage, mixing and application of materials free of foreign materials and residue.

3.4 APPLICATION

.1 Paint interior and exterior Exposed elements as noted on the Drawings and as required to complete design requirements. Do not paint excluded components indicated herein. Where an item or surface is not specifically mentioned in the schedules, Provide the same finish as similar adjacent materials or surfaces. If colour or finish is not designated on the Drawings, the Consultant will select from standard colors or finishes available.

.2 Provide finish uniform in sheen, colour and texture, free from streaks, shiners and brush or roller marks or other defects.

.3 Apply materials in accordance with manufacturer's directions and Specifications paying particular attention to appropriate time frame after cleaning when environmental conditions encourage flash-rusting, rusting, contamination or manufacturer's paint Specifications require earlier applications. Apply subsequent coatings in accordance with manufacturer’s recommended recoat “windows”. Do not use adulterants. Do any reduction of coating’s viscosity in accordance with the manufacturer’s directions.

.4 Use up paints within the period of shelf life recommended by the paint manufacturer.

.5 Successive coatings to be harmonious chemical compositions and materials of same manufacturer.

.6 Thoroughly mix materials before application. Apply materials evenly, under adequate illumination, free from sags, runs and other defects. Do cutting-in neatly and ensure paint is applied wet edge to wet edge.

.7 Sand and dust between each coat to provide an anchor for next coat and to remove defects visible from a distance up to 1000 mm (39").

.8 Ensure each coat is dry and hard as per manufacturers’ recommendations for recoats before a following coat is applied.

.9 Continue through paint finish behind wall-mounted items (e.g. markerboards and tack boards).

.10 Finishes and number of coats specified hereinafter in Drawings are intended as minimum requirements guide only. Refer to the manufacturer’s recommendations for exact instructions for thickness of coating to obtain optimum coverage and appearance. Some materials and colours may require additional coats and deeper colours may require use of manufacturers’ special tinted primers.

.11 Apply additional paint coats, beyond number of coats specified for any surface, to completely cover and hide substrate and to produce a solid, uniform appearance.

.12 Allow each coat of paint to cure and become dry and hard before application of succeeding coats (unless manufacturer's directions require otherwise).

.13 Before finishing paint coats are applied, inspect and touch-up shop coats of primers previously applied by other trades or fabricators.

.14 Provide paint coating thicknesses indicated, measured as minimum dry film thicknesses.

.15 Obtain colour chart giving colour schemes and gloss value for various areas from the Consultant. Colour chart shall give final selection of colours and surface textures of finishes and whether finishes are transparent (natural) or opaque (paint).

.16 Spraying is not allowed without written permission.

.17 Paint entire plane of areas exhibiting incomplete or unsatisfactory coverage and of areas which have been cut and patched. Patched appearance is not acceptable.

.18 Finish paint factory primed surfaces. Do not paint baked paint surface, chrome plated, stainless steel, aluminum or other surfaces finished with final finish in factory.

.19 Advise the Consultant when each applied paint coat can be inspected. Do not recoat without inspection. Tint each coat slightly to differentiate between applied coats.

.20 Apply final coats on smooth surfaces by roller or brush. Hand brush wood trim surfaces.

.21 Sand smooth paint and varnish undercoats prior to recoating.

.22 Apply primer coat soon after Surface Preparation is completed to prevent contamination of substrate.

.23 Woodwork:

.1 Prime woodwork designated for painting as soon as possible after delivery to site and before installation. Prime cut surfaces, whether exposed or not (i.e. all 6 edges of wood doors) before installation. Prime cut surfaces of woodwork to receive transparent finish with 1 coat of transparent finish reduced 25%.

.2 Fill open grain woods with filler tinted to match wood and work well into grain. Wipe excess from surface before filler sets.

.3 Apply primer-sealer coats by brush or roller. Permit to dry in accordance with manufacturer’s recommendations before applying succeeding coats. Touch up suction spots and sand between coats with No. 120 sandpaper.

.4 Apply final coats on smooth surfaces by roller or brush. Hand brush wood trim surfaces.

.24 Ferrous Metal Surfaces: Apply primer coat to unprimed ferrous metal surfaces. Where sandblast preparation is specified, apply specified primer immediately after blast cleaning.

3.5 EXISTING SPACES

.1 Refinish existing surfaces of rooms or areas which have been damaged, altered or otherwise affected by work. Also finish "new" work occurring thereon unless otherwise specified. Use same procedure as for new work but primer (or filler, stain and sealer in case of varnish finish) may be omitted. Prepare existing surfaces as specified herein. Ensure finish matches previous finish.

.2 Paint or repaint rooms or areas where noted on Drawings and/or as indicated on Drawings.

.3 Repaint surfaces entirely between changes of plane.

.4 Extend painting to a suitable boundary to avoid a “patched” effect. Sand, wire-brush, or scrape such existing finished surfaces to remove loose paint and to reduce gloss. Also clean existing films of dirt, grease or wax. If metallic surfaces are rusted, remove loose scale to Provide a firm surface. Patch and sand cracks and other imperfections.

.5 Provide paint to interior existing spaces effected by alterations [and shelled-in spaces] in accordance with following:

.1 Paint walls to the nearest inside and outside corners for the full wall height.

.2 Paint columns floor to ceiling.

.3 Paint full ceilings to the nearest wall or bulkhead.

.4 Unless indicated otherwise match the existing colour.

.5 Example Locations:

.1 pressed steel frames.
.2 hollow metal doors.
.3 access doors and frames.
.4 hose cabinets.
.5 miscellaneous exposed interior metal work.

3.6 MECHANICAL AND ELECTRICAL SERVICES

.1 Read Division 21, 22, 23 and Division 26 for their requirements and further instruction on painting mechanical and electrical work and perform such work under the supervision of the respective Subcontractors responsible for performing the work prescribed by the mechanical and electrical Divisions of the Specifications.

.2 Finish paint primed mechanical equipment: heaters, convectors, radiators, wall fin perimeter induction units, fan coil units and similar items.

.3 Prime and paint exposed, unfinished electrical raceways, fittings, outlet boxes, junction boxes, pull boxes and similar items.

.4 Keep sprinkler heads free of paint.

.5 Take steps to protect gauges, identification plates and similar items from being painted over or paint splattered.

.6 Remove grilles, covers, access panels for mechanical and electrical systems from installed location and paint separately, if these items are not factory finished

.7 Paint work to match surfaces they are seen against unless directed otherwise.

.8 Paint interior surfaces of air ducts visible through grilles and louvres, with 1 coat of flat black metal paint to limit of sight line.

3.7 CLEANING

.1 Clean adjacent surfaces which have been painted, soiled or otherwise marred.

.2 Remove masking and other protection provided under this Section.

.3 During the work of this Section cover finished floors, walls, ceilings and other work in the vicinity and protect such work from paint and damage.

.4 Painting work will not be considered complete until spatters, drippings, smears and overspray have been cleaned and removed to the satisfaction of the Consultant.

.5 Make Good any damage to structure building surfaces or furnishings resulting from painting operations at no cost to the Owner.

.6 Disposal of Paint Waste:

.1 Be responsible for removal and disposal of material and waste generated by this Section.

.2 Paint, stain and wood preservative finishes and related materials (such as thinners and solvents) are regarded as hazardous Products and are subject to regulations of Authorities Having Jurisdiction regarding their disposal. Obtain information on these controls from the applicable Provincial government departments having jurisdiction.

.3 Separate and recycle waste materials. Where paint recycling is available, collect waste paint by type and provide for delivery to recycling or collection facility. Materials that cannot be reused must be treated as hazardous waste and disposed of in an appropriate manner.

.4 Place materials defined as hazardous or toxic waste, including used sealant and adhesive tubes and containers, in containers or areas designated for hazardous waste.

.5 To reduce amount of contaminants entering waterways, sanitary/storm drain systems or into the ground adhere to following procedures:

.1 Retain cleaning water for water-based materials to allow sediments to be filtered out. In no case clean equipment using free draining water.
.2 Retain cleaners, thinners, solvents and excess paint and place in designated containers and ensure proper disposal.
.3 Return solvent and oil soaked rags used during painting operations for contaminant recovery, proper disposal, or appropriate cleaning and laundering.
.4 Dispose of contaminants in an approved legal manner in accordance with hazardous waste regulations.
.5 Dry empty paint cans prior to disposal or recycling (where available).
.6 Close and seal tightly partly used cans of materials including sealant and adhesive containers and store protected in well ventilated fire-safe area at moderate temperature.

.6 Set aside and protect surplus and uncontaminated finish materials not required by the Owner and deliver or arrange collection for verifiable re-use or re-manufacturing.

3.8 INTERIOR PAINT SCHEDULE

.1 **Standard Performance Finishes (PT) - for public areas including lobbies, corridors, waiting areas, not subject to high abuse (Refer to Drawings for specific locations)**

.1 Substrate: Concrete Vertical Surfaces (including undersides of mezzanines and stairs etc.) - Latex (Over Alkali-resistant Primer) (INT 3.1A as amended):

.1 Primer: 1 coat alkali-resistant primer (MPI #3)

.1 "Loxon Concrete & Masonry Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Perma-Crete Alkali Resistant Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Ultra Spec 500 Interior Primer" by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats latex Interior, Institutional Low Odor/VOC (MPI #143, MPI #144, #145)

.1 Zero VOC Latex Paint:

.1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Ultra Spec 500 Interior Finish" by Benjamin Moore (or Equivalent)

.2 Zero VOC and Silica-free Latex Paint (Garbage Rooms only):

.1 "Harmony Interior Latex — Odor Eliminating Technology, 0 g/L" by Sherwin Williams; no substitutions (or Equivalent)

.2 Substrate: Concrete Masonry Units - Institutional Low Odour/VOC Latex Finish (INT 4.2E as amended):

.1 Primer: 1 coat latex interior block filler (MPI #4):

.1 "PrepRite Block Filler, 45 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Hi Fill Acrylic Block Filler" by PPG - Pittsburgh Paint (or Equivalent)
.3 “Ultra Spec Masonry Block Filler K571”by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats latex Interior, Institutional Low Odor/VOC (MPI #143, MPI #144, #145)

.1 Zero VOC Latex Paint:

.1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Ultra Spec 500 Interior Finish" by Benjamin Moore (or Equivalent)

.2 Zero VOC and Silica-free Latex Paint (Garbage Rooms only):

.1 "Harmony Interior Latex — Odor Eliminating Technology, 0 g/L" by Sherwin Williams; no substitutions. (or Equivalent)

.3 Substrate: Gypsum Board and Plaster Ceilings and Soffits - Institutional Low Odour/VOC Latex Finish (gypsum wallboards, textured plasters, etc.) (INT 9.2M as amended)

.1 Primer: 1 coat multi-purpose latex interior primer sealer (MPI #149)

.1 Zero VOC Latex Primer:

.1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Primer 9-900" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Ultra Spec 500 Waterborne Interior Primer Sealer" by Benjamin Moore (or Equivalent)

.2 Zero VOC and Silica-free Latex Primer (garbage rooms only):

.1 "Harmony Interior Latex Primer — Odor Eliminating Technology, 0 g/L" by Sherwin Williams; no substitutions. (or Equivalent)

.2 Top Coats: 2 coats latex Interior, Institutional Low Odor/VOC (MPI #143, MPI #144, #145)

.1 Zero VOC Latex Paint:

.1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Ultra Spec 500 Interior Finish" by Benjamin Moore (or Equivalent)

.2 Zero VOC and Silica-free Latex Paint (garbage rooms only):

.1 "Harmony Interior Latex — Odor Eliminating Technology, 0 g/L" by Sherwin Williams; no substitutions. (or Equivalent)

.4 Substrate: Gypsum Board Walls - Institutional Low Odour/VOC Latex Finish (gypsum and fiberglass faced wallboards, textured plasters, etc.) (INT 9.2M as amended)

.1 Primer: 1 coat multi-purpose latex interior primer sealer (MPI #149)

.1 Zero VOC Latex Primer:

.1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Primer 9-900" by PPG - Pittsburgh Paint (or Equivalent)

.3 "K534 Ultra Spec 500 Waterborne Interior Primer Sealer" by Benjamin Moore (or Equivalent)

.2 Zero VOC and Silica-free Latex Primer (garbage rooms only):

.1 "Harmony Interior Latex Primer — Odor Eliminating Technology, 0 g/L" by Sherwin Williams; no substitutions. (or Equivalent)

.2 Top Coats: 2 coats latex Interior, Institutional Low Odor/VOC (MPI #143, MPI #144, #145)

.1 Zero VOC Latex Paint:

.1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Ultra Spec 500 Interior Finish" by Benjamin Moore (or Equivalent)

.2 Zero VOC and Silica-free Latex Paint (garbage rooms only):

.1 "Harmony Interior Latex — Odor Eliminating Technology, 0 g/L" by Sherwin Williams; no substitutions. (or Equivalent)

.5 Substrate: Fiberglass Mat Faced Gypsum Board Walls (Moisture resistant gypsum board, abuse resistant gypsum board, impact resistant gypsum board) (Non-MPI System)

.1 Primer: 1 coat high build surfacer (Minimum DFT: as recommended by manufacturer but not less than 10 mils)

.1 "Builders Solution, <50 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Maxbuild High Build Drywall Surfacer" by PPG - Pittsburgh Paint (or Equivalent)

.2 Sealing Coat: As recommended by Paint manufacturer.
.3 Top Coats: 2 coats latex Interior, Institutional Low Odor/VOC (MPI #143, MPI #144, #145)

.1 Zero VOC Latex Paint:

.1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Ultra Spec 500 Interior Finish" by Benjamin Moore (or Equivalent)

.6 Substrate: Painted Wood (Doors, Frames, Trims, Rails etc.) – latex finish (INT 6.3V as amended)

.1 Primer: 1 coat multi-purpose latex interior primer sealer (MPI #39)

.1 "Multi-Purpose Latex Primer" by Sherwin Williams (or Equivalent)
.2 "Seal Grip Acrylic Universal Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 “Fresh Start High-Hiding All-Purpose Primer K046” by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats acrylic Interior, Institutional Low Odor/VOC (MPI #147)

.1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Zero VOC" by PPG - Pittsburgh Paint (or Equivalent)

.3 "Ultra Spec 500 Waterborne Interior Finish" by Benjamin Moore (or Equivalent)

.7 Substrate: Stained Wood (Trims, Rails etc.) – polyurethane varnish (INT 6.3E as amended)

.1 Stain: 1 coat interior wood stain (semi-transparent) (MPI #90)

.1 "Minwax Wood Finish Stain, <250 g/L" by Sherwin Williams (or Equivalent)
.2 "Olympic Low VOC Oil Wood Stain" by PPG - Pittsburgh Paint (or Equivalent)
.3 Equivalent by Benjamin Moore

.2 Top Coats: 2 coats clear moisture cure polyurethane varnish (MPI #56, #57):

.1 "Minwax Waterbased Polyurethane Varnish, <275 g/L" by Sherwin Williams (or Equivalent)
.2 "Olympic Oil Based Polyurethane" by PPG - Pittsburgh Paint (or Equivalent)

.8 Substrate: Ferrous Metals

.1 Doors, Frames, Miscellaneous Metals etc.) - Water Based Light Industrial Coating (INT 5.1B or INT 5.18 as amended)

.1 Primer: 1 coat rust inhibitive primer (MPI #107)

.1 "Pro Industrial Pro-Cryl Universal Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 “Ultra Spec HP D.T.M. Primer FP04” by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats acrylic Interior, Institutional Low Odor/VOC (MPI #147, MPI #153):

.1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Zero VOC" by PPG - Pittsburgh Paint (or Equivalent)
.3 " K540 Ultra Spec 500 Waterborne Interior Finish" by Benjamin Moore (or Equivalent)

.2 Handrails (INT 5.1K as amended)

.1 Primer: 1 coat rust inhibitive primer (MPI #107)

.1 "Pro Industrial Pro-Cryl Universal Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Super Spec High Performance Acrylic Metal Primer" by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats water-based epoxy (MPI #115)

.1 "Pro Industrial Zero VOC Waterbased Epoxy, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Cornado 1138 Line" by Benjamin Moore (or Equivalent)

.9 Substrate: Galvanized Metal

.1 Doors, Frames, Miscellaneous Metals etc. (INT 5.3N or 5.3K as amended)

.1 Primer: 1 coat water-based galvanized primer (MPI #134)

.1 "Pro Industrial Pro-Cryl Universal Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 “Ultra Spec HP D.T.M. Primer FP04” by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats acrylic Interior, Institutional Low Odor/VOC (MPI #147, MPI #153)

.1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic" by PPG - Pittsburgh Paint (or Equivalent)
.3 "K540 Ultra Spec 500 Waterborne Interior Finish" by Benjamin Moore (or Equivalent)

.2 Handrails (INT 5.1K as amended)

.1 Primer: 1 coat rust inhibitive primer (MPI #107)

.1 "Pro Industrial Pro-Cryl Universal Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Super Spec High Performance Acrylic Metal Primer" by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats water-based epoxy (MPI #115)

.1 "Pro Industrial Zero VOC Waterbased Epoxy, 0 g/L" by Sherwin Williams (or Equivalent)
.2 “Pitt Glaze Acrylic Epoxy” (NOT MPI APPROVED) by PPG - Pittsburgh Paint (or Equivalent)
.3 "Cornado 1138 Line" by Benjamin Moore (or Equivalent)

.10 Substrate: Aluminum

.1 Primer: 1 coat quick dry primer (MPI #76, MPI #95, MPI #107)

.1 "Pro Industrial Pro-Cryl Universal Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 "KP04 Super Spec High Performance Acrylic Metal Primer" by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats acrylic Interior, Institutional Low Odor/VOC (MPI #147, MPI #153)

.1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic" by PPG - Pittsburgh Paint (or Equivalent)
.3 "K540 Ultra Spec 500 Waterborne Interior Finish" by Benjamin Moore (or Equivalent)

.2 **High Performance Finishes (PT-E) (Refer to Drawings for specific locations).**

.1 Substrate: Concrete Vertical Surfaces (including undersides of mezzanines and stairs etc.) - Epoxy Modified Latex (INT 3.1G as amended):

.1 Primer: As recommended by top coat manufacturer.
.2 Top Coats: 2 coats water-based epoxy (MPI #115)

.1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L" by Sherwin Williams (or Equivalent)
.2 Corotech Acrylic Epoxy V450 by Benjamin Moore (or Equivalent)

.2 Substrate: Concrete Masonry Units – Epoxy modified latex (INT 4.2J as amended)

.1 Primer: 1 coat latex interior block filler (MPI #4):

.1 "PrepRite Block Filler, 45 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Hi Fill Acrylic Block Filler" by PPG - Pittsburgh Paint (or Equivalent)
.3 ”Ultra Spec Masonry Block Filler K571” by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats water-based epoxy (MPI #115)

.1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L" by Sherwin Williams (or Equivalent)
.2 “Pitt Glaze Acrylic Epoxy” (NOT MPI APPROVED) by PPG - Pittsburgh Paint (or Equivalent)
.3 "Cornado 1138 Line" by Benjamin Moore (or Equivalent)

.3 Substrate: Gypsum Board and Plaster Ceilings and Soffits **below 6096 mm (20’ – 0”)** (gypsum and fiberglass faced wallboards, textured plasters, etc.) - Institutional Low Odour/VOC Latex Finish (INT 9.2M as amended)

.1 Primer: 1 coat multi-purpose latex interior primer sealer (MPI #149)

.1 Zero VOC Latex Primer:

.1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Primer 9-900" by PPG - Pittsburgh Paint (or Equivalent)
.3 "K534 Ultra Spec 500 Waterborne Interior Primer Sealer" by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats latex Interior, Institutional Low Odor/VOC (MPI #143, MPI #144, #145)

.1 Zero VOC Latex Paint:

.1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG - Pittsburgh Paint (or Equivalent)
.3 "K536 Ultra Spec 500 Interior Finish" by Benjamin Moore (or Equivalent)

.4 Substrate: Gypsum Board and Plaster Ceilings and Soffits **above 6096 mm (20’ – 0”)** (gypsum and fiberglass faced wallboards, textured plasters, etc.) - Institutional Low Odour/VOC Latex Finish (INT 9.2M as amended)

.1 Top Coats: 2 coats water based dry fall coating (MPI #118, MPI#226)

.1 "Low VOC Waterborne Acrylic Dryfall, <50 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Interior Latex Dryfall" by PPG - Pittsburgh Paint (or Equivalent)
.3 “Coronado Super Kote 5000 Latex Dry Fall Flat N110” by Benjamin Moore (or Equivalent)

.5 Substrate: Gypsum Board Walls (gypsum wallboards, textured plasters, etc.) – Epoxy Modified Latex (INT 9.2F as amended)

.1 Primer: 1 coat multi-purpose latex interior primer sealer (MPI #50)

.1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Interior Latex Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 "K534 Ultra Spec 500 Waterborne Interior Primer Sealer" by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats water-based epoxy (MPI #115)

.1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L" by Sherwin Williams (or Equivalent)
.2 “Pitt Glaze Acrylic Epoxy” by PPG - Pittsburgh Paint (MPI 151/153) (or Equivalent)
.3 " Corotech Acrylic Epoxy V450 " by Benjamin Moore (or Equivalent)

.6 Substrate: Fiberglass Mat Faced Gypsum Board Walls (Moisture resistant gypsum board, abuse resistant gypsum board, impact resistant gypsum board) (Non-MPI system)

.1 Primer: 1 coat high build surfacer (Minimum DFT: as recommended by manufacturer but not less than 10 mils)

.1 "Builders Solution, <50 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Maxbuild High Build Drywall Surfacer" by PPG - Pittsburgh Paint (or Equivalent)

.2 Sealing Coat: As recommended by paint and board manufacturer.
.3 Top Coats: 2 coats water-based epoxy (MPI #115)

.1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L" by Sherwin Williams (or Equivalent)
.2 “Pitt Glaze Acrylic Epoxy” (NOT MPI APPROVED) by PPG - Pittsburgh Paint (or Equivalent)
.3 " Corotech Acrylic Epoxy V450 " by Benjamin Moore (or Equivalent)

.7 Substrate: Ferrous Metals

.1 Unexposed Miscellaneous Ferrous Metals (with existing shop coat primer): No further finishing required except for touch-up of damaged surfaces. Prime with Product recommended by manufacturer for specific substrate.
.2 Doors, Frames, Miscellaneous Metals etc. - Water Based Light Industrial Coating (INT 5.1B or INT 5.18 as amended)

.1 Primer: 1 coat rust inhibitive primer (MPI #107)

.1 "Pro Industrial Pro-Cryl Universal Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 “Ultra Spec HP D.T.M. Primer FP04”by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats acrylic Interior, Institutional Low Odor/VOC (MPI #147, MPI #153):

.1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams (or Equivalent)

.2 "Pitt-Tech Plus DTM Acrylic" by PPG - Pittsburgh Paint (or Equivalent)
.3 "K540 Ultra Spec 500 Waterborne Interior Finish" by Benjamin Moore (or Equivalent)

.3 Handrails (INT 5.1K as amended)

.1 Primer: 1 coat rust inhibitive primer (MPI #107)

.1 "Pro Industrial Pro-Cryl Universal Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 “Ultra Spec HP D.T.M. Primer FP04” by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats water-based epoxy (MPI #115)

.1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L" by Sherwin Williams (or Equivalent)
.2 “Pitt Glaze Acrylic Epoxy” (NOT MPI APPROVED) by PPG - Pittsburgh Paint (or Equivalent)
.3 " Corotech Acrylic Epoxy V450 " by Benjamin Moore (or Equivalent)

.8 Substrate: Galvanized Metal

.1 Repair of Galvanized Metals: Touch-up damaged surfaces with zinc-rich coating.

.1 Primer: 1 coat organic zinc-rich epoxy primer:

.1 "Zinc Clad 5" by Sherwin Williams (or Equivalent)
.2 “Corotech Organic Zinc Rich Primer V170” by Benjamin Moore (or Equivalent)

.2 Doors, Frames, Miscellaneous Metals etc. – Institutional Low Odor/VOC (INT 5.3N or 5.3K as amended)

.1 Primer: 1 coat water-based galvanized primer (MPI #134)

.1 "Pro Industrial Pro-Cryl Universal Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint (or Equivalent)
.3 “Ultra Spec HP D.T.M. Primer FP04” by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 acrylic Interior, Institutional Low Odor/VOC (MPI #147)

.1 "Pro Industrial Zero VOC Acrylic, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "PPG – Pure Performance Interior Latex Zero VOC" by PPG - Pittsburgh Paint (or Equivalent)
.3 "K540 Ultra Spec 500 Waterborne Interior Finish" by Benjamin Moore (or Equivalent)

.3 Handrails (INT 5.1K as amended)
.1 Primer: 1 coat rust inhibitive primer (MPI #107)

.1 "Pro Industrial Pro-Cryl Universal Primer, <100 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt-Tech Plus DTM Acrylic Primer" by PPG - Pittsburgh Paint (or Equivalent)

.3 "Ultra Spec HP D.T.M. Primer FP04" by Benjamin Moore Moore (or Equivalent)

.2 Top Coats: 2 coats water-based epoxy (MPI #115)

.1 "Pro Industrial Zero VOC Waterborne Epoxy, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pitt Glaze Acrylic Epoxy" (NOT MPI APPROVED) by PPG - Pittsburgh Paint (or Equivalent)
.3 " Corotech Acrylic Epoxy V450 " by Benjamin Moore (or Equivalent)

.3 **Miscellaneous General Areas**

.1 Substrate: Concrete Horizontal Surfaces (Floors and Stairs):

.1 Refer to Section 03 35 00

.2 Substrate: Ferrous Exposed Ceilings and Decking (including bar joists) above 6096 mm (20' – 0") – Water-based Dry Fall (INT 5.1CC as amended)

.1 Primer:

.1 Shop-applied Q.D primer (MPI #275): Refer to Section 05 12 00. (or Equivalent)

.2 Top Coats: 1 coat water based dry fall coating (MPI #118, MPI#226)

.1 "Low VOC Waterborne Acrylic Dryfall, <50 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Interior Latex Dryfall" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Super Spec Sweep Up Latex" by Benjamin Moore (or Equivalent)

.3 Substrate: Galvanized Exposed Ceilings and Decking (including bar joists) above 6096 mm (20' – 0") – Water-based Dry Fall (INT 5.1CC as amended)

.1 Top Coats: 2 coats water based dry fall coating (MPI #118, MPI#226)

.1 "Low VOC Waterborne Acrylic Dryfall, <50 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Interior Latex Dryfall" by PPG - Pittsburgh Paint (or Equivalent)
.3 "Super Spec Sweep Up Latex" by Benjamin Moore (or Equivalent)

.4 Substrate: Non-insulated Pipes, Ducts, Conduit, Valves, Fittings and Equipment and Ancillary Items where "Exposed" in Completed Work

.1 Primer: As recommended by manufacturer for specific substrate.
.2 Top Coats: 2 coats latex coating (MPI #53)

.1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Zero Interior Latex" by PPG - Pittsburgh Paint (or Equivalent)
.3 "K536 Ultra Spec 500 Waterborne Interior Finish" by Benjamin Moore (or Equivalent)

.5 Substrate: Canvas and Cotton Coverings (Pipe and Duct Coverings, etc.) – Institutional Low Odor/Low VOC (INT 10.1D as amended)

.1 Primer: 1 coat multi-purpose latex interior primer sealer (MPI #50)

.1 "ProMar 200 Zero VOC Interior Latex Primer, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Speedhide Interior Latex Primer" by PPG - Pittsburgh Paint (or Equivalent)

.3 "K534 Ultra Spec 500 Waterborne Interior Primer Sealer" by Benjamin Moore (or Equivalent)

.2 Top Coats: 2 coats latex Interior, Institutional Low Odor/VOC (MPI #143, MPI #144, #145)

.1 Zero VOC Latex Paint:

.1 "ProMar 200 Zero VOC, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "Pure Performance Interior Latex Zero VOC 9-line" by PPG - Pittsburgh Paint (or Equivalent)
.3 "K536 Ultra Spec 500 Interior Finish" by Benjamin Moore (or Equivalent)

.2 Zero VOC and Silica-free Latex Paint:

.1 "Harmony Interior Latex — Odor Eliminating Technology, 0 g/L" by Sherwin Williams (or Equivalent)
.2 "K536 Ultra Spec 500 Interior Finish" by Benjamin Moore (or Equivalent)
.3 Equivalent by PPG - Pittsburgh Paint (or Equivalent)

.4 Substrate: Steel (High Heat) including heat exchangers, breeching, pipes, flues, stacks etc. – Heat Resistant Enamel – Maximum 205 deg C (400 deg F) (INT 5.2A as amended):

.1 Primer: As recommended by manufacturer.

.2 Finish Coats: Apply heat resistant enamel (MPI #21) coats in strict accordance with manufacturer's instructions:

.1 "Kem Hi-Temp Heat-Flex II 450" by Sherwin Williams (or Equivalent)
.2 "Ameron Engineered Siloxane PSX 892HS" by PPG (or Equivalent)

END OF SECTION

PART 1 - GENERAL

1.1 PRICING

1. All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

1. Read and conform to:
    1. the General Conditions and the Supplementary Conditions of the Contract.
    2. Division 01 requirements and documents referred to therein.

1.3 SUMMARY

1. Work Included: Provide labour, materials, Products, equipment and services to complete the phenolic toilet compartments specified herein. this includes, but is not necessarily limited, to:
    1. Maximum privacy, full height, phenolic-core toilet compartments, floor anchored.
    2. Barrier-free type hardware.
    3. Anchors, brackets and fastenings.
    4. Auxiliary materials required for complete installation.
2. Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole and may be directly applicable to this Section.

1.4 REFERENCES

1. Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

1. Preinstallation Meeting: Convene a pre-installation meeting at the site prior to commencing work of this Section. Review methods and sequence of work scope, special details and conditions, standards of workmanship, testing and quality control requirements, and other topics related to the work of this Section.

1.6 SUBMITTALS

1. General Requirements and Procedures for Submittals: In accordance with Section 01 30 00, Submittal Procedures.

2. Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for toilet compartments work specified in this Section

3. Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:
    1. Include plans, elevations, sections, and attachment details.
    2. Show locations of reinforcements for compartment-mounted grab bars and locations of blocking for surface-mounted toilet accessories.
    3. For overhead supported items, show ceiling grid, ceiling-mounted items, and overhead support or bracing locations.
    4. Indicate field-measured dimensions on Shop Drawings.
    5. For all overhead support work, ensure Shop Drawings are stamped by a Professional Engineer licensed to practice in Province of Ontario.

4. Samples:
    1. Samples: Submit initial selection samples for Products requiring colour, texture, or design selection. Submit manufacturer's list of finishes or colour swatches for Consultant's selection.
    2. As a minimum submit the following:
        1. Samples of phenolic finish material, minimum 152 mm (6 inches) x 152 mm (6 inches).
        2. Samples of hardware and accessories involving material and colour selection, minimum 152 mm (6 inches) thick.

1.7 CLOSEOUT SUBMITTALS

1. Operating and Maintenance Data: Submit care and maintenance instructions for Toilet Compartments to be included in building's operation and maintenance manual.

2. Warranty Documentation: Submit copy of extended warranties specified in this Section.

1.8 QUALITY ASSURANCE

1. Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.

2. Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.

3. Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

1.9 DELIVERY, STORAGE AND HANDLING

1. Deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

2. Store materials off-ground, in clean, dry, well-ventilated area.

3. Replace defective or damaged materials with new.

1.10 FIELD CONDITIONS

1. Environmental Restrictions: Do not deliver or install toilet compartments until building is enclosed, wet work is complete, and HVAC system is operational and will maintain temperature and relative humidity levels equal to occupancy levels for remainder of construction period.

1.11 WARRANTY

1. Warrant work of this Section for period of 5 years against defects and/or deficiencies in accordance with General Conditions of the Contract. Promptly correct any defects or deficiencies which become apparent within warranty period, to satisfaction of Consultant and at no expense to Owner. Defects include but are not limited to; opening of seams and delamination of finish.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

1. Products of following manufacturers are acceptable subject to conformance to requirements of Drawings, Schedules and Specifications:
    1. ASI Group Canada;
    2. Bobrick Washroom Equipment;
    3. Bradley;
    4. EAD;

2.2 PERFORMANCE / DESIGN CRITERIA

1. Design compartment and cubicle doors to provide maximum privacy. Partition and doors to extend as close to finished floor and ceiling as allowed by Building Code in staff change areas to provide maximized privacy. Door and pilaster edges designed to overlap, eliminating visual gaps.

2. Provide for adjustment of compartments and cubicles with screw jack through steel saddles made integral with pilaster. Conceal fixings with stainless steel boot assemblies

3. Install ceiling hung compartments and cubicles in accordance with manufacturer's written instructions, unless otherwise recommended by manufacturer.

4. For barrier-free compartments, comply with applicable provisions in National Building Code and other applicable provincial code, and CSA B651.

5. Configuration:
    1. Toilet Enclosure Depth, Width: As indicated on Drawings.
    2. Toilet Enclosure Height: As indicated on Drawings.
    3. Door Height: As indicated on Drawings.
    4. Door Size and Swings:
        1. Unless otherwise indicated, provide 610-mm- (24-inch-) wide, in-swinging doors for standard toilet compartments.
        2. Provide 950-mm wide out-swinging doors with a minimum 850-mm wide clear opening (in open position) for compartments designated as barrier-free.
    5. Floor Clearance: Manufacturer's standard for maximum privacy; but not more than 150 mm (6 in).

6. Style:
    1. Privacy: Provide full height partitions with no-sightline system; floor anchored.
    2. Coordinate with Section 06 10 00 and Section 09 21 16 for provision of adequate backing and supports in walls and partitions to ensure a rigid installation.

2.3 PHENOLIC TOILET COMPARTMENTS

1. Solid Phenolic Material: Provide compartments fabricated from solid phenolic construction conforming to BS EN 438-4 or NEMA LD3, Grade CGS consisting of a core layer fabricated from sheets of kraft paper impregnated with phenolic resins.
    1. Exposed Panel Edges: manufacturer's standard black edges.
    2. Graffiti Resistance: 8 out of 9 applied marks cleaned in accordance with ASTM D6578/D6578M.
    3. Flexural modulus (Modulus of elasticity): ASTM D790, > 1.4 x 106 psi,
    4. Flexural strength: ASTM D790, > 17, 500 psi. (applies for ceiling application only),
    5. Density: ASTM D792, > 1.35 g/m3,
    6. Fire resistance: ULC S102, Flame Spread Index 5 and Smoke Developed Index 70.
    7. Thickness: partition thickness 25 mm; pilaster thickness 32 mm.
    8. Acceptable Sources for Solid Phenolic Material:
        1. Abet Laminati (Abet Corporation)
        2. Fundermax

3. Trespa International B.V

9. Colour and pattern: as selected by Consultant from phenolic manufacturer's standard colours.

2. Hardware

1. Hardware: Equip each door with suitable pivot hinges, latch, latch keeper, bumper stop, and coat hook with bumper.

2. Hinges: concealed, heavy-duty chrome plated nonferrous or aluminum casting, self-lubricating inward swing.

3. Slide bolt and keeper: chrome plated nonferrous casting or extrusion, equipped for emergency access.

4. Door stop: chrome plated nonferrous casting or extrusion with rubber insert.

5. Connecting brackets: channel shaped, anodized aluminum extrusion or casting, continuous.

6. Pilasters Shoes: minimum 22 gauge ASTM A-167 stainless steel with satin finish, not less than 75 mm (3") in height.

7. Fasteners: chrome plated nonferrous tamperproof type screws and bolts.

8. Hardware Materials and Finish:

1. Stainless steel to ASTM A743/A743M, with AISI No. 4 finish

2. Aluminum to ASTM B221, with Class II clear-anodized finish.

2.4 FABRICATION

1. Fabricate toilet compartment components to sizes indicated. Coordinate requirements and provide cutouts for through-partition toilet accessories, and solid blocking within panel where required for attachment of toilet accessories.

2. Provide manufacturer's standard corrosion-resistant anchoring assemblies with leveling adjustment nuts at pilasters for connection to structural support above finished ceiling. Provide assemblies that support pilasters from structure without transmitting load to finished ceiling. Provide sleeves (caps) at tops of pilasters to conceal anchorage

3. Cut, shear, straighten and work steel in a manner to prevent disfigurement of finished work.

4. Ensure finished work is free of warp, open seams, buckles and other surface defects detrimental to appearance.

PART 3 - EXECUTION

3.1 EXAMINATION

1. Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

2. Confirm location and adequacy of blocking and supports required for installation.

3. Coordinate layout and installation of supports, inserts, and anchors built into other units of work for toilet compartment anchorage.

3.2 INSTALLATION

1. Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.

2. Install partitions and screens plumb and square to building lines and according to manufacturer's written instructions.

3. Install units rigid, straight, level, and plumb. Secure units in position indicated with manufacturer's recommended anchoring devices.

4. Provide anchorage devices and fasteners where necessary for securing to in-place construction. If necessary Provide additional reinforcing in accordance with requirements of Section 05 50 00. Provide for concealed adjustment of ceiling variations with screw jack through steel saddles made integral with pilaster. Conceal ceiling anchorage with stainless steel covers secured in position.

5. Ensure spaces between panels and pilasters, between panels and walls and between pilasters and walls are of uniform consistent width and sized to ensure that it is not possible to see persons using the compartments.

6. Coordinate installation with The Work of trades providing wall and floor finishes, washroom accessories and other adjacent components and construction.

7. Insulate contact surfaces to prevent electrolysis due to metal contact with masonry, concrete or dissimilar metal surfaces. Use bituminous paint, building paper or other approved means.

8. Perform drilling of steel, masonry or concrete necessary to Install work.

9. Install partitions and screens to tolerances specified and at locations shown.

10. Perform drilling of steel, masonry or concrete necessary to Install partitions.

11. Install hardware and ensure it is visually aligned.

12. Test, adjust and lubricate hardware according to hardware manufacturer's written instructions for proper operation. Set hinges on in-swinging doors to stay open 32 deg when compartment is not in use. Set hinges on out-swinging doors to return doors to fully closed position.

13. Touch up damaged shop finishes with matching site-applied finishes.

3.3 TOLERANCES

1. Maximum Clearances:
    1. Pilasters and Panels: 13 mm (1/2 inch).

2. Panels and Walls: 25 mm (1 inch).

3.4 REPAIR

1. Touch up shop paint that has been damaged.

2. Replace damaged work which cannot be satisfactorily repaired, restored or cleaned, to satisfaction of Consultant at no cost to Owner.

3.5 ADJUSTING

1. Test and adjust hinges and latches for ease of operation.

2. Set hinges on in-swinging doors to hold doors open approximately 30 degrees from closed position when unlatched.

3.6 PROTECTION

1. Protect toilet compartments from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.

2. Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.

3. Promptly replace Toilet Compartments work damaged during construction that cannot be satisfactorily repaired.

3.7 CLEANING AND WASTE MANAGEMENT

1. Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.

2. Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

END OF SECTION

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and the Supplementary Conditions of the Contract;

.2 Division 1 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide wall protection including but not limited to the following:

.1 sheet wall protection coverings

.2 corner guards

.3 accessories required for a complete installation

.2 Related Requirements: Specifications throughout the entirety of the Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them

1.4 REFERENCES

.1 Definitions:

.1 Full Height: Top of base to underside of ceiling.

.2 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Installation Meetings:

.1 Prior to starting the work of this Section, convene a pre-installation meeting at the Project site to review the Project requirements and site conditions with pertinent parties. Conform to requirements of Section 01 30 00.

1.6 SUBMITTALS

.1 Product Data: Submit manufacturer's literature and data sheets for each type of material provided under this Section for the Project in accordance with requirements of Section 01 30 00. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to specified materials.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Section 01 70 00, for adhesives, sealants and any other material designated by Consultant.

.3 Shop Drawings:

.1 Submit in accordance with Section 01 30 00. Ensure Shop Drawings indicate material characteristics, details of construction, connections and relationship with adjacent construction.

.4 Samples: Submit in accordance with Section 01 30 00. If requested by the Consultant, submit samples of Products.

.5 Test and Evaluation Reports: Submit test data substantiating that proposed materials meet performance criteria specified herein. Submit independent test results showing properties and acceptable fire hazard classification of applicable materials.

1.7 CLOSEOUT SUBMITTALS

.1 Operation and Maintenance Data: Submit maintenance instructions in accordance with Section 01 70 00 for wall protection specified herein.

1.8 MAINTENANCE MATERIAL SUBMITTALS

.1 Extra Materials: Supply the following quantity of maintenance material in accordance with Section 01 77 00:

.1 Quantity: 5% of The Work.

1.9 QUALITY ASSURANCE

.1 Qualifications: Provide the work of this Section executed by competent installers with a minimum of 5 years' experience in the application of the Products, systems and assemblies specified herein and with the approval and training of the Product manufacturers.

.2 Single source responsibility: Provide components of wall protection system manufactured by same company to ensure compatibility of color, texture and physical properties.

.3 Mock-ups: Provide mock-ups in locations designated by the Consultant and as required to demonstrate quality of workmanship. Maintain mock-ups during construction in an undisturbed condition as a standard for judging the completed work.

1.10 DELIVERY, STORAGE AND HANDLING

.1 Delivery and Acceptance Requirements: Comply with material manufacturer's ordering instructions and lead time requirements to avoid delays.

1.11 WARRANTY

.1 The Contractor warrants the work of this Section for a period of 3 years from Substantial Performance of the Work against defects and/or deficiencies in accordance with the General Conditions of the Contract. Promptly correct any defects or deficiencies which become apparent within this warranty period, to the satisfaction of the Consultant and at no expense to the Owner. Defects include but are not limited to: buckling, opening of seams, bond failure and extensive colour fading.

PART 2 - PRODUCTS

2.1 DESCRIPTION

.1 Regulatory Requirements:

.1 Fire Performance Characteristics: Wall panels shall have ULC or UL label indicating that they are identical to those tested in accordance with CAN/ULC S102.2 for characteristics, flame spread 25 or less; smoke development 450 or less.

.2 Install systems in accordance with Code regulations concerning access of physically challenged people and requirements of CAN/CSA B651.

2.2 MATERIALS

.1 Aluminum

.1 Aluminum Extrusions: ASTM B209M, size accurately formed as shown on Drawings, extruded aluminum alloy AA-6063- T5 or T6 for aluminum. Ensure surfaces are free from defects impairing appearance, strength and durability.

.2 Aluminum Sheet: ASTM B221M, Minimum thickness: 3 mm (1/8"); of type and characteristics to match finished extrusions; Concealed sheets to be Utility Aluminum mill finished; for intricate forming with decorative finishes use AA 1100 and for siding and exposed panels use AA-3003 with specified finish.

.2 Stainless Steel:

.1 Stainless Steel Sheet, Strip, Plate, and Flat Bar: ASTM A240 or ASTM A167 or ASTM A666, Type 304 and Type 316 alloy with exposed surfaces having No. 4 polished finish. Sizes as required to meet design requirements.

.2 Stainless Steel Tubing: ASTM A554, Grade MT 304.

.3 Stainless Steel Pipe: ASTM A312M, Grade TP 304.

.4 Provide highest architectural quality in various forms, straight and true. Ensure there are no scratches, scars, creases, buckles, ripples or chatter marks. Provide finish surfaces suitable for polishing where required. Ensure finished surfaces exposed to view are free of pitting, seam marks, roller marks, oil-canning, stains, discolourations or other imperfections.

2.3 MANUFACTURED UNITS

.1 SHEET WALL PROTECTION COVERINGS

.1 Vinyl/Acrylic Wall Protection (SWP): High impact semi-rigid sheet vinyl/acrylic wall cladding, with colour matched accessory trim pieces, outside edge caps, joint covers, inside corner and outside corners.

.1 Sheet Size: Manufacturers full sheet; maximum practical sizes to minimize seams unless otherwise indicated on Drawings.
.2 Sheet Thickness: 1.5 mm (0.060”)
.3 Trims: Manufacturer's standard, matching moldings and trim complete with division bars between panels, inside and outside corners and cap mouldings as required for complete installation.
.4 Colours and Texture: to be selected by Consultant at a later date.
.5 Height: Partial height unless otherwise indicted.
.6 Refer to Drawings and Schedules.
.7 Acceptable Products:

.1 “Acrovyn 4000” by C/S Construction Specialties Ltd.
.2 “G2” by InPro Corporation
.3 or Equivalent to the above.

.2 CORNER GUARDS:

.1 Stainless-Steel Corner Guards (CG): Satin-finish, 1.6 mm (16 ga.) minimum, Type 304 stainless-steel sheet corner guards; with 90-deg return, unless otherwise indicated; and formed edges. Provide full-height units unless otherwise indicated.

.1 Corner Guard (90o) - CG-1:

.1 Wing Length: 75 mm (3 inches)
.2 Height: As indicated on Drawings, but not less than 1220 mm.
.3 Mounting: Fully-adhered
.4 Corner Radius: 3 mm (1/8")
.5 Acceptable Products:

.1 "Model No. SM-20AN" by Construction Specialties Ltd
.2 "Model No. 183" by InPro Corporation.
.3 or Equivalent to the above.

.2 End wall Protector - CG-2:

.1 Wing Length: 50 mm (2 inches)
.2 Height: As indicated on Drawings, but not less than 1220 mm.
.3 Mounting: Fully-adhered
.4 Acceptable Products:

.1 "Model No. SSM-20AN" by Construction Specialties Ltd.
.2 "SS-WEFM" by InPro Corporation.
.3 or Equivalent to the above.

.3 Bumper Rail (BRLG):

.1 Dimensions and Profile: minimum 50 mm (2") high.

.1 Acceptable Products:

.1 "Model No. SCR-40N" by Construction Specialties Ltd.;
.2 or equivalent by InPro Corporation.

2.4 FABRICATION

.1 Accurately fit joints and intersecting members in true planes with adequate fastening.

.2 Fit and assemble work of this Section in shop where possible. Execute according to details and reviewed Shop Drawings. Where shop fabrication is not possible, execute trial assembly in shop.

.3 Fabricate finished work free from distortion, weld splatter and defects detrimental to appearance and performance.

.4 Provide exposed metal fastenings and accessories of the same material, texture, colour and finish as the base metal to which they are applied or fastened, unless otherwise specified herein.

.5 Do not expose trademarks or labels on finished surfaces.

2.5 ACCESSORIES

.1 Provide Prefabricated, injection-molded or otherwise matching end caps and inside and outside corners with concealed splices, cushions, mounting hardware, division bars between panels, and other accessories as required; field adjustable for close alignment with snap-on plastic covers (where applicable).

.2 Adhesives and Sealants: As recommended by manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation.

.2 Verify gypsum board substrate smooth, plumb and true, free of waves bulges and within tolerances specified in Section 09 21 16.

.3 Examine walls to which impact-resistant wall protection will be attached for blocking, grounds, and other solid backing that have been installed in the locations required for secure attachment of support fasteners.

.1 For impact-resistant wall protection units attached with adhesive or foam tape, verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.

.4 Proceed with installation only after unsatisfactory conditions have been corrected. Commencement of work implies acceptance of previously completed work.

3.2 PREPARATION

.1 Surface Preparation: Ensure substrate is dry, well-sealed and free of dirt, loose paint, wax and grease. Glossy surfaces may require sanding or priming before installation to help promote adhesion.

3.3 INSTALLATION

.1 Conform to manufacturer’s printed instructions for accurate, secure installation. Ensure proper operation.

.2 Provide the work of this Section true to dimensions, square, plumb, level and free from distortion or defects detrimental to appearance and performance.

.3 Provide work of this Section tightly fitted and level and flush to adjacent surfaces and components.

.4 Insulate between dissimilar metals, and metal and masonry materials to prevent electrolysis with bituminous paint to meet specified requirements of CAN/CGSB-1.108-M89; or with methacrylate lacquer, CAN/CGSB-1.159-92 if exposed to view.

.5 Provide splices, mounting hardware, anchors, and other accessories required for a complete installation.

.6 Provide all necessary reinforcing including but not limited to steel stud backup and securely fasten components to suit design requirements.

.7 Install impact-resistant wall protection units in locations and at mounting heights indicated on Drawings.

.8 Provide sheet wall protection covering materials on prime painted gypsum board walls where indicated. Install top and edge moldings, corners, and divider bars as required for a complete installation.

.9 Apply sheet wall protection covering in maximum widths carefully matched for colour, pattern, texture. Avoid shading. Thoroughly wash off excess adhesive from material and adjoining surfaces as work proceeds.

.10 Neatly and closely fit wall protection materials around switches, light outlets, grilles, trim and similar items. Carry wall covering into reveals, jambs, and heads of openings.

.11 Take care to ensure wall protection coverings are fully on the wall at inside corners, without coving or subsequently pulling away from the wall.

.12 Apply material to outside corners in a manner which will prevent gathering of air beneath the material on each side of the corner. No joints are allowed within 150 mm (6") of any corner.

.13 Remove material showing evidence of coming loose or showing any blisters, imperfect seams, wrinkles, dried adhesive, or other imperfections, and apply new material.

3.4 CLEANING

.1 Clean adjacent surfaces, which have been soiled or otherwise marred, to completely remove evidence of material causing same.

3.5 PROTECTION

.1 Cover finished surfaces and protect exposed corners and areas vulnerable to damage by persons or by movement of materials, tools or equipment.

END OF SECTION

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and Supplementary Conditions of the Contract.

.2 Division 1 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide accessories including, but not limited to, the following:

.1 Clothing Hook (CH)

.2 Barrier Free Clothing Hook (CH-BF)

.3 Electric Hair (EHD)

.4 Hand Dryer (HVHD)

.5 Grab Bar (GRB-1 and GRB-2)

.6 Janitorial Unit and Shelf (JS-1)

.7 Mirror (MIR-1)

.8 Soap Dispenser – Lavatory Mounted (SD-2)

.9 Shower Rod with Curtain (SH-ROD/C)

.10 Shelf (SHF-WR1)

.2 Owner Supplied/Contractor Installed Items (Code O/C): Items marked as O/C will be supplied by Owner and Contractor shall be responsible to Install them in accordance with requirements of this Section. Contact Owner at time of installation to confirm Schedule of types and locations for items designated as such. Where required, Provide supplementary reinforcing or service connections within ceilings or partitions to accommodate components.

.1 Refer to Accessories Schedule.

.3 Owner Supplied/Owner Installed Items (O/O): The following items have been marked as O/O under this Section and have been included for illustrative purpose only. These items will be supplied by the Owner and the Owner shall be responsible to Install them in accordance with the requirements of this Section. Cooperate and coordinate with the Owner's installer without delaying the Work for satisfactory expeditious completion of the work. Where required, Provide supplementary reinforcing or service connections within ceilings or partitions to accommodate components.

.1 Refer to Accessories Schedule.

.4 Related Requirements: Specifications throughout the entirety of the Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Conform to the administrative requirements of Division 01.

.2 Sequencing: Coordinate the installation work of this Section with those performing the Work of other related Sections.

1.6 SUBMITTALS

.1 Product Data: Submit the manufacturer's literature and data sheets for each type of material provided under this Section in accordance with the requirements of Division 01. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to the specified materials.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Section 01 70 00, for adhesives, sealants and any other material designated by Consultant.

.3 Shop Drawings: Submit Shop Drawings for work of this Section in accordance with the requirements of Division 01. Ensure Shop Drawings indicate material characteristics, details of construction, connections and relationship with adjacent construction. Submit Shop Drawings in the form of catalogue cuts and fully illustrate specified materials with a description of components, surface finishes, hardware and securement devices.

.4 Samples: Submit complete samples of each accessory and modular unit to the Consultant for the review of construction quality, materials and finish prior to delivery of required quantities of items. Submit sample of each colour where applicable. No trademark and/or labels are acceptable on exposed finishes.

.5 Maintenance Instructions: Submit maintenance instructions in accordance with the requirements of Division 01. Submit an accessories schedule, keys and parts manual as part of the Contract closeout documents. Submit two sets of the following items of manufacturer's literature:

.1 Technical Data Sheets of each item used for the Project.

.2 Service and Parts Manuals.

.3 Name of local representative to be contacted in the event of need of field service of consultation.

1.7 QUALITY ASSURANCE

.1 Installers: The Work of this Section shall be executed by competent installers with a minimum of 5 years of experience in the application of the Products, systems and assemblies specified herein and with the approval and training of the Product manufacturers.

.2 Single Source Responsibility: Ensure that the primary materials provided in this Section are obtained from one source by a single manufacturer and that secondary materials are obtained from sources recommended by the primary materials manufacturer. Ensure Products for work of this Section are keyed alike to the extent possible.

1.8 DELIVERY, STORAGE AND HANDLING

.1 Deliver materials in sealed cartons and containers with the manufacturer's name and Product description clearly marked thereon.

1.9 WARRANTY

.1 The Contractor warrants the mirrors of this Section for a period of 10 years from the date of Substantial Performance of The Work against defects and deficiencies in accordance with the General Conditions of the Contract. Promptly correct defects or deficiencies which become apparent within this warranty period, to the satisfaction of the Consultant and at no expense to the Owner. Defects include, but are not limited to, deterioration of the mirror's silvering.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of the following manufacturers (or Equivalent) are acceptable subject to conformance to the requirements of the Contract Documents:

.1 ASI Group Watrous Canada (ASI)

.2 Bobrick Washroom Equipment Company (Bobrick)

.3 Bradley Corporation (Bradley)

.4 Elcoma Barrier Free Products (Elcoma)

.5 Excel DryerInc.

.6 Frost Products Ltd (Frost)

.7 HealthCraft Products Inc. (HealthCraft)

.8 Kimberley-Clark Corporation (Kimberley Clark)

.9 or Equivalent to the above.

.2 Substitution Limitations: This Section is based on Products from the manufacturers listed in this Section. Comparable Products from manufacturers not listed in this Section will be considered provided they meet the requirements of this Section.

2.2 DESCRIPTION

.1 Regulatory Requirements:

.1 Install systems in accordance with OBC regulations concerning access of physically challenged and disabled persons. Comply with the requirements of CAN/CSA B651.

.2 Design and Performance Requirements:

.1 Provide accessories as specified herein with the options indicated on Drawings. Model numbers may not reflect all options required.

.2 Provide stainless steel collars to accommodate semi-recessed mounting of units whose depth exceeds wall cavity depth.

.3 Edges of sheet metal which are accessible to users or maintenance personnel shall be pneumatically sanded to yield smooth safe edges with no sharpness.

.4 Mount items with concealed fasteners unless otherwise indicated or unavoidable. Where exposed fasteners are unavoidable, use tamper-resistant type.

2.3 MATERIALS

.1 Ensure accessories are stainless steel conforming to ASTM A167, Type 304 or Type 302, of 1 type throughout, ANSI No. 4 mechanical brushed finish, of contemporary design, with minimum material thicknesses of components as specified in this Section. Arrange stainless steel sheet so grain of brushed finish runs vertically in finished installation.

.1 Minimum thickness, any location or component:0.645 mm

.2 Hygienic accessory - exposed double pan doors and panels: 0.645 mm

.3 Hygienic accessory - exposed single pan doors: 1.26 mm

.4 Reinforcement: 1.26 mm

.2 Reinforcing:

.1 Concealed Sheet Steel Reinforcing: Refer to Section 09 21 16 – Gypsum Board.

.3 Provide accessories as specified in this Section and on the Drawings and Accessory Schedule. Model numbers may not reflect all options required.

.4 Provide stainless steel collars to accommodate semi-recessed mounting of units whose depth exceeds wall cavity depth.

2.4 MANUFACTURED UNITS

.1 Clothing Hook (CH and CH-BF): Supply one per shower stall and washroom or as indicated on the Drawings, satin finished stainless steel, double hook type supplied with backplates and screws. Provide one of the following:

.1 Model No. B-6727 by Bobrick,

.2 Model No. 9124 by Bradley.

.3 Model No. 7345-S by ASI/Watrous

.4 or Equivalent to the above.

.2 Hair Dryer (EHD-1): Surface mounted, electric hair dryer, 1600 watts. Mount at heights indicated on Drawings.

.1 Acceptable Products: Conair Direct Wire 1600 Watt Wall-Mount Dryer by Conair Hospitality or approved equivalent.

.3 Hand Dryer (HVHD): Surface mounted, 120 V stainless steel hand dryer. Mount at heights indicated on Drawings.

.1 Acceptable Products: XLERATOR Hand Dryer by Excel Dryers or approved equivalent.

.4 Grab Bar (GRB-1): Stainless steel, 38 mm (1.5") outside diameter, 1.21 mm (18 ga) wall thickness with peened finish to Provide positive gripping surface unless otherwise indicated in the Contract Documents. Provide items complete with stainless steel mounting plates, flanges and accessories subject to moisture. Ensure grab bars can support a minimum load of 113 kg (250 lbs).

.1 Standard Grab Bar: Mount as shown on Drawings.

.1 Sizes: 610 mm (24”)
.2 Provide one of the following: Model No. B-6806.99 Series by Bobrick or Equivalent.

.5 Vertical L-Shaped Grab Bar (GRB-2): Provide vertical L-Shaped grab bar. Mount as shown on the Drawings. Provide the following:

.1 Model No. 3700, type 07-4P (30x30) by ASI/Watrous or equivalent by Bobrick, Bradley or Elcoma or Equivalent.

.6 Janitorial Unit with Shelf (JS-1): Type 304 stainless steel (satin finish) shelf with utility hooks and mop strip.

.1 Length: 864 mm (34”)

.2 Acceptable Products:

.1 Model No. 1308 by ASI Group Canada
.2 Model No. B-239 by Bobrick Washroom Equipment
.3 Model No. 9933 by Bradley
.4 or Equivalent to the above.

.7 Mirror (MIR-1): Supply Quality Select 6 mm (1/4") clear float glass conforming to ASTM C1503, Type 1, with process deposit of 5 silver coats, 3 copper coats and final protective seal. Supply unit in stainless steel angle framing and minimum 0.457 mm thick (26 ga) galvanized sheet steel backing. Refer to Drawings for sizes.

.1 Provide 1 of following:

.1 Model No. B-290 Series by Bobrick.
.2 Model No. 780 Series by Bradley.
.3 Model No. 0600 Series by ASI/Watrous.
.4 or Equivalent to the above.

.8 Soap Dispenser (SD-2) – Lavatory-mounted – Hands-free

.1 Soap type: liquid or lotion form.

.2 Acceptable *Products*:

.1 Model No. 20333 or 0391-(n) by ASI Group Canada
.2 Model No. B-826.18 by Bobrick Washroom Equipment
.3 Or Equivalent to the above.

.9 Shower Curtain Rods with Curtains (SH-ROD/C): Type 304 Stainless steel, 30 mm (1-1/8") od, minimum 1.2 mm (18 ga) wall thickness, complete with end flanges. Provide 1778 mm x 1830 mm (70" x 72") waterproof, scrubbable, mildew-proof, non-combustible white vinyl shower curtain as specified in this Section. Length to suit openings and as indicated on the Drawings. Fastening: Exposed. Provide one of the following:

.1 Model No. B-6047 (Shower Curtain Rod) complete with B-204-2 (Shower Curtain) and B-204-1 (Shower Curtain Hooks) by Bobrick.

.2 Model No. 9531 (Shower Curtain Rod) complete with 9533 (Shower Curtain) and 9536 (Shower Curtain Hooks) by Bradley.

.3 Model No. 1204 (Shower Curtain Rod) complete with 1200-V (Shower Curtain) and 1200SHU (Shower Curtain Hooks) by ASI/Watrous.

.4 or Equivalent to the above.

.10 Flip Up Shelf - Stainless steel (SHLF-WR1): Type 304 stainless steel, no. 4 finish, with hemmed front edge and flip up capabilities.

.1 Length:

.1 SHF-WR2: 305 mm x 127 mm (12” x 5”)

.2 Acceptable Products:

.1 Model No. B-287 by Bobrick Washroom Equipment

.2 or Equivalent to the above.

2.5 FABRICATION

.1 Fabricate accessories true, square, rigid, free from distortion and from defects detrimental to appearance and performance. Assemble sheet metal accessories by welding in accordance with CSA W59-M. Conceal welds, or grind smooth such as to be undetectable in finished work. Unless approved by the Owner, assembly fastenings, hardware fixings and mounting or installation devices shall be concealed in finished work.

.2 Use non-corrosive metal fasteners of expansion type, toggle type or other type approved by the Consultant of positive, mechanical anchor as required to suit construction to which accessory is to be mounted. Exposed fasteners, where permitted, shall be finished to match adjacent accessory surface, and be countersunk. Where accessories are mounted to sheet metal, Provide a 3 mm (1/8") thick minimum full-size metal back-up plate drilled and tapped to receive machine screws and finished to match adjacent sheet metal surface.

.3 Use stainless steel fasteners in all shower locations.

.4 Ensure frameless accessories have one piece fronts with 90 degree formed returns at their edges and openings. Ensure returns are continuously welded and ground smooth at corners. Where accessory fronts are framed, frame edges, both inside and outside, shall have 90 degree formed returns continuously welded and ground smooth at corners. Doors shall also have 90 degree formed returns.

.5 Use concealed stainless steel piano hinges which extend full-length of hinged element. Ensure hinged elements have concealed, mechanically-retained, rubber bumpers for silent closing, and close flush with faces of fronts or frames. Locate hinges to afford easy and unobstructed access to interiors taking into consideration location of accessory relative to surrounding and adjacent items and finishes.

.6 Portions of sheet metal accessory interiors which are visible in the completed work shall be stainless steel. Changes in plane shall be formed or continuously welded and ground smooth. Sheet metal accessory parts concealed in finished installation shall be galvanized or stainless sheet steel. The edges of sheet metal which are accessible by users or maintenance personnel shall be hemmed for safety with no sharp edges.

.7 Ensure lettering on accessories is silk screened with durable paint to withstand wear, or is engraved or embossed. Size, location and type face of lettering is subject to the approval of the Consultant. Ensure the edges of letters are straight and sharp.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide necessary wall reinforcement for grab bars and towel bars as detailed for a minimum 227 kg (500 lbs) downward pull.

.2 Install accessories in accordance with the manufacturer's printed installation instructions.

.3 Provide fastenings and mounting kits for accessories.

.4 Verify the wall opening for correct dimensions, plumbness of blocking or frames and other preparation that would affect the installation of accessories.

.5 Verify spacing of plumbing fixtures and toilet partitions that affect the installation of accessories.

.6 Securely fasten accessories, level and plumb using appropriate fastenings as recommended by the manufacturer.

.7 Provide corrosion resistant fastenings. Where fasteners are exposed, use tamper-proof fasteners finished to match items secured.

.8 Locate accessories where indicated on the Drawings and where directed by the Consultant. Obtain the Consultant's acceptance of the exact locations.

.9 Provide the manufacturer's recommended anchoring systems.

.10 Fit flanges of accessories snug to wall surfaces.

3.2 ADJUSTING, CLEANING AND POLISHING

.1 Remove protective coatings and paper including adhesives.

.2 Test mechanisms, hinges, locks and latches.

.3 Adjust and lubricate to ensure accessories are in perfect working order.

.4 Clean and polish mirrors, aluminum and stainless steel surfaces.

END OF SECTION

Deleted from contract
SEE ADD#8

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and the Supplementary Conditions of the Contract;

.2 Division 1 requirements and documents referred to therein.

1.3 SUMMARY

.1 Provide labour, materials, products, equipment and services to complete the sun control devices work specified herein. This includes, but is not necessarily limited to:

.1 Exterior sun shades a building exterior.

.2 Framing and associated anchorage.

.3 Auxiliary materials required for complete installation.

.2 Related Requirements: Specifications throughout the entirety of Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Definitions: the following definitions shall apply to this Section:

.1 “Post-Disaster Building”: means a building that is essential to provision of services in event of a disaster. This facility is classified as post disaster as defined in the OBC.

.2 “Operational and Functional Component” and “OFC”: means components within building which are directly associated with the function and operation of the facility. OFCs consist of architectural components, building services components, and building contents. Items specified herein may be designated as OFCs and may need to be designed in accordance with performance requirements specified herein and in Section 13 48 50.

.2 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Installation Meetings:

.1 Prior to starting work of this Section, convene a pre-installation meeting at the Project site to review the Project requirements and site conditions with pertinent parties. Conform to requirements of Section 01 30 00.

1.6 ACTION SUBMITTALS

.1 Product Data: Submit in accordance with Division 01 for the following:

.1 Submit manufacturer's instructions, printed product literature and data sheets for the sun control devices work and include product characteristics, performance criteria, physical size, finish and limitations.

.2 Shop Drawings: Submit in accordance with Division 01 for sun control devices and accessories. Include plans, elevations, sections, details, and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.

.3 Samples: Submit samples in accordance with Division 01 for each type of metal finish required.

1.7 QUALITY ASSURANCE

.1 Welding Qualifications:

.1 Provide welding in accordance with CSA W59-M performed by a fabricator and mechanics fully approved by the Canadian Welding Bureau as specified herein.

.2 Ensure fabricator is fully certified by Canadian Welding Bureau for fusion welding of steel structures to CSA W47.1 and for fusion welding of aluminum to CSA W47.2.

.2 Fabricator qualifications. A firm experienced in producing fencing/infill/gate products similar to those indicated for the Project and with a record of successful in-service performance.

.3 Source Limitations: Obtain sun control devices from single source from a single manufacturer where indicated to be of same type, design, or factory-applied colour finish.

.4 Licensed Professionals: Employ a full time structural Professional Engineer registered in the Province of Ontario, carrying minimum $2,000,000.00 professional liability insurance, to:

.1 design the components of the work of this Section requiring structural performance,

.2 be responsible for full assemblies and connections,

.3 be responsible for determining sizes, yield strengths, gauge thicknesses and joint spacing to allow thermal movement and loading of components in accordance with applicable codes and regulations,

.4 be responsible for production and review of Shop Drawings,

.5 inspect the Work of this Section during fabrication and erection,

.6 stamp and sign each Shop Drawing, and

.7 provide site administration and inspection of this part of the Work.

.5 Mock-ups: Provide mock-ups in locations designated by Consultant and as required to demonstrate quality of workmanship. Maintain mock-ups during construction in an undisturbed condition as a standard for judging the completed work.

1.8 FIELD CONDITIONS

.1 Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

1.9 WARRANTY

.1 Extended Warranty for Finishes: Repair or replace components on which finishes fail in materials or workmanship within specified warranty period.

.1 Deterioration includes, but is not limited to, the following:

.1 Colour fading more than 5 Hunter units when tested according to ASTM D2244.

.2 Chalking in excess of a No. 8 rating when tested according to ASTM D4214.

.3 Cracking, checking, peeling, or failure of paint to adhere to bare metal.

.2 Warranty Period: 10 years from date of Substantial Performance of the Work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of following manufacturers (or Equivalent) may be acceptable subject to conformance to requirements of Drawings, schedules and Specifications.

.1 Levolux;

.2 Construction Specialties

.3 TenPlus Architectural Products

.4 or Equivalent to the above.

.2 Substitution Limitations: This Specification is based on “Infiniti System” by Levolux. Equivalent Products from manufacturers listed herein offering functionally and aesthetically equivalent Products in Consultant’s opinion and subject to Consultant’s review, will be considered provided they meet the requirements of this Specification.

2.2 DESCRIPTION

.1 Regulatory Requirements:

.1 Design shall be based on Limit States Design principles using factored loads and resistance. Resistance and resistance factors shall be determined in accordance with the OBC and CSA S136 requirements.

.2 Design and Performance Requirements:

.1 Professional Engineering Design and Certification: Design sun control devices, including comprehensive engineering analysis by a Professional Engineer licensed to practice in the Province of Ontario, using structural performance requirements and design criteria indicated.

.2 Structural Performance: Sun control devices shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of sun control device components, noise or metal fatigue caused by sun control device-blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building.

.1 Wind Loads: Determine loads based on pressures as indicated on Drawings.

.2 Limit deflection of members and framing to L/360.

.3 Vibration Control: Ensure sun control device members do not vibrate when subjected to above wind loading.

.4 Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

.1 Temperature Change (Range): 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.

.5 SMACNA Standard: Comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" for fabrication, construction details, and installation procedures.

2.3 MATERIALS

.1 Steel Plates, Shapes, and Bars: ASTM A 36/A 36M or equivalent to CSA G40.20/G40.21, Grade 300W..

.2 Aluminum Extrusions: ASTM B 221M (ASTM B 221), Alloy 6063-T5, T-52, or T6.

.3 Aluminum Sheet: ASTM B 209M (ASTM B 209), Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.

.4 Fasteners: Use types and sizes to suit unit installation conditions.

.1 Use hex-head or Phillips pan-head screws for exposed fasteners unless otherwise indicated.

.2 For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.

.3 For fastening galvanized steel, use hot-dip-galvanized steel or 300 series stainless-steel fasteners.

.4 For fastening stainless steel, use 300 series stainless-steel fasteners.

.5 For color-finished sun control devices, use fasteners with heads that match colour of sun control devices.

.5 Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187.

.6 Grout: Non-shrink type, pre-mixed compound consisting of non-metallic aggregate, cement, and water-reducing and plasticizing additives.

2.4 MANUFACTURED UNITS

.1 Sun Control Devices: Provide ornamental system consisting vertical fixed shading blades, fabricated with extruded aluminum framing bars and supported by extruded aluminum posts with following characteristics:

.1 Fin Bracket: Stainless Steel.

.2 Support arm and support fixing: stainless steel.

.3 Fin: fixed extruded aluminum shading blades bars, spaced as required to provide solar shading. Size and angle: as indicated on reviewed Shop Drawings.

.4 Carrier Arm: Provide aluminum extruded tubular aluminum sections with solid aluminum caps sized as required to carry blade loadings.

.5 Basis-of-Design: “Infiniti System” by Levolux or Equivalent.

2.5 FABRICATION

.1 Factory assemble sun control devices to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

.2 Maintain equal sun control device blade spacing, including separation between blades and frames at head and sill, to produce uniform appearance.

.3 Include supports, anchorages, and accessories required for complete assembly.

.4 Join frame members to each other and to sun control device blades with fillet welds concealed from view unless otherwise indicated or size of sun control device assembly makes bolted connections between frame members necessary.

2.6 ALUMINUM FINISHES

.1 Finish sun control devices after assembly.

.2 High-Performance Organic Finish: Three-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70percent PVDF resin by weight in both colour coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

.1 Colour and Gloss: “Wood Look” colour or pattern as selected by Consultant from manufacturer's full range.

.2 Manufacturer’s standard powder coating of performance equivalent to AAMA 2605 is acceptable in lieu of high-performance organic finish specified in this Section.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify the Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

.2 Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

.1 Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.3 INSTALLATION

.1 Comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage and installation instructions, and datasheets.

.2 Locate and place sun control devices level, plumb, and at indicated alignment with adjacent work.

.3 Use concealed anchorages where possible.

.4 Form closely fitted joints with exposed connections accurately located and secured.

.5 Provide perimeter reveals and openings of uniform width for sealants and joint fillers.

.6 Protect unpainted galvanized and nonferrous-metal surfaces that are in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint or by separating surfaces with waterproof gaskets or nonmetallic flashing.

3.4 FIELD QUALITY CONTROL

.1 Manufacturer Services: Arrange for Product manufacturer’s technical representative to:

.1 meet and discuss installation procedures and unique conditions at the Place of the Work.

.2 inspect substrate surfaces and recommend solutions to accommodate adverse conditions.

.3 periodically visit and inspect installation and report unsatisfactory conditions to Contractor.

.4 attend final inspection and to submit written certification that Products, systems and assemblies have been installed in accordance with manufacturer’s requirements.

3.5 ADJUSTING AND CLEANING

.1 Clean exposed sun control device surfaces that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.

PARKIN

.2 Restore sun control devices damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, remove damaged units and replace with new units.

.3 Touch up minor abrasions in finishes with air-dried coating that matches colour and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION

Deleted through cost saving

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and Supplementary Conditions of the Contract.

.2 Division 1 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide flagpoles including, but not limited to, the following:

.1 flagpoles.

.2 concrete base.

.3 excavation for flagpole base.

.2 Work not included: Flag(s) with their respective fittings for attaching to halyards.

.3 Related Requirements: Specifications throughout the entirety of the Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Conform to the administrative requirements of Division 01.

.2 Sequencing: Coordinate the installation work of this Section with the Work of other related Sections.

1.6 SUBMITTALS

.1 Product Data: Submit the manufacturer's literature and data sheets for each type of material provided under this Section in accordance with the requirements of Division 01. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to the specified materials.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Section 01 70 00, for adhesives, sealants and any other material designated by Consultant.

.3 Shop Drawings:

.1 Submit shop Drawings in accordance with the requirements of Division 01.

.2 Indicate materials, dimensions, finishes, base jointing, anchoring and support systems, cleats, halyard boxes, trucks, finials and base collar for flagpoles.

.3 Provide templates and instructions for installation of flagpoles and bases.

.4 Samples: Submit two 50 mm x 100 mm (2" x 4") samples of flagpole finish.

1.7 QUALITY ASSURANCE

.1 Qualifications: The work of this Section shall be executed by competent installers with a minimum of 5 years of experience in the application of the Products, systems and assemblies specified herein and with the approval and training of the Product manufacturers.

1.8 DELIVERY, STORAGE AND HANDLING

.1 Spiral wrap each flagpole with heavy kraft paper, wood strip and steel band or polyethylene wrap and pack in tubing for shipment.

.2 Deliver flagpoles in manufacturer's wrappings and in one piece.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of the following manufacturers (or Equivalent) are acceptable subject to conformance to the requirements of the Contract Documents:

.1 All Canadian Flagpole Co Inc. (All Canadian Flagpole)

.2 Ewing Flagpole Co. Inc. (Ewing Flagpole)

.3 or Equivalent.

.2 Substitution Limitations: Comparable Products from manufacturers not listed herein will be considered provided they meet the requirements of this Specification.

2.2 DESCRIPTION

.1 Design and Performance Requirements:

.1 Design flagpole, bases and anchorage devices in accordance with NAMM FP 1001 to resist 100 km/h (60 mph) wind velocity minimum, flagged, or 165 km/h (100 mph) unflagged.

.2 Design flagpoles to accommodate minimum flag size: 2440 mm x 3660 mm (8’ x 12’)

2.3 MATERIALS

.1 Flagpoles: Complete aluminum poles, including accessories, bases and anchorage devices.

.2 Concrete Base: CSA A23.1, CSA A23.2 and CSA A23.3; 20 MPa compressive strength after 28 Days, maximum slump 100 mm (4"), air entraining 5% to 7%.

.3 Galvanized Steel: CAN/CSA-G164-M, minimum zinc coating of 0.610 kg/m^2 (2 oz/sq ft).

.4 Aluminum: Aluminum Association alloy AA 6063-T6 seamless extruded aluminum tubing.

.5 Bituminous Paint: Isolation paint, alkali-resistant bituminous paint or epoxy resin solution. To Provide dielectric separation and which will dry to be tack-free and able to withstand high

temperatures. Cold-applied asphalt mastic complying with SSPC-Paint 12, except containing no asbestos fibers.

.1 Acceptable Products and manufacturers shall be Carboline Bitumastic 50 by Carboline Canada, or Copper Creek Top Service 760 Black by Sherwin Williams Company, or other Equivalent Product and manufacturer acceptable to the Consultant.

2.4 ACCESSORIES

.1 Final: 100 mm (4") mm diameter ball of 1.6 mm (0.063") minimum thick aluminum anodized colour to match flagpole finish.

.2 Truck Assembly: Cast aluminum, stainless steel ball bearing, non-fouling, revolving double truck assembly (finish to match flagpole).

.3 Swivel Snaps: Two per halyard aluminum with neoprene or vinyl covers.

.4 Internal Halyard System: Pole manufacturer's superior system; for poles minimum height 9 m (30') and minimum butt diameter 150 mm (6"); heavy duty aircraft control cable; exposed parts to match the flagpole finish.

.1 Internal Winch: Stainless steel, gearless automatic brake and removable handcrank.

.2 Access Door: Keyed, removable flush mounted door in reinforced frame.

2.5 FABRICATION

.1 Supply 9 m (30') long flagpole as a complete unit including the base, mounting brackets, anchorage and fittings.

.2 Cone Tapered Flagpole:

.1 Seamless, uniform, straight line tapered section above the cylindrical butt section.

.2 Taper: 25 mm (1") for every 1.7 m (5' - 6") of the run.

.3 Provide internal splicing, self-aligning sleeve of same material as flagpole for snug fitting, watertight field joints.

.3 Perform welding in accordance to the appropriate CSA standard, by welders certified by the Canadian Welding Bureau. Finish exposed welds flush and smooth.

.4 Shop apply the isolation coating to metal surfaces of flagpole (and base) that will be (encased in concrete) (below grade level).

.5 Pole Base: Fixed, anchor type, flush base assembly, cast aluminum with galvanized steel template base and galvanized steel concrete anchors of minimum ultimate pull out strength of 88.96 kN (20,000 lbs). Base cover fabricated from aluminum alloy 6061, finish to match the flagpole.

.1 Fabricate mountings of galvanized steel where encased in concrete.

2.6 FINISHES

.1 Aluminum Finishes:

.1 Finish: Brushed satin and waxed finish for cone tapered flagpoles.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Excavate ground to depth indicated on the Drawings.

.2 Perform concrete work as follows:

.1 Of size and shape indicated on the Drawings.

.2 Top of base 150 mm (6") above finish ground level.

.3 Anchor bolts for flagpole support to extend minimum of 900 mm (36") into concrete base.

.4 Vertical exposed concrete placed into formwork and horizontal top provided with drainage channels or slopped.

.5 Bring exposed surfaces to smooth steel trowel finish.

.3 Apply one coat of bituminous paint on steel surfaces in contact with concrete.

.4 Install pole, base assemblies and fittings in accordance with the Shop Drawings and the manufacturer's instructions. Use suitable equipment to prevent scuffing and damage to the pole during erection.

.5 Erect the pole plumb and true in position.

.6 Provide positive lightning ground for each flagpole installation.

.7 Check and adjust installed fittings for smooth operation of halyards.

.8 Install the flag and demonstrate operation to the Consultant.

3.2 CLEANING

.1 Upon the completion of the work, remove the protection erected under this Section. Make Good any damage done to this work and the adjoining work. Remove surplus materials, debris, tools, plant and equipment and leave the Site in a condition satisfactory to the Consultant.

END OF SECTION

SEE ADD#9
Q#293

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form,

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and the Supplementary Conditions of the Contract;

.2 Division 1 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide manually operated roller window sun control shades including but not limited to the following:

.1 Chain operated roller window shade assembly complete with translucent and blackout shades.

.2 Roller shades systems shall meet design requirements and protect roller blind when not in use, keep it clear when windows are cleaned, and protect shade from dust collection

.2 Related Requirements: Specifications throughout the entirety of the Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Installation Meetings:

.1 Prior to starting work of this Section, convene a pre-installation meeting at Project site to review Project requirements and site conditions with pertinent parties. Conform to requirements of Section 01 30 00.

1.6 SUBMITTALS

.1 Product Data: Submit manufacturer's literature and data sheets for each type of material provided under this Section for the Project in accordance with requirements of Section 01 30 00. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to specified materials.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Section 01 70 00, for adhesives, sealants and any other material designated by Consultant.

.3 Shop Drawings: Submit Shop Drawings for Work of this Section in accordance with Section 01 30 00.

.1 Submit Shop Drawings which clearly indicate shade sizes, locations, operation, methods of attachment, and description of components. Indicate each component, size, shape, material, thickness, gauge, finish, methods of joining, joint locations, fastening devices, anchorage components, methods of attachment and relationship with adjacent components and construction.

.2 Submit reflected ceiling plans, drawn to scale, showing following items coordinated with each other, based on input from installers of items involved:

.1 Ceiling suspension system members and attachment to building structure.
.2 Ceiling-mounted or penetrating items including light fixtures, air outlets and inlets, speakers, sprinklers, recessed shades, and special moldings at walls, column penetrations, and other junctures of acoustical ceilings with adjoining construction.
.3 Shade mounting assembly and attachment.
.4 Size and location of access to shade operator and adjustable components.

.3 Field Measurements: Take field measurements prior to preparation of Shop Drawings and fabrication to ensure proper fitting of work. Do not fabricate work until Shop Drawings have been reviewed.

.4 Samples: Submit samples in accordance with Section 01 30 00. Submit following samples in sizes indicated:

.1 Submit sample shade fully representing shades to be provided complete with head rail, end caps, gears, sprocket wheels, chains, brackets and similar accessories.

.2 Submit samples of fabrics complete with edge reinforcing and finish colours for selection and approval. Do not order material until colour samples have been approved. Fabric sample: minimum 300 mm (12") square.

.5 Test Data: Submit test data substantiating that proposed shade fabric meets all performance criteria specified herein. Submit independent test results showing properties and acceptable fire hazard classification of shade fabric.

.6 Certificate: Submit written certification that materials, systems, and assemblies have been installed in accordance with manufacturer's requirements.

.1 Maintenance Instructions: Submit maintenance instructions in accordance with Section 01 70 00. Indicate methods for maintaining roller shades and finishes; precautions about cleaning materials and methods that could be detrimental to fabrics, finishes, and performance and operating hardware.

1.7 QUALITY ASSURANCE

.1 Applicator Qualifications: Provide Work of this Section executed by competent installers with a minimum of 5 years' experience in the application of the Products, systems and assemblies specified herein and with he approval and training of the Product manufacturers.

.2 Licensed Professionals: Employ a full time structural Professional Engineer registered in the Province of Ontario, carrying minimum $2,000,000.00 professional liability insurance, to:

.1 design the components of the Work of this Section requiring structural performance in accordance with OBC and requirements of standards referenced in this Section, review design documents, and provide site administration and inspection of this part of the Work.

.3 Mock-ups: Provide mock-ups in locations designated by Consultant and as required to demonstrate quality of workmanship. Maintain mock-ups during construction in an undisturbed

condition as a standard for judging completed work. The reviewed mock-up may form part of final installation if left undisturbed at the time of Substantial Performance of The Work .

.4 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from 1 source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.

1.8 DELIVERY, STORAGE AND HANDLING

.1 Deliver materials to site only when the work of this Section can be started.

.2 Before delivery to site verify each assembly for proper operation. Clean each assembly of marks and smudges prior to providing wrap up protective covering.

.3 Provide necessary crating and bundling for shipment of components to site including protection against weather likely to impair adequacy or appearance of material in finished assembly.

.4 Remove and replace damaged units at no additional cost to the Owner.

1.9 WARRANTY

.1 The Contractor warrants the work of this Section for a period of 2 years from Substantial Performance of the Work against defects and/or deficiencies in accordance with the General Conditions of the Contract. Promptly correct any defects or deficiencies which become apparent within this warranty period, to the satisfaction of the Consultant and at no expense to the Owner. Defects include but are not limited to: deformation of members, mechanical failure, and failure of system to operate as designed.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of following manufacturers (or Equivalent) are acceptable subject to conformance to requirements of Drawings, Schedules and Specifications:

.1 Altex;

.2 Elite Window Fashions

.3 Hunter Douglas Contract

.4 Nysan Shading Systems Ltd.

.5 Solarfective Products Limited

.6 Sun Glow

.7 SunProject Canada Inc.

.8 Urban Edge Shading, Inc.

.2 Substitution Limitations: This Specification is based on Solarfective “Manual Teleshade” Product. Comparable Products from manufacturers listed herein offering functionally, aesthetically equivalent Products in Consultant’s opinion and subject to Consultant’s review will be considered provided they meet the requirements of this Specification.

2.2 DESCRIPTION

.1 Regulatory Requirements:

.1 Flammability: Ensure fabric meets the OBC flammability requirements and CNAN/ULC S109 Small Scale vertical burn requirements when tested by independent testing and inspecting agency acceptable to Authorities Having Jurisdiction.

.2 Light fastness: AATCC Method 16A exceeding 60 hours. Class 5.

.3 Antibacterial and antifungal resistance:

.1 AATC Test Method 147: Pass
.2 AATC Test Method 30: Pass

.2 Design and Performance Requirements

.1 Seismic Performance: Design materials specified in this Section to withstand the effects of earthquake motions determined according to the OBC and CAN/CSA S832 requirements. The Professional Engineer referenced in this Section shall be responsible for designing systems and submitting signed and sealed analysis data and Shop Drawings illustrating seismic-resistant systems. Refer to structural Drawings for seismic sensitivity values

.2 Provide factory assembled roller window shade units consisting of surface mounted roller shade units on face of mullions or at ceiling with two end brackets, complete with shade roller tube, extruded fascia, hembar, fabric, fastenings, anchorages and accessories specified and required. Ensure units comply with requirements of WCMA A100.1.

.3 Provide installation brackets that facilitate easy removal and replacement of blinds.

.4 Design manually operated roller window shade system with side and bottom channels for easy lifting, finger tip control, with infinite positioning so that shade is capable of stopping and holding at any position within window opening.

.5 Provide assemblies to suit adjacent ceilings and finishes. Ensure removal does not require disassembly of shade unit. Provide left or right hand operative option as required to suit design requirements. Provide side and sill channels at locations requiring blackout shades.

.6 Fabric Performance Requirements:

.1 Provide shade fabric capable of hanging flat without buckling or distortion easy to clean and wipeable.
.2 Window coverings will allow control of exterior light entering room during daylight hours and provide privacy during daylight and non-daylight hours.
.3 Provide black-out window coverings where indicated on Drawings, Provide materials, tracks, seals, and operation suited to that purpose.
.4 Use window coverings manufactured from materials and mechanisms that minimize cleaning and maintenance operations and maximize infection prevention and control.
.5 Consider colour of window coverings and the impact this will have on mechanical system.
.6 Ensure edge when trimmed, hangs straight without raveling with unguided roller shade cloth rolling true and straight without shifting sideways more than $\pm$ 3 mm (1/8") in either direction due to wrap distortion or weave design.
.7 Fabric will be inherently anti-static, flame retardant, fade and stain resistant, light filtering, room darkening, & blackout fabrics providing openness factors specified herein. Fabric containing fiberglass, PVC, polyester, acrylic or vinyl laminates.

2.3 MATERIALS

.1 Formed Aluminum: ASTM B209M, Aluminum alloy 6063 - T5. Ensure surfaces are free from defects impairing appearance, strength and durability.

.2 Extruded Aluminum: ASTM B209M, Aluminum alloy 6063-XT6 for roll tube; 6060 for horizontal tracks; and 6063-T5 elsewhere

.3 Sheet Steel: ASTM A653/A653M-98, Designation Z275, stretcher levelled commercial quality galvanized steel.

.4 Chain Beads: ASTM A167, Series 300 stainless steel in ANSI No. 10 mirror finish having minimum 0.44 mm (0.017") diameter and with 47 to 48 beads for every 300 mm. (12") Chain to have pull test rating of 400 N. (90 lb.) Plastic bead chain is not acceptable.

.5 Galvanizing of odd shaped components: ASTM A153/A153M; minimum weight of zinc coating, in ounces per sq ft of surface in accordance with Table 1 of ASTM A153/A153M, for various classes of materials used on the Project.

.6 Shading Fabric: Provide vinyl coated polyester yarn. Provide fabric tensioned in finishing range prior to heat setting to keep wrap ends straight and minimize or eliminate weave distortion to keep fabric flat. Ensure fabric is dimensionally stable, non-flammable and moisture, UV, heat and fungi resistant.

.1 Solar Control Fabric (3% openness factor): Following types are acceptable:

.1 "SheerWeave Style 2410" by Phifer Wire Products or approved equivalent with following characteristics:

.1 Openness Factor: 3% + 0.0%

.2 UV. Blockage: 97%

.3 Thickness: 0.51 mm (0.020 inch)

.4 Mesh Weight: 478 g/m^2 (14.1 oz/yd^2).

.5 Composition: 36% fiberglass, 64% vinyl coated fiberglass.

.2 "E Screen Solar Protection Fabric" by Mermet Corp. or approved equivalent with following characteristics:

.1 Openness Factor: 3%

.2 UV. Blockage: 97%

.3 Thickness: 0.43 mm (0.017 inch)

.4 Mesh Weight: 393 g/m^2 (11.6 oz/yd^2).

.5 Composition: 36% fiberglass, 64% vinyl.

.2 Blackout Fabric: Following types are acceptable:

.1 "SheerWeave Style 7100" by Phifer Wire Products or approved equivalent with following characteristics:

.1 Openness Factor: 0% (Opaque)

.2 UV. Blockage: 99%

.3 Thickness: 0.64 mm (0.056 inch)

.4 Mesh Weight: 632 g/m^2 (21.6 oz/yd^2).

.5 Composition: 37% fiberglass, 63% vinyl coated fiberglass.

.2 "Avila Twilight" by Mermet Corp. or approved equivalent with following characteristics:

.1 Openness Factor: 0% (Blackout)

.2 UV. Blockage: 99%

.3 Thickness: 0.52 mm (0.020 inch)

.4 Mesh Weight: 490 g/m^2 (14.5 oz/yd^2).

.5 Composition: 100% polyester with acrylic foamed backing, PVC free.

.2 Fabric Colour: Selected by the Consultant from standard colour range of the specified manufacturer. Shade fabric on any one floor to be from the same dye lot.

2.4 MANUFACTURED UNITS

.1 Chain Operated Single Roller Window Shades (RBL-1):

.1 Provide chain operated single roller shade system with built-in clutch mechanism complete with loaded spring to allow system to be easily raised and lowered. Provide steel bead chain and connector complete with chain hold-down for each chain.

.2 Ceiling cover plate: Provide clear anodized aluminum finish for bottom coverage of shade (semi-enclosure) for recessed application in ceiling.

.3 Custom trim: Extruded aluminum to shapes and profiles indicated, where adjacent finishes abut the shade assembly, and to Provide attachment for adjacent finish, finished to match fascia/soffit.

.4 Hembar: External, clear anodized aluminum type with end caps

.5 Acceptable Products: “Manual Teleshade System” by Solarfective or “UE-205” by Urban Edge Shading or Equivalent.

.2 Dual Roller Window Shade Assembly (RBL-2):

.1 Provide chain operated dual roller shade system with built-in clutch mechanism complete with loaded spring to allow system to be easily raised and lowered. Ensure units are stacked to minimize protrusion. Provide steel bead chain and connector complete with chain hold-down for each chain.

.2 Ceiling cover plate: Provide clear anodized aluminum finish for bottom coverage of shade (semi-enclosure) for recessed application in ceiling.

.3 Hembar: External, clear anodized aluminum type with end caps.

.4 External weight bar: Clear anodized finish with end caps.

.5 Custom trim: Extruded aluminum to shapes and profiles indicated, where adjacent finishes abut the shade assembly, and to Provide attachment for adjacent finish, finished to match fascia/soffit.

.6 Blackout Channels: Extruded aluminum 28 mm (1-1/8") by 38 mm (1-1/2") complete with 12 mm (1/2") fuzz. Provide blackout channels at sides and sills. Do not Provide blackout channels at openings forming part of the building envelope.

.7 Acceptable Products: “Teleshade Dual System” by Solarfective or “UE-230” by Urban Edge Shading or Equivalent.

2.5 COMPONENTS

.1 Roller Window Shade Assembly:

.1 Design and fabricate heavy duty roller window shade assembly to keep maintenance to minimum.

.2 Ensure chain and sprocket operated and/or spring operated roller window shade assembly operates smoothly and has capability to control rate of fall, to adjust stop and hold at infinite number of positions as required.

.3 Provide automatic stop at highest and lowest shade position to prevent over winding or unrolling. Provide built-in, internal limit control winding stop contained within roller tube for shades as recommended by manufacturer. Ensure limit stop is adjustable without special tools.

.4 Ensure assembly allows fingertip control with built-in shock absorber system to prevent operator breakage under normal operating conditions. Factory set for size and travel of shades.

.5 Ensure assembly mechanism to have structural capacity to accommodate specified shades in window sizes required for this Project. Design assembly mechanism to suit size of windows and mass of system.

.2 Shade Mounting Brackets:

.1 Fabricate from minimum 3 mm (1/8") thick sheet steel and minimum 11 mm (7/16") welded steel shaft which serves as axis for entire sprocket and spring clutch assembly. Make reversible for left or right hand operation as directed by Consultant on Shop Drawings.

.2 Provide mounting in accordance with reviewed Shop Drawings as required to keep mechanism and brackets totally concealed from view when fully assembled. Mechanically attach cover plates to sheet steel brackets. Provide a means of attaching fabric without exposing hardware.

.3 Provide guides to retain gear assembly. Brackets to act as protective retainer for tube and shade assembly preventing accidental dislocation of tube and shade.

.3 Roller Tube:

.1 Design extruded aluminum alloy roller tube to suit assembly design with either end of tube to engage drive system through internal or external extruded keyway. Extruded roller tube to have wall thickness to suit design requirements with minimum wall thickness of 1.39 mm (0.0547") with reinforcement for fabric to provide anti-deflection support for wide span shades. Formed aluminum tube is unacceptable.

.2 Design tubes to be removable without removing the drive assembly, block resetting, or readjusting the pre-set stops. Shade tube to be self aligning.

.3 Roller tube to be sized and reinforced internally as necessary to prevent excessive deflection in span of tube. Excessive deflection is defined by observation whereby shades in their open position reveal puckering, sagging or billowing, or where the tube deflects beyond 4% of roller length.

.4 Identify each roller tube to its location in accordance with reviewed Shop Drawings.

.4 Fabric Mounting Spline:

.1 Fabricate snap-in-place spline of extruded vinyl with asymmetrical insertion locking channels and embossed fabric guide. Spline to have sufficient capacity to hold shades when spline is snapped and locked into the tube. Fabric shade to be readily removable without removing the tube from the retainer brackets, or removing the brackets from wall.

.2 Fabric-Guide End Cap: Fit delrin end cap with steel pin which permits up to 7 mm (5/16") lateral adjustment in tube width. End cap to have 55 mm (2-5/32") outside diameter minimum fabric guide tapered disc feature to ensure alignment and protection of shade cloth. Provide integral stainless steel eyelet at guide cables.

.5 Snap-In-Place Fascia:

.1 Provide rectangular formed metal fascia where shown of minimum 1.29 mm (0.0507") thick formed aluminum or extruded aluminum of minimum 2 mm (0.078") thick housing.

.2 Provide fascia that snaps onto shade bracket without any exposed fastening devices. Visible edges of ceiling brackets to be continuous. Clearance between arc of fascia and end of bracket to be minimum of 9 mm, (5/16",) a minimum reveal of 10 mm (3/8") will be permitted when two shades with fascia are butted together.

.3 Finished fascia to have return back at bottom to permit maximum opening of 50 mm. (2".) Provide in lengths of up to 3000 mm (10'-0") unsupported without visible sag or distortion.

.4 Where shades are face mounted to faceted window arrangement, Provide matching closure section and bridging clips between ends of abutting units.

.5 Fascia members are not required for overhead concealed application.

.6 Shade Fabric Hem Tube:

.1 Provide full shade width, single piece, prefinished, extruded aluminum section of approximately 15 mm (5/8") od with additional non-corrosive weight to maintain a weight of 1.4 kg/m (1 lb/ft) except for shades having a height dimension greater than the width, in which case weight to be 2.0 kg/m. (1.33 lb/ft.)

.2 At manufacturer's option, hem tube may be extruded aluminum, rectangular in shape, designed to hang perfectly perpendicular, and to totally conceal any heat-set or sewn seams within tube. Provide internal spline to secure the fabric evenly across full width. Provide separate port within tube to allow storage of non-corrosive weight.

2.6 FABRICATION

.1 Do necessary cutting and sewing of fabric to produce finished Product having neat, even appearance and meeting performance requirements specified.

.2 Fabricate shades with no vertical seams, and with a maximum of 2 horizontal seams per shade. Furnish fabric in adequate width to avoid horizontal seams at spacings of less than 1900 mm. (75"). Seams to be straight, even and offer minimum visual obstruction.

.3 Ensure fabric tracks perfectly straight in its movement to within ±1% of its width from fully open to fully closed position, and when rolled onto tube, stacks in layers to within ± 3 mm (1/8") of edge alignment.

.4 Provide clear, 10-12 mm (3/8" - 1/2") wide plastic edge tape reinforcing to prevent ravelling of raw edge of shades having glass fibre cores.

.5 Bottom edge to hang straight and true, with hem weights totally enclosed in extruded hem tube. Heat sealing alone is not acceptable.

.6 All sewing to incorporate heavy denier polyester yarn and machine stitching to be straight and neatly finished with no loose threads visible in finished Work. Heat seaming is not acceptable in areas in which fabric is exposed.

2.7 FINISHES

.1 Cleaning and Shop Painting for Concealed Steel Sheet Finishes: Hot dip galvanized, complying with ASTM A123/A123M.

.2 Aluminum Finish:

.1 Meeting or exceeding AAMA 2603, 1 coat system. ‘Duracron’ by PPG Industries or equivalent by Valspar (or Equivalent);

.2 Colour: To match adjacent framing.

.3 Dielectric Separator: To Provide die-electric separation between two dissimilar metals and prevent galvanic reaction. Best grade, quick drying non-staining alkali resistant bituminous paint or epoxy resin solution or membrane type acceptable to the Consultant.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify the Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

.1 Obtain corrective measures from Consultant prior to fabrication. Ensure suitability of adjacent building components in relationship to the work of this Section.

3.2 INSTALLATION

.1 Coordinate installation and fastenings with trades providing adjacent components. Coordinate location of support framing and blocking for installation of roller window shades.

.2 Provide, as part of the work of this Section, custom trim components including gypsum board and tee bar trim items to accommodate adjacent ceiling systems and finishes to approval of the Consultant.

.3 Install shades in accordance with manufacturer's instructions in accordance with reviewed Shop Drawings and as indicated, in true, flat planes.

.4 Securely attach all installation fittings to their mounting surfaces with screws of correct length and type, and with compatible plugs or anchors where required.

.5 Hang shades to substrate in a rigid and secure manner using fastener types and arrangements shown on Shop Drawings. Shades to have 15 mm (5/8") air space at sill unless designated as blackout.

.6 Ensure penetrating fastener do not interrupt continuity of air/vapour barrier integrity.

.7 Ensure shades and their fabrics hang flat at vertical installation without buckling or distortion. Edge when trimmed, to hang straight without curling or ravelling.

.8 Unguided roller shade cloth to roll true and straight without shifting sideways more than ±3 mm (1/8") in either direction due to warp distortions or weave design.

3.3 ADJUSTMENT AND CLEAN-UP

.1 Adjust shades for smooth operation and correct alignment. Perform system operation, service and replacements methods in presence of the Owner’s personnel.

.2 Remove protective coating. Clean shades and remove finger marks and smudges from shades and adjacent surfaces.

.3 Leave shades in raised position at completion of the work of this Section.

.4 Upon completion of the work of this Section, remove all products, materials, debris and equipment from the Site.

.5 Leave the Site in a neat and tidy condition, acceptable to the Consultant.

.6 Do all touch-up required to satisfaction of the Consultant.

3.4 ROLLER SHADE FABRIC SCHEDULES

.1 Roller Shade Fabric Schedules:

.1 Single Roller Window Shade (RBL-1):

.1 Translucent Fabric:

.1 "Mermet E Screen 3%" or "SheerWeave Style 2410" or Equivalent; 3% Open Factor

.2 Dual Roller Window Shade Assembly (RBL-2):

.1 Translucent Fabric:

.1 "Mermet E Screen 3%" or "SheerWeave Style 2410" or Equivalent; 3% Open Factor

.2 Blackout Fabric: "Mermet Avila Twilight" or "SheerWeave Style 7100" or Equivalent; 0% Open Factor

END OF SECTION

Deleted from contract
SEE ADD#2,Q#52

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and Supplementary Conditions of the Contract.

.2 Division 1 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide stainless steel casework including but not limited to following:

.1 Stainless Steel Countertops,

.2 Integral sinks where indicated.

.3 Auxiliary materials required for a complete installation.

.2 Related Requirements: Specifications throughout entirety of Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of Bid Closing Deadline of the Project, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Installation Meetings:

.1 Prior to starting work of this Section, convene a pre-installation meeting at Project site to review Project requirements and site conditions with pertinent parties. Conform to requirements of Section 01 30 00.

1.6 SUBMITTALS

.1 Product Data:

.1 Submit manufacturer's literature and data sheets for each type of material provided under this Section for Project in accordance with requirements of Section 01 30 00. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to specified materials.

.2 Submit data and details for construction of the stainless steel casework as well as information regarding the name, quantity, type and construction of materials (such as hardware, gauges and similar items), that will be used to complete the project.

.2 Shop Drawings:

.1 Submit Shop Drawings in accordance with Section 01 30 00 for fabricated items and assemblies of stainless steel casework with a detailed description, clearly indicated methods of construction, gauges, assembly, fastenings, services and similar items.

.2 Identify and explain any variation in Shop Drawings which do not adhere to original details and Specification requirements. Advise Consultant in writing of any conditions that would limit or adversely effect design intent.

.3 Ensure component parts and assemblies of each piece of equipment will support the loads anticipated without deflection detrimental to function, safety or appearance.

.4 Prepare fully dimensioned "Roughing-In" and final connection point Drawings for mechanical and electrical services. Separate mechanical and electrical, or combined Drawings, may be submitted. Include walk-in and fire suppression schematics and any pertinent installation diagrams including dimensioned "sleeving" drawing.

.5 Verify power and location requirements for any piece of equipment that is being supplied by Owner or is existing and being reused. Incorporate this information into the Shop Drawings, "Rough-in" and connection point Drawings.

.3 Samples:

.1 Submit sample in accordance with Section 01 30 00. Submit a sample of components or fabrication method, material or finish, for review and approval before proceeding with that aspect of work. Where necessary, request a shop inspection of an assembly which cannot be submitted for approval.

.4 Maintenance Manuals: Submit maintenance instructions in accordance with Section 01 70 00, bound and labeled.

1.7 QUALITY ASSURANCE

.1 Manufacturers: Provide Products for Work of this Section by manufacturer with minimum 10 years' experience in the manufacture of such materials.

.2 Installers: Provide Work of this Section executed by competent installers with minimum of 5 years' experience in application of Products, systems and assemblies specified and with approval and training of Product manufacturers.

.3 Single Source Responsibility: Ensure primary materials provided in this Section are obtained from 1 source by a single manufacturer and secondary materials are obtained from sources recommended by primary materials manufacturers.

.4 Mock-ups: Provide Mock-ups in locations designated by Consultant and as required to demonstrate quality of workmanship. Maintain Mock-ups during construction in an undisturbed condition as a standard for judging the completed work. Do not proceed with remaining work until installation is approved by Consultant.

1.8 DELIVERY, STORAGE AND HANDLING

.1 Co-ordinate deliveries of stainless steel casework in conjunction with millwork and other construction activity and progress at site and as designated by Owner.

.2 Deliver, unpack and set in place all component in designated position, ready for final connection of services, for units with electrical or mechanical connections where applicable.

.3 After installation has been completed and all items checked and adjusted where necessary for satisfactory operation, arrange for inspection of stainless steel casework. If items are found unsatisfactory, make necessary corrections and adjustments.

1.9 PROJECT SITE CONDITIONS

.1 Adhere to the following prior to undertaking work of this Section:

.1 Building must be enclosed (windows and doors sealed and weather-tight);

.2 An operational HVAC system that maintains temperature and humidity at occupancy levels must be in place;

.3 Adjacent and related work shall be complete;

.4 Ceiling, overhead ductwork and lighting must be installed;

.5 Site must be free of any further construction such as “wet work”;

.6 Required backing and reinforcements must be installed accurately and the project must be ready for casework installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of the following manufacturers (or Equivalent) are acceptable subject to conformance to requirements of Drawings, Schedules and Specifications:

.1 Mott Manufacturing Ltd.

.2 Lab Design/United Supply Corporation.

2.2 DESCRIPTION

.1 Regulatory Requirements:

.1 Plumbing or drainage systems shall conform to Plumbing Code and Ontario Water Resources Act except as modified by regulations and bylaws of authorities having jurisdiction.

.2 Design and Performance Requirements:

.1 As a minimum countertops to be designed as follows:

.1 Countertops to support all deadloads.
.2 Concentrated Live load bearing capacity: 2.67 KN (600 lb-f)
.3 Distributed Live load bearing capacity: 200 lb/ft (0.89 kN/m) without deformation or deflection.
.4 Maximum Deflection at Midspan: L/1000 or 3 mm (1/8”) whichever is less.

.2 Installation of stainless steel countertops and work surfaces shall comply with requirements of Scientific Equipment & Furniture Association (SEFA 3-2010). Abut top and edge surfaces in one true plane with flush hairline joints and with internal supports placed to prevent deflection

2.3 MATERIALS

.1 Sheet Steel:

.1 Mild steel, cold rolled furniture grade to requirements of ASTM A1008/A1008M, Grade C or higher, with smooth surfaces to furniture quality.

.2 Galvanized Sheet Steel:

.1 Commercial quality galvanized sheet steel to ASTM 653/A653M, Designation Z275 (G90).

.3 Stainless Steel:

.1 Provide highest architectural quality in various forms, straight and true. Ensure there are no scratches, scars, creases, buckles, ripples or chatter marks. Provide finish surfaces suitable for polishing where required. Ensure finished surfaces exposed to view are free of pitting, seam marks, roller marks, oil-canning, stains, discolourations or other imperfections.

.2 Stainless Steel Sheet: ASTM A240, type 316 alloy.

.3 Finish: Unless otherwise indicated, AISI No. 4 brushed Finish

.4 Use the following minimum steel thicknesses for manufacturing: 1.2mm (18 Ga)

.4 Sealant: Conforming to requirements of Section 07 92 00.

.5 Sheet Metal Thickness:

2.4 MANUFACUTURED UNITS

.1 Stainless Steel Countertops

.1 All factory welds shall be made using the TIG process. Filler rod shall be of the same composition as the base material. Countertops to be minimum 18 ga stainless steel unless indicated otherwise.

.2 Countertops without sinks: Form tops with 32mm (1.25”) high edges with 12mm (0.5”) return flange. Reinforce with veneer core plywood or metal hat channels as required or indicated on Drawings. Form edges, flanges, side and backsplashes integrally from one sheet of steel. Intersections between side and backsplashes and work surface shall be radiused a minimum of 9mm (0.375”). Where indicated on Drawings, Provide marine edges. Marine edges shall be 25mm (1”) wide and 6mm (0.25”) high.

.3 Countertops with sinks: Form tops with 32mm (1.25”) high edges with 12mm (0.5”) return flange. Provide marine edges at all locations. Marine edges shall integrally be formed on all edges. Marine edges shall be 25mm (1”) wide and 6mm (0.25”) high. Work surface shall be reinforced with wood core or metal hat channels as required or indicated on Drawings. Form edges, flanges, side and backsplashes integrally from one sheet of steel. Intersections between sidesplashes, backsplashes and work surface shall be radiused a minimum of 9mm (0.375”).

.4 Sink Bowls: Sink bowls shall be made of the same material as the work surface and shall be of equal or greater thickness. Sinks bowls shall be formed from one piece of steel with all inside corners radiused. Welds shall be hammered, ground and polished to produce a smooth, invisible joint. Sinks shall be welded into the work surface and welds shall be ground and polished to produce a smooth, invisible joint.

.5 Joints: Factory welds shall be ground and polished to provide an invisible joint. Field connections shall be mechanical “tongue and groove” interlocking design with concealed bolts to provide a hairline seam.

.6 Sound Deadener: Countertops and sinks shall have sound deadening material applied as required to the underside. Nominal thickness shall be 1.5mm (0.062”). Sound deadener shall be waterborne, non flammable and shall contain no volatile organic compounds.

.7 Drainboards: Provide fluted drain boards in material and thickness to match tops, sloped to sink, joined integrally with tops unless otherwise noted on Drawings.

2.5 FINISH

.1 All steel furniture in this section shall be constructed of stainless steel with a #4 brushed finish. Grain direction shall be horizontal except where cabinet dimensions do not permit.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Countertop Installation:

.1 Countertops are to have been fabricated in lengths according to drawings, with ends abutting tightly and sealed with corrosion resistant sealant.

.2 Tops will be anchored to base casework in a single true plane with ends abutting at hairline joints with no raised edges at joints.

.3 Joints shall be factory prepared having no need for in-field processing of top and edge surfaces.

.4 Joints shall be dressed smoothly, surface scratches removed and entire surface cleaned thoroughly.

3.2 CLEANING

.1 Ensure all products are unsoiled and match factory finish. Remove or repair damaged or defective units.

.2 Clean all finished surfaces, including drawers and cabinet shelves, and touch up as necessary.

.3 Counter tops shall be cleaned and free of grease or streaks.

3.3 PROTECTION

.1 Counter tops and ledges shall be protected with 19 mm (1/4 inch) ribbed cardboard for the remainder of the construction process.

.2 Examine casework for damaged or soiled areas; replace, repair, and touch-up as required.

.3 Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SEE ADD#2 Q#13

SEE ADD#4 Q#100 & 131

Updated through ADD#8

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and the Supplementary Conditions of the Contract.

.2 Division 01 requirements and documents referred to therein.

1.3 SUMMARY

.1 Provide labour, materials, Products, equipment and services to complete the pre-engineered building work specified herein. This includes all structural steel components above grade including, but is not necessarily limited, to:

.1 Primary structural steel: Welded plate section columns and beams for bolted field assembly.

.2 Secondary structural steel: Roof purlins and wall girts, cross bracing, hoist beam and supports, and lateral support for masonry walls.

.3 Support beams for cantilevered components and conventional framing interface.

.4 Standing seam roof cladding and gutter assembly.

.5 Insulated wall assembly.

.6 Eave overhangs, internal gutters, seals, metal flashings, copings, and closures.

.7 Rigid frame and miscellaneous framing, rough opening frame.

.8 Auxiliary materials required for a complete installation.

.2 Related Requirements: Specifications throughout all Divisions of the Project shall be read as a whole, and may be directly applicable to this Section. Related requirements provided below are for convenience purposes only:

.1 Section 07 21 00 - Building Insulation.

.2 Section 07 42 46 - Insulated-Core Metal Wall Panels

1.4 REFERENCES

.1 Definitions:

.1 “Post-Disaster Building”: means a building that is essential to provision of services in event of a disaster. This facility is classified as post disaster as defined in the OBC.

.2 “Operational and Functional Component” and “OFC”: means components within building which are directly associated with the function and operation of the facility. OFCs consist of architectural components, building services components, and building contents. Items specified herein may be designated as OFCs and may need to be designed in accordance with performance requirements specified herein and in Section 13 48 50.

.2 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 DEFINITIONS

.1 The following definitions per CSSBI 30 apply to this Section:

.2 Pre-Engineered Metal Building System: means an integrated assembly of manufactured steel structural components and cladding components specifically designed by the manufacturer to support and transfer loads and provide a complete or partial building shell

.3 Structural Framing: means the steel framework consisting of primary members (rigid frames, beams, girders, trusses, arches, rafters, columns), secondary members (purlins, joists, struts, bracing, tension rods, girts, eave struts, base angle and channel, header, jambs, sills and other structural items) and all necessary hardware.

.4 Cladding: means the exposed exterior wall and roof skin of any material type and combination including fasteners and attachments, weather sealants, trim, flashing, fascia, and closures, as applicable.

1.6 PREINSTALLATION MEETINGS

.1 Pre-installation Meetings: Schedule and hold a pre-installation meeting at the Project site at least one week before beginning work on this Section to coordinate activities with related Subcontractors.

.1 Required Attendance: Subcontractor performing work of this Section, representatives from manufacturers and fabricators involved in or affected by installation.

.2 Notification: Notify Consultant and Owner of scheduled meeting dates in advance; minimum 72 hour notice required.

.3 Agenda:

.2 Review progress of related construction activities and preparations for particular activity under consideration.

.3 Make note of required sequencing and coordination with materials and activities that have preceded or will follow.

.1 Reporting: Record significant discussions, agreements, and disagreements, including required corrective measures and actions.

.2 Distribution: Distribute minutes of the meeting to each party present and to other parties requiring information not more than 72 hours after meeting.

1.7 SEQUENCING

.1 Coordinate installation with other related Sections.

.2 Supply items to be installed by other Sections in ample time to avoid delays.

.3 Supply necessary measurements, templates, and instructions to ensure smooth progression of construction activities.

.4 Arrange for manufacturer’s technical representative to review procedures and conditions prior to commencing work.

1.8 SUBMITTALS

.1 Product Data: Submit manufacturer's product characteristics, catalogue cuts, installation instructions and other relevant information for each material and product used for pre-engineered building work specified in this Section.

.2 Shop Drawings: Submit Shop Drawings indicating material layouts, details of construction, connections, and relationship with adjacent construction. As a minimum indicate following:

.1 Include plans, elevations, sections and details as applicable.

.2 Show size, location, projection of anchor bolts, grid lines, structural members, connection details, and related elements.

.3 Clearly mark components and parts, and provide erection Drawings for identification and parts assembly.

.4 Indicate field-measured dimensions on Shop Drawings.

.3 Delegated Design Submittals:

.1 Engineering design completion of pre-engineered building work is delegated to Contractor based on structural design criteria indicated in Contract Documents.

.2 Submit Shop Drawings for work of this Section that bear the stamp of a Professional Engineer registered in Province of Ontario.

.3 Submit copy of structural calculations upon request by Consultant.

.4 Embodied Carbon / Environmental Product Declarations (EPDs): When available, submit product-specific or industry-wide EPDs conforming to ISO 14025 or other recognized environmental Product declaration framework meeting following criteria:

.1 EPD Scope: Must cover Cradle-to-Gate (A1 to A3) as a minimum.

.2 EPD Impact Categories: Must report Global Warming Potential (GWP) in form of unit of kgCO2e/declared unit as a minimum.

.3 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

.5 Material Ingredient Disclosure: When available, submit documentation disclosing chemical inventory of materials to at least 0.1% (1000ppm) meeting following criteria:

.1 Standard: Health Product Declaration (HPD) Open Standard, Cradle to Cradle v2 (Basic level) or Cradle to Cradle v3 (Bronze level), International Living Future Institute (ILFI) Declare, or other approved material ingredient declaration framework.

.2 Product Options: Give preference to Products with compliant documentation when choice is at Contractor's option.

.6 Welding Certificate: Submit certification for welding firms and welders to verify compliance with welding qualifications specified in this section.

1.9 CLOSEOUT SUBMITTALS

.1 Operating and Maintenance Data: Submit care and maintenance instructions for pre-engineered building to be included in building operation and maintenance manual.

.2 Warranty Documentation: Submit copy of extended warranties specified in this Section.

1.10 QUALITY ASSURANCE

.1 Manufacturer Qualifications: Provide Products for work of this Section by manufacturer with at least 10 years' experience manufacturing such materials.

.1 Steel building system manufacturer must be certified to CSA A660.

.2 Provide on-site supervision by a qualified technical representative during erection.

.2 Installer Qualifications: Engage an entity with at least five years' experience installing, erecting, or assembling work similar in material, design, and extent to that shown on Drawings and Schedules, and whose work has resulted in construction with a track record of successful in-service performance.

.3 Welding Qualifications: Qualify procedures and personnel in accordance with the following:

.1 Steel: to CSA W47.1 and CSA W59

.2 Aluminum: to CSA W47.2 and CSA W59.2

.3 Stainless Steel: to CSA W47.1 (Annex K) and CSA W59.

.4 Professional Engineer's Qualifications: Employ Professional Engineer licensed to practice in Province of Ontario who carries professional liability insurance and has at least five years' experience providing engineering services of similar kind, scope, and complexity.

.1 Professional Engineer's Responsibility:

.5 production and review of Shop Drawings,

.6 design and certification of pre-engineered building, including attachments for foundation, in accordance with applicable codes and regulations,

.7 stamping and signing of each Shop Drawing and associated calculations

.8 Single Source Responsibility: Obtain primary materials for this Section from a single source by a single manufacturer, and secondary materials from sources recommended by manufacturers of primary materials.

1.11 DELIVERY, STORAGE AND HANDLING

.1 Deliver, store and handle pre-engineered building materials in accordance with manufacturer's written instructions.

.2 Protect pre-finished sheet steel during handling and storage as per CSSBI Bulletin No. 9.

1.12 FIELD CONDITIONS

.1 Field Measurements: Verify actual dimensions of construction contiguous with pre-engineered building by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Provided requirements of Contract Documents are satisfied, the following manufacturers may supply Products for work this Section:

.1 Butler Manufacturing Company;

.2 Robertson Building Systems

.3 Steelway Building Systems

.4 Behlen Industries

.5 Varco Pruden

2.2 PERFORMANCE / DESIGN CRITERIA

.1 Design Intent: Architectural Drawings and details are diagrammatic and are only intended to show design concept, aesthetics, interfacing requirements, configuration, components and arrangements. They are not intended to identify or solve completely problems of thermal and structural movements, assembly framing, engineering design, fixings and anchorages.

.2 Structural Performance: Provide pre-engineered building capable of withstanding the effects of the following loads in accordance with requirements of Ontario Building Code (Part 4, Structural Design) (geographical location - Newmarket):

.1 Wind Loads: Determined in accordance with OBC requirements for the project's geographical location, with a 1 in 50-year return probability.

.2 Roof Snow Loads: Determined in accordance with OBC requirements for the project's geographical location.

.3 Seismic Loads: Determined in accordance with OBC requirements for the project's geographical location.

.4 Dead Loads: Account for loads attributable to weight of building system construction, including roof, framing, and covering materials.

.5 Collateral Loads: Include additional imposed loads required by Contract Documents, such as sprinklers, mechanical, electrical, and ceiling systems.

.6 Design cold-formed metal framing used for the work of this Section to CAN/CSA S136.

.7 Design structural steel framing used for the work of this Section to CAN/CSA S16.

.3 Deflections:

.1 Calculate deflections using only bare frame method. Do not use reductions based on engineering judgment unless actual calculations for the stiffness are included in the design for the specific project.

.2 Design frame bases assuming "pinned" connections to prevent moment transfer to foundations.

.3 Limit lateral deflections due to wind and gravity loads to H/500, where H is the building height at the eaves.

.4 Limit deflections of roof purlins to [L/180] under snow and wind loading.

.5 Limit lateral deflections of wall girts to [L/180]where girts brace metal siding and [L/720] where girts brace masonry walls.

.4 Rain Screen Principle:

.1 Design exterior envelope cladding systems based on Rain Screen Principle advocated by NRCC and Provide for drainage of water entering building envelope wall systems.

.2 Provide gaskets, baffles, overlaps, seals and compartmentalization where required to achieve appropriate pressure equalization in exterior envelope cavity wall design. Maintain integrity of continuous air barrier/vapour retarder system with adjacent surrounding air barrier/vapour retarder.

.3 Incorporate means of draining moisture to exterior. Design drainage system to provide clear, internal paths of drainage of any trapped moisture within construction to exterior.

Ensure weep water discharges in a manner that avoids staining of architectural finishes, collecting in puddles or formation of icicles.

.5 Thermal Movements: Ensure roof and wall framing allow for thermal movement without causing buckling, joint seal failure, undue stress on fasteners, or other detrimental effects.

.1 Temperature Change (Range): 67 deg C (120 deg F), ambient; 100 deg C (180 deg F), material surfaces.

.6 Condensation Control: Ensure no condensation on interior surfaces under the following conditions:

.1 Interior: 22 degrees C, 30% relative humidity (RH), still air.

.2 Exterior: Determined according to OBC Climatic Design Conditions for the project's geographical location (assume January Temperature at 1% return).

.7 Accommodate structural movement with expansion joints and clips without causing permanent distortion, damage to infills, joint racking, seal breakage, water penetration, or glass breakage.

2.3 MATERIALS

.1 Steel: to CAN/CSA G40.21, with a minimum yield strength of 350 MPa. Steel must be shop primed with a 30-day primer.

.2 Bolts: to ASTM A325M, complete with nuts and washers. Provide heavy, hexagon head high strength structural bolts, of standard size and required lengths for the thickness of members joined and the type of connection.

.3 Welded Materials: in accordance with CSA W59 standards.

.4 Shop-Applied Zinc-Rich Primer Paint: As recommended by manufacturer.

.5 Galvanized Steel Sheet: to ASTM A792, structural quality grade A, with AZ165 coating, regular spangle surface, and passivated for unpainted finish. For paint finish, use AZ150 unpassivated coating.

.6 Pre-Finished System for Steel Sheet Exposed to the Exterior: zinc-coated material with a factory-applied paint system conforming to CSSBI Technical Bulletin No. 7.

.7 Screws: corrosion-resistant, purpose-made, concealed screws.

2.4 INSULATION

.1 Refer to Section 07 21 00 - Building Insulation.

2.5 METAL ROOFING SYSTEM Roof type R-2, basis of design Robertson Thermal Systems (RST)

.1 Exterior sheet-roof: factory preformed steel sheet aluminum zinc alloy coated factory preformed steel sheet, prefinished from manufacturer's standard profiles and colours. M~~, m~~inimum core thickness 0.61 mm (24 Ga), standing seam roof panels with locking seam formed around concealed sliding panel clip and sealant. Include closures, gaskets, caulking, flashing and fasteners to effect weathertight installation.

.2 Roof Panel: Provide minimum 24 gauge roof panel assembly. Colour and Finish to be selected at a later date. Basis-of-Design: "Double-Lok Panel" by Robertson.

~~.2~~.3 Roof Guard: Provide metal roof snow retention system at bottom of sloped roofs. Basis-of-Design: "ColorGard – Metal Roof Snow Bar" By S-5!

~~.3~~.4 Roof liner: factory preformed steel sheet, zinc coated, prefinished from manufacturer's standard profiles and colours. Minimum core thickness 0.61 mm (24 Gauge) and prefinished to 5000

paint series. Install roof liner on top of roof purlins, caulked and sealed to Provide roof vapour barrier.

.4.5 Install thermal spacers, hat bar and continuous 9mm rigid insulation thermal break over roof liner to accommodate thickness of insulation and attachment of panel clips and exterior roof sheet. Sealants as recommended by manufacturer.

.6 Provide components required for a complete metal roof panel assembly including copings, fasciae, corner units, ridge closures, clips, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of metal roof panels unless otherwise indicated.

2.6 METAL CLADDING SYSTEM

.1 Insulated metal panel system as specified in Section 07 42 46 - Insulated-Core Metal Wall Panels.

2.7 ACCESSORIES

.1 Provide accessories as standard with metal building system manufacturer and as specified. Fabricate and finish accessories at the factory to greatest extent possible, by manufacturer's standard procedures and processes. Comply with indicated profiles and with dimensional and structural requirements.

2.8 FABRICATION

.1 Fabricate structural members according to Shop Drawings and CAN/CSA S16.1.

.2 Construct frames from welded plate section columns and roof beams, including necessary splice plates for bolted field assembly. Provide high-strength bolts for frame member assembly.

.3 Reinforce openings to maintain the design strength of structure.

.4 Factory weld base plates, cap plates, compression splice plates, and stiffener plates with shop-fabricated connection holes.

.5 Fabricate columns and roof beams with pre-drilled holes for attachment of secondary structural members and bracing, except as noted for field work on the manufacturer's erection Drawings.

.6 Use welded "H" sections or cold-formed "C" sections for exterior columns.

.7 Fabricate beams and posts with pre-drilled holes for secondary structural member attachment, except as specified for field work.

.8 Shop-fabricate splice plates and base clips with bolt connection holes. Factory weld base plates, cap plates, compression splice plates, and stiffener plates with shop-fabricated connection holes.

.9 Substitute intermediate frames for end-wall roof beams and corner posts as required.

.10 Ensure necessary endwall posts and connection holes to the intermediate frame are shop-fabricated.

.11 Design secondary structures, including purlins and girts, to support specified design loads. Place bracing as indicated on reviewed Shop Drawings.

.12 Attach diagonal bracing, consisting of hot-rolled rod, to columns and roof beams.

.13 Install cold-formed flange braces, purlin braces, and similar components as indicated on Drawings.

.14 Cladding Accessories: Brake or bend accessories to shape, using material and finish that matches the roof cladding or wall cladding.

2.9 TOLERANCES

.1 Ensure tolerances comply with CSSBI 30M.

.2 Provide holes for the attachment of other work as indicated on the Drawings.

2.10 SHOP FINISHING

.1 Clean, prepare surfaces, and shop prime structural steel in accordance with CAN/CSA S16.1, except where members are zinc-coated, zinc-aluminum alloy coated, or to be encased in concrete.

.1 Commercially blast clean frames and end structures to SSPC-SP2, SSPC-SP3 or SSPC-SP6 before painting with manufacturer's standard zinc-rich primer.

.2 Purlins and Girts: Cold form for galvanized coil.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Verify actual site conditions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

3.2 INSTALLATION

.1 Installation, generally: Install work of this Section in strict accordance with manufacturer's written installation instructions and reviewed Shop Drawings. Supplement manufacturer's installation instructions with additional installation requirements specified in this Section to produce specified work results.

3.3 ERECTION

.1 Do work in accordance with CSSBI 30M except where specified otherwise.

.2 Erect structural frame in accordance with shop drawings and to CAN/CSA-S16

.3 Connect major structural members using high-tensile bolts through pre-punched or predrilled holes for precise alignment.

.4 Do not field cut, drill, or alter structural members without written approval from the metal building system manufacturer's professional engineer.

.5 Include support for adjacent structural members as indicated on Structural Drawings. Set structural framing accurately in locations and to elevations indicated in accordance with CSA and CSSBI standards referenced in this section. Maintain structural stability of the frame during erection.

.6 Base and Bearing Plates

.1 Preparation: Clean concrete and masonry bearing surfaces of materials that may impair bond, and roughen surfaces before setting plates. Clean the bottom surface of plates.

.2 Setting Plates: Set plates for structural members on wedges, shims, or setting nuts as required.

.3 Alignment and Adjustment: Align and adjust structural framing before permanently fastening. Clean bearing surfaces and other surfaces that will be in permanent contact with framing before assembly. Perform necessary adjustments to compensate for

discrepancies in elevations and alignment. Level and plumb individual members of the structure. Allow for temperature differences between the time of erection and the mean temperature when the structure will be completed and in service.

.7 Primary Framing and End Walls: Erect framing level, plumb, rigid, secure, and true to line. Level baseplates to a true even plane with full bearing to supporting structures, set with double-nutted anchor bolts. Use grout to obtain uniform bearing and maintain a level base-line elevation. Moist-cure grout for at least seven days after placement. Make field connections using high-strength bolts installed according to manufacturer's instructions.

.8 Secondary Framing: Erect framing level, plumb, rigid, secure, and true to line. Field bolt secondary framing to clips attached to primary framing.

.1 Provide rake or gable purlins with tight-fitting closure channels and fasciae.

.2 Locate and space wall girts to suit openings such as doors and windows.

.3 Provide supplemental framing at the entire perimeter of openings, including doors, windows, ventilators, and other roof and wall penetrations.

.9 Bracing

.1 Install bracing in roof and sidewalls where indicated on erection drawings.

.2 Tighten rod and cable bracing to avoid sag.

.3 Locate interior end-bay bracing only where indicated.

.10 Framing for Openings: Provide shapes of proper design and size to reinforce openings and carry loads and vibrations imposed, including equipment furnished under mechanical and electrical work. Securely attach to structural framing.

3.4 PROTECTION

.1 Protect pre-engineered building from damage, soiling and contaminating substances resulting from construction activities or caused by work of other trades.

.2 Where soiling or spills have occurred, remove spills and soiling from adjacent surfaces using cleaning procedures recommended in writing by affected material's manufacturer. Do not use materials or process that can damage finishes, surfaces, or construction.

.3 Promptly replace pre-engineered building work damaged during construction that cannot be satisfactorily repaired.

3.5 CLEANING AND WASTE MANAGEMENT

.1 Cleaning: Maintain clean construction area at the end of each day. When activities of this Section are complete, remove materials, tools, equipment and rubbish.

.2 Waste Management and Disposal: sort waste for reuse, recycling, or disposal, as specified. Remove recycling bins and containers from site and dispose of contents at the appropriate waste disposal facilities.

END OF SECTION

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL

.1 Read and conform to:

.1 the General Conditions and Supplementary Conditions of the Contract.

.2 Division 1 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide seismic control assemblies for operational and functional components including but not limited to following:

.1 Work in this Section includes supplying and installing complete seismic restraint systems for architectural components. Work in this Section may also include the seismic restraint design and/or equipment/product certifications to be submitted for review by the registered design professional.

.2 Architectural assemblies or components requiring seismic restraint include, but are not limited to, the following:

.1 nonstructural exterior wall components,
.2 interior partitions and infill walls,
.3 suspended ceiling assemblies and bulkheads,
.4 exit doors, and overhead doors,
.5 roof accessories, and similar components,
.6 wall-mounted components weighing more than 9 kg (20 lbs)
.7 Owner-supplied, Contractor-installed equipment,
.8 other components needing seismic restraints and listed in Contract Documents.

.2 Related Requirements: Specifications throughout the entirety of Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Sequencing: Coordinate installation with the work of related Sections referenced herein.

.1 Prior to start of work, arrange for Project site meeting of parties associated with work of this Section.

.2 Scheduling:

.1 Prior to commencing work of this Section, arrange for manufacturer's technical representative to review with Contractor and Consultant procedures to be adopted and

conditions under which work shall be performed. Inspect surfaces to determine adequacy of existing and proposed conditions.

.2 Co-operate fully with other Subcontractors on the Work and promptly proceed with work of this Section as rapidly as job conditions permit.

.3 Co-operate with those performing the work of other Sections for application of all miscellaneous specialties.

.4 Supply items to be built-in in ample time to be incorporated into work of other Subcontractors, together with measurements and other information required for location of it.

1.6 SUBMITTALS

.1 Product Data: Submit manufacturer's literature and data sheets for each type of material provided under this Section for Project in accordance with requirements of Division 01. Ensure data sheets provide required information including detailed instructions for installing as well as maintaining, preserving and keeping materials in clean and safe conditions. Provide adequate warning of maintenance practices or cleaning agents detrimental to specified materials.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Section 01 70 00, for adhesives, sealants and any other material designated by Consultant.

.3 Shop Drawings: Submit in accordance with Division 01 and indicating following:

.1 Submit complete seismic restraint design, consisting of calculations, restraint selection, installation details, and other documentation signed and sealed by Professional Engineer stipulated herein. Seismic restraint Shop Drawings shall be prepared and overseen by a Professional Engineer as specified herein experienced in designing seismic restraints for operational and functional components as required by the Authority Having Jurisdiction

.2 Where walls, floors, slabs, or supplementary steel work is used for seismic restraint, submit details of acceptable attachment methods for equipment and components; including spacing, static loads, and seismic loads at all attachment and support points. Obtain approval of Consultant prior to installation.

.3 Provide specific details of seismic restraints and anchors; include number, size, and locations for each piece of equipment; provide details of suspension supports and restraints for equipment hung from ceiling.

1.7 QUALITY ASSURANCE

.1 Qualifications:

.1 Manufacturers:

.1 Provide work of this Section by a specialty consultant or equipment manufacturer designated to develop seismic restraint system and perform seismic calculations in accordance with requirements of OBC, standards stipulated herein and additional requirements particular to this Section.

.2 Ensure equipment manufacturer or specialty consultant specified herein designs, recommends, reviews, and supervises installation of proposed seismic restraint design and connection methods for entire Project, excluding work associated with Divisions 20, 21, 22, 23 & 26.

.2 Installers: Provide work of this Section executed by competent installers with minimum 5 years experience in the application of Products, systems and assemblies specified and with approval and training of the Product manufacturers.

.2 Licensed Professionals: Employ a full time structural Professional Engineer registered in the Province of Ontario, carrying minimum $2,000,000.00 professional liability insurance to:

.1 design the components of the work of this Section requiring structural performance,

.2 be responsible for full assemblies and connections,

.3 be responsible for determining sizes, yield strengths, gauge thicknesses and joint spacing to allow thermal movement and loading of components in accordance with applicable codes and regulations,

.4 be responsible for production and review of Shop Drawings,

.5 inspect the work of this Section during fabrication and erection,

.6 stamp and sign each Shop Drawing,

.7 provide site administration and inspection of this part of the Work, and

.8 submit certificate validating seismic assessment and field review of this part of the Work

.3 Single Source Responsibility: Ensure materials specified herein are designed and provided by a single seismic restraint manufacturer to ensure sole source responsibility for performance of seismic restraints used.

1.8 DELIVERY, STORAGE AND HANDLING

.1 Delivery and Acceptance Requirements:

.1 Comply with material manufacturer’s ordering instructions and lead time requirements to avoid delays.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Products of following manufacturers (or Equivalent) are acceptable subject to conformance to requirements of Drawings, Schedules and Specifications:

.1 Mason Industries.

.2 Tecoustics.

.3 Vibro-Acoustics.

2.2 DESCRIPTION

.1 Design and Performance Requirements:

.1 Seismic Control Assemblies design is based on mutually agreed upon details submitted by Subcontractor for final review by Consultant.

.2 Drawings covering work of this Section may show design intent and profiles that are diagrammatic in nature. Drawings may also show general building standards for seismic restraint of operational and functional components, which are to be completed and coordinated by this Section. Drawings are not intended to identify or solve completely problems of structural or seismic movements, assembly framing, engineering design, fixings and anchorages

.3 Requirements of this seismic restraint Section are in addition to other requirements specified elsewhere for the support and attachment of operational and functional components.

Nothing on Contract Documents shall be interpreted as justification to waive requirements of this Section.

.4 In addition to Contract Documents requirements, final design and performance of seismic control and restraint assemblies of operational and functional components and their approval by Authorities Having Jurisdiction is the responsibility of the contractor performing the work of this Section.

.5 Design seismic restraint system and clearly indicate attachment points to building structure and design forces (in X, Y, and Z direction) at the attachment points in accordance with OBC for designated seismic hazard values for location of Project as listed in Supplementary Standard SB-1. Design anchorage in accordance with ACI 318, Appendix D.

.6 Provide attachment loading values to Professional Engineer specified herein for verification of attachment methods and building's structure ability to accept imposed loading. Base seismic restraint design on actual OFC data (dimensions, weight, center of gravity, and similar criteria) obtained from submittals or item manufacturers. Ensure that equipment manufacturer verifies that attachment points on equipment and components can accept combination of seismic loading and other loads imposed.

.7 Design seismic restraint system in accordance with OBC requirements and requirements of CAN/CSA S832 based non-exhaustively on the following:

.1 Anticipated ground motion (including spectral response acceleration as defined by local codes and Authorities Having Jurisdiction);
.2 Soil type in specific geographic area
.3 Importance Factor of Building (i.e 1.5 for post-disaster buildings)
.4 Specific element of component factor
.5 Height factor
.6 Element's or component's response modification factor
.7 Element's or component's weight.

.8 For each element or component identified herein determine seismic risk rating score (low, moderate or high) and provide mitigation and reduction procedures in accordance with CAN/CSA S832.

.9 Include in seismic analysis calculated dead loads, static seismic loads, and capacity of materials utilized for connection of the equipment or system to building structure. Detail anchoring methods, bolt diameter, embedment and welded length. Ensure seismic restraint devices are designed to accept, without failure, forces through components or system's center of gravity.

2.3 MATERIALS

.1 Provide manufacturer's standard recommended materials or proprietary systems for seismic bracing and restraint to meet requirements of local codes and Authorities Having Jurisdiction based on design and performance criteria stipulated herein. Provide materials with full published ratings, verified through third party testing and bearing OSHPD pre-approval for use in the State of California. Provide following as a minimum and as applicable:

.1 Seismic Cable Restraints: Consisting of manufactured brackets and steel cables sized to resist seismic loads with minimum safety factor of 2 and arranged to provide all directional restraint. Ensure cables are pre-stretched to achieve certified minimum modulus of elasticity.

.1 Acceptable Products: "SCB/SCBH " by Mason Industries or approved Equivalent.

.2 Seismic Solid Braces: Consisting of manufactured brackets with steel angles, channels, or strut channels to resist seismic loads with minimum safety factor of 2 and arranged to provide all-directional restraint.

.1 Acceptable Products: “SSBS, SSRF” by Mason Industries or approved Equivalent.

.3 Steel angles or strut channels: Sized to prevent buckling and clamped to vertical support rods utilizing a minimum of two clamps at each restraint location when required. Provide spacing of vertical rod stiffeners in accordance with manufacturer’s recommendations.

.1 Acceptable Products “UCC, SRC” by Mason Industries or approved Equivalent.

.4 Anchors: Provide steel bolts, screws, cast in anchors utilizing rated values acceptable to structural Professional Engineer. Ensure post-installed anchors are approved for use in seismic zones for cracked and uncracked concrete. Ensure anchors have code listing approvals with ICC-ES reports certifying rated values for seismic loads.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Site Verification of Conditions: Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

.2 Evaluation and Assessment: Notify seismic restraint system manufacturer’s representative prior to installing seismic restraint devices. Seek manufacturer’s guidance regarding unusual installation procedures.

3.2 INSTALLATION

.1 Install seismic restraint systems in strict accordance with the manufacturer's written instructions and submittal data specified herein.

.2 Ensure installation of seismic restraints do not cause change of position of OFCs resulting in detrimental stresses or misalignment.

.3 Coordinate work with other trades to avoid rigid contact with building elements. Bring to attention of Consultant and structural consultant prior to installation, conflicts with other trades that may result in rigid contact with equipment due to inadequate space or other unforeseen conditions.

.4 Install ceiling suspension and connections components ensuring hanger rods are not subject to bending in accordance with requirements of ASTM E580.

.5 Do not brace seismic restraint system to 2 different structures, such as a wall and a ceiling.

.6 Unless otherwise indicated by seismic consultant specified herein, Provide following seismic mitigation measures to following building elements:

.1 Partitions:

.1 In buildings with flexible structural frames, anchor partitions to only structural element, such as a floor slab, and separate such partition by physical gap from other structural elements.

.2 Properly anchor masonry walls to the structure for restraint, so as to carry lateral loads imposed due to earthquake along with their own weight and other lateral forces.

.2 Ceilings And Lighting Fixtures:

.1 At regular intervals, laterally brace suspended ceilings against lateral and vertical movements, and provide with a physical separation at the walls.

.2 Independently support and laterally brace lighting fixtures. Refer to applicable portion of lighting Specifications.

.3 Facades And Glazing:

.1 Do not install concrete masonry unit filler walls in a manner that can restrain the lateral deflection of the building frame. Provide a gap with adequately sized resilient filler to separate the structural frame from the non-structural filler wall.
.2 Tie brick veneers to a separate wall that is independent of the steel frame as shown on construction drawings to ensure strength against applicable seismic forces at the project location.
.3 Install attachments to structure for all façade materials as shown on construction drawings to ensure strength against applicable seismic forces at the project location.

.4 Storage Racks, Cabinets, And Bookcases:

.1 Install storage racks to withstand earthquake forces and anchored to the floor or laterally braced from the top to the structural elements.
.2 Anchor filing cabinets that are more than 2 drawers high to the floor or walls, and equip all drawers with properly engaged, lockable latches.
.3 Anchor bookcases that are more than 30 inches high to the floor or walls, and equip any doors with properly engaged, lockable latches.

3.3 FIELD QUALITY CONTROL

.1 Manufacturers' Field Services:

.1 Upon completion of installation of seismic restraint system, have manufacturer's local representative inspect completed system and report in writing any installation errors, improperly selected seismic devices, or other faults which could affect system performance. Perform corrective measures until final approval is granted at no additional cost to Owner.

.2 Submit, upon request by Consultant, letter of certification signed by Professional Engineer specified herein, substantiating that seismic restraint materials have been properly installed.

3.4 CLEANING

.1 Upon completion of installation of seismic restraint materials and before Substantial Performance of the Work, clean debris beneath OFCs and leave the Place of the Work in a clean and acceptable condition.

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 This Section specifies products, criteria and characteristics, and methods and execution that are common to one or more Sections of Mechanical Divisions. It is intended as a supplement to each Section and is to be read accordingly.

1.2 REFERENCES

.1 Division 00 and Division 01 apply to and are a part of each Mechanical Division:

.1 Division 20 – Common Mechanical Requirements;

.2 Division 21 – Fire Suppression;

.3 Division 22 – Plumbing;

.4 Division 23 – Heating, Ventilating, and Air Conditioning;

.5 Division 25 – Integrated Automation.

.2 The provisions of this Section also apply to the following sections:

.1 Section 08 31 00 – Access Doors and Panels.

.2 Section 10 44 16 – Fire Extinguishers.

1.3 SUBMITTALS

.1 Submit shop drawings/product data sheets for:

.1 pressure gauges and thermometers;

.2 electric motors (submit with equipment they are associated with).

.2 Submit weight loads for selected equipment (upon request).

.3 Submit copy of architectural reflected ceiling plan drawings and elevation drawings to indicate proposed access door locations.

.4 Submit a list of equipment identification nameplates indicating proposed wording and sizes.

.5 Submit a list of pipe and duct identification colour coding and wording.

.6 Submit a proposed valve tag chart and a list of proposed valve tag numbering and identification wording.

.7 Submit drawings indicating size and location of required sleeves, recesses and formed openings in poured or precast concrete work.

.8 Submit a sample of each proposed type of access door if supplied under work of this Division.

.9 Submit samples of materials and any other items as specified in Sections of Mechanical Divisions.

.10 Submit any other submittals specified in this Section or other Sections of Mechanical Divisions.

1.4 MAINTENANCE MATERIAL SUBMITTALS

.1 As specified in Part 2 of this Section, submit a spare belt set, tagged, and identified, for each belt driven piece of equipment.

PART 2 - PRODUCTS

2.1 FIRESTOPPING AND SMOKE SEAL MATERIALS

.1 Firestopping and smoke seal system materials for mechanical penetrations through fire rated construction are specified in Section 20 05 17 - Sleeves and Sleeve Seals for Mechanical Piping, and work is to be done as part of mechanical work unless otherwise specified in Division 07.

[OR]

2.2 ACCESS DOORS

.1 Coordinate with Mechanical Contractor and General Trades Contractor to ensure access doors on project are provided by a single manufacturer, installed as part of work of General Trades Contractor and work involving both mechanical and electrical services, where possible, be accessible from common access door. Coordinate work to ensure same common location access doors are not supplied by more than one Division.

.2 Identify on reflected ceiling plans and wall elevation drawings, coordinated locations of proposed access door locations and submit to the Consultant for review.

.3 Refer to Section 08 31 00.

.4 Provide all access doors required for Mechanical work unless otherwise specified in Division 08. Coordinate consistency of look and finish of access doors on project with each Division of Work. Coordinate exact requirements with General Trades Contractor.

.5 Access doors to be rust resistant steel door panels, with concealed hinges and positive locking and self-opening screwdriver operated lock. Wall type frame to be suitable for wall installation and have integral keys for plaster walls. Doors in tile wall to be stainless steel and in ceilings to be suitable for plaster covering with only frame joint showing. Other doors to be prime painted steel.

.6 Size access doors to suit the concealed work for which they are supplied, and wherever possible they are to be of standard size for all applications, but in any case they are to be minimum 300 mm x 300 mm (12" x 12") for hand entry and 600 mm x 600 mm (24" x 24") for body entry.

.7 Lay-in type tiles, properly marked, may serve as access panels. Coordinate marking of ceiling tiles with the Consultant. Panels in glazed tile walls to be 12 gauge, 304 alloy stainless steel, No. 4 finish, with recessed frame secured with stainless steel counter-sunk flush head screws.

.8 Panels in plaster surfaces to have dish-shaped door and welded metal lath, ready to take plaster. Provide a plastic grommet for door key access.

.9 Other access doors to be welded 12 gauge steel, flush type with concealed hinges, lock and anchor straps, complete with factory prime coat. Submit to Consultant for review, details of non-standard door construction details.

.10 Access doors in fire rated ceilings, walls, partitions, structures, etc., to be ULC listed and labelled and of a rating to maintain fire separation integrity.

.11 Where access doors are located in surfaces where special finishes are required, they are to be of a recessed door type capable of accepting finish in which they are to be installed so as to maintain final building surface appearance throughout.

.12 Manufacturers:

.1 SMS.

.2 Bauco.

.3 Acudor.

2.3 FLEXIBLE PIPING CONNECTORS

.1 Double wall stainless steel flexible connectors for piping connections to vibration isolated equipment, each selected by manufacturer to suit the application. Shop drawings or product data sheets must indicate construction and performance requirements that suit the application.

.2 Manufacturers:

.1 Hyspan Precision Products Inc.;

.2 Senior Flexonics Ltd.;

.3 The Metraflex Co.

PART 3 - EXECUTION

3.1 GENERAL PIPING AND DUCTWORK INSTALLATION REQUIREMENTS

.1 Unless otherwise specified, locate, and arrange horizontal pipes and ducts above or at ceiling on floors, arranged so that under consideration of all other work in area, maximum ceiling height and/or usable space is maintained. If required to maintain ceiling heights, reroute and/or resize ductwork, with Consultant’s approval.

.2 Unless otherwise specified, install work concealed in finished spaces, and concealed to degree possible in partially finished and unfinished spaces. Refer to and examine Architectural drawings and room finish schedules to determine finished, partially finished, and unfinished areas. Walls which are painted are considered finished.

.3 Install pipes and ducts parallel to building lines and to each other.

.4 Neatly group and arrange exposed work.

.5 Locate work to permit easy access for service or maintenance as required and/or applicable. Locate valves, dampers and any other equipment which will or may need maintenance or repairs and which are to be installed in accessible construction so as to be easily accessible from access doors. Where valves, dampers and similar piping or ductwork accessories occur in vertical services in shafts, pipe spaces or partitions, locate accessories at floor level.

.6 Make connections between pipes of different materials using adapters suitable for application. Provide cast brass dielectric type adapters/unions at connections between ferrous and copper pipe.

.7 Comply with equipment and material manufacturer's installation instructions unless otherwise specified herein or on drawings, and unless such instructions contradict governing codes and regulations.

.8 Carefully clean ducts, pipe and fittings prior to installation. Temporarily cap or plug ends of pipe, ducts and equipment which are open and exposed during construction.

.9 Install piping and ductwork which are to be insulated so that they have sufficient clearance to permit insulation and finish to be applied continuously and unbroken around pipe or duct, except for ductwork at fire barriers, in which case insulation will be terminated at each side of the duct fire damper.

.10 Inspect surfaces and structure prepared by other trades before performing work. Verify surfaces or structure to receive work has no defects or discrepancies which could result in poor application or cause latent defects in installation and workmanship. Report defects in writing. Installation of work will constitute acceptance of such surfaces as being satisfactory.

.11 Any ferrous piping that exhibits in excess of 5% surface rust, either inside or outside or both, is to be wire brush cleaned to bare metal and coated with suitable primer. Steel pipe, fittings and

accessories are to be free of corrosion and dirt when work is complete or prior to being concealed from view. Where dirt is evident, clean piping prior to being concealed.

.12 Provide continuous galvanized sheet metal drip pan under drain, water and water solution piping extending through rooms with electrical equipment such as electrical, elevator equipment and transformer rooms, and other spaces provided primarily for the installation of electrical equipment. Drip pans are to be complete with a drain pipe connection and drain piping is to be extended to closest drain.

.13 For factory applied finishes, repaint or refinish surfaces damaged during shipment and installation. Quality of repair work is to match original finish. This requirement also applies to galvanized finishes.

.14 Where mechanical work is located in high humidity areas where ferrous metal products will be subject to corrosion and protection for such products is not specified, provide finishes on products to protect against corrosion or provide products which will not corrode in the environment, i.e. aluminium ductwork, copper or stainless steel pipe, etc.

.15 Provide screwed unions or flanges in piping connections to equipment and in regular intervals in long (in excess of 12 m (40')) piping runs to permit removal of sections of piping.

.16 Unless otherwise specified and except where space limitations do not permit, piping elbows are to be long radius. Eccentric reducers are to be installed with straight side at top of piping.

3.2 PIPE JOINT REQUIREMENTS

.1 Do not make pipe joints in walls or slabs.

.2 Ream piping ends prior to making joints.

.3 Properly cut threads in screwed steel piping and coat male threads only with Teflon tape or paste, or an equivalent thread lubricant. After pipe has been screwed into fitting, valve, union, or piping accessory, not more than 2 pipe threads are to remain exposed.

.4 Site bevel steel pipe to be welded or supply mill bevelled pipe. Remove scale and oxide from bevels and leave smooth and clean. Use factory made welding tees or welding outlet fittings for piping branches off mains. Do not use shop or site fabricated fittings unless written approval has been obtained.

.5 Welded joints are to be made by CWB certified licensed journeyman welders qualified in accordance with CSA B51, Boiler Pressure Vessel and Pressure Piping Code, and who are in possession of a proper certificate of qualification for each procedure to be performed. Each weld is to be identified with the welder’s identification symbol, and welds are not to be concealed until they have been inspected and approved. Electrodes are to be in accordance with CSA W48 Series, Electrodes, and requirements of CAN/CSA W117.2, Safety in Welding, Cutting and Allied Processes are to be followed.

.6 Unless otherwise specified, make flanged joints with Garlock 5500 or equivalent gasket materials to suit the application, and bolts and nuts. Bolts are not to be longer than length necessary to screw nut up flush to the end of bolt. Bolts used for flanged connections in piping with a working pressure of 690 kPa (100 psi) and greater are to be ASTM A-193 Grade B-7, with heavy hexagon nuts to ASTM A-194 CL-2H. Provide suitable washers between each bolt head and flange and between each nut and flange.

.7 A random check of bolted flanged connections will be made to verify flanged connections are properly mated with no shear force acting on bolts. Supply labour to disconnect and reconnect selected flanged joints. If improperly mated joints are found, remove and reinstall affected piping so flanges mate properly. If improperly mated joints are found, additional joints will be checked, and you will be responsible for the repair of any other improper joints discovered.

.8 Unless otherwise specified make soldered joints in copper piping using flux suitable for and compatible with type of solder being used. Clean the outside of pipe end and inside of fitting, valve, or similar accessory prior to soldering.

.9 Install mechanical joint fittings and couplings in accordance with manufacturer's instructions.

.10 Grooves are to be rolled. Make arrangements with coupling and fitting manufacturer for shop and/or site instructions and demonstrations as required, and adhere to manufacturer's instructions with respect to pipe grooving, support, type of gasket required, anchoring and guiding the grooved piping system.

.11 If pressure crimped couplings and fittings are used, ensure gaskets are fully compatible with piping fluid, and valves and piping accessories are suitable. Use only fitting manufacturer supplied crimping equipment. Comply with manufacturer’s latest published specification, instructions, and recommendations with respect to pipe, coupling, and fitting preparation and installation, and support, anchoring and guiding of the piping system.

.12 Solvent weld PVC piping in 2 parts, primer stage and cementing stage, in accordance with manufacturer’s recommendations, ASTM D2855, and CSA requirements.

.13 Install PVC piping with gasketed joints in accordance with manufacturer’s current published specifications, instructions and recommendations, and CSA requirements.

3.3 DUCT OPENINGS

.1 Duct openings, air inlet and outlet openings, fire damper and similar openings will be provided in new poured concrete work, masonry, drywall and other building surfaces by trade responsible for particular construction in which opening is required.

.2 Size openings for fire dampers to suit damper arrangement with folding blade out of air stream.

.3 For duct openings except where fire dampers are required, pack and seal space between duct or duct insulation and duct opening as specified above for pipe openings in non-fire rated construction.

3.4 SLEEVE AND FORMED OPENING LOCATION DRAWINGS

.1 Prepare and submit for review, drawings indicating size and location of required sleeves, recesses and formed openings in poured or precast concrete work.

.2 Such drawings are to be completely and accurately dimensioned and relate sleeve, recesses, and formed openings to suitable grid lines and elevation datum, and are to take into account structural items such as grade beams, column caps, and column drop slabs.

.3 Begin to prepare such drawings immediately upon notification of acceptance of bid and award of Contract.

3.5 INSTALLATION OF PIPE ESCUTCHEON PLATES

.1 Provide escutcheon plates suitably secured over exposed piping passing through finished building surfaces. A finished building surface is any surface with a factory finish or that receives a site applied finish.

.2 Install plates so they are tight against building surface concerned, completely covering pipe sleeves and/or openings, except where waterproof sleeves extend above floors, in which case fit plate tightly around sleeve.

3.6 SUPPLY OF ACCESS DOORS

.1 Supply access doors to give access to mechanical work which may need maintenance or repair but which is concealed in inaccessible construction, except as otherwise specified herein or on drawings.

.2 Before commencing installation of mechanical work, coordinate with other trades and prepare on a set of reflected ceiling plans and wall elevations, complete layouts of access doors. Submit these layouts for Consultant's review and show exact sizes and locations of such access doors. Locate and arrange mechanical work to suit.

.3 Access doors will be installed by trade responsible for particular type of construction in which doors are required. Supply access doors to trade installing same at proper time.

.4 Wherever possible, access doors to be of a standard size for each application. Confirm exact dimensions and minimum size restrictions with the Consultant prior to ordering.

.5 Group piping and ductwork to ensure minimum number of access doors is required.

.6 Submit a sample of each proposed access door for review prior to ordering.

.7 Coordinate with Electrical Contractor and General Trades Contractor to ensure access doors on project are provided by a single manufacturer, installed as part of work of General Trades Contractor and work involving both mechanical and electrical services should, where possible, be accessible from common access door. Coordinate work to ensure common location access doors are not supplied by both Mechanical Divisions and Electrical Divisions.

3.7 INSTALLATION OF VALVES

.1 Generally, valve locations are indicated or specified on drawings or specified in Sections of the Specification where valves are specified, however, regardless of locations shown or specified, following requirements apply:

.1 provide shut-off valves to isolate systems, at base of vertical risers, in branch take-offs at mains and risers on floors, to isolate equipment, to permit work phasing as required, and wherever else required for proper system operation and maintenance;

.2 install shut-off valves with handles upright or horizontal, not inverted, and located for easy access;

.3 unless otherwise specified, provide a check valve in discharge piping of each pump;

.4 valve sizes are to be same as connecting pipe size;

.5 valves are to be permanently identified with size, manufacturer's name, valve model or figure number and pressure rating, and wherever possible, valves are to be product of same manufacturer;

.6 for valves in insulated piping, design of valve stem, handle and operating mechanism is to be such that insulation does not have to be cut or altered in any manner to permit valve operation.

3.8 FINISH PAINTING OF MECHANICAL WORK

.1 Finish paint exposed mechanical work as specified and/or scheduled in accordance with requirements of Division 09.

.2 Touch-up paint damaged factory applied finishes on mechanical work products.

3.9 PIPE LEAKAGE TESTING

.1 Before piping has been insulated or concealed, and before equipment, fixtures and fittings have been connected, test piping for leakage.

.2 Tests are to be witnessed by the Consultant and/or Owner's representative, and, where required, representatives of governing authorities. Give ample notice of tests in writing and verify attendance. Have completed test report sheets dated and signed by those present to confirm proper test results.

.3 When circumstances prevent scheduled tests from taking place, give immediate and adequate notice of cancellation to all who were scheduled to attend.

.4 Gravity Drainage and Vent Piping

.1 Test piping in accordance with local governing building code.

.2 After fixtures and fittings are set and pipes are connected to building drain or drains, turn on water into pipe, fixtures, fittings and traps in order to detect any imperfect material or workmanship. Perform a smoke test if required by local governing authorities.

.5 Pumped Drainage Piping

.1 Test piping with cold water at a pressure of 1-½ times normal working pressure and maintain pressure for a minimum of 2 hours.

.6 Domestic Water Piping

.1 Test piping with cold water at a pressure of 1-½ times normal working pressure and maintain pressure for a minimum of 2 hours.

.7 Sprinkler System Piping

.1 Test system piping in accordance with requirements of NFPA No. 13, "Installation of Sprinkler Systems", and in accordance with any additional requirements of governing authorities.

.8 Standpipe System Piping

.1 Test system piping in accordance with requirements of NFPA No. 14, "Standpipe and Hose Systems", and in accordance with any additional requirements of governing authorities.

.9 CO2 Fire Extinguishing System Piping

.1 Test system piping in accordance with requirements of NFPA No. 12, "Standard on Carbon Dioxide Extinguishing Systems", and in accordance with any additional requirements of governing authorities.

.10 Clean Agent Fire Extinguishing System Piping

.1 Test system piping in accordance with requirements of NFPA No. 2001, "Standard on Clean Agent Extinguishing Systems", and in accordance with any additional requirements of governing authorities.

.11 Heat Transfer (HVAC) System Piping

.1 Test piping with cold water at a pressure of 1035 kPa (150 psi) for a minimum of 2 hours.

.12 Steam and Condensate Piping

.1 Test piping with cold water for a minimum of 2 hours at following pressures:

.1 0 kPa to 105 kPa (0 psi to 15 psi) low pressure piping – 690 kPa (100 psi);

.2 110 kPa to 690 kPa (16 psi to 100 psi) medium pressure piping – 1035 kPa (150 psi);

.3 greater than 690 kPa (100 psi) high pressure piping – 1380 kPa (200 psi).

.13 Natural Gas Piping

.1 Test piping in accordance with requirements of CAN/CSA B149.1 and any additional requirements of local governing authorities.

.2 After completion of the verification test, locate required tag stating results of the verification test at the point of entry of gas main into building, affixed to the pipe in a secure manner.

.3 Check piping joints and connections for leaks with a water/soap solution while piping is under pressure.

.14 Propane Gas Piping

.1 Test piping in accordance with requirements of CAN/CSA B149.2 and any additional requirements of local governing authorities.

.2 After completion of the verification test, locate required tag stating results of the verification test at the point of entry of gas main into building, affixed to the pipe in a secure manner.

.3 Check piping joints and connections for leaks with a water/soap solution while piping is under pressure.

.15 Compressed Air Piping

.1 Test piping with dry compressed air or nitrogen at 690 kPa (100 psi) for a minimum of 2 hours.

.2 Test piping joints with a water-soap solution while piping is under pressure to detect leaks.

.16 Fuel Oil Piping

.1 Test piping (not tanks) with dry compressed air or nitrogen for a minimum period of 2 hours at 1035 kPa (150 psi).

.2 Check piping joints and connections for leaks with a water/soap solution while piping is under pressure.

.17 Gasoline Piping

.1 Test piping (not tanks) with dry compressed air or nitrogen for a minimum period of 2 hours at 1035 kPa (150 psi) in accordance with TSSA requirements.

.2 Check piping joints and connections for leaks with a water/soap solution while piping is under pressure.

.18 Refrigerant Piping

.1 Test refrigerant piping for leakage and dehydrate in accordance with requirements of Chapter 18 of ASHRAE Handbook - Fundamentals.

.19 Control Air Piping and Tubing

.1 Test control air piping and tubing with dry compressed air or nitrogen before concealing and again before connection of instruments.

.2 Rough-in test pressure is to be 345 kPa (50 psi) maintained over 24 hours with a pressure drop not to exceed 35 kPa (5 psi).

.3 Test joints for leaks with a soap solution.

.4 Finish test is to be 205 kPa (30 psi) with a permissible loss of 7 kPa (1 psi) over a 4 hour period. Prior to connecting instruments, blow systems clean and dry, and test component connections for leaks with a water/soap solution.

.20 Pure Water Piping

.1 When piping has been properly flushed and cleaned, test at 690 kPa (100 psi) for 2 hours with only distilled water or filtered dry compressed air. If distilled water is used, drain system when testing is complete.

.21 Following requirements apply to all testing:

.1 ensure piping has been properly flushed, cleaned and is clear of foreign matter prior to pressure testing;

.2 temporarily remove or valve off piping system specialties or equipment which may be damaged by test pressures prior to pressure testing systems, and flush piping to remove foreign matter;

.3 when testing is carried out below highest level of the particular system, increase test pressure by the hydrostatic head of 7 kPa (1 psi) for every 600 mm (24") below the high point;

.4 include for temporary piping connections required to properly complete tests;

.5 piping under test pressure is to have zero pressure drop for length of test period;

.6 tighten leaks found during tests while piping is under pressure. If this is impossible, remove and refit piping and reapply test until satisfactory results are obtained;

.7 where leaks occur in threaded joints in steel piping, no caulking of these joints will be allowed under any conditions;

.8 tests are to be done in reasonably sized sections so as to minimize number of tests required;

.9 in addition to leakage tests specified above, demonstrate proper flow throughout systems including mains, connections and equipment, as well as proper venting and drainage, and include for any necessary system adjustments to achieve proper conditions.

3.10 INTERRUPTION TO AND SHUT-DOWN OF MECHANICAL SERVICES AND SYSTEMS

.1 Coordinate shut-down and interruption to existing mechanical systems with Owner. Generally, shut-downs may be performed only between the hours of 12:00 midnight Friday until 6:00 a.m. Monday morning, unless otherwise specified in Division 01. Include for costs of premium time to perform work during nights, weekends or other times outside of normal working hours, which may be necessary to comply with stipulations specified herein this Article. Services for operation of existing non-renovated areas of building are to be maintained.

.2 Upon award of a Contract, submit a list of anticipated shut-down times and their maximum duration.

.3 Prior to each shut-down or interruption, inform Owner and the Consultant in writing 5 working days in advance of proposed shut-down or interruption and obtain written consent to proceed. Do not shut-down or interrupt any system or service without such written consent. Shutdowns of some essential services may require additional advance notification time.

.4 Perform work associated with shut-downs and interruptions as continuous operations to minimize shut-down time and to reinstate systems as soon as possible, and, prior to any shut-down, ensure materials and labour required to complete the work for which shut-down is required are available at site.

.5 Pipe freezing shall be used to connect new piping to existing piping. Alternative methods may be proposed, if site conditions are evaluated and permit, and are approved by the Consultant.

.6 Where existing isolation valves do not hold, pipe freezing shall be used to connect new piping to existing piping.

3.11 MECHANICAL SERVICE REQUIREMENTS FOR FLOATING FLOOR SLABS

.1 Where mechanical services are required to be installed in or through a vibration isolated floating slab, install such services so as not to transmit any vibration to base slab on which floating floor slab is placed.

.2 Wherever possible, arrange mechanical work to avoid penetrating a floating floor slab.

3.12 EXCAVATION AND BACKFILL WORK

.1 Unless otherwise specified in Division 31, provide all excavation and backfill associated with the mechanical scope of work.

.2 Before commencement of excavation for work, determine in consultation with Consultant, Owner, Municipality and utilities, presence, if any, of existing underground services at site. Engage local utilities to locate and mark out such services. Ensure trades concerned are aware of their presence.

.3 Be responsible for any damage done to underground services caused by neglect to determine and mark out location of such services prior to excavation work commences.

.4 Where Work falls under jurisdiction of local governing utility, confirm requirements and comply with utility requirements.

.5 Unless otherwise specified in Division 31, provide excavation, backfill and related work required for mechanical work. Obtain a copy of soil test report if available from the Consultant. Depth of excavations must accommodate local governing requirements and local standard practices to compensate for local frost levels of Place of the Work.

.6 Inverts and locations of existing site services may have been site surveyed and approximate location may be shown on drawings. Confirm inverts and locations are correct, prior to commencing excavation and contact Utilities to accurately locate their services. Where discrepancies are found, immediately inform Consultant, and await a direction. Grade bottom of trench excavations as required.

.7 In firm, undisturbed soil, lay pipes directly on soil, unless otherwise directed.

.8 Before backfilling, arrange for inspection of work by the Consultant. Do not backfill work unless reviewed with the Consultant. Failure to do so prior to backfilling will require re-excavating work and re-backfill at no additional cost to Owner.

.9 Unless otherwise specified, backfill trenches within building with clean sharp sand in individual layers of maximum 150 mm (6”) thickness compacted to a density of 100% Standard Proctor. Hand compact first layers up to a compacted level of minimum 300 mm (12") above top of pipe. Hand or machine compact the balance up to grade.

.10 Unless otherwise specified, backfill trenches outside the building (not under roads, parking lots or traffic areas), up to a compacted level of 450 mm (18") thick above the pipe, hand compacted to a density of 95% Standard Proctor, using granular "A" gravel. Backfill the balance in 150 mm (6") layers with approved excavated material, compacted to 95% Standard Proctor density.

.11 Unless otherwise specified, backfill trenches outside building under roads, parking lots or traffic areas with crushed stone or granular "A" gravel in layers not exceeding 150 mm (6") thickness, compacted to 100% Standard Proctor density up to grade level.

.12 Provide minimum 1.37 m (4.5') of cover for underground piping subject to freezing and located outside building.

.13 Provide minimum 450 mm (18") of cover for underground piping subject to freezing and located inside building.

.14 After first lift of backfill has been compacted, mark entire path of pipe using continuous 75 mm (3") wide detectable identified marking tape equal to SMS Ltd. D-UGMT.

.15 Unless otherwise directed in Division 02 and/or Division 31, store and dispose of excavated materials as follows:

.1 during progress of contract, place material as directed in such a manner to minimize damage or disfigurement of ground and which in no way impedes progress of work;

.2 separately place surplus topsoil and subsoil as directed; leave site clean and unencumbered.

.16 Perform pumping as required to keep excavations free of water.

.17 Engage services of independent soils testing agency to test final backfill compaction density of each backfilled location. Compact backfill to satisfaction of testing agency and in accordance with Specification. Submit a copy of testing agency's report to the Consultant for review.

.18 Fill depressions to correct grade level with appropriate material, after an adequate period has passed to reveal any settlement. Use maximum possible compaction. Pay costs required to make good damages caused by settlement.

.19 Coordinate requirements for final surface toppings (concrete, asphalt, pavers, grass sod, etc.) with General Contractor.

3.13 CUTTING, PATCHING AND CORE DRILLING

.1 Unless otherwise provided by General Trades, perform cutting, patching, and core drilling of existing building required for installation of mechanical work. Perform cutting in a neat and true fashion, with proper tools and equipment to Consultant’s approval. Patching is to exactly match existing finishes and be performed by tradesmen skilled in particular trade or application. Work is subject to review and acceptance by the Consultant.

.2 Criteria for cutting holes for additional services:

- .1 cut holes through slabs only; no holes to be cut through beams;
- .2 cut holes 150 mm (6") diameter or smaller only; obtain approval from Structural Consultant for larger holes;
- .3 keep at least 100 mm (4") clear from beam faces;
- .4 space at least 3 hole diameters on centre;
- .5 for holes that are required closer than 25% of slab span from supporting beam face, use cover meter above slab to clear slab top bars;
- .6 for holes that are required within 50% of slab span, use cover meter underside of slab to clear slab bottom bars;
- .7 submit sleeving drawings indicating holes and their locations for Structural Consultant's review.

.3 Do not cut or drill any existing work without approval from Owner and Consultant. Be responsible for damage done to building and services caused by cutting or drilling.

.4 Where pipes pass through existing construction, core drill an opening. Size openings to leave 12 mm (½") clearance around pipes or pipe insulation.

.5 Prior to drilling or cutting an opening, determine, in consultation with Consultant and Owner, and by use of non-destructive radar scan (magnetic scan) of slab or wall, presence of any existing services and reinforcement bars concealed behind building surface to be cut and locate openings to suit. Coring is not permitted through concrete beams or girders.

.6 Where drilling is required in waterproof slabs, size opening to permit snug and tight installation of a pipe sleeve sized to leave 12 mm (½") clearance around pipe or pipe insulation. Provide a pipe sleeve, constructed of Schedule 40 galvanized steel pipe with a flange at one end and of a length to extend 100 mm (4") above slab, in opening. Secure flange to the underside of slab and caulk void between sleeve and slab opening with proper non-hardening silicone base caulking compound to produce a water-tight installation.

.7 Firestop and seal openings in fire rated construction. Do not leave openings open overnight unless approved by Owner and Consultant.

.8 Ensure openings in fire rated construction are fire stopped and sealed in accordance with requirements of article entitled Firestopping and Smoke Seal Materials in this Section. Ensure openings are not left open overnight unless approved by Owner and Consultant.

3.14 PACKING AND SEALING CORE DRILLED PIPE OPENINGS

.1 Pack and seal void between pipe opening and pipe or pipe insulation for length of opening as follows:

.1 non-fire rated interior construction – pack with mineral wool and seal both ends of opening with non-hardening silicone base caulking compound to produce a water-tight seal;

.2 exterior walls above grade – pack with mineral wool and seal both ends of sleeves water-tight with non-hardening silicone base caulking compound unless mechanical type seals have been specified;

.3 exterior walls below grade (and any other wall where water leakage may be a problem) – seal with link type mechanical seals as specified.

3.15 FLASHING FOR MECHANICAL WORK PENETRATING ROOF

.1 Unless otherwise specified in Division 07, perform required flashing work, including counter-flashing, for mechanical work penetrating and/or set in roof.

.2 Perform flashing work in accordance with requirements of drawing details and/or requirements specified in Division 07.

3.16 CLEANING MECHANICAL WORK

.1 Refer to cleaning requirements specified in Division 01.

.2 Clean mechanical work prior to application for Substantial Performance of the Work.

.3 Include for vacuum cleaning interior of air handling units and ductwork systems.

3.17 CONNECTIONS TO OTHER EQUIPMENT

.1 Carefully examine Contract Documents during bidding period and include for mechanical work piping and/or ductwork connections to equipment requiring such connections.

3.18 SEISMIC RESTRAINT ANCHOR POINTS FOR EQUIPMENT

.1 Where mechanical equipment requires seismic restraint, it is to be complete with manufacturer designed and rated seismic restraint anchor points and attachments, certified by equipment manufacturers, so equipment may be bolted down or restrained in the field.

.2 Equipment to be restrained must be designed such that the strength and anchorage of its internal components exceed force level; used to restrain and anchor the equipment to the supporting structure.

3.19 INSTALLATION OF FLEXIBLE CONNECTORS

.1 Provide flexible connectors in piping connections to seismically restrained equipment, where applicable, and wherever else shown.

.2 Provide flexible connectors in piping connections to vibration isolated equipment.

3.20 FAN NOISE LEVELS

.1 Submit sound power levels with fan shop drawings/product data, with levels measured to AMCA 300 and calculated to AMCA 301.

3.21 EQUIPMENT AND SYSTEM MANUFACTURER'S CERTIFICATION

.1 When equipment/system installation is complete, but prior to start-up procedures, arrange and pay for equipment/system manufacturer's authorized representative to visit site to examine installation, and after any required corrective measures have been made, to certify in writing to the Consultant that equipment/system installation is complete and in accordance with equipment/system manufacturer's instructions.

3.22 SYSTEM STARTUP

.1 When installation of equipment/systems is complete but prior to commissioning, perform start-up for equipment/systems as specified in mechanical work Sections in accordance with following requirements:

.1 Submit a copy of each equipment/system manufacturer's start-up report sheet to the Consultant for review, and incorporate any comments made by the Consultant.

.2 Under direct on-site supervision and involvement of equipment/system manufacturer's representative, start-up equipment/systems, make any required adjustments, document procedures, leave equipment/systems in proper operating condition, and submit to the Consultant complete set of start-up documentation sheets signed by manufacturer/supplier and Contractor.

.3 Commission interconnected life safety systems in accordance with CAN/ULC-S1001-11 and provide written report for Consultant's review.

END OF SECTION

PART 1 - GENERAL

1.1 PRE-TENDERED MECHANICAL EQUIPMENT

.1 Refer to Appendix for complete information regarding scope of work for pre-tendered equipment. Equipment has been pre-tendered, ordered, and paid for by the Owner. Associated work to be included as part of Work of Mechanical Division of this Project, that is to include for, but not be limited to, provision of following:

- .1 coordination with respective equipment manufacturers with regards to delivery, unloading and acceptance on site;
- .2 inspection upon delivery and acceptance;
- .3 unloading, transporting and moving/hoisting into installation position;
- .4 installation, connection, testing, and certification.

.2 Pre-tendered equipment includes following:

- .1 [ ];
- .2 [ ].

.3 Take over order and coordinate with various manufacturers/suppliers of pre-ordered equipment and associated Work. During inspection of pre-ordered equipment and associated components at site, report deficiencies to respective supplier and to the Owner and be responsible for resolving such deficiencies directly with respective supplier(s).

.4 Be available for and attend factory testing at supplier's offices of pre-ordered equipment and associated Work, as requested by the Consultant.

.5 Coordinate final installation requirements with manufacturers/suppliers of pre-ordered equipment and associated Work.

.6 For reference purposes, copy of shop drawing may be obtained from the Consultant after order has been made.

.7 Review installation schematics and diagrams, control system schematics, and wiring diagrams supplied by manufacturers/suppliers of pre-ordered equipment and associated Work. Coordinate interconnections with related various building systems.

.8 Refer also to Appendix for further details and requirements of pre-tendered equipment. Be responsible for review of issued documents and request further information from the Consultant, if required. Include and incorporate required provisions and associated costs required for a complete installation.

.9 Review and coordinate with each respective vendor of pre-tendered equipment the exact equipment and accessories that are being supplied and/or installed, and services being performed by pre-tendered equipment vendor. With each respective pre-tender equipment vendor, determine installation products and services which are not included as part of pre-tender packages, but which need to be supplied by respective pre-tender equipment vendor in order to complete onsite installation, and include for all costs associated with the above.

.10 Obtain following from suppliers of per-tendered equipment and submit to Owner:

- .1 operating and maintenance materials, testing and commissioning reports, and inspection certificates/ULC approvals/local governing inspection authority approvals, warrantees and other supplied documents; organize and combine documents into manuals as specified in Division 01 and/or Division 20;
- .2 spare parts, maintenance tools and kits, and loose accessories.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 PRE-TENDERED MECHANICAL EQUIPMENT

.1 Refer to respective equipment Section - Part 3 for additional installation requirements.

.2 Install equipment in accordance with drawing notes, specifications, and manufacturer's instructions and to comply with Owner's on-site standards and regulations.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 This Section specifies requirements that are common to Mechanical Divisions work Sections and it is a supplement to each Section and is to be read accordingly. Where requirements of this Section contradict requirements of Division 00 or Division 01, conditions of Division 00 or Division 01 to take precedence.

.2 Be responsible for advising product vendors of requirements of this Section.

1.2 RELATED REQUIREMENTS

.1 Division 00 and Division 01 apply to and are a part of this Section.

1.3 DEFINITIONS

.1 "concealed" – means hidden from normal sight in furred spaces, shafts, ceiling spaces, walls and partitions.

.2 "exposed" – means work normally visible, including work in equipment rooms, service tunnels, and similar spaces.

.3 "finished" - means when in description of any area or part of an area or a product which receives a finish such as paint, or in case of a product may be factory finished.

.4 “provision” or "provide" (and tenses of "provide") – means supply and install complete.

.5 "install" (and tenses of "install") – means secure in position, connect complete, test, adjust, verify, and certify.

.6 "supply" – means to procure, arrange for delivery to site, inspect, accept delivery, and administer supply of products; distribute to areas; and include manufacturer’s supply of any special materials, standard on site testing, initial start-up, programming, basic commissioning, warranties, and manufacturers’ assistance to Contractor.

.7 "delete" or "remove" (and tenses of "delete" or “remove”) – means to disconnect, make safe, and remove obsolete materials; patch and repair/finish surfaces to match adjoining similar construction; include for associated re-programming of systems and/or change of documentation identifications to suit deletions, and properly dispose of deleted products off site unless otherwise instructed by Owner and reviewed with the Consultant.

.8 "BAS" – means building automation system; "BMS" – means building management system; "FMS" – means facility management system; and “DDC” means direct digital controls; references to "BAS", "BMS", "FMS" and “DDC” generally mean same.

.9 "governing authority" and/or "authority having jurisdiction" and/or "regulatory authority" and/or "Municipal authority" – means government departments, agencies, standards, rules and regulations that apply to and govern work and to which work must adhere.

.10 "OSHA" and "OHSA" – stands for Occupational Safety and Health Administration and Occupational Health and Safety Act, and wherever either one is used, they are to be read to mean local governing occupational health and safety regulations that apply to and govern work and to which work must adhere, regardless if Project falls within either authority's jurisdiction.

.11 "Mechanical Divisions" – refers to Division 20, Division 21, Division 22, Division 23, Division 25, and other Divisions as specifically noted, and which work as defined in Specifications and/or on drawings is responsibility of Mechanical Contractor, unless otherwise noted.

.12 "Electrical Divisions" – refers to Division 26, Division 27, Division 28, and other Divisions as specifically noted, and which work as defined in Specifications and/or on drawings is responsibility of Electrical Contractor, unless otherwise noted.

.13 "Consultant" – means person, firm or corporation identified as such in Agreement or Documents, and is licensed to practice in Place of the Work, and has been appointed by Owner to act for Owner in a professional capacity in relation to the Work.

.14 Wherever words "indicated", "shown", "noted", "listed", or similar words or phrases are used in Contract Documents they are understood, unless otherwise defined, to mean product referred to is "indicated", "shown", "listed", or "noted" on Contract Documents.

.15 Wherever words "reviewed", "satisfactory", "as directed", "submit", or similar words or phrases are used in Contract Documents they are understood, unless otherwise defined, to mean that work or product referred to is "reviewed by", "to the satisfaction of", "submitted to", etc., Consultant.

1.4 DOCUMENTS

.1 Documents for bidding include but are not limited to issued Drawings, Specifications and Addenda.

.2 Specification is arranged in accordance with CSI/CSC 49 Divisions of MasterFormat.

.3 Drawings and Specifications are portions of Contract Documents and identify labour, products and services necessary for performance of work and form a basis for determining pricing. They are intended to be cooperative. Perform work that is shown, specified, or reasonably implied on the drawings but not mentioned in Specification, or vice-versa, as though fully covered by both.

.4 Review Drawings and Specifications in conjunction with documents of other Divisions and, where applicable, Code Consultant’s report.

.5 Unless otherwise specifically noted in Specifications and/or on Drawings, Sections of Mechanical Divisions are not intended to delegate functions nor to delegate work and supply of materials to any specific trade, but rather to generally designate a basic unit of work, and Sections are to be read as a whole.

.6 Drawings are performance drawings, diagrammatic, and show approximate locations of equipment and connecting services. Any information regarding accurate measurement of building is to be taken on site. Do not scale Drawings, and do not use Drawings for prefabrication work.

.7 Drawings are intended to convey the scope of work and do not show architectural and structural details. Provide, at your cost, offsets, fittings, transformations and similar products required as a result of obstructions and other architectural and/or structural details but not shown on Drawings.

.8 Locations of equipment and materials shown may be altered, when reviewed by the Consultant, to meet requirements of equipment and/or materials, other equipment or systems being installed, and of building, all at no additional cost to Contract.

.9 Specification does not generally indicate specific number of items or amounts of material required. Specification is intended to provide product data and installation requirements. Refer to schedules, Drawings (layouts, riser diagrams, schematics, details) and Specification to provide correct quantities. Singular may be read as plural and vice versa.

.10 Starter/motor control centre (MCC)/variable frequency drive (VFD) schedule drawings are both mechanical and electrical, and apply to work of Mechanical Divisions and Electrical Divisions. Be responsible for reviewing starter, MCC, VFD, and motor specification requirements prior to Bid submission. Confirm and coordinate exact scope of work and responsibility of work between Mechanical Divisions and Electrical Divisions.

.11 Drawings and Specifications have been prepared solely for use by party with whom Consultant has entered into a contract and there are no representations of any kind made by the Consultant to any other party.

.12 In the case of discrepancies between the drawings and specifications, documents will govern in order specified in “General Conditions”, however, when scale and date of drawings are same, or where discrepancy exists within specification, most costly arrangement will take precedence.

1.5 METRIC AND IMPERIAL MEASUREMENTS

.1 Generally, both metric and imperial units of measurement are given in Sections of Specification governed by this section. Measurement conversions may be generally "soft" and rounded off. Confirm exact measurements based on application. Where measurements are related to installation and onsite applications, confirm issued document measurements with applicable local code requirements, and/or as applicable, make accurate measurements onsite. Where significant discrepancies are found, immediately notify Consultant for direction.

1.6 EXAMINATION OF DOCUMENTS AND SITE

.1 Carefully examine Documents and visit site to determine and review existing site conditions that will or may affect work, and include for such conditions in Bid Price.

.2 Report to Consultant, prior to Bid Submittal, any existing site condition that will or may affect performance of work as per Documents. Failure to do so will not be grounds for additional costs.

.3 Upon finding discrepancies in, or omissions from Documents, or having doubt as to their meaning or intent, immediately notify Consultant, in writing.

1.7 WORK STANDARDS

.1 Where any code, regulation, bylaw, standard, contract form, manual, printed instruction, and installation and application instruction is quoted it means, unless otherwise specifically noted, latest published edition at time of submission of Bids adopted by and enforced by local governing authorities having jurisdiction. Include for compliance with revisions, bulletins, supplementary standards or amendments issued by local governing authorities.

.2 Where regulatory codes, standards and regulations are at variance with Drawings and Specification, more stringent requirement will apply unless otherwise directed by Owner and reviewed with the Consultant.

.3 Supplementary mandatory specification and requirements to be used in conjunction with project include but are not limited to following:

.1 Air-Conditioning, Heating and Refrigeration Institute (AHRI);

.2 Air Movement and Control Association (AMCA);

.3 American Iron and Steel Institute (AISI);

.4 American National Standards Institute (ANSI);

.5 American Society of Heating, Refrigerating and Air Conditioning Engineers, Inc., (ASHRAE);

.6 American Society of Mechanical Engineers (ASME);

.7 American Society of Testing and Materials (ASTM);

.8 American Water Works Association (AWWA);

.9 Associated Air Balance Council (AABC);

.10 Building Industry Consulting Services, International (BICSI);

.11 Canadian Gas Association (CGA);

.12 Canadian General Standards Board (CGSB);

.13 Canadian Standards Association (CSA);

.14 Electrical and Electronic Manufacturers Association of Canada (EEMAC);

.15 Electrical Safety Authority (ESA);

.16 Electronic Industries Association (EIA);

.17 Factory Mutual Systems (FM);

.18 Illuminating Engineering Society (IES);

.19 Institute of Electrical and Electronic Engineers (IEEE);

.20 International Standards Organization (ISO);

.21 Manufacturers Standardization Society of the Valve and Fittings Industry, Inc. (MSS);

.22 National Building Code of Canada (NBC);

.23 National Electrical Manufacturers Association (NEMA);

.24 National Environmental Balancing Bureau (NEBB);

.25 National Fire Protection Association (NFPA);

.26 National Standards of Canada;

.27 NSF International;

.28 Occupational Health and Safety Act (OHSA);

.29 Ontario Building Code (OBC);

.30 Ontario Electrical Safety Code (OESC);

.31 Sheet Metal and Air Conditioning Contractors' National Association (SMACNA);

.32 Technical Standards and Safety Authority (TSSA);

.33 Thermal Insulation Association of Canada (TIAC);

.34 Underwriters' Laboratories of Canada (ULC);

.35 Workplace Hazardous Materials Information System (WHMIS);

.36 Material Safety Data Sheets by product manufacturers;

.37 Local utility inspection permits;

.38 Codes, standards, and regulations of local governing authorities having jurisdiction;

.39 Additional codes and standards listed in Trade Sections;

.40 Owner's standards.

.4 Provide applicable requirements for barrier free access in accordance with latest edition of local governing building code.

.5 Where any governing Code, Regulation, or Standard requires preparation and submission of special details or drawings for review they are to be prepared and submitted to appropriate authorities. Be responsible for costs associated with these submittals.

.6 Unless otherwise specified, install equipment in accordance with equipment manufacturer's recommendations and instructions, and requirements of governing Codes, Standards, and Regulations. Governing Codes, Standards, and Regulations take precedence over manufacturer's instructions.

.7 Work is to be performed by journeyperson tradesmen who perform only work that their certificates permit, or by apprentice tradesmen under direct on site supervision of experienced journeyperson tradesman. Journeyperson to apprentice ratio is not to exceed ratio determined by the Board as

stated in Ontario College of Trades and Apprenticeship Act or local equivalent governing body in Place of the Work.

.8 Journeyperson tradesmen are to have a copy of valid trade certificates available at site for review with the Consultant at any time.

.9 Experienced and qualified superintendent is to be on-site at times when work is being performed.

.10 Coordinate work inspection reviews and approvals with governing inspection department to ensure that construction schedule is not delayed. Be responsible for prompt notification of deficiencies to the Consultant and submission of reports and certificates to the Consultant.

.11 Properly protect equipment and materials on site from damage due to elements and work of trades, to satisfaction of Owner and reviewed with the Consultant. Equipment and materials are to be in new condition upon Substantial Performance of the Work.

.12 Mechanical piping system work, including equipment, must comply in all respects with requirements of local technical standards authorities and CSA B51, Boiler, Pressure Vessels and Pressure Piping Code. Where required, mechanical work products must bear a CRN number.

.13 Electrical items associated with mechanical equipment are to be certified and bear stamp or seal of a recognized testing agency such as CSA, UL, ULC, ETL, etc., or bear a stamp to indicate special electrical utility approval.

1.8 PERMITS, CERTIFICATES, APPROVALS, AND FEES

.1 Contact and confirm with local authorities having jurisdiction including utility providers, requirements for approvals from such authorities. Obtain and pay for permits, certificates, and approvals required to complete Work.

.2 Be responsible for ensuring that authorities having jurisdiction which require on-site inspection of work, have ample notification to perform inspection, with sufficient lead time to correct deficiencies in a manner that will not impede schedule of completion of Work. If any defect, deficiency or non-compliant is found in work by inspection, be responsible for costs of such inspection, including any related expenses, making good and return to site, until work is passed by governing authorities.

.3 Obtain and submit to Consultant, approval/inspection certificates issued by governing authorities to confirm that Work as installed is in accordance with rules and regulations of local governing authorities and are acceptable.

.4 Include in each copy of operating and maintenance instruction manuals, copies of approvals and inspection certificates issued by regulatory authorities.

1.9 REQUIREMENTS FOR CONTRACTOR RETAINED ENGINEERS

.1 Professional engineers retained to perform consulting services with regard to Project work, i.e. seismic engineer, fire protection engineer or structural engineer, are to be members in good standing with local Association of Professional Engineers, and are to carry and pay for errors and omissions professional liability insurance in compliance with requirements of governing authorities in Place of the Work.

.2 Retained engineer’s professional liability insurance is to protect Contractor's consultants and their respective servants, agents, and employees against any loss or damage resulting from professional services rendered by aforementioned consultants and their respective servants, agents, and employees in regards to the Work of this Contract.

.3 Unless otherwise specified in Division 00 or Division 01, liability insurance requirements are as follows:

.1 coverage is to be a minimum of $1,000,000.00 CDN inclusive of any one occurrence;

.2 insurance policy is not to be cancelled or changed in any way without insurer giving Owner minimum thirty days written notice;

.3 liability insurance is to be obtained from an insurer registered and licensed to underwrite such insurance in the Place of the Work;

.4 retained consultants are to ascertain that sub-consultants employed by them carry insurance in the form and limits specified above;

.5 evidence of the required liability insurance in such form as may be required is to be issued to Owner, Owner's Consultant, and Municipal Authorities as required prior to commencement of aforementioned consultant's services.

1.10 WORKPLACE SAFETY

.1 Comply with requirements of Workplace Hazardous Materials Information System (WHMIS) regarding use, handling, storage, and disposal of hazardous materials. Submit WHMIS MSDS (Material Safety Data Sheets) for products where required, and maintain one copy at site in a visible and accessible location available to personnel.

.2 Comply with requirements of Occupational Health and Safety Act and other regulations pertaining to health and safety, including worker's compensation/insurance board and fall protection regulations. When working in confined spaces, comply with requirements of Occupational Health and Safety Act - Ontario Regulation 632, "Confined Spaces" and any other applicable Ministry of Labour requirements.

.3 If at any time during course of work, hazardous materials other than those identified in Documents and pertaining to Project Scope of Work, are encountered, or suspected that were not identified as being present and which specific instructions in handling of such materials were not given, cease work in area in question and immediately notify Consultant. Comply with local governing regulations with regards to working in areas suspected of containing hazardous materials. Do not resume work in affected area without approval from Owner and reviewed with the Consultant.

1.11 PLANNING AND LAYOUT OF WORK

.1 Base installation layout, design, terminations, and supply of accessories, on Contract Documents with specific coordination with reviewed shop drawings.

.2 Plan, coordinate, and establish exact locations and routing of services with affected trades prior to installation such that services clear each other as well as other obstructions. Generally, order of right of way for services to be as follows:

.1 piping requiring uniform pitch;

.2 piping 100 mm (4") dia. and larger;

.3 large ducts (main runs);

.4 cable tray and bus duct;

.5 conduit 100 mm (4") dia. and larger;

.6 piping less than 100 mm (4") dia.;

.7 smaller branch ductwork;

.8 conduit less than 100 mm (4") dia.

.3 Unless otherwise shown or specified, conceal work in finished areas, and conceal work in partially finished and/or unfinished areas to extent made possible by the area construction. Install services as high as possible to conserve headroom and/or ceiling space. Notify Consultant where headroom or ceiling space appears to be inadequate prior to installation of work.

.4 Do not use Contract Drawing measurements for prefabrication and layout of piping, sheet metal work and such other work. Locations and routing are to generally be in accordance with Contract Drawings, however, prepare layout drawings for such work. Use established bench marks for both horizontal and vertical measurements. Confirm inverts, coordinate with and make allowances for work of other trades. Accurately layout work, and be entirely responsible for work installed in accordance with layout drawings. Where any invert, grade, or size is at variance with Contract Drawings, notify Consultant prior to proceeding with work.

.5 Prepare plan and interference drawings (at a minimum drawing scale of 1:50 or ¼"=1' 0") of work for coordination with each trade Contractor. Arrange for preparation of detailed section drawings of ceiling spaces of corridors and any other congested areas. Sections are to be cross referenced with plan drawings so that trades may make use of section drawings. Section drawings to indicate lateral and elevation dimensions of major services within ceiling space. Lateral dimensions are to be from grid lines and elevations from top of floor slab. Obtain from Consultant, engineering drawings for this use. Contractors' interference drawings are to be distributed among other Trade Contractors. Submit drawings to the Consultant for review. Failure of General Contractor to prepare and coordinate overall interface drawings of trades does not relieve respective Division Contractor of responsibility to ensure that work is properly planned and coordinated.

.6 Carry out alterations in arrangement of work that has been installed without proper coordination, study, and review, even if in accordance with Contract Documents, in order to conceal work behind finishes, or to allow installation of other work, without additional cost. In addition, make necessary alterations in other work required by such alterations, without additional cost.

.7 Shut-off valves, balancing devices, air vents, equipment, and similar products, particularly such products located above suspended ceilings must be located for easy access for servicing and/or removal. Products which do not meet this location requirement are to be relocated to an accessible location at no additional cost.

.8 Be responsible for making necessary changes, at no additional cost, to accommodate structural and building conditions that were missed due to lack of coordination.

1.12 SCHEDULING

.1 Include for any and all scheduling, coordination, and construction phasing to suit project, specified in Division 01 and/or as indicated on the drawings. Review exact phasing requirements with Consultant prior to start of Work.

.2 [Phasing and scheduling of Work is required in order to maintain existing building operations. Include costs (including costs for "off hours" work) for scheduling, co-ordination, and construction phasing to suit this project as specified in Division 01 and on drawings. Review phasing requirements with the Consultant prior to start of Work.]

.3 [Protect existing areas above, below, and adjacent areas of Work from any debris, noise, or interruptions to existing services to satisfaction of Owner and reviewed with the Consultant. Maintain in operation existing services to these areas to allow Owner to continue use of these areas. If services that are required to be maintained run through areas of renovations, provide necessary protection to services or reroute, in coordination with Owner and Consultant. Include for required premium time work to meet these requirements.]

.4 [Work being performed within occupied spaces and work affecting surfaces adjacent to occupied spaces may need to be performed after regular business hours. For areas where spaces are used by Owner on a 24 hours basis or over various hours, coordinate hours of work with Owner on a regular basis to suit Owner's schedule. Execute work at times confirmed with and agreed to by Owner and reviewed with the Consultant, so as not to inconvenience Owner's occupation or in any way hinder Owner's use of building. Include for required premium timework to meet these requirements.]

.5 Project partial occupancy permits may be required throughout project. Provide for each partial permit, required local governing authority certificate and any other testing/verification certificates for systems.

1.13 COORDINATION

.1 Review Contract Documents and coordinate work with work of each trade. Coordination requirements are to include but not be limited to following:

.1 requirements for openings, sleeves, inserts and other hardware necessary for installation of work;

.2 concrete work such as housekeeping pads, sumps, bases, etc., required for work, and including required dimensions, operating weight of equipment, location, etc.;

.3 depth and routing of excavation required for work, and requirements for bedding and backfill;

.4 wiring work required for equipment and systems but not specified to be done as part of mechanical work, including termination points, wiring type and size, and any other requirements.

.2 Ensure materials and equipment are delivered to site at proper time and in such assemblies and sizes so as to enter into building and be moved into spaces where they are to be located without difficulty.

.3 Wherever possible, coordinate equipment deliveries with manufacturers and/or suppliers so equipment is delivered to site when it is required, or so it can be stored within building, subject to available space as confirmed with Owner and reviewed with Owner, and protected from elements.

.4 Ensure proper access and service clearances are maintained around equipment, and, where applicable, access space for future equipment removal or replacement is not impeded. Comply with code requirements with regards to access space provision around equipment. Remove and replace any equipment which does not meet this requirement.

.5 Where work is to be integrated, or is to be installed in close proximity with work of other trades, coordinate work prior to and during installation.

1.14 PRODUCTS

.1 Be responsible for ordering of products (equipment and materials) in a timely manner in order to meet project-scheduling timelines. Failure to order products to allow manufacturers sufficient production/delivery time to meet project-scheduling timelines is an unacceptable reason to request for other suppliers or substitutions.

.2 Provide Canadian manufactured products wherever possible or required and when quality and performance is obtainable at a competitive price. Products are to be supplied from manufacturer’s authorized Canadian representative, unless otherwise noted. Unless otherwise specified, products are to be new and are to comply with applicable respective Canadian standards. References to UL listings of products to include requirements that products are to be also Underwriters Laboratories of Canada (ULC) listed for use in Canada. Products are to meet or exceed latest ANSI/ASHRAE/IES 90.1 standards, as applicable. Do not supply any products containing asbestos materials or PCB materials.

.3 Systems and equipment of this Project are to be "State of the Art" and be most recent and up to date series/version of product that is available at time of shop drawing review process. Products that have been stored or "on shelf" for an extended period of time will not be accepted. Software is to be of latest version available and be provided with updates available at time of shop drawing review process. Systems are to be designed such that its software is backwards compatible. Future upgrades are not to require any hardware replacements or additions to utilize latest software.

.4 Products scheduled and/or specified have been selected to establish a performance and quality standard, and, in some instances, a dimensional standard. In most cases, base specified manufacturers are stated for any product specified by manufacturer's name and model number. Where manufacturers are listed, first name listed is base specified company. Bid Price may be based on products supplied by any of manufacturers' base specified or named as acceptable for particular product. If manufacturers are not stated for a particular product, base Bid Price on product supplied by base specified manufacturer.

.5 Documents have been prepared based on product available at time of Bidding. If, after award of Contract, and if successful manufacturer can no longer supply a product that meets base specifications, notify Consultant immediately. Be responsible for obtaining other manufacturers product that complies with base specified performance and criteria and meets project timelines. Proposed products are subject to review and consideration by the Consultant and are considered as substitutions subject to a credit to Contract. In addition, if such products require modifications to room spaces, mechanical systems, electrical systems, etc., include required changes. Such changes are to be submitted in detail to the Consultant for review and consideration for acceptance. There will be no increase in Contract Price for revisions. Above conditions supplement and are not to supersede any specification conditions with regards to substitutions or failure to supply product as per issued documents.

.6 Listing of a product as "acceptable" does not imply automatic acceptance by the Consultant and/or Owner. It is responsibility of Contractor to ensure that any price quotations received and submittals made are for products that meet or exceed specifications included herein.

.7 If products supplied by a manufacturer named as acceptable are used in lieu of base specified manufacturer, be responsible for ensuring that they are equivalent in performance and operating characteristics (including energy consumption if applicable) to base specified products. It is understood that any additional costs (i.e. for larger starters, larger feeders, additional spaces, etc.), and changes to associated or adjacent work resulting from provision of product supplied by a manufacturer other than base specified manufacturer, is included in Bid Price. In addition, in equipment spaces where equipment named as acceptable is used in lieu of base specified equipment and dimensions of such equipment differs from base specified equipment, prepare, and submit for review accurately dimensioned layouts of rooms affected, identifying architectural and structural elements, systems and equipment to prove that equipment in room will fit properly meeting design intent. There will be no increase in Contract Price for revisions.

.8 In addition to manufacturer's products base specified or named as acceptable, other manufacturers of products may be proposed as substitutions to the Consultant for review and consideration for acceptance, listing in each case a corresponding credit for each substitution proposed. However, base Bid Price on products base specified or named as acceptable. Certify in writing to the Consultant that proposed substitution meets space, power, design, energy consumption, and other requirements of base specified or acceptable product. It is understood that there will be no increase in Contract Price by reason of any changes to associated equipment, mechanically, electrically, structurally, or architecturally, required by acceptance of proposed substitution. Consultant has sole discretion in accepting any such proposed substitution of product. Indicate any proposed substitutions in areas provided on Bid Form. Do not order such products until they are accepted in writing by the Consultant.

.9 Where products are listed as "or approved equal", certify in writing that product to be used in lieu of base specified product, at least meets space, power, design, energy consumption, and other requirements of base specified product and is equivalent or better than base specified product. When requested by the Consultant, provide full design detail drawings and specifications of proposed products. Acceptance of these "or approved equal" products is at sole discretion of the Consultant. It is understood that there will be no increase in Contract Price by reason of any changes to associated equipment, mechanically, electrically, structurally, or architecturally, required

by acceptance of approved equal product. There must be no increase in Contract price due to Consultant's rejection of proposed equivalent product.

.10 Whenever use of product other than base specified product is being supplied, ensure corresponding certifications and product information (detailed catalogue and engineering data, fabrication information and performance characteristics) are submitted to the Consultant for review. Failure of submission of these documents to the Consultant in a timely manner to allow for review will result in base specified product to be supplied at Consultant's discretion, at no additional cost to Contract.

.11 Products supplied by a manufacturer/supplier other than a manufacturer listed as acceptable may be considered for acceptance by the Consultant if requested in writing with full product documentation submitted, a minimum of 10 working days prior to Bid closing date.

.12 Any proposed changes initiated by Contractor after award of Contract may be considered by the Consultant at the Consultant's discretion, with any additional costs for such changes if accepted by Owner and reviewed with the Consultant, and costs for review, to be borne by Contractor.

.13 Whenever use of product other than based specified products or named as acceptable is being supplied, time for process of submission of other products and Consultant's review of products will not alter contract time or delay work schedule.

1.15 SHOP DRAWINGS

.1 At start-up meeting, review with the Consultant products to be included in shop drawing submission. Prepare and submit list of products to the Consultant for review.

.2 Submit electronic copies of shop drawings unless otherwise directed by the Consultant. Coordinate exact requirements with the Consultant.

.3 Submit for review, drawings showing detail design, construction, and performance of equipment and materials as requested in Specification. Submit shop drawings to the Consultant for review prior to ordering and delivery of product to site. Include minimally for preparation and submission of following, as applicable:

- .1 product literature cuts;
- .2 equipment data sheets;
- .3 equipment dimension drawings;
- .4 system block diagrams;
- .5 sequence of operation;
- .6 connection wiring schematic diagrams;
- .7 functionality with integrated systems.

.4 Each shop drawing or product data sheet is to be properly identified with project name and product drawing or specification reference. Shop drawing or product data sheet dimensions are to match dimension type on drawings.

.5 Where any item of equipment is required by Code or Standard or By-Law to meet a specific energy efficiency level, or any other specific requirement, ensure this requirement is clearly indicated on submission.

.6 Ensure proposed products meet each requirement of Project. Endorse each shop drawing copy "CERTIFIED TO BE IN ACCORDANCE WITH ALL REQUIREMENTS". Include company name, submittal date, and sign each copy. Shop drawings that are received and are not endorsed, dated and signed will be returned to be resubmitted.

.7 Consultant to review shop drawings and indicate review status by stamping shop drawing copies as follows:

.1 "REVIEWED" or "REVIEWED AS NOTED" (appropriately marked) – If Consultant's review of shop drawing is final, Consultant to stamp shop drawing;

.2 "RETURNED FOR CORRECTION" – If Consultant's review of shop drawing is not final, Consultant to stamp shop drawing as stated above, mark submission with comments, and return submission. Revise shop drawing in accordance with Consultant's notations and resubmit.

.8 Following is to be read in conjunction with wording on Consultant's shop drawing review stamp applied to each and every shop drawing or product data sheet submitted:

.1 "THIS REVIEW BY CONSULTANT IS FOR SOLE PURPOSE OF ASCERTAINING CONFORMANCE WITH GENERAL DESIGN CONCEPT. THIS REVIEW DOES NOT MEAN THAT CONSULTANT APPROVES DETAILED DESIGN INHERENT IN SHOP DRAWINGS, RESPONSIBILITY FOR WHICH REMAINS WITH CONTRACTOR. CONSULTANT'S REVIEW DOES NOT RELIEVE CONTRACTOR OF RESPONSIBILITY FOR ERRORS OR OMISSIONS IN SHOP DRAWINGS OR OF CONTRACTOR'S RESPONSIBILITY FOR MEETING REQUIREMENTS OF CONTRACT DOCUMENTS. BE RESPONSIBLE FOR DIMENSIONS TO BE CONFIRMED AND CORRELATED AT JOB SITE, FOR INFORMATION THAT PERTAINS SOLELY TO FABRICATION PROCESSES OR TO TECHNIQUES OF CONSTRUCTION AND INSTALLATION, AND FOR COORDINATION OF WORK OF SUB-TRADES."

.9 Submit each system and each major component as separate shop drawing submissions. Submit together, shop drawings for common devices such as devices of each system are to be submitted together.

.10 Obtain shop drawings for submission from product manufacturer's authorized representatives and supplemented with additional items specified herein.

.11 Do not order product until respective shop drawing review process has been properly reviewed with the Consultant.

.12 Where extended warranties are specified for equipment items, submit specified extended warranty with shop drawing submittal.

.13 Applicable mechanical equipment has been selected to meet energy efficiency requirements of ANSI/ASHRAE/IES 90.1, Energy Standards for Buildings, and shop drawings/product data submittals for such equipment must indicate compliance with this Standard or they will be returned for correction and re-submittal.

1.16 EQUIPMENT LOADS

.1 Supply equipment loads (self-weight, operating weight, housekeeping pad, inertia pads, etc.) to the Consultant, via shop drawing submissions, prior to construction.

.2 Where given choice of specific equipment, actual weight, location, and method of support of equipment may differ from those assumed by the Consultant for base design. Back-check equipment loads, location, and supports, and include necessary accommodations.

.3 Where supporting structure consists of structural steel framing, it is imperative that equipment loads, location, and method of support be confirmed prior to fabrication of structural steel. Review locations of equipment with the Consultant prior to construction.

1.17 OPENINGS

.1 Supply opening sizes and locations to the Consultant to allow verification of their effect on design, and for inclusion on structural drawings where appropriate.

.2 No openings are permitted through completed structure without written approval from Owner and reviewed with the Consultant. Show required openings on a copy of structural drawings. Identify exact locations, elevations, and size of proposed openings and submit to the Consultant for review, well in advance of doing work.

.3 Prior to leaving site at end of each day, walk through areas of work and check for any openings, penetrations, holes, and/or voids created under scope of work of project, and ensure that any openings created under scope of work have been closed off, fire-stopped and smoke-sealed. Unless directed by Owner and reviewed with the Consultant, do not leave any openings unprotected and unfinished overnight.

1.18 SCAFFOLDING, HOISTING AND RIGGING

.1 Unless otherwise specified or directed, supply, erect and operate scaffolding, rigging, hoisting equipment and associated hardware required for work, and subject to approval from Owner and reviewed with the Consultant.

.2 Immediately remove from site scaffolding, rigging and hoisting equipment when no longer required.

.3 Do not place major scaffolding/hoisting equipment loads on any portion of structure without approval from Owner and reviewed with the Consultant.

1.19 CHANGES IN THE WORK

.1 Whenever Consultant proposes in writing to make a change or revision to design, arrangement, quantity, or type of work from that required by Contract Documents, prepare and submit to the Consultant for review, a quotation being proposed cost for executing change or revision.

.2 Quotation is to be a detailed and itemized estimate of product, labour, and equipment costs associated with change or revision, plus overhead and profit percentages and applicable taxes and duties.

.3 Unless otherwise specified in Division 00 or Division 01, allowable maximum percentages for overhead and profit are to be 7% and 5% respectively.

.4 Unless otherwise specified in Division 00 or Division 01, following additional requirements apply to all quotations submitted:

.1 when change or revision involves deleted work as well as additional work, cost of deleted work (less overhead and profit percentages but including taxes and duties) is to be subtracted from cost of additional work before overhead and profit percentages are applied to additional work;

.2 material costs are not to exceed those published in the latest edition of Allpriser price guide, less 20%;

.3 mechanical material labour unit costs are to be in accordance with Mechanical Contractors Association of America Labor Estimating Manual, less 25%;

.4 electrical material labour unit costs are to be in accordance with National Electrical Contractors Association Manual of Labor Units at difficult level, less 25%;

.5 costs for journeyperson and apprentice labour must not exceed prevailing rates at time of execution of Contract and must reflect actual personnel performing work;

.6 cost for site superintendent must not exceed 10% of total hours of labour estimated for change or revision, and change or revision must be such that site superintendent’s involvement is necessary;

.7 costs for rental tools and/or equipment are not to exceed local rental costs;

.8 overhead percentage will be deemed to cover quotation costs other than actual site labour and materials, and rentals;

.9 quotations, including those for deleted work, to include a figure for any required change to Contract time.

.5 Quotations submitted that are not in accordance with requirements specified above will be rejected and returned for re-submittal. Failure to submit a proper quotation to enable Consultant to expeditiously process quotation and issue a Change Order will not be grounds for any additional change to Contract time.

.6 Make requests for changes or revisions to work to Consultant in writing and, if Consultant agrees, will issue Notice of Change.

.7 Do not execute any change or revision until written authorization for the change or revision has been obtained from the Consultant.

1.20 PROGRESS PAYMENT BREAKDOWN

.1 Prior to submittal of first progress payment draw, submit a detailed breakdown of work cost to assist Consultant in reviewing and approving progress payment claims.

.2 Payment breakdown is subject to Owner’s approval and Consultant’s review. Progress payments will not be processed until an approved breakdown is in place. Breakdown is to include one-time claim items such as mobilization and demobilization, insurance, bonds (if applicable), shop drawings and product data sheets, commissioning including testing, adjusting and balancing, system testing and verification, and project closeout submittals.

.3 Indicate equipment, material and labour costs for site services (if applicable) and indicate work of each trade in same manner as indicated on progress draw.

1.21 NOTICE FOR REQUIRED FIELD REVIEWS

.1 Whenever there is a requirement for the Consultant to perform a field review prior to concealment of any work, to inspect/re-inspect work for deficiencies prior to Substantial Performance of the Work, for commissioning demonstrations, and any other such field review, give minimum 5 working days' notice in writing to the Consultant.

.2 If Consultant is unable to attend a field review when requested, arrange an alternative date and time.

.3 Do not conceal work until the Consultant advises that it may be concealed.

.4 When Consultant is requested to perform a field review and work is not ready to be reviewed, reimburse Consultant for time and travel expenses.

1.22 PRELIMINARY TESTING

.1 When directed by the Consultant, promptly arrange, pay for, and perform site tests on any piece of equipment or any system for such reasonable lengths of time and at such times as may be required to prove compliance with Specification and governing Codes and Regulations, prior to Substantial Performance of the Work.

.2 When, in Consultant’s opinion, tests are required to be performed by a certified testing laboratory, arrange and pay for such tests.

.3 These tests are not to be construed as evidence of acceptance of work, and it is agreed and understood that no claim for delays or damage will be made for injury or breakage to any part or

parts of equipment or system due to test where such injuries or breakage were caused by faulty parts and/or workmanship of any kind.

.4 When, in Consultant's opinion, tests indicate that equipment, products, etc., are defective or deficient, immediately remove such equipment and/or products from site and replace them with acceptable equipment and/or products, at no additional cost.

1.23 PROVISIONS FOR SYSTEMS/EQUIPMENT USED DURING CONSTRUCTION

.1 Permanent building mechanical systems are not to be used for temporary heating or cooling purposes during construction.

1.24 TEMPORARY SERVICES

.1 Coordinate with Prime Contractor, requirements for temporary services including but not limited to temporary heating, cooling, and water. Unless otherwise noted, provide required services in compliance with requirements of local governing building code and local governing inspection authorities.

.2 Maintain fire protection of areas which may include fire watch during temporary shutdowns of existing systems, in accordance with requirements of local governing code and local governing authorities.

1.25 MAINTAINING EQUIPMENT PRIOR TO ACCEPTANCE

.1 Maintain equipment in accordance with the manufacturer's printed instructions prior to start-up, testing and commissioning.

.2 Employ a qualified millwright to check and align shafts, drives, and couplings on all base mounted split coupled motor driven equipment.

.3 Where equipment lubrication fittings are not easily accessible, extend the fittings to accessible locations using copper or aluminium tubing.

.4 All filters are to be new upon Substantial Performance of the Work. This is in addition to any spare filters specified.

1.26 RECORD DOCUMENTATION

.1 Drawings for this project have been prepared on a REVIT system using Revit software of release version reviewed with the Consultant. For purpose of producing record "as built" drawings, copies of Contract Drawings can be obtained from the Consultant.

.2 As work progresses at site, clearly mark in red in a neat and legible manner on a set of bound white prints of Contract Drawings, changes, and deviations from routing of services and locations of equipment shown on Contract Drawings, on a daily basis. Changes and deviations include those made by addenda, change orders, and site instructions. Use notes marked in red as required. Maintain white print red line as-built set at site for exclusive use of recording as-built conditions, keep set up-to-date at all times, and ensure set is always available for periodic review. As-built set is also to include the following:

.1 dimensioned location of inaccessible concealed work;

.2 locations of control devices with identification for each;

.3 for underground piping and ducts, record dimensions, invert elevations, offsets, fittings, cathodic protection and accessories if applicable, and locate dimensions from benchmarks to be preserved after construction is complete;

.4 for fire protection systems, record actual locations of equipment, sprinkler heads, and valves, drains, and test locations, and deviations of pipe routing and sizing from that shown on the drawings;

.5 location of piping system air vents;

.6 location of concealed services terminated for future extension and work concealed within building in inaccessible locations.

.3 Before applying for a Certificate of Substantial Performance of the Work, update a clean copy of Contract Drawing set in accordance with marked up set of "as-built" white prints including deviations from original Contract Drawings, thus forming an "as-built" drawing set. Submit "as-built" site drawing prints to the Consultant for review. Make necessary revisions to drawings as per Consultant's comments, to satisfaction of the Consultant.

.4 Use final reviewed "as-built" drawing set to provide CAD files of drawings thus forming true "as-built" set of Contract Drawings. Identify set as "Project Record Copy". Load digital copies of final reviewed by the Consultant as-built drawings onto USB type flash drive. Provide 2 complete sets of "as-built" drawings on separate USBs. Submit "as-built" sets of white prints and USBs to Consultant.

.5 Submitted drawings are to be of same quality as original Contract Drawings. REVIT drawing files are to be compatible with Revit software release version confirmed with the Consultant.

.6 Unless otherwise noted in Division 00 or Division 01, failure to maintain accurate record drawings will incur additional 5% holdback on progress claims until drawings are brought up to date to satisfaction of Owner and reviewed with the Consultant.

.7 For projects with phased turnover of project (refer to Division 01), review with the Consultant completeness of as-built drawings prior to turn over of an area. Interim as-built drawings to be made available to Owner's maintenance personnel.

.8 Where part of the Mechanical Scope of Work, retain and pay for services of a land surveyor registered in Place of the Work to measure, verify, and record size, location, invert elevation and pitch of buried piping services, and, when complete, transfer survey work to as-built drawings.

1.27 OPERATION AND MAINTENANCE DATA

.1 For each item of equipment for which a shop drawing is required (except for simple equipment), supply indexed copies of equipment manufacturers' operating and maintenance (O&M) instruction data manuals. Consolidate each copy of data as a PDF file on a USB drive. Consolidated O&M manual PDF to include:

.1 front cover: project name; wording – "Mechanical Systems Operating and Maintenance Manual"; and date;

.2 introduction sheet listing Consultant, Contractor, and Subcontractor names, street addresses, telephone and fax numbers, and e-mail addresses;

.3 equipment manufacturer's authorized contact person name, telephone number and company website;

.4 Table of Contents sheet, and corresponding index tab sheets;

.5 copy of each "REVIEWED" or clean, updated "REVIEWED AS NOTED" shop drawing or product data sheet, with manufacturer's/supplier's name, telephone and fax numbers, email address, company website address, and email address for local source of parts and service; when shop drawings are returned marked "Reviewed As Noted" with revisions marked on shop drawing copies, they are to be revised by equipment supplier to incorporate comments marked on "Reviewed" shop drawings and a clean updated copy is to be included in operating and maintenance manuals;

.6 Operating data is to include:

.1 pressure test reports, and certificates issued by governing authorities;

.2 description of each system and its controls;

.3 control schematics for equipment/systems including building environmental controls;

.4 wiring and connection diagrams;

.5 if applicable, BAS architecture and all required operating data;

.6 description of operation of each system at various loads together with reset schedules and seasonal variances;

.7 operation instruction for each system and each component;

.8 description of actions to be taken in event of emergencies and/or equipment failure;

.9 valve tag schedule, and flow diagrams to indicate valve locations.

.7 Maintenance data is to include:

.1 operation and trouble-shooting instructions for each item of equipment and each system;

.2 schedules of tasks, frequency, tools required, and estimated task time;

.3 recommended maintenance practices and precautions;

.4 complete parts lists with numbers.

.8 Performance data is to include:

.1 equipment and system start-up data sheets;

.2 equipment performance verification test results, and final commissioning report;

.3 final testing, adjusting and balancing reports.

.9 copies of warranties;

.10 items requested specifically in Section Articles.

.2 Operating and maintenance instructions are to relate to job specific equipment supplied under this project and related to Owner’s building. Language used in manuals is to contain simple practical operating terms and language easy for in-house maintenance staff to understand how to operate and maintain each system.

.3 Before applying for a Certificate of Substantial Performance of the Work, assemble one copy of O&M Manual and submit to the Consultant for review prior to assembling remaining copies. Incorporate Consultant's comments into final submission.

1.28 COMMISSIONING

.1 After successful start-up and prior to Substantial Performance of the Work, commission the mechanical work. Commissioning work is the process of Contractor demonstrating to Owner and Consultant, for purpose of final acceptance, by means of successful and documented functional performance testing, that systems and/or subsystems are capable of being operated and maintained to perform in accordance with requirements of Contract Documents, as further described below.

.1 Retain services of a testing, adjusting, and balancing agency to perform testing and balancing of mechanical system air/fluid flows and capacities, prior to operational performance testing. Refer to Section 20 05 93 – Testing, Adjusting, and Balancing for Mechanical Systems.

.2 Test, adjust and operate equipment and systems after start-up but before functional performance testing, to confirm operations are in accordance with requirements of Contract Documents. Verify modes and sequences of control and monitoring, interlocks, and responses to emergency conditions. Complete commissioning data sheets to document successful operational performance testing.

.3 Repeat successful operational performance testing with completed commissioning data sheet documentation in the presence of Consultant and Owner to validate and verify equipment and systems are complete in all respects, function correctly, and are ready for acceptance.

.4 Submit final commissioning data sheets, TAB reports as specified in Section 20 05 93 – Testing, Adjusting, and Balancing for Mechanical Systems, project closeout documents, and other required submittals.

1.29 WARRANTY

.1 Unless otherwise specified in Division 00 and Division 01, warrant mechanical work to be in accordance with Contract Documents and free from defects for a period of 1 year from date of issue of a Certificate of Substantial Performance of the Work.

.2 Where equipment includes extended warranty period, e.g., 5 years, first year of warranty period is to be governed by terms and conditions of warranty in Contract Documents, and remaining years of warranty are to be direct from equipment manufacturer and/or supplier to Owner. Submit signed and dated copies of extended warranties to the Consultant.

.3 Warranty to include parts, labour, travel costs and living expenses incurred by manufacturer’s authorized technician to provide factory authorized on-site service.

.4 Repair and/or replace any defects that appear in Work within warranty period without additional expense to Owner. Be responsible for costs incurred in making defective work good, including repair or replacement of building finishes, other materials, and damage to other equipment. Ordinary wear and tear and damage caused wilfully or due to carelessness of Owner’s staff or agents is exempted.

.5 Do not include Owner deductible amounts in warranties.

.6 It is understood that warranties are to commence from time of Substantial Performance of the Work, regardless of what is noted within following Sections of Specification. Be responsible for providing whatever "bridging" or additional extended warranty period is required from time that material is purchased until this time.

.7 Visit building during warranty period with Owner representatives. Owner to organize these visits. At these meetings, Owner representatives are to review performance of systems. If performance is satisfactory, then no further action needs to be taken. If unsatisfactory, then correct deficiencies, as directed by Owner representatives, to satisfaction of Owner's representatives. These site visits to occur:

.1 once during 1st month of building operation;

.2 once during 3rd month of building operation;

.3 once between 4th and 10th month in a season opposite to 1st and 3rd month visits.

1.30 CLOSEOUT SUBMITTALS

.1 Prior to application for Substantial Performance of the Work, submit required items and documentation specified, including following as applicable to the project:

.1 Operating and Maintenance Manuals;

.2 as-built record drawings and associated data;

.3 extended warranties for equipment as specified;

.4 operating test certificates, i.e. Sprinkler Test Certificate;

.5 final commissioning report and TAB report;

.6 identified keys for equipment and/or panels for which keys are required, and other items required to be submitted;

.7 other data or products specified.

1.31 INSTRUCTIONS TO OWNER

.1 Refer to equipment and system operational and maintenance training requirements specified in Division 01.

.2 Train Owner's designated personnel in aspects of operation and maintenance of equipment and systems as specified. Demonstrations and training are to be performed by qualified technicians employed by equipment/system manufacturer/supplier. Supply hard copies of training materials to each attendee.

.3 Provide training to Owner as specified in trade Sections on the operation and maintenance procedures of mechanical systems and equipment.

.4 Unless where specified otherwise in trade Sections, minimum requirements are for manufacturer/suppliers of each system and major equipment, to provide minimum two separate sessions each consisting of minimum 4 hours on site or in factory training (at Owner's choice), of Owner's designated personnel (for up to 6 people each session), on operation and maintenance procedures of system.

.5 For each item of equipment and for each system for which training is specified, prepare training modules as specified below. Use Operating and Maintenance Manuals during training sessions. Training modules include but are not limited to:

.1 Operational Requirements and Criteria – equipment function, stopping and starting, safeties, operating standards, operating characteristics, performance curves, and limitations;

.2 Troubleshooting – diagnostic instructions, test and inspection procedures;

.3 Documentation – equipment/system warranties, and manufacturer's/supplier's parts and service facilities, telephone numbers, email addresses, and the like;

.4 Maintenance – inspection instructions, types of cleaning agents to be used as well as cleaning methods, preventive maintenance procedures, and use of any special tools;

.5 Repairs – diagnostic instructions, disassembly, component removal and repair instructions, instructions for identifying parts and components, and review of any spare parts inventory.

.6 Before instructing Owner's designated personnel, submit to the Consultant for review preliminary copy of training manual and proposed schedule of demonstration and training dates and times. Incorporate Consultant's comments in final copy.

.7 Obtain in writing from the Consultant list of Owner's representatives to receive instructions. Submit to Consultant prior to application for Certificate of Substantial Performance of the Work, complete list of systems for which instructions were given, stating for each system:

.1 date instructions were given to Owner's staff;

.2 duration of instruction;

.3 names of persons instructed;

.4 other parties present (manufacturer's representative, consultants, etc.).

.8 Obtain signatures of Owner's staff to verify they properly understood system installation, operation, and maintenance requirements, and have received operating and maintenance instruction manuals and "as-built" record drawings.

.9 Submit to the Consultant copy of electronic version of training materials and include in operating and maintenance manuals submission.

1.32 FINAL INSPECTION

.1 Submit to Consultant, written request for final inspection of systems. Include written certification that:

.1 deficiencies noted during job inspections have been completed;

.2 field quality control procedures have been completed;

.3 systems have been tested and verified, balanced, and adjusted, and are ready for operation;

.4 maintenance and operating data have been completed and submitted to, reviewed with the Consultant and accepted by Owner;

.5 tags and nameplates are in place and equipment identifications have been completed;

.6 clean-up is complete;

.7 spare parts and replacement parts specified have been provided and acknowledged by the Consultant;

.8 as-built and record drawings have been completed and submitted to and reviewed with the Consultant and accepted by Owner;

.9 Owner's staff has been instructed in operation and maintenance of systems;

.10 commissioning procedures have been completed.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 CLEANING

.1 During construction, keep site reasonably clear of rubbish and waste material resulting from work on a daily basis to the satisfaction of Owner and Consultant. Before applying for a Certificate of Substantial Performance of the Work, remove rubbish and debris, and be responsible for repair of any damage caused as a result of work.

.2 Clean equipment and devices installed as part of this project.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Motors and starters for all equipment specified in Mechanical Divisions.

1.2 RELATED REQUIREMENTS

.1 Section 26 05 83 – Wiring Connections.

1.3 SUBMITTALS

.1 Submit shop drawings/product data sheets for:

.1 electric motors (submit with equipment they are associated with).

.2 Submit a list of equipment identification nameplates indicating proposed wording and sizes.

PART 2 - PRODUCTS

2.1 EQUIPMENT BELT DRIVES

.1 ANSI/RMA Standard V-belt type rated at minimum 1.5 times motor nameplate rating, and in accordance with following requirements:

.1 belts are to be reinforced cord and rubber, and multiple belts are to be matched sets;

.2 sheaves are to be cast iron or steel, secured to shafts with removable keys unless otherwise specified, standard adjustable pitch (± 10% range) for motors under 10 hp, fixed pitch type with split tapered bushing and keyway for motors 10 hp and larger, and, if required, replaced as part of mechanical work to suit system air/water quantity testing and balancing work;

.3 motor slide rail adjustment plates are to allow for centre line adjustment.

