- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.02 DESCRIPTION

- .1 Provide fire extinguishers where indicated in the Documents, and in accordance with the requirements of the Authorities Having Jurisdiction (AHJs).

1.03 CODES AND STANDARDS

- .1 Fire extinguishers are to be in accordance with the following Codes and Standards:
 - .1 Ontario Fire Code (OFC);
 - .2 NFPA 10, Standard for Portable Fire Extinguishers;
 - .3 CAN/ULC-S508-02 (including Amendments 1 and 2), Standard for the Rating and Fire Testing of Fire Extinguishers.

PART 2 - PRODUCTS

2.01 GENERAL

- .1 All fire extinguishers are to be pressurized (stored pressure) rechargeable type, in accordance with NFPA 10, and UL and/or ULC listed and labelled for the class of fires and hazard locations for which they are specified.
- .2 Each extinguisher is to be complete with:
 - .1 a manufacturer's identification label indicating the extinguisher model number, rating, and operating instructions;
 - .2 an anodized aluminum or chrome plated forged brass valve with positive squeeze grip on-off operation and a pull-pin safety lock;
 - .3 discharge hose with nozzle or horn and hose securing clip;
 - .4 for wall mounted extinguishers, a wall mounting bracket.

2.02 MULTI-PURPOSE FIRE EXTINGUISHERS

- .1 Multi-purpose 4A 60B:C dry chemical extinguishers are to be 125 mm (5") dia., 4.54 kg (10 lb), each complete with a steel cylinder with a safety red baked enamel finish and a waterproof stainless steel pressure gauge.
- .2 Provide mounting bracket with each ABC-rated dry chemical fire extinguisher.

2.03 FIRE EXTINGUISHER CABINETS

- .1 Surface Mounted: Rectangular break-glass type enclosures sized to suit the extinguishers to be housed, constructed of #18-gauge corrosion resistant steel with a baked white enamel finish, front glass panel, break-glass mechanism, and keyed alike cylinder lock. Finish to be confirmed by architect.
- .2 Recessed: Rectangular cabinets sized to suit the extinguishers to be housed, with a #18 gauge corrosion resistant white enameled steel tub, #14 gauge cleaned and prime coat painted steel door and adjustable trim assembly with rounded corners, semi-concealed piano hinge, safety glass panel, and flush stainless steel door latch. Finish to be confirmed by architect.

PART 3 - EXECUTION

3.01 INSTALLATION OF FIRE EXTINGUISHERS

- .1 Provide fire extinguishers of the type(s) as per requirements of Ontario Fire Code and NFPA 10.

- .2 Install multi-purpose ABC-rated dry chemical fire extinguishers in each fire hose cabinet.
- .3 Unless otherwise shown or specified, wall mount extinguishers using wall brackets supplied with the extinguishers.
- .4 Do not install extinguishers until after wall finishing work is complete.
- .5 You will be responsible for all fire extinguishers until after Substantial Completion of the Work has been certified.
- .6 If extinguishers are indicated adjacent to a door, locate the extinguishers at the strike side of the door.

3.02 INSTALLATION OF FIRE EXTINGUISHER CABINETS

- .1 Provide wall cabinets for fire extinguishers where required.
- .2 Unless otherwise shown or specified, locate cabinets so that the centerline is approximately 1.2 m (4') above the finished floor.
- .3 Confirm exact locations prior to installation.

- 3.07 DOMESTIC HOT WATER RECIRCULATING PUMP**
- 3.08 TESTING OF POTABLE WATER SYSTEMS**
- 3.09 FLUSHING AND DISINFECTION OF PIPING**
- 3.10 EQUIPMENT WATER SERVICE CONNECTIONS**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with the requirements of Section 25 10 10 BAS Control Network
 - .1 Comply with all requirements including those referenced in Article "BAS Integration with Third Party Devices"

1.02 SCOPE OF WORK

- .1 Provision of domestic water piping, valves, circulation pumps, and flushing and disinfection of piping.
- .2 Provision of water service piping for Owner's Fixture, Furniture and Equipment (FF&E) connection requirements;

1.03 QUALITY ASSURANCE

- .1 Execute work of this Section only by skilled tradesmen regularly employed in the installation of plumbing and drainage piping systems, and related equipment.

1.04 SUBMITTALS

- .1 Submit the following Shop Drawings:
 - .1 Stainless steel piping;
 - .2 Stainless steel piping system fittings;
 - .3 Stainless steel piping system joints;
 - .4 Formal cleaning and disinfecting procedure for stainless steel piping systems;
 - .5 Valves;
 - .6 Domestic water pressure booster pumps sets.

1.05 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Proponent is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the successful Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the Bid Price.

PART 2 - PRODUCTS

2.01 POTABLE WATER PIPE, FITTINGS AND JOINTS

- .1 Above Ground Piping: Copper Tubing, Type "L", Hard Drawn, ASTM B88. Fittings: wrought copper solder joint pressure fittings, ANSI/ASME B16.22 or cast copper alloy solder joint pressure fittings, ANSI/ASME B16.18.
- .2 Below Grade Piping: Type "K" soft copper to ASTM B88, supplied in continuous coil with no joints as possible, and with, when joints are required, complete with soldered fittings to the requirements specified elsewhere in this Article.
- .3 Copper Piping Soldered and Brazed Joints:
 - .1 Soldered Fittings in Potable Water Systems up to 200 psi: Solder filler material to ASTM B 32, Alloy Sn95 (or equal) with Tin (Sn) approximately 95%, and Silver (Ag) approximately 5%;

- .2 Brazed Fittings in Potable Water Systems 200 psi to 300 psi: Brazing filler material to ANSI/AWS A5.8, BAg Series Silver alloys.
- .3 Maximum Lead (Pb) content of solder and brazed joint filler materials shall not exceed 0.2%.
- .4 Copper Piping Grooved End Joints and Fittings:
 - .1 Domestic water piping in accessible spaces with working pressures up to 300 psig (2100 kPa), provide Victaulic QuickVic Style 607 grooved copper piping systems utilizing rigid couplings consisting of ductile iron cast housings, with Grade EPDM gaskets, or equal, meeting NSF/ANSI Standard 61 for cold water (+73°F/+23°C) and hot water (+180°F/+82°C), with plated nuts and bolts to secure assembly together.
 - .1 Wrought copper fittings per ASTM B75 C12200, or ASTM B152 C110001 and ANSI B16.22;
 - .2 Bronze sand cast fittings conforming to UNS C89836.
- .5 Stainless Steel Piping, Fittings and Joints:
 - .1 At the option of the Contractor, and where allowed by the Authorities Having Jurisdiction ("AHJs"), domestic water piping size 2" (50 mm) in diameter or larger may be Schedule 10 type 304 stainless steel pipe conforming to ASTM A-312 with stainless steel fittings per ASTM A-403.
 - .2 Stainless steel pipe joints shall be roll grooved Victaulic Style 807N rigid type couplings and Grade EPDM coupling gaskets, or approved equal, meeting NSF/ANSI Standard 61, with plated nuts and bolts to secure assembly together; welded joints in stainless steel piping systems are not allowed unless an acceptable quality control program can be demonstrated to the Consultant.

2.02 SHUT-OFF VALVES

- .1 Ball Valves: Class 600, 4140 kPa (600 psi) WOG rated full port ball type valves, each complete with a forged brass body with solder ends, forged brass cap, and blowout-proof stem, solid forged brass chrome plated ball, "Teflon" or "PTFE" seat, and a removable lever handle. Valves in insulated piping are to be complete with stem extensions.
- .2 Butterfly Valves - Flanged Ends: Non-corrosive, minimum 1200 kPa (175 psi) cold water pressure rated, resilient seated butterfly valves, each complete with a coated cast ductile iron lug type body, stainless steel shaft, bronze disc, and EPDM seat, and each suitable for domestic water bubble-tight dead end service with the valve in position and either side of the connecting piping removed. Butterfly valves to and including 100 mm (4") dia. are to be equipped with lever handles; valves larger than 100 mm (4") dia. are to be equipped with worm gear operators.

2.03 STRAINERS – Y (WYE) PATTERN

- .1 Size ½" (12mm) to 2" (50mm), **Class 125** cast copper silicon alloy body, Y (wye) pattern strainer, equal to Watts Series LF777 (threaded ends), or LFS777 (soldered ends), as follows:
 - .1 Standards:
 - .1 NSF 372 for potable water applications
 - .2 Pressure and Temperature:
 - .1 ¼" (6mm) to 3" (75mm):
 - .1 **400 psi WOG** at 210°F
 - .2 125 psi WSP to 353°F
 - .2 4" (100mm):
 - .1 **300 psi WOG** at 210°F
 - .2 125 psi WSP to 353°F
 - .3 Materials:

- .1 Body: cast copper silicon alloy
- .2 Solid retainer cap: cast copper silicon alloy
- .3 Cap seal: EPDM O-ring for sizes ¼" (6mm) to 3" (75mm); Garlock gasket for size 4" (100mm)
- .4 Gasket: EPDM
- .5 Screen: #20 stainless steel mesh for sizes ½" (12mm) to 2 ½" (65mm); 3/64" (1.2mm) 304 stainless steel perforated screen for size 3" (75mm); 1/8" (3mm) 304 stainless steel perforated screen for size 4" (100mm)
- .2 Size 2 ½" (65mm) to 12" (300mm), cast iron body, Y (wye) pattern strainer, equal to Watts Series 77F-DI-FDA-125 flanged ends, as follows:
 - .1 Standards:
 - .1 NSF 372 for potable water applications
 - .2 Pressure and Temperature:
 - .1 **200 psi WOG** at 210°F
 - .2 125 psi WSP to 353°F
 - .3 Maximum 140°F operating temperature with epoxy coating
 - .3 Materials:
 - .1 Body: ASTM A-126 Class B cast iron complete with FDA approved epoxy coating on the interior and exterior surfaces
 - .2 Cover: ASTM A-126 Class B cast iron with drain/ blowoff connection and ASTM A6 closure plug; assembly complete with FDA approved epoxy coating on the interior and exterior surfaces
 - .3 Cover bolt: ASTM A6
 - .4 Cover bolt nut: ASTM A6
 - .5 Set screw: ASTM B16
 - .6 Plate: ASTM A6 complete with FDA approved epoxy coating on the interior and exterior surfaces
 - .7 Cotter pin: ASTM A112
 - .8 Washer: ASTM A6
 - .9 Cover gasket: Graphite
 - .10 Screen: 304 stainless steel with 1/16" perforations for sizes 2" (50mm) to 5" (125mm); 304 stainless steel with 1/8" perforations for sizes 6" (150mm) to 8" (200mm); 304 stainless steel with 3/16" perforations for sizes 10" (250mm) to 12" (300mm)

2.04 CHECK VALVES

- .1 Horizontal: Class 125, bronze, 1380 kPa (200 psi) WOG rated horizontal swing type check valves with solder ends.
- .2 Vertical: Bronze, 1725 kPa (250 psi) WOG rated vertical lift check valve with soldering ends.

2.05 DRAIN VALVES

- .1 Minimum 2070 kPa (300 psi) water rated, 20 mm (¾") dia., straight pattern full port bronze ball valves, each complete with a threaded outlet suitable for coupling connection of 20 mm (¾") dia. garden hose, and a cap and chain.

2.06 DOMESTIC HOT WATER PIPING FLOW BALANCING VALVES

- .1 Solder or flanged end type as required, globe style, non-ferrous flow balancing valves suitable for potable water applications and designed to facilitate precise flow measurement, precision flow balancing, and positive shut-off, complete with capped and valved drain connection, and valved ports for connection to a differential pressure meter.

2.07 DOMESTIC WATER PRESSURE BOOSTER PUMP PACKAGE

- .1 Skid-mounted pumping package Acceptable Manufacturers: Taco, Wilo, ITT Bell & Gossett, SA Armstrong, or approved equal.
- .2 The pumps shall be vertical inline, multi-stage design.
- .3 The capacities and characteristics shall be as called for in the Documents.
- .4 Pump outer casing shall be constructed as follows:
 - .1 For working pressure to 232 psig (16bar) at 248°F (120°F): 304 Stainless Steel with ANSI 150 Flanges;
 - .2 For working pressure to 370 psig (25bar) at 248°F (120°F): 304 Stainless Steel with ANSI 250 Flanges;
 - .3 For working pressure to 440 psig (30bar) at 248°F (120°F): 304 Stainless Steel with ANSI 300 Flanges.
- .5 Pump shall have type 304 Stainless Steel wetted parts, NSF 61 certified, suitable for use in potable water applications.
- .6 Each impeller shall be fitted with a Teflon seal ring; the 316L stainless steel shaft shall be fitted with Tungsten Carbide bearings.
- .7 The mechanical seal shall be suitable for the full pressure and temperature range of the pump and shall be fitted with carbon rotating face and silicon carbide stationary face.
- .8 The thrust bearing must be connected to the adaptor and shaft coupling in such manner as to eliminate pump axial loads from the motor, allowing NEMA design motors to be used.
- .9 Totally enclosed fan cooled ("TEFC") motors with thermal overload protection in accordance with Section 20 05 70 "Motors, Motor Starters, Motor Control Centres, and Wiring".
- .10 The base mounted pump shall be assembled in a vertical shaft configuration with the suction and discharge connections being in-line at the bottom.
- .11 The suction and discharge headers shall be made of Type L copper.
- .12 The system shall include mainly the pump & motor assemblies on a common structural steel base, the Integrated Drive Controller (IDC), suction and discharge piping & headers.
- .13 The system shall include stainless steel suction & discharge ball valves, bronze non-slam check valve on the discharge.
- .14 One single point pressure sensor to be wired by Mechanical Trades to the discharge pressure setpoint in accordance with the sequence of operation.
- .15 The system shall require only suction and discharge connections and a single point power connection.
- .16 Field connection of remote sensor/transmitters and connection to Building Automatic System (BAS) shall installed by Controls Trades.
- .17 All components shall be mounted on a structural steel base suitable for grouting.
- .18 The discharge of each pump shall be fitted with a check valve. Each pump and discharge valve assembly shall also be equipped with isolation valves so that the pump can be serviced without disruption to other pump operation.
- .19 Pressure gauges shall be installed on the suction and discharge headers.
- .20 Integrated Drive Controller:

- .1 The pump system controller shall be integrated with the variable frequency drive (IDC) as one unit.
- .2 The controller shall be microprocessor based capable of having software changes and updates via personal computer.
- .3 The controller shall have a fully graphic, multilingual display with a large, bright, backlit graphic display to provide complete drive information.
- .4 The controller shall provide internal galvanic isolation to all digital and analog inputs as well as all fieldbus connections.
- .5 The controller shall display the following as status readings from a single display on the controller:
 - .1 Current value of the control parameter.
 - .2 Most recent existing alarm (if any).
 - .3 System status with current operating mode.
 - .4 Status of each pump with current operating mode and rotational speed as a percentage.
- .6 The controller shall have as a minimum the following hardware inputs and outputs:
 - .1 2 Analog Inputs (4-20mA or 0-5Vdc or 0-10Vdc).
 - .2 6 Digital Inputs (Programmable and 2 can be used as outputs).
 - .3 1 Analog Output (Programmable).
 - .4 2 Standard Form C 240V Relay.
 - .5 Ethernet connection.
 - .6 Field Service connection to PC.
- .7 All analog inputs shall be provided with current limit circuitry to provide short circuit protection and safeguard against incorrect wiring of sensors.
- .8 Pump system programming shall include the following protections:
 - .1 Ground Fault
 - .2 Motor stall
 - .3 Motor over temperature
 - .4 Motor compensation & overload
 - .5 Pump no-flow
 - .6 Dry Pump
 - .7 Fault Tolerant Control
 - .8 Pump end of curve
 - .9 Short-cycle
- .9 The controller shall be capable of receiving a remote analog set point (0-5V, and 0-10V).
- .10 No flow shutdown shall not require any external flow meters or flow switches or pressure switches to determine when a NO FLOW condition exists.
- .11 The controller shall be compatible with the following communication protocols via the RS-485 port :
 - .1 Johnson Controls Metasys (N2)
 - .2 Siemens Building technologies system 600 (FLN)
 - .3 BACnet, FC Protocol
 - .4 Modbus RTU systems

- .21 Variable Frequency Drive ("VFD"):
- .1 The VFD shall convert incoming fixed frequency single phase (1Ø) or three phase (3Ø) AC power into a variable frequency and voltage for controlling the speed of the three phases AC induction motors.
 - .2 The VFD shall be a six pulse input design, and the input voltage rectifier shall employ a full wave diode bridge; VFD's utilizing controlled SCR rectifiers shall not be acceptable. The output waveform shall closely approximate a sine wave. The VFD shall be of a PWM output design utilizing current IGBT inverter technology and voltage vector control of the output PWM waveform.
 - .3 The VFD shall be in a NEMA 12 enclosure; VFD with plastic enclosure shall not be acceptable.
 - .4 The VFD shall provide internal DC link reactors to minimize power line harmonics and to provide near unity power factor.
 - .5 The VFD shall be able to provide its full rated output current continuously at 110% of rated current for 60 seconds.
 - .6 Automatic motor adaptation (AMA) algorithm shall be utilized. This feature shall allow for automatically optimized drive performance and efficiency leading to additional energy savings.
 - .7 The VFD shall provide full torque to the motor given input voltage fluctuations of up to +10% to 15% of the rated input voltage.
 - .8 The VFD shall be suitable for elevations to 3300 feet above sea level without derating. Maximum operating ambient temperature shall not be less than 104 degrees 'F VFD shall be suitable for operation in environments up to 95% non-condensing humidity.
 - .9 The VFD shall be capable of displaying the following information in plain English via a 40-Character alphanumeric display:
 - .1 Frequency
 - .2 Voltage
 - .3 Current
 - .4 Actual System Set point
 - .5 Actual System Demand
 - .6 Kilowatts per hour
 - .7 Fault identification
 - .8 Percent torque
 - .9 Percent power
 - .10 RPM
- .22 Sensor/Transmitters:
- .1 Provide field mounted single point pressure sensor transmitter(s). Unit shall transmit an isolated 0-5V or 0-10V DC signal indicative of process variable to the integrated drive controller via standard two wire 24VDC system.
 - .2 Unit shall have stainless steel wetted parts and a ceramic diaphragm with one ¼" male NPT process connection.
 - .3 A pressure snubber shall be required to protect against any water hammering. Accuracy shall be within 0.25% of full span.
 - .4 A certification of final calibration shall be required for each sensor/transmitter.
- .23 Sequence of Operation:

- .1 The IDC shall compare each sensor signal to the independent DCC representative determined set points
- .2 When all set points are satisfied by the process variable, the pump speed shall remain constant at the optimum energy consumption level.
- .3 The IDC shall continuously scan and compare each process variable to its individual set point and control to the least satisfied zone.
- .4 If the set point cannot be satisfied by the designated lead pump, the IDC shall initiate a timed sequence of operation to stage a lag pump.
- .5 The lag pump shall accelerate resulting in the lead pump decelerating until they equalize in speed.
- .6 Further change in process variable shall cause the pumps to change speed together.
- .7 No-Flow Detection:
 - .1 In addition to staging a pump off when it is running at minimum frequency, the VFD can also monitor the power provided to the motor by the drive. If this power is low for the operating speed, a no-flow condition is indicated.
 - .2 The no-flow power level for each drive/pump combination can be easily determined by using an automated macro during system start-up. If a drive's output power for its operating speed indicates a no-flow condition and the No- Flow Delay timer expires, the drive will enter a sleep condition and turn off.
- .8 End-Of-Curve Detection:
 - .1 End-of-curve detection is intended to detect a situation where a broken pipe causes one or more pumps to run at full speed and create excessive flow without reaching the set point pressure, the LEAD drive will issue a warning to indicate this.
- .9 Dry Pump Protection:
 - .1 This feature is used to detect if a pump has run dry, such as improper system fill at start up or when a pump has been out of service and restarted without water. This condition can cause pump damage if not detected and corrected promptly.
- .10 IDC Duplex Pump Set Operation:
 - .1 Both VFD's will be configured to be the LEAD and LAG Pump.
 - .2 The first VFD will act as the LEAD drive, using its PID controller to control the pressure based on sensor readings. The word LEAD PUMP will be displayed on the screen.
 - .3 The second VFD will act as the LAG drive, it will be instructed when to run by the LEAD drive. The word LAG PUMP will be displayed on the screen.
 - .4 The role of LEAD and LAG drive will be alternated between the 2 VFDs based on a predetermined time schedule. The system can also be manually altered by simultaneously pressing the [OK] and [RIGHT] keys on drive 1's keypad.
 - .5 In the event that the LEAD pump cannot maintain the load it will bring on the LAG pump and both will run in unison to maintain pressure. Once the VFDs reach a predetermined low speed together the LAG VFD will turn off and the LEAD VFD will maintain the load.
 - .6 In the event that either drive should fail the other will automatically take over regardless of the timer.
 - .7 The feedback signal will be piggybacked to both VFDs.
 - .8 Stall protection will be provided in the event that either of the pumps should experience a stall or locked rotor.
 - .9 A personal menu in the drive will be set to allow the operator to easily access the pressure set point, the LEAD-LAG timer settings, and to access the sensor range.

- .10 In the event that the pressure sensor should fail the VFD will go to a predetermined speed and remain there until the sensor is repaired. The LAG VFD will display the "Live Zero" alarm while the LEAD VFD will continue to run with a warning "Live zero".
- .11 IDC Triplex Pump Set Operation:
 - .1 A pressure feedback signal is compared to a pressure set point. The LEAD drive uses IDC's PID to analyze the error between the pressure feedback and set point and to adjust the speed of the system to correct for any error. An auto-tuning algorithm is provided in the drive to simplify adjustment of the system. The drives my Personal Menu allows for easy access to the pressure set point.
 - .2 The three VFD's will work in unison to control the flow required to maintain building domestic water pressure. The VFDs are set up such that all three can act as the LEAD, LAG1 or LAG2 VFD. The lead drive will be cycled on a rotation that will allow for similar run time for all of the pumps.
 - .3 When VFD #1 is the LEAD it will operate standalone until such time that it can no longer maintain pressure. If VFD #1 can no longer maintain pressure it will bring on VFD #2 (First lag pump), and these pumps will operate in unison to control the flow required to maintain building pressure. If VFD #1 and VFD #2 cannot maintain flow then VFD#3 (Second lag pump) will be started and all three VFD's will operate in unison to control the flow to maintain building pressure. Once the pressure begins to rise above set point with all three VFDs running at minimum speed then the two lag pumps will sequentially be dropped off and the lead pump will control the flow to maintain building pressure.
 - .4 On a regular schedule the VFD's will share the time as the LEAD pump, LAG pump #1 and LAG pump #2. The control of the alternation schedule will be maintained within VFD #1, and in the event of a failure of this pump the VFD#2 will become the lead pump and remain this way until the schedule in pump #1 is re-engaged.
 - .5 In the event that any of the VFDs should go into a failure or alarm mode then the VFD next in line will pick up the control.
- .12 The sensor that is being used to control the building pressure will be daisy- chained to all Pump Set VFDs to give the active lead drive access to the sensor reading. The daisy-chaining shall be wired in the factory; the installing contractor shall be responsible to wire the sensor into the control relay box (CRB).
- .24 Factory Prefabrication:
 - .1 The system shall be factory prefabricated, including isolation ball valves on the suction and discharge of each pump as well as headers sized for the flow rate indicated in the schedule.
 - .2 Type L copper construction with flanged connections; the only field connections required shall be piping to the system headers, over temperature drain tube and one incoming power connection at the control panel.
- .25 Factory Test and Certification:
 - .1 The booster system and its component parts shall undergo a complete operational flow test from zero to 100% design flow rate under the specified suction pressure conditions at factory prior to shipment, or be tested on site.
 - .2 The system certification shall include copies of the test data as certified by a factory engineer. Performance test certifications to be placed inside the control panel and extra copies with installation manual.
 - .3 The entire system shall be third party certified by Underwriters Laboratories Inc. In accordance with OSHA 29 CFR with references to nationally recognized testing laboratories.

2.08 DOMESTIC HOT WATER RECIRCULATING PUMPS

- .1 Capacity: As shown on the Equipment Schedules.
- .2 All wetted surfaces shall be suitable for use in potable water applications, the entire assembly shall be NSF 61 certified.
- .3 Construction: Closed-coupled, in-line centrifugal, all bronze construction, stainless steel or alloy steel shaft, stainless steel or bronze shaft sleeve, two oil lubricated bronze sleeves or ball bearing. Design for 125 psi at 230°F (860 kPa at 105°C) continuous service.
- .4 Motor: Totally Enclosed Fan Cooled ("TEFC") in accordance with 20 05 70 "Motors, Motor Starters, Motor Control Centres, and Wiring" with thermal overload protection.
- .5 Where noted on the Equipment Schedules pump(s) shall be complete with Variable Frequency Drive ("VFD") in accordance with Section 20 05 75 "Variable Frequency Drives" for variable flow control.
- .6 Acceptable Manufacturers: Taco, Wilo, S.A. Armstrong, ITT Bell & Gossett, or approved equal.

PART 3 - EXECUTION

3.01 DOMESTIC WATER PIPING INSTALLATION REQUIREMENTS

- .1 Install plumbing and pumping systems in accordance with Manufacturer's requirements and the requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required domestic water piping. Type M copper piping shall not be allowed.
- .3 Lay pipes true to line and grade with bells up grade. Fit sections together so that, when complete, the pipe has a smooth and uniform invert. Keep pipe thoroughly clean so that jointed compound will adhere. Inspect the pipe for defects before being lowered into the trench.
- .4 Slope all piping so that it can be completely drained.
- .5 Provide proper dielectric unions in all connections between copper pipe and ferrous pipe or equipment. Dielectric unions are to conform to ASTM F1545-97 and are to be complete with a thermoplastic liner.
- .6 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.

3.02 SHUT OFF VALVES

- .1 Provide shut-off valves at:
 - .1 all equipment connections
 - .2 base of all piping risers;
 - .3 branch piping connection from mains (branch piping serves two or more fixtures);
 - .4 where shown on the drawings.
- .2 Provide minimum 1/4" (6mm) full port ball valves in the pressure class required by the application for isolation of instrumentation components such as pressure gauges, thermometers, and other similar types of devices.

3.03 STRAINERS

- .1 Provide line size strainers in the following locations:
 - .1 On inlet side of water meters
 - .2 at the suction side of each pump;
 - .3 immediately upstream of each pressure reducing valve;
 - .4 immediately upstream of each entering side of a plate and frame heat exchanger;
 - .5 immediately upstream of each control valve;
 - .6 where shown on the Drawings and the Details

- .2 Install strainers in horizontal or down flow (Y (wye) pattern only) piping with clearance for removal of basket.
- .3 Supply strainers with extra construction screens and remove after systems have been thoroughly cleaned.
- .4 Equip each strainer 2" (50 mm) and smaller in size with plugged blow off tappings.
- .5 Equip each strainer 2 ½" (75mm) and larger in size with blow off tapping connection complete with shut off valve and blow off piping with same pressure and temperature rating of strainer. Terminate blow off piping in downward vertical position. Size blow off piping and valve the same size as the blow off tapping.
- .6 Ensure that each strainer can be isolated from piping systems with isolating valves on each side of strainer, and which are not more than 10 ft (3 metres) upstream or downstream from strainer.
- .7 Clean strainer baskets after piping system flushing and cleaning is complete, and before water quantity balancing commences.

3.04 DRAIN VALVES

- .1 Provide a drain valve at the bottom of domestic water piping risers, at all other piping low points, and wherever else shown.
- .2 Locate drain valves so that they are easily accessible

3.05 DOMESTIC HOT WATER PIPING FLOW BALANCING VALVES

- .1 Provide line size flow balancing valves in domestic hot water recirculation piping where shown on the drawings and where required by TAB Trades.
- .2 Locate each valve such that it is easily accessible.

3.06 DOMESTIC WATER BOOSTER PUMP PACKAGE

- .1 Install pumps in accordance with manufacturer's requirements.
- .2 Mount domestic water pressure booster pump package on a 100mm (4") housekeeping pad.
- .3 Make piping and electrical connections to pump and motor assembly and controls as indicated.
- .4 Mechanical Trades to provide conduit and wiring from the supply pressure sensor to the pump control package.
- .5 Provide drains for bases and stuffing boxes piped to and discharging into floor drains
- .6 Support piping adjacent to pump such that no weight is carried on pump casings.
- .7 Support suction guide and discharge elbow from a floor stand with rubber and shear sandwich pad isolators or from above with hangers and spring isolators
- .8 Check motor and pump lubrication points, fill oil reservoir on in-inline of pumps
- .9 Provide vibration isolated pipe hangers (resilient support) next to pumps on piping.
- .10 Start-Up of Domestic Water Pressure Booster Pump Package:
 - .1 The service of a factory-trained representative shall be made available on the job site to verify the installation and Start-Up and instruct operating personnel.
 - .2 Confirm pump rotation is correct.
 - .3 Set up and adjust all controls.

3.07 DOMESTIC HOT WATER RECIRCULATING PUMP

- .1 Install pumps in accordance with manufacturer's requirements.
- .2 Make piping and electrical connections to pump and motor assembly and controls as indicated.
- .3 Ensure pump and motor assembly do not support piping.
- .4 Confirm pump rotation is correct.
- .5 Set up and adjust all controls.

- .6 Provide, ball or butterfly valve, union or flange, as applicable, and strainer on pump discharge piping connections.
 - .1 Provide pressure gauges piped up to measure pressure at pump suction, pump discharge and across strainer.
- .7 Provide, ball or butterfly valve, union or flange, as applicable, check valve and on pump discharge piping connections
 - .1 Check valves in pump discharge shall be swing type with external lever and adjustable weight.
- .8 The service of a factory-trained representative shall be made available on the job site to verify the installation and Start-Up and instruct operating personnel.

3.08 TESTING OF POTABLE WATER SYSTEMS

- .1 Application of Tests
 - .1 After a section of a potable water system has been completed, and before it is placed in operation, a water pressure test shall be conducted, except that an air pressure test may be used during ambient test conditions below 39°F (4°C).
 - .2 A pressure test may be applied to each section of the system or to the system as a whole.
 - .3 Where a pre-fabricated system is assembled off the building site in such a manner that it cannot be inspected and tested on site, off site inspections and pressure tests shall be conducted, and in the presence of the Authorities Having Jurisdiction, or the Consultant, when requested.
 - .4 Where a prefabricated system is installed as part of a water system,
 - .1 All other plumbing work shall be tested and inspected, and
 - .2 The complete system shall be pressure tested when requested by the Authorities Having Jurisdiction, or the Consultant.
- .2 Pressure Tests of Potable Water Systems
 - .1 Except as required in Sentence (4) below, every potable water system shall be capable of:
 - .1 withstanding, without leaking, a water pressure that is at least equal to 1.5 times the maximum anticipated in-service pressure in potable water piping systems designed for operating pressures in excess of 80 psi (560 kPa), but in no case less than 145 psi (1000 kPa), for at least 60 minutes, or
 - .2 withstanding, without leakage, a water pressure that is at least 145 psi (1000 kPa) for systems designed for operating pressures less than 80 psi (560 kPa), for at least 60 minutes, or
 - .3 withstanding, for at least 120 minutes without a drop in pressure, an air pressure that is at least 100 psi (700 kPa) for systems designed for operating pressures less than 80 psi (560 kPa).
 - .2 Where a water pressure test is made, all air shall be expelled from the system before fixture shut-off valves or faucets are closed for system testing.
 - .3 Only potable water shall be used to test a potable water system.
 - .4 If a piping, or piping system component manufacturer states that an air pressure test is not recommended, a water pressure test shall be performed.

3.09 FLUSHING AND DISINFECTION OF PIPING

- .1 Flush and disinfect all new and/or reworked domestic water piping after leakage testing is complete.
- .2 Flushing:
 - .1 Before disinfecting, the mechanical contractor shall flush all foreign matter from the pipeline.
 - .2 Flush piping until all foreign materials have been removed and the flushed water is clear.

- .3 Provide hoses, pumps, temporary pipes as required to dispose of flushing water without causing damage to the building or adjacent properties. Open and close valves, faucets, hose outlets, and service connections to ensure thorough flushing.
- .4 The flushing velocities shall be at least 2.5 FPS.
- .5 For large diameter pipe, where it is impractical or impossible to flush the pipe at 2.5 FPS velocity, the pipeline shall be cleaned in place from the inside by brushing and sweeping, then flushing the line at a lower velocity.
- .3 Disinfection:
 - .1 Pipes intended to carry potable water shall be disinfected before being placed in service.
 - .2 Disinfection procedures shall conform to AWWA C601 and AWWA C651 as hereinafter modified or expanded, and the requirements of any governing agency having jurisdiction.
- .4 Disinfection Mixture:
 - .1 The mechanical contractor shall prepare the disinfection mixture with a chlorine-water solution having a free chlorine residual of 40 - 50 PPM.
 - .2 The disinfection mixture shall be prepared by injecting calcium or sodium hypochlorite and water into the piping and allowing it to flow at a measured rate so that water-chlorine solution is of the specified strength.
 - .3 If the calcium hypochlorite procedure is used, first mix the dry powder with water to make a thick paste, then thin to approximately a one percent solution (10,000 PPM Chlorine).
 - .4 If the sodium hypochlorite procedure is used, dilute the liquid with water to obtain a one percent solution.
- .5 Point of Application:
 - .1 The chlorine mixture shall be injected into the piping to be treated at the beginning of the line, and through a corporation stop or suitable tap in the top of the line.
 - .2 Water from the existing system or other approved sources shall be controlled so as to flow slowly into the newly installed pipe during the application of chlorine.
 - .3 The rate of chlorine mixture flow shall be in such proportion to the rate of water entering the pipe that the combined mixture shall contain 40-50 PPM of free available chlorine.
 - .4 Valves shall be manipulated so that the strong chlorine solution in the line being treated will not flow back into the line supplying the water.
 - .5 Check valves shall be used if deemed necessary.
 - .6 The chemical treatment representative shall analyze and record the free chlorine residual at the farthest fixtures from the injection point.
- .6 All valves, fixtures and other appurtenances shall be operated during disinfection to ensure that the disinfection mixture is dispersed into all parts of the line, including dead ends, new services and similar areas that otherwise may not receive the treated water.
- .7 Retention Period:
 - .1 Treated water shall be retained in the pipeline long enough to destroy all nonspore-forming bacteria.
 - .2 With proper flushing and the specified solution strength, 24 hours is adequate.
 - .3 At the end of the 24-hour period, the disinfection mixture shall have a strength of at least 25 PPM of chlorine.
 - .4 The chemical treatment representative shall analyze and record the free chlorine residual at the farthest fixtures from the injection point.
- .8 The above procedure shall be repeated at the mechanical contractor's expense if the free chlorine level drops below the minimum requirements.

- .9 After chlorination, the water from the line shall be flushed until it meets health department requirements.
- .10 Disposal of Disinfection Water:
 - .1 Disposal of disinfecting water shall be done in an approved manner.
 - .2 Disinfecting water should not be allowed to flow into a waterway without adequate dilution or other satisfactory method of reducing chlorine concentrations to a safe level.
- .11 Where stainless steel piping is used for domestic water applications, piping systems shall be annealed, de-greased and pickled and will be subject to formal cleaning and disinfecting along with all other parts and components of the domestic water system as per ASTM A-380.

3.10 EQUIPMENT WATER SERVICE CONNECTIONS

- .1 Provide all potable water service piping connection requirements required for Owner's Fixture, Furniture and Equipment (FF&E) supplied under other Sections of the Work.
- .2 Where required by the Documents, or the Authorities having Jurisdiction (AHJs), provide appropriate Back Flow Preventer (BFP) on equipment water service equipment connections to protect potable water supply(ies).
- .3 Provide all pipe fittings, valves, strainers, vacuum breakers, backflow preventers, unions, piping insulation any other ancillaries as indicated, specified or as recommended by Equipment Manufacturer.
- .4 Arrange for rough-in and piping connections to equipment, as recommended by Equipment Manufacturer.
- .5 Provide chrome plated uninsulated piping and piping components exposed to view, unless otherwise indicated. Provide chrome plate escutcheons at wall and floor penetrations.
- .6 Connect Equipment requiring plumbing connections.
- .7 Piping servicing Equipment shall be neatly racked together with heating pipes and shall be minimum of 12" (300 mm) above floor.

- 3.02 EXCAVATION, TRENCHING, BEDDING AND BACKFILL**
- 3.03 DRAIN, WASTE AND VENT PIPING INSTALLATION**
- 3.04 TESTING OF DRAINAGE AND VENT PIPING SYSTEMS**
- 3.05 BACKWATER VALVES**
- 3.06 EQUIPMENT DRAINAGE CONNECTIONS**
- 3.07 EQUIPMENT WASTE WATER SERVICE CONNECTIONS**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.02 SCOPE OF WORK

- .1 Provision of sanitary drainage piping, vent piping, sanitary sump pumps, and valves.
- .2 Provision of storm drainage piping, storm water sump pumps, and valves.
- .3 Provision of waste effluent drainage piping for Owner's Fixture, Furniture and Equipment (FF&E) connection requirements;

1.03 QUALITY ASSURANCE

- .1 Execute work of this Section only by skilled tradesmen regularly employed in the installation of plumbing and drainage piping systems, and related equipment.

1.04 SUBMITTALS

- .1 Submit the following Shop Drawings:
 - .1 Valves.

1.05 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Proponent is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the successful Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the Bid Price.

PART 2 - PRODUCTS

2.01 STORM AND SANITARY DRAINAGE AND VENT PIPING

- .1 PVC Sewer: SDR35 rigid, green PVC hub and spigot pattern sewer pipe and fittings to CAN/CSA B182.2, with gasket joints assembled with pipe lubricant.
- .2 Copper- Solder Joint: Type DWV hard temper to ASTM B306, with forged copper solder type drainage fittings and 50% lead - 50% tin solder joints.
- .3 Cast Iron: cast iron pipe, fittings, and mechanical coupling joints to CAN/CSA B70.
- .4 Copper-Victaulic Coupling Joint: Type DWV hard temper to ASTM B306, with factory or site rolled grooved ends (with grooving rolls designed for copper) and Victaulic "Copper Connection" wrought copper or cast bronze fittings and Style 606 gasket type couplings.

2.02 SHUT-OFF VALVES

- .1 Ball Valves: Class 600, 4140 kPa (600 psi) WOG rated full port ball type valves, each complete with a forged brass body with solder ends, forged brass cap, and blowout-proof stem, solid forged brass chrome plated ball, "Teflon" or "PTFE" seat, and a removable lever handle. Valves in insulated piping are to be complete with stem extensions.
- .2 Butterfly Valves - Flanged Joint: Non-corrosive, minimum 1200 kPa (175 psi) cold water pressure rated, resilient seated butterfly valves, each complete with a coated cast ductile iron lug type body, stainless steel shaft, bronze disc, and EPDM seat, and each suitable for domestic water bubble-tight dead end service with the valve in position and either side of the connecting piping removed. Butterfly valves to and including 100 mm (4") dia. are to be equipped with lever handles. Butterfly valves larger than 100 mm (4") dia. are to be equipped with worm gear operators.

Contract Number: RFTC-1868-24-TR88179

2.03 CHECK VALVES

- .1 Horizontal: Class 125, bronze, 1380 kPa (200 psi) WOG rated horizontal swing type check valves with solder ends.
- .2 Vertical: Bronze, 1725 kPa (250 psi) WOG rated vertical lift check valve with soldering ends.

2.04 BACKWATER VALVES

- .1 In-line backwater valves equal to Watts model BV-200 epoxy coated cast iron backwater valve with gasketed cover and removable bronze seat and flapper.

2.05 BACKWATER VALVES

- .1 Provide access to backwater valve seat and flapper through minimum 48" (1200mm) diameter pre-cast concrete maintenance access chamber with flat 24" (610mm) free diameter, gasketed water tight steel frame, and solid maintenance hole cover; pit depth to suit.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Install drainage and drainage pumping systems in accordance with Manufacturer's requirements and the requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.

3.02 EXCAVATION, TRENCHING, BEDDING AND BACKFILL

- .1 Perform excavation, trenching, bedding, backfill and related work required to complete the Mechanical scope of work. Ensure all services are buried a minimum of 5 ft. (1500mm) where piping is located outside the building perimeter walls.
- .2 Where excavation and backfill is required outside perimeter foundation walls, provide all required layout of mechanical services trenches.
- .3 Perform carving and trimming of final 150 mm (6") of trench bottom excavation.
- .4 Perform bedding, installation of services, backfilling and testing to 300 mm (12") above uppermost buried service.
- .5 Grade the bottom of the pipe trench excavation as required.
- .6 In firm undisturbed soil, lay pipes directly on the soil and shape soil to fit the lower segment of all pipes and pipe bells. Ensure even bearing along the barrels.
- .7 In rock and shale excavate to 150mm (6") below and a minimum of 200mm (8") to either side of the pipe. Fill back with a bedding of 12mm (1/2") crushed stone or granular 'A' gravel.
- .8 Prepare new bedding under pipe in unstable soil, in fill, and in all cases where pipe bedding has been removed in earlier excavation, particularly near perimeter walls of buildings, at manholes and catch basins. Compact to maximum possible density and support the pipe by 200mm (8") thick concrete cradle, spanning full length between firm supports. Install reinforcing steel in cradle and construct piers every 2400mm (8 ft.) or closer, down to solid load bearing strata. Provide a minimum of one pier per length of pipe. Use the same method where pipes cross.
- .9 Where excavation is necessary in proximity to and below the level of any footing, bed with 14,000 kPa (2000 psi) concrete to the level of the highest adjacent footing. Proximity is determined by the angle of repose as established by the Project Structural Engineer.
- .10 Provide support over at least the bottom one third segment of the pipe in all bedding methods.
- .11 Do not open trench ahead of pipe laying and bedding more than weather will permit. Break up rocks and boulders and remove by drilling and wedging. Do not use blasting unless specifically approved.

Contract Number: RFTC-1868-24-TR88179

- .12 Perform all, or required portions of backfilling as specified in Section 31 23 33 in 150mm (6") layers with clean selected materials acceptable to the Consultant.
- .13 Backfill and compact to the following standard Proctor percentages:
 - .1 Sodded area: 85%
 - .2 Under paving: 95%
 - .3 Under Floor slabs: 100%
- .14 Dispose of excavated material as directed by the Contractor.

3.03 DRAIN, WASTE AND VENT PIPING INSTALLATION

- .1 For underground pipe inside the building and to points 1.5 m (5') outside the building lines - rigid PVC sewer pipe, minimum 75mm (3") diameter;
- .2 For pipe inside the building and above ground in sizes to and including 65mm (2½") diameter - type DWV copper;
- .3 For pipe inside the building and above ground in sizes 75mm (3") diameter and larger - cast iron;
 - .1 for piping in Hospital Diagnostic Imaging Suites where material may be subject to magnetic fields (CT Scan and similar), provide DWV piping for size required;
- .4 For drainage pump discharge pipe connections from the pump to and including shut-off and check valve connections - Type "DWV" copper with grooved fittings and couplings, or Schedule 40 galvanized steel with grooved fittings and couplings.
- .5 Unless otherwise specified, slope horizontal drainage piping above ground in sizes to and including 75 mm (3") diameter 25mm (1") in 1.2 m (4'), and pipe 100mm (4") diameter and larger 25mm (1") in 2.4 m (8').
- .6 Install and slope underground drainage piping to inverts or slopes indicated on the drawings to facilitate straight and true gradients between the points shown. Verify available slopes before installing the pipes.
- .7 Unless otherwise specified, slope horizontal branches of vent piping down to the fixture or pipe to which they connect with a minimum pitch of 25mm (1") in 1.2 m (4'-0").
- .8 PVC drainage waste and vent piping that penetrates a fire separation shall be sealed at the penetration by a fire stop that has an FT rating not less than the fire-resistance rating of the fire separation in accordance with fire test method in CAN/ULC-S115.
- .9 Extend vent stacks up through the roof generally where shown but with exact locations to suit site conditions and in any case a minimum of 3m (10') from fresh air intakes. Terminate vent stacks a minimum of 330 mm (13") above the roof (including roof parapets) in vent stack covers as per CSA.
- .10 Provide proper dielectric unions at connections between copper pipe and ferrous pipe or equipment.

3.04 TESTING OF DRAINAGE AND VENT PIPING SYSTEMS

- .1 Except in the case of an external leader, after a section of a drainage system or a vent piping system has been roughed in, and before any fixture is installed or piping is covered, a water pressure test or an air pressure test shall be conducted.
- .2 After every fixture is installed and before any part of the drainage system or vent piping system is placed in operation, a final test shall be carried out when requested.
- .3 Where a prefabricated system is assembled off the building site in such a manner that it cannot be inspected and tested on site, off-site inspections and tests shall be conducted.
- .4 Where a prefabricated system is installed as part of a drainage system or venting system, all other plumbing work shall be tested and inspected and a final test shall be carried out on the complete system when requested.
- .5 When requested, a ball test shall be made to any pipe in a drainage system.
- .6 Tests of Pipes in Drainage Systems:

Contract Number: RFTC-1868-24-TR88179

- .1 Pipes in a drainage system, except an external leader or fixture outlet pipe, shall be capable of withstanding, without leakage, a water pressure test, air pressure test, and final test.
- .2 Pipes in a drainage system shall be capable of meeting a ball test.
- .7 Tests of Venting Systems:
 - .1 Venting systems shall be capable of withstanding, without leakage, a water pressure test, air pressure test and final test.
- .8 Water Pressure Tests:
 - .1 A water pressure test shall consist in applying a pressure of at least 4.5 psi (10.ft.wg, or 3m water column) to all joints.
 - .2 In making a water pressure test:
 - .1 Every opening, except the highest, shall be tightly closed with a testing plug or a screw cap, and
 - .2 The system, or the section, shall be kept filled with water for 15 minutes.
- .9 Air Pressure Tests
 - .1 Air pressure tests shall be conducted in accordance with the manufacturer's instructions for each piping material, and
 - .1 Air shall be forced into the system until a pressure of 35 kPa is created, and
 - .2 This pressure shall be maintained for at least 15 minutes without a drop in pressure.
 - .2 The addition of a non-toxic indicating substance, such as an aerosol, a fluorescent dye, smoke or an odorant, to an air pressure test may be used to identify the location of a leak, however, the additive must be compatible with the piping material being tested and in no way adversely affect the integrity of the plumbing system.
- .10 Final Tests
 - .1 Where a final test is made:
 - .1 every trap shall be filled with water,
 - .2 the bottom of the system being tested shall terminate at a building trap, test plug or cap,
 - .3 except as provided in Sentence (.10.2) below, smoke from smoke generating machines shall be forced into the system,
 - .4 when the smoke appears from all roof terminals, they shall be closed, and
 - .5 a pressure equivalent to a 1 in.wg (25 mm water column) shall be maintained for 15 minutes without the addition of more smoke.
 - .2 The smoke referred to in Clauses (.10.1.3) and (.10.1.4) above is permitted to be omitted, provided the roof terminals are closed and the system is subjected to an air pressure equivalent to 1 in.wg (25 mm water column) maintained for 15 minutes without the addition of more air.
- .11 Final Tests General Procedures:
 - .1 Fill all traps to their minimum water seal
 - .2 Plug the building drain through the main cleanout where the drain leaves the building
 - .3 All future connections are capped with permanent caps.
 - .4 One General Final Test Procedure is successfully completed.
 - .5 A final visual is done for the plumbing fixtures and trim.
 - .6 General Final Test Procedure #1

Contract Number: RFTC-1868-24-TR88179

- .1 Smoke (or air) is forced into the system through the main cleanout or other convenient connection.
- .2 When the smoke appears at the vent terminal it shall be closed.
- .3 Smoke will continue to be added until a pressure of 1 in.wg (25 mm water column) is achieved.
- .4 This pressure will then be maintained for a minimum of 15 minutes without the addition of more smoke.
- .5 If this pressure cannot be maintained, the leak shall be located and repaired. Once this is complete the procedure shall be repeated until the test passes.
- .6 The test equipment is removed, the main drain unplugged, and the caps on the vent terminals removed. All traps are to have their trap seals replenished if necessary.
- .7 General Final Test Procedure #2

Note: General Final Test Procedure #2 is intended to require no pressure gauges and will exert a pressure equal to or greater than 1 in.wg (25 mm water column).

 - .1 A toilet bowl is filled slowly with water, until the level in the bowl rises to the underside of the bowl rim.
 - .2 If the system is air tight, the level of the water in the bowl will remain at the underside of the bowl rim. The pressure that is created by the head of the water is equal to the air pressure in the plumbing system. This proves the system air tight.
 - .3 If the water level drops slowly, a small leak in the system is evident. If the water will not rise at all, then a large leak is evident. The leak must be located and repaired. The final test must then be repeated.
 - .4 Once the water level has remained constant for 15 minutes, a cleanout will be opened or the plug in the main drain pulled. At this time the toilet bowl will flush and the traps may siphon.
 - .5 The caps on the vent terminals are to be removed and the water seal replenished on all fixtures.
- .12 Ball Tests:
 - .1 Where a ball test is made, a hard ball, dense enough not to float, shall be rolled through the pipe.
 - .2 The diameter of the ball shall be not less than
 - .3 2" (50 mm) where the size of the pipe is 3" (75 mm) or more, or
 - .4 1" (25 mm) where the size of the pipe is less than 3" (75 mm).
 - .5 Ball Testing Procedure:
 - .1 The test ball shall be placed at the high end of the pipe, and allowed to roll through the pipe to the low end of the pipe.
 - .2 If there are not obstructions and the pipe is graded correctly, the test ball shall be caught and removed.
 - .3 The piping then passes the ball test.
 - .4 If the test ball doesn't roll all the way through, the Consultant will allow one 5 Imperial gallon bucket of water to be poured into the drain.
 - .5 If this does not dislodge the test ball and cause it to roll through the piping then the piping does not pass the ball test.
 - .6 The ball will have to be retrieved and test procedure repeated again until a pass is achieved.

Contract Number: RFTC-1868-24-TR88179

- .7 For newly installed plastic piping, the solvent used is heavily corrosive towards billiard balls. Ensure the solvent is given sufficient time to cure prior to conducting the test.

3.05 BACKWATER VALVES

- .1 Provide access to backwater valve seat and flapper through minimum 48" (1200mm) diameter pre-cast concrete maintenance access chamber with flat 24" (610mm) free diameter, gasketed water tight steel frame, and solid maintenance hole cover; pit depth to suit.

3.06 EQUIPMENT DRAINAGE CONNECTIONS

- .1 Provide all waste effluent drainage piping required for Owner's Fixture, Furniture and Equipment (FF&E) connection requirements.

3.07 EQUIPMENT WASTE WATER SERVICE CONNECTIONS

- .1 Provide all waste effluent drainage service piping connection requirements required for Owner's Fixture, Furniture and Equipment (FF&E) supplied under other Sections of the Work.
- .2 Provide all waste water fittings, valves, strainers, vacuum breakers, unions, piping insulation any other ancillaries as indicated, specified or as recommended by Equipment Manufacturer.
- .3 Arrange for rough-in and piping connections to equipment, as recommended by Equipment Manufacturer.
- .4 Provide chrome plated uninsulated waste water drainage piping and piping components exposed to view, unless otherwise indicated. Provide chrome plate escutcheons at wall and floor penetrations.
- .5 Connect Equipment requiring waste water drainage piping connections.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 10 50 Basic Materials and Methods.

1.02 SCOPE OF WORK

- .1 Provide all labour, materials, products, equipment and services to supply, install and commission compressed air system including all equipment, distribution piping and outlets.

1.04 SUBMITTALS

- .1 Submit shop drawings for all compressed air system Products Specified in this Section of the Specifications except for pipe and fittings.

- .2 Submit engineering design data to confirm products proposed meet requirements specified in this Section. Include certified power and control wiring diagrams where applicable.
- .3 Submit copies of all test and inspection reports, including test reports supplied by authority making the inspection, for all inspections specified in this Section. Complete and submit TSSA "Piping Systems Installation and Test Data Report", and submit all other documents required by TSSA.
- .4 Submit a letter from Air Compressor Manufacturer, or Manufacturer's designated representative, certifying air compressor set installation is in accordance with requirements specified in Part 3 of this Section.
- .5 Submit valid and up-to-date qualification certificates for tradesmen performing the work, all as specified in this Section.

1.05 QUALITY CONTROL

- .1 The work shall be carried out in accordance with the Specifications and, where applicable, in accordance with the manufacturer's instructions by Trades experienced in this type of work.
- .2 Trades performing registered pressure piping work to be licensed in accordance with the requirements of the Authorities Having Jurisdiction (AHJs).
- .3 Prior to submitting shop drawings/product data sheets for any system governed by the Boilers and Pressure Vessels Act, review Contract Documents for conformance with CSA B51 and related standards, and immediately report any discrepancies so as not to delay the work. This review is intended to avoid installation of materials and/or products that may later be rejected by AHJs.
- .4 Employ a subcontractor approved by AHJs (Boiler and Pressure Vessels Division), who has a Quality Plan filed with AHJs to complete the work of this Section.
- .5 Work is to be performed only by certified welders in accordance with requirements of Section entitled Basic Mechanical Materials and Methods, and by certified journeyman pipe fitters and licensed petroleum mechanics. Maintain copies of each registered tradesman's certificate on-site for examination upon request.
- .6 Install all work required to be registered under Boiler and Pressure Vessels Act in accordance with requirements of this Section and CSA B51, including related Codes and Standards.
- .7 Schedule, pay costs, and obtain reports for inspections by governing authority at regular intervals including but not limited to pre-construction material inspection, demonstration of welding procedures, general installation inspections, and any other inspection(s) requested by governing authority.

1.06 VIBRATION ISOLATION GENERAL REQUIREMENTS

- .1 All vibration isolators and bases shall be supplied by an approved supplier with the exception of isolators which are factory installed and are standard equipment with the machinery.
- .2 Provide shop and placement drawings for all vibration isolation elements for review, before materials are ordered. The drawings shall bear the stamp and signature of the responsible supplier's technical representative.
- .3 All vibration isolators shall have either known undeflected heights or other markings so that after adjustment, when carrying their load, the deflection under load can be verified to confirm the load is within the proper range of the device and that the correct degree of vibration isolation is being provided according to the requirements.
- .4 All isolators shall operate in the linear portion of their load versus deflection curve. Load versus deflection curves shall be furnished by the manufacturer and shall be linear over a deflection range of 50 percent above the design deflection.
- .5 The ratio of lateral to vertical stiffness shall not be less than 1.0 or greater than 2.0.

PART 2 - PRODUCTS

2.01 PIPING, JOINTS AND FITTINGS

- .1 Copper Piping:

- .1 Provide Type "L" hard-drawn copper piping conforming to ASTM Standard B88 for compressed air piping sizes up to NPS ¾" (20 mm).
- .2 Provide wrought copper braze joint fittings. Do not use cast fittings.
- .3 Make connection to piping of a different material with dielectric fittings.
- .4 Brazing Alloys:
 - .1 Provide silver type brazing alloys with a melting point of approximately 1100°F (593°C) and a tensile strength of 90,000 psi (621 MPa) minimum, cadmium free, requiring no flux for installation. Silver brazing alloy shall be Aircosil 45.
- .2 Black Steel Piping:
 - .1 Provide ASTM A53/A53M, seamless black steel.
 - .2 NPS 2" (50mm) and smaller:
 - .1 ASME 16.9, Schedule 40, welded joints
 - .2 ASME B16.11, Schedule 80 steel, threaded joints.
 - .3 NPS 2½" (65 mm) and larger:
 - .1 ASME 16.9, Schedule 80, welded joints
 - .2 ASME B16.11, Schedule 80, socket welded joints.
 - .4 Where welding is employed wall thickness to match pipe thickness
 - .5 Where threaded is employed for sizes NPS 2" (50mm) and smaller:
 - .1 Threaded malleable iron fittings, Class 150 to ANSI B16.3,
 - .2 150 psi (1030 kPa) black malleable iron, bronze face, ground joint unions.
 - .6 Couplings: To ASME B16.11, socket welded or threaded half coupling type.
 - .7 Unions: Malleable iron with brass-to-iron ground seat.
 - .8 Dissimilar metal junctions: Use di-electric unions.
 - .9 Flanges:
 - .1 NPS 2" (50mm) and smaller:
 - .1 Class 150 to ASME B16.5, forged steel, raised face and socket welded.
 - .2 NPS 2½" (65 mm) and larger:
 - .1 Class 150 to ANSI B16.5, forged steel raised face and slip-on or weld neck.
 - .2 Gaskets to ANSI B16.21, ANSI B16.20 or ANSI A21.11 of heavy duty graphite impregnated compressed sheet 1/16" (1.6 mm) thick
 - .10 Studs, bolts and nuts:
 - .1 to ANSI B18.2.1, ANSI 18.2.2 and ASTM A194, "high strength" type
 - .11 Jointing compound for screwed pipe:
 - .1 pulverized lead paste.

2.02 SHUT-OFF VALVES

- .1 Three-piece design or top entry for ease of in-line maintenance.
- .2 Black Steel Piping Service:
 - .1 To ASTM A181/A181M, Class 70, carbon steel body socket welded ends, carbon steel ball and associated trim suitable for compressed air application.
 - .2 To withstand 600 psig (4135 kPa) maximum pressure.
- .3 Copper Piping Service:

- .1 Provide for valves 2" (50 mm) and smaller, bronze ball valves ASME rated for non-shock cold water pressure of 600 psig (4135 kPa).
- .2 Provide for valves 2½" (65 mm) and larger, bronze solder and globe valves.

2.03 PRESSURE REDUCING VALVE STATIONS

- .1 Provide pilot operated pressure reducing valve stations complete with isolation valves where indicated on the Drawings. Pressure reducing valves shall be suitable for an operating pressure range from 150 psi (1035 kPa) inlet and an outlet pressure of 20 psi (140 kPa).
- .2 Provide pressure reducing valve stations at each piece of equipment indicated on the drawings. Station shall be complete with isolation valves, ¼" (6 mm) female quick detachable coupling and pressure gauge. Valve shall be suitable for an inlet pressure of 150 psi (1035 kPa) and an outlet pressure of 75 psi (515 kPa).

2.04 PRESSURE GAUGES

- .1 Provide 1½" (38 mm) pressure gauges complete with shutoff cocks and snubbers. Select gauges with 0-200 psig (0-1380 kPa) range.

2.05 OUTLET STATIONS

- .1 Provide, at each compressed air outlet station, 8 ft. (2440 mm) long by 3/8" (10 mm) internal dia. heavy duty neoprene standard service station hose, complete with plug hose stem to snap onto the female detachable coupling. Provide female hose barb for the other end of the hose.

2.06 COUPLERS/CONNECTORS

- .1 Industrial interchange series, full-bore coupling, ¼" (6 mm) female Quick-Connect Air Hose Fittings unless noted otherwise.
- .2 Maximum rated inlet pressure: 300 psi (2070 kPa).
- .3 Inlet temperature range: -40°F to +250°F (-40°C to +121°C)
- .4 Valve seat: moulded nylon.
- .5 Body: **brass/ stainless steel**.
- .6 Threads: NPT.

2.07 CONTROLS

- .1 Pressure switch shall be capable to initiate compressor start at 95 psi (655 kPa) and to stop at a pressure of 150 psi (1035 kPa); pressure start and stop setpoints shall be field adjustable.
- .2 For duplex or multi-plex systems, provide electrical alternation set to operate each compressor for 12 hours period and automatically alternate to the second compressor at the pre-set timeframe. In the event one compressor fails or is unable to supply the necessary demand, the stand by compressor automatically starts to maintain air pressure. Controls shall be integral to each individual compressor unit and be configured to communicate between compressor units.
- .3 Manual control with Hand-Off-Auto ("H-O-A") starter switch.
- .4 Provide panel suitable for 600V/3ph/60Hz cycle electric power supply and complete with external hinged metal cover with tamperproof lock concealing start/stop buttons and other instruments.
- .5 Provide all required motor control wiring.
- .6 Provide a remote status panel complete with 3" (75 mm) alarm bell, flashing red light, alarm silence button, all in 5¼" x 19" (135 mm x 485 mm) long enclosure arranged for electronic rack installation.
- .7 Provide auxiliary contacts at compressor control panel to enable BAS status and alarm connection.

2.08 AIR COMPRESSOR

- .1 Provide Atlas Copco GA-series, or equivalent, oil-injected rotary screw, full feature, floor-mounted air compressors complete with ASME rated receiver tank.
- .2 Maximum working pressure to be 150 psig (1035 kPa).

- .3 This unit to also be complete with matched set V-belt drive, pressure switch for automatic start/stop, check valve, air cooled after cooler, drain valve, belt guard, silenced inlet filler and pre-wired automatic drain.
- .4 Provide pressure reducing valves assemblies where noted on the drawings, and complete with pressure gauges on high and low pressure side of valve.
- .5 Safety relief valves: safety relief valves shall be provided in accordance with the requirements of the Authorities Having Jurisdiction. Provide relief vent piping to atmosphere with termination at roof level.
- .6 Motor: standard protected, 10 HP, 600V/3ph/60Hz.
- .7 Control:
 - .1 Manual control with H-O-A starter switch.
 - .2 Pressure switch to cut out at 115 psi (800 kPa) (adjustable) and with minimum differential pressure.
 - .3 Provide all required motor control wiring.
- .8 Accessories: Belt guard and pressure gauges.
- .9 Air intakes: Complete with bird screen, replaceable cartridge type intake filter and silencer.
- .10 Capacity: Refer to mechanical equipment schedules.
- .11 Vibration isolation: 95% minimum efficiency.

2.09 AIR RECEIVER

- .1 Provide vertical 120 gallon receiver built to CSA B51 Provincial regulations for working pressure of 200 psi (1378 kPa). Flange or screw inlet and outlet connections.
- .2 Fittings shall include adjustable pressure regulator, safety valve, pressure gauge, drain cock and automatic condensate drain.
- .3 Tank finish shall be shop primed.
- .4 Tank to have valid CRN Registration.

2.10 AIR COMPRESSOR FLEXIBLE CONNECTORS

- .1 Provide flexible stainless steel metal pipe connectors in discharge piping from each compressor. Flexible connectors shall have a minimum burst pressure of four times operating pressure. Pipe sizes through 2" (50 mm) ID shall be furnished with Hex male nipple fittings and pipe sizes 2½" (65 mm) ID and larger shall be furnished with fixed steel flanges both sides.

2.11 REFRIGERATED AIR DRYER

- .1 Provide refrigerated air dryer integral with air compressor package, or as an accessory as part of a built-up compressor package.
- .2 Provide non-cycling air dryer of self-contained mechanical refrigeration type.
- .3 Dryer shall be capable of achieving 37°F (3°C) dew point.

2.12 COMBINATION FILTER-REGULATOR

- .1 Factory assembled, heavy-duty with mounting bracket and low pressure side relief valve.
- .2 Maximum inlet pressure: 115 psi (800 kPa).
- .3 Operating temperature: 0°F to 125°F (-18°C to 52°C).
- .4 Filter element: 40 micron. Bowls: Polycarbonate.
- .5 Pressure range in regulator: 5 psi (34 kPa) to 115 psi (800 kPa).
- .6 Gauge range: 0 to 160 psi (1100 kPa).

2.13 COMPRESSED AIR FILTERS

- .1 Provide general purpose coalescing filter downstream of the refrigerant dryers capable of reducing water/oil aerosol to 0.1 PPM and particulates of 0.01 micron.
- .2 Provide an active carbon filter removing hydrocarbon odors to 0.003 PPM and shall be down stream of the refrigerant dryers.
- .3 Provide a general particulate filter upstream of the refrigerant dryer capable of 99% efficiency as it relates to particulate removal.

PART 3 - EXECUTION

3.01 COMPRESSED AIR SYSTEM INSTALLATION

- .1 Provide interconnecting compressed air piping including fittings, valves and auxiliaries required to achieve a fully functional compressed air generation and distribution system.
- .2 Piping joints and fittings:
 - .1 Up to NPS $\frac{3}{4}$ " (20 mm): copper with brazed fittings
 - .1 Connections between steel and copper pipe to made up with dielectric unions or brass adapters, or brass valves.
 - .2 NPS 2" (50 mm) and smaller: steel pipe, threaded with threaded fittings made up with joint compound.
 - .3 NPS $2\frac{1}{2}$ " (65 mm) and larger: steel pipe, welded with butt weld or socket weld fittings.
- .3 Provide tees in lieu of elbows at changes in direction of piping. Install plug in open ends of tees.
- .4 Make all branch takeoffs from top of main.
- .5 Grade compressed air piping not less than 1% (1" in 8 ft. or 10mm in 1m) to dirt pocket with drain.
- .6 Install full size dirt pockets not less than 6" (150 mm) long at the bottom of each riser and elsewhere where dirt or condensate may accumulate each complete with drain valve connection with drain piping extended to nearest drain. Do not exceed 100 ft. (30 m) between drain points.
- .7 Provide check valves on compressor discharge piping.
- .8 Provide shut-off valves at all outlets, each main, branch and riser, and in locations as indicated in the Documents. Install valves with stems upright or horizontal.
- .9 Provide quick-coupler chucks and pressure gauges on drop pipes.
- .10 Weld steel piping in accordance with Section 20 10 50 Basic Mechanical Materials and Methods and;
 - .1 To ASME code and requirements of Authorities Having Jurisdiction (AHJs).
 - .2 Weld concealed and inaccessible piping regardless of size.
- .11 Connections to equipment:
 - .1 Provide shut-off valves at each equipment connection.
 - .2 Make connections to equipment using steel pipe with screwed unions up to NPS 2" (50 mm), and flanges for NPS $2\frac{1}{2}$ " (65 mm) and larger to permit removal or replacement.

3.02 PIPE LEAKAGE TESTING

- .1 Meet testing requirements of all Authorities Having Jurisdiction (AHJs). Obtain certification and certify tests not required by AHJs. Perform not less than the following tests.
- .2 Complete pipe leakage in accordance with the Mechanical Contractors Association of America (MCAA) "Guide to Pressure Testing Safety".
- .3 Complete pipe leakage testing in accordance with the requirements of ASTM A1047 / A1047M-05 "Standard Test Method for Pneumatic Leak Testing of Tubing", as follows:
- .4 Pneumatic Pipe Leakage Testing:

- .1 A preliminary pneumatic test not to exceed 25 psig may be applied, prior to other methods of leak testing, as a means of locating major leaks for piping subject to ASME B31.1 and/or ASME B31.3.
- .2 For piping subject to ASME B31.1 and/ or ASME B31.1, perform a pneumatic pressure test.
- .3 For piping subject to ASME B31.1, the pneumatic test pressure shall be not less than 1.2 nor more than 1.5 times the design pressure of the piping system, but shall not exceed the maximum test pressure for any vessel, compressor, valve, or other component in the system under test.
- .4 For piping subject to ASME B31.3, the pneumatic test pressure shall be not less than 1.1 times the design pressure of the piping system
- .5 Pressurize test circuit with air or nitrogen to a gage pressure, which is the lesser of one-half the test pressure or 25 psig.
- .6 After reaching one-half the test pressure, gradually increase pressure in steps of one-tenth the test pressure until the test pressure is reached.
- .7 Test without pressure drop for a period of not less than 10 minutes at the maximum test pressure, then reduce to the design pressure, and hold for a period that allows for a complete visual inspection of the piping systems under test, however, for a period not less than 4 hours. Pneumatic leakage testing shall be repeated until no leaks are found.
- .8 Examination for leakage shall be conducted using soap bubble or equivalent detection methods, shall be made of all joints and connections. The piping system, exclusive of possible localized instances at pump or valve packing, shall show no visual evidence of weeping or leaking. Wipe joints clean after test.
- .5 Perform tests before piping is covered or concealed.
- .6 Eliminate leaks or remove and refit defective parts. Do not caulk threaded or welded joints.
- .7 Remove all components which will not withstand test pressure following any remedial work after testing.
- .8 After pressure testing is completed, adjust and put all parts of the system into proper working order. Leave the complete job ready for regular operation, all to the satisfaction of the Consultant.
- .9 After the testing period, drain the system, and compressed air is introduced into the system, clean out all dirt pockets and strainers.
- .10 The final test and acceptance shall not be made until the work is fully completed.

3.03 INSTALLATION OF COMPRESSORS

- .1 Install compressor(s) in accordance with manufacturer's written instructions, and all requirements of the Authorities having Jurisdiction (AHJs).
- .2 Install compressor(s) on vibration isolators set on 4" (100mm) high concrete housekeeping pad.

3.04 MAIN AIR PRESSURE REGULATORS

- .1 Install compressed air pressure regulating stations where noted on the drawings, and in accordance with drawing details.
- .2 Install pressure regulators in three valve by-pass arrangements.

3.05 INSTALLATION OF COMPRESSED AIR FILTERS

- .1 Install filters in accordance with Manufacturer's Installation requirements.
- .2 Install a general particulate filter upstream of the refrigerant dryer.
- .3 Install general purpose coalescing filter downstream of the refrigerant dryers.
- .4 Install an active carbon filter downstream of the refrigerant dryers.
- .5 Install filters in three valve by-pass arrangements.

3.06 EQUIPMENT TESTING

- .1 Have manufacturer of products Supplied under this Section review work involved in handling, installation, application, protection, and cleaning of their products and submit written reports, in acceptable format, to verify compliance with the operation of their product.
- .2 Provide manufacturer's commissioning services, consisting of periodic site visits for inspection of product installation, product use recommendations and, operating and service training of Owner's designated personnel.
- .3 Schedule site visits to review work at stages listed:
 - .1 After delivery and storage of products, and when preparatory work on which work of this Section depends is complete, but before installation begins.
 - .2 Twice during progress of work at 25% and 60% complete.
 - .3 Upon completion of Work, after cleaning is carried out.
 - .4 Operator training of Owner's service personnel.
- .4 Submit reports within three (3) days of manufacturer's site attendance.

3.07 SYSTEM START-UP

- .1 Thoroughly clean the compressed air system before and after testing to ensure that all dirt, water and moisture are removed.
- .2 Demonstrate the condition and operation of the complete compressed air installation to the satisfaction of the Consultant.
- .3 Upon completion and verification of performance of installation, remove surplus materials, excess materials, rubbish, tools and equipment.
- .4 Warrant the system to be completely oil free.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with requirements of Section 20 10 10 Plumbing Piping and Pumping Systems.

1.02 SCOPE OF WORK

- .1 Provision of plumbing equipment and specialties as described in this Section.

1.03 QUALITY ASSURANCE

- .1 Execute the Work of this Section only by skilled tradesmen regularly employed in the manufacture and installation of plumbing equipment and specialties.

1.04 SUBMITTALS

- .1 Submit the following Shop Drawings:
 - .1 Floor drain trap seal primers;
 - .2 Pressure reducing valves;
 - .3 Water hammer arrestors;
 - .4 Domestic hot water storage tanks;
 - .5 Hydro-pneumatic tanks;
 - .6 Backflow preventers;
 - .7 Water meters;

PART 2 - PRODUCTS

2.01 TRAP SEAL PRIMERS

- .1 Primer Valve Type: Precision Plumbing Products Inc. Model P2-500, or equal, trap primer valve, constructed of brass, adjustable to high or low water pressures and complete with "O" ring seals, 12 mm (½") threaded inlet and outlet connections, and, for priming two traps from the same primer, a DU-2 dual outlet distribution unit.
- .2 Primer Valve Type with Manifold: Precision Plumbing Products Inc. Model P1-500, or equal, trap primer valve constructed as specified above for the Model P2-500 primer valve, complete with a Model DU-3 or DU-4, 3 or 4 outlet distribution unit for priming 3 or 4 traps, and at Model "YS-8" supply tube with combinations of Model DU-3 and DU-4 distribution units for priming from 5 to 6 traps.
- .3 Electronic Type: Precision Plumbing Products #PT Series, or equal, surface wall mounting, CSA certified, 115 volt, 1 phase, 60 Hz., electronic, automatic trap priming manifolds, each sized to suit the number of drain traps or interceptors serviced, and each complete with:
 - .1 a galvanized steel cabinet with door;
 - .2 20 mm (¾") dia. NPT copper pipe inlet with shut-off valve and water hammer arrestor;
 - .3 a solenoid valve, an atmospheric vacuum breaker, and a discharge manifold with 12 mm (½") dia. compression type copper tube connections on 40 mm (1½") centres with quantity to suit the number of items to be primed;
 - .4 a control panel with circuit breaker, 5 ampere fuse, 24 hour timer, and manual override toggle switch.

2.02 BACFLOW PREVENTERS

- .1 Reduced pressure zone ("RPZ") style dual check valve design backflow preventers in accordance with CAN/CSA B64 (including supplements), each of bronze or epoxy coated cast iron bronze fitted construction depending on size, and complete with inlet strainer, inlet and outlet shut-off valves, an intermediate relief valve, ball valve type test cocks, and a proper air gap fitting.

2.03 TRAP SEAL PRIMERS

- .1 Equal to Precision Plumbing Products (PPP) model PTS electronic trap seal trap priming assembly shall automatically maintains a constant water seal in floor drain traps configured to accommodate 4 to 30 connections. Electronic trap seal primer assembly shall be as follows:
 - .1 Surface mounted NEMA-1 metal cabinet with cover plate: 12" x 12" x 4" deep (305mm x 305mm x 102mm deep)
 - .2 Domestic water inlet: ¾" (20mm) shut-off valve with female threaded connection to ANSI/ASME BI.20.1.
 - .3 Outlet: ½" (12mm) compression fitting(s) to SAEJ512.
 - .4 Manifold: ¾" (20mm) Type "L" copper tubing to ASTM B88.
 - .5 Soldered joints: 95-5 lead free containing lead not in excess of 0.2%.
 - .6 Electrical components: 2 Amp circuit breaker, manual over-ride switch/test button, timer, solenoid valve marked as UL listed.
 - .7 Backflow prevention: Anti-Siphon atmospheric vacuum breaker meets American Society of Sanitary Engineering (ASSE) Standard 1001 and CSA.
 - .8 Temperature rating: 32°F to 125°F (0°C to 51.7°C)
 - .9 Pressure rating: 20 psi to 150 psi (140 kPa to 1035 kPa).
 - .10 Electrical Specifications: 120V/1ph/60Hz; Watts: 6; Holding: 16 VA; In-rush: 34 VA

2.04 WATER HAMMER ARRESTORS

- .1 Piston type, 304 stainless steel, pressurized water hammer arrestors, each complete with a nesting type bellows and a casing of sufficient displacement volume to dissipate the kinetic energy generated in the piping system, a male treaded nipple connection, suitable for either vertical or horizontal installation, and each sized to suit the connecting potable water pipe and equipment it is provided for.

2.05 PRESSURE REDUCING VALVES

- .1 For piping 65 mm (2-1/2") diameter and larger, non-corrosive pilot operated pressure reducing valve to CAN/CSA B356, factory set at the required pressure, field adjustable, and complete with a bronze body and trim, screwed or flanged connections, and brass body pilot valve with stainless steel seat.

2.06 PLUMBING SYSTEM PRESSURE SAFETY RELIEF VALVES

- .1 Valve: to ASME Section IV.
- .2 Body Construction: brass.
- .3 Adjustable Pressure Setting: 8 to 25 psig (55 to 172 kPa).
- .4 Maximum Operating Differential Pressure From Open To Close:
 - .1 3 psig (20 kPa).
- .5 Acceptable Manufacturers:
 - .1 Bell & Gossett;
 - .2 Watts;
 - .3 Or Approved Equivalent

2.07 WATER MAKE-UP PRESSURE REDUCING VALVES

- .1 Iron body water pressure regulator with:

- .1 Low inlet pressure check valve;
- .2 fast fill /purge lever;
- .3 Removable stainless steel strainer, and;
- .4 Iron body diaphragm operated relief valve
- .2 Adjustable Low Pressure: 0.8 to 25 psig (55 to 172 kPa).
- .3 Acceptable Manufacturers:
 - .1 Bell & Gossett;
 - .2 Watts - No.1450F series
 - .3 A.W. Cash Valve - Type CBL
 - .4 Or Approved Equivalent

2.08 DOMESTIC HOT WATER STORAGE TANKS

- .1 Tank(s) shall be NSF 61 certified for use in potable water applications and have interior coated with a high temperature porcelain enamel, or glass lined (alkaline borosilicate composition) permanently fused to steel and furnished with magnesium anode rod(s) rigidly supported.
- .2 Heavy gauge steel jacket with baked enamel finish.
- .3 Storage tank(s) shall be constructed in accordance with the requirements of the ASME Boiler and Pressure Vessel Code, stamped and registered with the National Board of Boiler and Pressure Vessel Inspectors.
- .4 Tank(s) shall have a working pressure rating of 160 psi.
- .5 Tank(s) shall be insulated with a minimum of 50mm (2") of rigid polyurethane foam insulation; minimum R 12.5 thermal insulating value.
- .6 Storage tank(s) shall be covered by a five (5) year limited warranty against tank leaks.
- .7 Acceptable Manufacturers:
 - .1 Rheem- Ruud;
 - .2 A.O. Smith;
 - .3 PVI Industries;
 - .4 Or Approved Equivalent.

2.09 HYDRO-PNEUMATIC TANKS FOR POTABLE WATER SYSTEMS

- .1 Bladder type tank for Hydro-pneumatic applications for potable water system. The Domestic Cold Water shall not come into contact with the steel tank.
- .2 Capacity: As indicated on drawings.
- .3 Tanks shall be welded steel construction, ASME Section VIII, Division 1 suitable for a working pressure upto 250 psig (1722.5 kPa) and a temperature of 240°F (115°C).
- .4 Air shall be pre-charged at 40 psig (275.6 kPa). Tank shall be complete with an air charging valve.
- .5 Bladder shall be made of heavy duty Butyl Bladder.
- .6 All internal parts shall comply with the requirements of ANSI/NSF 61, FDA, Canadian Water Quality Association and Health Canada requirements.
- .7 Tanks shall be supported by steel legs or base for floor installations and shall be supported by adequate straps and hangers for ceiling installations.
- .8 Acceptable Manufacturers:
 - .1 Amtrol Well-X-Trol Series;
 - .2 Armstrong WX-L Series;
 - .3 HG Spec Expanflex AFX Series;

- .4 Or Approved Equivalent.

2.10 HYDRO-PNEUMATIC TANK FITTINGS

- .1 Expansion tank air control fitting.
- .2 Working Pressure: 125 psig (860 kPa).
- .3 Adjustable vent tube and built in manual vent valve.
- .4 Acceptable Manufacturers:
 - .1 Amtrol;
 - .2 Bell and Gossett;
 - .3 Or Approved Equivalent.

2.11 WATER SOFTENER SYSTEMS

- .1 Softener to have performance as noted on the Drawing Schedules.
- .2 Provide a complete automatic packaged and matched commercial water softening system comprised of resin tanks complete with following components:
 - .1 Softener Tank(s):
 - .1 Tanks to be sized for 100% of make-up requirements.
 - .2 Electrical welded pressure vessel, low carbon steel construction rated for 689.5 kPa (100 psi) working pressure and a minimum design pressure of 1.2 times working pressure amount. Tanks to be capable of withstanding testing with pressure fluctuations from 0 to 827 kPa (0 to 120 psi) for a minimum of 30,000 cycles.
 - .3 Each tank to be equipped with openings for mineral filling and periodic inspection.
 - .4 Tank finish to be a rust inhibiting primer.
 - .5 Tank supports to be structural steel legs that permit skid mounting. If required, comply with seismic zone 4 loading requirements.
 - .2 Fully integrated programmable microprocessor driven electronic controller to automatically cycle main operating valve through regeneration cycle.
 - .3 Audible alarm capable of emitting a tone of ~70 dBA and able to be disabled.
 - .4 Easily removable flow sensor with accuracy to 1% over full range and repeatability to +/- 0.5% of full range.
 - .5 Ion exchange resin capable of removing 30,000 grains of hardness with 6.8 kg (15 lb) of salt.
 - .6 Complete set of instructions, installation and operating manuals.
 - .7 Field service availability to supervise, inspect and provide operator training.
 - .8 Warranty covering workmanship and materials.
 - .9 Acceptable manufacturers are:
 - .1 Culligan Canada;
 - .2 Petwa Ltd;
 - .3 WaterMart;
 - .4 WaterGroup Companies Inc.

2.12 POTABLE WATER SEDIMENT FILTRATION SYSTEMS

- .1 Provide Judo model Profimat-Plus-ATP, or equal, protective potable water sediment filters with automatic backwash (time and differential pressure controlled) with performance and capacity as noted on the Drawing Schedules, and as follows:

- .1 Suitable for installation in horizontally and vertically orientation,
- .2 Complete with silver coated, stainless steel filter screen and high-efficiency point rotation system.
- .3 Suitable for drinking water temperature up to 86°F (30°C)
- .4 Operating pressure range: 20 - 230 psi (1.5 - 16 bar) for systems up to 2" (50mm) line size,
- .5 20 – 145 psi (1.5 - 10 bar) for sizes 2 ½" – 4" (65 – 100mm),
- .6 Plastic filter housing,
- .7 Servomotor,
- .8 Rotary flange with bayonet brass connection,
- .9 Threaded connections (up to 2" [50mm]) line size,
- .10 Automatic time-controlled and differential pressure-dependent backwash cycle,
- .11 Backwashing based on point rotation system with simultaneous cleaning of the inspection bell,
- .12 Adjustable backwash differential pressure up to maximum 1.5 psi (0.1 bar),
- .13 Electronic controller with function and fault display (light diode and buzzer), including:
 - .1 plug-in power supply,
 - .2 timer controlled backwash,
 - .3 settings: hourly, daily, weekly, monthly,
 - .4 manual backwash start-up button.

2.13 ULTRA-VIOLET POTABLE WATER STERILIZER SYSTEMS

- .1 Provide Pure-Aqua Inc. Series UVI, or equal, ultra-violet (UV) potable water sterilizer systems with performance and capacity as noted on the Drawing schedules.
- .2 UV potable water sterilizer systems shall employ ultraviolet generator technology. Untreated water shall enter the reaction chamber, circulate around a low-pressure mercury vapor lamp emitting ultraviolet light energy at 235.7nm wavelength to disrupt DNA of any microbiological (bacteria, viruses, ozone, chlorine, total organic carbon, and other micro-organisms) contaminants prior to discharge.
- .3 UV potable water sterilizer systems shall be constructed as follows:
 - .1 Electrical supply: 100-240V/50-60Hz,
 - .2 Maximum Operating Pressure: 100 psi (6.9 bar),
 - .3 Ambient Temperature: 32-104°F (0-40°C),
 - .4 Flow meter,
 - .5 Dynamic flow restrictor,
 - .6 Temperature management valve,
 - .7 Solenoid valve,
 - .8 Sensor reading output (4-20mA) UV sensor,
 - .9 Low-pressure high-output lamps (LPHO),
 - .10 Lamp status visual indicator,
 - .11 System hours of operation,
 - .12 Lamp out audible and visual alert (LOA),
 - .13 Remote start/stop (HOA),
 - .14 304 stainless steel control cabinet,
 - .15 316L stainless steel treatment reaction chamber,
 - .16 Ra 15 internal surface finish,
 - .17 EPDM elastomers,
 - .18 UV monitoring package: UV intensity reading with NIST certified sensor,
 - .19 Cool touch fan,

- .20 Control panel:
 - .1 UL type 4X or UL type 12,
 - .2 sloped top,
 - .3 4-20mA sensor reading output signal with UV monitoring option.

2.14 WATER METERS

- .1 Provide Neptune, or equal, municipal type water meter in accordance with sizes shown on the drawings and meeting City of Toronto requirements for accuracy and repeatability.
- .2 Provide dry contact type pulsed output with one pulse every 10 liters, or in units as otherwise noted on the Submittal, suitable for interface with the Building Automation System ("BAS"). Output to BAS shall provide instantaneous and totalized flow.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Install plumbing equipment and specialties in accordance with Manufacturer's requirements and the requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.

3.02 PRESSURE REDUCING VALVES

- .1 Provide domestic water pressure reducing valves in piping where required. Install so that each valve is readily accessible. Whenever possible, provide pressure reducing valves factory pre-set to required pressures.
- .2 Check and test operation and adjust as required.

3.03 TRAP SEAL PRIMERS

- .1 Prime all traps as required by Code and the Authorities having Jurisdiction (AHJs).
- .2 Prime all traps where called for in the design documents, such as fuel fired appliance flue vent drainage piping connections.
- .3 Install unit plumb and true with suitable access above finished floor.
- .4 Allow 1 ft. (300mm) of elevation for every 20 ft. (6m) of distance ran for floor drain make up line.
- .5 Coordinate with Electrical Trades suitable power source to provide power to electronic trap seal primer.

3.04 WATER HAMMER ARRESTORS

- .1 Provide accessible water hammer arrestors in domestic water piping in locations as follows:
 - .1 in headers at groups of plumbing fixtures;
 - .2 at the top of risers;
 - .3 at ends of long horizontal runs of piping;
 - .4 in piping connecting solenoid valves or equipment with integral solenoid valves;
 - .5 wherever else shown or required by Code.
- .2 Install each unit in a piping tee either horizontally or vertically in the path of potential water shock in accordance with the manufacturer's published instructions and details.

3.05 BACKFLOW PREVENTERS

- .1 Provide a backflow preventer in each direct domestic cold water connection to equipment other than plumbing fixtures and fittings.

- .2 Do not group make-up water connections to hydronic systems on a common backflow preventer. Provide a dedicated backflow preventer in the make-up water line to each system.
- .3 Locate each backflow preventer on a wall and above the floor such that it is easily accessible for maintenance and testing in accordance with Code requirements. Equip each backflow preventer with an air gap fitting and pipe the reduced pressure zone water outlet to drain.
- .4 Test operation of each backflow preventer in accordance with requirements of CAN/CSA B64 by personnel certified for such testing by governing authorities, and submit signed test results and a properly and clearly identified and marked inspection and test record card for each backflow preventer.
- .5 Provide drains to nearest floor drain on all back flow preventers.

3.06 INSTALLATION OF WATER SOFTENER

- .1 Provide a package type water softener assembly and secure in place on a concrete housekeeping pad.
- .2 Install equipment and components supplied loose with softener in accordance with softener manufacturer's instructions. Provide required valved piping, including drain piping terminated at a funnel floor drain combination.
- .3 Provide low voltage control wiring required in accordance with softener manufacturer's certified control wiring schematics. Install control wiring in conduit in accordance with requirements of electrical work specification.
- .4 Install initial charge of softener salt. Hand spare salt and soap test kit to Owner at site and store where directed.
- .5 Refer to General Mechanical requirements for equipment/system start-up requirements.
- .6 Refer to Section entitled Basic Mechanical Materials and Methods for equipment/system manufacturer certification requirements. Submit a copy of the letter prior to Substantial Performance of the Work.
- .7 Include for 4 hours of on-site training for 2 groups of 6 people. Training is to be a full review of all components including but not limited to a full operation and maintenance demonstration, with abnormal events.

3.07 INSTALLATION OF POTABLE WATER SEDIMENT FILTRATION SYSTEMS

- .1 Install potable water sediment filtration system in accordance with manufacturer's requirements, and all requirements of the Authorities Having Jurisdictions (AHJs.)
- .2 Provide isolation valves on the inlet and discharge piping connections to each potable water sediment filtration system.
- .3 Provide bypass valve around each potable water sediment filtration system with locking mechanism to allowing for valve to be locked in the closed position.

3.08 INSTALLATION OF ULTRA-VIOLET WATER STERILIZER SYSTEMS

- .1 Install Ultra-violet (UV) water sterilizer system in accordance with manufacturer's requirements, and all requirements of the Authorities Having Jurisdictions (AHJs.)
- .2 Provide isolation valves on the inlet and discharge piping connections to each UV water sterilizer system.
- .3 Provide bypass valve around each UV water sterilizer system with locking mechanism to allowing for valve to be locked in the closed position.

3.09 WATER METERS

- .1 Install water meter in accordance with Municipal requirements, manufacturer's instructions, and with isolation valves on inlet and discharge, and with lockable bypass valve around entire water meter assembly.

- .2 If water meter is not immediately available, provide spool pieces and filler connection. Remove filler pieces and install meter when available. Provide stanchion supports within {150 mm} [6"] of water meter inlet and outlet.

END OF SECTION

CONTENTS

PART 1 - GENERAL

- 1.01 GENERAL REQUIREMENTS**
- 1.02 DESCRIPTION**
- 1.03 SCOPE OF WORK**
- 1.04 QUALITY ASSURANCE**
- 1.05 SUBMITTALS**
- 1.06 SITE VISIT**

PART 2 - PRODUCTS

- 2.01 GENERAL REQUIREMENTS**
- 2.02 PLUMBING FIXTURE DATA SHEETS**

PART 3 - EXECUTION

- 3.01 GENERAL INSTALLATION REQUIREMENTS**
- 3.02 INSTALLATION OF PLUMBING FIXTURES**
- 3.03 INSTALLATION OF DRAINS AND CLEANOUTS**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .2 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .3 Comply with requirements of Section 20 11 10 Plumbing Piping and Pumping Systems.
- .4 Comply with requirements of Section 22 13 10 Sanitary and Storm Water Piping and Pumping Systems.
- .5 Comply with requirements of 22 30 10 Plumbing Equipment and Specialties.

1.03 SCOPE OF WORK

- .1 Provision of plumbing fixtures, roof drains, floor drains and cleanouts as described in this Section.

1.04 QUALITY ASSURANCE

- .1 Execute the Work of this Section only by skilled tradesmen regularly employed in the manufacture and installation of plumbing fixtures.

1.05 SUBMITTALS

- .1 Submit the following Shop Drawings:
 - .1 All plumbing fixtures specified.
 - .2 All roof drains specified
 - .3 All floor drains specified
 - .4 All cleanouts specified

1.06 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Trade Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Trade Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS

- .1 All plumbing fixtures provided shall comply with applicable Codes and Standards, and the requirements of the Authorities Having Jurisdiction ("AHJs").

2.02 PLUMBING FIXTURE DATA SHEETS

- .1 Reference the following plumbing fixture data sheets appended to this Section:
 - .1 Water closets
 - .2 Lavatories
 - .3 Showers
 - .4 Service sinks
 - .5 Emergency showers
 - .6 Emergency eyewash
 - .7 Floor drains

- .8 Cleanouts
- .2 Each lavatory, shower, and bathtub plumbing fixture shall be provided with a pressure balanced mixing valve to limit the hot water supply temperature to 49°C (120°F) in accordance with Ontario Building Code requirements whether one has been indicated on the plumbing fixture data sheets or not.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Installation of plumbing fixtures, roof drains, floor drains, and cleanouts shall comply with applicable Codes and Standards, and the requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Installation of plumbing fixtures, roof drains, floor drains, and cleanouts shall be in accordance with Manufacturer's requirements.

3.02 INSTALLATION OF PLUMBING FIXTURES

- .1 Make all required water piping, drain piping and vent piping connections to plumbing fixtures.
- .2 Each barrier free lavatory fixture that incorporates a horizontal offset drain connection at the base of the bowl shall have the incline angle of drain piping checked to ensure installation provides positive waste flow to drain. Correct drain incline until satisfactory positive waste flow is achieved.
- .3 In residential suites with washroom groups comprised of multiple plumbing fixtures, a common pressure balanced mixing valve may be provided in lieu of individual plumbing fixture mixing valves provided piping distribution from the outlet of the common mixing valve to the hot water connection at each fixture is limited to no more than 2 m (6 ft.).

3.03 INSTALLATION OF DRAINS AND CLEANOUTS

- .1 Make all required drain and vent piping connections to drain and cleanout bodies.
- .2 Prime all drainage traps as required by applicable Code(s) and Standards.
- .3 Provide 6 mil polyethylene under each drainage strainer and cleanout cover to prevent dirt from entering the system during construction. Remove polyethylene prior to Substantial Performance.
- .4 Coordinate all drain and cleanout provisions with affected Trades and the Architect.
- .5 Coordinate installation of roof drains and floor drains with all Trades to ensure location provides positive slope to drain, and to ensure proper integration of drain with any integral membrane layer.

LAV-1

Washfountain - Multi-Lav

SloanStone® 2-Station Wall-Mounted
Gradient Sink

To be specified

Sloan - Faucet

*CAD \$1,118.60

☑ **EBF-650-BAT-TEE-CP-0.35GPM-MLM-IR-FCT** OPTIMA®, Counter mounted, Automatic no-touch, Optional hardwired power (battery as a back-up), 24 VAC power harness connector supplied, Lavatory faucet, Polished chrome finish, 102 mm (4") centerset, Brass spout, 1.3 LPM (0.35 GPM) maximum flowrate, Multi-laminar spray outlet, Fixed Fixed spout, 116 mm (4-9/16") spout reach, 92 mm (3-5/8") high, Self-adapting infrared sensor, Dual inlet filter assembly with 9.5 mm (3/8") compression brass cap for tempered water included, Wireless bluetooth status view, setting adjustment and diagnostic via Sloan Connect App?®, Integral water supply shut off.

Sloan - Faucet and Flush Valve Power Kit

*CAD \$256.10

☑ **SL-EAF-70-A** For faucet

Lawler - Mixing Valve

*CAD \$287.30

☑ **570-86820** Point of Use and Master controlled fixtures, Thermostatic master water mixing control valve, The temperature is adjusted with the help of Spindle.

Sloan- Washfountain - Multi-Lav

☑ **ELGR-82000 (WH)**

Easily repairable and non-porus SloanStone solid surface material. Wall mounted, 559 mm (22") wide, 1524 mm (60") long, 127 mm (5") high, number of stations: Two stations, Single molded basins.

Refer to the product specification sheet for complete information

To be specified

Centoco - Seat

*CAD \$43.74

☒ **500STSCCFE-001** FAST-N-LOCK, For elongated bowl, Open front, Heavy-duty, For commercial applications, Polypropylene, Toilet seat, Less seat cover, Plastic commercial check hinges, and Stainless steel hinge pin, Specified in White finish,

FAST-N-LOCK mounting system takes the guess work out when tightening the hardware. The specially designed fasteners in click" when the appropriate torque is reached. The bolt and nut material shall be stainless steel,

Dimensions:25 mm (1") high, 473 mm (18-5/8") long, 371 mm (14-5/8") wide

Watts - Carrier

☒ **ISCA-141-4-D** Vertical, Industry Standard Back-to-Back Thin Wall Closet Carrier, 500 lb (227 kg), Adjustable for standard and wheelchair height, 102 mm (4") no hub waste, 51 mm (2") or 102 mm (4") vent connection, patented compression seal faceplate assembly, epoxy coated cast iron, with incremental measurements embossed onto legs to easily adjust height of carrier to most commonly used fixture requirements, epoxy coated cast iron foot support, neoprene bowl gasket, epoxy coated cast iron, integral test cap, chrome cap nuts, Plated hardware, Adjustable ABS nipple,

Codes and Compliances: Carrier complies with requirements of ASME A112.6.1M up to a 500 lb. (227 kg.) static load.

American Standard- Toilet

☒ **3351101.020**

*CAD \$457.00

Toilet, Wall-hung with wall outlet, Toilet operates in the range of 4.2 to 6.0 LPF (1.1 - 1.6 GPF), White finish Vitreous china, EverClean® antimicrobial surface, Elongated bowl, Concealed trapway design, Direct-fed siphon jet flush action, 38 mm (1-1/2") top spud, Flush valve by others, Fully-glazed 54 mm (2-1/8") trapway, Static load rating of 454 kg (1000 lb), this product is not recommended for bariatric use, Condensation channel, Toilet seat not included, Consisting of:
Overall Dimensions: 356 mm (14") wide, 660 mm (26") from finished wall, Water Surface: 254 x 305 mm (10" x 12") water surface area
Map Score: >=1000 MaP® flush score (when use with proper flush valve)
Compliances: ASME A112.19.2 compliant, CSA B45.1 compliant.

Refer to the product specification sheet for complete information

Centoco - Seat

*CAD \$43.74

☒ **500STSCCFE-001** FAST-N-LOCK, For elongated bowl, Open front, Heavy-duty, For commercial applications, Polypropylene, Toilet seat, Less seat cover, Plastic commercial check hinges, and Stainless steel hinge pin, Specified in White finish,

FAST-N-LOCK mounting system takes the guess work out when tightening the hardware. The specially designed fasteners in click" when the appropriate torque is reached. The bolt and nut material shall be stainless steel,

Dimensions: 25 mm (1") high, 473 mm (18-5/8") long, 371 mm (14-5/8") wide

Franke Commercial - Backrest

*CAD \$466.00

☒ **CM-16104-WM** wall mounting, back rest, solid core plastic laminate panel back, Antique white, 305 mm (12") wide, 102 mm (4") high, 137 mm (5-3/8"), 18 gauge stainless steel bar with #4 gloss with flanges and covers, concealed snap flanges and mounting hardware included, Provide adequate backing in wall for support and comply to local codes for barrier free requirements

American Standard- Toilet

☒ **3351101.020**

*CAD \$457.00

Toilet, Wall-hung with wall outlet, Toilet operates in the range of 4.2 to 6.0 LPF (1.1 - 1.6 GPF), White finish Vitreous china, EverClean® antimicrobial surface, Elongated bowl, Concealed trapway design, Direct-fed siphon jet flush action, 38 mm (1-1/2") top spud, Flush valve by others, Fully-glazed 54 mm (2-1/8") trapway, Static load rating of 454 kg (1000 lb), this product is not recommended for bariatric use, Condensation channel, Toilet seat not included,

Consisting of:

Overall Dimensions: 356 mm (14") wide, 660 mm (26") from finished wall,

Water Surface: 254 x 305 mm (10" x 12") water surface area

Map Score: >=1000 MaP® flush score (when use with proper flush valve)

Compliances: ASME A112.19.2 compliant, CSA B45.1 compliant.

Model range ceramic

Elegance meets technology. The complete absence of a flushing rim and sharp edges in the vitreous china urinals from URIMAT actively avoid any build-up of deposits. The non-porous glaze of the URIMAT ceramic bowl ensures that no residues are left. No water, no chemicals, no odour. The patented mechanical drain trap and the microbiological cleaning agents guarantee trouble-free, odourless operation.

Dimensions (in mm)

Mounting frames

The practical mounting element for new installation and renovation

URIMAT mounting frames ensure the accurate fit and simple assembly using just four fixing screws.

The four mounting brackets ensure highly secure installation and enable precise horizontal and vertical alignment.

URIMAT KeraFix is highly recommended in dry construction and when installing ceramic urinals.

When installing our high tech plastic urinals URIMAT MakroFix is the perfect solution.

Guardian- Emergency Equipment

☑ **G1814**

Wall-hung, Eye wash, constructed from Type 304 brushed stainless steel finish, 283 mm (11-1/8") Ø bowl size, Corrosion resistant powder coated finish finish. Two GS-Plus spray heads with flip top dust cover each, 13 mm (1/2") Ø IPS Chrome plated brass stay open ball valve, 13 mm (1/2") Ø NPT female inlet supply inlet, 32 mm (1-1/4") Ø NPT female outlet,

Codes and Compliances:, ANSI compliant.

Refer to the product specification sheet for complete information

Estimated Total: **Not available**
*List Price is intended for budgetary purposes only. Actual costs may vary.

FFD-1

- Floor drain

For Funnel application

To be specified

Pipe Size

- ☒ Unsize pipe
☐ 51 mm (2") pipe size
☐ 76 mm (3") pipe size
☐ 102 mm (4") pipe size
☐ 152 mm (6") pipe size

Connection Type

- ☒ To be determined
☐ No-hub outlet
☐ Push-on outlet
☐ Threaded outlet
☐ Inside caulk outlet
☐ Socket outlet (ABS or PVC)

Optional Body Material

- ☒ Standard body material
☐ PVC body (socket outlet)
☐ ABS body (socket outlet)

Strainer

- ☒ Unsize strainer
☐ 127 mm (5") diameter nickel bronze strainer
☐ 127 mm (5") diameter cast iron strainer

Options

- ☐ Sediment bucket
☐ Vandal-proof
☐ Backwater valve
☐ Galvanized top
☐ All galvanized
☐ Strainer extension (DD-50)
☐ Special epoxy from 3M range
☐ Side outlet
☐ Elastomeric flange

Watts- Floor Drain

☒ **FD-100-C-EG**

Epoxy coated cast iron, Floor drain, Adjustable Anchor flange, Reversible membrane clamp, 102 x 229 mm (4" x 9") "EG" elongated oval nickel bronze funnel, Collar with primary and secondary weepholes, 32 cm² (5 sq. in.) free area.

Refer to the product specification sheet for complete information

SK-1

Type 304 Stainless steel

Double compartment, Wall-hung,
Surgeon scrub-up sink

To be specified

Chicago Faucets - Faucet

☒ **116.104.AB.1** HYTRONIC®, Wall-hung, Automatic no-touch, Hardwired, Sink/lavatory faucet, Polished chrome finish, Single hole centerset, Lead Free ANSI/NSF 61 and ANSI/NSF 372 compliant, ECAST® brass construction, Stainless steel hoses included, 1.9 LPM (0.5 GPM) maximum flowrate, Pressure compensating non-aerated laminar spray outlet, includes optional 5.7 LPM (1.5 GPM) insert, Rigid/swing Gooseneck spout, 138 mm (5-3/8") spout reach, 305 mm (12") high, Dual infrared sensor, 12 volt AC transformer required (to be ordered separately).

Chicago Faucets - Faucet and Flush Valve Power Kit

*CAD \$117.40

☒ **243.260.00.1/242.340.00.1** Hardwired AC transformer, Transformer and wire

Lawler - Mixing Valve

*CAD \$287.30

☒ **570-86820** Point of Use and Master controlled fixtures, Thermostatic master water mixing control valve, The temperature is adjusted with the help of Spindle.

Franke Commercial- Sink

☒ **SSU2-2040-7MOD**

Anti-Microbial Coating, Without faucet ledge, 16 gauge Type 304 Stainless steel Polished to #4 satin finish, With backsplash, Radius coved bowl corners, Access panel for service and maintenance, Includes wall hanger brackets, Center waste location, 38 mm (1-1/2"-16) threaded tailpiece with special integral waste design to prevent use of waste plug,

Codes and Compliances: ASME A112.19.3 compliant, CSA B45.4 compliant,

Bowl Dimension: 953 mm (37-1/2") long, 343 mm (13-1/2") wide, 254 mm (10") deep,

Overall Dimension: 1016 mm (40") long, 502 mm (19-3/4") wide, 711 mm (28").

Refer to the product specification sheet for complete information

AD-1

Extra Heavy Duty (XD) -
Floor drain

For Area application

To be specified

Pipe Size

- ☒ Unsize pipe
☐ 51 mm (2") pipe size
☐ 76 mm (3") pipe size
☐ 102 mm (4") pipe size

Options

- ☐ Vandal-proof grate
☐ Nickel bronze top
☐ Threaded outlet

Watts- Floor Drain

☒ **FD-430**

Epoxy coated fabricated steel, Floor drain, Square Side outlet, Epoxy coated heel proof ductile iron hinged grate, Membrane clamping flange, Membrane clamping cast iron frame, Integral trap with cleanout plug, With sediment bucket, 265 cm² (41 sq. in.) free area,

Certification and Compliances include: ASME A112.21.1M compliant.

Refer to the product specification sheet for complete information

PART 3 - EXECUTION

- 3.01 INSTALLATION OF GAS PIPING SYSTEMS**
- 3.02 EQUIPMENT GAS SERVICE CONNECTIONS**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .2 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.03 WORK PERFORMED BY THIS SECTION

- .1 Provision of natural gas, propane and fuel oil piping systems.

1.04 QUALITY ASSURANCE

- .1 Execute work of this Section only by skilled tradesmen regularly employed in the manufacture and installation of natural gas, propane, and fuel oil and piping systems and related equipment.
- .2 Comply with all requirements of the Authorities Having Jurisdiction ("AHJs"). Carry out all testing and perform all remedial Work required to the satisfaction of the AHJs.

1.05 AUTHORITY FIELD APPROVALS

- .1 Submit application for and pay costs associated with TSSA variance approval and field inspection for the following elements of work:
 - .1 use design specifications schematic drawing(s), plan drawing(s) and section drawing(s).

1.06 SUBMITTALS

- .1 Submit the following Shop Drawings:
 - .1 Natural gas piping;
 - .2 Natural gas piping system fittings;

1.07 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the Bid Price.

1.08 NATURAL GAS SERVICE

- .1 Extend new natural gas line from the site service provided at the Building exterior by the Site Utility Trades.
- .2 Provide main gas meter and sub-meters as follows:
 - .1 Meters and sub-meters shall be certified for producing invoicing under Canada Weights and Measures Act;
 - .2 Meters and sub-meters shall be complete with a pulse metering head for monitoring instantaneous and totalized flow at the Building Automation System ("BAS").
- .3 Provide regulating valves and associated accessories to suit required downstream distribution pressure.

PART 2 - PRODUCTS

2.01 NATURAL GAS SYSTEM

- .1 Provide complete natural gas system, to CGA requirements.

- .2 Provide pressure reducing, regulating and relief valving required for compatibility between equipment and building natural gas distribution system.
- .3 Above Grade Steel Pipe: Schedule 40 ERW or CW black carbon steel pipe conforming to ASTM A53 Grade B, seamless as follows:
 - .1 NPS ½" to 1½" (12mm to 38mm) Exposed, Threaded Ends.
 - .2 NPS ½" to 1½" (12mm to 38mm) Concealed, Bevelled Ends.
 - .3 NPS 2" to 10" (50mm to 250mm), Bevelled Ends.
- .4 Below Grade Polyethylene Pipe: Series 125 polyethylene pipe certified to CAN/CSA B137.4-M with a smooth finish, free from imperfections such as grooves and ripples.
- .5 Jointing Material:
 - .1 Flange Gaskets: Nitrile binder flat ring type of 1/16" (1.6 mm) thickness to ANSI B16.21, ANSI B16.20 or ANSI A21.11. Flange gaskets shall be made of either neoprene or other similar material which shall be resistant to any action of gas. Natural rubber or asbestos shall not be utilized.
- .6 Fittings:
 - .1 Pipe fittings, screwed, flanged or welded shall be as follows:
 - .1 Screwed Fittings: Class 150 black malleable iron screwed fittings conforming to ASTM A197 and ANSI/ASME B16.9.
 - .2 Steel Pipe Flanges and Flanged Fittings: Class 150 forged carbon steel raised face slip-on or welding neck type conforming to ASTM A81 Grade 1 and ANSI/ASME B16.5. Remove raised face when connecting to valves or equipment having a flat faced flange.
 - .3 Welded Fittings: Schedule 40 carbon steel butt welding fittings conforming to ASTM A234 WPB Grade B and ANSI/ASME B16.9.
 - .2 Piping or fitting threads in accordance with ANSI B1.120.1.
 - .3 Unions: Class 250 black malleable iron "Dart" type with brass to brass seat.
 - .4 Bolts and Nuts: Hex head machine bolts with hexagon nuts, both of semi-finished carbon steel conforming to ASTM A307 Class A.
 - .5 Nipples, Schedule 40: to ASTM A53-82.
 - .6 For polyethylene pipe provide Series 125 polyethylene socket welding type, being compatible with the pipe material, certified to CAN/CSA B137.4-M. Join pipe and fittings using a heat fusion method as recommended and described in the pipe manufacturers installation manuals. Install in accordance with CSA Z184-M and Z184S1.
- .7 Flexible Gas Piping:
 - .1 The fuel gas piping system shall consist of corrugated semi-rigid stainless steel tubing with brass mechanical attachment fittings terminating in NPT pipe fittings for easy attachment to traditional black iron pipe systems and direct connections to gas appliances.
 - .2 Tubing is acceptable up to 2" (50mm) in size.
 - .3 The 300 series stainless steel tubing shall be jacketed with a non-metallic cover.
 - .4 The jacket shall be marked at intervals with the amount of tubing left on the reel, for quick measurement.
 - .5 Provide protection devices where flexible piping passes through studs, joists and other building materials. Provide a striker plate made from stamped steel that is specially hardened to resist penetration from screws and pneumatic nail guns.
 - .6 Acceptable Manufacturers: Omega Flex Trac Pipe.
- .8 Ball Valves:

- .1 Up to 2" (50mm) threaded valves.
- .2 Rated to 125 psig natural gas, bronze body, 2 piece, full port, complete with chrome plated bronze ball, TFE seats, adjustable or double O ring packing.
- .3 Stamped CSA and CGA 3.16 on the body.
- .4 Acceptable Manufacturers: Kitz 58, Toyo 5044A, Crane, Jenkins, Grinnell
- .9 Gate Valves:
 - .1 NPS 2½" (65mm) and Larger:
 - .1 CGA approved, Class 175 lubricated plug valve with semi steel body, flat faced flanged ends drilled to Class 125, tapered plug with lever operator for valves NPS 4 and smaller and worm gear handwheel operator for valves NPS 6 and larger.
- .10 Pressure Reducing Stations:
 - .1 Provide gas pressure reducing station(s) where required to reduce building distribution system pressures to appliance operating pressure ranges.
 - .2 Pressure regulators shall be spring-loaded self-operated design and shall be tight closing with replaceable orifices and discs and concealed accessible manual adjustment. Valve bodies shall be cast iron rated for {1034 kPa} [150 psig] gas pressure and all valve materials shall be epoxy painted to resist corrosive ambient conditions.
- .11 Pressure Relief Stations:
 - .1 Provide gas pressure relief stations downstream of all pressure reducing stations.
 - .2 Provide relief valves of spring-loaded design with throttling characteristics to reduce system pressure surges. Valve bodies shall be cast iron rated for {1034 kPa} [150 psig] gas pressure with replaceable orifices and discs and concealed accessible manual adjustment. All valve materials shall be epoxy painted to resist corrosive ambient conditions.

PART 3 - EXECUTION

3.01 INSTALLATION OF GAS PIPING SYSTEMS

- .1 Install natural gas service to meet CGA, and The Ontario Gas Utilization Regulations and all Authorities Having Jurisdiction ("AHJs").
- .2 Gas Piping:
 - .1 Install natural gas piping in accordance with CAN1-B149.1.
 - .2 Unless otherwise indicated, connect to equipment in accordance with manufacturer's instructions.
 - .3 Slope piping down in direction of flow to low points.
 - .4 Use eccentric reducers at pipe size change installed to provide positive drainage.
 - .5 Provide clearance for access for maintenance of equipment, valves and fittings.
 - .6 Ream pipes clean of scale and dirt, inside and out.
 - .7 Cap open ends during construction to prevent entry of foreign material.
 - .8 Make connection to equipment with unions or flanges. Install piping to minimize pipe dismantling for equipment removal.
 - .9 Provide vents for all gas piping shafts in accordance to Code.
 - .10 Pipe mounted outdoors shall be painted in its entirety.
 - .11 Natural gas pipe mounted on the roof shall be installed as indicated on the installation detail included on the drawings.
- .3 Purging:
 - .1 Purge after pressure testing in accordance with applicable Codes.

- .4 Gas Valves:
 - .1 Valves that are 2" (50mm) and smaller shall be ball valves. Valves 2½" (65mm) and larger shall be lubricated plug gate valves.
 - .2 Install valves with stems upright or horizontal unless approved otherwise.
 - .3 Install valves at all branch take-offs to isolate each piece of equipment, and as indicated.
- .5 Gas Connections to Equipment:
 - .1 Connect gas piping to all gas fired equipment.
- .6 Painting and Identification:
 - .1 Paint gas service piping to meet code requirements.
- .7 Testing
 - .1 Test gas piping system in accordance with applicable Codes and the requirements of the Authorities Having Jurisdiction ("AHJs").

3.02 EQUIPMENT GAS SERVICE CONNECTIONS

- .1 Provide all natural gas service piping connection requirements required for Owner's Fixture, Furniture and Equipment (FF&E) supplied under other Sections of the Work.
- .2 Provide all pipe fittings, valves, strainers, vacuum breakers, unions and any other ancillaries as indicated, specified or as recommended by Equipment Manufacturer.
- .3 Connect Equipment requiring natural gas connections.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with requirements of Section 20 08 10 Mechanical Commissioning

1.02 SCOPE OF WORK OF THIS SECTION

- .1 Provision of HVAC system water piping systems, pumping systems, heat exchangers and all related ancillaries.

1.03 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the installation of pressure piping and pumping systems for hydronic heating and cooling applications.
- .2 All combustible piping to be ULC labelled and listed for flame spread rating of less than 25 and smoke classification of less than 50.
- .3 Pressure testing of HVAC Hydronic Piping Systems shall be completed in accordance with ASTM E 1003 "Standard Test Method for Hydrostatic Leak Testing"

1.04 SYSTEM PRESSURE AND TEMPERATURE REQUIREMENTS

- .1 Application:
 - .1 The requirements of ASME B31.9 Building Services Piping Code apply generally to industrial, institutional, commercial, and public buildings, and multi-unit residences, which does not require the range of sizes, pressures, and temperatures covered in ASME B31.1 Power Piping Code.
 - .1 The requirements of ASME B31.9 Building Services Piping Code shall apply to the following HVAC piping systems:
 - .1 steam and condensate up to a maximum pressure of 15 psig (103 kPa gage)
 - .2 non-flammable heat transfer fluids up to a maximum 160 psig (1103 kPa gage) pressure, and maximum 250°F (121°C) temperature as follows:
 - .1 water and glycol solutions for heating and cooling
 - .2 condensing water
 - .3 other nontoxic heat transfer liquids
 - .2 The requirements of ASME B31.9 Building Services Piping have the following piping material and piping size limitations:
 - .1 carbon steel: NPS 48 in. (DN 1200 mm) and 0.50 in.(12.7 mm) wall thickness
 - .2 stainless steel: NPS 24 in. (DN 600 mm) and 0.50 in.(12.7 mm) wall thickness
 - .3 copper: NPS 12 in. (DN 300 mm) and 12.125 in. (308 mm) O.D. for copper tubing
 - .4 thermoplastics: NPS 24 in. (DN 600 mm)
 - .2 The requirements of ASME B31.1 Power Piping Code shall apply to the following high-temperature, high-pressure HVAC piping systems:
 - .1 steam and condensate in excess of 15 psig (103 kPa gage), and

- .2 non-flammable heat transfer fluids in excess of 160 psig (1103 kPa gage) pressure, and/or temperatures exceeding 250°F (120°C).
- .2 **Bronze valves** in HVAC piping systems shall be provided with construction classifications consistent with the anticipated maximum operating pressure and temperature of the system(s) generally as follows:

Max. Temperature	Pressure Ratings According to ASME/ANSI Standards (psig)		
	Bronze (ASTM B62)		Bronze (ASTM B61)
	Class 125 (Threaded)	Class 150 (Threaded)	Class 300 (Threaded)
100° F	200	300	600
150° F	200	300	600
200° F	185	270	560
250° F	170	240	525
300° F	155	210	490
350° F	140	180	450
400° F	---	---	410
406° F	125	150	---
450° F	---	---	375
500° F	---	---	340
550° F	---	---	300

- .3 **Gray (Cast) Iron and Ductile Iron valves** in HVAC piping systems shall be provided with construction classifications consistent with the anticipated maximum operating pressure and temperature of the system(s) as follows:

Max. Temp.	Pressure & Temperature Ratings According to ASME Construction Standards by Pipe Size								
	Gray (Cast) Iron (ASTM A126)				Ductile Iron (ASTM A395)				
	Class 125			Class 250		Class 150		Class 300	
	2 ½" to 12"	14" to 24"	30" to 48"	2 ½" to 12"	14" to 24"	2 ½" to 12"	14" to 24"	2 ½" to 12"	14" to 24"
	65 to 300mm	350 to 600mm	750 to 1200mm	65 to 300mm	350 to 600mm	65 to 300mm	350 to 600mm	65 to 300mm	350 to 600mm
100° F	200	150	150	500	300	250	250	640	640
150° F	200	150	150	500	300				
200° F	190	135	115	460	280	235	235	600	600
225° F	180	130	100	440	270				
250° F	175	125	85	415	260				

Max. Temp.	Pressure & Temperature Ratings According to ASME Construction Standards by Pipe Size								
	Gray (Cast) Iron (ASTM A126)					Ductile Iron (ASTM A395)			
	Class 125			Class 250		Class 150		Class 300	
	2 ½" to 12"	14" to 24"	30" to 48"	2 ½" to 12"	14" to 24"	2 ½" to 12"	14" to 24"	2 ½" to 12"	14" to 24"
	65 to 300mm	350 to 600mm	750 to 1200mm	65 to 300mm	350 to 600mm	65 to 300mm	350 to 600mm	65 to 300mm	350 to 600mm
275 F	170	120	65	395	250				
300° F	165	110	50	375	240	215	215	565	565
325° F	155	105	---	355	230				
350° F	150	100	---	335	220				
375° F	145	---	---	315	210				
400° F	140	---	---	290	200	200	200	525	525
425° F	130	---	---	270	---				
450° F	125	---	---	250	---				
500° F	---	---	---	---	---	170	170	495	495

- .4 Water, Oil, Gas ("WOG") indicates the maximum pressure, in PSIG, allowed at ambient temperatures between 20°F and 100°F (-29°C to 38°C).
- .5 Working Steam Pressure ("WSP") indicates the upper-temperature limitation at the steam pressure noted in PSIG.
- .6 Cold Working Pressure ("CWP"): represents the maximum pressure, in PSIG, allowed at ambient temperatures between 20°F and 100°F.

1.05 SUBMITTALS

- .1 Submit shop drawings for the following Products:
 - .1 Non-slam wafer type check valves;
 - .2 Flow Balancing valves;
 - .3 Air vents
 - .4 Safety and Relief valves;
 - .5 Pressure reducing valves;
 - .6 Expansion Tanks
 - .7 Air Separators

1.06 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 HVAC HYDRONIC PIPING SYSTEMS

- .1 Piping:
 - .1 Working service pressure up to and including 875 kPa (125 psi): Schedule 40 ASTM specification A53 seamless Grade B wrought steel black pipe with standard black malleable steel threaded fittings rated at 1380 kPa (200 psi) WOG for pipe sizes 50mm (2") and smaller.
 - .2 Working service pressure up to and including 875 kPa (125 psi): Schedule 40 ASTM specification A53 seamless Grade B wrought steel black pipe with schedule 40 black steel welding fittings rated at 1380 kPa (200 psi) WOG for pipe sizes 65mm (2½") and larger.
 - .3 Type L copper to ASTM B88 with 95/5 soldered wrought copper pressure fittings to ANSI B22.18 for piping system rated at 1380 kPa (200 psi) WOG for pipe sizes up to and including 50mm (2").
 - .4 Working service pressures over 875 kPa (125 psi) and up to 2100 kPa (300 psi) black steel pipe which meets ASTM A106 Grade B (seamless) and the following:
 - .1 For sizes {12 mm to 50 mm} [1/2" to 2"] - Schedule 40, threaded or plain end.
 - .2 For sizes {65 mm} [2-1/2"] and over - Schedule 40, bevel end.
- .2 Fittings for pipe 50mm (2") and smaller:
 - .1 Working service pressure up to 875 kPa (125 psi) WSP Soldered: Wrought bronze or cast copper, ASTM B32, solder joint fittings, ANSI/ASME B16.18 or B16.22.
 - .2 Working service pressure up to 875 kPa (125 psi) WSP Threaded: Banded black cast iron, ASTM A126, threaded, ANSI/ASME B16.4, Class 125, ASTM A126
 - .3 Working service pressure up to 1035 kPa (150 psi) WSP Threaded: Galvanized malleable iron, threaded, ANSI/ASME B16.3, Class 150.
- .3 Fittings for pipe 65mm (2 1/2") and larger:
 - .1 Welded: Black steel, butted welded, ASTM A234/A234M, ANSI/ASME B16.9, each stamped by manufacturer for conformance and working pressure.
 - .2 Up to 860 kPa (125 psi) WSP Flanged: Cast iron flanged fittings, ANSI/ASME B16.1, Class 125.
 - .3 Flanges: Provide either flat-face or raised-face flanges as required to match flange faces on valves and equipment.
 - .4 Up to 860 kPa (125 psi) WSP Threaded: Threaded cast iron flanges, ANSI/ASME B16.1, Class 125.
 - .5 1035 kPa (150 psi) WSP: Weld neck or slip-on steel flanges, ASTM A181/A181M, Class 60, ANSI/ASME B16.5, Class 150.
- .4 Grooved End Couplings:
 - .1 Grooved End Couplings shall be manufactured by Victaulic unless an alternative manufacturer is proposed by the Contractor and accepted by the Consultant. Meet the practices described in current Victaulic literature.
 - .2 Grooved End Couplings:
 - .1 Victaulic grooved end couplings for glycol piping systems shall only be used on 2" (50mm) to 8" (200mm) piping.
 - .2 Grooved End Coupling pipe joints may be used in accessible areas only.
 - .3 Grooved End Couplings shall be rigid Victaulic Style 107 QuickVic couplings for sizes 2" (50mm) to 8" (200mm), Style 07 "Zero-Flex" rigid couplings for sizes 10" (250 mm) to 12" (300 mm), and Style W07 AGS rigid couplings for sizes 14"

(350mm) to 60" (1525mm). For glycol systems use Style 107 Victaulic QuickVic couplings only.

- .5 Meet hanger requirements in accordance with pipe joint manufacturer's recommendations as a minimum, otherwise meet Section 20 01 50 "Basic Materials and Methods" pipe hanger requirements.
- .6 Flange Bolts:
 - .1 Working service pressure up to 875 kPa (125 psi) WSP: ASTM A307, Grade B, square-head machine bolts with heavy hex-nuts.
- .7 Unions for pipe sizes 50mm (2") and smaller:
 - .1 Working service pressure up to 875 kPa (125 psi) WSP Soldered: Wrought bronze or copper, ground joint, solder end unions.
 - .2 Working service pressure up to 1035 kPa (150 psi) WSP Threaded: ASTM A197/A197M, ANSI/ASME B16.39, Galvanized malleable iron unions with ground joints, brass seat, threaded ends.

2.02 PIPING CORROSION PREVENTION

- .1 Provide V line insulating piping dielectric couplings as supplied for prevention of galvanic corrosion at specific points where connections are required between copper, brass or bronze and black or galvanized steel piping.
- .2 Acceptable manufacturers:
 - .1 H & G Specialties Limited;
 - .2 EPCO;
 - .3 Watts;
 - .4 Or equivalent.

2.03 GATE VALVES

- .1 Size ½" (12mm) to 2" (50mm), screw-in-bonnet, rising stem, solid wedge disc, **Class 125** cast bronze gate valve, equal to Kitz model 24 (threaded ends), or model 44 (soldered ends), as follows:
 - .1 Standards:
 - .1 End connections: ANSI B1.20.1 (threaded ends), ANSI B16.18 (soldered ends);
 - .2 Design: Manufacturers Standardization Society of the Valve and Fittings Industry, Inc. MSS SP-80, TYPE 2
 - .2 Pressure and Temperature:
 - .1 125 psi – Saturated steam to 353°F
 - .2 125 psi – fluid to 406°F
 - .3 **200 psi non-shock cold WOG**
 - .3 Materials:
 - .1 Body: ASTM B62, cast bronze
 - .2 Bonnet: ASTM B62, cast bronze
 - .3 Stem: ASTM B62, cast bronze
 - .4 Disc: ASTM B62, cast bronze
 - .5 Packing nut: ASTM B283, grade C37700 cast bronze
 - .6 Gland: ASTM B16 brass rod
 - .7 Gland packing: Aramid fibers with graphite
 - .8 Hand wheel: ASTM B86 zinc die-cast for sizes ½" (12mm) to 1" (25mm); ASTM B85 aluminum die-cast for sizes 1 ¼" (32mm) to 3" (75mm)

- .9 Wheel nut: ASTM B16 brass rod
- .2 Size 2 ½" (65mm) to 14" (350mm), outside screw-and-yoke, bolted bonnet, bronze mounted, solid wedge disc, **Class 125** cast iron gate valve, equal to Kitz model 72, as follows:
 - .1 Standards:
 - .1 End to end: ANSI B16.10, Class 125 "Face-to-Face and End-to-End Dimensions of Valves"
 - .2 End connections: ANSI B16.1, Class 125 "Cast Iron Pipe Flanges and Flanged Fittings"
 - .3 Design: Manufacturers Standardization Society of the Valve and Fittings Industry, Inc. MSS SP-70, TYPE 1
 - .2 Pressure and Temperature:
 - .1 125 psi – Saturated steam to 353°F
 - .2 125 psi – fluid to 406°F
 - .3 **200 psi non-shock cold WOG for sizes 2" (50mm) to 12" (300mm)**
 - .4 **150 psi non-shock cold WOG for size 14" (350mm)**
 - .3 Materials:
 - .1 Body: ASTM A126, Class B, cast iron
 - .2 Bonnet: ASTM A126, Class B, cast iron
 - .3 Stem: ASTM B124, grade C37700 forged brass
 - .4 Disc: ASTM A126, Class B, cast iron
 - .5 Gland: ASTM A395 ductile iron
 - .6 Gland packing: non-asbestos packing
 - .7 Hand wheel: ASTM A126, Class B, cast iron for sizes 2" (50mm) to 10" (250mm); ASTM A395 ductile iron for sizes 12" (300mm) to 14" (350mm)
 - .8 Wheel nut: ASTM A307, grade B carbon steel
 - .9 Gasket: non-asbestos sheet
 - .10 Body seat ring: ASTM B62, cast bronze
 - .11 Bonnet nut: ASTM A307, grade B carbon steel
 - .12 Gland nut: ASTM A307, grade B carbon steel
 - .13 Bonnet bolt: ASTM A307, grade B carbon steel
 - .14 Gland bolt: ASTM A307, grade B carbon steel
 - .15 Yoke sleeve: ASTM B62, cast bronze
 - .16 Wheel washer: ASTM B62, cast bronze
 - .17 Yoke: ASTM A126, Class B, cast iron for sizes 10" (250mm) to 14" (350mm)
 - .18 Yoke nut: ASTM A307, grade B carbon steel for sizes 10" (250mm) to 14" (350mm)
 - .19 Yoke bolt: ASTM A307, grade B carbon steel for sizes 10" (250mm) to 14" (350mm)
 - .20 Disc seat ring: ASTM B62, cast bronze

2.04 GLOBE VALVES

- .1 Size ½" (12mm) to 2" (50mm), screw-in-bonnet, inside screw, rising stem, integral seat, solid wedge disc, **Class 125** cast bronze globe valve, equal to Kitz model 11 (threaded ends), or model 12 (soldered ends), as follows:
 - .1 Standards:

- .1 End connections: ANSI B1.20.1 (threaded ends), ANSI B16.18 (soldered ends);
- .2 Design: Manufacturers Standardization Society of the Valve and Fittings Industry, Inc. MSS SP-80, TYPE 2
- .2 Pressure and Temperature:
 - .1 125 psi – Saturated steam to 353°F
 - .2 125 psi – fluid to 406°F
 - .3 **200 psi non-shock cold WOG**
- .3 Materials:
 - .1 Body: ASTM B62, cast bronze
 - .2 Bonnet: ASTM B283, grade C37700 forged brass for sizes ½" (12mm) to 2"; ASTM B62 cast bronze for sizes 2 ½" (65mm) to 3" (75mm)
 - .3 Stem: ASTM B62, cast bronze
 - .4 Disc: ASTM B62, cast bronze
 - .5 Lock nut: ASTM B124, grade C37700 cast bronze
 - .6 Packing nut: ASTM B283, grade C37700 cast bronze
 - .7 Gland: ASTM B16 brass rod
 - .8 Gland packing: Aramid fibers with graphite
 - .9 Hand wheel: ASTM B86 zinc die-cast for sizes ½" (12mm) to ¾" (19mm); ASTM B85 aluminum die-cast for sizes 1" (25mm) to 3" (75mm)
 - .10 Wheel nut: ASTM B16 brass rod
- .2 Size 2 ½" (65mm) to 8" (200mm), outside screw-and-yoke, bolted bonnet, bronze mounted, beveled wedge disc, **Class 125** cast iron globe valve, equal to Kitz model 76 (125FCJ), as follows:
 - .1 Standards:
 - .1 End to end: ANSI B16.10, Class 125 "Face-to-Face and End-to-End Dimensions of Valves"
 - .2 End connections: ANSI B16.1, Class 125 "Cast Iron Pipe Flanges and Flanged Fittings"
 - .3 Design: Manufacturers Standardization Society of the Valve and Fittings Industry, Inc. MSS SP-85, TYPE 1
 - .2 Pressure and Temperature service:
 - .1 125 psi – Saturated steam to 353°F
 - .2 125 psi – fluid to 406°F
 - .3 **200 psi non-shock cold WOG**
 - .3 Materials:
 - .1 Body: ASTM A126, Class B, cast iron
 - .2 Bonnet: ASTM A126, Class B, cast iron
 - .3 Stem: ASTM B124, grade C37700 forged brass
 - .4 Disc: ASTM B62, cast bronze for size 2" (50mm); ASTM A126, Class B, cast iron for sizes 2 ½" (65mm) to 8" (200mm)
 - .5 Lock nut: ASTM B62, cast bronze
 - .6 Gland: ASTM A395 ductile iron
 - .7 Gland packing: non-asbestos packing

- .8 Hand wheel: ASTM A126, Class B, cast iron for sizes 2" (50mm) to 6"(200mm); ASTM A395 ductile iron for size 8" (200mm)
- .9 Wheel nut: ASTM A307, grade B carbon steel
- .10 Gasket: non-asbestos sheet
- .11 Body seat ring: ASTM B62, cast bronze
- .12 Bonnet nut: ASTM A307, grade B carbon steel
- .13 Gland nut: ASTM A307, grade B carbon steel
- .14 Bonnet bolt: ASTM A307, grade B carbon steel
- .15 Gland bolt: ASTM A307, grade B carbon steel
- .16 Yoke bush: ASTM B62, cast bronze
- .17 Lock plate: ASTM A167, type 304 stainless steel
- .18 Disc seat ring: ASTM B62, cast bronze
- .3 Size ¼" (6mm) to 2" (50mm), unibonnet, PTFE disc, rising stem, **Class 150** cast bronze globe valve, equal to Kitz model 09 (threaded ends), or model 10 (soldered ends), as follows:
 - .1 Standards:
 - .1 End connections: ANSI B1.20.1 (threaded ends), ANSI B16.18 (soldered ends);
 - .2 Design: Manufacturers Standardization Society of the Valve and Fittings Industry, Inc. MSS SP-80, TYPE 2
 - .2 Pressure and Temperature:
 - .1 150 psi – Saturated steam to 366°F
 - .2 150 psi – fluid to 406°F
 - .3 **300 psi non-shock cold WOG**
 - .3 Materials:
 - .1 Body: ASTM B62, cast bronze
 - .2 Bonnet: ASTM B283, Grade C37700 forged brass for sizes ½" (12mm) to 2"; ASTM B62 cast bronze for sizes 2 ½" (65mm) to 3" (75mm)
 - .3 Stem: ASTM B62, cast bronze
 - .4 Disc: G/F PTFE
 - .5 Packing nut: ASTM B283, Grade C37700 cast bronze
 - .6 Gland: ASTM B16 brass rod
 - .7 Gland packing: Aramid fibers with graphite
 - .8 Hand wheel: ASTM B86 zinc die-cast for size ½" (12mm); ASTM B85 aluminum die-cast for sizes ¾" (19mm) to 2 ½" (65mm), ASTM A536 ductile iron for size 3" (75mm)
 - .9 Wheel nut: ASTM B16 brass rod
 - .10 Bonnet ring: ASTM B62, cast bronze for sizes ½" (12mm) to 2" (50mm)
 - .11 Disc holder: ASTM B62, cast bronze
 - .12 Disc nut: ASTM B16 brass rod for sizes ½" (12mm) to ¾" (19mm); ASTM B283, grade C37700 forged brass for sizes 1" (25mm) to 3" (75mm)
 - .13 Split pin: copper
 - .14 Gasket: Aramid fiber sheet
 - .15 Bonnet nut: ASTM B16 brass rod

- .16 Bonnet bolt: carbon steel
- .4 Globe valves in grooved end piping systems may be substituted with globe valves from Victaulic, or similar grooved end piping system ancillaries manufacturer, provided it can be demonstrated that all pressure, temperature, and other performance metrics can be maintained for the useful life expectancy of the piping system.

2.05 BRASS BALL VALVES

- .1 Size ¼" (6mm) to 2" (50mm), forged brass, two piece, **full port**, chrome plated, PTFE seat, ball valves, equal to Kitz model 58 (AKSZA) threaded end, or model 59 (CSZA) soldered end, as follows:
 - .1 Standards:
 - .1 Threaded ends: ANSI B1.20.1, Class 150
 - .2 Soldered ends: ANSI B16.18
 - .3 MSS SP-110
 - .2 Pressure and Temperature:
 - .1 **600 psi service non-sock cold WOG**
 - .2 150 psi saturated steam to 366°F
 - .3 Materials:
 - .1 Body: ASTM B283, Grade C37700 forged brass
 - .2 Body Cap: ASTM B283, Grade C37700 forged brass
 - .3 Stem: ASTM B16 brass rod, nickel (Ni) plated
 - .4 Ball: ASTM B283, Grade C37700 forged brass, chrome (Cr) plated
 - .5 Handle: Carbon steel, zinc electroplated with plastic covering
 - .6 Handle nut: Carbon steel
 - .7 Ball seats: PTFE
 - .8 O-rings: FPM
 - .9 Thrust washer: PBT
- .2 Size 2 ½" (65mm) to 4" (100mm), forged brass, two piece, **full port**, chrome plated, PTFE seat, ball valves, equal to Kitz model 58 (AKSZA) threaded end, or model 59 (CSZA) soldered end, as follows:
 - .1 Standards:
 - .1 Threaded ends: ANSI B1.20.1, Class 150
 - .2 Soldered ends: ANSI B16.18
 - .3 MSS SP-110
 - .2 Pressure and Temperature:
 - .1 **400 psi service non-sock cold WOG**
 - .2 150 psi saturated steam to 366°F
 - .3 Materials:
 - .1 Body: ASTM B62, cast bronze
 - .2 Body Cap: ASTM B62, cast bronze
 - .3 Stem: ASTM B16 brass rod, nickel (Ni) plated
 - .4 Ball: ASTM B283, Grade C37700 forged brass, chrome (Cr) plated for size 2 ½" (65mm); cast brass for sizes 3" (75mm) and 4" (100mm)
 - .5 Handle: Carbon steel, zinc electroplated with plastic covering for size 2 ½" (65mm); ductile iron for sizes 3" (75mm) and 4" (100mm)

- .6 Handle nut: Carbon steel
- .7 Washer: Carbon steel for size 2 ½" (65mm)
- .8 Ball seats: PTFE
- .9 O-rings: FPM
- .10 Thrust washer: PTFE
- .3 Ball valves in grooved end piping systems may be substituted with ball valves from Victaulic, or similar grooved end piping system ancillaries manufacturer, provided it can be demonstrated that all pressure, temperature, and other performance metrics can be maintained for the useful life expectancy of the piping system.

2.06 BUTTERFLY VALVES

- .1 Size 2" (50mm) to 8" (200mm), **ductile iron body**, extended neck, bi-directional, molded seat, butterfly valve, equal to Kitz model 5123 (wafer style), or model 6123 (lug style), as follows:
 - .1 Standards:
 - .1 End connections: ANSI Class 125/150 flanges;
 - .2 MSS SP-67
 - .3 API-609, Cat. A
 - .4 NSF/ANSI – 372 suitable for drinking water
 - .2 Pressure and Temperature:
 - .1 **200 psi differential pressure** service
 - .2 -30°F to 275°F with EPDM seat
 - .3 Materials:
 - .1 Body: ASTM A536, Grade 65-45-12 ductile iron
 - .2 Stem: ASTM A276, Type 410 stainless steel (line scribed on top of stem to indicate valve position)
 - .3 Disc: Aluminum bronze, Grade C95400
 - .4 Handle bolt: Carbon steel
 - .5 O-rings: NBR/EPDM
 - .6 Bearing: Polyacetal
 - .7 Stem bearing: G/F PTFE for sizes 2" (50mm) to 5" (125mm); Metal backed PTFE for sizes 6" (150mm) and 8" (200mm)
 - .8 Plug: Zinc die-cast, chrome plated
 - .9 Cap: PVC for sizes 2" (50mm) to 6" (150mm)
 - .10 Index plate: Carbon steel
 - .11 Set bolt: Carbon steel
 - .12 Nut: Carbon steel
 - .13 Bottom stem: ASTM A276, Type 410 (ANSI Type 329) stainless steel
 - .14 Seat rubber: NBR/EPDM vulcanized to body
 - .15 Spring washer: Carbon steel
- .2 Size 10" (250mm) to 12" (300mm), **ductile iron body**, extended neck, bi-directional, square drive, molded seat, butterfly valve, equal to Kitz model 5123 (wafer style), or model 6123 (lug style), as follows:
 - .1 Standards:

- .1 End connections: ANSI Class 125/150 flanges;
 - .2 MSS SP-67 & SP-25
 - .3 API-609
- .2 Pressure and Temperature:
 - .1 **200 psi differential pressure** service
 - .2 -30°F to 275°F with EPDM seat
- .3 Materials:
 - .1 Body: ASTM A536, Grade 65-45-12 ductile iron
 - .2 Stem: ASTM A276, Type 410 stainless steel (line scribed on top of stem to indicate valve position)
 - .3 Disc: Aluminum bronze, Grade C95400
 - .4 Endplate bolts: Carbon steel
 - .5 Gland plate bolt: Stainless steel
 - .6 O-rings: NBR/EPDM
 - .7 Bearing: Polyacetal
 - .8 Steam bearing: Metal backed PTFE
 - .9 Set bolt: Carbon steel
 - .10 Bottom stem: ASTM A276, Type 410 (ANSI Type 329) stainless steel
 - .11 Seat rubber: NBR/EPDM vulcanized to body
 - .12 Gland plate: Carbon steel
 - .13 Spring washer: Carbon steel
 - .14 End plate: Carbon steel
- .3 Unless noted otherwise, butterfly valve sizes 2" (50mm) to 4" (100mm) shall have aluminum die-cast lever operated handle with ten (10) position throttling plate; butterfly valve sizes 6" (150mm) and larger shall have aluminum die-cast gear operated handle.
- .4 Butterfly valves in grooved end piping systems may be substituted with butterfly valves from Victaulic, or similar grooved end piping system ancillaries manufacturer, provided it can be demonstrated that all pressure, temperature, and other performance metrics can be maintained for the useful life expectancy of the piping system.
- .5 Victaulic Vic-300 grooved end valves may be substituted in grooved-end piping systems up to 300 psi (2100 kPa) as follows:
 - .1 To 175 psi (1225 kPa) working pressure, use Fig. 660L.
 - .2 To 225 psi (1575 kPa) working pressure, use Fig. 632-L648.
 - .3 To 250 psi (1750 kPa) working pressure, use Fig. Bhp-L1 meeting ANSI B16.5 as follows:
 - .1 285 psi (1995 kPa) to 100°F (38°C)
 - .2 265 psi (1885 kPa) to 212°F (100°C)
 - .3 250 psi (1750 kPa) to 250°F (121°C)
 - .4 Above 300 psi (2100 kPa) working pressure, use Bhp-L2 meeting ANSI B16.5 as follows:
 - .1 770 psi (5180 kPa) to 100°F (38°C)
 - .2 500 psi (3500 kPa) to 380°F (193°C)
 - .3 300 psi (2100 kPa) to 725°F (440°C)

2.07 FLOW BALANCING VALVES

- .1 Flow balancing valves ½" (12mm) to 2" (50 mm) provide Tour and Anderson series 786H (soldered end), series 787H (threaded end) or acceptable equivalent.
 - .1 Small bore flow balancing valves shall be suitable for working pressure up to **400 psi** for operating temperature range between -4°F to +248°F, with built-in drain connection with shut off valve and protective caps, and integral valve insulation.
- .2 Flow balancing valves from 2 ½" (65 mm) to 16" (400 mm) provide Tour and Anderson series 788 (flanged end), or series 789 (grooved end), or acceptable equivalent, Y-pattern style, cast iron body.
 - .1 Big bore flow balancing valves shall be suitable for working pressure up to **250 psi (grooved end connections), or 350 psi (flanged end connections)** for operating temperature range between -4°F to +248°F.
- .3 For each Tour and Anderson flow balancing valve, or acceptable equivalent, provide:
 - .1 vernier type handwheel settings for precision flow balancing
 - .2 positive shut off valve with no drip seat and plug type stem with teflon disc
 - .3 tamper proof hidden memory feature
 - .4 positive shut off metering valves with connections for portable meter
- .4 Select flow balancing valve size at 100% open to provide a pressure drop not to exceed a maximum pressure drop of 3.5 ft.wg. (10.5 kPa) under design flow conditions.
- .5 Flow balancing valves in grooved end piping systems may be substituted with flow balancing valves from Victaulic, or similar grooved end piping system manufacturer, provided it can be demonstrated that all pressure, temperature, and other performance metrics can be maintained for the useful life expectancy of the piping system.

2.08 SWING TYPE CHECK VALVES

- .1 Size ½" (12mm) to 2" (50mm), **Class 125 cast bronze**, screw cap, integral seat, PTFE seat, horizontal swing type check valve, equal to Kitz model 22T (AKYRT) threaded end, or model 23T (CYRT) soldered end, as follows:
 - .1 Standards:
 - .1 Threaded ends: ANSI B1.20.1, Class 125
 - .2 Soldered ends: ANSI B16.18
 - .3 MSS SP-80, Type 3
 - .2 Pressure and Temperature:
 - .1 **200 psi service non-sock cold WOG** at 150°F (65°C)
 - .2 125 psi fluids to 406°F
 - .3 125 psi saturated steam to 353°F
 - .3 Materials:
 - .1 Body: ASTM B62 cast bronze
 - .2 Cap: ASTM B283, Grade C37700 forged brass
 - .3 Disc: PTFE
 - .4 Disc holder: ASTM B62 cast bronze
 - .5 Disc nut: ASTM B16 brass rod for sizes ½" (12mm) to 1" (25mm); ASTM B283, Grade C37700 forged brass for sizes 1 ¼" (32mm) to 2" (50mm)
 - .6 Hinge pin: copper
 - .7 Plug: ASTM B16 brass rod
- .2 Size 2 ½" (65mm) to 10" (250mm), **Class 125 cast iron** swing type check valve, equal to Kitz model 78 (125FCO), as follows:

- .1 Standards:
 - .1 End to end: ASME B16.10, Class 125
 - .2 End connections: ASME B16.1, Class 125;
- .2 Pressure and Temperature:
 - .1 **200 psi service non-sock cold** WOG at 150°F (65°C)
 - .2 125 psi fluids to 406°F
 - .3 125 psi saturated steam
- .3 Materials:
 - .1 Body: ASTM A126, Class B cast iron
 - .2 Cover: ASTM A126, Class B cast iron
 - .3 Disc: ASTM B62 cast bronze for size 2" (50mm) to 4" (100mm); ASTM A216, Class B cast iron for sizes 5" (125mm) to 10" (250mm)
 - .4 Dis nut: ASTM A307, Grade B carbon steel
 - .5 Split pin: ASTM A580, Type 304 stainless steel
 - .6 Hinge pin: ASTM B124, Grade C37700 forged brass
 - .7 Plug: ASTM A36 carbon steel
 - .8 Gasket: Non-asbestos sheet
 - .9 Body seat ring: ASTM B62 cast bronze
 - .10 Cover nut: ASTM A36 carbon steel
 - .11 Cover bolt: ASTM A36 carbon steel
 - .12 Disc seat ring: ASTM B62 cast bronze
 - .13 Arm: ASTM A536, Grade 60-40-18 ductile iron
 - .14 Washer: ASTM A36 carbon steel
 - .15 Disc bolt: ASTM A307, Grade B carbon steel
 - .16 Spring pin: ASTM A686, Type W1
- .3 Check valves in grooved end piping systems may be substituted with check valves from Victaulic, or similar grooved end piping system ancillaries manufacturer, provided it can be demonstrated that all pressure, temperature, and other performance metrics can be maintained for the useful life expectancy of the piping system.

2.09 VERTICAL LIFT CHECK VALVES

- .1 Size ½" (12mm) to 2" (50mm), silent type, spring loaded, **cast bronze**, vertical lift type check valve, with renewable FPM disc, equal to Kitz model 36 (AKAF) threaded end, or model 26 (CAF) soldered end, as follows:
 - .1 Standards:
 - .1 Threaded ends: ANSI B1.20.1
 - .2 Soldered ends: ANSI B16.18
 - .2 Pressure and Temperature:
 - .1 **250 psi service** non-sock cold WOG
 - .2 175 psi fluids to 176°F
 - .3 Materials:
 - .1 Body: ASTM B584, Grade C84400 cast bronze
 - .2 Cap: ASTM B584, Grade C84400 cast bronze

- .3 Disc: FPM
- .4 Disc holder: ASTM B584, Grade C84400 cast bronze
- .5 Spring: Phosphor bronze
- .2 Vertical lift valves in grooved end piping systems may be substituted with vertical lift check valves from Victaulic, or similar grooved end piping system ancillaries manufacturer, provided it can be demonstrated that all pressure, temperature, and other performance metrics can be maintained for the useful life expectancy of the piping system.

2.10 NON-SLAM WAFER TYPE CHECK VALVES

- .1 Dual disc, non-slam, silent wafer type check valves, size 2" (50mm) to 54" (1350mm), equal to Mueller Steam Specialty, as follows:
 - .1 Standards: ASTM, ANSI, and API as applicable.
 - .2 **ASME Class 125**, model 71, as follows:
 - .1 Valve sizes 2" (50mm) to 12" (300mm) suitable for:
 - .1 **200 psi service** from -20°F to 150°F
 - .2 150psi at 353°F
 - .2 Valve sizes 14" (350mm) to 24" (600mm) suitable for:
 - .1 **150 psi service** from -20°F to 150°F
 - .2 105 psi service at 325°F
 - .3 Valve sizes 30" (750mm) to 54" (1350mm) suitable for:
 - .1 **150 psi service** from -20°F to 150°F
 - .2 100psi service at 225°F
 - .4 Body: ASTM A126, grade B, **grey cast iron**;
 - .5 Disc: ANSI 316 stainless steel;
 - .6 Shaft/ spring: 316 stainless steel
 - .7 Seat: Buna-N.

2.11 STRAINERS – Y (WYE) PATTERN

- .1 Size ½" (12mm) to 2" (50mm), **Class 125, cast copper silicon alloy body**, Y (wye) pattern strainer, equal to Watts Series LF777 (threaded ends), or LFS777 (soldered ends), as follows:
 - .1 Standards:
 - .1 NSF 372 for potable water applications
 - .2 Pressure and Temperature:
 - .1 ¼" (6mm) to 3" (75mm):
 - .1 **400 psi WOG** at 210°F
 - .2 125 psi WSP to 353°F
 - .2 4" (100mm):
 - .1 **300 psi WOG** at 210°F
 - .2 125 psi WSP to 353°F
 - .3 Materials:
 - .1 Body: cast copper silicon alloy
 - .2 Solid retainer cap: cast copper silicon alloy
 - .3 Cap seal: EPDM O-ring for sizes ¼" (6mm) to 3" (75mm); Garlock gasket for size 4" (100mm)

- .4 Gasket: EPDM
- .5 Screen: #20 stainless steel mesh for sizes ½" (12mm) to 2 ½" (65mm); 3/64" (1.2mm) 304 stainless steel perforated screen for size 3" (75mm); 1/8" (3mm) 304 stainless steel perforated screen for size 4" (100mm)
- .2 Size 2 ½" (65mm) to 12" (300mm), **cast iron body**, Y (wee) pattern strainer, equal to Watts Series 77F-DI-125 flanged ends, as follows:
 - .1 Standards:
 - .1 ASME Class 125
 - .2 NSF 372 for potable water applications
 - .2 Pressure and Temperature:
 - .1 **200 psi WOG** at 210°F
 - .2 125 psi WSP to 353°F
 - .3 Materials:
 - .1 Body: ASTM A-126 Class B cast iron
 - .2 Cover: ASTM A-126 Class B cast iron with drain/ blowoff connection and ASTM A6 closure plug
 - .3 Cover bolt: ASTM A6
 - .4 Cover bolt nut: ASTM A6
 - .5 Set screw: ASTM B16
 - .6 Plate: ASTM A6
 - .7 Cotter pin: ASTM A112
 - .8 Washer: ASTM A6
 - .9 Cover gasket: Graphite
 - .10 Screen: 304 stainless steel with 1/16" perforations for sizes 2" (50mm) to 5" (125mm); 304 stainless steel with 1/8" perforations for sizes 6" (150mm) to 8" (200mm); 304 stainless steel with 3/16" perforations for sizes 10" (250mm) to 12" (300mm)
- .3 Y (wee) pattern strainers in grooved end piping systems may be substituted with Y (wee) pattern strainers from Victaulic, or similar grooved end piping system ancillaries manufacturer, provided it can be demonstrated that all pressure, temperature, and other performance metrics can be maintained for the useful life expectancy of the piping system.

2.12 AUTOMATIC AIR VENT

- .1 Standard float vent with brass or cast iron body and ½" (12mm) connection and rated at 150 psig (1035 kPa) working pressure.
- .2 Float shall be solid material suitable for 240°F (115°C) working temperature.
- .3 Acceptable Manufacturers:
 - .1 Amtrol: No 720;
 - .2 Maid-O-Mist: No. 75;
 - .3 Braukman: EA122;
 - .4 Taco: 418;
 - .5 Spirax Sarco - Fig. 13W
 - .6 Grinnell - Fig. 1401
 - .7 ITT Bell & Gossett - Model 107

- .8 Or equivalent.

2.13 AIR SEPARATOR-BOILER MOUNTED

- .1 Dip tube type;
- .2 150 psig (1035 kPa) working pressure);
- .3 Acceptable Manufacturers:
 - .1 Armstrong BMA
 - .2 ITT Bell & Gossett - Airtrol boiler fitting
 - .3 Or equivalent

2.14 AIR SEPARATOR (IN-LINE)

- .1 Scoop separation type;
- .2 150 psig (1035 kPa) working pressure);
- .3 Acceptable Manufacturers:
 - .1 Taco - 430 Series
 - .2 ITT Bell & Gossett - IAS
 - .3 Amtrol - 400 Series
 - .4 Armstrong – PMA
 - .5 Or equivalent

2.15 CENTRIFUGAL AIR SEPARATOR

- .1 Where shown on drawings and/ or equipment schedules provide external constructed in accordance with Section VIII, Division I of the ASME Boiler and Pressure Vessel Code, stamped for design pressure and temperature.
- .2 Air separators with connections up to 3" (75mm) be complete with cast iron bodies with NPT connections and shall be designed and constructed for 160 psig @ 350°F. (1100 Pa @ 177°C.)
- .3 Air separators with connections of 4" (100mm) to 12" (300mm) shall be fabricated steel with flanged connections designed and constructed for 165 psig @ 375°F. (1140 Pa @ 191 C.).
- .4 Provide a bottom connection for blowdown cleaning.
- .5 Acceptable manufacturers:
 - .1 Taco - Air separator
 - .2 ITT Bell & Gossett - Rolairtrol
 - .3 Amtrol -Tangential air separator
 - .4 Armstrong – VA
 - .5 Or Acceptable Equivalent

2.16 BLADDER TYPE EXPANSION TANKS

- .1 Construction:
 - .1 Provide Horizontal or Vertical, cylindrical steel pressurized bladder type expansion tanks, for each closed circulation system.
 - .2 Each tank shall have an EPDM elastomer diaphragm suitable for a 50% solution of inhibited propylene glycol and 240°F (115°C) operating temperature.
 - .3 suitable for the system working pressure: 125 psig (860 kPa) with ASME Section VIII stamp for unfired Pressure Vessels, CSA B-51, and Provincial regulations
 - .4 welded construction conforming to ASTM A516 pressure vessel carbon steel plate with dished ends,

- .5 finish: primed on outside,
- .6 Provide saddles for horizontal installation or base mount for vertical installation;
- .7 Capacity: As indicated on the Documents.
- .8 Air pre-charged to initial fill pressure of system.
- .2 Nozzles and couplings:
 - .1 NPS 1" (25mm) expansion line fitting at/near bottom.
- .3 Accessories:
 - .1 Schraeder tank valve for compressed air located above bladder;
 - .2 air precharged to 84 kPa (12 psi), or initial fill pressure of system noted in the Documents.
- .4 Acceptable Manufacturers:
 - .1 Amtrol Extrol
 - .2 Taco CBX
 - .3 ITT Bell & Gossett
 - .4 Conbraco
 - .5 S.A. Armstrong,
 - .6 Or Acceptable Equivalent

2.17 HYDRONIC SYSTEM PRESSURE SAFETY RELIEF VALVE

- .1 Valve: to ASME Section IV.
- .2 Body Construction: brass.
- .3 Adjustable Pressure Setting: 8 to 25 psig (55 to 172 kPa).
- .4 Maximum Operating Differential Pressure From Open To Close:
 - .1 3 psig (20 kPa).
- .5 Acceptable Manufacturers:
 - .1 Bell & Gossett;
 - .2 Taco;
 - .3 Watts;
 - .4 Or approved equivalent

2.18 WATER MAKE-UP PRESSURE REDUCING VALVE

- .1 Iron body water pressure regulator with:
 - .1 Low inlet pressure check valve;
 - .2 fast fill /purge lever;
 - .3 Removable stainless steel strainer, and;
 - .4 Iron body diaphragm operated relief valve
- .2 Adjustable Low Pressure: 0.8 to 25 psig (55 to 172 kPa).
- .3 Acceptable Manufacturers:
 - .1 Bell & Gossett;
 - .2 Taco;
 - .3 Watts - No.1450F series
 - .4 A.W. Cash Valve - Type CBL
 - .5 Or approved equivalent

2.19 COMBINATION LOW PRESSURE RELIEF AND REDUCING VALVE

- .1 Adjustable Pressure Setting: 30 psig (206 kPa) relief, 8 to 25 psig (55 to 172 kPa) reducing.
- .2 Low inlet pressure check valve.
- .3 Removable strainer.
- .4 Acceptable Manufactures:
 - .1 Bell & Gossett;
 - .2 Taco;
 - .3 Watts;
 - .4 Or approved equivalent.

2.20 GLYCOL MAKE-UP UNIT AND MIXING TANK

- .1 Construction:
 - .1 210 litre (55 gallon) open cylindrical tank
 - .2 material: polypropylene, structurally formed tank or with channel reinforced bottom and support stand,
 - .3 enclosed, vented tank, or hinged gasketed cover with counterweight balanced hold-open mechanism.
- .2 Fittings and accessories:
 - .1 overflow, inlet and suction connections,
 - .2 pump mounting arrangement.
 - .3 suction and discharge piping with isolation valves and check valves.
- .3 Glycol transfer pump;
 - .1 single close-coupled iron fitted centrifugal feed pump with mechanical seal, mounted to mixing tank, and pre-piped to suction strainer,
 - .2 rated for 0.63 l/s at 210 kPa (10 gpm at 30 psi).
 - .3 low water level cut-out switch,
 - .4 high water level alarm,
 - .5 system low pressure pump start switch,
 - .6 remote annunciation contacts for low liquid level, high liquid level.
- .4 Acceptable Manufactures:
 - .1 Bell & Gossett - GMU
 - .2 Armstrong - GLA UHP1
 - .3 Or approved equivalent

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Comply with Manufacturer's requirements for the installation of all specified equipment and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Locate equipment as shown on the drawings to provide connection arrangement and accessibility for servicing.
- .3 Provide clearances on all sides of equipment as required by the Manufacturer's Installation Instructions.
- .4 Install items of equipment with due regard to Architectural treatment, and ensure all items are level and finished in keeping with good workmanship.

- .5 Provide chemical treatment connections on heating and cooling circuits in locations as directed by chemical treatment supplier. Following completion of pipe leakage testing, provide for continuous flushing and cleaning of new piping systems prior to opening connections to new systems. Provide letter from Chemical Treatment vendor that systems have been cleaned prior to opening new systems to existing systems.
- .6 Provide branch take-offs from mains of heating and cooling pipes with shut off valves.
- .7 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.
- .8 Install and connect remote components such as thermostats, humidistats, control panels, level controllers, and other similar ancillary devices that are supplied with the equipment. Install in locations as shown on the drawings.
- .9 All independent hydronic circulating systems shall be provided with a properly sized safety pressure relief valve.

3.02 HVAC HYDRONIC PIPING SYSTEMS

- .1 Use valves and strainers of the same size as pipe in which it is installed, unless otherwise indicated.
- .2 Install eccentric reducing fittings so as not to trap air.
- .3 Provide long radius elbows unless noted otherwise.
- .4 Provide flanges or unions at connections to all equipment.
- .5 Provide screwed or flanged joints only in accessible locations. Provide access doors as required.
- .6 Do not use field fabricated fittings.
- .7 The first hanger on branch take off piping from a riser shall be spring hung to reduce stress on riser and branch.
- .8 Connect branch pipe runouts to top of main distribution pipe.
- .9 Provide line size (minimum 2" [50 mm]) threaded piping connections at the base/ end of piping supply and return connection to equipment. Piping arrangement will allow for threaded flexible hose connections between supply and return piping ends that will allow for continuous flushing and cleaning of piping systems while equipment remains isolated.

3.03 GATE VALVES

- .1 Provide line size gate valves for shut-off applications as follows:
 - .1 Supply and return piping connections to each piece of equipment;
 - .2 Drain connections;
 - .3 All piping risers as follows:
 - .1 at the base when supplied from, or returned to below, or;
 - .2 at the top when supplied from, or returned to above.
 - .4 Branch connections from mains (branch connections serve two or more pieces of equipment);
 - .5 Where otherwise required by the Contract Documents.

3.04 GLOBE VALVES

- .1 Provide globe valves on the discharge of each pump downstream of a check valve for shut-off and, balancing, throttling or controlling flow.
- .2 Globe valves may be provided in lieu of flow balancing valves for balancing, throttling or controlling flow.

- .3 When used for balancing, throttling or controlling flow, globe valves shall have established Cv values suitable for use by Testing Adjusting and Balancing (TAB) Trades, and be complete with valved pressure gauge tapings at globe valve inlet and discharge locations.
- .4 Provide globe valves in the appropriate pressure class, for modulating control applications in either two or three way configuration. Refer to Division 25 Specifications for Control Valve requirements.

3.05 BALL AND BUTTERFLY VALVES

- .1 Line size ball valves or butterfly valves in the appropriate pressure and temperature class may be substituted for gate valves for shutoff applications.
- .2 Provide minimum ¼" (6mm) full port ball valves in the pressure class required by the application for isolation of instrumentation components such as pressure gauges, thermometers, and other similar types of devices.
- .3 Provide high performance butterfly valves (BHP), for modulating control applications in either two or three way configuration, and where electric actuators are used. Refer to Division 25 Specifications for Control Valve requirements.

3.06 FLOW BALANCING VALVES

- .1 Provide flow balancing valves for balancing, throttling or controlling flow as follows:
 - .1 on the common return pipe from each:
 - .1 air handling unit coil;
 - .2 heat recovery coil;
 - .3 terminal device (fan coil unit, unit heater, duct mounted reheat coil, perimeter heating element and similar);
 - .4 heat exchanger;
 - .5 hot water heating boiler;
 - .6 chiller evaporator and condenser;
 - .2 on each return piping riser;
 - .3 where otherwise required by the Contract Documents.

3.07 PIPELINE CHECK VALVES

- .1 Provide a check valve in the discharge piping of every pump, where required by the Documents, and wherever else required for proper operation and maintenance of systems.
 - .1 Provide a vertical lift check valve, or non-slam check valve in the discharge piping of every pump.
 - .2 Vertical lift check valves, or non-slam check valves for installation in the discharge of vertical inline circulating pumps may be supplied as a pump accessory from the pump manufacturer in lieu of independent check valves specified in this Section.
- .2 Check valve shall be mounted a minimum of six (6) times the nominal pipe diameter from the outlet of all pumps, elbows or other flow transition ancillaries in the piping system.
- .3 Check valves mounted in vertical piping shall be suitable for the application, and with flow in the upward direction.

3.08 PIPELINE STRAINERS

- .1 Provide line size strainers in the following locations:
 - .1 On inlet side of water meters
 - .2 at the suction side of each pump;
 - .3 immediately upstream of each pressure reducing valve;
 - .4 immediately upstream of each entering side of a plate and frame heat exchanger.

- .5 immediately upstream of each control valve (except at terminal device coils with piping connections NPS ¾" (20mm) or less, radiant heating elements, or radiant heating panels);
- .6 where shown on the Drawings and the Details.
- .2 Install strainers in horizontal or down flow (Y (wye) pattern only) piping with clearance for removal of basket.
- .3 Supply strainers with extra construction screens and remove after systems have been thoroughly cleaned.
- .4 Equip each strainer 2" (50 mm) and smaller in size with plugged blow off tappings.
- .5 Equip each strainer 2 ½" (75mm) and larger in size with blow off tapping connection complete with shut off valve and blow off piping with same pressure and temperature rating of strainer. Terminate blow off piping in downward vertical position. Size blow off piping and valve the same size as the blow off tapping.
- .6 Ensure that each strainer can be isolated from piping systems with isolating valves on each side of strainer, and which are not more than 10 ft (3 metres) upstream or downstream from strainer.
- .7 Clean strainer baskets after piping system flushing and cleaning is complete, and before water quantity balancing commences.

3.09 PIPELINE AIR VENTS

- .1 Provide air vents at high points, and in sections of piping subject to air binding, in both supply and return mains, at equipment connections, and wherever else required.
- .2 Equip each air vent with a ball type shut-off valve installed between unit and piping.
- .3 Pipe vent outlets to discharge to drain, over janitors sinks, over floor drains in mechanical rooms and other similar visible locations.
- .4 Provide manual air vents, screwdriver or key type at each unit heater, cabinet unit heater, convactor, wallfin section and fan coil unit.

3.10 PIPELINE DRAIN VALVES

- .1 Provide a drain valve in accordance with Section 20 01 50 "Basic Materials and Methods"
- .2 Additionally, provide a drain valve at the base of each piping riser, in drain connections to equipment, in low points of horizontal piping and wherever else required by the Contract Documents.

3.11 BLADDER TYPE EXPANSION TANKS

- .1 General:
 - .1 Provide expansion tanks where required.
 - .2 Secure each vertical tank stand to a concrete housekeeping pad by means of machine bolts. Support horizontal tanks on steel saddles secured to the structure by means of hanger rods.
 - .3 Extend a drain line from each tank piping and terminate each drain line with a drain valve.
- .2 Water system expansion tank:
 - .1 Install equalizer line from air separator in piping system to bottom of tank.
 - .2 Provide domestic cold water line with globe valve, strainer, and line size backflow preventer with isolating valves connected to equalizer line.
 - .3 Provide water make-up assembly on domestic water line on tank side of backflow preventer, complete with:
 - .1 water safety relief valve, located in piping near bottom of tank with relief pressures set to maintain 105 kPa (15 psi) at highest point in system with pumps off.

- .2 relief valve of same model and size as relief valve used on heating convertor, minimum NPT $\frac{3}{4}$ " (20mm), if tank is connected to steam generated hot water system,
 - .3 relief connection on backflow preventer, on make-up assembly, piped to nearest open drain,
 - .4 pressure gauge to show pressure in tank,
 - .5 compressed air to each tank or group of tanks with globe valve and check valve, terminating 1200 mm (4 ft) above finished floor near tanks with 6 m (20 ft) length of hose and hose end fitting compatible with Schraeder connection on tank.
- .3 Glycol system expansion tank
- .1 Provide:
 - .1 equalizer line from air separator in piping system to bottom of tank,
 - .2 glycol make-up line from glycol fill system, and valved drain line from bottom of tank piped to glycol mixing tank,
 - .3 domestic cold water line with globe valve, strainer, and line size backflow preventer with isolating valves connecting to glycol mixing tank,
 - .4 Manual air vent valve near top of tank and code rated water safety relief valve, located in piping near bottom of tank with relief pressures set to maintain 70 kPa (10 psi) at highest point in system with system circulating pumps off.
 - .5 relief valve of same model and size as relief valve used on heating convertor, minimum NPT $\frac{3}{4}$ " (20mm), if tank is connected to steam generated hot water system,
 - .6 relief connection on backflow preventer piped to nearest open drain,
 - .7 relief valve and valved drain line from bottom of tank piped to glycol mixing tank
 - .8 pressure gauge to show pressure in tank,
 - .9 compressed air to each tank or group of tanks with globe valve and check valve, terminating 1200 mm (4 ft) above finished floor near tanks with 6 m (20 ft) length of hose and hose end fitting compatible with Schraeder connection on tank.
 - .10 controls for make-up pump and alarm system connected and tested.

3.12 HYDRONIC SYSTEM PRESSURE SAFETY RELIEF VALVE

- .1 Provide factory set hydronic system pressure relief valves on hot water boilers, heating convertors, expansion tanks and other pressure vessels and where ever else required by Code.
- .2 Install in accordance with relevant Codes.
- .3 Pipe the discharge of each relief valve to drain unless otherwise specified.

3.13 HYDRONIC SYSTEM PRESSURE REDUCING VALVES

- .1 Install pressure reducing valve stations with shut-off valve on either side of assembly and 115 mm (4½ in) pressure gauges on upstream and downstream sides of station.

3.14 PIPELINE EXPANSION COMPENSATION

- .1 Provide expansion compensators (including expansion loops) in accordance with Section 20 01 50 "Basic Materials and Methods"

3.15 PIPE LEAKAGE TESTING

- .1 Meet testing requirements of all Authorities Having Jurisdiction (AHJs). Obtain certification and certify tests not required by AHJs. Perform not less than the following tests:
 - .1 Complete pipe leakage in accordance with the Mechanical Contractors Association of America (MCAA) "Guide to Pressure Testing Safety".

- .2 Complete pipe leakage testing in accordance with the requirements of ASTM E 1003 "Standard for Practice for Hydrostatic Leak Testing" and/ or ASTM A1047 / A1047M-05 "Standard Test Method for Pneumatic Leak Testing of Tubing", as follows:
 - .1 Hydrostatic Pipe Leakage Testing:
 - .1 Pressure testing for piping subject to ASME B31.1 and/ or ASME B31.9 shall be tested at a minimum of 1.5 times the design pressure, but shall not exceed the maximum test pressure for any vessel, pump, valve, or other component in the system under test.
 - .2 Test without pressure drop for a period of not less than 10 minutes at the maximum test pressure, then reduce to the design pressure, or 100 psig, whichever is greater, and hold for a period that allows for a complete visual inspection of the piping systems under test, however, for a period not less than four (4) hours. Hydrostatic leakage testing shall be repeated until no leaks are found.
 - .2 Pneumatic Pipe Leakage Testing:
 - .1 A preliminary pneumatic test not to exceed 25 psig may be applied, prior to other methods of leak testing, as a means of locating major leaks for piping subject to ASME B31.1 and/ or ASME B31.9.
 - .2 For piping subject to ASME B31.1 and/ or ASME B31.9, a pneumatic pressure test may only be completed in lieu of a hydrostatic pressure test with the approval of the Consultant, and will typically be only limited to independent hydronic circuit(s) with a vertical height less than 30 ft. (10 m).
 - .3 The pneumatic test pressure shall be not less than 1.2 nor more than 1.5 times the design pressure of the piping system, but shall not exceed the maximum test pressure for any vessel, pump, valve, or other component in the system under test.
 - .4 Test without pressure drop for a period of not less than ten (10) minutes at the maximum test pressure, then reduce to the design pressure, and hold for a period that allows for a complete visual inspection of the piping systems under test, however, for a period not less than four (4) hours. Pneumatic leakage testing shall be repeated until no leaks are found.
 - .5 Examination for leakage shall be conducted using soap bubble or equivalent detection methods, shall be made of all joints and connections. The piping system, exclusive of possible localized instances at pump or valve packing, shall show no visual evidence of weeping or leaking.
- .2 Perform tests before piping is covered or concealed.
- .3 Eliminate leaks or remove and refit defective parts. Do not caulk threaded or welded joints.
- .4 Remove all components which will not withstand test pressure following any remedial work after testing.
- .5 After pressure testing is completed, adjust and put all parts of the system into proper working order. Adjust all valves to achieve specified heating capacities. Leave the complete job ready for regular operation, all to the satisfaction of the Consultant.
- .6 After the testing period, drain the system, and before water treatment is introduced into the system, clean out all dirt pockets and strainers.
- .7 Provide lubricating oils, packing, and other accessories, for proper operation of the system.
- .8 The final test and acceptance shall not be made until the work is fully completed.

3.16 WATER BALANCING

- .1 Refer to Section 20 05 95.

- .2 Provide flow measurement ports as shown on detail drawings and piping schematics in locations as directed by the Testing Adjusting and Balancing ("TAB") Trades. Provide additional balancing valves where recommended by the TAB Trades.

- 3.04 EQUIPMENT START UP**
- 3.05 WATER BALANCING**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with requirements of Section 20 05 70 Motors, Motor Starters, Motor Control Centres, and Wiring
- .5 Comply with requirements of Section 20 08 10 Mechanical Commissioning

1.02 SCOPE OF WORK OF THIS SECTION

- .1 Provision of HVAC system water piping systems, pumping systems, heat exchangers and all related ancillaries.

1.03 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the installation of pressure piping and pumping systems for hydronic heating and cooling applications.
- .2 All combustible piping to be ULC labelled and listed for flame spread rating of less than 25 and smoke classification of less than 50.

1.04 SUBMITTALS

- .1 Submit shop drawings for the following Products:
 - .1 HVAC Pumps;
 - .2 HVAC Pump Accessories

1.05 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 HVAC SYSTEM PUMPS AND CIRCULATORS GENERAL REQUIREMENTS

- .1 Comply with Manufacturer's requirements for the installation of all specified equipment and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.
- .3 Provide HVAC pumps and circulators of type and size as indicated on the Equipment Schedules.
- .4 The following General Requirements apply to all HVAC Pumps and Circulators:
 - .1 Equipped with mechanical seals, non-overloading motor (not including motor service factor) in accordance with Section 20 05 70 over entire performance curve and bronze fitted except where noted.
 - .2 Provide split coupling for pumps with motor sizes equal to or greater than 7½ HP.
 - .3 The pump bearings shall be maintenance free permanently lubricated and sealed bearings with an L-10 life in excess of 100,000 hours, and L-50 life at 500,000 hours. Bearing frame shall be equipped with seals to protect bearings from moisture and airborne contaminants.

- .4 All pumps to be complete with suction and discharge flanged connections, tapings for gauges, drain and flush line connections.
- .5 Provide pump Suction Diffuser as follows:
 - .1 Standard Class 125 flange rated for 175 PSIG (1210 kPa) pressure and 250°F (120°C) temperature;
 - .2 Where noted, provide Class 250 flange rated for 300 PSIG (2070 kPa) pressure and 250°F (120°C) temperature;
 - .3 Ductile Iron Body;
 - .4 Ductile Iron Cover;
 - .5 Integral Ductile Iron Straightening Vanes;
 - .6 Stainless Steel (304) Permanent Strainer;
 - .7 Bronze (16 Mesh) Disposable Start Up Strainer;
 - .8 EPDM Cover O-Ring;
 - .9 Steel Grooved Adapter;
 - .10 Metering Port
 - .11 Blow Down port
 - .12 Magnetic Insert
- .6 Provide pump Multi-purpose Discharge Valve as follows:
 - .1 Standard Class 125 flange rated for 175 PSIG (1210 kPa) pressure and 250°F (120°C) temperature;
 - .2 Where noted, provide Class 250 flange rated for 300 PSIG (2070 kPa) pressure and 250°F (120°C) temperature;
 - .3 Five (5) functions as follows:
 - .1 shut off valve
 - .2 Globe style flow control valve with memory indicator, pointer and scale
 - .3 Non-slam check valve
 - .4 Flow metering valve complete with metering ports;
 - .4 Straight pattern valve shall be capable of field conversion to a right angle pattern valve;
 - .5 Ductile iron body;
 - .6 Stainless Steel (302) spring;
 - .7 Bronze gland;
 - .8 Teflon Impregnated Aramid Fiber (asbestos free) stem packing;
 - .9 Bronze/Stainless Steel (416) stem;
 - .10 EPDM seat
 - .11 Stainless Steel (304) seat disc;
 - .12 EPDM Body O-Ring;
 - .13 Steel grooved adapter.
- .7 Provide pump assembly supply and return piping connections double sphere neoprene flex connector with control units equal to Vibro-Acoustics type NNDCU.

2.02 BASE MOUNTED FLEX COUPLED PUMPS

- .1 Pumps shall be FloFab, ITT Bell & Gossett, S.A. Armstrong, TACO, Wilo Pumps, or approved equivalent meeting all Specification requirements. Alternative pumps may be considered by the Consultant provided a cost savings to the Owner can be demonstrated.
- .2 The pumps shall be single stage end suction rear pull out design. The bearings and seal shall be serviceable without disturbing the piping connections. The capacities and characteristics shall be as called for in the Schedules.
- .3 Pump casing shall be constructed of ASTM A48 class 30 cast iron. The pump casing/volute shall be rated for 250 psi working pressure.
- .4 The pump flanges shall be matched to suit the working pressure of the piping components on the job, with either ANSI Class 125 flanges or ANSI class 250 flanges.
- .5 The pump casing shall be drilled and tapped for gauge ports on both the suction and discharge connections and for a drain port at the bottom of the casing. The casing shall have an additional tapping on the discharge connection to allow for the installation of a seal flush line. The pump cover shall be drilled and tapped to accommodate a seal flush line connected to the corresponding tapping on the discharge connection, or to an external source to facilitate cooling and flushing of the seal faces.
- .6 All casings shall be flanged. Threaded casings not allowed unless extra unions and fittings are provided with that pump to allow servicing.
- .7 Pump volute shall be foot mounted; overhung cantilevered design will not be accepted.
- .8 The pump shall be center line discharge for both positive air venting and load distribution.
- .9 The pump casing inlet shall have an integrally cast anti-rotational vane.
- .10 The pump impeller shall be ASTM B584-836/875 bronze and hydraulically balanced.
- .11 The impeller shall be dynamically balanced to ANSI Grade G6.3 and shall be fitted to the shaft with a key.
- .12 The pump shaft shall be a dry shaft design to prevent the circulating fluid from contacting the shaft and shall be constructed of ASTM A582 Type 416T or ASTM A582 Type 410T stainless steel with field replaceable bronze SAE 660 shaft sleeve.
- .13 The pump shall be fitted with a single mechanical seal, with EPT elastomers and Carbon/Ceramic faces, rated up to 250°F. This seal must be capable of being flushed externally via a tapping in the pump cover adjacent to the seal cavity.
- .14 Open system pumping applications (condenser water pumps and similar) and closed system pumping applications (chilled water, heating water and similar) shall be furnished with a seal flush line and a Cuno / Kynar / Purocell #900 replaceable cartridge filter or separator with shut-off isolation valve installed in the seal flushing line. The filter shall have the ability to remove particles down to five microns in size.
- .15 All pumps to be provided with a fully welded, rigid structural steel base. The base shall include closed ends and top openings to allow for grouting. The base shall include an integral drain pan fabricated from steel with a minimum thickness of 0.1875" and shall contain an integral ¾" drain connection.
- .16 The pump shall be flexibly coupled to a NEMA standard T frame motor in accordance with Section 20 05 70. The coupler shall be suitable for across the line starting as well as variable speed conditions associated with variable frequency drives. The coupling shall be equal to a Woods Dura-Flex coupler.
- .17 The coupling and shafts shall be covered by a metal guard.
- .18 Pump shall be aligned upon receipt at job, during installation, and after system fill by Mechanical Contractor.

2.03 VERTICAL IN-LINE PUMPS

- .1 Pumps shall be FloFab, ITT Bell & Gossett, S.A. Armstrong, TACO, Wilo Pumps, or approved equivalent closed coupled for pumps with motors 5 HP and smaller, or split coupled for pumps with

- motors larger than 5 HP, meeting all Specification requirements. Alternative pumps may be considered by the Consultant provided a cost savings to the Owner can be demonstrated.
- .2 The pumps shall be single stage end suction rear pull out design. The seal shall be serviceable without disturbing the piping connections. The capacities and characteristics shall be as called for in the plans/schedules.
 - .3 Pump casing shall be constructed of ASTM A48 class 30 cast iron.
 - .4 The pump casing/volute shall be rated for 250 psi working pressure.
 - .5 The pump flanges shall be matched to suit the working pressure of the piping components, with either ANSI Class 125 flanges or ANSI class 250 flanges.
 - .6 The pump casing shall be drilled and tapped for gauge ports on both the suction and discharge connections and for a drain port at the bottom of the casing. The casing shall have an additional tapping on the discharge connection to allow for the installation of a seal flush line.
 - .7 The pump cover shall be drilled and tapped to accommodate a seal flush line which can be connected to the corresponding tapping on the discharge connection, or to an external source to facilitate cooling and flushing of the seal faces.
 - .8 All casings shall be flanged. Threaded casings not allowed unless extra unions and fittings are provided with that pump to allow for servicing.
 - .9 The pump shall have a factory installed vent/flush line to ensure removal of trapped air from the casing and mechanical seal cooling. The vent/flush line shall run from the seal chamber to the pump discharge.
 - .10 The pump impeller shall be ASTM B584-836/875 bronze and hydraulically balanced. The impeller shall be dynamically balanced to ANSI Grade G6.3 and shall be fitted to the shaft with a key.
 - .11 The pump shall be manufactured with ASTM A582 Type 416T or ASTM A582 Type 410T stainless steel shaft.
 - .12 The pump shall be fitted with a single mechanical seal, with EPT elastomers and Carbon/Ceramic faces, rated up to 250°F. This seal must be capable of being flushed externally via a tapping in the pump cover adjacent to the seal cavity.
 - .13 Model KS split coupled pumps shall be coupled via a high tensile aluminum split style coupling. The design shall permit easy replacement of the mechanical shaft seal without removal of the motor. The motor mount must be designed to accept several different motor frame standards; CZ and HP.

2.04 SEISMIC IN-LINE PUMP STANDS

- .1 For each vertical in-line pump assembly provide a Vibro-Acoustics, model SIPS-NP, or equal, seismic pump stand to ensure rigid support and restraint for vertical inline pump and motor assembly as follows:
 - .1 withstand at least 1 g of lateral seismic force for complete pump and motor assembly;
 - .2 complete with Neo+ isolation pads;
 - .3 tested per ANSI/ASHRAE 171;
 - .4 ANSI Class 125 and Class 250 bolt patterns to suit pump pressure rating;
- .2 Provide low-profile model where spring isolators are required.

2.05 IN-LINE CIRCULATORS

- .1 Pumps shall be FloFab, ITT Bell & Gossett, S.A. Armstrong, TACO, Wilo Pumps, or approved equivalent meeting all Specification requirements. Alternative pumps may be considered by the Consultant provided a cost savings to the Owner can be demonstrated.
- .2 The pumps shall be single stage horizontal in-line design. The seal shall be serviceable without disturbing the piping connections.
- .3 The capacities and characteristics shall be as called for in the Equipment Schedules.
- .4 Pump shall be constructed of ASTM A48 class 30 cast iron.

- .5 The pump casing shall be drilled and tapped for gauge ports on both the suction and discharge connections.
- .6 All casings shall be flanged connections.
- .7 The impeller shall be ASTM C87500 or C89833 bronze and hydraulically balanced.
- .8 The impeller shall be dynamically balanced to ANSI Grade G6.3 and shall be fitted with a holding taper and left handed 431 series stainless steel bolt.
- .9 The pump shall incorporate a dry shaft design to prevent the circulating fluid from contacting the shaft.
- .10 The pump shaft shall be AISI 1045 carbon steel with field replaceable copper nickel 90-10 shaft sleeve.
- .11 The pump shall be fitted with a single mechanical seal, with EPT elastomers and Carbon/Ceramic faces, rated up to 250°F.
- .12 The pump shall be coupled to a NEMA 56C face motor in accordance with Section 20 05 70 with threaded on shaft extension.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Comply with Manufacturer's requirements for the installation of all specified equipment and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Locate equipment as shown on the drawings to provide connection arrangement and accessibility for servicing.
- .3 Provide clearances on all sides of equipment as required by the Manufacturer's Installation Instructions.
- .4 Install items of equipment with due regard to Architectural treatment, and ensure all items are level and finished in keeping with good workmanship.
- .5 Provide chemical treatment connections on heating and cooling circuits as directed by chemical treatment supplier.
- .6 Provide branch take-offs from mains of heating and cooling pipes with shut off valves.
- .7 Install and connect remote components such as thermostats, humidistats, control panels, level controllers, etc., that are supplied with the equipment. Install in locations as shown on the drawings.

3.02 HVAC PUMPS

- .1 Install HVAC pumps as shown on detail drawings.
- .2 Pump shall be aligned upon receipt at job, during installation, and after system fill by the Mechanical Contractor.
- .3 Mount all vertical in line pumps over 5 HP at floor level as shown on the detail drawings.
- .4 Provide all pumps with Suction Diffusers and Multipurpose Discharge Valves in accordance with the specifications. Where Suction Diffusers and Multipurpose Discharge Valves are unavailable due to size or space restrictions provide the following:
 - .1 Pump Suction: line size shut-off valve, line size inlet strainer;
 - .2 Pump Discharge: line size check valve, line size Flow Balancing Valve.
- .5 Provide 12mm (1/2") drain lines with ball valves from Cuno filters to nearest floor drain.

3.03 TESTING

- .1 Meet testing requirements of all Authorities Having Jurisdiction (AHJs). Obtain certification and certify tests not required by AHJs. Perform not less than the following tests.
- .2 Prove hydronic piping tight under a hydrostatic test of 150% of design working pressure but not less than 700kPa (100 psi). Test without pressure drop for a period of not less than 4 hours.

- .3 Perform tests before piping is covered or concealed.
- .4 Remove all components which will not withstand test pressure and replace after tests.
- .5 Eliminate leaks or remove and refit defective parts. Do not caulk threaded or welded joints.
- .6 After work is completed, adjust and put all parts of the system into proper working order. Adjust all valves to achieve specified heating capacities. Leave the complete job ready for regular operation, all to the satisfaction of the Consultant.
- .7 After the testing period, drain the system, and before water treatment is introduced into the system, clean out all dirt pockets and strainers.
- .8 Provide lubricating oils, packing, and other accessories, for proper operation of the system.
- .9 The final test and acceptance shall not be made until the work is finally completed.

3.04 EQUIPMENT START UP

- .1 Follow manufacturer's instructions and have manufacturer's representative present to certify the installation.
- .2 Check each item of equipment to ensure proper piping connections, electrical connections, pump rotation and similar, to verify proper operation.

3.05 WATER BALANCING

- .1 Refer to Section 20 05 95.
- .2 Provide flow measurement ports as shown on detail drawings and piping schematics in locations as directed by the Testing Adjusting and Balancing ("TAB") Trades. Provide additional balancing valves where recommended by the TAB Trades.

- 3.02 INSTALLATION**
- 3.03 ELECTRICAL**
- 3.04 REFRIGERANT TESTS**
- 3.05 START-UP AND ADJUSTMENT**

PART 1 - GENERAL

1.01 RELATED WORK

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements and all Documents referenced therein.
- .3 Comply with requirements of Section 20 01 50 Mechanical Basic Materials and Methods.
- .4 In accordance with the Montreal Protocol on substances that deplete the Ozone layer, all new refrigerating, cooling and air conditioning equipment shall not contain any CFC nor HCFC based refrigerants nor mixtures of such refrigerants.

1.02 REFERENCE STANDARDS

- .1 Perform refrigeration system work in accordance with the Authorities Having Jurisdiction ("AHJs"), the latest version of Technical Standards & Safety Authority (TSSA) ("Refrigeration Code"), CSA B52 and ANSI B31.5.

1.03 PERMITS AND QUALIFICATIONS

- .1 Ensure permit is obtained before anyone commences to install or alter refrigeration system.
- .2 Persons installing or making alternations or repairs to refrigeration system shall be holder of valid Refrigeration Contractors license and persons repairing equipment with ODS/CFC's shall have completed Environment Canada approved training program.

1.04 WARRANTY

- .1 Warrant piping system loss of refrigerant for 5 years.

1.05 SHOP DRAWINGS

- .1 Provide Shop Drawings in accordance with Section 20 01 10.
- .2 Refrigeration trade shall prepare electrical control schematic for each type of system (product refrigeration only) and submit shop Drawings for review.

1.06 ELECTRICAL WIRING

- .1 Refrigeration trade shall carry out and be responsible for refrigeration control wiring unless otherwise noted, including line voltage wiring from disconnect switch to units.
- .2 Refrigeration trade shall provide electric heat trace cable on drain lines in cold rooms with temperatures below 35°F (1.7°C).
- .3 Power wiring to units shall be by Electrical Trades.

PART 2 - PRODUCTS

2.01 REFRIGERANT TUBING

- .1 Provide processed tubing for refrigeration installation, deoxidized, dehydrated and sealed.
- .2 Hard copper tube, Type "L", to ASTM B88M.
- .3 Annealed copper tube to ASTM B280, with minimum wall thickness as per CSA B52.

2.02 FITTINGS

- .1 Service: Design pressure 300 psi (2,070 kPa) and temperature 250°F (120°C).
- .2 Brazed: Wrought copper to ANSI B16.22 or cast bronze to MIL-F-1183E.
- .3 Flanged: Bronze or brass, Class 150 Class 300 to ANSI B16.24.
- .4 Flare: Bronze or brass, for refrigeration, to ANSI B16.26.
- .5 Long radius type for elbows and return bends.

2.03 JOINTS

- .1 Brazing materials shall be SIL-FOS-15 phosphor-copper-silver alloy for copper piping jointed by copper fittings and silver solder for brass fittings.
- .2 Flexible Connections: 9.5mm or less shall be made using coiled soft copper tubing. For larger sizes, use seamless flexible bronze hose with bronze wire braid covering. Use factory sealed neoprene jacket unit where freezing may occur.

2.04 VALVES

- .1 Shut-Off Valves:
 - .1 Line size, selected for low pressure drop.
 - .2 Acceptable Products:
 - .1 Sizes 1/4" (6 mm) to 5/8" (16 mm) Diameter: Henry Standard, Mueller Linemaster Special.
 - .2 Sizes 7/8" (22 mm) Diameter and Larger: Henry Wing Cap (back seating, Mueller Globemaster).
 - .3 All sizes may be Henry or Mueller ball valves.
 - .3 To be provided at each point of connection to all refrigeration equipment.
- .2 Solenoid Valves:
 - .1 With field replaceable coil, serviceable without removing valve from line.
 - .2 Coil voltage to suit field requirements.
 - .3 Provide upstream of thermostatic expansion valves.
 - .4 Acceptable Products: Alco 240 RA series.
- .3 Expansion Valves:
 - .1 Thermostatic type with external equalizer, adjustable superheat setting, capacity and bulb charge to suit operating conditions.
- .4 Water Regulating Valves:
 - .1 Pressure activated 2-way straight-through type.
 - .2 For 3-way regulators, install balancing valve in by-pass, adjusted to maintain constant system flow rate irrespective of valve position.
- .5 Charging and Purging Valves:
 - .1 Valves to be same size as line size into which they are connected or 1/2" (12 mm) whichever is larger.
 - .2 Valve complete with removable seal cap chained to valve body.
 - .3 Acceptable Products: Henry Standard type, Mueller Linemaster Special.

2.05 SIGHT GLASS

- .1 Provide sight glass in liquid line following filter drier.
- .2 Sight glass shall be combination moisture-liquid indicator and with protective removable cap.
- .3 Sight glass to be fitted in-line.
- .4 Acceptable Products: Henry Dri-Vue, Mueller Vuemaster, Sporlan See All.

2.06 ACCESS FITTINGS

- .1 Provide Schrader access fittings in each suction connection from evaporator, located adjacent to superheat sensing element of expansion valve.
- .2 Fittings to be used for checking superheat of suction gas.
- .3 Access fitting shall be soldered into tee and shall be complete with quick-seal cap.

2.07 FILTER DRIERS

- .1 Provide filter drier in liquid line from condenser. Shut-off valves shall be installed on each side of drier and sight glass.
- .2 Filter drier shall be selected to have pressure drop no more than 0 psi (0 kPa) when passing 150% of system flow rate.
- .3 Removable core with flare connections.
- .4 Desiccant drier material shall be replaceable.
- .5 Acceptable Products: Alco Extra-Klean, Catch-All, Henry Dri-Cor, Mueller Drymaster II, Sporlan.

2.08 REFRIGERANT DRIERS

- .1 Driers shall be in-line or angle type with copper or brass shell.
- .2 Desiccant drier material shall be replaceable.

2.09 STRAINERS

- .1 Refrigerant strainers shall be angle replaceable cartridge type with brass shell.
- .2 Cartridge material and screen size shall be suitable for refrigerant and piping material utilized in system.

2.10 PRESSURE GAUGES – REFRIGERATION

- .1 Acceptable Manufacturers:
 - .1 Marsh, Moeller, Trerice, Weiss, Weksler, Winters.
- .2 Minimum Requirements:
 - .1 Panel surface mounting type, flanged type.
 - .2 Flush panel mounting type, flush mount case style.
 - .3 Seamless phosphor bronze Bourdon tube type, with minimum 2-1/2" (65 mm) diameter dial, unless otherwise indicated.
 - .4 Cast aluminum, black steel or stainless steel case, with stainless steel or chrome-plated face ring.
 - .5 Accuracy $\pm 2\%$ of scale range.
 - .6 Scales to be calibrated in both pressure and corresponding temperature of refrigerant.
 - .7 Scale Range:

<u>Operating Pressure</u>	<u>Scale Range</u>
15" Hg (50 kPa) – 100 psi (690 kPa)	29.5" Hg (100 kPa) – 150 psi (1,034 kPa)
100 psi (690 kPa) – 400 psi (2,760 kPa)	0 – 500 psi (3,450 kPa)

- .8 Gauges complete with recalibrator and restrictor.
- .9 Install a needle valve (carp) ahead of each gauge.

2.11 EVAPORATOR DRAINS

- .1 Each evaporator shall be fitted with copper drain line, size as indicated.
- .2 Drain line shall be complete with running trap.

2.12 FLEXIBLE CONNECTIONS

- .1 Braided tin-bronze corrugated flexible connections.
- .2 Design pressure 300 psi (2,070 kPa).

- .3 Acceptable Products: Anaconda.

2.13 REFRIGERANT TUBE SUPPORTS

- .1 Middle Attachments (Rod):
- .1 Carbon steel black (electro-galvanized for mechanical rooms) continuous threaded rod – Grinnell Fig. 146 Myatt Fig. 434.
- .2 Pipe Hangers:
- .1 Uninsulated pipe, up to 1-1/4" (32 mm) – Grinnell 97C.
- .2 Insulated pipe, up to 25mm – Grinnell fig. 269 or Myatt Fig. 120.
- .3 Insulated pipe, 32mm – Grinnell Figs. 65 or 260 or Myatt Figs. 122 or 124.
- .4 Maximum horizontal pipe hanger spacing:

Pipe Size	Maximum Spacing	Rod Diameter
Up to 20mm	5'-0" (1.5 m)	3/8" (9.5 mm)
25mm and 32mm	6'-0" (1.8 m)	3/8" (9.5 mm)

- .5 On insulated piping, where insulation is specified to have continuous sealed vapour barrier, (cold services) install oversized clevis hangers and insulation protection shields (Grinnell Fig. 167 or equivalent) with metal thickness and lengths as recommended by Grinnell.
- .6 Hangers for copper pipe shall be copper plated or plastic dipped unless pipe hangers bear on piping insulation (cold services).
- .7 Cold Services – refrigerant suction lines.
- .3 Wall Supports:
- .1 Horizontal Pipe Adjacent to Wall: Angle iron wall brackets with specified hangers.
- .2 Vertical Pipe Adjacent to Wall: Exposed pipe wall support for lateral movement restraint – Grinnell Figs. 262 or 263.

PART 3 - EXECUTION

3.01 GENERAL

- .1 Install and test in accordance with Technical Standards & Safety Authority (TSSA) and CSA B52.

3.02 INSTALLATION

- .1 Refrigerant Tubing:
- .1 Fittings shall be "Sil-Fos" brazed or silver soldered as specified. Solder will not be permitted. Special precautions shall be taken to prevent overheating of copper tube. No joint shall be made without pressurized nitrogen flow through joint.
- .2 Tubing shall be cut square and have burrs removed.
- .3 Piping shall be kept meticulously clean. Cleaned piping in process of erection, whether installed or awaiting installation shall be capped or plugged.
- .4 Piping shall be installed in vertical and horizontal close to walls and ceilings, with specified pitch. Provide offsets to account for expansion.
- .5 Piping connections to equipment and terminal apparatus shall be supported independently and arranged to give easy access for maintenance.
- .6 Provide rubber grommets where refrigerant piping passes through metal surface.

- .7 Grade horizontal pipe carrying gases 1:240 down in direction of flow.
- .8 Locate double risers in hot gas or suction piping as indicated.
- .9 Locate trap every 15'-0" (4.5 m) of vertical rise in any suction riser 30'-0" (9 m) or more in length.
- .10 Install piping to prevent condensate or oil from flowing back into compressor or evaporator.
- .11 Provide isolation valves at the terminal equipment: VRF fan coils, refrigerant coils, or Branch controllers (VRF Systems).
- .2 Strainers:
 - .1 Provide full size strainer ahead of each automatic valve. Where multiple expansion valves with integral strainers are used, install single main liquid line strainer.
 - .2 On steel piping systems provide adequate strainer in suction line to remove scale and rust inherent to steel pipe.
 - .3 Provide shut-off valve on each side of strainer to facilitate maintenance.
- .3 Refrigerant Driers:
 - .1 Provide full flow permanent refrigerant drier in low temperature systems and systems utilizing hermetic compressors.
 - .2 Mount drier vertically in liquid line adjacent to receiver with three valve bypass assembly to permit isolation of drier for servicing.
- .4 Filter Driers:
 - .1 Filter driers may be used in systems instead of separate strainers and driers.
 - .2 Install with three valve bypass assembly to permit isolation for servicing.
- .5 Solenoid Valves:
 - .1 Provide solenoid valves in liquid line of system operating with single pump-out or pump-down compressor control, in liquid line of single or multiple evaporator systems and in oil bleeder lines from flooded evaporators to stop flow of oil and refrigerant into suction line when system shuts down.
 - .2 Provide solenoid valves with manually operated stems.
- .6 Expansion Valves:
 - .1 Size expansion valves to avoid penalty of being undersized at full load and of being excessively oversized at partial load.
 - .2 Evaluate refrigerant pressure drop through system to determine available pressure drop across valve.
 - .3 Select valves for maximum load at design operating pressure and minimum 126°F (52.2°C) of superheat.
 - .4 Locate remote expansion valve sensing bulb immediately after evaporator outlet and suction line.
- .7 Charging Valves:
 - .1 Provide refrigerant charging connections in liquid line between receiver shut-off valve and expansion valves.
- .8 Flexible Connectors:
 - .1 Install suction and hot piping connections to compressors with three directional changes for minimum of six pipe diameters before reaching point of support.
 - .2 Flexible connectors shall only be utilized at or near compressor where it is not physically possible to absorb vibration within piping configuration.

3.03 ELECTRICAL

- .1 In cold storage rooms, use one conduit to bring wiring into compartment, just below ceiling insulation. Seal inside of conduit at point where it penetrates wall.

3.04 REFRIGERANT TESTS

- .1 Each refrigerant system shall be tested as follows before operation with dry nitrogen gas to pressure not less than 1.5 times system working pressure. During test, each joint shall be tested for leaks with solution of soap and water. Compressors with refrigerant holding charge shall remain isolated from system
- .2 System shall then be evacuated to not less than 250 microns (33.25 Pa) absolute and left for 24 hours, during which pressure shall not have increased more than 250 microns (33.25 Pa). System shall then be pressurized to 0 psi (0 kPa) with refrigerant to be used and shall be evacuated to 500 microns (66.5 Pa) absolute and then immediately fully charged with refrigerant to be used in system and each joint checked with electronic testing device. Tests shall be performed before insulation is applied. Refrigerant charge shall be applied immediately after acceptance of tests. If any tube or other component failure results in the loss of part of refrigerant charge, another charge shall be applied.
- .3 Damaged or defective components shall be replaced with new (not reconditioned) components. Cracked or defective tube shall be replaced. If defect occurs in insulate tube, insulation shall be stripped to locate leak. Amount of insulation stripped shall be replaced with new to be finished as specified.

3.05 START-UP AND ADJUSTMENT

- .1 Provide necessary instruments, gauges and testing equipment required. Adjust controls, to obtain design requirements and Manufacturer's ratings.
- .2 Test and record cooling apparatus entering and leaving air temperatures, dry bulb and wet bulb.
- .3 Test and record voltage and running amperes and compare to motor nameplate data, and starter heater rating against design requirements.
- .4 Ensure that refrigerant temperatures are accurate to within 1°F (-17.2°C) of design requirements.
- .5 In cooperation with Controls Contractor's Representative, set and adjust automatic control system to achieve required sequence of operations.
- .6 Bring equipment into operation, trial run and make up loss of oil and refrigerant.
- .7 Test reports to be submitted for review and inclusion in Maintenance Manuals.

PART 3 - EXECUTION

- 3.01 GENERAL EXECUTION REQUIREMENTS**
- 3.02 PRE-OPERATIONAL CLEANING & PASSIVATION PROCEDURE**
- 3.03 WATER TREATMENT PROGRAM START-UP**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.02 SCOPE OF WORK

- .1 Provide for cleaning and degreasing of systems that use glycol or water as heat transfer medium.
- .2 Provide for cleaning and disinfection of domestic hot and cold systems.
- .3 Provide temporary strainers, connections and by-pass lines as required.
- .4 Provide equipment to add chemicals to systems as specified herein.
- .5 Provide equipment to operate and control system as specified herein. Provide appropriate protection so capped off unused piping does not corrode.
- .6 Provide corrosion coupons for closed and open loop circulation systems as specified herein, to include testing and analysis at least twice in the first year during the warranty period.
- .7 Piping systems to be chemically treated include the following systems:
 - .1 Chilled water system(s).
 - .2 Hot water heating system(s).
 - .3 Heat pump water system(s).
 - .4 Glycol system(s).
- .8 Provide complete start-up and commissioning, including the amounts of chemicals and filter media change-outs sufficient to calibrate the system and provide supplies for the first year of warranty.

1.03 QUALITY ASSURANCE

- .1 Water treatment chemicals and treatment process shall be supplied and performed by the Mechanical Trades. Work shall be supervised by Water Treatment Specialist who, upon completion, shall certify process is satisfactory and submit report outlining cleaning operation and treatment process. Mechanical Trades shall provide name and supplier of chemical treatment specialist as part of post-tender submittals and progress claim breakdown.

1.04 REFERENCE STANDARDS

- .1 Provide HVAC water treatment in accordance with ASME Boiler Code Section VII, and requirements and standards of Authorities having Jurisdiction (AHJs), except where specified otherwise.

1.05 SUBMITTALS

- .1 Submit shop drawings including proposed chemicals, quantities, procedures and equipment to be supplied. Provide written operating instructions and system schematics including Material Safety Data Sheet (MSDS) data, and safe disposal instructions. Provide samples of testing record sheets with recommended water treatment testing schedule for the proposed treatment.
- .2 Provide written report containing log and procedure of system cleaning, giving times, dates, problems encountered and condition of water.
- .3 Submit written report containing test results and list of chemicals added every fourteen (14) days from time of commissioning to acceptance.
- .4 Notify Consultant forty-eight (48) hours prior to chemical cleaning so work may be verified and reviewed.

1.06 WATER TREATMENT SERVICE

- .1 Water Treatment Specialist shall provide supervision of installations, set-up and adjustments and shall submit written report on system operations.
- .2 Chemicals, feed systems and test equipment shall be provided by Water Treatment Specialist.
- .3 Treatment chemicals shall not contain hydrazine.
- .4 Treatment chemicals shall be non-foaming.
- .5 Water Treatment Specialist shall instruct maintenance personnel before substantial completion. Written instructions of treatment, dosages, control charts and test procedures shall be included in maintenance manuals.
- .6 Water Treatment Specialist shall provide monthly visits to check chemical treatment, take water samples and recommend any changes to treatment, and provide written report for period of one year after Substantial Performance. Provide sufficient chemicals to treat system from time of commissioning to acceptance of building. Provide a stock of chemicals, filters and corrosion coupons suitable for twelve (12) months normal operation or minimum 5,000 hours of operation for system volume.
- .7 Provide test kit suitable for chemical treatments used. Test kit shall be made available for on-site tests. Hand kit over to Building Operator at project completion; obtain receipt.

PART 2 - PRODUCTS

2.01 CHEMICALS

- .1 Closed system pre-operational cleaner for systems **without** aluminum metallurgy:
 - .1 Concentrated blend of cleaners and surfactants to remove oil, grease, dirt and other construction debris from closed system piping to be used in cleaning and flushing as per procedure from Water Treatment Specialist (Equal to Chem-Aqua 61502).
- .2 Closed system chemical treatment (Hot Water, Chilled Water) for systems **without** aluminum metallurgy:
 - .1 Use Borated molybdate or nitrite or all organic based corrosion inhibitor. (Equal to Chem-Aqua 52885 or Chem-Aqua 51999 or Chem-Aqua 54205).
- .3 Glycol System:
 - .1 Charge hot water and/or heat recovery system(s) and chilled water system(s) with a 40% solution (by volume) in water of inhibited propylene glycol and suitable for system with aluminum if required.

2.02 EQUIPMENT

- .1 Closed Systems (hot water heating, chilled water, heat pump and closed circuit condenser water):
 - .1 Bypass Pot Feeder: Closed water systems shall have by-pass chemical pot feeder with 2 gal (7.6 L) capacity, constructed of heavy-duty cast-iron or welded steel (suitable for 300 psi working pressure), with quick opening cap and complete with NPS ¾ connections. Install isolating valves on inlet, outlet and drain.
 - .2 Automatic Chemical Injection system (optional): Board mounted NanoTron microprocessor controller, contact water meter and chemical dose pump to inject chemical into closed system piping automatically when required.
 - .3 Side Stream Filters: Closed systems shall have side stream filters. 304 stainless steel housing to accept 20 micron filter cartridges- single or multiple cartridges. Filter must be selected for handling minimum flow rate of 3% of system recirculation flow rate. Include 10 filter replacement cartridges for each side stream filter unit.
 - .4 Sight Flow Indicator: provide and install suitably sized sight flow indicator after the side-stream filter matching the pipe size.
 - .5 Provide contact water meter of size matching dia. of pipe of incoming make-up water complete with electronic output for analogue flow monitoring by building automation system.

- .6 Two (2) station Corrosion Coupon and Holder Assembly with Dole Valve:
 - .1 Mild steel and/or Copper and/or Aluminum corrosion coupons.
 - .2 Holder, NPS ¾" (20mm) or NPS 1" (25mm) connection.
 - .3 Provide malleable or cast-iron cross, NPS ¾" (20mm) or NPS 1" (25mm) connection.
- .2 Cooling Towers (Open systems):
 - .1 Board mounted- Packaged conductivity controller with 240 x 128 Graphic LED display, 0-10,000 microS, selectable feeders (pulse, %, post blow down, limit and 28 day), on-off switch, NEMA 4X enclosure. Mounted on a 24" x 18" x 3/8" (600 mm x 450 mm x 10 mm) thick wall, rigid PVC panel, mounting holes at each corner; conductivity probe; and flow switch mounting tee; with three (3) magnetic impulse solenoid pumps with a rated capacity to pump the required amount of chemical against system pressure, complete with manual stroke length adjustment, stroke frequency adjustment, manual stroke frequency override, suction tubing with foot valve, and discharge tubing with injection fitting.
 - .2 For using solid chemical products use HandiFeed Ultra-S Dissolving Feeders- 3 units; Provide one mixing unit per solid chemical product used
 - .3 Make-up Water Meter: Cumulative totalizer register, electrical contacting head water meter, sized to suit cooling tower make-up line size, adjustable output, pre-set to make contact at gallons selected by Water Treatment Specialist.
 - .4 Solenoid Bleed Valve: ¾" size 115/1/60, brass body, , normally closed operation, zero operating pressure differential, threaded connections, size by Water Treatment Specialist, to meet minimum requirements of NEMA-4, DIN43650A cable plug.
 - .5 Two (2) station Corrosion Coupon and Holder Assembly with Dole Valve:
 - .1 Mild steel and/or Copper and/or Aluminum corrosion coupons.
 - .2 Holder, NPS ¾" (20mm) or NPS 1" (25mm) connection.
 - .3 Provide malleable or cast-iron cross, NPS ¾" (20mm) or NPS 1" (25mm) connection.
 - .6 Filter: Filtration system shall be sized for 5% side stream flow and cooling tower sump to be fitted with Sweeper Jet System if required.
- .3 Steam System:
 - .1 Automatic Blow down and chemical feed Controller Package: Packaged conductivity controller with 240 x 128 Graphic LED display, 0-10,000 µS, selectable feeders (pulse, %, post blow down, limit and 28 day), on-off switch, NEMA 4X enclosure. Mounted on a 24" x 18" x 3/8" (600 mm x 450 mm x 10 mm) thick wall, rigid PVC panel, mounting holes at each corner; standard boiler electrodes with MNPT stainless steel bushing and FNPT cross designed for mounting in the surface blow-down line; with one (1) or more based on chemical products being used, magnetic impulse solenoid pumps with a rated capacity to pump the required amount of chemical against system pressure, complete with manual stroke length adjustment, stroke frequency adjustment, manual stroke frequency override, and discharge tubing with SS injection system.
 - .2 Blow down valve AVP 60-30-F: Steam Rated valve; 110 volts, single phase, 60 Hz
 - .3 For using Solid chemical products use HandiFeed Ultra-S Dissolving Feeders- Provide one mixing unit per solid chemical product used
 - .4 Sample cooler for drawing water samples
- .4 Glycol System:
 - .1 Bypass Pot Feeder: Closed glycol systems shall have by-pass chemical pot feeder with 2 gal (7.6 L) capacity, constructed of heavy-duty cast-iron or welded steel (suitable for 200

- psi (1,380 kPa) working pressure), with quick opening cap and complete with NPS ¾ connections. Install isolating valves on inlet, outlet and drain.
- .2 Side Stream Filters: Closed systems shall have side stream filters. 304 stainless steel housing to accept 20 micron filter cartridges- single or multiple cartridges. Filter must be selected for handling minimum flow rate of 3% of system recirculation flow rate. Include 10 filter replacement cartridges for each side stream filter unit.
 - .3 Sight Flow Indicator: provide and install suitably sized sight flow indicator after the side-stream filter matching the pipe size.
 - .4 Two (2 station Corrosion Coupon and Holder Assembly with Dole Valve:
 - .1 Mild steel and/or Copper and/or Aluminum corrosion coupons.
 - .2 Holder, NPS ¾" (20mm) or NPS 1" (25mm) connection.
 - .3 Provide malleable or cast-iron cross, NPS ¾" (20mm) or NPS 1" (25mm) connection.
 - .5 Automatic feed system with manual override (CA-GF-1A1A1M or acceptable equal), comprising the following:
 - .1 Pump: 1.5 US gpm (7.5 L/min) at 100 psi (690 kPa), Motor, 1725 rpm, 1/3 HP, 115/1/60 VAC.
 - .2 Tank: 55 US gal polyethylene tank with hinged poly cover on a steel stand
 - .3 Pressure Switch: Glycol addition shall be controlled by adjustable pressure switch with high and low set-points. When pressure in loop reaches low set-point, pump shall start and feed glycol until high set-point pressure is achieved and pump stops.
 - .4 Control Panel: NEMA 4X enclosure, 115/1/60 VAC and shall consist of the following:
 - .1 Power supply cord with molded plug.
 - .2 H-O-A switch for pump motor.
 - .3 Pump "ON" indication.
 - .4 "LOW" tank level indication with audible alarm.
 - .5 Push button to silence.
 - .6 Contacts for remote connection.
 - .5 Accessories:
 - .1 Float switch for low level cut off of pump.
 - .2 Pressure switch.
 - .3 Relief valve piped back to tank.
 - .6 Provide pressure gauge located in discharge piping.
 - .7 Provide chart showing specific gravity of specified solution by volume, at specified temperature.

PART 3 - EXECUTION

3.01 GENERAL EXECUTION REQUIREMENTS

- .1 Comply with the Water Treatment Specialist requirements for the provision of all specified equipment and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of Chemical Treatment supplied by the Water Treatment Specialist. Include all additional labour necessary as part of the project commissioning requirements.
- .3 Mechanical Trades shall be responsible for initial flush and final fill of all glycol solution systems.

3.02 PRE-OPERATIONAL CLEANING & PASSIVATION PROCEDURE

- .1 Follow the procedure as recommended by the Water Treatment Specialist.

3.03 WATER TREATMENT PROGRAM START-UP

- .1 Contact the Water Treatment Specialist to begin water treatment program immediately after flushing confirmation.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.02 WORK PERFORMED BY THIS SECTION

- .1 Provision of air distribution equipment and related ancillaries.
- .2 Louvers are to be supplied and installed by Trades other than Mechanical Division Trades.

1.03 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the construction and installation of air distribution equipment and related ancillaries.
- .2 Submittals: Submit shop drawings for the following Products:

1.04 REFERENCE STANDARDS

- .1 SMACNA HVAC Duct Construction Standards Metal and Flexible - Second Edition
- .2 NFPA 96 Ventilation Control and Fire Protection of Commercial Cooking Operations
- .3 NFPA 90A Installation of Air Conditioning and Ventilating Systems
- .4 NFPA 90B Installation of Warm Air Conditioning and Air Conditioning Systems
- .5 ASTM A621 & A621M - 1998 Specification for Forming Steel (FS), sheet and Strip, Carbon, Hot Rolled.
- .6 ASTM A653M Specification for Steel Sheet, Zinc Coated Galvanized or Zinc Alloy Coated (Galvannealed) by the Hot Dip Process
- .7 ASTM A924M General Requirements for Sheet Steel, Metallic Coated by the Hot Dip Process
- .8 Duct dimensions shown on Drawings are net, inside insulation and acoustic duct lining.

1.05 VOLATILE ORGANIC COMPOUND ("VOC") REQUIREMENTS

- .1 All adhesives, sealants, paints and coatings used on or inside of building weatherproofing layer shall have a VOC content that is less than the content limits defined in LEED® Product Requirements.

1.06 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 LOW PRESSURE DUCTWORK UP TO 4 in.wg. (1000 Pa)

- .1 Applies to ductwork serving systems with external static pressures up to 4 in.wg. (1000 Pa).
- .2 Low Pressure Ductwork Classification:
 - .1 Ductwork material shall be constructed in accordance with SMACNA ratings for the following pressure classifications. Pressure classifications shall be in accordance with the Low Pressure Classifications Table as follows:

TABLE – Low Pressure Classification			
Ductwork	Operating Pressure	Seal Classification	Remarks
Ductwork Exposed to the Outdoors	All	A	
Air Ductwork	3 to 4 in.wg. (750 - 1000 Pa)	A	
Supply Air Ductwork Upstream of VAV Boxes	Up to 3 in.wg. (750 Pa)	B	
Supply Air Ductwork Downstream of VAV Boxes	Up to 1 in.wg. (250 Pa)	C	
Exhaust and Return Air Ductwork	Up to +/- 1 in.wg. (+/- 250 Pa)	C	
Exhaust and Outside Air Intake Plenums	Up to +/- 1 in.wg. (+/- 250 Pa)	B	
All Other Ductwork Not Listed Above	Up to 0.5 in.wg. (125 Pa)	D	

.3 Sealing Classification:

- .1 Sealing classifications shall be in accordance with the Sealing Classifications Table as follows:

TABLE – Low Pressure Sealing Classification			
Seal Class	Sealing Requirements	Applicable Static Pressure Construction Class	Allowable Leakage Rate
A	All traverse joints, longitudinal seams and duct wall penetrations.	4 in.wg. (1000 Pa) -4 in.wg. (-1000 Pa)	3% of total system design at system operating pressure 4 in.wg. (1000 Pa)
B	All transverse joints and longitudinal seams	Up to 3 in.wg. (750 Pa) -3 in.wg. (-750 Pa) and less	3% of total system design at 3 in.wg. (750 Pa)
C	All transverse joints only	Up to 2 in.wg. (500 Pa) -2 in.wg. (500 Pa) and less	1.5% of total system design at 2 in.wg. (500 Pa)
D	Not sealed	Up to 1" w.g. (250 Pa) -1 in.wg. (-250 Pa) and less	5% of total system design at 1 in.wg. (250 Pa)

.4 Low Pressure Fittings:

- .1 Fabrication shall be to SMACNA Standards.
- .2 Radiused elbows shall be to standard radius.
- .3 Square elbows shall be used over 16" (400 mm) with double thickness vanes. Square elbows shall not be used unless specifically shown on drawings.
- .4 Main Supply Duct Branches: Provide branch duct balancing damper where deemed to be required by TAB Trades for balancing.
- .5 Transitions:
 - .1 Diverging: 1:7 maximum included angle.
 - .2 Converging: 1:4 maximum included angle.
- .6 Offsets: Radiused elbows as indicated.
- .7 Obstruction Deflectors: Maintain full cross-sectional area. Maximum included angles as for transitions.

.5 Galvanized Steel:

- .1 G-60 coated galvanized of lock-forming grade conforming to ASTM A653 and A924 Standards.
- .2 Minimum yield strength for steel sheet and reinforcements shall be 30,000 psi (207 kPa).
- .3 The sheet metal gauge and requirement for reinforcement shall be in accordance with Tables 1-3-1/2 in.wg. static pressure to Table 1-7 4 in.wg. static pressure of SMACNA.
- .4 Fabrication shall be to SMACNA Standards.
- .5 Joints: To SMACNA.
- .6 Joint reinforcement shall be in accordance with Tables 1-10 to 1-13 of the SMACNA Standard.

.6 Hangers and Supports:

- .1 Strap hangers shall be of same material as the duct material but shall be to the next sheet metal thickness heavier than the duct.
- .2 Hanger configuration shall be to SMACNA. Maximum size duct supported by strap hanger shall be 19" (500 mm).
- .3 Hangers: Galvanized steel angle with galvanized steel rods shall be in accordance with SMACNA.
- .4 Upper Hanger Attachments:
 - .1 Concrete: after concrete pour:
 - .1 expanded concrete anchors shall be made of steel;
 - .2 powder actuated fasteners shall not be utilized;
 - .3 holes for expanding fasteners shall be drilled either by a carbide bit or by the teeth on the fastener itself. Expansion shield shall be "set" by driving it into the hole and expanding it with a conical plug.
 - .2 Steel Joist: manufactured joist clamp or steel plate washer:
 - .1 clamp or washer shall be mounted to top chord of steel truss only.
 - .2 Acceptable Manufacturer: Joist Clamps: Grinnell: Fig. 61 or 86, Hunt or approved equal.
 - .3 Steel Beams: Manufactured beam clamps:
 - .1 Acceptable Manufacturer (as listed or equal): Grinnell: Fig. 60, Hunt or equal.
- .5 Round Ductwork: duct shall be supported as follows:
 - .1 duct dimensions 24" (600 mm) single hangers are acceptable;
 - .2 duct dimensions over 24" (600 mm) hanger rods shall be provided on both sides of the duct;
 - .3 minimum hanger sizes shall be in accordance with Table 4-2 of SMACNA.
 - .4 Where reviewed and accepted by seismic engineer, proprietary gripple hanger systems can be used.
- .6 Loading on trapeze bars shall be in accordance with Table 4-3 of SMACNA.
- .7 Duct hangers in MRI's shall be non-ferrous.
- .7 Round Ductwork:
 - .1 All round ductwork shall be of Spiro lockseam construction with rigidity equivalent to SMACNA Standard - Gauge Spiral Duct.
 - .2 Fittings:
 - .1 Elbows shall be standard gore construction.
 - .3 All couplings shall be slipped joint construction with minimum 2" (50 mm) insertion length. Duct sealer shall be applied on male end connectors before insertion and afterwards to cover the entire joint and sheet metal screws. Sheet metal screws shall be installed at a maximum 12" (300 mm) spacing, with a minimum of three (3) screws per joint. In large diameters, flanging gasketed joints are acceptable, in lieu of slip joints.
 - .4 All couplings shall be slipped joint construction with minimum 2" (50 mm) insertion length. Duct sealer shall be applied on male end connectors before insertion and afterwards to cover the entire joint and sheet metal screws. Sheet metal screws shall be installed at a maximum 12" (300 mm) spacing, with a minimum of three (3) screws per joint. In large diameters, flanging gasketed joints are acceptable, in lieu of slip joints.
- .8 Aluminum Duct for Static Pressures 3 in.wg and Less

- .1 To SMACNA: Aluminum type 3003-H-14.
- .2 Thickness: to SMACNA Section 1.12.
- .3 Fabrication: to SMACNA or as indicated.
- .4 Joints: to SMACNA.
- .5 Provide cadmium plated hangers and nuts for support of pool and change room ductwork.
- .6 Provide for the following systems:
 - .1 locker room exhaust
 - .2 as shown on drawings
- .9 Stainless Steel
 - .1 To ASTM A480m-09, Type 304.
 - .2 Thickness: SMACNA Standards.
 - .3 Duct: rectangular ductwork shall be welded pipe to SMACNA Standards for the pressure classification required. Round ductwork shall be of Spiro lockseam construction with an intermediate standard rib to provide rigidity equivalent to SMACNA Standard – Gauge Spiral Duct.
 - .4 Fittings: continuous weld.
 - .5 Joints: Vanstone gasketed flanges with bolts connections or welded joints.
 - .6 Fabrication: The ductwork shall be factory fabricated to SMACNA standards.
 - .7 All stainless steel shall be passivated prior to delivery to site.
 - .8 Provide for the following systems:
 - .1 as shown on drawings
 - .9 Provide stainless steel 20 mm ($\frac{3}{4}$ ") threaded pipe nipples and caps welded into the ductwork at all low points and at the base of each riser.

2.02 MEDIUM & HIGH PRESSURE DUCTWORK BETWEEN 4 in.wg. (1000 Pa) UP TO 10 in.wg. (2500 Pa)

- .1 Applies to ductwork serving systems with external static pressures between 4 in.wg. (1000 Pa) up to 10 in.wg. (2500 Pa) positive or negative.
- .2 Medium and High Pressure Ductwork:
 - .1 Thickness: To SMACNA; continuously welded. Vanstone joints are acceptable.
 - .2 Construction:
 - .1 All ductwork shall be of high pressure construction. Joints shall be sealed airtight.
 - .2 Circular and Oval: Factory fabricated spiral wound with matching fittings and specials to SMACNA.
 - .3 Provide stiffeners and reinforcements as required by the duct design.
 - .4 All flanges and stiffeners shall be compatible with material to match that of the attached ductwork.
 - .5 Minimum galvanized steel ductwork gauge and support locations shall be in accordance with SMACNA.
 - .6 Minimum stainless steel ductwork gauge and support locations shall be in accordance with SMACNA.
 - .3 Elbows:
 - .1 Centre line radius of 1.5 x diameter non-vaned to SMACNA and ASTM.
 - .4 Flanges:

- .1 All flanges to be of same material as duct sections they are connecting.
- .5 Instrument test ports shall be provided and will match ductwork materials in which they are installed.
- .3 Sealing Classification:
- .4 Sealing classifications shall be in accordance with the Sealing Classifications Table as follows:

TABLE – Medium and High Pressure Ductwork Sealing Classification					
Service	Operating Pressure	Particulate Density	Joining Method	Operating Temperature	Duct Class
Supply ductwork between air handling unit and terminal VAV boxes	up to 6 in.wg. (1500 Pa)	n/a		up to 85°F (up to 29.5°C)	2

- .5 Elbows:
 - .1 Elbows: radius with centreline radius of 1.5 x diameter non-vanned. Elbows to conform to requirements outlined in SMACNA.
- .6 Joints:
 - .1 The joining method shall be in accordance with requirements outlined in the Pressure Classification Table noted above.
 - .2 Joints - Flanged Systems:
 - .1 Transverse Joints: Vanstone or TDC/ TDF flange connections with associated gasket.
 - .2 Joints shall be provided with flange, non-extruding gasket and 8 mm (5/16") diameter bolts at a maximum spacing of 8" (200mm) intervals.
 - .3 Joints - Welded Systems:
 - .1 Provide penetration welds at all joints and seams. All welds shall conform to the following Standards:
 - .1 SMACNA - Managers' Guide to Welding;
 - .2 AWS D9.1.
 - .4 Regulating (Balancing) Dampers:
 - .1 Provide regulating dampers in locations as shown on the plans.
 - .2 Dampers shall be constructed in accordance with SMACNA (RIDCS).
 - .5 Hangers and Supports:
 - .1 Steel Joist: Manufactured joist clamp or steel plate washer.
 - .2 Steel Beams: Manufactured beam clamps.
- .7 Galvanized Steel
 - .1 G-60 coated galvanized conforming to ASTM A653 and A924 Standards. Minimum yield strength for steel sheet and reinforcements shall be 30,000 psi (207 kPa).

2.03 FLEXIBLE DUCTWORK

- .1 General Requirements:
 - .1 Factory fabricated.
 - .2 Pressure drop coefficients listed below are based on sheet metal duct pressure drop coefficient of 1.00.

- .3 Fire retardant type insulation materials, coverings and adhesives with maximum flame spread rating of 25 and maximum smoke developed rating of 50 when tested in accordance with CAN/ULC-S102 and NFPA 255-2006. Materials tested in accordance with ASTM C411-05 shall not flame, smoulder, glow or smoke at temperature to which exposed in service. Flexible duct system shall meet OBC requirements for smoke and flame spread for return air plenums.
- .2 Acoustic Flexible Ductwork
 - .1 Flexible ducting shall be equal to True Flex Acoustic – Model TFAPB-M by Peppertree Air Solutions Inc. and suitable for use in healthcare facilities.
 - .2 The core shall consist of a continuous spirally wound strip of perforated aluminum (with an open area of 20–25%); sheathed by a black polyethylene fiber retention jacket; wrapped in Owens Corning GREENGUARD Gold Certified fiberglass insulation (Certified R-Value of 8.0); and sleeved with a metalized polyester vapor barrier.
 - .3 Acoustic flexible ducting shall be ULC-S110 Listed as Class 1 Air Duct Connector with a Flame Spread Rating of not over 25 without evidence of continued progressive combustion and a Smoke Developed Rating of not over 50.

2.04 FLEXIBLE DUCT CONNECTIONS

- .1 Frame: galvanized sheet metal frame with fabric clenched by means of double locked seams.
- .2 Material: Fire resistant, self-extinguishing, neoprene coated glass fabric, temperature rated at -40°F to plus 194°F (- 40°C to plus 90°C), density of 0.266 lb/ft² (1.3 kg/m²).

2.05 SEALANT AND TAPE

- .1 Sealant: fibre reinforced, flame resistant (flame spread 5, smoke developed 0) high velocity duct sealing compound. Temperature range of minus -22°F to 200°F (30°C to plus 93°C). Sealant to meet ULS102. System to be rated up to 16 in.wg. without the need for fibreglass mesh tape.
- .2 Where system pressures are in excess of 16in.wg. utilize a fibreglass mesh scrim to reinforce the system. Where a gap exists which is larger than 1/4" provide fiberglass mesh scrim over the gap prior to applying the sealant.
- .3 Acceptable Manufacturer (as listed or equal): Phoenix #33-526, 3M or equal.

2.06 ACOUSTIC DUCT LINING

- .1 Provide {25 mm} [1"] thick acoustic duct liner where shown on drawings and as follows:
 - .1 Rectangular Duct Liner insulation equal to Johns Manville Linacoustic RC-IG meeting ASTM C 1071 with air surface coated with acrylic coating treated with EPA registered anti-microbial agent proven to resist microbial growth as determined by ASTM G 21 and G 22.
 - .1 Noise Reduction Coefficient: .70 or higher based on "Type A mounting" and tested in accordance to ASTM C 423.
 - .2 Adhesive: meeting ASTM C 916.
 - .3 Fasteners: Duct liner galvanized steel pins, welded or mechanically fastened.
 - .2 Round Duct Liner: rigid preformed round liner equal to Johns Manville Spiracoustic Plus with air surface coated with acrylic coating treated with EPA registered anti-microbial agent proven to resist microbial growth as determined by ASTM G 21 and G 22.
 - .1 Noise Reduction Coefficient of .70 as per ASTM C 423. (Type A mounting)
 - .3 Acoustic ducting lining shall be ULC-S102 Listed with a Flame Spread Rating of not over 25 without evidence of continued progressive combustion and a Smoke Developed Rating of not over 50.

PART 3 - EXECUTION

3.01 GENERAL DUCTWORK INSTALLATION REQUIREMENTS

- .1 Install ducts in accordance with SMACNA Standards and as indicated, and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.
- .3 Do not break continuity of insulation vapour barrier with hangers or rods. Insulate strap hangers 4" (100 mm) beyond insulated duct.
- .4 Support risers in accordance with SMACNA Standards or as indicated.
- .5 Provide a drain at the low point of all exhaust and outside air plenums. Slope plenum back to louvre. Pipe drain to funnel floor drain.
- .6 Return air plenums that are formed by exterior walls, and roof slabs shall be sealed air-tight to prevent untreated outdoor air from being drawn into the return air stream.

3.02 LOW PRESSURE DUCTWORK INSTALLATION REQUIREMENTS

Provide low pressure ductwork in accordance with the following:

Fan System Designation	Fan Shop Drawings	Duct Construction
VAV Box Discharge	3.5 in.wg.	2 in.wg.
Supply air ductwork	3.25 in.wg.	2 in.wg.
Return air ductwork	3.25 in.wg.	2 in.wg.

- .1 Install ducts in accordance with SMACNA Standards and as indicated.
- .2 Do not break continuity of insulation vapour barrier with hangers or rods. Insulate strap hangers 4" (100 mm) beyond insulated duct.
- .3 Support risers in accordance with SMACNA Standards or as indicated.
- .4 Suspended plenums shall have the bottoms sloped back towards the louvre; flash over top of the bottom channel of the louvre to allow for any moisture accumulation to drain outside.

3.03 MEDIUM AND HIGH PRESSURE DUCTWORK INSTALLATION REQUIREMENTS

- .1 Provide Medium and High Pressure ductwork as follows:

Fan System Designation	Fan Shop Drawings	Duct Construction
Air Handling Unit Supply Air Discharge	3.5 in.wg.	6 in.wg.

- .2 Install ducts in accordance with SMACNA or as indicated.
- .3 Do not break continuity of insulation vapour barrier with hangers or rods. Insulate band hangers 4" (100 mm) beyond insulated duct.
- .4 Support risers in accordance with SMACNA or as indicated.
- .5 Contractor to submit layout sheet metal shop drawings outlining all elbows, fittings, construction, clean-outs, etc. for approval prior to manufacturing and installation.
- .6 Support ductwork and Owner supplied accessories from structure.

3.04 FLEXIBLE DUCT INSTALLATION

- .1 Install where indicated and in accordance with preferred method of SMACNA and the following:
 - .1 Connections:
 - .1 Duct Sizes 300 mm (12") and Under:
 - .1 Provide a minimum of three (3) #8 sheet metal screws equally spaced to hold the flexible duct.
 - .2 Duct sizes above 300 mm (12"):
 - .1 Provide a minimum of five (5) #8 sheet metal screws equally spaced to hold the flexible duct.
 - .3 Screws shall be located at least 1/2" (12 mm) from the end of the duct.
 - .4 The collar to which the flexible duct is attached shall be a minimum 2" (50 mm) in length.
 - .2 Supports:
 - .1 Support shall be in accordance with SMACNA.
 - .3 Length – Class 1 Ductwork
 - .1 Minimum length of flexible duct: 1500 mm (5 ft.).
 - .2 Maximum length of flexible duct: 3600 mm (12 ft.).
 - .3 Maximum length of flexible duct connecting to light fixture troffers or ceiling diffusers shall be 72" (1800 mm).
- .2 Flexible ductwork shall be installed fully extended with bend radius greater than the duct diameter to avoid kinking.

3.05 WATERTIGHT DUCTWORK

- .1 Provide watertight ducts for:
 - .1 locker room exhaust
 - .2 as shown on drawings
- .2 Form bottom of horizontal duct without longitudinal seams Conform to ASTM Standard B32.
- .3 Seal all other joints with duct sealer.

3.06 DUCT HANGERS

- .1 Provide Duct Hangers in accordance with SMACNA.
- .2 Where ductwork is to be fire wrapped, increase size of hangers to suit the listing of fire wrap product.

3.07 DUCT LEAKAGE TESTING

- .1 Test air duct distribution systems to ensure they conform to the leakage requirements as specified above.
- .2 If ductwork fails leakage test, reseal ductwork and retest.
- .3 Conduct tests in accordance with AABC.
- .4 Acceptable Procedure:
 - .1 Provide an appropriate level of filtration on the intake to the test apparatus prior to starting the test procedure.
 - .2 Connect flexible tubing from the test apparatus to the duct section under test. Select the appropriate orifice plate and start test apparatus at minimum speed. Slowly increase the speed of the blower until the desired static pressure is achieved.
 - .3 Maintain attained system static pressure for a period of 15 minutes. From appropriate manometer gauge on test apparatus read the pressure differential. From the chart supplied

- with the test apparatus read leakage flow rate for a given pressure differential and orifice size. If the test results meet the allowable flow rate complete test report and obtain signatures as required.
- .4 Compare actual leakage with allowable rate. If the test result exceeds the allowable rate undertake appropriate remedial action and repeat the test until satisfactory outcome is achieved.
 - .5 Duct leakage shall not exceed that allowed for ductwork classification when calculated as follows:
 - .1 $Q = Q_1 \times L_1 \times F / L_2$
 - .2 Where:
 - .1 'Q' is allowable leakage in test section in cfm.
 - .2 'Q1' air quantity in cfm of total system.
 - .3 'L1' is Test section length in ft.
 - .4 'L2' is Total system length in ft.
 - .5 'F' is System allowable leakage expressed as a decimal for class of ductwork.
 - .6 When duct leakage tests are being performed on factory cleaned ductwork a HEPA filter shall be installed on the air intake for the pressure testing blower to prevent contamination of the ductwork.
 - .7 Notify the Consultant a minimum of forty-eight (48) hours prior to conducting leakage tests.
 - .8 Ductwork leak testing shall be witnessed by the Commissioning Authority or the Owner's Project Manager.

3.08 FLEXIBLE CONNECTIONS

- .1 Install in following locations where equipment is not internally isolated:
 - .1 Inlets to supply air units.
 - .2 Outlets from supply air units.
 - .3 Inlets and outlets of exhaust and return air fans.
 - .4 As indicated on the Drawings and in the Specifications.
- .2 Length of connection: 3-6" (75-150 mm) pending equipment size and operating pressure.
- .3 Minimum distance between metal parts when system in operation: 2" (50 mm).
- .4 Install in accordance with recommendations of SMACNA.

3.09 SEALANTS AND TAPES

- .1 Apply sealant in accordance with SMACNA and to manufacturer's recommendations. The application temperature for the sealer must be between 35°F (1.7°C) and 111°F (44°C).
- .2 Bed tape in sealant and recoat with minimum of one (1) coat of sealant to manufacturer's recommendations.

3.10 ACOUSTIC DUCT LINING INSTALLATION

- .1 Provide acoustic duct lining where indicated on the drawings.
- .2 Seal all leading and trailing edges and repair all rips or tears of acoustic duct liner with a suitable sealing compound similar to Johns-Manville Superseal.
- .3 Provide a tapered sheet metal nose piece to hold the leading edge of acoustic duct liner and direct the air over the edge.

3.11 DUCT CLEANING

- .1 Prior to shipping ductwork from the factory, the Sheet Metal Contractor shall ensure that all ductwork is clean. Ductwork shall be shipped to the site in closed trucks/trailers.
- .2 During installation, it shall ensure that no debris or foreign objects stay inside ductwork.

- .3 Prior to operation or test and balance, clean systems and equipment including but not limited to ductwork (supply/return/exhaust), air handling equipment, plenums, terminal units, fans, dampers, grilles/registers/diffusers to ensure they are free from debris and dust.
- .4 Cleaning shall be performed in accordance with National Duct Cleaners Association (NADCA) standards, and by agent specializing in this field of work, and a member in good standing with NADCA.
- .5 Protect equipment which may be harmed by excessive dirt with filters, or bypass during cleaning.
- .6 Cleaned according to the following procedures:
 - .1 The space shall be cleaned without debris and construction dust before duct cleaning. Once duct cleaning is complete for the area, there shall not be any more dust generating activities in the area.
 - .2 Ducts shall be cleaned before TAB work.
 - .3 Isolate sections of duct with friction-fitted blocks of closed-cell polyurethane foam, install HEPA vacuums at one end, and insert the full contact brushes at the other. Energize brushes so that they travel toward vacuum units, changing brush sizes as necessary to ensure a constant interference fit within the duct or component.
 - .4 Clean all fittings, components and other features within the system on the same section basis so that dirt from a section being cleaned will never pass through a section that has already been cleaned.
 - .5 Pass brushes through sections or components as many times as necessary to achieve the degree of cleanliness required.
 - .6 Where brushing and vacuuming is not appropriate or sufficient to clean a component of the system, dismantle and remove the component to the outside where it is to be pressure washed with water or chemical to the required state of cleanliness. Clean the component in place only if there is no hazard to the surroundings.
 - .7 Coils, walls, humidifiers, elements and heat exchange surfaces are to be brushed, vacuumed and, where necessary, low volume pressure washed in-place. Fan blades and housings should be wiped or vacuumed. Make all provisions and supply all materials necessary to accomplish this.
- .7 Cleaning of components:
 - .1 All components of the system are to be thoroughly cleaned, including fan units, turning vanes, filter racks, control components including sensing bulbs, branch take-off points, fire dampers, balancing dampers, splitter dampers and any other internal duct or system features, especially corners and pockets where dirt or dust may accumulate.
 - .2 After ducts are cleaned, ceiling diffusers and grilles shall be dusted by another section.
- .8 Equipment requirements:
 - .1 Self-propelling Full Contact Brushes:
 - .1 Employ brushes specially made and shaped to fit the individual ducts or components in which they are used. Ensure continuous full contact and powerful

- scrubbing action of the interior surfaces of the ducts or component in which they are installed.
- .2 Brush bristles to be of nylon, polypropylene or other non-metallic material.
- .3 Brushes to be robotic or self-propelled, in either case having an integrally-mounted propulsion motor or drive. Motors or drives must be powerful enough to continue to propel the brush even when the brush bristles have been severely distorted.
- .4 Brushes to have the capability to clean ventilation duct of 80 sq. mm. to 500 sq. mm.
- .2 Robotic Brush
 - .1 A remote controlled, self-propelled robotic brush is to be used in all areas where the self-propelled brush is not suitable or cannot reach.
 - .2 The robot-manipulated brush is to be of the same material as all other brushes, and have either a rotating or reciprocating scrubbing action. The brush shall maintain contact with the interior surfaces of the duct.
- .3 Robotic Acoustic Lining Cleaner
 - .1 Clean acoustic lining only by a specially-designed, self-propelled and remote controlled robotic assembly that has been demonstrated not to damage the lining. The unit shall be fitted with a compressed air supply which will then blow the freed dirt and dust toward the vacuums at the end of the respective section. The operation of this assembly shall be constantly video monitored and adjusted to ensure that no damage is caused to the acoustic lining.
 - .2 The robot vehicle shall be provided with a video camera device mounted to monitor cleaning process and record to video tape at all time. Where video camera is not part of the robot vehicle, contractor must provide a video record on the condition of the ventilation duct and components before and after cleaning as proof of cleaning has been completed as per the contract.
- .4 Vacuum
 - .1 Vacuum unit shall consist of fan, HEPA filter section, hose, and vacuum head. All vacuum units shall be equipped with integral HEPA filters. Filters must be maintained in top condition.
 - .2 Vacuum cleaning units shall be used only to supplement direct contact brushing.
 - .3 Vacuum units shall be powerful enough and multiple units shall be used, to entrain all removed dirt and particulate matter in the airstream until captured by the vacuum units.
 - .4 No cleaning operations shall take place until vacuum unit are in place and operating
- .9 Post Cleaning
 - .1 Carry out inspection with a third party certifier and/or engineer and provide a certificate with an engineer's stamp stating that the ductwork conforms to cleanliness stated in:
 - .1 NADCA; provide surface compassion test (method 2 in NADA ACR 2006). If test result is inconclusive, proceed with vacuum testing (method 3 in NADCA ACR 2006).

3.12 AIR BALANCING

- .1 Refer to Section 20 05 95.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .2 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.03 WORK PERFORMED BY THIS SECTION

- .1 Provision of air distribution equipment and related ancillaries.
- .2 Louvers are to be supplied and installed by Trades other than Mechanical Division Trades.

1.04 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the construction and installation of air distribution equipment and related ancillaries.
- .2 Submittals: Submit shop drawings for the following Products:

1.05 REFERENCE STANDARDS

- .1 SMACNA HVAC Duct Construction Standards Metal and Flexible - Second Edition
- .2 NFPA 96 – 2008 Ventilation Control and Fire Protection of Commercial Cooking Operations
- .3 NFPA 90A-2009 Installation of Air Conditioning and Ventilating Systems
- .4 NFPA 90B-2009 Installation of Warm Air Conditioning and Air Conditioning Systems
- .5 ASTM A621 & A621M - 1998 Specification for Forming Steel (FS), sheet and Strip, Carbon, Hot Rolled.
- .6 ASTM A653M – 09 Specification for Steel Sheet, Zinc Coated Galvanized or Zinc Alloy Coated (Galvannealed) by the Hot Dip Process
- .7 ASTM A924M – 09 General Requirements for Sheet Steel, Metallic Coated by the Hot Dip Process
- .8 Duct dimensions shown on Drawings are net, inside insulation and acoustic duct lining.

1.06 VOLATILE ORGANIC COMPOUND ("VOC") REQUIREMENTS

- .1 All adhesives, sealants, paints and coatings used on or inside of building weatherproofing layer shall have a VOC content that is less than the content limits defined in LEED® Product Requirements.

1.07 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 DUCT ACCESS DOORS

- .1 General.
 - .1 The access doors shall be of ultra-low leakage, premium quality design. Flat oval design optimizes access area and simplifies installation.
 - .2 The access doors shall be complete with insulated double flanged door with pre-punched holes on inner flange for surface mounting.

- .3 Provide camlock for positive seal and easy opening.
- .2 Construction
 - .1 Die-formed 24 gauge galvanized flanged frame for extra strength.
 - .2 Die-formed 24 gauge galvanized door panel for extra strength.
 - .3 1" (25mm) insulation with 24 gauge galvanized backing plate.
 - .4 3/16" (5mm) dia pre-punched attachment holes on inner flange for surface mounting.
 - .5 Plated steel camlock fasteners.
 - .6 Positive bulb door seal.
 - .7 Oval or flat oval shaped opening adaptable to all ducts 5" (125mm) and over.
 - .8 Tested in accordance to DW142 Class C – maximum leakage at 8 in.wg. (2kPa):
 - .1 12"x 6" (300 x 150 mm): 0.06 cfm (1.8 l/min)
 - .2 18"x12" (450 x 300 mm): 0.13 cfm (3.8 l/min)
 - .3 25"x 17" (625 x 425 mm): 0.28 cfm (8.1 l/min)
- .3 Acceptable Manufacturers:
 - .1 Nailor;
 - .2 Or approved equivalent.

2.02 INSTRUMENT TEST PORTS

- .1 0.063" (1.6 mm) thick steel zinc plated after manufacture.
- .2 Cam lock handles with neoprene expansion plug.
- .3 1" (25 mm) minimum inside diameter. Length to suit insulation thickness.
- .4 Neoprene mounting gasket.
- .5 Acceptable Manufacturers:
 - .1 Duro Dyne IP1 or IP2 for insulated ducts;
 - .2 Duro Dyne IP4 for non-insulated ducts.

2.03 ROUND TO RECTANGULAR DUCT CONNECTIONS

- .1 Equal to Flexmaster Canada Ltd. galvanized steel, flared, flanged or notched "Spin-On" round duct take-off collars with locking dampers in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible.

2.04 AIR TURNING VANES

- .1 For square duct elbows - multiple-radius turning vanes, interconnected with bars, adequately reinforced to suit the pressure and velocity of the system, and constructed of the same material as the duct they are associated with, and in accordance with SMACNA HVAC Duct Construction Standards Metal and Flexible.
- .2 For short branch ducts at grille and diffuser connections - air extractor type, each equipped with a matching bottom operated 90 degree opposed blade volume control damper, constructed of the same material as the duct it is associated with, and in accordance with SMACNA HVAC Duct Construction Standards Metal and Flexible.

2.05 SPLITTER DAMPERS

- .1 Minimum #20 gauge damper blade constructed of same material as duct, reinforced as required to suit blade size, system velocity, and to prevent "chatter", and complete with operating hardware equal to DynAir Inc. #Q-50 "DYN-A-QUAD S-S" quadrant regulator with RW-50 backup washers to prevent leakage, long square bearing pin, and slide pin.

2.06 SINGLE BLADE BALANCING DAMPERS

- .1 Of same material as duct. V-groove stiffened.
- .2 Size and configuration to recommendations of SMACNA, except maximum height 12" (300 mm).
- .3 Locking device.
- .4 Inside and outside end bearings for special fume exhaust ducts.

2.07 MULTI-BLADED BALANCING DAMPERS

- .1 Factory manufactured of material compatible with duct.
- .2 Opposed blade: configuration to recommendations of SMACNA.
- .3 Bearings: pin in bronze bushings.
- .4 Linkage: shaft extension with locking quadrant.
- .5 Channel frame complete with angle stop.
- .6 Inside and outside end bearings.

2.08 MULTI-LEAF AUTOMATIC CONTROL DAMPERS

- .1 Automatic Control Dampers are specified in Section 25 30 10 shall be supplied by the BAS Trades for installation in the Air Distribution system. Coordinate all requirements with BAS Trades.

2.09 AIR FLOW STATIONS

- .1 Air flow stations are specified in Section 25 30 10 shall be supplied by the BAS Trades for installation in the Air Distribution system. Coordinate all requirements with BAS Trades.

2.10 BACKDRAFT DAMPERS

- .1 Backdraft dampers shall meet the following minimum construction standards:
 - .1 Frame shall be 0.125" (3.2 mm) wall thickness 6063T5 extruded aluminum.
 - .2 Frame shall have galvanized steel braces at all corners.
 - .3 Blades shall be 0.070" (1.8 mm) wall thickness 6063T5 extruded aluminum.
 - .4 Blades shall begin to open at approximately 0.12 in. wg. and be fully open at approximately 0.20 in.wg. static pressure.
 - .5 Blade edge seals shall be extruded vinyl mechanically locked into blade edge; adhesive type seals are unacceptable.
 - .6 Bearings shall be corrosion resistant long life synthetic for quiet operation.
 - .7 Linkage shall be ½" (13mm) tie bar with stainless steel pivot pins; linkage shall have the capability of being manually locked in the closed position for independent fan isolation from the remained of fans in the array.
 - .8 Damper shall be designed for 3500 fpm maximum spot air velocity.

2.11 CASING AND PLENUM ACCESS DOORS

- .1 Gasketed access doors, factory insulated type in insulated casings or plenums, each constructed of galvanized steel (unless otherwise specified) in accordance with SMACNA HVAC Duct Construction Standards Metal and Flexible, to suit the pressure classification of the casing or plenum.
- .2 Where access doors occur in casings and/or plenums constructed of materials other than galvanized steel, the doors shall be as above but constructed of material to match the casing and plenum material.

2.12 SILENCERS

- .1 Provide silencers to maintain the maximum Noise Criteria (NC) levels as stated in the following Table:

Area	Maximum NC Level
------	------------------

Open office/reception areas	35
Private offices	30
Conference, interview & meeting rooms	30
Circulation and lobbies	40
Washrooms, service and storage areas	40

- .2 Silencers certified to ASTM E477 "Standard Method of Testing Duct Liner Materials and Prefabricated Silencers For Acoustical and Airflow Performance" completely prefabricated and as follows:

.1 Materials:

- .1 No-medial type rectangular type silencers shall be constructed with a 22 gauge (0.78 mm) galvanized steel outer casing and 26 gauge (0.47 mm) galvanized perforated steel;
- .2 Film lined rectangular type silencers shall be constructed with a 22 gauge (0.78 mm) galvanized steel outer casing and 26 gauge (0.47 mm) galvanized perforated steel.
- .3 No-media and film lined elbow silencers shall be constructed with an 18 gauge (1.24 mm) galvanized steel outer casing and 22 gauge (0.78 mm) galvanized perforated steel. All acoustical splitters shall be internally radiused and aerodynamically designed for efficient turning of the air. Half and full splitters are required as necessary to achieve the scheduled insertion loss. All elbow silencers with a turning cross-section dimension greater than 48" (1200 mm) shall have at least two half splitters and one full splitter.
- .4 Circular silencers shall be constructed with a galvanized steel casing as noted below and 22 gauge (0.78 mm) galvanized perforated steel. All casing and seams and joints shall be lock formed and sealed or stitch welded and sealed.

CASING DIAMETER	CASING GAUGE
Less than 30" (750 mm)	20
30" (750 mm) to 54" (1350 mm)	18
Over 54" (1350 mm)	16

.2 Acoustic Media:

- .1 Media for film lined silencers shall be media containing 100% natural cotton fibers treated with an EPA registered, non-toxic borate solution, "flash dried" to provide resistance to mold, mildew and fungi. Media shall comply with UL181 and NFPA 90A. Media shall be packed with a minimum of 15% compression during silencer assembly. Media shall not cause or accelerate corrosion of aluminum or steel.

.3 Acoustic Media Protection:

- .1 Film lined silencers shall be as above with acoustic media completely wrapped with Tedlar film to prevent shedding, erosion and impregnation of glass fibre. The wrapped acoustic media shall be separated from the perforated metal by a factory installed 1/2" (12 mm) thick acoustically transparent spacer. The spacer shall be

flame retardant and erosion resistant. A mesh, screen or corrugated liner will not be acceptable as a substitute for the specified spacer.

.4 High Transmission Loss ("HTL") Ductwork

- .1 Silencers shall have a High Transmission Loss ("HTL") walls externally applied and completely sealed to the silencer casing by the silencer manufacturer to assure quality controlled transmission loss. The HTL walls shall consist of media, airspace, mass and outer protective metal skin, as required to obtain the specified room noise criteria. Standard acoustical panels will not be accepted as HTL walls. Provide breakout noise calculations as part of the silencer shop drawing submissions for each air handling and fan system with HTL silencers. Breakout noise shall be based on the sound power levels of the specified equipment.

- .3 Manufacturer shall certify on shop drawings that silencer performance is per ASTM E477.

2.13 DYNAMIC FIRE DAMPERS

.1 Application:

- .1 HVAC System operates under fire alarm, smoke control, or smoke evacuation modes.

.2 Construction:

- .1 Provide Dynamic rated fire dampers, meeting or exceeding the following criteria:

- .1 Fire dampers shall all the requirements of UL and NFPA 80, 90A and 101 for fire dampers in dynamic HVAC systems, as well as National Building Code of Canada (NBC) requirements.

- .2 Manufactured, tested and labeled in accordance with UL 555 and CAN/ULC-S112 Standard for Dynamic Fire Dampers, including Dynamic Closure Test (formerly the Operation Test). Dampers shall be classified for dynamic closure against an airflow velocity of 2000 fpm (10.16 m/s) at 4" w.g. (1 kPa) static pressure differential across closed damper.

- .2 Each fire damper shall bear a UL 1½ hours or 3 hours fire resistance rating label in addition to label verifying the airflow and closure pressure ratings as established by the Dynamic Closure Test.

- .3 Each fire damper shall also be marked with the words "For use in dynamic systems"; Dampers marked "For use in static systems only" are not acceptable.

- .4 Each fire damper shall be complete with a 165°F (74°C) UL Listed fusible link.

- .5 Fire dampers shall each include a steel sleeve of appropriate length/gauge and retaining angles, supplied by damper manufacturer to ensure proper installation in accordance with damper manufacturer's instructions.

- .6 Contractor shall provide an access door at each fire damper, of appropriate size to allow for inspection, testing and fusible link replacement.

- .7 Fusible link dampers shall be Type B or Type C (as required) with curtain blade out of air stream. Type A dampers (with the curtain blade in the air stream) may be installed only where size or location are such that Type B and Type C cannot be installed. Consultant shall review application of Type A use prior to installation.

- .8 Fusible link dampers in ductwork other than galvanized steel are to be as specified above but constructed of type 316 stainless steel.

.3 Acceptable Manufacturers:

- .1 Nailor Industries D0100 series for 1½ hr rated, and D0500 series for 3 hr rated.
.2 EH Price, Brisk, Ruskin;
.3 Or acceptable equivalent

2.14 MULTI-BLADE FIRE DAMPERS

- .1 Application:
 - .1 Provide Multi-Blade Dynamic Fire Dampers as shown on plans and/or schedules,
 - .2 Each fire damper shall also be marked with the words "For use in dynamic systems". Dampers marked "For use in static systems only" are not acceptable.
- .2 Construction:
 - .1 Fire dampers shall meet the requirements of NFPA 80, 90A and 101 and shall be manufactured, tested and labeled in accordance with UL 555.
 - .2 Each damper shall bear a UL fire resistance rating label of 1½ hours or 3 hours, in accordance with the fire rating of the assembly being penetrated, and in addition, a label verifying the airflow and closure pressure ratings of 2000 fpm (10 m/s) at 4 in.wg. (1 kPa) static pressure differential, as established by the Dynamic Closure Test.
 - .3 Frame shall be constructed of 16 ga. (1.6) galvanized steel hat channel with mitered corners reinforced with die-formed corner gussets for strength.
 - .4 Blades shall be 14 ga. (2.0) equivalent galvanized steel formed double skin, airfoil design, on 5 1/2" (140) centers.
 - .5 Dampers shall be of opposed blade configuration with an inter-locking blade design. Blade seals are not acceptable.
 - .6 Blade axles shall be plated steel, double bolted at each end of blade to provide positive locking connection. Hex, square friction-fit or press-fit axles are not acceptable.
 - .7 Bearings shall be self-lubricating oilite bronze type. Blade linkage shall be zero-maintenance, concealed in frame, out of airstream. Each fire damper shall be complete with a 165°F (74°C) UL Listed fusible link that will cause the damper to close and lock in closed position by means of an over center/knee lock linkage for assured closure.
 - .8 Fire dampers shall each include a steel sleeve of appropriate length/gauge as field verified by contractor, with retaining angles supplied by damper manufacturer to ensure proper installation in accordance with damper manufacturer's instructions.
 - .9 Each damper shall be supplied with an internal manual quadrant(s) for setting and locking of blades in desired position. Contractor shall provide and install an access door at each fire damper, of appropriate size to allow for inspection, testing and fusible link replacement.
- .3 Acceptable Manufacturers:
 - .1 Nailor Industries.
 - .2 EH Price, Brisk, Ventex/Lloyd Industries, Ruskin;
 - .3 Or acceptable equivalent

2.15 LOW LEAKAGE MOTORIZED SMOKE DAMPERS

- .1 Application:
 - .1 Provide Class I low leakage motorized smoke dampers as shown on plans and/or schedules.
 - .2 Dampers shall be suitable for use in dynamic or static smoke control systems.
 - .3 Dampers shall be fail safe opposed blade configuration with an interlocking blade design that provides complete smoke seal under elevated temperature conditions when in closed position.
- .2 Construction:
 - .1 Dampers shall meet the requirements of NFPA 90A, 92, 101 and 105 and shall be classified as a Class I Leakage Rated (Smoke) Damper under UL 555S at an elevated temperature of 250°F (121°C) and each damper shall bear a ULC label verifying same.
 - .2 Dampers must comply with the requirements of AMCA 511 Certified Ratings Program and be qualified to bear the AMCA Seal.

- .3 Dampers shall have been operation tested by ULC to a minimum velocity/pressure rating of 2000 fpm @ 4 in.wg.
- .4 Frame shall be constructed of 16 ga. (1.6mm) galvanized steel hat channel with mitered corners reinforced with die-formed corner gussets for strength.
- .5 Blades shall be type 6063-T5 extruded aluminum airfoil design on maximum 6" (152) centers with integral structural reinforcing tube running full length of each blade
- .6 Blade axles shall be ½" (13mm) dia. plated steel, double bolted at each end of blade to provide positive locking connection; hex, square friction-fit or press-fit axles are not acceptable.
- .7 Bearings shall be self-lubricating bronze type.
- .8 Blade linkage shall be zero-maintenance, concealed in frame, out of airstream.
- .9 Jamb seals shall be compression type stainless steel.
- .10 Blade seals shall be silicone, mechanically locked in extruded blade slots.
- .11 Externally mounted electrical actuators shall be installed by the damper manufacturer in the factory; review with Consultant any smoke damper actuator proposed to be internally mounted prior to installation. Actuators shall incorporate an OEM internal spring-return mechanism. Damper and actuator assembly shall be factory cycled a minimum of three (3) times to ensure correct operation.
- .12 Submitted pressure drop data to be based on tests in accordance with AMCA Standard 500-D and shall demonstrate a maximum pressure drop of 0.02 in.wg. @ 849 fpm (5 Pa @ 4.3 m/s) across a 36" x 36" (914mm x 914mm) damper.
- .13 Damper shall come complete with a position indicator switch where damper is required to be reopened or closed from a remote location for smoke management and control; damper open end switches shall be adjustable in the field.
- .14 Provide manual test switch to demonstrate proper damper operation as part of regular on-going system maintenance and verification.
- .3 Acceptable Manufacturers:
 - .1 Nailor Industries
 - .2 EH Price
 - .3 Ruskin
 - .4 Or acceptable equivalent

2.16 COMBINATION FIRE/SMOKE DAMPERS

- .1 Application:
 - .1 Provide Combination Fire/Smoke Dampers as shown on plans and/or schedules.
- .2 Construction:
 - .1 Combination Fire Smoke Dampers shall meet the requirements of NFPA 80, 90A, 92 101 and 105.
 - .2 Combination Fire Smoke Dampers shall be classified by Underwriter's Laboratories and labeled as a 1½ hour Fire Damper under UL 555, and as a Class I Smoke Damper under UL 555S at an elevated temperature of 250°F (121°C). Each Combination Fire Smoke Damper shall bear a ULC label verifying same for use in dynamic or static Smoke Control Systems.
 - .3 Dampers must comply with the requirements of AMCA 511 Certified Ratings Program and be qualified to bear the AMCA Seal.
 - .4 Frame shall be constructed of 16 ga. (1.6mm) galvanized steel hat channel with mitered corners reinforced with die-formed corner gussets for strength.

- .5 Blades shall be 14 ga. (2.0mm) equivalent galvanized steel formed double skin, airfoil design.
- .6 Dampers shall be of opposed blade configuration with an interlocking blade design that provides complete flame and smoke seal under fire conditions at an elevated temperature of 2000°F (1093°C) when in closed position.
- .7 Blade axles shall be plated steel, double bolted at each end of blade to provide positive locking connection.
- .8 Bearings shall be self-lubricating bronze type.
- .9 Blade linkage shall be zero-maintenance, concealed in frame, out of airstream.
- .10 Jamb seals shall be compression-type stainless steel.
- .11 Dampers shall have been tested for dynamic closure by UL to a minimum velocity/pressure rating of 2000 fpm @ 4in.wg.
- .12 Dampers shall be supplied with factory installed sleeves of minimum 16" (406mm) length and shall be field verified by contractor, dependent on wall thickness. Factory sleeves shall be caulked to UL requirements and shall be 20 ga. (1.0mm) through 84" (2134mm) wide, and 18 ga (1.2mm) above 84" (2134mm) wide.
- .13 Appropriate electric (115 V/1ph/60Hz) actuator shall be installed by the damper manufacturer in the factory and shall have been tested and classified under UL 555S. Actuators shall incorporate an OEM internal spring return mechanism.
- .14 Each damper shall be equipped with a UL Classified heat responsive device that will cause the damper to close in a controlled manner and lock in a closed position by means of an over center/knee lock linkage, when the duct temperature reaches the maximum degradation temperature of the damper/actuator assembly as required by UL 555S. Closure devices that cause instantaneous closure are not acceptable.
- .15 Submitted pressure drop data to be based on tests in accordance with AMCA Standard 500-D and shall demonstrate a maximum pressure drop of 0.02 in.wg. @ 849 fpm (5 Pa @ 4.3 m/s) across a 36" x 36" (914 x 914) damper.
- .16 Damper shall come complete with a position indicating switch where damper is required to be reopened or closed from a remote location for smoke management and control; damper open end switches shall be adjustable in the field.
- .17 Provide manual test switch to demonstrate proper damper operation as part of regular on-going system maintenance and verification.
- .3 Acceptable Manufacturers:
 - .1 Nailor Industries.
 - .2 EH Price
 - .3 Ruskin
 - .4 Or acceptable equivalent

2.17 WIRE MESH (BIRDScreen)

- .1 Heavy-gauge galvanized steel or aluminum mesh, 12 mm x 12 mm (½" x ½") secured in a rigid galvanized steel or aluminum framework, sized as indicated on drawings, and constructed so as to be removable.

2.18 LOUVRES

- .1 Fixed Blade Horizontal Louvers, 6" (150mm) Deep:
 - .1 Nailor model 1606KD extruded aluminum stationary blade drainable louvers as follows:
 - .1 Frame: 6" (152mm) deep, Type 6063-T6 extruded aluminum, .080" (2.03mm) nominal wall thickness. Integral caulking slot provided;

- .2 Blades: Type 6063-T6 extruded aluminum, .080" (2.03) nominal wall thickness, with reinforcing bosses; K style.
- .3 Blade Angel: Fixed at 37 degrees;
- .4 Blade Spacing: Approx. 6" (152mm) on centers;
- .5 Free Area: 50%
- .6 Performance: 0.14 in.wg. APD at 1017 ft/min velocity through free area.
- .7 Blade Support Brackets: Concealed type, factory installed on rear of louver on maximum 60" (1524mm) centers; reinforced with 1 1/2" x 2" (38mm x 51mm) angle; adds approximately 2" (51mm) to overall louver depth;
- .8 Mullions: Concealed type allowing continuous line appearance up to 120" (3048mm) wide; larger assemblies require separate visible frames with downspouts;
- .9 Birdscreen: 3/4" x .051" (19mm x 1.3mm) expanded, flattened aluminum bird screen in removable frame, inside (rear) mount; adds approximately 3/8" (10mm) to louver depth.
- .10 Finish: Custom high performance powder coat finish to suit architectural requirements.

- .2 Other acceptable manufacturers: Ruskin, Greenheck, Ventex, Construction Specialties.

2.19 LOUVRE BLANK-OFF PANELS

- .1 Insulated, framed, sandwich construction panels consisting of two staggered layers of (2") 50 mm thick low temperature phenolic board insulation between minimum #20 gauge galvanized sheet steel with exterior face of panels finished to match finish of exterior wall louvres.

PART 3 - EXECUTION

3.01 GENERAL AIR DUCT ACCESSORIES INSTALLATION REQUIREMENTS

- .1 Install ducts in accordance with SMACNA Standards and as indicated, and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.
- .3 Do not break continuity of insulation vapour barrier with hangers or rods. Insulate strap hangers 4" (100 mm) beyond insulated duct.
- .4 Support risers in accordance with SMACNA Standards or as indicated.
- .5 Provide a drain at the low point of all exhaust and outside air plenums. Slope plenum back to louver. Pipe drain to funnel floor drain.
- .6 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.

3.02 DUCT ACCESS DOORS

- .1 Size:
 - .1 25" x 17" (650 x 425 mm) for person size entry.
 - .2 21" x 14" or 18" x 10" (525 x 350 mm or 450 x 250 mm) for servicing entry depending on required space.
 - .3 18" x 10" or 12" x 6" (450 x 250 mm or 300 x 150 mm) for viewing depending on site condition.

- .4 As indicated on the Drawings and in the Specifications.
- .2 Location:
 - .1 At fire and smoke dampers.
 - .2 At control dampers if linkage is located internally.
 - .3 Upstream of all reheat coils.
 - .4 At devices requiring maintenance.
 - .5 At locations required by Code.
 - .6 As indicated on the Drawings and in the Specifications.

3.03 INSTRUMENT TEST PORTS

- .1 General:
 - .1 For traverse readings, install in accordance with recommendations of SMACNA.
 - .2 Provide adjacent to all control sensors installed by Control Contractors to allow for confirmation and validation of the readings provided by these sensors. This includes but is not limited to temperature sensors, relative humidity sensors, pressure sensors, and flow stations.
 - .3 Install in accordance with manufacturer's instructions.

3.04 INSTALLATION OF ROUND TO RECTANGULAR DUCT CONNECTIONS

- .1 Cut round holes in rectangular ducts and provide round to rectangular lock-in fittings with dampers for connection of flexible round ductwork.

3.05 INSTALLATION OF TURNING VANES

- .1 Provide turning vanes in ductwork elbows where shown on drawings and wherever else required where, due to site installation routing and duct elbow radius, turning vanes are recommended in accordance with ANSI/SMACNA HVAC Duct Construction Standards Metal and Flexible.
- .2 Provide volume extractor type turning vanes in short branch supply duct connections off mains to grilles and diffusers where shown and/or specified.

3.06 INSTALLATION OF SPLITTER DAMPERS

- .1 Provide splitter dampers in supply ductwork at branch duct connections off supply air mains, and wherever else shown and/or specified on the drawings.
- .2 Install splitter dampers so they do not vibrate and rattle and so damper operation mechanisms are in an easily accessible and operable location.
- .3 Ensure operators for dampers in insulated ducts are equipped with stand-off mounting brackets.

3.07 MANUAL BALANCING DAMPERS

- .1 Provide balancing dampers as follows:
 - .1 at each branch duct connection from a main trunk duct (branch ducts serve more than one terminal device, diffuser, grille, or register);
 - .2 at each duct run-out to an individual terminal device, diffuser, grille, or register;
 - .3 where indicated in the Documents.
- .2 Install balancing dampers in accordance with recommendations of SMACNA.
- .3 Install dampers so operating mechanism is accessible and positioned for easy operation, and so dampers do not move or rattle.
- .4 Ensure operating mechanisms for dampers in insulated ducts are complete with stand-off mounting brackets.
- .5 Where a duct for which a balancing damper is required has dimensions larger than dimensions of maximum size volume damper available, provide multiple dampers bolted together in a properly

sized assembly, or bolted to a heavy-gauge black structural steel angle or channel framework which is properly sized. Seal to prevent air by-pass, and provide connecting linkage.

- .6 Confirm exact damper locations with TAB Trades performing air balancing testing work and install dampers to suit. Include for providing an additional eight [8] manual balancing dampers at no additional cost.

3.08 AUTOMATIC CONTROL DAMPERS

- .1 Sheet Metal Trades shall install Automatic Control Dampers supplied by BAS Trades.
- .2 Install in the exhaust air ducts from all air handling units and return fans where the exhaust duct connects to the exhaust air plenum unless otherwise noted on the drawings.
- .3 Outside air and return air dampers shall be factory mounted within the air handling units unless otherwise noted on the drawings.
- .4 Install in accordance with recommendations of SMACNA and in accordance with manufacturer's instructions.
- .5 Seal multiple damper modules with UL listed non-transparent silicon sealant.
- .6 Upon system start-up, ensure that dampers operate properly. Refer to BAS Specification Sections for additional requirements.

3.09 AIR FLOW STATIONS

- .1 Sheet Metal Trades shall install Air Flow Stations supplied by BAS Trades.

3.10 INSTALLATION OF FIRE DAMPERS, SMOKE DAMPERS AND COMBINATION FIRE AND SMOKE DAMPERS

- .1 General:
 - .1 Install dampers as per manufacturer's ULC listing.
 - .2 Where a fire damper, smoke damper or combination fire smoke damper exceeds maximum size limitations then a hybrid or Multi-blade dampers must be installed.
 - .3 Maintain integrity of fire wall and/or fire separation.
 - .4 For fire dampers, smoke dampers and combination fire/smoke dampers provide an access door adjacent to the damper to allow for inspection of the damper. Refer to Section 23 33 10 for access door requirements.
 - .5 After completion and prior to concealment, obtain approvals from the Authorities having Jurisdiction (AHJs) of complete installation.
 - .6 Provide fire stop flaps on any grilles penetrating fire-rated ceilings.
 - .7 The Mechanical Contractor shall review the Architectural Drawings. Any discrepancies between fire damper locations and the fire rated walls shall be brought to the attention of the Consultant.
- .2 Fire Dampers and Combination Smoke/Fire Dampers:
 - .1 Install fire dampers in accordance with NFPA 90A, UL555 and suppliers instructions, complete with retaining angles on both sides of wall or floor and fastened to damper collars.
 - .2 Minimum size of the opening for the fire damper shall be larger than the fire damper by 1/8" (3 mm) for each 12" (300 mm) of width or height of the damper to allow for expansion. The maximum allowable size of the opening shall be 1/2" (12 mm) larger in either dimension than the allowable minimum size.
 - .1 **Example, a sleeve dimension of 36" x 48" (900 x 1200 mm) shall have an opening of 36-3/8" x 48-1/2" (912 x 1212 mm) The maximum opening size shall be 36-7/8" x 49" (924 x 1224 mm).**
 - .3 The damper shall be connected to the sleeve by one (1) of the following methods:

- .1 Where the sleeve is the same metal gauge as the duct, the duct shall be connected to the sleeve utilizing one (1) of the approved slip joints.
- .2 Where the sleeve is 16-gauge up to 36" x 24" (900 x 600 mm) and 14-gauge for sizes exceeding 36" x 24" (900 x 600 mm) the duct may be connected with a rigid or fixed joint.
- .4 The damper shall be centred horizontally in the opening and all of the clearance in the vertical plane shall be at the top.
- .5 Dampers shall not be cast-in-place. Retaining angles and damper shall not be fastened directly to the wall or floor.
- .6 The damper shall be installed in the plane of the fire separation.
- .3 Smoke Dampers:
 - .1 Smoke dampers shall be installed in accordance with NFPA 92A, UL555S and the supplier's installation listing.
 - .2 All joints between the damper and the sleeve or duct and between dampers in multiple sections shall be sealed with silicone sealant on one (1) side only.
 - .3 Damper shall be installed a maximum of 24" (600 mm) from the smoke barrier.

3.11 INSTALLATION OF WIRE MESH (BIRDSCREEN)

- .1 Provide framed, removable wire mesh panels over openings in ducts and/or walls where shown and/or specified on drawings. Rigidly secure in place but ensure panels are removable.
- .2 Provide wire mesh panels for open-end return air ducts in ceiling spaces whether shown on drawings or not.

3.12 INSTALLATION OF LOUVRES

- .1 Provide louvres for wall openings.
- .2 Install louvre assemblies and secure in place in accordance with manufacturer's instructions and details.
- .3 Confirm exact louvre sizes and finish prior to ordering.
- .4 Provide vertical blade louvers for commercial kitchen exhaust applications subject to NFPA 96 requirements.
- .5 Hurricane rated louvers and sill flashing to be installed in accordance with the manufacturer's recommended procedures to ensure complete water integrity performance of louver system.

3.13 INSTALLATION OF LOUVRE BLANK-OFF PANELS

- .1 Provide blank-off panels for inactive portions of exterior wall louvres.
- .2 Secure panels in place with non-ferrous hardware so they cannot move or rattle, yet are easily removable.
- .3 Confirm exact finish of panels prior to fabrication.

3.14 AIR BALANCING

- .1 Refer to Section 20 05 95.

PART 3 - EXECUTION

- 3.01 INSTALLATION OF FANS**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .2 Comply with requirements of Section 20 10 50 Basic Materials and Methods.
- .3 Comply with requirements of Section 20 05 70 Motors, Motor Starters, Motor Control Centres, Variable Frequency Drives and Wiring
- .4 Refer to Section 25 30 10 BAS Instrumentation and Devices for Automatic Damper requirements.

1.03 SCOPE OF WORK

- .1 Provide fans and accessories for the Mechanical Work as specified herein.

1.04 RELATED WORK SPECIFIED ELSEWHERE

- .1 Power wiring for all electric motors will be by Mechanical Trades unless indicated otherwise.
- .2 Electromagnetic starters with required number of ancillary contactors will be provided by Mechanical Trades unless supplied as an integral part of equipment.
- .3 Testing, Adjusting and Balancing ("TAB") Work Specified in Section 20 05 95 Testing Adjusting and Balancing.

1.06 SUBMITTALS

- .1 Submit shop drawings as follows:
 - .1 Fans and accessories;

- .1 Provide fan curves for all fans;
- .2 Provide fan sound power levels (radiated and discharge) for all fans 200 l/s (400 CFM) capacity and greater.
- .2 AMCA A (Airstream) SRC includes all airstream parts constructed of a spark-resistant alloy. AMCA B (Wheel) SRC includes the fan wheel constructed of a spark resistant alloy and a buffer plate around the housing shaft-hole opening. AMCA C (Buffer) SRC includes a spark resistant alloy buffer affixed to the housing interior adjacent to the wheel back-place, a spark resistant alloy inlet cone, and a buffer plate around the housing shaft-hole opening.

PART 2 - PRODUCTS

2.01 GENERAL REQUIRMENTS

- .1 Provide Spark Resistant Construction where indicated on the Drawings and/or Equipment Schedules as follows:
 - .1 Class A: AMCA A (Airstream) SRC includes all airstream parts constructed of a spark-resistant alloy.
 - .2 Class B: AMCA B (Wheel) SRC includes the fan wheel constructed of a spark resistant alloy and a buffer plate around the housing shaft-hole opening.
 - .3 Class C: AMCA C (Buffer) SRC includes a spark resistant alloy buffer affixed to the housing interior adjacent to the wheel back-place, a spark resistant alloy inlet cone, and a buffer plate around the housing shaft-hole opening.

2.02 SQUARE INLINE CENTRIFUGAL FANS

- .1 Square Inline Centrifugal Fans: Belt-driven, square, inline fan suitable for duct installations handling clean ventilation air.
 - .1 Acceptable Manufacturers: Twin City, Greenheck, Cook, Northern Blower, or approved equal.
 - .2 Permanently attach nameplate displaying serial number and unit information.
- .2 Housing: Heavy-gauge galvanized steel with continuously gasketed contact surfaces and interior insulation.
 - .1 Provide inlet venturi matched to fan wheel.
 - .2 Provide removable side panels for maintenance.
 - .3 Construct fan to allow complete removal of motor, drives, and fan wheel when side panel is removed.
 - .4 Provide universal mounting brackets to allow for horizontal or vertical fan orientation.
 - .5 Provide one inch thick fiberglass neoprene coated insulation liner in fan housing. Do not expose fiberglass to airstream.
- .3 Fan Shaft:
 - .1 Turn, grind, and polish stainless steel shaft.
 - .2 Key shaft to wheel hub.
 - .3 Size shaft for first critical speed minimum 1.25 times maximum speed for each fan class.
- .4 Bearings: Manufacturer's standard, heavy duty, field-lubricated pillow block ball type, based on fan size and mounting orientation.
 - .1 Minimum L-10 life in excess of 100,000 hours; L-50 life at 500,000 hours at the maximum cataloged operating speed, in accordance with AFBMA.
 - .2 Provide belt and bearing enclosure to shield from airstream.
- .5 Fan Wheels: Aluminum hub and non-overloading wheel with backward-inclined blades, statically and dynamically balanced.

- .6 Belt Drive:
 - .1 Drive Components: V-Belt drive, rated for minimum 150 percent of motor nameplate horsepower, with machined, cast-iron pulleys, and heat resistant, oil resistant, static-free V-belts.
 - .2 Motor Pulley: Adjustable pitch.
- .7 Motors: Comply with NEMA MG-1 for designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 20 05 70.
 - .1 Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 - .2 When required, provide premium efficiency motor, suitable for inverter duty, for motors controlled by Variable Frequency Drive (VFD).
 - .3 Provide unfused disconnect switch, NEMA 3R (NEMA 4X for outdoor installations) shipped loose for field mounting and wiring.
- .8 Finish: Galvanized mill finish internal parts, and uncoated external aluminum parts exposed to weather.
- .9 Accessories:
 - .1 Backdraft Damper: Motorized, parallel-blade type. Adjust backdraft damper to close when fan is not running; fabricate frame from galvanized steel.
 - .1 Backdraft damper actuator suitable for 24 VAC, single phase.
 - .2 Belt Guard: Provide formed galvanized steel guard to cover the complete drive assembly.
 - .3 Motor Cover: Provide formed galvanized steel guard to cover the motor and complete drive assembly.
 - .4 Stainless steel hardware.
 - .5 Extended lube lines.
 - .6 Provide isolation hangers selected for 1 in. (25.4 mm) deflection.
 - .7 Side Discharge Kits: Provide replacement side panels to add 1-way, 2-way, or 3-way discharge.

2.03 TUBULAR INLINE CENTRIFUGAL FANS

- .1 Belt-driven backward inclined centrifugal fans, configured for horizontal or vertical flow of relatively clean air for Heating, Ventilating, and Air-Conditioning (HVAC) applications.
 - .1 Acceptable Manufacturers: Twin City, Greenheck, Cook, Northern Blower, or approved equal.
 - .2 Permanently attach nameplate displaying serial number and unit information.
- .2 Fan Capacities, Characteristics, and Configuration: Refer to Drawing schedule.
- .3 Fan Wheel: Fabricate backward inclined wheel from aluminum wheels 27 in. diameter and smaller, and steel for wheels 30 in diameter and larger. Include matched inlet venturi.
 - .1 Statically and dynamically balance wheel when fabricated, and again after fan unit has been assembled.
- .4 Fan Shaft: Turned, ground, and polished steel. Select shaft diameter so that First Critical Speed is minimum 1.25 times maximum operating speed. Finish with petroleum based rust protectant.
- .5 Bearings: Manufacturer's standard, self-aligning, field-lubricated pillow block ball bearings, based on fan size and mounting orientation, with polyethylene grease lines extended to outside fan housing.
 - .1 Minimum L-10 life in excess of 100,000 hours; L-50 life at 500,000 hours at the maximum cataloged operating speed, in accordance with AFBMA.

- .6 Housing: Formed [steel] [aluminum] with continuously welded seams and prepunched inlet and outlet flanges for duct connections. Include mounting feet or hanger connections to suit installation requirements.
- .7 Belt Drives:
 - .1 Drive Components: V-belt drive, rated for minimum 150 percent of motor nameplate horsepower, with machined, cast-iron pulleys, and heat resistant, oil resistant, conductive, static-free V-belts. Provide belt guard or motor cover to shield drives.
 - .1 Motor 20 HP and Smaller: Adjustable pitch.
 - .2 Motor Larger than 25 HP: Fixed pitch.
 - .3 Provide belt shield tubes to isolate drive components from airstream. Continuously weld tubes where they penetrate inner cylinder and outer housing.
 - .4 Belt Guard: Steel, totally encloses motor sheaves and V-belt drive assembly.
 - .5 Outdoor Weather Cover: Provide OSHA compliant steel weather cover to shield motor and belt-drive from weather. Fabricate with rainproof ventilation slots.
- .8 Motors: Comply with NEMA MG-1 for designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 20 05 70.
 - .1 Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 - .2 When required, provide premium efficiency motor, suitable for inverter duty, for motors controlled by Variable Frequency Drive (VFD).
 - .3 Provide unfused disconnect switch, NEMA 3R (NEMA 4X for outdoor installations), shipped loose for field mounting and wiring.
 - .4 Provide electrical metal tubing (EMT) conduit into motor compartment, with watertight fitting at curb cap penetration.
 - .5 Motor Mounting Platform: Heavy-duty motor mounting platform allows adjustment of drive belt tension.
- .9 Vibration Isolation:
 - .1 Provide spring vibration isolators in accordance with fan manufacturer's requirements; spring isolators selected for 1 in. (25.4 mm) deflection.
- .10 Finishes:
 - .1 After fabrication, clean and chemically pretreat steel parts by phosphatization. Apply two coats gray enamel.
- .11 Accessories:
 - .1 Mounting Brackets: Provide factory welded mounting brackets to mount fan unit in horizontal or vertical position.
 - .2 Belt Guard: Steel, totally enclosed and non-sealed.
 - .3 Inlet Vane Dampers: Provide pre-rotational inlet vane dampers nested in fan inlet.
 - .1 Provide inlet damper actuator suitable for 24VAC, single phase.
 - .4 Access Door:
 - .1 Provide inspection and maintenance of the internal section V-belt drive area units.
 - .2 Doors are gasketed, single-skinned, and hinged to the housing exterior.
 - .5 Shaft seal, including non-asbestos rubbing ring and metal cover plate, to limit airstream infiltration.
 - .6 Provide anti-static shaft grounding blocks to protect motor bearings by draining stray currents to ground.

- .7 Bolt-on companion flanges that match fan flanges for making connections to ductwork.

2.04 BACKWARD INCLINED SINGLE WIDTH SINGLE INLET (SWSI) CENTRIFUGAL FANS

- .1 Description: Belt Driven, Backward Inclined Centrifugal Fans: Single-width, single-inlet fan.
 - .1 Acceptable Manufacturers: Twin City, Greenheck, Cook, Northern Blower, or approved equal.
 - .2 Permanently attach nameplate displaying serial number and unit information.
- .2 Fan Capacities, Characteristics, and Configuration: Refer to Drawing schedule.
- .3 Fan Wheel: Fabricated wheel with flat, single thickness blades, continuously welded to conical rim and backplate. Hub to be keyed to shaft. Partial welds are not acceptable.
 - .1 Materials of Construction: Manufacturer's standard, based on wheel size and pressure class.
 - .2 Statically and dynamically balance wheel.
 - .3 Minimum Balance Quality Grade: G6.3, in accordance with AMCA Standard 204.
- .4 Fan Shaft: Turned, ground, and polished stainless steel shaft, with shaft keyed to wheel hub, sized for first critical speed minimum 1.25 times maximum speed for each fan class.
 - .1 Include OSHA compliant shaft and bearing guard.
- .5 Bearings: Heavy-duty, grease lubricated, spherical roller or anti-friction ball, self-aligning, pillow block type, based on fan size and mounting orientation, with grease lines extended to outside fan housing.
 - .1 Minimum L-10 life in excess of 100,000 hours; L-50 life at 500,000 hours at the maximum cataloged operating speed, in accordance with AFBMA.
- .6 Housing: Continuously welded steel, reinforced with rigid bracing. Includes aerodynamically spun inlet cone.
 - .1 Access Door - Bolted flush with interior, 6 inches (152 mm)
 - .2 Drain: 3/4 inch NPT with plug.
 - .3 Provide housing with pre-punched flanges for making connections to ductwork.
- .7 Supports: Steel angle, intermittently welded with sealant filled between welds.
- .8 Direct Drive:
 - .1 Where Direct Drive is noted on equipment schedules mount fan wheel directly on motor shaft.
 - .2 Provide coupling with service factor of 1.5 x motor HP between motor and fan shaft.
 - .3 Include OSHA compliant coupling guard.
- .9 Belt Drive:
 - .1 Where Belt Drive is noted on equipment schedules, provide V-belt drive, rated for minimum 150 percent of motor nameplate horsepower, with machined, cast-iron pulleys, and heat resistant, oil resistant, V-belts. Locate belts and drives outside fan housing.
 - .1 Motor 10 HP and Smaller: Adjustable pitch.
 - .2 Motor 15 HP and Larger: Fixed pitch.
 - .3 Belt Guard: Steel, ventilated, OSHA compliant.
- .10 Motors: Comply with NEMA MG-1 for designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified Section 20 05 70.
 - .1 Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 - .2 Motor Speed: Based upon performance requirements and application.

- .3 Provide unfused disconnect switch, NEMA 3R (NEMA 4X for outdoor installations), shipped loose for field mounting and wiring.
- .4 When controlled with a Variable Frequency Drive (VFD), provide premium efficiency motors suitable for inverter duty use.
- .11 Motor Mounting Platform: Heavy-duty motor mounting platform that allows adjustment of drive belt tension.
- .12 Isolation Type Base:
 - .1 Provide spring isolators with 1 in. (25.4 mm) deflection.
- .13 Accessories:
 - .1 Weather Cover: for exterior mounted fans provide steel weather cover with painted finish to shield motor and belt-drive from weather. Fabricate with ventilation slots.
 - .2 Spark Resistant Construction: where noted on the equipment schedules, mount bearings outside flow airstream.
 - .1 AMCA Type B: Provide aluminum fan wheel impeller and aluminum rub ring where shaft penetrates fan housing. Maximum operating temperature: 250 deg. F (121 deg. C).
 - .3 Piezometer Ring: Provide piezometer ring type differential pressure device with connections for field-installed flow measuring instrumentation.
 - .1 Pressure Transducer without Display: Provide piezometer ring and transducer to convert differential pressure readings to 4 - 20 mA DC signal proportional to flow for input to Building Automation ("BAS") system.
 - .4 Extended Lube Lines: Provide lubrication lines with grease fittings from the fan bearings terminating on the drive side of the fan for ease of lubrication.
 - .5 Standard Coating: All carbon steel components shall be cleaned and chemically treated by a phosphatizing process. Fan shall then be coated with blue enamel.

2.05 ROOF MOUNTED CENTRIFUGAL MUSHROOM VENTILATORS

- .1 Belt-Driven, Centrifugal Roof Ventilators: Centrifugal fan units, configured for vertical flow of relatively clean supply or exhaust air for general ventilation applications.
 - .1 Acceptable Manufacturers: Twin City, Greenheck, Cook, Northern Blower, or approved equal.
 - .2 Permanently attach nameplate displaying serial number and unit information.
- .2 Fan Capacities, Characteristics, and Configuration: Refer to Drawing schedule.
- .3 Motor Mount Assemblies: Provide motor mount assemblies fabricated of heavy gage galvanized steel.
- .4 Wheel: Centrifugal, backward inclined type, containing matching inlet venturi.
 - .1 Statically and dynamically balance wheel.
- .5 Fan Shaft: Turned, ground, and polished steel shaft, with shaft keyed to wheel hub, sized for first critical speed minimum 1.25 times maximum speed for each fan class.
- .6 Bearings: Manufacturer's standard, heavy duty, field-lubricated pillow block ball type, based on fan size and mounting orientation.
 - .1 Minimum L-10 life in excess of 100,000 hours; L-50 life at 500,000 hours at the maximum cataloged operating speed, in accordance with AFBMA.
- .7 Housing: Bolt on type. Heavy gauge spun aluminum construction of shroud, top cover, and motor bands. Roll edge beads.
 - .1 Fabricate units with deep formed inlet venturi to prevent snow and rain entry into building.
 - .2 Provide galvanized steel wire bird screen at fan outlet.

- .8 Curb Cap: One-piece, weather-tight construction, pre-punched mounting holes for correct attachment to roof curb. Fabricate from aluminum and include flange to mate with fan unit inlet flange.
- .9 Belt Drive:
 - .1 Drive Components: V-belt drive, rated for minimum 150 percent of motor nameplate horsepower, with machined, cast-iron pulleys, and heat resistant, oil resistant, static-free V-belts.
 - .1 Motor Pulley: Adjustable pitch.
 - .2 Motor and Drive Assembly: Resiliently mounted on rubber isolators.
 - .1 Provide mechanism that allows for precise belt tensioning by one person.
- .10 Motors: refer to Section 20 05 70
 - .1 Provide NEMA 3R (NEMA 4X for outdoor installations), unfused disconnect switch supplied loose for field mounting.
- .11 Finish: Galvanized mill finish internal parts, and galvanized steel parts exposed to weather.
- .12 Accessories:
 - .1 Roof Curb: 18 inches (457 mm) high, unvented, with 1-1/2 inch (38 mm) thick insulation.
 - .2 Curb Cap: One-piece, weather-tight construction, pre-punched mounting holes for correct attachment to roof curb. Fabricate aluminum and include flange to mate with fan unit inlet flange.
 - .3 Insulated automatic damper meeting requirements of 25 05 30.
 - .4 Aluminum wire insect screen.

2.06 PROPELLOR WALL FANS

- .1 Propeller Wall Fans: Belt Driven, heavy duty propeller wall fans for general-purpose ventilation
 - .1 Acceptable Manufacturers: Twin City, Greenheck, Cook, Northern Blower, or approved equal.
 - .2 Permanently attach nameplate displaying serial number and unit information.
- .2 Fan Capacities and Characteristics: Refer to Drawing schedule.
- .3 Propeller: Fixed pitch cast aluminum blades and hub. Secure wheel to fan shaft with taper lock bushing.
 - .1 Machine propeller to proper diameter.
 - .2 Statically and dynamically balance propeller.
- .4 Fan Shaft:
 - .1 Hot-rolled steel.
 - .2 Grind, polish and ring gauge shaft.
 - .3 Key shaft to wheel hub.
 - .4 Size shaft for first critical speed minimum 1.42 times maximum fan speed.
- .5 Bearings shall be heavy-duty, grease lubricated, anti-friction ball or roller type, self-aligning, mounted in pillow blocks.
 - .1 Minimum L-10 life in excess of 100,000 hours; L-50 life at 500,000 hours at the maximum cataloged operating speed, in accordance with AFBMA 9.
- .6 Belt Drive:
 - .1 Drive Components: V-belt drive, rated for minimum 150 percent of motor nameplate horsepower, with machined, cast-iron pulleys, and heat resistant, oil resistant, static-free V-belts.

- .1 Motor Pulley: Adjustable pitch for motors up to 15 HP.
- .2 Motor Pulley: Fixed pitch for motors 20 HP and larger.
- .7 Motors: refer to Section 20 05 70
 - .1 Provide NEMA 3R (NEMA 4X for outdoor installations), unfused disconnect switch, shipped loose for field mounting and wiring.
- .8 Frame: Formed tube steel supports welded to steel panel with formed inlet venturi and pre-punched holes for mounting anchors. Motor mounting plate bolted to frame tubes.
- .9 Finishes:
 - .1 After fabrication, deburr, clean and chemically pretreat metal parts by phosphatization.
 - .2 Apply two coats of air dry enamel.
- .10 Accessories:
 - .1 Motorized Damper, Center-pivoted steel type. Suitable for 3000 feet/minute (15.2 meter/second) air velocity.
 - .2 24V Damper actuator;
 - .3 Wall Box: Painted steel, sized to match dimensions of fan panel, with mounting flange and pre-punched mounting holes. Suitable for attachment of inlet screen, backdraft damper, weather hood, outlet screen, and disconnect switch.
 - .4 Wire Guards: Provide hinged welded or woven type wire to enclose fan and motor size of unit.

PART 3 - EXECUTION

3.01 INSTALLATION OF FANS

- .1 Fans shall be installed in strict accordance with Manufacturer's installation instructions and all requirements of the Authorities Having Jurisdiction.
- .2 Mount fans with vibration isolation, floor mounted springs or spring hangers as applicable, with minimum 1" (25mm) deflection. Ensure assembly is vibration free during fan performance testing.
- .3 For suspended fan applications provide steel support brackets from floor or overhead with vibration isolators at centreline supports on fan; do not place isolators on floor or at overhead attachment point. Install snubbers parallel with fan horizontal longitudinal axis.
- .4 Leave sufficient access for servicing fan components. Install belt guards and accessories as required.
- .5 Install all fan accessories in accordance with fan manufacturer's requirements.
- .6 Where remote fan air flow volume digital display is specified, locate the display where noted on the drawings and/or directed by the Consultant. Coordinate sensor BAS integration with Control Trades.
- .7 Where fan knock down is specified the Contractor shall identify limiting dimensions to move fan components to position on site and provide for the reassembly where noted on the Drawings. Reassembly and resulting fan performance shall be verified by fan manufacturer.

- 3.02 SPECIAL INSTALLATION REQUIREMENTS**
- 3.03 AIR BALANCING**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.02 WORK PERFORMED BY THIS SECTION

- .1 Provision of terminal air grilles and diffusers, and related ancillaries.

1.03 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the construction and installation of air distribution equipment and related ancillaries.
- .2 Submittals: Submit shop drawings for the following Products:
 - .1 All products specified

1.04 REFERENCE STANDARDS

- .1 SMACNA HVAC Duct Construction Standards Metal and Flexible - Second Edition

1.05 VOLATILE ORGANIC COMPOUND ("VOC") REQUIREMENTS

- .1 All adhesives, sealants, paints and coatings used on or inside of building weatherproofing layer shall have a VOC content that is less than the content limits defined in LEED® Product Requirements.

1.06 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 GENERAL

- .1 Provide standard product to meet capacity, throw, noise level, and throat and outlet velocity as indicated on the Drawings and the Equipment Schedules.
- .2 Where grilles, registers and diffusers penetrate fire walls and fire partitions, provide approved steel sleeve secured to structure in accordance with NFPA 90A and required fire damper.
- .3 Frames:
 - .1 Steel: primed cold rolled steel with exposed welded joints and mitred corners.
 - .2 Aluminum: extruded satin finish with mechanical fasteners and mitred corners.
 - .3 Provide plaster frames as plaster stops where set into plaster or gypsum board.
 - .4 Provide concealed fasteners and balancing operators in all finished areas.
 - .5 Final finish to be selected by Architect from standard manufacturer finishes at shop drawing stage.
 - .6 Style, frame, and installation details as indicated on the schedule.
 - .7 Sizes and capacities: as indicated on the Drawings and in the Equipment Schedules.
- .4 Wherever possible, grilles and diffusers shall be the product of one (1) manufacturer. Acceptable Manufacturers (unless noted otherwise):

- .1 Nailor;
- .2 EH Price;
- .3 Metalaire;
- .4 Tuttle and Bailey;
- .5 Or approved equivalent.

2.02 SUPPLY GRILLES AND REGISTERS

- .1 1¼" (32 mm) border double deflection with airfoil shape horizontal face and vertical rear bars and gaskets.

2.03 RETURN AND EXHAUST GRILLES AND REGISTERS

- .1 1¼" (32 mm) border, single deflection, air foil shape, horizontal bar type 35° max turn up, when shown on the schedule opposed blade damper with concealed operator and rubber sealing strips.
- .2 Egg crate to be ½"x½"x1" deep (12x12x25mm deep), type as per schedule.
- .3 Perforated Grilles shall consist of a perforated core with 3/16" (5) holes on 1/4" (6) centres staggered 60 degrees and an extruded aluminum border. Finish in accordance with the schedule.

2.04 DIFFUSERS

- .1 Diffusers shall consist of a precision formed back cone of one piece seamless construction which incorporates a round inlet collar of sufficient length for connecting rigid or flexible duct.
- .2 Refer to schedule for finish.
- .3 As indicated on the schedule, circular, square or perforated type, having adjustable fixed pattern.
- .4 Equip supply diffusers having a basic 4-way or all round air pattern for operation in one (1), two (2) or three (3) way pattern where so directed on the drawings
- .5 For plaque or cone diffusers an inner plaque assembly shall be incorporated that drops no more than 1/4" below the ceiling plane to assure proper air distribution performance. The inner plaque or cone assembly shall be completely removable from the diffuser face to allow full access to any dampers or other ductwork components located near the diffuser neck.

2.05 LINEAR GRILLES

- .1 Bar core linear grilles with frame as indicated, plaster frame, sealing strip and accessories as indicated.
- .2 All corners shall be mitred.
- .3 Floor grilles to be capable of supporting 200 lb (90 kg) point load weight between supports with negligible deflection.
- .4 Do not supply OBD in return air linear grilles.
- .5 Extruded aluminium linear slot diffuser with adjustable vane controls and accessories as indicated.
- .6 Provide end cap for continuous linear diffuser terminating at walls and partitions.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Comply with Manufacturer's requirements for the installation of all specified equipment and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.
- .3 Unless otherwise specified, install grilles and diffusers in accordance with requirements of SMACNA HVAC Duct Construction Standards Metal and Flexible.

- .4 Exactly locate grilles and diffusers to conform to the final architectural reflected ceiling plans and detailed wall elevations, and to conform to the final lighting arrangement, ceiling layout, ornamental and other wall treatment.
- .5 For linear bar grilles and linear slot diffusers site measure for exact fit.
- .6 Install and adjust air registers to provide noiseless and draftless distribution.
- .7 Supply plaster frames for installation by Drywall Trades for grilles and diffusers installed in plaster or drywall finishes. Fit frames tightly to prevent leakage and smudging.
- .8 Primary air balance to be completed at duct dampers with final adjustment only at diffusers and grilles.

3.02 SPECIAL INSTALLATION REQUIREMENTS

- .1 Grilles, registers and diffusers penetrating fire walls and fire partitions shall have steel sleeves secured to structure in accordance with ULC or cUL listing and NFPA 90A.
- .2 For security grilles and diffusers, and other grilles and diffusers exceeding 5 kg (12 lbs) weight, mechanically fasten grille/diffuser to ceiling or wall structure, independent of ductwork connection or support.

3.03 AIR BALANCING

- .1 Refer to Section 20 05 95.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.02 WORK PERFORMED BY THIS SECTION

- .1 Provision of air distribution equipment and related ancillaries.
- .2 Louvers are to be supplied and installed by Trades other than Mechanical Division Trades.

1.03 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the construction and installation of air distribution equipment and related ancillaries.
- .2 Submittals: Submit shop drawings for the following Products:
 - .1 Variable/ Constant Air Volume ("VAV/ CAV") control boxes;
 - .2 Fan Powered Box ("FPB") Terminal Control Units
 - .3 Bypass Terminal ("BPT") Units
 - .4 Duct Monitoring Stations ("DMS");

1.04 REFERENCE STANDARDS

- .1 SMACNA HVAC Duct Construction Standards Metal and Flexible - Second Edition
- .2 NFPA 90A - Standard for the Installation of Air-Conditioning and Ventilating Systems
- .3 NFPA 90B - Installation of Warm Air Conditioning and Air Conditioning Systems
- .4 ASTM A621 & A621M Specification for Forming Steel (FS), sheet and Strip, Carbon, Hot Rolled.
- .5 ASTM A653M Specification for Steel Sheet, Zinc Coated Galvanized or Zinc Alloy Coated (Galvannealed) by the Hot Dip Process
- .6 ASTM A924M General Requirements for Sheet Steel, Metallic Coated by the Hot Dip Process

1.05 VOLATILE ORGANIC COMPOUND ("VOC") REQUIREMENTS

- .1 All adhesives, sealants, paints and coatings used on or inside of building weatherproofing layer shall have a VOC content that is less than the content limits defined in LEED® Product Requirements.

1.06 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 VARIABLE AIR VOLUME/ CONSTANT AIR VOLUME ("VAV/ CAV") BOXES:

- .1 Single duct, pressure independent variable/constant air volume control assemblies, complete with discharge attenuator and electronic digital controls.
- .2 Units: Pressure independent volume regulator type; designed and constructed for hospital and critical care applications.

- .3 Low pressure systems of single duct type with constant or variable volume control and housed within sound attenuating box.
- .4 Casing: 22 gauge (0.89 mm) minimum thickness galvanized steel insulated with minimum of 13/16" (21 mm) thick 4 lb/cu.ft. (64 kg/cu.m) thermal and acoustic steri-liner insulation which complies with UL-181 and NFPA 90A. Fibreglass shall be with a reinforced aluminum FSK facing meeting the requirements of NFPA 90A, UL-181 and ASTM C655. Casing leakage upstream of the damper shall not exceed 2% @ 3" w.g. (746 Pa); casing leakage downstream of the damper shall not exceed 1% @ 1" w.g. (250 Pa).
- .5 The primary air valve damper shall be opposed blade type 16-gauge metal, with peripheral gasket, pivoted in self-lubricating bearings. In full closed position, air leakage past the closed damper shall not exceed 2% of the nominal catalog rating at 3 in.wg. (750 Pa) inlet static pressure as rated by ASHRAE Standard 130.
- .6 The primary air valve damper and DDC motor operator shall vary primary air in response to a signal. Damper operation shall be demonstrated to be closed to minimum position before heating is activated. No overlap under any circumstances shall be allowed. Damper shall be located inside unit. Damper connection to operating shaft shall be a positive mechanical connection.
- .7 The air flow sensor shall be of cross or diamond configuration located at the inlet of the assembly. The sensor shall have twelve total pressure sensing ports and a centre averaging chamber designed to accurately average the flow across the inlet of the assembly. Sensor shall be certified to provide accuracy within 5% of actual air flow with a 90° sheet metal elbow directly at the inlet of the assembly. The air flow sensor shall amplify the sensed air flow signal.
- .8 At an inlet velocity of 2000 fpm pressure drop for cfm range of box shall not exceed 0.11 in.wg. (27 Pa.).
- .9 All sound data shall be compiled in an independent laboratory and in accordance with the latest version of AHRI Standard 880 and ANSI/ASHRAE Standard 130. Sound rating of assembly including box and attenuator or dissipative silencer under design operating conditions shall not exceed the following:
 - .1 Radiated: NC 35 unless noted otherwise on the Equipment Schedules.
 - .2 Discharge: NC 35 Based on room absorption of 10 db, and an inlet static pressure of 1.5" W.G. (375 Pa.) unless noted otherwise on the Equipment Schedules.
- .10 Sound Attenuation:
 - .1 The manufacturer shall supply sound attenuators to meet scheduled acoustical performance requirements of NC 30 unless noted otherwise. The unit shall be provided with discharge attenuators and/ or discharge silencers as required to meet acoustic requirements.
 - .2 Where one attenuator fails to provide the sound performance required, provide additional attenuators or lengths of duct lining. Where attenuators with outlets are used they shall be rated with the outlets and not as straight attenuators without outlets
 - .3 Attenuators:
 - .1 Provide minimum 36" (914mm) discharge attenuator(s) in accordance with the Equipment Schedules.
 - .2 Attenuator sections shall contain a unit casing constructed of 22 ga. (.86) coated steel perforated baffles encapsulate fiberglass acoustic media; provide mylar lining with acoustical spacer to isolate material from airstream.
 - .3 Inlet and discharge shall be rectangular and configured for slip and drive connections.
 - .4 Each attenuator section shall be internally lined with 3/4" (19mm) thick, 4 lb./cu. ft. (64 kg/m³) density Steri-Liner insulation with a reinforced aluminum FSK facing, placed inside the top and bottom sides of the attenuator.

- .11 Provide integral **hot water heating coil** sized in accordance with the schedule where indicated on the drawings. Hot water heating coils shall be as follows:
 - .1 Terminal unit hot water heating coils shall be mounted on the discharge of the unit with slip and drive connections; provide an access door or panel on the bottom of the attenuator section of the terminal unit for servicing and cleaning the unit.
 - .2 Hot water heating coils shall be constructed with copper tubes and aluminum plate fins. Coils shall have a maximum of 10 fins per inch. Supply and return connections shall be on the same end of the coil. Fins shall be bonded to the tubes by means of mechanical expansion of the tubes. Fins shall be at least .0045" (0.11mm) thick.
 - .3 Coils shall have galvanized steel casings on all sides no lighter than 22 ga. (1.00mm).
 - .4 Copper tubes shall be 1/2" (13) O.D. and shall be spaced approximately 1 1/4" (32mm) apart and shall have a minimum wall thickness of 0.016" (0.41mm). Hot water shall be equally distributed through all tubes by the use of header design.
 - .5 Select coils with water velocity in the tubes not to exceed five feet per second. The water pressure drop through the coil shall not exceed 10 ft.wg. Heating coil face velocities shall not exceed the maximum face velocity indicated in the Schedules.
 - .6 Coils shall be tested by air pressure under water. Coils shall be tested at 350 psi (2,413 kPa) air static pressure.
 - .7 Coil ratings, calculations and selection data shall be in accordance with the applicable AHRI Standards and shall be submitted with the Shop Drawings.
 - .8 Control valves, automatic air vents and drain vents, shall be supplied and field installed by the Mechanical Trades.
- .12 All digital controls including motor, transducer, controller, and similar control devices to be supplied by the BAS Trade Contractor for factory installation by box manufacturer. The cost of the Installation of the controls shall be carried by the box manufacturer.
- .13 Equipment Schedules: as indicated on the Drawings.
- .14 Acceptable Manufacturers:
 - .1 Nailor Industries
 - .2 E.H. Price,
 - .3 Metalaire,
 - .4 Titus,
 - .5 Tuttle and Bailey,
 - .6 Or approved equivalent.

2.02 SERIES FLOW FAN POWERED POWER BOX ("FPB") TERMINALS

- .1 Provide series flow, constant or variable volume per the intended application, fan powered box terminal units of the sizes and capacities as indicated on the drawings. Units shall be **low noise**, pressure independent with digital electronic controls.
- .2 The entire terminal unit shall be designed and built as a single unit.
- .3 The units shall be provided with a primary variable air volume damper that controls the air quantity in response to an electronic thermostat.
- .4 Unit casings shall be space frame construction utilizing 18 ga. (1.31mm) galvanized steel corner structural members and 20 ga. (1.00mm) galvanized steel panels.
- .5 Each unit shall be internally lined with 3/4" (19mm) thick, 4 lb. /cu.ft. (64 kg/cu.m) density fiberglass insulation with a reinforced aluminum FSK facing. Units shall meet NFPA 90A and UL 181 standards.

- .6 Unit casing shall have four access panels, one on each side of the unit and one on the bottom and top for easy access to motor and blower assembly and for maintenance and replacement of parts without disturbing duct connections.
- .7 The unit shall be rated to operate in left hand or right hand mode by turning the unit over.
- .8 Access panels shall be attached to casing with quick acting latches.
- .9 Casing leakage shall not exceed 2% of terminal rated airflow at 0.5 in.wg. (125 Pa) interior casing pressure. All high side casing joints shall be sealed with approved sealant and high side casing leakage shall not exceed 2% of terminal rated airflow at 3 in.wg. (750 Pa).
- .10 Units shall have round inlets for the primary air connections and shall have a 6" (152mm) deep inlet duct collar for field connection. The outlets shall be rectangular and suitable for flanged duct connections. Casing shall have mounting area for hanging by sheet metal straps from a concrete slab.
- .11 The damper shall be of rectangular, multiple inclined opposed blade construction and designed to operate on a 45° arc. Blades shall be minimum 16 ga. (1.61mm) galvanized steel, single thickness construction with heavy duty gasket glued to the blades. The blades shall be screwed through the damper shaft to ensure that no slippage occurs. Blade shafts shall pivot on corrosion free bearings. Damper leakage shall not exceed 2% of the terminal rated air volume in CFM at 3 in.wg. (750 Pa) inlet static pressure.
- .12 Entire terminal unit shall be factory assembled with electronic controls. All components including all controls except the room thermostat shall be factory installed and mounted with the unit.
- .13 Provide a digital electronic flow control device that will limit the maximum and minimum airflow to that on the Equipment Schedules.
- .14 Airflow limits shall be factory set.
- .15 Thermostat signal shall reset the flow control device to adjust primary airflow to match load requirements.
- .16 Control of the terminal unit shall be pressure independent.
- .17 The terminal unit shall be capable of operation as described herein with inlet static pressure of 0.05 in.wg. (12 Pa) at full cooling with no mixing of induced and primary air.
- .18 Mixing of the primary and secondary airstreams shall be such that no more than 2.5°F (1.4°C) variation shall exist in the discharge airstream for each 20°F (11.1°C) of difference between the primary and secondary airstreams.
- .19 Blower casings shall be constructed of heavy gauge coated steel. Blower wheel shall be forward curved centrifugal type, dynamically balanced and driven by Electronically Commutated Motor(s). Motor(s) shall be suitable for 120 or 208 or 240 or 277 volt single phase power.
- .20 Fan airflow volume shall be factory set.
- .21 Fan assembly shall be mounted so as to isolate the casing from the motor and blower vibration at no less than four points. Isolation shall be supplied at the motor and at the blower mounting points.
- .22 A gasketed backdraft damper shall be included on the fan discharge to reduce primary air leakage back into the plenum space.
- .23 An electronic motor speed controller sized and designed for the specific blower motor combination shall be provided to allow infinitely adjustable fan speed from the minimum voltage stop to the line voltage signal to the motor. A minimum voltage stop shall be employed to ensure that fan cannot run in stall mode.
- .24 Units shall incorporate a single point electrical connection. The entire assembly including the hot water coil shall be cETL listed for zero clearance and labeled, and shall meet all requirements of the latest Canadian Electrical Code, CSA Standard C22.1. All electrical components shall be mounted in a control box. The entire assembly shall be cETL listed and labeled.
- .25 Hot Water Heating Coil:

- .1 A hot water coil shall be factory mounted as an integral package with the fan powered terminal unit. Hot water coils shall be sized as shown on the drawings.
- .2 The unit shall have a single point electrical connection.
- .3 Water coil casing and panels shall be a minimum of 20 ga. (1.00mm) galvanized steel.
- .4 Access panels shall be supplied on the top and bottom of the unit for easy access to the coil for inspection and cleaning.
- .5 All copper, including the headers and return bends, shall be encased to eliminate heat loss during heating sequence and heat gain during cooling sequence.
- .6 Coils shall be 1, 2 or 3 row as required and heating capacities shall be as shown on the Equipment Schedules.
- .7 Coils shall have aluminum plate fins spaced 10 per inch and bonded to ½" (13mm) O.D. copper tubes.
- .8 Copper connections shall be sweat joints.
- .9 All coils shall be tested at a minimum of 300 psi (2.1 MPa) under water to produce a working pressure of 250 psi (1.7 MPa).
- .10 Controls and valves for the hot water coils shall be field mounted.
- .11 Heating coils shall be located on the discharge side of the fan.
- .26 All sound data shall be compiled in an independent laboratory and in accordance with the latest version of AHRI Standard 880. All units shall be AHRI certified and bear the AHRI certification label.
- .27 Unit maximum radiated sound power levels at 1.0" w.g. (250 Pa) inlet pressure and 0.25" w.g. (63 Pa) discharge static pressure shall not exceed the values in Tables below at the specified airflow. No credit or reduction shall in any way be considered for room, plenum, ceiling and/or similar item effects.

Maximum Radiated Sound Power Levels Full Cooling (Fan on and 100% primary air)								
Unit Size	Airflow		Sound Power Octave Band Center Frequency (Hz)					
	cfm	l/s	2	3	4	5	6	7
			125	250	500	1000	2000	4000
1	400	189	63	61	53	46	43	41

7	2800	1321	79	76	73	71	68	67

- .1 Plenum Return Filter:
- .1 The plenum return shall be supplied with filters.
 - .2 When tested in accordance with ASHRAE 52.2, the filter shall have a Minimum Efficiency Reporting Value of MERV 8.
- .2 Sound Attenuation:
- .1 The manufacturer shall supply sound attenuators to meet scheduled acoustical performance requirements of NC30 unless noted otherwise. The unit shall be provided with inlet attenuators, discharge attenuators and discharge silencers as required to meet acoustic requirements.

- .2 Where one attenuator fails to provide the sound performance required, provide additional attenuators or lengths of duct lining. Where attenuators with outlets are used they shall be rated with the outlets and not as straight attenuators without outlets
- .3 Attenuators:
 - .1 Provide minimum 60" (1500mm) inlet and/ or discharge attenuator(s) in accordance with the Equipment Schedules.
 - .2 Attenuator sections shall contain a unit casing constructed of 22 ga. (.86) galvanized steel.
 - .3 Inlet and discharge shall be rectangular and configured for slip and drive connections.
 - .4 Each attenuator section shall be internally lined with 3/4" (19mm) thick, 4 lb./cu. ft. (64 kg/m³) density fiberglass insulation with a reinforced aluminum FSK facing, placed inside the top and bottom sides of the silencer.
- .3 Controls:
 - .1 Terminal unit manufacturer to provide fan relay, power transformer and power disconnect switch.
 - .2 Provide digital controller to operate primary air damper operator between maximum or minimum air volume settings.
 - .3 Terminal units to be factory set to 30% minimum air flow position unless noted otherwise on drawings. Minimum air flow to be field adjustable.
- .4 Acceptable Manufacturers:
 - .1 Nailor Industries Inc. model 35SST "Stealth".
 - .2 Or acceptable equivalent

2.03 BYPASS TERMINAL ("BPT") UNITS

- .1 General Information
 - .1 Provide variable air volume bypass terminal units where shown on the drawings. Performance and capacities shall be as scheduled on the drawings.
- .2 Construction
 - .1 Each section shall be internally lined with 3/4" (19mm) thick, 4 lb. density fiberglass insulation with a reinforced aluminum FSK facing. Units shall meet NFPA 90A and UL 181 standards.
 - .2 Units shall incorporate a heavy duty steel cylindrical flow diverter valve.
 - .3 Units shall include integral inlet and bypass balancing dampers for field adjustment as standard components.
 - .4 Static pressure taps shall be provided to facilitate air balancing.
- .3 Controls
 - .1 Units shall be provided with a modulating electronic control package. The 24 volt reversible actuator shall be factory mounted direct to the damper shaft and shall include an adjustable minimum air volume end stop as a standard feature.
 - .2 The 24 volt modulating electronic thermostat for field mounting shall be supplied with a (°C) (°F) temperature scale. The thermostat shall be suitable for vertical wall mounting.
 - .3 The thermostat shall be microprocessor based and provide proportional plus integral control of airflow and reheat when specified.
 - .4 A 115 to 24 volt 20 VA transformer shall be provided, complete with all necessary hardware for field mounting.

- .5 A changeover thermistor shall be provided with control packages designed to control both heating and cooling supply air.
- .4 Attenuators:
 - .1 Provide minimum 60" (1500mm) attenuator at the discharge of every box.
 - .2 Attenuator sections shall contain a unit casing constructed of 22 ga. (.86) galvanized steel.
 - .3 Inlet and discharge shall be rectangular and configured for slip and drive connections.
 - .4 Each attenuator section shall be internally lined with 3/4" (19mm) thick, 4 lb./cu. ft. (64 kg/m³) density fiberglass insulation with a reinforced aluminum FSK facing, placed inside the top and bottom sides of the silencer.
- .5 Provide integral hot water reheat coil sized in accordance with the schedule where indicated on the drawings. Hot water heating coils shall be as follows:
 - .1 Terminal unit hot water heating coils shall be mounted on the discharge of the unit with slip and drive connections; provide an access door or panel on the bottom of the attenuator section of the terminal unit for servicing and cleaning the unit.
 - .2 Hot water heating coils shall be constructed with copper tubes and aluminum plate fins. Coils shall have a maximum of 10 fins per inch. Supply and return connections shall be on the same end of the coil. Fins shall be bonded to the tubes by means of mechanical expansion of the tubes. Fins shall be at least .0045" (0.11mm) thick.
 - .3 Coils shall have galvanized steel casings on all sides no lighter than 22 ga. (1.00mm).
 - .4 Copper tubes shall be 1/2" (13) O.D. and shall be spaced approximately 1 1/4" (32mm) apart and shall have a minimum wall thickness of 0.016" (0.41mm). Hot water shall be equally distributed through all tubes by the use of header design.
 - .5 Select coils with water velocity in the tubes not to exceed five feet per second. The water pressure drop through the coil shall not exceed 10 ft.wg. Heating coil face velocities shall not exceed the maximum face velocity indicated in the Schedules.
 - .6 Coils shall be tested by air pressure under water. Coils shall be tested at 350 psi (2,413 kPa) air static pressure.
 - .7 Coil ratings, calculations and selection data shall be in accordance with the applicable AHRI Standards and shall be submitted with the Shop Drawings.
 - .8 Control valves, automatic air vents and drain vents, shall be supplied and field installed by the Mechanical Trades.
- .6 Acceptable Manufacturers:
 - .1 Nailor Industries,
 - .2 E.H. Price,
 - .3 Metalaire,
 - .4 Titus,
 - .5 Tuttle and Bailey,
 - .6 Or approved equivalent.

2.04 DUCT MONITORING STATIONS ("DMS")

- .1 Provide Nailor model 36VRS, or equivalent, pressure independent variable air volume duct monitoring stations ("DMS") for duct retrofit applications in accordance with the Equipment Schedules where shown on the drawings.
- .2 Duct monitoring stations shall be designed, constructed and configured to retrofit and convert existing constant air volume systems into variable air volume systems.
- .3 Duct monitoring station construction shall be as follows:

- .1 16 ga. Galvanized steel damper with extruded PVC blade seals and metallic side jamb seals;
 - .2 Leakage less than 2% of nominal air flow at 3.0 in.wg. pressure when tested in accordance with ASHRAE Standard 130;
 - .3 Celcon® bearings;
 - .4 ½" (13mm) diameter plated steel drive shaft, double bolted to blade;
 - .5 Indicator mark on the end of the drive shaft to show the damper position;
 - .6 A 20 ga. (0.91mm) galvanized steel control enclosure to enclose all controls (BAS Control Trades to verify enclosure size requirements to accommodate vendor specific devices);
 - .7 Multi-point averaging flow sensor complete with aluminum gauge taps for field balancing;
 - .8 Gasket material around the perimeter of the duct monitoring station mounting plate to seal the assembly to the interior surface of the duct.
- .4 Duct monitoring stations shall be complete with the following options:
- .1 A factory minimum air flow setting of zero (shut-off);
 - .2 16" (408mm) long sleeve;
 - .3 24V control transformer;
 - .4 Toggle disconnect switch;
- .5 Dust tight enclosure seal.
- .6 Acceptable Manufacturers:
- .1 Nailor Industries,
 - .2 Or approved equivalent.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Comply with Manufacturer's requirements for the installation of all specified equipment and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.
- .3 Support Air Terminal Control Units and connecting ductwork in accordance with SMACNA Standards or as indicated.
- .4 Provide an air vent at the high point of all hot water reheat coil piping.
- .5 Provide a drain at the low point of all hot water re-heat air piping.

3.02 INSTALLATION OF VARIABLE AIR VOLUME/ CONSTANT AIR VOLUME (CAV/VAV) BOXES

- .1 Secure each box in place from the structure by means of galvanized steel angles and hanger rods, independent of connecting ductwork.
- .2 Connect each box with ductwork as indicated. Provide straight inlet duct the same size as the box inlet and of a length equal to a minimum of four duct diameters. Co-ordinate final box adjustments and settings with personnel doing system testing and balancing work.

3.03 INSTALLATION OF FAN POWERED BOX ("FPB") TERMINALS

- .1 Secure each box in place from the structure by means of galvanized steel angles and hanger rods, independent of connecting ductwork.

- .2 Connect each box with ductwork as indicated. Provide straight inlet duct the same size as the box inlet and of a length equal to a minimum of four duct diameters. Co-ordinate final box adjustments and settings with personnel doing system testing and balancing work.

3.04 INSTALLATION OF BYPASS TERMINAL ("BPT") UNITS

- .1 Secure each box in place from the structure by means of galvanized steel angles and hanger rods, independent of connecting ductwork.
- .2 Connect each box with ductwork as indicated. Provide straight inlet duct the same size as the box inlet and of a length equal to a minimum of four duct diameters. Co-ordinate final box adjustments and settings with personnel doing system testing and balancing work.

3.05 DUCT MONITORING STATIONS ("DMS")

- .1 Install air monitoring stations ("DMS") in strict accordance with manufacturer's requirements and all requirements of the Authorities Having Jurisdiction.
- .2 Install duct monitoring stations generally where shown on the drawings to meet manufacturer's minimum upstream and downstream straight duct length requirements to ensure flow measurement accuracy and repeatability.
- .3 Confirm existing duct size in the field prior to ordering duct monitoring stations.

3.06 AIR BALANCING

- .1 Refer to Section 20 05 95.

- 3.02 INSTALLATION OF FILTERS**
- 3.03 INSTALLATION OF AIR FILTER HOUSING**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.02 REFERENCES

- .1 American Society of Heating, Refrigeration and Air-Conditioning Engineers (ASHRAE)
 - .1 ASHRAE 52.1, Gravimetric and Dust Spot for Testing Air-Cleaning Devices Used in General Ventilation for Removing Particulate Matter (ANSI Approved).

1.03 WORK PERFORMED BY THIS SECTION

- .1 Provision of air filters.
- .2 Provision of filter housings.
- .3 Provision of HEPA Filter Housings.
- .4 Activated Carbon Filters.

1.04 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the construction and installation of air filters.
- .2 Submittals shall include a letter of certification noting filter media rating meets or exceeds the specified and/or published values.
- .3 Submittals: Submit shop drawings for the following Products:
 - .1 Pre-Filers;
 - .2 Final Filters;
 - .3 Air filter housings;

PART 2 - PRODUCTS

2.01 GENERAL FILTER REQUIREMENTS

- .1 Allow minimum 18" (450mm) clear space upstream of filter frame to allow full utilization of filter area in contact with the air stream.
- .2 Filters: Suitable for air at 100% RH and air temperatures up to 350°F.
- .3 Filters shall bear burst strength of 10 in.wg. (2500 Pa).
- .4 Provide air filter section in each air handling unit to accept specified filters including frames for removal through the plenum section, upstream of the filters.
- .5 Provide frames reinforced to prevent deflection by the air stream with a 6 in.wg. (1500 Pa) pressure differential.
- .6 Provide blank-off plates and gaskets to prevent air bypass.
- .7 Acceptable filter manufacturers: American Air Filter ("AAF"), and Camfil. Alternative filters may be considered by the Consultant provided a cost savings to the Owner can be demonstrated.

2.02 PRE-FILTERS

- .1 Provide filter racks on each side of heating coil to accept pre-filters.
- .2 Pleated Panel Filters: 2" deep (50mm), MERV 8, UL 900 Class 2 and as follows:
 - .1 Each filter shall consist of an individual pleated media pack, enclosed in a clay coated board frame, with integral pleat stabilizers and support straps.

- .2 Filter media shall be a blend of 100% virgin synthetic fibres.
- .3 Filter media must be self-supporting in pleated form, with no metal or plastic material laminated to the media to provide pleat support.
- .4 The pleated media pack must be enclosed in a 1-piece, 28 pt. moisture resistant beverage carrier board frame.
- .5 Filter must have three pleat stabilizers bonded to the media on the air leaving side and three support straps adhered to the air entering side of the filter. The pleat stabilizers must be made of moisture resistant beverage carrier board, and bonded to the media to maintain the proper pleat spacing throughout the life of the filter. The support straps are to be made from moisture resistant beverage carrier board and must be adhered along the tips of each pleat.
- .3 Filters of the size and air flow capacity shall meet the rated performance specifications based on the ASHRAE 52.2-1999 test method. Pertinent tolerances specified in Section 7.4 of the Air-Conditioning and Refrigeration Institute (ARI) Standard 850-93 shall apply to the performance ratings. All testing is to be conducted on filters with a nominal 600mm x 600mm (24"x24") face dimension.
- .4 The filters shall be approved and listed by Underwriters' Laboratories, Inc. as Class 2 when tested according to UL 900 and CAN 4-5111.

2.03 HIGH EFFICIENCY CARTRIDGE TYPE FINAL FILTERS

- .1 Extended Surface V-Bank Cartridge Filters: 12" (305mm) deep, MERV 14 or MERV 13 per the equipment schedules, UL 900 Class 2 and as follows:
 - .1 Each filter shall consist of 8 pleated media packs assembled into 4 V-banks within a totally plastic frame.
 - .2 The filters shall be capable of operating at temperatures up to 176°F.
 - .3 The moulded end panels are to be made of high impact polystyrene plastic.
 - .4 The centre support members shall be made of ABS plastic; no metal components are to be used.
 - .5 The media shall be made of micro glass fibres with a water repellent binder. The media shall be a dual density construction, with coarser fibres on the air entering side and finer fibres on the air leaving side.
 - .6 The media shall be pleated using separators made of continuous beads of low profile thermoplastic material.
 - .7 Media packs shall be bonded to the structural support members at all points of contact to ensure rigidity and to eliminate potential air bypass.
- .2 Filters of the size, air flow capacity and nominal efficiency (MERV) shall meet the rated performance specifications based on the ASHRAE 52.2-1999 test method. Where applicable, performance tolerance specified in Section 7.4 of the Air-Conditioning and Refrigeration Institute (ARI) Standard 850-93 shall apply to the performance ratings. All testing is to be conducted on filters with a nominal 600mm x 600mm (24"x24") header dimension.
- .3 The filters shall be approved and listed by Underwriters' Laboratories, Inc. as Class 2 when tested according to UL 900 and CAN 4-5111.

2.04 AIR FILTER HOUSING

- .1 General
 - .1 Air Filter Housings shall be Camfil GlidePack, Uni Track 25 (25" deep), or approved equal.
 - .2 Filter housing shall be sized based on 12" (305mm) deep filters with nominal module sizes of 24"x24" (610mm x 610mm) up to a maximum of five (5) modules high by six (6) modules wide, and a maximum velocity of 500 fpm, unless noted otherwise in the documents.

- .3 Air Filter Housing shall be dual-stage air filter housing consisting of 16-gauge galvanized steel enclosure, extruded aluminum filter mounting track, dual-access doors, three static pressure taps, door and filter gaskets and seals. In-line housing depth shall not exceed 25".
- .2 Construction
 - .1 The housing shall be constructed from 16-gauge galvanized steel with standing flanges to facilitate attachment to other HVAC system components. Corner posts of Z-channel construction shall ensure housing stability and rigidity.
 - .2 The housing shall be weatherproof and suitable for rooftop/ outdoor installation without modification.
 - .3 The housing shall incorporate a nominal 1" (25.4mm) deep filter header track that will hold 12" (305mm) deep box filters, constructed of extruded aluminum and shall be an integral component of filter box housing.
 - .4 Dual access swing-open doors shall include high-memory sponge neoprene gasket to facilitate a door-to-filter seal against all individual stages of filtration. Each door shall be equipped with adjustable and replaceable positive sealing UV-resistant star-style knobs and replaceable door hinges.
 - .5 The housing shall include a pneumatic fitting to allow the installation of static pressure gauge to evaluate pressure drop across the installed air filter.
- .3 Performance
 - .1 Leakage at rated airflow, upstream to downstream of filter and slide mechanism shall not exceed 1% at 3.0 in.wg. Leakage into or out of the housing shall be less than 1% at 3.0 in.wg.
 - .2 Accuracy of pneumatic pressure fittings, when used to evaluate a single-stage, or multiple filter stages, shall be accurate within +/- 3% at 0.6 in.wg.
 - .3 Housing integrity to listed performance values shall be available on request from the housing manufacturer.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Comply with Manufacturer's requirements for the installation of all specified equipment and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.

3.02 INSTALLATION OF FILTERS

- .1 Provide all required air filters, located and arranged as shown and scheduled.
- .2 Provide all required filter assembly frames and install to prevent air by-pass and to permit easy filter removal. Construct frames from the same material as the plenum, casing or duct the filters are associated.
- .3 When air handling systems are complete and ready for start-up and testing, but building finishes are not complete and cleaning is not complete, provide minimum 20% average dust spot efficient (atmospheric) temporary glass fibre media in place of permanent filters prior to fan start-up, and provide temporary media over all return air openings in dirty, dusty, incomplete areas.
- .4 Prior to application for a Certificate of Substantial Performance, and when the systems are ready for air balancing, remove temporary media and install permanent filters.

3.03 INSTALLATION OF AIR FILTER HOUSING

- .1 Install air filter housing in duct main where shown on the drawings.
- .2 Install air filter housing in accordance with manufacturer's instructions.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with requirements of Section 20 08 10 Mechanical Commissioning

1.02 SCOPE OF WORK OF THIS SECTION

- .1 Provision of HVAC system heat exchangers and all related ancillaries.

1.03 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the installation of pressure piping and heat transfer systems for hydronic heating and cooling applications.

1.04 SUBMITTALS

- .1 Submit shop drawings for the following Products:
 - .1 Plate & Frame Heat Exchangers;
 - .2 Shell & Tube Heat Exchangers.

1.05 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Trade Contractor is to review all discrepancies and verify the locations of all existing services that are being extended, and the routing of new services.
- .2 Report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Trade Contractor.
- .3 Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 PLATE AND FRAME HEAT EXCHANGERS

- .1 General: Plate heat exchangers shall be suitable for potable water applications and shall be designed, constructed, tested, and "U" stamped in accordance with Section VIII, Division 1 of the ASME Pressure Code. A U-1 form and picture of the nameplate shall be furnished.
- .2 Frame Construction Requirements: Provide single pass designs with all connections on the head (fixed pressure plate).
- .3 The head (fixed pressure plate) and follower (loose pressure plate) shall be constructed of carbon steel in sufficient thickness and strength to operate within the designated design and test pressures. Welded reinforcements or stiffeners will not be allowed on the heat exchanger pressure plates .
- .4 Lifting lugs designed to support the entire flooded weight of the plate heat exchanger shall be included on all heat exchanger with 4" connections or greater.
- .5 The plate heat exchanger shall be flushed clean at factory prior to shipment. All connections shall be factory sealed to prevent the entrance of foreign material during transit.
- .6 Connection Requirements:
 - .1 Connections equal to or less than 2" shall be male NPT type.
 - .2 All plate heat exchangers with connections greater than 2" shall be equipped with studed connections conforming to ANSI B16.5.

- .3 Connections shall be clearly marked on the plate heat exchanger and shall correspond to vendor drawings.
- .7 Tightening Bolt Requirements:
 - .1 Frame tightening bolts, constructed of SA193 B7 with SA194 B2H nuts, will be mechanically retained to prevent accidental side removal. Tightening bolts will be equipped with a captive nut at the head (fixed pressure plate) and a keyed working nut at the follower (loose pressure plate) to allow for easy opening and closing of the plate heat exchanger.
 - .2 Tightening bolts are to be zinc plated. Rust prevention lubrication is not an acceptable substitute as it can be removed over time and use.
 - .3 Thrust bushings (ball bearing box washers) shall be located at all critical closing bolts on plate heat exchangers with 10" connections or greater. The thrust bushings allow for easy opening and closing of the plate heat exchanger without damaging the epoxy coating of the follower (fixed pressure plate).
 - .4 The bolting system shall be designed so that only four (4) main tightening bolts are required for the opening and closing of a plate heat exchanger.
- .8 Plate Requirements:
 - .1 Heat transfer plates shall be (2) two pieces of 0.35mm plates (double wall) pressed in one-step, no multi-stage pressing of one plate is allowed. No additional material should be added to the single metal plate sheet e.g. local reinforcements in hanger area or in gasket grooves.
 - .2 Heat transfer plates shall be permanently marked to identify material and origin.
 - .3 The design shall be such that the plate can withstand the maximum operating pressure with no pressure on the adjacent plates.
 - .4 Plate material shall be 316 Stainless Steel
- .9 Gasket Requirements:
 - .1 Gasketing system shall be non-glued.
 - .2 Inactive port gasket areas shall be vented to the exterior in such a manner that no mixing can occur between the fluid circuits.
 - .3 Gaskets shall include alignment shoulders to assist heat transfer plate alignment.
- .10 Acceptable Manufacturers: Flo-Fab, Kelvion Inc., Alfa Laval, S.A. Armstrong, Bell & Gossett, or equal approved by the Consultant.

2.02 SHELL AND TUBE HEAT EXCHANGERS

- .1 General: Steam to Water, shell and tube heat exchanger.
- .2 Heat exchanger shall be mounted on a carbon steel frame work and supplied with a suitably sized, ASME rated mild steel receiver, to handle the pumping load of the system so as not to cause any retention of condensate in the shell of the heat exchanger.
- .3 Heat exchanger shall be shell and tube, U bend removable bundle.
- .4 The following materials of construction shall be utilized:
 - .1 Front head: Cast Iron.
 - .2 Baffles: Steel
 - .3 Tie Rods/Spacers: Steel
 - .4 Shell: Steel
 - .5 Gasket Material: Compressed Fibre
 - .6 Tubes: 3/4" OD Seamless Copper
 - .7 Tubesheet : Steel

- .5 The tube side shall be constructed based on a 150 PSIG design pressure at 375°F.
- .6 The shell side shall be constructed based on a 150 PSIG design pressure at 375°F.
- .7 The ASME U symbol shall be stamped on the heat exchangers. Each unit shall be registered with the National Board of Boiler and Pressure Vessel Inspectors.
- .8 Capacity as indicated in the schedule.
- .9 Tubeside velocity shall not be more than 5.4 ft per second.
- .10 Fouling factors shall be +0.00063.
- .11 Shell diameter shall not be less than 4" (100mm).
- .12 Maximum bundle length shall be no more than 8 feet (2400 mm); unless otherwise noted.
- .13 Heat exchanger shall be provided with float thermostatic steam trap, sensing chamber, steel check valves, isolating valves and all ancillary pipe work.
- .14 Unit shall be factory assembled and tested and be ready to be fitted into the installation by connecting the steam supply, steam supply into the exchanger and condensate outlet away from the pump.
- .15 Unit shall be capable of draining condensate from the heat exchanger when the system is under vacuum and also when the back pressure on the system is greater than the steam pressure within the shell of the heat exchanger.
- .16 Acceptable Manufacturer: Flo-Fab, Taco, Spirax Sarco, S.A. Armstrong, ITT Bell & Gossett, or approved equal.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Comply with Manufacturer's requirements for the installation of all specified equipment and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.
- .3 Locate equipment as shown on the drawings to provide connection arrangement and accessibility for servicing.
- .4 Provide clearances on all sides of equipment as required by the Manufacturer's Installation Instructions.
- .5 Install items of equipment with due regard to Architectural treatment, and ensure all items are level and finished in keeping with good workmanship.
- .6 Provide chemical treatment by-pass connections at heat exchangers on heating and cooling circuits as directed by chemical treatment supplier.
- .7 Provide branch take-offs from mains of heating and cooling pipes with shut off valves.
- .8 Install and connect remote components and other similar ancillary devices specified or supplied loose with the equipment. Install in serviceable locations as shown on the equipment manufacturer's installation details, and where shown on the drawings.

3.02 HEAT EXCHANGERS

- .1 Provide package type plate and frame heat exchangers where shown and/or required.
- .2 Provide package type shell and tube heat exchangers where shown and/or required.
- .3 Provide a line size strainer or pump suction diffuser at the primary side inlet connection to each plate and frame heat exchanger.
- .4 Secure each heat exchanger in place on a prime coat painted welded structural steel stand to a concrete housekeeping pad.

3.03 TESTING

- .1 Meet testing requirements of all Authorities Having Jurisdiction (AHJs). Obtain certification and certify tests not required by AHJs. Perform not less than the following tests.
- .2 Prove hydronic piping tight under a hydrostatic test of 150% of design working pressure but not less than 700kPa (100 psi). Test without pressure drop for a period of not less than 4 hours.
- .3 Perform tests before equipment is covered or concealed.
- .4 Remove all components which will not withstand test pressure and replace after tests.
- .5 Eliminate leaks or remove and refit defective parts. Do not caulk threaded or welded joints.
- .6 After work is completed, adjust and put all parts of the system into proper working order. Adjust all valves to achieve specified heating capacities. Leave the complete job ready for regular operation, all to the satisfaction of the Consultant.
- .7 After the testing period, drain the system, and before water treatment is introduced into the system, clean out all dirt pockets and strainers.
- .8 Provide lubricating oils, packing, and other accessories, for proper operation of the system.
- .9 The final test and acceptance shall not be made until the work is finally completed.

3.04 EQUIPMENT START UP

- .1 Follow manufacturer's instructions and have manufacturer's representative present to certify the installation.
- .2 Check each item of equipment to ensure proper piping connections, to verify proper operation.

3.05 WATER BALANCING

- .1 Refer to Section 20 05 95.
- .2 Provide flow measurement ports as shown on detail drawings and piping schematics in locations as directed by the Testing Adjusting and Balancing ("TAB") Trades. Provide additional balancing valves where recommended by the TAB Trades.

PART 3 - EXECUTION

- 3.01 INSTALLATION**
- 3.02 HUMIDIFIERS**
- 3.03 START-UP SERVICE**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .2 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .3 Comply with requirements of Section 20 05 70 Motors, Motor Starters, Motor Control Centres, Variable Frequency Drives and Wiring
- .4 Comply with the requirements of Section 25 10 10 BAS Control Network
 - .1 Comply with all requirements including those referenced in Article "BAS Integration with Third Party Devices"

1.03 WORK PERFORMED BY THIS SECTION

- .1 Provision of Air to Air Recovery Systems

1.04 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the construction and installation of Air to Air Recovery Systems.
- .2 Submittals: Submit shop drawings for the following Products:
 - .1 Air to Air Recovery Systems and all components and accessories

1.05 REFERENCE STANDARDS

- .1 Provide fan ratings based on tests meeting ASHRAE and AMCA procedures and provide only fans carrying the AMCA seals. No fan will be accepted which has a point of rating not listed in the published data or which is not rated for air and sound performance.
- .2 Fans shall be factory balanced, statically and dynamically to AMCA Standards.
- .3 Factory finish coat over primer on all parts. Spray paint before assembly and repaint after reassembly.
- .4 Units shall be designed and constructed to meet the following standards:
 - .1 CSA Z317.2-15 Special Requirements for Heating, Ventilation, and Air-Conditioning (HVAC) Systems in Health Care Facilities. Note: Not all the requirements in this CSA Standard are summarized in this Section of Specification. Manufacturer shall make reference to and comply with this CSA standard.
 - .2 ASHRAE 51-07 – Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating.
 - .3 ASHRAE 90.1 – 2010 Standard for Energy Efficient Design for New Buildings.
 - .4 AMCA Standard 300-2006 Reverberant Room Method for Sound Testing of Fans.
 - .5 AMCA Standard 301-2006 Methods for Calculating Fan Sound Ratings from Laboratory Test Data.
 - .6 ARI Standard 575-94 Method of Measuring Machinery Sound Levels within Equipment Rooms.
 - .7 ARI Standard 350-2000 Sound Rating of Non-Ducted Indoor Air-Conditioning Equipment.
 - .8 ASHRAE Standard 68-97/ AMCA Standard 330-97 Method of Testing In-Duct Sound Power Measurement Procedure for Fans.
 - .9 ASHRAE 52.2
 - .10 ANSI Standard 221.47

- .11 ARI 850-93 Section 7.4
- .12 CGA, ETLC, CSA or UL/ULC certified for prewired equipment
- .13 NRCA Standard for Roof Curbs
- .14 NFPA 90A for flame and smoke spread for adhesives

1.06 ACOUSTICAL PERFORMANCE

- .1 Acoustical performance shall be established by AMCA standard 330, ASHRAE Standard 68 or ARI 260P procedures.
- .2 Sound data shall be supplied that does not exceeds levels requirements indicated on schedules or fan performance data sheets; any sound data presented as 'sones' or 'Bels' is not acceptable.

1.07 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

1.08 SUMITTALS

- .1 Submit product Shop Drawings in accordance with requirements of Section 20 01 10 with the following information:
 - .1 General layout drawing with plan and elevation views including all relevant dimensions,
 - .2 Performance schedule including airflow, heating and cooling capacities, electrical data, unit weight.
 - .3 Energy recovery wheel performance characteristics including:
 - .1 sensible and latent energy recovery efficiency,
 - .2 frost point based on design conditions,
 - .3 speed range in RPM.
 - .4 Fan energy consumption:
 - .1 kW of supply and exhaust fans at design condition,
 - .2 watts per CFM calculation defined as:
$$(\text{design condition supply fan watts} + \text{design condition exhaust fan watts}) / \text{supply fan airflow}$$
 - .5 Full fan curve.
 - .6 Sound power data by octave band for all openings and radiated through cabinet.
 - .7 Electrical schematics including field wiring connections.
 - .8 Component details including construction method and materials.
 - .9 Control point schematic and complete written sequence of operation.
 - .10 Curb mounting details.

1.09 ACCEPTABLE MANUFACTURERS

- .1 Swegon (Passive House Certified Component)
- .2 Ventacity (Passive House Certified Component)
- .3 Other Passive House accredited air to air recovery systems as approved by the Consultant.

PART 2 - PRODUCTS

2.01 AIR TO AIR RECOVERY SYSTEMS

.1 Casing

- .1 Cabinet shall be nominal 2" double wall panel with 3.0lb density glass fibre insulation. Insulation shall have a flame spread of rating not exceeding 25 and a smoke developed rating not exceeding 50. Cabinet exterior shall be 20 gauge pre-painted steel that meets or exceeds 650hour salt spray test based on ASTM B117. Liners and other steel components shall be galvalume AZ180 or equivalent. All seams shall be sealed to provide air tight casing.
- .2 Doors shall be nominal 50mm double wall panel with the same construction as the cabinet. Doors shall be fitted with flush mounted lockable two stage handles. Panel deflection shall not exceed L/240 at 125% of design static pressure, minimum +/- 1.25 kPa. Deflection shall be measured at the midpoint of the panel height.
- .3 The unit will be designed for service and maintenance on one side only to allow for a compact installation.
- .4 Units shall be tested in accordance with EN 1886 or equivalent and meet the following criteria:
 - .1 Casing air leakage = A (Air tightness class L2); Under 1.6 in.wg air leakage rate shall be no more than 3 cfm/100 sq.ft and under 2.8 in.wg air leakage rate shall be no more than 10 cfm/sq.ft.
 - .2 Thermal transmittance = T3;
 - .3 Thermal bridging factor = TB3; The ratio between the lowest temperature difference between any point on the external surface and the mean air-to-air temperature difference. Unit shall meet 0.6 bridging
 - .4 Environmental Class C4.
- .5 Units shall be designed so they can be unbolted and broken down into sections for access to restricted locations.
- .6 Provide SS 304 drain pans with cross break and pitch to drain connection. Provide extended drain pans under cooling coil section to avoid drift carryover.
- .7 All dampers shall have extruded heavy gauge 6063 aluminium frame that includes jamb seals. Blades will be airfoil shaped extruded aluminium with rubber blade seals. Damper blades shall be insulated with expanded polyurethane foam providing R-2.29 and include a thermal break. Linkage shall be installed in the frame outside the airstream.

.2 Fans

- .1 Fans shall be axial- centrifugal type with EC direct drive motor suitable for variable speed operation. Fan and motor assembly shall be mounted on common base with 25mm (1") deflection Rubber in shear isolation. on common base with 25mm (1") deflection spring isolation. Fan shall be connected to fan bulkhead by a canvas type flex connector.
- .2 Locate fan and motor internally on a steel base. Factory mount motor on a slide base that can be slid out of unit. Fan motors shall be permanent magnet, synchronous motor type with integral digital motor controller.
- .3 Provide self-aligning, grease lubricated, ball or roller bearings with extended copper lubrication lines to access side of unit. Provide grease fittings attached to fan base assembly near access door.
- .4 DOAS unit must not have unit sound power levels exceeding maximum Passive House Standards.

.3 Bearings and Drives

- .1 Fan motors shall be permanent magnet, synchronous motor type with integral digital motor controller. Fan bearings shall be serviceable type with an L-10 life of 40,000 hours.

- .2 All fans shall be equipped with integral airflow monitoring system connected to the unit controller.
- .4 Coils
 - .1 Provide access to coils from connection side of unit for service and cleaning. Enclose coil headers and return bends fully within unit casing. Fabricate coil connections, vents and drains to extend beyond unit casing including grommets for an airtight unit casing. Coils shall be removable through side panels and/or top panels of unit without removal and disassembly of entire section.
 - .2 Provide dual sloped 304 stainless steel drain pan located underneath and extending downstream of coil and intermediate drain pans.
 - .3 Coil performance shall be as scheduled. Coil performance data shall be certified in accordance with ARI Standard 410 where applicable.
 - .4 Construction:
 - .1 Tubes: Copper.
 - .2 Fins: Aluminum mechanically bonded to tubes.
 - .3 Headers: Seamless copper with vent and drain connections.
 - .4 Casing: 16-gauge, galvanized steel channels with 16-gauge center and end supports.
 - .5 Cooling/dehumidification and heating coils where water is the fluid shall be circuited drainable with a vent connection at the highest point and a drain connection at the lowest point. Coil headers shall be copper with steel male pipe connections.
 - .6 For water coils supply 2-way modulating control valves complete with valve actuators for field installation. Include wiring harness with quick connect wiring harness for both valve power source and control signals.
 - .7 Dehumidification coil section shall include passive wrap around heat pipe for passive reheat
- .5 Humidifier Section
 - .1 Provide a 1200 (48") long blank section, complete with access door and drain base, suitable for field installation of an electronic humidifier as Specified in Section 23 84 13.
- .6 Filters
 - .1 Provide filter box section with side loading MERV 8 pleated pre-filter section on exhaust side.
 - .2 Unit shall include side loaded cartridge filter rack suitable for 560mm (22"), ten (10) pocket MERV 13 bag filters on the fresh air side with MERV 8 pre-filters. Filters will be held in position by an expanding locking device.
- .7 Energy Recovery Device
 - .1 Unit shall include AHRI 1060 certified rotary heat exchanger that transfers both sensible and latent energy. Wheel shall be constructed of corrugated aluminium coated with Zeolite. Desiccant material shall be 4A or smaller molecular sieve. Wheel supports shall be galvanized steel with a rigid steel hub. Cassette shall be heavy duty reinforced galvanized steel with a built in purge section. Bearings shall be permanently sealed type. Rotary heat exchanger shall include adjustable face and peripheral brush seals. Drive motor shall be variable speed type integrated into unit controller.
 - .2 Dry Bulb temperature recovery efficiency to be not lower than indicated on schedules.
 - .3 Humidity recovery efficiency to be not lower than indicated on schedules.
 - .4 $\geq 75\%$ heat recovery efficiency is required for Passive Compliance. Heat recovery efficiency must be confirmed either according to PHI or through Passive House calculation procedure including ERV performance derating.

- .5 Rotary Heat Exchanger carry over must not exceed 0.45% and be certified to EN308: 1997.
- .6 Provide airflow monitor to measure outdoor airflow through enthalpy wheel. Monitor shall be integrated into unit controller. Airflow accuracy shall be minimum $\pm 5\%$ of design airflow.
- .7 The heat recovery wheel must be equipped with dual drive belts for redundancy.
- .8 The energy recovery wheel must be Carbon Trusts ETL listed and eligible for ECA.
- .8 Cross Contamination (EATR) Control
 - .1 Units shall include and utilize the following means to maintain cross contamination (EATR) at less than 0.5% of the supply airflow through the use of brush seals, rotor purge sector, variable speed rotor control to vary the rotor speed with supply airflow modulation, and return air opening pressure balance plates to ensure the correct pressure balance within the unit to ensure purge airflow from the outside airstream to the exhaust airstream:
 - .1 Units shall include standard pressure balancing plates at return air opening. These plates are to be set at startup, based on the pressure differential between supply and return air, to ensure purge airflow moves from the supply airstream to the exhaust airstream. Pressure gradient across the rotor seal must be between 0 and 0.08" and deliver EATR less than 0.5% as certified by 3rd party verification.
 - .2 Unit controls shall include built-in Air Quality Control algorithms. This feature includes standard algorithms in the unit controller and an optional factory installed modulating damper on the return airstream. The unit controls shall constantly monitor the pressure differential between supply and return air and maintain the pressure differential between 0 and 0.08" over the entire operating airflow range.
- .9 Digital Controls
 - .1 Unit shall include an integrated microprocessor based unit controller. The controls shall be located in the integral controls cabinet. All controls shall operate off a transformer from the main power supply for single point power connection. All internal controls and sensors shall be factory prewired and tested. The microprocessor shall have dual Ethernet ports with an internal firewall to allow remote access via third party without compromising the clients internal Network.
 - .2 ERV units must utilize built-in controls and ERV wheel speed control algorithms that use wheel speed modulation to:
 - .1 Control supply air temperature
 - .2 Prevent wheel frost development – Wheel frost control shall be done by reading wheel pressure differential. With an increase in pressure drop due to frost accumulation the wheel speed will slow providing wheel defrost. Frost controls based upon exhaust air temperature shall not be allowed due to loss of energy savings
 - .3 Modulate wheel speed as supply airflow modulates to ensure maximum purge efficiency and absolute minimum airflow cross-contamination at less than 0.45% EATR at all airflow conditions.
 - .3 Provide airflow monitor to measure outdoor airflow through enthalpy wheel. Monitor shall be integrated into unit controller. Airflow accuracy shall be minimum $\pm 5\%$ of design airflow.
 - .4 Provide temperature sensors at all four (4) cardinal point positions on the ERV wheel. Display outside air temperature and return air temperature on the unit handheld, touchscreen controls interface panel and provide all four (4) temperature readings via BACnet output to the BAS.
 - .5 Provide factory mounted pressure sensors to measure filter pressure drop across pre- filter and main filter. Pressure drop shall be digitally feedback to controller for utilization in control and alarm sequencing. Unit controller shall monitor filter pressure level and report when filter changes are required.

- .6 Include each unit with a touch pad type human interface that allows monitoring and control of all unit functions. Human interface shall communicate with unit controller by hardwire connection. Human interface shall be unit mounted.
- .7 The control system will regulate temperatures, airflows and other functions as required. Unit controller shall be pre-programmed with factory test software for all possible functions. Controller shall utilize "plug and play" feature that will automatically load and operate any necessary algorithm based on components and accessories that are connected to the controller such as air flow monitors, damper actuators, fans, rotary energy recovery, water control valves, etc.
- .8 The controller shall provide the following;
 - .1 Control of fans correcting for both changes in total static pressure and air density in both VAV and constant airflow applications.
 - .2 Real time total unit power consumption (fans, ERV wheel motor and controls) as "watts/CFM" monitored through the BAS.
 - .3 Fan performance monitoring.
 - .4 Ventilation airflow monitoring and control.
 - .5 Airflow density correction for winter and summer conditions.
 - .6 Energy recovery optimization including operation of rotary energy recovery device.
 - .7 Supplemental heating and cooling when included.
 - .8 Integration to VRF condensing units when included.
 - .9 Frost protection certified to meet the frost protection requirements of Passive House Institute
 - .10 Recirculation module when included.
 - .11 Monitoring alarms, faults and maintenance points including filter changeout.
 - .12 Time and date schedules.
 - .13 Building pressurization.
 - .14 Humidity control.
 - .15 Data logging and trending.
- .9 The microprocessor unit controller shall have the ability to control two (2) independent zones complete with heating and cooling coils, control valves and all sensors to accomplish the independent control sequence.
- .10 Include wireless capability via built-in WiFi connection that will allow the client to access remotely via Smart Phone, laptop, tablet, and similar without supplemental software.
- .11 Controller shall be BACnet certified and also include Modbus communication capability.
- .12 Controller shall be BTL certified for BACnet IP and also include Modbus, and Metasys communication. Communication shall include monitoring, control, alarms, faults and maintenance information.
- .13 Provide factory installed and tested contactors, overloads, fusing, motor speed controllers for supply, exhaust and rotary energy recovery device. Include all necessary control transformers.
- .14 Supply all necessary temperature and pressure sensors complete with plug in wiring harnesses for proper option of unit.
- .10 Unit Electrical
 - .1 Provide unit mounted non-fused disconnect switch with single point power connection for main ERV.

PART 3 - EXECUTION

3.01 INSTALLATION

- .1 Installation of air-to-air recovery systems shall be in strict accordance with manufacturer's instructions and the requirements of the Authorities Having Jurisdiction (AHJs).
- .2 Install floor mounted air handling units on a flat surface leveled within 3mm. Air handlers shall be mounted on housekeeping pads. Height of pad to be sufficient to allow for proper draining of deep P-trap sized to account for pressure differential between air handling unit interior and drain termination.
- .3 Provide condensate traps in accordance with manufacturers recommendations.
- .4 Install air handling units to allow proper service to all components.
- .5 Provide drain valves and vent cocks to each coil.
- .6 Arrange units for floor mounting complete with vibration isolators
- .7 Provide flexible duct connections between the equipment and duct connections
- .8 The equipment including coils, fans, and similar components shall be cleaned thoroughly before performing testing and balancing procedures.
- .9 Return/Exhaust side of all HVAC equipment shall be isolated from the surrounding environment during construction activities.
- .10 Protect acoustic lining and insulation as well as pre-lined and insulated ductwork from moisture accumulation and damage. This applies both to stored material and installed systems.

3.02 HUMIDIFIERS

- .1 The humidifier grid shall be installed at the factory of the air handling units. Installation instruction shall be provided to air handling unit manufacturer for reference.
- .2 Humidifier factory representative shall review shop drawing and installation to ensure absorption distance is maintained and humidifiers are installed in accordance with the manufacturer's instructions.
- .3 Provide a factory-trained service technician without additional charge to start and commission the humidifiers. In addition, factory shall allow for job site review of each air handling unit to carry out start-up, commissioning and instruct Owner's representatives; dates will be determined by owner's representative.

3.03 START-UP SERVICE

- .1 Provide a factory-trained service technician to start and commission the units. In addition, factory shall allow for each unit to carry out start-up, commissioning and instruct Owner's representatives; dates will be determined by Owner's representative. These shall be in addition to the field pressure testing of the air handling units.
- .2 Manufacturer shall allow for additional site visits to ensure compliance of the installation; these are in addition to those specified for start-up, testing and commissioning noted above. Dates will be assigned by Owner's representative.
- .3 Provide a start-up log by the manufacturer to document the unit start-up.

PART 3 - EXECUTION

- 3.01 GENERAL**
- 3.02 START-UP SERVICE**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .2 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .3 Comply with requirements of Section 20 05 70 Motors, Motor Starters, Motor Control Centres, Variable Frequency Drives and Wiring
- .4 Comply with the requirements of Section 25 10 10 BAS Control Network
 - .1 Comply with all requirements including those referenced in Article "BAS Integration with Third Party Devices"

1.03 WORK PERFORMED BY THIS SECTION

- .1 Provision of Packaged Rooftop Air-Conditioning Units.

1.04 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the construction and installation of Packaged Rooftop Air-Conditioning Units.
- .2 Submittals: Submit shop drawings for the following Products:
 - .1 Packaged Rooftop Air-Conditioning Units including all components and accessories

1.05 REFERENCE STANDARDS

- .1 Packaged air-cooled condenser units shall be certified in accordance with ANSI/AHRI Standard 340/360 performance rating of commercial and industrial unitary air-conditioning and heat pump equipment.
- .2 Unit shall be certified in accordance with UL Standard 1995/CSA C22.2 No. 236, Safety Standard for Heating and Cooling Equipment.
- .3 Unit and refrigeration system shall comply with ASHRAE 15, Safety Standard for Mechanical Refrigeration.
- .4 Unit shall be certified in accordance with ANSI Z21.47b/CSA 2.3b and ANSI Z83.8/CSA 2.6, Safety Standard Gas-Fired Furnaces.
- .5 Unit Energy Efficiency Ratio (EER) shall be equal to or greater that prescribed by ASHRAE 90.1, Energy Efficient Design of New Buildings except Low-Rise Residential Buildings.
- .6 Unit shall be certified by ETL and ETL Canada listed. Unit nameplate shall include the ETL/ETL Canada label. The nameplate, safety labels and warnings will be in English and French.
- .7 Unit shall be approved for use in and outside High Velocity Hurricane Zones (HVHZ) by the Florida Building Code (FL# 15031), when using the required steel rooftop curb and attachment methods. Maximum allowable lateral wind pressure is +100psf/-100psf.
 - .1 Maximum allowable uplift is +50psf/-50psf. Positive and negative required design pressures calculated for use with this system shall be determined by others on a job specific basis, in accordance with the governing code.
 - .2 Site specific pressures shall be less than or equal to the listed positive or negative allowable lateral wind design pressure and allowable uplift values for the product.

1.06 SUBMITTALS

- .1 Product Data:

- .1 Literature shall be provided that indicates dimensions, operating and shipping weights, capacities, ratings, fan performance, filter information, factory supplied accessories, electrical characteristics and connection requirements.
- .2 Installation, Operation, and Maintenance manual with start-up requirements shall be provided.
- .2 Shop Drawings:
 - .1 Unit drawings shall be provided that indicate assembly, unit dimensions, construction details, clearances and connection details.
 - .2 Computer generated fan curves for each fan shall be submitted with specific design operation point noted.
 - .3 Wiring diagram shall be provided with details for both power and control systems and differentiate between factory installed and field installed wiring.

1.07 DELIVERY, STORAGE, AND HANDLING

- .1 Unit shall be shipped with doors screwed shut and outside air hood closed to prevent damage during transport and thereafter while in storage awaiting installation.
- .2 Follow Installation, Operation, and Maintenance manual instructions for rigging, moving, and unloading the unit at its final location.
- .3 Unit shall be stored in a clean, dry place protected from construction traffic in accordance with the Installation, Operation, and Maintenance manual.

1.08 WARRANTY

- .1 Manufacturer shall provide a limited "parts only" warranty for a period of 12 months from the date of equipment startup or 18 months from the date of original equipment shipment from the factory, whichever is less.
- .2 Warranty shall cover material and workmanship that prove defective, within the specified warranty period, provided manufacturer's written instructions for Installation, Operation, and maintenance have been followed.
- .3 Warranty excludes parts associated with routine maintenance, such as belts and filters.

1.09 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS

- .1 Packaged rooftop unit shall include compressors, evaporator coils, filters, supply fans, dampers, air-cooled condenser coils, condenser fans, reheat coil, gas heaters, exhaust fans, and unit controls.
- .2 Unit shall be factory assembled and tested including leak testing of the DX coils, pressure testing of the refrigeration circuit, and run testing of the completed unit.
 - .1 Run test report shall be supplied with the unit in the service compartment's literature pocket.
- .3 Unit shall have decals and tags to indicate lifting and rigging, service areas and caution areas for safety and to assist service personnel.
- .4 Unit components shall be labeled, including refrigeration system components and electrical and controls components.

- .5 Estimated sound power levels (dB) shall be shown on the unit ratings sheet.
- .6 Installation, Operation, and Maintenance manual shall be supplied within the unit.
- .7 Laminated color-coded wiring diagram shall match factory installed wiring and shall be affixed to the interior of the control compartment's hinged access door.
- .8 Unit nameplate shall be provided in two locations on the unit, affixed to the exterior of the unit and affixed to the interior of the control compartment's hinged access door.

2.02 CONSTRUCTION

- .1 All cabinet walls, access doors, and roof shall be fabricated of double wall, impact resistant, rigid polyurethane foam panels.
- .2 Unit insulation shall have a minimum thermal resistance value of R-13. Foam insulation shall have a minimum density of 2 pounds/cubic foot and shall be tested in accordance with ASTM D1929-11 for a minimum flash ignition temperature of 610°F.
- .3 Unit construction shall be double wall with G90 galvanized steel on both sides and a thermal break. Double wall construction with a thermal break prevents moisture accumulation on the insulation, provides a cleanable interior, reduces heat transfer through the panel, and prevents exterior condensation on the panel.
- .4 Unit shall be designed to reduce air leakage and infiltration through the cabinet as follows:
 - .1 Cabinet leakage shall not exceed 1% of total airflow when tested at 3 times the minimum external static pressure provided in AHRI Standard 340/360.
 - .2 Panel deflection shall not exceed L/240 ratio at 125% of design static pressure, at a maximum 8 inches of positive or negative static pressure, to reduce air leakage.
 - .3 Deflection shall be measured at the mid-point of the panel height and width.
 - .4 Continuous sealing shall be included between panels and between access doors and openings to reduce air leakage.
 - .5 Piping and electrical conduit through cabinet panels shall include sealing to reduce air leakage.
- .5 Roof of the air tunnel shall be sloped to provide complete drainage.
- .6 Cabinet shall have rain break overhangs above access doors.
- .7 Access to filters, dampers, cooling coils, reheat coil, heaters, compressors, and electrical and controls components shall be through hinged access doors with quarter turn, zinc cast, lockable handles. Full length stainless steel piano hinges shall be included on the doors.
- .8 Exterior paint finish shall be capable of withstanding at least 2,500 hours, with no visible corrosive effects, when tested in a salt spray and fog atmosphere in accordance with ASTM B 117-95 test procedure.
- .9 Units with cooling coils shall include double sloped 304 stainless steel drain pans.
- .10 Unit shall be provided with base discharge and return air openings. All openings through the base pan of the unit shall have upturned flanges of at least 1/2 inch in height around the opening.
- .11 Unit shall include lifting lugs on the top of the unit.
- .12 Unit base shall be fabricated of 1 inch thick double wall, impact resistant, rigid polyurethane foam panels.
- .13 Unit shall include factory wired control panel compartment LED service lights.

2.03 ELECTRICAL

- .1 Unit shall have a 5kAIC SCCR.
- .2 Unit shall be provided with factory installed and factory wired, non-fused disconnect switch.
- .3 Unit shall be provided with a factory installed and field wired 115V, 20 amp GFI outlet in the unit control panel.

- .4 Unit shall be provided with phase and brown out protection which shuts down all motors in the unit if the electrical phases are more than 10% out of balance on voltage, the voltage is more than 10% under design voltage or on phase reversal.

2.04 SUPPLY FANS

- .1 Unit shall include direct drive, unhooded, backward curved, plenum supply fans.
- .2 Blowers and motors shall be dynamically balance and mounted on rubber isolators.
- .3 Motor shall be in accordance with Section 20 05 70 and shall include shaft grounding.

2.05 EXHAUST FANS

- .1 Exhaust dampers shall be sized for 100% relief.
- .2 Fans and motors shall be dynamically balanced.
- .3 Access to exhaust fans shall be through double wall, hinged access doors with quarter turn lockable handles.
- .4 Unit shall include direct drive, axial flow exhaust fans. Blades shall be adjustable pitch.
- .5 Motor shall be in accordance with Section 20 05 70 and shall include shaft grounding.

2.06 COOLING COILS

- .1 Evaporator Coils:
 - .1 Coils shall be designed for use with R-410A refrigerant and constructed of copper tubes with aluminum fins mechanically bonded to the tubes and galvanized steel end casings. Fin design shall be sine wave rippled.
 - .2 Coils shall have interlaced circuitry and shall be 6 row high capacity.
 - .3 Coils shall be hydrogen or helium leak tested.
 - .4 Coils shall be furnished with factory installed expansion valves.

2.07 REFRIGERATION SYSTEM

- .1 Unit shall be factory charged with R-410A refrigerant.
- .2 Compressors shall be scroll type with thermal overload protection and carry a 5 year non-prorated warranty, from the date of original equipment shipment from the factory.
- .3 Compressors shall be mounted in an isolated service compartment which can be accessed without affecting unit operation. Lockable hinged compressor access doors shall be fabricated of double wall, rigid polyurethane foam injected panels to prevent the transmission of noise outside the cabinet.
- .4 Compressors shall be isolated from the base pan with the compressor manufacturer's recommended rubber vibration isolators, to reduce any transmission of noise from the compressors into the building area.
- .5 Each refrigeration circuit shall be equipped with expansion valve type refrigerant flow control.
- .6 Each refrigeration circuit shall be equipped with automatic reset low pressure and manual reset high pressure refrigerant safety controls, Schrader type service fittings on both the high pressure and low pressure sides and a factory installed replaceable core liquid line filter driers.
- .7 Unit shall include a variable capacity scroll compressor on all refrigeration circuits which shall be capable of modulation from 10-100% of its capacity.
- .8 Lead refrigeration circuits shall be provided with hot gas reheat coil, modulating valves, electronic controller, supply air temperature sensor and a control signal terminal which allow the unit to have a dehumidification mode of operation, which includes supply air temperature control to prevent supply air temperature swings and overcooling of the space.

2.08 CONDENSERS

- .1 Air-Cooled Condenser:

- .1 Condenser fans shall be a vertical discharge, axial flow, direct drive fans.
- .2 Coils shall be designed for use with R-410A refrigerant. Coils shall be multi-pass and fabricated from aluminum microchannel tubes.
- .3 Coils shall be designed for a minimum of 10°F of refrigerant sub-cooling.
- .4 Coils shall be hydrogen or helium leak tested.
- .5 Condenser fans shall be VFD driven variable speed for condenser head pressure control. Factory provided and factory programmed VFDs shall continuously modulate the fan air flow to maintain head pressure at acceptable levels. Cooling operation shall be allowed down to 35°F with adjustable compressor lockout.

2.09 GAS HEATING

- .1 Stainless steel heat exchanger furnace shall carry a 25 year non-prorated warranty, from the date of original equipment shipment from the factory.
- .2 Gas furnace shall consist of stainless steel heat exchangers with multiple concavities, an induced draft blower and an electronic pressure switch to lockout the gas valve until the combustion chamber is purged and combustion airflow is established.
- .3 Furnace shall include a gas ignition system consisting of an electronic igniter to a pilot system, which will be continuous when the heater is operating, but will shut off the pilot when heating is not required.
- .4 Unit shall include a single gas connection and have gas supply piping entrances in the unit base for through-the-curb gas piping and in the outside cabinet wall for across the roof gas piping.
- .5 High Turndown Modulating Natural Gas Furnace shall be equipped with modulating gas valves, adjustable speed combustion blowers, stainless steel tubular heat exchangers, and electronic controller.
- .6 Combustion blowers and gas valves shall be capable of modulation.
- .7 Electronic controller includes a factory wired, field installed supply air temperature sensor. Sensor shall be field installed in the supply air duct work.
- .8 Supply air temperature set point shall be adjustable on the electronic controller within the controls compartment.
- .9 Gas heater shall be capable of capacity turndown ratio as shown on the unit rating sheet.
- .10 Heat trace shall be included on the condensate drain
- .11 Outdoor Airflow Monitoring:
 - .1 Unit shall include outside airflow measuring station and airflow signal processor that communicates directly with the factory provided control systems or can also be used with customer provided controls with a 0-10 VDC output signal. LonTalk and BACnet may also be available for some applications. Monitoring size is dependent on the cfm.

2.10 FILTERS

- .1 Unit shall include 4 inch thick, pleated panel filters with an ASHRAE MERV-13 rating, upstream of the cooling coil.
- .2 Unit shall also include 2 inch thick, pleated panel pre filters with an ASHRAE MERV-8 rating, upstream of the 4 inch standard filters.
- .3 Unit shall include a clogged filter switch.
- .4 Unit shall include a Magnehelic gauge mounted in the controls compartment.

2.11 OUTSIDE AIR/ECONOMIZER

- .1 Unit shall include 0-100% economizer consisting of a motor operated outside air damper and return air damper assembly constructed of extruded aluminum, hollow core, airfoil blades with rubber edge seals and aluminum end seals.

- .2 Damper blades shall be gear driven and designed to have no more than 20 cfm of leakage per sq ft. at 4 in. w.g. air pressure differential across the damper.
- .3 Low leakage dampers shall be Class 2 AMCA certified, in accordance with AMCA Standard 511.
- .4 Damper assembly shall be controlled by spring return enthalpy activated fully modulating actuator.
- .5 Unit shall include outside air opening bird screen, outside air hood, and barometric relief dampers.

2.12 CONTROLS

- .1 Factory Installed and Factory Provided Controller
 - .1 Unit controller shall be capable of controlling all features and options of the unit.
 - .2 Controller shall be factory installed in the unit controls compartment and factory tested.
 - .3 Controller shall be capable of stand-alone operation with unit configuration, set point adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling available without dependence on a building management system.
 - .4 Controller shall have an onboard clock and calendar functions that allow for occupancy scheduling.
 - .5 Controller shall include non-volatile memory to retain all programmed values without the use of a battery, in the event of a power failure.
 - .6 Constant Volume Controller:
 - .1 Unit shall modulate cooling with constant airflow to meet space temperature cooling loads.
 - .2 With modulating hot gas reheat, unit shall modulate cooling and hot gas reheat as efficiently as possible, to meet space humidity loads and prevent supply air temperature swings and overcooling of the space.
 - .7 Unit configuration, set point adjustment, sensor status viewing, unit alarm viewing, and occupancy scheduling shall be accomplished with connection to interface module with LCD screen and input keypad, interface module with touch screen, or with connection to PC with free configuration software.
 - .8 Controller shall be capable of connection with other factory installed and factory provided unit controllers with individual unit configuration, set point adjustment, sensor status viewing, and occupancy scheduling available from a single unit.
 - .9 Connection between unit controllers shall be with a modular cable.
 - .10 Controller shall be capable of communicating and integrating with a LonWorks or BACnet network.

2.13 ACCESSORIES

- .1 Unit shall be provided with a safety shutdown terminal block for field installation of a smoke detector which shuts off the unit's control circuit.

2.14 CURBS

- .1 Curbs shall to be fully gasketed between the curb top and unit bottom with the curb providing full perimeter support, cross structure support and air seal for the unit.
- .2 Curb gasket shall be furnished within the control compartment of the rooftop unit to be mounted on the curb immediately before mounting of the rooftop unit.
- .3 Seismic curb (with duct support rails) shall be provided for field installation.

PART 3 - EXECUTION

3.01 GENERAL

- .1 Manufacturer's installation instructions, and Operation, and Maintenance (O&M) manual shall be supplied with the equipment.

- .2 Installing Trades shall install equipment in strict accordance with the Manufacturer's installation instructions and the requirements of the Authority Having Jurisdiction.
- .3 Install and connect remote components including thermostats, humidistats, control panels, level controllers, flow proving switches, vibration switches, and any other similar ancillary devices specified or supplied loose with the equipment. Install in serviceable locations as shown on the equipment manufacturer's installation details, and where shown on the drawings.
- .4 Start up and maintenance requirements shall be complied with to ensure safe and correct operation of the unit.

3.02 START-UP SERVICE

- .1 Provide a factory-trained service technician to start and commission the units. In addition, factory shall allow for each unit to carry out start-up, commissioning and instruct Owner's representatives; dates will be determined by Owner's representative. These shall be in addition to the field pressure testing of the air handling units.
- .2 Manufacturer shall allow for additional site visits to ensure compliance of the installation; these are in addition to those specified for start-up, testing and commissioning noted above. Dates will be assigned by Owner's representative.
- .3 Provide a start-up log by the manufacturer to document the unit start-up.

PART 1 - GENERAL

1.01 RELATED WORK

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements and all Documents referenced therein.
- .3 Comply with requirements of Section 20 01 50 Mechanical Basic Materials and Methods.
- .4 Comply with the requirements of Section 25 10 10 BAS Control Network
 - .1 Comply with all requirements including those referenced in Article "BAS Integration with Third Party Devices"

1.02 WORK INCLUDED

- .1 Provided for complete and operational split system air conditioning units.
- .2 Refrigeration piping arrangement shall ensure:
 - .1 Compressor and oil and liquid return to compressor under load without harm to compressor.
 - .2 Minimum pressure drops.
 - .3 Restricted refrigerant migration during inoperative cycles.
 - .4 Accessories and piping prevent excessive compressor cycling.
 - .5 Pipe routing and isolation to avoid line breakage, excessive vibration and sound transmission to conditioned space.
 - .6 Maintenance of clean and dry systems.
- .3 Provide proper operation of safety controls and automatic controls provided by Mechanical Trades.
- .4 Match outdoor and indoor units with operating controls, electronic digital controls and communication system by one manufacturer.
- .5 Do not mix manufacturers of indoor and outdoor units.

1.03 QUALITY ASSURANCE

- .1 Systems shall be installed by trades with certificates of proficiency as refrigeration mechanics.
- .2 Comply with applicable codes, laws and regulations.
- .3 Conform to CSA-B52, Code for Mechanical Refrigeration and CSA-B131.5, Code for Refrigerant Piping.
- .4 Equipment shall be in accordance with ANSI/AHRI Standard 210/240, Performance Rating of Unitary Air-Conditioning and Air-Source Heat Pump Equipment.
- .5 System components shall bear CSA label and be factory tested and certified.

1.04 SHOP DRAWINGS

- .1 Provide shop Drawings in accordance with Section 20 01 10.
- .2 Shop Drawings for equipment shall include:
 - .1 Fan performance showing design operations point, r/min, power, etc.
 - .2 Dimensional data including weights, service space and clearance requirements.
 - .3 Schematic layout of refrigerant piping showing all piping components required for satisfactory operation and maintenance of the system(s), including but not limited to:
 - .1 pipe sizes,
 - .2 charging valve,
 - .3 isolating valves,

- .4 sight glasses,
- .5 strainers,
- .6 driers,
- .7 traps,
- .8 all other ancillaries necessary for the proper function of the system.
- .4 Complete installation instructions.
- .5 Electrical circuit diagrams including field-wired components and requirements for specific installation.
- .6 Electrical voltages, phase and power requirements.
- .7 Complete control wiring diagram and power requirements.
- .8 Programming instructions for inclusion in maintenance manuals.
- .3 Schematic diagram must be reviewed with and approved by air conditioning equipment supplier prior to submittal to Consultant.

PART 2 - PRODUCTS

2.01 SPLIT SYSTEM AIR CONDITIONING EQUIPMENT

- .1 Factory assembled and tested, package type equipment consisting of an indoor evaporator unit and an exterior condensing unit in accordance with drawing schedule, CSA or ETL listed and labelled, AHRI rated and certified and with a minimum system efficiency of 13 SEER.
- .2 Wall mounting evaporator assembly consisting of a white moulded high-strength plastic cabinet with front access panel, a motorized horizontal vane to automatically direct air flow in a horizontal and downward direction and which closes when fan operation is stopped, motorized vertical vanes controlled remotely, and a mounting plate supplied loose. Evaporator complete with:
 - .1 double inlet, forward curve fan(s) direct driven by a single 4-speed motor;
 - .2 removable and washable return air filter;
 - .3 factory pressure tested multi-angled coil of non-ferrous construction with aluminium fins, copper tubes with silver alloy solder joints, and an insulated condensate drain pan sloped to a drain connection for positive drainage.
- .3 Factory run tested, weatherproof condensing unit equipped with a control board to interface with indoor unit and perform all necessary operation functions. Pre-charge unit with refrigerant type noted for a minimum of 21 m (70') of refrigerant tubing. Unit is to be capable of operation at -18°C (0°F) without additional low ambient controls, and capable of a height difference between condensing unit and evaporator of 30 m (100'). Each condensing unit complete with:
 - .1 galvanized steel plate cabinet with an electrostatically applied thermally fused polyester powder finish, and an ABS plastic fan grille;
 - .2 draw-through direct driven balanced fan with horizontal air discharge, mounted in front of coil, arranged to pull air across coil, and equipped with a raised fan guard;
 - .3 "L" shaped coil with copper tubes and aluminium fins, factory pressure tested, complete with an integral metal guard and refrigerant flow controlled by a linear expansion valve metering orifice controlled by a microprocessor controlled step motor;
 - .4 vibration isolated DC rotary compressor driven by an inverter circuit to dynamically control compressor speed to match room load, complete with an accumulator, high pressure safety switch, and circuitry to permit a minimal amount of current to be applied to motor to maintain enough heat during off cycle to prevent liquid from accumulating.
- .4 System controls consisting of a microprocessor in each indoor and outdoor unit, and an indoor wall mounted controller site connected to indoor evaporator unit. System is to be capable of automatic restart after power interruption, and have self-diagnostics ability and indication of total compressor run time, and following:

- .1 Indoor unit microprocessor is capable of monitoring return air temperature and evaporator coil temperature, receiving and processing commands from wall mounted controller, providing emergency operation, and controlling outdoor unit through its microprocessor and interface board;
- .2 controller is complete with an integral temperature sensor, able to perform input and output functions necessary to operate system, and equipped with following:
 - .1 liquid crystal display to indicate diagnostic codes for both indoor and outdoor units, compressor run time, a weekly timer with up to 8 pattern settings per day, set temperature, room temperature, refrigerant piping temperatures, compressor operating conditions, and linear expansion valve opening pulses, sub-cooling and discharge super heat;
 - .2 On/Off button, Increase/Decrease Set Temperature buttons, a Cool/Dry/Fan mode selector, a Timer Menu button, a Timer On/Off button, Set Time buttons, a Fan Speed selector, a Vane Position selector, a Louvre Swing button, a Ventilation button, a Test Run button, and a Check Mode button.
- .5 Suitable anchoring connection hardware factory installed on equipment to suit requirements of Section entitled Seismic Control and Restraint.
- .6 Acceptable manufacturers are:
 - .1 Mitsubishi Electric Sales Canada Inc.;
 - .2 LG Electronics Canada Inc.;
 - .3 Panasonic Canada Inc.;
 - .4 Fujitsu General America Inc.;
 - .5 Daikin Industries Ltd.
 - .6 Approved equal.

PART 3 - EXECUTION

3.01 GENERAL

- .1 Provide split system air conditioning units in accordance with manufacturer's installation requirements and the requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Where specialist pipe fittings branching off to the indoor evaporator units are necessary, these branches shall be supplied by the unit Manufacturer. No other fittings are acceptable.

3.02 TESTING, DEHYDRATION, CHARGING AND START-UP OF REFRIGERANT SYSTEM

- .1 Connect outdoor condensing unit and indoor evaporator unit with refrigerant piping in accordance with piping shop drawing schematic. Provide any required additional refrigerant.
- .2 At completion of installation, pressurize system with nitrogen or refrigerant and check for leaks. Repair leaks and re-test. Dehydrate system and charge with refrigerant. Start-up system and check operation.
- .3 Carry out check using detailed check sheets provided by Equipment Manufacturer. Include completed and signed checklists in Operating and Maintenance Manuals.
- .4 If installation is completed in winter season, pump down refrigerant where applicable and repeat procedure at start of next cooling season.
- .5 Provide documentation for proper operation and maintenance of system. Provide on-site instruction period for Owner's personnel with Consultant's representative.
- .6 The pressure testing and the evacuation shall be carried out strictly according to the Manufacturer's installation instructions.
- .7 The final refrigerant charging and the commission of the system shall be carried out by the Mechanical Trades.

3.03 INSTALLATION OF SPLIT SYSTEM AIR CONDITIONING EQUIPMENT

- .1 Provide split system air conditioning equipment consisting of an exterior condensing unit and an indoor evaporator.
- .2 For condensing units mounted at grade, secure condensing unit in place, level and plumb, on vibration isolation pads on a concrete housekeeping pad.
- .3 For condensing units mounted on the roof, secure condensing unit in place, level and plumb, on vibration isolation pads on pressure treated wooden sleepers as indicated.
- .4 Provide flexible connections in all piping connections to equipment.
- .5 Mount indoor evaporator unit. Confirm exact location prior to roughing-in.
- .6 Provide all equipment with isolation valves at each piping connection.
- .7 Refrigerant pipe work shall be installed in a neat and workmanlike manner. All refrigeration pipe work shall be supported on galvanized cable tray, width to accommodate pipe work and controls cable.
- .8 Pipe work supports should be through entire length according to good practice; on horizontal pipe work, the bracketing should be over the thermal insulation to allow pipe movement due to contraction and expansion.
- .9 The vertical pipe work shall be bracketed at no more than 40" (1000 mm) centers and the horizontal at no more than 60" (1,500 mm) centers. The provision of special supports shall be incorporated in drop rods or pipe clips in pipe work supports.
- .10 Provide suitable isolation valving as required for the system configuration to enable minimized draw/refilling of refrigerant.
- .11 All refrigerant pipe work shall be insulated with Armaflex Class "O" insulation as manufactured by Armstrong Industries. The joints or headers shall be insulated with the pre-formed insulation supplied with these fittings. Insulation exposed to atmospheric conditions shall be protected with two coats of special Armstrong Adhesive and care should be taken that every part of the insulation is sealed to maintain a vapour barrier.
- .12 All installed pipe work lengths shall be accurately measured and recorded on the form provided in the removable access panel within the outdoor units and the operating and maintenance manuals. (This information is required for the accurate calculation of the refrigerant charge for the system).
- .13 Install loose control components and perform required control wiring between condensing unit and evaporator in conduit in accordance with manufacturer's control wiring schematic and wiring standards of electrical work.
- .14 Where required, provide Building Automation System (BAS) integration.
- .15 Include for 4 hours of on-site operation demonstration and training session. Training is to be a full review of all components including, but not limited to, a full operation and maintenance demonstration, with control set-up and abnormal events.

PART 1 - GENERAL

1.01 RELATED WORK

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with the requirements of Section 20 01 10 Mechanical General Requirements and all Documents referenced therein.
- .3 Comply with the requirements of Section 20 01 50 Mechanical Basic Materials and Methods.
- .4 Comply with the requirements of Section 23 23 10 Refrigerant Piping
- .5 Comply with the requirements of Section 25 10 10 BAS Control Network
 - .1 Comply with all requirements including those referenced in Article "BAS Integration with Third Party Devices"

1.02 WORK INCLUDED

- .1 Provided for complete and operational Variable Refrigerant Flow ("VRF") multi-split refrigeration systems.
- .2 Refrigeration piping arrangement shall ensure:
 - .1 Compressor and oil and liquid return to compressor under load without harm to compressor.
 - .2 Minimum pressure drops.
 - .3 Restricted refrigerant migration during inoperative cycles.
 - .4 Accessories and piping prevent excessive compressor cycling.
 - .5 Pipe routing and isolation to avoid line breakage, excessive vibration and sound transmission to conditioned space.
 - .6 Maintenance of clean and dry systems.
- .3 Provide proper operation of safety controls and automatic controls provided by Mechanical Trades.
- .4 Match outdoor and indoor units with operating controls, electronic digital controls and communication system by one manufacturer. Do not mix manufacturers of indoor and outdoor units.

1.03 QUALITY ASSURANCE

- .1 Systems shall be installed by tradesmen with certificates of proficiency as refrigeration mechanics.
- .2 Comply with applicable codes, laws and regulations. Conform to CSA-B52, Code for Mechanical Refrigeration and CSA-B131.5, Code for Refrigerant Piping.
- .3 System components shall bear CSA label and be factory tested and certified.

1.04 SHOP DRAWINGS

- .1 Provide shop Drawings in accordance with Section 20 01 10.
- .2 Shop Drawings for equipment shall include:
 - .1 Fan performance showing design operations point, r/min, power, etc.
 - .2 Dimensional data including weights, service space and clearance requirements.
 - .3 Schematic layout of refrigerant piping showing all piping components required for satisfactory operation and maintenance of the system(s), including but not limited to:
 - .1 pipe sizes,
 - .2 charging valve,
 - .3 isolating valves,

- .4 sight glasses,
- .5 strainers,
- .6 driers,
- .7 traps,
- .8 all other ancillaries necessary for the proper function of the system.
- .4 Complete installation instructions.
- .5 Electrical circuit diagrams including field-wired components and requirements for specific installation.
- .6 Electrical voltages, phase and power requirements.
- .7 Complete control wiring diagram and power requirements.
- .8 Programming instructions for inclusion in maintenance manuals.
- .3 Schematic diagram must be reviewed with and approved by air conditioning equipment supplier prior to submittal to Consultant.

PART 2 - PRODUCTS

2.01 GENERAL

- .1 System Description
 - .1 The variable capacity, heat pump heat recovery air conditioning system shall be a Mitsubishi VRF (Variable Refrigerant Flow) air source zoning system. The systems shall be the (simultaneous cooling and heating) split system heat pump with extended winter range down to -25°C
 - .2 Acceptable manufactures shall be Mitsubishi, Daikin, LG, or approved equal.
- .2 Quality Assurance
 - .1 The units shall be listed by Electrical Laboratories (ETL) and bear the ETL label.
 - .2 All wiring shall be in accordance with the National Electrical Code (N.E.C.).
 - .3 The units shall be manufactured in a facility registered to ISO 9001 and ISO14001 which is a set of standards applying to environmental protection set by the International Standard Organization (ISO).
 - .4 A full charge of R-410A for the condensing unit only shall be provided in the condensing unit.
- .3 Delivery, Storage and Handling
 - .1 Unit shall be stored and handled according to the manufacturer's recommendation.
- .4 Warranty
 - .1 The units shall be covered by the manufacturer's limited warranty for a period of one (1) year from date of installation if the systems are:
 - .1 Installed by a contractor that has successfully completed the manufacturers two (2) day service course, AND
 - .2 verified with a completed commissioning report submitted to and approved by the manufacturers Service Department, then the units shall be covered by an extended manufacturer's limited warranty for a period of ten (10) years from date of installation.
 - .2 In addition the compressor shall have a manufacturer's limited warranty for a period of ten (10) years from date of installation.
 - .3 If, during this period, any part should fail to function properly due to defects in workmanship or material, it shall be replaced or repaired at the discretion of the manufacturer.

- .4 This warranty shall not include labor.
- .5 All manufacturer technical and service manuals must be readily available for download by any local contractor should emergency service be required. Registering and sign-in requirements which may delay emergency service reference are not allowed.
- .6 The VRF system shall be installed by a contractor with extensive VRF install and service training. The mandatory contractor service and install training should be performed by the manufacturer.
- .7 The VRF system provided shall be specified and provided for "Low Ambient" operation, with the Hyper Heat package.

2.02 UNIT CABINET

- .1 The cabinet(s) shall be fabricated of hot-dip galvanized steel sheet for corrosion resistance.
- .2 The cabinet shall have the option of all field connections (refrigerant, water, line voltage and control wiring) on the top or left side of the unit.
- .3 The water-source units can be mounted side-by-side or stacked (with proper structural supports) depending on selected connection locations.
- .4 The cabinet shall have the option of drain line connections either in the front or the back.

2.03 REFRIGERANT

- .1 R410A or R-32 refrigerant shall be used.
- .2 Polyolester (POE) oil shall be required. Prior to bidding, manufacturers using alternate oil types shall submit material safety data sheets (MSDS) and comparison of hygroscopic properties for alternate oil with list of local suppliers stocking alternate oil for approval at least two weeks prior to bidding.

2.04 ELECTRICAL

- .1 The outdoor unit electrical power shall be 208 volts, 3-phase, 60 hertz.
- .2 The outdoor unit shall be capable of satisfactory operation within voltage limits of 187-253 volts.
- .3 The outdoor unit shall be controlled by integral microprocessors.
- .4 The unit electrical power shall be 208/230 volts, 1-phase, 60 hertz.
- .5 The system shall be capable of satisfactory operation within voltage limits of 187-228 volts (208V/60Hz) or 207-253 volts (230V/60Hz).

2.05 CONTROLS

- .1 This unit shall use controls provided by VRF manufacturer to perform functions necessary to operate the system.
- .2 Indoor unit shall compensate for the higher temperature sensed by the return air sensor compared to the temperature at level of the occupant when in HEAT mode. Disabling of compensation shall be possible for individual units to accommodate instances when compensation is not required.
- .3 Control board shall include contacts for control of external heat source. External heat may be energized as second stage with 1.8°F – 9.0°F adjustable deadband from set point.
- .4 Indoor unit shall include no less than four (4) digital inputs capable of being used for customizable control strategies.
- .5 Indoor unit shall include no less than three (3) digital outputs capable of being used for customizable control strategies.
- .6 Control board shall include contacts for control of external heat source. External heat may be energized as second stage with 1.8°F – 9.0°F adjustable deadband from set point.
 - .1 Indoor unit shall include no less than four (4) digital inputs capable of being used for customizable control strategies.

- .2 Indoor unit shall include no less than three (3) digital outputs capable of being used for customizable control strategies.

2.06 NETWORK CONTROLS

- .1 Overview
 - .1 The Controls Network (CMCN) shall be capable of supporting remote controllers, centralized controllers, an integrated web based interface, graphical user workstation, and system integration to Building Management Systems via BACnet® and LonWorks®.
- .2 Electrical Characteristics
 - .1 The controls network shall operate at 30VDC. Controller power and communications shall be via a common non-polar communications bus.
- .3 Wiring:
 - .1 Control wiring shall be installed in a daisy chain configuration from indoor unit to indoor unit, to the controller (main and subs, if applicable) and to the outdoor unit. Control wiring to remote controllers shall be run from the indoor unit terminal block to the controller associated with that unit.
 - .2 Control wiring for the Smart ME remote controller shall be from the remote controller to the first associated indoor unit (TB-5) M-NET connection. The Smart ME remote controller shall be assigned an M-NET address.
 - .3 Control wiring for the Simple MA and Wireless MA remote controllers shall be from the remote controller (receiver) to the first associated indoor unit (TB-15) then to the remaining associated indoor units (TB-15) in a daisy chain configuration.
 - .4 Control wiring for centralized controllers shall be installed in a daisy chain configuration from outdoor unit to outdoor unit, to the system controllers (centralized controllers and/or integrated web based interface), to the power supply.
- .4 Wiring type:
 - .1 Wiring shall be 2-conductor (16 AWG), twisted, stranded, shielded wire as defined by the Diamond System Builder output.
 - .2 Network wiring shall be CAT-5 with RJ-45 connection.
- .5 City Multi Controls Network
 - .1 The City Muti Controls Network (CMCN) consists of remote controllers, centralized controllers, and/or integrated web based interface communicating over a high-speed communication bus.
 - .2 The Controls Network shall support operation monitoring, scheduling, occupancy, error email distribution, personal web browsers, tenant billing, online maintenance support, and integration with Building Management Systems (BMS) using either LonWorks® or BACnet® interfaces.

PART 3 - EXECUTION

3.01 GENERAL

- .1 Provide Variable Refrigerant Flow ("VRF") systems in accordance with VRF manufacturer's installation requirements and the requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Where specialist pipe fittings branching off to the indoor VRF heads are necessary, these branches shall be supplied by the unit Manufacturer. No other fittings are acceptable.

3.02 TESTING, DEHYDRATION, CHARGING AND START-UP OF REFRIGERANT SYSTEM

- .1 Connect air source heat pump and indoor VRF head with refrigerant piping in accordance with piping shop drawing schematic. Provide any required additional refrigerant.

- .2 At completion of installation, pressurize system with nitrogen or refrigerant and check for leaks. Repair leaks and re-test. Dehydrate system and charge with refrigerant. Start-up system and check operation.
- .3 Carry out check using detailed check sheets provided by Equipment Manufacturer. Include completed and signed checklists in Operating and Maintenance Manuals.
- .4 If installation is completed in winter season, pump down refrigerant where applicable and repeat procedure at start of next cooling season.
- .5 Provide documentation for proper operation and maintenance of system. Provide on-site instruction period for Owner's personnel with Consultant's representative.
- .6 The pressure testing and the evacuation shall be carried out strictly according to the Manufacturer's installation instructions.
- .7 The final refrigerant charging and the commission of the system shall be carried out by the Mechanical Trades.

3.03 INSTALLATION OF VARRIABLE REFRIGERANT FLOW (VRF) EQUIPMENT

- .1 Provide VRF equipment consisting of an exterior air source heat pump unit and an indoor VRF head.
- .2 For air source heat pump units mounted at grade, secure air source heat pump unit in place, level and plumb, on vibration isolation pads on a concrete housekeeping pad.
- .3 For air source heat pump units mounted on the roof, secure air source heat pump unit in place, level and plumb, on vibration isolation pads on pressure treated wooden sleepers as indicated.
- .4 Provide flexible connections in all piping connections to equipment.
- .5 Mount indoor VRF head. Confirm exact location prior to roughing-in.
- .6 Provide all equipment with isolation valves at each piping connection.
- .7 Refrigerant pipe work shall be installed in a neat and workmanlike manner. All refrigeration pipe work shall be supported on galvanized cable tray, width to accommodate pipe work and controls cable.
- .8 Pipe work supports should be through entire length according to good practice; on horizontal pipe work, the bracketing should be over the thermal insulation to allow pipe movement due to contraction and expansion.
- .9 The vertical pipe work shall be bracketed at no more than 40" (1000 mm) centers and the horizontal at no more than 60" (1,500 mm) centers. The provision of special supports shall be incorporated in drop rods or pipe clips in pipe work supports.
- .10 Provide suitable isolation valving as required for the system configuration to enable minimized draw/refilling of refrigerant.
- .11 All refrigerant pipe work shall be insulated with Armaflex Class "O" insulation as manufactured by Armstrong Industries. The joints or headers shall be insulated with the pre-formed insulation supplied with these fittings. Insulation exposed to atmospheric conditions shall be protected with two coats of special Armstrong Adhesive and care should be taken that every part of the insulation is sealed to maintain a vapour barrier.
- .12 All installed pipe work lengths shall be accurately measured and recorded on the form provided in the removable access panel within the outdoor units and the operating and maintenance manuals. (This information is required for the accurate calculation of the refrigerant charge for the system).
- .13 Install loose control components and perform required control wiring between air source heat pump unit and VRF head in conduit in accordance with manufacturer's control wiring schematic and wiring standards of electrical work.
- .14 Where required, provide Building Automation System (BAS) integration.

- .15 Include for 4 hours of on-site operation demonstration and training session. Training is to be a full review of all components including, but not limited to, a full operation and maintenance demonstration, with control set-up and abnormal events.

- 2.02 FACTORY WITNESS TESTING**
- 2.03 ACCEPTABLE MANUFACTURERS**

PART 3 - EXECUTION

- 3.01 GENERAL**
- 3.02 EQUIPMENT INSTALLATION REQUIREMENTS**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with the requirements of Section 20 01 10 Mechanical General Requirements
- .2 Comply with the requirements of Section 20 10 50 Basic Materials and Methods
- .3 Comply with the requirements of Section 20 05 95 Testing Adjusting and Balancing
- .4 Comply with the requirements of Section 20 08 10 Mechanical Commissioning
- .5 Comply with the requirements of Section 25 10 10 BAS Control Network
 - .1 Comply with all requirements including those referenced in Article "BAS Integration with Third Party Devices"

1.03 WORK PERFORMED BY THIS SECTION

- .1 Supply, install and commission air source heat pump chiller(s), and related ancillary equipment and Services specified.

1.04 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the installation of air source heat pump chillers and ancillary equipment.
- .2 Unit shall meet or exceed energy efficiency per ASHRAE 90.1

1.05 SUBMITTALS

- .1 Product Data: For each type of product indicated. Include rated capacities, pressure drop, performance curves with selected points indicated, furnished specialties, and accessories.
- .2 Shop Drawings: Complete set of manufacturer's prints of equipment assemblies, control panels, sections and elevations, and unit isolation. Include the following:
 - .1 Assembled unit dimensions.
 - .2 Weight and load distribution.
 - .3 Required clearances for maintenance and operation.
 - .4 Sizes and locations of piping and wiring connections.
 - .5 Wiring Diagrams: For power, signal, and control wiring. Differentiate between manufacturer installed and field installed wiring.
- .3 Submit product data indicating options and specialties, electrical requirements, and wiring diagrams and connections. Indicate accessories, valves, strainers, and thermostatic valves required for the complete system.
- .4 Submit rigging, installation, and startup procedures. Include operations and maintenance data for the chiller and all ancillaries. Include location, size, and type of field piping connections.
- .5 Submit performance data indicating energy input versus cooling load output from 100 to 25 percent of full load with constant entering condenser water temperature.
- .6 Submit compressor and product data in table form indicating impeller speed (RPM), number of bearings, type of bearings, high speed impeller shaft RPM, sound pressure level per AHRI 575-2008 (dB), number of stages, number of sets of inlet guide vanes, amount of refrigerant charge (lb), and amount of oil required (US gallons).
- .7 Operation and Maintenance Data: Each unit to include operation and maintenance manual.

1.06 REGULATORY REQUIREMENTS

- .1 Conform to AHRI Standard 550/590 code for rating and testing of water chillers.
- .2 Conform to UL 1995 for Safety for Heating and Cooling Equipment.

- .3 Conform to ANSI/ASME SECTION VIII Boiler and Pressure Vessel Code for construction and testing of centrifugal chillers as applicable.
- .4 Conform to latest revision of ANSI/ASHRAE STANDARD 15 code for construction and operation of refrigeration equipment.
- .5 Unit shall bear the AHRI Certification Label for the specific type of chiller as applicable.

1.07 DELIVERY, STORAGE, HANDLING AND EQUIPMENT ROOM REQUIREMENTS

- .1 The successful Trade Contractor shall comply with manufacturer's installation instructions for rigging, chiller loading, local transportation requirements, unloading, storage, and final setting.
- .2 The successful Trade Contractor shall protect chiller and controls from physical damage. Leave factory shipping covers in place until installation. The entire unit must be shrink wrapped with an environmentally recyclable material standard. The material shall include an imbedded desiccant to minimize/eliminate internal moisture.
- .3 The chiller shall ship with a dry nitrogen charge to eliminate potential charge loss during delivery and construction.
- .4 The refrigerant must be shipped separately from the chiller.
- .5 The refrigerant monitoring system shall be active at the job site prior to the charging of the chiller.
- .6 The chiller should ship with a full charge of oil.

1.08 WARRANTY

- .1 Standard Warranty:
 - .1 Provide a parts and labor warranty for twenty four (24) months from delivery, or twelve (12) months from equipment startup, whichever occurs first.
 - .2 The original equipment purchase shall provide a refrigerant warranty for the duration of the first twelve (12) months of operation following start-up.
 - .3 This warranty will provide for replacement parts and refrigerant, if needed, and any labour costs associated with replacement parts and refrigerant.
 - .4 If the reason for refrigerant loss is found to be a defect in material or workmanship by the Chiller Manufacturer or the successful installation Trade Contractor, restore the Chiller to the proper refrigerant charge.
- .2 Extended Warranty:
 - .1 Prior to the expiration of the Standard Warranty, the Chiller Manufacturer shall submit to the Original Equipment Owner the following options to extend the Warranty:
 - .1 Whole unit parts;
 - .2 Whole unit labor;
 - .3 Refrigerant;
 - .4 Motor/transmission/compressor parts;
 - .5 Motor/transmission/compressor labor.
 - .2 At the Owner's discretion the optional extended the warranty may be selected for a period of between two (2) and seven (7) years.

1.09 MAINTENANCE SERVICES

- .1 All inspections and service of units shall be accomplished by factory trained and authorized servicing technicians.
- .2 All labor for leak checking the chiller according to the manufacturer's IOM and documentation must be included.

- .3 In conjunction with and supporting Factory Warranty, Original Equipment Manufacturer ("OEM") shall furnish complete factory authorized service and maintenance for applied chillers for one year from the Date of Substantial Completion. All work shall be done by manufacturer's commercial warranty agent.
- .4 OEM shall provide and report quarterly, semiannual, and annual maintenance in compliance with or better than ASHRAE Standard 180-2008.
- .5 Include maintenance items as recommended in manufacturer's operating and maintenance data.
- .6 Submit copy of service call work orders and summary report to the owner, including description of work performed, operating performance status and noted exceptions.

PART 2 - PRODUCTS

2.01 AIR SOURCE HEAT PUMP CHILLERS

- .1 General
 - .1 The Equipment Vendor shall supply air source heat pump chillers as shown on the Equipment Schedules. The units shall produce the specified performance per the scheduled data in accordance with the latest revision of AHRI 550/590. The unit shall bear the AHRI certification label as applicable.
 - .2 Each module shall be assembled on an integral white painted formed sheet metal steel frame. The required number of modules shall be assembled to a bank in factory.
 - .3 Each module shall be fully charged with refrigerant and factory tested for controller functions prior to shipment.
 - .4 The chiller system must be built for single point power supply connection.
 - .5 The power distribution panel shall incorporate a circuit breaker for overload protection to each chiller module.
 - .6 Electrical supply to each module shall consist of flexible conduit.
 - .7 No electrical connection to a module shall carry the load of more than that module.
 - .8 The electrical supply connections for each module shall be factory assembled and shipped with each module for field connection into the power distribution panel.
- .2 Frame
 - .1 Frame shall be constructed of formed sheet metal externally coated with white painted finish and internally coated in black.
- .3 Cabinet
 - .1 Formed sheet metal externally coated with white painted finish and internally coated in black. The panels shall be easily removable for servicing via stainless steel fasteners and retaining clips.
- .4 Compressors
 - .1 Two hermetically sealed, scroll compressors connected in series, on each compressor with rotalock connections, oil level sight glass, suction gas-cooled motor with solid-state sensors in the windings for overload protection, and circuit breaker protection.
 - .2 Compressors shall be mounted to the heavy gauge steel frame with rubber-in-shear vibration isolators.
- .5 Evaporators
 - .1 Single circuit brazed plate heat exchangers for use as evaporator in cooling or condenser in a heat pump operation.
 - .2 The fluid connections shall use Victaulic roll grooved couplings and neoprene gasket, for service convenience and ease of installation and shall be insulated with ¾" closed cell insulation.
- .6 Isolation Valves

- .1 Manual butterfly isolation valves shall be installed on the brazed plate heat exchanger inlet and discharge to isolate the module for servicing the strainer, flow switch and evaporator while allowing the remaining modules to continue to operate.
- .7 Filters
 - .1 A 40-mesh industrial grade filter strainer shall be factory installed between the header system and brazed plate heat exchanger and condenser inlet.
 - .2 The strainer shall be serviceable by isolation valves that permit each strainer to be removed and cleaned without shutting down fluid flow or power to the entire system and allowing the remaining modules to continue to operate.
 - .3 In-line strainers that require complete system shutdown for service and isolation are not acceptable
- .8 Condenser Fan Motors
 - .1 The condenser fan motors shall be maintenance free, quiet, highly efficient Electronically Commutated Motors (ECM) with energy reduction capabilities of up to 35%.
 - .2 These variable speed fan assemblies shall vary fan motor RPM to maintain the refrigeration pressure of the heat pump modules and allow operation of the heat pump down to -20°F ambient.
- .9 Transformer Included
 - .1 A 600V/3Ø/60Hz to 460V/3Ø/60Hz or 575V/3Ø/60Hz to 208V/3Ø/60Hz transformer shall be included on each module for all ECM fans on that module.
- .10 Condenser Fan Diffuser
 - .1 Each fan contains a diffuser that shall improve the efficiency and reduce the noise of the ECM fans.
 - .2 By increasing the fan efficiency, the motor speed can be reduced thereby lowering the sound pressure.
- .11 Condenser Coil
 - .1 Aluminum fins mechanically bonded to coppers tubes with integral subcooling circuits.
 - .2 Fin spacing shall not exceed 16 fins per inch.
 - .3 The coils shall be factory tested to a minimum of 600 psig.
- .12 Liquid Piping
 - .1 The fluid piping shall be Schedule 40 steel and be insulated using closed cell pipe insulation to prevent condensation.
 - .2 The chiller shall have service valves for the independent isolation of each heat exchanger, without affecting the fluid flow to the remaining heat exchangers.
 - .3 Each heat pump shall connect to the adjacent module using Victaulic type roll grooved steel couplings and neoprene gaskets.
 - .4 Any type of module-to-module connection external to the modules is unacceptable.
- .13 Refrigerant Piping
 - .1 Refrigerant piping shall be Type K seamless copper, insulated with closed cell pipe insulation on the suction lines.
- .14 Refrigerant Accessories
 - .1 Each refrigerant circuit shall include compressor rotalock service valves, solenoid valves for compressor pumpdown, and Schrader service valves in the suction, discharge, and liquid lines, liquid line sight glass with moisture indicator and a filter dryer.
- .15 Controls
 - .1 The bank controller shall incorporate the Master microprocessor controller.

- .2 The bank controller shall communicate with the unit controllers on the bank via a local network communications protocol.
 - .3 The bank controller shall read all analog and fault port values from all unit controllers and shall pass these values to the Building Automation System via BACnet, Modbus or Lonworks protocols.
 - .4 Each unit control system shall include operational switches for each compressor; high- and low-pressure transmitters to provide indication of refrigeration pressures; high and low refrigeration pressure alarms including shutting shut down the responsible compressor(s); anti-short cycling compressor timers; connection to Building Automation System through a BACnet gateway.
- .16 Microprocessor
- .1 The microprocessor shall provide the following minimum functions and alarms: alarms:
 - .1 Adjustable fluid temperature set point
 - .2 High and low fluid temperature alarm set points
 - .3 Water inlet and outlet temperature
 - .4 Suction and discharge refrigeration pressures
 - .5 Compressor run status
 - .6 Current alarm status
 - .7 Alarm logging with minimum of previously 20 logged alarms with time and date of each occurrence
 - .8 Remote start stop input
 - .9 Dry contact for general alarm
- .17 Heat Trace Cable Installation
- .1 Heat Trace Cable shall be installed in the drain pan and from drain pan to drain by installing contractor to ensure drainage during defrost from the heat pump unit.
 - .2 Any pipe from unit drain pan to drain shall be insulated and heat traced by installing contractor.

2.02 FACTORY WITNESS TESTING

- .1 For factory witness tests, the Owner or his designated representative(s) shall be notified fourteen (14) days in advance to witness the factory performance test. The Chiller Manufacturer representative shall assume all expenses incurred by the Owner or his representative(s) (up to four [4] attendees) to witness the test.
- .2 One of each size chiller shall be factory performance tested with the proposed refrigerant under full-load conditions in an AHRI certified test facility. The manufacturer shall supply a certified test report to confirm performance as specified. Proper AHRI certification documents for the manufacturer's test loop shall be made available for inspection upon request.
- .3 The factory test instrumentation shall be per AHRI Standard 550/590, and the calibration of all instrumentation shall be traceable to the National Institute of Standards and Technology (NIST, formerly NBS).

2.03 ACCEPTABLE MANUFACTURERS

- .1 Acceptable Heat Recovery Chiller Manufacturers are:
 - .1 Trane;
 - .2 York (JCI);
 - .3 McQuay;
 - .4 Carrier;
 - .5 Multi-stack

- .6 Owner approved manufacturer.

PART 3 - EXECUTION

3.01 GENERAL

- .1 All startup, maintenance and monitoring functions shall be provided confirming that equipment has been correctly installed in position on site and passes specification checklist prior to equipment becoming operational and covered under Original Equipment Manufacturers ("OEM") warranty.
- .2 Start-up shall be done in strict accordance with manufacturer's specifications and requirements.
 - .1 Provide a complete log of all operating parameters.
 - .2 Assure actual performance matches with submittals and computerized selection programs for other than submittal conditions.
 - .3 Submit a hard copy of the service report and logs.
- .3 Provide a minimum of eight (8) hours of training, four (4) hours of training over two (2) days. Training shall be a combination of classroom and hands on instruction.
- .4 For the duration of the warranty, during operation, there shall be physical on-site inspections in three (3) month intervals; perform the following during each inspection:
 - .1 Check the general operation of the unit.
 - .2 Provide a complete log as in "Start-up" item above.
 - .3 Check operation of the control circuit.
 - .4 Check operation of the lubrication system.
 - .5 Check operation of the motor and starter.
 - .6 Analyze the record data. Compare the data to the original design conditions and make any adjustments as necessary to return Chiller to original design conditions.
 - .7 Review operating procedures with operating personnel.
 - .8 Do one oil analysis and submit the written report. Change the oil and filter as required in the published manufacturer's literature.
 - .9 Complete all recommended maintenance and tests as documented in the manufacturer's published literature.
 - .10 Provide a written report of completed work, operating log, and indicate any uncorrected deficiencies.
 - .11 At the final inspection (to be performed within 30 days of warranty expiration), assure that the chillers are functioning correctly and that all warranty items are resolved to the customer's satisfaction.

3.02 EQUIPMENT INSTALLATION REQUIREMENTS

- .1 Receive equipment to the Site of the Work. Set equipment on temporary bases to avoid contact with the ground. Protect equipment from damage.
- .2 Provide for all rigging and hoisting of chillers into place as shown on the drawings and in accordance with the Chiller manufacturer's installation instructions.
- .3 Comply with manufacturer's requirements for the installation of all equipment.
- .4 Locate equipment as shown on the drawings to provide connection arrangement and accessibility for servicing.
- .5 Provide clearances on all sides of equipment as required by the manufacturer's Installation Instructions, or the Authorities Having Jurisdiction, whichever is more stringent.
- .6 Install items of equipment with due regard to Architectural treatment, and ensure all items are level and finished in keeping with good workmanship.

- .7 Provide line size, or minimum 2" (50mm) chemical treatment flushing connections, and equipment bypass connections, in heating and cooling circuits, and where directed by chemical treatment supplier.
- .8 Provide branch take-offs from mains of chilled water and condenser water piping with shut off valves.
- .9 Install and connect remote components including thermostats, humidistats, control panels, level controllers, flow proving switches, vibration switches, and any other similar ancillary devices specified or supplied loose with the equipment. Install in serviceable locations as shown on the equipment manufacturer's installation details, and where shown on the drawings.
- .10 Field wire chiller power and control wiring.
- .11 Provide piping with isolation valve, pressure gauge, and thermometer at each evaporator supply and return piping connection, and each condenser water supply and return piping connection.
- .12 Extend refrigerant relief vent piping, as required, to terminate outdoors in accordance with CSA B52.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .2 Comply with requirements of Section 20 01 50 Basic Materials and Methods.

1.03 SCOPE OF WORK OF THIS SECTION

- .1 Provision of HVAC terminal heating and cooling devices and all related ancillaries.

1.04 SUBMITTALS

- .1 Submit shop drawings for the following Products:
 - .1 Fan coil units;
 - .2 Radiant heating ceiling panels;
 - .3 Unit heaters;
 - .4 Cabinet Unit Heaters;
 - .5 Duct mounted re-heat coils.

1.05 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division Contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 MAXIMUM SURFACE TEMPERATURE

- .1 Unless noted otherwise, equipment manufacturer shall ensure the maximum equipment surface temperature within contact zones defined in ASTM C1055 "Standard Guide for Heated System Surface Conditions that Produce Contact Burn Injuries" does not exceed 110°F (44°C).

2.02 HORIZONTAL, LOW PROFILE, DIRECT DRIVE FAN COIL UNITS

- .1 Provide horizontal low profile direct drive fan coil units where indicated on the plans and the following specifications;
- .2 General:
 - .1 Provide horizontal low profile direct drive fan coil units in accordance with the Equipment Schedules.
 - .2 Units shall be completely factory assembled, tested and shipped as one piece.
 - .3 All units shall be capable of meeting or exceeding the scheduled capacities for cooling, heating and air delivery. All unit dimensions for each model and size shall be considered maximums.
 - .4 Units shall be ETL listed in compliance with UL/ANSI Standard 1995, and be certified as complying with the latest edition of AHRI Standard 440.
- .3 Construction:
 - .1 All unit chassis shall be fabricated of heavy gauge galvanized steel panels able to meet 125 hour salt spray test per ASTM B-117. All exterior panels shall be insulated with 1/2"

- thick insulation with a maximum k value of .24 (BTU - in) / (hr - ft² - °F) and rated for a maximum air velocity of 500 f.p.m.
- .2 Insulation must meet all requirements of ASTM C1071 (including C665), UL 181 for erosion, and carry a 25/50 rating for flame spread/smoke developed per ASTM E-84, UL 723 and NFPA 90A.
- .3 All concealed units shall have a minimum 1½" duct collar on the discharge.
- .4 Plenum and exposed units shall have a minimum ¾" duct collar on the return.
- .5 All exposed units shall have exterior panels fabricated of galvanized steel.
- .6 The fan and filter bottom access panel shall be attached with quarter turn quick open fasteners to allow for easy removal and access for service.
- .7 Unit mounting shall be by hanger brackets provided at four locations.
- .8 Hanger brackets shall include rubber grommet isolators with brass eyelets for threaded rod.
- .4 Sound:
 - .1 Units shall have published sound power level data tested in accordance with AHRI Standard 350-2000 (non-ducted equipment) and AHRI Standard 260-2001 (ducted equipment).
- .5 Fan assembly:
 - .1 Unit fan shall be a dynamically balanced, forwardly curved, DWDI centrifugal type constructed of 18 gauge zinc coated galvanized steel for corrosion resistance.
 - .2 The fan assembly shall be easily removable for servicing the motor and blower at, or away from the unit.
 - .3 The entire fan assembly shall be able to come out of the unit by removing two screws and unplugging the motor.
 - .4 Plenum unit fan assemblies shall be easily serviced through an access panel provided.
 - .5 Provide Electronically Commutated (EC) Motor capable of operation with low voltage 3 speed thermostat.
 - .6 Motor shall come factory programmed and configured for 3 speed operation. Each speed shall be manually adjustable in the field.
 - .7 All manual speed adjustments shall be stored in non-volatile memory.
 - .8 Motor shall be capable of accepting a 2-10 VDC output from BAS.
 - .9 Motor bearings shall be rated for L10-40,000 hours.
- .6 Coils:
 - .1 All cooling and heating coils shall optimize rows and fins per inch to meet the specified capacity.
 - .2 Coils shall have seamless copper tubes and shall be mechanically expanded to provide an efficient, permanent bond between the tube and fin.
 - .3 Fins shall have high efficiency aluminum surface optimized for heat transfer, air pressure drop and carryover.
 - .4 All coils shall be hydrostatically tested at 450 PSIG air pressure under water, and rated for a maximum of 300 PSIG working pressure at 200°F.
 - .5 Direct expansion cooling coils shall include a fixed orifice metering device.
 - .6 All evaporator coils shall be factory sealed and charged with a minimum 5 PSIG nitrogen or refrigerated dry air.
 - .7 Steam coils shall be standard steam type suitable for temperatures above 35°F and 15 PSIG maximum working pressure.

- .7 Drain pans:
 - .1 Primary condensate drain pans shall be single wall, heavy gauge galvanized steel for corrosion resistance, and extend under the entire cooling coil.
 - .2 Drain pans shall be of one-piece construction and be positively sloped for condensate removal.
 - .3 Drain pans on concealed models shall be field reversible for right or left hand connections.
 - .4 The drain pan shall be externally insulated with a fire retardant, closed cell foam insulation.
 - .5 The insulation shall carry no more than a 25/50 Flame Spread and Smoke Developed Rating per ASTM E-84 and UL 723 and an Antimicrobial Performance Rating of 0, no observed growth, per ASTM G-21.
- .8 Filters:
 - .1 All plenum and exposed units shall be furnished with a minimum 1" nominal glass fiber MERV 10 disposable filter.
 - .2 Filters shall be tight fitting to prevent air bypass.
 - .3 Plenum unit filters shall be easily removable from the bottom of the unit without the need for tools.
- .9 Electrical:
 - .1 Units shall be furnished with 208V/1/60 single point power connection.
 - .2 Provide a hinged electrical enclosure in the bottom of the unit for access to all electrical components, terminal blocks and wiring.

2.03 HORIZONTAL DIRECT DRIVE FAN COIL UNITS

- .1 Provide horizontal concealed direct drive fan coil units where indicated on the plans and the following specifications;
- .2 General:
 - .1 Provide horizontal concealed direct drive fan coil units in accordance with the Equipment Schedules.
 - .2 Units shall be completely factory assembled, tested and shipped as one piece.
 - .3 All units shall be capable of meeting or exceeding the scheduled capacities for cooling, heating and air delivery.
 - .4 All unit dimensions for each model and size shall be considered maximums.
 - .5 Units shall be ETL listed in compliance with UL/ANSI Standard 1995, and be certified as complying with the latest edition of ARI Standard 440.
- .3 Construction:
 - .1 All unit chassis shall be fabricated of heavy gauge galvanized steel panels able to meet 125 hour salt spray test per ASTM B-117.
 - .2 All exterior panels shall be insulated with 1/2" thick fiberglass insulation with a maximum k value of .24 (BTU • in) / (hr • ft² • °F) and rated for a maximum air velocity of 5000 f.p.m.
 - .3 Insulation must meet all requirements of ASTM C1071 (including C665), UL 181 for erosion, and carry a 25/50 rating for flame spread/smoke developed per ASTM E-84, UL 723 and NFPA 90A.
- .4 Sound:
 - .1 Manufacturer shall provide AHRI 260 sound power data at any specified airflow and static pressure.
- .5 Fan assembly:

- .1 Unit fan shall be a dynamically balanced, forward curved; DWDI centrifugal type constructed of galvanized steel for corrosion resistance.
- .2 Motors shall be high efficiency, permanently lubricated sleeve bearing, with UL and CSA listed automatic reset thermal overload protection and three separate horsepower taps.
- .3 The fan assembly shall be easily removable for servicing the motor and blower at, or away from the unit.
- .4 The entire fan assembly shall be able to come out of the unit by removing four nuts per fan and unplugging the motor(s).
- .5 Plenum unit fan assemblies shall be easily serviced through the filter opening or through the bottom panel.
- .6 Provide an electronic fan speed controller as an aid in balancing the fan capacity. The speed controller shall have a turn down stop to prevent the possibility of harming the motor bearings, and incorporate electrical noise suppression to minimize noise on the incoming power lines.
- .6 Coils:
 - .1 All coils shall be ARI 410 certified and tagged with an ARI 410 label.
 - .2 All cooling and heating coils shall optimize rows, circuit count, and fin density to meet the specified capacity.
 - .3 Coils shall have seamless copper tubes and shall be mechanically expanded to provide an efficient, permanent bond between the tube and fin.
 - .4 Fins shall have high efficiency aluminum surface optimized for heat transfer, air pressure drop and carryover.
 - .5 All coils shall be hydrostatically tested at 450 PSIG air pressure under water, and rated for a maximum of 300 PSIG working pressure at 200°F.
 - .6 Direct expansion cooling coils shall include a fixed orifice distributor. All evaporator coils shall be factory sealed and charged with a minimum 5 PSIG nitrogen or refrigerated dry air.
 - .7 Steam coils shall be standard steam type suitable for temperatures above 35°F and 15 PSIG maximum working pressure.
 - .8 All coils shall be provided with a manual air vent fitting to allow for coil venting.
 - .9 Heating coils shall be furnished in the reheat or preheat position.
- .7 Drain Pans:
 - .1 Primary condensate drain pans shall be single wall; heavy gauge galvanized steel for corrosion resistance, and extend under the entire cooling coil.
 - .2 Drain pans shall be of one-piece construction and be positively sloped for condensate removal.
 - .3 Drain pan shall be removable without the use of tools.
 - .4 The drain pan shall be externally insulated with fire retardant, closed cell foam insulation. The insulation shall carry no more than a 25/50 Flame Spread and Smoke Developed Rating per ASTM E-84 and UL 723 and an Antimicrobial Performance Rating of 0, no observed growth, per ASTM G-21.
- .8 Filters:
 - .1 All plenum and exposed units shall be furnished with a minimum 1" nominal glass fiber MERV 10 disposable filter.
 - .2 Filters shall be tight fitting to prevent air bypass.
 - .3 Plenum and exposed unit filters shall be easily removable from the bottom of the unit without the need for tools.

- .9 Electrical:
 - .1 Units shall be furnished with single point power connection.
 - .2 Provide an electrical junction box with terminal strip for motor and other electrical terminations.
 - .3 The factory mounted terminal wiring strip consists of a multiple position screw terminal block to facilitate wiring terminations for the electric control valves and thermostats.

2.04 BELT DRIVE FAN COILS UNITS

- .1 Provide belt driven blower fan coil units where indicated on the plans and the following specifications;
- .2 General:
 - .1 Provide belt driven blower fan coil units in accordance with the Equipment Schedules.
 - .2 Units shall be completely factory assembled and tested and shipped as one piece except where noted.
 - .3 All units shall be capable of meeting or exceeding the scheduled capacities for cooling, heating and air delivery. All unit dimensions for each model and size shall be considered maximums.
 - .4 All units shall be of "draw-thru" design with coils, fans, motor, and drain pan completely contained within the unit cabinet.
 - .5 Electric heat to be in the blow-thru configuration.
 - .6 Units shall be cETL listed in compliance with UL/ANSI Std. 1995.
 - .7 All unit coils shall meet or exceed the scheduled cooling and heating capacity, selected and rated in accordance with AHRI 410.
- .3 Construction:
 - .1 All units shall be fabricated of minimum 18 gauge galvanized steel, able to withstand a 125 hour salt spray test per ASTM B-117. Panels shall be die-formed "multibend" construction for optimum strength and rigidity.
 - .2 All exterior panels shall be single wall insulated with 1 inch thick fiberglass insulation, rated for a maximum air velocity of 5000 f.p.m.
 - .3 Insulation must meet all requirements of ASTM C1071 (including C665), UL181 for erosion, and carry a 25/50 rating for flame spread/smoke developed per ASTM E-84, UL723 and NFPA 90A. In addition to using adhesive complying with NFPA 90A, the insulation shall incorporate a secondary mechanical fastener attached to the unit casing wall. Adhesive as the only method of fastening the insulation to the casing is not acceptable.
 - .4 All access panels shall be fully insulated and attached with standard fasteners on at least two opposite sides. No single access panel shall be larger than 30" x 36" for safety and ease of handling. No coil or drain piping or electrical connections shall pass through any access panel.
 - .5 Each unit shall be furnished with a one-piece heavy gauge G90 steel or optional IAQ stainless steel drain pan with welded corner construction. Drain pan shall be insulated with minimum 1/8" closed cell foam. All units shall be provided with 9/16" diameter hanger rod holes in the top and bottom panels for "through-bolt" type suspension installation.
 - .6 All units shall have a minimum 1" duct collar on both the discharge and return.
- .4 Fan and Motor Assembly:
 - .1 All units shall be furnished with double inlet forward curved centrifugal blowers statically and dynamically balanced for smooth operation. Blower wheels shall be mounted directly on the motor shaft. Belt driven blowers are not acceptable.

- .2 Fan motors shall be electronically commutated with thermal overload protection and a constant torque operation. RPM control shall not be acceptable. Motors shall feature permanently lubricated ball bearings and operate on three or single phase power.
- .3 All motors to be installed, factory programmed and wired to the control panel.
- .4 All motors shall be isolated, depending on motor size, via belly band or torsion flex mount to the blower housing.
- .5 All motor wiring is to be terminated in a junction box, external to the unit casing.
- .6 All motors to be operated by single-speed or multi-speed local or remote controller.
- .5 Coils:
 - .1 All unit coils shall be rated in accordance with AHRI 410.
 - .2 All coils shall be ½" (12mm) O.D. seamless copper tubes with collared aluminum fins. All tubes shall be mechanically expanded to provide an efficient bond between tube and fin. All water coils shall be provided with a manual air vent fitting to allow for coil venting. Valve core type vent fittings shall not be accepted.
 - .3 All chilled water, hot water, and direct expansion (DX) coils shall have aluminum fins and 0.016" tube wall thickness.
 - .4 All coils shall be hydrostatically tested with air under water at 450 PSIG minimum pressure and rated for a maximum of 300 PSIG working pressure at 200°F.
 - .5 All steam coils shall have 0.025" tube wall thickness.
 - .6 All steams coils shall be suitable for 15 PSIG maximum operating pressure.
- .6 Filter Rack Assembly:
 - .1 All units shall be furnished with a flat filter rack with hinged access on both sides designed to accept a 2" nominal standard sized filters.
 - .2 All units shall be provided with nominal 2" MERV 10 disposable filters factory installed. One complete set of spare throwaway filters shall be provided for each unit.
- .7 Electrical Control:
 - .1 The unit fan motor shall be completely factory wired to an external electrical enclosure. Each unit shall include fan control package with 24 volt control voltage. Each unit shall include a motor control board, motor circuit fusing, control circuit transformer and terminal strip for connection of field wiring.
 - .2 Four speed motor control shall be provided with potentiometer type adjustment. Unit to be compatible with three speed control thermostat.
 - .3 Calibrated airflow curves shall be provided near the control box to aid in testing and balancing.
 - .4 A main incoming power non-fused disconnect switch with lock-out-tag-out ready feature shall be factory furnished and wired by the unit manufacturer for single point power connection.

2.05 RADIANT HEATING CEILING PANELS

- .1 T-bar ceiling mounted linear radiant heating ceiling panels, each complete with:
 - .1 extruded aluminum with ½" (13mm) diameter copper tubing mechanically attached to the white aluminium faceplate;
 - .2 a non-hardening heat conductive paste between the copper tubing and aluminium faceplate;
 - .3 cross channel braces, centre clips and end clips as required;
 - .4 piping return bends and interconnects as required;
 - .5 panel sections as required.

2.06 UNIT HEATERS

- .1 CSA certified hot water unit heaters, each complete with:
 - .1 casing-vertical units: top and bottom heavy-gauge circular steel plates, the top plate equipped with a depression for the motor and an opening for motor cooling air, threaded hanger rod connections, the bottom plate equipped with a die-formed fan venturi and a bolt-on adjustable air deflector, both plates bolted together with a circular heating coil in between.
 - .2 casing – horizontal units: minimum 0.95 mm thick die-formed steel front and back casing halves with formed ribs and rounded corners. Both halves to be secured together top and bottom with screws, equipped with threaded hanger rod connections at the top, a formed fan venturi with bolt-on wire grid guard in the back, and a rectangular formed discharge opening with adjustable horizontal and vertical air deflectors in the front.
 - .3 casing finish: factory applied, consisting of electrostatically applied baked power epoxy on cleaned and primed casing surfaces.
 - .4 heating coil: constructed for 200 psig (1380 kPa) working pressure suitable for steam or hot water according to the application, factory leak tested, consisting of minimum 5/8" (16mm) OD, minimum 0.03" (0.71mm) wall thickness, seamless copper tubing mechanically expanded into and permanently bonded to continuous plate type aluminium fins. Equip coils with screwed steel supply and return piping connections and silver brazed tube joints.
 - .5 fan and motor: continuous duty TEFC motor direct connected to a balanced propeller type fan wheel with aluminium blades secured to a steel hub complete with local ON/OFF disconnect switch.
 - .6 two-way (modulating) control valve shipped loose for field installation.

2.07 CABINET UNIT HEATERS

- .1 CSA certified hot water cabinet unit heaters, each complete with:
 - .1 cabinet: of welded fabrication, constructed from one-piece top and sides, and one-piece partition panels and backsheet, both die-formed from single sheets of minimum 1.2 mm thick furniture grade steel and complete with minimum 825 mm space at each end for piping and wiring, stamped grilles where required, and, for surface floor and wall mounted cabinets, key lock access doors for access to valves and speed controls;
 - .2 front panel: 1.5 mm thick removable front panel with tamperproof fasteners, stamped grille where required and insulation applied to the inside face;
 - .3 cabinet finish: for all exposed surfaces, a baked enamel prime coat finish applied to cleaned metal surfaces;
 - .4 heating coil: constructed for 200 psig (1380 kPa) working pressure suitable for steam or hot water according to the application, factory leak tested, consisting of seamless copper tubing mechanically expanded into and permanently bonded to continuous plate type aluminium fins, and equipped with screwed steel supply and return piping connections and silver brazed tube joints;
 - .5 fan and motor: a removable galvanized steel fan board with centrifugal, forward curved, formed aluminium fan wheel(s) with galvanized steel housings, direct connected to a continuous duty, three-speed permanent split capacitor motor complete with local ON/OFF disconnect switch;
 - .6 duct connection collars: for cabinets where indicated, duct connection collars;
 - .7 filter: a disposable 1" (25mm) MERV 8 filter upstream of heating coil;
 - .8 two-way (modulating) control valve shipped loose for field installation.

2.08 DUCT MOUNTED REHEAT COILS

- .1 Provide duct mounted re-heat coils as noted on the Drawings and in accordance with the performance requirements indicated on the Equipment Schedules.

- .2 Provide minimum face areas shown in Coil Schedule.
- .3 AHRI rated and certified hot water reheat coils, each drainable, self-venting, factory tested and constructed as follows:
 - .1 Minimum 5/8" (16mm) OD copper tubes permanently bonded to aluminum fins (hydraulically or mechanically expanded) equipped with same end supply and return pipe connections;
 - .2 Coils shall have a minimum 10 fins per inch, fins shall be at least .0045" thick;
 - .3 0.020" tube wall thickness, with supply and return connections shall be on the same end of the coil;
 - .4 Coils shall be constructed for 200 psig (1380 kPa) working pressure suitable for steam or hot water according to the application;
 - .5 flanged galvanized steel casings arranged to prevent air bypass around the coil and factory punched for duct connection flanges or slip/drive joint collars.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- .1 Comply with Manufacturer's requirements for the installation of all specified equipment and all requirements of the Authorities Having Jurisdiction ("AHJs").
- .2 Provide all required labour necessary for the installation of control components and devices supplied by Controls Trades. Include all additional labour necessary for the successful completion of point-to-point verification of devices, and performance verification of devices and systems as part of the project commissioning requirements.
- .3 Locate equipment as shown on the drawings to provide connection arrangement and accessibility for servicing.
- .4 Provide clearances on all sides of equipment as required by the Manufacturer's Installation Instructions.
- .5 Install items of equipment with due regard to Architectural treatment, and ensure all items are level and finished in keeping with good workmanship.
- .6 Install and connect remote components such as thermostats, humidistats, control panels, level controllers, and other similar devices supplied with the equipment. Install in locations as shown on the Drawings.
- .7 Provide pipe flanges or unions at connections to all terminal HVAC devices.
- .8 Provide minimum 3/4" (20mm) drain valves with threaded cap downstream of the supply piping isolation valve, and upstream of the return piping isolation valve at all terminal HVAC devices.
- .9 Provide screwdriver or key type manual air vents at each terminal HVAC devices including fan coil unit, radiant ceiling heating panel, , unit heater, cabinet unit heater, convactor, wallfin heating element section, duct mounted re-heat coil, and CAV and VAV box re-heat coil.

3.02 FAN COIL UNITS

- .1 Position units per manufacturer's requirements. Suspend ceiling mounted units from slab above with isolation hangers. Provide flexible duct connections for ducted units.

3.03 RADIANT HEATING CEILING PANELS

- .1 Field measure wall-to-wall wall-fin enclosures and ceiling radiant panels.
- .2 Provide end panels and filler pieces for wall-fin front panels to complete a neat, workmanlike installation.
- .3 Provide gaskets at the rear of each wall-mounted hydronic terminal unit.
- .4 Install all enclosures horizontal and level.
- .5 Support units top and bottom, on wall mounted brackets.

- .6 Wallfin cabinets running wall-to-wall or column-to-column shall have each end screwed to a piece of $\frac{3}{4}$ " (20 mm) plywood formed to the cabinet cross section and securely fastened to the wall. Provide plywood. Alternatively provide factory-fabricated steel mounting brackets for the same purpose.

3.04 DUCT MOUNTED REHEAT COILS

- .1 Install re-heat coils in accordance with typical coil connection details.

3.05 TESTING

- .1 Meet testing requirements of all Authorities Having Jurisdiction. Obtain certification and certify tests not required by authorities. Perform not less than the following tests.

3.06 EQUIPMENT START-UP

- .1 Follow manufacturer's instructions and have manufacturer's representative present to certify the installation.
- .2 Check each item of equipment to ensure proper piping connections, electrical connections, pump rotation and similar, to verify proper operation.
- .3 After work is completed, adjust and put all equipment into proper working order. Adjust all valves and dampers to achieve specified performance capacities. Leave the complete job ready for regular operation, all to the satisfaction of the Consultant.

3.07 INSTALLATION OF CONTROL DEVICES AND INSTRUMENTATION

- .1 Install all control devices and instrumentation for the hydronic systems as shown on the drawings, specified in Section 25 30 10 for items supplied by the Controls Trades.

3.08 TESTING ADJUSTING AND BALANCING ("TAB")

- .1 Refer to Section 20 05 95.
- .2 Provide flow measurement ports as shown on detail drawings and piping schematics in locations as directed by the Testing Adjusting and Balancing ("TAB") specialist.
- .3 Provide balancing valves and balancing dampers where specified and as directed by the TAB specialist.
- .4 Provide any system adjustments and modifications as recommended by the TAB Trades to achieve required system performance.

CONTENTS

PART 1 - GENERAL

- 1.01 GENERAL REQUIREMENTS**
- 1.02 DESCRIPTION**
- 1.03 REFERENCES**
- 1.04 SUBMITTALS**
- 1.05 SUPERVISION**
- 1.06 WARRANTY**

PART 2 - PRODUCTS

- 2.01 RADIANT FLOOR HEATING SYSTEM**
- 2.02 GLYCOL SNOW MELTING SYSTEM**

PART 3 - EXECUTION

- 3.01 RADIANT FLOOR SYSTEM INSTALLATION**
- 3.02 GLYCOL SNOW MELTING SYSTEM INSTALLATION**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Mechanical Basic Materials and Methods.

1.02 DESCRIPTION

- .1 Furnish and install, in accordance with the recommendations of the manufacturer, "in-slab" hydronic heat distribution system(s) for radiant floor heating and glycol snow melting.

1.03 REFERENCES

- .1 ASTM F876 Standard specification for cross linked polyethylene (PEX) Tubing.
- .2 ASTM F877 Cross linked polyethylene (PEX) plastic hot and cold water distribution systems.
- .3 CAN/CSA-B137.5 Cross linked polyethylene (PEX) tubing systems for pressure applications.

1.04 SUBMITTALS

- .1 The Mechanical Trades shall confirm complete and final CAD layout drawings as per bid documents showing tubing patterns, manifold locations, appropriate cross sections, and special installation techniques.
- .2 Prepare an exact detailed layout of the components for approval after award of tender prior to construction. The layout must meet or exceed the performance noted in these bid documents.

1.05 SUPERVISION

- .1 Supervision of the system installation shall be provided by an approved installation supervisor from the manufacturer.
- .2 The supervisor will monitor the system pressure test, immediately following installation to ensure the integrity of the system.
- .3 A specification sheet shall be provided as part of the warranty, outlining the system performance characteristics.

1.06 WARRANTY

- .1 System(s) shall be covered by a ten (10) year Limited System Performance Warranty.
- .2 The warranty requires that system design, installation supervision and witnessing of the pressure test all be performed by authorized personnel.
- .3 The manifolds and fittings shall carry a five (5) year non prorated warranty against failure due to a defect in material or workmanship.
- .4 Controls and electrical components shall carry a two (2) year non-prorated warranty against failure due to defect in material or workmanship.
- .5 The tubing shall carry a twenty five (25) year non-prorated warranty against failure due to manufacturing defect or exposure to stress cracking agents.
- .6 This warranty is to include tubing embedded in concrete.
- .7 Warranty shall apply to all defects arising from defects in material manufacturing. Liability is subject to the installation being performed in a qualified manner according to General Installation Guidelines and in compliance with specific installation guidelines and in compliance with installation instructions and applicable technical standards.
- .8 A specification sheet shall be provided as part of the warranty, outlining the system performance characteristics.
- .9 Warranty shall be transferrable to subsequent Owners.

PART 2 - PRODUCTS

2.01 RADIANT FLOOR HEATING SYSTEM

- .1 Tubing:
 - .1 Tubing embedded in concrete shall be high density cross linked polyethylene tubing in accordance with ASTM F877 as certified by NSF or CSA. All tubing shall be fully cross linked to the specified standard prior to shipment from the manufacturing facility.
 - .2 All piping shall be rated at 180°F maximum working temperature and up to 100 psi working pressure in accordance with ASTM standard F876 and F877. Tubing shall have 100% thermal memory when heated to 130°C (266°F).
 - .3 The minimum bend radius for cold bending of the tubing shall not be less than five (5) times the outside diameter. Bends with a radius less than stated will require the use of a bend support by the tubing manufacturer.
 - .4 Tubing shall be provided with an oxygen diffusion barrier. Oxygen diffusion barrier shall be capable of limiting oxygen diffusion through the tube to no greater than 0.10/g/cu.m/day at 104°F water temperature.
 - .5 Steel, copper, polybutylene, polypropylene, nitrile, polyester, rayon, neoprene and rubber piping are not acceptable.
- .2 Fittings and Manifolds:
 - .1 Tubing fittings shall be manufactured of dezincification resistant brass. These fittings must be supplied by the tube manufacturer. The tube fitting consists of a barbed insert, a serrated compression ring and a nut and be capable of connecting to the manifold or tube splice.
 - .2 Manifolds shall be of cast bronze construction and shall have integral loop balancing and loop control valves. Supply and return manifolds shall be able to vent air from the system and shall be provided with support (mounting) brackets. Manifolds shall be isolated from supply and return piping with valves that are suitable for isolation and balancing.
- .3 Controls:
 - .1 The system shall be controlled by the Building Automation System (BAS). Refer to the Controls specification and operating sequences.
- .4 Radiant Floor Heating Capacity:
 - .1 The in-floor radiant heating system shall be provided in the locations shown on the drawings. The in-floor radiant heating system shall provide the heat densities noted on the drawing/ equipment schedules but should not be lower than 32 BTUH/sq.ft (101 W/sq.m) throughout the area where it is installed and shall heat the slab to a temperature no higher than 90°F (32.2°C).
- .5 Pre-Assembled Mixing Control Panels:
 - .1 For each area of snow melting/radiant floor heating, provide a pre-assembled mixing control panel.
 - .2 Each panel shall consist of a compact, pre-piped mechanical system with connections to the supply and the return manifolds, in-line circulating pump in accordance with Section 23 21 23, check valves, isolation valves, supply and return temperature gauges, pressure bypass valve and a 24V activated 3-way modulating mixing valve with discharge temperature controls.
 - .3 The pre-assembled mixing control panel shall be in a compact insulated foam box ready for field mounting with supplied brackets.
 - .4 The mixing control panel shall include integral temperature control to control the local supply fluid temperature through BAS control.
 - .5 Provide all required transformers and relays required by BAS to control pumps and control valves.
 - .6 Each panel location shall come complete with slab temperature sensor.

- .7 Sensors shall be installed in appropriate locations within the zone to allow proper of monitoring of slab conditions.
- .8 Sensor shall be installed such that they can be replaced through non-destructive means if a sensor failure should occur.
- .9 Sensor termination points shall be within pre-assembled mixing control panels.
- .6 Acceptable Manufacturers:
 - .1 Uponor,
 - .2 Rehau,
 - .3 Or approved equal.