.2 Supply a spare belt set (tagged and identified) for each belt drive and hand to Owner upon Substantial Performance of the Work.

2.2 EQUIPMENT DRIVE GUARDS AND ACCESSORIES

.1 For V-belt drives – removable, 4-sided, fully enclosed, galvanized sheet steel guards to OHSA standards, cleaned, factory primed and painted with yellow equipment enamel, complete with a 2-piece full length hinged front panel to permit belt maintenance or replacement without removing guard, and 40 mm (1-½") diameter tachometer openings at each shaft location.

.2 For flexible couplings – removable "U" shaped galvanized steel guards to OHSA Standards with a 2.3 mm (3/32") thick frame and expanded mesh face.

.3 For unprotected fan inlets and outlets – unless otherwise specified, removable 20 mm (¾") galvanized steel wire mesh with galvanized steel frames, all to OHSA Standards.

2.3 ELECTRIC MOTORS

.1 Unless otherwise specified, motors are to conform to NEMA Standard MG 1, applicable IEEE Standards, and applicable CSA C22.2 standards, and are to meet NEMA standards for maximum sound level ratings under full load. Confirm motor voltages prior to ordering.

.2 Vertically mounted and submersible motors are to be purposely designed for mounting in this attitude.

.3 Efficiency of 1-phase motors to 1 hp is to be in accordance with CAN/CSA C747. Efficiency of 3-phase motors 1 hp and larger is to be in accordance with CAN/CSA C390 or IEEE 112B.

.4 Unless otherwise specified, 1-phase motors smaller than ½ hp are to be 115 V, continuous duty capacitor start type with an NEMA 48 or 56 frame size, solid base, heavy-gauge steel shell with solid die-cast end shields, dynamically balanced die-cast rotor, integral automatic reset thermal overload protection, Class "B" insulation, and a 1.15 service factor at 40°C (105°F) ambient temperature.

.5 Explosion-proof 1-phase motors are to be totally enclosed, fan cooled, 115 V continuous duty capacitor start type in accordance with CSA C22.2 No. 145, as specified for standard 1-phase motors but suitable for use in Class 1 Group D hazardous locations and complete with a rolled steel shell and a 1.0 service factor at 40°C (105°F) ambient temperature.

.6 Unless otherwise specified, motors ½ hp and larger are to be totally enclosed, fan cooled, 3-phase, T-frame, squirrel cage continuous duty induction motors suitable for voltages indicated on Drawings, NEMA Design "B" for normal starting torque or Design "C" for high starting torque as required by the application, each complete with Class "B" insulation, a 1.15 service factor at 40°C ambient temperature, grease lubricated open ball bearings with grease fittings to permit re-lubrication without dismantling motor, a cast iron frame with cast iron feet where required, cast iron end bracket and precision machined bearing fit, and balanced carbon steel shaft assembly with die-cast aluminum rotor windings.

.7 Explosion-proof 3-phase motors are to be totally enclosed fan cooled motors in accordance with CSA C22.2 No. 145, generally as specified above for standard 3-phase motors but suitable for use in Class 1 Group D hazardous locations and with a 1.0 service factor at 40°C (105°F) ambient temperature.

.8 Motor(s) for 2-speed fan(s) are to be as above but 2-speed double winding type.

.9 Unless otherwise indicated, motors 30 hp and larger are to be complete with a heat sensing PTC thermistor in the end turn of stator winding for each phase and connected in series inside motor with 2 marked leads brought out to motor conduit box.

.10 Motors for equipment with variable frequency drives are to be generally as specified above but inverter duty type to NEMA Standard MG 1 Part 31, quantified by CSA for operation from a variable frequency drive of type specified, and complete with Class "H" insulation. Motors are to be equipped with AEGIS, or approved equal, shaft grounding ring system to protect bearings from damage by diverting harmful shaft voltages and bearing currents to ground.

.11 Motors 150 hp and larger with "wye-delta" reduced voltage starters are to be complete with six leads for connection to motor starter.

.12 Motors for equipment which is scheduled or specified with a corrosion resistant coating or constructed from corrosion resistant materials are to be factory coated with a primer and epoxy paint finish.

.13 Manufacturers:

.1 TECO-Westinghouse Motors (Canada) Inc.;

.2 Canadian General Electric;

.3 Baldor Electric Co.;

.4 U.S. Electrical Motors;

.5 Weg Electric Corp.;

.6 Marathon Electric;

.7 Toshiba Corp.;

.8 Leeson Canada.

2.4 MOTOR STARTERS AND ACCESSORIES

.1 Motor starters must be capable of starting associated motors under the imposed loads. Confirm starter voltage matches motor prior to ordering.

.2 Unless otherwise specified, starters for 1-phase motors are to be 115 V, thermal overload protected manual starting switches with a neon pilot light, a surface or recessed enclosure to suit the application, and, where automatic operation is required, a separate H-O-A switch in an enclosure to match starter enclosure.

.3 Unless otherwise specified, starters for 3-phase motors less than 50 hp are to be combination "quick-make" and "quick-break" fused disconnects and full voltage non-reversing across-the-line starters, each complete with and overload relay per phase, an enclosure to suit the application, and, a H-O-A switch, pilot lights, control transformer, auxiliary contacts, and other accessories as per motor starter schedule.

.4 Unless otherwise specified, starters for 3-phase motors 50 hp to 150 hp are to be reduced voltage, non-reversing, auto-transformer type starters complete with one overload relay per phase, an enclosure to suit the application, and, a H-O-A switch, pilot lights, control transformer, auxiliary contacts, and other accessories as per motor starter schedule.

.5 Unless otherwise specified, starters for 3-phase motors 150 hp and larger are to be reduced voltage, non-reversing, closed transition "wye-delta" starters complete with one overload relay per phase, an enclosure to suit the application, and, a H-O-A switch, pilot lights, control transformer, auxiliary contacts, and other accessories as per motor starter schedule.

.6 Starters for 2-speed double winding motors are to be generally as specified above but suitable for motor and equipped with a 45 second time delay to permit equipment to coast down to low speed before it is operated at low speed.

.7 Starters for 2-speed single winding motors are to be generally as specified above but suitable for motor and equipped with a 45 second time delay to permit equipment to coast down to low speed before it is operated at low speed.

.8 Starters for reversible motors for cooling towers are to be generally as specified above but suitable for motor and equipped with a 45 second time delay to allow fan(s) to coast down to a stop before being operated in reverse rotation.

.9 Unless otherwise specified, motor starter enclosures are to be in accordance with following NEMA ratings:

.1 enclosures located in sprinklered areas – Type 2;

.2 enclosures exposed to the elements – Type 3R, constructed of stainless steel;

.3 enclosures inside the building in wet areas – Type 3R, constructed of stainless steel;

.4 enclosures in explosion rated area – Type 7 with exact requirements to suit the area and application;

.5 enclosures except as noted above – Type 1;

.6 enclosures located in finished areas – as above but recess type with brushed stainless steel faceplate.

.10 Motor control centres are to be multi-unit, 2.28 m (9') high, NEMA Class 1, type "B", factory assembled, dead front, floor mounted, free-standing motor control centre with tin plated copper bus and an NEMA Type 1 or Type 2 enclosure as for loose starters specified above. Each motor control centre is to be complete with starters as specified above, load and control wiring terminal boards, and required facilities for line and load side power wiring connections.

.11 Disconnect switches for motor control centres are to be heavy-duty, CSA certified, front operated switches as per motor starter schedule, each complete with a handle suitable for padlocking in "off" position and arranged so that door cannot be opened with handle in "on" position and an NEMA enclosure as specified for loose starters. Fusible units are to be complete with fuse clips to suit fuse types specified below.

.12 Fuses are to be, unless otherwise scheduled or specified, English Electric Ltd. HRC fuses, Form I Class "J" for constant running equipment and Form II Class "C" for equipment that cycles on and off.

.13 Manufacturers:

.1 Rockwell Automation Inc. - Allen-Bradley;

.2 Eaton Corp. – Cutler-Hammer;

.3 Eaton Corp. – Moeller Electric;

.4 Siemens Canada;

.5 Schneider Electric.

2.5 SPRINKLER PROOFING

.1 Provide drip shields for protection of surface mounted equipment enclosures from water spray and dripping of liquids. Features of shields include:

.1 factory constructed by respective equipment manufacturers;

.2 constructed from non-combustible materials (sheet steel);

.3 enamel painted to match equipment;

.4 surfaces and edges filled/sanded smooth prior to painting;

.5 supported from equipment with structural steel rods/metal framing or other method approved by Consultant;

.6 structural support finish painted to match shield.

.2 Include with equipment shop drawings, detailed dimensions of drip shields and methods of supporting.

.3 Equipment with top cable/conduit entries to include additional sealing of entries with gasketting and/or waterproof sealant to prevent water from entering enclosure.

.4 Design ventilation louvers such that live components are not exposed to water spray and dripping liquids.

.5 Above requirements are additional minimum "sprinkler proof" standards for equipment specified as NEMA 1, 2 or 12.

.6 Obtain CSA approval where required by local governing authorities.

PART 3 - EXECUTION

3.1 INSTALLATION OF EQUIPMENT DRIVE GUARDS AND ACCESSORIES

.1 Provide OHSA guards for exposed accessible rotating parts such as belt drives, couplings, fan wheels, and shaft ends on mechanical equipment.

.2 Install belt guards to allow movement of motors for adjusting belt tension.

.3 Provide a means to permit lubrication and use of test instruments with guards in place.

.4 Secure guards to equipment or equipment base but do not bridge sound or vibration isolation.

.5 Where equipment oil level gauges, oil reservoirs, grease cups, or grease gun fittings are integral with equipment but are not easily accessible for service, extend to an accessible location using aluminium or copper tubing.

3.2 SUPPLY OF MOTOR STARTERS AND ACCESSORIES

.1 Unless otherwise shown or specified, supply a starter for each item of motorized equipment. Refer to Motor Starter Schedule.

.2 Where 3-phase starters are indicated in motor control centres, supply motor control centres with starters and bolt to a concrete housekeeping pad.

.3 Where package type equipment with integral starters, or equipment with starters integral in loose power and control panels supplied with equipment is fed from a motor control centre, provide a disconnect switch in motor control centre in lieu of a motor starter.

.4 Where 3-phase starters are indicated and/or scheduled to be mounted on a motor starter panel, starters will be mounted and connected, complete with panels and splitter trough, as part of electrical work. Hand starters to electrical trade at site when they are required.

.5 Where package type equipment with integral starters, or equipment with starters integral in loose power and control panels supplied with equipment is fed from a motor starter panel, a disconnect switch will be provided on motor starter panel as part of electrical work.

.6 Unless otherwise specified or shown on drawings, 1-phase motor starters will be mounted adjacent to equipment they serve and connected complete as part of electrical work. Hand starters to electrical trade at site at the proper time.

3.3 ELECTRICAL WIRING WORK FOR MECHANICAL WORK

.1 Unless otherwise specified or indicated, following electrical wiring work for mechanical equipment will be done as part of the electrical work:

.1 "line" side power wiring to motor starters or disconnect switches in motor control centres and starters or disconnects on motor starter panels, and "load" side wiring from starters or disconnects to equipment.

.2 "line" side power wiring to individual wall mounted starters, and "load" side wiring from starters to equipment.

.3 "line" side power wiring to pre-wired power and control panels and variable frequency drives (VFD), and "load" side power wiring from the panels and VFD's to equipment.

.4 provision of receptacles for plug-in equipment.

.5 provision of disconnect switches for motors in excess of 10 m (30 ft) from starter location, or cannot be seen from starter location, and associated power wiring.

.6 motor starter interlocking in excess of 24 V.

.7 wiring from motor winding thermistors in motors 30 hp and larger to motor starter contacts.

.8 120 V power connections to electrical receptacles integral with small ceiling exhaust fans.

.9 [120 V power connections to small exhaust fans, and ceiling fans for all line voltage control devices, including but not limited to wiring through toggle switches, line voltage thermostats, countdown timer switches, or line voltage speed controllers. Coordinate requirements with Electrical Division.]

.10 120 V wiring connections to lighting fixture/switch combinations integral with air handling units.

.11 120 V wiring connections to duplex receptacles integral with air handling unit control panels.

.12 120 V wiring connections to BAS system controllers/panels and other control system or component requiring 120 V power including, but not limited to, VAV boxes, dampers, low voltage transformers, etc.

.2 Mechanical wiring work not listed above or specified herein or on drawings to be done as part of electrical work is to be installed in conduit and is to be done as part of mechanical work in accordance with wiring requirements specified for electrical work.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Variable Frequency Drives (VFD's) for all equipment specified in Mechanical Divisions.

1.2 SUBMITTALS

.1 Shop Drawings/Product Data: Submit shop drawings with product data sheets for variable frequency drives (VFDs). Include:

.1 construction and performance details;

.2 wiring and control schematics;

.3 dimensions of units;

.4 calculations specific to installation showing total harmonic voltage distortion is less than 5%;

.5 certified production test results with serial numbers for harmonic mitigation performance and energy efficiency under actual variable frequency drive loading.

1.3 CLOSEOUT SUBMITTALS

.1 Certification Letter: Submit a start-up and installation certification letter from supplier of VFDs as specified in Part 3 of this Section;

.2 Parameters: Prepare list of parameters for uploading for Owner's future use as specified in Part 3 of this Section. Load on USB type flash drive and submit to the Consultant.

.3 Extended Warranty: Where extended warranty is specified to be included, include a copy of VFD extended warranty in each Operating and Maintenance Manual. Prior to Substantial Performance of Work, submit a copy of warranty to Owner.

.4 Additionally, coordinate with Prime Contractor and Electrical Contractor to ensure that shop drawings clearly identify that proposed VFDs and connected motors are 100% compatible and Mechanical Contractor to sign off on selected VFDs.

1.4 COORDINATION WITH ELECTRICAL DIVISIONS

.1 This Section specifies VFD requirements for motors. Ensure that VFDs packaged with various system equipment, complies with specifications of this Section.

.2 VFDs are each to be approved by respective manufacturers of VFDs and connected motors, as suitable for installation on scheduled motors. VFD output current rating to match or exceed connected motor nameplate full load current rating.

.3 Coordinate and review with Electrical Divisions, responsibility requirements for supply of VFDs, harmonic filters and requirements for control and power conductors and connections.

.4 Check that motors are equipped with AEGIS or approved equal, shaft grounding ring system to protect bearings from damage in motors by diverting harmful shaft voltages and bearing currents to ground.

.5 Additionally, review and confirm responsibilities with Consultant and Prime Contractor.

1.5 WARRANTY

.1 VFDs to be warranted free from defective labour and materials for period of 36 months from date of Substantial Performance of the Work. Include for initial one year Contract warranty and an

additional 2 year extended warranty direct to Owner. Extended warranty terms and conditions are to be identical to one year Contract warranty, and extended warranty period is to commence day Contract warranty expires.

PART 2 - PRODUCTS

2.1 VFD BASIC REQUIREMENTS

.1 VFDs supplied on project to be products of same manufacturer and be CSA approved, ULC listed and labelled. Base specified product is ABB ACH series units that include compliance with following standards:

.1 CSA C22.2 No.14 Industrial Control Equipment;

.2 UL 508 - Industrial Control Equipment;

.3 UL 508C – Power Conversion Equipment;

.4 NEMA ICS 7 - Adjustable-Speed Drives.

.2 Basis for limiting harmonics is to be provided generally to IEEE Standard 519 - Recommended Practices and Requirements for Harmonic Control in Electrical Power Systems, except intended for user's electrical distribution system with point of common coupling (where harmonic limits are assessed) to be set at input terminals of harmonic mitigating equipment.

.3 Refer to Schedule of VFDs on drawings for features to include with respective VFDs.

.4 VFDs to include following basic requirements:

.1 regardless of horsepower (hp) rating are to be of same VFD model; I/O and control circuit boards as well as keypads are to be identical and interchangeable regardless of hp rating;

.2 to be capable of starting into a coasting load (forward or reverse) up to full speed and accelerate or decelerate to set point without safety tripping or component damage (flying start);

.3 6-pulse width modulated (PWM) AC to AC converter utilizing latest isolated gate bipolar transistor (IGBT) technology; PWM switching pattern to include a motor flux optimization circuit that automatically reduces applied motor voltage to the motor to optimize energy consumption and audible motor noise;

.4 carrier frequency control circuit that reduces the carrier frequency based on actual VFD temperature that allows higher carrier frequency without derating VFD or operating at high carrier frequency only at low speeds;

.5 provisions that determine motor torque and flux every 25 µs (40,000 times per second);

.6 completely assembled and tested by manufacturer in their facility;

.7 designed to provide at least 250,000 hours mean time before failure (MTBF) when specified preventative maintenance is performed.

.8 bypass system completely factory wired and tested;

.9 door interlocked padlockable disconnect switch that disconnects all input power from drive and all internally mounted options;

.10 control panel keyboard and display with password protection against parameter changes.

2.2 VFD RATINGS

.1 VFDs to be rated to operate from 3-phase input voltage of 208 V or 600 V ± 10%, as scheduled, and frequency range from 48 Hz to 63 Hz. In addition, a tolerated voltage window to allow system to

operate from a line of +30% to -35% nominal voltage. System to incorporate circuitry that allows drive or bypass contactor to remain “sealed in” over this voltage tolerance at a minimum.

.2 VFDs to employ a full wave rectifier to prevent input line notching and operate at a minimum fundamental input power factor of 0.97 at all speeds and loads.

.3 VFDs efficiency to be 96% or better at full speed and load.

.4 Output voltage and current ratings to match adjustable frequency operating requirements of standard 3-ph, 60 Hz, NEMA design B inverter-duty motors in compliance with NEMA-MG1, Part 31 Standard. Overload current capacity for variable torque overload capacity to be 110% of rated current for 1 minute out of 10 minutes and 130% for 2 seconds. Output frequency to be adjustable between 0 Hz and 500 Hz.

.5 Open loop static speed regulation to be 0.1% to 0.3% (10% of motor slip). Dynamic speed accuracy to be 4%-sec. or better open loop.

.6 When a suitable motor is used, drive provides breakaway torque equal to 200% of rated motor torque. Torque response time to be 5 ms or less.

.7 Enclosures:

.1 in climate controlled areas – minimum NEMA 12 with drip shield;

.2 in non-climate controlled areas – NEMA 3R.

2.3 HARMONIC FILTERS AND REACTORS

.1 VFDs to include internal 5% impedance AC line reactor (or equivalent 5% impedance dual positive and negative DC bus reactors) provided as a standard to reduce input current harmonic content and provide isolation from power line transients and to reduce RFI emissions.

.2 VFDs serving motors sized 11 kW (15 hp) or more to be provided with harmonic filters to limit harmonics distortion produced by each drive to following maximum levels as measured on input side of drive:

.1 Total harmonic distortion (voltage) – 5%;

.2 Total harmonic distortion (current) – 10%.

.3 Harmonic filter to be based on MIRUS International Inc. “LINEATOR AUHF” series, with features as follows:

.1 manufactured and tested in accordance with latest applicable standards of ULC, CSA and NEMA;

.2 treat characteristic low frequency harmonics generated by a 3-phase, diode bridge rectifier load (5th, 7th, 11th, 13th, etc.);

.3 passive inductor/capacitor network;

.4 low capacitive reactance (KVAR) of less than 20% of kVA rating, to ensure compatibility with engine generator sets;

.5 full load efficiency of harmonic mitigation equipment / VFD combination to be greater than 96%;

.6 copper wiring;

.7 220°C system insulation class and temperature rise of 130°C;

.8 anti-vibration pads between reactor or transformer core and enclosure;

.9 manufacturer’s standard ventilated, NEMA-3R enclosure.

2.4 CONTROLS AND ADJUSTMENT FUNCTIONS

.1 Include for following:

.1 programmable critical frequency lockout ranges to prevent VFD from operating load continuously at an unstable speed;

.2 proportional integral derivative (PID) speed loop regulators with an auto tune function as well as manual adjustments; PID set point controllers to allow pressure or flow signals to be connected to VFD, using microprocessor in VFD for closed loop control; includes 250 mA of 24 VDC auxiliary power and capability of loop powering a transmitter supplied by others; two parameter sets for first PID that allow sets to be switched via a digital input, serial communications or from keypad for night setback, summer/winter set points, etc.; independent, second PID loop that can utilize second analogue input and modulate analogue outputs to maintain set point of an independent process (i.e. valves, dampers, etc.); set points, process variables, etc. to be accessible from serial communication network;

.3 programmable analogue inputs that accept current or voltage signals.

.4 programmable analogue outputs (0-20 mA or 4-20 mA), that may be programmed to output proportional to Frequency, Motor Speed, Output Voltage, Output Current, Motor Torque, Motor Power (kW), DC Bus voltage, Active Reference, and other data;

.5 programmable digital inputs;

.6 programmable digital Form-C relay contact outputs for programmable on and off delay times and adjustable hysteresis; rated for maximum switching current 8 A at 24 VDC and 0.4 A at 250 VAC; maximum voltage 300 VDC and 250 VAC; continuous current rating 2 A RMS;

.7 run permissive circuit - for damper or valve control; dry contact closure that will signal damper to open (VFD motor does not operate); when damper is fully open, a normally open dry contact (end-switch) closes; closed end-switch is wired to a VFD digital input and allows motor operation; two separate safety interlock inputs, when either is opened, motor to coast to stop, and damper to close;

.8 two independently adjustable accel and decel ramps with 1-1800 seconds adjustable time ramps;

.9 fireman’s override input - upon receipt of a contact closure from fireman’s control station, VFD operates in one of two modes: operate at a programmed predetermined fixed speed or operate in a specific fireman’s override PID algorithm that automatically adjusts motor speed based on override set point and feedback; mode overrides all other inputs (analogue/digital, serial communication and keypad commands), except customer defined safety run interlock, and forces motor to run in one of the two modes; "Override Mode" to be displayed on control panel; upon removal of override signal, VFD resumes normal operation.

.2 Operator Control Panel:

.1 front mounted plug-in operator control panel consisting of keypad, multi-line backlit LCD display for programming and fault diagnostics;

.2 keys (switches) for HAND, OFF, AUTO, and manual speed control INCREASE/DECREASE;

.3 menu navigation and parameter selection keys for custom programming;

.4 date and time clock - clock to have a battery backup with 10 years minimum life span; clock to be used to date and time stamp faults and record operating parameters at time of fault; if battery fails VFD l automatically reverts to hours of operation since initial power up; clock also to be programmable to control start/stop functions, constant speeds, PID parameter sets and output relays; VFD to have a digital input that allows an override to time clock (when in off mode) for a programmable time frame; four (4) separate, independent timer functions that have both weekday and weekend settings;

.5 parameter names, fault messages, warnings and other information to be displayed in complete words or standard abbreviations to allow user to understand what is being displayed without use of a manual or cross reference table, as follows:

.1 “HAND” position to start drive and modify reference frequency by use of INCREASE/DECREASE keys;

.2 “OFF” position stops drive;

.3 "AUTO" position allows drive to be started or stopped using whichever remote start/stop command configured; drive speed controlled by external speed reference input or by PID controller.

.4 applicable operating values to be capable of being displayed in engineering (user) units; operating displayed include:

.1 Output Frequency;

.2 Motor Speed (RPM, %, or Engineering units);

.3 Motor Current;

.4 Drive Temperature;

.5 DC Bus Voltage;

.6 Output Voltage.

2.5 PROTECTIVE FUNCTIONS

.1 For each programmed warning and fault protection function, keypad displays a message in complete words or standard abbreviations.

.2 VFDs include metal oxide varistors (MOV’s) for phase to phase and phase to ground line voltage transient protection.

.3 Short circuit current rating of 100,000 amps to be provided per UL 508C without relying on line fuses.

.4 Ground fault protection, motor phase loss protection and phase unbalance protection to be provided. Single phase protection to be provided on input and output.

.5 VFDs to provide electronic motor overload protection qualified per UL 508C.

.6 Protection to be provided for AC line or DC bus overvoltage at 130% of maximum rated or undervoltage at 65% of minimum rated.

.7 Stall protection to be programmable to provide a warning or stop VFD after motor has operated above a programmable torque level for a programmed time limit.

.8 Underload protection to be programmable to provide a warning or stop VFD after motor has operated below a selected underload curve for a programmed time limit.

.9 Overtemperature protection to provide a warning if power module temperature is less than 5°C (9°F) below overtemperature trip level.

.10 Input terminal to be provided for connecting a motor thermistor (PTC type) to drive’s protective monitoring circuitry. An input to also be programmable to monitor an external relay or switch contact.

.11 VFDs through 56 kW (75 hp) to be protected from damage from input and output power miss-wiring. VFD to sense this condition and display an alarm on control panel.

.12 EMI / RFI filters to be provided as per standard EN 61800-3.

.13 dv/dt long lead filter (LRC) to protect power system network.

.14 Automatic reset feature to automatically reset selected faults and attempt to restart drive based on control parameters such as adjustable time delays, number of restart attempts and duration of restart attempts. Faults include following:

.1 Overcurrent;

.2 Overvoltage;

.3 Undervoltage;

.4 Analogue input signal reference loss;

.5 External fault.

.15 Additional built-in protection circuits include:

.1 Overcurrent trip limit;

.2 Undervoltage trip limit;

.3 Microprocessor fault;

.4 Keypad control panel loss;

.5 Serial communication loss;

.6 External fault interlock inputs;

.7 Adjustable output frequency and motor speed limits;

.8 Pass code parameter change protection;

.9 Keypad operator control lockout.

2.6 ELECTRONIC BYPASS

.1 Electronic bypass system to be a fully operational horsepower rated manual and automatic system for full speed operation without VFD, with following components and features:

.1 factory wired and tested microprocessor controlled bypass system consisting of an output contactor and bypass contactor, service (isolation) switch and VFD input fuses; (bypass designs, which have no VFD only fuses, or that incorporate fuses common to both VFD and bypass will not be accepted);

.2 bypass enclosure door and VFD enclosure to be interlocked such that input power is turned off before either enclosure can be opened;

.3 door interlocked padlockable disconnect switch that disconnects all input power from drive and all internally mounted devices;

.4 following operators:

.1 bypass Hand-Off-Auto;

.2 drive mode selector and light;

.3 bypass mode selector and light;

.4 bypass fault reset;

.5 bypass LCD display, 2 lines for programming and status / fault / warning indications.

.5 motor protection from single phase power conditions; bypass system to detect a single phase input power condition while running in bypass, disengage motor in a controlled fashion, and give a single phase input power indication;

.6 bypass system does not depend on VFD for bypass operation; bypass to be completely functional in both Hand and Automatic modes even if VFD is removed from enclosure for repair / replacement;

.7 run permissive circuit - for damper or valve control; dry contact closure that will signal damper to open (VFD motor does not operate); when damper is fully open, a normally open dry contact (end-switch) closes; closed end-switch is wired to a VFD digital input and allows motor operation; two separate safety interlock inputs, when either is opened, motor to coast to stop, and damper to close;

.8 bypass control to monitor status of VFD and bypass contactors and indicate when there is a welded contactor contact or open contactor coil; this failed contactor operation to be indicated on Bypass LCD display as well as over serial communications protocol;

.9 bypass control to include a programmable time delay for bypass start and control panel indication that this time delay is in process; this allows VAV boxes to be driven open before motor operates at full speed in bypass mode; time delay to be field programmable from 0-120 seconds;

.10 bypass control to be programmable for manual or automatic transfer to bypass; user to be able to select via control panel programming which drive faults will generate an automatic transfer to bypass and which faults require a manual transfer to bypass;

.11 adjustable motor current sensing circuit for bypass and VFD mode to provide proof of flow indication; condition is indicated on control panel display, transmitted over building automation protocol and on a relay output contact closure;

.12 programmable digital inputs, and programmable Form-C relay outputs;

.13 relay outputs from bypass to be programmable for any of following indications:

.1 system started;

.2 system running;

.3 bypass override enabled;

.4 drive fault;

.5 bypass fault;

.6 bypass H-O-A position;

.7 motor proof of flow (broken belt);

.8 overload;

.9 bypass selected;

.10 bypass run;

.11 system started (damper opening);

.12 bypass alarm;

.13 over temperature.

.14 digital inputs for system accept 24 VAC or 24 VDC; bypass incorporates internally sourced power supply and does not require an external control power source; bypass power board to supply 250 mA of 24 VDC for use by others to power external devices;

.15 interlock terminal strip: provide a separate terminal strip for connection of freeze, fire, smoke contacts, and external start command; external safety interlocks to remain fully functional whether system is in VFD or bypass mode; remote start/stop contact to operate in VFD and bypass modes; terminal strip allows for independent connection of up to four (4) unique safety inputs;

.16 User is able to select text to be displayed on keypad when safety opens; example text display indications include "Firestat", "Freezestat", "Over pressure" and "Low pressure"; user is able to determine which of four (4) safety contacts is open over serial communications connection;

.17 Class 10, 20, or 30 (selectable) electronic motor overload protection is included as required for specific applications.

2.7 MANUAL BYPASS

.1 Bypass system to be a fully operational horsepower rated manual system for full speed operation without VFD, with following components:

.1 VFD and By-pass output contactors, mechanically and electrically interlocked to allow only one mode of operation at one time;

.2 service switch or contactor to isolate VFD from supply;

.3 VFD input fuses;

.4 door mounted VFD/OFF/BY-PASS selector switch;

.5 VFD ON and BY-PASS ON indicator lights;

.6 door mounted HAND/OFF/AUTO switch if Hand operation is unavailable at VFD control panel;

.7 terminals for external customer safety interlocks.

.2 Bypass designs, which have no VFD only fuses, or that incorporate fuses common to both VFD and bypass are not acceptable.

.3 Door interlocked padlockable fused disconnect switch that supplies power to VFD and bypass, and disconnects input power from drive, bypass and all internally mounted devices.

2.8 COMMUNICATIONS

.1 VFD to be complete with communications connections of integrated RS-485 port suitable to allow for VFD to be controlled, supervised, monitored and programmed from one remote control panel or PC with VFD system Windows based application software.

.2 Communications protocol to be industry standard compatible to BAS of building. Coordinate exact requirements with Mechanical Divisions controls contractor and BAS vendor to ensure that appropriate interface module is supplied for drive system to communicate with BAS being used in building with interface capability to include serial communication standard protocols as follows:

.1 ModBus;

.2 Johnson Controls Metasys N2;

.3 Siemens Building Technologies FLN;

.4 BACnet.

.3 Serial communication to be used for drive setup, diagnostic analysis, monitoring and control with capabilities to include, but not be limited to:

.1 run-stop control;

.2 speed set adjustment;

.3 proportional/integral/derivative PID control adjustments;

.4 current limit;

.5 accel/decel time adjustments;

.6 ability to lock and unlock control panel keypad;

.7 capability of allowing BAS to monitor feedback such as process variable feedback, output speed / frequency, current (in amps), % torque, power (kW), kilowatt hours (resettable), operating hours (resettable), and drive temperature;

.8 monitoring relays output status, and digital input status and analogue output values;

.9 transmitting diagnostic warning and fault information over communications bus to BAS or other monitoring system;

.10 remote fault reset.

.4 Serial communication and Windows based software to be used for drive setup, diagnostic analysis, monitoring and control. Software to provide real time graphical displays of drive performance. VFD software communication capabilities include, but not be limited to:

.1 system ON/OFF;

.2 system status;

.3 Suitable input for speed control;

.4 run-stop control;

.5 ability to force unit to bypass;

.6 ability to lock and unlock control panel keypad;

.7 allowing BAS to monitor feedback such as, current (in amps), kilowatt hours (resettable), operating hours (resettable), and logic board temperature;

.8 monitoring relays output status, and all digital input status;

.9 transmitting diagnostic warning and fault information over communications bus to BAS or other monitoring system;

.10 remote fault reset;

.11 keypad "Hand" or "Auto" selected, and status indications and settings transmitted over serial communications bus;

.12 monitor if motor is running under load in both VFD and bypass (proof of flow) in VFD mode over serial communications or Form-C relay output;

.13 minimum of 40 field parameters to be capable of being monitored in bypass mode.

2.9 SITE SERVICES, TRAINING, AND MAINTENANCE MANUALS

.1 Provide onsite inspection, testing, start up and verification work of VFDs and filters by manufacturer’s authorized technician. Allow a minimum of 1/2 day per system. Also include for a second visit to site of one (1) day duration to train operating personnel in operation and

maintenance of drives. Provide verification reports and supply soft copy of system programming parameters.

.2 Upon completion of installation, supplier of VFDs to supply minimum one hard copy of complete sets of service and maintenance manuals including wiring and connection diagrams. Include for digital copy loaded onto a USB type flash drive.

.3 Provide system training and instructions on operating and maintenance procedures. Refer to additional requirements in General Instructions section and Division 01.

.4 Include for manufacturer's authorized technician to be in attendance to assist Commissioning Agent during commissioning process.

2.10 MANUFACTURERS

.1 Manufacturer List:

.1 ABB;

.2 Schneider Electric (Square D);

.3 Rockwell Automation;

.4 Eaton Cutler Hammer;

.5 Siemens Electric;

.6 Control Techniques.

PART 3 - EXECUTION

3.1 INSTALLATION OF VARIABLE FREQUENCY DRIVES

.1 Provide variable frequency drives for motorized equipment in accordance with drawing requirements. Coordinate requirements for conductors and connections with Electrical Divisions Contractor.

.2 Ensure that variable speed drives supplied are products of same manufacturer.

.3 Unless otherwise noted on drawings or in Part 2 of this Section, include minimally, a manual bypass with each VFD. Supply electronic bypass with VFDs noted and/or scheduled on the drawings.

.4 Ensure wire length between VFD and motor is less than 15 m (50') with properly sized conductors.

.5 Install VFDs in accordance with manufacturer's instructions. Ensure that VFDs installation include upstream protection, either fuses or circuit breakers in accordance with VFD manufacturer's recommendations and local electrical code requirements. Advise Electrical Divisions Contractor of these requirements in addition to required conductors and connections. Provide required control wiring and connections.

.6 Review VFD and related connected motor installation. Provide local disconnect to VFD in accordance with local governing code requirements.

.7 Mount VFDs operating controls/display at approximately 1.5 m (5') above finished floor level, unless otherwise directed by the Consultant. Provide dual back to back C-channel support system from floor to ceiling, complete with cross bracing to form a solid backing for VFD mounting at required locations.

.8 Properly support VFDs. Coordinate exact locations on site with the Consultant.

.9 Where VFDs are required for custom made air handling units VFDs to be supplied, factory mounted on fan cabinets, and "load" side connected to fan motors by air handling unit manufacturer. "Line" side power wiring to these VFDs to be provided as part of Electrical Divisions work.

.10 Where VFDs are required for commercial fans, mount each VFD generally where shown but with exact location to ensure that VFD is accessible in accordance with local governing electrical code requirements. "Line" and "load" side power wiring to these VFD's to be provided as part of Electrical Divisions work.

.11 Where VFDs are required for pumps, mount each VFD generally where shown but with exact location to ensure that VFD is accessible in accordance with local governing electrical code requirements. "Line" and "load" side power wiring to these VFDs to be provided as part of Electrical Divisions work.

.12 Install harmonic mitigation filter equipment as follows:

.1 in accordance with manufacturer's recommended installation practices and to comply with applicable local governing codes;

.2 provide each VFD as specified in per Part 2, with a harmonic filter sized as per manufacturer's rating table to match rating of connected VFD;

.3 mount harmonic filters sized up to 110 kW (150 hp) typically to wall/ceiling construction using suitable brackets, metal C-channel framework and vibration isolators assemblies, ensuring full support of units acceptable to local governing authorities;

.4 mount harmonic filters sized greater than 110 kW (150 hp) typically to floor mounted concrete pads with suitable vibration isolators and seismic restraints in accordance with local governing building codes;

.5 ensure that adequate ventilation and space for access is provided;

.6 review exact locations with the Consultant prior to installation;

.7 coordinate with Electrical Division Contractor to ensure units are connected complete to line side supply feed and to VFD in accordance with VFD manufacturer's instructions for standalone VFDs and VFD system with bypass; include required control wiring and connections.

.13 Ground and bond equipment as per local governing electrical code requirements and manufacturer's instructions.

.14 Provide engraved lamacoid nameplate identifying each piece of equipment. Review exact nomenclature with the Consultant.

.15 Be responsible for ensuring that VFDs, harmonic filters and connected motors are properly installed, connected, tested in proper working order and operation verified.

3.2 INSTALLATION OF VARIABLE FREQUENCY DRIVES

.1 Provide VFDs for motorized mechanical equipment in accordance with drawing requirements and coordinated with mechanical equipment vendors and Mechanical Divisions Contractor.

.2 Ensure that VFDs supplied for project are products of same manufacturer.

.3 Unless otherwise noted on drawings or in Part 2 of this Section, include minimally, a manual bypass with each VFD. Supply electronic bypass with VFDs specifically noted and/or scheduled on drawings.

.4 Supply and install wiring and connections to VFDs and harmonic filters are to recommendations of VFD Manufacturer. Ensure wire length between VFD and motor is less than 15 m (50') with properly sized conductors. Obtain required wiring diagrams from equipment vendors. Provide required control wiring and connections.

.5 Install VFDs in accordance with manufacturer's instructions.

.6 Review VFD and related connected motor installation. Provide local disconnect (fusible switch or breaker) to VFD in accordance with local governing electrical code requirements and VFD manufacturer instructions. Confirm requirements with VFD vendor.

.7 Mount VFDs operating controls/display at approximately 1.5 m (5') above finished floor level, unless otherwise directed by the Consultant. Provide dual back to back C-channel support system from floor to ceiling, complete with cross bracing to form a solid backing for VFD mounting at required locations.

.8 Properly support VFDs. Coordinate exact locations on site with Mechanical Divisions Contractor and review with the Consultant.

.9 Coordinate installation and control of VFDs with Mechanical Division Contractor and Controls Contractor. Confirm communications protocol required for compatibility with BAS and ensure VFD system includes for proper protocol.

.10 Install harmonic mitigation filter equipment as follows:

.1 to be handled, stored and installed in accordance with manufacturer's recommended installation practices and to comply with applicable local governing codes;

.2 provide each VFD as specified in per Part 2, with a harmonic filter sized as per manufacturer's rating table to match rating of connected VFD;

.3 mount harmonic filters sized up to 110 kW (150 hp) typically to wall/ceiling construction using suitable brackets, metal C-channel framework and vibration isolators assemblies, ensuring full support of units acceptable to local governing authorities;

.4 mount harmonic filters sized greater than 110 kW (150 hp) typically to floor mounted concrete pads with suitable vibration isolators and seismic restraints in accordance with local governing building codes;

.5 ensure that adequate ventilation and space for access is provided;

.6 review exact locations with the Consultant prior to installation;

.7 provide required conductors and connections in accordance with filter manufacturer's instructions; obtain required wiring diagrams from equipment vendors;

.8 connect complete to line side supply feed and to VFD in accordance with VFD manufacturer's instructions for standalone VFDs and VFD system with bypass.

.11 Ground and bond equipment as per local governing code requirements and manufacturer's instructions. Refer also to requirements of grounding and bonding article.

.12 Provide engraved lamacoid nameplate identifying each piece of equipment. Review nomenclature with the Consultant.

.13 Be responsible for ensuring that VFDs, harmonic filters and connected motors are properly installed, connected, tested in proper working order and operation verified.

3.3 TESTING, START-UP, AND VERIFICATION

.1 When installation of VFDs are complete, arrange for VFD manufacturer/supplier to:

.1 supply factory authorized technician at site for minimum of 4 hours per system to examine installation and connection of each VFD, and to perform start-up and set-up procedures in conjunction with equipment start-up and testing procedures;

.2 supply factory authorized technician at site for minimum of one 8 hour day to train Owner's personnel on VFD operating and maintenance procedures;

.3 prepare and submit letter to certify that VFDs have been properly installed, tested and adjusted, and are in proper operating condition;

.4 submit list of start-up and testing parameters for uploading for future use by Owner.

.2 Start-up data entries to include motor nameplate power, speed, voltage, frequency and current.

.3 Inspect VFDs and accessories for verification of proper operation and installation.

.4 Inspect interface wiring to BAS for verification of proper operation and installation.

.5 Verification of wire terminations to VFDs and bypass and to operational circuitry.

.6 Installation verification of VFD, bypass and motor being driven for proper operation and reliability.

.7 Verification that connections and communications to BAS or other monitoring/remote control system are of proper operation and installation and of full communications compatibility.

.8 Measurement for verification of proper operation on each of following items:

.1 Motor voltage and frequency;

.2 Verification of proper motor operation;

.3 Control input for proper building automation system interface and control calibration.

.9 Calibration check for following set points (and adjustment as necessary):

.1 minimum speed;

.2 maximum speed;

.3 acceleration and deceleration rates.

.10 Verify harmonic compliance with onsite field measurements of both voltage and current harmonic distortion at point of common coupling-input terminals of harmonic mitigating equipment with and without equipment operating. Utilize recording type Fluke 41 or equivalent harmonics analyser displaying individual and total harmonic currents and voltages.

.11 Document testing and results in a report signed by a Professional Engineer licensed in the Place of Work and authorized by system manufacturer. Include for minimum 3 hard copies and electronic copy of report to be submitted to the Consultant for review.

.12 Additionally, refer to applicable installation, testing, coordination, and verification requirements in Electrical Divisions Sections.

.13 Coordinate procedures specified above to be performed by VFD manufacturer/supplier authorized technician with system commissioning work.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 This Section specifies firestopping and smoke seal requirements that are common to mechanical work Sections of the Specification and it is a supplement to each Section and is to be read accordingly.

1.2 SUBMITTALS

.1 At least 4 weeks prior to work commencing, submit a sample of each type of firestop and smoke seal system in applied form, for approval. Identify each system with manufacturer's name and type, ULC designation, and proposed use. After samples are reviewed, work is to conform to reviewed samples.

.2 Submit a product data sheet and a WHIMIS sheet for each firestopping and smoke seal product.

.3 Submit for review, full company name and experience of proposed firestopping and smoke seal system applicator.

.4 Sleeve and Formed Opening Location Drawings

.1 Prepare and submit for review, drawings indicating size and location of required sleeves, recesses and formed openings in poured or precast concrete work.

.2 Such drawings are to be completely and accurately dimensioned and relate sleeve, recesses, and formed openings to suitable grid lines and elevation datum, and are to take into account structural items such as grade beams, column caps, and column drop slabs.

.3 Begin to prepare such drawings immediately upon notification of acceptance of bid and award of Contract.

1.3 CLOSEOUT SUBMITTALS

.1 Submit a letter of proper firestopping and smoke seal certification as specified in Part 3 of this Section.

1.4 QUALITY ASSURANCE

.1 Applicator is to have a minimum of 3 years of successful experience on projects of similar size and complexity, and applicator's qualifications are to be reviewed by the Consultant.

.2 Comply with firestopping and smoke seal product manufacturer's recommendations regarding suitable environment conditions for product installation.

PART 2 - PRODUCTS

2.1 PIPE SLEEVES

.1 Galvanized Sheet Steel – Minimum 16 gauge galvanized steel with an integral flange at one end to secure sleeve to formwork construction.

.2 Polyethylene – Factory fabricated, flanged, high density polyethylene sleeves with reinforced nail bosses.

.3 Waterproof Galvanized Steel Pipe – Schedule 40 mild galvanized steel pipe with a welded-on square steel anchor and water stop plate at sleeve midpoint.

.4 Galvanized Steel or Cast Iron Pipe – Schedule 40 mild galvanized steel, or Class 4000 cast iron.

2.2 FIRESTOPPING AND SMOKE SEAL MATERIALS

.1 Ensure all sealant and fire stopping is low VOC type in accordance with LEED.

.2 Asbestos-free elastomeric materials tested, listed and labelled by ULC in accordance with CAN/ULC-S115 and CAN/ULC-S101 for installation in ULC designated firestopping and smoke seal systems to provide a positive fire, water and smoke seal, and a fire-resistance rating (flame, hose stream and temperature) not less than fire resistance rating of surrounding fire rated construction.

.3 Materials are to be compatible with abutting dissimilar materials and finishes and complete with primers, damming and back-up materials, supports, and anchoring devices in accordance with firestopping manufacturer's recommendations and ULC tested assembly.

.4 Pipe insulation forming part of a fire and smoke seal assembly is specified in Section entitled Mechanical Insulation.

.5 Manufacturers:

.1 A/D Fire Protection Systems "FIREBARRIER";

.2 Tremco Inc. Fire Protection Systems Group "TREMSTOP";

.3 3M Canada;

.4 Hilti (Canada) Ltd. Firestop Systems;

.5 Specified Technologies Inc.

2.3 WATERPROOFING SEAL MATERIALS

.1 Modular, mechanical seal assemblies consisting of interlocking synthetic rubber links shaped to continuously fill annular space between pipe and pipe sleeve or wall opening, assembled with stainless steel bolts and pressure plates and designed so when bolts are tightened the links expand to seal the opening watertight. Select seal assemblies to suit pipe size and sleeve size or wall opening size.

.2 Manufacturers:

.1 Thunderline Corp. (Power Plant Supply Co.) "LINK SEAL" Model S-316;

.2 The Metraflex Co. "MetraSeal" type ES.

2.4 PIPE ESCUTCHEON PLATES

.1 One-piece chrome plated brass or #4 finish type 302 stainless steel plates with matching screws for attachment to building surface, each plate sized to completely cover pipe sleeve or building surface opening, and to fit tightly around pipe or pipe insulation.

PART 3 - EXECUTION

3.1 INSTALLATION OF PIPE SLEEVES

.1 Where pipes pass through concrete and/or masonry surfaces provide pipe sleeves as follows:

.1 in poured concrete slabs – unless otherwise specified, minimum 16 gauge flanged galvanized steel or, where permitted by governing authorities, factory fabricated plastic sleeves;

.2 in concrete or masonry walls – Schedule 40 galvanized steel pipe or Class 4000 cast iron pipe.

.2 Sleeves in waterproofed slabs or walls are to be lengths of Schedule 40 mild galvanized steel pipe with a waterstop plate in accordance with drawing detail. Provide waterproof sleeves in following locations:

.1 in mechanical room floor slabs, except where on grade;

.2 in slabs over mechanical, fan, electrical and telephone equipment rooms or closets;

.3 in floors equipped with waterproof membranes;

.4 in roof slab;

.5 in waterproof walls.

.3 Size sleeves, unless otherwise specified, to leave 12 mm (½") clearance around pipes, or where pipe is insulated, a 12 mm (½") clearance around pipe insulation.

.4 Pack and seal void between pipe sleeves and pipe or pipe insulation in non-fire rated construction for the length of sleeves as follows:

.1 pack sleeves in interior construction with mineral wool and seal both ends of sleeves with non-hardening silicone base caulking compound;

.2 pack sleeves in exterior walls above grade with mineral wool and seal both ends of sleeves water-tight with approved non-hardening silicone base caulking compound unless mechanical type seals have been specified;

.3 seal sleeves in exterior walls below grade (and any other wall where water leakage may be a problem) with link type mechanical seals as specified.

.5 Where sleeves are required in masonry work, accurately locate and mark sleeve location, and hand sleeves to mason for installation.

.6 Terminate piping for sleeves that will be exposed so sleeve is flush at both ends with building surface so sleeve may be completely covered by an escutcheon plate, except for sleeves in waterproof floors which are to terminate 100 mm (4") above finished floor.

.7 "Gang" type sleeving will not be permitted.

.8 Where sleeves are provided in non-fire rated construction for future piping, or where piping has been removed from existing sleeves, cap and seal both ends of sleeved opening.

3.2 INSTALLATION OF WATERPROOF MECHANICAL SEALS

.1 Provide watertight link type mechanical seals in exterior wall openings.

.2 Assemble and install each mechanical seal in accordance with manufacturer's instructions.

.3 After installation, periodically check each mechanical seal installation for leakage and, if necessary, tighten link seal bolts until seal is completely watertight.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for:

.1 pressure gauges and thermometers;

PART 2 - PRODUCTS

2.1 PRESSURE GAUGES AND THERMOMETERS

.1 Pressure gauges as follows:

.1 adjustable, glycerine filled, 100 mm or 115 mm (4" or 4-½") diameter and each accurate to within 1% of scale range;

.2 type 304 stainless steel case with relief valve and polished stainless steel bayonet;

.3 stainless steel rotary movement with stainless steel bushings and socket;

.4 clear acrylic window;

.5 dual scale white dial with a scale range such that working pressure of system is at approximate mid-point of scale;

.6 black pointer.

.2 Pressure gauge accessories and additional requirements as follows:

.1 a bronze ball type shut-off valve is to be provided in the piping to each pressure gauge;

.2 each pressure gauge for piping and equipment with normal everyday flow is to be equipped with a brass pressure snubber;

.3 each pressure gauge for steam piping or steam equipment is to be equipped with a steel coil syphon;

.4 pressure gauges in fire protection piping must be ULC listed and labelled;

.3 Manufacturers:

.1 H.O. Trerice Co.;

.2 Weiss Instruments;

.3 Ashcroft.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide pressure gauges in following locations where applicable:

.1 in valved tubing across suction, suction strainer (if applicable), and discharge piping of each circulating pump;

.2 in supply and return piping connections to main mechanical plant equipment such as boilers, chillers, heat exchangers, main coils, etc.;

.3 in expansion tank(s);

.4 in separate domestic hot water storage tank(s);

.5 at top most outlet in each standpipe fire protection system riser;

.6 in piping at each side of a pressure reducing valve;

.7 in potable water service piping downstream of meter;

.8 wherever else shown and/or specified.

.2 Provide thermometers in following locations where applicable:

.1 in supply and return piping connections to main mechanical plant equipment such as boilers, chillers, cooling towers, heat exchangers, main coils, etc., unless temperature indication is supplied with equipment;

.2 wherever else shown and/or specified.

.3 Conform to following installation requirements where applicable:

.1 for installation of thermometers in piping wells, provide a coat of metallic base heat transfer paste or grease in piping well;

.2 for pressure gauges in piping at equipment locations, install pressure gauge between equipment and first pipe fitting;

.3 locate, mount and adjust instruments so they are easily readable;

.4 where pressure gauges and/or thermometers are located at high level or in an area where they cannot be easily seen, provide remote reading instruments.

END OF SECTION

PART 1 - GENERAL

PART 2 - PRODUCTS

2.1 PIPING HANGERS AND SUPPORTS

.1 Pipe hanger and support materials, including accessories, are to be, unless otherwise specified, in accordance with Manufacturers Standardization Society (MSS) Standard Practice Manual SP-58, Pipe hangers and Supports-Materials, Design and Manufacture, and where possible, MSS designations are indicated with each product specified below. Conform to following requirements:

- .1 unless otherwise specified, ferrous hanger and support products are to be electro-galvanized;
- .2 hangers and supports for insulated piping are to be sized to fit around insulation and insulation jacket.

.2 Hangers and supports for horizontal suspended piping as follows:

- .1 adjustable steel clevis hanger – MSS Type 1;
- .2 adjustable swivel ring band hanger – MSS Type 10;
- .3 adjustable roller hanger – MSS Types 41, 43, and/or 45, with MSS Type 39 steel protection saddle.

.3 Supports for horizontal pipe on vertical surfaces as follows:

- .1 steel offset pipe clamp – Anvil Fig. 103 or Myatt Fig. 170;
- .2 heavy-duty steel pipe clip – MSS Type 26;
- .3 single steel pipe hook – Myatt Fig. 156;
- .4 epoxy coated steel pipe stays are not permitted.

.4 Floor supports for vertical risers as follows:

- .1 copper tubing riser clamp – MSS Type 8;
- .2 heavy-duty steel riser clamp – MSS Type 8.

.5 Supports for vertical piping on vertical surfaces as follows:

- .1 steel offset pipe clamp – Anvil Fig. 103 or Myatt Fig. 170;
- .2 heavy-duty steel pipe bracket or soil pipe bracket – MSS Type 26;
- .3 extension split pipe clamp – MSS Type 12;
- .4 epoxy coated steel pipe stays are not permitted.

.6 Base support for vertical risers in excess of 6 m (20') high extending out from base mounted equipment is to consist of a base elbow support with flange.

.7 For horizontal pipe on racks, Unistrut or equal galvanized steel pipe racks with pipe securing hardware as follows:

- .1 standard galvanized steel U-bolts/clamps supplied by rack manufacturer;
- .2 adjustable roller chair – MSS Type 44 with MSS Type 39 steel protection saddle.

.8 Special hangers and supports for various applications as follows:

- .1 vibration isolated riser supports – black steel riser clamps as specified above, complete with neoprene–steel–neoprene sandwich type vibration isolation pads between clamp and floor;

.2 for groups of pipes having same slope – MSS Type 32 welded steel brackets, Anvil Fig. 46 universal trapeze assemblies, or Unistrut or equal support assemblies, all with U-bolts, clamps, etc., to secure pipes in place;

.3 for sections of piping connected to vibration isolated equipment – hangers and supports as specified above but complete with MSS Type 48 spring cushions;

.4 for piping on existing roof – Portable Pipe Hangers (Canada) Inc. "PP" Series prefabricated portable pipe support system components to suit pipe, complete with required accessories including bases, galvanized structural steel frames, and galvanized steel pipe hangers and supports conforming to MSS SP-58;

[OR]

.5 for piping on new roofs – Lexcor "Flash-Tite" or Thaler Roofing Specialties Products Inc. "MERS" Series insulated aluminum support risers with diameter, height, securement method and flashing to suit the application, channel type aluminum cross members, and galvanized steel pipe hangers and supports conforming to MSS SP-58, complete with all required accessories;

.6 for glass drain and vent piping – special padded hangers supplied by pipe supplier;

.7 for plastic piping – generally as specified above but in accordance with pipe manufacturer's recommendations;

.8 for fire protection piping – generally as above but ULC listed and/or FM approved, and in accordance with Chapter requirements of NFPA Standard applicable to piping system;

.9 for bare horizontal copper piping – generally as above but factory vinyl coated to prevent direct copper/steel contact;

.10 for bare copper vertical piping – corrosion resistant ferrous clamps with flexible rubber gasket type material (not tape) to isolate pipe from clamp;

.11 insulation protection shields to and including 40 mm (1-½") dia. – MSS Type 40 galvanized steel shields with ribs to keep shield centred on hanger.

.9 Hanger rods are to be electro-galvanized carbon steel (unless otherwise specified), round, threaded, to ASTM A36, complete with captive machine nuts with washers at hangers, sized to suit loading in accordance with Table 3 in MSS SP-58, but in any case, minimum 9.5 mm (3/8") diameter.

.10 Manufacturers:

.1 E. Myatt & Co. Inc.;

.2 Anvil International Inc.;

.3 Empire Industries Inc.;

.4 Hunt Manufacturing Ltd.;

.5 Unistrut Canada Ltd.;

.6 Nibco Inc. "Tolco";

.7 Taylor Pipe Supports.

PART 3 - EXECUTION

3.1 INSTALLATION OF FASTENING AND SECURING HARDWARE

.1 Provide fastening and securing hardware required for mechanical work to maintain installations attached to structure or to finished floors, walls, and ceilings in a secure and rigid manner capable

of withstanding dead loads, live loads, superimposed dead loads, and any vibration of installed products.

.2 Use fasteners compatible with structural requirements, finishes and types of products to be connected. Do not use materials subject to electrolytic action or corrosion where conditions are liable to cause such action.

.3 Where floor, wall or ceiling construction is not suitable to support loads, provide additional framing or special fasteners to ensure proper securement to structure that is to support the products. Provide reinforcing or connecting supports where required to distribute loading to structural components.

.4 Obtain written consent before using explosive actuated fastening devices. If consent is obtained, comply with requirements of CAN/CSA Z166.1 and CAN/CSA Z166.2.

.5 Do not attach fasteners to steel deck without written consent from the Consultant.

3.2 INSTALLATION OF PIPE HANGERS AND SUPPORTS

.1 Provide required pipe hangers and supports.

.2 Provide any additional structural steel channels, angles, inserts, beam champs and similar accessories required for hanging or supporting pipe. Unless otherwise shown or specified, hang or support pipes from structure only.

.3 For insulated pipe, size hanger or support to suit diameter of insulated pipe and install hanger or support on outside of insulation and insulation finish.

.4 Support requirements for underground piping are as follows:

.1 support underground pipe, unless otherwise specified, on a well compacted bed of dry, natural, undisturbed earth free from rocks or protrusions of any kind, or on compacted material as specified;

.2 support underground service piping penetrating building exterior walls or foundations to prevent pipe damage if minor building settlement occurs;

.3 ensure bedding and supports for underground pipes are flat and true and allowances are made for pipe hubs, couplings, or other protrusions so no voids are left between pipe and bedding.

.5 Unless otherwise shown or specified, hang and/or support horizontal pipe above ground by means of hangers and/or supports specified in Part 2 of this Section. Unless otherwise shown or specified, hangers for suspended pipe less than or equal to 25 mm (1") dia. are to be clevis type or adjustable ring type, and hangers for suspended pipe greater than or equal to 40 mm (1-½") dia. are to be adjustable clevis type.

.6 Space hangers and supports in accordance with following:

.1 cast iron pipe – hang or support at every joint with maximum 2.4 m (8') spacing;

.2 plastic pipe – conform to pipe manufacturer’s recommended support spacing;

.3 glass pipe – conform to pipe manufacturer’s recommended support spacing and support requirements;

.4 copper and steel pipe – hang or support at spacing in accordance with following schedule:

Pipe dia.	Max. Spacing Steel	Max. Spacing Copper
to 25 mm (1")	2.4 m (8')	1.8 m (6')
40 mm (1-½")	2.7 m (9')	2.4 m (8')
50 mm (2")	3.0 m (10')	2.7 m (9')
65 mm (2-½")	3.6 m (12')	3.0 m (10')
75 mm (3")	3.6 m (12')	3.0 m (10')
90 mm (3-½")	3.6 m (12')	3.6 m (12')
100 mm (4")	4.2 m (14')	3.6 m (12')
250 mm (10")	6.0 m (20')	
300 mm (12")	6.7 m (22')	

.5 flexible grooved pipe/coupling joint piping – as above but with not less than one hanger or support between joints;

.7 Where pipes change direction, either horizontally or vertically, provide a hanger or support on horizontal pipe not more than 300 mm (12") from elbow, and where pipes drop from tee branches, support tees in both directions not more than 50 mm (2") on each side of tee.

.8 When pipes with same slope are grouped and a common hanger or support is used, space hanger or support to suit spacing requirement of smallest pipe in group and secure pipes in place on common hanger or support.

.9 Provide roller hangers or supports for heat transfer piping greater than or equal to 150 mm (6") diameter and conveying a material 75°C (170°F) or greater to facilitate pipe movement due to expansion and contraction, and at each hanger or support tack weld a steel protection saddle to pipe to protect piping insulation.

.10 Unless otherwise shown or specified, support vertical piping by means of supports specified in Part 2 of this Section, spaced in accordance with following:

.1 support vertical pipes at maximum 3 m (10') intervals or at every floor, whichever is lesser;

.2 for sections of vertical piping with a length less than 3 m (10'), support pipe at least once;

.3 for vertical cast iron plain end pipe (mechanical joint type), secure riser or pipe clamp around pipe under a flange integral with pipe for vertical support purposes, or provide a length of hub and spigot pipe to facilitate proper support;

.4 for vertical steel pipe risers in excess of 3 m (10'), weld shear lugs to pipe to carry load;

.5 for vibration isolated piping risers, provide rubber-steel-rubber vibration isolation pads between riser clamps and floor.

.11 Support piping on the roof as follows:

[OR]

.1 on new roof – supply manufactured roof supports as per Part 2 of this Section to accommodate piping involved and support spacing specified above, and hand supports to roofing trade on roof for installation as part of roofing work, then secure piping in place on supports.

.12 Each hanger, support or securement for horizontal bare copper tubing is to be plastic coated to prevent direct contact between pipe and ferrous hanger. Each wall or floor clamp for vertical bare copper piping is to be isolated from pipe by means of strips of flexible rubber inserts. Use of painted ferrous hangers and supports, including those painted with copper coloured paint, is not acceptable. Site application of tape or other types of isolation is not acceptable.

.13 For insulated horizontal piping less than or equal to 40 mm (1-½") diameter, provide galvanized steel insulation protection shields between insulation and hanger or support. Install shields immediately after pipe is insulated.

.14 Do not support piping from steel deck without written consent from Consultant.

3.3 EQUIPMENT BASES AND SUPPORTS

.1 Unless otherwise specified or required, set floor mounted equipment on minimum 100 mm (4") high reinforced concrete housekeeping pads 200 mm (8") clear of equipment on each side and end, or a minimum of 200 mm (8") from centreline of equipment anchor bolts to edge of the base, whichever is larger. Conform to following requirements:

.1 supply dimensioned drawings and equipment base templates, and provide anchor bolts for proper setting and securing of equipment on pads;

.2 place anchor bolts during concrete pour and be responsible for required levelling, alignment, and grouting of equipment;

.3 as a minimum, use wire mesh reinforcement, however, for pads for large heavy equipment, use reinforcement as per structural drawing details.

.2 For equipment not designed for base mounting, where required, provide welded, cleaned and prime coat painted structural steel stands or supports conforming to following requirements:

.1 provide stands and supports, except those for small equipment, designed by a structural engineer registered in jurisdiction of the work, and submit stamped and signed design drawings with calculations as shop drawings for review;

.2 flange bolt steel stands to concrete housekeeping pads;

.3 seismically restrained stands and supports in accordance with applicable requirements.

.3 Where indicated on mechanical drawings, provide welded, cleaned and prime coat painted structural steel platforms, designed by a structural engineer registered in the jurisdiction of the work, for service access to equipment. Submit stamped and signed design drawings with calculations as shop drawings for review. Conform to following requirements:

.1 platforms in accordance with OHSA requirements and adequately sized, braced, anchored, and, as required, seismically restrained;

.2 flooring equal to Fisher & Ludlow "Tru-Weld" Type 19-4, Borden type W/B (19-W-4), welded steel bar type grating;

.3 support legs constructed of welded Schedule 40 black steel pipe with welded steel cross-bracing, securely anchored and sway braced;

.4 safety guard rails, constructed from minimum 32 mm (1-¼") dia. Schedule 40 black steel pipe, for all platforms and complete with vertical stanchions at maximum 1.2 m (48") centres, top and intermediate horizontal railing, and toe plates at floor;

.5 vertical ladders constructed of Schedule 40 black steel pipe, 25 mm (1") dia. for equal height rungs, 40 mm (1-½") for stringers, anchored to floors and walls and sway braced as required;

.6 ships ladders, used wherever space conditions permit, of welded steel construction, climbing at an approximate 60º angle, and complete with channel iron stringers, open grate equal height risers approximately 165 mm (6-½") wide and factory made by grating manufacturer, handrails, and suitable anchoring and support.

3.4 CONCRETE WORK FOR MECHANICAL EQUIPMENT BASES AND PADS

.1 Unless otherwise specified in Division 03, provide poured concrete work, including reinforcing and formwork, required for mechanical equipment bases/pads. Perform concrete work in accordance with requirements specified in Division 03.

.2 Unless otherwise specified in Division 03, concrete is to be minimum 20,700 kPa ready-mix concrete in accordance with CAN/CSA-A23.1 and the Ontario Building Code.

.3 Submit for review, dimensioned shop drawings, prepared and stamped by a professional structural engineer registered in the jurisdiction of the work, for concrete pads or bases for support of large, heavy equipment. Indicate on shop drawings total weight of pad or base as well as equipment it is provided for, and concrete reinforcing.

.4 Ensure that bases and pads are keyed into the structure to meet seismic restraint requirements where applicable.

[OR]

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit heating cable and control shop drawings/product data sheets, complete with control schematics.

1.2 CLOSEOUT SUBMITTALS

.1 Submit a start-up certification letter from cable supplier as specified in Part 3 of this section.

.2 Submit certified cable megger test reports as specified in Part 3 of this section.

PART 2 - PRODUCTS

2.1 DOMESTIC HOT WATER TEMPERATURE MAINTENANCE CABLE

.1 Raychem Canada Ltd. "HWAT-Plus", CSA approved, 120 V, 1 phase heating cable sets to maintain temperature in domestic hot water piping, each set as specified/scheduled on drawings and complete with a Raychem AMC-1B thermostat set at 45°C (115°F), and following:

.1 required lengths of "HWAT-P1" self-regulating heating cable;

.2 "RayClic-PC" power connection with end seal per circuit;

.3 "RayClic-T" tee connections with end seals as required for pipe branches;

.4 "RayClic-S" splice connections as required;

.5 GT-66 glass tape to secure cable on pipe, and "Electric Traced" adhesive labels to be secured to pipe insulation.

.6 Complete with integral ground fault protection.

.2 Manufacturers:

.1 Raychem Canada Ltd.;

.2 Dimplex/Chromalox Inc.;

.3 Tyco Thermal Controls/Pyrotenax.

2.2 PIPE FREEZE PROTECTION HEATING CABLE

.1 Raychem Canada Ltd. "XL-Trace-CR" CSA certified, self-regulating piping freeze protection cable sets as specified and/or scheduled on drawings, each set complete with:

.1 required lengths of "XL-TRACE" self-regulating heating cable;

.2 power connection with end seal per circuit;

.3 tee connections with end seals as required for pipe branches;

.4 splice connections as required;

.5 GT-66 glass tape to secure cable on pipe, and "Electric Traced" adhesive labels to be secured to pipe insulation;

.6 pipe temperature sensing thermostat.

.7 Complete with integral ground fault protection.

.8 C910-485 microprocessor-based, single-point commercial heating cable control system with integrated equipment ground-fault protection, BACnet gateway, dry contact alarm output, NEMA 4X fiber reinforced plastic enclosure, 120-277 V 30 A double pole relay.

.2 Manufacturers:

.1 Raychem Canada Ltd.;

.2 Dimplex/Chromalox Inc.;

.3 Tyco Thermal Controls/Pyrotenax.

2.3 ELECTRIC SNOW MELTING CABLE

.1 Raychem Canada Ltd. "ElectroMelt EM2-XR" CSA certified, parallel circuit construction, self-regulating cable consisting of 2 #14 gauge nickel coated copper bus wires embedded in a parallel self-regulating polymer core and covered by a crosslinked dielectric jacket, protected by a tinned-copper braid and a 70 mm (2-3/4") thick modified polyolefin outer jacket, and complete with "ElectroMelt EMK-XJB" junction boxes for power connections and end seal terminations. Additional accessories as follows:

.1 expansion joint kits to permit cable to cross heated surface expansion joints;

.2 splice kits to permit splicing or repairing cable;

.3 for each snow melting area, an anodised aluminium snow melting area caution sign for flush with grade installation.

.4 Complete with integral ground fault protection.

.2 Manufacturers:

.1 Raychem Canada Ltd.;

.2 Dimplex/Chromalox Inc.;

.3 Tyco Thermal Controls/Pyrotenax.

2.4 SNOW MELTING CABLE CONTROL

.1 Raychem Canada Ltd. components as follows:

.1 Model CIT-1, 24 V AC, roof or mast mounting, solid-state, microcontroller design aerial snow sensor to detect falling or blowing precipitation at 3.37°C (38°F) before snow or ice begins to accumulate;

.2 Model APS-4C surface wall mounting snow controller with contactor and integral 30 mA ground fault circuit interrupter, test/reset facility, a relay interface for connection to a building management system, and an adjustable high temperature sensor to protect heating cable from excessive temperature.

.3 Complete with integral ground fault protection.

.2 Manufacturers:

.1 Raychem Canada Ltd.;

.2 Dimplex/Chromalox Inc.;

.3 Tyco Thermal Controls/Pyrotenax.

PART 3 - EXECUTION

3.1 INSTALLATION OF DOMESTIC WATER TEMPERATURE MAINTENANCE CABLE

.1 Supply electric tracing cable sets to maintain temperature of domestic hot water piping.

.2 Hand cable sets and accessories and cable manufacturer's installation instructions to electrical trade at site for installation on piping. Clearly identify piping to be traced. Ensure piping has been pressure tested prior to cable installation and manufacturer's installation instructions are observed.

.3 After cable installation but before application of piping insulation, megger test and commission cable in presence of the Consultant and in accordance with cable manufacturer's installation and operation manual. Replace any damaged or faulty cable, and when satisfactory results have been obtained, submit signed test reports to the Consultant.

.4 When traced piping has been insulated, install "Electrically Traced" labels on opposite sides of pipe at 3 m (10') intervals and in accordance with requirements specified in Section 20 05 00 – Common Work Results for Mechanical.

3.2 INSTALLATION OF FREEZE PROTECTION HEATING CABLE

.1 Supply electric tracing cable sets to prevent piping from freezing.

.2 Hand cable sets and accessories and cable manufacturer's installation instructions to electrical trade at site for installation on piping. Clearly identify piping to be traced. Ensure piping has been pressure tested prior to cable installation and manufacturer's installation instructions are observed.

OR

.3 Mount heat tracing controller as indicated on drawings or within 2 m of start of heat tracing.

.4 After cable installation but before application of piping insulation, megger test and commission cable in presence of the Consultant and in accordance with cable manufacturer's installation and operation manual. Replace any damaged or faulty cable, and when satisfactory results have been obtained, submit signed test reports to the Consultant.

.5 When traced piping has been insulated, install "Electrically Traced" labels on opposite sides of pipe at 3 m (10 ft) intervals and in accordance with requirements specified in Section 20 05 00 – Common Work Results for Mechanical.

.6 When cable installations are complete, check and test operation of each cable set with heater manufacturer's representative, make any required adjustments, and have cable manufacturer certify in writing that cable sets have been properly installed and operate as intended.

3.3 INSTALLATION OF SNOW MELTING SYSTEM CABLE

.1 Supply electric heating cable to prevent ice and snow formation on exterior surfaces.

.2 Hand cable and accessories and cable manufacturer's installation instructions to electrical trade at site for installation on the surfaces. Clearly identify areas to be heated. Ensure surfaces are cleaned and suitable for cable installation prior to cable installation, and manufacturer's installation instructions are observed.

.3 Install snow sensor and connect to snow controller with 24 V wiring in conduit in accordance with sensor manufacturer's instructions and wiring standard of electrical work. Test operation of sensor and controller in presence of cable manufacturer's representative and adjust as required.

.4 After cable installation but before placement of covering surface material, megger test and commission cable in presence of the Consultant and in accordance with cable manufacturer's

installation and operation manual. Replace any damaged or faulty cable, and when satisfactory results have been obtained, submit signed test reports to the Consultant.

.5 Carefully place an aluminium snow melting area caution sign flush with grade at each snow melting area, and coordinate placement with trade constructing finished surface.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 This Section specifies vibration isolation product requirements that are common to mechanical work Sections of the Specification and it is a supplement to each Section and is to be read accordingly.

1.2 RELATED REQUIREMENTS

.1 [Section 13 48 13 – Manufactured Sound and Vibration Control Components: floating floor for mechanical and generator rooms to minimize sound and vibration transmission to spaces below.]

1.3 SUBMITTALS

.1 Submit copies of manufacturer's product data sheets for products specified in this Section. Product data sheets are to include product characteristics, limitations, dimensions, finishes, and installation recommendations.

1.4 CLOSEOUT SUBMITTALS

.1 Submit a letter from vibration isolation manufacturer to certify correct installation of products, as specified in Part 3 of this Section.

1.5 SEISMIC RESTRAINT REQUIREMENTS

.1 Where applicable to the project, for requirements for the use of a Seismic Consultant and seismic restraint requirements required for vibration isolated materials and equipment, refer to Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

PART 2 - PRODUCTS

2.1 GENERAL

.1 Vibration isolation products are to be in accordance with the most recent edition of the ASHRAE Handbook and/or as indicated on drawings, schedules, details, and as specified below.

.2 Springs are to be stable, colour coded, selected to operate at no greater than 2/3 solid load, designed in accordance with Society of Automotive Engineers Handbook Supplement 9 entitled Manual on Design and Application of Helical and Spiral Springs, and with spring diameters in accordance with manufacturer's recommendations to suit static deflection and maximum equipment load.

.3 Steel components of isolation products not exposed to the weather or moisture are to be zinc plated. Steel components of isolation products exposed to the weather or in a damp, moist environment are to be factory painted with rust inhibiting primer and 2 coats of neoprene.

.4 Where weight of isolated equipment may change significantly due to draining or filling with a liquid, vibration isolators are to be equipped with limit stops to limit spring extensions.

.5 Seismic rated isolators and snubbers are to be listed, rated, and approved by State of California Office of Statewide Health and Planning Department (O.S.H.P.D.) and carry an O.S.H.P.D. pre-approved number. Seismic restraints supplied with vibration isolation are to meet requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.6 Flexible piping connections to vibration isolated equipment are specified in the appropriate piping sections of the Specification.

2.2 ISOLATION PADS

.1 Sandwich type pads, 20 mm (¾") nominal thickness, selected for 3.2 mm (1/8") static deflection unless otherwise specified, consisting of 2 waffle type or ribbed 50 durometer neoprene pads permanently bonded to a minimum 10 gauge steel plate, and complete with rubber bushed bolt holes and equipment anchor bolts with neoprene isolation grommets.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type NSN;

.2 The VMC Group Vibration Mounting & Controls Inc. (Korfund-Dynamics) "SHEAR-FLEX PLATES";

.3 Kinetics Noise Control Vibron Products Group Type NGS/NGD;

.4 Mason Industries Inc. Type SW/S/SW with HG Bolt Insertion Washers;

.5 J. P. America Inc. Type JSJ.

2.3 RUBBER FLOOR ISOLATORS

.1 Captive, bridge bearing quality neoprene mount selected for a minimum 4 mm (0.15") static deflection unless otherwise specified, with an integral ductile iron housing and integral equipment anchor bolt.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type R;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) Type RSM;

.3 Kinetics Noise Control Vibron Products Group Type RQ;

.4 Mason Industries Inc. Type BR;

.5 J. P. America Inc. Type TRM.

2.4 SPRING FLOOR ISOLATORS

.1 Seismically rated captive spring mount isolator complete with levelling bolts, upper and lower neoprene spring cups, neoprene cushion, ductile iron housing, neoprene sound pads, and neoprene isolation grommets for securing bolts.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type SFS;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) Type AMSR;

.3 Kinetics Noise Control Vibron Products Group Type FLSS;

.4 Mason Industries Inc. Type SSLFH;

.5 J. P. America Inc. Type TSO-C-SC.

2.5 OPEN SPRING MOUNTS

.1 Base mount free-standing assemblies, each complete with a stable colour coded steel spring welded in place, drilled mild steel mounting plate bonded to a ribbed rubber or neoprene acoustical pad, and an external 16 mm (5/8") diameter level adjustment bolt.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type FS;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) "Spring-Flex" Type A;

.3 Kinetics Noise Control Vibron Products Group Type FDS;

.4 Mason Industries Inc. Type SLFH;

.5 J. P. America Inc. Type TSO.

2.6 CLOSED SPRING MOUNTS

.1 Base mount free-standing enclosed assemblies, each complete with stable colour coded spring(s), 2 piece cast housing, non-binding rubber horizontal stabilizers, a ribbed rubber or neoprene acoustical pad bonded to base of the closed housing, and an external level adjustment bolt.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type CM;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) "Spring-Flex" Types B and C;

.3 Kinetics Noise Control Vibron Products Group Type FLS;

.4 Mason Industries Inc. Type C;

.5 J. P. America Inc. Type TSC.

2.7 TOTALLY RETAINED SPRING MOUNTS

.1 Base mount free-standing enclosed and retained assemblies to limit both vertical and lateral movement of mounted equipment, each complete with stable colour coded spring(s), drilled welded steel housing and top plate, ribbed rubber or neoprene acoustical pad bonded to bottom of housing, vertical limit adjusting hardware, and a level adjustment bolt.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type CSR;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) "Spring-Flex" Type MS;

.3 Kinetics Noise Control Vibron Products Group Type SM;

.4 Mason Industries Inc. Type SLRSO;

.5 J. P. America Inc. Type TSR.

2.8 SPRING HANGERS

.1 Welded steel plate housing with top and bottom rod mounting holes and spring retainer, neoprene double deflection isolation element, stable colour coded spring, and heavy-duty rubber washers.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type SHR-SN;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) "Spring-Flex" Series HRSA;

.3 Kinetics Noise Control Vibron Products Group. Type SRH;

.4 Mason Industries Inc. Type 30N;

.5 J. P. America Inc. Type TSH.

2.9 NEOPRENE HANGER ISOLATORS

.1 Neoprene double deflection rod isolators with steel housing and hanger rod bushing, selected for a minimum 4 mm (0.15") static deflection unless otherwise specified.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type NH;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) Type HR;

.3 Kinetics Noise Control Vibron Products Group Type RH;

.4 Mason Industries Inc. Type HD or WHD;

.5 J. P. America Inc. Type TRH.

2.10 CONCRETE INERTIA TYPE EQUIPMENT BASE

.1 Welded steel bases, each complete with a structural black steel channel frame, concrete reinforcing rods, and brackets for spring mounts welded to frame.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type CIB;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) Type CPF;

.3 Kinetics Noise Control Vibron Products Group. Type CIB;

.4 Mason Industries Inc. Type KSL;

.5 J. P. America Inc. Type BCI.

2.11 STEEL EQUIPMENT BASE

.1 Fully welded structural steel equipment and motor support bases, each complete with a wide flange steel frame, full depth cross members, brackets for spring mounts, and adjustable motor slide rails.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type SB;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) Type WFB;

.3 Kinetics Noise Control Vibron Products Group Type SFB;

.4 Mason Industries Inc. Type WFSL;

.5 J. P. America Inc. Type BWS (with motor slide rail).

2.12 COMBINATION STEEL/CONCRETE INERTIA EQUIPMENT BASE

.1 Welded steel bases with a structural black steel channel frame, concrete reinforcing rods, bottom sheet steel pan, brackets for spring mounts welded to frame and adjustable motor slide rails.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type CIB (with motor slide rails);

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) Type WPF (with motor slide rails);

.3 Kinetics Noise Control Vibron Products Group Type CIB (with motor slide rails);

.4 Mason Industries Inc. Type BMK or K;

.5 J. P. America Inc. Type BSI (with motor slide rail).

2.13 SLUNG STEEL BASE

.1 Slung steel bases of structural members with gusset plates welded to ends and complete with adjustable motor slide rails and vertical section size to suit equipment's motor power output.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Type SS;

.2 The VMC Group Vibration Mounting & Controls (Korfund-Dynamics) Type CPF;

.3 Kinetics Noise Control Vibron Products Group Type CIB-H;

.4 Mason Industries Inc. Type MSL.

2.14 CONTINUOUS RAIL TYPE ISOLATION FOR ROOF MOUNTED EQUIPMENT

.1 Continuous rooftop isolation shipped completely assembled, consisting of:

.1 galvanized steel sections formed to fit roof curb and associated equipment with a flexible air and weather seal joining upper and lower rail sections;

.2 stable springs, cadmium plated and selected to provide minimum deflection with 50% additional travel to solid;

.3 neoprene cushioned and wind restraints allowing 6 mm (¼") movement before engaging and resisting wind loads in any lateral direction.

.2 Manufacturers:

.1 Vibro-Acoustics Ltd. Vibro-Acoustics Type RTR;

.2 The VMC Group Vibration Mounting and Controls (Korfund-Dynamics) Type RTIR;

.3 Kinetics Noise Control Vibron Products Group Type KSR;

.4 Mason Industries Inc. Type RSC;

.5 J. P. America Inc. Type BRC.

PART 3 - EXECUTION

3.1 INSTALLATION OF VIBRATION ISOLATION MATERIALS

.1 Unless otherwise stated in the drawings, schedules and/or typical details, vibration isolation is to be provided for all mechanical equipment as per the recommendations contained within in the most recent edition of the ASHRAE Handbook.

.2 Supply to vibration isolation product manufacturer or supplier a copy of a "reviewed" shop drawing or product data sheet for each piece of equipment to be isolated and dimensioned pipe layouts of associated piping to be isolated.

.3 Unless otherwise specified, vibration isolation products are to be product of one manufacturer.

.4 Ensure vibration isolation manufacturer coordinates material selections with equipment provided in order to ensure adherence to performance criteria. Allow for expansion and contraction when material is selected and installed.

.5 Unless otherwise indicated, install isolation materials for base mounted equipment on concrete housekeeping pad bases which extend at least over the full base and isolated area of the isolated equipment. Additional requirements are as follows:

.1 block and shim bases level so ductwork and piping connections can be made to a rigid system at proper operating level, before isolated adjustment is made, and ensure there is no physical contact between isolated equipment and building structure;

.2 steel bases are to clear the sub-base by 25 mm (1");

.3 concrete bases are to clear the sub-base by 50 mm (2").

.6 Isolate piping larger than 25 mm (1") dia. directly connected to motorized and/or vibration isolated equipment with 25 mm (1") static deflection spring hangers at spacing intervals in accordance with following:

.1 for pipe less than or equal to 100 mm (4") dia. – first 3 points of support;

.2 for pipe 125 mm (5") to 200 mm (8") dia. – first 4 points of support;

.3 for pipe equal to or greater than 250 mm (10") dia. – first 6 points of support;

.7 First point of isolated piping support is to have a static deflection of twice the deflection of the isolated equipment but maximum 50 mm (2").

.8 Secure top of spring hanger frame rigidly to structure, and do not install spring hangers in concealed locations.

.9 Where it is impossible to use at least 2 spring hangers, provide Senior Flexonics Ltd. Style 102 (or 102-U as required) or equal, twin sphere, moulded rubber flexible connection assemblies, selected by manufacturer and suitable in all respects for intended application, and complete with required nipples and connections to provide proper vibration isolation.

.10 Isolate designated piping risers at floor support points in accordance with drawing detail and/or where indicated on drawings.

.11 Erect roof curb vibration isolation in accordance with instructions shipped with assembly. Match vibration isolation with associated roof top unit and orient isolation as identified by manufacturer to ensure proper loading and optimum performance. Caulk top of roof curb with 2 beads of caulking provided and centre isolation assembly onto roof curb and, unless otherwise noted, screw in place with 50 mm (2") lag screws at 900 mm (36") O.C. Position gasket on top rail or alternatively, caulk with 2 beads of caulking provided and orient and lower roof top unit onto isolation rails and, unless otherwise noted, screw unit into top rail with 25 mm (1") lag screws at 900 mm (36") O.C. After roof top unit is secured in place, but before damageable work is installed, spray each isolated equipment assembly with water and correct any water leaks.

.12 For control wiring connections to vibration isolated equipment ensure flexible metallic conduit with 90° bend is used for conduit 25 mm (1") dia. and smaller, and for conduit larger than 25 mm (1") dia., use Crouse Hinds EC couplings. Connections are to be long enough so that conduit will remain intact if equipment moves 300 mm (12") laterally from its installed position, and flexible enough to transmit less vibration to structure than is transmitted through vibration isolation. Coordinate these requirements with mechanical trades involved. If electrical power connections are not made in a similar manner as part of the electrical work, report this fact to the Consultant.

.13 For requirements pertaining to seismically restrained vibration isolation, refer to Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.14 Arrange and pay for vibration isolation product manufacturer to visit site to inspect installation of his equipment. Perform revision work required as a result of improper installation. When vibration isolation equipment manufacturer is satisfied with the installation, obtain and submit a letter stating manufacturer has inspected the installation and equipment is properly installed.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 This Section specifies seismic control and restraint requirements that are common to mechanical work Sections of the Specification and it is a supplement to each Section and is to be read accordingly.

1.2 SEISMIC CONSULTANT

.1 Retain and pay for services of an experienced Seismic Consultant who is a registered professional engineer licensed in the jurisdiction of the work and a member in good standing of a Professional Engineers Association in the jurisdiction of the work.

.2 Seismic Consultant is to:

.1 determine proper seismic hazard level, design, recommend, and review proposed mechanical work seismic restraint shop, placement and securing drawings, and sign and stamp drawings prior to submittal for review as specified below;

.2 supervise installation of mechanical work seismic restraint and, when work is complete, certify in writing that seismic restraint work has been installed in accordance with signed, stamped and reviewed drawings;

.3 prepare and submit to Municipality and authorities having jurisdiction, on a form approved by Municipality and authorities having jurisdiction, at the beginning of seismic restraint work and when work is complete, original signed and sealed Letters of Assurance for design, installation, and field review of seismic restraint work.

1.3 SUBMITTALS

.1 Obtain required equipment information and submit manufacturer's shop drawings/product data sheets for restraining devices and steel bases. Include placement data, and details of attachment to both equipment and structure meeting requirements of forces involved. Product data sheets and drawings are to be signed and stamped by Seismic Consultant referred to above.

.2 If requested, submit samples of seismic restraint materials for review.

1.4 CLOSEOUT SUBMITTALS

.1 Submit copies of Seismic Consultant's Letters of Assurance as specified above.

.2 Submit copies of Seismic Consultant and seismic control manufacturer's certification letters as specified in Part 3 of this Section.

1.5 QUALITY ASSURANCE

.1 Seismic restraints are to be designed by a registered professional engineer as specified above, and are to be installed by qualified tradesmen under supervision of and to the approval of the design engineer.

.2 Unless otherwise specified, seismic control and restraints are to be designed in accordance with Code requirements, ANSI/SMACNA Seismic Restraint Manual: Guidelines for Mechanical Systems, SMACNA/ASHRAE Service Restraint Applications CD-ROM, and the P.P.I.C. Manual Guidelines for Seismic Restraints of Mechanical Systems and Plumbing Piping Systems, all of which are to form a part of this Section.

.3 Seismic control and restraints for fire protection piping and equipment are to be in accordance with NFPA requirements. When specified and/or required, design is also to include Factory Mutual requirements.

.4 Restraint products must be tested in an independent testing laboratory, or certified by Seismic Consultant, to confirm restraint products meet requirements of this Section, i.e. dynamic ultimate limit load state as required by Code, "Fail Safe" design, etc. If particular tests are carried out to represent a restraint type, test is to be valid for the full load range of the restraint. Submit such tests or certification when requested.

.5 Seismic control and restraint product manufacturers are to provide required assistance during installation, and, when installation is complete, submit written reports listing any deficiencies to the installation.

PART 2 - PRODUCTS

2.1 GENERAL

.1 Isolation, anchors, bolts, bases, restraints, etc., are to be designed to withstand without failure or yielding, the dynamic G load as specified in Code for the seismic zone in which building is located. Design loads are ultimate limit state loads (1.5 times working load) acting through the centre of gravity of the anchored or restrained equipment. "Fail Safe" designs are acceptable.

.2 For both isolated and non-isolated floor mounted equipment, i.e. tanks, heat exchangers, boilers, etc., design and provide anchors and bolts to withstand, without failure or yielding, a dynamic ultimate limit state load as defined in Code, of the greater of 0.3 g (2.94 m/s^2) or as required by Code, applied horizontally through the centre of gravity.

.3 Where impact forces may be significant, use ductile materials.

.4 Seismic restraining devices factory supplied with equipment are to meet requirements of this Section.

2.2 MANUFACTURERS

.1 Mason Industries Inc.;

.2 Kinetics Noise Control;

.3 Vibro-Acoustics Ltd;

.4 Price Industries Inc.

2.3 SLACK CABLE RESTRAINTS

.1 Aircraft cable galvanized slack cable restraints meeting current requirements of Building Code, sized to suit the application and complete with required cable ties, anchor hardware (selected for a load equal to twice the weight of the equipment), and similar connection accessories.

2.4 ANCHOR BOLTS

.1 Equal to Mason Industries type SAB seismic anchor bolts.

2.5 FLEXIBLE PIPING CONNECTIONS

.1 Flexible piping connectors are to be supplied with seismic restraint materials. Where flexible connections are not specified with piping in other Sections they are to be equal to Mason Industries

twin sphere, non-metallic connectors with hose lengths preset in strict accordance with manufacturer's instructions and to approval of Seismic Consultant, each rated for continuous operation at 1725 kPa at 87.7°C (250 psi at 190°F) or 1380 kPa at 121°C (200 psi at 250°F), and complete with:

.1 nylon tire cord reinforced EPDM body;

.2 ductile iron reinforcing ring and ductile iron screwed or flanged connections as required and to suit piping system operating pressure.

2.6 VIBRATION ISOLATION PRODUCTS

.1 Refer to Section 20 05 48.13 - Vibration Controls for Mechanical Systems.

PART 3 - EXECUTION

3.1 INSTALLATION OF SEISMIC RESTRAINT MATERIALS

.1 Provide seismic restraint for mechanical equipment, piping, and ductwork, including diffusers, grilles, etc., as per requirements of current edition of Building Code and this Section of the Specification.

.2 Following Mechanical Components Restraint Guide is to be used as a general guide only to establish appropriate restraint methods, hardware, and attachments, however, due to differences in construction, size, weight, and configuration of different manufacturer's equipment and variety of ways and means that equipment and components can be installed, specific restraint methods are to be confirmed in the field. Seismic restraint materials and methods are to be reviewed and approved by Seismic Consultant.

.3 Mechanical Component Restraint Guide:

Item	Type of Restraint	Minimum no. of Restraints	Notes
In-line Pumps	SCR	2	Pipe mounted type pump
Pumps Non-Isolated	BTHP	4	Base mount type pump
Pumps Isolated	SNBR	4	Base mount type pump
Expansion Tanks	SCR	4	
D.H.W. Tanks	SCR	4	Attach to removable steel strap yoke
Glycol Tanks	SCR	4	Attach to removable steel strap yoke
Boilers			
- With Base	BTHP	4	
- Without Base	CSSB	4	
Chillers			
- Isolated	SNBR	4	
- Non-Isolated	BTHP	4	

Item	Type of Restraint	Minimum no. of Restraints	Notes
Cooling Towers Closed Circuit Coolers			
- Isolated	SNBR	4	
- Non-Isolated	BTSLPR	4	
Heat Exchangers	BTHP	4	Bolt to custom support frame
Radiant Panels	SCR	4	Per panel section
Unit Heaters	TSR-SCR	4	
Force Flow Heaters	TSR-SCR	4	
AHU's and A/C Units Free Standing			
- With Base	BTHP	4	
- Without base	CSSB	4	
AHU's and A/C Units Suspended			
- Isolated	SCR	4	
- Non-Isolated	SCR	4	
Packaged Rooftop Air Units (all types)			
On roof curb	BTRC	4	Roof curb bolted to roof.
Humidifiers	BTHP	4	Bolt unit to custom stand.
Electronic		4	Bolt stand to housekeeping pad or structure.
Fans – Suspended			
- Isolated	SCR	4	
- Non-Isolated	SCR	4	
Fans – Freestanding			
- Isolated	SNBR	4	
- Non-Isolated	BTHP	4	

Item	Type of Restraint	Minimum no. of Restraints	Notes
Grilles, Registers, Diffusers	SCR	4	Where not bolted to duct (i.e. in tee-bar ceilings)
Airflow Control Valves	SCR	4	Where suspended
Air Compressor Receiver Sets - Isolated - Non-Isolated	BTHP	4	
Piping	SCR TSR	As required	As per Specification
Ductwork	SCR TSR	As required	As per Specification

.4 Legend

Legend	
SCR	Slack cable restraint (bolted to structure)
SNBR	Seismic snubber (bolted to structure)
TSR	Threaded support rod (bolted or clamped to structure)
BTSLPR	Bolt to sleeper (sleeper bolted to structure)
BTHP	Bolt to concrete housekeeping pad (pad to be keyed to structure)
CSSB	Custom steel shoe base (bolted to structure)
BTRC	Bolt to roof curb (roof curb bolted to roof structure)

.5 Provide structural steel bases for equipment unless equipment manufacturer certifies direct attachment capabilities.

.6 Space restraints under equipment so minimum distance between adjacent corner restraints is at least equal to the height of the centre of gravity of the equipment. Include the height of the centre of gravity on shop drawings, otherwise, design for increased forces on supports and submit design calculations with shop drawings. In particular, chillers are to meet this requirement.

.7 Floor mounted isolated equipment is to be installed on 100 mm (4") high concrete housekeeping pads with at least 200 mm (8") clearance between drilled inserts and edges of pads. Ensure housekeeping pads are keyed to structure to resist seismic displacement.

.8 Requirements pertaining to seismic control work are as follows:

.1 execute seismic control and restraint work in accordance with drawing details, reviewed shop drawings, ANSI/SMACNA Seismic Restraint Manual, PIPC Manual: Guidelines for Seismic Restraints of Mechanical Systems and Plumbing Piping Systems, and National Uniform Seismic Installation Guidelines (NUSIG);

.2 seismic control systems are to work in all directions;

.3 fasteners and attachment points are to resist same maximum load as the seismic restraint;

.4 drilled or power driven anchors and fasteners are not permitted;

.5 no equipment, equipment supports or mounts are to fail before failure of structure;

.6 supports of cast iron or threaded pipe are not permitted;

.7 seismic control measures are not to interfere with integrity of firestopping;

.8 equipment is to be bolted to structure, and bolts are to be fitted with isolation washers;

.9 number, size, type, and installation of anchor bolts are to be as recommended by anchor bolt manufacturer and seismic design consultant;

.10 where more than a 3 mm (1/8") differential exists between an anchor or attachment bolt diameter, an anchor and attachment point hole, or an isolator gap attachment bolt and equipment anchor attachment hole, pack air gap with Mason type 0.5 FastSteel reinforced epoxy putty;

.11 hung equipment and pipe hangers are to be fitted with a means of preventing upward movement, and non-isolated equipment and pipe hanger rods are to be fitted with oversized steel washers and nuts above and below hanger or equipment attachment point, locked tight to prevent uplift of equipment or hanger;

.12 where suspended equipment hanger rod length exceeds 50 rod diameters between structure and equipment attachment point, reinforce rods with angle iron to prevent bending due to uplift forces;

.13 seismic control measures are not to jeopardize noise and vibration isolation systems, and 6 mm (¼") to 9 mm (3/8") clearance during normal operation of equipment and systems is to be provided between seismic restraint and equipment;

.14 where hold-down bolts for seismic restraint equipment penetrate roofing membranes coordinate with roofing trade for installation of pitch pockets/"gum cups" and sealing compound to maintain water-tight integrity of roof;

.15 where friction type clamps are used for support of equipment and connecting services, secure clamps to steel work by means of welding or other positive means to prevent slippage or loosening of clamps due to seismic forces.

.9 Provide slack cable restraint assemblies for:

.1 steam piping 32 mm (1-¼") dia. and larger;

.2 fuel gas, fuel oil, medical gas, compressed air and service piping 25 mm (1") dia. and larger;

.3 piping 32 mm (1-¼") dia. and larger located in boiler, fan, chiller, and similar equipment rooms;

.4 horizontal and vertical piping 65 mm (2-½") dia. and larger;

.5 ductwork and duct mounted equipment;

.6 isolated and non-isolated ceiling hung fans, tanks, equipment, etc.;

.7 generator exhaust system(s).

.10 Installation requirements for slack cable restraints include following:

.1 connect slack cable restraints to ceiling hung equipment in such a way that axial projection of wires passes through the centre of gravity of the equipment;

.2 orient restraint wires on ceiling hung equipment at approximately 90º to each other (in plan), and tie back to the ceiling slab at an angle not exceeding 45º to slab;

.3 install cables using appropriate grommets, shackles, and other hardware to ensure alignment of restraints and to avoid bending cables at connection points, and, where feasible, wrap cables directly around pipes as opposed to using collars;

.4 for piping systems, provide transverse slack cable restraints at a maximum spacing of 12.5 m (40'), and longitudinal restraints at 25 m (80') maximum spacing, or as limited by anchor/slack cable performance;

.5 for piping less than 250 mm (10") dia., reduce transverse restraint spacing to 6 m (20'), and note that smaller piping may be rigidly tied to larger piping for restraint, but not the reverse;

.6 vary adjacent spacing of restraints on a piping run by 10% to 30% to avoid coincident resonance;

.7 transverse bracing for one pipe section may also act as longitudinal bracing for piping connected perpendicular to it if bracing is installed within 600 mm (24") of elbow or tee, and if connected piping is same or smaller dia., and note that branch lines are not to be used to restrain main lines;

.8 provide flexibility in piping joints or sleeves where piping penetrates building seismic or expansion joints;

.9 wherever possible, support weight of vertical piping risers at a point or points above the centre of gravity of riser, and provide lateral guides at top and bottom of riser, and at intermediate points not to exceed the transverse spacing specified above for horizontal pipes, with guide clearance not exceeding 3 m (10');

.10 install restraints at least 50 mm (2") clear of other equipment and services;

.11 adjust restraint cables such that they are not visibly slack, or such that flexibility is approximately 40 mm (1-½") under thumb pressure for a 1.5 m (5') cable length, with an equivalent ratio for other cable lengths, and adjust clearance of cable strap/spacer piece restraints so as not to exceed 6 mm (0.23");

.12 provide transverse and axial restraints within 4 m (12') of a vertical bend;

.13 at steel trusses, connect to top chords at panel points and follow truss manufacturer's instructions;

.14 diffusers and grilles mounted in t-bar ceilings or which are not positively secured to ductwork or structure are to be fitted with slack cable restraints to prevent them from falling in the event the ceiling t-bar grid is displaced;

.15 do not bridge vibration isolators with slack cable restraints;

.16 other approved restraint systems are conventional pipe guides, rigid restraint where piping passes through a block or concrete wall, or a cable strap and spacer piece attached to structure and used where piping is adjacent to a wall and conventional slack cable restraints cannot be used.

3.2 INSTALLATION OF FLEXIBLE PIPING CONNECTORS

.1 Supply flexible piping connectors for connections (including plumbing) to seismically restrained equipment. Hand connectors to appropriate piping trade at site for installation.

3.3 SITE INSPECTION AND LETTERS OF CERTIFICATION

.1 When seismic control products have been installed, arrange for seismic control product manufacturer and Seismic Consultant to examine installation of seismic control products and to certify in writing (separate letters) that products have been properly installed in accordance with

governing Codes and Regulations, and recommendations and instructions. Seismic Consultant is to apply his professional stamp to the letter.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Nameplates.

.2 Tags.

.3 Pipe Markers.

1.2 REFERENCES

.1 ASME A13.1 – Scheme for the Identification of Piping Systems.

1.3 SUBMITTALS

.1 Section 01 33 00: Submittals.

.2 Submit list of wording, symbols, letter size, and colour coding for mechanical identification.

.3 Submit valve chart and schedule, including valve tag number, location, function, and valve manufacturer's name and model number.

.4 Product Data: Provide manufacturers catalogue literature for each product required.

.5 Samples: Submit two labels, tags samples to Consultant for approval.

.6 Manufacturer's Installation Instructions: Indicate special procedures, and installation.

1.4 CLOSEOUT SUBMITTALS

.1 Section 01 77 00: Project Closeout.

.2 Record actual locations of tagged valves.

PART 2 - PRODUCTS

2.1 MECHANICAL WORK IDENTIFICATION MATERIALS

.1 Confirm with the Owner if an existing mechanical work identification system is in place and, if so, match accordingly.

.2 If an existing mechanical work identification system is not in place, the following is to be used:

.1 Equipment nameplates are to be minimum 1.6 mm (1/16") thick 2-ply laminated coloured plastic plates, minimum 12 mm x 50 mm (½" x 2") for smaller items such as damper motors and control valves, minimum 25 mm x 65 mm (1" x 2-½") for equipment, and minimum 50 mm x 100 mm (2" x 4") for control panels and similar items. Additional requirements are as follows:

.1 unless otherwise specified or required, each nameplate is to be white, complete with bevelled edges and black engraved wording to completely identify equipment and its use with no abbreviations;

.2 wording is generally to be as per drawings, i.e. Fan EF-1, and is to include equipment service and building area/zone served, but must be reviewed prior to engraving;

.3 supply stainless steel screws for securing nameplates in place;

.4 nameplates for equipment suspended above floor level or generally not within easy viewing from floor level are to be increased in size so as to be easily readable from floor level.

.2 Valve tags are to be coloured, 40 mm (1-½") square, 2-ply laminated plastic with bevelled edges, red-white, green-white, yellow-black, etc., to match piping identification colour, each complete with a 3.2 mm (1/8") diameter by 100 mm (4") long brass plated steel bead chain, and four lines of engraved maximum size identification wording, i.e.:

VALVE V12
200 mm (8")
CHILL. WATER
NORMALLY
OPEN

.3 Standard pipe identification is to be equal to Smillie McAdams Summerlin Ltd., Brady or Primark Manufacturing Inc. vinyl plastic with indoor/outdoor type vinyl ink lettering and directional arrows, as follows:

.1 for pipe less than or equal to 150 mm (6") diameter, coiled type snap-on markers of a length to wrap completely around pipe or pipe insulation;

.2 for pipe larger than 150 mm (6") diameter, saddle type strap-on markers with 2 opposite identification locations and complete with nylon cable ties.

.4 Identification wording and colours for pipe identification materials are to be as follows:

Pipe Service	Identification Colour	Legend
domestic cold water	green	DOM. COLD WATER
domestic hot water supply	green	DOM. HW SUPPLY
domestic hot water recirculation	green	DOM. HW RECIRC.
tempered domestic water	green	TEMP. DOM. WATER
chilled drinking water	green	CH. DRINK WTR.
storm drainage	green	STORM

control air	green	CONTROL AIR

.5 Colours for pipe identification legends and directional arrows are to be as follows:

Identification Colour	Legend and Arrow Colour
yellow	black
green	white
red	white

.6 Duct identification is to be custom made Mylar stencils with 50 mm (2") high lettering to accurately describe duct service, i.e. "AHU-1 SUPPLY", complete with a directional arrow, and coloured ink with ink pads and roller applicators. Ink colour is generally to be black but must contrast with lettering background.

PART 3 - EXECUTION

3.1 PREPARATION

.1 Degrease and clean surfaces to receive adhesive for identification materials.

3.2 INSTALLATION

.1 Identify new exposed piping and ductwork as per Part 2 of this Section in locations as follows:

.1 at every end of every piping or duct run;

.2 adjacent to each valve, strainer, damper and similar accessory;

.3 at each piece of connecting equipment;

.4 on both sides of every pipe and duct passing through a floor, wall or partition, unless otherwise specified;

.5 at 6 m (20') intervals on pipe and duct runs exceeding 6 m (20') in length;

.6 at least once in each room, and at least once on pipe and duct runs less than 6 m (20') in length.

.2 Unless otherwise specified identify new concealed piping and ductwork as per Part 2 of this Section in locations as follows:

.1 at points where pipes or ducts enter and leave rooms, shafts, pipe chases, furred spaces, and similar areas;

.2 at maximum 6 m (20') intervals on piping and ductwork above suspended accessible ceilings, and at least once in each room;

.3 at each access door location;

.4 at each piece of connected equipment, automatic valve, etc.

.3 Provide an identification nameplate for equipment provided as part of this project, including items such as control valves, motorized dampers, instruments, and similar products. Secure nameplates in place, approximately at eye level if possible, with stainless steel screws unless such a practice is prohibitive, in which case use epoxy cement applied to cleaned surfaces. Locate nameplates in the most conspicuous and readable location.

.4 Paint new natural and/or propane gas piping with primer and 2 coats of yellow paint in accordance with Code requirements. Identify piping at intervals as specified above.

.5 Provide an identification nameplate for each motor starter or disconnect switch located in a motor control centre or on a motor starter panel, and on each individually mounted starter provided as part of mechanical work, and on each disconnect switch provided as part of the electrical work for motorized equipment provided as part of mechanical work.

.6 For electrically traced mechanical work, identification wording is to include "ELECTRICALLY TRACED".

.7 Tag valves and prepare a valve tag chart in accordance with following requirements:

.1 attach a valve tag to each new valve, except for valves located immediately at equipment they control;

.2 prepare a digital valve tag chart to list tagged valves, with, for each valve, the tag number, location, valve size, piping service, and valve attitude (normally open or normally closed);

.3 if an existing valve tag chart is available at site, valve tag numbering is to be an extension of existing numbering and new valve tag chart is to incorporate existing chart;

.4 include a copy of valve tag chart in each copy of operating and maintenance instruction manuals.

.8 Where shut-off valves, control dampers, sensors, and similar items which will or may need maintenance and/or repair are located above accessible suspended ceilings, provide round coloured ceiling tacks in ceiling panel material, or stickers equal to Brady "Quick Dot" on ceiling grid material to indicate locations of items. Unless otherwise specified, ceiling tack or sticker colours are to be as follows:

.1 HVAC piping valves and equipment: yellow

.2 fire protection valves and equipment: red

.3 plumbing valves and equipment: green

.4 HVAC ductwork dampers and equipment: blue

.5 control system hardware and equipment: orange

END OF SECTION

Updated through ADD#14

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 This Section specifies mechanical system testing, adjusting, and balancing requirements that are common to mechanical work Sections of the Specification and it is a supplement to each Section and is to be read accordingly.

1.2 DEFINITIONS

.1 “Agency” – means agency to perform testing, adjusting, and balancing work.

.2 “TAB” – means testing, adjusting, and balancing to determine and confirm quantitative performance of equipment and systems and to regulate specified fluid flow rate and air patterns at terminal equipment, e.g., reduce fan speed, throttling, etc.

.3 “hydronic systems” – includes heating water, chilled water, glycol-water solution, condenser water, and any similar system.

.4 “air systems” – includes outside air, supply air, return air, exhaust air, and relief air systems.

.5 “flow rate tolerance” – means allowable percentage variation, minus to plus, of actual flow rate values in Contract Documents.

.6 “report forms” – means test data sheets arranged for collecting test data in logical order for submission and review, and these forms, when reviewed and accepted, should also form permanent record to be used as basis for required future testing, adjusting, and balancing.

.7 “terminal” – means point where controlled fluid enters or leaves the distribution system, and these are supply inlets on water terminals, supply outlets on air terminals, return outlets on water terminals, and exhaust or return inlets on air terminals such as registers, grilles, diffusers, louvers, and hoods.

.8 “main” – means duct or pipe containing system’s major or entire fluid flow.

.9 “submain” – means duct or pipe containing part of the systems’ capacity and serving 2 or more branch mains.

.10 “branch main” – means duct or pipe servicing 2 or more terminals.

.11 “branch” – means duct or pipe serving a single terminal.

1.3 SUBMITTALS

.1 Within 30 days of work commencing at site, submit name and qualifications of proposed testing and balancing agency in accordance with requirements of article entitled Quality Assurance below.

.2 Submit sample test forms, if other than those standard forms prepared by Associated Air Balance Council (AABC) or National Environmental Balancing Bureau (NEBB), are proposed for use.

.3 Submit a TAB plan by Agency to indicate Agency’s evaluation of mechanical drawings with respect to service routing and location or lack of balancing devices. Include set of drawings used and marked-up by Agency to prepare report.

1.4 CLOSEOUT SUBMITTALS

.1 Submit a report by Agency after each site visit made by Agency during construction phase of this Project.

.2 Submit a draft report, as specified in Part 3 of this Section.

.3 Submit a final report, as specified in Part 3 of this Section.

.4 Submit a testing and balancing warranty as specified in Part 3 of this Section.

.5 Submit reports listing observations and results of post construction site visits as specified in Part 3 of this Section.

1.5 QUALITY ASSURANCE

.1 Employ services of an independent testing, adjusting, and balancing agency meeting qualifications specified below, to be single source of responsibility to test, adjust, and balance building mechanical systems to produce design objectives. Agency is to have successfully completed testing, adjusting, and balancing of mechanical systems for a minimum of 5 projects similar to this Project within past 3 years, and is to be certified as an independent agency in required categories by one of following:

.1 AABC – Associated Air Balance Council;

.2 NEBB – National Environmental Balancing Bureau.

.2 NBCTA certification in lieu of the above noted organizations is not permitted.

.3 Testing, adjusting, and balancing of complete mechanical systems is to be performed over entire operating range of each system in accordance with one of following publications:

.1 National Standards for a Total System Balance published by Associated Air Balance Council;

.2 Procedural Standards for Testing, Adjusting and Balancing of Environmental Systems published by National Environmental Balancing Bureau;

.3 Chapter 37, Testing, Adjusting, and Balancing of ASHRAE Handbook HVAC Applications.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 SCOPE OF WORK

.1 Perform total mechanical systems testing, adjusting, and balancing. Requirements include measurement and establishment of fluid quantities of mechanical systems as required to meet design specifications and comfort conditions, and recording and reporting results.

.2 Mechanical systems to be tested, adjusted, and balanced include:

.1 TAB of domestic water systems (all piping extended from Municipal main) is to include:

.1 domestic hot water recirculation piping;

.2 tempered water piping flows.

.2 TAB of fuel oil system is to include supply and return oil flows as applicable, and is to be in accordance with requirements of CAN/CSA B139.

.3 TAB of heating systems is to include piping and equipment fluid temperatures, flows and control, and if TAB is not done during heating season, a follow-up site visit during heating season will be required to confirm proper flows and temperatures, and any required system "fine tuning".

.4 TAB of cooling systems is also to include piping and equipment fluid temperatures, flows and control, and if TAB is not done during cooling season, a follow-up site visit during cooling season will be required to confirm proper flows and temperatures, and any required system "fine tuning".

.5 TAB of air handling systems is to include equipment and ductwork air temperatures, capacities, and flows.

3.2 TESTING, ADJUSTING, AND BALANCING

.1 Conform to following:

.1 as soon as possible after award of Contract, Agency is to carefully examine a set of mechanical drawings with respect to routing of services and location of balancing devices, and is to issue a report listing results of the evaluation;

.2 set of drawings examined by Agency is to be returned with evaluation report, with red line mark-ups to indicate locations for duct system test plugs, and required revision work such as relocation of balancing devices and locations for additional devices;

.3 after review of mechanical work drawings and specification, Agency is to visit site at frequent, regular intervals during construction of mechanical systems, to observe routing of services, locations of testing and balancing devices, workmanship, and anything else that will affect testing, adjusting, and balancing;

.4 after each site visit, Agency is to report results of site visit indicating date and time of visit, and detailed recommendations for any corrective work required to ensure proper adjusting and balancing;

.5 testing, adjusting, and balancing is not to begin until:

.1 building construction work is substantially complete and doors have been installed;

.2 mechanical systems are complete in all respects, and have been checked, started, adjusted, and then successfully performance tested.

.6 mechanical systems to be tested, adjusted and balanced are to be maintained in full, normal operation during each day of testing, adjusting, and balancing;

.7 obtain copies of reviewed shop drawings of applicable mechanical plant equipment and terminals, and temperature control diagrams and sequences;

.8 Agency is to walk each system from system "head end" equipment to terminal units to determine variations of installation from design, and system installation trades will accompany Agency;

.9 Agency is to check valves and dampers for correct and locked position, and temperature control systems for completeness of installation before starting equipment;

.10 wherever possible, Agency is to lock balancing devices in place at proper setting, and permanently mark settings on devices;

.11 Agency is to leak test ductwork as specified in Section entitled HVAC Air Distribution in accordance with requirements of SMACNA "HVAC Air Duct Leak Test Manual", coordinate work with work of aforementioned Sections, provide detailed sketch(es) to Sheet Metal

Contractor and Consultant identifying ductwork not in accordance with acceptable leakage values specified in aforementioned Sections, and retest corrected ductwork;

.12 Agency is to balance systems with due regard to objectionable noise which is to be a factor when adjusting fan speeds and performing terminal work such as adjusting air quantities, and should objectionable noise occur at design conditions, Agency is to immediately report problem and submit data, including sound readings, to permit an accurate assessment of noise problem to be made;

.13 Agency is to check supply air handling system mixing plenums for stratification, and where variation of mixed air temperature across coils is found to be in excess of ±5% of design requirements, Agency is to report problem and issue a detail sketch of plenum baffle(s) required to eliminate stratification;

.14 Agency is to perform testing, adjusting, and balancing to within ±5% of design values, and make and record measurements which are within ±2% of actual values;

.15 for air handling systems equipped with air filters, test and balance systems with simulated 50% loaded (dirty) filters by providing a false pressure drop;

.16 test, adjust and balance air conditioning systems during summer season and heating systems during winter season, including at least a period of operation at outside conditions within 2.8°C (5°F) wet bulb temperature of maximum summer design condition, and within 5.5°C (10°C) dry bulb temperature of minimum winter design condition, and take final temperature readings during seasonal operation.

.2 Prepare reports as indicated below.

.1 Upon completion of testing, adjusting, and balancing procedures, prepare draft reports on AABC or NEBB forms. Draft reports may be hand written, but must be complete, factual, accurate, and legible. Organize and format draft reports in same manner specified for final reports and submit for review.

.2 Upon verification and approval of draft reports, prepare final reports organized and formatted as specified below. Use units of measurement (SI or Imperial) as used on Project Documents.

.3 Report forms are to be those standard forms prepared by the referenced standard for each respective item and system to be tested, adjusted, and balanced. Report forms complete with schematic systems diagrams and other data are to be consolidated in electronic format as a PDF. PDF file to be indexed and organized into sections, as it applies to the project, as follows:

.1 General Information and Summary;

.2 Air Systems;

.3 Hydronic Systems;

.4 Temperature Control Systems;

.5 Special Systems.

.4 Agency is to provide following minimum information, forms, and data in report:

.1 inside cover sheet to identify Agency, Contractor, and Project, including addresses, and contact names and telephone numbers and a listing of instrumentation used for procedures along with proof of calibration;

.2 remainder of report is to contain appropriate forms containing as a minimum, information indicated on standard AABC or NEBB report forms prepared for each respective item and system;

.3 Agency is to include for each system to be tested, adjusted and balanced, a neatly drawn, identified (system designation, plant equipment location, and area served) schematic "as-built" diagram indicating and identifying equipment, terminals, and accessories;

.4 Agency is to include report sheets indicating building comfort test readings for all rooms.

.3 After final testing and balancing report has been submitted, Agency is to visit site with Contractor and Consultant to spot check results indicated on balancing report. Agency is to supply labour, ladders, and instruments to complete spot checks. If results of spot checks do not, on a consistent basis, agree with final report, spot check procedures will stop and Agency is to then rebalance systems involved, resubmit final report, and again perform spot checks with Contractor and Consultant.

.4 When final report has been accepted, Contractor is to submit to Owner, in name of Owner, a certificate equal to AABC National Guaranty Certification or a NEBB Quality Assurance Program Bond, and in addition, Contractor is to submit a written extended warranty from Agency covering one full heating season and one full cooling season, during which time any balancing problems which occur, with exception of minor revision work done during scheduled site visits, will, at no cost, be investigated by Agency and reported on to Owner, and if it is determined that problems are a result of improper testing, adjusting, and balancing, they are to be immediately corrected without additional cost to Owner.

.5 After acceptance of final report, Agency is to perform post testing and balancing site visits in accordance with following requirements:

.1 post testing and balancing site visits are to be made:

.1 once during first month of building operation;

.2 once during third month of building operation;

.3 once between fourth and tenth months in a season opposite to first and third month visit.

.2 during each return visit and accompanied by Owner’s representative, Agency is to spot rebalance terminal units as required to suit building occupants and eliminate complaints;

.3 Agency is to schedule each visit with Contractor and Owner, and inform Consultant;

.4 after each follow-up site visit, Agency is to issue to Contractor and Consultant a report indicating any corrective work performed during visit, abnormal conditions and complaints encountered, and recommended corrective action.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 This Section specifies insulation requirements common to Mechanical Divisions work Sections and it is a supplement to each Section and is to be read accordingly.

1.2 DEFINITIONS

.1 "concealed" – means mechanical services and equipment above suspended ceilings, in non-accessible chases, in accessible pipe spaces, and furred-in spaces.

.2 "exposed" – means exposed to normal view during normal conditions and operations.

.3 "mineral fibre" – includes glass fibre, rock wool, and slag wool.

.4 "domestic water" or "potable water" – means piping extended from building Municipal supply main.

1.3 SUBMITTALS

.1 At least 4 weeks prior to insulation work commencing, submit a sample of each type of insulation (and insulation accessories and finish), in applied form, for review. Mount samples on a plywood board. Identify each product with manufacturer’s name and insulation type, and proposed use of insulation. When sample board has been approved, mechanical insulation work is to conform to approved sample board.

.2 Submit a product data sheet for each insulation system product.

.3 Submit a fabrication drawing for each custom made cover to indicate material and fabrication details, and a 300 mm (12") square sample of proposed cover material.

.4 Submit a colour chart for coloured lagging adhesive for canvas jacketed insulation.

1.4 CLOSEOUT SUBMITTALS

.1 In accordance with Part 3 of this Section, submit a letter from fire rated duct wrap supplier to certifying duct wrap has been properly installed.

1.5 QUALITY ASSURANCE

.1 Mechanical insulation is to be applied by a licensed journeyman insulation mechanic, or by an apprentice under direct, daily, on-site supervision of a journeyman mechanic.

.2 Do not apply insulation unless leakage tests have been satisfactorily completed.

.3 Ensure surfaces to be insulated are clean and dry.

.4 Ensure ambient temperature is minimum 13°C (55°F) for at least 1 day prior to application of insulation, and for duration of insulation work, and relative humidity is and will be at a level such that mildew will not form on insulation materials.

.5 Company with sub-contract for mechanical insulation work is to be a member in good standing of Thermal Insulation Association of Canada.

.6 Insulation materials must be stored on site in a proper and dry storage area. Any wet insulation material is to be removed from site.

PART 2 - PRODUCTS

2.1 FIRE HAZARD RATINGS

.1 Unless otherwise specified, insulation system materials inside building must have a fire hazard rating of not more than 25 for flame spread and 50 for smoke developed when tested in accordance with CAN/ULC-S102, Surface Burning Characteristics of Building Materials and Assemblies.

2.2 THERMAL PERFORMANCE

.1 Unless otherwise specified, thermal performance of insulation is to meet or exceed values given in Tables entitled Minimum Piping Insulation Thickness Heating and Hot Water Systems and Minimum Piping Insulation Thickness Cooling Systems, as stated in ANSI/ASHRAE/IES Standard 90.1 version referenced in Ontario Building Code.

2.3 PIPE INSULATION MATERIALS

.1 Horizontal pipe insulation at hangers and supports are to be equal to Belform Insulation Ltd. "Koolphen K-Block" insulated pipe support inserts consisting of minimum 150 mm (6") long, pre-moulded, rigid, sectional phenolic foam insulation (of same thickness as adjoining insulation) with a reinforced foil and kraft paper vapour barrier jacket and a captive galvanized steel saddle.

.2 Flexible foam elastomeric is to be closed cell, sleeve type, longitudinally split self-seal, foamed plastic pipe insulation with a water vapour transmission rating of 0.10 in accordance with ASTM E96, Procedure B, and required installation accessories.

.1 Manufacturers:

.1 Armacell AP/Armaflex SS;

.2 IK Insulation Group K-Flex "LS" Self-Seal Pipe Insulation.

.3 Closed cell foamed glass is to be Owens Corning "FOAMGLASS", expanded, sectional, rigid sleeve type insulation with a liquid or vapour permeability rating (as per ASTM C240) of 0.00, and a factory applied "PITTWRAP SSII" self-sealing jacket and protective metal cladding.

.4 Premoulded mineral wool is to be rigid, sectional, sleeve type, non-combustible, longitudinally split mineral wool, or basalt pipe insulation with a reinforced vapour barrier jacket.

.1 Manufacturers:

.1 Roxul "Techton 1200";

.2 IIG (Johns Manville Inc.) MinWool-1200;

.3 Paroc 1200.

.5 Fire rated pre-moulded mineral wool is to be non-combustible, fire-rated, rigid, sectional, longitudinally split mineral wool or basalt pipe insulation with a reinforced vapour barrier jacket and compatible with CAN/ULC-S115 and CAN/ULC-S101 firestopping.

.1 Manufacturers:

.1 Roxul "Techton 1200";

.2 IIG (Johns Manville Inc.) MinWool-1200;

.3 Paroc 1200.

.6 Pre-moulded mineral fibre is to be rigid, sectional, sleeve type insulation to ASTM C547, with a factory applied vapour barrier jacket.

.1 Manufacturers:

.1 Johns Manville Inc. "Micro-Lok AP-T Plus";

.2 Knauf Fiber Glass "Pipe Insulation" with "ASJ-SSL" jacket;

.3 Manson Insulation Inc. "ALLEY K APT";

.4 Owens Corning “Fiberglas” Pipe Insulation.

.7 Blanket mineral fibre is to be blanket type roll insulation to CGSB 51-GP-11M, 24 kg/m3 (1-½ lb/ft³) density, with a factory applied vapour barrier facing.

.1 Manufacturers:

.1 Johns Manville Inc. Microlite FSK Duct Wrap Type 150;

.2 Knauf Fiber Glass Blanket Insulation FSK Duct Wrap Type III;

.3 Manson Insulation Inc. ALLEY WRAP FSK Duct Wrap Type III;

.4 Certainteed Corporation Softtouch FSK Duct Wrap Type 150.

.8 Pre-moulded weatherproof jacketed mineral fibre is to be Knauf Insulation "Redi-Klad 1000" sectional, sleeve type pipe insulation with a self-sealing weather-proof jacket and a 100 mm (4") butt joint sealing strip with each section.

2.4 BARRIER-FREE LAVATORY PIPING INSULATION KITS

.1 Removable, flexible, reusable, white moulded plastic insulation kits for barrier-free lavatory drain piping and potable water supplies exposed under lavatory.

.2 Manufacturers:

.1 Truebo "Lav-Guard 2" E-Z Series;

.2 Zeston "SNAP-TRAP";

.3 McGuire Manufacturing Co. Inc. "ProWrap".

2.5 EQUIPMENT INSULATION MATERIALS

.1 Blanket mineral fibre is to be blanket type roll form insulation to ASTM C553, 24 kg/m3 (1-½ lb/ft³) density, with a factory applied vapour barrier facing.

.1 Manufacturers:

.1 Johns Manville Inc. Microlite FSK Duct Wrap Type 150;

.2 Knauf Fiber Glass Blanket Insulation FSK Duct Wrap Type III;

.3 Manson Insulation Inc. ALLEY WRAP FSK Duct Wrap Type III;

.4 Certainteed Corporation Softtouch FSK Duct Wrap Type 150.

.2 Semi-rigid mineral fibre board is to be roll form, moulded insulation to ASTM C1393, with a factory applied vapour barrier facing consisting of laminated aluminum foil and kraft paper.

.1 Manufacturers:

.1 Knauf Fiber Glass Pipe and Tank Insulation;

.2 Manson Insulation Inc. "AK FLEX";

.3 Johns Manville Inc. Pipe and Tank Insulation “Micro-Flex”;

.4 Multi-Glass Insulation Ltd. "MULTI-FLEX MF";

.5 Owens Corning Pipe and Tank Insulation;

.6 Glass-Cell Fabricators Ltd. "R-Flex".

.3 Semi-rigid mineral wool blanket is to be equal to Roxul "Enerwrap MA 960" flexible, black fibrous scrim faced mineral wool blanket insulation to ASTM C553.

.4 Closed cell foamed glass is to be Owens Corning "FOAMGLAS" expanded, rigid board and block type insulation with a liquid or vapour permeability rating (as per ASTM C240) of 0.00.

2.6 REMOVABLE/REUSABLE INSULATION COVERS

.1 Valve, etc. covers are to be NO SWEAT reusable insulation wraps with vapour barrier jacket and self-sealing ends and longitudinal seam, with a length to suit the application and an insulation thickness equal to adjoining insulation.

.2 Custom manufactured equipment covers conforming to shape of item to be insulated, designed to be easily removable and replaceable to suit use and maintenance procedures of particular item, and to provide adequate personnel protection. Covers are to be complete with minimum 95 kg/m3 (6 lb/ft³) density ceramic fibre insulation sewn between minimum 542.5 g/m2 (1.8 oz/ft²) weight silicone impregnated fibreglass fabric in a quilted pattern using double stitches made with Kelvar or Teflon coated fibreglass thread. Overlap flaps are to be secured using laces, snaps, or Velcro double stitched in place.

.3 Manufacturers:

.1 Crossby Dewar Inc.;

.2 Insufab Systems Inc.;

.3 ADL Insulflex Inc.;

.4 Firwin Corp.;

.5 GlassCell Isofab Inc.

2.7 DUCTWORK SYSTEM INSULATION MATERIALS

.1 Rigid mineral fibre board is to be pre-formed board type insulation to ASTM C612, 48 kg/m3 (3 lb/ft³) density, with a factory applied reinforced aluminum foil and kraft paper facing.

.1 Manufacturers:

.1 Knauf Fiber Glass Insulation Board with FSK facing;

.2 Manson Insulation Inc. "AK BOARD FSK";

.3 Johns Manville Inc. Type 814 "Spin-Glas";

.4 Owens Corning 703.

.2 Semi-rigid mineral fibre board is to be roll form insulation to ASTM C1393, consisting of cut strips of rigid mineral board insulation glued to an aluminium foil and kraft paper facing.

.1 Manufacturers:

.1 Multi-Glass Insulation Ltd. "Multi-Flex MKF";

.2 Glass-Cell Fabricators Ltd. "R-FLEX";

.3 Owens Corning Pipe and Tank Insulation;

.4 Johns Manville Inc. Pipe and Tank Insulation.

.3 Blanket mineral fibre is to be blanket type roll form insulation to ASTM C553, 24 kg/m3 (1-½ lb/ft3) density, 40 mm (1-½") thick, with a factory applied vapour barrier facing.

.1 Manufacturers:

.1 Johns Manville Inc. Microlite FSK Duct Wrap Type 150;

.2 Knauf Fiber Glass Blanket Insulation FSK Duct Wrap Type III;

.3 Manson Insulation Inc. ALLEY WRAP FSK Duct Wrap Type III;

.4 Certainteed Corporation Softtouch FSK Duct Wrap Type 150.

.4 Pre-moulded calcium silicate is to be rigid block and sheet insulation.

.1 Manufacturers:

.1 Johns Manville Inc. "Thermo-12 Gold";

.2 Industrial Insulation Group "Thermo-12 Gold".

.5 Flexible foam elastomeric sheet is to be sheet form, CFC free, closed cell, self-adhering elastomeric nitrile rubber insulation with a water vapour permeability rating of 0.08 in accordance with ASTM E96 Procedure A.

.1 Manufacturers:

.1 Armacell "AP/Armaflex SA";

.2 IK Insulation Group "K-Flex Duct Wrap", S2S.

.6 Extruded polystyrene tapered insulation – equal to Soprema Sopra-ISO Tapered, closed cell polyisocyanurate foam core with organic facers reinforced with glass fibres, 172 kPa compressive strength as per ASTM D1621, 32 kg/m3 density, 50 mm minimum thickness, 2% slope. Thickness shall increase if width of duct work is larger than 1200 mm to maintain 2% slope.

2.8 FIRE RATED DUCT WRAP

.1 Flexible, non-combustible, blanket type mineral fibre duct wrap completely encapsulated in reinforced foil, suitable for installation with zero clearance to combustibles (for grease ducts), and ULC tested and listed (ULC Designs FRD-17 & 23 for ventilation ducts, ULC Design FRD-19 for kitchen exhaust/grease duct) to facilitate a 2 hour fire resistance rating (76 mm (3") thick) to kitchen grease exhaust duct in accordance with requirements of NFPA 96, and/or a 1 hour or 2 hour fire resistance rating (38 mm (1-½") thick) to ventilation or pressurization ductwork in accordance with requirements of ISO 6944.

.2 Manufacturers:

.1 3M Fire Barrier Duct Wrap 615;

.2 CL4 Inc. "CL4Fire";

.3 Unifrax Corp. "FyreWrap Elite 1.5";

.4 Morgan Thermal Ceramics "FireMaster FastWrap XL".

2.9 INSULATING COATINGS

.1 Equal to Robson Thermal Manufacturing Ltd. insulating coatings as follows:

.1 anti-condensation coating, "No Sweat-FX";

.2 thermal insulating coating, "ThermaLite".

2.10 INSULATION FASTENINGS

.1 Wire – minimum 15 gauge galvanized annealed wire.

.2 Wire with Mesh – minimum 15 gauge galvanized annealed wire factory woven into 25 mm (1") hexagonal mesh.

.3 Aluminium Banding – equal to ITW Insulation Systems Canada "FABSTRAPS" minimum 12 mm (½") wide, 0.6 mm (1/16") thick aluminium strapping.

.4 Stainless Steel Banding – equal to ITW Insulation Systems Canada "FABSTAPS" 0.6 mm (1/16") thick, minimum 12 mm (½") wide type 304 stainless steel strapping.

.5 Duct Insulation Fasteners – weld-on 2 mm (3/32") diameter zinc coated steel spindles of suitable length, complete with minimum 40 mm (1-½") square plastic or zinc plated steel self-locking washers.

.6 Tape Sealant – equal to MACtac Canada Ltd. self-adhesive insulation tapes, types PAF, FSK, ASJ, or SWV as required to match surface being sealed.

.7 Mineral Fibre Insulation Adhesive – clear, pressure sensitive, brush consistency adhesive, suitable for a temperature range of -20°C to 82°C (-4°F to 180°F), compatible with type of material to be secured, and WHMIS classified as non-hazardous.

.8 Flexible Elastomeric Insulation Adhesive – Armacell "Armaflex" #520 air-drying contact adhesive.

.9 Closed Cell Foamed Glass Insulation Adhesive – Pittsburgh Corning PC88 multi-purpose 2-component adhesive.

.10 Lagging Adhesive – white, brush consistency, ULC listed and labelled, 25/50 fire/smoke rated lagging adhesive for canvas jacket fabric, suitable for colour tinting, complete with fungicide and washable when dry.

.11 Screws – No. 10 stainless steel sheet metal screws.

2.11 INSULATION JACKETS AND FINISHES

.1 Canvas Jacket Material – ULC listed and labelled, 25/50 fire/smoke rated, roll form, minimum 170 g (6 oz).

.2 Roll Form Sheet and Fitting Covers – minimum 15 mm (1/2") thick white PVC, 25/50 fire/smoke rated tested in accordance with CAN/ULC-S102, complete with installation and sealing accessories.

.1 Manufacturers:

.1 Proto Corp. "LoSMOKE";

.2 The Sure-Fit System "SMOKE-LESS 25/50";

.3 Johns Manville Inc. "Zeston" 300.

.3 Rigid Aluminium Jacket – equal to ITW Insulation Systems Canada "Lock-on" 0.406 mm (0.016") thick embossed aluminum jacket material to ASTM B209, factory cut to size and complete with polysurlyn moisture barrier and continuous modified Pittsburgh Z-Lock, butt straps with "Fabstraps" to weatherproof the end to end joints, and 2-piece epoxy coated pressed aluminum fittings with weather locking edges.

.4 Stainless Steel Jacket – equal to ITW Insulation Systems Canada "Lock-on" 0.254 mm (0.010") thick type 304 embossed stainless steel jacket material to ASTM A240, factory cut to size and complete with moisture barrier and continuous modified Pittsburgh Z-Lock, butt straps with

"Fabstraps" to cover end to end joints, and 2-piece pressed stainless steel fittings with weather locking edges.

.5 Adhesive backed flexible aluminium is to be MFM Building Products Corp. "Flex-Clad 400" roll form sheet material with an aggressive rubberized asphalt adhesive backing, high density polyethylene reinforcement, and an embossed aluminum facing.

.6 Heat resistant, trowel consistency thermal insulating and finishing cement to CAN/CGSB 51.12, and suitable for the application.

.7 Foamed glass insulation protective coating is to be Pittsburgh Corning "PITTCOTE 300e" flexible acrylic latex weather barrier coating, white unless otherwise specified.

.8 UV and moisture resistant flexible foam insulation with protective jacket equal to Armacell “ArmaFlex Shield".

.9 Self adhesive multilayer jacketing - equal to 3M Ventureclad 1577CW. Multi-ply laminate flexible jacketing, acrylic adhesive, zero permeability vapor barrier, 480 N/mm tensile strength, 22N/25 mm peel adhesion strength, 15.2 kPa shear adhesion after 72 hours, 147 N puncture resistance, 0.2 mm thickness.

[OR]

.10 Self adhesive multilayer jacketing - equal to 3M Ventureclad 1579GCW series. Multi-ply laminate flexible jacketing, acrylic adhesive, zero permeability vapor barrier.

PART 3 - EXECUTION

3.1 GENERAL INSULATION APPLICATION REQUIREMENTS

.1 Unless otherwise specified, do not insulate following:

.1 factory insulated equipment and piping;

.2 heating piping within radiation unit enclosures, including blank filler sections of enclosures;

.3 heating piping in soffits and/or overhang spaces and connected to bare element radiation in spaces;

.4 branch potable water piping located under counters to serve counter mounted plumbing fixtures and fittings, except barrier-free lavatories;

.5 exposed chrome plated potable water angle supplies from concealed piping to plumbing fixtures and fittings, except barrier-free lavatories;

.6 heated liquid system pump casings, valves, strainers and similar accessories;

.7 heating system expansion tanks;

.8 fire protection pump casings;

.9 manufactured expansion joints and flexible connections;

.10 acoustically lined ductwork and/or equipment;

.11 factory insulated flexible branch ductwork;

.12 fire protection system water storage tanks;

.13 piping unions, except for unions in "cold" category piping.

.2 Install insulation directly over pipes and ducts, not over hangers and supports.

.3 Install piping insulation and jacket continuous through pipe openings and sleeves.

.4 Install duct insulation continuous through walls, partitions, and similar surfaces except at fire dampers.

.5 When insulating "cold" piping and equipment, extend insulation up valve bodies and other such projections as far as possible, and protect insulation jacketing from the action of condensation at its junction with metal.

.6 Insulate, vapour seal, and finish seismic restraints, braces, anchors, hanger rods, and similar hardware directly connected to "cold" piping and/or equipment, for a distance of 300 mm (12") clear of adjacent pipe or equipment finish, to match piping and/or equipment insulation.

.7 When insulating vertical piping risers 75 mm (3") diameter and larger, use insulation support rings welded directly above lowest pipe fitting, and thereafter at 4.5 m (14.7') centres and at each valve and flange. Insulate as per Thermal Insulation Association of Canada National Insulation Standards, Figure No. 9.

.8 Where piping and/or equipment is traced with electric heating cable, ensure cable has been tested and accepted prior to application of insulation, and ensure cable is not damaged or displaced during the application of insulation.

.9 Where existing insulation work is damaged as a result of mechanical work, repair damaged insulation work to Project work standards.

.10 Where mineral fibre rigid sleeve type insulation is terminated at valves, equipment, unions, etc., neatly cover exposed end of insulation with a purpose made PVC cover on "cold" piping, and with canvas jacket material on "hot" piping.

.11 Carefully and neatly gouge out insulation for proper fit where there is interference between weld bead, mechanical joints, etc., and insulation. Bevel away from studs and nuts to permit their removal without damage to insulation, and closely and neatly trim around extending parts of pipe saddles.

.12 Where thermometers, gauges, and similar instruments occur in insulated piping, and where access to heat transfer piping balancing valve ports and similar items are required, create a neat, properly sized hole in insulation and provide a suitable grommet in the opening.

3.2 INSULATION FOR HORIZONTAL PIPE AT HANGERS AND SUPPORTS

.1 At each hanger and support location for piping 50 mm (2") diameter and larger and scheduled to be insulated, except where roller hangers and/or supports are required, and unless otherwise specified, supply a factory fabricated section of phenolic foam pipe insulation with integral vapour barrier jacket and captive galvanized steel shield. Supply insulation sections to piping installers for installation as pipe is erected.

.2 For 100 mm (4") diameter and larger heating system piping where roller type hangers and supports are provided, a steel saddle will be tack welded to pipe at each roller hanger or support location. Pack saddle voids with loose mineral wool insulation.

3.3 PIPE INSULATION REQUIREMENTS – MINERAL FIBRE

.1 Insulate following pipe inside building and above ground with mineral fibre insulation of thickness indicated:

.1 domestic cold water piping, less than 100 mm (4") dia. – 25 mm (1") thick;

.2 domestic cold water piping, greater than or equal to 100 mm (4") dia. – 40 mm (1-½") thick;

.3 domestic hot water piping, less than 40 mm (1-½") dia. – 25 mm (1") thick;

.4 domestic hot water piping, greater than or equal to 40 mm (1½") dia. – 40 mm (1-½") thick;

.5 tempered domestic water piping, supply and return, less than 40 mm (1-½") dia. – 25 mm (1") thick;

.6 tempered domestic water piping, supply and return, greater than or equal to 40 mm (1-½") dia. – 50 mm (2") thick;

.7 storm drainage piping from roof drains to the point where main vertical risers extend straight down, without offsets, and connect to horizontal underground mains – 25 mm (1") thick;

.8 condensate drainage piping from fan coil unit or any other air conditioning system/unit drain pans to main vertical drain risers or to indirect drainage point – 25 mm (1") thick;

.9 drainage piping from refrigerated drinking fountains to nearest 75 mm (3") dia. or larger drain pipe – 25 mm (1") thick;

.10 chilled water piping, supply and return, less than 100 mm (4") dia. – 25 mm (1") thick;

.11 chilled water piping, supply and return, greater than or equal to 100 mm (4") dia. – 40 mm (1-½") thick;

.12 chilled glycol solution piping, supply and return, less than 100 mm (4") dia. – 25 mm (1") thick;

.13 chilled glycol solution piping, supply and return, greater than or equal to 100 mm (4") dia. – 40 mm (1-½") thick;

.14 hot water heating piping, supply and return, less than 40 mm (1-½") dia. – 40 mm (1-½") thick;

.15 hot water heating piping, supply and return, greater than or equal to 40 mm (1-½") dia. – 50 mm (2") thick;

.16 glycol solution heating or heat reclaim piping, supply and return, less than 40 mm (1-½") dia. – 40 mm (1-½") thick;

.17 glycol solution heating or heat reclaim piping, supply and return, greater than or equal to 40 mm (1-½") dia. – 50 mm (2") thick;

.18 low pressure (to 140 kPa (20 psi)) steam piping, less than 100 mm (4") dia. – 65 mm (2-½") thick;

.19 low pressure (to 140 kPa (20 psi)) steam piping, greater than or equal to 100 mm (4") dia. – 80 mm (3") thick;

.20 medium pressure (140 kPa to 415 kPa (20 psi to 60 psi)) steam piping, less than 40 mm (1-½") dia. – 100 mm (4") thick;

.21 medium pressure (140 kPa to 415 kPa (20 psi to 60 psi)) steam piping, greater than or equal to 40 mm (1-½") dia. – 112 mm (4-½") thick;

.22 low pressure condensate piping, less than 40 mm (1-½") dia. – 40 mm (1-½") thick;

.23 low pressure condensate piping, greater than or equal to 40 mm (1-½") dia. – 50 mm (2") thick;

.24 medium pressure condensate piping, less than 40 mm (1-½") dia. – 40 mm (1-½") thick;

.25 medium pressure condensate piping, greater than or equal to 40 mm (1-½") dia. – 50 mm (2") thick;

.26 boiler feedwater piping complete – 25 mm (1") thick;

.27 boiler blowdown piping complete – 40 mm (1-½") thick;

.28 chilled domestic cold water piping from remote water cooler(s) to drinking fountain(s) – 40 mm (1-½") thick;

.29 piping indicated to be traced with electric heating cable – minimum 50 mm (2") thick;

.30 drum drip(s) in dry zone standpipe and/or sprinkler system piping – 50 mm (2") thick;

.31 air compressor set fresh air intake piping – 25 mm (1") thick;

.32 heat pump equipment earthloop piping – 25 mm (1") thick.

.2 Secure overlap flap of the sectional insulation jacket tightly in place. Cover section to section butt joints with tape sealant.

.3 Insulate fittings with sectional pipe insulation mitred to fit tightly, and cover butt joints with tape sealant, or, alternatively, wrap fittings with blanket mineral fibre insulation to a thickness and insulating value equal to the sectional insulation, secure in place with adhesive and/or wire, and cover with PVC fitting covers.

.4 Unless otherwise specified, insulate unions, valves, strainers, and similar piping system accessories in "cold" piping with cut and tightly fitted segments of sectional pipe insulation with joints covered with tape sealant, or, alternatively, wrap piping union, valve, strainer, etc., with blanket mineral fibre and cover with PVC covers as for paragraph above.

.5 Terminate sectional insulation approximately 50 mm (2") from flange or coupling on each side of flange or coupling. Cover flange or coupling with a minimum 50 mm (2") thickness of blanket mineral fibre insulation wide enough to butt tightly to ends of adjacent sectional insulation. Secure blanket insulation in place and cover with a purpose made PVC coupling cover.

.6 Drum drips in dry zone sprinkler and/or standpipe system piping will be traced with electric heating cable as part of electrical work, and are generally not shown on drawing(s). Confirm number and size of drum drips required with trade providing piping and include for insulation to suit. Wherever possible drum drips will be located in heated areas.

.7 Take special care at concealed water rough-in piping at plumbing fixtures to ensure piping is properly insulated. If necessary due to space limitations, use 12 mm (½") thick sectional pipe insulation in lieu of 25 mm (1") thick insulation.

.8 Insulate seismic restraint hardware such as hanger rods, braces, anchors, etc., directly connected to "cold" category piping and equipment for a distance of 300 mm (12") from piping or equipment with insulation and finish to match pipe or equipment insulation. Coat seismic restraint hardware for a distance of 300 mm (12") from the termination of insulation with Robson Thermal "NO-SWEAT-FX" water based anti-condensation coating.

3.4 PIPE INSULATION REQUIREMENTS – MINERAL WOOL

.1 Insulate following pipe inside building and above ground with high temperature mineral wool insulation of thickness indicated:

.1 high pressure (above 415 kPa (60 psi)) steam piping, less than 40 mm (1-½") dia. – 100 mm (4") thick;

.2 high pressure (above 415 kPa (60 psi)) steam piping, greater than or equal to 40 mm (1-½") dia. – 115 mm (4-½") thick;

.3 high pressure condensate piping – 50 mm (2") thick;

.4 engine-generator set exhaust system piping – 75 mm (3") thick.

.2 Generally, install insulation on piping as specified above for mineral fibre insulation.

.3 Generally, install insulation on fittings as specified above for mineral fibre insulation but cover with canvas, not PVC fitting covers.

3.5 PIPE INSULATION REQUIREMENTS – FLEXIBLE FOAM ELASTOMERIC

.1 Install flexible elastomeric pipe insulation in strict accordance with manufacturer’s published instructions to suit the application, and using adhesive, joint sealants, and finish to produce a water-

tight installation. Insulate following pipe with flexible elastomeric pipe insulation of thickness indicated:

.1 refrigerant piping inside and outside building – 25 mm (1") thick.

3.6 PIPE INSULATION REQUIREMENTS – CLOSED CELL FOAMED GLASS

.1 Install closed cell foamed glass insulation in strict accordance with manufacturer's published instructions to suit the application, and using adhesive, joint sealants, and jacketing to produce a water-tight installation. Insulate following pipe with closed cell foamed glass of thickness indicated:

.1 piping located outside building and indicated to be heat traced – minimum 50 mm (2") thick.

3.7 PIPE INSULATION REQUIREMENTS – FIRE RATED INSULATION

.1 Where pipe (inside building and above ground) which is to be insulated as specified above penetrates fire rated construction, provide fire-rated, non-combustible sectional insulation on portion of pipe in fire barrier and for a distance of 50 mm (2") on either side of fire barrier. Insulation thickness is to be as specified, but in any case minimum 25 mm (1").

3.8 INSTALLATION OF WEATHER-PROOF JACKETED INSULATION

.1 Install sectional weather-proof jacketed pipe insulation in strict accordance with manufacturer's instructions to produce a water-tight weather-proof installation. Insulate fittings with blanket type glass fibre insulation of a thickness and insulating value equal to the sectional insulation and secured in place with adhesive and wire. Jacket fittings with manufactured aluminium fitting covers sealed water-tight. Insulate following pipe with weather-proof jacketed insulation:

.1 [ ];

.2 [ ].

3.9 INSTALLATION OF BARRIER FREE LAVATORY INSULATION KITS

.1 Provide manufactured insulation kits to cover exposed drainage and water piping under barrier free lavatories.

3.10 EQUIPMENT INSULATION REQUIREMENTS – BLANKET TYPE MINERAL FIBRE

.1 Insulate following equipment with mineral fibre blanket type insulation of thickness indicated:

.1 chilled water and/or domestic cold water pump casings – 40 mm (1-½") thick;

.2 roof drain sumps where inside the building – 25 mm (1") thick;

.3 water meter(s) – 40 mm (1-½") thick;

.4 top of radiant ceiling panels – per manufacturer's recommendation or minimum 50 mm (2") thick, whichever is greater.

.2 Unless otherwise noted, wrap equipment to a thickness and insulating value equal to an equivalent thickness of rigid sectional pipe insulation. Laminate insulation in place with a full coverage of adhesive and secure with wire. Apply a jacket of insulation vapour barrier material secured in place with adhesive or sealant tape.

.3 Cover roof drain sumps with purpose made PVC fitting covers.

.4 Lay fibreglass blanket on radiant ceiling panels after testing is complete.

3.11 EQUIPMENT INSULATION REQUIREMENTS – SEMI-RIGID MINERAL FIBRE

.1 Insulate following equipment with semi-rigid mineral fibre board insulation of thickness indicated:

.1 refrigeration machine water chiller(s) and suction elbow(s) – 50 mm (2") thick;

.2 uninsulated domestic hot water storage tank(s) – 40 mm (1-½") thick;

.3 shell and tube type heat exchangers – 40 mm (1-½") thick;

.4 condensate receiver(s) – 40 mm (1-½") thick;

.5 flash tanks – 40 mm (1-½") thick;

.6 hot well tank – 40 mm (1-½") thick;

.7 deaerating feedwater heater – 40 mm (1-½") thick;

.8 blow-down tank – 40 mm (1-½") thick;

.9 chilled water or chilled glycol solution storage tank – 50 mm (2") thick;

.10 heating main air separator – 40 mm (1-½") thick;

.11 chilled water expansion tank – 40 mm (1-½") thick.

.2 Install insulation as required to fit shape and contour of equipment. Secure insulation in place with adhesive, and with aluminum straps on 450 mm (18") centres. Apply a 6 mm (¼") thick skim coat of insulating cement, then, when insulating cement has dried, apply a 6 mm (¼") thick coat of cement trowelled smooth.

.3 For "cold" equipment, prime insulation with suitable sealer and apply a jacket of glass thread reinforced foil and kraft paper vapour barrier jacket material laminated in place with a full coverage of adhesive.

.4 Provide removable and replaceable insulated metal covers for equipment with removable heads to permit heads to be removed and replaced without damaging adjacent insulation work.

3.12 EQUIPMENT INSULATION REQUIREMENTS – SEMI-RIGID MINERAL WOOL

.1 Insulate following equipment with calcium silicate equipment insulation of thickness indicated:

.1 engine-generator set exhaust system silencer(s) – 75 mm (3") thick;

.2 uninsulated boiler breeching where inside the building – 75 mm (3") thick.

.2 Cut or mitre insulation (or use factory scored type insulation) to fit shape and contour of equipment and secure insulation in place with aluminum straps on 450 mm (18") centres. Point joints, mitres, scores and gaps with insulating cement. Apply a 12 mm (½") thick coat of insulating cement and trowel smooth.

3.13 EQUIPMENT INSULATION REQUIREMENTS – CLOSED CELL FOAMED GLASS

.1 Insulate following equipment with closed cell foam glass insulation of thickness indicated:

.1 [ ];

.2 [ ].

.2 Install insulation in strict accordance with manufacturer’s published instructions using adhesive, wrap, sealant, etc., to secure insulation in place, to secure and seal joints, and to produce a 100% water-tight installation.

3.14 EQUIPMENT INSULATION REQUIREMENTS – REMOVABLE/REUSABLE TYPE

.1 Provide custom designed and manufactured removable and reusable insulation covers for following:

.1 plate type heat exchanger(s);

.2 150 mm (6") dia. and larger piping strainers, backflow preventers, etc.;

.3 diesel engine exhaust manifolds;

.4 150 mm (6") dia. and larger steam traps and similar equipment.

.2 Provide "wrap type" removable and reusable insulation covers for "cold" circuit balancing valves, backflow preventers, and similar items, and for steam traps and similar items requiring service in piping less than 150 mm (6") dia.

3.15 DUCTWORK INSULATION REQUIREMENTS – MINERAL FIBRE

.1 Insulate following ductwork systems inside building and above ground with mineral fibre insulation of thickness indicated:

.1 Outdoor air and combustion air intake ductwork, casings and plenums from fresh air intakes to and including mixing plenums or sections, or, if mixing plenums or sections are not provided, to first heating coil, or if both mixing plenums or sections and heating coil sections are not provided, and fresh air is not tempered, then the fresh air ductwork system complete – minimum 40 mm (1-½") thick as required;

.2 mixed supply air or preheated supply air casings, plenums and sections to and including the fan section where not factory insulated – minimum 25 mm (1") thick rigid board or minimum 40 mm (1-½") thick flexible blanket as required;

.3 supply air ductwork outward from fans, except for supply ductwork exposed in area it serves – minimum 25 mm (1") thick rigid board or minimum 40 mm (1-½") thick flexible blanket as required;

.4 exhaust discharge ductwork for a distance of 3 m (10') downstream (back) from exhaust openings to atmosphere, including any exhaust plenums within the 3 m (10') distance – minimum 25 mm (1") thick rigid board or minimum 40 mm (1-½") thick flexible blanket as required;

.5 any other ductwork, casings, plenums, or sections specified or detailed on drawings to be insulated – thickness as specified.

.2 Provide rigid board type insulation for casings, plenums, and exposed rectangular ductwork. Provide blanket type insulation for round ductwork and concealed rectangular ductwork.

.3 Liberally apply adhesive to surfaces of exposed rectangular ducts and/or casings. Accurately and neatly press insulation into adhesive with tightly fitted butt joints. Provide pin and washer insulation fasteners at 300 mm (12") centres on bottom and side surfaces. Secure and seal joints with 75 mm (3") wide tape sealant. Additional installation requirements as follows:

.1 at trapeze hanger locations, install insulation between duct and hanger;

.2 provide drywall type metal corner beads on edges of ductwork, casings and plenums in equipment rooms, service corridors, and any other area where insulation is subject to accidental damage, and secure in place with tape sealant.

.4 Liberally apply adhesive to surfaces of concealed rectangular or oval ductwork, and wrap insulation around duct with a top butt joint and tight section to section butt joints. Provide pin and washer insulation fasteners at 300 mm (12") centres on bottom surfaces. Secure and seal joints with 75 mm (3") tape sealant. At each trapeze type duct hanger, provide a 100 mm (4") wide full length piece of rigid mineral fibre board insulation between duct and hanger.

.5 Accurately cut sections of insulation to fit tightly and completely around exposed and concealed round or oval ductwork. Liberally apply adhesive to surfaces of duct, and wrap insulation around duct with a top butt joint and tight section to section butt joints. Seal joints with tape sealant. At duct hanger locations install insulation between duct and hanger. At each hanger location for concealed ductwork where flexible blanket insulation is used, provide a 100 mm (4") wide full circumference strip of semi-rigid board type duct insulation between duct and hanger.

.6 Insulation application requirements common to all types of rigid ductwork are as follows:

.1 at duct connection flanges, insulate flanges with neatly cut strips of rigid insulation material secured with adhesive to side surfaces of flange with a top strip to cover exposed edges of the side strips, then butt the flat surface duct insulation up tight to flange insulation, or, alternatively, increase insulation thickness to depth of flange and cover top of flanges with tape sealant;

.2 installation of fastener pins and washers is to be concurrent with duct insulation application;

.3 cut insulation fastener pins almost flush to washer and cover with neatly cut pieces of tape sealant;

.4 accurately and neatly cut and fit insulation at duct accessories such as damper operators (with standoff mounting) and pitot tube access covers;

.5 prior to concealment of insulation by either construction finishes or canvas jacket material, patch vapour barrier damage by means of tape sealant.

3.16 DUCTWORK INSULATION REQUIREMENTS – FLEXIBLE ELASTOMERIC

.1 Insulate exposed exterior ductwork (except outdoor air intake ductwork) and associated plenums and/or casings outside building with minimum 75 mm (3”) thick flexible elastomeric sheet insulation as required, applied in 2 minimum 40 mm (1 ½”) thick layers with staggered tightly butted joints.

.2 Install with adhesive in strict accordance with manufacturer’s instructions to produce a weather-proof installation. Ensure sheet metal work joints are sealed watertight prior to applying insulation.

.3 Provide Calcium Silicate insulation between ductwork and duct supports. Tightly butt flexible elastomeric insulation to Calcium Silicate insulation. Cover Calcium Silicate insulation with a continuous sheet of self-adhesive multilayer jacketing which overlaps 75 mm past the Calcium Silicate insulation to the adjacent flexible elastomeric insulation.

.4 Provide extruded polystyrene tapered insulation between flexible elastomeric insulation and jacketing to allow for water runoff on all exterior duct work.

3.17 DUCTWORK INSULATION REQUIREMENTS – CALCIUM SILICATE

.1 Insulate following kitchen exhaust ductwork with minimum 40 mm (1-½") thick calcium silicate block insulation:

.1 kitchen exhaust ductwork from exhaust hood to masonry shaft – 2 hour rating;

.2 stairwell pressurization ductwork from fan to stairwell – 1 hour rating;

.3 Trauma Room and Operating Room supply and exhaust ductwork complete – 1 hour rating.

.2 Secure insulation in place with adhesive and with wire on 450 mm (18") centres. Point gaps and joints with insulating cement. Where ductwork is exposed, cover insulation with wire mesh secured to wire and with edges laced together and apply a coat of finishing cement trowelled smooth. Use drywall type metal corner bead for duct edges where finishing cement is applied.

3.18 DUCT WRAP REQUIREMENTS – FIRE RATED MATERIAL

.1 Provide blanket type fire rated duct wrap system material for following ductwork to produce fire rating indicated:

.1 kitchen exhaust ductwork from exhaust hood to masonry shaft – 2 hour rating;

.2 stairwell pressurization ductwork from fan to stairwell – 1 hour rating;

.3 Trauma Room and Operating Room supply and exhaust ductwork complete – 1 hour rating.

.2 Install duct wrap material in accordance with ULC design requirements and supplier's/manufacturer's instructions.

.3 Coordinate installation of duct wrap with installation of ductwork.

.4 Arrange and pay for duct wrap supplier to examine completed duct wrap system at site. Submit a letter from supplier to certifying duct wrap system has been properly installed.

3.19 APPLICATION OF INSULATING COATINGS

.1 Apply, in accordance with manufacturer's instruction, insulating coatings to following bare metal surfaces:

.1 paint bare metal surfaces clear of "cold" piping and/or equipment insulation for a distance of from 300 mm (12") to 600 mm (24") clear of pipe or equipment insulation, with "No Sweat-FX" anti-condensation coating;

.2 paint bare metal surfaces associated with mechanical systems with an operating temperature 60°C (140°F) with "ThermaLite" insulating coating.

.2 Apply coatings with a brush. Remove any splatter or excess coating from adjacent surfaces.

3.20 INSULATION FINISH REQUIREMENTS

.1 Unless otherwise shown and/or specified, jacket exposed mineral fibre insulation, and calcium silicate duct insulation work inside building with canvas secured in place with a full covering coat of lagging adhesive. Accurately cut canvas with scissors or a knife. Do not rip or tear canvas to size. Remove lagging adhesive splatter from adjacent uninsulated surfaces.

.2 Unless otherwise shown or specified, jacket exposed mineral fibre insulation listed below with canvas jacket secured in place with a full covering coat of coloured lagging adhesive. Accurately cut canvas with scissors or a knife. Do not rip or tear canvas to size. Remove lagging adhesive splatter from adjacent surfaces. Insulated services to receive coloured lagging adhesive are as follows:

.1 Chilled Water Piping;

.2 Chilled Glycol Piping

.3 Condenser Water Piping;

.4 Domestic Cold Water Piping;

.5 Domestic Hot Water Piping;

.6 Domestic Hot Water Recirculation Piping;

.7 High Temperature Heating Water Piping;

.8 High Temperature Heating Glycol Piping;

.9 Heating Water Piping;

.10 Condensate Drain Piping;

.11 Low Pressure Steam Piping;

.12 High Pressure Steam Piping;

.13 Indoor Ductwork;

.14 [ ].

.3 Jacket exposed pipe insulation work inside building with white sheet PVC and fitting covers. Install sheet PVC and fitting covers tightly in place with overlapped circumferential and longitudinal joints arranged to shed water. Seal joints to produce a neat water-tight installation. Provide slip-type expansion joints where required by manufacturer's instructions.

.4 Install rigid aluminum jacket material tightly in place with overlapped circumferential joints positioned to shed water and covered with butt straps supplied with the jacket. Provide aluminum jacket for following insulation:

.1 Chilled Water Piping;

.2 Chilled Glycol Piping

.3 Condenser Water Piping;

.4 High Temperature Heating Water Piping;

.5 High Temperature Heating Glycol Piping;

.6 Heating Water Piping;

.7 Condensate Drain Piping;

.8 Refrigerant Piping;

.9 Outdoor Ductwork;

.10 [ ].

.5 Install adhesive backed flexible aluminum to cleaned and primed metal surfaces which are between -23°C and 74°C (-10°F and 165°F) in strict accordance with manufacturer's published instructions and details, including shingle type overlap joints to shed water, and use of a hand roller to concentrate pressure on seams. Provide adhesive backed flexible aluminum jacket for following insulation:

.1 Chilled Water Piping;

.2 Chilled Glycol Piping

.3 Condenser Water Piping;

.4 High Temperature Heating Water Piping;

.5 High Temperature Heating Glycol Piping;

.6 Heating Water Piping;

.7 Condensate Drain Piping;

.8 Refrigerant Piping;

.9 Outdoor Ductwork;

.10 [ ].

.6 Install rigid stainless steel jacket material tightly in place with overlapped circumferential joints positioned to shed water and covered with butt straps supplied with jacket. Provide stainless steel jacket for following:

.1 Chilled Water Piping;

.2 Chilled Glycol Piping

.3 Condenser Water Piping;

.4 High Temperature Heating Water Piping;

.5 High Temperature Heating Glycol Piping;

.6 Heating Water Piping;

.7 Condensate Drain Piping;

.8 Refrigerant Piping;

.9 Outdoor Ductwork;

.10 [ ].

.7 Apply 2 heavy coats of "PITTCOTE 300e" coating with 24 hr between coats to foamed glass insulation exposed above grade.

.8 Apply 2 coats (with 24 hr between coats) of specified coating to flexible elastomeric insulation outside building.

.9 Install 3M Ventureclad series [1577CW] [1579GCW] on insulated ductwork and ensure supports are installed on the outside of the jacketing. Jacketing shall be finished as [Flat White] [Aluminum] [Aluminum Embossed]. Provide necessary insulation and jacketing materials at the time of duct work installation. Do not penetrate jacketing or install jacketing around duct supports. Provide 24GA G90 38 mm x 38 mm steel angle to protect all corners of rectangular ductwork and install between insulation and jacketing. Steel angle shall be continuous on entire duct work run. Provide additional steel angle between jacketing and duct support. Ensure jacketing is continuous with minimum 75 mm (or as required by manufacturer) overlapping on all joints. Provide jacketing on the following duct work:

.1 Exposed exterior duct work including outdoor air intake duct work, plenums and casings installed outside;

.2 Exposed interior insulated duct work;

.3 Interior outdoor air intake duct work, plenums, and casings;

.4 Single wall plenum casings (intake or exhaust) field insulated;

.5 Wherever indicated on drawings;

.10 Install 3M Ventureclad series [1577CW] [1579GCW] on exposed piping and ensure supports are installed on the outside of the jacketing. Do not penetrate or install jacketing around pipe supports. Jacketing shall be finished as [Flat White] [Aluminum] [Aluminum Embossed]. Provide galvanized insulation shield between insulation and jacketing at support points. Ensure jacketing is continuous with minimum 75 mm (or as required by manufacturer) overlapping on all joints. Provide jacketing on the following piping:

.1 Chilled water;

.2 Chilled glycol;

.3 High Temperature Heating Water;

.4 High Temperature Heating Glycol;

.5 Heating Water;

.6 Heating glycol;

.7 Low pressure steam (<104 kPa);

.8 Low pressure steam (<104 kPa) condensate;

.9 Domestic cold water piping;

.10 Domestic hot water piping;

.11 Coil condensate drain piping;

.12 Wherever indicated on drawings.

END OF SECTION

Updated through ADD#14

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 This Section specifies commissioning requirements that are common to Mechanical Divisions work Sections and it is a supplement to each Section and is to be read accordingly. When requirements of this Section contradict requirements of Division 00 or Division 01, conditions of Division 00 or Division 01 to take precedence.

1.2 REFERENCES

.1 Refer to commissioning requirements specified in Division 01.

1.3 COMMISSIONING AGENT INVOLVEMENT VERSUS WARRANTY OBLIGATIONS

.1 Involvement of Commissioning Agent performing duties as described in this Section is not in any way to void or alter any Contractual warranty obligations.

1.4 SUBMITTALS

.1 Submit to Commissioning Agent, at same time as submittal to the Consultant, one copy of each shop drawing or product data sheet associated with equipment or systems to be commissioned.

.2 Submit for review, a Commissioning Plan with schedule, commissioning procedures for commissioning events, and a copy of Commissioning Agent's commissioning data sheets for equipment/systems to be commissioned.

.3 Submit a list of commissioning instruments and for each instrument, indicate purpose of instrument and include a recent calibration certificate.

.4 Submit equipment and system manufacturer's start-up and test report sheets for review a minimum of 1 month prior to equipment and system start-up procedures.

1.5 CLOSEOUT SUBMITTALS

.1 After start-up and successful pre-functional performance testing and submittal of completed forms, submit, for each system or subsystem, a letter confirming pre-functional performance testing has been successfully completed and system or subsystem is ready for functional performance testing and commissioning process to commence.

1.6 DEFINITIONS

.1 Commissioning: process of demonstrating to Owner and Consultant, for purpose of final acceptance, by means of successful and documented functional performance testing, that systems and/or subsystems are capable of being operated and maintained to perform in accordance with requirements of Contract Documents, all as further described below.

.2 Commissioning Agent: commissioning authority who will supervise commissioning process, and who will recommend final acceptance of commissioned mechanical work.

.3 Start-Up and Adjusting: process of equipment manufacturer's/supplier's technical personnel, with Contractor, starting and operating equipment and systems, making any required adjustments, documenting process, and submitting manufacturer's/supplier's start-up reports to confirm equipment has been properly installed and is operational as intended.

.4 Pre-Functional Performance Testing: testing, adjusting and operating of components, equipment, systems and/or subsystems, by Contractor, after start-up but before functional performance testing, to confirm components, equipment, systems and/or subsystems operate in accordance with requirements of Contract Documents, including modes and sequences of control and monitoring, interlocks, and responses to emergency conditions, and including submittal of pre-functional performance testing documentation sheets.

.5 Functional Performance Testing: a repeat of successful pre-functional performance testing by Contractor, in presence of Commissioning Agent and the Consultant with completed Commissioning Agent's commissioning documentation sheets to document, validate and verify equipment, systems and subsystems are complete in all respects, function correctly, and are ready for acceptance.

.6 Commissioning Documentation Sheets: prepared sheets for pre-functional performance testing and for functional performance testing supplied by Commissioning Agent for each piece of equipment/system to be commissioned, each sheet or set of sheets complete with Project name and number, date of commissioning, equipment/system involved, equipment/system name and model number, equipment tag in accordance with drawings, and, for each commissioning procedure listed, a column giving expected data in accordance with Contract Documents, a column to fill in observed data during commissioning, and space for signatures of Contractor and Commissioning Agent.

.7 Systems Operating Manual: a manual prepared by Commissioning Agent to present an overview of building mechanical systems and equipment to be used by building maintenance personnel to assist them in daily operation of systems.

.8 Validate: to confirm by examination and witnessing tests correctness of equipment and system operation.

1.7 QUALITY ASSURANCE

.1 Commissioning work is to be in accordance with requirements of following:

.1 CSA Z320, Building Commissioning Standard and Check Sheets;

.2 ASHRAE Guideline 0, The Commissioning Process;

.3 ASHRAE Guideline 1.1, The HVAC Commissioning Process;

.4 ASHRAE Guideline 1.5, Commissioning Smoke Control Systems;

.5 Owner designated Commissioning Providert.

1.8 COMMISSIONING OBJECTIVES

.1 Objectives of commissioning process:

.1 to support quality management by means of monitoring and checking installation;

.2 to verify equipment/system performance by means of commissioning of completed installation;

.3 to move completed equipment/systems from "static completion" state to "dynamic" operating state so as to transfer a complete and properly operating installation from Contractor to Owner.

1.9 TESTING EQUIPMENT

.1 Supply instruments and test equipment required to conduct start-up, testing and commissioning procedures.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 COMMISSIONING

.1 Commission work in accordance with requirements of this Section and as required by Commissioning Agent.

.2 Prerequisites to successful completion of functional performance testing:

.1 submittal of signed start-up and test reports;

.2 completion of system testing, adjusting and balancing (TAB), and acceptance of TAB reports;

.3 permanent electrical and control connections of equipment;

.4 successful completion and documentation of pre-functional performance testing;

.5 submittal of letters to the Consultant certifying systems and subsystems have been started, tested, adjusted, successfully pre-functional performance tested, are ready for functional performance testing, and are in accordance with requirements of Contract Documents. BAS is fully programmed, graphics completed, and in AUTO.

3.2 PHASING OF COMMISSIONING

.1 If Project will be constructed in phases, phase commissioning accordingly to suit progress and phases of Work.

3.3 DEFICIENCIES LISTED DURING COMMISSIONING

.1 Correct deficiencies listed by the Consultant and Commissioning Agent during commissioning process within 15 calendar days of notification unless agreed otherwise with the Consultant, and when deficiencies have been corrected, notify the Consultant and Commissioning Agent immediately.

3.4 SYSTEMS TO BE COMMISSIONED

.1 Mechanical systems to be commissioned include, but are not to be limited to, systems described below. Specific commissioning procedures are to be as directed by Commissioning Agent.

.2 Commissioning of drainage systems includes:

.1 commissioning of drainage pumps and controls by means of tests recommended by manufacturer to confirm proper operation and performance;

.2 commissioning of equipment such as interceptors and backflow preventers.

.3 Commissioning of fire protection systems will be considered complete upon preparation and submittal by Contractor of completion certificates required by applicable NFPA Standards, demonstration of proper system operation to local Fire Chief and any other authorities, including

Owner's insurance underwriter as required, and coordination and cooperation with fire alarm system commissioning procedures, in particular smoke control systems and other such fan system control sequences.

.4 Commissioning of water systems (all piping extended from Municipal main) includes:

.1 commissioning of pumps and controls;

.2 commissioning of water heaters;

.3 commissioning of piping specialties such as backflow preventers, mixing valves, and similar components;

.4 commissioning of trap seal primer units, including adjustment of water flows and confirmation of water flow at each connected trap;

.5 commissioning of plumbing fixtures.

.5 Commissioning of compressed air system includes "head end" compressor equipment, pressure reducing equipment, and outlets.

.6 Commissioning of natural gas system includes pressure regulating equipment. Perform commissioning in accordance with requirements of CAN/CSA B149.1, and any supplemental requirements of governing authorities.

.7 Commissioning of propane gas system includes pressure regulating equipment. Perform commissioning in accordance with requirements of CAN/CSA B149.2, and any supplemental requirements of governing authorities.

.8 Perform commissioning of fuel oil system in accordance with requirements of CAN/CSA B139.

.9 Commissioning of heating systems includes piping, piping specialties, equipment, and control, as well as checking and validating temperature and flow documentation contained in TAB reports. If TAB is not done during heating season, a follow-up site visit during heating season will be required to confirm proper flows and temperatures, and any required system "fine tuning".

.10 Commissioning of cooling systems includes piping, piping specialties, equipment, and control, as well as checking and validating temperature and flow documentation contained in TAB reports. If TAB is not done during cooling season, a follow-up site visit during cooling season will be required to confirm proper flows and temperatures, and any required system "fine tuning".

.11 Commissioning of HVAC chemical treatment systems includes feed and monitoring equipment, and testing of system fluids to confirm proper concentration of chemical.

.12 Commissioning of air handling systems includes equipment, ductwork, ductwork specialties, controls, interlocks, and checking and validating air capacities and flows in accordance with TAB reports.

.13 Control work commissioning includes confirmation of proper operation of individual control components, and overall operation of controls in conjunction with operation of connected building systems, including heating season/cooling season testing requirements specified above.

.14 Commissioning of BAS includes confirmation of proper operation of components, input/output points, hardware and software, and demonstration of system performing required procedures.

.15 Commissioning of special usage room controls includes confirmation of proper operation of individual components, and proper operation of overall control system, all in accordance with governing Codes and Standards.

.16 Commissioning of noise and vibration control equipment includes noise and vibration measurements to confirm proper operation of equipment.

3.5 COMMISSIONING PROCESS

.1 Perform commissioning process in stages and include, but not be limited to, following:

.1 Stage 1: Commissioning of equipment/systems as listed in this Section, which is a prerequisite to an application for Substantial Performance of the Work and includes supervising and validating results of functional performance testing, and submittal of reviewed Systems Operating Manual.

.2 Stage 2: Commissioning work performed 12 months after issue of a Certificate of Substantial Performance and which includes supervision of Contractor's "fine tuning" of equipment/systems through seasonal occupancy, and any other such work to achieve optimal comfort and performance conditions.

.3 Stage 3: Successful completion of satisfactory equipment/system operation during 1st month after issue of a Certificate of Total Performance of the Work.

.4 Stage 4: Successful completion of satisfactory equipment/system operation during 3rd month after issue of a Certificate of Total Performance of the Work.

.5 Stage 5: Successful seasonal testing of building.

3.6 RESPONSIBILITIES OF CONTRACTOR

.1 During construction phase, Contractor is to:

.1 prepare and submit an installation schedule which includes a time schedule for each activity with lead and lag time allowed and indicated, shop drawing and working detail drawing submissions, and major equipment factory testing and delivery dates;

.2 prepare and submit a commissioning schedule which is to include a time schedule coordinated with installation schedule referred to above and Commissioning Agent, and allowances for additional time for re-tests as may be required, and update schedule on a monthly basis as required;

.3 when requested by Commissioning Agent, arrange site commissioning meetings with Owner, the Consultant, and applicable subcontractors present, to be chaired by Commissioning Agent who will also prepare and distribute meeting minutes;

.4 promptly correct reported deficient work, and report when corrective work is complete;

.5 where required by Codes and/or Specification, retain equipment manufacturers/suppliers or independent 3rd parties to certify correct installation of equipment/systems;

.6 under supervision of equipment manufacturers/suppliers, start-up and adjust equipment to design requirements, and submit start-up sheets which include equipment data such as manufacturer and model number, serial number where applicable, and performance parameters, all signed by equipment manufacturer/supplier and Contractor;

.7 complete Commissioning Agent's commissioning data sheets for multiple items of smaller equipment such as air terminal boxes, fan coil units, backflow preventers, etc., submit sheets to Commissioning Agent, accompany Commissioning Agent for an on-site check of 30% of data sheet information for each type of equipment, and perform any corrective action required as a result of site checks;

.8 perform system testing, adjusting and balancing and, when complete, issue a copy of final report to Commissioning Agent for review and a site check of results, and perform any corrective work required as a result of site checks by Commissioning Agent;

.9 in accordance with updated commissioning schedule and actual progress at site, certify in writing to the Consultant and Commissioning Agent that equipment and/or systems are complete, have been checked, started and adjusted, successfully pre-functional performance tested and documented, and are ready for functional performance testing and commissioning procedures, giving the Consultant and Commissioning Agent a minimum of 5 working days' notice;

.10 perform system and subsystem functional performance testing under supervision of Commissioning Agent, and submit to the Consultant and Commissioning Agent, completed and signed functional performance testing and commissioning data sheets (issued by Commissioning Agent) and also signed by Commissioning Agent.

.2 During post construction phase, Contractor is to:

.1 optimize system operation in accordance with building occupant’s needs and comments using System Operation Manual prepared by Commissioning Agent as reference;

.2 complete commissioning procedures, activities, and performance verification procedures that were delayed or not concluded during construction phase;

.3 accompanied by Commissioning Agent, complete system checks and "fine tuning" with signed documentation as follows:

.1 once during 1st month of building operation;

.2 once during 3rd month of building operation;

.3 once between 4th and 10th months in a season opposite to 1st and 3rd month visits.

.4 correct deficiencies revealed by system checks described above, and, where required, involve equipment manufacturers/suppliers during corrective actions, and report completion of corrective work;

.5 3 months after Substantial Completion conduct a question and answer session(s) at building with Owner’s operating and maintenance personnel, with duration of session(s) dictated by number of questions and concerns that have to be addressed.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for products specified in Part 2 of this Section except pipe and fittings.

1.2 QUALITY ASSURANCE

.1 Fire hydrants and connecting piping are to be in accordance with Municipal requirements, and following Codes and Standards:

.1 ANSI/AWWA C502, Dry Barrel Fire Hydrants;

.2 ANSI/AWWA C900, AWWA Standard for Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings;

.3 FM 1510, Fire Hydrants (dry barrel type) For Private Fire Service;

.4 CAN/ULC S520, Fire Hydrants;

.5 CSA B137.2, PVC Injection-Moulded Gasketed Fittings for Pressure Applications;

.6 CSA B137.3, Rigid Polyvinylchloride (PVC) Pipe and Fittings for Pressure Applications;

.7 AWWA C509, Resilient Seated Gate Valves for Water-Supply Service.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND JOINTS

.1 ULC listed, rigid, Class 200, DR14, 1380 kPa (200 psi) pressure rated bell and spigot pattern PVC pipe and CSA certified fittings to CSA and ANSI/AWWA Standards, complete with gasket joints, mechanical restraints, and a mechanical restraint collar for each thrust block required as per Part 3 of this Section.

2.2 FIRE HYDRANTS

.1 FM approved and ULC listed compression type, dry top, non-freeze hydrants manufactured to meet or exceed requirements of ANSI/AWWA and CAN/ULC Standards, designed for a 1035 kPa (150 psi) service pressure and a hydrostatic test pressure of 2070 kPa (300 psi), and complete with:

.1 flanged intermediate section painted with a bituminous black or epoxy coating, and with a length to suit the depth of the underground water main;

.2 Two 65 mm (2-½") dia. hose connections, each with a cap and chain and threaded to suit local Fire Department and pumper connection requirements;

.3 a bronze operating nut which opens in a counter-clock-wise direction, and a 140 mm (5-½") dia. compression type main valve;

.4 bronze to bronze interface between removable parts of main valve assembly and hydrant body;

.5 hydrant barrel complete with breakaway section at the ground line, with exposed bolts and nuts of rust and corrosion resistant alloy;

.6 150 mm (6") dia. elbow inlet connection to suit underground piping;

.7 2 coats of weatherproof epoxy enamel with colour(s) to local Municipal requirements.

.2 Manufacturers:

.1 Clow Canada M67 "Brigadier";

.2 Mueller Canada "Centurion".

2.3 FIRE HYDRANT SHUT-OFF VALVES

.1 Resilient seated, 1380 kPa (200 psi) rated, non-rising stem, FM approved and ULC listed wedge gate valves to AWWA C509, each with hub ends suitable for mechanical joint pipe connection, and an adjustable cast iron valve box (length to suit) with cover.

.2 Manufacturers:

.1 Clow Canada #F-6100 Series valve with box and cover;

.2 Mueller Canada #2360 Series with box and cover.

PART 3 - EXECUTION

3.1 MUNICIPAL SERVICE CONNECTION

.1 Make required arrangements with the Municipality for installation water service piping from Municipal main to property line.

.2 Pay all charges levied by Municipality for service connection work.

3.2 INSTALLATION

.1 Provide fire hydrants. Confirm exact locations and orientations with Consultant prior to roughing-in.

.2 Equip each hydrant with a shut-off valve and connect with piping. Provide rigid PVC piping.

.3 Conform to municipal installation standards, including provision of concrete thrust blocks at piping elbows and similar fittings.

.4 Set each valve box cover flush with finished grade in a formed 300 mm x 300 mm x 100 mm (12" x 12" x 4") thick concrete pad with a sack rubbed finish.

.5 Regardless of what is specified elsewhere in this Specification regarding provision of concrete, provide thrust block and valve box pad concrete.

3.3 SYSTEM STARTUP

.1 When installation is complete, remove hydrant nozzle caps and fully open to completely flush assembly and to test operation.

3.4 PROTECTION

.1 Touch-up paint any damaged hydrant finish.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets to regulatory authority for review and approval prior to submitting to the Consultant. Conform to following requirements:

.1 submit shop drawings/product data sheets for all products specified in this Section except pipe and fittings.

.2 sprinklers shall be referred to on drawings and product submittals and be specifically identified by the manufacturer's listed model or series designation. Trade names and other abbreviated listings are not allowed.

.3 submit complete CAD layout drawings indicating source of water supply with test flow and pressure, "head-end" equipment piping schematic, pipe routing and sizing, and zones, all signed and sealed by a qualified professional mechanical engineer registered in jurisdiction of the work as specified below.

.4 submit copies of all calculations, including hydraulic calculations, stamped and signed by same engineer who signs layout drawings, and a listing of all design data used in preparing the calculations, system layout and sizing, including occupancy-hazard design requirements.

.5 in addition to submitting shop drawings to regulatory authority as specified above, shop drawings must be approved by Owner’s insurer prior to being submitted to the Consultant for review.

1.2 CLOSEOUT SUBMITTALS

.1 Submit a complete sprinkler system test certificate as specified in Part 3 of this Section.

1.3 SPARE PARTS

.1 Fill spare sprinkler head cabinet complete with spare heads.

1.4 QUALITY ASSURANCE

.1 Fire protection sprinkler system work is to be in accordance with following Codes and Standards:

.1 NFPA 13, Standard for the Installation of Sprinkler Systems.

.2 CSA B137.2, Polyvinylchloride (PVC) Injection-Moulded Gasketed Fittings for Pressure Applications.

.3 CSA B137.3, Rigid Polyvinylchloride (PVC) Pipe for Pressure Applications.

.4 ASTM A53, Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc Coated, Welded and Seamless.

.5 ASTM A135, Standard Specification for Electric-Resistance-Welded Steel Pipe.

.6 ASTM A234, Standard Specification for Piping Fittings of Wrought Carbon Steel and Alloy Steel for Moderate and High Temperature Service.

.7 ASTM A536, Standard Specification for Ductile Castings.

.8 ASTM A795, Standard Specification for Black and Hot-Dipped Zinc Coated (Galvanized) Welded and Seamless Steel Pipe for Fire Protection Use.

.9 ANSI/ASME B16.4, Grey Iron Threaded Fittings (Classes 125 and 250).

.10 CAN/CSA B64.10, Backflow Preventers and Vacuum Breakers.

.2 Fire protection sprinkler work is to be performed by a sprinkler company who is a member in good standing of the Canadian Automatic Sprinkler Association. Site personnel are to be licensed in jurisdiction of the work and under the continuous supervision of a foreman who is an experienced fire protection system installer and a journeyman pipe fitter licensed in jurisdiction of the work.

.3 Check and verify dimensions and conditions at site and ensure work can be performed as indicated. Coordinate work with trades at site and accept responsibility for and cost of adjusting piping and/or spacing to avoid interference with other building components.

.4 Verify working condition of existing sprinkler system equipment which has direct interface with project work and is to remain. Replace with new equipment where necessary.

.5 System components must be ULC listed and labelled.

.6 All grooved couplings, and fittings, valves and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components.

.7 All castings used for coupling housings, fittings, valve bodies, etc., shall be date stamped for quality assurance and traceability.

1.5 DESIGN REQUIREMENTS

.1 Fire protection sprinkler work is to be designed in accordance with NFPA 13 and Provincial Standards, and, where required, local building and fire department requirements and standards of Owner's Insurer. If water supply flow and pressure test data is not available, conduct Municipal main water flow and pressure tests at nearest fire hydrant to obtain criteria to be used in system design. Include hydrant location and flow and pressure test data with system design calculations.

.2 Include for a qualified mechanical professional engineer registered and licensed in the jurisdiction of the work to design the fire protection standpipe work. For requirements regarding Contractor retained engineers, refer to Section 20 05 10 – Mechanical Work General Instructions.

.3 Sprinkler /System Occupancy – Hazard Design requirements: In accordance with NFPA 13 occupancy-hazard density requirements, unless otherwise specified.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND JOINTS

.1 Pipe, fittings, and joints are to be as follows, with exceptions as specified in Part 3 of this Section:

.1 PVC

.1 Class 200, DR14, rigid, hub and spigot pattern PVC pipe and CSA certified fittings to CAN/CSA B137.2 and B137.3 and complete with gasketed joints.

.2 Schedule 40 Steel – Grooved Coupling Joints

.1 Schedule 40 mild black carbon steel, ASTM A53, Grade B, complete with grooved ends and mechanical fittings and couplings equal to Victaulic "FireLock" fittings and Victaulic Style 009N, 107H, and 107N QuickVic and 005 rigid coupling joints. Strap type outlet fittings such as Victaulic "Snap-Let" are not acceptable.

.3 Schedule 40 Steel – Screwed and Welded Joints

.1 Schedule 40 mild black carbon steel, ASTM A53, Grade B. Screwed piping complete with Class 125 cast iron screwed fittings to ANSI/ASME B16.4. Welded piping complete with factory made seamless carbon steel butt welding fittings to ASTM A234, Grade WPB, long sweep pattern wherever possible.

.4 Schedule 10 Steel – Grooved Coupling Joints

.1 Schedule 10 mild black carbon steel, ASTM A53, Grade B, complete with grooved ends and fittings and couplings equal to Victaulic "FireLock" fittings and Victaulic Style 009N, 107H, and 107N QuickVic and 005 rigid coupling joints.

.5 Schedule 10 Steel – Screwed Joints

.1 Schedule 10 mild black carbon steel, ASTM A53, Grade B, complete with mill or site threaded ends, Class 125 cast iron screwed fittings to ANSI/ASME B16.4, and screwed joints.

.6 "Lightwall" Steel – Grooved Coupling Joints

.1 Commercial quality. "Lightwall" rolled mild carbon steel pipe to ASTM A135, Grade A, complete with a galvanized exterior, grooved ends, and fittings and couplings equal to Victaulic "Fire Lock" grooved fittings and Victaulic Style 009N QuickVic or 005 rigid coupling joints.

.7 "Lightwall" Steel – Screwed Joints

.1 Commercial quality, "Lightwall" rolled mild carbon steel pipe to ASTM A135, Grade A, ULC listed, mill or site threaded, complete with galvanized exterior, Class 125 cast iron screwed fittings to ANSI/ASME B16.4, and screwed joints.

.8 Flexible Pipe – Equal to Victaulic "VicFlex"

.1 The drop system shall consist of a braided type 304 stainless steel flexible tube, zinc plated steel 1" NPT Male threaded nipple for connection to branch-line piping, and a zinc plated steel reducer with a 1/2" or 3/4" NPT female thread for connection to the sprinkler head.

.2 Option: Victaulic FireLock IGS Groove Style 108 coupling for connection to branch-line piping, and a zinc plated steel reducer with a female thread for connection to the sprinkler head.

.3 The drop shall include a cULus/FM approved Series AH2 braided hose with a bend radius to 2" to allow for proper installation in confined spaces.

.4 The hose shall be listed for:

.1 (4) bends at 31" length.

.2 (5) bends at 36" length.

.3 (8) bends at 48" length.

.4 (10) bends at 60" length.

.5 (12) bends at 72" length.

.5 Union joints shall be provided for; ease of installation, prevention of hose torque stresses and on site changing of factory 5.75" straight reducing nipple in reduced spaces under obstructions (optional reducing nipples; 4.83" or 6.57" reducing 90 and 9" or 13" straight reducer x ½ or ¾" outlet) All VicFlex assemblies and related accessories to be installed as per the guidelines and listings in Victaulic submittal 10.85.

.6 On T Bar ceiling grid with drop in tile application, the flexible drop shall attach to the ceiling grid using a one-piece open gate Series AB1 bracket. The bracket shall allow installation before the ceiling tile is in place.

.7 On T Bar ceiling grid designed for hard lid drywall application; the flexible drop shall attach to the ceiling grid using a one-piece open gate Series AB2 bracket. The bracket shall allow for the vertical adjustment of the reducer/head from below the drywall, post drywall installation.

.8 On Hat Furring Channel grid with hard lid drywall application; the flexible drop shall attach to the ceiling grid using a one-piece open gate Series AB4 bracket. The bracket shall allow for the vertical adjustment of the reducer/head from below the drywall, post drywall installation.

.9 The braided drop system shall be cULus listed and FM Approved for sprinkler services to 175 psi (1206 kPa).

.10 For dry sprinkler heads Victaulic VicFlex dry sprinkler model VS1. The sprinkler shall provide a vertical or horizontal flexible connection with a bend radius to 2” and allow for up to 4 bends. The sprinkler body shall be die cast brass with brass deflector, supplied finished to match application and to architectural direction, and glass bulb with glycerin solution. The product shall consist of a braided type 300 stainless steel flexible hose with a swivel type branch line threaded connection, EPDM gasket seal, with PTFE-coated Beryllium Nickel and stainless-steel spring-seal assembly. The bracket shall be open gate or metal strap to provide for sprinkler placement and alignment. The flexible dry sprinkler and bracket system is UL listed for sprinkler services to 175 psi.

.9 Copper – Solder Joint

.1 Type "L" hard drawn seamless copper to ASTM B88, complete with copper solder type fittings to ASME/ANSI B16.18 and soldered joints.

.10 CPVC Pipe

.1 Equal to IPEX BlazeMaster solvent weld, orange, SDR 13.5 pipe and Schedule 80 fittings, ULC listed for use in wet pipe automatic sprinkler systems, with a flame spread rating less than 25 and a smoke developed rating less than 50 when tested in accordance with CAN/ULC S102.2, and in accordance with NFPA 13 requirements.

.2 Victaulic Standard Mechanical Couplings: Manufactured in two segments of cast ductile iron, conforming to ASTM A-536, Grade 65-45-12. Gaskets shall be pressure-responsive synthetic rubber, grade to suit the intended service, conforming to ASTM D-2000. Mechanical Coupling bolts shall be zinc plated (ASTM B-633) heat treated carbon steel track head conforming to ASTM A-449 and ASTM A-183. Couplings shall comply with ASTM F1476 - Standard Specification for Performance of Gasketed Mechanical Couplings for Use in Piping Applications.

.3 Rigid Type: Coupling housings with offsetting, angle-pattern bolt pads shall be used to provide system rigidity and support and hanging in accordance with NFPA 13. Couplings shall be fully installed at visual pad-to-pad offset contact. Couplings that require exact gapping of bolt pads at specific torque ratings are not permitted.

.4 Flexible Type: Use in locations where vibration attenuation and stress relief are required. Victaulic Style 177 (Quick-Vic™), Installation ready flexible coupling.

2.2 SERVICE MAIN DOUBLE CHECK VALVE ASSEMBLIES

.1 Minimum 1205 kPa (175 psi) rated dual check valve backflow preventer assembly to CAN/CSA B64, complete with tight-closing resilient seated shut-off valves, test cocks and strainer.

.2 Manufacturers:

.1 Watts Industries Canada.

.2 Zurn/Wilkins.

.3 Apollo Valves (Conbraco Industries).

2.3 SHUT-OFF VALVES

.1 Minimum 2070 kPa (300 psi) rated full port brass or bronze body screwed ball valves and lug body or grooved end type butterfly valves.

.2 Butterfly valves shall include a pressure responsive seat, and the stem shall be offset from the disc centerline to provide complete 360-degree circumferential seating.

.3 Basis of Design: Victaulic Style 705.

.4 OS&Y Gate Valves: 1725 kPa (250 psi), grooved ends. Ductile iron body, yoke, and handwheel conforming to ASTM A-536; EPDM coated ASTM A-126-B cast iron disc; ASTM B16 brass rising stem; flanged and epoxy coated ductile iron bonnet; EPDM O-ring stem seals and body gasket. Victaulic Series 771H (Grooved ends) and Series 771F (Grooved x Flanged).

.5 Supervised closed applications:

.1 Basis of Design: Victaulic Series 707C supervised closed butterfly valve.

2.4 CHECK VALVES

.1 Minimum 1725 kPa (250 psi) resilient seat check valves, suitable for vertical or horizontal installations.

.2 Basis of Design: Victaulic Series 717.

.3 Check valves associated with Fire Department connections and fire pump test connections are to be tapped for site installation of a 20 mm (¾") diameter ball drip.

2.5 BALL DRIPS

.1 Equal to National Fire Equipment Ltd. Model #A58, 20 mm (¾") diameter automatic ball drip.

2.6 SHUT-OFF VALVE SUPERVISORY SWITCHES

.1 Tamper-proof supervisory switches, each arranged to activate a fire alarm system trouble alarm condition if the valve is closed or tampered with, each suitable in all respects for the application, and each complete with all required mounting and connection hardware.

.2 Actuator housings shall be weatherproof.

2.7 FIRE DEPARTMENT CONNECTIONS

.1 Wall mounting polished brass clapper type dual inlet Fire Department connection with two 65 mm (2-½") diameter inlets threaded to Fire Department hose requirements and equipped with caps and chains, an outlet sized as shown, and a faceplate.

.2 Faceplate is to be polished brass and complete with "AUTO-SPKR" "STANDPIPE" cast-in raised lettering.

.3 Exposed metal parts of Fire Department connection are to be chrome plated.

.4 At the low point near each fire department connection, install a 90-degree elbow with drain connection to allow for system drainage to prevent freezing.

.5 Basis of Design: Victaulic #10-DR.

2.8 SPRINKLER MAIN "LOSS OF PRESSURE" ALARM SENSORS

.1 Piping mounted adjustable pressure sensor designed to actuate an alarm upon sensing a loss of pressure in the fire protection main. Switch is to be low voltage or line voltage as required.

2.9 WATER FLOW ALARM SWITCHES

.1 Pipe mounting water flow alarm switch, minimum 1725 kPa (250 psi) rated, designed to actuate two 7 A rated (at 125/250 VAC) SPDT snap action switches when water flow exceeds 0.758 L/sec. (10 Imp gpm), complete with a tamper-proof cover with conduit connection opening, a piping saddle and U-bolt, and an automatic rest pneumatic retard device with field adjustable (0 to 70 second) switch actuation delay to reduce false alarms caused by a single or series of transient water flow surges.

2.10 ELECTRIC BELL

.1 Equal to Potter PAC or PDC

.2 Surface wall mounted red steel electric bell available in VAC or VDC voltages. Mounted on a standard 4” square electrical box for indoor use or on a model BBK-1 or HC-BB weatherproof backbox for outdoor applications. UL and cUL listed.

2.11 SPRINKLER HEADS

.1 Sprinkler heads, unless otherwise specified, are to be as scheduled in Part 3 of this Section.

.2 Sprinkler body shall be die-cast, with a hex-shaped wrench boss integrally cast into the sprinkler body to reduce the risk of damage during installation. Wrenches shall be provided by the sprinkler manufacturer that directly engage the wrench boss.

.3 For locations where corrosive resistant coatings are required, body shall be coated with UL listed and FM approved anti-corrosion VC-250 coating (silver coloring).

.4 Sprinkler heads for healthcare facilities are to be quick response type.

.5 Provide quick response sprinkler heads unless standard response required to suit the hazard class.

.6 Recessed sprinkler heads in finished areas are to be chrome plated unless otherwise specified. Concealed sprinkler head ceiling plates are to match ceiling colour.

.7 Where exposed pendent heads occur in areas with suspended ceilings, they are to be complete with [chrome plated] escutcheon plates. Similarly, sidewall heads with concealed piping are to be complete with [chrome plated] escutcheon plates.

.8 Sprinkler heads which are exposed in areas where they may be subject to damage are to be complete with wire guards, [chrome plated] in finished areas.

.9 Escutcheons and guards shall be listed, supplied, and approved for use with the sprinkler by the sprinkler manufacturer.

.10 Sprinkler heads located in areas or over equipment where high ambient temperature is present are to be, unless otherwise specified, 74°C (165°F) heads. All other heads, unless otherwise specified or required, are to be 57°C (135°F) rated.

.11 Manufacturers:

.1 Victaulic Co.

.2 Tyco Fire Suppression & Building Products.

.3 The Viking Corporation.

.4 The Reliable Automatic Sprinkler Co.

2.12 SPARE SPRINKLER HEAD CABINETS

.1 Surface wall mounting, red enamelled steel, identified cabinet with hinged door, shelves with holes for mounting sprinkler heads, a wrench or wrenches suitable for each type of sprinkler head, and a full complement of spare sprinkler heads.

.2 Cabinet is to be sized to accommodate a minimum of 4 spare heads for each type of head used on the project, however, each cabinet is to be full of spare heads.

2.13 INDICATOR POST AND VALVES

.1 Cast iron, bronze trim, resilient seat, OS&Y gate valve with non-rising stem in accordance with AWWA 200W, minimum 1380 kPa (200 psi) cold water rated and complete with a square operating nut and ends to suit connecting piping.

.2 Adjustable indicator post assembly with a cast iron valve box of a length to suit valve depth and flange bolted to the valve, a cast iron lower barrel bolted to the valve box and of a length to suit valve location, and a cast iron upper housing bolted to the lower barrel and complete with wrench and operating mechanism with steel extension shaft and coupling nut sized to suit, operating handle, and valve "OPEN" and "CLOSED" identification visible through a clear polycarbonate window.

PART 3 - EXECUTION

3.1 MONITORING OF SYSTEMS

.1 Daily monitor and supervise existing sprinkler system serving renovated areas to ensure that each respective system is left in proper operating condition at end of each working day. Include for but not be limited to performing following:

.1 Under presence of Owner’s representative, check each morning and evening (start and end of work) of each day, sprinkler system to ensure that it is in proper working condition.

.2 If portions of sprinkler system are not in proper working order, provide temporary provisions subject to approval of local fire authority or local governing authority, to ensure that proper sprinkler coverage is provided and/or provide supervisory personnel to monitor areas where sprinkler system is not operational.

.3 Document and sign off with Owner’s representative signing off also, each respective daily check condition.

.4 Ensure that work to sprinkler system does not affect portion of system serving areas outside of renovation areas.

3.2 DEMOLITION

.1 Refer to demolition requirements specified in Section 20 05 05 – Selective Demolition for Mechanical.

3.3 PIPING INSTALLATION REQUIREMENTS

.1 Provide required sprinkler system piping.

.2 Perform piping work in accordance with requirements of NFPA 13, governing regulations, and "Reviewed" shop drawings.

.3 Piping, unless otherwise specified, is as follows:

.1 for underground piping inside or outside building – Class 200, DR14 rigid PVC, braced and secured at bends and tees with concrete blocks in accordance with Municipal standards and details.

.2 for piping inside building and above ground except as noted below – Schedule 40 grooved end black steel with Victaulic or equal fittings and coupling joints, or, for piping to and including 50 mm (2") diameter, screwed fittings and joints, or, for piping 65 mm (2-½") diameter and larger, welding fittings and welded joints.

.3 for wet system piping inside building and above ground – at your option, CPVC sprinkler pipe and fittings.

.4 for piping downstream of "head end" alarm valve(s) and equipment – Schedule 10 or "Lightwall" black steel pipe with Victaulic or equal fittings and coupling joints or screwed fittings and joints.

.5 for branch piping to heads in suspended ceilings, etc. – at your option, flexible piping installed in accordance with manufacturer's instructions.

.6 for branch piping to heads in MRI suites – copper pipe, fittings, and sprinkler head adapters with stainless steel hangers and support hardware.

.4 Exceptions to piping requirements specified above are as follows:

.1 dry pipe zone steel piping, fittings, unions, couplings and flanges are to be galvanized.

.2 wet zone steel piping, fittings, unions, couplings and flanges for sprinkler work exposed to weather either inside or outside building (including parking garages), are to be galvanized.

.3 PVC piping is not to be used above grade.

.4 ferrous pipe hangers, supports, and similar hardware used for galvanized steel piping are to be electro-galvanized.

.5 Pipe sizes, pipe routing, sprinkler head quantities and locations, and layout of work shown on drawings are to assist during the tendering period. Ensure adequate head coverage, head quantities and pipe sizing as specified in Part 1 of this Section. Do not reduce size of sprinkler main or re-route the main unless approved by consultant.

.6 Pipe, fittings, couplings, flanges and similar components are to be clean after erection is complete. Wire brush clean any ferrous pipe, fitting, coupling, flange, hanger, support and similar component which exhibits rust and carefully coat with suitably coloured primer.

.7 Where sprinklers are not protected by a dry system and may be subject to freezing, provide non-freeze, glycol-water solution filled sprinkler piping. Install piping complete with a CSA certified reduced pressure backflow preventer, valves, and glycol solution fill facilities in accordance with requirements of Chapter 3 of NFPA 13. Fill piping with a solution of 50% Union Carbide Canada Ltd. "UCAR THERMO-FLUID 17" or Dow Chemical Co. "Dowtherm SR1" propylene glycol with corrosion inhibitors, and 50% clean water. Prior to filling piping, check the specific gravity of the solution using a hydrometer with proper scale. Specific gravity is to be approximately 1.069 at 15.6°C.

.8 When sprinkler work is complete, test system components and overall system(s) and submit completed test certificate and other documentation in accordance with Chapter 8 of NFPA 13.

.9 Grooved joints shall be installed in accordance with the manufacturer's latest published installation instructions. Grooved ends shall be clean and free from indentations, projections, and roll marks. Gaskets shall be molded and produced by the coupling manufacturer and shall be verified as suitable for the intended service. A factory-trained field representative of the mechanical joint manufacturer shall provide on-site training for contractor's field personnel in the proper use of grooving tools and installation of grooved piping products. The factory-trained representative shall

periodically review the product installation and ensure best practices are being followed. Contractor shall remove and replace any improperly installed products.

3.4 INSTALLATION OF DOUBLE CHECK VALVE ASSEMBLY

.1 Provide a double check valve assembly in sprinkler main inside the building.

.2 Equip assembly with inlet and outlet shut-off valves with supervisory switches as specified below.

.3 Support each end of assembly from floor by means of flanged pipe supports with saddles.

3.5 INSTALLATION OF SHUT-OFF VALVES AND CHECK VALVES

.1 Provide shut-off valves and check valves in piping where shown and wherever else required.

.2 Locate valves for easy operation and maintenance.

.3 Confirm exact locations prior to roughing-in.

3.6 INSTALLATION OF SHUT-OFF VALVE SUPERVISORY SWITCHES

.1 Equip each shut-off valve with a supervisory switch.

.2 Identify each supervised valve with a 150 mm (6") square, engraved, laminated red-white plastic tag to correspond with supervised valve numbering specified and/or shown as part of the electrical work fire alarm system.

3.7 INSTALLATION OF FIRE DEPARTMENT CONNECTION

.1 Provide an exterior Fire Department connection. Confirm exact location prior to roughing-in. Confirm finish prior to ordering.

.2 Equip connection with a check valve. Equip check valve with a ball drip to drain piping between Fire Department connection and check valve and extend drainage piping from outlet of ball drip to nearest suitable floor drain.

3.8 INSTALLATION OF LOSS OF PRESSURE SENSOR

.1 Supply and mount a pressure sensor in the fire protection piping main to activate a "LOSS OF PRESSURE" trouble alarm should Municipal water service pressure fall below the acceptable level.

.2 Locate sensor for easy access and maintenance and set alarm pressure to suit site conditions. Confirm setting on site.

.3 Identify pressure sensor and its normal setting with a 150 mm (6") square red-white laminated plastic tag engraved to read "LOSS OF WATER PRESSURE SENSOR - NORMAL SETTING 210 kPa". Confirm wording prior to engraving.

3.9 INSTALLATION OF FLOW ALARM SWITCHES

.1 Provide water flow alarm switches in accessible locations in zone piping.

.2 Adjust to suit site water pressure conditions. Check and test operation.

.3 Identify each switch with a 150 mm (6") square red-white laminated engraved plastic tag. Confirm wording prior to engraving.

3.10 INSTALLATION OF SPRINKLER HEADS

.1 Provide required sprinkler heads in accordance with following schedule:

Application	Sprinkler Head Type
Healthcare Facility Type I rooms/areas as per CAN/CSA-Z317.2, Table 1, HVAC Design Criteria, first two columns	Victaulic V38/V39 or Tyco Series RFII "Royal Flush II" concealed pendent
Healthcare Facility Type II rooms/area as per CAN/CSA-Z317.2, Table 1, HVAC Design Criteria, first two columns	Victaulic V27 or Tyco Series TY-FRB recessed pendent
Healthcare Facility Type III rooms/areas as per CAN/CSA-Z317.2, Table 1, HVAC Design Criteria, first two columns	Victaulic V27 or Tyco Series TY-FRB recessed pendent
Healthcare patient unit without a suspended ceiling but with a ceiling bulkhead	Victaulic V27 or Tyco Series TY-FRB recessed horizontal sidewall Victaulic V38/V39 or Tyco Series RFII "Royal Flush II" concealed pendent or Victaulic V27 or Tyco Series TY-FRB recessed pendent in bottom of bulkhead if bulkhead is greater than 200 mm (8") deep
Healthcare Facility mental health room/areas	Tyco "RAVEN" institutional, tamper-resistant pendent or horizontal sidewall as required
Healthcare Facility MRI Suite	Reliable Model F4FR-NF non-ferrous concealed pendent
Rooms/areas with a suspended ceiling	Victaulic V38/V39 or Tyco Series RFII "Royal Flush II" concealed pendent Victaulic V27 or Tyco Series TY-FRB recessed pendent Victaulic V27 or Tyco Series TY-FRB pendent with escutcheon plates
Rooms/areas without a suspended ceiling	Victaulic V27 or Tyco Series TY-FRB pendent
Elevator shafts	Victaulic V27 or Tyco Series TY-FRB horizontal sidewall
Unheated exterior stairwells	Victaulic V36 or Tyco Series DS-1 dry pipe horizontal sidewall Victaulic V36 or Tyco Series DS-3 wet pipe horizontal sidewall

Application	Sprinkler Head Type
Air handling system outdoor air and relief air plenums (unheated)	Tyco Series DS-3 ECOH dry horizontal sidewalls in wet piping Victaulic V27 or Tyco Series TY-FRB upright or horizontal sidewall in dry pipe or anti-freeze piping
Unheated and unfinished areas	Victaulic V36 or Tyco Series DS-3 ECOH dry horizontal sidewall in wet piping Victaulic V27 or Tyco Series TY-FRB upright or horizontal sidewall in dry pipe or anti-freeze piping
Heated areas with overhead doors	Victaulic V27 or Tyco Series TY-FRB horizontal sidewall
Unheated parking garage	Victaulic V34 or Tyco Series EC-11 or EC-14 ECOH upright or Victaulic V27 or Series TY-FRB upright for dry piping
Heated parking garage	Victaulic V34 or Tyco Series EC-11 or EC-14 ECOH upright or Victaulic V27 or Series TY-FRB upright for wet piping
Parking garage ramp	Victaulic V34 or Tyco Series EC-11 or EC-14 ECOH upright or Series TY-FRB upright or Victaulic V27 or Series ELO SW-20 or SW-24 ECOH sidewall
At non-rated windows in rated walls	Tyco Model WS horizontal and pendent vertical sidewall

.2 Sprinkler head manufacturers indicated on schedule are for type indication purposes. Manufacturers are listed in Part 2 of this Section.

.3 Provide quick response type sprinkler heads for healthcare facilities.

.4 Coordinate sprinkler head locations with all drawings, including architectural reflected ceiling plan drawings, and, where applicable, electrical drawings. Coordinate sprinkler head locations in areas with suspended ceilings with the location of lighting, grilles, diffusers, and similar items recessed in or surface mounted on the ceiling as per the reflected ceiling plans. In areas with lay-in tile, centre the sprinkler head both ways in the lay-in tile wherever possible. Confirm locations prior to roughing-in.

.5 Maintain maximum headroom in areas with no ceilings.

.6 Provide guards for heads where they are subject to damage.

.7 Provide high temperature heads in equipment rooms and similar areas over heat producing or generating equipment.

3.11 INSTALLATION OF SPARE SPRINKLER HEAD CABINETS

.1 Supply a full complement (to fill cabinet) of spare sprinkler heads of types used (minimum 4 of each type) and place in a wall mounting storage cabinet located adjacent to sprinkler system "head end" equipment where later directed.

3.12 INSTALLATION OF INDICATOR POST VALVES

.1 Provide a shut-off valve in underground sprinkler main piping outside building. Equip valve with a valve box and an indicator post assembly.

.2 Confirm valve box length and steel shaft length prior to ordering and confirm exact location prior to roughing-in.

.3 When installation is complete, check and test operation of assembly and adjusts as required.

END OF SECTION

SEE ADD#2 Q#27 & 28

Deleted through ADD#16,Q#369

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets as follows:

.1 for all products specified in this section except pipe and fittings;

.2 submit complete CAD layout drawings indicating "head-end" equipment, piping schematic, pipe routing and sizing, zones, activation devices, and wiring schematics, all signed and stamped by a professional engineer registered in the jurisdiction of the work;

.3 submit copies of all calculations and a listing of all design data used in preparing the calculations, system layout and sizing, signed and stamped by the design engineer as specified above.

1.2 CLOSEOUT SUBMITTALS

.1 Submit weekly inspection reports by the system design engineer as specified below in the article entitled Quality Assurance.

.2 Submit an inspection and test report and certification by the system manufacturer’s design engineer confirming that the system is properly installed, has been tested, and is in proper operating condition, all as specified in Part 3 of this section.

.3 Training attendance records.

1.3 MAINTENANCE MATERIAL SUBMITTALS

.1 Submit three identified keys for the fire suppression agent release panel door prior to Substantial Performance.

1.4 QUALITY ASSURANCE

.1 Carbon dioxide fire suppression system work is to be in accordance with the following Codes and Standards:

.1 NFPA 12, Carbon Dioxide Fire Extinguishing System;

.2 ASTM A106, Standard Specification for Seamless Carbon Steel Pipe for High Temperature Service;

.3 ANSI B16.3, Malleable Iron Threaded Fittings;

.4 ANSI B16.11, Forged Steel Fittings, Socket Welding and Threaded;

.5 CAN/ULC-S524, Standard for the Installation of Fire Alarm Systems;

.6 CSA C22.1, Canadian Electrical Code.

.2 System installation personnel are to be licensed journeyman pipe fitters in the employ of the system manufacturer and under constant on-site supervision of a competent supervisor.

.3 The system manufacturer’s design engineer is to conduct weekly inspections during the course of the work, and submit an inspection report after each site visit. The design engineer is also to perform final inspection/start-up/programming and submit certification as specified in Part 3 of this section.

1.5 DESIGN REQUIREMENTS

.1 The system is to be designed by a professional engineer registered and licensed in the jurisdiction of the work and in the employ of the system manufacturer. The design engineer is to sign and stamp all shop drawings (not product data sheets) and design calculations.

.2 The fire suppression system is to utilize carbon dioxide gas and is to be in accordance with requirements of NFPA 12.

.3 The system is to be a permanent, piped, fixed discharge nozzle type system designed for total flooding of the gas to provide a sufficient amount of fire suppression agent to obtain a uniform (minimum) design concentration throughout the protected area while taking into account such factors as un-closable openings, "rundown" time of fans, time required for dampers to close, and any other feature of the facility that could affect gas concentration. Design concentration is to be by volume at 21°C (70°F).

.4 The system is to include but not be limited to the following main components:

.1 agent release control panel with addressable input and output modules;

.2 smoke detectors, located at maximum 37 m² (400 ft²) intervals and connected in cross-zoned circuits;

.3 a manual pull station and manual abort station at each protected area exit;

.4 audible alarm signals;

.5 visual alarm signal(s);

.6 charged cylinder(s) of carbon dioxide in re-chargeable cylinders designed to hold pressurized carbon dioxide in liquid form at atmospheric temperatures corresponding to a normal pressure of 5860 kPa (40 000 psi) at 21°C (15°F), with manifold if required, cylinder bracket(s), valve actuator(s), discharge hose/check valve assemblies, and orifice union/nipple assembly;

.7 motorized dampers;

.8 gas distribution piping system with discharge nozzles.

1.6 DESCRIPTION OF SYSTEM OPERATION

.1 Activation of any single smoke detector in any detection zone is to:

.1 transmit a first stage alarm signal to the carbon dioxide release control panel;

.2 transmit an alarm signal from the release control panel to the building fire alarm system control panel;

.3 energize a lamp on the activated smoke detector.

.2 Activation of a second smoke detector in any detector zone is to:

.1 transmit an alarm signal to the release control panel and from the release panel to the fire alarm control panel;

.2 energize auxiliary contacts for ventilation equipment shutdown and closure of motorized dampers;

.3 initiate a programmable release time delay in the release panel;

.4 initiate opening of room relief/smoke damper;

.5 actuate a local electronic alarm horn signal.

.3 Upon completion of the release panel time delay the system is to:

.1 cause a discharge signal to sound;

.2 actuate the room electronic horn to cause a second distinct signal to sound;

.3 actuate visual alarms at room entrances and within the room;

.4 energize the control solenoid for cylinder(s), thereby releasing carbon dioxide into the room;

.5 after the room relief/smoke damper has been open for a predetermined period of time, the release panel is to close the damper.

.4 The manual pull station section of the manual pull station/abort switch at each room exit, when activated, is to immediately release carbon dioxide, cause all audible and visual signal to activate, and all other system functions as if two cross-zoned smoke detectors had been activated. The manual abort section, if operated before carbon dioxide release, will interrupt the discharge of carbon dioxide.

.5 The system is to be electrically supervised and monitored for integrity of conductors, and is to be complete with:

.1 addressable interface between the carbon dioxide release control panel and the fire alarm system control panel;

.2 output signals and devices to shutdown associated room ventilation equipment;

.3 addressable communication techniques for local data acquisition and control;

.4 active/interrogative features whereby each system device is repetitively scanned, causing a signal to be transmitted to the release panel to indicate that initiating devices and signalling appliance circuit wiring is functional, with loss of signal at the release panel resulting in a trouble indication as specified herein for the particular input.

.6 System components are to be CSA certified and UL and/or ULC listed.

1.7 SYSTEM FEATURES AND SEQUENCES

.1 Features and sequences of the microprocessor based system are to include but not be limited to the following:

.1 alarm and trouble signals from intelligent reporting devices are to be digitally encoded onto a looped multiplex communication system;

.2 digitized electronic circuits are to employ check digits or multiple polling;

.3 a single ground or open on any system initiating device is not to cause system malfunction, loss of operating power, or ability to report an alarm;

.4 alarm signals arriving at the release panel are not to be lost following a power failure or power outage until the alarm signal is processed and recorded;

.5 Operation of any automatic alarm initiating device is to cause the following:

.1 an alarm signal to be transmitted to the fire alarm system control panel;

.2 the addressable device address to be indicated on the control panel;

.3 system alarm LED to flash;

.4 local signal in the carbon dioxide release panel to sound;

.5 80 character LCD display to indicate all information associated with the alarm condition, including the type of alarm point and its location;

.6 the panel to log information associated within the release panel’s condition, along with the time and date of the occurrence;

.7 system output programs assigned via control-by-event equations to be activated by the particular point in alarm to be executed, and associated system outputs (alarm signals and/or relays) to be activated.

.6 Non-emergency user operations are to be as follows:

.1 log trouble and energize the related LED for user features which modify, bypass, or inhibit normal operation of the fire alarm system, and suppress the common trouble signal during delivery of alarm signalling;

.2 operation of programming functions to utilize menu displays to guide the user through either addressable devices disconnect or view shared display troubles and other field programmable features, and restriction of the use of program by password;

.3 operation of programming functions to allow setting of display time and date, and when system is normal, annunciate "System Normal";

.4 operation of ancillary bypass features to prevent alarm operation of ancillary relays and display a trouble condition;

.5 operation of reset pushbutton to return the system to normal after initiating devices have been returned to normal.

.7 Operation of an addressable supervisory input device will sound a momentary audible signal, display on the panel alphanumeric display, and display the type, condition, and location message for the first alarm immediately without the need for operator response if no fire alarms are present, then log subsequent supervisory events for display by emergency user selection. The panel is also to display the current total number of supervisory events and chronologically number each event, and is to be complete with supervisory alarm priority to capture the display from a trouble or monitor event, and energize a respective yellow LED.

.8 System and system component operational functions and features are to be as follows:

.1 The system is to provide a means for adjusting the sensitivity of any or all anolog intelligent smoke detectors from the carbon dioxide release panel keypad or from the keyboard of a video terminal. Sensitivity range is to be within the allowed ULC window.

.2 Each intelligent addressable detector may be independently selected and enabled as an alarm verified detector. The release panel is to keep count of each time each detector has entered the verification cycle, and these counts may be displayed and reset by proper operator commands.

.3 System point operations are to include the following features:

.1 any device in the system may be enabled or disabled through the release panel;

.2 any system output point may be turned on or off from the release panel keyboard.

.4 The system is to display the following point status diagnostic functions without the need for peripheral equipment, and each point is to be annunciated for parameters listed:

.1 device status;

.2 device type;

.3 custom device label;

.4 software zone label;

.5 device zone assignments;

.6 detector analog value;

.7 all program parameters.

.9 Upon a command from the release panel operator status report is to be generated listing the system status.

.10 The release panel is to contain a non-volatile memory history buffer capable of storing up to 400 system input/output/control activations. Each activation is to be stored and time and date stamped with actual time activation, until the operator requires that the contents be displayed, at which point the history buffer may be manually reviewed, one event at a time, and the actual number of activations may also be displayed and printed.

.11 The release panel is to automatically interrogate each intelligent smoke detector and analyze detector responses over a period of time. If any detector in the system responds with a reading that is below or above normal limits, the system will enter the trouble mode and the particular detector will be annunciated on the system display. This feature will not inhibit receipt of an alarm condition.

.12 Operation of the pushbutton is to return the system to its normal state after the activated alarm initiating device(s) have been returned to normal.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND JOINTS

.1 Mild galvanized seamless steel pipe, ASTM A106, Grade C, Schedule 40, with 300 lb malleable iron screwed fittings to ANSI B16.3 and screwed joints downstream of the cylinder assembly union orifice, Schedule 80 with 20 685 kPa (3000 psi) screwed fittings to ANSI B16.11 and screwed joints for any piping upstream of the orifice union.

2.2 PIPE HANGERS AND SUPPORTS

.1 ULC listed galvanizes pipe hangers and supports as specified in Section 20 05 00 – Common Work Results for Mechanical.

2.3 ORIFICE UNION ASSEMBLIES

.1 Screwed, minimum 13 790 kPa (2000 psi) rated orifice union assembly threaded directly to manifold piping without the use of special adapters and designed to reduce pressure in the downstream piping. The assembly is to be permanently marked with the manufacturer’s name and orifice code.

2.4 DISCHARGE HOSE CHECK VALVES

.1 Flexible reinforced metallic discharge hose and check valve at the cylinder for connection to the manifold inlet.

2.5 FIRE SUPPRESSION AGENT

.1 Carbon dioxide.

2.6 STORAGE CYLINDERS

.1 DOT and TSSA approved and stamped stainless steel cylinders for vertical or horizontal mounting as required, factory filled with carbon dioxide, painted red and properly labelled, and complete with:

.1 a forged brass, pressure seat type valve and pressure gauge, and a factory set safety pressure relief device which relieves to atmosphere;

.2 one or two steel saddles (depending on cylinder length) with modular steel brackets to secure cylinders in the saddles and to permit bracketing or stacking of the cylinders as space conditions dictate.

2.7 VALVE ACTUATORS

.1 Continuous duty type, magnetic latch, 24 VDC brass valve actuators of stackable design with swivel connections to permit removal of actuators for maintenance or testing, and designed so that actuator operation will not require replacement of components.

2.8 DISCHARGE NOZZLES

.1 Baffle type permanently identified brass discharge nozzles, each sized for flow rates in accordance with system design flow calculations and complete with an inlet orifice plate with properly sized orifice machined in the nozzle body for a horizontal discharge pattern of carbon dioxide based on design coverage arrangements.

2.9 CARBON DIOXIDE RELEASE PANEL

.1 Surface wall mounting, 120 V, 60 Hz, 1-phase, microprocessor based control and annunciation panel with a NEMA 4 enamelled steel enclosure with lockable hinged door, backlit liquid crystal display, individual colour-coded system status LED's, and an alphanumeric key pad for field programming. The microprocessor is to communicate with and control the following:

.1 smoke detectors;

.2 addressable dry contacts in control and monitor modules;

.3 annunciator;

.4 printer;

.5 all other controlled devices.

.2 Programming and editing of the initial system program is to be achieved without special equipment and without interrupting the alarm monitoring functions of the panel.

.3 The microprocessor is to:

.1 communicate with, monitor and control all external interfaces with the control panel, and is to include an EPROM for system program storage, non-volatile memory for building specific program storage, and a "watch dog" timer circuit to detect and report microprocessor failure;

.2 contain and execute all control-by-event programs for specific action to be taken if an alarm condition is detected by the system, and such control-by-event programs are to be held in non-volatile memory and are not to be lost, even is system primary and secondary power failures occur;

.3 be complete with a real time clock for time annotation of system displays, printer, and history file, and time-of-day and date which is not to be lost if primary and secondary power supplies fail, and the real time clock may also be used to control non-fire functions at programmed time-of-day, day-of-week, and day-of-year.

.4 The addressable dry contact module is to connect one supervised initiating zone of conventional alarm initiating devices (any N.O. dry contact device) to one of the fire alarm panel SLC loops, and is to be complete with a LED that will flash under normal conditions, indicating that the monitor module is operational and in regular communication with the panel.

.5 The addressable two-wire detector module(s) are to connect one supervised initiating zone of conventional 2-wire smoke detectors or alarm initiating devices (any N.O. dry contact device), and each is to be complete with a LED that will flash under normal conditions, indicating that the monitor module is operational and in regular communication with the panel.

.6 The addressable control module is to supervise and control operation of one conventional signal circuit of compatible 24 VDC powered, polarized audio/visual signalling appliances. The control module signalling circuit is to be wired for Class A or B with up to 1 A of inductive signal, or 2 A of resistive signal operation, or as a dry contact (Form C) relay. The relay coil is to be magnetically latched to reduce wiring connection requirements, and to ensure that 100% of auxiliary relays or signals may be energized at the same time on the same pair of wires. The control module is to be suitable for pilot duty applications and rated for a minimum of 0.6 A at 30 VDC.

.7 The panel is to be complete with a very low frequency sweep earth detect circuit capable of detecting earth faults on sensitive addressable modules, and battery back-up power complete with:

.1 a 12 V Gel-Cell type maintenance free sealed battery of sufficient capacity to power the system for a minimum of 24 hours plus 30 minutes of alarms (including operation of all ancillary relays) upon failure of normal AC power;

.2 a battery charger for 24 hours of standby using dual-rate charging techniques for fast battery recharge, and capable of charging a completely discharged battery to 80% capacity within 12 hours;

.3 protection to prevent battery discharge through the charger;

.4 meters to indicate battery voltage and charging current.

2.10 SMOKE DETECTORS

.1 Addressable, intelligent, dual chamber, ionisation principle, ceiling mounting, interchangeable smoke detectors, each designed to plug into a separate, tamper-proof, twist-lock base containing an address switch. Each detector is to be connected to the agent release panel by means of two conductors, and is to be complete with:

.1 a power "ON" LED and an alarm LED, both arranged to flash under normal conditions and to be illuminated continuously to indicate an alarm condition;

.2 an output connection in the base to connect an external remote alarm LED;

.3 an internal identifying type code for the agent release panel or fire alarm panel to use to identify the detector as an ionisation smoke detector;

.4 the ability to measure products of combustion and, on command from the carbon dioxide release panel, send data to the panel representing analog level of products of combustion;

.5 a test means whereby detectors will simulate an alarm condition and report that condition to the release panel, with the test initiated at the detector itself by activating a magnetic switch or initiated remotely on command from the release panel.

.2 It is to be possible to set smoke detector sensitivity through the release panel and adjust sensitivity in the field by means of field programming of the system, and sensitivity may be automatically adjusted by the release panel on a time-of-day basis, or automatically by the fire alarm panel.

.3 Using software in the release panel, detectors are to automatically compensate for dust accumulation and other slow environmental changes that may affect their performance.

2.11 VISUAL ALARM STROBE LIGHTS

.1 Wall mounting 24 VDC strobe light fixture equal to GE/Edwards System Technology 891E Series, complete with a red Lexan housing and white translucent lens identified "FIRE".

2.12 AUDIBLE ALARM HORN

.1 Wall mounting 24 VDC alarm horn with electronic sounder capable of generating two different distinctive sounds upon receiving a signal from the agent release panel, and complete with all required mounting and connection hardware and accessories.

2.13 INTEGRATED MANUAL PULL STATION/ABORT SWITCH

.1 Integrated wall mounting device consisting of a suitably sized back box, a red front faceplate with device identification and clear operating instructions, and the following:

.1 a dual action manual release pull station;

.2 a momentary contact "dead man" type mushroom head pushbutton abort switch requiring constant pressure on the pushbutton to transfer a set of contacts;

.3 a white "POWER ON" LED and a red "CARBON DIOXIDE RELEASED" LED.

2.14 GAS SUPPRESSANT FLOW SWITCH

.1 Manifold mounting pressure type flow switch complete with all required mounting hardware and pipe fittings and designed to interface with the release panel to facilitate annunciation of carbon dioxide discharge.

2.15 DAMPERS

.1 Fire/Smoke Damper – Galvanized steel, low (Class 1) leakage, parallel blade dampers, ULC listed for 1½ hour fire rating, 121°C (250°F) temperature Class, and complete with:

.1 fabric reinforced silicone rubber blade edge seals and spring loaded zero clearance steel side seals;

.2 stainless steel bearings pressed into the damper frame;

.3 minimum 3.5 mm (1/8") thick galvanized steel wall sleeve with angle steel framework to secure the sleeve in place;

.4 motor and linkage mounted external to the sleeve, consisting of an open-close 24 V Belimo spring return (fail closed) damper actuator with mounting bracket and galvanized steel linkage.