2.02 GLYCOL SNOW MELTING SYSTEM

- .1 Tubing:
 - .1 Tubing embedded in concrete shall be high density cross linked polyethylene tubing in accordance with ASTM F877 as certified by NSF or CSA. All tubing shall be fully cross linked to the specified standard prior to shipment from the manufacturing facility.
 - .2 All piping shall be rated at 180°F maximum working temperature and up to 100 psi working pressure in accordance with ASTM standard F876 and F877. Tubing shall have 100% thermal memory when heated to 130°C (266°F).
 - .3 The minimum bend radius for cold bending of the tubing shall not be less than five (5) times the outside diameter. Bends with a radius less than stated will require the use of a bend support by the tubing manufacturer.
 - .4 Tubing shall be provided with an oxygen diffusion barrier. Oxygen diffusion barrier shall be capable of limiting oxygen diffusion through the tube to no greater than 0.10/g/cu.m/day at 104°F water temperature.
 - .5 Steel, copper, polybutylene, polypropylene, nitrile, polyester, rayon, neoprene and rubber piping are not acceptable.
- .2 Fittings and Manifolds:
 - .1 Tubing fittings shall be manufactured of dezincification resistant brass. These fittings must be supplied by the tube manufacturer. The tube fitting consists of a barbed insert, a serrated compression ring and a nut and be capable of connecting to the manifold or tube splice.
 - .2 Manifolds shall be of cast bronze construction and shall have integral loop balancing and loop control valves. Supply and return manifolds shall be able to vent air from the system and shall be provided with support (mounting) brackets. Manifolds shall be isolated from supply and return piping with valves that are suitable for isolation and balancing.
- .3 Controls:
 - .1 The system shall be controlled by the Building Automation System (BAS). Refer to the Controls specification and operating sequences.
- .4 Snow Melting Capacity:
 - .1 The snow melting system shall be provided in the locations shown on the drawings. The snow melting systems shall provide the heat densities noted on the drawing/ equipment schedules but should not be lower than 205 BTUH/sq.ft (646 W/sq.m) throughout the area where it is installed and shall heat the slab to a temperature no higher than 39°F (4°C).
- .5 Pre-Assembled Mixing Control Panels:
 - .1 For each area of snow melting/radiant floor heating, provide a pre-assembled mixing control panel.
 - .2 Each panel shall consist of a compact, pre-piped mechanical system with connections to the supply and the return manifolds, in-line circulating pump in accordance with Section 23 21 23, check valves, isolation valves, supply and return temperature gauges, pressure

- bypass valve and a 24V activated 3-way modulating mixing valve with discharge temperature controls.
- .3 The pre-assembled mixing control panel shall be in a compact insulated foam box ready for field mounting with supplied brackets.
- .4 The mixing control panel shall include integral temperature control to control the local supply fluid temperature through BAS control.
- .5 Provide all required transformers and relays required by BAS to control pumps and control valves.
- .6 Each panel location shall come complete with slab temperature sensor; and for snow melting systems, temperature sensors and snow sensors.
- .7 Sensors shall be installed in appropriate locations within the zone to allow proper of monitoring of slab conditions.
- .8 Sensor shall be installed such that they can be replaced through non-destructive means if a sensor failure should occur.
- .9 Sensor termination points shall be within pre-assembled mixing control panels.
- .6 Acceptable Manufacturers:
 - .1 Uponor,
 - .2 Rehau,
 - .3 Or approved equal.

PART 3 - EXECUTION

3.01 RADIANT FLOOR SYSTEM INSTALLATION

- .1 Tubing shall be embedded in concrete and shall be secured to a welded wire fabric or approved alternate fabric with wire ties provided by the pipe manufacturer.
- .2 Spacing of wire ties shall be a maximum of 900mm for straight lengths of tubing and a minimum of three (3) ties per 180° turn.
- .3 Contractor to supply field coordination and supervision of the water pressure testing of the field tubing.
- .4 Provide compressed air, inert gas or 80 psi water source for pressure testing.
- .5 Manufacturer's Representative shall be on site during all concrete pours. The system shall be pressure tested at 80psi for minimum of six (6) hours prior to and during the concrete application.
- .6 Test equipment to be supplied by and installed by the contractor. Pressure test using compressed air or inert gas is not acceptable.
- .7 Repair kits shall be on-site during the pour to allow for immediate repair of leaks should they occur during the concrete application period
- .8 In the event of freezing weather, the contractor shall install a glycol solution to the prescribed percentage to prevent any possibility of freezing the tubing system.
- .9 The system shall be thoroughly checked for possible tubing punctures by the authorized supervisor and shall be repaired by the contractor prior to and during the concrete application.
- .10 At all expansion joint penetrations provide sleeves for tubing.
- .11 Where tubing is light/UV sensitive, do not expose tubing to ultraviolet light for extended periods of time either in storage or during construction. Tubing exposure shall be under total exposure period stipulated by the manufacturer.
- .12 Tubing shall be installed by an installer that has been trained by the radiant heating supplier.
- .13 Provide start-up assistance to balance flow in the circuits and confirm proper control sequence. Submit start-up report to the Engineer.

- .14 Coordinate the timing of related activities.
- .15 The sequence should be: installation of rebar/wire mesh, field looping, tying tubes to rebar/wire mesh and pour of concrete.

3.02 GLYCOL SNOW MELTING SYSTEM INSTALLATION

- .1 Tubing shall be embedded in concrete and shall be secured to a welded wire fabric or approved alternate fabric with wire ties provided by the pipe manufacturer.
- .2 Spacing of wire ties shall be a maximum of 900mm for straight lengths of tubing and a minimum of three (3) ties per 180° turn.
- .3 Contractor to supply field coordination and supervision of the water pressure testing of the field tubing.
- .4 Provide compressed air, inert gas or 80 psi water source for pressure testing.
- .5 Manufacturer's Representative shall be on site during all concrete pours. The system shall be pressure tested at 80psi for minimum of six (6) hours prior to and during the concrete application.
- .6 Test equipment to be supplied by and installed by the contractor. Pressure test using compressed air or inert gas is not acceptable.
- .7 Repair kits shall be on-site during the pour to allow for immediate repair of leaks should they occur during the concrete application period
- .8 In the event of freezing weather, the contractor shall install a glycol solution to the prescribed percentage to prevent any possibility of freezing the tubing system.
- .9 The system shall be thoroughly checked for possible tubing punctures by the authorized supervisor and shall be repaired by the contractor prior to and during the concrete application.
- .10 At all expansion joint penetrations provide sleeves for tubing.
- .11 Where tubing is light/UV sensitive, do not expose tubing to ultraviolet light for extended periods of time either in storage or during construction. Tubing exposure shall be under total exposure period stipulated by the manufacturer.
- .12 Tubing shall be installed by an installer that has been trained by the radiant heating supplier.
- .13 Provide for draining the system and/or evacuating piping using compressed air.
- .14 Charge system with 40/60% propylene glycol.
- .15 Provide start-up assistance to balance flow in the circuits and confirm proper control sequence. Submit start-up report to the Engineer.

PART 1 - GENERAL

- 1.01 GENERAL REQUIREMENTS**
- 1.02 WORK PERFORMED BY THIS SECTION**
- 1.03 QUALITY ASSURANCE**
- 1.04 REFERENCE STANDARDS**
- 1.05 SITE VISIT**

PART 2 - PRODUCTS

- 2.01 ELECTRIC STEAM HUMIDIFICATION SYSTEM**

PART 3 - EXECUTION

- 3.01 GENERAL**
- 3.02 INSTALLATION**
- 3.03 FIELD QUALITY CONTROL**

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .4 Comply with the requirements of Section 25 10 10 BAS Control Network
 - .1 Comply with all requirements including those referenced in Article "BAS Integration with Third Party Devices"

1.02 WORK PERFORMED BY THIS SECTION

- .1 Provision of Humidifiers.

1.03 QUALITY ASSURANCE

- .1 Qualifications: execute work of this section only by skilled tradesmen regularly employed in the construction and installation of Humidifiers.
- .2 Submittals: Submit shop drawings for the following Products:
 - .1 Humidifiers, as specified below, including all components and accessories

1.04 REFERENCE STANDARDS

- .1 Humidifiers shall be designed and constructed to meet the following standards:
 - .1 ISO 9001-2000.
 - .2 CSA Z317.2 (2015) - Special Requirements for Heating, Ventilation, and Air-Conditioning (HVAC) Systems in Health Care Facilities.
 - .3 ANSI/AHRI 640 (2005) – Performance Rating of Commercial and Industrial Humidifiers
 - .4 ASHRAE 90.1 (2010) - Standard for Energy Efficient Design for New Buildings.
 - .5 CGA, ETLC, CSA or UL/ULC certified for prewired equipment
 - .6 ANSI/NFPA 70 - National Electrical Code.

1.05 SITE VISIT

- .1 Visit the site prior to tender and verify all conditions. Prior to submitting price, the Mechanical Division contractor is to review all discrepancies and verify the locations of all existing services that are being extended and the routing of new services. Also report all ambiguities, discrepancies, departures from building by-laws and/or from good practice. Failure to do so will result in all additional costs being the responsibility of the Mechanical Division Contractor. Include for any alternate routing of new or rerouting of existing services to accommodate all site conditions in the tender price.

PART 2 - PRODUCTS

2.01 ELECTRIC STEAM HUMIDIFICATION SYSTEM

- .1 Provide resistive element humidifier generating mineral-free, sterile steam for use with potable, De-ionized (DI), or Reverse Osmosis (RO) water.
- .2 Packaged unit, wall mounted, atmospheric steam generation using resistive heating element. Electrode technology and boiler steam (pressure steam) technology not acceptable.
- .3 Unit(s) to be complete with:
 - .1 Touchscreen controller with standard building automation connectivity:
 - .1 Intuitive touchscreen control with color graphic user interface.

- .2 Standard building automation communication protocols BACnet IP, BACnet MSTP (Slave) and Modbus. Additional hardware required for building automation communication not acceptable.
- .3 Standard manufacturer's online connectivity for remote monitoring and factory diagnostic.
- .4 Embedded web interface for easy configuration and remote monitoring from any computer with a web browser over a local area network (LAN) connection.
- .5 USB interface for new software/feature upload and download of operational information.
- .6 Single or dual channel analog signal acceptance, supporting both demand and transducer control. Ability to control setpoint from humidifier control when using transducer controls.
- .2 Packaged system with resistive element technology:
 - .1 Incoloy based resistive heating element for steam production.
 - .2 Modulating output between 4% and 100% of rated capacity.
 - .3 Control accuracy of up to +/- 1% RH using optional Solid State Relay control and high precision humidistat.
 - .4 Dual magnetic electronic float system, located outside of the boiling water to ensure accurate water level control and reduced maintenance.
 - .5 Self-diagnostics during start-up of system to prevent unsafe operation of the unit(s):
 - .1 Fill valve check.
 - .2 Float level check.
 - .3 Drain pump check.
 - .6 Durable powder coated steel cabinet with zero side clearance requirement for minimal footprint.
 - .7 Insulating air gap between plumbing and electrical compartment for increased electronic reliability.
 - .8 Standard internal drain water tempering to ensure maximum 140°F [60°C] drain water. External drain water cooler not acceptable.
 - .9 Integral fill cup with minimum 1-inch [25 mm] air gap to prevent back siphoning.
 - .10 Automatic off-season shut-down [after 3 days of "no call"] will completely drain the boiling tank[s] and automatically restart on call for humidity.
 - .11 Integral design allowing easy installation and access for servicing.
- .4 Optional Accessories:
- .5 Acceptable Manufacturers: Condair, Dri-Steem, Pure Humidifier Co, or approved equal.

PART 3 - EXECUTION

3.01 GENERAL

- .1 Air handling units with humidifier section shall be shipped as a complete packaged system. Shop drawings shall be submitted as one complete system.
- .2 Provide a factory-trained service technician without additional charge to start and commission the humidifiers. In addition, factory shall allow for job site review of each humidifier to carry out start-up, commissioning and instruct Owner's representatives; dates will be determined by owner's representative.

3.02 INSTALLATION

- .1 Install components plumb and level, in accordance with approved shop drawings, product installation details and manufacturer's recommendations.
 - .1 Install humidifiers and components per manufacturers' instructions.
 - .2 Seal humidifier duct penetrations with flange.
 - .3 Install with required clearance for service and maintenance.
- .2 Install humidity sensor as indicated on the floor plans and/or control sequences.
- .3 Terminate water supply overflow over nearest funnel and floor drain (FFD).
- .4 For humidifiers installed in ductwork, install access doors or panels in adjacent to humidifiers for servicing.
 - .1 Provide waterproof duct up and downstream of humidifier.
 - .2 Install drain connection at low point in duct, extend drain and terminate over nearest funnel and floor drain (FFD).
- .5 For humidifiers installed in air handling units, the humidifier grid shall be installed at the air handling unit factory.
 - .1 Installation instruction shall be provided to air handling unit manufacturer for reference.

3.03 FIELD QUALITY CONTROL

- .1 Manufacturer's Field Services:
 - .1 Manufacturer's Field Services: Provide manufacturer's field services consisting of product use recommendations and periodic site visits for inspection of product installation in accordance with manufacturer's instructions.
 - .2 Schedule site visits, to review Work, at stages listed:
 - .1 After delivery and storage of products, and when preparatory Work, or other Work, on which the Work of this Section depends, is complete but before installation begins.
 - .2 Upon completion of the Work, after cleaning is carried out.
- .2 Start-up:
 - .1 General: In accordance with project General Requirements, supplemented as follows:
 - .1 Steam lines are sloped to ensure steam condensate is drained away from the humidifier.
 - .2 Vapour lines and manifolds are sloped to ensure condensate is drained away from the duct system.
 - .3 Visually check distribution manifold to ensure:
 - .1 Even distribution of vapour.
 - .2 Freedom from water deposits.
 - .2 Adiabatic humidifier reverse osmosis (RO) water treatment system shall have a BactiQuant (BQ) water field test, using an enzyme targeted analysis; testing shall be performed by a BQ Certified manufacturer's technician.
 - .1 The field test shall consist of, an enzyme activity which shall be measured by use of a highly sensitive fluorescence technology, and shall quantify the amount of microbial enzymes. The fluorescence signal shall be directly proportional to the content of bacteria.
 - .2 The BQ test shall be completed in less than 60 minutes with passed results, indicating a clean hygienic system; should test results shows BQ values higher than 57, the system must be disinfected according to manufacturer's instructions

- .3 The field test must be a verified method by the United States Environmental Protection Agency (US-EPA). No Heterotrophic plate counts, nor ATP methods for bacterial test will be accepted.
- .3 Verification Reports:
 - .1 Submit Verification Reports indicating factory-trained service technician's acceptance of the humidifier installation, operation, and Owner's training is complete.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with the requirements of Section 20 01 10 Mechanical General Requirements
- .2 Comply with the requirements of Section 20 10 50 Basic Materials and Methods
- .3 Comply with the requirements of Section 20 05 70 Motors, Motor Starters, and Wiring
- .4 Comply with the requirements of Section 20 05 95 Testing Adjusting and Balancing
- .5 Comply with the requirements of Section 20 08 10 Mechanical Commissioning
- .6 Comply with the requirements of Section 25 10 10 BAS Control Network
- .7 Comply with the requirements of Section 25 30 10 BAS Instrumentation and Devices
- .8 Comply with the requirements of Section 25 56 26 Integrated Lighting System Controls

1.03 SCOPE OF WORK

- .1 Provide all detailed design, labour, materials, products and service to supply Building Automation System (BAS) with Direct Digital Control (DDC), and Energy Management (EMS) for building mechanical and electrical systems.
- .2 The entire BAS shall be peer-to-peer networked, stand-alone, distributed control in accordance with American National Standards Institute/American Society of Heating, Refrigerating and Air Conditioning Engineers (ANSI/ASHRAE) Standard 135-2004, BACnet – A Data Communication Protocol for Building Automation and Control Networks.
- .3 Be responsible for the complete installation of the Building Automation System (BAS) for this project and guarantee its proper function.
- .4 Include software and hardware, wiring, and computing equipment. The BAS shall be compatible with future control Products for ten (10) years or more.
- .5 Power wiring for all electric motors shall be by the Mechanical Trade Contractor unless indicated otherwise by the Construction Manager.
- .6 Provide sufficient resources to complete the Work within the Agreement time. Any required overtime and similar costs to complete the project by the agreed completion date is included in the Bid price.
- .7 Mechanical Trades will provide electromagnetic starters with required number of ancillary contactors unless supplied as an integral part of the Equipment. Where integral starters are supplied with Equipment, provide all additional wiring and ancillary devices to achieve specified equipment performance and control sequences.
- .8 Electrical Trades will provide lighting fixtures to be controlled by the Integrated Lighting Systems Control specified in Section 25 56 26.
- .9 Provide instruction on the revised system's operation to the Owner's maintenance personnel; allow for eight (8) days of on site and classroom instruction.
- .10 Arrange for all the necessary inspections and approvals of built-up control systems and relay panels by the Authorities Having Jurisdiction ("AHJ's"). All electrical equipment, material and its installation shall conform to the current requirements of the AHJ's including:
 - .1 Ontario Electrical Safety Code ("OESC")
 - .2 Ontario Building Code ("OBC")
 - .3 Ontario Fire Code ("OFC")
 - .4 Canadian Standards Association ("CSA")

- .11 Generally control systems, algorithms and sequence programming shall follow requirements outlined in ASHRAE Guideline 35 - High-Performance Sequences of Operation for HVAC Systems. Any proposed deviations from the Standard shall be reviewed with the Consultant prior to implementation on site.

1.04 BAS TRADE REQUIREMENTS

- .1 The BAS Trades shall co-ordinate and take the lead role in the onsite testing, supervision of assembly and Commissioning of the installation and verification of the performance of the BAS.
- .2 The BAS Trades shall ensure that all equipment meets all design and Code requirements prior to shipment from the BAS Trades shop.
- .3 The BAS Trades shall provide specialized expertise during the installation, Start-up and Commissioning of the BAS as follows:
 - .1 On-site technical supervision of the BAS Trades during installation and assembly of the equipment as per BAS component manufacturer's instructions.
 - .2 On-site technical supervision of the BAS Trades for calibration of equipment and systems prior to commencement of any system testing.
 - .3 Review of the electrical and communication wiring.
 - .4 Technical supervision of Start-up and Commissioning of the BAS.
 - .5 Completion of all forms necessary for Acceptance of the equipment by Owner and Consultant.
 - .6 Submission of BAS shop drawings and preparation of Operating and Maintenance ("O&M") Manuals.
 - .7 Owner's training for operation and maintenance of BAS equipment and ancillary components.

1.05 GENERAL BUILDING AUTOMATION SYSTEM ("BAS") DEFINITIONS

- .1 The following terms and references appear throughout the Division 25 Specifications, and the Control Sequences issued with the Documents and provide additional background information as to the intent of the functionality of the Building Automation System (BAS).
 - .1 **Actuator:** A mechanical device that is used to operate a final control element in a control system (e.g., Control Valve, or Damper) based on an electric, electronic, or pneumatic signal from a Controller.

Actuators may attach to the valve stem or damper shaft through a linkage or be direct coupled connecting directly to the stem or shaft, and can be two separate devices or together they can be one device.

The direction of shaft rotation on loss of control signal varies for spring-return Actuators. The direction can be clockwise (CW) or counterclockwise (CCW) as viewed from the drive end of the Actuator. Actuator controlled Control Valves and Dampers also vary as to whether they open or close on a loss of control signal. This depends on the specific Actuator, linkage arrangement, and Control Valve or Damper selected.

Actuators are available with various timings to drive through full stroke such as 15, 30, 60, 120, or 240 sec. In general, the timing is selected to meet the application requirements (e.g., an Actuator with 240 sec timing might be used to control the Variable Frequency Drive (VFD) for a fan in a floating control system).
 - .1 **Electric Actuator:** Electric actuators consist of an electric motor coupled to a gear train and output shaft. Typically, the shaft drives through 90 degrees or 160 degrees of rotation depending on the application. For example, 90-degree stroke Actuators are used with Dampers, and 160-degree stroke actuators are used with Control Valves. Limit switches, in the Actuator, stop the motor at either end of the stroke, or current limiters sense when the motor is stalled at the end of the stroke. Actuator gear trains are factory lubricated for life requiring no additional lubrication.

The Electric Actuator's motor may be electrically reversible by the controller for some applications. Electric Actuators with a return spring enables the output shaft to return to the normal position on loss or interruption of power; a solenoid brake may be used on spring-return actuators to hold the Actuator in the control position.

- .2 **Air Handling Unit (AHU):** Equipment that conditions air either through filtration, heating, humidifying, cooling, de-humidifying, or any combination thereof, and delivers it to an air distribution system.
- .3 **Algorithm:** A calculation method that produces a control output by operating on an Error signal or a time series of Error signals. Also see Control Algorithms.
- .4 **Analog:** Continuously variable (e.g., the outdoor air temperature is an Analog value).
- .5 **Analog Input (AI):** continuously variable input value, usually from a Sensor, referenced to a Controller.
- .6 **Analog Output (AO):** continuously variable output value, usually a control signal sent to an Actuator, referenced to a Controller.
- .7 **Analog-to-Digital (A/D) Converter:** The part of a microprocessor based controller that changes an analog input signal to a digital value for use by the microprocessor in executing software programs. Analog input values typically come from temperature, pressure, humidity, or other types of sensors or transducers.
- .8 **Application Software:** Programs that provide functions such as direct digital control, energy management, lighting control, event initiated operations, and other alarm and monitoring routines.
- .9 **Authority (Reset Authority or Compensation Authority):** A setting that indicates the relative effect a compensation sensor input has on the main Setpoint (expressed in percent).
- .10 **Authority Having Jurisdiction (AHJ):** An organization, office, or individual responsible for enforcing the requirements of a Code or Standard, or for approving equipment, materials, an installation, or a procedure. There may be more than one AHJ.
- .11 **Automatic Control System:** A system that reacts to a change or imbalance in the Controlled Variable it controls by adjusting other variables to restore the system to the desired balance.
- .12 **Binary:** A term applied to a signal or device that has only two discrete positions or states. When used in its simplest form, as in a "binary signal" (as opposed to "analog signal"), the term denotes an "on-off" or "high-low" state, i.e., one which does not represent continuously varying quantities. A Digital signal (value of 1 or 0) is an example of a Binary signal.
- .13 **Building Automation System (BAS):** A system that controls the comfort and safety of a buildings assets and environment, and which centralizes the monitoring, operations; management of a building to achieve a more efficient operation overall.
- .14 **Building Automation and Control Network (BACnet) Protocol:** A BAS communications protocol developed by the American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE).
- .15 **Building Control Unit (BCU):** A PC or other device used primarily by building operation personnel for everyday building operations. This processor can access points or data in all the lower level controllers and other BCUs on the network. The processor at this level typically incorporates colour operator terminal displays and plug-in function boards to accommodate additional operator terminals, printers, memory expansion, and communications links.
- .16 **Building Operator:** Building operations staff familiar with the operating and maintenance requirements of the building equipment and/or systems infrastructure.
- .17 **Commissioning:** The process of designing, achieving, verifying, and documenting the performance of a building, or building system(s), or other building infrastructure element to meet the operational needs of the building, and to confirm building system or element's performance capabilities align with the design documentation within the of the design and

the Owner's functional criteria. Commissioning also includes training of operating personnel. Also see Integrated System Testing (IST) requirements.

- .1 **Mechanical System Commissioning:** The process of documenting and verifying the performance of mechanical systems so that systems operate in conformity with the design intent. Refer to Specification 20 08 10 Mechanical Commissioning for additional requirements.
- .18 **Communications Protocol:** A set of conventions used to govern the format and content of data transmitted between Processors.
- .19 **Configurable Controller:** A controller with a set of selectable programs with adjustable parameters but without the ability to modify the programs.
- .20 **Contact Arrangement:** The electric switch configuration of a controller, relay, contactor, motor starter, limit switch, or other control device. Contacts which complete circuits when a relay is energized (pulled in) are called normally open (NO) or "in" contacts. Contacts which complete electric circuits when a relay is de-energized (dropped out) are called normally closed (NC) or "out" contacts. Many contact arrangements are available depending on the control device.
- .21 **Control Algorithms:**
 - .1 **Compensation Control:** A process of automatically adjusting the control Setpoint of a given Controller to compensate for changes in a second measured variable (e.g., outdoor air temperature). For example, the hot water temperature in a perimeter radiation system is normally reset upward as the outdoor air temperature decreases. Also called "Reset Control".
 - .2 **Derivative Control:** A control Algorithm that changes the output of a Controller in proportion to the rate of change of the Error.
 - .3 **Enhanced Proportional-Integral-Derivative (EPID) Control:** A control Algorithm that enhances the standard PID algorithm by allowing the designer to enter a startup output value and error ramp duration in addition to the gains and Setpoints. These additional parameters are configured so that at startup the PID output varies smoothly to the control point with negligible overshoot or undershoot.
 - .4 **Integral Control:** A method of changing the output of a controller by an amount proportional to the Error and the duration of that Error.
 - .5 **Proportional Control:** A control Algorithm or method in which the final control element moves to a position proportional to the Error.
 - .6 **Proportional-Integral (PI) Control:** A control Algorithm that combines the proportional (proportional response) and integral (reset response) control Algorithms. Reset response tends to correct the offset resulting from proportional control. Also called "proportional-plus- reset" or "two-mode" control.
 - .7 **Proportional-Integral-Derivative (PID) control:** A control algorithm that enhances the PI control algorithm by adding a component that is proportional to the rate of change (derivative) of the Error. Compensates for system dynamics and allows faster control response. Also called "three- mode" or "rate-reset" control.
- .22 **Control Modes:**
 - .1 **Modulating Control:** When an actuator is energized, it moves the damper or valve a distance proportional to the sensed change in the controlled variable. For example, a thermostat with a 10-degree throttling range moves the actuator 1/10 of the total travel for each degree change in temperature.
 - .2 **On/Off Control:** See Two-Position Control.
 - .3 **Two-Position Control:** When an actuator is energized it moves the valve or damper to one of the extreme positions either full ON or full OFF with no intermediate

- operating positions available. The valve or damper position remains unchanged until conditions at the controller have moved through the entire range of the differential.
- .4 **Floating Control:** When an actuator is energized, it moves the damper or valve until the controller is satisfied. The actuator maintains that position until the controller senses a need to adjust the output of the valve or damper.
- .23 **Control Point:** See Process Variable.
- .24 **Control Valve:** A device used to control the flow of fluids such as steam, water or aqueous glycol solution.
- .25 **Controlled Variable:** The quantity or condition of a medium measured by a Sensor and controlled by the BAS through a Controller. For example, temperature, relative humidity, pressure.
- .26 **Controller:** Controllers receive inputs from sensors. A Controller compares the input signal with the desired condition (Setpoint), determines the proper Corrective Action, and generates an output signal to operate a controlled device. A sensing device (eg. temperature, humidity, pressure sensor) inputs, at regular intervals, changes in the controlled, or process variable, to the Controller.
- .1 **Electronic Controller:** A solid-state device usually consisting of a power supply, a sensor amplification circuit, a process/comparing circuit, an output driver section, and various components that sense changes in the controlled variable and derive a control output which provides a specific control function. In general, adjustments such as setpoint and throttling range necessary for the process can be done at the controller via potentiometers and/or switches.
- .2 **Microprocessor Controller:** A microprocessor controller uses digital logic to compare input signals with the desired result and computes an output signal using
- .27 **Corrective Action:** Control action taken by the BAS resulting from a change in the Controlled Variable; initiated when the Controlled Variable deviates from Setpoint beyond the Deadband value.
- .28 **Damper:** A device used to control the flow of air in a duct or through a wall louver.
- .29 **Dashboard:** A high-level visualization tool(s) that displays a building's operating data, performance analytics and other useful information, at a Workstation, and intended to make it easy for operators to quickly visualize and prioritize their work. Information presented will allow operators to respond to changing operational parameters with a focus on building occupant comfort, energy usage, costs, Key Performance Indicators (KPIs), trends, and alarm management, and comparisons with similar buildings or building uses. Multiple dashboards may be provided for each building stakeholder or stakeholder group. Each stakeholder group must determine what information to present for each dashboard, and how it is to be presented.
- .30 **Deadband:** A range of measurement in which no corrective action is taken by the Controller. See also "Zero Energy Band".
- .31 **Demand:** the highest amount of power use (average KW over an interval) recorded for a building or service in a selected time frame.
- .32 **Detector:** See Sensor
- .33 **Deviation:** See Error.
- .34 **Digital:** A term used to describe a series of on and off, or Binary, pulses arranged to represent continuous values or discrete states. Processors operate using digital language.
- .35 **Digital-to-Analog (D/A) Converter:** The part of a microprocessor based controller that changes digital values from a software program to analog output signals for use in the control system. The analog signals are typically used to position actuators or actuate transducers and relays.

- .36 **Direct Digital Control (DDC):** A control loop in which a digital controller periodically updates a process as a function of a set of measured control variables and a given set of control algorithms.
- .37 **Digital Control:** A control loop in which a microprocessor- based controller directly controls equipment based on sensor inputs and setpoint parameters. The programmed control sequence determines the output to the equipment.
- .38 **Digital (Binary) Input (DI):** a two-state (On-Off) value, usually associated with a switch or state, referenced to a controller.
- .39 **Digital (Binary) Output (DO):** a two-state (On-Off) value, usually associated with starting or stopping equipment or generating an alarm, referenced to a controller.
- .40 **Dynamic Display Data:** Data displayed on a Workstation which periodically updates, such as temperature or ON/OFF status. The data updates automatically at a rate appropriate for the point or it may be updated manually.
- .41 **Electric Control:** A control circuit that operates on line or low voltage and uses a mechanical means, such as a temperature-sensitive bimetal or bellows, to perform control functions, such as actuating a switch or positioning a potentiometer. The controller signal usually operates or positions an electric actuator or may switch an electrical load directly or through a relay included in the circuit.
- .42 **Electronic Control:** A control circuit that operates on low voltage and uses solid-state components to amplify input signals and perform control functions, such as operating a relay or providing an output signal to position an actuator. Electronic devices are primarily used as sensors. The controller usually furnishes fixed control routines based on the logic of the solid-state components.
- .43 **Energy Management System (EMS):** The portion of the BAS that performs Energy Management System functions used for energy metering data acquisition, data storage, analysis, display and reporting of energy use.
- .44 **Error:** Deviation of the measured value of the Controlled Variable from the Setpoint. Also called Deviation or Offset.
- .45 **Ethernet:** a communications network that facilitates transmission of data between nodes across multiple networks in different contexts.
- .46 **Field Equipment Controller (FEC):** A microprocessor-based controller that controls centrally located HVAC equipment such as variable air volume (VAV) supply units, built-up air handlers, and central chiller and boiler plants. Field Equipment Controllers interface with controlled equipment directly through sensors and actuators, or indirectly through communications links with Zone Level Controllers (ZLCs). Field Equipment Controllers typically have an input/output (I/O) device capability, a library of control programs, and may control more than one mechanical system from a single controller, and may contain an integral Operating Terminal. In a BAS, these controllers provide processing of point data for higher-level processors such as Building Control Units (BCUs) and Management Level Processors (MLPs). FECs typically include energy management programs. FECs shall have local connectivity capability to a Laptop PC or Mobile User Interface.
- .47 **Final Control Element:** A device such as a Control Valve or Damper that acts to change the value of the Manipulated Variable. An Actuator positions the Final Control Element.
- .48 **Fire Alarm Control Unit or Fire Alarm Control Panel:** A system component that receives inputs from automatic and manual fire alarm devices. Fire Alarm Control Unit might also supply power to detection devices, transponders, or off-premises transmitter(s). The Fire Alarm Control Unit also operates releasing circuits or solenoids, to provide transfer of power to the notification appliances, or transfer of condition to relays or devices connected to the Fire Alarm Control Unit. A Fire Alarm Control Unit can be a local fire alarm data-gathering panel or a master control unit.

- .49 **Fire Alarm System (FAS):** Components and circuits arranged to monitor and annunciate the status of fire alarm or supervisory signal-initiating devices and to initiate the appropriate response to those signals.
- .50 **Gateway(s):** Software used to translate one application's protocol data (i.e., BACnet) to another (e.g., Modbus or LonTalk). Gateway software can be installed as a "driver" in a BAS controller (i.e., for Modbus), or provided by a separate Gateway device (i.e., for LonTalk) allowing the BAS to effectively Integrate with Third Party Devices.
- .51 **Input/ Output (I/O):** the communication signal between an information processing systems; Inputs are the signals or data received by the system and Outputs are the signals or data sent from it.
- .52 **Instrumentation:** A collection of Sensors, or their application, for the purpose of observation, measurement, control, or any combination of these.
- .53 **Integral Action:** An action in which there is a continuous linear relationship between the amount of increase (or decrease) on the output to the final control element and the deviation of the controlled variable to reduce or eliminate the deviation or offset.
- .54 **Integrate or Integration:** The process of ensuring information from Third Party Devices properly communicates with the BAS. Also see Gateway(s).
- .55 **Integrated Systems Testing (IST):** Integrated testing of fire protection and life safety systems completed in accordance with the requirements of CAN/ULC-S1001.
- .56 **Lag:** A delay in the effect of a changed condition at one point in the system, or some other condition to which it is related. Lag is also, the delay in response of the sensing element of a control due to the time required for the sensing element to sense a change in the sensed variable.
- .57 **Limit Sensor:** A device that senses a variable that may be other than the controlled variable and over rides the Main Sensor at a preset high or low limit.
- .58 **Linkage:** A device that connects an Actuator to a Damper or Control Valve. To open and close a Damper, the typical linkage consists of an actuator crank-arm, ball-joints, pushrod, and damper crank-arm. In a Control Valve application, the linkage connects the Actuator to the Control Valve and translates the rotary output of the Actuator to the linear action of the Control Valve stem.
- .59 **Load:** In a heating or cooling system, the heat transfer that the system called upon to provide. Also, the work that the system must perform.
- .60 **Local Area Network (LAN):** a communication network that transmits data between Processors, Sensors and other devices that are relatively close geographically.
- .61 **LonMark Standard:** A communications standard for control networks developed by the Echelon Corporation and the LonMark Interoperability Association.
- .62 **Loop:** A combination of two or more Instruments or control functions arranged so that signals pass from one to another for the purpose of measurement and/or control of a Process Variable.
- .63 **Main Sensor:** The primary Sensor measuring the medium to be controlled.
- .64 **Management Level Processor (MLP):** Management Level Processors (MLPs) reside at the top of the BAS system hierarchy, exercising control and management over the connected sub-systems. An MLP is typically a server with a desktop workstation used by management personnel to collect, store, and process data for reports on energy use, operating costs, and alarm activity. The MLP can access points or data in all the lower level processors and controllers. Many of the functions of the MLP may be incorporated into a Building Control Unit (BCU). MLPs shall have local connectivity capability to a Laptop PC or Mobile User Interface
- .65 **Manipulated Variable:** The quantity or condition of media or energy controlled and/or regulated by the BAS to achieve a desired change in the Controlled Variable's condition.

- .66 **Measured Variable:** A variable that is measured and may be Controlled (e.g., discharge air is measured and controlled, outdoor air is only measured).
- .67 **Microprocessor Based Control:** A control circuit that operates on low voltage and uses a microprocessor unit, digital input and output connections, A/D and D/A converters, a power supply, and software to perform logic and control functions, such as operating a Relay or providing an output signal to position an Actuator. Electronic devices are used primarily as Sensors. The Controller may also provide flexible DDC and energy management Algorithms.
- .68 **Mobile User Interface:** BAS network access for operator using Smart Phone Device or Tablet.
- .69 **Modulating:** Varying or adjusting by small increments and decrements.
- .70 **Negative Compensation:** A compensating action where a decrease in the compensation variable has the same effect as an increase in the controlled variable. For example, in a heating application as the outdoor air temperature decreases, the control point of the controlled variable increases. Also called Reverse Compensation, Winter Reset or Winter Compensation.
- .71 **Normally Closed (NC):** position of device in a de-energized state.
- .72 **Normally Open (NO):** position of device in a de-energized state.
- .73 **Occupied Zone:** The area in a room or building in which most human activity takes place, considered by ASHRAE to be between 3 and 72 inches from the floor and 2 feet from walls or fixed equipment.
- .74 **Operating Software:** The main operating system and programs that schedule and control the execution of all other programs in a microprocessor-based controller. This includes routines for input/output (I/O) scanning, A/D and D/A conversion, scheduling of application programs, and access and display of control program variables.
- .75 **Operator Workstation (OWS):** a computer terminal that used to access the BAS network. Operator Workstations are for use by a single Building Operator and are password protected.
- .76 **Peer-to-peer:** Control devices exist and communicate equally on same network. Devices on a LAN use peer-to-peer communication.
- .77 **Positive Compensation:** A compensating action where an increase in the compensation variable has the same effect as an increase in the controlled variable. For example, in a cooling application, as the outdoor air temperature increases, the control point of the controlled variable increases. Also called Direct Compensation, Summer Reset or Summer Compensation.
- .78 **Process Variable:** The actual value of the Controlled Variable (Setpoint plus or minus Error) received from a Sensor.
- .79 **Processor:** A communications device that receives a data from multiple Controllers and/or Sensors, performs logic and Control Algorithms with the data received, and creates an output data signal for use by multiple Controllers, and by Building Operators. All Processors shall have local connectivity capability to a Laptop PC or Mobile User Interface. Management Level Processors (MLPs), Building Control Units (BCUs), Field Equipment Controllers (FECs), and Zone Level Controllers (ZLCs) are examples of Processors.
- .80 **Proportional Band:** In a proportional controller, the control point range through which the Controlled Variable must pass to drive, or move, the final Control Element through its full operating range. Proportional Band is expressed in percent of primary Sensor span, usually expressed in a quantity of engineering units ((e.g., degrees Fahrenheit, percent relative humidity, pounds per square inch). As called Throttling Range and Modulating Range.
- .81 **Relay:** A relay uses an electric, pneumatic, or hydraulic signal to operate a Switch, allowing it to control a high-powered circuit with a low-powered signal. Relays are used to control circuits in applications where the control signal (low voltage) needs to be isolated from the circuit it controls (higher voltage). For example a motor starter.

- .82 **Remote Setpoint Adjustment:** A means for adjusting a Setpoint from a remote location, in lieu of adjusting it at the Controller itself. The means of adjustment may be manual with a panel or space mounted potentiometer, or automatic when a separate device provides a signal (voltage or resistive) to the Controller.
- .83 **Repeatability:** The closeness of agreement between the results of successive measurements of the same medium, carried out under by the same measurement procedure; with the same measuring instruments used under the same conditions; at relatively short intervals of time.
 - .1 **Non-Repeatability:** Deviation from Repeatability.
- .84 **Repeater:** Connects two communications network segments together to amplify the signals extending the length of the communication network. A Repeater provides a degree of electrical isolation and protection from electrical disturbances on the opposing side of the unit. A short or communications disruption created on one side of a Repeater will not affect the communications on the other side of the Repeater.
- .85 **Reset:** A control function that attempts to return a system or device to its normal state.
- .86 **Response Time:** The time it takes an element to respond to a change in the value of the measured variable or to produce a change in the output signal.
- .87 **Router:** Provides the electrical isolation and amplification functions of a Repeater, but also filters the transmission of data packets based on domain and sub-net addressing. This logically separates the two communication networks and filters the traffic between them. The filter function of the Router isolates data communication traffic and enhances the bandwidth utilization on the primary communications network. A Router separates the communications network into two different "channels", one on either side of the Router.
- .88 **Sensing Element:** A device or component that detects and measures the value of the Controlled Variable.
- .89 **Sensor:** A device, that includes a Sensing Element, placed in the medium to be measured or controlled. A Sensor will change the output signal in relation to a physical change in the sensed medium (e.g., temperature, humidity). Also known as a Detector.
- .90 **Setpoint:** An input variable on the Controller scale at which the Controller is set to the desired value (e.g., the desired room temperature set on a Temperature Sensor or Thermostat). The Setpoint may be manually set, or a value reset by a programmed Algorithm. The Setpoint value is expressed in the same units as the Controlled Variable.
- .91 **Step Control:** Control method in which a multiple-switch assembly sequentially switches equipment (e.g., electric heat, multiple chillers) as the controller input varies through the proportional band. Step controllers may be actuator driven, electronic, or directly activated by the sensed medium (e.g., pressure, temperature).
- .92 **Switch(es):** A device that opens or closes a circuit, allowing or preventing the flow of electricity.
 - .1 **Double Pole Double Throw (DPDT) Switch:** Two separate switches that operate simultaneously, each with a normally open and a normally closed contact and a common connection.
 - .2 **Single-Pole Single Throw (SPST) Switch:** A switch that only has one of either a normally open or a normally closed contact.
 - .3 **Single-Pole Double-Throw (SPDT) Switch:** A switch combining both normally open and normally closed switch contacts.
- .93 **Testing Adjusting and Balancing (TAB):** also see Section 20 05 95
 - .1 **Air Side:** adjusting air flow rates through air distribution system devices, such as fans and diffusers, by manually adjusting the position of dampers, splitters vanes, extractors, etc., or by using automatic control devices, such as constant air volume or variable air volume boxes.

- .2 **Hydronic Side:** adjusting water flow rates through hydronic distribution system devices, such as pumps and coils, by manually adjusting the position valves, or by using automatic control devices, such as automatic flow control valves.
- .94 **Third Party Devices:** Equipment or systems having their own integral control that are required to Integrate with the BAS. Third Party Devices shall use an open protocol to communicate relevant input and output data, or a Gateway shall be provided to ensure an equivalent data communication pathway. Examples of Third Party Devices are Variable Frequency Drives (VFDs), Chillers, Boilers, Computer Room Air Conditioning (CRAC) Units, Lighting Control Systems, Security Systems, and systems of similar complexity.
- .95 **Time Constant:** The time required for a dynamic component, such as a sensor, or a control system to reach 63.2 percent of the total response to an instantaneous (or “step”) change to its input. Typically used to judge the responsiveness of the component or system.
- .96 **Transducer:** A general term for a device that receives information in the form of one or more physical quantities from a Sensor, modifies the information and/or its form, and produces a resultant output signal.
- .97 **Transformer:** A device used to change voltage from one level to another. For control circuits this is usually line voltage to low voltage. Transformers can be used only on ac power.
- .98 **Transmitter:** A device that senses the low-level output of a Sensor or Transducer and generates a higher-level output signal for use by a Controller, Actuator or display device. A Sensor may or may not be integral with the Transmitter.
- .99 **Turndown:** Expressed as the ratio of maximum flow to minimum controllable flow. For example, in an air system with a maximum airflow of 2000 cfm and minimum controllable airflow of 400 cfm, the turndown is 5:1; for example, in a hydronic system, if the system requires a 66 usgpm maximum flow through the valve and since the minimum accurately controllable flow is 3 usgpm, the turndown is 22:1.
- .100 **Uninterruptible Power Supply (UPS):** A UPS power source is a type of continual power system that provides automated backup electric power to a load when the input power source or mains power fails. A UPS differs from a traditional emergency power supply system, or standby generator, in that a UPS will provide near-instantaneous protection from input power interruptions by switching to energy stored in battery packs, super-capacitors or flywheels.
- .101 **Variable Frequency Drive (VFD):** A specialized motor controller that varies the frequency and/or voltage of the electrical service to the motor varying the speed of the motor as part of a Control Algorithm. See Specification Section 20 05 75 Variable Frequency Drives for additional requirements.
- .102 **Variable Speed Drive (VSD):** See Variable Frequency Drive (VFD).
- .103 **Voltage:**
- .1 **Line Voltage:** A term which refers to the normal electric supply voltage. Line voltage can be used directly in some control circuits or can be connected to the primary side of a step down transformer to provide power for a low-voltage control circuit. Most line-voltage devices function at their rated voltage +10%/–15%. Line-voltage devices should be tested and listed by an appropriate approval agency.
- .2 **Low Voltage:** A term which applies to wiring or other electrical devices using 30 volts or less. Low-voltage control devices usually function on 24V ac +10%/–15%.
- .104 **Zone Level Controller (ZLC):** A microprocessor-based controller that controls distributed or unitary HVAC equipment such as VAV terminal units, fan coil units, and heat pumps. At the Zone Level, sensors and actuators interface directly with the controlled equipment. These controllers typically have relatively few connected I/O devices, standard control sequences, and are dedicated to specific applications. In a BAS, Zone Level Controllers (ZLCs) provide processing of point data for higher level processors. ZLCs shall have local connectivity capability to a Laptop PC or Mobile User Interface

- .105 **Zone (Zoning):** A defined area in a building from which a signal can be received, an area to which a signal can be sent, an area in which a form of control can be executed. The practice of dividing a building into sections, or zones, for heating and cooling comfort control, or an area protected by a life safety system. The term is used to create a relationship between monitored inputs to actuation outputs and peripherals.
- .2 **Instrumentation Definitions:** the following terms are used in addition to the General Building Automation System Definitions, and are used to describe common Input and Output signals to the BAS; however, terms may also be used to describe other control system components and functions.
 - .1 **Aquastat:** see Liquid Immersion Temperature Sensor.
 - .2 **Dewpoint Temperature Sensor:** A virtual point that measures and responds to changes in actual moisture content of the ambient air generated from an Algorithm using analog inputs from dry-bulb temperature and humidity Sensors, a Dewpoint temperature value input signal is sent to a Controller.
 - .3 **Dry-bulb Temperature Sensor:** A device that measures and responds to changes in dry-bulb temperature of the ambient air surrounding the Sensor and inputs a signal to a Controller. Also called a Thermostat.
 - .4 **Enthalpy Sensor:** A virtual point that measures and responds to changes in the energy content of the ambient air generated from an Algorithm using analog inputs from dry-bulb temperature and humidity Sensors, an Enthalpy value input signal is sent to a Controller.
 - .5 **Flow Measuring Station (FMS):** A device containing multiple static pressure sensors and multiple total pressure sensors manifolded separately for instantaneously measuring average pressures across the face of a duct.
 - .6 **Flow Meter:** A device that measures and responds to changes in the volumetric flow.
 - .1 **Flow Meter (Wet):** A device that measures and responds to changes in the volumetric flow of the liquid surrounding the Sensor and inputs a signal to a Controller.
 - .2 **Flow Meter (Dry):** A device that measures and responds to changes in the volumetric flow of the air, gas or steam surrounding the Sensor and inputs a signal to a Controller.
 - .7 **Humidity Sensor:** A device that measures and responds to changes in relative humidity of the ambient air surrounding the Sensor and inputs a signal to a Controller. Also called a Humidistat.
 - .8 **Liquid Immersion Temperature Sensor:** A device that measures and responds to changes in the temperature of the liquid surrounding the Sensor and inputs a signal to a Controller. Also called an Aquastat.
 - .9 **Liquid Level Sensor:** A device that detects the presence of, and/or measures the height of a liquid.
 - .10 **Pressure Sensor:**
 - .1 **Differential Pressure Sensor:** a device that measures the pressure difference between a gas or a fluid's condition relative to a different condition. Examples include a differential pressure measured between the supply and return chilled water piping mains serving a mechanical room, or the difference between an infectious patient hospital bedroom and the adjacent corridor.
 - .2 **Static Pressure Sensor or Tube:** A sensing device with holes perpendicular to the fluid flow stream that measures the fluid static pressure relative to the ambient surroundings.
 - .3 **Total Pressure Sensor or Tube:** A sensing device with holes facing the fluid flow stream that measures the fluid total pressure relative to the ambient surroundings.

- .4 **Velocity Pressure Sensor:** a device that measures the velocity pressure of a flowing fluid. A Velocity Pressure Sensor can also be a virtual point sensor that subtracts the Static Pressure of a flowing fluid from the Total Pressure.
- .11 **Thermostat:** see Dry-bulb Temperature Sensor.
- .12 **Wet-bulb Temperature Sensor:** A virtual point that measures and responds to changes in the moisture content of the ambient air generated from an Algorithm using analog inputs from dry-bulb temperature and humidity Sensors, a wet-bulb temperature value input signal is sent to a Controller.
- .3 **Air Side System Definitions:** the following terms are used in addition to the General Building Automation System Definitions, and used primarily for control in air conditioning, air handling, and air distribution systems, however, terms may also be used to describe other control system components and functions.
- .1 **Airflow:** The rate at which a volume of air moves through a duct. In this section, airflow is denoted Q and is measured in cubic feet per minute (cfm). Airflow is derived as follows:
$$Q = A \times V_{AVG}$$

Where:
Q = Airflow in cfm
A = Cross-sectional area of duct in square feet (sq.ft)
 V_{AVG} = Average velocity
- .2 **Constant Air Volume (CAV) Box:** The terminal device in a central supply fan system that maintains a fixed air volume delivered in the downstream ductwork regardless of varying discharge static pressure in the main upstream distribution ductwork.
- .3 **Constant Air Volume (CAV) System:** A central fan system arrangement in which air volume delivered in the duct does not vary or change.
- .4 **Dewpoint Temperature:** The temperature at which the air is fully saturated with water, or is at a 100% Relative Humidity condition. Measured virtually using an Algorithm that uses the Dry-bulb Temperature and the Relative Humidity.
- .5 **Dry-bulb Temperature:** The ambient air temperature measured by a temperature sensor that is freely exposed to the ambient air, but shielded from other heating or cooling effects.
- .6 **Duct Cross Sectional Area:** For round ducts, the duct cross-sectional area ($A = \pi \times [R^2]$), where R is the Radius (ft., or [in./12]), and the duct cross-sectional area is measured in square feet (sq.ft).
- Note: If duct dimensions are in inches (in.) and the result of the duct area is in square inches (sq.in.), divide the result by 144 sq.in/sq.ft to obtain square feet (sq.ft).
- .7 **Duct Diameter:** For round ducts, the diameter is twice the radius ($D = 2 \times R$).

For rectangular ducts, an equivalent diameter is derived from ASHRAE as follows:

$$D_{eq} = \frac{1.30 (ab)^{0.625}}{(a + b)^{0.250}}$$

Where:

D_{eq} = Equivalent Rectangular Duct Diameter (in.)

a = duct side length (in.)

b = duct opposite side length (in.)

- .8 **Electrostatic Air Cleaner:** A device that has an electrical charge to trap particles traveling in the airstream.
- .9 **Energy Recovery Ventilator (ERV):** a type of air-to-air heat exchanger combined with a ventilation system for bringing in fresh outside air, and preheated it at the same time with exhaust air. Also called a Heat Recovery Ventilator (HRV).
- .10 **Exhaust Air (EA):** Air from a space that is discharged to Outdoors and is not to re-enter the building.
- .11 **Fan Surge:** A condition that occurs when air passing over the fan blades causes a stall. A fan surge causes a fluctuation in duct static pressure and an increase noise level.
- .12 **Flow Differential:** The difference between supply and return airflows necessary to maintain a positive or a negative pressure in an area. For example, if supply airflow is 1800 cfm and return airflow is 1500 cfm, the differential (positive) is 300 cfm. The 300 cfm surplus leaves the building through exhaust fans or vents and exfiltration.
- .13 **Impact Tube:** A sensing device with a single opening that points directly into the airstream for measuring Total Pressure.
- .14 **Mixed Air (MA):** Typically a mixture of Outdoor Air (OA) and Return Air (RA) from the space.
- .15 **Outdoor Air (OA):** Unconditioned air brought in to the building from outdoors.
- .16 **Relative Humidity (RH):** The ratio of the quantity of water vapor in the air to the quantity of water vapor required for saturation at the same temperature. Measure with a Relative Humidity sensor.
- .17 **Return Air (RA):** Air entering an air handling system that has been returned from the occupied space.
- .18 **Return Air Volume (RAV) Box:** The terminal device in a central return fan system that modulates the air volume returned from a space. The RAV Box control may be arranged to maintain a constant airflow Setpoint, a varying air volume that tracks a VAV Box supply air Controller Setpoint, a Differential Pressure Setpoint, or other control Algorithm.
- .19 **Static Pressure (SP):** The pressure created by air (whether in motion or not) confined in an enclosed area such as a duct or building due to its potential energy. Static pressure is exerted perpendicularly on all interior walls of the enclosure (duct or building) with respect to a reference pressure outside the enclosure. When static pressure is above atmospheric pressure it is positive and when below atmospheric pressure it is negative.
- .20 **Supply Air (SA):** Conditioned air that has passed through a coil in an Air Handling Unit; Supply Air is typically Mixed Air that has been conditioned in an Air Handling Unit. Supply Air may also refer to air discharged from a supply duct outlet (register or diffuser) into a space. Also referred to as Discharge Air.
- .21 **Total Pressure (TP):** The algebraic sum of Velocity Pressure (VP) plus Static Pressure. Total pressure is derived:
$$TP = VP + SP$$
- .22 **Variable Air Volume (VAV) Box:** The terminal device in a central supply fan system that modulates the air volume delivered in the downstream ductwork, regardless of varying discharge static pressure in the main upstream distribution ductwork, to maintain a Setpoint.
- .23 **Variable Air Volume (VAV) System:** A central fan system in which airflow in the duct varies depending on the instantaneous load requirements of the connected VAV Boxes.
- .24 **Velocity:** The speed or rate of flow of the air stream in a duct. In this section, velocity is denoted V and is measured in feet per minute (fpm).
- .1 **Average Velocity:** The sum of the air velocities from equal area increments of a duct cross-section divided by the number of increments. Average velocity, denoted V_{AVG} , is derived:

$$V_{AVG} = \sum (V_1 + V_2 + V_3 + \dots + V_N) / N$$

Where:

N = Number of duct increments

- .2 **Peak Velocity:** The greatest air velocity occurring in an increment of a duct cross-section. Peak velocity is denoted V_{PK}
- .25 **Velocity Pressure (VP):** The pressure created by air moving at a velocity due to its kinetic energy. Velocity pressure, denoted VP, is always exerted in the direction of airflow and is always a positive value. Velocity pressure can be measured by the difference between total and static pressure. Also called Dynamic Pressure:

Velocity Pressure and Velocity are related by the equation:

$$V = \left(\sqrt{2G \times \frac{VP \text{ Dw}}{Da}} \times \frac{1 \text{ ft}}{12 \text{ in}} \right) \frac{60 \text{ sec}}{1 \text{ min}}$$

Where:

V = Velocity (ft./min)

G = Gravitational acceleration in feet per second squared (ft./sec²)

VP = Velocity pressure in inches of water gauge (in.wg.)

Dw = Density of water at a specified temperature measured in pounds per cubic foot (lb/cu.ft.)

Da = Density of the air flowing in the duct measured in pounds per cubic foot (lb/cu.ft.)

1ft./12 in. = Conversion factor to convert inches to feet

60 sec/1 min = Conversion factor to convert seconds to minutes

- .26 **Ventilation Air:** Conditioned Outdoor Air (OA) brought into the building with the primary intention that it be delivered to an occupied space.
- .27 **Wet-bulb Temperature:** The temperature at which air can no longer evaporate water, measured with a temperature sensor whose bulb is covered with a wet cloth, or virtually using an Algorithm that uses the Dry-bulb Temperature and the Relative Humidity.
- .4 **Control Damper Definitions:** the following terms are used in addition to the General Building Automation System Definitions, and Air Side System Definitions, and used primarily for control dampers used in air conditioning, air handling, and air distribution systems, however, terms may also be used to describe other control system components and functions.
- .1 **Blank-off Panel:** A sheet metal baffle or orifice placed inside the duct to reduce the duct size to the damper size.
- .2 **Damper:** A device used to regulate the flow of air in an HVAC system by modulating or two-position control.
- .3 **Opposed Blade Damper:** A damper constructed so adjacent blades rotate in the direction opposite to each other.
- .4 **Parallel Blade Damper:** A damper constructed so each blade rotates in the same direction as the blade next to it.
- .5 **Damper Leakage:** The amount of air passing through a damper with a given pressure drop and a given torque holding the damper closed.
- .6 **Damper Seals:** Construction features used to minimize the leakage through a damper.

- .7 **Damper System:** The damper plus the series resistance that relates to it (e.g., duct work, mixing boxes, diffusers, and coils).
- .8 **Drive Blade:** A damper blade that is positioned by an actuator connected by a linkage, axle, or jackshaft connected to the drive blade.
- .9 **Ideal Damper System:** A system with a linear relationship between the percent open damper position and the percent of full airflow.
- .10 **Opposed Blade Damper:** see Damper
- .11 **Parallel Blade Damper:** see Damper
- .5 **Hydronic Side System Definitions:** the following terms are used in addition to the General Building Automation System Definitions, and used primarily for control in hot water, chilled water, glycol, and potable (domestic) water systems, however, terms may also be used to describe other control system components and functions.
 - .1 **Approach:**
 - .1 **Air-cooled Condensing Unit Approach:** The difference between the liquid refrigerant temperature leaving the condenser and the entering air dry bulb temperature.
 - .2 **Heat Exchanger Approach:** The temperature difference between the entering Primary Side fluid and the leaving Secondary Side fluid.
 - .2 **Compressor:** A mechanical device for increasing a gas pressure.
 - .1 **Centrifugal Compressor:** A non-positive displacement compressor that uses centrifugal force to compress refrigerant vapors in a vapor-compression cycle chiller.
 - .2 **Positive Displacement Compressor:** A compressor that reduces the volume of a compression chamber to compress a gas; Reciprocating, Screw and Scroll Compressors are examples of Positive Displacement Compressors
 - .3 **Reciprocating Compressor:** A positive displacement compressor that uses the reciprocating motion of one or more pistons to compress a gas.
 - .4 **Screw Compressor:** A positive displacement compressor that uses the rotary motion of two meshed helical rotors to compress a gas.
 - .5 **Scroll Compressor:** A positive displacement compressor that uses the rotary motion of a spiral scroll to compress a gas.
 - .3 **Constant Speed Pumping:** A pumping system where the system pressure is maintained by a constant speed pump.
 - .4 **Differential Pressure Controller:** In a pumping network with varying demand (eg. heating of chilled water) a Differential Pressure Controller maintains a differential pressure Setpoint between the common supply and return legs of a piping network by varying the speed of the pump set.
 - .5 **Domestic Hot Water (DHW):** Potable water controlled at a constant supply temperature suitable for use in applications such as showers and hand washing stations.
 - .6 **Double Bundle Condenser:** A chiller condenser having two coils in the shell to allow the chiller to dissipate heat either to the cooling tower or to a heating load.
 - .7 **Head:** Pressure of a fluid
 - .1 **Head Pressure:** The pressure measured at the discharge of an operating pump or compressor.
 - .2 **Refrigerant Head:** The pressure difference between compressor suction and discharge pressures or the temperature difference between condensing and evaporating temperatures.
 - .3 **Static Head:** The pressure of a static fluid expressed as the height of the fluid or the height of another fluid it would support.

- .8 **Heat Exchanger:** Transfers hydronic energy from the Primary Side to a Secondary Side.
- .9 **Heat Transfer Station:** Arrangement of heat exchanger(s), pump(s) and controls for a secondary piping distribution network in a building.
- .10 **Hydrostatic Pressure:** The pressure due to the Head of a liquid column.
- .11 **Primary:** Thermal production of hydronic thermal energy such as heat pumps, chillers and boilers in a Central Plant.
- .12 **Primary Side:** Supply and return piping and pumping for hydronic medium (eg. chilled water, or heating water) from the Central Plant to remote heat transfer devices such as Heat Exchangers and AHU coils.
- .13 **Secondary:** Thermal consumption of hydronic thermal energy at remote heat transfer devices such as Heat Exchangers and AHU coils.
- .14 **Secondary Side:** Supply and return piping and pumping for hydronic heat transfer medium served from a Heat Transfer Substation to remote heat transfer devices and terminal units such as fan coil units and perimeter radiation elements.
- .15 **Variable Speed Pumping (VSP):** A pumping system where the flow/pressure is varied by changing the pump speed.
- .6 **Control Valve Definitions:** the following terms are used in addition to the General Building Automation System Definitions, and Hydronic Side System Definitions, and used primarily for control valves used in in hot water, chilled water, glycol, and potable (domestic) water systems, however, terms may also be used to describe other control system components and functions.
 - .1 **Ball Valve:** A ball valve has a precision ball between two seats within a body. Ball valves have several port sizes for a given body size and go from closed to open with a 90 degree turn of the stem. They are available in both two-way and three-way configurations. For HVAC applications, ball valve construction includes brass and cast iron bodies; stainless steel, chrome plated brass, and cast iron balls; resilient seats with larger port area for a given pipe size. Ball valves provide tight shut-off, while full port models have low flow resistance, and reduced port models can be selected for modulating applications.
 - .2 **Body:** The valve casting through which the controlled fluid flows.
 - .3 **Body Rating:**
 - .1 **Nominal:** The theoretical pressure rating, nominal body rating often has characteristics such as pressure-temperature ratings, wall thickness, and end connections that are determined by a society such as ANSI (American National Standards Institute). The figure below shows ANSI pressure-temperature ratings for valves. Note that the nominal body rating is not the same as the actual body rating.
 - .2 **Actual:** The correlation between safe, permissible flowing fluid pressure and flowing fluid temperature of the valve body (exclusive of the packing, disc, and other valve components). The nominal valve body rating is the permissible pressure at a specific temperature.

Example: A valve with an ANSI rating of 150 psi (ANSI Class 150) has an actual rating of 225 psi at 250°F.
 - .3 **Maximum Pressure and Temperature:** The maximum pressure and temperature limitations of fluid flow that a valve can withstand. These ratings may be due to valve packing, body, or disc material or actuator limitations. The actual valve body ratings are exclusively for the valve body and the maximum pressure and temperature ratings are for the complete valve (body and trim). Note that the maximum pressure and temperature ratings may be less than the actual valve body ratings.

Example: The body of a valve, exclusive of packing, disc, and other Trim, has a pressure and temperature rating of 125 psi at 335°F. If the valve contains a composition disc that can withstand a temperature of only 240°F, then the temperature limit of the disc becomes the maximum temperature rating for the valve.

- .4 **Butterfly Valve:** A valve with a cylindrical body, a shaft, and a rotating disc. The disc rotates 90 degrees from open to closed. The disc seats against a resilient body liner and may be manufactured for tight shut-off or made smaller for reduced operating torque but without tight close-off. For three-way applications, two butterfly valves are assembled to a pipe tee with linkage for simultaneous operation.
- .5 **Close Off Rating:** The maximum pressure drop that a valve can withstand without leakage while in the full closed position. The close-off rating is a function of actuator power to hold the valve closed against pressure drop, but structural parts such as the stem can be the limiting factor. The valve close-off rating is independent of the actual valve body rating. See Body Rating (Actual). For example, a valve with a close-off rating of 10 psi could have 40 psi upstream pressure and 30 psi downstream pressure. Note that in applications where failure of the valve to close is hazardous, the maximum upstream pressure must not exceed the valve close-off rating, regardless of the downstream pressure.
- .6 **Close Off Rating of Three-Way Valve:** The maximum pressure difference between either of the two inlet ports and the outlet port for mixing valves, or the pressure difference between the inlet port and either of the two outlet ports for diverting valves.
- .7 **Direction of Flow:** The correct flow of the controlled fluid through the valve is usually indicated on the valve body. If the fluid flow through the valve is incorrect, the disc can slam into the seat as it approaches the closed position. The result is poor control, excessive valve wear, and noisy operation. In addition, the actuator must work harder to reopen the closed valve since it must overcome the pressure exerted by the fluid on top of the disc rather than have the fluid assist in opening the valve by exerting pressure under the disc.
- .8 **Disc:** The part of the valve assembly that contacts the valve seat to close off flow of the controlled fluid. Some valve assemblies are built so the disc is replaceable. Replaceable discs are usually made of a composition material softer than metal.
- .9 **Double Seated Valve:** A valve with two seats, plugs, and discs. Double-seated valves are suitable for applications where fluid pressure is too high to permit a single-seated valve to close. The discs in a double-seated valve are arranged so that in the closed position there is minimal fluid pressure forcing the stem toward the open or closed position; the pressure on the discs is essentially balanced. For a valve of given size and port area, the double-seated valve requires less force to operate than the single-seated valve so the double-seated valve

can use a smaller actuator than a single-seated valve. Also, double-seated valves often have a large valves only. A limitation of double-seated valves is that they do not provide tight shut-off. Since both discs rigidly connect together and changes in fluid temperature can cause either the disc or the valve body to expand or contract, one disc may seat before the other and prevent the other disc from seating tightly.

- .10 **Equal Percentage:** A valve which changes flow by an equal percentage (regardless of flow rate) for similar movements in stem travel (at any point in the flow range).
- .11 **Flanged End Connections:** A valve that connects to a pipe by bolting a flange on the valve to a flange screwed onto the pipe. Flanged connections are typically used on various temperature ratings.
- .12 **Flow Coefficient (Capacity Index):** Used to state the flow capacity of a control valve for specified conditions; a control valve's flow coefficient, or C_v value, is determined based on the following formula:

$$C_v = Q \sqrt{\frac{1}{\Delta p} \cdot \frac{\rho}{\rho_w}}$$

Where:

Q = volumetric flow in US gallons per minute (usgpm).

ρ = fluid density in pounds per cubic foot (lb/cu.ft.).

ρ_w = density of water in pounds per cubic foot (lb/cu.ft.) within the temperature range of 40 to 100°F

Δp = static pressure loss across the valve in pounds per square inch (psi).

- .13 **Globe Valve:** A valve which controls flow by moving a circular disk against or away from a seat. When used in throttling control a contoured plug (throttling plug) extends from the center of circular disk through the center of the seat for precise control.
- .14 **Linear:** A valve which provides a flow-to-lift relationship that is directly proportional. It provides equal flow changes for equal lift changes, regardless of percentage of valve opening.
- .15 **Plug:** The part that varies the opening for the fluid to flow through the valve body.
- .16 **Port:** The opening in the valve seat.
- .17 **Pressure Drop:** The difference in upstream and downstream pressures of the fluid flowing through the valve.
- .18 **Pressure Drop (Critical):** The flow of a gaseous controlled fluid through the valve increases as the pressure drop increases until reaching a critical point. This is the critical pressure drop. Any increase in pressure drop beyond the critical pressure drop is dissipated as noise and cavitation rather than increasing flow. The noise and cavitation can destroy the valve and adjacent piping components.
- .19 **Quick Opening:** A valve that provides maximum possible flow as soon as the stem lifts the disc from the valve seat.
- .20 **Reduced Port Valve:** A valve with a capacity less than the maximum for the valve body. Ball, butterfly, and smaller globe valves are available with reduced ports to allow correct sizing for good control.
- .21 **Screwed End Connection:** A valve with threaded pipe connections. Valve threads are usually female, but male connections are available for special applications. Some valves have an integral union for easier installation.
- .22 **Seat:** The stationary part of the valve body that has a raised lip to contact the valve disc when closing off flow of the controlled fluid.

- .23 **Single Seated Valve:** A valve with one seat, plug, and disc. Single-seated valves are suitable for applications requiring tight shut-off. Since a single-seated valve has nothing to balance the force of the fluid pressure exerted on the plug, it requires more closing force than a double-seated valve of the same size and therefore requires more actuator force than a double-seated valve.
- .24 **Stem:** The shaft that runs through the valve bonnet and connects an actuator to the valve plug.
- .25 **Three Way Valve:** A valve with three ports. The internal design of a three-way valve classifies it as a mixing or diverting valve. Three-way valves control liquid in modulating or two-position applications and do not provide tight shut-off.
- .26 **Tight Shut Off/Close Off:** A valve condition in which no leakage of the controlled fluid occurs in the closed position. Generally, only single-seated valves provide tight shut-off. Double-seated valves typically have a one to three percent leakage in the closed position.
- .27 **Trim:** All parts of the valve that contact the controlled fluid. Trim includes the stem, packing, plug, disc, and seat; it does not include the valve body.
- .28 **Two Way Valve:** A valve with one inlet port and one outlet port. Two-way valves control water or steam in two- position or modulating applications and provide tight shut-off in both straight through and angle patterns.
- .29 **Valve Flow Characteristic:** The relationship between the stem travel of a valve, expressed in percent of travel, and the fluid flow through the valve, expressed in percent of full flow.

1.06 EQUIPMENT SUPPLIED FOR INSTALLATION BY MECHANICAL TRADES

- .1 BAS Trades shall install the following devices for equipment provided by Mechanical Trades:
 - .1 automatic control valve actuators,
 - .2 motorized damper actuators including associated damper end switches and relays.,
 - .3 liquid temperature sensors in hydronic system piping,
 - .4 liquid flow measuring devices in hydronic system piping,
 - .5 steam humidifier automatic control valve actuators,
 - .6 unit heater and cabinet unit heater line voltage thermostats
 - .7 Controllers for Variable Air Volume (VAV) Boxes, Constant Air Volume (CAV) Boxes Fan Powered (FP) Boxes, Fan Coil Units (FCU), and other terminal equipment. Arrange and pay for shipping to terminal unit manufacturer's facility for factory installation.

1.07 EQUIPMENT PROVIDED BY MECHANICAL TRADES OTHER THAN BAS TRADES

- .1 Mechanical Trades shall install the following devices supplied by the BAS Trades:
 - .1 temperature wells for controllers and sensors,
 - .2 automatic control valves,
 - .3 motorized control dampers,
 - .4 steam humidifiers and associated automatic control valves.

1.08 APPLICABLE STANDARDS

- .1 The following Standards are in addition to Codes, Standards and Regulations Specified on other Sections of the Specifications, and the requirements of the Authorities Having Jurisdiction (AHJs).
 - .1 ANSI/ASHRAE Standard 135 BACnet; A Data Communication Protocol For Building Automation And Control Network
 - .2 ANSI/CEA 709.1-D Control Network Protocol Specification
 - .3 Interfacing Standard:

- .1 Input/output devices to use ASCII (American Standard for Communication and Information Interchange) code and standard EI (Electronic Industry Association) interfaces.
- .2 CSA T530: Building Facilities, Design Guidelines for Telecommunications (same as EIA/TIA 569).
- .3 IEEE 802.3 Ethernet 10Base-T LAN.

1.09 MANUFACTURERS AND INSTALLERS

- .1 Provide BAS with DDC and Energy Management capabilities for mechanical and electrical systems by a Control Vendor that:
 - .1 specializes in design, installation, commissioning and service of open protocol BAS systems,
 - .2 has completed five (5) projects of similar size and complexity within the preceding five (5) years,
 - .3 employs certified journeymen experienced in this type of work.
- .2 Acceptable Manufacturers:
 - .1 Delta Controls
 - .2 Reliable Controls
 - .3 or Owner Approved Vendor

1.10 CONTINUITY OF STAFF AND SUBCONTRACTORS

- .1 Project Manager is to be nominated at time of shop drawing submission and is to remain involved with project, from shop drawing preparation through to Acceptance, unless request for change is submitted and approved by the Owner.
- .2 Subcontractors listed in Bid Form submission are to execute the scope of work defined unless request for change is submitted and approved by the Owner.

1.11 LEED SUPPORT REQUIREMENTS

- .1 Provide services of LEED Accredited Professional to support and provide input to Owner's LEED team, for aspects related to the design, implementation and operation of the BAS. LEED professional to implement a project management process specifically for this project.
- .2 Incorporate LEED related monitoring and verification elements, including:
 - .1 general monitoring,
 - .2 specific energy meter monitoring in accordance with the project M&V plan;
 - .3 temperature and humidity monitoring
 - .4 flow monitoring,
 - .5 air quality and CO2 monitoring
 - .6 Assist the Owner by providing input and associated supporting documentation on BAS related LEED Points, to attain the target LEED Green Building Rating, including services for:
 - .1 Optimum energy performance
 - .2 Optimize energy performance
 - .3 Water efficient landscaping and storm water management
 - .4 Thermal comfort
 - .5 Measurement and verification
 - .6 Carbon Dioxide monitoring
 - .7 HCFC and Halons monitoring
- .3 Throughout the duration of the Project, provide the following submittals;

- .1 LEED format scorecard qualifying the BAS related LEED points
- .2 credit Summary Sheet for each LEED point
- .3 written back-up documentation for each Summary Sheet
- .4 any other LEED related submittal documentation required for the LEED application submission.
- .4 Coordinate with the owner's Commissioning Authority (CxA) for commissioning requirements related to LEED certification.

1.12 THE BUILDING AUTOMATION SYSTEM ("BAS")

- .1 General:
 - .1 The BAS shall be an integrated package developed and using control components from one controls manufacturer.
 - .2 Generally, and unless specified otherwise, HVAC equipment, shall be provided as "Thermostat-Ready" meaning that the Building Automation System (BAS) shall have direct control over terminal equipment, and custom fabricated air handling units (AHUs) and other similar built-up equipment that include dampers, control valves, heating and cooling stages without the requirement of BACnet, Lonworks or other type of communication interface. Factory installed interlocks, safeties and anti-cycle timers shall be provided as required.
 - .3 Owner approved equipment that incorporate third party controls provided as part of the Original Equipment Manufacturer (OEM) package, such as those provided with Variable Frequency Drives (VFDs), chillers, heat pumps, boilers, Computer Room Air Conditioning (CRAC) units, and similarly complex equipment, shall be provided with a BACnet interface gateway for communication with the BAS.
 - .4 The BAS shall be a graphic based system with operator access by department and floor.
 - .5 The BAS shall be capable of expanding in scope and size to accommodate all of other areas and/or systems of the development not included as part of this BAS project.
 - .6 The BAS shall have internet access and capability for remote dial-out.
 - .1 The BAS shall have Dashboard flexibility for systems monitoring capability from multiple remote locations.
 - .2 The BAS shall have the ability to monitor and produce reports from remote locations.
 - .7 Internet access to the system shall be provided for individual Building Operators.
 - .8 A representative of the controls Contractor shall, for a period of one (1) month after Substantial Performance, be on site to assist and train the building maintenance staff in the operations of the various control systems.
 - .9 Provide engineering design, installation, configuration and programming, testing and commissioning of BAS controllers, instrumentation, actuators, power and communication wiring and conduit.
 - .10 Provide training of owner's operations staff.
 - .11 All temperature units for BAS and controlled equipment shall be in °C (degrees Celcius).
 - .12 The new BAS is intended to provide monitoring, control and alarms for mechanical equipment including, but not limited to, the following:
 - .1 Boilers;
 - .2 Chillers including Heat Pump Chillers;
 - .3 Central supply air handling units ("AHU") and related components including:
 - Supply air fans with integral variable frequency drives (VFDs);
 - Return air fans with integral variable frequency drives (VFDs);
 - Air flow sensors;

- Control dampers;
- Heating Coils and related control valves;
- Humidifiers and related control valves;
- Cooling Coils and related control valves;
- Duct Monitoring Stations (“DMS”);
- Integral temperature, humidity, dewpoint, enthalpy and pressure sensors associated with AHU control;
- .4 Central exhaust fan and/or ventilation fan systems including:
 - Exhaust and/or ventilation fan(s) with integral variable frequency drives (VFDs);
 - Air flow sensors;
 - Control damper(s);
 - Duct Monitoring Stations (“DMS”);
 - Integral temperature and pressure sensors associated with fan system control;
- .5 Hydronic heating and cooling systems including:
 - Pump(s) with integral variable frequency drives (VFDs);
 - Heat exchanger(s) and related control valves;
 - Integral temperature and pressure sensors associated with hydronic system control;
- .6 Plumbing service water heating, circulation and drainage pumping systems including:
 - Pump(s) with integral variable frequency drives (VFDs);
 - Heat exchanger(s) and related control valves;
 - Integral temperature and pressure sensors associated with plumbing system control;
 - Level controllers;
 - Packaged control panels.
- .7 All major fire protection equipment and systems
- .8 Fuel oil levels and system status
- .9 A Facilities Maintenance (“FM”) program for scheduled Preventative Maintenance (“PM”) work based upon run time
- .13 The BAS shall include control of the following terminal devices, equipment, and systems:
 - .1 Terminal re-heat coils;
 - .2 Terminal Fan Coil Units (FCUs) with integral ECM motors;
 - .3 Terminal VAV and/or CAV boxes;
 - .4 Terminal Fan Powered (FP) boxes;
 - .5 Unit heaters;
 - .6 Cabinet heaters;
 - .7 Perimeter wallfin radiation elements;
 - .8 Radiant heating panels;
 - .9 AV/IT Systems;
- .2 Network Architecture:

- .1 The BAS shall be a web-enabled, direct digital control (“DDC”) distributed open protocol, non-proprietary system. Acceptable open protocols are:
 - .1 BACNet/IP, BACNet MS/TP
- .2 The BAS shall integrate existing equipment in accordance with the following protocols:
 - .1 BACNet/IP for monitoring and control of Central Plant equipment such as chillers, and boilers;
 - .2 BACNet MS/TP for monitoring and control of Field Equipment Controllers (FECs) and Zone Level Controller (ZLCs) for mechanical equipment such as Air Handling Units (AHU’s), standalone terminal units, and Variable Frequency Drives (VFDs);
 - .3 BACNet MS/TP, or Modbus RTU for integration of metering devices, specialty HVAC equipment or process equipment;
 - .4 Other industrial protocols with the use of appropriate integration Gateways, for process equipment and electrical load management systems shall be allowed only following review and acceptance by the Owner.
- .3 The use of battery powered (meaning without external power) and/or wireless-communication controllers is prohibited unless agreed to by the Owner in writing.
- .4 Each Management Level Processor (MLP), Building Control Unit (BCU), and Field Equipment Controller (FEC) shall have integral battery backup power supply for a minimum of two (2) hours.
- .5 Each Building Control Unit (BCU) and Field Equipment Controller (FEC), and the overall Building Automation System (BAS) shall have 20% spare points for future use.
- .3 Equipment and System Integration:
 - .1 The BAS shall be integrated with other Third Party Systems and Devices including:
 - .1 Fire alarm (common first stage alarm, common second stage alarm and other alarms as noted in the Documents),
 - .2 Security,
 - .3 Lighting,
 - .4 AV/IT Systems,
 - .5 Electrical Power Transformation,
 - .6 Automatic Transfer Switch(es) (“ATS”),
 - .7 Emergency Generator Control,
 - .8 Fuel Oil Storage and Distribution Systems,
 - .9 Elevator Control Panel(s).
 - .2 The BAS shall be capable to integrate with other systems such that all monitoring information from the BAS is available to and usable (send and receive commands) by the Owner.
 - .3 The intent of the integration is to display information at the workstation in the same format for both the BAS and the existing stand-alone control systems, and to allow a building operator the same method of access to view information for the BAS and the existing stand-alone control system.
 - .4 Regardless of the method used, integration of the existing BAS includes at a minimum replication of the existing graphical displays including all setpoints, current values and alarm conditions.
- .4 Operator Workstation (OWS) Locations:
 - .1 Provide hierarchy password protected Operator Workstations (OWS) to access the BAS, including graphical displays, trend log information, tabular data, and alarm management in the following locations:

- .1 Main Maintenance/Facilities office;
 - .2 One additional location as directed by the Owner;
 - .3 Colour touchscreen devices with minimum 7-inch diagonal display in the existing main penthouse mechanical room; and
 - .4 By Mobile User Interface in the form of three (3) iPad mini tablets, or approved equal, shall supplied by the successful BAS Trade Contractor.
- .2 Proved high-level graphic visualization tool(s), or Dashboards, that displays a building's operating data, performance analytics and other useful information, at each Operator Workstation (OWS) as follows:
 - .1 easy for operators to quickly visualize and prioritize their work;
 - .2 Information presented to allow operators to respond to changing operational parameters with a focus on building occupant comfort, energy usage, costs, Key Performance Indicators (KPIs), trends, and alarm management, and comparisons with similar buildings or building uses;
 - .3 minimum three (3) Dashboards to be provided for each building stakeholder or stakeholder group with specific information for each dashboard to be decided by each stakeholder group.
- .5 WAN Access:
 - .1 Provide necessary interface and cabling to connect the BAS to the the Owner's WAN. Obtain the particular WAN system details from the Project Supervisor.
 - .2 The Owner shall supply the WAN IP address, Gateway and Subnet mask for the BBMD router in the network. The controls contractor will facilitate integration into the Owner's existing BAS BACNET network.
 - .3 On the network a BACnet IP device that is capable of BBMD will route information from other sites and the operator work station. In addition there shall be a CAT5 wire that is run to the Owner's IT switch with a 4' pigtail and connector.
- .6 Alarms:
 - .1 The BAS will be configured to provide for remote alarm capabilities.
 - .2 Alarms shall be capable of being routed to The Owner's IT server so that they can be sent to Operator's email addresses.
 - .3 The operator workstation shall provide audible, visual and printed means of alarm indication. The Alarm Dialog box shall always become the Top Dialog box regardless of the application(s) being run at the time (such as a word processor). A printout of all alarms shall be sent to the assigned terminal and port.
 - .4 Provide a log of alarm messages. The alarm log shall be archived to the hard drive of the operator workstation. Each entry shall include a point descriptor and address, time and date of alarm occurrence, point value at the time of alarm, time and date of point return to normal condition and time and date of alarm acknowledge.
 - .5 The BAS Trade Contractor shall work with the Owner to determine the alarms unless specified otherwise.
 - .6 Alarm messages shall be in plain English and shall be user definable on site or via remote communication.
- .7 DDC Controls for mechanical equipment and systems:
 - .1 Provide instrumentation and control devices as required to achieve full automatic control of all mechanical building services defined in the project Scope of Work.
 - .2 Sequences of operation shall be in accordance with the Mechanical Contract Documents.

- .3 Alarms and monitoring points shall provide the building operators with full knowledge of system operation including setpoint values, current measured values, equipment status, and equipment fault status.
- .4 Local adjustment of room temperature (where specified) shall be proved within a limited range (+/- 2.5°C);
- .5 CO2 monitoring shall be provided in all lobbies, open public areas, high occupant density areas, loading dock areas, and other areas specified to meet Demand Control Ventilation energy conservation strategies.
- .6 For Variable Frequency Drives (where specified), the following control functions shall be hard-wired in addition to any network integration provided:
 - .1 Remote start/stop;
 - .2 Summary alarm;
 - .3 Remote fault reset.
- .8 Instrumentation and Controlled Devices:
 - .1 The use of battery-powered (meaning without external power) and/or wireless-communication instruments, including but not limited to room temperature and humidity sensors/controllers, is prohibited except under the following conditions:
 - .1 In feature architectural finished areas such as main entrances where, due to the architectural and structural design, it is not possible to run conduit and wiring in a concealed location; or
 - .2 In other areas which are expressly approved in writing by the Owner for each instance of requested use.
 - .2 Provide the following metering which shall be monitored on the BAS:
 - .1 Air flow stations for each AHU and associated return/exhaust air fans;
 - .2 Domestic water flow meters;
 - .3 Natural gas flow meters;
 - .4 Bulk thermal energy meter;
 - .5 Thermal energy meters for secondary pumping systems for heating;
 - .6 Bulk thermal energy meters for primary chilled water system;
 - .7 Thermal energy meters for 24/7 cooling system.
- .9 BAS monitoring of equipment operating status:
 - .1 The BAS shall monitor the status of the following equipment types:
 - .1 Control valve position by end-switch or positioners for major equipment located in the Service Spaces and Service Rooms as follows:
 - AHU heating control valves;
 - AHU cooling control valves;
 - AHU humidification control valves;
 - AHU control dampers;
 - Exhaust fan control dampers;
 - Make-up air dampers;
 - Ventilation fan control dampers;
 - Relief dampers;
 - Energy Recovery Ventilator (ERV) dampers

- .2 Motorized air damper position by end-switch or positioner, as applicable to the type of damper control function. For fans with two-position dampers, the damper power shall be provided or controlled by the fan starter or VFD, and a damper proved-open end-switch shall be hard-wire interlocked to prevent the fan from operating unless the damper is proven open.
- .3 For two-position valves and dampers, provide end-switches to prove the valve or damper is open and closed.
- .4 For modulating valves and dampers, provide a feedback positioner to indicate the current position of the valve or damper.
- .5 Combination smoke and fire dampers, in both open and closed position;
- .6 Motor run status through current switches or transmitters on constant speed or two speed motors, or by VFD operating status;
- .7 Chillers and boilers by network communications status;
- .8 Air filters, by differential pressure switch or transmitter across each bank of filters (where specified).
- .2 Control valves on terminal equipment such as unit heaters, cabinet heaters, room reheat coils, or perimeter heating room control valves are not required to have position feedback.
- .10 Energy Management System ("EMS"):
 - .1 An Integrated Energy Management System to monitor, record, analyze and report on Energy Consumption from metered sources.
 - .2 Provide purpose developed, web-based database software suite of analytical and reporting tools to develop mathematical models of building system energy consuming equipment. Energy Management System software functionalities shall include:
 - .1 Database for dashboard display with dashboard editing software;
 - .2 Multi-building dashboard displays;
 - .3 Collects metered data from building system meters
 - .3 Web-based graphical displays of conventional trend-logs, Key Performance Indicators, multiple energy source consumption and cost comparison, period-to-period energy consumption comparison, graphical drill-down for data detail, web-integrated weather data and forecasting functions.
 - .4 Energy reporting including standard and custom graphic outputs, narrative fields, year-to-year comparisons, and greenhouse emission estimates.
 - .5 Graphical touchscreen displays for configuration of display information.
 - .6 MS Word, Excel or similar programs do not meet these requirements and shall not be used for analysis, display or reporting of energy performance.

1.13 CONTROLLED INDOOR ENVIRONMENTAL CONDITIONS

- .1 Unless noted otherwise, the BAS shall be arranged to maintain the following indoor environmental conditions:

	Occupied Mode				Un-occupied Mode			
	Winter		Summer		Winter		Summer	
Area	DB ¹ (°C)	RH ² (%)	DB ¹ (°C)	RH ² (%)	DB ¹ (°C)	RH ² (%)	DB ¹ (°C)	RH ² (%)
General Office	22	>30	23.5	<60	15	---	29.5	---
Corridors	22	>30	23.5	<60	15	---	29.5	---

	Occupied Mode				Un-occupied Mode			
	Winter		Summer		Winter		Summer	
Area	DB ¹ (°C)	RH ² (%)	DB ¹ (°C)	RH ² (%)	DB ¹ (°C)	RH ² (%)	DB ¹ (°C)	RH ² (%)
Lobbies	22	>30	23.5	<60	15	---	29.5	---
Toilets	22	>30	23.5	<60	15	---	29.5	---
Locker Room	22	>30	25	<60	15	---	29.5	---
Conference/ Meeting Room	22	>30	23.5	<60	15	---	29.5	---
Computer Room	22	>30	23.5	<60	22	---	23.5	---
Print Room	22	>30	23.5	<60	22	>30	23.5	<60

Emergency Power Generation Room	18	---	35 ³	---	18	---	35 ³	---
Storage Room	18	---	30	---	15	---	30	---
Bus Storage Garage	12	---	30	---	12	---	30	---
EMS Ambulance Bay	18	---	30	---	18	---	30	---
Vehicle Maintenance/ Repair	18	---	30	---	15	---	30	---

Notes:

1. Temperatures are degrees Celsius, to be maintained at +/- 1 °C.
2. Relative humidity to be maintained at +/- 5% RH. Maximum permissible humidity is 60% RH in conditioned areas.
3. Maximum temperature.
4. Electrical cables to be de-rated if required by Code.

- .2 Building heating shall be enabled when the outside air temperature is less than 10°C and shall be adjustable.
- .3 Overhead roll up doors (open/closed) shall be monitored by the BAS and interlocked with radiant tube or unit heaters so that heaters do not run when overhead doors are open. Space heating shall be disabled when the outdoor air temperature is above 10°C.

1.14 ENERGY AND RESOURCE METERING

- .1 Provide separate end-use metering for the following energy and/or resource services consumed:
 - .1 Natural Gas:
 - .1 Facility incoming bulk gas
 - .2 Space heating

- .3 Domestic water heating
- .4 Process gas
- .5 Commercial kitchen equipment
- .2 Potable (Domestic) Water:
 - .1 Facility incoming municipal water service
 - .2 Domestic hot water make-up
 - .3 Plumbing fixtures
 - .4 Heating plant water make-up
 - .5 Cooling plant water make-up
 - .6 Cooling tower and/or fluid cooler make-up
 - .7 Process water make-up (e.g. vehicle wash, humidification)
 - .8 Commercial kitchen water usage
 - .9 Landscape irrigation
- .3 Non-potable water:
 - .1 Greywater
 - .2 Harvested rainwater
 - .3 Landscape irrigation
- .4 Electrical metering for each separate end use type:
 - .1 Facility incoming electricity
 - .2 Interior Lighting
 - .3 Exterior Lighting
 - .4 Ventilation Fans
 - .5 Pumps
 - .6 Space Cooling
 - .7 Process electricity (e.g. compressors)
 - .8 Elevators
 - .9 Data Centres
 - .10 Plug loads
 - .11 Electric heating where it is the primary source of building heating
 - .12 Any other load 40 kW (50 HP for motors) or greater (submeter individually except where multiple similar pieces of equipment serve a similar load)
 - .13 Generation used as part of demand response systems
- .2 Metering shall include both instantaneous and cumulative consumption of energy and/or resource services.
- .3 Materials shall be compatible with the systems in which they are installed at all potential operating temperatures and pressures.
- .4 Meter accuracy shall be +/- 1.5% in expected operating range.

1.15 BAS ACCEPTANCE

- .1 Following satisfactory completion of testing and Commissioning of the BAS as described in the Specifications, and checklists and reports are submitted and reviewed, provide Certification in writing operation of the BAS including:

- .1 Control system checkout and testing
 - .2 Control system demonstration
 - .3 Owner Training
 - .4 As-built documentation, and Operating and Maintenance (O&M) manuals and instructions submitted and reviewed.
- .2 Certification document shall identify any testing that cannot be performed due to extenuating circumstances such as weather conditions. Append program to certification document for rectification and completing of these tests later during warranty period.
- .3 Submittals for Acceptance:
- .1 Provide system documentation at time of acceptance.
 - .2 As-Built Documentation:
 - .1 Within two weeks following Substantial Completion of the project, update the original submittal documents to reflect the "As Built" conditions of the project and submit four (4) copies to the Project Manager.
 - .2 Provide a separate laminated copy of the control drawings for mounting in the mechanical room or in the controls panels.
 - .3 Provide final point lists, shop drawings and all installed equipment data and operations sheets.
 - .4 Submit USB memory thumb drives containing up to date copies of the programs in each controller. Provide original program documentation proving registration for all software programs provided as a part of this contract including: the BAS operator interface software, and the BAS graphics (bitmap files). Provide one set of original thumb drives for every computer supplied under this contract or that the software has been loaded onto.
 - .5 Submit (4) printed copies of the final programs that include all point definitions, weekly and annual schedule setting, controller setpoints and tuning parameters, and documented programmed sequences of operation.
 - .3 Operation and Maintenance (O&M) Manuals:
 - .1 Provide two (2) paper copies of material and two (2) copies on USB memory storage stick in Adobe PDF format.
 - .2 O&M shall contain all information necessary for the operation, maintenance, replacement, installation, and parts procurement for the entire BAS and associated equipment. This documentation shall include specific part numbers and software versions and dates. A complete recommended spare part inventory list, and the lead time and expected frequency of use of each part clearly identified.
 - .3 Provide following information in separate sections, each with an index.
 - .1 Service and parts;
 - .1 Names, addresses, and telephone numbers of installing contractors and service representatives for equipment and control systems.
 - .2 List of recommended spare parts with part numbers and suppliers.
 - .2 System description;
 - .1 English language outline of BAS system and system architecture
 - .2 As-built versions of shop drawing product data.
 - .3 Reduced size (11 in x 17 in) copies of record drawings
 - .4 Graphic files, programs, and database on magnetic or optical media.

- .5 Licenses, guarantees, and warranty documents for equipment and systems.
- .3 Technical literature for equipment, including;
 - .1 catalogue sheets,
 - .2 calibration, adjustments and operation instructions,
 - .3 installation instructions,
 - .4 hardware and software manuals, with information supplied by original product developer, on application programs and on computers and controllers supplied
 - .5 Operator's manual with procedures for operating control systems; logging on and off, handling alarms, producing point reports, trending data, overriding computer control, and changing set-points and variables.
 - .6 Engineering, installation, and maintenance manual or set of manuals that explains how to design and install new points, panels, and other hardware; how to perform preventive maintenance and calibration; how to debug hardware problems; and how to repair or replace hardware.
 - .7 Original-issue documentation with installation and maintenance information for third-party hardware including computer equipment and sensors.
 - .8 Recommended preventive maintenance procedures for system components, including schedule of tasks such as inspection, cleaning, and calibration; time between tasks; and task descriptions.
 - .9 Programming manual or set of manuals with description of programming language and syntax, explanation of statements for algorithms and calculations used, procedures for point database creation and modification, documentation of techniques for program creation and modification, and instructions for use of editor.
 - .10 Documentation of programs created using custom programming language including set-points, tuning parameters, and object database. Electronic copies of programs to modify and create control logic, set-points, tuning parameters, and objects that can be viewed using programming tools.
- .4 Original Software:
 - .1 Furnish one original set of application and system software on original media. Disks to bear manufacturer's label. Field copies are not acceptable.
 - .2 Original-issue copies of software to include operating systems, custom programming language, application generation, graphic support, maintenance support, operator workstation or web server software, and other utilities provided in support of installed system.
- .5 On-line record documentation:
 - .1 After completion of testing and adjustment, install the following additional information on the server OWS.
 - .1 As-built record drawing files,
 - .2 detailed catalog data on all installed system components, with supplier contact information for purchasing and factory authorized repair service.
- .4 After start-up, testing, and BAS Commissioning has been completed demonstrating satisfactory and reliable operation of equipment and systems, and Owner Training has been complete, Preliminary

Acceptance shall be certified by the Consultant should the documented deficiencies remaining to be corrected have no adverse effect on the day-to-day operation of the building operation.

- .5 Final Acceptance of the BAS by the Consultant shall be certified when all of the above items have been satisfactorily completed and all identified deficiencies resolved.

1.16 CORRECTION AFTER ACCEPTANCE

- .1 Provide updates and patches to resolve software deficiencies in operator workstation or web server software, project-specific software, graphic software, database software, and firmware during warranty period.
- .2 Provide upgrades that improve routines and procedures of operator workstation software, web server software, project-specific software, graphic software, or database software, free of charge, during the warranty period .
- .3 Provide details of proposed changes and obtain written authorization before installation of updates, patches, or upgrades.
- .4 Include preventative maintenance, with allowance for spare parts, labour, and emergency (24 hour) service for system and equipment during the warranty period.
- .5 Equipment manufacturers to submit written undertakings to make circuit board repairs and provide spare parts, software support and patches, and technical assistance for at least five (5) years after Acceptance is certified.

1.17 LICENSES AND OWNERSHIP

- .1 Ownership of, and licenses for, hardware and software supplied or used for this project or for ongoing system operation, maintenance and modification to be registered, without restrictions, in Owner's name.
- .2 This is applicable to System Software, Workstation Application Editors, and Controller Software.
 - .1 Licensing to permit an unlimited number of users to access system without additional fees.
 - .2 As of last day of warranty period, software is to be upgraded to current version or release.
 - .3 Project-developed software and resulting documentation to be treated as part of system and subject to these same requirements for ownership and licensing. This material includes;
 - .1 Project graphic images
 - .2 CAD generated record drawings
 - .3 Project database
 - .4 Project-specific application programming code and documentation.
- .3 Software Licenses:
 - .1 Supply licenses for all software required to monitor, configure system, edit graphics, trend storage, (data exchange including ODBC (if applicable)) without limitations to points.
 - .2 Reliable Controls shall include licensing for the following: RC Studio, RC Webview, RC Archive.
 - .3 Delta Controls shall include licensing for the following: ORCAweb-Large, Illustrator, ORCAweb, OWS, ODBC, DDE, Historian Large.
 - .4 Automated Logic shall include licensing for the following: WEB CTRL, Advanced reports.
 - .5 The operator workstation interface software shall be designed to operate on the Windows 7 Professional platform or later.

1.18 WARRANTY

- .1 At completion of Work, submit written guarantee undertaking to remedy defects in work for period of two (2) years from date of Acceptance, which includes:
 - .1 Rectification of control system failures attributable to defects in workmanship, materials, hardware, and software; controllers excepted.

- .2 Service Technician to arrive on site within 24 hours of warranty service request, to install and de-bug software patches, to replace defective parts, materials or equipment, and to provide incidental supplies, and labour for remedial work during this period without cost to the Owner.
- .3 Technician to remain in attendance until system is returned to proper operating condition in accordance with system operation expectations.
- .2 All Controllers shall have a minimum five (5) year manufacturer's warranty.
- .3 Submit similar warranty for any part of Work accepted by Owner, prior to certification of Substantial Performance.

PART 2 - PRODUCTS

2.01 NOT USED

- .1 Not used.

PART 3 - EXECUTION

3.01 COORDINATION

- .1 Owner Coordination:
 - .1 The work shall occur while the control system remains on-line in order to maintain a minimum level of comfort within the building. The Owner shall be notified about situations in which equipment will be off-line for extended periods of time during the project. The Contractor shall conduct all on-site work in conjunction with building operating staff to streamline the new system startup.
- .2 Mechanical and Electrical Trade Coordination:
 - .1 Control Trades shall turn over control devices for installation in Work performed by Mechanical and Electrical Trades.
 - .2 Mechanical and Electrical Trades shall coordinate installation details and operational requirements with Control Trades.
 - .3 Mechanical and Electrical Trades shall provide sufficient labour, materials and equipment to complete point-to-point verification, system performance verification, and other activities as part of the project commissioning requirements.

3.02 ENERGY AND RESOURCE METERING

- .1 Provide meters complete with bypass piping arrangement, or other suitable means, to remove or isolate service without interruption to flow.
- .2 Provide meter manufacturer's calibration certificate(s), installation, operations and maintenance manuals (for meter(s) and data logger) and recommended meter recalibration interval(s).

3.03 BAS TESTING, COMMISSIONING AND ACCEPTANCE

- .1 Comply with the requirements of Section 20 08 10 Mechanical Commissioning and the additional requirements outlined in this Article.
- .2 The BAS Trades shall conduct full end-to-end testing and commissioning of the BAS installations and the overall monitoring and control of the building systems, including test documentation and requirements for testing and demonstration.
- .3 BAS Trade testing shall include the monitoring and supervisory control and data communications with all systems operational and integration with Third Party Devices complete.
- .4 Perform all necessary calibration, testing and de-bugging and perform all required operational checks to ensure that the system is functioning.
- .5 The BAS Subcontractor shall undertake joint testing of the BAS integration with the Project Stakeholder Group including:
 - .1 the Commissioning Authority,

- .2 the Owner,
- .3 the Owner's Project Manager,
- .4 the Consultant,
- .5 the Construction Manager/General Contractor, and
- .6 all affected Trades.
- .6 The BAS Contractor shall perform a complete and detailed operational check of each BAS component. Testing shall be documented on start-up forms.
- .7 Upon completion of the operational checks, repeat these tests, point-by-point in the presence of the Owner's representative, as required. Properly schedule these tests so that testing is completed by the time directed by the Owner's representative. The Project Stakeholder Group shall undertake such random testing as the Project Stakeholder Group considers necessary to verify the acceptability of the components.
- .8 Verify BACnet communications as specified and submit all point naming and identification values accordingly.
- .9 Provide a field checks for all controllers and front-end equipment (computers, printers, modems, and similar devices). The BAS Trades shall verify proper operation of both hardware and software of all system components. A checkout sheet shall be provided itemizing each device and a description of the associated tests shall be prepared and submitted to the Owner's Commissioning Authority at the completion of the project.
- .10 Point-to-Point (End-to-End) Testing:
 - .1 Provide schedule for point-to-point (end-to-end) checks and testing.
 - .2 Perform point-to-point (end-to-end) checks from an operator terminal to all sensors and actuators to the controller/outstation and from the controller to the presentation of the point on the graphic via LAN.
 - .3 Each analogue inputs (i.e. temperatures, pressure, etc.) shall be verified with an approved calibration device. All actual temperature readings should be with +/- 1°C of the readings observed at the workstation.
 - .4 Each analogue output shall be verified by manually commanding the output channel from the operator workstation to two or more positions within the 0-100% range and verifying the actual position of the actuator or device. All devices shall operate over their entire 0- 100% range from a minimum control range of 10-90%.
 - .5 Digital outputs shall be verified by witnessing the actual start/stop operation of the equipment under control.
 - .6 Digital inputs shall be verified by observing the status of the input point as the equipment is manually cycled on and off.
 - .7 Point-to-point (end-to-end) checks shall verify (at minimum) the following:
 - .1 Correct location of the field device for the application.
 - .2 Correct installation of the control device/interface with reference to the manufacturer's literature and check that sufficient access has been provided for maintenance.
 - .3 Verify and record in as built OEM drawings that control wiring is connected and free of shorts and ground faults. Verify that terminations are tight.
 - .4 That the control device has the correct range for the application, that the range is correctly entered in the controller and is correctly engineered on the operator's terminal.
 - .5 Correct operation of the controls device/interface, including any associated alarm and alarm text.

- .6 Verify and record that binary output devices operate and that normal positions are correct.
- .7 Verify and record that analog output devices are functional, that start and span are correct, and that direction and normal positions are correct.
- .8 Correct installation of each valve and damper actuator, and ensure that each valve and damper actuator is stroked correctly when checked against the BAS output; adjust valve stem and damper blade travel.
- .9 Calibration of the control device.
- .10 Labels provided on the control devices and mechanical equipment are correct.
- .8 Start-up testing shall commence once all component point-to-point (end-to-end) testing has been successfully completed and reviewed by the Consultant.
- .11 BAS Start-up Testing:
 - .1 Start-up testing to verify completion of control system before system demonstrations begins.
 - .1 Verify and record that system operates according to Sequences of Operation. Simulate changes in variables by overriding and varying inputs and schedules, and observe and record each operational mode response.
 - .2 Tune Control Mode loops and control routines.
 - .3 Check each alarm with an appropriate signal at value that will trip alarm.
 - .4 Trip interlocks using field contacts to check logic and to ensure that actuators fail in proper direction.
 - .5 Test interlock actions by simulating alarm conditions to check initiating value of variable and interlock action.
 - .2 Prepare and submit log documenting Start-up testing of each input and output device and each control routine, with technician's initials certifying each device and each routine is functioning correctly and sensors have been calibrated. Include list of deficiencies, if any, and schedule setting out rectification program with time lines.
 - .3 Manually operate each output for every system with a Mobile User Interface supplied by the BAS Trades as part of the Commissioning activities.
 - .4 Submit site-specific trends that contain all I/O points recorded at an analog or digital time frequency that confirms the correct system operation.
- .12 BAS Trade System Testing:
 - .1 Document the following:
 - .1 each point on the BAS including calibration checks and the stroking of actuators.
 - .2 all dynamic graphics comply with the mechanical and control specifications.
 - .3 all system programs comply with the specification under the normal modes of operation, emergency power, building fire detected and firefighter's override operating modes.
 - .4 all system alarms comply with the operating sequences and the specifications.
 - .5 System stability.
 - .6 Dynamic tests to prove control stability and that environmental comfort conditions are maintained.
- .13 Confirm and demonstrate to the Consultant and the Owner's agent that all systems are programmed and operating correctly.
- .14 System Performance Verification Testing:

- .1 Prior to acceptance, perform System Performance Verification Testing to demonstrate system operation and compliance with specification after, and in addition to, tests specified above. Show field operation of:
 - .1 each Sequence of Operation,
 - .2 Operator Interface,
 - .3 DDC loop response with graphical trend data output showing:
 - .1 Each DDC loop response to set point change producing an actuator position change of at least 25% of full range,
 - .2 Trend sampling rate to be from 10 seconds to 3 minutes, depending on loop speed,
 - .3 Loop trend data to show set point, actuator position, and controlled variable values,
 - .4 Documentation of further tuning of any loop that displays significantly under- or over-damped control,
 - .4 Demand limiting routine with trend data documenting action sampled with output showing demand-limiting algorithm action for each minute over a minimum 30-minute period indicating building kW, demand-limiting set point, and status of set-points and other affected equipment parameters,
 - .5 Building fire alarm system interface,
 - .6 Trend logs for each system point with:
 - .1 trend data to indicate set-points, operating points, valve positions, and other data as specified in points list provided with each Sequence of Operation,
 - .2 each log to cover three 48-hour periods and to have sample frequency not less than 10 minutes,
 - .3 occupancy sensor trend logs shall show the occupancy patterns of the space,
 - .4 confirmation that setpoints are being maintained and excessive cycling of equipment is not occurring.
 - .5 show that Logs are accessible through operator interface and can be retrieved for use in other software programs.
 - .7 Control loop tuning parameters shall be verified by applying a change to the current setpoint and observing the resulting trend log with setpoint being reached within a "reasonable" period of time without excessive cycling or hunting of the controlled device,
 - .8 Substantiate calibration and response of any input and output points requested,
 - .9 Provide at least two technicians equipped with two-way communication,
 - .10 Provide and operate test equipment to establish calibration and prove system operation.
- .2 Obtain approval of Start-up Testing and Trade System Testing documentation, including any rectifications made, prior to scheduling System Performance Verification Testing.
- .3 Provide notification not less than ten (10) business days before System Performance Verification Testing begins.
- .4 The System Performance Verification Testing shall be performed by the BAS Trades and shall be witnessed by the Consultant who shall complete the Consultant's portion of the system performance verification test sheets as each test is successfully completed.

- .5 The BAS Trade Contractor shall remedy any deficiencies that are observed during the system performance verification tests and shall be re-tested as required to demonstrate satisfactory performance.
- .6 System Performance Verification Testing to follow previously submitted and approved procedures;
 - .1 submit checklists and report forms for each system as part of demonstration,
 - .2 lists and forms to have initials of technicians conducting demonstrations,
 - .3 date of each demonstration and signatures of Owner's representatives witnessing each demonstration section.
- .15 Third Party Device Integrated Systems Testing:
 - .1 Third Party Device Integrated System Testing shall include the following minimum requirements:
 - .1 Test all Third Party monitored and controlled field devices, Third Party data points and all Third Party input and output points. Monitored data point values shall be verified against actual field device values to ensure both Third Party and BAS reported values are the same.
 - .2 Third Party controller device status and data communications status are accurately monitored at the BAS. Alarms for failed controllers and failed data communications are annunciated.
 - .3 BAS override control via the Operator Workstation of all Third Party output points and control data points shall be verified.
 - .4 Third Party data values displayed on the BAS dynamic system graphics, or in tabular data format, are functional and accurate.
 - .5 BAS facilities for operator adjustment of Third Party alarm definition parameters and thresholds, setpoint adjustment, control parameter adjustments, point trend initiation and modification to trends, and similar control functions, are fully operational.
- .16 Security System Monitoring to BAS:
 - .1 Provide digital input from security system.
 - .2 When building security armed all outside lighting control shuts off 20 minutes after alarm system armed.
 - .3 When building security armed all AHU's, Exhaust Fans and heating systems shall be changed to unoccupied mode immediately when armed regardless of scheduled times.
 - .4 All critical alarms as determined by the Owner.
- .17 When project is complete the BAS Trade Contract shall allow sufficient programming time in order to customize the sequences to meet operational needs, fine tuning of the system and other duties as required. The Owner will determine the schedule.
- .18 Commissioning Record Documentation.
 - .1 Test results shall be documented using test sheets. The test sheets shall be prepared in an appropriate format for the various categories of component and system to be tested. It is the responsibility of the BAS Trades to provide test verification sheets for each component and system that accurately reflect the sequences of operation and appropriate data for the components and systems
 - .2 All test documentation shall be maintained in electronic format and in hard copy.
 - .3 Submit a four (4) copies of the system Commissioning Report to the Consultant for review and approval.
 - .4 Record all out-of-season or unverified points in the commissioning report as "uncommissioned".

- .5 Submit inspection certificates.
- .6 Certificate of Acceptance to be withheld until Submittals are reviewed.
- .19 Ensure the BAS has met requirements outlined in the Article entitled 'Completion' found in Section 20 01 10.

3.04 OWNER TRAINING

- .1 Owner Training sessions shall include classroom type instruction and "hands on" instruction and shall be delivered by the BAS Trades on site using the completed installations. Arrange for additional meeting room space with the Owner.
- .2 Provide training tailored to the various Owner operations personnel requirements.
- .3 Materials:
 - .1 Provide course outline and materials for each class at least six weeks before first class.
 - .2 Provide training through instructor-led sessions, with computer-based, or web-based techniques.
 - .3 Instructors to be factory-trained and experienced in presenting this material.
 - .4 Perform classroom training using network of working controllers representative of installed hardware
- .4 Once five (5) consecutive Days of alarm-free operation are complete and documented, operator training may begin.
- .5 Provide one (1) day of instruction to the Owner's designated personnel on the operation of the BAS and describe its intended use with respect to the programmed functions.
- .6 Operator orientation of the BAS shall include, but not be limited to:
 - .1 the overall operation program,
 - .2 equipment functions (both individually and as part of the total integrated system),
 - .3 commands,
 - .4 systems generation,
 - .5 advisories, and
 - .6 appropriate operator intervention required in responding to the system's operation.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with the requirements of Section 20 01 10 Mechanical General Requirements
- .3 Comply with the requirements of Section 20 10 50 Basic Materials and Methods
- .4 Comply with the requirements of Section 20 05 70 Motors, Motor Starters, and Wiring
- .5 Comply with the requirements of Section 20 05 75 Variable Frequency Drives
- .6 Comply with the requirements of Section 25 05 10 BAS General Requirements
- .7 Comply with the requirements of Section 25 30 10 BAS Instrumentation and Devices
- .8 Comply with the requirements of Section 25 56 26 Integrated Lighting System Controls

1.02 DESCRIPTION OF THE BUILDING AUTOMATION SYSTEM

- .1 The building automation system is to consist of a modular, BACnet protocol, open architecture system incorporating direct digital control and monitoring of equipment and systems and consisting of all hardware and software required for the complete system. The BAS is to be accessible through standard personal computers within the building through a wireless application protocol device, or remotely through the Internet by means of a standard web browser.
- .2 The BAS is to be field expandable, with an architectural design to eliminate dependence upon any single device for alarm reporting and control execution. Failure of any single component or network connection is not to interrupt the execution of control strategies at other operational devices. The BAS is to maintain all settings and overrides through a system re-boot, and is to incorporate, as a minimum, the following integrated features, functions and services:
 - .1 operator information, alarm management, and control features;
 - .2 enterprise-level information and control access;
 - .3 information management including monitoring, transmission, archiving, retrieval, and reporting functions;
 - .4 dashboard graphics package providing current high-level operational status of alarms, building comfort, and building energy usage;
 - .5 diagnostic monitoring and reporting of BAS functions;
 - .6 off-site monitoring and management access;
 - .7 energy management;
 - .8 integrated lighting system controls;
 - .9 standard applications for terminal HVAC systems.
- .3 The BAS is to include, but not be limited to, the following:
 - .1 a web based operator work station user interface with colour monitor for colour-graphic displays, and a colour printer;
 - .2 a portable operator's terminal;
 - .3 Management Level Processor (MLP)
 - .4 Building Control Units (BCUs);
 - .5 Field Equipment Controllers (FECs);
 - .6 Zone Level Controllers (ZLCs)
 - .7 input/output modules;
 - .8 local display devices;
 - .9 distributed user interfaces;

- .10 network processing, data storage and communication equipment;
- .11 all other components required for a complete and operating BAS.
- .12 Interfaces to system utilizing standard communications protocols such as BACnet, Modbus and LON.

1.03 OPERATOR INTERFACE

- .1 Operator interface allowing for efficient communication of operational data and abnormal conditions, providing a consistent framework for viewing of information, and following requirements:
 - .1 critical areas (such as alarm icons) visible at all times;
 - .2 predefined area on screen providing operator messaging visible at all times;
 - .3 set of standard displays for configuration, and navigation around BAS system provided with every system and not requiring any engineering;
 - .4 unlimited number of custom (facility specific) displays created to meet needs of specific facility.
 - .5 software capable of running in Windows Server environment of version recommended by manufacturer;
 - .6 interactive and totally graphics and/or icon based, capable of supporting at least 65,000 colours at a minimum 1280 x 1024 pixel resolution;
 - .7 employ standard Windowing conventions so as to reduce required operator training, in particular, standard, totally configurable tool bar icons and drop-down menus available on standard and custom displays to allow easy access to common functions, and such functions also available via a standard set of function-key based pushbuttons without requiring configuration;
 - .8 support ability to "full screen lock" window so users cannot access other applications, and if "full screen lock" is not enabled, support for copy and paste facilities are to be provided between operator window and other Microsoft applications;
 - .9 operator interface connection:
 - .1 flexible in its connection to BAS server;
 - .2 Ethernet LAN or Internet connection used between server and operator workstations and browser clients;
 - .3 provide standard remote access support using industry standard tools like VNC, RADMIN, and Windows Terminal Services;
 - .4 where used, remote connections are to use password protected user authentication and encrypted network/internet protocols.
 - .10 following functions performed through operator interface:
 - .1 display and control of field equipment;
 - .2 acknowledge alarms on a priority basis;
 - .3 initiate printing of reports;
 - .4 archive and retrieve event logs;
 - .5 view historical plant information on predefined trend windows;
 - .6 view intranet or information from the Internet in a secure environment;
 - .7 change own password;
 - .8 monitoring of data communications channels;
 - .9 configure system parameters.
- .2 Web Browser Operator Interface

- .1 Operator interface fully available and functional through internet via an Internet Explorer browser allowing an operator to operate facility and perform all functions on same standard and custom graphics as used in standard operator interface. Custom graphics, alarm graphics and standard graphics available without modification or reengineering through Internet in an Internet Explorer browser user interface.
- .2 Browser interface providing login and security authentication in same way as standard operator interface. Large number of casual users permitted without any additional licensing burden with licensing based on number of simultaneous operator connections on a "first come first served" basis. Users with casual access are to automatically disconnect from BAS server after an idle timeout period.
- .3 Operator Interface Characteristics
 - .1 Following minimum capabilities are standard and require no custom programming or scripting:
 - .1 window re-size, zoom in, zoom out with display resolutions continuously resized to fit available window size;
 - .2 dedicated icons and pull down menus to perform multiple operations.
 - .2 Operator Input Devices
 - .1 Operator interface capable of being mouse driven and simultaneously support keyboard data input. Both fixed menus and configurable function keys supported to aid novice and experienced operator respectively. Interface also capable of supporting a touch-screen for pointing and command input.
 - .2 Utilizing a Tool Bar for common operator commands, and able to request display of commonly used displays and activate system functions via drop-down menus.
 - .3 Operator interface input is possible using only pointing device and QWERTY section of keyboard.

1.04 OPERATOR SECURITY

- .1 BAS shall have the capability to provide each operator with an assigned user profile that defines following:
 - .1 security and/or control level;
 - .2 operator identifier;
 - .3 unique encrypted password;
 - .4 operator scope of responsibility assignment;
 - .5 start graphic for that operator;
 - .6 timeout value for that operator.
- .2 Log actions initiated by operator in event database by operator identifier. In addition, any control actions to a given point are only allowed if control level configured in operator's profile exceeds level assigned to controlled point.
- .3 System to support at least 6 levels of operator security.
- .4 Sign-On/Sign-Off:
 - .1 Operator is permitted to sign on to system if correct operator identity and password have been entered. It is possible to have system authentication integrated directly into Windows, Windows Group Accounts, or an LDAP Server such that operator uses pre-existing account details to sign on to BAS system ensuring operators only need to remember 1 set of credentials for both their workstation and BAS.
 - .2 Each operator is to be assigned a password and a defined scope of responsibility which defines locations in facility that may be managed and controlled by individual operator.
 - .3 Operator may sign-off at any time by issuing a sign-off command.

- .5 Location Assignment / Scope of Responsibility Profile:
 - .1 Each operator is to be assigned one or more specific areas of building with appropriate monitoring and control responsibility (no view, view only, alarm acknowledge only or full control). Location is defined in this context as a logical entity comprising of a set of points in system. This in turn may represent a physical space in building. Locations are used to partition BAS database in such a way as to assign operators control over certain areas and prevent unauthorized access to other areas.
- .6 Duress:
 - .1 System to support operator duress function, so operator may discretely indicate they are signing in to BAS system under duress. System is to recognize operator is signing on under duress and be able to issue a control to alert appropriate assistance.
- .7 Command Partitioning:
 - .1 Possible to assign each operator a set of allowed commands for each assigned location. Commands can be mapped against output state of any given digital point in respective area to determine whether a control command is allowed for particular operator.
 - .2 With this feature, it will, for example, be possible to configure an operator to set a digital point to "ON", but to disallow same operator from setting same digital point to "OFF".

1.05 DISTRIBUTED BUILDING CONTROL UNITS

- .1 Provide a method for monitoring and control of points on remote BAS Building Control Units (BCUs), specifically real-time and history values. Features to be supported include:
 - .1 Global access to data, such that users at operator workstations on one Building Control Unit (BCU) can access data, history, point detail displays, and other information on any other Building Control Unit (BCU). It shall not be necessary to configure system wide, more than one point for each data value or signal, regardless of number of Building Control Units (BCUs) accessing data.
 - .2 Ability to nominate sets of points to be accessed on a BCU-by-BCU and user-by-user basis. Mechanism is to be same as mechanism to control individual operator and workstation access to data for single server systems.
 - .3 Operators and workstations at any server are to see alarms from any other BCU, and not necessary to configure alarms more than once, regardless of number of servers accessing data.
 - .4 Ability to configure real time and historical trends that combine data from any connected server on a single trend, and not necessary to configure more than one point for each data value or signal, regardless of number of BCUs accessing data.
 - .5 Graphics, reports, and applications at a server have same distributed access to data on other BCUs as described above for operators and workstations, and not necessary to configure more than one point for each data value or signal, regardless of number of BCUs accessing data.
 - .6 Important service-oriented architecture (SoA) web services enabling extension of BAS system providing seamless access to points, alarms and history from any distributed system BCU, without needing to directly address each individual BCU. Data across distributed system BCUs is to be seamlessly integrated into Web services.
- .2 Connections between Building Control Units (BCUs) can be made through local Ethernet connections, or Local Area Network (LAN).

1.06 REMOTE ACCESS VIA MOBILE USER INTERFACE

- .1 Available with an operator interface designed for use on various Smart Phone Devices and Tablets with network connectivity.
- .2 Mobile User Interface shall include full operator workstation functionality.

- .3 Mobile User Interface is to support standard operator workstation features including full operator scope of responsibility, and operable using commercial off-the-shelf technology.
- .4 Network Agnostic:
 - .1 Mobile user interface operating over standard TCP network connection, performing well down to mobile 3G speeds, and optimized to ensure very high performance across different network topologies.
- .5 Browser Agnostic
 - .1 Solution written with HTML5 web standards and browser agnostic, not deploying or using ActiveX controls, nor requiring installation of Java Runtime engine.
- .6 BAS Features Integrated into Mobile User Interface:
 - .1 Mobile solution incorporating full scope of responsibilities of BAS operators for remote mobile users, allowing them to view or control points within their assigned facility locations.
- .7 Operable Within Normal PC Desktop and Laptop Browsers
 - .1 Without alternation, Mobile User Interface operable within any standard internet browser from a normal personal computer.

1.07 SHOP DRAWINGS

- .1 Submit four (4) copies of following information to the consultant and/or the project manager for review and approval:
 - .1 Control Schematics.
 - .2 Detailed sequence of operation for each control schematic or controlled system.
 - .3 System Architecture indicating the proposed interconnection and location of all BAS panels, network connections and key peripheral devices (workstations, modems, printers, repeaters, and similar devices).
 - .4 BAS Points List indicating the panel ID, panel location, hardware address, point acronym, point description, field device type, point type (i.e, AO/DO/AI/DI), end device fail position, end device manufacture and model number, and wire tag ID). Terminal identification for all control wiring shall be shown on the shop drawings.
 - .5 Wiring diagrams including complete power system, interlocks, control and data communications.
 - .6 Hard copy graphical depiction of the application control programs.
 - .7 Manufacturers' data / specification sheets for all material supplied.
- .2 Submit shop drawings schedules for;
 - .1 control damper; spreadsheet type, to include separate line for each damper and columns for damper attributes.
 - .2 control valve; spreadsheet type, to include separate line for each valve and separate columns for valve attributes.
- .3 Submit catalogue cut-sheets for;
 - .1 manufacturer's description and technical data, such as performance curves, product specification sheets, and installation/maintenance instructions for equipment and hardware items as follows;
 - .1 Management Level Processors (MLPs)
 - .2 Controllers (BCU's, FEC's, ZLC's)
 - .3 Transducers/Transmitters and Sensors with
 - .1 accuracy data, range and scale information,

- .2 one sheet for each device marked with applicable options. (Where several devices of same type are to be used, submit one sheet for each device, individually marked.)
- .4 Actuators
- .5 Valves
- .6 Dampers
- .7 Relays/Switches
- .8 Panels
- .9 Power Supplies
- .10 Batteries
- .11 Operator Interface
- .12 Wiring and wiring accessories
- .13 All other Instrumentation and Devices Specified in Section 25 30 10
- .2 hardware data sheets for Operator Interfaces, local panels, and portable operator terminals.
- .4 Submit supporting documentation:
 - .1 examples of graphics for Operator Interface.
 - .2 Software manuals for applications programs for Operator Interface, portable operator terminals, and programming devices.
 - .3 Protocol Implementation Conformance (PIC) statement for BACnet devices.
 - .4 Where interfaces occur with control or wiring diagrams of other sections, obtain reproducible copies of these diagrams and revise to show terminal numbers at interface and include diagrams as part of interconnection schematic shop drawings.

1.08 BAS INTEGRATION WITH THIRD PARTY DEVICES

- .1 BAS Trades shall review Shop Drawings and other Submittals from Trades providing equipment and systems that are required to Integrate with the BAS.
- .2 BAS Trades shall ensure the BAS network architecture is compatible with Third Party Devices provided by multiple vendors to the Project, and that these Third Party Devices are provided with the required Integration capabilities.
- .3 Where Third Party Devices cannot communicate to the BAS through an open protocol, BAS Trades shall ensure appropriate Gateways are provided, including all relevant hardware and software, to allow bi-directional communication of all relevant data.
- .4 Gateway shall be required to pass Owner's Information Technology (IT) security audit prior to implementation if gateway is BACnet IP; if gateway is BACnet MSTP it shall be BTL certified.
- .5 Vendor should provide Protocol Implementation Conformance Statement (PICS) for Owner's review to confirm compatibility with existing supervisory controller.
- .6 There shall be one (1) vendor gateway per loop if using BACnet MSTP.
- .7 If using BACnet MSTP, Vendor shall provide wiring scheme regarding reference, shield, termination, and wiring specifications. Owner shall confirm compatibility with existing Base Building Control Vendor.
- .8 Any configuration or programming software/tool(s) used for this gateway shall be provided to Owner.
- .9 Vendor warranty shall include parts and service (labour) during warranty period.
- .10 No scheduling, no event and no trends shall be provided by the Gateway, these functions shall be provided through a separate dedicated controller by the BAS Vendor.

- .11 Any safety interlock, where possible, shall be hard wired and accomplished through the gateway or through BAS programming.
- .12 Vendor shall provide one (1) gateway for base building controller compatibility test.

PART 2 - PRODUCTS

2.01 GENERAL PERFORMANCE REQUIREMENTS

- .1 Provide equipment which functions and meets detailed performance criteria when operating in following minimum ambient condition ranges:
 - .1 Temperature - 0°C to 32.2°C (32°F to 90°F)
 - .2 Relative Humidity 10% to 90% non-condensing
 - .3 Electrical power service of single phase, 120 VAC +/- 10%, 60 Hz nominal.
- .2 Control system:
 - .1 high-speed, peer-to-peer network of microprocessor based Direct Digital Control (DDC) controllers with web-based operator interface,
 - .2 each mechanical system, building floor plan, and control device to be displayed through point-and-click graphics,
 - .3 Web server with network interface card to gather data from this system and generate web pages that can be accessed through conventional web browser on any PC connected to network,
 - .4 Operators to access this system through web browser, and browser interface to perform normal operator functions.
- .3 Open protocol:
 - .1 Provide an integrated, open protocol building automation system, either/ or in combination:
 - .1 BACnet to ANSI/ASHRAE Standard 135,
- .4 General functional requirements:
 - .1 Control mechanical and electrical equipment as specified in Control Sequences, shown on Control Schematics, and described in Equipment Schedules.
 - .2 System architecture to be modular, permitting stepped expansion of application software, system peripherals, and field hardware.
 - .3 Each controller;
 - .1 operates with local closed loop programming, independent from server, if peer-to-peer communication is interrupted;
 - .2 performs resident control routines;
 - .1 receiving information from field mounted sensors and switches and
 - .2 transmitting instructions to actuators to perform control sequences.
 - .3 manages local hardware and software alarms;
 - .1 to collect historical data,
 - .2 to facilitate operator input and output and
 - .3 to communicate with Central BAS web server and operator interface.
 - .4 Components installed within motor control devices to be designed to operate with transient electrical fields occurring within these devices.
- .5 Performance:
 - .1 General:
 - .1 information transmission and display times are based upon network, rather than modem, connections.

- .2 test systems using manufacturer's recommended hardware and software for operator interface.
- .6 Performance criteria:
 - .1 Graphic Display;
 - .1 display graphic with 20 dynamic points with current data within 10 seconds.
 - .2 Graphic Refresh;
 - .1 update graphic with 20 dynamic points with current data within 10 seconds and
 - .2 automatically refresh every 15 seconds.
 - .3 Configuration and Tuning Screens;
 - .1 special screens used for configuring, calibrating, or tuning points, PID loops, and similar control logic to refresh every 5 seconds.
 - .4 Refresh Rate;
 - .1 The Refresh Rate is defined as the time it takes the controller central processing unit (CPU) to sample all inputs, calculate all variables, update all timers and proportional integral derivative (PID) controllers, check all schedules, update all trend logs and runtime logs, execute all programs and assign values to all outputs.
 - .2 The maximum permissible refresh rate is one (1) second.
 - .5 Reporting Accuracy;
 - .1 system to report values with an end-to-end accuracy equal to or better than those listed below.
 - .2 control loops to maintain measured variable at set point value within tolerances equal to or better than those listed below.
- .7 Provide Owner's Training on the operation of the BAS.
- .8 Provide BAS As-built documentation, and Operating and Maintenance (O&M) manuals and instructions.

2.02 EQUIPMENT STANDARD

- .1 Products and software: manufacturer/developer/supplier's catalogued current stock.
- .2 This installation is not to be used as test site for newly developed product or software, without explicit written approval.
- .3 Equipment and systems installed under this Contract to meet;
 - .1 performance specifications when subjected to VHF, UHF, FM, AM or background RF interference as generated by commercial or private, portable or fixed transmitters that meet regulatory codes.
 - .2 Federal Communication Commission (FCC) Rules and Regulations, Part 15, Subpart J for computing devices.

2.03 BAS ARCHITECTURE

- .1 Automation Network: The BAS is to be based on a PC industry standard of Ethernet TCP/IP. Where used, LAN controller cards are to be standard "off-the-shelf" products available through normal PC vendor channels. The BAS is to be capable of operating at a communication speed of 100 Mbps, with full peer-to-peer network communication. The BAS is to be compatible with other enterprise-wide networks, and where indicated, the BAS is to be connected to the enterprise network and share resources with it by way of standard networking devices and practices.
- .2 Control Network: Management Level Processors (MLPs), Building Control Units (BCUs), are to provide supervisory control over the control network and are to support the BACnet Standard MS/TP, or approved equal, bus communication protocol (ASHRAE SSPC-135, Clause 9). The control networks are to provide either a "peer-to-peer", master-slave, or supervised token passing

communications and are to operate at a minimum communication speed of 9600 baud. DDC controllers are to reside on the control network.

.3 Integration:

- .1 The BAS is to include appropriate hardware and software to allow BACnet bi-directional data communications between the BAS and building equipment/system control panels. The BAS is to receive, react to, and return information from the equipment and systems. All data required by the application is to be mapped into the automation engine's data base and is to be transparent to the operator. Point inputs and outputs from building equipment/system control panels is to have real-time inter-operability with BAS software features such as control software, energy management, custom process programming, alarm management, historical data and trend analysis, totalization, and local area network communications.
- .2 The BAS is to include appropriate hardware and software to allow BACnet bi-directional data communications between the BAS and the existing facility's building automation system. Each system shall be capable of read access to a defined set the other systems data points.
- .4 Air Handling Equipment: The equipment will be provided by its manufacturer with an interface to monitoring and control points specified in the input/output point schedules of the BAS. Points specified in the input/output point schedules shall be the minimum acceptable list of points to be interfaced to the BAS. The contractor supplying the equipment shall use BACnet interface for the points listed as AI, DI, AO or DO in the input/output points schedule. The supplier of the equipment shall ensure they have supplied and installed all of the software and hardware so that the equipment will be able to provide the points listed on the BAS.
- .5 Variable Frequency Drive Equipment: The equipment will be provided by its manufacturer with an interface to monitoring and control points specified in the input/output point schedules of the BAS. Points specified in the input/output point schedules shall be the minimum acceptable list of points to be interfaced to the BAS. The contractor supplying the equipment may use Modbus or BACnet interface for the points listed as AI, DI, AO or DO in the input/output points schedule. The supplier of the equipment shall ensure they have supplied and installed all of the software and hardware so that the equipment will be able to provide the points listed on the BAS.
- .6 Lighting Control System Equipment: The equipment will be provided by its manufacturer with an interface to monitoring and control points specified in the input/output point schedules of the BAS. Points specified in the input/output point schedules shall be the minimum acceptable list of points to be interfaced to the BAS. The contractor supplying the equipment may use Modbus or BACnet interface for the points listed as AI, DI, AO or DO in the input/output points schedule. The supplier of the equipment shall ensure they have supplied and installed all of the software and hardware so that the equipment will be able to provide the points listed on the BAS.
- .7 Refrigerators and Freezers Equipment: The equipment will be provided by its manufacturer with an interface to monitoring and control points specified in the input/output point schedules of the BAS. Points specified in the input/output point schedules shall be the minimum acceptable list of points to be interfaced to the BAS. The contractor supplying the equipment may use Modbus or BACnet interface for the points listed as AI, DI, AO or DO in the input/output points schedule. The supplier of the equipment shall ensure they have supplied and installed all of the software and hardware so that the equipment will be able to provide the points listed on the BAS.
- .8 Generator Equipment: The equipment will be provided by its manufacturer with an interface to monitoring and control points specified in the input/output point schedules of the BAS. Points specified in the input/output point schedules shall be the minimum acceptable list of points to be interfaced to the BAS. The contractor supplying the equipment may use Modbus or BACnet interface for the points listed as AI, DI, AO or DO in the input/output points schedule. The supplier of the equipment shall ensure they have supplied and installed all of the software and hardware so that the equipment will be able to provide the points listed on the BAS.
- .9 Fuel Oil Equipment: The equipment will be provided by its manufacturer with an interface to monitoring and control points specified in the input/output point schedules of the BAS. Points specified in the input/output point schedules shall be the minimum acceptable list of points to be

interfaced to the BAS. The contractor supplying the equipment may use Modbus or BACnet interface for the points listed as AI, DI, AO or DO in the input/output points schedule. The supplier of the equipment shall ensure they have supplied and installed all of the software and hardware so that the equipment will be able to provide the points listed on the BAS.

- .10 Water Treatment Equipment: The equipment will be provided by its manufacturer with an interface to monitoring and control points specified in the input/output point schedules of the BAS. Points specified in the input/output point schedules shall be the minimum acceptable list of points to be interfaced to the BAS. The contractor supplying the equipment may use Modbus or BACnet interface for the points listed as AI, DI, AO or DO in the input/output points schedule. The supplier of the equipment shall ensure they have supplied and installed all of the software and hardware so that the equipment will be able to provide the points listed on the BAS.
- .11 In Floor Heating Equipment: The equipment will be provided by its manufacturer with an interface to monitoring and control points specified in the input/output point schedules of the BAS. Points specified in the input/output point schedules shall be the minimum acceptable list of points to be interfaced to the BAS. The contractor supplying the equipment may use LonTalk, Modbus or BACnet interface for the points listed as AI, DI, AO or DO in the input/output points schedule. The supplier of the equipment shall ensure they have supplied and installed all of the software and hardware so that the equipment will be able to provide the points listed on the BAS.
- .12 Miscellaneous Equipment: The equipment will be provided by its manufacturer with an interface to monitoring and control points specified in the input/output point schedules of the BAS. Points specified in the input/output point schedules shall be the minimum acceptable list of points to be interfaced to the BAS. The contractor supplying the equipment may use Modbus or BACnet interface for the points listed as AI, DI, AO or DO in the input/output points schedule. The supplier of the equipment shall ensure they have supplied and installed all of the software and hardware so that the equipment will be able to provide the points listed on the BAS.

2.04 CENTRAL BAS OPERATOR WORKSTATION (OWS)

- .1 General requirements:
 - .1 Operator Workstation shall be dedicated web based by means of a personal computer for command entry, information management, network alarm management, and database management functions. All real-time control functions including scheduling, history collection, and alarming is to be resident in the BAS network control panels to facilitate greater fault tolerance and reliability.
 - .2 Operator Workstation shall perform global application programs and data collection and consolidation as follows:
 - .1 communicating with controllers;
 - .2 obtaining data from field devices for central monitoring of building systems, and;
 - .3 transmitting instructions to controllers.
 - .3 Operator Workstation shall have software routines for;
 - .1 BAS Server operation,
 - .2 database creation and data storage,
 - .3 web based Graphical User Interface (GUI) with graphics generation and display,
 - .4 report formulation, printing, and presentation,
 - .5 alarm detection and reporting and
 - .6 event initiated programming.
 - .4 Audit Trail;
 - .1 The workstation software shall automatically log and timestamp every operation that a user performs at a workstation, from logging on and off a workstation to changing a point value, modifying a program, enabling/disabling an object, viewing

- a graphic display, running a report, modifying a schedule, and similar type of activity.
- .2 The system is to employ an event-driven rather than a device polling methodology to dynamically capture and present new data to the Operator. Additional features to be provided are as follows:
- .1 all inputs, outputs, set-points, and other parameters shown on the drawings, or required as part of the system software are to be displayed for operator viewing and modification from the operator interface software;
 - .2 the user interface software is to provide help menus and instructions for each operation and/or application;
 - .3 the system is to support customization of the user interface configuration and a home page for each operator;
 - .4 the system is to support user preferences in alarm, trend, display, and applications screen presentations;
 - .5 all controller software operating parameters are to be displayed for the operator to view/modify from the user interface, and these parameters are to include set-points, alarm limits, time delays, PID tuning constants, run times, point statistics, schedules, etc.;
 - .6 the operator interface is to incorporate comprehensive support for functions including but not limited to the following:
 - .1 user access for selective information retrieval and control command execution;
 - .2 monitoring and reporting;
 - .3 alarm, non-normal, and return to normal condition annunciation;
 - .4 selective operator override and other control actions;
 - .5 information archiving, manipulation, formatting, display and reporting;
 - .6 BAS internal performance supervision and diagnostics;
 - .7 on-line access to HELP menus;
 - .8 on-line access to current BAS as-built records and documentation;
 - .9 means for controlling, re-programming, and re-configuration of the BAS operation and for the manipulation of the BAS database information in compliance with applicable Codes and Regulations for individual BAS applications.
 - .7 the system is to support a list of application programs configured by the users that are called up by the Tools Menu, hyperlinks within the graphic displays, and key sequences;
 - .8 the operation of the control system is to be independent of the Operator Workstation, which is to be used for operator communication only.
- .3 Navigation Trees: The system is to have a minimum of five levels of nesting, and the capability of displaying multiple navigation trees to aid the operator in navigating throughout all systems and points connected, adding custom trees, defining any logical grouping of points and arranging them on a tree in any order, and nesting groups within other groups. The navigation trees are to be "dockable" to other displays such as graphics, meaning that the trees will appear as part of the display but can be detached and then minimized to the Windows task bar or closed altogether, however, a simple keystroke will reattach the navigation to the primary display of the user interface.
- .4 Alarms: Alarms are to be routed directly from network automation engines to PC's and servers, and it is to be possible for specific alarms from specific points to be routed to specific PC's and servers. The BAS is to annunciate diagnostic alarms indicating system failures and non-normal operating conditions, annunciate application alarms as required by points lists and sequences, and as a minimum, permit four categories of alarm sounds customizable through user defined wav. files. The alarm management segment of the user interface is to provide, as a minimum, the following alarm functions:
- .1 log, date, and time of alarm occurrence;

- .2 generate a "pop-up" window with audible alarm to inform a user that an alarm has been received;
 - .3 permit a user with the appropriate security level to acknowledge, temporarily silence, or discard an alarm;
 - .4 provide an audit trail on the PC hard drive for alarms by recording user acknowledgement, deletion or disabling of an alarm, the name of the user, the alarm, the action taken, and the time/date of the alarm;
 - .5 facilitate the ability to direct alarms to an email address or alphanumeric pager, in addition to the pop-up window described above;
 - .6 any attribute of any object in the system may be designated to report an alarm.
- .5 Reports and Summaries: Reports and summaries are to be generated and directed to the user interface displays with subsequent assignment to printers or discs. Summaries and reports are to be accessible via standard user interface functions, and selection of a single menu item, tool bar item, or tool bar button is to print any displayed report or summary. The system is to permit the creation of custom reports and queries via a standard web services XML interface and commercial off-the-shelf software such as Microsoft Access, Microsoft Excel, or Crystal Reports. As a minimum the BAS is to provide the following reports and summaries:
- .1 all points in the BAS;
 - .2 all points in each BAS application;
 - .3 all points in a specific controller;
 - .4 all points in a user-defined group of points;
 - .5 all points currently in alarm;
 - .6 all points locked out;
 - .7 all BAS schedules;
 - .8 all user defined and adjustable variables, schedules, interlocks, etc.
- .6 Schedules: A graphical display for time-of-day scheduling and override scheduling of building operations is to be provided, with weekly schedules for each group of equipment with a specific time use schedule, and it is to be possible to define one or more exception schedules for each schedule including reference to calendars, with monthly calendars provided to permit simplified scheduling of holidays and special days for a minimum of five years in advance, user selected with the pointing device or keyboard. Changes to schedules made from the user interface are to directly modify the network automation engine schedule database. Selection of a single menu item or tool bar button is to print any displayed schedule. As a minimum the following functions are to be provided:
- .1 weekly schedules;
 - .2 exception schedules;
 - .3 monthly calendars.
- .7 Passwords: The BAS is to be complete with multiple-level password access protection to permit the user/manager to user interface control and display, database manipulation capabilities deemed appropriate for each user, based on an assigned password. Password access protection features are to include:
- .1 each user is to have a user name (24 characters maximum), a password (12 characters maximum), and access levels;
 - .2 each user may change his or her password at any time;
 - .3 when editing or entering passwords the system is not to echo the actual characters for display on the monitor;
 - .4 a minimum of one hundred unique password is to be supported;

- .5 operators are to be able to perform only those commands available for their respective passwords, and display of menu selections is to be limited to only those items defined for the access level assigned to the password of each user;
- .6 the BAS is to automatically generate a report of log-on/log-off and system activity for each user, and any action that results in a change in the operation or configuration of the control system is to be recorded, including the acknowledgement and deletion of alarms;
- .7 a minimum of five levels of access is to be supported individually or in any combination of the following:
 - .1 Level 1 – view data;
 - .2 Level 2 – command;
 - .3 Level 3 – operator overrides;
 - .4 Level 4 – database modification;
 - .5 Level 5 – database configuration;
 - .6 Level 6 – all privileges including password add/modify.
- .8 Screen Manager: The user interface is to be equipped with screen management capabilities that allow the user to activate, close, and simultaneously manipulate a minimum of four active display windows plus a network of user defined navigation trees.
- .9 Dynamic Colour Graphics: The Graphic User Interface application program is to be an integral part of the user interface and is to include a create/edit function and a runtime function, and the system architecture is to support an unlimited number of graphic documents (graphic definition files) to be generated and executed. The graphics are to be capable of displaying and providing animation based on real-time data that is acquired, derived, or entered. Additional features include the following:
 - .1 graphics runtime functions: a maximum of sixteen graphic applications are to be able to be executed at any one time on a user interface or workstation with four visible to the user, and each graphic application is to capable of the following functions:
 - .1 all graphics are to be fully scalable;
 - .2 graphics are to support a maintained aspect ratio;
 - .3 multiple fonts are to be supported;
 - .4 a unique background is to be assigned on a per graphic basis;
 - .5 the colour of all animations and values on displays is to indicate the status of the object attribute.
 - .2 operation from graphics: it is to be possible to change values (set-points) and states in the system controlled equipment by using drop-down windows accessible via the pointing device;
 - .3 graphic editing tool: a graphic editing tool is to be provided to permit the creation and editing of graphic files, and the graphic editor is to be capable of performing/defining all animations, defining all runtime binding, and:
 - .1 in general, facilitate the creation and positioning of point objects by dragging from tool bars or drop-downs and positioning where required;
 - .2 be capable of adding additional content to any graphic by importing backgrounds in the SVG, BMP, or JPG file formats.
 - .4 aliasing: many graphic displays representing part of the building and various building components are exact duplicates, with the exception that the various variables are bound to different field values, consequently, it is to be possible to bind the value of a graphic display to aliases, as opposed to physical field tags.
- .10 Historical Trending and Data Collection: Trend and change of value data is to be stored within the BAS server and uploaded to a dedicated trend database or exported in a selectable data format via

a data export utility. Uploads to a dedicated database are to occur based on one of user-defined interval, manual command, or when the trend buffers are full. Exports are to be as requested by the user or on a time scheduled basis. The system is to be equipped with a configurable data storage sub-system for the collection of historical data which can be stored in either Microsoft Access or SQL database format. The Server is to store, trend, and point history data for all analog and digital inputs and outputs as follows:

- .1 any point, physical or calculated, may be designated for trending, and methods of collection are to be defined time interval or a change of value;
 - .2 the server is to be capable of storing multiple samples for each physical point and software variable based on available memory, including an individual sample time/date stamp, and points may be assigned to multiple history trends with different collection parameters.
- .11 Trend Data Viewing and Analysis: A trend viewing utility with access to all data points and the capability of defining trend study displays to include multiple trends is to be provided, and is to include:
- .1 the capability of retrieving any historical database point for use in displays and reports by specifying the point name and associated trend name;
 - .2 displays which are able to be single or stacked graphs with on-line selectable display characteristics such as ranging, colour, and plot style;
 - .3 display magnitude (zoom capability) and units selectable by the operator at any time without reconfiguration the processing or collection of data;
 - .4 display magnitude is to be automatically scaled to show full graphic resolution of the data being displayed;
 - .5 trend studies are to be capable of calculating and displaying calculated variables including highest value, lowest value, and time based;
 - .6 the display is to support the user's ability to change colours, sample sizes, and types of markers.
- .12 Database Management: The BAS is to be equipped with a database manager that separates the database monitoring and management functions by supporting two separate windows. Database secure access is to be accomplished using standard SQL authentication including the ability to access data for use outside of the BAS application. Additional features are as follows:
- .1 the database management function is to include summarized information on trend, alarm, event, and audit for backup, purge, and restore database management functions;
 - .2 the database manager is to support four tabs as follows:
 - .1 statistics, which is to display database server information and trend, alarm (event), and audit information on the BAS database;
 - .2 maintenance, which is to be an easy method of purging records from the BAS server trend, alarm (event), and audit databases by supporting separate screens for creating a backup prior to purging, selecting the database, and allowing for the retention of a selected number of day's data;
 - .3 backup, which is to provide the means to create a database backup file and select a storage location;
 - .4 restore, which is to provide a restricted means of restoring a database by requiring the user to log into an Expert Mode in order to view the Restore screen.
 - .3 the status bar is to appear at the bottom of the BAS database manager tabs and is to indicate information on the current display activity with icons as follows:
 - .1 Ready;
 - .2 Purging Record From Database;
 - .3 Action Failed

- .4 Refreshing Statistics;
- .5 Restoring Database;
- .6 Shrinking A Database;
- .7 Backing-Up A Database;
- .8 Resetting Internet Information Services;
- .9 Shutting Down The BAS Deice Manager;
- .10 Action Successful.
- .4 the database manager monitoring functions are to be accessed through the Monitoring Settings window and are to continuously read database information once after the user has logged in;
- .5 the system is to advise the user via task bar icons and email messages when a database value has exceeded a warning or alarm limit;
- .6 the Monitoring Settings window is to have the following sections:
 - .1 General, to allow the user to set and review scan intervals and start times;
 - .2 Email, to allow the user to create and review email and telephone text messages to be delivered when a Warning or Alarm is generated;
 - .3 Warning, to allow the user to define the warning limit parameters, set the Reminder Frequency, and link the email message;
 - .4 Alarm, to allow the user to define the alarm limit parameters, set the Reminder Frequency, and link the email message;
 - .5 Database Login, to protect the system from unauthorized database manipulation by creating a Read Access and Write Access for each of the trend, alarm (event), and audit databases as well as an Expert Mode required to restore a database.
- .7 the Monitoring Settings taskbars to display the following informational icons:
 - .1 Normal, which indicates by colour and size that all databases are within their limits;
 - .2 Warning, which indicates by colour and size that one or more databases have exceeded their warning limit;
 - .3 Alarm, which indicates by colour and size that one or more databases have exceeded their alarm limit.
- .8 the BAS is to indicate via taskbar icons and email messages when a database value has exceeded a warning or alarm limit;
- .13 Demand Limiting and Load Rolling: The BAS is to be equipped with a demand limiting and load rolling program for the purpose of limiting peak energy usage and reducing overall energy consumption. The program is to support both Sliding Window and Fixed Window methods of predicting demand. Additional features are as follows:
 - .1 the system is to support three levels of sensitivity in the Sliding Window demand calculations for fine tuning the system, as follows:
 - .1 Low Setting, which sheds loads later and over the shortest period of time and maximizes the period of time the equipment is on;
 - .2 Medium Setting, which sheds loads earlier over a period of time greater than the Low Setting, and increases the time the equipment is on and decreases the probability of exceeding the "Tariff Target";
 - .3 High Setting, which sheds loads earlier and over a longer period of time than the Medium Setting to minimize the probability of exceeding the "Tariff Target".
 - .2 the system is to have both a Shed Mode and a Monitor Only Mode of operation, as follows:

- .1 when the Shed Mode is engaged the system is to actively control the demand;
- .2 when the Monitor Mode is engaged the system is to simulate the shedding action but will not take any action.
- .3 the Demand Limiting Program is to monitor the energy consumption rate and compare it to a user defined "tariff Target", and maintain the consumption below the target by selectively shedding loads based on a user defined strategy;
- .4 the Demand Limiting Program is to be capable of supporting a minimum of ten separate load priorities, with each load user assigned, and a minimum of twelve separate "Tariff Targets" defining the maximum allowed average power usage during the current interval;
- .5 the system is to support a maximum shed time for each load as determined by the user, and the system is to restore the load before the maximum shed time has expired;
- .6 the system is to support a minimum shed time for each load as determined by the user, and the system is not to restore the load before the minimum shed time has expired;
- .7 the system is to support a minimum release time for each load as determined by the user, and the system is not to shed the load until it has been off for the minimum release time;
- .8 the system is to support three user defined options if the meter does not function properly, as follows:
 - .1 shedding – the currently shed loads will be released as their maximum shed time expires;
 - .2 maintain the current shed rate – the system will use the demand limiting shed rate that was present when the meter began to function improperly;
 - .3 use unreliable meter shed rate – the system is to control to a user defined unreliable shed rate target.
- .9 the Load Rolling Program is to sum the loads currently shed and compare the sum to a user defined load rolling target, and the system is to maintain consumption below the target by selectively shedding loads based on a user defined load priority;
- .10 the Load Rolling Program is to be capable of supporting a minimum of ten separate load priorities with each load user defined to a load priority;
- .11 the Load Rolling Program is to be capable of supporting a minimum of twelve separate "Tariff Targets" defining the amount of energy by which the demand must be reduced;
- .12 the system is to equip the user with a Load Tab that displays all the demand limiting and load rolling parameters for any selected load;
- .13 the system is to be complete with a Load Summary that displays all of the loads associated with the demand limiting and load rolling program, and status icons for each load are to indicate:
 - .1 Load Is Offline;
 - .2 Load Is Disabled;
 - .3 Load Is Shed;
 - .4 Load Is Locked;
 - .5 Load Is In Comfort Override.
- .14 the Load Summary is to include a load summary runtime view listing the following load conditions:
 - .1 Load Priority;
 - .2 Shed Strategy;
 - .3 Load Rating;
 - .4 Present Value;

- .5 Ineligible Status;
- .6 Active Timer;
- .7 Time Remaining;
- .8 Last Shed time.

2.05 MANAGEMENT LEVEL PROCESSOR (MLP)

- .1 Management Level Processor (MLP) shall reside at the top of the BAS system hierarchy, exercising control and management over the connected sub-systems.
- .2 A Management Level Processor (MLP) shall be a server connected to a desktop computer for use by management personnel to collect, store, and process data for reports on energy use, operating costs, and alarm activity.
- .3 The Management Level Processor (MLP) shall be capable of accessing points or data in all the lower level Processors and Controllers.
- .4 Many of the functions of the Management Level Processor (MLP) may be combined into a Building Control Unit (BCU).

2.06 BUILDING CONTROL UNIT (BCU)

- .1 Building Control Units (BCUs) are to be UL listed and labelled, BACnet Testing Labs certified and labelled, fully user programmable supervisory controllers to monitor a network of up to a minimum of ninety distributed Field Equipment Controllers (FECs) and Zone Level Controllers (ZLCs) over the BAS Local Area Network (LAN) for a global strategy and direction and to communicate on a peer-to-peer basis with other Building Control Units (BCUs)
- .2 User Interface: Each Building Control Units (BCUs) is to have the ability to deliver a web based user interface as specified above, and all computers connected physically or virtually to the automation network are to have access to the web based user interface. Additional characteristics/requirements are as follows:
 - .1 the web based user interface software is to be imbedded in each BCU;
 - .2 each BCU is to support a minimum of four concurrent users;
 - .3 the user is to be capable of accessing all system data through one BCU;
 - .4 remote users connected to the network through an internet service provider or by telephone dial-up are also to have total system access through one BCU;
 - .5 each BCU is to be capable of generating web based user interface graphics, and this capability is to be imbedded in the BCU;
 - .6 the user interface is to support the following functions using a standard version of Microsoft Internet Explorer:
 - .1 configuration;
 - .2 commissioning;
 - .3 data archiving;
 - .4 monitoring;
 - .5 commanding;
 - .6 system diagnostics.
 - .7 each BCU is to permit temporary use of portable devices without interrupting the normal operation of permanently connected modems.
- .3 Processor: Each Building Control Unit (BCU) is to be a multi-tasking, multi-user, microprocessor based real time digital control processor sized to meet requirements of the system with a minimum word size of 32 bits, and standard operating systems.
- .4 Memory: Each Building Control Unit (BCU) is to have sufficient memory to support its own operating system, databases, and control programs to provide supervisory control for all control level devices.

- .5 Real Time Clock: Each Building Control Unit (BCU) is to include an integrated, hardware based real time clock.
- .6 LED Indicators: Building Control Unit (BCU) is to be equipped with LED indicators to identify the following conditions:
 - .1 Power, On/Off;
 - .2 Ethernet Traffic, Ethernet Traffic/No Ethernet Traffic;
 - .3 Ethernet Connection Speed, 10 Mbps/100 Mbps;
 - .4 FC Bus A, Normal Communications/No Field Communications;
 - .5 FC Bus B, Normal Communications/No Field Communications;
 - .6 Peer Communication, data traffic between Building Control Units (BCUs);
 - .7 Run, BUC Running/BCU in Start-up/BCU Shutting Down/Software Not Running;
 - .8 Battery Fault, Battery Defective/Data Protection Battery Not Installed;
 - .9 24 VAC, 24 VAC Present/Loss of 24 VAC;
 - .10 Fault, General Fault;
 - .11 Modem RX, BCU Modem Receiving Data;
 - .12 Modem TX, BCU Modem Transmitting Data.
- .7 Communications Ports: Each Building Control Unit (BCU) is to be equipped with ports for operation of operator input/output devices such as industry standard computers, modems, and portable operator's terminals. Ports are to be as follows:
 - .1 two USB ports;
 - .2 two URS-232 serial data communication ports;
 - .3 two RS-485 ports;
 - .4 one Ethernet port.
- .8 Diagnostics: Each Building Control Unit (BCU) is to continually perform self-diagnostics, communications diagnostics, and diagnostics of all pane components, and transmit both local and remote annunciation of any detected component failure, low battery condition, and repeated failures to establish communication.
- .9 Power Failure: In the event of loss of normal power each Building Control Unit (BCU) is to continue to operate for a user adjustable period of up to two hours after which there is to be an orderly shut-down of all programs to prevent the loss of database or operating system software, and:
 - .1 during a loss of normal power the control sequences are to go to the normal system shutdown conditions, and all critical configuration data is to be saved into Flash memory;
 - .2 upon restoration of normal power and after a minimum off-time delay the controller is to automatically resume full operation through a normal soft-start sequence without manual intervention.

2.07 FIELD EQUIPMENT CONTROLLER (FEC)

- .1 Field Equipment Controller (FEC) shall be incorporate microprocessor-based controller that control centrally located HVAC equipment such as central air handling units, central chiller plants, and central boiler plants and other similar complex arrangements involving multiple equipment.
- .2 Field Equipment Controllers (FECs) shall communicate with Building Control Units (BCUs) over the BAS Local Area Network (LAN).
- .3 Field Equipment Controllers (FECs) may interface with controlled equipment directly through sensors and actuators, or indirectly through communications links with Zone Level Controllers (ZLC).

- .4 Field Equipment Controllers will incorporate input/output (I/O) device capability, a library of control programs, may control more than one mechanical system from a single controller, and must include a terminal communication port for an Operating Terminal plug-in.
- .5 Each Field Equipment Controller (FEC) is to be a fully user programmable BACnet Testing Labs certified and labelled digital controller that communicates via BACnet MS/TP protocol. Each controller is to be housed in a plenum rated plastic housing with removable base to permit pre-wiring of analog and binary input/output field points without the controller in place.
- .6 Each Field Equipment Controller (FEC) is to employ a finite state control engine to eliminate unnecessary conflicts between control functions at crossover points in their operational sequences, and are to be factory programmed with a continuous adaptive tuning algorithm that sense changes in the physical environment and continually adjusts loop tuning parameters appropriately.
- .7 Each field equipment controller is to:
 - .1 include troubleshooting LED's to identify the following conditions:
 - .1 Power On;
 - .2 Power Off;
 - .3 Download or Start-Up In Progress-Not Ready For Normal Operation;
 - .4 No Faults;
 - .5 Device Fault;
 - .6 Field Controller Bus-Normal Data Transmission;
 - .7 Field Controller Bus-No Data Transmission;
 - .8 Field Controller Bus-No Communication;
 - .9 Sensor Actuator Bus-Normal Data Transmission;
 - .10 Sensor Actuator Bus-No Data Transmission;
 - .11 Sensor Actuator Bus-No Communication.
 - .2 support universal inputs, configured to monitor any of the following:
 - .1 analog input, voltage mode;
 - .2 analog output, current mode;
 - .3 analog input, resistive mode;
 - .4 binary input, dry contact maintained mode;
 - .5 binary input, pulse counter mode.
 - .3 support binary inputs configured to monitor either of the following:
 - .1 dry contact maintained mode;
 - .2 pulse counter mode.
 - .4 support analog outputs configured to output either of the following:
 - .1 analog output, voltage mode;
 - .2 analog output, current mode.
 - .5 support binary outputs, 24 VAC Triac;
 - .6 support configurable outputs capable of the following:
 - .1 analog output, voltage mode;
 - .2 binary output mode.
 - .7 have the ability to reside on a master-slave/token-passing field controller bus supporting BACnet standard protocol as follows:

- .1 support communications, including input/output communications between the field controllers and the network automation engines;
- .2 support a minimum of one hundred input/output modules and field equipment controllers in any combination;
- .3 operate at a maximum distance of 4560 m (15,000') between the field controller and the furthest connected device.
- .8 have the ability to monitor and control a network of sensors and actuators over a master-slave/token-passing sensor-actuator bus supporting BACnet standard protocol as follows:
 - .1 the bus is to support a minimum of ten devices per trunk;
 - .2 the bus is to operate at a maximum distance of 365 m (1200') between the field controller and the furthest connected device.
- .9 the capability of executing complex control sequences involving direct wired input/output points as well as input and output devices communicating over the field controller bus or sensor-actuator bus;
- .10 support, but not limited to, the following:
 - .1 hot water, chilled water/central plant applications;
 - .2 custom air handling units for special applications;
 - .3 terminal units;
 - .4 special programs as required for systems control.
- .11 support a password protected local controller LCD back-lit display with six key keypad as an integral part of the field controller or as a remote device communicating over the sensor-actuator bus to permit the user to view monitored points without logging into the system, and to view and change set-points, modes of operation, and parameters;

2.08 INPUT/OUTPUT MODULES

- .1 Input/output modules to facilitate additional inputs and outputs for use with the Field Equipment Controller (FEC), are to similar to the FEC, but less the display and with a minimum of four and a maximum of seventeen points.
- .2 Input/Output Modules that are integral to a building Smoke Control System shall be listed to UL 864, UUKL category.

2.09 ZONE LEVEL CONTROLLER (ZLC)

- .1 Zone Level Controllers (ZLCs) shall be microprocessor-based controllers that control distributed or terminal equipment including:
 - .1 VAV Boxes;
 - .2 Fan Coil Units;
 - .3 Heat Pumps;
 - .4 Unit Ventilators;
 - .5 Cabinet Unit Heaters;
 - .6 Unit Heaters;
 - .7 Perimeter Heating Elements (Walfin, Radiant Panels, and similar);
 - .8 Other similar terminal devices.
- .2 At the Zone Level Controller (ZLC), sensors and actuators shall interface directly with the controlled equipment. These controllers are expected to have relatively few connected I/O devices, incorporate standard control sequences, and be dedicated to specific types of application control.

- .3 Within the BAS architecture, Zone Level Controllers (ZLCs) shall provide processing of point data for higher level processors such as Field Equipment Controllers (FECs), and Building Control Units (BCUs).

2.10 LOCAL CONTROL PANELS

- .1 NEMA/EEMAC 12 (NEMA/EEMAC 3R in sprinklered areas) wall mounting, enamelled steel barriered enclosures sized to suit the application with 20% spare capacity, a perforated sub-panel, numbered terminal strips for all low and line voltage wiring, hinged door, and slotted flush latch.
- .2 Local Control Panels may be used to house Zone Level Controllers (ZLCs) and other local BAS instrumentation.

2.11 ELECTRIC WIRING, CONDUIT AND JUNCTION BOXES

- .1 Refer to Division 26 for wiring, conduit and junction box requirements.

2.12 SYSTEM CONFIGURATION TOOLS

- .1 System Configuration Tool: The system configuration tool is a software package supplied with the BAS to enable a computer platform to be used as a stand-alone engineering configuration tool for a BCU and to permit programming of FECs and ZLCs. The configuration tool is to provide an archive database for the configuration and application data and is to have the same look and feel at the user interface regardless of whether the configuration is being done online or offline. Additional features and characteristics are as follows:
 - .1 the tool is to include:
 - .1 basic system navigation tree for connected networks;
 - .2 integration of system enabled devices;
 - .3 customized user navigation tress;
 - .4 point naming operator parameter setting;
 - .5 graphic diagram configuration;
 - .6 alarm and event message routing;
 - .7 graphical logic connector tool for custom programming;
 - .8 downloading, uploading, and archiving databases.
 - .2 the tool is to have the capability to automatically discover field devices on connected buses and networks;
 - .3 the tool is to be capable of configuring from a library of standard applications, simulating to verify applications, and commissioning FECs and field devices;
 - .4 the tool is to be complete with a Bluetooth Wireless Technology wireless access point to enable a wireless enabled portable computer to make a temporary Ethernet connection to the automation network.
- .2 Wireless MS/TP Converter: The Bluetooth Wireless Technology converter is to provide temporary wireless connection between field-controller bus and a wireless enabled portable computer. The converter is to be powered through a connection to either field-controller bus and is to support downloading and troubleshooting ECUs and field devices from the portable computer over the wireless connection. The converter is to be complete with LED indicators for the following conditions:
 - .1 Power: On/Off;
 - .2 Fault: Fault/No Fault;
 - .3 SA/FC Bus: Bus Activity/No Bus Activity;
 - .4 Bluetooth: Bluetooth Communication Established/Bluetooth Communication Not Established.

2.13 NAMEPLATES

- .1 All control equipment is to be labelled with new lamacoid plates with a designation corresponding to the specific system point description/label. All lamacoids shall be mechanically fastened (screwed or pop-riveted) to surfaces. Submit samples to Owner for approval.
- .2 All manual switches, unless they come with standard nameplates, are to be labelled. All thermostats, thermometers and switches installed on all local panels shall be similarly labelled. Permanent painted stencil labels may be used on controllers and relays mounted inside local panels, if so desired. Tape labels are not acceptable.
- .3 All duct and pipe mounted sensors, ASC's, and similar devices are to be similarly labelled.
- .4 Provide, on all equipment operated by BAS, red lamacoid tags with white lettering reading: "Warning: This equipment may start at any time. Do not service without disconnecting power."

PART 3 - EXECUTION

3.01 GENERAL

- .1 Examination:
 - .1 Inspect site and thoroughly examine documents to establish locations for control devices and equipment and report discrepancies, conflicts, or omissions for resolution before starting rough-in work.
 - .2 Be responsible for correction of defects caused through neglect of inspections and examinations or failure to report and resolve discrepancies.
- .2 Protection:
 - .1 Protect work and material against damage during construction and be responsible for work and equipment until inspected, tested, and accepted.
 - .2 Protect material not immediately installed and close open ends with temporary covers or plugs during storage and construction to prevent entry of foreign objects.
 - .3 Protect electronic equipment from elements during construction.
- .3 Coordination:
 - .1 Coordinate and schedule control work with other work in same area to ensure orderly progress.
 - .2 Testing and balancing:
 - .1 Supply set of tools for Testing and Balancing Technicians to interface to control system, train these technicians in use of tools and provide qualified Control Technician to assist with testing and balancing first 10 terminal units.
 - .2 Tools to be turned over to Owners on completion and sign-off of testing and balancing.
- .4 Controls work by others:
 - .1 Integrate and coordinate this control work with controls and control devices provided or installed by Others.
 - .2 Each supplier of control product to configure, program, start up, and test that product to satisfy requirements of Sequence of Operation regardless of where within contract documents product is specified or described.
 - .3 Resolve compatibility issues between control products provided by Control Trades and those provided by other Mechanical and Electrical Trades.
- .5 General Workmanship:
 - .1 Installation to be performed by skilled and certified technicians.
 - .2 All equipment shall be located for ease of maintenance and service access.
 - .3 Install equipment, piping, and wiring or raceways horizontally, vertically, and parallel to building lines.

- .4 Provide sufficient slack and flexibility in connections to allow for vibration isolation between conduit, raceways, piping and equipment.
- .5 Verify wiring integrity to ensure continuity and freedom from shorts and ground faults.
- .6 Install instrumentation and devices in locations providing adequate ambient conditions.
- .7 Protect components placed in areas of potentially high humidity.
- .6 Cleaning:
 - .1 Clean up debris, remove packaging material, collect waste and place in designated location, on a daily basis.
 - .2 Keep work areas free from dust, dirt, and debris.
 - .3 On completion of work, check finish of equipment provided under this section for damage and repair damaged factory-finished paint, replace deformed cabinets and enclosures with new material, and repaint to match original.
- .7 Field Quality Control:
 - .1 Ensure work, materials, and equipment comply with this specification and approved shop drawings.
 - .2 Monitor field installation for code compliance and workmanship quality.
 - .3 Arrange and pay for inspections required by Authorities Having Jurisdiction (AHJs).

3.02 EQUIPMENT LOCATION

- .1 Distributed Equipment:
 - .1 All distributed equipment such as VAV boxes, Rooftop units, unit ventilators, fan coil units, and similar terminal equipment that utilize dedicated BAS controllers, shall have locally mounted controllers in accessible locations within the building envelope.
 - .2 All locally mounted controllers shall be installed in enclosures suitable for that location. BAS controllers for mechanical equipment other than those listed above shall be mounted in mechanical rooms as noted below, unless specifically approved by the Consultant.
 - .3 All other BAS controllers, and interface devices that require regular inspection or that serve multiple HVAC systems shall be located in mechanical rooms, or in pre-approved storage rooms, or janitor closets.
 - .4 No BAS panel shall be located inside the rooftop fan enclosure under any circumstances. All BAS panels shall be located within the building envelope, and shall be enclosed in a metal locking enclosure.
- .2 All equipment located in mechanical rooms, storage rooms or janitor closets shall be installed in metal cabinets with hinged, lockable covers.
- .3 Transformers or power supplies for terminal control valves, actuators or zone controllers shall not be located in ceiling spaces unless approved by the Consultant. When transformers are installed above ceilings, transformers shall be installed in metal enclosures, and the location shall be clearly labeled on the ceiling to indicate power transformer location.
- .4 A 120 VAC duplex receptacle for laptop power shall be provided if the cabinet is located further than 5'-0" (1500mm) laterally from the nearest outlet.

3.03 ELECTRIC WIRING, CONDUIT AND JUNCTION BOXES

- .1 All wiring line and low voltage shall be installed in EMT conduit unless specifically specified otherwise.
- .2 All wiring shall be in accordance with the Ontario Electrical Code and any applicable local codes. All BAS wiring shall be installed in conduit unless otherwise allowed by the Ontario Electrical Code or applicable local codes. Where BAS plenum-rated cable wiring is allowed, it shall be run parallel to, or at right angles to, the structure, properly supported and installed in a neat and workmanlike

- manner. BAS wiring that runs in exposed ceiling spaces (eg garages, mechanical rooms) shall be installed in conduit.
- .3 In accessible ceilings, wiring from BAS controllers to sensors and actuators, control system network and low voltage wiring only may be installed with yellow jacket LVT cable. Where the ceiling is used as a return air plenum install plenum rated yellow jacket cable instead of LVT.
 - .4 BX or flex conduit may only be used for the final (approximately one meter) run to controls devices, where the controls equipment is mounted on vibrating machinery.
 - .5 Install EMT and cable at right angles to building lines, securely fastened, and in accordance with the standards set out in Division 26.
 - .6 No wire smaller than 18 gauge is to be used on the project except for: wiring between terminal computer devices, wire in standard communication cables, such as printers and short haul modems, wire used in communication networks, i.e. any cable transferring digital data, using twisted shielded pairs.
 - .7 All field wiring including sensor wiring and wiring from panels to devices shall be continuous. The use of wire connectors, wire nuts or splicing is not allowed.
 - .8 Provide wells for all specified temperature sensors in hydronic piping system. Strap-on sensors may be only be used where a well installation is not possible. Obtain approval of Engineer for the use of strap-on sensors.
 - .9 Power for control system shall not be obtained by tapping into miscellaneous circuits that could be inadvertently be switched off.
 - .10 Mount transformers and other peripheral equipment in panels located in serviceable areas. Provide line side breakers/fuses for all transformers.
 - .11 All 120 VAC power for any controls equipment shall be from dedicated circuits. Provide a breaker lock for each breaker used to supply the control system. Update the panel circuit directory.
 - .12 The controller may be powered from the equipment that it is directly controlling (i.e. heat pump, roof-top unit) only if the controller controls no other equipment and the power supply to the controller remains energized independently of unit operation or status.
 - .13 All BAS control wiring shall be yellow jacket for identification purpose.
 - .14 The breaker or power isolation location shall be clearly marked on the inside door of each BAS panel enclosure.
 - .15 Wiring in ceiling spaces to be installed clear of ceiling tiles and lights to allow access and removal of tiles and lights.
 - .16 Contractor shall prepare a wiring mock-up of a typical system/device/main panel to demonstrate quality and workmanship for approval by the Region. This approved mock- up quality shall be maintained throughout the entire installation. System requiring mock- up to be discussed with the Region's Project Manager.
 - .17 All wiring shall be routed orthogonally and drops shall have additional wiring coiled in ceilings to facilitate future sensor relocation.
 - .18 Wiring in ceiling spaces to be secured/tied every 48" minimum.
 - .19 Surge suppression shall comply, as a minimum, with the manufacturer's requirements.
 - .20 All equipment including controllers shall be grounded.
 - .21 All end-of-wire connectors shall be certified.
 - .22 All components shall be labelled and detailed in manuals.
 - .23 All wiring systems shall be colour coded to simplify maintenance.
 - .24 The 120VAC power wiring to each Management Level Panel (MLP), Building Control Unit (BCU), and Field Equipment Controller (FEC) shall be a dedicated run, with a separate breaker. Each run will include a separate hot, neutral and ground wire. The ground wire will terminate at the breaker panel ground. This circuit will not feed any other circuit or device.

- .25 Wiring is to be kept a minimum of six (6) inches from hot water, steam, or condensate piping. Where sensor wires leave the conduit system, they are to be protected by a plastic insert.

3.04 IDENTIFICATION AND LABELLING OF EQUIPMENT AND CIRCUITS

- .1 All panels must have a lamacoid tag (min. 3"x1") affixed to the front face indicating panel designation and function (i.e. "BAS Panel 1" or "Relay Panel 3").
- .2 All field sensors or devices must have a lamacoid tag (min. 3"x1") attached with tie-wrap or adhesive indicating the point software name and hardware address (i.e. AHU1_MAT, 2.IP4).
- .3 Room sensors and other sensors in finished areas will require a device tag.
- .4 All devices within a field enclosure will be identified via a label or tag.
- .5 All BAS panel power sources must be identified by an adhesive label indicating the source power panel designation and circuit number on the outside of the enclosure door (i.e. "120vac fed from LP-2A cct #1).
- .6 All field equipment panels fed from more than one power source must have a warning label on the front cover.
- .7 All wires will be identified with self-adhesive wire labels or clip-on plastic wire markers at both ends.
- .8 All rotating equipment controlled by the BAS will have a tag or label affixed indicating that the equipment may start without warning.
- .9 All BAS panels will have a points list sheet (within a plastic sleeve) attached to the inside door. The points list will identify the following for each point: Panel number, panel location, hardware address, software name, point description, field device type, point type (i.e. AI or DO), device fail position, device manufacturer and model number or reference and wire tag reference.
- .10 Where required, field panels will have wiring diagrams attached to the inside door.
- .11 Provide new or modify existing equipment wiring diagrams (i.e. boilers, chillers, etc.) wherever the BAS interfaces to other equipment.

3.05 CONTROL SYSTEMS

- .1 Install the entire Control system under supervision of factory trained engineers and technicians fully capable of providing instruction, routine maintenance, programming and emergency maintenance service on all system components.
- .2 During the Operator Training period and at no extra cost, make any required program changes to enable optimum system operation as directed by the Consultant.
- .3 Provide "status" confirmation by using auxiliary starter contacts load side activated relays or current transformer switches rated for design load operation for pumps. Use load side activated relays or auxiliary relay contacts for single phase motors. Use pressure differential switches for fans.
- .4 For stop/start operation wire only to starter "Auto" circuit. Failure to stop and start to register as an alarm.
- .5 In the event of a control system failure from any cause, provide for normally "ON" sequence for equipment such as boilers, boiler pumps, heating pumps and coil circulation pumps and normally open to heating for scheduling valves and other 3-port valves to prevent coil and equipment freeze-up.
- .6 Provide a minimum of two spare input and two spare output points on each controller.
- .7 Where motor operation is specified to provide enable/disable, permissive or sequential operation, use programming software wherever possible or provide hard wire interlocks.

3.06 BAS DATABASE NAMING CONVENTIONS & PROGRAMS

- .1 All BAS programs shall be created in each panel in logical order as determined by the equipment being controlled by each panel on the network.

- .2 All programs and program code is to follow proper coding practices including internal comments to describe the function of the statements and also ensure the source code is formatted in a consistent and logical manner. Programming coding should be kept as simple as possible.
- .3 System Schedules shall be submitted for Owner's approval and will include global and local scheduling.
- .4 The Outdoor Air Temperature Program shall be in its own program named OAT PG.
- .5 Network Status Panel Naming Conventions should indicate the building, panel location and panel number. The building name can be abbreviated as necessary to fit in the space.

3.07 CONTROL PROGRAMMING

- .1 General:
 - .1 The control programs shall be modular and structured in order to provide specific control operation of HVAC components.
 - .2 All control programs shall provide a minimum of 20% spare memory for expansion.
 - .3 Each control program shall contain "REM" statements which explain this program operation.
 - .4 Each control program shall open with a list of the I/O points used and controlled in the program.
- .2 Sensors and Devices - are listed in this specification. Provide 5% spare I/O capacity.
- .3 Implement all control program concepts in full, or partial as required, to provide complete HVAC equipment control. The programs shall perform all control strategies on the basis of protecting equipment operation, saving operational energy costs, and indicating alarm conditions.
- .4 Programs which increase the system energy consumption or cause equipment failures will be refused and resolved by the contractor at no additional cost to the Owner.

3.08 CONTROL SYSTEM GRAPHICS

- .1 BAS graphics shall incorporate, as a minimum, the following information for each system type as noted:
 - .1 Architecture Panel Layout (Locations on Floor Plans)
 - .1 Locations of each panel on each floor plan level
 - .2 Panel types indicated by different icon
 - .3 Controls transformers locations
 - .4 Main network wiring and sub-network wiring layout
 - .2 Floor Plans graphics
 - .1 Room numbers accurate as per room signage
 - .2 Mechanical rooms locations & signage tags
 - .3 Space temperatures for every temperature on each floor in appropriate room
 - .4 Space focus pick area for individual room control where applicable shall be yellow text
 - .5 Air Handler symbols indicating areas of the floor plan serviced by each air handler by a corresponding colour
 - .6 Status of Air Handler by colour change Red for off status, or text indication
 - .7 Supply air temperature for each air handler
 - .3 Air Handler (AHU) graphic
 - .1 Accurate representation of the AHU design
 - .2 All associated control points to be displayed

- .3 All points to be monitored for automatic mode and shall be displayed when in Manual mode
- .4 A calculated percentage of fresh air shall be indicated on the AHU graphic
- .5 Operator offset adjustment of the supply air setpoint, adjustable directly from the graphic
- .6 AHU physical location shall be indicated on the graphic
- .7 Weekly occupied time of day schedule for the associated AHU shall be accessible directly from the graphic by selecting an icon
- .8 Weekly student time of day schedule for the associated AHU shall be accessible directly from the graphic by selecting an icon
- .9 Trend logs shall be accessible directly from the graphic by selecting an icon
- .4 Boiler graphic
 - .1 Boiler graphic piping layout shall be accurate as per piping layout
 - .2 All associated control points for the boiler system to be displayed
 - .3 Operator offset adjustment of the scheduled water setpoint, adjustable directly from the graphic
 - .4 Lead boiler and boiler stages shall be indicated
 - .5 Lead pump shall be indicated
 - .6 Boiler status shall be indicated graphically
 - .7 Pump status shall be indicated graphically
 - .8 Calculated scheduled water setpoints to be displayed
 - .9 Operator offset editable directly from the graphic screen
 - .10 Weekly time of day schedule for the building occupied schedule shall be accessible directly from the graphic by selecting an icon
 - .11 Trend logs shall be accessible directly from the graphic by selecting an icon
- .5 Exhaust fans graphic
 - .1 Exhaust fans control shall be editable directly from the graphic
 - .2 Exhaust fan status shall be indicated in text and a change in the exhaust fan icon
 - .3 Exhaust fan physical location shall be indicated on the graphic
 - .4 Area of the building being exhausted shall be indicated on the graphic

3.09 BAS TESTING, COMMISSIONING AND ACCEPTANCE

- .1 Comply with requirements of Article entitled "BAS Testing, Commissioning and Acceptance" in Section 25 05 10 BAS General Requirements.
- .2 Ensure the Work has met requirements outlined in the Article entitled 'Completion' found in Section 20 01 10.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.
- .2 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .3 Comply with requirements of Section 20 10 50 Basic Materials and Methods.
- .4 Comply with the requirements of Section 20 05 70 Motors, Motor Starters and Wiring
- .5 Comply with the requirements of Section 20 05 75 Variable Frequency Drives.
- .6 Comply with the requirements of Section 25 05 10 BAS General Requirements.
- .7 Comply with the requirements of Section 25 10 10 BAS Control Network.
- .8 Comply with the requirements of Section 25 56 26 Integrated Lighting System Controls

1.02 SCOPE OF WORK

- .1 Provide all controls, instrumentation and wiring as specified and as may be required for the control of building systems as intended by the design.
- .2 System shall be designed to provide robust activation and control of mechanical systems and equipment to maintain equipment operating sequences, schedules and setpoints.
- .3 Provide all detailed design, labour, materials, products and Instrumentation necessary for Building Automation System (BAS) to function as intended by the Sequence of Operations indicated in the Documents.
- .4 Ensure that the equipment and system operation is fully coordinated within the construction documents, verify quantities and types of dampers, operators, alarms, and other control devices to be provided. Any discrepancies between contract documents, the greater quantity and better quality shall take precedence.
- .5 Electromagnetic starters with required number of ancillary contactors will be provided by Mechanical Trades unless supplied as an integral part of equipment. Where integral starters are supplied with equipment provide all additional wiring and ancillary devices to achieve specified control sequences.
- .6 Provide Owner's Training on the operation of the BAS.
- .7 Provide BAS As-built documentation, and Operating and Maintenance (O&M) manuals and instructions.
- .8 Arrange for all the necessary inspections and approvals of built-up and modified control systems and relay panels by the Authorities Having Jurisdiction ("AHJ's"). All electrical equipment, material and its installation shall conform to the current requirements of the AHJ's including:
 - .1 Ontario Electrical Safety Code ("OESC")
 - .2 Ontario Building Code ("OBC")
 - .3 Ontario Fire Code ("OFC")
 - .4 Canadian Standards Association ("CSA")
- .9 Generally control systems, algorithms and sequence programming shall follow requirements outline is ASHRAE Guideline 35 - High-Performance Sequences of Operation for HVAC Systems. Any proposed deviations from the Standard shall be reviewed with the Consultant prior to implementation on site.

1.03 SUBMITTALS

- .1 Submit shop drawings for all instrumentation and devices provided.
- .2 Submit shop drawing of schematics with operational descriptions for all control system sequences provided.

- .3 Automatic Control Valve shop drawings shall clearly show the following for each valve:
 - .1 Associated system.
 - .2 Manufacturer and model number with the indication of the medium
 - .3 Valve size and line size.
 - .4 Flow-rate, flow coefficient (Cv) and pressure drop at design conditions, and pressure drop across the associated mechanical equipment, (i.e. coil, heat exchanger, or similar heat transfer device) at design conditions.
 - .5 Valve configuration (e.g. two-way, three-way, butterfly).
 - .6 Leakage rate.
 - .7 Maximum pressure shut-off capability.
 - .8 Actuator manufacturer and model number.
 - .9 Valve body pressure and temperature rating,
 - .10 Normally Open or Normally Closed (failure) positions.

PART 2 - PRODUCTS

2.01 GENERAL REQUIREMENTS

- .1 A general guideline requires all new devices to be provided as specified. Sensors must provide responses that deliver accurate, reliable control of mechanical equipment.
- .2 Sensors and control devices are to be industry standard products that can be purchased by the Owner from the manufacturer.
- .3 Components installed within motor control devices to be designed to operate with transient electrical fields occurring within these devices.
- .4 NEMA 1 (NEMA 3R in sprinklered areas) sheet metal cubicles with vertically hinged lockable doors, panel(s) mounted outdoors shall meet NEMA 4 rating.
- .5 sensors, transducers, BAS controllers, and relays mounted on backing board and/or DIN rails within inner section,
- .6 enclosures to house controllers, power supplies for sensors and associated transformers, control relays, contractors, safety circuits wiring, conduits and other auxiliary equipment; enclosure shall be sized for twenty percent spare mounting space.
- .7 engraved lamaroid labels with white lettering indicating function of each sensor, transducer, controller, gauge and instrument.
- .8 wiring terminations shall be labelled
- .9 EMT conduit openings and adapters in sufficient quantities and sizes to accommodate wiring terminating within enclosure
- .10 wiring within enclosure installed in neat and protected manner, enclosed in wireways or plastic conduit.
- .11 inside each panel, one set of as built, plasticized control Shop Drawings for equipment served by that panel permanently affixed to cabinet frame.

2.02 TEMPERATURE SENSORS

- .1 General Requirements:
 - .1 Acceptable temperature sensing technologies:
 - .1 Resistance Temperature Device (RTD) of precision platinum element with:
 - .1 linear characteristics over sensor range,
 - .2 1000 Ω Platinum, IEC 751, 385 Alpha, thin film sensor,
 - .3 temperature coefficient of resistance $0.00385\Omega/\Omega/^{\circ}\text{C}$,

- .4 +/-0.3°C (+/-0.54°F) @ 0°C (32°F) sensor accuracy,
- .5 transducing circuit for 0-10,000 Ω linear output in 0.5°C (0.9°F) increments at 16-26°C (60-80°F) temperature range compatible with equipment controller
- .2 Resistance Temperature Device (RTD) of precision thin film nickel element with:
 - .1 linear characteristics over sensor range,
 - .2 1000 Ω Nickel, Class B, DIN 43760 sensor
 - .3 temperature coefficient of resistance 0.006178Ω/Ω/°C,
 - .4 +/-0.4°C (+/-0.72°F) @ 0°C (32°F) sensor accuracy,
 - .5 transducing circuit for 0-10,000 Ω linear output in 0.5°C (0.9°F) increments at 16-26°C (60-80°F) temperature range compatible with equipment controller
- .3 Thermistor element type with:
 - .1 non-linear, curve matched over sensor range,
 - .2 10,000 Ω at 25°C (77°F), NTC Type III, +/-0.2°C (+/-0.36°F) sensor
 - .3 +/-0.2°C (+/-0.36°F) sensor accuracy over 0°C to 70°C (32°F to 158°F),
 - .4 long term stability of 0.025°C (0.045°F) drift per year
 - .5 transducing circuit for 0-10,000 Ω linear output in 0.5°C (0.9°F) increments at 16-26°C (60-80°F) temperature range compatible with equipment controller
- .2 Provide temperature sensors, with accuracy as noted, in the following applications:
 - .1 chilled water, chilled glycol solution, outdoor air temperature: +/-0.2°C (+/-0.45°F);
 - .2 heating water, heating glycol solution, condenser water, duct dry-bulb temperature points: +/-0.3°C (+/-0.9°F);
 - .3 room dry-bulb temperature: +/-0.4°C (+/-1.35°F);
 - .4 algorithm(s) for measuring dewpoint temperature, wet-bulb temperature, and enthalpy: +/-0.2°C (+/-0.45°F);
 - .5 algorithm(s) used as part of metering applications: +/-0.2°C (+/-0.45°F);
- .3 Each temperature sensor shall be as follows:
 - .1 Complete with a custom label that references the model, manufacturer, specifications, and BAS point I.D.
 - .2 Complete with two (2) integral anchored lead wires
 - .3 Complete with a waterproof sensor to sheath seal
 - .4 strain minimizing construction
 - .5 Capable of being secured to standard junction box termination with cover
 - .6 Complete with pig-tail wire leads with wire nuts or screwed terminal connector block
 - .7 Factory calibrated and capable of end to end (sensing element to BAS), accuracy noted above, over full operating range of measured variable.
 - .8 Complete with a serial communications port for portable PC or hand held commissioning equipment.
- .2 Adjustable room/ space dry-bulb temperature sensors with display, Type 1:
 - .1 For measurement and adjustment of space dry-bulb temperatures in rooms at designated location and where ever called for on the Drawings or Sequences of Operation.
 - .2 Field configure for either °C or °F display;

- .3 sensor ambient operating temperature range from 0 to 50°C (32 to 122°F), 5 to 95 %RH non-condensing,
- .4 three digit LED digital temperature display with 0.5° display resolution
- .5 Up / Down keypad for ten (10) step temperature setpoint adjustment between 20°C to 25°C (68°F to 78°F);
- .6 Dry contact occupancy override feature;
- .7 minimum / maximum limit set point values adjustable from BAS operator interface and Controller
- .8 surface mounted plastic mono-chromatic guard with surface mounting plate and wall anchors; guard secured to mounting plate by screws.
- .9 When used with multi-speed terminal device such as a fan coil unit or cabinet heater, provide five (5) position fan speed switch - Off, Auto, Low, Medium, High – using resistive signal reference 0, 2, 4, 6, 8 KΩ respectively.
- .3 Room/ space dry-bulb temperature sensors (no adjustment, no display), Type 2:
 - .1 for measurement of space dry-bulb temperatures throughout facility
 - .2 sensor ambient operating temperature range from 0 to 70°C (32 to 158°F), non-condensing 5 to 95% RH
 - .3 surface mounted plastic mono-chromatic guard with surface mounting plate and wall anchors.
 - .4 guard secured to mounting plate by screws.
- .4 Secure area room/ space dry-bulb temperature sensors (no adjustment, no display), Type 3:
 - .1 for measurement of space dry-bulb temperatures at locations subject to vandalism, including spaces designated for Mental Health care, and where ever called for on the Drawings or Sequences of Operation.
 - .2 sensor ambient operating temperature range from -20 to 60°C (-4 to 140°F), non-condensing 5 to 95% RH
 - .3 stainless steel flat plate surface type with sensor epoxy-bonded to back of cover plate.
 - .4 tamperproof / secure concealed fasteners.
- .5 Concealed (Button) type room/ space dry-bulb temperature sensors (no adjustment, no display), Type 4:
 - .1 for measurement of space dry-bulb temperatures at locations where sensor is intended to be inconspicuous and where ever called for on the Drawings or Sequences of Operation.
 - .2 sensor ambient operating temperature range from -40 to 60°C (-40 to 140°F), non-condensing 5 to 95% RH
 - .3 White plastic button, paintable, for interior use only, IP30 (NEMA 1)
- .6 Duct mount probe type dry-bulb temperature sensors:
 - .1 for measurement of a single point dry-bulb temperature within a ducts of cross section less than 0.4 sq.m (4 sq.ft.), including toilet exhaust branch ducts and/or return ductwork serving areas subject to excessive vandalism such as prisoner holding cells and where ever called for on the Drawings or Sequences of Operation.
 - .2 sensor ambient operating temperature range from -40°C to 60°C (-40°F to 140°F), non-condensing 5 to 95% RH
 - .3 6.35mm (0.25") diameter, 304 series stainless steel probe
 - .4 metal mounting plate
 - .5 provide multiple sensors where single element cannot be located to provide proper duct or plenum temperature sampling.

- .7 Duct mounted probe type dry-bulb temperature sensors:
 - .1 for measurement of a single point dry-bulb temperature within a ducts of **cross section larger than 0.4 sq.m (4 sq ft)**, including toilet exhaust branch ducts and/or return ductwork serving areas subject to excessive vandalism such as prisoner holding cells and where ever called for on the Drawings or Sequences of Operation;
 - .2 insertion elements for single point temperature measurement inside duct;
 - .3 6 mm (0.236") diameter, 304 series stainless steel probe;
 - .4 -40 to 50°C (-40 to 122°F), 5 to 95% RH non-condensing;
 - .5 Standard lengths: 50 mm (2"), 100 mm (4"), 150 mm (6"), 200 mm (8"), 300 mm (12"), and 450 mm (18");
- .8 Duct averaging element type dry-bulb temperature sensors:
 - .1 for measurement of average dry-bulb temperature in ducts of **cross section greater than 0.4 sq.m (4 sq ft)**.
 - .2 sensor ambient operating temperature range from -40°C to 60°C (-40°F to 140°F), non-condensing 5 to 95% RH
 - .3 flexible multi-point duct averaging temperature sensor utilizes several precision sensors spaced at equal distances along probe length;
 - .4 7.94mm (0.315") diameter probe, soft copper construction;
 - .5 probe minimum length of 4m (13 ft.);
 - .6 probe field formable to minimum radius of 100 mm (4 in) at any point along probe length (within 200 mm (8 in) of connector box excepted), without degradation of performance;
 - .7 provided as multiple sensors where single averaging element cannot be located to provide proper duct or plenum temperature sampling.
- .9 Outside air dry-bulb temperature sensors:
 - .1 aluminum probe for measurement of a single point dry-bulb outdoor air temperature
 - .2 insertion type for through-the-wall installation with a 0.85" diameter hole for conduit connection or cable gland fitting;
 - .3 waterproof seal at wall;
 - .4 complete with non-corroding polycarbonate enclosure with a hinged and gasketed cover minimizing solar heating effect;
 - .5 sensor ambient operating temperature range from -40°C to 60°C (-40°F to 140°F), non-condensing 5 to 95% RH;
- .10 Temperature limit switches:
 - .1 minimum 4.5 m (15') sensing element for mounting horizontally across duct/plenum with sensing reaction from coldest or warmest 450 mm (18") section of element;
 - .2 where sensing element does not provide full coverage of air stream, additional switches are to be supplied as required;
 - .3 complete with manual reset type SPDT snap acting contacts rated for 16 amperes at 120 VAC
 - .4 Acceptable manufacturers:
 - .1 Johnson Controls Inc. Model A70,
 - .2 or approved equal.
- .11 Thermowell immersion temperature sensors:
 - .1 insertion elements for single point temperature measurement of fluid

- .2 6 mm (0.236") diameter, 304 series stainless steel probe
- .3 -40 to 50°C (-40 to 122°F), 5 to 95 %RH non-condensing
- .4 316 stainless steel thermowells, complete with thermal conductive compound added inside the thermowell for optimum thermal transfer.
- .5 Probe and thermowell length minimum 30% of pipe size;
- .6 Spring loaded construction with compression fitting for 20mm (NPS ¾") well mounting
- .12 Standalone Temperature Sensors:
 - .1 Standalone temperature sensors are not considered a component of the BAS but are required to be provided by the BAS Trades in accordance with the following.
 - .2 Standalone Low-voltage Thermostat:
 - .1 Low-voltage thermostats shall be single or multi-stage heating and/or type as required by application.
 - .2 Include modulating heating or cooling stage where used in conjunction with control valves; step controllers; SCR's; or similar equipment requiring modulation, and switches where ON - OFF - AUTO control is required.
 - .3 Combination heating/cooling thermostats shall have independent adjustments for heating and cooling set points and shall not allow set point crossover.
 - .4 Provide individual heat or cooling anticipator for each control stage. Anticipator shall be matched to connected load, or shall be adjustable.
 - .5 Suitable switch sub-bases shall be provided when required by application, with switch functions clearly identified by permanent labels. Field-applied "stick-on" labels are not acceptable.
 - .6 Microprocessor-based programmable type thermostats, when used, shall not lose time or program upon power failures of twelve (12) hours or less and must have password protection capability.
 - .7 All space thermostats in non-common areas shall have exposed temperature setpoint adjustment. The temperature setpoint is limited to between 18° C and 23°C.
 - .8 Insulated mounting bases shall be installed when thermostats are located on exterior walls and at locations noted in the Documents.
 - .3 Electric Line Voltage Thermostat:
 - .1 Provide heating/cooling type thermostat with dead-band where sequencing of heating and cooling/ventilation is required.
 - .2 Line-voltage thermostats shall be ULC or cUL-listed, SPDT, with contact rating suitable for application, maximum 1.5°C differential.
 - .3 Provide heavy duty type. Include back plate and bracket for mounting on standard size outlet box where required.
 - .4 Provide isolation switch for line thermostat power source and label at thermostat.

2.03 HUMIDITY SENSORS

- .1 Each humidity sensor general requirements shall be as follows:
 - .1 Thermoset polymer-based capacitive sensors technology directly detecting changes in sensor capacitance according to changes in ambient relative saturation (relative humidity),
 - .2 suitable for operating range of 0 to 100%RH,
 - .3 sensor operating temperature range from -40 to 60°C (-40 to 140°F)
 - .4 accuracy of +/-2% RH over 5 to 95%RH,

- .5 long term stability <0.25% RH drift per year,
- .6 +/-0.8 %RH @ 25°C (77°F) hysteresis,
- .7 field selectable 0-100% linear proportional output signal indicating relative humidity 4-20mA, 0-5Vdc or - 0-10Vdc,
- .8 complete with a custom label that references the model, manufacturer, specifications, and BAS point I.D.
- .9 strain minimizing construction
- .10 capable of being secured to standard junction box termination with cover,
- .11 complete with pig-tail wire leads with wire nuts or screwed terminal connector block,
- .12 factory calibrated and capable of end to end (sensing element to BAS), accuracy noted above, over full operating range of measured variable.
- .13 complete with a serial communications port for portable PC or hand held commissioning equipment.
- .2 Room/ space humidity sensors general requirements per above with:
 - .1 analogue LCD humidity display,
 - .2 surface mounted plastic guard with surface mounting plate and wall anchors
 - .3 guard secured to mounting plate by screws,
 - .4 an occupancy override button.
- .3 Duct mount probe type humidity sensors general requirements per above with:
 - .1 metal mounting plate, hinged and gasketed plastic guard, and thread adapter and cable gland fitting,
 - .2 field replaceable 230 mm (9") long by 12.7 mm (0.5") diameter 304 stainless steel probe,
 - .3 60 micron HDPE filter,
- .4 Outdoor air type humidity sensors general requirements per above with:
 - .1 weatherproof enclosure with cover with hinged and gasketed cover, and cable gland fitting,
 - .2 waterproof seal.

2.04 COMBINATION TEMPERATURE AND HUMIDITY SENSORS

- .1 Where both temperature and humidity are shown to be measured at the same location or in the same airstream, use of single measuring unit is permitted provided that features and performance of both temperature sensor and humidity sensor are in accordance with requirements of this Specification, and as follows:
 - .1 Provide LCD display and occupancy override for Room/space combination temperature and humidity sensors.
- .2 Provide a combination dry-bulb temperature sensor (thermistor type sensor) and humidity sensor, complete with appropriate algorithm, where the operating sequence requires one, or more, of the following measured variables:
 - .1 Dewpoint temperature,
 - .2 Wet-bulb temperature,
 - .3 Enthalpy,
 - .4 Humidity Ratio,
 - .5 Air specific volume, (cu.ft/lb) or (cu.m/kg).

2.05 PRESSURE SENSORS (AIR SIDE)

- .1 General

- .1 Pressure sensors monitoring fan operation to have set point adjustable from 0 to 3600 Pa (0 to 10 in wg.) and adjustable differential between 10 to 300 Pa (0.03 to 1 in wg).
- .2 Static Pressure and Differential Pressure Sensors (Air Service):
 - .1 Applications include:
 - .1 Duct static pressure measurement
 - .2 Space differential pressure measurement
 - .3 Filter bank differential pressure measurement
 - .2 diaphragm driven, capacitance change type, 0-100% linear proportional output signal indicating input static pressure or differential pressure at station, 4-20 mA, 0-5 Vdc or 0-10 Vdc
 - .3 field adjustable zero and span
 - .4 selected with span of not greater than twice maximum static pressure and not less than twice differential pressure at shut-off.
 - .5 minimum over pressure input protection of five (5) times rated input.
 - .6 accuracy, including non-linearity, hysteresis and non-repeatability; $\pm 1\%$ full scale
 - .7 operating temperature range; -18°C to 80°C (0°F to 175°F)
 - .8 operating humidity range; 10 to 90% non-condensing
 - .9 high and low pressure ports, brass hose barbed pressure fittings suitable for 8 mm ($\frac{1}{4}$ ") tubing
 - .10 mounting bracket, suitable for duct mounting
 - .11 exterior static pressure references shall be monitored via a static pressure sensor complete with surge dampener device capable of absorbing rapid pressure fluctuations to provide steady pressure outputs equal to Dwyer Model SD-01.
 - .12 dust proof enclosure, and
 - .13 screw terminal connector block.
- .3 Differential Pressure Switch (Air Service):
 - .1 Applications include:
 - .1 Air flow proving
 - .2 Duct Static Pressure - High Limit
 - .3 Filter Bank Pressure - High Limit
 - .2 UL, cUL, CSA listed and approved.
 - .3 SPDT switches rated for 10 amps minimum at 120 VAC for use as digital input to BAS
 - .4 Adjustable setpoint with a setpoint range to suit the application.
 - .5 $\frac{1}{4}$ " compression fittings suitable for copper sensing tubing.
 - .6 Temperature range of -18°C to 71°C (0°F to 160°F).
 - .7 operating humidity; 10 to 90% RH non-condensing.
 - .8 automatically reset when condition returns to normal.
 - .9 high and low pressure ports, brass hose barbed pressure fittings suitable for 8 mm ($\frac{1}{4}$ in) tubing with signal dampening facilities to prevent nuisance tripping where required.
 - .10 mounting bracket suitable for duct mounting,
 - .11 dust proof enclosure,
 - .12 screw terminal block,

- .13 Acceptable manufacturers:
 - .1 Kele Model AFS-460,
 - .2 Johnson Controls Inc.
 - .3 Cleveland Controls Inc. (Model AFS-222),
 - .4 Dwyer,
 - .5 or approved equal.
- .4 Differential Pressure Transmitters for Terminal Units:
 - .1 suitable for use in air with pressure independent terminal units (constant volume, variable volume, fan powered boxes and similar)
 - .2 capacitive sensor technology
 - .3 pressure range 0 Pa to 373 Pa (0 to 15 in.w.g.)
 - .4 linear output proportional to velocity pressure of unit inlet air stream, and suitable as analogue input to terminal unit controller
 - .5 accuracy including non-linearity, hysteresis, and non-repeatability; +/-1% full scale
 - .6 operating temperature range; 0°C to 50°C (32°F to 122°F)
 - .7 operating humidity range; 10 to 90% non-condensing
 - .8 high and low pressure ports, barbed pressure fittings suitable for 1/4" (6mm) tubing for connection to air flow pick up device provided with terminal box
 - .9 mounting kit, suitable for installation within terminal unit controller enclosure
 - .10 screw terminal connector block.

2.06 PRESSURE SENSORS (HYDRONIC SIDE):

- .1 General requirements:
 - .1 Pressure transmitters shall be suitable for pressure rating, temperature rating and hydronic medium being measured, and are to be constructed to withstand 100% pressure over-range without damage and to hold calibrated accuracy when subject to a momentary 40% over-range input.
 - .2 Pressure transmitters are to be complete with transducer to transmit a 0 to 5 VDC, 0 to 10 VDC, or 4 to 20 mA output signal.
 - .3 Differential pressure transmitters used for liquid flow measurement are to be sized to the flow sensing device and supplied with a tee fitting and shut-off valves in the high and low sensing pick-up lines to allow permanent ease of use connection for system testing, balancing, and commissioning.
 - .4 Transmitter housing is to suit mounting location. Standalone pressure transmitters are to be mounted in a minimum NEMA 1 (NEMA 3R in sprinklered area) enclosure for indoor installations by-pass valve assembly panel with high and low connections piped and valved, air bleed units, by-pass valves, and compression fittings. Provide NEMA 4 vapour tight enclosure for outdoor installations.
- .2 Single Point Pressure Sensor (Liquid Service):
 - .1 Applications include:
 - .1 Water;
 - .2 Propylene glycol solution;
 - .3 Ethylene glycol solution;
 - .2 Input range of 0 to 200 psi
 - .3 Complete with transducer with 4-20 mA output signal proportional to liquid pressure

- .4 0.5% accuracy over entire sensing range
- .5 Temperature range: -40°C to 100°C (-40°F to 212°F)
- .6 Operating humidity range: 10 to 90% non-condensing
- .7 Stainless Steel wetted parts suitable for continuous contact with the sensed medium.
- .8 Transducer with easily accessible, integral non-interacting zero and span adjustment
- .9 Over pressure input protection of two (2) times rated input
- .10 Burst pressure of five (5) times rated input
- .11 Long-term stability of 0.25% of full scale
- .12 NEMA 4 rated fittings
- .13 ANSI 300 rated
- .14 suitable for direct mounting to pressure port
- .15 dust proof enclosure, and
- .16 screw terminal connector block.
- .17 Acceptable Manufacturers:
 - .1 Dwyer
 - .2 Precise Sensor,
 - .3 Fisher/Rosemount,
 - .4 or approved equal.
- .3 Differential Pressure Sensor (Liquid Service):
 - .1 Complete with transducer with output of 4-20 mA proportional to the pressure sensed.
 - .2 Over pressure protection of five (5) times the rated input.
 - .3 Easily accessible, integral non-interacting zero and span adjustment.
 - .4 Operating range to suit application.
 - .5 Accuracy of +/- 2% of full scale reading.
 - .6 Valve taps shall be installed by the Mechanical Trades.
 - .7 Basis of design, Setra, or Greystone.
 - .8 Acceptable Manufacturers:
 - .1 Setra, Model 228-1,
 - .2 Veris Industries
 - .3 Alta Labs PW series,
 - .4 Mamac series PR-282,
 - .5 or approved equal.
- .4 Differential Pressure Switch (Liquid Service):
 - .1 Applications include:
 - .1 Liquid flow proving
 - .2 Over pressure protection (pump dead-head condition)
 - .2 UL, cUL, CSA listed and approved.
 - .3 SPDT switch rated for 10 amps minimum at 120 VAC.
 - .4 Adjustable setpoint with a setpoint range to suit the application.
 - .5 ¼" (6mm) compression fittings suitable for copper sensing tubing.

- .6 General purpose dust proof enclosure for use indoors with fluids at temperature greater than 0°C (32°F)
- .7 NEMA 4 vapour tight enclosure for use indoors or outdoors with fluids at temperatures below 0°C (32°F).
- .8 Provide sensing inputs complete with signal dampening facilities to prevent nuisance tripping where required.
- .9 Suitable for continuous contact with the sensed fluid (water, ethylene or propylene glycol, chlorinated or treated water).
- .10 Operating ambient temperature range; 0°C to 82°C (32°F to 180°F)
- .11 Operating liquid temperature range: 0°C to 121°C (32°F to 250°F)
- .12 Repeatability of +/- 1% of span.
- .13 Over pressure input protection to a minimum of five (5) times rated input.
- .14 Acceptable Manufacturers:
 - .1 Johnson Controls Inc Model P74
 - .2 Dwyer,
 - .3 Penn,
 - .4 Delta-Pro
 - .5 or approved equal.

2.07 OCCUPANCY SENSORS

- .1 Occupancy sensor shall sense the presence of human activity within the desired space and fully control the on/off function of the loads automatically. Sensors shall turn on the load within 0.6m (2 ft.) of entrance.
- .2 Passive Infrared (PIR) with temperature compensated pyro-electric dual active element sensing technologies shall be completely passive in nature, in that the occupancy sensor system shall not emit or interfere with any other electronic device, or human characteristic.
- .3 Upon detection of human activity by the detector, a Time Delay shall be initiated to maintain the "ON" state as specified and be field adjustable from 30 seconds to 20 minutes.
- .4 Provide red LED for occupancy indication
- .5 All sensors shall have non-adjustable factory calibrated sensitivity.
- .6 Sensors shall be capable of operating indoors between 0° C and 40° C.
- .7 BAS Trades shall be responsible for a complete and functional system. Proper coverage of the area for all types of human activity, and any necessary relays or miscellaneous devices is the responsibility of the BAS Trades
- .8 Occupancy sensors may be connected to the BAS or stand alone and direct to load (i.e., lighting). Application and control functionality to be defined in the sequences of operation.
- .9 Owner shall be able to completely configure the system and access all the data without requiring third party service teams. All firmware upgrades shall be possible remotely via IP.
- .10 Acceptable Manufacturers:
 - .1 InfraRed Integrated Systems, IRC 3000 series,
 - .2 Watt Stopper Model CX-100,
 - .3 or approved equal.

2.08 CARBON DIOXIDE (CO2) AIR QUALITY SENSOR (ROOM, DUCT AND OUTDOOR MOUNTED SENSORS)

- .1 Dual element, non-dispersive, thermally compensated lithium tantalate infrared detector

- .2 Complete with transducer with selectable 4-20 mA or 0-10VDC output signal proportional to carbon dioxide concentration.
- .3 Sensor measurement range: 0 - 2000 ppm adjustable from 1000 - 10,000ppm
- .4 Temperature dependency: +/-2.5ppm/°C
- .5 Sensor accuracy: +/- (30 ppm +3% of reading)
 - .1 In accordance with ASHRAE 62.1 requirements, manufacturer shall ensure CO2 sensors are certified to be accurate to within +/-75 ppm at concentrations of both 600 and 1000 ppm measured at sea level at 77°F (25°C).
- .6 Transmitter accuracy: +/-0.25% of span (including linearity, hysteresis and repeatability)
- .7 Annual Drift not to exceed +/-2% of full scale
- .8 Repeatability; ±1.0% of full scale
- .9 Operating temperature range - heated: -40 to 50°C (-40 to 122°F), unheated: 0 to 50°C (32 to 122°F)
- .10 Operating humidity range: 5 to 90 %RH non-condensing
- .11 warm up time: 60 seconds
- .12 response time: 20 seconds
- .13 Complete with auxiliary SPDT relay contacts for alarm indication.
- .14 Mounting and enclosure:
 - .1 Indoor: provide blank, white enclosure with no manufacturer Logo or LED indication.
 - .2 Duct mounted: provide sensor complete with aspiration box and air stream sensor.
 - .3 Outdoor: NEMA 4 Polycarbonate, with thread adapter and cable gland fitting
- .15 Acceptable Manufacturers:
 - .1 Greystone
 - .2 or approved equal.

2.09 VOLATILE ORGANIC COMPOUND (VOC) AIR QUALITY SENSORS (ROOM AND DUCT MOUNTED SENSORS)

- .1 MEMS metal oxide semiconductor VOC sensor technology, sensing, as a minimum, the following:
 - .1 Methane;
 - .2 Ethylene;
 - .3 Hydrogen;
 - .4 Carbon Monoxide;
 - .5 Carbon Dioxide;
 - .6 Ammonia.
- .2 Measurement range: 450-2000 ppm CO2 equivalent or 0-100%.
- .3 Drift compensation: Automatic baseline correction
- .4 Linear output signal: 0-5 / 0-10 Vdc (menu selectable) = 0-2000 ppm CO2 equivalent
- .5 Mounting and enclosure:
 - .1 Room sensors complete with NEMA 1 (NEMA 3R in sprinklered areas) wall mount plastic enclosure.
 - .2 Duct mounted sensors complete with weatherproof polycarbonate enclosure with duct mounting tabs and sampling tube inserted into the return air stream.
- .6 Operating temperature range: 0°C to 50°C (32°F to 122°F).

- .7 Operating humidity range: 5 to 90 %RH non-condensing
- .8 Acceptable Manufacturers:
 - .1 Greystone
 - .2 or approved equal.

2.10 CARBON MONOXIDE (CO) SENSORS

- .1 Provide electronic gas sensor suitable for either CO gasses in air as follows:
 - .1 Sensor shall produce an output signal to BAS proportional to concentration of gas sensed;
 - .2 Minimum Indicated Concentration: 15 ppm
 - .3 Repeatability: +/-5% of reading
 - .4 Accuracy: +/-10% of reading
 - .5 Span Drift: < 12% change per 6 months
 - .6 Response Time (Rise): T50 < 10 seconds, T90 < 30 seconds, successive exposures
 - .7 Recovery Time (Fall): T10 < 60 seconds
 - .8 Temperature Range: -20° to 50°C (-4° to 122°F)
 - .9 Humidity Range: 15–90 %RH, non-condensing
 - .10 Pressure Range: Ambient atmospheric, +/-1 psi

2.11 NITROGEN DIOXIDE (NO2) SENSORS

- .1 Provide electronic gas sensor suitable for NO2 gasses in air as follows.
 - .1 Sensor shall produce an output signal to BAS proportional to concentration of gas sensed;
 - .2 Minimum Indicated Concentration: 0.3 ppm
 - .3 Repeatability: +/- 2% of Reading
 - .4 Accuracy: +/- 10% of Reading
 - .5 Span Drift: < 12% change per 6 months
 - .6 Response Time (Rise): T50 < 10 seconds, T90 < 40 seconds, successive exposures
 - .7 Recovery Time (Fall): T10 < 120 seconds
 - .8 Temperature Range: -20° to 50°C (-4° to 122°F)
 - .9 Humidity Range: 15–90 %RH, non-condensing
 - .10 Pressure Range: Ambient atmospheric, +/-1 psi

2.12 MAINTENANCE GARAGE GAS DETECTION SYSTEM

- .1 Wall mounted with a NEMA 4 enclosure, 120/24 VAC step down transformer at each sensor, a protective cover-plate which will not restrict CO and NO2 Sensor operation, capability make-up and exhaust air fans, communicating with the BAS to monitor fan status (primary or secondary), zone concentration and alarms through required protocol, and complete with:
 - .1 continuous monitoring electro-chemical sensors, one for carbon monoxide, one for nitrogen dioxide each in accordance with the Specifications.
 - .2 password protected, factory programmed software to enable required sequence of operation;
 - .3 microprocessor-based, factory calibrated, ambient humidity and temperature compensated sensing element(s) capable of producing a RS-485 digital serial loop output signal to control panel;
 - .4 alphanumeric LCD display indicating system status and exact concentration level and type of gas detected, and two (2) alarm levels for each sensing point, Power (green), and Alarm Levels A and B (amber);

- .5 audible alarm rated at minimum 65 dBA at 1 m (3') that will fully activate at programmable levels.
- .6 three (3) levels of continuous diagnostics to verify reading of each sensor/transmitter for abnormal sensing behaviour, loss of communication between control panel and sensor/transmitter, and program corruption analysis;
- .7 capability of long term data logging to determine trends;
- .8 capability of output communication through BACnet/IP to BAS to monitor system status and to view logged historical data.
- .2 CO and/or NO2 monitoring shall be provided that adjusts the ventilation system by bringing in more outdoor air to maintain concentrations as follows:
 - .1 CO concentrations below 25ppm (adjustable) in a one hour period and 35ppm in an eight hour period and/or,
 - .2 NO2 below 0.25ppm (adjustable) in a one hour period.
- .3 Acceptable manufacturer:
 - .1 Honeywell model E³Point.
 - .2 Or approved equal.

2.13 REFRIGERANT LEAK MONITORING AND ALARM SYSTEM

- .1 Main Panel Located inside Chiller Mechanical Room:
 - .1 Main Refrigerant Leak Monitoring and Alarm System must provide all the functionalities necessary to comply with current ASHRAE 15 guidelines and CSA B-52 Mechanical Refrigeration Code, and all additional requirements of the Authorities Having Jurisdiction (AHJs).
 - .2 Provide compound specific refrigerant monitoring sensors in chiller rooms;
 - .3 Provide additional refrigerant monitoring sensors in the vent pipe on each chiller.
 - .4 Sensors will be monitored at the Main Refrigerant Leak Monitoring and Alarm System panel.
 - .5 Main Refrigerant Leak Monitoring and Alarm System panel shall be Password protected, and as follows:
 - .1 Use: Centralized Stand Alone refrigerant gas detection monitoring main controller with real-time gas reading, selective alarm activation
 - .2 Power Requirement: 22-27 Vac, 29-38 Vdc, 2A max @ 29Vdc
 - .3 Up to 20 gas transmitters provide digital communication via Modbus RTU, Modbus TCP/IP, BACNET/IP, Up to 61 m (200 ft.) from the controller.
 - .4 Alarm Levels: 3 fully programmable alarm levels
 - .5 Outputs: 4 DPDT form C relays (alarms and/or fault) at 5 A, 30 Vdc or 250 Vac (resistive load); 65dBA buzzer, 3 Outputs at 24 Vdc @ 250 mA each
 - .6 Integral Strobe/Horn: STAS flashing LED/105dBA, 4-28V, 2800Hz (RFSA)
 - .7 Display: 122 x 32 dot matrix backlit LCD display
 - .8 Visual Indicators: - Green LED - Normal Operation
 - .9 Red LED Gas Alarm A, B, and C
 - .10 Yellow LED: Fault/Service
 - .11 Manual Fan Start/Stop operation
 - .12 Audible Alarm with a silence key to acknowledge
 - .13 Visible Alarm

- .14 Operating Humidity Range: 0-95% RH, non-condensing
- .15 Operating Temperature Range: 0°C to 40°C (32°F to 100°F)
- .16 Enclosure rating: NEMA 4X, ABS - Polycarbonate - indoor
- .17 Certifications: CAN/CSA C22.2 No 61010-1
- .18 Conforms to: ANSI/UL 61010-1; IEC 61010-1 Including Amendments A1:1992 + A2:1995 and National Deviations (Canada, US)
- .6 Up to ten (10) Remote Refrigerant Leak Monitoring and Alarm System panels can be connected to the Main Refrigerant Leak Monitoring and Alarm System panel; Digital Communication Modbus RS- 485 up to 304m (1000ft)
- .7 Acceptable manufacturers:
 - .1 Honeywell Vulcain,
 - .2 Arjay Engineering Ltd Refrigerant Gas Monitor,
 - .3 Or approved equal.
- .2 Slave Panel Located outside Chiller Mechanical Room:
 - .1 Use: Remote Annunciator / Slave display panel located outside each entrance to Chiller Mechanical room
 - .2 Power Requirement: 22-27 Vac, 50 or 60 Hz, 29-38Vdc, 2.0 A max @ 24 Vdc
 - .3 The remote annunciator panel must provide all the functionalities necessary to comply with Current ASHRAE 15 and CSA B-52 Mechanical Codes. This includes a key for manual "fan start" only operation, strobe/horn audible visual alarm on top of the unit
 - .4 Display 122 x 32 dot matrix backlit LCD display
 - .5 Visual Indicators: - Green LED - Normal Operation
 - .6 Red LED Gas Alarm A, B, and C
 - .7 Yellow LED: Fault/Service
 - .8 Remote Refrigerant Leak Monitoring and Alarm System panel will display the concentration of refrigerant gas as displayed on the Main Refrigerant Leak Monitoring and Alarm System panel, and the refrigerant gas detected. The LCD display screen will indicate multiple alarm levels for each sensing point
 - .9 Operating Temperature Range: 0°C to 40°C (32°F to 100°F)
 - .10 Enclosure rating: NEMA 4X, ABS - Polycarbonate - indoor
 - .11 Certifications: CAN/CSA C22.2 No 61010-1
 - .12 Conforms to: ANSI/UL 61010-1; IEC 61010-1 Including Amendments A1:1992 + A2:1995 and National Deviations (Canada, US)
 - .13 Acceptable manufacturers:
 - .1 Honeywell Vulcain,
 - .2 Arjay Engineering Ltd Refrigerant Gas Monitor,
 - .3 Or approved equal.
- .3 Wired Refrigerant Gas Transmitter:
 - .1 Use: Wall mounted, wired refrigerant gas detector transmitter used in conjunction with Refrigeration Leak Monitoring and Alarm System controller, Diffusion Type with no internal sample pump or filter maintenance required.
 - .2 Power Requirement: 8.5 - 12.5 Vdc, 1A@10 Vdc Maximum
 - .3 Network: Modbus RS-485
 - .4 Sensing Technology: NDIR (Non Dispersive Infrared)

- .5 Accuracy: $\pm 10\text{ppm @ } 50\text{ ppm}$ / $\pm 40\text{ppm @ } 500\text{ ppm}$
- .6 Detection Range: Refrigerants 0-1000 ppm
- .7 Refrigerants: **specific to refrigerant compounds supplied to the project.**
- .8 Resolution: 1 ppm
- .9 Response Time (T90) 60 seconds
- .10 Operating Temperature Range: 0°C to 40°C (32°F to 100°F)
- .11 0 to 95% RH (non-condensing)
- .12 Enclosure NEMA 4X ABS/Polycarbonate - Indoor
- .13 Certified to: CAN/CSA C22.2 No. 61010-1
- .14 Conforms to: ANSI/UL 61010-1
- .15 Acceptable manufacturers:
 - .1 Honeywell Vulcain,
 - .2 Arjay Engineering Ltd Refrigerant Gas Monitor,
 - .3 Or approved equal.

2.14 DIGITAL TO ANALOG OUTPUT CONVERTOR

- .1 Receives up to eight (8) 4-20mA analog input signals and converts to one digital signal to the BAS or Variable Frequency Drive (VFD)
- .2 Transmitters may be located a maximum of 600 m (2000') from Digital to Analog Output Convertor control panel.
- .3 Unit shall include internal logic to provide either minimum/ maximum/average value signal for an unlimited number of input signals, or a single dedicated 4-20mA output signal.
- .4 Acceptable manufacturers:
 - .1 Honeywell Analytics/Vulcain Inc Model 4201.;
 - .2 Mine Safety Appliance Co. (MSA);
 - .3 Armstrong Monitoring Co.;
 - .4 Quatrosense Environmental Ltd. (QEL).

2.15 LIQUID LEVEL CONTROLLERS

- .1 Ultrasonic Liquid Level Controller:
 - .1 Provide ultrasonic liquid level sensor, suitable for sensing water/ fluid levels in atmospheric sumps, tanks, cisterns, and similar storage vessels.
 - .2 Ultrasonic level sensors shall employ high-frequency sound waves technology to detect changes in the wave reflection as they return to the sensor.
 - .3 Sensors shall be capable of reporting both real time point levels, and shall be capable of providing continuous sensing suitable for trend analysis (liquid levels increasing, liquid levels steady, liquid levels decreasing).
 - .4 Sensors shall be as follows:
 - .1 Material: Nylon
 - .2 Mounting: 1/2" [12.7 mm] NPT
 - .3 Sensor Input: 5-12 VDC (<30 mA)
 - .4 Enclosure: NEMA 4X vapour tight.
 - .5 Output Signal: Max 2A relay at 30 VDC, or: 0.3 A at 125 VDC digital output compatible with BAS to suit application

- .6 Cable Length: minimum 12" (305 mm), or custom length to suit application
- .7 Response Time: < 1ms (typical)
- .8 Temperature: 45 to 160°F (7 to 70°C)
- .9 Maximum Pressure: 150 psi
- .5 Where high level alarm or low level alarm is required by the control sequences, provide an independent Liquid Level Switch.
- .2 Continuous Liquid Level Sensor (Float Type):
 - .1 Corrosion resistant, 316 stainless steel.
 - .2 Solid state float actuated sensor.
 - .3 Complete with transducer with 4 to 20 mA signal output proportional to sensed level.
 - .4 Temperature range of 32°F to 125°F.
 - .5 Pressure range of 0 to 500 psia.
 - .6 Acceptable manufacturers:
 - .1 MagneTek, 7025 Series
 - .2 or approved equal.
- .3 Liquid Level Switch:
 - .1 Polypropylene float, PVC cable, hermetically sealed mercury switch.
 - .2 13 amp running current @ 120 VAC, 11 amp current @ 240 VAC.
 - .3 SPDT switch contacts. Switch contacts shall be selected to suit required sensing/control action.
 - .4 Operating temperature of 32°F to 160°F (0°C to 71°C).
 - .5 Operating pressure of 26 psi.
 - .6 Acceptable manufacturers:
 - .1 MagneTek, 7010 Series
 - .2 Scientific Technologies
 - .3 W.E. Anderson
 - .4 or approved equal.
- .4 Leak Detector
 - .1 Provide sensing cable to detect the presence of water.
 - .2 Provide sensing and relay module to monitor leak detection cable.
 - .3 Provide separate contacts for leak detection and cable break.
 - .4 Acceptable manufacturers:
 - .1 Raychem tracetek TT1000 type with TTC sensing and relay module
 - .2 Or approved equal.

2.16 TIME DELAY RELAYS

- .1 Time Delay Relays shall be solid-state plug-in type, UL listed, with adjustable time delay adjustable +/-100% from set point shown;
- .2 Provide Time Delay Relays contact rating, configuration, and coil voltage suitable for application;
- .3 Provide Field Equipment Panel enclosure for relays not installed in control panels.

2.17 LATCHING TYPE CONTROL RELAYS

- .1 Pickup rating, time and hold rating as required for individual applications

- .2 Rated for a minimum of ten (10) million mechanical operations and a minimum of 500,000 electrical operations.
- .3 Provide complete isolation between the control circuit and the BAS digital output.
- .4 NEMA 1 (NEMA 3R in sprinklered areas) enclosure for relays not installed in local control panels, otherwise locate relays in the BCU, FEC, ZLC or Field Equipment Panels;
- .5 Malfunction of a BAS component shall cause the controlled output to fail to the positions identified in the failure procedure.
- .6 10 amp contact rating at 240 volts;
- .7 Pin type terminals complete with mounting bases;
- .8 Acceptable Manufacturers:
 - .1 IDEC, RR Series;
 - .2 Potter Bromfield;
 - .3 Cutler Hammer;
 - .4 or approved equal.

2.18 MOMENTARY TYPE CONTROL RELAY

- .1 Coil ratings of 120 VAC, 50 mA or 10-30 VAC/VDC, 40 mA as suitable for the application;
- .2 Provide complete isolation between the control circuit and the BAS digital output;
- .3 Field Equipment Panel enclosure for relays not installed in local control panels
- .4 10 amp contact rating;
- .5 LED status indication;
- .6 Acceptable Manufacturers:
 - .1 Core Components, Model CVR;
 - .2 or approved equal.

2.19 POWER MONITORING (AMPS)

- .1 Power monitoring achieved through a combination of current transformer and current transducer with transformer sized to reduce full amperage of monitored circuit to a maximum 5 ampere current draw signal.
- .2 Current draw signal shall be converted to a 4 to 20 mA DDC compatible circuit for use by BAS.
- .3 Current transformer as follows:
 - .1 split core current transformer with an operating frequency of from 50 to 400 Hz, 0.6 Kv class, 10 Kv BIL insulation, and 5 ampere secondary;
 - .2 equal to Veris Industries
- .4 Current transducer as follows:
 - .1 current to voltage or current to mA transducer with an accuracy of +/-5%, a minimum load resistance of 30 kOhm, an input of 0 to 20 amperes and an output of 4 to 20 mA, and a 24 VDC regulated power supply.
 - .2 equal to Veris Industries

2.20 CURRENT SENSING SWITCHES

- .1 self-powered dry contact output switches for sensing run status of motor loads,
- .2 each calibrated to indicate a positive run status only when motor is operating under load,
- .3 each consisting of a current transformer, a solid-state current sensing circuit, adjustable trip point, solid-state switch, SPDT relay, and a LED to indicate on or off status;
- .4 Acceptable manufacturer:

- .5 Veris Industries,
- .6 or approved equal.

2.21 AC VOLTAGE TRANSMITTERS

- .1 self-powered single-loop (two-wire) type, 4-20 mA output with zero and span adjustment.
- .2 adjustable full-scale unit ranges; 100-130 Vac, 200-250 Vac, 250-330 Vac, and 400-600 Vac.
- .3 +/-1% full-scale accuracy at 500 ohm maximum burden.
- .4 UL/CSA listed, 600 Vac rated and conforming to ANSI/ISSA 50.1.

2.22 MOTOR STARTER TERMINAL STRIP

- .1 Provide a terminal strip within the starter enclosure or within a separate enclosure, mounted alongside the starter, to facilitate monitoring and control of the motor by the BAS, and to facilitate overriding control by the Fire Alarm System.
- .2 BAS Trades shall wire the motor starter to the terminal strip to enable the BAS to perform the required control and monitoring functions:
 - .1 ON/OFF control and status
 - .2 Speed Control
 - .3 High/Low Speed, plus status
 - .4 Damper Interlock
 - .5 Damper Control
- .3 The motor side load shall not exceed 10 amps at 120 volts for any signal to the BAS.

2.23 ELECTRONIC SIGNAL ISOLATION TRANSDUCERS

- .1 Provide Electronic Signal Isolation Transducers to establish a ground plane isolation between BAS and external control systems as follows:
 - .1 whenever an analog output signal from the BAS is to be connected to an external control system as an input (i.e. equipment control panel), or
 - .2 the BAS is to receive an input signal as an output from an external control system.
- .2 Acceptable manufacturers:
 - .1 Advanced Control Technologies
 - .2 Or approved equal

2.24 PRESSURE TO CURRENT TRANSMITTERS

- .1 Internal materials of the transducer suitable for continuous contact with industrial standard instrument air.
- .2 Input pressure range as required by application.
- .3 Output signal of 4-20 mA proportional to input pressure.
- .4 Output variation of less than 0.2% full scale for supply voltage variations of +/- 10%.
- .5 Combined non-linearity, repeatability and hysteresis effects not to exceed plus/minus 0.5% of full scale output over entire range.
- .6 Integral, accessible zero and span adjustments.
- .7 Operating temperature range of -10°C to 50°C with 5% to 90% RH non-condensing.
- .8 Temperature effect of 1.5% full scale 50°C or less.
- .9 Over pressure input protection to a minimum of twice maximum working input pressure.
- .10 Output short circuit and open circuit protection.
- .11 Dustproof housing.

- .12 Shock and vibration protection.

2.25 PRESSURE TO ELECTRIC SWITCHES

- .1 used to create electric switching from pneumatic control signals
- .2 diaphragm operated SPDT snap acting contacts with electrical rating suitable for application
- .3 designed to withstand up to 170 kPa (25 psi) input pneumatic control signal pressure,
- .4 adjustable cut-in and cut-out settings between 20 and 140 kPa (3 and 20 psi).

2.26 AUTOMATIC CONTROL DAMPERS (UNINSULATED)

- .1 Provide flanged, AMCA low leakage certified aluminium automatic dampers, custom fabricated to required size, opposed blade or parallel blade type as follows:
 - .1 two position dampers to be parallel;
 - .2 modulating dampers to be opposed blade type.
- .2 Blades to be of extruded aluminium profiles. Blade ends to be capped in order to seal hollow interior and reduce air leakage rate.
- .3 Blade and frame seals shall be of extruded silicon and be secured in an integral slot within the aluminium extrusions.
- .4 Bearings to be comprised of a Celcon inner bearing fixed to a 7/16" aluminium hexagon blade pin rotating within a polycarbonate outer bearing inserted in frame.
- .5 Linkage hardware shall be installed in frame side and be constructed of aluminium and corrosion resistant, zinc and nickel plated steel, complete with cup point trunnion screws for slip proof grip.
- .6 Dampers to be designed for operation in temperatures ranging between - 40°F and 212°F (- 40°C to 100°C).
- .7 Air leakage through a 48" x 48" (1220mm x 1220mm) damper in closed position shall not exceed 1.7 cfm/ft² against 1in.wg. differential static pressure at standard air.
- .8 Pressure drop of a fully open 48"x48" (1220mmx1220mm) damper shall not exceed 0.02 in.wg. at 1000 fpm.
- .9 Dampers shall be made to size and shall not be limited to standard sizes.
- .10 Acceptable manufacturer:
 - .1 Tamco Air Foil Series 1500,
 - .2 Ruskin CD50 Series,
 - .3 Arrow PBDAF 206,
 - .4 or approved equal.

2.27 AUTOMATIC CONTROL DAMPER (INSULATED)

- .1 Provide flanged, AMCA low leakage certified aluminium automatic dampers, custom fabricated to required size, opposed or parallel blade type as follows:
 - .1 two position dampers to be parallel;
 - .2 modulating dampers to be opposed blade type.
- .2 Damper frame shall be of extruded aluminium not less than 0.08" (2.03mm) in thickness. Damper frame to be 4" (101.6mm) deep and shall be insulated with Styrofoam on four sides. Entire frame shall be thermally broken by means of polyurethane resin pockets, complete with thermal cuts.
- .3 Blades to be of extruded aluminium, internally insulated with expanded polyurethane foam and shall be thermally broken. Complete blade shall have an insulating factor of R-2.29 and a temperature index of 55.
- .4 Blade and frame seals shall be of extruded silicon and be secured in an integral slot within the aluminium extrusions.

- .5 Bearings to be comprised of a Celcon inner bearing fixed to a 7/16" aluminium hexagon blade pin rotating within a polycarbonate outer bearing inserted in frame.
- .6 Linkage hardware shall be installed in frame side and be constructed of aluminium and corrosion resistant, zinc and nickel plated steel, complete with cup point trunnion screws for slip proof grip.
- .7 Dampers to be designed for operation in temperatures ranging between - 40°F and 212°F (- 40°C to 100°C).
- .8 Air leakage through a 48"x48" (1220mm x 1220mm) damper in closed position shall not exceed 4.12 cfm/ft² against 4 in.wg. differential static pressure at standard air.
- .9 Pressure drop of a fully open 48"x48" (1220mm x1220mm) damper shall not exceed 0.03 in.wg. at 1000 fpm.
- .10 Dampers shall be made to size and shall not be limited to standard sizes.
- .11 Acceptable manufacturers:
 - .1 Tamco Air Foil Series 9000 BF,
 - .2 Ruskin CDTI-50 BF Series,
 - .3 Arrow AFDTI-25LT insulated.
 - .4 or approved equal.

2.28 AUTOMATIC CONTROL DAMPER ACTUATORS

- .1 Electric/Electronic Sized to provide adequate power for opening, closing and modulating dampers in specified time.
- .2 Where indicated and/or specified, the normal position of the device, shall be the position that the damper returns to
- .3 All damper actuators to be provided with spring return to normal position when the control signal is lost as follows:
 - .1 normally open ("NO") or normally closed ("NC");
 - .2 either clockwise or counter clockwise rotation;
 - .3 sized to control the damper against maximum pressure or dynamic closing pressure, whichever is greater;
 - .4 sized to suit the sizes of dampers involved, and;
 - .5 provide sufficient force to maintain the damper rated leakage characteristics.
- .4 Actuators shall be equipped with a manual drive release mechanism and manual positioning mechanism in the absence of power.
- .5 Provide reversible gear type operators that can accept modulating control signals as follows:
 - .1 control signals:
 - .1 0 - 10VDC or 0 - 20ma for proportional control,
 - .2 power On-Off for two position service,
 - .2 Damper actuators shall have integral position potentiometer or 0 to 10 VDC feedback signals to indicate the drive shaft position of the damper at the BAS, all damper actuators shall include integral end position indicators,
- .6 Each is to be 1 phase AC, 120 or 24 volt as required or indicated, overload protected throughout the full range of rotation enabling the actuator to detect a blockage in the damper and withstand a continuous stall condition without premature failure in performance, and complete with an enclosure type as follows:
 - .1 general purpose, drip proof enclosure for indoor applications,
 - .2 NEMA 4 enclosure low temperature protected actuators for outdoor use, or exposed to the airstream inside an outdoor air intake plenum, suitable for operation down to -35°C.

- .7 Provide emergency power to each damper actuator.
- .8 Wherever possible, actuators to be provided to the original terminal device equipment manufacturer for factory installation (i.e. VAV terminal). Provide actuators meeting equipment Manufacturer's specifications.
- .9 Unless indicated otherwise in the Specifications, or on the drawings, actuators to be provided and set-up such that all recirculation air dampers are normally open, and outdoor air and exhaust dampers are normally closed.
 - .1 For air handling units intended to be used as part of a smoke control sequence, or remain operational during a fire alarm event, recirculation dampers shall be normally closed.
- .10 Each operator is to be complete with a damper position indicator, and external adjustable stops to limit the length of stroke in either direction, and is to be mounted on a corrosion resistant adjustable bracket.
- .11 Operating arms are to have double yoke linkages and double set screws for fastening to the damper shaft.
- .12 Actuators shall be quiet in operation such that noise from actuator operation is not detectable in any occupied spaces.
- .13 Operators for dampers to be connected to the building fire alarm system or to freeze protection devices are to be equipped with additional relays to permit the dampers to respond and return to the required position upon receipt of a signal.
- .14 Stroke dampers from fully closed to fully open in accordance with the following:

Service	Time Requirement
Two position normal service	75 seconds
Modulating normal service	120 seconds
Emergency service (stair pressurization, smoke control and similar)	<20 seconds

- .15 Acceptable manufacturers:
 - .1 Belimo,
 - .2 Siemens Building Technologies,
 - .3 Johnson Controls,
 - .4 Honeywell,
 - .5 or approved equal.

2.29 DAMPER POSITION SWITCHES

- .1 Provide damper end switch which indicates actual damper blade position; damper position switches which are actuated by damper crankshaft or actuator position will not be accepted for the following applications:
 - .1 Smoke control fans providing either 100% outdoor air, or 100% exhaust air;
 - .2 Dedicated make-up (100% outdoor) air fans;
 - .3 Dedicated exhaust fans.
- .2 Contacts shall be rated for the electrical load to be switched.
- .3 Provide auxiliary contacts as required by the Sequence of Operation.

2.30 ACTUATORS FOR TERMINAL UNIT DAMPERS

- .1 integrated DDC controller and damper actuator,
- .2 sized and selected in accordance with terminal box damper manufacturer's specifications,

- .3 gear drive, direct coupled type operators mounted to shaft with universal V-bolt clamp,
- .4 proportional type control,
- .5 selectable / reversible rotation direction,
- .6 input type and range as suitable for interfacing to output of terminal unit controller,
- .7 angle of rotation adjustable between 30 to 90° with mechanical limit stops,
- .8 damper position indication visible without cover removal,
- .9 manual override to set damper position without power applied to actuator,
- .10 electronic stall protection,
- .11 general purpose dust proof enclosure,
- .12 actuator running time of not more than 100 seconds,
- .13 delivered to terminal unit manufacturer's factory for installation.

2.31 CONTROL VALVES

- .1 General requirements:
 - .1 Provide control valves suitable for the operating pressures and temperatures of the systems. Ensure tight shut off against system operating differential pressures.
 - .2 Select valves with characteristics to suit the application.
 - .3 Body and trim materials selected in accordance with specification for globe valves, ball valves, or high performance butterfly valves, and in accordance with manufacturer's recommendations for design conditions and service.
 - .4 Size control valves for pressure drops and heating and cooling loads as scheduled with same pressure rating as globe valves under same service and pressure conditions.
 - .5 Size valves for two port and three port, two position service;
 - .1 line size,
 - .2 ball valves, sizes 2 ½" (65mm) and smaller,
 - .3 butterfly valves, sizes 3" (75mm) and larger.
- .2 For two port and three port modulating service;
 - .1 use globe valves for Cv rating 160 and smaller (4" [100mm] and smaller),
 - .2 use high performance butterfly valves for Cv rating above 160 based on 70° open position (6" [150mm] and larger)
- .3 Straight through two-way valves shall have equal percentage flow characteristics.
- .4 Three way valves shall have linear flow characteristics, to give constant total flow.
- .5 All valves shall have stainless steel stem and packing to suit application
- .6 For two-way and three-way valves ½" to 2" (12mm to 50mm) size in heating water, chilled water, condenser water, glycol solution (up to 50 percent), in modulating and two position (ON/ OFF) applications:
 - .1 General Requirements:
 - .1 ANSI Class 250 globe style valve body;
 - .2 single seat, metal to metal;
 - .3 Normally Closed (NC) or Normally Open (NO) action;
 - .2 Materials:
 - .1 bronze body
 - .2 stainless steel trim;

- .3 stainless steel stem to ASTM A582 Type 303
- .3 Packing:
 - .1 EPDM O-rings for liquid duty
- .4 Up to 50 psi (345 kPa) differential pressure for modulating service;
- .5 Minimum 100:1 rangeability;
- .6 Close-off rating per ANSI/FCI 70-2;
- .7 Class IV (0.01% of Cv) leakage rate;
- .8 Equal percentage flow characteristics.
- .7 For two-way and three-way valves 2 ½" to 6" (65mm to 150mm) size in heating water, chilled water, condenser water, glycol solution (up to 50 percent), in modulating and two position (ON/ OFF) applications:
 - .1 General Requirements:
 - .1 ANSI Class 250 globe style valve body;
 - .2 single seat, metal to metal;
 - .3 Normally Closed (NC) or Normally Open (NO) action;
 - .2 Materials:
 - .1 cast iron body ASTM A126 Class B;
 - .2 stainless steel trim;
 - .3 stainless steel stem to ASTM A582 Type 303
 - .3 Packing:
 - .1 EPDM O-rings for liquid duty
 - .2 PTFE V-rings and EPDM O-ring for steam applications
 - .4 Up to 50 psi (345 kPa) differential pressure for modulating service;
 - .5 Minimum 100:1 rangeability;
 - .6 Close-off rating per ANSI/FCI 70-2;
 - .7 Up to 200 psi close-off pressure in liquid applications;
 - .8 Class IV (0.01% of Cv) leakage rate;
 - .9 Equal percentage flow characteristics.
- .8 For two-way and three-way valves 6" (150mm) and larger size in heating water, chilled water, condenser water, glycol solution (up to 50 percent), in modulating and two position (ON/ OFF) applications:
 - .1 Provide Bray Series Series 31 lug (up to 125 psi), or Series 31H (high pressure service), or approved equal for use in 2-Way and 3-Way control valve arrangement suitable for a media temperature range based on water between -20°F to 250°F (-29°C to 120°C) in HVAC applications (chilled water, heating water, condenser water, glycol solution) in accordance with the following:
 - .2 Body:
 - .1 cast iron one piece lug design with extended neck to allow for 2" (50 mm) of piping insulation.
 - .2 Flange locating holes shall be provided on wafer bodies to allow for quick and precise alignment during valve installation.
 - .3 Flange hole drilling per international flange standard as specified.
 - .4 Provide a non-corrosive bushing and a self-adjusting stem seal

- .3 Disc:
 - .1 aluminum bronze disc material
 - .2 disc edge and hub on metal discs shall be spherically machined and hand polished for minimum torque and maximum sealing capability.
- .4 Stem:
 - .1 Shall be one piece design;
 - .2 .Disc-to-stem connection shall be and internal double "D" design with no leak paths in the disc-to-stem connection.
 - .3 Stem shall be mechanically retained in the body neck and no part of the stem shall be exposed to the line media.
- .5 Seat:
 - .1 Shall be tongue-and-groove bonded seat with a primary hub seal and a molded flange O-ring suitable for weld-neck and slip-on flanges.
 - .2 The seat shall totally encapsulate the body isolating it from the line media and no flange gaskets shall be required.
- .6 Testing:
 - .1 Valve shall be tested to 110% of the rated pressure.
- .7 Pressure Ratings:
 - .1 Valve shall be rated for bubble-tight shutoff at pressure rating as follows:
 - .1 2"-12" (50mm-300mm) 175 psi (12.0 Bar)
 - .2 14"-20" (350mm-500mm) 150 psi (10.3 Bar)
 - .3 For dead-end service:
 - .1 Provide larger retainer ring set screws to allow for the valve to be placed at the end of the line without a downstream flange in either flow direction while still holding full pressure (no downstream flanges and disc in closed position):
 - .2 2"-12" (50mm-300mm) 75 psi (5.2 Bar)
 - .3 14"-20" (350mm-500mm) 50 psi (3.4 Bar)
 - .4 For high pressure service:
 - .1 2" - 20" (50mm-500mm) 250 psi (17.2 Bar)
- .8 Approvals & Certifications:
 - .1 CE/PED Certification
 - .2 NSF/ANSI 61-2008 Certification (Potable Water)
 - .3 SIL Certification
 - .4 ABS Certification
 - .5 Bureau Veritas Certification
 - .6 DNV
- .9 Three-Way Valve Assembly:
 - .1 Three-way valve assemblies shall be furnished completely assembled with Tee, calibrated and tested, ready for installation;
 - .2 Tees fittings complying with ASME/ANSI B16.1 Class 125 Flanges; provide Class 250 fittings for high pressure service.
 - .3 Provide flange gaskets between control valve and Tee flanges;

- .4 Mount single actuator on primary control valve stem; provide suitable sized actuator linkage arm connected to secondary control valve stem to actuate secondary control valve disc at 90 degrees to primary control valve disc.
- .9 Valve sizing that is not noted in the Drawing Schedules or Control Sequences shall use the following sizing criteria:
 - .1 for two-position service; line size unless noted otherwise.
 - .2 for two-way modulating service unless otherwise shown; pressure drop at design flow **equal to greater of**:
 - .1 100% of pressure drop through heat transfer device (coil or heat exchanger) plus 2.0 psi (or 4.6 ft.wg),
 - .2 50% of pressure difference between supply and return mains, or
 - .3 35 kPa (5 psi).
 - .3 for three-way modulating service; pressure drop **equal to smaller of**:
 - .1 100% of pressure drop through heat transfer device (coil or heat exchanger) plus 2.0 psi (or 4.6 ft.wg),
 - .2 4.0 psi (9.2 ft.wg)
 - .4 for valves for radiation, terminal units and reheat coils;
 - .1 pressure drop of 1.5 psig (3.5 ft.wg)
- .10 Valve trim selected for close-off pressure ratings as follows;
 - .1 two-way modulating or two position service; 150% of pump shut off head.
 - .2 three-way modulating service; 300% of pressure differential between ports A and B at design flow or 100% of pump shut off head, whichever is greater.
 - .3 shut off head to be based on maximum rpm when pump is fitted with VFD
- .11 Pneumatic valve actuators used to sequence multiple valves shall be provided with pilot positioners to ensure proper sequence of each valve and to allow for an adjustable dead band between heating and cooling valves.
- .12 Control valves shall have the manufacturer's name and the pressure rating clearly marked on the outside of the body. Where this is not possible manufacturer's name and valve pressure rating shall be engraved on a minimum 50mm diameter stainless steel tag that shall be attached to the valve by a chain in such a manner that it cannot be unintentionally removed.
- .13 Control valves ½" to 2" (12mm to 50mm) shall have screwed ends with union fittings to allow easy removal for servicing.
- .14 Control valves 2 ½" (65mm) and larger shall have flanged ends.
- .15 All valves shall meet the appropriate ANSI requirements for service fluid, pressure and temperature.

2.32 POTABLE WATER SERVICE AUTOMATIC CONTROL VALVES

- .1 Valves for potable water service shall be as per above, and shall be NSF 61 certified for use in potable water applications.

2.33 CONTROL VALVE ACTUATORS

- .1 General Requirements:
 - .1 24 VAC electric/electronic motor driven type actuator coupled to control valves with linkage,
 - .2 Actuator construction shall be capable of withstanding high shock and vibration without operations failure, and be complete with:
 - .1 electronic interface control board;
 - .2 solid state drive;

- .3 reversible motor;
- .4 oil immersed gear train,
- .3 Actuator enclosure:
 - .1 general purpose, drip proof NEMA 3R die-cast housing with corrosion resistant hard-anodized aluminum or steel material cover for indoor applications;
 - .2 watertight NEMA 4 enclosure for outdoor use suitable for operation down to -35°C,
- .4 Actuator shall provide two position, or proportional control action as required by the intended application,
- .5 Actuator shall accept control signals compatible with the BAS analog or digital output of 0 to 10VDC, or 0 to 20mA as appropriate,
- .6 Actuator shall operate the valve from the fully closed to the fully open position and vice versa in less than two (2) minutes,
- .7 Actuator shall modulate the valve stem position in a linear relation to the control signal.
- .8 Control valve stem position shall be adjustable in increments of one (1%) percent or less of full stem travel,
- .9 Actuator shall have visual mechanical position indication, showing valve position,
- .10 Actuator shall have provision for manual positioning of valve when actuator is not powered,
- .11 Electronic overload or digital rotation sensing circuitry shall protect control valve actuator through entire range of rotation,
- .12 Provide span and zero travel adjustment,
- .13 Control valves larger than $\frac{3}{4}$ " (20mm) shall have integral position potentiometer or 0 to 10 VDC feedback signals to indicate the stem position of the valve at the BAS, all valve actuators shall include integral end position indicators,
- .14 Acceptable manufacturers:
 - .1 Belimo,
 - .2 Siemens Building Technologies,
 - .3 Johnson Controls Inc.,
 - .4 Honeywell
 - .5 Or approved equal.
- .2 Water and Glycol Solution Control Valve Actuators:
 - .1 Actuator selected for close-off pressure ratings as follows;
 - .1 two-way modulating or two position service; 150% of pump shut off head.
 - .2 three-way modulating service; 300% of pressure differential between ports A and B at design flow or 100% of pump shut off head, whichever is greater.
 - .3 shut off head to be based on maximum rpm when pump is fitted with VFD
 - .2 Actuator in include spring return mechanism to return valve to "normal" position on power failure or isolation from control signal as follows;
 - .1 Heating water and glycol zone valves; normally open.
 - .2 Heating coil valves in AHU; normally open.
 - .3 Chilled water control valves; normally closed.
 - .4 Chilled water differential pressure by-pass control valves; normally open.
 - .5 Hot water and glycol differential pressure by-pass control valves; normally closed.

2.34 AIR FLOW STATIONS (DUCT MOUNTED):

- .1 Air flow stations shall be multipoint flow cross or grid measuring arrangement, either rectangular or round as to suit the duct configuration. Provide a minimum of two flow sensing thermistors and temperature sensors per station.
- .2 Unit construction:
 - .1 14 gauge galvanized sheet steel casing, flanged for installation to duct or plenum as applicable,
 - .2 98% free area parallel cell 20 mm ($\frac{3}{4}$ ") aluminum honeycomb equalizer and air straightening grid,
 - .3 copper or stainless steel static pressure sensors and total pressure sensors, installed in a grid pattern to provide total coverage of the duct cross section.
- .3 Unit shall be capable of reading volumes within 1% for a velocity range of 0 to 5000 feet per minute (0 to 25 m/s).
- .4 Velocity pressure transmitter shall be selected to suit the system working pressures and shall meet the following performance requirements:
 - .1 Calibrated Accuracy: +/- 0.25% of span.
 - .2 Repeatability: 0.05% of output.
 - .3 Dead band & hysteresis: Not detectable.
- .5 Square root extractor and multiplier shall meet the following performance requirements:
 - .1 Calibrated Accuracy: +/- 0.5% of flow.
 - .2 Hysteresis: Not detectable.
 - .3 Repeatability: 0.05% of output.
 - .4 Response: 0.5 seconds.
 - .5 Multiplier: Adjustable 0.3 to 2.8.
- .6 Integral signal integrator to minimize primary signal noise from the output signal and shall be +/- 5% overall accuracy of measured flow.
- .7 Internal materials of the transducer suitable for continuous contact with air.
- .8 Transducer to be provided complete with easily accessible, integral non- interacting zero and span adjustment.
- .9 Temperature compensated linear analog output signal indicating average velocity at station, 4-20 mA, 0-5 Vdc or 0-10 Vdc proportional to measured differential pressure.
- .10 Operating temperature range of -18°C to 71°C (0°F to 160°F)
- .11 Operating humidity range; 0 to 99% RH non-condensing
- .12 Dedicated electronic, solid state digital processing control panel, with general purpose dustproof enclosure, wall mounted and shall contain all control equipment.
- .13 Each panel shall have a hinged door, latch and lock.
- .14 Acceptable manufacturers:
 - .1 Air Monitor Corporation,
 - .2 Tek-Air Systems Inc.,
 - .3 Veltron II,
 - .4 Ebtron,
 - .5 Or approved equal.

2.35 AIR FLOW STATIONS (FAN BELL MOUTH):

- .1 Air flow stations shall consist of air flow traverse probes mounted on the fan bell mouth. Provide a minimum of two flow sensing thermistors and temperature sensors per station, two stations for each DWDI fan.
- .2 The probes shall contain multiple total and static pressure sensors placed at concentric area centers along the exterior surface of the cylindrical probe and internally connected to their respective averaging manifolds.
- .3 Sensors shall not protrude beyond the surface of the probe, and not be adversely affected by particle contamination normally present in system airflows.
- .4 The fan inlet air flow traverse probes (two per inlet) shall have dual end support swivel brackets suitable for mounting in the fan inlet bell and symmetrical averaging signal takeoffs and fittings and shall be of aluminum construction with hard anodized finish, and suitable for continuous contact with air.
- .5 The fan inlet airflow traverse probes shall not induce a measurable pressure drop, nor shall the sound level with the system be amplified by its presence in the fan inlet bell.
- .6 The probes shall be capable of producing steady, non-pulsating signals of total and static pressure, without need for flow corrections or factors, with an accuracy of $\pm 3\%$ of actual flow over a fan operating range of 6:1 capacity turndown.
- .7 Velocity pressure transmitter shall be selected to suit the system working pressures and shall meet the following performance requirements:
 - .1 Calibrated accuracy within $\pm 0.25\%$ of span.
 - .2 Repeatability within 0.05% of output.
 - .3 Dead band & hysteresis not detectable or measurable.
- .8 Square root extractor and multiplier shall meet the following performance requirements:
 - .1 Calibrated Accuracy: $\pm 0.5\%$ of flow.
 - .2 Hysteresis: Not detectable.
 - .3 Repeatability: 0.05% of output.
 - .4 Response: 0.5 seconds.
 - .5 Multiplier: Adjustable 0.3 to 2.8.
- .9 Integral signal integrator to minimize primary signal noise from the output signal.
- .10 Combined sensor and transducer accuracy of $\pm 2.5\%$ of measured value.
- .11 Transducer to be provided complete with easily accessible, integral non-interacting zero and span adjustment.
- .12 Temperature compensated linear analog output signal indicating average velocity at station, 4-20 mA, 0-5 Vdc or 0-10 Vdc proportional to measured differential pressure.
- .13 Operating temperature range of -18°C to 71°C (0°F to 160°F)
- .14 Operating humidity range; 0 to 99% RH non-condensing
- .15 Dedicated electronic, solid state digital processing control panel, with general purpose dustproof enclosure, wall mounted and shall contain all control equipment
- .16 Acceptable manufacturers:
 - .1 Air Monitor Corp.,
 - .2 Tek-Air Systems Inc.,
 - .3 Ebtron,
 - .4 Dietrich Standard,
 - .5 Or approved equal.

2.36 FLUID FLOW MEASURING DEVICES

- .1 General requirements:
 - .1 Flow meters for chilled water, heating water and steam condensate shall be ultrasonic or electromagnetic type; steam flow meter shall be vortex type.
 - .2 Flow meters shall be installed either in the supply or return pipe of the system, or branch pipe of the system to be measured.
- .2 Clamp-on Ultrasonic Type Liquid Flow Meter:
 - .1 Ultrasonic meter shall be capable of measuring bi-directional flow.
 - .2 Ultrasonic meter shall be complete with matched transducers, self-aligning installation hardware and coaxial transducer cables.
 - .3 Ultrasonic transducers provided shall be optimized for the specific pipe & process conditions for each application and the transducer frequency shall be automatically matched to the resonant frequency of the pipe at start-up.
 - .4 Provide an integral auto-zero function for zero precision and high accuracy at low flow velocities. Accuracy shall be within $\pm 1\%$ of rate from 1 to 40 ft/sec and ± 0.01 ft/sec for velocities below 1 ft/sec. Overall turndown shall exceed 400:1.
 - .5 Output signals shall be 4-20 mA and programmable pulse proportional to flow, with integral digital totalizer. Supply voltage 24 Vdc.
- .3 Inline (full bore) Electromagnetic Type Liquid Flow Meter:
 - .1 Electromagnetic type liquid flow meter shall be complete with integral electronics module. Electronics module shall include a backlit graphic display and keypad.
 - .2 The flow meter shall be capable of measuring bi-directional flow.
 - .3 Connections to the piping shall be ANSI class 150 flanges (ANSI class 300 available where required).
 - .4 The flow tube shall be epoxy coated steel; the sensing electrodes shall be 316 stainless steel; the liner shall be polypropylene or ebonite for low temperature service, PTFE for hot water service.
 - .5 Each flow meter shall be individually wet-calibrated and accurate to within $\pm 0.2\%$ of reading from 1.6 to 33 feet per second velocity. A certificate of calibration shall be provided with each flow meter.
 - .6 Output signals shall be 4-20 mA and programmable pulse proportional to flow, with integral digital totalizer. Supply voltage 24 Vdc.
- .4 Turbine Type Liquid Flow Meter:
 - .1 Turbine type liquid flow meter shall be impedance based sensing device, with single or dual turbines, as required by application.
 - .2 Provide insertion type probe, bi directional, suitable for the system flow, temperature and pressure.
 - .3 Wetted material electroless nickel plated brass, or 316 stainless steel, as required by application.
 - .4 Pressure rating 2750 kPa, maximum / minimum continuous temperature rating -10°C to 93.3°C ,
 - .5 Sensing accuracy $\pm 2\%$ of reading with fluid velocity between 0.2 and 6.0 m/s.
 - .6 Pulse 0 -10 Vdc or 4-20mA output, proportional to flow, with integral digital totalizer. Supply voltage 24 Vdc.

2.37 FLUID FLOW ENERGY METERING

- .1 Where indicated in the documents provide fluid flow energy metering for the following services:

- .1 High Temperature Hot Water (supply and return),
- .2 Hot Water Heating (supply and return),
- .3 Chilled Water (supply and return),
- .4 Condenser water (supply and return),
- .5 Steam,
- .6 Condensate.
- .2 Flow metering installations shall be in compliance with the following:
 - .1 ISO Standard 5167 (latest version), Measurement of fluid flow by means of pressure differential devices inserted in circular cross-section conduits running full.
 - .2 AGA 3/ANSI 2530 (latest version), Orifice Metering of Natural Gas and Other Related Hydrocarbon Fluids,
 - .3 ASME MFC-3M (latest version) Measurement of Fluid Flow in Pipes Using Orifice, Nozzle, and Venturi.
 - .4 ASME Fluid Meters handbook (latest version),
- .3 Provide temperature and pressure compensation for mass flow density algorithms used for fluid flow energy metering as follows:
 - .1 Temperature sensors used in metering (eg. BTU) applications shall be in compliance with the following requirements:
 - .1 Tip-Sensitive thermistor sensors
 - .2 Provide compensation for resistance resulting from wire lead length.
 - .3 The sensors must be a matched pair.
 - .2 Provide 316 stainless steel thermowells for temperature sensors in compliance with the following requirements:
 - .1 Stainless steel probe length shall be at minimum 30% of the pipe width.
 - .2 Moisture/waterproof housing with conduit fitting.
 - .3 Provide complete with thermal transfer compound inside thermal well.
 - .3 Gauge Pressure Transmitter used in metering (eg. BTU) applications shall be in compliance with the following requirements:
 - .1 0.035% span accuracy, 150:1 range turndown, 15-yr stability
 - .2 Output 4-20 mA and HART protocol.
 - .3 Provide a two valve manifold (316SST) for instrument isolation and a drain/vent valve, drain/vent valve allows venting, draining, or calibration.
 - .4 Acceptable manufacturers:
 - .1 Rosemount MVP Series,
 - .2 Or approved equal
- .4 Water (Heating, Chilled, Condenser) Flow and Energy Metering
 - .1 The minimum turndown capability of 40:1.
 - .2 Communication shall be to the BAS via Modbus RTU, Modbus TCP/IP, BACNET MSTP, BACNET/IP.
 - .3 Capable of 4-20 mA analog, pulse and RS 485 output signal.
 - .4 A local LCD display & flow computer that may be configured for various energy and configuration displays.

- .5 Accuracy: +0.5%, -1.0% of flow for velocities greater than 0.3 m/s; +0.0015, -0.003 m/s for velocities less than 0.3 m/s
- .6 Acceptable manufacturer:
 - .1 Siemens Ultrasonic Flow meter
 - .2 Flexim Fluxus
 - .3 Or approved equal.

2.38 POTABLE WATER METER

- .1 Utility Meter
 - .1 Provide Neptune Tru/Flo, or equal, municipal type compound water meter of the sizes shown on the drawings and meeting the local requirements of the Authorities Having Jurisdiction for accuracy and repeatability.
 - .2 All meters shall meet or exceed the latest revision of AWWA C702.
 - .3 The BAS Trades shall provide connection from BAS to standard output of a water meter transducer provided by local authorities.
 - .4 Provide 4-20 mA or 0-10VDC output as appropriate for interfacing with BAS.
- .2 Sub-metering:
 - .1 Provide water meters complete with bypass piping arrangement or other means to remove or isolate for service without interruption to water flow.
 - .2 Materials shall be compatible with the systems in which they are installed at all potential operating temperatures and pressures.
 - .3 Meters shall provide a pulse output scaled to an appropriate volume. In general, provide a scaled pulse output of 0.001cu.m per pulse unless high consumption would result in pulses too frequent to be reliably captured by the pulse counting equipment.
 - .4 For the main incoming water supply, Utility company to provide pulse output meter where feasible.
 - .5 Meters requiring power shall be hard-wired to an independent emergency power circuit. Battery powered units are not acceptable.
 - .6 Provide meters with readout of totalized volume.
 - .7 Accuracy +/- 1.5% in expected operating flow range.
 - .8 Data logging Equipment:
 - .1 Internet Protocol (IP) based data logger complete with:
 - .1 Built-in web server.
 - .2 Capable of operating with a dedicated IP address (to be provided by the Owner).
 - .3 Communications Protocols:
 - .1 HTTP/Post capable of pushing data to 3rd party applications/databases.
 - .2 Modbus TCP.
 - .4 Built-in real-time and historic graphics accessible with any HTML 5 internet browser (computer, tablet, phone) on the Region's network. Data to be displayed in local time, adjusted for daylight savings time. All meter functions to be accessible via the browser.
 - .5 Real-time clock with battery backup and email alert for battery end of life.
 - .6 Time-Stamp:

- .1 Represent date and time
- .2 In UTC time or offset from a specified UTC time
- .3 Resolution: Minimum 1 second
- .7 Ability to export all stored trend data to comma separated value (.csv) or Microsoft Excel format for importing into spreadsheets. Time-stamps to be exported as a single field with a numeric (non-text) value in local time.
- .8 Published application programming interface (API) allowing data to be retrieved from the pulse counter via non-proprietary means, such as JavaScript Object Notation (JSON).
- .9 Built-in trending and data storage:
 - .1 3 years of consumption data at 5 minute intervals for each input with time-stamp
 - .2 Stored in non-volatile memory.
- .10 Battery/power backup (for pulse counting):
 - .1 Lasting a minimum of 72 hours
 - .2 Rechargeable
 - .3 Email alert for battery end of life.
- .11 Security:
 - .1 Unrestricted access to data and graphics over the Owner's network.
 - .2 Password protection for access to setup, changing settings/parameters and deleting data.
- .12 Ability to measure, store and trend the following data complete with time-stamp:
 - .1 Totalized consumption (cu.m)
- .2 Acceptable product:
 - .1 z3 Controls Inc. NetMeter OMNI
 - .2 or equivalent.

2.39 NATURAL GAS METERING

- .1 Utility Connection:
 - .1 The BAS Trades shall provide connection from BAS to standard output of a gas meter transducer provided by local authorities.
 - .2 Provide 4-20 mA or 0-10VDC output as appropriate for interfacing with BAS.
- .2 Sub-metering:
 - .1 Provide gas meters complete with bypass piping arrangement or other means to remove or isolate for service without interruption to gas flow.
 - .2 Materials shall be compatible with the systems in which they are installed at all potential operating temperatures and pressures.
 - .3 Meters shall provide a pulse output scaled to an appropriate volume. In general, provide a scaled pulse output of 0.01 m3 per pulse unless high consumption would result in pulses too frequent to be reliably captured by the pulse counting equipment.
 - .4 Meters requiring power shall be hard-wired to an independent emergency power circuit. Battery powered units are not acceptable.
 - .5 Provide meters with readout of totalized volume.

- .6 Accuracy +/- 1.5% in expected operating flow range.
- .7 Data logging Equipment:
 - .1 Internet Protocol (IP) based data logger complete with:
 - .1 Built-in web server.
 - .2 Capable of operating with a dedicated IP address (to be provided by the Region).
 - .3 Communications Protocols:
 - .1 HTTP/Post capable of pushing data to 3rd party applications/databases.
 - .2 Modbus TCP
 - .4 Built-in real-time and historic graphics accessible with any HTML 5 internet browser (computer, tablet, phone) on the Region's network. Data to be displayed in local time, adjusted for daylight savings time. All meter functions to be accessible via the browser.
 - .5 Real-time clock with battery backup and email alert for battery end of life.
 - .6 Time-Stamp:
 - .1 Represent date and time
 - .2 In UTC time or offset from a specified UTC time
 - .3 Resolution: Minimum 1 second
 - .7 Ability to export all stored trend data to comma separated value (.csv) or Microsoft Excel format for importing into spreadsheets. Time-stamps to be exported as a single field with a numeric (non-text) value in local time.
 - .8 Published application programming interface (API) allowing data to be retrieved from the pulse counter via non- proprietary means, such as JavaScript Object Notation (JSON).
 - .9 Built-in trending and data storage:
 - .1 3 years of consumption data (cu.m) at 5 minute intervals for each input with time-stamp.
 - .2 Stored in non-volatile memory
 - .10 Battery/power backup (for pulse counting):
 - .1 Lasting a minimum of 72 hours
 - .2 Rechargeable
 - .3 Email alert for battery end of life
 - .11 Security:
 - .1 Unrestricted access to data and graphics over the Owner's network.
 - .2 Password protection for access to setup, changing settings/parameters and deleting data.
 - .12 Ability to measure, store and trend the following data complete with timestamp:
 - .1 Totalized consumption (cu.m)
 - .2 Acceptable product:
 - .1 z3 Controls Inc. NetMeter OMNI
 - .2 or equivalent

2.40 ELECTRICAL METERING

- .1 Provide electrical sub-meters for loads identified in the Drawings and Specification; sub-metering refers to meters that are installed after the main utility meter and within the building.
- .2 Internet Protocol (IP) based electrical meters as follows:
 - .1 Built-in web server.
 - .2 Capable of operating with a dedicated IP address (to be provided by the Region).
 - .3 Communications Protocols:
 - .1 HTTP/Post capable of pushing data to 3rd party applications/databases.
 - .2 Modbus TCP
 - .4 Built-in real-time and historic graphics accessible with any HTML 5 internet browser (computer, tablet, phone) on the Region's network. Data to be displayed in local time, adjusted for daylight savings time. All meter functions to be accessible via the browser.
 - .5 Real-time clock with battery backup and email alert for battery end of life.
 - .6 Time-Stamp:
 - .1 Represent date and time
 - .2 In UTC time or offset from a specified UTC time
 - .3 Resolution: Minimum 1 second
 - .7 Ability to export all stored trend data to comma separated value (.csv) or Microsoft Excel format for importing into spreadsheets. Time-stamps to be exported as a single field with a numeric (non-text) value in local time.
 - .8 Published application programming interface (API) allowing data to be retrieved from the meter via non-proprietary means, such as JavaScript Object Notation (JSON).
 - .9 Built-in trending and data storage:
 - .1 2 years of consumption data (kWh) at 1 minute intervals with time-stamp; and
 - .2 10 years of consumption data (kWh) at 1 hour intervals with time-stamp.
 - .3 Stored in non-volatile memory.
 - .10 Security:
 - .1 Unrestricted access to data and graphics over the Region's network.
 - .2 Password protection for access to setup, changing settings/parameters and deleting data.
 - .11 Ability to measure, store and trend the following data at 1 minute intervals complete with time-stamp:
 - .1 Accumulated energy per phase (kWh)
 - .2 Accumulated total energy (kWh)
 - .3 Active power per phase (kW)
 - .4 Active total power (kW)
 - .5 RMS voltage per phase
 - .6 RMS current per phase
 - .7 Power factor per phase
 - .8 Total power factor
 - .9 Line frequency
- .3 Acceptable manufacturers:

- .1 z3 Controls Inc. NetMeter
- .2 Or approved equal

PART 3 - EXECUTION

3.01 GENERAL

- .1 Provide all control devices as indicated in the Documents and as may be necessary to properly execute sequence of operation indicated.
- .2 Install all controllers, cabinets, control devices and power supplies in readily accessible locations providing adequate ambient conditions for its specified application and to the requirements of the Authorities having Jurisdiction (AHJs).
- .3 Instrumentation and devices shall be installed in accordance with manufacturer's placement guidelines and installation instructions; and any installation requirements specific to the intended functioning of the control requirements. Report any discrepancies to the Consultant if any discrepancies are observed. Coordinate device locations with the mechanical, electrical and architectural drawings.
- .4 Mount all controllers and relays within Field Equipment Panels.
- .5 Mount sensor assemblies and elements;
 - .1 in clean areas wherever possible,
 - .2 accessible to allow for replacement and servicing without interfering with access for adjacent equipment and personnel traffic in surrounding space,
 - .3 provide access doors where assemblies and elements are concealed;
- .6 Rigidly support field mounted transmitters, transducers, and sensors on pipe stands or channel brackets.
- .7 Orient sensing elements to correctly sense measured variable and to be isolated from vibrations and environmental conditions that could affect measurement or calibration.
- .8 Identify each cable and wire at every termination point.
- .9 Air seal wires attached to sensors at entry into junction box.
- .10 Actuators shall be firmly mounted to provide positive movement and linkage(s) shall be adjusted to provide smooth continuous movement throughout 100 percent of the stroke.
- .11 All panel wiring within enclosures shall be protected by typical wire trough.

3.02 EXISTING INSTRUMENTATION

- .1 Remove and dispose of existing instrumentation which becomes redundant as part of the Work.
- .2 Reuse existing thermowells where possible.

3.03 POINT NAMING CONVENTION

- .1 BAS Trades shall confirm proposed point naming convention with the Owner prior to naming all points and controllers.
- .2 Each point shall be clearly identifiable by viewing from its point name.
- .3 Room numbering that is shown on the design documents should be followed.

3.04 COMPONENT IDENTIFICATION

- .1 Identify all control wires with labeling tape or sleeves using either words, letters, or numbers that can be exactly cross-referenced with as-built drawings.
- .2 All field enclosures, other than controllers, shall be identified with a backlit or engraved nameplate.
- .3 Junction box covers will be marked to indicate that they are a part of the BAS system.
- .4 All I/O field devices (except space sensors) that are not mounted within field panels shall be identified with name plates.

- .5 All I/O field devices inside panels shall be labeled.

3.05 SAFETY CONTROLS

- .1 Smoke detectors, freezestats, high-pressure cut-offs, and other safety switches and controls to be hard-wired to de-energize equipment as described in Sequence of Operation unless otherwise shown.
- .2 Safety switches and controls to require Operator intervention to activate local manual reset.
- .3 Provide contacts that allow BAS software to monitor safety control status.

3.06 FIELD EQUIPMENT PANELS

- .1 For all I/O requiring field interface devices, including transmitters, transducers, controllers, solenoid air valves and relays, install in NEMA 3R field equipment panel(s) to protect the device(s) from dust, moisture, conceal integral wiring and moving parts;
- .2 Cut-out mount switches and timers on control panel fronts.
- .3 Wiring to and from the field equipment panel(s) will be to screw type terminals; the use of wire nuts is prohibited;
- .4 Analog or communications wiring may use the field equipment panel(s) as a raceway without terminating;
- .5 Install wiring and tubing within enclosures in trays or individually clipped to back of panel with identification tags and terminal numbers visible;
- .6 Field panel enclosures shall be located immediately adjacent to the controller panel(s) to which it is being interfaced.

3.07 TEMPERATURE AND HUMIDITY SENSORS

- .1 Space temperature and humidity sensors shall be mounted away from machinery generating heat, direct light and diffuser air streams.
- .2 Mount space temperature and humidity sensors 1200 mm (4 ft) above finished floor.
- .3 Install room temperature and humidity sensors on concealed junction boxes supported by wall framing.
- .4 Use duct averaging temperature sensors in mixing plenums and hot and cold decks. Install temperature averaging sensors in serpentine manner vertically across duct. Support each bend with capillary clip.
- .5 Install mixing plenum low-limit temperature sensors in serpentine manner horizontally across duct. Support each bend with capillary clip. Provide temperature sensor element length to coil area ratio of 3 m per 1 m² (1 ft per 1 sq ft).
- .6 High-limit and low-limit temperature sensors:
- .7 Relay outputs for low-limit and high-limit temperature sensors shall include transient suppression across all coils. Suppression devices shall limit transients to 150% of the rated coil voltage.
- .8 Install hardwire interlocked to supply fan starter for respective system.
- .9 Low Limit Temperature Sensors:
 - .1 shall shut down the fan when duct temperature is equal to or less than 1.67°C (35 °F) (field adjustable).
 - .2 Shall be located to adequately cover potential areas of low level stratification;
 - .3 Shall be provided for each 2.8 sq.m (25 sq.ft.) of duct cross section;
 - .4 Shall be mounted on plastic clips.
- .10 High Limit Temperature Sensors:
 - .1 Shall shut down the fans when duct temperature is equal to or greater than 51.7°C (125°F).
 - .2 Shall be provided for each 3.7 sq.m (40 sq.ft.) of duct cross section.

- .11 Liquid Temperature Sensors:
 - .1 Install pipe-mounted liquid temperature sensors in wells with heat-conducting material. Pipe-mounted liquid temperature sensors shall be removable without shutting down the system in which they are installed.
 - .2 Where thermowell installation necessitates shutting down of pumps or draining of pumps, coordinate shut-down with Consultant and Owner.
 - .3 Cut and recover piping insulation to one foot either way for installation of strap-on temperature sensors. Provide removable insulation box over sensor and patch insulation to match existing.
- .12 Outdoor Air Temperature and Humidity Sensors:
 - .1 Outdoor air temperature and humidity sensors shall be mounted on the north building face directly in the outside air.
 - .2 Install outdoor sensors such that the effects of heat or cold from the building such as lamps and exhaust vents.
 - .3 Provide solar shield. Install shield to open downward.
 - .4 Locate minimum 1500 mm (5 ft) above horizontal surfaces.
 - .5 Where indicated or specified for installation in outside air intake, locate so as not to be affected by exhaust air flow or reverse flow.
 - .6 Seal interior of conduit at penetration through exterior wall.
- .13 Guards for Temperature and Humidity Sensors:
 - .1 For wall mount sensors where subject to damage or vandalism, and where indicated on the drawings provide guards.
 - .2 Guards shall be clear, ventilated polycarbonate covers with allen key locking hardware.

3.08 PRESSURE SENSORS

- .1 Piping to air pressure transducer pressure ports on all pressure transducers shall contain capped test port adjacent to transducer.
- .2 Locate air pressure transducers, except those controlling terminal unit boxes as follows:
 - .1 in control panels, not on monitored equipment or on ductwork,
 - .2 mount transducers in vibration-free location accessible for service without use of ladders or special equipment.
- .3 Duct Static Pressure Sensor Installations:
 - .1 Duct static pressure sensors, the high-pressure port shall be connected to a metal static pressure pitot tube inserted into the duct;
 - .2 the low pressure port shall be left open to reference the open area where the transmitter is installed.
 - .3 make pressure tap connections according to manufacturer's recommendations.
- .4 Building Static Pressure Sensor Installations:
 - .1 pipe pressure sensor's low-pressure port to static pressure port located on outside of building and install with a shielded static air probe to reduce pressure fluctuations caused by wind,
 - .2 pipe pressure sensor's high-pressure port inserted into the space via a metal tube behind thermostat cover
- .5 Fluid pressure measuring stations:
 - .1 Mount gauge tees adjacent to water differential pressure taps. Install shut-off valves before tee for water gauges in the high and low sensing pick-up lines.

- .2 Isolation valve and snubber to be installed between pressure sensor and pressure source.
- .3 Sensors and switches on steam lines and high temperature water to be protected by pigtail siphon installed between sensor and fluid line.
- .4 Provide two pressure transducers with software calculation at controller for differential pressure measurements in fluid piping systems.

3.09 INSTALLATION OF CURRENT SENSING SWITCHES

- .1 Relay portion shall relay portion shall be installed in local Field Equipment Panel, in the Controller enclosure, or in the wiring channel between MCC tubs, relay shall not be installed within MCC tubs;
- .2 Provide device securely mounted with screw type wire terminations;
- .3 Device shall be mounted for easy access.

3.10 INSTALLATION OF FLOW SWITCHES

- .1 Fit correct length paddle for diameter of pipe.
- .2 Adjust switch for specified flow condition in accordance with manufacturer's instructions

3.11 INSTALLATION OF AIR QUALITY SENSORS

- .1 CO Sensors:
 - .1 Mount the sensor 1200 to 1800 mm (4 to 6 ft.) above finished floor.
 - .2 Provide sufficient number of sensors for full coverage of the monitored area.
- .2 NO2 Sensors:
 - .1 Use two sensors per zone, mount one of the sensors 300 mm (1 ft.) above finished floor and the other 300 mm (1 ft.) from the ceiling or underside of exposed slab.
 - .2 Provide sufficient number of sensors for full coverage of the monitored area.

3.12 INSTALLATION OF GAS DETECTION SYSTEM

- .1 For Parking Garage and Loading Dock Gas Detection System, Refrigerant Leak Monitoring and Alarm System, and other Gas Detection Systems provide gas detection system sensor/transmitter and control panel equipment for areas where indicated and/or specified on drawings.
- .2 Review exact locations of equipment with Consultant prior to installation.
- .3 Perform required 24 volt wiring in conduit to control panel(s) and from each panel to associated sensor/transmitter units as required and in accordance with system manufacturer's certified wiring schematics.
- .4 Provide 24 volt interlock wiring to exhaust fan starters in accordance with drawing control requirements.

3.13 CONTROL DAMPERS

- .1 Furnish control dampers for installation by Mechanical Trades. Provide supervision on site during installation.
- .2 Installation of automatic control dampers shall be in accordance with manufacturer's installation guidelines.
- .3 Install uninsulated control dampers in areas maintained above freezing, and/or where shown in the Documents.
- .4 Install insulated control dampers on all systems that connect with (or transfer air to or from) the outdoors and/or where shown in the Documents.

3.14 CONTROL DAMPER ACTUATORS

- .1 Mount actuators and adapters according to manufacturer's recommendations.
- .2 Mount damper actuators directly on damper shaft or jackshaft using a V bolt design

- .3 Mount valve actuator directly on shaft or with linkages according to manufacturer's recommendations.
- .4 For low-leakage dampers with seals, mount actuator with minimum 5° travel available for damper seal tightening.
- .5 To compress seals when spring-return actuators are used on normally closed dampers, power actuator to approximately 5° open position, manually close damper, then tighten linkage.
- .6 Provide mounting hardware and linkages for actuator installation.
- .7 BAS Trades shall be responsible for connecting to existing pneumatic system, or supplying and installing pneumatic system, where required to operate pneumatically actuated dampers.

3.15 CONTROL VALVES

- .1 Furnish control valves for installation by Mechanical Trades. Provide supervision on site during installation.
- .2 Refer to Drawings for location of normally open/ normally closed and common ports. Where normally open or normally closed ports are defined, provide a valve that will fail to that position if power or control signal is lost.

3.16 CONTROL VALVE ACTUATORS

- .1 Mount actuators and adapters according to manufacturer's recommendations; actuator motor shall be fully accessible for ease of maintenance.
- .2 Connect actuators to control valves with adapters approved by actuator manufacturer.
- .3 BAS Trades shall be responsible for connecting to existing pneumatic system, or supplying and installing pneumatic system, where required to operate pneumatically actuated control valves.

3.17 AIRFLOW MEASURING STATIONS

- .1 Provide transducers, relays, and interconnection wiring to perform Sequences of Operations as detailed and Monitoring in accordance with Controls Schematics.
- .2 Provide mounting hardware for installation of airflow measuring stations by Sheet Metal Trades.
- .3 Provide supervision on site during installation.

3.18 AIR FLOW SENSORS, DUCT MOUNTED

- .1 Furnish duct mounted air flow sensors for installation in ductwork by Sheet Metal Trades.
- .2 Provide supervision on site during installation.

3.19 AIR FLOW SENSORS, FAN BELL MOUTH

- .1 Coordinate installation of air flow sensors at inlet of fans with fan manufacturer.
- .2 Provide supervision on site during installation.

3.20 FLUID FLOW METERS

- .1 BAS Trades shall verify all meter locations with the Consultant prior to installation.
- .2 Follow fluid flow meter manufacturer's installation instructions with particular attention paid to upstream and downstream straight pipe runs. Provide a flow straightener, if required to meet the manufacturer's minimum upstream straight pipe run requirement.
- .3 Provide lateral and horizontal supports as required to minimize vibration at each meter location.
- .4 Ultrasonic clamp-on type liquid flow meter shall be installed without making any openings in the pipe wall and shall utilize non-wetted ultrasonic transducers that may be located up to 300 ft from the meter.
- .5 Insertion type flow meters shall be provided with all installation hardware necessary to enable insertion and removal of the meter without system shutdown and shall be capable of being inserted and removed by hand up to 400 psi. Install sensor through a 1" (25 mm) full port ball valve for easy removal.

- .6 For installations in non-metallic pipe, install grounding rings or probes as required.
- .7 The installing Mechanical Trade contractor is responsible for providing suitable mating flanges and any required line reducer.
- .8 Each flow meter shall be factory programmed for its specific application, and shall be re-programmable using the integral keypad on the converter (no special interface device or computer required).

3.21 FLUID FLOW ENERGY METERS

- .1 Provide all configuration software and licenses and all required interface cables to the Owner.
- .2 The Energy Meter display/flow computer supplier shall set up, commission and verify energy measurement and shall train Owner in all aspects of Energy Meter computer setup and operation.
- .3 Energy Meter installation shall be complete including sensor wiring, power wiring, coordination of flow meter installation in a pipeline, setup for operation, labeling, commissioning with commissioning reports.

3.22 POTABLE WATER METERS

- .1 Provide potable water meters for each separate end use as follows:
 - .1 Facility incoming domestic cold water
 - .2 Plumbing fixtures
 - .3 Process water:
 - .1 vehicle wash,
 - .2 humidification.

3.23 CONTROL PROGRAMS

- .1 General:
 - .1 The control programs shall be modular and structured in order to provide specific control operation of HVAC components.
 - .2 All control programs shall provide a minimum of 20% spare memory for expansion.
 - .3 Each control program shall contain "REM" statements which explain this program operation.
 - .4 Each control program shall open with a list of the I/O points used and controlled in the program.
- .2 Sensors and Devices - are listed in this specification. Provide 5% spare I/O capacity.
- .3 Implement all control program concepts in full, or partial as required, to provide complete HVAC equipment control. The programs shall perform all control strategies on the basis of protecting equipment operation, saving operational energy costs, and indicating alarm conditions.
- .4 Programs which increase the system energy consumption or cause equipment failures will be refused and resolved by the contractor at no additional cost to the Owner.

3.24 CONTROL SYSTEMS

- .1 Install the entire Control system under supervision of factory trained engineers and technicians fully capable of providing instruction, routine maintenance, programming and emergency maintenance service on all system components.
- .2 During the training period and at no extra cost, make any required program changes to enable optimum system operation as directed by the Consultant.
- .3 Provide "status" confirmation by using auxiliary starter contacts load side activated relays or current transformer switches rated for design load operation for pumps. Use load side activated relays or auxiliary relay contacts for single phase motors. Use pressure differential switches for fans.

- .4 For stop/start operation wire only to starter "Auto" circuit. Failure to stop and start to register as an alarm.
- .5 In the event of a control system failure from any cause, provide for normally "on" sequence for equipment such as boilers, boiler pumps, heating pumps and coil circulation pumps and normally open to heating for scheduling valves and other 3 port valves to prevent coil and equipment freeze-up.
- .6 Provide a minimum of two spare input and two spare output points on each controller.
- .7 Where motor operation is specified to provide enable/disable, permissive or sequential operation, use programming software wherever possible or provide hard wire interlocks.

3.25 BAS TESTING, COMMISSIONING AND ACCEPTANCE

- .1 Provide Commissioning in accordance with Section 20 08 10 and Section 25 05 10.
- .2 When the BAS system is fully installed and operational, the Mechanical Trades, in conjunction with the BAS Trades, shall review and verify the system functions with the Engineer of Record, the Construction Manager/ General Contractor, the Commissioning Authority the Owner's Representative in accordance with the Documents.
- .3 Provide additional Testing as follows:
 - .1 Check the installation of each sensor, actuator, and controlled device.
 - .2 Verify and record in as built OEM drawings the wiring of each I/O sensor and device as installed.
 - .3 Calibrate each sensor as required.
 - .4 Manually operate each output for every system with a portable Mobile User Interface supplied by the BAS Trades for commissioning.
 - .5 Tune each control loop and print the response of trends for hard copy record. Identify correct PIO parameters on all print outs.
 - .6 Verify all start/stop operations, e.g. "schedule control", "Optimized I control", "unoccupied mode" setback.
 - .7 Verify all custom control programs and alarm functions.
 - .8 Perform end-to-end checks from an operator terminal to all sensors and actuators to verify system communications and control via LAN.
 - .9 Verify BACnet communications as specified and submit all point naming and identification values accordingly.
 - .10 Submit site specific trends which contain all I/O points recorded at an analog or digital time frequency that confirms the correct system operation.
- .4 Ensure the Work has met requirements outlined in the Article entitled 'Completion' found in Section 20 01 10.

PART 1 - GENERAL

1.01 GENERAL REQUIREMENTS

- .1 Comply with requirements of the Owner's General Requirements and all documents referred to therein.

1.02 DESCRIPTION

- .1 Comply with requirements of Section 20 01 10 Mechanical General Requirements.
- .2 Comply with requirements of Section 20 01 50 Basic Materials and Methods.
- .3 Comply with the requirements of Section 25 05 10 BAS General Requirements
- .4 Comply with the requirements of Section 25 10 10 BAS Control Network
- .5 Comply with the requirements of Section 25 30 10 BAS Instrumentation and Devices
- .6 Comply with the requirements of Section 26 05 00 Electrical General Requirements

1.03 WORK PERFORMED BY THIS SECTION

- .1 This section includes general specification for the integrated lighting control system.
- .2 Provide all conduit, wire, connectors, hardware, and other incidental items necessary for the complete and properly functioning relay lighting control system as described herein and shown on the plans.

1.04 SUBMITTALS

- .1 Submit shop drawings in accordance with Section 20 01 10 and Section 26 05 01.
- .2 Submittal package shall contain:
 - .1 A complete bill of materials
 - .2 Sets of catalog cuts for standard equipment
- .3 Sets of shop drawings detailing all mechanical and electrical equipment including one line diagrams, wire counts, internal wiring and physical dimensions of each item. Marked up catalog cuts are unacceptable.
- .4 Upon completion of all contractor's wiring, and after all fixtures are installed and lamped, the contractor shall request the services of a factory representative to completely check out the system prior to energizing the system. At the time of check out and testing, the owner's representative shall be thoroughly instructed in the proper operation of the system.
- .5 Two complete sets of as-built drawings shall ship with the equipment when it leaves the factory, along with operations and maintenance manuals for the relay system.
- .6 Be responsible to ensure that any fluorescent ballasts supplied are compatible with the equipment being furnished on this project.
- .7 Follow manufacturer's installation instructions.

1.05 QUALITY ASSURANCE

- .1 Obtain lighting controls from a single source with total responsibility for compatibility of lighting control system components specified in this Section.
- .2 All equipment shall be 100% tested. Sample testing is not acceptable.
- .3 All standard system line voltage components shall be UL listed and so labelled when delivered to the job site.
- .4 Manufacturer Requirements
 - .1 Experience – the manufacturer shall have been continuously engaged in the manufacture of architectural lighting controls and relays for no less than ten (10) years.
 - .2 Testing – manufacturer shall perform functional testing of all components to confirm proper operation prior to shipment.

1.06 DELIVERY, STORAGE AND HANDLING

- .1 Materials must be delivered in a timely manner to other trades.
- .2 Store materials away from exposure to harmful construction and weather conditions and at temperature and humidity conditions recommended by the manufacturer.

1.07 WARRANTY

- .1 All equipment shall be warranted free of defects in materials and workmanship.
- .2 24 months from date of turn-over to the Owner. Relay modules shall be warranted for a period of ten (10) years.

1.08 ACCEPTABLE MANUFACTURER

- .1 The specification is based on Intelligent Lighting Controls LightLEEDer and shall serve to indicate the quality of equipment required.
- .2 Alternate manufacturers must comply with the specifications herein in every detail.

PART 2 - PRODUCTS

2.01 LIGHTLEEDER PROGRAMMABLE LIGHTING CONTROL PANELS

- .1 Hardware Features:
 - .1 Controller Back-Box: Each programmable lighting controller shall be provided with a factory furnished; UL listed NEMA 1 enclosure designed for wall mounting. The backbox must be capable of being shipped ahead of the controller chassis insert to allow for rough-in of all electrical connections prior to receipt of the controller chassis insert.
 - .2 Controller Chassis Insert: Each programmable lighting controller shall be provided with a factory or field-installable controller chassis insert. The Controller chassis insert shall contain all controller electronics, power supplies, relays, contactors, and other required components. Controller chassis inserts shall arrive at the project site completely pre-wired and require only the connection of lighting circuits and control devices.
 - .3 Line Voltage / Control Voltage Separation: Each programmable lighting controller shall be provided with a mechanical barrier that separates all line voltage components and wiring from all control voltage components and wiring. An additional barrier may be installed within the line voltage section that shall provide isolation between normal and emergency circuits where required.
 - .4 Controller Covers: Each programmable lighting controller shall be provided with a dead front screw-held or hinged locking cover that is designed for either surface or flush mounting. Flush mount doors shall be provided with a trim ring. If a hinge-locking door is provided, it shall be provided with a slam-latch with 2 keys and door hooks to assist in mounting.
 - .5 Controller Capacity/Configurations: Controllers shall be available in sizes to accommodate 4, 8, 16, 24, 32, 40, 48, 56, and 64 relay outputs. Controllers shall be available with the electronics in the center and voltage dividers with the lighting relays on the right and left sides.
- .2 Electrical:
 - .1 Controller Power Supply: Each programmable lighting controller shall be provided with a dual-rated, UL-listed Class 2 transformer capable of either 120/277 VAC or 120/347 VAC primary (50 to 60 Hz). It shall contain an internal self-resetting fuse.
 - .2 Connections: All connections shall be made to clearly and permanently labeled termination points.
- .3 Controller Electronics:
 - .1 Controller CPU: Each programmable controller shall be provided with a CPU (Central Processing Unit) that shall provide all the programming and control functions for the entire controller.

- .2 Real-Time Clock: Each controller shall be provided with a Real-Time Clock used to perform all time-controlled functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second with the line-sync setting. Real-Time Clock functions shall include the time of day, day of the week, date, and automatic daylight-saving time and leap year adjustments. The time clock shall be protected against loss of time during a power outage for a period of up to 45 days without power of any type. Daylight Saving Time shall be adjustable with an enable/disable feature. Systems relying on a single clock device shall not be acceptable.
- .3 Relay Driver Module: Relay output cards shall be provided to expand the controller capability from 8 to 64 relay outputs in increments of 8. Electronics shall feature surge protection and optic isolation. It shall also provide an interface for mounting input boards.
- .4 Relay Control Switches: Controller shall contain push-button switches to turn all relays ON or OFF without the presence of any programming.
- .5 Backup and Restore: The controller shall be equipped with an internal memory backup and restore capability. It shall have the ability to back up all internal programming into additional onboard memory, verify present programming with backup, and restore programming.
- .6 Runtime Logging: The controller shall be equipped with memory to log the runtime of each relay. It shall be capable of storing up to 30 days or 1092 hours of data and be able to be exported in a delimitative format.
- .7 Non-Volatile Memory: Controller shall contain a minimum of 4 Mb of nonvolatile EEPROM memory with data retention of >200 years and electrostatic discharge protection of >4000V.
- .8 Power Input Surge Suppression: The controller's 24VAC power input shall be equipped with double surge suppression to protect the electronics from transient over-voltages. Protection shall clamp over-voltages up to 123 volts.
- .9 Data Line Surge Suppression: The controller data line communications shall be equipped with transient voltage suppression protection that will protect the electronics from electrostatic discharge and other transient over-voltages. Protection shall clamp transients up to 8kv direct discharges and 15kv air discharges.
- .10 Data Line Communications: The controller shall be equipped with serial communications through RJ45 connectors for communicating on CAT-5 cable with other panels and LightSync devices. It shall also be equipped with a separate local port for communicating with LightSync devices. The communications shall consist of 2-RS485 data lines.
- .11 USB Serial Communications: A USB port shall be provided for programming and interfacing the system with the use of a personal computer.
- .12 TCP/IP Communications: A TCP/IP port shall be provided for programming and interfacing the system with a personal computer over a network (LAN) or the internet (WAN).
- .13 Optional Module Interface: The controller shall contain 4 ports for interfacing optional modules which include communications and power. Optional modules shall be able to be mixed on each controller.
- .4 Switching and Control Devices:
 - .1 Device Node Capacity: The lighting controller shall support switch input control of up to 64 data line LightSync devices locally per panel and 254 per network for up to 16,510 devices. The first 8 device nodes shall be powered by the lighting controller. The addition of a power supply or power supply/repeater shall be required for each additional 20-device node. Each LightSync device shall have a unique address and shall be capable of being programmed to the applicable functions described in the Switched Input Types heading in this specification.
 - .2 Data Line Media: The data line shall consist of RS485 communications protocol transmitted over CAT-5, CAT-5E, or CAT-6 Cable. The cable shall have male RJ45 connectors installed on each end for interfacing controllers and LightSync devices. Both daisy-chain and "T" (3-direction branching) of cable runs shall be permitted. "T" branching shall be accomplished

- by the addition of power supply/repeaters. It shall be able to be wired in a home-run configuration for LightSync devices by the addition of a LightSync Hub.
- .3 LightSync Switch Stations: LightSync data line switch stations shall be available in momentary push button (1-7 switches and pilots) and each switch shall have an associated pilot light. It shall be provided with optional dimming Raise and Lower buttons. Switches can be provided as Scene Multi-zone, Scene Stations, Multi-zone Stations, or Non-Dim Stations. Each button shall control any or all the relays in the lighting controllers or the dimmer outputs on the network. There shall be an option to program each pilot LED to indicate the state of any Relay, Group, Preset, Scene, and static ON or OFF. It shall also have the capability to reverse the status: LED is ON if the relay is OFF etc. It shall be available with an optional Bluetooth interface option for interfacing and programming LLEVO panels with an app. It shall have an optional 915 MHz radio with point-to-point capabilities. It shall communicate 100 feet of line-of-sight with the wireless devices.
 - .4 LightSync Photocell Controllers: The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs on the network.
 - .5 LightSync Input Modules: The input module shall provide 4 inputs that accept momentary, momentary PB, and maintained switch closures. Each input shall be optically isolated and can accept dry contact closures or 12-24VDC signals. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs on the network. It shall provide four pilot outputs that provide the true status of relays, groups, and presets. It shall be installed in the control panel or remotely mounted.
 - .6 LightSync Disable Key Switch: The disable switch shall provide an RJ45 connector that shall disable all LightSync devices down line with the closure of a key switch. It shall also provide two RJ45 connectors to pass data through. It shall indicate with an LED when the disable switch is active.
 - .7 LightSync Occupancy Sensor Input Module: The occupancy sensor input module shall provide power and inputs for motion sensors. It shall have 4 or 8 independent inputs that shall be able to interface multiple sensors. Each input shall control any or all of the relays in the lighting controllers or the dimmer outputs on the network. It shall have the ability to set AND/OR conditional logic. It shall be installed in the control panel or remotely mounted.
 - .8 LightSync 0-10V Dimmer Output Module: The 0-10VDC dimmer output module shall be designed to control dimmable ballasts or other 0-10VDC devices. Each module shall have 4 independent output channels that can control up to 200 devices per output at .5mA per device. It shall have the capability to vary its level 256 steps between 0 and 10VDC. It shall be able to respond to photo controllers, switch inputs, DMX512 signals, and timers. Each output shall be galvanically isolated up to 1500V to protect electronics. It shall be installed in the control panel or remotely mounted.
 - .9 LightSync Motor Control Output Module: The motor control output module shall be designed to control shade motors, louver motors, blind motors, skylights, or any other class 2 DC motors. Each module shall have 4 independent outputs that can be controlled by a switch input, photocell, or timer. The control time shall be selectable from .1 to 300 seconds. Each lighting controller shall handle up to 8 modules with 4 outputs on each. Each output shall be equipped with a limit switch input for each direction of the motor.
 - .10 Graphical Touch Screen Control Station: The Touch screen control station shall display the status and control the lighting control panel relay outputs via pre-programmed control objects on standard or custom bitmap screens.
- .5 Special Purpose Modules: The following special-purpose controller nodes shall be available. Four modules shall be permitted per controller.
- .1 BACnet Control: This module shall communicate directly to the lighting controller through serial communications from the BAS system using BACnet MSTP or BACnet IP protocol. It

- shall be able to read the status of inputs and relays and control single or multiple relays in the lighting controller. It shall also be able to disable/enable inputs and shall be able to force timer options.
- .2 DMX Control: This module shall support the control of relays using the standard USITT DMX512 protocol used by theatrical lighting systems. Each relay in the lighting panel shall be configured to be controlled by any DMX channel. It shall contain a frame filter that can be set from 1 – 16 frames. It shall have a priority setting for switch inputs or DMX signals. It shall have the capability to control any 0 – 10V dimming output throughout the network. It shall display current DMX levels from the keypad.
 - .3 DMX Driver: This module shall send DMX signals from the lighting control panels using the standard USITT DMX512 protocol used by theatrical lighting systems. Each module added to the panel shall control up to 64 channels. Each dimming output channel shall be able to be mapped to 1-512 DMX channels. It shall be 1 to 1 mapped or programmed with free software. It shall be installed in the control panel or remotely mounted.
 - .4 Modbus Control: This module shall communicate directly to the lighting controller through RS485, RS232, or TCP serial communications from the BAS system using Modicon Modbus RTU or ASCII protocol. It shall be able to read the status of inputs and relays and control single or multiple relays in the lighting controller. It shall also be able to disable/enable inputs and shall be able to force timer options.
 - .5 N2 Control: This module shall communicate directly to the lighting controller through serial communications from the BAS system using the Metasys-N2 protocol. It shall be able to read the status of inputs and relays and control single or multiple relays in the lighting controller. It shall also be able to disable/enable inputs and shall be able to force timer options.
 - .6 Protocol Input Control: This module shall allow serial communications from a Modbus, N2, or BACnet network. It shall be capable of emulating LightSync switches or photocells for direct control and status of relays, dimmers, or motor controls.
- .6 Programming: Programmable controllers shall be capable of being programmed, monitored, backed up, or controlled through any of the below methods. All programming changes shall take effect immediately as they are programmed and shall not suspend or disable switches or other system functions. The same functions shall be available for any of the connection types.
- .1 Local Keypad and Display: The system user shall be able to program, monitor, and control any of the controller features and functions through the use of a simple menu-driven self-prompting user interface consisting of a 4-line 20-character backlit LCD display and 8 selection keys that change function based on the current operating mode.
 - .2 USB Serial Direct Connect: The system user shall be able to program, monitor, or control any of the controller features and functions utilizing LightLEEDer Pro Windows-based graphical user interface software using a USB port from a PC.
 - .3 TCP/IP Connect: The system user shall be able to remotely program, monitor, or control any of the controller features and functions utilizing LightLEEDer Pro Windows-based graphical user interface software using a PC with TCP/IP on a LAN or WAN.
- .7 Diagnostics: Programmable controllers shall have the ability to do the following diagnostics.
- .1 Power Status: Each programmable lighting controller shall be provided with an LED on the controller and each output board shall indicate that power is present.
 - .2 Keypad: System users shall be able to view thru the keypad the status of any relay, input, group, or preset and force any ON or OFF.
 - .3 Software: System users shall be able to view thru the LightLEEDer Pro software the status of any relay, input, group, or preset and force any ON or OFF. It shall also be able to scan the network for devices and controllers and then poll them to verify network quality.

- .4 Relay Cycle Test: The controller shall have a cycle test for relays to turn them off/on/off and then return them to the original state to verify proper operation. It shall display the results for each relay for turning the relay ON and OFF.
- .5 Device Finder: It shall have the capability through the keypad to find LightSync devices, dimmer devices, and motor devices on the network.
- .6 Switch Test Mode: It shall be able to enter a switch test mode, where a switch input status LED will light when switch inputs are activated. It shall disable normal control when in this mode.
- .7 Demo Clock: It shall have the ability to speed the clock's time by 10, 30, or 60 times for testing timer functions.
- .8 Power Failure and Power-Up: Each programmable lighting controller shall be provided with circuitry that shall automatically shut down the controller whenever the incoming power fails to be delivered to the controller within the required limits. When power is returned to the controller, one of the following power-up modes will be implemented for each controlled relay output in the system.
 - .1 No Action: Upon restoration of incoming control power, the controller electronics shall be restarted and resume normal operations and all circuits will be maintained in the condition they were last in.
 - .2 Turn ON: Controller shall turn the selected relay output to the ON state after power-up.
 - .3 Turn ON if Input Closed: Controller shall turn the selected relay output to the ON state after power-up if the local input selected is closed. It shall be able to select any input to monitor.
 - .4 Turn OFF: Controller shall turn the selected relay output to the OFF state after power-up.
 - .5 Turn OFF if Input Closed: Controller shall turn the selected relay output to the OFF state after power-up if the local input selected is closed. It shall be able to select any input to monitor.
 - .6 On if Open Time, OFF if Closed Time: Controller shall turn the selected relay output to the ON state during Open hours and shall turn selected relay outputs to the OFF state during Closed hours. This shall be used in conjunction with OPEN/CLOSED timers.
 - .7 OFF if Open Time, ON if Closed Time: Controller shall turn the selected relay output to the OFF state during Open hours and shall turn selected relay outputs to the ON state during Closed hours. This shall be used in conjunction with OPEN/CLOSED timers.
 - .8 Time of Day: Controller shall turn the selected relay output to the ON or OFF state based on the time of day in 30-minute increments for every day of the week.
- .9 True Relay Status Feedback: Each controller shall be provided with circuitry that shall monitor the actual status of each relay via a set of pilot contacts mechanically linked to the relay main contacts.
- .10 Switch Input Details: All switch inputs shall have the following options:
 - .1 Input Flexibility: Each switch input shall accept a 2 or 3-wire maintained or momentary switch. It shall be capable of accepting a dry contact, open collector closure, or a 12-24VDC signal. Each switch shall be able to have 2 switch types associated with it in an A/B form.
 - .2 Input to Output Programmability: Any switch input shall be programmed to control any or all the controller's relay outputs without limitations in the network.
 - .3 Input Logic Conditionals: All switch inputs shall have 2 conditionals that add a logic "AND" or "OR" dependent on a relay on, a relay off, an "on" input opened or closed, and an "off" input opened or closed. It shall also have a priority level setting.
 - .4 Input Active Times: All switch inputs shall have a time-of-day or open/close time of action. This shall change the switch type on the time of day every 30 minutes or change per open/closed times.
 - .5 Input Types:

- .1 Momentary ON/OFF: When momentary contact is made between the ON and COM, relay outputs controlled by this input shall be turned ON. When momentary contact is made between OFF and COM, relay outputs controlled by this input shall be turned OFF.
- .2 Momentary ON/OFF w/Blink: When momentary contact is made between the ON and COM, relay outputs controlled by this input shall be turned ON. When momentary contact is made between OFF and COM, relay outputs controlled by this input shall blink and postpone being turned OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice prior to turning it OFF. If an ON command is received during the blink alert time, relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
- .3 Momentary Push-Button ON/OFF: When momentary contact is made between the ON and COM, relay outputs controlled by this input are turned ON and OFF alternately, based on the current state, each time contact is made.
- .4 Momentary Push-Button ON: When momentary contact is made between the ON and COM, relay outputs controlled by this input shall be turned ON.
- .5 Momentary Push-Button OFF: When momentary contact is made between ON and COM, relay outputs controlled by this input shall be turned OFF.
- .6 Momentary Push-Button Toggle: When momentary contact is made between ON and COM, relay outputs controlled by this input shall toggle from the present state.
- .7 Maintained ON/OFF: When contact is made between the ON and COM, relay outputs controlled by this input are turned ON. When contact is broken between ON and COM, relay outputs controlled by this input are turned OFF.
- .8 Maintained Multi-way: When contact is either made or broken between the ON and COM, relay outputs controlled by this input will be toggled between ON and OFF conditions. This function shall be similar to that of standard 3 and 4-way switches.
- .9 Maintained ON/OFF w/Blink: When contact is made between the ON and COM, relay outputs controlled by this input are turned ON. When contact is broken between ON and COM, relay outputs controlled by this input shall blink and postpone being turned OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice prior to turning OFF. If an ON command is received during the blink alert time, relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
- .10 Timed ON: The timed-ON input shall operate either from the input closure or open. If programmed to operate from the closure, the relays turn ON when the input closes and turn OFF after the time duration. The relays do nothing when the input opens. If programmed to operate from the open, the relays turn ON when the input closes and remain ON. When the input opens, the relays turn OFF after the timed-ON duration.
- .11 HID Bi-Level: This feature requires the configuration of ON/OFF relay outputs and HI/LOW relay outputs. The first momentary contact between ON and COM sets the ON relay outputs to ON and the HI/LOW outputs to HI (for at least 15 Minutes). The second contact switches the HI/LOW outputs to LOW. Additional contact closures will toggle the HI/LOW relay outputs. The cycle then repeats until momentary contact is made between the switch input OFF and COM. then the ON/OFF outputs and HI/LOW outputs are turned OFF.
- .12 Two-Step Alternating Sequence: The first time the switch is activated, relay outputs programmed as "Group A" are turned ON, and relay outputs programmed as "Group B" are turned OFF. The second time the switch is activated, "Group A" relay

- outputs are turned OFF, and "Group B" relay outputs are turned ON. The third time the switch is activated, the pattern begins again at step one.
- .13 Four-Step Alternating Sequence: The first time the switch is activated, relay outputs programmed as "Group A" are turned ON, and relay outputs programmed as "Group B" are turned OFF. The second time the switch is activated, "Group A" relay outputs are turned OFF, and "Group B" relay outputs are turned ON. The third time the switch is activated; both "Group A" and "Group B" relay outputs are turned ON. The fourth time the switch is activated; both "Group A" and "Group B" relays are turned OFF. The fifth time the switch is activated, the process begins again at step one.
 - .14 Set Preset: When momentary contact is made between the ON and COM, the selected preset scene will be activated.
 - .15 Set Scene: When momentary contact is made between the ON and COM, the selected scene will be activated.
 - .16 Force Timer: When momentary contact is made between the ON and COM, the selected timer will be activated.
- .11 Timer Functions: Each of the programmable lighting controllers shall have the described timer options listed below for the relay outputs.
- .1 Time-of-Day Timers: Each programmable lighting controller shall be provided with a minimum of 128 available timers (scheduled events) for use in developing time-of-day automated schedules. Each timer shall have the ability to turn any or all relay outputs ON or OFF at any time in 1-minute increments. Timers shall be day-of-week selectable and may be programmed to activate on any combination of days of the week. Each shall be capable of being programmed to be enabled or disabled for any day of the calendar year.
 - .2 Astronomical Scheduling: Each controller shall contain an astronomical time clock that shall calculate sunrise and sunset times based on the geographical latitude and longitude positioning. Sunrise and sunset times may be used as activation times for any system timer. In addition to sunrise and sunset time activation, the control shall be capable of programming activation time before and after these times based on an offset of 1-999 minutes.
 - .3 Open/Closed Time Control: The user shall also have the option of controlling relay outputs in relation to the Open/Closed times of the facility. The Open/Closed times may vary for different days of the week and may be programmed for each day of the year. In addition to Open/Closed time activation, the control shall be capable of programming activation time before and after these Open/Closed times based on an offset of 1-999.
 - .4 Off-Hour Sweeps: The system shall also support after-hours OFF sweeps of selected relays or groups of relays at user-defined one, two, or three-hour intervals.
- .12 Relay Output OFF Options: Each relay shall have the option to control the relay OFF in a certain way other than the default OFF.
- .1 Single Blink Alert: Each relay output within the programmable lighting controller shall be individually programmable to blink and postponed prior to being turned OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice prior to turning OFF with a timer OFF sweep to warn occupants of the upcoming OFF event. If an ON command is received during the blink alert time, the relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
 - .2 Double Blink Alert: Each relay output within the programmable lighting controller shall be individually programmable to blink and postponed prior to being turned OFF and then blinked 1 minute before turning OFF. The alert time shall be programmable from 2 to 99 minutes. The blink alert function shall blink each relay twice for each alert to warn occupants of the upcoming OFF event. If an ON command is received during the blink alert time, the

- relay output shall be overridden and left ON for the override time. Override times shall be adjustable from 5 to 999 minutes in 1-minute increments.
- .3 HID Delay: Each relay output within the programmable lighting controller shall have the ability to be controlled like a Single Blink Alert as described above but without the blink, alert to prevent damage to HID lamps.
 - .4 Alarm ON: Relays shall be capable of performing a momentary ON function. The ON function shall be programmable from 1 to 99 seconds.
 - .5 Alarm OFF: Relays shall be capable of performing a momentary OFF function. The OFF function shall be programmable from 1 to 99 seconds.
 - .6 Alarm Pulsed ON: Relays shall be capable of being cycled ON and OFF at 1-second intervals and returning to the OFF state. It shall be programmable from 1 to 90 seconds.
 - .7 Alarm Pulsed OFF: Relays shall be capable of being cycled OFF and ON at 1-second intervals and returning to the ON state. It shall be programmable from 1 to 90 seconds.
 - .8 Automatic Control Switch-OFF: Relays shall be capable of being cycled OFF for 5 seconds and then returned to the ON state for controlling Sentry or AS110 switches.
 - .9 Automatic Control Switch-Blink: Relays shall be capable of being cycled OFF for 1.5 seconds and then returned to the ON state for controlling Delay-OFF mode on AS110 switches.
- .13 Presets: The lighting controller shall support up to 256 user-defined presets of ON/OFF relay patterns. The presets shall be invoked by a switch or timer actuation.
 - .14 Descriptive Names: The system shall support the optional assignment of descriptive names (up to 10 characters) to the lighting controller, relay outputs, relay groups, inputs, timers, and presets. These names shall be able to switch from custom names to default names.
 - .15 Password Protection: Each Programmable controller shall have user-definable 6-digit alphanumeric passwords with 2 levels of access. It shall have control and edit for level 1 and control-only access for level 2.
 - .16 Networking:
 - .1 Network Capacities: In addition to the data line devices mentioned in Section D, LightLEEDer Controllers shall be linked together on the data line to form a Local Area Network (LAN) of up to 254 controller nodes.
 - .2 Network Features: The network manager shall allow the connection of up to 254 controllers and 254 data line devices (on top of the 64 devices per panel) and provide USB communications. It shall have a high-speed LightSync scanner, 4 gateway device ports, power for LightSync devices, and TCP/IP.
 - .3 Network Universe: The network of panels shall be capable to connect to other networks over a network (LAN) or over the internet (WAN) to interconnect multiple systems.
 - .4 Network Gateway: The following special-purpose gateways shall be available and provides network-wide control from a single point for its specialized function:
 - .1 Modbus Control: The Modbus gateway shall support communications from the BAS system using Modicon Modbus protocol from a single-point connection. All network input status, relay status, and control shall be supported.
 - .2 N2 Control: The N2 gateway shall support communications from the BAS system using a Metasys-N2 protocol from a single-point connection. Network-wide group status and control shall be supported.
 - .3 BACnet Control: The BACnet gateway shall support communications from the BAS system using BACnet MSTP or BACnet IP protocol from a single point connection. It shall allow up to 500 single relays, 100 multiple relays, 48 groups, and 48 presets.
 - .4 Advanced BACnet Control: The Advanced BACnet gateway shall support communications from the BAS system using BACnet IP protocol from a single-point

connection. It shall allow up to per panel; 20 Relays, 20 Dimmers, 16 LightSync devices (128 maintained inputs), 64 Groups/Presets, and 48 Scenes.

- .17 BAS System / Lighting Control System: Programmable lighting controllers integrated/interfaced with other building control and alarm systems must remain completely functional and continue to process all programmed commands, including time schedules and local switching.
- .1 Runtime Logging and Trending: Each lighting control panel shall be capable of logging Runtime and Trending data for each relay. This data shall be able to be harvested and exported from the entire system.
 - .2 Runtime Logging: The controller shall be able to internally log the runtime of each relay for up to 30 days. This data shall be able to be harvested with a personal computer at 1-minute intervals.
 - .1 Logging and Trending Software: Runtime Logging and Trending software shall be available for harvesting data from the lighting control panels. It shall have a dedicated personal computer connected to the system through a LAN or USB cable to the panel or network controller.
 - .2 Load Configuration: Each relay in the system shall be able to have a wattage load assigned to it to represent the actual load on the relay. Loads shall be able to be named, or names shall be exported directly from the system programming software.
 - .3 Combined Loads: Up to 254 combined relay loads shall be allowed, for total wattage recording of areas in the facility. The combined loads shall allow relays from any panel in the network. Combined loads shall be able to be named for identification in reports and graphs.
 - .4 Daily or Monthly Usage Report: The software shall be capable of generating spreadsheet reports in a daily or monthly format for each relay or combined relays in the system.
 - .5 Export Data: The compiled reports shall be able to be exported to a .csv (comma-separated value) file. These files when exported shall be coded for the year, month, and date.
 - .6 Daily or Monthly Usage Graphs: The software shall be capable of generating usage graphs in a daily or monthly format for each relay or combined relays in the system.
 - .7 Printing: Daily or monthly usage graphs shall have the capability to be directly printed from the software.
 - .8 Live Usage Graphs: The software shall have 1 to 9 live usage meter dials to display the present wattage of combined loads.
 - .9 Calendar View: It shall provide a full-year calendar that shall display the number of calendar events.
- .18 Graphical Control Interface (InSite Software): The software shall be a Windows-based graphical interface that allows monitoring and control of LightLEEDer panels using icons on custom or standard graphical screens.
- .1 Graphical Background Screens: Graphical background screen shall consist of any bitmap image with any resolution or number of colors. There shall be virtually limitless numbers of screens with a limit to the capacity of the computer.
 - .2 Multiple Interfaces: It shall support an unlimited number of satellite computers controlling the same system. (1 Main computer, multiple remote computers).
 - .3 Virtual PC: It shall support web access via a virtual computer.
 - .4 Fault Log: It shall log and notify of any relay or network faults.
 - .1 The software shall monitor itself and restart if there is a communication issue with the system.
 - .2 It shall automatically send an e-mail to the user(s) notifying them of the problem.

- .3 An alarm shall report if a relay does not turn on or off correctly with real-time status updates.
- .4 It shall log the loss of communications of each network and every node per network. It shall log when it goes offline and when it goes back online.
- .5 Control Icons: Control icons shall be unlimited per screen and shall be chosen from an extensive library. It shall be able to use custom control icons that can be created and saved as BMP, JPEG, or GIF images. Control icons shall be able to be placed anywhere on the screen and edited at any time. Control icons shall control relays, LL Groups, LL Presets, LL Scenes, LL Timers, or dimmer scenes.
- .6 Control Options: It shall have the following capabilities for control and setup.
 - .1 Flood: It shall have the capability to flood areas or change the color of a defined section of the screen (floor plan) for depicting On/Off states.
 - .2 Sounds: It shall be able to trigger custom sound WAV files for on/off triggers.
 - .3 Verify: There should be settings to verify control action and relay sweep commands.
 - .4 Toggle: This shall be a selectable action for relays which shall include always, never, or selective relays.
 - .5 Sweep Enable: There shall be an option for a sweep command.
 - .6 Grid: A grid shall be available for the design and placement of icons on the screens. This shall be adjustable for size and color, plus it shall be able to allow a snap-to-grid feature.
 - .7 Tool Tips: It shall have an optional Tool Tips option that can display text when hovered over an icon.
 - .8 Extra Loads: It shall have the capability to add extra loads to a single relay control icon.
 - .9 Import: It shall have the capability to import LightLEEDer settings and objects.
 - .10 Synchronize InSite Screens: Remote computers shall have the capability to synchronize screens with a single button push.
 - .11 Text Icons: Text icons can be added to any screen and shall be able to be placed anywhere on the screen and edited at any time. They should be adjustable for size, color, font, and transparency.
 - .12 UDP Command: It shall support UDP command strings for special functions in the system.
- .7 Navigation Icons: These shall have navigation buttons for going from one screen to another. These icons shall have the capability to be Global and be visible on all screens. Icons shall have standard sizes that shall be editable for color, size, and font. It shall be able to use custom control icons that can be created and saved as BMP, JPEG, or GIF images. Navigation icons shall be able to be placed anywhere on the screen and edited at any time.
- .8 Sequence Control: It shall be able to sequences with up to 16 transitions over a 12-hour period for events. It shall be able to turn on/off single relays, LL Groups, set a Preset, or LL Scenes in a sequence.
- .9 Dimmer and Motor Control:
 - .1 Single Slider: Slide dimmers shall be available for single control and/or status of a 0-10V output or an sACN slot.
 - .2 Pop-up Multi-Sliders: It shall have up to 16 pop-up control sliders. Each shall be able to be linked to any dimmer(s) in the system. It shall have the capability to have a slider to control all dimmers, direct or proportional.

- .3 Motor Controls: It shall be able to create icons for controlling motor controls. Icons shall have standard sizes that shall be editable for color, size, and font. It shall control the motor "positive or negative" from .1 seconds to 300 seconds.
- .10 Security and User Access:
 - .1 It shall have an Administrator lock-out for specific screens and for specific users during an event in the facility.
 - .2 It shall support up to 5 levels of user security.
 - .3 There shall be advanced managed user access for up to 32 users.
 - .4 A settable administrator timeout shall be settable from 15 minutes to 4 hours.
 - .5 The Administrator shall be able to assign users' access and passwords.
- .11 Multi Network: It shall be able to link together up to 32 LightLEEDer networks with up to 254 nodes per network to operate as one system.
- .12 Schedules: It shall have programmable schedules that send commands to each network and each node in the system.
 - .1 It shall have up to 4000 programmable schedules.
 - .2 It shall automatically control relays, groups, scenes, presets, or trigger a sequence.
 - .3 Schedules shall be based on a fixed time, shared time, or before-at-after sunrise-sunset.
 - .4 It shall have settable Latitude, Longitude, and time-zone settings with adjustable DST settings.
 - .5 It shall have a search option for all schedules that include relays, LL Groups, LL Presets, InSite Presets, and Sequences.
- .13 Runtime Monitoring: It shall incorporate the "Runtime Logging and Trending" software as specified in section "Q".
- .14 Diagnostics Dashboard: It shall have a tool to monitor all of the relays and devices in the system.
- .15 Serial Interfaces:
 - .1 sACN Interface: It shall have the capability to view sACN via (no interface needed for viewing) and control sACN through an Interactive Technologies CueServer Interface optional add-on.
 - .2 DMX Control: It shall have an optional DMX output for lighting fixtures and ILC LightLEEDer dimmer outputs
 - .3 BACnet IP: It shall have an optional serial input for status and control from InSite. It shall have up to 750 control points and status for InSite Groups, InSite Presets, or InSite Sequence. It shall have an export to .csv file for documentation.
- .19 Emergency UL 924 Lighting Controller Option: Each lighting controller shall have the option to provide an emergency lighting bypass without the use of external devices. It shall be UL 924 listed and clearly marked.
 - .1 Bypass Control: If normal power is lost, if selected, the panel shall force the EM relays to the ON position. It shall also force any 0-10V dimming to 100%.
 - .2 Control Type: It shall have the option to select the EM relay control for Force On, Force Off, and No change.
 - .3 Phase Monitoring: It shall be able to monitor up to three phases of normal power. Upon loss of any phase, the panel will go into an emergency state. It shall be selectable for each phase monitored. It shall be able to monitor 120/277 VAC circuits.
 - .4 Isolation: It shall have barriers to separate Normal and Emergency circuits.

- .5 Remote Testing: It shall be provided with input for remote testing. It shall also be provided an output for driving a remote status LED.

2.02 LIGHTLEEDER EVO LIGHTING CONTROLLERS

- .1 LightLEEDer EVO Controller: Each controller shall be designed to be remotely installed and provide control of 4 remote load control relays. This controller shall have the same features as the Programmable Lighting Control Panels excluding add-ons and naming.
 - .1 Enclosure: Each controller shall be provided with a NEMA 1 galvanized steel enclosure with a removable screw cover. It shall also be provided with a 1/2" nipple and pre-drilled mounting holes.
 - .2 Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
 - .3 Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
 - .4 Controller Power Supply: Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC or optional 120/347 VAC primary (50 to 60 Hz). It shall contain an internal self-resetting fuse.
 - .5 High Voltage Connections: Each controller shall be provided with 6" wire leads for terminating the high voltage connections. All connections shall be made to clearly and permanently labeled termination points.
 - .6 Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data lines, and the relay connections. It shall also be provided push-to-connect connectors for occupancy sensors, and photo sensor inputs. All connections shall be made to clearly and permanently labeled termination points.
 - .7 Occupancy Sensor Inputs: It shall have 4 independent inputs, and each input shall be able to interface multiple occupancy sensors or hardwired switches. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
 - .1 200mA w/4 LightSync devices connected to the controller
 - .2 160mA w/5 LightSync devices connected to the controller
 - .3 120mA w/6 LightSync devices connected to the controller
 - .4 90mA w/7 LightSync devices connected to the controller
 - .5 60mA w/8 LightSync devices connected to the controller
 - .8 Photocell Inputs: It shall provide 2 integrated interfaces for ILC photocell heads. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.
 - .9 Local Data Line Port: It shall provide an RJ45 data line port for up to 61 LightSync data line devices. It shall provide power for LightSync devices as described in #7 or additional power added with an optional Power Supply Repeater.
 - .10 Real-Time Clock: Each controller shall be provided with a Real-Time Clock used to perform all time-controlled functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second with the line-sync setting. Real-Time Clock functions shall include the time of day, day of the week, date, and automatic daylight-saving time and leap year adjustments. The time clock shall be protected against loss of time during a power outage for a period of up to 45 days without power of any type. Daylight Saving Time shall be adjustable with an enable/disable feature. Systems relying on a single clock device shall not be acceptable.

- .11 Pre-Configured Programs: Each controller shall have up to 16 selectable pre-configured lighting application programs and 1 default contractor program.
- .2 LightSync -EVO Room Controller: Each controller shall be designed to be remotely installed and provide control of 4 load control relays. This controller shall have the same features as the Programmable Lighting Control Panels excluding add-ons and naming.
 - .1 Enclosure: Each controller shall be provided with a NEMA 1 galvanized steel enclosure with a removable screw cover. It shall also be provided with a 1/2" nipple and pre-drilled mounting holes.
 - .2 Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
 - .3 Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
 - .4 Controller Power Supply: Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC or optional 120/347 VAC primary (50 to 60 Hz). It shall contain an internal self-resetting fuse.
 - .5 High Voltage Connections: Each controller shall be provided with 6" wire leads for terminating the high voltage connections. All connections shall be made to clearly and permanently labeled termination points.
 - .6 Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data lines, and the relay connections. It shall also be provided push-to-connect connectors for occupancy sensors, and photo sensor inputs. All connections shall be made to clearly and permanently labeled termination points.
 - .7 Occupancy Sensor Inputs: It shall have 4 independent inputs, and each input shall be able to interface multiple occupancy sensors or hardwired switches. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
 - .1 200mA w/4 LightSync devices connected to the controller
 - .8 Photocell Inputs: It shall provide 2 integrated interfaces for ILC photocell heads. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.
 - .9 Local Data Line Port: It shall provide an RJ45 data line port for up to 4 LightSync data line devices. It shall provide power for LightSync devices as described in #7 or additional power added with an optional Power Supply Repeater.
- .3 LightLEEDer EVO Integrated -4 -8 Relay Controller: Each controller shall be designed to be remotely installed and provide control of 4 or 8 integrated load control relays. This controller shall have the same features as the Programmable Lighting Control Panels excluding add-ons and naming.
 - .1 Enclosure: Each controller shall be provided with a NEMA 1 galvanized steel enclosure with a removable screw cover. It shall also be provided with 1/2" knockouts and pre-drilled mounting holes.
 - .2 Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
 - .3 Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
 - .4 Controller Power Supply: Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
 - .5 Relay Ratings: It shall be provided with 4- or 8- 50A load relays that shall be de-rated for 16 amps for durability. It shall control 16A for each set of 4 outputs:

- .1 16A, 120/277VAC Electronic Ballast (LED)
- .2 16A 120/277VAC Tungsten
- .3 1/4 HP @ 120 VAC Motor Load
- .6 High Voltage Connections: Each controller shall be provided with terminal blocks for terminating the high voltage connections. All connections shall be made to clearly and permanently labeled termination points.
- .7 Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data lines, and photo sensor connections. It shall also be provided push-to-connect and screw connectors for occupancy sensors, dimming, and low-voltage inputs. All connections shall be made to clearly and permanently labeled termination points.
- .8 Occupancy Sensor Inputs: It shall have 4 independent inputs, and each input shall be able to interface multiple occupancy sensors or hardwired switches. Each input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
 - .1 60mA w/4 LightSync devices connected to the controller
 - .2 50mA w/5 LightSync devices connected to the controller
 - .3 40mA w/6 LightSync devices connected to the controller
 - .4 20mA w/7 LightSync devices connected to the controller
 - .5 0mA w/8 LightSync devices connected to the controller
- .9 Photocell Inputs: It shall provide an integrated interface for 1 ILC photocell head. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.
- .10 Local Data Line Port: It shall provide an RJ45 data line port for up to 17 LightSync data line devices. It shall provide power for LightSync devices as described in #8 or additional power added with an optional Power Supply Repeater.
- .11 Dimming: It shall be provided with 4 or 8 independent 0-10V dimming control outputs that shall sink a maximum of 100mA per output. Each output shall be galvanically isolated up to 1500V to protect the electronics. Each output will revert to 100% upon a power loss.
- .12 Real-Time Clock: Each controller shall be provided with a Real-Time Clock used to perform all time-controlled functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second with the line-sync setting. Real-Time Clock functions shall include the time of day, day of the week, date, and automatic daylight-saving time and leap year adjustments. The time clock shall be protected against loss of time during a power outage for a period of up to 45 days without power of any type. Daylight Saving Time shall be adjustable with an enable/disable feature. Systems relying on a single clock device shall not be acceptable.
- .13 Pre-Configured Programs: Each controller shall have up to 1 pre-configured default contractor program or 1 job-specific custom program.
- .4 LightLEEDer EVO Integrated 2 Relay Controller: Each controller shall be designed to be remotely installed and shall provide 2 integrated load control relays with dimming.
 - .1 Enclosure: Each controller shall be provided with a polycarbonate plastic enclosure provided with a 1/2" nipple and mounting tab.
 - .2 Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
 - .3 Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.

- .4 Controller Power Supply: Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
- .5 Relay Ratings: It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:
 - .1 16A, 120/277VAC Electronic Ballast (LED)
 - .2 20A 120/277VAC General
 - .3 1/4 HP @ 120 VAC Motor Load
- .6 High Voltage Connections: Each controller shall be provided with color-coded wire leads. All connections shall be made to clearly and permanently labeled terminations.
- .7 Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data lines, occupancy sensor, and photo sensor connections. Dimming shall be provided with color-coded wire leads. All connections shall be permanently labeled terminations.
- .8 Occupancy Sensor Inputs: It shall have 1 input with power provided. The input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
 - .1 70mA w/1 LightSync device connected to the controller
 - .2 60mA w/2 LightSync devices connected to the controller
 - .3 50mA w/3 LightSync devices connected to the controller
 - .4 40mA w/4 LightSync devices connected to the controller
- .9 Photocell Inputs: It shall provide an integrated interface for 1 ILC photocell head. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.
- .10 Local Data Line Port: It shall provide an RJ45 data line port for up to 17 LightSync data line devices. It shall provide power for LightSync devices as described in #7 or additional power added with an optional Power Supply Repeater.
- .11 Dimming: It shall be provided with 2 independent 0-10V dimming control outputs that shall sink a maximum of 100mA per output. Each output shall be galvanically isolated up to 1500V to protect the electronics. Each output will revert to 100% upon a power loss.
- .12 Pre-Configured Programs: Each controller shall have up to 1 pre-configured default contractor program or 1 job-specific custom program.
- .5 LightSync EVO Integrated 2 Room Controller: Each controller shall be designed to be remotely installed and shall provide 2 integrated load control relays with dimming.
 - .1 Enclosure: Each controller shall be provided with a polycarbonate plastic enclosure provided with a ½" nipple and mounting tab.
 - .2 Plenum Rated: Each controller shall be suitable for plenum mounting. Controllers without this rating shall be unacceptable.
 - .3 Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
 - .4 Controller Power Supply: Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
 - .5 Relay Ratings: It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:
 - .1 16A, 120/277VAC Electronic Ballast (LED)

- .2 20A 120/277VAC General
- .3 1/4 HP @ 120 VAC Motor Load
- .6 High Voltage Connections: Each controller shall be provided with color-coded wire leads. All connections shall be made to clearly and permanently labeled terminations.
- .7 Low Voltage Connections: Controllers shall also be provided with RJ45 connectors for the data lines, occupancy sensor, and photo sensor connections. Dimming shall be provided with color-coded wire leads. All connections shall be permanently labeled terminations.
- .8 Occupancy Sensor Inputs: It shall have 1 input with power provided. The input shall control any or all the relays in the lighting controllers or the dimmer outputs. Each controller shall provide 24VDC total power for the occupancy sensors with the following current capabilities:
 - .1 70mA w/1 LightSync device connected to the controller
 - .2 60mA w/2 LightSync devices connected to the controller
 - .3 50mA w/3 LightSync devices connected to the controller
- .9 **Photocell Inputs: It shall provide an integrated interface for 1 ILC photocell head. The photo controller shall be provided with 256 light to dark levels (0-1800fc). It shall allow the selection of 8 individual setpoints for OFF and ON and includes a selectable range of dead-band. It shall be programmable for a 2- or 30-second delay. Each set point shall control any or all the relays in the lighting controllers or the dimmer outputs.**
- .10 Local Data Line Port: It shall provide an RJ45 data line port for up to 3 LightSync data line devices. It shall provide power for LightSync devices as described in #8 or additional power added with an optional Power Supply Repeater.
- .11 Dimming: It shall be provided with 2 independent 0-10V dimming control outputs that shall sink a maximum of 100mA per output. Each output shall be galvanically isolated up to 1500V to protect the electronics. Each output will revert to 100% upon a power loss.
- .12 Pre-Configured Programs: Each controller shall have up to 1 pre-configured default contractor program or 1 job-specific custom program.

2.03 LIGHTLEEDER WIRELESS PRODUCT LINE

- .1 LightLEEDer Wireless EVO Controller: Each controller shall be designed to be remotely installed and shall provide wireless control from the LightLEEDer network to the wireless devices. This controller shall have the same features as the Programmable Lighting Control Panels.
 - .1 Enclosure: Each controller shall be provided with a polycarbonate plastic enclosure provided with a 1/2" nipple and mounting tab.
 - .2 Plenum Rated: Controller shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.
 - .3 Listing: Lighting control shall be UL/CUL listed and shall bear labels indicating compliance.
 - .4 Controller Power Supply: Each lighting controller shall be provided with a dual-rated, UL-listed Class 2 power supply capable of 120/277 VAC primary (50 to 60 Hz). It shall contain an internal fuse for protection.
 - .5 Real-Time Clock: Each controller shall be provided with a Real-Time Clock used to perform all time-controlled functions. It shall use a high-voltage line-sync circuit for timing and a crystal for backup. Clock accuracy shall be held +/- 2 minutes per year and displayed to the second with the line-sync setting. Real-Time Clock functions shall include the time of day, day of the week, date, and automatic daylight-saving time and leap year adjustments. The time clock shall be protected against loss of time during a power outage for a period of up to 45 days without power of any type. Daylight Saving Time shall be adjustable with an enable/disable feature. Systems relying on a single clock device shall not be acceptable.

- .6 Wireless Communications: It shall have a 915Mhz radio with point-to-point capabilities. It shall communicate 100 feet of line-of-sight with the wireless devices.
- .7 Bluetooth Wireless Communications: It shall have a Bluetooth radio for communications to a phone app for programming and control.
- .8 SWX Wireless Communications: It shall have the capability to communicate directly with ILC SWX occupancy sensors. It shall communicate 100 feet of line-of-sight with the wireless devices.
- .9 LightLEEDer Remote Wireless 5A Relay: The wireless remote relay shall be designed to be mounted to a junction box or fixture and shall control 1 load up to 5 Amps and 0-10V dimming.
- .10 Listing: Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.
- .11 Plenum: Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.
- .12 Labeling: Lighting control relays shall bear labels for relay current ratings.
- .13 Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
- .14 SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 277 VAC.
- .15 Relay Ratings: The lighting control load relays shall be designed for:
 - .1 5A, 120/277VAC Electronic Ballast (LED)
 - .2 5A 120/277VAC General
 - .3 1/4 HP @ 120 VAC Motor Load
- .16 Latching: Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
- .17 Mounting: It shall have a 1/2" nipple for mounting to an enclosure or fixture
- .18 Wireless Communications: It shall have a 915Mhz radio with point-to-point capabilities. It shall communicate 100 feet of line-of-sight with the wireless devices.
- .19 Wireless Direct Link/Networking: It shall support up to 6 Wireless Direct Link devices and 2 photo sensors. It shall be able to be controlled with a LLEVO-W controller.
- .2 LightLEEDer Wireless Remote 20A Relay: The wireless remote relay shall be designed to be mounted to a junction box or fixture and shall control 1 load up to 20 Amps and 0-10V dimming.
 - .1 Listing: Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.
 - .2 Plenum: Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.
 - .3 Labeling: Lighting control relays shall bear labels for relay current ratings.
 - .4 Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
 - .5 SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 277 VAC.
 - .6 Relay Ratings: It shall be provided with 1- 50A load relays that shall be de-rated for 20 amps for durability:
 - .1 16A, 120/277VAC Electronic Ballast (LED)
 - .2 20A 120/277VAC General
 - .3 1/4 HP @ 120 VAC Motor Load

- .4 It shall be suitable for plug-loads
- .7 Latching: Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
- .8 Mounting: It shall have a ½" nipple and a tab for mounting to an enclosure or fixture.
- .9 Wireless Communications: It shall have a 915Mhz radio with point-to-point capabilities. It shall communicate 100 feet line-of-sight with the wireless devices.
- .10 Wireless Direct Link/Networking: It shall support up to 6 Wireless Direct Link devices and 2 photo sensors. It shall be able to be controlled with a LLEVO-W controller.
- .3 LightLEEDer Wireless Remote 20A 2-Relay: The wireless remote relay shall be designed to be mounted to a junction box or fixture and shall control 2 loads up to 20 Amps and 0-10V dimming.
 - .1 Listing: Lighting control relays shall be individually UL and CUL listed and shall bear labels indicating compliance.
 - .2 Plenum: Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.
 - .3 Labeling: Lighting control relays shall bear labels for relay current ratings.
 - .4 Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
 - .5 SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 277 VAC.
 - .6 Relay Ratings: It shall be provided with 2- 50A independent isolated load relays that shall be de-rated for 20 amps for durability:
 - .1 16A, 120/277VAC Electronic Ballast (LED)
 - .2 20A 120/277VAC General
 - .3 1/4 HP @ 120 VAC Motor Load
 - .4 It shall be suitable for plug-loads
 - .7 Latching: Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
 - .8 Mounting: It shall have a ½" nipple and a tab for mounting to an enclosure or fixture.
 - .9 Wireless Communications: It shall have a 915Mhz radio with point-to-point capabilities. It shall communicate 100 feet line-of-sight with the wireless devices.
 - .10 Wireless Direct Link/Networking: It shall support up to 6 Wireless Direct Link devices and 2 photo sensors. It shall be able to be controlled with a LLEVO-W controller.
- .4 LightLEEDer Wireless Remote 20A 2-Relay with Emergency Bypass: The wireless remote relay shall be designed to be mounted to a junction box or fixture and shall control 2- load circuits up to 20 Amps and 0-10V dimming. It shall combine normal relay operation with the UL924 bypass relay.
 - .1 Listing: Lighting control relays shall be individually UL/CUL/UL924 listed and shall bear labels indicating compliance.
 - .2 Plenum: Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.
 - .3 Labeling: Lighting control relays shall bear labels for relay current.
 - .4 Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
 - .5 SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 277 VAC.

- .6 EM Function: It shall have one normal power relay and one EM relay. Both shall be controlled by a wireless system. Upon loss of power, the EM relay shall be forced to the ON state. During the EM state, 0-10 V dimming shall be forced to 100%.
- .7 Relay Ratings: It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:
 - .1 16A, 120/277VAC Electronic Ballast (LED)
 - .2 20A 120/277VAC General
 - .3 1/4 HP @ 120 VAC Motor Load
 - .4 It shall be suitable for plug-loads
- .8 Latching: Normal power lighting control relay shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
- .9 Mounting: It shall have a 1/2" nipple for mounting to an enclosure or fixture.
- .10 Test Button: It shall have a test button for testing the EM function.
- .11 Test Input: It shall have an input for testing the EM function from a remote location.
- .12 Wireless Communications: It shall have a 915Mhz radio with point-to-point capabilities. It shall communicate 100 feet line-of-sight with the wireless devices.
- .13 Wireless Direct Link/Networking: It shall support up to 6 Wireless Direct Link devices and 2 photo sensors. It shall be able to be controlled with a LLEVO-W controller.
- .14 Wireless Direct Link/Networking: It shall support up to 6 Wireless Direct Link devices and 2 photo sensors. It shall be able to be controlled with a LLEVO-W controller.

2.04 LIGHTING CONTROL RELAYS

- .1 LightLEEDer Reliant40-1 Single Pole Relay: It shall be designed for controlling high-inrush single pole lighting circuits. It shall employ 4 latching nickel-silver contacts.
 - .1 Listing: Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.
 - .2 Labeling: Lighting control relays shall bear labels for relay current and SCCR ratings.
 - .3 Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
 - .4 SCCR: Lighting relays shall have an SCCR rating of 18,000 amps up to 347 VAC.
 - .5 Relay Ratings: It shall be rated for the following:
 - .1 16A, 120/277/347 VAC Electronic Ballast (LED)
 - .2 40A 120/277/347 VAC Ballast
 - .3 40A 120/277/347 VAC Tungsten
 - .4 1/5 HP @ 120 VAC Motor Load
 - .5 It shall be suitable for plug-loads
 - .6 Latching: Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
 - .7 Auxiliary Contacts: Each Lighting control relay shall contain an auxiliary set of contacts rated at 1 AMP 30 VAC/VDC electrically isolated but mechanically linked to the main contacts for the purpose of true status monitoring and pilot light activation.
 - .8 Mounting: Relays shall be capable of panel mounting.
 - .9 Lock-Out: Relays shall be equipped with an Enable/Disable switch to lock out On/Off control from the controller.

- .10 Actuator: Relays shall be equipped with a manual actuator switch for turning the relay ON or OFF along with status indication.
- .2 LightLEEDer Reliant40-2 and 3 Pole Relay: It shall be designed for controlling high-inrush 2-, 3-pole lighting circuits. Each pole shall employ 4 latching nickel-silver contacts.
 - .1 Listing: Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.
 - .2 Labeling: Lighting control relays shall bear labels for relay current and SCCR ratings.
 - .3 Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
 - .4 SCCR: Lighting relays shall have an SCCR rating of 18,000 amps up to 347 VAC.
 - .5 Relay Ratings: Each relay shall be designed for the control of 208, 240, and 480 VAC lighting loads at the following per pole.
 - .1 16A, 120/277/347 VAC Electronic Ballast (LED)
 - .2 40A 120/277/347 VAC Ballast
 - .3 40A 120/277/347 VAC Tungsten
 - .4 1/5 HP @ 120 VAC Motor Load
 - .5 It shall be suitable for plug-loads
 - .6 Latching: Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
 - .7 Auxiliary Contacts: Each Lighting control relay shall contain an auxiliary set of contacts rated at 1 AMP 30 VAC/VDC electrically isolated but mechanically linked to the main contacts for the purpose of true status monitoring and pilot light activation.
 - .8 Mounting: Relays shall be capable of panel mounting.
 - .9 Lock-Out: Relays shall be equipped with an Enable/Disable switch to lock out On/Off control from the controller.
 - .10 Actuator: Relays shall be equipped with a manual actuator switch for turning the relay ON or OFF along with status indication.
 - .11 Mechanical Link: Poles within the relay shall be electrically isolated but mechanically linked so as to open and close together without the possibility of one pole being closed while the other remains open. Systems that utilize two single-pole relays to accomplish this function are not acceptable.
- .3 LightLEEDer Remote R20 Single Pole Relay: The remote relay shall be designed to be mounted to a junction box or fixture and shall control 1 load up to a 16 Amp circuit.
 - .1 Listing: Lighting control relays shall be individually UL/CUL listed and shall bear labels indicating compliance.
 - .2 Plenum: It shall be plenum rated.
 - .3 Labeling: Lighting control relays shall bear labels for relay current and SCCR ratings.
 - .4 Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
 - .5 SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 347 VAC.
 - .6 Relay Ratings: It shall be rated for the following:
 - .1 16A, 120/277/347 VAC Electronic Ballast (LED)
 - .2 16A 120/277/347 VAC Ballast
 - .3 16A 120/277/347 VAC Tungsten

- .4 16A 120/277/347 VAC Resistive
- .5 1/5 HP @ 120 VAC Motor Load
- .6 It shall be suitable for plug-loads
- .7 Latching: Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
- .8 Mounting: It shall have a ½" nipple for mounting to an enclosure or fixture
- .4 LightLEEDer Remote R20D Single Pole Relay W/Dimming: The remote relay shall be designed to be mounted to a junction box or fixture and shall control 1 load up to 16 Amp circuit and 0-10V dimming.
 - .1 Listing: Lighting control relays shall be individually UL and CUL listed and shall bear labels indicating compliance.
 - .2 Plenum: Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.
 - .3 Labeling: Lighting control relays shall bear labels for relay current ratings.
 - .4 Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
 - .5 SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 277 VAC.
 - .6 Relay Ratings: It shall be rated for the following:
 - .1 16A, 120/277/347 VAC Electronic Ballast (LED)
 - .2 16A 120/277/347 VAC Ballast
 - .3 16A 120/277/347 VAC Tungsten
 - .4 16A 120/277/347 VAC Resistive
 - .5 1/5 HP @ 120 VAC Motor Load
 - .6 It shall be suitable for plug-loads
 - .7 Dimming: Shall be able to control 0-10V dimming ballast and be able to sink up to 100 mA.
 - .8 Latching: Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
 - .9 Mounting: It shall have a ½" nipple for mounting to an enclosure or fixture
- .5 LightLEEDer Remote 20 Amp Dimming Relay with Emergency Bypass: The remote relay shall be designed to be mounted to a junction box or fixture and shall control 2- load up to 20 Amps circuits and 0-10V dimming. It shall combine normal relay operation with UL924 bypass relay.
 - .1 Listing: Lighting control relays shall be individually UL/CUL/UL924 listed and shall bear labels indicating compliance.
 - .2 Plenum: Each relay shall be suitable for plenum mounting and rated to the UL 2043 standards. Controllers without this rating shall be unacceptable.
 - .3 Labeling: Lighting control relays shall bear labels for relay current ratings.
 - .4 Endurance: Lighting control relays shall be designed and tested to have a minimum cycle life of 200,000 ON/OFF cycles @ FULL LOAD and 2,000,000 ON/OFF cycles at no load.
 - .5 SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 347 VAC.
 - .6 EM Function: It shall have one normal power relay and one EM relay. Both shall be controlled by a LightLEEDer controller. Upon loss of power, the EM relay shall be forced to the ON state. During the EM state, 0-10 V dimming shall be forced to 100%.

- .7 Relay Ratings: It shall be provided with 2- 50A load relays that shall be de-rated for 20 amps for durability:
 - .1 16A, 120/277VAC Electronic Ballast (LED)
 - .2 20A 120/277VAC General
 - .3 1/4 HP @ 120 VAC Motor Load
 - .4 It shall be suitable for plug-loads
- .8 Latching: Lighting control relays shall be designed with a latching mechanism that shall hold the relay in its last activated state indefinitely, with no change of state during an interruption of power. Solid-state or electrically held relays are not acceptable.
- .9 Mounting: It shall have a 1/2" nipple for mounting to an enclosure or fixture.
- .10 Test Button: It shall have a test button for testing the EM function.
- .11 Test Input: It shall have an input for testing the EM function from a remote location.
- .12 Wireless Communications: It shall have a 915Mhz radio with point-to-point capabilities. It shall communicate 100 feet line-of-sight with the wireless devices.
- .6 ILC EM20 Emergency Bypass Relay: The remote relay shall be designed to be mounted to a junction box or fixture. It shall provide automatic bypass for emergency power.
 - .1 Listing: Lighting control relays shall be individually UL/CUL/UL924 listed and shall bear labels indicating compliance.
 - .2 Labeling: Lighting control relays shall bear labels for relay current ratings.
 - .3 SCCR: Lighting relays shall have an SCCR rating of 5,000 amps up to 2777 VAC.
 - .4 Loads: Lighting bypass relays shall be designed for bypass of 120 or 277 VAC @ 20 amps.
 - .5 Bypass: It shall automatically bypass normal power upon loss of emergency power
 - .6 Mounting: It shall have a 1/2" nipple for mounting to an enclosure or fixture.

2.05 SWITCH STATIONS AND COVER PLATES

- .1 Hardwired Switches and Cover Plates: Electrical contractor shall provide and install switch plates and switches of the quantities and types shown on the drawings and specified herein.
 - .1 Heavy Duty Switch
 - .1 Switch: It shall consist of a single-pole double-throw center OFF momentary heavy-duty toggle or Decora® paddle switch rated at 15-20 Amps @ 120/277 VAC. They shall be available in ivory or white colors.
 - .2 Cover Plates: Plates shall be available for Decora® switches in ivory, white, or stainless steel with or without visible screws and come in 1-4 gangs.
 - .3 Nomenclature: Engraving shall be available on phenolic labels or directly on the plate.
 - .2 Key Switch
 - .1 Key Switch: Key switch shall consist of a single-pole double-throw momentary or maintained switch. They shall be available to allow the key to being removed in the ON position or the OFF position.
 - .2 Cover plates: Plates shall be available in stainless steel, brushed aluminum, or painted cold rolled steel. They shall be available with 1-2 switches per gang plate and up to 4 gangs.
 - .3 Status: LED status indicators shall be optional for each switch provided.
 - .4 Nomenclature: Engraving shall be available on phenolic labels or directly on the plate.
 - .3 Touch Activated Switch

- .1 Switch: Touch activated switch shall be a momentary output push-button with an IP65 rating.
 - .2 Cover plates: Plates shall be available in stainless steel, brushed aluminum, or painted cold rolled steel. They shall be available with 1-3 switches per gang plate and up to 4 gangs.
 - .3 Gasket: Cover plate neoprene gaskets shall be available for weatherproof applications.
 - .4 Status: LED status indicators rings shall be optional for each switch provided.
 - .5 Nomenclature: Engraving shall be available on phenolic labels or directly on the plate.
- .2 Custom Switch Plates and Graphic Switch Stations: Electrical contractor shall provide and install custom switch plates and graphical switching stations of the quantities and types shown on the drawings and specified herein.
- .1 Switch Plates: Switch plates shall consist of a control panel faceplate, switches, and other control devices as required, LED pilot lights and all mounting hardware.
 - .2 Material: Switch plates shall be manufactured from a single piece of stainless steel, aluminum, brass or bronze, finished and labeled as per the plans and specifications or as indicated on approved drawings.
 - .3 Mounting: Switch plates shall be designed to mount either to a standard electrical gang box supplied by the electrical contractor for either flush or surface mounting or to a custom back-box supplied by the manufacturer.
 - .4 Nomenclature: Switch plate graphics and labeling shall be accomplished through the use of one or a combination of multi-color anodized, engraving or phenolic labels; laser etched or painted graphics.
 - .5 Graphics: Each switch station shall contain a graphic representation of the controlled space with switches and other control devices graphically located on the station so as to indicate their associated areas of control.

PART 3 - EXECUTION

3.01 EXECUTION

- .1 Verify that wiring conditions, which have been previously installed under other sections or at a previous time are acceptable for product installation in accordance with manufacturer's instructions.
- .2 Field measurements and coordinating the physical size of all equipment with the architectural requirements of the spaces into which they are to be installed.
- .3 Inspect all material included in this contract prior to installation. Manufacturer shall be notified of unacceptable material prior to installation.

3.02 INSTALLATION

- .1 Receive, mount, connect and place into operation all equipment. Provide all conduit, wire, connectors, hardware and other incidental items necessary for a properly functioning lighting control and relay system as described herein and shown on the plans.
- .2 Comply with manufacturer's product data, including shop drawings, technical bulletins, product catalog installation instructions and product carton instructions for installation.
- .3 Test that all branch load circuits are operational before connecting loads to system load terminals and then de-energize all circuits before installation.
- .4 Power shall not be applied to the relay system during construction and prior to turn-on unless specifically authorized by written instructions from the manufacturer.

3.03 TESTING

- .1 Upon completion of the installation, notify the manufacturer that the system is ready for formal check out. Notification shall be given in writing a minimum of 21 days prior to the time factory-trained personnel are required on site.
- .2 Upon completion of all line, load and interconnection wiring and after all fixtures are installed and lamped, manufacturer's rep shall completely check the installation prior to energizing the system. Each installed relay system shall be tested for proper ON/OFF operations, and proper LED illumination. Each installed control panel shall be tested verifying that each controlled load adjusts to the selected setting and that all switch LED's illuminate properly.
- .3 At the time of check out and testing, the Owner's representative shall be thoroughly instructed in the proper operation of the system.

3.04 SITE PROTECTION

- .1 Contractor shall protect installed product and finished surfaces from damage during all phases of installation including storage, preparation, testing and clean-up.

END OF SECTION

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 In case of discrepancy of the specifications details, the Owner's standards and requirements attached in the Appendices shall take precedence.**
- .2 Comply with the requirements of Division 1 and all documents referred to therein.

1.2 APPLICATION

- .1 This Section applies to and is a part of all Sections of Division 26.

1.3 DEFINITIONS

- .1 Wherever the term "This Sub-Contractor" is used in the Division 26 Drawings and Specifications, it means the firm having a subcontract with the "Contractor" to perform, supervise and co-ordinate all work of this Division.
- .2 Wherever the term "install" (and tenses of "install") is used in the Division 26 Drawings and Specifications, it means install and connect complete.
- .3 Wherever the term "supply" is used in the Division 26 Drawings and Specifications, it means supply only.
- .4 Wherever the term "Provide" or "Provision of" are used in relationship to equipment and other materials specified for the Work of Division 26 it means "Supply, Install and Connect". Wherever the terms "Provide" or "Provision of" are used in connection with services such as testing, start-up and commissioning for any part of the Work of Division 26, it means procure, supervise, take responsibility and pay for these services.
- .5 Whenever "Drawings and Specifications" are referred to herein, it means "the Contract Documents".
- .6 Wherever the terms "Authorities" or "Authorities having jurisdiction" are used in the Division 26, Drawings and Specifications, it shall mean any and all current laws and/or by-laws of any Federal, Provincial or local authorized agencies having jurisdiction over the sum total or parts of the work including, but not restricted to the Municipal Planning and Building Department, Municipal Fire Department, the Construction Safety Act, Municipal Public Works Department, Federal and/or Provincial Fire Marshall, the Gasoline Handling Act, the Ontario Electrical Safety Code and other codes in effect at the time of construction.
- .7 Wherever the term "Work" is used in the Division 26 Drawings and Specifications, it means all equipment, permits, materials and labour to provide a complete electrical installation as required and detailed in the Drawings and Specifications.
- .8 Wherever the term "Acceptable" is used in the Division 26 Drawings and Specifications it means acceptable to the Consultant.

1.4 WORK INCLUDED

- .1 Sections of Division 26 are not intended to delegate functions nor to delegate work and supply to any specific trade and the Work shall include all labour, materials, equipment and tools required for a complete and working installation as described, but not necessarily limited to items in the following Sections:

Section 26 05 00	Electrical General Requirements
Section 26 05 01	Shop Drawings, Product Data and Samples
Section 26 05 03	Electrical Systems Commissioning
Section 26 05 05	Basic Materials and Methods
Section 26 05 08	Firestopping
Section 26 05 10	Electrical Identification
Section 26 05 11	Testing and Coordination Study of Distribution
Section 26 05 12	Arc Flash Hazard Study
Section 26 05 14	Work In Existing Facility
Section 26 05 21	Wire and Cable Up To 600 Volts
Section 26 05 27	Grounding and Bonding
Section 26 05 29	Hangers and Supports
Section 26 05 31	Splitter Trough
Section 26 05 33	Raceways and Boxes
Section 26 09 23	Digital Metering System
Section 26 11 10	Electrical High Voltage Service
Section 26 12 16	Low Voltage Dry Type Transformers
Section 26 24 01	Service Entrance LV Switchboard
Section 26 24 16	Panelboards
Section 26 27 26	Wiring Devices
Section 26 28 13	Fuses
Section 26 28 23	Safety Switches
Section 26 28 33	Quick Connect Switches
Section 26 29 01	AC Contactors
Section 26 32 13	Gas Generator (SU)
Section 26 36 23	Automatic Transfer Switches
Section 26 50 00	Lighting Luminaires
Section 26 80 00	Electric Vehicle Charger
Appendix A	YRND – Lighting Standard
Appendix B	YRND – Receptacle and Circuit Labelling Standard
Appendix C	YRND – Electrical Power Monitoring Standard
Appendix D	YRND – Electrical & ICAT Works Proposed Phasing
Appendix E	YRND – Proposed Phasing

1.5 PERMITS, FEES AND INSPECTIONS

- .1 Apply for, obtain, and pay for all permits, licenses, inspections, examinations and fees required for Work of Division 26. If the municipality is structured as a "single permit jurisdiction", the Contractor will apply, pay for and obtain the municipal building permit. In this case, the Division 26 contractor has no financial obligation for permit application except for permits not covered in the "single permit".
- .2 Arrange for inspection of all Work by the Authorities having jurisdiction over the Work. On completion of the Work, present to the Consultant the final unconditional certificate of approval of the inspecting Authorities.
- .3 Comply with the requirements of the latest edition of the applicable CSA standards, the requirements of the Authorities, Federal, Provincial and Municipal Codes, the applicable standards of the Underwriters' Association and all other Authorities having jurisdiction. These codes and regulations constitute an integral part of these specifications.

- .4 In case of conflict, the codes take precedence over the Contract Documents. In no instance reduce the standard or scope of work or intent established by the drawings and specifications by applying any of the codes referred to herein.
- .5 Before starting any work, submit the required number of copies of drawings and specifications to the Authorities for their approval and comments. Comply with any changes requested as part of the contract, but notify the Consultant immediately of such changes. Prepare and furnish any additional drawings, details or information as may be required.

1.6 CONTRACT DRAWINGS

- .1 The Drawings for Electrical work are performance drawings, diagrammatic, intended to convey the scope of work and indicate general arrangement and approximate location of apparatus, fixtures and conduit runs. The Drawings do not intend to show architectural and structural details.
- .2 Do not scale Drawings. Obtain information involving accurate dimensions from dimensions shown on Architectural and Structural drawings, and by site measurement.
- .3 Make, at no additional cost, any changes or additions to materials, and/or equipment necessary to accommodate structural conditions (conduits around beams, columns, etc.)
- .4 Alter, at no additional cost, the locations of materials and/or equipment as directed, that do not necessitate additional material.
- .5 Install ceiling mounted components (e.g., light fixtures, speakers, heat or smoke detectors) in accordance with reflected ceiling drawings.
- .6 Confirm on the site the exact location and mounting elevation of outlets and fixtures as related to Architectural and Structural details.

1.7 EXAMINATION OF SITE AND DOCUMENTATIONS

- .1 Prior to submitting tender, carefully examine conditions at the site which could affect the Work. Refer to and examine all contract documents.
- .2 Be responsible for any damage done to existing underground services caused by neglect to determine and mark out the location of such services prior to excavation work commencing.
- .3 Refer to room finish schedules to determine finished, partially finished and unfinished areas of the building.
- .4 Ensure that materials and equipment are delivered to the site at the proper time and in such assemblies and sizes so as to enter into the building and to be moved into the spaces where they are to be located without difficulty. Be responsible for any cutting and patching involved in getting assemblies into place.

1.8 CO-ORDINATION DRAWINGS

- .1 Prepare drawings in conjunction with all trades concerned, showing sleeves and openings for passage through structure, and all inserts, equipment bases, and supports, and relate these to suitable grid lines and elevation datum.

- .2 When requested, provide weights of major items of equipment.
- .3 Prepare interference and co-ordination drawings for all areas where the work of this Division could conflict with and/or obstruct the work of other trades and/or other Sections of this Division. Submit drawings for review by the Consultant.

1.9 RECORD DRAWINGS

- .1 The drawings for this Project have been prepared using Revit/BIM 360. For the purpose of exchanging model and producing record (as-built) drawings, a model file will be made available to the trade for a cost of \$850+HST. Edit Note: Price for model should be based on actual # of output drawings, example:

For 1 to 10 files	\$550.00
For 11 to 20 files	\$650.00
For 21 to 50 files	\$850.00
For 51 to 100 files	\$1,350.00
For greater than 100 files, charge \$10.00 per file + \$350.00.	

In using the model from the Consultant to produce record drawings, the Contractor is deemed to have agreed to take full responsibility for any and all information on the drawings.

- .2 Obtain a set of white prints as the job progresses, mark this set to accurately indicate installed work. Show location by dimension from walls or columns for all buried services as well as invert depths. Have these white prints available for inspection at the site at all times, and present for scrutiny at each job meeting.
- .3 At completion of the project, transfer all information from the white prints to the CAD files, and provide one CD with updated CAD files to the Consultant as part of the close out documents.
- .4 The contractor is responsible for all cost associated with the production and services required, such as recreating, plotting and printing to produce "as-built" drawings.

1.10 PRODUCT STANDARDS AND ALTERNATIVES

- .1 Provide new material and equipment as specified and to the acceptance of the Consultant.
- .2 Manufacturer's names are listed as the "Basis of Design" and to set a standard of quality, performance, capacity, appearance and serviceability. Other acceptable manufacturers where listed may be used in the submission of the Electrical bid, however it is the bidders responsibility to ensure the equipment will perform and fit the available space used in the design.
- .3 Where no other acceptable manufacturers are indicated, provide the exact make specified. Requests for acceptance of manufacturers not listed must be submitted not less than seven working days prior to closing date of the tender, and submissions must bear proof of acceptance by the Consultant if used in the tender.
- .4 Assume full responsibility for ensuring that when providing other acceptable manufacturers all space, weight, connections, power and wiring requirements, etc., are considered, and costs therefore included in the tender. Equipment

requiring greater than specified energy requirements or unduly limiting service space requirements will not be accepted.

- .5 All electrical equipment, material, wiring and devices to conform to the Ontario Electrical Safety Code for the purpose for which they are to be used and bear the approval of CSA or other acceptable testing agency, alternately the equipment must bear special approval of the inspection authority.

1.11 PATENTS

- .1 Pay all royalties and licence fees, and defend all suits or claims for infringement of any patent rights, and save the Owner and Consultant harmless of loss or annoyance on account of suit, or claims of any kind for violation or infringement of any letters, patent or patent rights, by this Subcontractor or anyone directly or indirectly employed by him or by reason of the use by him or them of any part, machine, manufacture or composition of matter on the work, in violation or infringement or such letters, patent or rights.

1.12 RIGHTS RESERVED

- .1 Rights are reserved to furnish any additional detail drawings, which in the judgement of the Consultant may be necessary to clarify the work, and such drawings shall form a part of this contract.

1.13 EQUIPMENT NAMEPLATES

- .1 Provide apparatus with proper nameplates affixed thereto, showing the size, name of equipment, serial number and all information usually provided, which also includes voltage, cycle, phase, horsepower of motors and the name and address of the manufacturer.

1.14 EXPEDITING AND DELIVERY

- .1 Continuously check and expedite delivery of equipment and materials. If necessary, inspect at the source of manufacture.
- .2 Continuously check and expedite the flow of necessary information to and from all parties involved.
- .3 Immediately inform the Consultant in case information is required from him.
- .4 Provide delivery records updated monthly.

1.15 SUPERINTENDENCE

- .1 Maintain at the job site, at all times, qualified personnel and supporting staff, with proven experience in erecting, supervising, testing and adjusting projects of comparable nature and complexity.
- .2 The supervising personnel and their qualifications are subject to the approval of the Consultant.

1.16 WORKMANSHIP

- .1 Install equipment, conduit and cables in a workmanlike manner to present a neat appearance to function properly to the satisfaction of the Consultant. Install runs parallel and perpendicular to building lines, in chases, behind furring or above

ceilings, where such concealment is possible. In areas where systems are to be exposed install neatly and group to present a tidy appearance.

- .2 Install equipment and apparatus requiring maintenance, adjustment or eventual replacement with due allowance therefore.
- .3 Include in the work all requirements of manufacturers shown on the shop drawings or manufacturers installation instructions.
- .4 Replace work unsatisfactory to the Consultant without extra cost.
- .5 Make provision to accommodate future plant and equipment indicated on drawings.
- .6 Protect from damage all equipment delivered to the site and during installation. Any damage or marking of finished surfaces shall be made good to the satisfaction of the Consultant.

1.17 TRIAL USAGE AND TESTS

- .1 The Owner has the privilege of the trial usage of Electrical Systems or parts thereof for the purpose of testing and learning the operational procedures.
- .2 Assist in trial usage over a length of time as deemed reasonable by the Consultant at no extra cost and do not waive any responsibility because of trial usage.
- .3 Trial usage shall not be construed as Substantial Completion of the Work, or acceptance by the Owner.
- .4 Provide and pay for all testing required on the system components where, in the opinion of the Consultant, manufacturers ratings or specified performance is not being achieved.

1.18 CLEANING

- .1 Before energizing any systems, inspect and clean the inside of panel boards, switchgear and cabinets to ensure that they are completely free from dust and debris.
- .2 Clean all polished, painted and plated work bright. Clean all lighting fixtures.
- .3 Remove all debris, surplus material and all tools.
- .4 Carry out additional cleaning operating of systems as specified in other sections of the specification.

1.19 COMPLETION

- .1 Leave electrical work in specified working order.

1.20 WARRANTIES

- .1 Provide warranty certificates, wherever given or required, in excess of the normal warranty period showing the name of the firm giving the warranty, dated and acknowledged, on specific equipment and systems.

1.21 INSTRUCTION TO OWNERS

- .1 Instruct the Owner's representatives in all aspects of the operation of systems and equipment.
- .2 Arrange for and pay for services of service engineers and other manufacturers' representatives required for instruction on specialized portions of the installation.
- .3 Submit to the Consultant at the time of final inspection a complete list of systems stating for each system:
 - .1 Date instructions were given to the Owner's staff.
 - .2 Duration of instruction.
 - .3 Name of persons instructed.
 - .4 Other parties present (manufacturer's representative, consultants, etc.).
- .4 Signatures of the Owner's staff stating that they properly understood the system installation, operation and maintenance requirements.

1.22 DOCUMENTATION AND SYSTEMS ACCEPTANCE

- .1 Assemble three (3) copies of operating and instruction manuals in three ring binders with index tabs each containing this subcontractor's and suppliers names and telephone numbers.
- .2 Each manual shall contain the following data:
 - .1 A set of as-built prints.
 - .2 Letters of Owner's Instructions
 - .3 Final ESA Certificate.
 - .4 A copy of each "reviewed" shop drawing.
 - .5 Complete explanation of operation principles and sequences.
 - .6 Complete part lists with numbers.
 - .7 Recommended maintenance practices and precautions.
 - .8 Complete wiring and connections diagrams.
 - .9 Certificate of warranty.
 - .10 Representative certificates for:
 - .1 Fire Alarm System
 - .2 Generator Assemblies
- .3 Ensure that operating and maintenance instructions are specific and apply to the models and types of equipment provided.

1.23 OWNER'S RIGHT TO RELOCATE ELECTRICAL ITEMS

- .1 The Owner reserves the right to relocate electrical outlets at a later date, but prior to installation, without cost, assuming that the relocation per outlet does not exceed 3000 mm from the original location. No credits shall be anticipated where relocation per outlet of up to and including 3000 mm reduces materials, products and labour.
- .2 Should relocations per outlet exceed 3000 mm from the original location the Contract Price will be adjusted accordingly.

- .3 Necessary changes, due to lack of co-ordination, and as required and when approved, shall be made at no additional cost, to accommodate structural and building conditions. The location of conduits and other equipment shall be altered without charge to the Owner, if approved, provided the change is made before installation.

1.24 ELECTRICAL LIST OF MANUFACTURERS, SUBTRADES AND PRICES

- .1 At the time of tender closing, list the names of manufacturers or subtrades carried (one per item), the total cost of the Electrical Works, any separate, unit and alternative prices where indicated.
- .2 If this Subcontractor neglects to list the specified or acceptable manufacturers or lists more than one manufacturer per item, or lists manufacturers not specified, the Consultant will have the option of making the selection of the manufacturer.
- .3 There will be no substitutions of named manufacturers or subtrades after tender close except as approved by the Consultant.

1.25 PHASING AND SCHEDULING OF WORK

- .1 Refer to Scope of work for a detailed description of the phasing and scheduling of the work. Execute work in accordance with the phasing and construction schedule. Provide all necessary temporary connections and equipment to provide functional, operational systems during construction period when part of the building will be occupied and construction is still continuing in other portions.

1.26 MATERIALS FURNISHED BY OTHERS

- .1 Where materials are furnished by others for installation under this Division, the Sub-Contractor shall notify the supplier of dates he will be ready for delivery as specified in the General Conditions. The Sub-Contractor shall receive, unload, handle, store, protect and insure the material until ready for actual installation. Upon receipt of material furnished by others, the Sub-Contractor shall spot-check or check the entire shipment and promptly advise the Consultant in writing of any damage and/or missing components. Any material which is subsequently lost or damaged due to negligence on the part of the Sub-Contractor shall be promptly replaced (or repaired to the satisfaction of the Owner) at the Sub-Contractor's expense.

1.27 CONNECTIONS TO EQUIPMENT FURNISHED BY OTHERS.

- .1 Where the Drawings indicated equipment to be furnished by others, provide Electrical rough-in for each unit pursuant to its shop drawings, and make final connections, disconnect switches and other electrical facilities for a complete installation.

1.28 ELECTRICAL LEGEND & SCHEDULES

- .1 Refer to Electrical Drawings for Legend and Schedules

Part 2 Products

2.1 NIL

Part 3 Execution

3.1 NIL

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.
- .2 Designate in the Construction Schedule, or in a separate coordination schedule, dates for submission and dates that reviewed Shop Drawings, Product Data and Sample will be required. Give due consideration for review time required by the Consultant, with a minimum of fifteen (15) working days required. The submission of Appendix 'X' will be considered an acceptable submittal schedule.
- .3 All data and dimensions on shop drawings, product data and sample information to be based on units (Imperial or Metric) as shown on the contract documents.
- .4 Shop Drawings with errors or omissions and deviations will be returned "Not Reviewed".
- .5 The Contractor's responsibility for deviations in submission from the requirements of Contract Documents is not relieved by the Consultant's review of submittals, unless a deviation on the submittal is noted as such in writing and has been accepted by the Consultant.
- .6 Keep one (1) reviewed copy of each submission on site.

1.2 SHOP DRAWINGS

- .1 Review and stamp Shop Drawings, Product Data and Samples prior to submission to the Consultant. Confirm that necessary requirements have been determined and verified and that each submittal has been checked and coordinated with requirements of the Work and the Contract Documents. Submittals not stamped, signed, dated and identified as to the specific project, will be returned without being examined and shall be re-submitted when completed.
- .2 Submit drawings in a clear and thorough manner:
 - .1 Identify details by reference to drawing No. and detail, schedule or room numbers as shown on Contract Documents.
 - .2 Minimum sheet size and larger sheets to be multiples of 8½" x 11".
 - .3 Indicate materials, methods of construction and attachment or anchorage, erection diagrams, connections, explanatory notes and other information necessary for completion of Work. Where articles or equipment attach or connect to other articles or equipment, indicate that such items have been co-ordinated. Indicate cross references to design drawings and specification.
 - .4 Adjustments to shop drawings by the Consultant do not change the cost of the work. If adjustments affect the cost of Work, advise through normal channels in writing prior to proceeding with the Work.
 - .5 Make changes in shop drawings as directed by the Consultant. Resubmit and note any revisions other than those requested.
 - .6 If only minor adjustments are made, shop drawings to be returned and fabrication and installation of work to proceed.

- .3 Determine and verify:
 - .1 Field measurements.
 - .2 Field construction criteria.
 - .3 Catalogue numbers and similar data.
 - .4 Conformance with Specifications.
- .4 Co-ordinate each submittal with requirements of the Contract documents.
- .5 Each Shop Drawing will be stamped by the Consultant in the following format:
 - ☐ NOT REVIEWED ☐ REVIEWED
 - ☐ RESUBMIT ☐ REVIEWED AS MODIFIED
 - ☐ NOT SPECIFIED BY MCW, REVIEWED FOR MEP ONLY
- .6 This review by the Consultant is for the sole purpose of ascertaining conformance with the general design concept. This review shall not mean that the Consultant approved the detail design inherent in the shop drawings, responsibility for which shall remain with this Subcontractor submitting same, and such review shall not relieve this Subcontractor of his responsibility for errors or omissions in the shop drawings or of his responsibility for meeting all requirements of the contract documents. The Contractor is responsible for dimensions to be confirmed and correlated at the job site, for information that pertains solely to fabrication.
- .7 Products not specified by MCW are reviewed to confirm compliance with services provided only. Any changes required between provided services and shop drawing requirements will be identified for coordination between trades.
- .8 Shop drawings shall be accompanied by a complete copy of the attached "Shop Drawing Submittal Sheet" Section 26 05 01, Appendix 'X'.
- .9 Begin no fabrication or work which requires submittals until return of submittals reviewed by Consultant.

1.3 **PRODUCT DATA**

- .1 Where specified, Manufacturer's standard schematic drawings, catalogue sheets, diagrams, schedules, performance charts, illustrations and other standard descriptive data is acceptable provided there is conformance with the following:
 - .1 Clearly identify pertinent products or models.
 - .2 Show performance characteristics and capacities.
 - .3 Show dimensions and clearances required.
 - .4 Show wiring or piping diagrams and controls.
- .2 Manufacturer's standard schematic drawings and diagrams may require modifications to drawings and diagrams to provide information applicable to the Work.
- .3 Provide information specifically applicable to the Work.

1.4 **SAMPLES**

- .1 Samples to be labelled, of sufficient size and quantity to clearly illustrate:
 - .1 Functional characteristics integrally related parts and attachment devices.

- .2 Full range of colour, texture and pattern.
- .2 Field Samples and mock-ups:
 - .1 Erect, at the project site and in location acceptable to the Consultant.
 - .2 Fabricate each sample and mock-up complete and finished.
 - .3 Remove mock-ups at conclusion of Work or as specified by the Consultant.

1.01 SUBMISSION REQUIREMENTS

- .3 Submit promptly to approved schedule and in sequence to prevent submission delay in the Work.
- .4 Submission requirements:
 - .1 Shop Drawings: Acceptable submissions are: Submit shop drawings electronically as agreed to during the kick off meeting with the Consultant.
 - .2 Product Data: Submit a copy for each O & M Manual.
 - .3 Samples: Submit as specified, or as requested during the shop drawing review period.

1.5 RESUBMISSION REQUIREMENTS

- .1 Make corrections or changes to the submittals noted by the Consultant and resubmit.
- .2 Shop Drawings and Product Data:
 - .1 Revise drawings or data, and resubmit as noted on the initial submittal.
 - .2 Indicate any changes which have been made other than those noted by the Consultant.
- .3 Samples: Submit new samples as required for initial submittal as soon as possible after notification of the rejection of the original submission and mark "resubmitted samples".

1.6 DISTRIBUTION

- .1 Distribute reproductions of Shop Drawings and copies of Product Data which carry the Consultant's stamp to all parties as specified by Division One General Requirements.
 - .1 Job site file
 - .2 Project record document file
 - .3 Other affected contractors
 - .4 Subcontractors
 - .5 Supplier or fabricator (as applicable)
 - .6 Operations Manual

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 SCOPE OF WORK

- .1 The Electrical Consultant is not acting as Commissioning Agent or Commissioning Authority and is not responsible for developing Commissioning Plans, manage and administer the commissioning process.
- .2 The Contractor shall provide all services, materials and labour required to fully Commission the Electrical Systems as specified herein.
- .3 The Contractor shall provide all services, materials and labour required to successfully complete Functional Performance Testing of the Electrical Systems as part of Commissioning the overall building systems as a holistic operation. Functional Performance Testing shall be as defined in CSA Z320.
- .4 The Contractor shall participate in the integrated systems testing per the requirements of CAN/ULC-S1001-11, Integrated Systems Testing of Fire Protection and Life Safety Systems.
- .5 Equipment Suppliers and Vendors are expected to support the Contractor complete Electrical Commissioning Specified in this Section. Support may come in the form of attendance on site to verify correct installation, performance, trouble shooting, training and final documentation at turn-over. The Contractor shall ensure Equipment Suppliers and Vendors provide the support necessary for successful Electrical Commissioning.

1.3 COORDINATION

- .1 Appoint a single person as Commissioning Coordinator who shall be responsible for advancing the commissioning activities of the Electrical Division.

1.4 QUALITY ASSURANCE

- .1 The following Standards shall be used to guide the commissioning process:
 - .1 CSA Z320-11 (R2016) Building Commissioning
 - .2 CAN/ULC-S1001-11 Integrated Systems Testing of Fire Protection and Life Safety Systems
 - .3 CAN/ULC-S537-13 Standard For Verification of Fire Alarm Systems
 - .4 CSA C282-15 Emergency Electrical Power Supply For Buildings
- .2 Hold and attend regular meetings during the commissioning process. Prepare detailed progress reports to coincide with regular commissioning meetings.
- .3 In addition to all tests listed under this section, the Electrical Division shall complete its own tests and any additional tests required by the Owner / Owner's Commissioning Authority to ensure that all facility, in its entirety, operates as intended.

Part 2 Products

2.1 NIL

Part 3 Execution

3.1 DESIGN AND PERFORMANCE REQUIREMENTS

- .1 Provide a schedule with regular updates for the completion of Electrical Division equipment and systems.
- .2 Six (6) weeks prior to the target Substantial Performance date, submit a detailed and comprehensive installation completion/ start-up/ testing schedule. Update the schedule and resubmit for review, on a bi-weekly basis, during the course of Commissioning. Provide regular revisions and updates to the schedule to suit the updated construction schedule. This schedule shall include, but is not limited to the following items:
 - .1 Low voltage switchboard
 - .2 Low voltage distribution panels
 - .3 Low voltage branch circuit panels
 - .4 Low voltage cables
 - .5 Emergency generator
 - .6 Automatic Transfer Switches
 - .7 Metering & provisions for 3rd party metering
 - .8 Current transformers
 - .9 Overcurrent and ground fault protective devices settings
 - .10 Transformers tap settings
 - .11 Ground gird resistance
 - .12 Grounding & bonding
 - .13 Interior lighting & control
 - .14 Exterior lighting & control
 - .15 Emergency lighting
 - .16 Exit signs
 - .17 Fire alarm system
 - .18 Fire alarm system interface & control
 - .19 Hold-open devices
 - .20 Electromagnetic locks
 - .21 Electric heat tracing cables for fire protection system
 - .22 Mechanical service electrical connections
 - .23 Start-up of various equipment and systems
 - .24 Operational testing of system components
 - .25 Performance testing of equipment and systems
 - .26 Acceptance testing of equipment installations and systems by Authorities Having Jurisdiction ("AHJs") and the Owner's insurance company
 - .27 Troubleshooting

- .28 Calibration of controls and point checkout
- .29 Control software setup and checkout
- .30 Submittal of completed equipment and system checkout sheets
- .31 Demonstration of systems and equipment
- .32 Maintenance manual preparation and submittal
- .33 Operator training program
- .34 Record documentation submittal

3.2 RECORD DOCUMENTATION

- .1 Prepare record documentation for each equipment installation covering:
 - .1 Equipment identification and supplier
 - .2 Shop Drawing submittal, review, production release, and delivery dates
 - .3 Dates for completion of all work required to prepare for equipment installation
 - .4 Dates for equipment installation, supplier prestart checkout and system availability for start-up
 - .5 Dates for equipment start-up, performance testing, proposal for temporary use, acceptance testing, demonstration, turnover and warranty start/finish
 - .6 List all specialist personnel and equipment required for the test and ensure that these are available by the test date.
 - .7 Provide documentation of the commissioning process for inclusion into the maintenance manuals. These are to include checkout sheets, equipment data sheets, start-up certificates from suppliers involved in start-up, documentation concerning demonstration to the Owner. Include all records and result sheets from commissioning tests.
 - .8 Maintain a log of key operating parameters, problems encountered, solutions employed and verification of effectiveness of solutions. Include log in maintenance manuals.

3.3 START-UP

- .1 Coordinate and supervise the start-up of the various pieces of equipment and systems. Utilize the start-up services of the manufacturer's representative. Ensure that the equipment is operating in a satisfactory manner. Check the following items:
 - .1 Initial site energization
 - .2 Voltage measurements
 - .3 Phase rotation
 - .4 Thermographic survey/report
 - .5 Load balance
 - .6 Temperature measurements and liquid sampling for transformers where applicable
 - .7 Visual inspections post energization
- .2 Prior to the equipment start-up, arrange to have the Manufacturer of all major equipment inspect the installation to ensure their equipment has been installed in accordance with their recommendations.

- .3 Functional testing is intended to begin upon successful completion of start-up. Functional testing may proceed prior to the completion of systems or sub-systems at the discretion of the Owner and the Owner's Commissioning Consultant. Beginning system functional testing prior to full completion does not relieve the Electrical Division from fully completing the system, including all start-up checklists.

3.4 TROUBLESHOOTING

- .1 Resolve inter-Division coordination problems.
- .2 Where problems become apparent during the commissioning process, identify and resolve these problems. The basic functions of troubleshooting include:
 - .1 Identify and define the problems
 - .2 Determine and evaluate the causes
 - .3 Determine the time available to resolve the problem
 - .4 Involve the designing authority in the review of the problem and proposed resolution
 - .5 Coordinate remedial action with the appropriate parties
 - .6 Evaluate the effectiveness of the remedial action
 - .7 Record the problem, cause, remedial action and result

3.5 OPERATIONAL TESTING

- .1 Test the operation of the individual components and systems. Go through each step of the sequence of operation and verify that each component operates correctly. Direct and ensure that all trades involved make the required changes and adjustments to effect the proper operation of all components and systems. Meet commissioning test requirements.
- .2 Document the operation and testing.
- .3 Ensure operational tests are completed for all seasons and modes of operation.
- .4 For any systems and assemblies where some testing has been deferred, coordinate seasonal commissioning for those systems that have been functionally tested and handed over in seasons where retesting and commissioning will be required during the opposite season.

3.6 DEMONSTRATION AND TRAINING

- .1 Demonstrate to the operating staff the proper operation of all Electrical equipment and systems. Demonstrations shall occur only after the operation and testing has been successfully completed. Ensure that all affected Electrical Division Trade Contractor(s) and equipment suppliers participate in the demonstrations as required.
- .2 Thoroughly instruct the operating staff in the safe and efficient operation and maintenance of all systems and equipment.
- .3 Provide designated operating personnel with comprehensive orientation and training in the understanding of the systems and the operation and maintenance of each piece of Electrical equipment including, but not limited to, pumps, boilers, chillers, heat rejection equipment, air conditioning units, air handling units, fans,

terminal units, controls and water treatment systems, fuel systems and other Electrical systems.

- .4 Training shall normally start with classroom sessions followed by hands-on training on each piece of equipment, which shall illustrate the various modes of operation, including start-up, shutdown, fire/smoke alarm, power failure, and other similar modes of operation.
- .5 During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
- .6 The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer's representative.
- .7 Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment is required. More than one party may be required to execute the training.
- .8 The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.
- .9 Training shall include:
 - .1 Use of the printed installation, operation and maintenance instruction material included in the O&M manuals.
 - .2 A review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.
 - .3 Discussion of relevant health and safety issues and concerns.
 - .4 Discussion of warranties and guarantees.
 - .5 Common troubleshooting problems and solutions.
 - .6 Explanatory information included in the O&M manuals and the location of all plans and manuals in the facility.
 - .7 Discussion of any peculiarities of equipment installation or operation.
 - .8 Classroom sessions shall include the use of overhead projections, slides, video/audio-taped material as might be appropriate.
 - .9 Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and preventative maintenance for all pieces of equipment.
 - .10 The Electrical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not controlled by the central control system.
 - .11 During any demonstration or hands-on training, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.

3.7 OPERATING AND MAINTENANCE MANUALS

- .1 Ensure that O&M Manuals are complete in accordance with the requirements of Section 26 05 00.

3.8 “AS-CONSTRUCTED” DRAWINGS

- .1 Ensure that Electrical Trade(s) “As-constructed” drawings have been produced and that they accurately reflect the completed Electrical systems.

3.9 COMPLETION

- .1 Confirm completion of all Electrical Work, including, but not limited to:
 - .1 Removal of all debris from inside Electrical systems and equipment.
 - .2 Compliance with manufacturer's written instructions.
 - .3 Removal of all temporary protection and covers.
 - .4 Record all settings of devices, equipment and systems.

3.10 COMMISSIONING TESTS

- .1 Factory tests/verification documents
- .2 Field electrical tests
- .3 Field test values
- .4 Operation of control circuits
- .5 Operation of trip circuits
- .6 Safety interlocks and operations
- .7 Demonstrate access to all junction boxes per code for servicing.
- .8 Verify the operation of all Electrical equipment.
- .9 Verify that interfacing to the work of other Divisions results in complete and operational systems.

3.11 POST OCCUPANCY EVALUATION

- .1 The post-occupancy evaluation period shall run for one full year following occupancy of the facility. The Commissioning Coordinator shall meet regularly with the operating staff throughout this period to review the operation of all Electrical systems and equipment. The Commissioning Coordinator shall provide written advice regarding questions and concerns raised by the operating staff.
- .2 Resolutions of operational problems shall, where appropriate, be used to modify the Operation and Maintenance Instructions for the equipment and systems involved.
- .3 Identify areas that may come under warranty and conduct a review of condition and operation. Seek remedy under warranty for any outstanding issues and problems before end of warranty period.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide materials as specified herein to complete the work as required by the contract documents.

1.3 SUBMITTALS

- .1 Submit Shop drawings as required.

Part 2 Products

2.1 SLEEVES

- .1 In concrete slabs, except as noted below, sleeves shall be #24 gauge galvanized steel or factory fabricated plastic sleeves, each with an integral flange to secure the sleeve to form work construction.
- .2 In waterproof concrete slabs and in other slabs where waterproof sleeves are required, provide Schedule 40 mild galvanized steel.
- .3 40 mild galvanized steel or suitable rigid, factory fabricated plastic sleeves.

2.2 ESCUTCHEON PLATES

- .1 One-piece chrome plated steel sized to completely cover sleeves and complete with set screws to secure the plates to the conduit. Split plates will not be acceptable.

2.3 INSERTS AND BEAM CLAMPS

- .1 Inserts for concrete form work shall be Crane Canada Ltd., #4-M Unistrut Ltd., or approved equal cast iron inserts, multiple type where required.
- .2 Inserts for precast concrete and existing concrete shall be lead cinch anchors of "WEJ-IT" or self-drilling "STARR" or "PHILLIPS" anchors.
- .3 Beam clamps for hanging and support to structural steel shall be Crane Canada Ltd., or equal.

2.4 ACCESS DOORS

- .1 Minimum #12 gauge prime coat painted bonderized steel flush access doors, each complete with a heavy frame and anchor, heavy duty rust-resistant concealed hinges, a positive locking screwdriver lock, and mounting and finishing provisions to suit the particular construction in which it is installed. Access door sizes shall suit the concealed work for which they are supplied. Access doors in fire rated ceilings, walls, partitions, structures, etc., shall be ULC listed and labelled and of a rating to maintain the fire separation integrity.

- .2 Where access doors are located in surfaces where special finishes are required, they shall be of a recessed door type capable of accepting the finish in which they are to be installed so as to maintain the final building surface appearance throughout.

Part 3 Execution

3.1 INSTALLATION OF SLEEVES

- .1 Where conduits, raceways and conductors pass through structural poured concrete, supply sleeves, unless otherwise noted.
- .2 Size sleeves, unless otherwise noted, to leave 12mm clearance around the conduit, raceway, etc. Pack and seal the void between the sleeves and the conduit, raceway, conductor etc. for the length of the sleeves.
- .3 Pack all sleeves with a ULC and CSA approved one part intumescent elastomer as manufactured by 3M. The installation shall be formed for each specific application using the manufacturers recommended combination of the following:
- .4 P25 caulk, Puty 303, penetration sealing system 7902 or 7904, composite sheet CS195 or wrap strip FS-195.
- .5 In poured concrete construction, accurately locate sleeves, and turn these sleeves over to the Division performing the concrete work for placement in the concrete form work. Sleeves shall be sufficiently rigid to prevent sleeve deformation when the concrete is poured, and shall be suitably plugged to prevent concrete from entering the sleeve.
- .6 Submit to the concrete reinforcement detailer at the proper times, drawings, indicating all required sleeves, recesses and formed openings in poured concrete work. Such drawings shall be completely and accurately dimensioned and shall relate sleeves, recesses and formed openings to suitable grid lines and elevation datum.
- .7 Supply sleeves of a water protecting type for installation in the following locations:
 - .1 In Mechanical and Fan Room floor slabs except where on grade;
 - .2 In slabs over Mechanical, Fan, Electrical and Telephone equipment rooms or closets;
 - .3 In all floors equipped with waterproof membranes;
 - .4 In the roof.
- .8 "Gang" type sleeving will be permitted only with the Consultant's approval.
- .9 Terminate sleeves for work which will be exposed so that the sleeve is flush at both ends with the wall, partition or slab surface so that the sleeves may be completely covered by escutcheon plates.
- .10 Openings for multiple conduit or conductor runs, etc., will be provided by the Division responsible for the particular construction in which the opening is required. Carefully co-ordinate the opening locations with the particular Division and ensure that openings are suitably sized and located. Seal the space between the opening and the conduit, conductors, etc., for the length of the opening as for sleeves above.

- .11 Where a round or formed opening is required, where placement of a sleeve has been missed, or where provision of an opening has not been properly co-ordinated with the Concrete Division, neatly cut a suitably sized hole or opening using proper tools to the approval of the Consultant. Prior to cutting any such holes or openings, determine whether or not any reinforcing steel or services, are concealed behind the surface where the hole or opening is to be cut and be responsible for all costs incurred for correcting any damage caused to the structure or services due to cutting holes or openings without prior study and approval.

3.2 INSTALLATION OF ESCUTCHEON PLATES

- .1 Provide escutcheon plates over all exposed conduit passing through walls, floors, ceilings, partitions, furrings, etc., in finished areas.

3.3 INSTALLATION OF INSERTS AND BEAM CLAMPS

- .1 Provide all inserts, beam clamps, fasteners, and similar hardware required for conduit, duct, raceway, conductor, etc., and equipment hanger and/or support materials unless otherwise noted.
- .2 Accurately and properly set concrete inserts in the concrete framework.
- .3 For runs of three (3) or more conduits, raceways, or conductors in concrete form work, use multiple type inserts used for the smallest conduit in the group.
- .4 Where inserts are required in pre-cast concrete and in concrete work where concrete inserts have not been installed, drill a neat hole of the proper diameter and depth in the concrete and insert an anchor to accept the hanger rod, bolt, etc. or where concrete mass permits, use self-drilling concrete anchors.
- .5 Fasten hangers and support provisions to brick or masonry with expansion shields and machine bolts, or for light loads, use plugs and screws.
- .6 In cavity walls and/or ceilings, use two (2) wing toggles and for heavy loads, provide steel anchor plates with two (2) or more toggles to spread the load.
- .7 Provide beam clamps for attaching, hanging and/or support provisions to structural steel, or where approved by the Consultant, weld the hanging and support provisions to the structural steel.
- .8 Explosive power actuated fasteners will not be permitted unless specific approval for their use has been obtained from the Consultant.
- .9 Use fibre or lead screw anchors for anchoring screws.

3.4 SUPPLY OF ACCESS DOORS

- .1 Supply access doors to give access to all junction boxes, pullboxes, conductor joints and other similar electrical work which may need maintenance or repair but which is concealed in inaccessible construction except as otherwise specified herein or on the drawings.
- .2 Before commencing installation of electrical work, prepare on a set of reflected ceiling plans with complete layouts of all ceiling access door which will be required. Submit these layouts to the Architect for approval and show the exact sizes and locations of such ceiling access doors. Locate access doors in walls and partitions to the Consultant's approval, and arrange electrical work to suit.

- .3 Supply the respective trade with panels, doors or the frames therefore complete with all pertinent information and pay their trade for installation.
- .4 Access doors shall be, wherever possible, of a standard size, for all applications. Confirm exact dimensions with the Consultant, prior to ordering.
- .5 Submit a sample of each proposed type of access door to the Consultant for approval.

3.5 PLYWOOD

- .1 Provide all plywood indicated on the drawings required for the work of Division 26. The backboards shall be 19mm thick, good both sides and shall be impregnated with white fire retardant paint on both sides.

3.6 EQUIPMENT CURBS, BASES AND SUPPORTS

- .1 Set all floor mounted equipment on 100mm high concrete housekeeping pads 100mm wider and longer than the equipment base dimensions.
- .2 Furnish dimensioned drawings, templates and anchor bolts for proper setting of equipment on bases and pads. Provide all structural steel frames, brackets, etc., for equipment bases and supports unless otherwise noted, and be responsible for all required levelling, alignment and grouting of the equipment.
- .3 Provide structural steel stands for equipment where indicated or specified. Flange bolt stands to housekeeping pads.
- .4 Where equipment is suspended above floor level it shall be, unless otherwise noted, supported on a suitable structural steel angles or channels bracketed to the wall or secured by hanger rods to slab construction, or where loading is excessive, from separate structural steel members carried to either the floor or ceiling, or both as required.

3.7 EXCAVATION AND BACKFILL

- .1 Do all excavating bedding backfill and related work for the work of Division 26 as specified therein.
- .2 For all electrical excavation, excavate to 150mm below and a minimum of 200mm to either side of the cable or duct run. Fill back with a bedding of granular 'A' gravel or sand. Minimum coverage shall be 750mm.
- .3 Refer to details on the drawings and to utility company requirements for concrete encased duct installation.
- .4 Where excavation is necessary in proximity to and below the level of any footings, bed with concrete to the level of the highest adjacent footing. Concrete strength shall be as directed by the Consultant.
- .5 Carry out pavement cutting and repair of the Owners and Public Property as may be required for excavation and backfill work.

3.8 CONCRETE

- .1 Do all concrete or related work required for the work of Division 26 as specified herein.

- .2 Division 26 shall be responsible for all co-ordination to meet authority having jurisdiction requirements for ducts, provision of ducts and fittings as specified.

3.9 CUTTING AND PATCHING

- .1 Inform other trades in time concerning required openings. In work already finished, cutting and patching shall be done by the trades installing the affected work, at the expense of Division 26. Obtain the approval of the Consultant, before doing any cutting.

3.10 PROVISION FOR SERVICES CROSSING BUILDING EXPANSION JOINTS

- .1 Wherever services (conduit, cables etc.) cross building expansion joints, install the services in such a manner to permit free movement without imposing additional stress or loading upon the support system, and to prevent excessive movement at joints and connections.

3.11 SPRINKLER PROTECTION

- .1 Weatherproof equipment where noted in the specifications and/or drawings shall have EEMAC Type 3 enclosure in accordance with the requirements of CSA C22.2 No. 94 Standard.

3.12 FLASHING

- .1 Flash all electrical parts passing through or built into an outside wall, or a waterproof floor.
- .2 Provide copper flashing for sleeves passing through exterior walls or water proof floors.
- .3 Provide counter flashing on conduits passing through roofs to fit over flashing or curb. Supply flashing to appropriate division for installation.

3.13 METALS

- .1 Steel construction required solely for the work of electrical trades and not shown on architectural or structural drawings shall be provided by Division 26 to the acceptance of the Consultant.

3.14 MOUNTING HEIGHTS

- .1 Maximum mounting height of equipment is from finished floor to centre line of equipment unless specified or indicated otherwise.
- .2 If mounting height of equipment is not indicated verify before proceeding with installation.
- .3 Prior to rough-in, co-ordinate and have approved by the Consultant all mounting heights of devices.
 - .1 Mounting heights shall meet the requirements of the "Barrier Free" section of OBC.
 - .2 Local switches: 1050mm
 - .3 Local switches in suites: 1050mm
 - .4 Wall receptacles:
 - .1 General: 400mm

- .2 Above top of continuous baseboard heater: 200mm
- .3 Above top of counters or splash back: 1100mm
- .4 In mechanical room: 1050mm
- .5 Panelboards (to top of panel trim): 1850mm
- .6 Data, telephone, television outlets: 400mm
- .7 Wall-mounted telephone and interphone outlets: 1050mm
- .8 Wall-mounted A/V speakers: 2100mm or as noted
- .9 Clocks: 2100mm
- .10 All fire alarm devices shall be installed in accordance with CAN/ULC-S524-14 including:
 - .1 Manual stations: 1150mm
 - .2 Audible devices (not less than): 2300mm or 150mm below ceiling
 - .3 Visual devices: entire lens shall be not less than 2000mm and not more than 2400mm above finished floor.
 - .4 Smoke detectors 100 – 300mm from ceiling to top edge of device.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Through Penetration Firestopping.
 - .2 Fire Resistive Joint Systems.
- .2 Related Sections
 - .1 Division 1 – General Requirements.
 - .2 Division 3 – Concrete.
 - .3 Division 4 – Masonry.
 - .4 Division 7 – Thermal and Moisture Protection.
 - .5 Division 9 – Finishes.
 - .6 Division 22 – Plumbing.
 - .7 Division 23 – Heating Ventilating and Air Conditioning.
 - .8 Division 26 – Electrical.
 - .9 Division 27 – Communication.

1.3 PERFORMANCE REQUIREMENTS

- .1 Provide systems that are listed by at least one the following:
 - .1 Underwriters Laboratories Inc. (UL), in "Fire Resistance Directory".
 - .2 Intertek Testing Service (Formerly known as Omega Point Laboratories), in "Directory of Listed Products".
 - .3 Factory Mutual (FM), in FMRC Approval Guide.
 - .4 Any other qualified independent testing and inspection agency that conducts periodic follow-up inspections and is acceptable to authorities having jurisdiction.

- .2 Provide firestop products that are flexible enough to allow for pipe vibration in a through penetration application.
- .3 Provide fire resistive sealants and sprays for construction joint applications that are flexible enough to satisfy the movement criteria per the test standards ASTM E 1399, ASTM E 1966 or ANSI/UL 2079.
- .4 Provide products with the appropriate flame spread index and smoke develop index, when tested in accordance with ASTM E 84.
- .5 Provide products that meet the intent of the L rating classification for the movement of smoke per ANSI/UL 1479 for through penetrations and ANSI/UL 2079 for construction joints.
- .6 Provide products identical to those tested and listed for classification by UL, Intertek or any other qualified independent testing agency.
- .7 Provide products that bear classification marking of qualified independent testing agency.
- .8 Where firestop systems not listed by any listing agency are required due to project conditions, submit a substitution proposal with evidence specified.
- .9 Use only products specifically listed for use in listed systems.
- .10 Provide products that are compatible with each other, with the substrates forming openings, and with the items, if any, penetrating the firestopping, under the conditions represented by this project, based on testing and field performance demonstrated by manufacturer.
- .11 Firestopping materials must meet and be acceptable for use by all building codes and NFPA codes cited in this section.
- .12 Provide products that meet the intent of the state or local guidelines on volatile organic compounds (VOC).
- .13 Where applicable provide products that meet the intent of the F rating classification for passage of flame per ANSI/UL 1479 for through penetrations.
- .14 Where applicable provide products that meet the intent of the T rating classification for the transfer of temperature per ANSI/UL 1479 for through penetrations.
- .15 Provide products that meet the intent of the L rating classification for the movement of smoke per ANSI/UL 1479 for through penetrations and ANSI/UL 2079 for construction joints.
- .16 Where applicable provide products that meet the intent of the W rating classification for passage of water per ANSI/UL 1479 for through penetrations.

1.4 SUBMITTALS

- .1 Submit under provisions of the Contract and Division 01 – General Requirements.
- .2 Shop Drawings: For each firestopping system, provide the following:
 - .1 Listing agency's detailed drawing showing opening, penetrating item(s), and firestopping materials, identified with listing agency's name and number or designation and fire rating achieved.

- .2 For proposed systems that do not conform strictly to the listing, submit written instructions showing modifications and approved by firestop system manufacturer.
- .3 Submit under provisions of the International Building Code (IBC) section 107 and 703 requiring a submittal package for fire-resistance ratings and fire tests.
- .3 Product Certificates: Submit certificates of conformance signed by firestop system manufacturer certifying that materials furnished comply with requirements.
- .4 Product Data: Furnish manufacturer's product data sheets on each material to be used in firestop systems. Information on manufacturer's product data sheet should include:
 - .1 Product characteristics including compliance with appropriate ASTM/UL/ANSI test standards.
 - .2 Storage and handling requirements and recommendations.
- .5 Installation Instruction: Furnish manufacturer's installation instructions.
- .6 Sustainable or LEED Submittals:
 - .1 VOC Content: For sealants and sealant primers, furnish documentation of VOC content.

1.5 QUALITY ASSURANCE

- .1 General: All through-penetration firestop systems and construction gap fire resistive systems shall be installed with approved methods using materials that have been tested and classified to produce an approved assembly.
- .2 Manufacturer Qualifications: All primary products specified in this section will be supplied by a single manufacturer with a minimum of twenty five (25) years experience.
 - .1 Products shall be manufactured in a facility that follows ISO 9001 best practices.
- .3 Installer Qualifications: Firm must be qualified by having experience, staff, and be properly trained to install the specified products, and meets the following criteria:
 - .1 Contractor is a **3M** Master Contractor.
 - .2 Contractor is a Certified **3M** Trained contractor.
 - .3 Contractor is acceptable to manufacturer.
 - .4 Contractor is acceptable to Authority Having Jurisdiction (AHJ).
 - .5 Contractor has completed the manufacturer's certified product installation training.
 - .6 Contractor must provide a list of completed projects as evidence of experience; include project name and address, owner's name and address, and architect's name and phone number.
 - .7 Certificate: Contractor should provide certificate of qualification.
- .4 Codes: Where manufacturer's application procedures are in conflict with those of the local Authority Having Jurisdiction, the more strict guidelines will prevail.

- .5 Pre-installation Meetings: Meetings to agree on firestop requirements, conditions, manufacturer's instructions.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver and store products until ready for installation in manufacturer's original unopened packaging, legibly marked with manufacturer's name and product identification, date of manufacture, lot number, listing agency's classification marking, curing/dry time, mixing instructions (if applicable) and MSDS reference number.
- .2 Store and handle in such a manner as to prevent deterioration or damage due to moisture, temperature changes, contaminants, and other causes; follow manufacturer's instructions.
- .3 Store and dispose of hazardous materials, and materials contaminated by hazardous materials, in accordance with requirements of local Authority Having Jurisdiction.

1.7 PROJECT CONDITIONS

- .1 Coordinate construction and cutting of openings so that each particular firestop system may be installed in accordance with its listing, including assembly rating, L rating, sizing, sleeves, manufacturer's published STC rating and penetrating items.
- .2 Coordinate firestopping of dynamic and static construction joints (top-of-wall, bottom-of-wall, floor-to-floor, floor-to-wall), wall-to-wall, perimeter so that each particular system may be installed in accordance with its listing, including assembly rating, sizing, movement capabilities and manufacturer's published STC rating.
- .3 Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install firestopping under environmental conditions outside manufacturer's absolute limits.
- .4 Provide ventilation as required by firestopping manufacturer, including mechanical ventilation if required.

1.8 WARRANTY

- .1 At project closeout, provide to Owner or Owners Representative an executed copy of the manufacturer's standard limited warranty against manufacturing defect, outlining its terms, conditions, and exclusions from coverage.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturer: **3M** Fire Protection Products, which is located at: **3M** Center Bldg. 223-2N-21 ; St. Paul, MN 55144-1000; Toll Free Tel: 800-328-1687; Email: request info (firetech1@mmm.com); Web: www.**3M**.com/firestop
- .2 Requests for substitutions will be considered in accordance with provisions of Division 1- General Requirements.

- .3 Single Source: To maintain control and integrity of the firestop applications a single manufacturer should be used. Specific UL or approved listing agencies systems applicable to each type of firestop condition should be supplied by one manufacturer.

2.2 SCOPE/APPLICATION

- .1 Provide installed firestop products that limit the spread of fire, heat, smoke, and gasses through otherwise unprotected openings in rated assemblies, including walls, partitions, floors, roof/ceilings, and similar locations, restoring the integrity of the fire rated construction to its original fire rating.
- .2 Provide firestop systems listed for the specific combination of fire-rated construction, type of penetrating item, annular space requirements, and fire rating, and the following criteria:
 - .1 F-Rating: Equal to or greater than the fire-resistance rating of the assembly in which the firestopping will be installed.
 - .2 T-Rating: In habitable areas where penetrating items are exposed to potential contact with materials on fire side(s) of rated assembly, T-rating must equal its F-rating.
 - .3 L-Rating: L-rating of 1 cfm per linear foot (5.5 cu m/h/m) maximum at ambient temperatures.
 - .4 W-Rating: meets UL Water Leakage Test, W Rating – Class 1 requirements for systems tested and listed in accordance with ANSI/UL 1479.
 - .5 Wall Penetrations: Through penetration systems must be symmetrical, with the same rating from both sides of the wall. Membrane penetrations may be asymmetrical.
 - .6 Testing: Determine ratings in accordance with ASTM E 814 or UL 1479.
- .3 Provide fire-resistive systems listed for construction gaps per the specific combination of fire-rated construction type, configuration, gap dimensions, and fire rating, and the following criteria:
 - .1 Fire resistance rating must be equal to or greater than that of the assembly in which it is to be installed.
 - .2 Movement capability must be appropriate to the potential movement of the gap, demonstrated by testing in accordance with ASTM E 1399/ASTM E 1966/UL 2079 for minimum of 500 cycles at 10 cycles per minute.
 - .3 L-Rating: L-rating of 1 cfm per linear foot (5.5 cu m/h/m) maximum.
 - .4 Determine ratings in accordance with ASTM E 1966/UL 2079.

2.3 THROUGH PENETRATION FIRESTOP PRODUCTS

- .1 **3M** Fire Barrier Cast-in-Place Devices: Firestopping device for use prior to a concrete pour. Adjustable height with pull tabs, straight edge design for close placement to walls and adjacent devices.
 - .1 Fire Resistance: For use in 1, 2, or 3 hour fire-rated systems.
 - .2 Locations: Horizontal assemblies only.

- .2 **3M** Fire Barrier Ultra RC Pack: One piece metal collar assembly encasing intumescent material for firestopping of pipes and cables through rated walls and floors.
 - .1 Fire Resistance: For use in 1 or 2 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .3 **3M** Fire Barrier Ultra Plastic Pipe Device: Intumescent device for firestopping of plastic pipe and cables through rated walls and floors.
 - .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 - .2 Configuration: One-piece metal collar, with locking latch and bendable tabs to secure; equipped also for conventional anchoring.
 - .3 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .4 **3M** Fire Barrier RC-1 Restricting Collar with either FS 195+ Wrap Strip or 3M Interam Ultra GS Wrap Strip . (See product descriptions below): For firestopping of plastic pipes from 4 inches (102 mm) to 10 inches (254mm) in diameter.
 - .1 Fire Resistance: For use in 1 or 2 hour fire-rated systems.
 - .2 Material: 28 gauge steel.
 - .3 Size: 25 foot (7.6 m) roll.
 - .4 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .5 **3M** Fire Barrier CP25WB+ Sealant: High-performance, intumescent, water-based sealant. No-sag, fast drying, paintable, red in color. Versatile firestop sealant for pipes (not for use with CPVC), cables, cable tray, blank opening and other penetrations along with mineral wool or other fire-rated assembly products.
 - .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
 - .3 STC rating of 54 when tested in STC 54-rated wall assembly.
- .6 **3M** Fire Barrier IC 15WB+ Sealant: General-purpose, intumescent, water-based sealant. No-sag, fast drying, paintable, yellow in color. Economical firestop sealant for pipes, cables, cable tray, blank opening and other penetrations along with mineral wool or other fire-rated assembly products.
 - .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
 - .3 STC rating of 54 when tested in STC 54-rated wall assembly.
- .7 **3M** Fire Barrier Sealant FD 150+: Single-part, water-based, acrylic latex sealant. No-sag, low-shrinkage, low VOC. Blue, red or limestone color. Used to firestop for pipe penetrations (not for use with CPVC).
 - .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
 - .3 STC rating of 54 when tested in STC 54-rated wall assembly.
- .8 **3M** Fire Barrier Water Tight Sealant 3000 WT: Single-part, water-tight, intumescent silicone firestop sealant for filling voids in concrete gypsum, metal, plastic, wood and insulation. Light gray color with black flecks. Meets UL Water Leakage Test, W Rating – Class 1 requirements.

- .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
 - .3 STC rating of 53 when tested in STC 54-rated wall assembly.
- .9 **3M** Fire Barrier Water Tight 1000 NS Sealant: Single-part, non-slump firestopping silicone sealant for floor and wall openings. Light gray color. Meets UL Water Leakage Test, W Rating – Class 1 requirements.
- .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems..
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
 - .3 STC rating of 56 when tested in STC 56-rated wall assembly.
- .10 **3M** Fire Barrier Water Tight Sealant 1003 SL: Single-part, self-leveling firestopping silicone sealant for floor openings. Light gray color. Meets UL Water Leakage Test, W Rating – Class 1 requirements.
- .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems..
 - .2 Locations: For horizontal assemblies only.
 - .3 STC rating of 56 when tested in STC 56-rated wall assembly.
- .11 **3M** Fire Barrier Sealant 2000 NS: Single-part, non-slump elastomeric silicone firestop sealant. Sag-resistant, low VOC. Light grey color. Used in mechanical, electrical and plumbing applications to firestop openings and penetrations through fire-rated floor or wall assemblies. Typical penetrants include: metallic pipe, non-metallic pipe (FGG/BM system CPVC compatible), conduit, power and communication cable and telephone or electrical wiring.
- .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire-rated systems.
 - .2 Locations: Vertical and horizontal assemblies.
 - .3 STC-Rating of 56 when tested in STC 56-rated wall assembly.
- .12 **3M** Fire Barrier Sealant 2000+: Single-part, elastomeric silicone firestop sealant. Sag-resistant, low VOC. Light grey color. Used in mechanical, electrical and plumbing applications to firestop openings and penetrations through fire-rated floor or wall assemblies. Typical penetrants include: metallic pipe, non-metallic pipe (FGG/BM system CPVC compatible), conduit, power and communication cable and telephone or electrical wiring.
- .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire-rated systems.
 - .2 Locations: Vertical and horizontal assemblies.
 - .3 STC-Rating of 56 when tested in STC 56-rated wall assembly.
- .13 **3M** Fire Barrier Moldable Putty+: One-part, 100 percent solids intumescent firestop. Remains pliable, flexible and easily re-enterable. Non-toxic synthetic formula. Versatile putty for pipes, cables, cable tray, blank opening and other penetrations along with mineral wool or other fire-rated assembly products.
- .1 Type: Stick or Pad
 - .2 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 - .3 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .14 **3M** Fire Barrier 2001 Silicone RTV Foam: Two-part, liquid-silicone elastomer, foams in place when mixed. For use sealing large or complex openings such as cable bundles, cable trays and conduit banks.

- .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
- .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .15 **3M** Fire Barrier Mortar: For sealing openings in concrete and masonry walls and floors. Self Leveling, non-sag, low VOC.
 - .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .16 **3M** Fire Barrier Self-Locking Pillow: Self-contained, intumescent firestop pillow with interlocking strips. Meets fire rating without the use of wire mesh. For use in firestopping larger openings
 - .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .17 **3M** Fire Barrier Pillow: Self-contained, intumescent firestop product. Meets fire rating without the use of wire mesh. For use in firestopping larger openings
 - .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .18 **3M** Fire Barrier CS-195+ Composite Sheet: Organic/inorganic intumescent elastomeric sheet, bonded on one side to a layer of 28 gauge galvanized steel. Other side reinforced with steel-wire mesh and covered with aluminum foil. Re-enterable. For use in firestopping larger openings
 - .1 Thickness: Nominal 0.3 inch (7.6 mm).
 - .2 Thermal Expansion: 8 - 10 times original size.
 - .3 Tensile Strength (ASTM D412): 93.6 psi (645 kPa)/489 percent.
 - .4 Fire Resistance: For use in 1, 2, 3 or 4 hour fire-rated systems.
 - .5 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .19 **3M** Interam Ultra GS Wrap Strip: Graphite based, flexible, largely inorganic, intumescent mat. For use around non-metallic piping with or with RC-1 collar.
 - .1 Fire Resistance: For use in 1, 2 or 3 hour fire rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .20 **3M** Fire Barrier FS-195+ Wrap/Strip: One-part, organic/inorganic intumescent strip with foil on one side. May be cut to fit irregular shapes. For use around non-metallic piping with or with RC-1 collar.
 - .1 Length: 24 inch (610 mm).
 - .2 Width: 1 or 2 inches.
 - .3 Fire Resistance: For use in 1, 2, 3 or 4 hour fire-rated systems.
 - .4 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .21 **3M** Fire Barrier Pass-Through Devices: One-Piece device for firestopping of cable penetrations through rated walls and floors.
 - .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .22 **3M** Fire Barrier Tuck-In: Graphite-based, flexible, intumescent wrap strip for use around non-metallic piping. Adhesive closure tab.

- .1 Fire Resistance: For use in 1, 2 or 3 hour fire-rated systems.
- .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.
- .23 **3M** Fire Barrier Putty Sleeve Kit: Device used for firestopping of cable penetrations through fire rated walls and floors.
 - .1 Fire Resistance: For use in 1, 2 3 or 4 hour fire-rated systems.
 - .2 Locations: Vertical assemblies, horizontal assemblies and smoke barrier.

2.4 FIRE RESISTIVE JOINT PRODUCTS

- .1 **3M** Fire Barrier Sealant FD 150+: Single-part, water-based sealant. Sag-resistant, low-shrinkage, low VOC.
 - .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire-rated systems.
 - .2 Location: For use at top-of-wall, bottom-of-wall, wall-to-wall and floor-to-floor.
 - .3 Compression/Extension Recovery: +/- 19 percent of original joint width.
 - .4 Meets optional L rating requirements.
 - .5 STC rating of 56 when tested in STC 56-rated wall assembly.
- .2 **3M** Fire Barrier Water Tight Sealant 1000 NS: Single-part, non-slump elastomeric silicone sealant. Sag-resistant, low VOC.
 - .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire rated systems.
 - .2 Meets UL Water Leakage Test, W Rating – Class 1 requirements.
 - .3 Location: For use at top-of-wall, bottom-of-wall, wall-to-wall, floor-to-floor, floor-to-wall and perimeter joints.
 - .4 Compression/Extension Recovery: +/- 15 percent of original joint width.
 - .5 STC-Rating of 56 when tested in STC-56-rated wall assembly.
- .3 **3M** Fire Barrier Water Tight Sealant 1003 SL: Single-part, self-leveling elastomeric silicone sealant. Sag-resistant, low VOC.
 - .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire rated systems.
 - .2 Meets UL Water Leakage Test, W Rating – Class 1 requirements.
 - .3 Location: For use at top-of-wall, bottom-of-wall, floor-to-wall and floor-to-floor joints.
 - .4 Compression/Extension Recovery: +/- 15 percent of original joint width.
 - .5 STC-Rating of 56 when tested in STC-56-rated wall assembly.
- .4 **3M** Fire Barrier Sealant 2000 NS: Single-part, non-slump elastomeric silicone sealant. Sag-resistant, low VOC.
 - .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire rated systems.
 - .2 Service Flexibility: Accommodate vibration from normal building movement.
 - .3 Location: For use at top-of-wall, bottom-of-wall, wall-to-wall, floor-to-wall, floor-to-floor and perimeter joints.
 - .4 Compression/Extension Recovery: +/- 31 percent of original joint width.
 - .5 STC-Rating of 56 when tested in STC 56-rated wall assembly.

- .5 **3M** Fire Barrier Sealant 2000+: Silicone Sealant: Single-part, elastomeric silicone sealant. Sag-resistant, low VOC.
 - .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire rated systems.
 - .2 Compression/Extension Recovery: +/- 13 percent of original joint width.
 - .3 Location: For use at top-of-wall, bottom-of-wall, wall-to-wall, floor-to-wall and floor-to-floor joints.
- .6 **3M** FireDam Spray 200: Water-based, paintable, low VOC, freeze/thaw resistant spray applied fire resistive product. Applied with conventional airless spray equipment.
 - .1 Fire Resistance: For use in 1, 2, 3 or 4 hour fire rated systems.
 - .2 Compression/Extension Recovery: +/- 50 percent of joint width.
 - .3 Location: For use at head-of-wall, wall-to-wall, floor-to-floor, bottom-of-wall, floor-to-wall and perimeter joints.
 - .4 STC-Rating of 56 when tested in STC 56-rated wall assembly.

2.5 FIRESTOPPING FOR SINGLE MEMBRANE PENETRATIONS

- .1 **3M** Fire Barrier Moldable Putty+: One-part, 100 percent solids intumescent firestop. Remains pliable, flexible and easily re-enterable. Non-toxic synthetic formula.
 - .1 Type: Pad.
 - .2 Fire Resistance: For use in 1, 2 or 3 hour fire rated systems.
- .2 **3M** Endothermic Mat E-5A-4: Endothermic heat absorbing mat.
 - .1 Type: Mat.
 - .2 Fire Resistance: For use in 1 or 2 hour fire rated systems.

Part 3 Execution

3.1 EXAMINATION

- .1 Do not begin installation until substrates have been properly prepared.
- .2 Conduct tests according to manufacturer's written recommendations to verify that substrates are free of oil, grease, rolling compounds, incompatible primers, loose mill scale, dirt and other foreign substances capable of impairing bond of firestopping.
- .3 Verify that items penetrating fire rated assemblies are securely attached, including sleeves, supports, hangers, and clips.
- .4 Verify that openings and adjacent areas are not obstructed by construction that would interfere with installation of firestopping, including ducts, piping, equipment, and other suspended construction.
- .5 Verify that environmental conditions are safe and suitable for installation of firestopping.
- .6 If substrate preparation is the responsibility of another installer, notify Architect or Engineer of Record of unsatisfactory preparation before proceeding.

3.2 PREPARATION

- .1 Prepare substrates in accordance with manufacturer's instructions and recommendations.
- .2 Install masking and temporary coverings as required to prevent contamination or defacement of adjacent surfaces due to firestopping installation.

3.3 INSTALLATION

- .1 Install in strict accordance with manufacturer's detailed installation instructions and procedures.
- .2 Install so that openings are completely filled and material is securely adhered.
- .3 Where firestopping surface will be exposed to view, finish to a smooth, uniform surface flush with adjacent surfaces.
- .4 After installation is complete, remove combustible forming materials and accessories that are not part of the listed system.
- .5 Repair or replace defective installations in accordance with manufacturer's recommendations, listed systems details and applicable code requirements.
- .6 At each through penetration or fire-resistive joint system, attach identification labels on both sides in location where label will be visible to anyone seeking to remove penetrating items or firestopping.
- .7 Clean firestop materials off surfaces adjacent to openings as work progresses, using methods and cleaning materials approved in writing by firestop system manufacturer and which will not damage the surfaces being cleaned.
- .8 Notify Authority Having Jurisdiction when firestopping installation is ready for inspection; obtain advance approval of anticipated inspection dates and phasing, if any, required to allow subsequent construction to proceed.
- .9 Do not cover firestopping with other construction until approval of authority having jurisdiction has been received.

3.4 FIELD QUALITY CONTROL

- .1 Owner will engage an independent testing agency to inspect installed firestopping and to prepare reports indicating whether the installed work complies with the contract documents.
- .2 Notify testing agency at least 7 days prior to date when firestopping installation will be ready for inspection; obtain advance approval of general schedule and phasing, if any, required to allow subsequent construction to proceed.

3.5 CLEANING AND PROTECTION

- .1 Remove left over material and debris from Work area. Use necessary means to protect fire protection product(s) before, during, and after installation.
- .2 Touch-up, repair or replace damaged products before Substantial Completion.
- .3 Install identification Labels for Through Penetration and Construction Joint Systems: Pressure sensitive self-adhesive vinyl labels, preprinted with the following information:

- .1 The applicable words "Warning - Through Penetration Firestop System - Do not Disturb. Notify Building Management of Any Damage." or "Warning – Construction Gap Fire Resistive System - Do not Disturb. Notify Building Management of Any Damage."
- .2 Listing agency's system number or designation.
- .3 System manufacturer's name, address, and phone number.
- .4 Installer's name, address, and phone number.
- .5 General contractor's name, address, and phone number (if applicable).
- .6 Date of installation.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide lamacoid nameplates and other identification means for a complete installation.

1.3 SUBMITTALS

- .1 Submit a list of proposed labels for review prior to manufacturing.

Part 2 Products

2.1 NIL

Part 3 Execution

3.1 STANDARD IDENTIFICATION

- .1 Identify electrical work as specified herein:
 - .1 For each piece of electrical distribution equipment from the electrical source of supply up to and including panelboards and motor systems, for special control panels and cabinets, and for any other piece of equipment where specified in this Section, provide engraved lamacoid identification nameplates.
 - .2 Nameplates shall generally be black-white-black with bevelled edges, secured to apparatus with stainless steel screws. Generally lettering shall be 6mm high but equipment in the main electrical room shall be provided with lettering 13mm high.
 - .3 Warning signs, if and when required, shall be red with white lettering.
 - .4 Equip large multiple cell or component apparatus such as switchboards and distribution panels with main nameplates identifying the equipment, voltage characteristics and capacity and with sub-nameplates clearly identifying each cell or component and its service.
 - .5 Panelboard nameplates shall identify the panelboard numbers designated on the drawings, unless otherwise instructed. Nameplates for disconnect switches, control panels and cabinets shall outline their service.
 - .6 Motor starters, magnetic and manual, shall identify the piece of motorized equipment being serviced.
 - .7 Exact nameplate wording and sizes must be approved by and confirmed by the Consultant prior to manufacture.
 - .8 Directories for branch circuit panelboards shall be clearly and neatly typewritten, accurately identifying the type, location and wattage of the connected load for each circuit breaker. Directories shall be secured to the rear of the cabinet door under protective plastic. Incorporate copies

- of all panel board directories in each copy of operating and instruction manuals.
- .9 Clearly identify each branch circuit breaker in a permanent manner to correspond with directories. Glued paper identification will not be acceptable.
- .10 Clearly identify main pull or junction boxes (excluding obvious outlet boxes) by painting the outside of the covers. Paint colours shall be in accordance with the following schedule:
- | | | | |
|----|-----------------------|---|--------|
| .1 | Lighting | - | Yellow |
| .2 | Power | - | Blue |
| .3 | Emergency Power | - | Orange |
| .4 | Fire Alarm | - | Red |
| .5 | Telephone | - | Cream |
| .6 | Miscellaneous Signals | - | Brown |
- .11 In addition to painting miscellaneous signal boxes clearly identify the specific system in which the box is installed.
- .12 Colour code empty conduit capped and terminated for future use as specified above and clearly identify its intended use by means of securely attached tags.
- .13 Colour code conductors throughout to identify phases, neutrals and grounds, by means of coloured conductor insulation. Colours shall be as follows:
- | | | | |
|----|---------|---|-------|
| .1 | Phase A | - | Red |
| .2 | Phase B | - | Black |
| .3 | Phase C | - | Blue |
| .4 | Ground | - | Green |
| .5 | Neutral | - | White |
- .14 Control conductors, in addition, shall be numbered with Brady Ltd., or Electrovert Ltd., Z-type markers. Colour code conductors, for special component per manufacturer's recommendations.
- .15 Use dymo tape to label each receptacle with its circuit number (e.g., UA-27).

3.2 PAINTING AND FINISHES

- .1 Painting of exposed electrical work will be done as part of the work of Division 9. Equipment to be located in finished areas shall be provided to site prime coated.
- .2 All exposed electrical fittings, supports, hangers, frames conduit, racks, boxes, raceways and similar material and apparatus shall be galvanized or finished with corrosion resistant primer ready to accept paint. Take special care when priming work exposed to the elements or in wet areas to prevent rust or corrosion from damaging adjacent surfaces.
- .3 All large switchgear, transformers, distribution centres, panelboard, starters, disconnects or similar apparatus shall be factory finished in gloss air dry enamel over corrosion resistant sealer primer. Unless specified to the contrary, this finish shall be ASA #61 grey.

- .4 Touch-up and/or repaint any factory finished equipment not scheduled to be painted by Division 9 that has been scratched or otherwise damaged during installation.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Include in the tender price the cost of an independent agency for on-site engineering inspection and testing and co-ordination of the following main distribution equipment:
 - .1 Secondary Switchboard,
 - .2 Distribution Equipment,
 - .3 Generator

1.3 SUBMITTALS

- .1 Submit the co-ordination study in the form of shop drawings before the submission of equipment shop drawings for review to the:
 - .1 Consultant
 - .2 Inspection Authority, if required

Part 2 Products

2.1 NIL

Part 3 Execution

3.1 EXTENT OF TESTING & INSPECTION

- .1 This engineering inspection and testing shall be done prior to the system being energized and shall include the following items where applicable:
- .2 Testing, cleaning where necessary, and calibrating all relays and circuit breaker trip devices. (Calibration of all protective devices shall conform to requirements of approved co-ordination curves.)
- .3 Transformers of 100 KVA and over shall be subject to the following tests:
 - .1 Insulation Resistance
 - .2 Ratio
 - .3 Polarity
 - .4 Phase Angle
- .4 Function test of associated control devices.
- .5 Megger test interconnecting cables.
- .6 Replacement of fuses destroyed or damaged during the testing.

- .7 Under a minimum of 50% rated load conditions perform an infra red scan of the main distribution equipment.
- .8 The presence, for the length of the required, or qualified and competent equipment service representatives during start-up.
- .9 Forward for approval prior to energization of the distribution system and equipment, four neat, typewritten copies of the engineering and testing report.

3.2 CO-ORDINATION STUDY

- .1 The protective system devices have been selected such that protection is adequate and good co-ordination is possible, however, since differences do exist between manufacturers, some changes in trip ratings or relay settings may be necessary and shall be carried out.
- .2 Arrange for the independent testing company to carry out the following:
 - .1 Immediately upon award of the contract and prior to the manufacture of the switchboards, prepare a set of co-ordination curves on KE No. 336E time current characteristic graph paper and forward eight copies to the Consultant for his approval. Make any changes as directed by the consultant at no additional charge to the Owner.
 - .2 This shall be accompanied by supporting symmetrical as well as asymmetrical fault current calculation data with tabulations to verify protection of the various elements of the system under maximum and minimum fault conditions at the various points in the system.
- .3 The time-current characteristic curves for the following shall be plotted
 - .1 The relays and fuses protecting the incoming service.
 - .2 Main and feeder protective devices at all voltage levels used in the distribution system.
 - .3 Protective devices associated with the largest motor in each MCC, the refrigeration compressor, and largest device in each distribution panel.
 - .4 Transformer damage curves and cable damage curves co-operate with and obtain from the utility and other manufacturers of equipment requiring protective devices to be used in the distribution system and prepare co-ordination curves as soon as possible. Be responsible, along with the other manufacturers of equipment connected to the distribution system, to ensure that the proper control and protective devices are selected such that they co-ordinate with all protective devices.
 - .5 Single line diagram indicating the emergency generator, emergency distribution, automatic transfer switch, breakers and fuses.
- .4 It shall be the responsibility of the switchgear manufacturer to examine the plans and specifications to ensure that all the relays and protective devices being installed in the distribution system will provide satisfactory co-ordination.
- .5 Breaker frame sizes, sensors, delay types, power fuses, and fuses shall be provided in accordance with the approved co-ordination study.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.
- .2 Ontario Electrical Safety Code, Rule 2-306.
- .3 CSA Z462 Electrical Workplace Safety.
- .4 IEEE 1584 - Guide for Performing Arc-Flash Hazard Calculations.
- .5 ANSI/NEMA Z535.4 – Product Safety Signs and Labels.

1.2 Scope

- .1 Retain the services of and independence 3rd party to provide an Arc Flash Hazard Analysis Study per the requirements set forth in the above noted standards.
- .2 The scope of the study shall include all new distribution equipment supplied for the project.

1.3 Submittals For Review/Approval

- .1 The arc flash hazard analysis study shall be submitted to the Consultant prior to receiving final approval of the distribution equipment shop drawings and/or prior to release of equipment drawings for manufacturing. If formal completion of the study may cause delay in equipment manufacturing, approval from the Consultant may be obtained for preliminary submittal of sufficient study data to ensure that the selection of device and characteristics will be satisfactory.
- .2 The results of the arc flash hazard analysis study shall be summarized in a final report.
- .3 The report shall include the following sections:
 - .1 Executive Summary.
 - .2 Descriptions, purpose, basis and scope of the study
 - .3 Details of the incident energy and flash protection boundary calculations.
 - .4 Recommendations for system improvements, where needed.
 - .5 One-line diagram.

1.4 Qualifications

- .1 The arc flash hazard analysis study shall be conducted under the supervision and approval of a Professional Electrical Engineer skilled in performing and interpreting the power system studies.
- .2 The Professional Electrical Engineer shall have a minimum of five (5) years of experience in performing power system studies.

Part 2 Products

2.1 Data Collection

- .1 The Engineer performing arc flash hazard analysis study shall furnish the Contractor with a listing of required data immediately after award of the contract. The Contractor shall expedite collection of the data to assure completion of the study as required for final approval of the distribution equipment shop drawings and/or prior to the release of the equipment for manufacturing.

2.2 Arc Flash Hazard Analysis

- .1 The arc flash hazard analysis shall be performed according to the IEEE 1584 equations.
- .2 The flash protection boundary and the incident energy shall be calculated at all significant locations in the electrical distribution system (switchboards, switchgear, motor-control centers, panelboards, busway and splitters) where work could be performed on energized parts.
- .3 The Arc-Flash Hazard Analysis shall include all significant locations in 600 volt and 208 volt systems fed from transformers equal to or greater than 125 kVA where work could be performed on energized parts.
- .4 Safe working distances shall be based upon the calculated arc flash boundary considering an incident energy of 1.2 cal/cm^2 .
- .5 When appropriate, the short circuit calculations and the clearing times of the phase overcurrent devices will be retrieved from short-circuit and coordination study model. Ground overcurrent relays should not be taken into consideration when determining the clearing time when performing incident energy calculations.
- .6 The short-circuit calculations and the corresponding incident energy calculations for multiple system scenarios must be compared and the greatest incident energy must be uniquely reported for each equipment location. Calculations must be performed to represent the maximum and minimum contributions of fault current magnitude for all normal and emergency operating conditions. The minimum calculation will assume that the utility contribution is at a minimum and will assume a minimum motor contribution (all motors off). Conversely, the maximum calculation will assume a maximum contribution from the utility and will assume the maximum amount of motors to be operating. Calculations shall take into consideration the parallel operation of synchronous generators with the electric utility, where applicable.
- .7 The incident energy calculations must consider the accumulation of energy over time when performing arc flash calculations on buses with multiple sources. Iterative calculations must take into account the changing current contributions, as the sources are interrupted or decremented with time. Fault contribution from motors and generators should be decremented as follows:
- .8 Fault contribution from induction motors should not be considered beyond 3-5 cycles.
- .9 Fault contribution from synchronous motors and generators should be decayed to match the actual decrement of each as closely as possible (e.g. contributions

from permanent magnet generators will typically decay from 10 per unit to 3 per unit after 10 cycles).

- .10 For each equipment location with a separately enclosed main device (where there is adequate separation between the line side terminals of the main protective device and the work location), calculations for incident energy and flash protection boundary shall include both the line and load side of the main breaker.
- .11 When performing incident energy calculations on the line side of a main breaker (as required per above), the line side and load side contributions must be included in the fault calculation.
- .12 Mis-coordination should be checked amongst all devices within the branch containing the immediate protective device upstream of the calculation location and the calculation should utilize the fastest device to compute the incident energy for the corresponding location.
- .13 Arc Flash calculations shall be based on actual overcurrent protective device clearing time. Maximum clearing time will be capped at 2 seconds based on IEEE 1584. Where it is not physically possible to move outside of the flash protection boundary in less than 2 seconds during an arc flash event, a maximum clearing time based on the specific location shall be utilized.

2.3 Report Sections

- .1 Submit the report incorporating the following sections:
 - .1 Arcing fault magnitude.
 - .2 Protective device clearing time.
 - .3 Duration of arc.
 - .4 Arc flash boundary.
 - .5 Working distance.
 - .6 Incident energy.
 - .7 Hazard Risk Category.
 - .8 Recommendations for arc flash energy reduction.

Part 3 Execution

3.1 Arc Flash Warning Labels

- .1 The contractor of the Arc Flash Hazard Analysis shall provide a 3.5 in. x 5 in. thermal transfer type label of high adhesion polyester for each work location analyzed.
- .2 All labels will be based on recommended overcurrent device settings and will be provided after the results of the analysis have been presented to the owner and after any system changes, upgrades or modifications have been incorporated in the system.
- .3 The label shall include the following information, at a minimum:
 - .1 Location designation
 - .2 Nominal voltage.

- .3 Flash protection boundary.
- .4 Hazard risk category.
- .5 Incident energy.
- .6 Working distance.
- .7 Engineering report number, revision number and issue date.
- .4 Labels shall be machine printed, with no field markings.
- .5 Arc flash labels shall be provided in the following manner and all labels shall be based on recommended overcurrent device settings.
 - .1 For each 600, 208 and applicable 120 volt panelboard, one arc flash label shall be provided.
 - .2 For each motor control center, one arc flash label shall be provided.
 - .3 For each low voltage switchboard, one arc flash label shall be provided.
 - .4 For each switchgear, one flash label shall be provided.
 - .5 For medium voltage switches one arc flash label shall be provided.
- .6 Labels shall be field installed by the engineering service division of the equipment manufacturer under the Startup and Acceptance Testing contract portion.

3.2 Arc Flash Training

- .1 The contractor of the Arc Flash Hazard Analysis shall train the owner's qualified electrical personnel of the potential arc flash hazards associated with working on energized equipment, minimum of 4 hours is required.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.
- .2 Comply with Section 27 05 00, Communications General Requirements and all documents referred to therein.
- .3 Comply with Section 28 05 00, Security General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Demolition and restoration of areas as identified on the contract documents.
- .2 Continuity of services and systems to entire existing facility.
- .3 Planning and phasing of construction activities that allow for the continued operation of the facility, or designated areas of the facility, during the construction period, including, but not necessarily limited to:
 - .1 Limitations on access to areas of the site,
 - .2 Limitations on use of the site,
 - .3 Coordination with site personnel,
 - .4 Maintenance of identified existing mechanical services during construction, or construction related activities, under control of the Contractor.

1.3 SUBMITTALS

- .1 Submit a Work Plan identifying how existing electrical, communications, security, and other technology systems services identified to be maintained during construction activities are intended to continue in operation unless approved as part of a pre-planned scheduled service disruption. The Work Plan will address the following:
 - .1 Services being disrupted,
 - .2 Anticipated start of disruption, length of disruption, and date when electrical services are anticipated to be re-established,
 - .3 Electrical services in the operational areas of the facility outside of the construction site that will be affected during the service disruption,
 - .4 How the electrical, communications, security, and other technology systems service, or portion of the electrical, communications, security, and other technology systems service, will be maintained during construction activities, or construction related activities, under control of the Contractor,
 - .5 The Contractor's plan for remedial work to reestablish any required electrical services to be maintained, but disrupted because of construction related activities, regardless of the effort to maintain the electrical services intended by the Work Plan.
- .2 Carefully schedule all disruption and/or shutdowns and ensure that the duration of same is kept to the absolute minimum.

- .3 The Contractor shall not execute any work on site until the Work Plan has been submitted and reviewed by the Owner.

1.4 WORK IN EXISTING FACILITY

- .1 Areas of the facility identified in the Documents, Appendix D, and Appendix E shall remain open and in operation during construction, or construction related activities under the control of the Contractor.
- .2 Where existing services such as electrical power, communications system, security system, other similar technology systems, etc., are required to be disrupted and/or shut-down, co-ordinate the shut-downs with the Owner and carry out the work at a time and in a manner acceptable to them. Carefully schedule all disruption and/or shut-downs and ensure that the duration of same is kept to the absolute minimum. Submit for approval a written, concise schedule of each disruption at least 72 hours in advance of performing work and obtain Owner's written consent prior to implementing.
- .3 Where disruption to life safety systems are required, comply with paragraph above and provide continuous monitoring during shut down period and ensure that all systems are reactivated prior to leaving site at the end of each working day.
- .4 Should any temporary connections be required to maintain services during work in the existing facility, supply and install all necessary material and equipment and provide all labour at no extra cost. Should any existing system be damaged, make full repairs without extra cost, and to the satisfaction of the Consultant.
- .5 Refer to Owner's General Requirements and Division 1 for phasing and staging of work and adhere to that program. Comply with instructions regarding working hours necessary to maintain the facility in operation.
- .6 The drawings indicating items of equipment to be deleted or relocated have been prepared as a guideline for this subcontractor, but shall not be construed as indicating every item of equipment or conduit. The Contractor shall be responsible for determining site conditions by their own examination.
- .7 Where existing services (conduits, receptacles, switches, etc.) presently mounted on and/or concealed behind existing finishes become exposed during the renovation work and where these services will not be concealed behind or mounted on new finishes, include for relocating the service so as to be concealed behind or on new or existing finishes. Co-ordinate new locations with the Consultant.

Part 2 Products

2.1 NIL

Part 3 Execution

3.1 Phasing of Works

- .1 Complete the scope of works per the proposed phasing strategy and sequencing of works identified as part of Appendix 'D'.

- .2 The proposed sequencing of works is provided for reference only. The Contractor shall propose new/revise the proposed phasing strategy to suit site conditions, the construction schedule, maintain existing facility operations, and minimize any downtime for any service interruptions.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide all wiring as specified herein for a complete installation, as required by the contract documents.

1.3 SUBMITTALS

- .1 Submit shop drawings of building wire and cables.
- .2 Submit a list of feeders used on the project, indicating cable type and size.

1.4 ACCEPTABLE MANUFACTURERS

- .1 Acceptable manufacturers are; Canada Wire and Pirelli.

Part 2 Products

2.1 BRANCH CIRCUIT CONDUCTORS

- .1 "RW90" single conductor to CSA C22.2 No. 38-95, colour coded 90°C rated, with approved manufactured connectors at joints.
- .2 "RWU90" (-40°C) single conductor to CSA C22.2 No. 38-95, colour coded, 90°C rated, with joints soldered and taped to the Consultant's approval.
- .3 Flexible armoured cable, CSA type "AC-90" to CSA C22.2 No. 51-95.
- .4 "TWH" single conductor to CSA C22.2 No. 75-M1983 (R1992), colour coded, 90°C, rated with approved manufactured connectors at joints.
- .5 Single conductor colour-coded, rubber insulated wire to CSA type "R90" 90°C rated.
- .6 Aluminum conductors where shown to be used, shall be provided with compression terminations, applied with corrosion preventing compound, and hydraulic or power activated tools shall be used for all connections.
- .7 Branch circuit conductors up to and including #12 AWG shall be solid. Branch circuit conductors in sizes larger than #12 AWG shall be stranded. All branch circuit conductors shall be constructed of 98% conductive copper, unless otherwise noted, and shall be approved for 600 volts.
- .8 Electric service, distribution and special conductors are specified in this Section and/or on the drawings.
- .9 Lubricant shall be Ideal "Yellow 77" or approved equal.

2.2 LOW VOLTAGE (24 VOLT) CONDUCTORS

- .1 Colour-coded #18 AWG TFF thermoplastic insulated wire for 600 volt service, complete with the number of copper conductors required.

2.3 MICC CABLE

- .1 Pyrotenax of Canada Ltd. two hour rated mineral insulated cables and accessories to CSA standard C22.2 No. 124.
- .2 Conductors shall be solid bare soft annealed copper.
- .3 Insulation shall be compressed powdered magnesium oxide to form compact homogeneous mass throughout the entire length of the cable.
- .4 The overall covering shall be an annealed seamless copper sheath type MI rated 600V, 250°C.
- .5 Terminations shall be factory pre-packaged kits.

Part 3 Execution

3.1 INSTALLATION OF BRANCH CIRCUIT CONDUCTORS

- .1 Provide all required branch circuit conductors.
- .2 Conductors for branch circuit work inside the building and above ground, except as noted below, shall be as specified in Article #2.01 Item .1 above.
- .3 Conductors for branch circuit work underground as specified in Article #2.01, Item .2 above.
- .4 Conductors for branch circuit lighting work (fixture tails) in accessible ceiling spaces, maximum length 1500mm, and branch circuit work in cavity wall construction from wiring devices to ceiling spaces, maximum length 6m, shall be as specified in Article #2.01, Item 3 above.
- .5 Conductors for branch circuit work to electric heating coils and/or units shall be as specified in Article #2.01, Items .4 and .5 above.
- .6 Branch circuit conductor sizes are scheduled and/or specified on the drawings. Such sizes are minimum requirements and must be increased, where required, to suit the length of run and voltage drop.
- .7 Do not use conductors smaller than #12 AWG in systems over 30 volts, unless otherwise noted.
- .8 Use lubricant when pulling wires into conduit. Ensure that wires are kept straight and are not twisted or abraded.
- .9 Neatly secure exposed wire in apparatus enclosures with approved supports or ties.
- .10 Splicing of all conductors shall be done with Ideal Wing nut #450 Series for conductors from #14 Awg to #8 Awg.
- .11 For all conductors larger than #8 AWG, splicing shall be done with Burndy Serut connectors wrapped with 3 m #33 scotch tape.
- .12 Provide a dedicated neutral for each branch circuit conductor unless noted otherwise.
- .13 Joints in all conductors shall be kept to a minimum and all conductors shall be installed in continuous unbroken runs.