.2 Backdraft Damper – Equal to Ruskin Model S2SS type 304 stainless steel backdraft damper with a 1.6 mm (1/16") thick channel frame, nylon bearings, and stainless steel linkage.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide a complete carbon dioxide fire suppression system to protect the area(s) indicated on the drawings.

.2 Install the system in strict accordance with reviewed shop drawings, the system manufacturer’s instructions, NFPA 12, and requirements of CAN/ULC-S524 and CSA C22.1.

.3 Piping: Install the flow switch (supplied loose) in manifold piping at the cylinder(s), and abide by the following piping requirements:

.1 install piping in accordance with reviewed shop drawings, securely supported, and arranged with close attention to the design layout since deviations may alter the design flow of fire suppression agent;

.2 bracket piping within 300 mm (12") of all discharge nozzles;

.3 ream all piping prior to erection, blow clear and swab with appropriate solvent to remove mill varnish and cutting oils;

.4 do not use multi-outlet fittings, other than tees, and reduce pipe sizes only in fittings;

.5 do not use flush bushings;

.6 assemble threaded joints using Teflon tape applied to male threads only;

.7 provide a dirt leg consisting of a tee and minimum 50 mm (2") long capped nipple at the end of each pipe run.

.4 Provide the required number of cylinders. Mount cylinder bracket assemblies to the wall to accommodate single row arrangement with supplied fasteners.

.5 Carefully coordinate the installation of nozzles with the location of other ceiling mounted items.

.6 As for nozzles, carefully coordinate the installation of smoke detectors with the location of other devices in the ceiling, and also coordinate with the location of equipment in the room. Secure detector bases to outlet boxes and plug-in detector heads when finishing work is complete.

.7 Strobe lights within the protected area are to be placed 2 m (6') above the highest floor level, or 150 mm (6") below the ceiling, whichever is lower. Strobe lights outside the protected area are to be located above the entering door frame(s).

.8 Supply combination fire/smoke dampers and a backdraft damper for openings as indicated and hand to the sheet metal trade at the site for installation. Supervise the installation.

3.2 WIRING

.1 Power wiring to the carbon dioxide release control panel will be done as part of the electrical work. Control wiring between the release panel and the fire alarm system control panel will be done as part of the electrical work.

.2 Do all wiring work between the release panel and system components, and all wiring between the release control panel and ventilation units for unit shut-down. Provide all relays, contacts, and related components. Install all wiring in metallic conduit in accordance with electrical work wiring requirements. Initiating device circuits are to be wired Class A. Power for initiating devices is to be from the release panel only.

.3 Provide liquid-tight flexible conduit for the final connections at the gas flow switch and cylinder solenoid valve.

.4 Wiring materials, boxes, etc., unless otherwise specified, are to be in accordance with the system manufacturer’s recommendations.

3.3 SITE TESTS AND INSPECTIONS

.1 As specified in Part 1 of this section the system design engineer is to make weekly site inspection of the work and submit inspection reports.

.2 When system installation is complete, the system manufacturer’s design engineer is to visit the site to examine the work, supervise pressure tests and a system operation test, do any release panel software programming required, and make any required adjustments.

.3 Obtain from the system manufacturer and submit to the [AHJ] [Consultant] a letter from the system design engineer stating that he/she has visited the site and reviewed the system installation and operation and that the system is in accordance with reviewed shop drawings and in proper operating condition.

3.4 TRAINING

.1 For general training requirements, refer to Section 20 05 10 – Mechanical Work General Instructions.

.2 Include for two site training sessions for a minimum of six people for 4 hours per session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for all products specified in Part 2 of this section except pipe and fittings.

1.2 CLOSEOUT SUBMITTALS

.1 Submit a copy of the plumbing inspection certificate prior to application for Substantial Performance of the Work.

.2 Submit laboratory water purity test results indicating chlorine residual prior to application for Substantial Performance of the Work.

.3 Record Documentation

.1 Retain services of a land surveyor, registered in jurisdiction of the work, to maintain an accurate record of all underground site services. Surveyor is to measure, verify and record size, location, invert elevation, pipe material, and slope of site service piping and connected products on site.

.2 When site services work is complete, surveyor is to prepare an original signed and sealed drawing, using same size and format as Contract Drawings, indicating all site services as-built information. Submit a copy of drawing to the Consultant. Include this drawing with Contract as-built record drawings.

1.3 SOILS TEST REPORT

.1 Carefully examine soils test report and include for requirements applicable as a result of the report.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND JOINTS

.1 Concrete

.1 Circular bell and spigot pattern pipe and fittings with rubber gasket joints to CAN/CSA A257 Series, produced by a member of Ontario Concrete Pipe Association in a plant which is currently approved under O.C.P.A. Plant Pre-qualification Program. Pipe less than or equal to 375 mm (15") dia. is to be non-reinforced Class 3. Pipe greater than 375 mm (15") dia. is to be reinforced Class III.

.2 PVC Sewer

.1 DR35 rigid, green PVC hub and spigot pattern sewer pipe and fittings to CAN/CSA B182.2, with gasket joints assembled with pipe lubricant.

.3 PVC Water Service

.1 ULC listed, rigid, Class 150, DR18, 1035 kPa (150 psi) pressure rated bell and spigot pattern PVC pipe to CAN/CSA B137.3, and CSA certified fittings to CAN/CSA B137.2, and AWWA C900, complete with gasket joints, and Ford "Uni-Flange" or equal restraint collars in accordance with Part 3 of this section.

.4 Soft Copper Water Service

.1 Type "K" soft copper to ASTM B88, supplied in a continuous coil with no joints if possible, and complete with, if joints are required, compression type flared joint couplings.

.5 Flexible Polyethylene

.1 Flexible polyethylene pipe to CAN/CSA B137.1, 690 kPa (100 psi) rated, complete with insertion type fittings secured with Series 300 stainless steel gear type clamps.

.6 Perforated Weeper Drainage Piping

.1 Flexible, 150 mm (6") dia. PVC perforated piping supplied in rolls and complete with a geodesic sock.

2.2 CATCH BASINS

.1 Pre-cast, water-tight reinforced concrete catch basins manufactured to ASTM C478 and Municipal standards, each sized and arranged to suit drainage pipe size and arrangement, and complete with:

.1 cast iron frame and cover to Municipal standards;

.2 required masonry work to raise top of catch basins flush with finished grade or pavement surfaces.

.2 Masonry work is to consist of cement mortar and clay or shale bricks to ASTM C32 Grade M5, or Oaks Precast Industries "MODULOC" or equal pre-cast interlocking concrete members and accessories.

2.3 MANHOLES

.1 Pre-cast, water-tight reinforced concrete manholes manufactured to ASTM C478 and Municipal standards, each sized and arranged to suit drainage pipe size and arrangement, and complete with:

.1 poured-in-place or pre-cast concrete base;

.2 cast-in-place "Safety" type aluminum steps on 300 mm (12") centres, each step coated with 2 coats of static asphalt paint;

.3 unperforated cast iron cover with lifting holes, and a matching frame;

.4 as required by manhole depth and safety regulations, cast-in-place hinged aluminum safety grating with SG 1 1 R-T6 aluminum alloy bearing bars, aluminum grate to CAN/CSA S157, and self-locking type stainless steel hinges and fasteners with galvanized steel safety chain and snap hook;

.5 required masonry work to raise top of manholes flush with finished grade.

.2 Masonry work is to consist of cement mortar and clay or shale bricks to ASTM C32 grade M5, or Oaks Precast Industries "MODULOC" or equal pre-cast interlocking concrete members and accessories.

2.4 WATER METER CHAMBER

.1 Pre-cast, water-tight reinforced concrete chamber manufactured to ASTM C478 and Municipal standards, each sized and arranged as shown and complete with:

.1 poured-in-place or pre-cast concrete base with a drain hole;

.2 cast-in-place "Safety" type aluminum steps on 300 mm (12") centres, each step coated with 2 coats of static asphalt paint;

.3 unperforated cast iron cover with lifting holes, and a matching frame;

.4 as required by chamber depth and safety regulations, cast-in-place hinged aluminum safety grating with SG 1 1 R-T6 aluminum alloy bearing bars, aluminum grate to CAN/CSA S157, and

self-locking type stainless steel hinges and fasteners with galvanized steel safety chain and snap hook;

.5 required masonry work to raise top of chamber flush with finished grade.

.2 Masonry work is to consist of cement mortar and clay or shale bricks to ASTM C32 grade M5, or Oaks Precast Industries "MODULOC" or equal pre-cast interlocking concrete members and accessories.

2.5 WATER METER

.1 Equal to Neptune Technologies Group (Canada) Ltd. "Neptune High Performance Turbine" tamper-proof, in-line serviceable meter suitable for connection of a remote automatic reading and billing unit and complete with a cast bronze main case, a roll-sealed magnetic drive register, and a turbine measuring element.

.2 Equip meter with a Neptune Technologies Group (Canada) Ltd. or equal "ARB-V" surface wall mounting automatic meter reading and billing unit with encoder register, polycarbonate housing, roll-sealed copper shell, and ABS plastic receptacle.

.3 Equip meter with Neptune Technologies (Canada) Ltd. or equal "Tricon" hardware for interface connection to building automation system for water flow and consumption monitoring.

2.6 WATER METER VALVES

.1 Shut-Off Valves

.1 Non-corrosive, minimum 1200 kPa (175 psi) cold water pressure rated, resilient seated, flanged butterfly valves, each complete with a coated cast iron lug type body, stainless steel shaft, bronze disc, and EPDM seat, and each suitable for domestic water bubble-tight dead end service with valve in position and either side of connecting piping removed. Equip butterfly valves less than or equal to 100 mm (4") dia. with lever handles. Equip butterfly valves greater than 100 mm (4") dia. with worm gear operators.

.2 Manufacturers:

.1 DeZurik #632L Series;

.2 Bray Valve and Controls Canada Series 34;

.3 Apollo Valves #143 Series;

.4 Centerline #L2000L or #G200L depending on size;

.5 Watts Industries (Canada) Inc. #BF-03.

.2 Check Valve

.1 Class 125, non-corrosive, 1380 kPa (200 psi) WOG rated horizontal swing type check valves, each approved for domestic water service and complete with flanged ends.

.2 Manufacturers:

.1 Toyo Valve Co.;

.2 Milwaukee Valve Co.;

.3 Kitz Corporation;

.4 Apollo Valves.

2.7 FIRE HYDRANTS

.1 FM approved and ULC listed, compression type, dry top, non-freeze hydrants manufactured to meet or exceed requirements of AWWA C502, designed for a 1035 kPa (150 psi) service pressure and a hydrostatic test pressure of 2070 kPa (300 psi), and complete with:

.1 flanged intermediate section painted with a bituminous black coating, and with a length to suit depth of underground water main;

.2 Two 65 mm (2-½") dia. hose connections, each with a cap and chain and threaded to CSA B89.2 (Ontario thread) to suit local Fire Department and pumper connection requirements;

.3 operating nut which opens in a counter-clockwise direction and a 140 mm (5-½") dia. compression type main valve;

.4 bronze to bronze interface between removable parts of main valve assembly and hydrant body;

.5 hydrant barrel complete with breakaway section at ground line, with exposed bolts and nuts of rust and corrosion resistant alloy;

.6 150 mm (6") dia. elbow inlet connection to suit underground piping;

.7 2 coats of weatherproof enamel with colour(s) to local Municipal requirements.

.2 Manufacturers:

.1 Clow Canada;

.2 Mueller Canada "Century".

2.8 FIRE HYDRANT SHUT-OFF VALVES

.1 Resilient seated, 1380 kPa (200 psi) rated, non-rising stem, FM approved and ULC listed wedge gate valves to AWWA C509, each with hub ends suitable for mechanical joint pipe connection, and an adjustable cast iron valve box (length to suit) with cover.

.2 Manufacturers:

.1 Clow Canada #F6100 Series valve with box and cover;

.2 Mueller #2360 Series with box and cover.

PART 3 - EXECUTION

3.1 DEMOLITION

.1 Perform required underground service piping demolition work. Refer to demolition requirements specified in Section 20 05 05 – Selective Demolition for Mechanical.

3.2 UNDERGROUND MUNICIPAL SERVICE CONNECTIONS

.1 Make required arrangements with Municipality for installation of underground service piping from Municipal main(s) to property line.

.2 Pay charges levied by Municipality for service connection work.

.3 Municipal charges for underground street service connection work will be paid out of a prime cost allowance. Submit original copies of invoices issued by Municipality for street service connection work.

3.3 EXCAVATION AND BACKFILL

.1 Refer to requirements specified in Section 20 05 00 – Common Work Results for Mechanical, and Section 31 23 00 – Excavation and Fill.

.2 Locate general reference points and take necessary precautions to prevent damage or destruction to these points. Be responsible for site services work lines, elevations, and measurements.

.3 Ensure locations of existing underground services, mechanical and electrical, are properly and accurately located and marked. Be responsible for any damage to existing services caused as a result of site services work.

.4 Excavate to a minimum of 150 mm (6") below bottom of pipe. Support pipe, unless otherwise specified, on a well compacted bed of dry, natural, undisturbed earth free from rocks or protrusions of any kind, or on compacted sand or granular B material as specified.

.5 Where unstable soil is present at bottom of trench, provide concrete saddles, pies, or other approved and suitable foundations.

.6 Retain and pay for the services of an independent testing agency to test and report on the compaction of backfill. Upon completion, obtain from testing agency and submit to the Consultant a signed and sealed report confirming all specified backfill compaction was achieved at all locations.

3.4 CONCRETE WORK

.1 Provide poured concrete work, including reinforcing and formwork, required for site services work.

.2 Concrete is to be minimum 20 700 kPa (3 000 psi) ready-mix concrete in accordance with CAN/CSA A23.1 and the Building Code.

3.5 DRAINAGE SERVICE PIPING INSTALLATION REQUIREMENTS

.1 Provide required underground drainage service piping to within 1.5 m (5') of building. Pipe, unless otherwise specified, is to be concrete or rigid PVC sewer pipe.

.2 Install and slope underground drainage piping to inverts or slopes indicated on drawings to facilitate straight and true gradients between points shown. Verify available slopes before installing pipes.

.3 At the end of each working day temporarily plug and/or cap open piping ends to prevent entry of debris or dirt.

3.6 WEEPER SYSTEM PIPING INSTALLATION REQUIREMENTS

.1 Provide sub-soil and building footing weeper system piping.

.2 Lay pipe on a 150 mm (6") bed of granular A material, then backfill 150 mm (6") above and around pipe with granular A material. Backfill remainder of trench as specified in this section.

3.7 CONNECTION OF BUILDING WEEPER SYSTEM PIPING

.1 Provide piping required to extend building weeper system piping into storm drainage piping system from connection point(s).

3.8 WATER SERVICE PIPING INSTALLATION REQUIREMENTS

.1 Provide required underground water service piping to within 1.5 m (5') of building.

.2 Piping, unless otherwise specified, is as follows:

.1 for service piping greater than or equal to 100 mm (4") dia. - rigid PVC;

.2 for service piping less than 100 mm (4") dia. - Type "K" soft copper;

.3 for distribution piping to exterior fixtures/outlets at grade level – flexible polyethylene, snaked in trench and in a continuous length wherever possible.

.3 Brace and secure underground water service pipe at bends, tees, and similar fittings with restraint devices, and provide concrete thrust blocks in accordance with Municipal or Provincial standards and details. Regardless of what is specified elsewhere in this Specification regarding provisions of concrete, provide thrust block concrete. Paint restraint devices with 2 coats of corrosion resistant black asphalt base coating and allow time to dry prior to backfilling.

.4 Lay pipes true to line and grade with bells upgrade. Fit sections together so, when complete, pipe has a smooth and uniform invert. Keep pipe thoroughly clean so jointed compound will adhere. Inspect pipe for defects before being lowered into trench.

.5 Slope piping so it can be completely drained.

.6 At the end of each working day, temporarily plug and/or cap all open piping ends to prevent entry of debris or dirt.

3.9 INSTALLATION OF MANHOLES

.1 Provide pre-cast concrete manholes. Properly bed each unit and set to required invert.

.2 Provide a reinforced pre-cast concrete base slab and bottom section for each manhole, or provide a poured-in-place concrete base. Ensure each manhole is sized to suit pipe size and arrangement. Conform to Municipal installation standards.

.3 Perform masonry work required to raise top of each assembly flush with finished grade level.

.4 When work is substantially complete, clean out each manhole.

3.10 INSTALLATION OF CATCH BASINS

.1 Provide pre-cast concrete catch basins. Properly bed each unit and set to required invert.

.2 Ensure each catch basin is sized to suit pipe size and arrangement. Conform to Municipal installation standards.

.3 Perform masonry work required to raise top of each assembly flush with finished grade level.

.4 When work is substantially complete, clean out each catch basin.

3.11 INSTALLATION OF WATER METER CHAMBER

.1 Provide a pre-cast concrete water meter chamber. Properly bed unit and set to required invert. Ensure base drain hole is placed over a granular A material soak-away area.

.2 Provide a reinforced pre-cast concrete base slab and bottom section for chamber. Ensure each chamber is properly sized and conforms to Municipal installation standards.

.3 Perform masonry work required to raise top of assembly flush with finished grade level.

.4 Provide PVC conduit with pull boxes as required and conductors from chamber to building for meter reading/BAS connections. Terminate conductors in a junction box.

.5 When work is substantially complete, clean out chamber.

3.12 SUPPLY OF WATER METER

.1 Supply domestic water service meter and hand (inside meter room) to trade installing the meter.

3.13 INSTALLATION OF WATER METER

.1 Provide domestic water service meter in meter pit. Secure meter in place on a concrete housekeeping pad and connect with piping, including a 3-valve bypass.

.2 Refer to drawing detail.

3.14 INSTALLATION OF FIRE HYDRANTS

.1 Provide fire hydrants. Confirm exact locations and orientations prior to roughing-in.

.2 Equip each hydrant with a shut-off valve and connect with piping. Piping is to be rigid PVC.

.3 Conform to Municipal installation standards, including provision of concrete thrust blocks at piping elbows and similar fittings.

.4 Set each valve box cover flush with finished grade in a formed 300 mm x 300 mm x 100 mm (12" x 12" x 4") thick concrete pad with a sack rubbed finish.

.5 Regardless of what is specified elsewhere in this Specification regarding provision of concrete, provide thrust block and valve box pad concrete.

.6 When installation is complete, remove hydrant nozzle caps and fully open to completely flush assembly and test operation.

.7 Touch-up paint any damaged hydrant finish.

3.15 TESTING AND INSPECTION OF SERVICES

.1 Prior to backfilling, test new service piping for leakage and flow in the presence of the Consultant and Plumbing Inspector. Give a minimum of 72 hours' notice for scheduled tests.

.2 Drainage Piping Leakage

.1 Perform infiltration or exfiltration tests on drainage piping as directed by the Consultant with leakage not to exceed values issued by the Consultant. Where leakage exceeds values issued, refit piping, and re-apply tests until acceptable results are obtained.

.3 Drainage Piping Flow

.1 When directed by the Consultant and/or Plumbing Inspector, perform ball flow tests on all drainage piping.

.4 Drainage Piping Interior Inspection

.1 Provide video inspection and documentation of drainage service piping after piping has been flushed and leakage tested. Give the Consultant a minimum of 72 hours' notice of inspections. Perform video inspections using an experienced specialist company in accordance with following requirements:

.1 video equipment specially designed for the purpose and videos are to be high-resolution colour videos recorded on DVD’s with audio documentation;

.2 each DVD is to be identified according to a piping segment marked on a site services drawing print by personnel performing the video work;

.3 report documenting all conditions discovered during video procedures is to be prepared by specialist company and submitted to the Consultant along with original video DVD's.

.5 Water Mains Leakage

.1 Leakage test new water mains using clean water at 1400 kPa (200 psi) for a minimum period of 8 hours with no pressure drop.

3.16 FLUSHING AND DISINFECTING WATER SERVICE PIPING

.1 Thoroughly flush domestic water service piping after leakage and flow testing is complete.

.2 Flush piping with clean water at a minimum velocity of 1.2 m/s (240 ft./min.) at 205 kPa (30 psi) minimum pressure until all foreign materials have been removed and flushed water is clear. Provide connections and pumps as required.

.3 When flushing is complete, disinfect piping with a solution of chlorine in accordance with AWWA C601.

.4 When disinfecting is complete, submit water samples to a certified laboratory for purity testing and, when testing indicates pure water in accordance with governing standards, submit a copy of test results and fill systems.

END OF SECTION

PART 1 - GENERAL

1.1 REFERENCES

.1 Domestic water piping and valves are to comply with following codes, regulations, and standards (as applicable):

.1 applicable local codes and regulations;

.2 CAN/CSA B64, Backflow Preventers and Vacuum Breakers;

.3 CAN/CSA B125.1, Plumbing Supply Fittings;

.4 CAN/CSA B125.3, Plumbing Fittings;

.5 CAN/CSA B137 Series, Thermoplastic Pressure Piping Compendium;

.6 NSF/ANSI 14, Plastics Piping System Components and Related Materials;

.7 NSF/ANSI 61, Drinking Water System Components – Health Effects;

.8 NSF/ANSI 372, Drinking Water System Components – Lead Content.

1.2 SUBMITTALS

.1 Submit shop drawings/product data sheets for all products specified in Part 2 of this Section except for pipe, fittings, and chlorine solution.

1.3 CLOSEOUT SUBMITTALS

.1 Submit laboratory water purity test results indicating chlorine residual prior to application for Substantial Performance of the Work.

.2 Prior Substantial Performance of the Work, submit a minimum of 3 identified keys for key operated hydrants.

.3 Submit signed test results and inspection and test log cards for each backflow preventer as specified in Part 3 of this Section.

.4 Submit anchor drawing(s) to detail fabrication and installation of water piping anchors. Drawing(s) are to be prepared and stamped by a professional structural engineer registered and licensed in jurisdiction of the work.

.5 As specified in Part 3 of this Section, submit a letter from anchor design engineer stating anchor installation has been examined at site and anchors are properly fabricated and installed.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND JOINTS

.1 PVC

.1 ULC listed, rigid, Class 150, DR18, 1035 kPa (150 psi) pressure rated bell and spigot pattern PVC pipe to CAN/CSA B137.3, and CSA certified fittings to CAN/CSA B137.2, and AWWA C900, complete with gasket joints, and Ford "Uni-Flange" or equal restraint collars as per Part 3 of this Section.

.2 Soft Copper

.1 Type "K" soft copper to ASTM B88, supplied in a continuous coil with no joints if possible, and complete with, if joints are required, compression type flared joint couplings.

.3 Stainless Steel

.1 Schedule 10S type 304 stainless steel, ASTM A312, factory or site roll grooved, complete with Victaulic or equal type 304 stainless steel roll grooved end fittings and, unless otherwise specified, Victaulic Style 807, 877 or 889 couplings and coupling gaskets equal to Victaulic Grade P fluoroelastomer.

.4 Copper - Solder Joint

.1 Type "L" hard drawn seamless copper to ASTM B88, complete with copper solder type fittings to ASME/ANSI B16.18 and soldered joints using The Canada Metal Co. Ltd. "SILVABRITE 100" or equal lead-free solder for cold water pipe, and 95% tin / 5% Antimony or "SILVABRITE 100" solder for other services.

.5 Copper - Pressure Coupled Joint

.1 Type "L" hard drawn seamless copper to ASTM B88 with Viega "ProPress with Smart Connect feature" copper fittings with EDPM seals, and pressure type crimped joints made by use of manufacturer recommended tool.

.6 Copper - Grooved

.1 Type "L" hard drawn seamless copper to ASTM B88 with Victaulic QuickVic Style 607 non-reducing, bolted connection type suitable and approved for application intended, 2” - 8" for copper tubing consisting of ductile iron cast housings, complete with a Grade P fluoroelastomer gasket of a pressure-responsive design, with plated nuts and bolts to secure unit together.

.7 Semi-Rigid Polyethylene Tubing

.1 Versa Fittings and Mfg. Inc. 12 mm (½") dia., high density, semi-rigid polyethylene tubing, 1380 kPa (200 psi) rated.

.8 For distribution piping and fittings from ½" to 4" inside buildings and aboveground, except for piping in vertical shafts, and penetrations through fire barriers. pipe and fittings have flame spread and smoke developed ratings less than 25/50 in accordance with CAN/ULC S102.2, and have working pressure ratings of 400 psi at 73°f and 100 psi at 180°F.

.9 CPVC

1. Ipex "Aquarise" CPVC pipe and fittings to CAN/CSA B137.6, 25/50 flame spread and smoke developed rated in accordance with CAN/ULC S102.2, and complete with primer/solvent weld joints.

2. Option: Fittings equal to Victaulic PGS-300 grooved piping system for schedule 40 and schedule 80 CPVC pipe per ASTM F441, 23447 minimum cell classification per ASTM D1784. Sizes 50 mm-300 mm (2”-12") consisting of ductile iron cast housings, complete with a grade “EHP” EPDM gasket of a pressure-responsive design, with plated nuts and bolts to secure unit together (Victaulic Style 357).

.10 Flexible Polyethylene

.1 Flexible polyethylene pipe to CAN/CSA B137.1, 690 kPa (100 psi) rated, complete with insertion type fittings secured with Series 300 stainless steel gear type clamps.

.11 Cross-Linked Polyethylene (PEX) Tubing

.1 Non-barrier type PEX piping in accordance with CAN/CSA B137.5, ASTM F876 and tested for compliance by an independent third-party agency, 25/50 flame spread/smoke developed rated when tested to CAN/ULC S102.2 and complete with brass inserts and crimp-ring or cold-expansion joint fittings and couplings.

2.2 SHUT-OFF VALVES

.1 Ball Valves

.1 Class 600, 4140 kPa (600 psi) WOG rated, lead-free, full port ball type valves, each complete with a forged brass body with solder ends, forged brass cap, blowout-proof stem, 304 stainless steel ball, "Teflon" or "PTFE" seat, and a removable lever handle. Valves in insulated piping are to be complete with stem extensions.

.2 Manufacturers:

.1 Toyo Valve Co.

.2 Milwaukee Valve Co.

.3 Kitz Corporation.

.4 Apollo Valves.

.5 Watts Industries (Canada) Inc.

.2 Butterfly Valves - Flanged Joint

.1 Non-corrosive, minimum 1200 kPa (175 psi) cold water pressure rated, resilient seated butterfly valves, each complete with a coated cast ductile iron lug type body, stainless steel shaft, bronze disc, and EPDM seat, and each suitable for domestic water bubble-tight dead end service with valve in position and either side of connecting piping removed. Butterfly valves to and including 100 mm (4") dia. are to be equipped with lever handles. Butterfly valves larger than 100 mm (4") dia. are to be equipped with worm gear operators.

.2 Manufacturers:

.1 DeZurik #632L Series;

.2 Kitz Corporation Code #6122EL/EG;

.3 Toyo Valve Co. #918BESL/EG;

.4 Bray Valve and Controls Canada Series 31;

.5 Apollo Valves #141 Series;

.6 Watts Industries (Canada) Inc. #BF-03.

.3 Butterfly Valves – Grooved End

.1 Equal to Victaulic Series 608N, for copper pipe rated to 300 psi and be both bi-directional and dead-end service capable to full rated pressure. Seat material shall be EPDM UL Classified in accordance with ANSI/NSF 61 for ambient +86°F and hot +180°F potable water service and ANSI/NSF 372.

.2 Victaulic Series 461, for stainless steel pipe rated to 300 psi and be both bi-directional and dead-end service capable to full rated pressure. Seat material shall be EPDM UL Classified in accordance with ANSI/NSF 61 for ambient +86°F and hot +180°F potable water service and ANSI/NSF 372.

2.3 CHECK VALVES

.1 Horizontal

.1 Lead-free, Class 125, bronze, 1380 kPa (200 psi) WOG rated horizontal swing type check valves with solder ends.

.2 Manufacturers:

.1 Toyo Valve Co. Fig. 237A-LF;

.2 Milwaukee Valve Co. #UP1509;

.3 Kitz Corporation Code 823;

.4 Apollo Valves #61LF Series.

.2 Vertical

.1 Equal to Kitz Corp. Code 826, lead-free, 1725 kPa (250 psi) WOG rated vertical lift check valve with soldering ends.

2.4 DRAIN VALVES

.1 Minimum 2070 kPa (300 psi) water rated, 20 mm (¾") dia., straight pattern full port bronze ball valves, each complete with a threaded outlet suitable for coupling connection of 20 mm (¾") dia. garden hose, and a cap and chain. Ball material to be 304 stainless steel.

.2 Manufacturers:

.1 Toyo Valve Co.

.2 Dahl Brothers Canada Ltd.

.3 Kitz Corporation.

.4 Apollo Valves.

.5 Watts Industries (Canada) Inc.

2.5 DOMESTIC HOT WATER PIPING BALANCING VALVES

.1 Equal to Victaulic Series 76X Low Lead Balancing Valve, lead-free and compliant with NSF-61 and NSF-372 for use in potable water applications, automatic flow limiting balancing valve (+/-5% over rated operating pressure range), complete with removable flow cartridge.

.2 Equal to Victaulic TA Series 78BL, solder or flange end type as required, ball valve style, lead-free and compliant with NSF-61 and NSF-372 for use in potable water applications, circuit balancing valves designed to facilitate precise flow measurement, precision flow balancing, and positive shut-off, complete with capped and valved drain connection, and valved ports for connection to a differential pressure meter.

2.6 PARTITION STOPS

.1 Equal to Dahl Brothers Canada Ltd. Fig. E2300 Series or equal lead-free partition stops with EDPM packing, slotted spindles, extension tubes, stainless steel access plates, and 3 identified keys.

2.7 PRESSURE REDUCING VALVES

.1 For piping less than or equal to 50 mm (2") diameter, lead-free, non-corrosive, non-ferrous direct spring acting pressure reducing valves to CAN/CSA B356, each factory set at 345 kPa (50 psi) unless otherwise specified or required, each field adjustable from 175 kPa (25 psi) to 520 kPa (75 psi) and each complete with an integral inlet strainer.

.1 Manufacturers:

.1 Apollo Valves #36HLF Series;

.2 Zurn/Wilkins #600XL Series;

.3 Watts Industries (Canada) Inc. #LF25AUB-Z3 Series;

.4 Cash-Acme EB-25 Series;

.5 Bermad Series 935-H.

.2 For piping greater than or equal to 65 mm (2-½") diameter, lead-free, non-corrosive pilot operated pressure reducing valve to CAN/CSA B356, factory set at required pressure, field adjustable, and complete with screwed or flanged connections, and brass body pilot valve with stainless steel seat.

.1 Manufacturers:

.1 Singer Valve #106 PR;

.2 Zurn/Wilkins #ZW209;

.3 Watts Industries (Canada) Inc. #LFM115 Series;

.4 Bermad Series 972.

2.8 DOMESTIC HOT WATER THERMOSTATIC MIXING VALVES

.1 Lawler Manufacturing Co. Inc. 800 Series "High-Low Thermostatic Mixer" factory assembled rough bronze thermostatic mixing valve assembly complete with rotatable union end inlet piping with check stops and stainless steel strainer screens, union outlet piping with thermometer connection, all sized as shown, and following:

.1 mixing valve with liquid motor, stainless steel piston and liner, tamper-resistant control adjustment, and 3-way protection against runaway temperatures, thermal shock, and scalding;

.2 dial type thermometer conforming to requirement specified in Section 20 05 00 – Common Work Results for Mechanical;

.3 ball type outlet shut-off valve conforming to valve requirements specified in this section;

.4 surface wall mounting enamelled steel cabinet with hinged door, key lock, and permanent identification;

.5 recessed wall mounting type 304 stainless steel cabinet with a #4 finish, hinged door, key lock, and permanent identification.

.2 Manufacturers:

.1 Lawler Manufacturing Co. Inc.;

.2 Leonard Valve Co.;

.3 Symmons Industries Inc.

2.9 CHLORINE

.1 Sodium hypochlorite to AWWA B300.

2.10 WATER METER

.1 Equal to Neptune Technology Group (Canada) Ltd. "Neptune T-10" tamper-proof, in line serviceable meter in accordance with requirements of AWWA C701 and NSF/ANSI 61, suitable for connection of a remote automatic reading and billing unit and complete with a cast bronze main case, a roll sealed register, and a positive displacement nutating disc measuring chamber.

.2 Equal to Neptune Technology Group (Canada) Ltd. "Neptune High Performance Turbine" tamper-proof, in-line serviceable meter in accordance with requirements of AWWA C701 and NSF/ANSI 61,

suitable for connection of a remote automatic reading and billing unit and complete with a cast bronze main case, a roll-sealed magnetic drive register, and a turbine measuring element.

.3 Equip meter with a Neptune Technology Group (Canada) Ltd. or equal "ARB-V" surface wall mounting automatic meter reading and billing unit with encoder register, polycarbonate housing, roll-sealed copper shell, and ABS plastic receptacle.

.4 Meter is also to be complete with Neptune Technology (Canada) Ltd. or equal "Tricon" hardware for interface connection to building automation system for water flow and consumption monitoring.

2.11 INTERIOR HOSE BIBBS

.1 Flush-Concealed

.1 Recessed, 92 mm (3-5/8") deep, recessed, encased wall hydrant with lockable bronze or stainless steel box with hinged cover identified "WATER", bronze interior parts, a screwdriver operated stop in the supply, key operated control valve, 20 mm (¾") dia. hose connection, and a vacuum breaker.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. #HY-330.

.2 Jay R. Smith #5509QT-CL-SAP;

.3 Zurn #Z1350;

.4 Mifab #MHY-55;

.2 Semi-Recessed - Finished Areas

.1 Anti-siphon type, 100 mm (4") deep hose bibb with stainless steel face with operating key, bronze interior parts, 20 mm (¾") dia. solder inlet, 20 mm (¾") dia. hose connection, and integral vacuum breaker.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. #HY-430.

.2 Jay R. Smith #5619-SAP-98;

.3 Zurn #Z1333 "ECOLOTROL";

.4 Mifab #MHY-30;

.3 Surface – Exposed – Cold Water – Unfinished Areas

.1 Brass or bronze hose bibb with hose end vacuum breaker.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. #SC8-1;

.2 Jay R. Smith #5609QT-SAP.

.3 Zurn/Wilkins # Z1341 with hose end vacuum breaker;

.4 Chicago Faucets #293-E27CP;

.4 Exposed – Unfinished Areas – Hot and Cold Water

.1 Mixing faucet for surface mounting.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. #HY-300-2-VB.

.2 Jay R. Smith #5560QT-LB-SAP;

.3 Zurn #Z841L1-RC;

.4 Delta Commercial #28T8083;

2.12 EXTERIOR NON-FREEZE WALL HYDRANTS

.1 Flush-Concealed

.1 Recessed, encased, self-draining hydrants, each complete with a copper casing, operating rod assembly to suit wall thickness, polished nickel bronze box with hinged locking cover, 20 mm (¾") dia. threaded hose connection outlet, vacuum breaker, and a loose tee handle operating key.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. #HY-725.

.2 Jay R. Smith #5519-98;

.3 Zurn #Z1320;

.4 Mifab #MHY-26;

.2 Semi-Recessed

.1 Self-draining hydrants, each complete with a copper casing, operating rod assembly to suit the wall thickness, 20 mm (¾") dia. threaded hose connection outlet, vacuum breaker, and a loose tee handle operating key.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. #HY-420.

.2 Jay R. Smith #5619-98;

.3 Zurn #Z1321;

.4 Mifab #MHY-16;

2.13 EXTERIOR NON-FREEZE GROUND HYDRANTS

.1 Flush

.1 Flush with grade mounting, encased head, self-draining bronze hydrants, each complete with a casing and operating rod assembly to suit the depth of piping bury, valve housing with drain port, grade box with hinged lockable cover and drain port, 20 mm (¾") dia. threaded hose connection, and a loose tee handle operating key.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. #HY-500.

.2 Jay R. Smith #5810-N-NV;

.3 Zurn #Z1360;

.4 Mifab #MHY-60;

.2 Exposed

.1 Self-draining exposed head bronze post hydrants, each complete with a casing and operating rod assembly to suit the height of hose outlet above grade and the depth of piping bury, valve

housing with drain port, 20 mm (¾") dia. threaded hose connection assembly with vacuum breaker and gravel guard, and a loose tee handle operating key.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. #HY-600.

.2 Jay R. Smith #5910-NV-H;

.3 Zurn #Z1385;

.4 Mifab #MHY-65;

2.14 NON-FREEZE ROOF HYDRANT

.1 Woodford Mfg. Model RHY2-MS non-freeze roof hydrant with 25 mm (1") diameter inlet connection, 20 mm (3/4") diameter hose end outlet with dual check backflow preventer, a 3.2 mm (1/8") diameter inlet connection drain hole to automatically drain hydrant when shut-off, a mounting system with cast iron support and under deck flange, and required mounting hardware and accessories.

2.15 FLOOR DRAIN TRAP SEAL PRIMERS

.1 Primer Valve Type

.1 Precision Plumbing Products Inc. Model P2-500 trap primer valve, constructed of brass, adjustable to high or low water pressures and complete with "O" ring seals, 12 mm (½") threaded inlet and outlet connections, and, for priming two traps from the same primer, a DU-2 dual outlet distribution unit.

.2 Primer Valve Type with Manifold

.1 Precision Plumbing Products Inc. Model P1-500 trap primer valve constructed as specified above for the Model P2-500 primer valve, complete with a Model DU-3 or DU-4, 3 or 4 outlet distribution unit for priming 3 or 4 traps, and at Model "YS-8" supply tube with combinations of Model DU-3 and DU-4 distribution units for priming from 5 to 6 traps.

.3 Electronic Type

.1 Precision Plumbing Products #PT Series surface wall mounting, CSA certified, 115 volt, 1-phase, 60 Hz., electronic, automatic trap priming manifolds, each sized to suit the number of drain traps or interceptors serviced, and each complete with:

.1 galvanized steel cabinet with door;

.2 20 mm (¾") dia. NPT copper pipe inlet with shut-off valve and water hammer arrestor;

.3 solenoid valve, an atmospheric vacuum breaker, and a discharge manifold with 12 mm (½") dia. compression type copper tube connections on 40 mm (1-½") centres with quantity to suit the number of items to be primed;

.4 control panel with circuit breaker, 5 ampere fuse, 24 hour timer, and manual override toggle switch.

2.16 SHOCK ABSORBERS

.1 Type 304 stainless steel piping shock absorbers, each complete with a nesting type bellows and a casing of sufficient displacement volume to dissipate kinetic energy generated in piping system, and each sized to suit connecting water pipe and equipment it is provided for.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. "SG" Series.

.2 Jay R. Smith 5000 Series "HYDROTROL";

.3 Zurn #Z1700 "SHOKTROL";

.4 Mifab "HAMMERGUARD" WHB Series;

2.17 WATER HAMMER ARRESTORS

.1 Piston type, sealed, all stainless steel construction, pressurized water hammer arrestors suitable for either vertical or horizontal installation, each complete with a pressurized compression chamber, welded nesting-type expansion bellows surrounded by non-toxic mineral oil, and a male treaded nipple connection.

.2 Manufacturers:

.1 Jay R. Smith 5000 Series;

.2 Precision Plumbing Products "SS" Series.

.3 Piston type, sealed, pressurized water hammer arrestors suitable for either horizontal or vertical installation, each complete with a hard drawn copper body, "O"-ring piston seals, an air charge, and an inlet opening equal to diameter of pipe in which arrestor is required.

.4 Manufacturers:

.1 Watts Industries (Canada) Inc. LF05 or LF15M2;

.2 Zurn #Z1260;

.3 Precision Plumbing Products Inc. SC Series;

.4 Mifab MWH Series.

2.18 BACKFLOW PREVENTERS

.1 Double Check Valve Assembly

.1 Minimum 1205 kPa (175 psi) rated lead-free dual check valve assembly backflow preventer to CAN/CSA B64 (including supplements), complete with tight-closing resilient seated shut-off valves, test cocks and strainer.

.2 Manufacturers:

.1 Watts Industries Canada;

.2 Zurn/Wilkins;

.3 Apollo Valves (Conbraco Industries).

.2 Reduced Pressure Zone Assembly

.1 Lead-free reduced pressure zone assembly backflow preventer in accordance with CAN/CSA B64 (including supplements), each of bronze or epoxy coated cast iron bronze fitted construction depending on size, and complete with inlet strainer, inlet and outlet shut-off valves, an intermediate relief valve, ball valve type test cocks, and a proper air gap fitting.

.2 Manufacturers:

.1 Watts Industries #LF009QT-S for 12 mm (½") size, #LF909QT-S for 20 mm to 50 mm (¾" to 2") size, and #LF909-NRS-S for 65 mm (2-½") and larger size;

.2 Zurn/Wilkins 975XL2 and 375 Series;

.3 “Apollo” Valves manufactured by Conbraco Industries Inc. Series 4ALF;

.4 Danfoss Flomatic Corp. Series RPZ.

2.19 PIPING EXPANSION COMPENSATORS AND GUIDES

.1 Pressurized type, selected to withstand system pressure and to suit calculated movement from -5°C (23°F) to maximum operating temperature plus 25% safety factor, complete with stainless steel bellows and shroud, copper tube sweat type female ends, anti-torque device, and proper and suitable alignment guides for both sides of each compensator.

.2 Manufacturers:

.1 Senior Flexonics Series HB;

.2 Hyspan Precision Products Series 8500.

2.20 PIPE ANCHORS

.1 Welded structural black steel anchors of a design, size, and type to securely anchor pipe at point shown. Each anchor is to withstand 150% axial thrust, and is to be designed and detailed by a professional structural engineer registered and licensed in jurisdiction of the work. Submit anchor design and fabrication shop drawings, stamped by design engineer.

2.21 LAVATORY SUPPLY FITTING TEMPERING VALVES

.1 Equal to Powers "HydroGuard" Series 490, model LM490 12 mm (½") dia. or model LM491 20 mm (¾") dia. as required, each CSA B125 certified, forged brass, tamper-proof thermostatic mixing valves, adjustable for water supply between 29°C and 49°C (85°F and 120°F), sized to suit number of lavatories in grouping, and complete with a stop and check valve and a lockable handle.

.2 Each mixing valve is to be complete with a stainless steel flush wall mounting cabinet with vandal-proof hinged door.

2.22 AIR VENTS

.1 Equal to ITT Hoffman Specialty No. 78 cast brass, 1035 kPa (150 psi) rated, 20 mm (¾") straight water main vent valves, each tapped at the top for a 3.2 mm (1/8") safety drain connection.

2.23 DOMESTIC WATER THERMAL EXPANSION TANK

.1 Pre-charged domestic water thermal expansion tank in accordance with Section VIII of the ASME Boiler and Pressure Code, carbon steel outer shell construction and complete with fixed butyl rubber bladder to prevent water from contacting shell interior, top NPT stainless steel system connection, 7.6 mm to 813 mm (0.301" to 32") charging valve connection and prime painted exterior.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. Series DETA;

.2 Zurn/Wilkins Model WTTA.

PART 3 - EXECUTION

3.1 DEMOLITION

.1 Refer to demolition requirements specified in Section 20 05 05 – Selective Demolition for Mechanical.

3.2 UNDERGROUND MUNICIPAL SERVICE CONNECTION

.1 Make required arrangements with Municipality for installation of domestic water service piping from Municipal main to property line.

.2 Pay charges levied by Municipality for service connection work.

.3 Municipal charges for underground street service connection work will be paid out of a prime cost allowance. Submit original copies of invoices issued by Municipality for street service connection work.

3.3 PIPING INSTALLATION REQUIREMENTS

.1 Provide required domestic water piping.

.2 Piping, unless otherwise specified, is as follows:

.1 for underground piping 100 mm (4") dia. and larger outside and/or inside the building – rigid PVC;

.2 for underground piping less than 100 mm (4") dia. inside building – Type "K" soft copper;

.3 for pipe 75 mm (3") dia. and larger inside building and above ground – Schedule 10 stainless steel;

.4 for 12 mm (½") dia. trap seal primer tubing located underground or in concrete or masonry construction – semi-rigid polyethylene;

.5 for pipe inside building and aboveground in sizes to 100 mm (4") dia., except in vertical shafts and through fire barriers – rigid CPVC;

.6 for branch hot and cold piping aboveground from mains and risers to fixtures and equipment where fire rated construction is not penetrated – at your option, PEX tubing installed and joined in strict accordance with manufacturer's instructions; when installed in unfinished areas, ensure piping is protected from ultra-violet light exposure.

.7 for underground piping outside building to fixtures/outlets at grade level – flexible polyethylene, snaked in the trench and in a continuous length wherever possible;

.8 for pipe inside building and aboveground in sizes to 100 mm (4") dia. – Type "L" hard copper with solder joints.

.1 Option: Type "L" hard copper with pressure coupled mechanical joints.

.2 Option: Type "L" hard copper with grooved end mechanical joints.

.1 Grooved pipe ends shall be clean and free from indentations, projections and roll marks in the area from pipe end to groove for proper gasket sealing. All couplings will meet Victaulic standards for visual inspection sizes 2" to 8". The gasket style and elastomeric material (grade) shall be verified as suitable for the intended service as specified. Install in accordance with manufacturer's latest recommendations. A Victaulic factory trained representative shall periodically visit the job site and review the installation for best practices. The installing Contractor shall correct any identified deficiencies. Victaulic product that has been examined

and has not met the visual inspection criteria for proper installation must be corrected and re-examined by Victaulic prior to the completion of the project.

.3 Brace and secure underground water service pipe at bends, tees, and similar fittings with restraint devices, and provide concrete thrust blocks in accordance with Municipal standards and details. Regardless of what is specified elsewhere in this Specification regarding provisions of concrete, provide thrust block concrete. Paint restraint devices with 2 coats of corrosion resistant black asphalt base coating prior to backfilling.

.4 Lay pipes true to line and grade with bells upgrade. Fit sections together so that, when complete, pipe has a smooth and uniform invert. Keep pipe thoroughly clean so jointed compound will adhere. Inspect pipe for defects before being lowered into trench.

.5 Slope piping so it can be completely drained.

.6 Provide cast brass dielectric type adapters/unions at connections between ferrous and copper pipe or equipment.

3.4 INSTALLATION OF SHUT-OFF AND CHECK VALVES

.1 Refer to Part 3 of Section 20 05 00 – Common Work Results for Mechanical.

.2 For shut off valves installed on solder joint copper piping up to and including 75 mm (3") diameter, provide ball type valves, and for flanged joints copper or stainless steel piping larger than 75 mm (3") diameter provide butterfly type valves.

3.5 INSTALLATION OF DRAIN VALVES

.1 Provide a drain valve at the bottom of domestic water piping risers, at other piping low points, and wherever else shown.

.2 Locate drain valves so they are easily accessible.

3.6 INSTALLATION OF DOMESTIC HOT WATER PIPING BALANCING VALVES

.1 Provide balancing valves in domestic hot water recirculation piping where shown or required.

.1 for pipe 25 mm (3/4”) dia. and less ground – equal to Victaulic Series 76X

.2 for pipe greater than 25 mm (3/4”) dia. – equal to Victaulic TA Series 78BL

.2 Locate each valve so it is easily accessible.

3.7 INSTALLATION OF PARTITION STOPS

.1 Provide partition stops in domestic water piping to each group of suite washroom plumbing fixtures. Locate partition stops in piping near floor level in inconspicuous but accessible locations. Confirm exact locations prior to roughing-in.

3.8 INSTALLATION OF PRESSURE REDUCING VALVES

.1 Provide domestic water pressure reducing valves. Install so each valve is readily accessible. Whenever possible, provide pressure reducing valves factory pre-set to required pressures.

.2 Check and test operation, and adjust as required.

3.9 INSTALLATION OF DOMESTIC HOT WATER THERMOSTATIC MIXING VALVES

.1 Provide a domestic hot water thermostatic mixing valve assembly and wall mount.

.2 Adjust each valve to design requirements and check and test operation. Set maximum temperature limit stops.

.3 Identify each valve and its water temperature delivery setting with an engraved nameplate.

3.10 INSTALLATION OF WATER METER

.1 Provide domestic water service meter. Secure meter in place on a concrete housekeeping pad and connect with piping, including required valve by-pass.

.2 Installation of water meter must comply with local municipal requirement.

3.11 INSTALLATION OF HOSE BIBBS

.1 Provide hose bibbs.

.2 Unless otherwise shown, specified, or required, mount hose bibbs approximately 1 m (3') above floor. Confirm exact locations prior to roughing-in.

3.12 INSTALLATION OF EXTERIOR NON-FREEZE WALL HYDRANTS

.1 Provide non-freeze wall hydrants.

.2 Install hydrants level and plumb such that hose outlets are approximately 600 mm (2') above grade level. Confirm exact locations prior to roughing-in.

.3 Provide a shut-off valve inside building to each exterior non-freeze wall hydrant.

3.13 INSTALLATION OF EXTERIOR NON-FREEZE GROUND HYDRANTS

.1 Provide non-freeze ground hydrants. Confirm exact locations prior to roughing-in.

.2 Ensure length of piping to outlet box suits depth of underground piping, and underground piping elbow and valve housing is set in an envelope of clean sharp, 100% Proctor density compacted sand. Provide a length of small bore copper tubing from valve drain port into sand envelope.

.3 Provide a shut-off valve inside building to each ground hydrant.

3.14 INSTALLATION OF NON-FREEZE ROOF HYDRANT

.1 Provide non-freeze roof hydrants. Confirm exact locations prior to roughing-in.

.2 Coordinate installation with trades providing roof opening and roofing work to ensure a water-tight roof penetration.

.3 Provide 3.2 mm (1/8") diameter drain piping from inlet connection assembly inside building to a funnel floor drain or other suitable indirect connection location.

3.15 INSTALLATION OF TRAP SEAL PRIMERS

.1 Provide required accessible trap seal primers to automatically maintain a water seal in floor drain traps, whether shown on drawings or not.

.2 Water closet flush valves may be used for priming washroom floor drain traps if flush tube is properly tapped and primer tubing exposed in washroom is chrome plated.

.3 Provide trap primer valves to prime single or multiple (1 to 6) traps. Install trap primer valves in domestic cold water piping to frequently used plumbing fixtures. Where from 2 to 6 traps are to be

primed from same primer valve, provide appropriate supply and distribution tube assemblies. Ensure primer valves are accessible.

.4 Provide 115 volt, electronic, surface wall mounting trap primer assemblies for multiple (4 to 30) traps. Include for a 115 volt 15 ampere panel breaker and wiring in conduit from closest panelboards to primer assembly, all to wiring standards of Electrical Division. Adjust primer water flow and timing to suit number of traps served.

.5 Ensure trap primer piping is secured to floor drain primer tappings and not terminated through the tapping in the throat of the drain.

3.16 INSTALLATION OF SHOCK ABSORBERS

.1 Provide accessible shock absorbers in make-up water piping to equipment.

.2 Ensure size of each shock absorber is properly selected to suit size of water pipe and equipment pipe is connected to.

.3 Install down stream of backflow preventor.

3.17 INSTALLATION OF WATER HAMMER ARRESTORS

.1 Provide accessible water hammer arrestors in domestic water piping in locations as follows:

.1 in headers at groups of plumbing fixtures;

.2 at top of risers;

.3 at ends of long horizontal runs of piping;

.4 in piping connecting solenoid valves or equipment with integral solenoid valves;

.5 wherever else shown or required by Code.

.2 Install each unit in a piping tee either horizontally or vertically in the path of potential water shock in accordance with manufacturer’s instructions and details.

3.18 INSTALLATION OF BACKFLOW PREVENTERS

.1 Provide a reduced pressure zone assembly backflow preventer on incoming DCW service and in each direct domestic water connection to equipment other than plumbing fixtures and fittings.

.2 Provide a double check valve assembly backflow preventer on incoming DCW service. Provide a reduced pressure zone assembly backflow preventer in each direct domestic water connection to equipment other than plumbing fixtures and fittings.

.3 Locate each backflow preventer on floor or wall between 765 mm (30”) and maximum 1.5 m (60") above floor such that it is easily accessible for maintenance and testing.

.4 Equip each reduced pressure zone backflow preventer with an air gap fitting and pipe the reduced pressure zone water outlet to drain.

.5 Test operation of each backflow preventer in accordance with requirements of CAN/CSA B64 by personnel certified for such testing by governing authorities, and submit signed test results and a properly and clearly identified and marked inspection and test record card for each backflow preventer.

3.19 INSTALLATION OF EXPANSION COMPENSATORS, GUIDES, AND ANCHORS

.1 Provide expansion compensators in domestic water piping.

.2 Ensure pipe ends are properly aligned. Provide alignment guides on each side of expansion compensators, properly secured to building structure.

.3 Provide anchors to secure domestic water piping to structure. Locate anchors generally where shown but with exact locations to suit piping as installed and requirements of reviewed anchor shop drawings.

.4 When installation of anchors is complete, arrange, and pay for anchor design engineer to visit site to review anchor installation. Submit a letter from design engineer confirming each anchor is properly installed.

3.20 INSTALLATION OF LAVATORY SUPPLY FITTING TEMPERING VALVES

.1 Provide thermostatic water tempering valves for hot water supply to public washroom lavatory supply fittings. Conceal valves and piping.

.2 Provide a flush wall mount panel for each valve. Confirm exact location prior to roughing-in.

.3 Install in accordance with manufacturer’s instructions and set mixing valves to deliver 32°C (90°F) tempered water.

3.21 INSTALLATION OF AIR VENTS

.1 Provide accessible air vents in domestic water piping to prevent air binding.

.2 Extend copper indirect drain piping from top drain connection of each vent to nearest suitable drain.

.3 Locate exact vent locations on as-built record drawings.

3.22 INSTALLATION OF DOMESTIC WATER THERMAL EXPANSION TANKS

.1 Provide domestic water thermal expansion tanks.

.2 Unless otherwise specified, mount at least 450 mm (18") from cold water inlet to domestic water heater.

.3 Adjust pre-charge to match incoming water pressure after installation.

.4 Install in accordance with manufacturer’s instructions and as per local governing Codes and Regulations.

3.23 FLUSHING AND DISINFECTING PIPING

.1 Flush and disinfect all new and/or reworked domestic water piping after leakage testing is complete.

.2 Isolate new piping from existing piping prior to flushing and disinfecting procedures.

.3 Flush piping until all foreign materials have been removed and flushed water is clear. Provide connections and pumps as required. Open and close valves, faucets, hose outlets, and service connections to ensure thorough flushing.

.4 When flushing is complete, disinfect the piping with a solution of chlorine in accordance with AWWA C601.

.5 When disinfecting is complete, submit water samples to a certified laboratory for purity testing and, when testing indicates pure water in accordance with governing standards, submit a copy of test results and fill the systems.

END OF SECTION

SEE ADD#4
Q#109

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for all equipment and associated hardware specified in this Section.

1.2 CLOSEOUT SUBMITTALS

.1 Submit manufacturer/supplier installation certification letters as specified in Part 3 of this Section.

.2 Submit, prior to Substantial Performance of the Work, start-up or test data specified in Part 3 of this Section.

PART 2 - PRODUCTS

2.1 COPPER SILVER IONIZATION SYSTEM FOR POTABLE WATER

.1 Description: Ion Chamber Cell(s):

.1 The ionization chamber cell will be constructed of Schedule 40 stainless steel (or) powder coated aluminum to meet fire building codes and international plumbing codes when applicable. CPVC Schedule 80 Chamber cells will be allowed when building fire codes do not apply to said facility potable water distribution network.

.2 The use of either Victaulic couplings or flange type connections

.3 When multiple chamber cells are required, such ion chamber cells must be installed in parallel to each other and not end to end as to prevent ionic re-deposition.

.4 Safety activation flow switch or flow meter as proposed by the manufacturer's recommendation and application process.

.5 Manufacturer will include a properly sized commercial grade flow meter. The flow meter will provide a 4-20 mA output signal to the automated ion controller for variable ionization process.

.6 Must identify type of waterproof engineering and pressure tolerance levels. Must also include the storage shelf life of the ionization chamber cells.

.7 Minimum operational water pressures of between 40 PSI to 200 PSI in any liquid water temperature or 33 degrees F (1 degree C) up to 176 degrees F (80 degrees C) for a period of no less than 12 consecutive hours.

.8 Having a water flow capacity of up to 45 GPM (170 LPM) each ion chamber cell

.9 Only one (1) ion chamber cell per automated 10-12 amps / 0-100 VDC drive or 10-12 amps / 0 VDC-180 VDC output.

.10 Electrode MSDS composition demonstrating alloy purity and trace elements present in the electrodes. Report must be by an independent 3rd party.

.11 Provide NSF61 documentation on all wetted components.

.12 Usage lifespan (warranty) of the ionization chamber cells must be associated to one (1) ion chamber cell only. Each chamber cell must be capable of treating no less than 20,000 US-GPD per day and last for a period of no less than 9 months.

.13 Replacement chamber cells "Spare cells" that extend the perceived warranty "lifespan" of an originally installed chamber cell will not be allowed.

.14 The internal electrodes will be composed of 99.99% pure copper (Cu) and 99.99% silver (Ag).

.15 The Cu and Ag alloy ratio will be no less than 90% Cu / 10% Ag and no more than 60% Cu / 40% Ag. The provider will indicate the composition of the proposed alloy.

.16 The solution will have less than 5 psi drop in water pressure post treatment.

.2 Description: Fully Automated PID (Computer & Software) Ion Controller

.1 Fully automated industrial grade (PID) copper silver ion generator capable of treating the required amount of daily potable water usage within the intended facility location.

.2 The copper silver ionization controller (s) must be able to generate via amperage set points between 0.2 - 0.4 ppm Cu and 0.02 - 0.04 ppm Ag within the DHW loop over existing pre-start-up.

.3 Manufacturers:

.1 AquaLyse / CSI Defender (Canada) by: ProCare Water Treatment Inc.

.2 EPI by Enrich Products Ionization (USA).

.3 Liquitech Inc. (USA).

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide copper-silver ionization system.

.2 Install system in accordance with manufacturer's instructions and recommendations, and make required piping connections.

.3 Coordinate installation with other trades making connections to equipment, namely control and power connections.

.4 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical. After installation is complete, charge system and test for leaks and test and adjust controls and safeties. Repair leaks and retest until no leaks occur. Replace any damaged or malfunctioning controls and equipment.

.5 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical. Submit a copy of the letter prior to Substantial Performance of the Work.

3.2 TRAINING

.1 Include for 4 hours of on-site training for 2 groups of 6 people. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for all products specified in this Section except pipe and fittings.

1.2 CLOSEOUT SUBMITTALS

.1 Submit a copy of plumbing inspection certificate prior to application for Substantial Performance of the Work.

.2 Submit letters from product manufacturers/suppliers to certify correct installation of products as specified in Part 3 of this section.

.3 Record Drawings: Indicate inverts of new below grade sanitary and storm piping on as-builts drawings.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND JOINTS

.1 PVC Sewer

.1 DR35 rigid, green PVC hub and spigot pattern sewer pipe and fittings to CAN/CSA B182.2, with gasket joints assembled with pipe lubricant.

.2 DR35 rigid, PVC sewer pipe and fittings, with solvent weld joints, all certified to CSA B182.1 and colour-coded as per local governing codes, regulations and standards.

.2 PVC - DWV

.1 For Low Buildings: Equal to IPEX System 15 drain, waste and vent pipe and fittings to CAN/CSA B181.2, complete with a flame spread rating not more than 25 when tested to CAN/ULC S102.2, with solvent weld joints or MJ Grey mechanical joint couplings, and, for fire barrier penetration, approved firestop conforming to CAN/ULC S115.

.2 For High Buildings and Plenums: Equal to IPEX System XFR drain, waste and vent pipe and fittings to CAN/CSA B181.2, complete with a flame spread rating not more than 25 and a smoke developed classification not more than 50 when tested to CAN/ULC S102.2, with solvent weld joints or MJ Grey mechanical joint couplings, and, for fire barrier penetration, approved firestop conforming to CAN/ULC S115.

.3 Copper - Solder Joint

.1 Type DWV hard temper to ASTM B306, with forged copper solder type drainage fittings and 50% lead - 50% tin solder joints.

.4 Cast Iron

.1 Class 4000 cast iron pipe, fittings, and mechanical coupling joints to CAN/CSA B70.

.5 Copper-Victaulic Coupling Joint

.1 Type DWV hard temper to ASTM B306, with factory or site rolled grooved ends (with grooving rolls designed for copper) and Victaulic "Copper Connection" wrought copper or cast bronze fittings and Style 606 gasket type couplings.

.6 Galvanized Steel - Victaulic Coupling Joint

.1 Schedule 40 mild steel, galvanized, ASTM A53, factory or site rolled grooved, complete with Victaulic galvanized ductile iron grooved end fittings and, unless otherwise specified, Victaulic Style 77 hot dip galvanized mechanical joint couplings with Grade M gaskets.

.7 PVC Weeper Piping

.1 150 mm (6") dia. corrugated perforated PVC pipe with an integral geodesic sock, supplied in coils.

2.2 SHUT-OFF AND CHECK VALVES

.1 Shut-off Valves

.1 Class 600, 4140 kPa (600 psi) WOG rated full port ball valves, each complete with a forged brass body, blowout-proof stem, chrome plated solid brass ball, solder or screwed ends as required, and removable lever handle.

.2 Manufacturers:

.1 Toyo Valve Co. Fig. 5049A or Fig. 5044A;

.2 Milwaukee Valve Co. #BA-155 or #BA -125;

.3 Kitz Corporation Code 58 or Code 59;

.4 Victaulic Co. of Canada Ltd. Series 722;

.5 Apollo Valves # 77-100 or # 77-200;

.6 Watts Industries (Canada) Inc. #FBVS-3C.

.2 Check Valves

.1 Class 125, bronze, 1725 kPa (250 psi) WOG rated vertical lift check valve with solder or screwed ends as required, and, for horizontal piping, Class 125, bronze 1380 kPa (200 psi) WOG rated swing check valves with solder or screwed ends.

.2 Manufacturers:

.1 Toyo Valve Co. Fig. 231 or Fig. 236 or Fig. 237;

.2 Milwaukee Valve Co. #1510 or #510;

.3 Kitz Corporation Code 36 or Code 22 or Code 23.

2.3 VENT STACK COVERS

.1 Equal to Lexcor Model "Flash-Tite" seamless, spun aluminum, insulated vent stack covers with caps and a factory applied asphalt primer coating on top and bottom of flange.

.2 Each vent stack cover is to be complete with a vandal-proof cap.

2.4 CLEANOUTS

.1 Horizontal Piping

.1 TY pipe fitting with an extra heavy brass plug screwed into the fitting.

.2 Vertical Piping

.1 Bronze or copper cleanout tees in copper piping, each complete with a bronze ferrule, and, for cast iron piping, "BARRETT" type cast iron cleanout tees, each gas and water-tight and complete with a bolted cover.

.3 Urinal(s)

.1 Wall access cleanout assemblies, each complete with a tapered plug, threaded brass insert, urethane rubber seal, and polished stainless steel access cover with vandal-proof stainless steel securing screw.

.2 Manufacturers:

.1 Watts Industries (Canada) Ltd. #CO-590-RD.

.2 Jay R. Smith #SQ4-1819;

.3 Zurn #ZSS-1666-1;

.4 Mifab #C1440-RD;

2.5 FLOOR CLEANOUT TERMINATIONS

.1 Factory finished cast iron terminations, each adjustable and complete with a cast iron body with neoprene sleeve, solid, gasketed, polished nickel-bronze scoriated top access cover to suit floor finish, a seal plug, and captive, vandal-proof, stainless steel securing hardware.

.2 Manufacturers:

.1 Watts Industries (Canada) Ltd. # CO-200-R-1.

.2 Jay R. Smith #4020-F-C Series;

.3 Zurn # ZN-1602-SP Series;

.4 Mifab # C1100-XR-1 or #C1000-R-3;

.3 Cleanout terminations in areas with a tile or sheet vinyl floor finish are to be as above but with a square top in lieu of a round top.

2.6 FLOOR DRAINS, FUNNEL FLOOR DRAINS, AND HUB DRAINS

.1 Unless otherwise specified or indicated, floor drains are to be vandal-proof drains in accordance with drawing symbol list, each complete with a cast iron body and a trap seal primer connection. Cast iron components are to be factory finished with latex based paint coating.

.2 Floor drains in areas with a tile or sheet vinyl floor finish are to be as above but with a square grate in lieu of a round grate.

.3 Manufacturers:

.1 Watts Industries (Canada) Ltd.;

.2 Jay R. Smith Manufacturing Co.;

.3 Zurn Industries Ltd.;

.4 Mifab Inc.

2.7 ROOF DRAINS

.1 Unless otherwise specified or indicated, roof drains are to be cast iron body drains with aluminium domes, in accordance with the drawing symbol list. Cast iron components are to be factory finished with a latex based paint coating.

.2 Manufacturers:

.1 Watts Industries (Canada) Ltd.;

.2 Jay R. Smith Manufacturing Co.;

.3 Zurn Industries Ltd.;

.4 Mifab Inc.

2.8 DRAINAGE TRENCH FRAMES AND GRATING

.1 Welded, hot dipped galvanized, 45 mm x 45 mm x 6.4 mm (1-¾" x 1-¾" x ¼") carbon steel angle frame, 300 mm (12") wide, with anchor straps and lengths as required, and baked epoxy coated cast iron slotted grating in 600 mm (24") long sections.

.2 Manufacturers:

.1 Watts Industries (Canada) Ltd. #TD-910-B1-4;

.2 Jay R. Smith #2971VP.

.3 Zurn # Z796VP;

2.9 TRENCH DRAINS

.1 Modular, pre-sloped, polyester fibreglass construction interlocking sections of drainage channel with overlapping joints, drain pipe connection outlets as required, end caps and covers to suit the application, integral anchor tabs for grate anchoring and trench levelling, heavy-duty coated steel angle top frames, and heavy-duty coated cast iron slotted grate supplied in 600 mm (24") long sections.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. “Dead Level” Series;

.2 Jay. R. Smith #9810 Series.

.3 Zurn "Flow-Thru" System;

.4 ACO Systems Ltd. "ACOdrain";

2.10 INTERIOR CATCH BASIN FRAMES AND COVERS

.1 Heavy-duty, 508 mm (13") square, baked epoxy coated cast iron, non-removable, hinged slotted grate with coated steel frame with concrete anchors.

.2 Manufacturers:

.1 Watts Industries (Canada) Ltd. #FD-410;

.2 Jay R. Smith #8915FC;

.3 Zurn #Z-799-1;

.4 Mifab #F1570.

2.11 BACKWATER VALVES

.1 Heat bonded powder epoxy coated cast iron in-line type, each complete with a bolted and gasketed cover, bronze flapper, stainless steel extension, and stainless steel hardware.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. BV-230-R Series;

.2 Jay R. Smith #7022-CAN.

.3 Zurn #Z-1095-15-MJ;

2.12 EXTENDABLE BACKWATER VALVES

.1 Equal to “Mainline Adapt-a-valve” ABS/PVC backwater valve cassette with ABS/PVC flush cap cleanout for use with ABS or PVC pipe. Provide extension piece cut to length to extend valve access to finished floor level. Provide flush cap cleanout cover to match backwater valve size and material.

2.13 EXTERIOR CATCH BASINS

.1 Pre-cast reinforced concrete catch basins manufactured to ASTM C478 and Municipal standards, each sized and arranged to suit drainage pipe size and arrangement, and complete with:

.1 cast iron frame and cover to Municipal standards;

.2 required masonry work to raise top of catch basins flush with finished grade or pavement surfaces.

.2 Masonry work is to consist of cement mortar and clay or shale bricks to ASTM C32 Grade M5, or Oaks Precast Industries "MODULOC" pre-cast interlocking concrete members and accessories.

2.14 EXTERIOR MANHOLES

.1 Pre-cast reinforced concrete manholes manufactured to ASTM C478 and Municipal standards, each sized and arranged to suit drainage pipe size and arrangement, and complete with:

.1 poured-in-place or pre-cast concrete base;

.2 cast-in-place "Safety" type aluminum steps on 300 mm (12") centres, each step coated with 2 coats of static asphalt paint;

.3 unperforated cast iron cover with lifting holes and a matching frame;

.4 as required by manhole depth and safety regulations, cast-in-place hinged aluminum safety grating with SG 1 1 R-T6 aluminum alloy bearing bars, aluminum grate to CAN/CSA S157, and self-locking type stainless steel hinges and fasteners with galvanized steel safety chain and snap hook;

.5 required masonry work to raise top of manholes flush with finished grade.

.2 Masonry work is to consist of cement mortar and clay or shale bricks to ASTM C32 grade M5, or Oaks Precast Industries "MODULOC" pre-cast interlocking concrete members and accessories.

2.15 GREASE INTERCEPTORS

.1 Grease intercepting and recovery unit of #11 gauge type 304 stainless steel construction with sensor controlled grease draw-off solenoid valve, automatic shut-down with audible/visual alarm if maximum grease capacity is exceeded, integral heating element with thermostat, gasketed stainless steel cover, stainless steel solids interceptor, and remote surface wall mounting indicator panel with status indicating lights, audible alarm, 115/24 volt control transformer and NEMA 2 enclosure.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. WD-E Series;

.2 Jay R. Smith #8000-ELECT series or #8400-ELECT series.

.3 Zurn #Z1172-UN series;

2.16 OIL INTERCEPTORS

.1 Epoxy coated steel construction automatic oil interceptor with removable baffles, deep seal trap with cleanout, sediment bucket, aluminum frame and cover, and remote wall mounting indicating panel with status indicating lights, audible alarm, 115/24 volt control transformer, and NEMA 2 surface wall mounting enclosure.

.2 Manufacturers:

.1 Watts Industries (Canada) Inc. OI-SS / HI 7873 Series;

.2 Jay R. Smith 8500-SC-ELECT-CAN Series.

.3 Zurn #Z1198 series;

PART 3 - EXECUTION

3.1 DEMOLITION

.1 Refer to demolition requirements specified in Section 20 05 05 – Selective Demolition for Mechanical.

3.2 UNDERGROUND MUNICIPAL SERVICE CONNECTION

.1 Make required arrangements with Municipality for installation of drain service piping mains from Municipal main to property line.

.2 Pay charges levied by Municipality for service connection work.

.3 Municipal charges for underground street service connection work will be paid out of a prime cost allowance. Submit original copies of invoices issued by Municipality for street service connection work.

3.3 DRAIN AND VENT PIPING INSTALLATION REQUIREMENTS

.1 Provide required drainage and vent piping. Pipe, unless otherwise specified, as follows:

.1 for underground pipe inside building and to points 1.5 m (5') outside building lines – rigid PVC sewer pipe, minimum 75 mm (3") dia.;

.2 for pipe inside building and aboveground in sizes less than or equal to 65 mm (2-½") dia. – type DWV copper;

.3 for pipe inside building and aboveground in sizes greater than or equal to 75 mm (3") dia. – Class 4000 cast iron;

.4 for pipe inside building and aboveground in lieu of type DWV copper and cast iron, at your option and where permitted by governing Codes and Regulations – rigid PVC DWV;

.5 for drainage pump discharge pipe connections from pump to and including shut-off and check valve connections – Type "DWV" copper with Victaulic "Copper Connection" fittings and couplings, or Schedule 40 galvanized steel with Victaulic fittings and couplings.

.2 Unless otherwise specified, slope horizontal drainage piping aboveground in sizes to and including 75 mm (3") dia. 25 mm (1") in 1.2 m (4'), and pipe 100 mm (4") dia. and larger 25 mm (1") in 2.4 m (8').

.3 Install and slope underground drainage piping to inverts or slopes indicated on drawings to facilitate straight and true gradients between points shown. Verify available slopes before installing pipes.

.4 Unless otherwise specified, slope horizontal branches of vent piping down to fixture or pipe to which they connect with a minimum pitch of 25 mm (1") in 1.2 m (4').

.5 Extend vent stacks up through roof generally where shown but with exact locations to suit site conditions and in any case a minimum of 3 m (10') from fresh air intakes. Terminate vent stacks a minimum of 330 mm (13") above roof (including roof parapets) in vent stack covers. Where not shown on drawings, route vent piping from source to building exterior as required in order to satisfy local governing codes and authority. Coordinate vent routing with other building services and ensure there is no architectural impact.

.6 Provide cast brass dielectric unions at connections between copper pipe and ferrous pipe or equipment.

3.4 INSTALLATION OF SHUT-OFF AND CHECK VALVES

.1 Provide a shut-off valve and a check valve in discharge piping of each drainage pump.

.2 Locate valves so they are easily accessible without the use of ladders or other such devices.

3.5 SUPPLY OF VENT STACK COVERS

.1 Supply a properly sized vent stack cover for each vent stack penetrating roof.

.2 Hand vent stack covers to roofing trade at site for installation and flashing into roof construction as part of roofing work. Coordinate installation to ensure proper locations. Provide waterproofing caps over vent stacks.

3.6 INSTALLATION OF CLEANOUTS

.1 Provide cleanouts in drainage piping in locations as follows:

.1 in building drain or drains as close as possible to inner face of outside wall, and, if a building trap is installed, locate cleanout on downstream side of building trap;

.2 at or as close as practicable to the foot of each drainage stack;

.3 at maximum 15 m (50') intervals in horizontal pipe 100 mm (4") dia. and smaller;

.4 at maximum 30 m (100') intervals in horizontal pipe larger than 100 mm (4") dia.;

.5 in the wall at each new urinal or bank of urinals in a washroom;

.6 wherever else shown on drawings.

.2 Cleanouts are to be same diameter as pipe in piping to 100 mm (4") dia., and not less than 100 mm (4") dia. in piping larger than 100 mm (4") dia.

.3 Where cleanouts in vertical piping are concealed behind walls or partitions, install cleanouts near floor and so cover is within 25 mm (1") of the finished face of the wall or partition.

3.7 INSTALLATION OF FLOOR CLEANOUT TERMINATIONS

.1 Where cleanouts occur in horizontal inaccessible underground piping, extend cleanout TY fitting up to floor, and provide a cleanout termination set flush with finished floor.

.2 In waterproof floors, ensure each cleanout termination is equipped with a flashing clamp device. Cleanout terminations are to suit floor finish.

.3 Where cleanout terminations occur in finished areas, confirm locations prior to rough-in and arrange piping to suit.

.4 Ensure cleanout termination covers in tiled floor are square in lieu of round.

3.8 INSTALLATION OF FLOOR DRAINS, FUNNEL FLOOR DRAINS AND HUB DRAINS

.1 Provide floor drains, funnel floor drains and hub drains.

.2 Coordinate location of floor drains, funnel floor drains and hub drains with equipment provided by Mechanical Division and Owner's supplied equipment. Install in accordance with manufacturer's instructions.

.3 Equip each drain with a trap.

.4 In equipment rooms and similar areas, exactly locate floor drains to suit location of mechanical equipment and equipment indirect drainage piping. In washrooms, exactly locate floor drains to avoid interference with toilet partitions.

.5 Confirm exact location of drains prior to roughing in. Where floor drains occur in washrooms coordinate locations with toilet partition installations.

.6 Temporarily plug and cover floor drains during construction procedures. Remove plugs and covers during final clean-up work and when requested, demonstrate free and clear operation of each drain. Replace any damaged grates, and refinish any areas of the drain where cast iron finish has been damaged or removed, including rusted areas.

3.9 INSTALLATION OF ROOF DRAINS

.1 Supply roof drains and place roof drain bodies in position for flashing into roof construction as part of roofing work. Connect with piping and provide accessories.

.2 Protect roof drains from damage and entrance of debris until roofing work is complete, and refinish any areas where cast iron factory finish has been damaged or removed, including rusted areas.

3.10 INSTALLATION OF DRAINAGE TRENCH FRAMES AND GRATING

.1 Supply frame and grating sections for drainage trench. Provide piping connections, traps, etc., as required.

.2 Hand frames to concrete trade forming and pouring trenches. Ensure frames are properly and accurately installed.

.3 Be present during concrete pour to ensure frames are not dislodged or damaged and remain straight and true. Immediately report any problems.

.4 Install grates and secure in place. Temporarily cover grates during construction procedures. Clean trenches when work is complete.

3.11 INSTALLATION OF TRENCH DRAINS

.1 Provide pre-sloped sections of drainage channel and install so top frames are level and plumb in relation to floor finishes. Provide accessories, traps, etc., as required.

.2 Be present during concrete pour to ensure trench drainage is not dislodged or damaged and remains straight and true. Immediately report any problems.

.3 Install grating and secure in place.

.4 Temporarily cover trench drainage openings during construction procedures. Clean trenches when work is complete.

3.12 INSTALLATION OF INTERIOR CATCH BASIN FRAMES AND COVERS

.1 Supply frames and hinged grates for interior catch basins and provide sump inlet and outlet piping and accessories.

.2 Hand frames to concrete trade pouring concrete sump, and coordinate installation of sump piping with the formwork installation.

.3 Install grates and secure in place. Clean sumps when work is complete.

3.13 INSTALLATION OF BACKWATER VALVES

.1 Provide backwater valves in drainage piping and connect with piping.

.2 Set backwater valve assembly such that cover is flush with finished floor. Provide an extension piece if required due to depth of piping.

3.14 INSTALLATION OF EXTERIOR MANHOLES

.1 Provide pre-cast concrete manholes. Properly bed each unit and set to required invert.

.2 Provide a reinforced pre-cast concrete base slab and bottom section for each manhole, or provide a poured-in-place concrete base. Ensure each manhole is sized to suit pipe size and arrangement. Conform to Municipal installation standards.

.3 Provide masonry work required to raise top of each assembly flush with finished grade level.

.4 When work is substantially complete, clean out each manhole.

3.15 INSTALLATION OF EXTERIOR CATCH BASINS

.1 Provide pre-cast concrete catch basins. Properly bed each unit and set to required invert.

.2 Ensure each catch basin is sized to suit pipe size and arrangement. Conform to Municipal installation standards.

.3 Provide masonry work required to raise top of each assembly flush with finished grade level.

.4 When work is substantially complete, clean out each catch basin.

3.16 INSTALLATION OF DRAINAGE INTERCEPTOR

.1 Provide an interceptor in drainage piping.

.2 Ensure unit is easily accessible for maintenance. Confirm exact location prior to roughing-in.

.3 Wall mount control panel and provide required 24 volt control wiring in conduit from control panel to interceptor.

.4 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.5 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical. Submit a copy of the letter prior to Substantial Performance of the Work.

.6 Include for 2 hours of on-site training for 2 groups of 6 people. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

Updated through ADD#10

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for all products specified in this section, except piping and valves.

1.2 CLOSEOUT SUBMITTALS

.1 Submit a letter from compressor manufacturer/supplier to certify proper compressor set installation as specified in Part 3 of this section.

.2 Training attendance records.

1.3 QUALITY ASSURANCE

.1 Compressed air piping system work is to be in accordance with the following:

.1 CSA B51, Boiler, Pressure Vessel, and Pressure Piping Code;

.2 ASME B31, Standards of Pressure Piping;

.1 ASME-B31.1 – Power Piping.

.3 ASME/ANSI B16 - Standards for Pipes and Fittings.

.4 and governing Provincial and/or Municipal Codes and Regulations.

.1 O.Reg. 220/01 - Boiler and Pressure Piping Regulation.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS AND JOINTS

.1 Galvanized Steel

.1 Schedule 40 mild steel, galvanized, ASTM A53, screwed, complete with Class 125 galvanized cast iron screwed fittings and screwed joints.

.2 Copper

.1 Type "L" hard drawn seamless copper to ASTM B88, complete with forged solder type fittings to suit pipe, and soldered joints using 95% tin / 5% Antimony solder.

2.2 PIPING UNIONS

.1 Screwed Steel Piping

.1 Malleable iron, galvanized, ground joint, brass to iron or bronze to bronze seat unions and union elbows with a minimum pressure rating of 1725 kPa (250 psi) steam at 260°C (500°F).

.2 Soldered Copper Piping

.1 Solder-on forged copper or bronze screwed unions suitable in all respects for the application.

2.3 LOW PRESSURE SHUT-OFF VALVES

.1 Class 600, 4140 kPa (600 psi) WOG rated full port ball valves, each complete with a forged brass or bronze body with solder joint or screwed joint ends as required, forged brass cap and blowout-proof stem, forged brass chrome plated ball, "Teflon" or "PTEF" seat, and a removable lever handle.

.2 Manufacturers:

.1 Toyo Valve Co. Fig. 5049A solder or Fig. 5044A screwed;

.2 Watts Industries (Canada) Ltd. #FBV-3 or #FBVS-3;

.3 Kitz Corporation Code 59 solder or Code 58 screwed;

.4 Apollo Valves #70-100 screwed or #70-200 solder.

2.4 HIGH PRESSURE SHUT-OFF VALVES

.1 Equal to Apollo Valves #70-100-27, 4140 kPa (600 psi) rated Class 600, screwed bronze ball valve with a PTFE seat, automatic relief vent, and removable lever handle.

2.5 DRAIN VALVES

.1 Minimum 2070 kPa (300 psi) water rated, 20 mm (¾") dia. straight pattern full port bronze ball valves, each complete with a threaded outlet suitable for coupling connection of 20 mm (¾") dia. garden hose, and a cap and chain.

.2 Manufacturers:

.1 Toyo Valve Co. Fig. 5046;

.2 Kitz Corporation Code 58CC;

.3 Apollo Valves #78-100 or #78-200;

.4 Watts Industries (Canada) Ltd. #B6000-CC.

2.6 AIR COMPRESSOR SET

.1 “Campbell Hausfeld”, CE5002 compressor features a cast iron, oil lubricated 2 stage pumps. 175 PSI max pressure, 7.6 SCFM @ 90 PSI. 60-gallon ASME vertical tank design. Induction engine. ASME, UL, CSA certified.

.2 Compressor set model number, performance and electrical characteristics as follows:

.1 model number: WBB2764020

.2 motor characteristics: 3.7 HP, 230 volts, 1 phase;

.3 tank capacity: 60 GAL

.3 Each compressor complete with:

.1 cast iron cylinders, heads, crankcase, and cast iron connecting roads with replaceable automotive type insert bearings;

.2 cast iron crankshaft supported on both ends by oversized tapered roller bearings;

.3 pressure type oil lubrication with oil sight gauge;

.4 steel inlet and discharge valves, and a high efficiency intercooler with steel fins on copper tubes;

.5 heavy-duty dry type inlet filter-silencer;

.6 high volume, statically balanced flywheel/cooing fan;

.7 motor conforming to requirements specified in Section 20 05 00 – Common Work Results for Mechanical, on an adjustable support base, and V-belt drive with OHSA type steel belt guard, also as specified in Basic Mechanical Materials and Methods.

.4 Welded steel receiver including an ASME rated tank in accordance with CSA B51 and TSSA requirements, complete with welded steel support feet, and following:

.1 ASME rated safety relief valve;

.2 positive seating ball type outlet valve, a screwed union, and a length of braided metallic flexible connection;

.3 pressure gauge with gauge cock;

.4 adjustable pressure switch for automatic start-stop operation of the compressors;

.5 valved manual tank drain, and an automatic tank drain;

.6 properly sized neoprene-steel-neoprene vibration isolating mounting pads;

.7 braided stainless steel flexible pipe connectors supplied loose.

.5 Surface wall mounting power and control panel in a NEMA 1 (NEMA 2 if room is sprinklered) enamelled steel enclosure with a hinged (piano hinge) lockable front door, door interlock disconnect switch, and following:

.1 overload protected across-the-line, non-reversing magnetic starter, and a door mounted H-O-A switch for each motor, in accordance with Section 20 05 00 – Common Work Results for Mechanical;

.2 fused control transformer;

.3 electronic alternator to automatically alternate lead compressor after each start cycle, and to automatically start lag compressor should the lead compressor fail to start;

.4 door mounted "power on" LED for panel and door mounted "run" LED for each compressor;

.5 terminal block and strips for power and control wiring connections, including control wiring from receiver mounted pressure switch.

.6 Manufacturers:

.1 CompAir Kellog;

.2 Atlas Copco Compressors Canada;

.3 DeVair Systems.

.4 Campbell Hausfeld.

PART 3 - EXECUTION

3.1 INSTALLATION OF AIR COMPRESSOR SET

.1 Provide an air compressor set.

.2 Secure set in place on vibration isolation on a concrete housekeeping pad.

.3 Ensure housekeeping pad is keyed to structure, and compressor assembly is secured to structure by slack cable restraints. Refer to Section 20 05 48.16 - Seismic Controls for Mechanical Systems.

.4 Install accessories shipped loose with set, except power and control panel.

.5 Extend type DWV soldered hard copper drainage piping from tank drain assemblies to nearest floor drain.

.6 Hand power and control panel to electrical trade at site for mounting and power wiring connections as part of electrical work.

.7 Connect receiver pressure switch to starter and control panel with wiring in conduit to the standards of the electrical work and in accordance with panel supplier's instructions.

.8 Touch-up paint any damage to the factory finish.

3.2 INSTALLATION OF PIPING AND PIPING SYSTEM COMPONENTS

.1 Provide required compressed air piping. Unless otherwise specified, install horizontal piping to outlets 1.5 m (5 feet) above finished floor level.

.2 Pipe is to be Schedule 40 mild galvanized steel, screwed, or type "L" hard copper, soldered.

.3 Support and secure piping generally as specified in Section 20 05 00 – Common Work Results for Mechanical, but with extra support and securing hardware as required to prevent drumming. Provide rigid supports at each side of outlets.

.4 Arrange piping so condensate will drain from mains and branches into drip legs. Provide drip legs at bottom of risers, every 30 m (100') of pipe run, and at the end of each branch piping run, whether indicated on drawings or not.

.5 Drip legs are to extend down from bottom of pipe and consist of a piping tee and 250 mm (10") long pipe nipple same size as main or branch pipe, then a reducing fitting (if required) and 12 mm (½") dia. piping extended down to floor level and terminated with a ball valve. Ensure drain points are easily accessible and identified.

.6 Extend branch piping to outlets and/or equipment off the top of the main(s).

.7 Provide shut-off valves in piping at all equipment connections, to isolate piping components for removal or maintenance, and wherever else specified or shown. Provide vented type valves between air compressor set and pressure reducing stations.

.8 Provide unions in piping at connections to equipment.

.9 When piping is complete and has been pressure tested, but before connection of outlets, blowout piping to remove oil and foreign matter.

.10 Provide adjustable pressure regulators, filters, compressed air outlets, etc. Unless otherwise indicated locate outlets 1.5 m (5 feet) above floor and properly secured in place. Provide a hose hanger at each outlet location. Confirm exact location of piping components prior to roughing-in.

3.3 SYSTEM STARTUP

.1 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical. Submit a copy of the letter prior to Substantial Performance of the Work.

3.4 CLOSEOUT ACTIVITIES

.1 Include for 4 hours of on-site training for 2 groups of 6 people. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Electric water heaters and water heater accessories.

1.2 REFERENCES

.1 ANSI Z21.22, Relief Valves for Hot Water Supply Systems.

.2 ASHRAE/IESNA 90.1, Energy Standard For Buildings Except Low-Rise Residential Buildings.

.3 CSA C22.2 No. 88, Construction and Test of Industrial Heating Equipment.

1.3 SUBMITTALS

.1 Product Data: For each product:

.1 Manufacturer's data sheets indicating unit performance and compliance with requirements.

.2 Include details of electrical and mechanical operating parts.

.3 Show mounting and securing requirements and utility connection requirements.

1.4 CLOSEOUT SUBMITTALS

.1 Submit manufacturer/supplier installation certification letters as specified in Part 3 of this Section.

.2 Submit with delivery of heater(s) a copy of the factory inspection and test report for each heater and include a copy of each report with O&M manual project closeout data.

.3 Submit, prior to Substantial Performance of the Work, start-up or test data specified in Part 3 of this Section.

1.5 WARRANTY

.1 Standard Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of electric, domestic-water heaters that fail in materials or workmanship within specified warranty period.

.1 Standard Warranty Period: From Date of Substantial Completion:

.1 Electrical Components: two years

.2 Heating Elements: four years

.3 Heat Exchanger free from leaks: eight years.

PART 2 - PRODUCTS

2.1 INSTANTANEOUS ELECTRIC HOT WATER HEATER (FOR REMOTE SINGLE FIXTURES)

.1 Chronomite Laboratories Inc., 1-phase, CSA certified, 98% energy efficient instantaneous point-of-use electric hot water heater with model number and performance as specified on drawings, factory pre-set to deliver 29°C (85°F) water, and complete with:

.1 a back plate for surface mounting;

.2 enclosure;

.3 Celcon waterways;

.4 stainless steel heating coil;

.5 fail-safe microprocessor based temperature controls that adjust heater's power to suit variations in flow rate;

.6 external digital temperature selection;

.7 differential pressure flow activated switch;

.8 on/off power switch;

.9 electrical access door;

.10 compression connection pipe fittings.

.2 Manufacturers

.1 Chronomite Laboratories Inc. (basis of design);

.2 Stiebel Eltron;

.3 EEMAX;

.4 Bosch.

2.2 POINT-OF-USE ELECTRIC DOMESTIC HOT WATER STORAGE TANK AND HEATER

.1 ULC listed and CSA certified electric domestic hot water storage tank and heater with model number and performance as specified on drawings, and complete with:

.1 1035 kPa (150 psi) rated (working pressure) steel tank, glass lined, polyurethane foam insulated, covered with an enamelled steel jacket with access panel, and equipped with a bottom hose end drain cock;

.2 immersion heating element imbedded in magnesium oxide and sealed in a seamless copper tube;

.3 sacrificial anode rod;

.4 surface mounted adjustable thermostat and a high temperature safety cut-out;

.5 ASME rated temperature and pressure relief valve;

.6 round galvanized steel auxiliary catch pan with drain hole and connection spigot.

.2 Acceptable manufacturers are:

.1 A.O. Smith Water Products Co.;

.2 John Wood (GSW Water Heating Co.);

.3 Rheem Canada Ltd.;

.4 Bradford White Canada Inc.

PART 3 - EXECUTION

3.1 DRAINAGE COORDINATION

.1 Coordinate drain requirements of plumbing equipment provided by Mechanical Division and or Owner with location of drains specified in Section 22 13 00.

3.2 INSTALLATION OF INSTANTANEOUS ELECTRIC HOT WATER HEATER

.1 Provide a tankless, electric, instantaneous, point-of-use domestic hot water heater.

.2 Rigidly secure in place in accordance with manufacturer's instructions and ensure unit is easily accessible.

.3 Coordinate installation with electrical trade who will connect heater with power wiring.

.4 Set thermostat to ensure heater produces maximum 49°C (120°F) hot water.

.5 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical. Submit a copy of the letter prior to Substantial Performance of the Work.

3.3 INSTALLATION OF POINT-OF-USE ELECTRIC DOMESTIC HOT WATER STORAGE TANK AND HEATER

.1 Provide a point-of-use domestic hot water storage tank and heater.

.2 Provide a wall bracket (supplied by the heater manufacturer) for heater mounting and rigidly secure in place.

.3 Mount heater in a catch pan and:

.1 pipe temperature/pressure relief valve outlet to drain;

.2 pipe auxiliary catch pan to drain;

.3 coordinate installation with electrical trade who will connect heater with power wiring;

.4 check and test heater operation and, unless otherwise specified or instructed, set thermostat to produce 48.8°C (120°F) hot water.

3.4 TRAINING

.1 Include for 2 hours of on-site training for 2 groups of 6 people. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for all equipment and associated hardware specified in this Section.

1.2 CLOSEOUT SUBMITTALS

.1 Submit with delivery of heater(s) a copy of the factory inspection and test report for each heater, and include a copy of each report with O&M Manual project closeout data.

.2 Submit manufacturer/supplier installation certification letters as specified in Part 3 of this Section.

.3 Submit, prior to Substantial Performance of the Work, start-up or test data specified in Part 3 of this Section.

PART 2 - PRODUCTS

2.1 ELECTRIC DOMESTIC HOT WATER TANK AND HEATER

.1 CSA certified electric domestic hot water tank and heater with model number and performance as specified on drawings, and complete with:

.1 1035 kPa (150 psi) rated (working pressure) steel tank, glass lined, insulated (except for control panel area) with injected minimum R-16 foam insulation, covered with an enamelled steel jacket, and equipped with 40 mm (1-½") dia. NPS brass nipple water inlet and outlet connections, a drain valve, and sacrificial anode rods;

.2 removable multiple immersion heating elements, each consisting of a wire filament in a sealed stainless steel sheath;

.3 ASME rated temperature and pressure relief valve;

.4 factory pre-wired power and control panel.

.2 Equip enamelled steel ventilated control panel with removable glass fibre insulation to cover bare area of tank, a hinged door, multiple knockouts, a ground screw, and following:

.1 terminal block for power wiring connections;

.2 magnetic contactors for heating elements;

.3 adjustable immersion thermostat;

.4 manual reset immersed high temperature limit control for each element;

.5 fuse block with fuses;

.6 element diagnostic panel with LED’s for each element to monitor on-off operation of each element;

.7 contacts, relays and any other hardware, compatible with building automation system protocol and required to connect heater(s) to BAS in accordance with BAS control points list.

.3 Equip heaters with factory fabricated type "L" hard copper inlet and outlet manifolds.

.4 Manufacturers

.1 A.O. Smith Water Products Co.;

.2 John Wood (GWS Water Heating Co.);

.3 Rheem Canada Ltd.;

.4 Bradford White Canada Inc.

2.2 ELECTRIC DOMESTIC HOT WATER BOOSTER HEATER

.1 CSA certified electric domestic hot water booster heater with model number and performance as specified on drawings, and complete with:

.1 1035 kPa (150 psi) rated (working pressure) steel tank with a double coating of high temperature glass, rigidly supported anode rods, blanket type glass fibre insulation, an enamelled steel enclosure with control centre hinged door and element and cleanout access panel, 32 mm (1-¼") dia. NPS brass nipple water inlet and outlet connections, a drain valve, and 150 mm (6") high stainless steel support legs;

.2 immersion type screw-in heating elements embedded in magnesium oxide sealed in a tinned copper tube;

.3 ASME rated relief valve;

.4 stainless steel rewired power and control panel with magnetic contactors, element diagnostic panel with LED's, element fuses, an adjustable thermostat, and immersion type high temperature limit control.

.2 Manufacturers:

.1 A.O. Smith Water Products Co.; John Wood (GSW Water Heating Co.);

.2 Rheem Canada Ltd.; Bradford White Canada Inc.

PART 3 - EXECUTION

3.1 ELECTRIC DOMESTIC HOT WATER TANK AND HEATER

.1 Drainage Coordination

.1 Coordinate drain requirements of plumbing equipment provided by Mechanical Division and or Owner with location of drains specified in Section 22 13 00.

.2 Installation

.1 Provide an electric domestic hot waters tank and heaters.

.2 Secure heaters in place, level and plumb, on a concrete housekeeping pads, and:

.1 pipe temperature/pressure relief valve outlet to drain;

.2 pipe drain valve outlet to drain;

.3 coordinate installation with electrical trade who will connect heater with power wiring.

.3 Ensure housekeeping pad is keyed to structure and tank assembly is secured to structure by slack cable restraints. Refer to Section 20 05 48.16 - Seismic Controls for Mechanical Systems.

.4 Install inlet and outlet manifolds supplied with heaters.

.5 Set thermostat to produce 48.8°C (120°F) hot water.

.3 System Startup

.1 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical. Submit a copy of the letter prior to Substantial Performance of the Work.

.4 Training

.1 Include for 2 hours of on-site training for 2 groups of 6 people. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.2 ELECTRIC DOMESTIC HOT WATER BOOSTER HEATER

.1 Drainage Coordination

.1 Coordinate drain requirements of plumbing equipment provided by Mechanical Division and or Owner with location of drains specified in Section 22 13 00.

.2 Installation

.1 Provide an electric domestic hot water booster heater.

.2 Secure heater in place, level and plumb, and:

.1 pipe temperature/pressure relief valve outlet to drain;

.2 pipe drain valve outlet to drain;

.3 coordinate installation with electrical trade who will connect heater with power wiring;

.4 set thermostat to produce 82°C (180°F) hot water.

.3 System Startup

.1 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical. Submit a copy of the letter prior to Substantial Performance of the Work.

.4 Training

.1 Include for 2 hours of on-site training for 2 groups of 6 people. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Plumbing fixtures and related components.

1.2 SUBMITTALS

.1 Submit product data sheets (fixture cuts) for all plumbing fixtures and fittings, including accessories.

.2 Product Data: Include selected fixture and trim, fittings, accessories, appliances, appurtenances, equipment, and supports and indicate materials and finishes, dimensions, construction details, and flow-control rates for each type of fixture indicated.

.3 Wiring Diagrams: Power, signal, and control wiring.

.4 Submit fixture manufacturer's standard colour charts for all fixtures where colours are available, but a particular colour is not specified.

1.3 CLOSEOUT SUBMITTALS

.1 Operation and maintenance data.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Subject to compliance with requirements, manufacturers that may be incorporated into the Work include, but are not limited to, following:

.1 Flush Valves:

.1 Sloan;

.2 Delta Commercial;

.3 Zurn Industries;

.4 Moen Commercial.

.2 Plumbing Brass:

.1 Sloan;

.2 Acorn Engineering;

.3 American Standard;

.4 Delta Commercial;

.5 Chicago Faucet;

.6 Moen Commercial.

.3 Stainless Steel Sinks:

.1 Franke Commercial;

.2 Novanni Commercial;

.3 Aristaline;

.4 Arch Metal Ind.

.4 Mop Sinks:

.1 Stern Williams;

.2 Acorn Engineering;

.3 Zurn Industries.

.5 Emergency Eye Wash and Emergency Showers:

.1 Haws;

.2 Speakman;

.3 Bradley.

.6 Drain Fittings, Angle Supplies, and Traps:

.1 McGuire;

.2 American Standard;

.3 Delta Commercial;

.4 Zurn Industries.

.7 Fixture Carriers:

.1 Watts Industries;

.2 Jay R. Smith;

.3 Zurn Industries.

.8 Hose Bibbs:

.1 Jay R. Smith;

.2 Zurn Industries.

.9 Water Closets, Lavatories, and Urinal:

.1 American Standard;

.2 Zurn Industries;

.3 Kohler.

.10 Thermostatic Mixing Valves:

.1 Lawler;

.2 Delta Commercial;

.3 Leonard.

.11 Shower and Associated Trim:

.1 American Standard;

.2 Delta Commercial;

.3 Zurn Industries;

.4 Moen Commercial.

.12 Toilet Seats:

.1 Olsonite;

.2 Centoco;

.3 Bemis Commercial.

.13 Electronic “No Touch” Flush Valves:

.1 Sloan;

.2 Delta Commercial;

.3 Zurn Industries;

.4 Moen Commercial.

.14 Electronic “No Touch” Faucets:

.1 Sloan;

.2 Delta Commercial;

.3 Zurn Industries;

.4 Moen Commercial.

2.2 GENERAL RE: PLUMBING FIXTURES AND FITTINGS

.1 Fixtures and fittings, where applicable, are to be in accordance with requirements of CAN/CSA B45 Series, General Requirements for Plumbing Fixtures, including supplements, ASME A112.1.18.1/CSA B125.1, Plumbing Supply Fittings, and CSA B125.3, Plumbing Fittings.

.2 Barrier-free fixtures and fittings are to be in accordance with governing Code requirements.

.3 Unless otherwise specified, vitreous china, porcelain enamelled, and acrylic finished fixtures are to be white.

.4 Unless otherwise specified, fittings and piping exposed to view are to be chrome plated and polished.

.5 Fittings located in areas other than private washrooms are to be vandal-proof.

.6 Fixture carriers are to be suitable in all respects for the fixture they support and construction in which they are located.

.7 Floor flanges for floor mounted water closets are to be cast iron or brass, secured to floor to prevent movement and complete with a wax seal and brass or stainless steel bolts, nuts, and washers. Plastic floor flanges will not be acceptable.

.8 Proper seal to mate with fixture carrier flange and produce a water-tight installation.

.9 Exposed traps for fixtures not equipped with integral traps, such as lavatories, are to be adjustable chrome plated cast brass "P" traps with cleanouts, minimum 17 gauge chrome plated tubular extensions, and chrome plated escutcheons, all to suit fixture type and drain connection.

.10 Concealed traps for fixtures not equipped with integral traps, such as counter sinks, are to be adjustable cast brass with cleanout plugs, all to suit fixture type and drain connection.

.11 Exposed supplies for fixtures which do not have supply trim/fittings with integral stops, i.e. lavatories, are to be solid chrome plated brass angle vales with screwdriver stops for public areas, wheel handle stops for private areas, flexible stainless steel risers, and stainless steel or chrome plated steel escutcheons, all arranged and sized to suit fixture.

.12 Water piping as specified, complete with ball type shut-off valves as specified with water piping, or Dahl Bros. Canada Ltd. ¼ turn Mini Ball Valves.

2.3 PLUMBING FIXTURES AND FITTINGS

.1 Plumbing fixtures and fittings are to be in accordance with the following:

.1 [ ].

2.4 CAULKING

.1 General Electric Series SCS-1200 Silicone Construction Sealant or Dow Corning 780 silicone rubber sealant with primers as recommended by sealant manufacturer. Caulking colour(s) for coloured fixtures other than white, if any, will be selected by the Consultant from sealant manufacturer's standard colour range.

PART 3 - EXECUTION

3.1 DEMOLITION

.1 Refer to demolition requirements specified in Section 20 05 05 – Selective Demolition for Mechanical.

3.2 INSTALLATION OF PLUMBING FIXTURES AND FITTINGS

.1 Provide required plumbing fixtures and fittings.

.2 Where new fixtures and fittings are to be connected to existing piping, include for required piping revisions.

.3 Connect plumbing fixtures and fittings with piping sized in accordance with drawing schedule. Refer to manufacturer's published connection (rough-in) requirements. Where manufacturer requires piping connection larger than shown below, provide piping accordingly:

Fixture and/or Fitting	Drain Size mm (in)	Vent Size mm (in)	DHW Size mm (in)	DCW Size mm (in)	Temp Water Size mm (in)
Water Closets Flush Valve Type	100 (4)	38 (1-½)	-	25 (1)	-
Urinals	75 (3)	38 (1-½)	-	25 (1)	-
Lavatories	32 (1-¼)	32 (1-¼)	12 (½)	12 (½)	-
Lavatories (Electronic Faucet)	32 (1-¼)	32 (1-¼)	12 (½)	12 (½)	12 (½)
Counter Sinks	38 (1-½)	32 (1-¼)	12 (½)	12 (½)	-
Shower Valves and Heads	-	-	12 (½)	12 (½)	12 (½)
Shower Stalls	50 (2)	38 (1-½)	12 (½)	12 (½)	12 (½)

Fixture and/or Fitting	Drain Size mm (in)	Vent Size mm (in)	DHW Size mm (in)	DCW Size mm (in)	Temp Water Size mm (in)
Prefab. Mop Sinks with Drain	75 (3)	38 (1-½)	20 (¾)	20 (¾)	-
Emergency Eye Wash	-	-	-	-	12 (½)
Emergency Shower	-	-	-	-	25 (1)

.4 Confirm exact location of plumbing fixtures and trim prior to roughing-in. Refer to architectural plan and elevation drawings.

.5 When installation is complete, check, and test operation of each fixture and fitting. Adjust or repair as required.

.6 For barrier-free fixtures, comply with mounting height and other requirements of governing Code(s).

.7 For barrier-free water closets utilizing manual flush controls, controls to be installed so that it is operable from the transfer side of the fixture.

.8 Supply templates for counter mounted fixtures and trim and hand to trades who will cut the counter. Ensure openings in counter are properly located.

.9 Locate control panels for electronic faucets under lavatories and recessed into wall. Coordinate panel installations with electrical trade who will provide 115 V power wiring to panels. Install flexible conduit (supplied with box) and extend cord from faucet through the flexible conduit to control box. Connect hot and cold water piping to mixing valve in each box, and tempered water piping from each mixing valve to faucet. Set mixing valve maximum temperature limit stops to 43°C (110°F) after domestic water systems (hot and cold) are complete. Ensure each programmable controller is properly programmed and water off after deactivation is set for 3 seconds.

.10 For electronic flush valves, locate transformer in ceiling space above electronic units to be served. Coordinate locations with electrical trade who will provide 120 V line supply to transformers. Provide low voltage wiring from transformers to each electronic flush valve terminal point. Electrical line supply and low voltage wiring is to be concealed and access to transformer must be provided for servicing.

.11 Protect shower bases from damage during construction and finishing work.

.12 Confirm exact mixing valve and shower head locations prior to roughing-in.

.13 Install refrigerated drinking fountains in accordance with manufacturer’s instructions. Plug into a wall receptacle provided as part of electrical work. Coordinate receptacle installation with electrical trade on site.

.14 For emergency showers, install so bottom of shower head is approximately 2 m (82 in) above floor, and approximately 400 mm (16 in) out from the wall. Wall mount mixing valve approximately 1.5 m (5 ft) above floor and adjacent shower head. Set valve temperature limit stop to 35°C (95°F). Ensure valve is open and exposed piping is chrome plated or stainless steel.

.15 Install eye wash fixtures in accordance with manufacturer’s instructions. Ensure exposed piping is painted.

.16 Wall mount mixing valves for emergency fixtures approximately 1.5 m (5 ft) above floor and secure in place. Check and confirm valve operation and temperature of tempered water supply. Provide cabinets. Identify each cabinet and hand 3 identified cabinet keys to Consultant prior to Substantial Performance of the Work.

.17 Set mop service basins on floor over drain piping and connect to roughed-in service. Install wall supply trim and any accessories specified.

3.3 CAULKING AT PLUMBING FIXTURES AND FITTINGS

.1 Caulk around plumbing fixtures and fittings where they contact walls, floors, and any other building surface.

.2 Clean areas/surfaces to be caulked and prime in accordance with sealant manufacturer's instructions. Where damage to a building surface may occur, mask surface to prevent damage and ensure a clean exact edge to the caulking bead.

.3 Apply caulking using a gun with proper size and shape of nozzle and force sealant into joints to ensure good surface contact and a smooth and even finished bead of sealant.

.4 If joints have been masked sealant may be tooled in a continuous stroke to obtain complete void filling. Remove masking tape immediately after tooling and before sealant begins to skin.

3.4 DISHWASHER CONNECTIONS

.1 Provide roughed-in water and drain connections for Owner supplied dishwasher consisting of:

.1 15 mm (½") dia. domestic hot water connection with a Dahl "Mini-Ball" valve with hose end and water hammer arrestor;

.2 40 mm (1-½") dia. DWV copper drain connection with "P" trap and cleanout plug.

3.5 CLOTHES WASHER CONNECTIONS

.1 Provide roughed-in water and drain connections for Owner supplied clothes washer consisting of:

.1 15 mm (½") dia. piping connection for both hot and cold water, each terminated in a Dahl "Mini-Ball" Valve with hose end and water hammer arrestor;

.2 50 mm (2") dia. standing waste with a height to suit the washer drain and complete with a "P" trap.

END OF SECTION

PART 1 - GENERAL

1.1 REFERENCES

.1 Ontario Building Code (OBC).

1.2 SUBMITTALS

.1 Provide in accordance with Section 20 05 00.

.2 Shop drawings including cut-sheets of equipment, and riser diagram of system showing all interconnections between control panel, sensors, and fans.

1.3 CLOSEOUT SUBMITTALS

.1 Provide in accordance with Section 20 05 00.

.2 Start-up report.

.3 System recertification recommendations.

.4 Attendance record from training session.

1.4 WARRANTY

.1 Unless otherwise specified in Division 00 and Division 01, warrant mechanical work to be in accordance with Contract Documents and free from defects for a period of 1 year from date of issue of a Certificate of Substantial Performance of the Work.

.2 Warranty to include parts, labour, travel costs and living expenses incurred by manufacturer's authorized technician to provide factory authorized on-site service.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Honeywell Analytics Inc.

.2 Armstrong Monitoring Co.

.3 Opera Inc.

.4 Quatrosense Environmental Ltd. (QEL).

2.2 GAS DETECTORS

.1 Basis of design: Honeywell Analytics E3SM-E3SCO & E3SM-E3SNO2

.2 Providing continuous monitoring in ambient air of two factory-set alarm levels and outputs.

.3 The transmitter will be capable of operating on a fully addressable Modbus RS-485 digital network in a daisy-chain configuration. Communication 915 m (3000 ft) max per channel and power 24 VAC 1000 ft max per channel.

.4 Transmitter will have an onboard DPDT relay (rated at 5 A, 30 Vdc or 250 Vac (resistive load)) and can be triggered through the programming on the control panel to activate remotely located fan starters without the need for a separate relay pack.

.5 Sensor cell shall have a continuous self-test to ensure operation and to provide EOL notification.

.6 The transmitter shall have a plug-in capability for a field replaceable gas cartridge. The replaceable gas cartridge shall be factory calibrated and certified to the target gas ready for operation without the requirement for site calibration.

.7 Transmitter will be capable of operating within relative humidity ranges of 5-95% non-condensing and temperature ranges of 4°F to 104°F (-20°C to 40°C).

.8 All sensors in maintenance bays to be outfitted for water ingress protection.

.9 Audible alarm rated at minimum 65 dBA at 1 m (3 ft) that will fully activate at programmable levels.

2.3 CONTROL PANEL

.1 Basis of design: Honeywell Analytics 301C-DLC

.2 The control panel must come c/w a BACnet/IP module, allowing for an output to the Building Automation System.

.3 The control panel must be capable of communicating digitally with the networked gas detection monitors on three separate RS-485 Modbus communication channels.

.4 The controller will house four internal DPDT relays at fully programmable alarm levels (and within programmable time delays). The relay rating will be no lower than 5 A, 30 VDC or 250 VAC (resistive load).

.5 Digital to Analog Output Convertor: Model 4201 24 VAC, 500 mA convertor to communicate digitally with up to 8 sensor/transmitter units and control panel within a daisy-chain network to convert digital signal from transmitters to analog outputs to permit each transmitter to produce up to 8 dedicated 4-20 mA signals to a building automation system or variable frequency drive from one central location which can be a maximum of 600 m (2000 ft) from control panel.

.6 The controller must include a self-test function that allows for the activation/deactivation of all the programmed outputs by simulating a continuous 5% increase/decrease value until the maximum/minimum value is reached.

.7 The controller must include a real-time clock that enables operation of the outputs for a specific timeframe.

.8 The controller must also include an energy saving feature that allows for output operation on alarms set at the max., min., or average value of a specific group of transmitters. This feature must also allow for the activation of outputs upon a certain number of a specific group (¾, ½, ⅓ and ¼) of transmitters reaching their alarm levels.

.9 The controller will indicate the exact concentration of gas, the gas detected, and the location of the sensor by sweeping through the network and displaying the detected levels at each point on a graphic LCD display.

.10 Integrate strobe/horn, 120 V, 85 dB at 3 m (10 ft) minimum with blue lens.

.11 Capacity for long term data logging.

.12 Ratings and Certifications:

.1 Conforms to International Mechanical and Electrical Codes.

.2 EMI/RFI Complies with EMC Directive 89/336/EEC.

.3 CSA Certification.

2.4 CONDUITS

.1 Provide conduits from control panel to sensors/transmitters and starter relays in accordance with Section 26 05 33.13.

2.5 SEQUENCE OF OPERATION

.1 When first alarm level is achieved, relay is energized to activate the exhaust fan and open corresponding damper. Program a relay delay-off of 2 minutes to allow gas time to clear.

Gas	First Alarm / Output (TWA)	Second Alarm / Output (STEL)	Sensor Mounting Height
Carbon Monoxide (CO)	50 ppm	100 ppm	1500 mm AFF
Nitrogen Dioxide (NO_2)	0.7 ppm	3 ppm	In accordance with manufacturer's instructions

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install hazardous gas monitoring equipment including sensors and control panel as shown on the drawings.

.2 Confirm exact locations of equipment prior to installation.

.3 Perform required 24 V wiring in conduit to control panel(s) and from each panel to associated sensor/transmitter units as required and in accordance with wiring requirement specified in the electrical work specification and system manufacturer's certified wiring schematics. Provide 24 V interlock wiring to exhaust fan starters in accordance with drawing control requirements.

.4 Install conduit and wiring from sensors to control panel and to the fan starters. Communication wiring 24 gauge shielded twisted pair Belden 9841 or equivalent; 610 m (2000 ft) max per channel from controller. Power is 24 VAC, 14 gauge; 305 m (1000 ft) max from the controller.

3.2 SITE TEST AND INSPECTIONS

.1 Test to demonstrate operation of functions described above under sequence of operation to be performed by manufacturer's certified technician.

.2 Provide start-up report to the Consultant prior to request for occupancy.

3.3 TRAINING

.1 Demonstrate operation of system to Owner's representatives.

.2 Instruct Owner on timeline for inspection and recertification of sensors.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Materials and installation for piping, valves, and fittings for gas fired equipment.

1.2 REFERENCES

.1 CSA B149.1:20, Natural Gas and Propane Installation Code.

.2 TSSA FS-255-21, Gaseous Fuels Code Adoption Document Amendment: Ontario requirements effective May 1, 2021.

.3 CSA C282:19, Emergency electrical power supply for buildings.

1.3 DEFINITIONS

.1 PRV – Pressure Reducing Valve.

1.4 SUBMITTALS

.1 Submit shop drawings/product data for all products specified in Part 2 of this section except for pipe, fittings, and unions. Indicate performance criteria, conformance to appropriate reference standards, and limitations.

.2 For each gas pressure regulating station, submit:

.1 a selection sheet for each PRV, indicating connected equipment, heating loads, design allowance, meter model, body size, spring range and orifice size;

.2 a selection sheet for each relief valve(s) serving a PRV.

1.5 CLOSEOUT SUBMITTALS

.1 Submit maintenance and engineering data for incorporation into manual specified in Section 01 78 00.

.2 Indicate operating set-points, relief settings and vent arrangements for each regulating station on as-built record drawings.

1.6 QUALITY ASSURANCE

.1 All gas system work is to be in accordance with requirements of CSA B149.1, Natural Gas and Propane Installation Code, as amended by local Gas Codes.

.2 All gas system work is to be performed only by licensed gas pipe fitters (holding Gas Technician 1 Certificate) authorized under the TSSA Act.

.3 Apply for, on TSSA forms, approval of the gas system design by the TSSA prior to work beginning at the site and prior to ordering any equipment. Submit the completed TSSA form and copies of shop drawings/product data sheets as required to the TSSA and obtain an approval certificate. Pay all costs for the TSSA review and approval process. If the TSSA requires revisions to the system and the revisions result in an extra cost, a Notice of Change will be issued by the Consultant for the revision.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND JOINTS

.1 Uncoated Black Steel - Screwed Joints: Schedule 40 mild black carbon steel, ASTM A53, Grade B, complete with malleable cast iron screwed fittings to ANSI B2.1, and screwed joints.

.2 Uncoated Black Steel - Welded Joints: Schedule 40 mild black carbon steel, ASTM A53, Grade B, mill or site bevelled, complete with factory made forged steel butt welding fittings and welded joints.

.3 Copper-Uncoated: Type "G" seamless copper tubing to ASTM B837, hard temper with wrought copper capillary brazed joint type fittings to ASTM B.61, and brazed joints made with "Sil-Fos" or "Sil-Fos 5" brazing alloy, or, soft temper with flared brass fittings of a single 45º flare type, forged or with a machined long nut and copper to copper threaded connectors, and, where required, flared brass copper to NPS adapters.

.4 Flexible Stainless Steel: Flexible, CSA certified, 860 kPa (125 psi) rated, gas-tight, convoluted stainless steel tubing factory jacketed with a bright yellow PVC coating which is continuously identified. The tubing is to be supplied in coils and is to be complete with factory attached stainless steel end fittings, and adapter unions, protective plates, and steel clamps.

.1 Manufacturers:

.1 Tru-Flex Metal Hose LLC. "Pro-Flex";

.2 Titeflex Corp. "Gastite";

.3 Omega Flex Canada "TracPipe".

2.2 PIPING UNIONS

.1 Screwed Piping: Malleable iron, ground joint, bronze or brass to iron or bronze to bronze seat screwed unions and union elbows with a minimum pressure rating of 1725 kPa (250 psi) steam at 260°C (500°F).

.2 Flanged Piping: Forged carbon steel slip-on type raised faced welding flange unions to ASTM A105, 150 lb. Class for steel pipe, and slip-on type 150 lb. Class bronze flanges for copper pipe.

.3 Copper to Steel: Equal to Kamco Products "Copper Stopper".

2.3 EARTHQUAKE ACTIVATED AUTOMATIC SHUT-OFF VALVES

.1 Equal to KAS International or Nihon Koso Model 315 HPF earthquake activated, flanged, high pressure automatic shut-off valve suitable for both natural gas and propane, ULC listed and in accordance with ANSI Z21.70, Earthquake Actuated Automatic Gas Shutoff Valves.

2.4 SHUT-OFF VALVES

.1 Ball Type:

.1 CSA certified, minimum 3100 kPa (450 psi) WOG rated, 1/4 turn, full port non-lubricated brass ball valves, each complete with a Teflon PTFE seat, chrome plated solid ball, removable lever handle, and screwed ends.

.2 Manufacturers:

.1 Neo Valves Inc. #425;

.2 Kitz Corp. Code 58;

.3 Toyo Valve Co. Fig. 5044A.

.2 Plug or Ball Type: CSA certified, plain face flanged, Class 125, 1380 kPa (200 psi) rated, 1/4 turn, cast iron lubricated plug valves, each wrench operated and complete with cylindrical plug with lubricant grooves, lubricant screw, and lubricant receptacle, or full port carbon steel ball valves with flanged ends.

.1 Manufacturers:

.1 Neo Valves Inc. #1AS40114 plug valve;

.2 Newman Hattersley #171M plug valve;

.3 Kitz Corp. Code No. 150 SCTAM-FS-CGA ball valve.

2.5 POSITION INDICATING SWITCHES FOR SHUT-OFF VALVES

.1 CSA approved limit switch, rated EX db IICT6/EX tb IIIC T85°C explosion proof, class 1, zone 1, IP67 enclosure.

.2 Secure water resistant case with multi-angle top and side visual indicator. Red to indicate fully closed position and yellow to indicate fully open position.

.3 Two single pole double throw mechanical switches.

.4 Includes position indicating contacts for connection of supervisory cabling and remote monitoring of valve status.

.5 NAMUR shaft.

.6 Ensure the shut off valve and the position indicating switch are compatible with one another.

.7 Manufacturers:

.1 CVS Controls Ltd., CVS 870 series limit switch.

.2 Rotork.

.3 Topworx.

2.6 NATURAL GAS CONVENIENCE OUTLET

.1 Neo Valves Model 3/375 quick-connect type CSA certified outlet with interlocking safety cam to prevent release of the appliance connector until the valve is off, integral thermal protection to prevent gas flow if the outlet is exposed to temperatures exceeding 90°C (195°F), and a wall enclosure box.

.2 Manufacturers:

.1 Neo Valves Inc.;

.2 Fairview Fittings & Mfg. Ltd.

2.7 PRESSURE REGULATORS

.1 CSA certified pressure regulators as follows:

.1 non-vented type: lever action, dead end lockup type, each complete with a vent limiter, self-aligning valve, die-cast aluminium housing, and synthetic rubber compound diaphragm.

.2 vented type: spring-loaded self-operated design, tight closing, selected for the facility gas pressure and piping pressure loss, and connected equipment load at full firing rate plus 20% spare, and complete with:

.1 1035 kPa (150 psi) rated cast iron body finished with corrosive resistant epoxy enamel.

.2 Aluminum diaphragm and spring case with Nitrile diaphragm, disc, and body o-ring.

.3 Throttling type, high flow rate, tight shut-off relief valve selected to protect equipment downstream of the regulator in coordination with regulator capacity.

.2 Manufacturers:

.1 Maxitrol Co.

.2 Fisher Controls.

.3 Leslie Controls Inc.

.4 Lakeside Process Controls.

PART 3 - EXECUTION

3.1 NATURAL GAS SERVICE

.1 Make all required arrangement with the natural gas supply utility on behalf of the Owner for installation of natural gas service piping with gas pressure regulator and meter assembly.

.2 Provide an earthquake activated automatic shut-off valve in gas service piping outside the building in accordance with the valve manufacturer's installation instructions. Provide an angle iron framed wire mesh enclosure around the valve and bolted to the wall.

.3 Provide 2 m (7') high minimum 200 mm (8") diameter Schedule 80 galvanized steel concrete filled bollards at the meter-regulator location in a pattern to protect the meter-regulator. Install the pipe straight and plumb a 1.2 m (4') below grade in a continuous 600 mm (2') diameter reinforced concrete footing. Smoothly crown the top of the concrete above the top of the pipe.

.4 Maintain minimum 300 mm (12 in) horizontal separation between buried natural gas piping and other services.

3.2 NATURAL GAS PIPING INSTALLATION REQUIREMENTS

.1 Provide all required natural gas distribution piping and connect gas fired or operated equipment, and provide all required vent piping to atmosphere, including vent piping from pressure regulators. Do all piping work in accordance with requirements of CAN/CSA-B149.1, Natural Gas and Propane Installation Code, as amended by local Gas Codes.

.2 Piping is to be as follows:

.1 for underground piping, coated Schedule 40 black steel, coated soft copper, or polyethylene;

.2 for above ground piping, uncoated Schedule 40 black steel, hard temper or soft copper, or, if permitted, flexible stainless steel.

.3 Install flexible stainless steel pipe in strict accordance with the pipe manufacturer's printed instructions.

.4 Slope gas piping in the direction of flow to low points.

.5 Where natural gas piping is run vertically through internal building risers, provide vent through roof for reach riser.

.6 Where natural piping serving an emergency generator is run internally to the building, provide a fire rated enclosure around that piping, isolated from all other natural gas piping or other building services.

.7 Ensure that supports for roof mounted piping are sized (height) to accommodate the roof slope and the required piping slope, and to permit the installation of low point dirt pockets.

.8 Provide full pipe diameter 150 mm (6") long drip pockets at the bottom of all vertical risers, at all piping low points, and wherever else shown and/or required.

.9 Identify all natural gas piping above ground with two coats of safety yellow enamel applied over primer and coil type vinyl identification makers with arrows. SMS Ltd. or equal can be used for identification markers.

.10 For all underground gas piping, provide continuous 75 mm (3") wide yellow PVC warning tape with "CAUTION - GAS LINE BURIED BELOW" wording at 750 mm (30") intervals located above the pipe approximately 250 mm (10") below grade.

.11 Rough-in all required natural gas piping for kitchen and laundry equipment in accordance with drawing plans and schedules. Obtain accurately dimensioned rough-in drawings for the equipment and confirm exact locations prior to roughing-in. When the equipment has been installed, connect the equipment from the roughed-in Work. Provide shut-off valves in all piping connections to the equipment.

.12 Include for mounting only of a solenoid valve in the gas piping to kitchen cooking equipment.

3.3 INSTALLATION OF SHUT-OFF VALVES

.1 Provide CSA approved ball type or lubricated plug type shut-off valves to isolate equipment, and wherever else shown.

.2 Ensure that valves are located for easy accessibility and maintenance.

.3 CSA C282:19 clause 7.3.7.(b): “any and all valves installed in the emergency gas supply line between the standardized pressure regulator station and the generator set fuel line connection shall have a position-indicating contact that will initiate a trouble alarm condition at the generator control panel”

.4

.5 For all valves installed in an emergency gas supply line including, but not limited to, the regulator station. Provide position indicating contacts to initiate a trouble alarm condition at the generator control panel and/or fire alarm control panel when any valve is closed. Provide in accordance with CSA C282:19 Emergency Electrical Power. Coordinate with electrical trade and generator supplier.

3.4 INSTALLATION OF NATURAL GAS CONVENIENCE OUTLETS

.1 Provide natural gas convenience outlets and wall mount.

.2 Provide a shut-off valve in connecting piping, confirm exact location prior to roughing-in, and ensure that the outlet is rigidly secured in place.

3.5 INSTALLATION OF PRESSURE REGULATORS

.1 Provide pressure regulators in gas distribution piping where indicated and/or required.

.2 For indoor appliances, use lever acting design vent limiter type, sized as shown and mounted in a horizontal upright position in strict accordance with the manufacturer’s instructions. Note that these pressure regulators do not require vent piping.

.3 Use vented type pressure regulators for all other applications.

.4 Install regulating stations in accordance with requirements of CAN/CSA-B149.1.

.5 CSA B149.1, 5.2.1.7. “a pressure regulator shall have a manual shut off valve installed upstream up the pressure regulator; and an overpressure protection device in accordance with Clause 5.3.”

.6

.7 Provide a manual shut-off valve upstream of the pressure regulator and provide overpressure protection devices.

.8 Provide 6 mm (1/4") diameter test ports upstream and downstream of each regulator assembly.

.9 Locate outdoor regulating stations vent termination a minimum of 300 mm (12") away from walkways, and 3 m (10') away from equipment air intakes and building openings. Provide all required vent piping and terminate vents in a turn-down elbow fitting with bronze bug screen secured in place.

.10 Locate indoor regulating stations in locations accessible without the use of ladders or lifts. Combine vents where permitted and increase vent pipe size accordingly. Extend vent piping up through the roof 3 m (10') away from equipment air intakes and building openings and terminated in a turn-down elbow fitting with bronze bug screen secured in place.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

.1 System to collect data on Natural Gas supplied as part of the Electricity Metering Package specified per Section 26 27 13.

1.2 RELATED REQUIREMENTS

.1 Section 26 27 13 – Electricity Metering:

.1 Refer to this Section for all requirements.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION – NOT USED

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for all products specified in this section except piping and unions.

.2 Submit motor product data sheets and certified performance curves with all pump shop drawings.

1.2 CLOSEOUT SUBMITTALS

.1 Submit with delivery of each unit a copy of factory inspection and test report, and include a copy of each report with O&M Manual project closeout data.

.2 Submit a site inspection and start-up report from manufacturer's representative as specified in Part 3 of this section.

.3 Prior to Substantial Performance of the Work, submit a spare seal flush line filter for each pump equipped with a seal flush line.

.4 Shop drawings for piping anchors must be prepared and stamped by a professional Structural Engineer registered in the jurisdiction of the work. Refer to requirements for Contractor retained engineers specified in Section 20 05 10 – Mechanical Work General Instructions.

.5 Submit a letter from pipe anchor design engineer to stating engineer has visited site to examine installation of pipe anchors and pipe anchor installation is in accordance with reviewed anchor shop drawing.

1.3 QUALITY ASSURANCE

.1 Pump motors are to comply with requirements of Section 20 05 00 – Common Work Results for Mechanical.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND JOINTS

.1 Black Steel - Screwed Joint

.1 Mild black carbon steel, Grade B, ASTM A53, complete with Class 125 cast iron threaded fittings to ANSI/ASME B16.4, and screwed joints.

.2 Black Steel - Welded Joint

.1 Mild black carbon steel, Grade B, ASTM A53, mill or site bevelled, complete with factory made seamless carbon steel butt welding fittings to ASTM A234, Grade WPB, with long sweep pattern elbows unless otherwise specified, and welded joints.

.3 Black Steel - Grooved End Mechanical Joint

.1 Mild black carbon steel, Grade B, ASTM A53, factory or site roll grooved, complete with cast ductile iron grooved end fittings, including full flow elbows, and conforming to ASTM A536.

.2 Manufacturers:

.1 Equal to Victaulic Style 107 "QuickVic" rigid couplings for sizes 2" to 12", Style 07 "Zero-Flex" rigid couplings, Style W07 AGS rigid couplings for sizes 350 mm (14") to 1525 mm (60");

.2 Flexible grooved couplings can be used where system flexibility is desired. Noise and vibration reduction at mechanical equipment connections is achieved by installing three flexible couplings near the vibrations source in lieu of braided flex connectors. Victaulic Style 177 QuickVic or Style 77 flexible couplings for sizes 50 mm (2”) to 300 mm (12”). Style W77 AGS flexible couplings for sizes 350 mm (14”) to 1525 mm (60”).

.3 Grooved end fittings shall be cast of ductile iron conforming to ASTM A-536, Grade 65-45-12, forged steel conforming to ASTM A-234, Grade WPB 0.375" wall (9.53 mm wall), or fabricated from Std. Wt. Carbon Steel pipe conforming to ASTM A-53, Type F, E or S, Grade B. Fittings provided with an alkyd enamel finish or hot dip galvanized to ASTM A-153. Branch reductions on 2" (DN50) through 8" (DN200) header piping. Bolted branch outlets shall be manufactured from ductile iron conforming to ASTM A-536, Grade 65-45-12, with synthetic rubber gasket, and heat treated carbon steel zinc plated bolts and nuts conforming to physical properties of ASTM A-183. Victaulic Style 920 / 920N.

.4 Black Steel – Plain End Mechanical Joint

.1 Mild black carbon steel, Grade B, ASTM A53, mill or site bevelled, complete with cast ductile iron end fittings conforming to ASTM A536.

.2 Manufacturers:

.1 Equal to Victaulic QuickVic SD rigid couplings for sizes 1/2" to 2", rated for a working pressure of 300 psi.

.5 Black Steel – Pressure Coupled Joints

.1 Mild black carbon steel conforming to ASTM F3226, IAPMO PS117, ICC LC1002, ASME B31.1, B31.3, or B31.9. MegaPress fittings ½-inch thru 4-inch for use with schedule 40 ASTM A53 carbon steel pipe.

.2 Pressure connect fittings shall carry CRN numbers.

.3 Pressure connect fitting shall have Viega Smart Connect technology to detect unpressed fittings shall be integrated into the body of the fitting.

.4 1/2 inch thru 2 inch fittings shall have stainless-steel grip ring with bidirectional teeth, 304 stainless separator ring, EPDM or FKM sealing element at each press connection. 2-1/2 inch thru 4 inch shall have stainless-steel grip ring with bidirectional teeth, PBT separator ring, and FKM sealing element at each press connection.

.5 There shall be no mixing of manufacturers.

.6 The manufacturer’s installation instructions shall be strictly adhered to.

.7 Special attention shall be given to the required two step pressure test.

.8 Initial test for unpressed fitting detection per manufacturer’s installation manual.

.9 Full pressure test in accordance with code requirements.

.10 Installers shall be field trained by Viega factory representative.

.6 Soft Copper Pipe

.1 Type "L" seamless soft copper to ASTM B77.

.7 Hard Copper - Solder Joint

.1 Type "L" hard drawn seamless copper to ASTM B88, complete with wrought copper fittings to ANSI B16.22, and 95% tin / 5% Antimony solder joints.

.8 Hard Copper - Pressure Coupled Joint

.1 Type "L" hard drawn seamless copper to ASTM B88, complete with Viega "ProPress with Smart Connect feature" system copper fittings with EDPM seals, and pressure type crimped joints made by use of manufacturer recommended tool.

2.2 PIPING UNIONS

.1 Screwed Piping

.1 Malleable iron, ground joint, bronze or brass to iron or bronze to bronze seat screwed unions and union elbows with a minimum pressure rating of 1725 kPa (250 psi) steam at 260°C (500°F).

.2 Flanged Piping

.1 Forged carbon steel slip-on type raised faced welding flange unions to ASTM A105, 150 lb. Class for steel pipe, and slip-on type 150 lb. Class bronze flanges for copper pipe.

2.3 SHUT-OFF VALVES

.1 Ball Type

.1 Class 600, 4140 kPa (600 psi) WOG rated full port ball valves, each complete with a forged brass or bronze body and cap, blowout-proof stem, solid forged brass chrome plated ball, "Teflon" or "PTFE" seat, threaded ends, and removable lever handle.

.2 Manufacturers:

.1 Toyo Valve Co. Fig. 5044A;

.2 Watts Industries (Canada) Inc. #FBV-3;

.3 Kitz Corp. Code 58;

.4 Victaulic Co. of Canada Ltd. Series 722;

.5 Apollo Valve #77-100.

.2 Butterfly Type

.1 Cast ductile iron, lug body style, 1200 kPa (175 psi) rated butterfly valve, each complete with a neck to permit 50 mm (2") of insulation above the flange, a field replaceable EPDM seat, ductile iron disc, stainless steel shaft with EPDM seal, a lever handle for valves to and including 150 mm (6") diameter, a handwheel and gear type operator for valves larger than 150 mm (6") diameter, and each suitable for bubble-tight dead end service with valve closed and either side of connecting piping removed.

.2 Manufacturers:

.1 DeZurik of Canada Ltd., Figure No. 632;

.2 Victaulic Co. of Canada Ltd. Vic-300 MasterSeal or AGS Vic-300;

.3 Apollo Valve 143 Series;

.4 Watts Industries (Canada) Inc. #BF-03;

.5 Kitz Corp. 6112 Series;

.6 Toyo Valve Co. 918DESL/G2.

2.4 SWING CHECK VALVES

.1 Bronze - Screwed

.1 Class 125, 1380 kPa (200 psi) WOG rated horizontal swing check valves, each complete with a "Y" pattern bronze body, hinged brass disc, easy access screw-in cap, and screwed ends.

.2 Manufacturers:

.1 Toyo Valve Co. Fig. 236;

.2 Nibco #T-433;

.3 Kitz Corp. Code No. 22.

.2 Steel - Grooved Ends

.1 Victaulic Co. of Canada Ltd. Series 716, 779 or W715 grooved end carbon steel check valves suitable for mounting horizontally or vertically.

.3 Cast Iron - Screwed and Flanged

.1 Cast iron, bronze trim, 1380 kPa (200 psi) rated swing check valves, each complete with a bronze disc and seat, malleable iron hinge, bolted cover, and screwed or flanged ends as required.

.2 Manufacturers:

.1 Toyo Valve Co. Fig. 435A;

.2 Watts Industries (Canada) Inc. #F-511;

.3 Kitz Corp. Code No. 78.

2.5 VERTICAL LIFT CHECK VALVES

.1 Class 150, 1380 kPa (200 psi) WOG rated bronze vertical lift check valves, each complete with screwed ends and a bronze disc.

.2 Manufacturers:

.1 Toyo Valve Co. Fig. 231;

.2 Watts Industries (Canada) Inc. #600;

.3 Kitz Corp. Code No. 36.

2.6 WAFER CHECK VALVES

.1 Threaded lug body type, full bore, ANSI Series 150, 1965 kPa (285 psi) rated at 38°C (100°F), non-slam wafer check valves, each complete with a carbon steel body, stainless steel discs, a shaft, springs, disc stop and thrust bearings constructed of type 316 stainless steel, and seat materials to suit the application. The inside diameter of the valve must equal the inside diameter of the connecting pipe.

.2 Manufacturers:

.1 Gulf Valve Co. "WAFER CHECK";

.2 Watts Industries (Canada) Inc. Series ICV-125;

.3 The Metraflex Co. Style CVXX.

2.7 DRAIN VALVES

.1 Minimum 2070 kPa (300 psi) WOG rated, 20 mm (¾") diameter straight pattern bronze ball valves, each complete with a threaded outlet suitable for coupling connection of 20 mm (¾") diameter hose, and a cap and chain.

.2 Manufacturers:

.1 Toyo Valve Co. Ltd. Fig. 5046;

.2 Watts Industries (Canada) Inc. #B-6000-CC;

.3 Kitz Corp. Code No. 68AC;

.4 Apollo Valves #78-104-01.

2.8 CIRCUIT BALANCING VALVES

.1 Screwed or flanged as required, globe style, non-ferrous circuit balancing valves designed to facilitate precise flow measurement, precision flow balancing, and positive shut-off, complete with capped and valved drain connection, and valved ports for connection to a differential pressure meter.

.2 Manufacturers:

.1 Equal to Victaulic Co. of Canada Ltd. (Tour & Anderson) Series 787 screwed, Series 788 flanged, and 789 grooved end, and Series 78K "Koil Kit" valves.

2.9 RADIATOR SHUT-OFF AND BALANCING VALVES

.1 Heavy pattern, straight, 1750 kPa (250 psi) rated at 120°C (250°F) bronze radiator valves, each complete with composition disc, spring loaded packing, and union. Equip inlet valves with a handle for shut-off. Equip outlet valves with a lockshield for shut-off and balancing.

.2 Manufacturers:

.1 Dahl Brothers Canada Ltd. #11042 and #13013;

.2 Spirax Sarco Ltd. Type R.

2.10 PRESSURE RELIEF VALVES

.1 ASME tested, rated, and certified, bronze or cast iron bronze fitted, 1725 kPa (250 psi) rated pressure relief valves, each capable of relieving full output of equipment it is associated with, and each factory set at 415 kPa (60 psi) unless otherwise specified.

.2 Manufacturers:

.1 ITT Bell & Gossett 3301/4100, or 790/1170;

.2 Dresser Industries "CONSOLIDATED";

.3 Spirax Sarco Ltd. SVI Series;

.4 McDonnell & Miller Models 250 and 260;

.5 Conbraco 10-600 Series;

.6 Watts Industries (Canada) Inc. 174A or 740.

2.11 AIR VENTS

.1 Manual Air Vents

.1 Equal to Conbraco 27 Series, 3.2 mm (⅛") diameter with a key handle.

.2 Automatic Air Vents

.1 Float actuated air vents, each complete with a semi-steel body and cap, a stainless steel float assembly and seat, and a neoprene head.

.2 Manufacturers:

.1 Spirax Sarco Ltd., Type 13 W for system working pressures to 1035 kPa (150 psi), 13 WH for system working pressures greater than 1035 kPa (150 psi);

.2 Armstrong International Inc. No. 1-AV.

2.12 STRAINERS

.1 Cast iron wye shaped strainers, minimum 890 kPa (125 psi) rated and complete with a removable type 304 stainless steel screen with perforations sized to suit the application, and, for strainers 50 mm (2") diameter and larger, a blowdown pipe connection tapping.

.2 Manufacturers:

.1 Spirax Sarco Ltd. Type IF-125 screwed or Type AF-250 flanged;

.2 Toyo Valve Co. Ltd. Fig. 380A screwed or Fig. 381 flanged;

.3 Victaulic Co. of Canada Style 732 or W732 "Vic-Strainer";

.4 Armstrong International Inc. A1 Series;

.5 Watts Industries (Canada) Inc. #77SCI;

.6 Mueller Steam Specialty Products Model 11M screwed or Model 758 flanged.

2.13 PIPING EXPANSION JOINTS

.1 Steel Piping Mains:

.1 Controlled flexing, flanged expansion joints, 2070 kPa (300 psi) rated, with corrugated stainless steel bellows with closely matched neck rings and reinforcing or control rings, and selected for operating pressure plus 25% safety factor.

.2 Manufacturers:

.1 Senior Flexonics Ltd. Series CSF "High-Corr";

.2 Victaulic Co. of Canada Ltd. Style 155 with Style 07 or 107 "Zero-Flex" couplings on each side of assembly and a full length steel "V" shaped support trough with hangers;

.3 The Metraflex Co. Model MC.

.2 Steel or Copper Branch/Runout Piping:

.1 Externally pressurized, 1380 kPa (200 psi) rated expansion joints with a stainless steel bellows and shroud, welding or threaded steel nipple ends for steel piping, and copper sweat nipple ends for copper piping.

.2 Manufacturers:

.1 Senior Flexonics Ltd. Series "H";

.2 The Metraflex Co. Model "HP".

2.14 PIPING ALIGNMENT GUIDES

.1 Prime coat painted black carbon steel pipe alignment guides sized and fabricated to suit pipe size and pipe insulation thickness.

.2 Manufacturers:

.1 Senior Flexonics Ltd. Series PGT;

.2 E. Myatt & Co. Ltd. Fig. 1267;

.3 Empire Tool & Mfg. Inc. Fig 256;

.4 The Metraflex Co. Style IV.

2.15 PIPE ANCHORS

.1 Welded structural black steel anchors of a design, size, and type to securely anchor pipe at point shown. Each anchor is to withstand 150% of axial thrust, and, as specified in Part 1 of this section, is to be designed and detailed by a Professional Structural Engineer.

2.16 FLEXIBLE PUMP CONNECTIONS

.1 Flexible metal hose assemblies, each complete with annular corrugated unbraided type 321 stainless steel inner core, braided type 321 stainless steel hose, and a collar and flange at each end, all suitable for twice the working pressure of the system.

.2 Manufacturers:

.1 Senior Flexonics Inc. A1 and A6 Series;

.2 The Metraflex Co. Model SST and "METRA-MINI".

.3 Option: Victaulic Series 380, 381 or 382 pump drop assemblies. Includes flow control, vibration-controlling flexible couplings, access ports for gauges and thermowells and an integral flanged pump connection. Rated to the working pressure of Class 150 flange connection. Sizes 2” to 12”.

2.17 AIR SEPARATORS

.1 Vortex type vertical air separator with side tangential inlet and outlet connections, a top air outlet connection, and bottom drain connection. Separator is to be constructed of cast iron or fabricated steel for a pressure of 1105 kPa (160 psi) at 180°C (350°F) in accordance with Section VIII, Division 1 of the ASME Boiler and Pressure Vessel Code.

.2 Manufacturers:

.1 S.A. Armstrong Ltd. Model "VA".

.2 ITT Bell & Gossett "Rolairtrol".

.3 Taco Canada Ltd. "Vortech".

.4 Flo-Fab Inc. “SEP-T” Series.

2.18 EXPANSION TANKS

.1 Replaceable bladder type, factory pressurized expansion tank with permanent separation of air and water, in accordance with drawing schedule and complete with:

.1 steel pressure tank suitable for a working pressure of 870 kPa (125 psi) at 115°C (240°F), constructed and stamped in accordance with the ASME Code for Unfired Pressure Vessels and

complete with a system connection, drain connection, air charging valve, and a red oxide primer finish;

.2 heavy-duty butyl rubber (EDPM) bladder;

.3 tapping for installation of a pressure gauge;

.4 For horizontal tanks only, mounting saddles supplied loose;

.5 factory secured seismic restraint connection hardware.

.2 Manufacturers:

.1 Hamlet & Garneau Inc. AL Series "Expanflex";

.2 S.A. Armstrong Ltd. Series "AX-V" Series "L";

.3 ITT Bell & Gossett Series "B" (ASME);

.4 Amtrol "Extrol" Series.

.5 Taco (Canada) Ltd. "CBX" Series.

.6 Flo-Fab Inc. “WX-C” Series, “ABT” Series

2.19 GLYCOL SOLUTION MIXING AND STORAGE TANKS

.1 Package type glycol solution mixing, storage and automatic feed assembly designed to maintain minimum system pressure levels and complete with:

.1 round, polyethylene or polypropylene tank sized to suit system capacity, complete with a solution level scale in litres and Imperial gallons, removable cover, and a welded steel angle stand assembly with legs, pump shelf, and control panel bracket, all factory finished with enamel;

.2 factory pre-piped minimum 1/3 hp, 115 V, 1-phase rotary bronze gear pump with capacity and pressure differential to suit system requirements, factory wired to control panel, mounted on a shelf integral with steel stand assembly, and complete with shut-off valve and strainer;

.3 tank pressure relief valve with discharge piped back into tank;

.4 tank low level switch;

.5 pressure gauge;

.6 Honeywell #L404A "Pressurtrol" or equal pipe mounting differential pressure switch with a 100 kPa to 1000 kPa (15 psi to 150 psi) range;

.7 115 V, 1-phase, factory mounted and pre-wired control panel with an NEMA 2 enamelled steel enclosure, designed to control and operate glycol gear pump either manually or automatically to pump glycol solution into system, and to stop pump and initiate an audible/visual alarm if a low glycol solution level occurs in tank, and complete with:

.1 terminal blocks for power and control wiring connections;

.2 H-O-A switch with green "Power On" indicator light;

.3 120 volt/12 volt control transformer;

.4 low glycol solution level alarm buzzer with silencing switch, an alarm light which remains illuminated until low-level switch is reset, and an alarm push-to-test button;

.5 dry contacts for building automation system alarm annunciation.

.8 factory secured seismic restraint connection hardware.

.2 Manufacturers:

.1 ITT Bell & Gossett Series GMU;

.2 S. A. Armstrong Ltd. GLA Standard Series;

.3 HG Spec. Inc.

2.20 GLYCOL

.1 Propylene glycol blended with Nitrite based corrosion inhibitors.

2.21 GENERAL RE: CIRCULATING PUMPS

.1 Pumps are to be bronze fitted centrifugal pumps in accordance with drawing schedule, each non-overloading under all operating conditions and factory tested at specified operating conditions.

2.22 BASE MOUNTED PUMPS

.1 End suction, horizontal, top discharge, factory mounted and aligned on a steel baseplate, connected to a motor by means of a flexible coupling with guard, and complete with:

.1 heavy-duty, radially split, gasketed cast iron volute designed for servicing and removal of rotating assembly without disturbing pipe connections, and complete with plugged tappings for gauge and drain;

.2 balanced bronze impeller secured to a carbon steel shaft equipped with a stainless steel shaft sleeve;

.3 ball type, heavy-duty, lifetime lubricated sealed bearings with back pull-out design bearing frame;

.4 TEFC motor;

.5 watertight John Crane Inc. JC2, OPID1 carbon rotating face type mechanical seal with tungsten carbide stationary seat, Viton secondary seal and alloy 20 springs, and bronze gland plate with stainless steel gland bolts to secure the stationary seat.

.2 Manufacturers:

.1 S.A. Armstrong Ltd.;

.2 ITT Bell & Gossett;

.3 Grundfos CBS Inc. PACO;

.4 Wilo

.5 Taco Canada Ltd.

.6 Patterson Pump Company.

2.23 SPLIT COUPLED VERTICAL IN-LINE PUMP

.1 Split coupled, single stage, vertical in-line pump complete with:

.1 radially split, gasketed cast iron volute with equally sized suction and discharge flanged connections, tappings for gauge, drain and flush line connections, and a cast iron motor mount bracket;

.2 dynamically balanced cast bronze impeller secured to a type 416 stainless steel shaft which is connected to motor by means of a high tensile strength aluminium bar split type spacer coupling with guard designed to permit servicing of mechanical seal without disturbing pump, motor, or electrical wiring;

.3 TEFC vertical mount motor;

.4 watertight John Crane Inc. #JC8B2, XP1D1 or Durametallic #RA EU5-FV carbon rotating face type outside mechanical seal with tungsten carbide stationary seat, Viton secondary seal and alloy 20 springs, and bronze gland plate with stainless steel gland bolts to secure stationary seat;

.5 factory installed seal flush line tubing with 50 micron Cuno cartridge type filter with 2 extra cartridges, a sight flow indicator, air vent, and valved tubing;

.6 For pump(s) [_____], in lieu of a flush line filter, factory installed valved seal flush line tubing with cyclone type separator and sight flow indicator.

.2 Manufacturers:

.1 S.A. Armstrong Ltd.;

.2 ITT Bell & Gossett;

.3 Grundfos CBS Inc. PACO;

.4 Wilo

.5 Taco Canada Ltd.

.6 Patterson Pump Company.

2.24 CLOSE COUPLED VERTICAL IN-LINE PUMP

.1 Close coupled, single stage vertical in-line pump complete with:

.1 radially split, gasketed cast iron volute with equally sized suction and discharge flanged connections, and tappings for gauge, drain and flush line connections;

.2 dynamically balanced bronze impeller with bronze shaft sleeve, secured to motor shaft;

.3 face mounted TEFC vertical motor;

.4 watertight John Crane Inc. #JC 8B2, XP1D1 or Durmetallic #RA EU5-FV carbon rotating face type inside mechanical seal with tungsten carbide stationary seat, Viton secondary seal and alloy 20 springs, and bronze gland plate with stainless steel gland bolts to secure stationary seat.

.2 Manufacturers:

.1 S.A. Armstrong Ltd.;

.2 ITT Bell & Gossett;

.3 Wilo

.4 Taco Canada Ltd.

.5 Grunfos CBS Inc. PACO;

.6 Patterson Pump Company.

2.25 SPLIT COUPLED, DUAL VERTICAL IN-LINE PUMP

.1 Split coupled, single stage, vertical in-line pump assemblies incorporating 2 radially split pumps, complete with:

.1 cast iron volute with equally sized suction and discharge flanged connections, tappings for gauge, drain and flush line connections, and cast iron motor mount brackets;

.2 For each pump, dynamically balanced cast bronze impeller secured to a type 416 stainless steel shaft which is connected to motor by means of a high tensile strength aluminium bar split type spacer coupling with guard designed to permit servicing of mechanical seal without disturbing pump, motor, or electrical wiring;

.3 For each pump, a TEFC vertical mount motor;

.4 For each pump, a watertight John Crane Inc. #JC8B2, XP1D1 or Durametallic #RA EU5-FV carbon rotating face type outside mechanical seal with tungsten carbide stationary seat, Viton secondary seal and alloy 20 springs, and bronze gland plate with stainless steel gland bolts to secure the stationary seat;

.5 factory installed seal flush line tubing with 50 micron Cuno cartridge type filter with 2 extra cartridges, a sight flow indicator, air vent, and valved tubing;

.6 For pump(s) ___ , in lieu of a flush line filter, factory installed valved seal flush line tubing with cyclone type separator and sight flow indicator.

.2 Manufacturers:

.1 S. A. Armstrong Ltd.;

.2 ITT Bell & Gossett;

.3 Wilo

.4 Taco Canada Ltd.

.5 Grunfos CBS Inc. PACO.

2.26 SPLIT COUPLED, DUAL, VFD DRIVE VERTICAL IN-LINE PUMP

.1 Split coupled, single stage, vertical in-line pump assemblies incorporating 2 radially split pumps, complete with:

.1 cast iron volute with equally sized suction and discharge flanged connections, tappings for gauge, drain and flush line connections, and cast iron motor mount brackets;

.2 For each pump, a dynamically balanced cast bronze impeller secured to a type 416 stainless steel shaft which is connected to motor by means of a high tensile strength aluminium bar split type spacer coupling with guard designed to permit servicing of mechanical seal without disturbing pump, motor, or electrical wiring;

.3 For each pump, a TEFC vertical mount motor;

.4 For each pump, a watertight John Crane Inc. #JC8B2, XP1D1 or Durametallic #RA EU5-FV carbon rotating face type outside mechanical seal with tungsten carbide stationary seat, Viton secondary seal and alloy 20 springs, and bronze gland plate with stainless steel gland bolts to secure stationary seat;

.5 factory installed seal flush line tubing with 50 micron Cuno cartridge type filter with 2 extra cartridges, a sight flow indicator, air vent, and valved tubing;

.6 For each pump, a factory mounted VFD pre-wired to pump motor, capable of operating in any of following control modes:

.1 duty/standby pumps with sensorless control;

.2 duty/standby pumps with remote sensor or building automation system control;

.3 parallel pumps with single or multiple sensor(s) system control with IPS controller.

.7 For pump(s) [___], in lieu of a flush line filter, factory installed valved seal flush line tubing with cyclone type separator and sight flow indicator.

.2 Manufacturers:

.1 S. A. Armstrong Ltd.;

.2 ITT Bell & Gossett;

.3 Wilo

.4 Taco Canada Ltd.

.5 Grundfos CBS Inc. PACO.

2.27 CLOSE COUPLED, DUAL VERTICAL IN-LINE PUMP

.1 Close coupled, single stage, vertical in-line pump assemblies incorporating 2 radially split pumps, complete with:

.1 cast iron volute with equally sized suction and discharge flanged connections, tappings for gauge, drain and flush line connections, and cast iron motor mount brackets;

.2 For each pump, a dynamically balanced cast bronze impeller secured to a type 416 stainless steel shaft which is connected to motor by means of a high tensile strength aluminium bar split type spacer coupling with guard designed to permit servicing of mechanical seal without disturbing pump, motor, or electrical wiring;

.3 For each pump, a TEFC vertical mount motor;

.4 For each pump, a watertight John Crane Inc. #JC8B2, XP1D1 or Durametallic #RA EU5-FV carbon rotating face type outside mechanical seal with tungsten carbide stationary seat, Viton secondary seal and alloy 20 springs, and bronze gland plate with stainless steel gland bolts to secure stationary seat;

.5 factory installed seal flush line tubing with 50 micron Cuno cartridge type filter with 2 extra cartridges, a sight flow indicator, air vent, and valved tubing;

.6 For pump(s) [___], in lieu of a flush line filter, factory installed valved seal flush line tubing with cyclone type separator and sight flow indicator.

2.28 VERTICAL IN-LINE PUMP VARIABLE FREQUENCY DRIVES

.1 Variable frequency drives for vertical in-line pumps as scheduled are to be in accordance with Section 20 05 13.13 – Variable Frequency Drives for Mechanical Equipment.

2.29 CIRCULATING PUMP SUCTION AND DISCHARGE CONNECTION ACCESSORIES

.1 Circulating pump manufacturer supplied suction guides with a cast iron body, stainless steel strainer screen, removable fine mesh start-up strainer screen and steel guide vanes, and cast iron body, angle, or straight type control valve assemblies, each acting as a check valve, balancing valve, and shut-off valve. Unless otherwise shown or specified, suction and discharge connection accessories are to be piping line size.

.2 Manufacturers:

.1 S.A. Armstrong Ltd. Type "SG" suction guides and "Flo-Trex" triple duty valve assemblies;

.2 ITT Bell & Gossett Bulletin B-820D suction guides and Bulletin B-821F triple duty valve assemblies.

2.30 HORIZONTAL IN-LINE PUMP

.1 Horizontal, in-line pump complete with:

.1 cast iron casing with flanged in-line pipe connections;

.2 alloy steel shaft with integral thrust collar, copper shaft sleeve, and oil lubricated bronze bearings;

.3 balanced, corrosion resistant steel, cast bronze, or stamped brass impeller;

.4 motor connected to pump by means of a 4-spring coupling with guard;

.5 mechanical seal.

.2 Manufacturers:

.1 S.A. Armstrong Ltd.;

.2 ITT Bell & Gossett;

.3 Grundfos Canada Inc.

.4 Wilo

.5 Taco Canada Ltd.

2.31 WET ROTOR 3-SPEED HORIZONTAL IN-LINE PUMP

.1 Grundfos Canada Inc. "VersFlo" Series UPS wet rotor design, 3-speed horizontal in-line pump with a head-capacity curve that has a steady rise in head from maximum to minimum flow within preferred operating range, factory tested as an assembly and with a maximum noise level when operating of 41 dBA, capable of continuous operation at 120°C (248°F), and equipped with:

.1 cast iron housing with flanged inlet and outlet with gauge taps, laser welded stainless steel impeller, bearing plate and shaft, stainless steel neck ring, dynamically balanced rotor with stainless steel cladding, and tungsten carbide sleeve type motor bearings;

.2 3-speed asynchronous, squirrel cage, self-venting motor cooled by pumped fluid and complete with stator housing drain holes to permit condensed water to drain;

.3 bolt-on terminal box with 3-speed switch assembly with each speed having a distinct pump performance curve, and fibre optic indicator lights for visual inspection of on/off, rotation, and troubleshooting;

.4 terminal box add-on protective module to permit direct electrical connection to feeder switch;

.5 terminal box add-on relay module to permit direct connection to electrical feeder switch, signals output for external operating or fault indications, and to permit operation of 2 pumps in parallel with 24 hour alternation;

.2 Manufacturers:

.1 Grundfos Canada Inc.;

.2 S. A. Armstrong Ltd.

2.32 WET ROTOR VARIABLE SPEED HORIZONTAL IN-LINE PUMP

.1 Grundfos Canada Inc. "Magna" Series wet rotor design, horizontal, variable frequency drive in-line pump with a head-capacity curve that has a steady rise in head from maximum to minimum flow within preferred operating range, factory tested as an assembly and with a maximum noise level when operating of 41 dBA, capable of continuous operation at 120°C (248°F), and equipped with:

.1 cast iron housing with flanged inlet and outlet with gauge taps, laser welded stainless steel impeller, bearing plate and shaft, stainless steel neck ring, dynamically balanced rotor with stainless steel cladding, and tungsten carbide sleeve type motor bearings;

.2 squirrel cage, self-venting motor suitable for a VFD, cooled by pumped fluid and complete with stator housing drain holes to permit condensed water to drain;

.3 bolt-on, integrated, CSA or ETL certified variable frequency drive assembly with "AUTOADAPT" function which automatically adjusts proportional pressure and sets an efficient performance curve whenever possible, an operating panel with control modules and clear indications for pump flow rate and head, and a bus communication module for site connection into building automation system.

.2 Manufacturers:

.1 Grundfos Canada Inc. “Magna” Series;

.2 Taco Canada Ltd. “Delta T”.

PART 3 - EXECUTION

3.1 DEMOLITION

.1 Perform required hydronic piping system demolition/revision work. Refer to demolition requirements specified in Section 20 05 05 – Selective Demolition for Mechanical.

3.2 PIPING INSTALLATION REQUIREMENTS

.1 Provide required hydronic piping. Pipe, unless otherwise specified, is to be:

.1 For pipe sizes up to and including 50 mm (2") diameter, Schedule 40 black steel, screwed, or type "L" hard copper with solder joints or pressure coupled joints;

.2 For pipe 65 mm (2-½") to 300 mm (12") dia. and larger, Standard weight grooved end black steel pipe, 10 mm (0.375") thickness, with grooved end fittings and couplings, or, Standard weight black steel pipe, 10 mm (0.375") thickness, with welding fittings and welded joints;

.3 For short branch connections, 25 mm (1”) pipe diameter size and less, to heating equipment where structural obstructions occur and site bending of pipe is advantageous, a single length of type "L" soft copper.

.2 Slope horizontal piping mains to provide a minimum continuous up-grade of 25 mm (1") in 6 m (20') to high points. Slope branch supply and return piping connections to equipment a minimum of 25 mm (1") in 1.2 m (4'). Leave sufficient room at high points for installation and maintenance of air vents.

.3 Install automatic control valves, piping wells and similar piping and/or equipment mounted control components required for automatic temperature control systems supplied as part of the control work. Refer to drawing control diagrams and details.

.4 Connect equipment provided as part of the work of other sections with piping as indicated and/or required. Refer to pipe connection details on drawings.

.5 Provide screwed unions, removable mechanical joint couplings, or weld-on or solder-on flanges in piping at all connections to valves, strainers and similar piping system components which may need maintenance or repair, at equipment connections, in runs of piping exceeding 9 m (30') at 4.5 m (15') regular intervals to permit removal of sections of piping, and wherever else indicated on drawings.

.6 Provide shut-off valves in piping connections to equipment, to isolate piping risers, to isolate other sections of systems as shown, and wherever else indicated on drawings. Valves in piping to and including 50 mm (2") dia. are to be ball type. All other shut-off valves are to be ball or butterfly type unless otherwise specified. Locate valves so they are easily accessible. Wherever possible, install

valves at uniform height. Provide chain operators for valves which are inaccessible for operation from floor level.

.7 Provide a check valve in discharge piping of every pump, and elsewhere in piping where shown on drawings. Where check valves are required in vertical piping, ensure they are suitable in all respects for the application. Check valves for vertical in-line and/or base mounted circulating pumps are integral with the discharge accessory.

.8 Provide a drain valve at base of each piping riser, in drain connections to equipment, in low points of horizontal piping, and wherever else shown and/or specified.

.9 Provide circuit balancing valves in piping generally where shown on drawings but with exact locations in accordance with instructions of personnel doing system flow balancing work. Confirm locations prior to installation.

.10 Grooved pipe ends shall be clean and free from indentations, projections and roll marks in the area from pipe end to groove for proper gasket sealing. All couplings will meet Victaulic standards for visual inspection sizes 2” to 12”. The gasket style and elastomeric material (grade) shall be verified as suitable for the intended service as specified. Install in accordance with manufacturer’s latest recommendations. A Victaulic factory trained representative shall periodically visit the job site and review the installation for best practices. The installing Contractor shall correct any identified deficiencies. Victaulic product that has been examined and has not met the visual inspection criteria for proper installation must be corrected and re-examined by Victaulic prior to the completion of the project.

3.3 INSTALLATION OF PRESSURE RELIEF VALVES

.1 Provide factory set pressure relief valves. Pipe discharge of each water piping relief valve to drain unless otherwise shown or specified.

.2 Pipe discharge of each glycol solution piping relief valve back to system expansion tank or return piping.

.3 Confirm relief valve settings.

3.4 INSTALLATION OF AIR VENTS

.1 Provide an air vent in piping mains at all high points, at equipment connections, and wherever else shown and/or specified. Equip each air vent with a ball type shut-off valve. Install vents in 100 mm (4") dia. and larger piping and all vents in mechanical rooms in accordance with drawing detail.

.2 Provide 9 mm (3/8") dia. copper drain piping from each automatic air vent to nearest suitable drain and terminate so discharge is visible. Identify drain piping.

3.5 INSTALLATION OF STRAINERS

.1 Provide strainers in piping. Locate strainers so baskets are easily accessible and removable. Clean strainer baskets during and after piping system flushing and cleaning is complete, and before water quantity balancing commences.

3.6 INSTALLATION OF EXPANSION COMPENSATORS

.1 Provide expansion compensation in piping.

.2 Generally, locate expansion compensation where shown, but with exact locations to suit piping as installed.

.3 Provide double pipe alignment guides in horizontal piping at each side of expansion compensation facilities to permit movement in axial direction only. Secure guides to building structure only.

.4 Provide a pipe guide at each side of expansion joints in vertical risers.

.5 When using grooved piping in a riser refer to a Victaulic riser design for anchor and guide locations.

3.7 INSTALLATION OF PIPING ANCHORS

.1 Provide anchors to secure piping to structure. Locate anchors generally where shown but with exact locations to suit piping as installed and requirements of reviewed anchor shop drawings.

.2 When installation of anchors is complete, arrange, and pay for anchor design engineer to visit site to review anchor installation. Submit a signed letter with engineer's stamp from design engineer confirming each anchor is properly installed.

3.8 INSTALLATION OF AIR SEPARATOR

.1 Provide an air separator in piping and connect with valved inlet and outlet piping.

.2 Extend valved blowdown piping from bottom pipe connection tapping to nearest floor drain location.

.3 Equip top pipe connection tapping with an automatic air vent, and piping as detailed.

3.9 INSTALLATION OF EXPANSION TANK

.1 Provide an expansion tank.

.2 Secure horizontal expansion tank in place from structure by means of properly sized galvanized steel hanger rods and support saddles supplied with tank.

.3 Secure tank stand to a concrete housekeeping pad by means of machine bolts.

.4 Brace and secure tank in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.5 Connect tank with system piping. Extend a drain line from tank piping and terminate drain line with a drain valve. Provide an air vent.

.6 Provide a water make-up connection line complete with relief valve and pressure gauge and connect to system piping. Terminate make-up piping for connection to domestic cold water piping as part of the work of Section 22 11 00 – Facility Water Distribution. Check relief valve operation and adjust as required.

.7 Check tank air charge and adjust to suit system.

3.10 INSTALLATION OF GLYCOL SOLUTION MIXING AND STORAGE TANK

.1 Provide a mixing and storage tank and feed assembly for each glycol solution circulating system.

.2 Secure tank stand to a concrete housekeeping pad. Connect with system piping. Refer to drawing detail.

.3 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.4 Fill tank with, unless otherwise specified, a solution of 50% water, 50% propylene glycol, and test solution to confirm proper concentrations.

.5 When installation is complete, test operation of assembly, including alarms, and adjust as required. Adjust pressure switch to suit glycol solution circulating system pressure.

3.11 INSTALLATION OF FLEXIBLE PIPING CONNECTIONS

.1 Provide flexible connections in piping connections to equipment.

.2 Install in accordance with manufacturer's instructions.

3.12 INSTALLATION OF CIRCULATING PUMPS

.1 Provide centrifugal circulating pumps.

.2 Secure base mounted pumps in place on seismic rated structural steel bases with vibration isolators as specified in Section 20 05 48.13 – Vibration Controls for Mechanical Systems, and restrain as specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems. Provide flexible connectors in pump suction and discharge piping 450 mm (18") from suction and discharge connection accessories.

.3 Secure base mounted pumps in place on a concrete housekeeping pad. Shim pump baseplate level using metal wedges prior to tightening bolts. When installation is complete and pump-motor alignment has been checked, fill void between pump base and housekeeping pad with KPM Industries Ltd. "In-Pakt" or equal non-shrink grout. Provide flexible connections in pump suction and discharge piping 450 mm (18") from suction and discharge connection accessories.

.4 Floor mount vertical inline pumps with seismically rated neoprene vibration isolators as specified in Section 20 05 48.13 – Vibration Controls for Mechanical Systems, and seismically rated steel pump mounting brackets custom welded to suction and discharge connections of pump. For further mounting requirements, refer to Section 20 05 48.16 – Seismic Controls for Mechanical Systems. Provide flexible connectors in vertical suction and discharge piping 450 mm (18") above suction and discharge connection accessories.

.5 Secure vertical inline pumps in place in accordance with requirements of drawing detail and provide flexible piping connections in vertical suction and discharge piping approximately 450 mm (18") above suction and discharge connection accessories.

.6 Provide a shut-off valve and suction guide in pump suction piping, and a combination check-balance-shut-off valve assembly in pump discharge piping, installed in accordance with manufacturer's instructions. Remove suction guide start-up strainer screens after piping flushing and cleaning is complete. Combination check-balance-shut-off valve assemblies are to be 150 mm (6") away from pump discharge for discharge piping to 150 mm (6") dia., and 300 mm (12") away from pump discharge for discharge pipe larger than 150 mm (6") dia.

.7 For pumps equipped with seal flush line filters, replace flush line filter cartridge when pipe flushing and cleaning is complete, and hand identified spare filter cartridges to Owner at site.

.8 Supply variable frequency drives (VFD) for pumps as scheduled. Hand VFD's to electrical trade at site for installation as part of the electrical work.

.9 Install horizontal inline pumps in place in vertical piping approximately 1.2 m (4') above floor in accordance with pump manufacturer's instructions.

.10 If circulating pumps are used for piping flushing and cleaning, and pump seal flush line filters are not installed, replace pump mechanical seals when flushing and cleaning is complete.

.11 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.12 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.13 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.13 FLUSHING AND CLEANING PIPING

.1 Flush and clean new piping in accordance with requirements specified in Section 23 25 00 – HVAC Water Treatment.

3.14 TESTING, ADJUSTING AND BALANCING

.1 When work is complete and equipment is operating as intended, test, adjust and balance water flows in accordance with requirements specified in Section 20 05 93 – Testing, Adjusting, and Balancing for Mechanical Systems, and Section 20 08 00 – Commissioning of Mechanical Systems.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Refrigerant piping, joining materials, valves, fittings, and accessories for refrigerant piping.

1.2 REFERENCES

.1 CSA B52-18, Mechanical refrigeration code.

1.3 SUBMITTALS

.1 Submit shop drawings/product data sheets for all products specified in Part 2 of this section except for pipe and fittings.

.2 Submit, in shop drawing form, a schematic piping diagram for each refrigerant piping system indicating pipe sizes, slopes, valves, traps, and piping specialties. Piping schematics must be reviewed, approved, and signed by refrigeration equipment manufacturers prior to being submitted to the Consultant for review.

1.4 CLOSEOUT SUBMITTALS

.1 Submit letters from equipment suppliers certifying proper installation and start-up of piping systems and equipment as specified in Part 3 of this section.

1.5 QUALITY ASSURANCE

.1 Refrigerant piping systems are to be in accordance with CSA B52, Mechanical Refrigeration Code, and any applicable local Codes and Regulations.

.2 Refrigerant piping installing contractor is to be certified by Technical Standards and Safety Authority (TSSA). Installing contractor is to install refrigerant piping in accordance with manufacturer's installation instructions and in accordance with local codes. Contractor is responsible for all regulatory approvals, if required. Upon completion of installation, documentation of refrigerant amount, test certificates and verification documentation, etc., is to be provided in a binder, in accordance with requirements of local authorities having jurisdiction.

.3 Refrigerant piping and direct expansion refrigeration equipment must be installed by or under direct on site supervision of a licensed journeyman refrigeration mechanic.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND JOINTS

.1 Type ACR hard drawn seamless copper refrigerant tubing to ASTM B280, factory degreased, dehydrated and capped or nitrogen filled and capped, complete with factory washed and bagged wrought copper soldering fittings to ASME B16.22, and brazed joints made with high melting point silver brazing alloy conforming to AWS Classification BcuP-5.

2.2 PIPING LINE SETS

.1 Equal to Great Lakes Copper Inc. "EZ-Roll" soft annealed copper to ASTM B280, suitable for use with refrigerant involved, factory cleaned and capped, and with sizes and lengths as required.

2.3 GENERAL RE: VALVES AND PIPING SPECIALTIES

.1 Refrigerant valves and piping specialties specified below are to factory cleaned, degreased, and supplied to site with capped ends.

2.4 SHUT-OFF VALVES

.1 Ball Valves

.1 ¼ turn, CSA certified forged brass ball valves, each suitable for a maximum working pressure of 3445 kPa (500 psi) and complete with carbon filled Teflon ball seals, 2 O-ring stem seals, a gasketed seal cap, a flow direction arrow cast into body, a ball position indicator on stem, and extended copper tube connections to permit brazing the valve into line without disassembling valve.

.2 Manufacturers:

.1 Mueller Industries Inc.;

.2 Sporlan Valve Co.;

.3 Superior Refrigeration Products/Sherwood.

.2 Diaphragm Valves

.1 Forged brass, frost-proof, Type 1 Series, CSA certified packless diaphragm valves, each suitable for a 3445 kPa (500 psi) working pressure and complete with an O-ring to prevent moisture from entering diaphragm chamber, one phosphor bronze and 2 stainless steel diaphragms, and extended copper tube brazing connections.

.2 Manufacturers:

.1 Mueller Industries Inc.;

.2 Sporlan Valve Co.;

.3 Superior Refrigeration Products/Sherwood.

2.5 CHECK VALVES

.1 Straight through type for valves 6.4 mm to 16 mm (¼" to 5/8") diameter, globe type for valves 22 mm (7/8") diameter and larger, each complete with extended tubing for brazing connections, and as follows:

.1 straight through type check valves complete with a machined brass gasketed body, phosphor bronze spring, and neoprene seat;

.2 globe type check valves complete with a cast bronze body, forged brass cap, phosphor bronze spring, Teflon seat disc, and neoprene O-ring seal.

.2 Manufacturers:

.1 Mueller Industries Inc.;

.2 Sporlan Valve Co.;

.3 Superior Refrigeration Products/Sherwood.

2.6 PIPING TRAPS

.1 Mueller Industries Inc. Style No. WE-554P brazing end copper "P" traps.

.2 Manufacturers:

.1 Mueller Industries Inc.;

.2 Sporlan Valve Co.;

.3 Superior Refrigeration Products/Sherwood.

2.7 PRESSURE VESSEL RELIEF VALVES

.1 Factory set pressure relief valves, straight through or angle type as required, each constructed in accordance with requirements of ANSI B9.1 and the ASME Code for Unfired Pressure Vessels, and each complete with a brass body, neoprene seat disc, and lead seal and locking wire.

.2 Manufacturers:

.1 Mueller Industries Inc.;

.2 Sporlan Valve Co.;

.3 Superior Refrigeration Products/Sherwood.

2.8 REFRIGERANT LIQUID MOISTURE INDICATORS

.1 Forged brass, triple sealed, CSA certified liquid moisture indicators, each suitable for a maximum working pressure of 3445 kPa (500 psi) and complete with a liquid indicator which shows "FULL" when system is fully charged with refrigerant and remains blank when there is a restriction or shortage of refrigerant in liquid line, a moisture indicator which changes colour from blue to pink when moisture is present in system, a plastic dust cover, and extended copper tube brazing connections.

.2 Manufacturers:

.1 Mueller Industries Inc.;

.2 Sporlan Valve Co.;

.3 Superior Refrigeration Products/Sherwood.

2.9 LIQUID LINE FILTER-DRIER

.1 Mueller Industries Inc. "Drymaster" CSA certified filter-driers, each suitable for a maximum 3445 kPa (500 psi) working pressure and complete with a combination of desiccants in a fluted briquette for drying, and a fluted briquette type filter.

.2 Manufacturers:

.1 Mueller Industries Inc.;

.2 Sporlan Valve Co.;

.3 Superior Refrigeration Products/Sherwood.

2.10 FLEXIBLE PIPING CONNECTIONS

.1 Senior Flexonics Canada "VIBRA-SORBERS" phosphor bronze construction, factory cleaned, dried, and sealed flexible piping connections with copper tube brazing ends.

.2 Manufacturers:

.1 Senior Flexonics Canada;

.2 The Metraflex Co.

2.11 THERMOSTATIC EXPANSION VALVES

.1 Factory tested, balanced port design thermostatic expansion valves, with exact selection to suit the application and refrigerant used, each complete within a replaceable stainless steel diaphragm and welded element construction thermostatic element charged with hydraulic fluid, and removable inlet strainer.

.2 Manufacturers:

.1 Mueller Industries Inc.;

.2 Sporlan Valve Co.;

.3 Superior Refrigeration Products/Sherwood.

PART 3 - EXECUTION

3.1 DEMOLITION

.1 Perform required refrigerant piping system demolition work. Refer to demolition requirements specified in Section 20 05 05 – Selective Demolition for Mechanical.

3.2 INSTALLATION OF REFRIGERANT PIPING, VALVES AND SPECIALTIES

.1 Provide required refrigerant piping. Piping is to be type ACR copper with wrought copper fittings. Install piping in accordance with requirements of reviewed refrigerant piping schematics referred to in Part 1 of this section.

.2 Make refrigerant piping joints using a light coat of approved brazing flux applied to both pipe and fitting. Do not use acid flux. During brazing process, ensure pipe and fittings are kept full of nitrogen or carbon dioxide to prevent scale formation inside pipe and fitting.

.3 Where shown or specified, use soft copper refrigerant piping line sets.

.4 Provide shut-off valves to isolate each piece of equipment if shut-off valves are not supplied integral with equipment. Provide ball or diaphragm type shut-off valves inside building. Provide diaphragm shut-off valves outside building.

.5 Provide a refrigerant charging valve for each system if such a valve is not supplied integral with equipment.

.6 Provide refrigerant piping accessories shown and/or required and install in accordance with manufacturer’s recommendations.

.7 Provide required refrigerant.

.8 Provide flexible connections at piping connections to roof mounted condensing units. Install in accordance with manufacturer’s instructions.

.9 Provide expansion valves where shown and/or required, each matched to coil and installed in accordance with manufacturer’s instructions.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 HVAC water-treatment systems.

.2 Chemical treatment test equipment.

.3 HVAC water-treatment chemicals.

1.2 SUBMITTALS

.1 Submit shop drawings/product data sheets for all water treatment chemical feed equipment and associated hardware.

.2 Submit product literature sheets for all chemicals, as well as WHMIS Material Safety Data Sheets for all chemicals.

1.3 CLOSEOUT SUBMITTALS

.1 Submit water treatment manufacturer/supplier certification letters as specified in Part 3 of this section.

.2 Training attendance records.

1.4 MAINTENANCE MATERIAL SUBMITTALS

.1 Submit water treatment test sets and spare chemicals as specified below and in Part 3 of this section.

.2 Supply water softener salt sufficient for 2 months of normal softener operation and store salt on-site where directed by Owner.

PART 2 - PRODUCTS

2.1 CHARACTERISTICS OF CHEMICALS AND SPARE CHEMICALS

.1 Chemicals specified in this section are to be non-toxic when released to atmosphere, non-corrosive, and non-staining if a leak occurs, and compatible with all system components.

.2 Chemicals must be approved by governing authorities for release into Municipal sewer system.

.3 For each treatment system for which chemicals are supplied, supply and hand to Owner, at Substantial Performance of the Work, spare chemical in original containers/packaging sufficient for 2 months of treatment system operation.

2.2 MANUFACTURERS/SUPPLIERS OF CHEMICALS AND FEED EQUIPMENT

.1 Manufacturers:

.1 Ashland Hercules Water Technologies;

.2 Klenzoid Inc.;

.3 Magnus Canada;

.4 Chem-Aqua Canada.

2.3 PIPING SYSTEM FLUSHING AND CLEANING CHEMICAL

.1 Liquid form alkaline type cleaner consisting of a concentrated blend of highly active penetrating agents and detergents with a 12.5 pH and specifically formulated to remove oil, mill scale and oxides from piping and equipment.

2.4 CLOSED HEAT TRANSFER SYSTEM TREATMENT

.1 Chemicals, chemical feed equipment, and test equipment to control corrosion in closed heat transfer circulating systems as indicated on drawings and as specified below.

.2 Enamelled steel or cast iron by-pass feeders sized as shown, 2060 kPa (300 psi) rated and complete with 20 mm (¾") diameter NPT pipe connection tappings, and a screw-on cast iron cap with "Buna N" "O" ring seal.

.3 By-pass filter and flow indicator assembly equal to a Shelco Inc. FOS78, 1725 kPa (250 psi) rated replaceable cartridge filter assembly with a stainless steel housing and 20 mm (¾") diameter piping connections, sized for approximately 5% of rated circulating pump flow and complete with a minimum of 6, 20 micron filter cartridges, and a sight flow indicator equal to an Anderson Midwest Model 350SS with 20 mm (¾") diameter piping connections.

.4 Piping tee mounting coupon holders, each complete with 25 mm (1") diameter NPT plugs with a minimum of one coupon for copper and one coupon for steel.

.5 Chromate free, nitrite/borate type corrosion inhibitor suitable for use with both ferrous and non-ferrous metals.

.6 Test kit for measuring inhibitor level.

2.5 OPEN HEAT TRANSFER SYSTEM TREATMENT

.1 Chemicals, chemical feed equipment, and test equipment to control corrosion and scale formation and inhibit algae/bacteria growth in open heat transfer circulating systems as indicated on drawings and as specified below.

.2 Chemical feed equipment consisting of following:

.1 surface wall mounting PVC panel with shelf;

.2 water treatment controller equal to a Lakewood Instruments Model 1575e, 115 volt, 1-phase, 60 Hz, electronic, single circuit board design, field programmable, menu driven controller housed in NEMA 4X surface mounting enclosure and complete with:

.1 power cord with plug, and 4 female receptacles;

.2 3 relays for feed control of treatment chemicals, with feed based on water makeup, percent of bleed time, percent of "on" time, or schedule, feed lockout upon low system flow condition, and bleed lockout when feeding biocide;

.3 2 water meter inputs, 2 drum switch inputs, conductivity sensor input, flow switch input, and one 4-20 mA output;

.4 heavy-duty, stainless steel, domed, numeric 16 tactile pushbutton keyboard and illuminated LCD graphic display screen.

.3 3, electronic, 115 volt, 1-phase, 60 Hz, diaphragm type metering pumps equal to Idex Corp. "PULSEFEER" Series C Plus, each complete with manually adjustable stroke rate and length, guided ball check valve systems, bleed valve assembly, a pipe mounting injection/back

pressure valve assembly, foot valve strainer assembly, and required suction and discharge tubing;

.4 make-up water meter sized to water make-up pipe dia., complete with hermetically sealed register, factory preset pulse rate, and contact head with 10 ampere rated 115 volt switch;

.5 flow sensor assembly equal to Drew #9427-01-5 or #9426-01-7 to suit system flow rate;

.6 CSA certified, 1035 kPa (150 psi) rated, 12 mm (½") dia., 115 volt, 1-phase, 60 Hz, normally closed forged brass solenoid valve for system bleed;

.7 pipe mounting conductivity sensor with conduit elbow and a minimum of 6 m (20') of cable.

.3 Treatment chemicals equal to following Drew Canada chemicals:

.1 "Performax Millennium" Series #2395 corrosion inhibitor and deposit control in a drum type container;

.2 "Biocide T" slime control agent in a pail type container;

.3 "Biosphere 250" for control of bacteria, fungi, and algae, and supplied in pail or drum type containers as required.

.4 Chemical test equipment consisting of:

.1 organic or phosphate test kit;

.2 alkalinity and chloride dropper test kit.

2.6 BOILER BOIL-OUT CHEMICALS

.1 Boiler boil-out chemicals selected by chemical treatment manufacturer/ supplier in consultation with Consultant and boiler manufacturer, and chemicals selected must be approved by boiler manufacturer.

2.7 WATER SOFTENERS

.1 Package type, automatic, water conserving counterflow design water softener assembly to remove hardness to not more than 0.3 grains per gallon as determined by an ASTM standard soap test method, sized for a continuous flow rate of system make-up requirements at maximum output, and complete with:

.1 2 fibreglass reinforced plastic vessels, each sized for 100% of make-up requirements and complete with a moulded polypropylene structural base;

.2 controller for both automatic and manual regeneration, with electronic automatic regeneration based on adjustable totalized quantity of softened feed water, and designed to prevent simultaneous regenerations and permit time adjustment for backwash, brine and rinse steps;

.3 full charge of cation exchange resin which has a capacity of 68.8 kg/m3 (4.3 lb/ft³) of resin at a regeneration salt dosage level of 240 kg/m^3 (15 lb/ft³) of resin;

.4 high density brine tank, sized to contain amount of salt required for 10 regenerations and complete with required PVC valves and tubing;

.5 softener inlet water meter, calibrated in m^3;

.6 softener salt required for initial brine tank fill and system start-up, and bags of salt as required for 2 months of system operation;

.7 test kit for conducting a soap hardness test;

.8 factory secured seismic restraint connection hardware.

2.8 WATER TREATMENT TESTING COUNTERS

.1 Factory made, 1.8 m (6') long, 915 mm (36") high, 600 mm (24") deep commercial grade counter assembly with toe space, complete with:

.1 at one end, a 508 mm x 520 mm x 175 mm (20" x 20-½" x 7") type 316 stainless steel sink equal to a AMI #1017-C, complete with 3-hole punched ledgeback, crumb cup strainer, and a drain fitting with 40 mm (2-½") dia. tailpiece;

.2 supply fitting equal to a Zurn #Z-831B4-Ict-25 with vandal-proof aerator and 100 mm (4") long blade handles;

.3 acid-resistant counter surface with minimum 250 mm (10") high splashback;

.4 set of double doors under sink;

.5 set of 4 drawers at end opposite sink;

.6 cupboard with 3 adjustable shelves adjacent to drawers;

.7 all required hardware, including concealed hinges, drawer slides with stops, and door pulls;

.8 acid-resisting white enamel finish on all wooden surfaces.

PART 3 - EXECUTION

3.1 PIPING SYSTEM FLUSHING AND CLEANING

.1 After new heat transfer system piping has been installed and leakage testing has been satisfactorily completed, but before mechanical equipment start-up and performance tests, flush and chemically clean piping systems.

.2 Provide required temporary piping connections, including bypass piping to isolate dirt sensitive mechanical plant equipment. Remove instrumentation such as flow meters and switches, orifice plates, meter valves and similar devices and plug pipe openings. Reinstall when flushing and cleaning work has been certified complete by chemical manufacturer/installer. Ensure control valves are operational and fully open during flushing and cleaning.

.3 Prior to chemical cleaning, flush piping, including dead ends, with water to remove loose solids. Clean all strainers. Replace chemical feeder line filters as required. Flush and drain until water runs clear.

.4 When flushing with water is complete, fill systems with fresh clean water. Meter amount of water required to fill each system or otherwise calculate system capacity. Ensure all air is vented from systems. Add cleaning chemical as instructed by chemical manufacturer and circulate solution for a period of time and at a temperature as required to produce a clean piping system. Conduct daily pH, conductivity, and total iron tests in accordance with chemical supplier’s instructions.

.5 After chemical cleaning when test results indicate a clean system, drain solution from piping, refill with clean water and circulate water for a minimum of 24 hours to flush out remaining chemical solution, then drain water from piping using all drain points and again clean all system strainers and replace filters. Arrange for chemical supplier to check each system after flushing and cleaning is complete and to certify in writing that flushing and cleaning procedures have been properly performed. Submit a copy of the certification letter. Fill systems.

3.2 INSTALLATION OF CLOSED HEAT TRANSFER SYSTEM TREATMENT

.1 After flushing and cleaning procedures have been certified complete, provide a by-pass chemical feeder, a cartridge filter assembly, and corrosion test coupons for each closed heat transfer system. Install in accordance with requirements of drawing details.

.2 Supply and feed into each system sufficient chemical to charge system to proper concentrations of chemical, and maintain proper levels in system until Substantial Performance of the Work.

3.3 INSTALLATION OF OPEN HEAT TRANSFER SYSTEM TREATMENT

.1 After flushing and cleaning procedures have been certified complete, provide a PVC panel type backboard, a water treatment controller, 3 metering pumps, a make-up water meter, a flow sensor, a solenoid valve, and a conductivity sensor for each open heat transfer system. Install in accordance with requirements of drawing detail.

.2 Supply and feed into each system, sufficient chemical to charge system to proper concentrations of chemical, and maintain proper levels in system until Substantial Performance of the Work.

.3 Arrange for chemical supplier to check chemical levels in each system, to certify in writing that feed equipment is properly installed and water in each system is properly treated with chemical. Submit a copy of the certification letter.

.4 Hand test sets and spare chemicals to Owner at site. Store chemicals at site where directed by Owner.

.5 In addition to work described above, provide a pot feeder in valved by-pass piping around each pump.

3.4 BOILER BOIL-OUT AND CLEANING

.1 When boiler installation is complete, inspect each boiler and remove all visible debris, rust, scale, and oil, then thoroughly flush each boiler with clean water. Provide required temporary piping connections.

.2 When flushing is complete boil-out each boiler with a chemical solution approved by boiler manufacturer to remove remaining grease, oil, and dirt. Operate each boiler at 50% of normal operating pressure for a minimum of 48 hours or until all contaminants are removed, then again flush each boiler with fresh water until all traces of chemical solution are removed.

.3 When boilers are clean and have been flushed, immediately fill each boiler with water which is chemically treated as specified in this section.

3.5 INSTALLATION OF WATER SOFTENER

.1 Provide a package type water softener assembly and secure in place on a concrete housekeeping pad.

.2 Brace and secure assembly in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.3 Install equipment and components supplied loose with softener in accordance with softener manufacturer’s instructions. Provide required valved piping, including drain piping terminated at a funnel floor drain combination.

.4 Install initial charge of softener salt. Hand spare salt and soap test kit to Owner at site and store where directed.

3.6 INSTALLATION OF WATER TREATMENT TESTING COUNTER

.1 Provide a counter assembly with sink and trim for use during water treatment testing of circulating system samples. Confirm exact location prior to rough-in of services.

.2 Store treatment test kits and a WHMIS Material Safety Data Sheet for each treatment chemical in the counter assembly.

3.7 MANUFACTURER'S CERTIFICATION, START-UP, AND TRAINING

.1 For all water treatment equipment include for on-site certification, start-up supervision, and system training by treatment chemical manufacturer's representative as follows:

.1 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical;

.2 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical;

.3 Include for 4 hours of on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 HVAC ducts and casings.

.2 Acoustic duct lining material.

.3 Special systems ductwork.

.4 Dampers.

.5 Louvres.

.6 Other duct work accessories.

1.2 SUBMITTALS

.1 Submit shop drawings/product data sheets for all products specified in this section except shop fabricated ductwork and fittings.

.2 Include capacity, throw and terminal velocity, noise criteria, and pressure drops with grille and diffuser shop drawing/product data sheet submission.

.3 With shop drawing/product data sheet submission, supply evidence that fire rated duct manufacturer is ULC listed to size requirements shows on drawings.

.4 Submit duct leakage test data prior to ductwork being covered from view.

.5 Submit manufacturer’s colour chart(s) for all items for which a finish colour is to be selected.

1.3 CLOSEOUT SUBMITTALS

.1 Submit proper installation certification from fire rated duct manufacturer as specified in Part 3 of this section.

1.4 MAINTENANCE MATERIAL SUBMITTALS

.1 Supply and hand to Owner at Substantial Performance of the Work, a minimum of 10 identified (with tags) grille/diffuser volume control damper adjustment keys.

1.5 COORDINATION

.1 Supply reviewed copies of ventilator/curb assembly shop drawings or product data sheets to trade who will cut roof openings for ventilators, and ensure openings are properly sized and located.

1.6 QUALITY ASSURANCE

.1 Grilles and diffusers are to be tested and performance certified to ANSI/ASHRAE 70, Method of Testing the Performance of Air Outlets and Air Inlets.

PART 2 - PRODUCTS

2.1 GALVANIZED STEEL DUCTWORK

.1 Galvanized steel sheet is to be hot dipped in accordance with requirements of ASTM A653. G60 galvanizing for bare uncovered duct to be finish painted. G90 for all other galvanizing.

.2 Rectangular

.1 Lock forming grade hot dip galvanized steel, ASTM A653, shop fabricated, minimum #26 gauge.

.3 Round

.1 Factory machine fabricated, spiral, mechanically locked flat seam, single wall duct, fittings and couplings.

.4 Flat Oval

.1 Factory machine fabricated, single wall, 4-ply spiral lock seam duct, fittings and couplings.

2.2 RECTANGULAR ALUMINUM DUCTWORK

.1 Alloy 3003 Temper H14 aluminum, ASTM B209, shop or factory fabricated, water-tight, with metal gauges and fabrication in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible to suit the duct working pressure classification, and type 316 stainless steel support hardware.

2.3 ROUND ALUMINUM DUCTWORK

.1 Alloy 3003 Temper H14 aluminum, ASTM B209, factory fabricated, water-tight, smooth interior, single wall duct, and fittings of spiral lockseam construction with site sealed beaded sleeve (slip type) joints, all in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible to suit duct working pressure classification, and type 316 stainless steel sheet metal screws and support hardware.

2.4 RECTANGULAR STAINLESS STEEL DUCTWORK

.1 300 Series stainless steel, type 304 or type 316 as specified in Part 3 of this Section, ASTM A167 and ASTM A480, with a #4 finish where bare (uncovered) and exposed in finished areas and a #2B finish elsewhere, with, unless otherwise specified, metal gauges in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible to suit duct location and working pressure classification, and stainless steel support hardware to match duct material.

2.5 ROUND STAINLESS STEEL DUCTWORK

.1 Factory made, spiral, mechanically locked flat seam, single wall duct fabricated from type 316 stainless steel to ASTM A240 with metal gauges in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible for 2.5 kPa (0.36 psi) pressure. Type 316 stainless steel fittings equipped with leak-proof stainless steel couplings secured to connecting duct by means of stainless steel sheet metal screws and duct sealer. Duct system performance is to meet SMACNA's Leakage Class 3 requirements at system design static pressure. Stainless steel finish is to be a #2B mill finish where concealed or exposed in unfinished areas and a #4 finish where exposed in finished areas.

2.6 ROUND STAINLESS STEEL LINED DUCTWORK

.1 Double wall self-sealing duct system constructed from type 316 stainless steel to ASTM A240 and consisting of 24 kg/m3 (1.5 lb/ft³) density, 25 mm (1") thick glass fibre insulation meeting NFPA 90A requirements and 25/50 flame spread/smoke developed ratings when tested in accordance with CAN/ULC S102 and wrapped in a thick non-woven polyester fabric, sandwiched between double wall duct and fittings. Spiral, mechanically locked, flat seam outer casing, and perforated inner liner with 3.2 mm (⅛") perforations on 6.4 mm (¼") staggered centres. Fittings and couplings constructed as for ducts and air-tight to SMACNA Leakage Class 3 requirements. Concealed duct and exposed

duct in unfinished areas is to have a #2B mill finish. Exposed duct in finished areas is to have a #4 finish.

2.7 FIBERGLASS REINFORCED PLASTIC DUCT – RECTANGULAR AND ROUND

.1 Factory fabricated duct and fittings in accordance with ASTM C582, ASTM D3982, ASTM D2996, SMACNA manual entitled "Thermoset FRP Duct Construction Manual", and with resin conforming to 25/50 flame spread/smoke developed rating when tested in accordance with CAN/ULC-S102, pigment coloured as selected from manufacturer's standard colours, with thixotropic resin paste sealed and fibreglass cloth and resin overwrapped bell and spigot joints for round ducts, air-tight gasketed flanged joints with type 316 stainless steel bolts, lock washers and nuts for rectangular ducts, and type 316 stainless steel support hardware.

2.8 FLEXIBLE METALLIC DUCTWORK

.1 Bare

.1 Spirally wound, semi-rigid, self-supporting corrugated aluminum duct with continuous triple lock seams, SMACNA Form "M-UN", CAN/ULC-S110 listed and labelled as a Class 1 Air Duct, constructed of dead soft aluminum strip, and supplied in 3 m (10') lengths.

.2 Insulated

.1 Spirally wound, semi-rigid, self-supporting corrugated aluminum duct with continuous triple lock seams, SMACNA Form "M-I", CAN/ULC-S110 listed and labelled as a Class 1 Air Duct, constructed of dead soft aluminum strip, supplied in 3 m (10') lengths and factory covered with 40 mm (1-½") thick, 12 kg/m3 (0.75 lb/ft³) density fibreglass insulation with a vinyl jacket meeting 25/50 flame spread and smoke developed requirements tested in accordance with CAN/ULC-S102.

2.9 FLEXIBLE FABRIC DUCTWORK

.1 Equal to DuctSox Corp. round fabric air duct, 25/50 flame spread/smoke developed rated when tested in accordance with CAN/ULC-S102, white or coloured (to manufacturer's standards), and complete with 3 x 1 tension cable suspension system.

2.10 FLEXIBLE FABRIC DUCTWORK

.1 Bare

.1 Equal to Flexmaster Canada Ltd. "Fabriflex" Type 4 ULC listed and labelled Class 1 flexible fabric duct consisting of vinyl coated fibreglass cloth mechanically bonded to a corrosion resistant galvanized steel helix.

.2 Insulated

.1 Equal to Flexmaster Canada Ltd. "Fabriflex" Type 4T ULC listed and labelled Class 1 flexible fabric duct consisting of vinyl coated fibreglass cloth mechanically bonded to a corrosion resistant galvanized steel helix and factory insulated with 25 mm (1") thick glass fibre insulation with a polyethylene vapour barrier jacket.

2.11 FLEXIBLE CONNECTION MATERIAL

.1 Waterproof, indoor-outdoor type flexible connection material meeting requirements of NFPA 90A, consisting of woven glass fibre fabric coated on both sides with synthetic rubber.

.2 Manufacturers:

.1 Duro Dyne Canada Inc. "DUROLON";

.2 Dyn Air Inc. "HYPALON".

2.12 METAL DUCT SYSTEM JOINT SEALANT

.1 ULC listed and labelled, premium grade, grey colour, water base, non-flammable duct sealer, brush, or gun applied, with a CAN/ULC S102 tested maximum flame spread rating of 5 and smoke developed rating of 0.

.2 Manufacturers:

.1 Johns Manville;

.2 Manson Insulation;

.3 Knauf Insulation.

2.13 ACOUSTIC LINING

.1 Minimum 25 mm (1") thick acoustic lining material meeting 25/50 flame spread and smoke developed ratings tested in accordance with CAN/ULC S102, meeting NFPA 90A, ASTM C1071, and ASTM G21 requirements, not supporting microbial growth, flexible for round ducts, board type for rectangular ducts, consisting of a bonded fiberglass mat coated on inside (airside) face with a black fire-resistant coating.

.2 Manufacturers:

.1 Johns Manville;

.2 Manson Insulation;

.3 Knauf Insulation.

2.14 FACTORY INSULATED FIRE RATED DUCTWORK

.1 Equal to DuraSystems Barriers Inc. "DuraDuct HP" or "DuraDuct GNX" duct, 2 hour fire rated, constructed, ULC listed and labelled for fire rated ventilation applications. Duct is constructed of a galvanized steel inner liner, a galvanized steel outer jacket, and all required fittings and accessories, including support hardware.

2.15 IN-SLAB EXHAUST DUCTWORK

.1 Equal to ECCO Manufacturing "ECCODUCT" spiral wound, galvanized steel, 300 mm x 45 mm (12" x 1-¾") rectangular duct supplied in 3 m (10') lengths complete with factory supplied galvanized steel connection couplers, fittings, exterior discharges with back draft dampers, and support brackets. Concrete encased duct and fittings are 3 hour fire rated in accordance with tests conducted by Intertek/Warnock Hersey in accordance with ULC S115 and ASTM E814, are to have an impact loading rating of 200 kg (440 lb) from 1.5 m (5') with no permanent deformations in accordance with CAN3-A23, and are to have a point loading rating with 1 mm (1/32") permanent deformation when tested to CSA S269.1.

2.16 CASING AND PLENUM MATERIAL AND ACCESSORIES

.1 Unless otherwise specified, casing and plenum material is to be same as connecting duct material.

.2 Accessories such as access doors and drain pans are to be constructed of same material as casing and plenum and are to be in accordance with Chapter 6 of SMACNA HVAC Duct Construction Standards Metal and Flexible.

2.17 ACOUSTIC PLENUM PANELS

.1 Vibro-Acoustics Ltd. type "AP", 100 mm (4") thick panels with acoustic media meeting NFPA 90A requirements sandwiched between minimum #24 gauge galvanized sheet steel, with airside face perforated, access doors where shown, and with acoustic performance as follows:

Octave Bands, (Hz)	125	250	500	1000	2000	4000
Transmission Loss	21	28	39	50	53	56
Absorption Coefficient	0.7	0.9	0.99	0.99	0.9	0.9

.2 Manufacturers:

.1 Vibro-Acoustics Ltd.;

.2 Kinetics Noise Control Inc.;

.3 Carrier Corp. – Racan;

.4 Haakon Industries;

.5 Price Industries Inc;

.6 Alumavent.

2.18 PLENUM ACCESS DOORS

.1 Factory fabricated, double wall insulated access doors, sized as indicated on drawings, and constructed of same material as connecting ductwork in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible to suit operating pressure of the system.

2.19 ROUND TO RECTANGULAR DUCT CONNECTIONS

.1 Equal to Flexmaster Canada Ltd. galvanized steel, flared, flanged or notched "Spin-On" round duct take-off collars with locking dampers in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible.

2.20 SPLITTER DAMPERS

.1 Minimum #20 gauge damper blade constructed of same material as duct, reinforced as required to suit blade size, system velocity, and to prevent "chatter", and complete with operating hardware equal to DynAir Inc. #Q-50 "DYN-A-QUAD S-S" quadrant regulator with RW-50 backup washers to prevent leakage, long square bearing pin, and slide pin.

2.21 AIR TURNING VANES

.1 For square elbows, multiple-radius turning vanes interconnected with bars, adequately reinforced to suit pressure and velocity of system, constructed of same material as duct they are associated with, and in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible.

.2 For short branch ducts at grille and diffuser connections, air extractor type each equipped with a matching bottom operated 90° opposed blade volume control damper, constructed of same material as duct it is associated with and in accordance with requirements and details in ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible.

2.22 MANUAL BALANCING (VOLUME) DAMPERS

.1 Flanged and drilled, single or parallel blade (depending on damper size) manual balancing dampers, each constructed of same material as connecting ductwork unless otherwise specified, each designed to maintain internal free area of connecting duct, and each complete with:

.1 hexagonal or square shaft extension through frame;

.2 non-stick, non-corrosive synthetic bearings for rectangular dampers, flange stainless steel bearings for round dampers;

.3 blade stops for single blade dampers, designed to prevent blade from moving more than 90°;

.4 linkage for multiple blade dampers;

.5 locking hand quadrant damper operator with, for insulated ducts 50 mm (2") standoff mounting.

.2 Rectangular Dampers: Nailor Industries Inc. 1800 Series, maximum size 1.2 m x 1.2 m (4' x 4') for a single damper.

.3 Round Dampers: Nailor Industries Inc. model 1890, maximum 600 mm (24") diameter, equipped with a minimum 200 mm (8") deep frame, and blade stiffeners where required.

.4 Multiple Rectangular Damper Section Assembly: Rectangular assembly supplied with the dampers or site constructed, of same material as damper and designed for tight and secure mounting of individual dampers.

.5 Manufacturers:

.1 Nailor Industries Inc.;

.2 T.A. Morrison & Co. Inc. "TAMCO";

.3 Greenheck Fan Corp.;

.4 Ruskin Co.

2.23 BACKDRAFT DAMPERS

.1 Nailor Industries Model 1370CB counterbalanced backdraft dampers, vertical or horizontal mounting, 50 mm (2") wide, sized as shown and complete with:

.1 extruded 6063-T5 aluminum frame, 2.3 mm (0.090") nominal wall thickness, with mitred corners;

.2 extruded 6063-T5 aluminum blades, 1.3 mm (0.050") nominal wall thickness on 92 mm (3-5/8") centres, and with extruded PVC blade seals;

.3 corrosion-resistant synthetic bearings;

.4 adjustable plated steel counterweights mounted internally in the airstream;

.5 concealed blade linkage located out of the airstream.

.2 Manufacturers:

.1 Nailor Industries Inc.;

.2 T.A. Morrison & Co. Inc. "TAMCO";

.3 Greenheck Fan Corp.;

.4 Ruskin Co.

2.24 FUSIBLE LINK DAMPERS

.1 Curtain blade type, dynamic, galvanized steel (unless otherwise specified) fusible link dampers, ULC classified to CAN/ULC S112 and in accordance with NFPA 90A requirements, factory tested

for closure under airflow, 1-1/2 hour or 3 hour rated as required, and complete with a constant force type 301 stainless steel closure spring, a blade lock assembly, a steel sleeve, retaining angles, and, unless otherwise specified, a 74°C (165°F) rated standard fusible link.

.2 Fusible link dampers are to be Type "B" or Type "C" (as required) with folded curtain blade out of air stream except where damper size or location requires use of type "A" dampers with curtain blade in air stream.

.3 Dampers in ductwork other than galvanized steel are to be as specified above but constructed of type 316 stainless steel.

.4 Manufacturers:

.1 Nailor Industries Inc.;

.2 Greenheck Fan Corp.;

.3 Ruskin Co.;

.4 Price Industries (E.H. Price).

2.25 COMBINATION FIRE/SMOKE DAMPERS

.1 Nailor Industries Series 1221, ULC listed to CAN/ULC S112 and CAN/ULC S112.1, meeting requirements of NFPA 80, 90A, 92, 101 and 105, consisting of type A, B, or C fusible link fire dampers as required and a fail-safe, opposed blade, normally closed, motor operated smoke damper complete with factory installed and tested 120 V electric actuator.

.2 ULC 1-1/2 hour fire rated and ULC Class I leakage rated for smoke, and equipped with a 74°C (165°F) ULC classified fusible link that will cause damper to close and lock independent of actuator when duct temperature reaches maximum temperature of damper assembly.

.3 Supply damper with factory installed sleeves of minimum 400 mm (16") length, field verified by contractor dependent on wall thickness. Caulk sleeves to ULC requirements and constructed of 20 gauge for sizes up to 2.1 m (84") wide and 18 gauge for sizes greater than 2.1 m (84") wide.

.4 Dampers in ductwork other than galvanized steel are to be as specified above but constructed of type 316 stainless steel.

.5 Manufacturers:

.1 Nailor Industries Inc.;

.2 Greenheck Fan Corp.;

.3 Ruskin Co.;

.4 Price Industries (E.H. Price).

2.26 SMOKE DAMPERS

.1 Multi-blade type, fail-safe, dynamic, galvanized steel (unless otherwise specified) smoke dampers, ULC classified to CAN/ULC S112.1, ULC Class I leakage rated for smoke, meeting requirements of NFPA 90A, 92, 101 and 105, normally closed, low pressure drop design, dynamically tested, each complete with jamb and blade seals, linkage concealed in the frame, a steel sleeve to suit the opening, and an electric actuator to automatically close damper upon receiving an external signal, and to automatically open damper when system is reset.

.2 Dampers in ductwork other than galvanized steel are to be as specified above but constructed of type 316 stainless steel.

.3 Manufacturers:

.1 Nailor Industries Inc.;

.2 Greenheck Fan Corp.;

.3 Ruskin Co.;

.4 Price Industries (E.H Price).

2.27 ROOF DUCT SUPPORTS

.1 Equal to PHP Systems Design Model PHP-D adjustable duct support assemblies sized to suit duct size, each assembly complete with injection moulded recycled plastic and carbon black bases and tubular hot dip galvanized steel framing.

2.28 PRESSURE RELIEF DOORS

.1 Greenheck model PRAD (positive) or VRAD (negative) pressure relief doors constructed of same material as duct or plenum they are associated with, each complete with a sealing gasket, special latches, cable assembly with spring to limit door opening to maximum 80° and factory set, field adjustable pressure relief magnet assembly.

.2 Size access doors to match requirements of system so pressure drop through open blow-out door at required flow rate will not exceed rated pressure of duct system.

.3 Manufacturers:

.1 Greenheck Fan Corp.;

.2 United Enertech.

2.29 DUCT ACCESS DOORS

.1 In accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible, with sizes suitable in all respects for purpose for which they are provided, and, unless otherwise specified, constructed of same material as duct they are associated with.

2.30 DUCTWORK DRAIN POINTS

.1 Equal to Ductmate Canada Ltd. "Moisture Drain", 20 mm (¾") diameter moisture drains with galvanized sheet metal funnel, and chrome plated brass threaded drain, nut, and cap.

2.31 INSTRUMENT TEST PORTS

.1 Equal to Duro-Dyne of Canada Ltd. #IP1 or #IP2 (to suit insulation thickness where applicable) gasketed, leakproof instrument test ports for round or rectangular ducts as required, each complete with a neoprene expansion plug and a plug securing chain.

2.32 WIRE MESH (BIRDSCREEN)

.1 Heavy-gauge galvanized steel or aluminum mesh, 12 mm x 12 mm (½" x ½") secured in a rigid galvanized steel or aluminum framework, sized as indicated on drawings, and constructed so as to be removable.

2.33 LOUVRES

.1 Price Industries Inc. DE439 or DE635, 100 mm (4") or 150 mm (6") deep (to suit wall thickness) factory assembled stationary, drainable, louvres sized as indicated on drawings, each AMCA water

penetration and air performance certified, constructed of welded, extruded, alloy 6063-T5 aluminum with drainable blades, mounting and securing hardware to suit the application, and 12 mm (½") mesh aluminum birdscreen in an aluminum frame.

.2 Acoustical Louvres: Price Industries Inc. Model QA1245 300 mm (12") deep, welded, extruded alloy 3003-H14 aluminum, storm-proof, stationary, drainable acoustical louvers, AMCA water penetration and air performance certified, with high density mineral wool acoustic media secured to blades and protected by perforated aluminum, sound ratings in accordance with ASTM E90 and ASTM E413, and mounting and securing facilities as required.

.3 Louvres are to be factory finished with a finish equal to PPG Industries "Duranar" fluoropolymer powder coating over primer with colour as selected from manufacturer's standard colour range.

.4 Manufacturers:

.1 Price Industries Inc.;

.2 The Airolite Co. LLC;

.3 Construction Specialities;

.4 Nailor Industries Inc.;

.5 Kinetics Noise Control Inc.

.6 Greenheck Fan Corp.

.7 Ventex.

2.34 LOUVRE BLANK-OFF PANELS

.1 Insulated, framed, sandwich construction panels consisting of 40 mm (1-½") thick rigid insulation (meeting NFPA 90A requirements) between minimum #20 gauge galvanized sheet steel with exterior face of panels finished to match finish of exterior wall louvres.

2.35 BRICK AND BLOCK VENTS

.1 Equal to Price Industries Inc. vents constructed of 6063-T5 alloy extruded aluminum, sized as shown, complete with stainless steel fasteners, aluminum rod vertical supports on minimum 300 mm (12") centres, #2 mesh fixed aluminum screen, and all required accessories to suit the application.

.2 Vent(s) to be factory finished with a finish equal to a baked "Kynar 500-XL" colour coat and a clear coat over cleaned and primed metal with colour as selected from manufacturer's standard colour range.

2.36 FIRE STOP FLAPS AND THERMAL BLANKET MATERIAL

.1 Rectangular or round, ULC listed and labelled, blade type galvanized steel fire stop flaps in accordance with CAN/ULC S112, Standard Methods of Fire Test of Fire-Damper Assemblies and CAN/ULC S112.2, Standard Method of Fire Test of Ceiling Firestop Flap Assemblies, each complete with #22 gauge G60 galvanized steel blade(s) and frame, a 74°C (165°F) fusible link, and, for dampers 300 mm (12") and larger, ceramic fibre insulation on both sides of the blades.

.2 Ceramic fibre material in accordance with 25/50 flame spread/smoke developed ratings when tested to CAN/ULC S102 and of a thickness to suit required fire rating.

2.37 GRILLES AND DIFFUSERS

.1 Grilles and diffusers of type, size, capacity, finish, and arrangement as shown on drawings and in accordance with drawing schedule, each equipped with all required mounting and connection accessories to suit mounting location and application.

.2 Manufacturers:

.1 Price Industries Inc.;

.2 Anemostat;

.3 Krueger Division of Air System Components Inc.;

.4 Titus;

.5 Nailor Industries Inc.;

.6 Tuttle & Bailey.

2.38 ROUND LOW SILHOUETTE ROOF MOUNTED VENTILATORS

.1 Spun aluminium, round, gravity roof mounting hoods in accordance with drawing schedule, each complete with:

.1 wind band with a rolled bead, and curb cap with one-piece, spun, deep venturi inlet, and pre-punched holes for mounting;

.2 galvanized steel bird screen;

.3 minimum 300 mm (12") high welded aluminium, insulated roof mounting curb with damper tray;

.4 aluminium backdraft damper supplied loose, for site installation in roof curb damper tray;

.5 non-corrosive motorized damper supplied loose for site installation in roof curb damper tray, equal to T. A. Morrison TAMCO Series 9000 insulated damper with linkage, end switch, and a Belimo or equal motor with voltage to suit control voltage requirements;

.6 factory secured seismic restraint connection hardware.

.2 Manufacturers:

.1 Greenheck Fan Corp.;

.2 PennBarry;

.3 Twin City Fan and Blower.

2.39 LOUVRED PENTHOUSE TYPE VENTILATORS

.1 Low silhouette, rectangular, roof mounting louvred penthouse type hoods in accordance with drawing schedule, each constructed of aluminium, supplied in knock-down form for site assembly, and each complete with:

.1 extruded aluminium, welded storm-proof louver blades with mitred corners and stainless steel securing screws;

.2 removable cover for internal access, lined with glass fibre insulation material and equipped with stainless steel fasteners;

.3 12 mm x 12 mm (½" x ½") aluminium mesh birdscreen;

.4 welded aluminium, minimum 300 mm (12") high insulated roof mounting curb with damper tray and curb seal;

.5 aluminium backdraft damper supplied loose, for site installation in roof curb damper tray;

.6 non-corrosive motorized damper supplied loose for site installation in roof curb damper tray, equal to T. A. Morrison TAMCO Series 9000 insulated damper with linkage, end switch, and a Belimo or equal motor with voltage to suit site control voltage requirements;

.7 factory secured seismic restraint connection hardware.

.2 Manufacturers:

.1 Greenheck Fan Corp.;

.2 Twin City Fan and Blower;

.3 PennBarry.

.4 Ventex.

2.40 HOODED TYPE VENTILATORS

.1 Low silhouette, rectangular, roof mounting hooded penthouse type ventilators in accordance with drawing schedule, each constructed of aluminium, supplied in knock-down form for site assembly, and each complete with:

.1 full 360° perimeter hood opening;

.2 12 mm x 12 mm (½" x ½") aluminium mesh bird screen;

.3 welded aluminium, minimum 300 mm (12") high insulated roof mounting curb with damper tray and curb seal;

.4 aluminium backdraft damper supplied loose for site installation in roof curb damper tray;

.5 non-corrosive motorized damper supplied loose for site installation in roof curb damper tray, equal to T. A. Morrison TAMCO Series 9000 insulated damper with linkage, end switch, and a Belimo or equal motor with voltage to suit site control voltage requirements;

.6 factory secured seismic restraint connection hardware.

.2 Manufacturers:

.1 Greenheck Fan Corp.;

.2 Twin City Fan and Blower;

.3 PennBarry.

2.41 INTAKE WALL BOX

.1 Equal to Reversomatic SWBL-INTAKE wall boxes leakproof seamless construction, extruded aluminum grille, sized as shown, complete with stainless steel fasteners, and all required accessories to suit the application. Contractor to coordinate colour and finish with colour as selected from manufacturer's standard colour range as noted in schedule.

2.42 EXHAUST WALL BOX

.1 Equal to Reversomatic SWBL wall boxes leakproof seamless construction, extruded aluminum grille, sized as shown, complete with stainless steel fasteners, neoprene backdraft damper, and all required accessories to suit the application. Contractor to coordinate colour and finish with colour as selected from manufacturer's standard colour range as noted in schedule.

PART 3 - EXECUTION

3.1 CLEANLINESS REQUIREMENTS FOR HANDLING AND INSTALLATION OF DUCTWORK

.1 Handle and install ductwork in accordance with SMACNA's Duct Cleanliness for New Construction Guidelines at the Advanced Level.

3.2 FABRICATION AND INSTALLATION OF GALVANIZED STEEL DUCTWORK

.1 Provide required ductwork, rectangular, round and/or flat oval. Where rectangular ductwork is shown, round or flat oval ductwork of equivalent cross-sectional area is acceptable.

.2 It is to be understood that all duct dimensions shown on drawings are clear internal dimensions.

.3 Unless otherwise specified, construct and install ductwork in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible to suit duct pressure class designation of minimum 500 Pa (2" w.c.) positive or negative as applicable, a minimum velocity of 10 m/s (2000 fpm), and so ductwork does not "drum". Flat surfaces of rectangular ductwork are to be cross-broken or beaded per SMACNA standards. Duct system sealing is to meet ANSI/SMACNA Seal Class A requirements.

.4 Variable air volume ductwork from supply fans to boxes is as above but rectangular duct take-offs are double side straight taper type with a take-off length equal to 0.5 times the branch duct width but minimum 150 mm (6") length, and double taper side is to have an included angle of minimum 60°.

.5 Confirm routing of all ductwork at site and site measure ductwork prior to fabrication. Duct dimensions may be revised to suit site routing and building element requirements, if dimension revisions are reviewed with and approved by the Consultant. Duct routing and/or dimension revisions to suit conditions at site are not grounds for a claim for an extra cost.

.6 Refer to structural drawings. Where ductwork is to be run within or through open web steel joists, ductwork shown on mechanical drawings is schematic only and is to be altered as required to suit steel joist configuration, spacing, panel points, and cross-bridging at no additional cost.

.7 Wherever ductwork is required at locations where sprayed fireproofing is applied to building construction, install ductwork only after fireproofing work is complete and do not compromise fire rating of sprayed fireproofing.

.8 Install (but do not connect) duct system mounted automatic control components supplied as part of the automatic control work.

.9 Where indicated, provide duct connections to fan powered heat transfer equipment with integral coils.

.10 Flange connect ductwork to hot water reheat coils in accordance with requirements of ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible. Coils will be suspended independent of connecting ductwork as part of the heat transfer work.

.11 Support horizontal rectangular ducts inside building in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible, but use trapeze hangers with, unless otherwise specified, galvanized steel channels, and galvanized steel hanger rods for exposed ducts and concealed ducts wider than 500 mm (20"). Support hardware constructed of same material as duct for metal duct, and, unless otherwise specified, type 316 stainless steel for non-metal duct. Supports for "heavy" duct such as cementitious core duct is to be suitable in all respects for the application and approved by the Consultant.

.12 Support round and flat oval ducts inside building in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible, but, unless otherwise specified, for both uninsulated

and insulated ducts exposed in finished areas, use bands and secure at top of duct to a hanger rod, all similar to Ductmate Canada Ltd. type "BA". If duct is insulated, size strap to suit diameter of insulated duct. Unless otherwise specified, duct support hardware for metal duct is constructed of same material as duct, and for non-metal duct, type 316 stainless steel.

.13 Where flanged duct joints are used, do not locate joints in wall or slab openings, or immediately at wall or slab openings. Do not use flanged joints for exposed uninsulated ducts in finished areas.

.14 Where watertight horizontal ductwork is required, construct ducts without bottom longitudinal seams. Solder or weld joints of bottom and side sheets. Seal all other joints with duct sealer. Slope horizontal duct to hoods, risers, or drain points. Provide drain points. Provide watertight ductwork for:

.1 ductwork outside building or otherwise exposed to the elements;

.2 dishwasher exhaust;

.3 shower exhaust ducts from grilles to duct main or riser;

.4 minimum of 3 m (10') upstream and downstream of duct mounted humidifiers or humidifier manifolds;

.5 fresh air intakes;

.6 wherever else shown.

.15 Leakage Testing:

.1 Ductwork leakage is not to exceed following:

.1 ductwork to 2" W.C. Class, 1% of total air quantity handled by respective fans;

.2 ductwork exceeding 2" W.C. Class, 2% of total air quantity handled by respective fans.

.2 Leakage testing is to be performed by the Testing, Adjusting and Balancing (TAB) agency in accordance with SMACNA HVAC Air Duct Leakage Test Manual and is to be witnessed by the Consultant.

.3 Leakage test following ductwork:

.1 [ ];

.2 [ ].

.4 Be responsible for following:

.1 preparing duct systems for leakage testing prior to installation of external insulation including capping duct runouts and provision of final tap-in for test equipment;

.2 schedule testing with TAB agency in advance, be present for all testing and ensure notice is given to the Consultant so they may witness testing;

.3 resealing and/or replacement of defective ductwork;

.4 bearing all costs associated with retesting ductwork which has failed to pass leakage testing.

.16 Seal all ductwork in accordance with SMACNA Seal Class "A", except for round duct with self-sealing gasketed fittings and couplings which does not require site applied sealant. Apply sealants by brush or gun to cleaned metal surfaces. Where bare ductwork is exposed apply neat uniform lines of sealant. Randomly brushed, sloppy looking sealant applications will be rejected and must be repaired or replaced with a neat application of sealant.

.17 Apply sealants by brush or gun to cleaned metal surfaces. Where bare ductwork is exposed apply neat uniform lines of sealant. Randomly brushed, sloppy looking sealant applications will be rejected and must be repaired or replaced with a neat application of sealant.

.18 Clean exterior exposed (uninsulated) ducts and coat with a heavy full coverage of Bakor #410-02 black metal paint.

.19 Where dissimilar metal ducts are to be connected, isolate ducts by means of flexible duct connection material.

.20 Equip ducts with a dimension of 600 mm (24") and larger and located in mechanical equipment rooms of any kind with hanger rods equipped with double deflection neoprene rod isolation hangers properly sized for associated load. Also refer to Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.21 In addition to SMACNA duct construction standards specified above, ductwork is to be constructed and installed to meet seismic requirements of British Columbia Building Code and ANSI/SMACNA The Seismic Restraint Manual: Guidelines for Mechanical Systems.

3.3 INSTALLATION OF ALUMINUM DUCTWORK

.1 Provide aluminum ductwork, rectangular or round.

.2 Provide aluminium ductwork for:

.1 [ ];

.2 [ ].

.3 Wherever bare aluminum ductwork comes in contact with ferrous metal or copper, paint ferrous metal or copper surface with a heavy, 100% covering coat of zinc chromate paint, asphalt paint or otherwise isolate direct contact with the bare aluminum.

.4 Refer to "Commentary on Aluminum Ducts" in ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible, however, do not use drive and S cleats for joining waterproof aluminum ductwork. Use following SMACNA joining methods:

.1 T-21 - welded flange;

.2 T-22 - companion angle and gasket;

.3 T-24A - flanged.

.5 Keep longitudinal joints at top surface of horizontal runs. Provide proper transverse supports to prevent deflection. Ensure duct is rigid.

.6 When mastic is used for sealing such as sealing longitudinal joints, apply mastic to both surfaces before they are mated. When dry, apply mastic again for a water-tight seal.

3.4 INSTALLATION OF STAINLESS STEEL DUCTWORK

.1 Provide stainless steel ductwork, round or rectangular.

.2 Provide stainless steel ductwork as follows:

.1 [ ];

.2 [ ].

.3 Exposed stainless steel kitchen exhaust duct is to be minimum #16 gauge and of welded construction with pickled and passivated welds which are ground to a finish to match duct finish.

3.5 INSTALLATION OF FIBREGLASS REINFORCED PLASTIC (FRP) DUCTWORK

.1 Provide rectangular fibreglass reinforced plastic ductwork.

.2 Provide FRP ductwork for:

.1 [ ];

.2 [ ].

.3 Generally, install duct in accordance with duct manufacturer's instructions and requirements of SMACNA publication entitled "Thermoset FRP Duct Construction Manual".

.4 Secure duct in place with type 316 stainless steel angles, straps, hanger rods, and accessories. Provide strips of felt or neoprene material between duct and hanging and support hardware.

3.6 INSTALLATION OF ROUND PVC COATED GALVANIZED STEEL DUCTWORK

.1 Provide round PVC coated galvanized steel ductwork.

.2 Provide round PVC coated galvanized steel ductwork for:

.1 [ ];

.2 [ ].

.3 Underground ductwork is to be constructed to SMACNA Positive Pressure Class 10" w.c. with minimum metal gauges as follows:

.1 150 mm (6") through 350 mm (14") dia. - #28 gauge;

.2 400 mm (15") through 660 mm (26") dia. - #26 gauge;

.3 685 mm (27") through 915 mm (36") dia. - # 24 gauge;

.4 940 mm (37") through 1.27 m (50") dia. - #20 gauge.

.4 Install underground ductwork in accordance with requirements and details for underslab duct in ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible.

3.7 INSTALLATION OF FABRIC DUCTWORK

.1 Provide fabric ductwork.

.2 Secure duct from structure by means of tension cable and suspension components supplied with ductwork.

.3 Install tension cable and suspension components in accordance with duct manufacturer's instructions.

.4 Provide metal duct connection collars as required.

.5 Start-up fabric duct system in accordance with manufacturer's instructions.

.6 Do not penetrate fire barriers with fabric duct.

3.8 INSTALLATION OF FLEXIBLE DUCTWORK

.1 For supply air ductwork, provide maximum 1.8 m fully stretched, long lengths of flexible ductwork for connections between galvanized steel duct mains and branches, and necks of ceiling grilles and diffusers. Do not install flexible ductwork through walls, even if shown on drawings.

.2 For return air ductwork, provide maximum 1.0 m fully stretched, long lengths of flexible ductwork for connections between galvanized steel duct mains and branches, and necks of ceiling grilles. Do not install flexible ductwork through walls, even if shown on drawings.

.3 At rectangular galvanized steel duct, accurately cut holes and provide flanged or "Spin-in" round flexible duct connection collars. Seal joints with duct sealer.

.4 Install flexible ducts as straight as possible and support in accordance with requirements of ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible, and secure at each end with nylon or stainless steel gear type clamps, and seal joints. Provide long radius duct bends where they are required.

.5 Do not penetrate fire barriers with flexible duct.

3.9 INSTALLATION OF ACOUSTIC LINING

.1 Provide acoustic lining in ductwork in locations as follows:

.1 wherever shown and/or specified on drawings;

.2 supply ductwork downstream of air terminal boxes for a distance of 2.4 m (8') measured along duct and outward from box in all directions;

.3 all transfer air ducts.

.2 Install lining in accordance with requirements of ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible, however, for all installations regardless of velocity, at leading and trailing edges of duct liner sections, provide galvanized steel nosing channel in accordance with detail entitled Flexible Duct Liner Installation found in the ANSI/SMACNA manual referred to above.

3.10 INSTALLATION OF FIRE RATED DUCTWORK

.1 Provide 2 hour fire rated ductwork.

.2 Install ductwork in strict accordance with duct manufacturer’s instructions using support hardware supplied with duct.

.3 When installation is complete, arrange, and pay for duct manufacturer to visit site and examine duct installation. Make any revisions requested by manufacturer, and when manufacturer is satisfied with installation, obtain and submit a letter certifying proper installation in accordance with ULC requirements.

3.11 INSTALLATION OF SHEET STEEL KITCHEN GREASE EXHAUST DUCTWORK

.1 Provide welded sheet steel kitchen grease exhaust ductwork from exhaust hood(s) to roof mounted exhaust fans, all in accordance with requirements of NFPA 96. Construct ductwork watertight with continuous externally welded seams and joints, cleanouts, duct expansion provisions, riser residue traps, etc.

.2 Clean and prime coat ground welds in black steel ducts.

.3 Support ductwork at not greater than 1.5 m (5') intervals and ensure fasteners at hangers do not penetrate duct. Install without forming dips, sags, or traps where grease reside might collect, and locate access door/cleanouts for ease of maintenance.

.4 Slope horizontal ductwork 25 mm per 300 mm (1" per foot) back to exhaust hood.

3.12 INSTALLATION OF IN-SLAB DUCTWORK

.1 Provide in-slab concrete encased ductwork, complete with required fittings and accessories.

.2 Install duct with support brackets supplied with duct and coordinated with location of reinforcing steel, post tensioning cables, and any other structural slab component. Install duct in strict

accordance with manufacturer's installation instructions and requirements of the Consultant. Ensure all joints are water-tight.

.3 Confirm finish of exterior discharge fittings with the Consultant prior to ordering.

3.13 INSTALLATION OF CASINGS AND PLENUMS

.1 Provide required shop or site fabricated casings and plenums. Unless otherwise specified or shown, construct casings and plenums of same material as connecting duct system.

.2 Construct and install casings and plenums in accordance with Chapter 6 of ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible to suit systems' pressure classification. Ensure plenums and casings secured to building structure are gasketed air-tight and equipped with angle reinforcing.

.3 Provide drain pans with accessible trapped drains for fresh air intake plenums, and wherever else shown.

.4 In addition to SMACNA duct construction standards specified above, casings and plenums are to be constructed and installed to meet seismic requirements of British Columbia Building Code and ANSI/SMACNA - The Seismic Restraint Manual: Guidelines for Mechanical Systems.

3.14 INSTALLATION OF ACOUSTIC PANELS

.1 Provide acoustic panels for plenums. Integrate acoustic plenums with standard casings and plenums. Install acoustic panels in strict accordance with manufacturer's instructions. Seal panels with acoustic caulking where pipes, ducts or conduit penetrate and make air and watertight.

.2 Provide floor to ceiling high acoustic plenums where shown, each complete with required framing, including framing for access doors and other openings, each structurally designed to resist excessive deflection or bowing, constructed to be air-tight when subjected to a pressure differential of 2.48 kPa (0.36 psi), and designed so any one panel can be removed without dismantling entire plenum.

.3 Provide acoustic type access doors where shown, and provide acoustic caulking at all locations where acoustic plenums abut building walls or slabs, and at all points where pipe, ducts or conduit penetrate acoustic panels.

.4 In addition to SMACNA duct construction standards specified above, acoustic plenums are to be constructed and installed to meet seismic requirements of [British Columbia Building Code] and ANSI/SMACNA, The Seismic Restraint Manual: Guidelines for Mechanical Systems.

3.15 INSTALLATION OF CASING AND PLENUM ACCESS DOORS

.1 Provide access doors into all site or shop fabricated casings and plenums requiring access, and wherever shown.

.2 Construct access doors to open in or out to suit positive and negative pressures of system.

.3 Provide pitot tube openings in access doors where required for system air quantity balancing purposes.

.4 Provide suitably sized, engraved, red-white laminated Lamacoid warning nameplates on access doors into casings and plenums where equipment is located, i.e. fans.

3.16 INSTALLATION OF ROUND TO RECTANGULAR DUCT CONNECTIONS

.1 Cut round holes in rectangular ducts and provide round to rectangular lock-in fittings with dampers for connection of flexible round ductwork.

3.17 INSTALLATION OF SPLITTER DAMPERS

.1 Provide splitter dampers in supply ductwork at branch duct connections off supply air mains, and wherever else shown and/or specified on drawings. Install splitter dampers so they cannot vibrate and rattle and so damper operation mechanisms are in an easily accessible and operable location. Ensure operators for dampers in insulated ducts are equipped with stand-off mounting brackets.

3.18 INSTALLATION OF TURNING VANES

.1 Provide turning vanes in ductwork elbows where shown on drawings and wherever else required where, due to site installation routing and duct elbow radius, turning vanes are recommended in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible.

.2 Provide volume extractor type turning vanes in short branch supply duct connections off mains to grilles and diffusers where shown and/or specified.

3.19 INSTALLATION OF MANUAL BALANCING (VOLUME) DAMPERS

.1 Provide manual balancing dampers as required to provide a fully balanced system, including but not limited to in all open end ductwork, in all duct mains, and wherever else shown and/or specified.

.2 Install dampers so operating mechanism is accessible and positioned for easy operation, and so dampers cannot move or rattle. Ensure operating mechanisms for dampers in insulated ducts are complete with stand-off mounting brackets.

.3 Where a duct for which a balancing damper is required has dimensions larger than dimensions of maximum size volume damper available, provide multiple dampers bolted together in a properly sized assembly, or bolted to a heavy-gauge black structural steel angle or channel framework which is properly sized. Seal to prevent air by-pass, and provide connecting linkage.

.4 Confirm exact damper locations with personnel doing air quantity balancing testing work and install dampers to suit. Include for providing 5 additional dampers at no additional cost.

3.20 INSTALLATION OF BACKDRAFT DAMPERS

.1 Provide backdraft dampers.

.2 Install and secure dampers so they cannot move or rattle.

3.21 INSTALLATION OF FUSIBLE LINK DAMPERS

.1 Provide fusible link dampers. Ensure damper rating (1-½ or 3 hr) is suitable for fire barrier it is associated with.

.2 Install dampers with retaining angles on all 4 sides of sleeve on both sides of damper and connect with ductwork in accordance with damper manufacturer’s instructions and details, and Code requirements.

.3 Provide expansion clearance between damper or damper sleeve and opening in which damper is required. Ensure openings are properly sized and located, and all voids between damper sleeve and opening are properly sealed to maintain rating of fire barrier.

.4 Where size of fire barrier opening requires use of a sectionalized fire damper assembly, provide multiple fusible link dampers (sized to CAN/ULC S112) bolted together in a properly sized assembly or bolted to a heavy-gauge black structural steel angle or channel framework.

3.22 INSTALLATION OF COMBINATION FIRE/SMOKE DAMPERS

.1 Provide combination fire/smoke dampers. Install dampers with retaining angles on all 4 sides of each side of damper, and, where required, connect with ductwork, all in accordance with damper manufacturer's instructions and details, and Code requirements.

.2 Coordinate damper installation with electrical work where electrical connections to damper actuators are specified.

3.23 INSTALLATION OF SMOKE DAMPERS

.1 Provide smoke dampers. Install dampers with retaining angles on all 4 sides of sleeve on both sides of damper and connect with ductwork in accordance with damper manufacturer's instructions and details, and Code requirements.

.2 Coordinate damper installation with electrical work where electrical connections to damper actuators are specified.

.3 Where size of fire barrier opening requires use of a sectionalized fire damper assembly, provide multiple smoke dampers (sized to CAN/ULC S112) bolted together in a properly sized assembly or bolted to a heavy-gauge black structural steel angle or channel framework.

3.24 INSTALLATION OF FLEXIBLE CONNECTION MATERIAL

.1 Provide a minimum of 100 mm (4") of flexible connection material where ducts, plenums, and/or easings connect to fans, and wherever else shown or specified.

.2 Rigidly secure a minimum of 75 mm (3") of duct material (minimum #24 gauge) to each edge of flexible fabric and to fan, duct, plenum, etc., in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible. Ensure connections to flexible fabric material are arranged and supported so as to not impose any external forces on the fabric.

.3 For system [_____] use high temperature flameproof flexible connection material.

3.25 INSTALLATION OF ROOF MOUNTED DUCT SUPPORTS

.1 Supply supports for roof mounted ductwork.

.2 Hand adjustable structural supports to roofing trade on roof for installation and flashing into roof construction as part of roofing work. Accurately mark exact locations and spacing of structural supports and supervise installation. Provide properly sized hot dip galvanized structural steel angles between structural supports and secure in place on support studs. Support ductwork on the angles and provide galvanized steel banding to secure ducts to the angles.

3.26 INSTALLATION OF PRESSURE RELIEF DOORS

.1 Provide pressure release access doors to prevent duct system explosion or implosion as a result of a duct obstruction, i.e. closed fire damper, which prevents normal air flow through the system. Size access doors in accordance with requirements of Part 2 of this section.

.2 Where pressure release doors are shown in suction ducts or plenums, mount access door assembly so door swings in and latch mechanism is on the inside of duct or plenum. If latch mechanism is not accessible, provide a standard access door at latch side of the pressure release access door for maintenance purposes.

.3 Adjust each latch mechanism by means of the adjusting pin to suit static pressure of the particular system in accordance with latch mechanism manufacturer's instructions.

3.27 INSTALLATION OF DUCT ACCESS DOORS

.1 Provide access doors in ductwork for access to all components which will or may need maintenance and/or repair, including reheat coils. Install in accordance with requirements of ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible.

.2 Identify access doors provided for fusible link damper maintenance with "FLD" stencil painted or marker type red lettering and ensure doors are properly located for damper maintenance.

.3 When requested, submit a sample of proposed duct access doors for review.

.4 Where sectionalized fusible link dampers and/or balancing dampers are provided in large ducts, provide a plenum type access door to suit, and adequately reinforce ductwork to suit access door installed.

3.28 INSTALLATION OF INSTRUMENTS TEST PORTS

.1 Provide instrument test ports in all main ducts at connections to fans, plenums, or casings, in all larger branch duct connections to mains, and wherever else required for proper air quantity balancing and testing.

.2 Locate test ports where recommended by personnel performing air quantity testing and balancing work.

3.29 INSTALLATION OF WIRE MESH (BIRDSCREEN)

.1 Provide framed, removable wire mesh panels over openings in ducts and/or walls where shown and/or specified on drawings. Rigidly secure in place but ensure panels are removable.

.2 Provide wire mesh panels for open-end return air ducts in ceiling spaces whether shown on drawings or not.

3.30 INSTALLATION OF LOUVRES

.1 Provide louvres for wall openings.

.2 Install louvre assemblies and secure in place in accordance with manufacturer’s instructions and details.

.3 Confirm exact louvre sizes and finish prior to ordering.

3.31 INSTALLATION OF LOUVRE BLANK-OFF PANELS

.1 Provide blank-off panels for inactive portions of exterior wall louvres.

.2 Secure panels in place with non-ferrous hardware so they cannot move or rattle, yet are easily removable.

.3 Confirm exact finish of panels prior to fabrication.

3.32 INSTALLATION OF BRICK AND BLOCK VENTS

.1 Supply brick or block vents for installation in exterior walls.

.2 Hand assemblies to masonry trade for installation.

.3 Accurately mark exact locations and coordinate installation.

3.33 INSTALLATION OF FIRE STOP FLAPS AND THERMAL BLANKETS

.1 Provide fire stop flaps in duct connection necks of grilles and diffusers installed in ULC fire rated suspended ceiling systems where shown on drawings.

.2 Provide thermal blanket material to completely cover grille and/or diffuser pans above suspended ULC fire rated ceilings. Cut, install, and secure in place in accordance with manufacturer's instructions and ULC requirements.

3.34 INSTALLATION OF GRILLES AND DIFFUSERS

.1 Provide grilles and diffusers. Wherever possible, grilles and diffusers are to be product of same manufacturer.

.2 Unless otherwise specified connect grilles and diffusers in accordance with requirements of SMACNA HVAC Duct Construction Standards Metal and Flexible.

.3 Exactly locate grilles and diffusers to conform to final architectural reflected ceiling plans and detailed wall elevations, and to conform to final lighting arrangement, ceiling layout, ornamental and other wall treatment.

.4 Equip supply diffusers having a basic 4-way or all round air pattern for operation in 1-, 2-, or 3-way pattern where indicated on drawings.

.5 Attach troffer type diffusers associated with typical ceiling mounted fluorescent lighting fixtures to the fixtures on floor prior to fixture installation in ceiling. When fixtures are installed, connect diffuser boots with flexible ductwork.

.6 Provide sheet metal plenums, constructed of same material as connecting duct, for linear grilles and/or diffusers where shown. Construct and install plenums in accordance with requirements of SMACNA HVAC Duct Construction Standards Metal and Flexible. Where individual sections of linear grilles or diffusers are not equipped with a volume control device, equip duct connection collar(s) with volume control device(s).

.7 Where linear type diffusers/grilles are installed in suspended T-bar ceilings, clip diffusers/grilles in place using clip supplied by diffuser/grille manufacturer.

.8 Confirm grille and diffuser finishes prior to ordering.

3.35 INSTALLATION OF FAN FILTER DIFFUSERS

.1 Provide fan filter diffusers.

.2 Exactly locate fan filter diffusers to conform to final architectural reflected ceiling plans, and to conform to final lighting arrangement and locations of ceiling equipment.

.3 Install in strict accordance with manufacturer’s instructions, including gasket tape on T-bar ceiling members at unit locations. Plug each unit into an adjacent ceiling receptacle.

.4 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.5 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.7 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including, but not limited to, a full operation and maintenance demonstration.

3.36 SUPPLY OF DOOR GRILLES

.1 Supply door grilles as shown and scheduled.

.2 Hand grilles to appropriate trade at site for installation.

3.37 INSTALLATION OF ROOF MOUNTED GRAVITY VENTILATORS

.1 Provide roof mounted gravity ventilators.

.2 Supply a roof mounting curb with each ventilator and hand curbs to roofing trade on roof for mounting and flashing into roof construction as part of the roofing work. Site assemble gravity ventilators as required, and secure in place on curbs.

.3 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.4 Install dampers in curb damper tray and secure in place.

3.38 INSTALLATION OF INTAKE AND EXHAUST WALL BOXES

.1 Supply brick or block vents for installation in exterior walls.

.2 Hand assemblies to masonry trade for installation.

.3 Accurately mark exact locations and coordinate installation.

3.39 DUCT SYSTEM PROTECTION, CLEANING AND START-UP

.1 Temporarily cover all open ends of ducts during construction.

.2 Remove all dirt and foreign matter from entire duct systems and clean duct system terminals and interior of air handling units prior to operating fans.

.3 Prior to starting any supply air handling system provide 50 mm (2") thick glass fibre construction filters at fan equipment in place of permanent filters.

.4 Provide cheesecloth over duct system inlets and outlets and run system for 24 hours, after which remove cheesecloth and construction filters, and install new permanent filters.

.5 Include all labour for a complete site walk-through with testing and balancing personnel following route of all duct systems to be tested, adjusted, and balanced for the purpose of confirming proper position and attitude of dampers, location of pitot tube openings, and any other work affecting testing and balancing procedures. Perform corrective work required as a result of this walk-through.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop product data sheets for silencers. Include all construction, acoustic and aerodynamic performance data, and details with submission. Acoustical data is to demonstrate that duct systems with silencers will reduce mechanical fan system noise to required levels in occupied spaces.

.2 Submit manufacturer's test data to indicate results of factory tests on the silencers prior to shipment.

.3 Submit a copy of the silencer manufacturer's National Voluntary Laboratory Accreditation Program (NVLAP) accreditation certificate for ASTM E477 test standards.

1.2 CLOSEOUT SUBMITTALS

.1 Submit an installation certification letter from silencer manufacturer as specified in Part 3 of this section.

1.3 QUALITY ASSURANCE

.1 Silencer performance must be substantiated by laboratory testing in a duct-to-reverberant room test facility according to ASTM E477, Standard Test Method for Measuring Acoustical and Airflow Performance of Duct Liner Material and Prefabricated Silencers.

.2 Silencer acoustic media and any lining/wrapping material must have a maximum flame spread rating of 25 and a smoke developed rating of 50 when tested in accordance with CAN/ULC-S102, Surface Burning Characteristics of Building Materials, and Accessories.

.3 All silencer surfaces in contact with airstream are to be in accordance with ANSI/ASHRAE 62.1, Ventilation for Acceptable Indoor Air Quality.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Vibro-Acoustics Ltd.;

.2 Kinetics Noise Control Vibron Products Group;

.3 Price Industries Inc.

2.2 GENERAL RE: SILENCERS

.1 Silencers are to be factory fabricated by same manufacturer and are to be in accordance with drawing schedule, and tested in accordance with ASTM E477 through National Voluntary Laboratory Accreditation Program (NVLAP) with valid accreditation certificate.

.2 Silencer inlet and outlet dimensions are to be equal to duct sizes shown on drawings. Unless otherwise shown or specified, transitions will not be permitted.

.3 Silencers are to be constructed in accordance with SMACNA HVAC Duct Construction Standards Metal and Flexible, to suit duct system pressure and velocity classification. Unless otherwise specified, casing seams and joints are to be lock-formed and sealed or stitch welded and sealed, and silencers are to be constructed so as not to fail when subjected to an internal static pressure of 3.9 kPa (8" wg).

.4 Perforated steel is to be adequately stiffened to ensure flatness and form, and welds are to be shop painted with zinc rich paint.

.5 Silencers are to be shipped with factory installed end caps.

.6 Galvanized steel is to be in accordance with ASTM A653.

2.3 OUTER CASING MATERIALS

.1 Rectangular Straight and Transitional Straight Silencers: minimum #22 gauge lock forming quality galvanized steel.

.2 Elbow and Transitional Elbow Silencers: minimum #18 gauge for elbow lock forming quality galvanized steel.

.3 High Transmission Loss (HTL) Rectangular and Elbow Silencers: #16 or #10 gauge stitch-welded and caulked galvanized steel in accordance with drawing schedule.

.4 Circular Silencers: Lock forming quality galvanized steel with minimum gauges as follows:

.1 300 mm to 660 mm (12" to 26") dia. - #22 gauge;

.2 675 mm to 1.52 m (27" to 60") dia. - #18 gauge;

.3 1.55 m to 2.13 m (61" to 84") dia. - #16 gauge.

2.4 INTERIOR BAFFLE-LINER-BULLET MATERIAL

.1 Minimum #22 gauge lock forming quality galvanized steel.

2.5 INTERIOR BAFFLE TRANSITION

.1 Transitioning for interior transition silencers is to occur internal to silencer such that height of air passage is uniformly changing with the length of the air passage.

2.6 ACOUSTIC MEDIA MATERIAL

.1 Except for no media silencers, and unless otherwise specified, inert, inorganic glass fibre of a density to obtain specified acoustic performance, packed under not less than 5% compression to eliminate voids due to vibration and settling.

.2 For silencers as specified and/or scheduled, acoustic quality insulation which does not contain any formaldehydes, phenolic resins, or volatile organic compounds that can off-gas, but containing cotton fibres treated with an EPA registered non-toxic borate solution, "flash dried" to actively inhibit the growth of mould, mildew, bacteria, and fungi.

.3 No media silencers are not to contain absorptive media of any kind, achieve attenuation with controlled impedance membranes and broadly tuned resonators.

2.7 ACOUSTIC MEDIA PROTECTION MATERIAL

.1 Material for lining/wrapping acoustic media to help prevent shedding and erosion, in accordance with drawing schedule, is to be:

.1 Tedlar film material separated from perforated metal liner with a 12 mm (½") thick acoustically transparent spacer;

.2 glass fibre cloth.

2.8 ALTERNATIVE SILENCER MATERIALS

.1 Where indicated on drawing silencer schedule, types 304 or 316 stainless steel or aluminum silencer material is to be used.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide silencers. Ensure silencers are installed with airflow arrows in the direction of airflow.

.2 Support each silencer independent of connecting ductwork.

.3 Properly layout ductwork for silencer locations to provide a minimum of 5 diameters of straight duct upstream of silencer and 10 diameters of straight duct downstream of silencer.

.4 Unless otherwise specified, do not install silencers in walls or slabs.

.5 Where cross-talk silencers penetrate partition walls, seal joint between perimeter of silencer and the wall, on both sides of the wall, with proper acoustic caulking.

.6 Seal all silencer connections to ducts with proper fire/smoke rated duct sealer.

3.2 FIELD QUALITY CONTROL

.1 When silencer installations are complete, arrange, and pay for silencer manufacturer to examine silencer installations. Perform any corrective work required by manufacturer, then obtain from manufacturer and submit a signed letter certifying proper installation and operation of all silencers.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for fans and accessories. Include following:

.1 certified fan performance curves at specified operating point with flow, static pressure and HP clearly plotted;

.2 certified sound power data that conforms to specified levels;

.3 product data sheets for all accessories;

.4 product data sheets for fan motors.

1.2 CLOSEOUT SUBMITTALS

.1 Submit with delivery of each unit a copy of the factory inspection report, and include a copy of each report with O&M Manual project closeout data.

.2 Submit a site inspection and start-up report from manufacturer's representative as specified in Part 3 of this section.

.3 Supply reviewed copies of fan/curb assembly shop drawings or product data to trade who will cut roof openings for fans, and ensure openings are properly located.

.4 Supply reviewed copies of fan assembly shop drawings or product data to trade who will form/prepare wall openings for fans, and ensure openings are properly located.

.5 Submit a signed copy of destratification fan manufacturer's 5 year extended parts and labour warranty.

.6 Submit a signed copy of ceiling mounted fan manufacturer's extended 3 year warranty.

.7 Training attendance records.

1.3 QUALITY ASSURANCE

.1 Fan manufacturers, as applicable, are to be current members of the Air Movement and Control Association International Inc. (AMCA), and fans are to be rated (capacity and sound performance) and certified in accordance with requirements of following standards:

.1 ANSI/AMCA Standard 210, Laboratory Method of Testing Fans for Certified Aerodynamic Performance Rating;

.2 AMCA Standard 211, Product Rating Manual for Fan Air Performance;

.3 ANSI/AMCA Standard 300, Reverberant Room Method for Sound Testing of Fans;

.4 AMCA Standard 311, Product Rating Manual for Fan Sound Performance;

.5 AMCA Standard 99-2408, Operating Limits for Centrifugal Fans.

PART 2 - PRODUCTS

2.1 CENTRIFUGAL FANS

.1 Centrifugal fans in accordance with drawing schedule, each capable of operating over the complete pressure class limits as specified in AMCA Standard 99-16.

.2 Continuously welded heavy-gauge steel housing, braced and reinforced as required to prevent vibration or pulsation, equipped with a discharge flange, spun, aerodynamically designed inlet cones or venturies with wire grid guards, drain plug, and epoxy enamel coated both inside and outside to a 3 mm dry film thickness.

.3 Continuously welded, stable, non-overloading wheel with die-formed steel blades and, unless otherwise required, a cast iron hub, statically and dynamically balanced prior to assembly, then balanced as an assembly and braced and secured to base prior to shipment.

.4 AISI C1040 or C1050 hot rolled steel fan shaft, accurately turned, ground, polished, and ring gauged for accuracy, and sized for a first critical speed of at least 1.25 times the maximum rated speed for fan, and heavy-duty, grease lubricated, ball or roller, self-aligning pillow block type bearings selected for an AFBMA L-10 minimum average bearing life in excess of 200,000 hours, and equipped with extended copper lubrication lines terminated in lubrication fittings immediately inside fan section access door.

.5 NEMA Premium TEFC motor, adjustable V-belt drive selected for 40% service factor based on motor nameplate data, and OHSA guard, all in accordance with requirements of Section 20 05 00 – Common Work Results for Mechanical.

.6 Fan and motor support base is to be rigid, welded structural steel, vibration isolated base with steel cross members, factory cleaned, deburred, and finished with epoxy enamel, and complete with a slide type motor base and stable, colour coded spring mounts with sound pads selected to suit static deflection and maximum equipment load and to operate at not greater than 2/3 solid load, and shipping restraints.

.7 Maximum acceptable sound power levels at the fan outlet are as follows:

Fan	Octave Bands							
	1	2	3	4	5	6	7	8
[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]

.8 Unless otherwise specified, finish is to consist of rust inhibiting primer applied to cleaned and deburred metal surfaces prior to assembly, then a second coat of primer after assembly and an air dried epoxy enamel finished coat both inside and outside to a 3 mm dry film thickness.

.9 Factory secured seismic restraint connection hardware.

.10 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 CML Northern Blower;

.5 PennBarry.

2.2 EXPLOSION-PROOF CENTRIFUGAL FANS

.1 Explosion-proof centrifugal fans in accordance with drawing schedule, each capable of operating over complete pressure class limits as specified in AMCA Standard 99-2408 and rated Spark A in accordance with AMCA Standard 99-0401, Classification for Spark Resistant Construction.

.2 Housing constructed as per ASTM Standard 99-0401 to suit "Spark" classification, with a wheel direct connected to an explosion-proof TEFC motor conforming to requirements specified in Section 20 05 00 – Common Work Results for Mechanical, statically and dynamically balanced prior to assembly, then balanced as an assembly and secured to base prior to shipment.

.3 Rigid, welded structural steel, vibration isolated fan support base with steel cross members, factory cleaned, deburred, and finished with epoxy enamel, and complete with stable, colour coded spring mounts with sound pads selected to suit static deflection and maximum equipment load and to operate at not greater than 2/3 solid load, and shipping restraints.

.4 Factory secured seismic restraint connection hardware.

.5 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 CML Northern Blower;

.5 PennBarry.

2.3 UTILITY FANS

.1 Centrifugal, single width and inlet, factory run tested utility fans in accordance with drawing schedule, and capable of operating over complete pressure class limits as specified in AMCA Standard 2408.

.2 Rotatable, continuously welded heavy-gauge steel housing, braced and reinforced as required to prevent vibration or pulsation, equipped with a spun, aerodynamically designed inlet cone, and an attached welded steel bearing and motor support platform.

.3 Riveted aluminum or welded steel wheel, statically and dynamically balanced.

.4 For belt driven fans only, AISI C1040 or C1045 hot rolled steel shaft, accurately turned, ground, polished, and ring gauged for accuracy, and sized for a first critical speed of at least 1.43 times maximum rated speed for fan, equipped with heavy-duty, grease lubricated, ball, pillow block type bearings, selected for a minimum average AFBMA L-50 bearing life of 200,00 hours at the maximum fan RPM, and secured to bearing support platform, and an adjustable V-belt drive with OHSA guard (weather cover) in accordance with requirements of Section 20 05 00 – Common Work Results for Mechanical.

.5 NEMA Premium TEFC motor conforming to requirements of Section 20 05 00 – Common Work Results for Mechanical.

.6 Unless otherwise specified, the finish is to consist of rust inhibiting primer applied to cleaned and deburred metal surfaces prior to assembly, then a second coat of primer after assembly and an air dried epoxy enamel finished coat both inside and outside to a 3 mm dry film thickness.

.7 Factory secured seismic restraint connection hardware.

.8 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 CML Northern Blower;

.5 PennBarry.

2.4 CENTRIFUGAL INLINE FANS

.1 Centrifugal, ULC listed, factory run tested rectangular inline fans in accordance with drawing schedule.

.2 Heavy-gauge galvanized steel housing with removable side panels to permit removal of power assembly without disturbing duct connections, universal mounting brackets and hardware including spring vibration isolators to accommodate horizontal or vertical mounting as required, a flanged inlet panel with inlet venturi, a flanged outlet panel, both with duct connection collars, and galvanized steel wire grid fan inlet/outlet guard(s).

.3 Non-overloading aluminium wheel with backward inclined blades with matching inlet venturi, statically and dynamically balanced as an assembly.

.4 For belt-drive fans only, hot rolled steel shaft, accurately turned, ground, and polished, and sized for a first critical speed of at least 1.25 times maximum rated speed for fan, and heavy-duty, self-aligning pillow block type bearings selected for an AFBMA L-50 minimum average life in excess of 500,000 hours and equipped with lubrication line and fitting, and an adjustable V-belt drive with guard conforming to requirements of Section 20 05 00 – Common Work Results for Mechanical.

.5 TEFC motor conforming to requirements specified in Section 20 05 00 – Common Work Results for Mechanical, mounted out of the airstream, complete with a cover, and factory pre-wired to a NEMA 4 disconnect switch.

.6 For fans as scheduled, factory supplied accessories as follows:

.1 for fans as scheduled, housing insulation (lining), consisting of neoprene spray coated glass fibre semi-rigid insulation meeting NFPA 90A requirements and 25/50 flame spread/smoke developed ratings when tested in accordance with CAN/ULC S102, permanently secured in place with no exposed edges;

.2 for fans as scheduled, a galvanized steel filter box with frame suitable for 25 mm (2") thick disposable panel type filters;

.3 factory secured seismic restraint connection hardware.

.7 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 JencoFan;

.5 Carnes Company Inc.

.6 PennBarry.

2.5 PLENUM FANS

.1 Centrifugal airfoil design plenum fans in accordance with drawing schedule, designed without a scroll type housing, and capable of operating over complete pressure class limits as specified in AMCA Standard 99-2408.

.2 Heavy-gauge reinforced steel inlet plate with perimeter square formed lip, spun steel inlet cone bolted to inlet plate for smooth airflow into venturi shaped inlet cone of the fan wheel, and a welded structural steel framework forming a mounting base and bearing support platform welded to the inlet plate.

.3 Non-overloading wheel with 9 backward inclined, die-formed, airfoil design steel blades continuously welded to a spun inlet cone, back plate, and cast iron hub, statically and dynamically balanced as an assembly, and designed for critical speeds of at least 1.25 times maximum class speed.

.4 For belt driven fans, AISI C1040 or C1050 hot rolled steel shaft, accurately turned, ground, polished and ring gauged for accuracy, and sized for a first critical speed of at least 1.25 times maximum rated speed for fan, and heavy-duty, grease lubricated, ball or roller self-aligning pillow block type bearings selected for an AFBMA L-10 minimum average life in excess of 200,000 hours and equipped with extended copper tube lubrication lines terminated in accessible lubrication fittings, and an adjustable V-belt drive selected for 40% service factor based on motor nameplate data and conforming to requirements specified in Section 20 05 00 – Common Work Results for Mechanical.

.5 NEMA Premium TEFC motor conforming to requirements specified in Section 20 05 00 – Common Work Results for Mechanical.

.6 Rigid, welded structural steel, vibration isolated fan and motor support base with steel cross members, factory cleaned, deburred, and finished with epoxy enamel, and complete with slide type motor base, and stable, colour coded spring mounts with neoprene sound pads selected to suit static deflection and to operate at not greater than 2/3 solid load, and equipped with shipping restraints.

.7 Rigid, open mesh galvanized steel screen enclosure with fan wheel access facilities, and a removable galvanized steel mesh inlet screen.

.8 Minimum acceptable AMCA sound power levels at the fan outlet are as follows:

Fan	Octave Bands							
	1	2	1	4	1	6	1	8
[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]
[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]	[ ]

.9 Unless otherwise specified, factory finish is to consist of rust inhibiting primer applied to cleaned and deburred surfaces prior to assembly, then a second coat of primer after assembly and an air dried epoxy enamel finish applied to all inside and outside surfaces to a 3 mm dry film thickness.

.10 Factory secured seismic restraint connection hardware.

.11 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 CML Northern Blower;

.5 PennBarry.

2.6 ROOF MOUNTED EXHAUST FANS

.1 Centrifugal, ULC listed, factory run tested roof mounted exhaust fans in accordance with drawing schedule.

.2 Spun aluminium housing with deep venturi inlet, aluminium curb cap with continuously welded corners, pre-punched mounting holes, galvanized steel or aluminium bird screen, and EMT conduit chase to the motor compartment.

.3 Centrifugal, non-overloading aluminum wheel with backward inclined blades matched to inlet venturi, statically and dynamically balanced as an assembly.

.4 For belt-drive fans only, hot rolled steel shaft, accurately turned, ground, and polished, and sized for a first critical speed of at least 1.25 times maximum rated speed for fan, and one-piece grease lubricated pillow block type bearings selected for an AFBMA L-50 minimum average life in excess of 500,000 hours at maximum catalogue operating speed and equipped with a lubrication fitting, and a heavy-gauge galvanized steel adjustable V-belt drive with guard conforming to requirements of Section 20 05 00 – Common Work Results for Mechanical.

.5 Motors are to conform to requirements specified in Section 20 05 00 – Common Work Results for Mechanical, mounted on vibration isolation in a compartment outside of the airstream, and factory pre-wired to a NEMA 4 disconnect switch.

.6 Prefabricated, minimum 300 mm (12") high heavy-duty aluminum roof mounting curb with factory installed wood nailer, 40 mm (1-½") thick insulation, continuously welded seams, and damper tray.

.7 For fans as scheduled, factory supplied accessories as follows:

.1 gravity backdraft damper with #20 gauge galvanized steel frame and #26 gauge aluminum blades with felt edge blade seals;

.2 non-corrosive motorized damper with linkage, end switch, and motor with voltage to match fan motor;

.3 continuous non-corrosive piano type curb hinge to permit access to fan, damper and connecting duct, complete with retaining chain and a security hasp to prevent removal of unit from curb cap and prevent building entry through connecting ductwork;

.4 2-speed switch and 2-speed double winding 1-phase motor in accordance with Section 20 05 00 – Common Work Results for Mechanical;

.5 factory secured seismic restraint connection hardware.

.8 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 JencoFan;

.5 Carnes Company Inc.

2.7 SIDEWALL PROPELLER FANS

.1 Axial flow type, ULC listed, factory run tested propeller fans in accordance with drawing schedule.

.2 Heavy-gauge galvanized steel drive component frame bolted or welded to formed galvanized steel fan panel equipped with formed flanged edges, pre-punched mounting holes, and a deep formed inlet venturi.

.3 Fabricated steel blades unless otherwise specified, welded to a heavy-gauge steel hub, and dynamically balanced.

.4 For belt-drive fans only, AISI 1045 cold rolled steel shaft, accurately turned, ground, and polished, and sized for a first critical speed of at least 1.25 times maximum rated speed for fan, and grease lubricated or permanently lubricated, sealed, ball type pillow block bearings selected for an AFBMA L-50 minimum average life in excess of 200,000 hours at maximum fan RPM, with a variable pitch adjustable V-belt drive with guard conforming to requirements of Section 20 05 00 – Common Work Results for Mechanical.

.5 Motor in accordance with requirements specified in Section 20 05 00 – Common Work Results for Mechanical.

.6 Unless otherwise specified, all bare steel surfaces are to be cleaned, primed, and factory finished with epoxy equipment enamel.

.7 Factory supplied accessories as follows:

.1 #16 gauge G90 galvanized steel wall box with removable screen guard, equipped with mounting flanges with pre-punched holes;

.2 back draft damper with galvanized steel frame, aluminum blades with felt edge seals, stainless steel shaft, and OHSA damper guard;

.3 galvanized steel weather hood with removable galvanized steel wire mesh bird screen, with mounting flanges equipped with pre-punched mounting holes;

.4 OHSA motor side guard with galvanized steel side panels and removable galvanized steel wire mesh screen;

.5 factory secured seismic restraint connection hardware.

.8 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 JencoFan;

.5 Carnes Company Inc.;

.6 PennBarry.

2.8 CORROSION RESISTANT CENTRIFUGAL FANS

.1 Centrifugal FRP fans in accordance with drawing schedule, with drive arrangement and configuration as indicated on drawings, and capable of operating over complete pressure class limits as specified in AMCA Standard 99-2408.

.2 Aerodynamically designed housing with high efficiency inlet, manufactured from resins, UV inhibited, reinforced with fibreglass, and with bolts holding housing to support plate encapsulated in FRP, and no uncoated metal in contact with corrosive air stream. Each assembly is to be complete with graphite impregnated interior casing, lifting lugs, type 304 stainless steel fasteners, a FRP ridge inside casing to divert condensation from dripping over hub and shaft, a flanged inlet and outlet, and an impeller inspection and service access door.

.3 Backward curved FRP wheel electronically statically and dynamically balanced after assembly, with an integral metal back plate encapsulated in resin and with hub extended to outside housing, a removable FRP cap to cover impeller end of shaft, and a vacuum hub seal to prevent contaminated air from escaping from fan housing.

.4 For belt driven fans, type 316 stainless steel shaft, accurately turned, ground, polished, and ring gauged for accuracy, and sized for a first critical speed of at least 1.25 times maximum rated speed for fan, and complete with guard, and heavy-duty, sealed, grease lubricated, ball or roller, self-aligning pillow block type bearings selected for an AFBMA L-10 minimum average bearing life in excess of 200,000 hours, and equipped with extended copper lubrication lines terminated

in lubrication fittings at exterior of fan assembly, and an adjustable V-belt drive selected for 50% service factor based on motor nameplate data, with FRP OHSA guard in accordance with requirements of Section 20 05 00 – Common Work Results for Mechanical.

.5 NEMA Premium TEFC motor conforming to requirements of Section 20 05 00 – Common Work Results for Mechanical.

.6 Rigid, welded structural steel unitary fan and motor support base, factory cleaned and finished with 4 to 6 mm thick baked powder epoxy enamel.

.7 Factory secured seismic restraint connection hardware.

.8 Manufacturers:

.1 M. K. Plastics Corp.;

.2 New York Blower Co.;

.3 Pasticair Inc.

2.9 VANEAXIAL FANS

.1 Vaneaxial, ULC listed, factory run tested fans in accordance with drawing schedule.

.2 Heavy-gauge welded ASTM A-569 hot rolled steel housing with inlet and outlet flanges, and, on the discharge side of fan wheel, aerodynamically designed stationary straightening guide vanes welded to both inner cylinder and fan housing interior.

.3 Propeller type wheel, solid, one-piece casting of A356-T6 aluminium with 7 airfoil shape blades and an integral centre hub, machined to proper diameter, secured to fan/motor shaft by means of a taper-lock bushing, and statically and dynamically balanced as an assembly.

.4 For belt-drive fans only, AISI 1040 or 1045 hot rolled steel shaft, accurately turned, ground, and polished, and sized for a first critical speed of at least 1.43 times maximum rated speed for fan, and heavy-duty, self-aligning, grease lubricated pillow block type bearings selected for an AFBMA L-50 minimum average life in excess of 200,000 hours at maximum fan RPM and equipped with extended lubrication lines terminated at housing exterior in lubrication fittings, and an adjustable V-belt drive with guard conforming to requirements of Section 20 05 00 – Common Work Results for Mechanical. Drive assembly is to extend through a 2-piece aerodynamically shaped belt fairing welded continuously to both inner cylinder housing fan shaft and bearings, and fan housing.

.5 TEFC foot mounted motor conforming to requirements specified in Section 20 05 00 – Common Work Results for Mechanical.

.6 Steel surfaces of entire fan assembly, excluding fan shaft, are to be thoroughly degreased, deburred, coated with rust-preventive primer, and finished with equipment enamel. Coat fan shaft with a petroleum-based rust protectant.

.7 For fans as scheduled, factory supplied accessories as follows:

.1 vibration isolators;

.2 torosoidal shaped inlet bell, flanged, drilled and bolted to fan’s flanged inlet;

.3 galvanized steel wire grid fan inlet/outlet guard(s);

.4 inlet/outlet cones, flanged at both ends and drilled to match fan flanges;

.5 steel support legs welded to fan flanges;

.6 formed steel angle support clips welded to fan housing;

.7 factory secured seismic restraint connection hardware.

.8 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 CML Northern Blower;

.5 PennBarry;

.6 JencoFan;

.7 Carnes Company Inc.

2.10 CEILING MOUNTED DESTRATIFICATION FANS

.1 Northwest Envirofan "Gold Line" white, down-blowing, extra heavy-duty industrial grade, CSA certified direct drive ceiling mount destratification fans in accordance with drawing schedule, each complete with:

.1 curved aluminum fan blades secured to a steel hub;

.2 permanent magnet, brushless, non-ventilated, heat sink design motor rated for continuous operation at maximum speed in a 55°C (130°F) ambient temperature and capable of modulating fan speed from 0 to 100% without the use of a gearbox or other mechanical means of control, and a factory programmed controller housed in an enclosure independent of motor to minimize starting and braking torques, with a simple diagnostic program and a LED to identify and relay faults in system;

.3 250 mm (10") long down rod, a 330 mm (13") long galvanized steel safety chain, and all other required mounting and securing hardware;

.4 400 mm (16") long power cord with 3-prong plug, factory pre-wired to motor;

.5 "Protecto-Guard" welded wire fan guard sized to suit fan blade size;

.6 120 volt variable speed (Off-High-Low) solid-state infinite speed fan controller with stainless steel faceplate designed to mount to a 100 mm (4") outlet box and to control fan groupings as indicated on drawings;

.7 factory secured seismic restraint connection hardware.

.2 Manufacturers:

.1 Northwest Envirofan;

.2 Big Ass Fan Co.;

.3 Marley Engineered Products "Leading Edge".

2.11 CEILING MOUNTED FANS

.1 ULC listed and labelled ceiling mounted centrifugal, AMCA rated and certified (capacity and sound to AMCA Standards 211 and 311), exhaust fans in accordance with drawing schedule, complete with:

.1 minimum #20 gauge galvanized steel housing equipped with duct connection collar(s), integral spring loaded aluminum backdraft damper, 12 mm (½") thick acoustic insulation meeting 25/50 flame spread/smoke developed ratings when tested in accordance with CAN/ULC S102, multi-position mounting brackets, and an integral CSA certified electrical receptacle in an outlet box for plug-in connection of fan motor;

.2 low RPM, resiliently mounted, direct connected fan wheel and motor assembly with a forward curved, statically and dynamically balanced galvanized steel or calcium carbonate filled polypropylene centrifugal wheel direct connected to a 1-phase motor conforming to requirements specified in Section 20 05 00 – Common Work Results for Mechanical, and equipped with a length of power cord and plug;

.3 for fans as indicated and/or scheduled, a white calcium carbonate exhaust grille;

.4 factory supplied accessories in accordance with drawing schedule, as follows:

.1 rectangular to round duct transitions;

.2 roof cap with backdraft damper and birdscreen;

.3 wall cap with backdraft damper and birdscreen.

.2 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 CML Northern Blower;

.5 PennBarry.

2.12 ROOF MOUNTED FILTERED SUPPLY FANS

.1 Low profile louvre penthouse type, weatherproof, packaged, centrifugal, factory run tested, roof mounted filtered supply fans as per the drawing schedule.

.2 Hood is to be all aluminium welded structural framing and aluminium alloy blade extrusions with mitred corners, removable top cap pitched for water run-off, side access panel, expanded aluminium mesh bird screen, formed filter channels, 25 mm (1") thick glass fibre insulation meeting 25/50 flame spread/smoke developed ratings when tested in accordance with CAN/ULC S102, and an aluminium curb cap.

.3 Galvanized steel fan housing of lock seam construction, braced to minimize pulsation and/or vibration and complete with spun, aerodynamically designed inlet cones or venturies, duct adaptor designed to fit over roof curb and permit duct connection before fan is set in place, and a fan inlet screen.

.4 Centrifugal, non-overloading aluminum wheel with backward inclined blades continuously welded to rim and back plate, and statically and dynamically balanced as an assembly.

.5 Disposable, 50 mm (2") thick glass fibre media filters, ULC Class 2, 20% – 35% efficient, minimum MERV 6 as per ASHRAE 52.2, enclosed in permanent galvanized steel frames with metal retainers on both sides.

.6 ANSI 1040 or 1045 cold rolled steel shaft, accurately turned, ground, and polished, and sized for a first critical speed of at least 1.25 times maximum rated speed for fan, and one-piece grease lubricated pillow block type bearings selected for an AFBMA minimum average life in excess of 200,000 hours at maximum catalogue operating speed and equipped with zinc rich paint coated steel bearing supports and a lubrication fitting.

.7 Motor mounted on a slide type base and factory pre-wired to a NEMA 4 disconnect switch on unit casing, and adjustable V-belt drive with guard conforming to requirements of Section 20 05 00 – Common Work Results for Mechanical.

.8 Prefabricated, minimum 300 mm (12") high heavy-duty aluminum roof mounting curb with factory installed wood nailer, 40 mm (1-½") thick insulation meeting 25/50 flame spread/smoke developed ratings when tested in accordance with CAN/ULC S102, and continuously welded seams.

.9 Non-corrosive motorized damper supplied loose for site installation in connecting ductwork, equal to T. A. Morrison TAMCO Series 9000 insulated damper with linkage, end switch, and a Belimo or equal motor with voltage to match fan motor.

.10 Factory secured seismic restraint connection hardware.

.11 Manufacturers:

.1 Twin City Fan and Blower;

.2 Loren Cook Co.;

.3 Greenheck Fan Corp.;

.4 CML Northern Blower;

.5 PennBarry;

.6 JencoFan;

.7 Carnes Company Inc.

PART 3 - EXECUTION

3.1 INSTALLATION OF CENTRIFUGAL FANS

.1 Provide centrifugal fans.

.2 Secure each base mounted fan in place, level and plumb, on vibration isolation on a concrete housekeeping pad.

.3 Secure suspended units in place from structure, level, and plumb, by means of vibration isolation spring hangers, properly sized galvanized steel hanger rods and galvanized structural steel angle or channel trapeze supports.

.4 Install explosion-proof units in accordance with classification requirements.

.5 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.6 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.7 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.8 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.2 INSTALLATION OF UTILITY FANS

.1 Provide utility fans.

.2 Secure each fan in place, level, and plumb, on vibration isolation on a concrete housekeeping pad or base as indicated.

.3 Secure suspended units in place from structure, level, and plumb, by means of vibration isolation spring hangers, properly sized galvanized steel hanger rods, and galvanized structural steel angle or channel trapeze supports.

.4 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.5 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.7 Include for a 4 hour on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.3 INSTALLATION OF CENTRIFUGAL INLINE FANS

.1 Provide inline centrifugal fans.

.2 Secure each fan in place from structure with vibration isolation, independent of connecting ductwork and in accordance with fan manufacturer's instructions.

.3 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.4 Ensure duct connections are made using flexible connection material.

.5 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.7 Include for a 4 hour on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.4 INSTALLATION OF PLENUM FANS

.1 Provide plenum fans in air handling system plenums.

.2 Secure fans in place, level, and plumb, on vibration isolation.

.3 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.4 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.5 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.5 INSTALLATION OF ROOF MOUNTED EXHAUST FANS

.1 Provide roof mounted exhaust fans.

.2 Supply a roof mounting curb with each fan and hand curbs to roofing trade on roof for mounting and flashing into roof construction as part of roofing work. Secure fans in place on curbs.

.3 Install dampers in curb damper tray and secure in place.

.4 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.5 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.7 Include for a 4 hour on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.6 INSTALLATION OF SIDEWALL PROPELLER FANS

.1 Provide sidewall propeller fans. Coordinate location(s) and size(s) of wall opening(s) with trade preparing the opening(s).

.2 Rigidly secure each fan and accessories in place to structure in accordance with fan manufacturer's instructions.

.3 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.4 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.5 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.7 INSTALLATION OF FRP CENTRIFUGAL FANS

.1 Provide FRP centrifugal fans.

.2 Secure each base mounted fan in place, level, and plumb, on corrosion resistant vibration isolation on a concrete housekeeping pad.

.3 Secure suspended units in place from structure, level and plumb, by means of corrosion resistant vibration isolation spring hangers, properly sized type 316 stainless steel hanger rods and a structural type 316 stainless steel angle, or channel support structure.

.4 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.5 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.8 INSTALLATION OF VANEAXIAL FANS

.1 Provide vaneaxial fans.

.2 Secure each fan in place to or from structure with vibration isolation as indicated, independent of connecting ductwork.

.3 Ensure duct connections are made using flexible connection material.

.4 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.5 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 For equipment/system start-up requirements, Refer to Section 20 05 00 – Common Work Results for Mechanical.

.7 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.9 INSTALLATION OF CEILING DESTRATIFICATION FANS

.1 Provide ceiling destratification fans.

.2 Secure each fan in place at the ceiling from structure in accordance with manufacturer's instructions and drawing details. Confirm exact locations prior to roughing-in. Install safety chains and fan blade guards.

.3 Plug each fan motor into an adjacent receptacle.

.4 Supply a fan speed controller for fans as indicated and hand to electrical trade at site for wall mounting and connection to fan motor controllers. Confirm exact speed controller locations prior to installation, and include for identification of each speed controller.

.5 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.6 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.7 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.8 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.10 INSTALLATION OF CEILING FANS

.1 Provide ceiling exhaust fans.

.2 Secure each ceiling mounted fan housing in place in ceiling space, flush with suspended ceiling.

.3 Secure suspended units in place from structure, level, and plumb, by means of vibration isolation spring hangers and galvanized steel hanger rods.

.4 Plug fan motors into housing receptacles.

.5 Supply exterior wall/roof discharge caps as indicated.

.6 Hand roof caps to roof trade for installation and flashing into roof construction as part of roofing work.

.7 Install wall caps and secure in place. Caulk perimeter of each wall cap in accordance with caulking requirements specified in Division 07.

.8 Connect fan housings and discharges with ductwork.

.9 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.10 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.11 INSTALLATION OF ROOF MOUNTED FILTERED SUPPLY FANS

.1 Provide roof mounted filtered supply fans.

.2 Supply a roof mounting curb with each fan and hand curbs to roofing trade on roof for mounting and flashing into roof construction as part of roofing work. Secure fans in place on curbs.

.3 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.4 Secure duct adaptors in place on curbs on foam tape or other suitable gasket material, and install motorized dampers (supplied loose) in connecting ductwork. Coordinate connection of power from fan starter to damper motor with electrical trade who will make the connection.

.5 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.12 CLOSEOUT ACTIVITIES

.1 Include for a 4 hour on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for the stack and accessories. Include material specifications and metal gauges, design details, fabrication details, and erection requirements as well as anchor bolt assembly details. Shop drawings are to be prepared, signed, and stamped by a Structural Engineer registered in jurisdiction of the work.

.2 Submit stack engineering calculations, prepared, stamped and signed by engineer who produced shop drawings, with shop drawing submittal to show conformance to Code requirements for wind exposure A and 1/100 probability at stack location with a gust factor of 2, wind sensitive deflection at top with a deflection limit of h/360, base movement, shear at base, vortex shedding, anchor bolt design, bolt circle diameter, and reinforcement around cleanout and breeching openings.

.3 If requested, submit mill test report for CSA G40.20/G40.21-300W steel outer casing.

.4 Submit a colour chart for stack exterior paint.

1.2 CLOSEOUT SUBMITTALS

.1 Submit a letter signed and stamped by structural engineer who designed stack to certify stack installation has been reviewed in field and is in accordance with "Reviewed" or "Reviewed as Noted" shop drawings/product data sheets.

1.3 MAINTENANCE MATERIAL SUBMITTALS

.1 Submit a 1 L (2 pint) container of stack finish touch-up paint as directed in Part 3 of this section.

1.4 QUALITY ASSURANCE

.1 Stack welding is to be full penetration conforming to CSA W47.1, and performed by CWB certified welders.

.2 Stack is to be erected by manufacturer.

PART 2 - PRODUCTS

2.1 EXHAUST STACK

.1 One-piece, free-standing, self-supporting, double wall insulated steel stack, designed and constructed so outer casing and inner liner can expand and contract vertically independent of each other, and for bolting to a concrete base without need for guy wires or roof bracing. Stack dimensions are to be as indicated on drawings, and stack is to be complete with:

.1 outer casing, minimum 6.4 mm (¼") thick CSA G40.20/G40.21-300W mild black structural steel plate with bevelled edges, fabricated into stack shape by rolling and welding with vertical joints offset 180°;

.2 inner liner, minimum 3.5 mm (⅛") thick type 304 stainless steel welded, laterally braced with welded tees to outer casing at 120° intervals every 6 m (20');

.3 sloped type 304 stainless steel plate rain shelf continuously welded at the circumference to inner liner, and equipped with a 50 mm (2") dia. type 304 stainless steel drain pipe extended from bottom of rain shelf to exterior of outer casing where it is to be terminated with a screw-on stainless steel cap;

.4 minimum 40 kg/m³ (2-½ lb/ft³) density, semi-rigid glass fibre insulation, 75 mm (3") thick, supported vertically every 4.8 m (16'), arranged with staggered joints, and banded to inner liner on 300 mm (12") centres with 12 mm (½") wide stainless steel bands;

.5 minimum #12 gauge type 304 stainless steel top cap sized to fit over both inner liner and outer casing with approximately 12 mm (½") clearance between the side of cap and inner liner;

.6 150 mm (6") dia. type 304 stainless steel inspection port welded to inner liner, extended out through outer casing, with reinforcing around outer casing opening, and equipped with a flanged bolt-on cover plate;

.7 double wall insulated tee breeching connection constructed as for stack, with welded steel plate reinforcing at opening through outer casing, and a 6.4 mm (¼") flange for connection to breeching;

.8 wind spoilers, 50 mm x 6.4 mm (2" x ¼") thick steel plates welded to top 3.6 m (12') of outer casing at staggered 120° intervals;

.9 minimum 35 mm (1-⅜") thick black steel base plate with minimum 12 mm (½") thick black steel gusset ring welded to outer casing, aligned bolt holes in both the base plate and gusset ring, and 12 mm (½") thick by 300 mm (12") high gusset plates welded on 45° centres to outer casing and between base plate and gusset ring;

.10 factory assembled anchor bolt assembly ready for placement and securing to concrete base formwork, consisting of a minimum of 8, 25 mm (1") dia. anchor bolts with double nuts and washers secured together to 2 circular steel retaining rings;

.11 2, 20 mm (¾") dia. 450 mm (18") long type 304 stainless steel lightning rods welded to top of stack, and a minimum of 2 ground lugs welded to breeching connection tee and to base of stack;

.12 prepare outer casing and factory finish as follows:

.1 preparation – commercial sand blast clean in accordance with SSPC-SP6 requirements and degrease, ready for painting;

.2 primer – apply one coat of ICI Devoe Coatings 4160 Series primer to a dry film thickness of between 50 microns and 62 microns;

.3 finish – 2 separate coats of ICI Devoe Coatings 4338 Series, each coat to a dry film thickness of between 50 microns and 62 microns, with finish colour as selected from paint manufacturer's standard colour range;

.4 touch-up – 1 L (2 pints) of finish coating in a sealed and identified metal container, supplied loose.

.13 wall sleeve factory fabricated and supplied loose with the stack, consisting of a type 304 stainless steel sleeve sized to the wall thickness and the insulated breeching, and equipped with a stainless steel escutcheon plate on each side of the wall;

.14 universal type flexible connection in accordance with drawing detail;

.15 factory secured seismic restraint connection hardware.

.2 Manufacturers:

.1 Ellesmere Fabricators Ltd.;

.2 Stefco Ltd.;

.3 The Schebler Co.;

.4 Cheminée Lining E. Inc.

PART 3 - EXECUTION

3.1 INSTALLATION OF STACK

.1 Provide a one-piece free-standing stack on a concrete base.

.2 Supply a base anchor bolt assembly and hand to concrete trade at site for installation in base formwork. Supervise installation of assembly and be present during concrete pour to ensure anchor bolt assembly is not disturbed.

.3 Supply required hoisting equipment for stack erection, and journeyman millwrights as required.

.4 Bolt stack to concrete base. Ensure stack is plumb, and bolts are securely tightened. Prior to erecting stack, touch-up any damage to factory finish.

.5 Anchor and restrain stack in accordance with requirements of Section 20 05 48.16 - Seismic Controls for Mechanical Systems.

.6 Supply a wall sleeve for breeching penetration through wall and hand sleeve to trade preparing wall opening. Install escutcheon plates tight against wall surface over breeching at each side of the wall. Caulk exterior sleeve/plate joints to produce a watertight installation.

.7 Provide a flexible connection assembly, in accordance with drawing detail, in exhaust connections to stack.

.8 Coordinate installation of stack with electrical trade who will provide ground rods and ground conductor connections to stack.

.9 Extend stack drain pipe down to grade using stainless steel pipe. Coordinate installation with electrical trade who will provide electric heating cable for drain pipe.

.10 When stack installation is complete, arrange for Structural Engineer who designed stack to visit site and review installation, then submit a letter signed and stamped by Structural Engineer certifying stack installation has been reviewed in field and is in accordance with "Reviewed" or "Reviewed as Noted" shop drawings/product data sheets.

.11 Perform any required final touch-up painting, and hand container of touch-up paint to Owner prior to Substantial Performance of the Work.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Listed gas vents and vent connectors for natural gas fired appliances.

1.2 REFERENCES

.1 CSA B149.1:20, Natural gas and propane installation code.

.2 CAN/ULC-S604:2016, Standard for factory-built type A chimneys.

.3 CAN/ULC 605:2022, Standard for Gas Vents.

.4 CAN/ULC 609:2022, Standard for low temperature vents type L and PL.

.5 ULC-S636-08, Standard for type BH gas venting systems.

1.3 SUBMITTALS

.1 Submit product data sheets for flue gas vents/air intakes and accessories.

1.4 COORDINATION

.1 Supply a reviewed shop drawing to appropriate trade to indicate vent size and flashing materials supplied, and accurately locate building openings.

PART 2 - PRODUCTS

2.1 CONDENSING APPLIANCE TYPE BH FLUE GAS VENTS (AND COMBUSTION AIR INTAKES)

.1 Equal to Ipex "System 636" PVC (for vent gas to 65°C (130°F)) or CPVC (for vent gas to 90°C (195°F)) solvent weld vent pipe and fittings, in accordance with CSA B149.1, certified as type BH vents to ULC-S636, Standard for Type BH Gas Venting Systems, suitable for negative or positive venting and complete with an orange warning label to verify compliance with ULC-S636, and a moulded cap with screen for vertical termination, or low profile wall termination kit, as applicable.

2.2 DOUBLE WALL TYPE "A" VENT

.1 Sectional, prefabricated, double wall, type 316 stainless steel, insulated Type "A" all fuel vent, ULC listed and labelled to CAN/ULC-S604, maximum 540°C (1000°F) rated, with prefabricated mated fittings, couplings and accessories including a flashing accessory, storm collar counter-flashing piece, and a termination cap.

2.3 DOUBLE WALL TYPE "B" VENT

.1 Sectional, prefabricated, double wall Type "B" gas vent, ULC listed and labelled to CAN/ULC 605, maximum 243°C (460°F) rated, with an aluminium alloy inner wall, G90 galvanized steel outer wall, annular air space, prefabricated mated fittings, couplings and accessories including a flashing accessory, storm collar counter-flashing piece, and a termination cap.

2.4 DOUBLE WALL STAINLESS STEEL VENT FOR CONDENSING EQUIPMENT

.1 Positive pressure double wall stainless steel flue gas vent with a type 304 outer casing, an AL29-4C inner flue, and a 25 mm (1") annular air space, ULC-S636 listed and labelled, complete with

prefabricated mated fittings and accessories including a flashing accessory, storm collar counter-flashing piece, and a termination cap.

2.5 DOUBLE WALL TYPE "L" VENT

.1 Type "L" Neutral or negative pressure Type "L" double wall stainless steel flue gas vent, listed and labelled to CAN/ULC 609, with a type 304 stainless steel outer casing, type 304 stainless steel inner flue, and a 12 mm (½") annular air space, maximum 300°C (570°F) rated, complete with prefabricated mated fittings and accessories including a flashing accessory, storm collar counter-flashing piece, and a termination cap.

2.6 BAROMETRIC DAMPERS

.1 Equal to Field Controls UL/ULC listed and CSA certified Type M+MG2, field adjustable, single or double acting barometric damper to suit burner fuel, each complete with a gate which rests on a long, thin, stainless steel knife edge which in turn is supported by self-aligning and self-cleaning bearings, sized to suit the application, approved by equipment manufacturer, and complete with a field thermal switch accessory for dual fuel oil/gas fired burners.

PART 3 - EXECUTION

3.1 INSTALLATION OF TYPE BH FLUE GAS VENTS (AND COMBUSTION AIR INTAKES)

.1 Provide type BH flue gas vents and combustion air intakes for condensing appliances.

.2 Support spacing is to be in accordance with flue gas vent manufacturer’s instructions. Installation is to be in accordance with gas fired appliance manufacturer’s instructions and requirements of CSA B149.1.

.3 Route piping using shortest route possible to termination point while avoiding interference with other work. Slope vent piping for positive drainage.

.4 Equip termination of vent with a turn-down elbow with open end covered with bronze insect screen. Terminate exhaust vent a minimum of 3 m (10') away from fresh air intakes and operable windows.

.5 Confirm flue gas vent diameter prior to ordering.

3.2 INSTALLATION OF FLUE GAS VENTS

.1 Provide ULC listed and labelled flue gas vents for equipment. Confirm flue gas vent diameters prior to ordering.

.2 Secure horizontal sections in place by means of support hardware supplied with vents and conforming to flue diameter, and hanger rods attached to structure. Support spacing is to be in accordance with vent manufacturer’s instructions.

.3 Support vertical flue sections inside building at roof level and wherever else required by means of purpose made vertical support accessories supplied by manufacturer.

.4 Hand flashing collars to roofing trade at site on roof for installation and flashing into roof construction. Install counter-flashing pieces over collars.

.5 Equip termination of each chimney with a rain cap. Confirm height requirement for chimney above roof prior to installation, and ensure proper distance from fresh air intakes is maintained.

.6 Provide braided stainless steel aircraft cable guy wires attached to roof anchors and to stainless steel strap anchors on the vents as required and/or shown.

.7 Anchor and restrain vents in accordance with requirements of Section 20 05 48.16 - Seismic Controls for Mechanical Systems.

.8 Provide required accessories, including insulated thimbles at building wall penetrations, barometric damper(s), cleanout(s), fire stops, and expansion joints where shown and/or required.

.9 Locate and install barometric dampers in accordance with manufacturer's instructions and field adjust to suit operating conditions.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for boilers, including accessories, and all required wiring schematics. Include boiler flue product data sheets with the submission.

1.2 CLOSEOUT SUBMITTALS

.1 Submit with delivery of boiler(s) a copy of factory inspection and test report for each boiler, and include a copy of each report with O&M Manual project closeout data.

.2 Submit a site inspection and boiler start-up report from boiler manufacturer's representative as specified in Part 3 of this section.

.3 Submit signed copies of a manufacturer's non-prorated 10 year extended warranty for cast aluminium heat exchanger against corrosion, thermal stress, mechanical defects, and workmanship, and 2 year extended warranty for all other boiler components.

.4 Training attendance records.

1.3 MAINTENANCE MATERIAL SUBMITTALS

.1 Supply a complete spare charge of calcium silicate chips for each acid neutralizing tank.

1.4 QUALITY ASSURANCE

.1 Boilers and installation of boilers are to be in accordance with requirements of following:

.1 applicable Provincial Codes and Standards;

.2 CSA B51, Boiler, Pressure Vessel and Pressure Piping Code;

.3 CAN/CSA B149.1, Natural Gas and Propane Installation Codes;

.4 ULC/ORD-C795:2021, Commercial-Industrial Gas-Fired Package Boilers.

.2 Boiler installation tradesmen are to be journeyman tradesmen licensed to install boiler equipment.

PART 2 - PRODUCTS

2.1 CONDENSING HOT WATER BOILERS

.1 De Dietrich Products Gas 310 "ECO" Series, fully condensing, single-stage, factory assembled, factory pressure and fire tested hot water boilers in accordance with drawing schedule and with performance requirements are as follows:

.1 99.3% boiler efficiency with 15.5°C (60°F) entering water.

.2 Boilers complete with following construction features:

.1 690 kPa (100 psi) rated and stamped cast aluminium sectional heat exchanger designed such that all condensing occurs within heat exchanger and equipped with a heat exchanger cleanout on service side for cleaning;

.2 cast aluminium vent and condensate manifold with 250 mm (10") dia. flue connection with gravity drain for condensate elimination without a collection reservoir, and a port for cleaning and inspection;

.3 baked powder epoxy coated steel casing and framework mounted on casters for ease of moving boiler to its final location;

.4 factory supplied and certified seismic restraint anchor points.

.3 Boiler trim includes following:

.1 low water cut-off control supplied loose for site installation, which, when installed and wired to burner control circuit will prevent burner operation if boiler water falls below a safe level, an auxiliary low water cut-off as above, and a McDonnell & Miller Model TC-4 "Test-N-Check" valve above and below both low water cut-offs;

.2 ASME rated factory sized and set relief valve, and a flow switch, both shipped loose for site installation.

.4 Forced draft, 5:1 turn-down ratio, fully modulating premix stainless steel cylinder burner with perforated holes for precise air-fuel mixture producing a maximum of 30 ppm of NOx corrected to 3% excess oxygen, designed to return to low fire position prior to ignition and to remain in low fire position during ignition and until main flame has been proven, and constructed to burn specified quantity of fuel at between 4" to 14" w.c. (0.99 to 3.5 kPa) without objectionable noise, pulsation, or vibration. Each burner complete with:

.1 automatic electric spark ignition of premix gas pilot, and a flame detector to monitor pilot flame to prevent primary fuel valve from opening until pilot flame has been established;

.2 stainless steel cylinder with perforated holes for precise air-fuel mixture and velocity, and woven stainless steel fibre for flame stability and heat insulation;

.3 pulse width modulation controlled forced draft fan for optimum mixing of air and fuel between air-fuel valve and burner, mounted in front head above burner, direct connected to motor conforming to requirements specified in Section 20 05 00 – Common Work Results for Mechanical, equipped with an overload protected automatic motor starter with auxiliary contacts, and with maximum sound level of 60 dBA measured 1 m (3') in front of boiler;

.4 Honeywell or equal modulating air-gas ratio valve to meter natural gas input;

.5 gas piping train with primary motorized gas shut-off valve controlled to start or stop burner and to close automatically in event of power failure, flame failure, excessive pressure or temperature, high or low gas pressure, or low water condition, a manual shut-off valve located ahead of primary valve, a plugged leakage test connection with shut-off cock as a means of testing tightness of primary valve, a gas pressure regulator, and high and low gas pressure switches

.6 factory piped and wired pilot gas piping train with separate pilot gas cock, gas pressure regulator, and pilot safety shut-off gas valve.

.5 Burner controls, unless otherwise specified, are to factory installed in a dead front enclosure mounted on front head of boiler and equipped with disconnect switch, power and control wiring terminal blocks, motor starter, fuses, control circuit transformer, and control switches and relays as required. Controls include a Honeywell MCBA OEM or equal solid-state, microprocessor-based boiler and burner control which incorporates functions of temperature control, 100% shut-down combustion safeguard control, message annunciation, and fault diagnostic display, a flash card to permit replacement of control without need to re-commission boiler, and features as follows:

.1 3 levels of access; one for end user, one for advanced trained set-up and service technicians, and one for factory;

.2 hardware and circuitry for building automation system control and enable/disable contacts;

.3 ability to communicate with a PC or PDA with ReCom communication software and interface cable;

.4 adjustable water temperature operating limit between 20°C to 90°C (70°F to 140°F) by means of an internal set-point, indoor/outdoor reset controller, or a building automation system 0-10 VDC signal, or from a lead/lag control system, and fixed safety high temperature limit;

.5 on/off switch, and supply and return water temperature indication;

.6 blocked heat exchanger and blocked vent indication;

.7 operating, service, and fault diagnostic coding;

.8 ability to be set-up with or without a computer;

.9 hardware and circuitry for pre-operation and post-operation of burner fan;

.10 contacts for connection to Boiler Room ventilation system to prevent boilers from operating unless ventilation system is operating (ventilation system is to "fail-open" to permit boiler operation should fan or damper motors fail or a power failure occurs).

.6 Double wall stainless steel AL29-4C stainless steel flue gas vent for each boiler with a type 304 outer casing and AL29-4C inner flue supplied by boiler manufacturer. Each boiler is to operate under Category IV positive vent pressure conditions for room air dependent operation. Venting is to feature condensate disposal and have 50 mm (2") clearance to combustibles.

.7 Equal to JJM Boiler Works or Condensate Neutralizer condensate acid neutralizing PVC tube sized to suit the boiler condensate discharge, supplied with boiler, filled with 12 mm (½") and 20 mm (¾") aggregate calcium carbonate and complete with floor mounting galvanized steel strut clamps, threaded PVC inlet and outlet fittings, and a spare charge of calcium silicate.

.8 Manufacturers:

.1 De Dietrich Products;

.2 Viessmann Manufacturing Co.;

.3 Buderus.

2.2 BOILER PLANT SEQUENCING CONTROL PANEL

.1 Surface wall mounting, NEMA 2, dead front, enamelled steel, 115 volt, 1-phase, 60 Hz AC, electronic, microprocessor-based, CSA certified, fully automatic boiler plant master sequencing control panel supplied by boiler manufacturer for lead-lag control of boiler operation with simple on-off switching of individual boilers, and boiler water temperature control as indicated.

.2 Panel is to be complete with:

.1 key lock door, and a door interlock type disconnect switch;

.2 green "Power On" LED and a white "Boiler Operating" LED for each boiler;

.3 door mounted 2-position "Manual/Automatic" switch for each boiler, connected such that when a switch is in "Manual" position respective boiler is disconnected from automatic sequence and will operate independently through its own controls while remaining boilers operate automatically through sequencing controls;

.4 rotary type, door mounted lead boiler selector switch, connected such that regardless of which boiler is chosen as lead boiler remaining boilers will operate in required sequence in numerical order, and with circuits isolated in programmer circuit such that switch may be rotated at any time with any number of boilers operating without overloading its contacts, and such that boilers remaining on line will not recycle thereby permitting changing of lead boiler without material loss of load;

.5 fused 24 volt secondary control transformer;

.6 numbered terminal strips for power and control wiring connections;

.7 hardware and circuitry required for specified control and sequencing, including adjustable time delay which is to be activated before lead boiler reaches high fire to allow lead boiler sufficient time to satisfy system demand before first lag boiler is activated;

.8 permanent identification of door mounted LED's and switches;

.9 operating control components as required, supplied loose for site installation.

.3 Boiler plant control sequence as follows:

.1 on first call for heat, lead boiler will come on line at low fire, and if system demand is such that output of lead boiler will not satisfy demand at low fire, boiler will modulate to high fire;

.2 if lead boiler is unable to satisfy system demand by time it reaches 80% of its firing rate, and over a reasonable period of time, first lag boiler is to come on line at low fire and, if required, modulate to high fire;

.3 remaining lag boilers are brought on line as above as required to satisfy system demand;

.4 as system demand is satisfied, boilers are to modulate back to low fire and shut-off in reverse order.

.4 Panel suitable in all respects for interface connection into building automation system without site installation of additional hardware.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide condensing hot water boilers.

.2 Move boilers into position, remove casters, and secure each boiler in place, level, and plumb, on neoprene-steel-neoprene vibration isolation pads on a concrete housekeeping pad.

.3 Anchor each boiler and concrete base in accordance with requirements specified in Section 20 05 48.16 - Seismic Controls for Mechanical Systems. Provide flexible connections in piping connections to each boiler.

.4 Connect each boiler with piping and flue.

.5 Install condensate acid neutralizers adjacent to boilers and connect with piping from boilers to neutralizers and from neutralizers to drain in accordance with manufacturer's directions and drawing requirements.

.6 Install control components shipped loose for each boiler, including low water cut-offs, relief valve, and flow switch. Unless otherwise instructed, follow manufacturer's installation instructions. Provide pressure gauges and thermometers in boiler water supply and return piping connections.

.7 Wall mount lead/lag control panel where shown but confirm exact location prior to installation.

.8 Perform required control wiring in conduit to connect control components. Follow boiler manufacturer's control wiring schematics and conduit and conductor installation requirements specified as part of electrical work.

.9 When boiler plant installation is substantially complete, but prior to start-up, and prior to flushing and cleaning heating piping system as specified in Section 23 25 00 - HVAC Water Treatment, inspect each boiler and remove visible dirt, oil and debris, then cooperate with the boiler boil-out chemical supplier to ensure proper boil-out procedures are followed.

3.2 SYSTEM STARTUP

.1 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.3 CLOSEOUT ACTIVITIES

.1 Include for a one day on-site boiler plant operation demonstration and training session. Training is to be a full review of all components including but not limited to a full boiler internal inspection, construction details, burner operation, maintenance, flame characteristics, and adjustments, gas train maintenance, boiler normal operation, abnormal events, normal shut-down, emergency shut-down, and setting up controls.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for heat exchangers, including accessories.

1.2 CLOSEOUT SUBMITTALS

.1 Submit with delivery of each unit a copy of the factory inspection report, and include a copy of each report with O&M Manual project closeout data.

.2 Submit a site inspection and start-up report from manufacturer's representative as specified in Part 3 of this section.

.3 Training attendance records.

1.3 QUALITY ASSURANCE

.1 Heat exchanger equipment is to be stamped with a Canadian Registration Number (CRN).

.2 Heat exchangers and accessories are to be in accordance with following:

.1 CSA B51, Boiler, Pressure Vessel, and Pressure Piping Code;

.2 ASME Boiler and Pressure Vessel Code;

.3 governing Provincial and/or Municipal Codes and Regulations.

PART 2 - PRODUCTS

2.1 PLATE TYPE HEAT EXCHANGERS

.1 Vertical plate type heat exchangers in accordance with drawing schedule, 1035 kPa (150 psi) working pressure rated, factory pressure tested and complete with:

.1 electro-galvanized carbon steel frames with baked epoxy enamel finish, same end ANSI 150 flanged connections, a fixed end panel and a removable end panel, and molybdenum greased electro-galvanized steel bolts protected by means of sleeves;

.2 type 316 stainless steel plates, fully supported and steered by upper and lower carrying bars to prevent misalignment in both vertical and horizontal directions, space between ports not feeding channels, and channels vented to atmosphere;

.3 one-piece snap-on nitrile rubber gaskets moulded in a groove around heat transfer area and plate portholes, and continually supported along inner and outer edges;

.4 heat exchangers for domestic water service shall be 316L stainless steel double wall construction and suitable in every respect for potable water applications;

.5 factory secured seismic restraint connection hardware.

.2 Manufacturers:

.1 S. A. Armstrong Ltd.;

.2 Alfa Laval Inc.;

.3 Baltimore Aircoil of Canada Inc.;

.4 Tranter Heat Exchangers (Canada) Ltd.;

.5 APV an SPX Brand;

.6 Danfoss Inc;

.7 GEA Canada Inc.;

.8 Taco (Canada) Ltd.

.9 Flo-Fab Inc.

PART 3 - EXECUTION

3.1 INSTALLATION OF PLATE TYPE HEAT EXCHANGERS

.1 Provide plate type heat exchangers.

.2 Secure each heat exchanger in place, level, and plumb, on a concrete housekeeping pad.

.3 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 - Seismic Controls for Mechanical Systems.

.4 Connect with piping in accordance with drawing detail.

.5 When installation is complete and piping has been permanently filled, start-up each heat exchanger, check and test all safeties and operating controls, and set controls to design conditions.

3.2 SYSTEM STARTUP

.1 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.3 TRAINING

.1 Include for a one half day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data for all units. Include:

.1 certified fan performance curves;

.2 estimated sound power levels to be expected across individual octave bands in dB;

.3 certified power and control wiring diagrams which differentiate between factory and site wiring;

.4 dimensioned layouts, including dimensioned curb layouts and duct penetrations, as applicable;

.5 product data for fan motors and drives;

1.2 CLOSEOUT SUBMITTALS

.1 Submit with delivery of each unit a copy of the factory inspection and fire test report, and include a copy of each report with O&M manual project close-out data.

.2 Submit a site inspection and start-up report from manufacturer's representative as specified in Part 3 of this section.

.3 Submit signed copies of manufacturer's extended warranties as follows:

.1 stainless steel gas fired unit heat exchanger: 10 years;

.2 refrigerant compressor(s): 5 years;

.3 integrated modular control: 3 years.

.4 Training attendance records.

1.3 MAINTENANCE MATERIAL SUBMITTALS

.1 Submit spare air filters as specified in Part 2 of this section.

1.4 COORDINATION

.1 Supply reviewed copies of curb assembly shop drawings or product data sheets to trade who will cut roof openings for ductwork, and ensure openings are properly sized and located.

1.5 QUALITY ASSURANCE

.1 Heating and air conditioning equipment is to be rated (capacity, performance, efficiency and sound) and certified in accordance with requirements of following Air-Conditioning, Heating and Refrigeration Institute Standards:

.1 ANSI/AHRI 210/240, Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment;

.2 ANSI/AHRI 270, Sound Performance Rating of Outdoor Unitary Equipment;

.3 ANSI/AHRI 340/360, Performance Rating of Commercial and Industrial Unitary Air-Conditioning and Heat Pump Equipment.

.2 Heating and air conditioning equipment is also to be in accordance with requirements of following Codes, Standards, and Regulations:

.1 CSA B52, Mechanical Refrigeration Code;

.2 CAN/CSA-C22.2 No. 236/UL 1995, Heating and Cooling Units;

.3 ANSI/ASHRAE/IES 90.1, Energy Standard for Buildings Except Low Rise Residential Buildings;

.4 CSA or ETL certification and labelling for all electrical components;

.5 CAN/CSA B149, Natural Gas and Propane Code;

.6 governing local Codes and Regulations.

.3 Gas fired heating and air conditioning units are to be installed by licensed journeyman gas fitters.

.4 Manufacturer to provide separate price to maintain the unit for the first 5 years including parts and labour.

.5 The Manufacturer shall provide 60-month parts and labour from the date of start up.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Daikin

.2 Trane Canada Corp.;

.3 Engineered Air

2.2 PACKAGED OUTDOOR AIR HANDLING UNITS

.1 Package type, factory assembled and tested, outdoor, weatherproof heating and air conditioning units in accordance with drawing schedule.

.2 Packaged units shall be shipped fully charged with R-32 Refrigerant and oil.

.3 Unit shall be provided with an outdoor air economizer section. The economizer section shall include outdoor, return, and exhaust air dampers. The economizer operation shall be fully integral to the mechanical cooling and allow up to 100% of mechanical cooling if needed to maintain the cooling discharge air temperature.

.4 Unit Construction

.1 Panel construction shall be double-wall construction for all panels. All floor panels shall have a solid galvanized steel inner liner on the air stream side of the unit to protect insulation during service and maintenance. Insulation shall be a minimum of 1" thick with an R-value of 7.0 and shall be 2 part injected foam. Panel design shall include no exposed insulation edges. Unit cabinet shall be designed to operate at total static pressures up to 1.24kPa (5.0 “ w.g);

.2 Casing to be constructed of pre-painted galvanized steel. Paint finish to include a base primer with polyester resin topcoat. Finished panel surfaces to withstand a minimum 1000-hour salt spray test in accordance with ASTM B117 standard for salt spray resistance;

.3 Service doors shall be provided on the fan section, filter section, control panel section, and heating vestibule in order to provide user access to unit components. All service access doors shall be mounted on multiple, stainless steel hinges and shall be secured by a latch system;

.4 The unit base shall overhang the roof curb and be seat on the roof curb gasket. Lifting brackets to be provided on the unit base;

.5 The outdoor air hood to be constructed from galvanized steel and finished with the same durable paint finish as the main unit

.5 Filters

.1 50mm (2”) prefilter rack and a 100mm (4”) final filter rack. A set of 50mm (2”) construction filters shall ship with the unit.

.2 Supply a spare set of 50mm (2”) Merv 8-30% and 100mm (4”) Merv 14-95% efficient filers.

.3 Outdoor air hood to include moisture eliminator filter.

.4 50mm (2") Merv 7 filters for energy recovery wheel outdoor air stream before the wheel.

.6 Dampers

.1 Modulating, parallel blade, spring return type dampers complete with direct coupled actuator for comparative enthalpy control.

.7 Supply Fan

.1 Fan to be capable of airflow modulation from 30% to 100% of the scheduled designed airflow. Fan not to operate in a state of surge at any point within the modulation range. Motor to have thermal overload and phase failure protection.

.2 Single inlet (SWSI) airfoil centrifugal supply fan. Class II construction with fan blades that are continuously welded to the hub plate and end rim. Direct drive fan mounted to the EC motor shaft.

.8 Exhaust Fan

.1 Fan not to operate in a state of surge at any point within the modulation range. Motor to have thermal overload and phase failure protection.

.2 Single inlet (SWSI) airfoil centrifugal exhaust fan. Class II construction with fan blades that are continuously welded to the hub plate and end rim. Direct drive fan mounted to the EC motor shaft.

.3 DDC controller shall provide building static pressure control.

.9 DX Cooling

.1 Draw through configuration, upstream of the supply air fan. The coil section complete with double sloped stainless steel drain pan, electronic controlled expansion valve.

.2 High efficiency copper tubing that is mechanically expanded into high efficiency aluminum plate fins.

.3 Condenser

.1 Cast Aluminum outdoor coils. Plate fins to be protected and brazed between adjoining flat tubes such that they shall not extend outside the tubes. A sub-cooling coil to be an integral part of the main outdoor air coil;

.2 Refrigeration system capable of operating down to -17°C (0°F) without installation of additional controls, complete with self-sealing discharge, suction and liquid line service gauge ports, freeze-stats, expansion valves, copper refrigerant tubing and insulation where required, liquid line filter drier, automatic reset high and low pressure compressor circuit controls, pressure transducers for the suction pressure and head pressure, temperature sensor for the suction temperature and refrigerant discharge temperature of the compressors, and fan control for -34°C (-30°F) low ambient operation;

.3 ECM type fan motor. Fan not to operate in a state of surge at any point within the modulation range. Motor to have thermal overload and phase failure protection;

.4 Low noise fan blade design. PVC coated condenser fan guard and condenser coil guard;

.5 Vibration isolated scroll type compressors. One of the compressors to be an inverter compressor providing proportional control. The inverter compressor to have a separate oil pump and low oil safety protection;

.10 Hot Gas Reheat

.1 Unit to be complete with a fully modulating aluminium hot gas reheat coil with hot gas coming from the unit condenser.

.11 Natural Gas Heating

.1 Gas furnace design shall be installed downstream of the supply air fan in the heat section. The heating module shall be a tubular design with in-shot gas burners. Induced draft fan to maintain a negative pressure.

.2 5:1 turndown

.3 Stainless steel heat exchanger tube construction.

.12 Heat Pump Heating

.1 The evaporator coil, condenser coil, compressors and refrigerant circuit to be designed for heat pump operation and shall included a 4 way reversing valve and electronic expansion valve to be controlled by unit controller.

.2 The refrigerant system shall have a pump-down cycle.

.13 Energy Recovery Wheel

.1 Provide rotary wheel air-to-air heat exchanger in a cassette frame complete with seals, drive motor and drive belt.

.2 The total energy recovery wheel to be coated with silica gel desiccant permanently bonded without the use of binders or adhesives. The substrate to be lightweight polymer.

.3 Wheels to be provided with removable energy transfer matrix. Wheel frame construction to be a welded hub, spoke and rim assembly of stainless, plated and coated steel and shall be self-supporting without matrix segments in place.

.4 Wheel bearings to be selected to provide an L-10 life in excess of 400,000 hours. Rim to be continuous rolled stainless steel. Wheels to be connected to the shaft by means of taper lock hubs.

.5 Controls to provide frost control for the energy recovery wheel. When a frost condition is encountered the unit controller shall slow down the wheel. When in the frost control mode the wheel shall be jogged periodically and not be allowed to stay in the stationary position.

.14 Electrical

.1 Each unit to be wired and tested at the factory before shipment. All wiring to be number coded per the electrical wiring diagrams. All electrical components to be labeled according to the electrical diagram and be CSA recognized.

.2 A terminal block to be provided for the main power connection and a terminal board to be provided for the low voltage control wiring. Knockouts to be provided in the bottom of the main control panel for field wiring entrance. Branch short circuit protection, 115-volt control circuit transformer and fuse, system switches, and a high temperature sensor to also be provided with the unit.

.3 Each compressor and condenser fan motor to be furnished with contactors and internal thermal overload protection. Supply fan motors to be supplied with external overload protection.

.4 A single non-fused disconnect switch to be provided for disconnecting electrical power at the unit. Disconnect switches to be mounted internally to the control panel and operated by an externally mounted handle

.15 Controller

.1 The unit control system to include all required temperature and pressure sensors, input/output boards, main microprocessor and operator interface. The unit control system to perform all unit control functions including scheduling, unit diagnostics and safeties.

.2 The DDC control system to permit starting and stopping of the unit locally or remotely. A set of contacts to be provided for outside air damper actuation, emergency shutdown, remote heat enable/disable, remote cool enable/disable, heat indication, cool indication, and fan operation.

.3 The unit control system to communicate with an Building Management System (BMS) via a direct BACnet communication connection. The independent BMS system to have access to “read only’ variables and “read & and write” variables. Communications not to require field mounting of any additional sensors or devices at the unit. The BMS system to be capable of interacting with the individual rooftop controllers in the following ways:

.1 Monitor controller inputs, outputs, set points, parameters and alarms

.2 Set controller set points and parameters

.3 Clear alarms

.4 Reset the cooling and heating discharge air temperature set point

.5 Set the heat/cool changeover temperature

.6 Set the representative zone temperature

.4 The following set points to be adjustable:

.1 Control mode (Off / Auto / Cool Only / Fan Only / Heat Only)

.2 Occupancy mode (Auto / Tenant Override / Occupied / Unoccupied)

.3 Changeover mode (return air, space temperature or network signal)

.4 Cooling and heating discharge air temperature control

.5 Compressor lockouts and timers

.6 Economizer changeover (enthalpy or dry bulb)

.7 Scheduling

.8 Building static pressure control

.5 The unit DDC controller to provide building static pressure control. The unit controller to provide proportional control of the exhaust fans from 25% to 100% of the supply air fan designed airflow to maintain the adjustable building pressure set point.

.6 Supply air reset options to include; return air temperature, outdoor air temperature, space temperature, airflow (VAV), network signal, external signal (1-5 vdc or 0-20 mA)

.7 The controller to be complete with night setback control. The controller shall use its internal time clock for scheduling and have an adjustable override timer. Provide wall mounted space sensor with an override button for field installation.

.16 Roof Curb

.1 Provide a prefabricated heavy gauge galvanized steel, mounting curb for field assembly on the roof prior to unit shipment. Full perimeter type with complete perimeter support of the air handling section and condensing section. The curb to be a minimum of 24" high and include a nominal 2"×4" wood nailing strip. Gasket to be provided for field mounting between the unit base and roof curb.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide outdoor heating and air conditioning units.

.2 Provide required rigging and hoisting/moving equipment required to move each unit to required locations. Perform rigging/hoisting/moving in accordance with unit manufacturer's directions and details.

.3 Hand a curb for each roof mounted unit to roofing trade on roof for installation and flashing into roof construction. Secure each unit in place on roof curb. Provide continuous gasketing around perimeter of each curb between curb and unit mounting frame.

.4 Install components shipped loose with units. Install in accordance with manufacturer's recommendations. Calibrate control components requiring field calibration.

.5 Extend condensate trapped drains using Schedule 40 galvanized steel piping to roof.

.6 Provide remote control panels. Confirm exact locations prior to roughing-in. Connect complete with 24 volt control wiring in conduit to standards of electrical work and in accordance with manufacturer's certified wiring diagram.

.7 Carefully coordinate installation of each unit with all other trades making connections to unit, in particular, power, interlock connections, and control connections.

3.2 SYSTEM STARTUP

.1 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.3 CLOSEOUT ACTIVITIES

.1 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including, but not limited to, a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for all make-up air units. Include following:

.1 certified fan performance curves;

.2 estimated sound power levels to be expected across individual octave bands in dB;

.3 certified power and control wiring diagrams which differentiate between factory and site wiring;

.4 dimensioned layouts, including dimensioned curb layouts and duct penetrations, as applicable;

.5 product data for fan motors and drives;

1.2 CLOSEOUT SUBMITTALS

.1 Submit with delivery of each furnace a copy of the factory inspection and fire test report as specified in Part 2 of this section, and include a copy of each report with O&M Manual project close-out data.

.2 Submit a site inspection and start-up report from manufacturer's representative as specified in Part 3 of this section.

.3 Training attendance records.

1.3 MAINTENANCE MATERIAL SUBMITTALS

.1 Submit spare air filters as specified in Part 2 of this section.

1.4 COORDINATION

.1 Supply reviewed copies of curb assembly shop drawings or product data sheets to trade who will cut roof openings for ductwork, and ensure openings are properly sized and located.

1.5 QUALITY ASSURANCE

.1 Make-up air units and installation are to be in accordance with requirements of following:

.1 all applicable Provincial Codes and Standards;

.2 CAN/CSA B149, Natural Gas and Propane Installation Codes;

.3 CSA or cETL listed and labelled electrical components.

.4 governing local Codes and Regulations.

.2 Make-up air unit installation tradesmen are to be journeyman and licensed gas fitters.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Daikin

.2 Trane Canada Corp.;

.3 Engineered Air

2.2 PACKAGED OUTDOOR AIR HANDLING UNITS

.1 Package type, factory assembled and tested, outdoor, weatherproof heating-only units in accordance with drawing schedule.

.2 Unit shall be provided with an outdoor air economizer section. The economizer section shall include outdoor, return, and exhaust air dampers. The economizer operation shall be fully integral to the unit and allow up to 100% of mechanical cooling if needed to maintain the cooling discharge air temperature.

.3 Unit Construction

.1 Panel construction shall be double-wall construction for all panels. All floor panels shall have a solid galvanized steel inner liner on the air stream side of the unit to protect insulation during service and maintenance. Insulation shall be a minimum of 1" thick with an R-value of 7.0 and shall be 2 part injected foam. Panel design shall include no exposed insulation edges. Unit cabinet shall be designed to operate at total static pressures up to 1.24kPa (5.0 “ w.g);

.2 Casing to be constructed of pre-painted galvanized steel. Paint finish to include a base primer with polyester resin topcoat. Finished panel surfaces to withstand a minimum 1000-hour salt spray test in accordance with ASTM B117 standard for salt spray resistance;

.3 Service doors shall be provided on the fan section, filter section, control panel section, and heating vestibule in order to provide user access to unit components. All service access doors shall be mounted on multiple, stainless steel hinges and shall be secured by a latch system;

.4 The unit base shall overhang the roof curb and be seat on the roof curb gasket. Lifting brackets to be provided on the unit base;

.5 The outdoor air hood to be constructed from galvanized steel and finished with the same durable paint finish as the main unit

.4 Filters

.1 50mm (2”) prefilter rack and a 100mm (4”) final filter rack. A set of 50mm (2”) construction filters shall ship with the unit.

.2 Supply a spare set of 50mm (2”) Merv 8-30% and 100mm (4”) Merv 14-95% efficient filers.

.3 Outdoor air hood to include moisture eliminator filter.

.4 50mm (2") Merv 7 filters for energy recovery wheel outdoor air stream before the wheel.

.5 Dampers

.1 Modulating, parallel blade, spring return type dampers complete with direct coupled actuator for comparative enthalpy control.

.6 Supply Fan

.1 Fan to be capable of airflow modulation from 30% to 100% of the scheduled designed airflow. Fan not to operate in a state of surge at any point within the modulation range. Motor to have thermal overload and phase failure protection.

.2 Single inlet (SWSI) airfoil centrifugal supply fan. Class II construction with fan blades that are continuously welded to the hub plate and end rim. Direct drive fan mounted to the EC motor shaft.

.7 Exhaust Fan

.1 Fan not to operate in a state of surge at any point within the modulation range. Motor to have thermal overload and phase failure protection.

.2 Single inlet (SWSI) airfoil centrifugal exhaust fan. Class II construction with fan blades that are continuously welded to the hub plate and end rim. Direct drive fan mounted to the EC motor shaft.

.3 DDC controller shall provide building static pressure control.

.8 Natural Gas Heating

.1 Gas furnace design shall be installed downstream of the supply air fan in the heat section. The heating module shall be a tubular design with in-shot gas burners. Induced draft fan to maintain a negative pressure.

.2 5:1 turndown

.3 Stainless steel heat exchanger tube construction.

.9 Energy Recovery Wheel

.1 Provide rotary wheel air-to-air heat exchanger in a cassette frame complete with seals, drive motor and drive belt.

.2 The total energy recovery wheel to be coated with silica gel desiccant permanently bonded without the use of binders or adhesives. The substrate to be lightweight polymer.

.3 Wheels to be provided with removable energy transfer matrix. Wheel frame construction to be a welded hub, spoke and rim assembly of stainless, plated and coated steel and shall be self-supporting without matrix segments in place.

.4 Wheel bearings to be selected to provide an L-10 life in excess of 400,000 hours. Rim to be continuous rolled stainless steel. Wheels to be connected to the shaft by means of taper lock hubs.

.5 Controls to provide frost control for the energy recovery wheel. When a frost condition is encountered the unit controller shall slow down the wheel. When in the frost control mode the wheel shall be jogged periodically and not be allowed to stay in the stationary position.

.10 Electrical

.1 Each unit to be wired and tested at the factory before shipment. All wiring to be number coded per the electrical wiring diagrams. All electrical components to be labeled according to the electrical diagram and be CSA recognized.

.2 A terminal block to be provided for the main power connection and a terminal board to be provided for the low voltage control wiring. Knockouts to be provided in the bottom of the main control panel for field wiring entrance. Branch short circuit protection, 115-volt control circuit transformer and fuse, system switches, and a high temperature sensor to also be provided with the unit.

.3 A single non-fused disconnect switch to be provided for disconnecting electrical power at the unit. Disconnect switches to be mounted internally to the control panel and operated by an externally mounted handle

.11 Controller

.1 The unit control system to include all required temperature and pressure sensors, input/output boards, main microprocessor and operator interface. The unit control system to perform all unit control functions including scheduling, unit diagnostics and safeties.

.2 The DDC control system to permit starting and stopping of the unit locally or remotely. A set of contacts to be provided for outside air damper actuation, emergency shutdown, remote heat enable/disable, remote cool enable/disable, heat indication, cool indication, and fan operation.

.3 The unit control system to communicate with an Building Management System (BMS) via a direct BACnet communication connection. The independent BMS system to have access to

"read only' variables and "read & and write" variables. Communications not to require field mounting of any additional sensors or devices at the unit. The BMS system to be capable of interacting with the individual rooftop controllers in the following ways:

.1 Monitor controller inputs, outputs, set points, parameters and alarms

.2 Set controller set points and parameters

.3 Clear alarms

.4 Reset the heating discharge air temperature set point

.5 Set the representative zone temperature

.4 The following set points to be adjustable:

.1 Control mode (Off / Auto / Fan Only / Heat Only)

.2 Occupancy mode (Auto / Tenant Override / Occupied / Unoccupied)

.3 Heating discharge air temperature control

.4 Economizer changeover (enthalpy or dry bulb)

.5 Scheduling

.6 Building static pressure control

.5 The unit DDC controller to provide building static pressure control. The unit controller to provide proportional control of the exhaust fans from 25% to 100% of the supply air fan designed airflow to maintain the adjustable building pressure set point.

.6 Supply air reset options to include; return air temperature, outdoor air temperature, space temperature, airflow (VAV), network signal, external signal (1-5 vdc or 0-20 mA)

.7 The controller to be complete with night setback control. The controller shall use its internal time clock for scheduling and have an adjustable override timer. Provide wall mounted space sensor with an override button for field installation.

.12 Roof Curb

.1 Provide a prefabricated heavy gauge galvanized steel, mounting curb for field assembly on the roof prior to unit shipment. Full perimeter type with complete perimeter support of the air handling section and condensing section. The curb to be a minimum of 24" high and include a nominal 2"×4" wood nailing strip. Gasket to be provided for field mounting between the unit base and roof curb.

PART 3 - EXECUTION

3.1 INSTALLATION OF MAKE-UP AIR UNIT

.1 Provide a gas fired make-up air unit on roof.

.2 Unless otherwise specified or required, provide required rigging and hoisting/moving equipment required to move units to required location. Perform rigging/hoisting/moving in accordance with unit manufacturer's directions and details.

.3 Hand a curb for each roof mounted unit to roofing trade on roof for installation and flashing into roof construction. Secure each unit in place on roof curb. Provide continuous gasketing around perimeter of each curb between curb and unit mounting frame.

.4 Install components shipped loose with units. Install a discharge air temperature sensor in supply ductwork approximately 2 m (6-½') downstream of unit and in accordance with manufacturer's recommendations.

.5 Provide remote control panels. Confirm exact locations prior to roughing-in. Connect complete with 24 volt control wiring in conduit to standards of electrical work and in accordance with manufacturer's certified wiring diagram.

.6 Carefully coordinate installation of each unit with all other trades making connections to unit, in particular, power, interlock connections, and control connections.

3.2 SYSTEM STARTUP

.1 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.3 CLOSEOUT ACTIVITIES

.1 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 RELATED REQUIREMENTS

.1 Section 23 23 00 – Refrigerant Piping.

1.2 SUBMITTALS

.1 Submit shop drawings/product data sheets, complete with control components, and piping and wiring schematics.

1.3 CLOSEOUT SUBMITTALS

.1 Submit a start-up and certification letter from equipment supplier as specified in Part 3 of this section.

.2 Prepare and submit a schematic layout of refrigerant piping showing all piping components required for satisfactory operation and maintenance of the system(s), including but not limited to pipe sizes, charging valve, isolating valves, sight glasses, strainers, driers, traps, etc. Schematic diagram must be reviewed with and approved by air conditioning equipment supplier prior to submittal to the Consultant.

1.4 QUALITY ASSURANCE

.1 Split system air conditioning equipment and installation of equipment are to be in accordance with requirements of following:

.1 All applicable Provincial Codes and Standards.

.2 ANSI/AHRI Standard 210/240, Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment.

.2 Split system air conditioning system installation tradesmen are to be journeyman refrigeration mechanics.

PART 2 - PRODUCTS

2.1 SPLIT SYSTEM AIR CONDITIONING EQUIPMENT

.1 Factory assembled and tested, package type equipment consisting of an indoor evaporator unit and an exterior condensing unit in accordance with drawing schedule, CSA or ETL listed and labelled, AHRI rated and certified and with a minimum system efficiency of 13 SEER.

.2 Wall mounting evaporator assembly consisting of a white moulded high-strength plastic cabinet with front access panel, a motorized horizontal vane to automatically direct air flow in a horizontal and downward direction and which closes when fan operation is stopped, motorized vertical vanes controlled remotely, and a mounting plate supplied loose. Evaporator complete with:

.1 double inlet, forward curve fan(s) direct driven by a single 4-speed motor;

.2 removable and washable return air filter;

.3 factory pressure tested multi-angled coil of non-ferrous construction with aluminium fins, copper tubes with silver alloy solder joints, and an insulated condensate drain pan sloped to a drain connection for positive drainage.

.3 Factory run tested, weatherproof condensing unit equipped with a control board to interface with indoor unit and perform all necessary operation functions. Pre-charge unit with R-410a refrigerant

for a minimum of 21 m (70') of refrigerant tubing. Unit is to be capable of operation at -18°C (0°F) without additional low ambient controls, and capable of a height difference between condensing unit and evaporator of 30 m (100'). Each condensing unit complete with:

.1 galvanized steel plate cabinet with an electrostatically applied thermally fused polyester powder finish, and an ABS plastic fan grille;

.2 draw-through direct driven balanced fan with horizontal air discharge, mounted in front of coil, arranged to pull air across coil, and equipped with a raised fan guard;

.3 "L" shaped coil with copper tubes and aluminium fins, factory pressure tested, complete with an integral metal guard and refrigerant flow controlled by a linear expansion valve metering orifice controlled by a microprocessor controlled step motor;

.4 vibration isolated DC rotary compressor driven by an inverter circuit to dynamically control compressor speed to match room load, complete with an accumulator, high pressure safety switch, and circuitry to permit a minimal amount of current to be applied to motor to maintain enough heat during off cycle to prevent liquid from accumulating.

.4 System controls consisting of a microprocessor in each indoor and outdoor unit, and an indoor wall mounted controller site connected to indoor evaporator unit. System is to be capable of automatic restart after power interruption, and have self-diagnostics ability and indication of total compressor run time, and following:

.1 Indoor unit microprocessor is capable of monitoring return air temperature and evaporator coil temperature, receiving and processing commands from wall mounted controller, providing emergency operation, and controlling outdoor unit through its microprocessor and interface board;

.2 controller is complete with an integral temperature sensor, able to perform input and output functions necessary to operate system, and equipped with following:

.1 large DOT liquid crystal display to indicate diagnostic codes for both indoor and outdoor units, compressor run time, a weekly timer with up to 8 pattern settings per day, set temperature, room temperature, refrigerant piping temperatures, compressor operating conditions, and linear expansion valve opening pulses, sub-cooling and discharge super heat;

.2 On/Off button, Increase/Decrease Set Temperature buttons, a Cool/Dry/Fan mode selector, a Timer Menu button, a Timer On/Off button, Set Time buttons, a Fan Speed selector, a Vane Position selector, a Louvre Swing button, a Ventilation button, a Test Run button, and a Check Mode button.

.5 Suitable anchoring connection hardware factory installed on equipment to suit requirements of Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

2.2 MANUFACTURERS

.1 Mitsubishi Electric Sales Canada Inc.;

.2 LG Electronics Canada Inc.;

.3 Panasonic Canada Inc.;

.4 Fujitsu General America Inc.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide split system air conditioning equipment consisting of an exterior condensing unit and an indoor evaporator.

.2 Secure condensing unit in place, level and plumb, on vibration isolation pads on a concrete housekeeping pad.

.3 Secure condensing unit in place, level and plumb, on vibration isolation pads on pressure treated wooden sleepers as indicated.

.4 Anchor equipment in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems. Provide flexible connections in all piping connections to equipment.

.5 Mount indoor evaporator unit. Confirm exact location prior to roughing-in.

.6 Connect condensing unit and indoor evaporator with refrigerant piping in accordance with piping shop drawing schematic. Refer to Section 23 23 00 – Refrigerant Piping. Provide any required additional refrigerant.

.7 Install loose control components and perform required control wiring (except building automation system connections) between condensing unit and evaporator in conduit in accordance with manufacturer's control wiring schematic and wiring standards of electrical work.

3.2 SYSTEM STARTUP

.1 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.3 CLOSEOUT ACTIVITIES

.1 Include for 4 hours of on-site operation demonstration and training session. Training is to be a full review of all components including, but not limited to, a full operation and maintenance demonstration, with control set-up and abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Variable Refrigerant Flow (VRF) air conditioning system consisting of one or more outdoor compressor units and multiple indoor fan coil units.

1.2 RELATED REQUIREMENTS

.1 Section 23 23 00 – Refrigerant Piping.

1.3 SUBMITTALS

.1 Submit shop drawings/product data sheets, complete with control components, and piping and wiring schematics.

.2 Prepare and submit a schematic layout of refrigerant piping showing all piping components required for satisfactory operation and maintenance of the system(s), including but not limited to pipe sizes, charging valve, CSA B52 refrigerant charge analysis, isolating valves, sight glasses, strainers, driers, traps, etc. Schematic diagram must be reviewed with and approved by air conditioning equipment supplier prior to submittal to the Consultant.

1.4 CLOSEOUT SUBMITTALS

.1 Submit a start-up and certification letter from equipment supplier as specified in Part 3 of this Section.

1.5 QUALITY ASSURANCE

.1 Split system air conditioning equipment and installation of equipment are to be in accordance with requirements of following:

.1 All applicable provincial codes and standards;

.2 ANSI/AHRI Standard 210/240, Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment.

.3 ANSI/AHRI Standard 1230. Performance Rating of Variable Refrigerant Flow (VRF) Multi-Split Air-Conditioning and Heat Pump Equipment

.2 Split system air conditioning system installation tradesmen are to be journeyman refrigeration mechanics.

PART 2 - PRODUCTS

2.1 GENERAL

.1 VRF system shall automatically vary the target evaporating and condensing temperatures based on building load and weather conditions to increase part load efficiency (Variable Refrigerant Temperature). The condensing unit shall also feature customizable operating modes which allows for the manual setting of target evaporating and condensing temperatures.

2.2 MANUFACTURERS

.1 Daikin Industries Ltd.;

.2 Mitsubishi Electric Sales Canada Inc.;

.3 LG Canada.

2.3 VRF FAN COILS

.1 VRF fan coils shall monitor and maintain the unit superheat (cooling mode) or subcooling (heating mode) using a computerized PID control. Internal unit components shall be factory wired and piped, and complete with electronic proportional expansion valve, flare connections, condensate drain pan, self-diagnostics, and auto-restart function.

.2 Wall Mounted Unit

.1 Wall mounted fan coil unit for installation onto a wall within a conditioned space. A mildew-proof, polystyrene condensate drain pan and resin net mold resistant filter shall be included as standard equipment.

.2 The indoor unit's sound pressure shall range from 31 dB(A) to 41 dB(A) at low speed measured at 1 m (3.3 feet) below and 1 m (3.3 feet) away from the unit.

.3 The unit shall have an auto-swing louver which ensures efficient air distribution, which closes automatically when the unit stops. The remote controller shall be able to set five (5) steps of discharge angle. The front grille shall be easily removed for washing.

.4 The cabinet shall be affixed to a factory supplied wall mounting template and located in the conditioned space.

.5 The cabinet shall be constructed with sound absorbing foamed polystyrene and polyethylene insulation.

.6 The fan type shall be direct-drive cross-flow with statically and dynamically balanced impeller with high and low fan speeds available.

.7 Units shall be provided with a loose field installed condensate pump.

.3 Round Flow Ceiling Cassette Unit

.1 Indoor unit shall be a round flow ceiling cassette fan coil unit with a variable speed direct drive DC type fan for installation into the ceiling cavity, equipped with an air panel grill. It shall be a round flow 360° air distribution type with a fresh white, impact resistant decoration panel.

.2 The supply air is distributed via four individually controlled motorized louvers. The louvers can be manually and individually adjusted for multiple configurations, without requiring blank off plates.

.3 The indoor unit shall be equipped with built-in occupancy sensor and surface temperature sensor to optimize occupant comfort.

.4 The indoor unit's sound pressure shall range from 27 dB(A) to 34 dB(A) at low speed measured at 5 feet below the unit.

.5 Return air shall be through the concentric panel, which includes a resin net, mold resistant, antibacterial filter.

.6 The indoor units shall be equipped with a condensate pan with antibacterial treatment and factory-mounted condensate pump. The pump shall provide up to 33-1/2" of lift from bottom of unit to top of the drain piping with built-in safety shutoff and alarm.

.7 The fan shall have a variable speed direct drive DC motor with a statically and dynamically balanced impeller with 3 user-selectable fan speeds. The automatic fan speed mode shall allow the fan to vary between 5 speeds based on space load.

.8 The fan motor shall be equipped as standard with adjustable external static pressure (ESP) settings to allow operation with the high efficiency air filter options.

.9 Units shall be supplied with an accessory kit allowing for the installation of additional supply air branches from the fan coil. To be provided to select scheduled units.

.10 Units shall be supplied with an optional fresh air intake kit. The kit shall allow the cassette to pull up to 20% fresh air. The kit shall then mix the fresh air with the return air before being treated by the coil. Air intake kits that do not have the ability to pull fresh air directly and to introduce it before the coil to allow mixing and conditioning by the unit shall not be acceptable. To be provided to select scheduled units.

.4 4 Way Vista Flat Ceiling Cassette Unit

.1 The indoor unit shall be a ceiling cassette fan coil unit with a variable speed direct drive DC type fan for installation into the ceiling cavity, equipped with an air panel grill. It shall be a four-way air distribution type with fresh white or Daikin silver, impact resistant washable decoration panel. The supply air is distributed via motorized louvers which can be horizontally and vertically adjusted from 0° to 90°.

.2 The indoor unit's sound pressure shall range from 25.5 dB(A) to 33 dB(A) at low speed measured at 5 feet below the unit.

.3 The 4-way supply air flow shall be capable of field modification to 2-way or 3-way airflow to accommodate various installation configurations including corner installations.

.4 The decoration panel shall be a low-profile design, extending only 5/16" below the ceiling without any overlap with neighboring ceiling tiles, allowing for installation directly adjacent to other ceiling components such as lights, diffusers, and sprinklers, etc.

.5 Return air shall be through the concentric panel, which includes a resin net mold resistant filter. The indoor units shall be equipped with a condensate pan and a factory-mounted condensate pump with up to 21" of lift, and have a built-in safety shutoff and alarm.

.6 Three auto-swing positions shall be available to choose from, which include standard, draft prevention and ceiling stain prevention.

.7 The fan shall have a variable speed direct drive DC motor with a statically and dynamically balanced impeller with 3 user-selectable fan speeds. The automatic fan speed mode shall allow the fan to vary between 5 speeds based on space load.

.8 Units shall be supplied with an accessory kit allowing for the installation of additional supply air branches from the fan coil. To be provided to select scheduled units.

.9 Units shall be supplied with an optional fresh air intake kit. The kit shall allow the cassette to pull up to 20% fresh air. The kit shall then mix the fresh air with the return air before being treated by the coil. Air intake kits that do not have the ability to pull fresh air directly and to introduce it before the coil to allow mixing and conditioning by the unit shall not be acceptable. To be provided to select scheduled units.

.5 Concealed Ceiling Mounted Ducted Unit

.1 Ceiling mounted ducted fan coil unit with variable speed direct drive DC type fan and auto CFM adjustment at commissioning. Casing shall be constructed of galvanized steel. Configuration shall be horizontal discharge air with horizontal return air, with a maximum height of 9-5/8'' and be designed to fit in tight ceiling plenums.

.2 The indoor unit's sound pressure shall range from 28 dB(A) to 36 dB(A) at low speed measured 5 feet below the ducted unit.

.3 The indoor units shall be equipped with a condensate pan and condensate pump. The condensate pump shall provide up to 25” of lift from the center of the drain outlet and have a built-in safety shutoff and alarm.

.4 The fan shall have a variable speed direct drive DC motor with statically and dynamically balanced impeller with 3 user-selectable fan speeds. The automatic fan speed mode shall allow the fan to vary between 5 speeds based on space load. The unit shall have logic for automatically adjusting external static pressure settings of the fan motor (selectable during commissioning).

.5 The unit shall ship from the factory in a rear return configuration and shall be field convertible to a bottom return configuration.

.6 Complete with field installed MERV8 filters and filter kits with 2” or 4” filter depths.

.6 Concealed Ceiling Ducted Unit – Medium Static

.1 Ceiling mounted ducted fan coil unit shall be a built-in ceiling concealed fan coil unit with variable speed direct drive DC type fan and auto static adjustment at commissioning. Casing shall be constructed of galvanized steel. Configuration shall be horizontal discharge air with horizontal return air, with a maximum height of 11-13/16" and be designed to fit in tight ceiling plenums.

.2 The indoor unit’s sound pressure shall range from 29 dB(A) to 43 dB(A) at low speed measured 5 feet below the ducted unit.

.3 The indoor units shall be equipped with a condensate pan and condensate pump. The condensate pump shall provide up to 18-3/8” of lift from the center of the drain outlet and have a built-in safety shutoff and alarm.

.4 The fan shall have a variable speed direct drive DC motor with statically and dynamically balanced impeller with 3 user-selectable fan speeds. The automatic fan speed mode shall allow the fan to vary between 5 speeds based on space load. The unit shall have logic for automatically adjusting external static pressure settings of the fan motor (selectable during commissioning).

.5 Complete with field installed MERV8 filters and filter kits with 2” or 4” filter depths.

.7

2.4 AIR COOLED CONDENSING UNIT

.1 The condensing unit shall be factory assembled in North America and pre-wired with all necessary electronic and refrigerant controls. The refrigeration circuit of the condensing unit shall consist of Daikin inverter scroll compressors, motors, fans, heat exchanger, electronic expansion valves, solenoid valves, 4-way valve, distribution headers, capillaries, filters, shut off valves, oil separators, service ports, liquid receiver (heat recovery only) and suction accumulator.

.2 The system will automatically restart operation after a power failure and will not cause any settings to be lost.

.3 The unit shall incorporate an auto-charging feature to ensure proper refrigerant charge.

.4 The following safety devices shall be included on the condensing unit: high pressure sensor and switch, low pressure sensor, control circuit fuses, crankcase heaters, fusible plug, overload relay, inverter overload protector, thermal protectors for compressor and fan motors, over current protection for the inverter, and anti-recycling timers.

.5 The inverter scroll compressors shall be high efficiency reluctance DC (digitally commutating), hermetically sealed, variable speed type. Temperatures and pressures shall be read every 20

seconds and calculated. With each reading, the compressor capacity (INV frequency) shall be controlled to eliminate deviation from target value. Non inverter-driven compressors shall not be accepted.

.6 Neodymium magnets shall be adopted in the rotor construction to yield a higher torque and efficiency in the compressor instead of the normal ferrite magnet type. Upon complete stop of the compressor, the neodymium magnets will position the rotor into the optimum position for a low torque start.

.7 The compressors' motors shall have a cooling system using discharge gas, to avoid sudden changes in temperature resulting in significant stresses on winding and bearings.

.8 Inverter board shall be refrigerant-cooled to prevent inefficient and unstable operation that can result from air-cooled inverter boards due to varying ambient conditions.

.9 The compressor shall be internally isolated to avoid the transmission of vibration.

.10 In the case of multiple condenser modules, operation hours of the compressors shall be balanced by means of the Duty Cycling Function

.11 The variable speed inverter compressors in Air-Cooled systems shall also use Flash Vapor injection technology with back pressure control for reduced leakage and additional balancing weights on main shaft for increased for increased compressor lifetime.

.12 The fan motor shall have inherent protection and permanently lubricated bearings. The motor shall be provided with a fan guard to prevent contact with moving parts. The condensing unit shall consist of one or more propeller type, direct-drive 350 W or 750 W fan motors that have multiple speed operation via a DC (digitally commutating) inverter. Motors shall be capable of delivering design air at high external static pressures up to 0.32 in WG (factory set as standard at 0.12 in. WG) to accommodate field applied condensing unit discharge ductwork.

.13 Night setback control for low noise operation shall automatically limit the maximum speed of the fan motor.

.14 The heat exchanger on the condensing units shall be manufactured from Hi-X seamless copper tubes with N-shape internal grooves mechanically bonded on to aluminum fins to an e-Pass Design. The heat exchanger coil shall be of a waffle louver fin and rifled bore tube design to ensure high efficiency performance.

.15 The fins are to be covered with an anti-corrosion hydrophilic blue coating as standard with a salt spray test rating of 1000 hr (ASTM B117 and Blister Rating:10), Acetic acid salt spray test of 500 hr (ASTM G85 and Blister Rating:10).

.16 The outdoor unit shall be capable of heating operation down to -13°F ambient temperature. Tested factory data on heating capacity and efficiency shall be available. Continuous heating shall be provided during defrost mode for multi-module systems.

.17 The outdoor unit shall be capable of cooling operation down to +23°F without any additional low ambient controls.

.18 The outdoor coil shall have a three-circuit heat exchanger design. The lower part of the coil shall be used for inverter cooling, enhancing defrost during heating operation.

.19 The system shall have a factory standard technical cooling option to allow simultaneous heating and cooling down to -4°F. Manufacturers that cannot guarantee simultaneous heating and cooling down to -4°F, even when the system is cooling-dominant, shall provide separate systems for zones requiring year-round cooling.

2.5 BRANCH SELECTOR BOX

.1 Selector box cabinets shall have a galvanized steel plate casing and shall house multiple electronic expansion valves and a sub-cooling loop. The unit shall contain sound absorption thermal insulating material made of flame and heat resistant foamed polyethylene.

.2 Branch selector boxes shall not require drain pan and drain connections. Manufacturers with branch selector boxes requiring secondary drain pans and drain connections shall coordinate with the installing contractor at no extra cost to the owner.

.3 Manufacturers with branch selector box sizes, arrangements, or locations that differ from what is specified shall make the necessary arrangements to ensure their alternative branch selector boxes both fit in the space and that CSA B52 compliance is still met (CSA compliance shall include the life-safety maximum refrigerant charge allowance).

.4 Manufacturers shall provide sound data for all branch selector boxes. If sound data is unavailable or exceeds the values below, or if branch boxes make use of solenoid valves instead of electronic expansion valves, necessary precautions shall be taken. Precautions shall include the supply and install of sound blankets, or the relocation of branch boxes away from the occupied spaces, or extra insulation to the ceilings and walls around the branch selector boxes, all at no extra cost to the owner.

Daikin	BS12Q54TVJ	230 V 1ph	1.2	40	48	32.3x11.7x18.9	106

2.6 LOCAL CONTROLS

.1 Expansion valve controller shall be provided with all required thermistors for proper electronic control of expansion valve. Thermistors shall be field mounted in the appropriate airstream and both liquid and suction refrigerant lines.

.2 Connection of air handling unit DX coils to non-VRV condensing units (which do not include inverter compressors) shall not be acceptable

.3 All VRV condensing units on the project, for the VRV indoor units and for the air handling units, shall be from the same manufacturer.

.4 Fan coil units shall be supplied with individual zone controllers.

.5 Zone controllers shall be hard wired by installing contractor.

.6 Controllers shall be able to function as follows:

.1 The controller shall have single and dual setpoints for occupied periods, and independent setback setpoints for unoccupied periods.

.2 The controller shall have the ability to digitally prohibit individual buttons and functions, including custom mode selection.

.3 The controller shall have a self diagnosis function that constantly monitors the system for malfunctions.

.4 The controller shall be equipped with a thermostat sensor.

.5 Controller shall have built-in 7 day, weekday plus Saturday Sunday (5+1+1), weekday plus weekend (5+2) and everyday (1) scheduler.

2.7 CENTRAL CONTROLS

.1 Provide an advanced multi-zone controller for installation in a common area as shown on the plans. The controller shall have a display with the following screen views and functionalities:

.1 Central control of set points, schedules, fan speeds, heat/cool mode, and of setback (override) temperature settings during unoccupied periods.

.2 Adjustable temperature limits to restrict local wall mounted thermostat setpoint ranges.

.3 Visible and audible alarm indication of any system malfunctions with error code.

.4 Tiered hierarchy allowing for control of fan coil units independently or as a group.

.5 Remotely disable individual functions of the wall mounted zone controllers.

.6 Web enabled for remote access from PC, tablet or portable device and automatic alert and error emails.

.2 The following two automatic changeover methods shall be available. One shall be selected upon commissioning.

.1 Averaging Method – the central controller shall sum up the difference between room temperatures and set points for all indoor units in the system. Once this delta reaches the primary changeover dead band of ± 2°F (adjustable), the central controller shall change over the system automatically.

.2 Voting Method – The central controller shall evaluate the difference between individual room temperatures and set points, and only include a fan coil in the algorithm if the difference has passed the primary dead band for more than the guard timer, or past the secondary dead band. Heating priority option shall be available.

.3 For both automatic changeover options, a weight (0-3) can be added to each indoor unit. The automatic changeover algorithm shall use this weighting to prioritize changeover for the more heavily weighted fan coils.

.4 Upon any changeover, a guard timer shall prevent another changeover for a period of 15, 30, or 60 (default) minutes.

.5 The guard timer shall be ignored by a change of setpoint manually from either the central controller or the remote controller, by schedule, or if the secondary dead band is reached with either of the automatic changeover algorithms. The secondary changeover dead band shall be the sum of the primary changeover dead band (adjustable) ± 1°F (adjustable)

.6 The central controller shall have the capability for site floor plans to be uploaded as a background to create a graphics interface. Background shall be project specific floor plans rendered in “2D” or “3D”.

.7 Floor plan layout shall be displayed both on the local central controller, as well as accessible from the web.

.8 Floor plan will include capability to control indoor unit, and auxiliary inputs / outputs, such as designated lighting control, as follows:

.9 Up to 4 status points to be assigned to the control point icon (room name, room temperature, set point, and mode).

.10 Status and control points to display on corresponding location of zone served on floor plan.

.11 Digital input and output icons will display On/Off status.

.12 Analog input icons will display analog value.

.13 Up to 60 floor layout sections shall be possible depending on project scope.

.14 The BACnet Server Gateway Option shall be capable of making the controller work as a BACnet gateway using the BACnet/IP protocol. The BACnet Server Gateway Option shall be capable of exposing indoor unit management points as BACnet objects to the BMS.

.15 The BACnet Server Gateway Option shall allow the following functions:

.1 Support Change of Value (COV) notifications.

.2 Provide unique virtual BACnet device identification number (ID) for every indoor unit group address.

.3 The BACnet Server Gateway Option shall be capable of being configured as a foreign device. It shall be capable of communicating across BACnet Broadcast Management Devices (BBMD) in different subnet networks.

.16 In addition to the standard BACnet VRF points, the Building Management System shall monitor and/or control the following BACnet objects for indoor units:

.1 Occupancy Mode: Unoccupied, Occupied, Standby

.2 Cooling and heating setpoints during occupied and unoccupied modes.

.17 The Building Management System may choose to monitor and control the following BACnet objects linked to controller control logic:

.1 Enable/Disable Schedule operation.

.2 Enable/Disable Auto Changeover Operation.

.3 Set Timed Override Minutes - Monitor and configure timer extension for the indoor unit on controller (30, 60, 90, 120, 150, 180 minutes)

.4 System forced off - Enable/Disable all emergency stop programs that are registered on the controller.

.18 The BMS shall have the ability to utilize scheduling functions on the controller.

.19 The BMS shall have the ability to utilize automatic changeover function on the controller, removing the need to program automatic changeover sequences on the BMS.

.20 VRF manufacturer shall commission the BACnet server. BMS contractor shall provide VRF manufacturer with static IP address and instance number for commissioning. IP connection shall be by BMS contractor.

.21 All programming for monitoring and control of VRF system via the BACnet server shall be by BMS contractor, as per the Sequence of Operation.

.22 Centralized controller shall be complete with power distribution software with the ability to generate .csv files with power consumption data for each fan coil in the system. The software shall have the

ability to assess how the power consumption of the condensing units shall be distributed to each fan coil. The energy consumption files shall be accessible from the web via a restricted security access.

2.8 ELECTRICAL

.1 Provide Independent electrical power for fan coils and branch selector boxes.

.2 Provide individual disconnect switches for each fan coil and condensing unit.

.3 Control wiring shall be installed in a daisy chain configuration between all VRF components as per Manufacturer.

.4 The control voltage between the indoor and outdoor unit shall be 16VDC. The control wiring shall be communication type stranded non-shielded 18-2 AWG.

.5 Control wiring shall be installed in a daisy chain configuration between all VRF components as per manufacturer.

.6 If power is lost or disconnected to any of the fan coils, the condenser shall have the capability to remain in operation at all times.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide VRF equipment consisting of exterior condensing units and indoor evaporator units as scheduled and/or indicated on the drawings.

.2 Units shall be stored and handled according to the manufacturer’s recommendations. Units shall be kept clean and isolated from dust and debris.

.3 Contractor shall inspect all equipment upon delivery and notify shipping company and manufacturer immediately of any damage.

.4 Install condensing units on a flat surface level within 1/8 inch and elevate a minimum of 18” from ground or roof surface, on vibration isolation pads. Provide intermediate supports as recommended by the equipment manufacturer.

.5 Indoor evaporator units to be installed as located on the drawings. Confirm exact location prior to roughing-in.

.6 Install loose control components and perform required control wiring (except building automation system connections) between condensing unit and evaporator in conduit in accordance with manufacturer’s control wiring schematic and wiring standards of electrical work.

.7 Connect condensing unit and indoor evaporator units with refrigerant piping in accordance with piping shop drawing schematic. Refer to Section 23 23 00. Provide any required additional refrigerant.

.8 High/low pressure gas line, liquid, and suction lines must be individually insulated between the outdoor and indoor units.

.9 Use refrigeration best practice to allow pipes to expand and contract freely. Review manufacturer installation instructions to ensure expansion joints are properly designed.

3.2 STARTUP AND ADJUSTING

.1 Pressure test all systems to 550 psi after system has been vacuumed and held to below 500 microns for at least one hour. Review manufacturer installation instructions for proper pressure test procedures.

.2 Design and install all piping as per TSSA and CSA B52 regulations and apply and obtain TSSA certification for all systems.

.3 Contractor to carry the cost of a minimum of two (2) manufacturer field inspection to review installation and startup. Notify consultant minimum of five days prior to inspection.

.4 Refer to Section 20 05 00 – Common Work Results for Mechanical; for equipment/system manufacturer certification and start-up requirements.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for air-to-water heat pumps, including accessories, and all required power and control wiring schematics.

.2 Heat pump dimensional drawings with elevation overview. Provide required service clearances and location of all field installed piping and electrical connections.

.3 Complete unit specifications.

.4 A summary of all auxiliary utility requirements for normal system operation. Auxiliary utility requirements include: electrical, water, and air. Include with summary of auxiliary equipment quantity and quality of each specific auxiliary utility required.

.5 Shipping and operating weight.

.6 Heat pump control documentation: include heat pump control hardware layout, and wiring diagrams depicting factory installed wiring, field installed wiring with points of connection, and points of connection for BAS control/interface points.

.7 Manufacturer certified performance data at full load and project-specific operating conditions.

.8 Minimum system volume requirements for each hydronic system.

.9 Unit Short Circuit Current Rating (SCCR).

.10 Piping layouts deviating from the schematics and/or floorplans must be submitted to consultant for review and approval.

1.2 CLOSEOUT SUBMITTALS

.1 Submit with delivery of each unit a copy of the factory inspection report, and include a copy of each report with O&M Manual project close-out data.

.2 Submit a site inspection and start-up report from manufacturer's representative as specified in Part 3 of this section.

.3 Training attendance records.

1.3 QUALITY ASSURANCE

.1 Heat pump equipment, as required, is to be stamped with a Canadian Registration Number (CRN).

.2 Heat pumps and accessories are to be in accordance with following:

.1 AHRI 550/590 - Performance Rating of Water-Chilling and Heat Pump Water-Heating Packages Using the Vapor Compression Cycle, latest edition.

.2 ANSI/ASHRAE Standard 15 - Safety Standard for Refrigeration Systems, latest edition.

.3 CAN/CSA B52, Mechanical Refrigeration Code;

.4 CAN/CSA C22.2 No. 236, Heating and Cooling Equipment;

.5 ASME Boiler and Pressure Vessel Code Section VIII, latest edition.

.6 UL 1995, Heating and Cooling Equipment;

.7 ANSI/AHRI Standard 210/240, Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment;

.8 governing Provincial and/or Municipal Codes and Regulations.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 AIM (ADVANCE INDUSTRIAL MECHANICAL)

.2 IBC;

2.2 AIR-TO-WATER HEAT PUMP

.1 Modular air-to-water heat pump in accordance with drawing schedule, charged with R-507 refrigerant, factory run tested, and certified and labelled electrically in accordance with ETL or CSA.

.2 Unit to consist of independent refrigerant circuits, each circuit equipped with a compressor, evaporator/heat exchanger, condenser with dual fans, and piping & controls,

.3 Heavy-gauge steel frame and enclosure. Exposed steel surfaces finished with a fused powder coat epoxy enamel finish. 11 gauge galvanized steel constructed frame and 18 gauge 304 galvanized steel sheet metal construction.

.4 Each module to be capable of heating if one or more refrigerant circuits fail.

.5 Provide easily removable, separate access panels to the control centre and the compressor compartment and removable top panel and condenser fan deck assemblies.

.6 Grooved end Schedule 40 steel supply and return piping connections suitable for Victaulic couplings and equipped with an integral mesh in-line strainer for inlet water connection.

.7 Brazed Plate Evaporator and Condenser- Mesh no larger than 0.9mm.

.8 Shell & Tube Condenser and Evaporator and Water Coils - 0.5mm to 1.5 mm mesh.

.9 Brazed plate type refrigerant to hydronic liquid heat exchanger constructed of type 316 stainless steel, designed, tested, and stamped in accordance with ASME Code for a 2480 kPa (360 psi) water-side working pressure.

.10 Vibration isolated, hermetic, reciprocating oil lubricated variable capacity compressor(s), each equipped with an overload protected motor and high discharge pressure and low suction pressure safety cut-outs. Compressor(s) to include shut-off valves suction and discharge, electronic oil monitoring, oil sight glass and thermally protected crankcase heater.

.11 Each compressor shall have three unloader steps and they shall be able to operate fully unloaded (0% capacity).

.12 Air-cooled evaporator shall be equipped with a “V” style coil with 2 independent refrigeration circuits. Fins shall be made of aluminum with a “sine wave” pattern. The coil casing shall be made of G90 galvanized steel. Evaporator fans shall be high efficiency direct drive EC controlled motors. Fans shall be variable speed for suction pressure control.

.13 The evaporator shall be defrosted through hot gas defrost sequence. The evaporator will have a 304 stainless steel drain pan below the coil. The drain pan shall be heat traced and the electrical connection shall be made within the unit control panel.

.14 Provide minimum one composite material multi-blade axial type fan. Fans to be driven by high efficiency ECM.

.15 Provide direct drive fan motors capable of variable speed operation based on refrigerant pressure control.

.16 Provide fan outlet guard.

.17 Provide each circuit with an electronic expansion valve, compressor suction and discharge service valves, manual liquid line shutoff valve with charging connection, replaceable core filter drier, liquid line sight glass with moisture indicator, liquid solenoid valve, purge valves, and relief valves.

.18 Provide each circuit with two pressure transducers, one for the evaporator and one for the condenser. Output signal directly to the microprocessor control system.

.19 Provide all refrigerant specialties including a properly sized refrigerant receiver to provide reliable operation down to the design ambient temperature indicated on the Air Source Heat Pump Schedule for each refrigerant circuit.

.20 Ship units with an operating charge R507A. Refrigerant R410A will not be accepted.

.21 Provide heat pump system with a single point power connection. Include pre-engineered wiring for field installation and connection to a factory mounted heat pump panel. Include panel with individual circuit protection and individual isolation for each module set and provide a single point of connection from the panel to building power. Setup to allow module(s) to be taken out of service while the remainder continue to operate. Provide centrally located field power connection, control interlock terminals and unit control system in a weatherproof enclosure.

.22 Provide the following power and starting components:

1. Circuit breaker for each compressor and each fan
2. Fusing for the control circuit
3. Compressor and fan starting contactors
4. Solid state compressor sequence start timer
5. Compressor overload protection in all three phases
6. Unit power terminal block for field connection to a single power supply and control power transformer.

.23 Factory secured seismic restraint connection hardware.

2.3 MASTER CONTROLLER

.1 Microprocessor-based master controller, factory installed and connected, designed to schedule various compressors in response to leaving hydronic liquid temperatures to suit system demand and such that a new lead compressor is selected every 24 hours. System response times and set-points are to be adjustable. A password shall be required to make system changes

.2 All programmable functions shall be entered on flash memory to ensure program retention should power fail.

.3 The screen shall display the following information:

.1 Date and time;

.2 Leaving hot water temperature set point;

.3 Ambient temperature;

.4 Unit stats (on, off, alarmed);

.5 System demand;

.6 Compressors suction pressure;

.7 Compressors discharge pressure;

.8 Compressors unloaders status (on,off);

.9 Compressor suction pressure setpoint;

.10 Water regulating valve opening position;

.4 The controller shall have the following functions:

.1 Compressor short-cycle control

.2 Compressor head and suction pressure control

.3 Automatic compressor sequencing

.4 Compressors load/unload control

.5 Compressor zero load timing

.6 High/Low pressure avoidance

.7 Evaporator defrost sequence

.8 Condenser Entering and Leaving Temp Sensor Failure

.9 Alarms for High or Low Pressure Sensors Failures

.10 Low Oil Flow Alarm

.11 Overload/SC Alarm

.12 Condenser Flow / Low flow Alarm

.13 Evaporator fan speed

.14 Voltage Phase Monitor

.5 Controller is to be complete with all required hardware and accessories for connection into building automation system in accordance with drawing requirements.

2.4 ADDITIONAL CONTROLS AND ACCESSORIES

.1 Heat pump assembly is to be complete with following additional controls and accessories:

.1 all required refrigerant circuit specialties including a properly sized refrigerant receiver and flooded head pressure control valves for operation in an ambient temperature as low as -28.8°C (-20°F);

.2 Display all temperatures with 0.1 deg. F. resolution Display all pressures with 0.1 psi resolution

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide air-to-water heat pumps.

.2 Install heat pump system in accordance with manufacturer’s written installation instructions. Ensure adequate clearances for servicing and maintenance. Provide ancillary components as required per manufacturer’s written literature.

.3 Install units on a flat surface, level within 0.125 mm (1/8 in.), and of sufficient strength to support concentrated loading.

.4 Provide a fine mesh strainer installed in the hydronic circuit upstream of the load water heat exchangers.

.5 Provide isolation valves, balancing valves, and flexible connections in water piping connections to each heat exchanger.

.6 Secure each heat pump assembly in place, level and plumb, on full length steel rails supplied with heat pump assembly and in accordance with manufacturer’s instructions.

.7 Provide all water piping so unit and water circuits are serviceable, without having to dismantle excessive lengths of pipe.

.8 Provide differential pressure gauge across all supply and return connections.

.9 Provide wells and taps for thermometers, sensors, and pressure gauges in water piping adjacent to inlet and outlet connections of each heat exchanger. Provide temperature and pressure gauges.

.10 Provide certified wiring schematics to the Electrical Division for the heat pump, associated equipment and controls. Provide all necessary control wiring as recommended by the manufacturer.

.11 Brace and secure each assembly in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

.12 Connect each heat pump assembly with valved piping with flexible connectors. Install components shipped loose with the assembly.

3.2 DELIVERY AND HANDLING

.1 Deliver heat pumps to the Place of the Work completely assembled and charged with refrigerant.

.2 Comply with the manufacturer's instructions for transporting, rigging, and assembly of heat pumps.

3.3 SYSTEM STARTUP

.1 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.3 Commence the warranty period at the date of initial startup, continuing for a period of two (2) years, not to exceed thirty (30) months from shipment. Provide manufacturer's warranty including all parts. Do not include refrigerant in the warranty.

.4 Provide the services of a factory authorized service engineer to provide complete start-up supervision.

3.4 CLOSEOUT ACTIVITIES

.1 Include for a 1/2 day on-site heat pump operation demonstration and training session. Training is to be a full review of all components including but not limited to a full heat pump internal inspection, construction details, operation, maintenance, abnormal events, and setting up controls.

.3 CSA C22.2 No. 236-15, Heating and cooling equipment.

1.2 SUBMITTALS

.1 Submit shop drawings/product data sheets for heating coils, including accessories.

PART 2 - PRODUCTS

2.1 DUCT MOUNTED ELECTRIC REHEAT COILS

.1 Electric reheat coils in accordance with drawing schedule, each certified in accordance with CSA C22.2 No. 155, Electric Duct Heaters and CSA C22.2 No. 236, and each complete with frame members, terminal boxes and covers and associated sheet metal work constructed of heavy-gauge die-formed steel with an integral corrosion-resistant coating and fabricated into coil shape by spot welding, a corrosion protected sheathed heating element, an automatic reset and an auxiliary manual reset snap-action high temperature limit control to protect coils from overheating from any cause, and a pre-wired control panel for electrical power and control connections.

.2 Each control panel is to be complete with:

.1 disconnect switch;

.2 magnetic contactor(s);

.3 terminal blocks for power and control wiring connections;

.4 pre-wired differential pressure switch to shut-down coil upon sensing a "no-airflow" condition;

.5 fused control transformer;

.6 electronic step controller to suit the number of heating stages;

.7 fused SCR (silicon control rectifier).

.3 Manufacturers:

.1 INDEECO;

.2 Thermolec Manufacturing Ltd.;

.3 Chromalox Inc.;

.4 Condex Wattco Inc.

PART 3 - EXECUTION

3.1 INSTALLATION OF DUCT MOUNTED ELECTRIC REHEAT COILS

.1 Provide electric reheat coils in supply ductwork.

.2 Secure each coil in place from structure by means of hanger rods, independent of connecting ductwork and located for easy removal and access to power and control panel.

.3 Coordinate installation with electrical trade who will connect coil with power wiring.

END OF SECTION

PART 1 - GENERAL

1.1 RELATED REQUIREMENTS

.1 Section 23 21 00 – Hydronic Piping and Pumps.

1.2 SUBMITTALS

.1 Submit shop drawings and/or product data sheets for following:

.1 cross-linked polyethylene (PEX) floor heating grid tubing, fittings and accessories, manifold assembly, control components and controls;

.2 copies of system manufacturer's loop layout design printouts indicating water flows and temperatures, floor profiles with floor covering(s), and heating outputs;

.3 certified tubing and piping layout and schematic for each system zone;

.4 certified power wiring schematic and a certified control wiring schematic with sequence of operation for each system zone;

.5 letter from system component manufacturer stating system components proposed meet all requirements of the Specification.

1.3 CLOSEOUT SUBMITTALS

.1 Submit, prior to Substantial Performance of the Work, start-up or test data specified in Part 3 of this section.

.2 Submit letters of installation certification from system manufacturer's representative as specified in Part 3 of this section.

.3 Training attendance records.

1.4 QUALITY ASSURANCE

.1 Radiant floor heating system is to be installed by journeyman tradesmen with a minimum of 3 years successful installation of PEX radiant floor system components supplied by manufacturer of components.

.2 Prior to installation of system components, meet on-site with system component manufacturer's representative and trades whose work is related to successful installation of system(s) to confirm floor areas involved are ready for tubing installation.

1.5 WARRANTY

.1 Submit, at Substantial Performance of the Work, a non-prorated transferable repair or replacement warranty in name of Owner, issued by and signed by system component manufacturer covering materials against failure due to defects in material and/or workmanship as follows:

.1 PEX tubing, 25 years;

.2 manifold assemblies, 5 years;

.3 controls and electrical components, 2 years.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Uponor Inc.;

.2 Watts Radiant Inc.;

.3 Rehau Inc.

2.2 SYSTEM MATERIALS

.1 Uponor Inc. radiant floor heating system components as follows:

.1 cross-linked polyethylene (PEX) tubing to CAN/CSA B137.5, ASTM F876 and F877, and SDR-9 requirements with an oxygen barrier in accordance with German Standard DIN 4726, flame spread, and smoke developed ratings in accordance with CAN/ULC S102 and ASTM E84, supplied in coils, and with characteristics and accessories as follows:

.1 Plastic Pipe Institute certified temperature and pressure ratings of 550 kPa at 93°C (80 psi at 200°F), 690 kPa at 82°C (100 psi at 180°F), and 1100 kPa at 23°C (160 psi at 74°F);

.2 where required, "ProPEX" cold expansion type fittings in accordance with ASTM F877, CAN/CSA B137.5, and ASTM F1960, each consisting of a barbed adapter with an o-ring and an applicable sized PEX ring;

.3 minimum bend radius of 6 times the tubing OD, with factory supplied bend supports required for tubing with a bend radius less than 6 times the tubing OD;

.4 all required installation and connection accessories to suit floor construction, all in accordance with tubing manufacturer’s instructions and factory supplied with tubing.

.2 Package type copper or brass supply and return manifold assembly to suit number of heating zones, factory assembled and equipped with wall mounting brackets and following:

.1 main supply and return full flow ball type isolating valves, zone pipe connection couplings, and fill/drain valves for both supply and return manifolds;

.2 supply manifold automatic air vent, and zone on/off valves with 24 volt AC actuators to suit control system;

.3 return manifold pressure balancing by-pass valve, and zone balancing valves and flow rate indicators;

.4 combination pressure gauge and thermometer for each manifold, and individual zone return piping thermometers for accurate visual zone balancing by zone temperature drops;

.5 all other required fittings and connection accessories.

.3 Controls in accordance with drawing control diagram and sequence.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide hydronic radiant floor heating zones and piping manifold assemblies. System installation is to be in strict accordance with manufacturer’s instructions.

.2 Piping is to be as follows:

.1 for pipe inside building and aboveground, Schedule 40 black steel, screwed, ASTM A53, Grade B, ERW, or Type "K" hard temper copper with forged copper solder type fittings and 95% tin / 5% Antimony solder joints, all in accordance with Section 23 21 00 – Hydronic Piping and Pumps.

.2 for floor grid piping, PEX pipe installed in continuous lengths with all required support and installation accessories.

.3 Provide a strainer in piping to manifold supply header and clean strainer screen when system balancing is to commence.

.4 Ensure grid tubing has been successfully pressure tested prior to concealment. Be present when covering is being placed over grid tubing to ensure integrity of tubing is not compromised during placement of remainder of floor construction.

.5 Where tubing and/or piping penetrates fire rated construction, carefully coordinate with firestopping work specified in Division 07.

.6 Where tubing and/or piping penetrates fire rated construction, provide firestopping in accordance with requirements specified in Section 20 05 17 – Sleeves and Sleeve Seals for Mechanical Piping.

.7 Prior to system flow balancing, ensure all air is purged from system and system operates successfully at design temperatures and pressure for a minimum of 2 days. Supply system manufacturer’s software for final balancing flow adjustment settings.

3.2 SYSTEM STARTUP

.1 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical. Ensure system manufacturer inspects grid tubing installation prior to concealment and certifies each zone correct in writing. Submit a copy of each certification letter prior to Substantial Performance of the Work.

3.3 TRAINING

.1 Include for 4 hours of on-site training for 2 groups of 6 people. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

Updated through ADD#10

PART 1 - GENERAL

1.1 RELATED REQUIREMENTS

.1 Section 23 21 00 – Hydronic Piping and Pumps.

1.2 DESCRIPTION OF WORK

.1 Supply and install a complete hydronic snow melting system consisting of (but not limited to) the following main components:

.1 A gas-fired heating plant including boilers, pumps, expansion tanks, glycol fill equipment and accessories serving snow melting system and floor radiant heating system;

.2 Snow melting embedded tubing;

.3 Piping distribution for the heating agent, including manifolds, valves, gauges and accessories;

.4 Valve and manifold concrete chambers;

.5 A digital control system to be tied into the Owner's building automation;

.6 Ancillary drainage, water make-up and accessories; and

.7 All power supply and control wiring required to make the system fully operational.

.2 Complete design of the snow melting system, including calculation, layouts and schematic drawings to show control sequence, equipment layout , tubing patterns, manifold locations, appropriate cross-sections and special installation techniques to suit final architectural requirements and layout as required by code, standards and Authorities Having Jurisdiction.

.3 Misinterpretation of any requirement of the drawings and specifications will not relieve the contractor of responsibility. If in any doubt, the contractor shall contact the Consultant for written clarification prior to submitting a bid for the Work.

.4 Wherever differences occur between specifications, plans, schematics and drawings, the maximum conditions shall govern and the bid shall be based on whichever indicates the greater cost

.5 In addition to the Work specifically mentioned in the Specifications and shown on the drawings, provide all other items that are obviously necessary to make a complete working installation, including those required by the Authorities Having Jurisdiction over the Work.

1.3 SUBMITTALS

.1 Submit shop drawings and/or product data sheets for following:

.1 cross-linked polyethylene (PEX) floor heating grid tubing, fittings and accessories, manifold assembly, control components and controls;

.2 copies of system manufacturer's loop layout design printouts indicating water flows and temperatures, floor profiles with floor covering(s), and heating outputs;

.3 certified tubing and piping layout and schematic for each system zone;

.4 certified power wiring schematic and a certified control wiring schematic with sequence of operation for each system zone;

.5 letter from system component manufacturer stating system components proposed meet all requirements of the Specification.

.2 Submit to the Consultant shop drawings, calculation and report for the snow melting system. Further details and special requirements called for in these specifications shall be shown on the shop drawings.

.3 Submit Product data of all mechanical equipment including but not limit to:

.1 Boilers;

.2 Burners;

.3 Boiler Controls;

.4 Glycol automatic fill station;

.5 Expansion tank; and

.6 Pumps.

.4 Provide mechanical layout and schematic drawing indicating heat source, mechanical piping and accessories from heat source to manifolds, circulators, water tempering and zone controls. Indicate primary loop and second loop's supply and return water temperatures and flow rates to manifolds.

.5 Provide installation drawings indicating tubing layout, manifold locations, zoning requirements and manifold schedules with details required for installation of the snow melting system.

.6 Indicate piping, valves and fittings shipped loose by packaged equipment supplier, showing their final location in field assembly. Submit selection and verification samples of piping.

.7 Provide control schematic drawing and detailed sequence of operation for snow melting system.

.8 Provide samples of mechanical equipment as requested in the Specification at the same time as the shop drawing submission.

.9 Ensure that copies of all reviewed shop drawings are available on the job site for reference.

1.4 CLOSEOUT SUBMITTALS

.1 Submit, prior to Substantial Performance of the Work, start-up or test data specified in Part 3 of this section.

.2 Submit letters of installation certification from system manufacturer's representative as specified in Part 3 of this section.

.3 Training attendance records.

1.5 AS-BUILT DRAWINGS

.1 Maintain up to date "as built" drawings on site and submit to the Consultant at completion of the Project as specified in this Section

.2 Any subsequent changes found by the Consultant shall remain the responsibility of the Contractor at no charge to the Owner.

1.6 QUALITY ASSURANCE

.1 Radiant heating system is to be installed by journeyman tradesmen with a minimum of 3 years successful installation of PEX radiant floor system components supplied by manufacturer of components.

.2 Prior to installation of system components, meet on-site with system component manufacturer's representative and trades whose work is related to successful installation of system(s) to confirm floor areas involved are ready for tubing installation.

.3 Unless a written order reviewed by the Consultant and countersigned or otherwise approved by the Owner, no additional work shall be undertaken by the Contractor.

1.7 WARRANTY

.1 Submit, at Substantial Performance of the Work, a non-prorated transferable repair or replacement warranty in name of Owner, issued by and signed by system component manufacturer covering materials against failure due to defects in material and/or workmanship as follows:

.1 PEX tubing, 25 years;

.2 manifold assemblies, 5 years;

.3 controls and electrical components, 2 years.

.2 All tubes, supply lines, and return lines shall carry a twenty-five (25) year non-prorated warranty against failure due to defect in material and/or workmanship.

.3 The complete system shall be covered by a two (2) year warranty against failure due to defect in materials and/or workmanship.

.4 The complete system shall be covered by a ten (10) year limited system performance warranty. This warranty requires that the system detailed design, supervision, commissioning, and witnessing all pressure tests shall be performed by Authorized personnel employed by system supplier.

.5 All warranty periods are measured from date of Substantial Performance of the Work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Uponor Inc.;

.2 Wirsbo;

.3 Stadler

2.2 CROSSLINKED POLYETHYLENE TUBING

.1 Cross-linked polyethylene (PEX) manufactured by the "Engle method". Manufactured in accordance with ASTM F876 and ASTM F877 and tested for compliance by an independent third-party agency. Show compliance with ASTM E119 and ANSI/UL 263 through certification listings through UL.

.2 Standard grade hydrostatic design and pressure ratings as issued by the Plastics Pipe Institute (PPI), a division of the Society of the Plastics Industry (SPI).

.3 Minimum bend radius (cold bending) shall be no less than six times the outside diameter. Manufacturer's bend supports must be used if radius is less than stated.

.4 Oxygen Diffusion Barrier:

.1 Not exceed an oxygen diffusion rate of 0.10 grams per cubic meter per day at 40°C (104°F) water temperature in accordance with German DIN 4726;

.2 Provide tubing with nominal inside diameter in accordance with ASTM F876, as indicated.

.1 12.7 mm (½").

.2 19 mm (¾").

.3 25 mm (1").

2.3 HEATING AGENT DISTRIBUTION PIPING

.1 All piping between the exterior wall of the boiler room and the interior wall of the distribution manifolds chamber(s) to be pre-insulated pipe system for buried commercial hydronic heating applications.

.2 Pipes to be Cross linked polyethylene (PEX-a) Engel-method tubing with an EVOH oxygen barrier that conforms to German DIN 4726; smoothness value of 0.02 mil; NSF certified SDR-9.

.3 Pipes insulated with Multilayered, closed-cell, PEX-foam insulation with a thermal conductivity of 0.26 BTU in./sq. ft./hour/°F; vapor permeability of 0.1g/100 sq. in./day

.4 Cover jacket for insulated piping to be Corrugated seamless high-density polyethylene (HDPE), UV- protected.

.5 Operating Limits:

.1 -50°C to 95°C (58°F to 203°F) at 87 psig.

2.4 MAIN HOT WATER PIPING AND FITTING

.1 Exposed hot water heating piping inside the boiler room shall be standard black carbon steel schedule 40 to ASTM A-53. Up to 50 mm (2") threaded with 1,050 kPa (150 psi) malleable iron fittings, 65 mm (2 ½") and up shall be welded, Victaulic grooved or flanged 150 psi welded.

.2 All fittings, elbows, steel copper brass transitions, shrink caps, and miscellaneous items to be compression type and supplied by the pipe manufacturer.

2.5 MANIFOLDS (COMMERCIAL, VALVED COPPER)

.1 Use 2" valved copper manifolds manufactured from Type L copper material, offered by the respective PEX tubing manufacturer. Valving shall include ball isolation valves.

.2 Ensure manifold end cap offers tapping for ⅛" FNPT and ½" FNPT for vent and drain.

.3 Install supply and return piping to the manifold in a reverse-return configuration to ensure self-balancing.

.4 Use manifolds with an isolation valve on each outlet.

.5 Use manifolds that support PEX tubing.

.6 If the supply and return piping is in direct-return configuration, install and balance flow setters on the return leg of each manifold to the mains.

2.6 HEPEX SNOW MELTING TUBING

.1 Section Includes: Hydronic snow and ice melting systems for various slab constructions and control strategies, using cross-linked polyethylene (PEX) tubing and applicable fittings.

.2 Material: Cross-linked polyethylene (PEX) manufactured by the "Engle method".

.3 Material Standard: Manufactured in accordance with ASTM F876 and ASTM F877 and tested for compliance by an independent third-party agency

.4 Pressure Ratings: Standard grade hydrostatic design and pressure ratings as issued by the Plastics Pipe Institute (PPI), a division of the Society of the Plastics Industry (SPI).

.5 Show compliance with ASTM E119 and ANSI/UL 263 through certification listings through UL.

.6 Minimum Bend Radius (Cold Bending): No less than six times the outside diameter. Use the PEX tubing manufacturer's bend supports if radius is less than stated.

.7 Standard of Acceptance: Upnor, Wirsbo, Stadler or approved equivalent

.8 Oxygen Diffusion Barrier:

.1 The oxygen diffusion barrier does not exceed an oxygen diffusion rate of 0.10 grams per cubic meter per day at 40°C (104°F) water temperature in accordance with German DIN 4726; and

.2 Nominal Inside Diameter: Provide tubing with nominal inside diameter in accordance with ASTM F876, as indicated.

.1 12.7 mm (½").

.2 19 mm (¾").

.3 25 mm (1").

.9

.10 Insulation:

.1 Use a 100 mm (4") rigid layer of Styrofoam insulation under the tubing (per structural drawings)

.11 Installer's Experience:

.1 The installing Contractor shall have a minimum of ten (10) years of demonstrated experience on projects of similar size and complexity in Ontario.

.12 Glycol/Water Solution:

.1 The heating fluid shall be premixed glycol/water solutions. PEX tubing manufacturer allows site-mixed solutions if mixed to the proper concentration before entering the system.

.2 Mix the glycol/water solution to proper concentration levels to protect the system freezing during operation shutdown.

.3 System circulators must operate continuously for a minimum of thirty (30) days after the system is filled to ensure the glycol and water does not separate in a static system.

.4 Do not use ethylene glycol due to toxicity issues. Instead, use of propylene glycol. Also, refer to the boiler manufacturer's recommendations.

.13 Field Quality Control:

.1 Site Tests:

.1 To ensure system integrity, pressure test the system before covering tubing in concrete or when other trades are working in the vicinity of the tubing.

.2 Test all electrical controls in accordance with respective installation manuals.

.14 Cleaning:

.1 Remove temporary coverings and protection of adjacent work areas.

.2 Repair or replace damaged installed products.

.3 Clean installed products in accordance with manufacturer's instructions prior to owner's acceptance.

.4 Remove construction debris from project site and legally dispose of debris.

.15 Demonstration:

.1 Demonstrate operation of hydronic snow and ice melting system to Owner's personnel.

.2 Advise the Owner about the type and concentration of glycol/water solution used in the hydronic snow and ice melting system.

.3 The Owner monitors the solution effectiveness through an established maintenance program as outlined by the glycol manufacturer.

.16 Protection:

.1 Protect installed work from damage caused by subsequent construction activity.

2.7 FITTINGS

.1 Use fittings, connectors, wall sleeves and other accessories offered by the PEX tubing manufacturer, including connectors to metallic piping

.2 The fitting assembly must comply with ASTM F877 and CAN/CSA-B137.5 requirements

.3 Fitting assembly manufactured from UNS C3600 series brass material.

.4 Fitting assembly consists of a barbed insert, a compression ring and a compression nut. The barbed insert is manufactured with an o-ring to facilitate air pressure testing.

.5 Fittings manufactured in accordance with ASTM F1960.

.6 Fitting assembly manufactured from material listed in paragraph 5.1 of ASTM F1960.

.7 The fitting assembly consists of a barbed adapter and an applicable sized PEX ring. The barbed insert may include an o-ring to facilitate pressure testing with air.

2.8 MANIFOLD CHAMBER

.1 Pre-cast or poured in place concrete. Footprint and depth sized to avoid classification as "confined space". Coordinate with Structural Division.

.2 Access doors

.1 Cover and frame to be constructed out of 6.35mm (¼") aluminum. Cover to be checkered plate type, reinforced for 150 psf (732 kg/m2), live load. Frame to be extruded aluminum with built-in anchor flange around the perimeter.

.2 Continuous heavy-duty type 316 stainless steel hinges.

.3 Type 316 stainless steel slam lock latch with fixed interior handle and removable exterior turn/lift handle. Latch release is protected by a flush, gasketed, removable screw plug.

.4 Engineered composite compression spring operators enclosed in telescopic tubes. Automatic hold-open arm with grip handle release. Steel compression springs with electro coated acrylic finish

.5 Access doors to be finished with mill finish aluminum with a bituminous coating applied to the exterior of the frame.

2.9 GLYCOL AUTOMATIC FILL STATION

.1 Install in accordance to the manufacturer's instruction. Provide concrete support pad.

.2 Connect to power supply and controls; including tie-in to the Owner's building automation system.

.3 Start-up and adjustment: by equipment manufacturer. Cost to be covered by the Contractor.

2.10 CONCRETE

.1 All concrete work required to complete this Project, whether shown on the drawings or not, shall be the Contractor's responsibility.

2.11 METALS

.1 All steel construction required for the completion of this Project, whether shown on the drawings or not, shall be the Contractor's responsibility.

2.12 CUTTING, PATCHING, ROOFING AND X-RAY

.1 All cutting, patching, roofing and X-Rays required for the completion of this Project whether shown on the drawings or not, shall be the Contractor's responsibility. The cutting and patching work shall be performed in accordance with the following.

2.13 ACCESSORIES

.1 Non-ferrous sleeves shall be provided wherever tubing enters and exits the floor.

.2 Bend supports shall be provided for all 90° elbows.

2.14 VALVES

.1 Asbestos packing is not acceptable

.2 All valves of the same type shall be products of a single manufacturer. Provide gate and globe valves with packing that can be replaced with the valve under full working pressure.

.3 Provide chain operators for valves 100 mm (4") and larger when the centerline is located 2,400 mm (8') or more above the floor or operating platform.

.4 Standard of Acceptance: Crane, Jenkins, Toyo, Kitz or approved equivalent.

.5 Gate Valves:

.1 50 mm (2") and smaller: MSS SP80, bronze, 1,034 kPa (150 lb.), wedge disc, rising stem, union bonnet.

.2 65 mm (2 ½") and larger: Flanged, outside screw and yoke.

.3 MSS SP 70, iron body, bronze mounted, 861 kPa (125 psig) wedge disc.

.6 Globe, Angle and Swing Check Valves:

.1 50 mm (2") and smaller: MSS SP 80, bronze, 1034 kPa (150 lb.) Globe and angle valves shall be union bonnet with metal plug type disc.

.2 65 mm (2 ½") and larger: 861 kPa (125 psig), flanged, iron body, bronze trim, MSS SP 85 for globe valves and MSS SP 71 for check valves.

.3 Non Slam or Silent Check Valve: Spring loaded double disc swing check or internally guided flat disc lift type check for bubble tight shut off. Provide where check valves are shown in chilled water and hot water piping.

.4 Body: Cast iron, ASTM A126, Class B, or steel, ASTM A216, Class WCB, or ductile iron, ASTM 536, flanged, grooved, or wafer type.

.5 Seat, disc and spring: 18-8 stainless steel, or bronze, ASTM B62. Seats may be elastomer material.

.7 Butterfly Valves:

.1 May be used in lieu of gate valves. Provide stem extension to allow 50 mm (2") of pipe insulation without interfering with valve operation.

.2 MSS SP 67, flange lug type (for end of line service) or grooved end rated 1205 kPa (175 psig) working pressure at 93°C (200°F).

.3 Body: Cast iron, ASTM A126, Class B. Malleable iron, ASTM A47 electro- plated, or ductile iron, ASTM A536, Grade 65 45 12 electro-plated.

.4 Trim: Bronze, aluminum bronze, or 300 series stainless steel disc, bronze bearings, 316 stainless steel shaft and manufacturer's recommended resilient seat. Resilient seat shall be field replaceable, and fully line the body to completely isolate the body from the product. A phosphate coated steel shaft or stem is acceptable, if the stem is completely isolated from the product.

.5 Actuators: Field interchangeable. Valves for balancing service shall have adjustable memory stop to limit open position.

.6 Valves 150 mm (6") and smaller: Lever actuator with minimum of seven (7) locking positions, except where chain wheel is required.

.7 Valves 200 mm (8") and larger: Enclosed worm gear with handwheel, and where required, chain wheel operator.

.8 Ball Valves:

.1 Brass or bronze body with chrome-plated ball with full port and Teflon seat at 2,760 kPa (400 psig) working pressure rating. Screwed or solder connections. Provide stem extension to allow operation without interfering with pipe insulation.

.9 Water Flow Balancing Valves:

.1 For flow regulation and shut off. Valves shall be line size rather than reduced to control valve size and be one of the following types.

.2 Butterfly valve as specified herein with memory stop.

.3 Eccentric plug valve: Iron body, bronze or nickel plated iron plug, bronze bearings, adjustable memory stop, operating lever, rated 861 kPa (125 psig) and 121°C (250°F).

.10 Circuit Setter Valve:

.1 A dual purpose flow balancing valve and adjustable flow meter, with bronze or cast iron body, calibrated position pointer, valved pressure taps or quick disconnects with integral check valves and preformed polyurethane insulating enclosure. Provide a readout kit including flow meter, readout probes, hoses, flow charts or calculator, and carrying case.

.11 Automatic Balancing Control Valves:

.1 Factory calibrated to maintain constant flow (± 5%) over system pressure fluctuations of at least ten (10) times the minimum required for control. Provide standard pressure taps and four sets of capacity charts. Valves shall be line size and be one of the following designs.

.2 Gray iron (ASTM A126) or brass body rated 1205 kPa (175 psig) at 93°C (200°F), with stainless steel piston and spring.

.3 Brass or ferrous body designed for 2067 kPa (300 psig) service at 121° C (250°F), with corrosion resistant, tamper proof, self-cleaning piston/spring assembly that is easily removable for inspection or replacement.

.4 Brass or ferrous body designed for 2067 kPa (300 psig) service at 121°C (250°F), with corrosion resistant, tamper proof, self-cleaning piston/spring assembly that is easily removable for inspection or replacement.

.5 Provide a readout kit including flow meter, probes, hoses, flow charts and carrying case.

PART 3 - EXECUTION

~~**1.1 DESCRIPTION OF WORK**~~

~~.1 Supply and install a complete hydronic snow melting system consisting of (but not limited to) the following main components:~~

~~.1 A gas-fired heating plant including boilers, pumps, expansion tanks, glycol fill equipment and accessories serving snow melting system and floor radiant heating system;~~

~~.1 Snow melting embedded tubing;~~

~~.1 Piping distribution for the heating agent, including manifolds, valves, gauges and accessories;~~

~~.1 Valve and manifold concrete chambers;~~

~~.1 A digital control system to be tied into the Owner's building automation;~~

~~.1 Ancillary drainage, water make-up and accessories; and~~

~~.1 All power supply and control wiring required to make the system fully operational.~~

~~.1 Complete design of the snow melting system, including calculation, layouts and schematic drawings to show control sequence, equipment layout , tubing patterns, manifold locations, appropriate cross-sections and special installation techniques to suit final architectural requirements and layout as required by code, standards and Authorities Having Jurisdiction.~~

~~.1 Misinterpretation of any requirement of the drawings and specifications will not relieve the contractor of responsibility. If in any doubt, the contractor shall contact the Consultant for written clarification prior to submitting a bid for the Work.~~

~~.1 Wherever differences occur between specifications, plans, schematics and drawings, the maximum conditions shall govern and the bid shall be based on whichever indicates the greater cost~~

~~.1 In addition to the Work specifically mentioned in the Specifications and shown on the drawings, provide all other items that are obviously necessary to make a complete working installation, including those required by the Authorities Having Jurisdiction over the Work.~~

3.1 INSTALLATION

.1 Comply with manufacturer's product data, including product technical bulletins, installation instructions and design drawings.

.2 Verify that site conditions are acceptable for installation of the snow melting system. Do not proceed with installation of the snow and ice melt system until unacceptable conditions are corrected.

.3 Slab-on-grade Construction with Edge and Under-slab Insulation:

.1 When using high-density foam insulation board, install the tubing by wire tie to rebar.

.2 The submitted snow-melt design shall specify the tubing on-center distance(s) and loop lengths, based on output and tubing diameter. On- center distances will not exceed 305 mm (12").

.3 Do not install tubing closer than 152 mm (6") from the edge of the heated slab.

.4 Install the tubing at a consistent depth below the surface elevation as determined by the Consultant. Tubing installation will ensure sufficient clearance for all control joint cuts.

.5 Fibrous expansion joints may be penetrated following the PEX tubing manufacturer's and structural engineer's recommendation.

.6 Metal or plastic bend supports will be used to support the tubing when departing from the slab in a 90° bend.

.4 Ensure grid tubing has been successfully pressure tested prior to concealment. Be present when covering is being placed over grid tubing to ensure integrity of tubing is not compromised during placement of remainder of floor construction.

.5 Heating Agent Distribution Piping:

.1 Piping shall be installed in a schedule 40 PVC pipe sleeve; the sleeve size shall be two diameter sizes larger than the combined diameter of the distribution piping plus insulation plus jacket.

.2 Maintain minimum 4" horizontal distance between the PVC sleeves.

.3 Coordinate with the site services discipline the depth of the sleeves and the back-filling material, depending on the nature of the surface above (landscape, pedestrian traffic, vehicular traffic, train right of way, etc.).

.4 Respect the minimum bending radius recommended by the manufacturer.

.6 Where tubing and/or piping penetrates fire rated construction, provide firestopping in accordance with requirements specified in Section 20 05 17 – Sleeves and Sleeve Seals for Mechanical Piping.

.7 Provide snow melt radiant heating zones and piping manifold assemblies. System installation is to be in strict accordance with manufacturer's instructions.

.8 Provide a strainer in piping to manifold supply header and clean strainer screen when system balancing is to commence.

.9 Prior to system flow balancing, ensure all air is purged from system and system operates successfully at design temperatures and pressure for a minimum of 2 days. Supply system manufacturer's software for final balancing flow adjustment settings.

.10 Balancing Across the Manifold:

.1 Balance all loops across each manifold for equal flow resistance based on actual loop lengths and total **manifold** flow.

.2 Balancing is unnecessary when all loop lengths across the manifold are within 3% of each other in length. Install the supply and return piping to the manifold in a reverse-return configuration to ensure self-balancing.

.3 Balancing between manifolds is accomplished with a flow control device installed on the return piping leg from each manifold when direct return piping is used for the supply and return mains.

.4 Adjust all boiler and system controls after the system has stabilized to ensure proper operation in accordance with the system design.

3.2 SYSTEM STARTUP

.1 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical. Ensure system manufacturer inspects grid tubing installation prior to concealment and certifies each zone correct in writing. Submit a copy of each certification letter prior to Substantial Performance of the Work.

.3 After all equipment has been installed, adjusted, balanced and started up, subject equipment to a series of performance tests, as soon as conditions permit.

.4 The timing of the tests shall be arranged to suit the convenience of the Consultant, and the manner and duration shall be as the Consultant deems necessary. Record the daily start and stop times, operating hours and functions performed. Ensure that the performance tests are witnessed by the Consultant.

.5 All major equipment including but not limited to boilers, and pumps, are to be inspected by the manufacturer to ensure that the equipment has been installed in accordance with their recommendations.

.6 Operate equipment under varying load conditions, demonstrate start-up sequence, normal shutdown, simulated emergency shutdown, operation of temperature, etc., and safety controls. Operate switches and electrical devices for correct wiring sequences. Adjust components to achieve a proper functional relationship among all the components of all the systems. Repeat these functions as many times as deemed necessary by the Consultant to achieve reliable operation.

.7 Repair defects and repeat tests as necessary. During test maintain lubrication schedule, set, align and tension drives.

.8 At the successful completion of Performance Tests and all testing and balancing, make the systems ready for final inspection and subsequent acceptance of the Owner. Replace and clean filters, flush out lines and equipment, remove and clean strainers, fill liquid systems and purge air as required by the codes. Disinfect all domestic water as required by current by-laws and Authorities Having Jurisdiction.

3.3 OPERATING AND MAINTENANCE MANUALS

.1 Provide minimum of four (4) copies of Mechanical Maintenance Manuals. Mechanical Maintenance Manuals to be delivered to the Consultant's office ten (10) days prior to the Substantial Completion of the Contract.

.2 Manuals to be bound in a hard cover neatly labeled: “OPERATING AND MAINTENANCE INSTRUCTIONS”.

.3 The Maintenance Manuals shall be divided into sections with neatly labeled and tabbed dividers between each section. The sections to be included in the manual and the information contained within each section are:

.1 Section I-General:

.1 A list giving name, address and telephone number of the Consultant, Engineers, and Contractor, Mechanical Trade and Controls Trade.

.2 Warranty certificates for the Mechanical Systems.

.3 A copy of the valve directory giving number, valve location, normal valve position, and purpose of valve (a framed copy of valve directory to be hung in the boiler room).

.4 Equipment lists and certificates shall be provided - certificates shall be signed and sealed by the appropriate suppliers.

.2 Section II & III-Metallic piping and pump Systems, plumbing fixtures and snow and ice melting plastic tubing/In-floor radiant heating tubing:

.1 A copy of all pressure tests and operational tests, a copy of Gas Operational Tests for gas fired equipment. A list giving the name, address and telephone number of all suppliers. A copy of all reviewed shop drawings for the mechanical equipment.

.3 Section IV-Automatic controls;

.1 Complete Control Diagrams, Wiring Diagrams and description of Control system and the functioning sequence of the system.

.4 Section V-Hydronic Balancing Reports:

.1 Complete results of the hydronic balancing.

3.4 TESTING, ADJUSTING AND BALANCING (TAB)

.1 Coordinate with the mechanical Contractor the TAB activity such that it does take place before the insulation is installed on ductwork and piping.

.2 In the absence of such coordination, the mechanical contractor shall be responsible for the repair to the ductwork and or piping insulation removed for TAB purposes, including the integrity of the vapor barrier material and the insulation jacket.

.3 General:

.1 Obtain applicable Contract Documents and copies of approved submittals for HVAC equipment and automatic control systems.

.4 Systems Inspection Report:

.1 Inspect equipment and installation for conformance with design.

.2 The inspection and report is to be done after air distribution equipment is on site and duct installation has begun, but well in advance of performance testing and balancing work. The purpose of the inspection is to identify and report deviations from design and ensure that systems will be ready for TAB at the appropriate time.

.3 Verify that all items such as ductwork piping, ports, terminals, connectors, etc., that is required for TAB are installed. Provide a report to the Consultant.

.4 Reports: Follow check list format developed by Associated Air Balance Council (AABC) or Sheet Metal and Air Conditioning Contractors' National Association (SMACNA), supplemented by narrative comments

.5 Tab Report:

.1 Format to be in accordance with referenced standard listed above, but using design drawing units.

.2 Produce “as-built” full system schematics. Use as-built drawings for reference.

.3 Submit 1 copy of preliminary TAB reports, each in “D” ring binders, complete with index tabs for verification and approval of Consultant.

.4 Submit copies of final TAB reports after approval by the Consultant, to be incorporated into the Maintenance and Operations Manual, as indicated in section 15010 General Mechanical Requirements.

.6 Procedures:

.1 Tab shall be performed in accordance with the requirement of the Standard under which TAB agency is certified.

.2 Start final TAB only when building is essentially completed, including: normal operation of mechanical systems affecting TAB.

.3 General: During TAB all related system components shall be in full operation. Fan and pump rotation, motor loads and equipment vibration shall be checked and corrected as necessary before proceeding with TAB. Set controls and/or block off parts of distribution systems to simulate design operation of variable volume air or water systems for test and balance work.

.7 Water Balance and Equipment Test:

.1 Include all circulating pumps, heat exchangers, boilers, coils, chillers, coolers and condensers, as applicable to this Project.

.2 Adjust flow rates for equipment to the values indicated on the Contract Drawings and schedules. Set balancing valves and circuit setters to the values on indicated on the equipment schedules.

.3 Record final measurements for hydronic equipment on performance data sheets. Include entering and leaving water temperatures for heating and cooling coils, and for heat exchangers. Include entering and leaving air temperatures for all equipment (boilers, manifolds, mixing valves, etc).

.8 Verification:

.1 Reported measurements shall be subject to verification by Consultant. Provide instrumentation and manpower to verify results of up to 30 % of all reported measurements. Number and location of verified measurements to be at discretion of Consultant.

.2 Bear costs to repeat TAB, as required, to satisfaction of Consultant.

.9 Marking Of Settings:

.1 Following approval of TAB final Report, the setting of all HVAC adjustment devices including valves, splitters and dampers shall be permanently marked by the TAB Specialist so that adjustment can be restored if disturbed at any time. Style and colours used for markings shall be coordinated with the Consultant

3.5 DIGITAL CONTROLS

.1 System Hardware:

.1 The system architecture will be comprised of PCUs (Primary Control Units), PACs (Programmable Application Controllers), ASCs (Application Specific Controllers) and any required communications or interface components networked together.

.2 All required site database and graphics files shall reside on the owner’s central server. The connection between the central server and the BAS controllers (to be reserved for future) serving a specific building shall be through the WAN.

.3 The building Staff shall be able to log into the local workstation, access and review on a read-only basis the graphical user interface showing the system layout and operational parameters.

.4 The owner specialized trades shall be capable of accessing and modifying the parameters and schedules using direct connectors at the control panels and portable computers (laptops, notebooks, etc.).

.5 Supply PCU's, PAC's and ASC's as required to interface to all specified equipment.

.6 Allow for a minimum of 25% spare program and trend memory capacity in each PCU and PAC.

.7 For each specified control point, the contractor shall supply the hardware point type (e.g. AI, AO, DI, DO) as indicated on the controls points list. The use of alternate hardware point types or the use of external interface cards or devices to simulate the function of a specified hardware point type is not acceptable. For example, the use of a DO point and an external PWM card to simulate the function of a physical AO point shall not be accepted.

.2 Primary Control Units (PCU):

.1 Use only Primary Control Units to directly control any major mechanical equipment. Major mechanical equipment includes air handling units, boiler plants, chiller plants, cooling towers, roof-top units and other critical equipment.

.2 Each PCU shall contain a real time clock and sufficient memory to store its own application database, operating parameters, user programs and trend data storage.

.3 Battery backup shall be provided to support the real-time clock and all volatile memory for a minimum of seventy-two (72) hours to eliminate operating data reload in case of power failure.

.4 Each PCU output shall include a Hand/Off/Auto (HOA) selector switch for each analog and digital output.

.5 Each PCU shall have a minimum of 10% spare capacity for each type of input and output channels and 10%.

.3 Programmable Application Controllers (PAC):

.1 Programmable Application Controllers (PAC) are fully programmable controllers used for controlling distributed equipment including, but not limited to pumps, exhaust fans, VAV boxes, heat pumps, force flow units and unit ventilators.

.2 PACs shall not be used for controlling major mechanical equipment as described above.

.3 Each PAC shall contain a real time clock and sufficient RAM to store its own application database, operating parameters, user programs and trend data storage.

.4 Battery backup shall be provided to support the real-time clock and all volatile memory for a minimum of seventy-two (72) hours to eliminate operating data reload in case of power failure.

.4 System Software:

.1 Trend Data:

.1 Provide trend logs for all hardware inputs and outputs.

.2 All trends should be accessible via the graphical interface.

.3 Trends should contain all related variables of a control loop (i.e. setpoint, measured variable and control output) and have the ability to be plotted simultaneously on the same graph.

.4 Field Devices individual trends should provide an appropriate “snapshot” of the variable. Slow reacting variables such as space temperatures should be sampled every thirty (30) to sixty (60) minutes while other variables such as mixed air or boiler water temperatures should be sampled every five (5) to ten (10) minutes.

.5 Provide the maximum number of trend samples within the controller while maintaining the requirement for spare memory capability.

.6 The primary input sensor for all control loops must physically be wired to the same panel containing the control loop output (e.g. boiler water temperature and burner control output).

.7 Trend data storage must be in the same panel as the hardware or logical points being trended.

.5 User Access:

.1 Provide the Owner-standard user IDs and passwords for operations, maintenance and engineering staff.

.6 Alarms:

.1 Alarms shall be assigned the following categories:

.1 Maintenance Alarms;

.2 Mismatch of equipment control and status for more than thirty (30) minutes; and

.3 Any other miscellaneous alarm not specifically noted herein.

.2 Alarms shall not require any acknowledgment before automatic reset by the system.

.3 An alarm notification shall not be issued when an alarm condition returns to normal.

.4 The Contractor shall provide additional alarms as directed by the Consultant and specified in this Section and customize the alarms to the operating characteristics of the specific the systems being controlled.

.7 Dynamic Graphics:

.1 Provide customized, site specific dynamic graphics to meet the requirements of the Consultant and/or the Owner.

.8 Sequence Of Operation:

.1 The heating plant shall serve the snow melting system and floor radiant heating system.

.2 The heating plant shall be enabled/disabled based on outdoor of temperature 12°C.

.3 The snow melting system shall be enabled/disabled based on outdoor air temperature 4°C.

.4 With the system enabled, the lead primary boiler pump shall start, while the lag pump shall be energized and in stand-by mode. The lead/lag status of the primary pumps shall alternate at one-hundred-sixty-eight (168) hour intervals (adjustable).

.5 Upon proof of flow in the primary loop, the boiler (B-3) shall start at minimum firing rate, while one of boilers (B-1 &2) shall be energized and another one shall be in stand-by mode. The lead/lag status of the boilers between B-1 & 2 shall alternate at 168 hour intervals (adjustable).

.6 After the boiler starts, its firing rate shall modulate as required to maintain the primary loop return temperature at 52°C (125°F), and subject to a maximum primary loop supply temperature of 66°C (150°F).

.7 If the boiler (B-3) fires at maximum rate for ten (10) minutes and cannot maintain the primary loop return temperature setpoint, another boiler shall start at minimum firing rate. If these two (2) boilers fire at maximum rate for ten (10) minutes and still cannot maintain the primary loop return temperature setpoint, the third boiler shall start at minimum firing rate, its burner shall ramp as required to achieve the maximum primary loop supply temperature of 66°C (150°F). The lead pump's capacity shall be changed by VFD panel to suit for the required water flow rate and pressure.

.8 With the snow melting system enabled, the lead secondary snow melting loop pump shall start, while the lag pump shall be energized and in stand-by mode. The lead/lag status of the secondary snow melting loop pumps shall alternate at one hundred sixty-eight (168) hour intervals (adjustable).

.9 With the floor radiant heating system enabled, the lead secondary pump shall start, while the lag pump shall be energized and in stand-by mode. The lead/lag status of the secondary snow melting loop pumps shall alternate at one hundred sixty-eight (168) hours intervals (adjustable), for detail refer to Section 15520 Hydronic Radiant Floor Heating System.

.10 The four-way mixing valve shall modulate as required to maintain the snow- melting slab temperature at the following temperatures:

.1 0°C (+32°F) if no snow or ice is detected on the surface of the slab by the respective sensor

.2 +4°C (+40°F) if snow or ice is detected on the surface of the slab.

.11 Additional settings for the operation of the 4-way mixing valve:

.1 Maintain the minimum primary loop return temperature of 52°C (125°F)

.2 Maintain the maximum temperature differential in the snow melting loop of 14°C (25°F) to prevent slab thermal shock.

.12 The system shall generate alarms in case of:

.1 Any pump failure (while automatically enabling the stand-by pump).

.2 Any boiler failure (while automatically enabling the stand-by boiler).

.3 Primary loop temperatures 6°C (±10°F) departure from the setpoint.

.4 Slab temperature 3°C (±5°F) departure from the setpoint.

.9 Installation of Snow Sensor:

.1 The installation of the snow sensor shall conform to the detail drawing.

.2 The contractor shall be responsible for the fabrication of the steel frame required to install the sensor at the prescribed elevation and maintain its position during the concrete pour.

.3 The installation procedure described on the detail drawing shall be followed accurately; at the conclusion of the installation work, a report shall be issued by the Contractor confirming that all installation steps have been followed and the installation of the sensor is in conformance with the detail.

.4 Installation of all wiring and tubing in the area of the sensor shall be as indicated on the detail.

.10 Installation Of Temperature Sensors In Piping:

.1 The Contractor shall ensure that thermowells are installed as described herein.

.2 For each immersion sensor, provide a compatible thermowell to the Mechanical Contractor for installation. Provide stainless steel thermowells where installed in piping carrying corrosive or chemically reactive fluids.

.3 Install thermowells in piping such that the bottom of the well does not make contact with the pipe. Install the well at a 90° elbow or tee where the pipe diameter is less than the well length.

.11 Cutting And Patching:

.1 All cutting, patching, painting and making good for the installation of the work shall be done by the Contractor. All cutting shall be performed in a neat and true fashion, with proper tools and equipment

.12 Identification And Labeling of Control Equipment:

.1 All panels must have a lamicoid tag (minimum 3”x1”) affixed to the front face indicating panel designation and function (i.e. “Panel 1” or “Relay Panel 3”).

.2 All field sensors or devices must have a lamicoid tag (minimum 3”x1”) attached with tie-wrap or adhesive indicating the point software name and hardware address (i.e. AHU1_MAT, 2.IP4). Tags must be secured by screws where mounted outside of the building, in un-heated spaces, in high humidity areas or where subject to vibration.

.3 All devices within a field enclosure shall be identified via a label or tag.

.4 All panel power sources must be identified by a label (minimum 3”x1”) indicating the source power panel designation and circuit number (i.e. “120vac fed from LP-2A cct #1).

.5 All field control equipment panels fed from more than one power source must have a warning label on the front cover.

.6 All wires shall be identified with the hardware address with a band-type self- adhesive strips or clip-on plastic wire markers at both ends.

.7 All rotating equipment shall have a tag or label affixed indicating that the equipment may start without warning.

.8 All panels will be supplied with a point’s list sheet (within a plastic sleeve) attached to the inside door.

.9 The points list shall identify the following for each point:

.1 Panel number;

.2 Panel location;

.3 Hardware address;

.4 Software name;

.5 Point description;

.6 Field device type;

.7 Point type (i.e. AI or DO);

.8 Device fail position;

.9 Device manufacturer;

.10 Model number or reference; and

.11 Wire tag reference.

.10 Provide laminated wiring diagrams for all field mounted relay enclosures. Securely attach to the inside door. Identify power panels and circuit numbers of the equipment being controlled.

.11 Provide laminated wiring diagrams or modify existing equipment wiring diagrams.Securely attach to the inside of the respective control cabinet.

.12 Provide lamcoid labels indicating the required operating sequences, on the boilers and valves, where the boiler plants have manual or automatic isolating valves. Submit actual wording to the Consultant for approval prior to fabrication and installation.

.13 Provide lamcoid or machine labels (as outlined above) for all interposing relays or contactors used in control circuits. The labels shall include the related point software name and hardware address.

.14 Provide a lamcoid label to identify the location of concealed devices above the ceiling space. Mount the label on the ceiling grid t-bar or a permanent surface adjacent to the devices.

.15 Provide lamcoid labels for all auxiliary HVAC equipment (e.g. force flow cabinets, unit ventilators, unit heater, window AC units, etc.). Mount the labels in the vicinity of the existing thermostat or power switch for the unit.

.16 Where directed by the Consultant, provide any and all additional labeling, diagrams, schematics or instructions as may be required to facilitate the correct operation and maintenance of controlled building systems.

.13 Systems Hardware Commissioning

.1 The Contractor shall be responsible for the “end to end” commissioning, testing, verification and start-up of the complete control system hardware including panels, sensors, transducers, end devices, relays and wiring. Where applicable, this shall include any points from an existing and/or re-used automation system in the building.

.2 The Contractor shall prepare a hardware commissioning report containing the following information and test results:

.1 Analogue inputs (i.e. temperatures, pressure, etc.) shall be verified with an approved calibration device. All actual temperature readings should be with ± 1°C of the readings observed at the workstation. Record calibration adjustments and settings.

.2 Analogue outputs shall be verified by manually commanding the output channel from the operator workstation to two or more positions within the 0-100% range and verifying the actual position of the actuator or device. All devices shall operate over their entire 0-100% range from a minimum control range of 10-90%. Record the actual output scale range (channel output voltage versus controller command) for each analogue end device.

.3 Digital outputs shall be verified by witnessing the actual start/stop operation of the equipment under control.

.4 Digital inputs shall be verified by witnessing the status of the input point as the equipment is manually cycled on and off.

.5 Record all out-of-season or unverified points in the commissioning report as “non-commissioned”.

.6 Identify any existing equipment (valves, dampers, fan starters, etc.) that are inoperative or require maintenance or repair.

.7 The panel power source shall be toggled on and off to ensure reboot functionality and power down memory retention of all parameters. During the power down test, all controlled system outputs shall go to their fail-safe position.

.8 Verify PID loop tuning parameters by applying a step change to the current setpoint and observing the response of the controlled device. Setpoint should be reached in an acceptable period of time without excessive cycling or hunting of the controlled device. Provide a graph of the trend response to setpoint change for important controlled devices (e.g. valves 1” or larger, dampers on major air handlers, etc.)

.9 Provide confirmation that a series of test alarms has been successfully received at designated remote monitoring workstations.

.10 Include with the hardware commissioning report a site floor plan indicating the location of all equipment installed in concealed or recessed locations (e.g. interposing relays in ceiling spaces).

.11 Provide testing of all LAN cabling to ensure that 100Mb bandwidth is supported.

.12 Verify conformance with TIA /EIA TSB-67 - Basic Link Test using a Level 2, bi-directional tester. Provide all equipment necessary to carry out the required tests.

.13 The hardware commissioning report must be signed and dated by the Contractor’s technician performing the tests and participating Owner’s trades staff.

.14 At the completion of site commissioning, submit four (4) copies of hardware commissioning report to the Owner.

.14 Substantial Completion Inspection:

.1 At the completion of the site hardware inspection, the Contractor shall test and verify that the system programming, graphics and alarm software is operating correctly and is in compliance all requirements of the Specifications.

.2 The Contractor shall provide written notification to the Owner that the site is ready for the Substantial Completion Inspection by the Consultant

.3 Issue a comprehensive site deficiency report to the Contractor for their immediate action.

.4 The Contractor shall correct all items noted in the site deficiency report within ten (10) business days of receipt.

.5 The Contractor shall provide written notification to the Owner that all items on the Consultant’s site deficiency report have been corrected

3.6 SENSORS AND DEVICES

.1 Snow Slab Sensor:

.1 The snow/ice sensor and socket are used with the main controller to automatically detect snow or ice on a driveway or walkway. The snow/ice sensor socket must be installed directly in the snow melt slab, halfway between the heating elements or pipes.

.2 Sensor weight: 2,000 g (4.4 lb), silicon brass. 20 m (65 ft) jacketed cable

.3 Socket weight: 830 g (1.8 lb), silicon brass

.4 Dimensions (sensor): 45 x 80 x 80 mm (1¾" H x 3-1/8" W x 3-1/8" D)

.5 Dimensions (socket):96 x 89 x 89 mm D (3¾" H x 3½" W x 3½")

.6 Operating range:-50 to 80°C (-60 to +175°F)

.7 Sensor: NTC thermistor, 10 kΩ @ 25°C ±0.2°C (77°F), ß=3892

.8 Standard of Acceptance: Tekmar type 094 in socket type or approved equivalent.

.2 In-Slab Sensor:

.1 Slab sensor has a PVC plastic sleeve which is designed for use in soils or concrete. The sensor is supplied with 40ft (12m) of 2 conductor cable.

.2 Packaged Weight: 0.7 lb. (320 g), PVC sleeve. 12 m ' (40) jacketed wire

.3 Dimensions: 13 o.d. x 51 mm (½" OD x 2")

.4 Operating range: -50 to 60°C (-60 to 140°F)

.5 Sensor-NTC thermistor, 10 kΩ @ 25°C ±0.2°C (77°F), ß=3892

.6 Standard of Acceptance: Tekmar 073 or approved equivalent.

.3 Outdoor Air Temperature Sensors:

.1 Provide outdoor air temperature sensors with the following minimum characteristics:

.2 Each sensor shall be a 6", 10K thermistor probe;

.3 Minimum two (2) sensors shall be installed for each site;

.4 Both sensors shall be mounted inside a heavy-duty (blow-proof) solar shield; and

.5 Provide a heavy-duty, metal, wire guard.

.6 Standard of Acceptance: Enercorp TS-O-T-10K, Honeywell, Johnson Controls or approved equivalent.

.4 Immersion Temperature Sensors:

.1 Use immersion temperature sensors with thermwells for all applications where a temperature of a fluid in a pipe is being sensed.

.2 Provide well-mounted water temperature sensors with the following minimum characteristics:

.1 The sensors shall be 10k ohm thermistor encapsulated in a 6 mm o.d., 50 m long probe, with screw fitting for insertion into a standard thermowell;

.2 Operating range -10 to +100°C;

.3 End-to-end accuracy ± 0.3°C over the entire operating range;

.4 The sensors shall be complete with brass thermowell;

.5 Provide a stainless steel thermowell where exposed to corrosive liquids;

.6 Use conductive gel when mounting the sensor in the thermowell; and

.7 The sensors to be mounted on insulated piping shall be installed clear of the insulation.

.3 Standard of Acceptance: Enercorp TS-P-4-T-10K, Honeywell, Johnson Controls or approved equivalent.

.5 Current Sensors (Analog):

.1 Current sensors (CT) shall be used for status monitoring of all motor-driven equipment, where specified.

.2 Technical Performance-Output should be only 4-20mA only. Voltage output will not be accepted. End-to-end accuracy ± 1% of full scale at each range.

.3 The current sensors shall be mounted inside the starter cabinets whenever possible. If this is not possible due to space limitation, provide an enclosure to house the sensor.

.4 Standard of Acceptance: Enercorp SA200, Honeywell, Johnson Controls or approved equivalent.

.6 Automatic Control Valve Actuators:

.1 Each automatic control valve shall be fitted with a “fail-safe” operator capable of tight shut-off against the differential imposed by the system.

.2 Operators for valves in electric-electronic control systems shall be single phase

.3 AC, 24V electric motor operators.

.4 Valve actuators on valves 3” diameter and larger shall be provided with a manual position override.

.5 Valve actuators shall accept a 0-10VDC or 4-20mA control signal for all proportional applications

.6 Floating point control of valves is not acceptable under any circumstances.

.7 Installed by the Contractor, unless specified otherwise.

.8 Each control valve shall be equipped with its own actuator.

.9 The Contractor shall ensure that each control valve assembly is properly connected and installed.

.10 The Contractor shall test, adjust and verify the operation of each control valve to ensure that it is properly functioning, as required and left in safe working order.

.7 Local Service Ports:

.1 Every DDC panel shall be provided with a local network access port to connect to laptop computer. A user connected to the local access port shall have the same level of system access and functionality as being connected to the networked Owner’s workstation

.2 Where points (four (4) or more) are located in a mechanical room that does not have a local panel installed, a remote network access port shall be provided. The access port shall be installed in a hinged metal enclosure with key-lock set and lamicoid ID label.

.8 LAN Cabling:

.1 All LAN cabling shall be Category V as defined by EIA/TIA 568A. The Contractor shall test all cabling to verify that 100Mb bandwidth is supported. See commissioning requirements.

.2 Cabling shall be four (4) pair, 100 Ω UTP, #24 AWG solid copper conductor PVC insulated, with blue or grey colour coded jacket. FT6 rated cable shall be used unless otherwise required to meet building codes or by-laws.

.3 Data outlets shall be RJ45, eight (8) pin connectors, with 50 microns of hard gold over nickel, minimum durability of 750 mating cycles and contact pressure of 100 grams per contact. Transmission characteristics shall meet TSB-40 Category V.

.4 Provide one RJ45 data outlet adjacent to each device to be terminated (e.g. workstation PC, DDC panel, hub, etc.) Use a flexible patch cable to connect from the data outlet to the end device.

.5 Provide protection from EMI sources in accordance withCAN/CSA-T530 article 4.

.6 The contractor shall test all cabling to verify conformance with TIA/EIA TSB-67Basic Link Test using a Level 2, bi-directional tester. See commissioning requirements.

.7 Where there are more than 2-90° in a conduit run, provide a pull box between sections so that there are two (2) bends or less in any one (1) section.

.8 Where a conduit run requires a reverse bend, between 100°and 180°, insert a pull box at each bend having an angle from 100° to 180°.

.9 Ream all conduit ends and install insulated bushings on each end. Terminate all conduits that protrude through the structural floor 2" above the concrete base. Do not use a pull box in lieu of a conduit bend. Align conduits that enter a pull box from opposite ends with each other.

.9 Automatic Control Valves:

.1 Automatic control valves shall be supplied by the Controls Contractor and installed by the Mechanical Contractor.

.2 Automatic control valves, unless otherwise specified, shall be globe type valves.

.3 Valves and actuators shall be ordered as one factory-assembled and tested unit.

.4 Submit to the Consultant for review, a valve schedule containing the following information for each valve:

.1 Valve type and size;

.2 Connection type;

.3 Line size;

.4 Valve manufacturer and model number;

.5 Valve flow coefficient;

.6 Design flow;

.7 Pressure drop across valve;

.8 Maximum close-off pressure;

.9 Actuator manufacturer and model number; and

.10 Actuator maximum torque.

.5 Valves 50 mm (2") and smaller shall be constructed of bronze. Valves 65 mm (2½") and larger shall have iron bodies and bronze mountings.

.6 All control valves shall have stainless steel stems.

.7 The bronze in bodies and bonnets of all bronze valves shall conform to ASTM B62 for valves rated up to 150psig (1,035 Kpa) working pressure and to ASTM B61 for valves rated at 200 psig (1,380 Kpa) working pressure.

.8 The bodies and bonnets of iron body valves shall conform to ASTM A126, Class B.

.9 Control valve discs and seats shall be of bronze for 100°C or less fluid temperature and of stainless steel for fluid temperatures above 100 °C.

.10 The control valves shall have tight shut-off. Flat disk valves are not acceptable.

.11 Control valves 50 mm (2") and smaller shall be complete with screwed ends type, except for bronze valves installed in soldered copper piping which shall be complete with soldering ends. Control valves larger than 50 mm (2") shall be complete with flanged end type and proper flanged adapters to copper shall be provided where flanged valves are installed in copper piping.

.12 The water control valves shall be sized for a pressure drop of 6 ft. water column or as indicated on mechanical drawings.

.13 Each automatic control valve must provide the design output and flow rates at pressure drops compatible with equipment selected.

.14 Each automatic control valve must be suitable for the particular system working pressure.

.15 Each automatic control valve shall be fitted with a position indicator.

.16 All the same type control valves shall be the products of a single manufacturer and have the manufacturer's name, pressure rating and size clearly marked on the outside of the body.

.17 Unless otherwise indicated, control valves for proportional operation shall have equal percentage characteristics, while the control valves for open/shut two- position operation shall have straight line flow characteristics.

.18 Standard of Acceptance:

.1 Siemens.

.2 Danfoss.

.3 Honeywell.

.4 Or approved equivalent.

3.7 TRAINING

.1 Include for 4 hours of on-site training for 2 groups of 6 people. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

.2 Prior to providing training perform system demonstration as per requirements of Section 01800 Project Closeout.

.3 Supply certified personnel to instruct the Owner on operation of new mechanical equipment. Supply maintenance specialist personnel to instruct operating staff on maintenance and adjustment of mechanical equipment and any changes or modification in equipment made under terms of warranty.

.4 Provide minimum four (4) hours of instruction time during regular work hours prior to acceptance and turn-over to operating staff for regular operation.

.5 Use operation and maintenance data manual for instruction purposes. On completion of instruction, turn manuals over to the Consultant.

.6 Scheduling of the timing for the training of the operating staff shall be arranged with the Consultant ten (10) days prior to the completion of the Project.

END OF SECTION

SEE ADD#7
Q#237

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for products specified in Part 2, including accessories.

.2 Submit, in shop drawing form, a schematic piping diagram for each refrigerant piping system indicating pipe sizes, slopes, valves, traps, and piping specialties. Piping schematics must be reviewed, approved, and signed by refrigeration equipment manufacturers prior to being submitted to the Consultant for review.

1.2 CLOSEOUT SUBMITTALS

.1 Submit with delivery of each unit a copy of the factory inspection report, and include a copy of each report with O&M Manual project close-out data.

.2 Submit a site inspection and start-up report from manufacturer's representative as specified in Part 3 of this section.

.3 Submit a signed copy of manufacturer's extended 2 year warranty.

.4 Training attendance records.

1.3 MAINTENANCE MATERIAL SUBMITTALS

.1 Submit 3 identified keys for cabinet doors for each humidifier prior to Substantial Performance of the Work.

.2 At Substantial Performance of the Work, hand to Owner a complete set of spare filters in "as shipped" packaging.

.3 Submit a spare steam/water cylinder for each humidifier prior to Substantial Performance of the Work.

1.4 QUALITY ASSURANCE

.1 Refrigerant equipment is to be in accordance with CSA B52, Mechanical Refrigeration Code, and any applicable local Codes and Regulations.

.2 Direct expansion refrigeration equipment must be installed by or under direct on site supervision of a licensed journeyman refrigeration mechanic.

PART 2 - PRODUCTS

2.1 ELECTRIC/ELECTRONIC STEAM HUMIDIFIER

.1 Nortec Air Conditioning Ltd. CSA certified, package type, 3-phase, 60 Hz, fully automatic electric/electronic steam humidifier in accordance with drawing schedule, capable of discharging pure steam with no mineral dust carryover, and complete with:

.1 1.3 mm (0.05") thick enamelled steel barriered wall mounting cabinet with hinged and lockable door with interlock switch for the 3-phase power electrical section, an additional door to isolate line voltage components, and a separate plumbing compartment;

.2 disposable plastic water/steam cylinders with mesh electrodes;

.3 solenoid drain and fill valves;

.4 control panel with self-diagnostic microprocessor-based control system with LCD display and keypad, steam capacity adjustment, manual drain activation pushbutton, rest pushbutton, digital operation and fault indication and display, and LED indication for current draw, humidistat demand, steam output, capacity adjustment, draining, normal operation and cylinder full, self-check on start-up, and automatic drain of cylinder at end of season;

.5 duct or plenum mounting steam distributor assembly with a length to suit mounting location, complete with condensate separator and return leg;

.6 required lengths of steam supply and condensate return hose;

.7 wall mounting steam distributing blower pack;

.8 wall mounting 24 volt adjustable tamper-proof humidistat with 10% to 90% RH range;

.9 duct mounting 24 volt adjustable humidistat with 10% to 90% RH range;

.10 duct mounting differential pressure switch for air flow proving interlock;

.11 duct mounting adjustable high limit humidistat.

.2 Manufacturers:

.1 Nortec Division (Climate Canada) Ltd.;

.2 Vapac Humidification;

.3 Armstrong International Ltd.;

.4 Hygromatic (Spirax Sarco);

.5 Carnes Co.;

.6 Northern Industrial Humidifiers "Neptronic".

2.2 GAS FIRED STEAM HUMIDIFIER

.1 Nortec GS Series, natural gas fired, CSA certified, package type, fully automatic steam humidifier in accordance with drawing schedule, capable of discharging pure steam with no mineral dust carryover, in accordance with requirements of CAN/CSA B149.1, and complete with:

.1 totally enclosed steel cabinet finished with a baked powder epoxy coating and equipped with 25 mm (1") thick insulation, top and front keyed access doors, and a cross-braced telescopic steel stand;

.2 fully piped, valved, 82% thermal efficiency combustion system with modulating variable speed forced draft blower, 100% premix burner, negative pressure regulator gas valve, and microprocessor controlled hot surface ignition system with flame system and 100% safety shutdown;

.3 type 304 stainless steel smooth flat surface heat exchanger and water tank, both removable and insulated with 25 mm (1") thick insulation meeting 25/50 flame spread/smoke developed ratings when tested to CAN/ULC S102 and complete with water level control consisting of a dual magnetic electronic float system with dual fill valves, an internal water supply air gap, internal water tempering for drain water cooling, a drain pump for scale removal, and timed periodic tank blow-down;

.4 control panel with self-diagnostic microprocessor-based control system capable of integration with building automation system and equipped with LCD display and keypad, steam capacity adjustment, modulating control demand status, tank water level indication, on/off control and safety (high limit, air proving) status, troubleshooting guide with scroll down menu, fault indication with date and time history, maintenance intervals, fill and drain status, drain/flush intervals and duration, capacity limitation, and 72 hours drain enable/disable;

.5 duct or plenum mounting stainless steel steam distributor assembly with a length to suit mounting location, complete with condensate separator and return leg;

.6 wall mounting steam distributing blower pack;

.7 wall mounting 24 volt adjustable tamper-proof humidistat with 10% to 90% RH range;

.8 duct mounting 24 volt adjustable humidistat with 10% to 90% RH range;

.9 duct mounting differential pressure switch for air flow proving interlock;

.10 duct mounting adjustable high limit humidistat;

.11 factory secured seismic restraint connection hardware.

.2 Manufacturers:

.1 Nortec Division Water Meier (Climate Canada) Ltd.;

.2 Vapac Humidification;

.3 Armstrong International Ltd.;

.4 Hygromatic (Spirax Sarco);

.5 Carnes Co.;

.6 Northern Industrial Humidifiers "Neptronic".

2.3 STEAM INJECTION HUMIDIFIER

.1 Spirax Sarco Canada Ltd. package type low pressure steam injection humidifier in accordance with drawing schedule, each capable of discharging clean dry steam without condensate drip or objectionable noise, and complete with:

.1 inlet strainer;

.2 stainless steel steam jacketed manifold, a dispersing tube, and a stainless steel noise attenuator;

.3 stainless steel separator;

.4 normally closed brass body control valve with a modulating motor operator to suit control system, and a temperature switch to prevent humidifier from operating until entire unit is up to steam temperature;

.5 cast iron float and thermostatic drip trap with stainless steel internal components for each manifold.

.2 Manufacturers:

.1 Spirax Sarco Canada Ltd.;

.2 Armstrong International Ltd.;

.3 DRI-STEEM Corp.

2.4 DEHUMIDIFIER

.1 Dectron Inc. "Dry-O-Tron" factory assembled and run tested, package type dehumidifier in accordance with drawing schedule, designed to operate with R410A refrigerant.

.2 Sectional cabinet constructed of formed and reinforced satin coated sheet steel with a #16 gauge base and #20 gauge panels, all phosphate degreased and coated with baked epoxy powder paint. Cabinet is equipped with:

.1 removable side service panels for access to all internal components;

.2 integral electrical power and control panel in a separate with #18 gauge subpanel for electrical components in a separate compartment so as not to disturb airflow during electrical servicing;

.3 integral filter rack with separate hinged access door with compression fasteners;

.4 15 mm (½") thick neoprene coated glass fibre duct liner meeting 25/50 flame spread/smoke developed ratings when tested to CAN/ULC-S102, for the entire evaporator coil section, mechanically secured in place and protected with reinforcing mesh.

.3 Factory pressure tested evaporator (dehumidifier) coil with seamless copper tubes mechanically expanded into plate type aluminium fins which are factory coated with "HyPoxy" corrosion resistant coating in accordance with ASTM B117/D1654 and ASTM D2126 corrosion resistance requirements. Coil casing and end plates are #16 gauge galvanized steel.

.4 Type 304 #20 gauge stainless steel drain pan constructed and sloped so as to eliminate standing water, and factory insulated on the bottom and sides with insulation meeting 25/50 flame spread/smoke developed ratings when tested to CAN/ULC S102.

.5 Factory pressure tested air reheat (hot gas) coil as specified above for evaporator coil.

.6 Double width, double inlet, multi-blade, forward curved, galvanized steel centrifugal blower wheel mounted on a silicon coated solid steel shaft, statically and dynamically balanced, direct connected to a motor conforming to requirements specified in Section 20 05 00 – Common Work Results for Mechanical, and secured in a galvanized steel housing with a baked enamel finish.

.7 Disposable, 50 mm (2") thick glass fibre media filters, ULC Class 2, minimum MERV 7 in accordance with ASHRAE 52.2.

.8 Resiliently mounted, overload protected, suction gas cooled hermetic compressor for use with R410A refrigerant, and equipped with time delay start to prevent short cycling, and a refrigerant circuit complete with following:

.1 in-line solder type liquid line filter drier;

.2 liquid and moisture indicator visible from outside unit;

.3 thermal expansion valve and head pressure control;

.4 receiver with fusible plug (water cooled units) or receiver with pressure relief valve (air cooled units);

.5 tamper-proof, hermetically sealed, non-adjustable high and low pressure controls;

.6 refrigerant service valves located outside air stream;

.7 minimum 15 mm (½") thick closed cell insulation meeting 25/50 flame spread/smoke developed ratings when tested to CAN/ULC S102, for refrigerant suction lines.

.9 Minimum NEMA 2 enamelled steel control panel, unit mounted, factory pre-wired, CSA certified, and complete with:

.1 protected blower motor and compressor motor contactors;

.2 power and control wiring terminal blocks;

.3 colour coded and numbered wiring;

.4 dry contact for remote on/off control;

.5 all other required contacts and hardware for control and/or monitoring connections as indicated on drawings;

.6 remote, electronic, adjustable tamper-proof thermostat and humidistat, each capable of independent control of unit operation without interfering with unit operation.

.10 Water cooled air conditioning, CSA certified, coaxial, corrosion resistant, copper tube, self-draining, counter flow design cooling water heat exchanger designed to reject all compressor heat and equipped with:

.1 self-aligning union fittings;

.2 cast brass, direct-acting, adjustable, modulating, head pressure actuated water regulating valve;

.3 2-way valve and a solenoid valve for positive shut-off for variable flow or water saving applications such as City water, or a 3-way valve for constant flow applications such as cooling towers or heat pump loops.

.11 Outdoor air cooled condenser, weather-proof #18 gauge satin coated formed and reinforced steel base and cabinet with a removable service panel for access to all internal components, mounting legs, a minimum of 2 coats of baked enamel finish, PVC coated steel fan outlet and air intake grilles, and following:

.1 factory pressure tested dual condenser coils with #16 gauge galvanized steel casings and end panels, and seamless copper tubing mechanically expanded into plate type corrugated aluminium fins;

.2 dynamically balanced condenser fan with dual (inlet and outlet) venturis with insulation in between;

.3 motor conforming to requirements of Section 20 05 00 - Common Work Results for Mechanical, factory wired to a unit mounted control panel with motor contactor, control transformer, and power and control wiring terminal strip.

.12 Factory secured seismic restraint connection hardware as required.

.13 Manufacturers:

.1 Dectron Inc.;

.2 PoolPak Technologies Corp.

PART 3 - EXECUTION

3.1 INSTALLATION OF ELECTRIC/ELECTRONIC STEAM HUMIDIFIERS

.1 Provide electric/electronic steam humidifiers.

.2 Secure each steam generator assembly in place, level, and plumb, in accordance with manufacturer’s instructions.

.3 Install steam distributor manifold assemblies and secure in place. Coordinate installation with sheet metal trade.

.4 Connect steam generators and distribution manifolds with steam and condensate hose kits supplied with humidifiers. Install in accordance with manufacturer’s instructions.

.5 Install humidistats and pressure differential air flow proving switches and connect with 24 volt control wiring in conduit to steam generator control panel.

.6 Supply a spare water/steam cylinder for each unit and 3 identified keys for each steam generator cabinet and hand to Consultant at site prior to Substantial Performance of the Work.

.7 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.8 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.9 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

.10 When installation is complete, arrange for the humidifier manufacturer to visit site to supervise start-up, testing and adjusting of each humidifier, including all controls and safeties, and when this work is complete, obtain from manufacturer and submit a letter stating humidifiers have been properly installed, started, adjusted, and are in proper operating condition.

3.2 INSTALLATION OF GAS FIRED STEAM HUMIDIFIERS

.1 Provide gas fired steam humidifiers.

.2 Secure each steam generator assembly in place, level, and plumb, on stand provided on a concrete housekeeping pad in accordance with manufacturer's instructions.

.3 Brace and secure each unit in accordance with requirements specified in Section 20 05 48.16 - Seismic Controls for Mechanical Systems.

.4 Install duct and/or plenum mounted steam distributor/manifold assemblies and secure in place. Coordinate installation with sheet metal trade.

.5 Provide blower packs and surface wall mount. Confirm exact locations prior to roughing-in.

.6 Connect humidifiers and distributor/manifold assemblies with valved steam and condensate piping. Install in accordance with humidifier manufacturer's instructions.

.7 Provide flue vent in accordance with Section 23 51 23 - Gas Vents.

.8 Install humidistats (duct or wall mounted as indicated) and duct mounted pressure differential air flow proving switches and high limit switches and connect with 24 volt control wiring in conduit to humidifier control panel.

.9 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 - Common Work Results for Mechanical.

.10 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.11 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.3 INSTALLATION OF STEAM INJECTION HUMIDIFIER MANIFOLD

.1 Provide steam injection humidifier manifold assemblies.

.2 Install each manifold assembly in accordance with manufacturer's instructions. Coordinate installation with sheet metal trade.

.3 Connect with valved steam and condensate piping.

.4 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.5 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.6 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.4 INSTALLATION OF DEHUMIDIFIERS

.1 Provide a dehumidifier.

.2 Secure indoor cabinet assembly in place, level, and plumb, from structure by means of galvanized steel hanger rods with galvanized steel hardware, and vibration isolation spring hangers. Ensure unit drain pan is connected with properly sized, insulated condensate drainage piping terminated over a suitable drain point.

.3 Secure outdoor unit in place on vibration isolation pads on support structure provided.

.4 Brace and secure equipment in accordance with requirements specified in Section 20 05 48.16 - Seismic Controls for Mechanical Systems.

.5 Provide valved piping to water cooled condenser as indicated and in accordance with unit manufacturer's instructions and requirements of Section 23 21 00 - Hydronic Piping and Pumps.

.6 Provide refrigerant piping from outdoor unit to indoor unit in accordance with unit manufacturer's instructions and piping schematics, and requirements of Section 23 23 00 - Refrigerant Piping. If unit is not factory charged with refrigerant, provide required refrigerant.

.7 Install thermostat and humidistat. Confirm exact locations prior to roughing-in.

.8 Perform required control wiring (except building automation system connection) in conduit in accordance with manufacturer's control wiring schematics and wiring standards of the electrical work.

.9 For equipment/system manufacturer certification requirements, Refer to Section 20 05 00 – Common Work Results for Mechanical.

.10 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.11 Include for a 1/2 day on-site operation demonstration and training session. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

END OF SECTION

PART 1 - GENERAL

1.1 SUBMITTALS

.1 Submit shop drawings/product data sheets for following:

.1 all control system components;

.2 identified schematic control diagrams with component identification, catalogue numbers, and sequence of operation for all systems;

.3 certified wiring diagrams for all systems.

.2 Submit following samples for review:

.1 control damper section with linkage, operator, and certified flow and leakage data;

.2 wall mounting control system flow diagram as specified in Part 2 of this Section;

.3 each type of thermostat to be used, each identified as to intended use.

1.2 CLOSEOUT SUBMITTALS

.1 Submit a site inspection and start-up report from manufacturer's representative as specified in Part 3 of this Section.

.2 Submit written confirmation from control component manufacturer that site installation personnel are qualified and experienced in installation of components, and have parts and service availability on a 24/7 basis.

1.3 QUALITY ASSURANCE

.1 Control systems are to be installed by control component manufacturer or by licensed personnel authorized by control component manufacturer. Submit written confirmation from control component manufacturer.

.2 Control wiring work is to be performed by licensed journeyman electricians, or under direct daily supervision of journeyman electricians.

PART 2 - PRODUCTS

2.1 AUTOMATIC CONTROL VALVES AND OPERATORS

.1 Each control valve must be suitable in all respects for the application, including system pressure, and must have design output and flow rates with maximum pressure drops as follows:

.1 chilled water valves for coils: __ kPa (__ psi);

.2 heating water/glycol solution valves for coils: ___ kPa (___ psi);

.3 heating water valves for radiation units: ___ kPa (___ psi);

.4 steam valves for coils: _____.

.2 Body and trim materials selected in accordance with specification for globe valves, ball valves, or high performance butterfly valves, and in accordance with manufacturer's recommendations for design conditions and service.

.3 Size control valves for pressure drops and heating and cooling loads as scheduled with same pressure rating as globe valves under same service and pressure conditions.

.4 Size valves for two port and three port, two position service;

.1 line size,

.2 ball valves, sizes NPS 1-1/2 and smaller,

.3 butterfly valves, sizes NPS 2 and larger.

.5 For two port and three port modulating service;

.1 use globe valves for CV rating 160 and smaller,

.2 use butterfly valves for CV rating above 160.

.6 Select butterfly valves based on CV rating at 70° rotation

.7 Hydronic system valves;

.1 two position service;

.1 straight through two port type, single seated, with replaceable disc or ball,

.2 quick opening linear or equal percentage flow characteristics.

.2 modulating service;

.1 straight through two port type, single seated,

.2 equal percentage flow characteristics.

.3 modulating diverting service; three port mixing valves,

.1 linear for each port to give constant total flow or,

.2 equal percentage flow characteristics with 25% valve authority (valve pressure drop equal to 33% pressure drop through load at full flow).

.4 actuator and trim selected for close-off pressure ratings as follows;

.1 two-way modulating or two position service; 150% of pump shut off head.

.2 three-way modulating service; 300% of pressure differential between ports A and B at design flow or 100% of pump shut off head.

.3 shut off head to be based on maximum rpm when pump is fitted with VFD.

.5 sized as follows;

.1 for two-position service; line size.

.2 for two-way modulating service unless otherwise shown; pressure drop at design flow equal to greatest of;

.1 200% of pressure drop through heat exchanger,

.2 100% of pressure drop through coil,

.3 50% of pressure difference between supply and return mains, or

.4 35 kPa (5 psi).

.3 for three-way modulating service; pressure drop equal to smaller of;

.1 twice pressure drop through coil or heat exchanger, or

.2 35 kPa (5 psi).

.4 for valves for radiation, terminal units and reheat coils;

.1 pressure drop of 7 kPa (1 psig)

.6 failed position on isolation from control signal as follows;

.1 Heating water and glycol zone valves; fail open.

.2 Heating coil valves in AHU; fail open.

.3 Chilled water control valves; fail closed.

.4 Chilled water differential pressure by-pass control valves; fail open.

.5 Hot water and glycol differential pressure by-pass control valves; fail closed.

.8 Steam valves:

.1 globe type, with equal percentage flow characteristics.

.2 actuator and trim selected for close-off pressure rating equal to 150% of operating (inlet) pressure.

.3 sized as follows:

.1 two-position service;

.1 pressure drop at design flow equal to 10%-20% of inlet steam gauge pressure.

.2 modulating service at inlet steam gauge pressure of 100 kPa (15 psig) or less;

.1 pressure drop at design flow equal to 80% of inlet steam gauge pressure.

.3 modulating service at inlet steam gauge pressure of 101-350 kPa (16-50 psig);

.1 pressure drop at design flow equal to critical pressure drop (45% of absolute inlet pressure).

.4 modulating service with inlet steam gauge pressure over 350 kPa (50 psig);

.1 pressure drop as scheduled.

.5 modulating steam loads greater than 570 kW (2000 lbs/hr) at all pressures;

.1 provide two valves, connected in parallel and controlled in sequence, with first valve in opening sequence sized for [a] and second for [b] of steam load.

.9 Valve actuators for service other than radiation, radiant panel and reheat coil valve applications;

.1 sized and selected in accordance with manufacturer’s specifications,

.2 electric/electronic for two position, or proportional control action, coupled to valves with linkage,

.3 electronic interface control board, solid state drive, reversible motor, oil immersed gear train,

.4 electronic overload or digital rotation sensing circuitry to protect damper operator through entire range of rotation,

.5 span and zero travel adjustment,

.6 position feedback signal on actuators used for proportional control,

.7 provision for manual positioning of valve when actuator is not powered,

.8 spring return mechanism to return valve to “normal” position on power failure (i.e. Normally Open (NO), or Normally Closed (NC)),

.9 control signals:

.1 0-10 VDC or 0-20 mA,

.2 modulate damper position with 2 to 10 VDC or 4-20 mA input signal operating range when in proportional service.

.3 input type and range as suitable for interfacing to output of BAS controller.

.10 feedback signals:

.1 two independent adjustable travel limit switches and wiring to BAS for indication of valve position.

.11 general purpose, drip proof NEMA 2 die-cast housing with corrosion resistant steel cover for indoor applications, watertight NEMA 4 enclosure for outdoor use,

.12 electric actuators suitable for operation down to -35°C where installed outdoors.

.10 Valve actuators for service on radiation, radiant panel, and reheat coil valve applications;

.1 output shaft driven by gear train mechanism.

.2 reversible motor with automatic load limit,

.3 input type and range as suitable for interfacing to output of BAS controllers,

.4 adjustable span and offset travel,

.5 position feedback signal on actuators used for proportional control,

.6 general purpose, dustproof, die-cast aluminum housing,

.7 actuator rotation limit.

.11 Chilled water “energy valves”:

.1 Belimo Energy Valve, pressure independent complete with Power Control and Belimo Delta T Manage logic built in to monitor coil performance and optimize the available energy of the coil by maintaining Delta T, standard analog signal and feedback wiring and connection to the BAS via BACnet MS/TP and built-in web server for visualization of the valves’ operation in real time.

.12 Unless otherwise specified, pneumatic valve operators are to be renewable neoprene diaphragm piston type. Pneumatic operators used to sequence multiple valves must be equipped with a pilot positioner to ensure proper sequence of each valve and allow for an adjustable "dead band" between heating and cooling valves.

2.2 CONTROL DAMPERS AND OPERATORS

.1 T. A. Morrison & Co. Inc. "TAMCO" 100 mm (4 in) deep, flanged, AMCA low leakage certified aluminium dampers. Dampers for modulating and mixing applications are to be parallel blade type. Dampers for open-shut service are to be opposed blade type. Maximum blade length is to be 1 m (4 ft). Dampers greater than 2 sections wide are to be complete with a jackshaft. Each damper is to be complete with:

.1 extruded 6063T5 aluminum frame and airfoil blades, each with an integral slot to receive a gasket;

.2 extruded TPE frame gaskets and extruded EPDM blade gaskets;

.3 slip-proof aluminium and corrosion resistant plated steel linkage of a metal thickness to prevent warping or bending during damper operation, concealed in frame, equipped with seal-sealing and self-lubricating bearings consisting of a Celcon inner bearing fixed on hexagonal blade pin and rotating in a polycarbonate outer bearing inserted in frame.

.2 For standard damper(s), Series 1000 as above.

.3 For insulated damper(s), Series 9000 as above but with all 4 sides of frame insulated with polystyrene, and blades thermally broken and insulated with expanded polyurethane foam.

.4 For stainless steel dampers, as above but constructed of type 316 stainless steel and equipped with Teflon blade bearings.

.5 Each damper motor is to be shaft mounted, spring return, fail safe in the normally open or normally closed position, sized to control damper against maximum pressure or dynamic closing pressure, whichever is greater, to suit sizes of dampers involved, and to provide sufficient force to maintain damper rated leakage characteristics. Each operator is to be complete with a damper position indicator, and external adjustable stops to limit length of stroke in either direction, and is to be mounted on a corrosion resistant adjustable bracket. Operating arms are to have double yoke linkages and double set screws for fastening to damper shaft. Operators for dampers to be connected to building fire alarm system or to freeze protection devices are to be equipped with additional relays to permit dampers to respond and go to required position in less than 15 s upon receipt of a signal. Operator enclosures are to be suitable in all respects for environment in which they are located.

.6 Electric damper operators are to be equal to Belimo EF Series 24 V or 120 VAC spring return, direct coupled electric motor operators for either modulating or 2-position control as required. Each operator is to be overload protected and complete with an enclosure to suit the mounting location.

.7 Pneumatic damper operators are to be replaceable elastomer diaphragm piston type, suitable in all respects for damper sequence.

2.3 LOCAL CONTROL PANELS

.1 NEMA 1 (NEMA 2 in sprinklered areas) wall mounting, enamelled steel barriered enclosures sized to suit the application with 20% spare capacity, a perforated sub-panel, numbered terminal strips for all low and line voltage wiring, hinged door, and slotted flush latch.

2.4 CONTROL SYSTEM COMPONENTS

.1 Components specified below are required for control of equipment and systems in accordance with drawing control diagrams and sequences of operation. Not all required components may be specified.

.2 Sensor/transmitter input devices must be suitable in all respects for the application and mounting location. Devices are as follows:

.1 unless otherwise specified, temperature sensors are to be resistance type, either 2-wire 1000 ohm nickel RTD or 2-wire 1000 ohm platinum RTD with accuracy (includes errors associated with sensor, lead wire, and A to D conversion), equipped with type 316 stainless steel thermowells for pipe mounting applications, as follows:

.1 chilled water, room temperature, and duct temperature points, ±1°C (±0.5°F);

.2 all other points, ±0.75°C (±1.3°F).

.2 room temperature sensors constructed to be selected in accordance with the following classifications:

.1 Type 1: Space temperature sensor (private/non-public areas);

.1 for measurement of space temperature only as shown on the floor plans and/or as described in the Sequence of Operation;

.2 set-point adjustment shall be accessible through the cover;

.3 sensor operating temperature range from 4°C to 60°C (40°F to 140°F);

.4 surface mounted plastic mono-chromatic guard with surface mounting plate and wall anchors;

.5 mono-chromatic guard secured to mounting plate by screws;

.2 Type 2: Space temperature sensor (public areas or secure areas);

.1 for measurement of space temperature of space temperature only in areas subject to vandalism as shown on the floor plans and/or as described in the Sequence of Operation;

.2 sensor operating temperature range from 4°C to 60°C (40°F to 140°F);

.3 stainless steel flat plate surface type with sensor epoxy-bonded to back of cover plate;

.4 tamperproof/secure concealed fasteners;

.5 set-point adjustment is to be concealed behind the cover.

.3 Type 3: Adjustable space temperature sensor with display (Private Areas, Office areas);

.1 for measurement and adjustment of space temperature as shown on the floor plans and/or as described in the Sequence of Operation;

.2 digital set point operating temperature adjustment range from 4°C to 60°C (40°F to 140°F);

.3 surface mounted plastic mono-chromatic guard with surface mounting plate and wall anchors;

.4 mono-chromatic guard secured to mounting plate by screws;

.5 on/off button to allow occupant override feature;

.6 three-digit LED digital temperature display with 0.2° display resolution;

.7 5% to 95% relative humidity, non-condensing;

.8 minimum/maximum limit set point values adjustable from the BAS operator interface and controller.

.9 set-point adjustment is to be accessible through the cover.

.3 outside air sensors designed and constructed for an ambient temperature of -25°C to 60°C (-13°F to 140°F) and 5% to 95% relative humidity, non-condensing, complete with a NEMA 3R enclosure, solar shield, a weatherproof seal at all wall penetrations, and a perforated plate surrounding sensor element where exposed to wind velocity pressure;

.4 insertion duct mounting sensors type with lock nut and mounting plate, designed to mount in an electrical box (weatherproof with gasket and cover where outside) through a hole in duct;

.5 for ducts greater than 1.2 m (4 ft) or for ducts where air temperature stratification occurs, averaging type sensors with multiple sensing points, and for plenums for applications such as mixed air temperature measurement to account for air turbulence and/or stratification, an averaging string of sensors with capillary supports on the sides of duct/plenum;

.6 Where both temperature and humidity are shown to be measured at same location or in same airstream, use of single measuring unit is permitted provided that features and performance of both temperature sensor and humidity sensor are in accordance with requirements of this specification.