3.2 INSTALLATION OF LOW VOLTAGE (24) VOLT CONDUCTORS

- .1 Install all low voltage wiring in conduit.
- .2 Refer to manufacturer's shop drawings for special requirements pertaining to low voltage wiring.
- .3 Refer to individual specification section and the drawings for additional wiring requirements.

3.3 INSTALLATION OF MICC CABLE

- .1 For feeders and branch circuit conductors which are used in connection with fire alarm systems and all life safety systems connected to a standby generator power source, and where such feeders and conductors are not embedded in concrete, or utilize Pyrotenax MICC cables as specified.
- .2 Cables shall be installed and terminations made as directed by the manufacturer.
- .3 MICC cables shall be clipped and fastened on maximum 12" centres and shall be fastened within 6" of each bend.
- .4 All MICC cables shall be meggered out using a 1000 volt megger upon completion of terminations.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide a complete system of electric service grounding as outlined herein and as specified and detailed on the drawings. Grounding shall comply with the requirements of all grounding work, which is required but not specified herein or shown on the drawings.

Part 2 Products

2.1 MATERIALS

- .1 All grounding conductors shall be stranded copper, bare or insulated as indicated on Drawings or in Specifications.
- .2 Use Cadweld or Burndy Thermoweld process for all weld connections. AMP of Canada Ltd. Wrench-Lok grounding connectors are an acceptable equivalent to welded connections.
- .3 All ground connectors to be designed and approved for grounding purposes.
- .4 Ground buses - 7 mm x 40 mm x 915 mm (1/4" x 1-1/2" x 36") solid copper.
- .5 Ground electrodes - 3050 mm x 20 mm (120" x 3/4") copper clad steel ground rods.

Part 3 Execution

3.1 INSTALLATION

- .1 Bond the electrical system ground to the main water supply pipe on the street side of the main water valve. Ground conductors shall be a minimum 3/0 copper wire connected with approved fittings.
- .2 Provide electrodes to code requirements. Ground electrode to comprise three 3050 mm x 20 mm (120" x 3/4") copper clad steel ground rods with their tops driven 300 mm (12") below grade. Space ground rods 3050 mm (120") apart. Where required provide additional ground rods.
- .3 Provide a perimeter ground bus in electrical rooms containing high voltage switchgear, power class transformers and secondary switchboards of 7 mm x 40 mm (1/4" x 1-1/2") solid copper rigidly supported on the wall. Connect all electrical systems and equipment ground wires back to ground bus in the electrical rooms. Make connections to ground bus with cable lugs, bolted through the copper with shake-proof lock washers and nuts. This ground bus to be the sole interconnection point for ground connections to:
 - .1 Main secondary switchboards.
 - .2 High voltage switchgear.

- .3 Power transformers.
- .4 All exposed metal work.
- .4 Bond all interior non-electrical metallic piping systems to the electrical system ground including, but not limited to, water supply, waste water, and gas systems.
- .5 Ground the neutral point of each secondary wye connected transformer.
- .6 Connect the ground bus inside each switchgear assembly to the grounding system.
- .7 Inside main secondary switchboards, connect the neutral bus to the ground bus with conductor rated minimum 25% main bus rating.
- .8 Final arrangement of grounding main secondary switchboards as approved by the ground fault system manufacturer.
- .9 Connect the ground bus in each 600 volt emergency distribution panel to the grounding system.
- .10 Ground all conduit, and all non-current carrying metal parts, equipment cases, frames, bases, brackets, frames of motors, duct systems, building steel, elevators, etc.
- .11 Where conduit systems are used for grounds, provide all necessary bushings, studs and jumpers as may be required to maintain effective continuity of ground. Provide separate ground conductors in all non-metallic conduits, concrete encased conduit, conduit below grade and EMT conduit. Bond the ground wire to all boxes and luminaries.
- .12 Ground each piece of fixed equipment back to the switchboard or panel feeding that equipment, by one of the following methods:
 - .1 Where equipment is fed by a steel conduit, provided sizing is adequate, utilize conduit for the ground return conductor. At switchboard provide a grounding bushing, and strap such conduits to the ground bus (size per Code).
 - .2 Where the size of the conduit is inadequate (per Code), or if the conduit is flexible, install a separate bare soft drawn copper ground inside the conduit. At the switchboard or distribution panel, provide a grounding bushing, loop the ground conductor through the bushing, and connect to the switchboard ground bus. At the fixed equipment, connect to an internal ground bus, or connect to the inside of the metal enclosure utilizing approved screws and connectors (remove all paint).
 - .3 For branch circuits, the conduits may be used for grounding, provided seamless steel fittings are used on EMT and threaded fittings are used on rigid conduit. At each receptacle connect a stranded copper ground wire from the outlet box to the grounding terminal on the receptacle. Install a separate grounding conductor in all PVC conduits.
 - .4 Where equipment is fed by a bus duct, provide a bare soft drawn copper ground bus inside the bus duct enclosure. Connect to the ground bus in the feeding switchboard, and to the equipment.
 - .5 Where equipment is fed by a multi-conductor power cable, provide a ground conductor in the cable. At the switchboard or panel, connect to the ground bus. Use a grounding connector on the cable for positive

grounding of the metallic sheath. Loop the ground wire to the grounding connector.

- .13 Where equipment is fed by single conductor flexible armoured cables, provide separate ground conductor and non-ferrous metallic plate and grounding connectors at the switchboard or panel for terminating cables. Run grounding conductor inside fixed equipment and terminate at the grounding connection. At the load end provide an insulating plate for terminating cables; the outer sheaths to be ungrounded.
- .14 Run a separate ground wire in all flexible conduits. Connect each end to ground bus or lug or connector.
- .15 Where mechanical protection is required for insulated grounding conductors install in rigid conduit. Use rigid PVC conduit in concrete or below grade slab and aluminum conduit in other locations.
- .16 Provide weld connection or wrench type grounding connectors for:
 - .1 All connections between grounding conductors.
 - .2 All connections to building steel.
 - .3 All connections between grounding conductors and cable lugs.
- .17 Arrange grounding to provide the minimum impedance paths for ground fault currents. Provide any additional grounding required for approval by the inspecting authorities.
- .18 Ground uninsulated metallic materials, which are located below surfaces heated by electric heating cable.
- .19 Where isolated grounding requirements are indicated, this shall be compromised of green insulated copper conductors sized as indicated and installed in conduit from the street side of the incoming water meter to the panelboard isolated ground bus. Maximum resistance to ground shall be 5 ohms.

3.2 TESTING

- .1 Test the resistance of the grounding system. Add additional ground wires and ground rods if required as directed by the Consultant and retest. Repeat this process until ground resistance is 2 ohms or less. Conduct all tests using Megger Null Balance or Megger Universal ground resistance test equipment.
- .2 Test all receptacles for proper connections with a neon lamp type polarity tester. Check that ground resistance is less than 0.2 ohms with an Edgecumbe Peebles Ltd., ground loop impedance tester.
- .3 Test and log all ground connections at panels, switchboards, transformers and ground buses prior to and after the computer is put into operation. Trace and isolate all equipment causing current in ground wires to exceed one ampere. Replace such equipment if furnished as part of this contract.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide all hangers and supports as required to provide a complete and operational system as required by the contract documents.

Part 2 Products

2.1 SUPPORT CHANNELS

- .1 U-shape, size 41 x 41 x 2.5mm thick, surface mounted, suspended or set in poured concrete walls and ceilings, as required for the specific application.

Part 3 Execution

3.1 INSTALLATION

- .1 Secure equipment to hollow or solid masonry, tile and plaster surfaces with nylon shields.
- .2 Secure equipment to poured concrete with expandable inserts.
- .3 Secure equipment to hollow masonry walls or suspended ceilings with toggle bolts.
- .4 Support equipment, conduit or cables using clips, spring loaded bolts, cable clamps designed as accessories to basic channel members.
- .5 Fasten exposed conduit or cables to building construction or support system using straps.
 - .1 One-hole steel straps to secure surface conduits and cables 50mm and smaller.
 - .2 Two-hole steel straps for conduits and cables larger than 50mm.
 - .3 Beam clamps to secure conduit to exposed steel work.
- .6 Suspended support systems
 - .1 Support individual cable or conduit runs with 6mm dia. threaded rods and spring clips.
 - .2 Support 2 or more cables or conduits on channels supported by 6mm dia. threaded rod hangers where direct fastening to building construction is impractical.
- .7 For surface-mounting of two or more conduits, use channels at 1.5m o.c. spacing.
- .8 Provide metal brackets, frames, hangers, clamps and related types of support structures where indicated or as required to support conduit and cable runs.

- .9 Ensure adequate support for raceways and cables dropped vertically to equipment where there is no wall support.
- .10 Do not use wire lashing or perforated strap to support or secure raceways or cables.
- .11 Do not use supports or equipment installed for other trades for conduit or cable support except with permission of other trade and approval of Consultant.
- .12 Install fastenings and supports as required for each type of equipment cables and conduits, and in accordance with manufacturer's installation recommendations.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide all splitter trough(s) for a complete installation, as required by the contract documents.

Part 2 Products

2.1 SPLITTER TROUGH

- .1 Provide CSA approved splitter boxes, each complete with a formed, primed and painted steel box with knock-outs, hinged coverplate, suitable mounting provisions, porcelain blocks complete with one (1) main conductor lug and six (6) branch conductor lugs per block, and a nameplate giving its rating.
- .2 Splitter boxes ratings shall be as specified on the drawings.
- .3 Splitter boxes mounted outside the building or exposed to weather shall be weatherproof.

Part 3 Execution

3.1 INSTALLATION OF SPLITTER TROUGH

- .1 Install splitter trough wherever shown, and/or specified on the drawings.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide all conduits, fastenings, fittings and boxes for a complete installation, as required by the contract documents.

Part 2 Products

2.1 CONDUITS

- .1 Rigid galvanized steel, CSA C22.2 No. 45, with exterior zinc and interior enamel coatings, galvanized threads where factory cut, red lead coated threads where site cut, factory made bends where site bending is not possible, factory made and threaded fittings and "tomic" joints and terminations made with rigid couplings, concrete tight where required.
- .2 EMT (Thinwall), to CSA C22.2 No. 83, complete with factory made bends where site bending is not possible and joints and terminations made with set screw type connectors, concrete tight where required, maximum allowable size shall be 50mm diameter.
- .3 Galvanized steel flexible liquid-tight metallic conduit, to CSA C22.2 No. 56, complete with proper and suitable liquid-tight flexible conduit connectors at terminations.
- .4 Galvanized steel flexible metallic conduit to CSA C22.2 No. 56, complete with suitable type connectors at terminations.
- .5 Rigid plastic (PVC) conduit to CSA C22.2 No. 211.1 complete with site made heat gun bends to 50mm diameter, factory made bends for conduit larger than 50mm, solvent weld joints with socket couplings and proper connectors and adaptors at terminations.
- .6 Electrical non-metallic tubing to CSA C22.2 No 211.0 complete with suitable type connections and couplings.
- .7 Conduit racks shall be Unistrut Ltd. Electrovert Ltd., "Cantruss", Burndy Ltd., "Flexible" or equivalent.

2.2 STANDARD OUTLET BOXES

- .1 Sheet Steel outlet boxes:
 - .1 Electro galvanized steel single and multi gang flush device boxes for flush installation.
 - .2 Electro galvanized steel utility boxes for outlets connected to surface mounted EMT conduit in interior application.
 - .3 102mm octagonal boxes for lighting fixture outlets
 - .4 102mm square outlet boxes with extension and plaster ring for flush mounting in finished plaster walls.

- .2 Masonry boxes: Electro galvanized steel masonry single and multi gang boxes for devices flush-mounted in exposed block walls.
- .3 Concrete boxes: Non-metallic concrete boxes with matching extension and plaster rings as required for flush-mounting in concrete.
- .4 Conduit boxes: Type FS and FD ferralloy boxes with factory threaded hubs and mounting feet for exterior surface wiring of switches and receptacles.
- .5 Each outlet box must be suitable in all respects for the application, and complete with securing lugs, knock-outs, and where necessary, suitable plaster rings, concrete rings, covers and any other required accessory.
- .6 Outlet boxes for special wiring devices, for special equipment and for special applications, if and where required, are specified hereinafter in this Section or on the drawings.
- .7 347 volt outlet boxes for 347 volt switching devices.
- .8 Provide blank cover plates for all boxes without wiring devices.

2.3 PULLBOXES AND JUNCTION BOXES

- .1 Pullboxes and junction boxes shall be constructed of galvanized or prime coated steel. Each shall be suitable in all respects for the applications, and complete with screw-on hinged covers as required.
- .2 The physical size of pullboxes shall be as required by the "Ontario Electrical Safety Code" to suit the number and size of conduits and conductors.

Part 3 Execution

3.1 INSTALLATION OF CONDUITS

- .1 Install conduit concealed in all finished areas, and concealed to the degree made possible by finishes in partially finished and unfinished areas. Conduit may be exposed in unfinished areas such as Electrical Rooms and Mechanical Rooms, unless otherwise noted on the drawings or specified herein. Refer to and examine the architectural drawings and on the drawings or specified herein. Refer to and examine the architectural drawings and room finish schedules to determine finished, partially finished and unfinished areas of the building.
- .2 Where conduits are exposed, arrange same to avoid interference with other work and parallel to the building lines. Where horizontal conduits are exposed, install as high as possible. Do not install conduit within 150mm of "hot" pipes or equipment unless the conduit is associated with the equipment.
- .3 Provide conduit for all electric service distribution and branch circuit conductors except armoured cable, and bus duct and except for applications where duct, cable tray and similar raceway material is provided.
- .4 Conduit for branch circuit and distribution conductors, except as noted hereinafter, shall be as specified in Article #2.01, Item .1 above.
- .5 From 1200mm above the ground floor slab.
 - .1 Conduit for branch circuit conductors concealed in masonry work in drywall, in shafts and furrings above ground and;

- .2 For branch circuit conductors exposed inside the building shall be as specified in Article #2.01 Item .2 above.
- .6 For distribution and branch circuit conductors concealed in poured concrete work above ground (not on grade); shall be as specified in Article #2.01 Item .6 above.
- .7 Conduit for short branch circuit connections to motorized equipment (minimum length 450mm; maximum length 600mm with 180 degree loop where possible) shall be as specified in Article #2.01, Item .3 above.
- .8 Conduit for short branch circuit connections to electric heating units where 90°C rated conductors are required (minimum length 450mm - maximum length 600mm with 180 degree loop where possible) and at points where distribution and/or branch circuit conductors cross building expansion joints shall be as specified in Article #2.01, Item .4 above.
- .9 Conduit for distribution and branch circuit conductors underground and for distribution and branch circuit conductors in special corrosive areas as defined herein shall be as specified in Article #2.01, Item .5 above.
- .10 Conduit for branch circuit conductors where concealed in walls or encased in concrete shall be as specified in Article #2.01 Item 6 above.
- .11 Conduits supplying equipment classified as explosion proof (i.e., fuel pumps and associated and adjacent equipment) shall be rigid galvanized steel for their entire length from their power source. Provide all required seals as specified in CEC Section 20.
- .12 Provide a separate ground conductor in all plastic and EMT conduit.
- .13 Secure conduit located in poured concrete work in place in a manner such that conduit will not float or move when concrete is poured. Protect conduit from concrete and water penetration during the concrete pour.
- .14 Support and secure surface mounted and suspended single or double runs of metal conduit at support spacing in accordance with "Canadian Electrical Code" requirements by means of galvanized pipe straps, conduit clips, ring bolt type hangers, or by other manufactured devices. Support multiple mixed size metal conduit runs with conduit racks spaced to suit spacing requirements of the smallest conduit in the group.
- .15 Install conduit parallel or perpendicular to building lines.
- .16 Generally, conduit is sized on the drawings. Conduit not sized on the drawings shall be sized in accordance with the latest edition of the Canadian Electrical Code. Note that the sizes of branch circuit conductors scheduled and/or specified on the drawings are minimum sizes and must be increased as required to suit length of run and voltage drop in accordance with the Canadian Electrical Code. Where conductor sizes are increased to suit voltage drop requirements, increase the scheduled or specified conduit size to suit.
- .17 Increase conduit sizes for heavily insulated conductors (i.e., "TWU"), a minimum of one (1) conduit size, regardless of the size indicated or required.
- .18 The maximum allowable size of conduit for installation in poured concrete work must be determined in consultation with the Consultant prior to installation. The placement of reinforcing steel in structural concrete work will take precedence

- over the placement of conduit. Multiple runs of conduit in poured concrete work must be adequately spaced as directed by the Consultant.
- .19 Do not install horizontal runs of conduit in masonry walls.
 - .20 Ensure that all conduit systems which are left empty are clean, clear, capped and properly identified. Provide suitable fish wires in all such conduit.
 - .21 Provide a minimum of two (2) 25mm diameter conduits up to and into ceiling spaces from flush mounted panelboards located below and/or near a hung ceiling.
 - .22 Support and secure surface mounted and suspended rigid PVC plastic conduit with hangers and supports as specified above for metal conduit but at support spacing in accordance with the conduit manufacturer's published recommendations.
 - .23 Support all conduit installed underground on well tamped flat bed of earth, free from rocks or protrusions of any kind.
 - .24 Conduit fittings shall be, unless otherwise noted, constructed of the same material as the conduit and suitable in all respects for the application.
 - .25 Provide proper adaptors for joining conduits of different materials.
 - .26 Ends of all site cut conduit must be square and properly reamed.
 - .27 All conduits for high voltage cable installation shall be rigid galvanized steel.
 - .28 Electrical conductors supplying all equipment connected to a source of emergency supply shall use Pyrotenax Mineral Insulated copper sheathed cables (MI).
 - .29 As an alternate to the use of MI Cables, electrical conductors supplying equipment connected to a source of emergency supply may be installed in service spaces that do not contain other combustible material or shall be protected against exposure to fire as allowed by the Building Code. Provide fire rated enclosures or provide concrete enclosure as required to ensure continued operation for a minimum period of 2 hours from the source of power supply to the branch circuit supplying the equipment.

3.2 INSTALLATION OF OUTLET BOXES

- .1 Provide an outlet box for each lighting fixture, wiring device, telephone outlet and any other outlet specified herein or shown or specified on the drawings, unless otherwise noted.
- .2 Generally, mounting heights and locations for outlets are shown on the drawings and/or specified herein, however, confirm the exact location and arrangement of all outlets with the Consultant prior to roughing-in. Architectural drawings and the Consultant's instructions have precedence over electrical drawing diagrammatic layouts and specified mounting heights and locations.
- .3 Do not install outlet boxes "back-to-back" in walls and partitions. Such outlets must be staggered and sealed against noise transmission. "Thru-Wall" type outlet boxes will not be permitted for any application.
- .4 Support and secure boxes independent of the conduit or cable connected thereto.

- .5 All recessed outlet boxes for surface mounted devices or lighting fixtures must be totally concealed by the device or fixture.

3.3 INSTALLATION OF PULLBOXES AND JUNCTION BOXES

- .1 Provide pullboxes in conduit systems wherever necessary to facilitate conductor installations. Generally, conduit runs exceeding 30m in length, or with more than two (2) 90 degree bends shall be equipped with a pullbox installed at a convenient and suitable intermediate location.
- .2 Provide a junction box wherever required and where shown and/or specified on the drawings.
- .3 All pullboxes and junction boxes must be accessible after the building is completed.
- .4 Accurately locate and identify all concealed pullboxes and junction boxes on "as-built" record drawings.
- .5 Support and secure all boxes independent of the conduit or cable connected thereto.
- .6 Install identification labels indicating system name on all pullboxes and junction boxes.

END OF SECTION

Part 1 GENERAL

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.
- .2 Provide Digital Metering System (DMS) per Owner's Standards. Refer to Specification Appendix for details.

1.2 WORK INCLUDED

- .1 Provide a system of conduits, backboxes, power outlets, etc. to allow the installation of a digital metering system as specified herein.

1.3 DIGITAL METERING SYSTEM

- .1 A Digital Metering System shall be provided per the drawings to meter energy consumption for the Facility electrical distribution system.
- .2 Scope of work responsibility shall be as described herein:

ELECTRICAL METERING			
EQUIPMENT	SUPPLIED BY	INSTALLED BY	ON SITE REQUIREMENTS
METER BACK BOXES, HARNESSSES AND CURRENT TRANSFORMERS (CTS)	CONTRACTOR	CONTRACTOR	SUITE DISTRIBUTION PANELS INSTALLED
METER HEADS	CONTRACTOR	CONTRACTOR	ELECTRICAL CLOSET DOOR AND LOCKS

Note: Division 26 to provide power for all mechanical data gathering panels required.
Co-ordinate all service with system supplier.

Part 2 PRODUCTS

2.1 CONDUITS AND DEVICES

- .1 Triaca 6000 series – powerhawk smart meters or approved equal.

Part 3 EXECUTION

3.1 INSTALLATION OF CONDUIT SYSTEM

- .1 Install conduit and power devices as required.
- .2 The metering system will be supplied and installed under direct contract with the client.
- .3 Conduits shall be minimum 20mm complete with pull strings. There shall not be more than two (2) 90° bends in any run of conduit and pullboxes shall be provided in runs in excess of 100' or where more than two (2) 90° bends are required.
- .4 Conduit shall be left clear and free of all obstructions and shall be terminated as shown. Equip terminations with bushings and clearly identify each run.
- .5 Co-ordinate the work with the Metering Supplier and obtain the exact location of equipment, conduit sizes, outlet box requirements prior to roughing-in.

- .6 Provide power outlets as required.
- .7 Where security equipment requires special back-boxes to be mounted, they will be provided by the Metering Contractor for installation by this Contractor.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 The main electric service will be supplied for this project underground by the Local Utility Company (LUC).
- .2 Supply all labour, tools, services and equipment and provide all the materials as required by the contract documents, per the LUC's standards, and Offer to Connect requirements.

1.3 SUBMITTALS

- .1 Submit shop drawings and installation details, to the consultant, and supply utility for review.

Part 2 Products

2.1 MATERIALS

- .1 Duct bank shall be as shown on the plans and provided per the LUC's standards and Offer to Connect requirements.
- .2 Ducts to be Scepter Super Duct enclosed in a reinforced concrete envelope.
- .3 Duct spacers to be cast concrete or fibre, installed at maximum 1200 mm ('x 4'-0") centres to maintain a clear space of 51mm (2") between ducts/
- .4 Plastic duct spacers will not be acceptable.

2.2 DUCT SEALANT

- .1 At all duct joints provide a duct sealant compound to ensure water tightness of the duct.
- .2 Sealant shall be Q-tel-2027, as manufactured by CHEMQUE
- .3 Sealant is a two-component polyurethane paste-like compound that provides gas tight seals.

Part 3 Execution

3.1 INSTALLATION

- .1 Size and brace all primary cables and equipment to withstand the forces of the available fault current of 500 MVA.
- .2 Provide suitable lugs and stress cones for the termination of the incoming cables.
- .3 Provide suitable method of support in main electrical room for incoming cables.
- .4 Obtain approval from Local Utility Company inspection prior to proceeding with the work.

- .5 On completion of installation, all ducts to be cleaned and all blocks cleared, to the approval of applicable authority.

3.2 INSTALLATION OF DUCT SEALANT

- .1 Provide duct sealant at all duct joints and at all sleeve points in the duct run.
- .2 Create a dam at the duct openings using rags or paper and dispense the compound into the duct opening.
- .3 Use a wooden stick to spread the compound around the cables and the edges of the duct, to create an airtight seal.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 PRODUCT DATA

- .1 Submit product data in accordance with Section 26 05 01 – Shop Drawings, Product Data and Samples.

1.3 REFERENCE STANDARDS

- .1 Design, manufacture and test the dry type transformers in accordance with good industry practices and in accordance with the latest versions of the following Standards.
 - .1 CSA Std C22.2 No 0.12-M1985 Equipment Rated 750V or Less.
 - .2 CAN/CSA-C22.2 No 47-M90.
 - .3 UL 1561- 4 Ed.
 - .4 CSA C802.2-06 Minimum Efficiency Values for Dry-Type Transformers.
 - .5 NEMA ST-20 for sound level

1.4 STORAGE

- .1 Store and handle in strict compliance with manufacturer's instructions and recommendations. Protect from potential damage from weather and construction operations.
- .2 Store so condensation will not form on or in the transformer housing and if necessary, apply temporary heat where required to obtain suitable service conditions. Handle transformer using proper equipment for lifting and handling; use when necessary lifting eye and/or brackets provided for that purpose.

1.5 ACCEPTABLE MANUFACTURERS

- .1 All transformers shall be of one manufacturer. Acceptable manufacturers are: STI, Hammond, Rex Transformers, Cutler Hammer, Square D and Siemens.

Part 2 Products

2.1 TRANSFORMER TYPE

- .1 Transformer shall be standard general purpose dry type unless otherwise indicated on drawings as K-Rated or Harmonic Mitigation type.

2.2 GENERAL PURPOSE TRANSFORMERS

- .1 Transformers shall have the following characteristics:
 - .1 Type: AN/AA Ventilated self-cooled.
 - .2 KVA, primary voltage and secondary voltage and as indicated.
 - .3 Single or three phase as indicated.

- .4 Delta connected primary for three phase transformers.
- .5 Secondary winding shall be wye connected for three phase transformers unless Harmonic Mitigation type, or unless otherwise noted.
- .6 Four full capacity 5% adjustment taps, 2 at 2.5% FCBN and 2 at 2.5% FCAN.
- .7 Copper Windings.
- .8 220°C Insulation Class.
- .9 150°C Temperature rise.
- .10 Standard Impedance.
- .11 10kV BIL.
- .12 Sound level per NEMA ST-20.
 - .1 Ventilated Type 1 enclosure with Grey finish (Options Type 2 (drip-proof), Type 3R (weatherproof), Type 4 (totally enclosed), Sprinkler-proof]
- .13 Anti-vibration pads shall be used between the core and the enclosure.
- .14 The impregnation process for the core-and-coil assembly shall include a period under vacuum, followed by pressure impregnation (VPI).
- .15 Transformer shall have embossed aluminum or stainless steel nameplate indicating, but not restricted to the following.
 - .1 KVA rating
 - .2 Voltage rating
 - .3 Impedance
 - .4 Type
 - .5 Insulation class
 - .6 Temperature rise
 - .7 Connection diagram

2.3 K-RATED TRANSFORMERS

- .1 In addition to all general purpose transformer characteristics in section 2.2, K-Rated transformers shall have the following features.
 - .1 Transformers shall be K-13 rated for non-linear loads.
 - .2 Transformers shall have 200% Rated Neutral.
 - .3 Transformers shall have an electrostatic shield between primary and secondary windings.

2.4 HARMONIC MITIGATION TRANSFORMERS

- .1 In addition to all general purpose transformer characteristics in section 2.2, Harmonic Mitigation transformers shall have the following features.
 - .1 Transformers shall be compatible with load profile up to K20.
 - .2 Transformers shall have 200% Rated Neutral.
 - .3 Transformers shall have an electrostatic shield between primary and secondary windings.

- .4 3rd, 9th & 15th harmonics and other zero sequence currents shall be treated within the secondary windings through cancellation of the zero sequence fluxes. Simply trapping these currents in the delta primary winding is NOT acceptable.
- .5 For 5th, 7th, 17th & 19th harmonics provide the appropriate primary-secondary phase shift at 60 Hz as shown on drawings, in order to cancel these harmonic currents with those of other loads fed from the same primary supply.
- .6 Harmonic mitigation shall be by electromagnetic means only. No capacitors or electronics shall be used.
- .7 Positive & negative sequence impedance at 60Hz: 2.5% to 3.8% (up to 75 kVA), 3.0% to 4.8% (112.5 to 300 kVA)
- .8 Zero sequence impedance/reactance at 60Hz: Less than 0.95% and 0.3% respectively for sizes up to 300 Kva.

Part 3 Execution

3.1 MOUNTING

- .1 Floor or wall-mount the dry type transformers up to 75 kVA as indicated.
- .2 Mount transformers 75 kVA and above, on floor. Floor mounted transformer shall be installed on an isolated housekeeping concrete pad (100mm) poured on 3 layers of "Duracoustic" continuous cushion material as detailed on the drawings..
- .3 Ensure adequate clearance around transformer for ventilation.
- .4 Install transformers in level upright position.
- .5 Remove shipping supports is any only after transformer is installed and just before putting into service.
- .6 Loosen isolation pad bolts until no compression is visible.
- .7 Supply and install anti-vibration dampers for wall or ceiling mounted transformers.
- .8 Make primary and secondary connections with flexible conduit and in accordance with wiring diagram.
- .9 Energize transformers as soon as possible after installation is completed.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide service entrance switchboards and all necessary equipment.

1.3 SUBMITTALS

- .1 Submit Shop drawings of the entire assembly and all components.
- .2 Provide to the Owner a framed single line as-built diagram of the electrical distribution system and install in each electrical room.

1.4 ACCEPTANCE MANUFACTURERS

- .1 Schneider Canada, Cutler Hammer and Siemens.

Part 2 Products

2.1 LOW VOLTAGE SWITCHBOARDS

- .1 General:
 - .1 Service entrance switchboard(s) shall be provided and installed as shown on the plans.
 - .2 The switchboard(s) shall consist of a main incoming section and one or more distribution sections as required for the feeder circuits, and shall be suitable for use on a 347/600V, 3-phase, 4-wire and solidly grounded system.
- .2 Construction:
 - .1 The vertical sections shall be of bolted steel channel frame with removable side and rear panels of code gauge steel. Provision for padlocking shall be provided for the main switch and the utility metering compartments. Provision for sealing shall be made on all panels covering unmetered bus. Full barriers shall be provided between the main section and the adjacent distribution sections.
 - .2 The distribution section shall be constructed so that operating handles of feeder devices are recessed from the face of the switchboard. The trim shall be split for ease of installation and safety.
 - .3 The switchboard shall be designed to be installed with the rear panels against a wall, so that ventilation and connection of all cables will be from the front.
- .3 Enclosure:
 - .1 The enclosure shall be sprinklered-proof with an extended top cover located on the front of the unit.

- .2 The switchboard frame and panels shall be thoroughly de-greased and painted with light grey ASA 61 enamel (other colours may be substituted as an option).
- .3 Engraved lamaroid nameplates, fastened with screws, shall identify main and distribution breakers and fusible switches as shown on the drawings.
- .4 Main Bus:
 - .1 The main bus shall be electrolytically tin-plated copper rated as shown on plans.
 - .2 Supported on a 2 inch stand-off insulator and braced to withstand stresses imposed by a short circuit of 50,000A RMS symmetrical, unless noted otherwise on the plans.
 - .3 Single bolt joints utilizing high strength steel bolts, large Belleville washers and locking strap shall be provided for ease of installation.
 - .4 Provision shall be made for future extension.
 - .5 A ground bus, bonded to each steel frame, shall be provided with a lug at each end suitable for 4/0 copper grounding cable.
- .5 Entry Options: Top entry and exit.
- .6 Main Device - Breaker:
 - .1 Electronic trip moulded case full function 100% rated circuit breaker, size as shown on plans and rated at 50 kA symmetrical, unless noted otherwise on the plans.
 - .2 The entire trip system shall be a microprocessor-based, true RMS sensing design.
 - .3 Provide the following time/current curve shaping adjustments to maximize system selective co-ordination. Each adjustment shall have discrete settings and each function is independent from all other adjustments:
 - .1 Adjustable Long Time Ampere Rating and Delay
 - .2 Adjustable Short Time Pick-up and Delay (delay includes 1st in and 1st OUT)
 - .3 Adjustable Instantaneous Pick-up
 - .4 Adjustable Ground Fault Pick-up and Delay (delay includes 1st in and 1st out)
 - .5 High Level Selective Override
 - .4 Circuit breakers(s) shall be provided with integral equipment protection for grounded systems.
 - .5 All lugs shall be UL Listed to accept solid and/or stranded copper conductors. Lugs shall be suitable for 90°C rated wire, sized according to the 75°C temperature rating.
- .7 Utility Metering: Space and provision shall be made under the main switches to mount utility current and potential transformers in accordance with the local utility requirements. The contractor shall obtain the transformers and mount them in the switchboard. Secondary wiring shall be done by utility personnel.
- .8 Distribution Devices

- .1 Circuit breakers 225 ampere frame and below shall be Square D with thermal-magnetic trip units and inverse time-current characteristics.
- .2 Circuit breakers 400 ampere through 1200 ampere frame shall be Square D with microprocessor-based RMS sensing electronic trip units and the following features:
 - .1 Each moulded case circuit breaker microprocessor-based tripping system shall consist of three current sensors, a trip unit, and a flux-transfer shunt trip. The trip unit shall use microprocessor-based technology to provide the adjustable time-current protection functions. True RMS sensing circuit protection shall be achieved by analyzing the secondary current signals received from the circuit breaker current sensors and initiating trip signals to the circuit breaker trip actuators when pre-determined trip levels and time delay settings are reached.
 - .2 Interchangeable rating plugs shall establish the continuous trip ratings of each circuit breaker. Rating plugs shall be fixed or adjustable as indicated. Rating plugs shall be interlocked so they are not interchangeable between frames, and interlocked such that a breaker cannot be closed and latched with the rating plug removed.
 - .3 The microprocessor-based trip unit shall have thermal memory capabilities to prevent the breaker from being reset following an overload condition until after a preset time delay.
 - .4 When the adjustable instantaneous setting is omitted, the trip unit shall be provided with an instantaneous override. Internal ground fault protection adjustable pick-up ratings shall not exceed 1200 amperes. Provide neutral ground fault current sensor for four wire loads.
 - .5 System co-ordination shall be provided by the following microprocessor-based time-current curve shaping adjustments:
 - .1 Adjustable long time pick-up and delay
 - .2 Adjustable short time pick-up and delay with selective curve shaping
 - .3 Adjustable instantaneous pick-up
 - .4 Adjustable ground fault pick-up and delay with selective curve shaping
- .9 Owner's Instrumentation:
 - .1 Digital Meter Panel (type PM850): A digital meter panel for customers use shall be installed and factory wired in the first distribution section of the switchboard. The system shall be microprocessor based, displaying volts and current for each phase as well as power factor, frequency, THD voltage, THD current, K factor, KVA, KVAR, KW, and the accumulated MWH. The meter shall monitor and store the minimum values of volts and power factor and the maximum values of amperes, KW, KVA, KVAR, and KWD.
 - .2 The meter shall be designed to operate on systems to 600V without the need for control or metering transformers.

- .3 All programmable parameters and accumulated values shall be stored in a non volatile memory in the event of a power failure.
- .4 The power meter shall have a KYZ / KY pulse output.
- .5 The power meter shall have a MODBUS RS 485 communications port

2.2 METERING CABINET

- .1 Provide metering equipment for the incoming electric services as shown.
- .2 Provide empty conduit between the incoming switchboard to the metering cabinet as shown.
- .3 Provide a 1/2" empty conduit complete with bushings at both ends between the revenue metering cabinet and the incoming telephone room for telephone service access.

Part 3 Execution

3.1 INSTALLATION A LOW VOLTAGE SWITCHBOARD

- .1 Install secondary switchboard as noted on the drawings and secure to a concrete housekeeping pad.

3.2 INSTALLATION OF METERING CABINET

- .1 Install metering equipment as shown.
- .2 Connect the equipment with conduit and provide fish wire for use by Toronto Hydro.
- .3 The conduit for telephone services shall be terminated at the top right hand corner of the cabinet.
- .4 Provide a 120 volt duplex receptacle in the bottom right hand corner of the cabinet and connect to emergency circuit.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.
- .2 The panelboards and all components shall be designed, manufactured and tested in accordance with the latest applicable standards of EEMAC and CSA.

1.2 WORK INCLUDED

- .1 Provide all panelboards as specified and shown for a complete installation, as required by the contract documents.

1.3 SUBMITTALS

- .1 Submit shop drawings showing the following information:
 - .1 Breaker layout drawing with dimensions indicated and nameplate designation.
 - .2 Component list.
 - .3 Conduit entry/exit locations.
 - .4 Assembly ratings including:
 - .1 Short circuit rating.
 - .2 Voltage
 - .3 Continuous current
 - .5 Cable terminal sizes.
- .2 Where applicable, the following additional information shall be submitted:
 - .1 Key interlock scheme drawing and sequence of operations.

1.4 QUALIFICATIONS

- .1 The manufacturer of the panelboard shall be the manufacturer of the major components within the assembly, including circuit breakers and fusible switches.
- .2 The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five (5) years. When requested by the Consultant, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

1.5 ACCEPTABLE MANUFACTURERS

- .1 Acceptable manufacturers are: Schneider Canada, Eaton (Cutler Hammer) and Siemens.

Part 2 Products

2.1 RATINGS

- .1 Panelboards shall have short circuit ratings as shown on the drawings or as herein scheduled, but not less than 10,000 amperes RMS symmetrical.

- .2 Panelboards shall be labelled with a CSA short circuit rating. When series ratings are applied with integral or remote upstream devices, a label shall be provided. Series ratings shall cover all trip ratings of installed frames. It shall state the conditions of the CSA series ratings including:

- .1 Size and type of upstream device.
- .2 Branch devices that can be used.
- .3 CSA series short circuit rating.

2.2 CONSTRUCTION

- .1 Interiors shall be completely factory assembled with bolt-on devices. They shall be designed such that switching and protective devices can be replaced without disturbing adjacent units and without removing the main bus connectors.
- .2 Trims for lighting and appliance panelboards shall have doors with concealed hinges over all circuit breaker handles. Doors in panelboard trims shall not uncover any live parts. Doors shall have a semi-flush cylinder lock and catch assembly. Trim fastening screws shall not be visible.
- .3 Distribution panelboard trims shall cover all live parts. Switching device handles shall be accessible.
- .4 Surface trims shall be same height and width as box. Flush trims shall overlap the box by one (1) inch on all sides.
- .5 A directory card with a clear plastic cover shall be supplied and mounted on the inside of each door.
- .6 All locks shall be keyed alike.

2.3 BUS

- .1 Main bus bars shall be plated aluminum sized in accordance with CSA standards to limit temperature rise on any current carrying part to a maximum of 65 degrees C above an ambient of 40 degrees C maximum.
- .2 Full-size insulated neutral bars shall be included for panelboards shown with neutral. Bus bar taps for panels with single-pole branches shall be arranged for sequence phasing of the branch circuit devices. Neutral bussing shall have a suitable lug for each outgoing feeder requiring a neutral connection.

2.4 POWER DISTRIBUTION PANELBOARDS – CIRCUIT BREAKER TYPE

- .1 Power distribution panelboards and the devices contained therein shall have series interrupting ratings as indicated on the drawings. Panelboards shall be Square D Type I-line. Panelboards shall have molded case circuit breakers as indicated below.
- .2 Molded case circuit breakers shall provide circuit overcurrent protection with inverse time and instantaneous tripping characteristics and shall be Square or approved equal. Ground fault protection shall be provided where indicated.
- .3 Circuit breakers shall be operated by a toggle-type handle and shall have a quick-make, quick-break over-centre switching mechanism that is mechanically trip-free. Automatic tripping of the breaker shall be clearly indicated by the

handle position. A push-to-trip button on the front of the circuit breaker shall provide a local manual means to exercise the trip mechanism.

- .4 Circuit breakers shall have a minimum symmetrical interrupting capacity as indicated on the drawings.
- .5 Where indicated, circuit breakers shall be CSA listed for series rating.
- .6 Where indicated, circuit breakers shall be current limiting.
- .7 Circuit breakers 400 ampere frame and below shall be Square D with thermal-magnetic trip units and inverse time-current characteristics.
- .8 Circuit breakers 600 ampere through 1200 ampere frame shall be Square D with microprocessor-based RMS sensing electronic trip units and the following features:
 - .1 Each molded case circuit breaker microprocessor-based tripping system shall consist of three current sensors, a trip unit, and a flux-transfer shunt trip. The trip unit shall use microprocessor-based technology to provide the adjustable time-current protection functions. True RMS sensing circuit protection shall be achieved by analyzing the secondary current signals received from the circuit breaker current sensors and initiating trip signals to the circuit breaker trip actuators when pre-determined trip levels and time delay settings are reached.
 - .2 Interchangeable rating plugs shall establish the continuous trip ratings of each circuit breaker. Rating plugs shall be fixed or adjustable as indicated. Rating plugs shall be interlocked so they are not interchangeable between frames, and interlocked such that a breaker cannot be closed and latched with the rating plug removed.
 - .3 The microprocessor-based trip unit shall have thermal memory capabilities to prevent the breaker from being reset following an overload condition until after a preset time delay.
 - .4 When the adjustable instantaneous setting is omitted, the trip unit shall be provided with an instantaneous override. Internal ground fault protection adjustable pick-up ratings shall not exceed 1200 amperes. Provide neutral ground fault current sensor for four wire loads.
 - .5 System coordination shall be provided by the following microprocessor-based time-current curve shaping adjustments:
 - .1 Adjustable long time pick-up and delay
 - .2 Adjustable short time pick-up and delay, with selective curve shaping
 - .3 Adjustable instantaneous pick-up
 - .4 Adjustable ground fault pick-up and delay, with selective curve shaping.
 - .6 Where indicated, provide circuit breakers CSA listed for application at 100% of their continuous ampere rating in their intended enclosure.
 - .7 Provide shunt trips, bell alarms, and auxiliary switches as shown on the contract drawings.

2.5 POWER DISTRIBUTION PANELBOARDS – FUSIBLE SWITCH TYPE

- .1 Power distribution panelboards shall have fusible switches as specified below and include fuses with ratings indicated on the drawings. Panelboard shall be Square D type QMQB or QMB.
- .2 Fusible switch units shall be quick-make, quick-break design. Units 30 through 600A shall be rated not less than 200 kAIC with rejection-type clips for Class J type fuses. Units 800A and 1200A shall be rated for 200 kAIC with Class L fuse provisions. Fuses for these switches shall be supplied and field installed by the electrical contractor.

2.6 BRANCH CIRCUIT PANELBOARDS

- .1 The Minimum Integrated Short Circuit Rating for branch circuit panelboards shall be indicated on the drawings. Panelboards shall be Square D type NF or NQOD. Panelboards shall have circuit breakers as indicated below.
- .2 Bolt-in type, heavy-duty, quick-make, quick-break, single- and multi-pole circuit breakers of the types specified herein, shall be provided for each circuit with toggle handles that indicate when unit has tripped.
- .3 Circuit breakers shall be thermal magnetic type with common type handle for all multiple pole circuit breakers. Circuit breakers shall be minimum 100 ampere frame and through 100 ampere trip sizes shall take up the same pole spacing. Circuit breakers shall be CSA listed as type SWD for lighting circuits.
 - .1 Circuit breaker handle locks shall be provided for all circuits that supply exit signs, emergency lights, energy management and control system (EMCS) panels and fire alarm panels.
- .4 Circuit breakers shall have a minimum interrupting rating of 10,000 amperes symmetrical at 240 volts and 14,000 amperes symmetrical at 600 volts.

2.7 ENCLOSURE

- .1 Enclosures shall be at least 20 inches wide made from galvanized steel. Provide minimum gutter space in accordance with the Canadian Electric Code. Where feeder cables supplying the mains of a panel are carried through its box to supply other electrical equipment, the box shall be sized to include the additional required wiring space. At least four interior mounting studs with adjustable nuts shall be provided.
- .2 Enclosures shall be provided with one (1) blank end and one end with knock-outs.
- .3 All enclosures shall be EEMAC 1 c/w drip shield for surface-mounted enclosure unless otherwise noted.

2.8 NAMEPLATES

- .1 Provide an engraved nameplate for each panel section.

2.9 FINISH

- .1 Surfaces of the trim assembly shall be properly cleaned, primed, and a finish coat of grey ANSI 49 paint applied.
- .2 Suite panel shall have WHITE finish.

Part 3 Execution

3.1 FACTORY TESTING

- .1 The following standard factory tests shall be performed on the equipment provided under this section. All tests shall be in accordance with the latest version of EEMAC and CSA standards.

3.2 INSTALLATION

- .1 The Contractors shall install all equipment per the manufacturer's recommendations and the contract drawings.

3.3 FIELD SETTINGS

- .1 The Contractor shall perform field adjustments of the circuit breakers as required to place the equipment in final operation condition. The settings shall be in accordance with the approved protective device co-ordination study or as directed by the Consultant.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide all wiring devices and cover plates for a complete installation as required by the contract requirements.

1.3 SUBMITTALS

- .1 Submit shop drawings of all wiring devices.
- .2 Submit samples of receptacles, switches, dimmers and plates.

1.4 ACCEPTABLE MANUFACTURERS

- .1 The specifications are based on Hubbell wiring devices, unless noted otherwise. Acceptable alternates are Pass and Seymour, Leviton, Arrow Hart and Bryant.
- .2 Dimmer specifications are based on Lutron.

Part 2 Products

2.1 STANDARD LINE VOLTAGE SWITCHES, RECEPTACLES AND PLATES

- .1 Provide specification grade switches and receptacles as specified below:
 - .1 Provide CSA approved, commercial specification grade switches and receptacles in all areas to suit the intended function – type and ratings to suit the drawings. Provide Hubbell or approved equal devices with white finish.
- .2 Generally, faceplates for flush-mounted toggle switches and receptacles shall be 0.04 inch thick type 302/304 non-magnetic stainless steel, smooth satin finish each supplied individually wrapped in a sealed protective envelope.
- .3 Unfinished areas - 0.06 inch thick impact resistant type 302/304 non-magnetic stainless steel, smooth satin finish each supplied individually wrapped in a sealed protective envelope.
- .4 Faceplates for surface-mounted switches and receptacles unless otherwise noted, shall be galvanised steel.
- .5 The colour of all devices must be approved by and confirmed with the Consultant prior to installation.
- .6 Receptacles located in all rooms, containing personal washing facilities such as washbasins bath tubs, showers, or similar devices and located within 3 metres of such devices shall provide GFCI protection (Hubbell Cat. No. GF5252IA).

- .7 All receptacles designated 'WP' (weatherproof) on the drawings shall be Hubbell GF5252IA receptacles with Hubbell non-metallic in use covers (MM or ML series – to be confirmed prior to order).
- .8 Special switches and/or receptacles are specified on the drawings and shall be complete with proper faceplates conforming to requirements specified herein before.

2.2 DIMMER SWITCHES

- .1 Dimmers shall be UL listed for a broad range of dimmable CFL's, LED, halogen and incandescent sources.
- .2 The dimmers shall have adjustable low end trim to suit various dimmable sources.
- .3 Dimmers shall be provided with built in switch to turn off positively as dimmer is set to zero.
- .4 Dimmers shall be Lutron Maestro C L Series, rated for load and source based on proposed LED sources.

Part 3 Execution

3.1 INSTALLATION OF STANDARD LINE VOLTAGE SWITCHES, RECEPTACLES AND PLATES

- .1 Provide standard switches and receptacles in locations shown and/or specified on the drawings.
- .2 Equip each switch and receptacle with a faceplate with an opening or openings suitable for the device it conceals. Secure faceplates to the device frames with metal screws finished to match the faceplate.
- .3 The exact colour of switches and receptacles, and associated faceplates in any area must be approved by and confirmed by the Consultant prior to installation.
- .4 Furnish and turn over to the Owner, a sufficient quantity of keys for key lock switches.
- .5 Change location of outlets at no extra cost or credit providing distance does not exceed 3 m and information is given before installation.

3.2 INSTALLATION OF DIMMER SWITCHES

- .1 Provide dimmer switches in single and multiple ganged 3" deep outlet boxes as required for the application, shown on the drawings.
- .2 When grouping dimmers, refer to manufacturer's requirements regarding derating of dimming switches.
- .3 Provide matching line voltage switches, as specified, in rooms where dimmers and line voltage switches are shown.
- .4 Provide multi-gang coverplates where multiple dimmers/switches are used within the same area. Provide coverplates to suit dimmer line-up requirements.
- .5 Provide engraved identification for all slide controls. Exact description of zone designations to Consultant's approval.

- .6 The exact colour of dimmers and associated face plates shall be approved by and confirmed by the Consultant and Interior Designer prior to installation.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide all fuses for a complete installation, as required by the contract documents.

1.3 SUBMITTALS

- .1 Submit shop drawings of all fuses required.

1.4 ACCEPTABLE MANUFACTURERS

- .1 Little Fuse, Mersen and Bussman (Eaton).

Part 2 Products

2.1 FUSES

- .1 For services up to 600 volts and up to and including 600 amps, provide HRCI-J (AJT) time delay fuses for motor and transformer circuits.
- .2 All remaining fuses up to 600 volts and up to and including 600 amps, shall be HRCI-J (CJ) fast acting fuses.
- .3 For services up to 600 volts and over 600 amps, provide class L-HRC (CL) fuses.

Part 3 Execution

3.1 INSTALLATION OF FUSES

- .1 Install fuses in all fuse holders to suit design requirements.
- .2 Provide three (3) spare fuses of each type and size used above 600 amp and six (6) spare fuses for each type and size up to and including 600 amps. Mount the spare fuses in clips neatly arranged and labelled in a suitably sized type "D" cabinet in the main electrical room.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide enclosed switches, fused and/or unfused, for a complete installation, as required by the contract documents.

1.3 SUBMITTALS

- .1 Submit shop drawings of enclosed switches.

1.4 ACCEPTABLE MANUFACTURERS

- .1 Acceptable manufacturers are: Schneider Canada, Eaton (Cutler Hammer) and Siemens.

Part 2 Products

2.1 ENCLOSED SWITCHES (DISCONNECTS)

- .1 Provide heavy duty, CSA approved enclosed switches.
- .2 Each enclosed switch shall be front operated with a handle suitable for padlocking in the "OFF" position and arranged so that the enclosure cover cannot be opened while the handle is in the "ON" position. Operating mechanisms shall be quick-make, quick-break, positive acting with visible blades and a line terminal shield.
- .3 Fusible units shall be complete with fuse clips suitable for HRC, Class "J" fuses unless otherwise noted. Each unit shall also be equipped with solderless lugs and a front cover nameplate identifying the catalogue number and electrical characteristics.
- .4 Enclosures shall be, unless otherwise noted, NEMA 1 general purpose enclosures and NEMA 3 weatherproof enclosures.
- .5 The ampere rating, number of poles and fuse requirements for enclosed switches shall be as specified on the documents.
- .6 Where the enclosed switch is for use on a hydraulic elevator application, such switches shall be provided with auxiliary contacts. These contacts shall be Commander positive action switches or equivalent.
- .7 Where the enclosed switch is for use on a variable frequency drive application, such switches shall be heavy duty type complete with auxiliary contacts, to wire remote stop to variable frequency drive.

Part 3 Execution

3.1 INSTALLATION OF ENCLOSED SWITCHES (DISCONNECTS)

- .1 Provide disconnects:
 - .1 Wherever shown on the drawings and/or specified herein.
 - .2 Wherever required by starter schedule drawings:
 - .3 For motorized equipment which cannot be seen from the motor starter location or is more than 10m away from the starter location.
 - .4 For all "packaged" equipment supplied by other Divisions and fed from a motor starter panel.
- .2 Enclosures mounted indoors and not exposed to the weather shall be NEMA 1 type.
- .3 Enclosures mounted outdoors or in locations exposed to the weather shall be NEMA 3 type.
- .4 Where the enclosed switch is for use on a variable frequency drive application, wire the normally closed contact on the switch to the stop circuit on the variable frequency drive.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide enclosed switches, fused and/or unfused, for a complete installation, as required by the contract documents.

1.3 SUBMITTALS

- .1 Submit shop drawings of enclosed switches.

1.4 ACCEPTABLE MANUFACTURERS

- .1 Acceptable manufacturers are: Schneider Canada, Eaton (Cutler Hammer) and Siemens.

Part 2 Products

2.1 MECHANICAL

- .1 All quick connect power panels shall be Type 3R compliant and constructed of aluminum, mild steel or Stainless Steel. The Type 3R rating shall be maintained with the temporary cables installed.
- .2 Cables shall enter and exit the wiring chamber via access holes specifically designed for conductors and shall be provided with a bushing or shall be formed so that there are no sharp edges with which conductor insulation may come in contact.
- .3 Connections shall be arranged so that cables drape downward when connected.

.4 Up to 800 Amp Models

- .1 The quick connect panel shall have an enclosure manufactured of aluminum and painted ANSI 61 gray or Grade 316 stainless steel.
- .2 The quick connect panel enclosure dimensions shall be 24" wide x 32" high x 11" deep.
- .3 The quick connect panel shall include four (4) integral mounting tabs for wall mounting.
- .4 The quick connect panel shall be divided into an upper termination chamber and a lower wiring chamber.
- .5 The upper termination chamber shall have a dead front panel covering all exposed electrical parts.
- .6 The lower chamber shall have individual cable holes to restrict access and reducing the possibility of theft.
- .7 The cable access holes shall have a hinged cover held closed by springs inherently resistant to corrosion in order to securely cover the cable access holes when the temporary cables are not installed.

- .5 The quick connect panel shall have an additional cable lock plate to reduce risk of cable theft. This lock plate will also serve to lock the hinged cable access door(s) when the temporary power cables are not installed.
- .6 The quick connect panel shall have an outer single hinged access door restricting access to both wiring chambers for safety and security.
- .7 The outer access door shall have a padlock hasp preventing unauthorized entry.

2.2 1200 and 1600 Amp Models

- .1 The quick connect panel shall have an enclosure manufactured of 12 gauge galvanized steel painted ANSI 61 gray or 316 stainless steel..
- .2 The quick connect panel enclosure dimensions shall be 35" wide x 56" high x 28" deep.
- .3 The quick connect panel shall include four (4) feet for floor or concrete pad mounting. Holes in the bottom of the feet shall be available for anchoring the enclosure to the floor or pad.
- .4 The quick connect panel shall be divided into an upper termination chamber and a lower wiring chamber.
- .5 The upper termination chamber shall have a key lock handle door covering all exposed electrical parts.
- .6 The lower chamber main door shall have a key lock handle main door covering all exposed camlock connectors.
 - .1 The lower chamber main door shall have a smaller trap door for cable egress. This trap door shall have a key lock handle to preventing unauthorized entry.

2.3 2000A-4000A Amp Models

- .1 The quick connect power panel shall have an enclosure manufactured of aluminum or 316 stainless steel.
- .2 The quick connect panel shall not have enclosure dimensions that exceed 39.00" H x 31.00" W x 50.00"D for 2000A and 39.00" H x 48.00" W x 50.00"D for 2400A and above.
- .3 The quick connect panel shall be able to accommodate rear, side and bottom cable entry.
- .4 Multiple Chamber style design to isolate permanent connections and camlock connections.
- .5 Pad-lockable tamper resistant door preventing access to temporary connections while unit is in use.
- .6 Trap door for cable egress.
 - .1 45 degree camlocks for hassle free connection eliminating stress on cables during operation.
- .7 Provisions for Trap Key interlock prevent access to temporary connections while cables are energized.
- .8 Slotted fingers to restrict cable access reducing theft.

2.4 ELECTRICAL

- .1 The quick connect panel shall be have input and output connections rated up to 600 VAC, as specified in the contract documents.
 - .1 Input Panels - Recessed male connectors
 - .2 Output Panels - Female connectors with flip covers.
- .2 All electrical connectors shall be cam type single pole connectors compatible with Maringo or Leviton 16 Series CAM Locks™ and available color coded as per industry standard practice:
 - .1 240V and below: phase 1 = black, phase 2 = red, phase 3 = blue (if required).
 - .2 440 to 480V: phase 1 = brown, phase 2 = orange, phase 3 = yellow.
 - .3 Ground shall always be green.
 - .4 Neutral shall always be white.

2.5 Up to 800 Amp Models

- .1 The upper termination chamber shall be provided with lug terminals for the permanently installed conductors.
- .2 The lower chamber shall have the cam type single pole connectors as specified above:
 - .1 For 400A models, there shall be one (1) row of up to five (5) series single pole connections.
 - .2 For 800A models, there shall be two (2) rows of up to five (5) single pole connections.
- .3 Withstand Current Rating (WCR) shall be no less than 10kA verified by testing supervised by a Nationally Recognized Testing Laboratory, not by calculation.

2.6 1200-1600A Amp Models

- .1 The upper termination chamber shall have copper buss bars:
 - .1 Designed for a current density not to exceed 725 amps per square inch cross sectional area
 - .2 With holes to accommodate standard ½" hardware drilled on 1.95" centers.
- .2 The lower chamber shall have the cam type single pole connectors as specified above:
 - .1 For 1200A, there shall be three (3) rows of up to 5 single pole connections.
 - .2 For 1600A, there shall be four (4) rows of up to 5 single pole connections.
- .3 Withstand Current Rating (WCR) shall be no less than 22kA verified by testing supervised by a Nationally Recognized Testing Laboratory, not by calculation.

2.7 2000A-4000A Amp Models

- .1 The rear chamber which houses the permanent connections will have mechanical lugs.

- .1 For 2000A, there shall be six (6) single (#2 AWG to 600 MCM) mechanical lugs.
- .2 For 2400A, there shall be eight (8) single (#2 AWG to 600 MCM) mechanical lugs.
- .3 For 2800A, there shall be nine (9) single (#2 AWG to 600 MCM) mechanical lugs.
- .4 For 3200A, there shall be ten (10) single (#2 AWG to 600 MCM) mechanical lugs.
- .5 For 3600A, there shall be eleven (11) single (#2 AWG to 600 MCM) mechanical lugs.
- .6 For 4000A, there shall be twelve (12) single (#2 AWG to 600 MCM) mechanical lugs.
- .2 The front of the panel shall have the cam type single pole connectors as specified above:
 - .1 For 2000A, there shall be three (5) rows of up to 5 single pole connections.
 - .2 For 2400A, there shall be four (6) rows of up to 5 single pole connections.
 - .3 For 2800A, there shall be three (7) rows of up to 5 single pole connections.
 - .4 For 3200A, there shall be four (8) rows of up to 5 single pole connections.
 - .5 For 3600A, there shall be three (9) rows of up to 5 single pole connections.
 - .6 For 4000A, there shall be four (10) rows of up to 5 single pole connections.
- .3 Withstand Current Rating (WCR) shall be no less than 100kA verified by testing supervised by a Nationally Recognized Testing Laboratory, not by calculation.
- .4 Phase Rotation Monitor
- .5 Two wire auto start

2.8 COMPLIANCE

- .1 The 400-4000 Amp quick connect Input panel must be listed to UL 1008 under Annex J as a Transfer Switch Accessory. Output Panel must be listed to UL 891 for Panelboards.
- .2 "Built to the standard" shall not be allowed: the quick connect panels shall be tested in accordance with and listed to UL 1008 or UL 891 standards.
- .3 UL 50 Listed enclosures may be used but only listed to UL 50 shall not be acceptable.

Part 3 Execution

3.1 INSTALLATION OF ENCLOSED SWITCHES (DISCONNECTS)

- .1 Provide disconnects:
 - .1 Wherever shown on the drawings and/or specified herein.

- .2 Wherever required by starter schedule drawings:
 - .3 For motorized equipment which cannot be seen from the motor starter location or is more than 10m away from the starter location.
 - .4 For all "packaged" equipment supplied by other Divisions and fed from a motor starter panel.
- .2 Enclosures mounted indoors and not exposed to the weather shall be NEMA 1 type.
 - .3 Enclosures mounted outdoors or in locations exposed to the weather shall be NEMA 3 type.
 - .4 Where the enclosed switch is for use on a variable frequency drive application, wire the normally closed contact on the switch to the stop circuit on the variable frequency drive.

3.2 Warranty & Service

- .1 The Quick Connect panel shall come with a warranty of no less than 24 months from date of shipment.
- .2 The Quick Connect Power Panel provider shall maintain a national service organization of company-employed personnel located throughout the contiguous United States.
- .3 The service center's personnel must be factory trained and must be on call 24 hours a day, 365 days a year.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide contactors, to suit application, complete with all accessories for a complete installation, as required by the contract documents.

1.3 SUBMITTALS

- .1 Submit shop drawings of contactors.

1.4 ACCEPTABLE MANUFACTURERS

- .1 Acceptable manufacturers are: Schneider Canada, Eaton (Cutler Hammer) and Siemens.

Part 2 Products

2.1 AC CONTACTORS

- .1 Provide magnetic full voltage contactors, Series A201 non-reversing type for heating and motor loads and Series A202 for lighting loads. Each contactor shall be suitable in all respects for the application.
- .2 Mount each contactor in a NEMA enclosure, complete with the necessary accessories including pilot light in cover.
- .3 The amperes rating, number of poles, etc., for contactors shall be as noted on the drawings.

Part 3 Execution

3.1 INSTALLATION

- .1 Install contactors as shown on drawings.
- .2 Comply with manufacturer's installation requirements.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 REQUIREMENTS OF REGULATORY AGENCIES

- .1 The electric generating system, consisting of a prime mover, generator, governor, coupling and all controls, must have been tested, as a complete unit, on a representative engineering prototype model of the equipment to be sold.
- .2 All components shall be CSA and/or ULC approved listed and labelled. The complete assembly to comply with CSA 282 Emergency Power Supply for Buildings.
- .3 The generator set must be pre-certified to meet Ministry of the Environment (MOE) emission and sound requirements for stationary standby. On-site emission testing & certification will not be acceptable for standby applications.
- .4 Provide necessary information to allow the client to and prepare the appropriate documentation, make application to and obtain Ministry of Environment (MOE) certification for emissions and noise levels for the generator installation.

1.3 WORK INCLUDED

- .1 Provide, install, and acceptance test a complete and operable Emergency / Standby electric generating system, including all devices and equipment specified herein, as shown on the drawings, or required for the service. Equipment shall be new, factory tested, and delivered ready for installation.
- .2 Provide standby power system(s) capacity as per drawings to supply electrical power at voltage as indicated on the drawings, 60 Hertz 3 Phase, 4 wire. . The generator(s) shall consist of a liquid cooled spark-ignited engine, a synchronous AC alternator, system controls with all necessary accessories for a complete operating system, including but not limited to the items as specified hereinafter.
- .3 The generator shall be applied at the listed ambient and elevation. Bidders to submit the generators rated power output at 35 degree C ambient and suitable for installation in Toronto.
- .4 Bidders are to submit the generator sound level in dBA at 23 ft based on the configuration specified.
- .5 The on-site gas pressure is between 11 and 15 inches of water column.

1.4 SUBMITTALS

- .1 Submit the following information for review:
 - .1 Manufacturer's product literature and performance data, sufficient to verify compliance to specification requirements.
 - .2 Manufacturer's certification of prototype testing.
 - .3 Manufacturer's published warranty documents
 - .4 Shop drawings showing plan and elevation views with certified overall dimensions, as well as wiring interconnection details.

- .5 Interconnection wiring diagrams showing all external connections required; with field wiring terminals marked in a consistent point-to-point manner.
- .6 Manufacturer's installation instructions.
- .7 Three (3) sets of owner's manuals specific to the product supplied must accompany delivery of the equipment. General operating instruction, preventive maintenance, wiring diagrams, schematics and parts exploded views specific to this model must be included.

1.5 WARRANTY

- .1 The standby electric generating system components, complete generator set and instrumentation panel shall be warranted by the manufacturer against defective materials and factory workmanship for a period of two (2) years. Such defective parts shall be repaired or replaced at the manufacturer's option, free of charge for parts, labor and travel.
- .2 The warranty period shall commence at the substantial completion date. Multiple warranties for individual components (engine, alternator, controls, etc.) will not be acceptable. Satisfactory warranty documents must be provided. Also, in the judgment of the specifying authority, the manufacturer supplying the warranty for the complete system must have the necessary financial strength and technical expertise with all components supplied to provide adequate warranty support.

1.6 ACCEPTABLE MANUFACTURERS

- .1 Acceptable manufacturers are: Genrep (Seneca Generators) Crothers (Caterpillar) Ltd, Gal Power and Paramount (Kohler).

Part 2 Products

2.1 ENGINE

- .1 Engine rating and performance
 - .1 The prime mover shall be a liquid cooled, spark-ignited, 4-cycle engine. It will have adequate horsepower to achieve rated kW output.
 - .2 The engine shall support a 100% load step.
 - .3 The system shall be sized and sequenced to allow emergency system loads as defined by CAN/CSA 282 to be transferred onto the generator(s) within 15 seconds. Non-emergency system loads will be sequenced onto the generator(s) as generator capacity comes on-line.
 - .4 The generator shall accept a load step of 100% of rated kW with a maximum frequency dip of 12 Hz.
- .2 Engine oil system
 - .1 Full pressure lubrication shall be supplied by a positive displacement lube oil pump. The engine shall have a replaceable oil filter(s) with internal bypass and replaceable element(s).
 - .2 The engine shall operate on mineral based oil. Synthetic oils shall not be required.
- .3 Engine cooling system

- .1 The engine is to be cooled with a unit mounted radiator, fan, water pump, and closed coolant recovery system. The coolant system shall include a coolant fill box which will provide visual means to determine if the system has adequate coolant level. The radiator shall be designed for operation in 122 degrees F, (50 degrees C) ambient temperature.
- .2 The engine shall have (a) unit mounted, thermostatically controlled water jacket heater(s) to aid in quick starting. The wattage shall be as recommended by the manufacturer.
- .3 Engine coolant and oil drain extensions, equipped with pipe plugs and shut-off valves, must be provided to the outside of the mounting base for cleaner and more convenient engine servicing.
- .4 A radiator fan guard must be installed for personnel safety that meets UL and OSHA safety requirements.
- .4 Engine starting system
 - .1 Starting shall be by a solenoid shift, DC starting system.
 - .2 The engine's cranking batteries shall be lead acid. The batteries shall be sized per the manufacturer's recommendations. The batteries supplied shall meet CAN/CSA 282 cranking requirements of 90 seconds of total crank time. Battery specifications (type, amp-hour rating, cold cranking amps) to be provided in the submittal.
 - .3 The generator shall have an engine driven, battery charging alternator with integrated voltage regulation.
 - .4 The generator shall have an automatic dual rate, float equalize, 10 amp battery charger. The charger must be protected against a reverse polarity connection. The chargers charging current shall be monitored within the generator controller to support remote monitoring and diagnostics. The battery charger is to be factory installed on the generator set. Due to line voltage drop concerns, a battery charger mounted in the transfer switch will be unacceptable.
- .5 Engine fuel system
 - .1 The engine shall be configured to operate on pipe line grade natural gas.
 - .2 The engine shall utilize a fuel system inclusive of carburetor, gas regulator, low gas pressure switch, and fuel shut-off solenoid. Generators larger than 80 kW are to include air-fuel-ratio control.
 - .3 The engines internal fuel connections shall be terminated to the generator frame via an NPT fitting for easy installation.
- .6 Engine controls
 - .1 Engine speed shall be controlled with an integrated isochronous governor function with no change in alternator frequency from no load to full load. Steady state regulation is to be 0.25%.
 - .2 Generator(s) shall incorporate an active air-fuel-ratio controller. The air-fuel-ratio controller shall be integrated into the generator controller to ensure security of settings and to support monitoring and remote diagnostics. External air-fuel-ratio controllers are not acceptable.
 - .3 Engine sensors used for monitoring and control are to be conditioned to a 4-20ma signal level to enhance noise immunity.

- .4 All engine sensor connections shall be sealed to prevent corrosion and improve reliability.
- .7 Engine exhaust & intake
 - .1 The engine exhaust emissions shall meet the MOE emission requirements for standby power generation.
 - .2 Generators engine will incorporate a 3-way catalytic convertor to meet MOE emission requirements.
 - .3 The manufacturer shall supply its recommended stainless steel, flexible connector to couple the engine exhaust manifold to the exhaust system. A rain cap will terminate the exhaust pipe after the silencer. All components must be properly sized to assure operation without excessive back pressure when installed.
 - .4 The muffler/silencer shall be HOSPITAL grade and shall be accompanied with a 24-inch flex connector linking the exhaust manifold with the muffler/silencer.
 - .5 Provide silencers as manufactured by SMS Silencers Inc., hospital grade, Model SM4 or approved equal. Approval is subject to acoustic engineers review.
 - .6 All exhaust piping from the turbo-charger discharge to the silencer shall be thermally wrapped to minimize heat dissipation inside the room.
 - .7 The engine intake air is to be filtered with engine mounted, replaceable, dry element filters.

2.2 ALTERNATOR

- .1 The alternator shall be the voltage and phase configuration as specified on the drawings.
- .2 The alternator shall be a 4-pole, revolving field, stationary armature, synchronous machine. The excitation system shall utilize a brushless exciter with a three phase full wave rectifier assembly protected against abnormal transient conditions by a surge protector. Photo-sensitive components will not be permitted in the rotating exciter.
- .3 The alternator shall include a permanent magnet generator (PMG) for excitation support. The system shall supply a minimum short circuit support current of 300% of the rating for 10 seconds.
- .4 The alternator shall support .8 pf of rated kilowatt delivery with a maximum voltage dip as per CAN/CSA C282.
- .5 Three phase alternators shall be 12 lead, broad range capable of supporting voltage reconnection. All leads must be extended into a NEMA 1 connection box for easy termination. A fully rated, isolated neutral connection must be included by the generator set manufacturer.
- .6 The alternator shall use a single, sealed bearing design. The rotor shall be connected to the engine flywheel using flexible drive disks. The stator shall be direct connected to the engine to ensure permanent alignment.
- .7 The alternator shall meet temperature rise standards of UL2200 (120 degrees C). The insulation system material shall be class "H" capable of withstanding 150 degrees C temperature rise.

- .8 The alternator shall be protected against overloads and short circuit conditions by advanced control panel protective functions. The control panel is to provide a time current algorithm that protects the alternator against short circuits. To ensure precision protection and repeatable trip characteristics, these functions must be implemented electronically in the generator control panel -- thermal magnetic breaker implementation are not acceptable.
- .9 An alternator strip heater shall be installed to prevent moisture condensation from forming on the alternator windings. A tropical coating shall also be applied to the alternator windings to provide additional protection against the entrance of moisture.

2.3 CONTROLS AND OPERATING SEQUENCE

- .1 Generator controller
 - .1 The generator control system shall be a fully integrated microprocessor based control system for standby emergency engine generators meeting all requirements of CAN/CSA 282.
 - .2 The generator control system shall be a fully integrated control system enabling remote diagnostics and easy building management integration of all generator functions. The generator controller shall provide integrated and digital control over all generator functions including: engine protection, alternator protection, speed governing, voltage regulation, synchronizing, load-sharing (real and reactive) and all related generator operations.
 - .3 Communications shall be supported with building automation via the Modbus protocol without network cards. Optional internet and intranet connectivity shall be available.
 - .4 The control system shall provide an environmentally sealed design including encapsulated circuit boards and sealed automotive style plugs for all sensors and circuit board connections. The use of non-encapsulated boards, edge cards, and pc ribbon cable connections are considered unacceptable.
 - .5 Circuit boards shall utilize surface mount technology to provide vibration durability. Circuit boards that utilize large capacitors or heat sinks must utilize encapsulation methods to securely support these components.
 - .6 A predictive maintenance algorithm that alarms when maintenance is required. The controller shall have the capability to call out to the local servicing dealer when maintenance is required.
 - .7 Diagnostic capabilities should include time-stamped event and alarm logs, ability to capture operational parameters during events, simultaneous monitoring of all input or output parameters, callout capabilities, support for multi-channel digital strip chart functionality and .2 msec data logging capabilities.
 - .8 In addition to standard CAN/CSA 282 alarms, the application loads should also be protected through instantaneous and steady state protective settings on system voltage, frequency, and power levels.
 - .9 The control system shall provide pre-wired customer use I/O: 4 relay outputs (user definable functions), 4 contact inputs, 2 analog inputs,

communications support via RS232, and RS485. Additional I/O must be an available option.

- .10 Customer I/O shall be software configurable providing full access to all alarm, event, data logging, and shutdown functionality. In addition, custom ladder logic functionality inside the generator controller shall be supported to provide application support flexibility. The ladder logic function shall have access to all the controller inputs and customer assignable outputs.
- .11 The control panel shall include a touch screen to display all user pertinent unit parameters including: engine and alternator operating conditions; oil pressure and optional oil temperature; coolant temperature and level alarm; fuel level (where applicable); engine speed; DC battery voltage; run time hours; generator voltages, amps, frequency, kilowatts, and power factor; alarm status and current alarm(s) condition per CAN/CSA 282.

2.4 TYPICAL/NORMAL OPERATING SEQUENCE

- .1 Upon the failure of utility power, the automatic transfer switch(es) (ATS) provides a two-wire start signal to the system controller. The system controller sends a start command to the generators via RS485 communication.
- .2 The emergency system transfer switch shall transfer first.
- .3 The “non-life safety system” transfer switch shall transfer once the generator has stabilized and has adequate generator capacity.
- .4 Once utility power has returned, the two-wire start signal will be removed. The generator will run in a cool down mode, and then generator shuts down.
- .5 Transfer switches supplied shall be capable of being inhibited from transferring with a contact from the system controller. The transfer switches supplied shall also be able to shed load via trip-to-neutral feature -- the load is shed and does not re-close to a utility that may have a fault present. For applications in which load shedding with the transfer switch is not feasible, load shedding requirements will be evaluated and accommodated as necessary.

2.5 ENGINE/ALTERNATOR PACKAGING

- .1 The engine/alternator shall be mounted with internal vibration isolation onto a welded steel base. These units shall not need external vibration isolation for normal pad mounted applications.
- .2 A mainline, thermal magnetic circuit breaker carrying the UL mark shall be factory installed. The breaker shall be rated between 100 to 125% of the rated ampacity of the generator. The line side connections are to feed from the alternator, and the load side of the breaker shall feed a paralleling switch. The breaker is to have aux contact and shunt trip. The breaker will function as a redundant tripping device in the system. If the paralleling switch fails to open, the generator breaker will be shunt tripped.
- .3 The generator shall include a unit mounted 120 volt convenience outlet.

2.6 REMOTE ANNUNCIATOR

- .1 Provide and install a 20-light LED remote alarm annunciator with horn, located in the CACF.
- .2 The remote annunciator shall provide all the audible and visual alarms called for by CAN/CSA 282 including indications for high battery voltage, low battery voltage, loss of normal power to the charger.
- .3 Spare lamps shall be provided to allow future addition of other alarm and status functions to the annunciator.
- .4 Provisions for labeling of the annunciator in a fashion consistent with the specified functions shall be provided.
- .5 Alarm silence and lamp test switch(es) shall be provided. LED lamps shall be replaceable, and indicating lamp color shall be capable of changes needed for specific application requirements.
- .6 Alarm horn shall be switchable for all annunciation points. Alarm horn (when switched on) shall sound for first fault, and all subsequent faults, regardless of whether first fault has been cleared.

2.7 ENCLOSURE

- .1 Generator Enclosure: Provide an outdoor weather-protective, acoustically insulated housing consisting of:
 - .1 Acoustically insulated housing to meet UL 94 HF1 flammable classification, with maximum sound pressure of 75 dB(A) at 7m.
 - .2 Insulated to maintain an inside temperature of 10°C based on outside design condition of -25°C.
 - .3 Hinged doors for access to both sides of the engine and alternator, and the control equipment including the distribution panel as noted. Key-locking and padlockable door latches shall be provided for all doors. Door hinges shall be stainless steel.
 - .4 Exhaust muffler internal to the enclosure, size and type as specified.
 - .5 Insulated motorized discharge dampers and intake dampers, angled to reduce noise levels.
 - .6 All sheet metal shall be primed for corrosion protection and finish painted with the manufacturer's standard color. All surfaces If all metal parts shall be primed and painted grey.
 - .7 Painting of hoses, clamps, wiring harnesses, and other non-metallic service parts shall not be acceptable. Fasteners used shall be corrosion resistant and designed to minimize marring of the painted surface when removed for normal installation or service work.
 - .8 Provide emergency battery light pack, 2 x 150W incandescent lamps and fixtures, 15A duplex GFI receptacle, properly sized unit heater w/ fan, thermo stat, and 8 circuit load centre to accommodate these items. Provide a 60 amp -120/2308 volt 3-phase service c/w feeder from the building service room to the enclosure to power the load centre.

2.8 LOOSE ITEMS

- .1 Supplier to itemize loose parts that require site mounting and installation.

- .2 Flexible fuel hose for use in gas piping installation.
- .3 Spare Parts:
 - .1 Fuses: One spare set
 - .2 Filters One spare set (air, fuel, oil)

2.9 ADDITIONAL PROJECT REQUIREMENTS

- .1 Factory Testing
 - .1 Before shipment of the equipment, the engine-generator set shall be tested under rated load for performance and proper functioning of control and interfacing circuits. Tests shall include:
 - .1 Verify voltage & frequency stability.
 - .2 Verify transient voltage & frequency dip response.
 - .3 Load test the generator for 60 minutes.

Part 3 Execution

3.1 INSTALLATION OF ENGINE - GENERATOR SET

- .1 Mount the assembly on vibration isolators secured to a concrete pad. Check engine generator alignment when installation is complete. If necessary, re-align in accordance with the manufacturer's recommendations.
- .2 Install the complete electrical generating system including all external fuel connections in accordance with requirements of CAN/CSA 282, and the manufacturer's recommendations as reviewed by the Engineer.
- .3 Provide adequate starting batteries with a charger rack, jumper cables, etc., and connect to the engine. Connect battery low voltage alarm signal wiring into the fire alarm system.
- .4 Check the specific gravity of engine coolant. Add glycol and/or water, if required.
- .5 Supply suitable fuel piping connections and install as required. Retain the services of the appropriate trade to complete the installation.
- .6 Provide flexible and rigid exhaust piping and an exhaust silencer as specified. Retain the services of the appropriate trade to complete the installation.
- .7 The muffler and associated piping shall be suspended from the ceiling with 1" deflection hangers such as Mason 30N isolators as per acoustic report recommendations.
- .8 Mount the control panel where shown and connect complete. Check all control panel functions.
- .9 Prepare and submit to the Engineer's approval, all necessary design, erection and layout drawings, wiring, piping and control diagrams, details and samples as required for proper execution and completion of the work.
- .10 Supply all materials for equipment touch-up painting and finishing after installation is complete.
- .11 Provide all required supervision by the manufacturer's personnel of the initial operation of the unit at the job site.

3.2 TESTING

- .1 Before acceptance, the manufacturer shall conduct tests at his premises to be witnessed by the Owner's representative and the electrical trade. All tests shall meet the requirements of CSA C282. These tests shall include:
 - .1 Unit start, transfer to load, retransfer to normal power, unit shut down, on "Automatic" control.
 - .2 Unit start and shut down on "Manual" control.
 - .3 Unit start and transfer on "Test" control.
 - .4 Unit start on "Engine start" control.
 - .5 Operation of manual bypass switch.
 - .6 Operation of automatic alarms and shut down devices.
 - .7 Run unit on load for minimum period of 4h to show load carrying ability, stability of voltage and frequency, and satisfactory performance of dampers in ventilating system to provide adequate engine cooling.
 - .8 At end of test run check battery voltage to demonstrate battery charger has returned battery to fully charged state.
 - .9 Demonstration of voltage and frequency regulation from no load to full load and with loads suddenly applied and dropped up to full load. Performance shall be recorded on a Esterline Angus Special Service Recorder.
 - .10 All equipment shall function precisely in accordance with these specifications during the runs and demonstrations listed above.
 - .11 The electrical loads used for testing shall be controllable and adjustable. The loading device shall provide a steady load free from fluctuation.
 - .12 Provide factory test data for the generator, exciter and voltage regulator.
 - .13 All shop tests specified shall be repeated on site and demonstrated at time of substantial completion to the Owner and Consultant.
 - .14 Fuel for all tests shall be provided by this Sub Contractor.
 - .15 Provide an on site portable dry load banks to indicate full rating of unit with incremental loading.

3.3 STARTUP AND COMMISSIONING

- .1 The supplier shall provide factory trained technicians to check-out the completed installation and to perform an initial startup inspection at site to include:
 - .1 Ensuring the engine starts (both hot and cold) within the specified time.
 - .2 Verification of engine parameters within specification.
 - .3 Verify no load frequency and voltage, adjusting if required.
 - .4 Test all automatic shutdowns of the engine-generator.
 - .5 Perform a load test of the electric plant, ensuring full load frequency and voltage are within specification by using building load.

3.4 TRAINING

- .1 Training is to be supplied by the start-up technician for the end-user during commissioning. The training should cover basic generator operation and common generator issues that can be managed by the end-user.
- .2 Training is to include manual operation of system.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.

1.2 WORK INCLUDED

- .1 Provide automatic transfer switches complete with all necessary auxiliaries required for a complete installation as per the contract requirements.

1.3 SUBMITTALS

- .1 Submit complete shop drawings.

1.4 ACCEPTABLE MANUFACTURERS

- .1 The specifications are based on Asco Electric.

Part 2 Products

2.1 EMERGENCY POWER TRANSFER AND BYPASS ISOLATION SWITCH

- .1 Provide transfer and bypass isolation switches of ampere capacity indicated on the drawings. The transfer and bypass isolation switches shall be 3-pole double throw for use on a 600/347V 3-phase, 4-wire, 60 Hertz system and shall be Asco 7000 Series. The transfer and bypass isolation switches shall be capable of withstanding without damage a short circuit of 200,000 amperes symmetrical when used in conjunction with current limiting fuses.
- .2 The automatic transfer switch shall be electrically operated, mechanically held and shall be rated for full load continuous duty on both tungsten filament and re-active loads. The switch shall be equipped with arc chutes and magnetic blow out coils.
- .3 In the event of a failure in any coil, the switch shall not be permitted to switch to a neutral position but shall always be maintained in a closed position. Failure of any continuously energized coil on the normal supply will cause the switch to automatically transfer to the emergency supply.
- .4 The switch shall contain an auxiliary contact which will close the automatic starting circuit of the emergency generator set on a normal power failure or if the normal voltage is reduced to 70% of the nominal rating or any phase.
- .5 The switch shall be equipped with the following feature:

Type 1	Time delay to override momentary normal source outages and delay all transfer switches and engine starting signals, adjustable from 0.5 to 6 seconds. Factory set at 3 seconds.
Type 2B	Transfer to emergency time delay. Adjustable from 0 to 1 minute for controlled timing of load transfer to emergency, factory set at 5 seconds.

Type 2E	Unloaded running time delay for emergency engine generator cool-down. Adjustable from 0 to 5 minutes factory set at 5 minutes.
Type 3A	Retransfer to normal time delay. Time delay is automatically bypassed if emergency source fails and normal source is available. Adjustable from 0 to 30 minutes. Factory set at 5 minutes.
Type 5A	Test switch to momentarily simulate normal source failure. Installed and connected on enclosure door.
Type 9A & 9B	Pilot lights to indicate switch positions. Green for connected to normal source and red connected to emergency source.
Type 14A & 14B	Auxiliary contacts, two contacts closed when the switch is in the normal position and 2 contacts closed when the switch is in the emergency position. The contacts should be rated 10 Amps and 600V.
Type 22	Fully rated solid neutral bar complete with lugs.
Type 27	In-phase monitor to ensure that on transfer and re-transfer motor load inrush currents do not exceed normal starting current.
Type 31	Elevator pre and post transfer signals.

- .6 The switch shall be mounted in NEMA 1 enclosure, complete with drip hoods.

Part 3 Execution

3.1 INSTALLATION OF EMERGENCY POWER TRANSFER SWITCH

- .1 Mount the switch where shown in accordance with the manufacturer's recommendations and connect complete as shown and detailed.
- .2 Provide from transfer switches, signal circuits to the elevator machine room controllers for pre-transfer signals (both directions); refer also to Section 26 05 16.
- .3 Provide from the transfer switch a signal circuit to the fire alarm control panel to annunciate "Failure to start - generator".
- .4 Provide from each transfer switch (including fire pump transfer switch provided by others) a signal circuit to the generator control panel to initiate generator start up in the event of a normal power failure.
- .5 Obtain services from transfer switch manufacturer to commission each transfer switch.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Electrical General Requirements and all documents referred to therein.
- .2 Comply with Section 25 56 26, Integrated Lighting System Controls.

1.2 WORK INCLUDED

- .1 Provide all fixtures, poles and auxiliary equipment as required for a complete installation.
- .2 This Contractor is responsible for releasing orders and coordinating deliveries of the light fixtures from the suppliers in order to adhere to the Construction schedule. This Contractor is responsible for receiving, handling and storing all light fixtures until ready for installation.
- .3 Inspect deliveries to ensure they are complete.
- .4 Install all electrical light fixtures as per architects reflected ceiling plans.
- .5 Coordinate with Mechanical and BAS sub-trades to ensure all proposed luminaires are fully compatible with the proposed integrated lighting controls system. Refer to Section 25 56 26, Integrated Lighting System Controls for details.

1.3 SUBMITTALS

- .1 Submittals:
 - .1 Submit information in accordance with Section 26 05 01.
 - .2 Submit shop drawings for all products as follows:
 - .1 Provide complete, fully dimensioned detail drawings including all major components and details fabrication of each fixture type.
 - .2 Provide requisite schematics and plans indicating assembly and installation of components.

1.4 QUALITY ASSURANCE

- .1 All components to be approved/listed and labelled by an approved agency.

1.5 SOURCE QUALITY CONTROL

- .1 The Manufacturer of all products specified herein must have been engaged in the fabrication of the equipment for at least the past 5 years.
- .2 The light fixtures listed in the light fixture schedule are pre-approved and are the standard of acceptance to be met through quality, performance, and architectural design.

1.6 DELIVERY AND STORAGE

- .1 All lighting equipment shall be individually packaged with sufficient, protective padding for the selected method of transport. All handling and shipping shall be performed in accordance with the equipment manufacturer's recommendations. Unopened containers shall be stored in a protected location.

1.7 WARRANTY

- .1 Provide Contractor warranties as well as factory warranties. All equipment and labor in this Contract shall be free from defects in products or workmanship for 24 months after substantial completion.

1.8 ACCEPTABLE MANUFACTURERS

- .1 Acceptable fixture manufacturers are as listed in the fixture schedules.

Part 2 Products

2.1 GENERAL

- .1 Provide new lighting fixtures complete with mounting accessories, junction boxes, trims, and lamps.
- .2 All products of a specified type are to be from the same manufacturer.
- .3 Fixture type catalogue numbers do not necessarily denote required mounting equipment or accessories. Provide complete mounting accessories appropriate for each mounting condition.
- .4 All fixtures shall be installed with a frame or canopy that is compatible with the ceiling type specified by the Consultant.
- .5 Provide appropriate accessories for proper mounting of all fixtures. Include plaster frames for plaster ceiling and firestop protection for fixtures in rated ceiling. For fixtures suspended from ceiling, provide pendants or aircraft cables complete with accessories to complete the installation as indicated on the drawings.
- .6 Where light fixture or light fixture suspension apparatus penetrates metal pan or sheet metal ceiling or canopies, an approved copy of the shop drawings of those fixtures shall be provided to the ceiling manufacturer. Apertures in the ceiling or openings for suspension cables shall be pre-cut by the ceiling manufacturer to suit light fixtures. Instruct the manufacturer accordingly.
- .7 If the words "equivalent" or "approved equal" are not indicated after light fixture manufacturer and catalog number in the fixture schedule, no other manufacturer will be acceptable for that particular type.

2.2 LAMPS

- .1 All fixtures shall be provided with proper, new, and operable lamps. Provide lamps indicated on the Fixture Schedule, or, if not indicated, as recommended by the fixture manufacturer. Lamps shall be compatible with the respective fixture in all cases.

2.3 LAMP HOLDERS

- .1 Lamp holders shall hold lamps securely to prevent damage caused by normal vibrations and maintenance handling.

2.4 FIXTURE CONSTRUCTION

- .1 General:

- .1 All fixtures shall be free of inappropriate light leaks.
- .2 Fixtures in non-accessible ceilings and in the columns shall have accessible junction boxes, drivers, and transformers through fixture apertures.
- .3 No metal clips, screws, angles, etc. shall be visible when the fixture is viewed from below.
- .4 All mounting frames installed in damp locations or in plaster ceiling shall be galvanized.
- .5 Extruded fixture housings shall have a minimum thickness of 2.3 ($\frac{3}{32}$ ") mm and be smooth and free of tooling lines. Die-cast end plates and joiner sections shall have a minimum thickness of 2 ($\frac{3}{32}$ ") mm thickness and concealed fasteners.
- .6 Die-casts shall be smooth, free of pits, grooves, and imperfections.
- .7 Spinning shall be smooth and clean with finished edges, and free of spinning lines.
- .8 Sheet metal fixture housings shall be of welded construction with seams filled and ground smooth. Any exceptions shall be noted under individual fixture types.
- .9 All adjustable fixtures shall have locking rotation and tilt devices.
- .10 Pendant-mounted fixtures shall have stems with ball swivels or be cable-mounted to allow 45 degrees swing in any direction from vertical.
- .11 Ball swivels and cables end hardware shall be concealed with sleeve.
- .2 Fixture utilizing both 120 volt services and 347 volt services or utilizing more than one 120 volt service or more than one 347 volt service shall have wiring sections and separate wiring connections and labelling as necessary to satisfy all Code and local inspection requirements.
- .3 Reflector Cones:
 - .1 Provide 45 Degrees lamp image cut-off when viewed from below unless indicated otherwise.
 - .2 Reflector cones shall have a minimum thickness of 0.8 (0.03125") mm and be manufactured of uniform gauge Alcoa 3002 alloy, free of spin marks, or other manufacturing defects. The use of plastic for cones or trim rings is not acceptable.
 - .3 Reflector finish shall be semi specular by means of an Alzak process. Reflector inner surface shall be free of water spotting and shall maintain a reflectivity ratio of no less than 80% on clear specular finish unless otherwise noted.
 - .4 Cone flange shall be formed as an integral part of cone and shall have identical appearance as inner cone unless otherwise indicated. Flange overlap shall have a perpendicular orientation to cone and shall have adequate width to cover ceiling opening with no visible light leaks.
 - .5 Fixtures with Alzak reflector cones shall all be furnished by the same manufacturer, unless otherwise indicated. All reflector cones shall have iridescent suppressant finish for linear and HID fixtures unless otherwise specified.
- .4 Parabolic Louvre Assemblies:

- .1 Louvre assemblies shall be shipped and stored in plastic bags and shall not be installed until construction has progressed to a suitably clean stage. Single piece peel-off seal on bottom of louvre is not acceptable. No construction dust or paint shall be allowed to accumulate on the louvres at any time. Louvres shall be constructed with minimum 0.6 (0.0235") mm Alcoa licensed process Coilzak semi-specular iridescent suppressant anodized aluminium. All louvre blades shall have parabolic designed curvature. All cell sizes shall be equal unless otherwise specified.
- .5 Unless otherwise noted, lenses for use with linear fixtures shall be of minimum 3.175mm (0.125") thickness.
 - .1 Material shall be light-stable 100% virgin acrylic with minimum 98% transmittance unless otherwise indicated. Acrylic shall conform to minimum standards of IES-NEMA-SPI, and have a minimum thickness of 3mm. Material shall perform as applied for a period of 20 years with no greater than 5% transmission loss.
- .6 Parabolic Baffles: All parabolic baffles shall be straight and paralleled with equal cell sizes. Baffles placed end to end shall have no visible break in appearance. Baffles shall be constructed with minimum 0.6mm (0.0235") Alcoa licensed process Coilzak semi-specular iridescent suppressant anodized aluminium unless otherwise specified.

2.5 LINEAR FIXTURES

- .1 The fixture housing pressure fit construction or utilizing rivets shall not be accepted and, when applicable, shall have lenses in hinged frame utilizing hidden release mechanisms of a heavy duty standard (i.e., visible frame releases will not be accepted). Lenses shall be securely retained in the frame assembly utilizing the equivalent of stainless steel spring clips.
- .2 Fixture reflectors, unless specifically designed using specular metal, shall have a complete coverage of white alkyd reflecting enamel. Enamel shall have a minimum 85% reflectivity, applied by either an electrostatically charged spray or dip process then baked in a temperature controlled oven until paint is thoroughly cured. Prior to applying enamel, each metallic surface shall be prepared using a five stage hot zinc phosphatizing process.
- .3 All fixtures shall have the following wording stencilled above each lamp and visible only when the lamp is removed: "RE-LAMP ONLY WITH (...TYPE) LAMPS". Type shall include colour, temperature and lamp series.
- .4 All painting to be done after cutting.

2.6 FIXTURE FINISHES

- .1 Painted fixtures shall have synthetic enamel, with acrylic, alkyd, epoxy, polyester or polyurethane base applied after the fixture is completely constructed. Paint shall be light stabilized, baked on at minimum 180 Degrees C, and catalytically or photochemically polymerized after application.
- .2 All metal parts shall be cleaned and treated with phosphate or chromate bonding process after fabrication for maximum paint adhesion.

- .3 All polished decorative metals, (brass, chrome, etc.), shall have a clear protective finish, baked-on lacquer or air-cured urethane.
- .4 All custom colour finishes are to be approved by the Consultant.
- .5 All fixtures, lenses, diffusers and fittings to have a flame spread rating of less than 250.

2.7 LIGHTING FIXTURE SCHEDULE

- .1 Catalogue numbers in the Lighting Fixture Schedule are shown to indicate approved manufacturer and fixture quality requirements. The numbers may or may not include variations or special light fixture features as specified in the associated fixtures carried in his bid include all features as specified in the Schedule.

2.8 EXTERIOR LIGHTING

- .1 Supply and install exterior lighting as indicated in the FIXTURE SCHEDULE and as shown on the Drawings complete with poles, arms, light fixtures, lamps, anchor bolts and setting template, nut covers and other accessories necessary for proper installation. Finish all metal surfaces with zinc chromate primer, and finish paint as directed by the Consultant.

2.9 WIRE GUARDS

- .1 Provide wire guards to all fixtures that are mounted so that any part of the fixture is less than 2400mm (8'-0") above adjacent floor, unless noted otherwise in the fixture schedules.
- .2 All fixtures in storage rooms and services rooms shall have wire guards.

Part 3 Execution

3.1 VERIFICATION OF CONDITIONS

- .1 Confirm all ceiling depths against final architectural ceiling plans and sections to ensure that recessed fixtures can be installed in all ceiling conditions and advise the Consultant immediately of any discrepancies prior to ordering of the fixtures or proceeding with the Work.

3.2 INSTALLATION – GENERAL

- .1 Lighting fixtures shall be installed as indicated on architectural reflected ceiling plans, Electrical Drawings and per approved shop drawings.
- .2 Lighting fixtures are indicated in the Lighting Fixture Schedule by means of type letters, which correspond to similar letters on the plans.
- .3 Lighting fixtures shall be installed in accordance with fixture manufacturers written instructions, applicable requirements of the consultant, applicable authorities, and with recognized industry practices.
- .4 Verify locations and spacings of lighting fixtures with reflected ceiling plans and notify Consultant of any variance or conflict between the plans and field conditions. Do not proceed until conflict has been resolved.

- .5 Work shall be co-ordinated with other trades. Lighting fixture locations shall have priority over location of ducts, diffusers, sprinklers, smoke detectors and other non-structural obstructions.
- .6 All fixtures shall be supported directly from the building structural members or from bridging attached to the structural members by rod hangers and inserts. Provide all necessary hardware and blocking to ensure that fixtures hang true, square, plumb, and in proper alignment.
- .7 Fixtures installed in suspended T-bar ceiling shall be equipped with suspension chains, securely fastened to fixture and slab above. The light fixture shall be centred in the ceiling grid opening. Provide a minimum of two chains, one each on diagonal opposite corners, and provide more chains if required by local authority having jurisdiction.
- .8 Provide every light outlet in the building with a lighting fixture as instructed complete with lamps and other accessories necessary for its proper installation and operation. If a fixture type is not designed for any particular outlet, obtain the necessary details from the Consultants prior to submission of tender. Alternatively, supply a suitable fixture for the outlet involved as directed by the Consultants.
- .9 For exact location of ceiling mounted lighting fixtures, refer to Architectural reflected ceiling plan.
- .10 Install lighting fixtures true to the surface in or to which they are mounted, and except where otherwise indicated on the Drawings, align correctly with building or room walls as the case directs. Mount wall fixtures at elevations specified or as shown on Architectural or Electrical Drawings. Where no elevation is shown, confirm mounting height with the Consultant prior to rough-in.
- .11 Where lighting fixtures are stem hung from 'ball and socket' swivels at the ceiling, use stranded wire, #16 AWG (19 x 29) minimum size from outlet box to the fixture.
- .12 Where lighting fixtures are chain-suspended, use solid conductor in armoured cable or flexible conduit and secure to chain with white or clear nylon cable ties.
- .13 Provide lamicoid plate (white letters on blue background) with inscription "UPS" or "EMERG" and fasten to T-bar or fixture frame for all lighting fixtures connected to the UPS or emergency system.
- .14 All parts of all linear and high intensity discharge lighting fixtures shall be securely fastened and if necessary fitted with neoprene spacers to minimize ballast noise amplification.
- .15 All fixtures shall be installed with the bottom of the fixture housing aligned with the finished ceiling line unless otherwise noted in manufacturers installation instructions.
- .16 Ceiling insulation shall be a minimum of 75 (3") mm away from fixture.
- .17 Support recessed linear fixtures by four hangers per fixture minimum independent of ceiling structure or tee bars unless ceiling system is designed to carry the fixtures. In this case, provide seismic restraints only.
- .18 Support recessed fixtures by one hanger per fixture minimum independent of ceiling structure or tee bars.

- .19 Provide wiring channel for mounting fixtures and wiring in between fixtures, suspended below mechanical piping, ductwork, etc., as directed on 15mm (0.6") rigid conduit or 10mm (0.4") galvanized rod hangers, on 2440mm (8 ft.) centres.
- .20 Nominal size of channels 70 x 70, 10mm (0.4") steel minimum, baked white enamel finish, complete with channel connectors, and closure pieces, coverpieces, mounting hickies, fixture connectors, etc., with jointer pieces 300mm (12") in length minimum to form a rigid assembly.

3.3 INSTALLATION OF RECESSED FIXTURES

- .1 Holes shall be cut to exact fixture size so that no gaps will be present when trims or cones are installed.
- .2 Round holes in acoustical tile ceilings shall be cut using adjustable diameter cutter on slow speed drill press.
- .3 Holes in metal pan and/or sheet metal ceiling and/or ceiling canopy shall be precut by ceiling manufacturer based on approved shop drawings of the light fixtures located in these areas. Electrical contractor shall be responsible for co-ordination between Division 26 and metal ceiling manufacturer(s) of light fixture installation in areas with metal ceilings.
- .4 Provide plaster frames or plaster trim as required and turn same over to the ceiling section for installation.
- .5 Installation of trims shall be tight with no gaps or light leaks. Reflector cones, baffles, aperture plates and decorative elements shall be installed after completion of plastering, ceiling tile work painting, and general clean-up in areas. Caulking or sealing fixture trim cones to ceiling to eliminate light leaks or gaps shall not be acceptable.
- .6 Where fixtures are recessed into non-accessible ceiling and the fixtures specified are not pre-wired, wire to an outlet box adjacent to each fixture and visible only when the fixture is removed, connect to the fixture with suitable high-temperature wire in at least 1200mm (48") of flexible conduit. Install fixtures so that they may be readily removed to gain access to these outlet boxes.
- .7 Provide insulated housings on all recessed lighting fixtures installed in ceilings where thermal insulation is installed.

3.4 INSTALLATION OF LINEAR FIXTURES

- .1 Linear fixtures, surface mounted or suspended, shall not have more than 6mm (1/4") variation in alignment for any 5 metre (17 feet) run.
- .2 In spaces with metal pan or sheet metal ceiling installation of linear fixtures shall be co-ordinated with ceiling supplier and installer. Refer to mounting details on Electrical, Architectural, Interior Design drawings and manufacturer recommendation.

3.5 INSTALLATION OF TRACK LIGHTING

- .1 In spaces with parallel rows of track, all track shall be installed such that neutral conductors and feeds have the same orientation.

3.6 INSTALLATION OF LAMPS AND auxiliary equipment

- .1 At the time of occupancy of any area, all lamps within that area shall be in proper place and working order.
- .2 In the event the Contractor request and receive approval to use the new permanent lighting fixture system for construction purposes (i.e. temporary lighting) and the use of the permanent fixtures is in excess of sixty (60) days prior to occupancy or substantial completion (whichever is first), the Contractor shall supply replacement lamps as follows:

3.7 FIELD QUALITY CONTROL

- .1 Operate each fixture after installation and connection. Each fixture shall be inspected for proper connection and operation.
- .2 Perform testing of operation of temporary or emergency power systems.
- .3 Verify that all lenses, louvres, baffles, fixture trim cones, diffusers and other parts are thoroughly cleaned in a manner recommended by the manufacturer.

3.8 LUMINAIRE WIRING

- .1 Connect recessed luminaires to outlet boxes with 10mm (0.4") flexible conduit and 90 Degrees C wire.

3.9 CONTROL AND CIRCUITING

- .1 Where no switching is shown, lighting shall be panel switched. Panel circuit breakers shall be suitable for switching duty marked "SWD".
- .2 Where circuiting is not specified, provide sufficient 15A - 1P breakers and wiring to limit loading to 1200 watts per circuit or to code whichever is the most restrictive.

3.10 FIXTURES IN SERVICE ROOMS

- .1 Before mounting any fixture in mechanical, electrical or other service room obtain written approval of layout to be used. Layout must suit equipment limitations in the room and must be installed clear of mechanical equipment.

3.11 ADJUSTMENTS

- .1 All adjustable fixtures shall be aimed as instructed by the Consultant. Personnel, lifts, and ladders shall be provided as required.
- .2 Adjust exit sign directional arrows, if required.

3.12 CLEANING

- .1 Remove all plastic bags from parabolic fixtures after construction is finished and prior to final acceptance.
- .2 All unnecessary equipment, materials, wiring, and fixtures shall be removed from those areas affected by the construction. Materials that are not part of the lighting or electrical distribution system shall be removed from the Site.
- .3 All lighting fixtures shall be cleaned in a manner approved by the manufacturer and shall be free of dirt and debris upon completion of installation.

3.13 DEMONSTRATION

- .1 Building personnel shall be trained to operate lighting control system. Building personnel shall be advised on relamping procedures and be given a list of lamps required for the fixtures on the Project.

3.14 PROTECTION

- .1 Lighting fixtures, once installed, shall be protected from damage during the remainder of construction period.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Section 26 05 00, Common Work Results for Electrical and all documents referred to therein.

1.2 SUMMARY

- .1 Section Includes:
 - .1 Provide Electric Vehicle Chargers as specified.
 - .2 Provide concrete bases to mount the EVC;s accordingly;
 - .3 Provide local stainless steel NEMA 3R disconnect switches ahead of each unit per NEC requirements.

1.3 SUBMITTALS

- .1 Submit shop drawings in accordance with Division 01 "General Requirements" and Section 26 05 01 Shop Drawings, Product Data and Samples.

Part 2 Products

2.1 MANUFACTURERS

- .1 Manufacturers: Basis of Design is Clipper Creek Share2 HCS-40 units. Alternate manufactures shall be submit to the Consultant for review prior to close of pricing.

2.2 FEATURES

- .1 Commercial grade plug units with the following features:
 - .1 25' SAE-J1772 cord with cable management;
 - .2 NEMA 4X enclosure
 - .3 Total max KW rating of 7 KW
 - .4 Protect units with 40amp breakers 2 pole breakers (208 volt – single phase, 2wire + grounding).
 - .5 Electrical protection – Overvoltage, Undervoltage, Surge, Ground Fault, Short Circuit, Over Current and Over Temperature.
- .2 The unit shall share power over 2 units in the private garages, allowing 100% of charge when only one car is plugged in and share 50/50 when 2 car are plugged in.

Part 3 Execution

3.1 INSTALLATION

- .1 Install units on bases or wall as shown. Coordinate rough-in details with structural consultant.
- .2 Provide empty conduit from each unit back to the building for IT Room for communication conduits.

Appendix A

YRND – Lighting Standards

Lighting Standard

Version	Date	Description of Revisions
1	December 1, 2009	
2	January 7, 2011	Last sentence of section 2 added
3	January 27, 2011	Updates to controls requirements and new illuminance requirement for active vehicle storage and maintenance
4	June 23, 2011	Various changes
5	October 9, 2012	Section 2.1.4 updated.
6	March 24, 2014	Several updates.
7	November 20, 2014	T5 lamps removed from section 2.2.1. Section 2.2.3 modified to include more exclusions. Re-numbering of sections.
8	March 17, 2015	Section 2.3.3 added regarding exterior lighting control.
9	August 16, 2016 Draft for Consideration	Section 2.2.3 added regarding exterior lighting and maximum colour temperature

1 General:

1.1 Scope:

- .1 The objective of this section is to provide guidance to the User for the purpose of designing Lighting systems.
- .2 It is applicable to the design of new facilities, upgrades and expansions of existing facilities, and leasehold improvement projects.
- .3 This section should be read in conjunction with the Program Specific Requirements.
- .4 Where Program Specific Requirements, Ontario Building Code and/or this Building and Facilities Design Standard (the Standard) conflict, the most stringent requirement shall apply.
- .5 Provide interior and exterior lighting photometric calculations including floor plans showing illuminance levels at the work plane for both full lighting and night lighting.

2 Design Requirements:

2.1 Lighting Power Density:

- .1 Target lighting power density shall be 40% less than the maximum allowed by ASHRAE 90.1-2010 while delivering maintained illuminance levels indicated in this Facilities Design Standard. Where the Standard does not address maintained illuminance levels for a specific space type, illuminance levels should target the lower end of the range recommended in the Illuminating Engineering Society (IES) *Lighting Handbook*, latest edition.

2.2 Light Sources:

- .1 Primary indoor illumination shall be LED luminaires with lamps having 4100K colour temperature and minimum 85 color rendering index. Initial system efficacy shall be at least 94 lumens per watt for T8. This includes task lighting, garage areas and other industrial-type spaces.
- .2 Primary exterior lighting shall be LED with minimum warranty of 5 years for LED + driver and minimum L70 of 70,000 hours when tested to IESNA LM79 standard at ambient temperature of 25 degrees C.
- .3 For sites that are adjacent to residential areas and where there is potential for light trespass into adjacent properties, exterior lighting shall have a maximum colour temperature of 3000K.
- .4 Incandescent, halogen, compact fluorescent, T5 or T8 fluorescent, high pressure sodium, low pressure sodium, metal halide and induction light sources light

-
- sources shall not be used..5 Exit signs shall be LED with maximum input power of 2 watts.
- 6 4-lamp recessed or troffer luminaires should not be used as this usually results in over-illumination directly under the luminaire.
- 7 The will be of the following options for lighting sources;
- 7.1 LED Flat panel lighting, which will have the following features:
- Capable of accepting 120V to 347V incoming power source
 - 0-10VDC Dimming controls
 - -The ability to switch colour temperature and watt out put using dip switches on unit
 - Available in 1'x4', 2'x2, 2'x4' sizes
- 7.2 LED Flat panel Pot lighting, which will have the following features:
- Capable of accepting 120V to 347V incoming power source
 - 0-10VDC Dimming controls
 - Available in 4", 6" and 8" Round sizes
- 7.3 LED tubes (for retro fits only), which will have the following features:
- Capable of being used for with electronic ballasts
 - Dimmable
 - Availble in 2700K, 3500K, 4000K and 5000K color temperatures
- 2.3 Distributed Lighting Controls:
- .1 Except for exit and emergency lighting, circuit breakers shall not be used to switch lighting circuits.
- .2 Provide interior whole building automatic lighting shutoff per ASHRAE 90.1-2010, section 9.4.1.1.
- .3 Exterior lighting shall be controlled by a photocell to automatically turn off lighting when sufficient daylight is available. Between midnight and 6 a.m., façade and landscape lighting shall be automatically shut off, and other exterior lighting shall be reduced by at least 30%.

-
- .4 Provide controls for individual spaces per ASHRAE 90.1-2010, section 9.4.1.2, including multi-level lighting and occupancy/vacancy sensors. Avoid unnecessary after-hours lit areas and associated energy use (via overrides) through appropriate zoning of controls.
 - .5 Provide automatic control devices with manual-off capability in addition to automatic off with the exception of washrooms and court rooms.
 - .6 Public restrooms, corridors and stairwells to be provided with occupancy sensors with automatic ON controls.
 - .7 In addition to ASHRAE 90.1-2010 requirements, provide vacancy sensors for the following spaces including recommended time out durations with the exception that mechanical and electrical rooms shall time out after one hour:
 - Mechanical rooms
 - Electrical rooms
 - Utility rooms
 - Janitor rooms
 - .8 Provide automatic daylighting controls per ASHRAE 90.1-2010, section 9.4.1.4 (sidelighting) and 9.4.1.5 (toplighting) as modified by the Ontario Building Code (Supplemental Standards SB-10, Division 2, Chapter 2, 1.1.1.7.(2) and (3). Daylighting controls shall be dimming rather than step for regularly occupied spaces such as offices and lobbies.
 - .9 Functional testing of lighting controls shall comply with ASHRAE 90.1-2013, section 9.4.3.
 - .10 Large spaces such as garages and industrial-type spaces shall have multiple overlapping levels of lighting control and /or Lighting Automation System

2.4 Centralized Lighting Controls:

- .1 Consider Digital Addressable LightingControl system in Region owned office buildings and/or where multiple lighting levels including day-lighting can provide significant energy savings. A tie-in to the Building Automation System (BAS) is preferred. During the initial design the Region shall supply the lighting controls contractor a range of BACnet addresses the Lighting Control System (LCS) will run on. The LCS network will have a BACnet over IP interface to interface with the BAS. All BAS points will be network visible so that other BACnet systems can auto discover them. Contractor shall consult with York Region Project Manager during the development of addresses.
- .2 Lighting zoning shall be coordinated with HVAC design to ensure HVAC and lighting zones can share zone after hours over-rides.

2.5 Illuminance:

- .1 Design illuminance shall be in accordance with the following table.

Table 1 – Recommended Maintained Illuminance

AREA USE	AVERAGE ILLUMINANCE IN FOOTCANDLES (LUX)	WORK-PLANE HEIGHT
General Office / Private office	30 – 50 fc (320 – 540 lux) Task lighting can be used to provide part of the requirement. Illuminance ratio not to exceed 3:1 (maximum: minimum).	30" (760 mm)
Lunchroom / Cafeteria	30 – 50 fc (320 – 540 lux) Illuminance ratio not to exceed 3:1 (maximum: minimum).	30" (760 mm)
Corridors / Stairs / Elevators	5 – 15 fc (60 – 160 lux)	0" (0 mm)
Washrooms (General)	10 – 20 fc (110 – 220 lux)	0" (0 mm)
Washrooms (Mirror)	30 – 50 fc (320 – 540 lux)	30" (760 mm)
Conference / Meeting Rooms	30 – 70 fc (320 – 750 lux) A low-level illuminance shall also be provided for presentations.	30" (760 mm)
Storage	10 – 20 fc (110 – 220 lux)	0" (0 mm)
Equipment Rooms (Mechanical / Electrical / Janitorial)	30 – 50 fc (320 – 540 lux)	0" (0 mm)
Covered Parking	5 fc (60 lux) Illuminance ratio not to exceed 4:1 (average: minimum).	0" (0 mm)
Outdoor Parking	1 fc (10 lux) Minimum 0.2 fc, illuminance ratio not to exceed 5:1 average: minimum and 20:1 maximum: minimum.	0" (0 mm)
Vehicle Maintenance	35 – 50 fc (350 – 500 lux) Illuminance ratio not to exceed 4:1 (average: minimum).	0" (0 mm)
Vehicle Storage	20 – 30 fc (200 – 300 lux) Illuminance ratio not to exceed 4:1 (average: minimum).	0" (0 mm)

Appendix B

YRND – Receptacle and Circuit Labelling Standard

Receptacle and Circuit Labelling Standard

Version	Date	Description of Revisions	Reason for Revisions
1	March 14, 2014		

NOTE:

This Guideline does not override any governing codes, by-laws or municipal standards. When conflict exists, the most stringent requirements will govern.

This is a CONTROLLED Document. Any documents appearing in paper form are not controlled and should be checked against the on-line file version prior to use.

Notice: This Document hardcopy must be used for reference purpose only.

The on-line copy is the current version of the document.

Any deviation from this document shall be approved by the Region Project Manager prior to proceeding.

1 General

1.1 SCOPE / SUMMARY

1.1.1 Provide labelling of electrical power outlets and receptacles throughout the entire building to provide identification of electrical circuit.

1.1.2 Provide circuit identification on electrical drawings.

1.2 APPLICABILITY

1.2.1 This Building & Facilities Design Standard and Guideline shall apply to:

1.2.1.1 All Region owned and leased buildings where electrical work is required.

1.3 RELATED SECTIONS

1.3.1 01 91 00 Commissioning

1.4 REFERENCE STANDARDS

1.4.1 Not applicable

2 Design Requirements / Products

2.1 RECEPTACLE LABELLING

2.1.1 Provide labelling as per photograph below and as follows:

2.1.1.1 Labels for circuits on normal power shall be in black lettering.

2.1.1.2 Labels for circuits on emergency power shall be red lettering.

2.1.1.3 Each label shall contain the distribution panel identification number and circuit number.

- 2.1.1.4 All project/construction drawings and as-built drawings shall show the distribution panel identification number and circuit number at each receptacle location.
- 2.1.2 Renovation projects that involve adding, replacing, deleting or moving receptacles shall follow the same requirements of 2.1.1.
- 2.1.3 Base building electrical drawings shall be updated as part of any renovation project to include the changes made to lighting or receptacles. Updates to include new location of light fixtures, receptacles and light switches; and the distribution panel and circuit number identification number at each receptacle and light switch.
- 2.1.4 Photograph of typical receptacle labelling:

1 General

1.1 SCOPE / SUMMARY

- 1.1.1 Provide all metering equipment required to measure and trend electrical consumption and demand by end use.

1.2 APPLICABILITY

- 1.2.1 This Building & Facilities Design Standard and Guideline shall apply to:
 - 1.2.1.1 All construction and major renovation of Region owned and leased buildings and facilities greater than or equal to 500m².

1.3 RELATED SECTIONS

- 1.3.1 Commissioning
- 1.3.2 Instrumentation and Controls for Plumbing
- 1.3.3 Instrumentation and Control Devices for HVAC
- 1.3.4 Electricity Meter Installation/Startup Verification Form
- 1.3.5 Corporate ITS Cabling & Wiring Standard

1.4 REFERENCE STANDARDS

- 1.4.1 Not applicable

2 Design Requirements / Products

2.1 DESIGN

- 2.1.1 Optimize electrical distribution to allow reduction in number of meters by grouping similar/like end use loads.
- 2.1.2 Provide metering basis of design with schematic design submission for review and comment by the Region

- 2.1.3 Provide schematic diagrams showing metering intent and outline specifications with design development submission for review and comment by the Region
- 2.1.4 Provide full schematics and specifications for metering system with construction documents submission for review and comment by the Region
- 2.1.5 Design electrical distribution that separates end uses identified in 2.2.1. End uses comprising less than 10% of the primary end use metered may be combined with other uses

2.2 END USES TO BE MONITORED

- 2.2.1 Provide electrical meters for each separate end use type, including:
 - 2.2.1.1 Facility incoming electricity
 - 2.2.1.2 Interior Lighting
 - 2.2.1.3 Exterior Lighting
 - 2.2.1.4 Ventilation Fans
 - 2.2.1.5 Pumps
 - 2.2.1.6 Space Cooling
 - 2.2.1.7 Process electricity (e.g. compressors)
 - 2.2.1.8 Elevators
 - 2.2.1.9 Data centres
 - 2.2.1.10 Plug loads
 - 2.2.1.11 Electric heating where it is the primary source of building heating

2.2.1.12 Any other load 40 kW (50 hp for motors) or greater (submeter individually except where multiple similar pieces of equipment serve a similar load)

2.2.1.13 Generation used as part of demand response systems

2.2.2 Exception: 2.2.1.2 to 2.2.1.13 need not apply to:

2.2.2.1 Leased buildings or spaces where the Region's anticipated occupancy is less than five years; or

2.2.2.2 Buildings less than 2322m²

2.2.3 End uses in spaces leased to tenants, spaces with significantly differing occupancy schedules or spaces with significantly differing facility use are to be metered separately.

2.2.3.1 Exception: Spaces leased to tenants less than 929m² need not be metered separately from other areas.

2.3 METERING EQUIPMENT

2.3.1 Electricity Meters

2.3.1.1 Internet Protocol (IP) based meter complete with:

2.3.1.1.1 Built-in web server.

2.3.1.1.2 Capable of operating with a dedicated IP address (to be provided by the Region).

2.3.1.1.3 Communications Protocols:

2.3.1.1.3.1 HTTP/Post capable of pushing data to 3rd party applications/databases.

2.3.1.1.3.2 Modbus TCP

2.3.1.1.4 Built-in real-time and historic graphics accessible with any HTML 5 internet

browser (computer, tablet, phone) on the Region's network. Data to be displayed in local time, adjusted for daylight savings time. All meter functions to be accessible via the browser.

2.3.1.1.5 Real-time clock with battery backup and email alert for battery end of life.

2.3.1.1.6 Time-Stamp:

2.3.1.1.6.1 Represent date and time

2.3.1.1.6.2 In UTC time or offset from a specified UTC time

2.3.1.1.6.3 Resolution: Minimum 1 second

2.3.1.1.7 Ability to export all stored trend data to comma separated value (.csv) or Microsoft Excel format for importing into spreadsheets. Time-stamps to be exported as a single field with a numeric (non-text) value in local time.

2.3.1.1.8 Published application programming interface (API) allowing data to be retrieved from the meter via non-proprietary means, such as JavaScript Object Notation (JSON).

2.3.1.1.9 Built-in trending and data storage:

2.3.1.1.9.1 2 years of consumption data (kWh) at 1 minute intervals with time-stamp; and

- 2.3.1.1.9.2 10 years of consumption data (kWh) at 1 hour intervals with time-stamp.
 - 2.3.1.1.9.3 Stored in non-volatile memory.
 - 2.3.1.1.10 Security:
 - 2.3.1.1.10.1 Unrestricted access to data and graphics over the Region's network.
 - 2.3.1.1.10.2 Password protection for access to setup, changing settings/parameters and deleting data.
 - 2.3.1.1.11 Ability to measure, store and trend the following data at 1 minute intervals complete with time-stamp:
 - 2.3.1.1.11.1 Accumulated energy per phase (kWh)
 - 2.3.1.1.11.2 Accumulated total energy (kWh)
 - 2.3.1.1.11.3 Active power per phase (kW)
 - 2.3.1.1.11.4 Active total power (kW)
 - 2.3.1.1.11.5 RMS voltage per phase
 - 2.3.1.1.11.6 RMS current per phase
 - 2.3.1.1.11.7 Power factor per phase
 - 2.3.1.1.11.8 Total power factor.

2.3.1.1.11.9 Line frequency

2.3.1.2 Acceptable product: z3 Controls Inc. NetMeter or equivalent

2.3.2 Current Transformers

2.3.2.1 Compatible with electricity meter input without the use of transformers or other devices.

2.3.2.2 Linear accuracy +/-1% of reading.

2.3.2.3 Accuracy at 10% to 130% of rated current.

2.3.2.4 Unburdened current transformers shall not be permitted.

2.3.3 Data Cabling

2.3.3.1 Follow Corporate ITS Cabling & Wiring Standard for data cable requirements.

2.3.3.2 Colour: Green

3 Execution

3.1 INSTALLATION REQUIREMENTS

3.1.1 Install meter in a painted, hinged NEMA 1 (or better) enclosure complete with modular terminal blocks, finger safe fuse holders, fuses and power supply. Label front of enclosure with meter name, IP address and load(s) measured.

3.1.2 Provide disconnect at panel board for voltage reference.

3.1.3 All communication cables to be continuous. No splicing is allowed.

3.1.4 Affix York Region Property Services Branch Asset ID tag (to be provided by the Region) to meter prior to installation.

- 3.1.5 Sensor and network configuration to be done in consultation with the Region's Property Services Branch.
- 3.1.6 Connect meter to the Region's IT network.
- 3.1.7 Commission meter:
 - 3.1.7.1 Ensure latest available firmware version is installed in meter
 - 3.1.7.2 Obtain Network information from York Region project manager and program into meter, including IP address, subnet mask, default gateway, primary and secondary DNS addresses.
 - 3.1.7.3 Set meter clock to current local time.
 - 3.1.7.4 Set up email alerts as specified and/or requested by the Region's project manager.
 - 3.1.7.5 Set up trend logging as specified and/or requested by the Region's project manager. At minimum, set up trend logging per 2.3.1.1.9 and 2.3.1.1.11 above.
 - 3.1.7.6 Set default homepage to display real-time demand graphs and consumption statistics.
 - 3.1.7.7 Verify CT rating is correctly entered in meter setup.
 - 3.1.7.8 Confirm each voltage and current reading displayed on meter software using voltmeter and clamp-on ammeter. Where circuits do not have a load at time of commissioning, induce a load to ensure readings are obtainable.
 - 3.1.7.9 Verify CT's are wired to corresponding voltage reference and that CT's are installed in correct orientation.

- 3.1.7.10 Verify meter information is viewable through a web browser on a device on the Region's network.
- 3.1.7.11 Complete and submit Energy Meter Installation/Startup Verification Form.
- 3.1.7.12 Provide training on meter software use to Region staff including Facilities Operations and Maintenance and Climate Change and Energy Conservation.
- 3.1.7.13 Provide meter manufacturer's calibration certificate(s), installation, operations and maintenance manuals and recommended meter recalibration interval(s).

END OF SECTION

ELECTRICITY METER INSTALLATION/STARTUP VERIFICATION FORM

Project Name:		Project Number:	
Installing Contractor:		Form Completed By (Name):	
Telephone No.:		Date (MM/DD/YY):	

Purpose: The following form is intended to ensure energy meters are correctly and completely set up prior to commissioning verification. Refer to *York Region Building and Facilities Design Standards and Guidelines–Electrical Power Monitoring Standard* for additional requirements.

1. General Information

Manufacturer:	
Model:	
Serial Number:	
Meter location (eg. room number):	

2. Physical Installation

26 09 13 Reference	Requirement	Confirm Compliance	Notes
3.1.1	Is the meter in a painted, hinged NEMA 1 (or better) enclosure complete with modular terminal blocks, finger safe fuse holders, fuses and power supply?	<input type="checkbox"/> Yes <input type="checkbox"/> No	
3.1.1	Is the front of the enclosure labelled with meter name, load measured and IP address?	<input type="checkbox"/> Yes <input type="checkbox"/> No	
3.1.2	Has a disconnect been provided for the voltage reference at the panel board?	<input type="checkbox"/> Yes <input type="checkbox"/> No	
3.1.3	Are communication cables continuous (i.e. not spliced)?	<input type="checkbox"/> Yes <input type="checkbox"/> No	
3.1.4	Has a York Region Property Services Branch Asset ID Tag been affixed to the meter?	<input type="checkbox"/> Yes <input type="checkbox"/> No	
3.1.6	Has the meter been connected to the Region's IT network?	<input type="checkbox"/> Yes <input type="checkbox"/> No	

3. Network Configuration (Note 1 indicates the data is to be provided by the Region's Project Manager)

MAC Address:				
DHCP Disabled?	<input type="checkbox"/> Yes	<input type="checkbox"/> No		
IP Address: ¹				
Gateway: ¹				
Subnet Mask: ¹				
Primary DNS: ¹				
Secondary DNS: ¹				
26 09 13 Reference	Requirement	Confirm Compliance		Notes
3.1.7.2	Has the meter's Network information been obtained from the Region's Project Manager?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	
3.1.7.10	Is the meter viewable through a web browser on a device connected to the Region's network?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	

4. Access

Administrator User Name:	
Administrator Password:	

5. Meter Configuration (Note 1 indicates the data is to be provided by the Region's Project Manager)

CT Setup:	<input type="checkbox"/> Single Phase (120 or 347V)	<input type="checkbox"/> Split Phase (240V)	<input type="checkbox"/> Three Phase (208 or 600V)	
CT Rating:	_____ A			
Voltage Multipliers:	General: _____	Phase A: _____	Phase B: _____	
Current Multipliers:	General: _____	Phase A: _____	Phase B: _____	
Meter Name: ¹				
Meter Description/Load Served:				
26 09 13 Reference	Requirement	Confirm Compliance		Notes
3.1.7.1	Has the latest firmware been installed in the meter?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	
3.1.7.3	Has the meter's internal clock been set to current local time?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	
3.1.7.4	Have email alerts been set up as specified?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	
3.1.7.5	Has trend logging been set up as specified?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	
3.1.7.6	Has the meter's web based home screen been set to display real-time demand graph and consumption statistics?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	
3.1.7.7	Has CT rating been correctly entered into meter setup?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	
3.1.7.9	Have CT's been wired to corresponding voltage reference?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	
3.1.7.9	Have CT's been installed with correct orientation?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	

6. Meter Data Verification

Complete the following Table with meter readings and voltmeter/ammeter reading to verify correct setup:

	Input 1		Input 2		Input 3		Input 4		Input 5		Input 6		Input 7		Input 8	
Measured Load: (ex. LP-1A)																
Parameter	Meter	Voltmeter/ Ammeter	Meter	Voltmeter/ Ammeter	Meter	Voltmeter/ Ammeter	Meter	Voltmeter/ Ammeter	Meter	Voltmeter/ Ammeter	Meter	Voltmeter/ Ammeter	Meter	Voltmeter/ Ammeter	Meter	Voltmeter/ Ammeter
V _{A-N}																
V _{B-N}																
V _{C-N}																
I _A																
I _B																
I _C																

26 09 13 Reference	Requirement	Confirm Compliance		Notes
3.1.7.8	Has each voltage and current reading displayed on meter software been verified using voltmeter and clamp-on ammeter?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	

7. Training

26 09 13 Reference	Requirement	Confirm Compliance		Notes
3.1.7.12	Has training been provided to Region staff?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	
3.1.7.13	Have meter manufacturer's calibration certificate(s), installation, operations and maintenance manuals and recommended meter recalibration interval(s) been provided to the Region's Project Manager?	<input type="checkbox"/> Yes	<input type="checkbox"/> No	

Appendix D

YRND – Electrical & ICAT Works Proposed Phasing

23137 YRND Operations Centre - Electrical Works Proposed Phasing R1

SCENARIO 2 - STEP 1

EXTERIOR

- 1 PROVIDE NEW POWER AND LOW VOLTAGE DUCT BANKS FOR NEW INCOMING SERVICES FROM BASELINE RD TO NEW PROPOSED ELECTRICAL ROOM AND IT ROOM LOCATION.
- 2 PROVIDE NEW POWER AND LOW VOLTAGE CONDUITS FROM EXISTING GATE TO NEW PROPOSED ELECTRICAL ROOM AND IT ROOM LOCATION.
- 3 PROVIDE NEW ELECTRICAL PROVISIONS FROM EXISTING SITE BUILDINGS AND EQUIPMENT TO NEW PROPOSED ELECTRICAL ROOM LOCATION. CONDUITS AND WIRING SHALL BE PROTECTED AND KEPT SAFE FOR FUTURE TERMINATIONS.
- 4 PROVIDE NEW ELECTRICAL PROVISIONS FROM PROPOSED RELOCATED CONTRACTOR TRAILERS LOCATION TO NEW PROPOSED ELECTRICAL ROOM LOCATION. CONDUITS AND WIRING SHALL BE PROTECTED AND KEPT SAFE FOR FUTURE TERMINATIONS.
- 5 PROVIDE NEW ELECTRICAL & ICAT SYSTEMS AND EQUIPMENT WITHIN CONSTRUCTION AREA.
- 6 PROVIDE TEMPORARY POWER AND ICAT SYSTEMS AND EQUIPMENT FOR TEMPORARY OFFICE/LOCKER RELOCATION.
- 7 EXISTING ELECTRICAL & ICAT INCOMING SERVICES, SYSTEMS, AND EQUIPMENT REQUIRED TO MAINTAIN FACILITY OPERATIONS SHALL BE PROTECTED AND REMAIN.

INTERIOR

- 1 EXISTING ELECTRICAL ROOM AND ALL ELECTRICAL & ICAT SYSTEMS AND EQUIPMENT REQUIRED TO MAINTAIN FACILITY OPERATIONS SHALL BE PROTECTED AND REMAIN.

SCENARIO 2 - STEP 2

EXTERIOR

- 1 EXISTING ELECTRICAL & ICAT INCOMING SERVICES, SYSTEMS, AND EQUIPMENT REQUIRED TO MAINTAIN FACILITY OPERATIONS SHALL BE PROTECTED AND REMAIN.
- 2 PULL PRIMARY AND SECONDARY POWER CABLES. PROTECT, KEEP SAFE, AND PREPARE CABLES FOR FUTURE TERMINATIONS.
- 3 PROVIDE TEMPORARY EQUIPMENT AND DEVICES, SUCH AS POWER FEEDS, SECURITY CAMERAS, DATA CONNECTIONS, ETC. REQUIRED ORDER TO MAINTAIN EXISTING FACILITY OPERATIONS.

INTERIOR

- 1 EXISTING ELECTRICAL ROOM AND ALL ELECTRICAL & ICAT SYSTEMS AND EQUIPMENT REQUIRED TO MAINTAIN FACILITY OPERATIONS SHALL BE PROTECTED AND REMAIN. ALL OTHER EXISTING ELECTRICAL AND ICAT DEVICES AND EQUIPMENT SHALL BE DEMOLISHED.
- 2 PROVIDE NEW ELECTRICAL AND ICAT DEVICES AND EQUIPMENT IN RENOVATION AREAS AND ADDITION BUILDING.
- 3 PROVIDE TEMPORARY EQUIPMENT AND DEVICES, SUCH AS POWER FEEDS, SECURITY CAMERAS, DATA CONNECTIONS, ETC. REQUIRED ORDER TO MAINTAIN EXISTING FACILITY OPERATIONS.

SCENARIO 2 - STEP 3

EXTERIOR

- 1 DEMOLISH AND REMOVE TEMPORARY POWER AND ICAT SYSTEMS AND EQUIPMENT FOR TEMPORARY OFFICE/LOCKER RELOCATION.
- 2 PROVIDE NEW PROPOSED SITE LIGHTING, BLOCK HEATER RECEPTACLES, EV CHARGING STATION PROVISIONS, AND ALL OTHER EXTERIOR DEVICES AND EQUIPMENT.
- 3 DEMOLISH EXISTING ELECTRICAL AND ICAT DEVICES AND EQUIPMENT.
- 4 DEMOLISH TEMPORARY EQUIPMENT AND DEVICES, SUCH AS POWER FEEDS, SECURITY CAMERAS, DATA CONNECTIONS, ETC. REQUIRED ORDER TO MAINTAIN EXISTING FACILITY OPERATIONS.

INTERIOR

- 1 PROVIDE NEW ELECTRICAL AND ICAT DEVICES AND EQUIPMENT IN RENOVATION AREAS AND ADDITION BUILDING.
- 2 ARRANGE ESA INSPECTIONS, COMMISSION, AND ENERGIZE ALL ELECTRICAL AND ICAT SYSTEMS.
- 3 CHANGEOVER ELECTRICAL AND ICAT SERVICES FROM EXISTING SYSTEMS TO NEW SYSTEMS.
- 4 DEMOLISH TEMPORARY EQUIPMENT AND DEVICES, SUCH AS POWER FEEDS, SECURITY CAMERAS, DATA CONNECTIONS, ETC. REQUIRED ORDER TO MAINTAIN EXISTING FACILITY OPERATIONS.

NOTES:

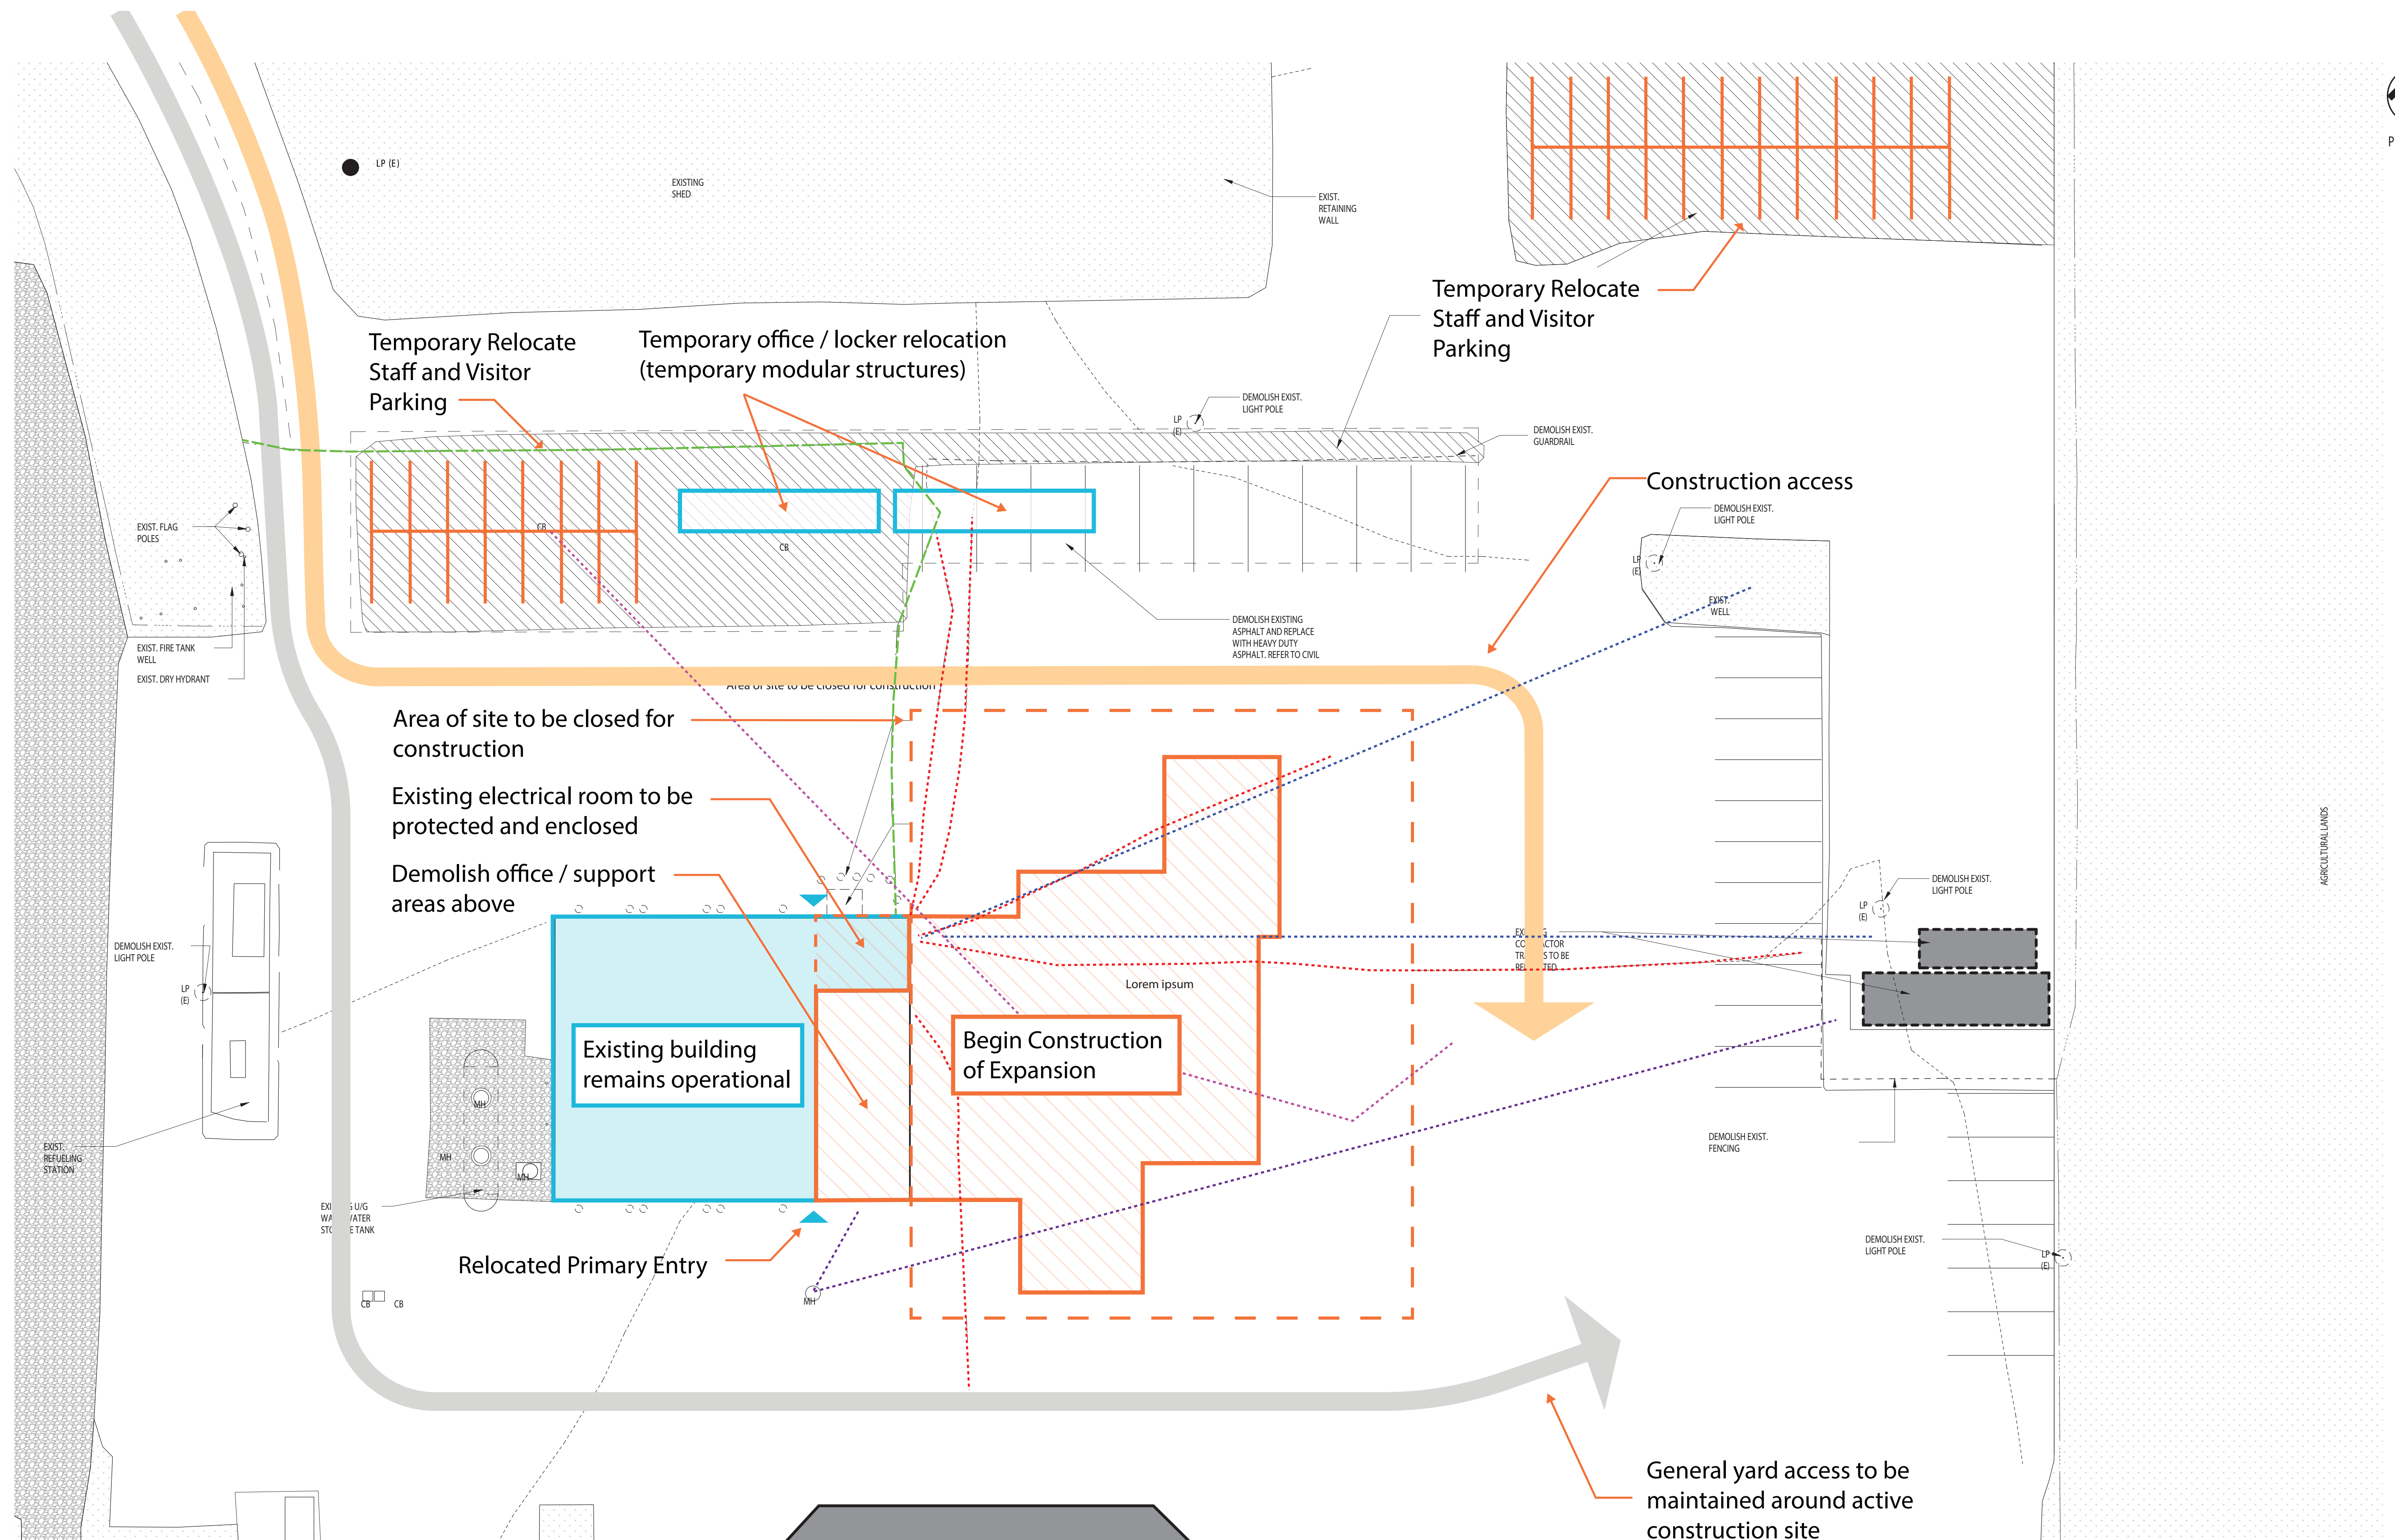

- 1 THE ABOVE PROPOSED PHASING PLAN IS PROVIDED FOR REFERENCE ONLY. THE CONTRACTOR SHALL PROPOSE NEW/REVISE TO SUIT SITE CONDITIONS AND CONSTRUCTION SCHEDULE.

Appendix E

YRND – Proposed Phasing

Start - Spring 2025 (Tender)

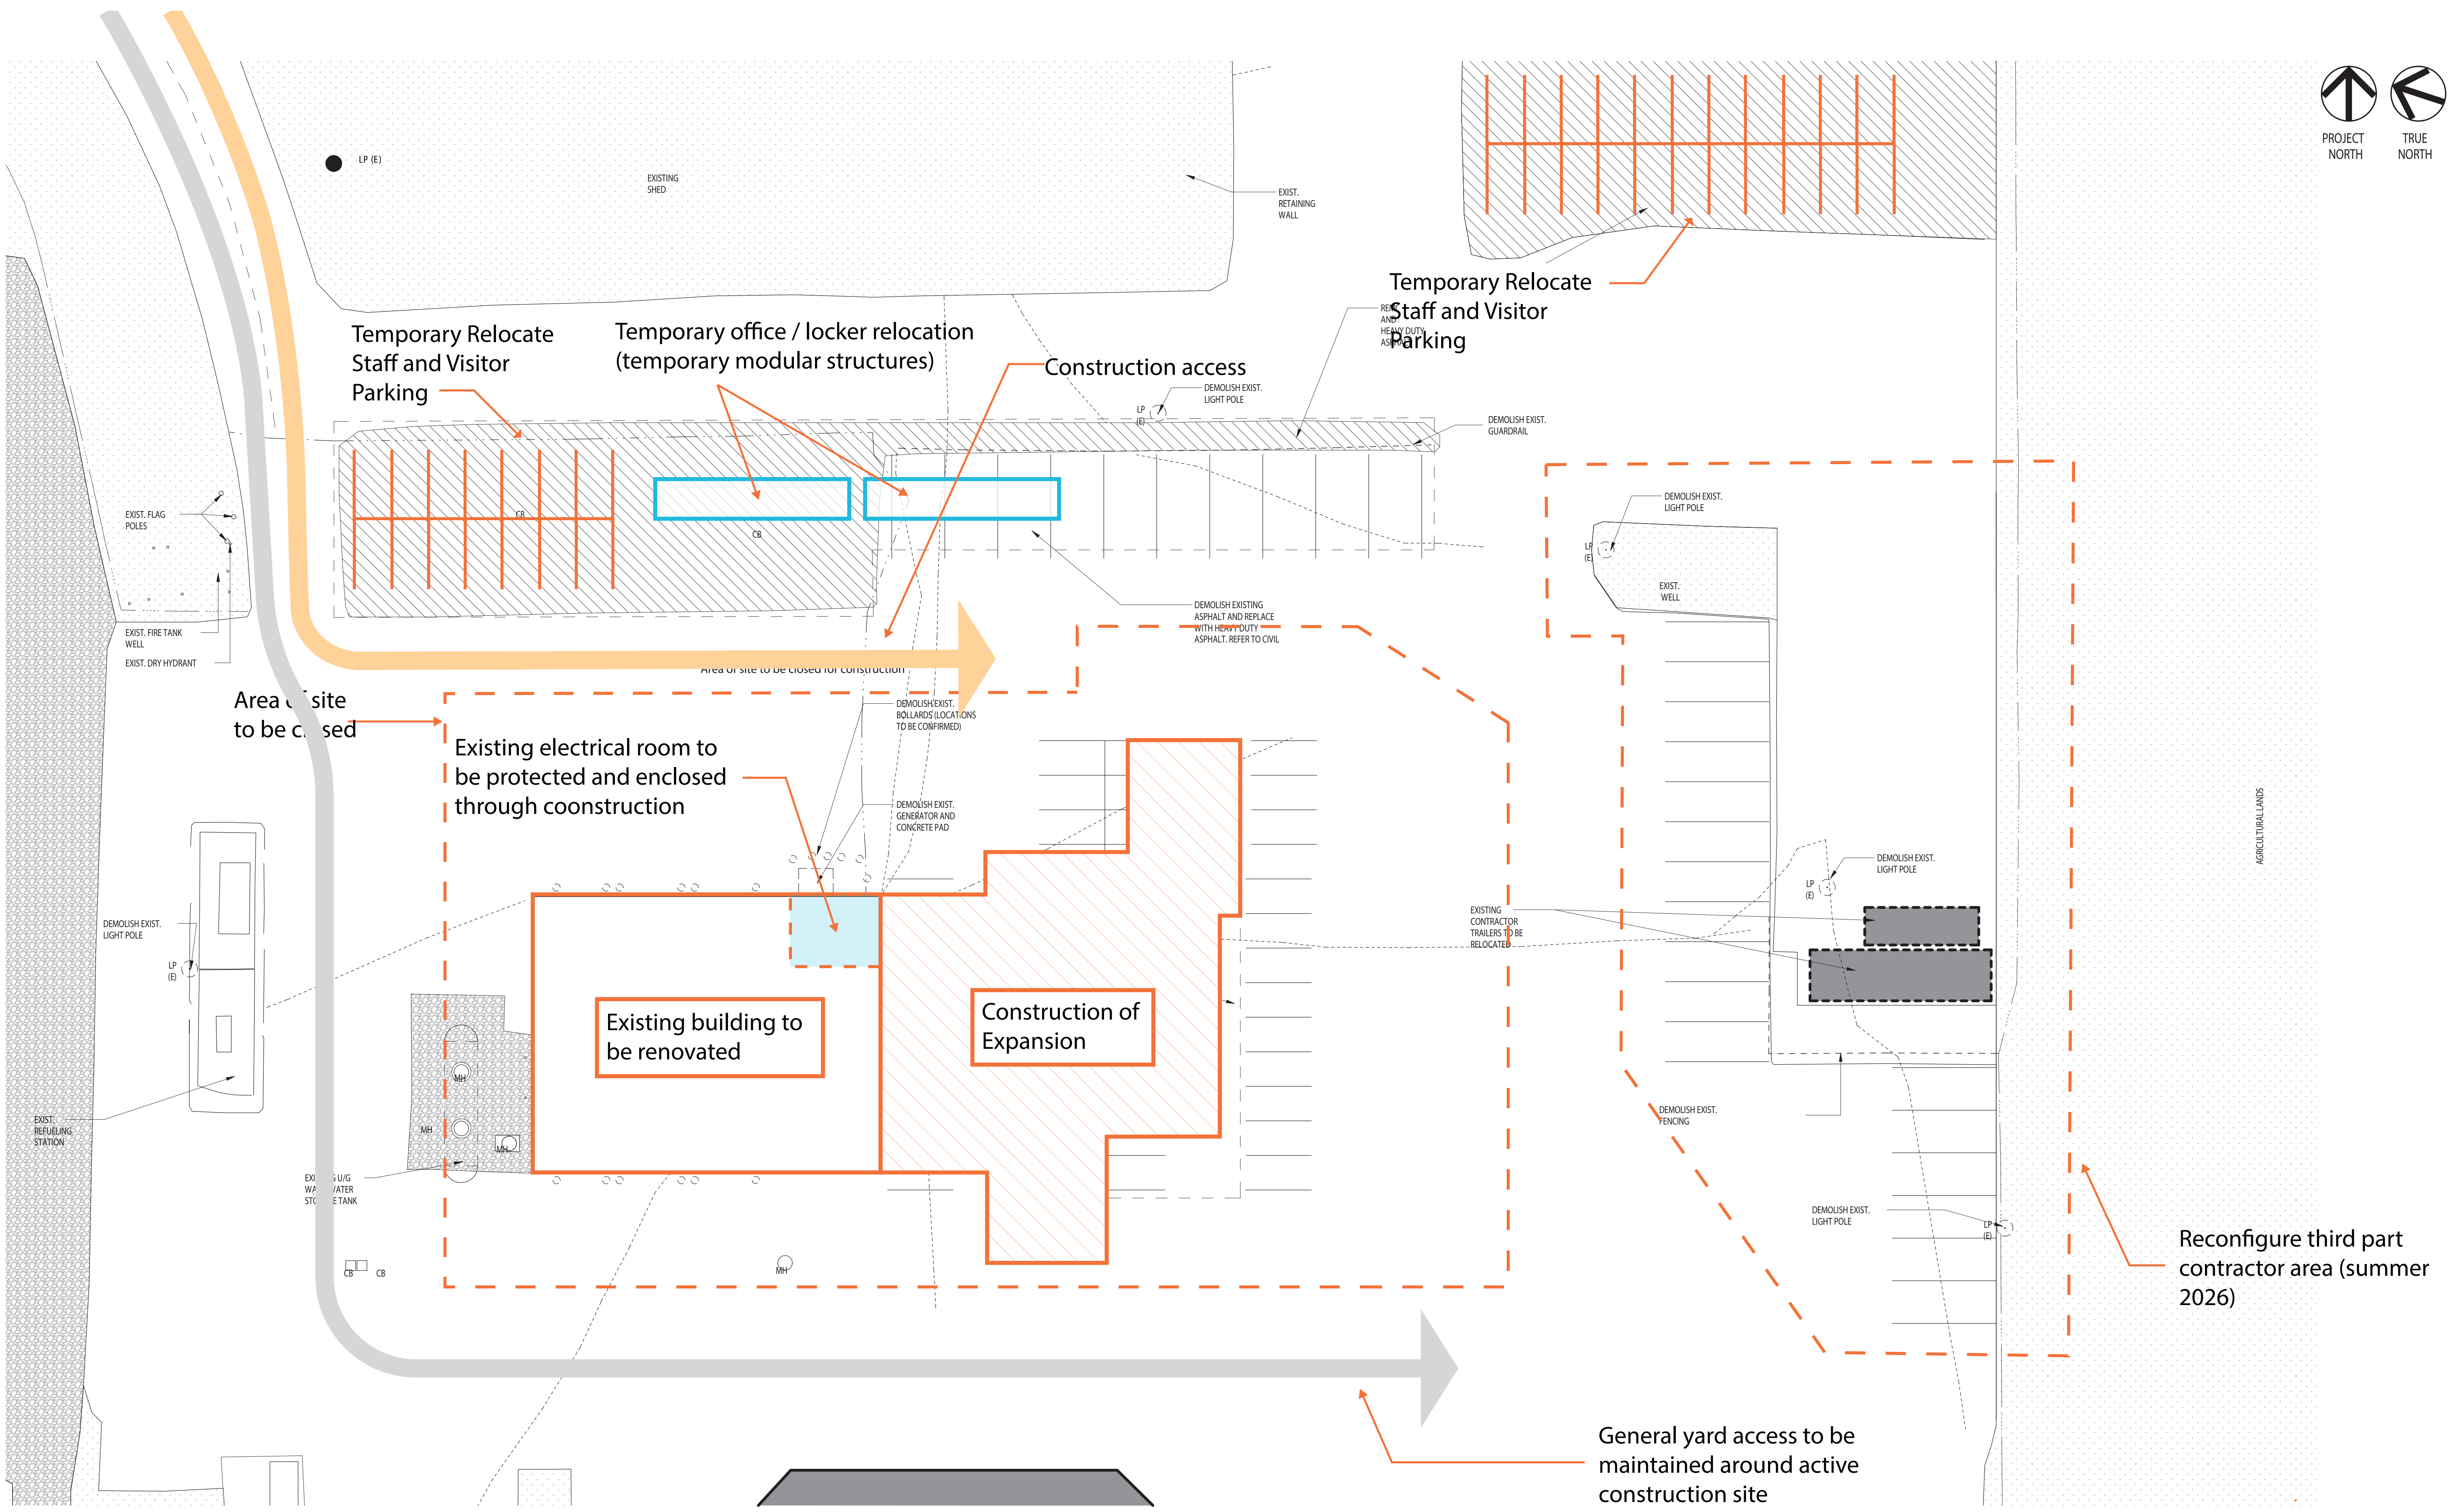

Scenario 2 - Step 1

Start - Late Summer / Fall 2025

Finish - April 1, 2026

- Gas line to be maintained through construction
- ... Denotes hydro line to be relocated
- ... Denotes water main to be relocated
- ... Denotes sanitary line to be relocated
- ... Denotes storm line to be relocated

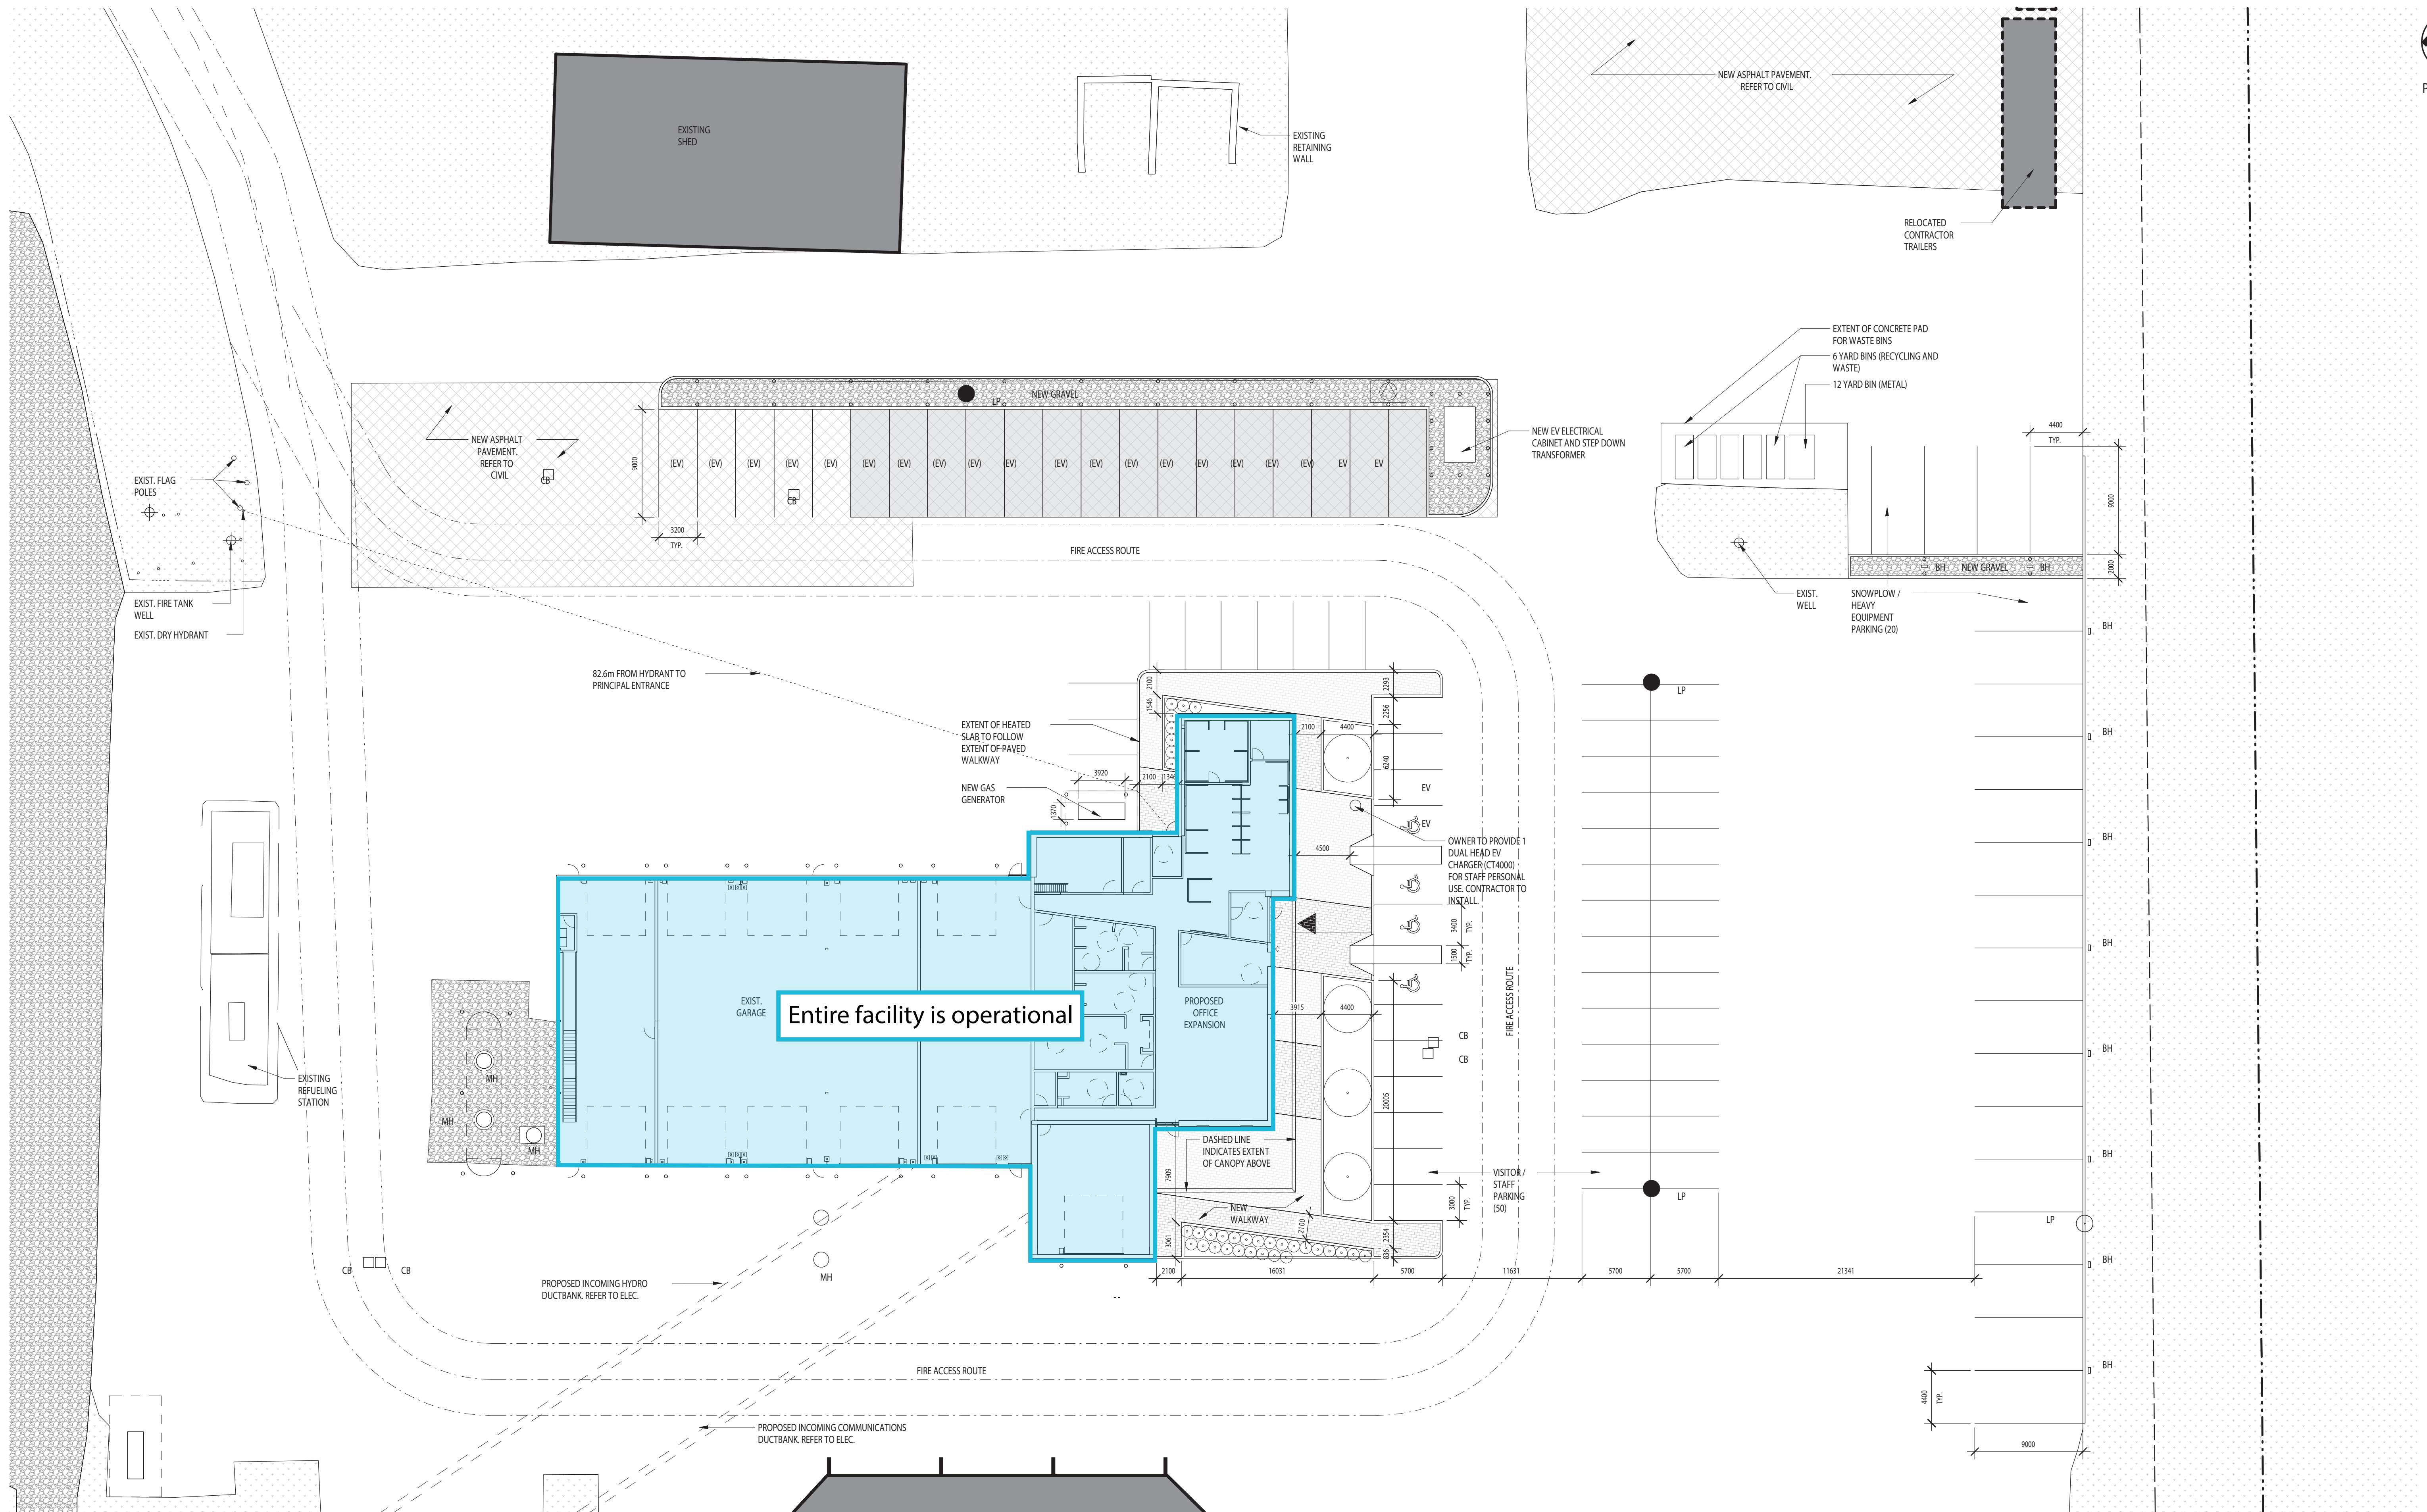

Scenario 2 - Step 2

Start - April , 2026
Finish - Fall 2026

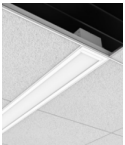

Scenario 2 - Step 3

Start - Before Nov. 1, 2026

Finish - Early 2027

Part 1 General

1.1 GENERAL REQUIREMENTS

- .1 In case of discrepancy of the specifications details, the Owner's standards and requirements attached in the Appendices shall take precedence.**
- .2 Comply with the requirements of Division 1 and all documents referred to therein.
- .3 Work related to telecommunications system shall be installed by a Structured Cabling System (SCS) manufacturers (CommScope, Belden, Panduit, Hubbell, Leviton or approved equal) authorized and certified trained installer and supervised an SCS manufacturers authorized and certified SCS Engineer. Owner reserves the right to review and approves any personnel assigned to this project in a supervisory or managerial role.
- .4 SCS contractor shall have had at least 10 years of comparable experience with telecommunications projects. As part of the proposal, SCS installer shall submit at least three (3) comparable Project reference descriptions with reference contacts. Comparable projects shall equal or exceed size and complexity of work on drawings.
- .5 SCS contractor shall assign RCDD certified Project Manager as the main contact for the project.
- .6 The Contractor shall propose alternate product at no additional cost to the Owner, if the design-based product has been discontinued or obsoleted. The proposed alternate product shall have equal or better performance than the original design-based product.

1.2 APPLICATION

- .1 This Section applies to and is a part of all Sections of Division 27.

1.3 ABBREVIATIONS, ACRONYMS AND DEFINITIONS

ACD	Automatic Call Distribution
AFF	Above Finished Floor
AWG	American Wire Gauge
BICSI	Building Industry Consulting Services International
CAT5	Category 5 Copper Cable
CAT5e	Category 5e Copper Cable
CAT6	Category 6 Copper Cable
CAT6A	Category 6A Copper Cable
CDDI	Copper Distributed Data Interface
CMP	Communications Multipurpose Plenum
CMR	Communications Multipurpose Riser
EIA	Electronic Industries Association
ELFEXT	Equal-Level Far-End Crosstalk
FEXT	Far End Crosstalk
Gbps	Gigabits per second
HSM	High Speed Migration
HVAC	Heating, Ventilation, and Air Conditioning
IDF	Intermediate Distribution
IEEE	Institute of Electrical and Electronics Engineers

IM	Information Management
ISDN	Integrated Services Digital Network
LAN	Local Area Network
Mbps	Megabits per second
MDF	Main Distribution Frame
MMF	Multi-mode fiber optics
MUTOA	Multi-User Telecommunications Outlet Assembly
NEXT	Near End Cross Talk
NRTL	Nationally Recognized Testing Laboratories
OSHA	Occupational Safety and Health Act
PBX-	Private Branch Exchange: telephone switch
PDS	Premises Distribution Systems
PoE	Power over Ethernet
POP	Point of Presence
PSACR	Power Sum Attenuation-to-Crosstalk Ratio
PSAFEXT	Power Sum Alien Far-End Crosstalk
PSAELFEXT	Power Sum Alien Equal Level Far-End Crosstalk
PSANEXT	Power Sum Alien Near-End Crosstalk
PSELFEXT	Power Sum Equal Level Far-End Crosstalk
PSNEXT	Power Sum Near-End Crosstalk
SCC	Security Command Center
SCS	Structured Cabling System
SFF	Small Form Factor
SMF	Single-mode fiber optics
TC	Telecommunications Closet
TE	Telecommunications Enclosure
TEF	Telecommunications Entrance Facility
TIA	Telecommunications Industry Association
TR	Telecommunications Room
TO	Telecommunications Outlet
UPS	Uninterruptible Power Supply
UTP	Unshielded Twisted Pair
VoIP	Voice over Internet Protocol
WAO	Work Area Outlet
WAN	Wide Area Network

- .1 Access Floor - A floor system that has removable floor panels.
- .2 Building Backbone Cabling – Cabling used to connect Floor Distributors (FD) or other local collection points to the Building Distributor (BD). Building backbone cabling typically carries aggregate traffic and, as such, impacts multiple network devices and users. Building backbone cabling may include either fiber optic or copper cabling or both.
- .3 Building Distributor (BD) – Termination point from which all building backbone cabling emanates and interconnection point for the network backbone. Commonly referred to as BDF in Americas, Main Comm Rooms in EMEA and Communication Room, IT Lab or IT Room in AsiaPac. Referred to as BD in international and European industry standards and Intermediate Cross-connect (IC) in American industry standards. There is one BD for each building and it feeds all FD's in the same building. The BD should be located so that all FD's served are within 300 cable meters (984 cable feet).

- .4 Campus Backbone Cabling – Cabling used to connect Building Distributors (BD) or other key network segments to the Campus Distributor (CD). With rare exceptions, campus backbone cabling carries aggregate traffic and typically impacts entire buildings worth of network devices and users and, as such, link redundancy with diverse routing is highly recommended. Campus backbone cabling almost exclusively consists of fiber optic cabling. Copper cabling may be used in short-distance (< 90m) applications. In such cases, lightning protection will usually be required by code.
- .5 Campus Distributor (CD) – Termination point from which all campus backbone cabling emanates and highest-level interconnection point for the network backbone. Commonly referred to as NOC in Americas and Main Comm Rooms in EMEA. Referred to as CD in international and European industry standards and Main Cross-connect (MC) in American industry standards. On smaller campuses, there is one CD for the campus. On larger campuses, there might be several CD's with each CD serving several buildings. Besides linking to each of the BD's it serves, the CD is also the network interconnection point for data center links and links to service providers.
- .6 Category 3 (Cat 3) – A category of transmission performance, defined in TIA standards, that specifies electrical properties up to 10 MHz. Cat 3 is the minimum performance grade permissible and is used typically for analog voice distribution.
- .7 Category 5e (Cat 5e) / Class D – A category/class of transmission performance that specifies electrical properties up to 155.5 MHz. Capable of supporting copper-based, four-pair Gigabit Ethernet (IEEE 802.3ab 1000BASE-T) applications. Category 5e is defined in TIA-568-C standard. Class D is defined in the ISO 11801 standard.
- .8 Category 6 (Cat 6) / Class E – A category/class of transmission performance that specifies electrical properties up to 250 MHz. Refer to the TIA- 568-C family of standards for more information on Category 6 and ISO/IEC 11801 for more information on Class E requirements. Also, refer to CENELEC EN50173.
- .9 Category 6A (Cat 6) / Class EA– A category/class of transmission performance that specifies electrical properties up to 500 MHz and capable of supporting data applications operating at 10Gbps. Refer to the TIA-568-C family of standards for more information on Category 6 and ISO/IEC 11801 for more information on Class EA requirements.
- .10 Category 7 – backward compatible with Class D/Category 5e and Class E/Category 6. Class F features even stricter specifications for crosstalk and system noise than Class E. To achieve this, shielding has been added for individual wire pairs and the cable as a whole.
- .11 Category 8 – ratified by the TR43 working group under ANSI/TIA 568-C.2-1. It is defined up 2000 MHz and only for distances from 30 to 36m depending on the patch cords used. ISO is expected to ratify the equivalent in 2018 but will have 2 options: Class I channel, Category 8.1 cable and Class II channel, Category 8.2 cable. Category 8 is designed only for data centers where distances between switches and servers is short. It is not intended for general office cabling.
- .12 Certification – The testing and documentation of the transmission performance (e.g., Category 5e / Class D) of a permanent link or channel, based on sweep frequency (where applicable) testing of numerous parameters with results

compared to a range of acceptable values. This project requires 100% certification (with documentation) of all permanent link cabling at the time of installation. Channel certification is optional and is the responsibility of the group using the channel.

- .13 Channel – The entire physical pathway between active equipment ports, inclusive of all patch cords, patch panels, jacks and cabling segments.
- .14 Class C – A category of transmission performance, defined in ISO and EN standards, that specifies electrical properties up to 16 MHz
- .15 Conduit - A raceway of circular cross-section.
- .16 Entrance Facility (EF) – Termination point of service provider cables that have entered the building and location of service demarcation point (MPOE) and interconnection point to the network. Commonly referred to as Telco Room in Americas, POP Room in EMEA and Building Entrance in AsiaPac. Referred to as Building Entrance Facility in international and European industry standards and Entrance Facility (EF) in American industry standards. The EF is linked to the CD, where present, or to the BD.
- .17 Floor Distributor (FD) – Termination point for horizontal cabling and interconnection point for network access. Commonly referred to as IDF. Referred to as Floor Distributor (FD) in international and European industry standards and Horizontal Cross-connect (HC) - FD quantities and locations are determined by building size and geometry so that all points served are within 90 cable meters (295 cable feet) of an FD. The FD feeds all Telecommunications Outlets (TO's) in its service zone. All FD's in a building are linked to the building's Building Distributor (BD) via backbone cabling.
- .18 Horizontal Cabling – Cabling used to connect individual work area outlets to local Floor Distributors (FD) or other collection points. Unlike backbone cabling, horizontal cabling does not typically carry aggregate traffic and, as such, impacts only single network devices or users. In buildings, horizontal cabling almost exclusively consists of copper cabling. Fiber optic cabling may be used where situations dictate but, unlike horizontal copper cabling, horizontal fiber optic cabling is not installed in advance as default building facilities. At this writing, horizontal copper cabling in many networks is capable of supporting Gigabit (1Gb/s) Ethernet applications as well as other applications of similar bandwidth.
- .19 Permanent Link – A stationary cabling segment, consisting of the permanently installed cable and the permanently affixed jack at both ends (typically at the outlet faceplate and closet patch panel, or on a patch panel on both ends). The concept assumes that, while patch cords might be disconnected or moved over time, the permanent cable and jacks will not be disturbed and the electrical characteristics of the permanent link will remain unaltered.
- .20 Plenum - A space within the building designed for the movement of environmental air; i.e., a space above a suspended ceiling or below an access floor.
- .21 Raceway - Any channel designed for holding wires or cables; i.e. conduit, electrical metal tubing, busways, wireways, ventilated flexible cableway.
- .22 Spine – also called a backbone, the main communications cables in an IDF.

1.4 DEFINITIONS & REFERENCE STANDARDS

- .1 Wherever the term "This Sub-Contractor" is used in the Division 27 Drawings and Specifications, it means the firm having a subcontract with the "Contractor" to perform, supervise and co-ordinate all work of this Division.
- .2 Wherever the term "install" (and tenses of "install") is used in the Division 27 Drawings and Specifications, it means install and connect complete.
- .3 Wherever the term "supply" is used in the Division 27 Drawings and Specifications, it means supply only.
- .4 Wherever the term "Provide" or "Provision of" are used in relationship to equipment and other materials specified for the Work of Division 27 it means "Supply, Install and Connect". Wherever the terms "Provide" or "Provision of" are used in connection with services such as testing, start-up and commissioning for any part of the Work of Division 27, it means procure, supervise, take responsibility and pay for these services.
- .5 Whenever "Drawings and Specifications" are referred to herein, it means "the Contract Documents".
- .6 Wherever the terms "Authorities" or "Authorities having jurisdiction" are used in the Division 27, Drawings and Specifications, it shall mean any and all current laws and/or by-laws of any federal, provincial or local authorized agencies having jurisdiction over the sum total or parts of the work including, but not restricted to the Municipal Planning and Building Department, Municipal Fire Department, The Construction Safety Act, Municipal Public Works Department, Federal and/or Provincial Fire Marshall, the Ontario Electrical Safety Code and the Ontario Building Code.
- .7 Wherever the term "Work" is used in the Division 27 Drawings and Specifications, it means all equipment, permits, materials and labour to provide a complete communications installation as required and detailed in the Drawings and Specifications.
- .8 Wherever the term "Acceptable" is used in the Division 27 Drawings and Specifications it means acceptable to the Consultant.
- .9 Reference Standards:
 - Ontario Building Code
 - Ontario Electrical Safety Code
 - Telecommunications Industry Association (TIA)
 - ANSI/TIA-568.0-E Generic Telecommunications Cabling for Customer Premises
 - ANSI/TIA-568.1-E Commercial Building Telecommunications Cabling Standard
 - ANSI/TIA-568.2-D Balanced Twisted-Pair Telecommunications Cabling and Components Standards
 - ANSI/TIA-568.3-D Optical Fiber Cabling and Components Standard
 - ANSI/TIA-568.4-D Coaxial Components
 - ANSI/TIA-569-E, Telecommunications Pathways and Spaces.
 - ANSI/TIA-526-7-A, Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant
 - ANSI/TIA-526-14-C, Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant

BICSI G1-17, ICT Outside Plant Construction and Installation: General Practices

1.5 WORK INCLUDED

- .1 Sections of Division 27 are not intended to delegate functions nor to delegate work and supply to any specific trade and the Work shall include all labour, materials, equipment and tools required for a complete and working installation as described, but not necessarily limited to all the sections in the specifications.

1.6 PERMITS, FEES AND INSPECTIONS

- .1 Apply for, obtain, and pay for all permits, licenses, inspections, examinations and fees required for Work of Division 27. If the municipality is structured as a "single permit jurisdiction", the Contractor will apply, pay for and obtain the municipal building permit. In this case, the Division 27 contractor has no financial obligation for permit application except for permits not covered in the "single permit".
- .2 Arrange for inspection of all Work by the Authorities having jurisdiction over the Work. On completion of the Work, present to the Consultant the final unconditional certificate of approval of the inspecting Authorities.
- .3 Comply with the requirements of the latest edition of the applicable CSA standards, the requirements of the Authorities, Federal, Provincial and Municipal Codes, the applicable standards of the Underwriters' Association and all other Authorities having jurisdiction. These codes and regulations constitute an integral part of these specifications.
- .4 In case of conflict, the codes take precedence over the Contract Documents. In no instance reduce the standard or scope of work or intent established by the drawings and specifications by applying any of the codes referred to herein.
- .5 Before starting any work, submit the required number of copies of drawings and specifications to the Authorities for their approval and comments. Comply with any changes requested as part of the contract, but notify the Consultant immediately of such changes. Prepare and furnish any additional drawings, details or information as may be required.

1.7 CONTRACT DRAWINGS

- .1 The Drawings for Communications work are performance drawings, diagrammatic, intended to convey the scope of work and indicate general arrangement and approximate location of apparatus, fixtures and conduit runs. The Drawings do not intend to show architectural and structural details.
- .2 Do not scale Drawings. Obtain information involving accurate dimensions from dimensions shown on Architectural and Structural drawings, and by site measurement.
- .3 Make, at no additional cost, any changes or additions to materials, and/or equipment necessary to accommodate structural conditions (conduits around beams, columns, etc.)
- .4 Alter, at no additional cost, the locations of materials and/or equipment as directed, that do not necessitate additional material.
- .5 Install ceiling mounted components in accordance with reflected ceiling drawings.
- .6 Confirm on the site the exact location and mounting elevation of outlets and fixtures as related to Architectural and Structural details.

1.8 EXAMINATION OF SITE AND DOCUMENTATIONS

- .1 Prior to submitting tender, carefully examine conditions at the site which could affect the Work. Refer to and examine all contract documents.

- .2 Be responsible for any damage done to existing underground services caused by neglect to determine and mark out the location of such services prior to excavation work commencing.
- .3 Refer to room finish schedules to determine finished, partially finished and unfinished areas of the building.
- .4 Ensure that materials and equipment are delivered to the site at the proper time and in such assemblies and sizes so as to enter into the building and to be moved into the spaces where they are to be located without difficulty. Be responsible for any cutting and patching involved in getting assemblies into place.

1.9 CO-ORDINATION DRAWINGS

- .1 Prepare drawings in conjunction with all trades concerned, showing sleeves and openings for passage through structure, and all inserts, equipment bases, and supports, and relate these to suitable grid lines and elevation datum.
- .2 When requested, provide weights of major items of equipment.
- .3 Prepare interference and co-ordination drawings for all areas where the work of this Division could conflict with and/or obstruct the work of other trades and/or other Sections of this Division. Submit drawings for review by the Consultant.

1.10 RECORD DRAWINGS

- .1 The drawings for this Project have been prepared using AutoCAD. For the purpose of producing record (as-built) drawings, copies of contract drawings may be purchased from the Consultant based on the following rates plus HST. In using the drawings from the Consultant to produce record drawings, the Contractor is deemed to have agreed to take full responsibility for any and all information on the drawings.
- .2 The drawings for this Project have been prepared using Revit/BIM 360. For the purpose of exchanging model and producing record (as-built) drawings, a model file will be made available to the trade for a cost of \$850 plus HST. In using the model from the Consultant to produce record drawings, the Contractor is deemed to have agreed to take full responsibility for any and all information on the drawings.

For 1 to 10 files	\$550.00
For 11 to 20 files	\$650.00
For 21 to 50 files	\$850.00
For 51 to 100 files	\$1,350.00
For greater than 100 files, charge	\$10.00 per file + \$350.00.
- .3 Obtain a set of white prints as the job progresses, mark this set to accurately indicate installed work. Show location by dimension from walls or columns for all buried services as well as invert depths. Have these white prints available for inspection at the site at all times, and present for scrutiny at each job meeting.
- .4 At completion of the project, transfer all information from the white prints to the CAD files, and provide one CD with updated CAD files, to the Consultant as part of the close out documents.

- .5 The contractor is responsible for all cost associated with the production and services required, such as recreating, plotting and printing to produce “as-built” drawings.

1.11 PRODUCT STANDARDS AND ALTERNATIVES

- .1 Provide new material and equipment as specified and to the acceptance of the Consultant. Manufacturer's names are listed to set a standard of quality, performance, capacity, appearance and serviceability. Other acceptable manufacturers are also listed, and their names may be used in the submission of the Communications List of Manufacturers, Subtrades and Separate and Unit Prices Tender subject to conditions stipulated in paragraph .3 of this article.
- .2 Where no other acceptable manufacturers are indicated, provide the exact make specified. Requests for acceptance of manufacturers not listed must be submitted not less than seven working days prior to closing date of the tender and submissions must bear proof of acceptance by the Consultant if used in the tender. No exceptions. Requests for substitutions shall be considered not approved unless approval is issued in writing by the Consultant.
- .3 Assume full responsibility for ensuring that when providing other acceptable and approved manufacturers, system performance shall be equal or better than the base system. Provide clause-by-clause specifications comparison between the base system and the alternate substituted system. Provide system performance study as required by the Consultant and to the satisfaction of the Consultant.

1.12 PATENTS

- .1 Pay all royalties and licence fees, and defend all suits or claims for infringement of any patent rights, and save the Owner and Consultant harmless of loss or annoyance on account of suit, or claims of any kind for violation or infringement of any letters, patent or patent rights, by this Subcontractor or anyone directly or indirectly employed by him or by reason of the use by him or them of any part, machine, manufacture or composition of matter on the work, in violation or infringement or such letters, patent or rights.

1.13 RIGHTS RESERVED

- .1 Rights are reserved to furnish any additional detail drawings, which in the judgement of the Consultant may be necessary to clarify the work, and such drawings shall form a part of this contract.

1.14 EQUIPMENT NAMEPLATES

- .1 Provide apparatus with proper nameplates affixed thereto, showing the size, name of equipment, serial number and all information usually provided, which also includes voltage, cycle, phase, horsepower of motors and the name and address of the manufacturer.

1.15 EXPEDITING AND DELIVERY

- .1 Continuously check and expedite delivery of equipment and materials. If necessary, inspect at the source of manufacture.

- .2 Continuously check and expedite the flow of necessary information to and from all parties involved.
- .3 Immediately inform the Consultant in case information is required from him.
- .4 Provide delivery records updated monthly.

1.16 SUPERINTENDENCE

- .1 Maintain at the job site, at all times, qualified personnel and supporting staff, with proven experience in erecting, supervising, testing and adjusting projects of comparable nature and complexity.
- .2 The supervising personnel and their qualifications are subject to the approval of the Consultant.

1.17 WORKMANSHIP

- .1 Install equipment, conduit and cables in a workmanlike manner to present a neat appearance to function properly to the satisfaction of the Consultant. Install runs parallel and perpendicular to building lines, in chases, behind furring or above ceilings, where such concealment is possible. In areas where systems are to be exposed install neatly and group to present a tidy appearance.
- .2 Install equipment and apparatus requiring maintenance, adjustment or eventual replacement with due allowance therefore.
- .3 Include in the work all requirements of manufacturers shown on the shop drawings or manufacturers installation instructions.
- .4 Replace work unsatisfactory to the Consultant without extra cost.
- .5 Make provision to accommodate future plant and equipment indicated on drawings.
- .6 Protect from damage all equipment delivered to the site and during installation. Any damage or marking of finished surfaces shall be made good to the satisfaction of the Consultant.

1.18 TRIAL USAGE AND TESTS

- .1 The Owner has the privilege of the trial usage of Communications Systems or parts thereof for the purpose of testing and learning the operational procedures.
- .2 Assist in trial usage over a length of time as deemed reasonable by the Consultant at no extra cost and do not waive any responsibility because of trial usage.
- .3 Trial usage shall not be construed as Substantial Completion of the Work, or acceptance by the Owner.
- .4 Provide and pay for all testing required on the system components where, in the opinion of the Consultant, manufacturers ratings or specified performance is not being achieved.

1.19 CLEANING

- .1 Remove all debris, surplus material and all tools.

- .2 Carry out additional cleaning operating of systems as specified in other sections of the specification.

1.20 COMPLETION

- .1 Leave communications work in specified working order.

1.21 WARRANTIES

- .1 A Manufacturers Limited Lifetime Product and Performance Warranty shall be obtained by the Contractor on behalf of the Owner covering all applicable structured cabling components of the installed system. It is the responsibility of the contractor to provide all forms/documents necessary to obtain the system warranty. Evidence of such warranty will be provided by Contractor as part of their contractual obligation and final retainage payments are contingent upon delivery to Owner of Manufacturers site warranty certificate.
- .2 Provide warranty certificates, wherever given or required, in excess of the normal warranty period showing the name of the firm giving the warranty, dated and acknowledged, on specific equipment and systems.
- .3 Contractor warranty: Provide all services, materials and equipment necessary for successful operation of entire telecommunications system and SCS system for a period of one year after system acceptance. Scope of warranty includes all equipment, devices, wiring, accessories, software, hardware, installation, programming, and configuration required to maintain a complete and operable system. Provide manufacturer's published recommended preventative maintenance procedures during warranty period. This shall apply to all items except those specifically excluded, or items wherein a longer period of service and warranty is specified or indicated. All warranties shall be effective for one year, minimum, from date Certificate of Final Acceptance is issued. Use of systems provided under this section for temporary services and facilities shall not constitute final acceptance of work nor beneficial use by Owner and shall not institute warranty period. The warranty shall cover repair or replacement of defective materials, equipment, workmanship, and installation that may be incurred during this period. Warranty work is to be done promptly and to Owner's satisfaction. In addition, warranty shall cover correction of damage caused in making necessary repairs and replacements under warranty.
- .4 At end of warranty period, transfer manufacturers' equipment and material warranties still in force to Owner.
- .5 If warranty work problems cannot be corrected immediately to Owner's satisfaction, advise Owner in writing, describing efforts to correct situation, and provide analysis of cause for problem. If necessary to resolve problem, provide at no cost services of manufacturer's engineering and technical staff at site in a timely manner to analyze warranty issues, and develop recommendations for correction, for review and approval by Owner.

1.22 INSTRUCTION TO OWNERS

- .1 Instruct the Owner's representatives in all aspects of the operation of systems and equipment.

- .2 Arrange for and pay for services of service engineers and other manufacturers' representatives required for instruction on specialized portions of the installation.
- .3 Submit to the Consultant at the time of final inspection a complete list of systems stating for each system:
 - .1 Date instructions were given to the Owner's staff.
 - .2 Duration of instruction.
 - .3 Name of persons instructed.
 - .4 Other parties present (manufacturer's representative, consultants, etc.).
- .4 Signatures of the Owner's staff stating that they properly understood the system installation, operation and maintenance requirements.

1.23 DOCUMENTATION AND SYSTEMS ACCEPTANCE

- .1 Assemble three (3) copies of operating and instruction manuals in three ring binders with index tabs each and searchable PDF in flash drive, containing this subcontractor's and suppliers names and telephone numbers.
- .2 Each manual shall contain the following data:
 - .1 A set of as-built prints.
 - .2 Letters of Owner's Instructions
 - .3 A copy of each "reviewed" shop drawing.
 - .4 Complete explanation of operation principles and sequences.
 - .5 Complete part lists with numbers.
 - .6 Recommended maintenance practices and precautions.
 - .7 Complete wiring and connections diagrams.
 - .8 Certificate of warranty.
- .3 Ensure that operating and maintenance instructions are specific and apply to the models and types of equipment provided.

1.24 OWNER'S RIGHT TO RELOCATE COMMUNICATIONS ITEMS

- .1 The Owner reserves the right to relocate telecom outlets at a later date, but prior to installation, without cost, assuming that the relocation per outlet does not exceed 3000 mm from the original location. No credits shall be anticipated where relocation per outlet of up to and including 3000 mm reduces materials, products and labour.
- .2 Should relocations per outlet exceed 3000 mm from the original location the Contract Price will be adjusted accordingly.
- .3 Necessary changes, due to lack of co-ordination, and as required and when approved, shall be made at no additional cost, to accommodate structural and building conditions. The location of conduits and other equipment shall be altered without charge to the Owner, if approved, provided the change is made before installation.

1.25 COMMUNICATIONS LIST OF MANUFACTURERS, SUBTRADES AND PRICES

- .1 At the time of tender closing, list the names of manufacturers or subtrades carried (one per item), the total cost of the Communications Works, any separate, unit and alternative prices where indicated.
- .2 If this Subcontractor neglects to list the specified or acceptable manufacturers or lists more than one manufacturer per item, or lists manufacturers not specified, the Consultant will have the option of making the selection of the manufacturer.
- .3 There will be no substitutions of named manufacturers or subtrades after tender close except as approved by the Consultant.

1.26 PHASING AND SCHEDULING OF WORK

- .1 Refer to Scope of work for a detailed description of the phasing and scheduling of the work. Execute work in accordance with the phasing and construction schedule. Provide all necessary temporary connections and equipment to provide functional, operational systems during construction period when part of the building will be occupied and construction is still continuing in other portions.

1.27 MATERIALS FURNISHED BY OTHERS

- .1 Where materials are furnished by others for installation under this Division, the Sub-Contractor shall notify the supplier of dates he will be ready for delivery as specified in the General Conditions. The Sub-Contractor shall receive, unload, handle, store, protect and insure the material until ready for actual installation. Upon receipt of material furnished by others, the Sub-Contractor shall spot-check or check the entire shipment and promptly advise the Consultant in writing of any damage and/or missing components. Any material which is subsequently lost or damaged due to negligence on the part of the Sub-Contractor shall be promptly replaced (or repaired to the satisfaction of the Owner) at the Sub-Contractor's expense.

1.28 CONNECTIONS TO EQUIPMENT FURNISHED BY OTHERS.

- .1 Where the Drawings indicated equipment to be furnished by others, provide communications cabling for each unit pursuant to its shop drawings for a complete installation.

1.29 COMMUNICATIONS LEGEND & SCHEDULES

- .1 Refer to Communications Drawings for Legend and Schedules

Part 2 Products

2.1 NIL

Part 3 Execution

3.1 NIL

END OF SECTION

Part 1 General

1.1 GENERAL

- .1 Submit Shop Drawings, Product Data and Samples as specified herein.
- .2 Designate in the Construction Schedule, or in a separate coordination schedule, dates for submission and dates that reviewed Shop Drawings, Product Data and Sample will be required. Give due consideration for review time required by the Consultant, with a minimum of fifteen (15) working days required. The submission will be considered an acceptable submittal schedule.
- .3 All data and dimensions on shop drawings, product data and sample information to be based on units (Imperial or Metric) as shown on the contract documents.
- .4 Shop Drawings with errors or omissions and deviations will be returned "Not Reviewed".
- .5 The Contractor's responsibility for deviations in submission from the requirements of Contract Documents is not relieved by the Consultant's review of submittals, unless a deviation on the submittal is noted as such in writing and has been accepted by the Consultant.
- .6 Keep one (1) reviewed copy of each submission on site.

1.2 SHOP DRAWINGS

- .1 Review and stamp Shop Drawings, Product Data and Samples prior to submission to the Consultant. Confirm that necessary requirements have been determined and verified and that each submittal has been checked and coordinated with requirements of the Work and the Contract Documents. Submittals not stamped, signed, dated and identified as to the specific project, will be returned without being examined and shall be re-submitted when completed.
- .2 Submit drawings in a clear and thorough manner:
 - .1 Identify details by reference to drawing No. and detail, schedule or room numbers as shown on Contract Documents.
 - .2 Minimum sheet size and larger sheets to be multiples of 8½" x 11".
 - .3 Indicate materials, methods of construction and attachment or anchorage, erection diagrams, connections, explanatory notes and other information necessary for completion of Work. Where articles or equipment attach or connect to other articles or equipment, indicate that such items have been coordinated. Indicate cross references to design drawings and specification.
 - .4 Adjustments to shop drawings by the Consultant do not change the cost of the work. If adjustments affect the cost of Work, advise through normal channels in writing prior to proceeding with the Work.
 - .5 Make changes in shop drawings as directed by the Consultant. Resubmit and note any revisions other than those requested.
 - .6 If only minor adjustments are made, shop drawings to be returned and fabrication and installation of work to proceed.
- .3 Determine and verify:

- .1 Field measurements.
- .2 Field construction criteria.
- .3 Catalogue numbers and similar data.
- .4 Conformance with Specifications.
- .4 Co-ordinate each submittal with requirements of the Contract documents.
- .5 Each Shop Drawing will be stamped by the Consultant in the following format:

<input type="checkbox"/> NOT REVIEWED	<input type="checkbox"/> REVIEWED
<input type="checkbox"/> RESUBMIT	<input type="checkbox"/> REVIEWED AS MODIFIED
- .6 This review by the Consultant is for the sole purpose of ascertaining conformance with the general design concept. This review shall not mean that the Consultant approved the detail design inherent in the shop drawings, responsibility for which shall remain with this Subcontractor submitting same, and such review shall not relieve this Subcontractor of his responsibility for errors or omissions in the shop drawings or of his responsibility for meeting all requirements of the contract documents. The Contractor is responsible for dimensions to be confirmed and correlated at the job site, for information that pertains solely to fabrication.
- .7 Products not specified by MCW are reviewed to confirm compliance with services provided only. Any changes required between provided services and shop drawing requirements will be identified for coordination between trades.
- .8 Shop drawings shall be accompanied by a complete copy of the attached "Shop Drawing Submittal Sheet" Section 27 05 01, Appendix 'X'.
- .9 Begin no fabrication or work which requires submittals until return of submittals reviewed by Consultant.

1.3 PRODUCT DATA

- .1 Where specified, Manufacturer's standard schematic drawings, catalogue sheets, diagrams, schedules, performance charts, illustrations and other standard descriptive data is acceptable provided there is conformance with the following:
 - .1 Clearly identify pertinent products or models.
 - .2 Show performance characteristics and capacities.
 - .3 Show dimensions and clearances required.
 - .4 Show wiring or piping diagrams and controls.
- .2 Manufacturer's standard schematic drawings and diagrams may require modifications to drawings and diagrams to provide information applicable to the Work.
- .3 Provide information specifically applicable to the Work.

1.4 SAMPLES

- .1 Samples to be labelled, of sufficient size and quantity to clearly illustrate:
 - .1 Functional characteristics integrally related parts and attachment devices.
 - .2 Full range of colour, texture and pattern.

- .2 Field Samples and mock-ups:
 - .1 Erect, at the project site and in location acceptable to the Consultant.
 - .2 Fabricate each sample and mock-up complete and finished.
 - .3 Remove mock-ups at conclusion of Work or as specified by the Consultant.

1.5 SUBMISSION REQUIREMENTS

- .1 Submit promptly to approved schedule and in sequence to prevent submission delay in the Work.
- .2 Submission requirements:
 - .1 Shop Drawings: Acceptable submissions are: PDF format via e-mail or project shared website. Paper and faxed copies are not acceptable.
 - .2 Product Data: Submit a copy for each O & M Manual.
 - .3 Samples: Submit as specified, or as requested during the shop drawing review period.

1.6 RESUBMISSION REQUIREMENTS

- .1 Make corrections or changes to the submittals noted by the Consultant and resubmit.
- .2 Shop Drawings and Product Data:
 - .1 Revise drawings or data, and resubmit as noted on the initial submittal.
 - .2 Indicate any changes which have been made other than those noted by the Consultant.
- .3 Samples: Submit new samples as required for initial submittal as soon as possible after notification of the rejection of the original submission and mark "resubmitted samples".

1.7 DISTRIBUTION

- .1 Distribute reproductions of Shop Drawings and copies of Product Data which carry the Consultant's stamp to all parties as specified by Division One General Requirements.
 - .1 Job site file
 - .2 Project record document file
 - .3 Other affected contractors
 - .4 Subcontractors
 - .5 Supplier or fabricator (as applicable)
 - .6 Operations Manual

Part 1 General

1.1 Work Includes

- .1 Provide all labor, materials, and equipment for the complete installation of work called for in the Contract Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for the equipment and cable installations in Telecom Spaces.
- .2 Included in this section are the minimum composition requirements and installation methods for the following:
 - .1 Grounding Electrode System
 - .2 Busbars
 - .3 Bonding accessories

1.3 Quality Assurance

- .1 All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative. Equipment and materials shall be of the quality and manufacture indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "approved equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.
- .2 Strictly adhere to all Building Industry Consulting Service International (BICSI) and Telecommunications Industry Association (TIA) recommended installation practices when installing communications/data cabling.
- .3 Material and work specified herein shall comply with the applicable requirements of the current revision of the following:
 - ANSI/TIA-568 Commercial Building Telecommunications Cabling Standard
 - ANSI/TIA-569 Telecommunications Pathways and Spaces
 - ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure
 - BICSI – Telecommunications Distribution Methods Manual
 - J-STD-607-A Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
 - Ontario Electrical Safety Code

1.4 Submittals

- .1 A. Provide product data for the following:
 - .1 Manufacturers cut sheets, specifications and installation instructions for all products (submit with bid).

Part 2 Products

2.1 Grounding Electrode System

- .1 Grounding Electrode System
 - .1 When required the Grounding Electrode System shall meet the following
 - .1 Active grounding system constantly replenishing moisture into the soil
 - .2 Provide low resistance to ground
 - .3 Provide season to season stability
 - .4 Be maintenance-free for 30 years
 - .5 Contain no hazardous materials or chemicals
 - .2 Approved Manufacturers:

2.2 Wall-mount Busbars

- .1 Telecommunications Main Grounding Busbar (TMGB)
 - .1 Telecommunications Main Grounding Busbar (TMGB) shall be constructed of .25" (6.4 mm) thick solid copper bar.
 - .2 The busbar shall be 4" (100 mm) high and 20" (510 mm) long and shall have 30 attachment points (two rows of 15 each) for two-hole grounding lugs.
 - .3 The hole pattern for attaching grounding lugs shall meet the requirements of ANSI-J-STD – 607-A and shall accept 27 lugs with 5/8" (15.8 mm) hole centers and 3 lugs with 1" (25.4 mm) hole centers.
 - .4 The busbar shall include wall-mount stand-off brackets, assembly screws and insulators creating a 4" (100 mm) standoff from the wall.
 - .5 The busbar shall be UL Listed as grounding and bonding equipment.
- .2 Telecommunications Grounding Busbar (TGB)
 - .1 Telecommunications Grounding Busbar (TGB) shall be constructed of .25" (6.4 mm) thick solid copper bar.
 - .2 The busbar shall be 2" (50 mm) high and 12" (300 mm) long and shall have 9 attachment points (one row) for two-hole grounding lugs.
 - .3 The hole pattern for attaching grounding lugs shall meet the requirements of ANSI-J-STD – 607-A and shall accept 6 lugs with 5/8" (15.8 mm) hole centers and 3 lugs with 1" (25.4 mm) hole centers.
 - .4 The busbar shall include wall-mount stand-off brackets, assembly screws and insulators creating a 4" (100 mm) standoff from the wall.
 - .5 The busbar shall be UL Listed as grounding and bonding equipment.

2.3 Bonding Accessories

- .1 Two Mounting Hole Ground Terminal Block
 - .1 Ground terminal block shall be made of electroplated tin aluminum extrusion.
 - .2 Ground terminal block shall accept conductors ranging from #14 AWG through 2/0.

- .3 The conductors shall be held in place by two stainless steel set screws.
- .4 Ground terminal block shall have two 1/4" (6.4 mm) holes spaced on 5/8" (15.8 mm) centers to allow secure two-bolt attachment to the rack or cabinet.
- .5 Ground terminal block shall be UL Listed as a wire connector.
- .2 Compression Lugs
 - .1 Compression lugs shall be manufactured from electroplated tinned copper.
 - .2 Compression lugs shall have two holes spaced on 5/8" (15.8 mm) or 1" (25.4 mm) centers, as stated below, to allow secure two bolt connections to busbars.
 - .3 Compression lugs shall be sized to fit a specific size conductor, sizes #6 to 4/0, as stated below.
 - .4 Compression lugs shall be UL Listed as wire connectors.
- .3 Antioxidant Joint Compound
 - .1 Oxide inhibiting joint compound for copper-to-copper, aluminum-to-aluminum or aluminum-to-copper connections.
- .4 C-Type, Compression Taps
 - .1 Compression taps shall be manufactured from copper alloy.
 - .2 Compression taps shall be C-shaped connectors that wrap around two conductors forming an irreversible splice around the conductors; installation requires a hydraulic crimping tool
 - .3 Compression taps shall be sized to fit specific size conductors, sizes #2 AWG to 4/0, as stated below.
 - .4 Compression taps shall be UL Listed.
- .5 Pedestal Clamp with Grounding Connector
 - .1 Pedestal clamp shall be made from electroplated tinned copper or bronze. Installation hardware will be stainless steel.
 - .2 Pedestal clamps shall be sized to fit a specific size conductor, size #6 and/or 2/0, as stated below.
 - .3 Pedestal clamp installation hardware shall be sized to attach to round and/or square raised access floor pedestals that are 1-1/8" to 1-3/4" in diameter, as stated below.
 - .4 Pedestal clamp shall provide straight (in-line) or cross (intersection) support for up to two conductors.
 - .5 Pedestal clamp shall be UL Listed as grounding and bonding equipment.
- .6 Pipe Clamp with Grounding Connector
 - .1 Pipe clamp shall be made from electroplated tinned bronze. Installation hardware will be stainless steel.
 - .2 Pipe clamp shall be sized to fit up to two conductors ranging in size from #6 to 250 MCM; conductors must be the same size.
 - .3 Pipe clamp installation hardware shall be sized to attach to pipes, sizes 1" to 6" (.75" to 6.63" in diameter), as stated below.

- .4 Pipe clamp shall be UL Listed as grounding and bonding equipment.
- .7 Equipment Ground Jumper Kit
 - .1 Kit includes one 24" L insulated ground jumper with a straight two-hole compression lug on one end and an L-shaped two-hole compression lug on the other end, two plated installation screws, an abrasive pad and a .5 ounce tube of antioxidant joint compound.
 - .2 Ground conductor is an insulated green/yellow stripe #6 AWG wire
 - .3 Lugs are made from electroplated tinned copper and have two mounting holes spaces .5" to .625" apart that accept 1/4" screws.
 - .4 Jumper will be made with UL Listed components.

Part 3 Execution

3.1 Installation

- .1 Outdoor grounding and bonding connections.
 - .1 All outdoor grounding and bonding (earthing) connections shall be accomplished using exothermic welding.
- .2 Wall-Mount Busbars
 - .1 Attach busbars to the wall with appropriate hardware according to the manufacturer's installation instructions.
 - .2 Conductor connections to the TMGB or TGB shall be made with two-hole bolt- on compression lugs sized to fit the busbar and the conductors.
 - .3 Each lug shall be attached with stainless steel hardware after preparing the bond per manufacturer recommendations and treating the bonding surface on the busbar with antioxidant to help prevent corrosion at the bond.
 - .4 The wall-mount busbar shall be bonded to ground as part of the overall Telecommunications Bonding and Grounding System.
- .3 Rack-Mount Busbars and Ground Bars
 - .1 When a rack or cabinet supports active equipment or any type of shielded cable or cable termination device requiring a ground connection, add a rack-mount horizontal or vertical busbar or ground bar to the rack or cabinet. The rack- mount busbar or ground bar provides multiple bonding points on the rack for rack and rack-mount equipment.
 - .2 Attach rack-mount busbars and ground bars to racks or cabinets per the manufacturer's installation instructions.
 - .3 Bond the rack-mount busbar or ground bar to the room's TMGB or TGB with appropriately sized hardware and conductor.
- .4 Ground Terminal Block
 - .1 Every rack and cabinet shall be bonded to the TMGB or TGB.
 - .2 Minimum bonding connection to racks and cabinets shall be made with a rack- mount two-hole ground terminal block sized to fit the conductor and rack and installed per manufacturer recommendations.

- .3 Remove paint between rack/cabinet and terminal block, clean surface and use antioxidant between the rack and the terminal block to help prevent corrosion at the bond.
- .5 Pedestal Clamp
 - .1 At minimum, bond every sixth raised access floor pedestal with a minimum #6 AWG conductor to the TMGB or TGB using a pedestal clamp sized to fit the pedestal and the conductor and installed per the manufacturer's recommendations.
 - .2 If pedestal clamps are used to construct a signal reference grid, bond the signal reference grid to the TMGB or TGB and bond each rack and/or cabinet to the signal reference grid using a compression tap or similar non-reversible bonding component sized to fit both conductors.
 - .3 Remove paint between the pedestal and pedestal clamp, clean surface and use antioxidant between the pedestal and the clamp to help prevent corrosion at the bond.
 - .4 Remove insulation from conductors where wires attach to the pedestal clamp.
- .6 Pipe Clamp
 - .1 Bond metal pipes located inside the data center computer room with a minimum #6 AWG conductor to the TMGB or TGB using a pipe clamp sized to fit the pipe and the conductor and installed per the manufacturer's recommendations.
 - .2 Remove paint between the pipe and pipe clamp, clean surface and use antioxidant between the pipe and the clamp to help prevent corrosion at the bond.
 - .3 Remove insulation from conductors where wires attach to the pipe clamp.
- .7 Equipment Ground Jumper Kit
 - .1 Bond equipment to a vertical rack-mount busbar or ground bar using ground jumper per the manufacturer's recommendations.
 - .2 Clean the surface and use antioxidant between the compression lugs on the jumper and the rack-mount busbar or ground bar to help prevent corrosion at the bond.

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 The work covered under this section consists of the furnishing of all necessary labor, supervision, materials, equipment, and services to completely execute the system of non-continuous cable supports as described in this specification.

1.2 Scope of Work

- .1 This Section includes the minimum requirements for the support structures for the Communications Systems for the project as outlined in the Bid Document.

1.3 Submittals

- .1 A. Submit product data on non-continuous cable support devices, including attachment methods. Product data to include, but not limited to materials, finishes, approvals, load ratings, and dimensional information.

1.4 Quality Assurance

- .1 Non-continuous cable supports and cable support assemblies shall be listed by Underwriters Laboratories for both Canadian and US standards (cULus).
- .2 Non-continuous cable supports shall have the manufacturers name and part number stamped on the part for identification.
- .3 Manufacturer: Company specializing in manufacturing products specified in this section with a minimum of five years documented experience in the industry, and certified ISO 9000.

1.5 Coordination

- .1 Coordinate installation of hangers, supports and cables with other trades.

Part 2 Products

2.1 Acceptable Manufacturers

- .1 A. Subject to compliance with these specifications, non-continuous cable supports shall be as manufactured by: Legrand or approved equal.

2.3 Non-continuous Cable Support Systems

- .1 Non-continuous cable supports
 - .1 Non-continuous cable supports shall provide a bearing surface of sufficient width to comply with required bend radii of high-performance cables; cULus Listed
 - .2 Non-continuous cable supports shall have flared edges to prevent damage while installing cables
 - .3 Non-continuous cable supports sized 1-5/16" and larger shall have a cable retainer strap to provide containment of cables within the hanger. The cable
 - .4 retainer strap shall be removable and reusable and be suitable for use in air handling spaces
 - .5 Non-continuous cable supports shall have an electro-galvanized or G60 finish and shall be rated for indoor use in non-corrosive environments
 - .6 Stainless Steel non-continuous cable supports are intended for indoor and outdoor use in non-corrosive environments or where only mildly corrosive conditions apply
- .2 Adjustable non-continuous cable support sling
 - .1 Constructed from steel and woven laminate; sling length can be adjusted to hold up to 425 4-pair UTP; rated for indoor use in non-corrosive environments. Rated to support Category 5e and higher cable, or optical fiber cable; cULus Listed.
 - .2 Adjustable non-continuous cable support sling shall have a static load limit of 100 lbs.
 - .3 Adjustable non-continuous cable support sling shall be suitable for use in air handling spaces

- .4 If required, assemble to manufacturer recommended specialty fasteners including beam clips, flange clips, C and Z purlin clips.
- .3 Multi-tiered non-continuous cable support assemblies
 - .1 Multi-tiered non-continuous cable support assemblies shall be used where separate cabling compartments are required. Assemblies may be factory assembled or assembled from pre-packaged kits. Assemblies shall consist of a steel angled hanger bracket holding up to six non-continuous cable supports, rated for indoor use in non-corrosive environments; cULus Listed.
 - .2 If required, the multi-tier support bracket may be assembled to manufacturer recommended specialty fasteners including beam clamps, flange clips, C and Z purlin clips.
- .4 Non-continuous cable support assemblies from tee bar
 - .1 Tee bar support bracket with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments; cULus Listed.
 - .2 Enter acceptable products:
- .5 Non-continuous cable support assemblies from drop wire/ceiling
 - .1 Fastener to wire/rod with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments; cULus Listed.
 - .2 Acceptable products:
- .6 Non-continuous cable support assemblies from beam, flange
 - .1 Fastener to beam or flange with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments; cULus Listed.
 - .2 Enter acceptable products:
- .7 Non-continuous cable support assemblies from C & Z Purlin
 - .1 Fastener to C or Z purlin with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments, cULus Listed
 - .2 Enter acceptable products:
- .8 Non-continuous cable support assemblies from wall, concrete, or joist
 - .1 Fastener to wall, concrete, or joist with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments, cULus Listed
 - .2 Enter acceptable products:
- .9 Non-continuous cable support assemblies from threaded rod
 - .1 Fastener to threaded rod with one non-continuous cable support, factory or jobsite assembled, rated for indoor use in non-corrosive environments, cULus Listed
 - .2 The multi-tiered support bracket shall have a static load limit of 300 lbs.

- .3 U-hooks and Double J-hook shall attach directly to threaded rod using standard nuts
- .4 Enter acceptable products:
- .10 Raised floor non-continuous cable support assemblies
 - .1 Fastener to raised (access) floor pedestal with one non-continuous cable support, factory or jobsite assembled, rated for indoor use in non-corrosive environments; cULus Listed
 - .2 Enter acceptable products:
- .11 Cantilever-Mounted cable supports
 - .1 U-hook shall be able to be assembled to a wide variety of wall mount brackets.
 - .2 Spacing of individual U-hooks as needed, max of 4' to 5' apart.
 - .3 U-hooks may have the optional attachment of a cable roller for ease in pulling cables
 - .4 Enter acceptable products:
- .12 Installation accessories for non-continuous cable supports
 - .1 Cable Pulley
 - .1 Non-continuous cable supports may be used as an installation tool when a removable pulley assembly is included. The pulley shall be made of plastic and be without sharp edges. The pin and bail assembly must be able to be secured to the J-Hook during cable installation. The pulley must remain secured while cables are being pulled.
 - .2 The pin and roller assembly must be removed after cables are installed.
 - .3 Enter acceptable products:
 - .2 Cable Protector
 - .1 The protective steel tube shall fit over threaded rod and be at least 4" in length.
 - .2 The tube shall prevent damage to cables placed in or pulled through CAT- CMTM U-hooks. The tube shall not inhibit the pulling of cables.
 - .3 Enter acceptable products:

2.4 Finishes

ASTM B633 Standard Specification for Electro-Deposited Coatings of Zinc on Iron and Steel
ASTM B 695 Standard Specification for coatings of Zinc Mechanically Deposited on Iron and Steel

ASTM A123 Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products

ASTM A924/A924M Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process

Non-continuous cable supports used where only mildly corrosive conditions apply shall be stainless steel, AISI type 304.

Part 3 Execution

3.1 Installation

- .1 Installation and configuration shall conform to the requirements of the current revision levels of TIA Standards 568 and 569, Ontario Electrical Safety Code, applicable local codes, and to the manufacturer's installation instructions.
- .2 Do not exceed load ratings specified by manufacturer.
- .3 Adjustable non-continuous support sling shall have a static load limit of 100 lbs.
- .4 Follow manufacturer's recommendations for allowable fill capacity for each size non- continuous cable support.
- .5 Locate pathways per Telecommunications Drawings.

END OF SECTION

Part 1 General

1.1 Scope

- .1 This SECTION describes the requirements for furnishing and installing firestopping for fire-rated construction. This includes all openings in fire-rated floors, walls and other rated elements of construction, both blank (empty) and those accommodating items such as cables, conduits, pipes, ducts, etc.
- .2 Fireblocking for Concrete Floor or Wall Sleeved Cables.
- .3 Fireblocking for Gypsum Wall Sleeved Cables.
- .4 Fireblocking for Concrete Block Wall Sleeved Cables.

1.2 Related Documents:

- .1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 7 Specification Sections, apply to this Section.
- .2 Cable fill calculations must be included to show the maximum cable fill ratio for each Firestopping System and cable type.