.3 factory solid-state relative humidity sensors with an element that resists contamination, weather-proof with a NEMA 3R enclosure for outside air applications, supplied with a type 304 stainless steel probe with mounting bracket and hardware for duct mounting, each complete with a factory calibrated humidity transmitter which is accurate (including lead loss and analog to digital conversion) to 3% between 25°C to 60°C (-13°F to 140°F) and 5% to 95% relative humidity, non-condensing and complete with non-interactive span and zero adjustments, and a 2-wire isolated loop powered, 4-20 mA, 0 to 100% linear proportional output;

.4 carbon dioxide sensors for air quality control purposes having a maximum 20 s response time, suitable for operating conditions from 0°C to 50°C (32°F to 122°F) and 0 to 100% RH non-condensing, complete with a calibration kit (to be handed to Owner) and characteristics as follows:

.1 measurement range: 0 to 2000 ppm;

.2 accuracy: ±100 ppm;

.3 repeatability: ±20 ppm;

.4 drift: ±100 ppm per year;

.5 output signal: 0-10 VDC proportional over the 0 to 2000 ppm range.

.5 Pressure transmitters are to be constructed to withstand 100% pressure over-range without damage and to hold calibrated accuracy when subject to a momentary 40% over-range input. Pressure transmitters are to transmit a 0 to 5 VDC, 0-10 VDC, or 4-20 mA output signal. Differential pressure transmitters used for flow measurement are to be sized to the flow sensing device and supplied with a tee fitting and shut-off valves in the high and low sensing pick-up lines to allow permanent ease of use connection for balancing, etc. Transmitter housing is to suit mounting location. Standalone pressure transmitters are to be mounted in a minimum NEMA 1 (NEMA 2 in sprinklered area) by-pass valve assembly panel with high and low connections piped and valved, air bleed units, by-pass valves, and compression fittings. Transmitters are to be as follows:

.1 low differential water pressure, 0 to 5 kPa (0 to 20" wc): equal to Setra or Mamac industrial quality transmitter capable of transmitting a linear 4-20 mA output signal in response to variation of flow meter differential pressure or water pressure sensing points, each complete with non-interactive zero and span adjustments adjustable from outside the cover, and performance as follows:

.1 maintain accuracy up to 20 to 1 ratio turndown;

.2 reference accuracy: +0.2% of full scale.

.2 medium to high differential water pressure, over 5 kPa (20" wc): equal to Setra or Mamac transmitters as specified above for low pressure transmitters but with a pressure range of from 2.5 kPa (10" wc) to 2070 kPa (300 psi), a reference accuracy of ±1% of full span (includes non-linearity, hysteresis, and repeatability);

.3 building differential air pressure: equal to Setra or Johnson Controls Inc. industrial quality transmitter with a range suitable for the application, capable of transmitting a linear 4-20 mA output in response to variation of differential pressure or air pressure sensing points, each complete with non-interactive zero and span adjustments adjustable from outside the cover, and performance as follows:

.1 maintain accuracy up to 20 to 1 ratio turndown;

.2 reference accuracy: +0.2% of full span.

.4 low differential air pressure, 0 to 1.25 kPa (0" to 5" wc): equal to Setra or Johnson Controls Inc. industrial quality transmitter with a range suitable for the application, capable of transmitting a linear 4-20 mA output signal in response to variation of differential pressure or air pressure

sensing points, each complete with non-interactive zero and span adjustments adjustable from outside the cover, and performance as follows:

.1 maintain accuracy up to 20 to 1 ratio turndown;

.2 reference accuracy: +0.2% of full span.

.5 medium differential air pressure, over 1.5 kPa (5" wc): equal to Setra or Johnson Controls Inc. transmitters as specified above for low pressure air transmitters but performance requirements as follows:

.1 zero and span: (c/o F.S./°F); 0.04% including linearity, hysteresis, and repeatability;

.2 accuracy: 1% F.S. (best straight line); static pressure effect: 0.5% F.S.;

.3 thermal effects: less than +0.33 F.S./°F over 40°F to 100°F (calibrated at 70°F).

.6 Air and water flow monitoring stations and probes are to be Air Monitor Corp., Tek-Air Systems Inc., Ebtron, or Dietrich Standard products as follows:

.1 Fan Inlet Air Flow Measuring Station: At fan inlet and near exit of inlet sound trap, air flow traverse probes are to continuously monitor fan air volume and system velocity pressure, and traverse probes are to be as follows:

.1 each probe is to be of a dual manifold, cylindrical, anodized type 3003 extruded aluminium construction probe with sensors located along the stagnation plane of approaching air flow, and the static pressure manifold is to incorporate dual offset static tops on opposing sides of averaging manifold so as to be insensitive to flow angle variations for as much as ±20° in approaching air stream;

.2 each probe is not to introduce a measurable pressure drop, nor is sound level within duct to be amplified by its singular or multiple presence in air stream, and each probe is to contain multiple static and total pressure sensors places at equal distances along its length in accordance with ASHRAE Standards for duct traversing.

.2 Single Probe Air Flow Measuring Sensor: Duct mounting hot wire anemometer type which utilizes 2 temperature sensors, one is a heater element temperature sensor and the other is to measure downstream temperature, with temperature differential related directly to air flow velocity. Sensor insertion length is to be adjustable up to 200 mm (8 in), and transmitter is to produce a 4-20 mA or 0-10 VDC signal linear to air velocity.

.3 Duct Flow Measuring Stations: 14 gauge galvanized steel casing with duct connection flanges of a size to mate with connecting ductwork, and complete with an air directionalizer and a 98% free area parallel cell 20 mm (3/4") honeycomb profile suppressor across entering air stream to equalize velocity profile and eliminate turbulent and rotational flow from the air stream prior to measuring point, mechanically fastened to casing so as to withstand velocities of up to 1828 m (6000 ft) per minute. Additional requirements as follows:

.1 total pressure measurement side (high side) is to be designed and spaced to requirements of Industrial Ventilation Manual, 16th Edition, page 9-5, and self-averaging manifolding is to be constructed of brass and copper components;

.2 static pressure sensing probes (low side) is to be bullet-nose shaped, per detailed radius, as illustrated in Industrial Ventilation Manual referred to above, page 9-5;

.3 main take-off point from both total pressure and static pressure manifolds is to be symmetrical, and manifolds are to terminate with external ports for connection to control tubing;

.4 each station is to be equipped with a label on casing indicating unit model number, size, area, and specified air flow capacity;

.5 each station is to have a self-generated sound rating of less than NC 40, and sound level within duct is not to be amplified nor is additional sound to be generated.

.4 Static Pressure Traverse Probe: Duct mounting, complete with multiple static pressure sensors located along exterior surface of cylindrical probe.

.5 Shielded Static Air Probe: Indoor type or outdoor type as required, each with multiple sensing ports, an impulse suppression chamber, and air flow shielding.

.6 Water Flow Monitoring: Equal to Onicon microprocessor-based electromagnetic water flow meters with an accuracy of 0.25%.

.7 Power (amps) monitoring is to be performed by a combination of a current transformer and a current transducer with transformer sized to reduce full amperage of monitored circuit to a maximum 5 A signal which will be converted to a 4-20 mA DDC compatible circuit for use by building automation system. Current transformer and current transducer are as follows:

.1 equal to Veris Industries split core current transformer with an operating frequency of from 50 Hz to 400 Hz, 0.6 kV class, 10 kV BIL insulation, and 5 A secondary;

.2 equal to Veris Industries current to voltage or current to mA transducer with an accuracy of ±5%, a minimum load resistance of 30 kOhm, an input of 0 to 20 A and an output of 4-20 mA, and a 24 VDC regulated power supply.

.8 Duct mounting smoke detectors supplied as part of electrical work for mounting as part of control system work.

.9 Double contact switches to monitor equipment status and safety conditions, and generate alarms when a failure or abnormal condition occurs. Status and safety switches are to be as follows:

.1 current sensing switches: equal to Veris Industries self-powered dry contact output switches for sensing run status of motor loads, each calibrated to indicate a positive run status only when motor is operating under load, and each consisting of a current transformer, a solid-state current sensing circuit, adjustable trip point, solid-state switch, SPDT relay, and a LED to indicate on or off status;

.2 air filter status switches: equal to Johnson Controls Inc. or Cleveland Controls automatic reset type differential pressure switches, each complete with SPDT contacts rated for 2 A at 120 VAC, a scale range and differential pressure adjustment appropriate for the service, and an installation kit which includes static pressure taps, tubing, fittings, and air filters;

.3 air flow switches: equal to Johnson Controls Inc. or Cleveland Controls pressure flow switches, bellows actuated mercury switch or snap-acting micro-switch type with an appropriate scale range and pressure adjustment;

.4 air pressure safety switches: equal to Johnson Controls Inc. or Cleveland Controls manual reset switches, each complete with SPDT contacts rated for 2 A at 120 VAC and an appropriate scale range and pressure adjustment;

.5 water flow switches: equal to Johnson Controls Inc. Model P74;

.6 low temperature limit switches: manual reset type equal to Johnson Controls Inc. Model A70, each complete with DPST snap acting contacts rated for 16 A at 120 VAC, a minimum 4.5 m (15 ft) sensing element for mounting horizontally across duct/plenum with sensing reaction from coldest 450 mm (18 in) section of element, and where sensing element does not provide full coverage of air stream, additional switches are to be supplied as required.

.10 Control relays as follows:

.1 control pilot relays: equal to Johnson Controls Inc. or Lectro modular plug-in design with snap-mount mounting bases, retaining springs or clips, DPDT, 3 PDT or 4 PDT as required for the application, with contacts rated for 10 A at 120 VAC;

.2 lighting control relays: latching type with integral status contacts rated for 20 A at 120 VAC, each complete with a split low voltage coil that moves the voltage contact armature to On or Off latched position, each controlled by a pulsed tri-state output (preferred) or pulsed paired binary outputs, and each designed so power outages will not result in a change-of-state and so multiple same state commands will simply maintain commanded state.

.11 Electronic signal isolation transducers equal to Advanced Control Technologies for installation whenever an analog output signal from building automation system is to be connected to an external control system as an input (i.e. equipment control panel), or is to receive as an input signal from a remote system, and to provide ground plane isolation between systems.

.12 Each manual override station is to be complete with contacts rated minimum 1 A at 24 VAC and is to provide following:

.1 integral H-O-A switch to override controlled device pilot relay;

.2 status input to building automation system to indicate whenever switch is not in the Auto position;

.3 status LED to illuminate whenever output is On;

.4 override LED to illuminate whenever H-O-A switch is in either the Hand or Off position.

.13 Electronic/pneumatic transducers equal to Johnson Controls Inc. transducers with an output of from 3 psig to 15 psig, an input of from 4-20 mA or 0-10 VDC, manual output adjustment, a pressure gauge, and an external replaceable supply air filter.

.14 Thermostats:

.1 Wall mounting adjustable set-point thermostats, each suitable in all respects for equipment (and operating sequence) they are provided for, equipped with a thermometer, a cover and any required mounting and connection accessories.

.2 Pneumatic thermostats are to be of bimetal element construction, double valve type, operating without constant waste of air.

.3 Line voltage thermostats are to be 115 V.

.4 Low voltage thermostats are to be 24 V electronic type.

.5 Set-point adjustment for thermostats in public spaces is to be concealed behind cover. Set-point adjustment for other thermostats is to be accessible through cover.

.6 Covers are to be removable, tamper-proof covers with temperature set-point and thermometer displays.

.7 Guards for thermostats are to be clear, ventilated acrylic covers with Allen key locking hardware.

.15 Humidistats:

.1 Direct or reverse acting (to suit system), proportional type, adjustable humidity controllers, each corrosion resistant, suitable in all respects for the application and complete with a nylon element, replaceable cartridge type air filter, internally adjustable limit stops for maximum and minimum settings, a cover, and required mounting and connection accessories.

.2 Pneumatic humidistats are to be 2 pipe type and complete with plug-in air connections.

.3 Electric humidistats are to be line voltage (115 V), or 24 V electronic type.

.4 Wall mounting humidistats are to be complete with a tamper-proof display type cover.

.5 Duct mounting humidistats are to be complete with a display type cover, duct sampling chamber with 300 mm (12 in) long extruded pick-up tube for duct mounting, a moulded mounting base, and a ventilated cover.

.16 Hardware to permit building automation system control and monitoring of input/output points in accordance with Section 25 05 02 – Building Automation System, points schedule, and drawing control diagrams and operation sequences. All such hardware is to be suitable in all respects for interface with the building automation system.

2.5 SYSTEM WIRING MATERIALS

.1 System wiring, conduit, boxes, and similar materials are to be in accordance with requirements specified in appropriate Section(s) of Electrical Work specification.

2.6 AIR COMPRESSOR SET AND ACCESSORIES

.1 Package type, duplex, receiver mounted, automatic, CSA certified air compressor set selected to meet all requirements of control system while operating not more than 33% of the time with a maximum of 6 starts per hour. Compressor set complete with a low resistance air intake filter/silencer, and motors and V-belt drives with guards in accordance with requirements of Section 20 05 00 – Common Work Results for Mechanical, and following:

.1 suitably sized, ASME rated and stamped steel receiver in accordance with CSA B51 and Provincial requirements with support feet, rubber-steel-rubber type vibration isolation pads, automatic tank drain, adjustable pressure switch, safety relief valve, check valve, self-lubricating ball type outlet valve, manual drain valve, and a flexible tank to air piping flexible connection supplied loose for site installation;

.2 separate (supplied loose) surface wall mounting starter and control panel factory pre-wired for single point site connection of electric power, complete with NEMA 2 enclosure, door interlock disconnect switch, a fused overload protected magnetic starter for each motor, control transformer, 2 NO and 2 NC auxiliary contacts, a green "power on" LED and a white LED for each working compressor, and an alternator to automatically alternate the working compressor after each start and to automatically start lag compressor if working compressor fails;

.3 packaged type refrigerated air dryer sized to suit and supplied lose for site installation, complete with hot gas by-pass to maintain continuous operation and stable dew point, power on and high temperature indicating lights, overload protected motor starter, an integral automatic condensate drain trap, and a manual 3-valve by-pass to permit removal of heat exchanger for servicing without disrupting control system;

.4 coalescing type oil removal filter supplied loose by compressor set manufacturer for site installation, sized to control air piping main size, and equipped with automatic drain and an indicator piping kit for media maintenance inspection.

.2 Acceptable manufacturers are:

.1 DeVilbiss (Canada) Ltd.;

.2 Compair Kellog;

.3 Atlas Copco Compressors Canada.

2.7 CONTROL AIR FILTER AND PRV ASSEMBLIES

.1 Combination filter/PRV assembly with quantities to suit control system capacity requirements, each assembly complete with:

.1 oil/particle filter with drain port and replaceable coalescing filter element in a transparent polycarbonate bowl with perforated metal shield;

.2 adjustable pressure reducing valve with inlet and outlet pressure gauges and outlet safety pressure relief valve;

.3 wall mounting bracket.

.2 Each filter is to remove both 0.08 micron diameter particles and 0.01 micron diameter oil aerosol, and filter elements are to be removable without disconnecting any piping.

2.8 CONTROL AIR PIPING AND TUBING

.1 High pressure piping mains are to be Type M hard drawn seamless copper with forged copper soldering type fittings and 95% tin / 5% Antimony solder joints.

.2 Low pressure tubing is to be:

.1 seamless hard drawn phosphorized copper tubing with proper soldering type copper fittings and 50% lead / 50% tin solder joints;

.2 annealed soft copper with Garlock compression fittings;

.3 type "FR" plenum rated flame retardant polyethylene control tubing, single, twin or bundled as required, and colour coded.

PART 3 - EXECUTION

3.1 GENERAL RE: INSTALLATION OF CONTROLS

.1 Provide complete systems of control and instrumentation to control and supervise building equipment and systems in accordance with this Section and drawings.

.2 Control systems are to generally be as indicated on drawing control diagrams and are to have all the elements therein indicated or implied.

.3 Control diagrams show only the principal components controlling the equipment and systems. Supplement each control system with all relays, transformers, sensors, etc., required to enable each system to perform as specified and to permit proper operation and supervision.

.4 Brace and secure control system equipment in accordance with requirements specified in Section 20 05 48.16 – Seismic Controls for Mechanical Systems.

3.2 INSTALLATION OF CONTROL AIR PIPING AND TUBING

.1 Provide required control air piping and tubing.

.2 Connect new control air piping/tubing to existing pneumatic control air supply.

.3 Piping/tubing is to be as follows:

.1 for piping mains and branches, type "M" seamless copper;

.2 for exposed connections to control components, hard or soft copper tubing;

.3 for tubing in accessible ceiling spaces, plenum rated polyethylene, neatly bundled with plastic ties and properly supported;

.4 for connections to control components within control cabinets, soft copper or plenum rated polyethylene tubing.

.4 Properly install and support piping and tubing. Provide suitably sized trap legs with drain valves at all low points to prevent condensation pockets.

.5 Solder all copper joints except at instruments or panels where compression fittings are to be used.

3.3 SUPPLY OF CONTROL AIR DAMPERS AND OPERATORS

.1 Unless otherwise specified, supply required control dampers. Hand dampers to sheet metal trade at site in location where they are required for installation as part of sheet metal work. Ensure each damper is correctly located and mounted.

.2 Unless otherwise specified or scheduled, insulated dampers to be provided for all outdoor air intake and exhaust air applications.

.3 Provide linkage and operators for dampers. Wherever possible locate damper operators so they are accessible from outside duct, plenum, and equipment casings. Bracket mount operators on ducts or plenums clear of insulation where applicable.

.4 Where sequence operation is indicated, or where multiple operators drive a series of dampers, provide pilot positioners to couple their action.

.5 Ensure dampers located in ductwork other than galvanized steel are constructed of type 316 stainless steel.

3.4 SUPPLY OF AUTOMATIC CONTROL VALVES AND OPERATORS

.1 Unless otherwise specified, supply required automatic control valves. Hand valves to appropriate piping trades at site in locations they are required for installation as part of piping work. Ensure each valve is properly located and installed.

.2 Provide an operator for each valve.

3.5 INSTALLATION OF THERMOSTATS

.1 Unless otherwise noted, provide required thermostats.

.2 Provide a ventilated clear acrylic cover for each thermostat located in finished areas, and a wire type guard for each thermostat located in unfinished areas and in areas such as mechanical rooms where thermostat is subject to damage.

.3 Unless otherwise indicated, mount room thermostats 1.5 m (5 ft) above finished floor level. Thermostats intended to be used by building occupants in a barrier-free path of travel to be mounted at 1.2 m (4 ft). Confirm exact location of all thermostats prior to roughing-in.

.4 Provide stand-off mounting and an insulated sub-base for thermostats on outside walls.

.5 Perform control wiring associated with installation of electric or electric-electronic thermostats.

3.6 INSTALLATION OF CONTROL SYSTEM COMPONENTS

.1 Provide required control system components and related hardware. Refer to drawing control diagrams and sequences.

.2 Where components are pipe, duct, or equipment mounted supply components at proper time, coordinate installation with appropriate trade, and ensure components are properly located and mounted.

3.7 CONTROL WIRING

.1 Perform required control wiring work for control systems except:

.1 power wiring connections to equipment and panels, except as noted below;

.2 control wiring associated with mechanical plant equipment and systems whose control is not part of work specified in this Section;

.3 starter interlock wiring.

.2 Except as specified below, install wiring in conduit. Unless otherwise specified, final 600 mm (2 ft) connections to sensors and transmitters, and wherever conduit extends across flexible duct connections is to be liquid-tight flexible conduit.

.3 Control wiring in ceiling spaces and wall cavities may be plenum rated cable installed without conduit but neatly harnessed, secured, and identified.

.4 Wiring work is to be in accordance with certified wiring schematics and instructions, and wiring standards specified in appropriate Sections of Electrical Work Specification.

3.8 INSTALLATION OF CONTROL AIR COMPRESSOR SET AND DRYER

.1 Provide a duplex air compressor set. Secure set in place on vibration isolation on a concrete housekeeping pad. Install flexible piping connections supplied with set and connect with required piping, including drain piping extended and terminated at nearest drain.

.2 Wall mount power and control panel(s) adjacent to equipment. Connect compressor set panel pressure switch with copper tubing to compressor set.

3.9 IDENTIFICATION AND LABELLING OF EQUIPMENT AND CIRCUITS

.1 Refer to identification requirements specified in Section 20 05 00 – Common Work Results for Mechanical.

.2 Identify equipment as follows:

.1 enclosures and components: engraved laminated nameplates with wording listed and approved prior to manufacture of nameplates;

.2 wiring: numbered sleeves or plastic rings at both ends of conductor, with numbering corresponding to conductor identification on shop drawings and "as-built" record drawings.

3.10 TESTING, ADJUSTING, CERTIFICATION, START-UP, AND TRAINING

.1 When control work is complete, check installation of components and wiring connections, make any required adjustments, and coordinate adjustments with personnel doing HVAC testing, adjusting, and balancing work.

.2 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.3 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.4 Include for 2 full, 8 hour days on-site operation demonstration and training sessions. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

.5 Include for 2 follow-up site training and troubleshooting visits, one 6 months after Substantial Completion and other at end of warranty period, both when arranged by Owner and for a full, 8 hour

day to provide additional system training as required, and to demonstrate troubleshooting procedures.

END OF SECTION

SEE ADD#6, Q#112 & ADD#10, Q#311

PART 1 - GENERAL

1.1 ABBREVIATIONS AND DEFINITIONS

.1 Abbreviations used in this Specification are as follows:

.1 BAS building automation system;

.2 DDC direct digital controls;

.3 LAN local area network;

.4 PC personal computer.

1.2 SUBMITTALS

.1 Submit shop drawings/product data sheets for BAS components. As a minimum, submit the following:

.1 BAS network architecture, including modes and interconnections;

.2 systems schematics, sequences, and flow diagrams;

.3 points schedule for each point in BAS, including point type, object name, expanded ID, display units, controller type, and address;

.4 samples of graphic display screen types and associated menus;

.5 detailed Bill of Materials for each system or application, identifying quantities, part numbers, descriptions, and optional features;

.6 control damper schedule including a separate line for each damper and a column for each of damper attributes including code number, fail position, damper type, damper operator, duct size, damper size, mounting and actuator type;

.7 control valve schedules including a separate line for each valve and a column for valves as for control dampers;

.8 room schedule including a separate line for each HVAC terminal unit indicating type, location and address;

.9 details of BAS interfaces and connections to other systems;

.10 product data sheets or marked catalogue pages including part number, photograph and description for BAS hardware and software.

1.3 CLOSEOUT SUBMITTALS

.1 Submit a site inspection and start-up report from manufacturer’s representative as specified in Part 3 of this Section.

.2 Record "as-built" drawings are to include:

.1 schematic outline of BAS for quick reference of overall system scope;

.2 adequate record of work as installed, including locations and routing of system wiring.

.3 O&M Manual is to include:

.1 hardware specification manual which gives a functional description of hardware components;

.2 operator’s manual which outlines concise instructions for operation of system and an explanation and recovery route for system alarms;

.3 engineering manual which outlines and defines system set-up, definition and application;

.4 data manual which indicates applications data programmed into system;

.5 system software documentation.

1.4 DESCRIPTION OF THE BUILDING AUTOMATION SYSTEM

.1 Building automation system is to consist of a modular, BACnet protocol, open architecture system incorporating direct digital control and monitoring of equipment and systems and consisting of all hardware and software required for complete, functional DDC control system. BAS is to be accessible through standard personal computers within building through a wireless application protocol device, or remotely through Internet by means of a standard web browser.

.2 BAS is to be field expandable, with a distributed architectural design to eliminate dependence upon any single device for alarm reporting and control execution. Failure of any single component or network connection is not to interrupt execution of control strategies at other operational devices. BAS is to maintain all settings and overrides through a system re-boot, and is to incorporate, as a minimum, following integrated features, functions, and services:

.1 graphic user interface for accessing and viewing BAS information, commanding points, changing setpoints, responding to alarms, programming time-of-day schedules;

.2 operator information, alarm management, and control features;

.3 enterprise-level information and control access;

.4 information management including monitoring, transmission, archiving, retrieval, and reporting functions;

.5 diagnostic monitoring and reporting of BAS functions;

.6 off-site monitoring and management access;

.7 energy management;

.8 standard applications for terminal HVAC systems.

.3 BAS is to include, but not be limited to, following:

.1 personal computer based server for networking and integrating all hardware components into a single BAS;

.2 personal computer based operator work station with colour monitor for colour graphic displays, and a colour printer;

.3 portable operator’s terminal;

.4 network of standalone network automation engine(s);

.5 network of field equipment controllers;

.6 input/output modules;

.7 local display devices;

.8 distributed user interfaces;

.9 network processing, data storage and communication equipment;

.10 all other components required for a complete and operating BAS.

1.5 QUALITY ASSURANCE

.1 BAS hardware and software is to be installed by experienced personnel employed and trained by manufacturer/supplier of field equipment controllers. System wiring is to be installed by journeyman electricians or under direct on-site supervision of journeyman electricians.

PART 2 - PRODUCTS

2.1 GENERAL RE: BUILDING AUTOMATION SYSTEM

.1 Control system components (field devices) other than those specified in this Section are generally specified in Section 25 05 01 – Automatic Control Systems. Components factory installed with equipment or supplied with equipment are specified in mechanical work Sections with equipment.

.2 BAS specified in this Section is an expandable DDC building automation system in accordance with drawing control diagrams and sequences, and points lists.

.3 Manufacturers:

.1 Johnson Controls Inc.;

.2 Siemens Building Technologies Inc.;

.3 Honeywell International Inc.;

.4 Trane Controls;

.5 Distech Controls;

.6 Delta Controls;

.7 Schneider Electric;

.8 Alerton.

2.2 BAS ARCHITECTURE

.1 BAS is to be based industry standard Ethernet TCP/IP communications protocol. Where used, LAN controller cards are to be standard "off-the-shelf" products available through normal PC vendor channels. BAS is to be capable of operating at a communication speed of 100 Mbps, with full peer-to-peer network communication. BAS is to be compatible with other enterprise-wide networks, and where indicated, BAS is to be connected to the enterprise network and share resources with it by way of standard networking devices and practices.

.2 Network automation engines are to provide supervisory control over control network and are to support BACnet Standard MS/TP bus communication protocol (ASHRAE SSPC-135, Clause 9). Control networks are to provide either a "peer-to-peer", master-slave, or supervised token passing communications and are to operate at a minimum communication speed of 9600 baud. DDC controllers are to reside on control network.

.3 BAS is to include appropriate hardware and software to allow BACnet bi-directional data communications between BAS and building equipment/system control panels. BAS is to receive, react to, and return information from connected equipment and systems. Data required by application is to be mapped into automation engine’s data base and is to be transparent to operator. Point inputs and outputs from building equipment/system control panels is to have real-time interoperability with BAS software features such as control software, energy management, custom process programming, alarm management, historical data and trend analysis, totalization, and local area network communications.

2.3 DEDICATED WEB BASED USER INTERFACE

.1 User interface is to be web based and is to operate on a personal computer for command entry, information management, network alarm management, and database management functions. Real-time control functions including scheduling, history collection, and alarming are to be resident in appropriate components of BAS network to facilitate greater fault tolerance, availability, and reliability.

.2 Architecture of personal computer is to be implemented to conform to industry standards such that it can accommodate applications provided with BAS and mechanical systems and equipment, including but not limited to Microsoft Office Applications. Specifically, it must conform to following interface standards:

.1 Microsoft Edge (or other standard browser) for user interface functions;

.2 Microsoft Office Professional for creations, modification and maintenance of reports, and sequencing other necessary building management functions;

.3 Microsoft Outlook or other email program for supplemental alarm functionality and communication of system events, and reports;

.4 required network operating system for exchange of data and network functions such as printing of reports, trends, and specific system summaries.

.3 Personal computer server or operator workstation is to be configured at minimum as follows:

.1 memory: 8 GB;

.2 processor: Intel;

.3 hard drive: 500 GB free hard drive;

.4 graphics card: 1 GB DDR3;

.5 ports: 1 HMDI, 2 serial, one parallel, and 2 USB-C ports;

.6 keyboard: 101 keyboard and 2-button mouse;

.7 monitors: 584 mm (23 in) LCD monitor with 1920 x 1080 resolution;

.8 LAN communications: 10/100/1000 network card.

.4 Operating System Software: Windows 7 Professional 64-bit Microsoft SQL 2008 Server and SQL 2008 Server Express are automatically installed by EBI. Where user interface is not provided via browser, PC is to be equipped with a complete workstation software package including any software or hardware keys, and package is to include original installation discs and licenses for all software, device drivers, peripherals, and software registration cards which are to be handed to Owner.

.5 Printer is to be at minimum equal to Hewlet Packard "DeskJet" colour printer with a speed of 600 DPI black and 300 DPI colour, and 64 kB input print buffer.

2.4 DISTRIBUTED WEB BASED USER INTERFACE

.1 Features and functions of dedicated web-based user interface described above are to be available on any computer connected directly or via a wide area or virtual private network to BAS network, which conforms to the following specifications:

.1 software is to run on Microsoft Edge (or other standard browser);

.2 minimum hardware requirements are:

.1 2 GB RAM;

.2 2.0 GHz clock speed Pentium 4 microprocessor;

.3 120 GB hard drive;

.4 keyboard with 83 keys minimum;

.5 SVGA 1024 x 768 resolution display with 64 k colours and 16 bit colour depth;

.6 mouse or other pointing feature.

2.5 REMOTE ACCESS VIA SMART PHONE AND/OR TABLET DEVICES

.1 Available with an operator interface designed for use on various modern smart phone devices with network connectivity with the follow features:

.1 Mobile user interface operating over standard TCP network connection, performing well down to standard mobile 3G speeds, and optimized to ensure very high performance across different network topologies.

.2 Solution written with HTML5 web standards and browser agnostic, not deploying or using ActiveX controls, nor requiring installation of Java Runtime engine.

.3 Mobile solution incorporating full scope of responsibilities of BAS operators for remote mobile users, allowing them to view or control points within their assigned facility locations.

.4 Without alternation, mobile user interface operable within any standard internet browser from a normal personal computer.

.2 Along with optimized smart phone user interface, a dedicated tablet access user interface, optionally providing full operator workstation functionality, on a tablet style device. Tablet interface is to support standard operator workstation features including full operator scope of responsibility, and operable using commercial off-the-shelf technology.

2.6 USER INTERFACE APPLICATION COMPONENTS

.1 Integrated browser based client application is to be used as user operator interface program. System is to employ an event-driven rather than a device polling methodology to dynamically capture and present new data to user. Additional features are as follows:

.1 inputs, outputs, set-points, and other parameters as defined in Part 3 of this Section, shown on drawings, or required as part of system software are to be displayed for operator viewing and modification from operator interface software;

.2 user interface software is to provide help menus and instructions for each operation and/or application;

.3 system is to support customization of user interface configuration and a home page for each operator;

.4 system is to support user preferences in alarm, trend, display, and applications screen presentations;

.5 controller software operating parameters are to be displayed for operator to view/modify from user interface, and these parameters are to include set-points, alarm limits, time delays, PID tuning constants, run times, point statistics, schedules, etc.;

.6 operator interface is to incorporate comprehensive support for functions including but not limited to following:

.1 user access for selective information retrieval and control command execution;

.2 monitoring and reporting;

.3 alarm, non-normal, and return to normal condition annunciation;

.4 selective operator override and other control actions;

.5 information archiving, manipulation, formatting, display and reporting;

.6 BAS internal performance supervision and diagnostics;

.7 on-line access to help menus;

.8 on-line access to current BAS as-built records and documentation;

.9 means for controlling, re-programming, and re-configuration of the BAS operation and for the manipulation of the BAS database information in compliance with applicable Codes and Regulations for individual BAS applications.

.7 system is to support a list of application programs configured by users that are called up by the Tools Menu, hyperlinks within graphic displays, and key sequences;

.8 operation of control system is to be independent of user interface, which is to be used for operator communication only.

.2 System is to have a minimum of 5 levels of nesting, and the capability of displaying multiple navigation trees to aid operator in navigating throughout all systems and points connected, adding custom trees, defining any logical grouping of points, and arranging them on a tree in any order, and nesting groups within other groups. Navigation trees are to be "dockable" to other displays such as graphics, meaning trees will appear as part of display but can be detached and then minimized to Windows task bar or closed altogether, however, a simple keystroke will reattach navigation to primary display of user interface.

.3 Alarms are to be routed directly from network automation engines to PC’s and servers, and it is to be possible for specific alarms from specific points to be routed to specific PC’s and servers. BAS is to annunciate diagnostic alarms indicating system failures and non-normal operating conditions, annunciate application alarms as required by points lists and sequences, and as a minimum, permit 4 categories of alarm sounds customizable through user defined wav files. Alarm management segment of user interface is to provide, as a minimum, following alarm functions:

.1 log, date, and time of alarm occurrence;

.2 generate a "pop-up" window or populate a dedicate section of screen with audible alarm to inform a user that an alarm has been received;

.3 permit a user with the appropriate security level to acknowledge, temporarily silence, or discard an alarm;

.4 provide an audit trail on PC hard drive for alarms by recording user acknowledgement, deletion or disabling of an alarm, name of the user, alarm, action taken, and time/date of alarm;

.5 facilitate ability to direct alarms to an email address or alphanumeric pager, in addition to pop-up window described above;

.6 any attribute of any object in system may be designated to report an alarm.

.4 Reports and summaries are to be generated and directed to user interface displays with subsequent assignment to printers or discs. Summaries and reports are to be accessible via standard user interface functions, and selection of a single menu item, tool bar item, or tool bar button is to print any displayed report or summary. System is to permit creation of custom reports and queries via a standard web services XML (Extensible Mark-up Language) interface and commercial of-the-shelf software such as Microsoft Access, Microsoft Excel, or Crystal Reports. As a minimum, BAS is to provide following reports and summaries:

.1 all points in BAS;

.2 all points in each BAS application;

.3 all points in a specific controller;

.4 all points in a user-defined group of points;

.5 all points currently in alarm;

.6 all points locked out;

.7 all BAS schedules;

.8 all user defined and adjustable variables, schedules, interlocks, etc.

.5 Graphical display for time-of-day scheduling and override scheduling of building operations is to be provided, with weekly schedules for each group of equipment with a specific time use schedule, and it is to be possible to define one or more exception schedules for each schedule including reference to calendars, with monthly calendars provided to permit simplified scheduling of holidays and special days for a minimum of 5 years in advance, user selected with the pointing device or keyboard. Changes to schedules made from user interface are to directly modify network automation engine schedule database. Selection of a single menu item or tool bar button is to print any displayed schedule. As a minimum, following functions are to be provided:

.1 weekly schedules;

.2 exception schedules;

.3 monthly calendars;

.4 global schedules.

.6 BAS Is to be complete with multiple-level password access protection to permit user/manager to user interface control and display, database manipulation capabilities deemed appropriate for each user, based on an assigned password. Password access protection features are to include:

.1 each user is to have a user name (24 characters minimum), a password (12 characters minimum), and access levels;

.2 each user may change his or her password at any time;

.3 when editing or entering passwords, system is not to echo actual characters for display on monitor;

.4 minimum of 500 unique password is to be supported;

.5 operators are to be able to perform only those commands available for their respective passwords, and display of menu selections is to be limited to only those items defined for access level assigned to password of each user;

.6 BAS is to automatically generate a report of log-on/log-off and system activity for each user, and any action that results in a change in operation or configuration of control system is to be recorded, including acknowledgement and deletion of alarms;

.7 minimum of 5 levels of access is to be supported individually or in any combination of following:

.1 Level 1 – view data;

.2 Level 2 – command;

.3 Level 3 – operator overrides;

.4 Level 4 – database modification;

.5 Level 5 – database configuration;

.6 Level 6 – all privileges including password add/modify.

.7 User interface is to be equipped with screen management capabilities that allows user to activate, close, and simultaneously manipulate a minimum of 4 active display windows plus a network of user defined navigation trees.

.8 Graphics application program is to be an integral part of user interface and is to include a create/edit function and a runtime function, and system architecture is to support a number of graphic documents (graphic definition files) limited only by memory and computing resources to be generated and executed. Graphics are to be capable of displaying and providing animation based on real-time data that is acquired, derived, or entered. Additional features include following:

.1 maximum of 16 graphic applications are to be able to be executed at any one time on a user interface or workstation with 4 visible to user, and each graphic application is to capable of following functions:

.1 all graphics are to be fully scalable;

.2 graphics are to support a maintained aspect ratio;

.3 multiple fonts are to be supported;

.4 unique background is to be assigned on a per graphic basis;

.5 colour of animations and values on displays is to indicate status of object attribute.

.2 it is to be possible to change values (set-points) and states in system controlled equipment by using drop-down windows accessible via pointing device;

.3 graphic editing tool is to be provided to permit creation and editing of graphic files, and graphic editor is to be capable of performing/defining animations, defining runtime binding, and:

.1 in general, facilitate creation and positioning of point objects by dragging from tool bars or drop-downs and positioning where required;

.2 be capable of adding additional content to any graphic by importing backgrounds in the SVG, BMP, or JPG file formats.

.4 many graphic displays representing part of building and various building components are exact duplicates, with exception that various variables are bound to different field values, consequently, it is to be possible to bind value of a graphic display to aliases, as opposed to physical field tags.

.9 Trend and change of value data is to be stored within the automation engines or server and uploaded to a dedicated trend database or exported in a selectable data format via a data export utility. Uploads to a dedicated database are to occur based on one of user-defined interval, manual command, or when trend buffers are full. Exports are to be as requested by user or on a time scheduled basis. System is to be equipped with a configurable data storage sub-system for collection of historical data which can be stored in either Microsoft Access or SQL database format. Each automation engine is to store, trend, and point history data for analog and digital inputs and outputs as follows:

.1 any point, physical or calculated, may be designated for trending, and methods of collection are to be defined time interval or a change of value;

.2 each automation engine or server is to capable of storing multiple samples for each physical point and software variable based on available memory, including an individual sample time/date stamp, and points may be assigned to multiple history trends with different collection parameters.

.10 Trend viewing utility with access to data points and capability of defining trend study displays to include multiple trends is to be provided, and is to include:

.1 capability of retrieving any historical database point for use in displays and reports by specifying point name and associated trend name;

.2 displays which are able to be single or stacked graphs with on-line selectable display characteristics such as ranging, colour, and plot style;

.3 display magnitude (zoom capability) and units selectable by operator at any time without reconfiguration of processing or collection of data;

.4 display magnitude is to be automatically scaled to show full graphic resolution of data being displayed;

.5 trend studies are to be capable of calculating and displaying calculated variables including highest value, lowest value, and time based;

.6 display is to support user's ability to change colours, sample sizes, and types of markers.

.11 BAS is to be equipped with a database manager that separates database monitoring and management functions by supporting 2 separate windows. Database secure access is to be accomplished using standard SQL authentication including ability to access data for use outside of BAS application. Additional features are as follows:

.1 database management function is to include summarized information on trend, alarm, event, and audit for backup, purge, and restore database management functions;

.2 database manager is to support 4 tabs as follows:

.1 statistics, which is to display database server information and trend, alarm (event), and audit information on BAS database;

.2 maintenance, which is to be an easy method of purging records from BAS server trend, alarm (event), and audit databases by supporting separate screens for creating a backup prior to purging, selecting database, and allowing for retention of a selected number of day's data;

.3 backup, which is to provide means to create a database backup file and select a storage location;

.4 restore, which is to provide a restricted means of restoring a database by requiring user to log into an Expert Mode in order to view Restore screen.

.3 status bar is to appear at bottom of BAS database manager tabs and is to indicate information on current display activity with icons as follows:

.1 Ready;

.2 Purging Record From Database;

.3 Action Failed;

.4 Refreshing Statistics;

.5 Restoring Database;

.6 Shrinking A Database;

.7 Backing-Up A Database;

.8 Resetting Internet Information Services;

.9 Shutting Down BAS Deice Manager;

.10 Action Successful.

.4 database manager monitoring functions are to be accessed through Monitoring Settings window and are to continuously read database information once user has logged in;

.5 system is to advise user via task bar icons and email messages when a database value has exceeded a warning or alarm limit;

.6 Monitoring Settings window is to have following sections:

.1 General: allow user to set and review scan intervals and start times;

.2 Email: allow user to create and review email and telephone text messages to be delivered when a warning or alarm is generated;

.3 Warning: allow user to define warning limit parameters, set reminder frequency, and link email message;

.4 Alarm: allow user to define alarm limit parameters, set reminder frequency, and link email message;

.5 Database Login: protect system from unauthorized database manipulation by creating a read access and write access for each trend, alarm (event), and audit databases as well as an Expert Mode required to restore a database.

.7 Monitoring Settings taskbars to display following informational icons:

.1 Normal: indicates by colour and size that databases are within their limits;

.2 Warning: indicates by colour and size that one or more databases have exceeded their warning limit;

.3 Alarm: which indicates by colour and size that one or more databases have exceeded their alarm limit.

.8 BAS is to indicate via taskbar icons and email messages when a database value has exceeded a warning or alarm limit;

.12 BAS is to be equipped with a demand limiting and load rolling program for purpose of limiting peak energy usage and reducing overall energy consumption. Program is to support both Sliding Window and Fixed Window methods of predicting demand. Additional features are as follows:

.1 system is to support 3 levels of sensitivity in Sliding Window demand calculations for fine tuning the system, as follows:

.1 Low Setting: sheds loads later and over shortest period of time and maximizes period of time equipment is on;

.2 Medium Setting: sheds loads earlier over a period of time greater than Low Setting, and increases time equipment is on and decreases probability of exceeding "Tariff Target";

.3 High Setting: sheds loads earlier and over a longer period of time than Medium Setting to minimize probability of exceeding "Tariff Target".

.2 system is to have both a Shed Mode and a Monitor Only Mode of operation, as follows:

.1 when Shed Mode is engaged, system is to actively control demand;

.2 when Monitor Mode is engaged, system is to simulate shedding action but will not take any action.

.3 Demand Limiting Program is to monitor energy consumption rate and compare it to a user defined "Tariff Target", and maintain consumption below target by selectively shedding loads based on a user defined strategy;

.4 Demand Limiting Program is to be capable of supporting a minimum of 10 separate load priorities, with each load user assigned, and a minimum of 12 separate "Tariff Targets" defining maximum allowed average power usage during current interval;

.5 system is to support a maximum shed time for each load as determined by user, and system is to restore load before maximum shed time has expired;

.6 system is to support a minimum shed time for each load as determined by user, and system is not to restore load before minimum shed time has expired;

.7 system is to support a minimum release time for each load as determined by user, and system is not to shed load until it has been off for minimum release time;

.8 system is to support three user defined options if meter does not function properly, as follows:

.1 shedding – currently shed loads will be released as their maximum shed time expires;

.2 maintain current shed rate – system will use demand limiting shed rate that was present when meter began to function improperly;

.3 use unreliable meter shed rate – system is to control to a user defined unreliable shed rate target.

.9 Load Rolling Program is to sum the loads currently shed and compare sum to a user defined load rolling target, and system is to maintain consumption below target by selectively shedding loads based on a user defined load priority;

.10 Load Rolling Program is to be capable of supporting a minimum of 10 separate load priorities with each load user defined to a load priority;

.11 Load Rolling Program is to be capable of supporting a minimum of 12 separate "Tariff Targets" defining amount of energy by which demand must be reduced;

.12 system is to equip user with a Load Tab that displays all demand limiting and load rolling parameters for any selected load;

.13 system is to be complete with a Load Summary that displays all loads associated with demand limiting and load rolling program, and status icons for each load are to indicate:

.1 Load Is Offline;

.2 Load Is Disabled;

.3 Load Is Shed;

.4 Load Is Locked;

.5 Load Is In Comfort Override.

.14 Load Summary is to include a load summary runtime view listing following load conditions:

.1 Load Priority;

.2 Shed Strategy;

.3 Load Rating;

.4 Present Value;

.5 Ineligible Status;

.6 Active Timer;

.7 Time Remaining;

.8 Last Shed time.

2.7 NETWORK AUTOMATION ENGINES

.1 Network automation engines are to be ULC listed and labelled, BACnet Testing Labs (BTL) certified and labelled, fully user programmable supervisory controllers to monitor a network of a minimum of 100 distributed application-specific controllers for a global strategy and direction and to communicate on a peer-to-peer basis with other network automation engines.

.2 Each network automation engine is to have ability to deliver a web based user interface as specified above, and computers connected physically or virtually to automation network are to have access to web-based user interface. Additional characteristics/requirements are as follows:

.1 web-based user interface software is to be imbedded in each network automation engine;

.2 each network automation engine is to support a minimum of 4 concurrent users;

.3 user is to be capable of accessing all system data through one network automation engine;

.4 remote users connected to network through an internet service provider or by telephone dial-up are also to have total system access through one network automation engine;

.5 each network automation engine is to be capable of generating web-based user interface graphics, and this capability is to be imbedded in network automation engine;

.6 user interface is to support following functions using a standard version of Microsoft Edge:

.1 configuration;

.2 commissioning;

.3 data archiving;

.4 monitoring;

.5 commanding;

.6 system diagnostics.

.7 each network automation engine is to permit temporary use of portable devices without interrupting normal operation of permanently connected modems.

.3 Each network automation engine is to be a multi-tasking, multi-user, microprocessor-based real time digital control processor sized to meet requirements of system with a minimum word size of 32 bits, and standard operating systems.

.4 Each network automation engine is to have sufficient memory to support its own operating system, databases, and control programs to provide supervisory control for control level devices.

.5 Each network automation engine is to include an integrated, hardware based real time clock.

.6 Each network automation engine is to be equipped with LED indicators to identify following conditions:

.1 Power, On/Off;

.2 Ethernet Traffic, Ethernet Traffic/No Ethernet Traffic;

.3 Ethernet Connection Speed, 10 Mbps/100 Mbps;

.4 FC Bus A, Normal Communications/No Field Communications;

.5 FC Bus B, Normal Communications/No Field Communications;

.6 Peer Communication, Data Traffic Between Network Automation Engines;

.7 Run, NAE Running/NAE in Start-up/NAE Shutting Down/Software Not Running;

.8 Battery Fault, Battery Defective/Data Protection Battery Not Installed;

.9 24 VAC, 24 VAC Present/Loss of 24 VAC;

.10 Fault, General Fault;

.11 Modem RX, NAE Modem Receiving Data;

.12 Modem TX, NAE Modem Transmitting Data.

.7 Each network automation engine is to be equipped with ports for operation of operator input/output devices such as industry standard computers, modems, and portable operator's terminals. Ports are to be as follows:

.1 2 USB ports;

.2 2 RS-232 serial data communication ports;

.3 2 RS-485 ports;

.4 one Ethernet port.

.8 Each network automation engine is to continually perform self-diagnostics, communications diagnostics, and diagnostics of all pane components, and transmit both local and remote annunciation of any detected component failure, low battery condition, and repeated failures to establish communication.

.9 In event of loss of normal power each network automation engine is to continue to operate for a user adjustable period of up to 10 minutes after which there is to be an orderly shut-down of all programs to prevent loss of database or operating system software, and:

.1 during a loss of normal power, control sequences are to go to normal system shutdown conditions, and critical configuration data is to be saved into Flash memory;

.2 upon restoration of normal power and after a minimum off-time delay, controller is to automatically resume full operation through a normal soft-start sequence without manual intervention.

2.8 FIELD EQUIPMENT CONTROLLERS

.1 Each field equipment controller is to be a fully user programmable BACnet Testing Labs (BTL) certified and labelled digital controller that communicates via BACnet MS/TP protocol. Each controller is to be housed in a plenum rated plastic housing with removable base to permit pre-wiring of analog and binary input/output field points without controller in place.

.2 Each controller is to employ a finite state control engine to eliminate unnecessary conflicts between control functions at crossover points in their operational sequences, and is to be factory programmed with a continuous adaptive tuning algorithm that sense changes in physical environment and continually adjusts loop tuning parameters appropriately.

.3 Each field equipment controller is to:

.1 include troubleshooting LED's to identify following conditions:

.1 Power On;

.2 Power Off;

.3 Download or Start-Up In Progress-Not Ready For Normal Operation;

.4 No Faults;

.5 Device Fault;

.6 Field Controller Bus-Normal Data Transmission;

.7 Field Controller Bus-No Data Transmission;

.8 Field Controller Bus-No Communication;

.9 Sensor Actuator Bus-Normal Data Transmission;

.10 Sensor Actuator Bus-No Data Transmission;

.11 Sensor Actuator Bus-No Communication.

.2 support universal inputs, configured to monitor any of following:

.1 analog input, voltage mode;

.2 analog output, current mode;

.3 analog input, resistive mode;

.4 binary input, dry contact maintained mode;

.5 binary input, pulse counter mode.

.3 support binary inputs configured to monitor either of following:

.1 dry contact maintained mode;

.2 pulse counter mode.

.4 support analog outputs configured to output either of following:

.1 analog output, voltage mode;

.2 analog output, current mode.

.5 support binary outputs, 24 VAC Triac;

.6 support configurable outputs capable of following:

.1 analog output, voltage mode;

.2 binary output mode.

.7 have ability to reside on a master-slave/token-passing field controller bus supporting BACnet standard protocol as follows:

.1 support communications, including input/output communications between field controllers and network automation engines;

.2 support a minimum of one hundred input/output modules and field equipment controllers in any combination;

.3 operate at a maximum distance of 4560 m (15,000 ft) between field controller and furthest connected device.

.8 have ability to monitor and control a network of sensors and actuators over a master-slave/token-passing sensor-actuator bus supporting BACnet standard protocol as follows:

.1 bus is to support a minimum of ten devices per trunk;

.2 bus is to operate at a maximum distance of 365 m (1200 ft) between field controller and furthest connected device.

.9 capability of executing complex control sequences involving direct wired input/output points as well as input and output devices communicating over field controller bus or sensor-actuator bus;

.10 support, but not limited to, following:

.1 hot water, chilled water/central plant applications;

.2 custom air handling units for special applications;

.3 terminal units;

.4 special programs as required for systems control.

.11 support a password protected local controller LCD back-lit display with 6 key keypad as an integral part of field controller or as a remote device communicating over sensor-actuator bus to permit user to view monitored points without logging into system, and to view and change set-points, modes of operation, and parameters.

2.9 INPUT/OUTPUT MODULES

.1 Input/output modules to facilitate additional inputs and outputs for use in field equipment controllers are to be similar to field equipment controllers but less display and with a minimum of 4 and a maximum of 17 points.

2.10 SYSTEM CONFIGURATION TOOLS

.1 System configuration tool is a software package supplied with BAS to enable a computer platform to be used as a stand-alone engineering configuration tool for a network automation engine and to permit programming of field equipment controllers. Configuration tool is to provide an archive database for configuration and application data and is to have same look and feel at user interface regardless of whether configuration is being done online or offline. Additional features and characteristics are as follows:

.1 tool is to include:

.1 basic system navigation tree for connected networks;

.2 integration of system enabled devices;

.3 customized user navigation tress;

.4 point naming operator parameter setting;

.5 graphic diagram configuration;

.6 alarm and event message routing;

.7 graphical logic connector tool for custom programming;

.8 downloading, uploading, and archiving databases.

.2 tool is to have capability to automatically discover field devices on connected buses and networks;

.3 tool is to be capable of configuring from a library of standard applications, simulating to verify applications, and commissioning field equipment controllers and field devices;

.4 tool is to be complete with a Bluetooth Wireless Technology wireless access point to enable a wireless enabled portable computer to make a temporary Ethernet connection to automation network.

.2 Bluetooth Wireless Technology converter is to provide temporary wireless connection between sensor-actuator bus or field-controller bus and a wireless enabled portable computer. Converter is to be powered through a connection to either sensor-actuator bus or the field-controller bus and is to support downloading and troubleshooting field equipment controllers and field devices from portable computer over wireless connection. Converter is to be complete with LED indicators for following conditions:

.1 Power: On/Off;

.2 Fault: Fault/No Fault;

.3 SA/FC Bus: Bus Activity/No Bus Activity;

.4 Bluetooth: Bluetooth Communication Established/Bluetooth Communication Not Established.

2.11 WIRING MATERIALS

.1 System wiring, conduit, boxes, and similar materials are to be in accordance with requirements specified in Division 26 – Electrical.

PART 3 - EXECUTION

3.1 GENERAL RE: INSTALLATION OF THE BAS

.1 Provide a complete building automation system in accordance with requirements of this Section of the Specification, Section 25 05 01 – Automatic Control Systems, drawings, and the input/output points list(s).

.2 Unless otherwise specified, perform BAS work in accordance with system manufacturer's instructions.

3.2 INSTALLATION OF DIRECT DIGITAL CONTROL SYSTEM COMPONENTS

.1 Provide required direct digital control hardware, software, accessories, and wiring for a complete BAS. Refer to drawing control diagrams and sequences, points list(s), and Section 25 05 01 – Automatic Control Systems.

.2 Provide operator workstation, including required power and data connections, in a location as directed by the Owner or as indicated on drawings.

.3 DDC work is to be performed by skilled technicians, properly trained and are qualified for this work.

.4 Materials and equipment used are to be standard components, regularly manufactured for this and/or other systems, and not custom designed especially for this project. Systems and components are to have been thoroughly tested and proven in actual use.

.5 System is to be modular, permitting expansion by adding hardware and software without changes in communication or processing equipment.

.6 Provide new communications bus as required complete with required ancillaries. Connect and extend existing communications bus.

.7 Provide 1 supervisory controller (SC) per cabinet fan (air handler). Provide necessary field equipment controllers (FEC).

.8 Provide necessary quantity of SC to accomplish requirements of this specification, and to minimize number of mechanical systems that would be inoperative in event of a FEC failure. A maximum of 2 major mechanical systems are to be controlled by 1 FEC.

.9 Surface wall mount SC and FEC control units in Mechanical Rooms ensuring they are not mounted on vibrating surfaces, and connect to 15 A/1-pole circuit breakers dedicated for control system applications, in branch panel circuit boards in adjacent spaces. Power wiring from control units to circuit breakers is to be the responsibility of the controls contractor. Wiring is to be in conduit and conduit and wiring are to be in accordance with standards and requirements of Division 26 – Electrical. Refer to electrical drawings for locations of branch circuit panelboards with dedicated circuits for controls system applications.

.10 Indicate via number, and systems controlled by SC and FEC. Indicate via a lamacoid label mounted inside panel the identification number of electrical panel supplying power to SC and FEC.

.11 Submit schedule(s) of input/output points to the Consultant for review. Directly connect each SC and FEC to point devices in accordance with control diagrams and schedule of miscellaneous

control points as shown on drawings. Sensor wires for each analogue input are to be 18 AWG twisted-shielded cable. Other types of wire required are to be as recommended by system supplier.

.12 Provide required sensors, remote devices, etc., and required interface accessories. Mount duct and/or plenum sensors half-way across duct or plenum.

.13 Differential pressure sensor used to provide space pressurization control through regulation of return air quantities must be mounted with snubbers on indoor pressure leg to prevent sudden fluctuations caused by door openings, etc. Mount outdoor air ports in locations that minimize effects of abnormal surface flow conditions and wind gusts.

.14 Supply and turn over to the Consultant prior to application for a Certificate of Substantial Performance of the Work, reports to be used in assisting Owner in defining and debugging DDC programs. These reports are to consist, as a minimum, of following:

.1 process control language (PCL) logs;

.2 control loop logs;

.3 PCL master point.

.15 Submit Point Data Input forms to Consultant that Owner will fill out with DDC system supplier's assistance. Input this point data into the system.

.16 Contacts will be supplied as part of mechanical work or electrical work for alarm and status points for systems and equipment other than building environmental systems and equipment. Connect to DDC system in accordance with point schedule.

3.3 IMPLEMENTATION OF ENERGY MANAGEMENT PROGRAMS

.1 Implement energy management programs indicated for building equipment and systems.

.2 Ensure energy management program adjustable parameters are accessible to and adjustable by building operations personnel at operator’s workstation.

.3 Configure energy management programs so they may be enabled/disabled on an individual basis for each system to which they apply.

3.4 CONTROL WIRING

.1 Perform required control wiring work for control systems except:

.1 power wiring connections to equipment and panels, except as noted below;

.2 control wiring associated with mechanical plant equipment and systems whose control is not part of work specified in this Section;

.3 starter interlock wiring.

.2 Except as specified below, install wiring in conduit. Unless otherwise specified, final 600 mm (2 ft) connections to sensors and transmitters, and wherever conduit extends across flexible duct connections is to be liquid-tight flexible conduit.

.3 Control wiring in ceiling spaces and wall cavities may be plenum rated cable installed without conduit but neatly harnessed, secured, and identified.

.4 Wiring work is to be in accordance with BAS manufacturer’s certified wiring schematics and instructions, and wiring standards specified in electrical work Division of this Specification.

3.5 IDENTIFICATION AND LABELLING OF EQUIPMENT AND CIRCUITS

.1 Refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 Identify BAS equipment as follows:

.1 enclosures: engraved laminated nameplates with lettering such as BAS Panel CP2, or BAS Relays, or BAS E/P Transformers, with all wording listed and approved prior to manufacture of nameplates;

.2 panel points: a weather-proof input/output layout sheet for each controller with the name of each point connected to controller, and associated wire labelling information;

.3 wiring: numbered sleeves or plastic rings at both ends of conductor, with numbering corresponding to conductor identification on shop drawings and "as-built" record drawings;

.4 interface components: a weather-proof layout sheet clearly illustrating/identifying purpose of each component within enclosure such that an operator or service technician can quickly identify exact use of each relay, transducer, contactor, etc., with each sheet fastened securely to back of enclosure door.

3.6 SYSTEM STARTUP

.1 For equipment/system manufacturer certification requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

.2 For equipment/system start-up requirements, refer to Section 20 05 00 – Common Work Results for Mechanical.

3.7 CLOSEOUT ACTIVITIES

.1 Include for demonstration and training sessions for each of 2 groups of Owner’s operating and maintenance personnel as follows:

.1 3 full, 8 hour day orientation sessions at system manufacturer’s office to educate personnel on BAS architecture, hardware, and software, with an overview of BAS operation and capabilities including but not limited to operational programmes, equipment functions (both individually and as part of a total integrated system), BAS commands, advisories, alarms, and appropriate operator intervention required in responding to BAS operation;

.2 2 full, 8 hour day sessions at site using BAS for a "hands-on" demonstration of BAS functions and features with instruction regarding chronological flow of information from field devices, contacts and sensors to operator’s workstation, an overview of communications network describing interplay between initiating devices, field hardware panels, systems communications, and their importance within operating BAS, and alarm indications and appropriate responses;

.3 2 full, 8 hour day seasonal (summer-winter) site sessions to perform additional instruction regarding seasonal changes and how they affect BAS.

.2 Include for 2 follow-up site training and troubleshooting visits, one 6 months after Substantial Completion and other at end of warranty period, both when arranged by Owner and for a full day to provide additional system training as required.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Building Automation System integration requirements related to electrical systems.

1.2 RELATED REQUIREMENTS

.1 Division 26 – Electrical.

PART 2 - PRODUCTS

2.1 POINTS SPECIFIED BUT NOT DESCRIBED IN SEQUENCES

.1 Any remaining points not detailed in this section are to be monitored and available for trending data.

2.2 SECTION 26 24 13 – SWITCHBOARDS

.1 Customer meter at main utility service entrance.

.2 Provide BACnet gateways to suit meter protocol output.

2.3 SECTION 26 27 13 – ELECTRICITY METERING

.1 Customer meters to building automation system.

2.4 SECTION 26 32 13.16 – GAS-ENGINE-DRIVEN GENERATOR SETS

.1 Connect all generator alarm and status contacts.

2.5 SECTION 26 36 23.13 – BYPASS-ISOLATION AUTOMATIC TRANSFER SWITCHES

.1 Connect all transfer switch alarms and status contacts, typical of the following transfer switches:

.2 [Fire pump transfer switch]

.3 [Life safety automatic transfer switch ATS-X]

.4 [Non-life safety automatic transfer switch ATS-E].

PART 3 - EXECUTION

3.1 INSTALLATION

.1 In accordance with Section [25 00 00] [25 05 02].

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Common requirements for electrical work.

.2 Mounting heights for electrical equipment and devices.

1.2 RELATED REQUIREMENTS

.1 Provisions of this section apply to all sections of Division 26, Division 27, Division 28, and sections related to electrical utilities in Division 33.

.2 Section 07 60 00 – Flashing and Sheet Metal.

.3 Section 07 84 00 – Firestopping.

.4 Section 08 31 00 – Access Doors and Panels.

.5 Section 09 91 00 – Painting.

.6 All sections related to heat tracing.

.7 Building Automation System integration requirements for Electrical Systems as described in Section 25 96 00.

.8 This section is to be read in conjunction with Division 00 documents, and Division 01 specification sections, which take precedence as described in CCDC 2-2020.

.1 General Conditions.

.2 Supplementary General Conditions.

.3 General Requirements.

1.3 INTENT

.1 Include all material, labour, equipment, and plant construction as necessary to make a complete installation as shown and specified hereinafter.

.2 Leave complete systems ready for continuous and efficient satisfactory operation.

.3 Discipline and Trade Jurisdiction:

.1 In accordance with CCDC 2-2020 GC 1.1.9: Neither the organization of the Specifications nor the arrangement of Drawings shall control the Contractor in dividing the work among Subcontractors and Suppliers.

.2 MasterFormat's organizational structure used in a project manual does not imply how the work is assigned to various design disciplines, trades, or subcontractors. MasterFormat is not intended to determine which particular elements of the project manual are prepared by a particular discipline. Similarly, it is not intended to determine what particular work required by the project manual is the responsibility of a particular trade. A particular discipline or trade is likely to be responsible for subjects from multiple Divisions, as well as from multiple Subgroups.

1.4 DRAWINGS AND SPECIFICATIONS

.1 The drawings and specifications are complementary each to the other and what is called for by one to be binding as if called for by both. Should any discrepancy appear between the drawings and specifications, which leaves the Contractor in doubt as to the true intent and meaning of plans and specifications, a ruling is to be obtained from the Consultant in writing before submitting Bid. If this

is not done, the maximum, the most expensive alternate or option will be provided in base tender bid.

.2 All drawings and all Divisions of these specifications shall be considered as a whole, and work of this Division shown anywhere therein shall be furnished under this Division.

.3 Drawings are diagrammatic and indicate the general arrangement of equipment and pathways. Most direct routing of conductors and wiring is not assured. Exact requirements are governed by architectural, structural, and mechanical conditions of the job. Consult all other drawings in preparation of the bid. Extra lengths of wiring or addition of pull and junction boxes, etc. necessitated by such conditions are to be included in the bid. Check all information and report and apparent discrepancies before submitting the bid.

.4 Contractor shall determine the exact locations of equipment and rough-ins, and the exact routing of pathways so as to best fit the layout of the job. Plan, coordinate, and establish exact locations and routing of services with affected trades prior to installation such that services clear each other, as well as other obstructions.

.5 Determine final locations of major work within ceiling spaces based on the largest equipment first.

.6 Unless otherwise shown or specified, conceal work in finished areas, and conceal work in partially finished and/or unfinished areas to extent made possible by the area construction. Install services as high as possible to conserve headroom and/or ceiling space. Notify the Consultant where headroom or ceiling space appears to be inadequate prior to installation of the work.

.7 Scaling off the drawings will not be sufficient or accurate for determining these locations. Where job conditions require reasonable changes in indicated arrangement and locations, such changes shall be made at no additional cost to the Owner.

.8 Because of the scale of the drawings, certain basic items, such as junction boxes, pull boxes, conduit fittings, etc. may not be shown, but where such items are required by other sections of the specifications of where there are required for proper installation of the work, such items are to be furnished and installed.

.9 Before ordering any conduit, cable tray, conductors, wireways, raceway bus duct, fittings, etc., verify all pertinent dimensions at the job site and be responsible for their accuracy.

.10 If obvious ambiguities or omissions are noticed when tendering refer same to the Consultant for a ruling and obtain the ruling in writing in the form of an Addendum. Claims for extras for ambiguities or omission of items brought to the attention of the Consultant after the award of a contract which, due to the nature of the ambiguity or omission, should have been brought to the attention of the Consultant during the tendering period, will not be allowed.

.11 The drawings are performance drawings, diagrammatic, and show locations for apparatus and materials. The drawings are intended to convey the scope of work and do not intend to show Architectural and Structural details. The locations shown are approximate, and may be altered, when approved by the Consultant, to meet requirements of the material and/or apparatus, other equipment and systems being installed, and of the building. Do not scale drawings.

.12 Control devices, equipment requiring maintenance, junction boxes, and similar products, particularly such products located above suspended ceilings must be located for easy access for servicing and/or removal. Products which do not meet this location requirement are to be relocated to an accessible location at no additional cost.

.13 Be responsible for making necessary changes, at no additional cost, to accommodate structural and building conditions that were foreseeable by a review of existing conditions or a review of drawings prepared by other disciplines.

.14 Where drawings indicate that acoustic tile ceiling is being suspended below existing plaster ceilings, coordinate the design of framework used to support this suspended ceiling, lighting, diffusers, and other components that are mounted within or through ceiling. Do not mount devices to suspended

ceilings. Secure and mount to ceiling slab above. Seal ceiling openings to maintain required fire rating.

.15 Provide any fitting, offset, transformation, etc., required to suit architectural and structural details but not shown.

1.5 WORK RESTRICTIONS

.1 Refer to Section 01 14 00.

.2 Do all cutting, patching, and making good to leave in a finished condition and to make the several parts of the Work come together properly. Co-ordinate work to keep cutting and patching to a minimum.

.3 Quality of workmanship and materials used in patching, making good and refinishing of existing construction and/or compartments shall be of a standard equal to that specified for new construction and if not specified, equal to or exceeding that of original existing work.

.4 Prior to cutting openings, examine wall, floor, and ceiling construction for buried electrical cables and pipes; and take adequate protection. Conduct cable locating tests to locate buried cables in existing work.

1.6 SUBSTITUTION PROCEDURES

.1 Refer to Section 01 25 00 and General Provisions of the Contract.

.2 Additionally, "Approved equal" shall be defined as a substitution approved by the Consultant.

.3 If during the tender bid process, the bidding contractor wishes to substitute the specified equipment for an "Approved equal", the bidding contractor must submit shop drawings to the Consultant before the tender close for approval. If no substitution request is made, the as-specified equipment is that to be provided.

.4 Where several manufacturers' names are given, the first named manufacturer constitutes the basis for job design and establishes the equipment quality required to be used in this contract.

.5 This contractor, at his option, may use equipment as manufactured by any of the listed manufacturers. This Contractor is responsible to ensure that all items submitted by these other manufacturers meets are requirements of the drawings and specification and fits in the allocated space. The final determination of a product being equivalent is to be determined by the Consultant when a catalog number is not listed, or listed in part.

.6 Any material, article or equipment of other unnamed manufacturers which will adequately perform the services and duties imposed by the design and is of a quality equal to or better than the material, article or equipment identified by the drawings and specifications may be used if approval is secured in writing from the Consultant as described in the General Provisions of the Contract for Submittals. The Contractor bears full responsibility for the unnamed manufacturers' equipment adequately meeting the intent of the design. The Owner or the Consultant may reject manufacturer at time of shop drawing submittal.

.7 In addition to manufacturer's products base specified or named as acceptable, other manufacturers of products may be proposed as substitutions to the Consultant for review and consideration for acceptance, listing in each case a corresponding credit for each substitution proposed. However, base Bid Price on products base specified or named as acceptable. Certify in writing to the Consultant that proposed substitution meets space, power, design, energy consumption, and other requirements of base specified or acceptable product. It is understood that there will be no increase in Contract Price by reason of any changes to associated equipment, mechanically, electrically, structurally, or architecturally, required by acceptance of proposed substitution. The Consultant has sole discretion in accepting any such proposed substitution of product. Indicate any proposed

substitutions in areas provided on Bid Form. Do not order such products until they are accepted in writing by the Consultant.

1.7 CONTRACT MODIFICATION PROCEDURES

.1 Refer to Section 01 26 00.

.2 Whenever the Consultant proposes in writing to make a change or revision to design, arrangement, quantity, or type of work from that required by Contract Documents, prepare, and submit to the Consultant for review, a quotation being proposed cost for executing change or revision.

.3 Quotation is to be a detailed and itemized estimate of product, labour, and equipment costs associated with change or revision, plus overhead and profit percentages and applicable taxes and duties.

.4 Unless otherwise specified in Division 00, Division 01, or as identified in the Owner/Contractor agreement, allowable maximum percentages for overhead and profit are to be 7% and 5% respectively.

.5 Unless otherwise specified in Division 00, or Division 01, following additional requirements apply to all quotations submitted:

.1 When change or revision involves deleted work as well as additional work, cost of deleted work (less overhead and profit percentages but including taxes and duties) is to be subtracted from cost of additional work before overhead and profit percentages are applied to additional work.

.2 Electrical material labour unit costs are to be in accordance with National Electrical Contractors Association (NECA) Manual of Labor Units (MLU), less 25%.

.3 Costs for journeyperson and apprentice labour must not exceed prevailing rates at time of execution of Contract and must reflect actual personnel performing work.

.4 Cost for site superintendent must not exceed 10% of total hours of labour estimated for change or revision, and change or revision must be such that site superintendent's involvement is necessary.

.5 Overhead percentage will be deemed to cover quotation costs other than actual site labour and materials, and rentals.

.6 Quotations, including those for deleted work, to include a figure for any required change to Contract time.

.6 The Consultant reserves the right to request backup quotations for any materials and/or rentals included within the quotation.

.7 Quotations submitted that are not in accordance with requirements specified above will be rejected and returned for re-submittal. Failure to submit a proper quotation to enable Consultant to expeditiously process quotation and issue a Change Order will not be grounds for any additional change to Contract time.

.8 Make requests for changes or revisions to work to Consultant in writing and, if Consultant agrees, will issue Notice of Change.

.9 Do not execute any change or revision until written authorization for the change or revision has been obtained from the Consultant.

1.8 COORDINATION

.1 Refer to Section 01 31 00.

.2 Coordinate work with other trades to avoid conflict and to provide correct rough-in and connection for equipment furnished under other trades that require electrical connection. Inform Contractors of

other trades of the required access to and clearances around electrical equipment to maintain serviceability and code compliance.

.3 Verify equipment dimensions and requirements with provision specified under this Section. Check actual job conditions before fabricating work. Report necessary changes in time to prevent needless work. Changes or additions subject to additional compensation, which are made without written authorization and an agreed price, shall be at Contractor's risk and expense.

.4 Read specifications and drawings of other trades and conform with their requirements before proceeding with any work specified in this Division related to other trades. Co-operate with all other trades on the job, so that all equipment can be satisfactorily installed, and so that no delay is caused to any other trades.

.5 Coordinate utility service outages with the owner. Obtain permission from Owner at least 24 hours before partially or completely disabling system. Minimize outage duration.

.6 Co-ordinate work with all trades to ensure a proper and complete installation. Notify all trades concerned of the requirement for openings, sleeves, inserts, and other hardware necessary for the installation and, where work is to be integrated with the work of other trades or is to be installed in close proximity with the work of other trades, carefully co-ordinate the work prior to installation.

.7 Working Detail Drawings

.1 The contractor is to prepare working detail drawings supplementary to the contract drawings, when deemed necessary by the Consultant, for all areas where a multiplicity of materials and or apparatus occur, or where the work due to architectural and structural considerations involves special study and treatment. Such drawings may be prepared jointly by all trades affected, or by the one trade most affected with due regard for and approval of the other trades, all as the Consultant will direct in each instance. Such drawings must be reviewed by the Consultant before the affected work is installed.

.2 Carry out all alterations in the arrangement of work which has been installed without proper study and approval, even if in accordance with the contract documents, in order to make such work come within the finished lines of walls, floors and ceilings, or to allow the installation of other work, without additional cost. In addition, make any alterations necessary in other work required by such alterations, without additional cost.

1.9 SUBMITTAL PROCEDURES

.1 Refer to Section 01 33 00.

.2 Before delivery to site of any item of equipment, submit shop drawings complete with all data, pre-checked and stamped accordingly, for review by the Consultant. Indicate project name on each brochure or sheet, make reference to the number and title of the appropriate specification section, type identifier such panelboard ID or luminaire type as indicated on appropriate schedule, and provide adequate space to accommodate the Consultant's review stamp(s).

.3 Verify field measurements and affected adjacent Work are coordinated, including passageway clearances for movement of equipment into location.

.4 Submit shop drawings to the Consultant in electronic (PDF) format, as coordinated after award of contract. Where submittals are derived from digital originals, do not print and rescan documents; submittals made as such will be immediately rejected.

.5 Submit a schedule of shop drawings within one week after award of contract. Group submittals by specification division as appropriate.

.6 Shop Drawings

.1 Submit for review, properly identified shop drawings showing in detail the design and construction of all equipment and materials as requested in sections of the specification governed by this Section.

.2 Obtain and comply with the manufacturer's installation instructions.

.3 Endorse each shop drawing copy "CERTIFIED TO BE IN ACCORDANCE WITH ALL REQUIREMENTS", stamp each copy with your company name, date each copy with the submittal date, and sign each copy. Shop drawings which are received and are not endorsed, dated, and signed will be returned for re-submittal.

.4 The Consultant will stamp shop drawings as follows:

.1 Reviewed ( )

.2 Reviewed as Modified ( )

.3 Revise and Re-Submit ( )

.4 Not Reviewed ( )

.5 If "REVIEWED" is checked-off, the shop drawing is satisfactory. If "REVIEWED AS MODIFIED" is checked-off, the shop drawing is satisfactory subject to requirements of remarks put on shop drawing copies. If "REVISE AND RE-SUBMIT" is checked-off, the shop drawing is entirely unsatisfactory and must be revised in accordance with comments written on shop drawing copies and resubmitted. If "NOT REVIEWED" is checked-off, the shop drawing is in error of submission, not applicable for this project.

.6 This review by the Consultant is for the sole purpose of ascertaining conformance with the general design concept. This review shall not mean that the Consultant approved the detail design inherent in the shop drawings, responsibility for which shall remain with the Contractor, and such review shall not relieve the Contractor of responsibility for errors or omissions in the shop drawings or of responsibility for meeting all requirements of the contract documents. Be responsible for dimensions to be confirmed and correlated at the job site, for information that pertains solely to fabrication processes or to techniques of construction and installation, and for co-ordination of the work as well as compliance with codes and inspection authorities such as CSA, etc.

.7 Confirm layouts of major electrical equipment rooms with the dimensions of as-procured equipment, and submit a layout sketch to the Consultant showing the major equipment and required clear spaces. The contractor may, at their option, revise the layout of the major electrical equipment rooms, but take responsibility for these new layouts and meeting the requirements of the local electrical utilities. Capture final room layouts on as-built drawings.

1.10 SUBMITTALS

.1 The Contractor is to submit dimensioned drawings or sketches that indicates the dimensions of the procured equipment, demonstrates that the equipment will fit in the allocated spaces, and demonstrates that manufacturer and code required clear spaces are provided.

.2 Include sketches for the following locations that includes at minimum, major equipment such as switchboards, panelboards, splitters, transformers, generators, transfer switches, major wall mounted or floor mounted telecommunications equipment, and fire alarm panels, passive graphics, and annunciator panels.

.1 Hanger.

.2 Telecommunications rooms.

.3 Mechanical rooms (layouts to be coordinated with mechanical trade).

1.11 SAFETY REQUIREMENTS

.1 Refer to Section 01 35 29.

.2 Be responsible for the safety of workers and the equipment on the project in accordance with all applicable safety legislation passed by Federal, Provincial, and local authorities governing construction safety. The more stringent regulations prevail.

1.12 REGULATORY REQUIREMENTS

.1 Refer to Section 01 41 00.

.2 Codes and Standards

.1 Ontario Electrical Safety Code including all bulletins and amendments.

.2 Ontario Building Code and its referenced standards.

.3 Applicable CSA and ULC standards.

.4 All work shall be in accordance with Owner’s Design Guidelines.

.3 Permits and Fees

.1 Obtain and pay for all permits and fees required for the execution and inspection of the electrical work and pay all charges incidental to such permits. Submit to Electrical Inspection Department and Supply authority necessary number of drawings and specifications for examination and approval prior to commencement of work. Arrange and pay for any special inspection of equipment specified if and when required.

.2 Apply, pay and obtain all permits as required for the electrical work.

.3 Upon substantial completion of your work, supply and turn over to the Consultant all required inspection certificates from governing authorities to certify that the work as installed conforms to the rules and regulations of the governing authorities.

.4 Patents

.1 Pay all royalties and licence fees, and defend all suits or claims for infringement of any patent rights, and save the Owner, Architect, Project Manager and Consultants harmless of loss or annoyance on account of suit, or claims of any kind for violation or infringement of any letters patent or patent rights, by this Subcontractor or anyone directly or indirectly employed by him or by reason of the use by him or them of any part, machine, manufacture or composition of matter on the work, in violation or infringement or such letters patent or rights.

1.14 DEFINITIONS

.1 Electrical and electronic terms: unless otherwise specified or indicated, terms used in these specifications, and on drawings, are those defined by IEEE SP1122.

1.15 QUALITY ASSURANCE

.1 Refer to Section 01 43 00.

.2 The specifications contained herein are set forth as the minimum acceptable requirements. This does not relieve the Contractor from executing other quality assurance measures to obtain a complete operating system within the scope of this project.

.3 Ensure that all workmanship, all materials employed, all required equipment and the manner and method of installation conforms to accepted construction and engineering practices, and that each piece of equipment is in satisfactory working condition to satisfactorily perform its functional operation.

.4 Provide quality assurance tests and operational check on all components of the electrical distribution system, all lighting fixtures, and communication systems.

.5 Only first class workmanship will be accepted, not only in regards to durability, efficiency and safety, but also in regards to neatness of detail. Present a neat and clean appearance on completion to the satisfaction of the Consultant. Any unsatisfactory workmanship will be replaced at no extra cost.

.6 Conform to the best practices applicable to this type of work. Install all equipment and systems in accordance with the manufacturer's recommendations, but consistent with the General Requirements of this specification. Electrical Contractor will be held responsible for all damage to the work of his own or any other trade, resulting from the execution of his work. Store all electrical equipment and materials in dry locations.

.7 Provide foreman in charge of this work at all times.

.8 The contractor shall be fully liable to provide and maintain in force during the life of this Contract, such insurance, including Public Liability Insurance, Product Liability Insurance, Auto Liability Insurance, Worker’s Compensation, and Employer’s Liability Insurance.

.9 Governing Federal, Provincial and Municipal codes and regulations will be considered minimum standards for the work and where these are at variance with the drawings and specification, the more stringent ruling will apply.

.10 Where any code, regulation, bylaw, or standard is quoted it shall mean the current edition including all revisions or amendments at the time of the tender.

.11 In case of conflict, the codes and regulations take precedence over the Contract Documents. In no instance reduce the standard or scope of work or intent established by the drawings and specifications by applying any of the codes referred to herein.

1.16 QUALITY CONTROL

.1 Refer to Section 01 45 00.

.2 Provide a full time Superintendent to oversee and coordinate all sub-trades in these divisions.

1.17 TEMPORARY UTILITIES

.1 Refer to Section 01 51 00.

.2 Do not use any of the permanent facility systems during construction except as may be specified, or unless written approval is obtained from the Consultant.

.3 The use of permanent facilities for temporary construction service will not affect in any way the commencement day of the warranty period.

.4 Temporary heating during the construction period will be provided as described in Division 01.

1.18 TEMPORARY FACILITIES AND CONTROLS

.1 Refer to Section 01 56 00.

.2 Prior to start of each work period in occupied area, install temporary protection to prevent damage to any personal property or furnishing. Coordinate with Owner's representative if any furniture must be relocated to facilitate work.

.3 Submit temporary protection plan to Owner's Representative for approval prior to use.

.4 Take necessary steps to ensure that required firefighting apparatus is accessible at all times. Flammable materials shall be kept in suitable places outside the building.

1.19 PRODUCT REQUIREMENTS

.1 Refer to Section 01 61 00.

.2 The design, manufacture and testing of electrical equipment and materials shall conform to or exceed the latest applicable CSA, IEEE, and ANSI standards.

.3 All materials must be new and be ULC or CSA listed. Any materials not covered by the aforementioned listing standards shall be tested and approved by an independent testing laboratory, Technical inspection Services, or other government agency.

.4 Materials and equipment are specifically described and named in this Specification in order to establish a standard of material and workmanship.

.5 Materials required for performance of work shall be new and the best of their respective kinds and of uniform pattern throughout work.

.6 Materials shall be of Canadian manufacture where obtainable. Materials of foreign manufacture, unless specified, shall be approved before being used.

.7 Equipment items shall be standard products of approved manufacturers. Identical units of equipment shall be of same manufacturer. In any unit of equipment, identical component parts shall be of same manufacturer, but the various component parts comprising the unit need not be of one manufacturer.

.8 Chemical and physical properties of materials and design performance characteristics and methods of construction and installation of items of equipment, specified herein, shall be in accordance with latest issue of applicable Standards or Authorities when such are either mentioned herein, or have jurisdiction over such materials or items of equipment.

.9 Materials shall bear approval labels as required by Code and/or Inspection Authorities.

.10 Install materials in strict accordance with manufacturer's recommendations.

.11 Include items of material and equipment not specifically noted on Drawings or mentioned in Specification but which are necessary to make a complete and operating installation.

.12 Remove materials, condemned as not approved for use, from job site and deliver and install suitable approved materials in their place.

.13 Unless otherwise noted, equipment and material specifications in Sections of the Specification governed by this Section are based on products of a manufacturer selected by the Consultant for the purpose of setting a standard of quality, size, performance, capacity, appearance, and serviceability.

.14 In most instances the names of acceptable manufacturers are also stated for materials and equipment, and you may base your tender price on equipment and materials produced by either the specified manufacturer or a manufacturer listed as acceptable.

.15 For any items of equipment, material, or for any system where acceptable manufacturers are not stated, you must provide only the equipment, material or system specified.

.16 If materials or equipment manufactured and/or supplied by a manufacturer named in the specifications are used in lieu of products of the manufacturer noted as “basis of design”, be responsible for ensuring that the substituted material or equipment is equivalent in size, performance and operating characteristics to the specified materials or equipment, and it shall be understood that all costs for larger starters, additional space, larger power feeders, and changes to associated or adjacent work required as a result of providing materials and equipment named as acceptable in lieu of the specified product will be borne by the Contractor.

.17 In addition to the manufacturers specified or named as acceptable, the Contractor may propose substitute manufacturers of equipment and/or apparatus to the Consultant for acceptance, listing in each case a corresponding credit for each substitute proposed, however, the tender price must be based on apparatus or materials specified or named as acceptable. Certify in writing to the Consultant that the substitute meets all space, power, design, and all other required of the specified or equivalent material or apparatus. In addition, it shall be understood that all costs for larger starters, space, power feeders, and changes to associated equipment, mechanical and/or electrical, required by acceptance of proposed substitutions, will be borne by the party making the proposal. Substitute equipment requiring greater than specified energy requirements or unduly limiting service space requirements will not be accepted.

.18 Where a manufacturer is not listed for a particular product, it will be deemed to mean that the Contractor will provide the specified manufacturer's product.

1.20 EXAMINATION AND PREPARATION

.1 Refer to Section 01 71 00.

.2 Examine the existing equipment, the site and surrounding areas and be fully informed as to the conditions and limitations under which the work has to be executed. Claims for additional costs will not be entertained with respect to conditions which could reasonably have been ascertained by an inspection prior to Tender closing.

.3 Examine work upon which your work depends. Report in writing defects in such work. Application of your work shall be deemed acceptance of work upon which your work depends.

.4 Drawings are, in part, diagrammatic and are intended to convey scope of work and indicate general and approximate location, arrangement and sizes of equipment, piping, and similar items. Obtain more accurate information about locations, arrangement and sizes from study and coordination of drawings, including shop drawings and manufacturers’ literature and become familiar with conditions and spaces affecting these matters before proceeding with work.

.5 Where job conditions require reasonable changes in indicated locations and arrangements, make such changes with approval of the Consultant at no additional cost to the Owner. Similarly, where existing conditions interfere with new installation and require relocation, such relocation is included in work.

1.21 CUTTING AND PATCHING

.1 Refer to Section 01 73 29.

.2 The Electrical Contractor will be responsible for all cutting and patching required for the electrical installation. Structural members are not to be cut without the consent of the Consultant.

.3 All cutting and patching required under Division 26, Division 27, and Division 28 shall be in accordance with Division 01. Layout such work for approval before undertaking same.

.4 Cutting shall be kept to an absolute minimum and performed in a neat and workmanlike manner using the proper tools and equipment. Caution shall be exercised in all cutting and procedures to ensure that concealed services are not affected. Do not cut if in doubt. Request the Consultant's presence to determine if concealed services exist.

.5 Assume responsibility for prompt installation of Work in advance of concrete pouring or similar Work. Should any cutting or repairing of finished/unfinished Work be required because such installation was not done, employ the particular trade, whose Work is involved, to do such cutting and patching. Pay for any resulting costs. Layout such Work for approval before undertaking same.

1.22 CLEANING AND WASTE MANAGEMENT

.1 Refer to Section 01 74 00.

.2 The Contractor and associated sub trades, at all times during construction, to keep the site free of all debris, boxes, packing, etc., resulting from work of this trade. At the completion of this work, the electrical installation is to be left in a clean and finished condition to the satisfaction of the Consultant.

.3 Clean and repair existing materials and equipment which remain or are to be reused.

.4 Assume responsibility for removing tools and waste materials on completion of Work, and leave Work in clean and perfect condition.

1.23 STARTING AND ADJUSTING

.1 Refer to Section 01 75 00.

.2 Conduct acceptance tests to demonstrate that the equipment and systems actually meet the specified requirements. Tests may be conducted as soon as conditions permit, and consequently make all changes, adjustments, or replacements required as the preliminary tests may indicate prior to the final tests. Tests shall be as specified in various sections of this Division. Carry out tests in the presence of the Consultant. Provide instruments, meters, equipment and personnel required to conduct tests during and at conclusion of project. The Electrical Contractor shall be in charge of the plant during tests. He shall assume responsibility for damages in the event of injury to the personnel, building, equipment, and shall bear all costs for liability, repairs, and restoration in this connection. Submit test results.

.3 Make tests of equipment and wiring at times requested.

.4 Tests shall include meggered insulation values, voltage and current readings to determine balance of panels and feeders under full load, and operation of each piece of equipment for correct operation.

.5 Supply meters, materials and personnel as required to carry out these tests.

.6 Test electrical work to standards and function of Specification and applicable codes in an approved manner. Replace defective equipment and wiring with new material and leave entire system in complete first class operating condition.

.7 Connect single phase loads so that there is the least possible unbalance of the supply phases.

.8 Submit all test results in report format.

.9 Trial Usage

.1 The Consultant reserves the right to use any system, piece of equipment, device, or material for such reasonable lengths of time and at such times as may be required to make a complete and thorough test of the same, or for the purpose of learning operational procedures, before the final completion and acceptance of the work. Such tests shall not be construed as evidence of acceptance of the work, and it is agreed and understood that no claim for damage will be made for injury or breakage to any part or parts of the above due to the aforementioned tests, where such injuries or breakage are caused by a weakness or inaccuracy of parts, or by defective materials or workmanship of any kind. Supply all labour and equipment required for such tests.

.2 Perform and pay for all costs associated with any testing required on the system components where, in the opinion of the Consultant the equipment manufacturer's ratings or specified performance is not being achieved.

1.24 CLOSEOUT PROCEDURES

.1 Refer to Section 01 77 00.

.2 The Consultant will carry out inspections and prepare deficiency list for action by the Contractor, during and on completion of project.

.3 Building Permit Compliance

.1 Provide a minimum of 10 business days notice to the Consultant for scheduling of Consultant’s occupancy inspection.

.2 Prior to requesting the Consultant’s letter “Review of General Conformance” for submission to the municipal building department to allow occupancy, the following items must be complete and submitted to the Consultant, as applicable:

.1 General

.1 Submit all applicable inspection reports from Authorities Having Jurisdiction.

.2 Continuity of fire separations at service penetrations must be complete.

.2 Electrical

.1 Provide Certificate of Acceptance from Electrical Inspection Department.

.2 Any devices not installed must have the wiring made safe and terminated in an outlet box complete with cover.

.3 All outlets must have cover plates installed. All electrical equipment not located in service rooms must have covers and/or doors installed complete.

.4 Emergency lighting system must be operational and tested by the Contractor. Where battery units and remote heads are indicated on the drawing, provide certification letter from equipment manufacturer indicating the system meets code requirements.

.5 Simulate normal power failure within the premises in the presence of the consultant and the owner's representative. Test and verify exit lights and emergency lighting operations under emergency conditions. Submit letter of certification copy to the Consultant stating that the systems have been tested, witnessed by the Consultant or the Owner's representative, etc., and the methods of installation and performance are satisfactory to all parties.

.6 All exit lights must be installed and operational.

.3 Electronic Safety and Security

.1 Fire alarm system and devices must be operational. Submit fire alarm verification report per CAN/ULC-S537, and submit audibility test. Indicate tap settings of all signalling devices.

.2 Functional testing of the fire alarm system and interconnected systems per CAN/ULC-S1001 must be completed.

.3 If any of the above items have not been completed at the time of Consultant's Inspection, and the letter of "assurance of professional field review and compliance" cannot be issued, any costs for subsequent Inspections will be charged to the Contractor.

1.25 CLOSEOUT SUBMITTALS

.1 Refer to Section 01 78 00.

.2 Project Record Documents

.1 Provide extra sets of white prints on which to make, as the job progresses, all approved changes and deviations from the original drawings. Complete as-built drawings accurately marked up in red ink must be submitted for review by the Consultant before the contract is considered to be completed.

.2 Changes and deviations include those made by addenda, change orders, and supplemental instructions, and changes and deviations to be marked on the white print record drawings indicated on supplemental drawings issued with addenda, change orders, and supplemental instructions. Maintain the "as-built" white prints at the site for periodic inspection by the Consultant throughout the duration of the work.

.3 Upon substantial completion of the work, obtain a set of reproducible white prints of the drawings and neatly amend the print in accordance with the marked-up white prints to produce a true "as-built" set of drawings.

.4 As-built drawings are to indicate all circuiting as installed and all distribution junction box locations as well as conduit routes.

.5 As-Built Revit drawings

.1 Request BIM release form from the Consultant, and submit completed form back to the Consultant.

.2 Transfer the information from the "as-built" white prints to the files, and submit to the Consultant for review.

.3 Employ a competent computer draftsperson to indicate changes on the electronic set of as-built drawings. Provide drawings in PDF and AutoCAD formats.

.4 Submit three (3) USB flash drives including as-built drawings in AutoCAD format, one with each O&M manual.

.5 Provide three (3) sets of full size as-built drawings in hard copy format, one with each O&M manual.

.6 As-built Single Line Diagram

.1 Provide in Main Electrical Room one wall mounted copy of as-built Single Line Diagram on 6 mm (1/4 in) foam board.

.2 As-built Single Line Diagram to indicate manufacturer name and catalogue numbers of as-installed products.

.3 Operations and Maintenance (O&M) Data

.1 Submit two complete sets of Operation and Maintenance instruction manuals in hard copy, and one in electronic format. Include in each copy of the manual:

.1 Verification certificates for installation of life safety systems by the manufacturer's representative.

.2 A copy of "reviewed" shop drawings.

.3 Complete explanation of operating principles and sequences.

.4 Recommended maintenance practices and precautions.

.5 Complete wiring and connection diagrams.

.6 Certificates of guarantees.

.2 Ensure that operating and maintenance instructions are specific and apply to the model and types of equipment provided.

.3 Include attendance records for each training session in the O&M manual.

.4 Warranties

.1 Submit a written guarantee to the Owner for one year from the date of acceptance. This guarantee shall bind the contractor to correct, replace or repair promptly any defective equipment workmanship without cost to the Owner.

.2 All equipment, materials and workmanship shall be unconditionally guaranteed for a minimum period of one year from the date of acceptance.

.3 Provide warranty certificates, wherever given or required, in excess of the normal warranty period showing the name of the firm giving the warranty, dated and acknowledged, on specific equipment and systems.

.4 Warranties for temperature controls and building automation systems will start on the date of verification of acceptance by the Consultant.

.5 Include these certificates with the maintenance and operating manuals in the appropriate sections.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 CONCRETE WORK

.1 Refer to Division 03 – Concrete and Section 26 05 29.

.2 Provide all concrete work required for the electrical work. Reinstall surfacing as per architectural requirements.

.3 Provide a 100 mm (4 in) high concrete housekeeping pad for floor mounted electrical distribution equipment, such as the following:

.1 Transformers.

.2 Switchgear and switchboards.

.3 Distribution panelboards.

.4 Engine Generators.

.5 Uninterruptible Power Supplies and batteries.

.6 Transfer Switches.

3.2 LINTELS

.1 Refer to Division 04 – Masonry.

.2 Lintels for openings in masonry shall conform with requirements of by-laws, and as approved by the Structural Engineer.

.3 Pay all costs for lintels over openings, required solely by the electrical trades, not shown on architectural or structural drawings.

3.3 METALS

.1 Refer to Division 05 – Metals.

.2 Steel construction required solely for the work of this trade, and not shown on architectural or structural drawings shall be provided by this Division to the requirements of Division 05.

3.4 FLASHING AND SHEET METAL

.1 Refer to Section 07 60 00.

.2 Flash all conduits and systems passing through roof or built into an outside wall, or a waterproof floor.

.3 Provide copper flashing for sleeves passing through exterior walls or waterproof floors.

3.5 FIRESTOPPING

.1 Provide firestopping in accordance with Section 07 84 00 and Section 26 05 44.13.

.2 Ensure that fire ratings of floors and walls are maintained.

.3 Provide ULC classified firestopping products by 3M, Hilti, STI, or approved equal which have been tested in accordance with CAN/ULC-S115.

.4 Pack clearance spaces, fill all spaces between openings, pipes and ducts passing through fire separations and install firestopping systems in accordance with the appropriate ULC system number for the products and type of penetration.

.5 Install firestopping systems using personnel trained or instructed by the product manufacturer.

3.6 ACCESS DOORS

.1 Provide access doors in accordance with Section 08 31 00.

.2 Before commencing installation of work, coordinate with other trades and prepare on a set of reflected ceiling plans and wall elevations, complete layouts of access doors. Submit these layouts for Consultant's review and show exact sizes and locations of such access doors. Locate and arrange the work to suit.

.3 Group conduit work to ensure the minimum number of access doors is required.

.4 Access doors are to be installed by the trade responsible for the particular type of construction in which the doors are required.

3.7 PAINTING AND FINISHES

.1 Refer to Section 09 91 00.

.2 Shop finish metal enclosure surfaces by application of rust resistant primer inside and outside, and at least two coats of finish enamel.

.3 Repair and finish factory finished equipment, damaged, or scratched during installation, in an approved manner.

.4 All structural steel including hangers, brackets, supports and other ferrous metals shall be shop or factory prime painted wherever practicable. Wherever structural steel including hangers, brackets, supports, and other ferrous metals cannot be shop or factory prime painted, wire brush to remove all traces of rust, clean of all traces of dirt, oil, and grease, and apply one coat of an approved rust inhibiting primer in accordance with CGSB-GB-40d, and leave ready to receive finish paint.

.5 Primary and final painting for Work, other than items specified as factory primed or finished, will be performed as described in Division 09 – Finishes.

.6 All electrical fittings, supports, hanger rods, pull boxes, channel frames, conduit racks, outlet boxes, brackets, clamps etc., to have galvanized finish or paint finish over corrosion-resistant primer.

.7 All panelboards, motor starters etc., to be factory finished with baked on enamel. All enamel to be baked on gloss over corrosion resistant primer.

.8 Touch up minor damage to finish on factory finished equipment. Items suffering major damage to finish shall be replaced at the direction of the Consultant.

.9 Protect work so that finishes will not be damaged or marred during construction. Maintain the necessary protection until completion of the work.

.10 Provide all exposed ferrous metal work on equipment with at least one factory prime coat, or paint one prime coat on job. Clean up or wire brush all equipment, etc., before painting.

.11 For factory applied finishes, repaint or refinish surfaces damaged during shipment, erection or construction work.

3.8 LOCATION OF OUTLETS

.1 Refer to Architectural drawings for dimensions denoting exact locations.

.2 The Consultant reserves the right to change the location of outlets to within 3 m from the point indicated on the plans without extra charge providing the Contractor is advised before installation is made.

.3 Location of lighting, convenience, telephone, power, and communication outlets shall be subject to change, without extra cost to Owners, provided information is given prior to installation. No extra amount will be paid for extra labour and materials for relocating outlets up to 3000 mm from their original location nor will credits be anticipated where relocation up to 3000 mm reduces materials and labour. Other cases will be considered on their individual merits.

.4 Coordinate location of boxes with latest architectural drawings and instructions to suit door swings, millwork etc. prior to rough-in.

3.9 MOUNTING HEIGHTS AND DEVICE LOCATIONS

.1 Refer to architectural drawings for exact location of electrical equipment and devices.

.2 Architectural elevations take precedence over electrical elevations. If there are conflicts between architectural and electrical, adjust locations of electrical equipment at no additional cost to the owner.

.3 Prior to roughing-in, the contractor is to mark locations of electrical equipment and devices for conflicts with architectural, studs, etc. If conflicts are noted, inform the Consultant for a decision prior to commencing the rough-in.

.4 Mounting heights of equipment and devices listed below is from finished floor to centreline of equipment, unless specified or indicated otherwise.

.5 If mounting height of equipment is not specified or indicated, verify before proceeding with installation.

.6 Install electrical equipment at following heights above finished floor (AFF). Dimensions are to centre of device unless indicated otherwise.

.1 Power door operator push buttons: 1000 mm.

.2 HVAC thermostats and manual HVAC controls: 1200 mm.

.3 Local switches, and manual lighting control devices:

.1 1100 mm.

.2 Locate on lock side of door.

.4 System furniture service fittings: to suit furniture layout.

.5 Wall receptacles:

.1 General: min. 400 mm AFF.

.1 Above top of counters: 175 mm.

.2 Above top of continuous baseboard heater, or mechanical heating/radiation units: 75 mm to bottom of device.

.3 In fan rooms, mechanical rooms, and electrical rooms: 1100 mm.

.4 For electric ranges: 130 mm.

.6 Outlets in raceways or millwork to be located as per Architectural details.

.7 Door bell pushbuttons: 1100 mm.

.8 Panelboards: as indicated in Section 26 24 16.

.9 Emergency lighting remote heads: 300 mm below finished ceiling, or 2400 mm AFF for exposed areas or areas with ceiling height above 2750 mm (9 ft).

.10 Communications:

.1 Typical communication outlets (voice and data): 400 mm.

.2 Communications outlets for wall mounted telephones, intercom, or similar: 1100 mm.

.3 Television outlets: 200 mm below finished ceiling.

.4 Wall mounted public address speakers: 2100 mm.

.5 Clocks: 2100 mm.

.11 Access control card readers and keypads: 900 mm.

.12 Fire alarm manual pull stations: 1200 mm.

.13 Wall mounted fire alarm audible devices, including bells or horns:

.1 2300 mm to the top of the device in areas of ceiling height 2450 mm or greater.

.2 150 mm below the finished ceiling for ceiling heights less than 2450 mm, measured to the top of the device.

.14 Wall mounted fire alarm visible signal devices, including strobes: 2300 mm.

3.10 MANUFACTURER'S INSTRUCTIONS

.1 Where the specifications call for an installation to be made in accordance with Manufacturer's recommendations, a copy of such recommendations shall be at all times be kept on the job site and be available to the Owner's Representative.

.2 Follow manufacturer's instructions where they cover points now specifically indicated on the drawings and specifications. If they are in conflict with the drawings and specifications obtain clarification from the Consultant before starting work.

3.11 TESTS AND ACCEPTANCE

.1 The operation of the equipment and electrical system does not constitute an acceptance of the work by the Owner. The final acceptance is to be made after the Contractor has adjusted his equipment and demonstrated that it fulfills the requirements of the drawings and the specifications.

.2 Testing of all systems shall be performed in the presence of the Owner's designated representative. The contractor shall give 72 hours advance notice to the Owner before beginning the tests.

.3 Upon completion of the installation, the Contractor shall furnish certificates of approval from all authorities having jurisdiction, as applicable. Contractor shall demonstrate that work is complete and in perfect operating condition, with raceway and conduit systems properly grounded, wiring free from grounds, shorts, and that the entire installation is free from any physical defects.

.4 Provide labour and material to conduct the integrated systems testing of interconnected life safety systems in accordance with CAN/ULC-S1001-11.

3.12 CLOSEOUT ACTIVITIES

.1 Refer to Section 01 79 00.

.2 In the presence of the Owner, demonstrate the proper operation of all systems.

.3 Instruct the Owner's designated representatives in all aspects of the operation and maintenance of systems and equipment listed in the trade sections governed by this Section. Obtain in writing from the Consultant a list of the Owner's representatives qualified to receive instructions.

.4 Arrange for and pay for the services of qualified service technicians and other manufacturer's representatives required for instruction of specialized portions of the installation.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Building wire and cable.

.1 Armoured cable.

.2 Metal clad cable.

.3 Fire resistive cables.

.4 Wiring connectors and connections.

.2 Permitted voltage drop for feeder and branch circuits.

.3 Conductor sizes are based on copper unless indicated as aluminum or "AL".

1.3 ALTERNATES

.1 Submit bid based on copper conductors only, unless aluminum conductors are explicitly indicated on the drawings. Submit with bid an alternative price indicating the credit to substitute 208 V and 600 V copper feeders rated above 100 A with equivalent feeders of aluminum. Contractor bears responsibility for increased wire size, and corresponding changes in the size of conduits, supports, penetrations, etc. associated with the related change in conductor material. Provide appropriate lugs that are rated for aluminum conductors and provide appropriate oxidation inhibitor (i.e. Noalox or equal).

1.4 COORDINATION

.1 Where wire and cable destination is indicated, and routing is not shown, determine exact routing and lengths required.

1.5 CLOSEOUT SUBMITTALS

.1 Record Documents: Indicate as-constructed feeder sizes on single line diagram.

.2 Megger test results.

.3 Fire resistive cables: manufacturer's certification that the cables have been installed in accordance with the manufacturer's instructions.

1.6 QUALIFICATIONS

.1 Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' experience.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 American Wire Group.

.2 BICC Phillips.

.3 General Cable.

.4 Nexans.

.5 Prysmian.

.6 Southwire.

2.2 REGULATORY REQUIREMENTS

.1 Provide products listed and classified by CSA Group as suitable for the purpose specified and indicated.

2.3 CONDUCTOR MATERIAL

.1 Submit bid based on copper conductors only

2.4 BUILDING WIRE

.1 RW90:

.1 Single copper conductor.

.2 Minimum 12 AWG for branch circuit wiring.

.3 Minimum 14 AWG for 120 V control wiring.

.4 Chemically cross-linked polyethylene insulation.

.5 Rated for 90°C, 600 V.

.6 Suitable for handling to -40°C.

.7 For interior installations in conduit.

.2 RWU90:

.1 Single copper conductor.

.2 Minimum 12 AWG for branch circuit wiring.

.3 Minimum 14 AWG for 120 V control wiring.

.4 Chemically cross-linked polyethylene insulation.

.5 Rated for 90°C, 1000 V.

.6 Suitable for handling to -40°C.

.7 For exterior installations, direct buried, or in conduit.

.3 T90 Nylon:

.1 Single copper conductor.

.2 Thin wall PVC insulation with nylon covering.

.3 Rated for 90°C, 600 V.

.4 May be used up to size 10 AWG for interior installations.

.5 Base conduit fill on RW90 cable diameters.

2.5 ARMOURED CABLE

.1 General

.1 Connectors: standard as required, complete with anti-short rings.

.2 Runs to be limited to fixture drops, and runs to devices in walls and partitions, maximum horizontal runs in exposed areas and ceiling spaces to be 1.8 m (6 ft).

.2 Type AC:

.1 Two, three or four copper conductors rated RW90, 1000 V.

.2 Bare copper ground wire.

.3 Insulation Voltage Rating: 600 V.

.4 Insulation Temperature Rating: 90°C (194°F).

.5 Insulation Material: Thermoplastic.

.6 Overall interlocked aluminum tape armour.

.3 Type SPC90:

.1 Use for LED lighting, fluorescent dimming controls, and other SMART building applications.

.2 Colour coded cable with power, control, and signal under one cable.

.3 12-2C Power with a 16-2C Control.

.4 Bare copper ground wire.

.5 Insulation Voltage Rating: 600 V.

.6 Insulation Temperature Rating: 90°C (194°F).

.7 Insulation Material: Thermoplastic.

2.6 FIRE RESISTIVE CABLES

.1 General:

.1 2 hour fire rating to CAN/ULC-S139 and to meet 2012 Ontario Building Code rule 3.2.7.10.

.2 Alternative means of compliance:

.1 Conduits encased in a minimum of 50 mm (2 in) of concrete.

.2 Be protected by a fire rated assembly listed to achieve the minimum fire rating as indicated.

.2 Manufacturers:

.1 nVent Pyrotenax 1850 series Mineral Insulated (MI) cable.

.2 VITALink MC Brand Type MC-RC90, manufactured by Marmon Wire & Cable Inc. (listed by ULC under ULC category code ‘FHIT7’ or ‘FHJR7’, dated 19 May 2015). This cable is not to be installed in conduit.

.1 Request quotation from manufacturer or manufacturer’s representative for field certification of installed Vitalink cables prior to requesting Consultant’s construction field review.

.2 Power cable must be installed according to UL protocol FHIT7.120 – Electrical circuit integrity systems certified in Canada.

.3 Prysmian Lifeline RC90 cable.

.1 Installation in accordance with UL protocol FHIT7-51, and FHIT7-51A.

.2 System makes use of Remke connectors and Resolve boxes, with no substitutions.

.3 Substitution Limitations:

.1 Substitutions may only be considered by the Consultant if the product is listed by ULC under ULC Category Codes ‘FHIT7’ or ‘FHJR7’.

2.7 TECK90 CABLE

.1 Single, three, or four conductors as indicated on drawings.

.2 Cable to CSA C22.2 No. 131.

.3 Conductors:

.1 Grounding conductor: copper.

.2 Circuit conductors: copper, size as indicated.

.4 Insulation: Cross-linked polyethylene (XLPE), type RW90, rating: 600 V.

.5 Inner jacket: polyvinyl chloride.

.6 Armour: interlocking aluminum.

.7 Overall covering: thermoplastic.

.8 Fastenings:

.1 One-hole steel straps to secure surface cables 50 mm diameter and smaller. Two-hole steel straps for cables larger than 50 mm diameter.

.2 Channel type supports for two or more cables at 1500 mm centres.

.3 Threaded rods: 6 mm diameter to support suspended channels.

.9 Connectors: Watertight, approved for TECK cable.

2.8 CONDUCTOR PULLING LUBRICANT

.1 Where pulling lubricant is required, use non-wax based cable lubricants compatible with cable manufacturer recommendations, such as American Polywater.

2.9 CONNECTORS

.1 Armoured cable connectors must be proper squeeze type connectors and plastic anti-short bushings at terminations.

.2 Connectors for conductors connecting to devices as per local governing electrical requirements to be equal to IDI Electric (Canada) Ltd., "Ideal" No. 451, No. 452, and No. 453, "Wing-Nut", CSA certified, 600 V, rated pressure type connectors.

.3 For conductors sized 3/0 AWG and greater, provide long barrel double crimp, two (2) hole compression type lug connectors, unless otherwise noted.

2.10 WIRING TERMINATION

.1 Lugs, terminals, or screws used for termination of wiring to be suitable for copper conductors. Identify wiring with permanent indelible identifying markings, either numbered or coloured plastic tapes, on both ends of phase conductors of feeders and branch circuit wiring. Maintain phase sequence and colour coding throughout.

.2 Splice wire, up to and including 6 AWG, with nylon insulated expandable spring type connectors.

.1 Thomas & Betts – Marr Max series.

.3 Splice large conductors using compression type connections insulated with heat shrink sleeves.

.1 Thomas & Betts – 5400 Series lugs & heat shrink type #s series.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Verify that field measurements are as indicated.

.2 Wire and cable routing indicated is approximate unless dimensioned.

.3 Where wire and cable destination is indicated and routing is not shown, determine exact routing and lengths required.

.4 Voltage Drop

.1 Ensure voltage drop in power and control conductors is in accordance with the requirements of the OESC.

.2 Size conductors accordingly when sizes are not identified.

.1 Feeder conductors: maximum voltage drop of 2%.

.2 Branch circuit conductors: maximum voltage drop of 3%.

.5 Verify that mechanical work likely to damage wire and cable has been completed.

.6 Verify that raceway installation is complete and supported.

3.2 PREPARATION

.1 Completely and thoroughly swab raceway before installing wire.

3.3 INSTALLATION

.1 Route wire and cable as required to meet project conditions.

.2 Install cable to CSA C22.1 and per manufacturer's installation guidelines.

.3 Conduit and cable supports:

.1 All wiring to be installed in EMT at all exposed areas unless otherwise specified.

.2 All mechanical equipment to be connected with liquid tight flexible conduit.

.3 Support cables above accessible ceiling, using spring metal clips to support cables from structure. Do not rest cable on ceiling panels.

.4 Conductors

.1 Provide separate neutral for each circuit. Common neutrals not permitted.

.2 Use solid conductor for feeders and branch circuits 10 AWG and smaller.

.3 Use stranded conductors for control circuits.

.4 Use conductor not smaller than 12 AWG for power and lighting circuits.

.5 Use conductor not smaller than 16 AWG for control circuits.

.6 Use 10 AWG conductors for 20 A, 120 V branch circuits longer than 25 m.

.5 Pulling conductors

.1 Pull all conductors into raceway at same time.

.2 Use suitable wire pulling lubricant for building wire 4 AWG and larger.

.3 Neatly train and lace wiring inside boxes, equipment, and panelboards.

.4 Protect exposed cable from damage.

.6 Connectors

.1 Use suitable cable fittings and connectors.

.2 Clean conductor surfaces before installing lugs and connectors.

.3 Make splices, taps, and terminations to carry full ampacity of conductors with no perceptible temperature rise.

.4 Use split bolt connectors for copper conductor splices and taps 6 AWG and larger. Tape uninsulated conductors and connector with electrical tape to 150 per cent of insulation rating of conductor.

.5 Use solderless pressure connectors with insulating covers for copper conductor splices and taps, 8 AWG and smaller.

.6 Use insulated spring wire connectors with plastic caps for copper conductor splices and taps, 10 AWG and smaller.

.7 Identification

.1 Identify and colour code wire and cable to Section 26 05 53. Identify each conductor with its circuit number or other designation indicated.

.2 Where colour-coded tape is utilized, apply a minimum of 50 mm (2 in) at terminations, junction and pull boxes and conduit fittings. Do not paint conductors under any condition.

.3 Utilize colour coding on bussing in panels and, switchgear, disconnects, and metering cabinets to match conductor colour coding.

3.4 CONDUCTORS, WIRES, AND CABLES

.1 Provide fire rated conductors or provide a fire rated assembly around conductors used for life safety applications as described in 2012 OBC 3.2.7.10.

.2 Indoor wiring installed in conduit, unless otherwise noted: 600 V "RW90 XLPE".

.3 Wiring in channel back of fluorescent and LED lighting fixtures: 600 V type GTF or TEW.

.4 Lighting and power branch circuit wiring:

.1 Copper, minimum 12 AWG.

.2 Home runs to lighting and receptacle panels, which exceed 22 m (75 ft) in length: minimum 10 AWG.

.5 Size wires for 2 per cent maximum voltage drop to farthest outlet on a maximum 80% loaded circuit.

.6 Outdoor wiring: “RWU90 XLPE”.

.7 Conductors shall be colour coded. Conductors 10 AWG and smaller shall have colour impregnated into insulation at time of manufacture. Conductors size 8 AWG and larger may be colour coded with adhesive colour coding tape, but only black insulated conductors shall be employed in this case, except for neutrals which shall be white wherever possible.

.8 Colour coding as follows:

.1 Phase "A" – Red.

.2 Phase "B" – Black.

.3 Phase "C" – Blue.

.4 Control – Orange.

.5 Ground – Green.

.6 Neutral – White.

.9 Neatly train circuit wiring in cabinets, panels, pull boxes and junction boxes and hold with nylon cable ties.

3.5 SITE TESTS AND INSPECTIONS

.1 Perform continuity tests of all feeders, motor circuits, and branch circuits.

.2 Perform insulation-resistance test (megger test) on each feeder. Submit report to the Consultant.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Low-voltage control cabling.

.2 Control-circuit conductors.

1.2 REFERENCES

.1 CSA Group:

1.3 QUALIFICATIONS

.1 Manufacturer: Company specializing in manufacturing products specified in this Section with minimum three years' experience.

1.4 COORDINATION

.1 Where wire and cable destination is indicated and routing is not shown, determine exact routing and lengths required.

PART 2 - PRODUCTS

2.1 REGULATORY REQUIREMENTS

.1 Conform to CSA C22.1.

.2 Provide products listed and classified by CSA Group as suitable for the purpose specified and indicated.

2.2 LOW VOLTAGE WIRING

.1 LVT:

.1 Multi conductor PVC insulated.

.2 Bare copper ground conductor.

.3 Overall PVC jacket.

.4 Rated 30 V.

.5 CMP (FT6) rated if cable is exposed.

.6 CMR (FT4) rated if cable is installed in conduit.

.2 Category 5e Network Cabling.

.1 CMP (FT6) rated if cable is exposed.

.2 CMR (FT4) rated if cable is installed in conduit.

2.3 TERMINATIONS AND SPLICES

.1 All terminations and splices shall be of an approved type for the conductors being used.

.2 Where conductors are terminated or spliced, it shall be done in the following manner:

.1 Where a single solid conductor is terminated in a device under one screw or clamping mechanism, no additional terminating hardware is required.

.2 Where multiple or stranded conductors are terminated in a device under one screw or clamping mechanism, self insulated crimp-on cable ends or approved equal shall be used up to and including 10 AWG sized conductors. Approved compression lugs shall be used for larger conductor sizes.

.3 Where multiple conductors are spliced, properly sized Wing Nut connectors, or approved equal, shall be used for up to two 8 AWG or three 10 AWG conductors. Pressure type sleeve cable connectors, splices, tee's, etc., shall be used for all larger size connections and terminations.

.4 Insulate all bare surfaces of splices with heat shrink sleeving or equivalent.

.5 Conductors connected to ground rods for service or equipment grounding or to building structural or architectural elements shall be terminated, connected, and spliced using a thermoweld process or approved non-mechanical compression type connectors.

.3 Install all service and feeder conductors as continuous lengths without breaks, measured and cut based on site dimensions.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Verify that mechanical work likely to damage wire and cable has been completed.

.2 Verify that raceway installation is complete and supported.

.3 Verify that field measurements are as indicated.

.4 Wire and cable routing indicated is approximate unless dimensioned.

3.2 PREPARATION

.1 Completely and thoroughly swab raceway before installing wire.

3.3 INSTALLATION

.1 Route control cabling as required to meet project conditions.

.2 Install cable to the CSA C22.1.

.3 Conduit and supports

.1 All wiring to be installed in EMT at all exposed areas and in partitions unless otherwise specified.

.2 All mechanical equipment to be connected with liquid tight flexible conduit.

.3 Support cables above accessible ceiling, using spring metal clips to support cables from structure. Do not rest cable on ceiling panels.

.4 Conductors

.1 Use stranded conductors for control circuits.

.2 Use conductor not smaller than 16 AWG for control circuits.

.5 Pulling conductors

.1 Pull all conductors into raceway at same time.

.2 Neatly train and lace wiring inside boxes, equipment, and panelboards.

.3 Neatly train circuit wiring in cabinets, panels, pull boxes and junction boxes and hold with nylon cable ties.

.4 Protect exposed cable from damage.

.6 Connectors

.1 Use suitable cable fittings and connectors.

.2 Clean conductor surfaces before installing lugs and connectors.

.3 Use solderless pressure connectors with insulating covers for copper conductor splices and taps, 8 AWG and smaller.

.4 Use insulated spring wire connectors with plastic caps for copper conductor splices and taps, 10 AWG and smaller.

.7 Identification

.1 Identify and colour code wire and cable to Section 26 05 53. Identify each conductor with its circuit number or other designation indicated.

.2 Where colour coded tape is utilized, apply a minimum of 50 mm (2 in) at terminations, junction and pull boxes and conduit fittings. Do not paint conductors under any condition.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Grounding electrodes and conductors.

.2 Equipment grounding conductors.

.3 Bonding.

.4 The terms “connect” and “bond” are used interchangeably in this Specification and have the same meaning.

1.2 RELATED REQUIREMENTS

.1 Section 27 05 26 – Grounding and Bonding for Communications Systems.

1.3 REFERENCES

.1 CSA Group:

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CSA C22.2 No. 0.4-17, Bonding of electrical equipment.

.4 CSA C22.2 No. 41-13, Grounding and bonding equipment.

.5 CSA C22.2 No. 75-17, Thermoplastic insulated wires and cables.

.3 Institute of Electrical and Electronics Engineers, Inc.

.1 IEEE 81-1983 - IEEE Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potentials of a Ground System.

1.4 ACTION SUBMITTALS

.1 Product Data: Provide for grounding electrodes and connections.

1.5 INFORMATIONAL SUBMITTALS

.1 Test Reports: Indicate overall resistance to ground and resistance of each electrode.

.2 Manufacturer's Instructions: Indicate application conditions and limitations of use stipulated by product testing agency specified under Regulatory Requirements. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

1.6 CLOSEOUT SUBMITTALS

.1 Project Record Documents: Record actual locations of components and grounding electrodes.

.2 Certificate of Compliance: Indicate approval of installation by authority having jurisdiction.

1.7 QUALIFICATIONS

.1 Manufacturer: Company specializing in manufacturing the products specified in this section with minimum three years' experience.

1.8 REGULATORY REQUIREMENTS

.1 Products: Listed and classified testing firm acceptable to the authority having jurisdiction as suitable for the purpose specified and indicated.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 B-Line by Eaton.

.2 Hubbell (Burndy).

.3 Panduit.

.4 Thomas & Betts.

2.2 PERFORMANCE CRITERIA

.1 Grounding System Resistance: 5 ohms.

.2 Provide all equipment grounding as required regardless of whether it has been shown on drawings or called for in this specification. Arrange grounds so that under normal operating conditions no injurious amount of current will flow in any grounding conductor.

2.3 GROUNDING AND BONDING CONDUCTORS

.1 Electrical grounding conductors shall be CSA C22.2 No. 75 insulated stranded copper, except that sizes 10 AWG and smaller shall be solid copper. Insulation colour shall be continuous green for all equipment grounding conductors.

.2 Bonding conductors shall be ASTM B8 bare stranded copper, except that sizes 10 AWG and smaller shall be ASTM B1 solid bare copper wire.

2.4 ROD ELECTRODES

.1 Material: Copper-clad steel.

.2 Diameter: 19 mm.

.3 Length: 3000 mm.

2.5 GROUND RODS

.1 Copper clad steel, 19 mm (3/4 in) diameter by 3000 mm (10 ft) long, conforming to CSA C22.2 No. 41.

.2 Quantity of rods shall be as required to obtain the specified ground resistance.

2.6 SPLICES AND TERMINATION COMPONENTS

.1 Components shall meet or exceed CSA C22.2 No. 41, and be clearly marked with the manufacturer, catalog number, and permitted conductor size(s).

2.7 GROUND CONNECTIONS

.1 Below Grade: Exothermic-welded type connectors.

.2 Above Grade:

.1 Bonding Jumpers: compression type connectors, using zinc-plated fasteners and external tooth lockwashers.

.2 Ground Busbars: Two-hole compression type lugs using tin-plated copper or copper alloy bolts and nuts.

2.8 GROUND TERMINAL BLOCKS

.1 At any equipment mounting location (e.g. backboards and hinged cover enclosures) where rack-type ground bars cannot be mounted, provide screw lug-type terminal blocks.

2.9 SPLICE CASE GROUND ACCESSORIES

.1 Splice case grounding and bonding accessories shall be supplied by the splice case manufacturer when available. Otherwise, use 6 AWG insulated ground wire with shield bonding connectors.

2.10 MECHANICAL CONNECTORS

.1 Material: Bronze.

2.11 WIRE

.1 Material: Stranded copper.

.2 Foundation Electrodes: 2/0 AWG.

.3 Grounding Electrode Conductor: Size to meet Ontario Electrical Safety Code requirements.

2.12 GROUNDING WELL COMPONENTS

.1 Well Pipe: 200 mm by 600 mm long concrete pipe with belled end.

.2 Well Cover: Cast iron with legend "GROUND" embossed on cover.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Verify that final backfill and compaction has been completed before driving rod electrodes.

3.2 INSTALLATION

.1 General

.1 Ground in accordance with the Ontario Electrical Safety Code, as shown on drawings, and as hereinafter specified.

.2 System Grounding:

.1 Secondary service neutrals: Ground at the supply side of the secondary disconnecting means and at the related transformers.

.2 Separately derived systems (transformers downstream from the service entrance): Ground the secondary neutral.

.3 Equipment Grounding: Metallic structures (including ductwork and building steel), enclosures, raceways, junction boxes, outlet boxes, cabinets, machine frames, and other conductive items in close proximity with electrical circuits shall be bonded and grounded.

.4 Ground electrical equipment and wiring in accordance with Ontario Electrical Safety Code and Local Inspection Authority's Rules and Regulations.

.5 Install grounding conductors, outside Electric Rooms and Electrical Closets in conduit and conceal where possible. Make connections to water mains, all metallic piping systems, neutral and equipment with brass, copper or bronze bolts and connectors or weld using Cadweld or Thermoweld processes.

.6 Provide grounding conductors, sized as per Code, and connect to grounding bus or water main wherever non-raceways are installed.

.2 Provide grounding electrode conductor and connect to reinforcing steel in foundation footing. Bond steel together.

.3 Provide bonding to meet Regulatory Requirements.

.4 Bond together metal siding not attached to grounded structure; bond to ground.

.5 Install ground grid under access floors indicated.

.6 Bond together each metallic raceway, pipe, duct, and other metal object entering space under access floors. Bond to underfloor ground grid. Use 6 AWG bare copper conductor.

.7 Equipment Grounding Conductor: Provide separate, insulated conductor within each feeder and branch circuit raceway. Terminate each end on suitable lug, bus, or bushing.

.8 Ground Resistance

.1 Grounding system resistance to ground not to exceed 5 ohms. Make necessary modifications or additions to the grounding electrode system for compliance without additional cost to the Owner. Final tests shall assure that this requirement is met.

.2 Resistance of the grounding electrode system shall be measured using a four-terminal fall-of-potential method as defined in IEEE 81. Ground resistance measurements shall be made before the electrical distribution system is energized and shall be made in normally dry conditions not less than 48 hours after the last rainfall. Resistance measurements of separate grounding electrode systems shall be made before the systems are bonded together below grade. The combined resistance of separate systems may be used to meet the required resistance, but the specified number of electrodes must still be provided.

.3 Services at power company interface points shall comply with the power company ground resistance requirements.

.9 Ground Rod Installation

.1 Drive each rod vertically in the earth, not less than 3000 mm (10 ft) in depth.

.2 Where permanently concealed ground connections are required, make the connections by the exothermic process to form solid metal joints. Make accessible ground connections with mechanical pressure type ground connectors.

.3 Where rock prevents the driving of vertical ground rods, install angled ground rods or grounding electrodes in horizontal trenches to achieve the specified resistance.

.10 Inaccessible Grounding Connections

.1 Make grounding connections, which are buried or otherwise normally inaccessible (except connections for which periodic testing access is required) by exothermic weld.

.11 Secondary Equipment and Circuits

.1 Main Bonding Jumper: Bond the secondary service neutral to the ground bus in the service equipment.

.2 Metallic Piping, Building Steel, and Supplemental Electrode(s):

.1 Provide a grounding electrode conductor sized per code between the service equipment ground bus and all metallic water and gas pipe systems, building steel, and supplemental or made electrodes. Jumper insulating joints in the metallic piping. All connections to electrodes shall be made with fittings that conform to CSA C22.2 No. 41.

.2 Provide a supplemental ground electrode and bond to the grounding electrode system.

.3 Conduit Systems:

.1 Ground all metallic conduit systems. All metallic conduit systems shall contain an equipment grounding conductor.

.2 Non-metallic conduit systems shall contain an equipment grounding conductor, except that non-metallic feeder conduits which carry a grounded conductor from exterior transformers to interior or building-mounted service entrance equipment need not contain an equipment grounding conductor.

.3 Conduit containing only a grounding conductor, and which is provided for mechanical protection of the conductor, shall be bonded to that conductor at the entrance and exit from the conduit.

.4 Feeders and Branch Circuits: Install equipment grounding conductors with all feeders and power and lighting branch circuits.

.5 Boxes, Cabinets, Enclosures, and Panelboards:

.1 Bond the equipment grounding conductor to each pull box, junction box, outlet box, device box, cabinets, and other enclosures through which the conductor passes (except for special grounding systems for intensive care units and other critical units shown).

.2 Provide lugs in each box and enclosure for equipment grounding conductor termination.

.3 Provide ground bars in panelboards, bolted to the housing, with sufficient lugs to terminate the equipment grounding conductors.

.6 Receptacles shall not be grounded through their mounting screws. Ground with a jumper from the receptacle green ground terminal to the device box ground screw and the branch circuit equipment grounding conductor.

.7 Raised Floors: Provide bonding of all raised floor components.

.12 Corrosion Inhibitors

.1 When making ground and ground bonding connections, apply a corrosion inhibitor to all contact surfaces. Use corrosion inhibitor appropriate for protecting a connection between the metals used.

.13 Conductive Piping

.1 Bond all conductive piping systems, interior and exterior, to the building to the grounding electrode system. Bonding connections shall be made as close as practical to the equipment ground bus.

3.3 FIELD QUALITY CONTROL

.1 Perform inspections and tests listed in NETA ATS, Section 7.13.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Conduit and equipment supports.

.2 Anchors and fasteners.

1.2 REFERENCES

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CECA - Canadian Electrical Contractors Association.

1.3 CLOSEOUT SUBMITTALS

.1 Submit the following in the Operation and Maintenance Manual for products used over the course of the project:

.1 Product Data: Provide manufacturer's catalogue data for fastening systems.

.2 Manufacturer's Instructions: Indicate application conditions and limitations of use stipulated by product testing agency specified under Regulatory Requirements. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

1.4 REGULATORY REQUIREMENTS

.1 Provide products listed and classified by Canadian Standards as suitable for purpose specified and shown.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 B-line by Eaton.

.2 Burndy Canada Ltd. (Hubbell).

.3 Erico Caddy.

.4 E. Myatt & Co. Inc.

.5 Hilti Canada.

.6 Thomas & Betts.

.7 Unistrut.

2.2 GENERAL

.1 All supporting devices, strut channel, threaded rod, anchors, etc. to be used shall be of the “hot dipped” galvanized type. Electrogalvanized components will not be accepted.

.2 Materials and Finishes: Provide adequate corrosion resistance.

.3 Provide materials, sizes, and types of anchors, fasteners and supports to carry the loads of equipment and conduit. Consider weight of wire in conduit when selecting products.

.4 Anchors and Fasteners:

.1 Concrete Structural Elements: Use expansion anchor sand preset inserts.

.2 Steel Structural Elements: Use beam clamps and welded fasteners.

.3 Concrete Surfaces: Use self-drilling anchors and expansion anchors.

.4 Hollow Masonry, Plaster, and Gypsum Board Partitions: Use toggle bolts and hollow wall fasteners.

.5 Solid Masonry Walls: Use expansion anchors and preset inserts.

.6 Sheet Metal: Use sheet metal screws.

.7 Wood Elements: Use wood screws.

2.3 ANCHORS AND HANGERS

.1 Hangers for electrical conduit shall be galvanized after fabrication.

.2 Perforated strapping: not permitted.

2.4 INSERTS

.1 Use only factory-made threaded or toggle type.

.2 Where inserts cannot be placed, use factory-made expansion shields for light weights, where approved by the Consultant.

.3 Do not use powder-activated tools except with the written permission of the Consultant.

2.5 SLEEVES

.1 Through interior walls, use standard weight steel pipes, conduit, or 18 gauge galvanized steel. Cut flush with finished surfaces. Check room finish schedules.

.2 Through exterior walls above grade, floors, and roof use standard weight steel pipes, machine cut, flush with finished surface inside and to suit flashing outside.

.3 Through exterior walls below grade, water-proofed floors, and other water-proof walls, use heavy weight cast iron pipes, machine cut. Extend sleeves 100 mm (4 in) above finished floors, and cut flush with underside of floor.

2.6 STEEL CHANNEL

.1 Description: Painted steel.

2.7 SUPPORTS

.1 Steel supports in wet or dry locations to be galvanized after fabrication.

.2 Where galvanized members are bolted together use cadmium plated bolts.

.3 For hanger rods use minimum 10 mm (3/8 in) diameter steel threaded rod. Use clevis type attachment.

.4 Provide minimum 100 mm (4 in) high concrete bases for all floor mounted equipment.

2.8 SUPPORTS AND BASES

.1 Submit proposed method of attachment of hangers and beam clamps, to cellular steel deck for approval before proceeding with Work.

.2 Supply and erect special structural Work required for the installation of electrical equipment. Provide anchor bolts and other fastenings unless noted otherwise. Mount equipment required to be suspended above floor level, where details are not shown, on a frame or platform bracketed from the wall or suspended from the ceiling. Carry supports to either the ceiling or the floor, or both as required, at locations where, because wall thickness is inadequate, it is not permitted to use such brackets.

.3 Electrical panels, switches or other electrical equipment shall be complete with suitable bases or mounting brackets.

.4 Provide channel or other metal supports where necessary, to adequately support lighting fixtures. Do not use wood unless wood forms part of the building structure.

.5 Support hangers, in general, from inserts in concrete construction or from building structural steel beams, using beam clamps. Provide additional angle or channel steel members, required between beams for supporting conduits and cables.

.6 Provide any additional supports required from existing concrete construction for any piping or equipment, by drilling same and installing expansion bolt cinch anchors.

.7 Do not use explosive drive pins in any section of Work without obtaining prior approval.

2.9 THREADED ROD COVERS

.1 Protect cable from abrasion caused by contact with threaded rod.

.2 To meet UL 94V-0 specifications.

.3 Colour: Black.

.4 Manufacturers:

.1 Panduit TRC18FR-X20Y.

.2 Approved equal.

2.10 STACKED TRANSFORMER SUPPORTS

.1 Stacking of transformers is only allowed if all other options have been exhausted due to lack of space. Stacking is only applicable to floor mount applications and is not allowed for ceiling or wall mount configurations. Stacking shall comply with the following requirements:

.1 The transformer stacked on top is the same size or smaller than the transformer below.

.2 The OESC clearance requirements for each individual transformer is satisfied.

.3 The ambient temperature must not exceed 30°C.

.2 Strut channel structure to support transformers shown on Drawings to be stacked above another transformer.

.3 Provide sheet metal heat diversion shield between stacked transformers. Install shield at an angle as not to trap heat.

2.11 CONCRETE BASES AND HOUSEKEEPING PADS

.1 Provide concrete bases of dimensions where indicated, but not less than 100 mm (4 in) larger in both directions than supported unit, and 100 mm (4 in) high, and so anchors will be a minimum of 10 bolt diameters from edge of the base. Chamfer edges.

.2 Use 20 MPa (3000 psi) 28 day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 03 – Concrete.

.3 Install dowel rods to connect concrete bases to concrete floor. Unless otherwise indicated, install dowel rods on 450 mm (18 in) centres around full perimeter of base.

.4 Anchor equipment to concrete base.

.5 Provide a housekeeping pad for floor mounted equipment, including but not limited to the following:

.1 Transformers.

.2 Switchgear and switchboards.

.3 Distribution panelboards.

.4 Engine Generators.

.5 Uninterruptible Power Supplies and batteries.

.6 Transfer Switches.

2.12 CONCRETE ANCHORS

.1 Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

.2 Drilled expansion anchors for anchors set in concrete block or poured concrete after the concrete has set. Size the insert and number of anchors so that the maximum load per anchor does not exceed the manufacturer's recommendation.

.3 U-channel concrete inserts shall be 12 gauge steel 1-5/8 in square with insert anchors 1 3/8 in long and 100 mm (4 in) on centre.

.4 Install anchor bolts to elevations required for proper attachment to supported equipment.

2.13 PLYWOOD EQUIPMENT BOARDS

.1 Plywood Equipment Boards: preservative treated, and kiln dried; thickness as indicated, or if not indicated, not less than 19 mm (3/4 in) deep. Provide marine grade plywood where subject to moisture conditions.

.2 Paint plywood board white, or to match adjacent finishes. Leave the fire-retardant label unpainted for verification by the Consultant and by Authority Having Jurisdiction (AHJ).

.3 Unless otherwise noted, boards shall be painted with two coats of good grade weatherproof flat gray non-conductive fire-retardant paint on all sides and edges (prior to mounting) and plumbed in a true vertical position. Provide nominal 13 mm (1/2 in) rustproof spacers between back of plywood and wall. Cut, fit, and place plywood equipment boards accurately in location, alignment, and elevation to support and anchor electrical materials and equipment. Select fastener sizes that will not penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections between members. Install fasteners without splitting wood members. Attach to substrates as required to support applied loads. Maintain at least 100 mm (4 in) from bottom of plywood equipment boards and the finished floor surface.

.4 Unless directed otherwise in field, plywood equipment boards shall be 2440 mm (8 ft) high by 19 mm (3/4 in) deep by length shown on drawings (as dimensioned or as scaled) or length as

required to accommodate equipment if not indicated on drawings. Unless directed otherwise in field, provide plywood equipment boards for all indoor surface mounted panelboards and systems "head-end" equipment for all applications where located in mechanical or electrical rooms/areas and only where specifically shown on drawings for all other applications.

2.14 ROOF SUPPORTS

.1 High-density polyethylene platform and base, height adjustable with rounded corners and edges to reduce likelihood of roof penetration.

.2 Large surface area to spread the weight of supported objects including conduits, and cable trays over a large surface footprint.

.3 No penetration of the waterproof membrane.

.4 Self drains water, rot proof, and sunlight resistant.

.5 Manufacturers:

.1 Thomas & Betts Superstrut Adjustable Universal Support.

.2 Eaton Dura-Blok series.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Obtain permission from the Consultant before drilling or cutting structural members.

.2 Fabricate supports from structural steel or steel channel. Rigidly weld members or use hexagon head bolts to present neat appearance with adequate strength and rigidity. Use spring lock washers under all nuts.

.3 Install surface-mounted cabinets and panelboards with minimum of four anchors.

.4 In wet and damp locations use steel channel supports to stand cabinets and panelboards 25 mm (1 in) off wall.

.5 Use sheet metal channel to bridge studs above and below cabinets and panelboards recessed in hollow partitions.

.6 Provide inserts, sleeves, equipment supports and hangers, sealing of sleeves and openings, as required for all electrical work. Ensure that the load onto structures does not exceed the maximum loading per square metre as shown on Structural Drawings or as directed by the Consultant.

.7 Provide insets, holes, anchor bolts and sleeves in time when walls, floors, and roof are erected.

.8 Place insets only in structural members and not in the finishing material.

.9 Secure all supports and hangers to the structure unless noted otherwise.

.10 Suspend hanger rods from approved concrete inserts and from beam clamps. Obtain Consultant's approval before welding to steel structural members.

.11 Secure supports to precast concrete members to inserts originally cast into the members or by rods passing between the members and connected to a steel plate bearing.

.12 Sealing of Sleeves and Openings to Maintain Fire Rating

.1 Use Dow-Corning #3-6548 'Silicone RTV' foam, Thomas & Betts "Flamesafe' firestopsystem, Electrovert 'Flameseal" firestop putty, or approved equal materials installed in accordance with the manufacturer's specifications and recommendations.

.2 Submit data sheets for review prior to installation.

.13 Supports

.1 All conduits, panels, etc. to be securely and adequately supported.

.2 Where more than three conduits run together, conduit racks to be used.

.3 Single runs of conduit to be supported by galvanized conduit straps or ring bolt type hangers. Tie wire or perforated metal strap hangers will NOT be accepted.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Rigid metal conduit.

.2 Flexible metal conduit.

.3 Liquid tight flexible metal conduit.

.4 Electrical metallic tubing (EMT).

.5 Electrical non-metallic tubing (ENT).

.6 Rigid PVC conduit.

.7 Fittings and conduit bodies.

1.2 REFERENCES

.1 CSA Group:

.6 CSA C22.2 No. 211.1-06 (R2021), Rigid types EB1 and DB2/ES2 PVC conduit.

.7 CSA C22.2 No. 211.2-06 (R2021), Rigid PVC (unplasticized) conduit.

.8 CSA C22.2 No. 227.1:19 (R2023), Electrical nonmetallic tubing.

.9 CSA C22.2 No. 227.2.1:19 (R2023), Liquid-tight flexible nonmetallic conduit.

.10 CSA C22.2 No. 2420-09 (R2019), Belowground reinforced thermosetting resin conduit (RTRC) and fittings.

1.3 RECORD DOCUMENTATION

.1 Accurately record actual routing of conduits larger than 51 mm (2 in).

.2 Accurately record actual routing of all conduits installed below grade, regardless of size, including whether direct buried or installed in concrete duct bank.

1.4 REGULATORY REQUIREMENTS

.1 Provide products listed and classified by CSA (Canadian Standards Association) as suitable for purpose specified and shown.

1.5 DELIVERY, STORAGE, AND HANDLING

.1 Accept conduit on site. Inspect for damage.

.2 Protect conduit from corrosion and entrance of debris by storing above grade. Provide appropriate covering.

1.6 PROJECT CONDITIONS

.1 Verify that field measurements are as shown on drawings.

.2 Verify routing and termination locations of conduit prior to rough-in.

.3 Conduit routing, if shown on drawings, is approximate unless dimensioned. Route as required to provide a complete wiring system.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Where products are listed in this section based on a single manufacturer, the equivalent product from the following manufacturers is acceptable:

.1 Appleton.

.2 Columbia-MBF.

.3 Crouse-Hinds by Eaton.

.4 Hubbell.

.5 Thomas & Betts Ltd.

2.2 RIGID METAL CONDUIT

.1 Rigid metal conduit: to CSA C22.2 No. 45, hot dipped galvanized steel, threaded.

.2 Epoxy coated conduit: to CSA C22.2 No. 45, with zinc coating and corrosion resistant epoxy finish inside and outside.

.3 Fittings and conduit bodies: Material to match conduit.

2.3 FLEXIBLE METAL CONDUIT

.1 Flexible metal conduit: to CSA C22.2 No. 56, interlocked steel construction.

.2 Fittings: CSA C22.2 No. 56.

2.4 LIQUID TIGHT FLEXIBLE METAL CONDUIT

.1 Description: Interlocked steel construction with PVC jacket.

.2 Fittings: CSA C22.2 No. 56.

2.5 ELECTRICAL METALLIC TUBING (EMT)

.1 Description: CSA C22.2 No. 83.1; galvanized tubing.

.2 Fittings and Conduit Bodies: CSA C22.2 No. 83.1; steel type.

2.6 ELECTRICAL NON-METALLIC TUBING (ENT)

.1 To CSA C22.2 No. 227.1.

2.7 NON-METALLIC CONDUIT

.1 Rigid Type EB1 PVC Conduit: to CSA C22.2 No. 211.1.

.2 Rigid Type DB2/ES2 PVC Conduit: to CSA C22.2 No. 211.1.

2.8 CONDUIT, FITTINGS, AND ACCESSORIES

.1 Conduit accessories, conduits and fittings conforming to CSA Standard C22.2 No. 18-1972.

.2 Provide rain tight connectors, couplings, fittings, junction boxes, pull boxes and surface outlet boxes shall be used for surface conduit installations exposed to moisture or in sprinklered buildings.

.3 Rigid conduit bushings:

.1 Thomas & Betts Ltd. - Series 5031.

.4 EMT Connectors:

.1 Thomas & Betts Ltd. - Steel City TC121A series.

.5 Ground Bushings:

.1 Thomas & Betts – Blackjack or 1220 series.

.6 Flexible conduit connectors:

.1 Thomas & Betts Ltd. - Series 3110.

.2 EMT couplings: steel concrete tight to match connectors.

.7 Terminate rigid conduit entering boxes or enclosures with nylon insulated steel threaded bushings.

.1 Thomas & Betts – 8125 series.

.8 Terminate EMT entering boxes or enclosures with nylon insulated steel concrete tight connectors.

.9 Terminate flexible conduit entering boxes or enclosures with nylon insulated steel connectors.

.1 Thomas & Betts – 5332 series.

PART 3 - EXECUTION

3.1 PREPARATION

.1 Produce layout sketches of conduit runs through mechanical and electrical service areas, through corridors, and other congested areas in order to resolve any interferences with other work, and to determine the most efficient route to run the conduit.

3.2 INSTALLATION

.1 Minimum size: 21 mm (3/4 in) unless otherwise specified.

.2 Conceal all conduit except in mechanical rooms and electrical rooms, or unless otherwise indicated in this specification, or noted on the drawings. Surface conduit work is not permitted unless specifically noted.

.3 Install wiring in conduit unless otherwise specified. Where conduit sizes are not shown on drawings, provide conduits sized in accordance with Ontario Electrical Safety Code, CSA C22.1. When conduits are indicated, they are the minimum size required, and must be increased to suit the length of run or voltage drop requirements.

.4 Conduit use:

.1 Unless otherwise specified below or shown on the drawings, all systems shall be installed in electrical metallic tubing (EMT).

.2 Equipment subject to vibration:

.1 Use liquid tight flexible metal conduit for connections to transformers, motors, and equipment, subject to vibration and movement.

.3 Outdoor locations, above grade: use rigid steel.

.4 Underground: Use rigid PVC conduit for wiring in slabs on grade, and wiring below grade.

.5 Wet and damp locations:

.1 Use rigid steel.

.2 Use liquid tight flexible metal conduit for connections to transformers, motors, and equipment, subject to vibration and movement.

.6 Dry locations:

.1 Concealed in metal stud partitions:

.1 Use electrical metallic tubing.

.2 Use of AC90 (Bx) as described in Section 26 05 19.

.2 Concealed in concrete: Use electrical non-metallic tubing or rigid PVC.

.3 Exposed areas: Use electrical metallic tubing.

.4 Use liquid tight flexible metal conduit below raised floors for connections to all devices.

.5 Aluminium conduit may be used, in lieu of steel conduit, in clean and dry locations, but shall not be used in poured concrete, or for signal and intercommunication systems wiring.

.6 Use epoxy coated conduit in corrosive areas.

.7 Equipment in sprinklered spaces:

.1 Provide CSA certified sealing rings for rigid steel galvanized conduit and CSA certified raintight connectors for steel galvanized electrical metallic tubing (EMT) where conduits enter the top or the sides of enclosures.

.5 Arrangement and supports:

.1 Arrange supports to prevent misalignment during wiring installation.

.2 Arrange conduit to maintain headroom and present neat appearance.

.3 Support conduit using coated steel or malleable iron straps, lay-in adjustable hangers, clevis hangers, and split hangers.

.4 Group related conduits; support using conduit rack.

.5 Construct rack using steel channel; provide space on each for 25 per cent additional conduits.

.6 Fasten conduit supports to building structure and surfaces to Section 26 05 29.

.7 Do not support conduit with wire or perforated pipe straps.

.8 Remove wire used for temporary supports.

.9 Do not attach conduit to ceiling support wires.

.10 Route exposed conduit parallel and perpendicular to walls.

.11 Route conduit installed above accessible ceilings parallel and perpendicular to walls.

.12 Route conduit in and under slab from point-to-point.

.13 In damp and unheated areas, avoid moisture traps; provide junction box with drain fitting at low points in conduit system.

.14 Provide suitable fittings to accommodate expansion and deflection where conduit crosses expansion joints.

.6 Clearances:

.1 Maintain adequate clearance between conduit and piping.

.2 Maintain 300 mm (12 in) clearance between conduit and surfaces with temperatures exceeding 40°C.

.7 Conduit bends:

.1 Install no more than equivalent of three 90 degree bends between boxes.

.1 Use conduit bodies to make sharp changes in direction, as around beams.

.2 Use hydraulic one-shot bender to fabricate bends in metal conduit larger than 50 mm size or provide prefabricated conduit bends.

.8 Install wall entrance seals where conduits pass through exterior walls below grade.

.9 Provide expansion coupling in conduit runs at building expansion joints and in long runs subject to thermal expansion, all in accordance with manufacturer recommendations.

.10 Cut conduit square using saw or pipe cutter; de-burr cut ends.

.11 Bring conduit to shoulder of fittings; fasten securely.

.12 Use suitable caps to protect installed conduit against entrance of dirt and moisture.

.13 Use conduit hubs or sealing locknuts to fasten conduit and to cast boxes.

.14 Provide suitable pull string in each empty conduit except sleeves and nipples.

.15 Ground and bond conduit to Section 26 05 26.

.16 Identify conduit to Section 26 05 53.

.17 Flexible conduit and armoured cable will be accepted for a maximum length of 1500 mm for final connection to lighting fixtures. Do not connect from fixture to fixture.

3.3 CLEANING

.1 Conduit manufacturer's touch-up enamel shall be used to repair all scratches and gouges on epoxy-coated conduit.

END OF SECTION

No Floor Boxes
SEE ADD#4,Q#97

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Wall and ceiling outlet boxes.

.2 Pull and junction boxes.

1.2 RELATED REQUIREMENTS

.1 Section 26 09 23 – Lighting Control Devices.

.2 Section 26 27 16 – Electrical Cabinets and Enclosures.

.3 Section 26 27 26 – Wiring Devices: Wall plates in finished areas, floor box service fittings, fire-rated poke-through fittings, and access floor boxes.

1.3 REFERENCES

.1 CSA Group:

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.1 CSA C22.2 No. 18.1:13 (R2022), Metallic outlet boxes.

.3 CSA C22.2 No. 18.1-13 (R2022) – Metallic Outlet Boxes (Tri-national standard, with UL 514A and ANCE NMX-J-023/1).

.4 CSA C22.2 No. 40-17 - Junction and Pull Boxes.

.5 CSA C22.2 No. 85-14 (R2018) – Rigid PVC Boxes and Fittings.

1.4 CLOSEOUT SUBMITTALS

.1 Record actual locations and mounting heights of outlet, pull, and junction boxes on project record documents.

1.5 REGULATORY REQUIREMENTS

.1 Provide products listed and classified by CSA (Canadian Standards Association) as suitable for the purpose specified and indicated.

PART 2 - PRODUCTS

2.1 OUTLET BOXES

.1 Sheet Metal Outlet Boxes: CSA C22.2 No. 18.1, galvanized steel.

.1 Luminaire and Equipment Supporting Boxes: Rated for weight of equipment supported; include 13 mm male fixture studs where required.

.2 Concrete Ceiling Boxes: Concrete type.

.2 Non-metallic Outlet Boxes: CSA C22.2 No. 18.1.

.3 Cast Boxes: CSA C22.2 No. 18.1, Type FD, aluminum. Provide gasketed cover by box manufacturer. Provide threaded hubs.

.4 Wall Plates for Finished Areas: As specified in Section 26 27 26.

2.2 PULL BOXES AND JUNCTION BOXES

.1 Sheet Metal Boxes: CSA C22.2 No. 18.1, galvanized steel.

.2 Hinged Enclosures: As specified in Section 26 27 16.

.3 Surface Mounted Cast Metal Box: CSA C22.2 No. 18.1, Type 4; flat-flanged, surface mounted junction box:

.1 Material: Cast aluminum.

.2 Cover: Provide with ground flange, neoprene gasket, and stainless steel cover screws.

2.3 OUTLET BOXES

.1 Conform to CSA C22.2 No. 18.1.

.2 Where 103 mm (4 in) square outlet boxes are installed in exposed concrete or cinder block finished areas, blocks will be cut as described in Division 04 as instructed under this Section. Cut openings to provide a close fit to boxes and covers so that edges of openings are not visible after installation of plates. Use of mortar to patch up openings that are cut too large or to patch ragged edges is not permitted.

.3 Ceiling boxes: 103 mm (4 in) octagon or square, complete with fittings, where required to support fixtures.

.4 Switch and receptacle boxes:

.1 103 mm (4 in) square with plaster ring, where flush mounted in plaster walls.

.2 Iberville 1104 series box, or equal, where flush mounted in wood or drywall, with stud fasteners as required.

.3 Masonry boxes in masonry walls.

.5 Where boxes are surface mounted in unfinished areas they shall be FS conduits.

.6 Standard outlet boxes manufactured from code gauge galvanized steel.

.7 Provide a suitable outlet box for each light, switch, receptacle, or other outlet, approved for the area it is to be installed.

.8 Support outlet boxes independently of conduit and cable.

.9 Locate outlet boxes, mounted in hung ceiling space, so they do not obstruct or interfere with the removal of lay-in ceiling tiles.

.10 Offset outlet boxes, shown back to back in partitions, horizontally a minimum 150 mm (6 in) to minimize noise transmission between adjacent rooms.

.11 Use gang boxes at locations where more than one device, of the same system only, is to be mounted. Utilize separate boxes for each system.

.12 Use tile wall covers where 103 mm (4 in) square outlet boxes are installed in exposed concrete or cinder block in finished areas.

.13 Provide flush mount boxes, panels, cabinets, and electrical devices, which are installed in finished areas, with suitable flush trims and doors or covers, unless specifically noted otherwise.

.14 Provide pre-formed polyethylene vapour barriers for all boxes located in walls with internal vapour barriers.

No Floor Boxes
SEE ADD#4,Q#97

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Verify locations of floor boxes prior to rough-in.

3.2 INSTALLATION

.1 Install boxes to CSA C22.1.

.2 Install in locations as shown on drawings, and as required for splices, taps, wire pulling, equipment connections and compliance with regulatory requirements.

.3 Set wall mounted boxes at elevations to accommodate mounting heights indicated.

.4 Electrical boxes are shown on drawings in approximate locations unless dimensioned. Adjust box location up to 3 m (10 ft) if required to accommodate intended purpose.

.5 Orient boxes to accommodate wiring devices oriented as specified in Section 26 27 26.

.6 Maintain headroom and present neat mechanical appearance.

.7 Install pull boxes and junction boxes above accessible ceilings and in unfinished areas only.

.8 Inaccessible Ceiling Areas: Install outlet and junction boxes no more than 150 mm (6 in) from ceiling access panel or from removable recessed luminaire.

.9 Install boxes to preserve fire resistance rating of partitions and other elements, using materials and methods.

.10 Coordinate mounting heights and locations of outlets mounted above counters, benches, and backsplashes.

.11 Locate outlet boxes to allow luminaires positioned as shown on reflected ceiling plan.

.12 Align adjacent wall mounted outlet boxes for switches, thermostats, and similar devices.

.13 Use flush mounting outlet box in finished areas.

.14 Locate flush mounting box in masonry wall to require cutting of masonry unit corner only. Coordinate masonry cutting to achieve neat opening.

.15 Do not install flush mounting box back-to-back in walls; provide minimum 150 mm (6 in) separation. Provide minimum 600 mm (24 in) separation in acoustic rated walls.

.16 Secure flush mounting box to interior wall and partition studs. Accurately position to allow for surface finish thickness.

.17 Use stamped steel bridges to fasten flush mounting outlet box between studs.

.18 Install flush mounting box without damaging wall insulation or reducing its effectiveness.

.19 Use adjustable steel channel fasteners for hung ceiling outlet box.

.20 Do not fasten boxes to ceiling support wires.

.21 Support boxes independently of conduit.

.22 Use gang box where more than one device is mounted together. Do not use sectional box.

.23 Use gang box with plaster ring for single device outlets.

.24 Use cast outlet box in exterior locations exposed to the weather.

.25 Use cast outlet box in wet locations.

.26 Set floor boxes level.

.27 Large pull boxes: Use hinged enclosure in interior dry locations, surface-mounted cast metal box in other locations.

3.3 ADJUSTING

.1 Adjust floor box flush with finish flooring material.

.2 Adjust flush-mounting outlets to make front flush with finished wall material.

.3 Install knockout closures in unused box openings.

3.4 CLEANING

.1 Clean interior of boxes to remove dust, debris, and other material.

.2 Clean exposed surfaces and restore finish.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Cables installed in ducts.

.2 Direct buried cables.

.3 Handholes.

1.2 RELATED REQUIREMENTS

.1 Section 31 23 00 – Excavation and Fill.

1.3 REFERENCES

.1 CSA Group:

.1 CSA C22.3 No. 7-15, Underground systems.

.2 Institute of Electrical and Electronics Engineers:

.1 IEEE 835-1994, Standard Power Cable Ampacity Tables.

.3 Insulated Cable Engineers Association, Inc. (ICEA).

1.4 SUBMITTALS

.1 Submit records of underground utility locates, indicating location plan of existing utilities as found in field and clearance record from utility authority and location plan of relocated and abandoned services, as required.

.2 Feeder ampacity calculations from cable manufacturer for any duct banks or direct buried feeders not constructed in accordance with OESC to demonstrate compliance with IEEE 835.

1.5 CLOSEOUT SUBMITTALS

.1 Record documentation:

.1 Records of underground utility locates.

.2 Record as-constructed location of all underground conduits and feeders on as-built drawings regardless of conduit size.

PART 2 - PRODUCTS

2.1 FILL MATERIALS

.1 Sand fill: clean, natural sand and gravel material, free from silt, clay, loam, friable or soluble materials and vegetable matter.

.2 Backfill material: Selected material from excavation or other sources, reviewed by the Consultant, unfrozen and free from rocks larger than 75 mm (3 inch), rock with sharp angular surfaces, cinders, ashes, sods, refuse, or other deleterious materials.

2.2 DIRECT BURIED AND CONCRETE ENCASED CONDUITS

.1 Rigid Type DB2/ES2 PVC conduit to Section 26 05 33.13.

2.3 CONDUCTORS

.1 RWU90, in accordance with Section 26 05 19 for use in direct buried applications, and in below grade conduits and duct banks.

2.4 TRACER WIRE

.1 Direct burial rated tracer wire: single, solid copper, 12 AWG minimum size with 30 mm PVC jacket.

.1 Provide red jacket for circuits 120 V and higher.

.2 Provide orange jacket for communications conduits and services lower than 120 V.

2.5 HANDHOLES

.1 460 mm (18”) round handhole.

.2 Precast concrete, to OPSD 2112.02 standard, suitable for use in vehicular traffic areas.

.3 Manufacturers:

.1 Armtec-Brooklin Concrete.

.2 Hy-Grade Precast Concrete.

.3 Utilicon.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Perform locates prior to start of work.

3.2 EXCAVATION AND FILL

.1 In accordance with Section 31 23 00.

.2 Trenching:

.1 Excavate to dimensions indicated. Ensure trench width is sufficient to accommodate mechanical vibratory compactor.

.2 Do not leave open trench at end of day’s operation.

.3 Backfilling:

.1 Do not proceed with backfilling operations until Electrical Inspection Authority has inspected and approved installation.

.4 Restoration:

.1 Restore surface of work area to conditions existing prior to execution of work.

.2 After backfilling trench, provide new topsoil as required to follow minimum depths after settlement of 100 mm (4 in) for grass seeded areas.

.3 Restore surface of paved areas to match existing.

3.3 CABLE INSTALLATION IN DUCTS

.1 Install cables as indicated in ducts.

.2 Do not pull spliced cables inside ducts.

.3 Install multiple cables in duct simultaneously.

.4 Use CSA approved lubricants of type compatible with cable jacket to reduce pulling tension.

.5 To facilitate matching of colour coded multiconductor control cables reel off in same direction during installation.

.6 Before pulling cable into ducts and until cables are properly terminated, seal ends of lead covered cables with wiping solder; seal ends of non-leaded cables with moisture seal tape.

.7 After installation of cables, seal duct ends with duct sealing compound.

3.4 DIRECT BURIAL OF CABLE

.1 Provide sand bed as indicated.

.2 Lay cables maintaining 75 mm (3 in) clearance from each side of trench to nearest cable. Do not pull cable into trench.

.3 Provide offsets for thermal action and minor earth movements. Offset cable 150 mm for each 60 m run, maintaining minimum cable separation and bending radius requirements.

.4 Install treated planks on cables for mechanical protection. Install above cables and below markers.

.5 Cable separation:

.1 Maintain 75 mm (3 in) minimum separation between cables of different circuits.

.2 Maintain 300 mm (12 in) horizontal separation between low and high voltage cables.

.3 When low voltage cables cross high voltage cables maintain 300 mm (12 in) vertical separation with low voltage cables in upper position.

.4 At crossover, maintain 75 mm (3 in) minimum vertical separation between low voltage cables and 150 mm between high voltage cables.

.5 Maintain minimum 300 mm (12 in) horizontal separation between cables or conduits and gas service where installed in the same trench.

3.5 MARKERS

.1 Mark cable every 150 m along duct runs and changes in direction.

.2 Mark underground splices.

.3 Where markers are removed to permit installation of additional cables, reinstall existing markers.

.4 Install cedar post type markers.

.5 Lay concrete markers flat and centred over cable with top flush with finish grade.

.6 Where warning tape is used to comply with 2021 OESC Rule 12-012(11) or latest edition, bury the tape approximately halfway between the installation and grade level, covering the width of the raceways or cables installed, in accordance with OESC Bulletin 12-2-(latest version).

.7 Tracer wires:

.3 Provide direct burial rated tracer wire above all underground raceways and duct banks for power, control/monitoring, lighting and branch circuits, and communications raceways.

.4 Install tracer wire above the warning tape.

3.6 FIELD QUALITY CONTROL

.1 Perform tests in accordance with Section 26 05 00.

.2 Perform tests using qualified personnel. Provide necessary instruments and equipment.

.3 Check phase rotation and identify each phase conductor of each feeder.

.4 Check each feeder for continuity, short circuits and grounds. Ensure resistance to ground of circuits is not less than 50 megohms.

.5 Pre-acceptance tests:

.1 After installing cable but before splicing and terminating, perform insulation resistance test with 1000 V megger on each phase conductor.

.2 Check insulation resistance after each splice and/or termination to ensure that cable system is ready for acceptance testing.

.6 Acceptance Tests:

.1 Ensure that terminations and accessory equipment are disconnected.

.2 Ground shields, ground wires, metallic armour, and conductors not under test.

.3 High Potential (Hipot) Testing.

.1 Conduct hipot testing in accordance with manufacturer's recommendations.

.7 Provide Owner with list of test results showing location at which each test was made, circuit tested and result of each test.

.8 Non-Conforming Work: Remove and replace entire length of cable if cable fails to meet any of test criteria.

3.7 WASTE MANAGEMENT

.1 Remove from site and dispose of all packaging materials at appropriate recycling facilities.

.2 Collect and separate for disposal paper, plastic, polystyrene, corrugated cardboard, packaging material in appropriate on-site bins for recycling in accordance with Waste Management Plan.

.3 Do not dispose of unused material into sewer system, into streams, lakes, onto ground or in other location where it will pose health or environmental hazard.

.4 Divert unused metal and wiring materials from landfill to metal recycling facility as approved by Departmental Representative.

.5 Do not dispose of preservative treated wood through incineration.

.6 Do not dispose of preservative treated wood with other materials destined for recycling or reuse.

.7 Dispose of treated wood, end pieces, wood scraps and sawdust at sanitary landfill approved by Departmental Representative.

.8 Fold up metal banding, flatten and place in designated area for recycling.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Sleeves, sealing of sleeves and openings, as required for all electrical work.

1.2 SUBMITTALS

.1 Submit data sheets for firestopping in accordance with Section 01 33 00.

.2 Submit copies of firestopping drawings with ULC certificate and system number for each specific installation.

.3 Submit schedule of opening locations and sizes, penetrating items, and required listed design numbers to seal openings to maintain fire resistance ratings.

.4 Submit dimensioned location drawings indicating required sleeves and formed openings in structural poured concrete or precast concrete construction or in roofing, and locations of cutting or drilling required for Electrical work.

PART 2 - PRODUCTS

2.1 SLEEVES

.1 Galvanized steel sleeves:

.1 24 gauge with an integral flange at one (1) end to secure sleeve to formwork construction.

.2 Schedule 40 pipe.

.2 Schedule 40 PVC sleeves.

2.2 SLEEVE SEALS

.1 Manufacturers

.1 Hilti Canada.

.2 Specified Technologies Inc.

.3 3M Canada Inc.

.4 Tremco.

.5 A/D Fire Protection Systems.

.6 Nelson.

.2 Asbestos-free, elastomeric materials and intumescent materials, tested, listed, and labelled by ULC in accordance with CAN/ULC-S115, and CAN/ULC-S101 for installation in ULC designated firestopping, and smoke seal systems to provide a positive fire, water and smoke seal and a fire resistance rating (flame, hose stream and temperature) no less than fire rating for surrounding construction.

.3 Materials are to be compatible with abutting dissimilar materials and finishes and complete with primers, damming and back-up materials, supports, and anchoring devices in accordance with firestopping manufacturer's recommendations and ULC tested assembly. Coordinate material requirements with trades supplying abutting areas of materials.

.4 Maintain fire rating of separation in accordance with architectural drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Where conduits and conductors pass through structural poured concrete, provide sleeves of type suitable for application, and approved by local governing codes.

.2 Sleeves in concrete slabs, except as noted below, are to be 24 gauge or equivalent, with an integral flange to secure sleeves for formwork construction.

.3 Sleeves in waterproof concrete slabs and in other slabs where waterproof sleeves are required are to be lengths of Schedule 40 pipe sized to extend 100 mm (4 in) above floor.

.4 Sleeves in poured concrete walls and foundation are to be Schedule 40 pipe.

.5 Through interior walls, use standard weight steel pipes, conduit, or galvanized steel. Cut flush with finished surfaces. Check room finish schedules.

.6 Through exterior walls above grade, floors, and roof use standard weight steel pipes, machine cut, flush with finished surface inside and to suit flashing outside.

.7 Through exterior walls below grade, water-proofed floors, and other water-proof walls, use heavy weight cast iron pipes, machine cut. Extend sleeves 100 mm (4 in) above finished floors, and cut flush with underside of floor.

.8 Size sleeves, unless otherwise noted, to leave 13 mm (1/2 in) clearance around conduit, duct, conductor, etc. Void between sleeves and conduit, duct, conductors, etc., to be packed and sealed for length of sleeves as in accordance with article entitled “Sleeve Seals” specified in this Section. Pack and seal sleeves set in exterior walls with governing authority approved materials suitable for application and pack both ends of sleeves watertight with approved permanently flexible and water tight materials. Coordinate exact responsibility of work with General Trades Contractor.

.9 Submit to concrete reinforcement detailer at proper time, drawings indicating required sleeves, recesses and formed openings in poured concrete work. Completely and accurately dimension such drawings and relate sleeves, recesses and formed openings to suitable grid lines and elevation datum.

.10 Supply sleeves of a water protecting type in accordance with detail found on drawings for installation in following locations:

.1 in Mechanical and Fan Room floor slabs, except where on grade.

.2 in slabs over Mechanical, Fan, Electrical and Telephone Equipment Rooms or closets.

.3 in floors equipped with waterproof membranes.

.11 "Gang" type sleeving to be permitted only with approval of Owner and reviewed with the Consultant.

.12 Terminate sleeves for work which is exposed, so that sleeve is flush at both ends with wall, partition, or slab surface such that sleeve may be covered completely by escutcheon plates.

.13 Sleeves are not required in interior walls and dry area floors where conduit is installed ahead of floor construction.

.14 Seal all openings and sleeves after installation of equipment:

.1 With an approved material to maintain fire rating where sleeves and openings pass through fire separations and floors.

.2 With an approved material to maintain fire rating for sleeves and openings provided for future equipment.

.3 Flash all conduits and systems passing through roof or built into an outside wall, or a waterproof floor.

.4 Provide copper flashing for sleeves passing through exterior walls or waterproof floors.

.15 Provide all flashing and waterproofing for sleeves through roof and exterior walls to the requirements of Division 07.

.16 Firestop sleeves in accordance with the manufacturer's specifications and recommendations.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Tested firestop systems used in penetrations for the passage of cables, conduit, and other electrical equipment through fire-rated vertical barriers (walls and partitions), horizontal barriers (floor/ceiling assemblies), and vertical service shaft walls and partitions.

1.2 RELATED REQUIREMENTS

.1 Coordinate work of this section with work of other sections as required to properly execute the work and as necessary to maintain satisfactory progress of the work of other sections, including:

.1 Section 07 84 00 – Firestopping.

.2 Section 27 05 44 – Sleeves and Sleeve Seals for Communications Pathways and Cabling.

.4 Ontario Building Code.

.5 Ontario Electrical Safety Code.

1.4 DEFINITIONS

.1 Firestopping: Material or combination of materials used to retain integrity of fire-rated construction by maintaining an effective barrier against the spread of flame, smoke, and hot gases through penetrations in fire rated wall and floor assemblies.

1.5 SUBMITTALS

.1 Submit Product Data: Manufacturer's specifications and technical data for each material including the composition and limitations, documentation of ULC or cUL firestop systems to be used and manufacturer's installation instructions to comply with Section 01 33 00.

.2 Manufacturer's engineering judgment identification number and drawing details when no ULC or cUL system is available for an application. Engineered judgment must include both project name and contractor’s name who will install firestop system as described in drawing.

.3 Submit material safety data sheets provided with product delivered to project site.

.4 Submit shop drawings in accordance with Section 01 33 00:

.1 Submit complete cUL, ULC, or equivalent approved systems for all applications. Ensure the listing is clearly noted on the submittal.

1.6 CLOSEOUT SUBMITTALS

.1 On completion of firestopping and smoke sealing installation, submit a Letter of Assurance to the Consultant certifying the firestopping and smoke sealing installation has been carried out throughout the building to electrical service penetrations and that installation has been done in strict accordance with requirements of the Ontario Building Code, any applicable municipal bylaws, ULC requirements, and manufacturer’s instructions.

1.7 QUALITY ASSURANCE

.1 Fire-Test-Response Characteristics: Provide through-penetration fire stop systems and fire-resistive joint systems that comply with specified requirements of tested systems.

.2 Firestop System installation must meet requirements of CAN/ULC-S115 tested assemblies that provide a fire rating as shown in Section 2.1 Clauses 4, 5, 6, and 7 below.

.3 Proposed firestop materials and methods shall conform to applicable governing codes having local jurisdiction.

.4 Firestop Systems do not re-establish the structural integrity of load bearing partitions/assemblies, or support live loads and traffic. Installer shall consult the structural engineer prior to penetrating any load bearing assembly.

.5 For those firestop applications that exist for which no ULC or cUL tested system is available through a manufacturer, a manufacturer's engineering judgment derived from similar ULC or cUL system designs or other tests will be submitted to local authorities having jurisdiction for their review and approval prior to installation. Engineering judgment drawings must follow requirements set forth by the International Firestop Council.

1.8 INSTALLER QUALIFICATIONS

.1 Engage an experienced Installer who is certified, licensed, or otherwise qualified by the firestopping manufacturer as having the necessary training to install manufacture’s products per specified requirements. A supplier’s willingness to sell its firestopping products to the Contractor or to an Installer engaged by the Contractor does not in itself confer qualification on the buyer.

.2 Installation Responsibility: assign installation of through-penetration fire stop systems and fire-resistive joint systems in Project to a single sole source firestop specialty contractor.

.3 The work is to be installed by a contractor with at least one of the following qualifications:

.1 FM 4991 approved contractor.

.2 UL approved contractor.

.3 Manufacturer’s accredited fire stop specialty contractor.

.4 Installer: Minimum 3 years experience with fire stop installation.

1.9 DELIVERY, STORAGE, AND HANDLING

.1 Deliver materials undamaged in manufacturer's clearly labeled, unopened containers, identified with brand, type, and ULC or cUL label where applicable.

.2 Coordinate delivery of materials with scheduled installation date to allow minimum storage time at project site.

.3 Store materials under cover and protect from weather and damage in compliance with manufacturer's requirements.

.4 Comply with recommended procedures, precautions or remedies described in material safety data sheets as applicable.

.5 Do not use damaged or expired materials.

1.10 PROJECT CONDITIONS

.1 Do not use materials that contain flammable solvents.

.2 Scheduling

.1 Schedule installation of CAST IN PLACE firestop devices after completion of floor formwork, metal form deck, or composite deck but before placement of concrete.

.2 Schedule installation of Drop-In firestop devices after placement of concrete but before installation of the pipe penetration. Diameter of sleeved or cored hole to match the listed system for the device.

.3 Schedule installation of other firestopping materials after completion of penetrating item installation but prior to covering or concealing of openings.

.3 Verify existing conditions and substrates before starting work. Correct unsatisfactory conditions before proceeding.

.4 Weather conditions: Do not proceed with installation of firestop materials when temperatures exceed the manufacturer's recommended limitations for installation printed on product label and product data sheet.

.5 During installation, provide masking and drop cloths to prevent firestopping materials from contaminating any adjacent surfaces.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

.1 Provide firestopping composed of components that are compatible with each other, the substrates forming openings, and the items, if any, penetrating the firestopping under conditions of service and

application, as demonstrated by the firestopping manufacturer based on testing and field experience.

.2 Provide components for each firestopping system that are needed to install fill material. Use only components specified by the firestopping manufacturer and approved by the qualified testing agency for the designated fire-resistance-rated systems.

.3 Provide a round fire-rated cable management device whenever cables penetrate fire rated walls, where frequent cable changes and additions may occur. The fire-rated cable management device shall consist of a corrugated steel tube with zinc coating, contain an inner plastic housing, intumescent material rings, and inner fabric smoke seal membrane. The length of the sleeve shall be 315 mm (12.4 inches). The fire-rated cable management device shall contain integrated intumescent firestop wrap strip materials sufficient to maintain the hourly rating of the barrier being penetrated. The fire-rated cable management device shall contain a smoke seal fabric membrane or intumescent firestop plugs sufficient to achieve the L-Rating requirements of the barrier type. Install device per the manufacturer's published installation instructions.

.4 Penetrations in Horizontal Assemblies: Provide firestopping with ratings determined in accordance with CAN/ULC-S115. For penetrations through a Fire Wall or horizontal Fire Separation provide a firestop system with a "FT" Rating as determined by ULC or cUL which is equal to the fire resistance rating of the construction being penetrated.

.5 W-ratings: in accordance with Section 07 84 00.

.6 Provide a firestop system with an Assembly Rating as determined by CAN/ULC-S115 which is equal to the time rating of construction joint assembly.

.7 Penetrations in Smoke Barriers: Provide firestopping with ratings determined in accordance with CAN/ULC-S115.

.1 L-Rating: Not exceeding 5.0 CFM/sqft of penetration opening at both ambient and elevated temperatures.

.8 Mold Resistance: Provide penetration firestopping with mold and mildew resistance rating of 0 as determined by ASTM G21.

.9 Rain and water resistance: provide perimeter joint sealant tested in accordance with ASTM D 6904 with less than 1 hour tack free time as tested in accordance with ASTM C 679.

2.2 MANUFACTURERS

.1 Manufacturer List:

.1 AD Fire Protection Systems.

.2 Hilti (Canada) Corporation

.3 3M.

.4 Specified Technologies, Inc. (STI).

.5 Tremco, Inc.

.2 Substitutions: Where a specific manufacturer is noted in this Section, equivalent products from the manufacturers listed above may be used, subject to compliance with through penetration firestop systems and joint systems listed in the ULC Fire Resistance Directory – Volume III, or UL Products Certified for Canada (cUL) Directory.

2.3 MATERIALS

.1 Use only firestop products that have been ULC or cUL tested for specific fire-rated construction conditions conforming to construction assembly type, penetrating item type, annular space requirements, and fire-rating involved for each separate instance.

.2 Accessories: provide components for each firestopping and smoke seal systems that are needed to install fill materials. Use only components specified by firestopping material manufacturer, and approved by the qualified testing agency. Accessories include, but are not limited to, the following items:

.1 Permanent forming, damming, and backing material.

.2 Temporary forming material.

.3 Pre-formed firestop devices for use with non-combustible and combustible pipes (closed and open systems), conduit and/or cable bundles penetrating concrete floors and/or gypsum walls:

.1 Hilti Tub Box Kit (CP 681) for use with tub installations.

.2 Hilti Cast-In Place Firestop Device (CP 680-PX) for use with XFR pipe.

.3 Hilti Cast-In Place Firestop Device (CP 680-M) for use with non-combustible penetrants.

.4 Hilti Speed Sleeve (CP 653) for use with cable penetrations.

.5 Hilti Firestop Drop-In Device (CFS-DID) for use with non-combustible and combustible penetrants.

.6 Hilti Cast-in Firestop sleeve (CFS-CID MD P) and (CFS-CID MD M) for use with combustible and non-combustible pipes through metal deck.

.7 Hilti Firestop Block (CFS-BL).

.8 STI SpecSeal series SSC Firestop Collars.

.9 STI SpecSeal series LCC Firestop Collars.

.4 Sealants or caulking materials for use with non-combustible items including steel pipe, copper pipe, rigid steel conduit and electrical metallic tubing (EMT).

.1 Hilti Intumescent Firestop Sealant (FS-ONE MAX).

.2 Hilti Fire Foam (CP 620)/CP 660.

.3 Hilti Flexible Firestop Sealant (CP 606).

.4 Hilti Firestop Silicone Sealant Gun Grade (CFS-S SIL GG).

.5 Hilti Firestop Silicone Sealant Self Leveling (CFS-S SIL SL).

.5 Intumescent sealants or caulking materials for use with combustible items (penetrants consumed by high heat and flame) including insulated metal pipe, PVC jacketed, flexible cable or cable bundles and plastic pipe.

.1 Hilti Intumescent Firestop Sealant (FS-ONE MAX).

.6 Foams, intumescent sealants, or caulking materials for use with flexible cable or cable bundles.

.1 Hilti Intumescent Firestop Sealant (FS-ONE MAX).

.2 Hilti Fire Foam (CP 620)/660.

.3 Hilti Flexible Firestop Sealant (CP 606).

.4 Hilti Firestop Silicone Sealant Gun Grade (CFS-S SIL GG).

.5 Hilti Firestop Silicone Sealant Self Leveling (CFS-S SIL SL).

.7 Firestop Putty Pads: Intumescent, non-hardening putty pads to be installed on metallic and non-metallic electrical switch and receptacle boxes to reduce horizontal separation between boxes to less than 610 mm (24 in):

.1 STI SpecSeal Series SSP Firestop Putty Pads.

.2 Hilti Firestop Putty Pad (CP 617).

.8 Materials used for large size/complex penetrations made to accommodate cable trays, multiple steel and copper pipes, electrical busways in raceways.

.1 Hilti Firestop Block (CFS-BL).

.2 Hilti Composite Sheet (CFS-COS).

.3 Hilti Firestop Mortar (CP 637).

.4 Hilti Fire Foam (CP 620)/660.

.5 Hilti Firestop Board (CP 675T).

.9 Non-curing, re-penetrable materials used for large size/complex penetrations made to accommodate cable trays, multiple steel and copper pipes, electrical busways in raceways.

.1 Hilti Firestop Block (CFS-BL).

.2 Hilti Firestop Board (CP 675T).

.10 Re-penetrable, round cable management devices for use with new or existing cable bundles penetrating gypsum or masonry walls.

.1 Hilti Speed Sleeve (CP 653) with integrated smoke seal fabric membrane.

.2 Hilti Firestop Cable Collar (CFS-CC).

.3 Hilti Firestop Sleeve (CFS-SL SK).

.4 Hilti Retrofit Sleeve (CFS-SL RK) for use with existing cable bundles.

.5 Hilti Gangplate (CFS-SL GP) for use with multiple cable management devices.

.6 Hilti Gangplate Cap (CFS-SL GP CAP) for use at blank openings in gangplate for future penetrations.

.11 For blank openings made in fire-rated wall or floor assemblies, where future penetration of pipes, conduits, or cables is expected.

.1 Hilti CFS-BL Firestop Block (for walls and floors).

.2 Hilti CFS-PL Firestop Plug (for walls and floors).

.12 Cast-In-Place Firestop Device: Single component molded firestop device installed on forms prior to concrete placement with totally encapsulated, tamper-proof integral firestop system and smoke sealing gasket. Device shall allow for a concrete floor thickness of minimum 63 mm (2-1/2 in) up to 914 mm (36 in) without the use of field applied extension tubing:

.1 STI SpecSeal CID Cast-In Firestop Device.

.2 Hilti CP 680 Cast-In Place Firestop Device (for floors only).

.13 For single or cable bundles up to 25 mm (1 in) diameter penetrating gypsum, masonry, concrete walls or wood floor assemblies.

.1 Hilti CFS-D Firestop Cable Disc.

PART 3 - EXECUTION

3.1 INSTALLERS

.1 Labour Use to Install Firestop Systems

.1 To ensure complete harmony on the project site, the installation of each scope of work is to be performed jurisdictionally correct per existing trade agreements.

3.2 PREPARATION

.1 Verification of Conditions: Examine areas and conditions under which work is to be performed and identify conditions detrimental to proper or timely completion.

.1 Verify penetrations are properly sized and in suitable condition for application of materials.

.2 Surfaces to which firestop materials will be applied shall be free of dirt, grease, oil, rust, laitance, release agents, water repellents, and any other substances that may affect proper adhesion.

.3 Provide masking and temporary covering to prevent soiling of adjacent surfaces by firestopping materials.

.4 Comply with manufacturer's recommendations for temperature and humidity conditions before, during and after installation of firestopping.

.5 Do not proceed until unsatisfactory conditions have been corrected.

3.3 COORDINATION

.1 Coordinate construction of openings, penetrations to ensure that the fire stop systems are installed according to specified requirements.

.2 Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration fire stop systems.

.3 Coordinate fire stopping with other trades so that obstructions are not placed in the way prior to the installation of the fire stop systems.

.4 Do not cover up through-penetration fire stop and joint system installations that will become concealed behind other construction until each installation has been examined by the building inspector.

3.4 INSTALLATION

.1 Regulatory Requirements: Install firestop materials in accordance with ULC Fire Resistance Directory or UL Products Certified for Canada (cUL) Directory or Omega Point Laboratories Directory.

.2 Manufacturer's Instructions: Comply with manufacturer's instructions for installation of through-penetration and construction joint materials.

.1 Seal all holes or voids made by penetrations to ensure an air and water-resistant seal.

.2 Consult with mechanical engineer, project manager, and damper manufacturer prior to installation of ULC or cUL firestop systems that might hamper the performance of fire dampers as it pertains to duct work.

.3 Protect materials from damage on surfaces subjected to traffic.

3.5 FIELD QUALITY CONTROL

.1 Examine sealed penetration areas to ensure proper installation before concealing or enclosing areas.

.2 Keep areas of work accessible until inspection by applicable code authorities.

.3 Inspection of through-penetration firestopping shall be performed in accordance with ASTM E 2174, “Standard Practice for On-Site Inspection of Installed Fire Stops”, or other recognized standard.

.4 Perform under this section patching and repairing of firestopping caused by cutting or penetrating of existing firestop systems already installed by other trades.

.5 Manufacturer’s Field Services: During Installation, provide periodic destructive testing inspections to assure proper installation/application. After installation is complete, submit findings in writing indicating whether or not the installation of the tested system identified was installed correctly.

3.6 IDENTIFICATION AND DOCUMENTATION

.1 The firestop contractor is to supply documentation for each single application addressed. This documentation is to identify each penetration location on the entire project.

.2 The Documentation Form for through penetrations is to include:

.1 A Sequential Location Number.

.2 The Project Name.

.3 Date of Installation.

.4 Detailed description of the penetration location.

.5 Tested System or Engineered Judgment Number.

.6 Type of assembly penetrated.

.7 A detailed description of the size and type of penetrating item.

.8 Size of opening.

.9 Number of sides of assemblies addressed.

.10 Hourly rating to be achieved.

.11 Installer’s Name.

.3 Copies of these documents are to be provided to the general contractor at the completion of the project.

.4 Identify through-penetration firestop systems with pressure-sensitive, self-adhesive, preprinted vinyl labels. Attach labels permanently to surfaces of penetrated construction on both sides of each firestop system installation where labels will be visible to anyone seeking to remove penetrating items or firestop systems. Include the following information on labels:

.1 The words: "Warning-Through Penetration Firestop System-Do Not Disturb. Notify Building Management of Any Damage."

.2 Contractor's Name, address, and phone number.

.3 Through-Penetration firestop system designation of applicable testing and inspecting agency.

.4 Date of Installation.

.5 Through-Penetration firestop system manufacturer's name.

.6 Installer's Name.

3.7 ADJUSTING AND CLEANING

.1 Remove equipment, materials, and debris, leaving area in undamaged, clean condition.

.2 Clean all surfaces adjacent to sealed holes and joints to be free of excess firestop materials and soiling as work progresses.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 This section provides minimum acceptance requirements for vibration isolation for all electrical equipment, conduit, and piping.

1.2 RELATED REQUIREMENTS

.1 Concrete work is described in Division 03 and Section 26 05 29.

.2 Section 26 12 16 – Dry-Type, Medium-Voltage Transformers.

.3 Section 26 22 13 – Low-Voltage Distribution Transformers.

.4 Section 26 32 13.16 – Gas-Engine-Driven Generator Sets.

1.3 SUBMITTALS

.1 All outdoor mounted equipment shall be restrained for the highest wind speed as specified by the project's structural engineer, the governing building code(s) or the authority having jurisdiction.

.2 Submit shop drawings for all devices specified herein and as indicated and scheduled on the drawings. Submittals shall indicate full compliance with the device specification in Part 2. Any deviation shall be specifically noted and subject to engineer approval. Submittals shall include device dimensions, placement, attachment, and anchorage requirements.

1.4 CLOSEOUT SUBMITTALS

.1 Submit a letter from vibration isolation manufacturer to certify correct installation of products, as specified in Part 3 of this Section.

1.5 QUALITY ASSURANCE

.1 All vibration isolation systems shall be by one manufacturer.

.2 Unless otherwise directed by the local authority having jurisdiction, the following codes and standards will apply:

.1 International Building Code 2009.

.2 American Society of Civil Engineers 7-05.

.3 Ontario Building Code, Latest Edition.

.3 Manufacturer's Qualifications: Firms regularly engaged in manufacture of vibration control products of type, size, and capacity required, whose products have been in satisfactory use in similar service for not less than 5 years.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Vibro-Acoustics.

.2 Kinetics Noise Control.

.3 BVA Systems.

.4 Vibron Limited.

.5 Mason Industries.

2.2 VIBRATION ISOLATION

.1 Springs: All springs shall have a minimum additional travel to solid equal to 50% of the rated deflection. All springs except internal nested springs shall have an outside diameter not less than 0.8 of the compressed height of the spring. Ends of springs shall be square and ground for stability. Laterally stable springs shall have kx/ky ratios of at least 0.9. All springs shall be fully colour-coded to indicate capacity – colour striping is not considered adequate.

.2 Corrosion Protection: All springs shall be powder-coated enamel. Housings shall be hot dipped galvanized, powder-coated enamel, or painted with rust-resistant paint.

.3 Isolators:

.1 Vibration Isolation Pads: Type N – Neoprene pad type isolators, 10 mm (3/8”) minimum thick, ribbed on both sides.

.1 Type NSN – Sandwich neoprene pad type isolators, with 10 mm (3/8”) minimum thick ribbed neoprene pads bonded to each side of a 3.5 mm (10 ga) minimum galvanized metal plate. Isolator pads shall be selected to ensure that deflection does not exceed 20% of isolator free height.

.2 Rubber-in-Shear Floor Mounts: Type RD – “Double-deflection” neoprene isolators, with neoprene-coated metal surfaces, and top and bottom surfaces ribbed. Isolators shall have bolt holes in the base.

.3 Restrained Spring Floor Mounted Isolators: Type CSR – Laterally stable, vertically restrained spring isolators with welded steel housings and heavy top plates for supporting equipment. Springs shall be supported either with a neoprene cup or a metal base plate complete with a ribbed neoprene pad, minimum 6 mm (1/4”) thick, bonded to the base plate. Housings shall include vertically restraining limit stops. Minimum clearance around the restraining bolts and between the housing and the spring shall be 13 mm (1/2”). Top plate and restraining bolts shall be out of contact with the housing during normal operation and neoprene grommets shall be incorporated to minimize short-circuiting of restraining bolts. For outdoor applications, housing must be hot-dip galvanized. For indoor applications, powder-coated finish for the housing is acceptable.

PART 3 - EXECUTION

3.1 GENERAL

.1 Coordinate size, doweling, and reinforcing of concrete equipment housekeeping pads and piers with vibration isolation manufacturer to ensure adequate space and prevent edge breakout failures. Pads and piers must be adequately doweled into structural slab.

.2 Coordinate locations and sizes of structural supports with locations of vibration isolators (e.g., roof curbs, cooling towers, air-cooled chillers, etc.).

.3 Isolated equipment, duct and piping located on roofs must be attached to the structure. Intermediate supports between the restraint and structure that are not attached to the structure must be approved by the restraint manufacturer.

3.2 VIBRATION ISOLATION

.1 Ensure housekeeping pads have adequate space to mount equipment and isolator housings and shall also be large enough to ensure adequate edge distance for isolator anchors.

.2 Select and locate vibration isolation equipment to give uniform loading and deflection, according to weight distribution of equipment.

.3 Engine-generator set silencers and associated exhaust piping shall be supported with Type SHR isolators with a minimum 40 mm (1-1/2 in) static deflection.

.4 Equipment Isolation:

						Floor Span								
			Slab on Grade			Up to 6 m (20 ft)			6 m to 9 m (20 ft to 30 ft)			9 m to 12 m (30 ft to 40 ft)

Transformers and UPS's														
All	All	All	N/A	NSN	3 mm (0.12")	N/A	NSN	3 mm (0.12")	N/A	NSN	3 mm (0.12")	NM	RD/NSN	6 mm (0.25")
Engine-Driven Generators														
All	All	All	N/A	CSR	19 mm (0.75")	N/A	CSR	38 mm (1.50")	N/A	CSR	64 mm (2.50")	N/A	CSR	89 mm (3.50")
Notes:	(1) Units that are suspended overhead shall use isolation hangers in place of floor mounted isolators with equal or greater deflection.													
	(2) Floor spans are defined as the distance between structural support columns or walls.													

.5 There shall be no rigid contact of isolated equipment with shaft walls, floor slabs, partitions, or non-flexible conduits connections.

.6 Where recommended by the manufacturer, isolator base plates shall be bolted to the structure or foundation. Bolting shall incorporate neoprene bushings and washers.

3.3 SITE TESTS AND INSPECTIONS

.1 After installation, arrange and pay for the vibration isolation product manufacturer, or representative, to visit the site to verify that the vibration isolation systems are installed and operating properly, and shall submit a certificate so stating. Verify that isolators are adjusted, with springs perpendicular to bases or housing, adjustment bolts are tightened up on equipment mountings, and hangers are not cocked.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Nameplates and labels.

.2 Wire and cable markers.

.3 Conduit markers.

.4 Receptacle labels.

.5 Signage.

1.2 RELATED REQUIREMENTS

.1 Section 09 91 00 – Painting.

1.3 SUBMITTALS

.1 Product Data: Provide catalogue data for nameplates, labels, and markers.

.2 Provide shop drawings of nameplates for Consultant’s review prior to fabrication (scale 1:1).

.3 Manufacturer's Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency specified under regulatory requirements. Include instructions for storage, handling, protection, examination, preparation, and installation of Product.

1.4 REGULATORY REQUIREMENTS

.1 Provide products listed and classified by CSA Group as suitable for the purpose specified and indicated.

PART 2 - PRODUCTS

2.1 NAMEPLATES AND LABELS

.1 Nameplates:

.1 Engraved three-layer laminated plastic, letters on contrasting background.

.2 Colours to match existing building system, where applicable. If no building system exists, use the following:

.1 347/600 volt system: White text on Blue background.

.2 120/208 volt system: Black text on White background.

.3 Fire Detection system: White text on Red background.

.4 Emergency Lighting system: Red text on White background.

.5 LV systems: White text on Green background.

.3 Confirm colours with the Consultant prior to ordering nameplates.

.2 Equipment Nameplates to indicate:

.1 Equipment/Panelboard ID.

.2 Ampacity.

.3 Voltage.

.4 Number of Phases.

.5 Number of wires in system.

.6 Interrupting Capacity.

.7 Size, number of poles, Panelboard ID, and circuit number of upstream overcurrent protection device.

.1 Location of upstream device if not in the same room.

.3 Coordination Study Labels to Section 26 05 73.16.

.4 Arc Flash Study Labels to Section 26 05 73.19.

.5 Locations:

.1 Distribution panelboards, and individual distribution panelboard branch breakers.

.2 Receptacle panelboards.

.3 Each electrical distribution and control equipment enclosure.

.4 Uninterruptible Power Supply.

.5 Mechanical Equipment.

.6 UPS receptacles.

.7 Disconnects, starters and contactors: indicate equipment being controlled and voltage.

.8 Terminal cabinets, junction boxes, and pull boxes: indicate system and voltage.

.9 Transformers: indicate capacity, primary and secondary voltages.

.6 Letter Size:

.1 Use 3 mm letters for identifying individual equipment and loads.

.2 Use 6 mm letters for identifying grouped equipment and loads.

.7 Labels:

.1 Mechanically fastened with sheet metal screws, with 5 mm white letters on black background.

.2 White letters on red background for UPS and equipment, and devices downstream of UPS.

.3 Labels: embossed plastic labels with 6 mm high letters unless specified otherwise.

.4 Wording on nameplates and labels to be reviewed by the Consultant prior to manufacturing.

.5 Allow for minimum of twenty-five (25) letters per nameplate and label.

.6 Nameplates for terminal cabinets and junction boxes to indicate system and/or voltage characteristics.

.7 Terminal cabinets and pull boxes: indicate system and voltage.

2.2 WIRING IDENTIFICATION

.1 Identify wiring with permanent indelible identifying markings, numbered, on both ends of phase conductors of feeders and branch circuit wiring.

.2 Maintain phase sequence and colour coding throughout.

.3 Colour coding: to CSA C22.1.

.4 Use colour coded wires in communication cables, matched throughout system.

2.3 WIRE MARKERS

.1 Description: tape, split sleeve, or tubing type wire markers.

.2 Locations: Each conductor at panelboard gutters, pull boxes, outlet and junction boxes and each load connection.

.3 Legend:

.1 Power and Lighting Circuits: Branch circuit or feeder number indicated on drawings.

.2 Control Circuits: Control wire number indicated on shop drawings.

2.4 CONDUIT AND BOX MARKERS

.1 Colour code conduits, boxes, and metallic sheathed cables.

.2 Location: Provide markers for each conduit longer than 2 m.

.3 Code with plastic tape or paint at points where conduit or cable enters wall, ceiling, or floor, and at 15 m intervals.

.4 Colours to match equipment nameplate background colour:

.1 347/600 volt system: Blue.

.2 120/208 volt system: Black.

.3 Fire Alarm system: Red.

.4 Emergency Lighting system: Red/White.

.5 LV Systems (EPO, Remote Monitoring, Generator Control, Communications): Green.

.6 120/208 volt Uninterruptable Power Supply (UPS): Orange.

.5 Confirm colours with the Consultant prior to commencing rough-in.

2.5 JUNCTION AND PULL BOXES

.1 Clearly identify main pull or junction boxes (excluding obvious outlet boxes) by painting outside of covers.

.2 Spray painting: not permitted.

.3 Paint colours to be in accordance with following schedule:

.1 Lighting: yellow.

.2 Normal power: blue.

.3 Emergency power: orange.

.4 Fire alarm: red.

.5 Communications systems including telephone and data: green.

.6 Miscellaneous signals: brown.

.4 In addition to painting miscellaneous signal boxes, clearly identify specific system in which box is installed. Identify source panelboard for power circuits.

2.6 BRANCH BREAKER LABELS

.1 General:

.1 Legibly identify every circuit and circuit modification as to its clear, evident, and specific purpose or use. Include sufficient detail to allow each circuit to be distinguished from all others.

.2 Label spare positions that contain unused overcurrent devices or switches.

.3 Do not describe any circuit in a manner that depends on transient conditions of occupancy.

.2 Switchboards, distribution panelboards, enclosed breakers, and disconnect switches:

.1 Locate identification at each switch.

.2 Branch breaker nameplates on switchboards, distribution panelboards and switchboards, and generator load breakers to indicate:

.1 Locate identification at each switch on a switchboard.

.2 Identification of downstream equipment fed from the breaker.

.1 Location of downstream device if not in the same room.

.3 Breaker size and number of poles.

.4 Interrupting Capacity.

.5 Circuit number (where applicable).

.6 Do not describe any circuit in a manner that depends on transient conditions of occupancy.

.3 Lighting and Receptacle Panelboards:

.1 Provide a circuit directory that is located on the face or inside of the panel door.

.2 Do not describe any circuit in a manner that depends on transient conditions of occupancy.

2.7 RECEPTACLE LABELS

.1 Label all receptacles with the panelboard ID and circuit number.

.2 Use receptacle labels by electronic labeller Brother P-Touch, model PT-20/25, Dymo-Tape or approved equal.

.3 Location: On receptacle wall plate.

PART 3 - EXECUTION

3.1 EQUIPMENT NAMEPLATES FROM MANUFACTURERS

.1 Ensure manufacturer's nameplates, CSA labels and identification nameplates are visible and legible after equipment is installed.

.2 Manufacturers' nameplates and CSA labels are to be visible and legible after equipment is installed. Provide warning signs, as specified, or to meet requirements of Inspection Department, Health and Safety, and the Consultant.

.3 Label power outlets with circuit identification on visible portion of faceplate or surface mounted outlet box.

3.2 CONDUIT AND BOX IDENTIFICATION

.1 Locate labels as follows:

.1 At every end of every conduit, duct, or cable run, adjacent to item of equipment serviced.

.2 On each exposed conduit, duct or cable passing through a wall, partition, or floor (one on each side of such wall partition or floor).

.3 At intervals of 15 m (50 ft) along every exposed conduit, duct or cable run exceeding 15 m (50 ft) in length.

.4 At every access point on concealed conduit duct or cable.

.5 At each junction box.

.2 Place labels so as to be visible from 1500 mm (5 ft) above adjacent floor platform.

3.3 PREPARATION

.1 Degrease and clean surfaces to receive nameplates and labels.

3.4 APPLICATION

.1 Confirm colours prior to start of work.

.2 Install nameplate and label parallel to equipment lines.

.3 Secure nameplate to equipment front using adhesive.

.4 Secure nameplate to inside surface of door on panelboard that is recessed in finished locations.

.5 Identify conduit using field painting.

.6 Paint coloured band on each conduit longer than 2 m.

.7 Paint bands 6 m on centre.

3.5 LABELLING

.1 Colour code wiring consistently throughout the installation and generally match colour coding of internal wiring of pre-wired components.

.2 Label wiring with point name using Thomas & Betts 12 character polestar metalized labels with 3 rows of characters per label, or equal by Brady. Label to occur as a minimum at both ends and at pull boxes of the wiring run.

.3 Identify all pull boxes, junction boxes, etc. (installed as part of this project or used by this project) with the exact use of the box. Indelible felt pen marker is acceptable.

.4 Label light control items with point name using Thomas & Betts 12 character label, or equal by Brady. Label to be black lettering on clear backing.

.5 Label relays and controllers inside panels using Thomas & Betts 12 character label, or equal by Brady.

.6 Provide red, 13 mm (1/2 in) diameter, sticker on emergency light fixture frame. Include circuit number on sticker with thin permanent black mark pen.

3.6 LABELS AND SIGNS

.1 Manufacturers' nameplates and CSA labels are to be visible and legible after equipment is installed. Provide warning signs, as specified, or to meet requirements of Inspection Department, Health and Safety, and the Consultant.

.2 Label power outlets with circuit identification on visible portion of faceplate or surface mounted outlet box.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Provide a short circuit and coordination study for the electrical distribution system. The basic analysis shall include a protective device evaluation, and a protective device coordination study.

.2 The project shall begin at the point of utility service for the facility and continue down through the system to all downstream distribution and branch panelboards, motor control centres and significant motor locations.

.3 The project shall include any new generators and any associated emergency power distribution equipment, including automatic transfer switches and generator ground fault protection.

1.2 RELATED REQUIREMENTS

.1 Section 26 05 73.19 – Arc-Flash Hazard Analysis.

.2 Single Line Diagram.

1.3 REFERENCE STANDARDS

.1 Perform all studies in accordance with the latest applicable IEEE and ANSI standards.

.1 ANSI C38.010-1999.

.2 ANSI C37.5-1979.

.3 ANSI C37.13-1990.

1.4 SUBMITTALS

.1 In accordance with Section 01 33 00:

.2 Submit the following:

.1 Submit for review three copies of the protection coordination study.

.2 Shop drawings for equipment affected by the coordination study will not be reviewed until the coordination study has been submitted and reviewed.

.3 Include a one-line diagram of the system.

.4 Bind the final report in a three-ring binder, as well as a soft copy.

.3 Projection System Coordination:

.1 Prepare a graph or coordination curves, prior to manufacture of service entrance and distribution equipment on K & E No. 336E Time-Current characteristic graph paper. Time-current characteristics shall be plotted of the following:

.1 Supply Authorities relays or fuses protecting incoming service (Contractor under this section shall obtain this information).

.2 Main and feeder protective devices at every voltage level used in distribution system.

.3 Protective devices associated with largest motor and/or refrigeration compressor.

.2 Preliminary submission of graph for comment will be accepted. Submit graph to Supply Authority for approval by them as providing satisfactory co-ordination. When curves have been approved by Supply Authority, they shall be submitted for approval. After approval has been obtained, order protective devices, and calibrate to conform with these curves.

.3 Each time-current characteristic curve sheet shall include:

.1 A single line diagram for the portion of the system involved.

.2 Transformer damage curves (where applicable).

.3 Cable damage curves (where applicable).

.4 Available fault levels for the portion of the system involved.

.4 Consult manufacturer of the refrigeration compressors and obtain recommendations for settings on starters. Incorporate information in co-ordination curves and submit the associated curves to Compressor Manufacturer and obtain approval from the manufacturer.

.5 Compressor manufacturer and mechanical trade contractor will determine and calibrate proper protection on motor starters and will ensure that it coordinates with protective devices on switchboard.

.6 Co-ordination curves, mentioned above, shall be prepared by distribution equipment manufacturers as soon as possible after award of contract.

.7 At the option of this contractor under this section, these co-ordination curves may also be prepared by an independent testing organization. In this case, the independent testing organization shall determine the proper settings of all protective relays and devices and pass them on to the switchboard manufacturer for incorporation into the switchboards. Include all associated costs in the tender.

.8 Distribution Equipment manufacturers shall examine drawings and specifications prior to award of contract to ensure that relays and devices being supplied by them will co-ordinate satisfactorily to Supply Authority requirements. Payment will not be allowed, after award of contract, for extra charges due to device changes to comply with recommended practices, due to oversight or negligence by distribution equipment manufacturers.

.4 Upon review by the Consultant, submit the coordination study to the local electrical utility for their review and approval.

1.5 CLOSEOUT SUBMITTALS

.1 The Engineer who prepared the report shall visit the site and confirm that the feeder sizes as installed are consistent with the report as submitted.

.2 Submit final version of the report with as-constructed feeder lengths and feeder sizes.

1.6 QUALITY ASSURANCE

.1 Preparer Qualifications: Firm experienced in the analysis, evaluation, and coordination of electrical distribution systems and similar to the system for this project.

.2 The study shall be prepared in accordance with the latest edition of NETA ATS, the Canadian Electrical Code, as well as manufacturer’s recommendations.

.3 Short-Circuit Analysis and Coordination Study shall be performed by a registered Professional Engineer. Study shall be signed and sealed by the Engineer. The Engineer shall have a minimum of eight years experience in the analysis, evaluation, and coordination of electrical distribution systems.

.4 The firm conducting the study shall have one million worth of Professional Liability Insurance in addition to standard general insurance.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Independent Testing Organizations

.1 AC Tesla.

.2 Brosz and Associates.

.3 C-INTECH.

.4 Eastenghouse.

.5 Enkompass.

.6 G.T. Wood.

.7 Haronitis and Associates Ltd.

.2 Electrical distribution manufacturers:

.1 Eaton.

.2 Schneider Electric.

2.2 PROTECTIVE DEVICE COORDINATION STUDY

.1 Prepare coordination time-current characteristic curves to determine the required settings/sizes of the protective devices to maximize selectivity. The utility upstream protective device feeding the facility shall be maintained as the upper limit for coordination. These settings shall be obtained by the preparer, along with any other protective device setting requirements. The coordination curves shall be prepared on log-log paper and illustrate adequate clearing times between series devices. The curves shall be created through the use of the study software package, but must reflect actual protective devices to be installed. Adequate time-current curves shall be generated to depict coordination. In addition, protective device characteristics shall be suitably determined to reflect calculated short-circuit levels at the location.

.2 A narrative analysis shall accompany each coordination curve sheet and describe the coordination and protection in explicit detail. All curve sheets shall be multi-colour for improved clarity. Areas lacking complete coordination shall be highlighted and reasons provided for allowing condition to remain or provide solution to resolve situation. System coordination, recommended ratings, and setting of protective devices shall be accomplished by a registered professional electrical engineer with a minimum of eight years of current experience in the coordination of electrical power systems.

.3 The following information shall be provided on all curve sheets:

.1 Device identification and associated settings/size.

.2 Voltage at which curves are plotted.

.3 Current multiplier.

.4 ANSI frequent fault damage curve.

.5 Cable insulation damage curves.

.6 Transformer inrush point.

.7 Single-line for the portion of the system.

.8 Motor starting profiles (where applicable).

2.3 SINGLE LINE DIAGRAM

.1 The final report shall include a multi-colour single line diagram of the electrical distribution system within the scope of the project. The single line diagram shall include:

.1 Transformer rating, voltage ratio, impedance, and winding connection.

.2 Feeder cable phase, neutral and ground sizes, length of cable, conductor material, and conduit size and type.

.3 Switchgear, switchboards, panelboards, MCC's, fuses, circuit breakers, ATS's and switches continuous current ratings.

.4 Protective relays with appropriate device numbers and CT's and PT's with associated ratios.

.5 Detailed legend indicating device type identification and other significant details.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Obtain fault level and X/R ratio information from the utility.

3.2 SUMMARY

.1 The results of the system studies shall be summarized in a final report.

.2 Where required, copies of the final report shall be submitted to the Supply Authority for their review and approval. Submit approved copies of the report to the Consultant.

3.3 ADJUSTING

.1 The contractor shall engage the manufacturer's service group or alternately a qualified independent testing firm to perform field adjustments of the protective devices as required for placing the equipment in final operating condition. The settings shall be in accordance with the approved short circuit study and protective device evaluation / coordination study.

.2 Necessary field settings of devices and adjustments and minor modifications to equipment to accomplish conformance with the approved protective device coordination study, shall be carried out by manufacturer's service group.

.3 Submit a final service report confirming that settings have been completed.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Provide an Arc Flash Hazard Analysis Study per the requirements described in CSA Z462 Standard for Electrical Safety in the Workplace.

.2 The arc flash hazard analysis shall be performed according to the IEEE 1584 equations that are obtained in CSA Z462-08, Annex D, or more recent version of the standard as cited by this Section.

.3 The scope of the studies shall include all existing distribution equipment and all new distribution equipment supplied by the equipment manufacturer under this contract.

1.2 RELATED REQUIREMENTS

.1 Section 26 05 73.16 – Coordination Studies.

.2 Single Line Diagram.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CSA Z462:21, Workplace electrical safety.

1.4 SUBMITTALS

.1 Submit the protective device coordination study to the Consultant prior to receiving final review of the distribution equipment shop drawings and/or prior to release of equipment drawings for manufacturing. If formal completion of the studies may cause delay in equipment manufacturing, approval from the engineer may be obtained for preliminary submittal of sufficient study data to ensure that the selection of device and characteristics will be satisfactory.

.2 Upon review by the Consultant, submit the arc-flash study to the local electrical utility for their review and approval.

1.5 CLOSEOUT SUBMITTALS

.1 The results of the protective device coordination and arc flash hazard analysis studies shall be summarized in a final report. Three (3) bound copies of the complete final report shall be submitted. Additional copies of the complete report with input and output data shall be provided on CD in PDF format.

.2 The report shall include the following sections:

.1 Executive Summary.

.2 Descriptions, purpose, basis, and scope of the study.

.3 Tabulations of circuit breaker, fuse, and other protective device ratings versus calculated short circuit duties.

.4 Protective device time versus current coordination curves, tabulations of relay and circuit breaker trip unit settings, fuse selection.

.5 Fault current calculations including a definition of terms and guide for interpretation of the computer printout.

.6 Details of the incident energy and flash protection boundary calculations.

.7 Recommendations for system improvements, where needed.

.8 Single Line Diagram.

.3 Arc flash labels (refer to CSA Z462 Annex Q) shall be provided in hard copy only.

1.6 QUALIFICATIONS

.1 Arc flash hazard analysis studies shall be conducted under the supervision and approval of a licensed Professional Electrical Engineer skilled in performing and interpreting the power system studies.

.2 The licensed Professional Electrical Engineer shall be a full-time employee of the equipment manufacturer or an approved engineering firm.

.3 The licensed Professional Electrical Engineer shall have a minimum of eight (8) years of experience in performing power system studies.

.4 The equipment manufacturer or approved engineering firm shall demonstrate experience with Arc Flash Hazard Analysis by submitting names of at least ten actual arc flash hazard analysis it has performed in the past year.

1.7 COMPUTER ANALYSIS SOFTWARE

.1 The studies shall be performed using the latest revision of the SKM or equivalent.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Independent Testing Organizations:

.1 AC Tesla.

.2 Brosz and Associates.

.3 C-INTECH.

.4 Eastenghouse.

.5 Enkompass.

.6 G.T. Wood.

.7 Haronitis and Associates Ltd.

.2 Electrical distribution manufacturers:

.1 Eaton.

.2 Schneider Electric.

2.2 STUDIES

.1 The contractor shall furnish an Arc Flash Hazard Analysis Study per CSA Z462, reference Section 4.1.8.2.2, 4.3.3.

2.3 DATA COLLECTION

.1 Contractor shall furnish all data as required by the power system studies. The Engineer performing arc flash hazard analysis studies shall furnish the Contractor with a listing of required data immediately after award of the contract. The Contractor shall expedite collection of the data to assure completion of the studies as required for final approval of the distribution equipment shop drawings and/or prior to the release of the equipment for manufacturing.

.2 Source combination may include present and future motors and generators.

2.4 ARC FLASH HAZARD ANALYSIS

.1 The arc flash hazard analysis shall be performed according to the IEEE 1584 equations that are presented in CSA Z462 Annex D.

.2 The flash protection boundary and the incident energy shall be calculated at all significant locations in the electrical distribution system (switchboards, switchgear, panelboards, and splitters) where work could be performed on energized parts.

.3 The Arc-Flash Hazard Analysis shall include all significant locations in 240 volt and 208 volt systems fed from transformers equal to or greater than 112.5 kVA where work could be performed on energized parts.

.4 Safe working distances shall be based upon the calculated arc flash boundary considering an incident energy of 1.2 calories per square centimetre.

.5 When appropriate, the short circuit calculations and the clearing times of the phase overcurrent devices will be retrieved from the short-circuit and coordination study model. Ground overcurrent relays should not be taken into consideration when determining the clearing time when performing incident energy calculations.

.6 The short-circuit calculations and the corresponding incident energy calculations for multiple system scenarios must be compared and the greatest incident energy must be uniquely reported for each equipment location. Calculations must be performed to represent the maximum and minimum contributions of fault current magnitude for all normal and emergency operating conditions. The minimum calculation will assume that the utility contribution is at a minimum and will assume a minimum motor contribution (all motors off). Conversely, the maximum calculation will assume a maximum contribution from the utility and will assume the maximum amount of motors to be operating. Calculations shall take into consideration the parallel operation of synchronous generators with the electric utility, where applicable.

.7 The incident energy calculations must consider the accumulation of energy over time when performing arc flash calculations on buses with multiple sources. Iterative calculations must take into account the changing current contributions, as the sources are interrupted or decremented with time. Fault contribution from motors and generators should be decremented as follows:

.1 Fault contribution from induction motors should not be considered beyond 3-5 cycles.

.8 Fault contribution from synchronous motors and generators should be decayed to match the actual decrement of each as closely as possible (e.g. contributions from permanent magnet generators will typically decay from 10 per unit to 3 per unit after 10 cycles).

.9 For each equipment location with a separately enclosed main device (where there is adequate separation between the line side terminals of the main protective device and the work location), calculations for incident energy and flash protection boundary shall include both the line and load side of the main breaker.

.10 When performing incident energy calculations on the line side of a main breaker (as required per above), the line side and load side contributions must be included in the fault calculation.

.11 Mis-coordination should be checked amongst all devices within the branch containing the immediate protective device upstream of the calculation location and the calculation should utilize the fastest device to compute the incident energy for the corresponding location.

.12 Arc Flash calculations shall be based on actual overcurrent protective device clearing time.

.13 Maximum clearing time will be capped at 2 seconds based on IEEE 1584.

.14 Where it is not physically possible to move outside of the flash protection boundary in less than 2 seconds during an arc flash event, a maximum clearing time based on the specific location shall be utilized.

2.5 REPORT SECTIONS

.1 Incident energy and flash protection boundary calculations:

.1 Arcing fault magnitude.

.2 Protective device clearing time.

.3 Duration of arc.

.4 Arc flash boundary.

.5 Working distance.

.6 Incident energy.

.7 Hazard Risk Category.

.8 Recommendations for arc flash energy reduction.

PART 3 - EXECUTION

3.1 FIELD ADJUSTMENT

.1 Adjust relay and protective device settings according to the recommended settings table provided by the coordination study. Field adjustments to be completed by the engineering service division of the equipment manufacturer under the Startup and Acceptance Testing contract portion.

.2 Make minor modifications to equipment as required to accomplish conformance with short circuit and protective device coordination studies.

.3 Notify Owner in writing of any required major equipment modifications.

3.2 ARC FLASH WARNING LABELS

.1 The contractor of the Arc Flash Hazard Analysis shall provide a 90 mm (3.5 in) by 125 mm (5 in) thermal transfer type label of high adhesion polyester for each work location analyzed.

.2 All labels will be based on recommended overcurrent device settings and will be provided after the results of the analysis have been presented to the owner and after any system changes, upgrades or modifications have been incorporated in the system.

.3 The label shall include the following information, at a minimum:

.1 Location designation.

.2 Nominal voltage.

.3 Flash protection boundary.

.4 Hazard risk category.

.5 Incident energy.

.6 Working distance.

.7 Engineering firm and issue date.

.8 Labels shall be machine printed, with no field markings.

.4 Arc flash labels shall be provided in the following manner and all labels shall be based on recommended overcurrent device settings.

.1 For each 600 volt, and applicable 208 volt panelboard, one arc flash label shall be provided.

.2 For each motor control centre, one arc flash label shall be provided.

.3 For each low voltage switchboard, one arc flash label shall be provided.

.4 For each switchgear, one flash label shall be provided.

.5 For medium voltage switches one arc flash label shall be provided.

.5 Arc Flash Warning Label General Instructions:

.1 Only qualified electricians who recognize and avoid the electrical and Arc Flash hazards are allowed to place the arc flash warning labels.

.2 Electricians should wear suitable PPE, such as electrical safety boots, Safety Glasses, etc. while performing labeling.

.3 Generally, arc flash label shall be put on a prominent pre-cleaned place on the front of the electrical equipment (such as switchgear, panel, disconnect switch, generator output breaker). Label should be visible and readable, displayed horizontally, attached flatly and securely, and not allowed to cover other signs or labels on the equipment.

.4 Under the special request of the client, labels could be put on the back of the panel door when the panel is located in clean and finished spaces such as an office area.

.5 When putting a label on small equipment with no space labeling on the wall just beside the equipment is allowed.

.6 Special request may be attached to this General Instruction. For examples, more than one identical label is applied for large equipment; different labels could be applied for different sections of one equipment; for a splitter with several disconnect switches only one label is placed on the splitter for this group.

.7 Take the pictures for each label to indicate both names of the label and equipment and labeling area of the equipment. Email these pictures to the Consultant for quality control and record.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Electrical connections to equipment specified in other sections.

.2 Conduit rough-ins for future equipment.

1.2 RELATED REQUIREMENTS

.1 Division 08 – Openings.

.2 Division 11 – Equipment.

.3 Division 14 – Conveying Equipment.

.4 Division 20 – Common Mechanical Requirements.

.5 Section 20 05 13 – Common Motor Requirements for Mechanical Equipment.

.6 Division 21 – Fire Suppression.

.7 Division 22 – Plumbing.

.8 Division 23 – Heating, Ventilating, and Air Conditioning.

.9 Division 25 – Integrated Automation.

1.3 REFERENCES

.1 NEMA WD 1 - General Colour Requirements for Wiring Devices.

.2 NEMA WD 6 - Wiring Devices - Dimensional Requirements.

1.4 COORDINATION

.1 Coordinate work to Section 01 31 00.

.2 Obtain and review shop drawings, product data, and manufacturer's instructions for equipment provided under other sections.

.3 Determine connection locations and requirements.

.4 Sequence rough-in of electrical connections to coordinate with installation schedule for equipment.

.5 Sequence electrical connections to coordinate with start-up schedule for equipment.

1.5 SUBMITTALS

.1 Submit to Section 01 33 00.

.2 Product Data: Provide wiring device manufacturer's catalogue information showing dimensions, configurations, and construction.

.3 Manufacturer's Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency specified under Regulatory Requirements. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

1.6 REGULATORY REQUIREMENTS

.1 Provide products listed and classified by testing firm acceptable to authority having jurisdiction as suitable for purpose specified and shown.

PART 2 - PRODUCTS

2.1 COMMON MOTOR REQUIREMENTS

.1 Motors up to and including 1/3 hp, shall be 1 phase, 60 Hz, 120 V.

.2 Motors 1/2 hp and above shall be 3 phase, 60 Hz, 575 V or 208 V.

2.2 CORDS AND CAPS

.1 Attachment Plug Construction: Conform to NEMA WD 1.

.2 Configuration: NEMA WD 6; match receptacle configuration at outlet provided for equipment.

.3 Cord Construction: NFPA 70, Type SJO multiconductor flexible cord with identified equipment grounding conductor, suitable for use in damp locations.

.4 Size: Suitable for connected load of equipment, length of cord, and rating of branch circuit overcurrent protection.

PART 3 - EXECUTION

3.1 CONDUIT PATHWAYS AND ROUGH-INS

.1 Where drawings indicate to rough-in conduits for future equipment, or equipment to be provided by the Owner, or other systems as noted on the plans, provide pull string in the conduit, and tag the conduit for the reserved future use/purpose.

.2 Where circuits breakers, disconnect switches, or other electrical distribution is provided for future equipment, tag the devices with the reserved future use/purpose.

3.2 WIRING OF EQUIPMENT PROVIDED UNDER OTHER DIVISIONS

.1 Use the following procedures for wiring of motors and equipment provided under other Divisions.

.2 The following equipment shall be responsibility of the trade supplying the equipment unless otherwise noted, in accordance with the requirements laid out in the individual section, or this division:

.1 Motors.

.2 Starters.

.3 Variable Frequency Drives.

.4 Motor Control Centres.

.5 Control wiring.

.3 In every instance, install starter, motor control centre, variable frequency drivers (VFD), etc. and wire to line side of the starter, the Motor Control Centre (MCC), or VFD. Extend wiring from starter, MCC, or VFD to motor as indicated.

.4 Provide all wiring for starters and VFD’s from supply to starter to VFD and to motor. Coordinate requirements with the appropriate trade.

.5 Provide 500 mm of liquid tight flexible metal conduit for final connection to motor. Provide disconnect switches where required by code, and as indicated on the drawings.

.6 Where individual starters and controls are grouped together provide a panel for mounting this equipment. Provide a feeder, main fused disconnect and a splitter of adequate size and capacity and wire to line side of the starters on this panel and from starters to motors.

.7 Equipment, General

.1 Ascertain exact locations of starters, motor control centres, motors, etc. from drawings and coordinate exact locations with the supplying trade.

.2 Control wiring shall be the responsibility of the supplying trade.

.1 Control wiring shall be in accordance with Section 26 05 19, and Section 26 05 23.

.2 Control wiring shall be installed in conduit in accordance with Section 26 05 33.13.

.8 Doors

.1 Ascertain exact locations of door operators, push buttons, automatic sensors, and other door hardware.

.2 Provide branch circuit wiring for door operators.

.3 Provide control and control wiring for all low voltage door interconnections.

.9 Overhead Doors and Folding Vehicle Doors

.1 Ascertain exact locations of control panels, remote controls, safety equipment such as safety eyes, overhead door contacts, etc. from shop drawings and architectural drawings, and coordinate exact locations with overhead door trade.

.2 Provide branch circuit wiring for door controls.

.3 Provide control and control wiring for all low voltage door interconnections.

.10 Conveying Equipment (e.g. Elevators): in accordance with Section 26 05 83.14.

.11 Plumbing Equipment

.1 Ascertain exact locations of starters, motor control centres, motors, infra-red plumbing fixture controls from Mechanical Drawings and coordinate exact locations with plumbing trade.

.2 Provide branch circuit wiring and an outlet for each infra-red plumbing fixture control.

.3 Control wiring shall be the responsibility of the plumbing trade, as described above.

.12 HVAC Equipment

.1 Ascertain exact locations of starters, motor control centres, motors, motorized dampers, VAV boxes, and heating control valves from HVAC drawings and coordinate exact locations with HVAC Division.

.2 In the case of unit heaters, reheat coils and cabinet unit heaters, terminate wiring on terminals provided. Control wiring, thermostats, or other control devices shall be the responsibility of the HVAC trade, as described above.

.3 Provide branch circuit wiring and an outlet for each motorized damper, variable air volume (VAV) box, or heating control valve. Control wiring shall be the responsibility of the HVAC trade, as described above.

.4 Provide 120 V power connections to small exhaust fans, and ceiling fans for all line voltage control devices, including but not limited to wiring through toggle switches, line voltage thermostats, countdown timer switches, or line voltage speed controllers. Refer to mechanical drawings and schedules for control devices and coordinate requirements with HVAC Division.

.5 Provide 120 V wiring connections to duplex receptacles integral with air handling unit control panels.

.6 Provide 120 V wiring connections to HVAC maintenance receptacles integral with roof mounted HVAC equipment.

.7 Provide 120 V wiring connections to lighting fixture/switch combinations integral with air handling units.

.13 Integrated Automation (Building Automation System)

.1 Provide 120 V wiring connections to BAS system controllers/panels and other control system or component requiring 120 V power including, but not limited to, VAV boxes, dampers, low voltage transformers, etc.

.2 From equipment as noted on drawings, extend suitable wiring in conduit from equipment contacts to designated BMS panel serving area, terminating wiring and conduit in a junction box. Leave wiring un-terminated with slack coiled length of minimum 2 m (6 ft) long. Clearly label junction box and wiring end for termination onto BMS panel by respective Mechanical Trade.

3.3 EXAMINATION

.1 Verify that equipment is ready for electrical connection, wiring, and energization.

3.4 ELECTRICAL CONNECTIONS

.1 Provide a local disconnect switch for all equipment, regardless of if a disconnect switch is shown or not shown on the plans.

.2 Make electrical connections to equipment manufacturer's instructions.

.3 Make conduit connections to equipment using flexible conduit. Use liquid-tight flexible conduit with watertight connectors in damp or wet locations.

.4 Make wiring connections using wire and cable with insulation suitable for temperatures encountered in heat producing equipment.

.5 Provide receptacle outlet where connection with attachment plug is indicated. Provide cord and cap where field-supplied attachment plug is indicated.

.6 Provide suitable strain-relief clamps and fittings for cord connections at outlet boxes and equipment connection boxes.

.7 Install disconnect switches, controllers, control stations, and control devices as indicated.

.8 Modify equipment control wiring with terminal block jumpers as indicated.

.9 Provide interconnecting conduit and wiring between devices and equipment where indicated.

END OF SECTION

Updated through ADD#14

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Commissioning of all building electrical systems and component including:

.1 Testing and adjustment.

.2 Demonstration and training.

.3 Instructions of all procedures for Owner's personnel.

.4 Updating as-built data.

.5 Co-ordination of Operation and Maintenance material.

.2 Provide labour and material to conduct the commissioning process as outlined in this specification section, including the hiring of an Independent Testing Contractor (ITC) as detailed below.

.3 Provisions of this section shall apply to all sections of Division 26, Division 27, Division 28, and sections related to electrical utilities in Division 33.

1.2 RELATED REQUIREMENTS

.1 Testing and commissioning are called for throughout the individual specifications. This does not relieve this trade from providing all testing and commissioning necessary to ensure that systems and equipment operate as required and that they interface with other systems and equipment as required.

.2 Section 26 08 50 – Commissioning of Lighting: additional commissioning requirements for commissioning of lighting and lighting controls.

1.3 COMMISSIONING PROCESS ALLOCATION

.1 The commissioning process shall be allocated a value equal to 5 per cent of the contract. The Electrical Contractor may draw from this allocation as the commissioning process is completed.

.2 The Electrical Contractor shall submit all test and verification forms. The Consultant will use these forms to calculate percentage complete.

.3 The Electrical Contractor may claim up to 3 per cent of the contract from this allocation leading up to performance testing. The remaining 2 per cent shall not be paid out until the performance testing, O&M manuals, and training have been completed satisfactorily.

1.4 DEFINITIONS

.1 Cx – Commissioning.

.2 Commissioning Provider (CxP)

.1 The Commissioning Provider (CxP), also referred to as the Commissioning Consultant, shall be hired by The Owner.

.2 The CxP responsibilities shall include:

.1 preparing the commissioning plan.

.2 co-ordinating with the contractor to schedule tests.

.3 preparing a test form manual.

.4 witnessing selected tests.

.5 receiving all test forms.

.6 co-ordinating the contractors training.

.7 chair the commissioning meetings.

.3 The Electrical Contractor shall co-operate with the CxP.

.4 The Electrical Contractor shall provide assistance to the CxP and have personnel available during the performance testing procedure. Each electrical system shall be tested in the operational mode.

1.5 SUBMITTALS

.1 Conform to Section 01 33 00 for requirements for shop drawings and record drawings.

.2 A commissioning document shall be prepared by the CxP prior to conducting these activities for use by the Commissioning Team.

.3 The electrical sub-contractor shall be responsible for ensuring all activities are properly documented in this manual and co-ordinated through the General Contractor.

.4 As-built drawings and data books must be available two weeks prior to commissioning for review and use by the consultant and Commissioning Team prior to the start of the commissioning activities.

1.6 CLOSEOUT SUBMITTALS

.1 Attendance records for all training sessions.

.2 Testing reports for system load balance measurements, infra-red test and harmonics tests.

1.7 QUALITY ASSURANCE

.1 Provide qualified trades persons, certified testing agencies, factory trained and approved by the Commissioning Team Leader.

.2 Submit the names of all personnel to be used during the Commissioning activities.

1.8 WARRANTY

.1 Equipment and system warranties shall not begin until the system demonstration and turnover has been conducted successfully and accepted by the Owner.

.2 The Electrical Contractor shall fill out the warranty form listing the equipment and systems and the start and finishing dates for warranty.

.3 Refer to Division 01 and Section 26 05 00 for the requirements during the warranty period.

PART 2 - PRODUCTS

2.1 EQUIPMENT

.1 The Contractor and manufacturers shall provide all instrumentation and equipment necessary to conduct the tests specified. The Contractor shall advise the Consultant of instrumentation to be used and the dates the instruments were calibrated.

PART 3 - EXECUTION

3.1 THE COMMISSIONING PROCESS

.1 The purpose of the commissioning process is to fully test all building systems including architectural, mechanical, and electrical components and operating procedures by challenging these systems to realistic operation conditions.

.2 The commissioning process consists of:

.1 Shop Drawings and Record Drawings.

.2 Installation inspection and equipment verification.

.3 Independent testing contractor.

.4 Testing of equipment and systems.

.5 Commissioning meetings.

.6 Operating and maintenance manuals.

.7 Operating training.

.8 Commissioning Agent testing.

.9 Systems Demonstration and turnover.

.10 Testing forms.

.11 Warranties.

3.2 PREPARATION

.1 Provide test instruments required for all activities as defined in the commissioning documents.

.2 Verify all systems are in compliance with the requirements of the commissioning documents prior to the pre-commissioning check out operation.

.3 Confirm all scheduled activities have identified personnel available.

.4 Where systems or equipment do not operate as required, make the necessary corrections or modifications, re-test and re-commission.

3.3 SYSTEM DESCRIPTION

.1 Perform all start-up operations, control adjustment, trouble shooting, servicing and maintenance of each item of equipment as defined in the commissioning documentation.

.2 Owner will provide list of personnel to receive instructions and will co-ordinate their attendance at agreed upon times.

.3 Prepare and insert additional data in the operations and maintenance manuals and update as-built drawings when need for additional data becomes apparent during the commissioning exercise.

.4 Where instruction is specified in the commissioning manual, instruct personnel in all phases of operation and maintenance using operation and maintenance manuals as the basis of instruction.

.5 Conduct presentation on Owner's premises. Owner will provide space.

3.4 COMMISSIONING

.1 Commission the components of the electrical system using the NETA Acceptance Testing Specifications.

.2 Refer to the project commissioning plan prepared by the CxP.

.3 Commissioning activities for the electrical systems must have available up to date as-built drawing information and accurate Operations and Maintenance Manuals. These documents shall be a major part of this activity.

.4 Contractor shall be responsible to update all documentation with information and any changes duly noted during the Commissioning exercise.

.5 Contractor shall arrange for all outside suppliers, equipment manufacturers, test agencies and others as identified in the commissioning sections of this specification. The cost associated with this requirement shall be included as part of the tender price.

3.5 FINAL REPORT

.1 This trade shall assemble all testing data and commissioning reports and submit them to the General Contractor for submission to the Owner.

.2 Each form shall bear signature of recorder, and that of supervisor of reporting organizer.

3.6 SCHEDULE OF ACTIVITIES

.1 Commissioning activities shall be conducted based on pre-established schedule with all members of the commissioning team.

.2 In addition, there will be two meetings held through the contract duration to introduce the parties of the commissioning team, establish the schedules and deadlines for the various activities and review the Commissioning Manual.

.3 Adhering to the established schedule is very important as the co-ordination and scheduling of the participants will be difficult to alter once this is established. Close co-ordination of this schedule is important.

.4 In the event project cannot be commissioned in the allotted time slot, the contractor shall pay for all costs associated with assembling the Commissioning Team at a later date. If the contractor has not performed his duties to reach commissioning stage as outlined earlier, he will incur all expenses of other trades and the Commissioning Team due to his non-compliance.

3.7 INSTALLATION INSPECTION AND EQUIPMENT VERIFICATION

.1 The Electrical Contractor shall co-ordinate with the Electrical Consultant who will inspect the electrical installation.

.2 The Electrical Contractor shall complete the equipment verification forms for each piece of equipment. The forms shall be included in the operating and maintenance manual. The equipment data shall include:

.1 Manufacturers name, address, and telephone number.

.2 Distributors name, address, and telephone number.

.3 Make, model number and serial number.

.4 Voltage and current ratings.

3.8 INDEPENDENT TESTING CONTRACTOR

.1 The Independent Testing Contractor (ITC) shall be hired by the contractor and shall issue reports to the Electrical Consultant.

.2 The ITC shall conduct load balancing measurements to verify load balancing performed in accordance with Section 26 05 00.

3.9 TESTING OF EQUIPMENT AND SYSTEMS

.1 The Electrical Contractor shall be responsible for all tests detailed in this Section, and those tests required by a manufacturer as part of their installation requirements.

.2 The Electrical Contractor shall schedule all tests which shall be witnessed by the Electrical Consultant or the Commissioning Consultant. The contractor shall complete and sign the testing forms.

.3 The Electrical Contractor shall conduct tests on the following equipment as a minimum. Refer to the individual specification sections for test procedures.

.1 Section 26 05 19 – Low-Voltage Electrical Power Conductors and Cables.

.2 Section 26 05 73.16 – Coordination Studies.

.3 Section 26 24 13 – Switchboards.

.4 Section 26 24 16 – Panelboards.

.5 Section 26 24 19 – Motor Control Centres.

.6 Section 27 51 16 – Public Address Systems.

.7 Section 28 10 00 – Access Control.

.8 Section 28 46 13 – Fire-Alarm Systems.

.4 When all testing has been completed and all mechanical and electrical systems are operational the contractor shall conduct system load balance measurements, infra-red test and harmonics tests.

3.10 COMMISSIONING MEETINGS AND REPORTING

.1 The Electrical Contractor shall include the schedule for all tests in the construction schedule.

.2 The Commissioning meetings shall occur during the regular construction meetings. The testing schedules and the results of all tests shall be reviewed.

.3 All testing forms and reports associated with the electrical systems shall be directed to the Electrical Consultant, with copies to the Consultant, Commissioning Consultant, and the Owner.

.4 The forms and reports to be issued shall include:

.1 Shop drawings, issued and accepted.

.2 Equipment verification forms.

.3 Testing forms.

.4 Reports resulting from tests.

.5 Testing schedule.

.6 Minutes of commissioning meetings.

.7 Manufacturers' Certificates.

3.11 OPERATING AND MAINTENANCE MANUAL

.1 Conform to the specification section for the requirements of the O&M manuals.

3.12 CLOSEOUT ACTIVITIES

.1 Conform to section for requirements for instructions to the Building Owner for each system and equipment.

.2 The training shall be provided by qualified technicians or electricians and shall be conducted in a classroom and at the equipment or system.

.3 The training sessions shall be scheduled, co-ordinated and video recorded by the Commissioning Consultant.

.4 Each training session shall be structured to cover:

.1 The operating and maintenance manual.

.2 Operating procedures.

.3 Maintenance procedures.

.4 Troubleshooting procedures.

.5 Spare parts.

.5 Submit a course outline to the Electrical Consultant before training commences. Provide course documentation for up to eight people.

.6 The training session shall be scheduled and co-ordinated by the Commissioning Consultant. Contractor shall video tape the sessions.

.7 Training shall be provided for the following systems:

.1 Electrical Systems including distribution and lighting: 8 hour minimum

.2 Section 27 51 16 – Public Address Systems: 1 hour minimum

.3 Section 28 10 00 – Access Control: 1 hour minimum

.4 Section 28 46 13 – Fire-Alarm Systems: 2 hours minimum

.8 The Electrical Contractor shall conduct a walkthrough of the installation. During the walkthrough the Electrical Contractor shall:

.1 Identify equipment.

.2 Identify electrical panels.

.3 Identify starters and disconnects.

.4 Review the electrical power distribution.

.5 Review the light power distribution.

.6 Review the switchgear.

.7 Review the general maintenance procedures.

3.13 THE ELECTRICAL SYSTEM DEMONSTRATION AND TURNOVER

.1 The system demonstration and turnover to The Owner shall occur when:

.1 The installation is complete.

.2 The acceptance test conducted by the Electrical Consultant has been completed successfully.

.3 Training has been completed.

.4 Equipment Operating and Maintenance Manuals have been accepted.

.5 System operating manuals have been accepted.

.6 Shop-drawings have been updated.

.7 As-built drawings have been completed.

.8 The commissioning process has been completed successfully and system operation accepted by the Electrical Consultant and Commissioning Consultant.

.2 The systems demonstration shall be conducted by the Electrical Contractor and manufacturers. The demonstration shall cover a physical demonstration of equipment installation and operation.

3.14 TESTING FORMS

.1 The Electrical Contractor and manufacturers shall fill out the forms listed in this section or provide other forms. The forms must be approved by the Electrical Consultant and the Owner before they are used.

END OF SECTION

Task	Contractor	Consultant	Commissioning
Manufacturer's Start-Up Checklist Completed			
Cooling System			
Inspect heat exchanger/radiator for leaks, damages and debris			
Check filter cap gasket and sealing surfaces			
Check ventilation louver operation			
Check coolant level, PH level, oil and rust contaminate			
Check hoses and connections for deterioration and tightness			
Check jacket water heater hoses for proper operation			
Check jacket water pump for leaks and unusual noises			
Check coolant conditioner concentration and temperature protection			
Check fan drive pulleys, belts and fan for proper lubrication, tension and wear, and clearance.			
Fuel System			
Verify natural gas isolation valve annunciates at control panel and/or fire alarm annunciator as specified on drawings			
Check fuel lines for leaks and tightness			
Check fuel line brackets for wear points			
Inspect governor oil level			
Check all governor control linkages for free movement			
Inspect primary and secondary fuel filters for leaks			
Air Induction and Exhaust System			
Inspect air filter restriction indicator for reading			
Inspect and clean air filter			
Inspect air filter housing and piping for leaks			
Inspect turbo chargers for oil/exhaust leaks			
Inspect exhaust manifolds for leaks, loose hardware and oil carry over.			
Inspect muffler and piping for leaks, loose hardware, rain cap and supports, drain muffler			
Inspect crankcase vent for restrictions or excessive blow by			
Lubrication System			
Check lube oil level and top up			
Check proper operation of oil pressure gauge			
Check hoses and piping for leaks			
Inspect unit for leaks			
Starting System			
Check starting batteries for electrolyte level and specific gravity.			
Clean and check batteries for loose/corroded connections			

Task	Contractor	Consultant	Commissioning
Load test batteries, measure voltage drop			
Inspect starter for loose connection and unusual noises			
Check battery charger output/float rate and equalize timer			
Inspect battery charger output'/float rate and equalize timer			
Inspect charging alternator belts, pulleys and voltage output.			
Engine Monitors and Safety Controls			
Check operation of LOP, HWT and over speed shutdown circuits			
Inspect and test all alarms for proper operation			
Inspect and perform functional test of natural gas valve alarms.			
Inspect wiring harness for weak and loose connections			
Check operation of engine mounted control panel and do an ATS Transfer Test if Allowed.			
Check oil pressure, water temperature, and alternator gauges for readings			
Control Panel			
Check for proper manual operation			
Operational check for correct voltmeter reading (adjust if necessary)			
Operational check for correction ammeter reading			
Operational check for correct frequency reading			
Inspect electrical connections			
Training and Demonstration			
Manufacturer's Performance Verification Checklist submitted to Cx Manager for final PV.			

END OF SECTION

Task	Contractor	Consultant	Commissioning
Manufacturer's Start-Up Checklist Completed			
ATS Visual Inspections			
ATS is correct voltage, ampacity			
Check terminations.			
Check for no voltage on Normal terminals with Normal source locked out and engine start disabled			
Check for no voltage on Emergency terminals with Emergency source locked out and engine start disabled			
Check ATS free from debris			
Check buswork and supporting hardware for carbon tracking, cracks, corrosion, or any other types of deterioration.			
Check stationary and movable contacts.			
Check system hardware for loose connections.			
Check all control wiring and power cables (especially wiring between or near hinged door) for signs of wear or deterioration.			
Check all control wiring and power cables for loose connections.			
Check cabinet interior for loose hardware.			
Check phase rotation.			
Tighten buswork, control wiring, power cables, and system hardware, as necessary.			

Task	Contractor	Consultant	Commissioning
ATS Operation			
Connect the set starting batteries. Connect the normal Bypass Operation			
Verify proper operation of the battery charger.			
Test system operation by enabling test function on transfer switch and verify transfer sequence and timers.			
Test system bypass isolation operation.			
Verify Bypass/Isolation interlocks			
Verify Bypass/Isolation indicator lights.			
Close and lock the cabinet door.			
Verify engine startup and transfer to generator on loss of normal source.			
Verify engine cooldown and shutdown after transfer back to normal power.			
Verify alarm contacts.			
Training and Demonstration			
Manufacturer's Performance Verification Checklist submitted to Cx Manager for final PV.			

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Common requirements for commissioning of all electric lighting, including interior, exterior, and emergency lighting.

.2 The party responsible for the functional testing shall not be directly involved in either the design or construction of the project.

1.2 RELATED REQUIREMENTS

.1 Section 26 09 23 – Lighting Control Devices.

.2 Section 26 51 19 – LED Interior Lighting.

.3 Section 26 52 13.13 – Emergency Lighting.

.4 Section 26 56 19 – LED Exterior Lighting.

1.3 REFERENCES

.1 ASHRAE

.1 ASHRAE Guideline 0-2005 – The Commissioning Process.

.2 ANSI/ASHRAE/IES 90.1-2013 – Energy Standard for Building Except Low-Rise Residential Buildings.

.2 Illumination Engineering Society (IES)

.1 IES DG-29-11 – Design Guide for the Commissioning Process Applied to Lighting and Control Systems.

.3 Ontario Building Code

.1 Supplementary Standard SB-10: Energy Efficiency Requirements, December 22, 2016 update.

1.4 ACTION SUBMITTALS

.1 Refer to Section 01 33 00.

.2 Submit sample commissioning forms.

1.5 CLOSEOUT SUBMITTALS

.1 Section 01 78 00: Submittals for project closeout.

.2 Submit commissioning reports.

.1 Submit a floor plan or spreadsheet table checklist that indicates each local lighting control device, occupancy sensors, daylighting controls, system component.

.2 Submit the system sequence of operation fully describing the equipment components and functionality, including set points and alarm functions.

.3 The detailed sequence of operation shall be provided regardless of the completeness and clarity of the sequences in the controls specification and/or drawings.

.3 The functional testing party shall provide documentation certifying that the installed lighting controls meet or exceed all documented performance criteria.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 SITE TESTS AND INSPECTIONS

.1 Sensor placement and orientation for all sensor types.

.2 Occupancy sensor function, sensitivity, and time delays.

.3 Daylight harvesting sensor calibration.

.4 Automated shade operation.

.5 Manual control placement and operation.

.6 Automated control operation, including scheduled on/off functions and dimming trims and presets.

.7 Override operation, access, and functionality.

.8 Centralized control interfaces and operation.

.9 Client education of operations.

.10 Documentation archived to client.

3.2 FUNCTIONAL TESTING

.1 Lighting control devices and control systems shall be tested to ensure that control hardware and software are calibrated, adjusted, programmed, and in proper working condition in accordance with the construction documents and manufacturer's installation instructions.

.2 When occupant sensors, time switches, programmable schedule controls, or photosensors are installed, at a minimum, the following procedures shall be performed:

.1 Confirm that the placement, sensitivity, and time-out adjustments for occupant sensors yield acceptable performance, lights turn off only after space is vacated and do not turn on unless space is occupied.

.2 Confirm that time switches and programmable schedule controls are programmed to turn the lights off.

.3 Confirm that photosensor controls reduce electric lights levels based on the amount of usable daylight in the space as specified.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Materials and installation for contactors for system voltages up to 600 V.

1.2 REFERENCES

.1 CSA Group:

.1 CSA C22.2 No. 14-18, Industrial Control Equipment.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Allen Bradley "500L" series

.2 Eaton.

.3 Schneider Electric.

.4 Siemens.

2.2 CONTACTORS

.1 Contactors: to CSA C22.2 No. 14.

.2 Electrically held controlled by pilot devices as indicated and rated for type of load controlled. Half size contactors not accepted.

.3 Contactors shall be electrically held 60 Hz, 120 V coil; NEMA Type 1 general purpose enclosure.

.4 Fused switch combination contactor as indicated.

.5 Complete with 2 normally open and 2 normally closed auxiliary contacts unless indicated otherwise.

.6 Mount in CSA Enclosure 1 unless otherwise indicated.

.7 Include following options in cover:

.1 Red indicating lamp.

.2 Hand-Off-Auto selector switch.

.8 Provided complete with control transformer, in contactor enclosure.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install contactors and connect auxiliary control devices.

3.2 EQUIPMENT IDENTIFICATION

.1 Provide equipment identification in accordance with Section 26 05 53.

.2 Size 4 nameplate indicating name of load controlled as indicated.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Occupancy and Vacancy sensors.

.2 Power packs, and auxiliary relays, momentary switches.

.3 Manual controls devices, including dimming switches and low voltage momentary switches.

.4 Timer switches.

.5 Daylight harvesting photo sensors.

.6 Emergency lighting control units.

1.2 PRODUCTS INSTALLED BUT NOT SUPPLIED UNDER THIS SECTION

.1 Line voltage manual control devices, as described in Section 26 27 26 – Wiring Devices.

.2 Multi-zone scene controllers, as described in Section 26 09 36 – Modular Dimming Controls.

1.3 RELATED REQUIREMENTS

.1 Section 26 08 50 – Commissioning of Lighting.

.2 Section 26 27 26 – Wiring Devices.

.3 Section 26 51 19 – LED Interior Lighting.

.4 Section 26 56 19 – LED Exterior Lighting.

.1 WD1 (R2005) –- General Color Requirements for Wiring Devices.

.2 WD6 – Dimensional Specifications.

.3 Ontario Building Code.

.4 UL 924 - Standard for Safety of Emergency Lighting and Power Equipment.

1.5 SUBMITTALS

.1 In accordance with Section 01 33 00.

.2 Product Data:

.1 Submit manufacturer's descriptive literature and product specifications for each product.

.2 Manufacturer's product drawings.

.3 Manufacturer's installation instructions.

.3 Where the lighting controls include the option for custom engraving, or custom touchscreen user interfaces on control devices, switches, or scene controllers, the Contractor is to submit proposed engraving/labelling/graphics as part of the shop drawing submittal, for review by the Owner.

1.6 CLOSEOUT SUBMITTALS

.1 Documentation of all lighting control system setpoints, sensor sensitivities, occupancy sensor timeouts, and as-programmed sequences of operation to aid in future troubleshooting.

.2 Lighting controls functional test report.

1.7 QUALITY ASSURANCE

.1 Manufacturer Qualifications: Products free of defects in material and workmanship.

1.8 WARRANTY

.1 Product is warranted free of defects in material and workmanship.

.2 Product is warranted to perform the intended function within design limits.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Wattstopper DLM.

.2 Acuity Brands Lighting (nLight, Sensorswitch).

.3 Cooper Lighting Solutions.

.4 Current Lighting (formerly Hubbell/GE).

.5 Lutron Vive.

2.2 GENERAL REQUIREMENTS OF ALL SENSORS AND POWER PACKS

.1 Manufactured by an ISO 9002 certified manufacturing facility and shall have a defect rate of less than 1/3 of 1 per cent.

.2 Five year warranty and CUL listed.

.3 In the event of failure, provide a bypass manual "override on" feature on each sensor.

.4 When bypass utilized, lighting to remain on constantly, or control is to be diverted to a wall switch until sensor is replaced. The override feature is to be designed for use by building maintenance personnel and not be readily achieved by building occupants.

2.3 OCCUPANCY AND VACANCY SENSORS

.1 General:

.1 Sensors using passive infrared, ultrasonic, microphonic, and multi-technology adaptive technology.

.2 Sensor timeouts configurable by system software.

.3 Electrical: Rating: 24 VDC input voltage, up to 40 mA current draw.

.4 Mechanical: Mounting: Sensors for mounting on ceilings and walls, including corners, must be available.

.5 Environmental:

.1 Operating Temperature Range: 0 degrees C to 40 degrees C

.2 Relative Humidity: 0 per cent to 95 per cent non-condensing.

.2 Dual Technology Wall Switch Sensor, 24V

.1 Wattstopper DW-100-24-W series (Basis of Design).

.2 Sensor capable of detecting presence in the control area by detecting Doppler shifts in transmitted ultrasound and passive infrared heat changes.

.3 Utilize a dual sensing verification principle for coordination between ultrasonic and Passive Infrared (PIR) Technologies to reduce likelihood of false triggering.

.4 For best results, sensor shall feature a trigger mode where the end-user can choose which technology will activate the sensor from Off mode (initial), the type of detection that will reset the time delay (maintain), and the type of detection that will cause the sensor to be turned back on immediately after the lights are turned off due to lack of motion (re-trigger). Selection of technologies for initial, maintain, and re-trigger shall be done with DIP switches.

.5 Sensor shall have its trigger mode factory preset to allow for quick installation in most applications. In this default setting, both technologies must occur in order to initially activate lighting systems. Detection by either technology shall maintain the lighting on, and detection by either technology shall turn lights back on after lights were turned off for 5 seconds or less in automatic mode, and 30 seconds or less in manual mode.

.6 Robotic test method, as referred in the NEMA WD 7 Guide, shall be utilized for minor motion coverage verification.

.7 Ultrasonic sensing shall be volumetric in coverage with a frequency of 40 kHz. It shall utilize Advanced Signal Processing which automatically adjusts the detection threshold dynamically to compensate for constantly changing levels of activity and air flow throughout controlled space.

.8 The PIR technology shall utilize a temperature compensated, dual element sensor and a multi-element Fresnel lens. The lens shall filter short wavelength IR, such as those emitted by the sun and other visible light sources. Face lens grooves in to avoid dust and residue build up which affects IR reception.

.9 Utilize zero crossing circuitry to reduce stress on relay, and therefore increase sensor life.

.10 Operate at 24 VDC and halfwave rectified and utilize a power pack or lighting control system input module to supply power.

.11 To blend in aesthetically, sensor protrusion not more than 3/8” from the wall and utilize colour-matched lens.

.12 To assure detection at desktop level uniformly across the space, sensor shall have a 28 segment, 2 level, Fresnel injection molded lens.

.13 Sensor shall feature a walk-through mode, where lights turn off 3 minutes after the area is initially occupied if no motion is detected after the first 30 seconds, set by DIP switch.

.14 To avoid false ON activations and to provide immunity to RFI and EMI, Detection Signature Analysis shall be used to examine the frequency, duration, and amplitude of a signal, to respond only to those signals caused by human motion.

.15 Coverage up to 1,000 sq. ft. for walking motion, with a field view of 180 degrees.

.16 Automatic-ON or manual-ON operation, adjustable with a DIP switch.

.17 Sensor shall have an adjustable time delay.

.18 Each sensing technology shall have an LED indicator that remains active at all times, in order to verify detection within the area to be controlled.

.19 Sensor shall have a service switch to allow end-users to operate the sensor in the unlikely event of a failure; set by a trim pot.

.20 Sensor shall have a built-in light level that features simple, one-step daylighting setup that works from 8 fc to 180 fc.

.21 The Dual Technology wall switch sensor shall be a completely self-contained control system that replaces a standard toggle switch

.3 Dual Technology Ceiling Mounted Sensor, 24V

.1 Wattstopper DT-300 series (Basis of Design).

.2 The Dual Technology sensor shall be capable of detecting presence in the control area by detecting doppler shifts in transmitted ultrasound and passive infrared heat changes.

.3 Sensor shall utilize Dual Sensing Verification Principle for coordination between ultrasonic or microphonic and Passive Infrared (PIR) Technologies. Detection verification of both technologies must occur in order to activate lighting systems. Upon verification, detection by either technology shall keep the lighting on.

.4 Sensor shall have a retrigger feature in which detection by either technology shall retrigger the lighting system on within 5 seconds of being switched off.

.5 Sensors shall be ceiling mounted with a flat, unobtrusive appearance, and provide 360 degree coverage.

.6 Ultrasonic sensing shall be volumetric in coverage, with a frequency of 40 kHz. It shall utilize Advanced Signal Processing that automatically adjusts the detection threshold dynamically to compensate for changing levels of activity and airflow throughout a controlled space.

.7 To avoid false ON activations, and to provide immunity to RFI and EMI, Detection Signature Analysis shall be used to examine the frequency, duration, and amplitude of a signal, in order to respond only to those signals caused by human motion.

.8 The PIR technology shall utilize a temperature compensated, dual element sensor and a multi-element Fresnel lens. The lens shall be Poly IR4 material to offer superior performance in the infrared wavelengths and filter short wavelength IR, such as those emitted by the sun and other visible light sources. The lens shall have grooves facing in to avoid dust and residue build up which affects IR reception.

.9 Sensors shall operate at 24 VDC, and halfwave rectified, and utilize a 24 V power pack.

.10 Sensors shall feature a walk-through mode, where lights turn off 3 minutes after the area is initially occupied if no motion is detected after the first 30 seconds.

.11 The sensor shall have a built-in light level sensor that works from 10 fc to 300 fc.

.12 The sensors shall feature terminal style wiring.

.13 Each sensing technology shall have an LED indicator that remains active at all times in order to verify detection within the area to be controlled. The LED can be disabled for applications that require less sensor visibility.

2.4 SPECIAL PURPOSE OCCUPANCY SENSORS

.1 Occupancy Sensors for High bay applications:

.1 For use in warehouses, distribution centres, and gymnasiums.

.2 Maximum 14 m (45 feet) mounting height.

.3 Surface-mount or end-mount model to suit application.

.4 180 degree and 360 degree coverage lenses available.

.5 Low-voltage, passive infrared (PIR) sensor.

.6 End-mount model to attach directly to industrial T5HO and T8 fixtures through an extended 13 mm (0.5 inch) chase nipple or junction box.

.7 Adjustable timeout for maximum energy savings.

.8 Basis of design: Lutron LUT-WSPSM24V-360-CPN6111 and similar.

2.5 POWER PACKS

.1 General:

.1 Self-contained transformer and relay module.

.2 Internal relay controlling up to 20A for 120, 230, 277VAC or 347VAC ballast loads and 120VAC incandescent loads.

.3 Provide a 24 VDC, 150 mA output.

.4 Capable of parallel wiring without regard to AC phases on primary.

.5 Power pack can be used as a standalone, low voltage switch, or can be wired to sensor for auto control.

.6 Construction: high impact, UL rated plastic case

.7 Power pack shall be UL/CUL Listed, FCC Certified, UL 2043 plenum rated and meets ASHRAE 90.1 requirements

.8 Shall at minimum meet the following environmental specifications:

.1 Operating Temperature Range: 0 degrees C to 40 degrees C

.2 Relative Humidity: 0 per cent to 95 per cent non-condensing

.2 Power Pack and Auxiliary Relay, 347 V

.1 Power Pack: Wattstopper B347D-P Series (Basis of Design)

.2 Auxiliary Relay: Wattstopper S347-E-P Series (Basis of Design)

.3 Power pack shall be a self-contained transformer and relay module measuring 45 mm by 70 mm by 38 mm (1.75 inch by 2.75 inch by 1.5 inch).

.4 For ease and speed of installation, power pack shall have 12 mm (1/2") snap-in nipple for 12 mm (1/2") knockouts and mounting on outside of enclosure.

.5 Power pack shall have dry contacts capable of switching 15 amp ballast @ 347 VAC, 60Hz.

.6 Power pack shall have primary voltage input of 347 VAC.

.7 Power pack shall provide a 24 VDC, 114 mA output, with the relay connected.

.8 Power pack shall be capable of parallel wiring without regard to AC phases on primary.

.9 Power pack can be used as a standalone, low voltage switch, or can be wired to sensor for auto control.

.10 Power pack shall have hold-ON and hold-OFF inputs for integration with lighting control panels, BMS and other building systems.

.11 Power pack shall have overcurrent protection if the low voltage current drawn exceeds 150 mA. In the event of an overcurrent, the low voltage output current shuts down and the LED will blink to indicate a fault condition.

.12 Power pack shall have an LED to indicate status of relay.

.13 Power pack shall utilize Zero Crossing Circuitry to protect from the effects of inrush current and increase product longevity.

2.6 DECORATOR LOW VOLTAGE MOMENTARY SWITCHES

.1 Wattstopper DCC2 series (Basis of Design).

.2 Switch intended for use with power packs and sensors requiring a momentary contact switch that provides on/off signals.

.3 12 VAC/VDC, 24 V Rectified, 24 VAC/VDC

.4 50 mA Max. Internal Contact rating

.5 500 mΩ resistance when closed

.6 Single pole, double throw with centre position rest.

2.7 DIMMING SWITCHES

.1 Direct control of dimming luminaires up to the luminaire manufacturer’s specified rating.

.2 Coordinate dimming signal configuration (2-wire phase cut, 3-wire, 4-wire 0-10V, or 4-wire DALI) with the fixture ballast or driver per Section 26 51 19, lighting fixture schedule, and related sections.

.3 Compatible with related lighting control devices i.e. occupancy sensors.

.4 Submit luminaire manufacturer’s dimmer compatibility documentation to demonstrate compatibility and limits of dimming level.

.5 Manufacturers:

.1 Lutron NovaT* style dimmers.

.2 Cooper

.3 Leviton.

.4 Approved Equal.

2.8 TIMER SWITCHES

.1 Digital time switch programmable to turn loads off after a preset time.

.2 Capable of operating as an ON/OFF switch.

.3 Five terminal, completely self-contained control system that replaces a standard toggle switch. Switching mechanism 30 V @ 1 A air gap relay.

.4 24 VAC when used in conjunction with power packs. For small rooms, or small localized loads, line voltage is permitted.

.5 No minimum load requirement.

.6 Time scroll feature permitting manual overriding of the preset time-out period. Selecting time scroll UP shall allow time-out period to scroll up throughout the timer possibilities to the maximum. Time scroll DN (down) shall allow time-out period to scroll down to minimum.

.7 Options available for user to enable:

.1 One second light flash warning at five minutes before the timer runs out and twice when the countdown reaches one minute (when used to control lighting loads).

.2 Beep warning sounding every five seconds once the time switch countdown reaches one minute.

.8 Manual timer reset where pressing the ON/OFF switch for more than 2 seconds resets the timer to the programmed time-out period.

.9 Liquid crystal display (LCD) that shows the timer's countdown.

.10 Incorporates two pulsed, open collector NPN transistor outputs for external latching relay coil drives or lighting control panel inputs.

.11 Fit behind a decorator style faceplate. Concealed calibration switch for setting time-out, time scroll, one second light flash, and beep warning to prevent tampering of adjustments and hardware.

.12 Time-out period adjustable in increments of 5 minutes from 5 minutes to 1 hour, and in increments of 15 minutes from 1 hour to 12 hours.

.13 Operate with power packs in order to control additional loads.

.14 Utilize terminal style wiring.

.15 For safety, in the event there is an open circuit in the low voltage line, automatically switch to OFF mode.

.16 Warranty: 5 year warranty.

.17 CUL listed.

.18 Wattstopper TS-400 and TS-400-24 series (Basis of Design).

2.9 EMERGENCY LIGHTING CONTROL UNIT FOR 120 VOLT CIRCUITS

.1 Description:

.1 Sequence of Operation: activate emergency lighting in the event of loss of normal utility power, regardless of control status of the luminaire.

.2 Provide all required functionality to allow any standard lighting control device to control emergency lighting in conjunction with normal lighting in any area within a building.

.2 Device shall be listed to UL 924 to meet the intent of Ontario Building Code for "fail-safe operation", and be approved for use in Canada.

.3 Example Manufacturers

.1 Functional Devices Inc. ESR01P series.

.2 Douglas Lighting Controls WR-RIB2401B-EL.

.3 Philips Bodine BLCD-20B.

.4 Schneider Electric SLSERC1277.

.5 Wattstopper ELCU-200 series.

.6 Approved Equal.

.4 Mounting: Able to fit in a standard junction box knockout.

.5 Features:

.1 Senses local single circuit power failure.

.2 LED indication for emergency and normal power.

.3 Provides absolute fail-to-on emergency lighting.

.4 Emergency lights are controlled with normal lighting.

.5 Sequence of Operation: automatically switch emergency lighting on and off as normal lighting is switched. When normal power is not available, force and hold emergency lighting on regardless of the state of any external control device until normal power is restored.

.6 Specifications:

.1 120 VAC; 60 Hz.

.2 Maximum Ballast Load: 10A @ 120 VAC.

.3 Housing: Fire rated V-0, 80 degrees C.

.4 Zero crossing circuitry to protect relay contacts from damaging effects of inrush current generated by switching electronic ballast loads.

.5 UL94 V-O plenum rated with compression wire terminals.

.6 UL, cUL listed Emergency Lighting and Equipment; five year warranty.

2.10 DAYLIGHT HARVESTING PHOTO SENSORS

.1 General:

.1 Class 2, low voltage.

.2 Ambient light sensor designed to interface directly with the analog input of the Lighting Control System.

.3 Supply an analog signal to the Lighting Control System proportional to the light measured.

.4 Sensor output shall provide for zero or offset based signal.

.5 Capable of a fully adjustable response in the range between 0 and 10,000 foot candles with a +/- 1 per cent accuracy at 21 degrees C.

.6 Input: 10 VDC.

.7 Output: 0 VDC to 10 VDC.

.8 Flame retardant housing and meet UL 94 HB standards.

.9 Operating temperature: -10 degrees C to 60 degrees C.

.2 Interior sensors: Fresnel lens, with a 60 degree cone of response. Range between 0 fc and 750 fc.

.3 Exterior sensors: Complete with hood over the aperture to shield the sensor from direct sunlight. Outdoor sensor circuitry completely encased in an optically clear epoxy resin. Sensor range between 0 fc and 750 fc.

.4 Atrium sensors: Translucent dome with a 180 degree field of view. Range from 2 fc to 2,500 fc.

.5 Skylight sensors: Translucent dome with a 180 degree field of view. Range between 10 fc and 7,500 fc.

2.11 SEQUENCES OF OPERATION

.1 To Section 26 06 50.19.

.2 Vacancy Sensor Operation: Manual On, Auto Off.

.3 In accordance with ASHRAE 90.1-2013.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 In accordance with manufacturer’s instructions.

.2 Minimum 14 AWG from the circuit control hardware relays.

.3 It shall be the contractor's responsibility to locate and aim sensors in the correct location required for complete and proper volumetric coverage within the range of coverage(s) of controlled areas per the manufacturer's recommendations. Rooms shall have 90 per cent to 100 per cent coverage to completely cover the controlled area to accommodate all occupancy habits of single or multiple occupants at any location within the room(s). The locations and quantities of sensors shown on the drawings are diagrammatic and indicate only the rooms which are to be provided with sensors. The contractor shall provide additional sensors if required to properly and completely cover the respective room.

.4 It is the contractor’s responsibility to arrange a pre-installation meeting with manufacturer's factory authorized representative, at Owner's facility, to verify placement of sensors and installation criteria.

.5 Proper judgement must be exercised in executing the installation so as to ensure the best possible installation in the available space and to overcome local difficulties due to space limitations or interference of structural components.

.6 Install manual control devices and sensors in accordance with manufacturer’s instructions for Vacancy Operation.

3.2 SYSTEM STARTUP

.1 The lighting controls manufacturer’s representative shall conduct system startup and submit startup report.

3.3 SITE TESTS AND INSPECTIONS

.1 The lighting controls manufacturer’s representative and Contractor shall conduct functional testing and provide report as described in ASHRAE 90.1-2013:

.1 Lighting control devices and control systems shall be tested to ensure that control hardware and software are calibrated, adjusted, programmed, and in proper working condition in accordance with the construction documents and manufacturer’s installation instructions.

.2 When occupant sensors, time switches, programmable schedule controls, or photosensors are installed, at a minimum, the following procedures shall be performed:

.1 Occupant Sensors

.1 Certify that the sensor has been located and aimed in accordance with manufacturer recommendations.

.2 For projects with up to seven (7) occupancy sensors, all occupancy sensors shall be tested.

.3 For projects with more than seven (7) occupancy sensors, testing shall be done for each unique combination of sensor type and space geometry.

.4 For each sensor to be tested, verify the following:

.1 Status indicator (as applicable) operates correctly.

.2 Controlled lights turn off or dim down to the specified level within the required time (20 minutes, or as noted), as applicable to the space type.

.3 For auto-on occupant sensors (occupancy mode), the lights turn on to the permitted level when someone enters the space.

.4 For manual-on sensors (vacancy mode), the lights turn on only when manually activated.

.5 The lights are not incorrectly turned on by movement in nearby areas or by HVAC operation.

.2 Automatic Time Switches

.1 Confirm that the automatic time switch control is programmed with appropriate weekday, weekend, and holiday (as applicable) schedules.

.2 Document for the owner automatic time switch programming, including weekday, weekend, and holiday schedules, as well as all setup and preference program settings.

.3 Verify that correct time and date are properly set in the time switch.

.4 Verify that any battery backup (as applicable) is installed and energized.

.5 Verify that the override time limit is set to no more than two (2) hours.

.6 Simulate occupied condition. Verify and document the following:

.1 All lights can be turned on and off by their respective area control switch.

.2 The switch only operates lighting in the enclosed space in which the switch is located.

.7 Simulate unoccupied condition. Verify and document the following:

.1 All non-exempt lighting turns off.

.2 Manual override switch allows only the lights in the enclosed space where the override switch is located to turn on or remain on until the next scheduled shut off occurs.

.3 Daylight Controls

.1 All control devices (photocontrols) have been properly located, field-calibrated, and set for appropriate set points and threshold light levels.

.2 Daylight controlled lighting loads adjust to appropriate light levels in response to available daylight.

.3 The location where calibration adjustments are made is readily accessible only to authorized personnel.

.3 The individual(s) responsible for the functional testing shall not be directly involved in either the design or construction of the project and shall provide documentation certifying that the installed lighting controls meet or exceed all documented performance criteria.

.2 Test lighting controls with fire alarm system in accordance with Section 28 08 46 and Section 28 46 51.

.3 Commissioning:

.1 Upon completion of the installation, the system shall be completely commissioned to verify all adjustments and sensor placement to ensure a trouble-free lighting control system.

.2 Submit commissioning report to the Consultant and the commissioning authority for review.

.3 Provide the Consultant and Commissioning Authority with ten working days written notice of the scheduled commissioning date.

3.4 TRAINING

.1 Provide training session of minimum 4 hours duration in accordance with Section 01 79 00.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Materials and components for dry type transformers up to 600 V primary, equipment identification and transformer installation.

1.2 REFERENCES

.1 ANSI/ASHRAE/IES Standard 90.1-2013 – Energy Standard for Buildings Except Low-Rise Residential Buildings.

.2 CSA Group:

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CSA C22.2 No. 47-13 (R2018), Air-cooled transformers (dry type).

.4 CSA C9-17, Dry-type transformers.

.5 CSA C802.2-18, Minimum Efficiency Values for Dry-Type Transformers.

.3 IEEE C57.110-2018, IEEE Recommended Practice for Establishing Liquid-Immersed and Dry-Type Power and Distribution Transformer Capability When Supplying Nonsinusoidal Load Currents: this standard defines how K-factor is calculated.

.4 National Electrical Manufacturers Association (NEMA):

.1 NEMA ST-20-2014, Dry-Type Transformers for General Applications: sound levels.

.5 NETA ATS - Acceptance Testing Specifications for Electrical Power Distribution Equipment (published by the International Electrical Testing Association).

.6 Ontario Building Code and its referenced standards.

.7 UL 1561, Standard for Dry-Type General Purpose and Power Transformers.

1.3 ACTION SUBMITTALS

.1 Product Data: Provide outline and support point dimensions of enclosures and accessories, unit weight, voltage, power, and impedance ratings and characteristics, tap configurations, insulation system type, and rated temperature rise.

1.4 INFORMATIONAL SUBMITTALS

.1 Test Reports: Indicate loss data, efficiency at 25, 50, 75, and 100 per cent rated load, and sound level.

.2 Submit manufacturer's installation instructions.

.1 Indicate application conditions and limitations of use stipulated by Product testing agency specified under Regulatory Requirements.

.2 Include instructions for storage, handling, protection, examination, preparation, and installation of product.

1.5 CLOSEOUT SUBMITTALS

.1 Record actual locations of transformers in project record documents.

.2 Document test results from NETA ATS.

.3 Copies of completed factory reports and testing reports.

1.6 DELIVERY, STORAGE, AND HANDLING

.1 Store and handle in strict compliance with manufacturer's instructions and recommendations. Protect from potential damage from weather and construction operations.

.2 Store so condensation will not form on or in the transformer housing and if necessary, apply temporary heat where required to obtain suitable service conditions. Store in a clean, dry space. Maintain factory wrapping or provide an additional heavy canvas or heavy plastic cover to protect units from dirt, water, construction debris, and traffic.

.3 Handle to manufacturer's written instructions. Lift only with lugs provided for the purpose. Handle carefully to avoid damage to transformer internal components, enclosure, and finish.

.4 Handle transformer using proper equipment for lifting and handling, use when necessary lifting eye, and/or brackets provided for that purpose.

1.7 WARRANTY

.1 The transformer shall carry a 1 year warranty from the time of substantial performance.

PART 2 - PRODUCTS

2.1 GENERAL

.1 Transformers shall be standard general purpose dry type unless otherwise indicated on drawings as K-Rated or Harmonic Mitigation type.

.2 Use transformers of one manufacturer throughout project and in accordance with CSA C22.2 No. 47 and CSA C9.

2.2 MANUFACTURERS

.1 Manufacturer List:

.1 Bemag.

.2 Delta Transformer.

.3 Eaton.

.4 Hammond.

.5 Powersmiths.

.6 Rex Power Magnetics.

.7 Siemens.

.8 Schneider Electric.

.9 STI.

.2 Substitutions: permitted if approved by the Consultant prior to Tender closing date.

2.3 REGULATORY REQUIREMENTS

.1 Products: Listed and classified by CSA (Canadian Standards Association).

.2 Efficiency ratings:

.1 Meet or exceed the efficiency levels indicated in CSA C802.2-12, and ASHRAE 90.1-2013, Table 8.4.4.

2.4 GENERAL PURPOSE TRANSFORMERS

.1 NEMA ST-20, factory-assembled, air cooled low-inrush dry type transformer, ratings and voltages as indicated on drawings.

.2 Single or three phase as indicated on drawings.

.3 Type: AN/AA ventilated self-cooled.

.4 Copper or Aluminum windings.

.5 Finish: Final coating to be ANSI 61 Grey Epoxy Powder.

.6 T-connected transformers are not acceptable.

.7 Isolate core and coil from enclosure using vibration-absorbing mounts.

.8 Impedance: standard (3% to 5% nominal for up to 75 kVA, 4% to 6% for transformers 112.5 kVA and greater).

2.5 K-FACTOR RATED TRANSFORMERS

.1 Provide where indicated on drawings.

.2 K-Factor Rating: Transformers shall be K-Factor 7, 13, or higher rated and comply with UL 1561 requirements for non-sinusoidal load current-handling capability to the degree defined by designated K-factor.

.1 Unit shall not overheat when carrying full-load current with harmonic distortion corresponding to designated K-factor.

.2 Indicate value of K-factor on transformer nameplate.

2.6 PRIMARY VOLTAGE

.1 600 V delta, 3 phase;

2.7 SECONDARY VOLTAGE

.1 120/208 V, 3 phase wye.

2.8 INSULATION SYSTEM AND AVERAGE WINDING TEMPERATURE RISE

.1 1-15 kVA: Class 185 with 150°C rise.

.2 16-500 kVA: Class 220 with 150°C rise.

.3 Above 500 kVA: Class 220 with 150°C rise.

2.9 CASE TEMPERATURE

.1 Limits in accordance with CSA C22.2 No. 47.

2.10 WINDING TAPS

.1 To NEMA ST-20.

.2 Four full capacity 5 per cent adjustment taps, 2 at 2.5 per cent FCBN (full capacity below nominal) and 2 at 2.5 per cent FCAN (full capacity above nominal).

2.11 BASIC IMPULSE LEVEL

.1 10 kV BIL.

2.12 GROUNDING

.1 Ground core and coil assembly to enclosure by means of a visible flexible copper grounding strap.

2.13 MOUNTING

.1 1-15 kVA: suitable for wall mounting.

.2 16-75 kVA: suitable for wall, or floor, as shown.

.3 Larger than 75 kVA: suitable for floor mounting.

2.14 COIL CONDUCTORS

.1 Continuous windings with terminations brazed or welded.

2.15 ENCLOSURE

.1 NEMA ST-20, CSA type 2 ventilated, sprinkler-proof. Provide lifting eyes or brackets.

.2 CSA type 3R for outdoor locations.

2.16 CATCHER/DRIP BASE PLATE

.1 Constructed from galvanized steel sheet metal having the minimum thickness as that of the transformer's enclosure.

.2 To be provided for all transformers that are wall mounted, or suspended off the floor.

2.17 SOUND LEVELS

.1 To NEMA ST-20 for transformers up to 300 kVA:

.1 Up to 9 kVA: 40 dB.

.2 10 – 50 kVA: 45 dB.

.3 51 – 150 kVA: 50 dB.

.4 151 – 300 kVA: 55 dB.

.2 Sound levels 3 dB less than NEMA ST-20 for transformers 301 kVA and greater:

.1 301 – 500 kVA: 57 dB.

.2 501 – 700 kVA: 59 dB.

.3 701 – 1000 kVA: 61 dB.

.4 Above 1000 kVA: 3 dB less than NEMA ST-20.

2.18 NAMEPLATE

.1 Transformer shall have embossed aluminum or stainless steel nameplate indicating, but not restricted to the following:

.1 kVA rating.

.2 Voltage rating.

.3 Impedance.

.4 Type.

.5 Insulation class.

.6 Temperature rise.

.7 Connection diagram.

.8 Serial number.

2.19 EQUIPMENT IDENTIFICATION

.1 Provide equipment identification in accordance with Section 26 05 53.

2.20 SOURCE QUALITY CONTROL

.1 Production test each unit according to NEMA ST-20.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Mounting:

.1 Mount dry type transformers up to 75 kVA, on floor, wall, or suspended from celling, as indicated on plans.

.2 Maintain clear space as described in 2021 OESC Rule 2-312.

.3 Mount dry type transformers rated above 75 kVA on floor.

.4 For wall mounted transformers, provide rubber-in-shear isolation mounts above bracket-supported rails secured from the wall.

.5 For ceiling mounted transformers, provide trapeze hangers and provide rubber-in-shear isolation mounts.

.6 Where a transformer is wall mounted or suspended off the floor, provide a metal catcher/drip base plate, and bolt to the bottom of the transformer below the base channel to conform to CSA C22.2 No. 47. Install in accordance with transformer manufacturer’s instructions and recommendations.

.7 Mount floor mounted transformers on concrete housekeeping pads, minimum 100 mm (4”) thick, and extending a minimum of 150 mm (6”) beyond the footprint of the transformer.

.8 Mount vibration isolating pads suitable for isolating the transformer noise from the building structure in accordance with Section 26 05 48.13.

.2 Set transformer plumb and level.

.3 Use flexible conduit, under the provisions of Section 26 05 33.13, 600 mm minimum length, for connections to transformer case. Make conduit connections to side panel of enclosure.

.4 Provide grounding and bonding to Section 26 05 26.

.5 Ensure adequate clearance around transformer for ventilation.

.6 Install transformers in level upright position.

.7 Remove shipping supports only after transformer is installed and just before putting into service.

.8 Loosen isolation pad bolts until no compression is visible.

.9 Make primary and secondary connections in accordance with wiring diagram.

.10 Energize transformers after installation is complete.

3.2 FIELD QUALITY CONTROL

.1 Section 01 43 00: Field Inspection, Testing, Adjusting.

.2 Perform inspections and tests listed in NETA ATS, Section 7.2.

3.3 ADJUSTING

.1 Measure primary and secondary voltages and make appropriate tap adjustments.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Power distribution panelboards – Circuit breaker type.

.2 Lighting and appliance branch circuit panelboards.

1.2 RELATED REQUIREMENTS

.1 Section 26 28 16.02 – Molded Case Circuit Breakers.

.2 Section 26 43 13 – Surge Protective Devices for Low-Voltage Electrical Power Circuits: externally mounted surge protective devices.

.3 NETA ATS – Acceptance Testing Specifications for Electrical Power Distribution Equipment (published by the International Electrical Testing Association).

1.4 SUBMITTALS

.1 Submit in accordance with Section 01 33 00.

.2 Work of this Section is to be submitted for review after Consultant's review of Coordination Study per Section 26 05 73.16 is completed.

.3 Shop drawings shall contain overall panelboard dimensions, interior mounting dimensions, and wiring gutter dimensions. The location of the main, branches, and solid neutral shall be clearly shown. In addition, the drawing shall illustrate one line diagrams with applicable voltage systems.

.4 Shop drawings:

.1 Indicate the following:

.1 Outline and support point dimensions.

.2 Voltage.

.3 Main bus ampacity.

.4 Integrated short circuit ampere rating.

.5 Circuit breaker arrangement, types, and sizes.

.2 The following information shall be submitted to the Consultant:

.1 Breaker layout drawing with dimensions indicated and nameplate designation.

.2 Component list.

.3 Conduit entry/exit locations.

.4 Assembly ratings including:

.1 Short-circuit rating.

.2 Voltage.

.3 Continuous current.

.5 Cable terminal sizes.

.6 Product data sheets.

.3 Where applicable, the following additional information shall be submitted to the Consultant:

.1 Key interlock scheme drawing and sequence of operations.

.5 Submittals for Construction

.1 The following information shall be submitted for record purposes:

.1 Installation information.

1.5 CLOSEOUT SUBMITTALS

.1 Refer to Section 01 78 00.

.2 Record actual locations of panelboards and record actual circuiting arrangements in project record documents.

.3 Maintenance Data: Include spare parts listing; source and current prices of replacement parts and supplies; and recommended maintenance procedures and intervals.

.4 Final as-built drawings and information shall incorporate all changes made during the manufacturing and installation process.

.5 Include a copy of each panelboard schedule in the Operation and Maintenance manual.

1.6 MAINTENANCE MATERIAL SUBMITTALS

.1 Manufacturer shall provide installation instructions and NEMA Standards Publication PB 1.1 – Instructions for Safe Installation, Operation and Maintenance of Panelboards Rated 600 volts or Less.

.2 Equipment operation and maintenance manuals shall be provided with each assembly shipped and shall include instruction leaflets, instruction bulletins and renewal parts lists where applicable, for the complete assembly and each major component.

.3 Provide two of each panelboard key.

.4 Provide final panelboard schedules indicating panelboard data, phasing, breaker sizes, and loads served.

1.7 QUALITY ASSURANCE

.1 Regulatory Requirements

.1 Products: Listed and classified by CSA (Canadian Standards Association).

.2 Qualifications

.1 Company specializing in manufacturing of panelboard products with a minimum of 20 years' experience.

.2 The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.

.3 For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

.4 The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five (5) years. When requested by the Consultant, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

1.8 DELIVERY, STORAGE, AND HANDLING

.1 Inspect and report concealed damage to carrier within their required time period.

.2 Handle carefully to avoid damage to panelboard internal components, enclosure, and finish.

.3 Store in a clean, dry environment. Maintain factory packaging and, if required, provide an additional heavy canvas or heavy plastic cover to protect enclosure(s) from dirt, water, construction debris, and traffic.

.4 Equipment shall be handled and stored in accordance with manufacturer's instructions. One copy of these instructions shall be included with the equipment at time of shipment.

1.9 WARRANTY

.1 Warrant specified equipment to be free from defects in materials and workmanship for eighteen (18) months from the date of purchase.

PART 2 - PRODUCTS

2.1 GENERAL

.1 Description: CSA C22.2 No. 29, circuit breaker type.

2.2 DISTRIBUTION PANELBOARDS – CIRCUIT BREAKER TYPE

.1 Manufacturers:

.1 Square D by Schneider Electric, I-LINE Series.

.2 Eaton Cutler-Hammer, PRL 3 and PRL4 Series.

.3 Equal by Siemens.

.2 The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if pre-approved by the Consultant ten days prior to bid date.

.3 Panelboard Bus:

.1 Copper, ratings as indicated.

.2 Provide copper neutral bus for panelboards indicated for 4-wire systems.

.3 Provide copper ground bus in each panelboard.

.4 Short Circuit Ratings:

.1 Panelboards rated 600 V shall have minimum integrated short-circuit ratings as shown on the drawings or as herein scheduled, but not less than 65 000 amperes RMS symmetrical.

.2 Distribution panelboards with bolt-on devices contained therein shall have interrupting ratings as specified herein or indicated on the drawings.

.3 Panelboards shall be fully rated.

.4 Where indicated, provide circuit breakers ULC listed for application at 100 per cent of their continuous ampere rating in their intended enclosure.

.5 Minimum integrated short circuit rating: Panelboards rated 240 V shall have minimum integrated short-circuit ratings as shown on the drawings or as herein scheduled, but not less than 10 000 amperes RMS symmetrical.

.6 Molded Case Circuit Breakers: To Section 26 28 16.02.

.7 Circuit Breaker Accessories: Trip units and auxiliary switches as indicated.

.8 Cabinet Front: Surface type, fastened hinge and latch, metal directory frame, finished in manufacturer's standard gray enamel.

.9 Enclosures: CSA type 2 sprinklerproof complete with drip hood, or as noted.

.10 Trims shall be equipped with a flush lock.

.11 Breaker positions labeled as “Spare” or “Space” shall constitute no less than 20 per cent of available breaker positions, whether indicated or not in panelboard schedules.

.12 Each panel shall be complete with a directory which shall be mounted inside door in a metal frame with clear plastic cover and copy in each Data Book. Use final Room Numbers for directories.

2.3 BRANCH CIRCUIT PANELBOARDS

.1 Manufacturers:

.1 Square D by Schneider Electric, NQ or NQOD Series.

.2 Eaton Cutler-Hammer, POW-R-LINE 1, POW-R-LINE 2, POW-R-LINE 3 Series.

.3 Equal by Siemens.

.2 Description: CSA C22.2 No.29, circuit breaker type, lighting and appliance branch circuit panelboard.

.3 Panelboard Bus:

.1 Copper, ratings as indicated.

.2 Provide copper neutral bus in each panelboard.

.3 Provide copper ground bus in each panelboard.

.4 Provide insulated ground bus where scheduled.

.4 Minimum Integrated Short Circuit Rating: 10 000 amperes RMS symmetrical for 240 V panelboards, or as indicated.

.5 Molded Case Circuit Breakers: NEMA AB 1, plug-on type thermal magnetic trip circuit breakers, with common trip handle for all poles, listed as Type SWD for lighting circuits, Type HACR for air conditioning equipment circuits, Class A ground fault interrupter circuit breakers where scheduled. Do not use tandem circuit breakers.

.6 Current Limiting Molded Case Circuit Breakers where indicated: NEMA AB 1, circuit breakers with integral thermal and instantaneous magnetic trip in each pole, coordinated with automatically resetting current limiting elements in each pole. Interrupting rating 100,000 symmetrical amperes, let-through current and energy level less than permitted for same size Class RK-5 fuse.

.7 Cabinet Front: Surface cabinet front with concealed trim clamps, concealed hinge, metal directory frame, and flush lock all keyed alike. Finish in manufacturer's standard gray enamel.

.8 Enclosure shall be CSA type 2 sprinklerproof complete with drip hood, or as noted.

.9 Trims shall be equipped with a flush lock.

.10 Breaker positions labeled as “Spare” or “Space” shall constitute no less than 20 per cent of available breaker positions, whether indicated or not in panelboard schedules.

.11 Panelboards: to CSA C22.2 No.29 and product of one manufacturer.

.1 Install circuit breakers in panelboards before shipment.

.2 In addition to CSA requirements manufacturer's nameplate must show fault current that panel including breakers has been built to withstand.

.12 Panelboards rated 240 VAC or less shall have short-circuit ratings as shown on the drawings or as herein scheduled, but not less than 10,000 amperes RMS symmetrical.

.13 Bus and breakers rated for symmetrical interrupting capacity, as indicated.

.14 Sequence phase bussing with odd numbered breakers on left and even on right, with each breaker identified by permanent number identification as to circuit number and phase.

.15 Panelboards: mains, number of circuits, and number and size of branch circuit breakers as indicated.

.16 Two keys for each panelboard and key panelboards alike.

.17 Copper bus with neutral of same ampere rating as mains.

.18 Mains: suitable for bolt-on breakers.

.19 Trim with concealed front bolts and hinges.

.20 Trim and door finish: baked grey enamel.

.21 The minimum short-circuit rating for branch circuit panelboards shall be as specified herein or as indicated on the drawings. Panelboards shall be fully rated.

.22 Bolt-on type, heavy-duty, quick-make, quick-break, single- and multi-pole circuit breakers of the types specified herein, shall be provided for each circuit with toggle handles that indicate when unit has tripped.

.23 Circuit breakers shall be thermal-magnetic type with common type handle for all multiple pole circuit breakers. Circuit breakers shall be minimum 100 A frame and through 100 A trip sizes shall take up the same pole spacing. Circuit breakers shall be ULC listed as type SWD for lighting circuits.

.1 Circuit breaker handle locks shall be provided for all circuits that supply exit signs, emergency lights, energy management, and control system (EMCS) panels and fire alarm panels.

.24 Circuit breakers shall have a minimum interrupting rating of 10 000 A symmetrical at 240 V, and 14 000 amperes symmetrical at 480 V, unless otherwise noted on the drawings.

.25 Each panel shall be complete with a directory which shall be mounted inside door in a metal frame with clear plastic cover and copy in each Data Book. Use final Room Numbers for directories.

.26 Panels shall be dead front type in code gauge steel enclosures. All panels shall be sprinkler proof c/w drip hoods as required.

.27 Panels shall have mains of voltage and capacity, and main and branch breakers, as shown on the drawings. Spaces shall include necessary bus work such that Owners, at a later date, need buy only the breakers.

.28 Where branch circuit metering is used on a panelboard, provide 762 mm (30”) tub width to accommodate the metering devices within the panelboard.

.29 Where panels exceed 84 circuits, use multi-section panel with main cross-over solid bus bars unless noted otherwise on drawings. Main bus capacity of each section shall be full size to match cross-over bus.

.30 Breakers shall have bolted type connections. Multi-pole breakers shall be common trip type with a single handle, suitable for voltage applied and of same manufacture as single pole breakers.

.31 Panels for 120/208 V, 3-phase, 4-wire systems shall be complete with full size breakers.

.32 Where shown on drawings or required by code, certain breakers shall include ground fault interrupter.

.33 Provide lighting and receptacle panels suitable for surface, or flush-mounting type, as shown.

.34 Provide locking bars on non-switched circuits where panels are used for switching lighting circuits.

.35 Panels for non-linear loads shall be complete with lugs for double neutrals.

.36 Panels shall be given a rust-resistant treatment to both tub and trim.

.37 Flush panels shall have concealed hinges and flush type combination lock latch. Locks shall be chrome plated. Doors shall open minimum 135 degrees. Trims shall have fasteners concealed and shall be prime coated to receive room finish paint.

.38 Surface mounted panels shall have manufacturer's standard surface door trim complete with lock and latch. Finish shall be grey.

.39 Recessed panels shall have standard flush trims.

.40 Co-ordinate panel finish with Room Finish Schedule.

2.4 MOLDED CASE CIRCUIT BREAKERS

.1 Breakers: to Section 26 28 16.02.

.2 Breakers with thermal and magnetic tripping in panelboards except as indicated otherwise.

.3 Main breaker: separately mounted on top or bottom of panel to suit cable entry. When mounted vertically, down position should open breaker.

.4 Lock-on devices for 10 per cent of 15 A to 30 A breakers installed as indicated. Turn over unused lock-on devices to Owner.

.5 Lock-on devices for fire alarm, security, and sprinkler circuits.

.6 Provide shunt trips, bell alarms, and auxiliary switches as shown on the contract drawings.

.7 Provide breakers for externally mounted Surge Protective Devices in accordance with Section 26 43 13.

2.5 CONSTRUCTION

.1 General:

.1 Interiors shall be completely factory assembled. They shall be designed such that switching and protective devices can be replaced without disturbing adjacent units and without removing the main bus connectors.

.2 Surface trims shall be same height and width as box. Flush trims shall overlap the box by 3/4 of an inch on all sides.

.3 A temporary directory card with a clear plastic cover shall be supplied and mounted on the inside of each door.

.4 All locks shall be keyed alike.

.2 Branch Circuit Panelboards:

.1 Trims for branch circuit panelboards shall be supplied with a hinged door over all circuit breaker handles. Doors in panelboard trims shall not uncover any live parts. Doors shall have a semi flush cylinder lock and catch assembly. Door-in-door trim shall be provided. Both hinged trim and trim door shall utilize three point latching. No tools shall be required to install or remove trim. Trim shall be equipped with a door-actuated trim locking tab. Equip locking tab with provision for a screw such that removal of trim requires a tool, at the owner's option. Installation shall be tamper resistant with no exposed hardware on the panelboard trim.

.3 Distribution Panelboards:

.1 Distribution panelboard trims shall cover all live parts. Switching device handles shall be accessible.

2.6 BUS

.1 Lugs: Copper and listed by CSA, or cUL, for use with copper conductors and sized to accept copper conductors of the ampacity specified.

.2 Main bus bars shall be copper sized in accordance with CSA standards to limit temperature rise on any current carrying part to a maximum of 65°C above an ambient of 40°C maximum.

.3 A copper system ground bus shall be included in all panelboards.

.4 Full-size (100 per cent rated) insulated copper neutral bars shall be included for panelboards shown with neutral. Bus bar taps for panels with single-pole branches shall be arranged for sequence phasing of the branch circuit devices. Neutral busing shall have a suitable lug for each outgoing feeder requiring a neutral connection. 200 per cent rated neutrals shall be supplied for panels designated on drawings with oversized neutral conductors.

2.7 EQUIPMENT IDENTIFICATION

.1 Provide equipment identification in accordance with Section 26 05 53.

.2 Nameplate for each panelboard size 4 engraved.

.3 Nameplate for each branch circuit in distribution panelboards size 2 engraved.

.4 Complete circuit directory with typewritten legend showing location and load of each circuit.

.5 Provide an engraved nameplate for each panelboard section.

.6 Provide copies of all circuit directories in manuals.

2.8 SOURCE QUALITY CONTROL

.1 The following standard factory tests shall be performed on the equipment provided under this section. All tests shall be in accordance with the latest version of NEMA and CSA standards.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install panelboards to CSA C22.1.

.2 Install panelboards plumb.

.3 Height: 1800 mm to top of panelboard; install panelboards taller than 1800 mm with bottom no more than 100 mm above floor.

.4 Provide filler plates for unused spaces in panelboards.

.5 Provide typed circuit directory for each branch circuit panelboard. Revise directory to reflect circuiting changes required to balance phase loads.

.6 Provide engraved plastic nameplates under the provisions of Section 26 05 53.

.7 Ground and bond panelboard enclosure according to Section 26 05 26.

.8 Locate panelboards as indicated and mount securely, plumb, true, and square, to adjoining surfaces.

.9 Install surface mounted panelboards on fire rated plywood backboards in accordance with Section 26 05 29. Where practical, group panelboards on common backboard.

.10 Connect loads to circuits.

.11 Connect neutral conductors to common neutral bus with respective neutral identified.

.12 Deliver five (5) duplicate keys for each panel lock to the Owner.

.13 Mount electrical panels, where possible, with top of trim at uniform height of 2000 mm.

.14 Cap ends of conduits in accessible locations in ceiling spaces above panels, to allow for future wiring.

.15 The Contractors shall install all equipment per the manufacturer’s recommendations and the contract drawings.

.16 Install panelboards in accordance with manufacturer's written instructions, NEMA PB 1.1 and Electrical Code requirements.

.17 After completion of wiring, type directory showing a clear description of each circuit being controlled from panel and place in metal frame inside door.

.18 Provide circuit breaker handle locks for all circuits that supply exit signs, emergency lights, energy management, and control system (EMCS) panels and fire alarm panels.

3.2 FIELD QUALITY CONTROL

.1 Perform inspections and tests listed in NETA ATS, Section 7.4 for switches, Section 7.5 for circuit breakers.

.2 Inspect complete installation for physical damage, proper alignment, anchorage, and grounding.

.3 Measure steady state load currents at each panelboard feeder; rearrange circuits in the panelboard to balance the phase loads within 20 per cent of each other. Maintain proper phasing for multi-wire branch circuits.

.4 Check tightness of bolted connections and circuit breaker connections using calibrated torque wrench or torque screwdriver per manufacturer's written specifications.

3.3 ADJUSTING

.1 Measure steady state load currents at each panelboard feeder; rearrange circuits in the panelboard to balance the phase loads to within 20 percent of each other.

.2 Maintain proper phasing for multi-wire branch circuits.

END OF SECTION

Added through ADD#10

PART 1 - GENERAL

1.1 REFERENCES

.1 ANSI/IEEE C12.20 – American National Standard for Electricity Meters

.2 NEMA C12.1 – Electric Meters; Code for Electricity Metering.

.3 IEEE C57.13 – Standard Requirements for Instrument Transformers

.4 Ontario Electrical Safety Code c/w Bulletins and Amendments.

.5 Ontario Building Code and its referenced standards.

.6 Underwriters Laboratories UL 1283 and UL 1449 (most recent edition).

.7 Canadian Standards (cUL or cETL).

1.2 SCOPE

.1 Install and commission a power monitoring, analysis and control system that employs computer technologies to provide a robust, reliable, and secure data network.

.2 The system shall be complete with web-enabled Power Monitoring and Control (PMAC) software package intended to monitor the entire data centre electrical distribution infrastructure.

.3 The system shall be designed to monitor and manage energy consumption throughout an enterprise, to improve energy availability and reliability, and manage and measure energy efficiency.

1.3 SUBMITTALS

.1 Shop Drawings:

.1 Sufficient information, clearly presented, shall be included to determine compliance with drawings and specifications.

.2 Include devices, locations, connections, conduit runs, wiring type, details, and attachments to other work.

.2 Product Data: Provide dimensions, ratings, and performance data.

.3 Submit manuals, simultaneously with the shop drawings, companion copies of complete maintenance and operating manuals including technical data sheets, wiring diagrams, and information for ordering replacement parts.

.1 Wiring diagrams shall have their terminals identified to facilitate installation, maintenance, and operation.

.2 Wiring diagrams shall indicate internal wiring for each item of equipment and the interconnection between the items of equipment.

.3 Provide a clear and concise description of operation, which gives, in detail, the information required to properly operate the equipment.

.4 Approvals will be based on complete submissions of manuals together with shop drawings.

1.4 CLOSEOUT SUBMITTALS

.1 Submit manufacturer's operation and maintenance instructions for each product.

.2 Software installation CD’s, etc.

.3 Manuals:

.1 The manuals submitted for review shall be updated to include any information necessitated by shop drawing approval.

.2 Complete “As Installed” wiring and schematic diagrams shall be included which show all items of equipment and their interconnecting wiring.

.3 Show all terminal identification.

.4 Include information for testing, repair, troubleshooting, assembly, disassembly, and recommended maintenance intervals.

.5 Provide a replacement part list with current prices. Include a list of recommended spare spares, tools, and instruments for testing and maintenance purposes.

.4 Certification by the contractor that assemblies have been properly installed, adjusted, and tested.

.5 Certified copies of all factor design and production tests, and field test data sheets and reports for the assemblies.

1.5 SUMMARY

.1 The specifications in this section describe the performance, furnishing, installation and connection of a digital electric metering system installed on electrical equipment such as low voltage switchboards, distribution panels and/or low voltage branch circuit panelboards of the power system. The specified system shall provide effective revenue quality metering of the loads indicated on the single line diagram. The system shall be accessible either at the meter(s) located in the data centre, or remotely by computer.

1.6 ENVIRONMENTAL REQUIREMENTS

.1 The operating temperature range shall be -40°C to 70°C (-40°F to 160°F).

1.7 QUALITY ASSURANCE AND WARRANTY

.1 The meter and supporting components shall be guaranteed by the manufacturer to be free of defects in material and workmanship for a period of three (3) years from the date of substantial completion of service and activation of the system to which the meter(s) are attached.

.2 Warranty service may be performed by the manufacturer or authorized representative.

.3 The contractor shall support the system for two years after commissioning.

1.8 MANUFACTURER QUALIFICATIONS

.1 The meter shall be manufactured by a manufacturer that has been regularly engaged in the design, manufacturing and testing of digital meters of the types and ratings required for a period of not less than five years. Manufacturers requesting product approval must meet or exceed the written specification contained herein. Manufacturers requesting approval must receive written verification of product acceptance by the specifying engineer 10 days prior to the bid date.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 The Digital Power Instrumentation Package shall be a complete system from one of the following:

.1 The Digital Power Instrumentation Package shall be a 7330 ION series as Manufactured by Power Measurement Limited.

.1 Model P7330R0B0B0E0A0A or approved equal.

.2 The PMAC Software shall be ION Enterprise V6.0 or latest version with a 10 device license as manufactured by Power Measurement Ltd.

.2 Eaton.

.3 Intellimeter

.4 Siemens.

.5 Electro Industries/GaugeTech.

2.2 REGULATORY REQUIREMENTS

.1 Products: Listed and classified by CSA (Canadian Standards Association), ULC (Underwriters' Laboratories of Canada), or CUL.

2.3 INSTRUMENT TRANSFORMERS

.1 General

.1 Mount and brace transformers to withstand 100,000 A short circuit current.

.2 Install in feasible location near upstream overcurrent device.

.3 Meters shall be revenue grade.

.2 Current Transformers (CTs)

.1 ANSI C57.13; 5 A secondary, with primary/secondary ratio as shown on drawings, to suit size of associated upstream overcurrent devices.

.2 All Current Transformers shall be split-core type with 80 mA secondary unless noted otherwise.

.1 Provide donut or square type to suit cable or bus, respectively.

.3 CTs shall be Measurement Canada type approved or have a minimum accuracy of 0.3%.

.4 One CT is required for each phase being metered.

.3 Potential Transformers (PTs).

.1 ANSI C57.13, 120 V secondary.

.2 Burden and accuracy consistent with connected metering and relay devices, 60 Hz.

.3 Potential transformers are required for metering an all electrical systems above 120/208 V.

.4 Potential transformers on 347/600 V systems shall be rated 347-120 V, connected phase-to-neutral, and installed on each phase.

.5 PTs shall be wired line-neutral for Wye systems and line-line for delta systems.

.6 CTs shall be Measurement Canada type approved or have a minimum accuracy of 0.3%.

.7 Meter shall not be powered from the PT secondary.

.8 Voltage inputs shall be fed from a dedicated 15 A breaker in distribution panel where practical.

.9 Supply and install appropriate 1 A fuses.

2.4 DIGITAL POWER INSTRUMENTATION PACKAGE

.1 The Digital Power Instrumentation Package shall be a true RMS, bi-directional, four quadrant meter capable of measuring, calculating and directly displaying on the front panel display the following information in user programmable groups.

.1 Voltage.

.2 Current.

.3 kW.

.4 kVAR.

.5 kVA Power Factor.

.6 Harmonics.

.7 Demand.

.8 minimums and maximums for each phase.

.9 minimum and maximum totals for all phases.

.10 KWh, kVARh, kVAh totals for all phases.

.11 Voltage and current unbalance.

.12 Frequency.

.13 k-factor.

.14 Harmonic distortion for each voltage and current input, up to the 15th harmonic.

.2 The Digital Power Instrumentation Package shall:

.1 Perform continuous true RMS measurement based on 32 samples-per-cycle sampling on all voltage and current signals. Readings shall be updated once per second.

.2 Retain all setup data in non-volatile memory (NVRAM).

.3 The PMAC Instrument shall include 512 kB of non-volatile memory with two fully programmable 16-channel data recorders.

.4 The PMAC instrument shall support multiport communications that provides two ports for RS-485 communications. Interface via ION, DNP3.0, Modbus TCP, and Modbus RTU protocols, through serial or Ethernet communications.

.5 Include 10BaseT Ethernet communications port and Ethergate networking capabilities.

.6 Have an on-board WebMeter.

.7 The PMAC Instrument shall provide setpoint control to four digital output relays.

.8 Meet the following standards:

.1 Measurement Canada Revenue approved.

.2 Certified to CAN/CSA-C22.2 No.1010-1.

.3 All inputs pass ANSI/IEEE C37.90-1989 surge withstand and fast transient tests.

.4 Manufactured under ISO 9002 Quality Assurance Standard.

.3 The Digital Power Instrumentation Package shall:

.1 Require no PTs on voltage inputs Wye (Star) for 120/208/240 V systems. PTs can be used on higher voltage systems.

.2 Must meet all ISO 9001 standards for quality control where all meters test to a minimum of +/-0.5% accuracy.

.3 The current transformers shall have a full scale output of 330 mV (split core), 80 mA (solid core donut) or 5 A (solid core or split-core donut) outputs for safety purposes.

.4 Meters to be complete with a Liquid Crystal Display (LCD) to access all energy measurements and phase diagnostics when needed.

.5 Meter to have backup storage power so no data is lost during power outages. Device must be capable of holding 2 years of interval data for a 20 year period. The system shall continue to function after resumption of power.

.6 Failure of the building electrical normal power system shall not result in loss of data and will not require manual restarting of the metering system.

2.5 METER ENCLOSURES

.1 The digital meters shall be installed in pre-wired, NEMA 12, CSA approved enclosures.

.1 Multiple meters shall be installed in the same enclosure.

.2 Meters supplied from two different switchboards or different sources cannot be installed in the same enclosure.

.3 Meters shall be wired according to manufacturer's recommended method.

.4 Each meter shall be labeled.

2.6 COMMUNICATIONS AND NETWORKING COMPONENTS

.1 RS485 communications for all meters shall be terminated in the enclosure according to manufacturer's recommended practice.

.2 To enable the meters to communicate to the central monitoring software, a Lantronix UDS10 or equivalent RS485 to Ethernet serial server shall be provided in each enclosure.

.3 Routers or other required networking components shall be provided according to Owner's standard.

.4 The electrical contractor shall be responsible for providing all metering communication wiring between the meters and shall provide a single Ethernet communication point from the meters(s) to the data centre infrastructure patch panel. All Ethernet wiring shall be minimum Category 6A CMP rated. Ethernet wiring shall be installed in EMT conduit.

.5 Coordinate with Division 27.

2.7 POWER MEASUREMENT AND CONTROL (PMAC), MONITORING AND REPORTING SOFTWARE

.1 Supply and install all software to be installed on one server as directed by the Owner.

.2 The metering system shall interface with a computing server component: Windows 7 operating system, 1 RU or 2 RU server, rack mountable form factor.

.3 Hardware shall meet the Software manufacturer's recommended requirements.

.4 Install and commission a power monitoring, analysis and control system that employs the latest computer technologies to provide a robust, reliable, and secure data network.

.5 The PMAC Enterprise software shall have the following functionality:

.1 Server Workstations shall be used for connection to PMAC instruments located at monitoring as recommended by the manufacturer.

.1 Workstations shall have minimum hardware features as recommended by the manufacturer.

.2 The Communications Server shall support communication between software components and IEDs with an arbitrary number of IEDs, multiple concurrent serial and Ethernet communications links.

.3 Require no proprietary network communication hardware.

.4 Support automatic alarm call-back for any IED equipped with this capability.

.5 Support any combination of the following communication protocols directly to IEDs: ION; Modbus RTU; Modbus TCP; Serial or TCP/IP.

.2 Data Storage and Data Sharing

.1 The PMAC software shall support an arbitrary number of Windows-based Server Workstations, each running log acquisition software (Log Server) that provides the ability to:

.1 Autonomously retrieve, from any or all IEDs in the PMAC network, log records of the following type:

.1 Event log records containing device event information.

.2 Historical log records containing numerical and Boolean data.

.3 Historical log records containing waveform data.

.2 Dynamically manage database tables to reflect changes in the configuration of any IED's waveform log or data log, with no need to shutdown and restart any software.

.3 Report the occurrence of events to all user interface software components that are in use for event and alarm indication. To ensure fast event annunciation, all event information shall be made available to the user interface software and the database software concurrently.

.2 The PMAC software shall include a database management component that provides the ability to:

.1 Selectively remove a range of records from the database

.2 Archive database files on magnetic tape or other buyer-approved off-line storage media.

.3 Use the MS SQL Server database software as the database engine. If the license is less than 10 nodes the MSDE database that is included with the

software can be used. If there are more than 10 nodes communicating with the PMAC, then MS SQL Server DB license must be included.

.3 Integrated Object Processing Software

.1 The PMAC software shall support an arbitrary number of Windows-based Server Workstations, each running an Integrated Object Processing software component.

.2 The Integrated Object Processing software can be used to autonomously collate information (objects) that has been acquired from multiple sources, using diverse protocols, and allows the information to be processed for user-defined analysis and logging purposes. The Integrated Object Processing software shall be ION-compliant.

.3 The software license shall be purchased to accommodate all nodes with communications to the software, plus an additional 10% nodes shall be included for future addition.

.4 User Interface

.1 The PMAC software shall support an arbitrary number of each of the following types of Graphical User Interface components:

.2 User Display software.

.3 Device Configuration software.

.4 Network Configuration software.

.5 WebReach Browser based viewer using IIS.

.6 The User Display component shall provide the graphical interface to power monitoring, analysis, and control functions through an arbitrary number of user diagrams.

.7 There shall be a summary screen of the electrical single line diagram showing all energy monitoring nodes in real-time on the same screen, with drill-down icons for more detailed real-time data on each node. If it is not practical to show all nodes on one screen, multiple screens can be developed.

.5 Reports.

.1 The PMAC software shall include a report generation tool written in Visual Basic Macros using MS Excel spreadsheets. The reports must allow for cost allocation, load aggregation and power quality.

.2 The number and type of reports and will be defined by the owner before commissioning.

.3 The software shall have the provision to include IMO real time pricing and shadow billing functionality that matches with the local utility billing structure to create accurate bills for comparison and verification. The future shadow billing package shall also support tenant billing or cost allocation based on the IMO real-time price structure and local utility rates.

2.8 LOCATIONS OF METERING DEVICES

.1 Locate as shown on Drawings and as recommended by Manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 All power supply and communications wiring connections shall be performed in accordance with the guidelines set out in the product documentation.

.2 The meters shall be mounted in the locations indicated.

.3 All unused openings shall be covered with a metal closure plate painted to match the existing enclosure.

.4 Any extension of wiring needed to accommodate the meters shall be done using terminal blocks and 10 AWG stranded copper wire, 600 V type SIS insulation. Splices are not allowed.

.5 Dangerous voltage will develop in the open circuit secondary windings of energized current transformers. De-energize the current transformers by short circuiting the secondary windings before disconnecting or connecting instruments to current transformers.

.6 Verify the proper operation of all meters. Compare the meter display readings to measurements taken with a clamp on amp-meter and handheld volt meter.

.7 This contractor shall provide all communication trunk wiring to provide for a single connection point to the data centre LAN.

.8 All communications networking equipment, including hubs, routers, etc. required to enable a single connection to the owner's IT infrastructure shall be provided by this contractor. Provide local circuit from UPS source.

.9 Communications networking shall be tested and proved to be working before acceptance.

.10 All voltage sending connections to PMAC instrumentation shall be made with 2 A fuses.

.11 Appropriately sized current transformers must be installed on each phase and must be installed with CT shorting blocks.

.12 Meters must be powered from an auxiliary power supply, and not powered from the PTs.

.13 The installation must be in accordance with the Ontario Electrical Safety Code.

.14 The contractor is responsible for ensuring pulse inputs are wired properly to the meter.

3.2 COMMISSIONING AND CONSTRUCTION VERIFICATION

.1 Contractor is responsible for utilizing construction verification checklists supplied under commissioning section.

3.3 SOFTWARE CONFIGURATION

.1 Contractor shall ensure the software is properly configured and communicating to all meters and related devices specified and as noted on the drawings.

.2 Provide system configuration documentation that can be used for an emergency recovery.

3.4 TRAINING

.1 The contractor shall conduct a training course for meter configuration, operation, and maintenance of the system as specified. The training shall be oriented for all components and systems installed under this contract. The training shall include:

.1 Physical layout of each piece of hardware.

.2 Meter configuration, troubleshooting and diagnostic procedures.

.3 Repair instructions.

.4 Preventative maintenance procedures and schedules.

.5 Testing and calibration procedures.

.6 Use of metering software.

.2 Contractor shall include hands-on training with a factory trained representative or local integrator to ensure the end user is comfortable with the software. Schedule training during normal business hours.

.2 Product Data: Provide manufacturer's catalogue information showing dimensions, colours, and configurations.

1.5 QUALITY ASSURANCE

.1 Manufacturer Qualifications: Products shall be free of defects in material and workmanship.

.2 Furnished products shall be listed or classified by third party agencies as suitable for the intended purpose.

1.6 WARRANTY

.1 Product is warranted free of defects in material and workmanship.

.2 Product is warranted to perform the intended function within design limits.

PART 2 - PRODUCTS

2.1 GENERAL

.1 NEMA 12/4X screw cover enclosures.

.2 NEMA 12/4X hidden hinge cover enclosures.

.3 NEMA 12/4X external hinge cover enclosures.

2.2 MANUFACTURERS

.1 Bel Products.

.2 EXM Manufacturing.

.3 Hammond Manufacturing.

.4 Hoffman.

.5 Thomas & Betts.

.6 Ralston Metal.

2.3 REGULATORY REQUIREMENTS

.1 Provide products listed and classified by CSA (Canadian Standards Association).

2.4 DESIGN AND PERFORMANCE REQUIREMENTS

.1 NEMA 12/4X screw cover enclosures:

.1 Enclosure shall be UL listed in accordance with UL-50 and CSA or cUL certified to CSA C22.2 No. 94.2.

.2 Enclosure shall have CSA enclosure ratings type 1, 2, 3, 3S, 3X, 3SX, 4, 4X and 12.

.3 Body shall be manufactured from a high-impact, corrosion resistant solid engineering thermoplastic material; UV stabilized for outdoor use and complies with UL-94 minimum V-2 requirements.

.4 Cover shall be manufactured from either a high-impact, corrosion resistant solid engineering material, UV stabilized for outdoor use and comply with UL-94 minimum V-2 requirements, or a clear polycarbonate material, UV stabilized for outdoor use and comply with UL-94 minimum V-2 requirements.

.5 Body and cover shall maintain physical properties through overall temperature range of -35°C to 110°C (-31°F to 230°F).

.6 Body shall be an industrial grey colour, and lid shall be either industrial grey or clear.

.7 Cover and body shall be free of rough corners, sharp edges, or burrs.

.8 Cover screws (10-32) shall be captive with a slotted stainless steel (type 304) fillister head.

.9 Factory installed brass inserts shall be provided for cover (10-32), mounting flanges (1/4-20), and panel mounting (10-32) screws.

.10 Mounting flanges shall be removable and shall permit vertical or horizontal placement on the body.

.11 Back panel mounting means shall accept standard size back panels.

.12 Interior body corners shall have dovetail to permit panel to be mounted at any depth.

.13 Swing out panel mounts shall be utilized when a second panel is desired, or when access to the rear of the primary panel is desired.

.14 Hardware kit for adjustable panel mounting shall be available.

.15 Hardware kit for swing out panel mounting shall be available.

.16 Enclosure gasket shall be oil resistant continuous closed cell neoprene.

.17 Enclosure body shall have tapered edges to keep liquids away from cover opening.

.18 Back panel shall be available in either 14 gauge steel, painted white, or in 7 mm (1/4 in) PVC.

.19 Enclosure shall be available as factory assembly or as individual components.

.2 NEMA 12/4X hidden hinge cover enclosures:

.1 Enclosure shall be UL listed in accordance with UL-50 and CSA or cUL certified to CSA C22.2 No. 94.2.

.2 Enclosure shall have CSA enclosure ratings type 1, 2, 3, 3S, 3X, 3SX, 4, 4X, and 12.

.3 Body shall be manufactured from a high-impact, corrosion resistant solid engineering thermoplastic material; UV stabilized for outdoor use and comply with UL-94 minimum V-2 requirements.

.4 Cover shall be manufactured from either a high-impact, corrosion resistant solid engineering material, UV stabilized for outdoor use and comply with UL-94 minimum V-2 requirements, or a clear polycarbonate material, UV stabilized for outdoor use and comply with UL-94 minimum V-2 requirements.

.5 Body and cover shall maintain physical properties through overall temperature range of -35°C to 110°C (-31°F to 230°F).

.6 Body shall be an industrial grey colour, and lid shall be either industrial grey or clear.

.7 Cover and body shall be free of rough corners, sharp edges, or burrs.

.8 Cover shall be mounted to body with integral hidden non-metallic hinges that shall provide 145° opening.

.9 Cover shall be removable and interchangeable.

.10 Body shall have integral boss for mounting quick release latches.

.11 Quick release (lockable) latches shall be available in either non-metallic, or in type 304 stainless steel.

.12 Cover screws (10-32) shall be captive with a slotted stainless steel (type 304) fillister head.

.13 Factory installed brass inserts shall be provided for cover (10-32), mounting flanges (1/4-20), and panel mounting (10-32) screws.

.14 Mounting flanges shall be removable and shall permit vertical or horizontal placement on the body.

.15 Back panel mounting means shall accept standard size back panels.

.16 Interior body corners shall have dovetail to permit panel to be mounted at any depth.

.17 Swing out panel mounts shall be utilized when a second panel is desired, or when access to the rear of the primary panel is desired.

.18 Hardware kit for adjustable panel mounting shall be available.

.19 Hardware kit for swing out panel mounting shall be available.

.20 Enclosure gasket shall be oil resistant continuous closed cell neoprene.

.21 Enclosure body shall have tapered edges to keep liquids away from cover opening.

.22 Back panel shall be available in either 14 gauge steel, painted white, or in 7 mm (1/4 in) PVC.

.23 Enclosure shall be available as factory assembly or as individual components.

.3 NEMA 12/4X external hinge cover enclosures:

.1 Enclosure shall be UL listed in accordance with UL 50 and CSA or cUL certified to CSA C22.2 No. 94.2.

.2 Enclosure shall have CSA enclosure ratings type 1, 2, 3, 3S, 3X, 3SX, 4, 4X, and 12.

.3 Body shall be manufactured from a high-impact, corrosion resistant solid engineering thermoplastic material, UV stabilized for outdoor use and comply with UL-94 minimum V-2 requirements.

.4 Cover shall be manufactured from either a high-impact, corrosion resistant solid engineering material, UV stabilized for outdoor use and comply with UL-94 minimum V-2 requirements, or a clear polycarbonate material, UV stabilized for outdoor use and comply with UL-94 minimum V-2 requirements.

.5 Body and cover shall maintain physical properties through overall temperature range of -35°C to 110°C (-31°F to 230°F).

.6 Body shall be an industrial grey colour, and lid shall be either industrial grey or clear.

.7 Cover and body shall be free of rough corners, sharp edges, or burrs.

.8 Cover shall be mounted to body with integral external non-metallic hinges that shall provide 240° opening.

.9 Cover shall be removable and interchangeable.

.10 Body shall have integral boss for mounting quick release latches.

.11 Quick release (lockable) latches shall be available in either non-metallic, or in type 304 stainless steel.

.12 Cover screws (10-32) shall be captive with a slotted stainless steel (type 304) fillister head.

.13 Factory installed brass inserts shall be provided for cover (10-32), mounting flanges (1/4-20), and panel mounting (10-32) screws.

.14 Mounting flanges shall be removable and shall permit vertical or horizontal placement on the body.

.15 Back panel mounting means shall accept standard size back panels.

.16 Interior body corners shall have dovetail to permit panel to be mounted at any depth.

.17 Swing out panel mounts shall be utilized when a second panel is desired, or when access to the rear of the primary panel is desired.

.18 Hardware kit for adjustable panel mounting shall be available.

.19 Hardware kit for swing out panel mounting shall be available.

.20 Enclosure gasket shall be oil resistant continuous closed cell neoprene.

.21 Enclosure body shall have tapered edges to keep liquids away from cover opening.

.22 Back panel shall be available in either 14 gauge steel, painted white, or in 7 mm (1/4 in) PVC.

.23 Enclosure shall be available as factory assembly or as individual components.

2.5 SPLITTER TROUGHS

.1 CSA approved.

.2 NEMA 1, formed, factory primed and painted steel box enclosure with knockouts.

.3 Hinged front cover plate.

.4 Suitable mounting provisions.

.5 Nameplate giving its rating.

.6 Terminal blocks consist of pressure type main lugs and branch lugs approved for copper wiring and mounted on porcelain bases.

.7 Splitter trough ratings are scheduled on the drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install to CSA C22.1.

.2 Install devices plumb and level.

3.2 CLEANING

.1 Clean exposed surfaces to remove splatters and restore finish.

END OF SECTION

No Floor Boxes
SEE ADD#4,Q#97

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Switches, receptacles, wiring devices, cover plates, and their installation.

1.2 RELATED REQUIREMENTS

.1 Section 26 09 23 – Lighting Control Devices.

.2 Section 26 27 26.13 – Floor Box Assemblies.

1.3 REFERENCES

.1 CSA Group:

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CSA C22.2 No. 14-13, Industrial control equipment.

.4 CSA C22.2 No. 42-10 (R2015), General use receptacles, attachment plugs, and similar devices.

.5 CSA C22.2 No. 42.1-13, Cover plates for flush-mounted wiring devices.

.6 CSA C22.2 No. 55-15 (R2020), Special use switches.

.7 CSA C22.2 No.111-10 (R2015), General-use snap switches.

.8 CSA C22.2 No. 182.1-17, Plugs, receptacles, and cable connectors of the pin and sleeve type.

1.4 INFORMATIONAL SUBMITTALS

.1 Submit shop drawings and product data in accordance with Section 01 33 00.

.2 Product Data: Provide manufacturer's catalogue information showing dimensions, colours, and configurations.

.3 Submit manufacturer's installation instructions.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Eaton.

.2 Hubbell Bryant.

.3 Leviton.

.4 Molex.

.5 Pass & Seymour (Legrand).

2.2 WALL SWITCHES

.1 Single pole, double pole, three-way, four-way switches to: CSA C22.2 No. 55 and CSA C22.2 No.111.

.2 Description: CSA 22.2 No. 111, Commercial Spec Grade, AC only general-use snap switch.

.3 Local switches shall be 20 A, silent, brown coloured, AC type and CSA certified, specification grade. Provide switches rated to suit system voltage 120 V or 347 V.

.4 Manually-operated general purpose AC switches with following features:

.1 Terminal holes approved for 10 AWG wire.

.2 Silver alloy contacts.

.3 Urea or melamine moulding for parts subject to carbon tracking.

.4 Suitable for back and side wiring.

.5 Voltage: 120 V or 347 V, AC as indicated.

.6 Current: 20 A.

.7 Body and Handle: white plastic with toggle handle. Confirm finish colour prior to ordering.

.8 Toggle operated fully rated for tungsten filament and fluorescent lamps, and up to 80% of rated capacity of motor loads.

.9 Example Products (Decorator style):

.1 120 V:

.1 Hubbell HBL2121 series.

.2 347 V:

.1 Pass & Seymour 2601-347 series.

.10 Example Products (Toggle style):

.1 120 V:

.1 Hubbell HBL1221 (single pole).

.2 Hubbell HBL1222 (double pole).

.3 Hubbell HBL1223 (three-way).

.4 Hubbell HBL1224 (four-way).

.2 347 V:

.1 Hubbell HBL18221 (single pole).

.2 Hubbell HBL18223 (three-way).

.3 Pass & Seymour PS372030I.

.11 Local switches and receptacles shall be of the same manufacturer throughout except where a specified item is not made by that manufacturer.

2.3 RECEPTACLES

.1 General

.1 Description: CSA C22.2 No. 42, Commercial Spec Grade general use receptacles.

.2 Device Body: white plastic.

.3 Configuration: Type as specified and indicated.

.4 Convenience Receptacle: Type 5-15, 5-20 where indicated.

.5 GFCI Receptacle: Convenience receptacle with integral ground fault circuit interrupter to meet regulatory requirements.

.6 Data Room Receptacle Types: As indicated on drawings.

.7 Receptacles of one manufacturer throughout project.

.2 Receptacles shall be white coloured, specification grade, unless noted otherwise.

.3 Receptacles shall be as listed below:

.1 15 A, 120 V, single phase grounded duplex receptacle shall be NEMA-U- ground type CSA Configuration 5-15R.

.2 20 A, 120 V, single phase grounded duplex receptacle shall be NEMA-U-ground type CSA Configuration 5-20RA

.3 15 A, 120 V, weatherproof receptacles shall be equal to those above but complete with gasketed cast plate and hinged covers.

.4 Other types of receptacles shall be provided as shown on Drawings.

.5 Duplex receptacles, CSA type 5-15 R, 125 V, 15 A, U ground, to: CSA C22.2 No. 42 with following features:

.1 White urea moulded housing.

.2 Suitable for No. 10 AWG for back and side wiring.

.3 Break-off links for use as split receptacles.

.4 Eight back wired entrances, four side wiring screws.

.5 Triple wipe contacts and riveted grounding contacts.

.6 Single receptacles CSA type 5-15 R, 125 V, 15 A, U ground with following features:

.1 White urea moulded housing.

.2 Suitable for No. 10 AWG for back and side wiring.

.3 Four back wired entrances, 2 side wiring screws.

.7 Other receptacles with ampacity and voltage as indicated.

.8 Example Products (Decorator style duplex 5-15R):

.1 Pass & Seymour 26252 Series.

.2 Hubbell HBL2152 Series.

.9 Ground Fault Circuit Interrupter (GFCI or GFI) Receptacles

.1 Protected by a ground fault circuit interrupter of the Class A type.

.2 Any receptacle within 1.5 m (5 ft) of a sink must be GFCI protected.

.3 Any receptacle located outdoor must be GFCI protected.

.10 Isolated Ground (IG) Receptacles:

.1 Marked as such (green triangle).

.2 Example Products:

.1 Hubbell IG2152 (15 A duplex decorator style, orange faceplate).

.11 Tamper-resistant receptacles.

.1 Marked as such (for example “TR”).

.2 To be used in the following spaces:

.1 Child care facilities and kindergarten classrooms.

.2 Guest rooms and suites of hotels and motels.

.3 Preschools and elementary education facilities, including kindergarten facilities.

.4 Dwelling units.

.3 Example Products:

.1 Hubbell BR15WHITR (15 A duplex decorator style).

.2 Hubbell BR20WHITR (20 A duplex decorator style).

.12 USB Charger receptacles: duplex tamper resistant device.

.1 USB ports: one type A and one type C USB charging port, 5 A, 5 V.

.2 Example: Hubbell USB15AC5WWR.

2.4 COVER PLATES

.1 Cover plates for wiring devices to: CSA C22.2 No. 42.1.

.2 Cover plates from one manufacturer throughout project.

.3 Sheet steel utility box cover for wiring devices installed in surface-mounted utility boxes.

.4 Stainless steel, vertically brushed, cover plates, thickness 2.5 mm for wiring devices mounted in flush-mounted outlet box.

.5 Cast cover plates for wiring devices mounted in surface-mounted FS or FD type conduit boxes.

.6 Weatherproof double lift spring-loaded cast aluminum cover plates, complete with gaskets for duplex receptacles as indicated.

.7 Weatherproof spring-loaded cast aluminum cover plates complete with gaskets for single receptacles or switches.

.8 Decorative Cover Plate: Polycarbonate.

.1 Pass & Seymour TP26W series.

.9 Switch, receptacle, telephone, and other plates shall be stainless steel 18-8 chrome metal alloy, Type 302, non-metallic in finished areas and pressed steel in unfinished areas. Finish brush marks shall be run in a vertical direction.

.10 Wet Location and weatherproof devices: receptacles and cover plates shall be suitable for wet locations and provide shielding with and without a plug inserted into the receptacle in accordance with 2021 OESC rule 26-708.

2.5 PENDANT RECEPTACLES

.1 Pendant cord mounted single receptacles complete with strain relief device.

.2 Strain relief system: Hubbell Kellems Grips, Molex, or equal.

2.6 SPECIAL WIRING DEVICES

.1 Pilot lights as indicated, with neon type 0.04 W, 125 V lamp and red plastic jewel flush type.

2.7 PIN AND SLEEVE DEVICES

.1 Manufacturers:

.1 Crouse-Hinds by Eaton.

.2 Hubbell.

.3 Meltric.

.4 Mennekes.

.5 Russellstoll (Thomas & Betts).

.6 Walther Electric.

.2 Refer to equipment schedule and plans for locations and specific requirements.

2.8 HAZARDOUS (CLASSIFIED) LOCATION RECEPTACLES

.1 In accordance with CSA C22.2 No. 159-18, Plugs, connectors, receptacles, and similar wiring devices for use in hazardous locations.

.2 Manufacturers:

.1 Crouse-Hinds.

.2 Appleton Electric.

.3 Killark; Division of Hubbell Inc.

2.9 REGULATORY REQUIREMENTS

.1 Provide products listed and classified by CSA (Canadian Standards Association).

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Verify that outlet boxes are installed at proper height.

.2 Verify that wall openings are neatly cut and will be completely covered by wall plates.

.3 Verify that branch circuit wiring installation is completed, tested, and ready for connection to wiring devices.

3.2 PREPARATION

.1 Provide extension rings to bring outlet boxes flush with finished surface.

.2 Clean debris from outlet boxes.

3.3 INSTALLATION

.1 Install to CSA C22.1.

.2 Mounting heights in accordance with Section 26 05 00.

.3 Install devices plumb and level.

.4 Install switches with OFF position down.

.5 Install wall dimmers to achieve full rating specified and indicated after de-rating for ganging as instructed by manufacturer.

.6 Do not share neutral conductor on load side of dimmers.

.7 Install receptacles with grounding pole on bottom.

.8 Connect wiring device grounding terminal to outlet box with bonding jumper.

.9 Install decorative plates on switch, receptacle, and blank outlets in finished areas.

.10 Connect wiring devices by wrapping conductor around screw terminal.

.11 Use jumbo size plates for outlets installed in masonry walls.

.12 Install galvanized steel plates on outlet boxes and junction boxes in unfinished areas, above accessible ceilings, and on surface mounted outlets.

.13 Switches:

.1 Install single throw switches with handle in "UP" position when switch closed.

.2 Install switches in gang type outlet box when more than one switch is required in one location.

.14 Receptacles:

.1 Install receptacles in gang type outlet box when more than one receptacle is required in one location.

.2 Where split receptacle has one portion switched, mount vertically and switch upper portion.

.3 Connect receptacle grounding terminal to the outlet box with an insulated green ground strap.

.4 Receptacles for maintenance of HVAC and similar equipment located on rooftops.

.1 Provide weatherproof GFI 5-20R receptacles on roof, installed at 750 mm (30 in) above finished roof level, complete with wet location “while in use” “extra duty” cover plate.

.2 Locate within 7500 mm (25 ft) of new HVAC equipment, and at least 2000 mm (6.5 ft) away from roof line.

.3 Refer to 2021 OESC rules 2-316, 26-708, and 26-710, and OESC bulletin 26-27-0, or latest edition.

.15 Cover plates:

.1 Protect stainless steel cover plate finish with paper or plastic film until painting and other work is finished.

.2 Install suitable common cover plates where wiring devices are grouped.

.3 Do not use cover plates meant for flush outlet boxes on surface-mounted boxes.

.4 Do not install plates until final painting of room or area is completed. Remove protective covering.

.16 Circuit identification: in accordance with Section 26 05 53.

3.4 FIELD QUALITY CONTROL

.1 Inspect each wiring device for defects.

.2 Operate each wall switch with circuit energized and verify proper operation.

.3 Verify that each receptacle device is energized.

.4 Test each receptacle device for proper polarity.

.5 Test each GFCI receptacle device for proper operation.

3.5 ADJUSTING

.1 Adjust devices and wall plates to be flush and level.

3.6 CLEANING

.1 Clean exposed surfaces to remove splatters and restore finish.

END OF SECTION

PART 1 - GENERAL

1.1 REFERENCES

.1 CSA C22.2 No. 248 series.

1.2 SUBMITTALS

.1 Provide submittals in accordance with Section 01 33 00.

.2 Product Data:

.1 Provide fuse performance data characteristics for each fuse type and size above 200 amps. Performance data to include average melting time-current characteristics.

.3 Shop Drawings:

.1 Provide shop drawings in accordance with Section 01 33 00.

1.3 DELIVERY, STORAGE, AND HANDLING

.1 Ship fuses in original containers.

.2 Do not ship fuses installed in switchboard.

.3 Store fuses in original containers in storage cabinet.

.4 Waste Management and Disposal:

.1 Separate waste materials for reuse and recycling in accordance with Section 01 74 00.

1.4 MAINTENANCE MATERIAL SUBMITTALS

.1 Provide maintenance materials in accordance with Section 01 78 00.

.2 3 spare fuses of each type and size installed above 600 A.

.3 6 spare fuses of each type and size installed up to and including 600 A.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Bussman by Eaton.

.2 GEC.

.3 Littelfuse.

.4 Mersen.

.5 Substitutions: not permitted.

2.2 FUSES - GENERAL

.1 Fuse type references L1, L2, J1, R1, etc. have been adopted for use in this specification.

.2 Fuses: product of one manufacturer.

.3 Fuses shall be sized as shown, time delay type, and of the same type throughout.

.4 Fuses shall be CSA certified Class-J for 1-600 A or Class-L for 650 A and above.

.5 Provide the following accessories where indicated or where required to complete installation:

.1 Fuseholders: Compatible with indicated fuses.

.2 [Fuse Reducers: For adapting indicated fuses to permit installation in switch designed for uses with larger ampere ratings.]

2.3 FUSE TYPES

.1 Class J fuses.

.1 Type J1, time delay, capable of carrying 500 per cent of its rated current for 10 seconds minimum.

.2 Type J2, fast acting.

.2 Class L fuses.

.1 Type L1, time delay, capable of carrying 500 per cent of its rated current for 10 seconds minimum.

.2 Type L2, fast acting.

.3 Class R fuses.

.1 Type R1, (UL Class RK1), time delay, capable of carrying 500 per cent of its rated current for 10 seconds minimum, to meet UL Class RK1 maximum let-through limits.

.2 Type R2, time delay, capable of carrying 500 per cent of its rated current for 10 seconds minimum.

.3 Type R3, (UL Class RK1), fast acting Class R, to meet UL Class RK1 maximum let-through limits.

2.4 FUSE REQUIREMENTS

.1 Dimensions and Performance: CSA C22.2 No. 248 Series, Class as specified or indicated.

.2 Voltage: Provide fuses with voltage rating suitable for circuit phase-to-phase voltage.

.3 Power Load Feeder Switches: HRC-1 Class J time delay type.

.4 Other Feeder Switches: HRC-1 Class J time delay type.

2.5 SPARE FUSE CABINET

.1 Description: Wall-mounted sheet metal cabinet, suitably sized to store spare fuses and fuse pullers specified.

.2 Doors: Hinged, with hasp for Owner's padlock.

.3 Finish: Prime finish for field painting.

.4 Dimensions: Minimum 914 mm by 914 mm by 305 mm (3 ft by 3 ft by 1 ft).

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install fuses to manufacturer's instructions.

.2 Install fuse with label oriented such that manufacturer, type, and size are easily read.

.3 Install spare fuse cabinet in electrical room.

.4 Provide a complete set of fuses in each fusible device supplied under this Division and provide 3 spare fuses for each size used in spare fuse cabinet.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Molded-case circuit breakers.

.2 Molded-case switches.

.3 Accessories.

1.2 RELATED REQUIREMENTS

.1 Section 26 24 13 – Switchboards.

.2 Section 26 24 16 – Panelboards.

1.3 REFERENCES

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CSA C22.2 No. 5-16, Molded-Case Circuit Breakers, Molded-Case Switches and Circuit-Breaker Enclosures.

.4 NEMA AB1 - Molded Case Circuit Breakers, Molded Case Switches, and Circuit - Breaker Enclosures.

.5 NETA ATS - Acceptance Testing Specifications for Electrical Power Distribution Equipment (published by the International Electrical Testing Association).

1.4 SUBMITTALS

.1 Submit product data in accordance with Section 01 33 00.

.2 Include time-current characteristic curves for breakers with ampacity of 400 A and above, or with interrupting capacity of 22,000 A symmetrical (rms) and over at system voltage.

.3 Include termination temperature rating in degrees C.

.4 Certificate of Origin

.1 Prior to any installation of circuit breakers in either a new or existing installation, Contractor must submit three (3) copies of a certificate of origin from the manufacturer, duly signed by the factory and the local manufacturer's representative, certifying that all circuit breakers come from this manufacturer, they are new and they meet standards and regulations. These certificates must be submitted to the Consultant for review.

.2 A delay in the production of the certificate of origin won't justify any extension of the contract and additional compensation.

.3 Any work of manufacturing, assembly or installation should begin only after acceptance of the certificate of origin by the Consultant. Unless complying with this requirement, Consultant reserves the right to mandate the manufacturer listed on circuit breakers to authenticate all new circuit breakers under the contract, and that, to Contractor's expense.

.4 In general, the certificate of origin must contain:

.1 The name and address of the manufacturer, and the person responsible for authentication. The responsible person must sign and date the certificate;

.2 The name and address of the licensed dealer, and the person of the distributor responsible for the Contractor's account.

.3 The name and address of the Contractor, and the person responsible for the project.

.4 The name and address of the local manufacturer's representative. The local representative must sign and date the certificate.

.5 The name and address of the building where circuit breakers will be installed:

.1 Project title.

.2 End user's reference number.

.3 The list of circuit breakers.

PART 2 - PRODUCTS

2.1 GENERAL

.1 Molded-case circuit breakers, Circuit breakers, and Ground-fault circuit-interrupters, Fused circuit breakers, and Accessory high-fault protectors: to CSA C22.2 No. 5.

.2 Bolt-on Molded case circuit breaker: quick- make, quick-break type, for manual and automatic operation with temperature compensation for 40 degrees C ambient.

.3 Plug-in Molded case circuit breakers: quick-make, quick-break type, for manual and automatic operation with temperature compensation for 40 degrees C ambient.

.4 Common-trip breakers: with single handle for multi-pole applications.

.5 Magnetic instantaneous trip elements in circuit breakers to operate only when value of current reaches setting.

.1 Trip settings on breakers with adjustable trips to range from 3-8 times current rating.

.6 Circuit breakers with interchangeable trips.

2.2 INTERRUPTING CAPACITY

.1 Protective devices shall be fully rated, for required available fault current. Series rated shall not be used on this installation.

.2 Refer to Section 26 24 13, and Section 26 24 16.

2.3 MOLDED CASE CIRCUIT BREAKERS – GENERAL

.1 Molded case circuit breaker to operate automatically by means of thermal and magnetic tripping devices to provide inverse time current tripping and instantaneous tripping for short circuit protection.

.2 NEMA AB 1, circuit breakers with integral thermal and instantaneous magnetic trip in each pole.

.3 Provide circuit breakers UL listed as Type HACR for air conditioning equipment branch circuits.

.4 1-, 2-, or 3-pole bold on, single-handle common trip voltage as indicated on drawings.

.5 Overcentre toggle-type mechanism, quick-make, quick-break action. Trip indication is by handle position.

.6 Calibrate for operation in 40 degree C ambient temperature.

2.4 MOLDED CASE CIRCUIT BREAKERS – UP TO 150 AMPERE

.1 Permanent trip unit containing individual thermal and magnetic trip elements in each pole, unless noted otherwise on drawings.

2.5 MOLDED CASE CIRCUIT BREAKERS – 151 TO 224 AMPERE

.1 Variable magnetic trip elements. Provide push-to-trip button on cover of breaker for mechanical tripping.

2.6 MOLDED CASE CIRCUIT BREAKERS – 225 AMPERE AND ABOVE

.1 Electronic trip type with adjustments for long-time, instantaneous, and short-time functions.

.2 Provide ground fault function for breakers greater than 1000 Amps.

.3 1000 Amp and Above:

.1 Modbus Communications

.1 Breaker status.

.1 Open.

.2 Closed.

.3 Tripped.

.2 Cause of trip.

.3 Time of trip.

.4 Current at time of trip.

.5 RMS currents per phase and ground.

.6 Peak demand.

.7 Present demand.

.8 Energy consumption.

.4 1200 Amp and Above:

.1 Provide handle mechanisms that are lockable in the open (off) position.

2.7 ADDITIONAL FEATURES

.1 Provide as indicated on drawings:

.1 Shunt trip.

.2 Auxiliary switch.

.3 Motor-operated mechanism.

.4 Under-voltage release.

.5 On-off locking device.

.6 Handle mechanism.

2.8 MOLDED-CASE SWITCHES

.1 Molded-case circuit breaker with fixed, high-set instantaneous trip only, and short-circuit withstand rating equal to equivalent breaker frame size interrupting rating.

.2 Accessories:

.1 Lugs: Mechanical style suitable for number, size, trip ratings, and material of conductors.

.2 Application Listing: Type HACR for heating, air-conditioning, and refrigerating equipment.

2.9 ENCLOSED BREAKERS AND ENCLOSED MOLDED-CASE SWITCHES

.1 Molded case, front operated, automatic circuit breakers sized as specified on drawings each secured in a NEMA 1, flush wall mounting enclosure with steel front panel.

.2 Voltage rating suitable for circuit phase to phase voltage as indicated on drawings.

.3 Units to include solid state adjustable trip units and contactors. Contactors to be of rating and type to suit application.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install circuit breakers as per related sections.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Fusible and non-fusible enclosed low-voltage disconnect switches from 30 amps to 800 amps.

1.2 RELATED REQUIREMENTS

.1 Section 26 28 13 – Fuses.

1.3 REFERENCES

.1 CSA Group:

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CSA C22.2 No. 4-16, Enclosed and Dead-Front Switches.

.4 CSA C22.2 No. 248 series, Low-voltage fuses.

.2 NETA (International Electrical Testing Association) ATS - Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

1.4 SUBMITTALS

.1 Product Data: Provide switch ratings, and enclosure dimensions.

1.5 CLOSEOUT SUBMITTALS

.1 Record actual locations of enclosed switches in project record documents.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Eaton Cutler-Hammer.

.2 Siemens.

.3 Square D by Schneider Electric.

2.2 REGULATORY REQUIREMENTS

.1 Products: Listed and classified by CSA or testing firm acceptable to the authority having jurisdiction as suitable for the purpose specified and indicated.

2.3 DISCONNECT SWITCHES

.1 Provide dedicated disconnect switches at electrical equipment.

.2 Fused or un-fused disconnect or safety switches: Type "A", quick-make, quick-break construction with provision for padlocking switches in either "ON" or "OFF" position.

.1 Quick-make, quick-break.

.2 Heavy duty industrial type.

.3 Lockable with up to 3 padlocks.

.4 Cover interlocked with switch mechanism.

.5 Viewing window for viewing blades.

.3 Fused switches equipped with fuse clips designed for Class "J" fuses and designed to reject standard NEC fuses.

.4 Enclosure: CSA Type 1 sprinkler-proof, or as noted.

.5 Switches throughout project of same manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Provide fused or un-fused safety or disconnect switches as shown and as required by Code.

.2 Install disconnect switches complete with fuses, if applicable, to CSA C22.1.

.3 Apply neatly typed adhesive tag on inside door of each fusible switch indicating NEMA fuse class and size installed.

.4 Coordinate fuse ampere rating with installed equipment. Fuse ampere rating variance between original design information and installed equipment, size in accordance with Bussmann Fusetron 40 degree C recommendations. Do not provide fuses of lower ampere rating than motor starter thermal units.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Loose motor starters.

.2 The section number for the work of this Section is assigned in accordance with MasterFormat numbers and titles, and classification within this division does not assign responsibility to a specific trade.

1.2 RELATED REQUIREMENTS

.1 Section 20 05 00 – Common Work Results for Mechanical.

.2 Section 20 05 13 – Common Motor Requirements for Mechanical Equipment.

.3 Section 26 28 13 – Fuses.

.4 Section 26 29 23 – Variable-Frequency Motor Controllers.

1.3 REFERENCES

.1 CSA C22.2 No. 14-18, Industrial control equipment.

.2 CSA C22.2 No. 106:05 (R2019), HRC-Miscellaneous fuses.

1.4 QUALITY ASSURANCE

.1 Starters, and all components shall be designed, manufactured, and tested in accordance with the latest applicable standards of NEMA, ANSI, and CSA 22.2 No. 14.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 ABB.

.2 Allen-Bradley products from Rockwell Automation.

.3 Benshaw.

.4 Eaton.

.5 Siemens.

.6 Square D by Schneider Electric.

2.2 MOTOR STARTERS, GENERAL

.1 Enclosures for starters located in sprinklered areas shall be CSA type 2.

.2 All other loose starter enclosures shall be CSA type 1, unless otherwise noted.

2.3 MOTOR STARTERS, SINGLE PHASE

.1 Starters for single phase motors shall be manual type, combination switch with overload relay and pilot light.

2.4 MOTOR STARTERS, THREE PHASE

.1 Unless otherwise noted, starters for 3-phase motors shall be combination "quick-make" and "quick-break" fused disconnects and full voltage, non-reversing magnetic starters for across-the-line service. Full protection of each phase shall be included in the starters by means of one overload relay per phase per starter. Starters shall be equipped with "hand-off-automatic" switches and pilot light required as a minimum.

.2 Starters for three phase motors shall include the following:

.1 Three overload elements sized to suit the characteristics of the motor.

.2 Manual reset button.

.3 CSA type 1 enclosure.

.4 Auxiliary contacts as required to satisfy interlocking and automatic control requirements. Include one spare contact for future connection to a Central Computer System.

.5 120 V fused control transformer inside the starter enclosure where control wiring extends outside the starter enclosure.

.6 Hand-Off-Auto switch, and pilot light.

.7 Additional components as noted in documents.

2.5 REDUCED VOLTAGE STARTERS

.1 Provide reduced voltage starters on all motors 10 hp, and larger.

.2 Manufacturers:

.1 Benshaw.

2.6 FUSES FOR MOTOR PROTECTION

.1 Fuses in accordance with Section 26 28 13.

.2 Fuses shall be CSA certified HRCI-J, and energy limiting type 200,000 ampere interrupting capacity to CSA C22.2 No. 106, time delay type.

.3 Supply a list of motors, with their starting and operating characteristics, and the type of equipment associated with the motors, to the Fuse Manufacturer for verification of fuse sizes.

.4 Size fuses in accordance with fuse manufacturer's recommendations. Note that fan motors are to be sized for 15 second maximum start-up time as specified in Article "Electric Motors".

.5 Where fuses supplied cause unnecessary outages or do not provide adequate protection, retain the Fuse Manufacturer's representative to determine the cause. Replace such blown fuses at no cost to Owner.

.6 Provide one spare set of fuses for each rating and type of fuse used in this Contract, and hand over to Owner at completion of Work.

.7 Fuses shall be NEMA type "J" as manufactured by:

.1 Chase Shawmutt - Amp. Trap.

.2 English Electric Co. of Canada Ltd.

.3 Appleton Electric Co.

.8 Size fuses installed in combination magnetic starters used in conjunction with magnetic starters, for a branch circuit and motor protection for over-current protection in accordance with Fuse Manufacturer's recommendations.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install starters in accordance with Section 26 05 83.

.2 A starter, and/or start/stop station as required, together with required pilot lights, remote switches and auxiliary contacts shall be supplied by trade Section of Mechanical Divisions for each motor or electrical item requiring control provided by that trade. This equipment shall be submitted to Division 26 for installation.

.3 Where individual starters and controls are grouped together, a panel for mounting this equipment shall be provided by Contractor under Electrical Division 26.

.4 Conduit and wiring to line side of remotely located starters or to line terminals of Motor Control Centres and from these points to a disconnect and/or motor will be provided under the Electrical Division 26.

.5 Wiring to water unit heaters and cabinet unit heaters will be under Electrical Division 26. Wiring and conduit required for a thermostat will be provided by as described in Section 26 05 23.

.6 Mechanical Divisions will provide all control wiring regardless of voltage for all of the equipment provide under Mechanical Divisions but not limited to:

.1 Interlocking of supply or exhaust air fans.

.2 Wiring for automatic controls.

.3 Individual fan shut-down due to fire stat, freeze stat duct smoke detector, etc.

.7 Wiring, motors, control devices and electrical equipment provided under Mechanical Divisions shall conform to the Canadian Electrical Code as amended to date.

.8 Wiring methods and standards shall conform to those specified in Electrical Division 26 for the area of the building in which the installation is to be made.

.9 Install wiring in conduit unless otherwise noted.

.10 Use thin wall conduit up to and including 32 mm size for wiring in ceilings, furred spaces, in hollow walls and partitions and where not exposed to mechanical injury. Use rigid galvanized steel conduit for wiring in poured concrete, where exposed and for conduit 38 mm size and larger. Plastic conduit is not acceptable above ground.

.11 Run conduit and cables in finished areas concealed above ceilings and in partitions. Run conduit and cable exposed in any unfinished areas such as mechanical rooms, rooms with no suspended ceilings, service tunnels and penthouses and install at right angles or parallel to building lines. Boxes shall be cast type.

.12 Wiring shall be RW90 X-Link type sized to carry 125% of the full load running current in accordance with the Electrical Code. Wiring shall be minimum No. 12 gauge, except for control wiring which shall be colour coded No. 14 gauge.

END OF SECTION

Updated through ADD#8

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Factory assembled packaged gas-engine generator set equipment with digital (microprocessor-based) electronic generator set controls, digital governor, and digital voltage regulator.

.2 Exhaust silencer and fittings.

.3 Fuel fittings.

.4 Remote control panel.

.5 Battery and charger.

.6 Weatherproof skin-tight enclosure.

.7 Accessories.

1.2 RELATED REQUIREMENTS

1.5 SUBMITTALS

.1 To Section 01 33 00.

.2 Work of this Section is to be submitted for review after Consultant's review of Coordination Study per Section 26 05 73.16 is completed.

.3 Shop Drawings:

.1 Indicate electrical characteristics and connection requirements. Show plan and elevation views with overall and interconnection point dimensions, fuel consumption rate curves at various loads, ventilation and combustion air requirements, and electrical diagrams, including schematic and interconnection diagrams.

.2 Outline drawings of assembly, including sound attenuated weatherproof enclosure and accessories.

.3 Weight of complete assembly, including fuel.

.4 One line diagrams and wiring diagrams for assembly and components.

.5 Interconnection wiring diagrams.

.4 Product data:

.1 Provide data showing dimensions, weights, ratings, interconnection points, and internal wiring diagrams for engine, generator, control panel, battery, battery rack, battery charger, exhaust silencer, vibration isolators, and remote radiator.

.2 Technical data on all major components. Technical data must include an alternator thermal damage curve, description and operating characteristics of the alternator protection device, and an alternator reactive capability curve. Alternator data demonstrating compliance to section.

.3 Certification of the emissions performance of the generator set engine by the engine manufacturer.

.4 Acoustical information of enclosure.

.5 Line-by-line compliance statement that demonstrates compliance with this Section.

.6 Test Reports: Indicate results of performance testing.

.7 Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

.8 Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

.9 Manufacturer's Field Reports: Indicate procedures and findings.

.10 Data for Ministry of Environment Environmental Activity and Sector Registry (Certificate of Approval).

.1 The maximum electrical output rating of the generator set (kW).

.2 Manufacturer's combustion contaminant emissions data or U.S. EPA emissions standard certification sheet.

.3 Layout drawing showing engine exhaust stack orientation, for generator sets installed in outdoor enclosures.

.4 Enclosure layout drawing.

.5 Manufacturer's enclosure noise emissions data.

.11 Colour samples for custom enclosure colour.

.12 Project information:

.1 Test reports and certifications.

.2 Factory test procedures.

1.6 CLOSEOUT SUBMITTALS

.1 Startup reports:

.1 Manufacturer's startup reports.

.2 Section 26 08 32.16 – Performance Checklist for Natural-Gas Generators.

.2 AHJ inspection documentation:

.1 Fuelling compliance certificate.

.2 Variance approval correspondence, as applicable.

.3 Maintenance Contracts:

.1 Manufacturer to maintain model and serial number records of each generator set provided for at least 20 years.

.2 The manufacturer shall itemize the complete offering of preventative and full-service maintenance contracts for the generator with submission, as described for each maintenance period described below.

.3 Maintenance service as part of base bid submission:

.1 Provide 7 x 24 x 365 service and maintenance of Generator for 2 years from Date of Substantial Completion. Price is to include two (2) full service maintenance program visits per each year.

.4 Additional maintenance service offers:

.1 Provide a separate price to extend 7 x 24 x 365 service and maintenance of generator for year three to year five.

.4 Operation and Maintenance Data:

.1 Operation Data: Include instructions for normal operation.

.2 Maintenance Data: Include instructions for routine maintenance requirements, service manuals for engine, oil sampling and analysis for engine wear, and emergency maintenance procedures.

.3 Provide electronic copies of all documents, test data, shop drawings, etc.

.5 Training records including attendance sheet, date, and training syllabus.

1.7 MAINTENANCE MATERIAL SUBMITTALS

.1 Provide three copies of maintenance materials.

.2 Spare Parts:

.1 Provide two of each of the following:

.1 Fuel oil filter element.

.2 Lube oil filter element.

.3 Air filter element.

.4 Fuel water separator.

.3 Tools: provide one set of tools required for preventative maintenance of the engine generator system. Package tools in adequately sized metal tool box.

.4 Keys.

1.8 MANUFACTURER'S QUALIFICATIONS

.1 The manufacturer of the generator set shall maintain service parts inventory at a central location which is accessible to the service location 24 hours per day, 365 days per year.

.2 The generator set shall be serviced by a local service organization that is trained and factory certified in generator set service. The supplier shall maintain an inventory of critical replacement parts at the local service organization, and in service vehicles. The service organization shall be on call 24 hours per day, 365 days per year.

.3 The manufacturer shall maintain model and serial number records of each generator set provided for at least 20 years.

.4 The generator set manufacturer shall be certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

.5 The manufacturer of this equipment shall have produced similar equipment for a minimum period of ten years. When requested by the Consultant, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

.6 Manufacturer: Company specializing in manufacturing the products specified in this section with minimum 2 years documented experience, and with service facilities within 160 km of project.

.7 Supplier: Authorized or franchised distributor of specified manufacturer with minimum 3 years documented experience.

1.9 DELIVERY, STORAGE, AND HANDLING

.1 Store equipment in original, undamaged package.

.2 Deliver to the project site in manufacturer's original wrapping and containers, labelled with manufacturer's name, product information, etc.

.3 Coordinate delivery date and time with the Owner and equipment supplier.

.4 Installing contractor to accept unit on site, inspect for damage, provide craning complete with spreader bars, and install equipment.

1.10 WARRANTY

.1 Warrant the material and workmanship of the generator set and associated equipment for a minimum of [two] years from registered commissioning and start-up, or 30 months from date of arrival on site.

.2 The warranty shall be comprehensive. No deductibles shall be allowed for travel time, service hours, repair parts cost, etc.

.3 Warrant all equipment provided under this section, whether or not is manufactured by the generator set manufacturer, so that there is one source for warranty and product service. Service of the generators sets to be performed by technicians specifically trained and certified by the manufacturer to support the product and employed by the generator set supplier.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Manufacturer List:

.1 Paramount Power Systems Ltd.

.2 Cummins Power Generation.

.3 Caterpillar.

.4 Kohler Power Systems.

.5 LMR Power Systems Inc.

.6 Generac Power Systems by Total Power Ltd.

.2 Substitution Limitations: Only those manufacturers listed above shall supply equipment provided under this contract. Proposals must include a line-by-line compliance statement based on this specification.

2.2 REGULATORY REQUIREMENTS

.1 Generator set to be listed and labelled by a certification organization accredited by the Standards Council of Canada.

.2 Comply with all applicable EPA emissions standards at the date of installation.

.3 Conform to requirements of CSA C22.1, the Ontario Electrical Safety Code, and other requirements of the Electrical Safety Authority (ESA).

2.3 GENERATOR SET

.1 Ratings

.1 The generator set shall operate at 1800 rpm and at a voltage of: 347/600 volts AC, three phase, 4-wire, 60 Hz.

.2 The generator set shall be rated per ISO 8528 at (per drawing) kW] at 0.8 PF, standby rating, based on site conditions of:

.1 Altitude: 914 m (3000 ft).

.2 Ambient temperatures up to 40°C (104°F)

.3 Emissions:

.1 25 kW to 300 kW – EPA Tier 3 certified.

.2 350 kW to 2250 kW – EPA Tier 3 certified.

.4 Standby rating, based on site conditions of: Altitude 400 m above sea level, ambient temperatures of 40°C, based on temperature measured at the control for indoor installations, and measured at the air inlet closest to the alternator for outdoor equipment.

.2 Performance

.1 Voltage regulation shall be plus or minus 0.5 percent for any constant load between no load and rated load for both parallel and non-parallel applications. Random voltage variation with any steady load from no load to full load shall not exceed plus or minus 0.5 percent.

.2 Frequency regulation shall be isochronous from steady state no load to steady state rated load. Random frequency variation with any steady load from no load to full load shall not exceed plus or minus 0.25%.

.3 The engine-generator set shall be capable of single step load pick up of 100% nameplate kW and power factor, less applicable derating factors, with the engine generator set at operating temperature.

.4 Motor starting capability shall be a minimum of [64 kVA]. The generator set shall be capable of sustaining a minimum of 90% of rated no load voltage with the specified kVA load at near zero power factor applied to the generator set.

.5 The alternator shall produce a clean AC voltage waveform, with not more than 5% total harmonic distortion at full linear load, when measured from line to neutral, and with not more than 3% in any single harmonic. Telephone influence factor shall be less than 40.

.6 The generator set shall be certified by the engine manufacturer to be suitable for use at the installed location and rating, and shall meet all applicable exhaust emission requirements at the time of commissioning.

.7 The time required to automatically start, accelerate to rated speed and voltage, synchronize, to the system bus on a normal power failure shall not exceed 15 seconds, assuming that the generator sets are in an ambient temperature of 15 degrees C or greater, and water jacket heaters are operating properly.

.8 The generator set, complete with sound attenuated enclosure, shall be tested by the generator set manufacturer per ANSI S1.13. Data documenting performance shall be provided with submittal documentation.

.3 Construction

.1 The engine generator set shall be mounted on a heavy-duty steel base to maintain alignment between components. The base shall incorporate a battery tray with hold-down clamps within the rails.

.2 All switches, lamps, and meters in the control system shall be oil tight and dust tight, and the enclosure door shall be gasketed. There shall be no exposed points in the control (with the door open) that operate in excess of 50 V.

.4 Connections

.1 The generator set load connections shall be composed of silver or tin plated copper bus bars, drilled to accept mechanical or compression terminations of the number and type as described in this specification. Sufficient lug space shall be provided for use with cables.

.2 Power connections to auxiliary devices shall be made at the devices, with required protection located at a wall-mounted common distribution panel.

.3 Generator set control interfaces to other system components shall be made on a common, permanently labeled terminal block assembly.

2.4 ENGINE AND ENGINE EQUIPMENT

.1 The engine shall be natural gas fueled, radiator and fan cooled. The horsepower rating of the engine at its minimum tolerance level shall be sufficient to drive the alternator and all connected accessories. Engine accessories and features shall include:

.1 Complete engine fuel system, including all pressure regulators, strainers, and control valves. The fuel system shall be plumbed to the generator set skid for ease of site connections to the generator set.

.2 An electronic governor system shall provide automatic isochronous frequency regulation. The governing system dynamic capabilities shall be controlled as a function of engine coolant temperature to provide fast, stable operation at varying engine operating temperature conditions. The control system shall actively control the fuel rate and excitation as appropriate to the state of the generator set. Fuel rate shall be regulated as a function of starting, accelerating to start disconnect speed, accelerating to rated speed, and operating in various isochronous or parallel states.

.3 Skid mounted radiator and cooling system rated for full load operation in 40°C (104°F) ambient as measured at the generator air inlet, based on 0.5 in H2O external static head. Radiator shall be sized based on a core temperature that is 20°F higher than the rated operation temperature, or prototype tested to verify cooling performance of the engine/radiator/fan operation in a controlled environment. Radiator shall be provided with a duct adapter flange. The equipment manufacturer shall fill the cooling system with a 50/50-ethylene glycol/water mixture. Rotating parts shall be guarded against accidental contact.

.4 Electric starter(s) capable of three complete cranking cycles without overheating.

.5 Positive displacement, mechanical, full pressure, lubrication oil pump.

.6 Full flow lubrication oil filters with replaceable spin on canister elements and dipstick oil level indicator.

.7 Replaceable dry element air cleaner with restriction indicator.

.8 Flexible fuel lines.

.9 Engine mounted battery charging alternator, 40 A minimum, and solid-state voltage regulator.

.2 Coolant Heater

.1 Engine mounted, thermostatically controlled, coolant heater(s) for each engine. Heater voltage shall be as shown on the project drawings. The coolant heater shall be UL499 listed and labeled.

.2 The coolant heater shall be installed on the engine with SAEJ20 compliant materials. Steel tubing shall be used for connections into the engine coolant system wherever the length of pipe run exceeds 300 mm (12 in). The coolant heater installation shall be specifically designed to provide proper venting of the system. The coolant heaters shall be installed using isolation valves to isolate the heater for replacement of the heater element. The design shall allow the heater element to be replaced without draining the engine cooling system or significant coolant loss.

.3 The coolant heater shall be provided with a 24 VDC thermostat, installed at the engine thermostat housing. An AC power connection shall be provided for a single AC power connection to the coolant heater system.

.4 Coolant heater(s) sized as recommended by the engine manufacturer to warm the engine to a minimum of 40°C in a 15°C ambient, in compliance with CSA C282 requirements, as a minimum, or the temperature required for starting and load pickup requirements of this section.

.3 Provide vibration isolators, spring/pad type, quantity as recommended by the generator set manufacturer. Isolators shall include seismic restraints if required by site location.

.4 Starting and Control Batteries: lead acid type, 24 VDC, sized as recommended by the engine manufacturer for compliance to CSA C282 starting requirements, complete with battery cables and connectors.

.5 Exhaust Silencer:

.1 Provide exhaust silencer for each engine of size and type as recommended by the generator set manufacturer and approved by the engine manufacturer.

.2 The silencer shall be selected by the manufacturer to suit the overall noise rating of the enclosed unit in Part 2 Article “Weatherproof Skin-Tight Enclosure”.

.3 Exhaust system shall be installed according to the engine manufacturer's recommendations and applicable codes and standards.

.4 Complete exhaust system to be installed within the enclosure, with vertical exhaust discharge.

.1 Vertical exhaust discharge extends a minimum of 1.2 m (4 ft) above the roof of the enclosure to ensure the following:

.1 Hot air does not recirculate in the air intake and overheat the engine.

.2 In case any snow builds up on the enclosure roof, the exhaust discharge is not covered which could prevent operation of the unit.

.2 Vertical exhaust discharge be complete with rain cap.

.5 Includes provisions for draining moisture that condenses in the exhaust system that could lead to corrosion.

.6 Provide Stainless Steel exhaust flex connector to suit engine outlet connection, minimum 610 mm (24”) length.

.6 Provide a minimum 10 A battery charger for each generator set battery bank. The charger shall include the following capabilities:

.1 Chargers shall be UL 1236-BBHH listed and CSA or CUL certified for use in emergency applications.

.2 The charger shall be compliant with UL 991 requirements for vibration resistance.

.3 The charger shall comply with the requirements of EN61000-4-5 for voltage surge resistance; EN50082-2 for immunity; EN61000-4-2 for ESD; N61000-4-3 for radiated immunity; ANSI/IEEE C62.41 category B and IN61000-4-4 for electrically fast transient; EN61000-4-6 for conducted emissions; and FCC Part 15 Class A for radiated emissions.

.4 The charger shall be capable of charging a fully discharged battery without damage to the charger. It shall be capable of returning a fully discharged battery to fully charged condition within 24 hours. The charger shall be UL-labeled with the maximum battery amp-hour rating that can be recharged within 24 hours.

.5 The charger shall incorporate a 4-state charging algorithm, to provide trickle charge rate to restore fully discharged batteries, a bulk charge rate to provide fastest possible recharge

after normal discharge, an absorption state to return the battery to 100 percent of charge, and a float stage to maintain a fully charge battery and supply battery loads when the generator set is not operating. In addition, the charger shall include an equalization timer. Charge rates shall be temperature compensated based on the temperature directly sensed at the battery.

.6 The DC output voltage regulation shall be within plus or minus 1%. The DC output ripple current shall not exceed 1 A at rated output current level.

.7 The charger shall include the following features:

.1 Two line alphanumeric display with programming keys to allow display of DC output ammeter and voltmeters (5% accuracy or better), display alarm messages, and perform programming;

.2 LED indicating lamp(s) to indicating normal charging condition (green), equalize charge state (amber), and fault condition (red);

.3 AC input overcurrent, over voltage, and undervoltage protection;

.4 DC output overcurrent protection;

.5 Alarm output relay;

.6 Corrosion resistant aluminum enclosure

.7 Emissions Requirements

.1 NOx not to exceed 9.2 g NOx per kWh.

.2 Engine exhaust to be complete with catalytic converter for units over 80 kWe.

2.5 AC ALTERNATOR

.1 The AC alternator shall be; synchronous, four pole, 2/3 pitch, brushless, revolving field, drip-proof construction, single pre-lubricated sealed bearing, air cooled by a direct drive centrifugal blower fan, and directly connected to the engine with flexible drive disc. The alternator design shall prevent shaft current from flowing and eliminate the need for insulated bearings. All insulation system components shall meet NEMA MG1 requirements for Class H insulation systems. Actual temperature rise measured by resistance method at full load shall not exceed 105°C in a 40°C ambient.

.2 The alternator shall be capable of delivering rated output (kVA) at rated frequency and power factor, at any voltage up to 5 percent above or below rated voltage.

.3 A permanent magnet generator (PMG) shall be included to provide a reliable source of excitation power for optimum motor starting and short circuit performance. The PMG and controls shall be capable of sustaining and regulating current supplied to a single phase or three phase fault at approximately 300% of rated current for not more than 10 seconds.

.4 The alternator shall be supplied with a dedicated, independent power source for the voltage regulation system, which provides sufficient excitation for the alternator to supply 300 per cent of rated output current for 10 seconds.

.5 The subtransient reactance of the alternator to not exceed 15 per cent, based on the standby rating of the generator set.

.6 Provide an anti-condensation heater for the alternator for generator sets installed outdoors or in unheated environments.

.7 Provide two embedded resistance temperature detectors per phase and temperature indication equipment. The control system shall annunciate high alternator temperature as a fault condition.

.8 The alternator shall be capable of operation with reverse kVAR of 0.15 per unit.

2.6 GENERATOR SET CONTROL

.1 The generator set shall be provided with a microprocessor-based control system that is designed to provide automatic starting, monitoring, protection, and control functions for the generator set. The control system shall also be designed to allow local monitoring and control of the generator set, and remote monitoring and control as described in this specification.

.2 The control shall be mounted on the generator set in an accessible location. The control shall be vibration isolated, and prototype tested to verify the durability of all components in the system under the vibration conditions encountered.

.3 The generator set mounted control shall include the following features and functions:

.1 Control Switches

.1 Mode Select Switch.

.1 The mode select switch shall initiate the following control modes. When in the RUN or Manual position the generator set shall start, and accelerate to rated speed and voltage as directed by the operator. In the OFF position the generator set shall immediately stop, bypassing all time delays. In the AUTO position the generator set shall be ready to accept a signal from a remote device to start and accelerate to rated speed and voltage.

.2 EMERGENCY STOP switch.

.1 Switch shall be Red "mushroom-head" push-button. Depressing the emergency stop switch shall cause the generator set to immediately shut down, and be locked out from automatic restarting. The switch shall include a lockout provision for use in safely disabling the generator set for necessary service.

.2 Locate inside Generator enclosure.

.3 RESET switch.

.1 The RESET switch shall be used to clear a fault and allow restarting the generator set after it has shut down for any fault condition.

.4 PANEL LAMP switch.

.1 Operating the panel lamp switch shall cause the entire panel to be lighted with DC control power. The panel lamps shall automatically be switched off 10 minutes after the switch is operated, or after the switch is operated a second time.

.5 Voltage and Frequency Adjustment. The genset mounted control shall include digital raise/lower switches for adjustment of voltage and frequency.

.2 Generator Set AC Output Metering. The generator set shall be provided with a metering set including the following features and functions:

.1 Digital metering set, 1% accuracy, to indicate generator RMS voltage and current, frequency, output current, output kW, kWh, and power factor. Generator output

voltage shall be available in line-to-line and line-to-neutral voltages, and shall display all three-phase voltages (line to neutral or line to line) simultaneously.

.2 Analog voltmeter, ammeter, frequency meter, power factor meter, and kilowatt (kW) meter. Voltmeter and ammeter shall display all three phases. Meter scales shall be colour coded in the following fashion: green shall indicate normal operating condition, amber shall indicate operation in ranges that indicate potential failure, and red shall indicate failure impending. Metering accuracy shall be within 1% at rated output. Both analog and digital metering are required.

.3 The control system shall monitor the total load on the generator set, and maintain data logs of total operating hours at specific load levels ranging from 0 to 110% of rated load, in 10% increments. The control shall display hours of operation at less than 30% load and total hours of operation at more than 90% of rated load.

.4 The control system shall log total number of operating hours, total kWh, and total control on hours, as well as total values since reset.

.3 Generator Set Alarm and Status Display.

.1 The generator set control shall include LED alarm and status indication lamps. The lamps shall be high intensity LED type. The lamp condition shall be clearly apparent under bright room lighting conditions. Functions indicated by the lamps shall include:

.2 The control shall include five configurable alarm-indicating lamps. The lamps shall be field adjustable for any status, warning, or shutdown function monitored by the genset. They shall also be configurable for colour, and control action (status, warning, or shutdown).

.3 The control shall include green lamps to indicate that the generator set is running at rated frequency and voltage, and that a remote start signal has been received at the generator set. The running signal shall be based on actual sensed voltage and frequency on the output terminals of the generator set.

.4 The control shall include a flashing red lamp to indicate that the control is not in automatic state, and red common shutdown lamp.

.5 The control shall include an amber common warning indication lamp.

.6 The generator set control shall indicate the existence of the warning and shutdown conditions on the control panel. All conditions indicated below for warning shall be field-configurable for shutdown. Conditions required to be annunciated shall include:

.1 low oil pressure (warning).

.2 low oil pressure (shutdown).

.3 oil pressure sender failure (warning).

.4 low coolant temperature (warning).

.5 high coolant temperature (warning).

.6 high coolant temperature (shutdown).

.7 high oil temperature (warning).

.8 engine temperature sender failure (warning).

.9 low coolant level (warning).

.10 fail to crank (shutdown).

.11 fail to start/overcrank (shutdown).

.12 overspeed (shutdown).

.13 low DC voltage (warning).

.14 high DC voltage (warning).

.15 weak battery (warning).

.16 low gas pressure (warning).

.17 high AC voltage (shutdown).

.18 low AC voltage (shutdown).

.19 under frequency (shutdown).

.20 over current (warning).

.21 over current (shutdown).

.22 short circuit (shutdown).

.23 over load (warning).

.24 emergency stop (shutdown).

.25 natural gas supply valve(s) closed.

.26 (4) configurable conditions

.7 Provisions shall be made for indication of four customer specified alarm or shutdown conditions. Labeling of the customer-specified alarm or shutdown conditions shall be of the same type and quality as the above-specified conditions. The non-automatic indicating lamp shall be red, and shall flash to indicate that the generator set is not able to automatically respond to a command to start from a remote location.

.4 Engine Status Monitoring.

.1 The following information shall be available from a digital status panel on the generator set control:

.1 engine oil pressure (psi or kPa).

.2 engine coolant temperature (degrees F or C).

.3 engine oil temperature (degrees F or C).

.4 engine speed (rpm).

.5 number of hours of operation (hours).

.6 number of start attempts.

.7 battery voltage (DC volts).

.2 The control system shall also incorporate a data logging and display provision to allow logging of the last 10 warning or shutdown indications.

.5 Engine Control Functions.

.1 The control system provided shall include a cycle cranking system, which allows for user selected crank time, rest time, and # of cycles. Initial settings shall be for 3 cranking periods of 15 seconds each, with 15 second rest period between cranking periods.

.2 The control system shall include an idle mode control, which allows the engine to run in idle mode in the RUN position only. In this mode, the alternator excitation system shall be disabled.

.3 The control system shall include an engine governor control, which functions to provide steady state frequency regulation as noted elsewhere in this specification. The governor control shall include adjustments for gain, damping, and a ramping function to control engine speed and limit exhaust smoke while the unit is starting.

.4 The control system shall include time delay start (adjustable 0-300 seconds) and time delay stop (adjustable 0-600 seconds) functions.

.5 The control system shall include sender failure monitoring logic for speed sensing, oil pressure, and engine temperature which is capable of discriminating between failed sender or wiring components, and an actual failure conditions.

.6 Alternator Control Functions:

.1 The generator set shall include a full wave rectified automatic digital voltage regulation system that is matched and prototype tested by the engine manufacturer with the governing system provided. It shall be immune from misoperation due to load induced voltage waveform distortion and provide a pulse width modulated output to the alternator exciter. The voltage regulation system shall be equipped with three phase line to neutral RMS sensing and shall control buildup of AC generator voltage to provide a linear rise and limit overshoot. The system shall include a torque-matching characteristic, which shall reduce output voltage in proportion to frequency below an adjustable frequency threshold. Torque matching characteristic shall be adjustable for roll-off frequency and rate, and be capable of being curve-matched to the engine torque curve with adjustments in the field. The voltage regulator shall include adjustments for gain, damping, and frequency roll off. Adjustments shall be broad range, and made via digital raise-lower switches, with an alphanumeric LED readout to indicate setting level. Rotary potentiometers for system adjustments are not acceptable.

.2 Controls shall be provided to monitor the output current of the generator set and initiate an alarm (over current warning) when load current exceeds 110% of the rated current of the generator set on any phase for more than 60 seconds. The controls shall shut down and lock out the generator set when output current level approaches the thermal damage point of the alternator (over current shutdown). The protective functions provided shall be in compliance to the requirements of NFPA 70 article 445. The protection for this function shall be 3rd party certified to very performance.

.3 Controls shall be provided to individually monitor all three phases of the output current for short circuit conditions. The control/protection system shall monitor the current level and voltage. The controls shall shut down and lock out the generator set when output current level approaches the thermal damage point of the alternator (short circuit shutdown). The protective functions provided shall be in compliance to the requirements of NFPA 70 article 445. The protection for this function shall be 3rd party certified to very performance.

.4 Controls shall be provided to monitor the kW load on the generator set, and initiate an alarm condition (over load) when total load on the generator set exceeds the generator set rating for in excess of 5 seconds. Controls shall include a load shed control, to operate a set of dry contacts (for use in shedding customer load devices) when the generator set is overloaded.

.5 A line to neutral sensing AC over/under voltage monitoring system that responds only to true RMS voltage conditions shall be provided. The system shall initiate shutdown of the generator set when alternator output voltage exceeds 110% of the operator-set voltage level for more than 10 seconds, or with no intentional delay when voltage exceeds 130%. Under voltage shutdown shall occur when the output voltage of the alternator is less than 85% for more than 10 seconds.

.6 The generator set control shall include a 120 VAC control heater.

.7 Other Control Functions

.1 The generator set shall be provided with a network communication module to allow LonMark compliant communication with the generator set control by remote devices. The control shall communicate all engine and alternator data, and allow starting and stopping of the generator set via the network in both test and emergency modes.

.2 A battery monitoring system shall be provided which initiates alarms when the DC control and starting voltage is less than 25 VDC or more than 32 VDC. During engine cranking (starter engaged), the low voltage limit shall be disabled, and DC voltage shall be monitored as load is applied to the battery, to detect impending battery failure or deteriorated battery condition.

2.7 OTHER EQUIPMENT TO BE PROVIDED WITH THE GENERATOR SET

.1 Control Interfaces for Remote Monitoring:

.1 The control system shall provide four programmable output relays. These relay outputs shall be configurable for any alarm, shutdown, or status condition monitored by the control. The relays shall be configured to indicate: (1) generator set operating at rated voltage and frequency, (2) common warning, (3) common shutdown, (4) load shed command.

.2 A fused 10 A switched 24 VDC power supply circuit shall be provided for customer use. DC power shall be available from this circuit whenever the generator set is running.

.3 A fused 10 A, 24 VDC power supply circuit shall be provided for customer use. DC power shall be available from this circuit at all times from the engine starting/control batteries.

.4 The control shall be provided with a direct serial communication link for the LonWorks communication network interface as described elsewhere in this specification and shown on the drawings.

.2 Provide and install a 20-light LED type remote alarm annunciator with horn, located as shown on the drawings or in a location that can be conveniently monitored by facility personnel. The remote annunciator shall provide all the audible and visual alarms called for by NFPA Standard 110 for level 1 systems for the local generator control panel. Spare lamps shall be provided to allow future addition of other alarm and status functions to the annunciator. Provisions for labeling of the annunciator in a fashion consistent with the specified functions shall be provided. Alarm silence and lamp test switch(es) shall be provided. LED lamps shall be replaceable, and indicating lamp colour shall be capable of changes needed for specific application requirements. Alarm horn shall be switchable for all annunciation points. Alarm horn (when switched on) shall sound for first fault, and all subsequent faults, regardless of whether first fault has been cleared, in compliance with NFPA 110 3-5.6.2. The interconnecting wiring between the annunciator and other system components shall be monitored and failure of the interconnection between components shall be displayed on the annunciator panel.

.3 The annunciator shall include the following alarm labels, audible annunciation features, and lamp colours:

Condition	Lamp Colour	Audible Alarm
Normal Power (to Loads)	Green	No
Genset Supplying Load	Amber	No
Genset Running	Green	No
Not in Auto	Red (Flashing)	Yes
High Battery Voltage	Red	Yes
Low Battery Voltage	Red	Yes
Charger AC Failure	Red	Yes
Fail to Start	Red	Yes
Low Engine Temperature	Amber	Yes
Pre-High Engine Temperature	Amber	Yes
High Engine Temperature	Red	Yes
Pre-Low Oil Pressure	Amber	Yes
Low Oil Pressure	Red	Yes
Overspeed	Red	Yes
Low Coolant Level	Amber	Yes
Low Fuel Pressure	Amber	Yes
Network OK	Green	Yes
Natural gas supply valve closed	Red	Yes
(4) Spares	Configurable	Configurable

.4 Low battery voltage lamp shall also be lighted for low cranking voltage or weak battery alarm.

.5 The generator set shall be provided with a mounted main line circuit breaker, sized to carry the rated output current of the generator set. The circuit breaker shall incorporate an electronic trip unit that operates to protect the alternator under all overcurrent conditions, or a thermal-magnetic trip with other overcurrent protection devices that positively protect the alternator under overcurrent conditions. The supplier shall submit time overcurrent characteristic curves and thermal damage curve for the alternator, demonstrating the effectiveness of the protection provided.

2.8 CIRCUIT BREAKERS

.1 CSA C22.2 No. 5, molded case circuit breakers on generator output with integral thermal and instantaneous magnetic trip in each pole, sized to CSA C22.1. Include battery-voltage operated shunt trip, connected to open circuit breakers on engine failure. Unit mount in enclosure to meet CSA C22.2 No. 100, Type 1 requirements.

.2 Bolt-on, molded case, temperature compensated for 40°C ambient, dual thermal-magnetic trip. Electronic trip type with adjustments for long-time, instantaneous, and short-time functions.

.3 Interrupting capacity: To suit available fault current from Generator set alternator.

.1 Minimum 25 kA IC.

.2 The emergency generator main overcurrent device shall be coordinated with the overcurrent devices of feeders and branch circuits downstream and in accordance with the Coordination Study specified in Section 26 05 73.16.

.4 Schedule of generator output circuit breakers:

.1 Generator Output Breaker to feed emergency terminals of Automatic Transfer Switches.

.2 Load Bank Breaker

.1 Rating and ampacity of load bank breaker to match generator output breaker.

.2 Equipped with shunt trip capability to ensure that the breaker will be tripped during testing upon receiving engine start signal from Automatic Transfer Switch. Electrical contractor to provide cables from each Automatic Transfer Switch to breaker to suit manufacturer's instructions.

.3 Provide lugs allowing ease of connection for load bank cables.

2.9 REMOTE ANNUNCIATION AND MONITORING

.1 Provide remote annunciator panel for field installation by installing Contractor.

.2 Provide BACnet/BACnet-IP and other interface required in order to connect the generator control panel to the Building Automation System. The BAS must be able to read all the monitoring and operation signals from genset. Provide all the conduit and wires to the BAS panel and coordinate with Division 25 for final connection. At a minimum, include the following:

.1 ON/OFF status.

.2 Oil Pressure.

.3 Coolant Level.

.4 Coolant temperature.

.5 Oil Temperature.

.6 Up to 10 additional points should be allowed to be programmable for Generator on the BAS.

.3 The Generator graphics should also be included on the BAS with the points listed above.

.4 Coordinate with Division 25 to ensure necessary critical alarm parameters are programmed to allow alarms to be sent to relevant stakeholders via email.

2.10 WEATHERPROOF SKIN-TIGHT ENCLOSURE

.1 Sound attenuating enclosure with sound attenuation to provide sound levels of no greater than 75 dB(A) at 7 m perimeter.

.2 To suit conduit entry from below grade.

.3 Access doors with key locks, welded hinges, and door lock port hole to keep door open during maintenance. Maximum access door width 1000 mm.

.4 Primed for corrosion protection and finish painted in a custom colour to be selected by the Owner and confirmed at submittal review.

.5 Interior of enclosure to consist of high reflectance materials to improve light levels when servicing or maintaining unit.

2.11 ACCESSORIES

.1 Factory provided accessories in the generator enclosure prewired to a panelboard in the generator enclosure:

.1 Heating:

.1 Battery thermal wrap, 120 V, minimum 75 W per battery to maintain battery temperature of 27°C (80°F), and complete with thermostat to eliminate batter damage caused by overheating or acid spill.

.2 Motorized intake dampers, 5 kW 208 V 3-phase forced flow heater in enclosure complete with reverse acting thermostat for control to maintain 10°C at all times.

.3 Engine block circulating coolant heater with thermostat, sized to engine manufacturer's recommendations].

.4 Regulator heater.

.2 Lighting:

.1 Two LED strip luminaires 4100 lumen nominal, 3500 K CCT, standard driver, frosted lens, wire guard, and control.

.1 Signify FluxStream series.

.2 Substitution by Acuity Brands, Cree, Cooper Lighting Solutions, Hubbell, Visioneering.

.2 Control for luminaires: white decorator style switch installed in surface mount utility box, complete with galvanized steel cover plate with rounded corners.

.3 Emergency lighting battery unit complete with 2 hours runtime on loss of utility power and complete with two MR16 LED heads, light output equivalent to two 20 W MR16 incandescent lamps, in accordance with CSA C282 clause 6.11.1.

.1 Minimum illumination: 50 lx (5 fc).

.2 Battery units shall include automatic self-diagnostic circuitry, and a transient voltage surge suppressor on the supply site of power to the unit.

.3 Battery unit to be complete with CSA 5-15 plug and plugged into a dedicated emergency lighting receptacle installed immediately adjacent to the battery unit.

.3 Minimum one 5-15R GFI duplex receptacle on generator (in addition to the battery unit receptacle).

.4 If spring isolators are to be used, provide generator frame-bottom metal sealing plate to maintain heat inside enclosure, proper directionality of airflow, maintain noise rating, and prevent animal ingress.

.5 Other accessories as indicated on the generator enclosure layout drawing, and as required for a complete operating system, and as recommended by the generator manufacturer.

.6 Accessories to be fed from a panelboard pre-installed within the generator enclosure, rated 100 A 120/208 V, 3-Ph, 4W, 10 kA IC, complete with main breaker, and complete with full size, bolt-on breakers, installed with vibration isolation from the generator enclosure.

.1 Plug-on breaker panelboard, or use of tandem circuit breakers will be rejected and field replaced at manufacturer's expense.

.2 Acceptable panelboard and circuit breaker manufacturers:

.1 Eaton PRL1 series.

.2 Schneider Electric NQ series.

.3 Siemens equal.

.3 Provide a minimum of one (1) spare 15 A single pole breaker.

.2 Supplier to include an inspection for unit enclosure and generator accessories by the Electrical Authority Having Jurisdiction (ESA in Ontario) prior to shipment to site. Submit ESA inspection report to the Consultant.

2.12 SEQUENCE OF OPERATION

.1 Start generator set on receipt of a start signal from remote equipment (automatic transfer switch). The start signal shall be via hardwired connection to the generator set control and a redundant signal over the required network connection.

.2 The generator set shall complete a time delay start period as programmed into the control.

.3 The generator set control shall initiate the starting sequence for the generator set. The starting sequence shall include the following functions:

.1 The control system shall verify that the engine is rotating when the starter is signalled to operate. If the engine does not rotate after three attempts, the control system shall shut down and lock out the generator set, and indicate “fail to crank” shutdown.

.2 The engine shall start and accelerate as quickly as practical to start disconnect speed. If the engine does not start, it shall complete a cycle cranking process as described elsewhere in this specification. If the engine has not started by the completion of the cycle cranking sequence, it shall be shut down and locked out, and the control system shall indicate “fail to start”.

.3 The engine shall accelerate to rated speed and the alternator to rated voltage. Excitation shall be disabled until the engine has exceeded programmed idle speed, and regulated to prevent over voltage conditions and oscillation as the engine accelerates and the alternator builds to rated voltage.

.4 On reaching rated speed and voltage, the generator set shall operate as dictated by the control system in isochronous, synchronize, load share, load demand, or load govern state.

.5 When all start signals have been removed from the generator set, it shall complete a time delay stop sequence. The duration of the time delay stop period shall be adjustable by the operator.

.6 On completion of the time delay stop period, the generator set control shall switch off the excitation system and shall shut down.

.1 Any start signal received after the time stop sequence has begun shall immediately terminate the stopping sequence and return the generator set to isochronous operation.

2.13 SOURCE QUALITY CONTROL

.1 Provide factory test, start-up by a supplier authorized by the equipment manufacturer(s), and on-site testing of the system.

.2 The generator set manufacturer shall perform a complete operational test on the generator set prior to shipping from the factory. A certified test report shall be provided to the Consultant. All testing shall be performed with calibrated metering.

.3 Factory testing may be witnessed by the Owner and the Consultant. Costs for travel expenses will be the responsibility of the Owner and the Consultant. Supplier is responsible to provide two weeks notice for testing.

.4 Generator set factory tests on the equipment shall be performed at rated load and rated power factor. Generator sets that have not been factory tested at rated power factor will not be acceptable. Tests shall include:

.1 4 hour run at full load.

.2 Maximum power.

.3 Voltage regulation.

.4 Transient and steady-state governing.

.5 Single step load pickup:

.1 Zero to 100% to zero.

.2 Zero to 75% to zero.

.3 Zero to 50% to zero.

.4 Zero to 25% to zero.

.6 Function of safety shutdowns.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired prior to final system testing. Equipment shall be thoroughly cleaned to remove all dirt and construction debris prior to final testing of the system.

.2 Remove battery from emergency lighting equipment and store indoors in a climate controlled area prior to installation of the generator set.

3.2 PREPARATION

.1 Location of generator in accordance with the National Fire Code of Canada:

.1 Locate at a minimum distance of 1 m to a building on the same property.

.2 Locate at a minimum distance of 1 m to a property line.

.3 Located such that the exhaust vent or chimney is minimum 3 m (10 ft) from any building.

3.3 INSTALLATION

.1 Install equipment in accordance with final submittals and contract documents. Comply with applicable provincial and local codes as required by the Authority Having Jurisdiction. Install equipment in accordance with manufacturer's instructions and instructions included in the listing or labeling of CSA listed products.

.2 Perform Work to CSA C22.1.

.3 Conform to CSA B149.1.

.4 Concrete housekeeping pad:

.1 Install generator on concrete housekeeping pads [designed by Structural Engineer] to Section 03 30 00.

.2 Cast-in-place concrete housekeeping pad to extend a minimum of 1 m beyond footprint of generator.

.3 Coordinate exact conduit entry point with equipment submittals prior to fabricating pad.

.4 Sleeve conduit stubs and caulk conduits after concrete pour.

.5 Permanently fasten equipment to the pad in accordance with manufacturer's instructions and seismic requirements of the site.

.5 Provide all interconnecting wiring between all major equipment provided for the on-site power system. Provide interconnecting wiring between equipment sections (when required), under the supervision of the equipment supplier.

.6 Provide a minimum 60 A, 2-wire plus neutral plus ground feeder, fed from a 60A/2P breaker in the local 120/208 V emergency receptacle panel to feed generator accessory panel, unless noted otherwise by the manufacturer.

.7 Install remote annunciator adjacent to the automatic transfer switch, or as noted on drawings.

3.4 GROUNDING AND BONDING (3-POLE ATS)

.1 Ground and bond to Electrical Code requirements, and Section 26 05 26.

.2 Remove bonding jumper from generator neutral to suit 3-pole ATS.

.3 For 3-pole transfer switches utilized on 4-wire systems with unswitched neutrals, provide warning sign at the generator to clearly indicate the use of a floating neutral and that the generator neutral is not separately grounded.

3.5 NOT USED

3.6 FIELD QUALITY CONTROL

.1 Inspect equipment for physical damage. Repair scratches and other installation damage prior to final system testing. Thoroughly clean equipment to remove all dirt and construction debris prior to initial operation and final testing of the system.

.2 Manufacturer Services:

.1 On completion of the installation, conduct a site evaluation to verify that the equipment is installed per manufacturer's recommended practice.

.2 Equipment shall be initially started and operated by representatives of the manufacturer. All protective settings shall be adjusted as instructed by the Consultant.

.3 Inspections

.1 Complete all verifications, inspections, and reports prior to scheduling TSSA inspection.

.2 Carry for the cost of all inspections by authorities having jurisdiction, including, but not limited to, the Electrical Safety Authority (ESA), and Technical Standards Safety Authority (TSSA).

.3 Carry the cost of all TSSA variances, or as detailed in CSA B149.1.

.4 Confirm the emergency lighting unit is fully operational.

.4 On Site Acceptance Test

.1 The complete installation shall be tested to verify compliance with the performance requirements of this specification following completion of all site work. Testing shall be conducted by representatives of the manufacturer. Notify the Consultant in advance of the test for the option to witness the tests. The generator set manufacturer shall provide a site test specification covering the entire system.

.2 Prior to start of active testing, all field connections for wiring, power conductors, and bus bar connections shall be checked for proper tightening torque.

.3 Installation acceptance tests to be conducted on-site shall include a "cold start" test, a 4 hour full load (resistive) test, and a one step rated load pickup test in accordance with CSA C282. Provide a resistive load bank and make temporary connections for full load test, if necessary.

.4 Perform a power failure test on the entire installed system. This test shall be conducted by opening the power supply from the utility service, and observing proper operation of the system for at least 2 hours. Coordinate timing and obtain approval for start of test with site personnel.

.5 The generator set supplier shall issue a test report documenting the results of testing, and including a complete list of all settings in the control system.

.5 Provide labour and material to conduct the integrated systems testing of interconnected life safety systems in accordance with CAN/ULC-S1001-11.

3.7 TRAINING

.1 The equipment supplier shall provide training for the facility operating personnel covering operation and maintenance of the equipment provided. The training program shall be not less than 4 hours in duration and the class size shall be limited to 5 persons. Training date shall be coordinated with the Owner.

.2 Familiarize the Owner’s Representative in the testing and maintenance requirements prescribed by Ontario Regulations, O.Reg 524/98:

.1 The system shall be used and operated for the purpose of testing or performing maintenance for a maximum of 60 hours in any 12 month period.

.2 The system shall be used and operated for the purpose of testing or performing maintenance only between the hours of 7 a.m. and 7 p.m.

.3 When the system is used and operated for the purpose of testing or performing maintenance, the air intakes, doors and windows of any buildings or structures located on the same site as the system shall be closed, if doing so would reduce the likelihood of emissions from the system entering the building or structure.

.4 If more than one generator unit is part of the system, only one unit shall be used and operated at any time for the purpose of testing or performing maintenance.

.5 If the Ministry of the Environment issues a smog advisory that identifies an area in which the system is located, the system shall not be used or operated for the purpose of testing or performing maintenance until a termination notice with respect to the advisory has been issued for that area.

3.8 MAINTENANCE

.1 Perform equipment maintenance as described in PART 1 of this section.

END OF SECTION

Updated through ADD#8

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Provide complete factory assembled power transfer equipment with field programmable digital electronic controls designed for fully automatic operation and including, voltage sensors on all phases of both sources, linear operator, permanently attached manual handles, positive mechanical and electrical interlocking, and mechanically held contacts for both sources.

.2 The Automatic Transfer Switch will transfer the load in delayed transition (break and delay-before-make) mode.

.3 Automatic transfer switches are to be electrically operated, mechanically held open contact type, without integral overcurrent protection. Transfer switches utilizing automatic or non-automatic molded case circuit breakers as switching mechanisms are not acceptable.

.4 The transfer switch shall feature a double-sided bypass isolation mechanism.

1.2 RELATED REQUIREMENTS

.1 Section 26 08 36 – Performance Checklist for Automatic Transfer Switches.

.2 Section 26 32 13.13 – Diesel-Engine-Driven Generator Sets.

.3 Section 26 32 13.16 – Gas-Engine-Driven Generator Sets.

.4 Section 28 46 13 – Fire-Alarm Systems.

1.4 ACTION SUBMITTALS

.1 Within ten days after award of contract, provide electronic copies of the following information for review:

.2 Product Data:

.1 Submit manufacturer's instructions, printed product literature and data sheets for transfer switches and include product characteristics, performance criteria, physical size, finish and limitations, including voltage, switch size, ratings and size of switching and overcurrent protective devices, operating logic, short circuit ratings, dimensions, weights, and enclosure details.

.2 A copy of the markings that are to appear on the transfer switches when installed.

.3 Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency specified under Regulatory Requirements. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of Product.

.4 Interconnection wiring diagrams showing all external connections required; with field wiring terminals marked in a consistent point-to-point manner.

.5 Manufacturer’s certification of prototype testing.

.6 Manufacturer’s published warranty documents.

.3 Shop Drawings:

.1 Indicate on drawings:

.1 Make, model and type.

.2 Single line diagram showing controls and relays.

.3 Description of equipment operation including:

.1 Automatic starting and transfer to standby unit and back to normal power.

.2 Test control.

.3 Manual control.

.4 Automatic shutdown.

.2 Submit drawing of the engraved phenolic equipment nameplate.

1.5 CLOSEOUT SUBMITTALS

.1 Provide operation and maintenance data for automatic load transfer equipment for incorporation into manual specified in Section 01 78 00. Make prints of electronic submittals.

.2 Operation and Maintenance Data: submit operation and maintenance data for transfer switches for incorporation into manual.

.3 Detailed instructions to permit effective operation, maintenance, and repair.

.4 Technical data:

.1 Schematic diagram of components, controls and relays.

.2 Illustrated parts lists with parts catalogue numbers.

.3 Certified copy of factory test results.

.5 On-site commissioning and functional testing reports.

.6 Warranty card, specifying the warranties for all ATS's.

1.6 OPERATIONS AND MAINTENANCE DATA

.1 Operation Data: Include instructions for operating equipment. Include instructions for operating equipment under emergency conditions.

.2 Maintenance Materials:

.1 Include routine preventative maintenance and lubrication schedule.

.2 List special tools, maintenance materials, and replacement parts, or indicate if there are no special tools or user serviceable parts.

.3 Provide two of each special tool required for maintenance, if applicable.

1.7 QUALITY ASSURANCE

.1 Manufacturer Qualifications

.1 Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum three years documented experience, and with service facilities to respond in timely manner.

.2 Supplier: Authorized distributor of specified manufacturer with minimum three years documented experience.

.3 The manufacturer of the transfer switch shall maintain service parts inventory at a central location which is accessible to the service location 24 hours/day, 365 days/year.

.4 The transfer switch shall be serviced by a local service organization that is trained and factory certified in transfer switch service. The supplier shall maintain an inventory of critical replacement parts at the local service organization, and in service vehicles. The service organization shall be on call 24 hours/day, 365 days/year.

.5 Manufacturer certified to ISO 9001 International Quality Standard and shall have third party certification verifying quality assurance in design/development, production, installation, and service, in accordance with ISO 9001.

.2 Regulatory Requirements

.1 Provide products listed and classified by CSA or testing firm acceptable to authority having jurisdiction as suitable for purpose specified and indicated.

.2 CSA listed and labeled.

.3 Meet all requirements as described in CSA C282.

1.8 DELIVERY, STORAGE, AND HANDLING

.1 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

.2 Storage and Handling Requirements:

.1 Store materials indoors in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.

.2 Store and protect transfer switches from nicks, scratches, and blemishes.

.3 Replace defective or damaged materials with new.

1.9 FIELD MEASUREMENTS

.1 Verify that field measurements are as indicated on shop drawings.

1.10 MAINTENANCE SERVICE

.1 Provide service and maintenance of transfer switch for one year from date of Substantial Completion.

1.11 WARRANTY

.1 Minimum one year from the date of commissioning, warranted against defects in materials and workmanship.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 ASCO 7000 Series automatic transfer and bypass isolation switch (basis of design).

.2 Cummins Power Generation.

.3 Caterpillar.

.4 Eaton.

.5 Kohler Power Systems.

.6 LMR Power Systems Inc.

2.2 RATINGS

.1 As indicated on single line diagram.

.2 Minimum interrupting capacity per the following table, unless a higher value is indicated on the drawings:

Switch Rating (amps)	AIC Rating (kA)
70 - 225	25
250	25
400	35
600, 800	65
1000, 1200	65
1600, 2000	65 [100 Optional]
2500, 3000	100
4000	100

2.3 SYSTEM DESCRIPTION

.1 Automatic load transfer equipment to:

.1 Monitor voltage on all phases of normal (utility) and emergency (generator) power sources.

.2 Initiate cranking of standby generator unit on normal power failure or abnormal voltage on any one phase below preset adjustable limits for adjustable period of time.

.3 Transfer load from normal supply to standby unit when standby unit reaches rated frequency and voltage pre-set adjustable limits.

.4 Transfer load from standby unit to normal power supply when normal power restored, confirmed by sensing of voltage on phases above adjustable pre-set limit for adjustable time period.

.5 Shut down standby unit after running unloaded to cool down using adjustable time delay relay.

2.4 AUTOMATIC TRANSFER AND BYPASS/ISOLATION SWITCH

.1 Description: NEMA ICS 2, automatic transfer switch with manual bypass switch suitable for continuous operation.

.2 Configuration: Draw-out type electrically-operated, mechanically-held transfer switch with manually-operated CONNECTED, TEST, AND DISCONNECTED draw-out positions, and with mechanically-operated, mechanically-held transfer switch connected to bypass automatic switch in both NORMAL and EMERGENCY positions.

.3 The transfer switch shall feature a double sided bypass-isolation mechanism to allow power transfer switches to be inspected, tested, and maintained without any interruption of power to the load.

.4 The isolate and bypass procedure shall not exceed 15 seconds.

.5 Transfer switch shall permit bypass of the load to either source without load interruption.

.6 Bypass Switch Ratings: Match automatic transfer switch for electrical ratings.

.7 Transition: Delayed.

2.5 CONSTRUCTION

.1 Transfer switches shall be double-throw, electrically and mechanically interlocked, and mechanically held in the source 1 and source 2 positions. The transfer switch shall be specifically designed to transfer to the best available source if it inadvertently stops in a neutral position.

.2 Transfer switches shall be equipped with permanently attached manual operating handles and quick-break, quick-make over-center contact mechanisms.

.3 Main switch contacts shall be high-pressure silver alloy. Contact assemblies shall have arc chutes for positive arc extinguishing. Arc chutes shall have insulating covers to prevent inter-phase flashover.

.4 Transfer switch internal wiring shall be composed of pre-manufactured harnesses that are permanently marked for source and destination. Harnesses shall be connected to the control system by means of locking disconnect plugs, to allow the control system to be easily disconnected and serviced without disconnecting power from the transfer switch mechanism.

.5 Power transfer switch shall be provided with flame retardant transparent covers to allow viewing of switch contact operation but prevent direct contact with components that could be operating at line voltage levels.

.6 Transfer switches shall be provided with a neutral bus and lugs. The neutral bus shall be sized to carry 100% of the current designated on the switch rating.

2.6 ENCLOSURE

.1 Enclosure: ICS 6, Type 1.

.2 Finish: Manufacturer's standard gray enamel.

.3 Maximum dimensions and space restrictions: refer to drawings.

.1 Ensure adequate space is available at sides and rear of the equipment as required to allow access during installation.

.4 Enclosures shall be UL listed. The enclosure shall provide wire bend space in compliance to the latest version of CSA standards. The cabinet door shall include permanently mounted key type latches.

.5 Transfer switch equipment shall be provided in a minimum NEMA 1 sprinklerproof enclosure.

.6 Enclosures shall be the NEMA type specified. The cabinet shall provide code-required wire bend space at point of entry as shown on the drawings. Manual operating handles and all control switches (other than key-operated switches) shall be accessible to authorized personnel only by opening the key-locking cabinet door. Transfer switches with manual operating handles and/or non key-operated control switches located on outside of cabinet do not meet this specification and are not acceptable.

.7 Enclosure shall be complete with wireway as required to accept top, side, or bottom cable entry.

2.7 CONNECTIONS

.1 Field control connections shall be made on a common terminal block that is clearly and permanently labeled.

.2 Transfer switch shall be provided with mechanical lugs suitable for copper conductors and sized to accept the full output rating of the switch.

.3 Lugs suitable for multiple parallel runs of conductors.

.4 Contractor to field verify exact size and quantity of existing conductors.

2.8 SERVICE CONDITIONS

.1 Transfer switches rated to carry 100 per cent of rated current continuously in the enclosure supplied, in ambient temperatures of -40°C to +60°C, relative humidity up to 95 per cent non-condensing, and altitudes up to 3000 m (10 000 feet).

2.9 MATERIALS

.1 Instrument transformers: to CAN/CSA C60044-1.

.2 Contactors: to NEMA ICS2.

2.10 CONTROLS AND INDICATORS

.1 Selector switches:

.1 2 position for system test with load “Test”, “Auto”

.2 3 position for generator control “Auto”, “Manual”, “Engine Start”

.3 Test position - normal power failure simulated. Engine starts and transfer takes place. Return switch to "Auto" to stop engine.

.4 Auto position - normal operation of transfer switch on failure of normal power; retransfers on return of normal voltage and shuts down engine.

.5 Manual position - transfer switch may be operated by manual handle but transfer switch will not operate automatically and engine will not start.

.6 Engine start position - engine starts but unit will not transfer unless normal power supply fails. Switch must be returned to "Auto" to stop engine.

.2 Control transformers: dry type with 120 V secondary to isolate control circuits from:

.1 Normal power supply.

.2 Emergency power supply.

.3 Relays: continuous duty, industrial control type, with wiping action contacts rated 10 A minimum:

.1 Voltage sensing: 3 phase for normal power and on three phases for emergency, solid state type, adjustable drop out and pick up, close differential, 2 V minimum undervoltage and over voltage protection.

.2 Time delays as indicated in the Sequence of Operation section

.3 Frequency sensing, to prevent transfer from normal power supply until frequency of standby unit reaches preset adjustable values.

.4 Product Options and Features

.1 Indicating Lights: Mount in cover of enclosure to indicate NORMAL SOURCE AVAILABLE, ALTERNATE SOURCE AVAILABLE, SWITCH POSITION, NORMAL BYPASS, ALTERNATE SOURCE BYPASS.

.2 Test Switch: Mount in cover of enclosure to simulate failure of normal source.

.3 Return to Normal Switch: Mount in cover of enclosure to initiate manual transfer from alternate to normal source.

.4 Transfer Switch Auxiliary Contacts: two normally open; two normally closed.

.5 Normal Source Monitor: Monitor each line of normal source voltage and frequency; initiate transfer when voltage drops below 85 percent or frequency varies more than 3 percent from rated nominal value.

.6 Alternate Source Monitor: Monitor alternate source voltage and frequency; inhibit transfer when voltage is below 85 percent or frequency varies more than 3 percent from rated nominal value.

.5 Operator Panel. Each transfer switch shall be provided with a control panel to allow the operator to view the status and control operation of the transfer switch. The operator panel shall be a sealed membrane panel rated NEMA 3R/IP53 or better that is permanently labeled for switch and control functions. The operator panel shall be provided with the following features and capabilities.

.1 High intensity LED lamps to indicate the source that the load is connected to (source 1 or source 2); and which sources are available. Source available LED indicators shall operate from the control microprocessor to indicate the true condition of the sources as sensed by the control.

.2 High intensity LED lamps to indicate that the transfer switch is “not in auto” (due to control being disabled or due to bypass switch enabled or in operation) and “Test/Exercise Active” to indicate that the control system is testing or exercising the generator set.

.3 “OVERRIDE” pushbutton to cause the transfer switch to bypass any active time delays for start, transfer, and retransfer and immediately proceed with its next logical operation.

.4 “TEST” pushbutton to initiate a pre-programmed test sequence for the generator set and transfer switch. The transfer switch shall be programmable for test with load or test without load.

.5 “LAMP TEST” pushbutton(s) to test all lamps on the panel by lighting them, either simultaneously from one control, or individually.

.6 The control system shall continuously log information on the number of hours each source has been connected to the load, the number of times transferred, and the total number of times each source has failed. This information shall be available via a PC-based service tool or an operator display panel.

.7 Security Key Switch or password on control panel to allow the user to inhibit adjustments.

.8 Key operated test operator switch to prevent manual operation or testing of the transfer switch unless key is in place and operated.

.9 Digital AC meter display panel, to display 3-phase AC Volts, Hz, kW load level, and load power factor. The display shall be colour-coded, with green scale indicating normal or acceptable operating level, yellow indicating conditions nearing a fault, and red indicating operation in excess of rated conditions for the transfer switch.

.10 Vacuum fluorescent or LCD alphanumeric display panel with push-button navigation switches. The display shall be clearly visible in both bright (sunlight) and no light conditions. It shall be visible over an angle of at least 120 degrees. The Alphanumeric display panel shall be capable of providing the following functions and capabilities:

.1 Display source condition information, including AC voltage for each phase of normal and emergency source, frequency of each source. Voltage for all three phases shall be displayed on a single screen for easy viewing of voltage balance.

.2 Display source status, to indicate source is connected or not connected.

.3 Display load data, including 3-phase AC voltage, 3-phase AC current, frequency, kW, kVA, and power factor. Voltage and current data for all phases shall be displayed on a single screen.

.4 The display panel shall allow the operator to view and make the following adjustments in the control system, after entering an access code:

.1 Adjust voltage and frequency sensor operation set points.

.2 Set up time clock functions.

.3 Set up load sequence functions.

.4 Enable or disable control functions in the transfer switch, including program transition.

.5 Set up exercise and load test operation conditions, as well as normal system time delays for transfer time, time delay start, stop, transfer, and retransfer.

.5 Display Real time Clock data, including date, and time in hours, minutes, and seconds. The real time clock shall incorporate provisions for automatic daylight savings time and leap year adjustments. The control shall also log total operating hours for the control system.

.6 Display service history for the transfer switch. Display source connected hours, to indicate the total number of hours connected to each source. Display number of times transferred, and total number of times each source has failed.

.7 Display fault history on the transfer switch, including condition, date/time of fault. Faults to include controller checksum error, low controller DC voltage, ATS fail to close on transfer, ATS fail to close on retransfer, battery charger malfunction, network battery voltage low, network communications error.

.6 Internal Controls

.1 Provide RMS voltage sensing and metering that is accurate to within plus or minus 1% of nominal voltage level. Frequency sensing shall be accurate to within plus or minus 0.2%. Voltage sensing shall be monitored based on the normal voltage at the site. Systems that utilize voltage monitoring based on standard voltage conditions that are not field configurable are not acceptable.

.2 Transfer switch voltage sensors shall be close differential type, providing source availability information to the control system based on the following functions:

.1 Monitoring all phases of the normal service (source 1) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the normal voltage level and dropout in a range of 75 to 98% of normal voltage level).

.2 Monitoring all phases of the emergency service (source 2) for under voltage conditions (adjustable for pickup in a range of 85 to 98% of the normal voltage level and dropout in a range of 75 to 98% of pickup voltage level).

.3 Monitoring all phases of the normal service (source 1) and emergency service (source 2) for voltage imbalance.

.4 Monitoring all phases of the normal service (source 1) and emergency service (source 2) for loss of a single phase.

.5 Monitoring all phases of the normal service (source 1) and emergency service (source 2) for phase rotation.

.6 Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over voltage conditions (adjustable for dropout over a range of 105 to 135% of normal voltage, and pickup at 95-99% of dropout voltage level).

.7 Monitoring all phases of the normal service (source 1) and emergency service (source 2) for over or under frequency conditions.

.8 Monitoring the neutral current flow in the load side of the transfer switch. The control shall initiate an alarm when the neutral current exceeds a preset adjustable value in the range of 100-150% of rated phase current for more than an adjustable time period of 10 to 60 seconds.

.3 All transfer switch sensing shall be configurable from the Transfer Switch or a Remote PC-based service tool, to allow setting of levels, and enabling or disabling of features and

functions. Selected functions including voltage sensing levels and time delays shall be configurable using the operator panel. Designs utilizing DIP switches or other electromechanical devices are not acceptable. The transfer control shall incorporate a series of diagnostic LED lamps.

.4 The transfer switch shall be configurable to control the operation time from source to source (program transition operation). The control system shall be capable of enabling or disabling this feature, and adjusting the time period to a specific value. A phase band monitor or similar device is not acceptable.

.5 The transfer switch shall incorporate adjustable time delays for generator set start (adjustable in a range from 0-15 seconds); transfer (adjustable in a range from 0-120 seconds); retransfer (adjustable in a range from 0-30 minutes); and generator stop (cool-down) (adjustable in a range of 0-30 minutes).

.6 The transfer switch shall be configurable to accept a relay contact signal and a network signal from an external device to prevent transfer to the generator service.

.7 The control system shall be designed and prototype tested for operation in ambient temperatures from -40°C to +70°C. It shall be designed and tested to comply with the requirements of the noted voltage and RFI/EMI standards.

.8 The control shall have optically isolated logic inputs, high isolation transformers for AC inputs, and relays on all outputs, to provide optimum protection from line voltage surges, RFI and EMI.

2.11 ACCESSORIES

.1 Ensure pilot lights indicate power availability normal and standby, switch position, green for normal, red for standby, mounted in panel.

.2 Plant exerciser.

.3 Auxiliary Relays:

.1 Auxiliary relays to provide normally open (NO) and normally closed (NC) contacts for remote alarms.

.2 The transfer switch will provide the following dry contact monitoring points to determine status of the ATS remotely:

.1 Normal power available

.2 Emergency power available

.3 ATS in “Normal” position

.4 ATS in “Emergency” position

.5 ATS “Not in Auto”

.6 Pre-transfer

.7 Failure to Synchronize

.8 Extended Parallel Alarm

.4 Instruments:

.1 Digital true RMS, indicating type 2 per cent accuracy, flush panel mounting:

.1 Voltmeter: AC, scale 0 to nominal system voltage +10%.

.2 Ammeter: ac, scale 0 to 10% above continuous rating.

.3 Frequency meter: scale 55 Hz to 65 Hz.

.4 Voltmeter selector switch: rotary, maintained contacts, panel mounting type, round notched handle, four position, labelled "OFF-Phase A-Phase B-Phase C".

.5 Ammeter selector switch: rotary, maintained contacts, panel mounting type, designed to prevent opening of current circuits, round notched handle, four position labelled "OFF - Phase A - Phase B - Phase C".

.6 Bypass and Isolator

.1 A two-way bypass-isolation switch shall provide manual bypass of the load to either source and permit isolation of the automatic transfer switch from all source and load power conductors. All main contacts shall be manually driven.

.2 Power interconnections shall be silver-plated copper bus bar. The only field installed power connections shall be at the service and load terminals of the bypass-isolation switch. All control interwiring shall be provided with disconnect plugs.

.3 Separate bypass and isolation handles shall be utilized to provide clear distinction between the functions. Handles shall be permanently affixed and operable without opening the enclosure door. Designs requiring insertion of loose operating handles or opening of the enclosure door to operate are not acceptable.

.4 Bypass to the load-carrying source shall be accomplished with no interruption of power to the load (make before break contacts). Designs that disconnect the load when bypassing are not acceptable. The bypass handle shall have three operating modes: "Bypass to Normal," "Automatic," and "Bypass to Emergency." The operating speed of the bypass contacts shall be the same as the associated transfer switch and shall be independent of the speed at which the manual handle is operated. In the "Automatic" mode, the bypass contacts shall be out of the power circuit so that they will not be subjected to fault currents to which the system may be subjected.

.5 The isolation handle shall provide three operating modes: "Closed," "Test," and "Open." The "Test" mode shall permit testing of the entire emergency power system, including the automatic transfer switches with no interruption of power to the load. The "Open" mode shall completely isolate the automatic transfer switch from all source and load power conductors. When in the "Open" mode, it shall be possible to completely withdraw the automatic transfer switch for inspection or maintenance to conform to code requirements without removal of power conductors or the use of any tools.

.6 When the isolation switch is in the "Test" or "Open" mode, the bypass switch shall function as a manual transfer switch.

.7 Designs requiring operation of key interlocks for bypass isolation or ATSs which cannot be completely withdrawn when isolated are not acceptable.

.7 Communications Module

.1 The communications shall be capable of connecting to the Ethernet TCP/IP network with BacNet card for BAS communication. This module shall allow for the seamless integration of communication transfer devices.

.2 Allow remote viewing of transfer switch information from a PC, including transfer switch name, real time load in kW on the transfer switch, current source condition, and current operating mode.

2.12 EQUIPMENT IDENTIFICATION

.1 Identify equipment in accordance with Section 26 05 53.

.2 Control panel:

.1 For selector switch and manual switch: size 4 nameplates.

.2 For meters, indicating lights, minor controls: use size 3 nameplates.

.3 Warning labels:

.1 For 3-pole transfer switches utilized on 4-wire systems with unswitched neutrals, provide warning sign on transfer switch to clearly indicate the use of a floating neutral and that the generator neutral is not separately grounded.

.2 For 4-pole transfer switches utilized on a 4-wire system with a switch neutral, provide warning sign on transfer switch to clearly indicate that each source is separately grounded.

.4 Nameplates:

.1 Engraved phenolic nameplate, 3 mm (1/8 in) thick plastic engraved sheet.

.2 Red face, white core unless noted otherwise.

.3 To be mechanically attached with self-tapping screws.

.4 White letters, 12 mm (1/2 in.) high unless otherwise noted below.

.5 To include:

.1 Identity of equipment (i.e. ATS-1), 20 mm (3/4 in.) high letters.

.2 Voltage.

.3 Ampacity.

.4 Number of phases.

.5 Identity, switchboard section (if applicable), circuit number, and size of Normal Power source.

.6 Identity, switchboard section (if applicable), circuit number, and size of Emergency Power source.

.7 Identity of device or panelboard on the Load side of the transfer switch.

.8 Date of installation.

.9 If upstream or downstream device is located in a separate room from ATS, indicate the room name and number.

.6 Confirm exact colours and text with the engineer prior to fabrication.

.7 Example of nameplate:

AUTOMATIC TRANSFER AND BYPASS ISOLATION SWITCH

ATS-1

800 A-4P, SWITCHED NEUTRAL, 347/600 V, 3PH, 4W

NORMAL FED FROM 800 A-3P BREAKER IN MAIN SWITCHBOARD

EMERGENCY FED FROM 450 kW STANDBY GENERATOR OUTSIDE

CONTROLS 450 kW GENERATOR FOR DATA CENTRE

FEEDING PANEL DPSP6A

INSTALLED APRIL 2013

2.13 SOURCE QUALITY CONTROL

.1 Complete equipment, including transfer mechanism, controls, relays, and accessories factory assembled and tested in presence of the Consultant.

.2 Notify Consultant 5 days minimum in advance of date of factory test.

.3 Tests:

.1 Operate equipment both mechanically and electrically to ensure proper performance.

.2 Check selector switch, in modes of operation Test, Auto, Manual, Engine Start and record results.

.3 Check voltage sensing and time delay relay settings.

.4 Check:

.1 Automatic starting and transfer of load on failure of normal power.

.2 Retransfer of load when normal power supply resumed.

.3 Automatic shutdown.

.5 Provide copy of test reports and include with Commissioning Manual.

2.14 SEQUENCE OF OPERATION

.1 The automatic and manual control of an emergency electrical power supply system, including the starting of a generator set or generator sets, and actuation of automatic transfer switches to connect a load to the emergency supply and reconnect it to the normal supply, shall be in the following sequence:

.1 Confirm initial set points with the Consultant prior to start up and commissioning.

.2 The generator sets shall be started when the normal supply at the transfer switch on one or more phase has been interrupted or is at a voltage that is less than 70 per cent of the nominal system voltage for 3 seconds.

.1 Initiate time delay to start alternate source engine generator: Upon initiation by normal source monitor.

.2 Time delay to start alternate source engine generator: 0 to 3 seconds, adjustable. Initial set point 3 seconds.

.3 Initiate transfer load to alternate source: Upon initiation by normal source monitor and permission by alternate source monitor.

.4 Time delay before transfer to alternate power source: 0 to 60 minutes, adjustable.

.1 Initial set point for “Non-Life Safety” transfer switches: 30 seconds.

.5 The set points for the items above shall be configured such that the generator is connected to and powering life safety equipment within 15 seconds of the loss of normal power.

.3 Where delayed emergency loads are arranged to be connected to the emergency supply later than the emergency loads, all of the delayed emergency loads and any other loads that have been arranged for connection at the same time.

.4 On restoration of the normal supply, and after nominal voltage and frequency have been maintained at nominal levels on all phases of the transfer switch for a period of 1 to 30 minutes, the automatic transfer switches shall transfer the loads back to the normal supply, except that the transfer shall occur without delay when an emergency supply fails.

.1 Initiate retransfer load to normal source: upon permission by normal source monitor.

.2 Time delay before transfer to normal power: 0 to 60 minutes, adjustable; bypass time delay in event of alternate source failure. Initial set point 10 minutes.

.3 Delayed transition duration: 0.5 to 3 seconds. Initial set point 0.5 seconds.

.5 After the transfer of loads back to the normal supply, the automatic shutdown of the generator set shall be delayed for 5 minutes or a reasonable length of time to stabilize the operating temperature under no-load conditions.

.1 Time delay before engine shut down: 0 to 60 minutes, adjustable, of unloaded operation. Initial set point 5 minutes.

.2 Automatic engine exerciser:

.1 Engine Exerciser: Start engine every 7 days; run for 30 minutes before shutting down. Bypass exerciser control if normal source fails during exercising period.

.2 Alternate System Exerciser: Transfer load to alternate source during engine exercising period.

.3 Initial set point: turn off automatic engine exerciser.

.3 Generator Set Exercise (Test) With Load Mode. The control system shall be configurable to test the generator set under load. In this mode, the transfer switch shall control the generator set in the following sequence:

.1 Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

.2 The transfer switch shall issue a compatible start command to the generator set, and cause the generator set to start and run at idle until it has reached normal operating temperature.

.3 When the generator set has reached normal operating temperature or after an adjustable time period (whichever is shorter), the control system shall accelerate the generator set to rated voltage and frequency.

.4 When the control systems senses the generator set at rated voltage and frequency, it shall operate to connect the loads to the generator set by opening the normal source contacts, and closing the alternate source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

.5 The generator set shall operate connected to the load for the duration of the exercise period. If the generator set fails during this period, the transfer switch shall automatically reconnect the generator set to the normal service.

.6 On completion of the exercise period, the transfer switch shall operate to connect the loads to the normal source by opening the alternate source contacts, and closing the normal source contacts a predetermined time period later. The timing sequence for the contact operation shall be programmable in the controller.

.7 The transfer switch shall operate the generator set unloaded for a cool-down period, and then remove the start signal from the generator set. If the normal power fails at any time when the generator set is running, the transfer switch shall immediately connect the system loads to the generator set.

.4 Generator Set Exercise (Test) Without Load Mode. The control system shall be configurable to test the generator set without transfer switch load connected. In this mode, the transfer switch shall control the generator set in the following sequence:

.1 Transfer switch shall initiate the exercise sequence at a time indicated in the exercise timer program, or when manually initiated by the operator.

.2 When the control systems senses the generator set at rated voltage and frequency, it shall operate the generator set unloaded for the duration of the exercise period.

.3 At the completion of the exercise period, the transfer switch shall remove the start signal from the generator set. If the normal power fails at any time when the generator set is running, the transfer switch shall immediately connect the system loads to the generator set.

2.15 SOURCE QUALITY CONTROL

.1 The transfer switch manufacturer shall perform a complete operational test on the transfer switch prior to shipping from the factory. Tests shall be conducted as per CSA standards. A certified test report shall be included in each copy of the Operations Manual. Test process shall include calibration of voltage sensors. The following factory tests shall be performed:

.1 Visual inspection to verify that each ATS is in accordance with the specifications.

.2 Mechanical test to verify that ATS sections are free of mechanical hindrances.

.3 Insulation resistance test to ensure integrity and continuity of entire system.

.4 Main switch contact resistance test.

.5 Electrical tests to verify complete system electrical operation and to set up time delays and voltage sensing settings.

.2 Provide for the Owner and Consultant to witness factory testing.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Verify existing conditions, including restrictions for moving equipment into position and ensure equipment can suit these limitations.

.2 Coordinate disassembly and field assembly of equipment with the manufacturer.

3.2 INSTALLATION

.1 Install transfer switches to in accordance with codes, as shown on the drawings, and as recommended by manufacturer's instructions.

.2 Provide engraved plastic nameplates.

.3 Locate, install and connect transfer equipment as indicated.

.4 Check relays and solid state monitors and adjust as required to ensure correct operation.

.5 Install and connect remote alarms and IP based monitoring.

.6 Connect generator control wiring.

.1 Provide one pair of stranded conductors from the ATS “start-stop” signal contacts to the generator.

.2 Provide one-pair of conductors from the ATS “on generator source” contacts to the load bank shunt trip breaker.

.7 Set field-adjustable intervals and delays, relays, and engine exerciser. Verify exact set points with the Consultant.

3.3 MANUFACTURER'S FIELD SERVICES

.1 The manufacturer shall provide disassembly, field assembly, and field certification services to suit restrictions of moving equipment into place.

.2 A factory-authorized service representative is to perform start-up and testing of the ATS in the presence of the commissioning authority.

3.4 FIELD QUALITY CONTROL

.1 Perform tests in accordance with Section 26 05 00, and Section 26 08 00.

.2 Energize transfer equipment from normal power supply.

.3 Set selector switch in "Test" position to ensure proper standby start, running, transfer, retransfer. Return selector switch to "Auto" position to ensure standby shuts down.

.4 Set selector switch in "Manual" position and check to ensure proper performance.

.5 Set selector switch in "Engine start" position and check to ensure proper performance. Return switch to "Auto" to stop engine.

.6 Set selector switch in "Auto" position and open normal power supply disconnect. Standby should start, come up to rated voltage and frequency, and then load should transfer to standby. Allow to operate for 10 minutes, then close main power supply disconnect. Load should transfer back to normal power supply and standby should shutdown. Repeat, at 1 hour intervals, 4 times, complete test with selector switch in each position, for each test.

3.5 SITE TESTS AND INSPECTIONS

.1 Submit commissioning reports to the Consultant.

.2 A factory-authorized service representative is required to inspect components, assemblies, and equipment installation, including connections, and to assist in testing.

.3 Following completion of automatic transfer switch installation and after making proper adjustments and settings, site tests shall be performed by the manufacturer’s representative in accordance with manufacturer's written instructions to demonstrate that each automatic transfer

switch functions satisfactorily and as specified. Advise the Consultant of the site testing within five days prior to its scheduled date, and provide certified field test reports within 14 days following successful completion of the site tests. Test reports shall describe adjustments and settings made and site tests performed. Minimum operational tests shall include the following:

.1 Insulation resistance shall be tested, both phase-to-phase and phase-to-ground.

.2 Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.

.3 Verify that manual transfer warnings are properly placed.

.4 Perform manual transfer operation.

.5 After energizing circuits, demonstrate the interlocking sequence and operational function.

.6 Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.

.7 Simulate loss of phase-to-ground voltage for each phase of normal source.

.4 Verify time-delay settings.

.5 Verify pickup and dropout voltages by data readout or inspection of control settings.

.6 Verify proper sequence and correct timing of automatic engine starting, transfer time delay, re-transfer time delay on restoration of normal power, and engine cool-down and shut-down.

.7 Test bypass/isolation unit functional modes and related automatic transfer-switch operations.

.8 Power failure of normal source shall be simulated by opening upstream protective device. This test shall be performed a minimum of five times.

.9 Power failure of emergency source with normal source available shall be simulated by opening upstream protective device for emergency source. This test shall be performed a minimum of five times.

.10 Low phase-to-ground voltage shall be simulated for each phase of normal source.

.11 Operation and settings shall be verified for specified automatic transfer switch operational feature, such as override time delay, transfer time delay, return time delay, engine shutdown time delay, exerciser, auxiliary contacts, and supplemental features.

.12 Manual and automatic transfer and bypass isolation functions shall be verified.

3.6 CLEANING

.1 Progress Cleaning: clean in accordance with Section 01 74 00. Leave Work area clean at end of each day.

.2 Final Cleaning: upon completion remove surplus materials, rubbish, tools, and equipment in accordance with Section 01 74 00.

3.7 DEMONSTRATION

.1 At the final inspection in the presence of the Consultant, demonstrate that the complete auxiliary electrical power system operates properly in every respect.

.2 Coordinate this demonstration with the demonstration of the engine-generator.

.3 Demonstrate operation of transfer switch in bypass, normal, and emergency modes.

.4 Demonstrate operation of IP based monitoring and configuration.

3.8 TRAINING

.1 The equipment supplier shall provide training for the facility operating personnel covering operation and maintenance of the equipment provided.

.2 The training program shall be not less than two hours in duration.

.3 Training date shall be coordinated with the Owner.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

.1 Section Includes

.1 These specifications describe pertinent material requirements and installation practices for externally mounted, Low Voltage AC Power Panel Surge Protective Devices (SPDs). Furnish and install the SPDs equipment having the electrical characteristics, ratings and modifications as specified herein and as shown on the contract drawings.

.2 The specifications in this section describe the electrical and mechanical requirements for a protection system provided by high-energy Surge Protective Devices. The specified system shall provide effective, high-energy surge current diversion and be suitable for application in ANSI/IEEE C62.41 Category A, B, and C environments (as tested by ANSI/IEEE C62).

.2 Applicability

.1 SPDs shall be fully applicable for the purpose of protecting all facility AC electrical circuits from the hazardous effects of transient voltages. These transients may be generated externally by lightning induced energies, utility load factor corrections, and substation switching, or they can be internally generated due to inductive and/or capacitive load switching.

.3 Suitability

.1 SPDs shall be suitable for all service entrance switchboards, panelboards and motor control centres as indicated on the electrical layouts and single line diagrams. Products are to be configured for parallel installation - no series designs shall be considered acceptable. Design products to allow installation as a stand-alone device allowing mounting adjacent to switchboards, panelboards, and motor control centres. Installation is to be accomplished by a qualified electrical contractor.

1.2 RELATED REQUIREMENTS

.1 Section 26 24 16 – Panelboards.

.2 Section 26 28 16.02 – Molded Case Circuit Breakers.

.6 Other relevant standards:

.1 MIL-STD-220C, Method of Insertion-Loss Measurement.

1.4 DEFINITIONS

.1 Surge Protective Device: A device composed of at least one non-linear component and intended for limiting surge voltages on equipment by diverting or limiting surge current and is capable of repeating these functions as specified. SPDs were previously known as Transient Voltage Surge Suppressors (TVSS) or secondary surge arresters.

.2 SPD Types:

.1 Type 1 – Permanently connected device installed before or after the service disconnect overcurrent device and intended to be installed with no external overcurrent protective device.

.2 Type 2 – Permanently connected Type 2 SPDs are intended for installation on the load side of the service equipment overcurrent device, including SPDs located at the branch panel.

.3 Type 3 – Point of use SPDs that are installed with a minimum of 30 feet of conductor length from the service panel. These 30 feet of conductor length does not include conductors used to attach the SPD. Some examples of Type 3 SPDs are cord connected, direct plug-in and receptacle type SPDs.

.4 Type 4 – component assemblies.

.5 Type 5 – components.

.3 L-G: measurements from phase to equipment grounding conductor as line terminals of utilization equipment.

.4 L-L: measurements from phase to phase in a polyphase system, or from one line to another line in a single-phase system.

.5 L-N: measurement from phase(s) to neutral for both single and three phase systems.

.6 N-G: measurements from neutral to equipment grounding conductor at line terminal of utilization equipment.

.7 Externally mounted SPD: Surge Protective Device (SPD) mounted outside of the power panel as a separate component.

1.5 SUBMITTALS

.1 Submit in accordance with Section 01 33 00.

.2 Shop Drawings:

.1 Line drawings or catalog sheets detailing dimensions and weight of enclosure, lifting and support points, and enclosure details.

.2 Internal wiring diagram illustrating all modes of protection in each type of SPD required.

.3 Wiring diagram showing all field connections and manufacturer's recommended wire size, recommended circuit breaker or fuse size, required overcurrent protection type, and maximum lead length.

.3 Provide the following product data:

.1 Voltage Protection Ratings (VPRs), I-nominal ratings, Short Circuit Current Ratings, SPD type designations, dimensions showing construction, per mode and per phase peak surge current, modes of discrete suppression circuitry, warranty period, and replacement terms.

.2 List and detail all protection systems such as fuses, disconnecting means, and protective features.

.4 Submit product data for all components and accessories.

.5 Manufacturer's Installation Instructions:

.1 Indicate application conditions and limitations of use stipulated by product testing agency specified under Regulatory Requirements.

.2 Include instructions for storage, handling, protection, examination, preparation, installation, and starting of product.

.6 Test reports:

.1 Submit cover sheet of test report from a recognized independent testing laboratory certifying compliance with CSA C22.2 No. 269.2.

.2 Provide verification that the SPD complies with CSA C22.2 No. 269.2.

.3 Provide spectrum analysis of each unit based on MIL-STD-220C test procedures between 10 kHz and 100 kHz verifying the devices noise attenuation equals or exceeds values indicated in this section.

.4 Documentation verifying Short Circuit Current Rating (SCCR).

.5 Proof of UL 1283 listing for EMI filters.

.7 Upon request, present unencapsulated but complete SPD for visual inspection; proprietary technology included. MOV type and quantity shall reflect kA ratings on cut sheets, verification of monitoring, thermal, overcurrent protection, etc.

.8 Include the following information:

.1 Data for each suppressor type indicating conductor sizes, conductor types, and connection configuration and lead lengths.

.2 Manufacturer's certified test data indicating the ability of the product to meet or exceed requirements of this specification.

.3 Drawings, with dimensions, indicating SPD mounting arrangement and lead length configuration, and mounting arrangement of any optional remote diagnostic equipment and assemblies.

.4 List and detail all protection systems such as fuses, disconnecting means and protective materials.

.5 Indicate SPD wiring, bonding, and grounding connections on wiring diagrams for each system. Include installation details demonstrating mechanical and electrical connections to equipment to be protected.

.6 Wiring diagram of SPD diagnostic indicators.

1.6 CLOSEOUT SUBMITTALS

.1 Maintenance data: submit operation and maintenance data, and engineering data for incorporation into manual specified in Section 01 78 00.

.2 Warranty document.

1.7 ENVIRONMENTAL REQUIREMENTS

.1 Operating temperature range: -40 degrees C to 70 degrees C (-40 degrees F to 160 degrees F).

.2 Elevation: Operation up to 3 658 m (12 000 feet) above sea level.

.3 Generate no appreciable magnetic fields.

1.8 DELIVERY, STORAGE, AND HANDLING

.1 Deliver, store, and handle in accordance with Section 01 61 00.

.2 Store materials in dry, secure location and protect from weather.

.3 Protect from moisture and humidity.

.4 Store in accordance with manufacturer's written instructions.

.5 Waste management and disposal in accordance with Section 01 74 00.

1.9 MANUFACTURER WARRANTY

.1 Five-year warranty.

.2 Since "Acts of Nature" or similar statements typically include the threat of lightning to which the SPD shall be exposed, any such clause limiting warranty responsibility in the general conditions of this specification shall not apply to this section. This is, the warranty shall cover the effects of lightning, single phasing, and all other electrical anomalies. The warranty shall cover the entire device, not just various components, such as modules only.

1.10 MANUFACTURER QUALIFICATIONS

.1 Manufacturer regularly engaged in the design, manufacturing and testing of SPD’s of the types and ratings required for a period of not less than five years. Manufacturers requesting product approval must meet or exceed the written specification contained herein. Manufacturers requesting approval must receive written verification of product acceptance by the Consultant ten days prior to the bid date.

1.11 QUALITY ASSURANCE

.1 All SPDs manufactured by a single ISO 9001 registered company normally engaged in the design, development, and manufacture of such devices for electrical and electronic system equipment protection.

.2 Manufacturer regularly engaged in the manufacture of surge suppression products for the specified categories for minimum of ten years.

.3 Manufacturer shall offer repair or replacement service for all materials and components incorporated in the Surge Protective Devices.

.4 Technical assistance (no cost to customer) provided by manufacturer through a factory representative or a local distributor and a factory staffed toll-free technical hotline.

.5 Manufacturer shall provide a toll-free customer service phone number to facilitate all inquiries regarding product returns, warranty claims, purchasing requirements and payment or credit issues.

.6 Listed to most recent edition of CSA C22.2 No. 269.2.

.7 Products certified by a recognized testing agency accredited by the Standards Council of Canada, and bear a certification mark from that agency indicating acceptance to Canadian standards.

.1 Equipment certification by one of the following bodies:

.1 Listed by Underwriters Laboratories, Inc. and exhibit the cUL Listing Mark for the category "Surge Protective Devices" or SPD. Provide UL Listing Card under category VZCA7 (SPDs certified for Canada) to confirm compliance to CSA C22.2 No. 269.2, and assigned Voltage Protection Ratings.

.2 Listed by ETL.

.3 Certified by CSA Group.

.2 SPD to be labeled with no less than a 100 kA Short Circuit Current Rating (SCCR).

PART 2 - PRODUCTS

2.1 OUTDATED AND DEFUNCT SPECIFICATION CRITERIA

.1 Selection of SPD is not be made, solely, or in part, based upon any of the following ambiguous specifications, and obsolete terminology. These terms are no longer recognized by ANSI, NEMA, IEEE, or IEC standards as bonafide suppressor performance parameters. Submittals bearing reference to any of the following will be rejected.

.1 A1 ringwave: removed in 2002 revisions of IEEE C62 documents.

.2 Joule ratings: there is no recognized standard for SPD joule ratings.

.3 NEMA LS-1: document rescinded by NEMA.

.4 Response time: not endorsed by IEEE, NEMA, or UL as a valid SPD rating parameter.

.5 Suppressed Voltage Ratings (SVR): terminology deprecated with UL 1449 third and subsequent editions.

2.2 MANUFACTURERS

.1 Manufacturer List

.1 Asco.

.2 Citel.

.3 Current Technology.

.4 Mersen.

.5 Raycap Electrical Protection Systems.

.2 Substitution Limitations: No unit will be accepted as an “approved equal” unless it meets the warranty, strength, safety features, performance ratings, and all other requirements of this specification.

.3 Product Options:

.1 The inclusion of a manufacturer in the following list does not indicate the manufacturer meets all the requirements in this specification. Likewise, the omission of a manufacturer is not indicative of any lack of qualification. The manufacturer and product must meet all the requirements of this specification.

.2 The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if pre-approved by the Consultant ten (10) days prior to bid date.

2.3 SURGE PROTECTION DEVICES – GENERAL

.1 Obtain all surge suppression devices through one source from a single manufacturer.

.2 SPD separate from panelboards. Integral SPDs not acceptable.

.3 The SPD listed by recognized testing agency accredited by the Standards Council of Canada, and bear a certification mark from that agency indicating acceptance to Canadian standards, and to UL’s 1283 and UL’s 1449 standards (latest edition, latest revision), and not merely the components or modules. Label all SPDs as a Type 2 for use in Type 1 and Type 2 locations.

.4 Protect all modes L-G, L-N, L-L, and N-G, have discrete suppression circuitry in L-G, L-N, and N-G, and have bidirectional, positive, and negative impulse protection. Line-to-neutral-to-ground protection is not acceptable where line-to-ground is specified, and accordingly reduced mode units with suppression circuitry built into only four modes are not acceptable. In delta systems, line-to-ground-to-line protection is not acceptable where line-to-line is specified.

.5 If a disconnect switch is specified, the disconnect switch and the SPD as a system shall be capable of interrupting up to a minimum 100 kA symmetrical fault current with 600 VAC applied.

.6 Suppression Components:

.1 Metal Oxide Varistors (MOVs).

.2 Gas tubes, silicon avalanche diodes, or selenium cells: not permitted.

.3 Every suppression component of every mode, including N-G, shall be protected by internal overcurrent and thermal overtemperature controls, such as through the use of Thermally Protected MOVs (TPMOVs).

.4 Where SPD is not equipped with overtemperature controls, pack all surge components, current carrying paths and fusing in fuse grade silica sand or epoxy potting for arc quenching capability, minimization of smoke and contaminates in the event of failure.

.7 Internal Fusing - Overcurrent Protection

.1 Individually fuse each suppression component for safety and performance.

.2 Fusing shall be present in every mode, including Neutral-to-Ground.

.3 All overcurrent protection must be included within the device, and not require external overcurrent protection.

.8 Surge Current Rating

.1 Service Entrance: 200 kA per phase.

.2 Distribution: 100 kA to 200 kA per phase.

.3 Point of Use: 100 kA per phase.

.9 Short Circuit Current Rating (SCCR), sometimes referred to as fault current rating: minimum 100 kA.

.10 Nominal Discharge Current (In, or I-nominal):

.1 UL labelled with a minimum 10 kA I-nominal.

.11 Maximum Continuous Operating Voltage (MCOV): The maximum continuous operating voltage (MCOV) of all components not less than 125 per cent for a 120 V system, 120 per cent for 220 and 240 V systems, and 115 per cent for 347 and 600 V systems.

.1 277 V systems: 320 V MCOV.

.2 480 V systems: 552 V MCOV.

.12 Voltage Protection Ratings (VPRs) to not exceed the following:

Voltage	**L-N**	**L-G**	**N-G**
208Y/120	800 V	800 V	800 V
480Y/277	1200 V	1200 V	1200 V
600Y/347	1500 V	1500 V	1500 V
Voltage	**L-L**	**L-G**	
480 Delta	1800 V	1800 V	
600 Delta	2500 V	2500 V	

.13 Minimum EMI/RFI filtering of -50 dB at 100 kHz.

.14 SPD enclosure:

.1 Minimum NEMA type 12 rating in indoor applications.

.2 Minimum NEMA type 4 in outdoor applications.

.15 Diagnostics and Monitoring:

.1 Visual LED diagnostics to indicate failure of a suppression component. Monitor every suppression component of every mode, including N-G.

.2 Form C dry contacts (NO or NC) for remote monitoring capability to indicate the failure of any MOV in the unit.

.3 Surge event counter with backup power source.

2.4 SERVICE ENTRANCE AND TRANSFER SWITCH SPDS

.1 CSA certified and labeled as a Type 2 device.

.2 SPDs relying on an external breaker or fuse as supplemental overcurrent protection do not meet the intent of this specification and will be rejected.

.3 CSA certified listed and labeled with a minimum I-nominal rating of 20 kA.

.4 An approved disconnect switch provided as a means of service disconnect if a 60 A breaker is not available.

.5 Connect SPD using the manufacturer’s breaker/wire recommendations. If recommendations are not available, use a 60 amp breaker and 6 AWG cable with full size ground.

.6 Minimum Surge Current Rating: 200 kA per phase (100 kA per mode).

2.5 DISTRIBUTION PANELBOARD AND MOTOR CONTROL CENTRE SPDS

.1 CSA certified listed and labeled as a Type 2 device.

.2 SPDs relying on an external breaker or fuse as supplemental overcurrent protection do not meet the intent of this specification and will be rejected.

.3 CSA certified listed and labeled with a minimum I-nominal rating of 20 kA.

.4 SPD connected using the manufacturer’s breaker/wire recommendations. If recommendations are not available a 60 A breaker and 6 AWG with full size ground will be used.

.5 Minimum Surge Current Rating: 100 kA per phase (50 kA per mode).

2.6 LIGHTING AND RECEPTACLE BRANCH CIRCUIT PANELBOARD SPDS

.1 CSA certified listed and labeled as a Type 2 device.

.2 SPDs relying on an external breaker or fuse as supplemental overcurrent protection do not meet the intent of this specification and will be rejected.

.3 CSA certified listed and labeled with a minimum I-nominal rating of 10 kA.

.4 SPD connected using the manufacturer’s breaker/wire recommendations. If recommendations are not available a 60 A breaker and 6 AWG will be used.

.5 Minimum Surge Current Rating: 100 kA per phase (50 kA per mode).

PART 3 - EXECUTION

3.1 PRE-INSTALLATION MEETINGS

.1 Pre-installation meetings: conduct pre-installation meeting one week prior to commencing work of this Section and on-site installations to verify project requirements, substrate conditions and co-ordination with other building sub-trades, to review manufacturer's installation instructions and warranty requirements.

3.2 FIELD QUALITY CONTROL

.1 Have manufacturer of products supplied under this Section review Work involved in the handling, installation, application, protection, and cleaning of its products. Submit written reports in acceptable format to verify compliance of Work with Contract in accordance with Section 01 33 00 and Section 01 78 00.

.2 Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.

.3 Schedule site visits to review work at stages listed:

.1 After delivery and storage of products, and when preparatory work on which the work of this Section depends is complete, but before installation begins.

.2 Twice during progress of work at 66 per cent and 99 per cent complete.

.3 Upon completion of the work, after cleaning is carried out.

.4 Obtain reports within three (3) days of review and submit immediately to the Consultant.

3.3 EXAMINATION

.1 Verify service and separately derived system Neutral to Ground bonding jumpers.

3.4 INSTALLATION

.1 Do complete installation in accordance with CSA C22.1, CSA C22.2 No. 0, ANSI/IEEE C62.41, and all other applicable codes.

.2 Manufacturer’s instructions:

.1 Install SPD in accordance with manufacturer’s installation instructions with lead lengths as short and as straight as practically possible. Lead lengths no greater than 600 mm (24 inches). Gently twist conductors together.

.2 Compliance: comply with manufacturer's written recommendations or specifications, including product technical bulletins, handling, storage, and installation instructions.

.3 Connect SPD to service panel being protected via a circuit breaker for each phase, based on the number of poles and the connecting wire size, with a 100 A maximum.

.4 Follow the SPD manufacturer’s recommended installation practice as outlined in the equipment installation manual. Ensure that all neutral conductors are bonded to the system ground at the service entrance or the serving isolation transformer prior to installation of the associated SPD.

.5 Installation position of SPD:

.1 Locate SPD adjacent to the panelboard, in a position as close as possible to the neutral and ground lugs. Rearrange breaker positions for SPDs to minimize the length of the phase, neutral, and ground conductors.

.2 Mount SPD as close as possible to panel being protected in a position that will minimize lead lengths between suppressor and control breaker(s) to which suppressor connects. Utilize conduit, preferably metallic, to accomplish these connections with a recommended minimum wire size of 10 AWG, a maximum wire size of 4 AWG (for ease of dressing), or as noted on the single line diagram. Do not extend suppressor leads beyond manufacturer's recommended maximum length without specific engineering approval. The rationale for this is the longer connecting leads between the SPD and the power panel, the higher the residual transient voltage.

.3 Locate surge suppressors as indicated and mount securely, plumb, true, and square to adjoining surfaces.

.4 Install surface mounted surge suppressors on fire-retardant plywood backboards as recommended in manufacturer's written instructions. Where practical, group SPDs on common backboard with other equipment.

.5 Mount housings and enclosures on fire-retardant plywood backboard with top not higher than 1.8 m (6 feet) above finished floor.

.6 Wiring:

.1 Install units on a breaker, sized, where indicated, that meets or exceeds the fault current rating of the switchgear or panelboard.

.2 Connect SPD to service panel being protected via a circuit breaker for each phase, based on the number of poles and the connecting wire size. Connect SPD using the manufacturer’s breaker/wire recommendations.

.1 If recommendations are not available, a 60 A breaker and 6 AWG phase, neutral, and ground conductors will be used.

.2 If the SPD is supplied with lead wires, match the overcurrent protection to the 75 degree C ampacity of the wiring as described in Ontario Electrical Safety Code, Table 2; i.e. a 30 A breaker to suit 10 AWG lead wires.

.3 Install SPD in a neat, workmanlike manner. Dress leads as short and as straight as possible and be consistent with recommended industry practices for the application on which these units are installed. Bind phase, neutral, and ground conductors tightly (one twist per 30 cm) over entire run, from suppressor to service panel, and always use the shortest length of connecting cable possible.

.4 If the SPD is supplied by the manufacturer with lead wires, cut excess lead length.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Solid state, light emitting diode (LED) source interior luminaires.

.2 New, fully integrated luminaires for indoor applications.

1.2 RELATED REQUIREMENTS

.1 Section 26 09 23 – Lighting Control Devices.

.2 Section 26 52 13.13 – Emergency Lighting.

1.3 REFERENCES

.1 CSA Group:

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CSA C22.2 No. 250.0 - Luminaires (Bi-National Standard, with UL 1598).

.2 DesignLights Consortium (DLC):

.1 Solid-State Lighting Technical Requirements v5.1, or latest edition.

.2 Where the specifications do not explicitly call for DLC qualified LED luminaires, the technical criteria provided in the DLC Technical Requirements provide the basis of the requirements for this section of the Specification.

.3 Energy Star:

.1 Program Requirements for Luminaires - Eligibility Criteria, Version 1.2, or latest edition.

.4 Illuminating Engineering Society (IES):

.1 IES HB-10-11 – The Lighting Handbook, 10th Edition.

.2 IES LM-79-08 – Approved Method: Electrical and Photometric Measurements of Solid-State Lighting Products.

.3 IES LM-80-08 – IES Approved Method for Measuring Lumen Maintenance of LED Light Sources.

.4 IES TM-21-11 – IES Technical Memorandum on Projecting Long Term Lumen Maintenance of LED Light Sources.

.5 IES TM-30-15 – IES Method for Evaluating Light Source Color Rendition.

.5 IEEE 1789-2015 – IEEE Recommended Practices for Modulating Current in High-Brightness LEDs for Mitigating Health Risks to Viewers.

.6 National Electrical Manufacturer's Association (NEMA):

.1 SSL-1-10 – Electronic Drivers for LED Devices, Arrays, or Systems.

.2 WD 6 - Wiring Devices - Dimensional Requirements.

1.4 DEFINITIONS

.1 CCT: Correlated colour temperature.

.2 CRI: Colour-rendering index.

.3 LED: Light Emitting Diode.

.4 Lumen: Measured output of lamp and luminaire, or both.

.5 Luminaire: Complete lighting fixture, including ballast housing if provided.

1.5 ACTION SUBMITTALS

.1 Refer to Section 01 33 00.

.2 Product submittals shall be accompanied by product specification sheets or other documentation that includes the designed parameters as detailed in this specification. These parameters include (but not limited to):

.1 Maximum power in Watts.

.1 If a transformer is used in conjunction with a driver (for example on some 347 volt lighting circuits), the maximum power shall include the transformer losses.

.2 L70 in hours, when extrapolated for the worse case operating temperature. TM-21 report shall be submitted to demonstrate this.

.3 Product submittals shall be accompanied by performance data that is derived in accordance with appropriate IESNA testing standards and tested in a laboratory that is NVLAP accredited for Energy Efficient Lighting Products.

1.6 INFORMATIONAL SUBMITTALS

.1 Installation instructions.

1.7 CLOSEOUT SUBMITTALS

.1 Section 01 78 00: Submittals for project closeout.

.2 Submit manufacturer's operation and maintenance instructions for each product.

.3 Warranty information.

1.8 QUALIFICATIONS

.1 Manufacturer: Company specializing in manufacturing the products specified in this section with minimum five years documented experience.

1.9 REGULATORY REQUIREMENTS

.1 Products shall be listed and classified by CSA (Canadian Standards Association), ULC (Underwriter’s Laboratories of Canada), or certified by recognized independent testing organizations that test to CSA standards.

.2 Products shall be certified by a recognized testing agency accredited by the Standards Council of Canada and bear a certification mark from that agency.

.3 All luminaires shall be listed and labeled for installation in fireproof or non-fireproof construction, dry, damp, or wet locations as required.

.4 Recessed fixtures mounted in an insulated ceiling shall be listed for use in insulated ceilings.

1.10 DELIVERY, STORAGE, AND HANDLING

.1 Deliver, store and handle materials in accordance with Section 01 61 00.

.2 Deliver materials to site in original factory packaging, labelled with manufacturer's name, address.

1.11 EXTRA STOCK MATERIALS

.1 Refer to Section 01 78 00.

.2 Provide the following additional equipment as listed herein.

.1 Provide an additional 2 per cent spare luminaires of each new type to be provided.

.2 Provide 1 per cent of each plastic lens type.

.3 Provide three of each type of any special tools required for system use and maintenance.

1.12 WARRANTY

.1 Refer to Section 01 78 00 and Section 26 05 00.

.2 The manufacturer shall provide a warranty against loss of performance and defects in materials and workmanship for the luminaires for a period of 5 years after acceptance of the luminaires. Warranty shall cover all components comprising the luminaire.

.3 All warranty documentation shall be provided to customer prior to the first shipment.

.4 LED Luminaires shall have a manufacturer’s warranty for a period of not less than five years.

.5 LED boards, drivers and associated components shall have a warranty of 5 years on the LEDs, 5 years on the driver, 10 years on the paint finish.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 As noted on Lighting Fixture Schedule.

2.2 INDOOR LED LUMINAIRES, GENERAL

.1 Initial delivered lumens – thermal losses should be less than 10 per cent when operated at a steady state at an average ambient operating temperature of 25 degrees C, and optical losses should be less than 15 per cent.

.2 Average Delivered Lumens – Average delivered lumens over 50 000 hours should be minimum of 85 per cent of initial delivered lumens.

.3 All luminaires shall be tested per LM79/80 and published L70 data.

.4 Colour rendition:

.1 Interior luminaires with a CRI greater than or equal to 80, or as indicated on the lighting fixture schedule.

.2 Where minimum 90 CRI is indicated, the following may be considered acceptable in lieu, subject to confirmation with the Consultant by means of a Request for Interpretation during the bid period:

.1 CRI (Ra) ≥ 90.

.2 CRI (Ra) ≥ 80 and R9 (R9) ≥ 50.

.3 IES Rf ≥ 78, IES Rg ≥ 100, -1% ≤ IES Rcs,h1 ≤ 15%.

.5 Correlated colour temperature as indicated on the lighting fixture schedule.

.6 Accessibility and Maintenance:

.1 All LED luminaires shall be field serviceable, with LED arrays, LED modules, drivers, etc. fully serviceable and easily accessible. In the case of recessed ceiling mounted, and in the case of surface mounted ceiling fixtures, these components must be accessible from below. Luminaires in which any of these components are accessible only from above are not acceptable.

.2 Ballasts, drivers, LED arrays, LED modules, and lamps shall be serviceable while the fixture is in its normally installed position. Ballasts or drivers shall not be mounted to removable reflectors or wireway covers unless so specified. In the case of ceiling mounted luminaires, the serviceable components must be accessible from below.

.7 Housings:

.1 Formed to prevent warping and sagging. Housing, trim, and lens frame shall be true, straight (unless intentionally curved), and parallel to each other as designed.

.2 Sheet steel housings to be minimum 20 gauge.

.3 Wireways and fittings: free of burrs and sharp edges, and shall accommodate internal and branch circuit wiring without damage to the wiring.

.4 When installed, any exposed fixture housing surface, trim frame, door frame, and lens frame shall be free of light leaks.

.5 Hinged door frames shall operate smoothly without binding. Latches shall function easily by finger action without the use of tools.