1.3 References:

- .1 Ontario Building Code
- .2 Ontario Electrical Safety Code
- .3 ANSI/TIA 569 - Telecommunications Pathways and Spaces
- .4 ANSI/NFPA 70 – National Electrical Code (NEC)
- .5 ASTM E-814 - Fire Tests of Through-Penetration Fire Stops
- .6 ASTM E-119 - Fire Tests of Building Construction and Materials
- .7 UL 1479 - Fire Tests of Through-Penetration Firestops
- .8 UL Fire Resistance Directory – Penetration Firestops System (XHE2) and Fill, Void or Cavity Materials

1.4 Submittals

- .1 Submit manufacturer's product literature and installation procedures for each type of Firestop material to be installed. Literature shall indicate product characteristics, typical uses, performance and limitation criteria and test data. Submit cured samples of firestop materials.
- .2 Shop drawings: Show typical installation details for the methods of installation. Indicate which firestop materials will be used where and when applications requirements to meet Specific jobsite conditions.
- .3 Product Data: Shall be clearly marked to indicate all technical information which specifies full compliance with requirements of this section and Contract Documents, including the following:
 - .1 Copy of UL illustration of each proposed system indicating manufacturer's approved modifications.

- .2 Each condition requiring penetration seals in proposed UL systems materials, anchorage, methods of installation and actual adjacent construction.
- .4 Applicator's Qualification Statement: Shall include a list of projects indicating required experience.

1.5 Quality Assurance

- .1 Firestopping systems (materials and design) shall conform to both Flame (F) ratings and Time (T) ratings as required by local building code and as tested by nationally accepted test agencies per ASTM E814 or UL 1479 fire tests in a configuration that is representative of field conditions.
- .2 The work of this section shall be performed by a company which specializes in stalling UL Classified penetration seals required for this Project, with a minimum of five years of documented successful experience and shall be performed by skilled Workmen thoroughly experience in the necessary crafts.
- .3 Deliver material in the manufacturer's original, unopened containers or packages with the manufacturer's name, product identification, lot number, UL label, and mixing and installation instructions as applicable.
- .4 Store materials in the original, unopened containers or packages, and under conditions recommended by the manufacturer.
- .5 All firestop materials shall be installed prior to expiration of shelf life.

1.6 Coordination

- .1 Coordinate layout and installation of Firestopping System with other trades.
- .2 Revise locations and elevations from those indicated as required to suit field conditions and as approved by the Architect.
- .3 Storage and Handling: Avoid breakage, denting and scoring finishes. Damaged products will not be installed. Store devices and accessories in original cartons and in clean dry space; protect from weather and construction traffic. Wet materials will be unpacked and dried before storage.

Part 2 Products

2.1 Acceptable Manufacturers:

- .1 Materials and products required for work of this section shall not contain asbestos or polychlorinated biphenyls (PCB)
- .2 Manufacturer and Firestopping System must be approved by the local AHJ before purchase or installation

2.2 General

- .1 Provide and install firestopping materials to meet applicable codes and installation requirements for each firestopping application. Products using caulking, putties, wrap
- .2 strips, mortars, composite boards and/or mechanical devices shall be used as appropriate for the specific condition

2.3 Caulking

- .1 When caulking is used, provide and install flexible caulking materials. Cured firestop materials 1/8 thick shall be able around a 1" mandrell without breaking

2.4 Firestop

- .1 Do not use any firestop products which re-emulsify, leach active intumescent ingredients or dissolve when placed in water after curing. Product must withstand the passage of cold smoke, either as inherent property of the system or using a separate product included as part of the UL system or device, and designed to perform this function.

2.5 Penetration Seals

- .1 General:
 - .1 Penetration seals (firestopping material) shall be asbestos-free and capable of maintaining an effective barrier against flame, smoke and gases in compliance with requirements of ASTM E814 and UL 1479.
 - .2 Materials shall meet and be acceptable for use by all three model building codes, Basic/National Building Code, Building Code and Standard Building Code, per National Evaluation Service, Inc. report # NER-243.
 - .3 Materials shall meet requirements of NFPA 101 and NFPA 70.
 - .4 Materials shall be suitable for the firestopping of penetrations made by steel, glass, plastic and insulated pipe, conduit, bus duct, non-insulated pipe and ductwork.
 - .5 On insulated pipe, fire-rating classification must not require removal of insulation.
 - .6 The rating of penetration seals shall not be less than the rating of the time-rated floor or wall assembly.
 - .7 Systems shown below are examples and other equal systems may be approved or required by the AHJ.
- .2 2-hour Rated Concrete Floor:
 - .1 Penetrants: Multiple pipes
 - .2 UL System: No. 93
- .3 2-hour Rated Concrete Floor:
 - .1 Penetrants: Maximum 30" dia. Metal pipe/conduit
 - .2 UL System: No.319
- .4 1-2 –Hour Rated Gypsum Board Wall:
 - .1 Penetrant: Metal pipe/conduit
 - .2 UL System: No. 147
- .5 2-Hour Rated Gypsum Board Wall:
 - .1 Penetrant: Metal pipe/conduit
 - .2 UL System: No. 147
- .6 3-Hour Rated Concrete Wall:

- .1 Penetrant: Metal duct, maximum 2' square and maximum dimension of 30"
- .2 UL System: No. 105
- .7 Walls Below Grace:
 - .1 Penetrants: Pipe sleeves.
 - .2 Seal: Thunderline "Link Seal" casing seal

Part 3 Execution

3.1 Inspection

- .1 Examine the areas and condition where Firestops are to be installed and notify the Architect of conditions detrimental to the proper and timely completion of the work. Do not proceed with work until unsatisfactory conditions have been corrected by the contractor in a manner acceptable to the Architect.

3.2 Conditions Requiring Firestopping

- .1 General – Provide firestopping for conditions specified whether or not firestopping is indicated, and if indicated, whether such material is designed as insulation, safing, or otherwise.
- .2 At any point where a fire rated wall is penetrated with cable or conduit.
- .3 Penetrations
 - .1 Penetrations include conduit, cable wire, pipe, duct or other elements which pass through one or both outer surfaces of a fire rated floor, wall or partition.
 - .2 These requirements for penetrations shall apply whether or not sleeves have been provided, and whether or not penetrations are to be equipped with escutcheons or other trim. If penetrations are sleeved firestop any annular space between the sleeve and wall opening.
- .4 Provide firestopping to fill miscellaneous voids and openings in fire-rated construction as specified herein.

3.3 Installation

- .1 General
 - .1 Installation of Firestops shall be performed by an applicator/installer qualified and trained by the manufacturer. Installation shall be performed in strict accordance with manufacturer's detailed installation procedures.
 - .2 Apply Firestops in accordance with fire test reports, fire resistance requirements, acceptable sample installations, and manufacturer's recommendations.
 - .3 Coordinate with plumbing, mechanical, electrical and other trades to assure that all pipe, conduit, cable, and other items which penetrate fire-rated construction have been permanently installed prior to installation of Firestop.
- .2 Field Quality Control

- .1 Prepare and install firestopping systems in accordance with manufacturer's printed instructions and recommendations.
 - .2 Follow safety procedures recommended in the Material Safety Data Sheets.
 - .3 Finish surfaces of firestopping which is to remain exposed in the completed work to a uniform and level condition.
 - .4 All areas of work must be accessible until inspection by the applicable Code Authorities.
 - .5 Correct unacceptable firestops and provide additional inspection to verify compliance with this specification at no additional cost.
- .3 Calculate the maximum cable fill ratio for each Firestopping System and cable type. Do not exceed the maximum fill ratio.
 - .4 Prepare and install firestopping systems in accordance with manufacturer's printed instructions and recommendations.

3.4 Warranty

- .1 Comply with General Conditions, and include but not be limited to:
 - .1 Repairs and replacement of penetration seals which fail in joint adhesion, cohesion, abrasion, resistance, weather resistance, extrusion resistance, migration resistance, stain resistance, or general durability, or appear to deteriorate in any other manner not clearly specified in submitted manufacturer's data as an inherent quality of the material for exposure indicated.

3.5 Cleaning

- .1 Remove spilled and excess materials adjacent to firestopping without damaging adjacent surfaces.
 - .1 Leave finished work in neat, clean condition with no evidence of spillovers or damage to adjacent surfaces.

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 Work covered by this Section shall consist of furnishing labor, equipment and materials necessary for the labeling of the telecommunications infrastructure as described on the Drawings and/or required by these specifications.

1.2 Scope of Work

- .1 This Section includes the minimum requirements for the Identification and labeling of the Communications Systems for the project as outlined in the Bid Document.

1.3 Summary

- .1 Administration of the telecommunications infrastructure includes documentation of cables, termination hardware, patching and cross-connection facilities, conduits, other cable pathways, Telecommunications Rooms, and other telecommunications spaces. All facilities shall apply and maintain a system for documenting and administering the telecommunications infrastructure.
- .2 The owner maintains a standard labeling scheme for voice and data outlets and patch panels.
- .3 Industry Labeling Standards and Conventions shall be used unless otherwise stated in the bid documents or by the Owner's Representative.
- .4 Telecommunications Infrastructure Records must be maintained in a computer spreadsheet, or in a computer database. Paper records are encouraged, but are optional. A cable record is prepared for each backbone cable. The record will show the cable name, and must describe the origin point and destination point of the cable. The cable record will record what services and/or connections are assigned to each cable pair or strand. An equipment record is prepared for services distributed from a certain piece of equipment, such as a router, or a system such as the telephone system PBX.
- .5 Installer shall maintain accurate, up-to-date Installation or Construction Drawings. At a minimum, the Installation Drawings shall show pathway locations and routing, configuration of telecommunications spaces including backboard and equipment rack configurations, and wiring details including identifier assignments.
- .6 Installer shall provide a complete and accurate set of as-built drawings. The as-built drawings shall record the identifiers for major infrastructure components including; the pathways, spaces, and wiring portions of the infrastructure which may each may have separate drawings if warranted by the complexity of the installation, or the scale of the drawings.

1.4 Quality Assurance

- .1 All labels shall be installed in a neat and workmanlike manner. All methods of labeling that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative.

- .2 Labels shall be of the quality and manufacture indicated. The labels and labeling equipment specified are based upon the acceptable manufacturers listed. Where “approved equal” is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.
- .3 Strictly adhere to all Building Industry Consulting Service International (BICSI) and Telecommunications Industry Association (TIA) recommended installation practices when installing communications/data labeling.
- .4 Material and work specified herein shall comply with the applicable requirements of the current adopted revision of the following:
 - TIA-606-C Administration Standards for Telecommunications Infrastructure TIA-569 Telecommunications Pathway and Spaces
 - TIA-568 Telecommunications Cabling Standard
 - BICSI Telecommunications Distribution Methods Manual
 - UL 969 - UL Standard for Safety for Marking and Labeling Systems

1.5 Submittals

- .1 Provide product data for the following:
- .2 Manufacturers cut sheets, specifications and installation instructions for all products.

1.6 Coordination

- .1 Coordinate installation of labels with other trades.
- .2 Storage and Handling: Avoid breakage, denting and scoring finishes. Damaged products will not be installed. Store materials in original cartons and in a clean dry space; protect from weather and construction traffic. Wet materials will be unpacked and dried before storage.

Part 2 Products

2.1 Manufacturers

2.2 Labels

- .1 Shall meet the legibility, defacement, exposure and adhesion requirements of UL 969
- .2 Shall be preprinted or computer printed type. Hand written labels are not acceptable
- .3 Where insert type labels are used provide clear plastic cover over label
- .4 Outside plant labels shall be totally waterproof even when submerged
- .5 Equipment Room Copper, Fiber, and Coax Backbone Cable Labels
- .6 Equipment Room Copper, Fiber, and Coax Horizontal Cable Labels
- .7 Work Area Copper, Fiber, and Coax Riser Cable Labels
- .8 Patch Panel and Patch Cords Labels

Part 3 Execution

3.1 Identification & Labeling

- .1 The size, color, and contrast of all labels should be selected to ensure that the identifiers are easily read. Labels should be visible during the installation of and normal maintenance of the infrastructure.
- .2 Labels should be resistant to the environmental conditions at the point of installation (such as moisture, heat, or ultraviolet light), and should have a design life equal to or greater than that of the labeled component.
- .3 All labels shall be printed or generated by a mechanical device.

3.2 Telecommunication Identifiers

- .1 Outside Plant cabling shall be clearly marked using permanent means. Outside plant shall use the following system of numbering and labeling:
 - .1 Fiber Optic:
 - .1 Identify: far-end building name, building number, fiber-type and strand-count
 - .2 Label at entrance and exit points of tunnel system and at conduit entry points between 12 inches and 36 inches from the conduit or at closet point that is clearly visible and long cable length in tunnel at 200 foot intervals.
 - .3 Label at termination panels at both ends
 - .2 Copper:
 - .1 Identify: far-end building name, building number and strand-count
 - .2 Label at entrance and exit points of tunnel system and at conduit entry points between 12 inches and 36 inches from the conduit or at closet point that is clearly visible and long cable length in tunnel at 200 foot intervals
- .2 Riser cabling shall be clearly marked using permanent means. Riser cabling shall use the following system of numbering and labeling:
 - .1 Fiber Optic:
 - .1 Identify: far-end EF / ER / TR, fiber-type and strand-count.
 - .2 When small facilities are fed from a primary location and treated as an ER, riser shall be labeled similar to Outside Plant Fiber Optic
 - .2 Copper:
 - .1 Identify: far-end EF / ER / TR and pair-count
 - .2 Termination points shall be labeled as to actual pair at every fifth (5th) pair-point.

3.3 Labeling Procedures

- .1 To be consistent with ANSI/TIA standards and industry practices, it is important that both labeling and color coding be applied to all telecommunications infrastructure components. Labeling with the unique identifier will identify a

particular component. Proper color coding will quickly identify how that component is used in the overall telecommunications infrastructure of the facility.

- .2 Visibility and durability:
 - .1 The size, color, and contrast of all labels should be selected to ensure that the identifiers are easily read. Labels should be visible during the installation of and normal maintenance of the infrastructure.
 - .2 Labels should be resistant to the environmental conditions at the point of installation (such as moisture, heat, or ultraviolet light), and should have a design life equal to or greater than that of the labeled component.
 - .3 Labels are generally of either the adhesive or insert type. All labels must be legible, resistant to defacement, and maintain adhesion to the application surface.
 - .4 Outside plant labels shall be totally waterproof, even when submerged.
 - .5 Labels applied directly to a cable shall have a clear vinyl wrapping applied over the label and around the cable to permanently affix the label.
 - .6 Other types of labels, such as tie-on labels, may be used. However, the label must be appropriate for the environment in which it is used, and must be used in the manner intended by the manufacturer.
- .3 Mechanical generation
 - .1 All labels shall be printed or generated by a mechanical device.
 - .2 Handwritten labels are NOT acceptable.

END OF SECTION

Part 1 General

1.1 General Requirements

- .1 Transmission performance of structured cabling varies with length, connecting hardware, cords and total number of connections. The installer must take care to properly install the cabling components. To ensure that the installed structured cabling solution meets or exceeds the required performance it must be 'tested' or 'certified'.
- .2 The requirements for each category of cabling (Cat5e, Cat6, or Cat6A) and optical fiber optics links are located in the ANSI/TIA-568 series standards.
- .3 Test equipment must meet the requirements set forth in the ANSI/TIA-568 series Standard for Field Test Equipment. All Copper testers shall be Level III. All fiber testers shall meet the requirements in ANSI/TIA-568.
- .4 Field Power Meters shall meet the following:

Accuracy	± 0.2 dB
Resolution	0.01 dB
Precision	± 0.15 dB
- .5 The Field light source shall meet the following:

Accuracy	± 0.01 dB
Wavelength	850 ± 30 nm
	1300 ± 50 nm
	1310 ± 30 nm
	1550 ± 30 nm
- .6 The calibration on all test equipment shall be current.
- .7 The software in all test equipment shall be current.

1.2 Manufacturers

The following manufacturer's testers are approved.

- .1 FLUKE
 - .1 OptiFiber OTDR
 - .2 DTX-CLT CertiFiber Optical Loss Test Set
- .2 Ideal
 - .1 LanTEK II
 - .2 LANTEK 6/6A/7G
 - .3 FIBERTEK
- .3 Or other test equipment approved by the Owner

1.3 Systems Testing and Documentation GENERAL REQUIREMENTS

- .1 Provide installation testing of equipment where required by manufacturer's installation instructions.

- .2 Provide complete end to end testing for all copper and fiber optic systems/channels based on latest applicable standards. Document all testing and submit with final as-built submittal package.
- .3 For all controls and operating equipment, submit equipment/systems to at least three complete operational sequences, in which all equipment operations are tested, observed, and verified.
- .4 Prior to substantial completion and project acceptance inspection, submit test reports to indicated scope of startup and operational tests, with results of testing for each specified operation.

1.4 Copper Cabling System Testing

- .1 General: Copper cabling shall be tested and certified after installation as follows and as required for cable manufacturer's warranty. Twisted-pair copper cable channels shall be tested for continuity as specified below, presence of ac/dc voltage, and performance. All cabling shall be tested for conformance to horizontal cable specifications as outlined herein, and shall be tested per test set manufacturer's instructions utilizing latest firmware and software. Testing shall include all electrical parameters as specified under Product. All cables and termination hardware shall be 100 percent tested by installation contractor for defects in installation and to verify cable performance under installed conditions. All conductors of each installed cable shall be verified useable by Contractor prior to system acceptance. All cables shall be tested per contract documents, manufacturer's warranty provisions, and best industry practices. If any of these are in conflict, Contractor shall comply with most stringent requirements. All defects in cabling system installation shall be repaired or replaced to ensure 100 percent useable conductors in all cables installed, at no additional cost to Owner.
- .2 Continuity: Each pair of each installed cable shall be tested using a test unit that shows opens, shorts, polarity and pair-reversals, crossed pairs and split pairs. The test shall be recorded as pass/fail as indicated by test unit per manufacturers recommended procedures, and referenced to appropriate cable identification number and circuit or pair number. Any faults in wiring shall be corrected and cable re-tested prior to final acceptance.
- .3 Length: Each installed cable link shall be tested for installed length using a TDR type device. The cables shall be tested from patch panel to patch panel, block to block, patch panel to outlet or block to outlet as appropriate. The cable length shall conform to maximum distances set forth in ANSI/TIA-568-C standards and all other applicable standards specified under Division 27. Cable lengths shall be recorded, referencing cable identification number and circuit or pair number. For multi-pair cables, shortest pair length shall be recorded as length for cable.
- .4 Factory testing: Every reel of cable shall be tested by cable manufacturer for all characteristics specified for cable type in this section. This testing shall be performed using a sweep test method and include frequencies specified for cable. A test report shall be available electronically, at no additional cost, for a minimum of five (5) years from the date of manufacture. The test report shall include the reel number, the date of the test, the Lot number, and test results for Return Loss (RL), Insertion Loss (Attenuation), Pair-to-Pair NEXT, and Power Sum NEXT Pair-to-Pair ELFEXT and Power Sum ELFEXT. The test report shall show the "Worst Case Margin" for the listed transmission characteristics.

- .5 Test results: Test results shall be automatically evaluated by equipment, using most up- to-date criteria from TIA-568-C standards and all other applicable standards all other applicable standards specified under Division 27, and result shown as pass/fail. Test results shall be printed directly from test unit or from a download file using an application from test equipment manufacturer. The printed test results shall include all tests performed, expected test result and actual test result achieved.
- .6 Test reports: Test reports for all factory testing and field test reports for copper cabling installation shall be submitted to the Owner's Representative and manufacturer prior to commissioning voice and data system and final contract payment. Refer to Submittals in this Section.

1.5 Optical Fiber Cable Testing

- .1 General: Optical fiber cabling shall be tested and certified after installation as described below and as required for cable manufacturer's warranty. Fiber testing shall be performed on all fibers in completed end to end system. Testing shall consist of a bi-directional end to end test in accordance with applicable industry standards, or a bi-directional end to end test performed by TIA-455-53A and all other applicable standards. The system loss measurements shall be provided at 850 and 1300 nanometers for multimode type glass and 1310 and 1550 nanometers for single-mode type glass. These tests shall also include continuity checking of each fiber. For spans greater than 90 meters, each tested span must test to a value less than or equal to value determined by calculating a link loss budget. For horizontal spans less than or equal to 90 meters, each tested span must be less than or equal to 2.0 decibels. The insertion loss for each mated optical fiber connector pair shall not exceed 0.40 decibels.
- .2 Pre-installation testing: Test all optical fiber cable for all fibers prior to installation of cable.
- .3 Performance testing: Where links are combined to complete a circuit between devices, Contractor shall test each link from end to end to ensure performance of system. Only a basic link test is required. Contractor can optionally install patch cords to complete circuit and then test entire channel. The test method shall be same used for test described above. The values for calculating loss shall be those defined in applicable TIA standards: Codes, Standards, and Informative References.
- .4 Attenuation testing: Attenuation testing shall be performed with a stable launch condition using two-meter jumpers to attach test equipment to cable plant. The light source shall be left in place after calibration and power meter moved to far end to take measurements.
- .5 Loss budget: All fiber cabling shall be tested at both wavelengths 850 nm and 1310 nm for multimode and 1300 nm and 1550 nm for single mode. The link attenuation shall be calculated using:
 - .1 The CommScope Fiber Performance Calculator for CommScope installations or approved equal.
 - .2 The following calculation for other installations:
Link Attenuation Allowance (dB) = Cable Attenuation (dB) + Connector loss (dB) + Splice Insertion Loss (dB)
Where:

Cable attenuation (dB) = Cable attenuation (dB/km) X Length (km)
Connector loss (dB) = Number of Connector pairs X Allowable connector loss (dB)
Splice Insertion Loss (dB) = Number of Splices X Allowable Splice loss (dB)

- .6 Link loss: A mated connector to connector interface shall be considered a single connector. Loss numbers for installed link shall be calculated by taking sum of bi-directional measurements and dividing that sum by two. All links not meeting requirements of standard shall be brought into compliance by Contractor, at no additional cost to Owner.
- .7 Documentation: Following final documentation shall be submitted to the owner's representative prior to commissioning data system and final contract payment according to Submittals in this section.
- .8 Test results: Test results shall be automatically evaluated by equipment, using most up-to-date criteria from all applicable standards specified in 27 02 20.20 and result shown as pass/fail. Test results shall be printed directly from test unit or from a download file using an application from test equipment manufacturer. The printed test results shall include all tests performed, expected test result and actual test result achieved.
- .9 End to End Loss Data: final documentation shall be submitted to the owner's representative.
- .10 As Installed/ As Built Diagrams: Final documentation shall be submitted to the owner's representative.

1.6 Test Documentation

- .1 Electronic Format – if required
 - .1 Certification Test Reports shall be submitted in electronic format using the appropriate software supplied by the test equipment manufacturer. The data format should be that of the test report software (i.e. *.flw files for Fluke). The contractor shall provide any necessary software to view and evaluate the test data.
 - .2 The following list is provided as a reference:
Tester Test Report Software
Fluke LinkWare
Ideal LanTek Reporter
 - .3 One electronic copy of the Test Reports shall be provided.
- .2 Paper Format – if required
 - .1 Provide test documentation in 3-ring binders within 2 weeks after completion of project testing. Binders shall be clearly marked on outside front cover and spine with words Test Results, project name, and date of completion (month and year). Major heading tabs, Horizontal and Backbone, shall divide binder. Each major heading shall be further sectioned by test type. Within horizontal and backbone sections, divide by tabs scanner test results by category, optical fiber attenuation test results, and continuity test results. Present test data within each section in sequence listed in administration records.
 - .2 Provide test equipment by name, manufacturer, model number and last calibration date at the end of document. Unless manufacturer specifies

more frequent calibration cycle, annual calibration cycle shall be required on all test equipment used for this installation.

- .3 Test document shall detail test method used and specific settings of equipment during test. Scanner tests shall be printed on 8 1/2 by 11 inches. Hand written test results (attenuation results and continuity results) shall be documented on a suitable test form.
- .4 When repairs and re-tests are performed, note problem found and corrective action taken, and collocate in binder both failed and passed test data.

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 This document describes the products and execution requirements relating to furnishing and installing Balanced Twisted Pair and Fiber Optic Cabling and Components at the new or remodeled buildings.
- .2 All cables and related terminations, support and grounding hardware should be furnished, installed, wired, tested, labeled, and documented as detailed in this document.
- .3 Products specifications, general design considerations, and installation guidelines are provided in this document. Quantities of telecommunications outlets, typical installation details, cable routing and outlet types will be provided as an attachment to this document. If the bid documents are in conflict, this specification should take precedence.
- .4 The successful Vendor shall meet or exceed all requirements for the Balanced Twisted Pair and Fiber Optic Cabling and Components described in this document.

1.2 Regulatory references

- .1 All workmanship and materials shall be in full conformance with applicable building, electrical, and other codes, as determined by the authority having jurisdiction (AHJ).
- .2 All materials should be UL Listed and should be marked as such. If UL has no published standards for a particular item, then other national independent testing standards should apply and such items should bear those labels. Where UL has an applicable system listing and label, the entire system should be so labeled.

1.3 Reference list

- .1 If this document and any of the documents listed above are in conflict, then the more stringent requirement should apply. All documents listed are believed to be the most current releases of the documents. The contractor has the responsibility to determine and adhere to the most recent release when developing the proposal for installation.
- .2 This document does not replace any code, either partially or wholly. The contractor must be aware of and in compliance with local codes as determined by the authority having jurisdiction (AHJ) that may impact this project.

1.4 Approved Installation

- .1 The bidder must be a certified trained contractor of the Manufacturer. The bidder must have successfully completed all manufacturer design and installation training.

Part 2 Products

2.1 Approved Products

.1 Cabinets & Racks

- .1 Hammond Manufacturing (base design), Belden, Panduit, Hubbell or approved equal
Networking wall-mount cabinets HWC Series
Networking wall-mount low profile cabinets HLP Series (shallow closet application)

Adjustable depth center swing wall rack, HWMR Series (shallow closet application)
Specialized cabinets EN4DH and HDME Series
High-density open-rack 2-Post system DNRRHDW Series (1,500 lb)
High-density open-rack 2-Post system DRZ4 Series (2,000lb)
High-density open-rack 4-Post system DC4R Series
Server cabinets C4RR Series
Multi-media (AV) cabinets RB-AV Series
Data-center network cabinets H1 Series

.2 Power and Monitoring

- .1 Vertical Power Distribution Units (PDU). 208V, 30A, 5kW, L6-30P locked input plug, 30xC13 & 6xC19 receptacles, integral circuit breaker, environmental monitoring port.
Approved Power and Monitoring manufacturer:
Belden 9PB2-361005
Hubbell
Hammond Manufacturing
Eaton
APC
Panduit
Approved equal

.3 Heat Containment

- .1 Hammond Manufacturing (base design), Belden, Panduit, Hubbell or approved equal
Aisle containment TCS Series
Chimney containment CLCH Series

.4 Rack Accessories

- .1 Hammond Manufacturing (base design), Belden, Panduit, Hubbell or approved equal
Mounting hardware 10-32 Mounting, 12-24 Mounting,
Cage Nuts, Clip Nuts, bolt down and ganging kit Hardware
Filler/Blanking panels PBPA Series (aluminum), PBPS Series (steel),
PBFS Series (formed steel), RB-TBP Series (tool free)
2 post = RAS Series (universal rack shelf), DNRMA Series (adjustable),
DNDM Series (center mount), DNRM Series (center mount deep channel),
BRS Series (battery), RSP Series (sliding), RKBM Series (keyboard),
RMS Series (shelf/keyboard/storage combo)

4 post = ADS Series (adjustable), RSUS Series (sliding), RZVS Series (zero U / fixed), RF Series (fixed)
Grounding and bonding accessories RIK Series (isolation kit), GRDKIT Series (bonding kit), GRDBAR Series (horizontal and vertical bus bar), BUSBAR Series (modular, horizontal and vertical)

.5 Security

- .1 Hammond Manufacturing (base design), Belden, Panduit, Hubbell or approved equal
Data-center access system EL SERIES (electronic door locking handles)
Open-rack security door RSDP Series (rail mounting hinged security door), PHPF Series (rack mount locking hinged door panel), RMSC Series (hinged clear security cover)

.6 Cable Management

- .1 Hammond Manufacturing (base design), Belden, Panduit, Hubbell or approved equal
Vertical Management = RB-VCM Series, RRCM Series, FRCM Series, VFM Series,
Horizontal Management = PCMDD Series, RB-HFM Series, RB-HFMD Series, RB-HRM Series, PCMDS Series

.7 Zone Access Ceiling Box Enclosure

- .1 Hubbell ZCB7UA (base design), Belden, Panduit, Hammond or approved equal
Active zone ceiling box, ceiling flush mounted, 24"x24"x12", 7RU, plenum rated, complete with 2x20A 120V duplex receptacles, 2-gang back box, 9 CFM 12V fan and transformer, knob assemblies, fire rated foam kit for cable entries and exits, support brackets, hinged door plate, equipment mounting assemblies, lock kit and key.

2.2 Alternative Products

- .1 Alternative solutions or value-engineering opportunities may be considered. Any alternatives must be submitted in addition to the specified material for comparison purposes with a clear demonstration of how the alternatives will meet the performance, functional, and operational requirements of the solution.

Part 3 Execution

3.1 Lifetime application assurance

- .1 Manufacturer certification provides the assurance that all present and future applications engineered for the performance level of the cabling system used will work for the lifetime of the certified solution.
- .2 Should the manufacturer certified solution fail to support the application(s) designed to operate over it - whether at the time of cutover to the new cabling system, during subsequent use, or after upgrading to a newer supported application – the manufacturer Belden and the Vendor should take prompt corrective action.

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 Provide all labor, materials, and equipment for the complete installation of work called for in the Contract Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for Horizontal and Backbone cable terminations installed in communications equipment rooms (Telecommunications Rooms, Equipment Rooms, or "Telecommunications Closets").
- .2 Included in this section are the minimum composition requirements and installation methods for the following:
Patch Panels

1.3 Quality Assurance

- .1 All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative. Equipment and materials shall be of the quality and manufacture indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "approved equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.
- .2 Strictly adhere to all Building Industry Consulting Service International (BICSI) and Telecommunications Industry Association (TIA) recommended installation practices when installing communications/data cabling.
- .3 Material and work specified herein shall comply with the applicable requirements of the current adopted revision of the following:
ANSI/TIA-568 Series Commercial Building Telecommunications Cabling Standard
ANSI/TIA-569 Telecommunications Pathways and Spaces
ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure
BICSI - Telecommunications Distribution Methods Manual
CENELEC EN-50173 - Generic cabling systems
ISO/IEC 11801 - Generic cabling for customer premises
J-STD-607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
NFPA 70 National Electric Code

1.4 Submittals

- .1 Provide product data for the following:
 - .1 Manufacturers cut sheets, specifications and installation instructions for all products.

Part 2 Products

2.1 Patch Panels

- .1 Category 5e/Class D Patch Panels
 - .1 General specifications: Patch panel shall be constructed of high strength steel with black powder finish and designed for wall or 19-inch rack mounting.
 - .2 Panels shall be available in 24-port and 48-port configurations, with height of 1 Rack Unit (RU) of 44.5 millimeters (1.75 inches) for each group of 24 ports.
 - .3 The panels shall feature IDC 110-punchdown modules with a cutting ledge directly adjacent to IDCs against which the wires can be directly terminated and cut in one action.
 - .4 Removable rear mounted cable management bar.
 - .5 Accommodation for front and rear identification labels.
 - .6 Panel shall support 1 Gb network line speeds.
 - .7 Panel shall be Category 5 and 3 backward compatible.
 - .8 Panel shall comply with the standards for Category 5e/Class D patch panels listed in the TIA-568 Series Standards and ISO/IEC 11801.
 - .9 Panel shall support IEEE 802.3 1000BASE-T plus other legacy LANs and applications.
 - .10 The patch panel will comply with IEEE 802.3bt (Type 4) Power over Ethernet (PoE+) applications up to 90 watts
 - .11 Contact tines shall be plated with a minimum of 50 microns of gold.
 - .12 The panels shall support both T568A and T568B wiring map.
 - .13 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .2 Category 6/Class E Patch Panels
 - .1 General specifications: Patch panel shall be constructed of high strength steel with satin chrome finish and designed for wall or 19-inch rack mounting.
 - .2 Panels shall be available in 24-port and 48-port configurations, with height of 1 Rack Unit (RU) of 44.5 millimeters (1.75 inches) for each group of 24 ports.
 - .3 Removable rear mounted cable management bar and front and rear identification labels.
 - .4 Patch panels must be capable of connection to the CommScope Intelligent Patching solution or upgradable to connection to the CommScope Intelligent Patching Solution.
 - .5 Patch panels shall support 5 meter cables in 3 and 4 connector channels, 3 meter cables in 2 connector channels and cross connect cords down to 1 meter.
 - .6 Comply with the standards for Category 6/Class E patch panels listed in the TIA- 568 Series Standards and ISO/IEC 11801.

- .7 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .3 Category 6A/Class EA Patch Panels
 - .1 General specifications: Patch panel shall be constructed of high strength steel with satin chrome finish and designed for wall or 19-inch rack mounting.
 - .2 Panels shall be available in 24-port and 48-port configurations, with height of 1 Rack Unit (RU) of 44.5 millimeters (1.75 inches) for each group of 24 ports.
 - .3 The panels shall feature IDC 110-punchdown modules with a cutting ledge directly adjacent to IDCs against which the wires can be directly terminated and cut in one action.
 - .4 Removable rear mounted cable management bar
 - .5 Accommodation for front and rear identification labels.
 - .6 Removable rear mounted cable management bar and front and rear identification labels.
 - .7 Patch panels shall support 5 meter cables in 3 and 4 connector channels, 3 meter cables in 2 connector channels and cross connect cords down to 1 meter.
 - .8 Comply with the standards for Category 6A/Class EA patch panels listed in the TIA-568 Series Standards and ISO/IEC 11801.
 - .9 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .4 High Density Modular Patch Panels
 - .1 General specifications: Patch panel shall be constructed of high strength steel with black powder finish and designed for wall or 19-inch rack mounting.
 - .2 Panels shall be available in a 48-port configuration, with height of 1 Rack Unit (RU) of 44.5 millimeters (1.75 inches).
 - .3 Panel shall be designed for Category 6 and 6A modular snap in information Outlets.
 - .4 Removable rear mounted cable management bar and front and rear identification labels.
 - .5 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .5 Fiber Optic Shelf Panels
 - .1 General specifications: Shelves shall be constructed of high strength steel with black powder finish and designed for wall or 19-inch rack mounting.
 - .2 Shelves shall be available in multi U configurations, with height of 1 Rack Unit (RU) 44.5 mm (1.75 in), to 4 RU 177.8 mm (7 in).
 - .3 Removable rear mounted cable management bar, door or cover and front and rear identification labels.

- .4 Comply with the standards for patch panels listed in the TIA-568 Series Standards and ISO/IEC 11801.
- .5 Fiber Shelf Panels shall accept ST, SC or LC modular adapter panels or pre-terminated MPO cassettes.
- .6 The rack mount optical fiber Enclosure shall be capable of terminating tight-buffered or loose tube optical fiber cable and support either direct connectorization or fusion slicing
- .7 Panel shall incorporate a sliding tray (in 1RU & 2RU) that removes completely from panel for ease of field terminations and splicing
- .8 Approved Manufacturer 1U, 2U and 4U shelves:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .6 Multimedia Patching Systems
 - .1 General specifications: Patch panel shall be constructed of high strength steel with black powder finish and design for wall or 19-inch rack mounting.
 - .2 Patch panels shall allow mix-and-match of shielded, UTP and fiber cassettes in any combination.
 - .3 Patch panels shall be able to hold up to 48 duplex fiber channels or 48 copper ports in a 1RU space.
 - .4 Patch panels shall accept up to 8 copper cassettes or up to 8 single height or 4 double height fiber cassettes.
 - .5 Panels shall be available in 1RU straight or angled configurations.
 - .6 Removable rear mounted cable management bar and front and rear identification labels.
 - .7 Jacks, Outlets and Adapters
 - .1 Unit shall support modular video jacks, 8P8C jacks, and fiber optic type jacks
 - .2 Comply with requirements specified for jacks corresponding to the cable and terminations specified or indicated for the patch panel.
 - .3 Colors shall be specified or selected by the Owner's Representative from the manufacturer's standard colors.
 - .8 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .7 Broadband Community Antenna Television (CATV) patch panel
 - .1 Provides for analog broadband video distribution over horizontal UTP cabling to video adapters located in the work area locations. Horizontal UTP cabling shall be category 6 or higher, as specified or indicated. Video signal transmission distances supported by the system shall be as follows for the operational frequency bandwidth of 5 to 550 megahertz:
 - .1 60 meters: 77 channels for minimum received signal level of 0 decibels referenced to millivolt
 - .2 100 meters: 28 channels for minimum received signal level of 0 decibels referenced to millivolt

- .3 100 meters: 50 channels for minimum received signal level of –10 decibels referenced to millivolt
- .2 Construction: Rack mounted base unit, 1 RU (44 millimeters [1.72 inches])
- .3 Port types:
 - .1 Input: F-type coaxial input connector (female)
 - .2 Output: 8P8C connector jacks rated as Category 6A/Class EA, Category 6/Class EA or Category 6 compliant
- .4 Port quantity: Provide mounting for 16 outlets.
- .5 Standards compliance:
UL, CSA, and IEC 950
FCC Part 76
CISPR 22

2.2 TERMINATION BLOCKS

- .1 Cat 6A 110 Type Cross-Connect Kits:
 - .1 The cross-connect kit shall be a wall-mount Category 6A 110-style wiring kit including block, base, C4 clips and labeling.
 - .2 They shall provide 110 terminations supporting voice, data, video, and Category 6A data applications when used with 4 pair UTP Category 6A rated cabling.
 - .3 The components shall be UL listed and ANSI/TIA-568.2-D compliant.
 - .4 Wall-mount 110 wiring block shall support 64 pair density with provision for ANSI/TIA-606 compliant labeling.
 - .5 The termination block shall comply with the following PoE standards
 - .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
 - .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts, IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
 - .3 IEEE 802.3bt (Type 4) Power over Ethernet (PoE+) applications up to 90 watts
 - .4 Cisco Universal Power Over Ethernet (UPOE+) applications up to 90 watts
 - .5 Power over HDBaseTTM (POH) applications up to 100 watts
 - .6 Plastic bases and blocks must be made of fire-retardant plastic rated UL 94V-0.
 - .7 Wiring blocks must allow for termination of 22-26 AWG solid copper wire
 - .8 The block must meet Category 6A component requirements.
 - .9 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal
- .2 Cat 6 110 Type Cross-Connect Kits:
 - .1 The cross-connect kits shall be Category 6 110-style wiring kits including blocks, bases, C4 clips and labeling available for wall or rack-mount.

- .2 They shall provide 110 terminations supporting voice, security, and Category 6 data applications when used with 4 pair UTP Category 6 rated cabling.
- .3 The components shall be UL listed and ANSI/TIA-568.2-D compliant.
- .4 Wall-mount 110 wiring blocks shall support 96 and 288 pair densities with provision for ANSI/TIA-606 compliant labeling.
- .5 Rack-mount kits shall support 96 pair densities with provision for ANSI/TIA-606 compliant labeling.
- .6 The termination block shall comply with the following PoE standards
 - .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
 - .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts, IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
 - .3 IEEE 802.3bt (Type 4) Power over Ethernet (PoE+) applications up to 90 watts
 - .4 Cisco Universal Power Over Ethernet (UPOE+) applications up to 90 watts
 - .5 Power over HDBaseTTM (POH) applications up to 100 watts
- .7 Plastic bases and blocks must be made of fire-retardant plastic rated UL 94V-0.
- .8 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal
- .3 Cat 5e 110 Type Wiring Cross connect Kits:
 - .1 The cross-connect kits shall be Category 5e 110-style wiring kits including blocks, bases, C4 or C5 clips and labeling available for wall or rack-mount.
 - .2 They shall provide 110 terminations supporting voice, security, and Category 5e data applications when used with 4 pair UTP Category 5e rated cabling.
 - .3 The 110 rack-mount panels shall mount to a 19" distribution frame or hinged wall mount bracket.
 - .4 The components shall be UL listed and ANSI/TIA-568.2-D compliant.
 - .5 Wallmount 110 wiring blocks shall support 100 pr density with provision for ANSI/TIA-606-B compliant labeling.
 - .6 Plastic bases and blocks shall be made of fire-retardant plastic rated UL 94V-0.
 - .7 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell or approved equal.

Part 3 Execution

3.1 Installation

- .1 All Patch Panels shall be installed in the racks installed in the telecommunications space.
- .2 Each patch panel shall be attached to the rack using the four (4) rack screws supplied with the panel
- .3 All Patch Panels shall be installed level and plum within the racks.
- .4 Patch Panels shall be installed per the elevation drawings for the Telecommunications space.

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 Provide all labor, materials, and equipment for the complete installation of all Optical Fiber Backbone Cables called for in the Contract Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for Optical Fiber Backbone Cables.
- .2 Included in this section are the minimum composition requirements and installation methods for the following:
 - Intra Building Backbone (Inside buildings (ISP))
 - Inter Building Backbone (Between buildings (OSP))

1.3 General Specifications

- .1 Cables shall be designed for Point to Point applications and shall provide a high level of protection for optical fiber installed in building applications.
- .2 Higher optical fiber count cables shall utilize a sub-unitized design with color-coded subunits for easy identification.

1.4 Cable Performance Specifications

- .1 Cables shall comply with the applicable standards per cable type:
 - .1 EN 50173; ISO/IEC 11801
 - .2 ANSI/ICEA S-83-596
 - .3 ANSI/TIA-568.3-D
 - .4 NFPA 130
 - .5 ITU-T G.657.A1 and ITU-T G.652.D compliant for Single-Mode (bend insensitive).
 - .6 ANSI/ICEA S-87-640, Standard for Optical Fiber Outside Plant Communications Cable
 - .7 Telcordia, GR-20-CORE, Generic Requirements for Optical Fiber and Optical Fiber Cable
 - .8 Telcordia, GR-409-CORE, Generic Requirements for Indoor Fiber Optic Cables
 - .9 Telcordia requirements for superior armored cable

1.5 General - Multimode Fiber

- .1 Cable shall support current and next generation LAN, SAN, and WAN applications through laser-optimized 50/125 micrometer optical fibers and shall extend distance of low-cost 850-nanometer vertical cavity surface-emitting laser (VCSEL) based electronics.
- .2 Cable shall support dual speed 1 gigabit per second/10 gigabits per second ports, allowing incremental upgrades of switches and servers with less disruption.

- .3 Optical fibers shall be differential mode delay (DMD) tested using a high-resolution test bench that exceeds fiber optic test procedure (FOTP) 220 standards and independently certified by UL.
- .4 Cable shall also support existing and legacy multi-mode applications that traditionally operate in 850 and 1300 nanometer regions.
- .5 Basis for Design Specifications: CommScope multimode optical (OM3, OM4) or singlemode fiber unless otherwise noted, in strand-count identified on Telecommunications Drawing and/or the Bid Document, and with the appropriate jacket material [OFNR, OFNP, OFN (LS)] for the pathway in which the cable will be routed.

Part 2 Products

2.1 Intra Building Backbone (ISP)

- .1 Indoor Cables - All cable shall be listed for use indoors per the Ontario Electrical Safety Code and shall meet one of the following, per bid document.
 - .1 **Indoor Riser Rated Tight Buffer** - UL-listed OFNR: Tight buffer optical fibers, aramid strength yarn, and riser-rated outer jacket.
 - .2 **Indoor Plenum Rated Tight Buffer** UL-listed OFNP cable: Tight buffer optical fibers, aramid strength yarn, and plenum-rated outer jacket.
 - .3 **Indoor Low Smoke/Zero Halogen Riser Rated Tight Buffer LSZH** cable: Solid copper conductors with non-halogen HDPE insulation and low smoke, zero halogen, compound jacket to achieve LSZH rating.
 - .4 **Indoor Armored Riser Rated Tight Buffer** - UL-listed OFCR: Tight buffer optical fibers, aramid strength yarn, a riser-rated jacket, aluminum interlocking armor with an overall riser-rated sheath jacket to provide additional protection and security.
 - .5 **Indoor Armored Plenum Rated Tight Buffer** UL-listed OFCP cable: Tight buffer optical fibers, aramid strength yarn, a plenum-rated outer jacket, aluminum interlocking armor with an overall plenum-rated sheath jacket to provide additional protection and security.

2.2 Inter Building Stranded Backbone (OSP)

- .1 All cable shall be manufactured and constructed for use in the Outside Plant Environment and shall meet one of the following, per bid document.
 - .1 Outside Plant (OSP) loose tube all dielectric - Dielectric design with MDPE sheath jacket and no metallic elements to provide environmental protection.
 - .2 Outside Plant (OSP) loose tube metallic sheath - Metallic sheath design with MDPE sheath jacket to provide environmental protection. Metallic armor of corrugated polymer coated steel tape to provide added crush protection. Armor shall meet Telcordia requirements for superior armored cable.
- .2 Buffer tubes and optical fibers

- .1 Industry standard buffer tubes stranded around a central strength member and compatible with standard hardware, cable routing, and fan-out kits.
- .2 Optical fibers shall be industry-standard color coded and separated into 12-fiber color-coded binder groups surrounded by plastic core tubes
- .3 Water blocking
 - .1 OSP Fiber Cables are available as either fully dry or dry core with gel in the buffer tubes. The bid document will specify the cable type.
 - .1 Dry water-blocking compound suitable for underground conduit, direct burial, and aerial applications in cable and buffer tubes.
 - .2 Dry water-blocking compound suitable for underground conduit, direct burial, and aerial applications with gel filled buffer tubes.

2.3 Inter Building Central Tube Backbone (OSP)

- .1 All cable shall be manufactured and constructed for use in the Outside Plant Environment and shall meet one of the following, per bid document.
 - .1 **Outside Plant (OSP) Central Tube loose tube all dielectric** - Dielectric design with medium-density polyethylene (MDPE) sheath jacket over a central buffer tube with longitudinal polyester ripcords and no metallic elements to provide environmental protection.
 - .2 **Outside Plant (OSP) loose tube metallic sheath** - Metallic sheath design with medium-density polyethylene (MDPE) sheath jacket over a central buffer tube with longitudinal polyester ripcords and metallic armor of corrugated polymer coated steel tape to provide added crush protection. Armor shall meet Telcordia requirements for superior armored cable.
- .2 Buffer tubes and optical fibers:
 - .1 Central tube of polybutylene terephthalate (PBT) material, containing all optical fibers, with 2 dielectric longitudinal outer strength members extending length of cable.
 - .2 Optical fibers shall be industry-standard color coded and separated into 12-fiber color-coded binder groups and industry-standard color coding.
- .3 Water blocking:
 - .1 OSP Fiber Cables are available as either fully dry or dry core with gel in the buffer tubes. The bid document will specify the cable type.
 - .1 Dry water-blocking compound suitable for underground conduit, direct burial, and aerial applications in cable and buffer tubes.
 - .2 Dry water-blocking compound suitable for underground conduit, direct burial, and aerial applications with gel filled buffer tubes.

2.4 Intra Building Backbone Indoor/outdoor(ISP/OSP)

- .1 Indoor/Outdoor Cables - All cable shall be listed for use indoors per the National Electrical Code (NFPA-70) and shall meet the following, per bid document.
 - .1 **Indoor Plenum Rated Tight Buffer** – UL listed OFNP: Tight buffer optical fibers, aramid strength yarn, and plenum-rated outer jacket.

- .2 **Indoor Riser Rated Tight Buffer** - UL-listed OFNR: Tight buffer optical fibers, aramid strength yarn, and riser-rated outer jacket.
- .3 **Indoor Low Smoke/Zero Halogen Riser Rated Tight Buffer** UL-listed OFN(LS) cable: Solid copper conductors with non-halogen HDPE insulation and low smoke, zero halogen, compound jacket to achieve LSZH rating

2.5 OM4 Multimode Fiber Specification

- .1 The multimode fibers shall fully meet or exceed the OM4 fiber specifications in:
- .2 ANSI/TIA-492AAAD standards
EN 50173-1:2011
ISO/IEC 11801:2010
IEC/EN 60793-2-10 (A1a fiber)
Local/National Codes and Regulations
- .3 The OM4 multimode fiber shall be manufactured with an inside vapor deposition process such as the MCVD (Modified Chemical Vapor Deposition) or PCVD (Plasma Clad Vapor Deposition) processes. Multimode fibers produced with outside vapor deposition processes, such as OVD or VAD, will not be accepted. Inside vapor deposition manufacturing processes results in superior control of Refractive Index Profile required for high bandwidth.
- .4 The OM4 Multimode Fiber SCS shall be capable of supporting, at minimum, the following IEEE Ethernet applications:

802.3j	10BASE-F 10 Mb/s
802.3j	10BASE-FL 10 Mb/s
802.3u	100BASE-FX 100 Mb/s
802.3u	100BASE-SX 100 Mb/s
802.3z	1000BASE-SX 1000 Mb/s
802.3ae	10GBASE-SR 10Gb/s
802.3aq	10GBASE-LRM 10Gb/s with EDC
802.3ba	40GBASE-SR4 40 Gb/s
802.3ba	100GBASE-SR10 100 Gb/s

- .5 Additionally, the OM4 Multimode Fiber SCS shall be capable of supporting the following Fiber Channel Applications Standards, per Technical Committee 11 of INCITS:

1GFC
2GFC
4GFC
8GFC
10GFC
16GFC

- .6 The OM4 multimode fiber shall comply with the following physical specifications:

Cladding Diameter	125 µm
-------------------	--------

Cladding Diameter Tolerance	±1.0 µm
Cladding Non-Circularity, maximum	1%
Coating Diameter (Colored)	254 µm
Coating Diameter (Uncolored)	245 µm
Coating Diameter Tolerance (Colored)	±7 µm
Coating Diameter Tolerance (Uncolored)	±10 µm
Coating/Cladding Concentricity Error, maximum	6 µm
Core Diameter	50.0 µm
Core Diameter Tolerance	±2.5 µm
Core/Clad Offset, maximum	1.5 µm
Numerical Aperture	0.200 ± 0.015
Zero dispersion wavelength	1297 - 1316 nm
Zero dispersion slope	≤ 0.105 ps/nm 2-km
Maximum DMD (note: must comply with at least one of the 6 templates specified below 850 nm 1300 nm)	Meets or exceeds TIA-492AAAC-A and IEC 60793-2-10 A1a.2 See attached templates 0.88 ps/m

- .7 The OM4 multimode fiber shall meet the following requirements:

Maximum Fiber Cabled Loss	3.0 dB/km at 850 nm* 1.0 dB/km at 1300 nm*
Minimum Effective Modal Bandwidth	4700 MHz.km at 850 nm (DMD, laser) 500 MHz.km at 1300 nm (DMD, laser)
Minimum overfilled Modal Bandwidth	3500 MHz.km at 850 nm (OFL) 500 MHz.km at 1300 nm (OFL)
Operating Temperature Range (cabled fiber)	-20°C to 50°C (-4°F to 122°F)*
Storage Temperature Range (cabled fiber)	0°C to 50°C (32°F to 122°F) for LSZH -40°C to 65°C (-40°F to 149°F) for others
Maximum Pulling Tension	90 kg
Minimum Tensile Strength	0.7 GPa (100,000 psi)

THIS VALUE REFLECTS CABLED FIBER LOSS. UN-CABLED FIBER VALUES WILL NOT BE ACCEPTED

- .8 The OM4 multimode fibers shall be color coded to facilitate individual fiber identification. Color coding shall follow industry standard TIA-598-C Optical Fiber Cable Color Coding
- .9 The coating shall be mechanically strippable.

- .10 The OM4 fiber shall meet a minimum of one of the DMD templates listed below, accounting for the wider inner and outer mask specifications when compared with TIA 492AAAc and IEC 60793-2-10 standards:
- .11 Differential Mode Delay Testing
The OM4 multimode fiber shall be tested in accordance with: IEC/EN 60793-1-49
TIA-455-220-A
TIA-492AAAC-A
- .12 The following additional enhancements to the DMD tests must be made to ensure high bandwidth:

Enhancement to IEC/EN 60793-1-49 and ANSI/TIA-492AAAC-A standards	
Parameters	Test Requirement
Speed of Laser	5 ps pulse width
Scan Resolution (Radial Increment)	1 μ m
Inner Mask Radial Coverage	0 – 18 μ m (no central hole)
Number of Quadrants Tested	4 quadrants
Test Length	300- 550 meters

- .13 The Cable Manufacturer must have the capability to test DMD for cabled product. Third party verification of the DMD test bench must be provided with the bid response.

2.6 OM3 Multimode Fiber Specification

- .1 The OM3 Multimode Fiber SCS shall comply with the following standards
ANSI/TIA-568-C
EN 50173-1:2011
EN 50173-2:2010
IEC 60603-7-4
IEEE 802.3 applications as outlined in section (b) ISO/IEC 11801:2010
Local/National Codes and Regulations
- .2 The OM3 Multimode Fiber SCS shall be capable of supporting, at minimum, the following IEEE Ethernet applications:

802.3j	10BASE-F 10 Mb/s
802.3j	10BASE-FL 10 Mb/s
802.3u	100BASE-FX 100 Mb/s
802.3u	100BASE-SX 100 Mb/s
802.3z	1000BASE-SX 1000 Mb/s
802.3ae	10GBASE-SR 10Gb/s
802.3aq	10GBASE-LRM 10Gb/s with EDC
802.3ba	40GBASE-SR4 40 Gb/s
802.3ba	100GBASE-SR10 100 Gb/s

- .3 Additionally, the OM3 Multimode Fiber SCS shall be capable of supporting the following Fiber Channel Applications Standards, per Technical Committee 11 of INCITS:

1GFC
2GFC
4GFC
8GFC
10GFC
16GFC

- .4 The multimode fibers shall fully meet or exceed the OM3 fiber specifications in:
ANSI/TIA-492AAAC standards
EN 50173-1:2011
IEC/EN 60793-2-10 (A1a fiber)
ISO/IEC 11801:2010
- .5 The OM3 multimode fiber shall be manufactured with an inside vapor deposition process such as the MCVD (Modified Chemical Vapor Deposition) or PCVD (Plasma Clad Vapor Deposition) processes. Multimode fibers produced with outside vapor deposition processes, such as OVD or VAD, will not be accepted. Inside vapor deposition manufacturing processes results in superior control of Refractive Index Profile required for high bandwidth.
- .6 The OM3 multimode fiber shall comply with the following physical specifications:

Cladding Diameter	125 µm
Cladding Diameter Tolerance	±1.0 µm
Cladding Non-Circularity, maximum	1%
Coating Diameter (Colored)	254 µm
Coating Diameter (Uncolored)	245 µm
Coating Diameter Tolerance (Colored)	±7 µm
Coating Diameter Tolerance (Uncolored)	±10 µm
Coating/Cladding Concentricity Error, maximum	6 µm
Core Diameter	50.0 µm
Core Diameter Tolerance	±2.5 µm
Core/Clad Offset, maximum	1.5 µm
Numerical Aperture	0.200 ± 0.015
Zero dispersion wavelength	1297 □ 1316 nm
Zero dispersion slope	≤ 0.105 ps/nm ² -km
Maximum DMD (note: must comply with at least one of the 6 templates specified below)	Meets or exceeds TIA-492AAAC-A and IEC 60793-2-10 A1a.2
850 nm	See attached templates
1300 nm	0.89 s/m

- .7 The OM3 multimode fiber shall meet the following requirements:

Maximum Fiber Cabled Loss	3.0 dB/km at 850 nm* 1.0 dB/km at 1300 nm*
---------------------------	---

Minimum Bandwidth	2000 MHz.km at 850 nm (DMD, laser) 500 MHz.km at 1300 nm (DMD, laser) 1500 MHz.km at 850 nm (OFL) 500 MHz.km at 1300 nm (OFL)
Operating Temperature Range (cabled fiber)	-20°C to 50°C (-4°F to 122°F)*
Storage Temperature Range (cabled fiber)	0°C to 50°C (32°F to 122°F) for LSZH -40°C to 65°C (-40°F to 149°F) for others
Maximum Pulling Tension	90 kg
Minimum Tensile Strength	0.7 GPa (100,000 psi)

THIS VALUE REFLECTS CABLED FIBER LOSS. UN-CABLED FIBER VALUES WILL NOT BE ACCEPTED

- .8 The OM3 multimode fibers shall be color coded to facilitate individual fiber identification. Color coding shall follow industry standard ANSI/TIA-598-C Optical Fiber Cable Color Coding
- .9 The coating shall be mechanically strippable.
- .10 The OM3 fiber shall meet a minimum of one of the DMD templates listed below, accounting for the wider inner and outer mask specifications when compared with TIA 492AAAc and IEC 60793-2-10 standards:

Template	850 nm DMD-Inner Mask (ps/m) Radius from 0 to 18 µm)	850 nm DMD-Outer Mask (ps/m) Radius from 0-23 µm
1	≤ 0.23	≤ 0.70
2	≤0.24	≤ 0.60
3	≤0.25	≤ 0.50
4	≤0.26	≤ 0.40
5	≤0.27	≤ 0.35
6	≤0.33	≤ 0.33

- .11 The OM3 multimode fiber shall be tested in accordance with:
IEC/EN 60793-1-49
ANSI/TIA-455-220-A
ANSI/TIA-492AAAC-A
- .12 The following additional enhancements to the DMD tests must be made to ensure high bandwidth:

Enhancement to IEC/EN 60793-1-49 and ANSI/TIA-492AAAC-A standards	
Parameters	Test Requirement
Speed of Laser	5 ps pulse width
Scan Resolution (Radial Increment)	1 µm
Inner Mask Radial Coverage	0 – 18 µm (no central hole)
Number of Quadrants Tested	4 quadrants
Test Length	3061 meters

- .13 Third party verification of the DMD test bench must be provided with the bid response.

2.7 OS2 Single-mode 8.3 Micrometer Fiber Specification

- .1 The OS2 Single-mode Fiber SCS shall comply with the following standards
ANSI/TIA-568-C
EN 50173-1:2011
EN 50173-2:2010
IEC 60603-7-4
IEEE 802.3 applications as outlined in section (iii) ISO/IEC 11801:2010
Local/National Codes and Regulations
- .2 The OS2 optical fiber glass shall be manufactured from ultra-pure synthetic silica glass. Single-mode fibers manufactured from natural quartz will not be accepted.
- .3 The OS2 Single-mode Fiber SCS shall be capable of supporting, at minimum, the following IEEE Ethernet applications:

100M	100BASE-LX10
1G	1000BASE-LH
	1000BASE-BX10
	1000BASE-LX10
	1000BASE-PX10-D
	1000BASE-PX10-U
	1000BASE-PX20-D
	1000BASE-ZX
10G	10GBASE-LR
	10BASE-LX4
	10GBASE-ER
40G	40GBASE-LR4
100G	100GBASE-LR4

- .4 The OS2 single-mode Fiber SCS shall be capable of supporting the following Fiber Channel Applications Standards, per Technical Committee 11 of INCITS:

1GFC
2GFC
4GFC
8GFC
10GFC
16GFC

- .5 The OS2 single-mode fibers shall fully meet or exceed the specifications in: EN 50173-1:2011
ISO/IEC 11801:2010
IEC/EN 60793-2-50 (b1.3 fiber)
ANSI/TIA-492CAAB
ITU-T G.652.D
- .6 The OS2 single-mode fiber shall comply with the following physical specifications:

Physical Characteristics	
Cladding Diameter	125.0 ± 0.7 µm
Core/Clad Offset	≤ 0.5 µm
Coating Diameter (Uncolored)	245.0 ± 10 µm
Coating Diameter (Colored)	254.0 ± 7 µm
Coating/Cladding Concentricity Error, Max.	12 µm
Clad Non-Circularity	≤ 1.0 %

- .7 The OS2 single-mode fiber shall comply with the following mechanical specifications:

Mechanical Characteristics	
Proof Test	100 kpsi (0.69 Gpa)
Coating Strip Force	0.3 – 2.0 lbf (1.3 – 8.9 N)
Fiber Curl	≥ 4 m
Dynamic fatigue Parameter (nd)	≥ 18
Macrobending, Max. (100 turns)	0.05 dB (1,310/1550 nm @50mm) 0.05 dB (1,625 nm @ 60 mm)
Macrobending, Max. (1 turn @32 mm mandrel)	0.05 @1,550 nm

- .8 The OS2 single-mode fiber shall comply with the following mechanical specifications:

Optical Characteristics, Wavelength Specific				
	1310 nm	1385 nm	1550 nm	
Max Attenuation Loose Tube Cable	0.34 dB/km	0.31 dB/km	0.22 dB/km	
Max Attenuation Tight Buffer Cable	0.50 dB/km	0.50 dB/km	0.50 dB/km	
Mode Field Diameter	9.2 ± 0.3 µm	9.6 ± 0.6 µm	10.4 ± 0.5 µm	
Group Refractive Index	1.467	1.468	1.468	
Dispersion, Max.	3.5 ps/(nm-km) from 1,285 to 1,330 nm		18 ps/(nm-km)	

- .9 The OS2 single-mode fiber shall comply with the following optical and environmental specifications:

Optical Characteristics, General	
Points defects, Max.	0.10dB
Cut-Off Wavelength	≤ 1260
Zero Dispersion Wavelength	1,302 – 1,322 nm
Zero Dispersion Slope, max.	0.090 ps/[km-nm-nm]
Polarization Mode Dispersion Link Design Value	≤ 0.06 ps/sqrt (km)
Backscatter Coefficient	-79.6/-82.1 dB @ 1310/1550 nm
Index of Refraction	1.466/ 1.467 @ 1310/1550 nm

Environmental Characteristics	
Temperature Dependence -76°F to 185°F (-60°C to 85°C)	≤ 0.05dB
Temperature humidity Cycling 14°F to 185°F (-10°C to 85°C) up to 95% RH	≤ 0.05dB
Water Immersion, 73.4°F (23°C)	≤ 0.05dB
Heat Aging, 185°F (85°C)	≤ 0.05dB

2.8 Backbone Cabling

- .1 Approved Manufacturer: CommScope, Belden, Panduit, Hubbell, Leviton or approved equal

Part 3 Execution

3.1 Installation

- .1 General - Inter and Intra Building Fiber Backbone Cable
 - .1 Contractor shall comply applicable codes, standards and with all local codes and requirements. It is the responsibility of the contractor to identify and adhere to any unique codes or requirements governed by the region where the work is to be performed.
 - .2 Provide all necessary products for installation of Fiber Backbone cabling to include cable attachments, etc.
 - .3 Where multiple cables are housed in conduits, fiber backbone cables shall be installed in a separate corrugated "inner duct" pathway inside the shared conduit.
 - .4 Backbone cable shall be installed following industry standard practices.
 - .5 Contractor shall not exceed the maximum pulling tension or the minimum bending radius for fiber cables per manufacturer's specifications.
 - .6 All installations shall comply with:
 - ANSI/TIA-568 Series Commercial Building Telecommunications Cabling
 - Standard ANSI/TIA-569 Telecommunications Pathways and Spaces
 - ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure
 - ANSI-J-STD-607 Joint Standard for Commercial Building Grounding (Earthing)
 - and Bonding Requirements for Telecommunications
 - BICSI Telecommunications Distribution Methods Manual NFPA 70
 - National Electric Code
- .2 Backbone Cable Testing
 - .1 Complete end-to-end test results for all Fiber Optic cables installed are required.
 - .2 All fiber optic cable must be visually inspected and optically tested on the reel upon delivery to the installation site. Using an Optical Time Domain Reflectometer (OTDR), an access jumper with like fiber, a pigtail, and a mechanical splice, all fibers shall be tested for continuity and attenuation.

- .3 Testing for continuity and attenuation on the reel must confirm factory specifications to ensure that the fiber optic cable was not damaged during shipment. The test results must match the results of the factory-attached tag on the reel, or the fiber shall not be used. Reel data sheet must be provided showing test results.
- .4 End to end (bi-directional) test measurements shall be provided for single-mode and multimode fibers (2 wavelengths per test are required). Test results must be submitted for review as part of the installation inspection requirements. Test results shall be in paper form and electronic form, and must contain the names and signatures of the technicians performing the tests.
- .5 Testing shall be performed on 100% of the fibers in the completed end-to-end system. TIA-568, provides the technical criteria and formulae to be used in fiber optic testing. Note however, that all UH fiber must be tested, rated and guaranteed for Ethernet GigaSPEED 1000B-X performance.
- .6 Additionally, all fiber optic cable links must pass all installation and performance tests both recommended and mandated by the cable manufacturer.
- .7 The Owner is to be notified at least 24 hours prior to testing to allow observation at the Owner's discretion. If the Owner confirms his intention to observe, a reasonable starting time shall be agreed upon. Should the Owner not be present at the scheduled commencement time, the Contractor may begin testing as scheduled.
- .8 Testing Format: Test Results must be submitted in two (2) formats. First, must be original file(s) down loaded from tester. Second, the file must be cohesively placed in Excel format with the following fields:
ER/TR RM # / RM # of drop / Port # / all relevant test information in as many fields as necessary.
- .9 All test results are to be recorded and submitted to the Owner.
- .3 Cable and Termination Panel Labeling Backbone Cable Testing Label the installed cables in accordance with Section 27 05 53
- .4 Cable Support
 - .1 Provide cable supports and clamps to attach cables to backboards and walls.
 - .2 Backbone cables spanning more than three (3) floors shall be securely attached at the top of the cable run with a wire mesh grip and on alternating floors.
 - .3 Attach horizontal and vertical backbone cables at 2 foot intervals using Owner approved supports; such as D-rings or jumper troughs utilized for wire management.
 - .4 Attach cables to manhole racks using Owner approved methods
 - .5 Backbone cabling shall be secured to the cable/ladder tray following manufacturer recommended procedures, and appropriate installation hardware and methods as defined by local code or the authority having jurisdiction (AHJ).

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 Provide all labor, materials, and equipment for the complete installation of all Copper Horizontal Cabling applications called for in the Bid Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for Copper Horizontal Cables.
- .2 Horizontal cable shall consist of Category 5e, 6 or 6A copper cable for all Data and Voice applications.

1.3 Quality Assurance

- .1 All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative. Equipment and materials shall be of the quality and manufacture indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "approved equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.
- .2 Strictly adhere to all Building Industry Consulting Service International (BICSI) and Telecommunications Industry Association (TIA) recommended installation practices when installing communications/data cabling.
- .3 Material and work specified herein shall comply with the applicable requirements of the current adopted revision of the following:
 - ANSI/TIA-568 Series Commercial Building Telecommunications Cabling Standard
 - ANSI/TIA-568.1-E – Commercial Building Telecommunications Cabling Standard
 - ANSI/TIA-568.2-E - Balanced Twisted-Pair Telecommunications Cabling and
 - ANSI/TIA-569 Telecommunications Pathways and Spaces
 - ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure
 - ANSI-J-STD-607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
 - BICSI – Telecommunications Distribution Methods Manual Components Standards
 - NFPA 70 – National Electric Code
 - ISO/IEC 11801 - Generic Cabling for Customer Premises
 - CENELEC EN-50173 - Generic Cabling Systems

1.4 Cable Construction (by Type):

- .1 Listed CMR(FT4) cable: Solid copper conductors with high-density polyolefin insulation and an overall low smoke polyvinyl chloride (PVC) jacket to achieve a riser (i.e., non- plenum) rating by applicable NEC requirements.
- .2 Listed CMP(FT6) cable: Solid copper conductors with fluorinated ethylene propylene (FEP) insulation and an overall low smoke PVC jacket to achieve plenum rating by applicable NEC requirements.

- .3 LSZH cable: Solid copper conductors with non-halogen high-density polyethylene (HDPE) insulation and a low smoke, zero halogen, compound jacket to achieve a LSZH rating by applicable IEC standards
- .4 LC cable: Solid copper conductors with FEP fluoropolymer insulation and overall FEP fluoropolymer jacket to achieve CMP 50 rating by UL standards
- .5 OSP outdoor cable rated for wet locations: Solid copper conductors with polyethylene insulation.

1.5 Submittals

- .1 Provide product data for the following:
 - .1 Manufacturers cut sheets, specifications and installation instructions for all products.

1.6 Coordination

- .1 Coordinate layout and installation of cable tray with other trades.

Part 2 Products

2.1 Data/Voice Communications Horizontal Cabling (Category 3/Class C)

- .1 Category 3 horizontal cabling shall not be used for Data Communication cable. Category 3 cabling may be used for telephone cable for special instances where ANALOG ONLY service is required and is specified in the bid document.
 - .1 All Cables shall be of round construction
 - .2 Each cable shall contain 4 to 100 color coded pairs as required in the bid document.
 - .3 Cable shall be listed for the environment where it will be installed (Plenum, Riser, LSZH, etc.)
 - .4 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .2 Category 3 Cabling shall comply with the following application standards:
 - .1 Voice, facsimile, modem, Switched 56, T-1, and ISDN. 2. RS-232, RS-422, and RS-485.
 - .2 IEEE 802.3 1BASE5, 10BASE-T, 100BASE-T, and 1000BASE-T.
 - .3 IEEE 1394B transfer mode S100.
 - .4 IEEE 802.5 at 4 megabits per second and 16 megabits per second at 100 meters (328 feet).
 - .5 TP-PMD technology at 100 megabits per second.
 - .6 ATM at 155 megabits per second and 622 megabits per second using parallel transmission schemes.
- .3 Category 3 Cabling shall comply with following BAS application specifications:
 - .1 Operating voltages for dry locations: 0 to 30 Vac at 60 hertz, 0 to 70.7 Vac for audio frequencies, and 0 to 60 Vdc

- .2 Operating currents at 25 degrees C (77 degrees F) ambient temperature
 - .1 One current-carrying pair per cable: 1.5 amperes on each conductor
 - .2 Two to Four current-carrying pairs per cable: 3.36 amperes for all pairs
 - .3 Audio frequencies and 1 current-carrying pair per cable: 1 ampere on each conductor

2.2 Data Communications Horizontal Cabling (Category 5e/Class D)

- .1 Category 5 Enhanced (5e) Unshielded Twisted-Pair (UTP) Cable
 - .1 All Cables shall be of round construction
 - .2 Each cable shall contain 4pr 24awg color coded conductors
 - .3 Cable shall be listed for the environment where it will be installed (Plenum/FT6, Riser/FT4, LSZH, etc.)
 - .4 Plenum (CMP/FT6) and riser (CMR/FT4) cables shall be cULus listed to UL 444 - CAN/CSA C22.2 No. 214.
 - .5 CMP/FT6 cable shall have an operating temperature range of -20°C to +75°C. CMR/FT4 cable shall have an operating temperature range of -20°C to +60°C.
 - .6 The cable shall support the following POE standards when installed according to Manufacturer's recommendations.
 - .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
 - .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts
 - .3 IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
 - .7 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal

2.3 Data Communications Horizontal Cabling (Category 6/Class E)

- .1 Category 6/Class E Unshielded Twisted-Pair (UTP) Cable
 - .1 All Cables shall be of round construction
 - .2 Each cable shall contain 4pr 24awg color coded conductors
 - .3 Cable shall be listed for the environment where it will be installed (Plenum, Riser, LSZH, etc.)
 - .4 Plenum (CMP/FT6) cables shall be cULus listed to UL 444 - CAN/CSA C22.2 No. 214. Riser (CMR/FT4) cables shall meet UL 1666 Fire rating.
 - .5 CMP/FT6 cable shall have an operating temperature range of -20°C to +75°C. CMR/FT4 cable shall have an operating temperature range of -20°C to +60°C.
 - .6 The cable shall support the following POE standards when installed according to Manufacturer's recommendations.

- .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
- .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts
- .3 IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
- .7 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal

2.4 Data Communications Horizontal Cabling (Category 6A/Class EA)

- .1 Category 6 Augmented (6A)/Class EA Unshielded Twisted-Pair (UTP) Cable
 - .1 All Cables shall be of round construction
 - .2 Each cable shall contain 4pr 23awg color coded conductors
 - .3 Cable shall be listed for the environment where it will be installed (Plenum, Riser, LSZH, etc.)
 - .4 Cable shall be cULus listed to UL 444 - CAN/CSA C22.2 No. 214 and be RoHS Compliant.
 - .5 Cable shall have an operating temperature range of -20°C to +75°C.
 - .6 The cable shall support the following POE standards when installed according to Manufacturer's recommendations.
 - .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
 - .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts
 - .3 IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
 - .4 Cisco Universal Power Over Ethernet (UPOE) applications up to 60 watts
 - .5 IEEE 802.3bt (Type 4) Power over Ethernet (PoE+) applications up to 90 watts
 - .6 Power over HDBaseTTM (POH) applications up to 100 watts
 - .7 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal

2.5 Data Communications Horizontal Cabling COLOR

- .1 Data drop cables shall be in Blue.
- .2 Voice cables shall be in Green.
- .3 Wireless Access Point cables shall be in Orange.
- .4 Camera cables shall be in Yellow.
- .5 Intercom cables shall be in Red.
- .6 Clock cables shall be in Black.

- .7 Public Address cables shall be in White.
- .8 All other cables not list above shall be in Violet.

Part 3 Execution

3.1 Installation

- .1 Contractor shall comply applicable codes, standards and with all local codes and requirements. It is the responsibility of the contractor to identify and adhere to any unique codes or requirements governed by the region where the work is to be performed.
- .2 Cable shall be installed following industry standard practices.
- .3 Horizontal cabling shall be installed from the work area outlet location to the nearest Telecommunications Space.
- .4 Horizontal cabling shall be terminated on a patch panel in the telecommunication space which is the same category rating as the Cable. i.e. Cat 6 cable terminates on Cat 6 panels.
- .5 Contractor shall not exceed the maximum pulling tension or the minimum bending radius for twisted pair cables per manufacturer's specifications.
- .6 Contractor shall test all horizontal links per the ANSI/TIA-568 Requirements.
- .7 Contractor shall provide PoE extender for all horizontal cablings exceed 90m at no additional cost to the Owner.

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 Provide all labor, materials, and equipment for the complete installation of all Jack/Information outlets and connections called for in the Bid Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for Jack/Information outlets and Connectors.
- .2 The channel performance for the installation shall meet or exceed the requirements of ANSI/TIA-568 and ISO/IEC 11801 for the specified Category.
- .3 The Jack/Information outlets shall match the category of the cabling
- .4 All jacks/information outlets shall meet UL 94 V-O

1.3 Quality Assurance

- .1 All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative.
- .2 Equipment and materials shall be of the quality and manufacture indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "approved equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.
- .3 Strictly adhere to all Building Industry Consulting Service International (BICSI) and Telecommunications Industry Association (TIA) recommended installation practices when installing communications/data cabling.
- .4 Material and work specified herein shall comply with the applicable requirements of the current adopted revision of the following:
 - ANSI/TIA-568 Series Commercial Building Telecommunications Cabling Standard
 - ANSI/TIA-569 Telecommunications Pathways and Spaces,
 - ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure
 - BICSI Telecommunications Distribution Methods Manual
 - J-STD-607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
 - NFPA 70 National Electric Code
 - ISO/IEC 11801
 - CENELEC EN-50173

1.4 Submittals

- .1 Provide product data for the following:
 - .1 Manufacturers cut sheets, specifications and installation instructions for all products (submit with bid).

1.5 Coordination

- .1 Coordinate installation of Jack/Information outlets and connectors with other trades.

Part 2 Products

2.1 General

- .1 All products will be compliant to RoHS 2002/95/EC
- .2 All products will be designed, manufactured and/or distributed under this quality management system: ISO 9001:2008
- .3 Telecommunications jacks shall be 8-position/8-conductor modular outlets accepting industry standard modular RJ45 type plugs and insulation displacement conductor (IDC) terminations.
- .4 The Universal design shall support T568A and T568B wiring and shall have universal wiring labels, including color-coded insert identification labels to ensure accurate identification.
- .5 Provide crosstalk cancellation with compensation and alien crosstalk mitigation using printed wiring board materials and compensation technology.
- .6 Jack shall be backward compatible with lower category cords and cables.
- .7 Low-profile wire cap shall protect against contamination and secure connection. Jacks shall be suitable for:
 - .1 Modular patching applications or as modular TO
 - .2 Installation without special faceplates at either 45- or a 90-degree angle in manufacturer's modular faceplates and frames, including those on surface- mounted boxes
- .8 Electrical Specifications
 - .1 Contact Resistance Variation, maximum: 20 mOhm
 - .2 Contact Resistance, maximum: 100 mOhm
 - .3 Current Rating: 1.5 A @ 20 °C, 1.5 A @ 68 °F
 - .4 Dielectric Withstand Voltage, RMS, conductive surface: 1500 Vac @ 60 Hz
 - .5 Dielectric Withstand Voltage, RMS, contact-to-contact: 1000 Vac @ 60 Hz
 - .6 Insulation Resistance, minimum: 500 MOhm
- .9 Environmental Specifications
 - .1 Flammability Rating: UL 94 V-0
 - .2 Operating Temperature: -10 °C to +60 °C (+14 °F to +140 °F)
 - .3 Relative Humidity: Up to 95%, non-condensing
 - .4 Safety Standard: cUL, UL
 - .5 Storage Temperature: -40 °C to +70 °C (-40 °F to +158 °F)
- .10 Mechanical Specifications

- .1 Conductor Type: Solid
- .2 Material Type: Copper alloy, High-impact, flame retardant, thermoplastic
- .3 Outlet/Module Contact Plating: Precious metals
- .4 Plug Insertion Life, minimum: 750 times
- .5 Plug Insertion Life, test plug: IEC 60603-7 compliant plug
- .6 Plug Retention Force, minimum: 30 lbf, 133 N
- .7 Rear Termination Contact Plating: Precious metals
- .8 Rear Termination Type: IDC
- .9 Wiring: T568A or T568B
- .10 Can be mounted either at 90 degrees (straight) or 45 degrees (angled)

2.2 Category 5 Enhanced (5e)/Class D Outlets

- .1 The modular connector shall be independently tested and verified by a Nationally Recognized Testing Laboratory to meet or exceed the Category 5e component performance requirements of ANSI/TIA-568.2-D and ISO/IEC 11801 from 1 MHz to 100 MHz to meet or exceed the IEEE 802.3 standard for 1000BASE-T network performance.
- .2 The connector module shall be third party certified to meet the IEC 60512-99-002 standard for support of IEEE 802.3bt Type 4 PoE (90 watt) applications.
- .3 The connector module will exceed IEEE 802.3bt standard to support up to 0.5 amps per conductor (100 watts) continuously
- .4 The connector module shall utilize an engineered tine geometry to prevent POE arcing damage due to plug removal cycles from occurring at the critical contact-mating zone between the plug and connector module tines.
- .5 The eight-position connector module shall utilize a method of tine tensioning that
 - .1 Prevents contact bouncing and arcing at the critical contact-mating zone between the plug and connector module tines.
 - .2 Prevents six-position modular plug insertion from damaging either the cord or the module.
- .6 Contact tines shall be plated with a minimum of 50 microns of gold.
- .7 All plastics used in construction of connector bodies shall be fire retardant with a UL flammability rating of 94V-0.
- .8 Connector Module shall comply with UL 2043 as suitable for installation in plenum spaces.
- .9 Backward compatible with Category 5 and 3 cords
- .10 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell or approved equal

2.3 Category 6/Class E Outlets

- .1 Electrical performance guaranteed to meet or exceed TIA-568-C.2 Category 6 and ISO/IEC Category 6/Class E specifications.

- .2 The modular connector shall be independently tested and verified by a Nationally Recognized Testing Laboratory to meet or exceed the Category 6 component performance requirements of ANSI/TIA-568.2-D and ISO/IEC 11801 from 1 MHz to 250 MHz to meet or exceed the IEEE 802.3 standard for 1000BASE-T network performance.
- .3 The connectors shall also be in compliance with US National Electrical Codes; compliant with ANSI/TIA-1096-A (formerly FCC Part 68); UL listed; and independently verified.
- .4 The connector module shall be third party certified to meet the IEC 60512-99-002 standard for support of IEEE 802.3bt Type 4 PoE (90 watt) applications.
- .5 The connector module will exceed IEEE 802.3bt standard to support up to 0.5 amps per conductor (100 watts) continuously
- .6 The connector module shall utilize an engineered tine geometry to prevent POE arcing damage due to plug removal cycles from occurring at the critical contact-mating zone between the plug and connector module tines.
- .7 The eight-position connector module shall utilize a method of tine tensioning that
 - .1 Prevents contact bouncing and arcing at the critical contact-mating zone between the plug and connector module tines.
 - .2 Prevents six-position modular plug insertion from damaging either the cord or the module.
- .8 Contact tines shall be plated with a minimum of 50 microns of gold.
- .9 Optional Plastic Icons and Dust Covers available
- .10 Backward compatible with Category 5e, 5 and 3 cords and cables, however optimal performance achieved when used with same manufacturer patch cords.
- .11 Can support network line speeds in excess of 1 gigabit per second.
- .12 Qualifies for a lifetime product and applications assurance warranty when included as part of a certified channel.
- .13 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell or approved equal

2.4 Category 6 Augmented (6A)/Class EA Outlets

- .1 The modular connector shall be independently tested and verified by a Nationally Recognized Testing Laboratory to meet or exceed the Category 6A component performance requirements of ANSI/TIA-568-C.2 and ISO/IEC 11801 from 1 MHz to 500 MHz to support the IEEE 802.3an standard for 10GBASE-T network performance.
- .2 The connector shall also be in compliance with US National Electrical codes; compliant with ANSI/TIA-1096-A; cUL Listed; and independently verified.
- .3 The connector module shall be third party certified to meet the IEC 60512-99-002 standard for support of IEEE 802.3bt Type 4 PoE (90 watt) applications.
- .4 The connector module will exceed IEEE 802.3bt standard to support up to 0.5 amps per conductor (100 watts) continuously

- .5 The connector module shall utilize an engineered tine geometry to prevent POE arcing damage due to plug removal cycles from occurring at the critical contact-mating zone between the plug and connector module tines.
- .6 The eight-position connector module shall utilize a method of tine tensioning that
 - .1 Prevents contact bouncing and arcing at the critical contact-mating zone between the plug and connector module tines.
 - .2 Prevents six-position modular plug insertion from damaging either the cord or the module.
- .7 Contact tines shall be plated with a minimum of 50 microns of gold.
- .8 Optimal performance is achieved when using the same manufacturers patch cords.
- .9 Can support network line speeds up to at least 10 gigabits per second.
- .10 Qualifies for the Lifetime Extended Product Warranty and Applications Assurance when included as part of a registered channel.
- .11 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell or approved equal

2.5 Data OUTLET COLOR

- .1 Data outlets shall provided per the drawings and Owner's Standards. Coordinate with Owner prior to procurement and installations.

Part 3 Execution

3.1 Installation

- .1 Contractor shall comply applicable codes, standards and with all local codes and requirements. It is the responsibility of the contractor to identify and adhere to any unique codes or requirements governed by the region where the work is to be performed.
- .2 Jack/Information outlets and Connectors shall be installed following industry standard practices.
- .3 Horizontal cabling shall be terminated on a Jack/Information outlet which is the same category rating as the Cable. i.e. Cat 6 cable terminates on Cat 6 Jack/Information outlets.
- .4 Contractor shall not exceed the maximum pulling tension or the minimum bending radius for twisted pair cables per manufacturer's specifications.
- .5 Contractor shall test all horizontal links per the ANSI/TIA-568 Requirements.

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 Provide all labor, materials, and equipment for the complete installation of all Fiber Connectors, Adapters and Adapter Panels called for in the Bid and Engineering Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for Fiber Connectors, Adapters and Adapter Panels.
- .2 The performance for the installation shall meet or exceed the requirements of ANSI/TIA-568 and ISO/IEC 11801 and other requirements as noted in this specification for the specified Fiber Type.
- .3 The connectors and adapters shall match the fiber type of the cabling
- .4 All connectors and adapters shall meet UL 94 V-O

1.3 Quality Assurance

- .1 All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative.
- .2 Equipment and materials shall be of the quality and manufacture indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "approved equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.
- .3 Strictly adhere to all Building Industry Consulting Service International (BICSI) and Telecommunications Industry Association (TIA) recommended installation practices when installing communications/data cabling.
- .4 Material and work specified herein shall comply with the applicable requirements of the current adopted revision of the following:

ANSI/TIA-568 Series Commercial Building Telecommunications Cabling Standard

ANSI/TIA-568.3-D – Optical Fiber Cabling Components Standard

ANSI/TIA- 569 Telecommunications Pathways and Spaces

ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure

ANSI-J-STD-607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications

BICSI – Telecommunications Distribution Methods Manual

Belcore, fiber distributed data interface (FDDI) standards

NFPA 70 – National Electric Code

Telcordia's Generic Requirements for Optical Fiber and Optical Fiber Cable

ISO/IEC 11801 - Generic Cabling for Customer Premises

CENELEC EN-50173 - Generic Cabling Systems

1.4 Submittals

- .1 Provide product data for the following:
 - .1 Manufacturers cut sheets, specifications and installation instructions for all products (submit with bid).

1.5 Coordination

- .1 Coordinate installation of Jack/Information outlets and connectors with other trades.

Part 2 Products

2.1 General

- .1 All products will be:
 - .1 Compliant to RoHS 2002/95/EC
 - .2 Designed, manufactured and/or distributed under this quality management system: ISO 9001:2008

2.2 LC Fiber Adapters

- .1 Multimode adapter for use with 50/125 OM3 and OM4 Fiber
 - .1 The adapter plate shall be modular and functional for use in panel or Panel (rack- or wall-mount) specified.
 - .2 The adapter plate shall be offered in 12, or 24 fiber configurations.
 - .3 The adapter plate shall be compliant to ANSI/TIA-568.3-D and ISO 11801 (for performance) and respective ANSI/TIA-604-X and applicable IEC (for intermateability) standards.
 - .4 Color – Aqua Entire adapter plate shall be color coded, not just feed-thrus, to identify performance grade.
 - .5 Alignment Sleeve Material - ~~Phosphorous bronze~~ zirconia ceramic sleeves
 - .6 LC adapters shall be compatible with locking keyed patch cords and port blockers.
 - .7 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell or approved equal
- .2 Single-mode adapter for use with G.652.D or G.652.D, OS2 fiber
 - .1 The adapter plate shall be modular and functional for use in panel or Panel (rack- or wall-mount) specified.
 - .2 The adapter plate shall be offered in SC, LC, and ST styles in 6, 8, 12, or 24 fiber configurations.
 - .3 The adapter plate shall be compliant to ANSI/TIA-568.3-D and ISO 11801 (for performance) and respective ANSI/TIA-604-X and applicable IEC (for intermateability) standards.

- .4 Color – Blue Entire adapter plate shall be color coded, not just feed-thrus, to identify performance grade.
- .5 Alignment Sleeve Material – Zirconia Ceramic sleeves
- .6 LC adapters shall be compatible with locking keyed patch cords and port blockers.
- .7 Approved Manufacturer
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell or approved equal

2.3 LC Fiber Connectors

- .1 Single-mode Connector for use with G.652.D or G.652.D, OS2 fiber
 - .1 Color – Blue
 - .2 Ferrule Geometry - Pre-radiused
 - .3 Ferrule Material - Zirconia
 - .4 Performance meets or exceeds ANSI/TIA-568-C.2 standard
 - .5 Insertion Loss, typical - 0.20 dB
 - .6 Return Loss, minimum - 55.0 dB
 - .7 Insertion Loss Change, mating - 0.30 dB
 - .8 Insertion Loss Change, temperature - 0.30 dB
- .2 Keyed Multimode Connector for use with OM3 and OM4 fiber
 - .1 Color – per key
 - .2 For use with Keyed adapters
 - .3 Offer a tamper-proof design, reducing the chance of unauthorized connections.
 - .4 Ten connector-adapter combinations must exist, identified by color
 - .5 The connector and adapter colors must match for a connection to be possible
 - .6 Ferrule Geometry - Pre-radiused
 - .7 Ferrule Material - Zirconia
 - .8 Performance meets or exceeds ANSI/TIA-568-C.3 standard
 - .9 Insertion Loss, typical - 0.17 dB
 - .10 Return Loss, minimum - 20.0 dB
 - .11 Insertion Loss Change, mating - 0.20 dB
 - .12 Insertion Loss Change, temperature - 0.30 dB
 - .13 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .3 Keyed Single-mode Connector for use with G.652.D or G.652.D, OS2 fiber
 - .1 Color – per key
 - .2 For use with Keyed adapters
 - .3 Offer a tamper-proof design, reducing the chance of unauthorized connections.

- .4 Ten connector-adapter combinations must exist, identified by color
- .5 The connector and adapter colors must match for a connection to be possible
- .6 Ferrule Geometry - Pre-radiused
- .7 Ferrule Material - Zirconia
- .8 Performance meets or exceeds ANSI/TIA-568-C.2 standard
- .9 Insertion Loss, typical - 0.20 dB
- .10 Return Loss, minimum - 55.0 dB
- .11 Insertion Loss Change, mating - 0.30 dB
- .12 Insertion Loss Change, temperature - 0.30 dB
- .4 LC Connectors with mechanical splice
 - .1 Color coded per industry standard requirements to aide in identification during and after installation
 - .2 Factory pre-polished for field installation
 - .3 Mechanical splice technology
 - .4 Must include a factory pre-cleaved fiber stub and a proprietary index-matching gel
 - .5 Options for singlemode and multimode fibers
 - .6 Compatible with 250µm and 900µm optical fibers
 - .7 Performance exceeds ANSI/TIA-568-C.2 standard
 - .8 Complete tool kit with cleaning solution, wipes, and scrap fiber container designed for quick setup and tear-down
 - .9 Factory-installed wedge clip shall be included with each connector; wedge is discarded upon completion of the termination
 - .10 Translucent wedge shall enable the use of a common VFI to provide a "pass/fail" signal once physical contact is achieved
 - .11 Capability to be re-terminated if the first installation fails
 - .12 Shall not require a custom termination kit
 - .13 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal

2.4 SC Fiber Adapters

- .1 Multimode adapter for use with 50/125 OM3 and OM4 Fiber
 - .1 The adapter plate shall be modular and functional for use in panel or Panel (rack- or wall-mount) specified.
 - .2 The adapter plate shall be offered in 6, or 12 fiber configurations.
 - .3 The adapter plate shall be compliant to ANSI/TIA-568.3-D and ISO 11801 (for performance) and respective ANSI/TIA-604-X and applicable IEC (for intermateability) standards.
 - .4 Color – Aqua Entire adapter plate shall be color coded, not just feed-thrus, to identify performance grade.
 - .5 Alignment Sleeve Material - zirconia ceramic sleeves

- .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .2 Single-mode adapter for use with G.652.D or G.652.D, OS2 fiber
 - .1 The adapter plate shall be modular and functional for use in panel or Panel (rack- or wall-mount) specified.
 - .2 The adapter plate shall be offered in 6, or 12 fiber configurations.
 - .3 The adapter plate shall be compliant to ANSI/TIA-568.3-D and ISO 11801 (for performance) and respective ANSI/TIA-604-X and applicable IEC (for intermateability) standards.
 - .4 Color – Blue Entire adapter plate shall be color coded, not just feed-thrus, to identify performance grade.
 - .5 Alignment Sleeve Material - Zirconia ceramic sleeves
 - .6 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal

2.5 SC Fiber Connectors

- .1 Multimode Connector for use with OM3 and OM4 fiber
 - .1 Color – Beige
 - .2 Ferrule Geometry - Pre-radiused
 - .3 Ferrule Material - Zirconia
 - .4 Performance meets or exceeds ANSI/TIA-568-C.3 standard
 - .5 Insertion Loss, typical - 0.30 dB
 - .6 Return Loss, minimum - 20.0 dB
 - .7 Insertion Loss Change, mating - 0.30 dB
 - .8 Insertion Loss Change, temperature - 0.30 dB
 - .9 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .2 Single-mode Connector for use with G.652.D or G.652.D, OS2 fiber
 - .1 Color – Blue
 - .2 Ferrule Geometry - Pre-radiused
 - .3 Ferrule Material - Zirconia
 - .4 Performance meets or exceeds ANSI/TIA-568-C.2 standard
 - .5 Insertion Loss, typical - 0.30 dB
 - .6 Return Loss, minimum - 55.0 dB
 - .7 Insertion Loss Change, mating - 0.30 dB
 - .8 Insertion Loss Change, temperature - 0.30 dB
 - .9 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal
- .3 SC Connectors with mechanical splice

- .1 Color coded per industry standard requirements to aide in identification during and after installation
- .2 Factory pre-polished for field installation
- .3 Mechanical splice technology
- .4 Must include a factory pre-cleaved fiber stub and a proprietary index-matching gel
- .5 Options for singlemode and multimode fibers
- .6 Compatible with 250µm and 900µm optical fibers
- .7 Performance exceeds ANSI/TIA-568-C.2 standard
- .8 Complete tool kit with cleaning solution, wipes, and scrap fiber container designed for quick setup and tear-down
- .9 Factory-installed wedge clip shall be included with each connector; wedge is discarded upon completion of the termination
- .10 Translucent wedge shall enable the use of a common VFI to provide a "pass/fail" signal once physical contact is achieved
- .11 Capability to be re-terminated if the first installation fails
- .12 Shall not require a custom termination kit
- .13 Approved Manufacturer:
 - .1 CommScope, Belden, Panduit, Hubbell, Leviton or approved equal

Part 3 Execution

3.1 Installation

- .1 Contractor shall comply applicable codes, standards and with all local codes and requirements. It is the responsibility of the contractor to identify and adhere to any unique codes or requirements governed by the region where the work is to be performed.
- .2 Fiber Connectors, Adapters and Adapter Panels shall be installed following industry standard practices.
- .3 Horizontal cabling shall be terminated on a Fiber Connectors, Adapters and Adapter Panels which is designed for the fiber type of the cable. i.e. Singlemode cable terminates on Singlemode Connectors and Adapters.
- .4 Contractor shall not exceed the maximum pulling tension or the minimum bending radius for twisted pair cables per manufacturer's specifications.
- .5 Contractor shall test all horizontal links per the Relevant Standards and Requirements.

END of SECTION

Part 1 General

1.1 Work Includes

- .1 Provide all labor, materials, and equipment for the complete installation of all Faceplate/wall plates and Surface mount Boxes called for in the Bid Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for Faceplate/wall plates and Surface mount Boxes.
- .2 Faceplates and SMB shall be designed to accept the CommScope, Belden, Panduit, Hubbell, Leviton or approved equal information outlets.
- .3 Number of outlets per faceplate shall be as detailed on the Telecommunications Drawings.

1.3 Quality Assurance

- .1 All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative.
- .2 Equipment and materials shall be of the quality and manufacture indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "approved equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.
- .3 Strictly adhere to all Building Industry Consulting Service International (BICSI) and Telecommunications Industry Association (TIA) recommended installation practices when installing communications/data cabling.
- .4 Material and work specified herein shall comply with the applicable requirements of the current adopted revision of the following:
ANSI/TIA-568 Series Commercial Building Telecommunications Cabling Standard
ANSI/TIA-568.1-E – Commercial Building Telecommunications Cabling Standard
ANSI/TIA-568.2-E - Balanced Twisted-Pair Telecommunications Cabling and Components Standards
ANSI/TIA-568.3-D – Optical Fiber Cabling Components Standard
ANSI/TIA-569 Commercial Building Standard for Telecommunications Pathways and Spaces
ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure
BICSI-Telecommunications Distribution Methods Manual
CENELEC EN-50173 - Generic Cabling Systems
ISO/IEC 11801 - Generic Cabling for Customer Premises
J-STD-607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
NFPA 70 – National Electric Code

1.4 Submittals

- .1 Provide product data for the following:

- .1 Manufacturers cut sheets, specifications and installation instructions for all products (submit with bid).

1.5 Coordination

- .1 Coordinate installation of Faceplate/wall plates and Surface mount Boxes with other trades.

Part 2 Products

2.1 Flush Wallmount Faceplates w/ ID Windows

- .1 Wallplate housing shall be a one-piece, single- or dual-gang flush mount style that fits standard NEMA openings.
- .2 Wallplate shall provide 1, 2, 3, 4, 6, 8 or 12 ports.
- .3 Wallplate must be able to accept modular jacks from approved manufacturer.
- .4 Wallplate shall accommodate connections of any type, UTP, optical fiber, coax, or AV modules.
- .5 Wallplate must be made of high-impact, fire-retardant plastic rated UL 94V-0, and be UL Listed, cULus Listed (UL 1863 & CAN/CSA-C22.2 No. 182.4) and meet ANSI/TIA-568-D specifications.
- .6 Colors, port counts and configurations to be specified per schedule on plans.
- .7 Colors available are white, light almond, ivory, gray and black.
- .8 Wallplate screws must match wallplate color.
- .9 The flush faceplate housing the connector modules shall have no visible mounting screws.
- .10 The faceplate housing the connector modules shall have the option of being mounted on adapter boxes for surface mount installation.
- .11 The faceplate housing the connector modules shall have a labeling capability using built-in labeling windows, to facilitate outlet identification and ease network management.
- .12 The faceplate housing the connector modules shall provide flexibility in configuring multimedia workstation outlets that respond to present or future network needs such as audio, video, coaxial and optical fiber applications.
- .13 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.2 Angled Wallmount Faceplates w/ ID Windows

- .1 Angled Wallplate housing shall be a one-piece, single-gang flush mount style that fits standard NEMA openings.
- .2 Angled Wallplate shall provide 1, 2 or 4 ports and feature a 45-degree angled design to facilitate cable management.

- .3 Angled Wallplate must be able to accept modular jacks from approved manufacturer.
- .4 Angled Wallplate shall accommodate connections of any type, UTP, optical fiber, coax, or AV modules.
- .5 Angled Wallplate must be made of high-impact, fire-retardant plastic rated UL 94V-0, and be UL Listed, cULus Listed (UL 1863 & CAN/CSA-C22.2 No. 182.4) and meet ANSI/TIA-568-D specifications.
- .6 Colors, port counts and configurations to be specified per schedule on plans.
- .7 Colors available are white, light almond, ivory, and black.
- .8 The flush faceplate housing the connector modules shall have no visible mounting screws.
- .9 The faceplate housing the connector modules shall have the option of being mounted on adapter boxes for surface mount installation.
- .10 The faceplate housing the connector modules shall have a labeling capability using built-in labeling windows, to facilitate outlet identification and ease network management.
- .11 The faceplate housing the connector modules shall provide flexibility in configuring multimedia workstation outlets that respond to present or future network needs such as audio, video, coaxial and optical fiber applications.
- .12 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.3 Stainless-Steel Flush Wallmount Faceplates

- .1 Stainless-Steel wallplate housing shall be a single-gang or dual-gang flush mount style that fits standard NEMA openings.
- .2 Stainless-Steel Wallplate shall provide 1, 2, 3, 4, or 6 ports single-gang and 2, 4, 6, 8 or 12 ports dual-gang.
- .3 Stainless-Steel Wallplate must be able to accept modular jacks from approved manufacturer.
- .4 Stainless-Steel Wallplate shall accommodate connections of any type, UTP, optical fiber, coax, or AV modules.
- .5 Wallplate shall be manufactured from 304 stainless steel in a brushed finish to provide corrosion resistance in a non-magnetic material, ABS plastic carrier, be cULus Listed (UL 1863 & CAN/CSA-C22.2 No. 182.4) and meet ANSI/TIA-568-D specifications.
- .6 Port counts and configurations to be specified per schedule on plans.
- .7 The faceplate housing the connector modules shall have the option of being mounted on adapter boxes for surface mount installation.
- .8 Specify port identification method with colored modules or designation labels or custom silk-screening.

- .9 The faceplate housing the connector modules shall provide flexibility in configuring multimedia workstation outlets that respond to present or future network needs such as audio, video, coaxial and optical fiber applications.

- .10 Approved Manufacturer:

- .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.4 Stainless-Steel Flush Wallmount Faceplates with ID Windows

- .1 Stainless-Steel Wallplate housing shall be a single-gang or dual-gang flush mount style that fits standard NEMA openings.
- .2 Stainless-Steel Wallplate shall provide 1, 2, 3, 4, or 6 ports single-gang and 4 or 8 ports dual-gang.
- .3 Stainless-Steel Wallplate must be able to accept modular jacks from approved manufacturer.
- .4 Stainless-Steel Wallplate shall accommodate connections of any type, UTP, optical fiber, coax, or AV modules.
- .5 Wallplate shall be manufactured from 304 stainless steel in a brushed finish to provide corrosion resistance in a non-magnetic material, ABS plastic carrier, be cULus Listed (UL 1863 & CAN/CSA-C22.2 No. 182.4) and meet ANSI/TIA-568-D specifications.
- .6 Port counts and configurations to be specified per schedule on plans.
- .7 The faceplate housing the connector modules shall have the option of being mounted on adapter boxes for surface mount installation.
- .8 Specify port identification method with colored modules or designation labels.
- .9 Wallplate mounting screw holes shall be slotted to permit leveling (+/- 4 degrees for single -gang and +/- 2 degrees for double-gang).
- .10 The faceplate housing the connector modules shall provide flexibility in configuring multimedia workstation outlets that respond to present or future network needs such as audio, video, coaxial and optical fiber applications.
- .11 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.5 Angled Stainless-Steel Flush Wallmount Faceplates with ID Windows

- .1 Angled Stainless-Steel Wallplate housing shall be single-gang or dual-gang flush mount style that fits standard NEMA openings.
- .2 Angled Stainless-Steel Wallplate shall provide 2 or 4 ports single-gang and 4 or 8 ports dual-gang design that feature a 45-degree angled design to facilitate cable management.
- .3 Angled Stainless-Steel Wallplate must be able to accept modular jacks from approved manufacturer.
- .4 Angled Stainless-Steel Wallplate shall accommodate connections of any type, UTP, optical fiber, coax, or AV modules.

- .5 Wallplate shall be manufactured from 304 stainless steel in a brushed finish to provide corrosion resistance in a non-magnetic material, ABS plastic carrier, be cULus Listed (UL 1863 & CAN/CSA-C22.2 No. 182.4) and meet ANSI/TIA-568-D specifications.
- .6 Port counts and configurations to be specified per schedule on plans.
- .7 The faceplate housing the connector modules shall have the option of being mounted on adapter boxes for surface mount installation.
- .8 Specify port identification method with colored modules or designation labels.
- .9 Wallplate mounting screw holes shall be slotted to permit leveling (+/- 4 degrees for single -gang and +/- 2 degrees for double-gang).
- .10 The faceplate housing the connector modules shall provide flexibility in configuring multimedia workstation outlets that respond to present or future network needs such as audio, video, coaxial and optical fiber applications.
- .11 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.6 Stainless-Steel Flush Wallmount Phone Faceplates

- .1 Stainless-Steel wallplate housing shall be a 1-port single-gang recessed or flush mount style designed with rivets to support a variety of wall mount telephones. Wallplate shall fit standard NEMA openings.
- .2 Stainless-Steel Wallplate must be able to accept modular jacks from approved manufacturer.
- .3 Wallplate shall be manufactured from 302 stainless steel in a brushed finish and provide corrosion resistance, be cULus Listed (UL 1863 & CAN/CSA-C22.2 No. 182.4) and meet ANSI/TIA-568-D specifications.
- .4 Recessed or flush configurations to be specified per schedule on plans.
- .5 The faceplate housing the connector modules shall have the option of being mounted on adapter boxes for surface mount installation.
- .6 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.7 Surface mount boxes

- .1 The surface mount housing shall be small and low profile to accept 1, 2, 4, 6 or 12 field-configurable snap in connector modules.
- .2 Base and snap-on cover shall include knockouts for rear, bottom, or side cable entry.
- .3 Base shall also include cable anchor points.
- .4 The housing shall be mountable with screws, tape, or magnets, and have mounting holes compatible with standard NEMA and Euro wall boxes.
- .5 Cover shall include an identification window, which also hides a user provided #6 x 1/2" security screw.

- .6 Construction shall be of high-impact fire-retardant plastic rated UL 94V-0.
- .7 Box shall be cULus listed and compliant with ANSI/TIA-568-D.
- .8 1- and 2-port housings shall comply with UL 2043 as suitable for use in air-handling spaces per NEC 300-22(b)(c).
- .9 The surface mount box shall accommodate connections of any type, UTP, optical fiber or coax.
- .10 One and two-port housings shall comply with UL 2043 as suitable for use in air handling spaces per NEC 300-22(b)(c).
- .11 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.8 Industrial Outlet Kits

- .1 Industrial Outlet Kits shall be pre-assembled and available in single-gang and dual-gang stainless steel standard NEMA box dimensions.
- .2 The single-gang industrial outlet kit shall provide 1 or 2 ports and an equivalent amount of connector housings and dust caps assembled.
- .3 The dual-gang industrial outlet kit shall provide 2 or 4 ports and an equivalent amount of connector housings and connector caps assembled.
- .4 Industrial outlet wall plates shall include over molded gasket to seal to outlet boxes and screw holes shall have an embedded sealing feature.
- .5 Connector housings mounted in industrial wallplates shall accept all standard connector modules from the same Manufacturer and be encapsulated RJ-45 design to protect the standard connector modules.
- .6 Outlet assembly related components shall be IP67 rated for dust and liquid and have an operating temperature range of -40°C to 65°C.
- .7 Outlet assembly wallplate shall be constructed of stainless steel, with an integral over-molded gasket.
- .8 Connector housing shall be made of PBT, be cULus listed, and compliant with ANSI/TIA-1005 and ANSI/TIA-568-D.
- .9 Outlet kits shall mate via twist-lock seal with industrial category 6A patch cords.
- .10 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

Part 3 Execution

3.1 Installation

- .1 Contractor shall comply applicable codes, standards and with all local codes and requirements. It is the responsibility of the contractor to identify and adhere to any
- .2 Unique codes or requirements governed by the region where the work is to be performed.

- .3 Faceplate/wall plates and Surface mount Boxes shall be installed following industry standard practices.
- .4 Contractor shall not exceed the maximum pulling tension or the minimum bending radius for twisted pair cables per manufacturer's specifications.
- .5 Contractor shall test all horizontal links per the ANSI/TIA-568 Requirements.

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 Provide all labor, materials, and equipment for the complete installation of all Copper Patch cords into the approved patch panels called for in the Bid Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for Copper Patch Cords.
- .2 All Patch/Equipment Cords shall be new.
- .3 On new installations, Patch/Equipment Cords shall be made by the same manufacturer as the Horizontal Cable used in the new installation.
- .4 All Patch/Equipment Cords shall be factory manufactured and tested for compliance to the appropriate standards and performance.
- .5 Patch/Equipment Cord length shall be determined by the end user.
- .6 Patch/Equipment Cords shall be installed using proper cable management.
- .7 Minimum bend radius shall not be exceeded.

1.3 Quality Assurance

- .1 All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative.
- .2 Equipment and materials shall be of the quality and manufacture indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "approved equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.
- .3 Strictly adhere to all Building Industry Consulting Service International (BICSI) and Telecommunications Industry Association (TIA) recommended installation practices when installing communications/data cabling.
- .4 Material and work specified herein shall comply with the applicable requirements of the current adopted revision of the following:
 - ANSI/TIA-568 Series Commercial Building Telecommunications Cabling Standard
 - ANSI/TIA-569 Commercial Building Standard for Telecommunications Pathways and Spaces
 - ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure
 - BICSI – Telecommunications Distribution Methods Manual
 - J-STD – 607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
 - NFPA 70 – National Electric Code

1.4 Submittals

- .1 Provide product data for the following:

- .1 Manufacturers cut sheets, specifications and installation instructions for all products.

1.5 Coordination

- .1 Coordinate layout and installation of Patch/Equipment Cords with other trades.

Part 2 Products

2.1 Category 5 Enhanced (5e) Cords

- .1 The Modular Patch Cords shall meet or exceed Attenuation and NEXT Category 5 and Category 5e specifications for patch cords as specified in ISO/IEC 11 801, CENELEC, EN50173 and ANSI/TIA-568-C.2.
- .2 Patch cords shall be UTP construction, stranded 24 AWG conductors, and a nominal outside diameter of .220" (5.6mm)
- .3 Patch Cords shall have 8-position modular plug on each end and feature a narrow profile snagless strain relief boot.
- .4 Patch cord plug shall be industry standard, FCC compliant clear material with 50 micro inches of gold plating.
- .5 Patch cords shall meet UL 444 CM rating.
- .6 The patch cord shall comply with the following POE standards
 - .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
 - .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts,
 - .3 IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
 - .4 Cisco Universal Power Over Ethernet (UPOE) applications up to 60 watts
- .7 The cords shall be available in lengths of 3, 5, 7, and 10 feet. Additional lengths are available as non-stocked options.
- .8 The patch cords shall qualify as part of the Manufacturers Lifetime Product and Systems Performance Warranty when installed as part of a certified system.
- .9 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.2 IDC CATEGORY 5E PATCH CORDS

- .1 The IDC Patch Cords shall meet or exceed Attenuation and NEXT Category 5 and Category 5e specifications for patch cords as specified in ISO/IEC 11 801, CENELEC, EN50173 and ANSI/TIA-568-C.2.
- .2 Patch cords shall be UTP construction, solid 24 AWG conductors
- .3 Patch Cords shall have 8-position modular plug on each end and feature a narrow profile snagless strain relief boot.

- .4 Patch cord plug shall be industry standard, FCC compliant clear material with 50 micro inches of gold plating.
- .5 Patch cords shall meet UL 1666 CMR or CMP rating as appropriate.
- .6 The patch cord shall comply with the following POE standards
 - .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
 - .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts,
 - .3 IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
 - .4 Cisco Universal Power Over Ethernet (UPOE) applications up to 60 watts
- .7 Cords shall come in custom lengths
- .8 The patch cords shall qualify as part of the Manufacturers Lifetime Product and Systems Performance Warranty when installed as part of a certified system.
- .9 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.3 Category 6 / Class E Patch Cords

- .1 Patch cords shall be tested and verified to meet ANSI/TIA-568.2-D and ISO 11801-1 Category 6 component requirements.
- .2 Patch cords shall be UTP construction, stranded 24 AWG conductors, and a nominal outside diameter of .225" (5.72 mm).
- .3 Patch Cords shall have 8-position modular plug on each end and feature a narrow profile snagless strain relief boot.
- .4 Patch cords shall meet ANSI/TIA-1096-A (formerly FCC Part 68) and be RoHS compliant with 50 micro inches of gold plating.
- .5 Patch cords shall meet UL 444 CM rating.
- .6 The patch cord shall comply with the following PoE standards
 - .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
 - .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts,
 - .3 IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
 - .4 IEEE 802.3bt (Type 4) Power over Ethernet (PoE+) applications up to 90 watts
 - .5 Cisco Universal Power Over Ethernet (UPOE+) applications up to 90 watts
 - .6 Power over HDBaseT™ (POH) applications up to 95 watts
- .7 For 100-watt applications – up to 100 cables in a bundle.
- .8 The patch cords shall have an operating temperature range of -4°F to +140°F (-20°C to +60°C).

- .9 The cords shall be available in standard lengths of 3, 5, 7, 10, 15 and 20 feet (custom lengths available upon request).
- .10 The patch cords shall qualify as part of the Manufacturers Product and Systems Performance Warranty when installed as part of a certified system.
- .11 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.4 IDC CATEGORY 6 PATCH CORDS

- .1 The IDC Patch Cords shall meet or exceed TIA ANSI/TIA-568-C.2 Category 6 and ISO/EIC Category 6/Class E specifications and shall be fully backward compatible with Category 5e and 5 connectors.
- .2 Patch cords shall be UTP construction, solid 24 AWG conductors
- .3 Patch Cords shall have 8-position modular plug on each end and feature a narrow profile snagless strain relief boot.
- .4 Patch cord plug shall be industry standard, FCC compliant clear material with 50 micro inches of gold plating.
- .5 Patch cords shall meet UL 1666 CMR or CMP rating as appropriate.
- .6 The patch cord shall comply with the following POE standards
 - .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
 - .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts,
 - .3 IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
 - .4 Cisco Universal Power Over Ethernet (UPOE) applications up to 60 watts
- .7 Cords shall come in custom lengths
- .8 The patch cords shall qualify as part of the Manufacturers Lifetime Product and Systems Performance Warranty when installed as part of a certified system.
- .9 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.5 Category 6 Augmented (6A) / Class 6A Patch Cords

- .1 The Modular Patch Cords shall meet or exceed the channel specifications of Amendment 1 to ISO/IEC 11 801:2002 Class EA and ANSI/TIA-568-C.2 Category 6A up to 500 MHz when used as part of a UTP Channel.
- .2 Patch cords shall be independently tested and verified to meet ANSI/TIA-568.2-D and ISO 11801-1 Category 6A component requirements.
- .3 The patch cord shall be 26 AWG, FTP construction with stranded conductors and nominal outside diameter of .240".
- .4 Patch cords shall be universal, can be used in both shielded and unshielded channels.

- .5 The patch cord shall incorporate shielded plugs with a snagless tab design. Boots shall be short body style without bend radius control for limited space applications.
- .6 Product shall meet ANSI/TIA-1096-A requirements to include 50 micro inches of gold plating.
- .7 The patch cord jacket shall meet UL 444 CMR (300V) rating.
- .8 The patch cord shall be RoHS compliant and cULus listed.
- .9 The patch cord shall comply with the following POE standards
 - .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
 - .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts,
 - .3 IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
 - .4 IEEE 802.3bt (Type 4) Power over Ethernet (PoE+) applications up to 90 watts
 - .5 Cisco Universal Power Over Ethernet (UPOE+) applications up to 90 watts.
 - .6 Power over HDBaseT™ (POH) applications up to 95 watts
- .10 Cord labels shall include part number, length and lot information.
- .11 The patch cords shall be available in standard 3, 5, 7, 10, 15, and 20 foot lengths. Custom lengths shall also be available through a made to order program.
- .12 Channel performance shall be tested and verified in a 4 connector, 100 meter channel.
- .13 The patch cords shall qualify as part of the Manufacturers Product and Systems Performance Warranty when installed as part of a certified system.
- .14 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.6 IDC CATEGORY 6A PATCH CORDS

- .1 The IDC Patch Cords shall meet or exceed the channel specifications of Amendment 1 to ISO/IEC 11 801:2002 Class EA and ANSI/TIA-568-C.2 Category 6A up to 500 MHz when used as part of a UTP Channel.
- .2 Patch cords shall be UTP construction, solid 23 AWG conductors
- .3 Patch Cords shall have 8-position modular plug on each end and feature a narrow profile snagless strain relief boot.
- .4 Patch cord plug shall be industry standard, FCC compliant clear material with 50 micro inches of gold plating.
- .5 Patch cords shall meet UL 1666 CMR or CMP rating as appropriate.
- .6 The patch cord shall comply with the following POE standards

- .1 IEEE 802.3at (Type 1) Power over Ethernet (PoE) applications up to 15.4 watts
- .2 IEEE 802.3at (Type 2) Power over Ethernet (PoE+) applications up to 30 watts,
- .3 IEEE 802.3bt (Type 3) Power over Ethernet (PoE+) applications up to 60 watts
- .4 IEEE 802.3bt (Type 4) Power over Ethernet (PoE++) applications to 90 watts
- .5 Cisco Universal Power Over Ethernet (UPOE) applications up to 90 watts
- .7 Cords shall come in custom lengths
- .8 The patch cords shall qualify as part of the Manufacturers Lifetime Product and Systems Performance Warranty when installed as part of a certified system.
- .9 Approved Manufacturer:
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.7 Patch / equipment cord COLOR

- .1 Data patch cords shall be in Blue.
- .2 Voice patch cords shall be in Green.
- .3 Wireless Access Point patch cords shall be in Orange.
- .4 Camera patch cords shall be in Yellow.
- .5 Intercom patch cords shall be in Red.
- .6 Clock patch cords shall be in Black.
- .7 All other patch cords not list above shall be in Violet.

Part 3 Execution

3.1 Installation

- .1 Copper Jumpers/patch cables
 - .1 Contractor shall comply applicable codes, standards and with all local codes and requirements. It is the responsibility of the contractor to identify and adhere to any unique codes or requirements governed by the region where the work is to be performed.
 - .2 Cable shall be installed following industry standard practices.
 - .3 Contractor shall not exceed the maximum pulling tension or the minimum bending radius for copper cables per manufacturer's specifications.
 - .4 All installations shall comply with:
 - .1 ANSI/TIA-568 Series Commercial Building Telecommunications Cabling Standard,
 - .2 ANSI/TIA-569 Commercial Building Standard for Telecommunications

- .3 Pathways and Spaces ANSI/TIA – 606 Administration Standard for the Telecommunications Infrastructure of Commercial Buildings
- .4 BICSI – Telecommunications Distribution Methods Manual
- .5 J-STD – 607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
- .6 NFPA 70 – National Electric Code

END OF SECTION

Part 1 General

1.1 Work includes

- .1 Provide all labor, materials, and equipment for the complete installation of all 50 Micron Multimode Optical Fiber Cords and Pigtails into the approved patch panels called for in the Bid Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for Fiber Patch Cords.
- .2 All Patch/Equipment Cords shall be new.
- .3 On new installations, Patch/Equipment Cords shall be made by the same manufacturer as the Horizontal Cable used in the new installation.
- .4 Patch/Equipment Cords shall be available in multiple colors. Colors required are to be detailed in the Bid Documents.
- .5 All Patch/Equipment Cords shall be factory manufactured and tested for compliance to the appropriate standards and performance.
- .6 Patch/Equipment Cord length shall be determined by the end user.
- .7 Patch/Equipment Cords shall be installed using proper cable management.
- .8 Minimum bend radius shall not be exceeded.

1.3 Quality Assurance

- .1 All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative.
- .2 Equipment and materials shall be of the quality and manufacture indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "approved equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.
- .3 Strictly adhere to all Building Industry Consulting Service International (BICSI) and Telecommunications Industry Association (TIA) recommended installation practices when installing communications/data cabling.
- .4 Material and work specified herein shall comply with the applicable requirements of the current adopted revision of the following:
 - ANSI/TIA – 568 Series Commercial Building Telecommunications Cabling Standard
 - ANSI/TIA-569 Commercial Building Standard for Telecommunications Pathways and Spaces
 - ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure
 - BICSI-Telecommunications Distribution Methods Manual
 - J-STD-607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
 - NFPA 70-National Electric Code

Telcordia, GR-20-CORE, Generic Requirements for Optical Fiber and Optical Fiber Cable

1.4 Submittals

- .1 Provide product data for the following:
 - .1 Manufacturers cut sheets, specifications and installation instructions for all products.

1.5 Coordination

- .1 Coordinate layout and installation of Fiber Cords and Pigtailes with other trades.

Part 2 Products

2.1 Optical Fiber Patch Cords and Pigtailes

- .1 To maintain channel integrity, optical fiber patch cords and pigtailes shall be fabricated to meet the performance parameters corresponding to the optical fiber cable approved product type specified below. Patch cord and pigtail plug connectors shall be equipped with boots, and shall have same colors as related optical fiber backbone cables, unless specified or indicated otherwise. Optical fiber patch cords and pigtailes shall be available with the following options as indicated on the bid document.

2.2 Multimode Fiber Patch Cords

- .1 Multimode fiber patch cords shall meet or exceed the requirements of ANSI/TIA-568.3-D.
- .2 Multimode Fiber Patch Cords shall be available in 62.5/125 micron OM1, 50/125-Micron OM2, and 50/125-Micron Laser Optimized OM3 and OM4.
- .3 Multimode patch cords shall meet an optical return loss equal to or better than 25 dB per mated pair.
- .4 Insertion loss shall not exceed 0.4 dB per mated pair.
- .5 Multimode fiber patch cord shall have a maximum attenuation of:
 - .1 3.5dB/km@ 850 nm and 1.5 dB/km @1300 nm for OM1
 - .2 3.0dB/km@ 850 nm and 1.0 dB/km @1300 nm for OM2/OM3/OM4.
- .6 The optical fiber cord connectors shall have precision pre-radiused zirconia ferrules.
- .7 Patch cords shall be available with LC, SC, ST connectors in any combination.
- .8 Cable Jacket color shall be: OM1/OM2 (Orange), OM3/OM4 (Aqua), OS2 (Yellow).
- .9 The fiber cord assembly shall be dual zip, OFNR or OFNP rated as required.
- .10 LC Patch cord outside diameters:
 - .1 Simplex: 1.6 mm (0.063 in)
 - .2 Duplex: 1.6 mm x 3.3 mm (0.063 in x 0.130 in)

- .11 SC Patch cord outside diameters:
 - .1 Simplex: 3.0 mm (0.118 inches)
 - .2 Duplex: 3.0 mm x 5.9 mm (0.063 in x 0.232 in)
- .12 Duplex LC and SC fiber patch cords shall be A-B polarity.
- .13 Standard stock lengths of 1m, 2m, 3m, 5m, and 10m shall be available. Custom lengths shall be available through a made to order program.
- .14 Approved Manufacturer
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.3 MULTIMODE FIBER PIGTAILS

- .1 Multimode fiber Pigtails shall meet or exceed the requirements of ANSI/TIA-568.3-D.
- .2 Multimode Fiber Pigtails shall be available in 62.5/125 micron OM1, 50/125-Micron OM2, and 50/125-Micron Laser Optimized OM3 and OM4.
- .3 Multimode Pigtails shall meet an optical return loss equal to or better than 25 dB per mated pair.
- .4 Insertion loss shall not exceed 0.35 dB per mated pair.
- .5 Multimode fiber Pigtail shall have a maximum attenuation of:
 - .1 3.5dB/km@ 850 nm and 1.5 dB/km @1300 nm for OM1
 - .2 3.0dB/km@ 850 nm and 1.0 dB/km @1300 nm for OM2/OM3/OM4.
- .6 The optical fiber pigtail connectors shall have precision pre-radiused zirconia ferrules.
- .7 The fiber pigtail assembly shall be 3m in length, tight buffered 900m O/D.
- .8 Pigtails shall be available in kits of 12.
- .9 Approved Manufacturer
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

Part 3 Execution

3.1 Installation

- .1 Fiber Optic Jumpers/patch cables
 - .1 Contractor shall comply applicable codes, standards and with all local codes and requirements. It is the responsibility of the contractor to identify and adhere to any unique codes or requirements governed by the region where the work is to be performed.
 - .2 Cable shall be installed following industry standard practices.
 - .3 Contractor shall not exceed the maximum pulling tension or the minimum bending radius for fiber cables per manufacturer's specifications.
 - .4 All installations shall comply with:

ANSI/TIA – 568 Series Commercial Building Telecommunications Cabling
Standard ANSI/TIA-569 Commercial Building Standard for
Telecommunications Pathways
and Spaces
ANSI/TIA-606 Administration Standard for the Telecommunications
Infrastructure
BICSI-Telecommunications Distribution Methods Manual
J-STD-607 Joint Standard for Commercial Building Grounding (Earthing)
and Bonding Requirements for Telecommunications
NFPA 70-National Electric Code
Telcordia, GR-20-CORE, Generic Requirements for Optical Fiber and
Optical Fiber Cable

END OF SECTION

Part 1 General

1.1 Work Includes

- .1 Provide all labor, materials, and equipment for the complete installation of all Single- Mode Optical Fiber Cords and Pigtails into the approved patch panels called for in the Bid Documents.

1.2 Scope of Work

- .1 This section includes the minimum requirements for Fiber Patch Cords.
- .2 All Patch/Equipment Cords shall be new.
- .3 On new installations, Patch/Equipment Cords shall be made by the same manufacturer as the Horizontal Cable used in the new installation.
- .4 Patch/Equipment Cords shall be available in multiple colors. Colors required are to be detailed in the Bid Documents.
- .5 All Patch/Equipment Cords shall be factory manufactured and tested for compliance to the appropriate standards and performance.
- .6 Patch/Equipment Cord length shall be determined by the end user.
- .7 Patch/Equipment Cords shall be installed using proper cable management.
- .8 Minimum bend radius shall not be exceeded.

1.3 Quality Assurance

- .1 All cable and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the contract documents shall be subject to the control and approval of the Owner or Owner Representative.
- .2 Equipment and materials shall be of the quality and manufacture indicated. The equipment specified is based upon the acceptable manufacturers listed. Where "approved equal" is stated, equipment shall be equivalent in every way to that of the equipment specified and subject to approval.

- .4 Material and work specified herein shall comply with the applicable requirements of the current adopted revision of the following:
 - ANSI/TIA – 568 Series Commercial Building Telecommunications Cabling Standard
 - ANSI/TIA-569 Commercial Building Standard for Telecommunications Pathways and Spaces
 - ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure
 - BICSI-Telecommunications Distribution Methods Manual
 - J-STD-607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications
 - NFPA 70-National Electric Code

Telcordia, GR-20-CORE, Generic Requirements for Optical Fiber and Optical Fiber Cable

1.4 Submittals

- .1 Provide product data for the following:
 - .1 Manufacturers cut sheets, specifications and installation instructions for all products.

1.5 Coordination

- .1 Coordinate layout and installation of Fiber Cords and Pigtailes with other trades.

Part 2 Products

2.1 Optical Fiber Patch Cords and Pigtailes

- .1 To maintain channel integrity, optical fiber patch cords and pigtailes shall be fabricated to meet the performance parameters corresponding to the optical fiber cable approved product type specified below. Patch cord and pigtail plug connectors shall be equipped with boots, and shall have same colors as related optical fiber backbone cables, unless specified or indicated otherwise. Optical fiber patch cords and pigtailes shall be available with the following options as indicated on the bid document.

2.2 SINGLEMODE FIBER PATCH CORDS

- .1 Singlemode fiber patch cords shall meet or exceed the requirements of ANSI/TIA-568.3-D
- .2 Single mode patch cords shall meet an optical return loss equal to or greater than 50 dB per mated pair FOR UPC polish or 55dB for APC polish.
- .3 Insertion loss shall not exceed 0.35 dB per mated pair.
- .4 Single mode fiber patch cord shall have a maximum attenuation of:
 - .1 .4 dB/km@ 1310 nm and .3 dB/km @1550 nm
- .5 The optical fiber cord connectors shall have precision pre-radiused zirconia ferrules.
- .6 Cable Jacket color shall be: OS2 (Yellow).
- .7 The fiber cord assembly shall be dual zip, OFNR rated.
- .8 Patch cords shall be available with LC, LC/APC, SC, SC/APC, FC or ST connectors in any combination.
- .9 Duplex fiber patch cords shall be A-B polarity.
- .10 Standard stock lengths of 1m, 2m, 3m, 5m, and 10m shall be available. Custom lengths shall be available through a made to order program.
- .11 LC Patch cord outside diameters:
 - .1 Simplex: 1.6 mm (0.063 in)

- .2 Duplex: 1.6 mm x 3.3 mm (0.063 in x 0.130 in)
- .12 SC Patch cord outside diameters:
 - .1 Simplex: 3.0 mm (0.118 inches)
 - .2 Duplex: 3.0 mm x 5.9 mm (0.063 in x 0.232 in)
- .13 Lengths: As specified in the bid document
- .14 Approved Manufacturer
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

2.3 SINGLEMODE FIBER PIGTAILS

- .1 Singlemode fiber Pigtails shall meet or exceed the requirements of ANSI/TIA-568.3-D.
- .2 Singlemode Pigtails shall meet an optical return loss equal to or better than 50 dB per mated pair.
- .3 Insertion loss shall not exceed 0.25 dB per mated pair.
- .4 The optical fiber pigtail connectors shall have precision pre-radiused zirconia ferrules.
- .5 The fiber pigtail assembly shall be 3m in length, tight buffered 900m O/D.
- .6 Pigtails shall be available in kits of 12.
- .7 Approved Manufacturer
 - .1 Leviton, CommScope, Belden, Panduit, Hubbell, or approved equal

Part 3 Execution

3.1 Installation

- .1 Fiber Optic Jumpers/patch cables
 - .1 Contractor shall comply applicable codes, standards and with all local codes and requirements. It is the responsibility of the contractor to identify and adhere to any unique codes or requirements governed by the region where the work is to be performed.
 - .2 Cable shall be installed following industry standard practices.
 - .3 Contractor shall not exceed the maximum pulling tension or the minimum bending radius for fiber cables per manufacturer's specifications.
 - .4 All installations shall comply with:
 - ANSI/TIA-568 Series Commercial Building Telecommunications Cabling Standard
 - ANSI/TIA-569 Commercial Building Standard for Telecommunications Pathways and Spaces
 - ANSI/TIA-606 Administration Standard for the Telecommunications Infrastructure of Commercial Buildings
 - BICSI – Telecommunications Distribution Methods Manual
 - J-STD-607 Joint Standard for Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications

NFPA 70 – National Electric Code

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Division 1, General Requirement, and all documents referred to therein.

1.2 APPLICATION

- .1 This Section applies to and is a part of all Sections of Division 28.

1.3 SCOPE OF WORK

- .1 **In case of discrepancy of the specifications details, the Owner's standards and requirements attached in the Appendices shall take precedence.**
- .2 The intent of the Tender is to obtain pricing for the supply, installation, testing and demonstration of a fully operational security systems as specified herein and shown on the contract drawings.
- .3 Work related to security systems shall be installed and programmed by manufacturers authorized and certified trained technician and installer. Owner reserves the right to review and approves any personnel assigned to this project in a supervisory or managerial role.
- .4 The Security Contractor shall have had at least 10 years of comparable experience with security projects. As part of the proposal, the contactor shall submit at least three (3) comparable Project reference descriptions with reference contacts. Comparable projects shall equal or exceed size and complexity of work on drawings.
- .5 The Contractor shall be the security systems integrator to fully integrate all the systems described in Division 28 specifications.
- .6 The successful Contractor shall be required to co-ordinate all work with the Division 26 Electrical Contractor, who will be responsible for the installation of raceways and power.
- .7 The successful Contractor shall be required to co-ordinate all work with the Division 27 Communications Contractor, who will be responsible for the installation of communications cabling.

1.4 PRE-QUALIFIED SECURITY INTEGRATORS

- .1 The following security integrators are on the MCW's pre-qualified list. Other security integrators will be considered to accept bidding on this project, subject to the acceptance by the Owner or Owner's representative.
- .2 Security Systems shall be provided by one of the following pre-qualified (Preferred) Value Add Resellers (VAR):

Firm	Contact Name	Email	Phone
360 Advanced Security Corporation	Andrew Pierce	Andrew.p@360asc.com	416-798-2228

Firm	Contact Name	Email	Phone
Chubb Fire and Security Canada Corporation	Stephen Yates	Stephen.yates@chubbfs.com	416-659-1754
ComNet Networks and Security	Andrew Reedman	areedman@com-net.ca	416-704-7434
Paladin Technologies Inc	Marc Kingsbury	mkingsbury@paladintechologies.com	647-459-5691
Securitas Technology	Tom Nanou	tom.nanou@securitasES.com	416-678-7353

- .3 Lenel security systems shall be provided by and completed by one of the following pre-qualified (Preferred) Security Integrators:

Firm	Contact Name	Email	Phone
AC Electric	Alex Chambers	estimating@acelectricinc.ca	416-939-0244
CEC Services Inc.	Kyle Feinstein	estimating@beswickgroup.com	905-713-3711
Electro-Works Ltd.	Dondi Keough	dondi@tcsecure.ca	416-529-7180
Ozz Electric	Shamil Abaev	sabaev@ozzelectric.com	416-999-9417

DEFINITIONS

- .4 Refer to the Standard Construction Document CCDC 2 and the Supplementary Conditions for all contract Definitions.
- .5 The following definitions shall also apply:
- .1 Wherever the term "install" (and tenses of "install") is used, it means install and connect complete.
 - .2 Wherever the term "supply" is used it means supply only.
 - .3 Whenever "Drawings and Specifications" are referred to herein, it means "the Contract Documents".
 - .4 Wherever the terms "Authorities" or "Authorities having jurisdiction" are used in this Division, they shall mean any and all current laws and/or by-laws of any federal, provincial or local authorized agencies having jurisdiction over the sum total or parts of the work including, but not restricted to the Municipal Planning and Building Department, Municipal Fire Department, The Construction Safety Act, Municipal Public Works Department, Federal and/or Provincial Fire Marshall, the Ontario Electrical Safety Code and the Ontario Building Code.

1.5 WORK INCLUDED

- .1 Sections of Division 28 are not intended to delegate functions nor to delegate work and supply to any specific trade and the Work shall include all labour, materials, equipment and tools required for a complete and working installation as described.

1.6 PERMITS, FEES AND INSPECTIONS

- .1 Apply for, obtain, and pay for all permits, licenses, inspections, examinations and fees required for Work of Division 28.
- .2 Prepare professional engineer stamped documents and apply for Electromagnetic (Maglock) Permit with AHJ.
- .3 Arrange for inspection of all Work by the Authorities having jurisdiction over the Work.
- .4 In case of conflict, the codes take precedence over the Contract Documents. In no instance reduce the standard or scope of work or intent established by the drawings and specifications by applying any of the codes referred to herein.

1.7 CONTRACT DRAWINGS

- .1 The Drawings are performance drawings, diagrammatic, intended to convey the scope of work and indicate general arrangement and approximate location of devices. The Drawings do not intend to show architectural and structural details.
- .2 Do not scale Drawings. Obtain information involving accurate dimensions from dimensions shown on Architectural drawings, and by site measurement.
- .3 Make, at no additional cost, any changes or additions to materials, and/or equipment necessary to accommodate structural conditions (conduits around beams, columns etc.)
- .4 Alter, at no additional cost, the locations of materials and/or equipment as directed that do not necessitate additional material.
- .5 Install ceiling mounted components in accordance with reflected ceiling drawings.
- .6 Confirm on the site the exact location and mounting details as related to Architectural details.

1.8 EXAMINATION OF SITES AND DOCUMENTATIONS

- .1 Prior to submitting tender, carefully examine conditions at the site which could affect the Work. Refer to and examine all contract documents.
- .2 Ensure that materials and equipment are delivered to the site at the proper time and in such assemblies and sizes so as to enter into the building and to be moved into the spaces where they are to be located without difficulty. Be responsible for any cutting and patching involved in getting assemblies into place.

1.9 RECORD DRAWINGS

- .1 The drawings for this Project have been prepared using AutoCAD. For the purpose of producing record (as-built) drawings, copies of contract drawings may be purchased from the Consultant based on the following rates plus HST. In

using the drawings from the Consultant to produce record drawings, the Contractor is deemed to have agreed to take full responsibility for any and all information on the drawings.

- .2 The drawings for this Project have been prepared using Revit/BIM 360. For the purpose of exchanging model and producing record (as-built) drawings, a model file will be made available to the trade for a cost of \$850 plus HST. In using the model from the Consultant to produce record drawings, the Contractor is deemed to have agreed to take full responsibility for any and all information on the drawings.

For 1 to 10 files	\$550.00
For 11 to 20 files	\$650.00
For 21 to 50 files	\$850.00
For 51 to 100 files	\$1,350.00
For greater than 100 files, charge \$10.00 per file + \$350.00.	

- .3 At the completion of construction, pay for all services required such as recreating, plotting and printing to produce "as constructed" drawings.
- .4 At the completion of the project, submit as part of the close-out documents in searchable PDF in flash drive with all design information including operating and instruction manuals as described below.

1.10 PRODUCT STANDARDS AND ALTERNATIVES

- .1 Provide new material and equipment as specified and to the acceptance of the Consultant.
- .2 Equipment is specified as "generic". Provide details of all proposed equipment for review by the Consultant.

1.11 PATENTS

- .1 Pay all royalties and license fees, and defend all suits or claims for infringement of any patent rights, and save the Owner and Consultant harmless of loss or annoyance on account of suit, or claims of any kind for violation or infringement of any letters, patent or patent rights, by this Subcontractor or anyone directly or indirectly employed by him or by reason of the use by him or them of any part, machine, manufacture or composition of matter on the work, in violation or infringement or such letters, patent or rights.

1.12 RIGHTS RESERVED

- .1 Rights are reserved to furnish any additional detail drawings, which in the judgment of the Consultant may be necessary to clarify the work, and such drawings shall form a part of this contract.

1.13 EXPEDITING AND DELIVERY

- .1 Continuously check and expedite delivery of equipment and materials. If necessary, inspect at the source of manufacture.
- .2 Continuously check and expedite the flow of necessary information to and from all parties involved.
- .3 Immediately inform the Consultant in case information is required from him.

- .4 Provide delivery records updated monthly.

1.14 WORKMANSHIP

- .1 Install equipment and cables in a workmanlike manner to present a neat appearance to function properly to the satisfaction of the Consultant.
- .2 Install equipment and apparatus requiring maintenance, adjustment or eventual replacement with due allowance therefore.
- .3 Include in the work all requirements of manufacturers shown on the shop drawings or manufacturers installation instructions.
- .4 Replace work unsatisfactory to the Consultant without extra cost.
- .5 Make provision to accommodate future plant and equipment indicated on drawings.
- .6 Protect from damage all equipment delivered to the site and during installation. Any damage or marking of finished surfaces shall be made good to the satisfaction of the Consultant.

1.15 TRIAL USAGE AND TESTS

- .1 The Owner has the privilege of the trial usage of the Security Systems or parts thereof for the purpose of testing and learning the operational procedures.
- .2 Assist in trial usage over a length of time as deemed reasonable by the Consultant at no extra cost and do not waive any responsibility because of trial usage.
- .3 Trial usage shall not be construed as Substantial Completion of the Work, or acceptance by the owner.
- .4 Provide and pay for all testing required on the system components where, in the opinion of the Consultant, manufacturer's ratings or specified performance is not being achieved.

1.16 CLEANING

- .1 Before energizing any systems, inspect and clean all equipment to ensure that they are completely free from dust and debris.
- .2 Remove all debris, surplus material and all tools.

1.17 COMPLETION

- .1 Leave Security work in specified working order.

1.18 INSTRUCTION TO OWNERS

- .1 Instruct the Owner's representatives in all aspects of the operation of systems and equipment.
- .2 Arrange for, and pay for services of service engineers and other manufacturers' representatives required for instruction on specialized portions of the installation.
- .3 Submit to the Consultant at the time of final inspection a complete list of systems stating for each system:
 - .1 Date instructions were given to the Owner's staff.

- .2 Duration of instruction.
- .3 Name of persons instructed.
- .4 Other parties present (manufacturer's representative, consultants, etc.).
- .5 Signature of the Owner's staff stating that they properly understood the system installation, operation and maintenance requirements.

1.19 DOCUMENTATION AND SYSTEMS EXPERIENCE

- .1 Assemble three (3) copies of operating and instruction manuals in three ring binders with index tab each and searchable PDF in flash drive, containing this subcontractor's and supplier's names and telephone numbers.
- .2 Each manual shall contain the following data:
 - .1 A set of as-built prints;
 - .2 Letters of Owners Instructions
 - .3 A copy of each "reviewed" shop drawing;
 - .4 Detailed equipment list itemizing the quantity, model number and serial number of all installed equipment;
 - .5 Complete explanation of operation principles and sequences;
 - .6 Complete part lists with numbers;
 - .7 Recommended maintenance practices and precautions;
 - .8 Complete wiring and connections diagrams;
 - .9 Certificate of warranty.
- .3 Ensure that operating and maintenance instructions are specific and apply to the models and types of equipment provided.

1.20 PHASING AND SCHEDULE OF WORK

- .1 Execute work in accordance with the phasing and construction schedule. Provide all necessary temporary connections and equipment to provide functional, operational systems during construction period when part of the building will be occupied and construction is still continuing in other portions.

Part 2 Products

2.1 NIL

Part 3 Execution

3.1 NIL

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with the requirements of Division 1 and all documents referred to therein.
- .2 **In case of discrepancy of the specifications details, the Owner's standards and requirements attached in the Appendices shall take precedence.**

1.2 WORK INCLUDED

- .1 The project is to be considered "turn-key" meaning that any omissions under the drawings and specifications that are deemed to be part of the overall general scope shall be included by the Contractor at no additional cost to the Owner.
- .2 The Contractor may specify at the time of bid proposal, any item deemed to be "outside" of the contract scope, but must submit a price for the item(s) at the time of bidding. No item shall be considered an "extra" after the award of the contract if it is deemed to have made the original project "turn-key".
- .3 The Contractor agrees to supply all necessary permits (and thus drawings and approvals) where required, by Local Municipal, Provincial or Federal laws.
- .4 The Contractor shall make known to the Owner, any deficiencies in the specifications prior to bid closing and thus contract award. The Contractor is required to "make-good" for any equipment either missed or unforeseen post contract award that would have been required to make the installation "turn-key".
- .5 The Contractor shall propose alternate product at no additional cost to the Owner, if the design-based product has been discontinued or obsoleted. The proposed alternate product shall have equal or better performance than the original design-based product.

1.3 INDIVIDUAL MERIT

- .1 Bidders are invited to include information on themselves that may influence the final decision. This may include company history, project history, prior dealings with the Owner, testimonials and referrals.
- .2 The contractor shall be vendor certified with certified technicians for the proposed systems and products.

1.4 SUBMITTALS

- .1 Submit Shop Drawings for all equipment, including:
 - .1 A detailed list of equipment.
 - .2 Component data sheets.
 - .3 Conceptual drawings of the proposed equipment layouts.
 - .4 Functional and wiring diagrams.
 - .5 A list of recommended spare parts and consumable items.
 - .6 An operator training course outline for both operations and administration staff.
 - .7 An overall project schedule containing dates for all project milestones.
- .2 Provide a brief overview of the system's proposed configuration and operation, including a block diagram which illustrates the system configuration.

- .3 Provide step by step procedures for the operator to perform each operation of the Integrated Security Systems including Video Surveillance System, Access Control, Intrusion Alarm and Video Management System (VMS) at the control desk or locations as shown on the drawings. These procedures are to be written in plain text and shall not require technical knowledge over and above that typically encountered with security guard forces and operation staff.
- .4 Provide manufacturer's operating instructions of all system front and components.
- .5 Provide a detailed equipment list itemizing the quantity, model number and serial number of all installed equipment.
- .6 Provide wiring lists presenting all system interconnect wiring detail in tabular form. As a minimum the lists shall contain the following information from each wire:
 - .1 Associated cable number
 - .2 Originating equipment jack/terminal block number
 - .3 Terminating equipment jack/terminal block number
 - .4 Wire colour code.
- .7 Provide a cable pull schedule which identified the cable content of each conduit run in tabular form. As a minimum, the schedule shall provide the following information for each cable run:
 - .1 Cable type(s) pulled
 - .2 Quantity of each type of cable
 - .3 Function of each cable
 - .4 Cable number/identification
- .8 Prior to start of work, the contractor is required to meet and coordinate all wiring and infrastructure with Div. 26 and 27 to ensure a complete and coordinate installation.
- .9 As the site is an active construction site, the contractor is advised to make arrangements to visit the site and understand the installed rough-in services. This contractor shall be responsible to extend services from rough-in points as required to complete the installation.

1.5 WARRANTIES AND MAINTENANCE

- .1 Warranty the complete system, including all equipment, computer software and documentation for a period of one (1) years from the date of final acceptance. The warranty shall include all parts and labour.
- .2 Assign to the Owner any manufacturer's warranties which exceed one (1) year.
- .3 Maintain the system during the warranty period and, as a minimum, provide preventative maintenance on a semi-annual basis, based on schedule submitted to, and approved by the Owner.
- .4 As a minimum during the warranty period, provide guaranteed response time of eight (8) hours for major system failure and twenty four (24) hours for a minor system failure, on a 24 hour per day, 7 days per week basis.

- .5 A major system failure is defined as the failure of any operator controls, recording components, camera power supply, or cable link which renders a number of cameras/devices inoperative.
- .6 A minor system failure is defined as the failure of a single device such as a camera, monitor, etc.
- .7 Include a current service price list for comparison purposes. If any future (beyond warranty) service price list is available, this may influence the decision of tender award. It is a requirement to list at the time of tender any mandatory service contract that may be required at the time of tender or in any future years of the system(s) operation.

1.6 QUALITY ASSURANCE

- .1 Unless otherwise specified, all equipment shall be designed to operate in a continuous unattended state and the performance of the equipment shall be maintained under varying voltage, frequency, current and environmental conditions. All components shall operate within their stated tolerances.
- .2 All equipment powered by 120 VAC shall be either CSA, ULC or ESA certified.
- .3 All AC and DC power wiring shall conform to CSA Standard C22.1 and other applicable Local and National Codes.
- .4 All wires and cables supplied under this contract shall be formed, neatly laced or Velcro wrapped and clamped into position. No adhesive or stick-on clamps or tie raps are permitted. The use of masking tape is not acceptable under any condition. The use of electrical tape is only acceptable where the use of lacing or Velcro wraps is not practical. Zip ties are not acceptable unless all other methods are not practical.
- .5 Sufficient slack shall be provided to prevent undue stress and strain on connectors and cables, to allow easy disconnection of equipment and to allow a minimum of three re-terminations of each cable or wire in the event of breakage.
- .6 Where wires run through open holes in metal, they shall be protected by suitable grommets.
- .7 Wires and cables external to equipment and enclosures shall be run in conduit or wireway. Where free movement of equipment is required, flexible conduit shall be employed. All cables in racks shall be neatly bundled and fanned into position with minimal excess on or behind the rack.
- .8 Wires and cables shall be continuous between termination and connection points. Connectors and splices shall be located within secure enclosures and are not permitted inside conduit or wireway.
- .9 Wires and cables shall be located so that inductive and capacitive effects do not degrade system operation.
- .10 All field terminations must be tested and individual test results shall be included in the completion documents.
- .11 Alpha-numerical labelling shall be installed on all equipment including equipment racks with wire list left on the site in the equipment rack. This shall be in the form of printable or pre-printed labels or wire markers.

- .12 All visible wires and cables typically accessed for service shall be labelled at both ends. As well, all connecting strips, terminal blocks, plugs and sockets shall be labelled. The marking on the labels shall be consistent with the as-built drawings. This shall be in the form of printable or pre-printed labels or wire markers.
- .13 Indoor camera equipment installed in a sheltered and heated environment shall be capable of operating in a continuous unattended mode under the following conditions:
 - .1 Ambient Temperature: 0°C to 50°C
 - .2 Ambient Humidity: 20% to 90% RH
- .14 Outdoor camera equipment installed in an exposed environment shall be capable of operating in a continuous unattended mode under the following conditions:
 - .1 Ambient Temperature: -40°C to 55°C
 - .2 Ambient Humidity: up to 100% RH
 - .3 Adverse Weather: wind up to 165 km/hr and 5cm of ice loading
 - .4 Sand and Dust: fine dust up to 150 microns.
- .15 The Contractor shall ensure that all services in the immediate areas of the System installation are protected against damage or interference by the Contractor.
- .16 Damage done to property (including equipment, buildings, etc.) during the course of the installation or testing shall be made good by the Contractor.
- .17 Any damage whatsoever during installation of the equipment supplied by the Contractor shall result in that equipment being replaced by new undamaged equipment.
- .18 During installation activities, the work area must be kept as clean and free of debris as practicable. At the end of each day during the installation period, the portions of the site utilized by the Contractor shall be cleaned, tidied and any waste material generated by the Contractor shall be disposed of. At the conclusion of an installation, the site and equipment shall be thoroughly cleaned and all damage to site or equipment made good.

1.7 COMMISSIONING

- .1 The commissioning phase begins when the installation is complete.
- .2 The Owner will perform a visual and mechanical inspection in accordance with the installation requirements of this Section and with particular emphasis on but not limited to, the following:
 - .1 Neatness, clamping and tying of wiring and cabling.
 - .2 Wire, cable and equipment identification, labelling and documentation.
 - .3 Crimping of cables and neatness around and in equipment racks, general appearance and finish.
 - .4 Programming of all systems
 - .5 Detailed staff training and records
 - .6 Field equipment installation neatness
- .3 All field devices and front end components will be acceptance tested to manufacturer's installation standards. Following acceptance tests, the Owner will

prepare and submit a deficiency list to the Contractor. Correct all deficiencies and notify the Owner when the work is complete.

- .4 Upon verifying that all deficiencies have been corrected, the Owner will issue a letter of technical acceptance signifying that the equipment and installations have been accepted.

1.8 FINAL SYSTEM ACCEPTANCE

- .1 Final system acceptance shall be awarded when all the terms of the Commissioning and the Project's Contract have been met.

Part 2 Systems INFORMATION AND PRODUCTS

2.1 SECURITY SYSTEMS - GENERAL

- .1 Provide a **fully unified, integrated and compatible** security platform for the access control, intrusion detection, video surveillance, intercom, and all other systems included in this Specifications.
- .2 Provide rack mounted UPS with 20 mins back up time for the system if the building UPS power is not available.
- .3 The security systems shall be limited to the following manufacturers and as shown on the drawings, or approved equal by the Consultant.
 - .1 Access Control System Platform (Software)
 - .1 See ICAT Specifications Appendix B
 - .2 Access Control Panels
 - .1 See ICAT Specifications Appendix B
 - .3 Access Control Card Readers (Mobile credentials ready)
 - .1 See ICAT Specifications Appendix B
 - .4 Video Management System (VMS)
 - .1 See ICAT Specifications Appendix B
 - .5 Video Surveillance Cameras (ONVIF compliant)
 - .1 See ICAT Specifications Appendix B
 - .6 Video Surveillance Monitors
 - .1 See ICAT Specifications Appendix B
 - .7 Intrusion Detection
 - .1 See ICAT Specifications Appendix B
 - .8 Intercom
 - .1 See ICAT Specifications Appendix B
 - .9 Entry Phone
 - .1 See ICAT Specifications Appendix B
 - .10 Security Switch & Server Manufacturers
 - .1 See ICAT Specifications Appendix B

2.2 ACCESS CONTROL SYSTEM (ACS)

- .1 Refer to drawings for Electronic Security & Door Hardware Responsibility Matrix and similar matrix in Division 8.
- .2 100 access fobs, 100 smartcards.
- .3 100 long range windshield tags, 100 combi cards for garage overhead door control.
- .4 Initial fob/card and system programming.
- .5 Capable of control of up to a minimum of 8 remote sites within supplied software.
- .6 System to have a fully distributed database, allowing it to be fully functional, including the execution of time tasks, without the computer/software being "on-line".
- .7 Software to be capable of running under Windows multi-tasking conditions.
- .8 Rack mount computer server, flat screen monitor and keyboard.
- .9 Power supply and door controllers. The Contractor shall provide and propose the power supply and door controller, types and quantities to suit the number of connected doors for a fully functional system.
- .10 The Electronic Access Control System software shall provide a fully integrated system package, with standard software modules to support:
 - .1 Access Control (including Biometric technologies)
 - .2 Alarm Monitoring & Reporting
 - .3 Cardholder ID Badging and Design
 - .4 System Command & Control
 - .5 Report generation for database & historical records
 - .6 Elevator control
 - .7 Guard Tour
 - .8 Asset management
 - .9 CCTV video surveillance
 - .10 Interactive Graphical mapping
 - .11 Automatic data import/export
 - .12 Data Integration Services for Active Directory and Relational Databases (such as SQL and Oracle)
 - .13 Visitor Management
 - .14 Time & Attendance and Muster Report Generation
 - .15 E-Mail/SMS Messaging
 - .16 Wireless PDA integration for Remote ID verification of Cardholders, as well as Entry & Exit Control
 - .17 Fire Alarm System Integration
 - .18 Intrusion Detection Alarm Integration (including Perimeter Detection)
 - .19 Building Management System Integration
- .11 The Electronic Access Control System shall provide the capability to fully integrate with virtually any video surveillance system, providing on-screen display of live video, and playback of recorded video from any camera on the video

surveillance system. Video display shall be manually requested, or linked to automatically display based on any specified system event. The following functionality shall be included as a minimum:

- .1 View Live Images
 - .2 Recorded Image playback
 - .3 Transaction Search
 - .4 SMS event Search
 - .5 Full PTZ Control
 - .6 Manual Recording Start/Stop
 - .7 JPEG Snapshot of Live image
 - .8 JPEG Snapshot of Recorded Image
 - .9 Download of Video Clip to AVI
 - .10 Recording Start/Stop from EACS Event
 - .11 Send PTZ pre-sets based on alarm event
 - .12 Reporting of DVR/NVR Alarm Input events
 - .13 Reporting of DVR/NVR Analytic alarm events
 - .14 Instant Replay of last minute
 - .15 Loss of Connection reporting
 - .16 Auto Reconnect
- .12 Where as shown on the drawings, electromagnetic locks (maglocks) system shall be provided by the Security Contractor, the following shall be included but not be limited to.
- .1 Maglocks shall be fail-safe, auto-sensing voltage between 12-24V DC
 - .2 All maglocks to have an LED, bond sensor and door status switch and to be ULC approved.
 - .3 Maglock power supply shall be fail-safe, complete with 120V AC input, 12-24V DC output, AC power fail and battery fail supervisory outputs, onboard DC fail and status supervisory outputs, and shall be connected to the Access Control panel for power supply monitoring.
 - .4 Maglock power supply shall be compatible with the maglocks, access control panels, fire alarm system, the maglock override/reset key switch, and batteries back-up.
 - .5 Maglock override and reset tamper-resistant key switch.
 - .6 Submit wiring diagram to the Consultant for review.
 - .7 Apply for, provide and pass all permits required for maglocks installation.

2.3 INTRUSION DETECTION SYSTEM

- .1 8 – 32 zones control panel
- .2 One zone per security device
- .3 Fully program touchscreen keypad
- .4 Ensure all devices are programmed, located and set to minimize false alarms
- .5 All devices to be fully wired. Wireless devices be accepted

2.4 VIDEO SURVEILLANCE SYSTEM

- .1 Refer Camera Schedule on drawings for details.
- .2 All cameras shall be ONVIF compliant.
- .3 Cameras shall be set to record on motion.
- .4 Outdoor housing to be provided with heater if required by manufacturer to operate.
- .5 Network Video Recorder (NVR) shall be 2U rack mounted server with licenses included, 8 HDD slots and 64 video channels.
- .6 Network Video Recorder (NVR) shall be minimum 24TB, minimum of 30 days camera recording storage. Use 50% motion as basis for storage calculation at 30 frames/second at maximum resolution in H.264 video compression format.
- .7 Contractor to submit calculations in the shop drawings to justify the proposed storage capacity to in line with the proposed cameras characteristic.
- .8 Provide all PoE and PoE+ switches, and network cable extenders as required for a complete system.
- .9 Provide rack mount computer servers, flat screen monitor and keyboard at Security Desk or location as shown on the drawings.

2.5 VIDEO ANALYTICS SYSTEM

- .1 Provide Video Analytics system functionality as below.
 - .1 Video Motion Detection: enables the camera to detect motion in the video and trigger a recording, either locally or in a video management system.
 - .2 Digital Autotracking: automatically detects, zooms in on and follows moving objects such as persons and vehicles, making it possible for the operator to effectively handle incidents and object identification.
 - .3 Fence Guard: for intrusion detection by detecting moving objects crossing user-defined virtual lines.
 - .4 Motion Guard: for motion detection in predefined areas.
 - .5 Loitering Guard: for time-based alerts of unwanted presence in semi-public areas.
 - .6 People Counter: for staff planning and entrance management.
 - .7 Queue Monitor
 - .8 Demographic Identifier
 - .9 Occupancy Estimator
 - .10 Tailgating Detector: for providing real-time alerts of unauthorized entry.
 - .11 Direction Detector: for detecting people moving in the wrong direction.
 - .12 Random Selector: for unbiased inspection of items such as shopping bags to help reduce theft and fraud.
 - .13 Perimeter Defender: a highly accurate video analytics application for perimeter protection.

2.6 VIDEO MANAGEMENT SYSTEM (VMS)

- .1 The Video Management System (VMS) shall IP-based and consist of central stations, multiple monitors, application system, system switches & servers and field installed cameras and equipment connected by the building common converged network through the application of segregated virtual dedicated local area network. The VMS shall be capable of the following:
 - .1 Scalable to add more equipment on the system.
 - .2 Available as a stand-alone system offering or pre-loaded on turnkey workstations and servers with configurable storage.
 - .3 Streaming live and recorded video from cameras connected to the system.
 - .4 Display and export saved views.
 - .5 Require no proprietary recording hardware, multiplexers, time-division technology.
 - .6 Support decompression of H.264 video through client graphics card or graphical processing
 - .7 Secure video and audio data by transmitting all command and control data via TCP/IP using cryptographic keys based on SSL.
 - .8 Support storage and processing of high definition video and audio.
 - .9 Support industry standard compression formats including but not limited to JPEG2000, H.264, MJPEG and MPEG-4.
 - .10 Provide footage of minimum 1080p resolution at 30fps.
 - .11 The Video Surveillance System servers shall deliver camera database, video streaming, video storage and video archiving functions. The server be sized to provide video retention at 15fps, H.264 compression for a minimum period of 30 days. Failover servers shall provide failover redundancy architecture such that the system is capable of complete operational integrity without system downtime due to hardware failure or maintenance.
- .2 The VMS shall be managed by a comprehensive centralized Network Video Management System (VMS).
- .3 The VMS shall be able to integrate with the Access Control System Platform seamlessly by integration or unification. The VMS shall be able to control the Access Control System Platform or vice versa under the same user interface application without the need to switch between VMS and the Access Control System Platform.
- .4 The VMS shall be capable of easily pinpointing the cameras by building, by floor, by sector and by point of interest.
- .5 The VMS shall be capable of displaying up to 16 images on any one monitor.
- .6 The VMS shall be capable of simultaneously executing viewing commands in real time and off-line, recording commands and system configuration commands.
- .7 The VMS shall be capable of remotely accessing a given camera's menu to modify its configuration parameters.

- .8 The VMS shall support a configuration and compression format that reduces bandwidth and increases archiving time, without unreasonably sacrificing the quality of the information received.
- .9 The VMS shall perform video detection so as to attract attention and to optimize archiving.
- .10 The VMS shall be capable of automatically displaying a video clip that includes images that were recorded before and during a triggering event.
- .11 The VMS shall incorporate the ability to limit access to system functions based on a person's priority levels and shall require the use of a password.
- .12 The VMS shall incorporate the appropriate functionality to ensure that the images recorded are legally admissible (protection from fabricated images).
- .13 The VMS shall allow for display and review through network-based client applications allowing for authorized users to remotely view, control and manage all aspects of the surveillance system across the network. System will have network and web access for remote monitoring, using predefined user authentication.
- .14 The VMS shall reside on system servers that shall be sized to allow for maximum system performance without any degradation, lag or video footage quality reduction.
- .15 The VMS system shall allow for viewing of all cameras at a minimum of thirty frames per second (30fps).

2.7 SECURITY SWITCHES AND SERVERS

- .1 The Video Network Switch shall be BCD BCD-ALE-6360p48X and better, or approved equal.
- .2 The Video Recording Server shall be BCD Professional grade BCD218-PVS and better, or approved equal.
- .3 The Video Surveillance Workstation shall be BCD Professional grade BCD102SD-PWS and better, or approved equal.
- .4 The Video Surveillance Storage shall be BCD SAN Storage Arrays BCD584X-SAN and better, or approved equal.

2.8 SYSTEMS INTEGRATION

- .1 The security systems shall be integrated on a single common IP network via respective servers; controllers and a common data switch to provide integrated functions as described in this specifications document and on Contract Drawings.
- .2 Access Control System and Video Surveillance System
 - .1 Upon invalid card, forces entry at a secured door or door held open beyond pre-set acceptable duration, the access control system shall signal the Video Surveillance System to display the video streams from the Video Surveillance camera with view of the respective door. The video stream shall be displayed immediately on each Security Station Monitor following the event. It shall be possible to display the video stream in full screen format or reduces size format.

- .3 Intrusion Detection System and Video Surveillance System
 - .1 Upon activation of an intrusion alarm the intrusion detection system shall signal the Video Surveillance System to display the video streams from the Video Surveillance camera with view of the activated alarm point. The video stream shall be displayed immediately on each Security Station Monitor following the event. It shall be possible to display the video stream in full screen format or reduces size format.
- .4 Access Control System and Intrusion Detection System
 - .1 Upon activation of an alarm on the access control system, the access control system shall relay the alarm as a unique addressed alarm to the intrusion detection system. The intrusion detection system shall relay the alarm to 3rd party alarm monitoring company.
- .5 Access Control System and Intercom System
 - .1 Upon activation of a door / gate intercom substation, an operator shall have the ability to open the respective door by activating a door / gate release button on the answering master intercom station.
- .6 Video Surveillance System and Intercom System
 - .1 Upon activation of an intercom station, the video feed from the activated intercom station shall be displayed at the relative master video intercom station. The video feed from the activated intercom station shall be recorded on the network video recorder.
- .7 Video Surveillance System and Duress Alarm System
 - .1 Upon activation of Panic / Duress Alarm station, the Panic / Duress Alarm shall signal the Video Surveillance system to automatically pop-up and display video streams from the Video Surveillance cameras that are in view of each activated Panic / Duress Alarm station.
- .8 Intrusion Detection System and 3rd Party Alarm Monitoring Company
 - .1 Upon activation of an alarm on the intrusion detection system the intrusion detection system shall relay the alarm as a unique addressed alarm to the 3rd party alarm monitoring company.
- .9 Access Control System and Elevator Control System
 - .1 For elevator cabs equipped with card reader, a cardholder shall be able to call the cab using the elevator call button, present their access control credential and select the destination floor. Once a selection has been made, all other floors become de-activated unless another card holder selects a different floor to travel to.
 - .2 For floors equipped with card readers located in the elevator lobby, a cardholder shall be able to call the cab by presenting their access control credential to the card reader and then press the elevator call button.
 - .3 When leaving the building, a similar procedure shall be necessary unless the destination is the ground floor.
 - .4 Each elevator control unit shall have provision to support an elevator access control board capable of individually controlling access of a minimum of thirty-two (32) floors in one elevator cab.

- .5 The service elevator control unit shall support access of all floors.
- .6 Each elevator control unit / elevator access control board combination shall control one elevator cab card reader and one floor call card reader where floor call card readers are required.
- .7 The elevator control panel shall interface with the building fire alarm panel in order to provide a hardware bypass of the access control system during a fire alarm (elevator operation shall revert to normal).
- .8 The system shall provide the ability to specify a unique unlock schedule for each elevator floor. As with reader unlock schedules, elevator schedules shall support an unlimited number of windows per day and include holiday support.
- .9 All elevator card transactions shall be sorted in memory and become available for historical report printing, including complete floor tracking capabilities, which shall capture and store which floors specific users accessed and the corresponding times and dates.
- .10 Access to controlled floors shall be restricted to cardholders with access authority for those specific floors after-hours access and shall be granted to individuals who present their card to the verification reader first.
- .11 Cardholder access authority shall be granted on a cab-by-cab and a floor-by-floor basis to provide maximum flexibility in defining a cardholder's floor access authority.
- .12 Elevator access control shall be enabled and disabled automatically according to a 7 day schedule. This schedule shall include provisions for 40 Holiday Dates on which the schedules are overridden.
- .13 Manual enabling / disabling of access control for individual floors shall be possible both remotely (from the Host) and locally using specified access cards at the cab reader.
- .14 When elevator access control is disabled, elevator operation shall revert to normal (e.g. free access shall be granted to the cab and all floors).
- .15 The response time from the moment an access card is presented to the elevator cab reader to the moment the elevator panel becomes active shall be no more than one (1) second.
- .10 Code White and Panic / Duress Alarm
 - .1 Upon activation of a Panic / Duress Alarm station, the intrusion detection system shall signal the code white system to display the activated station on a graphical map of the facility on the Security Station.
- .11 Code White
 - .1 Upon activation of a Code white wireless button, the code white system shall display the location of the wireless button on a graphical map of the facility on the Security Station.
- .12 Hospital Various Code Systems
 - .1 To be agreed with the hospital project team and user groups

Part 3 Execution

3.1 ACCESS CONTROL SYSTEM

- .1 Install front-end equipment in rack or cabinet provided by Div.27 as shown on the drawings.
- .2 Provide connection to one Owner workstation per area via Owner's network.
- .3 Conduit with pull string will be provided by Division 26.
- .4 Use cable only as specified by the manufacturer and all cables to be wire marked with detail left on-site and provided to Owner.
- .5 All exposed cable shall be mechanically protected with conduit, boxes or metal flex.
- .6 Anchor all enclosures to surfaces with lead expansion anchors and lag bolts in concrete or toggle bolts in hollow finishes or tile ceilings where electrical boxes are not provided.
- .7 Provide all wiring required to complete the installation.
- .8 Fire alarm relay and secondary contacts will be provided by Division 26 in all pull stations where maglocks are to be installed.
- .9 Provide maglock signs where and as required by building code for all maglock doors.
- .10 Division 26 will provide emergency lighting at all maglock doors.
- .11 Each/any door on the system, to be individually controlled and individually identified of an alarm condition through software.
- .12 Attach computers via Ethernet card and set up all computers in the project via Ethernet connections.
- .13 Coordinate with the Owner (minimum 8 hours) for system programming.
- .14 Show system operation (8 hours training) to Owner staff as required.

3.2 INTRUSION DETECTION SYSTEM

- .1 Use appropriate ceiling or wall mount as required for the installation.
- .2 Cost for monthly digital (phone line) monitoring per area.
- .3 Cost for 3G GSM transmission device per area and additional monthly cost.
- .4 Cost for opening closing signals per area.
- .5 Cost for failure to close (station watches for openings and closings).
- .6 Cost for monthly opening and closing reports per site.
- .7 Use cable only as specified by the manufacturer and all cables to be wire marked with detail left on-site and provided to Owner.
- .8 Conduit with pull string will be provided by Division 26.
- .9 Coordinate with the Owner (minimum 8 hours) for system programming.
- .10 Show system operation (8 hours training total) to Owner staff as required.

3.3 VIDEO SURVEILLANCE SYSTEM

- .1 Actual camera positions to be determined by this Contractor based on the intended locations shown on the drawings.
- .2 Install front-end equipment in rack or cabinet provided by Division 27.
- .3 Exposed cable installations shall be completely enclosed by conduits or Wiremold if cannot be concealed behind walls and ceilings.
- .4 Anchor all enclosures to surfaces with lead expansion anchors and lag bolts in concrete or toggle bolts in hollow finishes or tile ceilings where electrical boxes are not provided.
- .5 Conduit with pull string will be provided by Division 26.
- .6 Final camera images to be acceptable to the Owner/Consultant.
- .7 Coordinate with the Owner (minimum 8 hours) for system programming.
- .8 Show system operation (8 hours training total) to Owner staff as required.

3.4 VIDEO MANAGEMENT SYSTEM (VMS)

- .1 The product shall perform in all material respects in accordance with the accompanying user manual, and the media on which the Software Product resides will be free from defects in materials and workmanship under normal use. Software defects are covered through Service Releases and Cumulative Updates which are available for a period of 1 year from the date of the software purchase.
- .2 Extended warranty, up to 5 years, shall be available through the purchase of the manufacturer's support service which includes the following additional services over the standard warranty:
 - .1 Access to phone support and online chat for technical assistance
 - .2 Online case management
 - .3 Online system availability monitor
 - .4 Access to Major and Minor Release Upgrades
 - .5 24/7 pager support and dedicated support specialist
- .3 The contractor shall engage the services of the VMS vendor to assist in the end user training of the VMS at the end-user site.

END OF SECTION

Part 1 General

1.1 REFERENCES

- .1 Comply with Division 1, General Requirement, and all documents referred to therein.

1.2 APPLICATION

- .1 This Section applies to and is a part of all Sections of Division 28.

1.3 SYSTEM DESCRIPTION

- .1 IP Network Compatible Video Intercom System: A network-based communication and security system featuring video entry security, internal communication, emergency stations, and paging. All units and app in the systems shall be able to unlock doors remotely on a network, assist onsite visitors from an offsite location, broadcast emergency announcements, and communicate using a PoE network.
 - .1 Power Source: Power over Ethernet (802.3af).
 - .2 Network Interface: 10 BASE-T / 100 BASE-TX Ethernet (RJ-45).
 - .3 Network Protocols: IPv4, IPv6, TCP, UDP, SIP, HTTP, HTTPS, MJPEG, RTSP, RTP, RTCP, IGMP, MLD, SMTP, DHCP, NTP, DNS.
 - .4 Bandwidth Usage:
 - .1 G.711: 64Kbps x 2 per video call.
 - .2 64Kbps per monitor.
 - .3 H.264: 24Kbps ~ 2,048Kbps.
 - .5 Communication: Hands-free (VOX), push-to-talk (simplex), or handset (full-duplex).
 - .6 Video Display: 3-1/2 inches (89 mm) color LCD.
 - .7 Camera: Type:
 - .1 1/4 inch (6 mm) color CMOS.
 - .2 View Area: 2 feet 2 inches (660 mm) vertical x 3 feet 1 inch (940 mm) horizontal at 20 inches (508 mm).
 - .8 Video Stream: ONVIF Profile S.
 - .9 Door Release: Programmable Form C dry contact, 24V AC/ DC, 500mA - use EL-12S (use RY-24L for larger contact rating, which requires 24V DC power supply) or use RY-IP44 with 4 multipurpose relays.
 - .10 Wire Type: CAT-5e or CAT-6.
 - .11 Distance:
 - .1 Door Station or RA Station to Network Node: 330 feet (100 meters).
 - .2 Master Station to Network Node: 330 feet (100 meters).

1.4 SUBMITTALS

- .1 Product Data: Manufacturer's data sheets on each product to be used, including:
 - .1 Preparation instructions and recommendations.
 - .2 Storage and handling requirements and recommendations.

- .3 Installation methods.
- .2 Shop Drawings: Submit the following:
 - .1 Wiring Diagrams: Indicate wiring for each item of equipment and interconnections between items of equipment.
 - .2 Include manufacturer's names, model numbers, ratings, power requirements, equipment layout, device arrangement, complete wiring point-to-point diagrams, and conduit layouts.
- .3 Installation and Operation Manuals:
 - .1 Submit manufacturer's installation and operation manual, including operation instructions and component wiring diagrams.
 - .2 Provide detailed information required for Owner to properly operate equipment.
- .4 Warranty: Submit manufacturer's standard warranty.

1.5 QUALITY ASSURANCE

- .1 Manufacturer Qualifications: ISO 9001:2008 certified company.
- .2 Installer Qualifications: Factory trained and experienced with system installations of scope and size required for the Project.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.
- .2 Storage: Store materials in clean, dry area indoors in accordance with manufacturer's instructions.
- .3 Handling: Protect materials during handling and installation to prevent damage.

1.7 PROJECT CONDITIONS

- .1 Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

Part 2 Products

2.1 MANUFACTURERS

- .1 Acceptable Manufacturer: Aiphone Corp.
- .2 Substitutions: 2N, Guardian or approved equal.
- .3 IP Video Intercom System: IX Series Intercom System as manufactured by Aiphone Corporation.

2.2 SYSTEM DESIGN

2.3 FUNCTIONAL COMPONENTS:

- .1 As indicated on the drawings or as required to complete system.

- .1 Video Master Station Model IX-MV7-H:
 - .1 An IP addressable video master station with a 7" color LCD touchscreen, wall or desk mounted (desk stand included), PoE, SIP compatible, 8 speed dial buttons, camera for 2-way video calls, hands-free communication with handset for privacy, card slot for microSD card, 500 station address book capacity.
- .2 Audio/Video Door Station Model with Wave To Call Model IX-DVF-HW:
 - .1 Wave to call, hand wave touchless call sensor, SIP 2.0 compliant, 1.23MP fixed color video camera, white LED for low light illumination, ONVIF compliant, card slot for microSD card, weather and vandal resistant, contact outputs/tigger inputs, stainless steel, 802.3af PoE compliant, RJ45 in/out with PoE pass-through, flush mount.
- .3 Audio/Video Door Station with Card Reader Model IX-DVF-P:
 - .1 IP addressable, HID multiclass SE proximity (or other approved 3rd party) card reader, PoE, SIP compatible, fixed camera, stainless steel panel, weather and vandal resistant, flush mount.

Part 3 Execution

3.1 EXAMINATION

- .1 Examine areas to receive integrated security and communication system.
- .2 Notify Architect of conditions that would adversely affect installation or subsequent use.
- .3 Do not begin installation until unacceptable conditions are corrected.

3.2 PREPARATION

- .1 Verify the following compliance before starting installation.
 - .1 The unit turns inoperative during power failure.
 - .2 Keep the intercom wires at least 1 foot (30 cm) away from strong electrical wiring (AC 100-240V) including, in particular, wiring for inverter electrical appliances. Noise and malfunction could result.
 - .3 If a strong light shines on the main unit screen, the picture may turn white or only silhouettes will be visible.
 - .4 Other manufacturer's devices (such as sensor, detectors, door releases) used with this system, comply with the manufacturer's installation requirements.
 - .5 The LCD panel is manufactured with very high precision techniques, inevitably will have a very small portion of its picture elements always lit or not lit at all. This is not considered a unit malfunction. Please be aware of this in advance.

3.3 INSTALLATION

- .1 Install integrated security and communication system in accordance with manufacturer's instructions at locations indicated on the Drawings.

- .2 Mount equipment plumb, level, square, and secure. For video entrance stations and video door stations, comply with manufacturer's design requirements to provide optimum picture quality of station monitoring.

3.4 SET-UP AND ADJUSTING

- .1 Adjust integrated security and communication system for proper operation in accordance with manufacturer's instructions.

3.5 DEMONSTRATION AND TRAINING

- .1 Demonstration:
 - .1 Demonstrate that integrated security and communication system functions properly.
 - .2 Perform demonstration at final system inspection by qualified representative of manufacturer.
- .2 Instruction and Training:
 - .1 Provide instruction and training of Owner's personnel as required for operation of integrated security and communication system.
 - .2 Provide hands-on demonstration of operation of system components and complete system, including user-level program changes and functions.
 - .3 Provide instruction and training by qualified representative of manufacturer.

3.6 PROTECTION

- .1 Protect installed integrated security and communication system from damage during construction.

Change Summary

Date	Summary
July 28, 2016	Minor grammar and syntax updates. Fax Lines Requirement – Deleted. Appendix D & E updated.
January 9, 2017	Replaced must with shall, and added Document Changes table to document history.
August 28, 2017	Changed cabling 6A to 6A F/UTP.
April 24, 2018	Changed in-building renovations in scope, multimode optical fibre to OM4, added appendix B, changed BAS, Security Panel (Honeywell), rack cabinet installation, and applied new corporate writing style.
May 9, 2018	Updated contact information.
June 28, 2018	Added Appendix K.
January 22, 2019	Updated technical specifications.
December 19, 2019	Renamed from Cabling and Wiring for Voice and Data Communications to Corporate ITS Cabling & Wiring Standard. Updated network equipment.
March 25, 2020	Formatting, grammar, spelling updates.
April 21, 2020	Updated Appendix 2, and general requirements for network equipment.

July 9, 2020	Updated network devices on York Networks, category patch cords, and vertical cable managers.
September 14, 2020	Minor grammar and syntax updates. Removed duplicate heading product specifications n page 18. Promoted second and first level heading, fibre optical cable page 20. Added Appendix L – WAP/Mounting.
November 9, 2020	Updated appendices H with cable talk 2 post rack; M with WAN/ISP duct bank; N with WAN/ISP ducts inside communications room; updated network equipment; and updated communication rack and cabinet.
March 1, 2021	Background & Purpose, Network Devices on York Network, updated to Securing Network Devices on York Network,c, d, and e added. Technical Specifications, updated to Structured Cabling Technical Specifications Termination Hardware, updated to Termination Specification Horizontal Cables, updated to Category Patch Panels Fibre Optic Cable, Connectors moved to section Termination Specification PS Security section updated Enclosure Wiring, changed to Labeling Guidelines Update: Property Services – Security Panel, Building Automation System (BAS)
April 12, 2021	Minor update and changes.
June 28, 2021	The following has sections that have been modified, relocated or deleted: Enforcement Language; Background and Purpose, Contact, Objectives, Scope; Structured Cabling Technical Specification, Recognized Media, Regulatory References & Standards, Waste Management & Disposal, Testing & Commissioning; Product Specification, Backbone Cabling, Conduits, Backbone Interconnect, Fibre Optic Cable, Fibre Optic Connectors, Category Patch Cord; Network Access Closet has been changed to Network Access Room; Execution, Horizontal Cable Installation, Fibre Optic Cable Installation; Appendix; References
July 21, 2021	Further changes to grammar, syntax and tightening of language through the standard.
February 8, 2022	Minor spelling, grammar changes.
February 6, 2023	Updates to the following sections: Site Walk through; Telecom Contractor to provide port count; Structural Cabling Technical Cabling update to include end-to-end by specified color and single contractor for cabling; Cabinets for small deployment and for ENV NEMA4 inserted Appendix F, Category Cabling Color Scheme for Services inserted Appendix L; Sample Matrix of Port Count Report inserted Appendix M; Network Closet Checklist for Standard Sites inserted Appendix N, and remaining adjusted accordingly;
May 12, 2023	Added wall mount cabinet to Appendix D; updated Appendix K, and changed underscore to hyphen.
June 18, 2024	Updates to the Environmental section #3.; Appendix G: removed Hammond and replace with Hoffman Cabinet; and updated the URL in Appendix E.
February 10, 2025	Appendix A, update data drop format; NAC Floor finish epoxy; Patch cable gauge from 26 to 28; correct grammar; change name of file/document to reflect name on title page.

Additional Information

Enterprise Architecture manages annual reviews and promotion of the standard.

Contact

This standard is updated frequently. Contact the person below to ensure that you have the most recent version of this document.

Orville Pitter, Senior Network Analyst, Infrastructure, Planning & Operations
orville.pitter@york.ca

Consulted Organizations

The following individuals and groups were consulted in the formation of this standard.

Organization Consulted	Division	Branch	Date
Ministry of Government Services	Infrastructure Technology Services	Corporate Architecture Branch	April 2011
Belden			May 18, 2021

Committee or Working Group Consulted	Date
Enterprise Architecture	March 2012
Infrastructure and Operations	March 22, 2011
ITS Branch Review	April, 2012

Enforcement Language

The meaning of the words shall or should or must and recommend are clearly define here:

- Shall: this word, or the terms required or must, means that the statement is an absolute requirement.
- Should: this word, or the adjective recommended, means that there may exist valid reasons in particular circumstances to ignore the recommendations, but the full implications must be understood and carefully weighed.
- Exception: An exception refers to a specific case where a standard does not apply, even though the general rule remains in effect for all other cases. Exceptions are often temporary.
- Exemption: An exemption is the complete release from the standard for specific individuals, groups, or circumstances. An exemption is more permanent and grants full freedom from compliance with a particular rule or requirement.

Cabling and its installation shall comply with the requirements of the authority having jurisdiction (AHJ) and applicable regulations. This includes, but is not limited to, the cabling jacket ratings.

Introduction

Background & Purpose

This standard defines the design minimum technical and quality requirements for wiring of voice and data communications rooms in all buildings that are managed by, or on behalf of The Regional Municipality of York.

This standard includes new developments, revisions, and updates in cabling plant such as Power over Ethernet (PoE) data centre specific standards, cabling for wireless access points, digital signage, security, and other operational technologies (O/T) that use structured cabling for their infrastructure and the administration standard for cabling plant management. Four topic areas include.

1. **Data centres that are managed by or on behalf of the Regional Municipality of York.** Data centres are included to provide requirements and guidelines for the data centre design and installation. These requirements and guidance are found in ANSI/TIA-942: Telecommunications Infrastructure Standard for Data Centres.
2. **The Cabling of buildings for wireless access points.** Provides requirements and guidelines on the installation of a customer premises cabling system infrastructure for an array of coverage areas that form a wireless network grid within a building. These requirements and guidelines are found in TIA TSB-162: Telecommunications Cabling Guidelines for Wireless Access Points.
3. **Specific adherence to the IEEE 802.3 standards** provides for the implementation of power over Ethernet or data lines within the plant owned by, or managed on behalf of the Regional Municipality of York.
4. Specifies a uniform administration approach to the management of a telecommunications cabling system as found in ANSI/TIA -606: Administration Standard for Telecommunications Infrastructure.

This standard applies to all new or major retrofit wiring of data and voice communications in existing Regional Municipality of York buildings.

Network Equipment

1. Project will provide the budget for all network equipment including network switches, wireless access points, wireless controller, uninterrupted power supply, firewalls and any other network equipment that ITS considers mandatory to support the setup and configuration the network to meet ITS standards.
2. ITS will procure all network equipment including network switches, wireless access points, wireless controller, uninterrupted power supply, firewalls and any other network

equipment that ITS considers mandatory to support the setup and configuration of the network to meet ITS standards based on the budget.

3. Telecom contractor shall supply network racks, cables, patch panels, cable trays and any associated supplies for cabling based on ITS Cabling and Wiring Standards.
4. Telcom contractor shall provide port count by network closet and by device type (data/voice, WAP, BAS, Energy, Camera, IoT) to enable Corporate ITS requested quotes for network equipment and to assign IP-addresses (see Appendix M).
5. Telecom contractor shall provide any emulated Wi-Fi surveys with input, review and acceptance for Corporate ITS.
6. Telecom shall install racks, run network cables and terminate to patch panels, install UPS and WAPs based on instructions provided by Corporate ITS.
7. Backbone and horizontal infrastructure cabling shall be completed by an installer certified by the cabling system manufacturer, and the cabling shall be certified upon completion.
8. ITS recommends that category cable patch panels be from manufacturers that meets or exceeds ANSI/TIA 568.2 Category 6A performance requirements and design specifications.

Securing Network Devices on York Network

1. All devices that require connectivity to York Networks shall be direct network run.
2. A list of all devices not issued by York ITS that will connection to the York Network must be provided to Corporate ITS. The list must include the make, model and specification and function.
3. ITS Security must conduct ITS security testing on all devices prior to connection to the York Region Network.
4. If testing of device is not done prior to connection, then it is done when the first device is added to the network.
5. If York ITS identifies security issues, these issues need to be resolved by the vendor.
6. ITS Security and Enterprise Architecture will review and make recommendations as well as provide a path to ensure that the device is a safe device to be on the York Region network.

Objectives

The Objectives of this standard are to:

1. Provide safe, reliable, uniform and up to date facilities for the convenient connection of telephones, computers, computer terminals and other communications related technologies utilizing cabling and wiring in Regional offices.
2. Achieve significant cost savings in the rearrangement of government offices and the relocation of government services and personnel by uniform and flexibly arranged communications connections.
3. Increase the value of the investment in the cabling infrastructure by reducing the labour expense of maintaining the system, extending the useful life of the system and providing effective service to users.

Scope of Standard

The following platforms, and facilities are in scope of this standard.

1. Horizontal and vertical structured cabling platforms
2. Data centre structured cabling platforms
3. In-building facilities including
 - a. Main telecommunications room
 - b. Telecommunications rooms
 - c. Workstations
4. In-building renovations
 - a. If cabling is less than Category 6 standard or older than 10 years, must be replaced with current standard including the patch panel and all related connectivity.

Out of Scope

Electrical cabling is not covered by this standard.

Education & Training

Data Centre and technical staff shall be trained and experienced on the technologies used pertaining to structure cabling infrastructure.

ITS Corporate Network Cabling Standard

eDOCS: 5708119

Authority, Exceptions and Exemptions

Any change, exception, exemption or deviation from this standard shall be reviewed by the Region's Strategy & Architecture, Technology Planning units and approved by the Technology Standards Working Group (TSWG). Any change to this standard shall be submitted to the TSWG.

Structured Cabling Technical Specification

1. The contractor shall provide a complete and operating Structured Cabling Platform to support existing and future communication systems in Regional facilities. This includes all horizontal cabling for data applications as well as backbone.
2. All cabling for the network shall be completed by one cabling contractor that is able to provide cable as built and test results.
3. Network (horizontal) cabling shall adhere to York ITS Network Standard Category cabling color specification and installed end-to-end including keystone and patch cables.
4. If product specifications, design and installation guidelines are not provided or in conflict with references listed below. The more stringent requirement shall apply.
5. The Horizontal Structured Cabling Platform installed shall meet or exceed the channel requirements for voice and data transmissions as defined by ANSI/TIA-568.2.
6. Any Structured Cabling Platform installed in a Data Centre or Communications Room shall follow the mandatory requirements, guidelines and best practices for data centre cabling systems, pathways and design considerations found in Regulatory References and Standards: Telecommunications Infrastructure Standard for Data Centres.
7. Category 6A UTP (500MHz) 23AWG cabling shall be used as the minimum rated twisted pair cable. Horizontal cabling should be installed point-to-point, no network consolidation point.
8. Cables, associated connecting hardware, jumpers, patch cords, equipment cords and zone area cords shall meet all applicable requirements specified in ANSI/TIA-568.2.2 and ANSI/TIA-568.3.

Recognized Media

1. 100 ohm twisted-pair cable, ANSI/TIA-568.2, Category 6A UTP 23AWG.
2. Patch cables of minimum Category 6A F/UTP 28AWG.
3. Multimode optical fibre cable OM4, ANSI/TIA-568.3.
4. Single-mode optical fibre cable, ANSI/TIA-568.3.

Regulatory References & Standards

The standard defines specific categories of cabling, components, transmission performance, system models, and measurement procedures. These are needed for verification of cabling performance that shall be used at a minimum for any new or major retrofit wiring of data and voice communications in existing York Region buildings. These are the requirements found in recognized telecommunications industry standards:

Cabling Systems

1. ANSI/TIA-568-C.0: Generic Telecommunications Cabling for Customer Premises
2. ANSI/TIA-568.1: Commercial Building Telecommunications Infrastructure Standard
3. ANSI/TIA-568.2: Balanced Twisted Pair Telecommunications Cabling and Components Standard
4. ANSI/TIA-568.3: Optical Fibre Cabling and Component Standard

Spaces and Pathways

5. ANSI/TIA-569: Telecommunications Pathways and Spaces.

Cabling Administration

6. ANSI/TIA606: Administration Standard for Telecommunications Infrastructure.

Telecommunications Infrastructure Standard for Industrial Premises

7. ANSI/TIA-1005: Telecommunications Infrastructure for Industrial Premises.

Telecommunications Infrastructure Standard for Data Centers

8. ANSI/TIA-942: Telecommunications Infrastructure Standard for Data Centres.

Wireless Access Points

9. TIA TSB-162: Telecommunications Cabling Guidelines for Wireless Access Points

In addition, coverage of this standard includes new developments and updates in cabling plant such as Power Over Ethernet (PoE) data centre specific standards, cabling for wireless access points and the administration standard for cabling plant management.

All work shall conform to industry accepted practices, manufacturer's component installation guidelines, the Ontario building code, the Canadian Electrical Code, and all applicable standards. The following referenced documents are indispensable for the application of this standard. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document applies. Furthermore, compliance with the AHJ will supersede all other specifications.

This standard applies to all new or major retrofit wiring of data and voice communications in existing Regional Municipality of York buildings.

Documentation

Documentation related to the installation, maintenance and disposal of cabling plant shall be created and maintained by the parties responsible for installing and maintaining the cabling infrastructure on behalf of the Regional Municipality of York. This administration of the cabling plant is governed by the mandatory use of Standard Update to Administration for the telecommunications infrastructure; and the labelling convention described in Regulatory References and Standards under Cabling Administration.

The following line items describe individual requirements that are to be applied to all Communications Cabling projects. The line items are meant to serve as a guideline for the Regional requirements.

All horizontal cabling shall be installed from the workstation location, or on modular patch panels installed into racks or cabinets. For small sites, the customer can specify wall-mounted patch panels in lieu of racks where appropriate due to site constraints and capacity requirements.

Allowances

Devices, racks, cabinets, backboards or outlets may be relocated, prior to installation, from the location shown on the contract drawings, to a maximum distance of 3.05 meters (10 feet) without adjustment to the contract price.

Waste Management & Disposal

1. The cabling contractor shall remove and dispose of all abandoned horizontal voice, data and coaxial cabling.
2. If the cabling contractor is unsure of the status of the cables, they shall confirm the removal with the project manager prior to performing the work.

Testing & Commissioning

1. Provide two copies of testing and commissioning documentation for all items and their related components to the project manager prior to the completion of the project or at the project manager's request.
2. Include maintenance manuals, operating instructions for the Region's staff.
3. All test data, including daily equipment reference checks, shall be submitted in native tester format (e.g. FLW files for Fluke) and summary in PDF.

Warranty

1. The contractor shall provide a complete and operating Structured Cabling Platform to support existing and future communication systems in Regional facilities. This includes all horizontal cabling for data applications as well as backbone.
2. The structure cabling platform in each individual building or site shall be manufactured and warranted by a single manufacturer for all components of the structured cabling platform including backbones.
3. The successful bidder shall install a complete structured cabling platform that is manufactured and warranted by a single vendor.
4. The successful bidder shall be authorized by the cable vendor to install and warranty the system.
5. If a sub-contractor is used for the installation, it is mandatory that the sub-contractor be currently authorized to install and warranty the system.

Site Walkthrough

The cabling contractor shall participate in network cabling walkthroughs:

1. 0% walkthrough: Initial pre-construction walkthrough with ITS, York Region and General Contractor (GC) to ensure that the scope of work is understood and for questions regarding ITS Network cabling standards.
2. 50% walkthrough: to confirm the project is on track and the cabling standards are adhered to.
3. 100% walkthrough: for the network closet acceptance (cabling is completed, Network closet is free of all debris, testing results and has builds have been provided, etc) with ITS, York Region, GC and cabling contractor. The acceptance is contingent on satisfying the criteria outlined in "ITS New/Renovated Site Networking Provisioning Checklist" (Appendix N).

Product Specifications

Backbone Cabling

Optical Cabling Backbone

1. OM4 fibre backbone cabling shall comply to ANSI/TIA-568.3.
2. Each Fibre backbone cable shall have a minimum of 12 strands OM4 distribution type fibre. The OM4 distribution type fibre will perform as per industry standards over the required distance defined for the site. Mated connector loss for OM4 shall not to exceed 0.25 dB.

Conduits

1. Conduit fill ratios shall never exceed the recommendations of ANSI/TIA-569.

Backbone Interconnect

1. If there is a requirement for an interconnection between wiring closets on the same floor, or multiple floors, it shall be interconnected with minimum of six fibre OM4 rated fibre optic backbone terminated with LC connectors.
2. All connectors for the termination of the fibre optic backbone cable shall be duplex LC connectors.
3. Fibre optic enclosure shall meet the following requirements:
 - a. Enclosure shall include a slide-out drawer for front access of the terminations.
 - b. Enclosure shall support LC connectors.
4. For multimode fibre optic terminations inside access closets fibre patch panels the connectors shall be preloaded adapters configured with LC duplex multimode adapters.
5. Provide duplex OM4 fibre optic patch cables LC to LC.

Termination Specification

Category Patch Panels

5. All horizontal cables are to be terminated on RJ45 jacks, inserted into modular category patch panels, and placed in the telecommunications room for that floor.
6. The modular patch panel should minimise the rack space used and should not exceed two rack units in height.

Fibre Patch Panels

1. If required, the number of strands to be supplied and installed is a minimum of 12. The project manager, in consultation with the Region, will finalize quantity and type of fibre to be installed.
2. All Fibre backbone is to be terminated using a fibre patch panel on a communications rack.
 - a. The 12 strands of fibre shall be installed in the fibre patch panel and placed in a rack in the telecommunications room for that floor.
 - b. The fibre patch panel should minimize the rack space used, it cannot exceed three rack units in height.
 - c. The fibre patch panel shall be serviceable from the front by allowing the fibre patch panel to slide or pivot away from the rack.
 - d. The fibre patch panels are to be mounted at the upper most position on the racks of each floor.
3. Provide all necessary accessories for a complete fibre patch panel including, but not limited to: clear cover plates, mounting brackets and hardware, LC duplex fibre bulkheads, LC connectors and fibre cable management.
4. The physical fibre optic cabling topology and the type of fibre connectors shall be determined and finalized during design build of project.

Fibre Optic Cable

1. Provide all fibre optic cable, connectors and appurtenances that make up the backbone cable segments.
2. The fibre optic backbone cable segments shall meet the requirements of the TIA/EIA-568.3 specifications.
3. Multi-mode fibre optic backbone cable shall be OM4.
4. Single mode fibre optic backbone cable shall be OS2.

Connectivity

Category Patch Cord

1. Three patch cords seven feet in length per drop shall be provided on site, two for the IP phone/desktop connectivity, and one for the patch panel to network switch.
 - a. These cords shall match the cabling category being installed. Further small OD patch cords shall be used where the performance of the network will not be negatively affected: i.e. channel length and configuration, data transmission and power delivery.
2. The project manager, in conjunction with the ITS planner and Network Operations, shall determine the fibre and category patch cable length as needed.

Fibre Patch Cord

1. All fibre patch cords shall be connected to the customer supplied active equipment using LC duplex zip cords.
2. The fibre patch cords are to be seven feet in length. LC duplex zip cords are to be consistent with the grade and manufacturer of the fibre cable that is being warranted.

Communications Rack & Cabinet

1. All racks and cabinets to be supplied and installed to be bolted to the floor or otherwise secured to prevent tipping, 19" floor mounted with 44U of rack mounting space.
 - a. Racks and cabinets shall be tapped both front and back with mounting holes as per EIA-310-C, size 10-32, as well as include a ground lug to accept a #6 AWG grounding wire.
2. All network access spaces dedicated to York Region ITS network and Security should utilize 2-Post open frame rack (see Appendix H).
 - a. If other services beyond ITS Network/Security is to be hosted, types of rack/cabinet installation should be discussed and determined by York Region IT Services.

Vertical Cable Managers

1. Network cabinet shall come complete with two vertical cable managers installed: one mounted on each side.
2. Network rack cable managers shall be one of two dimensions. Micro and small sites four inches wide by four inches deep.
3. Medium and large sites 7.5 inches width by six inches deep.
4. The vertical cable manager shall have hinged front door(s), back and side cut outs to allow for patch cords.
 - a. It shall also have lancets along the back of the cable manager to allow for the fastening of the horizontal cable to the outside of the manager itself.
 - b. Higher density drops may require vertical cable management with increased width and depth.

Overhead Cable Manager & Chimney

1. Each cabinet and rack shall come complete with a hinged overhead cable manager installed, with minimum dimensions of eight inches wide by two inches deep.
 - a. Where racks are ganged, the overhead cable manager is to be continuous across the gang of racks; both ends of the ganged racks are to be completed with end caps.

2. At the right side of each rack a cable management chimney shall be installed. They shall extend from the top of the overhead cable manager to the underside of the ladder tray/ceiling tile above.

Equipment Shelves

1. Each cabinet and rack is to be supplied with, at a minimum, one equipment shelf if requested; this is to be installed at the direction of the customer.
2. The equipment shelf shall be centre mounted and have a minimum of 18 inches of depth.

Vertical Switched Zero PDU

1. Each cabinet and rack is to come complete with two vertical switched Zero U PDU mounted to the back of the rack.
2. Each PDU is to have a minimum of eight outlets rated at 110V, 15A. The power bars are to have a minimum power cord length of six feet.
3. The power bars shall not have reset breakers or an on/off switch.
4. The Customer may require additional power requirements over and above what is detailed above. It is the responsibility of the Project Manager to provide these requirements to the Cabling Contractor.

General Enclosure Requirements

1. All indoor enclosures containing network components are to be installed in a two-post, four-post open rack frame, or cabinet.
2. All screws, bolts, fasteners etc. are to be corrosion resistant stainless steel.
3. All wall-mounted panels are to be separated from the wall by stainless steel spacers or galvanised steel struts.
4. Doors shall have continuous hinges with removable pin and oil resistance cellular neoprene gasket secured by gasket retainers.
5. Door handles shall be recessed type (freestanding enclosures) or three-point external latch wall mount, complete with key locks. All key locks are to be identically keyed. The key number shall be provided to the Contractor during construction.
6. Cable bundles shall be neatly laced, run in ducting or approved cable managers and secured to 19-inch rack or mounting back-panel.
7. All enclosure doors shall open through 180 degrees without restriction.
8. Enclosure layout and equipment spacing shall be constructed to allow for device removal, calibration and maintenance without disassembly of adjacent devices.
9. All freestanding, floor-mounted enclosures shall have removable CSA eyebolts to facilitate sling handling of each enclosure.
 - a. Eyebolt mounting shall be a part of the structural support bracing to distribute stresses and enclosure weight while sling handling enclosures during installation.
10. All enclosures shall have sufficient structural reinforcements to ensure a limited plane surface vibration and to provide rigidity during shipment, installation and operation without distortion or damage to the enclosure, mounting panel or mounted instruments.
11. All enclosure seams shall be continuously welded and ground smooth to be undetectable after painting.
12. Devices shall be installed on the enclosure back-panel or 19-inch rack.
13. There shall be no devices installed on the side plates of the enclosure.

Enclosure Wiring

1. All enclosure wiring shall run through cable management. All cabling is managed, protected, and enclosed.
2. Cable managers shall not be filled to more than 50 percent of their volume upon initial installation.

3. All wires and cables, including spares, shall be identified at each end and at any connection. Use durable non-fading sleeve type wire markers to identify all network cables as follows:
 - a. Labels for cabling shall be laser printed, self-laminating, adhesive, polyester (indoor/outdoor).
 - b. Hand-written labels will not be accepted.
 - c. Lettering shall be black on a white background. Characters shall be a minimum of four millimetre high.
 - d. Wire markers are required on each conductor in panel board gutters, and at load connections. The identification shall include branch circuit or feeder number for power and lighting circuits, and control wire numbers for control wiring.
 - e. All field wires and cables terminated within enclosures shall be identified at each termination with a marking that corresponds with the drawings and supporting documentation.
 - f. Power wiring insulation shall be rated at 600 volts at 90 C and be type RW 90 THHN. Conductors shall be stranded copper. No wire smaller than 12 AWG shall be used for power wiring, unless noted otherwise on the drawings.

Rack & Cabinet Installation

1. All cable is to enter through the bottom or top of the cabinets. If coring of the floor is required for the passage of cable the Contractor is to X-Ray the floor in accordance with Division 1.
2. Provide a 12" wide minimum cable tray segregated for power, fibre and horizontal UTP cables for overhead cabling as shown on the Contract drawings. Cable management is to be provided from the cable tray to the enclosure to ensure that the minimum bend radius for each cable is maintained and the cable is rigidly supported.
3. Electrical
 - a. Provide the electrical distribution for each core and server closet as per the related Electrical Distribution drawings and relevant standards.
 - b. Provide each core and server closet with required number of duplex 15A, 120 VAC.
 - c. The project manager will provide UPS Receptacle specification to the contractor, typically one of the following which will be dependent on Load/Runtime requirement or if building generator/UPS is in scope.

ITS Corporate Network Cabling Standard

eDOCS: 5708119

First published: July 9, 2012
Scheduled review: Annual
Last updated: February 14, 2025
Last Reviewed: February 14, 2025
Approved by: TSB

UPS Receptacle Option	UPS Series	Input Power
Option 1	APC UPS 1500	NEMA 5-15R
Option 2	APC UPS 2200	NEMA 5-20R
Option 3	APC UPS 3000	NEMA L5-30R
Option 4	APC UPS 5000	NEMA L6-30R

- d. Secure each rack and cabinet to ground.
- e. The duplex receptacles shall be mounted in such a manner as not to interfere with access to or removal of other equipment within the enclosures.
- f. Power distribution within the enclosure shall be via vertically mounted power bars.
- g. Redundant power supplies, within the same device, shall not be connected to the same UPS circuit.

Network Access Room

1. Network Access Rooms (NAR) shall be large enough to accommodate all of the equipment and wiring that will be placed in it and include extra space to accommodate any future growth.
2. NAR shall meet the requirement of ANSI/TIA-569

Environmental Specifications

1. Shall satisfy environmental requirements that include, but not be limited to power supply, heating, ventilation, and air conditioning.
2. NAR should maintain a room temperature between 19 to 23 degrees Celsius for the cold zone with the assumption that air flow is from front to back (cold to hot) when all LAN equipment is in full operation and a relative humidity of between 30 to 50 percent.
3. Open water sources are prohibited. Sources include but are not limited to hose bibs, slop sinks, plumbing fixtures and maintenance drains in hydronic heating and cooling.
4. The wiring closet shall not double as a storage area for cleaning products, chemicals, equipment, cardboard, or furniture. The wiring closet shall be kept clean and free of any debris.
5. There should be at least one duplex power outlet positioned every 1.8 meters along each wall of the room and should be positioned 15 cm above the floor. A wall switch that controls the room's main lighting should be placed immediately inside the door.
6. Floor finish to be general service, low volatile organic compound (VOC) solid colored (grey) epoxy coating.
7. UPS plug type and BTU for equipment shall be provided by York Region ITS.

Cable Access & Support

1. If data closet serves as a Main Distribution Facility/Facilities (MDF), all cables running from it to Intermediate Distribution Facility/Facilities (IDF), computers and communications rooms on other floors of the same building should be protected by a four inch conduit or sleeved core.
2. The exact amount of conduit that is required is determined by the amount of fibre optic, UTP, and STP cable that shall be supported in each NAR.
3. Cabling should be run through four-inch sleeves that are placed above the door level. To ensure proper support, the cable should be run from the sleeve directly onto a 12-inch ladder racked in the room.

4. Supply and install all horizontal wiring, jack boxes, raceway, wall plates, telephone punch-down blocks and identification labels.
5. Identify all wiring at both ends, at the jack end and in wiring closet.
6. Terminate, test and certify all installed wiring in accordance with industry standards.
7. Include additional lengths of conduit to provide for future growth.

Property Services — Security Panel

1. Lenel solutions is used for access control, Bosch for Intrusion and Milestone for CCTV for all new sites. CCTV system is a requirement for facilities accessed by the public unless otherwise specified (examples. Court Services, YRT, ENV and Corporate Sites). This will include an onsite video server, UPS back-up and the XProtect application connected to the database servers at 17250 Yonge Street, Newmarket.
2. Security cabinets shall be placed in the NAR or Electrical room and will require a standard wall space of four feet high by eight feet wide. This may increase depending on the size of the facility and requirements for card access and panic alarms.
3. The following requirements shall be adhered to:
 - a. There shall be 32 square feet of wall space.
 - b. Be eight-inch in depth, and require an additional 28 inches of clearance for a total of three feet.
 - c. Panel area should be situated three feet vertically from the floor and the panel should be installed on fire retardant backboard.
 - d. Security panels should not be placed in mechanical rooms, or general areas opened to staff or other personal.
 - e. Security panels are to be supplied with dedicated emergency power.
4. Category 6A cable, Purple in color should be used for end-to-end horizontal cabling, patch cable and keystone.
5. Facilities with on-site security guards will require a XProtect Smart Client workstation with monitors. The quantity referenced in site specific design and are to be in the security office.

Building Automation System (BAS)

1. Building automation equipment may be in various locations including, but not limited to the NAR, ceiling, mechanical room and the electrical Room.
2. Typical cabinet size that would be expected to be in the NAR.

- a. Two feet wide by three feet high and six inches in depth with a door swing of two feet, seven inches
 - b. Eighteen inches wide by eighteen inches high and six inches in depth with a door swing of nineteen inches
 - c. Quantity maybe one to three depending on number of points Panels should be situated six feet vertically from the panel top to floor and should be installed on fire retardant backboard.
3. Conduits should be used to join the larger cabinets.
4. Power Supply to BAS panel should be separate and has its own junction box or panel.
5. Category 6A cable, Orange in color should be used for end-to-end horizontal cabling, patch cable and keystone.
6. All BAS Category 6A drops shall be terminated to a patch panel in the network rack.
7. Requirement of one data jack per IP device located beside the cabinets in which the devices are located.
8. If placed in the vicinity of a network racks, there should be an additional two feet of clearance.
9. All enclosure wiring shall run through cable management. All cabling is managed, protected, and enclosed.
10. Cable managers shall not be filled to more than 50 percent of their volume upon initial installation.

Labeling Guidelines

1. All wires and cables shall be identified at each end, and at any connection. Use durable non-fading sleeve type wire markers to identify all network cables as follows:
 - a. Labels for cabling shall be laser printed, self-laminating, adhesive, polyester suitable for indoor and outdoor use.
 - b. Hand-written labels will not be accepted.
 - c. Lettering shall be black on a white background. Characters shall be a minimum of four millimeters high.
 - d. Wire markers are required on each conductor in panel board gutters, and at load connections. The identification shall include branch circuit or feeder number for power and lighting circuits, and control wire numbers for control wiring.

- e. All field wires and cables terminated within enclosures shall be identified at each termination with a marking that corresponds with the drawings and supporting documentation.

Category & Fibre Patch Panel Identification

1. York Region Category and fibre patch panels identification shall follow the standards outlined below. Any exceptions to the following requirements shall be approved by the Region's project manager.
 - a. Labels for patch panels shall be laser printed, self-laminating, adhesive, and polyester or polyolefin.
 - b. Hand-written labels will not be accepted.
 - c. Lettering shall be black on a white background and shall be a minimum of six millimetres high.
 - d. Labels shall be applied to be readily visible, and not obscured by structured cabling or patch cords.
 - e. The tagging convention for network closet patch panels will employ a six-character alphanumeric tag. The first three characters will indicate location consisting of floor and access closet identifier. The last three characters shall use a unique number incrementing with each drop within each closet.

Face Plate

1. York Region UTP patch panel termination point identification shall follow the standards outlined below. Any exceptions to the following requirements shall be approved by the Region's project manager.
 - a. Labels for faceplate shall be laser printed, self-laminating, adhesive, and polyester or polyolefin.
 - b. Hand-written labels will not be accepted.
 - c. Lettering shall be black on a white background and shall be a minimum of four millimetres high.
 - d. A label shall be applied to the top of each faceplate indicating the destination of the faceplate.

Fibre Optic Patch Panel

1. York Region fibre optic patch panel termination point identification shall follow the standards outlined below. Any exceptions to the following requirements shall be approved by the Region's project manager.
 - a. Terminate all fibres of each fibre optic cable in either 36/72 Fibre Enclosures for access closets, or 36/72/144 Fibre Enclosures for core closets.
 - b. The ordering and colour of individual fibres will be the same for each fibre cable and compliant with ANSI/EIATIA-568.3.
 - c. Labels shall be laser printed, self-laminating, adhesive, and polyester or polyolefin.
 - d. Hand-written labels will not be accepted.
 - e. Lettering shall be black on a white background and shall be a minimum of four millimetres high.
 - f. A label shall be applied to the top of the fibre duplex adapter modules associated with a single fibre cable indicating the destination of the cable.

Backbone & Horizontal

1. York Region network cable identification shall follow the standards outlined below. Any exceptions to the following requirements shall be approved by the Region's project manager.
 - a. Use durable non-fading sleeve type wire markers to identify all network cables.
 - b. Labels for cabling shall be laser printed, self-laminating, adhesive, and polyester for indoor and outdoor use.
 - c. Hand-written labels will not be accepted.
 - d. Lettering shall be black on a white background and shall be a minimum of four millimetres in height.
 - e. Fibre Optic Backbone Cables
 - i All fibre optic backbone cables are to be labelled at both ends of the cable.
 - ii The fibre backbone cables are to be labelled at each transition. A transition is defined as: a change in ducting (e.g. cable tray to conduit), a change in direction of more than 45 degrees, or an entrance and exit of ducting through a wall or floor.
 - iii If the fibre cable is run in conduit, then the transition labels shall be applied to the conduit.

- iv The tagging convention for identification of fibre optic backbone cables shall indicate the source and destination of the cable.

- b. Horizontal Cables

- i As a minimum, all horizontal Category 6A UTP cable is to be labelled at both ends of the cable.
- ii The tagging convention for identification of horizontal cables shall indicate the drop sequence and Telecommunications Room (TR) of the cable.

Execution

1. Provide all components and appurtenances necessary to ensure that the network closets are functional and meet the intent of this specification.
2. Locate work area outlets where the length of the horizontal cable runs from the access closet interconnect to the work area outlet shall be less than 90 meters. For work area outlets where this proves impossible the Contract Administrator will authorize in writing an exception if the link still meets the performance requirements of this specification.
3. The Contract Administrator reserves the right to relocate access closets and work area outlets within three metres of the locations identified in the contract drawings at no additional cost to the Region.
4. The contractor is responsible to size all power supply cables to meet the requirements of the Ontario Hydro Safety Code based on field verified length of cable run and power supply load.
5. Cable & Conduit
 - a. Provide one Category 6A UTP, horizontal cables to each work area outlet from an access closet in a Electric Magnetic Tube (EMT) conduit, sized to accommodate quantity of cabling and a minimum trade size of 35 1-1/4.
 - b. Conduit carrying horizontal cables shall enter the work area outlet through the top or bottom.
 - c. Conduit shall be Electric Magnetic Tube conduit (EMT). Corrosive environments will be noted on the access closet Installation drawings. Conduit running through corrosive environments shall be Rigid PVC.

Work Area Outlets

1. Work Area Outlets
 - a. Horizontal cabling installed using wall outlets and floor boxes are to use single gang, or double gang if required, and they are to match the decora straps. Each

decora style strap is to have a minimum of two positions for communications modules. Each outlet is to be equipped with the appropriate modules. Any unused communication positions in wall outlets shall be filled with a blank. The colours of the UTP modules and furniture adapter plates may be changed at the discretion of the project manager.

- b. Provide one one-port, single-gang, metal work-area outlets, connectors and appurtenances for termination of the horizontal Category 6A UTP cables. If four Category 6A UTP cables are consolidated at the Work Area Outlet, then one four-port work-area outlet is required. If eight Category 6A UTP cables are consolidated at the Work Area Outlet, then one eight-port work-area outlets is required.
- c. Each work-area outlet will be associated with a one-port, snap-in faceplate installed in the access closet or Core Closet patch panel.
- d. All Category 6A UTP connectors shall be modular jacks and wired for a T568A wire-map.
- e. All Category 6A UTP shielded connectors shall be bonded to ground.

Horizontal Cable Installation

- 1. All horizontal cabling from the access closet to the work area shall comply with the manufacturer's certification requirements and recommendations; as well as meet the performance parameters of ANSI/TIA-568.2 and the design requirements of ANSI/TIA-568.1.
- 2. Pathways shall be in EMT conduit minimum trades size 1-1/4 or as specified by the AHJ. Pathways shall be sized according to the requirements of the AHJ in addition to the recommendations of ANSI/TIA-569 with a planned capacity threshold of initial installation requirements +20%.
- 3. All labeling to confirm to ANSI/TIA-606 and a sample of the proposed labeling scheme to be submitted to the client for approval.

Fibre Optic Cable Installation

- 1. All fiber optic cabling from the access closet to the work area shall comply with the manufacturer's certification requirements and recommendations. They shall meet the performance parameters of ANSI/TIA-568.3 and the design requirements of ANSI/TIA-568.1. For outside plant installations, the requirements of ANSI/TIA-758 shall be followed. No cable splices are allowed for inbuilding fiber optic cabling.
- 2. Indoor pathways shall be in EMT conduit minimum trades size 1-1/4 or as specified by the AHJ. Pathways shall be sized according to the requirements of the AHJ in addition to

Part Number and Description: CTR-1977-PL Practical Line Rack with Cable Management

Appendix J – Naming Convention for Wi-Fi Access Point (AP)

Staff Wi-Fi

1. AP should be labelled: **Site-FL-RM-AP#**. Where Site is Site Name, FL is the floor, RM is the Network Closet Room Number, AP# is the number of AP on that floor and numbering should restart on each floor.
 - a. le: AP number 16 on the first floor in the Annex that is cabled back to room 1-006 would be labelled as follows: ANNEX-1-1-006-AP16
2. Data Jack labelling: **RM-AP#**
 - a. le: data jack that is used for AP number 16 on the first floor of the Annex that is cabled back to room 1-006 would be labelled as follows: 1-006-AP16
3. Patch Panel should be labelled: **AP#**
 - a. le: patch panel that is used for AP number 16 on the first floor of the Annex that is patched back to room 1-006 would be labelled as follows: AP16

Public Wi-Fi

4. Public AP should be labelled: **PUB-FL-RM-AP#**. Where PUB represents Public Wi-Fi, FL is the floor, RM is the Network Closet Room Number, AP# is the number of AP on that floor and numbering should restart on each floor.
 - a. le: Public Wi-Fi AP number 16 on the first floor in the Annex that is cabled back to room 1-006 would be labelled as follows: PUB-1-1-006-AP16
5. Data Jack labelling: **PUB-RM-AP#**
 - a. le: data jack that is used for Public Wi-Fi AP number 16 on the first floor of the Annex that is cabled back to room 1-006 would be labelled as follows:
PUB-1-006-AP16
6. Patch Panel should be labelled: **PUB-AP#**
 - a. le: patch panel that is used for Public AP number 16 on the first floor of the Annex that is patched back to room 1-006 would be labelled as follows:
PUB-AP16
7. Cabling for Public Wi-Fi shall on a separate patch panel from the York Region internal network.

Appendix K – Wireless Access Point (WAP) Installation & Mounting

Installation of WAP shall meet the requirements of manufacturer and follow recommendations of TIA-TSB-162.

1. The communication contractor shall install all wireless access points (WAP) which shall be supplied by York Region.
2. Provide patch cable and all necessary hardware to mount WAP's as shown.
3. Communication contractor shall
 - a. Receive WAP's
 - b. Unpack the WAP's
 - c. Attach the WAP's mounting bracket
 - d. Mount the WAP's
 - e. Patch the WAP's at both ends
 - f. Record AP MAC address and WAP Cable ID that AP was patched into. Record this into the AP Connectivity Table that shall be submitted upon AP installation completion of each floor.

Appendix L – Category Cabling Color Scheme for Services

Blue	Data/WiFi/Clock/IoT Category Cable and anything that is not specified.
Purple	Security Category Cable
Orange	BAS Category Cable
Green	Energy Category Cable

Appendix N – Network Closet Checklist for Standard Sites

For ITS and Cabling Contractor Use

Walkthrough: 100% ☐ Final ☐

Network Closet : New/Renovated Closet *			
Details (Y/N)	T1	T2	Comment
Cabling Trays or J hooks			
Fire Rated Plywood Wallboard			
Power Receptacles NEMA L5-20R			
HVAC (with central monitoring)			
Rack Installation (clearance for vertical and horizontal cable management)			
Patch Panels			
Fibre Backbone (York Net Sites Only) (shielded/protected/labeled)			
Copper/analog line installed			
Verify that network closets are secure by lock or proximity scanners			
Electrical Grounding			
Room sweep/clean and all refuse/garbage is removed			
Network Closet ready for setup			
Network Closet setup complete			
Cabling Test Submitted and Accepted			
As-Built Diagram Submitted & Accepted			

* Each network closet must have a completed checklist

Appendix O - WAN/ISP Duct Bank

Communication conduits can be placed on top of electrical conduits

NOTES:

- .1 PROVIDE DUCTBANK TO OESC STANDARDS AND APPROVAL.
- .2 PROVIDE BELL FITTINGS AT EACH END. PROVIDE DUCT SPACERS AT 1.0M INTERVALS.
- .3 REFER TO SPECIFICATIONS FOR DETAILED DESCRIPTION.
- .4 ALL DIMENSIONS ARE TYPICAL IN MM.

Appendix P - WAN/ISP Ducts Inside Communication Room

Three 4" ducts stubbed inside communication room, preferred height minimum 12" above the floor.

SECURITY REQUIREMENTS AND SPECIFICATIONS

1. GENERAL REQUIREMENTS

1.1 INTRODUCTION

- .1 This document provides all of the General Requirements applicable to any security related project undertaken by or on behalf of York Region. These requirements are at all times subordinate to the requirements as defined in the Project Specifications and related documents, i.e., be it in the Specifications, the drawings or the Contract Documents.
- .2 If there is any perceived lack of clarity or confusion, the Contractor has the responsibility to obtain clarification from York Region.
- .3 The contractor is responsible for ensuring the reference documents, standards and specifications are the most recent version applicable to the current project.
- .4 York Region will ensure that, as may occur, any modifications to its General Requirements are communicated to the Contractor.
- .5 The Contractor shall use the General Requirements as provided in this document as a reference describing the design and installation procedures to be used for delivery of the project. These procedures generally follow industry Best Practices applicable to Information Technology and Security Applications.
- .6 This “General Specifications Document” consists of two inter-related sections:
 - a. General Requirements – which describes the overall design and functionality to be provided by the completed security system without reference to specific products; and
 - b. Appendices – which provide detailed reference to specific equipment, standards, protocols etc.
- .7 Contractors are invited to advise York Region of any suggestions for improvements that could be made to the design or specifications.
- .8 As technology evolves the Region will continue to upgrade software and hardware in order to ensure the highest levels of security and reliability for all of its properties and facilities. Hence the contractors working on new projects are responsible to validate the versions of software, firmware and hardware currently in service and to validate the compatibility of any new installations with the existing installations.
- .9 All equipment installed during the execution of any security projects shall be acquired through manufacturer approved dealers and installed by factory trained and approved technicians. Approved sources for the primary items of equipment are identified in the Appendices I, J, K and L.
- .10 The contents of this document are to be considered confidential and remain the property of York Region and prior permission shall be obtained for any use or copying of the contents which is unrelated to work which is being undertaken for York Region.