.6 Drivers shall not be mounted to removable reflectors or wireway covers unless so specified.

.8 Mechanical Safety: Lighting fixture closures (lens doors, trim frame, hinged housings, etc.) shall be retained in a secure manner by captive screws, chains, aircraft cable, captive hinges, or fasteners such that they cannot be accidentally dislodged during normal operation or routine maintenance.

.9 Metal Finishes:

.1 Fixture finish and construction to meet ULC listings and CSA certifications related to intended installation.

.2 All metal components of fixtures shall be painted after fabrication to mitigate raw metal edges, and thus prevent premature corrosion.

.3 The manufacturer shall apply standard finish (unless otherwise specified) over a corrosion-resistant primer, after cleaning to free the metal surfaces of rust, grease, dirt and other deposits. Edges of pre-finished sheet metal exposed during forming, stamping or shearing processes shall be finished in a similar corrosion resistant manner to match the adjacent surface(s). Fixture finish shall be free of stains or evidence of rusting, blistering, or flaking, and shall be applied after fabrication.

.4 Interior light reflecting finishes shall be white with not less than 85 per cent reflectance, except where otherwise shown on the drawing.

.10 Wiring:

.1 Lighting fixtures shall have a specific means for grounding metallic wireways and housings to an equipment grounding conductor.

.2 Supplied complete with a luminaire disconnect plug.

.11 Control of Visual Perceptions of Temporal Light Modulation (flicker):

.1 All electric lights (except decorative lights, emergency lights and other special-purpose lighting) used in regularly occupied spaces meet at least one of the following requirements for flicker:

.1 A minimum frequency of 90 Hz at all 10% intervals from 10% to 100% light output.

.2 LED products with a “low risk” level of flicker (light modulation) of less than 5%, especially below 90 Hz operation as defined by IEEE standard 1789-2015 LED.

2.3 DRIVERS, GENERAL

.1 Electronic LED drivers shall be integral to the luminaire, and be designed to be accessible in the field for replacement and servicing.

.2 Input Voltage:

.1 Driver with a voltage range of (120-277) +/- 10% or (347-480) +/- 10%.

.2 Refer to lighting fixture schedule.

.3 For luminaires connected to a 347 volt circuit and utilizing a natively 120-277 volt driver, provide an appropriately sized step down transformer.

.3 Input frequency 60 Hz.

.4 Load regulation: +/- 1 per cent from no load to full load.

.5 Output ripple less than 10 per cent.

.6 Output should be isolated.

.7 Case temperature: rated for -40 degrees C through +80 degrees C.

.8 Overheat protection, self-limited short circuit protection and overload protected.

.9 Primary fused.

.10 Driver life rating not less than 50 000 hours

.11 Power Factor and Total Harmonic Distortion

.1 Power factor of greater than or equal to 0.9 at full load.

.2 THD of less than or equal to 20 per cent at full load.

.12 Dimming Control:

.1 Coordinate with Section 26 09 23.

.2 0-10 V dimming control typical for all fixtures unless otherwise noted.

.3 Control range: 10 per cent to 100 per cent typical, unless noted otherwise.

.4 Provide a mock-up to demonstrate the luminaire is free of flicker throughout the dimming range when used with the dimming controllers described in related sections.

2.4 INTERIOR WALL-WASH LED LUMINAIRES

.1 Minimum Light Output: 575 lm.

.2 Zonal lumen density:

.1 Minimum 60 per cent between 0 degrees and 90 degrees from nadir.

.2 Minimum 60 per cent of the lumens must be produced in the “forward” hemisphere, towards the wall.

.3 Minimum luminaire efficacy: 45 lumens per watt.

.4 Correlated Colour Temperature (CCT): 3500 K

.5 Colour Rendition Index (CRI): 80 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.5 TRACK OR MONO-POINT DIRECTIONAL LED LUMINAIRES

.1 Minimum Light Output: 250 lm.

.2 Zonal lumen density:

.1 Minimum 85 per cent between 0 degrees and 90 degrees from nadir.

.3 Minimum luminaire efficacy: 45 lumens per watt.

.4 Correlated Colour Temperature (CCT): 3500 K

.5 Colour Rendition Index (CRI): 80 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.6 DOWNLIGHT LUMINAIRES

.1 Minimum Light Output: 500 lm.

.2 Zonal lumen density: Minimum 75 per cent between 0 degrees and 60 degrees from nadir.

.3 Minimum luminaire efficacy: 45 lumens per watt.

.4 Correlated Colour Temperature (CCT): 3500 K

.5 Colour Rendition Index (CRI): 80 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.7 NOMINAL 610 MM BY 610 MM (2 FOOT BY 2 FOOT) LUMINAIRES FOR AMBIENT LIGHTING OF INTERIOR SPACES

.1 Minimum Light Output: 2 000 lm.

.2 Zonal lumen density:

.1 Minimum 75 per cent between 0 degrees and 60 degrees from nadir.

.3 Spacing Criteria:

.1 0 degrees to 180 degrees: 1.0 to 2.0

.2 90 degrees to 270 degrees: 1.0 to 2.0

.4 Minimum luminaire efficacy: 85 lumens per watt.

.5 Correlated Colour Temperature (CCT): 3500 K

.6 Colour Rendition Index (CRI): 80 CRI minimum.

.7 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.8 NOMINAL 305 MM BY 1220 MM (1 FOOT BY 4 FOOT) LUMINAIRES FOR AMBIENT LIGHTING OF INTERIOR SPACES

.1 Minimum Light Output: 1 500 lm.

.2 Zonal lumen density:

.1 Minimum 75 per cent between 0 degrees and 60 degrees from nadir.

.3 Spacing Criteria:

.1 0 degrees to 180 degrees: 1.0 – 2.0

.2 90 degrees to 270 degrees: 1.0 – 2.0

.4 Minimum luminaire efficacy: 85 lumens per watt.

.5 Correlated Colour Temperature (CCT): 3500 K

.6 Colour Rendition Index (CRI): 80 CRI minimum.

.7 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.9 NOMINAL 610 MM BY 1220 MM (2 FOOT BY 4 FOOT) LUMINAIRES FOR AMBIENT LIGHTING OF INTERIOR SPACES

.1 Minimum Light Output: 3 000 lm.

.2 Zonal lumen density:

.1 Minimum 75 per cent between 0 degrees and 60 degrees from nadir.

.3 Spacing Criteria:

.1 0 degrees to 180 degrees: 1.0 – 2.0

.2 90 degrees to 270 degrees: 1.0 – 2.0

.4 Minimum luminaire efficacy: 85 lumens per watt.

.5 Correlated Colour Temperature (CCT): 3500 K

.6 Colour Rendition Index (CRI): 80 CRI minimum.

.7 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.10 LINEAR AMBIENT LUMINAIRES: INDIRECT

.1 Minimum Light Output: 500 lm per foot.

.2 Zonal lumen density:

.1 Minimum 50 per cent between 90 degrees and 150 degrees from nadir.

.3 Minimum luminaire efficacy: 85 lumens per watt.

.4 Correlated Colour Temperature (CCT): 3500 K

.5 Colour Rendition Index (CRI): 80 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.11 LINEAR AMBIENT LUMINAIRES: INDIRECT/DIRECT

.1 Minimum Light Output: 500 lm per foot.

.2 Zonal lumen density:

.1 Minimum 25 per cent between 0 degrees and 60 degrees from nadir.

.2 Minimum 50 per cent between 90 degrees and 150 degrees from nadir.

.3 Minimum luminaire efficacy: 85 lumens per watt.

.4 Correlated Colour Temperature (CCT): 3500 K

.5 Colour Rendition Index (CRI): 80 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.12 LINEAR AMBIENT LUMINAIRES: DIRECT/INDIRECT

.1 Minimum Light Output: 500 lm per foot.

.2 Zonal lumen density:

.1 Minimum 40 per cent between 0 degrees and 60 degrees from nadir.

.2 Minimum 35 per cent between 90 degrees and 150 degrees from nadir.

.3 Minimum luminaire efficacy: 85 lumens per watt.

.4 Correlated Colour Temperature (CCT): 3500 K

.5 Colour Rendition Index (CRI): 80 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.13 LINEAR AMBIENT LUMINAIRES: DIRECT

.1 Minimum Light Output: 375 lm per foot.

.2 Zonal lumen density:

.1 Minimum 40 per cent between 0 degrees and 60 degrees from nadir.

.3 Minimum luminaire efficacy: 85 lumens per watt.

.4 Correlated Colour Temperature (CCT): 3500 K

.5 Colour Rendition Index (CRI): 80 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.14 HIGH-BAY LUMINAIRES FOR COMMERCIAL AND INDUSTRIAL BUILDINGS

.1 Minimum Light Output: 10 000 lm.

.2 Zonal lumen density:

.1 Minimum 30 per cent between 20 degrees and 50 degrees from nadir.

.3 Minimum luminaire efficacy: 80 lumens per watt.

.4 Correlated Colour Temperature (CCT): 4000 K

.5 Colour Rendition Index (CRI): 70 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 35 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.15 LOW-BAY LUMINAIRES FOR COMMERCIAL AND INDUSTRIAL BUILDINGS

.1 Minimum Light Output: 5 000 lm.

.2 Zonal lumen density:

.1 Minimum 30 per cent between 20 degrees and 50 degrees from nadir.

.3 Minimum luminaire efficacy: 80 lumens per watt.

.4 Correlated Colour Temperature (CCT): 4000 K

.5 Colour Rendition Index (CRI): 70 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 35 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

2.16 HIGH-BAY AISLE LUMINAIRES

.1 Minimum Light Output: 10 000 lm.

.2 Zonal lumen density:

.1 Minimum 30 per cent between 0 degrees and 20 degrees from nadir.

.2 Minimum 50 per cent between 20 degrees and 50 degrees from nadir.

.3 Minimum luminaire efficacy: 80 lumens per watt.

.4 Correlated Colour Temperature (CCT): 4000 K

.5 Colour Rendition Index (CRI): 70 CRI minimum.

.6 Minimum L70 lumen maintenance to occur at 35 000 hours in accordance with LM-80 testing data and TM-21 extrapolation.

PART 3 - EXECUTION

3.1 VERIFICATION OF CONDITIONS

.1 Coordinate the lighting system installation with the relevant trades so as to eliminate interferences with hangers, mechanical ducts, sprinklers, piping, steel, etc.

3.2 INSTALLATION

.1 Install lighting equipment, including but not limited to luminaires, controls, auxiliary devices and the integration of same in strict conformance with all manufacturers' recommendations and instructions the securing of which shall be the responsibility of the Contractor.

.2 Integrate luminaires with controls in accordance with respective luminaire manufacturers' and controls manufacturers' recommendations and instructions and to provide a complete, trouble-free operation without compromising safety, code and CSA requirements.

.3 Seal all luminaires for wet locations (i.e. all knock-outs, all pipe and wire entrances, etc.) as is standard industry practice to prevent water from entering luminaires.

.4 Luminaire Alignment:

.1 Locate recessed ceiling luminaires as indicated on reflected ceiling plan. Install recessed luminaires to permit removal from below. Include accessories and materials to meet applicable codes and regulatory requirements.

.2 Align luminaires mounted in continuous rows to form straight uninterrupted line.

.3 Align luminaires mounted individually parallel or perpendicular to building grid lines.

.4 Install surface mounted luminaires plumb and adjust to align with building lines and with each other. Secure to prevent movement.

.5 Locate and install luminaires as indicated. Mounting heights and configuration of the luminaires shall be as specified in the Luminaire Schedule portion of the Specification or indicated on the drawings, and where conflicts exist, as approved by the Consultant.

.6 Installed all luminaires plumb and true and level as viewed from all directions unless specifically identified otherwise in the Lighting Fixture Schedule. Luminaires shall remain plumb and true without continual adjustment or visibly obvious means beyond what is shown on luminaire submittal drawings.

.7 For installation in suspended ceilings, ensure that the luminaires are supported such that there is no resultant bowing or deflection of the ceiling system greater than 1/360 of the length of the total span of the ceiling member.

.5 Install recessed luminaires using accessories and firestopping materials to meet regulatory requirements for fire rating.

.6 Whenever a luminaire or its hanger canopy is installed directly to a surface mounted junction box, use a finishing ring painted to match the ceiling to conceal the junction box.

.7 Suspended Luminaires:

.1 Install suspended luminaires and exit signs using pendants supported from swivel hangers. Provide pendant length required to suspend luminaire at indicated height.

.2 Suspended luminaires shall be installed plumb and true and level unless specifically identified otherwise in the Luminaire Schedule portion of this Specification and at a height from finished floor as specified on the drawings, details and Luminaire Schedule. In cases where this is impractical, refer to the Consultant for a decision. All appurtenances shall be consistently organized for a neat, uniform appearance.

.8 Install wall mounted luminaires at height as indicated.

.9 Accessories:

.1 Reflector cones, louvers, baffles, lenses, trims and other decorative elements shall be installed after completion of ceiling tile installation, plastering, painting and general cleanup.

.2 Install accessories provided with each luminaire.

.3 All accessories shall be properly installed and adjusted by Contractor in accordance with specification and installation instructions. Any spare items shall be clearly labeled (indicate type of accessory and associated luminaire types).

3.3 TESTING AND ADJUSTMENT

.1 As required, all adjustable luminaires shall be aimed, focused, locked, etc., by the Contractor under the observation of the Consultant. As aiming and adjusting is completed, locking setscrews and bolts and nuts shall be tightened securely by the Contractor.

.2 For luminaires with field selectable lumen output and/or CCT, ensure the correct setting matches the intended set points.

.3 All ladders, scaffolds, lifts, etc. required for aiming and adjusting luminaires shall be furnished by the Contractor.

.4 Where possible, units shall be focused during the normal working day. However, where daylight interferes with seeing lighting effects, aiming shall be accomplished at night.

3.4 LUMINAIRE SUPPORTS

.1 Provide adequate support to suit ceiling system.

.2 Support luminaires independently of ceiling framing, unless ceiling is certified by the manufacturer to support weight of installed devices. Confirm if T-bar ceilings are metric or imperial and provide luminaires to suit ceiling dimensions.

.3 Provide chain hangers for new and existing luminaires.

.4 Install clips to secure recessed grid-supported luminaires in place.

.5 Fixtures supported by suspended ceiling systems shall be securely fastened to the ceiling framing member by mechanical means, such as bolts, screws, or rivets. Ceiling framing members must be securely attached to each other and to the building structure as required by all applicable codes and standards. Use of integral clips is not acceptable.

3.5 WIRING

.1 Use SPC90 conductors for final connections to luminaires (including 0-10 V dimming conductors for applicable luminaires).

.2 Install luminaire disconnect plugs on all new luminaires not provided as such from the manufacturer.

.3 Connect luminaires to branch circuit outlets provided under Section 26 05 33.13 using flexible conduit.

.4 Make wiring connections to branch circuit using building wire with insulation suitable for temperature conditions within luminaire.

.5 Bond products and metal accessories to branch circuit equipment grounding conductor.

3.6 FIELD QUALITY CONTROL

.1 Operate each luminaire after installation and connection. Inspect for proper connection and operation.

.2 Make wiring connections to the branch circuit using building wire with insulation suitable for temperature conditions within luminaire.

.3 Occupancy Sensors.

.1 Locate and aim sensors in the correct location required for complete and proper volumetric coverage within the range of coverage(s) of controlled areas.

.2 Rooms shall have 90 per cent to 100 per cent coverage to completely cover the controlled area to accommodate all occupancy habits of single or multiple occupants at any location within the room.

.3 Exercise proper judgment in executing the work to ensure the best possible installation in the available space and to overcome local difficulties due to space limitations or interference of structural components.

3.7 CLEANING

.1 Thoroughly clean all luminaires and accessories after installation. All fingerprints, dirt, tar, smudges, drywall mud, dust, etc. shall be removed by the Contractor from the luminaire bodies, reflectors, trims, and lens or louvers prior to final acceptance. All reflectors shall be free of paint other than factory-applied, if any. All reflectors, cones and lenses shall be cleaned only according to manufacturers' instructions.

.2 Clean electrical parts to remove conductive and deleterious materials.

.3 Remove dirt and debris from enclosures.

.4 Clean photometric control surfaces as recommended by manufacturer.

.5 Clean finishes and touch up damage.

.6 Luminaire finishes which are disturbed in any way during construction shall be touched up or refinished in a manner satisfactory to the Consultant.

3.8 COMMISSIONING

.1 In accordance with Section 26 08 50.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Emergency lighting units with battery back-up for emergency illumination of remote emergency fixtures and internally illuminated exit signs.

.2 Remote emergency fixtures.

1.2 RELATED REQUIREMENTS

.1 Section 26 51 19 – LED Interior Lighting.

.2 Section 26 52 13.16 – Exit Signs.

1.3 REFERENCES

.1 CSA Group:

.1 CSA C22.2 No. 141-15 (R2020), Emergency lighting equipment.

.2 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.3 Ontario Electrical Safety Code (28th edition/2021).

.2 Ontario Building Code.

.3 National Building Code of Canada.

.4 Underwriters Laboratories, Inc. (UL):

.1 UL 924 – Standard for Safety of Emergency Lighting and Power Equipment.

1.4 SUBMITTALS

.1 Submit in accordance with Section 01 33 00.

.2 Product Data:

.1 Submit manufacturer's instructions, printed product literature and data sheets for emergency lighting and include product characteristics, performance criteria, physical size, finish, and limitations.

1.5 CLOSEOUT SUBMITTALS

.1 Submit in accordance with Section 01 78 00.

.2 Operation and Maintenance Data: submit operation and maintenance data for emergency lighting for incorporation into manual.

1.6 EXTRA MATERIALS

.1 Allow the cost for material and for installation of the following to be installed as directed by the Consultant during construction:

.1 An additional five dual head emergency remote units.

.2 An additional one battery unit, based on the maximum battery capacity as specified.

1.7 QUALITY ASSURANCE

.1 Manufacturer Qualifications: Products shall be free of defects in material and workmanship.

.2 Furnished products are listed and/or certified by third party agencies as suitable for the intended purpose.

.3 All units will be certified that they have been tested prior to shipping.

1.8 DELIVERY, STORAGE, AND HANDLING

.1 Deliver, store, and handle materials in accordance with Section 01 61 00 and with manufacturer's written instructions.

.2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.

.3 Storage and Handling Requirements:

.1 Store materials off ground indoors in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.

.2 Store and protect emergency lighting from nicks, scratches, and blemishes.

.3 Replace defective or damaged materials with new.

.4 Packaging Waste Management: remove for reuse and return by manufacturer of pallets, crates, padding and packaging materials as specified in Construction Waste Management Plan in accordance with Section 01 74 00.

1.9 WARRANTY

.1 Product is warranted free of defects in material and workmanship.

.2 Product is warranted to perform the intended function within design limits.

.3 For batteries in this Section, 12 month warranty period is extended to 24 months.

PART 2 - PRODUCTS

2.1 EMERGENCY BATTERY UNITS

.1 Manufacturers:

.1 Lumacell RG12S series.

.2 Aimlite.

.3 BeLuce (formerly Beghelli).

.4 Emergi-Lite.

.5 Lithonia (Acuity Brands Lighting).

.6 Stanpro.

.2 Battery Unit Features:

.1 Self-contained unit equipment for LED emergency lighting shall be manufactured and labeled as certified to meet CSA C22.2 No 141.

.2 Housing: Constructed of formed and welded 18 gauge cold rolled steel with knockouts for conduit, finished in baked white enamel. Cabinet suitable for direct or shelf mounting to wall. Removable or hinged front panel for easy access to batteries.

.3 Charger:

.1 Solid-state micro-controller PCB, Pulse-Guard charger, features include; auto-equalized, temperature compensated, current limited, short circuit and reverse polarity protected.

.2 Recharges battery within 24 hours in accordance with CSA requirements.

.4 Transfer: Upon failure of the power supply, or voltage dip below 75 per cent of nominal, a sealed relay automatically and instantaneously connects the battery to the emergency lighting load and disconnects when battery discharge reaches 87.5 per cent expectancy.

.5 Batteries: seal lead calcium, maintenance free, and 10 year pro-rated service life.

.6 Auto-test: Unit to perform self-test for 1 minute ever 30 days, 10 minutes on the 6th month, and 30 minutes every 12 months.

.3 Battery Electrical Features:

.1 Input Voltage:120-347 VAC universal input:

.1 Provided with plug and receptacle when connected to 120 volt source panelboard.

.2 direct connected to 347 volt source panelboard.

.2 Output Voltage: 12 VDC; balance loads to battery unit terminals.

.1 Normally "Off" output: wattage capacity as indicated for emergency remotes and internally illuminated exit signs.

.2 Battery Run Time at full load: must meet OBC minimum, 60 minutes.

.3 Voltage regulation: ± 5 per cent of nominal maximum.

.3 Signal lights: solid state, for 'AC Power ON' and 'High Charge'.

.4 Lamp heads:

.1 Integral on unit, 345 degrees horizontal and 180 degrees vertical adjustment.

.2 Lamp type:

.1 Two 12 V, 6 W MR16 LED lamps mounted on top of the battery cabinet, shall be injection molded thermoplastic, white finish.

.2 Average lamp lumens: 170 lm.

.3 Centre Beam Candlepower: 440 cd.

.4 Beam angle: 30 degrees.

.5 Lamp efficacy: 42.5 lm/W.

.5 Auxiliary equipment:

.1 Ammeter.

.2 Voltmeter.

.3 Test switch.

.4 Time delay relay.

.5 Battery disconnect device.

.6 AC input and DC output terminal blocks inside cabinet.

.7 Shelf Bracket.

.8 Cord and single twist-lock plug connection for AC.

.9 RFI suppressors.

.10 Voltage Sensing Relay:

.1 Up to six inputs for line voltage detection from different normal lighting zone. The wire connection from each zone circuit shall be made with terminal blocks.

.2 Operation Sequence: In the case of power failure of one or several circuits feeding normal lighting, the output circuit will open and transfer the battery unit(s) in emergency lighting mode.

.3 Provide “push to test” push button and a pilot light for each zone circuit for manual testing and service.

2.2 VOLTAGE SENSING RELAY (VSR) ZONE CONTROL STAND-ALONE EXTENSION MODULE

.1 Manufacturers: Lumacell VSR series (basis of design).

.2 The equipment shall have an adequate quantity of inputs (up to 24 inputs) for line voltage detection from different building zones. The wire connection from each zone circuit shall be made with terminal blocks. The output circuit shall be a dry-contact relay, normally closed and shall be accessible for connection on a terminal block. The output circuit shall be connected at installation in series with the AC line supplying the battery unit equipment.

.3 Operation Sequence: In the case of power failure of one or several circuits feeding normal lighting, the output circuit will open and transfer the battery unit(s) in emergency lighting mode.

.4 Include a “push to test” push button and a pilot light for each zone circuit for manual testing and service.

2.3 EMERGENCY LIGHTING EMERGENCY REMOTE HEADS

.1 Refer to drawings and lighting schedule.

.2 One or two lamps, shall be injection molded thermoplastic, white finish, lamps shall be MR16 LED 12 V, 540 lumen, 25 degree beam angle, 6 watt.

.3 Remote heads to be mounted not less than 2100 mm (6’-10") AFF.

.4 LED MR16 lamps:

.1 Lumacell MQM-x-12V4W-LD10 series.

.2 Equal by Emergi-Lite.

.3 Equal by Stanpro.

.4 Equal by Beluce (formerly Beghelli).

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Verification of Conditions: verify that conditions of substrate previously installed under other Sections are acceptable for emergency lighting installation in accordance with manufacturer's written instructions.

.1 Visually inspect substrate in presence of Owner.

.2 Inform Owner of unacceptable conditions immediately upon discovery.

.3 Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Owner.

3.2 INSTALLATION

.1 Install emergency lighting in compliance with local inspection authorities.

.2 Wiring:

.1 Connect battery input to source panelboard. Balance the emergency lighting loads connected to battery output terminal blocks. Provide and connect remote fixtures and internally illuminated exit signs as specified and as required for system performance in compliance with OBC minimum egress illumination requirements. Install remotes in locations as shown on the drawings. Connect all remotes to normally "Off" output from battery units.

.2 Contractor is responsible for revisions to system, including relocations, aiming and additional remote heads as determined by testing results. All wiring shall be in accordance with manufacturer's recommendations.

.3 Use minimum #10 gauge or heavier if needed to provide a maximum voltage drop of 5 per cent. Consult manufacturer's table for sizing the minimum gage and length of wire runs permitted for connected loads to ensure a maximum voltage drop of 5 per cent from the battery unit to the farthest emergency remote, in accordance with OBC and local inspection authorities.

.3 Mounting: Suitable for wall mounting, complete with bracket from manufacturer lighting heads, test switch and diagnostic LED indicator shall be visible.

.4 Provide Voltage Sensing Relays internal or external to battery units to meet the intent of OESC Rule 46-304 (4). Unit equipment shall be installed in such a manner that it will be automatically actuated upon failure of the power supply to the normal lighting in the area covered by that unit equipment.

3.3 TESTING AND COMMISSIONING

.1 When installation of emergency lighting equipment is complete, contractor shall commission and test the entire system and adjust if necessary.

.2 Contractor is responsible for arranging and cost of a verification test of emergency illumination levels by the manufacturer’s representative.

.1 Verification test shall be performed with a lux/footcandle meter at 1 m intervals along all paths of egress throughout the space, and record light level readings on floor plans provided by the consultant.

.2 The contractor shall also provide consultant with a letter stating the recorded emergency lighting levels meet the OBC requirements of 10 lx (1 fc) average with minimum readings not less than 1 lx (0.1 fc) on the path of egress.

.3 The manufacturer is to provide a letter of verification confirming testing and operation of all emergency lighting as well as installation to all applicable codes.

.3 Contractor is to indicate in the letter the duration of emergency lighting run time that was observed.

.4 Testing shall be performed during non-daylight hours. Contractor shall aim all remotes to optimise illumination on the floor and stair.

.5 Contractor shall certify in writing to the Consultant that the system is complete, installed per CSA C22.2 No. 141, has been tested, and operates for the specified battery run time.

.6 Contractor shall notify the Owner and the Consultant at least ten days prior to proposed testing date and schedule testing at time and date acceptable to the Owner.

.7 Installation shall be in accordance with the electrical code and manufacturer’s instructions.

.8 The Contractor is to submit a letter on Contractor's letterhead confirming the criteria specified above is met, including light levels, and run time, and include a copy of the plans with light levels recorded.

.9 Provide breaker lock on emergency lighting circuit at source panelboard.

3.4 PROTECTION

.1 Protect installed products and components from damage during construction.

.2 Repair damage to adjacent materials caused by emergency lighting installation.

3.5 TESTING, MAINTENANCE, AND WARRANTY SERVICE

.1 Provide complete instructions for the operation and care of the emergency power supply or unit equipment that shall specify testing at least once every month to ensure security of operation. Instructions to be framed under glass.

.2 OBC testing obligations: Owner's facility maintenance personnel are required to document one manual test of the battery units each month, and conduct one full discharge test once a year per OBC and CSA C22.2 No. 141 requirements.

.3 Annual Maintenance: The manufacturer recommends maintenance to be performed by a qualified service provider. Contact the manufacturer for any warranty service.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Internally illuminated “Running Man” exit sign units for ordinary location use.

1.2 RELATED REQUIREMENTS

.1 Section 26 52 13.13 – Emergency Lighting: Emergency Battery Units.

1.3 REFERENCES

.1 Canadian Standards Association (CSA International):

.2 CAN/ULC-S572, First Edition Standard for Photoluminescent and Self-Luminous Exit Signs and Path Marking Systems.

1.4 SUBMITTALS

.1 Provide submittals in accordance with Section 01 33 00.

.2 Product Data: Submit manufacturer's printed product literature, specifications and datasheet and include product characteristics, performance criteria, physical size, finish, and limitations.

.3 Instructions: submit manufacturer's installation instructions and special handling criteria, installation sequence, cleaning procedures and maintenance.

1.5 EXTRA STOCK MATERIALS

.1 Allow the cost for material and for installation of an additional five exit signs, single face or dual face, to be installed as directed by the Consultant during construction. Include 15.24 m (50 feet) of wire and conduit for AC and for DC circuits per exit sign.

1.6 QUALITY ASSURANCE

.1 Products ULC Listed and/or CSA Certified to CSA C22.2 No. 141 and CSA C860.

.2 Furnished products are listed and/or certified by third party agencies as suitable for the intended purpose.

.3 Manufacturer Qualifications: Products shall be free of defects in material and workmanship.

.4 All units will be certified that they have been tested prior to shipping.

1.7 DELIVERY, STORAGE, AND HANDLING

.1 In accordance with Section 01 61 00.

1.8 WARRANTY

.1 Product is warranted free of defects in material and workmanship for a minimum of one year from substantial completion.

PART 2 - PRODUCTS

2.1 EXIT SIGNS, GENERAL

.1 Manufacturers

.1 Aimlite.

.2 BeLuce (formerly Beghelli).

.3 Emergi-Lite.

.4 Lithonia (Acuity Brands Lighting).

.5 Lumacell.

.6 Stanpro.

.7 Other manufacturers as indicated in Section 26 52 13.13.

.2 Substitution Limitations:

.1 Manufacturer of exit signs to be the same as manufacturer of emergency lighting battery units and remote heads specified in Section 26 52 13.13.

.2 No manufacturer substitutions.

.3 Description:

.1 Green and White LED Pictogram “Running Man” exit sign.

.2 The pictogram sign shall be certified as CSA 22.2 No. 141, and meet ISO 3864-1 and ISO 7010.

.3 The pictogram legend shall have a minimum illuminated dimension of 5.9" high and 11.13" with ISO 3864-1 and ISO 7010 pictogram printed on a pure-acrylic panel.

.4 The sign shall include a standard single face with optional double-faceplate included.

.5 Not acceptable:

.1 Red LED EXIT signs.

.2 Externally illuminated photoluminescent, or non-electrical radioluminescent type of pictogram signs are unacceptable.

.4 Mounting

.1 Universal canopy to allow for wall, end, or ceiling mount.

.5 Electrical

.1 The LED light source shall be long-life white Light-Emitting Diodes and shall provide uniform illumination of the pictogram in normal and emergency operation.

.2 The sign shall operate with universal 2-wire AC input voltage of 120 to 347 Vac at less than 3 Watts, and universal 2-wire DC input voltage from 6 to 24 Vdc at less than 2.5 Watts for single and double face legends with a single arrow either left or right.

.3 If arrow left and arrow right is required for T intersection, the contractor shall supply and install two separate pictogram signs.

.4 The pictogram edge-lit exit sign where indicated on the plans in a self-powered configuration shall use a sealed Nickel-Cadmium battery of 2.4 V nominal voltage and shall stay illuminated during emergency operation for at least two hours upon AC failure.

2.2 ALL-PLASTIC PICTOGRAM EXIT SIGN, COMMERCIAL GRADE

.1 Manufacturers

.1 Lumacell LP Series

.2 Equivalent products from manufacturers as described in Article 2.01 of this section.

.2 Materials

.1 The sign shall come standard with a canopy and shall be suitable for wall, end, or ceiling mounting. The frame, faceplates, back plate and canopy shall each be constructed of a one-piece UV-stabilized thermoplastic material colored factory white.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install exit lights to manufacturer's recommendations, listing requirements, CSA standard and local regulatory requirements.

.2 Ensure exit signs are not obscured. Where an exit sign is to be installed in an area with no ceiling, provide a suitable pendant mount.

.3 Connect fixtures to exit light circuits normal power supply and emergency battery units specified in Section 26 52 13.13.

.4 Ensure that emergency lighting circuit breaker is locked in ON position.

.5 If arrow left and arrow right is required for T intersection, the contractor shall supply & install two separate pictogram signs.

3.2 FIELD TESTS AND INSPECTIONS

.1 When installation of emergency lighting equipment is complete, contractor shall commission and test the entire system and adjust if necessary.

.2 Certify in writing to the consultant that the system is complete, installed per CSA C22.2 No. 141, has been tested, and operates for the specified battery run time.

.3 Notify owner and consultant at least ten days prior to proposed testing date and schedule testing at time and date acceptable to the owner.

.4 Installation shall be in accordance to the electrical code and manufacturer’s instructions.

.5 Provide breaker lock on emergency lighting circuit at source panelboard.

3.3 CLEANING

.1 Proceed in accordance with Section 01 74 00.

.2 On completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.

.3 Waste Management

.1 Separate waste materials for reuse and recycling in accordance with Section 01 74 00.

3.4 PROTECTION

.1 Protect installed products and components from damage during construction.

.2 Repair damage to adjacent materials caused by exit sign installation.

END OF SECTION

Added through ADD#15

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Materials and installation for steel lighting poles.

.2 Architectural concrete bases.

1.2 RELATED REQUIREMENTS

.1 Section 03 30 00 – Cast-in-Place Concrete.

.2 Section 26 27 26 – Wiring Devices: receptacles at pole bases.

.3 Section 26 56 19 – LED Exterior Lighting.

.4 Section 28 20 00 – Video Surveillance: CCTV camera brackets.

.5 Section 31 23 00 – Excavation and Fill.

1.3 REFERENCES

.1 CSA Group:

.1 CSA C22.2 No. 206-17, Lighting poles.

1.4 COORDINATION

.1 Ensure shop drawings are submitted promptly to ensure adequate time for the Consultant's review and to permit timely release of anchor bolts.

.2 Coordinate the installation of all light poles with the work of other trades. This includes but is not limited to placement of poles in conjunction with civil work such as sidewalks, roadways, parking lots, landscaping and building exteriors.

1.5 SUBMITTALS

.1 Submit product data in accordance with Section 01 33 00.

.2 Product Data: For each pole, accessory, luminaire-supporting and lowering device, arranged as indicated on the plans and as required.

.1 Include data on construction details, profiles, effective projected area (EPA), cable entrances, materials, dimensions, weight, rated design load, and ultimate strength of individual components.

.2 Include finishes for lighting poles and luminaire-supporting devices.

.3 Anchor bolts.

.4 Manufactured pole foundations.

.5 Manufacturer cut sheets indicating pole catalog number selections with highlighted selections. Include pole designations that match the project designations if applicable.

.6 All distinct poles required on the project shall be submitted in one single submittal so all poles can be reviewed at one time.

.3 Shop Drawings:

.1 Anchor-bolt templates keyed to specific poles and certified by manufacturer.

.2 Include plans, elevations, sections, and mounting and attachment details.

.3 Include details of equipment assemblies, indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

.4 Detail fabrication and assembly of poles and pole accessories.

.5 Foundation construction details, including material descriptions, dimensions, anchor bolts, support devices, and calculations, signed and sealed by a professional engineer licensed in the jurisdiction of the project site.

.6 Method and procedure of pole installation. Include manufacturer's written installation instructions.

.4 Delegated Design Submittals:

.1 Soil test report prepared by a Geotechnical Engineer licensed in the jurisdiction of the project site.

.2 Provide pole base details using the submitted poles and luminaires, sealed by a Structural Engineer licensed in the jurisdiction of the project site.

.3 Contractor is responsible for hiring geotechnical and structural engineers as part of base bid.

1.6 CLOSEOUT SUBMITTALS

.1 In accordance with Section 01 78 00.

.2 Include soil reports and sealed base details in O&M manual.

.3 Reviewed shop drawings.

.4 Warranty documentation.

1.7 DELIVERY, STORAGE, AND HANDLING

.1 Protect products from moisture and dust by storing them in a clean, dry location remote from areas involved in construction operations. Provide additional protection in accordance with manufacturer's instructions.

.2 Store poles on decay-resistant skids at least 305 mm (12 in) above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.

.3 Retain factory-applied pole wrappings on metal poles until immediately before pole installation. Handle poles with web fabric straps.

.4 Protect pole finishes prior and during install by applying a strippable, temporary protective covering as required.

1.8 WARRANTY

.1 Special Warranty: Manufacturer agrees to repair or replace components of pole(s) that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within a specified warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs from special warranty period.

.1 Warranty Period: Five (5) years from date of Substantial Completion.

.2 Warranty Period for Corrosion Resistance: Five (5) years from date of Substantial Completion.

.3 Warranty Period for Colour Retention: Five (5) years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 ARCHITECTURAL CONCRETE BASES

.1 Manufacturers:

.1 Manufacturer list:

.1 ArtFORMS International Inc. (basis of design).
Tel: 905 642-3225, Fax: 905-642-3227,
Email: ArtFORMS@ArtFORMSConcreteBases.com.

.2 Substitution limitations:

.1 Equivalent architectural precast concrete luminaire pole base by Utility Structures Inc.

.2 Provide bases in styles, sizes, and profiles indicated. Depth of bases to be in accordance with Structural Engineer's detail.

.3 Cast-in-place architectural concrete base (basis of design):

.1 Use single-use Concrete Forms.

.2 Provide cast-in-place architectural concrete bases for lighting poles, bollards, floodlights, flagpoles, signs, columns fence posts, and other applications as noted.

.3 Self-locking, vandal-resistant, wraparound aluminum colour accent band around finished bases, where indicated.

2.2 PAINTED GALVANIZED STEEL POLES

.1 Galvanized steel poles: to CSA C22.2 No. 206 designed for underground wiring and:

.1 Suitable for mounting on concrete anchor base.

.2 Monotube style, minimum 3.0 mm thick, straight or tapered, round or square as indicated.

.3 Access handhole 300 mm (12 inches) above pole base for wiring connections, with welded-on reinforcing frame and bolted-on cover.

.4 Galvanized anchor bolts complete with galvanized double nuts and galvanized washers, and plastic bolt covers.

.5 Two lugs: one for grounding and one for bonding.

.6 Two-piece aluminium base cover to suit pole.

.7 Manufacturer's standard flat pole cap.

.8 For poles noted with other services including CCTV cameras or other extra low voltage equipment, provide a conduit or suitable voltage divider in the pole.

.9 Effective Projected Area (EPA) rating to meet or exceed the requirement of luminaires, mounting brackets, etc.

.10 Finishes:

.1 Polyester powder coat finish.

.11 Manufacturer's nameplate indicating manufacturer's name, model number of pole, and date of manufacture with a permanent, stamped/printed or engraved label.

.2 Manufacturers:

.1 Aluminous Lighting Products.

.2 Dynapole.

.3 LSI Industries.

.4 Lumec.

.5 Polefab.

.6 Spina.

.7 Valmont West Coast Engineering.

2.3 POLE ACCESSORIES

.1

.2 Duplex Receptacle: Only where required of particular project scope, a 120 V, 15 A, specification grade receptacle in a weatherproof assembly complying with Section 26 27 26, ground-fault circuit-interrupter type.

.1 Surface mounted, a minimum of 300 mm (12 inches) above finished grade, or at the height indicated on the plans.

.2 Nonmetallic polycarbonate, weatherproof, while-in-use cover.

.3 With cord opening allowing for use while the cover is pad locked.

2.4 LUMINAIRE MOUNTING BRACKETS

.1 Mounting brackets for specified luminaires:

.1 Single, twin, and quad brackets as indicated.

2.5 LUMINAIRES

.1 In accordance with Section 26 56 19.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

.2 Examine poles, luminaire-mounting devices, lowering devices, and pole accessories before installation. Components that are scratched, dented, marred, wet, moisture damaged, or visibly damaged are considered defective.

.3 Examine roughing-in for foundation and conduit to verify actual locations of installation.

.4 Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 BASE INSTALLATION

.1 Install specified below-grade fiber form, reinforcing steel, ducts, etc. to required grade.

.2 Place form on top of empty fiber form. Position vertical seams in desired direction.

.3 Pour specified concrete through open top of form into fiber form below. Avoid contact with inside surface. Bring concrete to top of formwork.

.4 Mechanically vibrate concrete with small vibrator, and vigorously hand tap outside surface of formwork.

.5 Place and centre anchor bolt assembly (or post, etc.) into concrete. Trowel-finish top surface of concrete.

.6 Reinforce bases with vertical steel reinforcing rods and horizontal steel reinforcing ties as noted on the drawings.

.7 Coordinate installation of conduit at bases for lighting poles, bollards, floodlights, and signs.

.8 Cast and cure bases in accordance with requirements of Section 03 30 00.

.9 Install self-locking, vandal-resistant, wraparound aluminum colour accent band around finished bases, where indicated.

.10 Base Stripping:

.1 Strip concrete form within 24 hours of pouring of base.

.2 Cut steel bands. Strip form in two halves. Pry open at the two vertical seams with flat-bladed hand-tool e.g. ice-scraper or square-nose shovel. Insert blade and separate form at top, middle, and bottom of first seam. Repeat for second seam.

.3 Wire brush any traces of form material remaining on finished concrete base.

.4 Use rubbing stone to make smooth any rough concrete edges around top of base and along vertical seams.

.5 If there is risk of damage by construction equipment to exposed base, protect base by tie-wiring or duct taping the two formwork halves back in place around base until safe to remove protection.

.6 Install colour accent band(s), where applicable, in horizontal reveal(s) around finished base.

3.3 POLE INSTALLATION

.1 Alignment: Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on the pole.

.2 Raise and set poles using web fabric slings (not chain or cable) at locations indicated by manufacturer.

.3 Install poles true and plumb, complete with brackets in accordance with manufacturer's instructions.

.4 Mount standards on bases plumb and true utilizing shims as required and then securely anchor standards to anchor bolts. Touch up all chips and scratches on poles upon completion.

.5 Provide label on each pole to allow for individual identification of each pole, minimum 125 mm (5 inch) text height of contrasting colour to that of pole finish, installed at approximately 3048 mm (10 feet) above finished grade.

.6 Install luminaires on pole.

.7 Check luminaire orientation, level, and tilt.

.8 Connect luminaires to lighting circuits.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Pole mounted, wall mounted, and canopy mounted solid state, light emitting diode (LED) source exterior luminaires.

1.2 RELATED REQUIREMENTS

.1 Division 04 – Masonry: brick grinding requirements for wall mounted luminaires.

.2 Section 26 09 23 – Lighting Control Devices: photocells, astronomical timers.

.3 Section 26 09 26 – Lighting Control Panelboards.

.4 Section 26 09 43.19 – Wireless Network Lighting Controls.

.5 Section 26 56 13 – Lighting Poles and Standards.

1.3 REFERENCES

.1 CSA Group:

.2 WD 6 - Wiring Devices - Dimensional Requirements.

.5 Underwriters Laboratories Inc. (UL):

.1 ANSI/UL 1449, (4th Edition), Standard for Safety, Surge Protective Devices.

1.4 ACTION SUBMITTALS

.1 Submit product data in accordance with Section 01 33 00.

.2 Manufacturer reports: Provide a point-by-point photometric analysis of the site, in accordance with the procedures laid out in IES RP-8-18, for review by the Consultant. Include point-by-point calculation zones along the property line. The designer shall lay out a grid of points on the pavement at a maximum spacing of one-third the light fixture mounting height, commencing within one-half the grid spacing from the perimeter boundary.

.3 Product specification sheets or other documentation that includes the designed parameters as detailed in this specification. These parameters include (but are not limited to):

.1 Luminaire cut sheets.

.1 Highlight all parameters of the complete luminaire part number, including lumen package, correlated colour temperature, IES distribution type, and driver information.

.2 Highlight the input watts of the luminaire and the B-U-G rating.

.3 Cut sheet to document L70 lumen maintenance data, in hours, when extrapolated for the worse case operating temperature.

.4 Lighting Manufacturer's photometric analysis when requested by the Consultant during submittal review.

1.5 INFORMATIONAL SUBMITTALS

.1 Instructions for installation and maintenance.

1.6 CLOSEOUT SUBMITTALS

.1 Section 01 78 00: Submittals for project closeout.

.2 The Contractor shall be responsible for obtaining from the supplying lighting manufacturers, for each luminaire, a recommended maintenance manual including:

.1 Vendor and local representative's contact information.

.2 Tools required.

.3 Maintenance instructions.

.4 Types of cleaners to be used.

.5 Replacement parts identification lists.

.6 Equipment product data (high-quality reproducible copies).

.3 Complete warranty information including manufacturer's warranty conditions, including driver, luminaire, and accessories.

.4 Light level measurements demonstrating the installation is consistent with the photometric analysis.

1.7 QUALITY ASSURANCE

.1 Luminaires tested to IES LM-79.

.2 Design Qualification Testing performed by a National Voluntary Laboratory Accreditation Program (NVLAP) testing facility. Such testing may be performed by the manufacturer, or an independent testing lab hired by the manufacturer on new luminaire designs, and when a major design change has been implemented on an existing design. A major design change is defined as a design change (electrical or physical) which changes any of the performance characteristics of the luminaire,

results in a different circuit configuration for the power supply, or changes the layout of the individual LED's in the module.

.3 Products certified by a recognized testing agency accredited by the Standards Council of Canada, and bearing a certification mark from that agency. Certification shall include wet location rating.

1.8 WARRANTY

.1 Manufacturer Warranty against loss of performance and defects in materials and workmanship for the luminaires for a period of 5 years after acceptance of the luminaires. Warranty to cover all components comprising the luminaire.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 As noted on Lighting Fixture Schedule.

2.2 OUTDOOR LED LUMINAIRES, GENERAL

.1 Maximum nominal luminaire input wattage as specified for each luminaire type as indicated on the Luminaire schedule.

.2 Luminaires designed for ease of component replacement and end-of-life disassembly.

.3 Input Voltage:

.1 As indicated on Luminaire schedule.

.2 Driver to be compatible with system voltage without use of a step-down transformer. If the manufacturer’s standard product offering cannot achieve this, clearly indicate on the shop drawings and clearly indicate location of transformer.

.4 Surge Protection

.1 UL 1449 recognized surge protective device that is wired in front of the driver(s) and protects the luminaire to a minimum Category C Low (per ANSI/IEEE C62.41.2).

.5 Power Factor and Total Harmonic Distortion

.1 Power factor of greater than or equal to 0.9.

.2 THD of less than or equal to 20 per cent.

.6 0-10 V dimming, or as indicated on drawings.

.7 Driver rated for minimum 50 000 hours.

.8 Gasket: neoprene seal between refractor and housing.

.9 Light Distributions:

.1 Fixtures available with IES distribution types I, II, III, IV, V, and other distributions, as noted.

.2 Pole mounted luminaire shall have an available option for low-profile house-side shield.

.10 Self-locking latches of stainless steel and aluminum.

.11 Factory wired including integral driver, terminated at terminal block.

.12 Luminaires with cast aluminum weatherproof housing.

.13 Ingress protection: sealed against moisture and environmental contaminants to IP65 rating or better for both light engines/optics and overall luminaire.

.14 Finishes

.1 Housing and heat sink finished in polyester powder coat paint, minimum 2.5 mil nominal thickness.

.2 Standard finish colours to include black, bronze, grey, white, dark platinum, and graphite metallic.

.3 RAL and custom colour matches to be available as indicated on the luminaire schedule.

2.3 OUTDOOR POLE/ARM MOUNTED AREA AND ROADWAY LED LUMINAIRES

.1 Pole mounted luminaires suitable for the EPA rating of the pole.

.2 Pole finish colour to match that of luminaire.

.3 Source: Light Emitting Diode (LED).

.1 Zonal Lumen Density:

.1 100 per cent between 0 degrees and 90 degrees from nadir.

.2 Less than or equal to 10 per cent between 80 degrees and 90 degrees from nadir.

.2 Minimum luminaire efficacy: 105 lumens per watt.

.3 Correlated Colour Temperature (CCT): 3000 K.

.4 Colour Rendition Index (CRI): 70 CRI minimum.

.5 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation. LM-80 testing is to utilize 10 000 hour testing data.

2.4 OUTDOOR WALL MOUNTED AREA LED LUMINAIRES

.1 Source: Light Emitting Diode (LED).

.1 Zonal Lumen Density:

.1 100 per cent between 0 degrees and 90 degrees from nadir.

.2 Less than or equal to 10 per cent between 80 degrees and 90 degrees from nadir.

.2 Minimum luminaire efficacy: 105 lumens per watt.

.3 Correlated Colour Temperature (CCT): 3000 K.

.4 Colour Rendition Index (CRI): 70 CRI minimum.

.5 Minimum L70 lumen maintenance to occur at 50 000 hours in accordance with LM-80 testing data and TM-21 extrapolation. LM-80 testing is to utilize 10 000 hour testing data.

2.5 FIXTURE MOUNTED CONTROLS PROVISION

.1 Provide NEMA 7-pin receptacle on all pole mounted luminaires, complete with shorting cap.

.1 Shorting Cap, Locking-Type Mounting: 3-prong locking-type plug connector. It is used with luminaries with a photocontrol receptacle to complete circuit when a photocontrol is not required.

.2 Basis of design: Intermatic K4500 series.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install lighting equipment, including but not limited to luminaires, controls, auxiliary devices and the integration of same in strict conformance with all manufacturers' recommendations and instructions the securing of which shall be the responsibility of the Contractor.

.2 Luminaires shall be integrated with controls in accordance with respective luminaire manufacturers' and controls manufacturers' recommendations and instructions and to provide a complete, trouble-free operation without compromising safety, code, and UL/CSA/NOM requirements.

.3 Contractor shall be responsible for sealing all outdoor luminaires for wet locations (i.e. all knock-outs, all pipe and wire entrances, etc.) as is standard industry practice to prevent water from entering luminaires.

.4 All luminaires shall be installed plumb and true and level as viewed from all directions unless specifically identified otherwise in the Luminaire Schedule. Luminaires shall remain plumb and true without continual adjustment or visibly obvious means beyond what is shown on luminaire submittal drawings.

.5 Luminaire finishes which are disturbed in any way during construction shall be touched up or refinished in a manner satisfactory to the Consultant.

.6 Whenever a luminaire or its hanger canopy is installed directly to a surface mounted junction box, a finishing ring painted to match the ceiling, shall be used to conceal the junction box.

.7 All accessories shall be properly installed and adjusted by Contractor in accordance with specification and installation instructions. Any spare items shall be clearly labeled (indicate type of accessory and associated luminaire types).

.8 Install luminaires on poles in accordance with Section 26 56 13.

.9 For wall mounted luminaires:

.1 Provide a smooth grinding of brick, including type such as split face, to ensure a flush contact between luminaire and wall in accordance with Division 04 requirements.

.2 Provide a silicone seal around the luminaire.

.10 Connect luminaire to lighting circuit.

3.2 SITE TESTS AND INSPECTIONS

.1 Perform lighting system commissioning in accordance with Section 26 08 50.

.2 Perform light meter testing at night and report values to the Consultant.

3.3 ADJUSTING

.1 As required, all adjustable luminaires shall be aimed, focused, locked, etc., by the Contractor under the observation of the Consultant. As aiming and adjusting is completed, locking setscrews and bolts and nuts shall be tightened securely by the Contractor.

.2 All ladders, scaffolds, lifts, etc. required for aiming and adjusting luminaires shall be furnished by the Contractor.

.3 Where possible, units shall be focused during the normal working day. However, where daylight interferes with seeing lighting effects, aiming shall be accomplished at night.

3.4 CLEANING

.1 All luminaires and accessories shall be thoroughly cleaned after being installed. All fingerprints, dirt, tar, smudges, drywall mud and dust, etc. shall be removed by the Contractor from the luminaire bodies, reflectors, trims, and lens or louvers prior to final acceptance. All reflectors shall be free of paint other than factory-applied, if any. All reflectors, cones and lenses shall be cleaned only according to manufacturers' instructions.

END OF SECTION

SEE ADD#4
Q#69

PART 1 - GENERAL

1.1 SUMMARY

.1 Provide a complete system of empty conduit, pull boxes, outlets, and sleeves for enclosure of communications cabling.

1.2 RELATED REQUIREMENTS

.1 Section 26 05 33.13 – Conduit for Electrical Systems.

.2 Section 26 05 33.16 – Boxes for Electrical Systems.

1.3 REFERENCES

.1 BISCI Telecommunications Distribution Methods Manual, 14th Edition.

1.4 CLOSEOUT SUBMITTALS

.1 Record documentation:

.1 Records of underground utility locates.

.2 Record as-constructed location of all underground conduits and telecommunications pathways on as-built drawings regardless of conduit size.

PART 2 - PRODUCTS

2.1 OUTLETS

.1 Wall outlets shall be 115 mm square boxes with plaster rings to suit single gang devices unless otherwise noted.

.2 Provide 53 mm conduit through walls as noted.

2.2 CONDUITS

.1 Conduit size shall be in accordance with recommended standard for conduits in Building as published by BICSI.

.2 Minimum conduit size shall be 21 mm diameter.

.3 Minimum space requirements in pull boxes for 90 degree pulls, shall be as follows:

Maximum conduit size	Size of pull boxes in millimetres			For each additional conduit size increase width by:
	Width	Length	Depth	
21 mm	150 mm	300 mm	100 mm	50 mm
27 mm	200 mm	400 mm	150 mm	75 mm
35 mm	250 mm	450 mm	200 mm	75 mm
41 mm	300 mm	600 mm	250 mm	100 mm
53 mm	350 mm	750 mm	300 mm	125 mm

.4 Plenum cables are permitted in accessible ceilings. Provide 'J' hooks in these locations [for later cable installation by others].

.5 Plywood backboards shall be minimum 1200 mm by 2400 mm, 19 mm thick, painted with 2 coats of fire retardant light grey enamel.

.6 Provide a minimum of two 5-15R duplex receptacles on separate circuits at each backboard.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Vertically mount outlet boxes, unless noted otherwise, 300 mm to centre above floor, or 150 mm above counter top where shown at counters or benches.

.2 Fish conduit, clear blockages and outlet and clean out pull boxes at completion of installation. Leave conduit free of water or excess moisture. Install No. 12 gauge galvanized soft iron pull wire, or 3.2 mm (1/8") nylon pull cord continuously from outlet to outlet, through conduit and fasten at each box.

.3 Conduit shall have a bending radius of not less than nine times conduit diameter. Ream out conduit and identify ends with green paint.

.4 Install additional steel pull boxes in such a manner that, throughout entire system, there shall be not more than two 90 degree or equivalent bends or more than 30 m in each run, so that wire or cables may be pulled in or withdrawn with reasonable ease. Minimum space requirements in pull boxes having one conduit each in opposite ends of the box, shall be as follows:

Maximum conduit size	Size of pull boxes in millimetres			For each additional conduit size increase width by:
	Width	Length	Depth	
21 mm	150 mm	300 mm	100 mm	50 mm
27 mm	200 mm	400 mm	150 mm	75 mm
35 mm	250 mm	450 mm	200 mm	75 mm
41 mm	300 mm	600 mm	250 mm	100 mm
53 mm	350 mm	750 mm	300 mm	125 mm

.5 Show as-installed conduit routing and location of all pull boxes on the record drawings, prior to project completion, for use by future installer to facilitate wiring and equipment installation. Include above noted information on final record drawings at project completion.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Flexible textile raceway, innerduct, or conduit.

.2 To allow for future communication upgrades, including transitioning from multi-pair copper cables to optical fiber media, a specific number of conduits shall be dedicated for that purpose. And to further that effort and achieve maximum conduit utilization, those conduits shall contain innerduct.

1.2 REFERENCES

.1 Innerduct definition per the American National Standards Institute (ANSI).

1.3 SUBMITTALS

.1 Product Data - Provide standard details and installation instructions.

PART 2 - PRODUCTS

2.1 GENERAL

.1 Materials and Equipment: Labeled and/or listed as acceptable to the authority having jurisdiction as suitable for the intended use.

.2 Flexible optical fiber/communication raceway.

.3 Provide wire management in a building for fiber optic and data and communications cabling.

.4 A non-metallic raceway, usually circular, placed within a larger raceway. (Sub duct).

2.2 MANUFACTURERS

.1 MaxCell Group/TVC Communications
600 Plum Creek Dr., Wadsworth, OH. 44281, Tel: 1-888-387-3828.

.2 Approved equal.

2.3 MATERIALS

.1 White Polyester and Nylon resin polymer.

2.4 TEXTILE INNERDUCT

.1 Standard Outdoor Textile Innerduct: Micro (33 mm), 2 inch, 3 inch, and 4 inch single or multi-cell polyester/nylon textile innerduct containing 1250 lb polyester flat woven pull tape.

.2 Detectable Outdoor Textile Innerduct: Micro (33mm), 2 inch, 3 inch, and 4 inch single or multi-cell polyester/nylon textile innerduct containing 1250 lb polyester flat woven pull tape, and a solid copper, polyvinyl color coated conductor (19 AWG minimum) for tracing and rated for a minimum of 6 amps and 600 volts. Conductor shall be placed in the sidewall edge fold of the textile sleeve.

.3 Indoor Textile Innerduct (Riser-listed): Micro (33 mm), 2-inch, 3-inch and 4-inch single or multi-cell nylon textile innerduct containing 1250 lb polyester flat woven pull tape which meets UL2024A for flame propagation and smoke density values for general applications.

.4 Plenum-Listed Textile Innerduct: Micro (33 mm), 2-inch and 3-inch single or multi-cell nylon textile innerduct containing 200 lb nylon-resin flat woven pull tape which meets UL2024A for flame propagation and smoke density values for use in air handling spaces.

2.5 TEXTILE INNERDUCT FITTINGS

.1 Conduit Plugs: Compression-type conduit plugs with locking nuts for sealing and securing one or more textile innerducts within a 4-inch inside diameter conduit, e.g. a. 4 inch plug with nine holes for cables in a 3 pack (9-cell) configuration.

.2 Termination Bags: Inflation-type bags for sealing and securing around one or more textile innerducts and cables within 2-inch outside diameter or larger conduit.

2.6 PULL TAPE

.1 Pull Tape: measuring and pulling tape constructed of synthetic fiber, printed with accurate sequential footage marks. Color-coded.

2.7 PENETRATION SEALING MATERIALS

.1 Duct Water Seal: products suitable for closing underground and entrance conduit openings where innerduct or cable is installed, to prevent entry of gases, liquids, or rodents into the structure.

PART 3 - EXECUTION

3.1 PROTECTION DURING CONSTRUCTION

.1 Protect products from the effects of moisture, UV exposure, corrosion and physical damage during construction.

3.2 TEXTILE INNERDUCT TYPE TO BE USED

.1 Aboveground, Exterior and Interior Conduit Installations: Outdoor textile innerduct (Standard or Detectable as desired).

.2 Interior Exposed Locations

.1 Non-plenum Areas: Indoor textile innerduct.

.2 Plenum Areas: Plenum-listed indoor innerduct.

.3 When installed in 4 in conduit, use two 3 in 3-Cell packs with an additional pull tape on the outside for future pulls in each conduit.

.4 Cable Tray: use standard outdoor or indoor textile innerduct.

3.3 TEXTILE INNERDUCT INSTALLATION

.1 Provide textile innerduct in conduit and wire ways, and place textile innerduct within and under cable trays using continuous unspliced lengths of textile innerduct between maintenance holes, pull boxes, and/or termination points as indicated on the drawings.

.2 Make a 2 in incision, approximately 18 in from the end of textile innerduct. Pull out and cut off approximately 2 feet of pull-tape. Thus allowing the pull tape ends to retract back into the cells.

.3 Using approximately 6 feet of pull tape, tie a non-slip knot to the incision. Then tie 3 to 6 half-hitch knots down to the end of textile innerduct. Apply black vinyl tape over all knots and the end of textile

innerduct. Using a Bow Line knot tie a swivel to the end of 3 feet pull tape. For multi-pack installations one swivel is sufficient, but stagger each textile innerduct.

.4 Using a Bow Line knot, attach the pull rope located in the rigid conduit to the other end of the swivel. Install textile innerduct – ensuring that no twist is introduced to the innerduct.

.5 Provide suitable textile innerduct slack in the maintenance holes, hand holes, pull boxes, and at turns to ensure there is no kinking or binding of the product.

.6 Textile Innerduct Mountings, Hangers and Attachments: When exposed indoors or in maintenance holes, hold firmly in place using independent support.

.1 Design and install hangers and other similar fittings adequate to support loads and so as to not damage innerduct.

.2 Do not fasten textile innerduct to steam, water, or other piping, ductwork, mechanical equipment, electrical equipment, electrical raceways, or wires.

.3 When appropriate, use the following cable ties to secure textile innerduct through previously created incisions:

.1 Plenum areas: plenum-rated plastic or stainless steel.

.2 Non plenum areas: Conventional flame-retardant nylon ties.

.3 Underground locations: Conventional plastic cable ties.

.7 Maintenance Hole and Hand Hole Installation:

.1 At locations where textile innerduct will be continuous through a manhole or hand hole, allow sufficient slack so that the innerduct may be secured to the side of the vault maintaining the minimum bend radius.

.2 At maintenance holes serving as the junction location, pull the exposed end of the innerduct to the far end of the vault, install termination bag, and secure to the vault.

.8 Cable Tray and Runway Installation: Cut incisions every 24 inches into the edge of the textile innerduct and cable wrap to one side of vertical ladder rack or horizontal ladder-type cable tray at each incision.

3.4 PENETRATIONS

.1 Seal all conduit and textile innerduct entering structures at the first box or outlet to prevent entrance into the structure of gases, liquids, or rodents.

.2 Inspect fire stopping installation by others between building structure and conduit, wire way, and cable tray to verify integrity of installation.

.3 Exposed Textile Innerduct Penetrations: Install conduit sleeves or fire barrier sealing systems in all openings where open and exposed textile innerduct passes through fire-rated walls and floors. After installation, install intumescent fire barrier penetration sealing material (Hilti system) between textile innerduct and sleeves or fire barrier system.

.4 Raceway Penetrations: After textile innerduct installation, install intumescent fire barrier penetration sealing material (Hilti system) between textile innerduct and conduit or wire way at all exposed penetration locations.

.5 Protect adjacent surfaces from damage during water seal or fire stop installation. Repair any damage.

.6 Document entire installation process for future referral.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

.1 Provide a complete system of empty conduits, terminal cabinets, plywood backboards, pull boxes and outlets for enclosure of wiring by Security Contractor under Cash Allowance.

1.2 RELATED REQUIREMENTS

.1 Section 26 05 33.13 – Conduit for Electrical Systems.

.2 Section 26 05 33.16 – Boxes for Electrical Systems.

PART 2 - PRODUCTS

2.1 OUTLETS

.1 Wall and door outlets shall be single boxes, or 115 mm square boxes with plaster rings to suit single gang devices unless otherwise noted. Coordinate with Security Contractor.

2.2 CONDUITS

.1 Provide conduit in all walls, exposed areas, and inaccessible ceilings. All conduit work shall be concealed.

.2 Minimum conduit size shall be 21 mm diameter.

.3 Provide J hooks in accessible ceilings for plenum rated wiring.

.4 Minimum space requirements in pull boxes for 90 degree pulls, shall be as follows:

Maximum conduit size	Size of pull boxes in millimetres			For each additional conduit size increase width by:
	Width	Length	Depth	
21 mm	150 mm	300 mm	100 mm	50 mm
27 mm	200 mm	400 mm	150 mm	75 mm
35 mm	250 mm	450 mm	200 mm	75 mm
41 mm	300 mm	600 mm	250 mm	100 mm
53 mm	350 mm	750 mm	300 mm	125 mm

.5 Plywood backboards shall be minimum 1200 x 2400 mm, 19 mm thick, painted with 2 coats of fire retardant light grey enamel.

.6 Provide a minimum of 2 duplex receptacles on separate circuits at each backboard.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Vertically mount outlet boxes, unless noted otherwise, 300 mm to centre above floor, or 150 mm above counter top where shown at counters or benches.

.2 Fish conduit, clear blockages and outlet and clean out pull boxes at completion of installation. Leave conduit free of water or excess moisture. Install No. 12 gauge galvanized soft iron pull wire, or 3.2 mm (1/8") nylon pull cord continuously from outlet to outlet, through conduit and fasten at each box.

.3 Conduit bonds shall have a bending radius of not less than nine times conduit diameter. Ream out conduit and identify ends with green paint.

.4 Install additional steel pull boxes in such a manner that, throughout entire system, there shall be not more than two 90 degree or equivalent bends or more than 30 m in each run, so that wire or cables may be pulled in or withdrawn with reasonable ease. Minimum space requirements in pull boxes having one conduit each in opposite ends of the box, shall be as follows:

Maximum conduit size	Size of pull boxes in millimetres			For each additional conduit size increase width by:
	Width	Length	Depth	
21 mm	150 mm	300 mm	100 mm	50 mm
27 mm	200 mm	400 mm	150 mm	75 mm
35 mm	250 mm	450 mm	200 mm	75 mm
41 mm	300 mm	600 mm	250 mm	100 mm
53 mm	350 mm	750 mm	300 mm	125 mm

.5 Show as-installed conduit routing and location of all pull boxes on the record drawings, prior to project completion, for use by Security installer to facilitate wiring and equipment installation. Include above noted information on final record drawings at project completion.

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

.1 Provide a complete system of empty conduits, terminal cabinets, plywood backboards, pull boxes and outlet boxes for enclosure of cabling [by Owner] under a separate contract.

1.2 RELATED REQUIREMENTS

.1 Section 26 05 33.13 – Conduit for Electrical Systems.

.2 Section 26 05 33.16 – Boxes for Electrical Systems.

PART 2 - PRODUCTS

2.1 VIDEO SURVEILLANCE EQUIPMENT [BY OWNER]

.1 Video Surveillance equipment shall be based on IP cameras. Size conduits based on industry practices based on Category 6 communications cabling.

2.2 OUTLETS

.1 Wall and door outlets shall be single boxes, or 115 mm square boxes with plaster rings to suit single gang devices unless otherwise noted. Coordinate with Owner's video surveillance contractor.

2.3 CONDUITS

.1 Provide conduit in all walls, exposed areas, and inaccessible ceilings. All conduit work shall be concealed.

.2 Minimum conduit size shall be 21 mm diameter.

.3 Provide J hooks in accessible ceilings for plenum rated wiring.

.4 Minimum space requirements in pull boxes for 90 degree pulls, shall be as follows:

Maximum conduit size	Size of pull boxes in millimetres			For each additional conduit size increase width by:
	Width	Length	Depth	
21 mm	150 mm	300 mm	100 mm	50 mm
27 mm	200 mm	400 mm	150 mm	75 mm
35 mm	250 mm	450 mm	200 mm	75 mm
41 mm	300 mm	600 mm	250 mm	100 mm
53 mm	350 mm	750 mm	300 mm	125 mm

.5 Plywood backboards shall be minimum 1200 mm by 2400 mm, 19 mm thick, painted with 2 coats of fire retardant light grey enamel.

.6 Provide a minimum of two duplex receptacles on separate circuits at each backboard.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Vertically mount outlet boxes, unless noted otherwise, 300 mm to centre above floor, or 150 mm above counter top where shown at counters or benches.

.2 Fish conduit, clear blockages and outlet and clean out pull boxes at completion of installation. Leave conduit free of water or excess moisture. Install No. 12 gauge galvanized soft iron pull wire, or 3.2 mm (1/8") nylon pull cord continuously from outlet to outlet, through conduit and fasten at each box.

.3 Conduit bonds shall have a bending radius of not less than nine times conduit diameter. Ream out conduit and identify ends with green paint.

.4 Install additional steel pull boxes in such a manner that, throughout entire system, there shall be not more than two 90 degree or equivalent bends or more than 30 000 mm in each run, so that wire or cables may be pulled in or withdrawn with reasonable ease. Minimum space requirements in pull boxes having one conduit each in opposite ends of the box, shall be as follows:

Maximum conduit size	Size of pull boxes in millimetres			For each additional conduit size increase width by:
	Width	Length	Depth	
21 mm	150 mm	300 mm	100 mm	50 mm
27 mm	200 mm	400 mm	150 mm	75 mm
35 mm	250 mm	450 mm	200 mm	75 mm
41 mm	300 mm	600 mm	250 mm	100 mm
53 mm	350 mm	750 mm	300 mm	125 mm

.5 Show as-installed conduit routing and location of all pull boxes on the record drawings, prior to project completion, for use by Security installer to facilitate wiring and equipment installation. Include above noted information on final record drawings at project completion.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Cable trays, including ladder rack, wire mesh, optical fibre trough, and accessories.

1.2 RELATED REQUIREMENTS

.1 Section 26 05 26 – Grounding and Bonding for Electrical Systems.

.2 Section 26 05 29 – Hangers and Supports for Electrical Systems.

1.3 REFERENCES

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th Edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CSA C22.2 No. 126.1-17 (CSA/NEMA) - Metal Cable Tray Systems (Binational standard with NEMA VE 1-2017).

1.4 ACTION SUBMITTALS

.1 Product Data: Provide data for fittings and accessories.

.2 Shop Drawings: Indicate tray type, dimensions, support points, and finishes.

1.5 INFORMATIONAL SUBMITTALS

.1 Manufacturer's Instructions:

.1 Indicate application conditions and limitations of use stipulated by Product testing agency specified under Regulatory Requirements.

.2 Include instructions for storage, handling, protection, examination, preparation, and installation of product.

1.6 CLOSEOUT SUBMITTALS

.1 Project Record Documents: Record actual routing of cable tray and locations of supports.

1.7 REGULATORY REQUIREMENTS

.1 Products: Listed and classified by CSA (Canadian Standards Association as suitable for the purpose specified and indicated.

PART 2 - PRODUCTS

2.1 LADDER RACK-TYPE CABLE TRAY

.1 Description: CSA 22.2 No. 126.1, Class ladder type tray.

.2 Material: Aluminum.

.3 Inside width: As indicated.

.4 Inside depth: As indicated.

.5 Straight section rung spacing: 152 mm (6 in) on centre.

.6 Inside Radius of Fittings: As indicated.

.7 Unless otherwise noted, provide manufacturer's standard clamps, hangers, brackets, splice plates, reducer plates, blind ends, barrier strips, connectors, and grounding straps.

.8 Refer to drawings for details.

.9 Manufacturers:

.1 Hubbell Nextframe Ladder Rack.

.2 Canadian Electrical Raceways “Telecom Cable Rack”.

.3 Approved equal.

2.2 WIRE BASKET CABLE TRAY

.1 Description: CSA 22.2 No. 126.1, Class Basket type tray.

.2 Material: Carbon Steel, Hot Dipped Galvanized to ASTM A 123.

.3 Inside Width: As indicated.

.4 Inside Depth: As indicated.

.5 Straight Section Rung Spacing: refer to drawings.

.6 Inside Radius of Fittings: As indicated.

.7 Unless otherwise noted, provide manufacturer's standard clamps, hangers, brackets, splice plates, reducer plates, blind ends, barrier strips, connectors, and grounding straps.

.8 Refer to drawings for details.

.9 Rung spacing 152 mm (6 in).

.10 Radius for tees 305 mm (12 in) minimum. Exact size to be verified on site.

.11 Do not employ tray elbows. Use Tees to permit future extension of tray.

.12 Radius for the dropouts 125 mm (5 in) minimum. Exact size to be verified on site.

.13 Manufacturers:

.1 Cablofil.

.2 Canadian Electrical Raceways Inc.

.3 Hubbell.

.4 Thomas & Betts.

2.3 OPTICAL FIBRE ROUTING SYSTEM (FIBRE TRAY)

.1 The optical fiber routing system shall be used to route, segregate, and protect fiber optic communication cabling.

.2 ULC Listed (UL2024A)

.3 Size:

.1 100 mm x 100 mm (4 in x 4 in).

.2 As otherwise indicated on drawings.

.4 50 mm (2”) minimum bend radius through-out pathway.

.5 Impact resistant and flame-retardant material (UL94-V0 Flammability).

.6 Color: Black.

.7 Will include all mounting hardware, waterfalls, directional fittings, and other accessories required for installation.

.8 Manufacturers:

.1 Panduit Fiberrunner series.

.2 ADC FiberGuide series.

.3 Commscope SpeedPRO series.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Trays to be sized to 40 per cent maximum capacity.

.2 Install metallic cable tray to CSA C22.1 SB-02 and C22.2 No. 126.1.

.3 Install fibreglass cable tray to CSA C22.1 SB-02 and C22.2 No. 126.2.

.4 Support trays to Section 26 05 29. Provide supports at each connection point, at the end of each run, and at other points to maintain spacing between supports.

.5 Use expansion connectors where required.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Firestopping through penetrations in fire rated assemblies.

1.2 RELATED REQUIREMENTS

.1 Section 07 84 00 – Firestopping.

1.3 REFERENCES

.1 ASTM E 84, “Surface Burning Characteristics of Building Materials”.

.2 ASTM E 119, “Fire Tests of Building Construction and Materials”.

.3 ASTM E 814, “Fire Tests of Penetration Firestop Systems”.

.4 ANSI/UL263, “Fire Tests of Building Construction and Materials”.

.5 ANSI/UL723, “Surface Burning Characteristics of Building Materials”.

.6 ANSI/UL1479, “Fire Tests of Through Penetration Firestops”.

.7 Underwriters Laboratories Inc. (UL) – Fire Resistance Directory

1.4 PERFORMANCE REQUIREMENTS

.1 Fire rated pathway devices shall be the preferred product and shall be installed in all locations where frequent cable moves, add-ons and changes will occur, such devices shall:

.1 Meet the hourly rating of the floor or wall penetrated.

.2 Permit the allowable cable load to range from 0% to 100% visual fill thereby eliminating the need to calculate allowable fill ratios.

.3 Not require any additional action on the part of the installer to open or close the pathway device or activate the internal smoke and fire seal, such as, but not limited to:

.1 Opening or closing of doors.

.2 Twisting an inner liner.

.3 Removal or replacement of any material such as, but not limited to, sealant, caulk, putty, pillows, bags, foam plugs, foam blocks, or any other material.

.4 Permit multiple devices to be ganged together to increase overall cable capacity.

.5 Allow for retrofit to install around existing cables.

.6 Include an optional means to lengthen the device to facilitate installation in thicker barriers without degrading fire or smoke sealing properties or inhibiting ability of device to permit cable moves, add-ons, or changes.

.2 Where single cables (up to 7 mm (0.27 in) diameter) penetrate gypsum board/stud wall assemblies, a fire-rated cable grommet may be substituted. Acceptable products shall be molded from plenum-grade polymer and conform to the outer diameter of the cable forming a tight seal for fire and smoke. Additionally, acceptable products shall lock into the barrier to secure cable penetration.

.3 Where non- mechanical products are utilized, provide products that upon curing do no re-emulsify, dissolve, leach, breakdown or otherwise deteriorate over time from exposure to atmospheric

moisture, sweating pipes, ponding water, or other forms of moisture characteristic during or after construction.

.4 Where it is not practical to use a mechanical device, openings within floors and walls designed to accommodate telecommunications and data cabling shall be provided with re-enterable products that do not cure or dry.

.5 Cable trays shall terminate at each barrier and resume on the opposite side such that cables pass independently through fire-rated pathway devices. Cable tray shall be rigidly supported independent from fire-rated pathway devices on each side of barrier.

1.5 SUBMITTALS

.1 Submit under provisions of Section 01 33 00.

.2 Product Data: Provide manufacturer's standard catalog data for specified products demonstrating compliance with referenced standards and listing numbers of systems in which each product is to be used.

.3 Shop Drawings: Submit schedule of opening locations and sizes, penetrating items, and required listed design numbers to seal openings to maintain fire resistance ratings.

.4 Certificates: Product certificates signed by firestop system manufacturer certifying material compliance with applicable code and specified performance characteristics.

.5 Installation Instructions: Submit manufacturer's printed installation instructions.

1.6 QUALITY ASSURANCE

.1 Products/Systems: Provide firestopping systems that comply with the following requirements:

.1 Firestopping tests are performed by a qualified, testing and inspection agency. A qualified testing and inspection agency is UL, or another agency performing testing and follow-up inspection services for firestop system acceptable to authorities having jurisdiction.

.2 Firestopping products bear the classification marking of qualified testing and inspection agency.

.2 Installer Qualifications: Experience in performing work of this section who is qualified by the firestopping manufacturer as having been provided the necessary training to install firestop products in accordance with specified requirements.

1.7 DELIVERY, STORAGE, AND HANDLING

.1 Delivery:

.1 Manufacturer's original, unopened, undamaged containers, identification labels intact identifying product and manufacturer, date of manufacture; lot number; shelf life, if applicable; qualified testing and inspection agency's classification marking; and mixing instruction for multicomponent products.

.2 Handle and store products according to manufacturer's recommendations published in technical materials. Leave products wrapped or otherwise protected and under clean and dry storage conditions until required for installation.

.2 Storage and Protection:

.1 Store materials protected from exposure to harmful weather conditions and at temperature and humidity conditions recommended by manufacturer.

1.8 PROJECT CONDITIONS

.1 Do not install firestopping products when ambient or substrate temperatures are outside limitations recommended by manufacturer.

.2 Do not install firestopping products when substrates are wet due to rain, frost, condensation, or other causes.

.3 Maintain minimum temperature before, during, and for a minimum 3 days after installation of materials.

.4 Do not use materials that contain flammable solvents.

.5 Coordinate construction of openings and penetrating items to ensure that through-penetration firestop systems are installed according to specified requirements.

.6 Coordinate sizing of sleeves, openings, core-drilled holes, or cut openings to accommodate through-penetration firestop systems.

.7 Schedule installation of firestopping after completion of penetrating item installation but prior to covering or concealing of openings.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Specified Technologies Inc.
200 Evans Way, Somerville, NJ 08876. Tel: (800) 992-1180, Fax: (908) 526-9623, Email: specseal@stifirestop.com, Website: www.stifirestop.com.

.2 Substitutions: as approved by the Consultant prior to tender closing.

.3 Single Source: Obtain firestop systems for each type of penetration and construction condition indicated only from a single manufacturer.

2.2 MATERIALS

.1 General: Use only firestopping products that have been tested for specific fire resistance rated construction conditions conforming to construction assembly type, penetrating item type, annular space requirements, and fire rating involved for each separate instance.

2.3 FIRE RATED CABLE PATHWAYS

.1 Steel raceway with intumescent foam pads allowing 0 to 100 percent cable fill, the following products are acceptable:

.1 Specified Technologies Inc. (STI) EZ-PATH Fire Rated Pathway.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Before beginning installation, verify that substrate conditions previously installed under other sections are acceptable for installation of firestopping in accordance with manufacturer’s installation instructions and technical information.

.2 Surfaces shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellants, and any other substances that may inhibit optimum adhesion.

.3 Provide masking and temporary covering to protect adjacent surfaces.

.4 Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

.1 General: Install through-penetration firestop systems in accordance with Performance Criteria and in accordance with the conditions of testing and classification as specified in the published design.

.2 Manufacturer's Instructions: Comply with manufacturer's instructions for installation of firestopping products.

3.3 FIELD QUALITY CONTROL

.1 Inspections: Engage qualified independent inspection agency to inspect through-penetration firestop systems.

.2 Keep areas of work accessible until inspection by authorities having jurisdiction.

.3 Where deficiencies are found, repair firestopping products so they comply with requirements.

3.4 ADJUSTING AND CLEANING

.1 Remove equipment, materials, and debris, leaving area in undamaged, clean condition.

.2 Clean all surfaces adjacent to sealed openings to be free of excess firestopping materials and soiling as work progresses.

END OF SECTION

Updated through ADD#14

PART 1 - GENERAL

1.1 SUMMARY

.1 Provide commissioning of fire alarm and interconnected systems to verify that installations are in accordance with project requirements, and to ensure proper system operation.

1.2 RELATED REQUIREMENTS

.1 Section 01 91 13 – General Commissioning Requirements.

.1 Section 01 91 26.13 – Integrated Systems Testing of Fire Protection and Life Safety Systems.

1.3 REFERENCES

.1 CAN/ULC-S1001-11 – Integrated Systems Testing of Fire Protection and Life Safety Systems.

1.4 SUBMITTALS

.1 Commissioning plan.

1.5 CLOSEOUT SUBMITTALS

.1 Final commissioning and functional test report.

1.6 QUALIFICATIONS

.1 Commissioning Organizations:

.1 Certified member of Electrical Contractors Association of Ontario (ECAO) or Canadian Fire Alarm Association (CFAA).

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 SITE TESTS AND INSPECTIONS

.1 Perform testing of integrated systems in accordance with CAN/ULC-S1001.

.2 Follow manufacturer's recommendations for testing.

.3 Inspect wiring connections to all devices comprising the system.

.4 Verify supervision of wiring at every device connection to a supervised circuit.

.5 Test operation of every device on a system to verify its function.

.6 Examine equipment for any apparent damage or tampering that may interfere with its intended operation.

.7 Test equipment with capabilities for field adjustment to establish that it functions as intended under the conditions prevailing at its point of installation.

.8 Examine devices for evidence of damage or obstructions which may interfere with their operating mechanisms.

.9 Test automatic devices by simulating an operating condition.

.10 Wiring:

.1 Inspect every device and test to demonstrate that disconnection of the device from the circuit or malfunction of the equipment or wiring activates the required supervisory signals. Inspection shall include verification that:

.1 Supervisory signals operate in response to open circuits, short circuits, ground faults and disconnection of plug-in components;

.2 Terminations of conductors entering and leaving equipment have been made;

.3 Circuit polarities are in accordance with the system design, where applicable.

.2 In addition, test to establish that the power supplied to any device is within its recommended operating range and that the required voltage levels are maintained and that the fusing is correct.

.11 Initiating Devices - Manual:

.1 Inspect manual alarm stations in consideration of the following:

.1 The device shall be mounted with sufficient clearance to facilitate ease of access and proper operation;

.2 Operate each manual alarm station, toggle switch and key switch to verify proper functions.

.12 Automatic heat detectors:

.1 Use a heat source reproducible in its intensity, as recommended by the manufacturer of the device, to initiate an alarm.

.2 Test equipment - Heat lamp or Air heater. DO NOT USE AN OPEN FLAME HEAT SOURCE.

.3 Apply heat source as to not damage or operate fusible disc parts.

.13 Automatic heat detectors - non-resettable:

.1 Test by simulating its electrical operation by jumpering the wiring points (creating a short) adjacent to its operating mechanism.

.14 Automatic smoke detectors - area type:

.1 Test by introducing smoke into its detecting chamber. This may consist of actual smoke from burning materials or artificially generated smoke aerosol spray as recommended by the manufacturer. The sensitivity should be noted and adjusted if necessary.

.15 Automatic smoke detectors:

.1 Examine the air sampling arrangements of the detectors under actual conditions of balanced air circulation by conducting a check of the field sensitivity and a check of the air velocity in accordance with the manufacturers' recommendations.

.2 Test gas to be used similar to Automatic Smoke Detector.

.16 Alarm signals - audible:

.1 Test on main power supply and standby power supply with the maximum expected load on the system.

.2 The audible signalling appliances shall function as intended and shall be audible throughout the building over the background noise present.

.3 Decibel recordings in each area covering 100 sq. metres shall be taken.

.4 The level of sound should usually be 15 dB above ambient noise level.

.17 Alarm signals - visual:

.1 The visual signal appliances shall function as intended and shall be clearly visible.

.18 Fire suppression supervision:

.1 Coordinate with the requirements of Section 21 12 00, and Section 21 13 00.

.2 Sprinkler and standpipe trade to active each sprinkler and standpipe supervisory and alarm device by operating valves and producing flows as required in conjunction with fire alarm technician to observe activation of flow switches, pressure switches, supervised valves, etc.

.19 Annunciators, printers, and workstations:

.1 Inspect and operate to establish that their operation in conjunction with the control equipment and other system components, is as intended. The equipment shall be inspected to ensure:

.1 The zone of each alarm initiating device is properly indicated;

.2 The legend is clearly visible;

.3 Adequate voltage under local conditions is present;

.4 Wiring connections have been made in a workmanlike manner.

.5 Proper care must be taken to establish that each item is complete and satisfactory.

.20 Standby power supplies - batteries:

.1 Examine batteries for possible damage and consideration of the following:

.1 The charging system functions as intended;

.2 The installation has not resulted in the bypassing of a fuse or a similar protective device;

.3 The installation protects the batteries from accidental or mechanical damage.

.4 The batteries must be able to operate the fire alarm system with the charger input disconnected for one rated load cycle.

.21 Control equipment and transponders:

.1 Test to establish that they function as intended. The following examinations and tests shall be performed:

.1 A visual and physical inspection of all cables, plug interconnections, plug-in circuit components, lamps, sockets and controls to establish that their mechanical and electrical connections and mounting are as required for intended function and, where applicable, to confirm electrical supervision;

.2 Verification that all field wiring is terminated in a workman-like manner;

.3 All lamps and indicators shall be tested for operation and intended function;

.4 All keypad functions shall be tested for operation and intended function;

.5 All control unit functions shall be operated to verify appropriate response including all software routines and programme functions are simulated;

.6 Simulation of open circuits, short circuits and ground faults on all relevant internal circuits in order to confirm the appropriate supervisory response;

.2 Commissioning Report:

.1 Provide in accordance with requirements of Section 01 91 13, supplemented as specified herein.

.2 Report to include relevant information of the system including:

.3 Each system part described.

.4 How the system is operated.

.5 What functions the system performs.

.6 Requirements for tests and service.

.7 Itemization of all devices connected on the system, their general location.

.8 The date of the performed tests.

.9 All pertinent details of the report sheets requested.

.3 Verification:

.1 The Commissioning Report to be submitted to the Commissioning Manager upon completion of commissioning and will be subject to verification by the Commissioning Manager.

3.2 SIMULATIONS OF INTERCONNECTED SYSTEMS

.1 Provide simulations of all interconnected systems in accordance with CAN/ULC-S1001.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 [Single stage] [Two-stage] [Modified Two-Stage] addressable fire alarm systems.

.2 System testing and verification.

.3 Work to be done under this Section shall include furnishing of labour, materials, and equipment required for installation, testing, and putting into proper operation a complete Fire Alarm System as shown, as specified, and as otherwise required. Complete system shall be left ready for continuous and efficient satisfactory operation.

1.2 RELATED REQUIREMENTS

.1 Section 08 71 00 – Door Hardware: additional requirements for access control devices, magnetic door holders, etc.

.2 Section 21 12 00 – Fire-Suppression Standpipes.

.3 Section 21 13 00 – Fire-Suppression Sprinkler Systems.

.4 Section 26 05 00 – Common Work Results for Electrical.

1.3 UNIT PRICES

.1 Refer to Document 00 43 00.26.

.2 Submit with Tender unit prices to provide the following. Include installation and verification in the unit price:

.1 Section 28 46 31:

.1 Fire detector (heat detector or smoke detector) complete with wiring and conduit, based on 10 metre distance.

.2 Duct type smoke detector complete with wiring and conduit on a separate zone, based on 30 metre distance.

.2 Section 28 46 31.31:

.1 Manual pull station, complete with wiring and conduit based on 10 metre distance.

.3 Section 28 46 31.41:

.1 Zone Addressable Module (ZAM).

.4 Section 28 46 41:

.1 Fire alarm horn complete with wiring and conduit, based on 10 metre distance.

.2 Combination Fire alarm horn/strobe complete with wiring and conduit, based on 10 metre distance.

[OR]

.3 Speaker complete with wiring and conduit, based on 10 metre distance.

.4 Combination speaker/strobe complete with wiring and conduit, based on 10 metre distance.

.5 Unit cost of additional conduit and wire for the above items.

.6 Wire guard for any fire alarm device.

1.4 REFERENCES

.1 Definitions

.1 FACP: Fire Alarm Control Panel. This is the central component of a fire alarm/detection/communication system and consists of a control panel(s) and contains the system power supply, system CPU, circuit terminations, and system annunciation functions.

.2 INITIATION DEVICE: Examples are smoke detectors, heat detectors, water flow switches, valve tamper switches, and manual pull stations. These are devices which initiate a signal and send it to the FACP telling it that an abnormal event has taken place. Data Centre extinguishing systems, kitchen hood extinguishing systems, and other special extinguishing system control panels are additional examples of initiating devices.

.3 NOTIFICATION DEVICE: Examples are alarm horns, alarm speakers, and strobe lights. These devices are used to indicate through visual and audible means the existence of an abnormal event throughout all areas of the protected premises.

.4 CONTROL DEVICE: Examples are electronic relays or solenoids. These devices allow the FACP to automatically take certain actions during an abnormal event. For example, the FACP may energize a relay which, in turn, shuts down an air handling unit.

.5 CENTRAL PROCESSING UNIT (CPU): The central computer of a multiplex fire alarm system.

.6 CONCEALED: Where used in connection with installation of piping or conduit and accessories shall mean "hidden from sight" as in shafts, furred spaces, soffits or above suspended ceilings.

.7 EXPOSED: Where used in connection with installation of piping or conduit and accessories shall mean "visible" or "not concealed."

.8 AHJ: Authority Having Jurisdiction.

.9 LISTED: Materials or equipment included in a list published by a nationally recognized laboratory that maintains periodic inspection of production of listed equipment and materials, and whose listing states either that the equipment or material meets nationally recognized standards or has been tested and found suitable for use in a specified manner.

.10 NFPA: National Fire Protection Association.

.11 CLASS A: Applies to wiring from transponder to central processing unit. The CPU will detect circuit trouble and transponder will retain the ability to transit alarm upon a single fault condition.

.12 CLASS B: Applies to wiring from initiating device to transponder. A trouble signal will be transmitted to the panel upon a single fault condition.

.13 TRANSPONDER: Single or multiple zone/point data collection panel used within a multiplex system.

.14 UL, and ULC: Underwriters Laboratories, Inc., and Underwriters Laboratories of Canada, Inc.

.15 ULC Listed: Materials or equipment listed by Underwriters Laboratories of Canada and included in the most recent edition of the UL and ULC Fire Protection Equipment Directory.

.16 AHU: Air Handling Unit.

.17 FM: Factory Mutual Research Corporation/Factory Mutual Engineering Association.

.2 Reference Standards

.1 The publications listed below form a part of this specification. The publications are referenced in text by the basic designation only. The equipment and installation shall comply with the latest edition/amendment referenced code, standard, or publication.

.1 CSA Group:

.1 CSA C22.1:21, Canadian Electrical Code, Part 1 (25th edition), Safety Standard for Electrical Installations.

.2 Ontario Electrical Safety Code (28th edition/2021).

.3 CSA C22.2 No. 208-14 - Fire Alarm and Signal Cable.

.2 Ontario Regulations:

.1 2012 Ontario Building Code.

.2 2007 Ontario Fire Code.

.3 Underwriters Laboratories of Canada:

.1 [CAN/ULC-S524-14] [CAN/ULC-S524:2019], Standard for Installation of Fire Alarm Systems.

.2 CAN/ULC-S525 – Audible Signal Appliances for Fire Alarm Systems.

.3 CAN/ULC-S526 – Visual Signal Appliances for Fire Alarm Systems.

.4 CAN/ULC-S527 – Control Units for Fire Alarm Systems.

.5 CAN/ULC-S528 – Manual Pull Stations for Fire Alarm Systems.

.6 CAN/ULC-S529 – Smoke Detectors for Fire Alarm Systems.

.7 CAN/ULC-S530 – Heat Detectors for Fire Alarm Systems.

.8 CAN/ULC-S533 – Egress Door Securing and Releasing Devices.

.9 CAN/ULC-S536 – Inspection and Testing of Fire Alarm Systems.

.10 CAN/ULC-S537 – Verification of Fire Alarm Systems.

.11 CAN/ULC-S548 – Alarm Initiating and Supervisory Devices for Water Type Extinguishing Systems.

.12 CAN/ULC-S561-13 – Standard for Installation and Services for Fire Signal Receiving Centres and Systems.

.13 CAN/ULC-S1001-11 (R2018) – Integrated Systems Testing of Fire Protection and Life Safety Systems.

.4 All requirements of the Authority Having Jurisdiction (AHJ).

.2 In the case of any discrepancy between these specifications, the project drawings, and any applicable local codes, the installed Fire Alarm / Life Safety System shall comply with the most stringent requirement.

1.5 ACTION SUBMITTALS

.1 In accordance with Section 01 33 00.

.2 Product Data: Provide electrical characteristics and connection requirements.

.3 Submit drawings to municipal Fire Department if required, showing annunciation devices, manual pull stations, complete wiring diagrams and annunciator details and obtain their approval.

.4 Shop Drawings:

.1 Sufficient information, clearly presented, shall be included to determine compliance with drawings and specifications.

.2 Include manufacturer's name(s), model numbers, ratings, power requirements, equipment layout, and device arrangement, and clearly showing ULC certification of all components.

.3 Show annunciator layout and main control panel module layout, configurations and terminations.

.4 Floor plan layouts showing all devices.

.5 Complete riser diagram, and auxiliary functions.

.6 The supplier of the system shall prepare a complete zoning schedule and artwork layout for passive graphic to be included with submittal package.

.7 Sequence of Operation narrative and zone chart.

1.6 INFORMATIONAL SUBMITTALS

.1 Manufacturer's Installation Instructions: Indicate application conditions and limitations of use stipulated by Product testing agency. Include instructions for storage, handling, protection, examination, preparation, installation, and starting of products.

1.7 CLOSEOUT SUBMITTALS

.1 Maintenance Contracts

.1 [Provide service and maintenance of fire alarm system for one year from Date of Substantial Completion.]

.2 Operation and Maintenance Data

.1 Operation Data: Operating instructions.

.2 Maintenance Data: Maintenance and repair procedures.

.3 Record Documentation

.1 Record actual locations of initiating devices, signaling appliances, and end-of-line devices.

.2 Electrical Safety Authority (ESA) inspection certificate.

.3 Fire alarm verification report.

.4 Audibility test.

.5 CAN/ULC-S1001 functional test report.

.4 Manuals

.1 Submit complete operating and maintenance manuals listing the manufacturer's name(s) including technical data sheets (with model numbers to be used indicated).

.2 Wiring diagrams shall indicate terminals and the interconnections between the items of equipment.

.3 Provide a clear and concise description of operation which gives, in detail, the information required to properly operate the equipment.

1.8 SPARE PARTS

.1 Supply the following additional equipment as spare parts in a proper metal enclosure sized to accept the equipment as listed herein. Label the enclosure fire alarm spare parts. Enclosure shall be placed in the same room as the FACP.

.1 Supply [six] keys of each type.

.2 Supply [three] of each type of addressable detector base, smoke detector, heat detector, and fire alarm pull station.

.3 Supply [three] of each type of other installed initiating, notification, or controlling devices.

.4 Supply [three] of each type of any special tools required for system use and maintenance.

.5 Supply [three] of each type of signalling device used on the project.

.2 Provide (supply and install) an additional [five] of each of the following devices as directed during construction. Turn over unused surplus in addition to those devices listed above:

.1 Section 28 46 31:

.1 [Heat detectors].

.2 Smoke detectors.

.3 Duct smoke detectors.

.2 Section 28 46 41:

.1 Fire alarm horns.

.2 Combination Horn/Strobes.

[OR]

.3 Section 28 46 41:

.1 Fire alarm speakers.

.2 Combination speaker/strobes.

.4 Door hold open devices.

1.9 QUALITY ASSURANCE

.1 Manufacturer shall examine drawings and specifications prior to award of contract to ensure that detectors, control panels and miscellaneous devices being supplied will provide a satisfactory working installation.

.2 Each and all items of the fire alarm system shall be listed as the products of a single manufacturer under the appropriate category by Underwriters Laboratories of Canada and shall bear the “ULC” label.

.3 The fire alarm control, panel shall meet the modular listing requirements of ULC. Each subassembly of the FACP, including all printed circuit boards, shall include the appropriate ULC modular label.

.4 Each and all items of the fire alarm system shall be covered by a one-year parts and labour warranty covering defects resulting from faulty workmanship and materials. The warranty shall be deemed to begin on the date the system is accepted by the Project Manager on issuance of the substantial performance certificate for the project.

.5 Regulatory Requirements

.1 Provide products listed and classified by ULC as suitable for purpose specified and indicated.

.6 Qualifications of Manufacturer

.1 Equipment and materials shall be provided by an experienced reputable manufacturer to ensure proper specification adherence, final connection, test, turnover, warranty compliance, and service.

.2 The manufacturer is required to have been in the fire alarm industry (service and installation) for a minimum of ten years.

.3 The manufacturer shall have in-house engineering and project management capability consistent with the requirements of this project. Qualified and approved representatives of the system manufacturer shall perform the detailed engineering design of central and remote control equipment.

.4 International Standards Organization. The system and all components will be manufactured to ISO 9001 international Quality Management and Quality Assurance Standards.

.5 Manufacturer must have service facilities within a 50 km radius of the installation location.

.7 Qualifications of Installers

.1 All work performed to comply with this specification shall be carried out by and/or managed by a competent firm regularly engaged in the installation and testing of fire alarm systems for commercial buildings. Equipment manufacturer shall also be competent firms which are regularly engaged in the design, installation, testing, and servicing of fire alarm systems for this type of building.

.2 Review of cut-sheets, shop drawings, calculations and other materials submitted by the contractor shall not relieve the contractor's responsibility for full compliance with the design drawings and specification unless written approval is requested by the contractor and obtained from the Consultant for each non-complying feature. Finalized agreements for all equipment deviations from the drawings and specification shall be completed prior to award of the installation contract.

.3 For those instances where the contractor cannot conform to the drawings and specification, a proposed variance shall be submitted in writing to the Consultant at least five working days prior to the bidding date. The Consultant will respond to all proposed variances within two working days of receipt.

.4 All questions concerning interpretation of the design drawings and specification shall be submitted to the Consultant in writing no later than three working days prior to the bidding date. Requests for interpretations received after this date will not be answered. The Consultant will respond to all requests for interpretations in writing and will provide a summary of each request and the response to all bidding contractors. The Consultant will respond to all requests for interpretations within two working days of receipt.

.5 The contractor shall utilize the services of a fire alarm equipment distributor who is a factory authorized representative and a full line stocking distributor of the equipment manufacturer and shall maintain a constant inventory of the parts typical of those used in the system installation covered under this specification.

.6 The contractor and the fire alarm equipment manufacturer or distributor shall each have a minimum of 7 years of continuous experience in the design and/or installation of fire alarm systems and shall have completed a minimum of five projects of similar scope and complexity which were completed using addressable/analog systems. It is intended that these projects incorporated the same equipment, manufacturer, and model number, as is being proposed for this project. To verify the qualifications, the contractor and the fire alarm equipment distributor shall submit a brief design narrative which covers at least five fire alarm systems selected for references. This narrative shall indicate the project location, approximate contract value, system size by device counts, and a functional overview. These narratives shall provide an end-user contact name and telephone number for each referenced system. Where a fire alarm equipment distributor is a branch office of a fire alarm manufacturer, the references shall be chosen from projects in which the branch office completed both the design implementation and the installation.

.7 The Owner reserves the right to request documentation from the contractor with respect to any pending litigation against the contractor or any subcontractor. Further, the Owner reserves the

right to review an audited financial statement of the contractor or any subcontractor for the most recently completed fiscal year.

.8 The Owner reserves the right to disqualify any contractor who does not comply with all requirements of the Contractor Performance Standard of this specification.

.9 Installer must be certified by the Province of Ontario as a fire alarm installer.

1.10 DELIVERY, STORAGE, AND HANDLING

.1 In accordance with Section 01 61 00.

1.11 WARRANTY

.1 All work performed and all material and equipment furnished under this contract shall be free from defects and shall remain so for a period of at least one year from the date of Substantial Performance.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 All references to manufacturer's model numbers and other pertinent information herein is intended to establish minimum standards of performance, function and quality.

.1 [Autocall 4100ES series.]

.2 Edwards; EST4 series.

.3 Notifier by Honeywell; Onyx [NFS2-640C] [NFS2-3030] series.

.4 Mircom; FX-4000 series.

.5 Siemens; Desigo series.

.6 SimplexGrinnell by Tyco Integrated Fire & Security; 4100ES series.

.2 All equipment and components shall be the manufacturer's current model.

.3 The materials, appliances, equipment, and devices shall be tested and listed by a nationally recognized approvals agency for use as part of a protected premises protective signaling (fire alarm) system.

.4 The authorized representative of the manufacturer of the major equipment, such as control panels, shall be responsible for the satisfactory installation of the complete system.

.5 The contractor shall provide, from the acceptable manufacturer's current product lines, equipment, and components, which comply, with the requirements of these specifications.

.6 Manufacturer is to support a 20 year product.

2.2 CONDUIT AND WIRE FOR FIRE ALARM SYSTEM

.1 Conduit:

.1 In accordance with Section 26 05 33.13.

.2 Conduit shall be in accordance with the Electrical Safety Authority (ESA), local and provincial requirements.

.3 All wiring shall be installed in conduit or raceway.

.2 Terminal Boxes, Junction Boxes and Cabinets:

.1 All boxes and cabinets shall be listed for their purpose and use.

.3 Fire Alarm Cable

.1 To Section 27 15 01.19.

[OR]

.2 Wiring shall be in accordance with local, provincial and national codes and as recommended by the manufacturer of the fire alarm system. Number and size of conductors shall be as outlined in the Ontario Electrical Safety Code and as recommended by the fire alarm system manufacturer.

.3 All wire and cable shall be listed and/or approved by a recognized testing agency for use with a protective signalling system, as outlined in the Ontario Electrical Safety Code.

.4 Conductors: 300 V rated multiconductor, insulated, colour coded, copper conductor, minimum size to be 16 AWG for device loops and 14 AWG for signal circuits.

.5 Certified by CSA as fire alarm and signal cable type FAS 105 to CSA C22.2 No. 208.

.6 Non-Fire rated cable:

.1 Insulation: 105°C flame retardant PVC

.2 Outer Jacket: 105°C flame retardant PVC Red.

.3 Armour: Interlocking aluminum without overall jacket. For drops to devices in suspended ceilings from conduit system.

.7 Fire rated fire alarm cable:

.1 Pentair Pyrotenax 1850 series mineral insulated (MI) cable with 2 hour fire rating to ULC S139 and to meet 2012 Ontario Building Code rule 3.2.7.10.

.2 Substitution: VITALink MC Brand Type MC, manufactured by Marmon Wire & Cable Inc. (listed by ULC under ULC category code ‘FHJRC’, dated 19 May 2015).

2.3 ADDRESSABLE FIRE ALARM SYSTEM

.1 The system to be electrically supervised, non-coded, annunciated, [single] [two]-stage, addressable fire alarm system using addressable devices.

[OR]

.2 The system to be electrically supervised, non-coded, annunciated, [single] [two] [modified two] stage, complete with voice communication, addressable fire alarm system using addressable devices.

.3 The Central Processing Unit (CPU) uses multiplex communication techniques to receive data from and transmit data to transponders remotely located throughout facility to minimize wiring costs, simplify design, to allow economical expansion and easy retrofit.

.4 Make provisions during detailed design for future expansion of the system.

.5 System to be complete with a minimum of three data loops per node.

.6 The CPU is microprocessor-based to increase system reliability, speed response to alarm conditions, and reduce cost. CPU response time to alarm conditions to be no more than four seconds, regardless of system size.

.7 Fire alarm system will be zoned as required plus 20 per cent spares.

.8 Basic Performance:

.1 Alarm signals arriving at the main FACP shall not be lost following a power failure (or outage) until the alarm signal is processed and recorded.

.2 Provided with an emergency power supply, i.e. batteries capable of providing supervisory power for not less than 24 hours, and immediately following, emergency power under full load for not less than two hours.

2.4 FIRE ALARM ANNUNCIATOR PANEL (FAAP) AND GRAPHIC

.1 To Section 28 46 21.22.

2.5 ULC MONITORING TRANSMITTER

.1 To Section 28 46 21.24.

2.6 FIRE ALARM SYSTEM ACCESSORIES

.1 To Section 28 46 25.

2.7 FIRE ALARM INITIATION DEVICES

.1 Automatic Initiating Devices to Section 28 46 31.

.2 Manual Pull Stations to Section 28 46 31 31.

.3 Supervisory Signal devices and Sprinkler Flow Switch alarms to Section 28 46 31.41.

2.8 FIRE-ALARM SUPERVISED INTERFACE HARDWARE

.1 Door Hardware Fire Alarm Integration to Section 28 46 51.08.

.2 HVAC Integration to Section 28 46 51.23.

.3 [Data Centre Aisle Containment to Section 28 46 51.28.]

2.9 SIGNALLING DEVICES

.1 [Bells] [Horns] [Speakers] and visual signal devices (strobes) to Section 28 46 41.

.1 Strobe Frequency: maximum 5 Hz.

.2 Programmable Electronic Sounders:

.1 Shall be flush mounted as required.

.3 Audible/Visual Combination Devices:

.1 Shall meet the applicable requirements listed above for audibility.

.2 Shall have a built in strobe, 75 candela.

.4 Strobe Synchronizing Modules:

.1 Synchronize strobes at 1 Hz and horns at temporal over single wire pan.

2.10 OPERATION SEQUENCE

.1 To Section 28 46 15.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 The entire system shall be installed in accordance with the edition of CAN/ULC-S524 as adopted by the applicable legislation, and the manufacturer's manuals and wiring diagrams.

.2 The contractor shall furnish all labour, conduit, wiring, outlet boxes, junction boxes, cabinets, and similar devices necessary for a complete, functional life safety fire alarm system.

.3 Provide all necessary power supply, interconnecting and remote signal wire in dedicated conduit throughout and installed in accordance with the manufacturer's wiring diagrams and the requirements of the Canadian Electrical Code and the Inspection Authority.

.4 All penetration of floor slabs and fire walls shall be fire stopped in accordance with all local fire codes.

.5 Power supply:

- .1 Connect fire alarm system power supply to a dedicated circuit.
- .2 Circuit breaker(s) feeding fire alarm system to be coloured red, clearly labelled, and be locked in the ON position.

.6 Wiring:

- .1 Install all wiring in metal raceways.
- .2 Provide wiring suitable for fire alarm circuits.
  - .1 Class "A" wiring for initiating circuits.
  - .2 Class "A" wiring for signalling circuits unless noted otherwise.
- .3 Provide fire rated cables for fire alarm circuits as required by applicable codes and standards.
- .4 Provide separate signalling circuits for audible and visual devices.
- .5 End-of-line resistors shall be furnished as required for mounting as directed by the manufacturer on Class B circuits.
  - .1 Install EOL resistors maximum 1800 mm above finished floor in interior spaces.

.7 Install manual pull stations at 1200 mm above finished floor.

.8 [Install factory wire guards in gymnasium on pull stations, fire detectors, strobes, and fire alarm horns.]

.9 Identification

- .1 Provide lamacoid label (white text on red background) for all supporting field devices indicating function of the device.

3.2 FIELD QUALITY CONTROL

.1 The installing contractor shall provide a qualified project superintendent for the overall management and supervision of the work.

.2 The project superintendent shall assure that adequate supervision is provided during all periods of installation of the fire alarm system. The project superintendent and all job site supervisors shall have a minimum of five years of continuous experience in the installation of fire alarm systems of similar scope and complexity.

.3 Upon completion of the installation, the installing contractor shall test all alarm initiating devices, supervisory devices, control devices and notification devices for proper response and effectiveness.

Operation of all annunciating devices including the FACP, printer and remote LCD panel shall be verified. Testing shall include thorough sound level measurements of audible notification devices. These tests shall be fully documented. All testing up to the point of conducting the final acceptance tests shall be recorded using a temporary printer. The permanent printer of the system, where such has been provided, shall not be installed prior to the final acceptance tests.

.4 All smoke detectors shall be suitably protected against contamination up to the time of the final acceptance tests.

.5 An itemized test report in accordance with CAN/ULC-S524, CAN/ULC-S536, and CAN/ULC-S537 shall be submitted to the Consultant. This report shall provide complete details of the testing completed for all devices as well as circuit testing parameters. Data shall be submitted indicating the sensitivity level of all system smoke detectors.

.6 Following completion of a 100 per cent system functional test, the contractor shall perform a thorough acceptance test of the system at the direction of and to the satisfaction of the Owner and Consultant. This test shall not be carried out until at least 15 days after completion of all contractor's testing, modification and repairs following the original contractor's functional test and submittal of the functional testing documentation to the Consultant. The 15 day interval is also intended to be a system "burn-in" period. Any false activations of the system which occur within the burn-in period which are determined to be the result of a system fault shall result in the restart of the 15 day period.

.7 In the event that the acceptance test of the system results in the need for system repair or modification, the contractor shall demonstrate the operability of the system to the full satisfaction of the Owner and Consultant following the completion of repairs or modification.

.8 In the event that the AHJ requires a separate demonstration of the operability of the system for acceptance purposes, these additional tests shall be carried out by the Contractor without expense to the Owner.

.9 The contractor shall conduct an independent quality assurance review of all developed "record" drawings to assure accuracy and completeness of these drawings. Any discrepancies shall be brought to the attention of the Consultant prior to construction start.

.10 Only directly prior to verification, remove smoke detector protectors, and clean smoke detectors thoroughly.

.11 Inspect and check each individual device in entire system for proper connection, supervision, and function in accordance with CAN/ULC-S537. Identify detectors, manual pull stations and signal appliances not installed within requirements of CAN/ULC-S524 in remarks column of verification report.

.12 Obtain verification certificate and verification report from manufacturer showing each device checked, and that work has been carried out. Utilize standard verification forms similar to Canadian Fire Alarm Association (CFAA) forms.

3.3 ADJUSTING

.1 Contractor to verify programming of room names prior to fire alarm system programming, and allow for a revision to the fire alarm system programming should the Owner or AHJ wish to revise the room names.

3.4 MONITORING

.1 Fire alarm control panel to be located as indicated. Coordinate third party CUL Listed monitoring with Owner.

3.5 MANUFACTURER SERVICES

.1 At the final inspection a factory trained representative of the manufacturer of the major equipment shall demonstrate that the systems function properly in every respect.

.2 The manufacturer's representative shall perform an inspection of the fire alarm equipment, including those components necessary to the direct operation of the system such as manual stations, thermal and smoke actuated detectors and controls, whether or not manufactured by the manufacturer. The inspection shall comprise an examination and test of such equipment for the following:

.1 That the type of equipment installed is that designated by the specifications.

.2 That the wiring connections to all equipment components show that the installer undertook to have observed ULC requirements. That all products of combustion (smoke) detectors have been properly calibrated, and adjustments set correctly.

.3 That the representative's equipment has been installed in accordance with the manufacturer's recommendations.

.4 That the supervisory wiring of all devices connected to a supervised circuit is operating and that the wiring, having been met to the satisfaction of the inspecting officials.

.3 Testing to be done in the presence of the local building inspector, and the local fire inspector.

.4 The manufacturer(s) of the fire alarm shall make a complete inspection of all components installed for system(s), such as manual stations, horns, and annunciators and sprinkler and standpipe valves and smoke detectors to ensure the following:

.1 That the system is complete in accordance with Specifications.

.2 That the system is connected according to ULC requirements.

.3 That the system is connected in accordance with the manufacturer's recommendations.

.4 That the regulations concerning the supervision of components have been adhered to (e.g. stations, detectors, supervised valves, bells), and are properly wired and supervised.

.5 That all valves are properly connected and displayed correctly on each annunciator.

.6 That any subsequent changes necessary to conform to the above will be carried out with technical advice supplied by the Manufacturer.

.7 That all thermal detectors, smoke detectors and manual pull stations have been operated and are in good working order.

.8 That all sprinkler system and standpipe system valves have been operated and are in good working order.

.9 That all annunciators correctly pin-pint the origin of any fire alarm.

.10 That actual smoke concentration of sufficient density, have been applied to each smoke detector to cause the detector to be set off and that the sensitivity of each smoke detector has been set.

.11 That all devices are in good working order. Include for replacing any defective/damaged devices at no extra cost to Owner.

.12 That signal audibility is acceptable in all areas. Submit audibility readings for every Room.

3.6 SITE TESTS AND INSPECTIONS

.1 Provide the service of a competent, factory-trained engineer or technician authorized by the manufacturer of the fire alarm equipment to technically supervise and participate during all of the adjustments and tests for the system.

.2 All initial testing shall be in accordance with the latest issue of ULC-S537 Verification of Fire Alarm Systems standard.

.3 Provided integrated testing of life safety systems in accordance with Section 28 08 46.

.4 A representative of the electrical contractor shall be present to participate and assist the manufacturer representative during the course of the verification. The electrical contractor shall make good any deficiencies discovered during the verification. Verify all devices. The electrical contractor shall provide one person for assistance with the verification.

.5 The verification report shall be submitted for approval to the Consultant.

.1 Ensure verification report uses room numbers and space descriptions that are consistent with the drawings.

.6 On completion of the inspection the manufacturer shall supply a certificate, together with detailed inspection record sheets showing location of each device and certifying the test results per unit, confirming that the system is installed, supervised, and operate in accordance with Article "System Verification".

.7 Audibility Test:

.1 Provide audibility test of signalling devices after other systems have been commissioned to verify operation at ambient sound levels.

.2 Provide audibility test report to the Consultant.

.3 Implement varied tone to suit audibility requirements.

3.7 CLOSEOUT ACTIVITIES

.1 The System Supplier shall schedule and present documented formalized instruction for the building owner, detailing the proper operation and maintenance of the installed System.

.2 The instruction shall be presented in an organized and professional manner by a person factory trained in the operation and maintenance of the equipment and who is also thoroughly familiar with the installation.

.3 The instruction shall cover the schedule of maintenance required by ULC and any additional maintenance recommended by the system manufacturer.

.4 Instruction shall be made available to the Local Municipal Fire Department if requested by the Local Authority Having Jurisdiction.

.5 The contractor shall provide for a minimum of three training sessions of two hours in length. At least one of these training sessions shall be carried out for key personnel prior to the system being initially placed on-line for the beginning of the burn-in period.

.6 Three bound copies which summarize the training instruction shall be submitted to the Owner for future reference.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 [Single stage] addressable fire alarm system Sequence of Operation.

1.2 RELATED REQUIREMENTS

.1 Section 28 46 13 – Fire-Alarm Systems.

1.3 CLOSEOUT SUBMITTALS

.1 Manuals

.1 Provide a clear and concise description of operation which gives, in detail, the information required to properly operate the equipment.

PART 2 - PRODUCTS

2.1 GENERAL

.1 The sequence listed below is representative sequence of operation, based on typical buildings.

.2 The Contractor shall submit a project specific sequence of operation, as part of the submittal process.

2.2 OPERATION SEQUENCES

.1 An alarm is caused by actuation of any one of the following devices:

.1 Pulling a manual station.

.2 Operation of an automatic fire alarm detector.

.3 Operation of a sprinkler flow switch.

.4 Operation of a smoke detector.

.2 If, in any area of the building, an alarm is caused by actuation of the aforementioned devices, the following shall occur:

.1 Signals in the building shall sound.

.2 Annunciators shall indicate exact zone where alarm originated.

.3 The activation of a manual pull station, automatic fire detector, automatic smoke detector, or sprinkler flow switch shall initiate the following sequence of operation:

.1 Sound an alarm signal throughout building.

.2 Control panel and remote annunciators shall indicate exact location of alarm via a zoned RED LED.

.3 Fans shall be automatically turned off.

.4 Initiate alarm origin on CPU and at graphic annunciator.

.5 Display the alarm event on all annunciator panels.

.6 Actuate CPU causes evacuation signal to sound and strobes to operate.

.7 The internal audible device shall sound at the control panel.

.8 Signal transmission to external systems:

.1 Transmit signal to monitoring station.

.2 Central station shall be automatically alerted via telephone lines connected for fire alarm system.

.3 Transmit signal to Building Automation System.

.4 Transmit signal to Access Control System.

.9 Door Releases:

.1 All stairwell/exit doors shall unlock throughout the building.

.2 All self-closing fire/smoke doors held open shall be released.

.10 HVAC Shutdowns:

.1 [Shut down air supply and return air fans.]

.2 Activate smoke dampers.

.11 CPU indicates trouble when any fault occurs within the system.

.4 Alarm:

.1 Actuate CPU causes evacuation signal to sound and strobes to operate.

.2 The internal audible device shall sound at the control panel.

.3 Signal transmission to external systems:

.1 Transmit signal to monitoring station.

.2 Transmit signal to Building Automation System.

.3 Transmit signal to Access Control System.

.4 Door Releases:

.1 All stairwell/exit doors shall unlock throughout the building.

.2 All self-closing fire/smoke doors held open shall be released.

.3 Site entrance and exit gates open.

.5 HVAC Shutdowns:

.1 Shut down air supply and return air fans.

.2 Activate smoke dampers.

.5 Supervisory

.1 If, in any area of the building, supervised valves of the sprinkler, systems are operated or exhibit short or open circuits, the following shall occur:

.1 The annunciator shall identify, as a separate zone, the item causing the trouble signal.

.2 The trouble buzzer on the annunciator(s) shall sound.

.3 The signals in the building shall not be sounded.

.2 The activation of a sprinkler supervised valve or pressure switch shall initiate the following sequence of operation:

.1 The control panel and remote annunciator shall indicate exact location of activity via a zoned AMBER LED

.2 Activate an audible tone on the control panel and remote annunciator.

.3 The signals in the building shall not be sounded.

.6 Trouble

.1 A short, ground fault or open circuit to any fire alarm conductor, the tamper or removal of any field device or the loss of primary or standby power to any control equipment will result in the following trouble sequence of operation:

.1 The control panel and remote annunciator shall indicate exact location of activity via a zoned YELLOW LED.

.2 Activate an audible tone on the control panel and remote annunciator.

.3 The signals in the building shall not be sounded.

PART 3 - EXECUTION – NOT USED

END OF SECTION

PART 1 - GENERAL

1.1 SUMMARY

.1 Section Includes

.1 Fire Alarm Control Panel.

.2 [Fire alarm transponders, Data Gathering Panels.]

.3 Fire alarm power supplies and batteries.

1.2 RELATED REQUIREMENTS

.1 Section 28 46 21.22 – Fire-Alarm Remote Annunciators.

.2 Section 28 46 21.24 – Supervising Station Alarm Systems Communications Equipment.

1.3 REFERENCES

.1 Design, manufacture, install and test fire alarm system in accordance with good industry practice and in accordance with the following Codes and Standards:

.1 CAN/ULC-S524-14 – Standard for the Installation of Fire Alarm Systems.

.2 CAN/ULC-S536-13 – Standard for the Inspection and Testing of Fire Alarm Systems.

.3 CAN/ULC-S537-13 – Standard for the Verification of Fire Alarm Systems.

.4 CAN/ULC-S527-11 – Control Units for Fire Alarm Systems.

.2 If any of the requirements of the above Codes and Standards is in conflict with the Drawings or Specifications, the Code or Standard requirements shall govern, but in no instance shall the standards established by these Drawings and Specifications be reduced by any of the Codes and Standards listed above.

1.4 ACTION SUBMITTALS

.1 Submit shop drawings in accordance with Section 01 33 00 and items noted below. Documentation to be project specific.

.1 Generic documentation and/or alternate or as-equal products are unacceptable.

.2 Product data for each type of system component including list of materials and Underwriters' Laboratories of Canada (ULC) listing. Product data to include technical documentation features, and/or functions, and parts list.

.3 Dimensioned drawings illustrating minimum clearances and any required access space.

.4 Point to point wiring diagrams of the entire installed system differentiating clearly between factory and field installed wiring. Identify all terminals and interconnections including conductor numbering.

1.5 INFORMATIONAL SUBMITTALS

.1 Dimensional elevation of fire alarm control panel and mounting instructions.

1.6 CLOSEOUT SUBMITTALS

.1 In accordance with Section 01 78 00.

.1 Operation and Maintenance Manuals: Data on each product type including all features and operating sequences for both automatic and manual operations including trouble shooting and maintenance instructions, schematic and wiring diagrams, final reviewed shop drawings, manufacturer's warranty and verification test report.

.2 Final device address list and application program listing for the system as installed at the time of acceptance.

.3 A list of all input and output points in the system with a label indicating location or use of initiating device circuit, notification appliance circuit, relay, sensor, and auxiliary control circuits.

.4 System power and battery charts with performance graphs and voltage drop calculations to assure that the system will operate per the prescribed backup time periods and under all voltage conditions per ULC standards.

.5 Operating instructions for control panel.

.6 Installation and programming manuals covering the installed system.

.7 All final and certified documentation.

.8 Drawings in PDF format.

.2 Operations and Maintenance Manuals: Submit such manuals in accordance with Division 01, and prior to completion of project, in triplicate, containing following:

.1 Actual system functional description, and sequence of operation of completed installation.

.2 Detailed maintenance instructions for control equipment and each device type, maintenance schedule in accordance with CAN/ULC-S536. Trouble shooting guide for control panels and devices.

.3 Pictorial drawing of control equipment layout, showing location of components, modules and parts, indicating catalogue numbers.

.4 Schematic diagrams of control equipment, except modules which can be exchanged as unit and internal interconnecting cables and wires.

.5 Copy of verification certificate, verification report and warranty certificates such as for fire alarm system, batteries, ancillary devices, including battery suppliers date coding for batteries.

.6 Name, address and telephone number of service representative of manufacturer to be contacted during warranty period.

.7 Name, address and telephone number of representative responsible for future software programming changes.

1.7 MAINTENANCE MATERIAL SUBMITTALS

.1 Keys.

1.8 QUALITY ASSURANCE

.1 Testing Personnel Qualifications: In addition to the requirements specified in [Division 01 Section "Quality Control"], provide persons currently certified by the Canadian Fire Alarm Association (CFAA) for fire alarm system testing and verification, to supervise on-site testing and verification as specified in Part 3.

.2 Installer Qualifications: Engage an experienced factory-authorized installer to supervise work of this Section.

.3 Single-Source Responsibility: Obtain fire alarm components from a single source who assumes responsibility for compatibility of system components.

.4 Compliance with Local Requirements: Comply with the applicable building code, local ordinances, and regulations, and the requirements of the authorities having jurisdiction.

.5 Listing and Labelling: Provide fire alarm systems and components specified in this Section that are listed and labelled by ULC.

1.9 TESTING AND COMMISSIONING

.1 Perform testing and commissioning services described herein, after fire alarm, visual and audible signalling system has been installed and pretested.

1.10 WARRANTY

.1 Provide a warranty for materials and workmanship, including microprocessor components and software, to be free of defects for period from date of acceptance of system by Owner in accordance with the General Conditions.

.2 Repair response times for problems defined as routine to be addressed and corrected within twenty-four (24) hours, excepting statutory holidays and weekends.

.3 Repair response times for problems defined as major to be addressed and corrected within four (4) hours, excepting statutory holidays and weekends.

.4 Contractor to provide a recommended list of spare components and devices.

.5 Manufacturers of the major components to provide written confirmation of full warranty, extended warranty and service back-up in case of the failure to perform or insolvency of the successful supplier.

.6 Maintain maintenance records for each system supplied, and must submit a monthly report containing a time and date record of all reported or detected problems, detail of corrective action taken and the cause of the problem.

.7 [At end of warranty period, perform tests described above, and in accordance to CAN/ULC-S536 annual inspection and produce a final inspection report.]

PART 2 - PRODUCTS

2.1 GENERAL

.1 The Central Processing Unit (CPU) to use multiplex communication techniques to receive data from and transmit data to transponders remotely located throughout the facility to minimize wiring costs, simplify design, to allow economical expansion and easy retrofit.

.2 Make provisions during detailed design for future expansion of the system.

.3 The CPU is microprocessor-based to increase system reliability, speed response to alarm conditions, and reduce cost. CPU response time to alarm conditions to be no more than four seconds, regardless of system size.

.4 Fire alarm system will be zoned as required plus 20 per cent spares.

2.2 FIRE ALARM CONTROL PANEL

.1 Fire Alarm Control Panel (FACP) complete with Central Processing Unit (CPU) shall be housed in a surface wall mounted cabinet with baked enamel finish, full viewing window, and hinged front door cover complete with lock and [two] keys.

.1 Opening cabinet door shall provide access to all operating controls, but will not expose live electrical connections.

.2 Cabinet provided with sufficient capacity to allow maximum system expansion and to house alphanumeric display.

.2 [Modules: concentrated in single central location in modular central control panel.]

[OR]

.3 [CPU shall be designed for use with transponders.]

.4 Control panel, with number of zones as identified on fire alarm schedule plus 20% spare capacity, shall contain the following:

.1 Reset button, LED test button, alarm signal silencing push button, ground fault indicator light, system trouble indicating light, trouble signal silencing button and annunciator trouble indicating light.

.2 Relays and control modules as required for door releases, fan shut-down, extinguishing system release, and audible alarms.

.3 Alarm receiving modules for number of zones as indicated on drawings plus provision for 20% spares. Zone modules shall be capable of handling any type of device including pull stations, smoke detectors, and heat detectors to allow for future changing of devices without changing modules. Each module to contain a trouble alarm indicator.

.4 Power supply modules as required.

.5 Signal control modules as required.

.6 All modules shall have visual supervision against removal.

.5 Ancillary functions:

.1 Each ancillary function of the fire alarm system shall have its own independent bypass switch, (i.e. fans, door holders, security locks, bells, elevator homing, BMS, monitoring, etc.). Each switch is to be clearly labeled with LED annunciation of its normal and active positions.

.2 The panel shall contain enough bypass switches with a least 3 spares to provide each special system and/or ancillary system with bypass capability.

.6 Power supply: self-contained unit, with integral power supply, battery charger, and standby batteries. Short circuit, over voltage, and brown-out monitoring to protect powered components by automatically switching to standby batteries whenever trouble condition exists in power supply.

.7 [Communication between FACP and remote DGP's to be supervised, DCLC style. Communications failure between FACP and remote units, audible and visual trouble to be indicated at FACP.]

.1 [Communication between nodes in networked system to be supervised, DCLC style. Communication failure between any 2 nodes, other nodes on loop to continue to communicate with each other and programmed functions on communicating nodes to continue operating.]

.8 As a result of alarm conditions received at the FACP, the system shall have ability to automatically operate specified control points such as CAN/ULC-S561 monitoring, or stopping exhaust fans, air conditioning units, and releasing magnetically held doors or other Fire Alarm related devices.

2.3 [TRANSPONDERS (DATA GATHERING PANELS)]

.1 Transponders to be remotely located throughout the facility to minimize wiring costs, simplify design, to allow economical expansion, and to allow easy retrofit.

.2 Distributed throughout the building as shown on drawings in separately enclosed units (DGP'S) and interconnected to central control unit utilizing multiplex data transmission techniques.

.3 Transponders shall have the capability to interface with all specified peripheral devices, such as smoke and thermal detectors, door holders, horns, firefighter phones. Communication between CPU and transponders shall be one twisted shielded pair.

.4 The Data Gathering Panels (DGPs) (referred to as Transponders in CAN/ULC-S524) shall have standalone capabilities in the event that communication is lost between the central fire alarm panel and the DGPs. The DGPs shall be capable of receiving and processing alarms and all other functions for their respective areas in the event of a communication loss with the fire alarm control panel.

.5 Transponder provided with the following features which are active when in stand-alone mode:

.1 Signal silence, reset, and trouble silence switches with visual indicators, and stand-alone capability indicators.

.2 In event of loss of communication with the CPU, the DGP shall be capable of operating in stand-alone mode to ensure survivability of the system.

.6 System to be complete with a minimum of three data loops per DGP.

.7 Power supply: self-contained unit, with integral power supply, battery charger, and standby batteries. Short circuit, over voltage, and brown-out monitoring to protect powered components by automatically switching to standby batteries whenever trouble condition exists in power supply.

.8 The area served by a transponder shall cover the same area for both inputs and outputs.

2.4 POWER SUPPLIES

.1 The system shall be provided with sufficient battery capacity to operate the entire system upon loss of normal AC power in a normal supervisory mode for a period of 24 hours with [2 hours] of alarm operation at the end of this period. The system shall automatically transfer to battery standby upon power failure. All battery charging and recharging operations shall be automatic.

.2 All circuits requiring system-operating power shall be 24 VDC and shall be individually fused at the control unit or transponder.

.3 The incoming power to the system shall be supervised so that any power failure will be indicated at the control unit. A green "power on" LED shall be displayed continuously while incoming power is present.

.4 The system batteries shall be supervised so that a low battery or depleted battery condition or disconnection of the battery shall be indicated at the control unit and displayed for the specific fault type.

.5 The system shall support 100% of addressable devices in alarm, or operated at the same time, under both primary (AC) and secondary (battery) power conditions.

.6 Loss of primary power shall annunciate a trouble signal at the FACP. FACP shall indicate when the system is operating on an alternate power supply.

.7 120 V, 60 Hz as primary source of power for system.

.1 Provide [one][four] 120 V circuits to each [DGP or] FACP, or as directed by fire alarm system manufacturer.

.8 Standby batteries: sealed, maintenance free, lead calcium sealed batteries.

.1 The batteries shall be sealed maintenance free type with expected life of ten years.

.2 Batteries shall be enclosed in a steel housing, or within the fire alarm control unit.

.3 A fully automatic battery charger shall be provided which shall be capable of restoring a dead battery’s capacity per ULC standards.

.9 Alarm signals arriving at the main FACP shall not be lost following a power failure (or outage) until the alarm signal is processed and recorded.

2.5 PASSIVE GRAPHIC DISPLAY

.1 [ ].

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Install to CAN/ULC-S524.

.2 Control Panel mounting height: arranged such that visual displays and operating controls are not less than 600 mm and not more than 1800 mm above the finished floor level.

.3 Power to be provided by 120 VAC [emergency] circuit.

.4 Label batteries with the in-service date.

.5 Install Fire Alarm System components as follows:

.1 Install fire alarm control panel [and DGPs] where shown on drawings.

.2 [Provide DCLC loop with 1 hour fire rated conductors between FACP and DGPs. Maintain minimum spacing of the loop per CAN/ULC-S524 figure 1.1.]

3.2 FIELD QUALITY CONTROL

.1 Verification in accordance with Section 28 46 13.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Fire alarm annunciator panels.

.1 Main annunicator panel and remote LCD annunicator panels.

.2 Firefighter entrances.

.3 Passive graphics.

1.2 RELATED REQUIREMENTS

.1 Section 21 12 00 – Fire-Suppression Standpipes.

.2 Section 21 13 00 – Fire-Suppression Sprinkler Systems.

.3 Section 26 05 00 – Common Work Results for Electrical.

.4 Section 28 46 13 – Fire-Alarm Systems.

1.3 REFERENCE STANDARDS

.1 The publications listed below form a part of this specification. The publications are referenced in text by the basic designation only. Comply with the latest edition/amendment referenced code, standard, or publication.

.1 Ontario Regulations

.1 Ontario Building Code.

.2 Ontario Fire Code.

.2 Underwriters Laboratories of Canada

.1 CAN/ULC-S524 – Installation of Fire Alarm Systems.

.2 CAN/ULC-S525 – Audible Signal Appliances for Fire Alarm Systems.

.3 CAN/ULC-S526 – Visual Signal Appliances for Fire Alarm Systems.

.4 CAN/ULC-S527 – Control Units for Fire Alarm Systems.

.5 CAN/ULC-S528 – Manual Pull Stations for Fire Alarm Systems.

.6 CAN/ULC-S529 – Smoke Detectors for Fire Alarm Systems.

.7 CAN/ULC-S530 – Heat Detectors for Fire Alarm Systems.

.8 CAN/ULC-S533 – Egress Door Securing and Releasing Devices.

.9 CAN/ULC-S536 – Inspection and Testing of Fire Alarm Systems.

.10 CAN/ULC-S537 – Verification of Fire Alarm Systems.

.11 CAN/ULC-S548 – Alarm Initiating and Supervisory Devices for Water Type Extinguishing Systems.

.12 ULC/ORD 693 – Central Station Fire Protective Signaling.

.3 All requirements of the Authority Having Jurisdiction (AHJ).

.2 In the case of any discrepancy between these specifications, the project drawings, and any applicable local codes, comply with the most stringent requirement.

1.4 COORDINATION

.1 Coordinate between all trades for inclusion of information to be included on passive graphic.

1.5 ACTION SUBMITTALS

.1 In accordance with Section 01 33 00, and Section 28 46 13.

.2 Shop Drawings:

.1 Annunciator:

.1 Provide annunciator layout and system wiring diagram showing each device and wiring connection required.

.2 Show annunciator layout and main control panel module layout, configurations, and terminations.

.2 Passive Graphic:

.1 Prepare a complete zoning schedule and artwork layout for each passive graphic to be included with submittal package.

.2 Submit colour PDF (electronic submittal) using the identical colours as will be used in a temporary graphic for use during occupancy review by municipal fire inspector.

.3 After occupancy review, incorporate comments from municipal fire inspector, and submit colour PDF (electronic submittal) using the identical colours as will be used in the final production graphic.

1.6 DELIVERY, STORAGE, AND HANDLING

.1 In accordance with Section 01 61 00.

1.7 WARRANTY

.1 All work performed and all material and equipment furnished to be warranted as free from defects and for a period of at least one year from the date of acceptance.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 In accordance with Section 28 46 13.

2.2 FIRE ALARM ANNUNCIATOR PANEL (FAAP)

.1 Annunciator panels will have an alphanumeric display for each detection device, and will identify the detection device initiating an alarm.

.2 Annunciator panel located at the firefighter’s entrance will have separate zone indication for each zone.

.3 Install panel in a [recessed] [floor mounted] enclosure with brushed aluminum finish [to suit the construction of the vestibule]. Coordinate exact location and dimensions with Architectural drawings.

.4 Identify emergency exit door numbers/identifiers, and on the control panel/annunciator panel LED labels in order to identify the manual pull stations adjacent to said doors when being activated when cross referenced with the passive graphic.

.1 Coordinate with architectural plans indicating door IDs.

2.3 PASSIVE GRAPHIC DISPLAYS

.1 Provide passive colour graphic display to be mounted adjacent to the fire alarm control panel and each annunciator panel as indicated on the drawings.

.1 Provides building and zone layout while defining zone boundaries.

.2 Visual reference of user’s location within the building.

.2 Multicoloured Passive Graphics:

.1 Plastic laminate type, on white background, framed and under plexiglass, 600 mm by 600 mm (24 inch by 24 inch) minimum size.

.2 Different brilliant colours used to distinguish the various fire alarm zones and building outline from one another, silk-screened with durable acrylic-based inks on a white matte 3 mm (1/8 inch) thick acrylic sheet. Use UV protected inks to protect against fading or colour changes for life.

.3 Provide a minimum of six different colours.

.4 Uppercase text, minimum height of 4 mm (0.15 in).

.5 Graphical display will indicate the following at minimum. Coordinate between all trades for inclusion of this information.

.1 "YOU ARE HERE" indicated in red (unique to each passive graphic location), and properly oriented to the viewer when standing in front of the graphic.

.2 Zone colours to clearly indicate the extents of all fire alarm zones.

.1 Define all egress corridors in a distinctive (dot) black hatch pattern.

.2 All enclosed stairs and elevators to be coloured yellow.

.3 Indicate the extents of zones served by air handling units with shut downs.

.4 Indicate the location of the fire alarm control panel, all annunciators, and network panels/nodes.

.5 Indicate the location of the ULC monitoring transmitter.

.6 Indicate the location and designation of sprinkler and standpipe monitoring devices.

.7 Indicate the location of Sprinkler Room(s), and all supervised fire protection devices. Coordinate with the fire protection trade(s) for exact locations of devices.

.8 Emergency exit doors with door numbers shown. These will be needed to cross reference with the annunciator panel labels for pull stations that are activated next to these doors.

.9 Label all Stair Letters. Designations to match Architectural drawings.

.10 Main gas shut off location.

.3 Frame

.1 [Stainless steel] [Extruded aluminum] frame with concealed mounting hardware and concealed screws

.2 Brushed silver finish.

.3 Concealed security mounting hardware.

.4 Frame to permit future replacement of graphic if the building or zone layouts change in future.

.4 Allow for other requirements per the Authorities Having Jurisdiction, including the Municipal Building Inspector, and Municipal Fire Inspector.

2.4 [FIRE ALARM REMOTE LCD ANNUNCIATORS (FARA)]

.1 Description: Remote Control and Annunciation provided using back-lit, alphanumeric display. Information is presented including:

.1 Point Status (alarm, trouble, etc.);

.2 Alarm Type (smoke detector, manual station, etc.);

.3 Number of System Alarms, Supervisory Conditions, and Trouble Conditions.

.2 Features:

.1 Display:

.1 LCD Display with two lines of 40 characters each.

.2 LED status indicators.

.2 Controls:

.1 Switches for system acknowledge, alarm silence, and system reset.

.2 Four programmable control switches.

.3 Lamp/LCD test

.3 Finish: brushed stainless steel trim.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Installation in accordance with Section 28 46 13.

.2 Install annunciators and passive graphics with the top no greater than 1800 mm (70 in) above finished floor.

.3 Install main annunciators with temporary passive graphics in the following locations:

.1 Ground floor lobby (firefighter’s entrance).

.2 [CACF room.]

.3 [Main Electrical Room.]

.4 Other locations as noted on drawings.

.4 Install temporary passive graphic at fire alarm control panel.

.5 Install remote annunciators with temporary passive graphics in the following locations:

.1 [Nurse's stations].

3.2 SITE TESTS AND INSPECTIONS

.1 Review passive graphics and annunciators with municipal fire inspector on site during occupancy review. Incorporate any comments and resubmit to the Consultant for review.

.2 Include reprogramming of zone nomenclature by system manufacturer to suit municipal review comments.

.3 After review by the Consultant, fabricate final passive graphics, and replace temporary graphics on site.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 End-of-Line Devices.

.2 Fault Isolators.

.3 Wire Guards.

.4 [Illuminated Signs.]

1.2 RELATED REQUIREMENTS

.1 Section 28 46 13 – Fire-Alarm Systems.

.2 Section 28 46 31.31 – Fire-Alarm Manual Initiating Devices: manual pull station covers.

1.3 REFERENCES

.1 CAN/ULC-S524-14 – Installation Standard for Fire Alarm Systems.

1.4 UNIT PRICES

.1 Refer to Document 00 43 00.26.

.2 Unit price to supply and install wire guard for any fire alarm device.

1.5 CLOSEOUT DOCUMENTS

.1 As-Built Drawings: include location and zone of all End-of-Line devices.

1.6 MAINTENANCE MATERIAL SUBMITTALS

.1 Extra Stock Materials

.1 Provide (supply and install) an additional [five] of each of the following devices as directed during construction. Turn over unused surplus in addition to those devices listed above:

.1 Fault Isolators.

.2 End-of-Line devices.

.3 Wire guard.

.2 Spare Parts

.1 Supply the following additional equipment as spare parts in a proper metal enclosure sized to accept the equipment as listed herein. Label the enclosure fire alarm spare parts. Enclosure shall be placed in the same room as the FACP.

.1 Supply three of each type of other installed initiating, notification, or controlling devices.

.3 Tools

.1 Supply three of each type of any special tools required for system use and maintenance.

PART 2 - PRODUCTS

2.1 END OF LINE DEVICES

.1 One watt type resistors mounted within outlet boxes separate from those for other devices at the locations indicated. Provide on the cover plate for each such device on approved nameplate, engraved "END-OF-LINE RESISTOR" or with an approved symbol. Provide red lamacoid plate with white 6 mm letters identifying zone.

.2 [Finish of end of line device cover plates to be priced based on stainless steel finish; confirm exact finish with the Consultant during submittal review process.]

2.2 FAULT ISOLATORS

.1 Module shall detect and isolate a short-circuited segment of a fault-tolerant loop whilst allowing the rest of the addressing circuit to function normally.

2.3 DEVICE GUARDS

.1 Description: Welded wire mesh of size and shape for the initiation, signaling, or other device requiring protection.

.1 Factory fabricated and furnished by manufacturer of device.

.2 Finish: Paint of colour to match the protected device.

.2 Pull station covers: as described in Section 28 46 31.31.

2.4 [ILLUMINATED “FIRE DO NOT ENTER” SIGNS]

.1 Internally illuminated sign with red LED illuminating text.

.2 Lettering within the sign not visible unless the sign is illuminated.

.3 Display text:

.1 FIRE DO NOT ENTER

.2 Other custom text where specified on drawing.

.4 Designed for 24 VAC/DC with integrated supervisory function.

.5 Manufacturers:

.1 Geographics

.1 GEO-LIS series (indoor use).

.2 GEO-LIS-WP series (outdoor use).

.2 Fire alarm system manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Installation to Section 28 46 13 and CAN/ULC-S524.

.2 End-of-Line devices:

.1 Provide End-of-Line devices as directed by the manufacturer on Class B circuits.

.2 Install 1800 mm above finished floor in interior spaces and provide a label indicating the zone service.

.3 Installation of End-of-Line devices within other field devices: not permitted.

.4 Provide a permanent mark to identify the zone or circuit served by the End-of-Line device.

.3 Fault Isolators:

.1 Provide fault isolators in accordance with CAN/ULC-S524.

.4 Illuminated “Fire Do Not Enter” Signs

.1 Feed illuminated signs from the fire alarm system and provide electrically supervised output circuits.

3.2 FIELD TESTS AND INSPECTIONS

.1 Testing and inspection to Section 28 46 13.

.2 Verification to Section 28 46 13.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Spot Heat Detectors.

.2 Spot Smoke Detectors.

.3 Duct mounted smoke detectors.

.4 Accessories.

1.2 RELATED REQUIREMENTS

.1 Section 28 01 80.71 – Revisions and Upgrades of Fire Detection and Alarm.

.2 Section 28 46 31.18 – Carbon Monoxide Detection Sensors.

1.3 UNIT PRICES

.1 Refer to Document 00 43 00.26.

.2 Submit with Tender unit prices to provide the following. Include installation and verification in the unit price:

.1 Fire detector (heat detector or smoke detector) complete with wiring and conduit, based on 10 metre distance.

.2 Duct type smoke detector complete with wiring and conduit on a separate zone, based on 30 metre distance.

.3 Unit cost of additional conduit and wire for the above items.

1.4 MAINTENANCE MATERIAL SUBMITTALS

.1 Extra Stock Materials:

.1 Provide (supply and install) an additional [five] of each of the following devices as directed during construction. Turn over unused surplus in addition to those devices listed above:

.1 [Heat detectors.]

.2 Smoke detectors.

.3 Duct smoke detectors.

.2 Spare Parts:

.1 Supply the following additional equipment as spare parts in a proper metal enclosure sized to accept the equipment as listed herein. Label the enclosure fire alarm spare parts. Enclosure shall be placed in the same room as the FACP.

.1 Supply three of each type of addressable detector base, smoke detector, heat detector, and fire alarm pull station.

.2 Supply three of each type of other installed initiating, notification, or controlling devices.

.3 Tools:

.1 Supply three of each type of any special tools required for system use and maintenance.

PART 2 - PRODUCTS

2.1 AUTOMATIC CONVENTIONAL HEAT DETECTORS

.1 Automatic heat detectors shall have a combination rate of rise and fixed temperature rated at 57.2 degrees C (135 degrees F) for areas where ambient temperatures do not exceed 37.7 degrees C (100 degrees F), and 93.33 degrees C (200 degrees F) for areas where the temperature does not exceed 65.5 degrees C (150 degrees F).

.2 Automatic heat detectors shall be a low profile, ceiling mount type with positive indication of activation.

.3 The rate of rise element shall consist of an air chamber, a flexible metal diaphragm, and a factory calibrated, moisture-proof, trouble free vent, and shall operate when the rate of temperature rise exceeds 9.4 degrees C (15 degrees F) per minute.

.4 The fixed temperature element shall consist of a fusible alloy retainer and actuator shaft.

.5 Automatic heat detectors shall have a smooth ceiling rating of 232 square metres (2500 square feet).

.6 Style of detectors shall match existing system.

2.2 FIXED TEMPERATURE HEAT DETECTORS

.1 Manufacturers:

.1 Basis of design: Potter CF series.

.2 Features:

.1 Low profile design

.2 White plastic housing

.3 Up to 70’ inter detector spacing

.4 Open or closed contact versions.

.5 Product includes a 5 year warranty.

2.3 COMBINATION RATE-OF-RISE AND FIXED TEMPERATURE HEAT DETECTORS

.1 Manufacturers:

.1 Basis of design: Potter CR series.

.2 Features:

.1 Low profile design

.2 White plastic housing

.3 Up to 70’ inter detector spacing

.4 Open or closed contact versions.

.5 Product includes a 5 year warranty.

2.4 CONVENTIONAL PHOTOELECTRIC AREA SMOKE DETECTORS

.1 Smoke detector shall be a System Sensor i3 Series, listed to ULC.

.2 The detector shall be a photoelectric type (model C2W-BA for 2-wire, model C4W-BA for 4-wire).

.3 The detector shall include a mounting base for mounting to 3½-inch and 4-inch octagonal, single gang, and 4-inch square back boxes with a plaster ring, or direct mount to the ceiling using drywall anchors.

.4 Wiring connections shall be made by means of SEMS screws. The detector shall allow pre-wiring of the base and the head shall be a plug-in type.

.5 The detector shall have a nominal sensitivity of 2.5 percent-per-foot nominal as measured in the ULC smoke box. The detector shall be capable of automatically adjusting its sensitivity by means of drift compensation and smoothing algorithms. The detector shall provide dual color LED indication which blinks to indicate power up, normal standby, out of sensitivity, alarm, and freeze trouble (Model C2WT-BA, C4WT-BA) conditions.

.6 When used in conjunction with the C2W-MOD2A module, 2-wire models shall include a maintenance signal to indicate the need for maintenance at the alarm control panel, and shall provide a loop testing capability to verify the circuit without testing each detector individually.

.7 The CSENS-RDRA, a wireless device, displays the sensitivity of i3 detectors in terms of percent per-foot-obscuration.

.1 Supply one CSENS-RDRA in project for each project site.

2.5 CONVENTIONAL DUCT SMOKE DETECTORS

.1 Duct smoke detectors shall be a 24 VDC type with visual alarm indicator, visual power indicator, and a reset switch. Each detector shall be installed upon the composite supply/return air ducts(s), with properly sized air sampling tubes.

2.6 CONVENTIONAL MANUAL PULL STATIONS

.1 General Requirements for Manual Fire-Alarm Boxes: Comply with CAN/ULC-S528. Boxes shall be finished in red with molded, raised-letter operating instructions in contrasting color; shall show visible indication of operation; and shall be mounted on recessed outlet box. If indicated as surface mounted, provide manufacturer's surface back box.

.2 Description: Conventional [single-] [double-]action type, red LEXAN. Station shall mechanically latch upon operation and remain so until manually reset by opening with a key common with the control units. Station shall be pull-lever type; with integral terminal strip to accommodate wiring connections to fire-alarm control unit Initiating Device Circuit. Where double-action stations are provided, the mechanism shall require two actions [break front glass] [push top activation door] to initiate an alarm.

.3 Indoor Protective Shield: Where required, or as indicated on the drawings, provide a factory-fabricated, tamperproof, clear LEXAN enclosure shield and red frame that easily fits over manual pull stations which shall be hinged at the top to permit lifting for access to initiate a local alarm. Unit shall be ULC listed. [Lifting the cover shall actuate an integral battery-powered audible horn intended to discourage false-alarm operation. The horn shall be silenced by lowering and realigning the shield. The horn shall provide 85 dB at 10 feet and shall be powered by a 9 VDC battery.] [none]

.4 Barrier Free Path of Travel: Where required, manual station shall be operable using a closed fist and with a force of not more than 22.2 N. Provides a more easily operated manual station compared to standard stations.

.5 Weatherproof Protective Shield: Factory-fabricated clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm.

[OR]

.6 Basis of Design: Mircom MS-401.

.7 Manual fire alarm stations shall be non-coded, non-breakable glass type.

.8 Stations must be designed such that after an actual activation, they cannot be restored to normal without the use of a special tool.

.9 An operated station shall automatically condition itself so as to be visually detected, as operated, at a minimum distance of 30.5 m (100 feet) front or side.

.10 Manual stations shall be constructed of metal, with operating instructions provided on the cover. The word FIRE shall appear on the manual station in letters 12.7 mm (0.5 inch) in size or larger.

.11 Provide polycarbonate vandal resistant covers for new manual pull stations.

.12 Style of new manual pull stations to match existing system

2.7 ACCESSORIES

.1 Relay Base.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Installation to Section 28 46 13.

.2 [Provide wire guards for heat detectors in gymnasiums.]

3.2 RESIDENTIAL SMOKE ALARM INSTALLATION

.1 Install in accordance with manufacturer’s instructions.

.2 Circuit from same breaker as the washroom lighting.

3.3 IDENTIFICATION

.1 Provide an engraved phenolic nameplate, red text on red background at the ceiling location below any concealed duct mounted smoke detectors indicating “Smoke Detector Above – DSD-1” where DSD-1 is the identification of the detector. Locate on lay-in ceiling grid or access hatch where located.

3.4 FIELD TESTS AND INSPECTIONS

.1 Testing, and inspection to Section 28 46 13.

.2 Verification to Section 28 46 13.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Sensors for the detection of Carbon Monoxide (CO) gas.

1.2 RELATED REQUIREMENTS

.1 Section 28 46 13 – Fire-Alarm Systems.

1.3 REFERENCES

.1 Ontario Building Code.

.2 CAN/ULC-S529:2016 – Smoke Detectors for Fire Alarm Systems.

1.4 CERTIFICATIONS

.1 The CO detector shall be ULC-S529 and CSA 6.19 as Carbon Monoxide alarm device.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Edwards signature series “SIGA2” devices.

.2 S-Tech.

.3 CO detectors shall be compatible with the system in Section 28 46 13.

2.2 CARBON MONOXIDE SENSORS

.1 The CO element shall be modular and can be replaced when the CO detector reaches end of life, so that the whole detector does not need to be replaced. Detectors that require the complete device to be replaced are not acceptable.

.2 The CO detector element shall have an integral count-down timer that counts down from 6 years (expected life span of the CO detector component). The detector’s processor shall monitor the CO detector component to ensure that if the CO device is out of tolerance before the 6-year time frame, the device will register a trouble condition and identify itself to the control panel.

.3 Devices include, SIGA2-COS, carbon monoxide detector, SIGA2-PCOS, combination Photoelectric/CO detector, SIGA2-PHCOS combination Photo/Thermal/ CO detector as well as SIGA2-HCOS combination Heat/CO detector. The combination devices shall only utilize one detector address and have the ability to separate the device types to a maximum of two different inputs from each addressable detector. It shall be possible to have the smoke detector activate the sounder base only like a smoke alarm and have the heat detector activate the general alarm condition. And if the CO sensor activates, the sounder base must sound the ISO Temporal 4 CO alarm code.

.4 The CO sensor in a sounder base shall be listed as a Carbon Monoxide Alarm to CSA-6.19. Addressable Carbon Monoxide (CO) Detector, EST model SIGA2-COS with audible sounder base. Provide intelligent addressable Carbon Monoxide Detector with Temporal 4 Audible Base.

.5 The CO detection element shall indicate a trouble condition at the FACP signaling end of life and the CO element of the detector shall be field replaceable. It shall be programmed at the main control panel as a supervisory indication and transmit a separate supervisory signal to the central station.

.6 Alternate product for mechanical rooms: S-Tech STCH-1000HW (hard wired alarm, wall mount), and STCH-100HWR (hard wired alarm with relay).

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Installation to Section 28 46 13.

.2 Install CO detectors in accordance with 2012 Ontario Building Code, section 6.2.12, and as indicated on the drawings.

.1 [Mechanical rooms.]

.2 [Generator rooms.]

3.2 SITE TESTS AND INSPECTIONS

.1 Testing, and inspection to Section 28 46 13.

.2 Verification to Section 28 46 13.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Intelligent Modules.

.2 Fire Alarm Pull Stations for Single Stage Fire Alarm Systems.

1.2 RELATED REQUIREMENTS

.1 Section 21 12 00 – Fire-Suppression Standpipes.

.2 Section 21 13 00 – Fire-Suppression Sprinkler Systems.

.3 Section 26 05 00 – Common Work Results for Electrical.

.4 Section 28 46 13 – Fire-Alarm Systems.

1.3 REFERENCES

.1 CAN/ULC-S528, Manual Stations for Fire Alarm Systems.

1.4 UNIT PRICES

.1 Refer to Document 00 43 00.26.

.2 Submit with Tender unit prices to provide the following. Include installation and verification in the unit price:

.1 Manual pull station, complete with wiring and conduit based on 10 metre distance.

.2 Unit cost of additional conduit and wire for the above items.

.3 Unit cost for supply and installation of pull station cover.

1.5 MAINTENANCE MATERIAL SUBMITTALS

.1 Extra Stock Materials

.1 Provide (supply and install) an additional [five] of each manual pull station to be used as directed on site during construction.

.2 Turn over unused surplus in addition to those devices listed below.

.2 Spare Parts

.1 Supply the following additional equipment as spare parts in a proper metal enclosure sized to accept the equipment as listed herein. Label the enclosure fire alarm spare parts. Enclosure shall be placed in the same room as the FACP.

.1 Supply 6 keys of each type.

.2 Supply 3 of each type of fire alarm pull station.

.3 Supply 10 manual pull station break-glass rods.

.3 Tools:

.1 Supply three of each type of any special tools required for system use and maintenance.

PART 2 - PRODUCTS

2.1 MICROPROCESSOR BASED INTELLIGENT MODULES

.1 General

.1 Zone Addressable Modules (ZAM) shall be used for the monitoring of water flow, valve tamper, fire suppression control panels, non-addressable detectors, and for control of fans or dampers that require shutdown or manual control in an alarm condition.

.2 Monitor ZAM's shall monitor any N/O contact device and be capable of powering 2-wire smoke detectors. The ZAM will communicate the zone's status (normal, alarm, trouble) to the transponder. The ZAM's zone address shall be set at the time of installation via a dip switch package.

.3 Control ZAM's shall be able to provide supervised or non-supervised control of any control function. The ZAM will communicate the zone's status (normal, trouble) to the transponder. Each control ZAM shall provide a double pole double throw relay for switching loads of up to 120 VAC. Each common leg of the relay shall be equipped with a replaceable 2 Amp fuse. The ZAM's zone address shall be set at the time of installation via a dip switch package.

.4 Fire Alarm / Life Safety System shall incorporate microprocessor-based addressable modules for the monitoring and control of system Input and Output functions over a 2-wire electronic communications loop, using both broadcast and serial polling protocols. All modules shall display communications and alarm status via LED indicators. The function of each connected module shall be determined by the module type, and shall be defined in the system software through the application of a personality code. All addressing of the Microprocessor-based Addressable Modules shall be done electronically, and the electrical location of each module shall be automatically reported to the Fire Alarm Control Panel, where it may be downloaded into a PC, or printed out. The addressing of the modules will not be dependent on their electrical location on the circuit. All field wiring to the Microprocessor-based Addressable Modules shall be supervised for opens and ground faults and shall be location identified to the module of incidence. Diagnostic circuitry, and their associated indicators, with reviewable Trouble Codes, shall be integral to the Microprocessor-based Addressable Modules to assist in troubleshooting system faults. Each module shall be suitable for operation in the following environment:

.1 Temperature: 0°C to 49°C (32°F to 120°F).

.2 Humidity: 0-93% RH, non-condensing.

.2 Single Input Module:

.1 Microprocessor-based Addressable Modules shall be used to provide one (1) supervised Class A input circuit capable of latching operation for use with contact devices, non-damped Waterflow Switches, non-latching supervisory sprinkler switches.

.3 Dual Input Module:

.1 Microprocessor-based Addressable Modules shall be used to provide two (2) independent supervised Class A input circuits capable of operation with contact devices. Both of the input circuits shall be terminated to, and operated from, the same microprocessor-based addressable module.

.2 Modules configured for water flow operation shall have an automatic delay of 15 seconds before reporting the water flow alarm condition to the Fire Alarm Control Panel. The module shall monitor sprinkler supervisory switches and shall automatically report the supervisory function to the Fire Alarm Control Panel each time the associated dry contact closes.

.4 Monitor Module:

.1 The Microprocessor-based Addressable Monitor Module shall be factory set to support one (1) supervised Class A Normally-Open Active Non-Latching Monitor circuit. The module shall automatically report the monitor function to the Fire Alarm Control Panel each time the associated dry contact closes.

.5 Control Relay Module:

.1 Microprocessor-based Addressable Control Relay Modules shall provide one form “C” dry relay contact rated at 2 amps at 24 VDC or 0.5 amps at 120 VAC to, control external appliances or equipment processes. The control relay module shall be rated for pilot duty applications. The position of the relay contact shall be confirmed by the system firmware.

2.2 MICROPROCESSOR BASED ADDRESSABLE MANUAL PULL STATIONS

.1 Addressable manual fire alarm boxes shall, on command from the control panel, send data to the panel representing the state of the manual switch and the addressable communication module status. They shall use a key operated test-reset lock, and shall be designed so that after actual emergency operation, they cannot be restored to normal use except by the use of a key.

.2 Stations must be designed such that after an actual activation, they cannot be restored to normal without the use of a special tool.

.3 All operated stations shall have a positive, visual indication of operation and utilize a key type reset.

.4 Manual fire alarm boxes shall be constructed of Lexan with clearly visible operating instructions provided on the cover. The word FIRE shall appear on the front of the stations in raised letters, 44 mm (1.75 in) or larger.

.5 All addressing of the Manual Pull Stations shall be done electronically, and the electrical location of each station shall be automatically reported to the Fire Alarm Control Panel, where it may be downloaded into a PC, or printed out. The addressing of the Manual Pull Station will not be dependent on their electrical location on the circuit.

.6 The manual station shall be suitable for mounting on a North American 38 mm (1-1/2 inch) deep, 100 mm (4 inch) square electrical box with 13 mm (1/2 inch) raised cover.

.7 All Manual Fire Alarm station shall be suitable for operation in the following environment:

.1 Temperature: 0 degrees C to 49 degrees C (32 degrees F to 120 degrees F).

.2 Humidity: 0-93 per cent RH, non-condensing.

.8 Pull Station Cover

.1 All Manual Fire Alarm pull stations shall be provided with a clear, tamperproof, polycarbonate shield and frame that fits over manual pull stations. When lifted to gain access to the actual alarm, it shall sound a 95 dB or 105 dB warning horn.

.2 The cover is connected to the frame by a cable. When the cover is lifted, it hangs off of the frame and the horn will sound until the cover is snapped back onto the frame (or for the life of the battery).

.3 Battery shall be provided for each cover.

.1 Tamper or protecting covers for manual stations shall comply with CAN/ULC-S528, Including Accessories.

.2 Red surface backbox

.1 Similar to Mircom BB-300, or Notifier BB series.

.9 Pull stations shall be addressable, single action, non-coded, single stage, semi-flush mounted type.

.10 Provide contacts for connection to magnetic locking devices power supply such that upon activation of the local pull station or first stage fire alarm signal the magnetic locks release.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Installation to Section 28 46 13.

.2 Provide manual pull stations at the following locations:

.1 Near the principal entrance to the building.

.2 Near every required exit.

.3 At doors equipped with electromagnetic locks, locate on the wall not more than 600 mm from the door.

.4 Other locations as described in the Building Code.

.3 Install manual pull stations at 1200 mm above finished floor.

.4 Where possible, install the manual station on the latch side of a single door at a maximum lateral distance of 1500 mm (59 in) from the door opening.

.5 Install manual pull stations on both sides of a series of doors exceeding 12 m (39 feet) in total width, and within 1500 mm (59 in) of each side of the opening.

.6 When installing manual pull station on a glass partition mullion, provide red surface backbox for pull station, and fish armoured flexible cables through mullion of door frame.

3.2 SITE TESTS AND INSPECTIONS

.1 Testing, and inspection to Section 28 46 13.

.2 Verification to Section 28 46 13.

END OF SECTION

1.5 MAINTENANCE MATERIAL SUBMITTALS

.1 Extra Stock Materials

.1 Provide (supply and install) an additional [five] of each of the following fire alarm devices as directed during construction. Turn over unused surplus in addition to those devices listed below:

.1 Zone Addressable Modules (ZAMs).

.2 Spare Parts

.1 Supply the following additional equipment as spare parts in a proper metal enclosure sized to accept the equipment as listed herein. Label the enclosure fire alarm spare parts. Enclosure shall be placed in the same room as the FACP.

.1 Supply three of each type of other installed initiating, notification, or controlling devices.

.3 Tools

.1 Supply three of each type of any special tools required for system use and maintenance.

PART 2 - PRODUCTS

2.1 MICROPROCESSOR BASED INTELLIGENT MODULES

.1 General

.1 Zone Addressable Modules (ZAM) shall be used for the monitoring of water flow, valve tamper, fire suppression control panels, non-addressable detectors, and for control of fans or dampers that require shutdown or manual control in an alarm condition.

.2 Monitor ZAM's shall monitor any N/O contact device and be capable of powering 2-wire smoke detectors. The ZAM will communicate the zone's status (normal, alarm, trouble) to the transponder. The ZAM's zone address shall be set at the time of installation via a dip switch package.

.3 Control ZAM's shall be able to provide supervised or non-supervised control of any control function. The ZAM will communicate the zone's status (normal, trouble) to the transponder. Each control ZAM shall provide a double pole double throw relay for switching loads of up to 120 VAC. Each common leg of the relay shall be equipped with a replaceable 2 Amp fuse. The ZAM's zone address shall be set at the time of installation via a dip switch package.

.4 Fire Alarm / Life Safety System shall incorporate microprocessor-based addressable modules for the monitoring and control of system Input and Output functions over a 2-wire electronic communications loop, using both broadcast and serial polling protocols. All modules shall display communications and alarm status via LED indicators. The function of each connected module shall be determined by the module type, and shall be defined in the system software through the application of a personality code. All addressing of the Microprocessor-based Addressable Modules shall be done electronically, and the electrical location of each module shall be automatically reported to the Fire Alarm Control Panel, where it may be downloaded into a PC, or printed out. The addressing of the modules will not be dependent on their electrical location on the circuit. All field wiring to the Microprocessor-based Addressable Modules shall be supervised for opens and ground faults and shall be location identified to the module of incidence. Diagnostic circuitry, and their associated indicators, with reviewable Trouble Codes, shall be integral to the Microprocessor-based Addressable Modules to assist in troubleshooting system faults. Each module shall be suitable for operation in the following environment:

.1 Temperature: 0°C to 49°C (32°F to 120°F)

.2 Humidity: 0-93% RH, non-condensing

.2 Single Input Module:

.1 Microprocessor-based Addressable Modules shall be used to provide one (1) supervised Class A input circuit capable of latching operation for use with contact devices, non-damped Waterflow Switches, non-latching supervisory sprinkler switches.

.3 Dual Input Module:

.1 Microprocessor-based Addressable Modules shall be used to provide two (2) independent supervised Class A input circuits capable of operation with contact devices. Both of the input circuits shall be terminated to, and operated from, the same microprocessor-based addressable module.

.2 Modules configured for water flow operation shall have an automatic delay of 15 seconds before reporting the water flow alarm condition to the Fire Alarm Control Panel. The module shall

monitor sprinkler supervisory switches and shall automatically report the supervisory function to the Fire Alarm Control Panel each time the associated dry contact closes.

.4 Monitor Module:

.1 The Microprocessor-based Addressable Monitor Module shall be factory set to support one (1) supervised Class A Normally-Open active non-latching monitor circuit. The module shall automatically report the monitor function to the Fire Alarm Control Panel each time the associated dry contact closes.

.5 Control Relay Module:

.1 Microprocessor-based Addressable Control Relay Modules shall provide one form “C” dry relay contact rated at 2 amps @ 24 VDC or 0.5 amps at 120 VAC to, control external appliances or equipment processes. The control relay module shall be rated for pilot duty applications. The position of the relay contact shall be confirmed by the system firmware.

2.2 TEMPERATURE SWITCHES

.1 To sense a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for firefighting purposes.

.2 Basis of design: Potter RTS series.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Installation to Section 28 46 13.

.2 Provide temperature sensor in any room containing a dry pipe valve and connect to fire alarm system to indicate a supervisory signal on the building fire alarm system annunciator for a temperature approaching the freezing point in any dry pipe valve enclosure or water storage container used for firefighting purposes.

3.2 SITE TESTS AND INSPECTIONS

.1 Testing, and inspection to Section 28 46 13.

.2 Verification to Section 28 46 13.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Fire Alarm Horns.

.2 Fire Alarm Strobes.

.3 Combination Horn/Strobes.

.4 Boosters.

1.2 RELATED REQUIREMENTS

.1 Section 26 05 00 – Common Work Results for Electrical.

.2 Section 28 46 13 – Fire-Alarm Systems.

1.3 UNIT PRICES

.1 Refer to Document 00 43 00.26.

.2 Submit with Tender unit prices to provide the following. Include installation and verification in the unit price:

.1 Fire alarm horn complete with wiring and conduit, based on 10 metre distance.

.2 Fire alarm strobe complete with wiring and conduit, based on 10 metre distance.

.3 Combination fire alarm horn/strobe complete with wiring and conduit, based on 10 metre distance.

.4 Unit cost of additional conduit and wire for the above items.

1.5 SUBMITTALS

.1 Booster battery calculations, booster power supply voltage drop calculations.

1.6 MAINTENANCE MATERIAL SUBMITTALS

.1 Extra Stock Materials

.1 Supply the following additional equipment as spare parts in a proper metal enclosure sized to accept the equipment as listed herein. Label the enclosure fire alarm spare parts. Enclosure shall be placed in the same room as the FACP.

.1 Supply three of each type of signalling device used on the project.

.2 Spare Parts

.1 Provide (supply and install) an additional [five] of each of the following devices as directed during construction. Turn over unused surplus in addition to those devices listed above:

.1 Fire alarm horn.

.2 Fire alarm strobes.

.3 Combination horn/strobes.

.3 Tools

.1 Supply three of each type of any special tools required for system use and maintenance.

1.7 CERTIFICATIONS

.1 All appliances which are supplied for the requirements of this specification shall be ULC listed.

.2 All appliances of the same manufacturer as the Fire Alarm Control Panel specified to ensure absolute compatibility between the appliances and the control panels, and to ensure that the application of the appliances are performed in accordance with the single manufacturer's instructions.

.3 Any appliances that do not meet the above requirements, and are submitted for use must show written proof of their compatibility for the purpose intended. Such proof shall be in the form of documentation from all manufacturers that clearly states that their equipment (as submitted) is 100% compatible with each other for the purpose intended.

PART 2 - PRODUCTS

2.1 HORNS

.1 Vibrating horn: semi-flush mounted, 24 VDC, selectable 94 dBA or 98 dBA, suitable for installation in a standard electrical box.

.2 Red enamel typical, or white enamel as indicated on the drawings[, and as confirmed by the Owner].

2.2 MINI HORNS

.1 Vibrating horn: semi-flush mounted, 24 VDC, 91 dBA, suitable for installation in a standard electrical box.

.2 Red enamel typical, or white enamel as indicated on the drawings, and as confirmed by the Owner.

2.3 HORN-STROBES

.1 Vibrating horn: semi-flush mounted, 24 VDC, selectable 94 dBA or 98 dBA, suitable for installation in a standard electrical box.

.2 Red enamel typical, or white enamel as indicated on the drawings[, and as confirmed by the Owner].

.3 Provide horn-strobes where shown on plans and drawings. Strobe output shall be determined as required by its specific location and application from a family of 15/75 cd, 30 cd, and 110 cd devices. Strobes shall provide a synchronized flash.

.4 Strobes shall be 24 VDC and ULC listed.

.5 Strobe circuits shall be coordinated with audible circuits such that activation of an audible circuit results in activation of the companion strobe circuit. The strobe circuits shall be capable of being arranged such that they continue to operate in the event that the audible circuits have been silenced

and remain operating until the FACP has been reset. Strobe circuits should also be coordinated with the audible circuits such that they are zoned in the same manner as the audible circuits.

.6 All strobes and combination horn strobes shall be mounted such that the bottom of the device is mounted 2000 mm (79 in) above the finished floor or 150 mm (6 in) below the ceiling, whichever is lower.

2.4 STROBES

.1 Strobes shall be supplied where shown on plans and drawings. Strobe output shall be determined as required by its specific location and application from a family of 15/75 cd, 30 cd, and 110 cd devices. Strobes shall provide a synchronized flash.

.2 Size strobe power supplies based on all strobes set at 75 cd with exact setting determined in the field to provide adequate visual signals in accordance with CAN/ULC-S524.

1.02 REMOTE BOOSTER POWER SUPPLIES

.1 Power supply booster designed to extend power available to notification appliance circuits.

.2 Enclosure: Steel, with lockable front panel allowing access to all interior components, surface mounted.

.3 Functions: Contains circuits to monitor and charge batteries, control, and supervise four Class B appliance circuits, and monitor two controlling inputs from external sources.

.1 Configurable to operate at any one of three signaling rates, or to follow the main panel's notification appliance circuit.

.2 Trouble contact with 16-second delay.

.4 Batteries: Two, sized for 24 hours of standby followed by 15 minutes of alarm.

.5 Indicators: LEDs, one for each circuit, one for battery supervision, one for ground fault, and one for power.

.6 Input: 120 volt circuit.

PART 3 - EXECUTION

3.1 INSTALLATION

.1 Installation to Section 28 46 13.

.2 Strobe light output (candela) in accordance with CAN/ULC-S524-14:

.1 Table 5 – Light Output for Wall-Mounted Strobe Lights for Various Room Sizes:

Maximum Area of Coverage (m)	Minimum Light Output, Candela (Effective Luminous Intensity)		
	One Light per Area	Two Lights per Area	Four Lights per Area
6.10 x 6.10	15	Not allowable	Not allowable
8.53 x 8.53	30	15	Not allowable
9.14 x 9.14	34	15	Not allowable
12.2 x 12.2	60	30	15
13.7 x 13.7	75	60	30
15.2 x 15.2	94	60	30
16.5 x 16.5	110	60	30
18.3 x 18.3	135	95	30
21.3 x 21.3	184	95	60
24.4 x 24.4	240	135	60
27.4 x 27.4	304	185	95
30.5 x 30.5	375	240	95
33.5 x 33.5	455	240	135
36.6 x 36.6	540	305	135
39.9 x 39.9	635	375	135

.2 Table 6 – Light Output for Ceiling-Mounted Strobe Lights for Various Room Sizes:

Maximum Area of Coverage (m)	Minimum Light Output, Candela (Effective Luminous Intensity)	
	Maximum Mounting Height (m)	One Light
6.10 x 6.10	3	15
9.14 x 9.14	3	30
12.2 x 12.2	3	60
15.2 x 15.2	3	95
6.10 x 6.10	6	30
9.14 x 9.14	6	45
12.2 x 12.2	6	80
15.2 x 15.2	6	115
6.10 x 6.10	9	55
9.14 x 9.14	9	75
12.2 x 12.2	9	115
15.2 x 15.2	9	150

.3 Table 7 – Corridor Spacing Allocation for Ceiling or Wall-Mounted Strobe Lights:

Corridor Length (m)	Minimum Number of 15 cd Strobe Lights
0 – 9	1
10 – 40	2
41 – 70	3
71 – 100	4
101 – 130	5
131 - 160	6

3.2 SITE TESTS AND INSPECTIONS

1.4 SUBMITTALS

.1 Submit under provisions of Section 01 33 00.

.2 Product Data: Manufacturer's data sheets on each product to be used, including:

.1 Preparation instructions and recommendations.

.2 Storage and handling requirements and recommendations.

.3 Installation methods.

.3 Operating and Maintenance Data: Include operating, troubleshooting, maintenance, and repair instructions for each item, with lists of spare parts, if any, and name, address, and phone number of local stocking distributors.

1.5 MAINTENANCE MATERIAL SUBMITTALS

.1 Extra Stock Materials:

.1 Provide (supply and install) an additional [five] of each door hold open device as directed during construction.

.2 Turn over unused surplus in addition as spare parts.

.2 Tools:

.1 Supply three of each type of any special tools required for system use and maintenance.

1.6 QUALITY ASSURANCE

.1 Installer Qualifications: experienced door hardware installer.

1.7 DELIVERY, STORAGE, AND HANDLING

.1 Store products in manufacturer's unopened packaging until ready for installation.

1.8 WARRANTY

.1 Provide manufacturer's standard warranties:

.1 Magnets: Lifetime warranty.

PART 2 - PRODUCTS

2.1 SYSTEM INTERFACES

.1 Emergency Power Systems:

.1 Provide a Supervisory input for Emergency Power Supply supervisory contacts as follows:

.1 [Generator] Common Alarm.

.2 [Automatic Transfer Switch] “Not in Auto”.

.2 Provide a monitoring input for Emergency Power supply contacts as follows that provides status indication but does not cause an audible alert, and automatically resets:

.1 [Generator] running.

.2 Provide relays to interface with the following systems upon fire alarm signal:

.1 [Lighting Controls]: activate [all] emergency lighting upon alarm.

.2 [Audio-Video Systems] [Sound Masking] [Public Address]: deactivate sound systems upon fire alarm.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Do not begin installation until substrates have been properly prepared.

.2 If substrate preparation is the responsibility of another installer, notify Consultant of unsatisfactory preparation before proceeding.

3.2 PREPARATION

.1 Clean surfaces thoroughly prior to installation.

.2 Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

.1 Install in accordance with manufacturer's instructions.

.2 Test for proper operation with building power energized; coordinate with start-up procedures of other installers.

3.4 SITE TESTS AND INSPECTIONS

.1 Perform functional test in accordance with CAN/ULC-S1001 and Section 28 08 46 to confirm that systems operate as described. Perform test in the presence of the Contractor, sub-trades, Consultant, and applicable vendors.

3.5 PROTECTION

.1 Protect installed products until completion of project.

.2 Repair or replace damaged products before Substantial Performance.

.3 Three bound copies which summarize the training instruction shall be submitted to the Owner for future reference.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Electromagnetic door holders (“hold opens”).

.2 Electromagnetic locks.

.3 [Door operators for bottom of stair OBC SB-4 Measure A.]

.4 Transformers, power supplies, and accessories.

1.2 RELATED REQUIREMENTS

.1 Section 08 06 71 – Door Hardware Schedule.

.2 Section 08 71 00 – Door Hardware: Locksets, exit devices, and other door hardware.

.3 Section 28 15 15 – Electrified Locking Devices and Accessories: electromagnetic locks.

.4 Section 28 46 13 – Fire-Alarm Systems.

.5 Section 28 46 31 – Fire-Alarm Initiating Devices: smoke detectors.

.6 Section 28 46 31.31 – Fire-Alarm Manual Initiating Devices: manual pull stations for doors with electromagnetic locks.

1.3 REFERENCES

.1 Ontario Building Code.

.2 Ontario Building Code – Supplementary Standard SB-4.

.3 [CAN/ULC-S524-14] [CAN/ULC-S524:2019], Standard for Installation of Fire Alarm Systems.

.4 CAN/ULC-S573:2018, Standard for Installation of Ancillary Devices Connected to Fire Alarm Systems.

.5 CAN/ULC-S533-15, Standard for egress door securing and releasing devices.

.6 CAN/ULC-S567, Door closers and electromagnetic door holders.

.7 CAN/ULC-S1001-11, Standard for Integrated Systems Testing of Fire Protection and Life Safety Systems.

.8 NFPA 80-13, Standard for Fire Doors and Other Opening Protectives.

1.4 SUBMITTALS

.1 Submit under provisions of Section 01 33 00.

.2 Product Data: Manufacturer's data sheets on each product to be used, including:

.1 Preparation instructions and recommendations.

.2 Storage and handling requirements and recommendations.

.3 Installation methods.

.3 Shop Drawings: Door Schedule showing each item of hardware to be installed on each door.

.1 Use door numbers on door schedule.

.2 Schedule may be combined with submittals required in other door hardware sections.

.4 Operating and Maintenance Data: Include operating, troubleshooting, maintenance, and repair instructions for each item, with lists of spare parts, if any, and name, address, and phone number of local stocking distributors.

1.5 MAINTENANCE MATERIAL SUBMITTALS

.1 Extra Stock Materials:

.1 Provide (supply and install) an additional [five] of each door hold open device as directed during construction.

.2 Turn over unused surplus in addition as spare parts.

.2 Tools:

.1 Supply three of each type of any special tools required for system use and maintenance.

1.6 QUALITY ASSURANCE

.1 Installer Qualifications: experienced door hardware installer.

1.7 DELIVERY, STORAGE, AND HANDLING

.1 Store products in manufacturer's unopened packaging until ready for installation.

1.8 WARRANTY

.1 Provide manufacturer's standard warranties:

.1 Magnets: Lifetime warranty.

PART 2 - PRODUCTS

2.1 MATERIALS

.1 General Requirements: Provide devices suitable for door type, lock type, frame type, dimensions, and overall operation.

.1 Coordinate with doors, frames, and hardware specified in other sections.

.2 Provide all brackets, spacers, shims, lip extensions, strike boxes, and other accessory parts necessary to complete the installation.

.3 Power Supplies or Transformers: Provide all necessary components to supply power to devices from building power distribution system.

2.2 ELECTROMAGNETIC DOOR HOLD OPEN DEVICES

.1 Manufacturers

.1 Allegion/LCN.

.2 SimplexGrinnell.

.3 Fire alarm system manufacturers as noted in Section 28 46 13.

.4 [Substitutions: Not permitted.]

.5 [Requests for substitutions will be considered in accordance with provisions of Section 01 61 00.]

.2 Coordinate with Section 08 71 00.

.3 Provide auxiliary relay to disconnect door holders upon fire alarm.

.4 Description: Units shall be listed under ULC Fire Door Holders Certified for Canada (GTPR7) for wall or floor mounting as indicated and are complete with matching door plate. Unit shall operate from a 120 VAC, a 24 VAC or a 24 VDC source, and develop a minimum of 11.4 kg (25 lbs) of holding force.

.5 Material and Finish: Match door hardware.

.6 Furnish and install where shown on the drawings, magnetic door holders designed for positive release to secure openings as indicated for limiting smoke spread. The units furnished shall be brushed aluminum finish, compatible with the doors as listed in the door schedule as follows:

.1 120 Vac concealed wiring with 11.4 kg (25 lbs) holding force.

.2 120 Vac surface wiring with 11.4 kg (25 lbs) holding force.

.3 120 Vac recessed door with 11.4 kg (25 lbs) holding force.

.4 120 Vac floor mounting, single door with 11.4 kg (25 lbs) holding force.

.5 120 Vac floor mounting, double door with 11.4 kg (25 lbs) holding force.

.6 120 Vac sliding door with 54.4 kg (120 lbs) holding force, grey hammer-tone finish.

.7 120 Vac overhead door with 54.4 kg (120 lbs) holding force, grey hammer-tone finish.

.7 Smoke detectors shall be provided on both sides of doors with hold open devices. Smoke detectors shall be complete with auxiliary relay bases, connected to release the respective hold open device.

.8 Accessories: Provide extension and misalignment rods (various lengths) enabling parallelism between door and wall at distances greater than 300 mm (12 inches) and misalignment over 100 mm (4 inches).

.9 Operation Sequence

.1 Upon detection of smoke at any smoke detector located within 1500 mm (59 in) of the electromagnetically held door, release the door holder. Mechanical closer on the door will close the door to maintain required fire separation.

2.3 ELECTROMAGNETIC LOCKS

.1 Locks to Section 28 15 15.

.2 Manual pull stations:

.1 Provide manual pull station maximum 600 mm horizontally from the door.

.2 Provide auxiliary contact on pull station to deactivate power local electromagnetic lock.

.3 Operation Sequence:

.1 The locking device, and all similar devices in the access to exit leading to the exit door, are installed as ancillary devices to the fire alarm system and release immediately upon activation of:

.1 The alarm signal where a single stage fire alarm system is installed,

.2 The alert signal where a two-stage fire alarm system is installed, or

.3 The alarm signal of a two-stage fire alarm system installed in a care, care and treatment or detention occupancy or in a retirement home,

.2 The locking device releases immediately upon loss of power to the fire alarm control panel or loss of power controlling the electromagnetic locking mechanism and its associated auxiliary controls.

.3 The locking device releases immediately upon actuation of a manually operated switch readily accessible only to authorized personnel and located near the main entrance of the building.

[OR]

.4 The locking device releases immediately upon actuation of a manually operated switch readily accessible only to authorized personnel and located in the Central Alarm and Control Facility.

.5 The locking device releases immediately upon a fault being detected in the electrical circuit between the fire alarm control panel and the controller of the locking device.

.6 The locking device releases immediately upon the operation of a manual pull station for the fire alarm system located on the wall not more than 600 mm from the door.

.7 Provide a bypass for the ancillary relay on the fire alarm system. The operation of any bypass switch, where provided for testing of the fire alarm system, causes an audible signal and a visual signal to be indicated at the fire alarm annunciator panel and at the monitoring station.

2.4 POWERED DOOR OPERATORS IN FIRE SEPARATIONS

.1 References: 2012 OBC 3.1.8.5.(2)(a), NFPA 80.

.2 Sequence of operation: Power-operated fire doors shall be equipped with a releasing device that shall automatically disconnect the power operator at the time of fire, allowing a self-closing or automatic device to close the door regardless of power failure or manual operation.

.3 Provide fire alarm relay to disable each power door operator as noted.

2.5 [SMOKE CONTROL DOOR OPERATORS FOR EXIT STAIR DOORS OPENING TO EXTERIOR (OBC SB-4 MEASURE A)]

.1 Door Operators:

.1 To Section 08 71 00.

.2 Door operator to be complete with Form C dry contact indicating when door is fully open.

.2 Operation Sequence

.1 Door to open upon alarm signal from fire alarm control panel. Door operator complete with dry contact when fully open, dry connected to fire alarm system. Fire alarm panel to annunciate supervisory condition if door is not open while in alarm.

[OR]

.2 Door to open upon signal from fire alarm control panel 2nd stage alarm. Door operator complete with dry contact when fully open, dry connected to fire alarm system. Fire alarm panel to annunciate supervisory condition if door is not open while in 2nd stage alarm.

.3 Refer to 2012 OBC rule 3.2.6.2.(3) and accompanying commentary in MMAH supplementary Standard SB-4, measure A.

.3 Provide manual initiation control and bypass on fire alarm control panel for each stair door operator in the CACF room.

.4 Connect door operator “fully open” door contact to fire alarm system as a supervisory alarm.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Do not begin installation until substrates have been properly prepared.

.2 If substrate preparation is the responsibility of another installer, notify the Consultant of unsatisfactory preparation before proceeding.

3.2 PREPARATION

.1 Clean surfaces thoroughly prior to installation.

.2 Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

.1 Install in accordance with manufacturer's instructions.

.2 Coordinate with installers of other door hardware.

.3 Adjust installed items to operate properly without interfering with operation of door and other hardware.

.4 Test for proper operation with building power energized; coordinate with start-up procedures of other installers.

3.4 INTERFACE WITH OTHER WORK

.1 Connect hold opens to fire alarm system described in Section 28 46 13.

.2 Provide spot smoke detectors to Section 28 46 31.

3.5 SITE TESTS AND INSPECTIONS

.1 Perform functional test in accordance with CAN/ULC-S1001 and Section 28 08 46 to confirm that held doors and fire shutters release and close upon smoke detection with the presence of the Contractor, sub-trades, Consultant, and the door hardware vendor.

3.6 PROTECTION

.1 Protect installed products until completion of project.

.2 Repair or replace damaged products before Substantial Performance.

.3 Three bound copies which summarize the training instruction shall be submitted to the Owner for future reference.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Shutdown relays.

.2 Smoke Control.

1.2 RELATED REQUIREMENTS

.1 Section 23 30 00 – HVAC Air Distribution.

.2 Section 23 34 00 – HVAC Fans.

.3 Section 23 70 00 – Centralized HVAC Equipment.

.4 Section 23 75 00 – Custom Air Handling Units.

.5 Section 28 46 13 – Fire-Alarm Systems.

.6 Section 28 46 31 – Fire-Alarm Initiating Devices: duct mounted smoke detectors.

1.01 REFERENCES

.7 Ontario Building Code.

.9 CAN/ULC-S573:2018, Standard for Installation of Ancillary Devices Connected to Fire Alarm Systems.

.10 CAN/ULC-S1001-11, Standard for Integrated Systems Testing of Fire Protection and Life Safety Systems.

1.3 SUBMITTALS

.1 Submit under provisions of Section 01 33 00.

.2 Product Data: Manufacturer's data sheets on each product to be used, including:

.1 Preparation instructions and recommendations.

.2 Storage and handling requirements and recommendations.

.3 Installation methods.

.3 Shop Drawings: Door Schedule showing each item of hardware to be installed on each door.

.1 Use door numbers on door schedule.

.2 Schedule may be combined with submittals required in other door hardware sections.

.4 Operating and Maintenance Data: Include operating, troubleshooting, maintenance, and repair instructions for each item, with lists of spare parts, if any, and name, address, and phone number of local stocking distributors.

1.4 QUALITY ASSURANCE

.1 Installer Qualifications: experienced door hardware installer.

1.5 DELIVERY, STORAGE, AND HANDLING

.1 Store products in manufacturer's unopened packaging until ready for installation.

1.6 WARRANTY

.1 Provide manufacturer's standard warranties:

.1 Magnets: Lifetime warranty.

PART 2 - PRODUCTS

2.1 MATERIALS

.1 General Requirements: Provide devices suitable for door type, lock type, frame type, dimensions, and overall operation.

.1 Coordinate with doors, frames, and hardware specified in other sections.

.2 Provide all brackets, spacers, shims, lip extensions, strike boxes, and other accessory parts necessary to complete the installation.

.3 Power Supplies or Transformers: Provide all necessary components to supply power to devices from building power distribution system.

2.2 AIR HANDLING UNIT SHUTDOWN RELAYS

.1 Provide duct smoke detectors in the supply air duct of air handling units feeding more than one storey, or more than one suite in a storey.

.2 Provide a relay to shut down the air handling system upon detection of smoke at the aforementioned smoke detector.

2.3 [HVLS FANS]

.1 In buildings equipped with sprinklers, all HVLS (High Volume, Low Speed) fans shall be interlocked to shut down immediately upon receiving a sprinkler waterflow signal via the fire alarm system.

2.4 [SMOKE DAMPERS]

.1 Smoke dampers and combination smoke and fire dampers shall be configured so as to close automatically upon a signal from an adjacent smoke detector located as described in CAN/ULC-S524, “Installation of Fire Alarm Systems”, within 1.5 m horizontally of the duct or air-transfer opening in the fire separation,

.1 on both sides of the air-transfer opening, or

.2 in the duct downstream of the smoke damper or combination smoke and fire damper.

.2 Provide smoke detectors in accordance with code requirements for control of smoke dampers.

2.5 [SMOKE CONTROL ANNUNCIATOR]

.1 On/Auto/Off switches and status indicators (LEDS) shall be provided for monitoring and manual control of each fan, damper, HVAC control unit, stairwell pressurization fan, and smoke exhaust fan. To ensure compliance the units supplied shall meet the following UL categories: UUKL, PAZX, UDTZ, QVAX as well as the requirements of NFPA 90A, HVAC, and NFPA 92A & 92B, Smoke Control. The control System shall be field programmable for either 90A operation or 92A/B operation to allow for future use and system expansion.

.2 The OFF LED shall be Yellow, the ON LED shall be green, the Trouble/Fault LED shall be Amber/Orange for each switch. The Trouble/Fault indicator shall indicate a trouble in the control

and/or monitor points associated with that switch. In addition, each group of eight switches shall have two LEDS and one momentary switch which allow the following functions: An Amber LED to indicate an OFF-NORMAL switch position, in the ON or OFF position; A Green LED to indicate ALL AUTO switch position; A Local Acknowledge/Lamp Test momentary switch.

.3 Each switch shall have the capability to monitor and control two addressable inputs and two addressable outputs. In all modes, the ON and OFF indicators shall continuously follow the device status not the switch position. Positive feedback shall be employed to verify correct operation of the device being controlled. Systems that indicate on/off/auto by physical switch position only are not acceptable.

.4 [All HVAC switches (i.e., limit switches, vane switches, etc.) shall be provided and installed by the HVAC contractor.]

.5 It shall be possible to meet the requirements mentioned above utilizing wall mounted custom graphic.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Do not begin installation until substrates have been properly prepared.

.2 If substrate preparation is the responsibility of another installer, notify the Consultant of unsatisfactory preparation before proceeding.

3.2 PREPARATION

.1 Clean surfaces thoroughly prior to installation.

.2 Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

.1 Install in accordance with manufacturer's instructions.

.2 Coordinate with installers of other door hardware.

.3 Adjust installed items to operate properly without interfering with operation of door and other hardware.

.4 Test for proper operation with building power energized; coordinate with start-up procedures of other installers.

3.4 SITE TESTS AND INSPECTIONS

.1 Perform functional test to confirm that held doors release upon smoke detection.

3.5 PROTECTION

.1 Protect installed products until completion of project.

.2 Repair or replace damaged products before Substantial Performance.

.3 Three bound copies which summarize the training instruction shall be submitted to the Owner for future reference.

END OF SECTION

PART 1 - GENERAL

1.1 SECTION INCLUDES

.1 Automatic door controls for restrooms.

.2 Emergency call systems for universal and barrier-free restrooms.

.3 Automatic door relay controls.

.4 Automatic door activation.

.5 Automatic door wireless activation.

1.2 RELATED REQUIREMENTS

.1 Section 08 71 00 – Hardware: requirements for door operators and electric strikes interconnected with this equipment.

.2 Section 26 05 00 – Common Work Results for Electrical.

1.3 REFERENCES

.1 ANSI A117.1 - Accessible and Usable Buildings and Facilities.

.2 ANSI A156.19 - Standard for Power Assist and Low Energy Power Operated Doors.

.3 Ontario Building Code 2012, section 3.8.3.12.(2) – Universal Washrooms.

1.4 SUBMITTALS

.1 Submit under provisions of Section 01 33 00 – Submittal Procedures.

.2 Product Data: Manufacturer's data sheets on each product to be used, including:

.3 Preparation instructions and recommendations.

.4 Storage and handling requirements and recommendations.

.5 Installation methods.

.6 Shop Drawings: Electrical schematic, device mounting requirements and rough-in for recessed devices.

.7 Verification Samples: For each finish product specified, two samples, minimum size 150 mm (6 in) square representing actual product, color, and patterns.

1.5 CLOSEOUT SUBMITTALS

.1 Functional test report.

.2 Training attendance records.

1.6 QUALITY ASSURANCE

.1 Manufacturer Qualifications: Minimum 5 year experience manufacturing similar products.

.2 Installer Qualifications: Minimum 2 year experience installing similar products.

.3 Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.

.1 Finish areas designated by Architect.

.2 Do not proceed with remaining work until workmanship is approved by the Consultant.

.3 Rework mock-up area as required to produce acceptable work.

1.7 PRE-INSTALLATION MEETINGS

.1 Convene minimum two weeks prior to starting work of this section.

1.8 DELIVERY, STORAGE, AND HANDLING

.1 Deliver and store products in manufacturer's unopened packaging bearing the brand name and manufacturer's identification until ready for installation.

.2 Handling: Handle materials to avoid damage.

1.9 PROJECT CONDITIONS

.1 Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by the manufacturer for optimum results. Do not install products under environmental conditions outside the manufacturer's recommended limits.

1.10 SEQUENCING

.1 Ensure that products of this section are supplied to affected trades in time to prevent interruption of construction progress.

1.11 WARRANTY

.1 Manufacturer's Warranty: Provide manufacturer's warranty for defective parts for a three-year period from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

.1 Camden Door Controls (basis of design).

.2 Substitutions: Thomas Door & Security Hardware, TA-3230C-KIT.

2.2 EMERGENCY CALL SYSTEMS FOR UNIVERSAL RESTROOMS

.1 Performance:

.1 Emergency Call System shall comply with the latest requirements of the Ontario Building Code (OBC), effective January 1, 2015.

.2 Emergency Call System shall be designed to provide a washroom occupant with the ability to request emergency assistance, to receive visual and audible confirmation that their request has been made, and visual and audible notification to building staff and occupants outside the restroom of an emergency condition.

.2 Product: Emergency Call Systems For Universal and Barrier Free Restrooms – CX-WEC10K2 System as manufactured by Camden Door Controls.

.1 Operation: the 'Press For Emergency Assistance' mushroom push button is activated by the occupant. This energizes the LED annunciator and sounder within the washroom and the dome

light with sounder outside the washroom. Both annunciators will be energized until the latching mushroom push button switch is pulled out.

.2 Components:

.1 The following items are part of the CX-WEC10K2 equipment package:

.1 CM-AF540SO Double gang, push/pull mushroom push button, red, 'Assistance Required', w/ LED annunciator and adjustable sounder, 'Assistance Requested'.

.1 ‘Press for Emergency Assistance’ switch, ‘Push/Pull’ operation 41.27 mm (1-5/8”) vandal resistant red button, N/O and N/C contacts, rated 10 Amp @ 30 VDC and permanently laser etched graphics (black).

.2 Single gang LED annunciator with adjustable sounder rated 85 dB at 102 mm (4 in), weather and vandal-resistant construction, brushed stainless steel faceplate, with 'ASSISTANCE REQUESTED'. ‘White Out’ text shall not be legible unless the annunciator is energized.

.3 Heavy gauge stainless steel double gang faceplate.

.2 CM-AF141SO: Single gang LED dome light with adjustable piezo sounder, rated 93 dB at 1 m (3 feet), weather (indoor/outdoor) and vandal resistant construction, white. 180 degree visibility with ‘ASSISTANCE REQUIRED' text printed on two sides of the lens.

.3 CM-SE21A: sign, to be located above the activation switch, 1.6 mm (1/16 in), 152 mm high by 270 mm wide (6 in by 10-5/8 in), fire-rated expanded PVC white with 25 mm (1 in) red lettering. The text shall be “IN THE EVENT OF AN EMERGENCY PUSH EMERGENCY BUTTON AND AUDIBLE AND VISUAL SIGNAL WILL ACTIVATE”.

.2 The following items are required, but not included in the CX-WC11 equipment package:

.1 CX-PS13 24V linear power supply and CX-TRX-4024 UL listed 40 VA transformer.

.2 Electric Strike: CX-ED2079 ('Universal' Grade 2 Electric Strike).

.3 Contact for Pushbutton (normally closed CM-4000/61N).

.4 Door contact.

2.3 AUTOMATIC DOOR CONTROLS FOR RESTROOMS

.1 Performance:

.1 Automatic door controls shall comply with Americans with Disability Act.

.1 Regulatory compliance with Accessibility Guidelines (ADAAG) and the Uniform Federal Accessibility Standard (UFAS) as required by Authority Having Jurisdiction (AHJ).

.2 Automatic door controls shall comply with National Building Code of Canada.

.3 Automatic door controls shall comply with NFPA National Fire Code or International Fire Code for restroom doors acting as egress doors as required by Authority Having Jurisdiction (AHJ).

.4 Emergency Power: System shall be provided with an emergency power connection.

.2 Product: Push Button and Annunciator Restroom Control System - CX-WC11 as manufactured by Camden Door Controls.

.1 Operation:

.1 The door is normally closed and either locked or unlocked. Pressing the exterior push plate unlocks and opens the door. Once inside and the door is closed, pressing the 'Push to Lock' mushroom pushbutton locks the door, disables the exterior ' Push to Open' push plate switch and illuminates the exterior annunciator to show ' Occupied when Lit'. Pressing the interior push plate switch unlocks the door, deactivates the illuminated annunciator, and resets the system. If the door is opened manually to exit the restroom, the overhead magnetic contact switch resets the system.

.2 Status: Normally locked. Fail secure electric strike.

.3 Status: Normally unlocked. Fail safe electric strike.

.2 Components:

.1 The following items are part of the CX-WC11 equipment package:

.1 CX-33PS includes Advanced Logic Control Relay and 2 Amp Power Supply in pre-wired metal cabinet.

.2 CM-45/4 114 mm (4.5 in) square activation (wall) switch (2 required), stainless steel construction, N/O contacts rated 15 Amps @ 30 VDC and paint filled debossed ‘wheelchair symbol and ‘Push To Open’ graphics (blue). Mounted on in-wall single gang electrical box.

.3 CM 400/8 ‘Push to Lock’ Mushroom Push Button with heavy duty brushed stainless steel faceplate, 40 mm (1-5/8”) vandal resistant red button and N/O contacts rated 10 Amps @ 30 VDC.

.4 CM-AF500 Single Gang LED Annunciator, with heavy duty 18 gauge, vandal resistant stainless steel faceplate, ‘Occupied When Lit’ ‘white out’ text, super-bright LEDs, 10 VDC to 36 VDC voltage, max. 40 mA current draw.

.5 CX-MDA surface mount SPST N/C Magnetic Door Contact.

.6 CX-ED2079 Electric Strike, grade 2 ‘universal’ strike for cylindrical locksets c/w 3 faceplates, 12/24V AC/DC, selectable fail safe/fail secure. The strike shall have horizontal faceplate adjustment.

.2 The following items are required, but not included in the CX-WC11 equipment package:

.1 CX-PS13 12/24V linear power supply and CX-TRX-4024 UL listed 40 VA transformer.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Do not begin installation until substrates have been properly prepared.

.2 If substrate preparation is the responsibility of another installer, notify the Consultant of unsatisfactory preparation before proceeding.

3.2 PREPARATION

.1 Clean surfaces thoroughly prior to installation.

.2 Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

.1 Install in accordance with manufacturer's instructions.

.1 Install push button and the red “assistance requested’ annunciator ganged together adjacent to the toilet.

.2 Install the emergency push button adjacent to the toilet, and post the sign above the emergency button.

.3 Install the dome light at exterior of the universal washroom, above the door of the washroom.

.4 Install conduit between system components, and install wiring as directed by manufacturer.

.2 Provide all low voltage control wiring between system components.

.3 [Connect emergency push button to remote duress system where noted on plans.]

3.4 FIELD QUALITY CONTROL

.1 Perform test of system in the presence of the Owner. Submit report documenting the test was completed.

3.5 DEMONSTRATION AND TRAINING

.1 Manufacturer's representative shall provide on-site training of staff and maintenance of operation, maintenance and "trouble/error" detection/correction.

3.6 PROTECTION

.1 Protect installed products until completion of project.

.2 Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

Part 1 - General

1.1 RELATED REQUIREMENTS

.1 Section 31 05 16 Aggregates for Earthworks

.2 Section 31 23 33.01 Excavation, Trenching and Backfilling

.3 Section 31 32 19.16 Geotextile Soil Stabilization

.4 Section 01 57 00 Temporary Erosion and Sediment Control

1.2 REFERENCE STANDARDS

.1 Ontario Provincial Standard Specifications (OPSS)

.1 OPSS 206: Grading

.2 OPSS 510 Removal

.3 OPSS 517 Dewatering

1.3 ACTION AND INFORMATIONAL SUBMITTALS

.1 Submit in accordance with Section 01 33 00 - Submittal Procedures.

.2 Sustainable Design Submittals:

.1 Erosion and Sedimentation Control: submit erosion and sedimentation control plan in accordance with authorities having jurisdiction.

.2 Regional Materials: Not Used

Part 2 - Products

2.1 MATERIALS

.1 To Section 31 05 16 Aggregates for Earthwork.

Part 3 - Execution

3.1 EXAMINATION

.1 Verification of Conditions:

.1 Examine soil report.

.2 Before commencing work establish locations of buried services on and adjacent to the site.

.2 Evaluation and Assessment:

.1 Arrange with appropriate authority for relocation of buried services that interfere with the execution of the Work. Pay costs of relocating services.

.2 Testing of materials and compaction of backfill and fill will be carried out by a testing laboratory designated by the Contractor.

.3 Not later than 48 hours before backfilling or filling with approved material, notify the Consultant so that compaction tests can be carried out by designated testing agency.

.4 Before commencing work, conduct, with the Consultant, a condition survey of existing structures, trees and plants, lawns, fencing, service poles, wires, rail tracks and paving, survey bench marks and monuments which may be affected by work.

3.2 PREPARATION

.1 Temporary Erosion and Sedimentation Control:

.1 Use temporary erosion and sedimentation control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, in accordance with Section 01 57 00.

.2 Inspect, repair, and maintain erosion and sedimentation control measures during construction until permanent vegetation has been established.

.3 Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.

.2 Protection of in-place conditions:

.1 Protect excavations from freezing.

.2 Keep excavations clean, free of standing water, and loose soil.

.3 Where soil is subject to significant volume change due to change in moisture content, cover and protect to Consultant's approval.

.4 Protect natural and man-made features required to remain undisturbed. Unless otherwise indicated or located in an area to be occupied by new construction, protect existing trees from damage.

.5 Protect buried services that are to remain undisturbed.

.3 Removal:

.1 Remove obsolete buried services within 2 m of foundations. Cap cut-offs.

.2 Remove obstructions, ice and snow, from surfaces to be excavated within limits indicated.

.3 Cut pavement or sidewalk neatly along the limits of the proposed excavation in order that surface may break evenly and cleanly.

.4 Remove trees, stumps, logs, brush, shrubs, bushes, vines, undergrowth, rotten wood, dead plant material, exposed boulders and debris within areas designated on drawings.

.5 Remove stumps and tree roots below footings, slabs, and paving, and to 600mm below finished grade elsewhere.

3.3 EXCAVATION

.1 Shore and brace excavations protect slopes and banks and perform work in accordance with provincial and municipal regulations.

.2 Do blasting in accordance with provincial and municipal regulations. Repair damage to approval of the Consultant. No blasting will be permitted within 3 m of any building and where damage would result.

.3 Excavate as required to carry out work, in all materials met.

.1 Do not disturb soil or rock below bearing surfaces. Notify the Consultant when excavations are complete.

.2 If bearings are unsatisfactory, additional excavation will be authorized in writing and paid for as additional work.

.3 Fill excavation taken below depths shown without the Consultant's written authorization with concrete of same strength as for footings.

.4 Excavate trenches to provide uniform continuous bearing and support for 150mm thickness of pipe bedding material on solid and undisturbed ground. Trench widths below point 150mm above pipe not to exceed diameter of pipe plus 600 mm.

.5 Excavate for slabs and paving to subgrade levels.

.1 Remove topsoil, organic matter, debris and other loose and harmful matter encountered at subgrade level.

3.4 SITE QUALITY CONTROL

.1 Fill material and spaces to be filled to be inspected and approved by the Consultant.

3.5 BACKFILLING

.1 Start backfilling only after inspection and receipt of written approval of fill material and spaces to be filled from the Consultant.

.2 Remove snow, ice, construction debris, organic soil and standing water from spaces to be filled.

.3 Lateral support: maintain even levels of backfill around structures as work progresses, to equalize earth pressures.

.4 Compaction of subgrade: compact existing subgrade under walks, paving, and slabs on grade, to same compaction as specified for fill. Fill excavated areas with gravel and sand compacted as specified for fill.

.5 Placing:

.1 Place backfill, fill and basecourse material in 150 mm lifts. Add water as required to achieve specified density.

.2 Place unshrinkable fill in areas as indicated. Consolidate and level unshrinkable fill with internal vibrators.

.6 Compaction: compact each layer of material to following densities for material to ASTM D698 in accordance with municipal standards.

.7 Under slabs and paving:

.1 As per Owner's geotechnical engineer's recommendations.

.8 In trenches:

.1 Up to 300 mm above pipe or conduit: sand placed by hand.

.2 Over 300 mm above pipe or conduit: as indicated on drawings.

.9 Under seeded and sodded areas: use site excavated material to the bottom of topsoil except in trenches and within 600 mm of foundations.

.10 Blown rock material, not capable of fine grading, is not acceptable, imported material must be placed on this type of material.

.11 Against foundations (except as applicable to trenches and under slabs and paving): excavated material or imported material with no stones larger than 200 mm diameter within 600 mm of structures.

.12 Underground tanks: use sand to the bottom of granular base courses or to the bottom of topsoil, as applicable.

3.6 GRADING

.1 Grade to ensure that water will drain away from buildings, walls and paved areas, to catch basins and other disposal areas approved by the Consultant. Grade to be gradual between finished spot elevations as indicated.

3.7 CLEANING

.1 Progress Cleaning: clean in accordance with Section 01 74 00 - Cleaning.

.1 Dispose of cleared and grubbed material off site daily.

.2 Final Cleaning: upon completion remove surplus materials, rubbish, tools and equipment in accordance with Section 01 74 00 - Cleaning.

1.4 SUBMITTALS FOR REVIEW

.1 Section 01 33 00: Submission procedures.

.2 Samples: Submit, in air-tight containers, 5 samples of each aggregate or mixture to be incorporated into the project to the testing laboratory designated by the owner.

.3 Submit the name of each material supplier and the specific type and source of each material. Any change in source throughout the job requires the approval of the Owner and Engineer.

.4 Submit materials certificate to on-site independent testing laboratory which is signed by the material producer and Contractor, certifying that materials comply with, or exceed, the requirements herein.

1.5 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Materials Source: Submit the name of imported materials suppliers.

.3 Sustainable Design:

.1 Manufacturer's Certificate: Certify that Products meet or exceed local municipal and provincial Standards.

1.6 CLOSEOUT SUBMITTALS

.1 Section 01 33 00: Submission procedures.

.2 Sustainable Design Closeout Documentation: Sieve analysis and compaction reporting

1.7 QUALITY ASSURANCE

.1 Perform Work in accordance with provincial & local municipal standards.

Part 2 Products

2.1 COARSE AGGREGATE MATERIALS

.1 Coarse Aggregate: Conforming to Provincial & Local Municipal standards for each type of material as identified within the provided plans and/or the geotechnical report.

.1 Sieve Size | Percent Passing.

.1 50 mm [100].

.2 25 mm [95].

.3 19 mm [95] to [100].

.4 16 mm [75] to [100].

.5 10 mm [55] to [85].

.6 4.75 mm [35] to [60].

.7 450 micro m [10] to [25].

.8 1.18 mm [15] to [35].

.9 75 micro m [5] to [10].

2.2 FINE AGGREGATE MATERIALS

.1 Conforming to Provincial & Local Municipal standards for each type of material as identified within the provided plans and/or the geotechnical report.

.1 Sieve Size | Percent Passing.

.1 4.75 mm [100].

.2 1.40 mm [10] to [100]0.

.3 300 micro m [5] to [90].

.4 150 micro m [4] to [30].

.5 75 micro m [0].

2.3 SOURCE QUALITY CONTROL

.1 Fine Aggregate Material - Testing and Analysis: Perform in accordance with Provincial and Local municipal standards.

.2 If tests indicate materials do not meet specified requirements, change material or material source and retest.

.3 Provide materials of each type from the same source throughout the Work.

Part 3 Execution

3.1 STOCKPILING

.1 Stockpile materials on site at locations designated by the Consultant and/or as indicated on the Contrac Drawings.

.2 Stockpile in sufficient quantities to meet Project schedule and requirements.

.3 Separate differing materials with dividers or stockpile them apart to prevent mixing.

.4 Direct surface water away from the stockpile site to prevent erosion or deterioration of materials.

3.2 STOCKPILE CLEANUP

.1 Remove the stockpile and leave the area in a clean and neat condition. Grade site surface to prevent free standing surface water.

.2 Leave unused materials in a neat, compact stockpile.

.3 If a borrow area is indicated, leave the area in a clean and neat condition. Grade site surface to prevent free standing surface water.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

.1 Removal of subsoil and stripping of topsoil.

.2 Cutting, grading, compacting, rough contouring, and filling the site for site structures and building pads.

1.4 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Sustainable Design:

.1 Not Used

1.5 CLOSEOUT SUBMITTALS

.1 Section 01 78 10: Submission procedures.

.2 Record Documentation: Accurately record actual locations of utilities remaining by horizontal dimensions, elevations or inverts, and slope gradients.

.3 Sustainable Design Closeout Documentation: Geotechnical reporting on material type and compaction methods and results.

1.6 QUALITY ASSURANCE

.1 Perform Work to provincial & local municipal standards.

Part 2 Products

2.1 MATERIALS

.1 Topsoil: as specified in OPSS 802.

.2 Subsoil Fill: Native fill or imported fill per OPSS 206.

Part 3 Execution

3.1 EXAMINATION

.1 Verify existing conditions before starting work.

.2 Verify that the survey benchmark and intended elevations for the Work are as indicated.

3.2 PREPARATION

.1 Identify required lines, levels, contours, and datum.

.2 Stake and flag locations of known utilities.

.3 Locate, protect, and identify utilities that remain, from damage.

.4 Notify the local utility authority to remove and/or relocate utilities.

.5 Protect above and below grade utilities that remain.

.6 Protect plant life, lawns and other features remaining as a portion of final landscaping.

.7 Protect benchmarks, paving, fences, sidewalks, curbs and existing structures from excavating equipment and vehicular traffic.

3.3 SUBSOIL EXCAVATION

.1 Excavate subsoil from areas identified as cut areas on the provided plans.

.2 Do not excavate wet subsoil or excavate and process wet material to obtain optimum moisture content.

.3 When excavating through roots, perform work by hand and cut roots with a sharp axe.

.4 Remove subsoil from the site.

.5 Stockpile in the area designated on site to a depth not exceeding 2.5 m and protect from erosion. Remove from the site, and subsoil is not being reused. Removal per OPSS 510.

.6 Benching Slopes: Horizontally bench existing slopes greater than 3:1 to key placed fill material to slope to provide a firm bearing.

.7 Stability: Replace damaged or displaced subsoil to the same requirements as for specified fill.

3.4 FILLING

.1 Install Work in accordance with the Contract Documents.

.2 Fill areas to contours and elevations with unfrozen materials.

.3 Place fill material on continuous layers and compact in accordance with the schedule at end of this section.

.4 Maintain optimum moisture content of fill materials to attain the required compaction density.

.5 Make grade changes gradual. Blend slope into level areas. Compaction per Section 31 23 33.01 - Excavating, Trenching and Backfilling.

.6 Remove surplus fill materials from the site. Removal per OPSS 510.

3.5 TOLERANCES

.1 Top Surface of Subgrade: Plus or minus 30 mm from the required elevation.

3.6 FIELD QUALITY CONTROL

.1 Testing: To Provincial and local municipal standards.

.2 If tests indicate Work does not meet specified requirements, remove Work, replace and retest.

END OF SECTION

SEE ADD#4
Q#126

PART 1 - GENERAL

.1 DESCRIPTION

.1 This section specifies the quality and placement of topsoil and finish grading operations.

.2 Related work specified elsewhere:
Trees, Shrubs, and Groundcover - Section 32 93 00

.2 SOURCE QUALITY CONTROL

.1 Advise Landscape Architect of sources of topsoil to be utilized seven (7) days in advance of starting work.

.2 Contractor is responsible for soil analysis and requirements for amendments to supply topsoil as specified.

.3 MEASUREMENT FOR PAYMENT

.1 Supplying, placing and spreading topsoil will be measured in cubic metres as determined from actual surface area covered and depth of topsoil specified. Specified depth of topsoil shall be measured and approved by the Landscape Architect after settlement and consolidation as specified.

.2 Finish grading will be measured in square metres from actual surface measurements as determined by the Landscape Architect.

PART 2 - PRODUCTS

.1 TOPSOIL

.1 Topsoil: mixture of mineral particulates, micro-organisms, and organic matter which provides a suitable medium for supporting intended plant growth.

.1 Soil texture based on the Canadian System of Soil Classification, to consist of 20 - 70% sand and contain 2 - 10% organic matter by weight.

.2 Fertility: major soil nutrients present in the following ratios:
- Nitrogen (N): 20 - 40 micrograms of available N per gram of topsoil.
- Phosphorus (P): 10 - 20 micrograms of phosphate per gram of topsoil.
- Potassium (K): 80 - 120 micrograms of potash per gram of topsoil.
- Calcium, magnesium, sulfur and micro-nutrients present in balanced ratios to support germination and / or establishment of intended vegetation.

.3 Ph value: 6.5 - 8.0

.4 Contain no toxic elements or growth inhibiting materials.

.5 Free from debris and stones over 50mm diameter and course vegetative material, 10mm diameter and 100mm length, occupying more than 2% of soil volume.

.6 Consistence: friable when moist.

.2 SOIL AMENDMENTS

.1 Peatmoss:

.1 Derived from partially decomposed species of Sphagnum Mosses.

.2 Elastic and homogeneous , brown in colour.

.3 Free of wood and deleterious material which could prohibit growth.

.4 Shredded particle minimum size: 15mm

.2 Sand: washed course silica sand, medium to course textured.

.3 Limestone:

.1 Ground agricultural limestone containing minimum calcium carbonate equivalent of 85%.

.2 Gradation requirements: percentage passing by weight, 90% passing 1.0mm sieve, 50% passing 0.125mm sieve.

.4 Fertilizer: complete, commercial, with 35% soluble nitrogen.

PART 3 - EXECUTION

.1 PREPARATION OF EXISTING GRADE

.1 Verify that grades are correct. If discrepancies occur, notify the Landscape Architect or Engineer and do not commence work until instructed to by the Landscape Architect or Engineer.

.2 Grade soil, eliminating uneven areas and low spots, ensuring positive drainage.

.3 Remove debris, roots, branches, stones in excess of 50mm diameter and other deleterious materials. Remove soil contaminated with calcium chloride, toxic materials and petroleum products. Remove debris which protrudes more than 75mm above ground surface. Dispose of removed material off site.

.2 PLACING AND SPREADING OF TOPSOIL

.1 Place topsoil after Landscape Architect has accepted subgrade.

.2 Spread topsoil in uniform layers not exceeding 150mm, over unfrozen subgrade free of standing water.

.3 Spread topsoil to the following minimum depth after settlement and 80% compaction.

Planting beds	18" - 450mm minimum
Sodded and Seeded Area	4" - 100mm minimum

.4 Manually spread topsoil around any obstacles.

.3 SOIL AMENDMENTS

.1 Amendment to topsoil for use in planting beds and turf areas to be determined upon receipt of the required soils test.

.4 FINISH GRADING

.1 Grade to eliminate rough spots and low areas and ensure positive drainage. Prepare loose friable bed by means of cultivation and

subsequent raking.

.2 Consolidate topsoil to required bulk density using equipment approved by Landscape Architect. Leave surfaces smooth, uniform, and firm against deep footprinting.

.5 ACCEPTANCE

.1 Landscape Architect will inspect and test topsoil in place and determine acceptance of material, depth of topsoil, and finish grading. Approval of topsoil material subject to soil testing and analysis.

.2 Testing of topsoil will be carried out by a testing laboratory designated by the Landscape Architect. Soil sampling, testing and analysis to be in accordance with Provincial regulations and standards.

.6 SURPLUS MATERIAL

.1 Dispose of materials not required, as directed by the Landscape Architect, off site.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

.1 Final grading for topsoil, sodding and landscaping.

1.2 RELATED SECTIONS

.1 Section 01 71 00 - Examination and Preparation

.2 Section 31 05 10 - Corrected Maximum Dry Density for Fill

.3 Section 31 05 16 - Aggregate Materials

.4 Section 31 23 33.01 - Excavating, Trenching and Backfilling

Part 2 Products

2.1 MATERIALS

.1 Topsoil – In accordance with OPSS 802

.2 Refer to landscaping material specifications.

Part 3 Execution

3.1 EXAMINATION

.1 Verify existing conditions before starting work.

.2 Verify building and trench backfilling have been inspected.

.3 Verify substrate base has been contoured and compacted.

3.2 SUBSTRATE PREPARATION

.1 Eliminate uneven areas and low spots.

.2 Remove debris, roots, branches, and stones, in excess of 50 mm in size. Remove subsoil contaminated with petroleum products.

.3 Scarify the surface to a depth of 75 mm where topsoil is scheduled. Scarify in areas where equipment used for hauling and spreading topsoil has compacted subsoil.

3.3 PLACING TOPSOIL

.1 Place topsoil in areas where sodding is required to a nominal depth of 150mm. Place topsoil during dry weather.

.2 Fine grade topsoil to eliminate rough or low areas. Maintain profiles and contour of subgrade.

.3 Remove roots, weeds, rocks, and foreign material while spreading.

.4 Manually spread topsoil close to plant life and the building to prevent damage.

.5 Remove surplus subsoil and topsoil from the site.

.6 Leave stockpile area and site clean and raked, ready to receive landscaping.

3.4 TOLERANCES

.1 Top of Topsoil: Plus or minus 13 mm.

3.5 PROTECTION OF FINISHED WORK

.1 Protect landscaping and other features remaining as final work.

.2 Protect existing structures, utilities, paving, fences, sidewalks, and curbs.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

.1 Excavating trenches for utilities as per the designed on site servicing plan.

.2 Compacted fill from the top of utility bedding to subgrade elevations.

.3 Backfilling and compaction.

1.2 RELATED SECTIONS

.1 Section 01 52 00 - Construction Facilities and Temporary Controls: Water control in excavations.

1.4 DEFINITIONS

.1 Utility: Any buried pipe, duct, conduit, or cable.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Coordination:

.1 Coordinate with other work having a direct bearing on the Work of this Section.

.2 Verify work associated with lower elevation utilities is complete before placing higher elevation utilities.

1.6 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Sustainable Design:

.1 Not Used

1.7 CLOSEOUT SUBMITTALS

.1 Section 01 33 00: Submission procedures.

.2 Sustainable Design Closeout Documentation: Not Used

Part 2 Products

2.1 FILL MATERIALS

.1 Structural Fill Type: As specified in Sections 33 14 16 Site Water Utility Distribution Piping, 33 31 11 Public Sanitary Sewerage Gravity Piping and 33 41 00 Storm Utility Drainage Piping.

.2 Concrete: Lean concrete.

.3 Concrete: Structural concrete with a compressive strength of 32 MPa.

2.2 ACCESSORIES

.1 Geotextile/ Filter Fabric: Non-biodegradable, non-woven.

.1 Product: 270 R, manufactured by TerraFix

Part 3 Execution

3.1 EXAMINATION

.1 Section 01 70 00: Verify existing conditions before starting work.

.2 Verify that the survey benchmark, control point, and intended elevations for the Work are as shown on the drawings.

3.2 PREPARATION

.1 Identify required lines, levels, contours, and datum locations.

.2 Protect plant life, lawns and other features remaining as a portion of final landscaping.

.3 Protect benchmarks, curbs, sidewalks, fences, paving, existing structures, and fences, from excavating equipment and vehicular traffic.

.4 Maintain and protect above and below grade utilities which are to remain.

.5 Cut out soft areas of subgrade not capable of compaction in place. Backfill with Suitable Fill and compact to a density equal to or greater than requirements for subsequent backfill material.

3.3 EXCAVATING

.1 Excavate subsoil required for utilities as designed on the provided plans in accordance with OPSS 401 and OHSA.

.2 Cut trenches sufficiently wide to enable installation and allow inspection. Remove water or materials that interfere with the Work.

.3 Do not interfere with 45 degree bearing splay of foundations.

.4 Hand trim excavation and remove loose matter.

.5 Remove lumped subsoil, boulders, and rock up to 0.25 cu m, measured by volume.

.6 Correct areas over excavated in accordance with Section 31 23 23.

.7 Stockpile excavated material in an area designated on site and/or remove excess material not required from the site.

.8 Remove excavated material from the site in accordance with OPSS 501.

.9 Dewater excavation as required in accordance with OPSS 517.

3.4 BACKFILLING

.1 Backfill trenches to contours and elevations with unfrozen fill materials.

.2 Systematically backfill to allow maximum time for natural settlement. Do not backfill over porous, wet, frozen, or spongy subgrade surfaces.

.3 Place geotextile fabric over Structural Fill Type prior to placing the next lift of fill.

.4 Granular Fill: Place and compact materials in equal continuous layers not exceeding 200 mm compacted depth.

.5 Employ a placement method that does not disturb or damage foundation perimeter drainage and utilities in the trench.

.6 Maintain optimum moisture content of fill materials to attain the required compaction density.

.7 Remove surplus fill materials from the site. Removals per OPSS 510.

.8 Leave fill material stockpile areas completely free of excess fill materials.

3.5 TOLERANCES

.1 Top Surface of Backfilling Under Paved Areas: Plus or minus 15 mm from required elevations.

.2 Top Surface of General Backfilling: Plus or minus 25 mm from required elevations.

3.6 FIELD QUALITY CONTROL

.1 Section 01 45 00: Quality Control

.2 Compaction testing will be performed per Geotechnical Engineer's recommendations.

.3 If tests indicate the Work does not meet specified requirements, remove the deficient Work, replace, compact, and retest.

3.7 PROTECTION OF FINISHED WORK

.1 Reshape and re-compact fills subjected to vehicular traffic during construction.

3.8 SCHEDULES

.1 Pipe and Bedding:

.1 Cover pipe and bedding with Fill Type S, in 200 mm lifts, compacted to 95%.

END OF SECTION

Part 1 - General

1.1 RELATED REQUIREMENTS

.1 Section 31 05 16 Aggregates for Earthwork.

.2 Section 31 23 33.01 Excavation, Trenching and Backfilling

1.2 MEASUREMENT AND PAYMENT

.1 Measure geotextiles in square metres of surface covered by material. No allowance will be made for seams and overlaps.

.4 Ontario Provincial Standard Specifications (OPSS)

.1 OPSS 1860, Material Specification for Geotextiles.

1.4 ACTION AND INFORMATIONAL SUBMITTALS

.1 Submit in accordance with Section 01 33 00 - Submittal Procedures

.2 Product Data:

.1 Submit manufacturer's instructions, printed product literature and data sheets for geotextiles and include product characteristics, performance criteria, physical size, finish and limitations.

.3 Test and Evaluation Reports:

.1 Submit copies of mill test data and certificate at least 4 weeks prior to the start of Work.

1.5 DELIVERY, STORAGE AND HANDLING

.1 Deliver, store and handle materials in accordance with the manufacturer's written instructions.

.2 Storage and Handling Requirements:

.1 Store materials off ground and in accordance with the manufacturer's recommendations in a clean, dry, well-ventilated area.

.2 Store and protect geotextiles from direct sunlight and UV rays.

.3 Replace defective or damaged materials with new ones.

.3 Not Used

Part 2 - Products

2.1 MATERIAL

.1 Geotextile: synthetic fibre fabric, supplied in rolls.

.1 To OPSS 1860

.2 Physical properties:

.1 To OPSS 1860

.3 Hydraulic properties:

.1 To OPSS 1860

.4 Securing pins and washers: to CSA-G40.21, Grade 300W, hot-dipped galvanized with minimum zinc coating of 600 g/m² to ASTM A123/A123M.

.5 Factory seams: sewn in accordance with the manufacturer's recommendations.

.6 Thread for sewn seams: equal or better resistance to chemical and biological degradation than geotextile.

Part 3 - Execution

3.1 EXAMINATION

.1 Verification of Conditions: Verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for geotextile material installation in accordance with the manufacturer's written instructions.