1.2 OVERVIEW

- .1 The Regional Municipality of York (York Region) is committed to operating a single security system for the all the Region's properties. The state-of-the-art system is configured using industry standard products as specified here. The implementation is currently in operation at many locations but will continue to be deployed at additional locations as opportunities arise.
- .2 The Regional security system has 3 distinct components and these components are described further below. The components are designed to monitor and control:
 - a. Access Control (AC) using personal access cards;
 - b. Intrusion Detection (ID) using multiple sensors and detectors;
 - c. Closed Circuit Television (CCTV) cameras used to monitor key locations;
 - d. Intercoms which allow for those wishing access at a gate or door to communicate with the operations centre; and
 - e. Panic alarms/buttons can be wired or wireless, generally located in areas where staff interact with the public e.g., reception areas, judicial services, social services, health services, etc. Wired panic buttons are to be used when fixed furniture is available, wireless panic buttons are to be used if there is no fixed furniture where staff interact with higher risk clients.
- .2 The independent, commercial products are integrated so that the system operators are able to control and manage all the security functions enumerated above from the single user interface which is connected only to the Access Control System. The diagram below (Figure 1) is intended to provided a high-level overview of how the key components of the Region's security system are interconnected.
- .3 Figure 2, below shows how York Region's remote sites are interconnected with the Main Regional Control Centre. Key aspects are that the security system at each site functions locally but all activities and exceptions are communicated to the primary equipment which is located at the Main Regional Control Centre. The architecture is fully scalable and is the same at all sites as appropriate, e.g., the water treatment facilities use SCADA displays for local alarm monitoring which are different than at other sites.

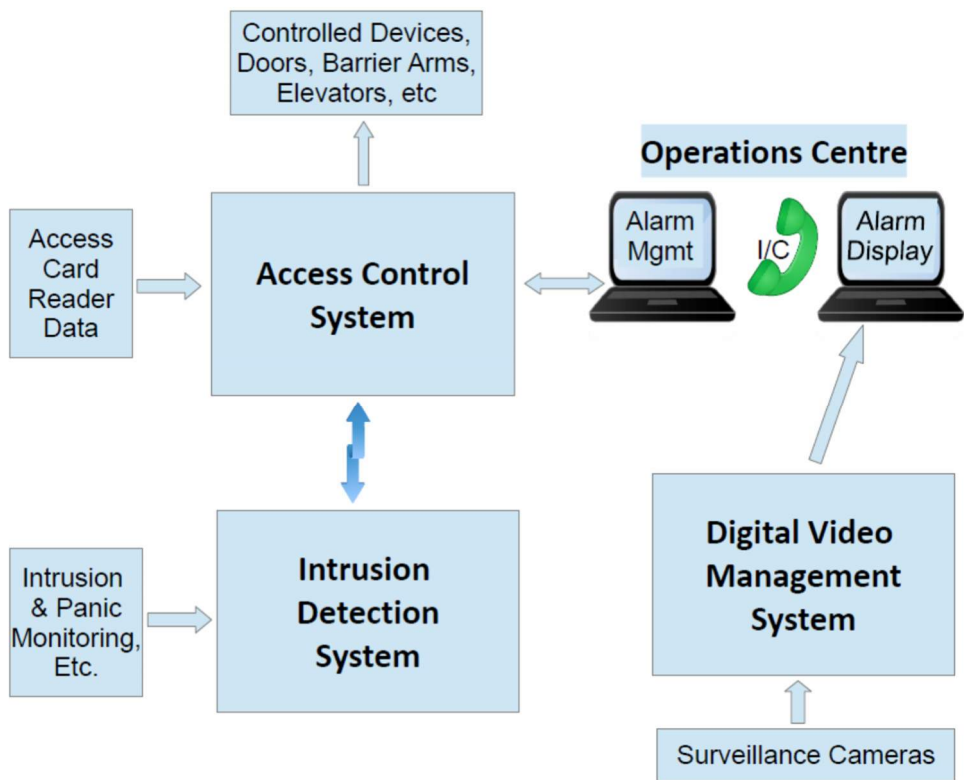

Figure 1: Overview of York Region's Security System Architecture

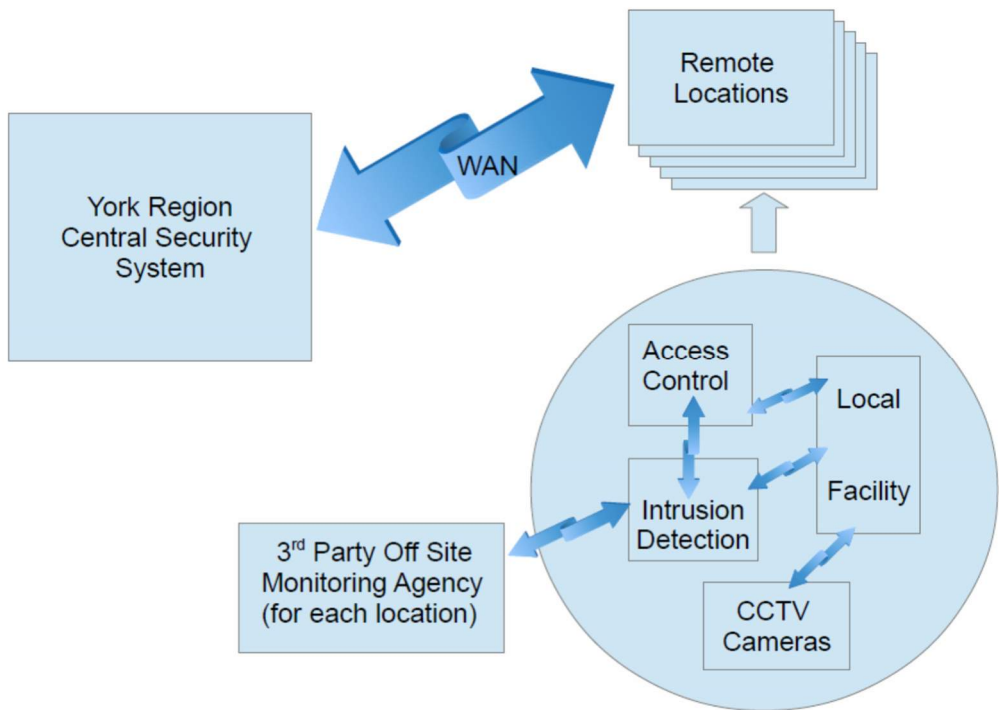

Figure 2: Architecture for the Sites Connected to the Main Regional Control Centre

- .4 The Access Control System and also its User Interface are based on a single, previously approved, security system, for which details can be found in Appendices J and K. The door hardware is controlled by the most recent available interfaces available from the same single manufacturer or supplier. Power supplies are all provided by a single manufacturer, who must be approved by the security system manufacturer. More details regarding these devices may be found in Appendix J.
- .5 The integration of the Access Control and the Intrusion Detection aspects of the security system shall be achieved via the network for full control of both components via the server as well as at a local level for seamless offline operation.
- .6 The CCTV System shall be based on a standard, commercial, digital video management system as detailed in Appendix P.
- .7 The Contractor shall work with York Region on the technical design of the proposed system or contract work, clarification of technical requirements and shall provide a full set of Technical Shop Drawings for approval before proceeding to installation. The Technical Shop Drawings shall include, but not be limited to, network connectivity diagrams, high level riser diagram(s), system riser diagram(s), vertical and horizontal wiring diagrams, point-to-point wiring diagrams, typical and site specific device termination/wiring schematic(s) and diagrams, hardware DIP Switch setting configuration(s), device landing schedule(s), system integration wiring diagrams, intrusion detection point schedule(s), tub/enclosure layout diagram(s), electrical connections and wiring diagrams, explanation of the sequence of operation, integration techniques and operational scenarios. The Contractor shall adhere to the Region's conventions including the allocation of sequential addresses commencing from "1" and avoidance of any reserved addresses. The Contractor shall clearly identify any dependencies which are not included in these Drawings, such as wall space, electrical requirements, air conditioning.
- .8 In addition to the foregoing Shop Drawings, the Contractor shall provide addressing charts, product specifications, and cut-sheets, and other relevant information, required by York Region to complete the full evaluation of the design and to provide for the contractor's installation.
- .9 Following approval by York Region, the Contractor shall deliver one hard copy and one electronic copy of the Technical Shop Drawings to the security system installer for review and comment. The hard copy of these documents shall be printed so that they may be readily read and marked up as may be required.
- .10 The electronic documents shall be delivered both in editable form, i.e., AutoCAD or Word and also in PDF formats.
- .11 The Contractor shall at all times certify that all the electronic documents and the media which are being submitted have all been checked for all forms of malware prior to their submission for any purpose to any other party using any means of transmission.
- .12 The comments made by the security system installer are to be shared with York Region so that it is aware of any concerns which may have been expressed by the installer. York Region shall approve or, as may be appropriate, justify adoption of the original design or

a modified variation before any changes are incorporated. The costs and schedule impact of any such changes shall be clearly identified in these documents.

- .13 The Contractor shall be fully responsible for the work completed by its employees as well as its sub-contractors, including the security system installers, electrical contractor, locksmith and door hardware subcontractors. The Contractor shall employ the installation services of one of the Region's approved security system installers, as listed in Appendix I; to perform the installation and configuration of the security system.
- .14 The installation and termination of all required conduit, cabling, network equipment, communication lines and devices, security devices and head end equipment shall be completed by a pre-qualified security system installer (See Appendix I). All necessary cable, conduit, fittings, and other general installation hardware shall be specified by the Contractor and supplied and installed by the security system installer or by other specialist sub contractors retained by the security system installer, e.g., network installers or electricians.
- .15 The Contractor shall be responsible for supplying the system equipment, licencing, and hardware in accordance with the Contract Documents, including Specifications and Drawings provided by the Region. The Contractor shall be responsible for the final design, supply, installation, configuration, testing and commissioning of the fully operational system to the satisfaction of the Region.
- .16 Where an item is shown on the Drawings and is specified in this Specification, such item shall conform to the requirements of this Specification Section.
- .17 The Contractor and all others working for the Contractor shall conform to all of the requirements of this Specification, including as may be appropriate, all of the related appendices.
- .18 The Contractor shall provide design (shop) drawings prior to the execution of the work, identifying all physical security devices which are to be installed at each field location in accordance with the requirements in the Contract Documents as provided by York Region and as specified in Appendices E, J, K, L, M, N and O.
- .19 All work undertaken in this project shall conform to the standards and practices identified in these security specifications and as noted in Appendix D.
- .20 As required, the Contractor shall submit the necessary number of working drawings and specifications to any applicable authority for examination and approval prior to commencement of work. Any changes required by the examining authority shall be reviewed and approved by York Region.
- .21 Carry out all changes and alterations required by an authorized inspector of the ESA and any other authority having jurisdiction without delay to the progress of the Work. All such changes shall be reviewed and approved by York Region.
- .22 The Contractor shall fully train the Region's personnel (and contractors if applicable) to operate and to perform routine maintenance on the systems and equipment which is installed under the current contract.

- .23 The Contractor shall provide all warranty services for facility security system for a period of two (2) years from the date of Total Performance of the Work, and shall provide all necessary material required to replace any defective products during this period. The warranty period shall restart from the date of the completion of such replacement.
- .24 Details of the Pre-Qualified Value-Added Resellers and Installers may be found in Appendix I.

1.3 APPLICABLE STANDARDS

- .1 All work performed for York Region must be inspected and approved prior to being commissioned. Such work must be compliant with all of the applicable Standards. Some of these Standards may be found in Appendix D. It is the responsibility of the contractor to ensure that the Standards being applied to any project are:
 - a. The most current version of the Standard or Code; and
 - b. Those applicable in the specific project and in the specific jurisdiction.

1.4 SOFTWARE/SYSTEM CONFIGURATION

- .1 The Security System installed as part of this Contract or any modifications to the existing installation shall be reflected in the existing security system database. All programming and configuration for the work under this Contract must be consistent with the existing programming to guarantee consistent functionality of the system and all of its components across the Region.
- .2 The Contractor is only responsible for the work related to this Contract and shall NOT adjust or alter the existing configuration for any other facilities within the system without written authorization from the Region. The Contractor shall NOT alter, modify, delete or interfere in any way with any settings, configuration or variables that may affect the functionality of the existing facilities, systems or their components without prior written authorization from the Region.
- .3 The installed Security Access Control system must be configured to meet all existing Regional standards (Security, Operational, IT). The Contractor shall be responsible for identifying the requirements, developing a custom solution to meet those requirements, and presenting available options in the form of an implementation plan to the Region for approval before implementing the proposed solution.
- .4 All software licencing must be detailed, supplied and installed to operate the security solution. The Contractor shall supply and install all of the necessary proprietary integration licences, card reader licences and workstation licences, as may be required. It is the Contractor's responsibility to quantify and provide the number of licences required based on the Drawings and Specifications provided in the Contract Documents. All costs associated with provision of the required licences shall be included in the Contract Price including any modifications to the Contract Price.
- .5 The Contractor shall work with the Region's IT department to perform application or database server programming and configuration and network device security penetration testing. The contractor shall supply copies of all network device specifications and data

sheets to IT when requested in preparation for the penetration testing. All work requiring access to the database and/or application servers must be coordinated with the Region a minimum of one week in advance.

- .6 All changes to the network configuration and network attached devices must be approved by the ITS department to ensure that the network complies with ITS's "penetration" resistance requirements. It is noted that IT maintains a list of approved devices which may therefore not require individual testing. In the event that penetration testing is required, the costs of the testing incurred by the Contractor, and of any remediation which may be required by IT, will be borne by the Region if the deficiency is encountered after the award of contract.
- .7 All server, network, and other requirements shall be coordinated with the Regional IT Services department and validated by the security system manufacturer prior to installation. All servers and network switches shall be provided by the Region unless otherwise specified in the Contract Documents.
- .8 The software and/or system deployment and configuration shall be overseen and validated by the Regional representative(s) from the Capital Delivery Coordinator department. The Contractor shall use manufacturer provided software applications to program, configure and test the system. No configuration shall be completed utilizing any client applications on the client servers.
- .9 There shall be a single, integrated, Audit Trail log which records all of the actions and activities for the entire site. The integration of the activities at each site shall be similar, subject only to the configuration of the site, and shall include:
 - a. Local date and time (using Canadian - ISO style and 24 hour clock);
 - b. All access card activities including name, action granted or denied and reason;
 - c. Logging in and out of operators;
 - d. Schedule activations and deactivations;
 - e. Trouble and alarm reports;
 - f. All failures, arming and disarming of systems; and
 - g. System resets and restarts.
- .10 The intrusion detection system at each Facility (or group of buildings) must be armed by using a card swipe on the card reader on the secure side of the door followed by pressing a button which is labelled for this purpose. The intrusion detection system must disarm automatically when access is granted at a perimeter door, i.e., an access which is granted, at a perimeter door will disarm the intrusion detection system unless otherwise specified. Note that the door does not have to be opened for the alarm system to be disarmed. The intrusion detection system shall not permit arming until all intrusion points are "fault free", i.e., closed. This arming process may proceed if trouble alarms, which generally are not operational, are present. All relevant information related to the current status of the area shall be displayed on the local intrusion detection system keypad(s). The same information shall also be displayed by means of dynamic icons on the local and the central, access control interface Alarm Monitoring software client interactive map. Integration between the access control hardware, the access control software and the

intrusion system must be seamless in both online and offline modes. The contractor shall create custom alarms for each facility which shall properly display any intrusion events using the access control Alarm Monitoring application.

- .11 The intrusion detection system Alarm Keypads shall display the name of the facility and the nature of any faults in the system but shall not be used for “Arming” the system, “Disarming” the system or clearing any faults. All the keypads in each facility shall also annunciate any active alarms occurring in that facility using its internal sounder, e.g., intrusion alarms, panic alarm, system failure.
- .12 Arming shall be implemented locally by a valid card swipe on an adjacent, dedicated, internal card reader followed by a button press or, alternatively, through the access control system Interactive Map utilizing dynamic icons.
- .13 Disarming shall be performed locally by a valid card swipe on any of the external, perimeter readers or, alternatively, through the access control Interactive Map utilizing dynamic icons.
- .14 The intrusion detection system shall allow persons to exit from the facility without triggering an event until and after the system is fully armed after the exit delay time. The system shall alarm instantaneously when any intrusion zone is faulted while the system is in the armed state and shall record details in the Audit Trail log. All intrusion alarms shall be annunciated:
 - a. Locally on all the keypad(s) at the corresponding Facility;
 - b. On the local access control system graphic map(s) where available;
 - c. Remotely on the access control system Alarm Monitor client application;
 - d. To the 3rd party Central Monitoring Station; and
 - e. To the SCADA Control Panel for ENV OMM facilities.
- .15 The Contractor shall create or update a graphical map interface for the system reflecting any work performed under the current contract, making it the same or similar in appearance and functionality to the existing graphical maps (see Appendix W: “Graphic Maps”). The graphical map interface shall be implemented as a multilayer hierarchy with the highest level or main map displayed as a map of York Region identifying all the municipal boundaries.
- .16 The Regional facilities shall be represented on the display using distinct icons depicting corporate, environmental, transportation, paramedic and other departments (see Appendix W). Each facility shall be represented by the applicable architectural floor plan, (multilayered, if necessary), to identify the areas, floors and buildings. The facility graphical map shall be created by the Contractor from the CAD or PDF files which are provided by the Region, in a resolution which displays properly on a typical 24” display configured at 1920 x 1080 PPI resolution unless otherwise specified. Pixilated, blurred and/or illegible maps shall not be accepted. See Appendix W: “Graphic Maps”, for further information.
- .17 The graphical interface shall show all field devices together with their associated status dispositions. Typical status options shall include but are not limited to Armed, Disarmed,

Normal, Alarmed, Forced, Held Open, Locked, Unlocked, Tamper, Faulted, Active, On schedule, Offline, AC Fail, Battery Trouble, etc. (see Appendix C for meaning of foregoing terms). All required status symbols are already available and may be reused for this project. Some of the symbols developed specifically for York Region are shown in Appendix W: "Graphic Maps".

- .18 Each facility's graphical map shall contain a displayed control /status panel allowing direct control with functions, such as Arm, Disarm, Door control operations, intrusion area operations, map navigation, etc., and at all times displaying the real-time status of the facility, such as Armed/Disarmed Status, Ready to Arm Status, Intrusion Alarm Status, System Components Status etc. (see Appendix C for meaning of terms). The Contractor shall use the existing custom dynamic icons to populate the graphical interface or, if necessary, create additional icons. The existing custom icons will be provided to the contractor on request.
- .19 Whenever a panic alarm is activated, the local graphic map display and the central graphic map display (as may be available) will immediately both be updated to identify the location of the active alarm by showing a flashing red icon at the alarm location and display a text message on the keypad which will also be sounding. The screen will have an icon "Panic Clear" which both clears the map display and also silences the keypad.
- .20 The Contractor shall create new and update existing Schedules (Time Zones), Access Levels and Monitor Zones (to enable remote monitoring by system administrators), as may be required for each contract. The Region shall provide the Contractor with the initial configurations for these options.
- .21 All system components shall be configured using the Regional Security System Naming Conventions Standards as outlined in Appendix A. Naming conventions shall be consistent throughout the system.
- .22 All security panels shall report AC Fail, AC Restore, Battery Trouble and enclosure tamper events to the Access Control System Software by using the Alarm Monitoring application and this information shall be displayed on the graphical maps by means of the corresponding dynamic icons.
- .23 Batteries included in any panels or modules which are supplied or installed in the course of the Contract, shall be labelled identifying the date of initial deployment using the ISO 8601 format, i.e., YYYYMMDD or YYYY-MM-DD.
- .24 The Contractor shall update all system hardware components with the latest manufacturer approved firmware versions prior to final commissioning. The Contractor shall ensure that any firmware updates are fully compatible with the existing software releases prior to performing such upgrades. Where firmware versions are indicated by the manufacturer on the devices or in the devices, updates performed by the Contractor shall be reflected by modifying the original labelling so as to show the installed version or release of the firmware.

1.5 SUBMITTALS

A. GENERAL

- .1 All submittals to the Region will be reviewed by the Region and must be accepted by the Region before any construction is permitted.
- .2 Submissions shall be made in accordance with the schedule developed and approved for each project and shall comply with all of the requirements as stated in this document and in the Contract Documents.
- .3 All submissions shall be in English and spell checked in accordance with normal Canadian spelling and grammatical practices. The text documents shall use Times Roman font in 11 point as the body font with a minimum of single line spacing.
- .4 As described in Section 1.2 the submission shall be provided in at least one hard copy and one electronic copy. The former shall be printed single sided and suitably bound and indexed on 8.5 x 11 ins. Drawings shall be printed in a size to be agreed to between the parties and provided with a suitable cover page and index page. The electronic copy shall be provided both in an editable format using Microsoft Word for text and AutoCAD for drawings and also in Adobe PDF. These files may be transferred via a secure link or on a portable storage medium. The Contractor is responsible to certify that all of the electronic files are free of any malware and the files shall have no electronic locks, encryption or restrictions.
- .5 York Region shall review the documents and provide comments to the Contractor indicating in particular if the Contractor may or may not proceed with the project and if a modified submittal is required. These comments shall be provided to the Contractor within 15 working days, unless an alternative schedule is agreed to by all parties.
- .6 York Region and its agents shall be the final arbiter with regard to the suitability of the submissions.

B. SHOP DRAWINGS:

- .1 Prior to the start of construction, the Contractor shall submit a complete set of:
 - a. all relevant technical documentation, and
 - b. technical shop drawings and specificationsfor approval by the Region and also for review by the Security Installation Contractor prior to the implementation phase of the project.
- .2 The Contractor shall provide one full hardcopy and one digital copy of shop drawings (see Section 1.5.1 and Appendix D) which shall cover the entire scope of the Work as defined by the Contract Documents, including but not limited to:
 - i. System riser diagram(s)
 - ii. System layout/floorplan
 - iii. Network connectivity diagrams
 - iv. Vertical and horizontal wiring diagrams

- v. Point-to-point wiring diagrams
- vi. Typical and site-specific termination/wiring schematic(s) and diagrams
- vii. DIP Switch and similar configurations
- viii. Device landing schedule(s)
- ix. System integration schematic(s) and wiring diagrams
- x. Intrusion detection point schedule(s)
- xi. Tub/enclosure layout diagram(s)
- xii. Electrical connections and wiring diagrams
- xiii. Explanation of the sequence of operation
- xiv. Integration techniques and operational scenarios
- xv. Addressing charts
- xvi. Product specifications and cut-sheets
- xvii. Complete Bill of Materials
- xviii. Proposed testing and acceptance activities
- xix. Other relevant information required for the installation

C. AS-BUILT DOCUMENTATION

- .1 The as-built drawings, documents and materials as described here shall be submitted no later than 15 Working Days after the substantial completion of Work, i.e., after the commissioning of the system has been completed and any identified deficiencies have been resolved.
- .2 All as-built documentation must use the Region defined naming convention for all system components and must be consistent with the naming convention used in the software.
- .3 The Contractor shall submit detailed documentation describing the entire scope and extent of the Work which has been performed in accordance with the Contract Documents, in compliance with the requirements identified in Appendix D and in a form acceptable to the Region. The requirement is that this documentation shall be sufficient for “a person knowledgeable in the industry and familiar with the technology to have the ability to perform the work described in the Contract Documents without the need for further instruction”. These documents shall include, as may be appropriate, some or all of the following but are not limited to:
 - a. As-built drawings, documents and materials: In conformity with the requirements noted in Appendix D, the documentation shall cover the entire scope of work, including but not limited to the items listed below and detailed commissioning documentation, as well as other relevant information, e.g., firmware versions, warranty details. In practice the Contractor is expected to resubmit the shop drawings, which were submitted earlier, with the incorporation of the modifications to reflect the actual work which has been completed.
 - i. System riser diagram(s)
 - ii. System layout/floorplan
 - iii. Network connectivity diagrams
 - iv. Vertical and horizontal wiring diagrams
 - v. Point-to-point wiring diagrams

- vi. Typical and site-specific termination/wiring schematic(s) and diagrams
 - vii. DIP Switch and similar configurations
 - viii. Device landing schedule(s)
 - ix. System integration schematic(s) and wiring diagrams
 - x. Intrusion detection point schedule(s)
 - xi. Tub/enclosure layout diagram(s)
 - xii. Electrical connections and wiring diagrams
 - xiii. Explanation of the sequence of operation
 - xiv. Integration techniques and operational scenarios
 - xv. Addressing charts
 - xvi. Product specifications and cut-sheets
 - xvii. Complete Bill of Material
 - xviii. Documents recorded during the testing and acceptance activities
 - xix. Other relevant information
- b. One additional hard copy of the as-built drawings with all relevant drawings and documentation shall be provided by the Contractor and stored on-site inside or near to the main system enclosure along with warranty/contact information.
- c. All technical notes, software scripts, firmware details and other documentation covering the IT portion of the Work covered under this Contract. All configuration modifications and configuration backup files shall be documented as a part of the as-built package.
- d. Lists of all passwords, keywords, serial numbers, licences and/or configurations that are encountered during the installation and configuration of the system.
- e. Complete set of manufacturers' installation manuals, maintenance manuals and specifications for all system software and hardware components by make and model. This information shall include comprehensive, descriptive data sheets, brochures, installation, and technical manuals for all systems and equipment forming part of the contract. The manuals shall include operational and schematic diagrams for the System and all related components.
- f. Detailed commissioning documentation in the format approved by the Region (see Appendix B), populated with all relevant information and worksheets identifying all testing and commissioning procedures which were undertaken. The commissioning documentation must be completed by the Contractor and signed by the Regional representative. An example of the Region approved commissioning form is presented in Appendix B.
- g. Theory of Operation – system outline and overview.
- h. Operational manuals explaining the system operator's available features, functions and capabilities.
- i. System administration manuals including operational and maintenance requirements and procedures associated with the proposed solution. Description

of administrative functions required to supervise and manage the integrated system(s).

- j. Full schedule of maintenance which is to be carried out on each system component during the warranty period of 24 months after the date of Total Performance of the Work and for the entire lifetime of the system and its components.
- k. The Contractor shall commit to the Region that the Contractor will meet the Region's requirements for response time and return to service time in regard to any service calls made during the Warranty period and that suitable spare parts will be readily available to meet those commitments.
- l. The contractor shall propose an inventory of spare parts which the Region may wish to acquire for the system following expiry of the Warranty period.

1.6 Testing and Quality Assurance

- .1 The Contractor shall ensure that, upon completion of the contract, all hardware and software components are functioning as intended within the Region's IT and the security network environments.
- .2 At the discretion of the Region, final acceptance testing shall be carried out at any or all of the following defined levels:
 - a. per point basis;
 - b. per system component basis;
 - c. per software function basis; and
 - d. per total system basis.
- .3 The Contractor shall document, test and verify the proper installation and functionality of the system and all of its components including integration to the systems described in this Section, application and database integration as well as online and offline operation. Upon request, these functionalities shall be demonstrated to the satisfaction of the Region which shall be performed without extra cost to the Region.
- .4 The Contractor shall inspect all installed devices and equipment to ensure that all of these devices will achieve the intended system functionality. Any devices which are not capable of fulfilling the required system functionality shall be documented to the Region in writing. Any corrective measures which are required shall be approved by the Region and the Contractor. The costs for any modifications are to be borne by the Contractor unless the equipment configuration was selected by the Region.
- .5 The Contractor shall test all field devices and system components which are configurable or adjustable to ensure that they achieve optimal performance and fulfill the performance requirements as installed. All configurable settings must be approved by the Region prior to installation and shall be documented for the Region. Upon request, this shall be demonstrated to the satisfaction of the Region without extra cost to the Region.
- .6 All tests shall be performed to the satisfaction of the Region and, if any tests are repeated and then achieve different results, the Region has the option of requesting device

replacement. If any adjustments are made in order to achieve the required test results, the Region or the Contractor shall identify if other tests need to be repeated to ensure that the adjustment does not prejudice any other test results. All such retesting and adjustments shall be performed without extra costs to the Region.

- .7 Once the Contractor has established that the System is operating as required, on-site commissioning shall be scheduled with the Regional representative(s). The contractor shall demonstrate to the satisfaction of the Region that the system and all of its components are functioning, as intended by the approved design. This approval process shall be performed in 2 phases:
 - a. A pre-commissioning demonstration with the Region's Security System Administrator who may be reached at (905) 830-4444 ext.76900 and:
 - b. A final commissioning with the Region's Capital Delivery Project Coordinator.
- .8 The testing and commissioning shall be completed and accepted both by the on-site Regional Project Coordinator and by the remote Regional Security and York Region System Administrators. It is the responsibility of the Contractor to arrange and carry out commissioning sessions with the Region and to provide all parties with suitable records of the commissioning and minutes of the activities.
- .9 In the event that the testing and commissioning activities do not meet with the approval of any of the Regional representatives, the Contractor is required to address the matters that led to the rejection of the system. Such alterations and repeating of the test and commissioning processes, in part or in whole, shall be performed expeditiously and without extra charges to the Region.
- .10 The Contractor shall assist the Region in configuring, and/or reconfiguring, and populating, and/or repopulating all System related databases. As may be required, the Contractor shall also assist with any modifications which may be required to the existing integrations, configuring and/or reconfiguring all the system parameters to the Region's satisfaction. All the procedures and activities required to accomplish such changes shall be fully documented and shall, as may be applicable, follow existing procedures.
- .11 The Contractor's assistance shall continue until initial configurations and integrations are complete and functional, and/or until all affected systems are working to the Region's satisfaction and the related documentation has been accepted by the Region. In the event of any matters arising during the 12 months immediately following the acceptance of the system by the Region, the Contractor shall provide suitable assistance to achieve resolution under the terms of the Warranty.
- .12 The assistance, referenced in the above paragraphs, shall be provided by a single technician working physically side by side with the Region's representative(s) assisting and instructing the Region's representative(s) step by step in configuring system parameters and integration configurations to the systems outlined in the Contract Documents.

1.7 Training

- .1 The purpose of the training is to allow the local and the Regional staff to safely and reliably:

- a. Perform all routine operations and maintenance functions required for the systems;
 - b. Make minor changes to the system configurations;
 - c. Address any intrusions, access card management issues, emergencies, accommodate visitors, manage issues related to parking and deliveries; and
 - d. Recognise when more expert advice is required and to identify the nature of that requirement.
- .2 Training of the Regional staff shall be provided by Contractor staff familiar with the project and equipment and experienced in delivering such training courses in English. If the training is considered inadequate by the Region, it shall be repeated without extra charges to the Region.
- .3 All necessary supplies and documentation for the training course shall be supplied by the Contractor. The Region shall provide a location with basic audio-visual equipment, i.e., a screen, tables, chairs and internet accessibility. Other equipment and network access can be requested but might not be provided by the Region.
- .4 The training program shall provide suitable training for those at the Region responsible for operation, the administration and the supporting of the “security systems”. The scope of the training shall cover the entire scope of work defined by the Contract Documents as well as its interaction with previously existing systems.
- .5 The Contractor shall provide a detailed description and syllabus of the training program to the Region for review at least 2 weeks ahead of the proposed training session. This description shall identify:
 - a. The intended audience for the upcoming training session, i.e., system operators, system administrators or support staff;
 - b. The material to be presented;
 - c. The supplies being provided by the Contractor;
 - d. Any supplies (other than the training room) to be provided by the Region; and
 - e. The anticipated duration of the training program.
- .6 The Region shall review the proposed training program and provide comments to the Contractor. If the comments are significant the Region may elect, without incurring any extra charges to delay the training program and to undertake a further review of the edited training program.
- .7 The Region shall identify the number of individuals anticipated at the planned training session at least 1 week prior to the start of the training session.
- .8 Training documentation shall be developed by the Contractor in adequate quantities to satisfy the requirements of the training; and shall be submitted by the Contractor for future reference by the Region in printed and digital formats (see Appendix D). At the discretion of the Region, the training session may be recorded. Such a recording shall be

used only by the Region and its employees for internal training purposes, e.g., additional employees.

- .9 Training may not take place using the Region's live system but the Contractor may, by mutual agreement between the Contractor and the Region, use the Region's live system to show the reality of a "live system".
- .10 The Contractor shall ask the attendees partaking in the training session to complete an evaluation of the training program to help with improvements to future training sessions. The results of this survey shall be provided to the Region.

1.8 Network TCP/IP Coordination

- .1 The Region's Project Manager will coordinate the installation of any required network system components or modifications with ITS (Information Technology Services) Department and the appropriate BSA (Business System Analyst) at the Site. Such changes may be required to allow for communications between the new security installation and the database server(s) which are located at Region's Data Centre so as to provide the requisite tie in and commissioning of the security system.
- .2 The Contractor is reminded that all equipment which is being installed to the network must comply with ITS's penetration approval requirements (see Section 1.4.6).
- .3 If local, wired, IT Wide Area Network infrastructure is not present on a site, Wireless or DSL VPN network equipment shall be used. York Region ITS will supply the contractor with the pre-configured Wireless or DSL Modem/Router and network switch as well as specific installation instructions.
- .4 The Contractor shall install all required conduits and junction boxes as well as the exterior antenna for the Wireless equipment, in a location which has been identified by ITS to provide suitable network performance for this application. If required, the Contractor shall provide such additional infrastructure as may be required to ensure that the complete communications system performs in accordance with the design. Note that, in accordance with Code requirements, conductive data and high power cables (120 V or higher) cannot be placed in the same conduits.
- .5 The wide area network data switch shall be located within the following separate dedicated cabinet, 'Nema4 Hammond ERP Series Eclipse Rack Panel, complete with EHLPL Padlock Handle, Eclipse Rack Panel (ERP) and compatible Rack Rail Mounting Rails'. Both the modem and the data switch shall be powered from the UPS power supplies being used by the access control system.

1.9 SHOP DRAWINGS

- .1 Submit shop drawings showing the proposed location of all equipment to be installed under this Contract.
- .2 Shop drawings submission shall include, as may be appropriate, some or all of the following:
 - i. System riser diagram(s)

- ii. System layout/floorplan
- iii. Network connectivity diagrams
- iv. Vertical and horizontal wiring diagrams
- v. Typical and site-specific termination/wiring schematic(s) and diagrams
- vi. DIP Switch and similar configurations
- vii. Device landing schedule(s)
- viii. System integration schematic(s) and wiring diagrams
- ix. Intrusion detection point schedule(s)
- x. Tub/enclosure layout diagram(s)
- xi. Electrical connections and wiring diagrams
- xii. Explanation of the sequence of operation
- xiii. Integration techniques and operational scenarios
- xiv. Addressing charts
- xv. Product specifications and cut-sheets
- xvi. Complete Bill of Material
- xvii. Description of test methodology
- xviii. Other relevant information required for the installation

.3 Additional Shop Drawing Requirements:

- a. For devices containing DIP switches, jumpers or programming keypads include with the shop drawings, as appropriate:
 - i. Functional description.
 - ii. Performance data.
 - iii. Physical, electrical and environmental requirements.
 - iv. Location drawing.
 - v. Equipment descriptive literature.
 - vi. Wiring details.
- b. For programmable equipment, communication links and networks, submit a Bill of Materials. Include the hardware documentation with the Bill of Materials.
 - i. For hardware items include and clearly identify: Description, make, model, part number and serial number (once this available).
 - ii. For documentation include: Title, version, date and publisher for each item.
- c. For Programmable Hardware Equipment include:
 - i. Product description for each item including:
 - a) Wiring and installation instructions.
 - b) Functional description.
 - c) Performance data.
 - d) Physical, electrical and environmental requirements.
 - e) Adapters and controllers.
 - ii. Equipment layout drawings showing location of hardware, boards, jacks, cables and terminals.

- iii. Related field tag numbers and wire numbers, module tag assignment, rack module assignment, and terminal numbers.
 - iv. Location, identifier and pin assignment of plugs, jacks, and cables.
 - v. Switch settings and addresses, firmware.
 - vi. Interconnection Diagrams including wiring, cables, jacks between internal and external components, power supplies, processors, communications modules, racks, input/output modules and peripherals. Label terminals, jacks and pins. Show settings for jumpers and switches. Show address for each hardware module and point.
 - vii. Any backup or other maintenance requirements.
 - viii. Listing (hard and digital copies) of all programming details.
- .4 The review of shop drawings shall only be in reference to general design. The review of the shop drawings shall not, in any way, relieve the Contractor of responsibility for errors, omissions or physical interference, or from the necessity of furnishing such work and materials as may be required for the completion of the work at any time prior to formal acceptance. The Contractor shall be cognisant that the shop drawings may require resubmission before the contractor may proceed to the next phase of the project (see submission of Shop Drawings under General Requirements).

2. PRODUCTS

2.1 Security, Access Control and Intrusion Detection

- .1 Because of the deployment of existing devices which have all been designed to provide a uniform security solution for all properties belonging to York Region, there are pre-approved devices and solutions which shall be used wherever possible.
- .2 These pre approved security devices are listed in the Appendices J, K, L, M, N and O.
- | | | |
|----|------------|--|
| a. | Appendix J | List of Approved Security Equipment |
| b. | Appendix K | Approved Access Control Equipment |
| c. | Appendix L | Approved Intrusion Detection Equipment |
| d. | Appendix M | Intercom Equipment |
| e. | Appendix N | Approved Card Reader Equipment |
| f. | Appendix O | Miscellaneous Security Devices |
- .3 Typical installation configurations in which these devices are used may be found in the sample “assembly drawings” which are shown in Appendix E “Standardized Security Configurations”.
- .4 The Contractor shall ensure that all supplied systems which are to be deployed are compatible with the existing security installation. Hence the general industry guideline of using the most recent versions of software, firmware and hardware may lead to unsatisfactory performance due to incompatibility. It should be noted that the existing

installation may not have been updated to the latest versions because of prior, known incompatibilities. The contractor is responsible to validate all such equipment and ensure full compatibility between newly supplied equipment and the already installed components. Any proposed firmware or software updates must therefore be reviewed with the Region before any updates are undertaken. If any modifications or upgrades are required, these changes must be included in the project budget and identified in the proposal.

- .5 The contractor may request that the Region consider use of devices other than those pre-approved by the Region. The procedure and the form to be submitted when requesting such a substitution is set forth in Appendix F “Procedure for Equipment Substitution”. It should be noted that the decision of the Region in regard to any such request is final.
- .6 The use of any equipment which is not approved by the Region shall constitute a Breach of Contract and grounds for terminating the Contract in progress and lead to an Action to complete the contract in accordance with the approved design as well as consequential damages.

2.2 Performance Criteria

- .1 Contractors shall recognise that the purpose of installing any Security System is to ensure that intruders cannot enter and that any attempt to bypass or otherwise defeat the hardening which has also been installed in order to deter intruders must successfully report all details of this attempt.
- .2 The Region is therefore adopting suitable criteria which they will use to determine the effectiveness of the Security Systems.
- .3 The Probability Of Detection (POD) is a measure which is described in Appendix C -- Standardised Abbreviations and, as its title implies, recognizes that some Security Systems do not detect every attempt at compromise. The Region expects however that the POD shall meet or exceed 97% with suitable information being provided in a timely manner to the security staff for them to investigate.
- .4 The corollary to an effective detection system is that the system must have a very low False Alarm Rate (FAR). It is well known in the industry that false alarms are a major cause of the failure to detect intrusion attempts. When an alarm is reported and the security patrol determines that this was caused by “acceptable events” it is either classified as a false alarm or as a “nuisance alarm”. Both of these situations generate distrust in the alarm system ultimately leading to the failure of responders to pay attention to alarms. (See further discussion in Appendix C – Standardised Terminology.)
- .5 The Region will not accept a false alarm rate which exceeds 2% i.e., no more than two out of every hundred reported alarms may be classified as a false alarm or as a nuisance alarm.

2.3 Surveillance

- .1 Because of the existing deployment of devices which have been designed to provide a uniform surveillance solution for all properties belonging to York Region, there are pre-approved devices and solutions which should be used wherever possible.
- .2 Surveillance cameras shall be installed so that they can observe locations which would otherwise require regular security guard patrols. The images stored on the DVMS system must be of sufficient quality to fulfill the expectations of the designer. There are many factors which affect the quality of the image and these need to be clearly defined for a satisfactory outcome of the Contract. The following identifies a number of the key factors which may need consideration:

i. Stability

If a surveillance camera is mounted on an unstable base, the image may be very hard to interpret. This applies much more to outdoor cameras where the camera may be mounted on a pole or a building roof and wind plays a major role. Indoors there can be issues related to a wall in which there is a frequently used door which may slam shut with vibrations affecting the stability of the camera. It is clear that a minor vibration on a wide-angle lens may be barely perceived at an image distance of 15 m (50 ft) but if the same installation is used with a telephoto lens looking at an image distance of 1,500 m (~5,000 ft) the same deflection caused by the vibration will cause 100 times the distortion of the image. There are different forms of stabilization which can reduce the impact of any vibration transmitted to the images if the source of the vibration cannot be eliminated.

ii. Pixels on Target

The effectiveness of an image by which to identify an intruder when using a surveillance camera is determined by the number of image pixels used to provide the image of the topic of interest. In security surveillance applications this is usually defined in terms of a requirement, such as the resolution of the viewing screen, the resolution of the camera, the size of the screen, the height of the “target human intruder” and the minimum acceptable image size, e.g., “the minimum height of the human who is 1.8 m (~6 ft) at a distance of 30 m (~100ft) shall be 7.5 cms (~3 ins) on a 21 inch screen. This may be calculated for a particular configuration such as an 18 mm lens with a 15 μ pixel pitch to have a “Detection” range of 537 m (~1,750 ft), a “Recognition” range of 134 m (~440 ft) and an “Identification” range of 84 m (~275 ft).

iii. Recognition vs Detection

The camera designer must answer the question as to the purpose of any surveillance camera installation. The criteria for an acceptable surveillance image are often based, at least in part, Johnson’s Criteria. Generally, the purpose of surveillance in a security setting may be defined as one of the following:

- a. Detection: an object is present – 2 pixels on target.
- b. Recognition: discern the type of object, a human versus a vehicle – 8 pixels on target.

- c. Identification: discern specific objects, a man versus a woman, a car model – 12.8 pixels on target.

The above examples are simplified and ignore the image quality which is affected by lighting, contrast and other issues such as moving trees which can provide additional challenges.

iv. CIF vs Frame Rate

When recording images there are a number of terms which are used and which should be understood;

- a. CIF is Common Intermediate Format (360 x 240 pixels) and is a common format used for recording digital images to be played back in any standard format.
- b. 4CIF is an enhanced quality image over CIF and provides data at 704 x 480 pixels.
- c. Frames per second reflects the rate at which images are refreshed and is the term which was widely used with Analog(ue) Cameras which are now no longer current. Common values are 30 or 60 fps (the latter of consequence with high-speed action). This is of course the speed at which the older film technology moved the “celluloid” through the projector.

v. Illumination and Shadows

Illumination by artificial sources always generates shadows in the same place whereas illumination by the sun or even the moon causes shadows which vary by time of day and also by season. From a security perspective the shadows are a potential hiding place for any malfeasant. Hence great care is required to ensure that shading hiding places are minimised as is the basis of CPTED.

vi. Infra Red

Many security cameras are now available with integrated IR illuminators which allow the cameras to “see in the dark”. Infra red illuminators are harmless to humans and animals and are invisible without technological aids so that such surveillance can be considered “covert”. The images provided by these cameras are monochrome (generally appearing as black and white) as the lighting source is a single frequency.

vii. Thermal Cameras

Thermal cameras, which are sometimes incorrectly referred to as infra red cameras because they detect “heat” (which is related to infra red waves), will display images based on the heat signature of any item in the field of view which differs from the background. These cameras can provide very effective imaging with no artificial light during any time of day and are oblivious to the shadows or glare caused by natural or artificial lighting. Generally, because of optical considerations, zoom lenses are not available for thermal cameras. One popular option is to co-locate a thermal camera with an optical camera thereby providing versatile and reliable imaging at any time of day.

viii. Direct Sunlight

The glare caused by direct or reflected sunlight will cause optical camera images to “be blinded” and therefore the images to be unsuitable for surveillance use. Placement of the outdoor cameras can possibly reduce the impact but in some instances, thermal cameras provide an alternative because the sensor does not respond to “visible light” of any kind.

ix. Colour v Black & White Images

To an ever-increasing extent, surveillance cameras of all kinds are being offered with colour imaging. Such images are very attractive and make recognition much more convenient. There are challenges for colour imaging under low light conditions and some colour cameras change automatically to black and white images when the light conditions are reduced. If artificial lighting is used it must have frequency spectrum and colour temperature representative of sunlight to ensure that the images are comparable with day lighting. Sodium (HPS) or mercury (HID) lights, which have long been used in outdoor applications, make colour recognition essentially impossible.

x. PTZ v fixed lens v multi unit cameras v 360° cameras

PTZ (Pan, Tilt and Zoom) cameras are attractive to some designers but are an anathema to other designers. Such cameras can cover a very large field of view using pre-programmed “tours” in which they move automatically through a pre-configured inspection of the landscape being surveyed. As the image is being recorded it is clear that only the current image is recorded and depending on the frequency and nature of the tour, coverage of the landscape will be far from continuous. In other situations, PTZ cameras are used by staff who may have reason to steer the camera image to look carefully to an aspect of an image observed on a fixed camera, e.g., a fixed camera image shows an apparent moving shadow along a security fence line which can be observed in greater detail by directing the PTZ camera to the same place at a much longer focal length (telephoto). Some address situations of this kind by using multiple, single lens, fixed cameras instead of a PTZ cameras and manufacturers are now manufacturing single camera housings which include multiple imaging devices which can be configured independently or as a single defined group. There is one other group of cameras which also have a very special feature in that they can provide a single 360° image. Such cameras often include recording playback software allowing, for example, tracking of a person walking through an art gallery. It is clear that selecting the correct camera configuration for any job is crucial.

xi. Analogue v Digital Cameras

The cameras which are currently being used are digital, meaning that they include a direct connection on to the available LAN and no transformation of the video data is required. Analogue Cameras are also defined by their encoding systems, such as NTSC and PAL. The older, now largely outdated, cameras use analog signals which need to be converted to a digit signal to be transmitted over the LAN which is generally used as the means of interconnecting buildings and equipment.

- .2 The design should be evaluated by using a camera simulation package to ensure that the resulting images meet all of the design intent before the construction is completed.

- .3 These pre-approved surveillance devices are listed in the Appendix P “Digital Video Management System”.
- .4 The Digital Video Management System (“DVMS”) is now, and shall continue to be, capable of supporting a further future expansion of the reconfigured system by a further 20% of cameras following completion of the current project.
- .5 As a minimum, the system must support the most recent, currently available network cameras, encoders and camera streamers as may be available and are being used during the project execution.
- .6 The Contractor shall use the latest generation of the equipment listed in Appendix P. The contractor must ensure that all equipment which is being supplied will be compatible with the existing and previously installed components. If any modifications or upgrades are required, these changes must be included in the project budget and identified in the proposal.
- .7 It is the responsibility of the contractor to ensure that any upgrades or modifications of any kind to the existing equipment which is being proposed to accommodate the current project will in no way degrade or modify the performance of the existing installation.
- .8 Hence the general industry guideline of using the most recent versions of software, firmware and hardware may lead to unsatisfactory performance due to incompatibility. It should be noted that the existing installation may not have been updated to the latest versions because of prior, known incompatibilities. The contractor is responsible to validate all such equipment and ensure full compatibility between newly supplied equipment and the already installed components. Any proposed firmware or software updates must therefore be reviewed with the Region before any updates are undertaken.
- .9 The DVMS shall, as a minimum, support the industry-standard Motion JPEG (MJPEG), MPEG-4, H.264, and H.265 as well as Axis’s proprietary Zipstream video compression technology formats.
- .10 The DVMS system shall continue to be fully integrated with the Access Control system version currently in use by York Region and shall also be fully compatible with all announced updates to that system at the time of installation. This system is being used as the primary user interface to monitor all surveillance cameras.
- .11 York Region uses fixed lens cameras for surveillance unless otherwise stated. All design decisions shall be made in consultation with York Region Capital Projects.

2.4 Video Recording Requirements

- .1 The recording system must provide faithful and reliable recordings of all the cameras which are connected to it. The recording system must use some form of RAID technology or equivalent technology so as to ensure that in the event of any drive failure the data will continue to be available. Redundancy and fail over options must be included in the network to ensure that recording cameras is never at risk.

- .2 Recording of a camera image is generally performed if there is motion in the field of view, although in some cases, recording can be performed continuously at a very slow rate until there is motion at which time the frame rate accelerates. The recording is intended to analyse events after they have occurred and therefore it is important that the time prior to an incident can be recorded. Such recording from before the event is often configurable to allow for the 2 minutes or for the 15 seconds before the “alarm went off”. This is generally achieved by continuously recording to volatile memory. Typically, recording is at a fixed rate, e.g., 15 fps and continuously erasing the data which is older than the configured time “before the incident”. While cameras are continuously increasing their resolution, the current trend is to generally record at “1080” resolution for most surveillance applications. The higher the resolution, the quicker the disks will fill when recording.
- .3 It is by no means unusual to upgrade street or other lighting when surveillance is implemented. Cameras are using more and more sensitive detectors but for high contrast and high quality images there may be a strong justification to provide lighting to eliminate shadows.
- .4 Care must be taken when allowing for the amount of power which is required and the distance to the power source is mostly provided by POE data switches.
- .5 While the recording of up to 300 cameras per NVR is normal, there can of course be unlimited numbers of NVRs. The NVRs must have an accurate source of time so that images can be synchronised across the network. Typically, the recorded image from each camera includes a burn-in, i.e., an image which is configured to show the date and time and the camera description on every frame of the recording.
- .6 The recordings should be “searchable”, i.e., the NVR has an interface which allows for searching for specific images using a number of different criteria, such as:
 - a. Date and time
 - b. Alarms
 - c. Facial recognition
 - d. Location
 - e. Analytics, such as when a car drove into the driveway etc.
- .7 While reviewing recordings to perform an investigation, security staff may review many images from many cameras and there needs to be mechanism to quickly return to the most useful images. A good NVR will provide a “bookmarking” tool to effectively allow for the storage of particular scenes.
- .8 Archiving of the recorded images should be performed automatically from the live NVRs several times (e.g., 4 times) during the day in order to offload the recorders to ensure optimal hardware performance. The archived data can remain on the network where it is readily accessible for a limited period.
- .9 The use of surveillance cameras and the retention of the recordings should be reviewed for compliance with the requirements of the FIPPA and MFIPPA which may have limitations on these activities.

- .10 While it is commonplace to erase recordings which have “no significance” after a period such as 30 days, there are also situation such as a pending investigation which may take months to unfold. The recordings associated with that investigation may need to be kept, protected and not available for review by any “unauthorised” person. Such evidence will be secured with an “evidence lock”.
- .11 If a recording is required by a law enforcement authority in order to prosecute a case, there may be a requirement to apply a digital signature so that, it can be shown in court, that the recording has not been modified or “contaminated”.
- .12 There should be tools allowing for the security staff at the main control centre to forward the image of an incident which has occurred to “mobile colleagues” via their cell phones or tablets. A similar operation must be available to send video images as files in e-mail messages.
- .13 The NVR and its related components should not use proprietary hardware but adhere to industry standard configurations so that all computers used by the Region, can be maintained and procured from a single source.
- .14 It is almost universal to incorporate an LPR program in the surveillance management software, with the ability to recognise any licence plate from Canada or the USA. This function should provide for searching the recordings or monitoring for the appearance of a particular vehicle. Note that the inconsistent requirement of one or two licence plates on a car can make such applications relatively challenging.
- .15 The video system manufacturer should be able to supply an API or and an SDK. These tools will allow developers to create tools to facilitate the use of the video recordings, e.g., transfer a video clip to a specific security guard or to notify a security officer each time when a particular entrance is used.
- .16 The foregoing list is intended to identify the manner in which a modern video surveillance recorder can be configured and implemented. The options are not exhaustive and have omitted the questions of reliability and ease of use which is taken for granted.

2.5 Elevator Access Control Integration

- .1 There are a number of options which come into play when the decision to install elevator access control is made. This section will identify the most common topics and issues. Among such issues is the requirement that the designers understand some of the serious limitations which are discussed below.
- .2 Basic elevator control is commonly achieved by installing a card reader in each elevator car. When a user swipes their access card at the card reader, the floors that they have access to are unlocked for a short period of time, e.g., 7 seconds. During this time, the user is able to select a floor by pressing the “floor button” inside the cab.
- .3 The interface between the access control system and the elevator can be achieved in two very different ways. Both require the card reader installed in the elevator car (cab) to communicate with the access control system electronics (typically a controller) which is

generally located in the elevator machine room close to where the elevator controller is also installed.

- .4 Access to the elevator control room is heavily regulated by the Elevator Code, the Elevator technician Union and the TSSA because of the inherent dangers of that location and it is common practice that an elevator technician may have to be present just to ensure safety and compliance.
- .5 The approval of the floor control may require that the TSSA be involved. The installation of the card readers in the elevator cab may involve the elevator technician's presence because the work and the wiring are interpreted as "elevator work" although, again, this work is often performed by the security technician under the watchful eye of the elevator technician.
- .6 In an emergency, such as power failure or a building fire alarm activation the elevator may need some special functions. In the event of a power failure, it is commonplace for a standby emergency generator to power each car in a bank of elevators in turn so as to return all cars and their passengers to a particular floor, generally the ground floor. In the event of a fire alarm the process is similar except that as long as there is regular power available, the cars will return to an exit floor expeditiously so as to provide subsequent availability for fire fighters. It is recommended that in such circumstances the access control be automatically disabled to allow the first responders free access to all areas of the building.
- .7 The vagaries of the Elevator Code require that the main exit floor is not normally a controlled floor, meaning that anybody in the building can freely use the elevator to reach the Ground floor from where there is an exit to the street.
- .8 The concept of placing a card reader in the elevator cars and then locking some or all of the floors is not very "reliable" for a number of reasons. The general situation in an elevator is that there may be a dozen or maybe more, passengers in the car as it heads upwards from the ground floor. Often the passengers do not know each other and some will recognise that they do not need to press a particular floor because it has already been activated as shown by the illumination of that floor button. Hence, an intruder just has to keep discretely quiet and then be taken to the "locked" floor to which he wishes access. When this person wishes to leave, the departure generally requires no access card. Note further that, when an authorised user is granted access during a brief time window to multiple floors, either the authorised user or a miscreant can press multiple buttons, thus directing the elevator to stop at multiple "locked" floors.
- .9 The functionality which is described here can be implemented by interrupting all of the floor buttons which are to be controlled for each of the cars with a normally open relay contact. The use of the card will cause the relays to change status for the permitted floors and to thereby allow the selection signal to pass through the contacts while they are briefly closed. Once the timed process is complete the relays return to their open state which inhibits selection of any controlled floor from that elevator. In almost all cases, all the elevators in a bank of elevators will be programmed identically.
- .10 When the audit trail log is reviewed with regard to the elevator activity, there are 2 possibilities in regard to the amount of data which can be found.

- a. Most commonly there is no “destination reporting” which means that the initial card swipe will unlock all the floors allowed by the access level accorded to that user, for example, floors 3, 4, 5, 6 and 7. The user will swipe this card and the audit trail log will report that user “John Doe was granted access to floors 3, 4, 5, 6 and 7 in Car 5”. When the user selects a floor there is no data capture of this information and therefore the audit trail log has no means of knowing to which floor this user was travelling.
 - b. A further complication which arises is that the other passengers on the elevator can press any of the other “unlocked” floors during the “unlock time”. It is obvious that the unlock time has to be short, but it is equally clear that if it is too short, there will be complaints and if it is too long the security is weakened. The recommendation is about 5 to 7 seconds as a practical compromise.
 - c. Many elevators have dual sets of floor buttons to simplify life for the passengers when the elevator is relatively crowded or to increase overall elevator reliability. Since the panels work together, the single card swipe will unlock both floor button panels, thereby allowing selection of floors simultaneously from both sets of floor buttons.
 - d. With more sophisticated configurations it is possible to ensure that the destination floor which is selected is written to the audit trail log. This then requires inputs to the elevator controller from the access control system. The use of the relays as described above is combined with the detection of the current flowing in the one floor button circuit which is interpreted as the floor to which the elevator is being dispatched. Clearly more wiring is required for this option and also more equipment. Hence this option is more expensive and less frequently used. In some situations, the functionality is achieved by using an elevator lobby which includes access control on all the entrances/exits from the lobby.
- .11 Low level elevator integration with the access control system, as described above, enables cost effective access control of almost any elevator system, regardless of age or capability. Basic integration is achieved by wiring the access control controller outputs directly to elevator floor relays, thereby allowing the access control system to control the “locking and unlocking” of floors.
- .12 As an alternative, where required, elevator floor buttons can be connected to the access control controller inputs, enabling the controller to record which floor a user has selected when they are given access to the authorised call buttons in the elevator. The access control system monitors the inputs from the car buttons and activates the selected floor relay to mimic the function of the floor button in the elevator. By performing this function, the access control is responding to the floor call button and can record which floor that individual has selected. Note that this does not prevent the person alighting from the elevator on any floor where the elevator stops. The security system does not have any record of the floor to which the elevator is called. This process is usually referred to as Destination Reporting.
- .13 Some access control systems can also achieve high level interface (HLI) integration with selected manufacturer’s elevator systems. In such installations the access control controller communicates with an elevator server or controller over the TCP/IP network (or other communications protocol such as BACnet) rather than using individual physical

outputs and inputs. Because each elevator system is proprietary, it is not really possible to provide more details in a generic format. As is evident, many of the previously noted considerations still apply and the only major difference is that the integration between the elevator control system and the access control system is significantly less complex.

- .14 Generally, when implementing an access control system for a new elevator installation, the card reader will communicate over a special cable incorporated in the “travelling cable” which travels with the cab and provides many conductors for the power, signalling, card reader, surveillance camera, ventilation and screen in the cab. While this sounds straightforward, this process may not be trivial in high rise buildings where the cable length can grow rapidly. For an approximate example, a building of 50 stories will typically have the travelling cable terminated at the 25th floor. The cable itself has to reach up and down 25 floors and the link to the elevator control room from the termination is another 25 floors, i.e., the overall length of the cable will be about 60 floors of approximately 4.5 m each for a total of 270 m (890 ft). As is obvious this length is significant and for much of the distance the communications cable is bound integrally with cables which may be carrying “dirty” electrical power.
- .15 When installing a “retrofit” elevator access control system the recommendation is often to replace the travelling cable which is extremely costly and time consuming. There are signal conditioning and signal amplification devices which are recommended as an alternative (see Appendix R -- Cabling, Conductors and Miscellaneous Accessories). Since the elevator industry has long had the practice to equip the travelling cables with a generous number of spare conductors, there is generally no difficulty in negotiating for permission to use the spare power conductors in the travelling cable. These conductors can be used in conjunction with the signal conditioner to connect the card reader placed in the elevator to the access control controller in the elevator room (which is where the travelling cable is terminated. This link will then provide reliable card data from the elevator cab to the access control controller.
- .16 The elevator technicians can provide suitable terminals in the elevator machine room for each elevator car where the security technician can connect the access control output relays to complete the control circuit.
- .17 Control relays can be wired in either a normally open connection (fail secure) or a normally closed connection (fail safe). The particular selection should be reviewed with the Region in order to determine which of these is more appropriate for any given project. Depending on the cause of a power failure, the elevators may not be moving in the event of a power failure.
 - a. Fail Safe: When power is interrupted (fails), the electronic locking device is released (unlocked). This is recommended for most “regular” applications and is mandatory if the installation is to comply with UL specifications.
 - b. Fail Secure: When power is interrupted (fails), the electronic locking device is secured (locked). This option may be preferred in an environment where individuals are at risk if they have freedom, e.g., protective custody.
- .18 The floor call buttons for the access control function must be interrupted on all the elevator cars independently and programming is then configured to allow the same

functionalities on all the cars in the group. The card swipe identifies the car which is being used and only the call buttons in that elevator will be activated.

- .19 Although breaking either side of the call button wiring will provide the same functionality, it is recommended that the elevator company, break the “control signal” and not the “common supply” for the button. This method allows a simple migration to destination reporting if required in the future.
- .20 Because the elevator “service mode” generally does not use the floor call buttons, the access control does not generally affect the service mode. Thus, when the elevator service technicians use a key to activate the “service mode” there is no inconvenience for them. The janitorial staff often use the service mode so that they can keep control of the elevator which will not respond to any “regular passenger dispatch requirements”.
- .21 The service mode will then not record who is using the elevator or where the elevator is travelling and there are no restrictions on the floors to which the elevator may be taken. A modification can be incorporated whereby use of the key to activate or deactivate the service mode in each cab is associated with a unique “input” and the change of state is logged. This change of state is best identified at the elevator controller.
- .22 If the card reader loses contact with the controller, it causes a communication failure but not necessarily a system notification. Suitable programming allows an option of choosing whether to automatically allow or prevent access to all controlled floors in this situation, i.e., to fail safe or fail secure.
- .23 Optional programming of the access control cards can provide the ability to lock floors based on a suitable schedule. Thus, for example, schedules can be defined so that guests who do not have suitable cards can access the floor with the office reception between 9:00 am and 5:00 pm, staff can access certain floors including the reception from 7:00 am to 7:00 pm and the security guards can have 24 hour access. The freight elevator can of course have an independent set of schedules and access privileges.
- .24 The elevator access control does not offer the concept of “door forced” or “held open” as managed by the security system. All elevator operational alarms are routed to the elevator controllers and are unrelated to the security system.
- .25 In some buildings there will be multiple tenants who do not use the same access cards or even use the same security system. Such situations can generally be resolved successfully while using a single card reader providing there is cooperation between the tenants and the landlord. The details are beyond the scope of this document. In brief, the card reader (which may be multi-technology capable) output is sent simultaneously to each of the associated security systems i.e., the security system for each tenant, and providing that the card numbers (including the facility code) are unique no more than a single system should grant access to any given card. Clearly precautions are required to electrically isolate the inputs and outputs but even this is readily achieved.
- .26 In some cases, multiple tenants may have the security of their office space managed for them by the a single, landlord managed access control / intrusion detection system. The foregoing description provides an alternative and offers some potential advantages:
 - a. No personal or personnel information is divulged to the landlord;

- b. Multi branch operations can use a single card for all offices across its available networks;
 - c. Updating of cards etc are under the company control, meaning fewer delays to implementing changes; and
 - d. The tenant can determine their own security policies and equipment selections.
- .27 It is strongly recommended that there shall be a simple toggle switch (or key switch) associated with the relay bank for each car which is controlled by the access control system. This will avoid any disputes between the elevator contractor and the security system contractor and accelerate problem identification, if or when, there is any problem related to the elevator call buttons. This switch will have 2 positions, namely “normal operation” where the access cards allow access to the locked floors and “bypass” where all the relays permit free access to all floors and the elevator operates as if there was no access control system. In this way, the building staff can unequivocally identify if a problem lies with the security system or with the elevator controls.
- .28 In most elevator access control applications, the fire alarm system has to have the ability to “recall” the elevators to the “main” floor where the fire department can readily access and use the elevators as they may require. In the presence of an access control system the fire alarm system should also “bypass” the access control function to ensure that the fire department can travel freely through the building as may be required. The extent of the “fire alarm induced bypass action” will need to be considered and this may be a Code related matter. In particular the locking of floors in the elevator may be irrelevant when the elevator is being used in fire fighting mode (see service mode above) although using an addressable relay on the fire alarm system to “bypass the relay bank” as described above is a very simple procedure.
- .29 The access levels with permission for the users’ access cards must include the floors to which the users require access. This can be achieved either by creating new access levels for the floors or by adding the elevator floors to the existing access levels which already span different floors.
- .30 The access control (security system) does not in any way alter the requirement for emergency voice communications for passengers in the elevator as required by the Elevator Code. There is currently no requirement to place surveillance cameras in elevator cars but, increasingly, such cameras are being installed to ensure the safety of passengers.

2.6 Network and Video Cabling

- .1 Network and Video Cabling devices are not defined specifically for a particular project and shall adhere to the industry standards and performance criteria as identified in Appendix D “Standards Applicable to Regional Security Projects” or, as may be otherwise defined by the Region and by the ITS department as in its Corporate ITS Cabling & Wiring Standard (February 8, 2021). The information cited here is, in part, extracted from that document.
- .2 The form of communications between the proprietary components of the security system is not mandated by this section but shall address the requirements of the security system.

The cabling for such communications will generally be based on similar standards to those advocated here. Sharing of any pathways, labelling and termination considerations shall follow the same guidelines as for the Local or Wide Area Networks as described here.

- .3 A Local Area Network (LAN) shall be provided for communication as may be required between the security system elements and the existing ITS infrastructure. All interfaces which are attached to the LAN shall be configured, where possible, for a minimum of 1000BaseTX Ethernet (1Gbps). It is noted that some security equipment functions with lower data rates and all high-speed equipment can operate at lower interface speeds. The LAN may need to use additional technologies within the backbone for greater speed or distance. Acceptable technologies are:
 - a. FDDI (Fibre Distributed Data Interface)
 - b. 1000BaseSX or 1000BaseLX Gigabit Ethernet (fibre)
 - c. Asynchronous Transfer Mode (ATM)
 - d. 1000BASE-TX UTP
- .4 The LAN shall use industry standard network cables. Acceptable cable types are:
 - a. OM4 Optical Multi-Mode, 50 μ Core diameter / 125 μ cladding diameter, Class 1a, graded index optical waveguide Fibre. All connectors shall be LC compliant and conform to ANSI/TIA-492AAAC.
 - b. Category 6A (250 MHz) or better, Unshielded Twisted Pair (UTP) terminated using TIA 568A configuration.
- .5 Each fibre backbone cable shall have a minimum of 12 strands OM4 distribution type fibre. The OM4 distribution type fibre shall perform as per industry standards over the required distances defined for the site.
- .6 Where there is a requirement for backbone interconnection between wiring closets on the same floor or multiple floors, such interconnection shall use a minimum of a 6 fibre strand, duplex, multi-mode 50 / 125 μ (OM4) rated fibre optic backbone terminated with:
 - a. 1 U x 19 ins rack mounted fibre patch panel
 - b. Connectors shall be OM4 (minimum), LC style;
 - c. $\frac{3}{4}$ inch fibre inner duct (corrugated) rated at FT-6 for ceiling plenum or FT-4 if the plenum is not used as a return air plenum;
 - d. Pulling force shall be limited to the maximum force permitted by the manufacturer;
 - e. Bend radius of the conduit and inner duct shall not be smaller than permitted by manufacturer's specifications; and
 - f. The inner duct shall be restrained so that the fibre inside of it is protected and not unnecessarily stressed.
- .7 Cable Distances in excess of 100 m (330 ft) shall use multi-mode fibre (as opposed to UTP).

- .8 All connectors for the termination of fibre optic backbone cables shall use duplex LC connectors.
- .9 Fibre optic enclosures shall meet the following requirements:
 - a. Enclosures shall include a slide out drawer for frontal access of the terminations.
 - b. Enclosures shall be compatible with LC connectors.
- .10 For multi-mode fibre optic terminations inside access closets fibre patch panels the connectors shall be preloaded adapters configured with LC duplex, multimode, adapters.
- .11 The LAN used for surveillance and security applications shall be logically and/or physically separate from any other existing LAN infrastructure. Interconnection to other LANs shall only be through one of the following:
 - a. A router;
 - b. A Layer 3 capable network switch; or
 - c. As an additional VLAN to the existing LAN equipment.
- .12 Where the design requires an interconnection between VLANs, a router or a Layer 3 capable switch shall be provided by the Contractor and be approved by the ITS department.
- .13 Network video cables shall not be connected individually to the Camera Server. All communications with the Camera (DVMS) Server shall use the LAN. Each network camera or video streamer shall have a single Ethernet network connection which is to be used both for video and also for camera control, e.g., for Pan/Tilt/Zoom (PTZ) communications.
- .14 Cameras shall be powered using POE switches and, only in exceptional cases, will power injectors or local power sources be approved by the Region.
- .15 Supply a complete and working Closed-Circuit Television System (CCTV) System and Digital Video Management System (DVMS).
- .16 All camera passwords shall be changed from their factory defaults to a password provided by the Region.

2.7 Conduits, Pathways, Fittings, Cables and Miscellaneous Accessories

- .1 The construction of all conduits and associated components shall comply with the requirements of the Ontario Electrical Safety Code (OESC) and with other requirements as stated in Appendix Q: "Conduits, Fittings and Accessories" and in the Contract Documents. This compliance requirement applies even if the conduit is not being used for electrical applications.
- .2 All new communications conduits are limited to a fill capacity of 30% of the cross-sectional area. The industry practice and Codes allow for 40% fill but new conduits shall allow for a future expansion in cable occupancy to 40% fill. Where existing conduits are

being reused by addition of new cables the conduits may not exceed 40% fill upon completion of the construction.

- .3 All cabling, wiring and conductors shall comply with the requirements set forth in Appendix R: “Cabling, Conductors and Miscellaneous Accessories” and, as applicable, are also subject to the specifications as defined in the OESC including the fire rating FT-4 or FT-6 and CSA or equivalent certification.

2.8 Parking Controls

- .1 Details pertaining to the specific equipment for Parking Control may be found in Appendix S: “Parking Barriers”.
- .2 The Parking Control Devices are activated through and also, largely report, all status information through the use of dry contacts. Therefore, unlike many of the network connected security devices, the Region is largely agnostic to the choice of parking equipment supplied by the contractor.
- .3 Because York Region does not have pre-approved equipment for Parking Barriers it will evaluate and approve submissions for specific products on an individual case basis. Submissions for each project must include the Gate Manufacturer and proposed model, reference to existing operating installations and provide assurance of parts and maintenance availability.
- .4 Barrier arms shall break away readily and shall be readily replaced. As applicable, the barrier arms shall be illuminated to allow high visibility when available illumination is poor.
- .5 All control functions for the operation of barriers are to be controlled through the Access Control security system.
- .6 Where supply and installation of high-speed automatic rising barrier for vehicles is required for access control, the barrier arm is to open via authorisation given in response to valid card reads using a multi technology card reader compatible with the access control system.
- .7 The pedestal on which the card reader and intercom are installed will generally be designed to facilitate use by trucks or passenger vehicles by providing suitable readers at 2 different heights. Further details are provided in Appendix S, “Parking Barriers”. There is to be a long-range card reader for use by truck drivers which is mounted so that the driver can hold the access card in line with, but distant from the long-range reader (up to 24 inches). There will be a second, traditional reader, keypad and intercom installed at a suitable height for use by passenger vehicle drivers who are able to reach the reader, the keypad and the intercom directly from the “driver’s window”. The actual geometry and distances may vary by project but must be approved by the Region.
- .8 Alternatively, “visitors” wishing to enter the parking area may use the intercom to ask for remote release of the entrance barrier which will be provided through a manual operation from the Central Operations Centre by using the access control system.

- .9 Suitably placed cameras should be associated with the audio intercom to capture the driver's face and the vehicle identification.
- .10 The access control system will provide a NO, momentary, dry contact closure to activate the entrance barrier arm, whether activated by the use of a card swipe or via the operator response to an Intercom request.
- .11 There will be 2 vehicle detector loops in the entrance lane to streamline the barrier operation:
 - a. The first loop will ensure that the barrier arm will only open when there is a vehicle at the reader location, i.e., a pedestrian cannot open the barrier arm and then allow an "unauthorised" vehicle to have access.
 - b. The second loop will be triggered as any entering vehicle passes beyond the raised entrance barrier so that the barrier will then lower.
 - c. These loops will not function in reverse, i.e., the barrier will remain down if a vehicle attempts to exit via the entrance.
- .12 The barrier arm is to open on vehicle exit by means of a vehicle departure sensing loop and a reset loop. The departure loop senses the vehicle and opens the arm which recloses when the "reset" loop detects the departing vehicle. These loops should be designed to prevent and detect illegal entry and are more fully described in the Appendix S.
- .13 The barrier arms shall be designed only for passenger cars or small trucks, or for both passenger and commercial vehicles as may be required by the Contract Documents.
- .14 Lighting shall be integrated into the barrier arms to ensure clear visibility during night time conditions.
- .15 All barrier arms shall incorporate breakaway features.
- .16 Provisions shall be incorporated to allow for the configuration of the barrier arms to permit anti-passback operation if required by the Contract documents. This configuration would require the use of a card reader instead of a detection loop to activate the exit barrier arm. The exit lane would therefore also have to be equipped with a pedestal allowing for dual height readers (as in the entrance lane) and an intercom to facilitate any calls for help.
- .17 The gate shall also be able to open and close with a configurable timer or through a maintained contact from the access control system. The timer will enable the barrier arm to be closed during certain hours, e.g., parking lot closed after 8:00 pm until 7:00 am or the barrier arm can be open continuously from 9:00 am until 5:00 pm.
- .18 Security system installer to ensure that the barrier arm is integrated with security system, i.e., barrier arm status information is provided to the access control system where it shall be logged.
- .19 Provisions shall be included to ensure that the entrance and exit barrier arms cannot close onto a vehicle which is either stationery under the barrier arm or moving through either the entrance or the exit lanes. However, should the situation arise where the barrier arm

encounters an “object” such as a car while it closing, the barrier arm shall immediately signal an alarm to the access control system and reverse direction and stop operation when it is completely open. The barrier arm shall provide sufficient information so that all of its operations, i.e., open, close and close followed by “hit an obstacle and open” shall be logged by the access control system. Time stamps from these logs shall be synchronised with the recorded surveillance images thereby allowing detailed information about the arrivals and departures from the parking areas.

- .20 Provisions shall be included so that the barrier arm can be manually operated locally in the event of a power or communications failure. Usually this is achieved by key operated, weatherproof switches on the pedestal. Such manual operation will not respect the signals from the detection loops.
- .21 The parking system as proposed shall include any required options necessary to ensure that the system shall operate reliably under any and all anticipated environmental conditions (see Appendix H: “Environmental Requirements”).
- .22 All civil, electrical and communications requirements shall be identified in the proposed implementation and submissions.
- .23 Provisions shall be included in the design to provide physical protection of the barrier arms, e.g., posts to protect against vehicular collision, warning lights to identify the barrier arms and kerbs to control vehicle location.
- .24 As described above, the parking barriers shall use detector loops and loop amplifiers to control the entrance and exit activities which depend on vehicle presence detection. Apart from the requirement that these loops be reliable for all types of vehicles, i.e., large, small, multi-axle, high bed or low slung, aluminum, steel or plastic bodies and that the amplifiers be readily integrated into the access control system, York Region will evaluate the suitability of any properly proposed submission.
- .25 The vehicle detection loops shall be placed in the travelled lanes to provide the required functionalities and to assure the Region of reliable performance in the environmental conditions as described in Appendix H. Note that the Region has no preference as to whether the loops are pre-formed or are formed in situ. The loops shall however withstand the technologies used to keep the roadway clear of ice and snow as well as sun and rain.

2.9 Locksmithing and Door Hardware

- .1 Details pertaining to the specific requirements applicable to keys and locks may be found in Appendix T “Locks”.
- .2 All doors are to be equipped as outlined in the associated Security Device Summary document. Where specific details regarding locks are not available, doors should be equipped in accordance with the requirements laid out in Appendix T: “Locks”.

- .3 Interior exiting through any door (not overhead doors) should involve the use of a push paddle or panic crash bar exit device installed at a standard height not exceeding 1,200 mm (approximately 48 ins) AFF as required by the OBC.
- .4 York Region does not have a registered keyway or a dedicated locksmith.
- .5 During the construction phase, the Contractor shall supply temporary cylinders keyed to any convenient, secure combination. The Region shall be given five copies of the keys providing access to the area under construction for emergency and security patrol use.
- .6 There is no general policy regarding provision of grandmaster or sub master keying of locks and the Contractor shall comply with the requirements as defined in the Contract Documents.
- .7 Upon completion of the construction, three passkeys shall be provided for each door on which a final lock cylinder has been installed and the combination of each shall be recorded by the Contract Administrator.
- .8 The final lock cylinders or cylinder core shall be installed only after the final commissioning has been successfully completed.
- .9 Details of the locksmith providing the cylinders and keys as described in this section shall be furnished to the Region as part of the required As-Built Documentation.
- .10 Door hardware which is not defined in Appendix T: "Locks" shall meet all required standards and specifications as provided in the architectural specification and is therefore not specified in this security document.

2.10 Universal Washroom Requirements

- .1 A **universal washroom** is an enclosed space with a barrier free toilet, sink and turning space so that a wheeled mobility device may be accommodated. These **washrooms** aim to provide privacy and dignity for people with a disability, including for those who require an assistant.
- .2 The details of the washroom requirements are generally specified in the Ontario Building Code, particularly in Section "3.8.3.12. Universal Washrooms" but only those portions related to control of the door and those functions related to the "emergency button" are being addressed in this document. All other aspects of the washroom construction fall under the General Contractor and the Architect's mandates.

.3 OBC 3.8.3.12.2 states that:

A universal washroom shall have,

- (a) an emergency call system that consists of audible and visual signal devices inside and outside of the washroom that are activated by a control device inside the washroom, and*
- (b) an emergency sign that contains the words “IN THE EVENT OF AN EMERGENCY PUSH EMERGENCY BUTTON AND AUDIBLE AND VISUAL SIGNAL WILL ACTIVATE” in letters at least 25 mm high with a 5 mm stroke and that is posted above the emergency button.*

Additionally, the OBC states the following requirement:

Ensure emergency alarms are linked to a centrally monitored switchboard for facilities that have the capability. If third party monitoring is not available, alarms will remain local.

- .4 The security Contractor is to ensure that the emergency button alarms are reporting to the access control system. Monitoring of the washroom alarm will be implemented both locally, i.e., by the Region, and also by an off-site, 3rd party monitoring station.
- .5 All devices identified in Appendix U: “Universal Washroom” are to be purchased and installed under the General Contractor’s Contract or through any designated subcontractors.
- .6 Note that there are Code compliant kits available from some key manufacturers which provide all the required devices to provide the control functions for the washroom door. Such kits are outside the scope of this security document.
- .7 Details of the approved hardware to implement the control and monitoring of the Universal Washroom can be found in Appendix U: “Universal Washroom”.

3. EXECUTION

3.1 Electrical Installation

- .1 The Electrical work required under this contract shall conform to the requirements of the OESC and meet with the approval of the ESA.
- .2 Electricians working on the site shall adhere to the requisite safety procedures and Best Practices required to protect themselves from any risks arising from potential Arc Flash sources.
- .3 Electricians shall not work on “hot circuits” without special permission from the Region.

3.2 Installation – Wires and Cables

- .1 Provide wires of number and gauge (including corresponding raceways) as required, with sufficient space for conductors as indicated in the Drawings. Provide adequate wiring for the actual equipment which is being installed. There is no requirement to make allowance for future expansion by using oversized conductors or excess numbers of conductors. As noted, conduits shall have spare capacity.
- .2 Provide wire and cable according to the drawings and security system requirements. This includes consideration of wire types (related to environmental criteria) colours, conductor types, jacketing, conductor type and gauge.
- .3 Pull cable into ducts, conduits and cable trays in accordance with cable manufacturer's recommendations. Use specialised cable grips suitable for cable type, or pulling eyes fastened directly onto cable conductors.
- .4 Limit pulling tension and minimum bending radii to those recommended by manufacturer. Also observe that the conduits which are being used must adhere to the Code limitations regarding numbers of bends, lengths of pulls and provision of pull boxes.
- .5 Prevent damage to cable jackets by utilizing adequate amount of approved lubricant when pulling cables through ducts and conduits.
- .6 Support cables in manholes and utility tunnels on cable trays or cable racks.
- .7 Arrange cables in parallel rows on cable trays. Maintain cable spacing by fastening cables, with Velcro, a minimum of every 2000 mm on straight horizontal runs and to each rung at bends, including two rungs of adjoining straight sections. Fasten cables on vertical tray runs every 1000 mm. Limit the number of cables in each bundle of cables in accordance with best practices.
- .8 Connect cables to electrical boxes and equipment enclosures located in outdoor, wet or sprinklered areas with watertight cable connectors.
- .9 Provide cable grips for vertical and horizontal (catenary) cable suspension installations to reduce cable tension at connectors and at cable bends. Provide supporting messenger cables in accordance with best practices.
- .10 Install through wiring in junction boxes and pull boxes having no connection within the box. Leave a minimum of 300 mm (12 ins) of slack inside box or follow best practices in accordance with the type of cable and the location.
- .11 Facilitate making of splices and connections by leaving sufficient slack length of each conductor at panel boards, outlet boxes and other devices. Typically, the conductors should allow for 3 m (10 ft) of spare cable during the cable pulling process prior to the termination and dressing of each cable.
- .12 Where suitable, e.g., outdoor or below ground, seal the conduits after completing the cable installation to mitigate the risk of rodent damage to the cable jackets. The sealant being used shall be designated for this purpose and shall be approved by the Region.

- .13 Install instrumentation/system (low voltage) conductive signal wires in separate raceways from power and control wiring as is required by Code.
- .14 Identify each cable by attaching a cable marker at each end, in all intermediate manholes, junction boxes and pull boxes. (See Appendix V: "Labelling Requirements".
- .15 Install cables so as to conserve headroom in exposed locations and to minimize the amount of interference in spaces through which they pass.
- .16 Where exposed, install raceways, conduits and cables parallel or perpendicular to building lines and group neatly.
- .17 Maintain the integrity of all fire separations by sealing around all cables, trays or conduits where they pass through such fire separations. Generally, this includes all floors, ceilings and concrete or masonry walls. Fire stopping may be performed with approved materials meeting the NFPA requirements or by means of manufactured systems which may more readily permit later additions. In all cases the resulting installation must meet or exceed that of the existing barrier.
- .18 As far as is practicable, all feeder wiring shall be continuous from origin to panel termination without installing splices in intermediate pull boxes or splicing chambers. Sufficient slack (typically 3 m or 10 ft) shall be left at the termination point to make proper connections to the equipment. Any splices must be in accordance with the requirements of the Code and best practices. The communication cables may have specific length restrictions and splices or intermediate connections are generally not permitted. All splices or junctions must be readily accessible, i.e., must be visible and accessible subsequent to completion of the project.

3.3 Installation – All Security System Devices

- .1 Supply, install, configure, test, and commission all the access control system and intrusion detection system components, communications equipment and all system components to ensure the functionality of complete security system and network. All of the pre-approved equipment which is used to create these systems are listed in Appendices J, K, L, M, N and O. The contractor shall identify and report all pre-existing or related construction defects which will affect the progress of the Work to the Region and the Consultant before commencing construction.
- .2 The Drawings included with the project Specifications have been developed on a conceptual basis. The Contractor is responsible for providing/verifying the quantities and part numbers contained in these documents which are based on the pre-approved products as listed in the above-mentioned Appendices. The Contractor shall also itemise all additional components, cables, etc. which are required to complete the Work as defined in the Specifications and on the Drawings. The Contractor shall also itemise the Bill of Materials in a logical, per building, per floor, and per area manner. The detailed design shall be done by the Contractor who shall verify the part numbers and quantities which are required. The contractor shall include any recommended spare parts as may be appropriate. In particular, the contractor shall also identify any compatibility issues, should these exist, between the existing installation and the proposed new equipment.

- .3 Please refer to the drawings provided with the Contract Documents which identify the project requirements, the security device summary document, the Specifications and the Appendices for the specific security, locksmithing requirements and any other needs related to this project.
- .4 A minimum quantity of 20% of inputs and 20% of relay outputs are to remain available for use in all systems which are being affected by the project unless otherwise stated. Unless otherwise noted in the Contract Drawings and Documents, the total quantity of inputs and outputs in the security system shall be less than 80% full, leaving a minimum of 20% capacity available for future use.
- .5 All of the security system hardware and devices and additional nodes, as may be identified during the detailed design, are to be housed in NEMA 2 (IP11), NEMA 3 (IP54), or NEMA 4 (IP66) rated enclosures as listed in Appendix J or approved equivalent to suit the application. All enclosures are to be wall mounted and located as shown on the drawings. The Region will review and, as appropriate, approve the recommendations proposed by the Contractor.
- .6 The enclosure sizes shall be sufficient to ensure ease of maintenance, adequate ventilation, and space for the elsewhere defined potential for 20% expansion.
- .7 Where cabinets are exposed to the environment (see Appendix H “Environmental Requirements”), the Contractor is responsible for ensuring that the cabinet incorporates sufficient ventilation to ensure that the temperature inside the cabinet remains within acceptable tolerances, even when considering direct sunlight or winter storms. Such ventilation may require heaters, fans or air conditioning along with suitable thermostats. While some equipment to be housed in such cabinets may, for example, be rated for operation to -20°C, the condensation which occurs at temperatures below 5°C is of itself damaging and is therefore to be avoided. The Contractor shall provide suitable calculations and design information to justify the solution which is being proposed for such cabinets.
- .8 Equipment location and other mounting locations may be modified with prior approval from the Region.
- .9 The pre-approved Power Supplies are listed in Appendix J: “List of Approved Security Equipment” and shall be installed with a back plate. Only the approved power distribution modules are to be used for the system design.
- .10 Enclosure and Power Supply solutions are to be presented to the Region for approval.
- .11 All control panels, where applicable, are to be equipped with local battery backup power. Control panel batteries are to consist of 12V, 7Ah sealed lead acid batteries. Batteries shall be labelled with the installation contractor name and the date when initially installed and this information is to be updated when the batteries are replaced (see Section 1.4.22).
- .12 All equipment is to be installed according to the manufacturer’s recommendations and the Region shall be informed whenever such recommendations are not being followed. The Region shall receive an explanation or justification when such conditions occur and direct the Contractor accordingly. If any instances are identified by the Region where the

manufacturer's recommendations have been disregarded, corrective measures may be required by the Region. Any such modifications shall be at the Contractor's costs.

- .13 All security system control panel enclosures must include:
 - a. Tamper switches on the cabinet door(s);
 - b. UPS back up (as may be required by the Region);
 - c. Key operated lock on the cabinet door(s);
 - d. Battery backup;
 - e. Switched LED light inside panel to facilitate maintenance (as may be required);
 - f. Clear and approved label on the outside;
 - g. Internally stored configuration documentation etc;
 - h. A dedicated network jack for maintenance purposes; and
 - i. A dedicated 120VAC power circuit.
- .14 The Contractor shall supply all necessary wiring, termination equipment/devices and other necessary miscellaneous components which are not specified in the Contract Documents but which are necessary to implement a fully functional access control, intrusion detection and security system as well as mechanical/electromechanical key locking system. Details for lock placement, function and keying can be found in the associated Security Device Summary document. The door lock override key shall be the Medeco Intelligent Key Systems – M3 & X4 CLIQ (see also Appendix T: "Locks").
- .15 All cables and wires shall be CSA or equivalent approved and have a flame test rating equal to, or greater than, that required by the local building or fire code where it is being used, including the OBC and OESC and be clearly marked with the seal of approval by the testing agency.
- .16 End of Line (EOL) supervision shall be used on all sensor connections monitoring door status or other conditions. End of line resistor packs shall always be installed at the remote end of the detection line and not at the control panel. The Contractor shall install resistor packs using either one resistor (2 state monitoring) or using two resistors to provide 4 state monitoring. Resistance values are determined by the manufacturer of the equipment which is being used and the Region will define where and how such supervision implementation is to be installed. Both of these "supervision" configurations will alert the intrusion detection system when the connection wires are cut or short circuited and signal a "tamper trouble" status.
- .17 All cable runs should, where possible, be installed using a continuous, splice free cable run.
- .18 If splices are required, the splices shall be made in CSA or other approved junction boxes utilizing DIN rail-mounted terminal blocks. Splice box locations shall be marked on the wiring diagram and included in as-built documentation. All splice locations shall be clearly marked in accordance with the requirements identified in Appendix V "Labelling Requirements" and shown on the drawings.
- .19 Wiring lists shall be permanently affixed inside all cabinets where splices, or control components are installed.

- .20 Security wiring should not be run in parallel within 30 cms (12”) of 110 VAC or higher voltage electrical wiring or conduit.
- .21 All wiring shall adhere to applicable local, Provincial and Federal Codes and industry Best Practices shall be followed (also see Appendix D: “Standards Applicable to Regional Security Projects” for a partial list).
- .22 The location of equipment shown on the Drawings may be revised during construction prior to its installation and the Contractor shall not be entitled to any additional costs for the relocation of equipment if the new location is within 10 metres (33 ft) of the original location.
- .23 The contractor shall provide unit costing for each item in the Contract Documents which shall apply for all quantity changes of increase or decrease within +/- 5% of the quantities specified in the original documents. If the change exceeds this limit, then the job shall be repriced.
- .24 Install transformers complete with mounting brackets and hardware in positions in accordance with the manufacturer’s instructions and where approved by the Region.
- .25 The Contractor shall provide all necessary lugs and mounting equipment which are not already provided with transformers and which are not individually specified.
- .26 For the Regional Water and Wastewater facilities, the Control Panel relay outputs are to be wired to a local facility field controller so as to provide security system discrete dry contact inputs to the SCADA system. Inputs which are to be wired in a fail-safe mode include:
 - a. Intrusion Alarm
 - b. Security System Armed
 - c. Security System Disarmed
 - d. Spare
- .27 Communications between all of the distributed security devices and the York Regional Security servers shall use TCP/IP. The internal communication between the security devices and the prime security system interface port will use a protocol determined by the equipment manufacturer and, as long as it is does not involve the Region’s networks, does not need to be documented or approved by ITS. Configuration and activation of switch/hub ports on networking equipment maintained by the Region’s Information Technology Services Group (“ITS”) is to be co-ordinated by the Region. The Contractor shall provide one (1) week advance notification to the Region’s ITS Group for configuration of network ports.
- .28 IP addresses shall be provided by the Region’s ITS department on request.
- .29 If local IT Network infrastructure linking from the remote site to the Regional security servers is not present, Wireless network equipment shall be used. York Region ITS will supply the pre-configured Wireless Modem and network switch as well as the installation guidelines, (see Section 1.8 “Network TCP/IP Coordination”).

- .30 The Network switch which is being used to communicate between a remote location and the security server shall be housed within the security system enclosure at the remote location. Both the modem and the switch should be powered from UPS power supplies.
- .31 All replaced or surplus equipment is to be delivered to the Region upon completion of this Contract for possible re-use.
- .32 Where magnetic locking devices are to be used, and where permitted by Federal, Provincial, Local Municipal or Town/City Codes, all necessary permits, engineered drawings and fire alarm interconnection shall be completed by the Contractor. Modification of the fire alarm system, signage and security systems, as may be required, shall be performed by the Fire Alarm System contractor of record for that location and by the Contractor as appropriate.
- .33 Pre-Approved magnetic locks are shown in the Appendix T, "Locks". Such locks shall be Plate Magnet style locks with a minimum of 1200 lbf (540 kgs) holding force. In addition, they shall have indicator LED's showing if they are closed or open and have integral Hold Force Sensors (HFS) (Bond Sensors) and Door Contacts.
- .34 Where electro-magnets are being installed for a double door entrance, the magnetic lock shall be equipped with 2 electromagnets and 2 "plates" enclosed in a single housing. Door status monitoring may interpret the 2 doors as a single "opening".
- .35 The installation of the electromagnet may depend on the direction of "emergency egress" and wherever possible must be on the secure side of the door opening to reduce the risk of malicious attacks.
- .36 The final inspection regarding permit approval of the magnetic lock inspection shall be coordinated by the Contractor and shall take place in the presence of the Region's Project Coordinator. Presence of other required participants shall be coordinated by the Contractor.
- .37 All manufacturers' requirements and electrical Code requirements for grounding and bonding, including the requirements of the OESC and OBC, shall be followed. For larger projects there shall be 2 independent grounds, the power system ground and the telecommunications ground. Ground wires, ground lugs, grounding bolts and ground bars shall all be made of copper or bronze.
- .38 Concealed magnetic door contacts are to be installed on all exterior access doors and interior doors, as identified on the Device Summary Chart as well as on the Contract drawing.
- .39 Electric door strikes are to be installed on all doors which are identified within the Device Summary Chart as well as the Contract drawings. The electric strike shall be fire rated where these doors are a part of a fire separation. The strikes shall be configured to fail secure, i.e., when there is no applied power, the door shall be locked. Door key cylinders and locks shall be installed in every such door to allow key override of door strikes in all doors equipped with electric strikes. A message will be generated by the security system noting that the door has been "forced" when the door is opened using an "override" key.

- .40 The Contractor shall install snubbing diodes in all security devices incorporating electro-magnetic devices to minimize the induced reverse voltage which occurs when such devices are deactivated. Such diodes shall, for example, be installed close to all electric strikes and electro magnetic locks to maximise protection.
- .41 Installation of all electric strikes shall incorporate use of an “in-line power controller” to reduce the voltage supplied to the electric strike after the initial voltage surge activates the device. This device must be rated for the electric strike which is being installed and is intended to protect strikes which remain powered for long durations, such as an office entrance which may be opened by a schedule at 9:00 am and then powered until the office closes at end of the day. This is to be installed on all strikes to facilitate future applications of any door. The Contractor shall certify the use of such “in-line power controllers” so that the Region may exploit the doubling of the factory warranty period on such installations.
- .42 The Contractor shall label all enclosures containing security equipment identifying the nature of the equipment and the addresses of the enclosed nodes. All networked equipment is to be labelled with the corresponding IP information. Main alarm outputs and relays shall be labelled accordingly. All alarm points, card readers and other system components shall be labelled in accordance with the door numbering and description syntax. All labelling shall be consistent on site, in the as-built documentation and in the software. Labels shall be weather/environment resistant type (see Appendix V: “Labelling Requirements”).
- .43 The contractor shall post warranty/contact information on the inside of the main control enclosure for each facility. Where possible this information should identify contact information which is operational 24/7.
- .44 Dedicated security system alarm outputs shall be provided for all Environmental Services facilities and connected to the SCADA control panel so as to provide integrated monitoring of intrusion detection alarm and arming status (see Section 3.2.26). The SCADA system accepts only dry form C relay contacts, i.e., NO and NC contacts. Integration with the Region’s SCADA system must be coordinated with the Region, 2 weeks in advance of the integration so as to have a representative from Environmental Services scheduled to be present and assist with the integration. All work undertaken in chemical rooms (chlorine, ammonia rooms) at Environmental Water and Wastewater facilities must also be coordinated with the Region in advance to have a representative from Environmental Services scheduled to be present.
- .45 The Contractor is responsible for programming and testing of the intrusion reporting component if it is to be monitored by a 3rd party Central Station. The Contractor is to coordinate with the central monitoring station for configuration and testing of the system for all relevant signals. The intrusion reporting system at the Region’s sites shall be equipped with both Wireless and IP-Wired communication modules. The Contractor shall supply, install, configure, test and commission a compatible cellular communication module(s) complete with an active SIM card and an application appropriate antenna, i.e., the contractor shall enroll the security system as a subscriber. This antenna is to be installed on the inside or outside of the building so as to ensure a consistent and reliable signal and shall be in accordance with the requirements of applicable laws, including municipal, Provincial and Federal legislation and regulations. The contractor shall

coordinate the subscription with the Region and establish the appropriate response plan for each of the alarm points. If there is an existing contract with a local monitoring service, the Contractor shall modify the existing contract to allow for the added service.

- .46 The Contractor shall ensure that the cellular service and the monitoring service are so configured that the billing and other communications from the carrier are routed as requested by the Region.
- .47 All Alarms shall be the only notifications communicated to the 3rd Party Monitoring Service. No pre-alarms (as are associated with the Door Held Open alarms) shall be communicated to the 3rd Party Monitoring service.
- .48 The Contractor shall configure a routine test alarm transmission to the 3rd Party Monitoring Service which shall be set up to independently confirm the operation of both the wireless and the IP communications links during the silent night hours e.g., 2:00 am and 2:15 am every 24 hours unless otherwise instructed.
- .49 The Contractor shall work with the Region to confirm the:
 - a. Unique and unambiguous naming of all the alarm points;
 - b. Name and contact information of three contacts for each alarm point; and
 - c. A suitable Response plan for each alarm point.
- .50 The Contractor shall ensure that the response plan and contact information is confirmed with the 3rd Party Monitoring Service and shall test the system response by tripping each of the alarm points in turn and validating the 3rd Party Monitoring Service logs with those recorded by the Central Operations Audit Trail log in conjunction with the Region's representative.

3.4 Installation – Enterprise Software Integration

- .1 Integrate or modify the configuration for the facility which being modified into the Region's existing Enterprise software database.
- .2 The Contractor shall co-ordinate the Work to incorporate the facility into the existing Enterprise system with the Region.
- .3 This work shall be completed a minimum of 15 Working Days prior to the date of Substantial Performance of the Work. The Contractor shall coordinate this integration effort with the Region's Security and Life Safety Coordinator at 1-877-464-9675 ext. 76900 unless informed otherwise.

3.5 OPERATION - GENERAL

- .1 Operation of the new security system is to function similarly to existing systems installed at other Regional facilities of a similar type. The Contractor shall confirm all security system functions and operation with the Region of York Security and Life Safety Coordinator at 1-877-464-9675 ext.76900 prior to undertaking any programming unless otherwise informed.

- .2 Overview: A general overview of the intended operation of the system is as follows:
- a. The system shall allow for the monitoring of intrusion detection alarms inside the system alarm monitoring module, in addition to giving command and control of supported intrusion detection devices. Once alarms are brought in to the system, they shall be stored in the system Audit Trail log.
 - b. All system events either designated as alarm conditions or not designated as alarm conditions shall be stored in the system Audit Trail log.
 - c. Panic alarms both from wired and wireless buttons/devices are to annunciate on the security systems graphic map via alarm pop up which includes a floor plan showing the exact panic alarm location. This alarm will remain active until the event has been investigated by security staff who can then acknowledge the alarm using the 'panic all clear' button on the associated graphic.
 - d. Each door shall be programmed to generate "Door Forced" and "Door Held Open" alarms. These alarms shall have a user-definable, independent time delay which if not otherwise specified should be:
 - i. Time to trigger a "door held open" pre-alarm is 45 seconds;
 - ii. Additional time for a "door held open" alarm is 10 seconds; and
 - iii. Time to trigger "door forced" alarm is immediate.
 - e. Request to exit ("RTE") motion sensors are to be installed on the interior of all perimeter exit doors which are equipped with door contacts in order to prevent false "forced entry" alarms caused by egress of personnel even when the security system is armed. RTE's (motion sensors) are to be configured to only shunt egress detection for 45 seconds unless otherwise specified. RTEs shall not be configured to release the electric strike. These RTE's shall be aimed carefully so that the sensor is not triggered by individuals or activities not related to exiting through the door, such as by individuals using a stairwell or a coffee machine close to the exit door. The RTE described here will require a different configuration if the door is locked by an electro magnet.
 - f. Where access control and intrusion detection systems are installed on doors which also have automatic operators (also referred to as handicapped door operators), there are a number of special requirements. In order to achieve these added functions, there needs to be a door interface relay / sequence board which can integrate and schedule operation of the inputs and outputs in a way that the security system cannot. This device is normally installed in the ceiling above the handicapped door. This device integrates some of the functions identified below and introduces delays as may be required to ensure that the door lock and the handicapped operator function in sequence and not simultaneously. The usual sequence of operations is as follows.
 - i. The card reader on the insecure side of the door is always active.
 - ii. The insecure side handicapped paddle is normally inactive.
 - iii. The door is normally closed and locked unless there is a schedule during which the lock is disengaged.
 - iv. The secure side handicapped paddle is normally active and there is also an RTE device (typically a motion sensor)

- v. When entering the secure space from the insecure side:

The user will swipe a valid card on the reader which will enable the insecure side handicapped paddle and unlock the door. Those who are capable of doing so may open the door manually and enter through the door which will automatically close and relock behind that person. Mobility challenged individuals may press the handicapped paddle which will activate the handicapped operator by activating the REN (Request to Enter) on the access control system. Once the operator completes its cycle and closes the door the insecure side handicapped paddle will be inactive and the door will relock.
 - vi. When leaving the secure space and going to the insecure side:

The user will approach the door thereby activating the RTE device, thereby unlocking the door. The door can be opened by pulling on the handle or by pressing the handicapped paddle to activate the door operator. Once the operator completes its cycle and closes the door the secure side handicapped paddle will be active and the door will relock.
 - g. The security system shall automatically upload/download information to/from the control panels while the control panels are in communication with the host server application. A data download/upload may also be initiated manually by a technician should this be required. This transfer of data may consist of either controller database information or alarms and events.
 - h. Data transfer shall not interfere with normal daily operations. The local system shall be capable of working for at least 24 hours or 5,000 events written to local logs without communications to the central system. Alarms will sound locally and they and the events will be recorded locally when such downloads/uploads are unavailable. Should the local storage capacity be exceeded the oldest records will be overwritten. Once the downloads/uploads resume, these records will be transferred and will then appear in the Central Audit Trail log.
- .3 Authentication to the security System shall be via programmed Access Levels, e.g., all users will have only the access levels which are predicted to be relevant to their responsibilities, and these may relate to only one site for a local responsibility such as a librarian, or to many sites for an ITS trainer. When new sites are brought on-line, existing access levels may need to be augmented or new ones may need to be approved. Such access levels can be further customised by using schedules to allow for the accesses to be limited by time of day or day of week, thereby providing more control and greater security.
- .4 Proximity Card Reader and combination “Proximity Card Reader and Arming Button” shall function as a method of disarming and arming the security system respectively.
- .5 When a valid card is presented to the Card Reader on the insecure side of the door, the system of which that reader is a part will disarm immediately and temporarily unlock the door. The door does not need to be opened and even if the door is not opened the system will remain disarmed and the lock will relock after the timer expires.

- .6 The security system shall only Arm if there are no open contacts, open areas, or alarms in the system. Troubles will generally not inhibit Arming of the system, e.g., a low battery voltage causes a trouble signal which will not prevent arming of the system. When the system is “secure”, i.e., “ready to arm” (as shown on the keypad), swiping the card at the Card reader on the secure side of the door and then pressing the arming button which incorporates a 45 second delay and will result in the system commencing a countdown timer, which will be set to 1 minute unless otherwise specified. During this “Exit Delay” the keypad display will beep slowly and display “Exit Delay in Progress”. When the “Exit Delay” is complete, the sounder will become silent and the “Ready to Arm” indication will be replaced with the “armed” LED status indicator at the keypad will be illuminated on the keypad.
- .7 Upon presentation of proximity card with the correct Access Level, i.e., a valid access card, to a card reader, the security system shall activate the unlocking mechanism on the corresponding door, allowing that door to be opened. As noted above this will happen when the security system area is armed or not.
- .8 Upon authorized entry through a door (Access Granted) the system shall automatically disarm the security system area related to that door if it was previously armed. “Security System Disarmed” status shall be indicated as an input to the access control and intrusion system.
- .9 Prior to exiting from a facility, personnel shall arm the security system by presenting their card to the secure side “Arming” card reader and then pushing the adjacent push button (Arming Button). This sequence of events will initiate arming of the security system. “Security System Armed” input shall be signalled to field controller. The system shall only Arm if there are no alarms or “open contacts” in the system.
- .10 The use of a manual, “override” key entry to an armed facility, (or any other means of opening the door except for the use of an approved access card) shall cause “Intrusion Alarm” input to be signalled to the access control system and to the intrusion detection system.
- .11 Upon a forced entry to the facility, “Intrusion Alarm” input will be signalled to the local access control system and the intrusion detection system. The Central System maintains “Security System Armed” input signal to the access control system and intrusion detection system.

3.6 Security Wiring Field Quality Control

- .1 Sensor and other signal wiring should be tested for continuity of each conductor using ohmmeter or DC buzzer. Resistance values shall not exceed 5 ohms. Megger or 120 Volt filament lamp testing is not acceptable.
- .2 Carry out functional tests with the Region’s Representative to confirm field wiring, interconnections, and device functionality.
- .3 Depending upon the magnitude and the complexity of the system, the Contractor may elect to divide the security system into logical sections, and activate one section at a time so as to sequentially verify the operation of each selected section.

- .4 Upon completion of the sectional tests, the Contractor shall undertake testing of the integrated system comprised of all the sections.
- .5 The Contractor shall verify operation of the complete system for operational sequencing.
- .6 For local testing, each device/sensor should be tested and marked off one by one until all devices/sensors are tested. Each sensor shall be verified to the intended zone.
- .7 Submit one copy of all signed and dated test results to the Consultant. This shall only be done after any aberrations uncovered during the testing have been rectified.

3.7 Network Wiring Field Quality Control

- .1 The network cabling requires certification in order to achieve full acceptance by both the Region and the Manufacturer.
- .2 The Region requires that the performance of the entire LAN infrastructure be certified to Category 6a performance which shall include at least the following parameters as defined in the ANSI/TIA/EIA-568-B.1 and other compatible standards by using a calibrated tester.
- .3 Cable installers will generally provide these results for each cable link in tabular and graphical format which should be generated by the test equipment. These results will automatically flag those measurements which do not meet the performance standards which were selected, e.g., Category 5, Category 5e Category 6, Category 6a etc.
 - a. Wire map
 - b. Propagation delay
 - c. Delay Skew
 - d. Cable Length
 - e. Insertion Loss
 - f. Return Loss
 - g. Near-End Crosstalk (NEXT)
 - h. Power Sum NEXT (PSNEXT)
 - i. The Equal-Level Far-End Crosstalk (ELFEXT)
 - j. Power Sum ELFEXT (PSELFEXT)
 - k. Attenuation-to-Crosstalk ratio (ACR)
 - l. Power sum ACR (PSACR)
 - m. DC Loop Resistance
- .4 Naturally for the entire network to perform satisfactorily the components forming part of the network must all be certified to the same standard. Patch cords in particular are generally purchased pre-manufactured and are not normally a part of the “link testing”.

- .5 The system inspection shall include inspection of the labelling, the cable dressing, the terminations, the testing, patch panels, the jacks and the type of the insulation which has been used. All of these items shall be accepted by the Region only if all components are certified to the same standard.

3.8 Warranty

- .1 The entire passive network shall be accepted by the manufacturer after certification under its “lifetime warranty” program.
- .2 The beneficiary of the Warranty shall be the Regional Municipality of York.
- .3 The Contractor shall be responsible to ensure that installation complies with the warranty conditions. The general requirements are that:
 - a. All components shall be from a single manufacturer.
 - b. The installation is performed by Factory Trained installers.
 - c. The installation is tested and certified to meet the required standard.
- .4 During the Warranty period and as may be determined thereafter, the Region requires that the Contractor ensure that the service and repairs to the security system shall meet the following target service levels for the entire security system installed under the contract.
- .5 Response Time, Repair Time and Overall System Availability
 - a. The Contractor will respond to warranty work in reasonable time such that overall requirements for system availability are met. Availability of replacement components will support a reasonable response time. The Contractor shall be penalized when, during the warranty period, an incident involving a failure of any part of the system results in more than 48 hours of down-time or if the Contractor fails to commence warranty service within 12 consecutive hours from the first notification (being “Made Aware”) of the incident by York Region personnel or by system diagnostics.
 - b. “Made Aware” means when the Contractor has been advised by any party or when detected by or should have been detected by the Contractor. Additionally, the cumulative downtime shall not exceed 220 hours in any 6 month period or a penalty for each additional 24 hour period of downtime shall be applied.
 - c. Failure of any part of the system is defined as, but not limited to, any loss of functionality, malfunction of the security system or failure to attain the performance requirements as defined in this specification, in the Contract Documents or described in the training provided to the York Region staff or any on-line terminal malfunction, or communications failure which is not the result of a utility company to provide their service, under normal usage, vandalism, or traffic damage. These considerations clearly apply to the components which are referenced as the Security system or the surveillance camera system.
 - d. The following table summarizes incident response times, incident repair times, and cumulative downtimes:

Target Response	Response Time	Penalty Rate
Maximum Time to respond to an incident	24 hours	\$250.00 per 24-hour period or portion thereof.
Maximum Time to repair problem causing an incident	48 hours	\$250.00 per 24-hour period or portion thereof.
Cumulative down time during any 6-month period	220 hours	\$250.00 per 24-hour period or portion thereof.

- e. The Contractor shall submit system Diagnostic Reports to the York Region Security Coordinator on a monthly basis throughout the warranty period within 14 days of each month end. These reports shall validate the performance during the previous month and certify compliance with the performance and up time requirements.
- f. The Contractor shall make available qualified technical support during normal working hours and emergency support at all times 24 hours a day for each day throughout the warranty period.

3.9 Close Out

- .1 Close Out of the project shall require that the some or all of the following documents and miscellaneous items shall be provided to the Region, addressed to the Security Project Coordinator, via e-mail or to 145 Harry Walker Parkway, Newmarket, ON, L3Y 7C5.
 - a. One copy of all signed and dated test results as approved by the Consultant. This shall only be done after any aberrations uncovered during the testing have been rectified;
 - b. A written list of all passwords, keywords, serial numbers and/or configurations that were encountered during the installation of the operating system and application software;
 - c. Assignment of all warranties, licences and product registrations to the “Regional Municipality of York” and documentation to this effect;
 - d. Ensure that any permits or temporary configurations of any kind are returned to their permanent “operational” status and appropriate documentation is provided confirming this status;
 - e. All installation software, user manuals, accessory cables, calibration units and any other material accompanying the installed equipment; and
 - f. All keys, special tools, spare parts, unused components, permits, approvals, as-built drawings and project related documentation.
 - g. All documentation shall be provided in both hard copies and also in soft copies (using both source document format and PDF format). Source documents shall be in AutoCAD or Word format. There shall be no locks, keys or restrictions preventing the use of these documents by the Region and the documents shall be certified to be free of viruses or other malware of any kind.

3.10 Wiring Identification

- .1 Identify all wiring infrastructure including fibre optic cabling and conduits with wire markers in accordance with the requirements and guidelines of Appendix V: “Labelling Requirements”.
- .2 Identify each conductor, including any spares, with a unique alphanumeric designation to facilitate troubleshooting and maintenance as identified by Region of York standards.
- .3 Identify all controller wiring at terminal blocks and connection points with the controller terminal (I/O) address numbers.

3.11 Site Testing

- .1 Following installation or modification of the security System at a facility, Site testing shall be performed by the Contractor. Testing is to be co-ordinated with the Region.
- .2 Record test results in a log book and submit to the Consultant for reference and approval. Replace or repair circuits which do not meet requirements before submitting to the Consultant.
- .3 The Facility is to be tested to confirm/demonstrate the proper operation of the System in accordance with a test plan approved by the Consultant.
- .4 The Region’s representative is to be present for all final testing. The Region’s representative is to confirm that testing has been satisfactorily completed and that the system is ready for operational use as intended.
- .5 All exterior facility access doors are to be tested for valid access control functions and intrusion detection operation while using test proximity card(s). The corresponding inputs to the SCADA system are also to be verified when they are present. The security system is to be tested with both valid and invalid proximity cards in online and offline operating modes. The testing shall ensure that both the mechanical and electronic aspects of the doors as well as any other special features function correctly. The various trouble options shall also be shown to work properly. Any malfunctions must be corrected prior to the Region accepting the system.
- .6 Use of the “emergency” mechanical key override through all perimeter doors is to be tested by manually opening such doors. The key must readily provide access without any action by the access control system but must also report the key operation as a “Door Forced” event. Corresponding inputs to the SCADA system are to be confirmed as may be appropriate.
- .7 Since all arming is activated by use of a card and push button at one of the doors in each facility, there needs to be a careful verification of this function at each door which is equipped with this function. The testing shall ensure that any of the “faults” intended to inhibit the arming function do prevent the arming and that these situations are clearly identified on the keypad screens. Such faults include, door open, trouble events, inadequate credential access level, communications failure etc. The testing process

requires comparison of the Audit Trail log with the local record maintained by the testing team.

- .8 All event and alarm conditions are to be verified and logged to the system Audit Trail log. The activation of such alarms and associated events are to be logged using an accurate time source, e.g., a cell phone and then recorded. There are several different responses which should be initiated by this testing process and which therefore require testing:
 - a. A local response, e.g., siren at the door,
 - b. A facility wide response, e.g., an active icon on the alarm management screen in the facility,
 - c. A Regional central monitoring operation notification, e.g., an active icon on the alarm management screen; and
 - d. Notification to the 3rd Party, off site Monitoring Station.
- .9 Upon completion of the on-site testing, the “test team” records shall be compared with the system Audit Trail log report and with the notification log which shall be obtained from the 3rd Party Monitoring Station. Any evidence of a malfunction in this auditing process needs to be corrected before the Region will accept the system.
- .10 Following successful integration with the Region’s Security Server, “shift programming”, otherwise referred to as “access level adjustments” of the facility, if applicable, are to be coordinated through the Region’s Security and Security Systems Administrator who is available at 1-877-464-9675 ext.76900.

APPENDICES

4. LIST OF APPENDICES

Appendix	Contents
A	Regional Security System Naming Convention Standards
B	Regional Approved Commissioning Form
C	Standardised Terminology
D	Standards Applicable to Regional Security Projects
E	Standardised Security Configurations
F	Procedure for Equipment Substitution
G	Standardised Abbreviations
H	Environmental Requirements
I	Access Control System Value Added Resellers
J	List of Approved Security Equipment
K	Approved Access Control Equipment
L	Approved Intrusion Detection Equipment
M	Approved Intercom Equipment
N	Approved Credential and Credential Reading Equipment
O	Miscellaneous Security Devices
P	Digital Video Management System
Q	Conduits, Fittings and Accessories
R	Cabling, Conductors and Miscellaneous Accessories
S	Parking Barriers
T	Locks
U	Universal Washroom
V	Labelling Requirements
W	Sample Graphic Map, Regional Layout and Icons

4.1 Appendix A – Regional Security System Naming Convention Standards

All components and interconnections are to be identified by a unique name which shall be used on drawings, documentation and labels.

These names are to be assigned in compliance with the following guidelines.

Labels are to be attached in a manner which is durable, can be readily read and are in accordance with these guidelines and is further documented in Appendix V.

A full list of the Sites and existing buildings can be provided on request. The Contractor is advised to obtain the latest listing to ensure that this contains any recent updates.

Site:

E005-B (Facility/Building Code)
followed by address
and/or building name

E = Municipality (example: East Gwillimbury)
005 = Building Site Sequential Number
B = Identifies site as an owned Building
Other options:
L = Leased Building
P = Property

System Controllers and Panels (Lenel LNL-2220, Bosch B9512G):

E005SS01 (LNL-2220)
E005SI01 (B9512G)

E005 = Site Number
S = Security controller
S = Intelligent System Controller (ISC)
I = Intrusion Alarm Panel (Bosch)
01 = ISC/Intrusion Panel Sequential Number

Door:

E005D001

E005 = Site Number
D = Card Reader/Door
001 = Matches Reader Port it is associated with.

4.2 Appendix B – Regional Approved Commissioning Form

The commissioning procedure is described in the Specification Document, Section 1.6 Testing and Quality Assurance.

The appropriate Commissioning Forms are to be completed and submitted to the York Region Project Manager for approval no later than 48 hours prior to the proposed commissioning. The Contractor is responsible to ensure that the forms correctly identify the quantity and description of the elements which are associated with a particular project. Note that the forms are available in Excel format and should be submitted in that format. There are 3 forms, one provides the Legend which is to be used and the Overall Project Summary, the second provides a record of the Individual Security Devices and the third form identifies changes to the video surveillance system. The sample forms are to be replaced by those included with the contract documents. Additional copies of these forms shall be created as may be required.

The contractor shall obtain copies of these forms directly from the Region so as to ensure that the forms being used reflect the latest version of the forms and incorporate the latest updates and reflect any technology changes.

SECURITY DEVICE LEGEND

DEVICE	DESCRIPTION	QUANTITY	MODEL NO.
DC	Door Contact		
MD	Motion Sensor		
CR	Card Reader		
REX	Request-To-Exit Motion Sensor		
GB	Glass Break Sensor		
PHB	PhotoBeam Detector		
ES	Electric Strike		
ML	Magnetic Lock		
OHD	Overhead Door Contact		
PB	Panic Button		
DU	Door Unlock/Lock Button		
FC	Fixed Camera		
PTZ	PTZ Camera		
KP	Keypad		
AB	Arming Button		
SS	Access Control Panel		
INTCOM	Aiphone Entry System		
SI	Intrusion System Panel		

SECURITY SYSTEM SUMMARY AND SIGN-OFFS

Building Name, Code, Address:	
120VAC Panel and Circuit Breaker Number for Security Panel:	
Network Information documented (ie.IP Addresses, Ports, switch etc.)	

General Inspections

YES

All devices and modules are labelled.
 All Graphic Devices/Design completed
 Access Levels, Cards/Schedules uploaded/functioning
 Batteries are hooked-up/ UPS test completed
 Tamper/Locks installed
 ESA Inspection passed
 OnGuard Panel notes complete with service information
 3rd party CMS connected and tested

yes
yes
yes
yes

yes

Names of Personnel that performed the commissioning	Date	Signature
Names of York Region Personnel that performed the commissioning	Date	Signature
Warranty start:		

[illegible]

CCTV Commissioning document

Building Name:	
Project Number:	
Date:	

[illegible]

Notes:

- 1-Following parameters must be provided to Honeywell before starting the programming: **Camera name**, **Camera server name**, **Camera address**, **Location**, **Description**, **IP address**
- 2- Honeywell tech can suggest the **Camera name**. **Camera address**, **Location**, **Description**, and **VR** provides sign off if they are acceptable
- 3- Honeywell tech to create PTZ presets and tour based on VR's required field of view of a PTZ
- 4- Following are the VR standards for programming unless otherwise suggested by VR:

Live View frame rate	15 frame per second
Background recording duration	24 hours
Background record frame rate	Full frame-rate
Background delete after	1 month
compression format	H.264
compression Ratio	Medium
resolution for PTZ	1920 x 1080
resolution for Fixed	1280 x 720
PTZ preset Speed	20
PTZ Preset dwell Time	1s

Sign-Off Summary

	Name	Signature
	Honeywell tech performed the commissioning	
	YR personnel accepted the commissioning	

4.3 Appendix C – Standardised Terminology

ACCESS CARD is generally a plastic card, the size of a standard Credit card, with a chip or magnetic stripe containing encoded data that is read by passing the card through or over an electronic device which in turn transmits the encoded data to an electronic controller. From this data the controller identifies the card user and allows or denies access to restricted or secure areas or systems. There are many different forms of card encoding and card reading in common use.

ACCESS CONTROL see Access Control System.

ACCESS CONTROL SYSTEM is an electronic system which controls the status of control locations in accordance with the rules and inputs which have been programmed.

ACCEPTANCE is the process by which the security system is deemed to have passed the Commissioning test and when required the Burn-In testing. The Warranty period will then commence.

ALARM is the name given to the Intrusion Detection System status when a situation occurs which requires immediate on-site investigation, generally because of an unauthorised entry or because a sensor has notified the detection system of an unacceptable status. An Alarm may originate from either the Access Control System or from the Intrusion Detection System. The nature of the alarm notification is not defined and can be a loud siren, stroboscopic lights, electronic messaging or any combination of these and other alternatives. The IDS is normally expected to provide a sequential time stamped log to allow for forensic investigations following an alarm.

ALERT is a low priority notification which may originate from either the Access Control System or from the Intrusion Detection System. Alerts are normally activated in order to “alert” security staff that something is not “quite as expected” and may in some cases be followed by an Alarm when the status has extended from “not quite as expected” to “seriously out of order”. As examples consider that

- The temperature in a food freezer has warmed from -20°C to a threshold of -10°C at which temperature an alert is signalled and when the temperature rises to -3°C, an Alarm is signalled.
- An access-controlled door is held open for 2 minutes longer than the programmed “opening time” causing an Alert to be issued and sound locally but if the door remains open for 4 minutes longer than expected, the Alarm will be activated.
- If the “panic alarm” is activated by a staff member in a washroom or at a service counter there will be no alert, but the Alarm will immediately be activated.
- As soon as the power fails in a building an alert will be issued but the alarm will only be issued when the failure has lasted for, say 2 hours.

ASSETS are tangible or intangible things of the Region of York. Assets include but are not limited to information in all forms and media, networks, systems, material, real property, financial resources, employee trust, public confidence and reputation.

ATTACK is any action to execute a threat.

AUTOMATIC DOOR OPERATOR is a motorised device used to activate a door thereby allowing those with restricted strength or mobility to open doors which might otherwise be too heavy. These are also referred to as Handicapped Door Operators although this term is generally no longer used.

AVAILABILITY is the condition of being usable on demand to support operations, programs and services.

BACnet is a communication protocol for Building Automation and Control (BAC) networks that leverage the ASHRAE, ANSI, and ISO 16484-5 standard protocol. BACnet was designed to allow communication of building automation and control systems for applications such as heating, ventilating, and air-conditioning control (HVAC), lighting control, access control, and fire detection systems and their associated equipment.

BASE BUILDING SECURITY is a description of the security safeguards provided to protect a facility but not the necessarily the assets contained in the building. Basic building security provides a base or starting point for other security requirements (i.e., minimum and enhanced safeguards) to be added to protect the specific assets held by the facility. This is dependent on a TRA and a specific business requirement.

BASELINE SECURITY REQUIREMENTS are the mandatory provisions of the Region of York and its associated operational standards and technical documentation.

BINARY DIGIT is the smallest unit of data in a computer and is often abbreviated to “bit”. A bit has a single binary value, either 0 or 1 (see also Byte).

BITS PER SECOND is the speed of data transmission measured in bits per second and is often referred to as “baud”. Network speeds are generally measured in bps and have risen sharply with a tenfold increase for each new technology ranging from 1 Mbps through 10, 100 Mbps and 1Gbps and 10 Gbps.

BOND SENSOR see Hold Force Sensor.

BURN-IN TESTING is an extended form of “in service” System Integration Testing. For the period which has been defined for this test the system shall be left operational and shall endure all normal in-service characteristics. This may include power outages, weather extremes, etc. The Burn-In Test is designed to prove the operational capabilities of the entire system. This test may, therefore, require that the system function through a normal range of weather and perform in the manner which is expected for a minimum of 30 days. Thus, some burn-in tests can only be performed during the summer or during the winter seasons. No adjustments, configuration changes or maintenance of any kind should be performed during this period. The details of the BIT which is to be performed shall be noted in the Contract Documents.

BUSINESS CONTINUITY PLANNING is an all-encompassing term which includes the development and timely execution of plans, measures, procedures and arrangements to ensure minimal or no interruption to the availability of critical services and assets.

BY-PASS indicates that either one or more sensors or zones are by-passed or off-site monitoring has been “disabled”. While all of these options are generally invoked during testing, the purpose in all cases is to allow for the testing of an alarm system without activating a response from security agents responsible for such investigations. In some situations, if the security system is malfunctioning and the problem has been reduced to a particular sensor or zone, the sensor or zone may be bypassed to allow the remainder of the system to function normally pending the repair of the defect, a by-passed sensor or zone does not provide any signalling. If the entire security system is by-passed, the monitoring service will not activate any response plan for the duration of the “by-pass”. It is common practice, in these circumstances for the

monitoring service will provide a detailed listing of all the alarms received to the client so that the client or the security contractor can compare the report with the stimuli applied to the security system.

BYTE consists of a number of bits and has generally been associated with 8 bits leading to its common nomenclature of an “octet” and allowing for values from 0 to 255. Most modern computers use 4 or 8 bit “words” yielding 32-bit or 64-bit architectures.

BYTES PER SECOND or the number of bytes transmitted per second. There are commonly 8 bits per byte so that a speed of 110 baud is equivalent to approximately 10 characters per second when allowing for parity and other error correction bits.

COMMON ACCESS CARD is a term describing the particular form of access card used by all US Government and military personnel. It should not be confused with any other form of commonly used access cards.

CBRN a general term covering attacks using “Chemical”, “Biological”, “Radiological” or “Nuclear” weapons.

CBRNE this term adds “Explosives” to the possible threats (see CBRN).

CLOSED CIRCUIT TELEVISION, often referred to as “Surveillance”.

CENTRAL STATION see Monitoring Station.

CIVIL DISTURBANCES Means acts of violence and or disorder prejudicial to the public law and order. Civil disturbances most often arise from political grievances, urban economic conflicts, community unrest, terrorist acts, or foreign influences. They can range from peaceful picketing to full-blown riot situations.

CODE can refer to the most recent enacted version of any of a number of Codes which govern the construction and operation of buildings and systems. Typically, the pertinent Codes will include at least the Ontario Electrical Safety Code, the Ontario Building Code, the Elevator Code and the Fire Code.

COMMISSIONING describes the activity of commissioning which is the measured process of placing the security system into its initial operation and may include Proof of Performance and System Integration Tests sufficient to demonstrate the operational status of the entire system under operating conditions. Following the completion of the Commissioning process, the security system shall, if required, complete the Burn-In testing to qualify for Acceptance.

COMPROMISE is the unauthorized disclosure, destruction, removal, modification, interruption or use of assets. Also used to classify the unauthorised opening of a portal, door etc. i.e., an intrusion.

CONTACT ID is the number of the Monitoring Station information in the security system reference list of numbers and alternatives to be called when notification of an alarm is to be transmitted.

CONTINUOUS LIGHTING consists of a series of fixed lights arranged to flood an area continuously with overlapping cones of light.

CONTRACT DOCUMENTS are the documents describing the construction project and the responsibilities of the parties to the agreement. Generally, these documents will include either a detailed design including drawings or may define the performance requirements thereby requiring the contractor to perform the

detailed design. In some construction projects the contract documents may include work to be performed by more than one discipline and in other circumstances the project work relates to only a single discipline.

CONTROL OF ACCESS describes the process of ensuring authorized access to assets within a facility or restricted areas by screening visitors and material at entry points by personnel, guards or automated means and, where required, monitoring their movement within the facility or restricted access areas by escorting them.

CRIME PREVENTION THROUGH ENVIRONMENTAL DESIGN defines territories and how they are controlled and managed based on the use of “concentric rings of control and protection.” Outermost rings are supported by additional inner rings of protection. Each of these concentric rings will be addressed as layers of protection within these guidelines and are intended to sequentially deter, deny access to, and slow down possible malefactors.

CREDENTIALS are a means of identifying a user in to order to manage the “privileges” accorded to that individual. The most common credential is an access card but other credentials technically include keys (mechanical or electronic), fobs (with microchips), voice signatures, finger prints, retinal patterns, hand geometries and other evolving technologies. Credentials are used both in Physical Security settings (doors, windows etc) and in Cyber Security settings (remote access, banking etc).

CANADIAN STANDARDS ASSOCIATION is the Author and Authority who originate the standards, (including the Ontario Electrical Safety Code), which govern most of the devices, particularly the electrical devices used in Canada. The CSA symbol (or approved equivalent) must be permanently attached to every electrical device used with any regular power supply.

CATEGORY 4, 5, 5e, 6 etc define the performance of unshielded twisted pair (UTP) ethernet cables as specified by the Standards developed by the ISO/IEC and ANSI/TIA/EIA 568. These standards define the cable length as limited to 90m (300 ft), a characteristic impedance of 100 ohms. The cable Categories have increased in ordinal and in performance in response to network demands moving from 10 Mbps to 100 Mbps to 1 Gbps to 10 Gbps and rendering older wiring systems obsolete.

CYBER SECURITY is the practice of defending computers, servers, communications links, mobile devices, electronic systems, networks, and data from malicious attacks. It is also known as information technology security or electronic information security. This is quite distinct from Physical Security which is the focus of this document.

DETECTION refers to the use of appropriate devices, systems and procedures to signal that an attempted or actual unauthorized access has occurred.

DIN RAIL is a commonly used device for mounting many types of modules inside enclosures. It was originally specified by the Deutsches Institut für Normung (DIN) in 1928 and has since been adopted internationally (Top Hat Rail IEC/EN 60715).

DOCUMENTATION shall include shop drawings, catalogue sheets, calculations, drawings, diagrams, test print outs, photographs or/and text. Specific references may limit the particular documentation to specific criteria. All documentation submitted to the Owner shall be in English. The format of the Documentation shall be in accordance with the requirements as specified in the Contract Documents.

EMERGENCY LIGHTING depends on alternative power sources, and therefore, is reserved for times when regular lighting is not available. Typically, such lights are selected luminaires or fixtures which are selected from the continuous lighting fixtures and which are provided with an alternative source of power.

END OF LINE or END OF LINE RESISTOR refers to the placement of one or sometimes more than 1 resistor at the remote end of the sensor communications line. See Supervision for more details.

ENVIRONMENTAL THREATS refers to natural phenomena/disasters that have the potential to damage resources or services or to interrupt activities or operations, e.g., hurricanes, floods, heat waves.

EXPLOSION PROOF refers to the certification required of electrical and related safety devices used in hazardous locations. In electrical and safety engineering, hazardous locations are places where particular fire or explosion hazards may exist. Sources of such hazards include gases, vapours, dust, fibres, and airborne particles, which are combustible or flammable. Electrical equipment installed in such locations could provide an ignition source, due to electrical arcing, or high temperature. Standards and regulations exist to identify such locations, classify the hazards, and design equipment for safe use in such locations.

EXTERNAL THREATS refer to threats to the integrity and security brought about by individuals or circumstances outside of the Region of York.

FACILITY - a physical setting used to serve a specific purpose. A facility may be part of a building, a whole building, or a building plus its site; or it may be a construction that is not a building. The term encompasses both the physical object and its use (for example, weapons ranges, agriculture fields).

FAIL OPEN indicates that a failure of the control system will lead to the door or portal being uncontrolled and unlocked. See FAIL SAFE for a further discussion.

FAIL SAFE is a term which may be confusing to the casual user as the term “SAFE” may relate to a portal (door) being “safe for humans”, i.e., open or “safe for property”, i.e., closed. The terms, “FAIL OPEN” and “FAIL SECURE” are less ambiguous and therefore preferred. The reference to “FAIL” refers to the state assumed by the door or portal when control is lost, e.g., when the power has failed, a cable is cut or software malfunctions. It should be noted that while the establishing of a desirable “FAILURE” mode is desirable, unforeseen circumstances may prevent this mode being achieved, e.g., when a mechanical component seizes up or breaks.

FAIL SECURE indicates that a failure of the control system will lead to the door or portal being uncontrolled and locked. See FAIL SAFE for a further discussion.

FALSE ALARM refers to alarm systems being triggered by something other than the expected trigger-event. Examples of those applications include residential burglar alarms, smoke detectors, industrial alarms, and signal detection theory. False alarms are, correctly, limited to those alarms caused by a system not behaving in accordance with the system programming, e.g., a smoke detector activated by dust, a motion sensor activated by a mouse, a glass shock sensor activated by a tree branch hitting the window. (See Nuisance Alarm).

FALSE ALARM RATE, is defined as the number of false alarms (in which an alarm, or warning, is given in spite of a non-event) per the total number of ‘non-events’ (times the event didn’t happen). A false alarm rate is also known as the probability of false detection.

FALSE ALARM RATIO, is the number of false alarms (in which an alarm, or warning, is given in spite of a non-event) per the total number of warnings or alarms in a given study or situation.

HAZARDOUS LOCATIONS refer to electrical and safety engineering locations where fire or explosion hazards may exist. Sources of such hazards include gases, vapors, dust, fibers, and air borne particles, which are combustible or flammable. Electrical equipment installed in such locations could provide an ignition

source, due to electrical arcing, or high temperature. Standards and regulations exist to identify such locations, classify the hazards, and design equipment for safe use in such locations.

HOLD FORCE SENSOR (also referred to as a “Bond Sensor”) is a Hall Effect device mounted in an Electromagnetic lock to monitor the force between the solenoid (coil) and the armature (steel plate). This force which is frequently either 600 lbf (3,000 N) or 1,200 lbf (5,300 N) diminishes rapidly if there is an accumulation of dirt (e.g., rust) on the surface or any other obstacle which prevents the 2 components mating properly. The Hold Force Sensor (HFS) can detect any such holding force reduction and initiate an alarm indicating that the door is closed improperly.

INSIDER THREATS refers to trusted persons, possibly employees of the Region of York, who have been granted access to secured resources or services but could have ulterior motives.

INTERNATIONAL STANDARDS ORGANISATION which defines standards of many kinds and which are implicitly used by the national standards organisations such as CSA etc. These international standards are crucial for example to allow for communications or for manufacturing.

INTEGRITY refers to the accuracy and completeness of assets, and the authenticity of transactions.

INTRINSICALLY SAFE is a protection technique for safe operation of electrical equipment in hazardous areas by limiting the energy, electrical and thermal, available for ignition. In signal and control circuits that can operate with low currents and voltages, the intrinsic safety approach simplifies circuits and reduces installation cost over other protection methods. Areas with dangerous concentrations of flammable gases or dust are found in applications such as petrochemical refineries and mines. As a discipline, it is an application of inherent safety in instrumentation. The alternative to using Intrinsically Safe techniques is to use equipment which is certified as “Explosion Proof”. High-power circuits such as electric motors or lighting cannot use intrinsic safety methods for protection.

INTRUSION DETECTION SYSTEM is a system to monitor, detect and notify unauthorised access or the deviation of sensor observations from acceptable values, e.g., a door which has opened with the presentation of an approved credential or a motion sensor detecting movement in a room which is thought to be closed.

LATCH or LATCHING relates to a lock being set electronically to simulate a “latched door”. In this mode the door is insecure and can be opened without using credentials. The status change may be automated, as in the scheduled opening of an office main entrance, may occur as a result of a manual action at the system console or may be activated by a specially authorised credential.

LOCAL AREA NETWORK is a computer network that interconnects computers within a limited area such as a residence, school, laboratory, university campus or office building. In such an environment the single network can be managed and it is often true that all of the computers belong to a single person or entity, thereby providing for enhanced security. Similarly, the network infrastructure generally all belongs to the same entity thereby ensuring adherence to the same technical criteria.

LOCKDOWN can be used to protect people inside a facility or, for example, a computing system, from a threat or other external event. In buildings, doors leading to the outside are usually locked so that no person may enter or exit. A “full lockdown” usually means that people must “stay where they are and may not enter or exit a building or rooms within it, needing to go to the nearest place designated safe if not already in such a place.” Lockdowns can be defined as “Exit permitted”, “Entrance permitted” or “Full lockdown” thereby defining how access cards will function during the emergency.

MAINTENANCE CONTRACTOR means the Contractor who, following the supply and installation of the Security System, will be responsible for the Maintenance or Modification of the system.

MATERIAL- any tangible object with the exclusion of those embodying information.

MATERIAL SAFETY DATA SHEETS, have been renamed to SDS, Safety Data Sheets (See Safety Data Sheets).

MEAN TIME BETWEEN FAILURES is the predicted, mean or average elapsed time between inherent failures of a mechanical or electronic system, during normal system operation. This is usually measured in hours, days or weeks. The term is used for repairable systems.

MEAN TIME TO FAILURE denotes the expected time to failure for a non-repairable system. Because Mean Time to Failure is relevant only for assets and equipment that cannot or should not be repaired, MTTF can also be thought of as the average lifespan of an asset. This is usually measured in hours, days or weeks.

MEAN TIME TO REPAIR is a measure of the maintainability of a repairable item, which tells the average time required to repair a specific item or component and return it to working status. It is a basic measure of the maintainability of equipment and parts. This includes the notification time, diagnosis and the time spent on actual repair as well as other activities required before the equipment can be returned to service. This is usually measured in hours, days or weeks.

MONITORED is to watch for or detect a breach of security.

MONITORED CONTINUOUSLY is to confirm on a continuous basis that there has not been a breach of security. Examples include electronic intrusion detection system, or someone guarding a particular point on a constant basis.

MONITORED PERIODICALLY is to confirm on a regular basis that there has not been a breach of security. The frequency and diligence of monitoring is based on the recommendations of a Threat and Risk Assessment. Examples of monitoring periodically include by means of a guard patrol, or through employees working at the location.

MONITORING STATION is the contracted agency to who all alarms which have been programmed for external notification are sent. The monitoring station will then follow the Response Plan provided by the customer for each Reporting ID which may include calling phone numbers until a contact is reached or dispatching suitable response personnel.

MULTI MODE FIBRE is a type of optical fibre mostly used for communication over short distances, such as within a building or on a campus. Multi-mode links can be used for data rates up to 100 Gbit/s. Multi-mode fibre has a fairly large core diameter that enables multiple light modes to be propagated and limits the maximum length of a transmission link because of modal dispersion. (See also Single Mode Fibre).

NORMALLY CLOSED identifies that when a momentary switch is not actuated, it is in its “normal” state. Similarly, a relay is in its “normal” state when it is NOT powered. Depending on how the device is constructed, its “normal” state can be either an “open” circuit or a “short” circuit. When a contact is “open” until the button is actuated, it's said to be “normally open” (abbreviated NO) and conversely when the contact is “closed” until the button is activated it is said to be “normally closed” (abbreviated NC). Unfortunately, the security industry has corrupted these explanations and, for example, a door contact's normal state is defined by the status of the door, i.e., the “normal state” of the door corresponds with the door being closed at which time the door contact is “energised” by the magnet or by the door and is referred

to as “normally closed” although, in its “at rest” or normal state, the contact will generally be “open”. The lesson is that the function of normally open and normally closed contacts must be reviewed with caution and varies by specific trades.

NORMALLY OPEN identifies that when a momentary switch is not actuated, it is in a “normal” state. Depending on how the button is constructed, its normal state can be either an “open circuit” or a “short circuit”. When a contact is open until actuated, it is said to be “normally open” (abbreviated NO). Unfortunately, the security industry has corrupted these explanations and, for example, a door contact’s normal state is defined by the status of the door, i.e., the “normal state” of the door corresponds with the door being closed at which time the door contact is “energised” by the magnet or by the door and is referred to as “normally closed” although, in its “at rest” or normal state, the contact will generally be “open”. The lesson is that the function of normally open and normally closed contacts must be reviewed with caution and varies by specific trades.

NUISANCE ALARM is intended to reflect the correct operation of a security system which is however triggered by the incorrect operation of the system without any malicious intent, e.g., furniture movers wedging doors open so that they can work more quickly, opening a window in an already secured area, i.e., such alarms are reporting correctly but the cause is generally “human error”.

ONTARIO ELECTRICAL SAFETY CODE, the Canadian Electrical Code as modified and approved for use in Ontario. This modification is generally enacted about 18 months following the issue of the CSA electrical code.

OPEN SYSTEMS INTERCONNECTION, (ISO 7498) a joint ISO and ITU-T standard for computer networks and communication protocols. The OSI model, is a 7 layered description for communications and computer network protocol design, (Physical, Data Link, Network, Transport, Session, Presentation, Application).

OPERATIONS AND MAINTENANCE shall mean all services and materials necessary for the functioning of the ACS and IDS Systems.

PHYSICAL SECURITY refers to the use of physical safeguards to prevent or delay unauthorized access to assets, to detect attempted and actual unauthorized access and to activate appropriate responses. This may be amplified to describe security measures that are designed to deny unauthorized access to facilities, equipment and resources and to protect personnel and property from damage or harm (such as espionage, theft, or [terrorist attacks](#)). Physical security involves the use of multiple layers of interdependent systems that can include CCTV surveillance, [security guards](#), [protective barriers](#), [locks](#), [access control](#), [perimeter intrusion detection](#), deterrent systems, fire, and other systems designed to protect persons and property.

PHYSICAL SECURITY ASSESSMENT REPORT which is essentially equivalent to a Threat and Risk Assessment report and is generally provided prior to designing a security solution.

PLENUM RATED is a designation used in conjunction with cable insulation. Code requirements demand that any cable placed without suitable conduit in an air return plenum, such as is commonly done, shall have a low smoke generation capability. Such cables are said to Plenum Rated, FT-6 or CMP certified. (See Riser Rated)

PRE-INSTALLATION TESTING includes all testing undertaken prior to the installation of equipment and may also include testing of mock-ups, prototypes and normal factory production testing. This is generally required for any New Equipment, i.e., equipment which is specially manufactured, but may be waived for Standard Equipment, i.e., equipment which is production manufactured.

PREVENTIVE MAINTENANCE (or preventative maintenance) is maintenance that is regularly performed on a piece of equipment or on a system to lessen the likelihood of failure. It is performed while the equipment is still working so that it does not break down unexpectedly. For example, door closers are required to ensure that doors close properly after a controlled entrance but may need inspection and adjustment to ensure that the air pressure from the HVAC system does not impact this function during seasonal changes.

PROBABILITY OF DETECTION is used in to establish the capability of a system to detect intrusions. The use of analytics in combination with CCTV and other sensors are known to have some limitations and therefore to sometimes fail to provide alarms or alerts when expected.

PROOF OF PERFORMANCE TESTING includes all testing undertaken following the field installation of equipment to verify the physical and operational features of each item of equipment and each sub system. This is required for all equipment.

PROTECTION in the context of physical security means the use of physical, procedural and psychological barriers to delay or deter unauthorized access, including visual and acoustic barriers.

PROVEN EQUIPMENT shall mean equipment, other than specified in the project specifications which has been supplied and installed by the vendor for a different but similar purpose. To comply with this definition, the equipment shall have been installed, in at least, five sites in the last ten years, currently be operational and references shall be available from such Agencies.

RACK UNIT is a commonly used measure of height or width when referencing 19 or 23 inch electronic equipment racks as well as the modular equipment installed in them. It is defined in the IEC 60297 as 1.75 inches (44.45 mm) so that a full height rack is often referred to as 42 RU or 42 U high, i.e., 6 ft 1.5 ins (1.8669m).

RECOVERY is the term used to describe the restoration of full levels of service delivery following an interruption in such service.

REPORTING ID is the internally programmed number identifying the location and nature of the alarm and which forms part of the information sent to the Monitoring Station.

RESPONSE is the implementation of measures to ensure that security incidents are reported to appropriate security officials and that immediate and long-term corrective action is taken.

RESPONSE PLAN is the document provided by the client to the Monitoring Station which identifies the action to be taken by the Monitoring Station for each of the Reporting ID's. Typically, the response plan will provide alternatives to address urgent situations if certain individuals are not available.

RESTRICTED, when applied to an Access Area, describes areas where access is limited to authorized individuals and generally includes Operations, Security and High Security Zones.

RISER RATED cables may be used without conduit in fire rated risers or riser rooms but may not be used in air return plenums where the smoke which the insulation would generate under fire conditions would be hazardous. Such cables are referred to as Riser Rated, FT-4 or CMR.

RISK is the measure of probability of a particular mode of "attack" by an intruder to be successful in gaining entry. It may also be summarised as the chance of a vulnerability being exploited.

SAFETY DATA SHEETS are required to provide information regarding all the potentially dangerous chemicals which may be on site as well as the required emergency procedures to be followed in the event of a misadventure. See Material Safety Data Sheets.

SECURITY CONTRACTOR will be the Contractor providing and installing the system described in this Specification and who is trained and certified on the equipment which is being installed under this project.

SENSOR is any device used to monitor a parameter which provides remotely monitored information, e.g., door contact, glass break sensor, water leakage sensor, power failure or motion sensor.

SIMPLE APPARATUS is considered not to appreciably affect the safety of an Intrinsically Safe system. This apparatus is exempted from the requirement for certification. The simple requirements are clearly specified in the apparatus standard. "Simple Apparatus" should always be readily demonstrable to be adequately safe. The usual examples of "Simple Apparatus" are switches, thermocouples, resistive temperature detectors and junction boxes

SINGLE MODE FIBRE is a fibre optic cable which has a smaller diameter core than the Multi-Mode Fibre and allows only one mode of light to propagate. Because of this, the number of light reflections occurring as the light passes through the core decreases, lowering attenuation and creating the ability for the signal to travel further. This application is typically used in long distance, higher bandwidth runs by Telco's, CATV companies, and Colleges and Universities. (See also Multi Mode Fibre).

STANDARD EQUIPMENT see PROVEN EQUIPMENT.

STAND-BY POWER is often a generic term referring to the availability of both a short term, battery-based power source designed to last for a brief period (see Uninterruptible Power Supply) and also a longer-term power source which may be from a local generator or an alternative feeder from a sub-station or transformer.

STRUCTURED CABLING is the communications cabling architecture defined by standards so that the cabling can be maintained and the associated networks can be modified and upgraded as may be required. This architecture defines 6 components, Entrance Facilities, Equipment Rooms, Backbone Cabling, Horizontal Cabling, Telecommunications Rooms (or Enclosures) and Work Area Components.

SUBSTITUTION is the process of requesting and justifying the use of equipment other than that specified by the project specifications. The contractor may request the substitution but must follow the process for submission and justification of the alternative equipment. The Region of York is the final arbiter with regard to the request for a substitution.

SUPERVISION is the term given to the use of resistors in different configurations to monitor the connections between remote sensors and the panels to which they are connected. Most sensors switch between "open" and "closed", i.e., between "infinite resistance" and "zero resistance", when they change state. By placing resistors in series and in parallel with the "sensor", the system will generate alerts if the wires are cut, shorted or the resistance measured by the terminating panel differs from the expected configuration. This supervision ensures that any "tampering" with the infrastructure will be identified and the alarms triggered by such situations are generally referred to as "tamper alarms". See TAMPER ALARMS.

SUPERVISORY CONTROL AND DATA ACQUISITION protocol and associated equipment which is used, particularly in association with the water and waste water equipment used by the Region and which is interconnected with the security system. Many of the devices or parameters associated with the

monitoring of water and waste water relate to analogue data such as temperature, pressure and flow rates as opposed to most security monitoring which is digital, i.e., the door is open or it is closed.

SURREPTITIOUS ATTACK is a secret unauthorized attack to breach or circumvent a defensive system or some of its components in such a manner that the custodians and/or security force cannot readily detect the attack.

SURVIVABILITY is the ability for the equipment to be subjected to the conditions which are referenced for an indefinite period without being operated and then returned to normal operation under different conditions without suffering any degradation or damage, e.g., keeping electronic equipment in a storage facility which is at -40°C when the operational requirement might call for a minimum to -20°C could affect the equipment survivability.

SYSTEM INTEGRATION TESTING includes all testing required to verify the harmonious operation of all designated subsystems. In the case where the larger system consists of individually approved sub components, partial testing shall be carried out on selected samples of equipment only.

TAMPER is the general process of attempting to make unauthorised modifications to a security system, generally in order to defeat the system's ability to detect a planned intrusion. The term "tamper" is often used colloquially to refer to a "tamper switch" which is contact attached to an equipment panel door to detect any unauthorised opening of the cabinet, i.e., tampering with the equipment.

TAMPER SWITCH see TAMPER

TEST REPORT is a pre-programmed call made from the Client site to the Monitoring Station, typically once per day and generally during "silent hours". The Reporting ID is defined as a "Test Report" and the Response Plan will confirm that no action is required. If the scheduled Test Report is not received, the Monitoring Station will typically generate a notification to the Client indicating the absence of the Test Report at the agreed upon scheduled time.

THREAT The perceived imminence of intended aggression by a capable entity to harm any aspect or all of a facility or its contents. **THREAT** can also be considered as any potential event or act, deliberate or accidental, that could cause injury to employees or assets.

THREAT AND RISK ASSESSMENT i.e., an evaluation of the vulnerability of a facility or asset which is generally provided as a report prior to designing a security solution.

TIME TO REPAIR is the time measured from informing the maintenance provider of a problem to the correction and the return to full service of the defective system.

TOGGLE generally refers to the ability to activate a control function repeatedly thereby changing the output state between 2 alternative conditions. This may be the control of lights, i.e., turning them on and then off, or the control of a door, i.e., latching a door open and closed. Such toggling may, for example, be activated by activating a button or by using a specially programmed access card

TROUBLE INPUTS are internal inputs defined within a security system which generate "alerts" to notify the system operators of an internal fault or "trouble". Such "troubles" need attention even if the reported problem does not appear to be causing any immediate concerns. Typical trouble inputs may include battery failure, AC power failure, power supply failure, LAN communications failure, phone line failure excess temperatures in the cabinet, system restart etc.

UNDERWRITERS LABORATORIES or UNDERWRITERS LABORATORIES OF CANADA is one of a number of global industry-based safety testing and certification laboratories which has been approved to perform tests of equipment where otherwise CSA testing would be required.

UNINTERRUPTIBLE POWER SUPPLY is an alternative source of main electrical power which is always available in the event that the primary source of power fails. Generally, the UPS power is on line at all times thereby ensuring that the power to the equipment never fails for even an instant. In many circumstances the UPS is associated with a Standby Generator which starts up and can generate power for a long time after about 1 minute thereby providing power for a long time if the Utility power is absent.

VLAN “virtual LAN” is any broadcast domain that is partitioned and isolated in a computer network at the data link layer (OSI layer 2). LAN is local area network and in this context virtual refers to a physical object recreated and altered by additional logic. VLANs work by applying tags to network frames and handling these tags in networking systems thereby creating the appearance and functionality of network traffic that is physically on a single network but acts as if it is split between separate networks.

VULNERABILITY - an inadequacy related to security that could permit a threat to cause injury.

WALK TEST is a method for testing sensors, generally in an operational security system, without causing false, system alarms. During a walk test, a person will go through each area and intentionally activate sensors so that they are recognized by the system. Arguably, the most important sensors to check during a Walk Test are motion sensors. This is because motion sensors are particularly prone to false alarms when they are mounted improperly. However, the testing process should also include all other sensors which are being monitored. During the Walk Test, the faulted zones will be displayed, but no alarms will be reported to the central station.

WARRANTY is the requirement for the contractor to provide a reliable system with an acceptable “return to service” response time. Typically, this requirement will define availability of parts and trained technicians for a specified period.

WHMIS The Workplace Hazardous Materials Information System are laws, created in 1988 to: give employers and workers information about the hazardous products or chemicals they may be exposed to at work. By international agreement this is now synonymous with a global system known as the Globally Harmonized System for the Classification and Labelling of Chemicals (GHS).

WIDE AREA NETWORK is a computer network spanning regions, countries, or even the world and which may be partially made of infrastructure belonging to many and possibly unknown partners. The application is generally to provide for sharing of data or for the networking of computers.

Wi-Fi is a family of wireless network protocols, based on the IEEE 802.11 family of standards, which are commonly used for area networking of devices and Internet access. *Wi-Fi* is a trademark of the non-profit Wi-Fi Alliance which restricts the use of the term *Wi-Fi Certified* to products that successfully complete interoperability certification testing. Communication using Wi-Fi allows for wireless local area networking (See Appendix D, Standards Applicable to Regional Security Projects, for details of 802.11)

ZONES defines a series of clearly discernible and securable spaces to progressively control access.

4.4 Appendix D – Standards Applicable to Regional Security Projects

This appendix lists the Standards which are generally applicable to portions of the security work specified by the York Region for Security related work. It is the contractor's responsibility to ensure that the most recent version of such Standards or Codes is being used. Should there be any conflicts which arise in the interpretation of such documents the Region of York shall be the final authority.

Standards are divided into distinct groupings and when enforced by Regulation or by Legal Statutes are generally referred to as Codes:

- Internal, i.e., York Region policy and experience-based policies
- Municipal, Provincial and National Standards
- Technology Standards

Any specific standards will be referenced for particular projects as required. Standards shall always be the most current commonly available version at the time the contract was awarded. This list is not intended to be exhaustive but is intended to guide contractors. Contractors are always responsible for adhering to all required and customary standards, best practices and are exclusively responsible for obtaining clarification if required. The primary authoring agencies of the Codes which may be encountered are identified below. It must be noted that these agencies are not necessarily respected or approved in Canadian jurisdictions and the list is not necessarily complete.:

ANSI	American National Standards Association,
BICSI	Building Industry Consulting Service International
CCIR	Consultative Committee for International Radio
CE	Conformity for Europe
CSA	Canadian Standards Association
EEMAC	Electrical Equipment Manufacturers Association of Canada
EIA	Electronic Industry Association
ETL	Electrical Testing Laboratories
FCC	Federal Communications Commission
IEEE	Institute of Electrical and Electronic Engineers
ISO	International Organization for Standardization
JPEG	Joint Photographic Experts Group
MPEG	Moving Picture Experts Group
NFPA	National Fire Prevention Association
NRC	National Research Council (of Canada)
NTSC	National Television Systems Committee
PAL	Phase Alternating by Line
TIA	Telecommunications Industry Association, 568, 569, 606, 607 etc
UL	Underwriters Laboratories Inc.
ULC	Underwriter's Laboratories of Canada

The following Codes may be applicable to most projects

CEC	Canadian Electrical Code 2018, Part 1, C22.1-18
OESC	Ontario Electrical Safety Code 2018
OBC	Ontario Building Code 2012 updated 2020
NBC	National Building Code 2015
NFPA	National Fire Prevention Association 70E, 101, 2021
ULC	Underwriter's Laboratories of Canada, 437 etc
TIA	Telecommunications Industry Association, 568, 569, 606, 607 etc

EEMAC TC3 PVC Fittings for use with Rigid PVC Conduit and Tubing.

CSA C22.2 No. 211.2-06 Rigid PVC (Unplasticized) Conduit.

CAN/CSA C22.2 No. 18-06, Outlet Boxes, Conduit Boxes, and Fittings and Associated Hardware.

Canadian ICES-003 (Interference Causing Equipment Standard Policy)

ANSI / TIA-606-C Cable Labelling Standards (July 2017)

TIA-568.0-D Generic Telecommunications Cabling for Customer Premises

TIA-568.1-D Commercial Building Telecommunications Cabling Standard

TIA-568.2-D Balanced Twisted-Pair Telecommunications Cabling and Components Standard

TIA-568.3-D Optical Fibre Cabling Components

TIA-569-D Telecommunications Pathways and Spaces

TIA-606-C Administration Standard for Telecommunications Infrastructure

TIA-607-C Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises

TIA-862-B Building Automation Systems Cabling Standard

TIA-942-B Telecommunications Infrastructure Standard for Data Centers

TIA-1005-A Telecommunications Infrastructure Standard for Industrial Premises

TIA-1179-A Healthcare Facility Telecommunications Infrastructure Standard

ISO/IEC 11801 Generic Cabling for Customer Premises

IEEE 802.3 Standards

IEEE 802.3af Power over Ethernet (PoE) Standard

IEEE 802.3at Power over Ethernet+ (Plus) Standard

IEEE 802.3bt 4-Pair Power Over Ethernet (4PPoE) Standard

IEEE 802.3an Physical Layer and Management Parameters for 10 Gbps Operation Type 10GBASE-T

IEEE 802.3ba Media Access Control Parameters, Physical Layers and Management Parameters for 40 Gbps and 100 Gbps Operation

IEEE 802.11 Wireless Standard

IEEE 802.11 STANDARDS Wireless Standard

IEEE 802.11, the Wi-Fi standard, denotes a set of wireless LAN/WLAN standards developed by Working Group 11 of the IEEE LAN/MAN standards committee (IEEE 802). The term 802.11x is also used to denote this set of standards and is not to be mistaken for any one of its elements. There is no single 802.11x standard.

IEEE 802.11 details a wireless interface between devices to manage packet traffic (to avoid collisions, etc.). Some common specifications and their distinctive attributes include the following:

IEEE 802.11a – Operates in the 5 GHz frequency range (5.125 to 5.85 GHz) with a maximum 54 Mbps signalling rate. The 5 GHz frequency band isn't as crowded as the 2.4 GHz frequency because it offers

significantly more radio channels than the 802.11b and is used by fewer applications. It has a shorter range than 802.11g, is actually newer than 802.11b and is not compatible with 802.11b.

IEEE 802.11b – Operates in the 2.4 GHz Industrial, Scientific and Medical (ISM) band (2.4 to 2.4835 GHz) and provides signalling rates of up to 11 Mbps. This is a commonly used frequency. Microwave ovens, cordless phones, medical and scientific equipment, as well as Bluetooth devices, all work within the 2.4 GHz ISM band.

IEEE 802.11e – Ratified by the IEEE in late September 2005, the 802.11e quality-of-service specification is designed to guarantee the quality of voice and video traffic. It is particularly important for companies interested in using Wi-Fi phones.

IEEE 802.11g – Similar to 802.11b, this standard supports signalling rates of up to 54 Mbps. It also operates in the heavily used 2.4 GHz ISM band but uses a different radio technology to boost overall throughput. Compatible with older 802.11b.

IEEE 802.11i – Also sometimes called Wi-Fi Protected Access 2 (WPA 2), 802.11i was ratified in June 2004. WPA 2 supports the 128-bit-and-above Advanced Encryption Standard, along with 802.1x authentication and key management features.

IEEE 802.11k – Passed in June 2008, the 802.11k Radio Resource Management Standard will provide measurement information for access points and switches to make wireless LANs run more efficiently. It may, for example, better distribute traffic loads across access points or allow dynamic adjustments of transmission power to minimize interference.

IEEE 802.11n – Ratified in September 2009, 802.11n is a set of standards for wireless local area network (WLAN) communications, developed by the IEEE LAN/WAN Standards Committee (IEEE 802) in the 5 GHz and 2.4 GHz public spectrum bands. The proposed amendment improves upon the previous 802.11 standards by adding multiple-input multiple-output (MIMO) and many other newer features.

IEEE 802.11ac – Published in January 2014 by the IEEE 802.11 LAN/WAN Standards Committee, the standard increases WLAN multi-station throughput from the previous 802.11n standard to at least 1 gigabit per second and to a single link throughput of at least 500 megabits per second (500 Mbit/s). The increased throughput is achieved by utilizing wider RF bandwidth (up to 160 MHz), more MIMO spatial streams (up to eight), downlink multi-user MIMO (up to four clients), and high-density modulation (up to 256-QAM).

IEEE 802.11ad – This amendment defines modifications to both the IEEE 802.11 physical layers (PHYs) and the IEEE 802.11 medium access control layer (MAC) to enable operation in frequencies around 60 GHz and capable of very high throughput up to 7 Gbps.

For further information on cabling standards, please obtain the full versions of the original standards documents.

TIA-568.0-D (2009)	Generic Telecommunications Cabling for Customer Premises
TIA-568.1-D (2009)	Commercial Building Telecommunications Cabling Standard
TIA-568.2-D (2009)	Balanced Twisted-Pair Telecommunications Cabling and Components Standard

Documentation submissions

All documents are to be submitted to York Region using:

- Microsoft Office 2019 or later as appropriate
- AutoCAD 2019 or later as appropriate
- Photographs shall be formatted in JPG but shall be no larger than 10 MB each.

Unless otherwise agreed to or documented in the Contract Documents, hardcopy submittals shall:

- Be printed single side, 8.5 x 11 inches and bound;
- The binding system which is used shall be sufficiently durable for the purpose, i.e., for review or for ongoing reference. Typical binding systems are 3 rings binders, Cerlox and Wire Binding Spines. Note that only the 3 rings binder can be easily updated;
- Pages shall be numbered in the format of “page 23 of 120”, i.e., indicating the total number of pages in the document; and
- Where colour is used to explain any aspect of the documentation the submittal must be printed in colour.

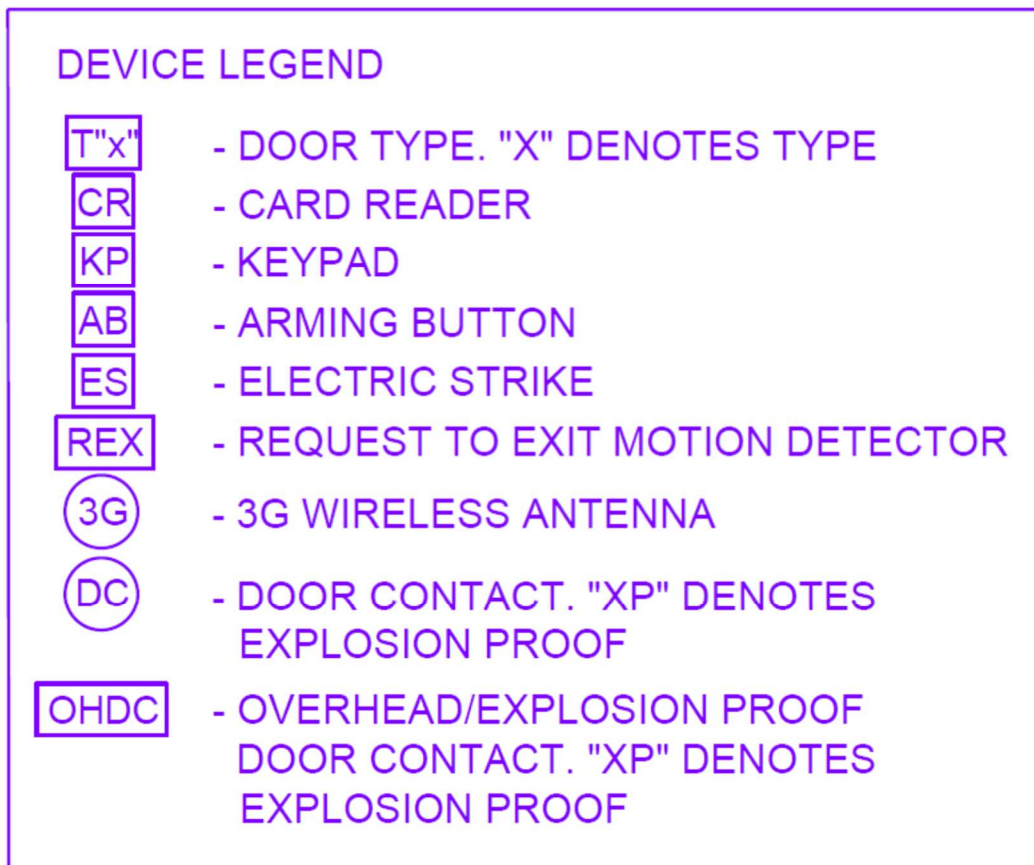

Unless otherwise agreed to or documented in the Contract Documents, Digital submittals shall:

- Be provided in both Adobe’s Portable Document Format (PDF) and in the source document editing format, e.g., Microsoft Word etc. using software and versions which comply with the Region’s Standards as defined in this Appendix;
- The submittal of the digital information may be provided on a portable media, e.g., a thumb drive or a Digital Video Disk (DVD), or through an e-mail or File Transfer Protocol (FTP) exchange;
- Be certified by the sender to be free of all forms of malware, including trojan horses, viruses, worms etc;
- Be free of any encryption, locks, passwords or devices to restrict access unless this is acknowledged and documented prior to the document transmission; and
- Not be subject to any form of proprietary restrictions or copyright.

4.5 Appendix E – Standardised Security Configurations

This section provides typical assemblies, components, drawing conventions and title blocks as used by York Region and which shall be used as the basis of all security contracts undertaken for York Region. If there is a requirement for a function which are not addressed by any of the supplied assemblies, the Contractor shall inform the York Region Project Manager and obtain suitable guidance.

The Contractor shall obtain the most up to date version of these diagrams from the Region prior to preparing the drawings so as to ensure that any updates or technology changes have been incorporated.

Notes:

1. Dedicated 120VAC circuit shall be installed by the contractor for the Security System.
2. The existing security wiring shall NOT be reused.
3. The existing security devices shall NOT be reused.
4. Integration with SCADA and 3rd party monitoring company shall be installed by the Contractor as per Security Specifications and tested in the presence of the Region's representative.
5. Wherever replacing an existing security system the Contractor shall limit the switchover time to one day, making sure there is minimum down time in security for the facility. No facility shall remain unsecured overnight.
6. The Contractor shall install all required conduit, junction boxes, cabling and devices for the Security System including Network (DSL/LTE/Fiber) and SCADA/3rd party monitoring integration.
7. The Contractor shall follow all relevant codes and regulations when installing conduit, wiring and devices in areas labeled as Explosion Proof (Class 1, Div 1(2)).
8. The Contractor shall perform installation conserving wall-space wherever possible.
9. The Contractor shall decommission an existing security system and turn over decommissioned parts to the Region undamaged for future use.
10. The Contractor shall integrate doors with Automatic Door Operators with the new security system using CX-12 module or similar.
11. The Contractor shall install DSL/Fiber/Cable/3G wireless network infrastructure and equipment as directed by the Region.
12. Devices indicated in purple already exist and need to be replaced.
13. Devices indicated in red are new devices. Infrastructure and devices shall be installed by the Contractor
14. For all doors secured with card access the Contractor shall supply and install Medeco CLIQ E-KEY System and all necessary door hardware.

10

[illegible]

[illegible]

1. ALL DOOR HARDWARE AND SECURITY DEVICES SHALL BE OF TYPE AND CONFIGURED TO PROVIDE FREE EGRESS AT SECURE SIDE OF DOOR.
2. FOR EXACT DEVICES, REFER TO SPECIFICATIONS AND DEVICE SUMMARY MATRIX.
3. CONTRACTOR SHALL PROVIDE BACKBONES AND CONDUIT C/W PULLSTRINGS.
4. ALL DEVICES AND WIRING SHALL BE SUPPLIED AND INSTALLED BY APPROVED SECURITY CONTRACTOR.
5. PROVIDE 25 DIAMETER HOLE AT DOOR FRAME AND TOP OF DOOR.

ARMING/ DISARMING ENTRY SINGLE DOOR DETAIL
DOOR TYPE - T1

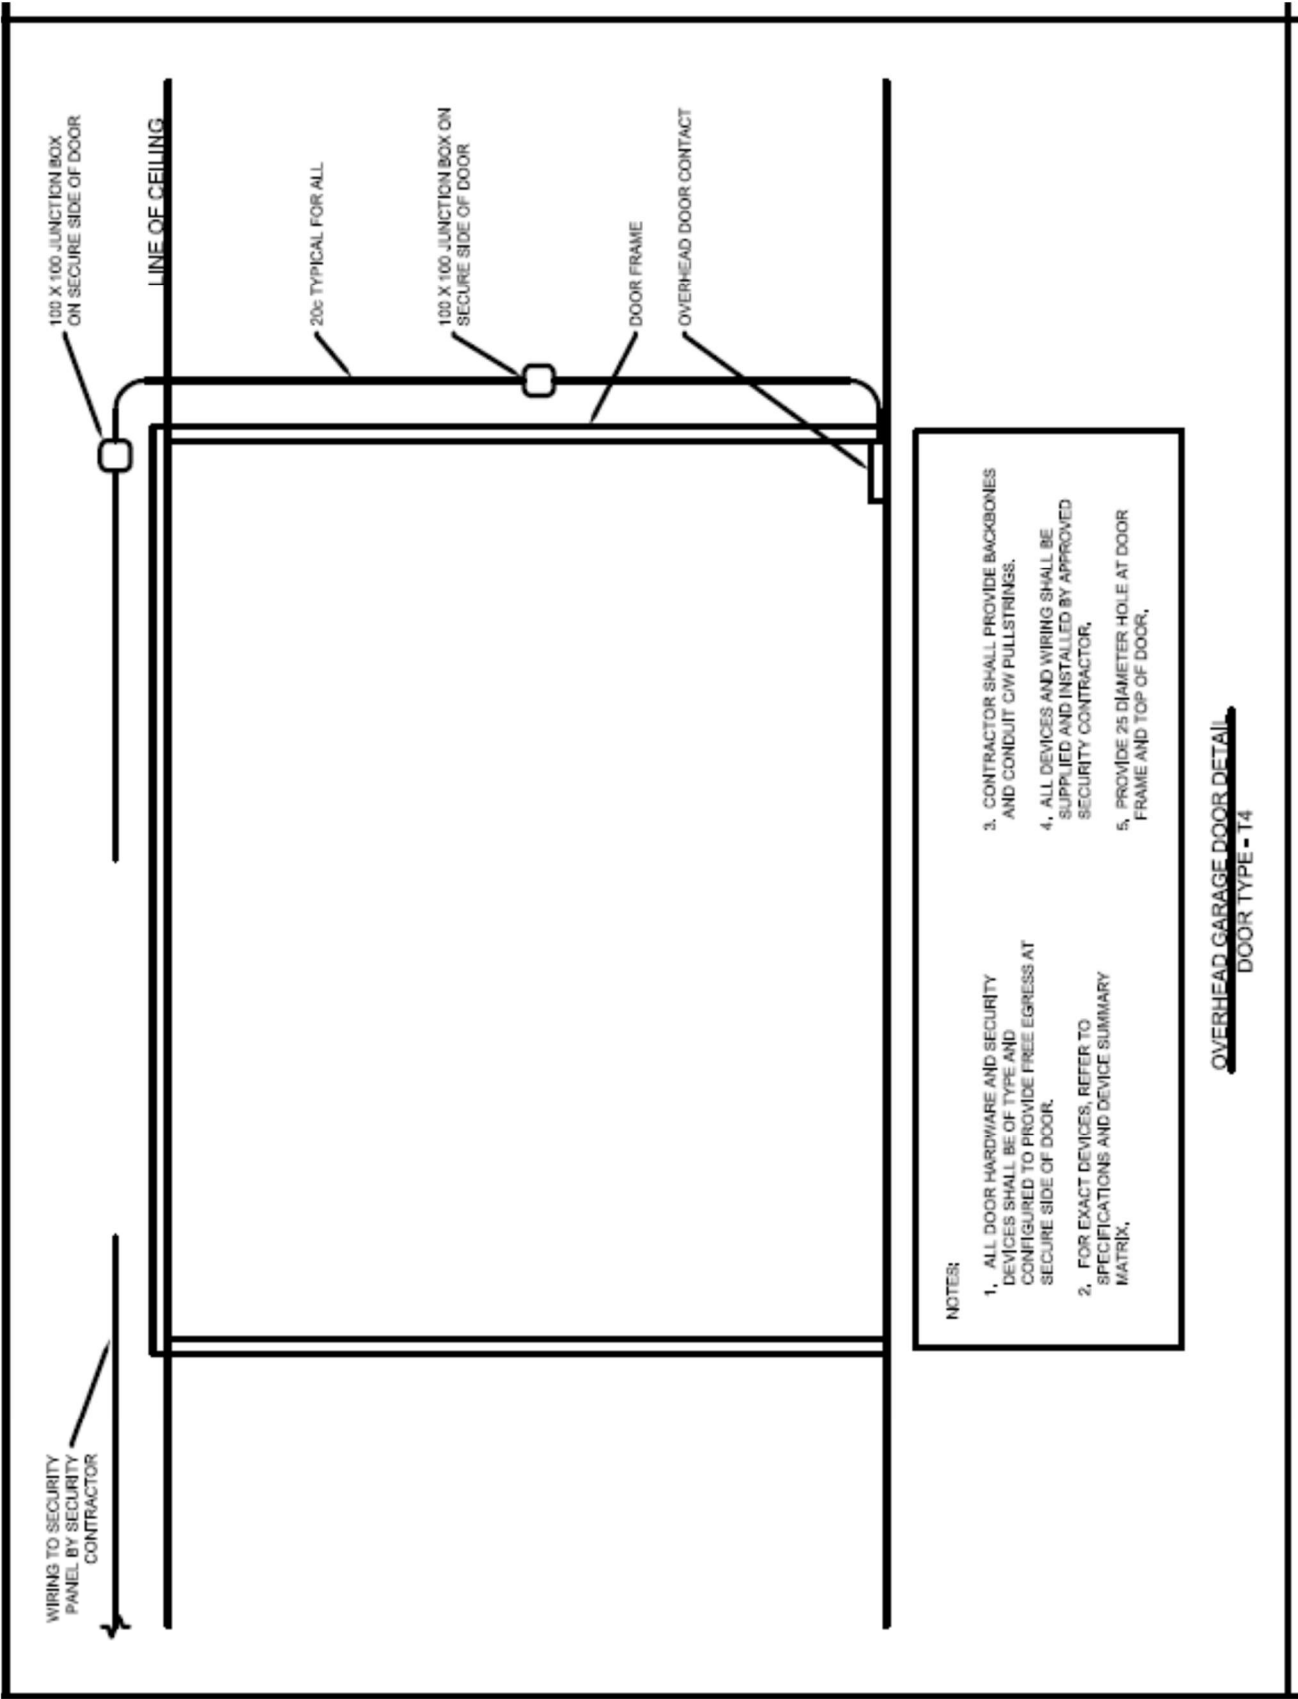

NOTES:

1. ALL DOOR HARDWARE AND SECURITY DEVICES SHALL BE OF TYPE AND CONFIGURED TO PROVIDE FREE EGRESS AT SECURE SIDE OF DOOR.
2. FOR EXACT DEVICES, REFER TO SPECIFICATIONS AND DEVICE SUMMARY MATRIX.
3. CONTRACTOR SHALL PROVIDE BACKBONES AND CONDUIT CAN PULLSTRINGS.
4. ALL DEVICES AND WIRING SHALL BE SUPPLIED AND INSTALLED BY APPROVED SECURITY CONTRACTOR.
5. PROVIDE 25 DIAMETER HOLE AT DOOR FRAME AND TOP OF DOOR.

SECONDARY ENTRY SINGLE DOOR DETAIL
DOOR TYPE - T2

NOTES:

1. ALL DOOR HARDWARE AND SECURITY DEVICES SHALL BE OF TYPE AND CONFIGURED TO PROVIDE FREE EGRESS AT SECURE SIDE OF DOOR.
2. FOR EXACT DEVICES, REFER TO SPECIFICATIONS AND DEVICE SUMMARY MATRIX.
3. CONTRACTOR SHALL PROVIDE BACKBONES AND CONDUIT C/W PULLSTRINGS.
4. ALL DEVICES AND WIRING SHALL BE SUPPLIED AND INSTALLED BY APPROVED SECURITY CONTRACTOR.
5. PROVIDE 25 DIAMETER HOLE AT DOOR FRAME AND TOP OF DOOR.

REMOTE CARD READER / GATE ACCESS POINT DETAIL
DOOR TYPE - T6

SECONDARY ENTRY DOUBLE DOOR DETAIL
DOOR TYPE - T2

- NOTES:
1. ALL DOOR HARDWARE AND SECURITY DEVICES SHALL BE OF TYPE AND CONFIGURED TO PROVIDE FREE EGRESS AT SECURE SIDE OF DOOR.
 2. FOR EXACT DEVICES, REFER TO SPECIFICATIONS AND DEVICE SUMMARY MATRIX.
 3. CONTRACTOR SHALL PROVIDE BACKBONES AND CONDUIT C/W PULLSTRINGS.
 4. ALL DEVICES AND WIRING SHALL BE SUPPLIED AND INSTALLED BY APPROVED SECURITY CONTRACTOR.
 5. PROVIDE 25 DIAMETER HOLE AT DOOR FRAME AND TOP OF DOOR.

TAMPERING / MONITORING POINT DETAIL
DOOR TYPE - T8

4.6 Appendix F – Procedure for Equipment Substitution

.1 INTRODUCTION

The following procedures and forms are provided to the Contractor in order to ensure that if the pre-approved equipment is not going to be installed, there is a clear and fair process to be followed by all parties. The procedure and form require that the costs, quality, reliability as well as potential implications have all been identified and considered.

.2 SUBSTITUTION PROCEDURES

PART 1 GENERAL

.2.1.1 Definitions

Substitutions: Changes in products, materials, equipment, and methods of construction from those required by the Contract Documents and proposed by Contractor.

Architect: Reference to Architect in this Appendix is a reference to the authorised person overseeing the construction contract who may be an Architect, Engineer, Project Manager or a Consultant.

- a. Substitutions for Cause: Changes proposed by Contractor that are required due to changed Project conditions, such as unavailability of product, regulatory changes, or unavailability of required warranty terms.
- b. Substitutions for Convenience: Changes proposed by Contractor or Owner that are not required in order to meet other Project requirements but may offer advantage to Owner.

2.1.2 Submittals

Substitution Requests: Prepare and submit each substitution request for consideration using the procedures listed in Section “Submittal Procedures”. Identify product or fabrication or installation method to be replaced. Include Specification Section number and title and Drawing numbers and titles.

- .1 Substitution Request Form: Use copy of form provided in this Appendix.
- .2 Documentation: Show compliance with requirements for substitutions and the following, as applicable:
 - a. Statement indicating why specified product or fabrication or installation cannot be provided, if applicable.
 - b. Coordination information, including a list of changes or modifications needed to other parts of the Work and to construction performed by Owner and separate Contractors, that will be necessary to accommodate proposed substitution.

- c. Detailed comparison of significant qualities of proposed substitution with those of the Work specified. Include annotated copy of applicable specification section. Significant qualities may include attributes such as performance, weight, size, durability, visual effect, sustainable design characteristics, warranties, and specific features and requirements indicated. Indicate deviations, if any, from the Work specified.
 - d. Product Data, including drawings and descriptions of products and fabrication and installation procedures.
 - e. Samples, where applicable or requested.
 - f. Certificates and qualification data, where applicable or requested.
 - g. List of similar installations for completed projects with project names and addresses and names and addresses of architects and owners.
 - h. Material test reports from a qualified testing agency indicating and interpreting test results for compliance with requirements indicated.
 - i. Research reports evidencing compliance with building code in effect for Project, from ICC-ES.
 - j. Detailed comparison of Contractor's construction schedule using proposed substitution with products specified for the Work, including effect on the overall Contract Time. If specified product or method of construction cannot be provided within the Contract Time, include letter from manufacturer, on manufacturer's letterhead, stating date of receipt of purchase order, lack of availability, or delays in delivery.
 - k. Cost information, including a proposal of change, if any, in the Contract Sum.
 - l. Contractor's certification that proposed substitution complies with requirements in the Contract Documents except as indicated in substitution request, is compatible with related materials, and is appropriate for applications indicated.
 - m. Contractor's waiver of rights to additional payment or time that may subsequently become necessary because of failure of proposed substitution to produce indicated results.
- .3 *Architect's Action:* If necessary, Architect will request additional information or documentation for evaluation within seven days of receipt of a request for substitution. Architect will notify Contractor of acceptance or rejection of proposed substitution within 10 days of receipt of request, or seven days of receipt of additional information or documentation, whichever is later.
- a. Forms of Acceptance: Change Order, Construction Change Directive, or Architect's Supplemental Instructions for minor changes in the Work.
 - b. Use product specified if Architect does not issue a decision on use of a proposed substitution within time allocated.

- c. The architect shall identify costs which may be associated with the revisions to the Contract documents or Contract Drawings and identify who shall be responsible for paying such costs.

2.1.3 Quality Assurance

- .1 Compatibility of Substitutions: Investigate and document compatibility of proposed substitution with related products and materials. Engage qualified testing agency to perform compatibility tests recommended by manufacturers.

2.1.4 Procedures

- .1 Coordination: Modify or adjust affected work as necessary to integrate work of the approved substitutions.

PART 2 PRODUCTS

3.1.1 Substitutions

Substitutions for Cause: Submit requests for substitution immediately upon discovery of need for change, but not later than 15 days prior to time required for preparation and review of related submittals.

Conditions: Architect will consider Contractor's request for substitution when the following conditions are satisfied. If the following conditions are not satisfied, Architect will return requests without action, except to record noncompliance with these requirements:

- a. Requested substitution is consistent with the Contract Documents and will produce indicated results.
- b. Substitution request is fully documented and properly submitted.
- c. Requested substitution will not adversely affect Contractor's construction schedule.
- d. Requested substitution has received necessary approvals of authorities having jurisdiction.
- e. Requested substitution is compatible with other portions of the Work.
- f. Requested substitution has been coordinated with other portions of the Work.
- g. Requested substitution provides specified warranty.
- h. If requested substitution involves more than one contractor, requested substitution has been coordinated with other portions of the Work, is uniform and consistent, is compatible with other products, and is acceptable to all contractors involved.

Substitutions for Convenience: Architect will consider requests for substitution if received within 60 days after commencement of the Work. Requests received after that time may be considered or rejected at discretion of Architect.

Conditions: Architect will consider Contractor's request for substitution when the following conditions are satisfied. If the following conditions are not satisfied, Architect will return requests without action, except to record noncompliance with these requirements:

- a. Requested substitution offers Owner a substantial advantage in cost, time, energy conservation, or other considerations, after deducting additional responsibilities Owner must assume. Owner's additional responsibilities may include compensation to Architect for redesign and evaluation services, increased cost of other construction by Owner, and similar considerations.
- b. Requested substitution does not require extensive revisions to the Contract Documents.
- c. Requested substitution is consistent with the Contract Documents and will produce indicated results.
- d. Substitution request is fully documented and properly submitted.
- e. Requested substitution will not adversely affect Contractor's construction schedule.
- f. Requested substitution has received necessary approvals of authorities having jurisdiction.
- g. Requested substitution is compatible with other portions of the Work.
- h. Requested substitution has been coordinated with other portions of the Work.
- i. Requested substitution provides specified warranty.
- j. If requested substitution involves more than one contractor, requested substitution has been coordinated with other portions of the Work, is uniform and consistent, is compatible with other products, and is acceptable to all contractors involved.

Revised: <<YYYY-MM-DD>>

What effect will the proposed substitution have on the work schedule in comparison to the work schedule without approval of the proposed substitution?

Cost comparison of the proposed substitution to the originally specified item, including correlating modifications required to other work:

Net cost to the Owner: _____

Changes in contract time: _____

Signatures:

Permission to make any substitution after award of contract shall be effected by Change Order. It shall not relieve the Contractor, any subcontractor, or manufacturer, fabricator, or supplier from the responsibility for any deficiency that may exist in the substituted product or any departures or deviations from the Contract Documents as modified by such Change Order.

Except as otherwise expressly specified by the Contractor in the Request for Substitution and expressly approved in such Change Order, the Contractor shall be deemed to warrant, by his request, that the proposed substitute will satisfy all standards and requirements satisfied by the original product, material or equipment specified and the Change Order shall not be deemed to modify the Contract Documents with respect thereto.

If any substitution will affect a correlated function, adjacent construction, or the work of other trades or contractors, the necessary changes and modifications to the affected work shall be considered as an essential part of the proposed substitution, to be accomplished by the Contractor without additional time or expense to the Owner if and when accepted.

4.7 Appendix G – Standardised Abbreviations

The following abbreviations are provided for the convenience of the reader. Note that some of the abbreviations are case sensitive and may be used in conjunction with other units.

A	Amps (Amperes)
AC	Access Control
AC	Alternating Current (see DC)
ACS	Access Control System
ADO	Automatic Door Operator
ADSL	Asymmetric Digital Subscriber Line
AM	Amplitude Modulation (as in broadcast radio)
ANSI	American National Standards Institute
API	Application Programming Interface
ASCII	American Standard Code for Information Interchange
ASHRAE	American Society of Heating, Refrigeration and Air-Conditioning Engineers
ATM	Asynchronous Transfer Mode
A to D	Analog to Digital conversion
b	bit (digital bit)
B	Byte
BCP	Business Continuity Plan
BICSI	Building Industry Consulting Service International
BIT	Burn-In Testing
BMP	Best Maintenance Practices
BSA	Business System Analyst)
bps	bits per second
C	Celsius, Degrees
C	Common (as in electrical connection)
C and D	Collection and Distribution
CA	Contract Administrator
CAC	Common Access Card
CBRN	Chemical, Biological, Radiological and Nuclear (as in threat)
CBRNE	Chemical, Biological, Radiological, Nuclear and Explosive (as in threat)
CCIR	Consultative Committee for International Radio
CCTV	Closed Circuit Television

CCVE	Closed Circuit Video Equipment
CE	Conformity for Europe (as in European Common Market)
CEC	Canadian Electrical Code
cm	Centimetre
CMMI	Capability Maturity Model Integration
CMP	Plenum Rated Cable
CMR	Riser Rated Cable
CPU	Central Processing Unit
CPTED	Crime Prevention Through Environmental Design
CSA	Canadian Standards Association
CSV	Comma Separated Values (Comma Separated Variables)
dB	decibels (logarithmic ratio of sound levels, usually relative to 1 mW)
DC	Direct Current (see AC)
DIN	Deutsche Institut für Normung i.e., German Institute for Standardisation
DSL	Digital Subscriber Line
DTMF	Dual Tone Multi-Frequency
D to A	Digital to Analog Conversion
DVMS	Digital Video Management System
DVR	Digital Video Recorder, a precursor to the NVR
EC	Environment Canada
EEMAC	Electrical Equipment Manufacturers Association of Canada
EIA	Electronic Industry Association
EN	European Standards (European Norms)
ENV	Environmental Department (York Region)
EOL	End of Line (Supervision Resistor)
ESA	Electrical Safety Authority (Ontario)
ETL	Electrical Testing Laboratories
F	Fahrenheit, Degrees
F	Farad, the unit of Capacitance
FAR	False Alarm Ratio
FAR	False Alarm Rate
FCC	Federal Communications Commission (US Government Agency)
FDDI	Fibre Distributed Data Interface

FIPPA	The Freedom of Information and Protection of Privacy Act provides individuals with a right of access to certain records and personal information under the custody or control of institutions covered by the Act.
FM	Frequency Modulation (as in broadcast radio)
FM	Facility Management
fps	frames per second, number of individual still images recorded or shown per second.
ft	Foot or Feet
FT-4	Flame Test Level 4 (Riser Rated Cable)
FT-6	Flame Test Level 6 (Plenum Rated Cable)
G	Abbreviation for Giga, see Giga
GFCI	Ground Fault Circuit Interrupter (see GFI)
GFI	Ground Fault Interrupter (see GFCI)
Giga	The prefix to a value meaning 1,000 000 000 or 10^9
HTML	Hyper Text Mark-up Language
H	Henry, the unit of inductance
Hz	Hertz (frequency in cycles/second)
IDS	Intrusion Detection System
IEC	International Electrotechnical Commission
IEEE	Institute of Electrical and Electronics Engineers (A standards organisation)
in or ins	Inch or Inches
IP	Internet Protocol, also Intellectual Property
IR	Infra-Red
IS	Intrinsically Safe
ISC	Intelligent System Controller
ISO	International Organization for Standardization
ISP	Internet Service Provider
IT	Information Technology
ITS	Information Technology Services
ITU	International Telecommunication Union (A UN Agency)
ITU-T	ITU Telecommunication Standardisation Sector
JPEG	Joint Photographic Experts Group
k	kilo (as in 1,000 of subsequent unit)
K	Kelvin, Degrees
LAN	Local Area Network

LPR	Licence Plate Recognition
LTE	Long Term Evolution
m	Metre
m	milli (as in 0.001 of subsequent unit)
M	Mega (as in 1,000,000 of subsequent unit)
MFIPPA	The Municipal Freedom of Information and Protection of Privacy Act provides individuals with a right of access to certain records and personal information under the custody or control of institutions covered by the Act.
micro	a value of 0.000 001 or a millionth of the subsequent unit (μ)
mm	millimetre
MPEG	Moving Picture Experts Group
MSDS	Material Safety Data Sheet (see SDS)
MTBF	Mean Time Between Failures
MTTF	Mean Time to Failure
MTTR	Mean Time To Repair
nano	a value of 0.000 000.001 or 10^{-9}
NBC	National Building Code (of Canada)
NC	Normally Closed
NEC	National Electrical Code (US Electrical Code)
NEMA	National Electrical Manufacturers Association
NFPA	National Fire Prevention Association
NO	Normally Open
NPT	National Pipe Thread
NTSC	National Television Systems Committee (also form of TV encoding)
NVR	Network Video Recorder
O&M	Operations and Maintenance
OBC	Ontario Building Code
ODBC	Open Database Connectivity
OEM	Original Equipment Manufacturer
OESC	Ontario Electrical Safety Code
OHSA	Occupational Health and Safety Act (Ontario)
OHSS	Ontario Health and Safety Standards
OMM	Operations Maintenance Monitoring (York Region)
OSI	Open Systems Interconnection (model)
p	pico, the prefix to any unit to indicate 10^{-12} , i.e., 0.000 000 000 001

Pa	Pascal (Unit of Pressure - see PSI)
PAL	Phase Alternating by Line (form of TV encoding)
PDC	Power Distribution Centre
PIT	Pre-Installation Testing
PPI	Pixels per Inch
PPM	Preventive Maintenance (same as Preventative)
PMPP	Point to Multipoint Protocol
POD	Probability Of Detection
POE	Power Over Ethernet
POP	Proof Of Performance Testing
PPP	Point-to-Point Protocol
PSAR	Physical Security Assessment Report
PSI	Pounds per Square Inch (see Pascal)
PTZ	Pan, Tilt and Zoom (3 axes of motion for a surveillance camera)
QC / QA	Quality Control / Quality Assurance
QAM	Quadrature Amplitude Modulation (as in digital TV)
RAID	"Redundant Array of Inexpensive Disks" or "Redundant Array of Independent Disks" is a data storage virtualization technology that combines multiple physical disk drive components into one or more logical units for the purposes of data redundancy, performance improvement, or both.
RH	Relative Humidity, expressed as a percentage, indicates a present state of absolute humidity relative to a maximum humidity given the same temperature.
RTD	Resistive Temperature Detector
RU	Rack Unit, also abbreviated as "U".
SAE	Society of Automotive Engineers
SCADA	Supervisory Control And Data Acquisition
SDS	Safety Data Sheet (formerly MSDS)
SDK	Software Development Kit
SI	International System of Units (Metric system)
SIL	Safety Integrity Level, 1, 2, 3 or 4 (IEC 61508)
SIT	System Integration Test
SMTP	Simple Mail Transfer Protocol
SPICE	Software Process Improvement and Capability dEtermination
SQL	Structured Query Language

T	Temperature
T	Abbreviation for Tera (see Tera)
TCP/IP	Transmission Control Protocol (TCP) / Internet Protocol (IP)
Tera	is the prefix to indicate 10^{12}
TIA	Telecommunications Industry Association (standards agency)
TRA	Threat and Risk Assessment
TSSA	Technical Standards and Safety Authority. The Technical Standards and Safety Authority (TSSA) promotes and enforces public safety in Ontario.
TTR	Time To Repair
U	Rack Unit also abbreviated as “RU”.
UL	Underwriters Laboratories (USA)
ULC	Underwriters Laboratories of Canada
UPS	Uninterruptible Power Supply
UTP	Unshielded Twisted Pair, generally referring to Cat 4, Cat 5 or Cat 6 cables
UV	Ultra Violet
V	Volt
VAR	Value Added Reseller
VMS	Video Management System
WAN	Wide Area Network
WHMIS	Workplace Hazardous Materials Information System

4.8 Appendix H – Environmental Requirements

The following requirements are identified for all Security equipment provided to York Region unless otherwise identified.

Unless specifically identified all indoor and outdoor equipment should be capable of performing and or surviving the following operational conditions. Note that particularly in moist or wet locations the contractor has the responsibility to minimise or eliminate all electro chemical potentials which are a primary cause of corrosion. These specifications are intended to address only the requirements in “normal” spaces and do not extend to the special requirements which may exist in “special” locations, such as sewage or water treatment facilities.

Outdoor Operational Environments

Air Temperature Minimum:	-40 °C (-40 °F)
Air Temperature Maximum	+40 °C (105 °F)
Ambient Humidity	10% to 80% (RH)
Wind	240 km/hr (150 mph)
Rain / Snow	6 mm/min
Solar Radiation	1000 W/m ²
Vibration	1.5 mm displacement, 20 m/s ² acceleration, 2 – 200 Hz frequency)
Dust	3.0 mg / m ² h

Indoor Operational Environments

Air Temperature Minimum:	10 °C (50 °F)
Air Temperature Maximum	35 °C (95 °F)
Ambient Humidity	10% to 80% (RH)
Vibration	1.5 mm displacement, 20 m/s ² acceleration, 2 – 200 Hz frequency)

Storage Environments

Air Temperature Minimum:	-45 °C (-50 °F)
Air Temperature Maximum	45 °C (115 °F)
Ambient Humidity	10% to 90% (RH)

4.9 Appendix I – Access Control System Value Added Resellers

- .1 Security Systems shall be provided by one of the Value Added Resellers (VAR) prequalified under Request for Supplier Qualification Number RFSQ-755-22 as listed below (as of July 28, 2023):

360 Advanced Security Corporation	Andrew Pierce Andrew.p@360asc.com (647) 212-9654
Chubb, UTC Fire and Security Canada Inc.	Stephen Yates stephen.yates@chubbfs.com (416) 659-1754
Paladin Technologies Inc.	Greg Cowan gcowan@paladintechnologies.com (437) 684-7963
Securitas Electronic Security (Canada) Inc.	Tom Nanou Tom.nanou@securitasES.com (416) 678-7353

- .2 Installation of the Lenel security system(s) shall be completed by one of the Security System Installers pre-qualified under Request for Supplier Qualifications Number RFSQ-756-22 as listed below (as of October 31, 2023):

AC Electric	Chambers, Alex estimating@acelectricinc.ca (416) 939-0244
CEC Services Inc.	Kyle Feinstein estimating@beswickgroup.com (905) 713-3711
Electro-Works Ltd.	Dondi Keough dondi@tcsecure.ca (416) 529-7180
Ozz Electric	Michael Manias mmanias@ozzelectric.com (416) 989-7568

4.10 Appendix J – List of Approved Security Equipment

The following equipment is pre-approved and detailed equipment submission is not required. Note, however that the contractor is responsible to ensure that the version of equipment must be fully compatible with the environment currently in use or envisaged for imminent use at the York Region. Note that in those categories where multiple manufacturers and models are identified, the contractor is responsible to identify to York Region, the model and manufacturer which is to be used for any given project.

If the contractor requires to use equipment not shown in this listing, full details and justification shall be provided in accordance with the procedure set out in Appendix F “Procedure for Equipment Substitution”. The York Region has the authority to accept or to reject the use of the proposed substitute equipment.

If the function to be provided by the “proposed equipment” is addressed by any equipment which is not listed, then the proposed equipment must be processed through a “Procedure for Equipment Substitution” as documented in Appendix F.

Some of the door contacts used by York Region need to comply with the requirements of Hazardous Locations and therefore shall be certified for use in such areas (Explosion Proof). Even for use in such areas, an approach referred to as “Intrinsically Safe” may be used. This approach requires the use of a certified “barrier” which ensures very low current levels when used with devices which themselves comply with the requirements of a “simple apparatus” and do not need certification. For example, when using a SIL rated barrier, regular door contacts (not explosion proof) may be acceptable for use in a hazardous location. This document is not the place to undertake a detailed design or to recommend solutions. The list of approved equipment which follows includes alternative devices which may be considered for Hazardous Locations.

The information for the principal equipment is listed in Appendices K, L, M, N, O, P and Q and is summarised in the tables below.

.1 Access Control Components

Part#	Description
LNL-2220	Intelligent Dual Reader Controller
LNL-3300	Intelligent System Controller
LNL-4420	Advanced Dual Reader Controller
LNL-1300	Single Reader Interface Module
LNL-1320	Dual Reader Interface Module
LNL-1100	Input Control Module
LNL-1200	Output Control Module
Signo Reader 20/20k/40/40k	HID Corporation, HID® Signo™ Contactless smartcard reader, multi-technology, mobile ready, to suit application
NRP Series	NRP Series pre-fabricated resistor packs by Nascom
SD-80 Series	1" Steel Door Recessed Type Contacts by Tane Alarm
N78 Series	1" recessed wide gap door contact by Nascom
MSS Series	1" Steel Door Recessed Type Contacts by Magnasphere
MET-44 WG	Overhead Door Contact by Tane Alarm or equivalent by Nascom or Magnasphere
LSX Series Micro Switches	Explosion Proof Mechanical Door Contact by Honeywell
TA-4106-ES	Magnetic Door Contact, Manufacturer unknown; available from K M Thomas
EA800, EA880	Explosion Proof Limit Switches by NAMCO, Available from Galco
HSS-L25-800, HSS-L1.5-101	Simple Apparatus Contacts in an Intrinsically Safe Scheme, by Magnasphere
D5030 I.S. SIL3	Relay Out Repeater by GMInternational, available from Exloc Instruments
IS310/IS320	Request-to-Exit (RTE) motion sensors
2966906 Phoenix	SPST Relay 12VDC with base DIN rail-mount or equivalent
2900329 Phoenix	DPDT Relay 12VDC with base DIN rail-mount or equivalent
NP7-12	12V/7Ah Backup Battery
LSP MCLASS FlexPower power supplies and power distribution components	Life Safety Power MCLASS FlexPower Power Supply, Enclosure, Door with backplane/standoffs, no wire management.
Hoffman NEMA Enclosure	Hoffman Concept Series enclosure to suit application and to fit corresponding LSP Enclosure. Shall be lockable with Medeco AWP Padlock and to work with the Region owned Medeco Electronic Keys.
Hoffman Enclosure Accessories	Hoffman Enclosures shall be completed with ADP2, CWHPTO padlock handle, LED24V15 LED Enclosure Light, and full-conductive back panel or Hammond equivalent.
Hammond Eclipse Series Type 4 Steel Enclosure	Type 4 Mild Steel Wallmount Enclosure Eclipse Series to suit application and to fit corresponding LSP Enclosure; padlock handle and lockable with Medeco AWP Padlock and to work with the Region owned Medeco Electronic Keys.
Hammond ERP Eclipse Series Rack Panel	Complete with EHLPL Padlock Handle, Eclipse Rack Panel (ERP) and compatible Rack Rail Mounting Rails. Shall be lockable with Medeco AWP Padlock and to work with the Region owned Medeco Electronic Keys.
R991RBPTD9	Pneumatic delay arming Button, w/delay RED Blank by RCI (Dormakaba)
HES 1006 KD	HES 1006 KD 630 Electric Strike (provided by Locksmith)
HES 9600	HES 9600 The surface mounted, windstorm rated solution for rim exit devices (Provided by Locksmith)
Smart Pac III	In-Line Power Controller for electric strikes by HES (Assa-Abloy)

IN 4007	Snubbing (Snubber) Diodes (any manufacturer)
---------	--

.2 Intrusion Detection System Components

Part#	Description
B9512G	Bosch D9512G Control Panel Alarm Panel
B208 SDI2	Bosch B208 SDI2 8-Input Expansion Module
B308 SDI2	Bosch B308 SDI2 8-Output Expansion Module
B942	Bosch B942 Touch Screen Keypad
B930 ATM	Bosch B930 ATM Style-Alpha Numeric Keypad (SD12)
B56	B56 Keypad Surface Mount Box
B426	Bosch B426 Conettix Ethernet Communication Module
B444-A	Bosch Plug-in Cellular, LTE
FG-1625F or equivalent	Glass Break Detector
DS940Q, Optex DX40 or equivalent	Motion Detector

4.11 Appendix K – Approved Access Control Equipment

.1 Control Panel

Lenel Intelligent System Controllers (To be specified by the Contractor during the design of the security system).

- .1 LNL-2220 Intelligent Dual Reader Controller (IDRC) provides a single board solution for interfacing one or two doors to an OnGuard® system. On-board Ethernet 10/100Base-T port, 6 MB on-board, non-volatile flash memory, Battery-backed, non-volatile storage of 50,000 events, 16 different formats, 12 or 24 VDC input power, 32 downstream devices.
- .2 The LNL-3300 Intelligent System Controller (ISC) by Lenel is designed for advanced access control applications. On-board Ethernet 10/100Base-T port, 15 MB on-board, non-volatile flash memory, Battery-backed, non-volatile storage of 50,000 events, 16 different formats, 12 or 24 VDC input power, 64 downstream devices via two individual downstream RS-485 ports.
- .3 The LNL-4420 is an Advanced Dual Reader Controller by Lenel that provides a single-board solution for interfacing up to 64 doors, plus auxiliary inputs and outputs, to an OnGuard® system.

.2 Input/Output Modules

- .1 LNL-1100: Series 3 Lenel® Input Control Module (ICM) provides the access control system with high-speed acknowledgement of critical alarm points in monitored areas.
- .2 LNL-1200 Series 3: Lenel® Output Control Module (OCM). 16 Form-C 5 A, 30 VDC contacts for load switching, 2 dedicated digital inputs for tamper and power failure status, Elevator control, support for 128 floors, Advanced Encryption Standard (AES) 128-bit or 256-bit encryption.

.3 Reader Interface Unit

- .1 LNL-1300 Series 3: Single Reader Interface (SRI) Module. Access control card readers, keypads, or readers with keypads that use standard Wiegand Data1/Data0, Supervised or Unsupervised F2F, or Clock/Data communication are supported, as are those supporting the bidirectional RS-485 Open Supervised Device Protocol (OSDP™). 12 or 24 VDC power supply, Two Form-C relay outputs (5 A door strike and 1 A aux relays), Up to 16 different card formats, Door contact and REX open or closed, supervised or non-supervised, Strike control output.
- .2 LNL-1320 Series 3: Dual Reader Interface (DRI) Module: Access control card readers, keypads, or readers with keypads that use standard Wiegand Data1/Data0, Supervised or Unsupervised F2F, or Clock/Data communication are supported, as are those supporting the bidirectional RS-485 Open Supervised Device Protocol (OSDP™). 12 or 24 VDC power supply, six Form-C 5 A at 28 VDC relay outputs, up to 16 different formats, door contact and REX open or closed, supervised or non-supervised, strike control output, dedicated tamper and power failure circuits, on-board regulator allows 12 VDC reader support from 24 VDC power source

- .3 LNL-8000: The Star Multiplexer from Lenel is designed to implement star topology on a downstream port of any Lenel® Intelligent System Controller or on any host communication port of any OnGuard® server. Up to eight RS-485 (2-wire) connections or four RS-485 (4-wire) connections can be made downstream of the LNL-8000. Host communications - 38.4 kbps direct wire (RS-232/RS-485 multi-dropped), 12 VDC input power, Status LEDs for heartbeat, upstream and downstream communication.

4.12 Appendix L – Approved Intrusion Detection Equipment

.1 Control Panel

- .1 Bosch B9512G Control Panel Alarm Panel for intrusion devices: Burglary, Commercial Panel has 599 individually identified points, 32 areas. ULC listed. To be used in combination with Bosch B426 Conettix Ethernet Communication Module and/or application appropriate B44x cellular communicator module. Each Bosch panel shall have a minimum of 2 paths of communication to support 3rd party monitoring and integration with Lenel OnGuard.

.2 Keypad

- .1 Bosch B942 Touch Screen Keypad for office and corporate sites.
- .2 Bosch B930 ATM Style-Alphanumeric keypad (SD12) for environmental services non-office facilities.

.3 Input / Output Modules

- .1 Bosch B208 SDI2 8-Input Expansion Module connects to a control panel through the SDI2 bus. This module is supervised and communicates back to the control panel all point status changes. The module's expansion points operate the same as the points on the control panel.
- .2 Bosch B308 SDI2 8-Output Expansion Module. The B308 Octo-output Module provides eight programmable outputs. Each relay provides dry contact switching rated for 1.0 A at 5-24 VDC. The outputs are accessed through on-board screw terminal connections. The B308 is compatible with the SDI2 bus. The onboard switches are used to specify module addresses. Control panel programming will determine output response to specific events.

4.13 Appendix M – Approved Intercom Equipment

.1 Zenitel Stentofon

1. **Zenitel Stentofon** IP & SIP intercom system. Desktop video intercom station ITSV-2 with 5” capacitive touch screen and support for 720P HD Video and TCIV-2+outdoor video intercom. These devices are Power Over Ethernet (“POE”) and connect directly to the building LAN via POE network switch.
 - a. Facility main entrance security gates, card reader pedestal lower mount
 - b. Facility main entrance doors

4.14 Appendix N – Approved Credential and Credential Reading Equipment

.1 Multi-Technology Bluetooth Ready Reader

- .1 Card Readers: Provide multi-technology HID® Signo™ Contactless smartcard reader – multi-technology, mobile ready, proximity card readers where shown on the Drawings and/or where required by the Contract. Card Readers shall be rated for indoor and outdoor use, have multicolour LED with beeper for operator status indications and will operate on 5-16 V DC. Provide thin line mullion style readers where required to match door frame configuration.
- .2 HID Corporation, HID® Signo™ proximity card reader HID Signo Reader Model 20/20K/40/40K, configured to work with all Regional credentials.

.2 Proximity Card

- .1 Proximity Cards used by the Region are HID Corporation ProxCARD II, HU-1326LSSSV (i.e., 120 kHz, 26 bit).

The Contractor is not required to supply proximity cards to the Region unless otherwise indicated.

.3 Long Range Card Reader

- .1 Long range proximity card reader, typical read range 3 to 5 metres
- .2 HID® Proximity MaxiProx® 5375.
- .3 Nedap 9215689 TRANSIT Ultimate. To be utilized for motorized entrance gates at the following facilities (to be identified in the York Region design drawings) with the prior approval from the Region:
 - a. Transit Bus Storage Facilities
 - b. Roads and Traffic Operation Yards

.4 Long Range Proximity Tag

- .1 Long range proximity card, 860 – 960 MHz proximity active vehicle tag.
- .2 HID Corporation, SIO Enabled UHF/iCLASS Smart Card.
- .3 Nedap 9882650 Window Button R/O. To be utilized for motorized entrance gates at the following facilities (to be identified in the York Region design drawings) with the prior approval from the Region:
 - a. Transit Bus Storage Facilities
 - b. Roads and Traffic Operation Yards

4.15 Appendix O – Miscellaneous Security Devices

.1 Door Contacts

- .1 Magnetic door contacts.
- .2 1” recessed steel door approved door contact as shown in the list in Appendix J - List of Approved Security Equipment. Overhead door contact as shown in the list in Appendix J - List of Approved Security Equipment to be installed off the ground. Alternative solution might be required based on door type, mounting requirements, and environment.
- .3 Explosion Proof door contacts or Intrinsically Safe devices as shown in the list in Appendix J - List of Approved Security Equipment to be used in Class 1, Div.1 and Div.2 classified areas.
- .4 DPDT door contacts shall be used at facilities with Intrusion Detection integration requirements.

.2 Rechargeable Lead-Acid Batteries

- .1 12V 7Ah Sealed Non-Spillable Lead Acid Battery
- .2 Yuasa, Honeywell, Bosch-Canada, or approved equivalent.

.3 Exit Devices / Panic Bars

- .1 Push pad exit device, dull chrome finish, UL Listed Von Duprin Panic Hardware FVSR SA163 (N), tested in accordance to ANSI A156.3, 1989, Grade 1.
- .2 Von Duprin 99K-NL Series Panic Exit Devices, or approved equivalent.

.4 Electric Door Strikes

- .1 Heavy duty, stainless steel construction, 3000 lbs static strength, UL 1034, ANSI/BHMA Grade 1, 0.25 Amps @ 24 VDC.
- .2 HES 1006 Series Electric Strike or approved equivalent.
- .3 HES 9600 Series Electric Strike, or approved equivalent.

.5 Electrical Power Transfer

- .1 Transfer of electrical power from door frame to the edge of a swinging door; two (2) 18 AWG wiring, 24VDC, 2A continuous, 16A maximum surge.
- .2 Von Duprin EPT-2, or approved equivalent.

.6 Control Transformers

- .1 120V input, 16V output, 40VA, 60 Hz, single phase rating, copper conductors, dry type.
- .2 Transformers shall be designed, constructed and rated in accordance with UL, CSA and NEMA standards.
- .3 All transformers for each project shall be from the same manufacturer.
- .4 ATC Frost Magnetic Inc., 1640, or approved equivalent.

.7 Request to Exit Sensors

- .1 Wall mount high impact ABS plastic enclosure, alarm output: form “C” contact, single or double door use, adjustable to 60 s, UL Listed.
- .2 Honeywell Model IS310

.8 Push Buttons

a. Exit Push Button

- .1 Wall mount brushed stainless steel plate enclosure, momentary switch output, SPDT 10A @ 125/250 VAC, UL Listed.
- .2 Tyco Security Products - Kantech PB-EXIT, or approved equivalent.

b. Arming Push Button

- .1 RCI R991RBPTD9 Wall mount brushed stainless steel plate enclosure, push button with pneumatic time delay (adjustable 0-45 seconds), blank red button.

.9 Glass Break Detectors

- .1 Shall detect breakage of plate, tempered, layered, laminated and wired glass types, complete with automatic environment test circuitry, detection range of 9 metres, alarm contact 50mA @ 24VDC, UL Listed.
- .2 Honeywell FlexGuard FG-1625F, or approved equivalent.

.10 Motion Detectors

- .1 Wall mount motion monitor with temperature compensation, high impact ABS plastic enclosure, alarm output: form “C” contact, 125 mA @ 28 VDC, tamper and trouble output contacts, UL Listed.
- .2 Detection Systems DS940Q.
- .3 Optex DX40.
- .4 Approved equivalent.

.11 Audio Annunciator

- .1 Wall mount, 24 VDC, 100 dB @ 10', UL Listed.
- .2 Toxalert Inc. HORN/REM RH-24 VDC, or approved equivalent.

.12 Uninterruptible Power Supply

- .1 APC Back-UPS Pro to power all security, access control and wireless network solution. Model to be used is Antigen-presenting cell ("APC") Pro BR1500G or approved equivalent.
- .2 The UPS must reside on a dedicated AC circuit fed from an emergency power panel wherever possible.

4.16 Appendix P – Digital Video Management System

.1 Digital Video Management System (DVMS)

- .1 Lenel Milestone XProtect® Expert Digital Video Management System. The Digital Video Management System (DVMS) shall be designed and developed in conformity with the following standards:

- ISO 9001 (2015) Quality management systems
- ISO/IEC 15504 Measurement Framework for Process Capability and CMMI Level 3 or higher (Capability Maturity Model Integration) (SPICE 2.0 Software Process Improvement and Capability dEtermination)
- SEI CMM Level 3 or higher (American Software Engineering Institute - Capability Maturity Model)

The Digital Video Management System shall include:

- Database Server(s)
- Application Server(s)
- Local recording Networked Camera Server(s) with appropriate software and databases as required
- Operator Workstations (dedicated to the DVMS)
- Network connected cameras and/or network connected video encoders
- Continuous Recording capability for a minimum of thirty (30) days at 30 frames per second (note: see more on the attached camera configuration parameters)

- .2 The Digital Video Management System (“DVMS”) shall be capable of supporting unlimited number of cameras.

As a minimum, the system must support all the latest Axis network cameras, encoders and camera streamers.

- .3 The following DVMS equipment must be used:

- Camera Streamers / Video Encoders:
 - AXIS Communications
- PTZ Network Cameras:
 - AXIS Communications Q6078-E
- Fixed Indoor Dome Cameras:
 - AXIS Communications P3247-LV
- Fixed Outdoor Dome Cameras:
 - AXIS Communications P3247-LVE
- Fixed 360 Indoor/Outdoor Camera:
 - AXIS Communications P3719-PLE
- Use the latest generation of the equipment mentioned in this paragraph. The contractor must ensure that all equipment which is being supplied will be compatible with the existing and previously installed components. If any modifications or upgrades are required, these changes must be included in the project budget and identified in the proposal.

- .4 The DVMS shall support at least the industry-standard Motion JPEG, MPEG-4, H.264, and H.265 as well as Axis's Zipstream technology encoding formats.
- .5 The DVMS system shall be fully integrated with the Lenel OnGuard version currently in use by York Region and be fully compatible with all announced Versions of OnGuard at the time of installation. Lenel OnGuard will be used as the primary user interface.

.2 Network and Video Cabling

- .1 A Local Area Network (LAN) shall be provided for communication between the system elements. All interfaces to the LAN shall be a minimum of 1000BaseTX Ethernet. The LAN may use additional technologies within the backbone for greater speed or distance. Acceptable types are:
 - a. FDDI (Fibre Distributed Data Interface)
 - b. 1000BaseSX or 1000BaseLX Gigabit Ethernet (fibre)
 - c. Asynchronous Transfer Mode (ATM)
 - d. 1000BASE-TX
- .2 The LAN shall use standard network cables. Acceptable cable types are:
 - a. Optical Fibre
 - b. Category 6a or greater Unshielded Twisted Pair (UTP)
- .3 The LAN shall be logically and/or physically separate from any existing LAN infrastructure. Interconnection to other LANs shall **only** be through one of the following:
 - a. A router
 - b. A Layer 3 capable network switch
 - c. As an additional VLAN to the existing LAN equipment. Where required to interconnect VLANs, a router or Layer 3 capable switch shall be provided by the contractor.
- .4 Network video cables shall not be run back to the Camera Server individually. All communications with the Camera Server shall be via the LAN. Each network camera or video streamer shall have a single network interface which is to be used for video and also Pan/Tilt/Zoom communications.
- .5 Supply a complete and working Closed-Circuit Television System (CCTV) System and Digital Video Management System (DVMS).

4.17 Appendix Q – Conduits, Fittings and Accessories

.1 Conduit, Fastenings and Fittings

- .1 Comply with the latest proclaimed version of the OESC.
- .2 Rigid PVC conduit: Conduit, including elbows and fitting, Schedule 40 wall thickness, solvent weld connections, by IPEX Inc., Carlon or approved equivalent.
- .3 Rigid PVC conduit connectors: Adapter type with threaded male portion, by IPEX Inc., Carlon or approved equivalent.
- .4 Conduit straps for rigid steel and PVC conduit: Malleable iron, hot-dip galvanized, single hole type for conduits up to 50 mm, two-hole type for conduits larger than 50 mm.
- .5 Beam clamps: Hot dip galvanized steel designed to clamp onto both sides of the flange. Cat. #S997BC-HG (100-230 mm flange) by Sasco Tube & Roll Forming Inc., Cat. #S999BC-HA (175-430 mm flange) by Sasco Tube & Roll Forming Inc., or type CS91 by Construt Inc. or approved equivalent.
- .6 Expansion couplings: With ground straps or clamps. Type XJ by Cooper Crouse-Hinds Canada or approved equivalent.
- .7 Swivel couplings: Threaded, one piece, by Elliot Electrical Manufacturing Co. Running threads are not acceptable or approved equivalent.
- .8 Conduit spacers: Malleable iron, sized to suite conduit size, by O-Z/Gedney Co., or 1300 Series by Thomas & Betts Ltd or approved equivalent.
- .9 Conduit seals and fittings for hazardous locations: Suitable for applications in designated area, by Crouse-hinds, Pyle-National of Canada Inc., Killark Electrical Manufacturing Co., Appleton Electric Ltd., O-Z/Gedney Co., or approved equivalent
- .10 Hazardous area seal filling compound: As recommended by seal manufacturer.
- .11 Pull cords: 6 mm polypropylene or nylon material. Pro-pull rope by Ideal Industries Inc. or approved equivalent
- .12 Bituminous backpaint: In accordance with CAN/CGSB-1.108.
- .13 Conduits and all junction boxes shall be colour coded to identify the nature of the cabling which is contained within. Where it is not practical to paint the entire conduit, pull box or junction box, e.g., PVC devices, suitable coloured markings shall be applied and visible from a distance, e.g., boxes on the ceiling shall be visible from the ground.

.2 York Region Convention for Conduit Colours:

Sequence No.	Voltage	Colour
1	High Voltage (In Excess Of 750 V):	Brown
2	347/600 V:	Sand
3	120/208 V:	Grey
4	Emergency Power:	Associated Voltage Colour
5	Fire Alarm & Fire phone:	Red
6	Security/Intrusion/Surveillance:	Green
7	Low Voltage Switching:	Black
8	Annunciator Cabinets:	Black
9	Data/Telephone Cabinets:	Blue
10	Telephone Backboards:	Grey
11	Television:	White
12	Public Address/Intercom:	Purple

Cable Colours are not specified unless they are defined for a particular project

4.18 Appendix R – Cabling, Conductors and Miscellaneous Accessories

.1 Wiring and Miscellaneous Accessories

- .1 Provide all RS-232, RS-485, Optical Fibre and Ethernet cabling, and Fibre and Ethernet jacks as required for a complete network, as applicable.
- .2 Direct burial cable for all outdoor applications.

.2 Cabling

- .1 RS-485 Cables
 - .1 Belden EIA Industrial RS-485.
 - .2 Conductors: Twisted pair, each conductor No. 22 AWG stranded copper.
 - i. Pairs: 2.
 - ii. Shield: Aluminum-polyester and 90% copper tinned braid.
 - iii. Jacket: Black UV resistant PVC.
 - iv. Electrical Characteristics at 20°C
 - o Capacitance: 36.1 pF/m
 - o Impedance: 120 ohms
 - o Propagation Velocity: 78%
 - v. Belden Datalene Insulated 3107A.

.2 Lenel hardware wiring shall follow the wiring guide below:

Purpose	Cable type	Gauge	Cond.	Description	Belden number
RS-485, 4-wire	Non-plenum	24	2P	Overall shield	9842
RS-485, 4-wire	Plenum	24	2P	Overall shield	88102
RS-232	Non-plenum	24	5	Overall shield	9610
	Plenum	24	6	Overall shield	83506
Reader drops	Non-plenum	22	6/8	Overall shield	5504FE/ 5506FE
	Non-plenum	22	6	Overall shield	5504FE, 9536
	Plenum	22	6/8	Overall shield	6504FE/6506FE
12 VDC power	Non-plenum	18	2	Overall shield	5300FE, 8760
	Plenum	18	2	Overall shield	6300FE, 88760

.3 CAT6a Cables

.1 Conform with the following plenum rated Ethernet 1000BASE-TX TIA/EIA 568-B.2-1 Category 6a cable:

- i. CSA Certified for trays and risers.
- ii. Conductors: Unshielded twisted pair, #23 AWG solid copper.
- iii. Pairs: 4
- iv. Jacket: Purple Flamearrest, CSA FT4/FT6 rating.
- v. Certification/Testing to at least Category 6a in accordance with the current TIA/ISO Channel Standards.
- vi. Belden Inc. #2400 or approved equivalent.

.4 Instrumentation Cables (4-20mA)

.1 Belden Inc. #8760 or approved equivalent.

- i. #18 AWG.
- ii. 16-stranded copper.
- iii. Beldfoil aluminium polyester shield.
- iv. Twisted shielded pair.
- v. Bare #20AWG copper drain wire.

.3 Wiring Accessories

- .1 Wire and cable markers: Printable, self-laminating, self-adhesive markers, white background, black lettering on white background, vinyl plastic or polyester film suitable to environment. Wire marker to be sleeved with clear heat shrink tubing.
- .2 Terminal blocks: 600 V, 25 A minimum rating, modular, 35 mm DIN rail mounted, provision for circuit number labelling, individually removable, sized to accommodate conductor size and circuit current.
 - a. SAK Series by Weidmuller Ltd.,
 - b. UK Series by Phoenix Terminal Blocks Ltd.,
 - c. WK Series by Wieland Electric Inc.,
 - d. ABB Entrelec or
 - e. Approved equivalent.
- .3 Field wiring terminations: Where screw-type terminal blocks are provided, supply insulated fork tongue terminals.
 - a. Sta-Kon by Thomas & Betts Ltd.,
 - b. Scotchlok by 3M Canada Inc or
 - c. Approved equivalent.
- .4 Moisture and waterproofing: In wet locations, with Liquid Tape by Ideal Industries Canada Corp. or approved equivalent.
- .5 Cables ties: Nylon, one-piece, self-locking type, by
 - a. Thomas & Betts Ltd.,
 - b. Burndy Inc.,
 - c. Wieland Electric Inc or
 - d. Approved equivalent.
- .6 Electrical insulating tape: Scotch 33 by 3M Canada Inc or approved equivalent.
- .7 Cable grips: To accommodate type and geometry of cable supported, single weave, variable mesh design, by:
 - a. Thomas and Betts Ltd.,
 - b. Crouse Hinds,
 - c. Woodhead Canada Ltd or
 - d. Approved equivalent.
- .8 Cable pulling lubricant shall be compatible with cable covering and not to cause damage or corrosion to conduits or ducts. Yellow77 or Clear-Glide by Ideal Industries Canada Corp. or approved equivalent.
- .9 Input 120 VAC power to all security related and access control panels must be provided at each location identified in the design drawings and must be dedicated and separated from any other loads.
- .10 Where conduits may be accessible to “rodents”, or if gas seepage is a risk, steps should be taken to block such rodents from entering and damaging cable insulation.

The contractor shall ensure that the proposed products do not prejudice the cables which are installed in the conduits (or ducts). Possible products include:

- a. Polywater Conduit/Duct Seal,
 - b. 3M Scotchcast Duct Sealing Kit,
 - c. Filoseal + HD Duct Sealing Kit or
 - d. Approved equivalent.
- .11 Wherever conduits or cables are installed through fire rated elements the contractor is responsible to repair any damage to the impregnability of the wall in conformity with the Code requirements.

.4 Communications Line Extenders

1. When communications lines are subject to interference from electrical noise, as for example, when using travelling lines intended for power transmission to elevator cars or lines passing through elevator mechanical rooms, precautions are needed to avoid the introduction of erroneous data.
2. Products provided by Cypress Integration Solutions have been proven to allow Wiegand signals to maintain their integrity under onerous conditions and are to be used for the Region under such circumstances.
3. The recommended device is the Suprex RS-485, Single Reader Extender SPX-1300. 2 modules are required, one at the computer end and one in the elevator and both will require power.

4.19 Appendix S – Parking Barriers

.1 General Observations

.1 There are currently no specified manufacturers or models for the following items:

- a. Detector Loops
- b. Detector loop sealants
- c. Loop Amplifiers
- d. Barrier Arms

Full details of the proposed equipment must therefore be provided for each project.

4.20 Appendix T – Locks

1. Keys and Cylinders

- .1 All doors are to be equipped as outlined in the Security Device Summary document which is associated with the current project. The final configuration will require that the construction (temporary) lock cylinder cores will be replaced with Medeco M³ IC cores. Where specific locks are not defined, doors should initially be equipped with:
 - a. Sargent,
 - b. Assa Abloy or
 - c. Corbin locksets.
- .2 All interior pedestrian exit doors (not overhead doors) shall be equipped with either a “push paddle” or a “panic crash bar” exit device. Such devices shall be installed at a standard height.
- .3 For ALL Environmental Water and Wastewater facilities Medeco M³ Logic Cylinders shall be used for all exterior doors, and doors that need to be secured. All door hardware must be compatible with Medeco M³ Logic Cylinders.

2. Electromagnetic Locks

- .1 As is stated elsewhere electromagnets may be used on York Region projects where specified. Such installations require permits and integration with the Fire Alarm system.
- .2 The Hold Force Sensor should be wired to the door controller if the controlled allows for an auxiliary connection to this sensor or may be wired in series with the door contact so that in either case the Intrusion Detection System will report that the door is improperly closed.
- .3 Note that in the event that the power to the magnet fails and the door remains closed, the HFS will report the door as being “forced”.
- .4 It is recommended that the electromagnet should be installed with the factory installed door position indicators and LED status indicator.
- .5 The Contractor shall reinforce the door and, as required the door frame, to ensure that neither will distort sufficiently to allow the door to open because of a mechanical misalignment.
- .6 The Pre-Approved Electromagnetic Lock is:
 - a. RCI (Dormakaba) Model 8310 (single door) and Model 8320 (double door) with auto sensing 24 / 12 V DC and LED Status indicator.
 - b. Brushed Aluminum by default but optional finishes are available.
 - c. Optional Door Status Sensor (DSS), i.e., Door Contact.
 - d. Optional Security Condition Sensor (SCS), i.e., Bond Sensor.

4.21 Appendix U – Universal Washroom

1. Available Washroom Kit

- .1 The approved hardware required to implement the Universal Washroom in compliance with the OBC is

Camden Door Control equipment package CX-WEC10, “Universal Emergency Call System Kit” which includes: Emergency Button, LED Annunciator with sounder, Dome Light (various colours) with sounder and sign.

4.22 Appendix V – Labelling

1. Introduction

- .1 This section describes the requirement for the Contractor to suitably identify and label all pieces of equipment.
- .2 ANSI/TIA-606-C is the current version of the voluntary standard for administering telecommunications cabling infrastructure, released by the Telecommunications Industry Association (TIA) in July 2017. TIA-606-C builds on the guidelines already established in TIA-606-B, released in 2012, as well as includes some new additions and updates. This standard provides extensive guidelines to the proper use of labelling for environments such as that used at York Region.
- .3 The primary objecting of the labelling is to ensure that all those charged with the responsibility of performing maintenance or repairs on the system at any time can uniquely and safely refer to each component of the system.
- .4 The labelling shall always correspond with the terminology and format of the labels defined on the drawings. Labels shall always be applied to every serviceable or adjustable component of the system.
- .5 Details related to the labelling should always be presented to York Region before being applied.
- .6 Depending on the installation, there will be equipment cabinets, junction boxes, pull boxes, man holes, cameras, network components and other components which are installed to support the security system. Each of these “devices” must be labelled clearly and permanently, using the same nomenclature than has been documented in the system schematics.
- .7 Typically, the preferred form of permanent labelling is engraved Lamacoid. The colours and the format of the label shall be approved by York Region and shall follow the guidance of this section. The selection of colours should be designed so that the engraved or printed labels exhibit good contrast and will not fade or deteriorate due to exposure to the environment in which they are installed, e.g., sunlight or de-icing chemicals.
- .8 The labels, Lamacoid or flexible cable labels shall not, inherently or through their means of installation, induce damage or corrosion to the surface to which they are being attached.
- .9 There will be situations where other means of labelling devices may be more suitable and such options should be reviewed with York Region.
- .10 The labels shall be screwed to the cabinets or, at the discretion of York Region, may be attached to the cabinet using a suitable double-sided weatherproof tape. The surfaces to which the tape is to be applied shall be properly prepared if this approach is selected. All labels to be attached in this manner shall be in “landscape mode” and centred from left to right.

- .11 In some situations, labels will need to be “hung” directly from a component, and this may be accomplished by means of a hole drilled into the label and the use of suitable stainless-steel aircraft cable made for this purpose.
- .12 Further a suitable colour code which may be implemented on conduits with a colour band or in the labelling is recommended. (See Appendix Q: Conduits, Fittings and Accessories)
- .13 All labels shall be machine-generated. Handwritten labels are not acceptable.
- .14 All cables and conductors shall be labelled at each end and at each pull box or hand-hole.
- .15 All labelling shall be consistent on site, in the as-built documentation and in the software.
- .16 Special care should be exercised and labels should be applied to provide warnings related to special procedures when opening some “devices”. For example, if there are multiple sources of power, potentially dangerous supervision of, or monitoring of, automated responses to “tampering” etc. notifications should be present to advise the service staff of such situations.
- .17 The contractor shall post warranty/contact information on the inside of the main control enclosure for each facility as well as the commissioning date.

2. Labelling Details

- .1 Details with respect to the information to be included within the labels are provided below.
- .2 Main alarm outputs and relays shall be labelled accordingly. All alarm points, card readers and other system components shall be labelled in accordance with the door numbering and description syntax.

3. Enclosures

- .1 **Electrical cabinets shall be identified with at least:**
 - Voltage, type of power, power source (including as appropriate Circuit No);
 - Purpose of the cabinet; and
 - Name of the cabinet as shown on the drawings.
- .2 **Communications / Security cabinets shall be identified with at least:**
 - Type of Application, Signal source (including as appropriate Circuit / Port No);
 - Purpose of the cabinet; and
 - Name of the cabinet as shown on the drawings.
- .3 **Junction boxes shall be identified with at least:**
 - Nature of enclosure content, e.g., Data, CCTV, Power, etc
 - If appropriate, Voltage, type of power, power source (including as appropriate Circuit No);
 - Purpose of the cabinet; and
 - Name of the cabinet as shown on the drawings.

- .4 The Contractor shall label all enclosures containing security equipment indicating the nodes installed within.
- .5 All Networked equipment is to be labelled with corresponding IP information.

4. Conduits

- .1 The following information is repeated here for the sake of convenience and also appears in Appendix Q: Conduits, Fittings and Accessories.
- .2 York Region uses the following Conduit colours:

Category No.	Voltage	Colour
.1	High Voltage (in excess of 750 V):	Brown
.2	347/600 V:	Sand
.3	120/208 V:	Grey
.4	Emergency Power:	Associated Voltage Colour
.5	Fire Alarm & Fire phone:	Red
.6	Security/Intrusion/Surveillance:	Green
.7	Low Voltage Switching:	Black
.8	Annunciator Cabinets:	Black
.9	Data/Telephone Cabinets:	Blue
.10	Telephone Backboards:	Grey
.11	Television:	White
.12	Public Address/Intercom:	Purple

- .3 Cable Colours are not specified unless they are defined for a particular project.

5. Cables

- .1 Each end of every cable including the grounding system shall be labelled. Every cable shall also be identified at every pull box or other accessible location along the length of the run.
- .2 These labels shall be of the “wraparound” variety, and as for all other labels shall be machine-generated.
- .3 The labels shall be of suitable size to fit the cables to which they are applied i.e., there will generally be a requirement for multiple label sizes. The labels shall be PANDUIT PLL-33-Y3-5 labels or approved equivalent.
- .4 The specific cable label types are designated based on diameters anticipated for a project. It is recognised that some of the cable diameters may be changed during project execution and for this, or other reasons, the Contractor shall ensure that the overall requirement to ensure that the clear part of the cable label protects the printed part of the cable label is always satisfied. This specification may demand alternative cable labels which shall be from the PANDUIT PLL product line or approved equivalent.
- .5 The label shall be applied within 15 cm (6 ins) of the end of the cable and shall be located so that the cable may readily be identified.
- .6 The printing shall be at least 12-point Arial font or approved equivalent.

- .7 All labelling must be mechanically printed using a laser printer and follow the ANSI/EIA/TIA-606C guideline for colour codes. Hand written labels are not permitted. The following identifies the labelling convention.

6. Cable Labelling Conventions

- .1 The labelling of cables shall clearly identify the application of the cables. This convention requires that cables be identified as follows:
- C for communications;
 - F for fire related applications;
 - H for “high”-voltage power (greater than 48V);
 - L for “low”-voltage power (less than 48V);
 - N for networking;
 - S for signalling;
 - T for transducer; and
 - V for video cables.
- .2 A typical cable label might, for example, be labelled as: “L0003-GAR001-064-ADMIN009-922”. Which would signify,
- Low Voltage Cable
 - Number 0003 cable
 - Cable is from location “GAR001”, “connection 064” to location “ADMIN009”, “connection 922”, i.e., source and destination must be uniquely specified.
- .3 Such cable identifications shall be incorporated in the documentation.
- .4 The Contractor shall obtain the York Region’s approval of any modification or extension to this convention.
- .5 Main alarm outputs and relays shall be labelled accordingly. All alarm points, card readers and other system components shall be labelled in accordance with the door numbering and description syntax.

7. Considerations Regarding ANSI / TIA-606-C:

- .1 TIA-606-C is the latest update to the voluntary standard for administering telecommunications cabling infrastructure, released by the Telecommunications Industry Association (TIA) in July 2017. TIA-606-C builds on the guidelines already established in TIA-606-B, released in 2012, as well as includes some new additions and updates.

8. How to Properly Identify Cables According to TIA-606-C

- .1 Each of the following components must be clearly labelled with the appropriate identifiers:
- Pathways
 - Work area outlets
 - Patch panels
 - Racks and cabinets
 - Ports
 - Grounding busbars
 - Cabling
 - Firestop locations
 - Telecommunications space
 - Data center room grid

9. Examples of TIA 606C Compliant Labelling (Brady Labels)

a. LINK Identifier Not Terminated in the Same Space Label Example

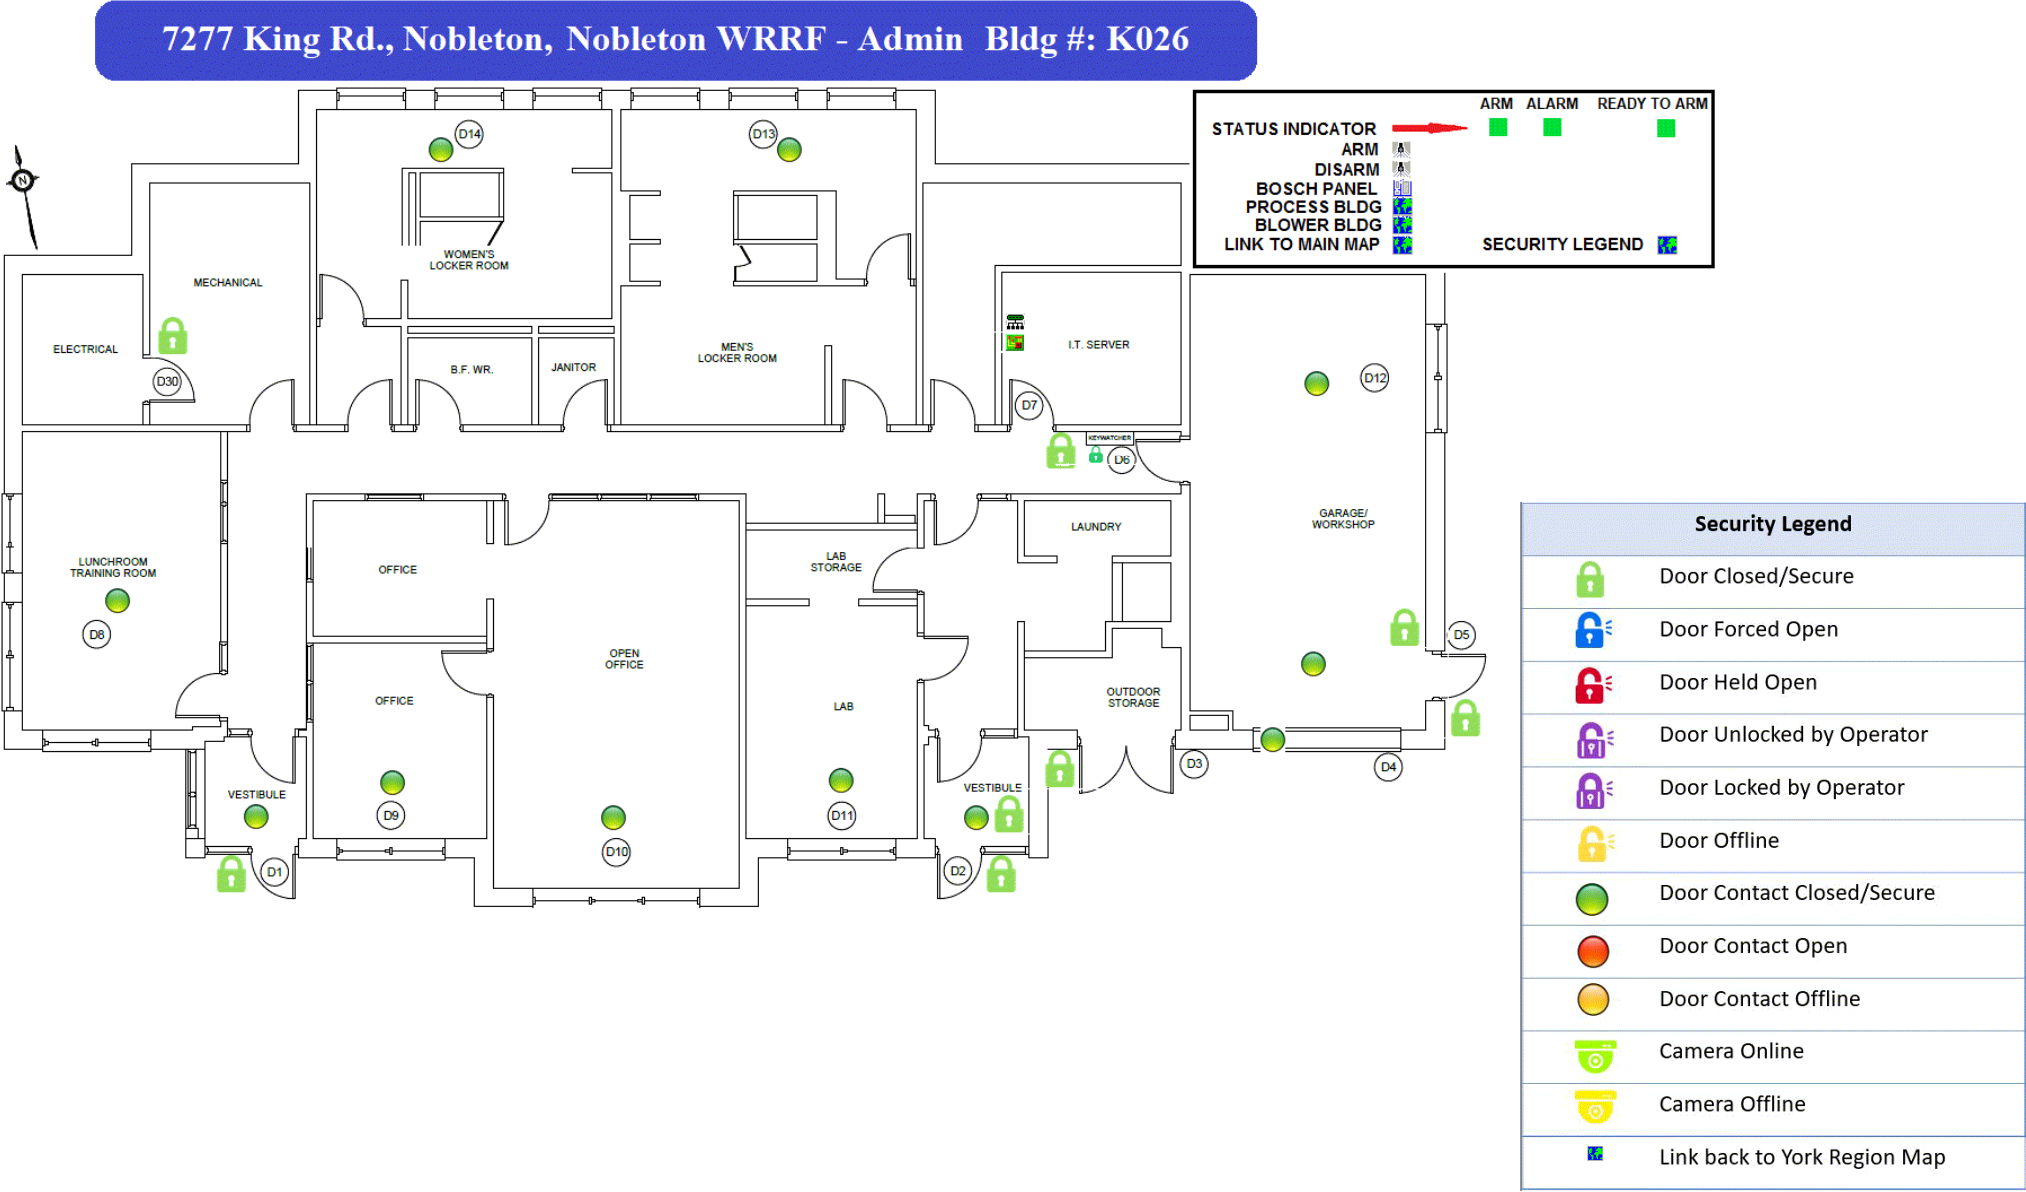

b. LINK Identifier Terminated in Same Space Label Example

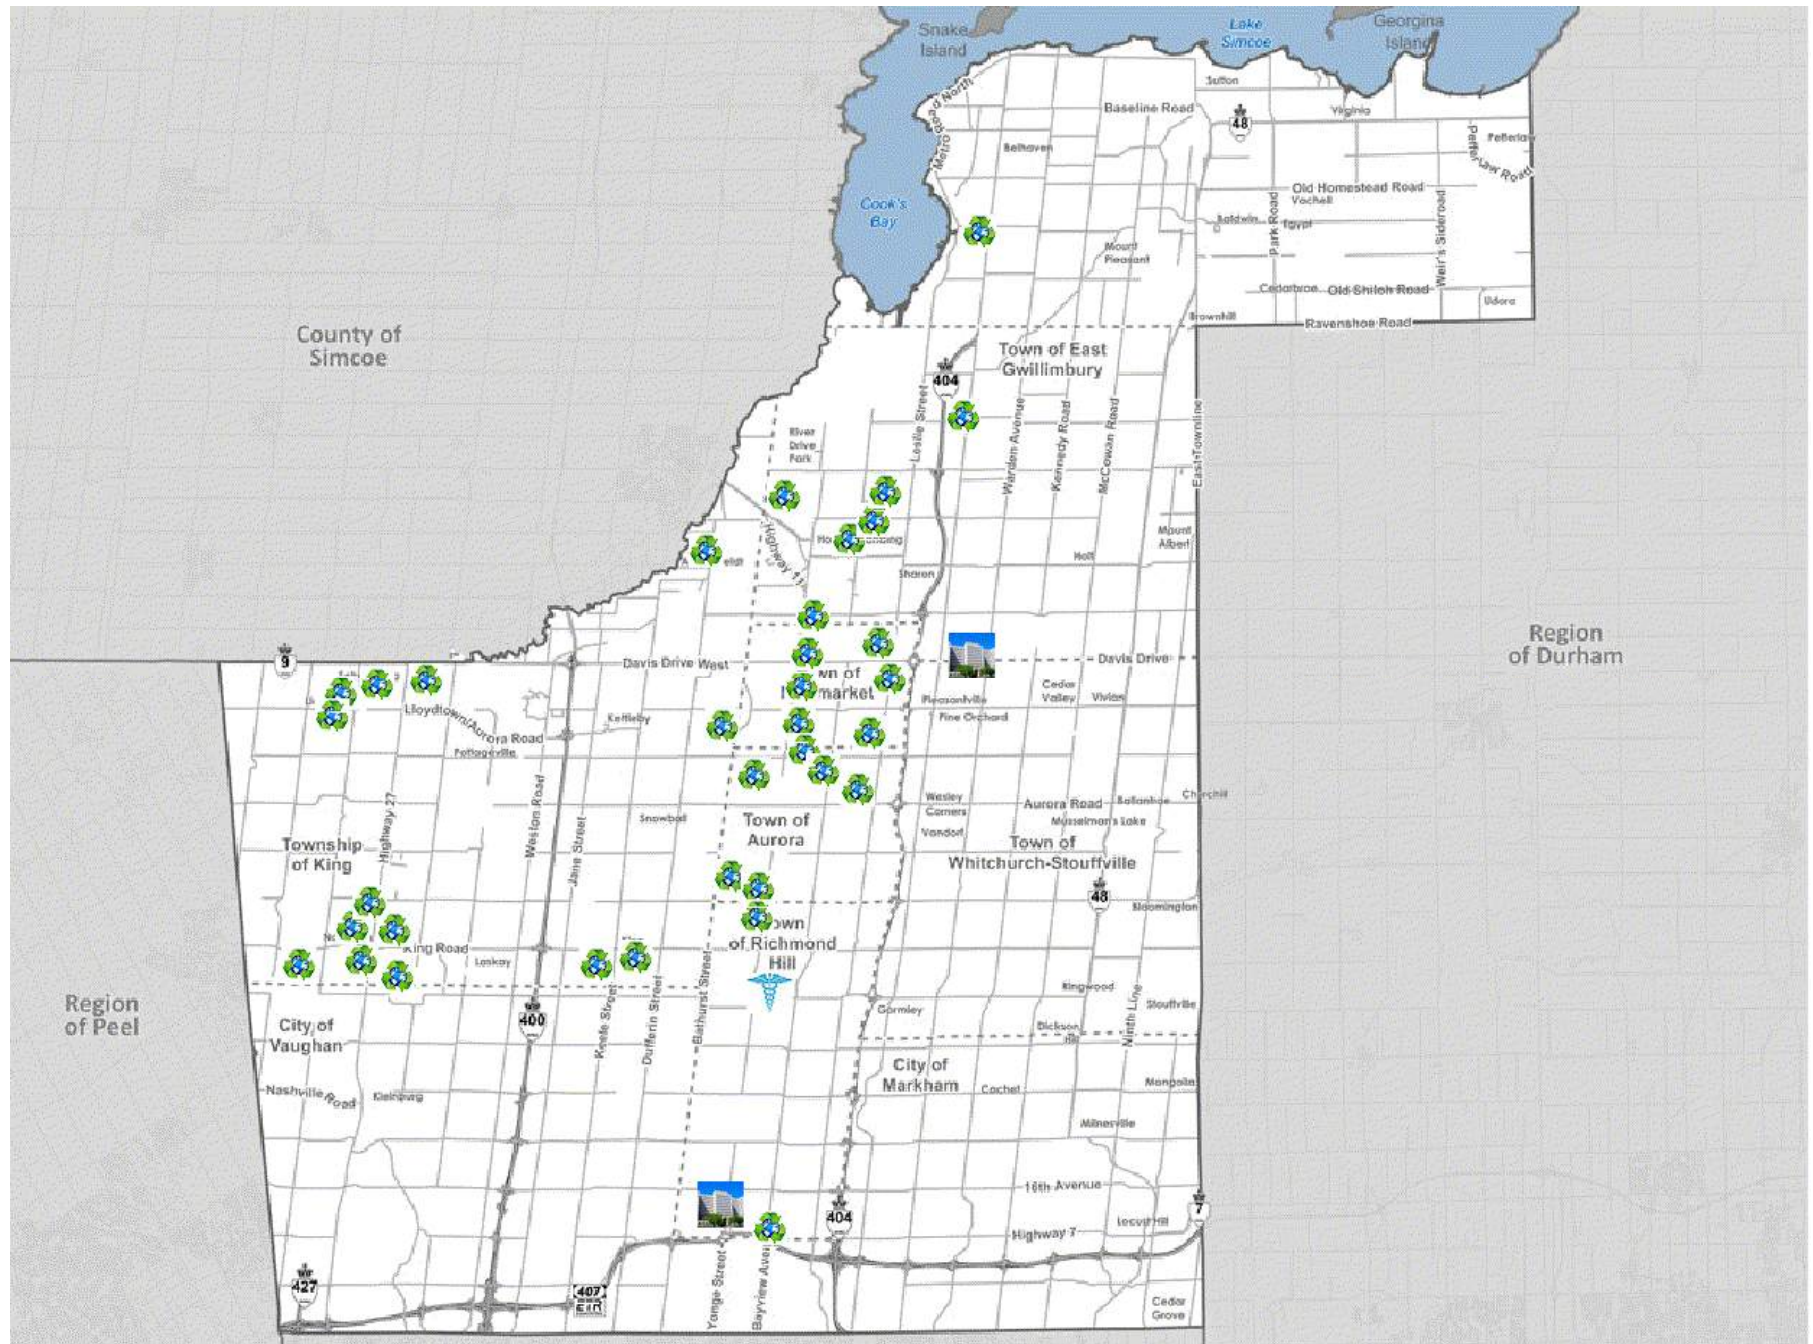

c. Patch Panel Identification Label Example

4.23 Appendix W – Sample Graphic Alarm Map, Regional Layout and Icons

1 General

1.01 RELATED REQUIREMENTS

- .1 Section 03 30 00 – Cast-in-Place Concrete

1.02 ABBREVIATIONS

- .1 GW: Well-graded gravel
- .2 GP: Poorly graded gravel
- .3 GC: Clayey gravel
- .4 SW: Well-graded sand
- .5 SP: Poorly graded sand
- .6 SC: Clayey sand
- .7 CL: Lean clay
- .8 ML: Silt
- .9 CH: Fat clay
- .10 MH: Elastic silt

1.03 REFERENCE STANDARDS

- .1 ASTM International (ASTM):
 - .1 ASTM C136/C136M-19, Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates
 - .2 ASTM D1140-17, Standard Test Methods for Determining the Amount of Material Finer than 75-µm (No.200) Sieve in Soils by Washing
 - .3 ASTM D2487-17e1, Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)
 - .4 ASTM D4318–17e1, Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils
 - .5 ASTM D4791-19, Standard Test Method for Flat Particles, Elongated Particles, or Flat and Elongated Particles in Coarse Aggregate

1.04 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Submit in accordance with Section 01 33 00 – Submittal Procedures.
- .2 Product Data: Submit manufacturer's instructions, product literature, and data sheets for aggregate materials. Include product characteristics, performance criteria, practical size, finishes, and limitations.
- .3 Samples:
 - .1 Submit 1-kg samples of each type of aggregate, as specified.
 - .2 Allow continual sampling by consultant during production.

- .3 Supply new or clean sample bags or containers appropriate for the type of aggregate materials.
- .4 Install sampling facilities at discharge end of production conveyor to allow Consultant to obtain representative samples of items being produced. Stop conveyor belt when requested by Consultant to permit full cross-section sampling.
- .5 Provide front-end loader or other suitable equipment and a trained operator for stockpile sampling as necessary. Move samples to storage location reviewed by Consultant.

1.05 DELIVERY, STORAGE, AND HANDLING

- .1 Segregation, contamination, and degradation of aggregates during handling and transportation is not permissible.
- .2 Store washed materials or materials excavated from underwater for a minimum of 24 hours to allow for free drainage of water and for materials to reach uniform water content.

2 Products

2.01 MATERIALS

- .1 Aggregate Quality: Sound, hard, durable material free from soft, thin, elongated or laminated particles, organic material, clay lumps or minerals, and adherent coatings or other deleterious substances.
- .2 Aggregate Classification:
 - .1 Cohesionless materials: To ASTM D2487.
 - .2 Cohesive materials: To ASTM D2487.
 - .3 Perform testing in accordance with ASTM D4318, ASTM C136/C136M, and ASTM D1140.
- .3 Flat and Elongated Particles of Coarse Aggregate: To ASTM D4791.
 - .1 Length to thickness ratio equal to or greater than 5:1.
- .4 Fine aggregates satisfying requirements of applicable sections, such as Section 03 30 00 – Cast-in-Place Concrete to be one of or a blend of the following:
 - .1 Screenings produced from crushing quarried rock, boulders, gravel or slag.
 - .2 Reclaimed asphalt pavement.
 - .3 Reclaimed concrete material.
- .5 Coarse aggregates satisfying requirements of applicable sections, such as Section 03 30 00 – Cast-in-Place Concrete to be one of or a blend of the following:
 - .1 Crushed rock.
 - .2 Gravel composed of naturally formed particles of stone.
 - .3 Lightweight aggregate, including slag and expanded shale.

- .4 Reclaimed asphalt pavement.
- .5 Reclaimed concrete material.

2.02 SOURCE QUALITY CONTROL

- .1 Inform Consultant of proposed source of aggregates and provide access for sampling a minimum 1 weeks before starting production.
- .2 If materials from proposed source do not meet or cannot reasonably be processed to meet specified requirements then locate alternative source.
- .3 Advise Consultant a minimum 2 weeks in advance of proposed change of material source.
- .4 Provide Consultant with access to source and processed material for sampling.
- .5 Acceptance of material at source does not exclude it from potential future rejection if it fails to conform to specified requirements, lacks uniformity, or if its site performance is found to be unsatisfactory.
- .6 Pay cost of sampling and testing of aggregates which fail to meet specified requirements.

3 Execution

3.01 EXAMINATION

- .1 Verification of Conditions:
 - .1 Topsoil:
 - .1 Examine topsoil for clods, rocks, snow, large roots, litter, and toxic substances before proceeding with stripping.
 - .2 Proceed with topsoil stripping, after unacceptable conditions have been remedied [and after receipt of written approval to proceed from Consultant.

3.02 TOPSOIL STRIPPING

- .1 Do not handle topsoil when wet or frozen or in any manner in which soil structure is adversely affected.
- .2 Begin topsoil stripping of areas as reviewed by Consultant after clearing and removal of brushes, weeds and grasses from site.
- .3 Strip topsoil to depths as reviewed by Consultant. Avoid mixing topsoil with subsoil.
- .4 Stockpile in locations as indicated by Departmental Representative. Stockpile height not to exceed 2 m.
- .5 Dispose of topsoil to location as indicated Departmental Representative.

3.03 AGGREGATE SOURCE PREPARATION

- .1 Clear, grub, and strip unsuitable surface materials before excavating for aggregate production. Dispose of unsuitable materials using method reviewed Consultant.
- .2 Where clearing is required, leave screen of trees between cleared area and roadways as indicated on Contract Documents.
- .3 Clear, grub and strip area ahead of quarrying or excavate sufficiently to prevent contamination of aggregate by deleterious materials.
- .4 When excavation is completed, dress sides of excavation to nominal 1.5:1 slope. Provide drains or ditches as required to permit for proper drainage.
- .5 Trim off and dress slopes of waste material piles. Leave site in neat condition.
- .6 Provide silt fence or other means to prevent contamination of existing watercourse or natural wetland features in accordance with Section 01 57 00 – Temporary Controls.

3.04 PROCESSING

- .1 Process aggregate uniformly using methods that prevent contamination, segregation, and degradation.
- .2 Blend aggregates as required, including reclaimed materials that meet specified requirements in order to satisfy gradation requirements or specified particle shapes.
 - .1 Use methods and equipment reviewed in writing by Consultant.
- .3 When operating in stratified deposits use excavation equipment and methods that produce uniform and homogeneous aggregate gradation.
- .4 Screen, crush, wash, classify and process aggregates with suitable equipment to meet requirements.
 - .1 Use only equipment reviewed in writing by Consultant.

3.05 STOCKPILING

- .1 Stockpile aggregates on site in locations as indicated unless directed otherwise by Departmental Representative. Do not stockpile on completed pavement surfaces.
- .2 Stockpile aggregates in sufficient quantities to meet project schedules.
- .3 Use stockpile sites that are level, well-drained and have adequate bearing capacity to support the weight of stockpiled materials and handling equipment.
- .4 Except where stockpiled on acceptably stabilized areas:
 - .1 Provide compacted sand base minimum of 300 mm in depth to prevent contamination of aggregate; or,
 - .2 Stockpile aggregates on ground but do not incorporate bottom 300 mm of stockpile into Work.
- .5 Divide different aggregates by strong, full depth bulkheads, or separate each stockpile by a sufficient distance to prevent intermixing.

- .6 Do not use intermixed or contaminated materials. Remove and dispose of rejected materials [in accordance with Section 01 74 19 – Waste Management and Disposal within 48 hours of rejection.
- .7 Stockpile materials in uniform layers a maximum 1.5 m in depth. Complete and level each layer before placing the subsequent layer.
- .8 Uniformly spot-dump aggregates delivered to stockpile in trucks and build up stockpile as specified.
- .9 Do not cone piles or spill material over edges of piles. Keep the completed stockpiles neat, regular in form and occupying the smallest possible area.
- .10 Do not use stacking conveyors.
- .11 During winter operations, prevent penetration of ice and snow into stockpile or in material being removed from stockpile.

3.06 CLEANING

- .1 Cleaning: Perform in accordance with Section 01 74 00 – Cleaning.
- .2 Leave aggregate stockpile site in tidy, well-drained condition, free of standing surface water.
- .3 Leave any unused aggregates in neat compact stockpiles in locations directed by Departmental Representative.
- .4 Waste Management: Perform in accordance with Section 01 74 19 – Waste Management and Disposal.
- .5 For temporary or permanent abandonment of aggregate source, restore source to condition meeting requirements of AHJ.

Restrict public access to temporary or permanently abandoned stockpiles by means acceptable to Departmental Representative or Consultant in accordance with Section 01 56 00 Temporary Barriers and Enclosures.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes:
 - .1 Stabilizing Base Gravel.
 - .2 Filter Fabric.
 - .3 Backfill Material.
 - .4 Fillcrete.
 - .5 Trenching.
 - .6 Shoring.
 - .7 Trench Drainage.
 - .8 Backfilling.
 - .9 Backfill Compaction.
 - .10 Testing Backfill Compaction.

1.2 PRICE AND PAYMENT PROCEDURES

- .1 Measurement and Payment:
 - .1 Payment for the work of this Section shall be on a lump sum basis as tendered which shall be full compensation for labour, materials and equipment necessary to complete the work, including all subsidiary and incidental items thereto for which separate payment is not elsewhere provided.

1.3 REFERENCES

- .1 Definitions:
 - .1 Common Excavation:
 - .1 The excavation of all materials including hardpan, quicksand, and frozen earth; also rock, concrete or masonry less than 1.0 m³ in volume shall be classified as common excavation.
 - .2 Rock Excavation:
 - .1 The excavation of rock, concrete or masonry exceeding 1.0 m³ in volume; and solid ledge rock, concrete or masonry which requires for its removal drilling, blasting, wedging, sledging, barring or breaking with a power operated hand tool shall be classified as rock excavation. Soft or disintegrated rock, concrete or masonry which can be removed with a hand pick, power operated excavator or shovel; and loose, shaken or previously blasted rock will not be classified as rock excavation.
 - .3 Class One Backfill:
 - .1 Class One backfilling shall consist of backfilling the trench with sand or gravel compacted in even layers not exceeding 300 mm in depth so that there is no subsequent subsidence in the trench. Backfill shall be compacted to a minimum of 100% Standard Proctor Density. Fillcrete may be used in lieu of Class One backfill.

- .4 Class Two Backfill:
 - .1 Class Two backfilling shall consist of replacing the excavated material in even layers not exceeding 300 mm in depth, and compacting each layer by mechanical means to 95% Standard Proctor Density.
- .5 Class Three Backfill:
 - .1 Class Three backfilling shall consist of replacing excavated material in the trench by approved methods. Every attempt shall be made to consolidate the backfill to avoid bridging and subsidence. The Contractor shall ensure that settlement of the surface shall not exceed 100 mm over a period of one year. Contractor shall be responsible for all costs associated with the repairs of subsistence during the warranty period.
- .6 Topsoil:
 - .1 The top layer of soil containing organic material capable of supporting good vegetative growth and suitable for use in top dressing, landscaping and seeding.
- .2 Reference Standards:
 - .1 Ontario Government:
 - .1 Occupational Health and Safety Act.
 - .2 American Society for Testing and Materials International (ASTM):
 - .1 ASTM C136/C136M-19, Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.
 - .2 ASTM D698-12(2021), Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12 400 ft.-lbf/ft³ (600 kN-m/m³)).
 - .3 ASTM D1883-21, Standard Test Method for California Bearing Ratio (CBR) of Laboratory-Compacted Soils.
 - .4 ASTM D3786/3786M-18, Standard Test Method for Bursting Strength of Textile Fabrics-Diaphragm Bursting Strength Tester Method.
 - .5 ASTM D4533/D4533M-15, Standard Test Method for Trapezoid Tearing Strength of Geotextiles.
 - .6 ASTM D4632/D4632M-15a, Standard Test Method for Grab Breaking Load and Elongation of Geotextiles.
 - .7 ASTM D4833/D4833M-07(2020), Standard Test Method for Index Puncture Resistance of Geomembranes and Related Products.

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS:

- .1 Samples:
 - .1 At least two weeks prior to commencing work, inform Engineer of proposed source of granular materials.
 - .2 The Contractor shall provide a sieve analysis of the material for the Engineer's approval.
 - .3 Sand and gravel shall be approved by the Engineer before being used.

.2 Test and Evaluation Reports:

- .1 Submit compaction and density test results to the Consultant.
- .2 The cost of all initial testing will be borne by the Owner and the Contractor is responsible for the costs of any re-testing for areas where initial testing failed.

1.5 QUALITY ASSURANCE

.1 Safety Requirements:

- .1 The Contractor shall be required to observe all applicable Sections of the Province of Ontario's Occupational Health and Safety Act and Code covering worker safety in trenches and excavations.
- .2 Open cut trenches shall be sheeted and braced as required by the Accident Prevention Regulations of the Occupational Health and Safety Division of the Department of Labour and Municipal Ordinances, and as may be necessary to protect life, property and the work.
- .3 Prefabricated cages or shields, provided they conform with all applicable safety requirements, may be used to supplement or replace conventional shoring.

Part 2 Products

2.1 STABILIZING BASE GRAVEL

- .1 Stabilizing base gravel shall be well graded gravel consisting of hard durable particles free from clay lumps, cementation, organic material, frozen material and other deleterious materials.
- .2 The material shall meet one of the following gradations depending on the native foundation material encountered:

Screened Rock-Washed (Not Crushed)		Crushed Gravel	
Sieve Size (mm)	Percent Passing (by weight)	Sieve Size (mm)	Percent Passing (by weight)
25	100	25	100
10	30 – 55	20	35 - 60
2	5 – 25	5	15 - 40
0.4	0 – 5	0.4	5 - 15
		0.063	0 - 5

- .3 The liquid limit shall not exceed 25 and the plasticity index shall not exceed six.

2.2 FILTER FABRIC

- .1 The synthetic filter fabric shall consist of a durable, permeable, non-woven, polyester fabric composed of continuous synthetic filaments in a random arrangement with typical properties as follows:

Tensile Grab Strength – ASTM D4632/D4632M	700 N
Trapezoid Tear Strength – ASTM D4533/D4533M	285 N

Mullen Burst Strength – ASTM D3786/D3786M 2,100 kPa
Puncture – ASTM D4833/D4833M 400 N
Filter fabric shall be Amoco 4551, Layfield 601 or approved equal.

2.3 CLASS 1 BACKFILL MATERIAL

- .1 Material for Class One backfill shall consist of sound, hard, durable, uniformly graded crushed gravel and shall not contain organic or soft materials, materials that break up when alternately frozen and thawed or wetted and dried, or other deleterious materials. When compacted near the optimum moisture content to not less than 95% of the maximum dry density corrected for the stone content as determined by ASTM D698, the material shall have a minimum bearing ratio as defined ASTM D1883, of fifteen percent (15%).
- .2 Class One backfill shall meet the following gradation when tested to ASTM C136/C136M:

Sieve Size (mm)	Percent Passing (by weight)
60	100
16	32 - 85
5	20 - 65
0.315	6 - 30
0.08	2 - 10

2.4 FILLCRETE

- .1 Non-shrinking fill made up of a mixture of Portland cement, sand, water and admixtures conforming to the following:
 - .1 Minimum 28 day compressive strength 1.00 to 2.00 MPa
 - .2 Slump 100 mm \pm 25 mm
 - .3 Portland Cement Type Ten
 - .4 Air entrainment 5% \pm 1%

Part 3 Execution

3.1 PREPARATION

- .1 Protection of in-place conditions:
 - .1 Existing buried utilities and structures:
 - .1 Prior to commencing any excavation work, notify applicable owner or authorities, establish location and state of use of buried utilities and structures. Clearly mark such locations to prevent disturbance during work.
 - .2 Maintain and protect from damage, water, sewer, gas, electric, telephone and other utilities and structures encountered. All damage incurred shall be repaired by the Contractor at his expense.
 - .2 Existing buildings and surface features:

- .1 Maintain and protect from damage existing buildings, trees and other plants, lawns, fencing, service poles, wires, rail tracks, paving, survey bench marks and monuments which may be affected by work. All damage incurred shall be repaired by the Contractor at his expense.
- .2 Site Preparation:
 - .1 Strip organic material, clear and grub, remove weeds and grasses as specified or as required by the Engineer prior to excavation. Avoid intermixing of subsoil fill materials with organic material and from other forms of contamination.

3.2 TRENCHING

- .1 Trench width:
 - .1 The minimum trench width below the crown of the pipe shall be not less than the nominal diameter of the pipe plus 400 mm. The maximum width of the trench below the crown of the pipe including shoring shall be not more than the nominal diameter of the pipe plus 600 mm or not more than a total width of 900 mm, whichever is the larger. Where the maximum trench width is exceeded, the Contractor shall, at his own expense, provide special bedding or take other precautions as directed by the Engineer. Where more than one pipe is laid in the same trench, the minimum and maximum widths shall be as directed by the Engineer.
 - .2 The Contractor shall confine his activities to the immediate area of the trench. All activities outside trench boundaries shall be performed so as not to damage other existing features. The Contractor shall generally have the option of using either vertical shored trenches or Vee trenches. Every effort shall be made to restrict the trench widths to minimize the area disturbed.
- .2 All excavated material shall be piled at least 1.0 m clear of the trench top to prevent material from falling back into the excavation. The material shall be piled in such a manner that it will not endanger the work, or obstruct other work or rights-of-way. Sufficient clear space must be left on one side of the trench to accommodate the Engineer's stakes.
- .3 The trench shall be excavated so that the pipe can be laid to the alignment, grade and depth required.
- .4 Trench Rock Excavation:
 - .1 Where excavation is made in rock or where excavation is made in a material which cannot provide an even, uniform and smooth surface; or where large stones are encountered in the trench, such material shall be removed to provide a clear distance between any part or projection of such material and the surface of all pipe and fittings of not less than 150 mm for 600 mm outside diameter pipe or less, and 200 mm for pipe having an outside diameter greater than 600 mm. The subgrade shall then be made by backfilling with an approved sand compacted in 75 mm layers at the Contractors expense. Excavated rock shall not be used for

- backfill. The finished subgrade surface shall be shaped by hand tools to provide a uniform and continuous support for the pipe.
- .2 Blasting for excavation will be permitted only with the approval of the Engineer and only when proper precautions are taken for the protection of persons or property. The Contractor's method of procedure in blasting shall conform to provincial statutes and municipal ordinances.
- .5 The subgrade shall provide an uniform and continuous support for the pipe and fittings on solid undisturbed ground. Any over excavation by the Contractor below the required grade shall be backfilled at his expense with an approved compacted sand.

3.3 UNSTABLE SUBGRADE

- .1 Where the subgrade of the trench is unstable or will not properly support the pipe, or where it contains materials harmful to the pipe such as ashes, cinders, refuse, vegetable or organic material, the Contractor shall excavate such material to the width, depth and length ordered by the Engineer and dispose of the material as directed. The subgrade shall then be made by backfilling with an approved stabilizing gravel compacted in 75 mm layers. The finished subgrade surface shall be shaped by hand tools to provide an uniform and continuous support for the pipe.
- .2 The stabilization gravel may be completely wrapped in the filter fabric as specified. The fabric shall be overlapped a minimum of 500 mm at all joints to provide a full, continuous wrap and shall be smooth and free of tension, stress, folds, wrinkles or creases.
- .3 Where the subgrade cannot be made to properly support the pipe by replacing unsound material with stabilizing gravel, the Contractor shall construct a foundation for the pipe in accordance with a drawing prepared at the time by the Engineer. Payment for this work shall be made in accordance with the provisions for extra work unless specified otherwise.

3.4 SHORING

- .1 When close sheeting is required, it shall be so driven as to prevent adjacent soil from entering the trench either below or through such sheeting. The Engineer reserves the right to order the sheeting driven to the full depth of the trench or to such additional depths as may be required for the protection of the work.
- .2 Trench bracing may be removed when the backfilling has reached the respective level of such bracing. Sheeting shall be removed as the backfilling proceeds. Backfilling of holes left by sheeting below the trench bottom shall be carefully compacted, and thereafter backfilling and withdrawal of sheeting shall proceed together. No voids shall be left in the backfill by the withdrawal of the sheeting.
- .3 When a cage or shield is used in the trench instead of shoring, special care shall be taken to ensure that there is no lateral or longitudinal movement of the pipe when the cage is moved. The cage shall be raised vertically so that the bottom member is clear of the crown of the pipe before the cage is pulled forward in the trench.

3.5 TRENCH DRAINAGE

- .1 Gutters and natural drainage channels shall not be obstructed. Satisfactory provisions shall be made for alternate drainage where this is impractical.
- .2 The trench shall be so drained that the workmen may work safely and effectively. All water encountered in trenches shall be pumped or bailed out, and in no case shall the pipe be used as a drain for such water. It is essential that the discharge of the trench dewatering pumps be conducted away from the site of the work and into natural drainage channels, drains or storm sewers.

3.6 BACKFILLING

- .1 Bedding and initial backfilling shall be as specified for the particular pipe installed.
- .2 General backfilling:
 - .1 Class Two backfill as defined in Section 1.1 - Definitions shall be used.
 - .2 No boulders, rock, ice, snow, organic material or debris shall be permitted in the trench. These unsuitable materials shall be hauled away.
 - .3 All surplus excavated material shall also be hauled away, or disposed of as directed by the Engineer. In the event of deficiency of backfill material, suitable material shall be supplied by the Contractor at his expense.
 - .4 All trenches shall be backfilled as the work proceeds and no more than 30 m shall be left open at the end of a days work.

3.7 BACKFILL COMPACTION

- .1 The Contractor shall be responsible for adequate compaction of the trenches and for the correction of settlement during the maintenance period of the Contract. Mechanical compaction equipment shall not be used until there is sufficient cover to prevent damage to the pipe.
- .2 The type of compaction equipment shall be chosen with regard to minimizing the vibration effect on nearby buildings and utilities. The Contractor shall inspect the condition of buildings prior to construction. The Engineer shall have the right to request the Contractor to replace any equipment causing unacceptable vibrations. The Contractor is responsible for any damage caused to buildings due to construction.

3.8 TESTING BACKFILL COMPACTION

- .1 Compaction results shall be based on a minimum of two density tests per 100 metres of trench for each 0.6 metres of compacted vertical backfill. Additional tests may be called for by the Engineer as deemed necessary.
- .2 If a density test indicates insufficient compaction at any depth, then two more densities, where are proportionally representative of trench length, shall be taken at that depth. If the average of these tests is below the required density, the trench shall be re-excavated and re-compacted to meet the specified density.
- .3 This testing in no way relieves the Contractor of his maintenance responsibilities with respect to settlements as specified. The Contractor shall repair any

settlement and damaged surface improvements due to the settlement which occurs during the maintenance period.

- .4 The cost of all initial testing will be borne by the Owner and the Contractor is responsible for the costs of any re-testing for areas where initial testing failed. Non-conformity with the specified density or moisture content shall constitute sufficient grounds for rejection of the work.

3.9 AUGERED/BORED CROSSINGS

- .1 The augering/boring machine shall be aligned and set to the required grade. If the hole deflects from desired course, another hole shall be bored in the location specified by the Engineer. Minimum allowable grades and maximum allowable bends shall be as specified by water mains laid in an open trench.
- .2 The bored hole shall be of sufficient size to allow the carrier pipe or casing pipe, as specified, to pass through unrestricted. After installation of the pipe, the bored hole void shall be backfilled with pneumatically blown free running sand or sealed with 5 MPa pressure grouting.
- .3 Highway crossings shall be cased as shown on the drawings. Casing pipe joints shall be welded. Each joint shall be coated and wrapped with primer and tape.
- .4 Anodes and warning signs shall be installed as specified.

3.10 FENCES AND GATES

- .1 Maintain gates and fences along and crossing the right-of-way and on access roads.
- .2 Do not open fences crossing the construction right-of-way unless installing the pipe underneath the fence is not feasible.
- .3 Notify landowners and tenants if a fence must be opened. Install temporary gates in accordance with the wishes of the landowners and tenants.
- .4 Return fences to original condition, at no cost to the Owner, as soon as fence openings or alterations are no longer required for construction.

END OF SECTION

1 GENERAL

1.01 RELATED REQUIREMENTS

- .1 Section 02 41 13 – Selective Site Demolition
- .2 Section 31 05 16 – Aggregate Materials
- .3 Section 33 31 11 – Public Sanitary Sewerage Gravity Piping
- .4 Section 33 41 00 – Storm Utility Drainage Piping

1.02 DEFINITIONS

- .1 Unclassified excavation: excavation of deposits of whatever character encountered in Work.
- .2 Topsoil:
 - .1 Material capable of supporting good vegetative growth and suitable for use in top dressing, landscaping and seeding.
 - .2 Material reasonably free from subsoil, clay lumps, brush, objectionable weeds, and other litter, and free from cobbles, stumps, roots, and other objectionable material larger than 25 millimeters 1 inch in any dimension.
- .3 Waste material: Excavated material unsuitable for use in Work or surplus to requirements.
- .4 Borrow material: Material obtained from locations outside area to be graded, and required for construction of fill areas or for other portions of Work.
- .5 Recycled fill material: Material, considered inert, obtained from alternate sources and engineered to meet requirements of fill areas.
- .6 Unsuitable materials:
 - .1 Weak, chemically unstable, and compressible materials.
 - .2 Frost susceptible materials:
 - .1 Fine grained soils with plasticity index less than 10 when tested to ASTM D4318, and gradation within limits specified when tested to ASTM D422 and ASTM C136/C136M : Sieve sizes to CAN/CGSB-8.1 CAN/CGSB-8.2 .
 - .2 Table:

Sieve Designation	% Passing
2.00 mm	100
0.10 mm	45-100
0.02 mm	10-80
0.005 mm	0-45

- .3 Coarse grained soils containing more than 20 % by mass passing 0.075 mm sieve.
- .7 Unshrinkable fill: very weak mixture of cement, concrete aggregates and water that resists settlement when placed in utility trenches, and capable of being readily excavated.

1.03 REFERENCE STANDARDS

- .1 ASTM International (ASTM):
 - .1 ASTM C117- 17 , Standard Test Method for Material Finer than 0.075 mm (No.200) Sieve in Mineral Aggregates by Washing
 - .2 ASTM C136/C136M- 19 , Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates
 - .3 ASTM D422-63 2002 , Standard Test Method for Particle-Size Analysis of Soils
 - .4 ASTM D698- 12 , Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft³) (600 kN-m/m³)
 - .5 ASTM D1557- 12 , Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³) (2,700 kN-m/m³)
 - .6 ASTM D4318- 17el , Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils
- .2 Canadian General Standards Board (CGSB):
 - .1 CAN/CGSB-8.1-88, Sieves, Testing, Woven Wire, Inch Series
 - .2 CAN/CGSB-8.2-M88, Sieves, Testing, Woven Wire, Metric
- .3 CSA Group (CSA):
 - .1 CAN/CSA-A3000- 18 , Cementitious Materials Compendium (Consists of A3001, A3002, A3003, A3004 and A3005)
 - .1 CSA-A3001- 18 , Cementitious Materials for Use in Concrete
 - .2 CSA-A23.1/A23.2- 14 , Concrete Materials and Methods of Concrete Construction/Methods of Test and Standard Practices for Concrete

1.04 MEASUREMENT PROCEDURES

- .1 Excavated materials will be measured in cubic metres in their original location.
 - .1 Common Unclassified excavation quantities measured will be actual volume removed within the following limits:
 - .1 Width for trench excavation as indicated.
 - .2 Width for excavation for structures as indicated.
 - .3 Depth from ground elevation and surface of pavement surface of sidewalk immediately prior to excavation, to elevation as indicated as directed by Consultant .
 - .2 Rock quantities measured will be actual volume removed within the following limits:
 - .1 Width for trench excavation as indicated.
 - .2 Width for excavation for structures to be bounded by vertical planes up to 500 mm outside of and parallel to neat lines of footings as indicated.
 - .3 Depth from rock surface elevations immediately prior to excavation, to elevation as indicated.
 - .4 Where design elevation is less than 300 mm below original rock surface, depth will be considered to be 300 mm below original rock surface.
 - .5 Volume of individual boulders and rock fragments will be determined by measuring three maximum mutually perpendicular dimensions.
- .2 Sheeting and bracing left in place on direction of Consultant will be measured in square metres of surface area of plane surface of sheeting.
- .3 Shoring, bracing, cofferdams, underpinning and de-watering of excavation will not be measured separately for payment.
- .4 Backfilling to authorized excavation limits will be measured in cubic metres compacted in place tonnes for each type of material specified.
- .5 Placing and spreading of topsoil will be measured for payment in cubic metres calculated from cross sections taken in area of excavation from original location.
 - .1 If double handling of topsoil is directed by Consultant (stockpiling and later placing), then quantities will be measured twice; on excavation from original location and on excavation from stockpile.

1.05 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Make submittals in accordance with Section 01 33 00 – Submittal Procedures .
- .2 Quality Control: in accordance with Section 01 45 00 – Quality Control :
 - .1 Submit condition survey of existing conditions as described in EXISTING CONDITIONS article of this Section.
 - .2 Submit for review by Consultant proposed dewatering and heave prevention methods as described in PART 3 of this Section.

- .3 Submit to Consultant written notice at least 7 days prior to excavation work, to ensure cross sections are taken.
- .4 Submit to Consultant written notice when bottom of excavation is reached.
- .5 Submit to Consultant testing results and report as described in PART 3 of this Section.
- .3 Preconstruction Submittals:
 - .1 Submit construction equipment list for major equipment to be used in this section prior to start of Work.
 - .2 Submit records of underground utility locates, indicating: location plan of existing utilities as found in field and clearance record from utility authority and location plan of relocated and abandoned services, as required .
- .4 Samples:
 - .1 Submit samples in accordance with Section 01 33 00 – Submittal Procedures .
 - .2 Inform Consultant at least 4 weeks prior to beginning Work, of proposed source of fill unshrinkable fill materials and provide access for sampling.
 - .3 Submit 70 kg samples of type of fill specified including representative samples of excavated material .
 - .4 Ship samples prepaid to Consultant , in tightly closed containers to prevent contamination and exposure to elements.
 - .5 At least 4 weeks prior to beginning Work, inform Consultant source of fly ash and submit samples to Consultant .
 - .1 Do not change source of Fly Ash without written approval of Consultant .

1.06 QUALITY ASSURANCE

- .1 Where Consultant is employee of Contractor, submit proof that Work by Consultant is included in Contractor's insurance coverage.
- .2 Submit design and supporting data at least 2 weeks prior to beginning Work.
- .3 Design and supporting data submitted to bear stamp and signature of qualified professional engineer registered or licensed in Ontario , Canada.
- .4 Keep design and supporting data on site.
- .5 Engage services of qualified professional Engineer who is registered or licensed in Ontario , Canada in which Work is to be carried out to design and inspect cofferdams, shoring, bracing and underpinning required for Work.
- .6 Do not use soil material until written report of soil test results are reviewed and approved by Consultant .

1.07 WASTE MANAGEMENT AND DISPOSAL

- .1 Separate waste materials for reuse and recycling in accordance with Section 01 74 19 – Waste Management and Disposal .

- .2 Divert excess aggregate materials from landfill to local quarry recycling facility for reuse as directed by Consultant .

1.08 EXISTING CONDITIONS

- .1 Examine soil report
- .2 Buried services:
 - .1 Before commencing work verify location of buried services on and adjacent to site.
 - .2 Arrange with appropriate authority for relocation of buried services that interfere with execution of work: pay costs of relocating services.
 - .3 Remove obsolete buried services within 2 m of foundations: cap cut-offs.
 - .4 Size, depth and location of existing utilities and structures as indicated are for guidance only. Completeness and accuracy are not guaranteed.
 - .5 Before beginning excavation Work, notify applicable Consultant authorities having jurisdiction establish location and state of use of buried utilities and structures. Consultant authorities having jurisdiction to clearly mark such locations to prevent disturbance during Work.
 - .6 Confirm locations of buried utilities by careful test excavations and/or soil hydrovac methods .
 - .7 Maintain and protect from damage, water, sewer, gas, electric, telephone and other utilities and structures encountered as indicated .
 - .8 Where utility lines or structures exist in area of excavation, obtain direction of Consultant before removing or re-routing . Costs for such Work to be paid by Owner .
 - .9 Record location of maintained, re-routed and abandoned underground lines.
 - .10 Confirm locations of recent excavations adjacent to area of excavation.
- .3 Existing buildings and surface features:
 - .1 Conduct, with Consultant , condition survey of existing buildings, trees and other plants, lawns, fencing, service poles, wires, rail tracks, pavement, survey bench marks and monuments which may be affected by Work.
 - .2 Protect existing buildings and surface features from damage while Work is in progress. In event of damage, immediately make repair as directed by Consultant .

2 PRODUCTS

2.01 MATERIALS

- .1 Type 1 and Type 2 fill: properties to Section 31 05 16 – Aggregate Materials and the following requirements:
 - .1 Crushed, pit run or screened stone, gravel, or sand.
 - .2 Gradations to be within limits specified when tested to ASTM C136/C136M and ASTM C117 . Sieve sizes to CAN/CGSB-8.1 CAN/CGSB-8.2 .

.3 Table:

Sieve Designation	% Passing	
	Type 1	Type 2
75 mm	-	100
50 mm	-	-
37.5 mm	-	-
25 mm	100	-
19 mm	75-100	-
12.5 mm	-	-
9.5 mm	50-100	-
4.75 mm	30-70	22-85
2.00 mm	20-45	-
0.425 mm	10-25	5-30
0.180 mm	-	-
0.075 mm	3-8	0-10

- .2 Type 3 fill: selected material from excavation or other sources, approved by Consultant for use intended, unfrozen and free from rocks larger than 75 mm, cinders, ashes, sods, refuse or other deleterious materials.
- .3 Unshrinkable fill: proportioned and mixed to provide:
 - .1 Maximum compressive strength of 0.4 MPa at 28 days.
 - .2 Maximum cement content of 25 kg/m³ with 40 % by volume fly ash replacement : to CSA-A3001, Type GU .
 - .3 Minimum strength of 0.07 MPa at 24 h.
 - .4 Concrete aggregates: To CSA-A23.1/A23.2
 - .5 Cement: Type GU .
 - .6 Slump: 160 to 200 mm
- .4 Shearmat: Honeycomb type bio-degradable cardboard 100 mm thick, treated to provide sufficient structural support for poured concrete until concrete cured.

3 EXECUTION

3.01 SITE PREPARATION

- .1 Remove obstructions, ice, and snow from surfaces to be excavated within limits indicated.
- .2 Cut pavement or sidewalk neatly along limits of proposed excavation in order that surface may break evenly and cleanly in accordance with Section 02 41 13 – Selective Site Demolition .

3.02 PREPARATION/PROTECTION

- .1 Protect existing features in accordance with Section 01 56 00 – Temporary Barriers and Enclosures and applicable local regulations.
- .2 Keep excavations clean, free of standing water and loose soil.
- .3 Where soil is subject to significant volume change due to change in moisture content, cover and protect to Consultant approval.
- .4 Protect natural and man-made features required to remain undisturbed. Unless otherwise indicated or located in an area to be occupied by new construction, protect existing trees from damage.
- .5 Protect buried services that are required to remain undisturbed.

3.03 STRIPPING OF TOPSOIL

- .1 Begin topsoil stripping of areas as indicated as directed by Consultant after area has been cleared of brush weeds and grasses and removed from site.
- .2 Strip topsoil to depths as indicated as directed by Consultant .
 - .1 Do not mix topsoil with subsoil.
- .3 Stockpile in locations as indicated as directed by Consultant .
 - .1 Stockpile height not to exceed 2 m and should be protected from erosion.
- .4 Dispose of unused topsoil to location as indicated as directed by Consultant off site .

3.04 STOCKPILING

- .1 Stockpile fill materials in areas designated by Consultant .
 - .1 Stockpile granular materials in manner to prevent segregation.
- .2 Protect fill materials from contamination.
- .3 Implement sufficient erosion and sediment control measures to prevent sediment release off construction boundaries and into water bodies.

3.05 COFFERDAMS, SHORING, BRACING AND UNDERPINNING

- .1 Maintain sides and slopes of excavations in safe condition by appropriate methods and in accordance with Health and Safety Act for the Province of Ontario .
 - .1 Where conditions are unstable, Consultant to verify and advise methods .

- .2 Obtain permit from authority having jurisdiction for temporary diversion of water course.
- .3 Construct temporary Works to depths, heights and locations as indicated or directed by Consultant .
- .4 During backfill operation:
 - .1 Unless otherwise indicated or directed by Consultant , remove sheeting and shoring from excavations.
 - .2 Do not remove bracing until backfilling has reached respective levels of such bracing.
 - .3 Pull sheeting in increments that will ensure compacted backfill is maintained at elevation at least 500 mm above toe of sheeting.
- .5 When sheeting is required to remain in place, cut off tops at elevations as indicated.
- .6 Upon completion of substructure construction:
 - .1 Remove cofferdams, shoring and bracing.
 - .2 Remove excess materials from site and restore watercourses as directed by Consultant .

3.06 DEWATERING AND HEAVE PREVENTION

- .1 Keep excavations free of water while Work is in progress.
- .2 Provide for Consultant's review and approval details of proposed dewatering or heave prevention methods, including dikes, well points, and sheet pile cut-offs.
- .3 Avoid excavation below groundwater table if quick condition or heave is likely to occur.
 - .1 Prevent piping or bottom heave of excavations by groundwater lowering, sheet pile cut-offs, or other means.
- .4 Protect open excavations against flooding and damage due to surface run-off.
- .5 Dispose of water in accordance with Section 01 35 43 – Environmental Procedures to approved runoff areas and in manner not detrimental to public and private property, or portion of Work completed or under construction.
 - .1 Provide and maintain temporary drainage ditches and other diversions outside of excavation limits.

3.07 EXCAVATION

- .1 Advise Consultant at least 7 days in advance of excavation operations for initial cross sections to be taken.
- .2 Excavate to lines, grades, elevations and dimensions as indicated by Consultant .
- .3 Remove concrete masonry paving walks demolished foundations and rubble and other obstructions encountered during excavation in accordance with Section 02 41 13 – Selective Site Demolition .
- .4 Excavation must not interfere with bearing capacity of adjacent foundations.

- .5 Do not disturb soil within branch spread of trees or shrubs that are to remain.
 - .1 If excavating through roots, excavate by hand and cut roots with sharp axe or saw.
- .6 For trench excavation, unless otherwise authorized by Consultant in writing, do not excavate more than 30 m of trench in advance of installation operations and do not leave open more than 15 m at end of day's operation.
- .7 Keep excavated and stockpiled materials safe distance away from edge of trench as directed by Consultant .
- .8 Restrict vehicle operations directly adjacent to open trenches.
- .9 Dispose of surplus and unsuitable excavated material off site .
- .10 Do not obstruct flow of surface drainage or natural watercourses.
- .11 Earth bottoms of excavations to be undisturbed soil, level, free from loose, soft or organic matter.
- .12 Notify Consultant when bottom of excavation is reached.
- .13 Obtain Consultant approval of completed excavation.
- .14 Remove unsuitable material from trench bottom including those that extend below required elevations to extent and depth as directed by Consultant .
- .15 Correct unauthorized over-excavation as follows:
 - .1 Fill under bearing surfaces and footings with concrete specified for footings fill concrete Type 2 fill compacted to not less than 100 % of corrected Standard Proctor maximum dry density in accordance with Section 31 05 10 – Corrected Maximum Dry Density for Fill
 - .2 Fill under other areas with Type 2 fill compacted to not less than 95 % of corrected Standard Proctor maximum dry density in accordance with Section 31 05 10 – Corrected Maximum Dry density fir Fill
- .16 Hand trim, make firm and remove loose material and debris from excavations.
 - .1 Where material at bottom of excavation is disturbed, compact foundation soil to density at least equal to undisturbed soil.
 - .2 Clean out rock seams and fill with concrete mortar or grout to approval of Consultant .

3.08 FILL TYPES AND COMPACTION

- .1 Use types of fill as indicated or specified below. Compaction densities are percentages of maximum densities obtained from ASTM D698 ASTM D1557 in accordance with Section 31 05 10 – Corrected Maximum Dry Density for Fill .
 - .1 Exterior side of perimeter walls: use Type 3 fill to subgrade level. Compact to 95 % of corrected maximum dry density.
 - .2 Within building area: use Type 2 to underside of base course for floor slabs. Compact to 100 % of corrected maximum dry density.

- .3 Under concrete slabs: provide 150 mm compacted thickness base course of Type 1 fill topped with shearmat filler as indicated to underside of slab. Compact base course to 100 %.
- .4 Retaining walls: use Type 2 fill to subgrade level on high side for minimum 500 mm from wall and compact to 95 %. For remaining portion, use Type 3 fill compacted to 95 %.
- .5 Place unshrinkable fill in areas as indicated.

3.09 BEDDING AND SURROUND OF UNDERGROUND SERVICES

- .1 Place and compact granular material for bedding and surround of underground services as indicated and as specified in Section 33 14 16 – Site Water Utility Distribution Piping Section 33 31 11 – Public Sanitary Sewerage Gravity Piping Section 33 41 00 – Storm Utility Drainage Piping .
- .2 Place bedding and surround material in unfrozen condition.

3.10 BACKFILLING

- .1 Vibratory compaction equipment: _____ .
- .2 Do not proceed with backfilling operations until completion of the following:
 - .1 Consultant has inspected and approved installations.
 - .2 Consultant has inspected and approved of construction below finish grade.
 - .3 Inspection, testing, approval, and recording location of underground utilities.
 - .4 Removal of concrete formwork.
 - .5 Removal of shoring and bracing; backfilling of voids with satisfactory soil material.
- .3 Areas to be backfilled to be free from debris, snow, ice, water and frozen ground.
- .4 Do not use backfill material which is frozen or contains ice, snow or debris.
- .5 Backfilling around installations:
 - .1 Place bedding and surround material as specified elsewhere.
 - .2 Do not backfill around or over cast-in-place concrete within 24 hours after placing of concrete.
 - .3 Place layers simultaneously on both sides of installed Work to equalize loading. Difference not to exceed _____ m.
 - .4 Where temporary unbalanced earth pressures are liable to develop on walls or other structures:
 - .1 Permit concrete to cure for minimum 14 days or until it has sufficient strength to withstand earth and compaction pressure and approval obtained from Consultant or :
 - .2 If approved by Consultant , erect bracing or shoring to counteract unbalance, and leave in place until removal is approved by Consultant .
- .6 Place unshrinkable recycled fill in areas as indicated.

- .7 Consolidate and level unshrinkable fill with internal vibrators.
- .8 Install drainage system in backfill as indicated .

3.11 RESTORATION

- .1 Upon completion of Work, remove waste materials and debris in accordance to Section 01 74 19 – Waste Management and Disposal , trim slopes, and correct defects as directed by Consultant .
- .2 Replace topsoil as indicated .
- .3 Reinstall lawns to elevation which existed before excavation.
- .4 Reinstall pavements and sidewalks disturbed by excavation to thickness, structure and elevation which existed before excavation.
- .5 Clean and reinstall areas affected by Work as directed by Consultant .
- .6 Use temporary plating to support traffic loads over unshrinkable fill for initial 24 hours.
- .7 Protect newly graded areas from traffic and erosion and maintain free of trash or debris.

END OF SECTION

Part 1 General

1.1 RELATED SECTIONS

- .1 Section 01 74 19 - Waste Management and Disposal.

1.2 MEASUREMENT FOR PAYMENT

- .1 No measurement for payment will be made under this Section.
- .2 Measure cleaning pavement surfaces in square metres of pavement surface cleaned.
- .3 Measure removal of pavement markings metres of solid lines or painted length of broken lines removed.

1.3 WASTE MANAGEMENT AND DISPOSAL

- .1 Separate and recycle waste materials in accordance with Section 01 74 19 - Waste Management And Disposal.
- .2 Remove from site and dispose of all packaging materials at appropriate recycling facilities.
- .3 Collect and separate for disposal: paper, plastic, polystyrene, corrugated cardboard, packaging material in appropriate on-site bins for recycling in accordance with Waste Management Plan.
- .4 Place materials defined as hazardous or toxic in designated containers.
- .5 Fold up metal banding, flatten and place in designated area for recycling.
- .6 Do not dispose of unused solvent materials into landfill. Divert materials to municipal hazardous materials depot as approved by Contract Administrator.

Part 2 Products

2.1 MATERIALS

- .1 Abrasives and solvents used for removal of paint, oil, grease, rubber deposits: proprietary products specially designed for pavement cleaning, subject to approval by Contract Administrator.

Part 3 Execution

3.1 REMOVING PAVEMENT MARKINGS

- .1 Remove rubber tire deposits and paint markings, in areas designated by Contract Administrator, by sand blasting, rotary grinding, heater planing or other method approved by Contract Administrator.

- .2 Exercise care to avoid dislodging of coarse aggregate particles, excessive removal of fines, damage to bituminous binder or damage to joint and crack sealers.
- .3 Do not heat pavement surfaces above 120°C, when using heater planning equipment.

3.2 PAVEMENT SURFACE CLEANING

- .1 Remove sealing compound which has protruded excessively, where directed by Contract Administrator. Dispose of removed material as directed by Contract Administrator.
- .2 Remove dust, contaminants, loose and foreign materials, oil and grease, in areas designated and by method approved by Contract Administrator.
- .3 Use rotary power brooms and vacuum sweepers as needed supplemented by hand brooming.

END OF SECTION

1 General

1.01 RELATED REQUIREMENTS

- .1 Section 32.12.16 Asphalt paving

1.02 REFERENCE STANDARDS

- .1 American Association of State Highway and Transportation Officials (AASHTO)
 - .1 AASHTO T245-97-UL-2004, Standard Method of Test for Resistance to Plastic Flow of Bituminous Mixtures Using Marshall Apparatus.
- .2 Ministry of Transportation Ontario (MTO)
 - .1 MTO Laboratory Testing Manual-09: LS-283, Resistance to Stripping of Asphalt Cement in Bituminous Mixtures by Immersion Marshall.

1.03 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Submit in accordance with Section 01 33 00 – Submittal Procedures.
- .2 Samples:
 - .1 Submit 2 samples of each proposed asphalt paving mixture.

2 Products

2.01 MATERIALS

- .1 Representative samples of each asphalt paving mixture proposed for use on Project.

2.02 EQUIPMENT

- .1 One or more water baths with automatic controls for immersing specimens. Baths normally used for Marshall Immersion Test are suitable for test.
- .2 Scale and water bath with suitable accessory equipment for weighing test specimens in air and in water to determine their densities.
- .3 Flat transfer plates of glass or metal. Keep 1 plate under each specimen during immersion period and during subsequent handling, except when weighing and testing, to prevent breakage or distortion of specimens.
- .4 Apparatus required to conduct Marshall Immersion Test.

3 Execution

3.01 PREPARATION

- .1 Prepare at least 8 specimens for each test [with hand-operated hammer], in accordance with LS-283, except where specified otherwise.

3.02 TEST PROCEDURE

- .1 Do Marshall testing to LS-283.

- .2 Weigh each specimen in air and in water. Weigh in water as rapidly as possible to minimize absorption.
- .3 Calculate specific gravity of each specimen as follows:
 - .1 Specific Gravity = $A / A - B$
 - .2 Where A = weight of specimen in air in grams
 - .3 B = weight of specimen in water in grams
- .4 Sort each set of 8 specimens into 2 groups of 4 specimens each so that average specific gravity of specimens in group 1 is essentially same as that of group 2.
- .5 Test group 1 specimens for Marshall stability. Calculate S1 = Marshall stability of group 1 (average).
- .6 Immerse group 2 specimens in water for 24 hours at 60 degrees C, then test immediately for Marshall stability. Calculate S2 = Marshall stability of group 2 (average).

3.03 CLOSEOUT ACTIVITIES

- .1 Report test results to consultant.
- .2 Report numerical index of retained stability as resistance of asphaltic paving mixtures to detrimental effect of water, expressed as percentage of original stability retained after immersion period.
- .3 Calculate index as follows:
 - .1 Index of Retained Stability = $S2 / S1 \times 100$.

END OF SECTION

Part 1 General

1.1 MEASUREMENT PROCEDURES

- .1 Asphalt tack coat will be measured in square metres at 15 degrees C of undiluted emulsified asphalt actually applied.
 - .1 Volume to be corrected to the volume at 15 degrees C to ASTM D1250 for cutback asphalt, and ASTM D633 for tar, and Table IV-3 of the Asphalt Institute's Manual MS-6 for emulsified asphalt.
 - .2 Water added to emulsified asphalt will not be measured for payment.

1.2 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Submit in accordance with Section 01 33 00 - Submittal Procedures.
- .2 Product Data:
 - .1 Submit manufacturer's instructions, printed product literature and data sheets for asphalt tack coat and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Samples:
 - .1 Submit two - 4 L samples of asphalt tack coat material proposed for use in new, clean, airtight, sealed, wide plastic lined cans to Contract Administrator, at least 2 weeks prior to beginning Work.
 - .2 Sample asphalt tack coat material to: ASTM D140.
 - .3 Provide access on tank truck for contract Administrator to sample asphalt material to be incorporated into Work to ASTM D140.

1.3 QUALITY ASSURANCE

- .1 Upon request Contract Administrator, submit manufacturer's test data and certification that asphalt prime material meets requirements of this Section.

1.4 DELIVERY, STORAGE AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements and with manufacturer's written instructions.
- .2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- .3 Storage and Handling Requirements:
 - .1 Store materials in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.
 - .2 Store and protect asphalt tack coats from nicks, scratches, and blemishes.
 - .3 Replace defective or damaged materials with new.
- .4 Deliver, store and handle materials in accordance with ASTM D140.
- .5 Provide, maintain and restore asphalt storage area.

Part 2 Products

2.1 MATERIALS

- .1 Anionic emulsified asphalt: to CAN/CGSB-16.2, grade: SS-1, SS-1h.
- .2 Cut-back asphalt; to AASHTO M081-92-UL, grade RC-70 or RC-250.
- .3 Water: clean, potable, free from foreign matter.

2.2 EQUIPMENT

- .1 Equipment required for Work of this Section to be in satisfactory working condition and maintained for duration of Work.
- .2 Pressure distributor:
 - .1 Designed, equipped, maintained and operated so that asphalt material can be:
 - .1 Maintained at even temperature.
 - .2 Applied uniformly on variable widths of surface up to 5 m.
 - .3 Applied at readily determined and controlled rates from 0.2 to 5.4 L/m² with uniform pressure, and with allowable variation from any specified rate not exceeding 0.1 L/m.
 - .4 Distribute in uniform spray without atomization at temperature required.
 - .2 Equipped with meter, registering travel in metres per minute, visibly located to enable truck driver to maintain constant speed required for application at specified rate.
 - .3 Equipped with pump having flow metre graduated in units of 5 L or less per minute passing through nozzles and readily visible to operator. Pump power unit to be independent of truck power unit.
 - .4 Equipped with easily read, accurate and sensitive device which registers temperature of liquid in reservoir.
 - .1 Measure temperature to closest whole number.
 - .5 Equipped with accurate volume measuring device or calibrated tank.
 - .6 Equipped with nozzles of same make and dimensions, adjustable for fan width and orientation.
 - .7 Equipped with nozzle spray bar, with operational height adjustment in increments of 0.6 metres and capable of being raised or lowered.
 - .8 Cleaned if previously used with incompatible asphalt material.

Part 3 Execution

3.1 EXAMINATION

- .1 Verification of Conditions: verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for asphalt tack coat installation in accordance with manufacturer's written instructions.

- .1 Visually inspect substrate in presence of Contract Administrator.
- .2 Inform Contract Administrator of unacceptable conditions immediately upon discovery.
- .3 Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Contract Administrator.

3.2 APPLICATION

- .1 Apply asphalt tack coat only on clean and dry surface.
- .2 Dilute asphalt emulsion with water at 1:1 ratio for application.
 - .1 Mix thoroughly by pumping or other method approved by Contract Administrator.
- .3 Apply asphalt tack coat evenly to pavement surface at rate as recommended by supplier but not to exceed 0.7 L/m²
- .4 Paint contact surfaces of curbs, gutters, headers, manholes and like structures with thin, uniform coat of asphalt tack coat material.
- .5 Apply asphalt tack coat only when air temperature greater than 10 degrees C and when rain is not forecast within 2 hours minimum of application.
- .6 Apply asphalt tack coat only on unfrozen surface.
- .7 Evenly distribute localized excessive deposits of tack coat by brooming as directed by Contractor Administrator.
- .8 Where traffic is to be maintained, treat no more than one half of width of surface in one application.
 - .1 Control traffic in accordance with Section 01 55 26 - TRAFFIC CONTROL.
- .9 Keep traffic off tacked areas until asphalt tack coat has set.
- .10 Re-tack contaminated or disturbed areas as directed by Contractor Administrator.
- .11 Permit asphalt tack coat to set before placing asphalt pavement.
- .12 Submit summary report within 7 days minimum of date of application and include information as follows:
 - .1 Total area tack coated.
 - .2 Quantity of tack coat used.
 - .3 Mean application rate.
 - .4 Actual product quantity used when using equipment on pressure distributors.
 - .5 Dipstick measurements or electronic printouts are acceptable.
- .13 Carry out measurements in presence of Contractor Administrator upon request.
- .14 Inspect tack coat application to ensure uniformity.
 - .1 Re-spray areas of insufficient or non-uniform tack coat coverage as directed by Contractor Administrator.

- .2 Ensure tack coating performed using hand held devices is consistent in appearance with adjacent areas of machine applied material.

END OF SECTION

Part 1 General

1.1 MEASUREMENT AND PAYMENT

- .1 Measure asphalt concrete paving in tonnes of asphalt concrete actually incorporated into Work.
- .2 Measure supply of asphalt cement in tonnes litres at 15 degrees C.
- .3 Measure supply of hydrated lime in tonnes.

1.2 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Submit in accordance with Section 01 33 00 - Submittal Procedures.
- .2 Product Data:
 - .1 Submit manufacturer's instructions, printed product literature and data sheets for asphalt mixes and aggregate and include product characteristics, performance criteria, physical size, finish and limitations.
 - .2 Submit viscosity-temperature chart for asphalt cement to be supplied showing either Saybolt Furol viscosity in seconds or Kinematic Viscosity in centistokes, temperature range 105 to 175 degrees C 4 weeks prior to beginning Work.
- .3 Samples:
 - .1 Inform Contract Administrator of proposed source of aggregates and provide access for sampling 4 weeks prior to beginning Work.
 - .2 Submit samples of following materials proposed for use 4 weeks prior to beginning Work.
 - .1 One 5 L container of asphalt cement.
 - .2 1 kg of hydrated lime.
- .4 Test and Evaluation Reports:
- .5 Certificates:
 - .1 Certification to be marked on pipe.
- .6 Test and Evaluation Reports:
 - .1 Submit manufacturer's test data and certification that asphalt cement meets specification requirements.
 - .2 Submit manufacturer's test data and certification that hydrated lime meets specified requirements.
 - .3 Submit asphalt concrete mix design and trial mix test results to Contract Administrator for review at least 4 weeks prior to beginning Work.
 - .4 Submit printed record of mix temperatures at end of each week.

1.3 DELIVERY, STORAGE AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements and with manufacturer's written instructions.

- .2 Deliver and stockpile aggregates in accordance with Section 31 05 16 - Aggregate Materials and erosion and sedimentation control plan. Stockpile minimum 50 % of total amount of aggregate required before beginning asphalt mixing operation.
- .3 When necessary to blend aggregates from one or more sources to produce required gradation, do not blend in stockpiles.
- .4 Stockpile fine aggregate separately from coarse aggregate, although separate stockpiles for more than two mix components are permitted.
- .5 Provide approved storage, heating tanks and pumping facilities for asphalt cement.
- .6 Submit to Contract Administrator copies of freight and waybills for asphalt cement as shipments are received.
 - .1 Contract Administrator reserves right to check weights as material is received.
- .7 Stockpile crushed RAP separately in accordance with Section 31 05 16 - Aggregate Materials where directed by Contract Administrator.
- .8 Protect and cover stockpiles of crushed RAP from rain to approval of Contract Administrator in accordance with erosion and sedimentation control plan.

Part 2 Products

2.1 MATERIALS

- .1 Performance graded asphalt cement: to AASHTO M320, grade PG58-28 when tested to AASHTO R29.
- .2 RAP:
 - .1 Crushed and screened to ensure 100% of RAP material passes 50 mm screen before mixing.
- .3 Aggregates: in accordance with Section 31 05 16 - Aggregate Materials General and requirements as follows:
 - .1 Crushed stone or gravel.
 - .2 Gradations: within limits specified when tested to ASTM C136 and ASTM C117. Sieve sizes to CAN/CGSB-8.1 CAN/CGSB-8.2.
 - .3 Table:

Sieve Designation	% Passing		
	Lower Course	Surface Course	Sheet Asphalt
200 mm	-	-	-
75 mm	-	-	-
50 mm	-	-	-
38.1 mm	-	-	-
25 mm	100	-	-
19 mm	-	-	-
12.5 mm	70-85	100	-

9.5 mm	-	-	100
4.75 mm	40-65	55-75	85-100
2.00 mm	30-50	35-55	80-95
0.425 mm	15-30	15-30	40-70
0.180 mm	5-20	5-20	10-35
0.075 mm	3-8	3-8	4-14

- .4 Coarse aggregate: aggregate retained on 4.75 mm sieve and fine aggregate is aggregate passing 4.75 mm sieve when tested to ASTM C136.
- .5 When dryer drum plant or plant without hot screening is used, process fine aggregate through 4.75 mm sieve and stockpile separately from coarse aggregate.
- .6 Separate stockpiles for coarse and fine aggregates not required for sheet asphalt.
- .7 Do not use aggregates having known polishing characteristics in mixes for surface courses.
- .8 Sand equivalent: ASTM D2419. Min: 50.
- .9 Magnesium Sulphate soundness: to ASTM C88. Max % loss by mass:
 - .1 Coarse aggregate surface course: 12 %.
 - .2 Coarse aggregate lower course: 12%.
 - .3 Fine aggregate, surface course: 16 %.
 - .4 Fine aggregate, lower course: 16 %.
- .10 Los Angeles degradation: Grading B, to ASTM C131. Max % loss by mass:
 - .1 Coarse aggregate, surface course: 25 %.
 - .2 Coarse aggregate, lower course: 35 %.
- .11 Absorption: to ASTM C127. Max % by mass:
 - .1 Coarse aggregate, surface course: 1.75 %.
 - .2 Coarse aggregate, lower course: 2.00 %.
- .12 Loss by washing: to ASTM C117. Max % passing 0.075 mm sieve:
 - .1 Coarse aggregate, surface course: 1.5 %.
 - .2 Coarse aggregate, lower course: 2.0 %.
- .13 Lightweight particles: to ASTM C123. Max % by mass less than 1.95 relative density:
 - .1 Surface course: 1.5 %.
 - .2 Lower course: 3.0 %.
- .14 Flat and elongated particles: to ASTM D4791, (with length to thickness ratio greater than 5): Max % by mass:
 - .1 Coarse aggregate, surface course: 15 %.
 - .2 Coarse aggregate, lower course: 15 %.
- .15 Crushed fragments: at least 60 % of particles by mass within each of following sieve designation ranges, to have 1 minimum freshly fractured face. Material to be divided into ranges, using methods of ASTM C136.

Passing		Retained on
25 mm	to	12.5 mm
12.5 mm	to	_____ mm

- .16 Regardless of compliance with specified physical requirements, fine aggregates may be accepted or rejected on basis of past field performance.
- .4 Mineral filler:
 - .1 Ensure finely ground particles of limestone, hydrated lime, Portland cement or non-plastic mineral matter approved by Contract Administrator are thoroughly dry and free from lumps.
 - .2 Add mineral filler when necessary to meet job mix aggregate gradation or as directed by Contract Administrator to improve mix properties.
 - .3 Ensure mineral filler is dry and free flowing when added to aggregate.
- .5 Anti-stripping agent: hydrated lime to ASTM C207 type N.
 - .1 Add lime at rate of approximately 2-3 % of dry weight of aggregate.
- .6 Water: to approval of Contract Administrator.

2.2 EQUIPMENT

- .1 Pavers: mechanical grade controlled self-powered pavers capable of spreading mix within specified tolerances, true to line, grade and crown indicated.
- .2 Rollers: sufficient number of type and weight to obtain specified density of compacted mix.
- .3 Vibratory rollers:
 - .1 Drum diameter: 1200mm minimum.
 - .2 Amplitude of vibration (machine setting): 0.5 mm maximum for lifts less than 40 mm thick.
- .4 Haul trucks: sufficient number and of adequate size, speed and condition to ensure orderly and continuous operation and as follows:
 - .1 Boxes with tight metal bottoms.
 - .2 Covers of sufficient size and weight to completely cover and protect asphalt mix when truck fully loaded.
 - .3 In cool weather or for long hauls, insulate entire contact area of each truck box.
 - .4 Use only trucks which can be weighed in single operation on scales supplied.
- .5 Hand tools:
 - .1 Lutes or rakes with covered teeth for spreading and finishing operations.

- .2 Tamping irons having mass 12 kg minimum and bearing area not exceeding 310 cm² for compacting material along curbs, gutters and other structures inaccessible to roller. Mechanical compaction equipment, when approved by Contract Administrator, may be used instead of tamping irons.
- .3 Straight edges, 4.5 m in length, to test finished surface.
- .6 Plant testing facility: provide laboratory space at plant site for exclusive use of Contract Administrator, for performing tests, keeping records and making reports.

2.3 MIX DESIGN

- .1 Mix design to be provided approved in writing by Contract Administrator.
- .2 Mix design to be developed by testing laboratory approved in writing by Contract Administrator.
- .3 Mix to contain maximum 50% by mass of RAP. Contract Administrator may approve higher proportion of RAP if Contractor demonstrates ability to produce mix meeting requirements of specification.
- .4 Design of mix: by Marshall method to requirements below.
 - .1 Compaction blows on each face of test specimens: 50.
 - .2 Mix physical requirements:

Property	Airfield Pavements	Roads	Sheet Asphalt
Marshall Stability at 60 degrees C kN min	7.0	5.5 surface course/4.5 lower course	3.0
Flow Value mm	2-4	2-4	2-5
Air Voids in Mixture, %	3-5	3-5 surface course/2-6 lower course	3-5
Voids in Mineral Aggregate, % min	15 surface course/13 lower course	15 surface course/13 lower course	16
Index of Retained Stability % minimum	75	75	75

- .3 Measure physical requirements as follows:
 - .1 Marshall load and flow value: to AASHTO T245.
 - .2 Compute void properties on basis of bulk specific gravity of aggregate to ASTM C127 and ASTM C128. Make allowance for volume of asphalt absorbed into pores of aggregate.
 - .3 Air voids: to ASTM D3203.
 - .4 Voids in mineral aggregates: to AI MS2.
 - .5 Index of Retained Stability: measure in accordance with Section 32 12 10 - Marshall Immersion Test for Bitumen.
- .4 Do not change job-mix without prior approval of Contract Administrator. When change in material source proposed, new job-mix formula will be reviewed by Contract Administrator.
- .5 Return plant dust collected during processing to mix in quantities acceptable to Contract Administrator.

Part 3 Execution

3.1 EXAMINATION

- .1 Verification of Conditions: verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for asphalt paving in accordance with manufacturer's written instructions.
 - .1 Visually inspect substrate in presence of Contract Administrator.
 - .2 Inform Contract Administrator of unacceptable conditions immediately upon discovery.
 - .3 Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Contract Administrator.

3.2 PLANT AND MIXING REQUIREMENTS

- .1 Batch and continuous mixing plants:
 - .1 To ASTM D995.
 - .2 Feed aggregates from individual stockpiles through separate bins to cold elevator feeders.
 - .1 Do not load frozen materials into bins.
 - .3 Feed cold aggregates to plant in proportions to ensure continuous operations.
 - .4 Calibrate bin gate openings and conveyor speeds to ensure mix proportions are achieved.
 - .5 Before mixing, dry aggregates to moisture content not greater than 1 % by mass or to lesser moisture content if required to meet mix design requirements. Heat to temperature required to meet mixing temperature as directed by Contract Administrator after combining with RAP.
 - .6 Immediately after drying, screen aggregates into hot storage bins in sizes to permit recombining into gradation meeting job-mix requirements.
 - .7 Store hot screened aggregates in manner to minimize segregation and temperature loss.
 - .8 Heat asphalt cement and aggregate to mixing temperature directed by Contract Administrator. Do not heat asphalt cement above 160 degrees C maximum temperature indicated on temperature-viscosity chart.
 - .9 Make available current asphalt cement viscosity data at plant. With information relative to viscosity of asphalt being used, Contract Administrator to approve review temperature of completed mix at plant and at paver after considering hauling and placing conditions.
 - .10 Maintain temperature of materials within 5 degrees C of specified mix temperature during mixing.
 - .11 Mixing time:

- .1 In batch plants, both dry and wet mixing times as directed by Contract Administrator. Continue wet mixing as long as necessary to obtain thoroughly blended mix but not less than 30s or more than 75s.
 - .2 In continuous mixing plants, mixing time as directed by Contract Administrator but not less than 45s.
 - .3 Mixing time as directed by Contract Administrator.
- .12 Where RAP is to be incorporated into mix:
 - .1 Feed from separate cold feed bin specially designed to minimize consolidation of material.
 - .2 Ensure positive and accurate control of RAP cold feed by use of hydraulic motor or electric clutch and equip with anti rollback device to prevent material from sliding backward on feed belt.
 - .3 Combine RAP and new aggregates in proportions as directed by Contract Administrator specified. Dry mix thoroughly, until uniform temperature within plus or minus 5 degrees C of mix temperature, as directed by Contract Administrator, is achieved prior to adding new asphalt cement.
- .2 Dryer drum mixing plant:
 - .1 To ASTM D995.
 - .2 Load aggregates from individual stockpiles to separate cold feed bins. Do not load frozen materials into bins.
 - .3 Feed aggregates to burner end of dryer drum by means of multi-bin cold feed unit and blend to meet job-mix requirements by adjustments of variable speed feed belts and gates on each bin.
 - .4 Where RAP is to be incorporated into mix, dryer drum mixer is to be designed to prevent direct contact of RAP with burner flame or with exhaust gases hotter than 180 degrees C.
 - .5 Feed RAP from separate cold feed bin designed to minimize reconsolidation of material.
 - .6 Meter total flow of aggregate and RAP using electronic weigh belt system with indicator that can be monitored by plant operator and which is interlocked with asphalt pump to ensure proportions of aggregate prepare, RAP and asphalt entering mixer remain constant.
 - .7 Allow for easy calibration of weighing systems for aggregates and RAP without having material enter mixer.
 - .8 Calibrate bin gate openings and conveyor speeds to ensure mix proportions are achieved.
 - .1 Calibrate weigh bridge on charging conveyor by weighing amount of aggregate passing over weigh bridge in set amount of time.
 - .2 Difference between this value and amount shown by plant computer system to differ by not more than plus or minus 2 %.
 - .9 Make provision for conveniently sampling full flow of materials from cold feed.

- .10 Provide screens or other suitable devices to reject oversize particles or lumps of aggregate and RAP from cold feed prior to entering drum.
- .11 Provide system interlock stop on feed components if either asphalt or aggregate from bin stops flowing.
- .12 Accomplish heating and mixing of asphalt mix in approved parallel flow dryer-mixer in which aggregate enters drum at burner end and travels parallel to flame and exhaust gas stream.
 - .1 Control heating to prevent fracture of aggregate or excessive oxidation of asphalt.
 - .2 Equip system with automatic burner controls and provide for continuous temperature sensing of asphalt mixture at discharge, with printing recorder that can be monitored by plant operator.
 - .3 Submit printed record of mix temperatures at end of each week.
- .13 Ensure mixing period and temperature to produce uniform mixture in which particles are thoroughly coated, and moisture content of material as it leaves mixer is 2 % maximum.
- .3 Temporary storage of hot mix:
 - .1 Provide mix storage of sufficient capacity to permit continuous operation and designed to prevent segregation.
 - .2 Do not store asphalt mix in storage bins in excess of 3 hour.
- .4 While producing asphalt mix for this Project, do not produce mix for other users unless separate storage and pumping facilities are provided for materials supplied to this project.
- .5 Mixing tolerances:
 - .1 Permissible variation in aggregate gradation from job mix (percent of total mass).

4.75 mm sieve and larger	
2.00 mm sieve	
0.425 mm sieve	
0.180 mm sieve	
0.075 mm sieve	2.0
 - .2 Permissible variation of asphalt cement from job mix: 0.25%.
 - .3 Permissible variation of mix temperature at discharge from plant: 5 degrees C.
- .6 Addition of anti-stripping agent:
 - .1 Plant to be equipped with pug mill to thoroughly mix aggregates and lime prior to entering the plant.
 - .2 Plant to be equipped with suitable conveyor systems capable of supplying aggregates and lime at constant rate.
 - .3 Plant and equipment used for addition of lime to be equipped with covers to control loss of lime.
 - .4 Plant to be equipped to control rate of lime incorporation to within 1/4%.
 - .5 Add water to aggregate prior to entering pug mill.

- .6 Add water to lime sufficiently in advance to permit time to slake prior to entering pug mill.

3.3 PREPARATION

- .1 Temporary Erosion and Sedimentation Control:
 - .1 Provide temporary erosion and sedimentation control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to requirements of authorities having sediment and erosion control plan, specific to site, that complies with EPA 832/R-92-005 or requirements of authorities having jurisdiction, whichever is more stringent.
 - .2 Inspect, repair, and maintain erosion and sedimentation control measures during construction until permanent vegetation has been established.
 - .3 Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.
- .2 Reshape granular roadbed and asphalt pavement in accordance with Section 32 11 17 - Reshaping Granular Roadbed and Section 32 01 16.13 - Reshaping Asphalt Pavement.
- .3 When paving over existing asphalt surface, clean pavement surface in accordance with Section 32 01 11.01 - Pavement Cleaning and Marking Removal.
 - .1 When levelling course is not required, patch and correct depressions and other irregularities to approval of Contract Administrator before beginning paving operations.
- .4 Apply tack coat in accordance with Section 32 12 13.16 - Asphalt Tack Coats prior to paving.
- .5 Prior to laying mix, clean surfaces of loose and foreign material.

3.4 TRANSPORTATION OF MIX

- .1 Transport mix to job site in vehicles cleaned of foreign material.
- .2 Paint or spray truck beds with limewater, soap or detergent solution, or non petroleum based commercial product, at least daily or as required.
 - .1 Raise truck bed and thoroughly drain, and ensure no excess solution remains in truck bed.
- .3 Schedule delivery of material for placing in daylight, unless Contract Administrator approves artificial light for night placing.
- .4 Deposit mix from surge or storage silo to trucks in multiple drops to reduce segregation.
 - .1 Do not dribble mix into trucks.
- .5 Deliver material to paver at uniform rate and in an amount within capacity of paving and compacting equipment.

- .6 Deliver loads continuously in covered vehicles and immediately spread and compact.
 - .1 Deliver and place mixes at temperature within range as directed by Contract Administrator, but not less than 135 degrees C.

3.5 TEST STRIP

- .1 Construct and test test strip to approval of Contract Administrator.
- .2 For airfield pavement, construct test strip in non-critical area to resolve anticipated problems with equipment, mix behaviour or compaction, prior to starting paving operation.
- .3 Construct test strip with at least 500 tonnes of mix, and involving more than one lane, so that joint finishing techniques can be established.
- .4 During construction of test strip, Contract Administrator will establish optimum rolling pattern by taking nuclear densimeter readings and observations to:
 - .1 Determine sequence and number of passes.
 - .2 Determine correct operating characteristics of vibratory rollers.
 - .3 Determine maximum density of asphalt mix.
 - .4 Ensure smooth surface finish.
 - .5 Establish actual density achieved by coring in order to determine if additional or other rolling equipment is required to achieve density of not less than 98 % of density obtained with Marshall specimens prepared from samples of mix being used.

3.6 PLACING

- .1 Obtain Contract Administrator approval of base and existing surface and tack coat prior to placing asphalt.
- .2 Place asphalt concrete to thicknesses, grades and lines as indicated.
- .3 Placing conditions:
 - .1 Place asphalt mixtures only when air temperature is 5 degrees C minimum.
 - .2 When temperature of surface on which material is to be placed falls below 10 degrees C, provide extra rollers as necessary to obtain required compaction before cooling.
 - .3 Do not place hot-mix asphalt when pools of standing water exist on surface to be paved, during rain, or when surface is damp.
- .4 Place Hot Max Asphalt in compacted lifts of thickness as indicated.
 - .1 Levelling courses to thicknesses required but not exceeding 50 mm.
 - .2 Lower course in 1 layer of 50 mm SP19.0 CAT-D PG 58-28.
 - .3 Surface course in 1 layer of maximum 50 mm SP12.5 CAT-D PG 64-28XJ.
- .5 Where possible do tapering and levelling where required in lower lifts. Overlap joints by not less than 300 mm.

- .6 Place individual strips no longer than 500 m.
- .7 Spread and strike off mixture with self propelled mechanical finisher.
 - .1 Construct longitudinal joints and edges true to line markings.
 - .1 Contract Administrator to establish lines for paver to follow parallel to centerline of proposed pavement. Position and operate paver to follow established line closely.
 - .2 When using pavers in echelon, have first paver follow marks or lines, and second paver follow edge of material placed by first paver.
 - .1 Work pavers as close together as possible and in no case permit them to be more than 30 m apart.
 - .3 Maintain constant head of mix in auger chamber of paver during placing.
 - .4 If segregation occurs, immediately suspend spreading operation until cause is determined and corrected.
 - .5 Correct irregularities in alignment left by paver by trimming directly behind machine.
 - .6 Correct irregularities in surface of pavement course directly behind paver.
 - .1 Remove excess material forming high spots using shovel or lute.
 - .7 Do not throw surplus material on freshly screeded surfaces.
- .8 When hand spreading is used:
 - .1 Use approved wood or steel forms, rigidly supported to assure correct grade and cross section.
 - .1 Use measuring blocks and intermediate strips to aid in obtaining required cross-section.
 - .2 Distribute material uniformly without broad casting material.
 - .3 During spreading operation, thoroughly loosen and uniformly distribute material by lutes or covered rakes.
 - .1 Reject material that has formed into lumps and does not break down readily.
 - .4 After placing and before rolling, check surface with templates and straightedges and correct irregularities.
 - .5 Provide heating equipment to keep hand tools free from asphalt.
 - .1 Control temperature to avoid burning material.
 - .2 Do not use tools at higher temperature than temperature of mix being placed.

3.7 COMPACTING

- .1 Roll asphalt continuously using established rolling pattern for test strip and to density of not less than 100% of maximum density determined for test strip.
- .2 Do not change rolling pattern unless mix changes or lift thickness changes.
 - .1 Change rolling pattern only as directed by Contract Administrator.
- .3 Roll asphalt continuously to density not less than 98 % blow Marshall density to AASHTO T245.

.4 General:

- .1 Provide at least 2 rollers and as many additional rollers as necessary to achieve specified pavement density. When more than 2 rollers are required, 1 roller must be pneumatic tired type.
- .2 Start rolling operations as soon as placed mix can bear weight of roller without excess displacement of material or cracking of surface.
- .3 Operate roller slowly initially to avoid displacement of material. Do not exceed 5 km/h for breakdown and intermediate rolling for static steel-wheeled and pneumatic tired rollers. Do not exceed 9 km/h for finish rolling.
- .4 Use static compaction for levelling coarse less than 25 mm thick.
- .5 For lifts 50 mm thick and greater, adjust speed and vibration frequency of vibratory rollers to produce minimum of 25 impacts per metre of travel. For lifts less than 50 mm thick, impact spacing not to exceed compacted lift thickness.
- .6 Overlap successive passes of roller by minimum of 200 mm and vary pass lengths.
- .7 Keep wheels of roller slightly moistened with water to prevent pick-up of material but do not over-water.
- .8 Do not stop vibratory rollers on pavement that is being compacted with vibratory mechanism operating.
- .9 Do not permit heavy equipment or rollers to stand on finished surface before it has been compacted and has thoroughly cooled.
- .10 After traverse and longitudinal joints and outside edge have been compacted, start rolling longitudinally at low side and progress to high side.
 - .1 Ensure that all points across width of pavement receive essentially equal numbers of passes of compactors.
- .11 When paving in echelon, leave unrolled 50 to 75 mm of edge which second paver is following and roll when joint between lanes is rolled.
- .12 Where rolling causes displacement of material, loosen affected areas at once with lutes or shovels and restore to original grade of loose material before re-rolling.

.5 Breakdown rolling:

- .1 Begin breakdown rolling with static steel wheeled roller and vibratory roller immediately following rolling of transverse and longitudinal joint and edges.
- .2 Operate rollers as close to paver as necessary to obtain adequate density without causing undue displacement.
- .3 Operate breakdown roller with drive roll or wheel nearest finishing machine. When working on steep slopes or super-elevated sections use operation approved by Contract Administrator.
- .4 Use only experienced roller operators.

.6 Intermediate rolling:

- .1 Use pneumatic-tired, steel wheel or vibratory rollers and follow breakdown rolling as closely as possible and while paving mix temperature allows maximum density from this operation.
- .2 Rolling to be continuous after initial rolling until mix placed has been thoroughly compacted.
- .7 Finish rolling:
 - .1 Accomplish finish rolling with two-axle or three-axle tandem steel wheeled rollers while material is still warm enough for removal of roller marks.
 - .1 If necessary to obtain desired surface finish, use pneumatic-tired rollers as directed by Contract Administrator.
 - .2 Conduct rolling operations in close sequence.
- .8 Dust entire area of sheet asphalt pavements with hydrated lime immediately after rolling to eliminate tendency to pick-up under traffic.

3.8 JOINTS

- .1 General:
 - .1 Remove surplus material from surface of previously laid strip.
 - .1 Do not deposit on surface of freshly laid strip.
 - .2 Construct joints between asphalt concrete pavement and Portland cement concrete pavement as indicated.
 - .3 Paint contact surfaces of existing structures such as manholes, curbs or gutters with bituminous material prior to placing adjacent pavement.
- .2 Transverse joints:
 - .1 Offset transverse joint in succeeding lifts by at least 600 mm.
 - .2 Cut back to full depth vertical face and tack face with thin coat of hot asphalt prior to continuing paving.
 - .3 Compact transverse joints to provide smooth riding surface. Use methods to prevent rounding of compacted surface at joints.
- .3 Longitudinal joints:
 - .1 Offset longitudinal joints in succeeding lifts by at least 150 mm.
 - .2 Cold joint is defined as joint where asphalt mix is placed, compacted and left to cool below 100 degrees C prior to paving of adjacent lane.
 - .1 For airfield runway paving, avoid cold joint construction in mid 30 m of runway.
 - .2 If cold joint can not be avoided, cut back by saw cutting previously laid lane, by at least 150 mm, to full depth vertical face, and tack face with thin coat of hot asphalt of adjacent lane.
 - .3 Overlap previously laid strip with spreader by 25 to 50 mm.
 - .4 Before rolling, carefully remove and discard coarse aggregate in material overlapping joint with lute or rake.
 - .5 Roll longitudinal joints directly behind paving operation.

- .6 When rolling with static or vibratory rollers, have most of drum width ride on newly placed lane with remaining 150 mm extending onto previously placed and compacted lane.
- .4 Construct feather joints so that thinner portion of joint contains fine graded material obtained by changed mix design or by raking out coarse aggregate in mix.
 - .1 Place and compact joint to ensure joint is smooth and without visible breaks in grade.
 - .2 Locate feather joints as indicated.
- .5 Construct butt joints as indicated.

3.9 FINISH TOLERANCES

- .1 Finished asphalt surface to be within 5 mm of design elevation but not uniformly high or low.
- .2 Finished asphalt surface not to have irregularities exceeding 5 mm when checked with 4.5 m straight edge placed in any direction.

3.10 DEFECTIVE WORK

- .1 Correct irregularities which develop before completion of rolling by loosening surface mix and removing or adding material as required.
 - .1 If irregularities or defects remain after final compaction, remove surface course promptly and lay new material to form true and even surface and compact immediately to specified density.
- .2 Repair areas showing checking, rippling, or segregation.
- .3 Adjust roller operation and screed settings on paver to prevent further defects such as rippling and checking of pavement.

SECTION

Part 1 General

1.1 SUMMARY

- .1 Section Includes concrete paving, sidewalks, curbs and gutters including:
 - .1 Forming.
 - .2 Steel reinforcement.
 - .3 Subgrade preparation and compaction.
 - .4 Sand and granular cushion.
 - .5 Concrete placement.
 - .6 Concrete finishing.
 - .7 Pavement markings.
 - .8 Accessories including joint filler and curing compound.
- .2 Related Requirements:
 - .1 Section 03 20 00 – Concrete Reinforcing
 - .2 Section 03 30 00 – Cast-In-Place Concrete
 - .3 Section 31 23 00 – Excavation and Fill

1.3 ADMINSTRATIVE REQUIREMENTS

- .1 Pre-Installation Meeting: Convene pre-installation meeting one week prior to beginning work of this Section and on-site installation, with Contractor, Consultant, installer, manufacturer's representative to:
 - .1 Verify project requirements.
 - .2 Review installation and substrate conditions.
 - .3 Co-ordination with other building subtrades.
 - .4 Review manufacturer's installation instructions and warranty requirements.
- .2 Coordination: Coordinate with York Region requirements for standard sidewalks, curbs, and gutters.

1.4 ACTION SUBMITTALS/INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittals:
 - .1 Submit design mixes for each concrete pavement mixture including alternate mix designs when characteristics of materials, project conditions, weather, test results, or other circumstances require adjustments.
 - .2 Provide electronic copy of WHMIS SDS - Safety Data Sheets in accordance with WHMIS acceptable to Labour Canada, and Health and Welfare Canada.
- .2 Certificates: Submit to Consultant, manufacturer's test data and certification that the following material meets requirements of this section prior to starting concrete work:
 - .1 Cementitious materials.
 - .2 Supplementary Cementing Material.
 - .3 Steel reinforcement and reinforcement accessories.
 - .4 Admixtures.
 - .5 Joint Sealants.
 - .6 Curing Materials.

.7 Joint Filler.

- .3 LEED Submittals: provide LEED submittals in accordance with Section 01 61 01 – LEED Product Requirements.

1.5 QUALITY ASSURANCE

- .1 Use ready mixed concrete producers in accordance with CSA A23.1, CSA A23.2 and CSA A3000 requirements for production facilities and equipment, and which is a member of the Ready Mixed Concrete Association of Ontario.
- .2 Installer Qualifications: Company or person specializing in Portland cement concrete paving with five years documented experience who has completed systems similar in materials, design and extent to that indicated for Project and with a record of successful performance.
- .3 Testing:
- .1 Compaction testing of base, and testing of concrete, will be performed in accordance with Sections 03 30 00 and 31 23 10 respectively.

1.6 DELIVERY, STORAGE, AND HANDLING

- .1 Packaging Waste Management
- .1 Separate and recycle waste materials in accordance with Section 01 74 19 – Construction Waste Management.

1.7 SITE CONDITIONS

- .1 Ambient Conditions:
- .1 Use winter concreting methods in accordance with CSA A23.1 section 7.4.2.5 when the mean daily temperature falls below 5°C. Concrete shall not be considered a seasonal deficiency and shall be installed with heating and hoarding as part of the Contract.

Part 2 Products

2.1 FORMS

- .1 Form Materials: Plywood, metal, metal framed plywood, or other acceptable panel type materials to provide full depth, continuous, straight, smooth exposed surfaces.
- .2 Use flexible or curved forms for curves with a radius of 30 m or less.
- .3 Form Release Agent: Commercially formulated form release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces.

2.2 STEEL REINFORCEMENT

- .1 Deformed Steel Welded Wire Reinforcement: Meeting the requirements of ASTM A497/A497M, flat sheet.
- .2 Welded Wire Fabric: to AASHTO M 336M/336.
- .3 Tie Bar for Construction Joints: plain steel bars to CSA G30.18.

- .4 Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars, welded wire reinforcement, and dowels in place, fabricated from steel wire, plastic, or precast concrete of greater compressive strength than concrete; equip wire bar supports with sand plates or horizontal runners where base material will not support chair legs.

2.3 CONCRETE MATERIALS

- .1 Cement Type: Normal Portland Cement in accordance with CSA A3000, Type GU.
- .2 Water: Meeting requirements of CSA A23.1/A23.2.
- .3 Aggregates For Concrete: to CSA A23.1 and as follows:
 - .1 Normal Density Fine Aggregate: Nominal maximum aggregate size in accordance with CSA A23.2-1A, uniformly graded to maintain Workability and control water bleed out, as indicated on Drawings.
 - .2 Normal Density Coarse Aggregate: Aggregate selected from Group I or Group II Grading Classifications, to suit design mix, in accordance with CSA A23.2-13A, nominal maximum aggregate sizes and applications as indicated on Drawings.
 - .3 Ironstone content of aggregates in exposed interior or exterior concrete subject to intermittent or continuous wetting shall not exceed the following, when tested Meeting requirements of ASTM C295/C295M:
 - .1 Coarse Aggregate: maximum 1%.
 - .2 Fine Aggregate, Retained on 2.5 mm Sieve: maximum 1.5%.
- .4 Air Entraining Admixtures for Concrete: to CAN3-A266.1.

2.4 CONCRETE MIXES

- .1 Design ready-mix concrete conforming to CSA A23.1/A23.2, and as indicated in Structural Specifications.
 - .1 Compressive Strength: Minimum 32 MPa after 28 days.
 - .2 Class of Exposure: C-2.
 - .3 Slump: 30 mm maximum.
 - .4 Air Content Category: 1.
 - .5 Maximum Water to Cement Ratio: 0.45.
 - .6 Aggregate Size: 20 mm Maximum.
 - .7 Concrete Admixtures:
 - .1 Air Entrained.
 - .2 Fly Ash or Pozzolan, limited to 25% maximum.
- .2 Temperature of concrete mix at placing shall be no less than 10°C and no greater than 27°C. Provide mix toward lower end of temperature range during hot weather and toward higher end of temperature range during cold weather, in accordance with CSA A23.1.
- .3 Use of admixtures, other than air-entraining admixtures, are not permitted without prior written approval of Consultant.

- .4 Site mix concrete is permitted for placements not exceeding 1 m³ and for core filling of non-load bearing masonry and bond beams.
- .5 Add an air entraining admixture to all concrete exposed to the weather or in contact with the ground, producing entrained air in accordance with CSA A23.1, Table Ten; air entraining admixture is not required for interior slabs on grade.

2.5 PAVEMENT MARKINGS

- .1 Paint: Latex traffic paint meeting requirements of ASTM D4797, colour to ASTM E1360 yellow, white and blue in accordance with MPI Architectural Painting Specification Manual "Approved Product" listing MPI #97, Latex Traffic Marking Paint. Refer to Section 09 91 00, Exterior System EXT 2.1A.

2.6 ACCESSORIES

- .1 Poured Joint Filler: Asphalt elastic compound.
- .2 Preformed Joint Filler: asphalt impregnated type to ASTM D1751.
- .3 Curing Compound: to ASTM C309, Type Two white pigmented, Class B resin-based, liquid membrane-forming type.

Part 3 Execution

3.1 PROTECTION

- .1 Protection of In-Place Conditions:
 - .1 Prevent damage to buildings and adjacent property.

3.2 SUBGRADE PREPARATION

- .1 Construct subgrade to elevation and grade indicated.
- .2 Compact subgrade to 95% Standard Proctor Maximum Dry Density.
- .3 Excavate soft spots and fill with 50 mm crushed gravel compacted to 95% Standard Proctor Maximum Dry Density.

3.3 SAND AND GRANULAR CUSHION

- .1 Place 50 mm thick sand layer and crushed gravel layer on prepared subgrade, and compact to 95% Standard Proctor Dry Density.
- .2 Place 50 mm thick sand cushion layer for precast sidewalk blocks and compact to 95% Standard Proctor Dry Density.

3.4 REINFORCEMENT

- .1 Install steel reinforcement in accordance with CSA A23.1 for fabricating, placing, and supporting reinforcement.
- .2 Clean reinforcement of loose rust and mill scale, earth, ice, or other bond-reducing materials.
- .3 Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement; maintain minimum cover to reinforcement.

- .4 Install welded wire reinforcement in longest practical lengths; lap adjoining pieces at least one full mesh and lace splices with wire; offset laps of adjoining widths to prevent continuous laps in either direction.

3.5 CONCRETE PLACEMENT

- .1 Inspect and complete formwork installation, steel reinforcement, and items being embedded or cast in concrete before placing concrete; notify other trades to permit installation of their work.
- .2 Remove snow, ice, or frost from sub-base surface and reinforcement before placing concrete; do not place concrete on frozen surfaces.
- .3 Moisten sub-base to provide a uniform dampened condition at time concrete is placed; do not place concrete around manholes or other structures until they are at required finish elevation and alignment.
- .4 Place concrete in accordance with recommendations in CSA A23.1 for measuring, mixing, transporting, and placing concrete.
- .5 Do not add water to concrete during delivery, at project site, or during placement.
- .6 Consolidate concrete with mechanical vibrating equipment.
- .7 Do not add water to fresh concrete after testing.
- .8 Deposit and spread concrete in a continuous operation between transverse joints; do not push or drag concrete into place or use vibrators to move concrete into place.
- .9 Place concrete in two operations as follows, hooking and raising reinforcing mats will not be considered as an acceptable method for setting reinforcing:
 - .1 Strike off initial pour for entire width of placement and to the required depth below finish surface.
 - .2 Lay welded wire fabric or fabricated bar mats immediately in final position.
 - .3 Place top layer of concrete, strike off, and screed.
 - .4 Remove and replace concrete that has been placed for a maximum of 15 minutes without being covered by top layer, or use bonding agent if acceptable by Consultant.
- .10 Screed pavement surfaces with a straightedge and strike off.
- .11 Commence initial floating using bull floats or darbies to impart an open textured and uniform surface plane before excess moisture or bleed water appears on the surface; do not further disturb concrete surfaces before beginning finishing operations or spreading surface treatments.
- .12 Submit revised mix design and laboratory test results that meet or exceed requirements when automatic machine placement is used for curb and gutter placement; produce curbs and gutters to required cross section, lines, grades, finish, and jointing as specified for formed concrete; remove and replace with formed concrete where results are not acceptable to the Consultant.
- .13 Submit revised mix design and laboratory test results that meet or exceed requirements when automatic machine placement is used for pavement; produce pavement to required thickness, lines, grades, finish, and jointing as required for

formed pavement; compact sub-base and prepare sub-grade of sufficient width to prevent displacement of paver machine during operations.

3.6 JOINTS

- .1 Construct joints true to line with faces perpendicular to surface of paving. Construct transverse joints at right angles to paving centreline and longitudinal joints, unless otherwise indicated.
- .2 Expansion Joints at Building Face or Other Vertical Abutments: place 15 mm wide preformed joint filler 5 mm below finished surface for full width and depth of concrete.
- .3 Contraction Joints for Concrete Paving, Curbs and Gutters: construct 35 mm deep by 5 mm wide joints 3 m on centre and where shown on drawings by means of marking tool or other approved method.
- .4 Align curb, gutter, and sidewalk joints.

3.7 FINISHING

- .1 Do not add water to concrete surfaces during finishing operations.
- .2 Begin second floating operation when bleed water sheen has disappeared and concrete surface has stiffened sufficiently to permit operations, and as follows:
 - .1 Float surface with power driven floats, or by hand floating if area is small or inaccessible to power units
 - .2 Finish surfaces to true planes.
 - .3 Cut down high spots and fill low spots.
 - .4 Re-float surface immediately to uniform granular texture.
- .3 Apply following finishes as indicated on Drawings:
 - .1 Medium-to-Fine Textured Broom Finish: Draw a soft bristle broom across float finished concrete surface perpendicular to line of traffic to provide a uniform, fine-line texture.

3.8 CURING AND PROTECTION

- .1 Cure freshly deposited concrete in accordance with CSA A23.1.
- .2 Apply curing compound immediately after finishing, in accordance with manufacturer's instructions. Promptly re-coat areas subjected to heavy rainfall within three hours after initial application.
- .3 When ambient air temperature is at or below 5°C, or when there is a probability of it falling to 5°C within 24 hours of placing, provide cold weather protection until a period of seven days of concrete temperature at or above 10°C has been attained. Protection shall meet requirements of CSA A23.1.
- .4 Estimate rate of surface moisture evaporation in accordance with CSA A23.1 and provide protection from drying as required.
- .5 Keep vehicular traffic off paved areas until paving has cured sufficiently to support such loads.

3.9 TOLERANCES

- .1 Place concrete in accordance with tolerances listed in CSA A23.1 and as follows:
 - .1 Elevation: 6 mm.
 - .2 Thickness: +10 mm, -6 mm.
 - .3 Surface: Gap below 3 m long, unlevelled straightedge not to exceed 6 mm.
 - .4 Lateral Alignment and Spacing of Tie Bars and Dowels: 25 mm.
 - .5 Vertical Alignment of Tie Bars and Dowels: 6 mm.
 - .6 Alignment of Tie-Bar End Relative to Line Perpendicular to Pavement Edge: 13 mm.
 - .7 Alignment of Dowel-Bar End Relative to Line Perpendicular to Pavement Edge: Length of dowel 6 mm per 300 mm.
 - .8 Joint Spacing: 75 mm.
 - .9 Contraction Joint Depth: +6 mm, no minus.
 - .10 Joint Width: +3 mm, no minus.

3.10 PAVEMENT MARKINGS

- .1 Do not apply pavement marking paint until layout, colours, and placement have been verified with Consultant.
- .2 Allow concrete pavement to cure for a minimum of 28 days and be dry before starting pavement marking; delay application of pavement markings where slow curing conditions exist.
- .3 Sweep and clean surface to remove loose material and dust.
- .4 Apply paint with mechanical equipment to produce pavement markings of dimensions indicated with uniform, straight edges to paint manufacturer's recommended wet film thickness.

3.11 FIELD QUALITY CONTROL

- .1 Testing Agency: Engage qualified independent testing and inspecting agency to sample materials, perform tests, and submit test reports during concrete placement according to requirements specified in this Article in accordance with CSA A23.2.
 - .1 Testing Frequency:
 - .1 Obtain at least one composite sample for each 75 m³ or 450 m², or fraction thereof of each concrete mix placed each day.
 - .2 Conduct testing from at least five randomly selected batches or from each batch if fewer than five are used when frequency of testing will provide fewer than five compressive strength tests for each concrete mixture.
 - .2 Slump: Perform one test at point of placement for each composite sample, but a minimum of one test for each day's pour of each concrete mix. Perform additional tests when concrete consistency appears to change.

- .3 Air Content: Perform one test for each composite sample using pressure method, with a minimum of one test for each day's pour of each concrete mix.
- .4 Concrete Temperature: Perform one test hourly when air temperature is 4°C and below and when 27°C and above, and one test for each composite sample.
- .5 Compression Test Specimens: Cast and laboratory cure one set of three standard cylinder specimens for each composite sample.
- .6 Compressive Strength Tests: Test One specimen at seven days and two specimens at 28 days, and one specimen at 56 days.
- .2 Non-Destructive Testing: Impact hammer, sonoscope, or other non-destructive device may be permitted by Consultant, but will not be used as sole basis for acceptance or rejection of concrete.
- .3 Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by Consultant with costs being paid for by the Contractor.
- .4 Remove and replace concrete pavement where test results indicate that it does not meet specified requirements.
- .5 Additional testing and inspecting, at Contractor's expense, will be performed to determine acceptance of replaced or additional work with specified requirements.

3.12 REPAIRS

- .1 Remove and replace concrete pavement that is broken, damaged, or defective or that does not comply with requirements in this Section.

3.13 PROTECTION

- .1 Protect surfaces of fresh concrete against damage by rain, dirt and dust, debris and traffic until sufficient strength attained to resist damage.
- .2 Protect concrete from damage:
 - .1 Exclude traffic from pavement for at least 14 days after placement.
 - .2 Maintain pavement as clean as possible by removing surface stains and spillage of materials as they occur when construction traffic is permitted.
- .3 Maintain concrete pavement free of stains, discolouration, dirt, and other foreign material.
- .4 Sweep concrete pavement a maximum of two days before date scheduled for Substantial Performance.

END OF SECTION

1 General

1.01 REFERENCE STANDARDS

- .1 ASTM International
 - .1 ASTM C 136-06, Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.
 - .2 ASTM C 117-04, Standard Test Method for Material Finer Than 0.075 mm (No. 200) Sieve in Mineral Aggregates by Washing.
- .2 Canadian General Standards Board (CGSB)
 - .1 CAN/CGSB-8.1-88, Sieves, Testing, Woven Wire, Inch Series.
 - .2 CAN/CGSB-8.2-M88, Sieves, Testing, Woven Wire, Metric.

1.02 MEASUREMENT AND PAYMENT

- .1 Measure granular base in cubic metres of material incorporated into Work and accepted by Consultant.
- .2 Measure granular topping in cubic metres of material incorporated into Work and accepted by Consultant.

1.03 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Submit submittals in accordance with Section 01 33 00 - Submittal Procedures.

1.04 DELIVERY, STORAGE AND HANDLING

- .1 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- .2 Store crushed stone as and where directed by Consultant.

2 Products

2.01 MATERIALS

- .1 Granular base in accordance with the following requirements:
 - .1 Crushed stone or gravel: hard, durable, angular particles, free from clay lumps, cementation, organic material, frozen material and other deleterious materials.
 - .2 Gradations: within limits specified when tested to ASTM C 136 and ASTM C 117]. Sieve sizes to CAN/CGSB-8.1 and CAN/CGSB-8.2.
 - .3 Table:

<u>Sieve Designation</u>	<u>% Passing</u>
19 mm	100
12.5 mm	70-100
4.75 mm	40-70
2.00 mm	23-50
0.425 mm	7-25
0.075 mm	3-8

- .4 Liquid limit: ASTM D 4318 maximum 25
- .5 Plasticity index: ASTM D 4318 maximum 6
- .2 Granular topping:
 - .1 Screenings: hard, durable, crushed stone particles, free from clay lumps, cementation, organic material, frozen material and other deleterious materials.
 - .2 Gradations: within limits specified when tested to ASTM C 136 and ASTM C 117.

<u>Sieve Designation</u>	<u>% Passing</u>
9.5 mm	100
4.75 mm	50-100
2.00 mm	30-65
0.425 mm	10-30
0.075 mm	5-10

3 Execution

3.01 SUBGRADE

- .1 Ensure subgrade preparation conforms to levels and compaction required, to allow for installation of granular base.

3.02 GRANULAR BASE

- .1 Granular sub-base material minimum thickness: 150 mm.
- .2 Place material in uniform layers not to exceed 150 mm compacted thickness.
 - .1 Compact layer to 98 % Standard Proctor Density.

3.03 GRANULAR TOPPING

- .1 Place granular topping to compacted thickness of 150 mm minimum.
- .2 Place material in uniform layers not to exceed 50 mm compacted thickness.
 - .1 Compact layer to 98 % Standard Proctor Density.

3.04 CLEANING

- .1 Progress Cleaning: Clean in accordance with Section 02 41 13 - Site Selective Demolition.
- .2 Final Cleaning: Upon completion, remove surplus materials, rubbish, tools and equipment in accordance with Section 01 77 00 - Closeout Procedures.

3.05 PROTECTION

- .1 Prevent damage to buildings, landscaping, curbs, sidewalks, trees, fences, roads and adjacent property.
- .1 Repair damages incurred.

END OF SECTION

Part 1 GENERAL

1.1 GENERAL

- .1 Comply with General Conditions, Supplementary General Conditions, General Requirements, Addenda thereto, specifications and drawings.

1.2 RELATED SECTIONS

- .1 Comply with following sections:
 - .1 Section 32 12 16 – Asphalt Pavement

1.3 REFERNECES

- .1 Comply with following, which are invoked and form part of this specification section, as modified by this section:
 - .1 OPSS 710 Construction Specification for Pavement Marking
 - .2 OPSS 1712 Material Specification for Organic Solvent Based Traffic Paint.
 - .3 MTO Manual of Uniform Traffic Control Devices.
 - .4 Metrolinx GO Design Requirements Manual

1.4 DEFINITIONS

- .1 Definitions of the referenced OPSS sections are invoked and apply to this section.

1.5 QUALITY ASSURANCE

- .1 Use only products from the MTO Designated Sources for Materials (DSM).
- .2 Paint applicator equipment to be an approved pressure-type distributor capable of applying paint in single, double and dashed lines.
- .3 Quality Assurance requirements of the referenced OPSS are invoked and apply to the Work of this section, except as noted in 1., (e)., (i). and (ii). herein.
- .4 OPSS 1712.09 Authority Purchase of Material by Purchase Order is not used.

1.6 SUBMITTALS

- .1 Submit paint manufacturer's material data sheets.
- .2 OPSS 710.04.01, and 710.05.03 through 710.06, and 710.06.02.02 and 710.06.02.03 are not used.

1.7 DELIVERY, STORAGE & HANDLING

- .1 Protect products from contamination and freezing.
- .2 Store securely in original containers with all proper labelling.

Part 2 PRODUCTS

2.1 MATERIALS

- .1 Paint: to OPSS 1712 and listed with MTO DSM.
- .2 Reflectorized glass beads are not required for parking lot pavement markings.
- .3 Pre-marking paint to be compatible with final marking paint listed above.
- .4 Purchase and supply traffic paint for this Contract. OPSS 1712.09 Authority Purchase of Material by Purchase Order is not used.

Part 3 EXECUTION

3.1 SURFACES PREPARATION

- .1 Examine surfaces prior to performing work.
- .2 Comply with OPSS 710.07.02, and pavement surface to be free from ponded water, frost, ice, dust, oil, grease and other foreign materials.
- .3 Commencement of work signifies the Contractor's acceptance of conditions.

3.2 APPLICATION

- .1 Methods and equipment used in surface preparation shall not result in dust or debris that could mar or cause damage to existing structures and vehicles parked within and adjacent to the Place of the Work.
- .2 Notwithstanding 3., (b)., (vi) below, do not carry out premarking or permanent paint application during environmental conditions where wind speed will result in paint particle drift that could mar or cause damage to existing structures and vehicles parked within and adjacent to site of the work.
- .3 At no change in the Contract Price, make good to the satisfaction of the direction of Consultant, damage to or claims against the Owner or third party property resulting from surface preparation and application of painted traffic lines and markings. At no change in the Contract Price, pay any claims for damage to the Owner or third party property resulting from surface preparation and application of painted traffic lines and markings.
- .4 Lay out pavement markings as shown on drawings.
- .5 Apply pavement markings in accordance with OPSS 710.07.09.01 and 710.07.09.02 for Organic Solvent Based Traffic Paint without reflectorizing glass beads.
- .6 Comply with 710.07.09.02. In addition to 710.07.02.02, unless otherwise approved by Consultant, apply paint only when air temperature is above 5°C, wind speed is less than 40 km/h and no rain is forecast within next 4 hours.
- .7 Apply one coat of traffic paint evenly at a rate that results in a dry film thickness of not less than 200 microns.
- .8 Symbols and letters to conform to dimensions indicated.
- .9 Paint lines to be of uniform colour and density with sharp edges.
- .10 Thoroughly clean distributor tank before refilling with paint of different colour.

3.3 TOLERANCE

- .1 Paint markings to be within plus or minus 12 mm of dimensions indicated.

3.4 PROTECTION OF COMPLETED WORK

- .1 Protect pavement markings until dry.

3.5 COLOURS AND DIMENSIONS

- .1 Pavement Marking Colour

Line Marking (Parking Structures Only)	
Location	Colour
Parking stalls, parking restricted areas and islands	Yellow
Directional dividing lines	White with reflectorizing glass beads
Lane lines, stop lines and arrows	White with reflectorizing glass beads
Stop Block	White with reflectorizing glass beads
Pedestrian crosswalk lines	White with reflectorizing glass beads

- .2 Vehicular Parking Diagram – Detail
.3 Line Marking – Row Parking Stalls
.4 Hatched Parking Area Configuration
.5 Line Marking for Islands

END OF SECTION

Part 1 GENERAL

1.1 GENERAL

- .1 Comply with General Conditions, Supplementary General Conditions, General Requirements, Addenda thereto, specifications and drawings.

1.2 RELATED SECTIONS

- .1 Comply with following sections:
 - .1 Section 32 12 16 – Asphalt Pavement

1.3 REFERNECES

- .1 Comply with following, which are invoked and form part of this specification section, as modified by this section:
 - .1 ASTM D-4541 Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Tester.
 - .2 ASTM D-4060 Test Method for Abrasion Resistance of Organic Coatings by the Taber Abraser.
 - .3 ASTM D-2697 Standard Test Method for Volume of Nonvolatile Matter in Clear or Pigmented Coatings.
 - .4 ASTM D522-93A Standard Test Method for Mandrel Bend Test of Attached Organic Coatings.
 - .5 ASTM D1653 Standard test method for water vapor transmission through organic film coatings.
 - .6 ASTM G-154 QUV Accelerated Weathering Environment. Standard Practice for Operating Fluorescent Light Apparatus for UV Exposure of Nonmetallic Materials.
 - .7 ASTM D 2369 Weight Solids Standard test method for Volatile Content of Coatings.
 - .8 ASTM D 1475 Standard Test method for Density of Paint, Varnish, Lacquer, Other related products.
 - .9 ASTM D-2240 (2000) Standard Test Method for Rubber property – Durometer hardness
 - .10 ASTM D-5895 Standard Test Method of drying or curing during film formation of organic coatings using mechanical recorders.
 - .11 ASTM D-570 Standard Test Method for water absorption of plastics.

1.4 QUALITY ASSURANCE

- .1 Applicator must be approved by the manufacturer, and have minimum five years experience on projects of similar size.

1.5 SUBMITTALS

- .1 Submit manufacturer's material data sheets.
- .2 Submit copy of the Accreditation Certificate, available from the Applicator.

- .3 Provide independent test results upon request

1.6 DELIVERY, STORAGE & HANDLING

- .1 Protect products from contamination and freezing.
- .2 Store securely in original containers with all proper labelling.

Part 2 PRODUCTS

2.1 MATERIALS

- .1 Coating: epoxy modified acrylic waterborne coating.
- .2 Density: 1.58 kg/l to ASTM D1475
- .3 Abrasion Resistance: 0.76 g/1000 cycles to ASTM D4060 dry, 1.67 g/1000 cycles to ASTM D4060 wet.
- .4 Shore Hardness: 38.3 to ASTM D2240
- .5 Permeance: 3.45 g/m²/24hu/mm Hg to ASTM D1653
- .6 Colourant: UV stable pigment.
- .7 Colour: provide in dark grey colour with minimum SR value of 0.33.
- .8 Basis of Design Materials:
 - .1 StreetbondSR, HUBSS
 - .2 Acceptable Alternate Materials:
 - .1 Reflective Coating, Neyra Superior Pavement Products and Surfacing Solutions.

Part 3 EXECUTION

3.1 SURFACES PREPARATION

- .1 Examine surfaces prior to performing work.
- .2 Prepare surfaces in accordance with manufacturer's recommendations.
- .3 Commencement of work signifies the Contractor's acceptance of conditions.

3.2 APPLICATION

- .1 Apply pavement coating in accordance with manufacturer's instructions through sprayers onto completely clean and dry asphalt. Allow to dry between coats as required by manufacturer's instructions.
- .2 Apply in coating thickness to suit application for up to 500 cars per day on surface.

3.3 PROTECTION OF COMPLETED WORK

- .1 Protect pavement coating until dry.

END OF SECTION

1 GENERAL

1.01 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Product Data:
 - .1 Provide manufacturer's instructions, printed product literature and data sheets for furniture and playground structures and include product characteristics, performance criteria, physical size, finish and limitations.
- .2 Shop Drawings:
 - .1 Submit shop drawings indicating dimensions, sizes, assembly, anchorage and installation details for each furnishing specified.

1.02 CLOSEOUT SUBMITTALS

- .1 Provide maintenance data for care and cleaning of site furnishings for incorporation into manual specified in Section 01 77 00 - Closeout Procedures.

1.03 DELIVERY, STORAGE AND HANDLING

- .1 Deliver, store and handle materials in accordance with manufacturer's written instructions.
- .2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- .3 Storage and Handling Requirements:
 - .1 Store materials in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.
 - .2 Store and protect furnishings and playground structures from nicks, scratches, and blemishes.
 - .3 Replace defective or damaged materials with new.

2 PRODUCTS

2.01 BENCH

- .1 Manufacturer: Subject to compliance with requirements, provide the following products:
 - .1 MAGLIN SITE FURNISHINGS INC. Canada, Woodstock, ON
 - .1 Ogden Series
 - .1 Model: Straight backless
 - .2 Mount: Wall mount
 - .1 Rust resistant and tamper proof hardware
 - .3 Material
 - .1 Wood Grain Texture High Density Polyethylene
 - .2 Colour: Cedar
 - .4 Finish: Powder Coated Matte Black
 - .5 Warranty: Standard manufacturer warranty

2.02 CLUSTER SEATING

- .1 Manufacturer: Subject to compliance with requirements, provide the following products:
 - .1 MAGLIN SITE FURNISHINGS INC. Canada, Woodstock, ON
 - .1 210 Series
 - .1 Model: MTB-210-00027
 - .2 Mount: Surface mount
 - .1 Rust resistant and tamper proof hardware
 - .3 Material
 - .1 Wood Grain Texture High Density Polyethylene
 - .2 Colour: Cedar
 - .4 Finish: Powder Coated Matte Black
 - .5 Warranty: Standard manufacturer warranty

3 EXECUTION

3.01 EXAMINATION

- .1 Verification of Conditions: verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for exterior site furnishing installation in accordance with manufacturer's written instructions.
 - .1 Visually inspect substrate in presence of Consultant.
 - .2 Inform Consultant of unacceptable conditions immediately upon discovery.
 - .3 Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Consultant.

3.02 PREPARATION

- .1 Locate and protect utility lines.
- .2 Notify and acquire written acknowledgement from utility authorities before beginning installation Work

3.03 INSTALLATION

- .1 Assemble furnishings in accordance with manufacturer's written recommendations.
- .2 Install furnishing true, plumb and anchored as indicated contract documents and to manufacturer's recommendations.
- .3 Touch-up damaged finishes to approval of Consultant.

3.04 CLEANING

- .1 Progress Cleaning: Clean in accordance with Section 02 41 13 - Selective Site Demolition.

.2 Final Cleaning: Upon completion, remove surplus materials, rubbish, tools and equipment in accordance with Section 01 77 00 - Closeout Procedures.

3.05 PROTECTION

- .1 Protect installed products and components from damage during construction.
 - .2 Repair damage to adjacent materials caused by site furnishing installation.

END OF SECTION

1 General

1.01 RELATED REQUIREMENTS

- .1 Not Used.

1.02 DEFINITIONS

- .1 Compost:
 - .1 Mixture of soil and decomposing organic matter used as fertilizer, mulch, or soil amendment.
 - .2 Compost is processed organic matter containing 40% or more organic matter as determined by Walkley-Black or Loss On Ignition (LOI) test.
 - .3 Product must be sufficiently decomposed (i.e. stable) so that any further decomposition does not adversely affect plant growth (C:N ratio below 25), and contain no toxic or growth inhibiting contaminants.
 - .4 Composed bio-solids to: CCME Guidelines for Compost Quality, Category (A)(B).

1.03 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Quality control submittals:
 - .1 Soil testing: submit certified test reports showing compliance with specified performance characteristics and physical properties as described in PART 2 - SOURCE QUALITY CONTROL.
 - .2 Certificates: submit product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.

1.04 QUALITY ASSURANCE

- .1 Testing Agency Qualifications: An independent, or university-operated laboratory; experienced in soil science, soil testing, and plant nutrition; with the experience and capability to conduct the testing indicated; and that specializes in types of tests to be performed.
 - .1 Laboratories: Subject to compliance with requirements, provide testing by one of the following:
 - .2 A & L Canada Laboratories Inc., 2136 Jetstream Rd, London, Ontario N5V 3P5.
 - .3 Euorofins Environment Testing Canada Inc., 8-146 Colonade Road, Ottawa, Ontario K2E 7Y1
 - .4 SGS Agrifood Laboratories, 503 Imperial Road, Unit #1, Guelph, Ontario N1H 6T9
 - .5 University of Guelph, Laboratory Services, P.O. Box 3650 95 Stone Road, West Guelph, Ontario N1H 8J7
 - .6 Stratford Agri-Analysis, 1131 Erie Street, Box 760, Stratford, Ontario N5A 6W1
 - .7 Activation Laboratories Ltd., 41 Bittern Street, Ancaster, Ontario L9G 4V5
 - .8 Honeyland Ag Services, 3918 West Corner Drive, Ailsa Craig, Ontario N0M 1A0

- .2 Multiple Laboratories: At Contractor's option, work may be divided among qualified testing laboratories specializing in physical testing, chemical testing, and fertility testing.
- .3 Qualifications: Submit proof of qualifications when requested by Consultant.
- .4 Contractor Qualifications:
 - .1 Landscape Contractor: To be a Member in Good Standing of International Society of Arboriculture, Canadian Nursery Landscape Association, or Landscape Ontario Green for Life (LO).
 - .2 Landscape Supervisor: Landscape Horticulturist Journeyperson or Landscape Industry Certified Technician with Softscape Installation designation or equivalent.

2 Products

2.01 TOPSOIL

- .1 Topsoil for planting beds and sod: mixture of particulates, micro-organisms and organic matter which provides suitable medium for supporting intended plant growth. For horticultural beds of shrubs and perennials, a mixture of topsoil, coarse sand and compost mixed to the following proportions, by volume: Topsoil 40% (+/- 10%); Coarse Sand 50% (+/- 10%); High-lignin Organic Matter 10% (+/- 2%)
 - .1 Soil parameters:
 - .1 pH: 5.5-7.5
 - .2 Phosphorous (ppm): 10-60
 - .3 Potassium (ppm): 80-250
 - .4 Calcium (ppm): < 5000
 - .5 Magnesium (ppm): 100-300
 - .6 Soluble salt: < 1.5 mmhos/cm
 - .7 Organic matter: 4-15%
 - .8 Sodium (ppm): <200
 - .2 Contain no toxic elements or growth inhibiting materials.
 - .3 Finished surface free from:
 - .1 Debris and stones over 50 mm diameter.
 - .2 Coarse vegetative material, 10 mm diameter and 100 mm length, occupying more than 2% of soil volume.
 - .4 Consistency: Friable when moist.
- .2 Topsoil for sodded and seeded areas: mixture of particulates, micro organisms and organic matter which provides suitable medium for supporting intended plant growth.
 - .1 Soil parameters:
 - .1 Total Sand (0.05-2 mm): 50-60%
 - .2 Silt: 20-40%
 - .3 Clay: 6-10%
 - .4 pH: 6-7.5
 - .5 Phosphorous (ppm): 10-60
 - .6 Potassium (ppm): 80-250

- .7 Calcium (ppm): < 5000
- .8 Magnesium (ppm): 100-300
- .9 Soluble salt: < 1.5 mmhos/cm
- .10 Organic matter: 2-5%
- .2 Contain no toxic elements or growth inhibiting materials.
- .3 Finished surface free from:
 - .1 Debris and stones over 50 mm diameter.
 - .2 Course vegetative material, 10 mm diameter and 100 mm length, occupying more than 2% of soil volume.
 - .4 Consistence: friable when moist.
- .3 Note any trees or plants that are specified as "pH sensitive" and adjust soil to meet required values.

2.02 SOIL AMENDMENTS

.1 INORGANIC SOIL AMENDMENTS

- .1 Lime: ASTM C 602, agricultural liming material containing a minimum of 80 percent calcium carbonate equivalent and as follows:
 - .1 Class: T, with a minimum of 99 percent passing through a 2.36-mm sieve and a minimum of 75 percent passing through a 0.25-mm sieve.
 - .2 Form: Provide lime in form of ground dolomitic limestone.
- .2 Sulfur: Granular, biodegradable, and containing a minimum of 90 percent elemental sulfur, with a minimum of 99 percent passing through a 3.35-mm sieve and a maximum of 10 percent passing through a 0.425-mm sieve.
- .3 Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.
- .4 Perlite: Horticultural perlite, soil amendment grade.
- .5 Agricultural Gypsum: Minimum 90 percent calcium sulfate, finely ground with 90 percent passing through a 0.30-mm sieve.
- .6 Sand: Clean, washed, natural or manufactured, free of toxic materials, and according to ASTM C 33/C 33M.

.2 ORGANIC SOIL AMENDMENTS

- .1 Compost: Well-composted, stable, and weed-free organic matter produced by composting feedstock, and bearing CCC's "Compost Quality Alliance seal," and as follows:
 - .1 Feedstock: Limited to leaves May include sewage sludge May include animal waste.
 - .2 Reaction: pH of 5.5 to 8.
 - .3 Soluble-Salt Concentration: Less than 4 dS/m.
 - .4 Moisture Content: 35 to 55 percent by weight.
 - .5 Organic-Matter Content: 50 to 60 percent of dry weight.
 - .6 Particle Size: Minimum of 98 percent passing through a 25-mm sieve.
- .2 Sphagnum Peat: Partially decomposed sphagnum peat moss, finely divided or of granular texture with 100 percent passing through a 13-mm sieve, a pH of 3.4 to 4.8, and a soluble-salt content measured by

- electrical conductivity of maximum 5 dS/m.
- .3 Muck Peat: Partially decomposed moss peat, native peat, or reed-sedge peat, finely divided or of granular texture with 100 percent passing through a 13-mm sieve, a pH of 6 to 7.5, a soluble-salt content measured by electrical conductivity of maximum 5 dS/m, having a water-absorbing capacity of 1100 to 2000 percent, and containing no sand.
- .4 Wood Derivatives: Shredded and composted, nitrogen-treated sawdust, ground bark, or wood waste; of uniform texture and free of chips, stones, sticks, soil, or toxic materials.
 - .1 Partially Decomposed Wood Derivatives: In lieu of shredded and composted wood derivatives, mix shredded and partially decomposed wood derivatives with ammonium nitrate at a minimum rate of 2.4 kg/cu. m of loose sawdust or ground bark, or with ammonium sulfate at a minimum rate of 4 kg/cu. m of loose sawdust or ground bark.
- .5 Manure: Well-rotted, unleached, stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, debris, and material harmful to plant growth.

2.03 FERTILIZERS

- .1 Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid.
- .2 Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
 - .1 Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified testing agency.
- .3 Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
 - .1 Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified testing agency.

2.04 SOURCE QUALITY CONTROL

- .1 Advise Consultant of sources of topsoil and manufactured topsoil to be used with sufficient lead time for testing.
- .2 Contractor is responsible for amendments to imported soil(s) as specified.
- .3 Conduct soil testing by recognized testing facility for pH, Nitrogen (N), Phosphorous (P), and Potassium (K), and organic matter.
- .4 Carry out testing of topsoil by testing laboratory designated by Consultant.
 - .1 Perform soil sampling, testing and analysis in accordance with applicable Provincial standards.

3 Execution

3.01 STRIPPING OF TOPSOIL

- .1 Begin topsoil stripping of areas as directed by Consultant after area has been cleared of stumps, rocks 100 mm and over, invasive and noxious plants and their reproductive parts, brush, weeds and grasses and removed from site.
- .2 Strip topsoil to depths as directed Consultant.
 - .1 Avoid mixing topsoil with subsoil where textural quality will be moved outside acceptable range of intended application.
- .3 Stockpile in locations as directed by Consultant.
 - .1 Stockpile height not to exceed 2 m.
 - .2 Protect stockpile from adverse weather conditions, contamination from invasive plant material, and compaction.
 - .3 Avoid placing stockpile in low areas where natural drainage or storm water could pond, or erode these materials during inclement weather.
- .4 Dispose of unused topsoil in an environmentally responsible manner but do not use as landfill as directed by Consultant.

3.02 PREPARATION OF EXISTING GRADE

- .1 Verify that grades are correct.
 - .1 If discrepancies occur, notify Consultant and do not start work until instructed by Consultant.
- .2 Grade soil, eliminate uneven areas and low spots, ensure positive drainage.
- .3 Remove debris, roots, branches, stones in excess of 50 mm diameter and other deleterious materials.
 - .1 Remove soil contaminated with calcium chloride, toxic materials and petroleum products.
 - .2 Remove debris which protrudes more than 75 mm above surface.
 - .3 Dispose of removed material off site.
- .4 Cultivate entire area which is to receive topsoil to minimum depth of 100 mm.
 - .1 Cross cultivate those areas where equipment used for hauling and spreading has compacted soil.

3.03 PLACING AND SPREADING OF TOPSOIL/PLANTING SOIL

- .1 Place topsoil after Consultant has accepted subgrade.
- .2 Spread topsoil in uniform layers of 150 mm to 300mm.
- .3 Keep topsoil 15 mm below finished grade for sodded areas.
- .4 Spread topsoil as indicated to the following minimum depths after settlement.
 - .1 150 mm for sodded and seeded areas.
 - .2 450 mm for flower beds and for shrub beds.

- .3 1200 mm for tree beds.
- .5 Manually spread topsoil/planting soil around trees, shrubs and obstacles.
- .6 Avoid spreading or grading in wet, frozen, or saturated state.

3.04 FINISH GRADING

- .1 Grade to eliminate rough spots and low areas and ensure positive drainage.
 - .1 Prepare loose friable bed by means of cultivation and subsequent raking.
- .2 Consolidate topsoil to required bulk density using equipment approved by Consultant.
 - .1 Leave surfaces smooth, uniform and firm against deep footprinting.

3.05 PROTECTION

- .1 Protecting Graded Areas: Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.
- .2 Repair and re-establish grades to specified tolerances where completed or partially completed surfaces become eroded, rutted, settled, or where they lose compaction due to subsequent construction operations or weather conditions.
 - .1 Scarify or remove and replace soil material to depth as directed by Prime Consultant; reshape and recompact.
- .3 Where settling occurs before Project correction period elapses, remove finished surfacing, backfill with additional soil material, compact, and reconstruct surfacing.
 - .1 Restore appearance, quality, and condition of finished surfacing to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.06 ACCEPTANCE

- .1 Consultant will inspect and test topsoil in place and determine acceptance of material, depth of topsoil and finish grading.

3.07 SURPLUS MATERIAL

- .1 Dispose of materials except topsoil not required off site with the approval of the Consultant. Materials to be used for fill to remain on site.

3.08 CLEANING

- .1 Leave Work area organized and tidy at end of each day.
- .2 Keep pavement and area adjacent to site clean and free from mud, dirt, and debris at all times.
- .3 Upon completion remove surplus materials, rubbish, tools and equipment.

- .1 Clean and reinstate areas affected by Work.
- .4 Divert unused fertilizer from landfill to official hazardous material collections site.

END OF SECTION

1 GENERAL

1.01 RELATED REQUIREMENTS

- .1 Section 02 41 13 "Site Preparation"
- .2 Section 32 91 19.13 "Topsoil Placement and Grading"

1.02 MEASUREMENT AND PAYMENT

- .1 Measure hydraulic seeding square metres of actual surface area for:
 - .1 Low maintenance "eco-lawn" mixture
- .2 Measure maintenance during warranty period of areas seeded in square metres.

1.03 ADMINISTRATIVE REQUIREMENTS

- .1 Scheduling:
 - .1 Schedule hydraulic seeding to coincide with preparation of soil surface.
 - .2 Schedule hydraulic seeding using grass mixtures and mixtures between dates recommended by Provincial Agricultural Department.

1.04 SUBMITTALS PRIOR TO ANY PROGRESS DRAW

- .1 Product Data:
 - .1 Submit manufacturer's instructions, printed product literature and data sheets for seed, mulch, tackifier, fertilizer, liquid soil amendments and micronutrients.
- .2 Submit in writing:
 - .1 Volume capacity of hydraulic seeder in litres.
 - .2 Amount of material to be used per tank based on volume.
 - .3 Number of tank loads required per hectare to apply specified slurry mixture per hectare.
- .3 Samples:
 - .1 Submit [0.5] kg container of each type of fertilizer used.
- .4 Certificates:
 - .1 Product certificates signed by manufacturer certifying materials comply with specified performance characteristics and criteria and physical requirements.
- .5 Test Reports:
 - .1 Submit certified test reports showing compliance with specified performance characteristics and physical properties.

1.05 QUALITY ASSURANCE

- .1 Qualifications:
 - .1 Landscape Contractor: to be a Landscape Ontario Member in Good Standing

- .2 Landscape Planting Supervisor: Landscape Industry Certified Technician with Softscape Installation designation.
- .3 Landscape Maintenance Supervisor: Landscape Industry Certified Technician with Turf Maintenance designation.

1.06 DELIVERY, STORAGE AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section with manufacturer's written instructions.
- .2 Delivery and Acceptance Requirements:
 - .1 Labelled bags of fertilizer identifying mass in kg, mix components and percentages, date of bagging, supplier's name and lot number.
 - .2 Inoculant containers to be tagged with expiry date.
- .3 Storage and Handling Requirements:
 - .1 Store fertilizer in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.
 - .2 Replace defective or damaged materials with new.

1.07 WARRANTY

- .1 For seeding, 24 months warranty period is extended to 2 full growing seasons.
- .2 End-of-warranty inspection will be conducted by Consultant.
- .3 Refer to Fixed price Construction Contract (between Hallman Construction Ltd. and the "Contractor").

2 PRODUCTS

1.1 MATERIALS

- .1 Seed: "Canada pedigreed grade" in accordance with Government of Canada Seeds Act and Regulations.
 - .1 Low Maintenance "Eco-Lawn" Mixture: OSC Seeds
 - 1. Mixture composition:
 - .1 35% Audubon Creeping Red Fescue
 - .2 35% J-5 Chewings Fescue
 - .3 20% Ecostar Hard Fescue
 - .4 10% Evolution Perennial Ryegrass
- .2 Mulch: specially manufactured for use in hydraulic seeding equipment, non-toxic, water activated, green colouring, free of germination and growth inhibiting factors with following properties:
 - .1 Type I Mulch:
 - .1 Made from wood cellulose fibre.

- .2 Organic mater content: 95% plus or minus 0.5%
 - .3 Value of pH: 6.0
 - .4 Potential water absorption: 900%
- .2 Type II Mulch:
 - .1 Made from newsprint, raw cotton fibre and straw, processed to produce fibre lengths of 15 mm minimum and 25 mm maximum. Greater proportions of ingredients to be straw.
- .3 Tackifier: water soluble vegetable carbohydrate powder.
- .4 Water: Free of impurities that would inhibit germination and growth.
- .5 Fertilizer:
 - .1 To Canada "Fertilizers Act" and Regulations.
 - .2 Complete synthetic, slow release with 35% of nitrogen content in water-insoluble form.
- .6 Inoculants: inoculant containers to be tagged with expiry date.
- .7 Erosion Mat (Required on slopes of 3 to 1 or greater – Refer to drawings by Civil Engineer):
 - .1 Supplier: Terrafix Geosynthetics Inc. or approved equal.
 - .2 Model: Terrafix Geosynthetics erosion control blanket, C200, 100% coconut fibre, double net, with biodegradable straw fibre fill.

3 EXECUTION

1.1 EXAMINATION

- .1 Verification of Conditions: verify conditions of substrate previously installed under other Sections or Contracts are acceptable for hydraulic seeding in accordance with manufacturer's written instructions.
 - .1 Visually inspect substrate in presence of Consultant.
 - .2 Inform Consultant of unacceptable conditions immediately upon discovery.
 - .3 Proceed with installation only after unacceptable conditions have been remedied.

1.2 INSTALLERS

- .1 Use installers-members in Good Standing.

1.3 PROTECTION OF EXISTING CONDITIONS

- .1 Protect structures, signs, guide rails, fences, plant material, utilities and other surfaces not intended for spray.
- .2 Immediately remove any material sprayed where not intended as directed by Consultant.

1.4 PREPARATION OF SURFACES

- .1 Do not perform work under adverse field conditions such as wind speeds over 10km/h, frozen ground or ground covered with snow, ice or standing water.
- .2 Fine grade areas to be seeded free of humps and hollows.
 - .1 Ensure areas are free of deleterious and refuse materials.
- .3 Cultivated areas identified as requiring cultivation to depth of 25 mm.
- .4 Ensure areas to be seeded are moist to depth of 150 mm before seeding.
- .5 Obtain Consultant's approval of grade and topsoil depth before starting to seed.

1.5 FERTILIZING PROGRAM

- .1 Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
 - .1 Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.
- .2 Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
 - .1 Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing laboratory.

1.6 PREPARATION OF SLURRY

- .1 Measure quantities of materials by weight or weight-calibrated volume measurement satisfactory to Consultant. Supply equipment required for this work.
- .2 Charge required water into seeder. Add material into hydraulic seeder under agitation. Pulverize mulch and charge slowly into seeder.
- .3 After materials are in seeder and well mixed, charge tackifier into seeder and mix thoroughly to complete slurry.

1.7 SLURRY APPLICATION

- .1 Ensure seed is placed under supervision of certified Landscape Planting Supervisor.
- .2 Hydraulic seeding equipment:
 - .1 Slurry tank.
 - .2 Agitation system for slurry to be capable of operating during charging of tank and during seeding, consisting of recirculation of slurry and/or mechanical agitation method.
 - .3 Capable of seeding by 50 m hand operated hoses and appropriate nozzles.
 - .4 Tank volume to be certified by certifying authority and identified by authorities "Volume Certification Plate".

- .3 Slurry mixture applied per hectare.
 - .1 Apply mixture per manufacturer's recommendation.
- .4 Apply slurry uniformly, at optimum angle of application for adherence to surfaces and germination of seed.
 - .1 Using correct nozzle for application.
 - .2 Using hoses for surfaces difficult to reach and to control application.
- .5 Blend application 300mm into adjacent grass areas or sodded areas to form uniform surfaces.
- .6 Re-apply where application is not uniform.
- .7 Remove slurry from items and areas not designated to be sprayed.

1.8 CLEANING

- .1 Leave work area clean at end of each day.
- .2 Keep pavement and area adjacent to site clean and free from mud, dirt, and debris at all times.
- .3 Final Cleaning: upon completion remove surplus materials, rubbish, tools and equipment. Clean and reinstate areas affected by work.

1.9 PROTECTION

- .1 Protect seeded areas from trespass until plants are established.
- .2 Remove protection devices as directed by Consultant.

1.10 MAINTENANCE DURING ESTABLISHMENT PERIOD

- .1 Ensure maintenance is carried out under supervision of certified Landscape Maintenance Supervisor.
- .2 Perform the following operations from time of seed application until acceptance by Consultant:
 - .1 Repair and reseed dead or bare spots to allow establishment of seed prior to acceptance.
 - .2 Fertilize seeded areas after 10 weeks after germination provided plants have mature true leaves.
 - .3 Control weeds by mechanical or chemical means utilizing acceptable integrated pest management practices.
 - .4 Water seeded area to maintain optimum soil moisture level for germination and continued growth of grass. Control watering to prevent washouts.

1.11 ACCEPTANCE

- .1 Seeded areas will be accepted by Consultant provided that:
 - .1 Plants are uniformly established.

- .2 Areas have been fertilized.
- .2 Areas seeded in fall will achieve final acceptance in following spring, one month after start of growing season provided acceptance conditions are fulfilled.

1.12 MAINTENANCE DURING WARRANTY PERIOD

- .1 Perform the following operations from time of acceptance until end of warranty period:
 - .1 Repair and reseed dead or bare spots to satisfaction of Consultant.
 - .2 Fertilize seeded areas in accordance with fertilizing program. Spread half of required amount of fertilizer in one direction and remainder at right angles.

END OF SECTION

1 General

1.01 RELATED REQUIREMENTS

- .1 Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
- .1 Section 32 91 19.13 - Topsoil Placement and Grading

1.02 REFERENCE STANDARDS

- .1 Canadian Nursery Landscape Association (CNLA)
 - .1 Canadian Standards for Nursery Stock, Latest Edition.
- .2 Health Canada/Workplace Hazardous Materials Information System (WHMIS)
 - .1 Material Safety Data Sheets (MSDS).

1.03 COORDINATION

- .1 Coordination with Turf Areas (Lawns): Plant trees, shrubs, and other plants after finish grades are established and before planting turf areas unless otherwise indicated.
 - .1 When planting trees, shrubs, and other plants after planting turf areas, protect turf areas, and promptly repair damage caused by planting operations.

1.04 ACTION AND INFORMATION SUBMITTALS

- .1 Scheduling: obtain approval from Consultant of schedule 7 days in advance of shipment of plant material.
 - .1 Schedule to include:
 - .1 Quantity and type of plant material.
 - .2 Shipping dates.
 - .3 Arrival dates on the Place of the Work.
 - .4 Planting Dates.
- .2 Product Data: For each type of product.
 - .1 Plant Materials: Include quantities, sizes, quality, and sources for plant materials.
- .3 Samples for Verification: For each of the following:

- .1 Organic Compost Mulch: 0.5-L volume of each organic mulch required; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch. Each Sample shall be typical of the lot of material to be furnished; provide an accurate representation of color, texture, and organic makeup.
- .2 Mineral Mulch: 1.0 kg of each mineral mulch required, in sealed plastic bags labeled with source of mulch. Sample shall be typical of the lot of material to be delivered and installed on-site; provide an accurate indication of color, texture, and makeup of the material.
- .4 Edging Materials and Accessories: Manufacturer's standard size, to verify selected.
- .5 Weed Control Barrier: 300 by 300 mm.
- .6 Stakes: Provide mock up of staking on tree prior to completing all trees. Approved mock up can remain.
- .7 Qualification Data: For landscape Installer. Include list of similar projects completed by Installer demonstrating Installer's capabilities and experience. Include project names, addresses, and year completed, and include names and addresses of owners' contact persons.
- .8 Product Certificates: For each type of manufactured product, from manufacturer, and complying with the following:
 - .1 Manufacturer's certified analysis of standard products.
 - .2 Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.
- .9 Pesticides and Herbicides: Product label and manufacturer's application instructions specific to Project.
- .10 Sample Warranty: For special warranty.

1.05 CLOSEOUT SUBMITTALS

- .1 Maintenance Data: Recommended procedures to be established by Owner for maintenance of plants during a calendar year. Submit before expiration of required maintenance periods.

1.06 QUALITY ASSURANCE

- .2 Installer Qualifications: A qualified landscape installer whose work has resulted in successful establishment of plants.
 - .1 Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the Canadian Nursery Landscape Association.
 - .2 Experience: Five years' experience in landscape installation.

- .3 Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on the Place of the Work when work is in progress.
- .4 Personnel Certifications: Installer's field supervisor shall have certification in one of the following categories from the Professional Landcare Network:
 - .1 Landscape Industry Certified Technician - Exterior.
 - .2 Landscape Industry Certified Interior.
 - .3 Landscape Industry Certified Horticultural Technician.
 - .4 Pesticide Applicator: Province licensed, commercial.
- .3 Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements in ANLA Z60.1-2014 - Nursery Stock.
 - .1 Selection of plants purchased under allowances is made by Consultant, who tags plants at their place of growth before they are prepared for transplanting.
- .4 Measurements: Measure according to ANLA Z60.1-2014 - Nursery Stock. Do not prune to obtain required sizes.
 - .1 Trees and Shrubs: Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-grown stock and container-grown stock. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip to tip. Take caliper measurements 150 mm above the root flare for trees up to 100-mm caliper size, and 300 mm above the root flare for larger sizes.
 - .2 Other Plants: Measure with stems, petioles, and foliage in their normal position.
- .5 Plant Material Observation: Consultant may observe plant material either at place of growth or at the Place of the Work before planting for compliance with requirements for genus, species, variety, cultivar, size, and quality. Consultant may also observe trees and shrubs further for size and condition of balls and root systems, pests, disease symptoms, injuries, and latent defects and may reject unsatisfactory or defective material at any time during progress of work. Remove rejected trees or shrubs immediately from the Place of the Work.
 - .1 Notify Consultant of sources of planting materials seven days in advance of delivery to the Place of the Work.

1.07 DELIVERY, STORAGE, AND HANDLING

- .6 Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of compliance with state and Federal laws if applicable.
- .7 Bulk Materials:
 - .1 Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.

- .2 Provide erosion-control measures to prevent erosion or displacement of bulk materials; discharge of soil-bearing water runoff; and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
- .3 Accompany each delivery of bulk materials with appropriate certificates.
- .8 Deliver bare-root stock plants within 24 hours of digging. Immediately after digging up bare-root stock, pack root system in wet straw, hay, or other suitable material to keep root system moist until planting. Transport in covered, temperature-controlled vehicles, and keep plants cool and protected from sun and wind at all times.
- .9 Do not prune trees and shrubs before delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape. Provide protective covering of plants during shipping and delivery. Do not drop plants during delivery and handling.
- .10 Handle planting stock by root ball.
- .11 Store bulbs, corms, and tubers in a dry place at 16 to 18 deg C until planting.
- .12 Apply antidesiccant to trees and shrubs using power spray to provide an adequate film over trunks (before wrapping), branches, stems, twigs, and foliage to protect during digging, handling, and transportation.
 - .1 If deciduous trees or shrubs are moved in full leaf, spray with antidesiccant at nursery before moving and again two weeks after planting.
- .13 Wrap trees and shrubs with burlap fabric over trunks, branches, stems, twigs, and foliage to protect from wind and other damage during digging, handling, and transportation.
- .14 Deliver plants after preparations for planting have been completed, and install immediately. If planting is delayed more than six hours after delivery, set plants and trees in their appropriate aspect (sun, filtered sun, or shade), protect from weather and mechanical damage, and keep roots moist.
 - .1 Heel-in bare-root stock. Soak roots that are in less than moist condition in water for two hours. Reject plants with dry roots.
 - .2 Set balled stock on ground and cover ball with soil, peat moss, sawdust, or other acceptable material.
 - .3 Do not remove container-grown stock from containers before time of planting.
 - .4 Water root systems of plants stored on-site deeply and thoroughly with a fine-mist spray. Water as often as necessary to maintain root systems in a moist, but not overly wet condition.
- .15 Plants specified B/B (Ball and Burlap) or W/B (Wire Basket) on the plant list shall be moved with root systems as solid units, with balls of earth firmly wrapped with burlap. The diameter and depth must be sufficient to encompass a fibrous and feeding root

system necessary for the healthy development of the plant. No plant shall be accepted when the ball of earth surrounding its roots has been cracked or broken preparatory to, or during planting, or after the burlap, staves, ropes, or platform required in connection with its transplanting has been removed. All balled plants that cannot be planted at once shall be kept watered and shaded from the hot sun. The least possible time shall elapse between the digging of the tree and its final planting. The entire root system of all plant material shall be kept moist and at no time shall the root system be exposed to drying winds or air.

1.08 FIELD CONDITIONS

- .1 Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with planting work.
- .2 Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions and warranty requirements.
- .3 Installation shall be done under weather conditions and in suitable growth season for each specified material, and as approved by the Consultant.

1.09 WARRANTY

- .4 Special Warranty: Installer agrees to repair or replace plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.
 - .1 Failures include, but are not limited to, the following:
 - .1 Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by Owner.
 - .2 Structural failures including plantings falling or blowing over.
 - .3 Faulty performance of tree stabilization.
 - .4 Deterioration of metals, metal finishes, and other materials beyond normal weathering.
- .5 Warranty Periods: From date of Substantial Completion.
 - .1 Trees, Shrubs, Vines, and Ornamental Grasses: 24 months.
 - .2 Ground Covers, Biennials, Perennials, and Other Plants: 24 months.
 - .3 Annuals: Three months.

- .4 Trees and shrubs planted in the fall that are found to be dead, defective, or not in a healthy, growing condition in the spring are to be replanted at that time, not at the end of the warranty period. Trees planted in the spring that are found to be dead, defective, or not in a healthy growing condition in the fall, are to be replanted. All plants that are replaced are to be re-guaranteed for an additional one year dated from the date of replacement.
- .6 Include the following remedial actions as a minimum:
 - .1 Immediately remove dead plants and replace unless required to plant in the succeeding planting season.
 - .2 Replace plants that are more than 25 percent dead or in an unhealthy condition at end of warranty period.
 - .3 A limit of one replacement of each plant is required except for losses or replacements due to failure to comply with requirements.
 - .4 Replace, during next planting season, trees and shrubs which failed to survive. Replacements are subject to same approval and guarantee conditions specified for initial planting. Continue this replacement until all specified trees and shrubs are well established.

2 Products

1.2 PLANT MATERIAL

- .1 General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant List, Plant Schedule, or Plant Legend indicated on Drawings and complying with ANLA Z60.1-2014 - Nursery Stock; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.
 - .1 Trees with damaged, crooked, or multiple leaders; tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark"); crossing trunks; cut-off limbs more than 19 mm in diameter; or with stem girdling roots are unacceptable.
 - .2 Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.
- .2 Provide plants of sizes, grades, and ball or container sizes complying with ANLA Z60.1-2014 - Nursery Stock for types and form of plants required. Plants of a larger size may be used if acceptable to Consultant, with a proportionate increase in size of roots or balls.
- .3 Bare root plant material that has come out of dormant stage and is too far advanced will not be accepted unless due to special circumstances and if Consultant's approval has been obtained.

- .4 Use of plant material which has been held in "Cold Storage" requires approval of the Consultant.
- .5 Container grown stock is acceptable if containers are large enough for root development. Trees and shrubs must have grown in container for minimum of one growing season but not longer than two. Root system must be able to "hold" soil when removed from container. Plants that have become root bound are not acceptable. Container stock must have been fertilized with slow releasing fertilizer. Soil mixture in container must consist of: 6 parts loam soil, 3 parts peatmoss and 1 part sand.
- .6 Balled and Burlapped: Conifer, Broad-leaf evergreens and trees in excess of 10'0" (3 m) height must have been dug with large firm ball. Measure calliper at 12" (300 mm) above ground level. A tree with 3" (75 mm) calliper requires root ball of 40" (1 m) diameter. Increase diameter of root ball by 10" (250 mm) with each increase of 1" (25 mm) in calliper. Root balls of proper size must include 75% of fibrous and feeder root system. This excludes use of native trees grown in light sandy or rocky soil. Secure root balls with burlap, heavy twine and rope. Use hessian burlap. Frozen root balls will be permitted provided root balls are sufficiently protected to prevent breakage. Protect root balls from sudden changes in temperature and exposure to heavy rainfall.
- .7 The sizes of root balls for trees shall be as specified below. Ball sizes are minimum and shall be adjusted according to growth habits of plants.

DECIDUOUS TREES

<u>Calliper</u>	<u>Root Ball Diameter</u>
1" (25 mm)	24" (.6 m)
2" (50 mm)	32" (.8 m)
3" (75 mm)	40" (1.0 m)
4" (100 mm)	50" (1.25 m)
5" (125 mm)	60" (1.5 m)
6" (150 mm)	70" (1.75 m)
7" (175 mm)	80" (2.0 m)
8" (200 mm)	90" (2.25 m)

CONIFEROUS TREES

<u>Height</u>	<u>Root Ball Diameter</u>
6'-8' (1820 mm to 2430 mm)	32" (800 mm)
8'-10' (2430 mm to 3040 mm)	36" (900 mm)

10'-12' (3040 mm to 3650 mm)	44" (1100 mm)
12'-15' (3650 mm to 4570 mm)	48" (1200 mm)
15'-18' (4570 mm to 5480 mm)	56" (1400 mm)

- .8 Imported plant material must be accompanied by the necessary permits and import licences. Conform to Federal and Provincial Regulations.
- .9 Root-Ball Depth: Furnish trees and shrubs with root balls measured from top of root ball, which begins at root flare according to ANLA Z60.1-2014 - Nursery Stock. Root flare shall be visible before planting.
- .10 Labeling: Label at least one plant of each variety, size, and caliper with a securely attached, waterproof tag bearing legible designation of common name and full scientific name, including genus and species. Include nomenclature for hybrid, variety, or cultivar, if applicable for the plant.
- .11 If formal arrangements or consecutive order of plants is indicated on Contract Drawings, select stock for uniform height and spread, and number the labels to assure symmetry in planting.
- .12 Annuals and Biennials: Provide healthy, disease-free plants of species and variety shown or listed, with well-established root systems reaching to sides of the container to maintain a firm ball, but not with excessive root growth encircling the container. Provide only plants that are acclimated to outdoor conditions before delivery and that are in bud but not yet in bloom.

1.3 WATER

- .1 Free of impurities that would inhibit plant growth.

1.4 PLANT ACCESSORIES

- .1 Refer to Contract Documents and Standard Details for the local municipal body.
- .2 Anchors: For support of large shrubs and trees up to (90 mm) in calliper use wooden stakes.
 - .1 Size: 50mm x 50mm x 2400mm
- .3 Ties: Ties shall form a loose loop around the stake and loop in a figure '8' around the trunk of the tree. Interlink both figure '8's and secure Arbortie to the stake using nails.
 - .1 Arbortie or approved equivalent
 - .1 Colour: Green
 - .2 Nails: 1" galvanized roofing nails

- .4 Hose: New black rubber hose (12.7 mm) in diameter, with 2 ply wire tie or as required by the municipality.
- .5 Tree guard: Arborgard + AG9-4 or approved equivalent

1.5 MULCH

- .1 Organic Mulch: Free from deleterious materials and suitable as a top dressing of trees and shrubs, consisting of the following:
 - .1 Type: Shredded hardwood.
 - .2 Size Range: 76 mm maximum, 13 mm minimum.
 - .3 Color: Natural.
 - .4 Depth: 150mm over planting soil.
 - .5 Do not place mulch directly in contact with the trunk. Do not under any circumstances mound mulch up against trunk.
- .2 Compost is a widely used bulk organic mulch and a recycled product. Because it is applied at much greater rates than fertilizer, compost has a significant cumulative effect on nutrient availability and may reduce or eliminate top-dressed fertilizing. Consider each plant's pH and soluble-salt requirements and how those relate to the compost being used.
- .3 Compost Mulch: Well-composted, stable, and weed-free organic matter, pH of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through a 25-mm sieve; soluble-salt content of 2 to 5 dS/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:
 - .1 Organic Matter Content: 50 to 60 percent of dry weight.
 - .2 Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.
- .4 Stone Mulch: Hard, durable stone, washed free of loam, sand, clay, and other foreign substances, of the following type, size range, and color:
 - .1 Type: Rounded riverbed stone or smooth-faced stone.
 - .2 Size Range: 150mm maximum, 75mm minimum.
 - .3 Color: Readily available natural grey gravel color range.

1.6 FERTILIZER

- .1 Shall be complete commercial fertilizer 50% of the elements of which shall be derived from organic sources, and shall contain no less than 60% urea formaldehyde with the following percentages by weight of nitrogen, phosphoric acid, and potash in that order for:
 - .1 Trees 10-6-4

.2 Shrubs 12-6-6

- .2 Peatmoss: Decomposed plant material, fairly elastic and homogenous, free of decomposed colloidal residue, wood, sulphur and iron. Brown in colour containing minimum 60% organic matter by weight and moisture content not exceeding 15%. Shredded particles, may not exceed (6 mm) in size. Minimum PH value of peat, 4.5, maximum 6.0.
- .3 Bonemeal: Raw commercial, finely ground, and with a content of minimum 4% Nitrogen and 20% Phosphoric Acid.
- .4 Lime: Lime to be used in all cases where the PH of the soil is less than 6.0 limestone containing not less than 8% of calcium and magnesium carbonates combined, finely ground to pass a 10 mesh sieve with at least one half passing a 100 mesh sieve. Rate of application shall be determined after determining the PH of the topsoil.
- .5 Planting Tablets: Tightly compressed chip-type, long-lasting, slow-release, commercial-grade planting fertilizer in tablet form. Tablets shall break down with soil bacteria, converting nutrients into a form that can be absorbed by plant roots.
 - .1 Size: 21-gram tablets.
 - .2 Nutrient Composition: 20 percent nitrogen, 10 percent phosphorous, and 5 percent potassium, by weight plus micronutrients.

1.7 WEED CONTROL BARRIERS

- .1 Nonwoven Geotextile Landscape Fabric: Polypropylene or polyester fabric, 101g/sq. m minimum, composed of fibers formed into a stable network so that fibers retain their relative position. Fabric shall be inert to biological degradation and resist naturally encountered chemicals, alkalis, and acids.

1.8 PESTICIDES

- .1 General: Pesticide registered and approved by Environment Canada, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.
- .2 Pre-Emergent Herbicide (Selective and Nonselective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.
- .3 Post-Emergent Herbicide (Selective and Nonselective): Effective for controlling weed growth that has already germinated.

1.9 LANDSCAPE EDGING

- .1 Aluminum Edging: Standard-profile extruded-aluminum edging, ASTM B 221M, Alloy 6063-T6, fabricated in standard lengths with interlocking sections with loops stamped from face of sections to receive stakes.
 - .1 Edging Size: 4.8 mm thick by 140 mm deep.
 - .2 Stakes: Aluminum, ASTM B 221M, Alloy 6061-T6, approximately 38 mm wide by 300 mm long.

1.10 TREE WATERING BAG

- .1 Reusable watering bag with the following specifications or approved equivalent:
 - .1 Manufacturer: Treegator
 - .2 Model: Original
 - .3 Trunk Diameter: 1 to 2 inch (2.54 to 5.08 cm)
 - .4 Water Capacity: 15 gallons (56.78 liters)

1.11 MISCELLANEOUS PRODUCTS

- .1 Wood Pressure-Preservative Treatment: AWP A U1, Use Category UC4a; acceptable to authorities having jurisdiction, and containing no arsenic or chromium.
- .2 Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's written instructions.
- .3 Burlap: Non-synthetic, biodegradable.
- .4 Clear Drainage Gravel: Washed, sound crushed stone or gravel complying with ASTM D 448 for Size No. 8.
- .5 Filter Fabric: Nonwoven geotextile manufactured for separation applications and made of polypropylene, polyolefin, or polyester fibers or combination of them.
- .6 Root Barrier: Black, molded, modular panels 610 mm deep, 2.2 mm thick, and with vertical root deflecting ribs protruding 19 mm out from panel surface; manufactured with minimum 50 percent recycled polyethylene plastic with UV inhibitors.
- .7 Mycorrhizal Fungi: Dry, granular inoculant containing at least 5300 spores per 0.45 kg of vesicular-arbuscular mycorrhizal fungi and 95 million spores per 0.45 kg of ectomycorrhizal fungi, 33 percent hydrogel, and a maximum of 5.5 percent inert material.

3 Execution

1.12 EXAMINATION

- .1 Examine areas to receive plants, with Installer present, for compliance with requirements and conditions affecting installation and performance of the Work.
 - .1 Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
 - .2 Verify that plants and vehicles loaded with plants can travel to planting locations with adequate overhead clearance.
 - .3 Suspend planting operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
 - .4 Uniformly moisten excessively dry soil that is not workable or which is dusty.
- .2 If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Consultant and replace with new planting soil.
- .3 Proceed with installation only after unsatisfactory conditions have been corrected.

1.13 PREPARATION

- .1 Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.
- .2 Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.
- .3 Lay out individual tree and shrub locations and areas for multiple plantings. Stake locations, outline areas, adjust locations when requested, and obtain Consultant's acceptance of layout before excavating or planting. Make minor adjustments as required.

1.14 EXCAVATION AND PREPARATION

- .1 Preparation of planting beds in accordance with Section 32 91 19.13 - "Topsoil Placement and Grading".
- .2 For individual planting holes:
 - .1 Stake out location and obtain approval from Consultant prior to excavating.
 - .2 Excavate to depth and width as indicated in Contract Documents and Standard York Region tree planting detail.

- .3 Remove subsoil, rocks, roots, debris and toxic material from excavated material that will be used as planting soil for trees and individual shrubs. Dispose of excess material.
 - .4 Increase the size of planting holes in compacted soils 150mm for every 300mm of diameter of root ball.
 - .5 Scarify sides of planting hole to 200mm.
 - .6 Remove water which enters excavations prior to planting. Notify Consultant if water source is ground water.
- .3 Planting Pits and Trenches: Excavate circular planting pits.
- .1 Excavate planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are unacceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.
 - .2 Excavate approximately three times as wide as ball diameter for balled and burlapped, balled and potted, container-grown, fabric bag-grown stock.
 - .3 Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball.
 - .4 If area under the plant was initially dug too deep, add soil to raise it to the correct level and thoroughly tamp the added soil to prevent settling.
 - .5 Maintain angles of repose of adjacent materials to ensure stability. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.
 - .6 Maintain supervision of excavations during working hours.
 - .7 Keep excavations covered or otherwise protected after working hours when unattended by Installer's personnel.
 - .8 If drain tile is indicated on Contract Documents or required under planting areas, excavate to top of porous backfill over tile.
- .4 Backfill Soil: Subsoil and topsoil removed from excavations may not be used as backfill soil unless otherwise indicated.
- .5 Obstructions: Notify Consultant if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.
- .1 Hardpan Layer: Drill 150-mm-diameter holes, 600 mm apart, into free-draining strata or to a depth of 3 m, whichever is less, and backfill with free-draining material.
- .6 Drainage: Notify Consultant if subsoil conditions evidence unexpected water seepage or retention in tree or shrub planting pits.

- .7 Fill excavations with water and allow to percolate away before positioning trees and shrubs.

1.15 TREE, SHRUB AND VINE PLANTING

- .1 Inspection: At time of planting, verify that root flare is visible at top of root ball according to ANLA Z60.1-2014 - Nursery Stock. If root flare is not visible, remove soil in a level manner from the root ball to where the top-most root emerges from the trunk. After soil removal to expose the root flare, verify that root ball still meets size requirements.
- .2 Roots: Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.
- .3 Balled and Burlapped Stock: Set each plant plumb and in center of planting pit or trench with root flare 20 mm above adjacent finish grades.
 - .1 Backfill: Planting soil.
 - .2 After placing some backfill around root ball to stabilize plant, carefully cut and remove burlap, rope, and wire baskets from tops of root balls and from sides, but do not remove from under root balls. Remove burlap and rope from the top 1/3 of root ball. Cut top horizontal wire of wire basket in four places and fold down into planting soil unless basket is a low profile.
 - .3 Remove pallets, if any, before setting. Do not use planting stock if root ball is cracked or broken before or during planting operation.
 - .4 Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
 - .5 Place planting tablets equally distributed around each planting pit when pit is approximately one-half filled. Place tablets beside the root ball about 25 mm from root tips; do not place tablets in bottom of the hole.
 - .1 Quantity: As indicated on Drawings.
 - .6 Continue backfilling process. Water again after placing and tamping final layer of soil.
- .4 Balled and Potted and Container-Grown Stock: Set each plant plumb and in center of planting pit or trench with root flare 25 mm above adjacent finish grades.
 - .1 Backfill: Planting soil.
 - .2 Carefully remove root ball from container without damaging root ball or plant.
 - .3 Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.

- .4 Place planting tablets equally distributed around each planting pit when pit is approximately one-half filled. Place tablets beside the root ball about 25 mm from root tips; do not place tablets in bottom of the hole.
 - .1 Quantity: As indicated on Drawings.
- .5 Continue backfilling process. Water again after placing and tamping final layer of soil.
- .5 Fabric Bag-Grown Stock: Set each plant plumb and in center of planting pit or trench with root flare 25 mm above adjacent finish grades.
 - .1 Backfill: Planting soil.
 - .2 Carefully remove root ball from fabric bag without damaging root ball or plant. Do not use planting stock if root ball is cracked or broken before or during planting operation.
 - .3 Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
 - .4 Place planting tablets equally distributed around each planting pit when pit is approximately one-half filled. Place tablets beside the root ball about 25 mm from root tips; do not place tablets in bottom of the hole.
 - .1 Quantity: As indicated on Drawings.
 - .5 Continue backfilling process. Water again after placing and tamping final layer of soil.
- .6 Slopes: When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the surrounding soil. Apply enough soil to cover the downhill side of the root ball.

1.16 TREES, SHRUB, AND VINE PRUNING

- .1 Remove only dead, dying, or broken branches. Do not prune for shape.
- .2 Prune, thin, and shape trees, shrubs, and vines as directed by Consultant.
- .3 Prune, thin, and shape trees, shrubs, and vines according to standard professional horticultural and arboricultural practices. Unless otherwise indicated by Consultant, do not cut tree leaders; remove only injured, dying, or dead branches from trees and shrubs; and prune to retain natural character.
- .4 Do not apply pruning paint to wounds.

1.17 GROUND COVER AND PLANT PLANTING

- .1 Set out and space ground cover and plants other than trees, shrubs, and vines as indicated on Drawings in even rows with triangular spacing.
- .2 Use planting soil for backfill.
- .3 Dig holes large enough to allow spreading of roots.
- .4 For rooted cutting plants supplied in flats, plant each in a manner that minimally disturbs the root system but to a depth not less than two nodes.
- .5 Work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.
- .6 Water thoroughly after planting, taking care not to cover plant crowns with wet soil.
- .7 Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

1.18 ROOT BARRIER INSTALLATION

- .1 Install root barrier where trees are planted within tree pits in paving.
- .2 Align root barrier vertically and run it around root ball in tree pit to deflect roots below adjacent paving or other hardscape elements.
 - .1 Position top of root barrier according to manufacturer's written recommendations.
 - .2 Overlap root barrier a minimum of 300 mm at joints.
 - .3 Do not distort or bend root barrier during construction activities.

1.19 PLACING SOIL IN PLANTERS

- .1 Place a layer of drainage gravel at least 100 mm thick in bottom of planter. Cover bottom with filter fabric and wrap filter fabric 150 mm up on all sides. Duct tape along the entire top edge of the filter fabric, to secure the filter fabric against the sides during the soil-filling process.
- .2 Fill planter with planting soil. Place soil in lightly compacted layers to an elevation of 38 mm below top of planter, allowing natural settlement.

1.20 PLANTING AREA MULCHING

- .1 Install weed-control barriers before mulching according to manufacturer's written instructions. Completely cover area to be mulched, overlapping edges a minimum of 300mm and secure seams with galvanized pins.
- .2 Mulch backfilled surfaces of planting areas and other areas indicated.

- .1 Trees and Treelike Shrubs in Turf Areas: Apply organic mulch ring of 50-mm average thickness, with 900-mm radius around trunks or stems. Do not place mulch within 75 mm of trunks or stems.
- .2 Organic Mulch in Planting Areas: Apply 50-mm average thickness of organic mulch extending 300 mm beyond edge of individual planting pit or trench and over whole surface of planting area, and finish level with adjacent finish grades. Do not place mulch within 75 mm of trunks or stems.

1.21 EDGING INSTALLATION

- .1 Aluminum Edging: Install aluminum edging where indicated according to manufacturer's written instructions. Anchor with aluminum stakes spaced approximately 1200 mm apart, driven below top elevation of edging.

1.22 WATERING

- .1 All plant material shall be thoroughly watered within eight (8) hours of planting. The Contractor shall be responsible for supply, delivery and application of the water. The Contractor should note that watering will be the Contractor's responsibility (as per warranty) even during draught conditions.
- .2 Regular and adequate watering shall be provided in order to promote healthy plant growth.
- .3 During extended periods of high temperatures and draught, additional watering may be required to promote plant establishment and healthy plant growth. It is the responsibility of the Contractor to determine watering schedule in order for plant material not to become stressed in dry periods.
- .4 See City Planting Detail for additional planting requirements.

1.23 PLANT MAINTENANCE

- .1 Maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, adjusting and repairing tree-stabilization devices, resetting to proper grades or vertical position, and performing other operations as required to establish healthy, viable plantings.
- .2 Fill in, as necessary, soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.
- .3 Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use integrated pest management practices when possible to minimize use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.

1.24 PESTICIDE APPLICATION

- .1 Apply pesticides and other chemical products and biological control agents according to authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.
- .2 Pre-Emergent Herbicides (Selective and Nonselective): Apply to tree, shrub, and ground-cover areas according to manufacturer's written recommendations. Do not apply to seeded areas.
- .3 Post-Emergent Herbicides (Selective and Nonselective): Apply only as necessary to treat already-germinated weeds and according to manufacturer's written recommendations.

1.25 REPAIR AND REPLACEMENT

- .1 General: Repair or replace existing or new trees and other plants that are damaged by construction operations, in a manner approved by Consultant.
 - .1 Submit details of proposed pruning and repairs.
 - .2 Perform repairs of damaged trunks, branches, and roots within 24 hours, if approved.
 - .3 Replace trees and other plants that cannot be repaired and restored to full-growth status, as determined by Consultant.
- .2 Remove and replace trees that are more than 25 percent dead or in an unhealthy condition before the end of the corrections period or are damaged during construction operations that Consultant determines are incapable of restoring to normal growth pattern.
 - .1 Provide new trees of same size as those being replaced for each tree of 100 mm or smaller in caliper size.
 - .2 Species of Replacement Trees: Same species being replaced.

1.26 CLEANING AND PROTECTION

- .1 During planting, keep adjacent paving and construction clean and work area in an orderly condition. Clean wheels of vehicles before leaving the Place of the Work to avoid tracking soil onto roads, walks, or other paved areas.
- .2 Remove surplus soil and waste material including excess subsoil, unsuitable soil, trash, and debris and legally dispose of them off Owner's property.
- .3 Protect plants from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged plantings.

- .4 After installation and before Substantial Completion, remove nursery tags, nursery stakes, tie tape, labels, wire, burlap, and other debris from plant material, planting areas, and the Place of the Work.
- .5 At time of Substantial Completion, verify that tree-watering devices are in good working order and leave them in place. Replace improperly functioning devices.

1.27 MAINTENANCE SERVICE

- .1 Maintenance Service for Trees and Shrubs: Provide maintenance by skilled employees of landscape Installer. Maintain as required in "Plant Maintenance" Article. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established, but for not less than maintenance period below:
 - .1 Maintenance Period: 24 months from date of Substantial Completion.
- .2 Maintenance Service for Ground Cover and Other Plants: Provide maintenance by skilled employees of landscape Installer. Maintain as required in "Plant Maintenance" Article. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established, but for not less than maintenance period below:
 - .1 Maintenance Period: 24 months from date of Substantial Completion.

END OF SECTION

Part 1 General

1.1 MEASUREMENT PROCEDURES

- .1 Measure excavation and backfill in accordance with Section 31 23 33.01 - Excavating Trenching and Backfilling.
- .2 Measure maintenance holes and catch basins in units within depth classifications as follows, measured from top of cover or grating to lowest pipe invert top of base slab:
 - .1 2 m or less.
 - .2 Greater than 2 m but not more than 2.5 m.
 - .3 Greater than 2.5 m but not more than 3 m.
 - .4 Greater than 3 m but not more than 3.5 m.
 - .5 Further stages in increments of 0.5 m.
- .3 Measure outfall structures in units.
- .4 Measure adjusting tops of existing maintenance holes or catch basins in units adjusted.
- .5 Measure gratings in units supplied and installed.
- .6 Measure I-beam in metres of each size incorporated into work.
- .7 Measure sealing over existing maintenance holes or catch basins in units sealed.

1.2 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Submit in accordance with Section 01 33 00 - Submittal Procedures.
- .2 Product Data:
 - .1 Submit manufacturer's instructions, printed product literature and data sheets for [maintenance holes and catch basin structures] and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Shop Drawings:
 - .1 Submit drawings stamped and signed by professional engineer registered or licensed in Ontario, Canada.

1.3 QUALITY ASSURANCE

- .1 Submit in accordance with Section 01 45 00 - Quality Control.
- .2 Certifications:
 - .1 Submit manufacturer's test data and certification at least 4 weeks prior to beginning Work. Include manufacturer's drawings, information and shop drawings where pertinent.
 - .2 Certificates: submit certificates signed by manufacturer certifying that materials comply with specified performance characteristics and physical properties.

- .3 Manufacturer's Instructions: submit manufacturer's installation instructions and special handling criteria, installation sequence, cleaning procedures.

1.4 DELIVERY, STORAGE AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements and with manufacturer's written instructions.
- .2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- .3 Storage and Handling Requirements:
 - .1 Store materials in dry location and in accordance with manufacturer's recommendations in clean, dry, well-ventilated area.
 - .2 Store and protect maintenance holes and catch basin structures] from [nicks, scratches, and blemishes.
 - .3 Replace defective or damaged materials with new.

Part 2 Products

2.1 MATERIALS

- .1 Precast maintenance hole units: to ASTM C478M, circular or oval.
 - .1 Top sections eccentric cone or flat slab top type with opening offset for vertical ladder installation.
 - .2 Monolithic bases to be approved by Contract Administrator and set on concrete slabs cast in place.
- .2 Precast catch basin sections: to ASTM C139, ASTM C478M.
- .3 Joints: made watertight using rubber rings, bituminous compound, epoxy resin cement or cement mortar.
- .4 Mortar:
 - .1 Aggregate: 19.0mm.
 - .2 Masonry Cement: to CAN/CSA-A3002.
- .5 Ladder rungs: to CSA G30.18, No.25M billet steel deformed bars, hot dipped galvanized to ASTM A123/A123M.
 - .1 Rungs to be safety pattern (drop step type).
- .6 Adjusting rings: to ASTM C478M.
- .7 Concrete Brick: to CAN/CSA-A165 Series.
- .8 Drop maintenance hole pipe: same as sewer pipe.
- .9 Galvanized iron sheet: approximately 2 mm thick.
- .10 Steel gratings, I-beams and fasteners: as indicated.
- .11 Frames, gratings, covers to dimensions as indicated and following requirements:

- .1 Metal gratings and covers to bear evenly on frames.
 - .1 Frame with grating or cover to constitute one unit.
 - .2 Assemble and mark unit components before shipment.
- .2 Gray iron castings: to ASTM A48/A48M, strength class 30B.
- .3 Castings: sand blasted or cleaned and ground to eliminate surface imperfections.
- .4 Maintenance hole frames and covers: cover cast with perforations and complete with two 25 mm square lifting holes to OPSS 407.
- .5 Catch basin frames and covers: to OPSS 407.
- .6 Maintenance hole frames and covers: to CCDG.
- .7 Catch basin frames and covers: to CCDG.
- .8 Maintenance hole frames and covers: heavy duty municipal type for road service.
 - .1 Cover cast without perforations and complete with two 25 mm square lifting holes.
- .9 Catch basin frames and covers: minimum 100 kg per set.
- .10 Size: 762 mm clear diameter.
- .12 Granular bedding and backfill: in accordance with Section 31 05 16 - Aggregate Materials and following requirements:
 - .1 Crushed gravel sand.
 - .2 Gradations to be within limits specified when tested to ASTM C136 and ASTM C117. Sieve sizes to CAN/CGSB-8.1.
 - .3 Table:

Sieve Designation	% Passing	
	Stone/Gravel	Gravel/Sand
200 mm	-	-
75 mm	-	-
50 mm	-	-

- .4 Concrete mixes and materials: in accordance with Section 03 30 00 - Cast-in-Place Concrete].
- .13 Unshrinkable fill: in accordance with Section 31 23 33.01 - Excavating, Trenching and Backfilling].

Part 3 Execution

3.1 EXAMINATION

- .1 Verification of Conditions: verify that conditions of substrate previously installed under other Sections or Contracts are acceptable for maintenance holes and catch basin structures installation in accordance with manufacturer's written instructions.
 - .1 Visually inspect substrate in presence of Contract Administrator.
 - .2 Inform Contract Administrator of unacceptable conditions immediately upon discovery.
 - .3 Proceed with installation only after unacceptable conditions have been remedied and after receipt of written approval to proceed from Contract Administrator.

3.2 EXCAVATION AND BACKFILL

- .1 Excavate and backfill in accordance with Section 31 23 33.01 - Excavating Trenching and Backfilling and as indicated.
- .2 Obtain approval of Contract Administrator before installing outfall structures, maintenance holes or catch basins.

3.3 CONCRETE WORK

- .1 Do concrete work in accordance with Section 03 30 00 - Cast-in-Place Concrete.
- .2 Place concrete reinforcement in accordance with Section 03 20 00 - Concrete Reinforcing.
- .3 Position metal inserts in accordance with dimensions and details as indicated.

3.4 INSTALLATION

- .1 Construct units in accordance with details indicated, plumb and true to alignment and grade.
- .2 Complete units as pipe laying progresses.
 - .1 Maximum of 3 units behind point of pipe laying will be allowed.
- .3 Dewater excavation to approval of Contract Administrator and remove soft and foreign material before placing concrete base.
- .4 Cast bottom slabs directly on undisturbed ground.
- .5 Set precast concrete base on 150 mm minimum of granular bedding compacted to 100% maximum density to ASTM D69.
- .6 Precast units:
 - .1 Set bottom section of precast unit in bed of cement mortar and bond to concrete slab or base.

- .2 Make each successive joint watertight with Contract Administrator approved rubber ring gaskets, bituminous compound, cement mortar, epoxy resin cement, or combination of these materials.
- .3 Clean surplus mortar and joint compounds from interior surface of unit as work progresses.
- .4 Plug lifting holes with precast concrete plugs set in cement mortar or mastic compound.
- .7 For sewers:
 - .1 Place stub outlets and bulkheads at elevations and in positions indicated.
 - .2 Bench to provide smooth U-shaped channel.
 - .1 Side height of channel to be 0.75 times full diameter of sewer.
 - .2 Slope adjacent floor at 1 in 20.
 - .3 Curve channels smoothly.
 - .4 Slope invert to establish sewer grade.
- .8 Compact granular backfill to 95% maximum density to ASTM D698.
- .9 Place unshrinkable backfill in accordance with Section 31 23 33.01 - Excavating, Trenching and Backfilling.
- .10 Installing units in existing systems:
 - .1 Where new unit is installed in existing run of pipe, ensure full support of existing pipe during installation, [and carefully remove that portion of existing pipe to dimensions required] and install new unit as specified.
 - .2 Make joints watertight between new unit and existing pipe.
 - .3 Where deemed expedient to maintain service around existing pipes and when systems constructed under this project are ready for operation, complete installation with appropriate break-outs, removals, redirection of flows, blocking unused pipes or other necessary work.
- .11 Set frame and cover to required elevation on no more than 4 courses of brick.
 - .1 Make brick joints and join brick to frame with cement mortar.
 - .2 Parge and make smooth and watertight.
- .12 Place frame and cover on top section to elevation as indicated.
 - .1 If adjustment required use concrete ring.
- .13 Clean units of debris and foreign materials.
 - .1 Remove fins and sharp projections.
 - .2 Prevent debris from entering system.
- .14 Install safety platforms in maintenance holes having depth of 5 m or greater, as indicated.

3.5 ADJUSTING TOPS OF EXISTING UNITS

- .1 Remove existing gratings, frames and I beam and store for re-use at locations designated by Contract Administrator.
- .2 Sectional units:
 - .1 Raise or lower straight walled sectional units by adding or removing precast sections as required.
 - .2 Raise or lower tapered units by removing cone section, adding, removing, or substituting riser sections to obtain required elevation, then replace cone section.
 - .1 When amount of raise is less than 600 mm use standard maintenance hole brick, moduloc or grade rings.
- .3 Monolithic units:
 - .1 Raise monolithic units by roughening existing top to ensure proper bond and extend to required elevation with mortared brick course for 150 mm or less alteration.
 - .2 Lower monolithic units with straight wall by removing concrete to elevation indicated for rebuilding.
 - .3 When monolithic units with tapered upper section are lowered more than 150 mm, remove concrete for entire depth of taper plus as much straight wall as necessary, then rebuild upper section to required elevation with cast-in-place concrete.
 - .4 Install additional maintenance hole ladder rungs in adjusted portion of units as required.
 - .5 Re-use existing gratings, frames and I beams.
 - .6 Re-set gratings and frames to required elevation on not more than 4 courses of brick.
 - .1 Make brick joints and join brick to frame with cement mortar, parge and trowel smooth.
 - .2 Re-set gratings and frames to required elevation on full bed of cement mortar, parge and trowel smooth.

3.6 SEALING OVER EXISTING UNITS

- .1 Cut galvanized iron sheet to extend 50 mm beyond opening of existing maintenance hole or catch basin grating.
 - .1 Center iron sheet over existing grating and spot or stitch weld to grating.
- .2 Fill with cast-in-place concrete.

3.7 FIELD QUALITY CONTROL

- .1 Leakage Test:
- .2 Install watertight plugs or seals on inlets and outlets of each new storm sewer maintenance hole and fill maintenance hole with water.
- .3 Leakage not to exceed 0.3% per hour of volume of maintenance hole.

Contract Number: RFTC-1868-24-TR88179

- .4 If permissible leakage is exceeded, correct defects.
- .5 Repeat until approved by Contract Administrator.
- .6 Contract Administrator will issue Test Certificate for each maintenance hole passing test.

END OF SECTION

Part 1 General

1.1 SCHEDULING

- .1 Schedule Work to minimize interruptions to existing services and to maintain existing flow during construction.
- .2 Submit schedule of expected interruptions for approval and adhere to approved schedule.

1.2 ACTION AND INFORMATIONAL SUBMITTALS

- .1 Submit in accordance with Section 01 33 00 - Submittal Procedures.
- .2 Product Data:
 - .1 Submit manufacturer's instructions, printed product literature and data sheets for pipes, and backfill and include product characteristics, performance criteria, physical size, finish and limitations.
- .3 Shop Drawings:
 - .1 Shop drawings to indicate proposed method for installing carrier pipe for undercrossings.
 - .2 Submit drawings stamped and signed by professional engineer registered or licensed in Ontario, Canada.
- .4 Samples:
 - .1 Inform Contract Administrator at least 4 weeks prior to beginning Work, of proposed source of bedding materials and provide access for sampling.
- .5 Certification to be marked on pipe.
- .6 Test and Evaluation Reports: submit manufacturer's test data and certification at least 2 weeks prior to beginning Work.
- .7 Manufacturer's Instructions: submit to Contract Administrator 1 copy of manufacturer's installation instructions.

1.3 DELIVERY, STORAGE AND HANDLING

- .1 Deliver, store and handle materials in accordance with Section 01 61 00 - Common Product Requirements and with manufacturer's written instructions.
- .2 Delivery and Acceptance Requirements: deliver materials to site in original factory packaging, labelled with manufacturer's name and address.
- .3 Storage and Handling Requirements:
 - .1 Store materials in accordance with manufacturer's recommendations.
 - .2 Store and protect pipes from damage.
 - .3 Replace defective or damaged materials with new.

Part 2 Products

2.1 PLASTIC PIPE

- .1 Type PSM Poly Vinyl Chloride (PVC): to ASTM D3034, CAN/CSA-B1800.
 - .1 Standard Dimensional Ratio (SDR): 28.
 - .2 Locked-in gasket and integral bell system.
 - .3 Nominal lengths: 4m or 6m.
- .2 Large diameter, ribbed PVC sewer pipe and fittings: to ASTM F794, CAN/CSA-B1800.
- .3 Corrugated polyethylene pipe: high density to ASTM F667, ASTM F405, BNQ-3624-115.
- .4 Acrylonitrile - Butadiene - Styrene (ABS): to ASTM D2680, CAN/CSA-B1800.

2.2 PIPE BEDDING AND SURROUND MATERIAL

- .1 Granular material in accordance with Section 31 05 16 - Aggregate Materials and following requirements:
 - .1 Crushed or screened stone, gravel or sand.
 - .2 Gradations to be within limits specified when tested to ASTM C136 and ASTM C117. Sieve sizes to CAN/CGSB-8.1, CAN/CGSB-8.2.
- .2 Table:

Sieve Designation (mm)	% Passing	
	Stone/Gravel	Gravel/Sand
200	-	-
75	-	-
50	-	-
38.1	-	-
25	100	-
19	-	-
12.5	65-90	100
9.5	-	-
4.75	35-55	50-100
2.00		30-90
0.425	10-25	10-50
0.180	-	-
0.075	0-8	0-10

- .3 Concrete mixes and materials for bedding, cradles, encasement, supports: in accordance with Section 03 30 00 - Cast-in-Place Concrete.

2.3 BACKFILL MATERIAL

- .1 As indicated Granular A.
- .2 Type 2 in accordance with Section 31 23 33.01 - Excavating, Trenching and Backfilling.
- .3 Unshrinkable fill: in accordance with Section 31 23 33.01 - Excavating, Trenching and Backfilling.

2.4 JOINT MORTAR

- .1 Portland cement: to CAN/CSA-A3000, normal type 2.
- .2 Mortar: one part Portland cement to two parts clean sharp sand mixed with minimum amount of water to obtain optimum consistency for use intended. Do not use additives.

Part 3 Execution

3.1 PREPARATION

- .1 Temporary Erosion and Sedimentation Control:
 - .1 Provide temporary erosion and sedimentation control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to sediment and erosion control drawings.
 - .2 Inspect, repair, and maintain erosion and sedimentation control measures during construction until permanent vegetation has been established.
 - .3 Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.
- .2 Clean pipes and fittings of debris and water before installation, and remove defective materials from site to approval of Contract Administrator.

3.2 TRENCHING

- .1 Do trenching Work in accordance with Section 31 23 33.01 - Excavating, Trenching and Backfilling.
- .2 Protect trench from contents of sewer.
- .3 Trench alignment and depth to approval of Contract Administrator prior to placing bedding material and pipe.
- .4 Water jetting of backfill under haunches of corrugated steel pipe may be permitted if recommended by manufacturer and approved by Contract Administrator.

3.3 CONCRETE BEDDING AND ENCASEMENT

- .1 Do concrete Work in accordance with Section 03 30 00 - Cast-in-Place Concrete. Place concrete to details as directed by Contract Administrator.
- .2 Position pipe on concrete blocks to facilitate placing of concrete.
 - .1 When necessary, rigidly anchor or weight pipe to prevent flotation when concrete is placed.
- .3 Backfill over concrete once cured to at least 80% specified compressive strength and as directed by Contract Administrator.

3.4 GRANULAR BEDDING

- .1 Place bedding in unfrozen condition.

- .2 Place granular bedding material in uniform layers not exceeding 150 mm compacted thickness to depth as indicated.
- .3 Shape bed true to grade and to provide continuous, uniform bearing surface for pipe.
 - .1 Do not use blocks when bedding pipes.
- .4 Shape transverse depressions as required to suit joints.
- .5 Compact each layer full width of bed to at least 95% maximum density to ASTM D698.
- .6 Fill excavation below bottom of specified bedding adjacent to manholes or catch basins with compacted bedding material.

3.5 INSTALLATION

- .1 Lay and join pipes to: ASTM C12.
- .2 Lay and join pipe in accordance with manufacturer's recommendations and to approval of Contract Administrator.
- .3 Handle pipe using methods approved by Contract Administrator.
 - .1 Do not use chains or cables passed through rigid pipe bore so that weight of pipe bears upon pipe ends.
- .4 Lay pipes on prepared bed, true to line and grade with pipe inverts smooth and free of sags or high points.
 - .1 Ensure barrel of each pipe is in contact with shaped bed throughout its full length.
- .5 Begin laying at outlet and proceed in upstream direction with socket ends of pipe facing upgrade.
- .6 Lay corrugated steel pipe:
 - .1 With outside circumferential laps facing upgrade and longitudinal laps or seams at side or quarter points.
 - .2 With longitudinal centre line of paved invert coinciding with flow line.
- .7 Joint deflection permitted within limits recommended by pipe manufacturer.
- .8 Water to flow through pipes during construction only as permitted by Contract Administrator.
- .9 Whenever Work is suspended, install removable watertight bulkhead at open end of last pipe laid to prevent entry of foreign materials.
- .10 Install plastic pipe and fittings in accordance with CAN/CSA-B1800.
- .11 Joints:
- .12 When any stoppage of Work occurs, restrain pipes as directed by Contract Administrator, to prevent "creep" during down time.
- .13 Plug lifting holes with Contract Administrator approved prefabricated plugs, set in shrinkage compensating grout.

- .14 Cut pipes as required for special inserts, fittings or closure pieces, as recommended by pipe manufacturer, without damaging pipe or its coating and to leave smooth end at right angles to axis of pipe.
- .15 Make watertight connections to manholes and catch basins.
 - .1 Use shrinkage compensating grout when suitable gaskets are not available.
- .16 Use prefabricated saddles or approved field connections for connecting pipes to existing sewer pipes.
 - .1 Joint to be structurally sound and watertight.
- .17 Temporarily plug open upstream ends of pipes with removable watertight concrete, steel or plastic bulkheads.

3.6 PIPE SURROUND

- .1 Place surround material in unfrozen condition.
- .2 Upon completion of pipe laying, and after Contract Administrator has inspected pipe joints, surround and cover pipes as indicated.
 - .1 Leave joints and fittings exposed until field testing is completed.
- .3 Hand place surround material in uniform layers not exceeding 150 mm compacted thickness as indicated.
 - .1 Do not dump material within 1m of pipe.
- .4 Place layers uniformly and simultaneously on each side of pipe.
- .5 Compact each layer from pipe invert to mid height of pipe to at least 95 % maximum density to ASTM D698.
- .6 Compact each layer from mid height of pipe to underside of backfill to at least 90 % maximum density to ASTM D698.
- .7 When field test results are acceptable to Contract Administrator, place surround material at pipe joints.

3.7 BACKFILL

- .1 Place backfill material in unfrozen condition.
- .2 Place backfill material, above pipe surround, in uniform layers not exceeding 150 mm compacted thickness up to grades as indicated.
- .3 Under paving and walks, compact backfill to at least 95 % maximum density to ASTM D698. In other areas, compact backfill to at least 90 % maximum density to ASTM D698.
- .4 Place unshrinkable backfill in accordance with Section 31 23 33.01 - Excavating, Trenching and Backfilling.

3.8 FIELD TESTS AND INSPECTIONS

- .1 Repair or replace pipe, pipe joint or bedding found defective.

- .2 Draw tapered wooden plug with diameter of 50 mm less than nominal pipe diameter through sewer to ensure that pipe is free of obstruction directed by Contract Administrator.
- .3 Remove foreign material from sewers and related appurtenances by flushing with water.
- .4 Television and photographic inspections:
 - .1 Carry out inspection of installed sewers by television camera, photographic camera or by other related means.
 - .2 Provide means of access to permit Contract Administrator to do inspections.
 - .3 Payment for inspection services in accordance with Price and Payment Procedures in PART 1.

END OF SECTION

Part 1 General

1.1 SUMMARY

- .1 This Section includes requirements for supply and installation of perimeter foundation drainage system with granular filter and/or geotextile filter material.

1.2 RELATED REQUIREMENTS

1.3 REFERENCES

- .1 American Society for Testing and Materials (ASTM):
 - .1 ASTM C4-04(2018), Standard Specification for Clay Drain Tile and Perforated Clay Drain Tile.
 - .2 ASTM C136/C136M-19, Standard Method for Sieve Analysis of Fine and Coarse Aggregates.
 - .3 ASTM C444/C444M-17 Standard Specification for Perforated Concrete Pipe (Metric).
 - .4 ASTM C654M-19, Standard Specification for Porous Concrete Pipe (Metric).

1.4 ACTION SUBMITTALS / INFORMATIONAL SUBMITTALS

- .1 Submit product data in accordance with Section 01 33 00 – Submittals Procedures.
 - .1 Submit manufacturer's product literature for each product listed including manufacturer's recommended installation procedures and any modifications required to suit installation conditions.
- .2 Submit samples in accordance with Section 01 33 00 - Submittal Procedures.
 - .1 Drainage Pipe: Provide a 300 mm length of perforated pipe and end connection.
 - .2 Filter Fabric: Provide 600 mm x 600 mm filter cloth sample for review and acceptance.
- .3 Certificates:

- .1 Submit manufacturer's test data and certification that drain pipe materials meet requirements of this Section at least two weeks prior to beginning Work.
- .2 Submit proposed source of granular bedding and filter materials a minimum of two weeks before beginning work of this Section, indicate gradation and certification of expected flow rate of granular materials.
- .3 Certification to be marked on pipe.

1.5 DELIVERY, STORAGE, AND HANDLING

- .1 Deliver, handle, store and protect materials in accordance with Section 01 61 00 - Common Product Requirements.
- .2 Store materials in accordance with manufacturer's written instructions.
- .3 Packaging Waste Management
 - .1 Separate and recycle waste materials in accordance with Section 01 74 21 - Waste Management and Disposal.

Part 2 Products

2.1 MATERIALS

- .1 Corrugated Plastic Drainage Tubing: PVC DR 35 to CSA B182.1, perforated, tapered ends, sizes as indicated on drawings. Unperforated matching pipe leads.
- .2 Other pipe as indicated on the drawings or as directed by the Consultant.
- .3 Filter Gravel: Coarse aggregates to CSA A23.1, Table Three, Group 1, 20 mm to 5 mm nominal size of aggregate.
- .4 Filter Cloth and Sock: Tensile strength minimum 400 N, equivalent opening size 120 microns or less.
 - .1 Basis-of-Design Materials:
 - .1 DLCS100, Earthmate, CCG
- .5 Accessories: Drainage pipe couplings (where pipe does not have bell connectors), end caps, clean-outs, and access covers, all as required for complete system.
- .6 Geotextile filter: Geotextile to be non-woven plastic, non-biodegradable type designed for separation of fill materials while permitting movement of ground water.
 - .1 Basis-of-design Material:
 - .1 NudrainPD20, Nillex.

Part 3 Execution

3.1 PREPARATION

- .1 Trenching

- .1 Do excavating, trenching and backfilling in accordance with Section 31 23 10 – Excavating, Trenching, and Backfilling.
- .2 Trim and compact trench bottom to provide firm uniform support throughout length of pipe.
- .3 Allow 100 mm clearance on both sides of pipe for filter aggregate.
- .2 Bedding
 - .1 Place 100 to 150 mm layer of bedding filter material as indicated and compact to minimum 95% of maximum density to ASTM D698.

3.2 INSTALLATION OF PIPE SUB-DRAINS

- .1 Lay pipe drains on prepared bed, true to line and grade with inverts smooth and free of sags or high points.
- .2 Place at trench bottom the geotextile fabric of sufficient width to completely wrap around filter aggregate and pipe with minimum 300 mm overlap. Alternatively a sock of approved geotextile fabric may be slipped over the pipe.
- .3 Ensure barrel of each pipe is in contact with bed throughout full length.
- .4 Begin laying at outlet and proceed in upstream direction.
- .5 Lay perforated pipes on fabric with perforations 2/3 down.
- .6 Lay bell and spigot pipe with bell ends facing upstream.
 - .1 Do not mortar joints.
- .7 Make joints tight in accordance with manufacturer's instructions.
- .8 Make watertight connections to existing drains, new or existing manholes and catch basins where indicated or as directed by Consultant. Seal joints with approved sealant.
- .9 Plug open upstream ends of pipes with watertight concrete, steel or wood bulkheads.
- .10 Surround and cover drain with filter material in uniform 150 mm layers to an elevation of at least 150 mm above top of drain and compact to at least 95% maximum density to ASTM D698. Level aggregate surface and overlap the fabric.
- .11 Cover filter material with geotextile filter.
- .12 Backfill remainder of trench to Section 31 23 00 – Excavation and Fill and as directed by Consultant.
- .13 Do not place bedding surround and backfill materials in frozen condition.
- .14 Protect sub-drains against flotation during installation.
- .15 Install "Y" connections to surface as indicated, for flushing.

END OF SECTION