.1 Visually inspect the substrate in the presence of the Engineer.

.2 Inform the Consultant of unacceptable conditions immediately upon discovery.

.3 Proceed with installation only after unacceptable conditions have been remedied.

3.2 INSTALLATION

.1 Place geotextile material by unrolling onto the graded surface in the orientation, manner and locations indicated and retain it in position with pins or stakes.

.2 Place geotextile material smooth and free of tension stress, folds, wrinkles and creases.

.3 Place geotextile material on sloping surfaces in one continuous length from the toe of the slope to the upper extent of the geotextile.

.4 Overlap each successive strip of geotextile 600 mm over the previously laid strip.

.5 Join successive strips of a geotextile by sewing.

.6 Pin successive strips of geotextile with securing pins.

.7 Protect installed geotextile material from displacement, damage or deterioration before, during and after the placement of material layers.

.8 After installation, cover with an overlying layer within 4 hours of placement.

.9 Replace damaged or deteriorated geotextile with the approval of the Engineer.

.10 Place and compact soil layers in accordance with Section 31 23 33.01 - Excavating, Trenching and Backfilling.

3.3 CLEANING

.1 Progress Cleaning: clean in accordance with Section 01 74 00 - Cleaning.

.1 Leave the Work area clean at the end of each day.

.2 Final Cleaning: upon completion remove surplus materials, rubbish, tools and equipment in accordance with Section 01 74 00 - Cleaning.

3.4 PROTECTION

.1 Vehicular traffic is not permitted directly on geotextile.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

.1 This Specification covers the requirements for inspecting new and existing sanitary and storm pipe sewers, and pipe culverts by closed circuit televisions.

1.2 RELATED SECTIONS

.1 Section 01 78 10 - Closeout Submittals

.2 Section 33 05 16 - Manholes and Catch Basins

.3 Section 33 31 11 - Site Sanitary Sewage Piping

.4 Section 33 41 00 - Storm Utility Drainage Piping

1.3 REFERENCES

.1 OPSS 409 Closed-Circuit Television (CCTV) Inspection of Pipelines

.2 OPSS 411 Cleaning and Flushing of Pipe Sewers, Catch Basins, Maintenance Holes, Ditch Inlets, and Oil-Grit Separators

.3 The Town of East Gwillimbury Engineering Standards and Design Criteria, Section 11.0

1.4 DEFINITIONS

.1 For this Specification the following definitions apply:

.2 CCTV: means closed circuit television.

.3 Drainage Structure: means a catch basin, maintenance hole or ditch inlet.

.4 NAAPI: means North American Association of Pipeline Inspectors.

1.5 SUBMISSION AND DESIGN REQUIREMENTS

.1 A copy of the CCTV operator's current NAAPI Certification Certificate is to be provided to the Engineer two weeks prior to the start of CCTV inspection operations. A copy of the said certificate is required for each operator working on the Project.

Part 2 Products

1.6 USB / FTP

.1 Video files must be provided via a USB flash drive or accessible through a secure FTP (File Transfer Protocol) site. The file format is to be operable through standard windows software, and any additional software required to view the

videos will be provided by the Contractor. The DVD format is only to be submitted upon acceptance by the Engineer.

1.7 SURVEY VEHICLE

.1 The survey vehicle shall contain a separate area for viewing, recording and controlling the CCTV operation.

.2 The viewing and control area shall be insulated against noise and externals in temperature. External and internal sources of light shall be controlled in a manner to ensure the light does not impede the view of the monitor screen. Proper seating accommodation shall be provided to enable persons, in addition to the operator to clearly view the monitor screen.

.3 All equipment utilized within the pipeline shall be stored outside the viewing, recording and control area.

.4 The vehicle shall include a telephone or suitable alternative as agreed with the Sitework Engineer of Record for the duration of the Work.

1.8 SURVEY EQUIPMENT

.1 The surveying equipment shall be capable of surveying a length of pipeline up to:

.1 350 m where entry to the pipeline may be obtained at each end of the pipeline;

.2 30 m where rodding is used; or

.3 150 m where a self propelled unit is used when entry is at one end of the pipeline only.

.2 Work shall not commence in a Work shift until the Engineer is satisfied that all items of the survey equipment have been provided and are in full working order.

.3 Each survey unit shall contain a means of transporting the CCTV camera in a stable condition through the pipeline.

.4 Where the CCTV camera is towed by winch and cable through the pipeline, all winches shall be stable during the entire CCTV inspection. All cables shall be steel or of equally non-elastic material to ensure the smooth and steady progress of the CCTV camera.

.5 Each unit shall carry sufficient numbers of guides and rollers such that, when surveying, all cables are supported away from pipe and maintenance hole edges. All CCTV cables and lines used to measure the camera's location within the pipeline shall be maintained in a taut manner and set at right angles, where possible, to run through or over the measuring equipment.

1.9 VIDEO EQUIPMENT QUALITY

.1 The electronic systems, television camera and monitor shall be of such quality as to enable the following to be achieved.

1.10 CAMERA

.1 The pan and tilt camera shall have the capability of panning the pipe at 360 degrees with a tilt capability of 275 degrees to ensure complete inspection and view of all laterals and deficiencies.

.2 Resolution: The live picture shall be visible with no interference and capable of registering a minimum resolution of 640 x 480.

.3 Colour Constancy: To ensure the camera Provides optimum results when used with its own illumination source, the lighting shall be fixed to intensity prior to commencing the survey. To ensure colour constancy, no variation in illumination shall take place during the survey.

1.11 DIGITAL RECORDER

.1 The digital recorder shall be capable of reproducing a minimum resolution of 640 x 480.

1.12 FOCUS, IRIS, ILLUMINATION

.1 The adjustment of focus and iris shall allow optimum picture quality to be achieved and shall be remotely operated. The illumination shall be such as to allow an even distribution of the light around the pipeline perimeter without the loss of contrast or flare out of picture shadowing.

Part 3 Execution

1.13 CCTV INSPECTION

.1 The Work shall include a CCTV inspection of the pipeline, and the preparation of all digital and written reports.

.2 The CCTV operator shall be certified by the NAAPI.

.3 A fixed camera shall be used for pipelines less than 300 mm in diameter. For pipelines equal to or greater than 300 mm a pan and tilt camera shall be used.

.4 At the start of each pipeline being surveyed, the length of the pipeline from zero chainage up to the cable calibration point shall be recorded and reported in order to obtain a full record of the: pipe sewer length from the inside face of the maintenance hole to the inside face of the next maintenance hole or outlet end of the pipe sewer; or pipe culvert length from one end of the pipe culvert to the other.

.5 The metre reading entered into the data display at the cable calibration point shall allow for the distance from the start of the survey to the cable calibration point such that the metre reading at the start of the survey is zero.

.6 In the case of surveying through a maintenance hole where a new header sheet is required, the metre reading shall be set at zero with the camera focused on the outgoing pipe entrance.

.7 At the start of each maintenance hole length, a data generator shall electronically generate and clearly display on the viewing monitor and video recording a record of data in alpha-numeric form containing the following minimum information:

.1 Automatic update of the camera's metre reading position in the pipeline from adjusted zero.

.2 Pipeline dimensions.

.3 Maintenance hole/pipe length reference numbers.

.4 Date of the survey.

.5 Road name/location.

.6 The direction of the survey.

.7 Time of start of the survey.

.8 Pipeline use.

.8 Once the survey of the maintenance hole length is underway, an automatic update of the camera's metre reading position in the pipeline from zero, in metres and tenths of a metre, shall be continually displayed.

.9 The camera shall be stopped when defects are being noted on the coding sheet.

.10 The survey shall be restarted at the opposite end of the pipeline if a blockage or obstruction is encountered.

1.14 CAMERA PREPARATION

.1 The camera lens shall be positioned centrally in the pipeline with a positioning tolerance of +/- 10% of the vertical pipeline dimension. In all instances, the camera lens shall be positioned looking along the longitudinal axis of the pipeline.

1.15 CAMERA TRAVEL SPEED

.1 The travelling speed of the camera in the pipeline shall be limited to:

.1 0.1 m/s for a pipeline of diameter less than 200 mm:

.2 0.15 m/s for diameters exceeding 200 mm but not exceeding 310 mm; and

.3 0.20 m/s for diameters exceeding 310 mm.

1.16 CAMERA POSITION METER READING DEVICE

.1 A suitable meter reading device shall be used which enables the cable length to be accurately measured to indicate the location of the camera. The metre reading device shall be accurate to +/- 1% of the length of the sewer surveyed. The tolerance shall be demonstrated using one or both of the following methods in conjunction with a linear measurement audit form, which shall be completed each day during the survey:

.2 Cable calibration devise.

.3 Tape measurement of the surface distance between maintenance holes.

.4 If the accuracy of the measuring device fails it is to be replaced. The Sitework Engineer of Record may require that those lengths of pipeline first inspected with the original measuring device be resurveyed using the new measuring device.

1.17 SURVEYING REPORTING

.1 Reports shall be submitted to the Engineer in the following formats, within 10 working days of the completion of the field Work, with the noted number of copies.

.2 2 copies of the report and CCTV surveys in USB flash drive format, or credentials to access the report and surveys on a secure FTP site.

.3 All required header information fields shall be completed and verified for correctness. The software used to produce the survey report shall not allow the operator to continue inputting information until the MSCC.

.4 All dimensions in the survey report shall be metric.

1.18 SITE CODING SHEETS

.1 Each pipeline length shall be recorded according to the MSCC. Any variation from the manual shall be noted in the survey report.

1.19 DRAWINGS

.1 One clean set of the Owner's Drawings showing maintenance hole numbers, which coincide with the coding sheets and video tapes, shall be returned to the Sitework Engineer of Record on completion of the survey. The Drawings shall be clearly annotated to show any discrepancies between the Drawings and the survey report. Such discrepancies shall be brought to the attention of the Sitework Engineer of Record during the survey.

1.20 PIPELINE CLEANING AND DEWATERING

.1 All pipelines shall be cleaned and flushed immediately in accordance with OPSS 411 prior to inspection.

1.3 SAMPLES

.1 Not Used

Part 2 - Products

2.1 MATERIALS

.1 Granular sub-base material: in accordance with Section 31 05 16 - Aggregate Materials and the following requirements:

.1 Granular 'B' or 50mm Crusher Run limestone to OPSS.MUNI 1010.

.2 Granular 'A' or 50mm Crusher Run limestone to OPSS.MUNI 1010 where indicated for modified heavy duty asphalt structure.

Part 3 - Execution

3.1 EXAMINATION

.1 Verification of Conditions: verify conditions of substrate previously installed under other Sections or Contracts are acceptable for granular sub-base installation.

.1 Visually inspect the substrate in presence of the Sitework Engineer.

.2 Inform the Engineer of unacceptable conditions immediately upon discovery.

.3 Proceed with installation only after unacceptable conditions have been remedied.

3.2 PREPARATION

.1 Temporary Erosion and Sedimentation Control:

.1 Provide temporary erosion and sedimentation control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to sediment and erosion control drawings.

.2 Inspect, repair, and maintain erosion and sedimentation control measures during construction until permanent vegetation has been established.

.3 Remove erosion and sedimentation controls upon completion of site restoration and stabilization of landscaped surfaces with grass seed within areas disturbed during removal.

3.3 PLACING

.1 Place granular sub-base after subgrade is inspected and approved by the Engineer.

.2 Construct a granular sub-base to depth and grade in areas indicated.

.3 Ensure no frozen material is placed.

.4 Place material only on a clean unfrozen surface, free from snow or ice.

.5 Begin spreading sub-base material on the crown line or high side of one-way slope.

.6 Place granular sub-base materials using methods which do not lead to segregation or degradation.

.7 For spreading and shaping material, use spreader boxes having adjustable templates or screeds which will place material in uniform layers of required thickness.

.8 Place material to full width in uniform layers not exceeding 150 mm compacted thickness.

.9 Shape each layer to smooth contour and compact to a specified density before the succeeding layer is placed.

.10 Remove and replace a portion of the layer in which material has become segregated during spreading.

3.4 COMPACTION

.1 Compaction equipment to be capable of obtaining required material densities.

.2 Compact to the density of not less than 98% SPMDD unless directed otherwise by the Sitework Engineer.

.3 Shape and roll alternately to obtain a smooth, even and uniformly compacted sub-base.

.4 Apply water as necessary during compaction to obtain specified density.

.5 In areas not accessible to rolling equipment, compact to specified density with mechanical tampers approved by the Sitework Engineer.

.6 Correct surface irregularities by loosening and adding or removing material until the surface is within the specified tolerance.

3.5 PROOF ROLLING

.1 For proof rolling use a standard roller of 45,400 kg gross mass with four pneumatic tires each carrying 11,350 kg and inflated to 620 kPa. Four tires are arranged abreast with the centre to centre spacing of 730 mm maximum.

.2 Obtain written approval from the Sitework Engineer to use non standard proof rolling equipment.

.3 Proof roll at to a level in sub-base as indicated.

.1 If non standard proof rolling equipment is approved, the Sitework Engineer will determine the level of proof rolling.

.4 Make sufficient passes with the proof roller to subject every point on the surface to three separate passes of the loaded tire.

.5 Where proof rolling reveals areas of defective subgrade:

.1 Remove sub-base and subgrade material to depth and extent as directed by the Engineer.

.2 Backfill excavated subgrade with sub-base material and compact in accordance with this section.

.3 Replace sub-base material and compact.

.6 Where proof rolling reveals areas of defective sub-base, remove and replace in accordance with this section at no extra cost.

3.6 SITE TOLERANCES

.1 The finished sub-base surface is to be within 10 mm of the calculated sub-base elevation based on the required asphalt pavement thickness for finished grade elevations as indicated, but not uniformly high or low.

3.7 PROTECTION

.1 Maintain finished sub-base in condition conforming to this section until succeeding base is constructed, or until granular sub-base is accepted by the Sitework Engineer.

END OF SECTION

.3 OPSS 1150 Hot Mix Asphalt

.4 OPSS 308 Tack Coating and Joint Painting

.5 OPSS 1212 Hot-Poured Rubberized Asphalt Joint Sealing Compound

1.4 PERFORMANCE REQUIREMENTS

.1 Paving: Designed for light duty commercial vehicles, residential streets, parking and main street arteries. Each area is identified on the provided plans.

1.5 SUBMITTALS FOR INFORMATION

.1 Sustainable Design:

.1 Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

1.6 CLOSEOUT SUBMITTALS

.1 Section 01 78 10: Submission procedures.

.2 Sustainable Design Closeout Documentation: As-constructed survey and asphalt mix designs and compaction and sampling test results.

1.7 QUALITY ASSURANCE

.1 Perform Work to OPSS 1150.

.2 Mixing Plant: Requirements for all Mixing Plants per 1150.06.01.

.3 Obtain materials from the same source throughout.

1.8 REGULATORY REQUIREMENTS

.1 Conform to applicable code for paving work on public property.

1.9 ENVIRONMENTAL REQUIREMENTS

.1 Section 01 35 26: Environmental conditions affecting products on site.

.2 Do not place asphalt when ambient air or base surface temperature is less than 4 degrees C, or the surface is wet or frozen.

.3 Place the bitumen mixture when the temperature is not more than 8 C degrees below the bitumen supplier's bill of lading and not more than the maximum specified temperature.

Part 2 Products

2.1 MATERIALS

.1 Asphalt Cement: In accordance with OPSS 1150.

.2 Aggregate for Base Course Mix: In accordance with OPSS 1003 and 1150.

.3 Aggregate for Surface Course Mix: In accordance with OPSS 1003 and 1150.

.4 Fine Aggregate: In accordance with OPSS 1003.

.5 Tack Coat: In accordance with OPSS 308.

.6 Seal Coat: In accordance with OPSS 1212.

2.2 ASPHALT PAVING MIX

.1 Use dry material to avoid foaming. Mix uniformly.

.2 Base Course: Thickness as indicated on Contract Drawings

.3 Surface Course: Thickness as indicated on Contract Drawings

2.3 SOURCE QUALITY CONTROL AND TESTS

.1 Submit the proposed mix design of each class of mix for review prior to the beginning of work.

.2 Test samples are to be determined by the Consultant.

Part 3 Execution

3.1 EXAMINATION

.1 Verify existing conditions before starting work.

.2 Verify that the compacted granular base and subgrade are dry and ready to support paving and imposed loads.

.3 Verify gradients and elevations of the base are correct.

3.2 SUBBASE

.1 Section 32 11 23: Aggregate base course forms the base construction for the work of this section.

3.3 PREPARATION - TACK COAT

.1 Apply the tack coat to the manufacturer's written instructions.

.2 Apply tack coat in accordance with OPSS 308.

.3 Apply tack coat on asphalt or concrete surfaces over subgrade surfaces at a uniform rate of 1.5 L/sq m. Apply tack coat to contact surfaces of curbs and gutters.

.4 Coat the surfaces of the catchbasin and manhole frames with oil to prevent bond with asphalt pavement. Do not tack coat these surfaces.

3.4 PLACING ASPHALT PAVEMENT - SINGLE COURSE

.1 Install Work in accordance with Provincial and Local municipal standards.

.2 Place asphalt within twenty-four (24) hours of applying primer or tack coat.

.3 Place binder course in successive lifts in order to achieve thickness as identified on the provided plans and as per Provincial and Local municipal standards.

.4 Install manhole frames and gutter drainage grilles and frames in the correct position and elevation.

.5 Compact pavement by rolling to a specified density. Do not displace or extrude pavement from position. Hand compact in areas inaccessible to rolling equipment.

.6 Perform rolling with consecutive passes to achieve an even and smooth finish, without roller marks.

3.5 PLACING ASPHALT PAVEMENT - DOUBLE COURSE

.1 Place asphalt binder course within twenty-four (24) hours of applying primer or tack coat.

.2 Place binder course in successive lifts in order to achieve thickness as identified on the provided plans and as per Provincial and Local municipal standards.

.3 Place wearing course within two (2) hours of placing and compacting binder course.

.4 Install manhole frames and gutter drainage grilles and frames in the correct position and elevation.

.5 Compact pavement by rolling to a specified density. Do not displace or extrude pavement from position. Hand compact in areas inaccessible to rolling equipment.

.6 Perform rolling with consecutive passes to achieve an even and smooth finish, without roller marks.

3.6 CURBS

.1 Install extruded asphalt curbs as shown and detailed on the provided plans.

3.7 SEAL COAT

.1 Apply seal coat to the surface course and asphalt curbs in accordance with Provincial or Municipality standards.

3.8 TOLERANCES

.1 Flatness: Maximum variation of 6 mm measured with 3 m straight edge.

.2 Variation from True Elevation: Within 13mm.

3.9 FIELD QUALITY CONTROL

.1 Section 01 45 00: Field inspection and testing.

Take samples and perform tests on AI MS-2.

.2 Independent Testing Laboratory shall prepare test reports that indicate test location, elevation data, and test results. The Owner, Engineer, and Contractor shall be provided with copies of reports within 96 hours of the time test were performed. In event that any test performed fails to meet these Specifications, the Owner, Engineer and Contractor shall be notified immediately by Independent Testing Laboratory. The Owner reserves the right to employ an Independent Testing Laboratory and to direct any testing that is deemed by them to be necessary. Contractor shall provide free access to the site for testing activities.

.3 Costs related to retesting due to failure shall be paid for by the Contractor at no additional expense to the Owner.

3.10 PROTECTION OF FINISHED WORK

.1 Immediately after placement, protect the pavement from mechanical injury for 2 days or until the surface temperature is less than 60 degrees C.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

.1 Formed and reinforced concrete sidewalks, street side curbs and gutters.

.2 Paraplegic ramps.

1.2 RELATED SECTIONS

.1 Section 31 23 23 - Excavating, Trenching and Backfilling

.2 Section 32 11 23 - Aggregate Base Course

1.4 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Sustainable Design:

.1 Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

1.5 CLOSEOUT SUBMITTALS

.1 Section 01 78 10: Submission procedures.

.2 Sustainable Design Closeout Documentation: Not Used.

Part 2 Products

2.1 MATERIALS

.1 Granular Base: Sections 32 11 16.01 and 31 23 33.01 for Excavating, Backfilling and Compaction.

.2 Forms: Forms shall be according to OPSS 919.

.3 Concrete Mix and Materials: Per OPSS 1350

.4 Curing Compound: Curing compound shall be according to OPSS 1315

.5 Joint filler: Hot poured rubberized asphalt joint sealing compound shall be according to OPSS 1212.

.6 Form Release Agent: Non-staining mineral type, chemically active containing compounds that react to provide a water-soluble soap for ease of release.

Part 3 Execution

3.1 PREPARATION

.1 Construct embankments using excavated material free from organic matter or other objectionable materials.

.2 Dispose of surplus or unsuitable excavated material at a location off site OPSS 510.

.3 In constructing an embankment, provide a minimum of 1m shoulders, outside of lines of placed concrete.

.4 Place fill in a maximum of 150 mm layers, compact to 95% of optimum density or as directed by the Engineer.

.5 Obtain Engineer approval of subgrade before placing granular base.

.6 Place granular base material to lines, widths, and depths as indicated.

.7 Compact base to 100% of optimum density or as directed by the Engineer.

3.2 TOLERANCES

.1 Finish surfaces flat to within 3 mm in 1 m as measured with a straightedge placed on the surface.

3.3 JOINTS

.1 Install tooled transverse contraction joints after floating, when concrete is stiff but still plastic, at intervals specified within the Provincial and Local municipal standards.

.2 Place lateral expansion joints at intervals of 6 m or as specified within the Provincial and Local municipal standards.

.3 Place isolation joints around manhole rings, catch basins, and adjacent to concrete curbs, catch basins, buildings, or permanent abutting surfaces.

.1 Seal isolation joints with sealant approved by the Engineer.

.4 When the sidewalk is adjacent to the curb or gutter, form joints of the curb, gutter, and sidewalk to coincide (key).

3.4 CURING

.1 Cure concrete by adding moisture continuously to CSA-A23.1/A23.2, to exposed finished surfaces for a minimum of one (1) day after placing, or by sealing moisture with a surface curing compound approved by the Engineer.

.2 Apply the curing compound evenly to form a continuous film to the compound manufacturer's requirements.

3.5 PARAPLEGIC RAMPS

.1 Remove existing curbs, gutters or sidewalks as necessary to construct the paraplegic ramp.

.2 Removals are to begin and end at existing joints only. No saw cuts in existing work are permitted.

.3 Construct concrete paraplegic ramps to lines and grades and slope gradients as per Provincial and Local municipal standards.

.4 Hand finish ramp surfaces as per provincial and local municipal standards.

END OF SECTION

Updated through ADD#8

PART 1 - GENERAL

1.1 PRICING

.1 All costs associated with the work required by and associated with this Section shall be included as part of the Contract Price and in the price listed in item #1 of the Bid Form.

1.2 GENERAL INSTRUCTIONS

.1 Read and conform to:

.1 the General Conditions and the Supplementary Conditions of the Contract.

.2 Division 01 requirements and documents referred to therein.

1.3 SUMMARY

.1 Work Included: Provide labour, materials, products, consumables and equipment for the fencing work specified herein.

.2 Related Requirements: Specifications throughout the entirety of Divisions of this Project are directly applicable to this Section, and this Section is directly applicable to them.

1.4 REFERENCES

.1 Reference Standards: Latest published editions of reference standards listed in this Section in effect as of the closing date and time of the Request for Tenders for the Contract, including any amendments adopted, are applicable unless otherwise indicated.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Pre-Installation Meetings:

.1 Prior to starting work of this Section, convene a pre-installation meeting at Project site to review Project requirements and site conditions with pertinent parties. Conform to requirements of Section 01 30 00.

1.6 SUBMITTALS

.1 Product Data: Product Data: Submit manufacturer's literature and data sheets for each type of material provided under this Section for the Project in accordance with requirements of Division 01.

.2 Safety Data Sheets (SDS): Submit SDS for inclusion in Operation and Maintenance Manual specified in Section 01 70 00, for adhesives, sealants and any other material designated by Consultant.

.3 Shop Drawings: Submit Shop Drawings in accordance with Section 01 30 00.

PART 2 - PRODUCTS

2.1 MATERIAL

.1 Fencing, unless specified otherwise in Drawings and Shop Drawings, shall comply with the following requirements:

.1 All chain link fencing to be heavy-duty hot dipped galvanized finish to municipal standards and in conformance with the detailed Drawings.

.2 Refer to Shop Drawings and detail Drawings for specific requirements of fencing and chain link fencing. Refer to plans for fencing locations.

.2 Concrete mixes and materials: to Section 03 30 00 - Cast-in-Place Concrete and as per detail Drawings. Concrete strength to be 3000 psi after 28 Days, unless specified otherwise in Section 03 30 00 – Cast-in-Place Concrete.

.3 Chain link fence fabric: to CAN/CGSB-138.1-M80, as per detail Drawings and to a minimum of:

.1 Mesh to be hot dipped galvanized after waving and knuckled finish top and bottom selvage edges. Galvanized fabric to have a minimum zinc application of 490 g/m2 of surface area or as illustrated on the Drawings.

.4 All items to be as per detail Drawings and Shop Drawings.

2.2 FINISHES

.1 Galvanizing:

.1 For chain link fabric: to CAN/CGSB-138.1-M80 Grade 2.

.2 For pipe: 550 g/m2 minimum to ASTM A90-81.

.3 For other fittings: to CSA G164-M1981.

~~.3~~.2 Finish: to be black vinyl coated.

PART 3 - EXECUTION

3.1 EXAMINATION

.1 Site Verification of Conditions:

.1 Verify actual site dimensions and location of adjacent materials prior to commencing work. Notify Consultant in writing of any conditions which would be detrimental to the installation. Commencement of work implies acceptance of previously completed work.

3.2 GRADING

.1 Remove debris and correct ground undulations along fence line to obtain smooth uniform gradient between posts. Provide clearance between bottom of fence and ground surface as specified on drawings.

3.3 GENERAL INSTALLATION

.1 Ensure Drawings and/or on-site instructions clearly indicate which side of fence line the fabric and overhang are to be installed.

.2 Erect fence along lines indicated and in accordance with CAN/CGSB-138.3-M80 and manufacturer's specifications.

.3 Excavate post holes to dimensions indicated.

.4 Space line posts as indicated, measured parallel to ground surface.

.5 Install additional bracing as indicated in detailed Drawings.

.6 Install corner post where change in alignment exceeds 10 degrees, unless otherwise specified on the Drawings.

.7 Install end posts at end of fence and at buildings. Install gate posts on both sides of gate openings.

.8 Place concrete/grout in post holes then embed posts into concrete to depths indicated. Concrete to drain away from posts. Brace to hold posts in plumb position and true to alignment and elevation until concrete has set.

.9 Do not install fence fabric until concrete has cured a minimum of 5 Days.

.10 Unless otherwise indicated, install brace between end and gate posts and nearest line post, placed in centre of panel and parallel to ground surface. Where indicated, install braces on both sides of corner and straining posts in similar manner.

.11 Install overhang tops and caps where required.

.12 Install top rail between posts, fasten securely to posts and secure waterproof caps and overhang tops.

.13 Install middle and bottom rails between posts and fasten securely, as per the detail Drawings.

.14 Lay out fence fabric. Stretch tightly to tension recommended by manufacturer and fasten to end, corner, gate and straining posts with tension bar secured to post with tension bar bands spaced as per details. Knuckled selvage at bottom; twisted selvage at top, unless otherwise indicated on details and Shop Drawings.

.15 Secure fabric to top rails, line posts and bottom rails with 6-gauge tie wires as per detail and Shop Drawings. Give tie wires minimum three twists.

3.4 INSTALLATION OF CHAIN LINK GATES

.1 Install gates as indicated on detail plans and Shop Drawings.

.2 Determine position of centre gate rest for double gate. Cast gate rest in concrete as directed. Dome concrete above ground level to shed water.

.3 Install gate stops where indicated.

3.5 TOUCH UP

.1 Touch up as required.

~~.1~~ .2 Clean damaged surfaces with wire brush removing loose and cracked coatings. Apply two coats of organic zinc-rich paint to damaged areas; pre-treat damaged surfaces according to manufacturers' instructions for zinc-rich paint.

3.6 RESTORATION

.1 Clean and trim areas disturbed by operations to satisfaction of the Consultant. Dispose of surplus material off site.

3.7 WARRANTY

.1 The Contractor shall provide a warranty, with a warranty period that is a minimum of five (5) years starting on Substantial Performance of the Work, for all fence and gate components including workmanship.

END OF SECTION

PART 1 - GENERAL

.1 GENERAL REQUIREMENTS

.1 This section specifies the supply and placement of cultivated sod.

.2 Related work specified elsewhere:
Topsoil and Finished Grading - Section 31 22 16

.2 QUALITY ASSURANCE

.1 The contractor must have five (5) years of experience in sodding work. All crew members must work under the direction of a skilled foreman.

.2 Submit topsoil test report with adjustment recommendation to consultant prior to sod installation.

.3 PRODUCT DELIVERY, STORAGE AND HANDLING

.1 Cut sod by approved methods in accordance with recommendations of the Nursery Sod Growers Association (N.S.G.A.) of Ontario. Cut in pieces approximately 1.000 square metres in area with a minimum soil thickness of 20mm.

.2 Roll or fold sod prior to lifting in such a manner as to prevent tearing or breaking.

.3 Protect sod during transportation to prevent drying and ensure that it arrives at the site in a fresh and healthy condition.

.4 Install sod immediately after arrival. If there is a delay in installation, keep sod moist and cool and protected from direct exposure to the sun until installation.

.5 Provide fertilizer in standard manufacturer's containers, clearly marked with the name of the manufacturer, weight and analysis.

.6 Store fertilizer in a weatherproof storage area until use.

.4 JOB CONDITIONS

.1 Proceed with sodding operations only during suitable weather conditions and in accordance with good horticultural practice.

.5 INSPECTION

.1 Obtain approval from the Landscape Architect of the finished topsoil surface before proceeding with sodding.

.2 Give timely notice, in writing, to the Landscape Architect when final acceptance is required.

.6 MAINTENANCE

.1 Maintain sodded areas from the time of installation, until final acceptance by the Landscape Architect.

.2 Maintenance shall include all measures necessary to establish and maintain all sodded areas in vigorous and healthy growing condition, including but not limited to:

.1 Mowing at regular intervals to maintain a maximum height of 60mm. Do not cut more than one third (1/3) of the grass height at any one mowing. Trim and clip edges. Remove clippings after mowing and clipping.

.2 Watering when required and in sufficient quantities to prevent sod from drying out.

.3 Weed control when required and / or directed. Use herbicide only in accordance with the manufacturer's recommendations, federal, provincial and local bylaws or ordinances. Make good all damage resulting from the use of herbicides at no extra cost.

.4 Make good any erosion that results from faulty workmanship and /or material at no extra cost.

.5 Replace with new sod any dead, deteriorated, or bare spots.

.7 GUARANTEE

.1 Guarantee all sodded areas for a period of six months from the date of acceptance.

.2 During the guarantee period replace all material that is dead or not in satisfactory, healthy growing state or which does not meet the requirements of the specifications, at no extra cost to the contract. Final determination of the acceptability of the sod will be made by the Landscape Architect.

PART 2 - PRODUCTS

.1 MATERIALS

.1 Grass Sod

Certified No. 1 grade 'Camel Grass' Sod with a composition of 100% TWCA Approved Kentucky Bluegrass or as specified on the drawings, grown and sold in accordance with the N.S.G.A. classifications. At the time of sale, the sod must have a strong, fiberous root system and be free of stone and burned or bare spots. Mosses and clover shall not be apparent in the turf with no more than 2 broadleaf weeds or 10 other weeds per 40 square meters.

.2 Wooden Pegs: 25mm x 25mm x 230mm minimum length hardwood pegs.

.2 TOPSOIL

.1 Topsoil: fertile and friable sandy loam with a minimum 2% organic matter content with acidity values between pH 6.0 and 7.5, free from admixtures of subsoil, clay lumps, stones or roots over 50mm in diameter, toxic chemicals or any other foreign matter.

.2 Test all topsoil, native and imported, for nitrogen, phosphorous, magnesium, soluble salt content, texture, organic matter content, pH and chemical residues through accredited laboratory with recommendations for improvement for intended use. Make improvements in accordance with analysis.

.3 Topsoil may be taken from existing stockpile provided it meets specified requirements.

.4 At no extra cost to the Contract, provide topsoil from another source if quantity of suitable stockpiled material is not sufficient.

PART 3 - EXECUTION

.1 PREPARATION

.1 Provide a finished topsoil surface that is smooth and firm against footprints, with a fine loose texture, before sod is placed. Finished topsoil surface is to be free of rocks or other deleterious material.

.2 INSTALLATION OF PLANT MATERIAL

.1 Lay sod with tight butt joints. Do not leave any open joints or overlap adjacent pieces of sod.

.2 Ensure finished sod surface is flush with adjoining grass area, pavement, or top surface of curbs.

.3 On slopes steeper than 3:1, lay sod perpendicular to the slope and peg each row at intervals of not more than 600mm on each side of the sod strip. Drive pegs flush with the surface of the sod.

.4 Immediately after installation, water the sod with sufficient quantities of water to penetrate the sod and top 50mm of the underlying topsoil.

.5 When the sod has dried sufficiently to prevent damage, roll all sodded areas to ensure a good bond between topsoil and sod.

.6 Ensure that topsoil is amended as recommended by the soil analysis.

.3 CLEAN UP

.1 At the completion of sodding operations remove all excess material from the site at no extra cost.

.2 Make good all damage resulting from work carried out under this contract, at no extra cost.

END OF SECTION

PART 1 - GENERAL

1.1 General Requirements

.1 This section specifies the supply and placement of mechanical seeding in all areas indicated as such on the drawings to the satisfaction of the specifications.

.2 Related work elsewhere, Topsoil and Finished Grading, Section 31 22 16.

1.2 Quality Assurance

.1 Obtain approval of seed mixture in writing from the Consultant before work commences.

.2 The contractor must have five(5) years of experience in mechanical seeding work. All crew members must be under the direction of a skilled foreman.

1.3 Scheduling

.1 Schedule mechanical seeding to coincide with preparation of soil surface.

.2 Recommended schedule for mechanical seeding using grass mixtures to be preformed only during the periods of March 1 to June 30 and August 1 to December 31.

.3 No work shall be performed when the ground is frozen, wet or otherwise untillable, or when even distribution of materials cannot be obtained.

PART 2 - PRODUCTS

2.1 Delivery and Storage

.1 The seed mixture shall be mixed and supplied by a recognized seed house with tested rates for purity and germination of not less than government standard rates.

.2 All grass seed specified, shall be mixed and supplied by a recognized seed house with tested rates for purity and germination of not less than government standard rates.

3. Seed shall be packed in a bag clearly showing the name of the supplier and indicating the certified quantities of different types of the mixture. The Consultant may request a test for purity and germination.

2.2 Materials

.1 Seed: "Canada pedigreed grade" in accordance with Government of Canada Seeds Act and Regulations, having minimum germination of 75% and minimum purity of 97%.

.2 Mixture:" Certified", "Canada No. 1 Grass Mixture" in accordance with Government of Canada Seeds Act and Regulations with the following mixture composition at a rate of 185kg/Ha.:

20% Ecostar Hard Fescue
35% Creeping Red Fescue
35% Jamestown II Chewings Fescue
10% Top Gun Perennial Rye

.3 Water: Potable and free of impurities that would inhibit germination and growth.

.4 Fertilizer: To Canada "Fertilizers Act" and "Fertilizers Regulations". Adjust nitrogen and potassium on the field according to attached soil test report.

PART 3 - EXECUTION

3.1 Workmanship

.1 Protect areas from trespass until grass is established.

.2 Keep site well drained.

.3 Perform work under optimum field conditions. Do not undertake seeding operation under adverse conditions including moisture, temperature, wind or scheduling related work.

.4 Clean up immediately soil or debris spilled onto pavement and dispose of deleterious materials.

3.2 Preparation of Surfaces

.1 Rough grade soil shall be scarified to a minimum depth of 75mm to produce an even, loose textured surface, free of all stones, roots, branches, etc., large than 25mm.

.2 Fine grade areas to be seeded free of humps and hollows. Ensure all areas are free of deleterious and refuse materials. The finished grade shall be smooth,

loose textured and free of all stones, roots, branches, etc., larger than 25mm diameter and shall be inspected by the Consultant prior to commencing seeding operations.

.3 Areas to be seeded are to be cultivated to a minimum depth of 25mm.

3.3 Fertilizing Program

.1 Fertilizer shall be applied by means of an approved mechanical spreader immediately prior to seeding. The fertilizer shall be well worked into the upper 50mm of soil by discing or harrowing.

3.4 Installation

.1 Obtain Consultant's approval of topsoil grade and depth before starting seeding.

.2 Sow during calm weather (winds less then 6mph) using equipment suitable for the area involved to the approval of the Consultant. Sow half of the required seed in one direction and the remainder at right angles. Incorporate the seed into the soil a minimum depth of 6mm simultaneously or within on half hour after seeding operation. Mix carefully with light chain harrow or wire rake and roll area immediately afterward with water ballast type lawn or agricultural type roller.

.3 Water with fine spray, avoiding washing out seed. Apply enough water to ensure penetration of minimum of 50mm.

.4 Re-seed at 2 week intervals where germination has failed.

.5 Protect seeded areas from trespass satisfactory to the Consultant.

3.5 Maintenance During Establishment Period

.1 Perform the following maintenance operations from the time of the seed application until acceptance by Consultant. Such maintenance shall include all measures necessary to establish and maintain grass in a vigorous growth condition.

.2 Grass Mixture:

.1 Repair and reseed dead or bare spots to allow establishment of seed prior to acceptance.
.2 Mow grass to 40mm whenever it reaches a height of 60mm.
.3 Fertilized seeded areas after the first cutting to the specified rates. Spread half of the fertilizer in one direction, and the remainder at right angles.

.4 Eliminate weeds by mechanical means.
.5 Water seeded area to maintain optimum soil moisture level for germination and continued growth of grass. Control watering to prevent washouts.
.6 Erosion resulting from contractor's faulty workmanship and / or materials shall be repaired and reseeded at his expense.

3.6 Inspection

.1 Acceptance inspection will be conducted within sixty (60) days after completion.

.2 Where the contractor requests inspection for partial acceptance of mechanical seeding work, the contractor will notify the Consultant in writing at least two (2) days in advance.

.3 Partial acceptance will be given when mechanical seeding work has been delayed due to circumstances beyond the control of the contractor or when further mechanical seeding work would be in accordance with good horticultural practice and would jeopardize the performance of work and materials.

.4 At the time of inspection for acceptance, all mechanical seeded areas shall have a healthy and even stand of grass, free of thin, poor, or burned out patches.

3.7 Acceptance

.1 Seeded areas will be accepted by the Landscape Architect provided that:
.1 Plants are uniformly established and seed areas are free of rutted, eroded, bare or dead spots and free of weeds.
.2 Seeded areas have been fertilized.

.2 Areas seeded in the fall will be accepted in the following spring, one month after the start of the growing season, provided that acceptance conditions are fulfilled.

3.8 Maintenance During Warranty Period

.1 Perform the following operations from time of acceptance until end of warranty period:
.1 Repair and reseed dead or bare spots to the satisfaction of the Consultant.

END OF SECTION

Part 1 General

1.1 SCOPE

.1 This specification covers the requirements for sodding.

1.2 RELATED SECTIONS

.1 Section 31 22 19 - Finish Grading

.2 31 23 33.01 Excavating, Trenching and Backfilling

.3 Section 01 57 00 - Temporary Erosion and Sediment Control

1.3 REFERENCES

.1 OPSS 803 Sodding

1.4 DEFINITIONS

.1 Weeds: Includes Dandelion, Jimsonweed, Quackgrass, Horsetail, Morning Glory, Rush Grass, Mustard, Lambsquarter, Chickweed, Cress, Crabgrass, Canadian Thistle, Nutgrass, Poison Oak, Blackberry, Tansy Ragwort, Bermuda Grass, Johnson Grass, Poison Ivy, Nut Sedge, Nimble Will, Bindweed, Bent Grass, Wild Garlic, Perennial Sorrel, and Brome Grass.

1.5 ADMINISTRATIVE REQUIREMENTS

.1 Coordination:

.1 Coordinate with other work having a direct bearing on the work of this section.

.2 Coordinate with installation of underground sprinkler system piping and watering heads.

.2 Sequencing: Sequence installation to ensure utility connections are achieved in an orderly and expeditious manner.

1.6 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Sustainable Design:

.1 Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

1.7 CLOSEOUT SUBMITTALS

.1 Section 01 78 10: Submission procedures.

.2 Maintenance Contracts:

.1 Provide service and maintenance of sodded areas for three (3) months from the Date of Substantial Completion.

.2 Maintain sodded areas immediately after placement until the grass is well established and exhibits a vigorous growing condition.

.3 Operation Data: Submit for continuing Owner maintenance.

.4 Maintenance Data: Include maintenance instructions, cutting method and maximum grass height; [types, application frequency, and recommended coverage of fertilizer].

1.8 QUALITY ASSURANCE

.1 Sod: Minimum age of eighteen (18) months, with root development that will support its own weight without tearing, when suspended vertically by holding the upper two corners.

.2 Submit sod certification for grass species and location of sod source.

.3 Sod Producer: Company specializing in sod production and harvesting with a minimum of five (5) years experience, and certified by the Province of Ontario.

.4 Installer: Company approved by the sod producer.

1.9 REGULATORY REQUIREMENTS

.1 Comply with regulatory agencies for fertilizer and herbicide composition.

.2 Provide a certificate of compliance indicating approval of fertilizer and herbicide mixture.

1.10 DELIVERY, STORAGE, AND PROTECTION

.1 Deliver sod and protect exposed roots from dehydration.

.2 Do not deliver more sod than can be laid within twenty-four (24) hours.

Part 2 Products

2.1 MATERIALS

.1 Sod: Per OPSS 803.05.01.

.2 Stakes: Per OPSS 803.05.02

.3 Fertilizer: Per OPSS 803.05.03

2.2 SOURCE QUALITY CONTROL

.1 Provide mix formulation for fertilizer.

.2 Analyze to ascertain the percentage of nitrogen, phosphorus, potash, soluble salt content, organic matter content, and pH value.

.3 Submit a minimum 10 oz sample of topsoil proposed. Forward the sample to the approved testing laboratory in sealed containers to prevent contamination.

.4 Testing is not required if recent tests are available for imported topsoil. Submit these test results to the testing laboratory for approval. Indicate, by test results, information necessary to determine suitability.

Part 3 Execution

3.1 EXAMINATION

.1 Verify existing conditions before starting work.

.2 Verify that the prepared soil base is ready to receive the work of this section.

3.2 PREPARATION OF SUBSOIL

.1 Prepare subsoil and eliminate uneven areas and low spots.

.2 Maintain lines, levels, profiles and contours. Make changes in grades gradual. Blend slopes into level areas.

.3 Remove foreign materials and undesirable plants and their roots. Do not bury foreign material beneath areas to be sodded.

.4 Remove contaminated subsoil.

.5 Scarify subsoil to a depth of 100 mm where topsoil is to be placed.

.6 Repeat cultivation in areas where equipment, used for hauling and spreading topsoil, has compacted subsoil.

3.3 PLACING TOPSOIL

.1 Spread topsoil to a minimum depth of 50 mm over the area to be sodded.

.2 Place topsoil during dry weather and on the dry unfrozen subgrade.

.3 Remove vegetable matter and foreign non-organic material from topsoil while spreading.

.4 Grade topsoil to eliminate rough, low or soft areas, and to ensure positive drainage.

.5 Install edging at the periphery of sodded areas in straight lines to a consistent depth.

3.4 FERTILIZING

.1 Apply fertilizer to the manufacturer's written instructions.

.2 Apply after smooth raking of topsoil and before installation of sod.

.3 Apply fertilizer no more than forty-eight (48) hours before laying sod.

.4 Mix thoroughly into the upper 50 mm of topsoil.

.5 Lightly water to aid the dissipation of fertilizer.

3.5 LAYING SOD

.1 Moisten the prepared surface immediately before laying sod.

.2 Lay sod within twenty-four 24 after harvesting to prevent deterioration.

.3 Lay sod tight with no open joints visible, and no overlapping; stagger end joints 300 mm minimum. Do not stretch or overlap sod pieces.

.4 Lay smooth. Align with adjoining grass areas.

.5 Place the top elevation of sod 13 mm below adjoining paving, curbs, and edging.

.6 On slopes 1:2 and steeper, lay sod perpendicular to the slope and secure every row with wooden pegs at a maximum of 600 mm on centre. Drive pegs flush with the soil portion of the sod.

.7 Prior to placing sod, on slopes exceeding 0.66:1, place wire mesh over the topsoil. Securely anchor in place with wood pegs sunk firmly into the ground.

.8 Water sodded areas immediately after installation. Saturate sod to 100 mm of soil.

.9 After sod and soil have dried, roll sodded areas to ensure a good bond between sod and soil and to remove minor depressions and irregularities.

3.6 MAINTENANCE

.1 Mow grass at regular intervals to maintain a maximum height of 65 mm. Do not cut more than 1/3 of the grass blade at any one mowing.

.2 Neatly trim edges and hand clip where necessary.

.3 Immediately remove clippings after mowing and trimming.

.4 Water to prevent grass and soil from drying out.

.5 Roll the surface to remove minor depressions or irregularities.

.6 Control the growth of weeds. Apply herbicides in accordance with the manufacturer's written instructions. Remedy damage resulting from improper use of herbicides.

.7 Immediately replace sod in areas which show deterioration or bare spots.

.8 Protect sodded areas with warning signs during the maintenance period.

.9 The Contractor shall maintain the site and control erosion as specified in this specification until the sod has been replaced.

END OF SECTION

PART 1 - GENERAL

.1 RELATED WORK

.1 This section specifies the supply and installation of plant material.

.2 Related work specified elsewhere:
Topsoil - Section 32 91 19

.2 QUALITY ASSURANCE

.1 Planting work is to be carried out by experienced personnel under the direction of a skilled foreman.

.2 Submit topsoil test report with adjustment recommendation to consultant.

.3 PRODUCT DELIVERY, STORAGE AND HANDLING

.1 Supply manufactured items such as fertilizer, bonemeal, mulch, etc., in standard containers, clearly indicating contents, weight, component analysis, and the name of the manufacturer.

.2 Store manufactured materials, subject to deterioration, in a weatherproof place on site and in such a manner that their effectiveness is not impaired.

.3 Supply plant material as specified on the plant list.

.4 Provide all material, specified "B. & B." (balled and burlapped) on the plant list, with a solid, earth root ball, wrapped in burlap.

.5 Do not use plant material on which the root ball has been cracked or broken preparatory to or during the planting process.

.6 Cut all roots cleanly when digging plants. Split roots are not acceptable. Roots should be cut even with the edges of the root ball.

.7 Protect all plant material from damage and breakage. Protect all parts of the plant material from drying out from the time of digging until they are installed.

.8 Do not transport plant material in an open truck unless it is adequately protected from sun and wind.

.9 Carefully tie in all branches before transporting.

.10 Pad all points of contact between plant material and equipment.

.11 Heel in any plant material that cannot be planted during the current day's operations.

.12 Keep all roots and root balls moist prior to planting.

.4 JOB CONDITIONS

.1 Proceed with planting operations only during suitable weather conditions.

.5 SUBSTITUTIONS

.1 Supply and install plant material as specified on the plant list. Substitutions with other plant material will not be allowed without the written approval of the Landscape Architect.

.6 INSPECTION

.1 Make plant material available for inspection at source by the Landscape Architect before installation and inform him/her as to when the inspection can take place.

.2 Approval of plant material at source will not impair the right of the Inspector to inspect plants upon arrival on the site or during the course of construction and to reject plants which have been damaged, or which, in any way do not conform to the specifications.

.3 Give timely notice in writing to the Landscape Architect when acceptance is required.

.4 If partial acceptance is desired, give notice to the Landscape Architect.

.5 Partial acceptance will be given when planting work has been delayed due to circumstances beyond the control of the contractor or where planting would not be in accordance with good horticultural practices and would jeopardize the performance of the work and plants.

.6 Final inspection of all plant material will be made at the end of the specified guarantee period. All plants must be in a healthy growing condition at the time of this inspection.

.7 MAINTENANCE

.1 Maintain all plant material from the time of planting until the date of acceptance.

.2 Maintenance shall include all measures necessary to establish and maintain all plants in vigorous and healthy growing condition, including but not limited to:

.1 Cultivating and weeding of planting beds and tree pits. Use herbicides in accordance with the manufacturer's directions. Make good any damage, resulting from herbicide use at no extra cost.

.2 Watering when required and in sufficient quantities to saturate the root system.

.3 Pruning, including the removal of the dead or broken branches.

.4 Disease and insect control when required. Use chemical methods in accordance with the manufacturer's directions. Make good any damage at no extra cost.

.5 Keep all accessories in good condition and properly adjusted. Repair or replace accessories when required at no extra cost.

.6 At the time of acceptance, all materials must be in a healthy, vigorous growing condition. Beds and tree pits must be freshly cultivated and free of weeds, rubbish and debris.

.8 GUARANTEE

.1 Guarantee all plant material for a period of one year commencing on the date of acceptance.

.2 During the guarantee period replace all material that is dead or not in satisfactory, healthy growing state or which does not meet the requirements of the specifications, at no extra cost to the contract. Final determination of the acceptability of the plants will be made by the Landscape Architect.

.3 All replacements must be plants of the same size and species as shown on the plant list, supplied and planted in accordance with the drawings and specifications.

PART 2 - PRODUCTS

.1 PLANT MATERIAL

.1 All plant material must be nursery grown and meet the specifications set

out in the latest Guide Specifications for Nursery Stock prepared by the Canadian Nursery Trades Association (C.N.T.A.) for size, height, spread, grading, quality and method of cultivation.

.2 Nomenclature of specified plants shall conform to the International Code of Nomenclature for Cultivated Plants and the latest edition of Standardized Plant Names.

.3 Any plant material not conforming to 2.0.1.A. above will be designated as collected plants.

.4 Collected plants may only be used when approved in writing by the Landscape Architect.

.5 Plant Material: true to name and type, structurally sound, well branched; healthy and vigorous and free from disease, insect infestations, rodent damage, sun scald, frost cracks and other abrasions to the bark and densely foliated with healthy, well developed root system. Pruning wounds must show vigorous bark growth on all edges and all parts must show live and green cambium tissue when cut.

.6 All material must conform to the sizes shown on the plant list except that larger material may be used when approved by the Landscape Architect. Use of larger plants will not increase the contract price.

.7 Plant material sizes must conform to the following standards:

.1 Caliper - diameter of the trunk measured 300mm above the normal grade around the plant.

.2 Height - measured from the normal grade around the plant to the top of the main foliage mass.

.3 Spread - the diameter of the main foliage mass, at its widest point.

.2 TOPSOIL

.1 Topsoil: fertile and friable sandy loam with a minimum 2% organic matter content with acidity values between pH 6.0 and 7.5, free from admixtures of subsoil, clay lumps, stones or roots over 50mm in diameter, toxic chemicals or any other foreign matter.

.2 Test all topsoil, native and imported, for nitrogen, phosphorous, magnesium, soluble salt content, texture, organic matter content, pH and chemical residues through accredited laboratory with recommendations for improvement for intended use. Make improvements in accordance with analysis.

.3 Topsoil may be taken from existing stockpile provided it meets specified requirements.

.4 At no extra cost to the Contract, provide topsoil from another source if quantity of suitable stockpiled material is not sufficient.

.3 OTHER MATERIAL

.1 Tree wrap: 224 g (8 oz.) burlap supplied in strips 150 mm minimum to 250 mm maximum (6" minimum to 10" maximum) width or heavy, waterproof crepe paper 100 mm to 150 mm (4" to 6") wide.

.2 Anchor stakes: metal "T" bars of the type used for the erection of snow

fence.

.3 Wire: #9 gauge galvanized wire for trees 75 mm (3") calliper or larger and #10 gauge galvanized wire for smaller trees.

.4 Hose: two ply reinforced, 13 mm (1/2") diameter, new, rubber garden hose.

PART 3 - EXECUTION

.1 PREPARATION

.1 Obtain the approval of the Landscape Architect of all planting excavations as outlined.

.2 INSTALLATION OF PLANT MATERIAL

.1 Ensure width of all planting excavations is 300 mm (12") greater on all sides than the width of the root ball.

.2 Place plant plumb in the centre of the planting pit with a minimum of 150 mm (6") of compacted planting soil mixture under the root ball. Face the plant to give the best appearance or relationship to adjacent structures. Cut away ropes and fold down top 1/3 of the root ball burlap into the pit.

.3 Backfill with planting soil in 150 mm (6") layers and firmly tamp each layer to ensure the plant retains its orientation. Ensure no air pockets remain around the roots.

.4 Thoroughly water when hole is 1/2 full of tamped soil mixture, and again

when the operation is complete.

.5 Except for plants in planting beds, construct an earth saucer around each plant equal to the diameter of the rootball and 50 mm (2") minimum depth to retain water around the roots.

.3 INSTALLATION OF PLANTING ACCESSORIES

.1 Wrap all trees over 50 mm (2") caliper. Apply wrapping in a spiral manner from grade to above the second branch. Secure wrapping with suitable cord.

.2 Stake or guy all trees as outlined in the drawings and details.

.4 PRUNING

.1. Prune plants after planting to compensate for root loss and in such a manner that the natural shape and character is retained.

.2 Do not cut a leader. Use only clean and sharp tools.

.5 CLEAN-UP

.1 At the completion of the planting operations, remove all surplus material from the site at no extra cost.

.2 Make good all damage resulting from planting operations at no extra cost.

York Regional Police

FUNCTIONAL SERVICING AND STORMWATER MANAGEMENT REPORT

350 Garfield Wright Boulevard

Version: 1st Submission

August 30, 2024

EXECUTIVE SUMMARY

This Functional Servicing and Stormwater Management Report ('FSSR') has been prepared to support a Site Plan Approval ('SPA') for the site municipally known as 350 Garfield Wright Boulevard in the Town of East Gwillimbury (referred to as 'the subject site' in this report). The report has been prepared on behalf of York Regional Police (the applicant).

The subject site is currently vacant, and it is proposed to be developed into a helicopter hangar building and parking, an associated vehicle parking, and landscaped areas.

The servicing strategy for the proposed development is summarized as follows:

Water Servicing:

The adjacent municipal roadways contain typical sized watermains to service the proposed development. The domestic and fire flow water demands were calculated in accordance with Town of East Gwillimbury criteria and the Fire Underwriter's Survey methodology. The maximum day demand plus fire flow demand is 12,026 L/min.

A hydrant flow test will need to be conducted on the existing watermain on Garfield Wright Boulevard to confirm available watermain pressure at the required flow rates.

Sanitary Servicing:

The subject site is located outside the urban service boundary of the Town of East Gwillimbury and there are no sanitary sewers in the vicinity of the subject site. The proposed hangar building will be serviced by a private on-site septic system consisting of a Waterloo anaerobic digester, a Waterloo Biofilter, and an in-ground dispersal bed. The sanitary daily design flow for the subject site is 3,629 L/day and has been calculated in accordance with Part 8 of the Ontario Building Code.

Stormwater Servicing & Stormwater Management:

The subject site is located within the York Region Industrial Subdivision (YRIS) SWM facility service area. The YRIS SWM facility provides quality, erosion control, and quantity control for the entire catchment area of YRIS. Stormwater quantity control for the development area will be provided by the downstream YRIS SWM facility. The downstream YRIS SWM facility will provide water balance, erosion control, and stormwater quality control (Enhanced Level 1 / 80% TSS removal). Per the Lake Simcoe Region Conservation Authority Phosphorus Budget Guidance Tool, the pre-development phosphorus loading is 0.05 kg/year. The unmitigated post-development phosphorus loading is 1.22 kg/year. To mitigate the phosphorus loading to levels below the pre-development conditions, a treatment train approach consisting of an upstream infiltration trench and a Jellyfish filter unit to reduce the phosphorus loading to 1.22 kg/year.

1.0 INTRODUCTION

1.1 BACKGROUND

This Functional Servicing and Stormwater Management Report (FSSR) has been prepared to support the development of the new York Regional Police (YRP) hangar to be located within York Regional lands located east of Bales Drive East in the Town of East Gwillimbury. Dillon Consulting Limited (Counterpoint Land Development) has been retained by Parkin Architects Limited to prepare the SWM and functional site servicing/grading plans of the proposed development.

The subject site is located on the north side of Garfield Wright Boulevard and is bounded by the existing York Region Industrial Subdivision (YRIS) SWM facility to the east, the existing gravel parking lot to the north and the existing septic bed/open space to the west. Refer to **Figure 1** for the Site Location Plan.

The proposed development will consist of a one-story building consisting of office space and helicopter parking, a helicopter landing pad and parking areas, driveways and a parking lot, and associated landscaped areas.

1.2 STUDY PARAMETERS

This functional servicing assessment for the subject site is based on the review of the following documents and drawings:

- Architectural site plan prepared by Parkin Architects Limited
- Technical Design Brief – Stormwater Management Facilities for York Regional Industrial Subdivision 19T-94016; July 2004 prepared by Cumming Cockburn Limited (CCL).
- Storm Drainage Area Plan (Drawing 5390-STM2) for the YRIS storm sewers prepared by CCL and dated May 2004.
- Ontario Building Code, Section 8
- Town of East Gwillimbury Engineering Standards and Design Criteria, September 2012
- Lake Simcoe Region Conservation Authority Technical Guidelines for Stormwater Management Submissions April 2022
- Lake Simcoe Region Conservation Authority Black River Subwatershed Plan
- Ministry of the Environment, Conservation and Parks Design Guidelines for Drinking Water Systems, January 2016
- Stormwater Management Implementation Report for 2696 & 2740 Davis Drive Industrial Development, dated July 2013 prepared by RJ Burnside & Associates Ltd.
- Servicing and Grading Plans for the Technicore Industrial Subdivision, dated February 2007 and prepared by RJ Burnside.
- Determination of Estimated T-Time, dated July 31, 2016, and prepared by Azimuth Environmental Consulting Inc./GEI Consultants

2.0 WATER SUPPLY

2.1 EXISTING WATER SUPPLY

There is an existing 300 mmø watermain on the south side of Garfield Wright Boulevard. Refer to **Figure 2 - Water Servicing Plan** for the existing watermain layout. There are two municipal hydrants located on the south side of the road allowance. There are no existing water service services within the subject site.

Municipal water service is currently provided to the Town of East Gwillimbury and some other areas, distributed through a network of water mains with diameters up to 400 mm. The remainder of the municipality relies on individual wells for their water needs. The municipal water system depends on a groundwater supply from local wells.

2.2 WATER DEMAND

2.2.1 DOMESTIC DEMAND

Calculation of the water demand for the proposed development has been performed using the guidelines outlined within the Town of East Gwillimbury Engineering Standards and Design Criteria (September 2012), and the MECP Design Guidelines for Drinking Water Systems (2016).

Per the Town of East Gwillimbury, the average day demand for commercial land use is 28,000 L/ha/day. Maximum Day and Peak Hour factors shall be 2.0 and 2.75 respectively, or as recommended by the MECP.

Refer to **Appendix A** for the supporting calculations of the following proposed domestic demands:

- Maximum Hour Demand = 35.8 L/min
- Maximum Day Demand = 26.0 L/min

2.2.2 FIREFLOWS

The fire flow required for the proposed hangar building has been calculated using the criteria indicated in the Water Supply for Public Fire Protection Manual, 1999, by the Fire Underwriters Survey (FUS). The calculation incorporates various parameters such as coefficient for fire-resistant construction, area reduction accounting for a fire-resistant (one-hour rating) protection, reduction for low-hazard occupancies, adjustment for sprinkler protection system, and factor for neighbouring building proximity. Based on the calculations, the minimum fire suppression flow required is 4,725 L/min. This fire flow plus the maximum day demand or peak hour demand, whichever is greater, must be available at the nearest hydrant with a minimum pressure of 140 KPa. Refer to **Appendix A** for the supporting calculations of the following proposed fireflows:

WATER SERVICING PLAN

DESIGNED BY: PM	DATE: APRIL 2024
CHECKED BY: PW	PROJECT No. 24015
DRAWING BY: ET	
CHECKED BY: PM	FIGURE No. 2
SCALE: 1:600	

- Fire Flow Demand (2 hours) = 12,000 L/min
- Maximum Day Demand plus Fire Flow Demand = **12,026 L/min**

In accordance with the FUS fire flows for the existing watermain on Garfield Wright Boulevard will not be less than **12,026 L/min** for a 2-hour duration in addition to the maximum daily domestic demand, delivered with a residual pressure of not less than 140 kPa.

A hydrant flow test will need to be conducted on the existing watermain on Garfield Wright Boulevard to confirm available watermain pressure at the required flow rates.

2.3 WATER SERVICE CONNECTION

It is proposed to install a 200mm diameter water service for the building connecting to the existing 300mm diameter municipal watermain on Garfield Wright Boulevard. This water connection will branch to a separate 100mm diameter domestic watermain and 200mm fireline. A valve chamber will be provided on the fireline at the streetline. The domestic water service and fire line will enter the hangar building from the west side at the mechanical room as indicated on the **Figure 2 – Water Servicing Plan.**

Fire protection will be provided by a proposed private site fire hydrant, which is located on the south side of the proposed hangar building. The fire hydrant will be located within 90m of the principal building entrances and 45m of the proposed Siamese connection in accordance with the Ontario Building Code. The location of the fire hydrants and Siamese connection are indicated on the **Figure 2 - Water Servicing Plan.**

3.0 WASTEWATER SERVICING

Given that the subject site is located outside the urban service boundary of the Town of East Gwillimbury, and that there are no sanitary sewers in the vicinity of the subject site, the proposed hangar building will be serviced by a private on-site septic system similar to the adjacent developments within the YRIS. In this regard, the proposed hangar building will be serviced by a septic system which consists of a Waterloo anaerobic digester, a holding tank housing a Waterloo biofilter, and an in-ground dispersal bed as indicated on the **Figure 3 – Sanitary Servicing Plan.**

3.1 SANITARY DEMAND

The daily design flow for a septic system is to be calculated in accordance with Part 8 of the OBC. For non-residential uses, the flow is calculated based on the most applicable occupancy as listed in OBC Table 8.2.1.3.B – office @ 450m^2.

Based on the office occupancy and floor area, the peak daily design flow is 3,629 L/day. Refer to the Sanitary Design Calculation included in **Appendix B**.

SCALE: 1:300	

3.2 SEPTIC SYSTEM COMPONENTS

The septic system is comprised of several components which are to be sized based on the daily design flow and the percolation rate ("T" time) of the native soil conditions. The configuration of the proposed septic system is illustrated in **Figure 3 – Sanitary Servicing Plan** and the sizing of the components is summarized in the following sections.

3.2.1 SEPTIC TANK

A gravity sanitary drain will convey sewage flows to the septic tank from the proposed hangar building via a sanitary manhole. In accordance with the manufacturer's design and installation guide, the treatment unit volume is to be a minimum of the daily design flow as follows:

- Minimum Tank Size = 3,629 L/day
- Selected Treatment Unit Size = 4,000 L (Anaerobic Digestor – AD-9000)

In accordance with the manufacturer's recommendations, an effluent filter is to be installed in the outlet of the septic tank. Access risers over the tank's inlet and outlet will extend to the finished grade for inspection and maintenance. Effluent from the septic tank will drain to the pump tank.

3.2.2 FLOW BALANCING

Given the relatively low sanitary daily design flow and intended use of the hangar building, sanitary flows will be predictable with minimal variability from day to day. As such flow balancing will not be required.

3.2.3 TERTIARY TREATMENT UNIT - WATERLOO BIOFILTER

In order to minimize the land area required for the disposal bed and to achieve a level of treatment higher than that of a conventional septic system, the use of an alternative treatment system has been considered.

There are several alternative treatment systems available that have been approved by the recognized by the Ontario Building Code. Alternative treatment systems designed as "Treatment Units" other than septic tanks must meet the requirements of Section 8.6.2.2 of the OBC, must produce either secondary or tertiary quality effluent, and must have received authorization from the Building Materials Evaluation Commission (BMEC). One such technology providing tertiary treatment is the Waterloo Biofilter® manufactured by Waterloo Biofilter Systems Inc.

The Waterloo Biofilter is an aerobic trickling filter that uses an absorbent synthetic filter material. Septic tank effluent is applied intermittently over modules of plastic foam pieces (patented biofilter medium) contained in wire mesh baskets. This synthetic media supports microbiological growth, and these microorganisms are responsible for the aerobic breakdown of the wastewater. Approximately 50% of the effluent exiting the unit is pumped back to the septic tank, while the other half is directed to a disposal bed.

In accordance with the manufacturer's guidelines, based on a balanced design flow of 3,629 L/day the Waterloo Biofilter Basket Tank System (BT-9000) is required. Details of the Waterloo Biofilter® are contained in **Appendix B** together with standard details for the anaerobic digester.

3.2.4 SUBSURFACE DISPOSAL

The BMEC authorization for the Waterloo Biofilter permits the use of an area bed dispersal system which is implemented in the majority of installations. The area bed is to be comprised of a stone layer overlying a sand layer where the stone layer is to be a minimum of 300 mm in depth, wrapped with a permeable geo-textile fabric, and comprised of stone meeting the requirements of the OBC. Distribution pipes having 75 mm diameter are to be spaced evenly within the stone layer with spacing not exceeding 1.2 m. The sand layer is to be a minimum of 600 mm in depth below the stone layer and 300 mm above the stone layer.

A field percolation test was conducted by Azimuth Environmental Consulting Inc. which determined that the native soils in the vicinity of the proposed area bed (TP 24-6) as silt, some sand, some clay with trace gravel. The investigation determined the soils have a percolation rate of a percolation rate ("T" time) of 50 min/cm. The field percolation test is included in **Appendix B.**

Stone Layer:

Given that the daily design flow is more than 3,000 L, the loading on the surface of the stone layer is calculated as follows:

Minimum Surface Area = Q / 50 = 3,629 / 50 L= 72.58 m^2

Design Surface Area = 6.5m x 16m = 104 m^2

Sand Contact Area:

Given that the "T" time of the native soil greater than 15 min/cm the sand layer is to extend over an area which is calculated as follows:

Minimum Surface Area = Q x T / 400 = 3,629 L x 50 min/cm / 400 = 453.62 m^2

Design Surface Area = 465.73 m^2 (Refer to **Figure 3- Sanitary Servicing Plan**)

4.0 STORM DRAINAGE

The subject site is located within the York Region Industrial Subdivision (YRIS) SWM facility service area. The details of the design of this SWM facility are provided in the report titled " Technical Design Brief – Stormwater Management Facilities for York Regional Industrial Subdivision 19T-94016" which was prepared by CCL. See **Appendix C**. Based on that report, the Town of East Gwillimbury and the LSRCA have both reviewed the design concept of the SWM facility and drainage area, provided comments, and approved the design.

The YRIS SWM facility has the following characteristics:

- It provides quality, erosion control, and quantity control for the entire catchment area of YRIS (approximately 29 Ha as indicated on Figure 7 of the CCL Technical Design Brief).
- It is designed for enhanced Level 1 quality control.
- It is designed to provide extended detention of a 25 mm storm for 24 hours for erosion control.
- It is designed to provide post-to-peak flow control for storms ranging from a 2-year design event to a 100-year design event.

The design brief of the YRIS SWM facility notes that the SWM approach of the site plans within the service area will be addressed through the site plan approval process and East Gwillimbury Stormwater Master Plan and the Lake Simcoe Protection Plan in addition to the YRIS SWM facility design requirements.

Refer to **Figure 4 – YRIS SWMF Drainage Plan** for the location of the subject site within the extent of the drainage area of the YRIS SWM facility**.**

4.1 EXISTING CONDITIONS & WATERSHED

The subject site is located in the Lake Simcoe watershed, which is under the jurisdiction of the Lake Simcoe Region Conservation Authority (LSRCA). Specifically, the site is situated in the Black River Subwatershed, which occupies 375 km² of land south of the eastern portion of Lake Simcoe. The headwaters of the Black River originate on the Oak Ridges Moraine, and the river's watercourses flow mainly through natural features and agricultural areas throughout much of the system before reaching the community of Sutton and ultimately draining into Lake Simcoe. The Subwatershed supports a high level of natural features as well as agricultural activities. Its jurisdiction is primarily within York Region, with a small portion extending into Durham Region. The municipalities within its boundaries include Georgina, East Gwillimbury, Whitchurch-Stouffville, and Uxbridge.

Based on a review of the topographic survey which was provided by Parkin and prepared by Lloyd & Purcell Ltd. in 2014 and updated in 2024, the majority of the subject site can be described as having a gently sloping towards the east while a small portion of the subject site slopes towards the north. Drainage from the major portion of the subject site sheet flows directly to the YRIS SWM facility (south forebay) while drainage from the minor portion is collected by a swale and conveyed to the north forebay. The boulevard appeared to be unfinished and did not drain onto the roadway as per the typical subdivision design standard.

DRAWING BY: ET	
CHECKED BY: PM	FIGURE No. 5
SCALE: 1:750	

4.2 STORMWATER MANAGEMENT CRITERIA

The following stormwater management criteria have been established for the subject site based on the review of the YRIS SWM facility design brief. The design criteria will conform to the

requirements of the LSRCA Watershed Development Policies and Town of East Gwillimbury Storm Drainage & SWM Design Criteria.

- Quantity Control: to be addressed by the YRIS SWM facility, based on site imperviousness of 80% (R = 0.75)
- Quality Control: to be addressed by the downstream YRIS SWM facility (Enhanced Level 1/ 80% TSS removal)
- Water Balance & Erosion Control: to be addressed by the downstream YRIS SWM facility.
- Phosphorus Loading: target onsite removal of 80% of the annual total phosphorus (TP) load from all major development areas through onsite measures.

4.3 STORMWATER RELEASE RATES

In the post development condition, the subject site is divided into two major areas – development area where impervious areas – asphalt, building and walkways are to be introduced and non-development areas where the existing condition (landscaped) will be maintained). Refer to **Figure 5 – Stormwater Drainage Plan** for the delineation of the post development drainage areas.

As noted in **Section 4.2**, quantity control for the entire site will be provided by the downstream YRIS SWM facility. As indicated on **Figure 5 – Stormwater Drainage Plan,** the post development runoff coefficient for the development area is 0.66 which is lower than the 0.75 as per the YRIS SWM facility design. No additional stormwater runoff attenuation is necessary.

The stormwater release rates have been calculated for the development area and are indicated on **Table 1** below and included in **Appendix C**.

Table 1: Stormwater Release Rates

POST-DEVELOPMENT DRAINAGE AREA	RECEIVING SYSTEM	5-YEAR RELEASE RATE (L/S)	100-YEAR RELEASE RATE (L/S)
Area 100 – Development Area	YRIS SWM Pond Municipal via storm sewer	139	21.2
Area 101 – Development Area	YRIS SWM Pond via Existing overland flow channel	312	52.8

4.4 PROPOSED STORM SERVICING

Stormwater from the 'development area' portion of the subject site will be captured by catch basins and conveyed internally through the site via storm sewers. The internal storm sewer system will be designed to convey the 5-year storm event in accordance with the Town of East Gwillimbury Engineering Standards and Design Criteria. DICB 101 and storm sewer lead will be designed to runoff from storm exceeding the 5-year storm event (up to the and including the 100-year event). Refer to **Figure 6 – Storm Servicing Plan** for the layout of the internal storm sewer system.

4.5 STORMWATER QUANTITY CONTROL

As noted in **Section 5.2** stormwater quantity control for the entire site (development + non development areas) will be provided by the downstream YRIS SWM facility. A Jellyfish filter unit will be provided upstream of the control manhole to provide further quality control and phosphorus removal that is discussed in **Section 5.7.** Refer to **Figure 6 – Storm Servicing Plan** for the location of the YRIS SWM facility.

4.6 WATER BALANCE & STORMWATER QUALITY CONTROL

The downstream YRIS SWM facility will provide water balance, erosion control and stormwater quality Control (Enhanced Level 1 / 80% TSS removal).Refer to **Figure 6 – Storm Servicing Plan** for the location of the YRIS SWM facility.

4.7 PHOSPHORUS CONTROL

Lake Simcoe is enriched by nutrients from land use activities in its watershed and has, for many years, been the focus of efforts to protect and restore its water quality. In 2009, the Lake Simcoe Protection Plan (LSPP) was approved to regulate the input of nutrients, specifically phosphorus, into Lake Simcoe. The intent of the policies in the LSPP is for new development in the Lake Simcoe watershed to adopt BMP, LID techniques, and innovative stormwater management approaches to achieve sustainable development practices that reduce phosphorus loading from new urban development. In this regard, the policy requires that post-development loadings on any major development site be reduced from pre-development loadings.

To establish a method for quantifying and comparing pre- and post-development phosphorus loadings that reflect differing precipitation patterns, soils, and slopes across the Lake Simcoe watershed, the MECP released the Phosphorus Budget Guidance Tool (PBGT) to guide new development in the Lake Simcoe watershed in 2012. PBGT uses estimates of phosphorus export developed for specific land uses, coupled with standard estimates of phosphorus reduction efficiencies for various BMPs and LID techniques.

TOWN OF EAST GWILLIMBURY, ONTARIO

STORM SERVICING PLAN

DESIGNED BY: PM	DATE: APRIL 2024
CHECKED BY: PW	PROJECT No. 24015
DRAWING BY: ET	
CHECKED BY: PM	FIGURE No. 6
SCALE: 1:600	

4.7.1 PRE-DEVELOPMENT LOADING

Under pre-development conditions, based on the land use categories of the PBGT the 0.6691 Ha site development area is considered to be partially "hay/pasture". Based on this category, the PBGT indicates that the pre-development phosphorus loading is 0.05 kg/year as summarized in **Table 2**.

The PBGT output for the pre-development loading is provided in **Appendix C** together with tables listing the various coefficients and land use categories.

4.7.2 POST-DEVELOPMENT LOADING

Under post-development conditions, based on the land use categories of the PBGT, the site is "High Intensity Development – Commercial". Based on this category, the PBGT indicates that the unmitigated post-development phosphorus loading is 1.22 kg/year.

The results summarized in **Table 2** indicate that there will be an increase decrease of 1.17 kg/year and therefore mitigation measures are required. The PBGT output for the post-development loading is provided in **Appendix C**.

Table 2: Phosphorus Loading Summary

LAND USE	AREA (HA)	PHOSPHORUS COEFFICIENT (KG/HA)	PHOSPHORUS LOAD (KG/YR)
PRE-DEVELOPMENT			
Hay/Pasture	0.6691	0.08	0.05
POST DEVELOPMENT			
High Intensity Development – Commercial	0.6691	1.82	1.22
SUBTOTAL (Before TP mitigation)			1.22
Infiltration Trench (c/w perforated pipe) will provide 87% TP removal from controlled areas@ 1.82 kg/Ha.	0.6691	1.82	0.73
TOTAL TP remaining (after infiltration trench mitigation)			0.16
Jellyfish filter will remove 77% of TP remaining after infiltration trench mitigation.	0.6691	1.82	0.12
TOTAL TP remaining (after infiltration trench + Jellyfish filter mitigation)			0.04

To mitigate the phosphorus loading to levels below the pre-development conditions, a treatment train approach consisting of an upstream infiltration trench (c/w perforated pipe) and Jellyfish

filter (housed in a precast manhole) will be implemented. LSRCA credits Perforated Pipe Infiltration/Exfiltration Systems with 87% TP removal while the Jellyfish filter is Environmental Technology Verification (ETV) certified for 77% TP removal. Refer to the ETV certification statement for the Jellyfish filter included in **Appendix C**. The infiltration trench will be situated upstream of the Jellyfish filter unit. Refer to **Figure 6 – Storm Servicing Plan** for the location of the infiltration trench and Jellyfish filter unit.

5.0 EROSION AND SEDIMENT CONTROL

Construction activity, especially operations involving topsoil stripping and bulk earthworks dramatically increases the availability of particulate matter for erosion and transport by surface drainage. To mitigate the adverse environmental impacts caused by the release of silt-laden stormwater runoff into receiving watercourses, measures for erosion and sediment control (ESC) are required for construction sites. The Erosion & Sediment Control Guidelines for Urban Construction, December 2006 will guide the selection of the proposed ESC measures. Control measures must be selected that are appropriate for the erosion potential of the site and they must be implemented and modified on a staged basis to reflect the site activities. Furthermore, their effectiveness decreases with sediment loading and therefore regular inspection and maintenance are required. The following ESC measures are proposed:

5.1 SILT FENCE

Silt Fences are to be installed adjacent to all grading limits to protect the development area prior to topsoil stripping and in other locations, such as at the bases of topsoil stockpiles. It is recommended that earthworks not extend immediately adjacent to the silt fence and instead 1m to 2 m vegetated buffer be maintained for additional protection. The silt fences are to be constructed with 150 x 150 mm heavy-duty wire farm fence fabric to properly support the geotextile. A heavy-duty silt fence which involves two fences with a straw bale between is recommended to be installed in the vicinity of the buffer area/valleyland.

5.2 MUDMAT

A mud mat is to be installed at the construction entrance prior to commencing earthworks to minimize the tracking of mud onto municipal roads. The mud mat will be installed at the location of the existing site entrance on Garfield Wright Boulevard.

5.3 SEDIMENT TRAPS

Sediment traps are to be installed at all catchbasin locations once the storm sewer system has been constructed to prevent silt laden runoff from entering. These sediment traps are comprised of clear stone and filter fabric over the catchbasin grate.

5.4 STORM SEWER BULKHEADS

Bulk heads are to be installed in the storm sewer manholes at key locations to provide additional sediment control of storm runoff prior to being conveyed to the receiving SWMF. The temporary bulkhead will be installed to the springline elevation of the storm sewer and will remain in place until all surfaces are stabilized. All accumulated sediment is to be removed from the manhole prior to removing the bulkhead.

6.0 CONCLUSIONS

This Functional Servicing and Stormwater Management Report presents a site servicing strategy for the proposed development that addresses the requirements of the applicable design guidelines and provides the basis for detailed servicing design.

We trust this report sufficiently addresses the site servicing requirements and allows for approval of the proposed SPA application with respect to the subject site for the proposed use described herein. Should there be any questions or comments, please feel free to contact the undersigned.

Sincerely,

Counterpoint Land Development by Dillon Consulting Limited

GEI Consultants

July 31, 2024

Azimuth Environmental Consulting Inc.
642 Welham Road
Barrie, Ontario
L4N 9A1

Attn: Brendan MacNaughton

RE: Job No. 24-054
Determination of Estimated T-Time

GEI Consultants Ltd. (GEI) was provided with three (3) soil samples on July 23, 2024 to complete grain size analyses to determine the percolation rate of the tested soils (T-Time analysis).

The delivered samples were identified as shown below.

- TP-24-1-2, YRP Hanger
- TP-24-6-4, YRP Hanger
- TP-24-3-2, YRP Hanger

Three grain size distribution curves were developed by testing the above referenced soil samples in accordance with ASTM D6913 Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis and ASTM D7928 (sedimentation / hydrometer analysis). The result of the laboratory test and graphical representation of the grain size analyses are enclosed.

Determination of percolation rate is based on the "*Ministry of Municipal Affairs and Housing (MMAH) Supplementary Guidelines SB-6, Percolation Time and Soil Descriptions, September 14, 2012*". Based on this document, a summary of the result and the estimated percolation rates of the soil are as follows:

Client Reference	Soil Description (MIT)	USCS Soil Classification	Coefficient of Permeability (K- cm/sec)	Estimated Percolation Rate or "*T-Time*" (mins/cm)
TP-24-1-2	SILT, Some Clay, Trace Sand	M.L.	$<10^{-6}$	>50 mins/cm
TP-24-6-4	SILT, Some Sand, Some Clay, Trace Gravel	M.L.	10^{-6}	50 mins/cm
TP-24-3-2	SANDY SILT, Some Clay, Trace Gravel	M.L.	10^{-6}	50 mins/cm

*Reference MMAH Supplementary Standard SB-6, Table 2

It is noted that percolation time not only varies based on the grain size distribution but is also influenced by other soil characteristics such as the density of the soil, the structure of the soil, the percentage/mineralogy of clay, the plasticity of the soil, the organic content of the soil, and the groundwater table level which are not expressly calculated as part of a grain size analysis.

No field investigation was conducted by GEI in conjunction with the above testing and did not witness the depth or location in which these samples were obtained. GEI is providing the percolation rates as factual information, to be used in design by a qualified professional with due regard to the limitations as indicated above.

We trust this information is sufficient for your present purposes. Should you have any questions concerning the above, or if we can be of any further assistance, please do not hesitate to contact the undersigned.

Yours truly,
GEI Consultants Ltd.

Test Pit Location Plan

APPENDIX C

East Gwillimbury IDF Curve data and Post Development Stormwater Release Rates

MECP PBGT output

Jellyfish Filter ETV verification statement

Background YRIS SWMF design reports

All storm sewers are to have a minimum horizontal separation of 2.5 m and a vertical clearance of 0.5 m from watermains in accordance with MOE regulations.

35.3 Termination Points

All sewers shall be terminated at the subdivision limits when external drainage areas are considered in the design with suitable provision in the design of the terminal manholes to allow for the future extension of the sewer.

35.4 Sewer Alignment

All storm sewers shall be laid in a straight line between manholes unless radial pipe has been designed as outlined in Section 36.9.

35.5 Pipe Crossings

A minimum clearance of 75 mm shall be provided between the outside of the pipe barrel at the point of crossing for storm and sanitary sewers. A minimum clearance of 0.5 m shall be provided for all sewer and watermain crossings.

In the event the minimum clearances cannot be obtained, the designs must adhere to MOE policies. In addition the pipes shall be concrete encased to ensure that the pipes are properly bedded.

35.6 Changes in Pipe Size

No decrease of pipe size from a larger upstream pipe to a smaller downstream size will be allowed due to the increase in grade.

35.7 Pipe Bedding and Backfill

The class of pipe and the type of bedding shall be selected to suit loading and proposed construction conditions. Details and types of bedding and backfill are illustrated in OPSD 802.010 and 802.030. The width of the trench at the top of the pipe must be carefully controlled to ensure that the maximum trench width is not exceeded unless a higher class of bedding or higher pipe strength pipe is used. The recommendations of a Geotechnical Engineer will be required in determining strength of pipe required and construction methods to be used.

36.0 MANHOLES

36.1 Location

Manholes shall be constructed at the following locations:

- at changes in pipe size
- at pipe junctions
- at changes in pipe slope

Technology description and application

The Jellyfish® Filter is an engineered stormwater quality treatment technology designed to remove a variety of stormwater pollutants including floatable trash and debris, oil, coarse and fine suspended sediments, and particulate-bound pollutants such as nutrients, heavy metals, and hydrocarbons. The Jellyfish Filter combines gravitational pre-treatment (sedimentation and floatation) and membrane filtration in a single compact structure. The system utilizes membrane filtration cartridges comprised of multiple detachable pleated filter elements ('filtration tentacles") that provide high filtration surface area with the associated advantages of high flow rate, high sediment capacity, and low filtration flux rate.

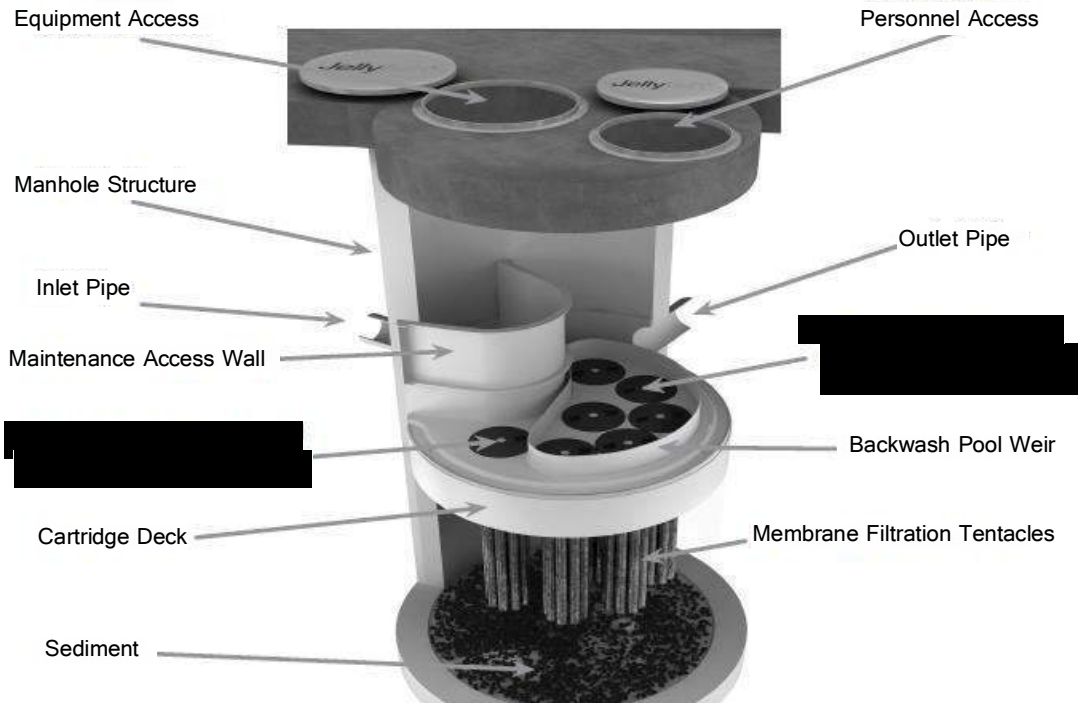

Figure 1. Cut-away graphic of a Jellyfish® Filter manhole with 6 hi-flo cartridges and 1 draindown cartridge

Figure 1 depicts a cut-away graphic of a typical 6-ft diameter Jellyfish® Filter manhole with 6 hi-flo cartridges and 1 draindown cartridge (JF6-6-1). Stormwater influent enters the system through the inlet pipe and builds a pond behind the maintenance access wall, with the pond elevation providing driving head. Flow is channeled downward into the lower chamber beneath the cartridge deck. A flexible separator skirt surrounds the filtration zone where the filtration tentacles of each cartridge are suspended, and the volume between the vessel wall and the outside surface of the separator skirt comprises a pre-treatment channel. As flow spreads throughout the pre-treatment channel, floatable pollutants accumulate at the surface of the pond behind the maintenance access wall and also beneath the cartridge deck in the pre-treatment channel, while coarse sediments settle to the sump. Flow proceeds under the separator skirt and upward into the filtration zone, entering each filtration tentacle and depositing fine suspended sediment and associated particulate-bound pollutants on the outside surface of the membranes. Filtered water proceeds up the center tube of each tentacle, with the flow from each tentacle combining under the cartridge lid, and discharging to the top of the cartridge deck through the cartridge lid orifice. Filtered effluent from the hi-flo cartridges enters a pool enclosed by a 15-cm high weir, and if storm intensity and resultant driving head is sufficient, filtered water overflows the weir and proceeds across the cartridge deck to the outlet pipe. Filtered effluent discharging from the draindown cartridge(s) passes directly to the outlet pipe, and requires only a minimal amount of driving head (2.5 cm) to provide forward flow. As

storm intensity subsides and driving head drops below 15 cm, filtered water within the backwash pool reverses direction and passes backward through the hi-flo cartridges, and thereby dislodges sediment from the membrane which subsequently settles to the sump below the filtration zone. During this passive backwashing process, water in the lower chamber is displaced only through the draindown cartridge(s). Additional self-cleaning processes include gravity, as well as vibrational pulses emitted when flow exits the orifice of each cartridge lid, and these combined processes significantly extend the cartridge service life and maintenance cleaning interval. Sediment removal from the sump by vacuum is required when sediment depths reach 30 cm, and cartridges are typically removed, externally rinsed, and recommissioned on an annual basis, or as site-specific maintenance conditions require. Filtration tentacle replacement is typically required every 3 – 5 years.

Performance conditions

The data and results published in this Verification Statement were obtained from the field testing conducted on a Jellyfish Filter JF6-6-1 (6-ft diameter manhole with 6 hi-flo cartridges and 1 draindown cartridge), in accordance with the requirements outlined by the Technical Guidance Manual for Evaluating Emerging Stormwater Treatment Technologies Technology Assessment Protocol – Ecology (TAPE) as written by the Washington State Department of Ecology, (WADOE, 2011). The drainage area providing stormwater runoff to the test unit was 86 acres and was 32% impervious. Throughout the monitoring period (March 2017 – April 2020), a total of 25 individual storm events were sampled. The Basic Treatment standard outlined in the TAPE requires ≥ 80% total suspended solids (TSS) removal at influent TSS concentrations ranging from 100 to 200 mg/L. In addition, the Phosphorus Treatment standard outlined in the TAPE requires ≥ 50% removal of total phosphorus (TP) at influent concentrations ranging from 0.10 to 0.5 mg/L. For this verification, the performance claim for TSS removal is for influent TSS concentration ≥ 100 mg/L, and the performance claim for TP removal is for influent TP concentration ≥ 0.1 mg/L. Based on these requirements, 15 and 18 sample pairs deemed qualified for evaluating the removal performance of TSS and TP, respectively. Prior to starting the performance testing program, a quality assurance project plan (QAPP) was submitted to and approved by the State of Washington Department of Ecology.

Table 1 shows the specified and achieved TAPE criteria for storm selection and sampling.

Table 1. Specified and achieved TAPE criteria for storm selection and sampling

Description	TAPE criteria value	Achieved value
Total rainfall	> 3.8 mm (0.15 in)	> 3.8 mm (0.15 in)[1]
Minimum inter-event period	6 hours	6 hours
Minimum flow-weighted composite sample storm coverage	Minimum 70% including as much of the first 20% of the storm	> 70%
Minimum influent/effluent samples	10, but a minimum of 5 subsamples for composite samples	10, except for two events that had 9 aliquots
Total sampled rainfall	N/A	8.29 in
Number of storms	Minimum 15 (preferably 20)	25

[1]N.B. Storm event depth was greater than the TAPE rainfall depth guideline of 0.15 inches for all events sampled, except for the 3/21/2017, 3/22/2019, 3/26/2019, and 04/13/2019 events. Given the size of the drainage basin, storm events below this threshold produced adequate runoff volume for sampling. Only two of these events were used to evaluate performance, and all had rainfall depths of 0.11 inches or greater. These events were included as their runoff volumes, precipitation durations, and influent TSS concentrations were all within range of the total data set.

The 6-ft diameter test unit has sedimentation surface area of 2.62 m^2 (28.26 ft^2). Each of the seven filter cartridges employed in the test unit uses filtration tentacles of 137 cm (54 in) length, with filter surface area of 35.4 m^2 (381 ft^2) per cartridge, and total filter surface area of 247.8 m^2 (2667 ft^2) for the seven cartridges combined. The design treatment flow rate is 5 L/s (80 gal/min) for each of the six hi-flo

cartridges and 2.5 L/s (40 gal/min) for the single draindown cartridge, for a total design treatment flow rate of 32.5 L/s (520 gal/min) at design driving head of 457 mm (18 in). This translates to a filtration flux rate (flow rate per unit filter surface area) of 0.14 L/s/m^2 (0.21 gal/min/ft^2) for each hi-flo cartridge and 0.07 L/s/m^2 (0.11 gal/min/ft^2) for the draindown cartridge. The design flow rate for each cartridge is controlled by the sizing of the orifice in the cartridge lid. The distance from the bottom of the filtration tentacles to the sump is 61 cm (24 in).

Performance claim(s)

The Jellyfish® Filter demonstrated the removal efficiencies indicated in **Table 2** for TSS and TP during field monitoring conducted in accordance with the Washington State Department of Ecology's Technology Assessment Protocol – Ecology (TAPE), and using the following design parameters:

- System hydraulic loading rate (system treatment flow rate per unit of sedimentation surface area) of 12.5 L/s/m^2 (18.4 gal/min/ft^2) or lower
- Filtration flux rate (flow rate per unit filter surface area) of 0.14 L/s/m^2 (0.21 gal/min/ft^2) or lower for each hi-flo cartridge and 0.07 L/s/m^2 (0.11 gal/min/ft^2) or lower for each draindown cartridge
- Distance from the bottom of the filtration tentacles to the sump of 61 cm (24 in) or greater
- Driving head of 457 mm (18 in) or greater

Table 2. Bootstrapped mean, median, and 95% confidence interval (median) for removal efficiencies of Total Suspended Solids (TSS) and Total Phosphorus (TP)

Parameter	Mean (%)	Median (%)	Median – 95% Lower Limit	Median – 95% Upper Limit
TSS [1]	87.6	90.1	85.1	91.6
TP [2]	77.3	77.5	70.8	85.6

[1] TSS influent concentration ≥ 100 mg/L
[2] TP influent concentration ≥ 0.1 mg/L

N.B. As with any field test of stormwater treatment devices, removal efficiencies will vary based on pollutant influent concentrations and other site-specific conditions.
The performance claims can be applied to other Jellyfish® Filter models smaller or larger than the tested model as long as the untested models are designed in accordance with the design parameters specified in the performance claims.

Performance results

Performance Claims – Removal Efficiency for Total Suspended Solids

Raw data summarizing the percent removal of total suspended solids (TSS) by the Jellyfish® Filter at the design system hydraulic loading rate of 12.5 L/s/m^2 (18.4 gal/min/ft^2) for 15 sample pairs deemed qualified are presented in **Table 3**. Data were analyzed and evaluated using a bootstrap approach of random sampling by replacement to estimate population distribution and thereby the upper and lower limit of the confidence interval.

Table 3. Raw data summarizing the percent removal of total suspended solids (TSS)

Verification

The verification was completed by the Verification Expert, the Centre for Advancement of Water and Wastewater Technologies ("CAWT"), contracted by GLOBE Performance Solutions, using the International Standard ***ISO 14034:2016 Environmental management -- Environmental technology verification (ETV)***. Data and information provided by Imbrium Systems to support the performance claim included the performance monitoring report "General Use Level Designation Technical Evaluation Report" prepared by CONTECH Engineered Solutions, Portland, OR, USA, and dated December 28, 2020. This report is based on a field testing completed by CONTECH personnel at a site in Dundee, Oregon between March 2017 and April 2020 in accordance with the Technical Guidance Manual for Evaluating Emerging Stormwater Treatment Technologies Technology Assessment Protocol – Ecology (TAPE) as written by the Washington State Department of Ecology (WADOE, 2011).

What is ISO14034:2016 Environmental management – Environmental technology verification (ETV)?

ISO 14034:2016 specifies principles, procedures and requirements for environmental technology verification (ETV) and was developed and published by the *International Organization for Standardization (ISO)*. The objective of ETV is to provide credible, reliable and independent verification of the performance of environmental technologies. An environmental technology is a technology that either results in an environmental added value or measures parameters that indicate an environmental impact. Such technologies have an increasingly important role in addressing environmental challenges and achieving sustainable development.

LIST OF APPENDICES

1.0 INTRODUCTION

Cumming Cockburn Limited has been retained by the Regional Municipality of York to develop the overall stormwater management plan for the York Region's Industrial Subdivision (19T-94016), located northeast of the intersection of Woodbine Avenue and Davis Drive at the Town of East Gwillimbury within the Regional Municipality of York (Region) as illustrated in **Figure 1**.

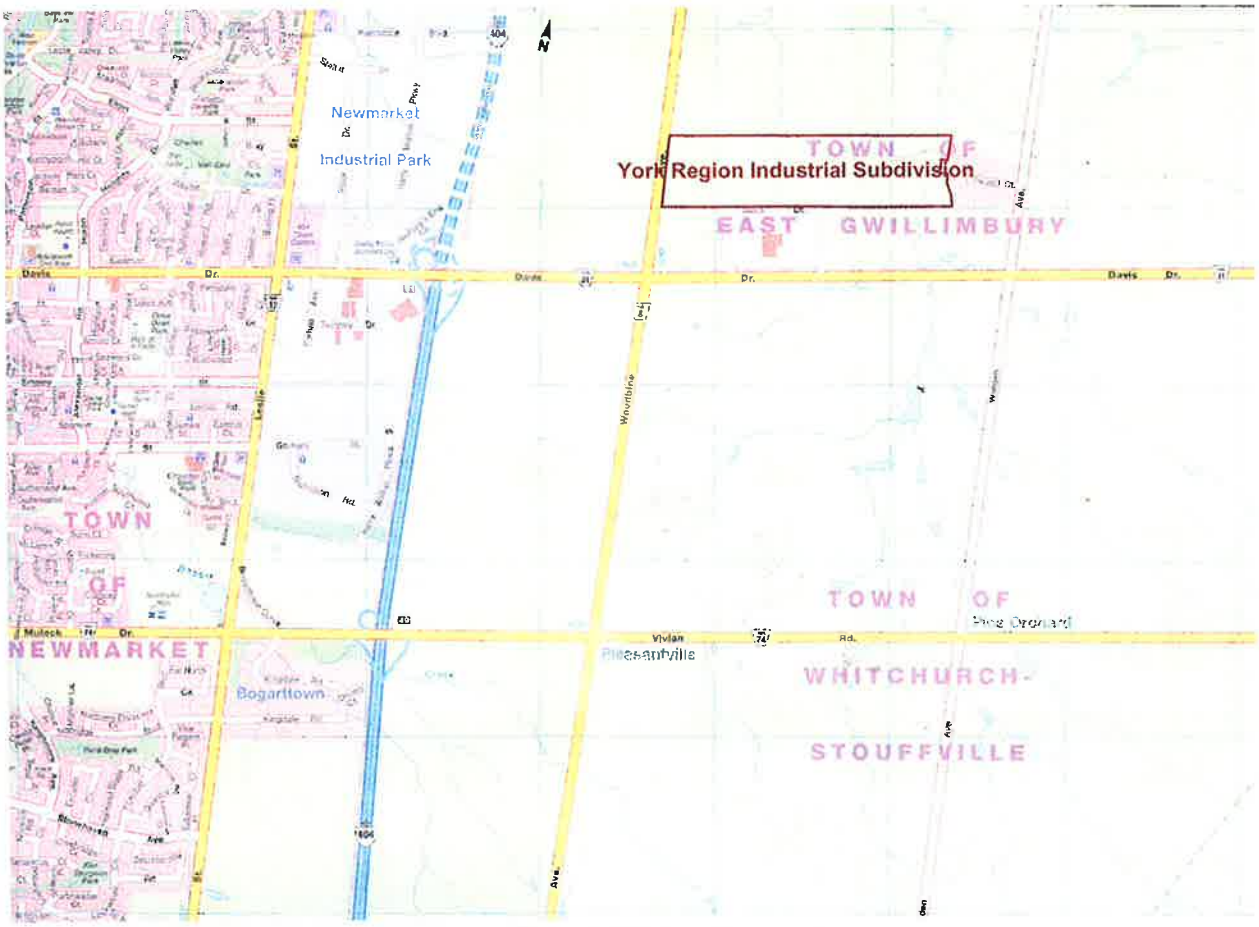

Figure 1. Site Location

As shown in **Figure 2**, the subject property consists of five parcels of land (Blocks 1, 2, 3, 4 and 5) with a total area over 60 ha. The Black River transverses the eastern portion (within Block 5) of the site and naturally collects and drains runoff from Blocks 4 and 5, and the east half of Block 3. An intermittent swale transverses the central portion (within Block 3) of the site and naturally collects and drains runoff from Blocks 1 and 2, the west half of Block 3 and the external industrial development area to the south.

York Region

FIGURE 2 EXISTING LAND USE

SCALE 1:5000

CCL
Cumming Cockburn Limited
Kingston ▪ London ▪ Ottawa ▪ Toronto ▪ Waterloo
9133 Leslie Street, Suite 200
Richmond Hill, ON, L4B 4N1
P: (905) 763-2322, F: (905)763-9983

According to the draft State of the Watershed Report for Black River Subwatershed (referred to as the Black River Subwatershed Study in this Report) by the Lake Simcoe Conservation Authority (LSRCA) in August 2002, the subject site and its external industrial development area to the south are located within the headwaters of the Black River and entirely outside of the designated Oak Ridges Moraine protection area as illustrated in **Figure 3**. As a result, it is not subject to the requirements of the Oak Ridges Moraine Conservation Act (Ont. Reg. 140/02).

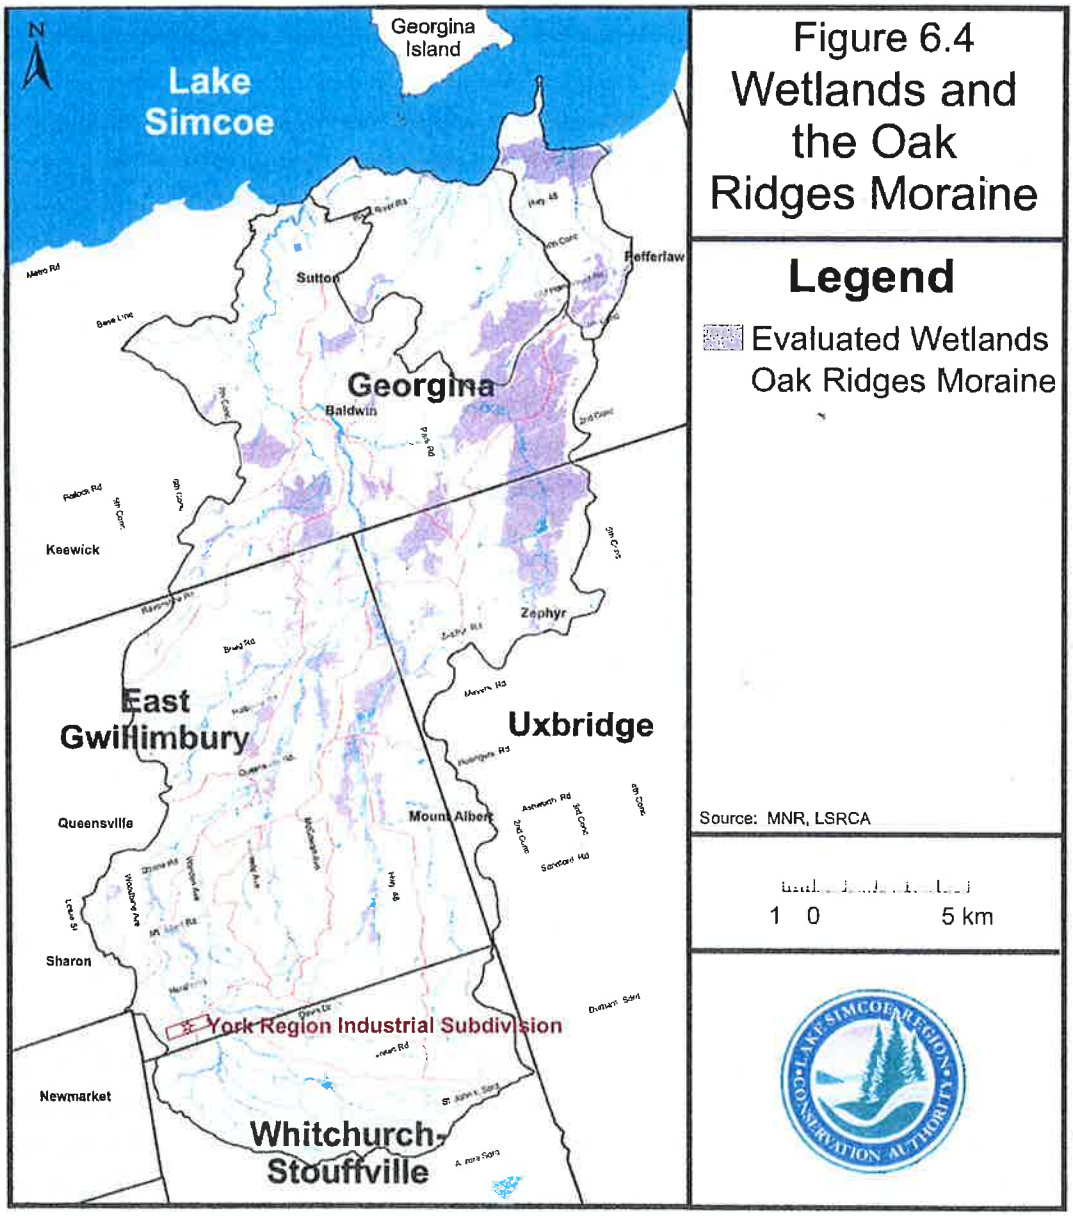

Figure 3. Site Location within Black River Watershed in Relationship with Oak Ridges Moraine (LSRCA, 2002)

A Functional Servicing Report for the York Region Industrial Subdivision was completed by URS Cole Sherman & Associated Limited in August 2002, and proposed two end-of-pipe stormwater management facilities of SWMF1 and SWMF2 located within Blocks 2 and 4 respectively to treat and attenuate runoff from the developments in Blocks 1 and 2, and in Blocks 3 and 4 respectively, and Block 5 is designated as open space. In addition to these two facilities, Cumming Cockburn Ltd. proposed one additional facility SWMF3 located at the south half of the intermittent swale in Block 3 to provide *Enhanced* (Level 1) water quality, erosion and flood controls not only for a part of the York Region Industrial Subdivision, but also for the external existing and future industrial development areas to the south (including the areas associated with the extension and urbanization of Garfield Wright Boulevard) as desired by the Town.

Since the engineering design of SWMF1 has been completed by Marshall Macklin Monaghan Ltd. in Oct. 2003 and approved by the regulatory agencies to service the immediate development of the York Region Material Recovery and Transfer Facility in Block 2 and the future industrial development in Block 1, the technical design brief for the two remaining facilities SWMF2 and SWMF3 was prepared by Cumming Cockburn Limited in Nov. 2003 and submitted to the Town, the LSRCA, and the Regional Municipality of York for review and comments.

According to the review comments received from the LSRCA dated Feb. 2 and April 16 of 2004 (see **Appendix A**), the Authority doesn't support the on-line facility SWMF3 because fish (Brook Stickleback) were observed and captured at a culvert approximately 188 m downstream of Garfield Wright Boulevard, based on the finding of a site visit conducted by the Authority's fisheries biologist and aquatic ecologist on April 16, 2004. The intermittent swale is, therefore, classified by the LSRCA as the headwaters of a fully functioning cold to coolwater tributary that would not require stormwater treatment regardless the existing development of Bales Industrial Subdivision.

Considering the LSRCA's concern on the fishery issue and the immediate development needs associated with the urbanization and extension of Garfield Wright Blvd, Cumming Cockburn Ltd., after consultation with the LSRCA, the Town and the Region (see **Appendix A**), proposes to use SWMF2 (located at the southeast corner of Block 4) to accommodate all the developments within Block 4, east portion of Block 3, and the areas associated with the extension and urbanization of Garfield Wright Boulevard. The intent of the revised stormwater management plan is to maximize useable lands, minimize the number of the stormwater management facilities, and maintain the current storm drainage pattern to the intermittent swale as much as possible for the existing fish habitat.

Since only a small portion of Block 4 is subject to the immediate development in addition to the extension and urbanization of Garfield Wright Boulevard, the primary objective of this report is to provide the technical design brief for the interim SWMF2 to accommodate the immediate development needs (i. e. the interim development condition), but a separate easement block (Block 9) is reserved and designated based on the engineering design of the ultimate SWMF2 for future extension of the interim SWMF2 to accommodate the full industrial development (i. e. the ultimate development condition).

2.0 SITE DESCRIPTION AND EXISTING DRAINAGE CONDITIONS

2.1 Background Information

The Regional Municipality of York, Lake Simcoe Region Conservation Authority, Town of East Gwillimbury, Matrix Management Corp., URS Architects & Engineers Canada Inc., and Marshall Macklin Monaghan Limited were consulted to acquire the available background information and clarify the stormwater management design criteria. The primary background materials gathered during the preparation of this report can be summarized as follows:

- Draft Plan for the York Region Industrial Subdivision, URS Architects & Engineers Canada Inc., April. 2004.
- Stormwater Management Plan for the York Region Waste Transfer Station, Marshall Macklin Monaghan Limited, Oct. 2003.
- Geotechnical Investigation for Pavement Design and Storm Sewers along Bales Drive and Roads "A" and "B", Shaheen & Peaker Ltd., Sept. 26, 2003.
- Functional Servicing Report for the York Region Industrial Subdivision, URS Cole Sherman & Associated Ltd., Aug. 2002.
- Sub-Surface Soils Investigation for York Industrial Subdivision, Jagger Hims Ltd., Aug. 2002.
- State of the Watershed Report: Black River Subwatershed (Draft), LSRCA, August 2002.
- Preliminary Hydrogeological Study for the Proposed Integrated Solid Waste Processing and Transfer Facility, Gartner Lee Limited, Feb. 2002.
- Soil Survey of York County - Report No. 19 of the Ontario Soil Survey, Ontario Ministry of Agriculture and Food and the Research Branch of Agriculture Canada, March 1955.

2.2 Existing Land Use

The subject property is legally described as Part of Lot 2, Concession 4 within the Town of East Gwillimbury. The site is bounded by Woodbine Avenue to the west, agricultural lands to the north, existing residential subdivision and open space to the east, and Garfield Wright Boulevard (formerly Bales Drive) and agricultural lands to the south.

Figure 2 presents the existing land use within and around the subject site. Except for an existing farmhouse with a driveway to Woodbine Ave. in Block 1, most of the subject lands are currently used for the sod farming. Block 5 (located at the east end of the subject site) lies mainly within the regulatory floodplain of the Black River and is characterized by natural riparian marsh meadow, typical of saturated soils with the groundwater table at or near to the ground surface.

To the south of the subject site, there is an existing industrial subdivision (referred to as Bales Industrial Subdivision in this Report) that is bounded by Garfield Wright Boulevard to the north,

Bales Drive East to the east, Davis Drive to the south and Bales Drive West to the west. Within the Bales Industrial Subdivision, there are several industrial buildings with large parking lots and vacant lands that can be developed in the future.

2.3 Native Soils and Groundwater Characteristics

The Soil Survey of York County (Report 19 of the Ontario Soil Survey published by the Ontario Ministry of Agriculture and Food and the Research Branch of Agriculture Canada in March 1955) and the findings of several site geotechnical investigations were used to determine soil types, soil drainage characteristics and groundwater natures within and around the subject site.

It was found that Schomberg silt loam (Shs) is dominant underlying soil presented within Blocks 1, 2 and 3, and the external area to the south, in addition to Brighton sandy loam (Brsl) mainly presented within Blocks 4 and 5.

The parent materials of Schomberg silt loam contain lacustrine, grey and calcareous clay and silt clay. Schomberg silt loam belongs to the soil group of Grey-Brown Podzolic with good drainage characteristics, and it is classified as the hydrologic soil group of BC with the runoff curve number (CN) of 68 under the Level II (average) antecedent moisture conditions for pasture, open space, lawns and parks, based on the Drainage Management Manual published by the Ontario Ministry of Transportation in 1997.

The parent material of Brighton sandy loam has well sorted grey, calcareous sand and stratified sand and gravel. Brighton sandy loam belongs to the soil group of Grey-Brown Podzolic with very good drainage nature, and it is classified as the hydrologic soil group of AB with the runoff curve number (CN) of 50 under the Level II (average) antecedent moisture conditions for pasture, open space, lawns and parks.

There is a weathered zone (layer with enhanced permeability) extending between 3.0 and 5.0 m in depth that is host to fluctuating groundwater levels. As the area is underlain by low permeability soils, there is a high-perched groundwater table that seasonally fluctuates between 0.5 m and 2.0 m below the ground surface, almost across the entire site. The depth of the groundwater table appears to become shallower towards the east when approaching the main branch of the Black River in Block 5.

A very minor portion of groundwater flows towards the Black River through the weathered zone, and forms a shallow horizontal groundwater flow from west to east. The results of geotechnical investigations indicate that the bulk of groundwater moves downwards since the average annual horizontal groundwater flow is only 1.1 litres/minute for the full width of the site, comparing to the downward flow rate of 47 litres/minute. Therefore, the water that soaks into the ground largely

moves downward to recharge the regional groundwater system, and only a very small part of it (<3%) moves laterally toward the Black River via the weathered zone. The hydrogeological study by Gartner Lee Ltd. in February 2002 indicated that this perched groundwater has low ecological value. All geotechnical reports to date further suggest that groundwater will not be a significant excavation issue and may be handled by a conventional sump or pumping technique.

2.4 Existing Drainage and Environmental Features

Figure 4 shows existing drainage conditions within and around the subject site. Currently, runoff from Blocks 4 and 5, and the east half of Block 3 drains easterly towards the main branch of the Black River. Runoff from Blocks 1 and 2, west half of Block 3 and the existing and future industrial development areas to the south drains towards the intermittent swale. The finding and conclusion of the geotechnical investigation reports indicate that the north portion of the intermittent swale is a localized shallow groundwater discharge zone during wet periods of a year. In addition, it also services as a surface drainage channel. According to the finding of a site visit by the LSRCA's fisheries biologist and aquatic ecologist on Apr. 16, 2004, the swale is classified as the headwater of a fully functioning cold to coolwater tributary that would not require stormwater treatment regardless the existing development of Bales Industrial Subdivision (see **Appendix A**).

Based on the Black River Subwatershed Study, there is no terrestrial issue and environmentally significant area (ESA) such as biological/hydrogeological ESA, significant wetland, area of natural and scientific interest (ANSI), or provincial archaeological protection area within the subject site and its external area to the south.

In Block 5, there is existing forest along the east side of the Black River as well as open marsh meadow over the balance. Under the interim and ultimate development plans for the York Region Industrial Subdivision, Block 5 is designated as the open space (green buffer area).

2.5 Interim and Ultimate Development Plans

Although the entire subject site is designated as the York Region Industrial Subdivision, there is preliminary draft plan of subdivision and two site plans that are ready for immediate development. The staff at the Region and the Town was contacted to clarify the immediate and potential future development plans for the subdivision and the external industrial development areas to the south. Based on the background information available at this time, the immediate (interim) and future (ultimate) developments that will be serviced by SWMF1 and SWMF2 (located at the northeast corner of Block 2 and at the southeast corner of Block 4 respectively) can be summarized in **Table 1**. The detailed interim and ultimate development plans are illustrated in **Figures 5 and 6** respectively.

Table 1. Interim and Ultimate Developments Serviced by SWMF1 and SWMF2

SWM Facility	Developments under Interim Conditions	Developments under Ultimate Conditions
SWMF1	• York Region Material Recovery and Transfer Facility in Block 2.	• All developments under the interim conditions. • Full industrial development in Block 1.
SWMF2	• Transportation and Works Operations Centre in Block 4. • Joint Communications Centre in Block 4. • Zenon Sewage Treatment Plant in Block 4. • North extension of Bales Drive East. • Urbanization of existing Garfield Wright Blvd. • West extension of Garfield Wright Blvd from Bales Drive West to Woodbine Avenue, and the small at the south side of the extended portion of Garfield Wright Blvd.	• All developments under the interim conditions. • Full industrial development within the east part of Block 3 to maximize developable lands. • Full industrial development for the balance of Block 4, excluding the easement Block 9 designated and reserved to accommodate the ultimate SWMF2.

Notes:

- SWM: stormwater management.
- SWMF: stormwater management facility.
- SWMF1: the first stormwater management facility (located at the northeast corner of Block 2) to accommodate the ultimate industrial development within Blocks 1 and 2. The design of the ultimate SWMF1 had been completed by Marshall Macklin Monaghan Limited in Oct. 2003 on behalf of Miller Waste Systems, and approved by the regulatory agencies.
- SWMF2: the second stormwater management facility (located at the southeast corner of Block 4) to accommodate the industrial development within Block 4, the major portion of Block 3 and the areas associated with the extension and urbanization of Garfield Wright Blvd to Woodbine Ave. The detailed engineering design of the interim SWMF2 is detailed in this Report and the attached engineering design drawings, in addition to the preliminary design of the ultimate SWMF2 with a designated stormwater management easement block (Block 9) to accommodate the ultimate SWMF2.
- The detailed interim and ultimate development plans are illustrated in **Figures 5 and 6**.

3.0 DESIGN OF STORMWATER MANAGEMENT FACILITIES

3.1 Stormwater Management Design Criteria

The following criteria were identified for the design of stormwater management facilities:

- Respect the regulatory floodplain of the Black River.
- Provide *Enhanced* (Level 1) water quality protection.
- Detain runoff from the 25-mm design storm over a period of 24 hours for erosion control.
- Control the post-development peak flows to or below the pre-development equivalents for the 1:2 to 1:100 year design storms.
- The minor drainage system designed to convey runoff up to the 1:5 year design storm.
- The major drainage system designed to convey runoff up to the 1:100 year design storm, and the water quantity control storage required for the pond checked by the 24-hour SCS storms.
- Minimize erosion potential at stormwater drainage outlets where flow becomes concentrated.
- Provide temporary erosion and sedimentation control during construction.

3.2 Interim and Ultimate Drainage Conditions

According to the interim and ultimate development plans (see **Figures 5 and 6**), the interim and ultimate drainage patterns in relationship with the facilities of SWMF1 and SWMF2 are proposed and presented in **Figures 7 and 8** respectively. As concluded in the Report entitled "Stormwater Management Plan for the York Region Waste Transfer Station" completed by Marshall Macklin Monaghan Ltd. in Oct. 2003 and approved by the regulatory agencies, the ultimate SWMF1 has been designed to accommodate the ultimate industrial development within Block 1 and Block 2.

SWMF2 is to accommodate the interim and ultimate industrial developments within Block 4, the major portion of Block 3 and the area associated with the extension and urbanization of Garfield Wright Blvd. Under this arrangement, the current drainage conditions within the existing Bales Industrial Subdivision and the majority of the area to its west will remain draining toward the intermittent swale as the source of water supply to the existing fish habitat along the intermittent swale. Only the minimum area associated with the extension and urbanization of Garfield Wright Blvd will be drained into SWMF2 for erosion, water quality and water quantity control. Because the extension of Garfield Wright Blvd to Woodbine Ave. and the small area to its south belong to the new developments, the peak flows up to the 1:100 year return period from these areas are to be conveyed via the storm sewer system to SWMF2 for water quantity control. It should be noted that, as required by the LSRCA, new development within the existing Bales Industrial Subdivision and the area to its west must provide *enhanced* water quality, water quantity and erosion controls before releasing water into the intermittent swale to prevent the flooding, protect the existing fish habitat, and the ecosystem along the swale.

3.3 Engineering Design of the Interim SWMF2

The interim SWMF2 is designed to accommodate the interim development (including the partial development in Block 4, and the areas associated with the urbanization and extension of Garfield Wright Blvd) as illustrated in **Figure 5**. The development status and drainage areas controlled by the interim SWMF2 are shown in **Figure 7**, and the major design parameters for the interim SWMF2 are detailed in **Table 2**.

Table 2. Major Design Parameters for the Interim SWMF2

SWM Facility	Development / Drainage Contributing Area	Development Status	Area (ha)	Imperviousness (%)	CN* (-)
Interim SWMF2	East portion of Block 3 located at the west side of the extension part of Bales Drive East	Undeveloped	5.23	0%	62
	Transportation and Works Operations Centre; North extension of Bales Drive East; Joint Communications Centre; and Zenon Sewage Treatment Plant in Block 4	Developed	7.54	88%	35
	The balance of Block 4 draining towards the interim SWMF2, located at the east side of Transportation and Works Operations Centre and including the interim SWMF2 area	Undeveloped except for SWMF2	5.49	0%	35
	The areas associated with the extension and urbanization of Garfield Wright Blvd to Woodbine Ave.	Developed	5.36	87%	62

Notes:

- SWM: stormwater management.
- Interim SWMF2: the interim stormwater management facility located at the southeast corner of Block 4 to provide the stormwater management control for the interim development plan (as described in **Table 1** and illustrated in **Figures 5 and 7**) for the industrial development in Block 4, the major portion of Block 3 and the areas associated with the extension and urbanization of Garfield Wright Blvd.
- CN*: modified runoff curve number for the pervious area and its calculation details are presented in **Appendix D**.
- Development status: whether or not the area is considered as the developed area for the design of the interim SWMF2.

The interim SWMF2 is located at the southeast corner of Block 4 and it is a deep extended wet pond with a sediment forebay in front. Both wet pond and forebay are situated entirely outside of the regulatory floodplain of the Black River. As illustrated in **Figure 7**, the total drainage area to the interim SWMF2 is approximately 23.6 ha, including the 12.9 ha development area with the average imperviousness of 87.5% and the 10.7 ha undeveloped area (including SWMF2 itself). SWMF2 treats and attenuates the post-development stormwater runoff from the development site and discharges the treated water into the Black River directly at the controlled rates to satisfy the desired design criteria.

Sediment Forebay: The sediment forebay is designed to facilitate operation and maintenance of the wet pond and improve pollutant removal by trapping large sediments from entering the pond. Considering the 12.9 ha development area with an average imperviousness of 87.5%, the annual sediment loading to the forebay is about 51.2 m^3/year (3.97 m^3/ha/year), according to the current MOE Stormwater Management Planning and Design Manual published in March 2003.

The procedure recommended in the MOE Stormwater Management Planning and Design Manual was followed to design the sediment forebay as detailed in **Appendix D**. According to the current

design, the 2.0 m deep sediment forebay provides a total storage volume over 1,631 m^3 with an average cleanout frequency exceeding 10 years.

Storage Requirement: Based on the desired design criteria, the storage required for the interim SWMF2 should satisfy the following criteria:

- Storage required for *water quality control:* in accordance with the current MOE standards, the storage required to provide *Enhanced* water quality protection under the interim development conditions should be the maximum of the following storage volume requirements:
    1) for the 12.9 ha development area with 87.5% imperviousness:
       permanent pool required: 2,763 m^3 (214.2 m^3/ha)
       extended detention required: 516 m^3 (40.0 m^3/ha)
       total storage volume required: 3,279 m^3 (254.2 m^3/ha)
    2) for the 23.62 ha drainage area to SWMF2 with 47.8% imperviousness:
       permanent pool required: 3,118 m^3 (132.0 m^3/ha)
       extended detention required: 945 m^3 (40.0 m^3/ha)
       total storage volume required: 4,063 m^3 (172.0 m^3/ha)
- Storage required for *erosion control:* the post-development stormwater runoff produced from the development site under the 25-mm design storm must be detained over 24 hours. Based on the hydrologic analysis, the storage requirement for erosion control is about 3,120 m^3.
- Storage required for *flood control:* the post-development peak flows released from SWMF2 is to be controlled to or below the pre-development equivalents for the 1:2 to 1:100 year design storms. Based on the hydrologic analysis, the storage requirement for flood control up to the 1:100 year design storm is about 10,110 m^3.

Therefore, the total storage required for the interim SWMF2 is approximately 13,228 m^3, including the permanent pool of 3,118 m^3 and the extended detention of 10,110 m^3 (excluding the storage created by the free board). Based on the current design, the interim SWMF2 provides a total storage over 24,884 m^3, including the permanent pool of 10,066 m^3 and the active storage of 14,818 m^3 (including the storage created by the free board). The average depth of the wet pond is 4.60 m, including the 3.0 m permanent pool as requested by the LSRCA with bottom draws for the coldwater fisheries and the 1.6 m deep active storage.

To maintain the permanent pool within the wet pond and the sediment forebay, a 1.0 m thick clay liner (that must be uniformly compacted to achieve at least 95% of its maximum Standard Proctor dry density) is suggested to be placed on their bottoms and slopes slightly above the permanent pool level and surrounded by subdrain draining toward the Black River. As requested by the LSRCA, the 300 mm thick topsoil will be placed on the slopes of the wet pond and the forebay above the permanent pool for landscaping.

Outlet Structure: The outlet structure of the interim SWMF2 is designed, through a trial-and-error approach, to satisfy the design criteria required to provide *Enhanced* water quality, erosion and flood control. According to the design, the outlet structure is located at the south end of the wet pond to increase the length of the flow path and consists of a 180 mm diameter orifice (at the outlet end of the reversed pipe to draw cold water from the bottom of the wet pond) with the invert elevation of 266.00 m; a 340 mm diameter orifice (at the inlet end of a 675 mm diameter concrete outlet pipe connected to the DICB structure) with the invert elevation of 265.60 m used only when the water level in the wet pond is above 266.60 m; and a 8.0 m wide overflow spillway crested at the elevation of 267.20 m for emergency spill. The detailed stage-discharge-storage relationship of the interim SWMF2 is presented in **Table 3**. The schematics illustrating the overall grading and outlet details of the interim SWMF2 are included **Appendix D**.

Drawdown Time: Based on the design configuration of the interim SWMF2, the drawdown time of SWMF2 under the 25-mm design storm is about 34 hours, calculated using the MOE approach as detailed in **Appendix D**, and it satisfies the minimum drawdown time of 24 hrs as required.

Operation and Maintenance: Proper operation and regular maintenance are essential to ensure optimal performance of the facility as designed. As SWMF2 consists of the sediment forebay and wet pond, operation and maintenance activities mainly include monitoring and inspections, weed control, grass cutting, upland and aquatic vegetation replanting, cleaning and adjustment of the outlet, removal of accumulated sediments, shoreline and flood fringe vegetation replanting, and trash removal for the pond, forebay and all inlet and outlet structures, excluding the operation and maintenance activities for temporary erosion and sediment controls for construction as described in **Appendix D**.

The inspections and monitoring of the facility determine required maintenance activities, and they include many aspects such as the hydraulic performance of the facility, slope stability, conditions of vegetation in and around the facility, evidence of spill and oil/grease contamination, measured sediment depth and frequency of sediment and trash build-up among others. During the first two years of operation, it is recommended inspections to be made after every significant storm to ensure proper functioning of the facility (on average about four inspections per year). After this initial period, when the designed operation and performance of SWMF2 have been achieved or confirmed, annual inspections may suffice.

Generally speaking, it is recommended to limit grass cutting and weed control (governed by local by-laws) around SWMF2 since grass growth tends to enhance water quality treatment, provide ideal wildlife habitat among other benefits for the wet pond. Grass around the wet pond and the forebay should not be cut to the edge of the permanent pool. As a safety precaution, grass cutting should be done parallel to the shoreline with grass clipping being ejected upland to reduce the potential for organic loadings to the wet pond.

Table 3. Stage-Storage-Discharge Relationship of the Interim SWMF2

Elevation (m)	Depth (m)	Permanent Pool Storage (m^3)	Active Storage (m^3)	Total Storage (m^3)	Orifice A[(2)] Outflow (m^3/s)	Orifice B[(2)] Outflow (m^3/s)	Emergency Spillway (m^3/s)	Total Outflow (m^3/s)

Design Specifications of the Interim SWMF2:

(1) *Extended Wet Pond:* top of berm elevation of 267.60 m, bottom elevation of 263.00 m, permanent pool level of 266.00 m, average wet pond depth of 4.60 m (including 3.00 m for the permanent pool as requested by the LSRCA and 1.60 m for the active storage), and the average side slope of 5:1 (Horizontal:Vertical).

(2) *Outlet Structure:* one 180 mm diameter orifice (Orifice A) at the invert elevation of 266.00 m at the outlet end of the reversed pipe, one 340 mm diameter orifice (Orifice B) at the invert elevation of 265.60 m at the inlet end of the outflow pipe from the DICB structure, and one 8.0 m wide emergency overflow spillway crested at the elevation of 267.20 m to discharge the treated water directly into the Black River.

(3) Orifice flow equation: $Q = C_d A\sqrt{2gH}$ where Q is the discharge (m^3/s); C_d the orifice discharge coefficient (C_d = 0.6); A the orifice area (m^2); g the gravitational acceleration constant (9.81 m/s^2); and H the effective water head above the orifice (m).

(4) Weir flow equation: $Q = CBH^{1.5}$ where Q is the discharge (m^3/s); C the weir flow coefficient (C = 1.7); B the weir width (m); and H the effective head of water above the weir crest (m).

Trash removal is an integrated part of regular maintenance activities, and it is recommended that a "spring cleanup" is as least required to remove trash from the facility, and is then performed as required based on observations during regular inspections.

One of the most important maintenance requirements for the effective performance of SWMF2 is the removal of accumulated sediment, particularly in the forebay. Because the sediment forebay is in front of the wet pond to trap large sediments from entering the pond, the minimum sediment removal is required for the wet pond, except for the portion connected to the outlet structure as the sediment accumulation at the inlet end of the reversed pipe can block the flow from entering the pipe and the flow control orifice. Based on the current design, the sediment forebay has to be cleaned at least once in every 10 years on average, though the sediment removal for the forebay may be required shortly after the completion of the construction activities.

The typical excavation equipment such as the backhoes and hydraulic dredging may be used to remove sediment from the forebay and the wet pond. Because SWMF2 is designed to collect the stormwater runoff from the industrial subdivisions, it is recommended all sediment removed from the wet pond and the sediment forebay to be tested, confirm whether or not it is classified as the hazardous waste and determine alternative disposal options. The current MOE sediment disposal requirements should be consulted for information pertaining to exact parameters and acceptable levels for different disposal options.

3.4 Engineering Design of the Ultimate SWMF2

The ultimate SWMF2 is designed to accommodate the ultimate development plan (see **Figure 6**) due to the full development in Blocks 3 and 4, and in the areas associated with the urbanization and extension of Garfield Wright Blvd. The development status and drainage areas controlled by the ultimate SWMF2 are shown in **Figure 8**, and the major design parameters for the ultimate SWMF2 are detailed in **Table 4**.

The ultimate SWMF2 is a deep extended wet pond with a sediment forebay both of which are situated outside of the regulatory floodplain of the Black River. As shown in **Figure 8**, the total drainage area to the ultimate SWMF2 is about 32.3 ha, including the 29.4 ha development area with the average imperviousness of 83.3%. SWMF2 treats and attenuates the stormwater runoff from the development site and discharges the treated water back into the Black River directly at the controlled rates to satisfy the desired design criteria.

Sediment Forebay: Considering the 29.4 ha development area with an average imperviousness of 83.3%, the annual sediment loading to the forebay is about 108.5 m^3/year (3.69 m^3/ha/year) according to the current MOE Stormwater Management Planning and Design Manual.

The procedure recommended in the MOE Stormwater Management Planning and Design Manual was followed to design the ultimate sediment forebay as given in **Appendix D**. According to the current design, the 2.0 m deep sediment forebay provides a total storage volume over 3,187 m^3 with an average cleanout frequency exceeding 11 years.

Table 4. Major Design Parameters for the Ultimate SWMF2

SWM Facility	Development / Drainage Contributing Area	Development Status	Area (ha)	Imperviousness (%)	CN* (-)
Ultimate SWMF2	Major portion of Block 3 at the west side of the extension part of Bales Drive East	Developed	7.83	80%	62
	Transportation and Works Operations Centre; North extension of Bales Drive East; Joint Communications Centre; and Zenon Sewage Treatment Plant in Block 4	Developed	7.54	88%	35
	The balance of Block 4 draining towards the ultimate SWMF2, located at the east half of Block 4 and excluding the ultimate SWMF2 site	Developed	8.68	80%	35
	The site to accommodate the ultimate SWMF2 in Block 4	Undeveloped except for SWMF2	2.90	0%	35
	The areas associated with the extension and urbanization of Garfield Wright Blvd to Woodbine Ave, including the small area to its south	Developed	5.36	87%	62

Notes:

- SWM: stormwater management.
- Ultimate SWMF2: the ultimate stormwater management facility located at the southeast corner of Block 4 to provide the stormwater management control for the ultimate development plan (as described in **Table 1** and illustrated in **Figures 6 and 8**) for the industrial development in Block 4, the major portion of Block 3 and the areas associated with the extension and urbanization of Garfield Wright Blvd.
- CN*: modified runoff curve number for the pervious area and its calculation details are presented in **Appendix D.**
- Development status: whether or not the area is considered as the developed area for the design of the ultimate SWMF2.

Storage Requirement: Based on the desired design criteria and other design assumptions, the storage requirement for the ultimate SWMF2 should satisfy the following criteria:

- Storage required for *water quality control:* in accordance with the current MOE criteria, the storage requirement to provide *Enhanced* (Level 1) water quality protection for the 29.4 ha development area with 83.3% imperviousness is 7,270 m^3 (247.2 m^3/ha), including the permanent pool storage of 6,094 m^3 (207.2 m^3/ha) and the extended detention storage of 1,176 m^3 (40.0 m^3/ha).
- Storage required for *erosion control:* the post-development stormwater runoff produced from the development site under the 25-mm design storm must be detained over 24 hours. Based on the hydrologic analysis, the storage requirement for erosion control is about 6,388 m^3.
- Storage required for *flood control:* the post-development peak flows released from SWMF2 is to be controlled to or below the pre-development equivalents for the 1:2 to 1:100 year design storms. Based on the hydrologic analysis, the storage requirement for flood control up to the 1:100 year design storm is about 20,170 m^3.

Therefore, the total storage required for the ultimate SWMF2 is about 26,264 m^3, including the permanent pool of 6,094 m^3 and the extended detention of 20,170 m^3 (excluding the storage created by the free board). Based on the current design, the ultimate SWMF2 provides a total

storage over 56,629 m^3, including the permanent pool of 26,956 m^3 and the active storage of 29,674 m^3 (including the storage created by the free board). The average depth of the wet pond is 4.60 m, including the 3.0 m permanent pool as requested by the LSRCA with bottom draws for the coldwater fisheries and the 1.6 m deep active storage.

Outlet Structure: The outlet structure of the ultimate SWMF2 is designed to satisfy the design criteria required to provide *Enhanced* water quality, erosion and flood control under the ultimate development condition. According to the current design, the proposed outlet structure consists of a 260 mm diameter orifice (at the outlet end of the reversed pipe to draw cold water from the bottom of the wet pond) with the invert elevation of 266.00 m; a 390 mm diameter orifice (at the inlet end of a 675 mm diameter concrete outlet pipe connected to the DICB structure) with the invert elevation of 265.60 m used only when the water level in the wet pond is above 266.60 m; and a 13.0 m wide overflow spillway crested at the elevation of 267.20 m for emergency spill. The detailed stage-discharge-storage relationship of the ultimate SWMF2 is presented in **Table 5.**

The schematics illustrating grading and outlet details of the ultimate SWMF2 are presented in **Appendix D**, and the outlet structure of the ultimate SWMF2 will be constructed through minor modifications of the interim outlet structure as described below:

- at the outlet end of the reversed concrete pipe, install a larger 260 mm diameter orifice at the same location of the 180 mm diameter interim orifice with the same invert elevation of 266.0 m at the permanent pool level;
- at the inlet end of a 675 mm diameter concrete outlet pipe connected to the DICB structure, install a larger 390 mm diameter office at the same location of the 340 mm diameter interim orifice with the same invert elevation of 265.6 m; and
- widen the emergency spillway from the interim length of 8.0 m to the ultimate length of 13.0 m at the same weir invert elevation of 267.20 m. As requested by the LSRCA, a 13.0 m long concrete weir should be installed in the berm under the ultimate condition.

It should be noted that the site plans for the future industrial development areas located within Blocks 3 and 4 are not available at this time. When the blocks are developed, they will require site plan approval and the preparation of a storm drainage report to provide a detailed engineering design of the major and minor storm drainage systems and retrofit the interim SWMF2, in accordance with the drainage design criteria outlined in this report, to safely convey runoff into SWMF2 and provide the desired Level 1 (*enhanced*) water quality, erosion and water quantity control for the development.

Drawdown Time: According to the design configuration of the ultimate SWMF2 and its outlet, the drawdown time under the 25-mm storm is about 32 hours, calculated using the MOE approach detailed in **Appendix D**, and it satisfies the minimum drawdown time of 24 hrs required.

Table 5. Stage-Storage-Discharge Relationship of the Ultimate SWMF2

Elevation (m)	Depth (m)	Permanent Pool Storage (m^3)	Active Storage (m^3)	Total Storage (m^3)	Orifice A[(2)] Outflow (m^3/s)	Orifice B[(2)] Outflow (m^3/s)	Emergency Spillway (m^3/s)	Total Outflow (m^3/s)

Design Specifications of the Ultimate SWMF2:

(1) *Extended Wet Pond:* top of berm elevation of 267.60 m, bottom elevation of 263.00 m, permanent pool level of 266.00 m, average wet pond depth of 4.60 m (including 3.00 m for the permanent pool and 1.60 m for the active storage), and the average side slope of 5:1 (Horizontal:Vertical).

(2) *Outlet Structure*: one 260 mm diameter orifice (Orifice A) at the invert elevation of 266.00 m at the outlet end of the reversed pipe, one 390 mm diameter orifice (Orifice B) at the invert elevation of 265.60 m at the inlet end of the outflow pipe from the DICB structure, and one 13.0 m wide emergency overflow spillway crested at the elevation of 267.20 m to discharge the treated water directly into the Black River.

(3) Orifice flow equation: $Q = C_d A\sqrt{2gH}$ where Q is the discharge (m^3/s); C_d the orifice discharge coefficient (C_d = 0.6); A the orifice area (m^2); g the gravitational acceleration constant (9.81 m/s^2); and H the effective water head above the orifice (m).

(4) Weir flow equation: $Q = CBH^{1.5}$ where Q is the discharge (m^3/s); C the weir flow coefficient (C = 1.7); B the weir width (m); and H the effective head of water above the weir crest (m).

SWMF2 will be receiving Zenon Sewage Treatment Plant effluent discharge. The plant will be producing water suitable and used for recycling within the building, with only that not required being discharged. The effluent is of a high quality, normally better than that of receiving streams. The ultimately expected design discharge from the plant is 6,750 l/day, with the interim condition being about half. The ultimate discharge of 6,750 l/day corresponds to 0.0781 l/s (or 0.0000781 m^3/s) that is well below the level of significance of the design inflow to SWMF2, and therefore implicitly included in the design flows.

It should be noted that several safety signs are suggested around the SWMF2 site and contain the warning, for example: "Warning of Hazardous Conditions: This is a stormwater management facility and contains features which may become potentially hazardous under certain condition. Hazards include pollutants, fluctuating water levels and thin ice within the facility. Please exercise extreme caution within this area. For further information, please contact the Town of East Gwillimbury at (905) 478-4282".

4.0 HYDROLOGIC ANALYSIS

4.1 Hydrologic Model

Both pre- and post-development hydrologic analyses were conducted by using the OTTHYMO model. The model has been widely used in similar analyses for stormwater management across Ontario and is recognized as a reliable modelling tool to estimate the hydrologic response to both rural and urban watersheds.

The inputs to the OTTHYMO model include meteorological and physiographic data to describe the hydraulic and hydrologic response of the watershed or the stormwater management facilities to the design storms. The major input of the model includes the drainage area, rainfall intensity, soil cover complex curve number, time to peak, an average slope of the catchment and channel, the Manning's roughness coefficient, imperviousness and so on.

4.2 Design Storms

The design storms were determined based on the intensity-duration-frequency (IDF) curves using the rainfall data obtained from the Atmosphere Environment Service Station (AES) at Oak Ridges located at the latitude of 43° 58', longitude of 79° 28', and the altitude of 320 m. A summary of the rainfall depths for the complete range of the design storm events is presented in **Table 6**, and the coefficients of the Chicago distribution for the complete range of the design storms are given in **Table 7**. The six-hour Chicago storms were used for the hydrologic analysis. To be conservative, the storage volume requirement of SWMF2 for the water quantity control were checked using the hurricane Hazel and 24-hour SCS Type II distributions under the various return periods.

Table 6. Rainfall Depths (mm) under Different Design Storm Events

Storm Duration	1:2 Year Storm	1:5 Year Storm	1:10 Year Storm	1:25 Year Storm	1:50 Year Storm	1:100 Year Storm
5 min	8.7	11.2	12.8	14.8	16.3	17.8
10 min	13.0	17.8	21.0	25.1	28.1	31.1

4.3 Pre-Development Peak Flows

As illustrated in **Figure 4**, the entire study area is divided into several catchments under the pre-development conditions for the hydrologic analysis. Because the post-development runoff from all developments interested drains into the facility SWMF2 located at the southeast corner of Block 4, the pre-development hydrologic analysis focused on Catchment 103 that includes Block 4 and the east portion of Block 3 with a total area of approximately 25.7 ha.

Several parameters such as the weighted modified soil cover complex number, catchment slope, and time to peak were used to simulate the peak flow and the runoff volume under the different design storms. The catchment slope (1.7% for Catchment 103) is calculated using the Equivalent Slope Method suggested in the MTO Drainage Management Manual with the following equation:

$$S_w = 100 \cdot \left[n / \Sigma \left(S_n^{0.5} \right) \right]^2$$

where: S_w is the watershed slope (%).
S_n is the slope of an individual reach of the channel (m/m).
n is the number of reaches of approximately equal length (-).

To estimate time to peak (0.24 hours for Catchment 103), the following three-parameter equation is used for catchments with slopes less than 2% and the two-parameter equation for catchments with slopes greater than 2% as suggested in the MTO Drainage Management Manual:

Three-parameter equation: $t_p = 0.0086 * A^{0.422} * S^{-0.46} * (L/W)^{0.133}$

Two-parameter equation: $t_p = 0.016 * A^{0.31} * S^{-0.5}$

where: t_p is the time to peak (hour).
A is the drainage area (ha).
S is the slope (m/m).
L is the catchment length (m).

W is the catchment width (m).

Table 8 presents the pre-development peak flows for Basin 103 under the 1:2 to 1:100 year Chicago and SCS II design storms. A copy of the complete pre-development OTTHYMO output under the 25 mm, 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year Chicago and SCS II design storms is included in **Appendix B**.

Table 8. Pre-Development Peak Flows under Different Design Storms

Items and Specifications	Peak Flows (m^3/s)					
	1:2 Year Storm	1:5 Year Storm	1:10 Year Storm	1:25 Year Storm	1:50 Year Storm	1:100 Year Storm
Basin 103 for a total area of 25.67 ha						
under the Chicago Storms	0.15	0.30	0.42	0.61	0.76	0.94
under the SCS II Storms	0.18	0.33	0.46	0.64	0.79	0.95

Notes:
- Locations of different catchments under the pre-development conditions are illustrated in **Figure 4**.
- Design Storm Events: six-hour Chicago storms and 24-hour SCS II storms at the AES Oak Ridges Station.
- A hard copy of the pre-development OTTHYMO output is included in **Appendix B**.

4.4 Performance of the Interim and Ultimate SWMF2

Figures 7 and 8 present the interim and ultimate drainage conditions. In accordance with the interim and ultimate development plans and design assumptions described in **Table 2** and **Table 4**, the OTTHYMO model was used to simulate the uncontrolled and controlled post-development peak flows and the performance of SWMF2 under the Hurricane Hazel, Chicago and SCS II rainfall storms. The results of the post-development peak flows and the performance of SWMF2 under the different design storms are summarized in **Table 9** and **Table 10** for the interim and ultimate conditions respectively. A copy of the post-development OTTHYMO output for the 25 mm, 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year Chicago and SCS II storms and the Hurricane Hazel is included in **Appendix C** under both interim and ultimate development conditions.

Table 9. Performance of Interim SWMF2 under Different Design Storms

Technical Parameter Specifications	Rainfall Storm Events						
	1:2 Year	1:5 Year	1:10 Year	1:25 Year	1:50 Year	1:100 Year	Hazel
PERFORMANCE OF INTERIM SWMF2 UNDER 6-HOUR CHICAGO DESIGN STORMS							
Peak inflow to SWMF2 (m^3/s)	2.74	3.78	4.49	5.39	6.12	6.81	3.07
Peak outflow from SWMF2 (m^3/s)	0.05	0.18	0.24	0.26	0.27	0.29	2.85
Allowable peak flow (m^3/s)*	*0.11*	*0.21*	*0.30*	*0.43*	*0.54*	*0.67*	-
Max water level in SWMF2 (m)	266.54	266.67	266.76	266.93	267.05	267.18	267.53
Max storage used in SWMF2 (m^3)	4,110	5,320	6,180	7,770	8,950	10,290	13,990
Max W/L above the PP (m)	0.54	0.67	0.76	0.93	1.05	1.18	1.53
Max W/depth above the PB (m)	3.54	3.67	3.76	3.93	4.05	4.18	4.53
PERFORMANCE OF INTERIM SWMF2 UNDER 24-HOUR SCS TYPE II STORMS							
Peak inflow to SWMF2 (m^3/s)	1.11	1.59	1.94	2.37	2.73	3.07	-
Peak outflow from SWMF2 (m^3/s)	0.06	0.24	0.25	0.27	0.28	0.45	-
Allowable peak flow (m^3/s)*	*0.13*	*0.24*	*0.32*	*0.45*	*0.56*	*0.68*	-
Max water level in SWMF2 (m)	266.61	266.72	266.84	267.01	267.14	267.24	-
Max storage used in SWMF2 (m^3)	4,720	5,750	6,920	8,550	9,870	10,930	-
Max W/L above the PP (m)	0.61	0.72	0.84	1.01	1.14	1.24	-
Max W/depth above the PB (m)	3.61	3.72	3.84	4.01	4.14	4.24	-

Notes:

- The interim post-development drainage conditions are illustrated in **Figure 7**.
- W/L: water level; Max: maximum; PP: permanent pool; W/depth: water depth; PB: the bottom of the wet pond.
- *: allowable peak flows are estimated by multiplying the peak flows presented in **Table 8** by an area reduction factor of 18.25/25.67 = 0.71 because there is a small area (7.42 ha) out of 25.67 ha draining directly into the Black River rather than into SWMF2 under the interim development condition.
- A hard copy of the interim OTTHYMO output is included in **Appendix C**.

Table 10. Performance of Ultimate SWMF2 under Different Design Storms

Technical Parameter / Specifications	Rainfall Storm Events						
	1:2 Year	1:5 Year	1:10 Year	1:25 Year	1:50 Year	1:100 Year	Hazel
PERFORMANCE OF ULTIMATE SWMF2 UNDER 6-HOUR CHICAGO DESIGN STORMS							
Peak inflow to SWMF2 (m^3/s)	5.31	7.78	9.26	11.10	12.61	14.03	4.49
Peak outflow from SWMF2 (m^3/s)	0.09	0.24	0.31	0.34	0.35	0.37	4.09
Allowable peak flow (m^3/s)*	*0.14*	*0.28*	*0.40*	*0.58*	*0.72*	*0.89*	-
Max water level in SWMF2 (m)	266.52	266.67	266.76	266.92	267.03	267.15	267.50
Max storage used in SWMF2 (m^3)	8,300	11,030	12,820	15,800	17,910	20,300	27,610
Max W/L above the PP (m)	0.52	0.67	0.76	0.92	1.03	1.15	1.50
Max W/depth above the PB (m)	3.52	3.67	3.76	3.92	4.03	4.15	4.50
PERFORMANCE OF ULTIMATE SWMF2 UNDER 24-HOUR SCS TYPE II STORMS							
Peak inflow to SWMF2 (m^3/s)	2.30	3.24	3.89	4.72	5.41	6.05	-
Peak outflow from SWMF2 (m^3/s)	0.10	0.30	0.32	0.35	0.36	0.48	-
Allowable peak flow (m^3/s)*	*0.17*	*0.31*	*0.43*	*0.60*	*0.75*	*0.90*	-
Max water level in SWMF2 (m)	266.59	266.72	266.84	267.00	267.12	267.22	-
Max storage used in SWMF2 (m^3)	9,520	11,970	14,240	17,270	19,630	21,810	-
Max W/L above the PP (m)	0.59	0.72	0.84	1.00	1.12	1.22	-
Max W/depth above the PB (m)	3.59	3.72	3.84	4.00	4.12	4.22	-

Notes:

- The ultimate post-development drainage conditions are illustrated in **Figure 8**.
- W/L: water level; Max: maximum; PP: permanent pool; W/depth: water depth; PB: the bottom of the wet pond.
- *: allowable peak flows are estimated by multiplying the peak flows presented in **Table 8** by an area reduction factor of 24.34/25.67 = 0.95 because there is a small area (1.33 ha) out of 25.67 ha draining directly into the Black River rather than into SWMF2 under the ultimate development condition.
- A hard copy of the interim OTTHYMO output is included in **Appendix C**.

The results of the interim and ultimate hydrologic analysis support the following conclusions:

- Due to the Garfield Wright Blvd extension to Woodbine Avenue and industrial development, quantity of runoff will increase significantly in terms of peak flow and volume under the interim and ultimate conditions. Water quantity control, therefore, is required to alleviate the increase.
- Under the 25-mm design storm, it is expected that the maximum water level may reach 266.4 m within the interim SWMF2. Since over 95% of daily precipitation events in southern Ontario are less than 25 mm, this reflects normal operational conditions of the interim SWMF2.
- It is expected that the maximum water level in the interim SWMF2 will reach 266.5, 266.7 and 267.2 m under the 1:2, 1:5 and 1:100 year Chicago design storms respectively (that is 0.5, 0.7 and 1.2 m above the permanent pool; and 3.5, 3.7 and 4.2 m above the wet pond bottom respectively), in comparison with 266.6, 266.7 and 267.2 m under the 24-hour SCS II design storms respectively. Under the Hurricane Hazel, the maximum water level within the interim SWMF2 can reach as high as 267.5 m.

- Under the interim conditions, the controlled peak outflow from SWMF2 to the Black River is 0.05, 0.18, 0.24, 0.26, 0.27 and 0.29 m^3/s under the 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year Chicago storms respectively, below the corresponding allowable peak flows of 0.11, 0.21, 0.30, 0.43, 0.54 and 0.67 m^3/s respectively.
- Under the interim conditions, the controlled peak outflow from SWMF2 to the Black River is 0.06, 0.24, 0.25, 0.27, 0.28 and 0.45 m^3/s under the 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year SCS II design storms respectively, below the corresponding allowable peak flows of 0.13, 0.24, 0.32, 0.45, 0.56 and 0.68 m^3/s respectively.
- Under the ultimate conditions, the controlled peak outflow from SWMF2 to the Black River is 0.09, 0.24, 0.31, 0.34, 0.35 and 0.37 m^3/s under the 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year Chicago storms respectively, below the corresponding allowable peak flows of 0.14, 0.28, 0.40, 0.58, 0.72 and 0.89 m^3/s respectively.
- Under the ultimate conditions, the controlled peak outflow from SWMF2 to the Black River is 0.10, 0.30, 0.32, 0.35, 0.36 and 0.48 m^3/s under the 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year SCS II design storms respectively, below the corresponding allowable peak flows of 0.17, 0.31, 0.43, 0.60, 0.75 and 0.90 m^3/s respectively.
- The results of the hydrologic analysis indicate that the drawdown time of the ultimate SWMF2 is over 42 hours under the 25-mm design storm and satisfies the target minimum drawdown time of 24 hours as required.
- Based on the current design of the ultimate SWMF2, the easement Block 9 (4.2 ha including the area within the regulatory floodplain) is designated for the construction of the ultimate SWMF2, by expanding the interim SWMF2 using same inlet/outlet structures with only minor adjustments. It should be noted that the size and land requirement for the ultimate SWMF2 presented in this Report are subject to the design assumptions made for future development in York Region Industrial Subdivision and the area for the extension of Garfield Wright Blvd.
- As the post-development stormwater runoff from the areas associated with the extension of Garfield Wright Blvd to Woodbine Ave. is to be drained to SWMF2, not toward the intermittent swale as it is now, it is expected that there will be no increase of peak flows at the north limit of York Region Industrial Subdivision under both interim and ultimate conditions.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The detailed results of the hydraulic and hydrologic analysis support the following conclusions and recommendations:

1. Because only a small portion of Block 4 is subject to the immediate development in addition to the extension and urbanization of Garfield Wright Blvd to Woodbine Ave, the technical design brief for the interim SWMF2 is presented in this report to accommodate the interim development plan for enhanced water quality, erosion and water quantity controls for a total drainage area of 23.6 ha.

2. The interim SWMF2 is a deep extended wet pond with a sediment forebay, located at the southeast corner of Block 4 and entirely outside of the regulatory floodplain of the Black River. As designed, the interim SWMF2 provides a total storage of 24,884 m^3, including the permanent pool of 10,066 m^3 and the active storage of 14,818 m^3. The average depth of the wet pond is 4.60 m, including the 3.0 m permanent pool as requested by the LSRCA and the 1.6 m deep active storage.

3. Under the 25-mm design storm, the maximum water level within the interim SWMF2 may reach 266.4 m approximately. Since over 95% of daily precipitation events in southern Ontario are less than 25 mm, this reflects normal operational conditions of the interim SWMF2.

4. The maximum water level within the interim SWMF2 will reach 266.5, 266.7 and 267.2 m under the 1:2, 1:5 and 1:100 year Chicago storms respectively (that is 0.5, 0.7 and 1.2 m above the permanent pool; and 3.5, 3.7 and 4.2 m above the wet pond bottom respectively), in comparison with 266.6, 266.7 and 267.2 m under the 24-hour SCS II storm events respectively. Under the Hurricane Hazel, the maximum water level within the interim SWMF2 can reach as high as 267.5 m.

5. Under the interim conditions, the controlled peak outflow from SWMF2 is 0.05, 0.18, 0.24, 0.26, 0.27 and 0.29 m^3/s under the 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year Chicago storms respectively, below the allowable peak flows of 0.11, 0.21, 0.30, 0.43, 0.54 and 0.67 m^3/s respectively.

6. Under the interim conditions, the controlled peak outflow from SWMF2 is 0.06, 0.24, 0.25, 0.27, 0.28 and 0.45 m^3/s under the 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year SCS II design storms respectively, below the allowable peak flows of 0.13, 0.24, 0.32, 0.45, 0.56 and 0.68 m^3/s respectively.

7. Based on the current design, the ultimate SWMF2 needs a total storage of 56,629 m^3, including the permanent pool of 26,956 m^3 and the active storage of 29,674 m^3 with the average depth of the wet pond of 4.60 m (including the 3.0 m permanent pool and the 1.6 m active storage). As a result, Block 9 (4.2 ha including the area within the regulatory floodplain of the Black River) is reserved and will be

transferred to the Town of East Gwillimbury. The block has been sized to accommodate the ultimate SWMF2, through expanding the interim SWMF2 using the same inlet and outlet structures with minor adjustments to the outlet control structure and emergency overflow weir.

8. Under the ultimate conditions, the controlled peak outflow from SWMF2 is 0.09, 0.24, 0.31, 0.34, 0.35 and 0.37 m^3/s under the 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year Chicago storms respectively, below the allowable peak flows of 0.14, 0.28, 0.40, 0.58, 0.72 and 0.89 m^3/s respectively.

9. Under the ultimate conditions, the controlled peak outflow from SWMF2 is 0.10, 0.30, 0.32, 0.35, 0.36 and 0.48 m^3/s under the 1:2, 1:5, 1:10, 1:25, 1:50 and 1:100 year SCS II design storms respectively, below the allowable peak flows of 0.17, 0.31, 0.43, 0.60, 0.75 and 0.90 m^3/s respectively.

10. As the post-development stormwater runoff generated from the areas associated with the extension and urbanization of Garfield Wright Blvd to Woodbine Ave is to be drained into SWMF2, not toward the intermittent swale as it is under existing conditions, it is expected that there will be no increase of peak flows at the north limit of the York Region Industrial Subdivision under both interim and ultimate development conditions.

11. It should be noted that the site plans for the future industrial development areas located within Blocks 3 and 4 are not available at this time. When the blocks are developed, they will require site plan approval and the preparation of a storm drainage report to provide a detailed engineering design of the major and minor storm drainage systems and retrofit the interim SWMF2, in accordance with the drainage design criteria outlined in this report, to safely convey runoff into SWMF2 and provide the desired Level 1 (*enhanced*) water quality, erosion and water quantity control for the development.

Richmond Hill, ON L4B 4N1

Dear Mr. Acosta:

Re: York Region Industrial Subdivision
Technical Design Brief
Dated May 2004
Engineering Drawings
Dated May 21, 2004
Part of Lot 2, Concession 4
Town of East Gwillimbury

We have completed our review of the above noted submission which we received on May 31, 2004 and comment as follows. These comments are numbered in accordance with those in our letter dated February 2, 2004:

1.0) Fisheries Comments:

1.1) The design of the Black River storm outfall channel for Pond SWMF2 is to be revised such that rounded granite rock is used rather than the rip rap which is currently proposed.

1.2) Pond SWMF1 will not be constructed. Pond SWMF3 has already been approved by the Authority. As such, this comment can be considered addressed.

2.0) Technical Design Brief Comments

2.1) We will accept the phased approach suggested in the report for the construction of Pond SWMF2.

2.2) Addressed.

Leaders In

2.3) Addressed. Please note that the proposed revision to the pond design in your fax dated June 9, 2004 would be acceptable to the Authority. Please revise all related drawings and the report accordingly.

Watershed

2.4) The 24 hour event is to be run for the pre-development condition as well. The flows predicted for this event are the target flows for the post-development 24 hour storm scenario.

2.5) Addressed.

Health

2.6) Addressed.

2.7) Please provide us with the calculations done to produce CN*.

2.8) Addressed.

2.9) Addressed.

2.10) Addressed.

2.11) Addressed.

The following are comments arising from our review of the revised SWM brief.

2.12) Page 10. The required water quality storage should be double checked using the total drainage area draining to the pond under the interim condition and the total imperviousness during this interim phase.

2.13) Figure 8. The 8.68 ha. area beside SWMF2 will drain to the pond, not to the river as shown on this figure.

2.14) Table 8. The allowable flows in this table are different than those in Table 9.

2.15) Table 9 shows increases in peak flows (post versus pre) for several of the storm events which is not permissible.

3.0 Design Drawing Comments

3.1) Addressed.

3.2) No longer applicable.

3.3) Addressed.

3.4) SWM2 is to show the location of anti-seepage collars on the outlet pipes.

3.5) The landscaping plans have been received by the Authority and are currently under review. Comments will be provided in the near future.

3.6) Notes regarding the pond berm construction are to be added to SWM1.

3.7) Addressed. Due to the infrequent use of the maintenance path, we recommend that it be topsoiled and seeded (on top of the gravel base) in order to provide a more natural boundary to the permanent pool.

3.8) Addressed. Please note that galvanized steel plate orifices are acceptable for use in municipally owned and operated SWM facilities.

June 25, 2004
Mr. Jaime Acosta, P.Eng.
York Industrial Subdivision
Town of East Gwillimbury
Page 3 of 3

3.9) Under the 24 hour 1:100 year storm condition, the overflow weir will be used for flow control (0.45 cms). As such, we will require that a concrete weir be installed in the berm as requested previously.

3.10) Addressed.

3.11) Addressed.

3.12) Erosion and Sediment Control Plan Comments

a-f) Due to the limited development proposed during the interim condition, the level of detail on this plan is acceptable.

The silt control fence east of SWMF2 is to be extended past the north limit of the pond.

3.13) Addressed.

3.14) Addressed.

The following are additional comments resulting from our review of the latest design drawings.

3.15) A permit is required for the culvert extensions proposed at station 0+660 on Garfield Wright Blvd. In order to reduce the potential for a HADD, it is suggested that a headwall be fitted on the end of the existing culverts rather than extending them.

3.16) The reference to sodding the pond slopes on drawing SWM1 is to be deleted. Reference should made on this drawing to the pond planting plans.

Should you have any questions regarding the above, please do not hesitate to contact the undersigned.. We request that you provide a letter with your next submission detailing how each of the above comments has been addressed. Please refer to the above noted file numbers in all future correspondence.

Yours truly,

Tom Hogenbirk, CMM, P.Eng.
Manager, Engineering and Technical Services

Richmond Hill, ON L4B 4N1

Dear Mr. Acosta:

Re: York Industrial Subdivision
Storm Sewers
NE Davis Drive an Woodbine Avenue
Town of East Gwillimbury, 19T-94016
York Region Approval No. EG.05.04

Attached please find the following marked up 1st submission documents:

- Partial set of engineering drawings
- Storm sewer design sheets
- Application for Approval of Sewage Works for proposed storm sewers
- Two applications for Approval of Sewage Works for proposed stormwater management pond
- Sample MOE project description for storm sewers and stormwater management pond

In addition, Stormwater Management Report shall be revised to include figures/schematics presenting grading and outlet details for proposed SWM pond under interim and ultimate conditions including description of proposed outlet structure modifications under ultimate conditions. Stage-Storage-Discharge Curves (Table 3 and Table 5) shall be updated to clearly present actual orifice and weir coefficients used in the hydraulic calculations.

Please resubmit revised documents, including Stormwater Management Report to my attention. If you have any questions, please contact me at 905-830-4444 ext. 5749.

Sincerely,

Eva Pulnicki, M.Eng., P.Eng.
Environmental Servicing Engineer

Mr. Kevin Walters, P.Eng.
Cumming Cockburn Limited
9133 Leslie St., Ste. 200
Richmond Hill, ON L4B 4N1

Dear Mr. Walters:

Re: York Region Industrial Subdivision
Technical Design Brief
Dated November 19/03
Engineering Drawings
Dated November 1/03
Part of Lot 2, Concession 4
Town of East Gwillimbury

We have completed our review of the aforementioned design brief (received November 24/03) and engineering drawings (received December 4/03). Please be advised that effective March 1, 1998 the Board of Directors of the Conservation Authority adopted Staff Report 3-98-BOD which provided for the collection of fees for the review of planning and engineering submissions to the Conservation Authority. As such, we will require a review fee in the amount of $2,500.00 for this development. Please remit this payment with your next submission.

1.0) Fisheries Comments

As part of our Level III agreement with Department of Fisheries and Oceans (DFO), our fisheries biologist, Jeff Anderson, has reviewed the above noted submission and provides the following comments:

1.1) Additional details are required for the outfall from SWMF2 into the Black River.

1.2) SWM F1 and SWM F3, are noted as discharging to or being placed on line of an "Intermittent Swale". This swale was electrofished approximately 600 metres downstream of the subject property by the Ontario Ministry of Natural Resources (OMNR) in 1995. This effort exposed the presence of blacknose dace (*Rhynicthys atratulus*), northern redbelly dace (*Phoxinus eos*) and mottled sculpin (*Cottus bairdi*). The presence of mottled sculpin is significant as they are a coldwater fish that are indicators of groundwater activity.

Due to this, it is suggested that the intermittent swale represents fish habitat and an on-line pond would represent a HADD.

The DFO could support off-line treatment draining to this watercourse if stream temperatures were respected and maintained or enhanced (e.g. riparian plantings).

We would be pleased to meet with you on this matter at your earliest convenience.

Watershed

Health

2.0) Technical Design Brief Comments

2.1) In general, the Authority prefers that SWM facilities be built out to their ultimate design capacity in order to minimize disturbance in the future. It also would simplify the development of the remaining lots in the subdivision as the builder on these lots would not need to perform any off site works. It is recommended that the design of the ponds be revised accordingly.

2.2) If addressing the above noted comment is not feasible at the present time, we will require the following revisions in the report.
a) A separate section is required on the ultimate design parameters for ponds F2 and F3 including total upstream areas and assumed imperviousness. This section should include a figure showing the extent of the fully developed drainage areas to be serviced by the ponds along with the final pond sizes.
b) Figure 5 is to be revised to clearly identify the areas (developed and undeveloped) that will be serviced by the interim ponds.
c) Figure 5 should include dashed-in outlines of the estimated ultimate foot prints of SWM F2 and F3. There must be sufficient land set aside for the expansion of these ponds in the future.

2.3) As the Black River and its tributaries in this area are considered coldwater, we will require that the SWM ponds be designed as deep wet ponds (3 metres) with bottom draws. The shape of the pond should be designed in such a manner to facilitate shading by bank vegetation.

2.4) The quantity control volumes for the SWM ponds are to be checked using the 24 hour SCS storm distributions for the various storm events.

2.5) A disk of the OTTHYMO input / output files is to be provided.

2.6) The hydrologic modelling for the site is to include the modelling completed for Blocks 1 and 2 by Marshall Macklin Monaghan. The modelling needs to demonstrate that there will not be an increase in peak flows at the north limit of the subdivision.

2.7) Information is to be provided justifying the use of 75 as the curve number for the subject property.

2.8) A table should be provide listing the input parameters for each of the catchment areas (pre and post development) and how these were derived.

2.9) Draw down calculations (as per the equations in the 2003 SWMPP Design Manual) are required to demonstrate that 24 hour detention is provided for the run off from a 25 mm event.

2.10) Emergency overflow weirs and supporting calculations are required for the SWM facilities.

2.11) The report should include a section on the operation and maintenance requirements for the SWM pond including standard operation methods, recommended inspection program, expected frequency of forebay clean outs and recommended methodology for removal of sediment, grass cutting and weed control.

February 2, 2004
Mr. Kevin Walters, P.Eng.
York Region Industrial Subdivision
File No.: 19T-94016
IMS No.: PSDC112C4
Town of East Gwillimbury
Page 3 of 4

3.0) Design Drawing Comments

3.1) Emergency overflow weirs are required on the SWM ponds.

3.2) Please verify the sizing of the outlet swale from Street B (1:100 year?) The rip rap in this swale should be underlain with filter fabric.

3.3) The lowest part of the reverse sloped pipes are to be anchored securely.

3.4) Anti seepage collars are to be provided on the outlet pipes from all SWM facilities.

3.5) A detailed landscaping plan is required for each of the SWM ponds. Please note that a topsoil thickness of 300 mm is required through all pond areas and that creeping red fescue should not be included in ground cover seed mixtures specified for the ponds. Native species of trees and shrubs should be used. In addition, shade trees should be planted near the flood fringe around the permanent pool and thicker groupings of these should be concentrated at the south and west ends of the pond.

3.6) Notes on the construction of the pond berms (i.e. acceptable soils with low permeability to be used, inspection by a geo-tech and compaction %) are to be included on the SWM pond drawings.

3.7) The proposed 4.0 metre wide gravel access road around the permanent pools in the SWM ponds would inhibit the pond's ability to naturalize. In addition, it would make it more difficult to shade the water using trees and shrubs on the banks. As such, we will require that the extent of these roads be reduced to a minimum.

3.8) Details are required for the proposed outlet control structures.

3.9) As it is proposed to use the weir structures as flow control devices for the less frequent events, we will require that a concrete weir be installed in the berm to more precisely set the weir shape and elevation. A section should be provided detailing the shape of each weir.

3.10) The clay liner in the SWM pond should be extended to above the permanent pool water level.

3.11) The plan for SWMF2 should show the regional flood line (265.13 masl).

3.12) Erosion and Sediment Control Plan Comments:

The Sediment and Erosion Control Plan must include the following:

a) Topsoil stockpile locations.

b) Stone mud mats at all construction entrances.

c) The SWM ponds should be temporarily fitted with filter fabric / clear stone wrapped Hickenbottom riser outfalls (with anti seepage collars) and rip rap overflow weirs. The riser should be surrounded by stone and this stone wrapped in filter fabric. A final layer of stone should then be placed on the filter fabric. This substantially increases the fabric surface area and thus reduces the potential for clogging. These ponds are to be sized to provide a minimum of 125 m3/ha. 24 hr. extended detention and 125 m3/ha. "permanent" pool storage. Larger ponds may be required depending on soil type and erosion potential.

d) Notes on the installation timing, inspection and maintenance of sediment controls. Sediment controls must be inspected on a regular basis and after every rain fall event. Repairs must be done in a timely manner to prevent movement of sediment into the water.

e) Lines delineating the limit of cut and fill areas

f) Notes requiring the stabilization of all areas which will remain disturbed for more than thirty days.

3.12) The storm drainage plan (STM1) appears to delineate only the drainage areas tributary to the road storm sewers. This should be clearly stated on this plan.

3.13) The drainage areas for the developed portions of Block 4 are labelled but not delineated on plan STM1.

3.14) The legend for plan STM1 has incorrect labels for the drainage catchment areas.

Should you have any questions regarding the above, please do not hesitate to contact the undersigned. Please reference the above file numbers in all future correspondence.

Yours truly,

Tom Hogenbirk, P.Eng.

Dear Mr. Bradley:

Re: York Region Industrial Subdivision
Technical Design Brief
Dated November 19/03
Engineering Drawings
Dated November 1/03
Part of Lot 2, Concession 4
Town of East Gwillimbury

Further to our previous letter dated February 2, 2004, staff of the Authority visited the site on April 16, 2004. The results of this site visit, which was conducted by our Senior Fisheries Biologist and our Aquatic Ecologist, are summarized as follows:

The noted intermittent "swale" was flowing the day of investigation. Fish were found at a culvert approximately 188 metres downstream of Bales Drive wherein Brook Stickleback (*Culaea inconstans*) were observed and captured. Upstream of Bales Drive the tributary flowed through a small wetland (west of the pipe under Bales Drive) and continued upstream to cross Bales Drive second time (see attached Map).

Regardless of existing development, this "swale" represents the headwaters of a fully functioning cold to coolwater tributary. The waters of this tributary would not require stormwater treatment.

For these reasons, Authority staff can not support the proposed on-line pond as it would constitute a HADD. We would fully support a properly designed off-line facility that would take stormwater flows from both Bales Drive and the eastern swale.

Should you have any questions regarding the above, please do not hesitate to contact the undersigned or Jeff Andersen of our office. Please refer to the above noted file numbers in all future correspondence.

Lake Simcoe Region Conservation Authority
Engineering and Technical Services
120 Bayview Parkway, Box 282
Newmarket, ON L3Y 4X1

ATTENTION: Mr. Tom Hogenbirk, P. Eng.
Manager, Engineering and Technical Services

Dear Sir:

Re: Revised Drainage Areas for the Stormwater Management Plan
York Region Industrial Subdivision 19T-94016
Northeast of Woodbine Avenue and Davis Drive
Town of East Gwillimbury, Regional Municipality of York

In accordance with our telephone conversation on May 3, 2004, enclosed please find the revised drainage areas for the stormwater management plan of the York Region Industrial Subdivision.

The intent of the revised stormwater management plan is to maximize useable lands, minimize the number of the stormwater management facilities, and maintain the existing drainage pattern to the intermittent swale as much as possible for the existing fish habitat.

Under the revised stormwater management plan, previously proposed facilities SWMF4 and SWMF5 (located at the northwest and northeast corners of the intersection of Garfield Wright Boulevard and the swale respectively) are eliminated, and all the developments within Blocks 3 and 4 and the areas associated with the expansion and urbanization of Garfield Wright Blvd will be accommodated by SWMF2 located at the southeast corner of Block 4.

Since the Authority has classified the intermittent swale as the headwater of a fully functioning cold to coolwater tributary that would not require stormwater treatment regardless the existing development, the current drainage conditions within the existing Bales Industrial Subdivision and the majority of the area to its west will remain and continue draining toward the intermittent swale as the source of water supply for the existing fish habitat. Only the

Consulting Engineers of Ontario
9133 Leslie Street, Suite 200 Richmond Hill, Ontario L4B 4N1 | T: 905-763-2322 | F: 905-763-9983

minimum area associated with the immediate development for the expansion and urbanization of Garfield Wright Boulevard will be drained into SWMF2 for erosion, water quality and water quantity control. Since the extension part of Garfield Wright Boulevard and the small area to its south belong to the new development, the peak flows up to the 1:100 year design storm from this area will be conveyed through the storm sewer system into SWMF2 for water quantity control.

Since only a part of Blocks 3 and 4 is subject to the immediate industrial development in addition to the expansion and urbanization of Garfield Wright Blvd, SWMF2 will be designed to accommodate the interim development, but one stormwater management block will be reserved and designated for the future expansion or retrofit of SWMF2 to accommodate the ultimate development of the subdivision.

Based on the assumptions mentioned above, we are proceeding with the detailed engineering design of SWMF2 and the extension and urbanization of Garfield Wright Blvd and Bales Drive East, and addressing your comments expressed in the letters dated Feb. 2 and April 16 of 2004. Should you have any question or concern with regard to the revised stormwater management plan, please do not hesitate to contact the undersigned.

Yours very truly,

GEI Consultants

July 31, 2024

Azimuth Environmental Consulting Inc.
642 Welham Road
Barrie, Ontario
L4N 9A1

Attn: Brendan MacNaughton

RE: Job No. 24-054
Determination of Estimated T-Time

GEI Consultants Ltd. (GEI) was provided with three (3) soil samples on July 23, 2024 to complete grain size analyses to determine the percolation rate of the tested soils (T-Time analysis).

The delivered samples were identified as shown below.

- TP-24-1-2, YRP Hanger
- TP-24-6-4, YRP Hanger
- TP-24-3-2, YRP Hanger

Three grain size distribution curves were developed by testing the above referenced soil samples in accordance with ASTM D6913 Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis and ASTM D7928 (sedimentation / hydrometer analysis). The result of the laboratory test and graphical representation of the grain size analyses are enclosed.

Determination of percolation rate is based on the "*Ministry of Municipal Affairs and Housing (MMAH) Supplementary Guidelines SB-6, Percolation Time and Soil Descriptions, September 14, 2012*". Based on this document, a summary of the result and the estimated percolation rates of the soil are as follows:

Client Reference	Soil Description (MIT)	USCS Soil Classification	Coefficient of Permeability (K- cm/sec)	Estimated Percolation Rate or "*T-Time*" (mins/cm)
TP-24-1-2	SILT, Some Clay, Trace Sand	M.L.	$<10^{-6}$	>50 mins/cm
TP-24-6-4	SILT, Some Sand, Some Clay, Trace Gravel	M.L.	10^{-6}	50 mins/cm
TP-24-3-2	SANDY SILT, Some Clay, Trace Gravel	M.L.	10^{-6}	50 mins/cm

*Reference MMAH Supplementary Standard SB-6, Table 2

It is noted that percolation time not only varies based on the grain size distribution but is also influenced by other soil characteristics such as the density of the soil, the structure of the soil, the percentage/mineralogy of clay, the plasticity of the soil, the organic content of the soil, and the groundwater table level which are not expressly calculated as part of a grain size analysis.

No field investigation was conducted by GEI in conjunction with the above testing and did not witness the depth or location in which these samples were obtained. GEI is providing the percolation rates as factual information, to be used in design by a qualified professional with due regard to the limitations as indicated above.

We trust this information is sufficient for your present purposes. Should you have any questions concerning the above, or if we can be of any further assistance, please do not hesitate to contact the undersigned.

Yours truly,
GEI Consultants Ltd.

YRP Hanger - Servicing Assessment

Test Pit Location Plan

Part 1 General

1.1 SECTION INCLUDES

.1 Adjustments of existing manholes, catch basins and water valves.

1.2 RELATED SECTIONS

.1 Section 33 05 16 – Maintenance Holes and Catch Basin Structures.

.2 Section 32 12 16 – Asphalt Paving

1.3 REFERENCES

.1 [ASTM C139-11 - Standard Specification for Concrete Masonry Units for Construction of Catch Basins and Manholes.]

.2 [CAN/CSA-A165 Series-04 (R2009) - Standards on Concrete Masonry Units.]

.3 [CAN/CSA-A179-04 (R2009) - Mortar and Grout for Unit Masonry.]

.4 [CSA-A257 Series-09 - Standards for Concrete Pipe and Manhole Sections.]

.5 CAN/CSA-A3000-08 - Cementitious Materials Compendium (Consists of A3001, A3002, A3003, A3004 and A3005).

.6 OPSS 407 - Maintenance Hole, Catch Basin, Ditch Inlet and Valve Chamber Installation

.7 OPSS 408 Adjusting or Rebuilding Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers

.8 OPSS 1351 - Precast Reinforced Concrete Components for Maintenance Holes, Catch Basins, Ditch Inlets and Valve Chambers

.9 OPSS 1351 - Precast Reinforced Concrete Components for Maintenance Holes, Catch Basins, Ditch Inlets and Valve Chambers

1.4 ADMINISTRATIVE REQUIREMENTS

.1 Project management and coordination procedures.

.2 Schedule work to minimize interruptions to existing services during construction.

1.5 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Sustainable Design:

.1 Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

.3 Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with a minimum of three (3) years of documented experience.

.4 Installer Qualifications: Company specializing in performing the work of this section with a minimum of three (3) years of documented experience and approved by the manufacturer.

1.6 REGULATORY REQUIREMENTS

.1 Conform to applicable Ontario Provincial Standards and Specifications (OPSS) and Ontario Provincial Standard Drawings (OPSD).

Part 2 Products

2.1 MANUFACTURERS

.1 Acceptable manufacturers offering functionally and aesthetically equivalent products.

2.2 MATERIALS

.1 Precast Manhole Section:

.1 OPSD 701.01, circular profile.

.2 Top sections eccentric cone or flat slab top type with opening offset based on the requirements of each specific manhole shown on the provided plans.

.2 Reinforced Precast Catch Basin Sections: to OPSD 705, with slotted cast iron cover to OPSD 400.10.

.3 Mortar:

.1 Aggregate: CAN/CSA-A179.

.2 Cement: CAN/CSA-A3000

.4 Manhole Ladder Rungs: Preformed galvanized steel or aluminum rungs.

.5 Adjusting Rings: CSA-A257, configured to suit and fit the top ring and lid.

.6 Concrete Brick: CAN/CSA-A165 Series, of dimensions to suit coursing and concrete rings.

Part 3 Execution

3.1 EXAMINATION

.1 Verify existing conditions before starting work.

.2 Verify existing manholes, catch basins, and water valves are ready to receive work in this section.

3.2 MANHOLES AND CATCH BASINS

.1 Remove the existing frame and cover. Identify and store for re-use at locations designated.

.2 Adjust the manhole barrel to the required elevation by removing or installing precast concrete ring sections.

.3 Set manhole frame and cover to required elevation using no more than three (3) concrete rings and one (1) course of brick – each set in a full bed of mortar.

.4 Recess the catch basin frame and cover 10 mm below the gutter elevation and 10 mm behind the face of the curb.

.5 Join the brick course to the frame with cement mortar, and parge and make it smooth and watertight using a bituminous gasket.

.6 Install additional ladder rungs in manholes as specified in the OPSD drawings and OPSS 408.

3.3 WATER VALVES

.1 Excavate and expose the adjustable portion of the water valve casing.

.2 Adjust the water valve casing to the required elevation.

.3 Recess the top of the water valve 5 mm below the finished surface elevation.

.4 Backfill and compact areas surrounding valve and fittings.

.5 Ensure the water valve casing will not move or settle.

3.4 FIELD QUALITY CONTROL

.1 Section 01 45 00: Quality Control

.2 Operate valve in presence of the Consultant to verify it is operational following adjustment.

.3 All work to adhere to OPSS 408.

END OF SECTION

SEE ADD#12
Q#326

Part 1 General

1.1 SCOPE

.1 This specification covers the requirements for the installation of maintenance holes, catch basins, ditch inlets, and valve chambers.

1.2 RELATED SECTIONS

.1 Section 31 23 33.01- Excavating, Trenching and Backfilling

1.3 REFERENCES

.1 OPSS 402 Excavating, Backfilling, and Compacting for Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers

.2 OPSS 407 Maintenance Hole, Catch Basin, Ditch Inlet and Valve Chamber Installation

.3 OPSS 408 Adjusting or Rebuilding Maintenance Holes, Catch Basins, Ditch Inlets, and Valve Chambers

.4 OPSS 510 Removal

.5 OPSS 517 Dewatering of Pipeline, Utility, and Associated Structure Excavation

1.4 SUBMITTALS FOR REVIEW

.1 Section 01 33 00: Submission procedures.

.2 Shop Drawings: Indicate manhole locations, elevations, piping sizes and elevations of penetrations.

.3 Product Data: Provide manhole covers, component construction, features, configuration, and dimensions.

1.5 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Sustainable Design:

.1 Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

1.6 CLOSEOUT SUBMITTALS

.1 Section 01 78 10: Submission procedures.

.2 Sustainable Design Closeout Documentation: As constructed survey including RIM and INVERT elevations.

1.7 QUALITY ASSURANCE

.1 Products of This Section: Manufactured to OPSS 407.

.2 Manufacturer: Company specializing in manufacturing products specified in this section with a minimum of three (3) years of documented experience.

Part 2 Products

2.1 MANUFACTURERS

.1 Acceptable manufacturers offering functionally and aesthetically equivalent products.

2.2 MATERIALS

.1 Manhole Sections: Reinforced precast concrete in accordance with OPSD 701.01.

.2 Manhole Sections: Reinforced cast-in-place concrete.

.3 Manhole Sections and Integral Steps: Fibre reinforced plastic to ASTM D3753.

.4 Mortar and Grout: As per OPSS 407.05.06.

2.3 COMPONENTS

.1 Lid and Frame: As per OPSD 401.01.

.2 Manhole Steps: Formed integrally with manhole sections galvanized steel or aluminum as per provincial & local municipal standards.

.3 Manhole Steps: Steps and ladders shall be according to OPSS 1351 and as specified in the Contract Documents.

.4 Base Pad: Cast-in-place concrete and levelled top surface.

.5 Strap Anchors: Bent steel shape galvanized to ASTM A123/A123M.

.6 Adjustment Units: Precast concrete adjustment units shall be according to OPSS 1351.

2.4 CONFIGURATION

.1 Shaft Construction: Concentric with eccentric cone top section; lipped male/female joints; sleeved to receive pipe and conduit sections.

.2 Shape: Cylindrical.

.3 Clear Inside Dimensions: 1200 mm diameter or as indicated on plans.

.4 Design Depth: As indicated on contract documents.

.5 Clear Lid Opening: 600 mm minimum diameter in all directions.

.6 Pipe Entry: Provide openings as indicated on plans.

.7 Steps: Design to be specified on the OPSD drawings. The top step must be a maximum of 450 mm below the finished top of grade elevation.

.8 Adjustment Units: Installation of adjustment units shall be according to OPSS 408.

.9 Steps: As required by OPSS 1351.

.10 Storm and Sanitary Manhole Benching: Per OPSD 701.021.

.11 Where the difference in elevation between the obvert of the inlet and outlet pipes exceeds 0.60m, a drop pipe as indicated on OPSD 1003.010.

Part 3 Execution

3.1 EXAMINATION

.1 Verify existing conditions before starting work.

.2 Verify items provided by other sections of Work are properly sized and located.

.3 Verify that built-in items are in the proper location, and ready for roughing into Work.

.4 Verify excavation for manholes is correct.

3.2 PREPARATION

.1 Coordinate placement of inlet and outlet pipe or duct sleeves required by other sections.

3.3 PLACING MANHOLE SECTIONS

.1 Place base pad and trowel on top surface level.

.2 Place manhole sections plumb and level, trim to correct elevations and anchor to the base pad.

.3 Form and place manhole cylinder plumb and level, to correct dimensions and elevations.

.4 Cut and fit for pipes.

.5 Grout the base of shaft sections to achieve slope to exit piping. Trowel evenly. Contour as required.

.6 Set cover frames and covers level without tipping, to correct elevations.

.7 Coordinate with other sections of work to provide the correct size, shape, and location.

.8 Manhole frames shall be grouted to the concrete structure. The grout shall be so rounded on a radius of not less than 150 mm from the top of the frame to the outer edge of the concrete structure. All grouting of frames and moduloc risers is to be completed on the outside of the structure only.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

.1 Pipe and fittings for site water line including fire water line and domestic water line.

.2 Fire hydrants and Valves.

1.2 RELATED SECTIONS

.28 OPSS 1359 Unshrinkable Backfill

1.4 SUBMITTALS FOR REVIEW

.1 Section 01 33 00: Submission procedures.

.2 Product Data: Provide data on pipe materials, pipe fittings, valves and accessories.

1.5 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Sustainable Design:

.1 Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

1.6 CLOSEOUT SUBMITTALS

.1 Section 01 78 10: Submission procedures.

.2 Manufacturer's Certificate: Certify that Products meet or exceed Provincial and local requirements.

.3 Record actual locations of piping mains, valves, connections, thrust restraints, and invert elevations.

.4 Identify and describe unexpected variations to subsoil conditions or the discovery of uncharted utilities.

1.7 QUALITY ASSURANCE

.1 Products of This Section: Manufactured to OPSS 441 and meet the Town of East Gwillimbury Engineering Standards and Design Criteria.

.2 Perform the Work in accordance with OPSS 441 the Town of East Gwillimbury Engineering Standards and Design Criteria.

.3 Valves: The manufacturer's name and pressure rating are marked on the valve body.

1.8 DELIVERY, STORAGE, AND PROTECTION

.1 Section 01 61 00: Transport, handle, store, and protect products.

.2 Deliver and store valves in shipping containers with labelling in place.

Part 2 Products

2.1 WATER PIPE

.1 Pipe size and class shall conform to the requirements shown on the contract drawings. Pipe material shall be selected in accordance with the Material Specifications unless otherwise specified on the contract drawings. All valves, hydrants, fittings and accessories shall be in accordance with the Material Specifications and shall be compatible with the class and type of pipe with which they will be used.

.2 All materials contacting potable water must meet NSF/ANSI 61 and all lubricants/chemicals to meet NSF/ANSI 60. Stainless steel bolt and nuts are to be used on all fittings and joint restraints. All metallic fittings, valves and joint restraints must be wrapped end to end with an approved corrosion protection system that includes petrolatum primer (paste), petrolatum moulding mastic, and low temperature petrolatum tape.

2.2 Appurtenances

.1 Detector Check In Valve: Refer to the Town of East Gwillimbury Engineering Standards and Design Criteria.

.2 Insulation: Refer to the Town of East Gwillimbury Engineering Standards and Design Criteria.

.3 Caps and Tee: Refer to the Town of East Gwillimbury Engineering Standards and Design Criteria.

2.3 BEDDING AND COVER MATERIALS

.1 Bedding: Refer to the Town of East Gwillimbury Engineering Standards and Design Criteria.

.2 Cover: Backfilling and compacting shall be according to OPSS 401.

2.4 ACCESSORIES

.1 Concrete for Thrust Restraints: Concrete for thrust blocks shall conform to the requirements of OPSS 1301 with a nominal minimum twenty-eight day compressive strength of 15 MPa. Concrete for precast valve chambers to conform to the requirements of OPSS 1351.

.2 Backflow Preventer: Refer to the Town of East Gwillimbury Engineering Standards and Design Criteria.

.3 Meter: Refer to mechanical specifications.

.4 Manhole and Cover: Refer to Section 33 05 13.

Part 3 Execution

3.1 EXAMINATION

.1 Verify existing conditions before starting work.

.2 Verify that the building service connection and municipal utility water main size, location and invert are as indicated.

3.2 PREPARATION

.1 Cut pipe ends square, ream pipe and tube ends to full pipe diameter and remove burrs.

.2 Remove scale and dirt on the inside and outside before assembly.

.3 Prepare pipe connections to equipment with flanges or unions.

3.3 BEDDING

.1 Excavate pipe trench in accordance with Section 31 23 16 for work of this Section. Hand trim excavation for accurate placement of pipe to elevations indicated.

.2 Form and place 20MPA concrete for pipe thrust restraints at any change of pipe direction. Place concrete to permit full access to pipe and pipe accessories.

.3 Place bedding material at trench bottom, level fill materials in one (1) continuous layer not exceeding 200 mm compacted depth; compact to 95%.

.4 Backfill around the sides and to the top of the pipe with cover fill, tamp in place and compact as specified.

.5 Maintain optimum moisture content of bedding material to attain required compaction density.

3.4 INSTALLATION - PIPE

.1 The contractor is to coordinate and stage watermain installation and final connections such that existing water services to existing buildings are maintained during regular business hours or as agreed with the Owner.

.2 Refer to OPSS 441 for additional specifications on watermain installation procedures and staging.

.3 Maintain separation of water main from sanitary and storm sewer piping in accordance with Provincial and local codes.

.4 Group piping with other site piping work whenever practical.

.5 Install pipe to indicated elevation to within a tolerance of 5/8 inches.

.6 Route pipe in a straight line.

.7 Install pipe to allow for expansion and contraction without stressing pipe or joints.

.8 Install access fittings to permit disinfection of the water system.

.9 Slope water pipe and position drains at low points.

.10 Form and place concrete for thrust restraints at each elbow or change of direction of the pipe main.

.11 Establish elevations of buried piping to ensure a minimum cover according to Municipality Standards.

.12 Install trace wire continuously over the top of the pipe.

.13 Backfill material under pavement, sidewalk, curb and within 1.5m of the edge of pavement to 100% Standard Proctor Density. In other areas, compact to 95% Standard Proctor Density.

.14 Unshrinkable fill is to be used when backfilling under the municipal roadway and it shall conform to OPSS 1359.

.15 Trench excavations backfilled with unshrinkable fill shall be covered with

a) Steel plates rated for a minimum of H-20 loading in paved areas, driveways and areas used by vehicles.

b) Wood planks or other approved material in areas used by pedestrians.

3.5 INSTALLATION - VALVES AND HYDRANTS

.1 Set valves on the solid bearing.

.2 Centre and plumb valve box over the valve. Set box cover flush with finished grade.

.3 Set hydrants plumb; locate pumper nozzle perpendicular to and facing the roadway.

.4 Set hydrants to grade, with nozzles at least 500 mm above ground.

.5 Paint hydrants in accordance with local municipality standards.

3.6 DISINFECTION OF DOMESTIC WATER PIPING SYSTEM

.1 Flush and disinfect system as per local municipal standards.

3.7 SERVICE CONNECTIONS

.1 Provide water service to local municipal requirements with reduced pressure backflow preventer and/or water meter with by-pass valves as shown on the provided plans.

.2 Provide sleeve in retaining wall for service main. Support with a reinforced concrete bridge. Calk enlarged sleeve watertight.

.3 Anchor service main to the interior surface of the foundation wall.

3.8 FIELD QUALITY CONTROL

.1 Section 01 45 00: Quality Control

.2 Compaction testing will be performed per OPSS 514.

.3 If tests indicate Work does not meet specified requirements, remove Work, replace, and retest.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

.1 Sanitary sewerage drainage piping, fittings, accessories, and bedding.

.2 Connection of building sanitary drainage system to municipal sewers.

.3 Clean-out access.

1.2 RELATED SECTIONS

.1 Section 31 05 10 – Corrected Maximum Dry Density for Fill

.15 OPSS 514 Trenching, Backfilling, and Compacting

.16 OPSS 517 Dewatering

.17 OPSS 1359 Unshrinkable Backfill

1.4 DEFINITIONS

.1 Bedding: Fill placed under, beside and directly over pipe, prior to subsequent backfill operations.

.2 Adjustment Unit: means circular and rectangular units used between the structure and the frame to adjust the elevation of the frame for grates and covers.

1.5 SUBMITTALS FOR REVIEW

.1 Section 01 33 00: Submission procedures.

.2 Product Data: Provide data indicating pipe, pipe accessories, and fittings.

1.6 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Installation Data: Manufacturer's special installation requirements.

.3 Certificates: Certify that products meet or exceed local municipal standards.

.4 Sustainable Design:

.1 Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

1.7 CLOSEOUT SUBMITTALS

.1 Section 01 33 00: Submission procedures.

.2 Record the location of pipe runs, connections, catch basins, clean-outs, control points, invert and rim elevations.

.3 Identify, indicate, and describe unexpected variations to subsoil conditions or discovery of uncharted utilities.

1.8 REGULATORY REQUIREMENTS

.1 Conform to the applicable code for installation and materials of the Work of this section.

Part 2 Products

2.1 PIPE MATERIALS (To be determined by the notes and details shown on Contract Drawings)

.1 Concrete Pipe: CSA A257.2-03 (minimum 65-D).

.2 Non-reinforced Concrete Pipe: CSA A257.2-03 Class 3.

.3 Mainline PVC Pipe: ASTM D3034-04A, DR 35 CSA B182.2-06.

.4 HDPE Pipe: Per CSA B182.8 with Type 1 water-tight joints.

.5 Service Connections: Minimum 150mm diameter DR28.

2.2 PIPE ACCESSORIES

.1 Pipe Joints: Mechanical clamp ring type, stainless steel expanding and contracting sleeve, neoprene ribbed gasket for positive seal.

.2 Fittings: Same material as pipe moulded or formed to suit pipe size and end design, in required tee, bends, elbows, clean-outs, reducers, traps and other configurations required.

.3 Trace Wire: Magnetic detectable conductor, plastic covering, imprinted with SEWER SERVICE in large letters.

2.3 BEDDING MATERIALS

.1 Bedding materials shall be placed as shown on the notes on Contract Drawings.

.2 The bedding shall be shaped true to line and grade, free from depressions and high points.

.3 Bedding materials shall be placed in the trench to the grades of the bottom of the pipe. The pipe shall then be lowered to the trench and laid on the bedding material which shall be shaped to conform to the bell end of the pipe. The remaining bedding material shall be placed simultaneously on each side of the spring line of the pipe.

.4 At pipe joints, bedding materials shall be left clear of the joints to permit their completion as specified elsewhere. After the connection has been completed, approved bedding material shall be placed under the joint and thoroughly tamped to the compaction specified.

Part 3 Execution

3.1 EXAMINATION

.1 Verify existing conditions before starting work.

.2 Verify that the excavation base and trench cut are ready to receive work and that excavations, dimensions, and elevations are as indicated on the Civil Drawings.

3.2 PREPARATION

.1 Hand trim excavations to required elevations. Correct over excavation with fine aggregate.

.2 Remove large stones or other hard matter which could damage the pipe or impede consistent backfilling or compaction.

3.3 BEDDING

.1 Excavate pipe trench as specified in the provided plans for work of this section. Hand trim excavation for accurate placement of pipe to elevations indicated.

.2 Place bedding material at the trench bottom and compact to 100% SPD.

.3 Maintain the moisture content of bedding material to plus or minus 2% of optimum to attain the required compaction density.

3.4 INSTALLATION – PIPE

.1 The contractor is to ensure sanitary services to existing buildings remain operational and are maintained at all times.

.2 Please refer to OPSS 410 for additional specifications on sanitary sewer installation procedures and staging of works.

.3 Install pipe, fittings, and accessories to ASTM C12, ASTM C14, and/or manufacturer's written instructions and local requirements. Seal joints watertight.

.4 Lay pipe to slope gradients noted on the provided plans; with maximum variation from a true slope of 1:1000.

.5 Install bedding at the sides and over the top of the pipe as shown on the notes on Contract Drawings.

.6 Refer to Section 31 23 33.01 for Excavating, Trenching and Backfilling requirements. Do not displace or damage the pipe when compacting.

.7 Refer to Section 33 05 16 for manhole requirements.

.8 Connect to the municipal sewer system and building sanitary sewer outlet as indicated on the provided plans and to the satisfaction of the Town of East Gwillimbury site inspector or the Town’s Director of Public Works.

.9 Coordinate the Work with the termination of sanitary sewer connection outside the building, connection to municipal sewer utility service, and trenching.

.10 Backfill material under pavement, sidewalk, curb and within 1.5m of the edge of pavement to 100% Standard Proctor Density. In other areas, compact to 95% Standard Proctor Density.

.11 Unshrinkable fill is to be used when backfilling under the municipal roadway and it shall conform to OPSS 1359.

.12 Trench excavations backfilled with unshrinkable fill shall be covered with

a) Steel plates rated for a minimum of H-20 loading in paved areas, driveways and areas used by vehicles.

b) Wood planks or other approved material in areas used by pedestrians.

.13 Jointing Pipes – Refer to the Town of East Gwillimbury Engineering Standards and Design Criteria.

.14

.15 Cutting of Pipes - Refer to the Town of East Gwillimbury Engineering Standards and Design Criteria.

3.5 INSTALLATION - CLEAN-OUTS

.1 Form bottom of the excavation clean and smooth to correct installation.

.2 Establish elevations and inverts for inlets and outlets as indicated.

.3 Mount clean-out surface hub level in the grout, to elevation, indicated.

.4 Form and place cast-in-place concrete base pad, with provision for sanitary sewer pipe to be installed to proper elevations. Final elevations for the top of the structure are to be set at the time of asphalt placement.

3.6 FIELD QUALITY CONTROL

.1 Section 01 45 00: Quality Control

.2 Request inspection prior to placing bedding.

.3 Compaction testing will be performed to standards identified within the geotechnical report and to meet or exceed local municipal standards.

.4 If tests indicate the Work does not meet specified requirements, remove the Work, replace and retest at no cost to the Owner.

.5 Frequency of tests, pressure testing, infiltration testing and deflection testing are all be completed as per provincial and local municipal standards.

3.7 PROTECTION OF FINISHED WORK

.1 Protect pipe and aggregate cover from damage or displacement until the backfilling operation is in progress.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

.1 Specifies requirements for construction and performance of an underground stormwater quality membrane filtration treatment device that removes pollutants from stormwater runoff through the unit operations of sedimentation, floatation, and membrane filtration.Connection of drainage system to municipal sewers.

.4 ASTM D 4101: Specification for Copolymer steps construction

.5 CAN/CSA-A257.4-M92: Joints for Circular Concrete Sewer and Culvert Pipe, Manhole Sections and Fittings Using Rubber Gaskets

.6 CAN/CSA-A257.4-M92 Precast Reinforced Circular Concrete Manhole Sections, Catch Basins and Fittings

1.4 ADMINISTRATIVE REQUIREMENTS

.1 Coordination:

.1 Coordinate with other work having a direct bearing on the work of this Section.

.2 Coordinate the Work with the termination of storm sewer connection outside the building, trenching, connection to the foundation drainage system and the municipal sewer utility service.

1.5 SUBMITTALS FOR REVIEW

.1 Section 01 33 00: Submission procedures.

.2 Shop drawings for the structure and performance are to be submitted with each order to the contractor. Contractor shall forward shop drawing submittal to the consulting engineer for approval. Shop drawings are to detail the structure's precast concrete and call out or note the fiberglass (FRP) internals/components.

1.6 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Installation Data: Indicate special procedures required to install Products specified.

.3 Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

.4 Sustainable Design:

.1 Not Used

1.7 PRODUCT SUBSTITUTIONS

.1 No product substitutions shall be accepted unless submitted 10 days prior to project bid date, or as directed by the engineer of record.

.2 Submissions for substitutions require review and approval by the Engineer of Record, for hydraulic performance, impact to project designs, equivalent treatment performance, and any required project plan and report (hydrology/hydraulic, water quality, stormwater pollution) modifications that would be required by the approving jurisdictions/agencies.

.3 Contractor to coordinate with the Engineer of Record any applicable modifications to the project estimates of cost, bonding amount determinations, plan check fees for changes to approved documents, and/or any other regulatory requirements resulting from the product substitution.

Part 2 GENERAL

2.1 FILTRATION DEVICES

.1 The device shall be a cylindrical or rectangular, all concrete structure (including risers), constructed from precast concrete riser and slab components or monolithic precast structure(s), installed to conform to ASTM C 891 and to any required state highway, municipal or local specifications; whichever is more stringent. The device shall be watertight.

2.2 CARTRIDGE DECK

.1 The cylindrical concrete device shall include a fiberglass deck. The rectangular concrete device shall include a coated aluminum deck. In either instance, the insert shall be bolted and sealed watertight inside the precast concrete chamber. The deck shall serve as: (a) a horizontal divider between the lower treatment zone and the upper treated effluent zone; (b) a deck for attachment of filter cartridges such that the membrane filter elements of each cartridge extend into the lower treatment zone; (c) a platform for maintenance workers to service the filter cartridges (maximum manned weight = 450 pounds (204 kg)); (d) a conduit for conveyance of treated water to the effluent pipe.

2.3 MEMBRANE FILTER CARTRIDGES

.1 Filter cartridges shall be comprised of reusable cylindrical membrane filter elements connected to a perforated head plate. The number of membrane filter elements per cartridge shall be a minimum of eleven 2.75-inch (70-mm) diameter elements. The length of each filter element shall be a minimum 15 inches (381 mm). Each cartridge shall be fitted into the cartridge deck by insertion into a cartridge receptacle that is permanently mounted into the cartridge deck. Each cartridge shall be secured by a cartridge lid that is threaded onto the receptacle, or similar mechanism to secure the cartridge into the deck. The maximum treatment flow rate of a filter cartridge shall be controlled by an orifice in the cartridge lid, or on the individual cartridge itself, and based on a design flux rate (surface loading rate) determined by the maximum treatment flow rate per unit of filtration membrane surface area. The maximum design flux rate shall be 0.21 gpm/ft2 (0.142 lps/m2).

.2 Each membrane filter cartridge shall allow for manual installation and removal. Each filter cartridge shall have filtration membrane surface area and dry installation weight as follows (if length of filter cartridge is between those listed below, the surface area and weight shall be proportionate to the next length shorter and next length longer as shown below):

Filter Cartridge Length (in / mm)	Minimum Filtration Membrane Surface Area (ft2 / m2)	Maximum Filter Cartridge Dry Weight (lbs / kg)
15	106 / 9.8	10.5 / 4.8
27	190 / 17.7	15.0 / 6.8
40	282 / 26.2	20.5 / 9.3
54	381 / 35.4	25.5 / 11.6

.3 **Backwashing Cartridges:** The filter device shall have a weir extending above the cartridge deck, or other mechanism, that encloses the high flow rate filter cartridges when placed in their respective cartridge receptacles within the cartridge deck. The weir, or other mechanism, shall collect a pool of filtered water during inflow events that backwashes the high flow rate cartridges when the inflow event subsides. All filter cartridges and membranes shall be reusable and allow for the use of filtration membrane rinsing procedures to restore flow capacity and sediment capacity; extending cartridge service life.

.4 **Maintenance Access to Captured Pollutants:** The filter device shall contain an opening(s) that provides maintenance access for removal of accumulated floatable pollutants and sediment, removal of and replacement of filter cartridges, cleaning of the sump, and rinsing of the deck. Access shall have a minimum clear vertical clear space over all of the filter cartridges. Filter cartridges shall be able to be lifted straight vertically out of the receptacles and deck for the entire length of the cartridge.

2.4 BEND STRUCTURE

.1 The device shall be able to be used as a bend structure with minimum angles between inlet and outlet pipes of 90-degrees or less in the stormwater conveyance system.

2.5 DOUBLE-WALL CONTAINMENT OF HYDROCARBONS

.1 The cylindrical precast concrete device shall provide double-wall containment for hydrocarbon spill capture by a combined means of an inner wall of fiberglass, to a minimum depth of 12 inches (305 mm) below the cartridge deck, and the precast vessel wall.

2.6 Baffle

.1 The filter device shall provide a baffle that extends from the underside of the cartridge deck to a minimum length equal to the length of the membrane filter elements. The baffle shall serve to protect the membrane filter elements from contamination by floatables and coarse sediment. The baffle shall be flexible and continuous in cylindrical configurations, and shall be a straight concrete or aluminum wall in rectangular configurations.

2.7 Sump

.1 The device shall include a minimum 24 inches (610 mm) of sump below the bottom of the cartridges for sediment accumulation, unless otherwise specified by the design engineer. Depths less than 24 inches may have an impact on the total performance and/or longevity between cartridge maintenance/replacement of the device.

Part 3 PRECAST CONCRETE SECTIONS

All precast concrete components shall be manufactured to a minimum live load of HS-20 truck loading or greater based on local regulatory specifications, unless otherwise modified or specified by the design engineer, and shall be watertight.

3.1 JOINTS

.1 All precast concrete manhole configuration joints shall use nitrile rubber gaskets and shall meet the requirements of ASTM C443, Specification C1619, Class D or engineer approved equal to ensure oil resistance. Mastic sealants or butyl tape are not an acceptable alternative.

3.2 GASKETS

.1 Only profile neoprene or nitrile rubber gaskets in accordance to CSA A257.3-M92 will be accepted. Mastic sealants, butyl tape or Conseal CS-101 are not acceptable gasket materials.

2.4 FRAME AND COVER

.2 Frame and covers must be manufactured from cast-iron or other composite material tested to withstand H-20 or greater design loads, and as approved by the local regulatory body. Frames and covers must be embossed with the name of the device manufacturer or the device brand name.

3.3 DOORS AND HATCHES

.1 If provided shall meet designated loading requirements or at a minimum for incidental vehicular traffic.

3.4 CONCRETE

.1 All concrete components shall be manufactured according to local specifications and shall meet the requirements of ASTM C 478.

3.5 FIBERGLASS

.1 The fiberglass portion of the filter device shall be constructed in accordance with the following standard: ASTM D-4097: Contact Molded Glass Fiber Reinforced Chemical Resistant Tanks.

3.6 STEPS

.1 Steps shall be constructed according to ASTM D4101 of copolymer polypropylene, and be driven into preformed or pre-drilled holes after the concrete has cured, installed to conform to applicable sections of state, provincial and municipal building codes, highway, municipal or local specifications for the construction of such devices.

3.7 INSPECTION

.1 All precast concrete sections shall be inspected to ensure that dimensions, appearance and quality of the product meet local municipal specifications and ASTM C 478.

Part 4 PART 3 – PERFORMANCE

4.1 GENERAL

.1 Verification – The stormwater quality filter treatment device shall have been field tested in accordance with either TARP Tier II Protocol (TARP, 2003) and New Jersey Tier II Stormwater Test Requirements – Amendments to TARP Tier II Protocol (NJDEP, 2009) or Washington State Technology Assessment Protocol – Ecology (TAPE), 2011 or later version. The field test shall have been verified in accordance with ISO 14034:2016 Environmental Management – Environmental Technology Verification (ETV). See Section 3.2 of this specification for field test performance requirements.

.2 Function - The stormwater quality filter treatment device shall function to remove pollutants by the following unit treatment processes; sedimentation, floatation, and membrane filtration.

.3 Pollutants - The stormwater quality filter treatment device shall be ISO 14034 ETV verified to remove oil/grease, suspended solids, metals and nutrients from stormwater runoff.

.4 Bypass - The stormwater quality filter treatment device shall typically utilize an external bypass to divert excessive flows. Internal bypass systems shall be equipped with a floatables baffle, and must avoid passage through the sump and/or cartridge filtration zone.

.5 Treatment Flux Rate (Surface Loading Rate) – The stormwater quality filter treatment device shall treat 100% of the required water quality treatment flow based on a maximum design treatment flux rate (surface loading rate) across the membrane filter cartridges of 0.21 gpm/ft2 (0.142 lps/m2).

4.2 FIELD TEST PERFORMANCE

.1 At a minimum, the stormwater quality filter treatment device shall have been field tested in accordance with either TARP Tier II Protocol (TARP, 2003) and New Jersey Tier II Stormwater Test Requirements – Amendments to TARP Tier II Protocol (NJDEP, 2009) or Washington State Technology Assessment Protocol – Ecology (TAPE), 2011 or later version. The field test shall have been verified in accordance with ISO 14034:2016 Environmental Management – Environmental Technology Verification (ETV). The field test shall have monitored a minimum of twenty (20) TARP or TAPE qualifying storm events.

.2 Suspended Solids Removal - The stormwater quality filter treatment device shall have ISO 14034 ETV verified load based median TSS removal efficiency of at least 85% and load based median SSC removal efficiency of at least 98%.

.3 Runoff Volume – The stormwater quality filter treatment device shall be engineered, designed, and sized to treat a minimum of 90 percent of the annual runoff volume determined from use of a minimum 15-year rainfall data set.

.4 Fine Particle Removal - The stormwater quality filter treatment device shall have demonstrated the ability to capture fine particles as indicated by a minimum median removal efficiency of 75% for the particle fraction less than 25 microns, and an effluent d50 of 15 microns or lower for all monitored storm events.

.5 Turbidity Reduction - The stormwater quality filter treatment device shall have demonstrated the ability to reduce turbidity such that effluent turbidity is 15 NTU or lower.

.6 Nutrients:

.1 Total Phosphorus (TP) Removal - The stormwater quality filter treatment device shall have ISO 14034 ETV verified load based median TP removal efficiency of at least 49%.

.2 Total Nitrogen (TN) Removal - The stormwater quality filter treatment device shall have ISO 14034 ETV verified load based median TN removal efficiency of at least 39%.

.7 Metals:

.1 Total Zinc (Zn) Removal - The stormwater quality filter treatment device shall have ISO 14034 ETV verified load based median Zn removal efficiency of at least 69%.

.2 Total Copper (Cu) Removal - The stormwater quality filter treatment device shall have ISO 14034 ETV verified load based median Cu removal efficiency of at least 91%.

4.3 INSPECTION and MAINTENANCE

The stormwater quality filter device shall have the following features:

.1 Durability of membranes are subject to good handling practices during inspection and maintenance (removal, rinsing, and reinsertion) events, and site specific conditions that may have heavier or lighter loading onto the cartridges, and pollutant variability that may impact the membrane structural integrity. Membrane maintenance and replacement shall be in accordance with manufacturer's recommendations.

.2 Inspection which includes trash and floatables collection, sediment depth determination, and visible determination of backwash pool depth shall be easily conducted from grade (outside the structure).

.3 Manual rinsing of the reusable filter cartridges shall promote restoration of the flow capacity and sediment capacity of the filter cartridges, extending cartridge service life.

.4 The filter device shall have a minimum 12 inches (305 mm) of sediment storage depth, and a minimum of 12 inches between the top of the sediment storage and bottom of the filter cartridge tentacles, unless otherwise specified by the design engineer. Variances may have an impact on the total performance and/or longevity between cartridge maintenance/replacement of the device.

.5 Sediment removal from the filter treatment device shall be able to be conducted using a standard maintenance truck and vacuum apparatus, and a minimum one point of entry to the sump that is unobstructed by filter cartridges.

.6 Maintenance access shall have a minimum clear height that provides suitable vertical clear space over all of the filter cartridges. Filter cartridges shall be able to be lifted straight vertically out of the receptacles and deck for the entire length of the cartridge.

.7 Filter cartridges shall be able to be maintained without the requirement of additional lifting equipment.

Part 5 EXECUTION

5.1 INSTALLATION

.1 PRECAST DEVICE CONSTRUCTION SEQUENCE:

.1 The installation of a watertight precast concrete device should conform to ASTM C 891 and to any state highway, municipal or local specifications for the construction of manholes, whichever is more stringent. Selected sections of a general specification that are applicable are summarized below.

.1 The watertight precast concrete device is installed in sections in the following sequence:
.2 aggregate base
.3 base slab
.4 treatment chamber and cartridge deck riser section(s)
.5 bypass section
.6 connect inlet and outlet pipes
.7 concrete riser section(s) and/or transition slab (if required)
.8 maintenance riser section(s) (if required)
.9 frame and access cover

.2 The precast base should be placed level at the specified grade. The entire base should be in contact with the underlying compacted granular material. Subsequent sections, complete with joint seals, should be installed in accordance with the precast concrete manufacturer's recommendations.

.3 Adjustment of the stormwater quality treatment device can be performed by lifting the upper sections free of the excavated area, re-leveling the base, and re-installing the sections. Damaged sections and gaskets should be repaired or replaced as necessary to restore original condition and watertight seals. Once the stormwater quality treatment device has been constructed, any/all lift holes must be plugged watertight with mortar or non-shrink grout.

.4 Inlet and Outlet Pipes Inlet and outlet pipes should be securely set into the device using approved pipe seals (flexible boot connections, where applicable) so that the structure is watertight, and such that any pipe intrusion into the device does not impact the device functionality.

.5 Frame and Cover Installation Adjustment units (e.g. grade rings) should be installed to set the frame and cover at the required elevation. The adjustment units should be laid in a full bed of mortar with successive units being joined using sealant recommended by the manufacturer.

Frames for the cover should be set in a full bed of mortar at the elevation specified.

5.2 MAINTENANCE ACCESS WALL

.1 In some instances the Maintenance Access Wall, if provided, shall require an extension attachment and sealing to the precast wall and cartridge deck at the job site, rather than at the precast facility. In this instance, installation of these components shall be performed according to instructions provided by the manufacturer.

5.3 FILTER CARTRIDGE INSTALLATION

.1 Filter cartridges shall be installed in the cartridge deck only after the construction site is fully stabilized and in accordance with the manufacturer's guidelines and recommendations. Contractor to contact the manufacturer to schedule cartridge delivery and review procedures/requirements to be completed to the device prior to installation of the cartridges and activation of the system.

Part 6 QUALITY ASSURANCE

6.1 FILTER CARTRIDGE INSTALLATION

.1 Manufacturer shall coordinate delivery of filter cartridges and other internal components with contractor. Filter cartridges shall be delivered and installed complete after site is stabilized and unit is ready to accept cartridges. Unit is ready to accept cartridges after is has been cleaned out and any standing water, debris, and other materials have been removed. Contractor shall take appropriate action to protect the filter cartridge receptacles and filter cartridges from damage during construction, and in accordance with the manufacturer's recommendations and guidance. For systems with cartridges installed prior to full site stabilization and prior to system activation, the contractor can plug inlet and outlet pipes to prevent stormwater and other influent from entering the device. Plugs must be removed during the activation process.

6.2 INSPECTION AND MAINTENANCE

.1 The manufacturer shall provide an Owner's Manual upon request.

.2 After construction and installation, and during operation, the device shall be inspected and cleaned as necessary based on the manufacturer's recommended inspection and maintenance guidelines and the local regulatory agency/body.

6.3 REPLACEMENT FILTER CARTRIDGES

.1 When replacement membrane filter elements and/or other parts are required, only membrane filter elements and parts approved by the manufacturer for use with the stormwater quality filter device shall be installed.

END OF SECTION

Part 1 General

1.1 SECTION INCLUDES

.1 Site storm sewerage drainage piping, fittings and accessories, and bedding.

.2 Connection of drainage system to municipal sewers.

.3 Catch basins, area drainage, plant area drains and detention tanks.

1.2 RELATED SECTIONS

.1 Section 31 23 33.01- Excavating, Trenching and Backfilling

.2 Section 33 31 11 - Site Sanitary Sewerage Gravity Piping

.3 Section 33 05 13 - Maintenance Holes and Catch Basin Structures

1.4 ADMINISTRATIVE REQUIREMENTS

.1 Coordination:

.1 Coordinate with other work having a direct bearing on the work of this Section.

.2 Coordinate the Work with the termination of storm sewer connection outside the building, trenching, connection to the foundation drainage system and the municipal sewer utility service.

1.5 SUBMITTALS FOR REVIEW

.1 Section 01 33 00: Submission procedures.

.2 Product Data: Provide data indicating pipe and pipe accessories.

1.6 SUBMITTALS FOR INFORMATION

.1 Section 01 33 00: Submission procedures.

.2 Installation Data: Indicate special procedures required to install Products specified.

.3 Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

.4 Sustainable Design:

.1 Not Used

1.7 CLOSEOUT SUBMITTALS

.1 Section 01 33 00: Submission procedures.

.2 Accurately record actual locations of pipe runs, pipe slope, connections, catch basins, cleanouts, maintenance holes, RIM and invert elevations.

.3 Identify and describe unexpected variations to subsoil conditions or the discovery of uncharted utilities.

.4 Sustainable Design Closeout Documentation: CCTV Videos of installed services and as-constructed plan of services including pipe runs, pipe slope, connections, catch basins, cleanouts, maintenance holes, RIM and invert elevations.

1.8 REGULATORY REQUIREMENTS

.1 Conform to the applicable code for materials and installation of the Work of this section.

Part 2 Products

2.1 SEWER PIPE MATERIALS (to be determined by the notes and details shown on the provided plans)

.1 Cast Iron Pipe: Not Used

.2 Cast Iron Pipe Joint Device: Not Used

.3 Vitrified Clay Pipe: Not Used

.4 Vitrified Clay Pipe Joint Device: Not Used.

.5 Concrete Pipe: Refer to the notes and details shown on the Contract Drawings.

.6 Concrete Pipe Joint Devices: Refer to the notes and details shown on the Contract Drawings.

.7 Reinforced Concrete Pipe: Refer to the notes and details shown on the Contract Drawings.

.8 Reinforced Concrete Pipe Joint Device: Refer to the notes and details shown on the Contract Drawings.

.9 Plastic Pipe: Refer to the notes and details shown on the Contract Drawings.

.10 Plastic Pipe: ASTM D2729, polyvinyl chloride (PVC) material; bell and spigot solvent sealed joint end.

.11 Plastic Pipe: ASTM D3034, Type PSM, Poly (Vinyl Chloride) (PVC) material, bell and spigot style rubber ring sealed gasket joint.

.12 Corrugated Steel Pipe: Refer to the notes and details shown on the Contract Drawings.

.13 Coupling Bands: Refer to the notes and details shown on the Contract Drawings

2.2 ACCESSORIES

.1 Pipe Joints: Mechanical clamp ring type, stainless steel expanding and contracting sleeve, neoprene ribbed gasket for positive seal.

.2 Fittings: Same material as pipe moulded or formed to suit pipe size and end design, in required tee, bends, elbows, cleanouts, reducers, traps and other configurations required.

.3 Filter Fabric: Non-biodegradable, non-woven 270R

.4 Trace Wire: Magnetic detectable conductor, plastic covering, imprinted with [STORM SEWER SERVICE in large letters.

.5 Grout: As per local Municipal and Provincial standards.

2.3 BEDDING AND COVER MATERIALS

.1 Bedding: As per geotechnical recommendations, provincial and local municipal standards.

.2 Cover: As per geotechnical recommendations, provincial and local municipal standards.

.3 Execution

2.4 EXAMINATION

.1 Section 01 70 00: Verify existing conditions before starting work.

.2 Verify that the excavation is ready to receive work and that excavations, dimensions, and elevations are as indicated on the Contract Drawings.

2.5 PREPARATION

.1 Hand trim excavations to required elevations. Correct over excavation with compacted material.

.2 Remove large stones or other hard matter which could damage piping or impede consistent backfilling or compaction.

2.6 BEDDING

.1 Excavate pipe trench for work of this section. Hand trim excavation for accurate placement of pipe to elevations indicated.

.2 Place bedding material at trench bottom, level materials in a continuous layer not exceeding 200mm compacted depth.

.3 Maintain optimum moisture content of bedding material to attain required compaction density.

2.7 INSTALLATION – PIPE

.1 Existing storm sewers are to remain operational and maintained at all times.

.2 Install pipe, fittings, and accessories in accordance with the notes and details on the Contract Drawings. Seal joints watertight.

.3 Place the pipe on minimum deep bed granular aggregate as identified in the geotechnical report and provided plans to springline at the sides. Provide top cover to minimum compacted thickness of 300 mm and compact as specified.

.4 Refer to Section 31 23 23 for trenching requirements. Do not displace or damage the pipe when compacting.

.5 Refer to Section 31 05 16 for manhole requirements.

.6 Connect to the municipal storm sewer system, manholes, and building collection points as shown on the Contract Drawings.

2.8 INSTALLATION - CATCH BASINS AND CLEANOUTS

.1 Form bottom of the excavation clean and smooth to correct elevation.

.2 Form and place cast-in-place concrete base pad, with provision for storm sewer pipe end sections.

.3 The level top surface of the base pad; sleeve concrete shaft sections to receive storm sewer pipe sections.

.4 Establish elevations and pipe inverts for inlets and outlets as indicated.

.5 Mount lid and frame level in the grout, secured to the top cone section to elevation indicated.

2.9 FIELD QUALITY CONTROL

.1 Section 01 45 00: Quality Control

.2 Request inspection prior to placing the aggregate cover over the pipe.

.3 Compaction testing will be performed to standards identified within the geotechnical report and to meet or exceed local municipal standards.

.4 If tests indicate the Work does not meet specified requirements, remove the deficient Work, replace and retest at no cost to the Owner.

.5 Frequency of tests, pressure testing, infiltration testing and deflection testing are all completed as per Provincial and local municipal standards.

2.10 PROTECTION OF FINISHED WORK

.1 Protect pipe and aggregate cover from damage or displacement until the backfilling operation is in progress.

2.11 SCHEDULES

.1 Not Used.

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

.1 Not Used

1.2 SUMMARY

.1 Section Includes:

.1 Subdrainage systems behind retaining walls within paved areas and surrounding storm structures.

1.3 REFERENCES

.1 American Society for Testing and Materials (ASTM):

.2 ASTM D 2729 Standard Specification for Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings.

.3 OPSS 405 Pipe Subdrains

.4 OPSS 1860 Geotextile

.5 OPSS 510 Removals

1.4 SUBMITTALS

A. Section 01300 - Submittals: Procedures for submittals.

Part 2 Products

2.1 PIPE MATERIALS

.1 Polyvinyl Chloride Pipe: ASTM D 2729; perforated; 100 mm inside diameter; with required fittings.

2.2 FILTER AGGREGATE

.1 Coarse Filter Aggregate: Clean well graded natural gravel or crushed stone; free from shale, clay, organic materials and debris; 9 mm to 35 mm in size, unless otherwise specified.

2.3 FILL MATERIAL

.1 The type specified for the paved areas.

2.4 ACCESSORIES

.1 Joint covers and pipe sleeves as required for installation.

.2 Subdrain shall be wrapped with a knitted sock geotextile/filter fabric: Water previous, non-woven, needle punch, geotextile polypropylene fabric weighing a minimum of 4 ounces per square yard. Subject to compliance with the above, provide the following:

.1 Trevira 1114 by AGS Canada.

.2 270R by Terrafix Geosynthetics Inc or equivalent.

Part 3 Execution

3.1 EXAMINATION

.1 Verify that the excavation base is ready to receive work, and excavations, dimensions, and elevations are as indicated on the Contract Drawings.

.2 The beginning of installation means acceptance of existing conditions.

3.2 PREPARATION

.1 Hand trim excavations to required elevations. Correct over excavation with fill material of coarse aggregate.

.2 Remove large stones or other hard matter which could damage drainage tile or impede consistent backfilling or compaction.

3.3 INSTALLATION

.1 Separate earth and filter aggregate with geotextile filter fabric.

.2 Do not disturb the drainage system in subsequent backfilling compaction operations.

.3 Subdrain is to be installed as per the detail on the Contract Drawings.

.4 Subdrain installed within the parking areas at catchbasins, catchbasin manholes, and curbs must be backfilled completely to the underside of the asphalt surface.

.5 Subdrains shall be connected to maintenance holes, catch basins, and ditch inlets by a 1 m section of nonperforated pipe. Subdrain and outlet pipe connections to concrete maintenance holes, catch basins, and ditch inlets shall be cored and grouted as specified in the Contract Documents.

.6 Management of excess material shall be according to OPSS 510.

3.4 PROTECTION

.1 Protect pipe and filter aggregate cover from damage or displacement until backfilling operation begins.

3.5 TRANSPORTATION

.1 Off-site, materials shall be transported to the project using well maintained and operating vehicles. Once on the job site, all transporting vehicles shall stay on

designated haul roads and shall at no time endanger any of the improvements by rutting, overloading or pumping the haul road.

END OF SECTION
